1.0 INTRODUCTION

On behalf of Doña Ana Dairies (Dairies), EA Engineering, Science, and Technology, Inc., PBC (EA) has prepared this Stage 2 Implementation and Quarterly Monitoring Report for Doña Ana Dairies located south of Las Cruces, New Mexico (Figure 1). The report was completed in accordance with the *Stage 2 Abatement Plan* and the *Sampling and Analysis Plan, Doña Ana Dairies, Doña Ana County, New Mexico* dated November 7, 2013 and August 11, 2008, respectively, and the Conceptual Work Plan (CWP) dated February 1, 2008. All were prepared to satisfy requirements stated in the New Mexico Administrative Code (NMAC), Title 20, 6.2 §4106 through §4110. The Sampling and Analysis Plan was approved by the New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) on September 25, 2008. On March 25, 2015, the Stipulated Agreement to additional requirements to the Dona Ana Dairies Stage 2 Abatement Plan was agreed to by NMED, Doña Ana Dairies, and the Rio Valle Concerned Citizens. On April 10, 2015, the Stage 2 Abatement Plan was approved by NMED by Final Order.

1.1 Objective

The objectives of this report are to comply with the Stage 2 Abatement Plan and the Stipulated Agreement and to satisfy the requirements set forth in NMAC 20.6.2 §4110.

The following work was performed to meet the objective of the Stage 2 Abatement Plan and the Stipulated Agreement:

- Installed four monitoring wells, DAD-23 through DAD-26.
- Plugged and abandoned Del Oro Dairy discharge plan (DP) well 692-01.
- Completed baseline compound specific isotope analysis (CSIA) for nitrogen-14 and nitrogen-15 ($^{15}\text{N}/^{14}\text{N}$ [$\delta^{15}\text{N}$]) from 15 select wells and total organic carbon (TOC) from 16 select wells.
- Recalculated background concentrations for chloride and total dissolved solids (TDS) for the northern portion.
- Completed baseline geostatistics and updated trend analysis.
- Completed analytical capture analysis of the irrigation and supply wells.
- Gauged DP, abatement plan (AP) and Anthony Waste Water Treatment Plant monitoring wells.
- Collected groundwater samples from AP and DP monitoring wells that contained sufficient water to sample. The samples were analyzed for nitrate, chloride, total Kjeldhal nitrogen (TKN), and samples from select wells were analyzed for sulfate. During sampling, field parameters were monitored and recorded.

1.2 Background

In correspondence dated April 7, 2006, NMED required a Stage 1 Abatement Plan for 13 dairies in Doña Ana County, based on analytical results from DP monitoring of on-site compliance monitoring wells that showed concentrations of nitrate, chloride, and TDS exceeding ground water standards promulgated in New Mexico Water Quality Control Commission (NMWQCC) Regulations (20 NMAC 6.2 §3103). On October 30, 2006, the Dairies notified NMED that they had reached an agreement to work as a group and submit a joint response to NMED's request (Doña Ana Dairies, 2006).

On December 11, 2006, on behalf of the Doña Ana Dairies, Golder Associates (Golder) submitted a Stage 1 and 2 Abatement Plan Proposal to address impacts to groundwater in the area of the Dairies (Golder 2006). The first major deliverable in the Abatement Plan Proposal was an Existing Data Report (EDR) to bring together in one document historical data and practices of the constituent dairies.

The EDR, submitted on February 1, 2008, (Golder 2008a) was intended to satisfy the Dairies commitment for compilation and submission of existing data identified in the Doña Ana Dairies response (2006) to the NMED requirement for Stage I Abatement Plans. Section 9 of the EDR outlined data gaps identified during the preparation of the report, as well as the actions recommended. To facilitate the discussion of the path forward after the submittal of the EDR and concurrent with the EDR submission, a conceptual work plan (CWP) was prepared (Golder 2008b).

On July 15, 2008, the Dairies, Golder and NMED met (Golder 2008c). During that meeting, plume maps presented in the EDR (Golder 2008a), new monitoring data, and knowledge of well locations and groundwater chemistry results at adjacent DP-regulated facilities were used to identify data gaps with respect to groundwater flow direction and plume delineation. The agreed upon data gaps yielded new well locations (including contingency locations) as recorded in the meeting minutes (Golder 2008c) and depicted in the Sampling and Analysis Plan (SAP) dated August 8, 2008 (Golder 2008d). The SAP outlined the details of the field operations to be implemented for completion of data gaps, such that a Site Investigation Report (§4106.C.6) and Stage 2 Abatement Plan (§4106.D) could be prepared.

Groundwater gauging was conducted concurrent to discussions with NMED at the Dairies for four quarters, February 2008, June 2008, September 2008, and December 2008, to determine the current and historical site groundwater gradient.

In May 2009, field work was conducted as outlined in the SAP and ten (10) AP monitoring wells (DAD-01 through DAD-10) were installed. In July 2009, the Site Investigation Report was submitted to the NMED (EA 2009).

On February 9, 2012 the Final Site Investigation Report was submitted to NMED (EA 2012a). The report summarized field activities that occurred from October 10 through October 14, 2011 and November 10 through 18, 2011, during which eleven soil borings were advanced at the site

and converted into monitoring wells DAD-12 through DAD-14, DAD-16 through DAD-22, and DP well 177-03A.

On August 16, 2012 soil boring/monitoring well DAD-15 was installed and on August 20, 2012 well DAD-15 was sampled. An addendum to the Final Site Investigation Report was submitted to NMED on September 7, 2012, which summarized DAD-15 field activities (EA 2012b).

A Stage 2 Abatement Plan was submitted to NMED on March 13, 2013 (EA 2013a). Based on an NMED response in August 2013, a Revision to the Stage 2 Abatement Plan was submitted on November 7, 2013 (EA 2013b).

On March 25, 2015, the Stipulated Agreement to additional requirements to the Dona Ana Dairies Stage 2 Abatement Plan was agreed to by NMED, Dona Ana Dairies, and the Rio Valle Concerned Citizens (NMED, Doña Ana Dairies, and Rio Valle Concerned Citizens 2015). On April 10, 2015 the Stage 2 Abatement Plan was approved by NMED by Final Order (NMED 2015).

2.0 WELL INSTALLATION AND PLUGGING ACTIVITIES

Site investigation activities included the installation of four new DAD wells (DAD-23 through DAD-26), and collection of groundwater samples from all new DAD wells. All field activities followed the Sampling and Analysis Plan for Dona Ana Dairies dated August 8, 2008 (Golder 2008d). Field forms are provided in Appendix A.

2.1 Preliminary Investigation Activities

Prior to performing any field activities, access was obtained for off-site well locations and notice was provided to the NMED Ground Water Quality Bureau (GWQB). Access was needed for wells DAD-23 and DAD-26. Well DAD-23 is located on property owned by the City of Anthony, New Mexico, and well DAD-26 is located on property owned by Doña Ana County. Access was obtained from both the City of Anthony, and from Doña Ana County.

One well location, DAD-23, was relocated relative to the proposed location. The well was relocated at the request of Doña Ana County from La Fe Avenue to Cristo Avenue. NMED approved the relocation of well via email on December 9, 2015.

EA prepared a site-specific health and safety plan, which is included in Appendix B. On December 1, 2015, EA provided notice of impending field activities to the NMED GWQB project manager, Mr. Ray Montes.

2.2 Boring Installation and Site Geology

On December 14 through 18, 2015, 3 soil borings were advanced at the site and converted into monitoring wells DAD-23, DAD-25, and DAD-26. On December 21, 2015, an attempt was made to install soil boring DAD-24; however, the boring was not installed due to equipment failure. On February 3 and 4, 2016, boring DAD-24 was successfully advanced and converted

into a vertical delineation well. Locations of the newly installed wells are shown on Figures 2, 3, 4, and 5.

Borings DAD-23, DAD-25, and DAD-26 were advanced using the hollow stem auger drilling method. Vertical delineation well DAD-24 was advanced using the mud rotary drilling method to approximately 130 feet below the ground surface (bgs).

During drilling activities, the site geologist logged soil samples every five feet using the Unified Soil Classification System. Soil samples were retrieved using a decontaminated split spoon sampling device during hollow stem auger drilling and from cuttings during mud rotary drilling. Lithology was recorded on boring log forms. The boring logs are included in Appendix C.

The subsurface lithology present in the northern and central portions was similar and corresponded to lithology encountered during previous investigations. The subsurface lithology present within the northern and central portions during this investigation consisted predominantly of sand. The sand is brown in color, very fine to medium grained, and poorly graded or well graded. The sand may have up to 5 percent gravel. Intervals of well graded gravels were present in many of the borings as well as either brown sandy clay or clayey sand.

The southern portion (Del Oro Dairy) subsurface lithology consists predominantly of sand and gravel from the surface to approximately 70 feet bgs where a 2 to 10 foot thick clay interval is present. Below the clay is a silty to fine grained sand. Groundwater was present in the southern portion in what appears to be two distinct intervals: a perched zone present above the clay layer and a deeper zone (regional aquifer) present below the clay layer. There is approximately a 7 to 10 foot difference in the water table elevation between wells completed in the perched aquifer and those completed in the regional aquifer. The clay layer appears to dip toward the west-southwest and thin toward the north. The lateral extent of the clay aquitard is unknown. Boring DAD-26 was installed in the perched aquifer and the lithology encountered was similar to what was observed during previous investigations.

2.3 Monitoring Well Installation

From December 14 through 17, 2015 and February 3 and 4, 2016, four monitoring wells (DAD-23 through DAD-26) were installed at the site. One water table monitoring well (DAD-23) was installed within the northern portion in the Del Cerro neighborhood, south of Gonzalez Dairy. One water table monitoring well (DAD-25) and one vertical delineation well (DAD-24) were installed within the central portion at Big Sky Dairy. One water table monitoring well (DAD-26) was installed within the southern portion south-southwest of Del Oro Dairy. Figures 2, 3, 4, and 5 show the locations of the new wells.

The water table monitoring wells were constructed with 2-inch Schedule 40 polyvinyl chloride (PVC), flush thread-jointed casing, and 20 feet of Schedule 40 PVC 0.010-inch machine-slotted screen. One exception, well DAD-26, was completed with 15 feet of Schedule 40 PVC 0.010-inch machine-slotted screen. Filter pack consisting of 12-20 mesh silica sand was placed from the bottom of the borehole to at least 2 feet above the screen interval, followed by a 3- to 4-

foot hydrated bentonite seal, and finally cement-bentonite grout to the surface. However, well DAD-25 was completed with a hydrated bentonite seal to the surface and no grout.

The vertical delineation well (DAD-24) was constructed with 2-inch Schedule 40 polyvinyl chloride (PVC), flush thread-jointed casing, and 5 feet of Schedule 40 PVC 0.010-inch machine-slotted prepack screen (screen and 10-20 mesh silica sand filter pack combined). The screen was placed approximately 60 feet below the top of the water table. Filter pack consisting of 12-20 mesh silica sand was placed from the bottom of the borehole to at least 2 feet above the screen interval, followed by bentonite seal (TR-30 time release bentonite in saturated interval) to the surface.

DAD-23 and DAD-26 were completed with well vaults flush with the ground surface set in 2-foot by 2-foot by 4-inch thick concrete pads. Wells DAD-24 and DAD-25 were completed with above-grade steel locking shroud with 2-foot stick up placed in 2-foot by 2-foot by 4-inch thick concrete pads. Four 4-inch carbon steel bollards were placed around each well head to protect the monitoring wells. Soil boring/well completion diagrams are included in Appendix C. Photographic documentation of the well completions is provided in Appendix D.

2.4 Well Development

Groundwater monitoring wells DAD-23 and DAD-26 were developed no earlier than 24 hours after the wells were completed. Wells DAD-24 and DAD-25 were developed within 24 hours of being completed because grout was not used in their construction. Water levels and total depths were gauged in the wells with an electronic water level indicator. Development was accomplished with the use of a submersible pump or by hand bailing. The pump or bailer was used to surge and clean the filter pack of any fines. Wells were purged until the well yielded clear water to extent practicable. Development water was ground discharged.

2.4 Well Plugging and Abandonment

On December 22, 2015, EA and Terracon plugged and abandoned Del Oro Dairy well 692-01R by removing the surface completion and approximately 50 feet of well casing. Then neat cement was pumped via tremie pipe from the total depth to approximately two-feet below ground surface pursuant of the New Mexico Office of the State Engineer. Photographic documentation of the plugging & abandonment is provided in Appendix D. The Office of the State Engineer Plugging Record is included in Appendix E.

2.5 Surveying

The new AP monitoring wells were surveyed by Christian A. Clausen, a New Mexico Licensed Surveyor. All well locations were surveyed using United States State Plane Coordinates, North American Datum of 1983. Elevations are based on the North America Vertical Datum of 1988. Wells were located to within 0.01 foot horizontal and 0.01 foot vertical. The survey results are attached in Appendix F.

3.0 GROUNDWATER MONITORING ACTIVITIES

Groundwater monitoring activities conducted by D&H Petroleum and Environmental Services (D&H) included gauging and sampling DP and AP monitoring wells and the collection of groundwater samples from dairy supply and irrigation wells. Groundwater samples were analyzed for nitrate, chloride, TDS, and TKN. Select irrigation wells were sampled for sulfate also. Select wells were sampled for CSIA and TOC. The resulting data from this groundwater monitoring event are compiled and presented herein. Field forms are provided in Appendix A.

3.1 Well Gauging

From February 9 through February 11, 2016, representatives from D&H gauged the DP and AP monitoring wells with an electronic water level indicator. A broken well casing prevented the gauging of groundwater elevation at Sunset Dairy well 257/260-01. Due to a declining water table, several wells were dry or contained insufficient water for sampling. Table 1 provides a summary of the groundwater gauging data collected from the monitoring network. Potentiometric surface maps were constructed based on these data (Figures 2, 3, 4, and 5).

3.2 Groundwater Sampling

From February 25 through March 1, 2016, D&H sampled the AP monitoring wells DAD-01 through DAD-26 with disposable bailers with the exception of well DAD-06, which was dry. Three well casing volumes were purged unless the well contained insufficient water.

D&H sampled the DP wells from February 15 through February 24, 2016. Prior to sampling, the DP wells were purged of three casing well volumes, if practicable, by (1) hand-bailing with new disposable bailers and twine, (2) pumping with a submersible pump and new polyethylene tubing, or (3) pumping with a dedicated pump and tubing.

The wells were sampled from clean to dirty to the extent possible to minimize cross-contamination potential. All non-dedicated or disposable equipment was decontaminated between wells with an Alconox™ solution to further ensure sample quality. All meters were calibrated and/or checked with standards in accordance with manufacturer's specifications prior to daily use. Purge water was ground discharged.

When sufficient water was available, field parameters were recorded from DP and AP monitoring wells. The recorded field parameters included specific conductance, pH, temperature, ORP, and dissolved oxygen. Parameters were monitored using a YSI 556 MPS and recorded. Field parameters from August 2015 to present are summarized in Table 2.

All groundwater samples were collected immediately after purging. Sampling was either accomplished by carefully pouring groundwater from the bailer into the sample containers or by pumping groundwater through polyethylene tubing into the sample container. Method of sample collection is documented on the field forms (Appendix A). Sample containers were provided by TraceAnalysis. Container size, type, sample preservatives, analytical methods, and holding times are specified in Table 3. All samples were preserved in accordance with method

requirements, labeled, then immediately cooled to $<6^{\circ}\text{C}$ with ice, and delivered under chain-of-custody to TraceAnalysis in El Paso, Texas. All analytical laboratory reports are provided in Appendix G.

3.3 CSIA and TOC Groundwater Sampling

Sixteen wells selected by NMED and EA were sampled for CSIA and TOC. On December 15 through 17, 2015, EA collected groundwater samples from DP wells 70-02, 177-05, 177-07R, 167-04, 167-07, 833-02, 833-09, 257-01, 257-02, and 692-02 and from AP wells DAD-09 and DAD-14. On December 21, 2015, D&H collected groundwater samples from DP well 42-03 and AP wells DAD-23 and DAD-25, and D&H collected a groundwater sample from DP well 42-06 on March 15, 2016.

All wells were sample utilizing low-flow sampling methodology with a decontaminated submersible pump and new disposable tubing except wells 42-03 and 42-06. Wells 42-03 and 42-06 were sample utilizing the dedicated pumps installed in the wells. All non-dedicated equipment was decontaminated between wells with an Alconox™ solution to further ensure sample quality. Field parameters including, at a minimum, specific conductance, pH, and temperature were monitored and recorded. All meters were calibrated and/or checked with standards in accordance with manufacturer's specifications prior to daily use. Purge water was ground discharged.

All groundwater samples were collected immediately after purging. Sampling was accomplished by pumping groundwater through disposable polyethylene tubing or dedicated piping into the laboratory supplied sample container. Container size, type, sample preservatives, analytical methods, and holding times are specified in Table 3. All samples were preserved in accordance with method requirements, labeled, then immediately cooled to $<6^{\circ}\text{C}$ with ice, and delivered under chain-of-custody to the laboratory. All analytical laboratory reports are provided in Appendix G.

All groundwater samples were analyzed for CSIA $^{15}\text{N}/^{14}\text{N}$ ($\delta^{15}\text{N}$) and TOC. Groundwater samples for CSIA were packed in coolers with double bagged ice and delivered under chain-of-custody to Pace Analytical Energy Services LLC (Pace) in Pittsburgh, Pennsylvania. Groundwater samples for TOC analysis were delivered under chain-of-custody to either TraceAnalysis in El Paso, Texas or Hall Environmental Analysis Laboratory in Albuquerque, New Mexico.

3.4 Irrigation/Supply Well Groundwater Sampling

Fourteen irrigation/supply locations were sampled in March and April 2016. Samples were analyzed for nitrate, chloride, TDS, and TKN. Groundwater from wells LRG-00457, LRG-3348-AS, and LRG-3348-B were also analyzed for sulfate. Irrigation/supply wells were sampled by collecting a grab aliquot from a faucet or tank located nearest to the pump outlet. The wells were operational at the time of sampling; therefore, no purging was necessary.

Two of the samples were collected from irrigation wells. One is located at the Mountain View Land Application Area (LRG-0457) and one at the Dominguez Dairy pecan orchard (LRG-00590-S-6). The irrigation well (LRG-314495-POD1) adjacent to AP well DAD-08 was scheduled to be sampled; however, the irrigation well has not been operational for two years.

Twelve of the samples are from dairy supply wells located near their respective milking parlors. The supply wells at Bright Star Dairy, Dominguez Dairy, Desert Land Dairy, and Del Oro Dairy were sampled from their holding tanks using new disposable bailers or taps located on the tank. At Dominguez Dairy and Del Oro Dairy more than one supply well pumped water into the holding tank; therefore, the groundwater sample collected was a composite sample. At Dominguez Dairy water is supplied to their holding tank by two supply wells. At Del Oro Dairy water is supplied to their holding tank by three supply wells.

Additional sampling occurred in May 2016. Buena Vista Dairy II well LRG-01876 and Mountain View Dairy well LRG-952 were inadvertently omitted during the March/April sampling event. Gonzalez well LRG-05351-S was sampled in March and then resampled in May. It was suspected that the wrong well was sampled during the earlier sampling event, but the newer results confirm that the correct well was sampled.

4.0 GROUNDWATER MONITORING RESULTS

4.1 Hydraulic Gradient and Direction of Groundwater Flow

This quarter, groundwater was present beneath the site at depths ranging from 13.07 feet below top of casing (ft btoc) in abatement well DAD-03 to 132.75 ft btoc in Dominguez #2 well 42-12. Groundwater was encountered at shallower depths near the Mesquite Drain and at greater depths near I-10 where the topographic elevation increases.

Potentiometric surface maps were completed using the monitoring well gauging data for the northern, central, and southern portions of the Dairies and are provided as Figures 2, 3, 4, and 5. Hydrographs were completed for select monitoring wells and are provided in Appendix H. On average, water levels have increased in the northern portion, central portion, and southern portion regional aquifer when compared to the monitoring event conducted in November 2015, while water levels in the southern portion perched aquifer decreased. Long term decreases in water levels have resulted in many wells becoming dry.

The groundwater flow direction in the northern and southern portion of the regional aquifer is to the southeast, and the groundwater flow in the central portion of the regional aquifer is southerly. The gradient in the southern perched aquifer of the dairy near Anthony, New Mexico flows southwest. The hydraulic gradient across the Dairies is approximately 0.001 ft/ft.

4.2 Groundwater Field Parameters

Field parameters from the most recent monitoring event including specific conductance, pH, temperature, ORP, and dissolved oxygen are discussed below. The field parameters were recorded on the sampling field forms (Appendix A) and summarized in Table 2. Though dissolved oxygen and ORP measurements from wells containing a pump were recorded, these

measurements are not representative of aquifer conditions and therefore are not included in the discussion. Many dissolved oxygen and ORP values do not appear to be accurate, possibly due to a malfunctioning meter or improper calibration.

Northern Area

In the northern area, pH values ranged from 6.34 in Dominguez Dairy well 624-02 to 7.52 in Gonzalez Dairy well 42-06 for the February 2016 monitoring event. The pH values recorded on February 15, 2016 were not used for comparison since the values appear to be suspect. Specific conductivity ranged from 1,732 microsiemens per centimeter ($\mu\text{S}/\text{cm}$) in Dominguez 2 Dairy well 42-12 to 9,366 $\mu\text{S}/\text{cm}$ in Mountain View Dairy well 70-03. Dissolved oxygen ranged from 1.36 milligrams per liter (mg/L) in Mountain View Dairy well 70-04 to 6.08 mg/L in abatement well DAD-02. The ORP ranged from 165.0 millivolts (mV) in Organ Dairy well 126-05 to 367.9 mV in abatement well DAD-11 for the most recent monitoring event.

Central Area

In the central area, pH values ranged from 6.45 in River Valley Dairy well 167-06 to 8.02 in Big Sky Dairy well 833-09 for the most recent monitoring event. Specific conductivity ranged from 1,550 $\mu\text{S}/\text{cm}$ in abatement well DAD-17 to 7,896 $\mu\text{S}/\text{cm}$ in abatement well DAD-08. Dissolved oxygen ranged from less than 0.01 mg/L in Sunset Dairy well 257/260-01 to 6.49 mg/L in River Valley Dairy well 167-02. The ORP ranged from -312.4 mV in Sunset Dairy well 257/260-01 to 597.0 mV in Buena Vista Dairy well 74-03 for the most recent monitoring event.

Southern Area

In the southern area of the regional aquifer, pH values ranged from 7.01 in Del Oro Dairy well 692-05 to 7.28 in abatement well DAD-10 for the most recent monitoring event. Specific conductivity ranged from 2,072 $\mu\text{S}/\text{cm}$ in Del Oro Dairy well 692-08 to 2,390 $\mu\text{S}/\text{cm}$ in Del Oro Dairy well 692-07. Dissolved oxygen ranged from 3.63 mg/L in abatement well DAD-10 to 3.78 mg/L in Del Oro Dairy well 692-06. The ORP ranged from 167.3 mV in Del Oro Dairy well 692-06 to 229.0 mV in abatement well DAD-10 for the most recent monitoring event.

In the southern area's perched aquifer, pH values ranged from 6.49 in Del Oro Dairy well 692-02 to 7.42 in abatement well DAD-20 for the most recent monitoring event. Specific conductivity ranged from 2,888 $\mu\text{S}/\text{cm}$ in abatement well DAD-09 to 4,818 $\mu\text{S}/\text{cm}$ in Del Oro Dairy well 692-02. Dissolved oxygen ranged from 1.46 mg/L in Del Oro Dairy well 692-02 to 5.29 mg/L in abatement well DAD-20. The ORP ranged from 192.0 mV in abatement well DAD-22 to 335.4 mV in Del Oro Dairy well 692-02 for the most recent monitoring event.

4.3 Groundwater Nitrate, Chloride, and TDS Analytical Results

4.3.1 Abatement Plan Well Results

Groundwater analyte concentrations were below the NMWQCC standard for nitrate (10 mg/L) in 11 of the 25 monitoring wells sampled. The AP wells that had nitrate concentrations above

standards are DAD-02, DAD-08, DAD-09, DAD-10, DAD-11 (vertical delineation well), DAD-12 (vertical delineation well), DAD-13, DAD-14, DAD-19 (vertical delineation well), DAD-20, DAD-21, DAD-22, DAD-25, and DAD-26.

Both chloride and TDS concentrations exceeded their respective NMWQCC standards in all 25 wells sampled, except for well DAD-17 where chloride decreased from 373 in November 2015 to 183 mg/L in March 2016.

Newly installed AP wells DAD-23 and DAD-24 (vertical delineation well) were below the standard for nitrate, but nitrate concentrations were above the standard in newly installed AP wells DAD-25 and DAD-26. Nitrate concentrations decreased in AP wells DAD-01, DAD-04, DAD-07, DAD-08, DAD-11, DAD-15, DAD-16, and DAD-19 (vertical delineation well). Nitrate concentrations increase or remained the same in all the other AP wells. The nitrate concentrations in wells DAD-03, DAD-04, DAD-17, and DAD-23 were below detection limits for this monitoring event. Well DAD-21 saw the largest increase in nitrate concentrations from 6.28 mg/L in November 2015 to 35.6 mg/L for this monitoring event. The highest nitrate concentrations were found in wells DAD-25 and DAD-26 at 52.5 mg/L and 61.1 mg/L, respectively. Wells DAD-10 and DAD-13 were above standards for the first time since May 2015. Wells DAD-09 and DAD-21 were above standards for the first time since 2013 and 2014, respectively, and well DAD-22 was above standards for the first time since December 2012.

Chloride concentrations in the AP wells range from 183 mg/L in well DAD-17 to 1,990 mg/L in well DAD-08 for this event, and TDS ranged from 1,260 mg/L in well DAD-17 to 5,740 mg/L in well DAD-08.

Table 4 summarizes the analytical results for AP monitoring wells and the analytical laboratory results are found in Appendix G. Nitrate and chloride concentration trends for DAD wells are presented in Appendix I.

4.3.2 Abatement Plan and Discharge Permit Well Results by Area

DP groundwater analytical results are presented in Table 5. These data were combined with the analytical data collected from the 25 AP monitoring wells sampled and are plotted on Figures 6, 7, 8, and 9. Analytical laboratory reports are included in Appendix G. The following discussions summarize the results by area at the Dairies.

Northern Portion

The highest nitrate concentration was detected at Bright Star Dairy well 340-01 with a concentration of 99.1 mg/l. The northern nitrate plume downgradient well, DAD-02, was slightly above the NMWQCC standard for nitrate (10 mg/L) for the first time in May 2015 and has remained slightly above the standard since. In the most recent monitoring event, nitrate was detected at DAD-02 at a concentration of 10.3 mg/L. However, newly installed well DAD-23, which is located upgradient of well DAD-02, was below method detection limits. This may indicate that the contamination present in well DAD-02 is not coming from the Dairies. Upgradient wells 70/86/340-01 and 86/340-01 (Northern Land Application wells) had above-

standard nitrate concentrations of 12.1 mg/L and 12.9 mg/L, respectively. Eastern cross-gradient wells 42-10, 42-11, 42-12, and DAD-01 had nitrate concentrations below the standard. Cross gradient well DAD-13 was above standards for the first time since May 2015 at 11.0 mg/L. The western delineating cross-gradient well Dominguez 624-05 had a nitrate concentration of 6.72 mg/L in February 2013; however, the well has remained dry since that time. Nitrate concentrations in the well nearest to Dominguez well 624-05, Day Break (Dominguez #2) well 42-02, remained below NMWQCC standards during this monitoring event with a concentration of 9.10 mg/L.

The chloride and TDS concentrations are above standards in all wells sampled within the northern portion. The highest concentrations of chloride and TDS were observed at Northern Land Application Area well 70-03 with concentration of 3,340 mg/L and 8,380 mg/L, respectively.

Central Portion

The highest nitrate concentration was observed in Big Sky Dairy well 833-09 at a concentration of 112 mg/L. The upgradient extent of the nitrate plume is defined in the central portion by Buena Vista Dairy II well 74-03 which was below detection limits for nitrate for this event. Sunset Dairy well 257-02 defines the downgradient extent of the plume. It has remained below the standard since May 2014 except in the November 2015 event which concentrations were slightly above the standard with a concentration 12.2 mg/L. The nitrate concentration during this event returned to below the standard at a concentration of 4.98 mg/L. The eastern cross-gradient extent of the plume is defined by wells DAD-07 and DAD-15, and the western extent is defined by wells DAD-04, DAD-16, 167-01A, 167-05, 167-08, and 833-10; nitrate concentrations remain below standards in all of these wells. The new AP well, DAD-25, located in the southeastern corner of the central portion was above standards for nitrate. The new vertical delineation well DAD-24 was below the nitrate standard, which has now defined the vertical extent of nitrate contamination.

Chloride and TDS concentrations are above standards in all wells within the central portion. The highest chloride and TDS concentrations were observed at well DAD-08 with concentrations of 1,990 mg/L and 5,740 mg/L, respectively. Well DAD-08 is located east of Sunset Dairy, adjacent to irrigation well LRG-00590-S-6. This irrigation well has not been operational since 2014.

Southern Portion

Nitrate is present within both the regional and perched aquifers in the southern portion of the Dairies. All of the wells in the regional aquifer are below the NMWQCC standard for nitrate. For the last two events (September and November 2015), AP well DAD-10 in the regional aquifer has been below the standard, but nitrate concentrations increased above the standard for this event at a concentration of 10.5 mg/L.

The well with the highest nitrate concentration in the shallow perched aquifer is Del Oro Dairy well 692-02 with a concentration of 140 mg/L. The nitrate concentration in AP wells DAD-09,

DAD-20, DAD-21, DAD-22, and newly installed DAD-26 were above the NMWQCC standard (10 mg/L). Wells DAD-09 and DAD-21 were above standards for the first time since 2013 and 2014, respectively, and well DAD-22 was above standards for the first time since December 2012.

Chloride and TDS concentrations are above NMWQCC standards in all wells sampled within the southern portion. Chloride concentrations in this area ranged from 445 mg/L in Del Oro Dairy well 692-09 to 990 mg/L in well 692-02. TDS ranged from 1,280 mg/L in Del Oro Dairy well 692-09 to 3,480 mg/L in Del Oro Dairy well 692-02. Upgradient Del Oro well 692-08 had a chloride concentration of 448 mg/L and a TDS concentration of 1,300 mg/L.

4.3.3 Irrigation/Supply Well Results

Groundwater analytical results for the sampled irrigation/supply wells are presented in Table 6. Locations are provided on Figures 6, 7, 8, and 9. Analytical laboratory reports are included in Appendix G.

Nitrate concentrations were below the NMWQCC standard for nitrate in 11 of the 14 sampled irrigation/supply wells. In the northern portion, nitrate standard exceedances occurred at Bright Star Dairy well LRG-00953, Dominguez well LRG-00590-S-6, and Gonzalez well LRG-05351-S. Concentrations ranged from 10.3 to 20.4 mg/l. In the central portion, an exceedance occurred at Buena Vista Dairy II well LRG-01876 in March 2016 with a concentration of 12.2 mg/l. However, when the well was re-sampled in May 2016 the nitrate concentration measured 0.140 mg/l.

All irrigation/supply wells were above the NMWQCC standard for chloride and TDS. Chloride concentrations ranged from 328 to 1,200 mg/l. TDS concentrations ranged from 1,260 to 4,040 mg/l. Both chloride and TDS concentration ranges are similar to the concentrations observed in discharge plan and abatement plan monitoring wells, further indicating that chloride and TDS concentrations observed are regionally above standards.

Sulfate was below the NMWQCC standard in all three wells that were sampled.

4.4 Groundwater CSIA and TOC Analytical Results

Sixteen wells selected by NMED and EA (Mountain View Dairy 70-02, Dominguez Dairy 42-03 and 42-06, Gonzalez Dairy 177-05 and 177-07R, River Valley Dairy 167-04 and 167-07, Big Sky Dairy 833-02 and 833-09, Sunset Dairy 257-01 and 257-02, Del Oro Dairy 692-02, and AP wells DAD-09, DAD-14, DAD-23, and DAD-25) were sampled for CSIA and TOC analysis (Table 7). CSIA consisted of analysis of nitrogen-14 and nitrogen-15 stable isotopes ($^{15}\text{N}/^{14}\text{N}$ [$\delta^{15}\text{N}$]), as well as oxygen-18 ($\delta^{18}\text{O}$). One well 167-07 located at River Valley Dairy could not be analyzed for CSIA due to low nitrate concentrations. These wells are located along the center line of the plume through the northern, central and southern portions of the Dairies.

CSIA is an analytical method that measures the ratio of naturally occurring stable isotopes (ITRC 2011). The CSIA information can be used to assess environmental forensics and determine

different sources of nitrate. The nitrogen and oxygen isotopic composition can be used to discern different sources of nitrate (Pace 2016). This is completed by plotting the nitrogen $\delta^{15}\text{N}$ and the oxygen $\delta^{18}\text{O}$ on a graph. Generally, the isotopic compositions from the same source will plot linearly. The CSIA results from the 15 wells, where analysis could be completed, were plotted on a graph (Figure 10). The plot indicates that there is a similar linear trend for all samples analyzed except for the sample collected from DAD-23, which appears to be an outlier. This may indicate that the nitrate concentration present in DAD-23 is from a separate source other than the Dairies.

The TOC results from the sixteen wells ranged from <1.0 mg/L in well DAD-09 to 14.6 mg/L in well DAD-25. The average TOC concentration from the sixteen wells is 3.85 mg/L.

Analytical laboratory results for the CSIA and TOC are included in Appendix G.

5.0 DATA GAPS

Installation of additional monitoring wells is proposed to address existing data gaps. The downgradient extent of the nitrate plume in the central portion of the regional aquifer is not defined. As a result, installation of a well southeast of DAD-25 is proposed. The downgradient extent of the nitrate plume in the southern portion of the perched aquifer is also not defined. Installation of a monitoring well southwest of well DAD-26 is recommended. Details on installation and sampling of the proposed wells will be submitted as a SAP addendum.

6.0 EXISTING CONDITION/BACKGROUND CONCENTRATION FOR CHLORIDE AND TDS

Background or existing concentrations for chloride and TDS at the Dairies have been determined using upgradient well(s) in each portion of Doña Ana Dairies. The Stipulated Agreement requires that the chloride and TDS background concentration for the northern portion be recalculated using 3 and perhaps 4 suitable existing wells and that the upper confidence level (UCL) at 95% be used to estimate mean background concentrations. In addition, the Stipulated Agreement requires that the background will be recalculated for the northern, central, and southern portions every five years.

The existing condition for the northern portion was recalculated using the following wells:

- Northern Land Application Area well 86/340-01
- Organ Dairy well 126-09
- Dominguez 2 Dairy well 42-10

Analytical data from March 2009 to February 2016 were used to compute the UCL to establish existing conditions for the northern portion. A summary of the background statistical analysis performed is included in Appendix J.

The average background or existing concentration as established by the UCL for chloride and TDS is as follows:

- Northern portion - chloride 1,015 milligrams per liter (mg/L) and TDS 3,178 mg/L.

Analytical data from March 2009 to February 2016 were used to compute the upper prediction limits (UPL) to establish the existing conditions for the central and southern portion as calculated in the Stage 2 Abatement Plan (EA 2013). A summary of the background statistical analysis performed is included as a technical memorandum in Appendix J.

The average existing concentration as established by the UPL for chloride and TDS from March 2009 to February 2016 is as follows:

- Central portion - chloride 1,781 mg/L and TDS 5,328 mg/L.
- Southern portion - chloride 503 mg/L and TDS 2,552 mg/L.

Tables 4 and 5 present the wells that exceed the existing conditions.

6.0 GEOSTATISTICS AND TREND ANALYSIS

Analytical results from March 2009 to February 2016 from all AP and DP wells located in the northern, central and southern portions of the Dairies were used to complete a statistical trend analysis to determine if the nitrate, chloride and TDS plumes are stable, decreasing or increasing.

Trend analyses of nitrate, chloride and TDS from AP and DP wells were conducted using the Mann-Kendall test. The trend analysis indicated whether the concentrations at a particular well were stable, increasing or decreasing. A summary of the trend analysis is provided in Appendix J, which include concentration trend graphs for nitrate, chloride and TDS. Table 8 provides a summary of the trend analysis for the AP and DP wells.

In addition to the trend analysis, a baseline geostatistical analysis was completed to estimate analyte distribution and calculate contaminant plume area. Interpolation by kriging was applied to nitrate, chloride, and TDS concentrations from February 2016. Interpolation was based on analytical data from abatement plan and discharge plan wells. Isopleths were manually adjusted where appropriate. TDS in the southern regional aquifer was not modeled because TDS concentrations were below regional background levels.

Table 9 provides the calculated areas of plumes in the north, central, and south portions. In the future, the results of these analyses will be used to track changes in plume areas. Distributions of contaminants are displayed in Figures 11 through 21. Note that the contaminant plumes displayed in these figures are statistically generated. As a result, modeled concentration intervals may have a small offset from measured concentrations at individual monitoring locations.

The following is a discussion of the trend analysis for each portion of the Dairy.

6.1 Northern Portion

Trend analysis was conducted on 38 DP wells and 6 AP wells within the Stage 2 Abatement Plan

area for the northern portion. The following wells had a decreasing or increasing nitrate trend analysis:

- Decreasing Nitrate Trend: Northern Land Application Area well 70/86/340-01, Organ Dairy well 126-09, Dominguez 2 Dairy wells 42-02 and 42-08, Dominguez Dairy wells 624-04, 624-05, and 624-07, Gonzalez Dairy wells 177-02, 177-04, 177-05, and 177-06.
- Increasing Nitrate Trend: Northern Land Application Area well 86/340-01, Organ Dairy wells 126-04, 126-07, and 126-13, Mountain View Dairy wells 70-01 and 70-04, Bright Star Dairy well 340-01, Dominguez 2 Dairy wells 42-03 and 42-12, Gonzalez Dairy well 177-07R, and AP wells DAD-11 and DAD-13.

For chloride, 13 of the 44 wells analyzed had a decreasing trend and 12 had an increasing trend:

- Decreasing Chloride Trend: Organ Dairy wells 126-07, 126-09, and 126-12, Mountain View Dairy well 70-02, Dominguez 2 Dairy wells 42-03, 42-06, 42-07, 42-08 and 42-13, Dominguez Dairy wells 624-01, 624-02 and 624-07, Gonzalez Dairy well 177-02.
- Increasing Chloride Trend: Northern Land Application Area wells 70/86/340-01, Organ Dairy wells 126-04 and 126-05, Dominguez 2 Dairy wells 42-02 and 42-09, Gonzalez Dairy wells 177-01 and 177-05, and AP wells DAD-02, DAD-11, DAD-12, DAD-13, and DAD-14.

TDS decreasing and increasing concentration trends are as follows:

- Decreasing TDS Trend: Organ Dairy well 126-09, Dominguez 2 Dairy wells 42-03, 42-06, 42-08, 42-12, and 42-13, Dominguez Dairy wells 624-02, 624-05, and 624-07, Gonzalez Dairy well 177-02, and AP well DAD-02.
- Increasing TDS Trend: Northern Land Application Area wells 70/86/340-01, Organ Dairy wells 126-04, 126-05, and 126-13, Mountain View Dairy wells 70-01 and 70-02, Bright Star Dairy well 340-01, Dominguez 2 Dairy well 42-02, Gonzalez Dairy wells 177-01, 177-05, and 177-06, and AP wells DAD-11 and DAD-13.

Table 8 lists all the wells within the northern portion that had an increasing trend of at least one of the analytes (nitrate, chloride and TDS). Of the 44 wells in the northern portion, 20 wells had stable or decreasing nitrate, chloride and TDS results. There are three wells, Organ Dairy well 126-04, DAD-11, and DAD-13, in the northern portion that have increasing nitrate, chloride and TDS trends. Organ Dairy well 126-04 and DAD-11 are located well within the Abatement Plan Area. Well DAD-13 is a downgradient well with nitrate concentrations just above the standard and has chloride and TDS concentrations below existing conditions.

The wells downgradient of the Northern Land Application Area have decreasing or stable nitrate, chloride, and TDS trends. All Dominguez Dairy wells are either stable to decreasing for nitrate, chloride, and TDS.

6.2 Central Portion

A trend analysis was conducted on all 40 wells within the Stage 2 Abatement area of the central portion. The following summarizes trend statistics for the nitrate plume:

- Decreasing Nitrate Trend: Buena Vista Dairy well 74-03, River Valley wells 167-01A, 167-03, 167-06, and 167-08, and Sunset Dairy Well 257-02, and AP well DAD-19.
- Increasing Nitrate Trend: River Valley Dairy well 167-04, Big Sky Dairy wells 833-05 and 833-09, and AP wells DAD-05, DAD-07, and DAD-08.

The chloride summary trend statistics indicate that chloride concentrations are decreasing in 14 wells and increasing in 8 wells as follows:

- Decreasing Chloride Trend: Buena Vista II Dairy wells 74-02 and 74-03, River Valley wells 167-01A, 167-02, 167-03, 167-04, 167-05, 167-06, and 167-07, Big Sky Dairy 833-05, Sunset Dairy well 257-03 and AP wells DAD-03, DAD-04, and DAD-05.
- Increasing Chloride Trend: Buena Vista II Dairy wells 74-01 and 74-04, Sunset Dairy well 257-02, and AP wells DAD-08, DAD-15, DAD-16, DAD-18 and DAD-19.

Based on the statistical trend analysis there are 9 wells with decreasing TDS trends and 5 wells with increasing TDS trends. The following summarizes the trend statistics for TDS:

- Decreasing TDS Trend: Buena Vista II Dairy wells 74-02 and 74-03, River Valley Dairy wells 167-01A, 167-02, 167-03, and 167-04, Big Sky Dairy well 833-05, and AP wells DAD-03 and DAD-04.
- Increasing TDS Trend: Buena Vista II Dairy well 74-04, Big Sky well 833-07, Sunset Dairy well 257-02, and AP wells DAD-06 and DAD-18.

Table 8 lists all the wells within the central portion that had an increasing trend of at least one of the analytes (nitrate, chloride, and TDS). Of the 40 wells analyzed, 25 of the wells had decreasing or stable trends for nitrate, chloride, and TDS within the central portion. No wells in the central portion had increasing trends for all three contaminants (nitrate, chloride and TDS).

Wells downgradient of the River Valley Land Application Area have decreasing or stable nitrate, chloride, and TDS trends.

Sunset well 257-01 (located adjacent to the lagoon) had a stable trend for nitrate, chloride, and TDS. A decreasing to stable nitrate trend is present downgradient of the Buena Vista II lagoons, River Valley lagoons, and three of the five Big Sky lagoons. It is expected that similar trends will occur downgradient of all synthetically lined lagoons in the future. Additionally, the wells with increasing nitrate trends downgradient of Big Sky lagoons are not located along the margins of the abatement plan area.

6.3 Southern Portion

The southern portion statistical trend analysis was completed on all wells, except the new well where there is not enough data to calculate a trend. The analysis was completed for both the regional and perched aquifers. Of the 13 wells analyzed in the southern portion of the Dairies, seven had decreasing or stable concentrations of nitrate, chloride, and TDS.

Within the regional aquifer no increasing trends of nitrate, chloride or TDS were observed except for wells 692-05 and DAD-10. Concentrations of nitrate are increasing at Del Oro Dairy well 692-05, but nitrate concentrations are below the standard, and chloride and TDS concentrations are stable. At DAD-10, concentrations are just above the standard of 10 mg/L for nitrate, and chloride and TDS are below existing conditions. All other wells in the regional aquifer had stable to decreasing nitrate, chloride and TDS trends.

In the perched aquifer the statistical trend analysis indicated 3 of the 7 wells had stable or decreasing trends for all analytes. Del Oro Dairy well 692-02 is the only well that had an

increasing nitrate trend. AP wells DAD-20, DAD-21 and DAD-22 had increasing chloride trends. AP well DAD-21 also had an increasing TDS trend.

7.0 CAPTURE ANALYSIS OF IRRIGATION SUPPLY WELLS

An estimation of the capture zones of pumping wells at the constituent dairies, comprised of milking parlor and feed pen supply wells and irrigation wells, were computed using the well in a uniform flow field method described by Todd (1980). Todd establishes the follow relationships for capture of a pumping well:

$$Y_L = \pm \frac{Q}{2Kbi}$$

and

$$X_L = -\frac{Q}{2\pi Kbi}$$

Where:

Y_L = capture width on each side (transverse to groundwater flow) of pumping well (ft)

X_L = downgradient capture of pumping (ft)

Q = well discharge (ft³/min)

K = hydraulic conductivity (ft/min)

b = aquifer thickness (ft)

i = hydraulic gradient (ft/ft)

Since Y_L is plus or minus the capture width (from well flow field centerline), the full width of capture (both sides of pumping well) is $2Y_L$. Comparing the full capture width with X_L shows

the downgradient capture is 2π (or about 6 times) less than the capture width.

The approach taken to estimate the capture zone of the supply and irrigation wells was to prorate total well discharge (Q) versus borehole leakance contribution (Q_{pro}) and total saturated thickness (b) relative to plume thickness (b_{con}). The borehole leakance factor was estimated, and is based on the following concepts:

- It was neither a past nor present requirement that the annular space of the dairy supply or irrigation wells be grouted or sealed other than from surface to twenty feet below grade;
- The lack of grout in the annulus across low permeability zones such as silt or clay means that under pumping stress, vertical drainage of water from all levels can occur, even across aquitards;
- These annuluses were typically filled with sand or gravel, which is assumed to leak vertically with the permeability of the fill; and
- Ten percent of the prorated discharge (see below) is apportioned to this borehole leakance.

Accordingly, the following relations were used to estimate capture zone:

$$Q_{pro} = 10\% Q_{avg} \frac{b_{con}}{b}$$

where:

Q_{avg} = average pumping rate per annum = total discharge per annum divided by total pumping time in minutes per annum (estimated from dairy pumping records and/or practices) and Q_{pro} = 10% borehole leakance from contaminant plume thickness by total thickness (estimated contaminant plume pumping stress)

and

$$b = \text{total well depth} - \text{depth to groundwater}$$

and

$$b_{con} = \text{depth to base of contamination} - \text{depth to groundwater}$$

Table 10 provides a summary of the analysis and the respective capture zones. The capture zones of the supply and irrigation wells based on the analysis is hundreds to thousands of feet, and suggests these supply and irrigation wells capture the groundwater locally. This agrees with potentiometric surface maps which indicate the southeast groundwater flow direction in the northern portion as an example, and the impact on plume migration noted at DAD-08 by pumping of an adjacent irrigation well at Sunset Dairy.

8.0 CONCLUSIONS AND RECOMMENDATIONS

The groundwater monitoring event included the gauging of all accessible DP and AP wells and sampling of 25 AP wells and the DP wells that were accessible and contained sufficient water to sample. Based on the data collected, the following conclusions and recommendations are presented:

- The depth to groundwater at the site ranged from 13.07 to 132.75 ft btoc.
- On average, water levels have increased in the northern and central areas relative to November 2015 water levels, while water levels in the southern portion of the perched aquifer have decreased.
- The groundwater flow direction at the Dairies within the regional groundwater aquifer is south-southeast. The hydraulic gradient is 0.001 ft/ft.
- The perched groundwater aquifer at Del Oro Dairy has a groundwater flow direction toward the southwest.
- Nitrate was below the NMWQCC standards in 11 of the 25 groundwater samples collected from the AP wells.
- Chloride was above the NMWQCC standard in all monitoring wells sampled, except for well DAD-17 which had a chloride concentration of 183 mg/L.
- TDS was above the NMWQCC standard in all monitoring wells sampled.
- Chloride and TDS remain above standards in wells upgradient of the northern, central, and southern portions of the plume at the Dairies. Chloride and TDS are regionally elevated above standards and not necessarily attributed to the Dairies.
- Nitrate concentrations were below the NMWQCC standard for nitrate in 11 of the 14 sampled irrigation/supply wells. All irrigation/supply wells analyzed for sulfate were below the NMWQCC standard. All irrigation/supply wells were above the NMWQCC standard for chloride and TDS. Both chloride and TDS concentration ranges are similar to the concentrations observed in discharge plan and abatement plan monitoring wells, further indicating that chloride and TDS concentrations observed are regionally above standards.
- CSIA analysis was completed for groundwater from 15 wells. Plotted results indicate that there is a similar linear trend for all samples analyzed except for the sample collected from DAD-23, which appears to be an outlier. This may indicate that the nitrate concentration present in DAD-23 is from a separate source other than the Dairies.

- Existing conditions were calculated for chloride and TDS for the northern, central, and southern portions of the Dairies based on data collected between March 2009 and February 2016.
- Trend analysis indicates that 20 of the 44 wells analyzed in the northern portion had decreasing or stable trends for nitrate, chloride, and TDS.
- Trend analysis indicates that 25 of the 40 wells analyzed in the central portion had decreasing or stable trends for nitrate, chloride, and TDS.
- Trend analysis indicates that 7 of the 13 wells analyzed in the southern portion had decreasing or stable trends for nitrate, chloride, and TDS.
- Installation of an additional monitoring well southeast of DAD-25 is recommended to delineate the central nitrate plume in the regional aquifer.
- Installation of an additional monitoring well southwest of DAD-26 is recommended to delineate the southern nitrate plume in the perched aquifer.

Notes:

^a Horizontal control to NM State Plane Coordinates Central NAD83 Grid Coordinates (in feet)

^b Vertical Control to NAVD88 Datum in feet above mean sea level

^c Measured in feet below the top of casing at survey point on north side of well

^d Measured in feet

Wells were gauged on a different date by Magee and Associates Inc.

Wells were gauged on a different date by EnviroCompliance Inc.

Measured data were suspect and corrected to reflect appropriate trends in accordance with surrounding wells

NOTES:
 * = Well contains a pump; as a result, DO and ORP values are not representative of aquifer conditions.
 °C = Degrees celsius
 DO = Dissolved oxygen
 mg/L = Milligrams per liter
 mV = Millivolts
 NM = Not measured
 ORP = Oxidation-reduction potential
 SpC = Specific conductance
 Temp = Temperature
 uS/cm = Microsiemens per centimeter

**TABLE 3. SUMMARY OF GROUNDWATER SAMPLE ANALYTICAL METHODS AND SAMPLING REQUIREMENTS
DONA ANA DAIRIES, DONA ANA COUNTY, NEW MEXICO**

Target Analytes	Analytical Method	Sample Container	Preservative	Holding Time
Nitrate - N	EPA 300.0	250 mL HDPE Bottle	Cool to <6°C,	48 Hours
Total Kjeldhal Nitrogen	SM 4500 NORG C	250 mL HDPE Bottle	H ₂ SO ₄ to pH <2, Cool to <6°C	28 Days
Chloride	EPA 300.0	250 mL HDPE Bottle	Cool to <6°C	28 Days
Total Dissolved Solids	SM 2540 C MOD	250 mL HDPE Bottle	Cool to <6°C	28 Days
Total Organic Carbon	EPA 415.1	2 - 40 mL Glass VOA Vial	H ₂ SO ₄ to pH <2, Cool to <6°C	28 Days
CSIA - ¹⁵ N/ ¹⁴ N	¹⁵ N/ ¹⁴ N (δ ¹⁵ N)	1 - 1 liter Plastic Poly Bottle	Cool to <6°C	-

NOTES:
 °C = Degree Celsius
¹⁴N = Nitrogen 14
¹⁵N = Nitrogen 15
 CSIA = Compound-specific isotope analysis
 EPA = U.S. Environmental Protection Agency
 HDPE = High-density polyethylene
 mL = milliliter
 MOD = Modified
 N = Nitrogen
 SM= Standard method
 VOA = Volatile organic analysis

DONA ANA DAIRIES, DONA ANA COUNTY, NEW MEXICO**

Monitoring Well	Groundwater Concentration Trend			Comments
	Nitrate	Chloride	TDS	
NORTHERN AREA				
Northern Land Application Area (DP-340)				
70-03	Stable	Stable	Stable	
70/86/340-01	Decreasing	Increasing	Increasing	Concentrations expected to decrease as LAA is phased out.
86/340-01	Increasing	Stable	Stable	Concentrations expected to decrease as LAA is phased out.
Organ Dairy (Former Del Norte Dairy) (DP-126)				
126-04	Increasing	Increasing	Increasing	Chloride and TDS concentration below upgradient conditions. Nitrate is expected to stabilize over time now that lagoon is synthetically lined.
126-05	Stable	Increasing	Increasing	Well is not located along the margins of the abatement plan area. Nitrate is stable and chloride is below existing conditions. Chloride and TDS expected to stabilize now that lagoon is synthetically lined.
126-07	Increasing	Decreasing	Stable	Well is not located along the margins of the abatement plan area. Nitrate is expected to stabilize now that lagoon is synthetically lined.
126-09	Decreasing	Decreasing	Decreasing	
126-12	Stable	Decreasing	Stable	
126-13	Increasing	Stable	Increasing	Well is not located along the margins of the abatement plan area. Chloride and TDS are below existing conditions. Concentrations of nitrate and TDS expected to stabilize now that lagoon is synthetically lined.
Mountain View Dairy (DP-70)				
70-01	Increasing	Stable	Increasing	Well is not located along the margins of the abatement plan area. Chloride is stable and Nitrate and TDS are expected to stabilize now that lagoon is synthetically lined.
70-02	Stable	Decreasing	Increasing	Well is not located along the margins of the abatement plan area. TDS is expected to stabilize now that lagoon is synthetically lined.
70-04	Increasing	Stable	Stable	Well is not located along the margins of the abatement plan area. Nitrate is expected to stabilize now that lagoon is synthetically lined.
Bright Star Dairy (DP-340)				
340-01	Increasing	Stable	Increasing	Well is located downgradient from former Buena Vista Dairy 1, concentrations are expected to decrease since the Dairy is no longer in use. TDS is below existing conditions.
340-02	Stable	Stable	Stable	
Dominguez 2 Dairy (DP-42)				
42-02	Decreasing	Increasing	Increasing	TDS and Chloride concentration are below existing conditions.
42-03	Increasing	Decreasing	Decreasing	Well located along the margin of the abatement area, will monitor well as part of performance assessment. Nitrate expected to decrease as chloride and TDS have since waste water lagoon and LAA have been removed. TDS and Chloride are above existing conditions; however, they both have decreasing trends.
42-06	Stable	Decreasing	Decreasing	Chloride and TDS are decreasing. Nitrate has stabilized now that lagoon is synthetically lined.
42-07	Stable	Decreasing	Stable	Has been dry since 2012.
42-08	Decreasing	Decreasing	Decreasing	Has been dry last two quarters.
42-09	Stable	Increasing	Stable	Chloride is below existing conditions.
42-10	Stable	Stable	Stable	
42-11	Stable	Stable	Stable	
42-12	Increasing	Stable	Decreasing	Nitrate well below the standard.
42-13	Stable	Decreasing	Decreasing	Water level below the permanent pump in the well for last two quarters.

 - Land Owned by Dairies
 - Stage 2 Abatement Plan Area
 - Public Land Survey System
- TDS Concentration (mg/L)**
- 2,552-2,700
 - 2,700-3,000
 - 3,000-3,300
 - >3,300

Notes:

Units are in milligrams per liter.
 Dashed line indicates manually adjusted isopleth.

Cl = Chloride
 mg/L = Milligram(s) per liter
 NO₃ = Nitrate as N
 TDS = Total Dissolved Solids
