STATE OF NEW MEXICO
WATER QUALITY CONTROL COMMISSION

IN THE MATTER OF:

PETITION FOR REGULATORY CHANGE TO
ADOPT AMENDMENTS TO 20.6.4 NMAC –
Standards For Interstate and Intrastate Surface Waters **WQCC 25-75 (R)**

DIRECT TECHNICAL TESTIMONY OF MICHAEL BACA

I. INTRODUCTION

My name is Michael Baca, and I am the Water Quality Standards Coordinator for the New Mexico Environment Department (NMED or Department) Surface Water Quality Bureau (SWQB). I am presenting this written testimony (**NMED Exhibit 1**) on behalf of the Petitioner, NMED, concerning the proposal to amend the State of New Mexico's *Standards for Interstate and Intrastate Surface Waters* (Standards or WQS), codified at Title 20, Chapter 6, Part 4 of the New Mexico Administrative Code (20.6.4 NMAC). Section 303(c)(1) of the federal Clean Water Act (CWA) requires states to hold a public hearing at least every three years to review and amend, as appropriate, a state's WQS, commonly referred to as a Triennial Review.

The SWQB has five primary objectives for the 2026 Triennial Review:

1) adopt WQS for the protection of surface waters of the state, including wetlands;
2) amend or add definitions for terms used in the Standards or to implement the Standards;
3) make the Standards clearer, informative, consistent, and accessible;
4) address segment-specific issues; and
5) update criteria applicable to existing, designated, or attainable uses (20.6.4.900 NMAC) to reflect new information and technical capabilities.

My testimony provides an overview of water quality standards; an outline of the regulatory requirements for adopting standards; information regarding this Triennial Review, background from prior Triennial Reviews; a summary of the proposed amendments for this Triennial Review; and stakeholder engagement activities, including public notice. Additionally, my testimony provides the basis and supporting evidence for amendments proposed in 20.6.4 New Mexico

Administrative Code (NMAC) associated with definitions (Section 7), administrative rulemaking procedures and costs (Section 10), amendments to WQS (Section 10 and 15), temporary standards (Section 7, 10, and 318), and NMAC structure, style, or grammar in conformance with 1.24.10 NMAC.

II. QUALIFICATIONS AND EXPERIENCE

I hold a Bachelor of Arts in Chemistry from Carleton College, and I am currently employed as the Surface Water Quality Bureau (SWQB) Monitoring, Assessment, and Standards Section (MASS) Standards and Outreach Team Supervisor, and serve as the Water Quality Standards Coordinator for the SWQB. In this position, I lead and assist MASS staff with the development, review, revision, and maintenance of surface water quality standards; supervise SWQB's Quality Assurance Officer; and provide direction to staff working on special initiatives related to harmful algal blooms and volunteer data collection.

I began working for the Department in February of 2005 as an Environmental Scientist and Specialist – Operational in the Environmental Health Bureau in the Gallup Field Office. In this position I provided training, issued permits, conducted compliance inspections and completed enforcement actions for the Food Safety, Onsite Wastewater, and Public Pool and Spa Safety Programs. I was promoted to Environmental Scientist and Specialist – Advanced in July of 2006 to serve as the Pool Specialist in northwestern New Mexico. I continued my duties in the food and onsite wastewater programs while taking on additional responsibilities as the subject matter expert and certified trainer for the pool program. In this role, I ensured consistent administration, implementation, and enforcement of the program across the district and provided internal and external training, technical guidance, and policy development at a state level.

I started working for the NMED Air Quality Bureau in July of 2008 as an Environmental

Analyst – Advanced in their Policy and Planning Section's Control Strategies Team in Las Cruces. In this position, I served as the border liaison and worked on climate, particulate matter and ozone pollution issues. I worked with stakeholders in formal and informal settings on cross jurisdictional air quality and climate concerns in the tri-state, bi-national Paso del Norte Airshed near Sunland Park, New Mexico, El Paso, Texas and Ciudad Juárez, Mexico. I developed ozone and particulate matter air quality management plans and participated in special studies regarding emissions inventories, monitoring, and photochemical modeling. I developed New Mexico's recommendation for an ozone nonattainment area in and around Sunland Park in southern Doña Ana County, as well as portions of that area's nonattainment State Implementation Plan (SIP) under the federal Clean Air Act.

From December of 2018 to September 2023, I served as the Control Strategies manager in Santa Fe, with a staff of six that develop air quality rules and the New Mexico SIP; track and comment on federal air quality and climate rules, guidance, and regulatory actions; manage and participate in air quality studies; lead and participate in regional and local climate change and air quality improvement groups and committees; implement air quality management plans and grant programs; and facilitate stakeholder engagement, outreach and education events. My team also managed the Diesel Emissions Reduction Act and the Volkswagen Environmental Mitigation Trust settlement, awarding nearly $20 million dollars to replace heavily polluting diesel vehicles and equipment with cleaner burning alternative fueled models, including electric vehicles and charging stations.

I have led and been a part of several rulemaking efforts for NMED before the Environmental Improvement Board, including the Ozone Precursor Rule (20.2.50 NMAC),

Energy Transition Act Rule (20.2.101 NMAC), Regional Haze (draft 20.2.68 NMAC), Fugitive Dust (20.2.23 NMAC) and Permitting Rules for Nonattainment Areas (20.2.79 NMAC), covering emission sources in the Oil and Gas, Electric Power, and Construction Sectors. Additionally, I have led and participated in rulemaking efforts before the Water Quality Control Commission regarding the designation of Outstanding National Resource Waters (20.6.4.9 NMAC), Copper Site Specific Criteria for the Pajarito Plateau (20.6.4.900 NMAC), Sandia Canyon Use Attainability Analysis (20.6.4.126 NMAC and 20.6.4.141 NMAC), and the reclassification of Tijeras Arroyo as an ephemeral stream (20.6.4.97 NMAC). An accurate and up-to-date copy of my resume is included as **NMED Exhibit 2**.

III. WATER QUALITY STANDARDS

Under the New Mexico Water Quality Act (WQA), the Water Quality Control Commission (WQCC or Commission) is responsible for adopting WQS. NMSA 1978, § 74-6-4(D). The standards must at a minimum protect public health or welfare, enhance the quality of water and serve the purposes of the WQA. *Id.* The federal CWA regulations provide similar direction: "States adopt water quality standards to protect public health or welfare, enhance the quality of water and serve the purposes" of the CWA. 40 C.F.R. § 131.2. Section 101(a)(2) of the CWA requires that, wherever attainable, water quality shall provide "for the protection and propagation of fish, shellfish and wildlife and for recreation in and on the water." 33 U.S.C. § 1251(a). In accordance with 40 C.F.R. § 131.10(a), each State must specify appropriate water uses to be achieved and protected. Additionally, adoption of WQS must ensure the attainment and maintenance of WQS for downstream waters. 40 C.F.R. § 131.10(b). The water quality standards requirements as outlined in the WQA, 40 C.F.R. § 131, and the CWA have been codified in New Mexico regulations under 20.6.4 NMAC. Throughout the Department's testimony, we use the terms WQS

and 20.6.4 NMAC interchangeably.

A water quality standard "defines the goals for a water body, or portion thereof, by designating the use or uses to be made of the water and by setting criteria necessary to protect the uses." 40 C.F.R. § 131.2. The designated uses in New Mexico's Surface Water Quality Standards, set forth in 20.6.4.900 NMAC, are:

- fish culture
- public water supply
- industrial water supply
- domestic water supply
- irrigation and irrigation storage
- primary and secondary contact
- livestock watering
- wildlife habitat, and
- aquatic life (seven subcategories)

The Standards also establish water quality criteria that protect the designated uses of a water body. Criteria also serve as the primary regulatory basis for Total Maximum Daily Load (TMDL) calculations and National Pollutant Discharge Elimination System (NPDES) permit limits. These criteria can be general narrative criteria that apply to all waters or categories of waters, or numeric criteria that apply to a specific designated use or water quality segment. An example of a narrative criterion is that for plant nutrients, which states, "Plant nutrients from other than natural causes shall not be present in concentrations that will produce undesirable aquatic life or result in a dominance of nuisance species in surface waters of the state." 20.6.4.13(E) NMAC. Examples of numeric criteria include maximum, 4T3 temperature[1], or 6T3 temperature[2] criteria

[1] "4T3 temperature" means the temperature not to be exceeded for four or more consecutive hours in a 24-hour period on more than three consecutive days. 20.6.4.7(A)(2) NMAC.
[2] "6T3 temperature" means the temperature not to be exceeded for six or more consecutive hours in a 24-hour period on more than three consecutive days. 20.6.4.7(A)(3) NMAC.

applicable to various existing, designated, or attainable uses, found in 20.6.4.900(H) NMAC.

According to CWA regulations at 40 C.F.R. §131.12, water quality standards must also contain an antidegradation policy. New Mexico's antidegradation policy is codified at 20.6.4.8 NMAC. The Commission has also adopted implementation measures specific to antidegradation through its approval of the State of New Mexico Water Quality Management Plan and Continuing Planning Process (WQMP/CPP), specifically Appendix A: Antidegradation Policy Implementation Procedure (**NMED Exhibit 3**). Such measures are also subject to EPA review and action consistent with Section 303(c) of the CWA and with 40 C.F.R. § 131.12(a), which require states to identify methods for implementing their statewide antidegradation policy, and 40 C.F.R. § 130.5(b)(6), which requires that the state describe the process for establishing and assuring adequate implementation of new or revised standards in its WQMP/CPP. EPA approved New Mexico's current antidegradation policy and implementation procedures on October 23, 2020.

In addition to setting water quality goals, 40 C.F.R. § 131.2 specifies that WQS also serve "as the regulatory basis for the establishment of water quality-based treatment controls and strategies beyond technology-based levels of treatment required by Sections 301(b) and 306 of the [Clean Water] Act." Discharges from point sources or nonpoint sources are to be managed in such a manner that designated uses are protected. Point source discharges are currently regulated under NPDES permits, issued by EPA under Section 402 of the CWA, and the discharge of dredged or fill material requires a permit issued by the U.S. Army Corps of Engineers under Section 404 of the CWA. In both cases, pursuant to Section 401 of the CWA, NMED must certify that the permitted activities will be conducted in a manner that will comply with applicable NM WQS. 20.6.2.2001 and 20.6.2.2002 NMAC. NMED also implements a Nonpoint Source Management

Program that identifies non-regulatory strategies for controlling nonpoint sources of pollution to achieve the Standards. Finally, NMED is authorized to enforce the WQA against a person that violated or is violating the Standards and may issue compliance orders, bring legal actions in court, and assess civil penalties. NMSA 1978, § 74-6-10.

IV. REGULATORY AUTHORITY FOR ADOPTION OF STANDARDS

In accordance with the WQA, "The Commission is the state water pollution control agency for this state for all purposes of the federal [Clean Water] [A]ct…" NMSA 1978, § 74-6-3(E). Furthermore, the Commission must "adopt water quality standards for surface and ground waters of the state based on credible scientific data and other evidence appropriate under the WQA." NMSA 1978, § 74-6-4(D).

As provided in NMSA 1978, § 74-6-4(G), the Commission "…shall assign responsibility for administering its regulations to constituent agencies to assure adequate coverage and prevent duplication of effort. To this end, the Commission may make such classification of waters and sources of water contaminants as will facilitate the assignment of administrative responsibilities to constituent agencies." Since the administrative authority for upholding the requirements under the federal CWA in the State of New Mexico is delegated to the WQCC, and the Commission has no technical staff of its own, many of the tasks associated with reviewing and proposing amendments to the State's water quality standards are delegated to the Department (**NMED Exhibit 4**). As such, the Department serves as the Petitioner for the Triennial Review.

V. 2026 TRIENNIAL REVIEW

In accordance with Section 303(c)(1) of the CWA, the State is required to hold a public hearing from time to time, but at least every three years, to review and, as appropriate, modify and adopt water quality standards. 33 U.S.C. § 1313. New or revised Standards adopted by the

Commission must be submitted by the State to the EPA for approval in accordance with Section 303(c)(2) of the CWA. In addition, the State must submit the methods used and analyses conducted to support the water quality standard revisions and general information that aids EPA in determining the adequacy of the scientific basis of the amendments that do not include the uses specified in Section 101(a)(2) of the CWA, commonly referred to as the fishable/swimmable uses. *See* 33 U.S.C. § 1251. Lastly, the state must submit information on general policies applicable to the State's standards, which may affect their application and implementation. 40 C.F.R. § 131.6.

State and federal rulemaking regulations require an adequate opportunity for public participation at the hearing, including opportunities to provide public comment, views, or arguments to the Commission. Following the hearing, the Commission will deliberate, considering public comments and technical testimony provided in the record proper before making a decision to adopt proposed amendments or new WQS. A rule cannot become effective until after the Commission has issued its Statement of Reasons, and the rule is filed and published with the State Records Center and Archives (SRCA). The State Rules Act states that a rule adopted by the Commission becomes effective after publication in the *New Mexico Register*. NMSA 1978, § 14-4-5. However, the WQA adds that "[n]o regulation or water quality standard or amendment or repeal thereof adopted by the [C]ommission shall become effective until thirty days after its filing…" with the SRCA. NMSA 1978, § 74-6-6(E). Once the new rule or proposed amendments are adopted and effective for State purposes, the Department will submit a rulemaking record to EPA to review the findings of the Triennial Review. Pursuant to 40 C.F.R. § 131.6, the State is required to submit a Certification by the State Attorney General that the water quality standards were adopted pursuant to applicable State laws.

Since 2010, NMED considers the "public hearing" requirement, as termed in 40 C.F.R. § 131.20, as being met through the Commission's public rulemaking process, which is initiated upon the filing of a petition and request for hearing with the Commission and completed upon EPA's approval. For this Triennial Review, the Department satisfied the three-year review requirements by initiating stakeholder outreach in August 2025 and by holding a 60-day public comment period and a public meeting, and by filing a rulemaking petition with the WQCC on November 26, 2025. This petition was timely filed as EPA last approved New Mexico's Triennial Review on January 20, 2023.

The Department filed a Statement of Reasons and the Proposed Amendments to 20.6.4 NMAC, *Standards for Interstate and Intrastate Surface Waters*, in support of the petition. The Commission heard the Department's request for hearing on the petition at a regularly scheduled Commission meeting on December 9, 2025, and granted a public hearing. After further consideration of public and internal comments, the Department submitted an amended petition on June 2, 2026. It is the purpose of this Triennial Review hearing to fulfill the requirements of the federal CWA as well as the WQA and other applicable federal and state regulations.

It should be noted that the State does not limit proposed amendments to the Standards to only the Triennial Review hearing. Rather, in accordance with 20.6.4.9 NMAC, 20.6.4.10 NMAC, and 20.6.4.15 NMAC, there are mechanisms by which the Commission may grant hearings to any person for designating waters as Outstanding National Resource Waters; amending designated uses; adopting temporary standards; or adopting site-specific water quality criteria, as needed outside of the Triennial Review process. In fact, since EPA approved the 2020 Triennial Review, the Standards have been amended six times.

VI. PREVIOUS TRIENNIAL REVIEWS AND SCOPE OF CURRENT PROCEEDING

Although the State, or other petitioners, may bring amendments before the Commission at any time, most amendments not directly related to uses for specific waterbodies are only proposed during the Triennial Review process. The State has undergone numerous Standards amendments to what is now codified as 20.6.4 NMAC, including those adopted in 1968, 1969, 1970, 1971, 1973, 1975, 1976, 1977, 1978, 1979, 1980, 1981, 1982, 1985, 1987, 1988, 1991, 1995, 2000, 2002, 2005, 2006, 2007, 2010, 2011, 2012, 2017, 2018, 2019, 2020, 2022, 2025 and most recently in February of 2026. Although rare, there have been cases where there have been multiple amendments adopted and made effective for State purposes within a single calendar year. For instance, in 2025, the WQCC adopted amendments related to Outstanding National Resource Waters in 20.6.4.9 NMAC (WQCC 24-46), site-specific criteria on the Pajarito Plateau (WQCC 24-31), and classified waters under 20.6.4.126 and .141 NMAC (WQCC 24-65).

Those amendments adopted prior to the statutory amendments to the CWA in 1972 and prior to the creation of the EPA were not subject to EPA approval. The Department affirms that it completed amendments made in 1985, 1991, 1995, 2000, 2005, 2010, 2017 and most recently in 2022 as formal Triennial Reviews. As can be noted by the dates, Triennial Reviews are not always adopted every three years as the name indicates. The additional time between Triennial Reviews is predominately due to the lengthy administrative process, which must provide adequate opportunity for public engagement, the Commission's deliberations and adoption of proposed rules, and approval by EPA.

The hearing for the last Triennial Review was initiated in 2020; however, amendments were not adopted by the Commission and made effective for State implementation until April 23, 2022. In accordance with 40 C.F.R. § 131.20, the Department submitted the revised standards for

review and approval by EPA on May 2, 2022 (**NMED Exhibit 5**). EPA issued a technical support document on January 19, 2023, approving a majority of the amended WQS (**NMED Exhibit 6**). However, EPA withheld approval of criteria for acrolein, ammonia, cadmium, carbaryl, chloride, chloropyrifos, demeton, guthion, iron, malathion, methoxychlor, mirex, parathion, and tributyltin. Adoption of these criteria are subject to the consultation requirements of the federal Endangered Species Act. EPA completed consultation with the U.S. Fish and Wildlife Service (USFWS) for acrolein, cadmium, carbaryl, demeton, guthion, methoxychlor, mirex, parathion, and tributyltin and approved those criteria on April 27, 2023 (**NMED Exhibit 7**). Due to an initial difference of professional opinion, EPA conducted a formal consultation with USFWS for ammonia, chloride, and iron. EPA approved of those criteria on June 13, 2024 (**NMED Exhibit 8**). EPA continues consultation with USFWS on a national level regarding pesticides, including chlorpyrifos and malathion criteria, but has not provided NMED with additional information regarding their approval status.

As part of this Triennial Review, SWQB proposes several types of amendments to the Standards. SWQB considered all Triennial Review requirements detailed in 40 C.F.R. § 131.20 and proposed updates to the Standards accordingly. The proposed amendments include new and revised definitions, clarification of third-party rulemaking procedures and costs, revisions to segment descriptions, WQS for wetlands, clarification of implementation language, updated references, as well as, new or revised designated uses, criteria, and antidegradation requirements. The Department has also proposed non-substantive amendments to correct cross references or conform to NMAC formatting, grammar, or style.

These changes were the result of a public participation process and stakeholder engagement

opportunities, including an informal 60-day public comment period. In addition, proposed amendments resulted from internal comments, implementation challenges, and the CWA § 303(d)/§ 305(b) Integrated Report.

VII. RULEMAKING PROCEDURES, PUBLIC NOTICE, AND STAKEHOLDER ENGAGEMENT

The Triennial Review is a rulemaking process governed by several federal and state laws. The New Mexico Legislature delegated authority to the Commission to "adopt water quality standards for surface and ground waters of the state based on credible scientific data and other evidence appropriate under the Water Quality Act." NMSA 1978, § 74-6-4(D). Amendments to the Standards must comply with NMSA 1978, § 74-6-6 and 20.1.6 NMAC, which set forth procedural requirements for rulemaking proceedings before the Commission.

In accordance with NMSA 1978, § 74-6-6, no amendment to a water quality standard may be adopted or amended until after a public hearing. In addition, and in accordance with 40 C.F.R. § 131.20, EPA requires states to have a "public hearing for the purpose of reviewing applicable water quality standards adopted pursuant to 40 C.F.R. §§ 131.10 through 131.15". EPA requires that these hearings are held according to State law and EPA's public participation regulation found in 40 C.F.R. Part 25.

Rulemaking before the Commission begins when a person files a written petition and statement of reasons to adopt, amend, or repeal a regulation, in accordance with 20.1.6.200 NMAC. The petitions must specify the statutory authority for the Commission to adopt proposed rules, estimate the amount of time to conduct the hearing, and include a copy of the entire rule with line numbers and proposed changes in redline fashion (20.1.6.200(B) NMAC). The Commission may grant a rulemaking hearing, in accordance with 20.1.6.200(C) NMAC and

specify the procedures for conducting the hearing as outlined in 20.1.6.200(D) NMAC, including provisions for public notice and public participation.

EPA's regulations under 40 C.F.R. § 25.5 set out a state's responsibilities to notify the public of hearings associated with the federal CWA, including hearings for Triennial Reviews of State WQS. In part, EPA requires that a notice of the hearing be "well-publicized" and mailed to interested and affected parties at least 45 days prior to the hearing date. The WQCC's rulemaking rules at 20.1.6.201 NMAC require publication of the public notice at least 60 days prior to the hearing.

A. PUBLIC AND STAKEHOLDER OUTREACH

In accordance with 40 C.F.R. § 25.3 states are required to provide for, encourage, and assist the participation of the public for activities being carried out under the CWA, such as a rulemaking. Public participation includes providing access to the decision-making process, seeking input from and conducting dialogue with the public, assimilating public viewpoints and preferences, and demonstrating that those viewpoints and preferences are considered. Public agencies should encourage full presentation of issues at an early stage so that they can be resolved, and timely decisions can be made. The Department ensures adherence to the requirements in 40 C.F.R. § 25.3 through the application of public outreach actions prescribed in the State's approved WQMP/CPP (**NMED Exhibit 3**).

The Department provided an early public comment period for a Public Review Draft (PRD) of amendments prior to petitioning the Commission for a hearing (**NMED Exhibit 9**). As part of the Department's efforts to provide the public opportunity for meaningful engagement, notification was distributed via several outlets, including posting the notification on the Bureau's main

webpage, the Water Quality Standards webpage, and the 2026 Triennial Review webpage. The Department provided notification in both English and Spanish through the SWQB's listserv email to 1,920 individuals subscribed to the Bureau's distribution list (**NMED Exhibit 10**).

The public comment period was open from August 15, 2025, through October 15, 2025. The Department conducted a virtual public meeting as a part of the public outreach efforts to familiarize the public with the Triennial Review and how to participate in the process. The meeting was held on September 10, 2025, from 5:30 – 7:00 pm with approximately 20 people in attendance (**NMED Exhibit 11**). In addition, the Department posted a recording of the meeting on the Bureau's 2026 Triennial Review webpage at https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. The Department received comments from EPA Region 6 (**NMED Exhibit 12**); Triad National Security (management and operating contractor for Los Alamos National Laboratory); New Mexico Mining Association; San Juan Water Commission; Western Resource Advocates; one private citizen, and a collaborative submission from Amigos Bravos, American Rivers Action Fund, Breath of My Heart Birthplace, Communities for Clean Water, Concerned Citizens for Nuclear Safety, Gila Resources Information Project, Green Latinos, New Mexico Acequia Association, New Mexico Interfaith Power and Light, New Mexico Wild, Partnership for Earth Spirituality, Rio Grande Chapter of the Sierra Club, Trout Unlimited, and Western Environmental Law Center (**NMED Exhibit 13**). The Department posted the comments, as submitted, on the Department's Triennial Review webpage. These comments, in addition to those from EPA and SWQB staff, helped inform the proposed amendments to 20.6.4 NMAC as submitted in the Department's petition on November 26, 2025, and in the amended petition on June 2, 2026.

The SWQB has not received any additional contact or comments regarding this matter. However, written public comment for the hearing is being accepted through the close of the hearing via the Department's Public Comment Portal and by the Commission Administrator through their email account. All public comments are posted on the portal as they are received to allow for WQCC and public review. Additionally, oral public comment opportunities will be provided each day of the hearing, both in-person and virtually.

B. PUBLIC NOTICE

Notice of rulemaking hearings must be provided to the public in accordance with the State Rules Act (NMSA 1978, § 14-4-1) and 20.1.6.201(A) NMAC. The public notice must include publication in a newspaper of general circulation, the *New Mexico Register*, and other means necessary as determined by the Commission. 20.1.6.201(B) NMAC. The public notice of rulemaking must include: the subject, a summary, and the purpose of the proposed rule, the legal authority for the rule and its adoption, the technical basis for the proposed rule and how to find technical information, governing laws of procedure, and information on how to present information and participate in the hearing, examine documents, and download information. 20.1.6.201(C)(1)-(7) NMAC. The public notice may also state the Commission's intent to make a decision at the conclusion of the hearing, as applicable. 20.1.6.201(C)(8) NMAC. In addition to publication of notice, the Commission must "provide [notice] to the public," as defined at 20.1.6.7(P) NMAC, by distributing rulemaking information by:

- posting it on the Commission's website,
- posting it on the New Mexico Sunshine Portal,
- making it available at [NMED's] district, field, and regional offices,
- sending it by email to persons who have made a written request for notice of announcements addressing the subject of the rulemaking proceeding and who have provided an email address to the Commission Administrator,

- sending it by email to persons who have participated in the rulemaking and who have provided an email address to the Commission Administrator,
- sending written notice that includes, at a minimum, an internet and street address where the information may be found to persons who provide a postal address; and
- providing it to the New Mexico Legislative Council [Service] for distribution to appropriate interim and standing legislative committees.

The public notice for the hearing was published by the Department in the *Albuquerque Journal*, *Santa Fe New Mexican*, *Silver City Daily Press* and the *New Mexico* Register on June 23, 2026, in the Tri-City Record on June 24, 2026, and in the Las Cruces Sun News and *Roswell Daily Record* on June 25, 2026 (**NMED Exhibit 14**). The Department assisted the Commission Administrator with completing notification requirements and provided rulemaking information to the public, as described in 20.1.6.7(P) NMAC. The Department posted public notice and the proposed rules to the SWQB's 2026 Triennial Review website, the WQCC's Docketed Matters webpage, NMED's public notice webpage, and the New Mexico Sunshine Portal. The Department also posted notice of the hearing and the proposed rules at its District and Field Offices around the state. Public notice was also provided through emails to the Legislative Council Service, persons and organizations that participated in the rulemaking through early public comment, the WQCC's listserv distribution list, and the SWQB's listserv distribution list, which reached 3,190 subscribers. The Department completed "provide to the public" notice requirements on or before June 25, 2026 (**NMED Exhibit 15**).

C. NOTICE TO NEW MEXICO'S NATIONS, TRIBES, AND PUEBLOS

The State recognizes the importance of communication and collaboration with its Nations, Tribes, and Pueblos to ensure water quality across boundaries. The State has memorialized this sentiment through the State-Tribal Collaboration Act, NMSA 1978, § 11-18-3, Executive Order 2005-004, and the Department's Tribal Communication and Collaboration Policy. In an effort to

ensure the opportunity for adequate communication and collaboration with tribal nations, the Department provided initial notice of the Triennial Review, public comment period, and opportunities for engagement to representatives of the governments of New Mexico's Nations, Tribes, and Pueblos on August 15, 2025 (**NMED Exhibit 16**), including a copy of the PRD (**NMED Exhibit 9)**.

In addition to the initial notification, the Department provided notice of the public hearing with a copy of the proposed amendments to representatives of the governments of New Mexico's Nations, Tribes, and Pueblos on June 23, 2026. The notification included information on how to participate in the hearing and engage with NMED, should they choose to do so. The Department notified the following Nations, Pueblos, and Tribes: the Navajo Nation; the Pueblos of Acoma, Cochiti, Isleta, Jemez, Kewa, Laguna, Nambe, Ohkay Owingeh, Picuris, Pojoaque, San Felipe, San Ildefonso, Sandia, Santa Ana, Santa Clara, Taos, Tesuque, Ysleta del Sur, Zia, and Zuni, as well as, the Eight Northern Indian Pueblos Council; and the Fort Sill Apache Tribe, Jicarilla Apache Tribe, Mescalero Apache Nation, and Ute Mountain Ute Tribe (**NMED Exhibit 16**).

D. NOTICE TO THE SMALL BUSINESS REGULATORY ADVISORY COUNCIL

Finally, in accordance with the Small Business Regulatory Relief Act (NMSA 1978, § 14-4A-4), the Department provided notification of the proposed amendments to the Small Business Regulatory Advisory Council on July 7, 2026 (**NMED Exhibit 17**).

VIII. PROPOSED AMENDMENTS TO WATER QUALITY STANDARDS

A. 20.6.4.7 NMAC - DEFINITIONS

i. 20.6.4.7(A)(1) NMAC, definition of "4Q3"

The Department proposes to amend the definition for "4Q3" to include the term "hydrologically based" as EPA requested in its January 2023 Action Letter for the 2020 Triennial

Review (**NMED Exhibit 6)**. With the exception of human health-organism only criteria, the "4Q3" is the critical low flow value used to develop NPDES permit requirements to meet the other criteria in 20.6.4.97 through 20.6.4.900 NMAC. Although "4Q3" is referenced in the Standards only in relation to NPDES permits, other applications such as TMDL calculations and water quality modeling use the "4Q3" as a low-flow statistic. The proposed change clarifies that the definition is hydrologically based and does not alter the meaning nor will this proposed modification affect implementation of the WQS.

ii. 20.6.4.7(A)(4) NMAC, abbreviations used for units and subparagraph lettering

The Department proposes new abbreviations to reflect the biological sampling methods associated with newly proposed criteria for Selenium, Perfluorooctane Sulfonate (PFOS) and Perfluorooctanoic Acid (PFOA). The new abbreviations are proposed for adoption at 20.6.4.7(A)(4)(c), (d), (e), (f) and (o) NMAC and cover fish tissue and invertebrate sampling methods, including "dw" for dry weight, "iwbt" for invertebrate whole body tissue, "fmt" for fish muscle tissue, "fwbt" for fish whole body tissue, and "ww" for wet weight. These abbreviations are included in 20.6.4.7(A)(4) in alphabetical order, necessitating the renumbering of the existing subparagraphs from 20.6.4.7(A)(4)(e)-(j) NMAC to 20.6.4.7(A)(4)(g)-(n) NMAC, respectively.

iii. 20.6.4.7(A)(7) NMAC, New definition for "administrative rulemaking costs"

The Department proposes to add a new definition at 20.6.4.7(A)(7) NMAC for administrative rulemaking costs. Within that proposed definition, the Department excluded costs and activities that are not under the control of, or paid for, by a third party. Some of these costs and activities include posting notice and rulemaking information on the Commission's website, posting on the New Mexico Sunshine Portal, publishing in the *New Mexico Register*, paying for a

venue for the rulemaking hearing, paying for a hearing officer, or filing adopted rules with SRCA. The Department is excluding these costs for third-party petitioners and agreeing to provide these services and funding on an ongoing basis.

Additional costs that may be incurred during a rulemaking process include a court reporter, transcripts, translations, interpretations, public engagement, and publishing public notice in newspapers. This is not an exhaustive list of administrative costs that a petitioner would be responsible for. Furthermore, this does not include the technical or legal costs that a petitioner may be charged to develop and present a rulemaking petition before the Commission.

iv. 20.6.4.7(A)(8) and (9) NMAC, paragraph numbering

The Department proposes to amend the current 20.6.4.7(A)(7) and (8) NMAC to 20.6.4.7(A)(8) and (9) NMAC, for "Aquatic life" and "Attainable use," respectively. The renumbering would be necessary if the Commission adopts the proposed definition in 20.6.4.7(A)(7) NMAC.

v. 20.6.4.7(C)(9) NMAC, definition of "Criteria"

The Department proposes to change the term "water" to "waterbody" to focus the term on surface waters specifically and recognize that criteria support the chemical, biological, or physical characteristics that define a designated use for a waterbody (e.g., river, stream, lake, etc.).

vi. 20.6.4.7(E)(3) NMAC, definition of "Ephemeral"; 20.6.4.7(I)(2) NMAC, definition of "Intermittent"; 20.6.4.7(P)(2) NMAC, definition of "Perennial": consistent terminology - "water body" to "waterbody"

The Department proposes to make non-substantive amendments to change the term "water body" to "waterbody"—by deleting the space between two words and creating a single word—in several definitions to provide consistency throughout the WQS. Throughout the standards, these two terms are used interchangeably. The Department's research indicated that the use of the terms

was a matter of preference and not restricted by regulatory definition or common usage. The proposed change does not alter the meaning of the term nor will it affect implementation of the WQS.

vii. 20.6.4.7(P)(7) NMAC, definition of "Public water supply"

The Department proposes to amend the definition of "public water supply" to accurately reflect the Drinking Water rules at 20.7.10 NMAC and 40 C.F.R. § 141. The Department proposes to amend language because "public water system" is not defined in 20.7.10 NMAC, as indicated. Instead, the rules rely on the definition provided in 40 C.F.R. § 141, through incorporation by reference. The Department is also proposing to clarify that the term specifically applies to public water systems that use surface water as a source.

The Department proposes to amend "may need to" to "shall" to indicate these waters are subject to drinking water regulations before public consumption. When surface waters are used as a source supply for a public water system, they are subject to the treatment requirements of 40 C.F.R. § 141.70, also known as Subpart H – Filtration and Disinfection. Further, the Department indicates that those systems should be complying with applicable drinking water standards in order to supply water to customers. The purpose of this statement is to indicate to the public that surface waters, even those with the public water supply use are not safe to drink without some form of treatment. Public water supply criteria remain limited to the general criteria in 20.6.4.13 NMAC and the numeric criteria for bacterial quality, pH, and temperature. 20.6.4.900(A) NMAC. In no way does this create new obligations or requirements for public water systems.

viii. 20.6.4.7(T)(2) NMAC, New definition of "Temporary standard"

The Department proposes to relocate the definition of "temporary standard" to 20.6.4.7(T)(2) NMAC to provide a consistent location for definitions, in accordance with

1.24.10.8(F) NMAC. Additionally, the Department is proposing to add "or water quality variance as defined by 40 CFR § 131.3(o)" at the suggestion of EPA to maintain equivalency between the federal and state terms.

ix. 20.6.4.7(T)(3) – (5) NMAC, paragraph numbering

The Department proposes to amend the paragraph numbering to reflect the proposed amendment to include temporary standard in the definitions. If that proposed amendment is adopted, the subsequent paragraphs would need to be renumbered from 20.6.4.7(T)(2)-(4) NMAC to 20.6.4.7(T)(3)-(5) NMAC for "Toxic pollutant," "Tributary," and "Turbidity," respectively.

x. 20.6.4.7(W)(4) NMAC, definition of "Wetlands"

The Department proposes to amend the definition of "wetlands" for clarity. Wetlands provide a variety of important functions, and vary regionally and locally due to their soils, topography, climate, hydrology, water chemistry, vegetation, and other factors. New Mexico surface water quality programs conduct waterbody and habitat condition assessments, evaluate antidegradation provisions, develop appropriate mitigation ratios, and develop effluent limitations and permit conditions for surface water discharges, including point source and dredge and fill discharges.

The SWQB Wetlands Program has been mapping wetlands using the Cowardin Classification, which only requires one parameter, hydrology, soil, or vegetation to classify a system as a wetland. To align the "wetlands" definition with that work, the Department proposes to remove "sufficient to" and "and under normal circumstances do support, a prevalence of" and replaced them with "that typically" support vegetation. "Prevalence of vegetation" may not be typical for some wetlands such as playa lakes where vegetation may only be present along the annulus/fringe seasonally during wet conditions.

The Department also proposes to clarify that constructed wetlands for wastewater treatment are excluded from this definition, unless they impound a surface water of the state.

B. 20.6.4.10 NMAC - REVIEW OF STANDARDS; NEED FOR ADDITIONAL STUDIES

The Department proposes to amend the language pertaining to reviewing and amending standards (20.6.4.10 NMAC) to clarify when and how a designated use or criterion may be amended for a surface water of the State. Based on recent experience with third-party rulemakings, the Department is proposing to clarify expectations and roles of the petitioner, the Department, and the Commission Administrator to hold a hearing. As previously mentioned, the WQS were amended six times since EPA's last approval of the Triennial Review. For three of these rulemakings (see WQCC 24-31, WQCC 24-64, and WQCC 25-28) third parties (i.e., parties other than the Department) petitioned the Commission to initiate the rulemaking process. The proposed amendments to this section are the result of those hearing processes and experiences, and public comment received on the PRD in October of 2025.

i. 20.6.4.10(F) NMAC, New Subsection for rulemaking and associated costs

The Department proposes a new Subsection F at 20.6.4.10 NMAC, to clarify that any person may petition the Commission for a rulemaking and provide examples of the types of new or amended WQS a petitioner might seek. Additionally, the Department proposes to clarify that the petitioner would be responsible for any "Administrative Rulemaking Costs" as proposed within the definitions in 20.6.4.7(A)(7) NMAC.

In addition to the Department's recent experiences with third party rulemakings, early public comment received on the PRD shaped the proposed amendment and highlighted the need to clarify costs associated with rulemaking and the expected financial responsibility of the

petitioner. LANL, Amigos Bravos (and other NGOs), and the San Juan Water Commission (SJWC) provided comment on the PRD in partial or full opposition of the draft amendment.

LANL suggested that petitioners may be responsible for other parties' legal or technical experts. Although the basis for change in the PRD included a non-exhaustive list of costs, including "technical experts, scientific reports, and additional stakeholder outreach" the proposed language in the PRD did not reflect responsibility for third party contracting. LANL further suggested that the administrative costs of rulemaking would be a deterrent from initiating the rulemaking process and felt that they should only be responsible for the costs borne from presenting their case as the petitioner, but not be responsible for the costs due to the participation of outside parties, including their court reporting services. Additionally, LANL suggested, and the Department agreed, that the rules should define the costs a petitioner may bear and limit those to costs under the petitioner's control. See Section VIII.A.iii above for the Department's proposed language for "administrative rulemaking costs" at 20.6.4.7(A)(7) NMAC.

The Department feels that the largest and most prohibitive costs to rulemaking are those for legal and technical expertise, not the administrative costs. Additionally, the proposed amendment does not limit the Department from agreeing to initiate a rulemaking process or include such amendments during the next Triennial Review. Furthermore, it's the petitioner's responsibility to convince the WQCC to adopt their proposal and facilitate the public involvement that should lead up to such a decision. The Department does not agree that third party petitions and rulemakings, outside of the Triennial Review, are the "costs of having, administering, and improving" the surface water quality standards as suggested by LANL.

The San Juan Water Commission fully opposed the new language and argued that

"hearings are a statutory function of the WQCC" and it is the WQCC's fiscal responsibility to ensure adequate funding to hold hearings. Although Section 74-6-6 of the Water Quality Act requires a public hearing before a regulation or water quality standard is adopted, the Commission is not obligated to grant hearings. Additionally, the Department could oppose rulemaking petitions solely on the grounds of lack of budget, potentially further restricting the rulemaking process for third party petitioners. The Commission currently does not have an annual budget of its own to pay the "administrative rulemaking costs" and relies on the Department, and, more specifically, each Bureau to pay these costs. NMED's Bureaus are generally aware of rulemakings that they intend to initiate each fiscal year and can request funds to cover administrative costs in their annual budgets. This is especially true when considering and planning for complex and lengthy hearings that may incur more expensive administrative costs, such as those associated with a court reporter, transcript production, or simultaneous interpretation. Historically, NMED covered all costs of a rulemaking hearing when it was the petitioner. The Department did not cover these costs for third party petitioners, unless discussed and agreed upon before a third party petitioned the WQCC.

Furthermore, requiring that all hearings be paid for by the WQCC or the Department will increase a rulemaking's timeline by one to two years to accommodate a new budget cycle. Budgets for new fiscal years (FY), starting on July 1, are requested in September of the previous FY. For rulemakings that would be petitioned in October of a given year, they would have to wait eleven months to be included in a budget request, and an additional ten months before funding would be available to start the rulemaking hearing process.

To illustrate the potential length of time required for this, I'll discuss a timeline for a third party rulemaking with a hypothetical petition date of October 2025, which would not be included

in NMED's budget request until September 2026. If the budget request is approved, the funding would be available on July 1, 2027. The Department would then be able to start procurement for the hearing process that would typically be held 90 days later, or September of 2027. This would be nearly two years after the petition, *if the budget request was approved*.

The proposed amendment is not a new concept as existing regulatory language in 20.6.4.15 NMAC already requires petitioners to be responsible for administrative costs for Use Attainability Analyses (UAAs). The Department proposes expanding this concept to the other types of rulemaking for 20.6.4 NMAC. The WQS allow for amendments that are based on sound science and include robust public involvement. A petitioner may initiate a rulemaking at any time, but they should be aware that the process is dynamic, and at times controversial, which requires constant communication with stakeholders and adaptable planning. For the public, the largest costs and obstacles for rulemaking are the technical and legal work required to prepare petitions and present technical testimony at a hearing. Legal and technical fees will far exceed the administrative costs of rulemaking discussed here.

Historically, NMED works with the public to identify standards amendments and will take on rulemakings that benefit the public and environment of New Mexico. The Triennial Review serves as one avenue which the public can make their interests known and begin discussions with the Department. Outside of the Triennial Review, a recent example of NMED taking on a rulemaking due to public interest was the 2024 ONRW special designations (WQCC 24-46).

The Department will continue to work with third parties to ensure the WQS are protective of the designated uses. Additionally, the Department will continue to engage with interested parties to evaluate the need for new or amended WQS outside of the Triennial Review, including those

where the Department would be the petitioner, or agree to be partially or fully responsible for the "administrative rulemaking costs" for a hearing. These proposed amendments are provided to clarify the process and are in no way intended to limit the public from initiating or participating in the rulemaking process.

ii. 20.6.4.10(G)(3) – (6) NMAC, New paragraphs related to Site Specific Criteria

The Department proposes new paragraphs in the proposed Subsection G to align the rulemaking process for site-specific criteria and conducting a UAA. The Department proposes to include work plan requirements for entities outside of the Department for deriving site-specific criteria. A work plan will improve communication between outside agencies, the regulated community, stakeholders, and the Department. The work plan should clearly outline expectations and responsibilities for the third party and the Department when deriving criteria. Additionally, work plans are already required for conducting a UAA by an entity other than NMED and this will bring more uniformity to the process for new or amended WQS.

iii. 20.6.4.10(H)(12) NMAC, definition of "Temporary standard"

The Department proposes to move the definition of "temporary standard" where it is currently located in 20.6.4.10(H)(12) NMAC and place it within the definitions at 20.6.4.7 NMAC as outlined above in my testimony in Section VIII.A.x.

iv. 20.6.4.10 (C), (G) – (I) NMAC, Amended language, subsections' lettering, paragraph numbering, and cross references to maintain consistency.

The Department proposes to update the cross references in the current 20.6.4.10(C) and (H) NMAC to align with the newly proposed Subsection F. If the newly proposed subsection is adopted, the current Subsections F, G, and H would have to be re-lettered to Subsections G (Site-Specific Criteria), H (Natural Background), and I (Temporary Standards), necessitating the need

to update the cross references.

In addition, throughout this section, the Department proposes to amend the terms "water body" to "waterbody" to provide a consistent term throughout the WQS as previously discussed.

C. 20.6.4.11 NMAC – APPLICABILITY OF WATER QUALITY STANDARDS

i. 20.6.4.11(E)(2) NMAC, cross reference

The Department proposes to update the cross references in the current 20.6.4.11(E)(2) NMAC from Subsection "K" to "L" to align with the numerical criteria values provided therein and provide clarity to staff implementing the regulations.

ii. 20.6.4.11(G) NMAC, New clarifying language

The Department proposes to include the new language "for persistent toxic pollutants, unless" to remain consistent with 20.6.4.900(H)(7) NMAC and the criteria language for Limited Aquatic Life.

D. 20.6.4.15 NMAC – USE ATTAINABILITY ANALYSIS

i. 20.6.4.15(B) NMAC, New and updated references, amended paragraph numbering

The Department proposes to amend Subsection B of 20.6.4.15 NMAC to reflect the most current methods for developing a UAA including a new reference at 20.6.4.15(B)(1) NMAC to EPA's Water Quality Standards Handbook that provides current guidance and case studies for developing and implementing WQS. If adopted by the Commission, the subsequent paragraphs would need to be renumbered from 20.6.4.15(B)(1)-(3) NMAC to 20.6.4.15(B)(2)-(4) NMAC. This is an online resource updated by EPA periodically and currently available at https://www.epa.gov/wqs-tech/water-quality-standards-handbook.

The Department further proposes to include updated economic guidance intended to be

used in conjunction with the existing reference at 20.6.4.15(B)(3) for economic guidance (**NMED Exhibit 18**). These resources provide a framework for WQS decisions with economic considerations, like UAAs and temporary standards.

ii. 20.6.4.15(D)(2) and (3) NMAC, consistency and clarity

Throughout this section, the Department proposes to change the terms "water body" to "waterbody" to provide a consistent term throughout the WQS, as previously discussed.

The Department proposes to amend language at 20.6.4.15(D)(2)(g) NMAC to clarify that EPA will not provide approval of a UAA until duly adopted by the WQCC and submitted to them under Section 303(c)(2) of the CWA.

The Department proposes to include a new Paragraph 3 at 20.6.4.15(D) NMAC to correct an oversight in NMAC formatting. This paragraph should have been previously identified as separate from Paragraph (2) and included as proposed. Additionally, the Department proposes to include "designated use" to clarify what amendment would result from conducting and adopting a UAA.

iii. 20.6.4.15(E) NMAC, third party UAAs

The Department proposes to amend language within Subsection E to remove the term "proponent" from the WQS. This term is undefined in the WQS and is not commonly used in New Mexico Statute or rulemaking rules, becoming a potential source of confusion. The Department proposes further edits to clarify actions and language.

As previously discussed in Sections VIII.A.iii and VIII.B.i of my testimony, the Department proposes to consolidate the financial responsibility requirements for the administrative rulemaking process in 20.6.4.10(F) NMAC and provide a definition of "administrative rulemaking costs" at 20.6.4.7(A)(7) NMAC. Further, the Department proposes to remove the reference to costs

of developing a UAA and the subsequent costs associated with the administrative rulemaking process within the existing Paragraph 5 of 20.6.4.15(E) NMAC.

E. 20.6.4.318 NMAC – CANADIAN RIVER BASIN

The Temporary Standard for Doggett Creek that was approved by the WQCC and EPA in 2020 became effective for federal CWA purposes on July 24, 2020. In accordance with the Temporary Standard at 20.6.4.318(C)(10) NMAC, the Department reviewed socioeconomic factors in Raton, NM, trends in highest attainable condition (HAC), and progress made toward implementation of pollutant control technologies. Socioeconomic conditions and HAC remain unchanged from the initial evaluation. Progress has been made by the City of Raton and nutrient concentrations are decreasing in discharge to Doggett Creek but are not at the levels required by the temporary standard. The City of Raton has made progress toward improvement including pilot testing coagulation for phosphorous removal, performing a zero-discharge feasibility study, and submitting funding applications for facility upgrades.

The Department presented the temporary standard reevaluation to the WQCC on May 13, 2025, and recommended that the temporary standard remain as written and approved in 20.6.4.318 NMAC. The WQCC deliberated after the presentation and voted to approve "no changes" to the temporary standard other than to update the "Proposed Actions and Implementation Schedule" within the city's NPDES permit.

Public comment and participation on the Temporary Standard was solicited through the public notice and comment period for the draft renewal of NPDES permit no. NM0020273, which occurred in November of 2025. The NPDES permit was reissued with an effective date of March 1, 2026.

i. 20.6.4.318(C) NMAC, effective date language and cross reference

The Department proposes to amend language within the temporary standard to reflect the EPA approval/effective date of July 24, 2020. This will provide a baseline date to track the reevaluation interval as well as invite public comment on the Section in accordance with 20.6.4.318(C)(10) NMAC.

The Department also proposes to update the cross reference in 20.6.4.318(C)(10) NMAC to reflect proposed changes to 20.6.4.10 NMAC to renumber Subsection H to Subsection I.

IX. CONCLUSION

The Department recommends that the Commission adopt the proposed amendments to the Standards, filed with the Department's First Amended Petition (**NMED Exhibit 27**) and based upon the testimony of the SWQB's witnesses. This concludes my direct testimony.

MICHAEL G. BACA

EDUCATION - September 1999-June 2004, Carleton College, Northfield, MN, B.A. in Chemistry

PROFESSIONAL EXPERIENCE – February 2005-Present, New Mexico Environment Department

October 2023 – Present, Surface Water Quality Bureau, Water Resources Manager I

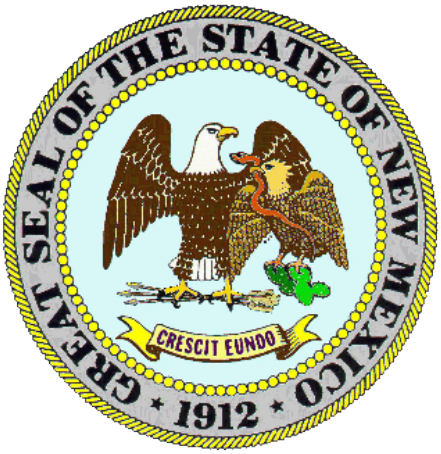
Serve as the Water Quality Standards Coordinator and the supervisor for the Standards and Outreach Team. Oversee, lead, and assist in the development, revision, and implementation of New Mexico's surface water quality standards, including rulemakings and special projects. Provide technical testimony and exhibits for proposed water quality management plans and standards amendments presented before the Water Quality Control Commission, including third-party rulemakings, the Triennial Review and the Water Quality Management Plan and Continuing Planning Process. Organize public stakeholder engagement opportunities regarding proposed changes to standards to provide feedback and discussion with the public, regulated community, interests groups, nonprofit organizations, academia and state, local and federal government agencies and elected officials. Build effective partnerships with the public, government agencies, stakeholders, and regulated entities through effective communication and collaborations. Direct the day-to-day operations of the team: manage, assign and prioritize tasks and projects in accordance with grant objectives and budgets, oversee professional growth development, provide team leadership, interpret technical and policy guidance, and administer personnel related actions such as evaluations, discipline, and hiring.

December 2018-September 2023, Air Quality Bureau, Staff Manager

Manage the daily operations of the Control Strategies Section including a staff six to implement and enforce the federal Clean Air Act in New Mexico through the development and revision of the State Implementation Plan and other air quality management plans and rules for the state, including Climate Change. Assign and prioritize completion of tasks and projects to achieve the vision and mission of the Department and the Bureau's performance measures. Provide technical and policy guidance through the development of work products and administration of existing programs, policies, rules, regulations, and resources. Oversee, lead and assist with rulemaking and special projects including the adoption of rules and management plans by presenting testimony and exhibits before the Environmental Improvement Board. Manage air quality programs and projects to award contracts and grants, ensure timely submission of deliverables and technical reports, and review financial expenditures to meet contractual obligations and compliance with state procurement rules. Organize and develop public stakeholder engagement strategies to provide meaningful engagement opportunities and collaborations with the public, regulated community, interests groups, nonprofit organizations, academia and state, local and federal government agencies and elected officials. Complete timely HR actions to include training, employee evaluations, discipline, hiring and other personnel actions.

July 2008-December 2018, Air Quality Bureau, Environmental Analyst

Represent the Department as the air quality liaison with binational border air quality agencies and stakeholders, participating in the Joint Advisory Committee and the US Environmental Protection Agency (USEPA) border programs. Develop and prepare technical testimony and exhibits for public hearings in front of the Environmental Improvement Board to present and defend air quality and climate change plans and rules for adoption in New Mexico, including state implementation plans required by the USEPA. Analyze ambient air quality monitoring data and prepare technical documents for submission to the USEPA for high wind blowing dust events that cause air pollution episodes. Conduct public education and outreach meetings and develop educational material regarding air quality, rule requirements, and rule



development. Review and comment on permits, Environmental Impact Statements, and Environmental Assessments for compliance with federal and state rules and standards. Manage air quality research projects and contracts in the border area to ensure timely submission of deliverables.

February 2005 -July 2008, Field Operations Division, Environmental Scientist and Specialist

Oversee public swimming pool program at a district level to ensure consistent permitting, inspection, and enforcement actions across six counties in northwest New Mexico. Review engineering plans and approve permits for construction of swimming pool and bath facilities. Conduct training for swimming pool department staff and operators. Permit and inspect restaurants and food processors, swimming pool facilities, and liquid waste disposal system installations and initiate enforcement actions for compliance with applicable regulations. Conduct public education and outreach to help the regulated community comply with environmental management principles, administrative requirements, and state regulations.

I. INTRODUCTION

A. Purpose

New Mexico's Statewide Water Quality Management Plan and Continuing Planning Process (WQMP/CPP) provides a concise summary of the water quality management system in New Mexico (NM) and the roles of the major participants in that system, as required by Sections 208 and 303 of the federal Clean Water Act (CWA) and New Mexico Statutes Annotated (NMSA) 1978, Section 74-6-4(B) of the New Mexico Water Quality Act (WQA).

In accordance with Section 303(e) of the CWA and 40 CFR 130.5, states are required to have a CPP which describes the processes used to manage the state's water quality programs. The state may determine the format of its CPP as long as it meets the minimum requirements, as described in Section 303(e)(3)(A)-(H) of the CWA and 40 CFR 130.5, but it may also include other processes at its discretion.

In accordance with 40 CFR 130.6(b), the WQMP is used to direct implementation and draw upon the water quality assessments to identify priority point and nonpoint water quality problems, consider alternative solutions and recommend control measures, including the financial and institutional measures necessary for implementing recommended solutions. The WQMP/CPP addresses nine (9) elements to implement water quality management planning, in accordance with 40 CFR 130.6(c) and as described under Section 205(j) of the CWA; areawide Waste Treatment Management under Section 208 of the CWA; and Water Quality Standards (WQS) and implementation plans as described under Section 303 of the CWA.

The Statewide WQMP/CPP is used to direct implementation of New Mexico's water quality programs. The WQMP/CPP is intended to provide a consistent approach to preserve, protect, and improve water quality by ensuring that WQS are established to protect designated uses, the quality of water in the environment is periodically assessed, and point and nonpoint pollution sources that may adversely impact water quality are identified, prioritized, and controlled.

B. Significant Challenges to Water Quality Management in New Mexico

There are many challenges in meeting the objectives of the CWA and the WQA. This section highlights some of the more significant surface water quality issues in New Mexico.

Climate Change

The impact of climate change on the state's water resources should be acknowledged because the science shows that these changes will lead to further problems and uncertainties. Droughts are predicted to increase in both frequency and severity in many regions of the world, including the southwestern U.S., due to climate change. In general, droughts and the immediate recovery period have substantial water quality effects on the waterbody and its watershed. For example, decreases in stream flow typically increase pollutant concentrations due to evaporation and less dilution. Other water quality impacts associated with climate change and drought include higher water temperatures, enhanced algal production, toxic algal blooms, and lower dissolved oxygen

NMED Exhibit 3

levels, all of which are stressors to aquatic life. As temperature and precipitation patterns undergo extreme cycles, more frequent and more powerful storms will increase pollutant runoff from the watershed, physically modify and erode riparian habitat, and disrupt biological communities that depend on these habitats. In addition, shifting temperature and precipitation patterns affect vegetation composition and density and increase the propensity for wildfire in non-fire adapted ecosystems.

As waters become stressed by climate change, drought, wildfires, overuse, and groundwater mining, many perennial and intermittent streams and springs will fade. Currently, many perennial "rivers" and "tributaries" in New Mexico contain non-perennial sections. As a result of climate change, these "perennial" waters will likely diminish and the need for clean water will strain these systems even further.

To address some of these concerns, in 2019 Governor Lujan Grisham signed executive order 2019-003 on Addressing Climate Change and Energy Waste Prevention. EO 2019-003 directs all State agencies to evaluate the impacts of climate change on their programs and operations and integrate climate change mitigation and adaptation practices into their programs and operations. The WQMP/CPP ties in directly with various initiatives for resource management in the State of New Mexico, including EO 2019-003. The long-term water quality monitoring programs under the State's Water Quality Management Plan are designed to identify trends in water quality and evaluate project effectiveness. In addition, watershed restoration projects enhance the natural environment and improve watershed resilience to climate change.

Stormwater and MS4s

Controlling stormwater runoff and its impact is a serious issue facing communities across New Mexico. Urban and highway stormwater runoff is rainfall or snowmelt that runs off the ground or impervious surfaces such as buildings, roads, and parking lots, and drains into natural or man-made drainage systems. In most cases, it drains directly into streams, river, lakes, or wetlands without receiving any treatment to remove pollutants. Because of this, stormwater is a leading cause of water pollution.

Changes in land use have a major effect on both the quantity and quality of stormwater runoff. Urbanization, if not properly planned and managed, can dramatically alter the natural hydrology of an area because it increases impervious cover, decreases the amount of rainwater that can naturally infiltrate into the soil, and consequently increases the volume and rate of stormwater runoff. Stormwater runoff also typically contains elevated concentrations of a variety of constituents that exceed water quality standards (e.g., copper, lead, and zinc; polyaromatic hydrocarbons (PAHs) and pesticides; oil and grease; nutrients (nitrogen and phosphorus); sediment; and *E. coli* bacteria). Untreated stormwater entering our waterways can kill aquatic life and result in the contamination of fish tissue and drinking water supplies; prohibit or limit swimming, fishing or boating; present dangers to public health and safety; and increase the frequency and magnitude of flooding.

NMED Exhibit 3

Polluted stormwater runoff also is commonly transported through municipal separate storm sewer systems (MS4s) in urbanized areas to local waterbodies. To prevent harmful pollutants from being washed or dumped into MS4s, certain operators are required to obtain National Pollutant Discharge Elimination System (NPDES) permits and develop stormwater management programs (SWMPs). The SWMP describes the stormwater control practices that will be implemented consistent with permit requirements to minimize the discharge of pollutants from the urbanized area. Furthermore, effective water quality protection requires the "treatment" of stormwater through the use of various preventive and control measures (e.g., best management practices, low impact development, structural controls) to reduce the impact of impervious surfaces and minimize increases in stormwater runoff.

The U.S. Environmental Protection Agency's (EPA) "Procedures for Implementing NPDES Permits in New Mexico – NMIP" establishes procedures to effectively incorporate state water quality standards and total maximum daily loads (TMDLs) into NPDES permits. EPA Region 6 is the NPDES permitting authority in New Mexico. As such, EPA R6 uses the NMIP to explain NPDES permitting decisions in New Mexico. The EPA developed the NMIP in coordination with the NMED Surface Water Quality Bureau. Specific measures to ensure permitting effectiveness and appropriate implementation of New Mexico's water quality standards and TMDLs are contained in the NMIP.

Navigable Waters Protection Rule and "Waters of the U.S."

In 2019, the EPA and the Department of the Army proposed the Navigable Waters Protection Rule to define "waters of the U.S." and delineate which waters are protected under the federal CWA. The rule was finalized in April 2020 and went into effect on June 22, 2020. The new rule interprets the term "waters of the U.S." to encompass the following four categories of waters:

1. Territorial seas and traditional navigable waters;
2. Perennial and intermittent tributaries to territorial seas and navigable waters;
3. Certain lakes, ponds and impoundments of jurisdictional waters; and
4. Wetlands adjacent to other jurisdictional waters.

The new rule identifies 12 categories that are not "waters of the U.S." and therefore, not federally regulated or protected under the CWA, including ephemeral features that flow only in response to rainfall, groundwater, wetlands that do not abut a jurisdictional water, many farm and roadside ditches, certain artificial lakes and ponds, and waste treatment systems.

Under the new rule, at least 89 percent of the state's rivers and streams and approximately 40 percent of the state's wetlands lose federal regulation and protection from pollution. New Mexico is one of three states in the U.S., and the only state in the West, that does not have authority (aka "delegation") from the EPA to administer and implement the NPDES program under Section 402 of the CWA. The NPDES program regulates facilities that discharge pollutants into "waters of the U.S." and includes permit issuance, compliance, and enforcement activities.

This federal rollback of environmental protections for streams and wetlands will put more burden on the State's water quality management agencies, especially the New Mexico Environment

NMED Exhibit 3

Department (NMED), to ensure continued protection of surface waters of the state and adequate resources to maintain and improve water quality. Without a state permitting program to authorize discharges to surface waters of the state including waters of the U.S., NMED is unable to fill the regulatory gap created by the new rule.

Currently, NMED is actively investigating available options. This includes conducting a NPDES gap analysis that (1) evaluates statutory, regulatory, and programmatic gaps associated with potential pursuit of NPDES program authorization for the State of New Mexico and (2) identifies actions necessary to eliminate the gap and assume authority over the program.

Watershed Management and Water Quality

Interagency collaboration has always played a significant role in managing watersheds on public lands within New Mexico. There are many federal and state agencies with varying missions and priorities for utilizing and protecting New Mexico's natural resources. In part, these activities include habitat restoration, water quality management, water rights management, mining, grazing, silviculture, conservation management, wildlife management, outdoor recreation, hunting, and fishing. As discussed in further detail under subsection F of this Section, this Water Quality Management Plan identifies some of those entities the State engages with to ensure continued water quality protection for the State of New Mexico.

C. Cross-walk of Sections in the WQMP/CPP and the Federal Requirements

The nine (9) federal requirements of a WQMP are found in 40 CFR 130.6(c), and the nine (9) federal requirements of a CPP are found in 40 CFR 130.5(b). Table I-1 shows how this document is organized to incorporate requirements of both the WQMP and the CPP. Any reference to the State's WQMP or CPP in statutes, regulations, standards or other documents refers to this document.

Table I-1: Federal Requirements for WQMP and CPP

WQMP/CPP Section	40 CFR 130.6 WQMP Requirements	40 CFR 130.5 CPP Requirements
I. Introduction	Not required by 40 CFR 130.6	**40 CFR 130.5(b)(4)** *The process for updating and maintaining WQMPs, including schedules for revision;* **40 CFR 130.5(b)(5)** *The process for assuring adequate authority for intergovernmental cooperation in the implementation of the State's WQMP.*
II. Water Quality Standards	Not required by 40 CFR 130.6	**40 CFR 130.5 (b)(6)** *The process for establishing and assuring adequate implementation of new or revised water quality standards.*
III. Assessment, Monitoring and Reporting	Not required by 40 CFR 130.6	Not required under 40 CFR 130.5

WQMP/CPP Section	40 CFR 130.6 WQMP Requirements	40 CFR 130.5 CPP Requirements
IV. Total Maximum Daily Loads (TMDLs)	**40 CFR 130.6 (c)(1)** *A list of approved TMDLs.*	**40 CFR 130.5(b)(3)** *The process for developing TMDLs and individual water quality-based effluent limitations for pollutants.*
V. Effluent Limitations	**40 CFR 130.6 (c)(2)** *Effluent limitations including water quality-based effluent limitations and schedules of compliance.*	**40 CFR 130.5 (b)(1)** *The process for developing effluent limitations and schedules of compliance;* **40 CFR 130.5(b)(9)** *The process for determining the priority of permit issuance.*
VI. Municipal and Industrial Waste Treatment	**40 CFR 130.6 (c)(3)** *Identification of anticipated municipal and industrial waste treatment works; programs to provide necessary financial arrangements for such works; establishment of construction priorities and schedules for initiation and completion of such treatment works including an identification of open space and recreation opportunities from improved water quality.*	**40 CFR 130.5(b)(7)** *The process for assuring adequate controls over the disposition of all residual waste from any water treatment processing;* **40 CFR 130.5(b)(8)** *The process for developing an inventory and ranking, in order of priority of needs for construction of waste treatment works.*
VII. Nonpoint Source Management and Control	**40 CFR 130.6 (c)(4)** *The regulatory and non-regulatory programs, activities, and Best Management Practices (BMPs) to control nonpoint source pollution where necessary to protect or achieve approved water uses.*	Not required by 40 CFR 130.5
VIII. Management Agencies	**40 CFR 130.6 (c)(5)** *Identification of agencies necessary to carry out the WQMP and provision for adequate authority for intergovernmental cooperation.*	Not required by 40 CFR 130.5
IX. Implementation Measures	**40 CFR 130.6(c)(6)** *Identification of implementation measures necessary to carry out the WQMP.*	Not required by 40 CFR 130.5
X. Dredge and Fill Program	**40 CFR 130.6(c)(7)** *Identification and development of programs for the control of dredge and fill material.*	Not required by 40 CFR 130.5.
XI. Basin Plans	**40 CFR 130.6(c)(8)** *Identification of any relationship to applicable basin plans developed under Section 209 of the CWA.*	**40 CFR 130.5(b)(2)** *The process for incorporating elements of any applicable areawide waste treatment plans under Section 208, and applicable basin plans under Section 209 of the CWA.*
XII. Groundwater	**40 CFR 130.6(c)(9)** *Identification and development of programs for control of ground-water pollution.*	Not required by 40 CFR 130.5

WQMP/CPP Section	40 CFR 130.6 WQMP Requirements	40 CFR 130.5 CPP Requirements
XIII. Determination of Compliance with WQS – Human Health Criteria	Not required by 40 CFR 130.6 (required by 20.6.4 NMAC)	Not required by 40 CFR 130.5
XIV. Public Participation	Not required by 40 CFR 130.6	**40 CFR 130.5(b)(4)** *The process for updating and maintaining the WQMP.*

D. History and updates to the WQMP/CPP

The New Mexico Water Quality Control Commission (WQCC) first adopted the WQMP and the CPP in 1979, under the statutory authority of Section 74-6-4(B) of the WQA. Prior to 2011, the WQMP and the CPP were maintained independently of each other. Beginning in 2011, the New Mexico Environment Department's (NMED's) Surface Water Quality Bureau (SWQB) consolidated the WQMP and CPP into one document.

The chronological summary of the subsequent updates are as follows:

- March 1976 CPP initially adopted
- October 1978 WQMP initially adopted
- May 1979 WQMP
  - Initially adopted Work Elements 2.5 (Trout Hatcheries), 4.3 (Sediment Study) 8.0 (Industrial Waste Treatment System Needs: Toxic Substance Study) and 9.5 (Development of Statewide Groundwater Monitoring System)
- October 1979 WQMP
  - Updated Work Element 3 (Population Projections)
- October 1980 WQMP
  - Initially adopted Work Element 13 (Designation of Management Agencies)
  - Updated Work Element 3 (Population Projections)
- May 1982 WQMP
  - Updated Work Element 6 (Point Source Load Allocations)
- September 1983 WQMP
  - Updated Work Element 4.1 (Irrigated Agriculture)
- August 1984 WQMP
  - Initially adopted Work Element 14 (Implementation Schedules)
  - Updated Work Elements 4.1 (Irrigated Agriculture), 4.2 (Silviculture), 4.3 (Sediment Study), 13 (Designation of Management Agencies)
- October 1985 WQMP
  - Updated Work Elements 6 (Point Source Load Allocations) and 13 (Designation of Management Agencies)
- April 1986 WQMP
  - Updated Work Element 3 (Population Projections)
- September 1988 WQMP

NMED Exhibit 3

    - Updated Work Element 13 (Designation of Management Agencies)
- September 1989 WQMP
    - Updated Work Element 6 (Point Source Load Allocations)
- July 1998 CPP
- December 2002 WQMP
    - Approved December 17, 2002
    - Restructured for comprehensiveness, accessibility, and usability
    - Reorganized to track current federal requirements
    - Removed outdated or non-applicable elements
    - Consolidated partial updates
- May 2003 WQMP
    - Updated Introduction to provide background on how water quality is managed and Work Element 11 (Public Participation Program) (now Section XIV) to include outreach protocols and strategies
- December 2004 CPP
    - Initially adopted Antidegradation Policy Implementation Procedure
- November 2010 WQMP
    - Updated the Antidegradation Policy Implementation Procedure (Appendix A)
- May 2011 WQMP/CPP
    - Consolidated WQMP and CPP
    - Initially adopted the following new elements:
        - Developed Wetlands Program
        - Adopted Underground Injection Control (UIC) regulations
        - Created Water Cabinet for Water and Wastewater Infrastructure
        - Added Hydrology Protocol for determining water body type (ephemeral, intermittent, perennial)
    - Updated and revised:
        - References and citations
        - Program descriptions
        - WQS amendments
        - Completion of the TMDL settlement agreement requirements
        - Process for establishing TMDLs
        - Nonpoint Source Management Program
        - Provided a format that supported opportunity for future growth of the WQMP

The primary goals of this 2020 update include the following:

- Incorporate changes and new developments that have occurred since the last revision in 2011;
- Update the antidegradation policy implementation procedure (Appendix A);
- Incorporate the Wetland Program (Previously Section XV) into regulatory mandated portions of the WQMP/CPP primarily under the Nonpoint Source Management and Control (Section VII); and
- Update program descriptions and citations to referenced documents.

NMED Exhibit 3

E. The process for updating and maintaining the WQMP/CPP including schedules for revision

[As required by 40 CFR 130.5(b)(4) for CPP]

To ensure that the WQMP/CPP continues to provide an effective framework for water quality management, updates may be developed for reasons such as: changes in population, economic development, changing water quality conditions, results of implementation activities, new and revised effluent limitations, and new requirements, including new laws, regulations, and standards.

The WQMP/CPP is periodically reviewed and revised in accordance with 40 CFR 130.5 and 40 CFR 130.6(e) to ensure the processes are current and adequately reflect the State's water quality management system. Any updates and revisions to the WQMP/CPP must be approved by the WQCC and the United States Environmental Protection Agency (EPA).

Following an identification for the need to update the WQMP/CPP, NMED proceeds with outreach efforts to Tribal counterparts in accordance with NMED's 2009 Tribal Collaboration and Communication Policy. Identification of potential stakeholders is also conducted to engage individuals or entities that may be impacted by the actions under the WQMP/CPP. Following outreach to Tribes and Stakeholders, the public notice process is driven primarily by various Federal and State regulations as well as NMED policies as outlined in Section XIV of this WQMP/CPP. After public comments are received, NMED reviews and incorporates necessary revisions, as applicable. NMED then presents the proposed revisions to the WQCC for consideration and approval. NMED may submit a proposed update to EPA for technical review before presentation to the WQCC. The WQCC considers the proposed update at one of its public meetings. At the WQCC meeting, the WQCC allows all interested persons reasonable opportunity to provide comment before deciding whether to approve the update.

After adopting an update, the WQMP/CPP is sent to the Governor or designee by the Department on behalf of the WQCC for review and certification that the update is consistent with all other parts of the plan. The WQCC sends the approved WQMP/CPP, along with the Governor's certification, to EPA Region 6 for approval. Once approved by EPA Region 6, the approved WQMP/CPP is maintained within NMED and filed as a State publication with the New Mexico State Library.

Updates to the appendices of the WQMP/CPP, including the Antidegradation Policy Implementation Procedure and the Hydrology Protocol for the Determination of Uses Supported by Ephemeral, Intermittent and Perennial Waters (Appendix A and C, respectively), are done in accordance with the process to update the WQMP/CPP. Updates to the TMDL List (Appendix B) are made once a TMDL has been adopted or removed in accordance with the process described in Section IV of this WQMP/CPP.

NMED Exhibit 3

Several documents that relate to components of this WQMP/CPP are incorporated by reference. Documents incorporated by reference may be revised and updated independently, but in accordance with the WQMP/CPP. The context of each reference should be used to determine if a specific version or the most current version of the document is being referenced. The regulations and documents incorporated by reference into the WQMP/CPP include the following:

Ground and Surface Water Protection regulations *(20.6.2 NMAC)*

New Mexico Nonpoint Source Management Plan

Standards for Interstate and Intrastate Surface Waters regulations *(20.6.4 NMAC)*

State of New Mexico Integrated Clean Water Act §303(d)/§305(b) Integrated Report

Surface Water Quality Bureau Quality Management Plan (QMP)

Surface Water Quality Bureau Quality Assurance Project Plan for Water Quality Management Programs (QAPP)

F. Process for assuring adequate authority for intergovernmental cooperation in the implementation of the State's Water Quality Management Program

[As required by 40 CFR 130.5(b)(5) for CPP]

The creation of the WQCC as the control agency for all purposes of the WQA and, in turn, the federal CWA, are established under NMSA 1978, Section 74-6-3 of the WQA. The duties and powers of the WQCC under Section 74-6-4 of the WQA assure adequate authority for intergovernmental cooperation in the implementation of the WQMP/CPP.

Intergovernmental cooperation in the implementation of the WQMP/CPP programs is provided by four factors:

Factor 1: The composition of the WQCC.

The WQCC is the water pollution control agency for New Mexico. It is responsible for developing specific water quality policy in NM, in a manner that implements the broader policies set forth by the NM Legislature in the WQA. In accordance with Section 74-6-3 of the WQA, the WQCC is comprised of fourteen (14) members; nine (9) of which are representatives of State agencies involved in some aspect of water quality management; one (1) member is a representative of county or municipal government; and the other four (4) members are representatives of the public that are appointed by the Governor. Thus, the WQCC itself serves as a forum for exchange of information, coordination, and cooperation. The fourteen members of the WQCC include:

- Secretary of the Environment Department*
- Secretary of the Department of Health*
- Director of the Department of Game and Fish*

NMED Exhibit 3

- State Engineer*
- Chair of the Oil Conservation Commission*
- Director of the State Park and Recreation Division of the Energy, Minerals and Natural Resources Department (EMNRD)*
- Director of the New Mexico Department of Agriculture*
- Chair of the Soil and Water Conservation Commission or a Soil and Water Conservation District Supervisor designated by him/her
- Director of the Bureau of Geology and Mineral Resources at the New Mexico Institute of Mining and Technology*
- Representative of County or Municipal Government
- Four representatives of the public to be appointed by the governor for terms of four years

*indicates that a Commissioner can appoint a designee.

The WQCC is the entity with authority to approve the WQMP/CPP, adopt WQS to protect waters of the State, as well as various regulations aimed at achieving compliance with those standards. In addition to its formal rulemaking role, the WQCC serves as a forum to facilitate and advance a statewide policy dialogue on a variety of important water quality topics. In accordance with NMSA 1978, Section 74-6-4(F), the WQCC shall also hear and decide disputes between constituent agencies as to jurisdiction concerning any matters within the purpose of the WQA. Additional duties and powers of the WQCC are defined in the WQA at NMSA 1978, Section 74-6-4.

Factor 2: The delegation of responsibilities to constituent agencies by the WQCC.

Under Section 74-6-4(F) of the WQA the WQCC has the authority to delegate responsibility for administering its regulations to constituent agencies to assure adequate coverage and prevent duplication of effort. The WQCC reviews, adopts, and records such delegations at its regular open meetings. As the WQCC has no staff of its own, responsibilities for administering its regulations are assigned among eight (8) constituent agencies identified in the WQA at NMSA 1978, Section 74-6-2(K). Those agencies, along with any applicable responsibilities pertaining to this WQMP/CPP, are as follows:

New Mexico Environment Department (NMED)

The Secretary of NMED is delegated as a member of the WQCC. Under the WQCC's delegation of Responsibilities to Environmental Improvement Division (now NMED) and Oil Conservation Division (OCD) dated July 21, 1989, NMED is the primary constituent agency responsible for administering and enforcing all programs implemented by the state under the CWA. Such actions include implementing the WQMP/CPP, as well as administering regulations adopted by the WQCC for discharges to surface and ground water. NMED is the principal source of technical expertise available to the WQCC in its rulemaking and other policy-setting activities. The WQCC, in accordance with NMSA 1978, Section 74-6-3(F), is administratively attached to NMED.

NMED Exhibit 3

On July 21, 1989, through the Water Quality Control Commission's "Delegation of responsibilities to Environmental Improvement Division and Oil Conservation Division "the WQCC delegated NMED as the constituent agency to administer the following duties:

- Maintain, restore and improve the quality of the State's waters;
- Regulate discharges for compliance with regulations and standards;
- Develop water quality classifications and standards;
- Perform site application and design and specification reviews of new or expanding domestic wastewater treatment facilities;
- Undertake monitoring and enforcement of the statutes and permits;
- Coordinate water quality management planning;
- Manage state and federal construction grant and loan assistance programs which provide financial support to municipalities for construction or improvement of wastewater treatment facilities;
- Manage the groundwater quality protection program with the goal of protecting the public health and beneficial ground water uses; and
- Provide technical assistance to local governments regarding water and wastewater treatment.

Section 74-6-4(F) of the WQA also specifically assigns the following duties to NMED:

- Provide technical services, including certification of permits pursuant to the federal CWA, and
- Maintain a repository of the scientific data required by the WQA.

The following describes specific NMED bureaus and their responsibilities relating to the implementation of the WQMP/CPP. For additional information visit: https://www.env.nm.gov/.

Construction Programs Bureau (CPB): The CPB is involved in implementing portions of the WQMP/CPP as they pertain to prioritizing water, wastewater, and solid waste planning, design, and construction funding through the administration of the following programs: New Mexico Clean Water State Revolving Fund (CWSRF), also known as the Wastewater Facility Construction Loan Fund; Rural Infrastructure Program (RIP); and Capital Outlay Special Appropriations Program (SAP). As part of these programs, the CPB:

- Administers low interest loan and grant programs for water, wastewater and other environmental infrastructure projects that protect surface and groundwater;
- Manages the timely construction and administrative completion of publicly funded water, wastewater, and solid waste projects; and
- Ensures that projects are environmentally sound, of high quality, and free of waste, fraud, and abuse.

Ground Water Quality Bureau (GWQB): The GWQB protects the quality of NM's groundwater resources in accordance with the WQMP/CPP and as mandated by the WQA, the federal Safe

Drinking Water Act (SDWA), Ground and Surface Water Protection Regulations (20.6.2 NMAC), Ground Water Protection-Supplemental Permitting Requirements for Dairy Facilities (20.6.6 NMAC), and Ground Water Protection-Supplemental Permitting for Copper Mine Facilities (20.6.7 NMAC). The GWQB:

- Develops standards and regulations pertaining to groundwater quality;
- Issues groundwater pollution prevention discharge permits;
- Implements the Department's responsibilities under the New Mexico Mining Act to ensure that environmental issues are addressed, and standards are met;
- Implements NM's underground injection control (UIC) programs;
- Oversees groundwater investigation and remediation activities; and
- Identifies, investigates and remediates contaminated sites that pose significant risks to human health and the environment through implementation of the Bureau's Voluntary Remediation Program, Brownfields Program, and the federal Superfund program.

GWQB also strives to increase industry and public understanding and awareness of the importance of safe groundwater supplies in sustaining the quality of life in New Mexico for this and future generations, and the importance of protecting groundwater quality through pollution prevention initiatives.

Surface Water Quality Bureau (SWQB): The SWQB protects and improves NM's surface water quality by controlling pollution from both discrete point sources and dispersed nonpoint sources. The SWQB maintains and revises the WQMP/CPP and is the primary bureau within NMED that is responsible for implementing the majority of the sections under the WQMP/CPP. Operating under the CWA, the SDWA, the WQA, the Standards for Interstate and Intrastate Surface Waters (20.6.4 NMAC), and Ground and Surface Water Protection regulations (20.6.2 NMAC) the SWQB:

- Administers the Nonpoint Source (NPS) Program through the federally funded Program under Section 319 of the CWA and the state-funded River Stewardship Program;
- Administers the Wetlands Program;
- Certifies federal permits issued under Section 402 of the CWA pertaining to National Pollutant Discharge Elimination System (NPDES) and Section 404 of the CWA pertaining to Dredge and Fill;
- Assists the WQCC in developing surface WQS and regulations for the State;
- Conducts monitoring and assessment activities to report on water quality status and identify impairments of NM's surface waters; and
- Develops water quality planning documents identifying pollutant load reductions necessary to attain WQS.

Other NMED Bureaus and Programs: Other Bureaus and Programs also contribute to water quality protection and may work indirectly under the WQMP/CPP from time to time. Some of which are listed as follows:

- Utility Operator Certification Program ensures adequate training and certification for drinking water and wastewater operators.
- The Liquid Waste Program regulates individual on-site liquid waste systems to protect public health and to prevent contamination of ground and surface water.
- The Petroleum Storage Tank Bureau reduces, mitigates and eliminates the threats to the environment posed by petroleum products or released from underground and above ground storage tank systems.
- The Solid Waste Bureau assures that solid waste is managed in such a way as to minimize impact on the environment and public health.
- The Drinking Water Bureau assists communities in protecting the sources of their drinking water supplies from contamination.
- The Hazardous Waste Bureau regulates hazardous waste treatment, storage and disposal facilities, oversees cleanup of contaminated sites, and implements Federal Facility Compliance Orders at Los Alamos and Sandia National Laboratories.

Office of the State Engineer and Interstate Stream Commission

The State Engineer is delegated as a member of the WQCC. No other applicable responsibilities pertaining to this WQMP/CPP have been identified.

New Mexico Department of Game and Fish

The Director of the New Mexico Department of Game and Fish is delegated as a member of the WQCC. The Department of Game and Fish has also been delegated authority through the WQCC to enforce the regulation for disposal of refuse in a watercourse. No other applicable responsibilities pertaining to this WQMP/CPP have been identified.

New Mexico Oil Conservation Commission

The chair of the New Mexico Oil Conservation Commission is delegated as a member of the WQCC. In accordance with NMSA 1978, Section 70-2-4, the chair of the Oil Conservation Commission is elected from one of the three Commission members; a designee of the commissioner of public lands, a designee of the secretary of New Mexico's Energy, Minerals and Natural Resources Department (EMNRD), and the Director of the Oil Conservation Division (OCD).

In accordance with NMSA 1978, Section 70-2-6, the Oil Conservation Commission has concurrent jurisdiction and authority with the Oil Conservation Division (OCD). The WQCC's delegation of Responsibilities to Environmental Improvement Division (now NMED) and Oil Conservation Division (OCD), dated July 21, 1989, outlines the division of responsibilities between the agencies for administering WQCC regulations to protect water quality and abate water pollution (*see generally* 20.6.2 NMAC). The OCD administers these regulations as they pertain to "discharges from facilities for the production, refinement, pipeline transmission of oil and gas or products thereof, the oil field service industry as related to oil and gas production activities, oil field brine production wells, geothermal installations and carbon dioxide facilities" (*see* Subsection A(1) of 20.6.2.1201 NMAC).

NMED Exhibit 3

The disposition by use of produced water not for drilling, completion, producing, secondary recovery, pressure maintenance or plugging of wells pursuant to 19.15.34 NMAC requires prior approval from the OCD (see Subsection A *of* 19.15.34.8 NMAC), and also requires the submission of a Notice of Intent to NMED and/or EPA if the use includes a potential discharge to ground or surface waters (*see* 20.6.2.1201 NMAC and Section 402 of the CWA, respectively). Discharges from other types of facilities that could affect groundwater quality are regulated by NMED's Ground Water Quality Bureau. No other applicable responsibilities pertaining to this WQMP/CPP have been identified.

New Mexico State Parks Division of the Energy, Minerals and Natural Resources Department

The Director of the New Mexico State Parks Division of the Energy, Minerals and Natural Resources Department is delegated as a member of the WQCC. The State Parks Division of the EMNRD has been delegated authority to enforce the WQCC regulation for disposal of refuse in a watercourse. No other applicable responsibilities pertaining to this WQMP/CPP have been identified.

New Mexico Department of Agriculture

The Director of the New Mexico Department of Agriculture is delegated as a member of the WQCC. No other applicable responsibilities pertaining to this WQMP/CPP have been identified.

New Mexico Soil and Water Conservation Commission

The Chair of the New Mexico Soil and Water Conservation Commission is delegated as a member of the WQCC. No other applicable responsibilities pertaining to this WQMP/CPP have been identified.

New Mexico Bureau of Geology and Mineral Resources at the New Mexico Institute of Mining and Technology

The Director of the Bureau of Geology and Mineral Resources at the NM Institute of Mining and Technology is delegated as a member of the WQCC. No other applicable responsibilities pertaining to this WQMP/CPP have been identified.

Factor 3: The authority of the WQCC to enter into or authorize its constituent agencies to enter into agreements with federal or state agencies for purposes consistent with the WQA.

Under the WQA at NMSA 1978, Section 74-6-4(G), the WQCC has the authority to enter into, or authorize constituent agencies to enter into, agreements with the federal government or other state governments. This provides the WQCC with a means of formally coordinating with agencies outside of the WQCC and allows the WQCC to use the expertise of those agencies in fulfilling its responsibilities.

Factor 4: The designation of management agencies to carry out specific responsibilities under the WQMP/CPP.

NMED Exhibit 3

The WQCC designates management agencies to carry out specific responsibilities. Designated Management Agencies (DMAs) are generally municipal or public entities that must satisfy the requirements of 40 CFR 130.6(c)(5), including demonstration that the agencies have the legal, institutional, managerial, and financial capability, as well as programmatic capacity, to carry out the designated responsibilities. The designation must be formally accepted by the management agency and adopted by the WQCC before it is certified by the Governor.

Pursuant to Section 208 of the CWA, the governor of a state must identify areas of the state which, as a result of urban or industrial concentration or other significant factors, have substantial water quality problems. The governor may designate regional planning agencies for these areas, after consultation with local governmental officials having jurisdiction over the area, to conduct the planning required by Section 208. As specified at 40 CFR 130.12(b), Section 201 of the CWA funding can only be awarded to DMAs that are in conformance with the statewide WQMP/CPP. A list of approved DMAs can be found in Section VIII of this WQMP/CPP.

G. Other Entities participating in water quality management

A multi-agency approach is implemented to carry out the directives of the CWA, the State's WQA and the mission of NMED. Numerous entities at the local, state and federal level participate in water quality management. The following describes the entities and their identified roles and responsibilities as they pertain to water quality management and planning in New Mexico.

Other State Agencies

Several other state agencies conduct activities that impact water quality and are considered in the coordination and implementation of this WQMP/CPP as appropriate. These include, but are not limited to:

- Department of Transportation
- Department of Health
- State Forestry Division
- State Land Office
- Energy, Minerals and Natural Resources Department (specifically, Mining and Minerals Division)

Other Watershed-Based Water Quality Authorities/Associations/Forums

Increasing interest in a watershed-based approach to water quality management has led to the development of a number of local and regional initiatives in NM. These initiatives reflect a great diversity of organizational models and functional roles. The various initiatives focus on a number of different priorities such as: implementation of site-specific control regulations adopted by the WQCC, information sharing (outreach and education), or implementation of remediation and restoration projects. The number and nature of these local and regional watershed initiatives in New Mexico is evolving rapidly. No effort is made in this WQMP/CPP to comprehensively catalogue or describe such initiatives.

NMED Exhibit 3

U.S. Environmental Protection Agency (EPA)

In addition to providing a significant amount of programmatic funding through CWA grant programs, EPA has several roles with respect to NM's water quality control programs:

- WQS In accordance with Section 303(c)(3) of the CWA, EPA is required to review state water quality standards and either approve WQS as being compliant with the federal act, or to disapprove and promulgate classifications and standards for NM.

- TMDLs - EPA reviews and approves the State's CWA §303(d) List of Impaired Waters. States are required to develop TMDLs for impaired waterbodies (Per Section 303(d) of the CWA, 33 U.S.C. §1313). TMDLs that are first adopted by the WQCC are then reviewed and approved by EPA under the CWA.

- Discharge Permits - EPA issues NPDES discharge permits in New Mexico which are certified by SWQB under Section 401 of the CWA.

- EPA is responsible for approving Section 208 of the CWA plans (regional WQMPs) submitted by states, as well as state CPPs prepared in accordance with Section 303(e) of the CWA.

- Guidance - In addition to adopting regulations establishing water quality program requirements that must be met by states, EPA frequently issues guidance documents or policy statements on a variety of water quality topics.

Other Federal Agencies

Several other federal agencies involved in water quality management in NM, including the U.S. Forest Service (USFS), U.S. Bureau of Land Management (BLM), and National Park Service (NPS), consider water quality protection in their management programs. The U.S. Army Corps of Engineers (USACE) administers the permit program under Section 404 of the CWA, which regulates the discharge of dredged and fill material that may adversely impact waters of the United States, including wetlands. The U.S. Bureau of Reclamation (BOR) has increasingly included environmental protection considerations into its management of federal water projects. The U.S. Department of Agriculture (USDA) administers an Environmental Quality Incentive Program under the federal Farm Bill. The U.S. Fish and Wildlife Service (USFWS) consults with other federal agencies under Section 7 of the Endangered Species Act regarding activities that may adversely impact threatened or endangered species. EPA consults with USFWS to evaluate potential impacts from water quality program activities on threatened and endangered species. The U.S. Geological Survey (USGS) undertakes a variety of studies regarding water quality, including the National Water Quality Assessment program.

Tribes

Although the State's water quality regulations are not applicable to tribal waters within the exterior boundaries of a tribe or those lands to which the Tribe has incorporated into federal

NMED Exhibit 3

trust; many waters cross boundaries and jurisdictional protections, and as such there is a shared interest in the protection of water quality between the Tribes and the State of New Mexico. The State recognizes the importance of communication and collaboration with Tribes to ensure water quality across boundaries.

The State has memorialized this sentiment through Executive Order 2005-004, The State-Tribal Collaboration Act, NMSA 1978, Section 11-18-1, and subsequently NMED's *Tribal Consultation and Collaboration Policy* (NMED Office of the Secretary 2020). It is through the *Tribal Consultation and Collaboration Policy* that NMED engages Tribes during any action(s) that may impact the natural, cultural and environmental resources of a Tribe. Tribes are recognized as sovereign entities. Therefore, the State interacts accordingly with them in a government-to-government capacity. These actions with Tribes are independent of stakeholder and public outreach efforts.

The 23 federally recognized Tribes throughout the State of New Mexico include:

- *Acoma Pueblo
- Pueblo de Cochiti
- *Pueblo of Isleta
- Jemez Pueblo
- *Laguna Pueblo
- *Nambe Pueblo
- *Ohkay Owingeh
- *Picuris Pueblo
- *Pojoaque Pueblo
- *Pueblo of Sandia
- Pueblo of San Felipe
- Pueblo de San Ildefonso
- *Pueblo of Santa Ana
- *Santa Clara Pueblo
- Santo Domingo Pueblo
- *Taos Pueblo
- *Pueblo of Tesuque
- Pueblo of Zia
- Zuni Pueblo
- Mescalero Apache
- Jicarilla Apache
- Fort Sill Apache
- *Navajo Nation

*Indicates that as of the approval date of this WQMP/CPP, tribe was identified by EPA to have Treatment in a Similar Manner as a State ("TAS") under Section 303(c) of the CWA allowing them to develop their own water quality standards for waters within the exterior boundaries of their Tribe. Please note this is a designation through the EPA and is independent of the State of New Mexico and the status, as listed here, may change at any time. For current status of TAS and WQS for tribes refer to EPA's website (https://www.epa.gov/wqs-tech/epa-actions-tribal-water-quality-standards-and-contacts).

NMED Exhibit 3

In addition, the State also recognizes the Ysleta del Sur Pueblo near El Paso, Texas which also has critical interest in the protection of water quality along the Rio Grande as it enters Texas from New Mexico. The State also recognizes the Southern Ute Indian Tribe of the Southern Ute Reservation and Ute Mountain Ute Tribe in Colorado along the New Mexico Colorado border.

Stakeholders and the General Public

Stakeholder and public participation are an integral part of water quality management in NM. All regulatory actions of the WQCC and NMED are required to follow appropriate public comment, notice, and hearing requirements. In addition, with respect to policy-related and non-regulatory activities of the WQCC and NMED, an opportunity for public input is often provided through informational public meetings.

II. SURFACE WATER QUALITY STANDARDS

A. Extent of Authority

New Mexico's Standards for Interstate and Intrastate Surface Waters (20.6.4 NMAC) establish surface WQS that consist of designated uses for surface waters of the State, the water quality criteria necessary to protect the designated uses, and an Antidegradation Policy. These standards are not applicable to tribal waters within the exterior boundaries of a tribe or those lands to which the tribe has incorporated into federal trust. Section 518 of the CWA authorizes EPA to treat eligible Indian tribes with reservations in a similar manner to states (TAS) for administering each of the principal CWA regulatory programs. Therefore, protection of these waters is administered under the individual tribe's WQS as approved by EPA or by EPA for those tribes that have not received TAS under Section 518(e) of the CWA. The State of New Mexico does not have jurisdiction to adopt or impose WQS for tribal waters within NM's borders.

B. Objective

The Standards for Interstate and Intrastate Surface Waters state the following objective:

> *The State of New Mexico is required under the New Mexico Water Quality Act … and the federal Clean Water Act … to adopt water quality standards that protect the public health or welfare, enhance the quality of water, and are consistent with and serve the purposes of the New Mexico Water Quality Act and the federal Clean Water Act. It is the objective of the federal Clean Water Act to restore and maintain the chemical, physical, and biological integrity of the nation's waters, including those in New Mexico. This part is consistent with Section 101(a)(2) of the federal Clean Water Act, which declares that it is the national goal that wherever attainable, an interim goal of water quality that provides for the protection and propagation of fish, shellfish, and wildlife and provides for recreation in and on the water be achieved by July 1, 1983. Agricultural, municipal, domestic and industrial water supply are other essential uses of New Mexico's surface water; however, water contaminants resulting from these activities will not be permitted to lower the quality of surface waters of the state below that required for protection and propagation of fish, shellfish and wildlife and recreation in and on the water, where practicable.* (20.6.4.6(B) NMAC).

C. Components of New Mexico's Surface Water Quality Standards

The federal WQS regulation (40 CFR 131) establishes the requirements for states and tribes to review, revise and adopt WQS. It also establishes the procedures for EPA to review, approve, disapprove and promulgate WQS pursuant to Section 303 (c) of the CWA. As such, WQS are designed to protect the public health or welfare, enhance the quality of water and serve the purposes of the Act. New Mexico's WQS (20.6.4 NMAC), as required under the CWA, define water quality goals by designating uses for surface waters of the State, setting criteria to protect those uses, and establishing an Antidegradation Policy and implementation plan to preserve water quality. Each of these components is described in more detail below.

NMED Exhibit 3

Designated Uses

In accordance with 40 CFR 131.10, the State is required to specify goals and expectations for how each water body is used. The system for designating these uses is through development of surface WQS. Numeric criteria are adopted to protect each designated use. It is through the designation of a use for a specific waterbody that water quality protections are implemented.

Designated uses include fish culture, public water supply, industrial water supply, domestic water supply, irrigation and irrigation storage, primary contact, secondary contact, livestock watering, wildlife habitat, and several aquatic life subcategories. The full list of designated uses is specified in 20.6.4.900 NMAC.

Within each river basin, waters are divided into individual "segments" for classification and standard-setting purposes (20.6.4.101 through 20.6.4.899 NMAC). Most of the state's perennial water segments and many non-perennial segments have designated uses listed under 20.6.4.101 to 899 NMAC. All other "non-classified" waters are assigned default designated uses under 20.6.4.98 to 99 NMAC; however, some waters that have been characterized through a use attainability analysis have designated uses specified under 20.6.4.97 NMAC.

Water Quality Criteria

Water quality criteria are established to sustain and protect designated uses of surface waters of the State. States typically adopt both narrative criteria (e.g., general criteria that describe the desired condition of a surface water) and numeric criteria (e.g., maximum allowable pollutant concentration in a surface water).

The State of New Mexico has adopted narrative, or general, criteria under 20.6.4.13 NMAC. General criteria apply to all surface waters of the state and declare that:

> *"…surface waters of the State shall be free of any water contaminant in such quantity and of such duration as may, with reasonable probability, injure human health, animal or plant life or property, or unreasonably interfere with the public welfare or the use of property."*

As identified under Subsections A to M of 20.6.4.13 NMAC, New Mexico's general criteria include: bottom deposits and suspended or settleable solids; floating solids, oil and grease; color; organoleptic quality (odor and taste of fish and water); plant nutrients; toxic pollutants; radioactivity; pathogens; temperature; turbidity; total dissolved solids (TDS); dissolved gases; and biological integrity.

Numeric criteria are specific quantitative limits for pollutants established to protect specific designated uses and specific WQS segments. Use-specific numeric criteria are provided in 20.6.4.900 NMAC and apply to all waters with the applicable designated uses, unless otherwise specified in 20.6.4.101 through 20.6.4.899 NMAC as segment-specific criteria. The WQS also include numeric "human health-organism only" criteria established to protect human health when aquatic organisms are consumed from waters containing pollutants.

NMED Exhibit 3

Antidegradation Policy

New Mexico's Antidegradation Policy, which is based on requirements in 40 CFR 131.12, describes how waters are to be protected from degradation (Subsection A of 20.6.4.8 NMAC). At a minimum, the policy protects existing instream uses. Water quality that exceeds the levels necessary to support the propagation of fish, shellfish, and wildlife, and recreation in and on the water is to be maintained unless the WQCC finds that allowing lower water quality is necessary to accommodate important economic and social development. Waters designated as Outstanding National Resource Waters (ONRWs) are to receive the highest level of antidegradation protection. Designated ONRWs are listed in 20.6.4.9 NMAC.

D. Process for Establishing and Updating Water Quality Standards

[As required by 40 CFR 130.5(b)(6) for CPP]

General Process for Establishing or Revising Water Quality Standards

Under the State's WQA, NMSA 1978, Section 74-6-2(H), the duties and powers of the WQCC include adoption of standards for surface and groundwaters of the state. Anyone may propose new or revised standards to the WQCC at any time in accordance with the rulemaking procedures for the WQCC (20.1.6 NMAC) and the State's WQS (20.6.4 NMAC). These regulations specify requirements for pre-hearing procedures and petitions for regulatory changes, hearing notices, hearing participation, post-hearing actions and appeals. It is recognized that notification and engagement of the public prior to petition is vital to the rule-making process and, therefore, additional requirements have been identified under this WQMP/CPP to encourage participation, allow effective presentation of evidence and points of view, allow participants an opportunity to submit information, and assure that hearings are conducted in a fair and equitable manner. For all proposed changes to the State's WQS, the WQCC bases its decision on evidence presented at the public hearing.

The process to adopt new or amended surface WQS conforms to requirements under numerous federal and state acts including, but not limited to, the CWA (33 U.S.C. § 1251 *et seq)*, the Endangered Species Act (16 U.S.C. §1531 *et seq*), the Civil Rights Act (18 U.S.C. § 241 *et seq*), the Americans with Disabilities Act (42 U.S.C. 12101 *et seq*), the Freedom of Information Act 5 U.S.C. § 552, the WQA (NMSA 1978, Section 74-6-4), the New Mexico State Rules Act (NMSA 1978, Section 14-4-1), and the New Mexico Open Meetings Act (NMSA 1978, Section 10-15-1).

New or amended WQS codified under 20.6.4 NMAC, as adopted by the WQCC, are filed with the State Records Center pursuant to the regulatory provisions under the State's WQA (NMSA 1978, Section 74-6-1 *et seq*.) and the State Rules Act (NMSA 1978, Section 14-4-1 *et seq*.), and in accordance with the State's regulations for rules filed under 1.24.1 NMAC. The new or amended standards become effective for state purposes thirty (30) days after filing.

New or revised surface WQS adopted by the WQCC are certified by the State Attorney General as being duly adopted pursuant to state laws and then submitted by the WQCC to the EPA Region

NMED Exhibit 3

6 Administrator. In accordance with the CWA Section 303(c)(3), the EPA Administrator must determine, within sixty days of submission, if the new or amended WQS meet the requirements of the CWA. If the Administrator determines that any such revised or new standard is not consistent with the applicable requirements of the CWA, the Administrator shall notify the State and specify the changes to meet such requirements no later than the ninetieth day after the date of submission. If the State does not remedy the deficiencies, EPA will publish proposed regulations and promulgate a standard to supersede the disapproved State standard.

Establishing or Revising Water Quality Standards through the Triennial Review

Section 303(c)(1) of the CWA requires the State to hold public hearings for the purpose of reviewing WQS including standards that do not include the uses specified in section 101(a)(2) of the Clean Water Act and, as appropriate, amend and adopt standards at least once every three years. This review is referred to as a "Triennial Review." The WQCC conducts a Triennial Review of the State's surface WQS as required by Section 303(c)(1) of the CWA and 20.6.4.10 NMAC. NMED is delegated the responsibility for organizing and presenting the Triennial Review at the required intervals. The general process for establishing or revising water quality standards described above are followed for Triennial Review proceedings.

Establishing or Revising a Designated Use through a Use Attainability Analysis

The process for establishing or revising a designated use occurs through the development of a Use Attainability Analysis (UAA). The UAA is a scientific study that assesses the factors affecting the attainment of a designated use. In accordance with 20.6.4.15 NMAC, the UAA is required to be conducted before a designated use specified in Section 101 (a)(2) of the CWA may be removed or changed to a subcategory requiring less stringent criteria. The uses specified in Section 101(a)(2) of the CWA "provides for the protection and propagation of fish, shellfish, and wildlife, and provides for recreation in and on the water." The established designated uses meeting this goal in the State's WQS include the wildlife habitat use, the primary and secondary contact use, and all aquatic life use subcategories except the limited aquatic life use.

In order for a state to designate a use, or remove a use that is not an existing use, the UAA must demonstrate that attainment of the use is not feasible based on one of the factors identified at 40 CFR 131.10(g):

(1) Naturally occurring pollutant concentrations prevent the attainment of the use; or

(2) Natural, ephemeral, intermittent or low flow conditions or water levels prevent the attainment of the use, unless these conditions may be compensated for by the discharge of sufficient volume of effluent discharges without violating State water conservation requirements to enable uses to be met; or

(3) Human caused conditions or sources of pollution prevent the attainment of the use and cannot be remedied or would cause more environmental damage to correct than to leave in place; or

(4) Dams, diversions or other types of hydrologic modifications preclude the attainment of the use, and it is not feasible to restore the water body to its original condition or to operate such modification in a way that would result in the attainment of the use; or

NMED Exhibit 3

(5) Physical conditions related to the natural features of the water body, such as the lack of a proper substrate, cover, flow, depth, pools, riffles, and the like, unrelated to water quality, preclude attainment of aquatic life protection uses; or

(6) Controls more stringent than those required by sections 301(b) and 306 [technology-based effluent limitations] of the Act would result in substantial and widespread economic and social impact.

A UAA may be conducted by the Department or, in accordance with Subsection D of 20.6.4.15 NMAC, by any person who submits notice to the Department with intent to conduct a UAA. A UAA must rely on a scientifically defensible method and the result, should it support a designated use change under one of the six factors under 40 CFR 131.10(g), must undergo the same administrative review and hearing process as that for the Triennial Review.

Prior to commencement of any investigation, third-parties seeking to conduct a UAA, shall submit a work plan to the Department and EPA for review. Upon approval of the work plan by the Department, the proponent may then conduct the UAA. Upon completion, data, findings and conclusions will be submitted to the Department and either the proponent or the Department may proceed with the administrative review and hearing process for the designated use change. As with the Triennial Review process, the change shall not be considered effective for State purposes until approved by the WQCC and published with an effective date in the New Mexico Register. For CWA purposes, the designated use change shall only be considered effective following EPA review and approval process described above.

For a designated use change that is being proposed based on evidences of the natural, ephemeral, intermittent or low flow conditions as identified under 40 CFR 131.10(g)(2), the *Hydrology Protocol* method under Appendix C of this WQMP/CPP is recommended. The *Hydrology Protocol* was designed as a multi-parameter evaluation to determine the natural hydrologic conditions of a waterbody and the associated designated uses that should be attainable. For studies investigating a possible designated use change due to hydrologic conditions under 40 CFR 131.10(g)(2), consideration must be taken for any supplemental flows attributed to permitted effluent discharges.

Existing uses, defined in the WQS as "a use actually attained in a surface water of the state on or after November 28, 1975, whether or not it is a designated use", may not be removed regardless of the outcome of a UAA unless a use with more stringent criteria is added. (40 CFR 131.10(h) and Subsection A of 20.6.4.15 NMAC).

Establishing or Revising a Designated Use using the *Hydrology Protocol*

There are three primary types of hydrologic conditions defined under the WQS in New Mexico, each of which has established designated uses for protections under Section 101(a)(2) of the CWA. These include listed ephemeral waters (20.6.4.97 NMAC), general intermittent waters (20.6.4.98 NMAC), and general perennial waters (20.6.4.99 NMAC). In addition, the State's WQS also identify many classified waters by their hydrology, e.g., "perennial tributaries to" or "perennial reaches of" (20.6.4.101 to 899 NMAC).

NMED Exhibit 3

The *Hydrology Protocol,* attached as Appendix C, is primarily used to provide scientific technical support for a designated use change through a UAA based on natural, ephemeral, intermittent or low flow conditions or water levels that prevent the attainment of the designated use. Since the *Hydrology Protocol* is done in support of a UAA, it can be conducted either by the Department, or by an entity other than the Department. If an entity other than the Department conducts this type of analysis, a UAA workplan for the use of the *Hydrology Protocol* must be submitted to the Department for review and approval in accordance with Subsection D of 20.6.4.15 NMAC before proceeding with the survey.

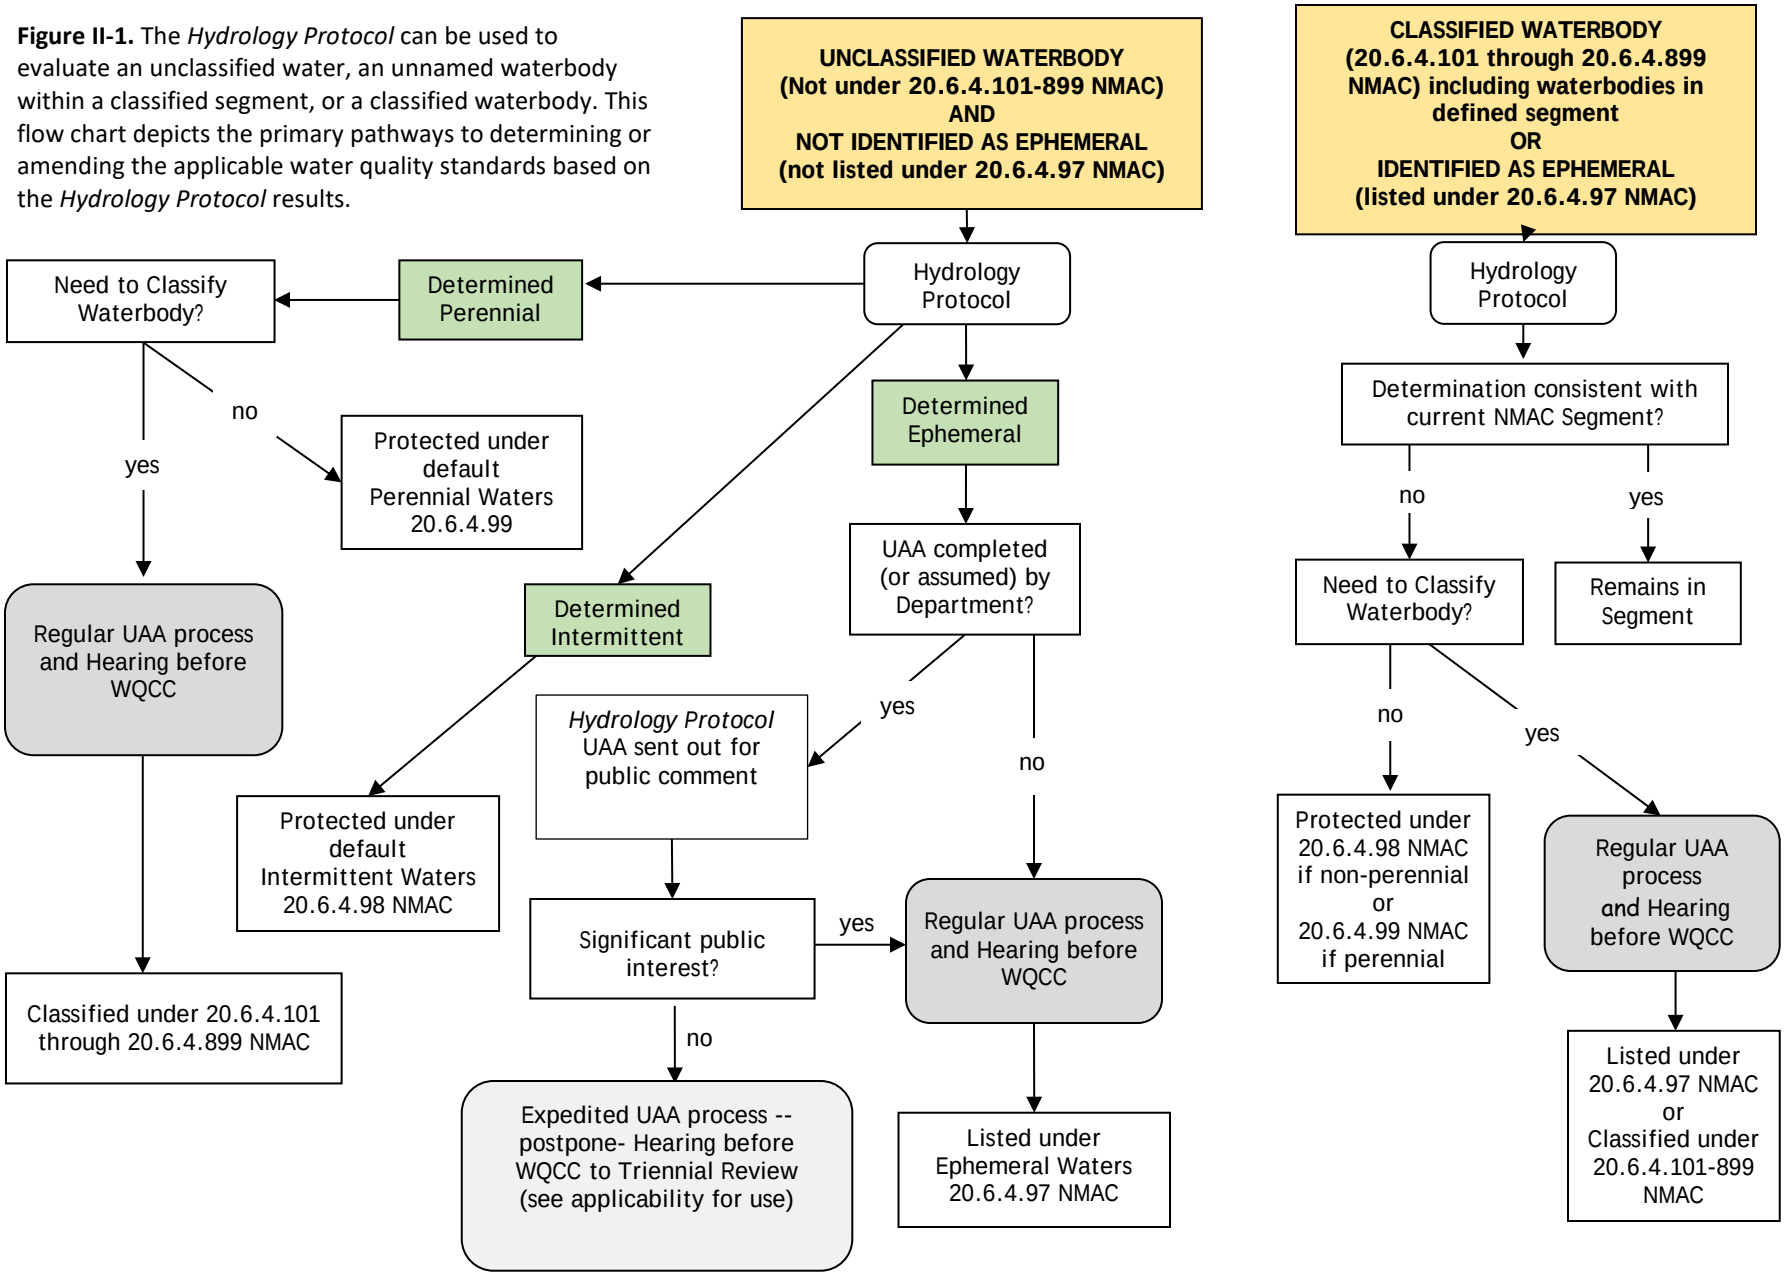
For waterbodies that are classified under 20.6.4.101 to 899 NMAC, the State asserts protections for these waters under the classified segment. A survey using the *Hydrology Protocol* can be used to confirm or delineate segment-specific hydrological regimes that may or may not lead to a revision to the State's WQS. For example, numerous classified segments in the WQS include only perennial waters, without specifically identifying which reaches are perennial (e.g., "perennial reaches of…", "perennial tributaries to…"). In such cases, the *Hydrology Protocol* can be used to determine whether a waterbody in whole, or a segment of the waterbody is perennial and therefore included in the classified segment, or non-perennial and therefore subject to the designated uses and criteria for general non-perennial waters in 20.6.4.98 NMAC. Such determinations do not require a UAA or a hearing because they do not change the designated uses or criteria but merely allow for the applicable uses to be properly identified. However, if a revision to incorporate the results of the *Hydrology Protocol* survey are needed to further refine, delineate or re-classify a waterbody under 20.6.4.101 to 899 NMAC this must be done through the UAA process.

For waterbodies that are perennial but have not been classified under 20.6.4.101 to 899 NMAC, the State asserts perennial protections for these waters under 20.6.4.99 NMAC. A survey using the *Hydrology Protocol* may be used to verify the hydrological regime for these unclassified perennial waters. A revision to incorporate the results of the *Hydrology Protocol* survey to classify a waterbody under 20.6.4.101 to 899 NMAC is done through the UAA process.

For the waterbodies in the State that are non-perennial but have not undergone an in-depth investigation to determine the hydrologic regime (i.e., intermittent, ephemeral), the State asserts intermittent protections for these waters under 20.6.4.98 NMAC, consistent with the goals in Section 101(a)(2) of the CWA. If the results of the *Hydrology Protocol* survey indicate that the waterbody is in fact intermittent, no further action is required because it is protected, by default, under 20.6.4.98 NMAC for intermittent waters.

For those cases in which the results of the *Hydrology Protocol* survey demonstrate that an unclassified non-perennial waterbody is ephemeral, designated uses that are not existing uses may only be changed if a UAA is conducted according to 40 CFR 131.10(g) and 20.6.4.15 NMAC in order for the State to assert protections for the ephemeral waterbody under 20.6.4.97 NMAC.

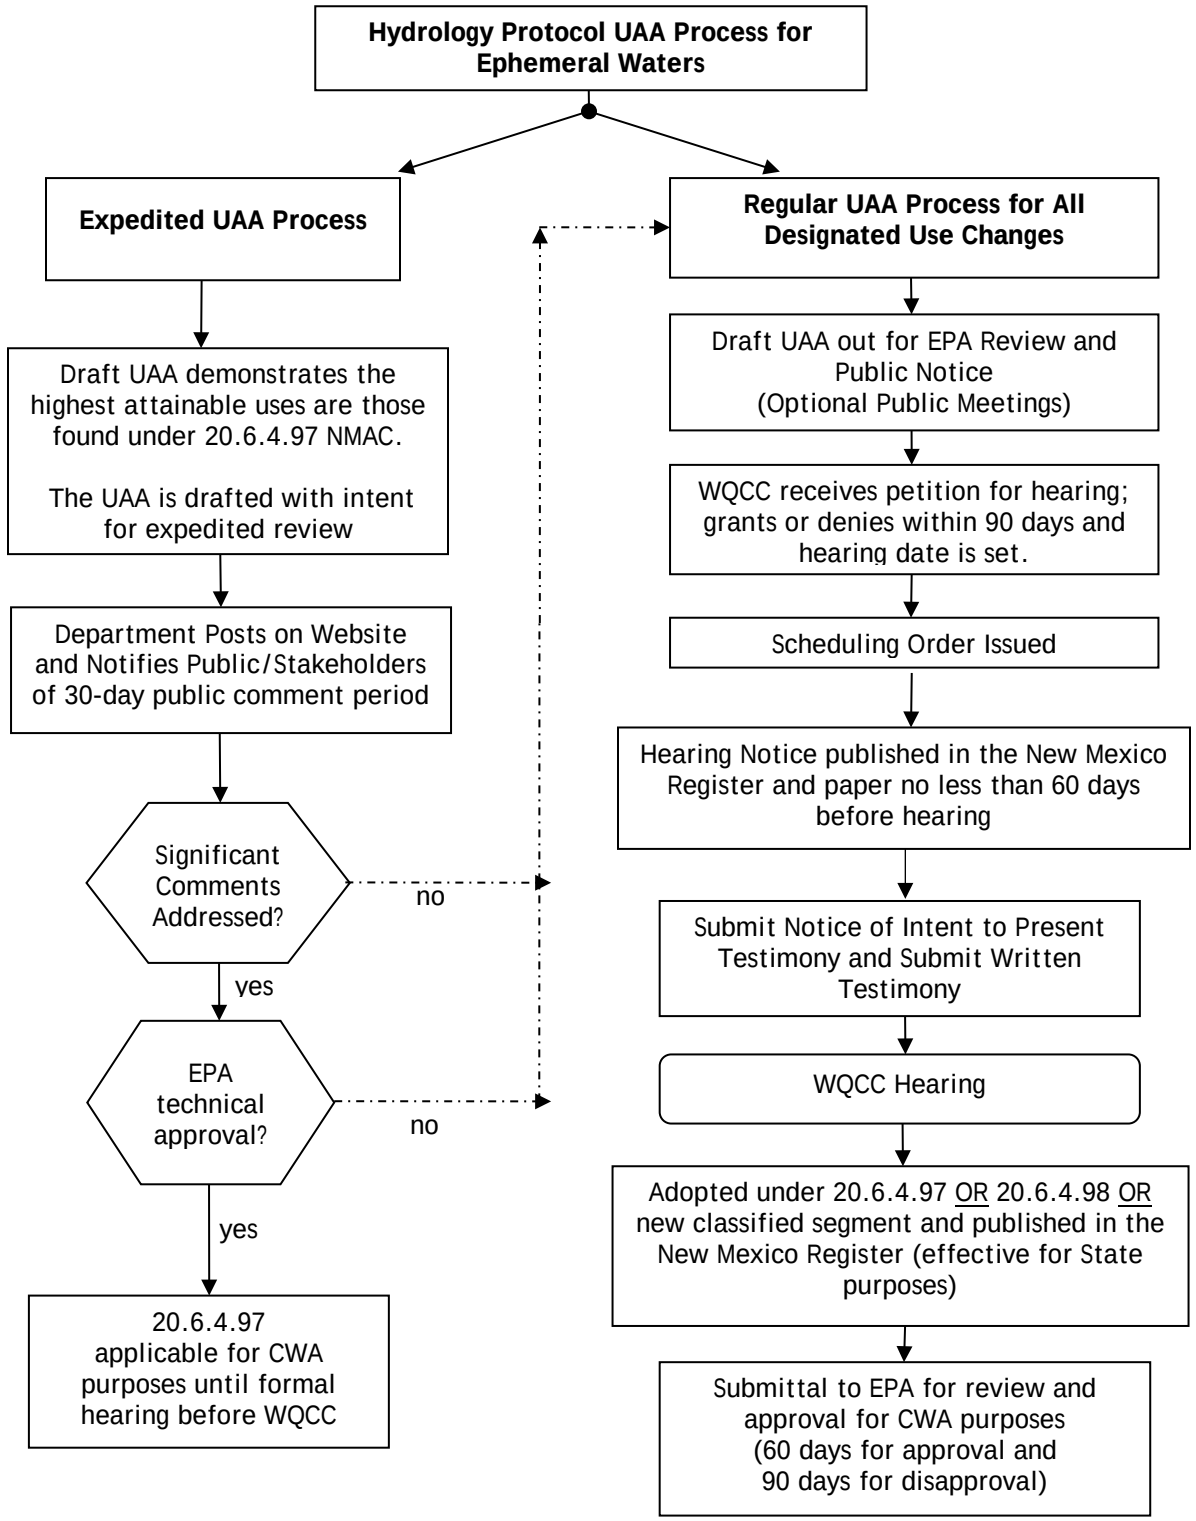
NMED Exhibit 3



In some cases, an expedited UAA process outlined under Subsection C of 20.6.4.15 NMAC and illustrated in Figures II-1 and II-2 may be pursued. The expedited UAA process is not applicable for entities other than the Department. However, this does not preclude third-parties from developing and executing a workplan for the use of the *Hydrology Protocol* and submitting the UAA to the Department for use in the expedited process. The expedited UAA process facilitates the efficient application of the limited aquatic life and secondary contact uses to ephemeral waters where appropriate. As described under Subsection C of 20.6.4.15 NMAC, it is the Departments' role and responsibility to post the use attainability analysis on its water quality standards website, notify its interested parties of a 30-day public comment period, submit to EPA and if given technical approval, petition and testify regarding the standards changes before the WQCC periodically.

The *Hydrology Protocol* can also be used to support other factors under 40 CFR 131.10(g), such as those attributed to hydrological modifications, and provide additional evidence that "it is not feasible to restore the water body to its original condition or to operate such modification in a way that would result in the attainment of the use." 40 CFR 131.10(g)(4).

Persons or entities proposing to conduct a UAA using the *Hydrology Protocol* must submit a UAA workplan for the use of the *Hydrology Protocol* to the SWQB for review and approval before proceeding (Subsection D of 20.6.4.15 NMAC). Such an approach will help ensure that the *Hydrology Protocol* and UAA process proceed smoothly, without delay, and that the study will comply with applicable statutes and rules.



NMED Exhibit 3

Figure II-1. The *Hydrology Protocol* can be used to evaluate an unclassified water, an unnamed waterbody within a classified segment, or a classified waterbody. This flow chart depicts the primary pathways to determining or amending the applicable water quality standards based on the *Hydrology Protocol* results.

NMED Exhibit 3

Figure II-2. Flow chart compares the expedited UAA process for an ephemeral stream determined through a hydrology protocol with the UAA process.

Establishing or Revising a Site-Specific Standard

In accordance with 20.6.4.10 NMAC, there are circumstances such as species sensitivity; site specific physical, chemical or biological conditions that alter bioaccumulation of a chemical; or natural background concentrations that exceed a particular numeric criterion for an established designated use that warrants inclusion or updating due to site specific conditions. The commission may adopt site-specific numeric criteria based on relevant site-specific conditions pertaining to those conditions listed under 20.6.4.10(D)(1).

Any person may petition the commission to adopt site-specific criteria, giving a thorough explanation of the rational for the proposal that justifies the proposed criteria and relying on scientifically defensible methods that demonstrate the site-specific criteria fully protects the designated use, such as those listed under Subsection D(4) of 20.6.4.10 NMAC. In the same process for establishing or revising designated uses for waterbodies, establishing site-specific standards requires the petitioner (the State or other party) to submit demonstration of the supporting evidence for the standard. The process to petition for a site-specific criteria is a rulemaking under 20.6.4 NMAC and requires adherence to rulemaking processes by the WQCC under 20.1.6 NMAC.

Process for Establishing or Revising a Temporary Standard

When a waterbody has been determined to have the appropriate designated use, but specific limiting conditions prevent the attainment of that use in the short-term, the WQCC may adopt a temporary standard. A temporary standard is a time-limited designated use and criterion for a specific pollutant(s) or water quality parameter(s) that reflects the highest attainable condition during the term of the temporary standard. A temporary standard is a change in a designated use, and therefore, must be adopted by the WQCC and EPA under rule-making procedures, just as with any other water quality standard amendment. A temporary standard may be granted if the petitioner can meet the applicability and demonstration requirements identified under 20.6.4.10(F) NMAC. .

Water Quality Standards for Wetlands

Wetlands in New Mexico are protected as "surface waters of the state." However, wetland-specific designated uses and criteria associated with those uses have not been developed. Wetlands designated and protected as ONRWs are identified in the *Maps and List of Wetlands Within United States Forest Service Wilderness Areas Designated as Outstanding National Resource Waters* (Subsection D(3)(h) of 20.6.4.9 NMAC). Other wetlands not identified as ONRWs and not identified as a classified water in sections 20.6.4.101 through 20.6.4.899 NMAC are protected through the designated uses identified in 20.6.4.98 and 20.6.4.99 NMAC, depending on their hydrology.

SWQB is working toward increasing wetlands protection through monitoring and strengthening WQS that pertain to the State's wetlands resources. To achieve these goals the SWQB is currently:

NMED Exhibit 3

- developing a Rapid Assessment Methodology for New Mexico (NMRAM) for a range of environments and wetland types;
- mapping wetland resources in New Mexico; and,
- ranking the condition of existing wetlands.

SWQB will utilize the information gathered from the monitoring effort to propose wetland-specific state WQS to the WQCC. This information and data will also be used to assess the effectiveness of wetland restoration and mitigation activities.

E. Process for Assuring Adequate Implementation of Water Quality Standards

[As required by 40 CFR 130.5(b)(6) for CPP]

NMED, acting under the authority delegated by the WQCC, implements the WQS by establishing and maintaining controls on the discharge of point source and non-point source pollutants to surface waters of the state. This occurs through ongoing monitoring and assessment of water quality to the State's approved WQS (*see* Section III of this WQMP/CPP); evaluation of proposed discharges in accordance with the Implementation Plan described at Subsection B of 20.6.4.8 NMAC and the State's *Antidegradation Policy Implementation Procedure* (Appendix A of this WQMP/CPP); establishment of controls on point source pollutant discharges as described under Section V of this WQMP/CPP; and through Best Management Practices (BMPs) applied to nonpoint sources of pollution, as outlined under the State's Nonpoint Source Management Program (NPSMP) and Section VII of this WQMP/CPP. Violations of the WQS are enforceable through civil and/or criminal actions pursuant to the WQA at NMSA 1978, Section 74-6-10.

NMED Exhibit 3

III. SURFACE WATER QUALITY MONITORING, ASSESSMENT & REPORTING

Monitoring, assessment, and reporting are ongoing throughout the state. This WQMP/CPP relies upon these activities to identify priorities and recommend control measures.

A. Monitoring

Monitoring of surface water quality is an important component of the State's Water Quality Management Program and is essential to identify and characterize water quality problems, revise WQS, and develop and evaluate the results of control actions. Additionally, water quality monitoring data can be used for pollutant allocation computer modeling and as evidence for enforcement actions. The goal of the Monitoring Program is to provide information to assess the quality of surface waters and direct water quality management activities. The surface water monitoring strategy implemented by SWQB focuses on collecting chemical, physical, and biological data from rivers, streams, lakes, reservoirs, and other aquatic habitats. The comprehensive strategy is described in the *State of New Mexico Surface Water Quality 10-Year Monitoring and Assessment Strategy* (NMED SWQB 2016 or most current revision). In the last major revision to the *Strategy*, the state incorporated wetlands monitoring and assessment. The monitoring goal of the New Mexico Wetlands Program is to provide the information and data necessary to create a baseline inventory and condition of existing wetlands, facilitate wetland protection, develop WQS for wetlands, assess wetland mitigation activities, and monitor wetland restoration activities for efficacy.

The monitoring strategy establishes methods of identifying and prioritizing water quality data needs, specifies procedures for acquiring and managing water quality data, and describes how these data are used toward three basic monitoring objectives. These objectives include conducting water quality assessments, developing water quality-based controls to minimize pollutants, and evaluating the effectiveness of such controls. From approximately 1998 to present, the SWQB has primarily utilized a rotating basin system approach to water quality monitoring similar to several other states. Using this approach, a select number of watersheds are monitored for two years with an approximate return frequency of eight to ten years depending on available staff, watershed conditions, and financial resources. SWQB will continue to pursue additional funding to increase the frequency of monitoring in New Mexico's surface waters. The rotating basin strategy is supplemented with other data collection efforts and external data sources that meet SWQB's quality assurance and quality control requirements.

The SWQB has established sampling and analytical techniques under 20.6.4.14 NMAC and maintains a Quality Management Plan (QMP), Quality Assurance Project Plans (QAPPs), Field Sampling Plans (FSPs) and Standard Operating Procedures (SOPs) that cover all monitoring activities. The Bureau's QMP and QAPPs must be approved by EPA prior to work being conducted under them. The QAPPs and SOPs are key elements in implementing this WQMP/CPP. SWQB staff conducting activities specified in the QAPP and SOPs must sign acknowledgement pages indicating they are familiar with the processes outlined in the document and will adhere to its procedures.

NMED Exhibit 3

B. Assessment

Assessment is the process by which water quality data are analyzed to determine if WQS are being attained. Assessments are based on surface water quality data collected by the SWQB and also by other federal, state, and local agencies and groups, when available. All data used for assessment must meet the Bureau's quality assurance and quality control requirements.

Water quality data are assessed every other year according to the most recent version of the Comprehensive Assessment and Listing Methodology (CALM) and associated appendices, which are reviewed and updated as appropriate. The water quality assessment results are then used as a basis for water quality management decisions, such as:

- Determining whether proposals to make changes to the standards are needed;
- Identifying the need for water quality-based effluent limitations in NPDES permits;
- Conducting an antidegradation review of proposed new or increased permitted discharges as prescribed in the *Antidegradation Policy Implementation Procedure*, found in Appendix A of this WQMP/CPP;
- Developing TMDLs that identify pollutant reduction targets designed to improve water quality and meet standards;
- Developing source water protection plans designed to reduce pollutants and provide safe drinking water quality;
- Determining efficacy of projects for watershed protection and restoration under Section 319 of the CWA; and,
- Certifying federal permits under Section 401 of the CWA.

C. Reporting

The CWA has two primary requirements for reporting water quality in a state: The "303(d) List," and the "305(b) Report." These requirements have been combined into the *State of New Mexico CWA §303(d)/§305(b) Integrated Report* (IR; NMED SWQB 2018, or most recent approved version), which is incorporated into this WQMP/CPP by reference. The IR is designed to satisfy the statutory requirements of Section 303(d), Section 305(b), and Section 314 of the CWA, and must be approved by the WQCC and EPA. The two elements are described below. An explanation of assessment and listing methods, as well as definitions of Integrated Reporting categories, can be found in the current version of the CALM, available at: https://www.env.nm.gov/surface-water-quality/calm/.

303(d) List

Section 303(d) of the CWA requires states to submit to EPA a list of water bodies that do not meet applicable WQS. Waterbodies and segments are included on the 303(d) list of impaired waters, based on an evaluation of biological, chemical and/or physical data that demonstrate nonattainment of applicable numeric or narrative standards resulting in designated use impairment. Once a water body is listed as impaired, several management decisions can be made to improve water quality including development of TMDLs or watershed-based plans (WBPs); proposing changes to the standards; identifying appropriate effluent limits in NPDES permits; and prioritizing where restoration projects should be implemented. If the data indicate that a

NMED Exhibit 3

previously impaired stream segment is meeting applicable WQS, the waterbody would be delisted, i.e., removed from the 303(d) list.

305(b) Report

Section 305(b) of the CWA requires states to prepare and submit a report biennially to EPA on the status of water quality within the state. The report provides an assessment of water quality in a state, a summary of water quality management programs, and an estimate of the environmental, social, and economic impacts associated with achieving the objectives of the CWA. EPA uses the information contained in the Section 305(b) Report to update the U.S. Congress on: progress toward meeting the goals of the CWA; the costs and benefits of working towards these goals; program plans and needs in areas such as permits, grants, effluent guidelines, etc.; and mechanisms to implement needed changes.

NMED Exhibit 3

IV. TOTAL MAXIMUM DAILY LOADS (TMDLs)

[As required by 40 CFR 130.6(c)(1) for WQMP]

A. Background

Pursuant to Section 303(d) of the CWA, TMDLs or TMDL alternatives must be developed for water quality limited segments (also known as "impaired" waterbodies). Water quality limited segments are those segments where water quality does not meet, or is not expected to meet, applicable WQS. TMDLs are established on a pollutant by pollutant basis for each assessment unit or watershed. A TMDL establishes the amount of a pollutant a waterbody can assimilate without causing a violation of WQS. The target load is generally determined by multiplying the applicable water quality criterion by the critical flow and a pollutant-specific conversion factor.

Per 40 CFR §130.2(i), TMDLs are the sum of the following three components: 1) the individual Waste Load Allocations (WLA) for point sources; 2) the Load Allocations (LA) for nonpoint sources and background conditions; and 3) the Margin of Safety (MOS) to account for uncertainty:

$$TMDL = \Sigma WLA + \Sigma LA + MOS$$

Where Σ= sum

In practical terms, a TMDL is a water quality planning document that establishes specific goals to meet surface WQS. Once the required TMDL calculations are documented, probable sources of pollutants are examined, and a brief outline of a potential implementation plan is described.

B. TMDL Prioritization

From 1997 to 2007, the development of TMDLs was prioritized according to the terms and schedule set forth in a consent decree and settlement agreement negotiated between EPA and Forest Guardians/Southwest Environmental Center. The consent decree TMDLs have been completed, and the consent decree was dismissed in 2009.

Following completion of the settlement agreement schedule, SWQB prioritizes TMDL development based on the results of ongoing monitoring and assessment. SWQB developed the *Prioritization Framework and Long-Term Vision for Water Quality in New Mexico* (NMED SWQB 2015a), and as a result the TMDL program in New Mexico was revised to allow a greater focus on state water quality priorities, encourage TMDL alternatives, and emphasize the value of protecting waterbodies that are not impaired. Additionally, SWQB will develop TMDLs as outlined under the current Section 106 and 604(b) of the CWA work plans. TMDLs may also be developed, reviewed, and updated in response to changed conditions, new data, or revised standards.

C. Process for TMDL Development

[As required by 40 CFR 130.5(b)(3) for CPP]

NMED Exhibit 3

TMDLs are incorporated into the WQMP/CPP upon approval by EPA. The process SWQB uses for developing a TMDL is as follows:

- Develop a list of Category 5 assessment units and pollutants from the most recent *State of New Mexico CWA §303(d)/§305(b) Integrated Report* . Identify those Category 5 assessment units that may be candidates for TMDL alternatives, such as a Watershed Based Plan.
- Collate all existing and readily available data necessary to draft TMDLs, including field and laboratory data (chemical, physical and biological) from the assessment process, and critical flow data. In addition, identify point sources covered by individual and general NPDES permits, NPDES permit numbers, and expiration dates.
- Plan a sampling effort to collect any additional data that are needed.
- Draft the TMDL document; solicit and incorporate comments from SWQB, NMED Office of General Counsel, and EPA staff.
- Conduct public participation for the TMDL in accordance with Section XIV of the WQMP/CPP. This includes a public comment period of at least 30 days. SWQB issues a public notice for distribution via email and the SWQB website. The public notice must include:
    - a description of the watershed and parameters for which the TMDL is proposed;
    - a brief explanation of the TMDL;
    - the start and end dates of the public comment period;
    - how and where to submit comments for inclusion in the record;
    - a description of the process for requesting approval of the TMDL before the WQCC;
    - how to obtain a copy of the TMDL document or request additional information;
    - the location, date, time, purpose, and format of any proposed public meeting or other forum for obtaining information;
    - contact information for persons with disabilities to obtain assistance in participating in the public process.
- After the public comment period closes, collate all comments, prepare a response to comments, and make appropriate changes to the draft TMDL based on those comments. The response to comments is added as an appendix to the draft TMDL and provided to those stakeholders who submitted written comments.
- Post the final draft TMDL on NMED website no less than 10 days before the WQCC meeting.
- Present the final draft TMDL at a WQCC meeting and request approval. WQCC comments are incorporated into the TMDL as necessary.
- Following adoption by the WQCC as an amendment to Appendix B of the WQMP/CPP, submit the TMDL to EPA Region 6 for approval. The submittal to EPA shall be certified by the Governor or the Governor's designee (e.g., NMED Secretary) that the WQMP/CPP update is consistent with all other parts of the plan as required by 40 CFR 130.6(e).

NMED Exhibit 3

- Post the approved TMDL document, the response to comments, the WQCC approval document, and EPA approval document on SWQB's website, and update the administrative record accordingly.
- Update Appendix B of this WQMP/CPP to include the approved TMDL. (Available at https://www.env.nm.gov/surface-water-quality/wqmp-cpp/)

TMDLs may be revised as necessary, following the process outlined above, based on changes to WQS or other factors influencing the TMDL calculation or distribution between the WLA and LA in the TMDL. TMDLs may be removed from the WQMP with WQCC approval if the waterbody is no longer impaired and meets the requirements for TMDL removal.

D. TMDL Implementation

As TMDLs are developed and approved, they are incorporated into Appendix B-1 of this WQMP/CPP and used as the basis for implementation of water pollution control activities. For point sources, TMDLs are implemented through NPDES permits (see Section V), whereas for nonpoint sources, TMDLs are implemented through the Nonpoint Source Management Program (NPSMP; see Section VII).

Point Sources

The process for incorporating WLAs as individual effluent limitations in NPDES permits is described in Section V.B of this WQMP/CPP.

Nonpoint Sources

The NPSMP seeks voluntary solutions to address nonpoint source water quality problems and provides funding opportunities for implementation projects. The NPSMP, funded through Section 319 of the CWA, prioritizes watershed-based planning and on-the-ground implementation projects where TMDLs have been developed. Priority watersheds for watershed-based planning are defined in the current NPS management plan as 12-digit hydrologic unit codes (HUCs, or watersheds) (see https://www.env.nm.gov/surface-water-quality/nps-plan). The large majority of these priority watersheds are where TMDLs have been developed. Watershed-based plans (WBPs) are, in essence, TMDL implementation plans (US EPA 2013). Completed WBPs are available at https://www.env.nm.gov/surface-water-quality/accepted-wbp/.

NMED Exhibit 3

V. EFFLUENT LIMITATIONS

[As required by 40 CFR 130.6(c)(2) for WQMP]

A. Introduction

The primary mechanism for controlling point source discharges to "waters of the United States" (as defined under 40 CFR 122.2) in New Mexico is the NPDES permit program established under Section 402 of the CWA. The State of NM is not currently delegated authority for issuing NPDES permits; therefore, EPA Region 6 is the permitting authority responsible for issuing NPDES permits in New Mexico and specifying the amount and concentration of pollutants (i.e. effluent limitations) that a permittee may discharge to a surface water. The permitting authority is also responsible for the enforcement of effluent limitations stipulated by NPDES permits.

Two types of effluent limitations are developed by EPA for NPDES permits: technology based effluent limitations (TBELs) and water quality-based effluent limitations (WQBELs). TBELs are defined in federal regulations and are applicable across a category of effluent discharge. The applicability of effluent limitations is summarized in Table V-1.

Table V-1. Effluent Limitations for NPDES Permits

Technology Based		Water Quality Based	
Publicly Owned Treatment Works (POTWs) – Secondary Treatment (40 CFR 133)	Industry – Effluent Limitation Guidelines (40 CFR Subchapter N, or Best Professional Judgment (BPJ))	WLA from approved TMDL	If there is no TMDL or WLA, a WQBEL may be developed on a case by case basis to protect water quality
Additional State-adopted control strategies for protection of public health or environment		WQBELs may be expressed as chemical specific limitations (e.g., phosphorus), narrative limitations (e.g., visible sheen, BMPs, etc.), or as whole effluent toxicity requirements (e.g., biomonitoring).	

Federal regulations require that NPDES permits include TBELs and other necessary effluent limitations for toxic pollutants and sewage sludge. EPA is responsible for development and promulgation of TBELs pursuant to Sections 301, 304, 306, 307, and 316 of the CWA. Federally promulgated TBELs for each industry are published by EPA in 40 CFR Chapter I Subchapter N - *Effluent Guidelines and Standards*. If TBELs have not been established by regulation for a particular industry, a permit writer may establish effluent limitations based on "best professional judgment" with the rationale should be documented in the permit's fact sheet (major facilities) or statement of basis (minor facilities).

If TBELs are not adequate to protect applicable WQS, then NPDES permits must contain WQBELs (40 CFR 122.44(d)). WQBELs may be calculated as part of a WLA in a TMDL (see Section IV) and

NMED Exhibit 3

incorporated into an NPDES permit; WQBELs may be based on reasonable potential calculations drafted by EPA; or WQBELs may be based on an antidegradation review in accordance with the *Antidegradation Policy Implementation Procedure* in Appendix A of this WQMP/CPP. EPA will evaluate all three scenarios and, in coordination with NMED through the 401 Certification process, choose the most protective effluent limitation.

If a WLA has been developed in a TMDL, the permitting authority is required to incorporate it into the NPDES permit. A TMDL details the assumptions and processes used to develop the WLA. EPA's Technical Support Document (TSD) procedures should be used by the permitting authority to incorporate the WLA into the NPDES permit. However, if no TMDL has been established, the permitting authority reviews effluent discharge data to ensure that NPDES permits are protective of WQS. For all pollutants that have a reasonable potential to cause or contribute to a violation of a water quality standard, the permitting authority performs calculations or modeling to determine effluent limitations for those pollutants. This review is done in accordance with applicable federal regulations and guidance. Specific evaluations for NPDES permits issued in New Mexico are discussed in the EPA Region 6 document *Procedures for Implementing NPDES Permits in New Mexico* (NMIP) developed by EPA in consultation with NMED.

In addition, the WQCC previously adopted additional control strategies for the protection of public health and the environment. This strategy was originally adopted by the WQCC in 1989 in the WQMP's Work Element 6 and retained in the 2002 WQMP update in Work Element 2. In the 2011 update, the previously included fecal coliform limitation of 500 colony forming units (cfu)/100 milliliters (mL) was dropped because the WQS now apply *E. coli* bacterial criteria to all waters. These strategies are as follows:

- NMED will review NPDES permit actions for purposes of state certification in accordance with Section 401 of the CWA, WQA NMSA 1978, 74-6-5(E), and 20.6.2.2001 NMAC. NMED will assure through appropriate review and communication with the permitting authority that permit requirements and effluent limitations are compatible with appropriate state law, protect WQS and implement this WQMP/CPP.

- NMED will use a pH limitation of 6.0-9.0 for state certifications of NPDES permits except when:
    a. more stringent effluent limitations are needed to meet the antidegradation policy and implementation plan of the New Mexico WQS, (20.6.4 NMAC);
    b. the WQCC has adopted a more stringent effluent limitation in a point source WLA.

  In all cases, state-certified effluent limitations for pH shall be stringent enough so that receiving waters meet WQS.

For effluent discharges that are not addressed by an NPDES permit or that are in extended violation of an NPDES permit, Sections 20.6.2.2100 through 2102 NMAC of the *Ground and*

NMED Exhibit 3

Surface Water Protection regulations specify additional effluent limitations for the protection of surface water quality.

Compliance schedules for NPDES permits are allowed by 20.6.4.12 NMAC and 40 CFR 122.47. Compliance schedules are established by EPA per the NMIP. Compliance schedules may be included in NPDES permits at the time of renewal or modification and are written to require compliance at the earliest practicable time. Compliance schedules include milestone dates and provisions for submitting progress reports and a final report detailing activities conducted toward meeting compliance schedule provisions. Other uses of compliance schedules by the NPDES permitting authority may also be allowable.

The permitting authority may not issue an NPDES permit that is in conflict with this WQMP/CPP (40 CFR 130.12(a)). Effluent limitations, including WQBELs and compliance schedules where applicable, are contained in NPDES permits, which can be viewed at: https://www.env.nm.gov/surface-water-quality/npdes-permits/.

B. Process for Development and Certification of Effluent Limitations and Schedules of Compliance for NPDES Permits

[As required by 40 CFR 130.5(b)(1) for CPP]

As the current NPDES permitting authority for NM, EPA Region 6 develops effluent limitations and schedules of compliance in accordance with the NMIP, which is based on applicable federal regulations and guidance. NPDES permits may not be issued until the State is provided an opportunity to review and certify the permit. The WQA assigns the responsibility for certifying permits issued under the CWA to NMED (NMSA 1978, Section 74-6-4(F)), and also specifies the conditions under which a certification shall be denied (NMSA 1978, Section 74-6-5(E)). NPDES regulations at 40 CFR § 124.53(e) require that state certification shall include conditions which are necessary to assure compliance with the applicable provisions of CWA and appropriate requirements of state law. For each more stringent condition, NMED must cite WQA or State law references upon which the condition is based. Failure to provide such a citation waives the right to certify (and require) the condition.

Section 20.6.2.2001 NMAC of the *Ground and Surface Water Protection* regulations sets forth procedures for state certification of NPDES permits. The procedures specify public notice requirements, a public comment period, the content and distribution of a certification or denial, timeframes, and appeal requirements. NMED also evaluates outreach needs for the affected community during the process of permit reissuance and evaluates the need for document translation and other access needs during the public comment period. A public involvement plan (PIP) will be developed for each action and a link posted on NMED's website. If an affected party or the public needs additional assistance to participate in the permitting process, they must make the request to the Point Source Regulation Program Manager - contact information is listed at: https://www.env.nm.gov/surface-water-quality/point-source-regulation-section/.

NMED Exhibit 3

C. Incorporating TMDL Waste Load Allocations into NPDES Permits

Pursuant to 40 CFR 130.12(a), NPDES permits must be consistent with the WQMP. Each NPDES permit issued must contain requirements necessary to achieve WQS (40 CFR 122.4(d)). Therefore, where a WLA has been assigned through the TMDL process, the WLA must be incorporated into the permit as specific effluent limitations. All WLA (original and revised) are documented in Appendix B-2 of this WQMP/CPP.

If an application for a new or revised permit is received for a discharge into an impaired waterbody with an approved TMDL but with no previously developed WLA, the permit may be issued without revision of the TMDL provided the discharge is at or less than the in-stream TMDL target concentration. In the case of a new permit, the WLA will be calculated using the TMDL target concentration and applicable flow value as specified in EPA's NMIP. In the case of a revised permit for which there is already an existing WLA but there has been a change to the design flow, the TMDL will be revised to include a revised WLA calculated using the TMDL target concentration and the change in design or production flow. In the case of a new or revised stormwater WLA, the jurisdictional area approach will be used to calculate the WLA unless another method is determined to be more appropriate. All new and revised WLA will be tracked in Appendix B-2 of this WQMP/CPP and the associated TMDL will be revised during the next scheduled TMDL development.

D. Process for Determining the Priority of Permit Issuance

[As required by 40 CFR 130.5(b)(9) for CPP]

As the current permitting authority for New Mexico, EPA Region 6 determines the priority of NPDES permit issuance.

E. Process for Deriving WQBELs based on Narrative Standards in NPDES Permits

[As required by 40 CFR 130.5(b)(1) for CPP]

EPA derives numeric permit limitations from effluent limitations guidelines in the federal regulations at 40 CFR 405 through 471, or from numeric WQS at 20.6.4 NMAC. New Mexico also has narrative water quality standards at 20.6.4 NMAC, but because of the difficulty of deriving permit limits from narrative standards, this issue has largely been unaddressed. However, circumstances may arise that require narrative standards to be addressed in NPDES permits due to the issuance of a TMDL or the presence of a 303(d) impairment in the facility's receiving water.

Nutrients

There are no technology-based effluent limits for nutrients in EPA's *Effluent Guidelines and Standards* in the code of federal regulations (40 CFR Ch. 1 Sub. N), which has resulted in much discussion nationwide about the process for incorporating nutrient limits into NPDES permits. SWQB's listing methodology uses thresholds to determine what background levels of nutrients are expected in a healthy, reference stream. Consequently, these thresholds are also used in TMDL development, which has led to stringent effluent limitations in NPDES permits. The WQS

NMED Exhibit 3

have provisions for temporary standards, or Use Attainability Analyses, but these tools may not apply in some situations.

When SWQB reviews draft permits in accordance with the 401 Certification process, the approach that will be taken with respect to nutrient effluent limitations is the following:

- When an impairment exists in the waterbody without a TMDL and there are no data, SWQB will first require monitoring of effluent to collect nutrient data.

- When an impairment exists in the waterbody without a TMDL and there are available effluent data, SWQB will analyze the effluent data to determine an effluent limit that will be protective of the receiving waterbody based on the frequency of collection and confidence of the data. This approach is consistent with Tier One protection of SWQB's antidegradation policy, which states that no further degradation of existing water quality is permitted in a surface water where the existing water quality does not meet applicable WQS.

SWQB will evaluate other methods for deriving numeric nutrient limits as necessary.

TDS Salinity

As outlined in the Colorado River Salinity Control Forum, SWQB will adhere to the monitoring frequency outlined in that document for both municipal and industrial facilities.

Other Narrative Standards

As future numeric translators are developed, SWQB will utilize those translators as appropriate to evaluate protective water quality-based effluent limitations in the appropriate NPDES permits.

NMED Exhibit 3

VI. MUNICIPAL AND INDUSTRIAL WASTE TREATMENT

[As required by 40 CFR 130.6(c)(3) for WQMP]

A. Clean Watersheds Needs Survey

Every four years EPA conducts the Clean Watersheds Needs Survey and submits a report to Congress in compliance with Section 516 of the CWA. The report is a comprehensive assessment of the capital needs to meet the water quality goals set in the CWA. The states and EPA collect information about publicly owned wastewater collection and treatment facilities; stormwater and combined sewer overflows control facilities; nonpoint source pollution control projects; and decentralized wastewater management.

The State of New Mexico participates in these surveys by collecting information and submitting it to EPA. The current version of the report is available at: http://www.epa.gov/cwns/.

B. Clean Water State Revolving Fund

The CWA, as amended in 1987, authorized EPA to make capitalization grants to the states to establish revolving loan funds with the condition that the states make 20% matching contributions. The Clean Water State Revolving Fund (CWSRF) provides affordable loans for the construction of wastewater treatment facilities and other water quality projects to prevent or abate water pollution. CWSRF monies can also be used for nonpoint source control (see Section VII). Combination loan/grants are available for projects that meet the criteria described in the CWSRF regulations. A portion of the available CWSRF funding may be targeted for projects that support green infrastructure, water or energy efficiency, and environmentally innovative projects.

NMED's CPB administers the loan program under 20.7.5, 20.7.6 and 20.7.7 NMAC and WQA NMSA 1978, Sections 74-6A-1 to 74-6A-15. In the 2018 session of the New Mexico Legislature, the CWSRF authorizing state statute (Wastewater Facility Construction Loan Act, WQA NMSA 1978, Sections 74-6A-1 to 15) was amended to expand the types of eligible projects and borrowers to bring it into alignment with the CWA and the 2014 Water Resources Reform and Development Act. The 2018 statutory change affected 20.7.5.6 NMAC and was therefore amended by the WQCC in August of 2018. The remaining NMAC sections are planned to be administratively amended within a year of approval of this document.

C. Process for Priority Rating of Wastewater Construction Loans Projects and Management of the Priority List

[As Required by 40 CFR 130.5(b)(8) for CPP]

As part of its administration of the CWSRF program, CPB follows a priority rating system compliant with 40 CFR 35.2015. The Priority Rating System Guidance document is available on CPB's website at: https://www.env.nm.gov/construction-programs/clean-water-state-revolving-fund-cwsrf/. The document establishes a systematic, fair and consistent approach for ranking

funding applications. The results of each application cycle are published on the website above as the Integrated Project Priority list and the corresponding Intended Use Plan.

The priority rating process is summarized as follows:

- Determine the time frame for opening the priority list per federal requirements.
- Send out an invitation to eligible entities to apply.
- Receive applications.
- Review the applications for eligibility.
- Inform applicants if they are not eligible for the CWSRF and if they may be eligible for other funding programs.
- Perform a technical review of each application using the Priority Rating System.
- Compile the CWSRF Integrated Projects Priority List.
- Prepare the draft Intended Use Plan that identifies the intended uses of the CWSRF and describe how those uses support the goal of the fund and incorporates the Integrated Projects Priority List.
- Publish the draft Intended Use Plan and associated Integrated Projects Priority List on its website at: https://www.env.nm.gov/construction-programs/clean-water-state-revolving-fund-cwsrf/ for public comment.
- Submit the draft Intended Use Plan to EPA for comment and approval.

CPB reviews the Priority Rating System periodically and proposes any amendments deemed necessary for effective program implementation. Any revisions to the Priority Rating System are presented to WQCC for approval. The amended system must then be approved by EPA.

As part of the funding process, CPB reviews preliminary engineering reports or technical memorandum for projects requesting CWSRF funding. CPB follows USDA Guidance 1780-2 for preliminary engineering reports.

D. Rural Infrastructure Revolving Loan Program

The New Mexico Rural Infrastructure Act (NMSA 1978, Sections 75-5-1 to -6) created the Rural Infrastructure Revolving Loan Program (RIP) in 1988. The purpose of the RIP is to provide financial assistance to local authorities for the construction or modification of water supply facilities. The Rural Infrastructure Act was amended in 2001 to include construction or modification of wastewater facilities and solid waste facilities.

Any incorporated city, town, village, mutual domestic association, or water and sanitation district whose water supply facility serves a population of less than twenty thousand persons or a county that serves a population of less than two hundred thousand may be eligible. These types of projects can be financed through RIP:

NMED Exhibit 3

- Eligible water, wastewater and water pollution control projects
- Water pipelines
- New sewer interceptors and collectors
- Infiltration/inflow correction
- Water and sewer system rehabilitation
- Treatment plant improvements
- Nonpoint source projects (e.g., septic tanks)
- Cost of water rights acquisition
- Eligible solid waste facilities including collection, disposal, storage and recycling
- Engineering studies and design
- Project inspection
- Easement and right-of-way
- Project legal costs
- Purchase of equipment

E. Special Appropriations Program

CPB provides oversight for water, wastewater and other environmental infrastructure construction projects funded through the Special Appropriations Program. These are state grants for special projects issued annually when authorized by the New Mexico Legislature during the legislative session and approved by the Governor. Since 1973 NMED has managed over $542 million in Special Legislative Appropriations for construction of community water supplies, wastewater facilities and other environmentally related projects.

F. Process for Controlling Disposition of Residual Waste from Wastewater Treatment Processing

[As required by 40 CFR 130.5(b)(7) for CPP]

Proper biosolids management to prevent ground and surface water pollution is important. State regulations allow several methods for the disposal of municipal sludge:

- The disposal of dry sludge in landfills, or composting and reuse, regulated under 40 CFR 503 and NM's *Solid Waste Management* regulations at 20.9.1 – 20.9.10 NMAC.
- Land application, including the injection of liquid sludge into subsurface soil, regulated under 40 CFR 503, Subpart B and NM's *Ground and Surface Water Protection* regulations under 20.6.2 NMAC.
- Surface disposal within an approved disposal unit, regulated under 40 CFR 503, Subpart C and NM's *Ground and Surface Water Protection* regulations under 20.6.2 NMAC.

NMED Exhibit 3

VII. NONPOINT SOURCE MANAGEMENT AND CONTROL

[As required by 40 CFR 130.6(c)(4)]

A. Nonpoint Source Management Program

Nonpoint sources of water pollution are recognized as major contributors to water pollution in New Mexico as well as the nation. Principal sources of surface water nonpoint source pollution in New Mexico include on-site liquid waste disposal, roads, recreation, urban storm water run-off, erosion from rangelands, agricultural activities, construction, silviculture, wildfires, resource extraction and land disposal. Hydromodification may affect attainment of designated uses by diverting water out of stream channels, impounding waters, and channelizing or otherwise disturbing streambeds. Principal known sources of nonpoint source groundwater pollution in rural and suburban areas include household septic tanks, cesspools, hard rock mines, and agricultural activities.

B. Nonpoint Source Management Plan

NM's plan for management of nonpoint source pollution is described in the *New Mexico Nonpoint Source (NPS) Management Plan*. The purpose of the NPS Management Plan is to describe the regulatory and non-regulatory programs, programmatic actions, and best management practices (BMPs) necessary to reduce pollutants from nonpoint sources entering surface water and groundwater. Included in the plan are six objectives that facilitate achievement of program goals. Implementation of the plan will help New Mexico succeed in attainment of surface water quality criteria that will fully protect designated uses as described in the State's WQS, meet the goals of the federal CWA and ensure adequate groundwater quality for municipal, domestic, and agricultural uses.

The NPS Management Plan has established a process to develop programs and activities within watersheds that will facilitate the achievement of surface WQS. Watershed-based planning is emphasized as a means of coordinating watershed restoration efforts, fostering watershed associations, and encouraging partnership among agencies, nongovernmental organizations, and the public. The Plan supports local watershed-based implementation of TMDLs and also coordinates with other land and resource management agencies that have established resource protection programs and activities.

The NPS Management Plan uses a voluntary approach to achieve water quality improvements. Incentives to voluntarily implement projects and restoration efforts include competitive grant funding through Section 319(h) of the CWA and technical support and guidance through SWQB. EPA has provided watershed planning guidance in the *Nonpoint Source Program and Grants Guidelines for States and Territories* (USEPA 2013). Completion of watershed planning per the guidelines is a requirement for Section 319 funds to be used for water quality restoration activities.

In order to fund water quality improvement projects, SWQB issues annual requests for applications for projects to be considered for funding from the federal NPS program grant under

NMED Exhibit 3

Section 319(h) of the CWA. The requests identify impaired waters with TMDLs describing the impairments, and a smaller category of impaired waters which do not require TMDL development because the impairments are thought to be caused by insufficient flow rather than excessive pollutant loading (Category 4C waters). Proposed projects must address impairment issues in these waters through planning or implementation.

Low-interest loans through the CWSRF are another potential source of funding for nonpoint source control projects. Both public and private entities as defined in the CWA are eligible for funding for non-point source projects.

SWQB has reviewed, upgraded, and will continue to implement all Section 319(b) management program components. These components include:

- Identification of BMPs appropriate to nonpoint source pollution problems in NM, as well as appropriate application and implementation of these BMPs;
- A schedule of milestones that provides focus, traceable events, and deadlines for program implementation;
- Identification of funding sources and potential partnerships based on available funding programs; and
- Identification of federal financial assistance programs and development projects.

Another important element of the NPS Management Plan is coordination with government agencies. Many of the stream segments which have been or are water quality limited due to nonpoint source pollution pass through public lands. A number of the federal agencies involved have agreed, formally or informally, to ensure that all new and renewed land use authorizations, easements, rights-of-way documents, allotment management plans, term-grazing permits, and other agreements involving permitted activities on properties administered by the federal agency would have enforceable provisions for compliance with WQS. Efforts under these agreements have resulted, and are expected to continue to result, in the implementation of BMPs and mitigation measures at many sites.

C. Wetlands Program

The SWQB Wetlands Program administers wetland restoration and program development grants received from EPA under Section 104(b)(3) of the CWA. The overall goals of the Wetlands Program are to protect and restore NM's wetlands and riparian areas and to increase self-sustaining and naturally functioning wetlands and riparian areas. The Wetlands Program emphasizes the role of wetlands in prevention and reduction of water quality impairments and providing habitat for aquatic life and wildlife.

EPA identified four core components critical to effective, comprehensive wetland programs (EPA 2009). The components are regulatory actions; monitoring and assessment (*see* Section III of this WQMP/CPP); restoration and protection; and WQS (*see* Section II of this WQMP/CPP). A description of these components in NM's Wetlands Program are found in the *Wetlands Program*

NMED Exhibit 3

Plan for New Mexico (NMED SWQB 2019). Regulatory actions/controls and restoration and protection are described in further detail below.

Regulatory Controls

The State's regulatory program, which applies to all surface waters of the state including wetlands, is described in Dredge and Fill Program and Effluent Limitations sections of this WQMP/CPP (Section X and V, respectively). Specifically, NPDES permits under Section 402 of the CWA regulate discharges to wetlands, and the Dredge and Fill Program under Section 404 of the CWA regulates other activities affecting wetlands.

Restoration and Protection

SWQB encourages wetland protection on a watershed basis. This approach involves assisting watershed groups throughout the state to develop "Wetland Action Plans" as a component of watershed-based plans. A Wetland Action Plan is a planning document designed specifically to address wetlands and riparian resources within the boundaries of a specific watershed. Participating watershed groups assess wetlands and riparian areas in their watershed and develop proposals to protect, restore, and create wetlands locally. This effort helps watershed groups incorporate wetland issues into their mission and promotes stewardship of wetlands through cooperative approaches involving agencies, local governments, tribes, nonprofit organizations, and the public.

In addition, SWQB promotes wetland restoration as an integral part of watershed restoration and health. A number of restoration projects are occurring statewide and are funded by EPA Region 6 Program Development grants under Section 104(b)(3) of the CWA. Project activities include restoration of wet meadows and waterfowl habitat on the Rio Grande along the central flyway, restoration of Bosque on private land parcels, re-establishment of natural flooding, increasing wetland plant diversity and habitat diversity, removal of exotic vegetation, restoration of springs, planning for open-space and conservation easements to protect wetlands resources including buffer zones, restoring beaver habitat, restoring high mountain fen wetlands, river restoration to address transportation maintenance issues, and conservation of playas and closed basin wetlands. The Wetlands Program maintains the New Mexico Statewide Wetlands Roundtable, consisting of state and federal agency and tribal participation. The wetland restoration and protection program also includes provisions for technical assistance to landowners or organizations carrying out wetland restoration projects, active research regarding effective wetland restoration techniques and methods to measure the success of restoration activities, and training and capacity-building for organizations interested in joining restoration partnerships.

NMED Exhibit 3

VIII. MANAGEMENT AGENCIES

[As required by 40 CFR 130.6(c)(5) for WQMP]

A. Designated Management Agencies for Wastewater Management

Under Section 208 of the CWA, WQMPs are to include identification of Designated Management Agencies (DMAs) necessary to implement the WQMP and provisions for adequate authority for intergovernmental cooperation. DMAs must demonstrate legal, institutional, managerial, and financial capability, and specific activities necessary to carry out their responsibilities. Incorporated municipalities, counties, sanitation districts, and water and sanitation districts have the necessary authorities under state law to satisfy the requirements of Section 208(c)(2) of the CWA, which include the authority to:

- carry out appropriate portions of an areawide waste treatment management plan developed under Section 208(b)of the CWA;
- manage effectively waste treatment works and related facilities serving such area in conformance with any plan required by subsection (b) of this section;
- directly or by contract, design and construct new works, and to operate and maintain new and existing works as required by any plan developed pursuant to subsection (b) of this section;
- accept and utilize grants, or other funds from any source, for waste treatment management purposes;
- raise revenues, including the assessment of waste treatment charges;
- incur short- and long-term indebtedness;
- assure in implementation of an areawide waste treatment management plan that each participating community pays its proportionate share of treatment costs;
- refuse to receive any wastes from any municipality or subdivision thereof, which does not comply with any provisions of an approved plan under this section applicable to such area; and
- accept, for treatment, industrial wastes.

State law provides the designated agencies with the necessary authority to design, construct, operate, and maintain wastewater treatment plants and to accept and utilize state and/or federal funds for these purposes. As specified at 40 CFR 130.12(b), Section 201 of the CWA funding can only be awarded to DMAs that are in conformance with the statewide WQMP.

B. Process for Designating Wastewater Management Agencies

The WQCC has the responsibility of designating management agencies which are then certified by the Governor (40 CFR 130.6(e)). DMAs must demonstrate legal, institutional, managerial and financial capability necessary to carry out the entity's responsibilities in accordance with Section 208(c) of the CWA. EPA shall accept such designations unless it is found that the DMAs do not have adequate specified authorities required in Section 208(c)(2) of the CWA (40 CFR 130.9(d)).

NMED Exhibit 3

As economic development and growth continue in NM, or as the need arises, additional DMAs for wastewater will be considered. The WQCC will consider new DMAs upon presentation of a petition requesting such designation. The petitioning DMA must demonstrate legal, institutional, managerial, and financial capability necessary to carry out the entity's responsibilities in accordance with Section 208(c) of the CWA. Designation of a management agency will occur only after appropriate public participation and presentation of relevant authorities by the petitioner.

C. Management Agencies for Point Source Management

The Governor certified the designation of ninety-seven (97) wastewater management agencies in 1980. Additional management agencies were certified in September 1983, August 1984, October 1985, April 1999, and May 2001. A total of eighty-four (84) municipalities, two (2) counties, eleven (11) sanitation or water and sanitation districts, four (4) state agencies, and two (2) Native American tribal entities have been designated wastewater management agencies.

Designated wastewater management agencies are listed in Table VIII-1. Each agency that has accepted this designation shall be responsible for wastewater management in its facility planning area and shall, if the agency satisfies applicable federal regulations, be able to receive construction program funding under Section 201 of the CWA.

D. Management Agencies for Nonpoint Source Management

The NPS Management Plan identifies specific federal, state and local agencies with a role in implementing nonpoint source pollution management and control. Unlike with the Wastewater Designated Management Agencies, a nonpoint source management agency can be entered into through interagency agreements, which are developed as needed to outline management responsibilities unique to each agency's area of responsibility and expertise.

For nonpoint source management, agencies or organizations participating through formal agreements under the NPS Management Plan will be considered a management agency for purposes of the WQMP/CPP.

IX. IMPLEMENTATION MEASURES

[As required by 40 CFR 130.6(c)(6) for WQMP]

A. Overview

This section addresses implementation measures necessary to carry out those programs that are listed in this Statewide WQMP/CPP. Schedules that specify when pollution control programs are expected to be implemented are useful in tracking the progress of control programs incorporated into the WQMP/CPP. Implementation schedules inform management agencies responsible for the programs, and other interested or affected parties, when significant milestones leading to implementation are expected to occur.

Where appropriate or required, individual documents also contain additional implementation procedures specific to a program. For example, Appendix A describes the implementation procedure for the State's Antidegradation Policy. Another example is the NPS Management Plan that identifies implementation and financing of measures for nonpoint source pollution control.

Implementation schedules may also be affected by statutory or Court imposed orders. An example of a statutory schedule is Section 303(c) of the CWA which requires States to review their WQS every three years. An example of a Court imposed schedule is the consent decree and settlement agreement that resulted from *Forest Guardians and Southwest Environmental Center v. Carol Browner, Administrator, U. S. Environmental Protection Agency* (1997) and the resultant MOU between EPA and NMED for the development of TMDLs (see Section IV of this WQMP/CPP).

Measures for financing these programs arise from a variety of sources including federal grants (e.g., Sections 106, 201, and 319 of the CWA), state budgets authorized by the NM Legislature, state revolving funds, local governments, cost sharing with stakeholders (public and private) or other means as appropriate to the task.

B. Planning Strategy for Implementation Measures

Implementation measures will be completed by:

- Using the process descriptions in this WQMP/CPP as a reference guide to program implementation and scheduling.
- Adhering to statutory, regulatory and court sanctioned schedules.
- Using funding sources appropriate to the task.
- Posting on NMED's website anticipated or tentative review schedules. Examples include but are not limited to: Triennial Review of WQS and biennial review of the *State of New Mexico CWA §303(d)/§305(b) Integrated Repor*t.

NMED Exhibit 3

X. DREDGE AND FILL PROGRAM

[As required by 40 CFR 130.6(c)(7) for WQMP]

A. Description of the Dredge and Fill Program

The U.S. Army Corps of Engineers (USACE) is responsible for issuing permits for activities involving the discharge of dredged or fill materials to waters of the U.S. pursuant to Section 404 of the CWA. New Mexico is not delegated authority for the issuance or enforcement of Section 404 permits, but NMED does review the permits for purposes of state certification or denial under Section 401 of the CWA.

In addition to the certification of permits, the Dredge and Fill Program includes consultation with applicants and USACE as needed, compliance site inspections, education, and outreach activities.

B. Process for Certification of Dredge and Fill Permits under Section 401 of the CWA

In accordance with Section 401 of the CWA, USACE may not issue permits for the discharge of dredged or fill materials to waters of the U.S. until the State is provided an opportunity to review and certify the permit. The WQA assigns the responsibility for certifying permits issued under the CWA to NMED (NMSA 1978, Section 74-6-4(F)), and also specifies the conditions under which a certification shall be denied (Section 74-6-5(E)).

Section 20.6.2.2002 NMAC of the *Ground and Surface Water Protection* regulations sets forth procedures for the state certification of dredge and fill permits. The procedures specify public notice requirements, a public comment period, the content and distribution of a certification or denial, timeframes, and appeal requirements.

C. Planning Strategy for the Dredge and Fill Program

NMED, through the SWQB, will review the Dredge and Fill Program annually to determine if improvements are required. SWQB will also review and certify, certify with conditions, or deny USACE individual, regional and nationwide permits under Section 404 of the CWA.

NMED Exhibit 3

XI. BASIN PLANS

[As required by 40 CFR 130.6(c)(8) for WQMP]

A. Introduction

Basin plans were initially developed by the State for water quality planning in the early and mid-1970s. In the 1980s the State shifted to planning on a statewide basis rather than basin-by-basin. According to 40 CFR 130.6(c)(8), a WQMP must identify "any relationship to applicable basin plans developed under Section 209" of the CWA. Because New Mexico has chosen to do its planning on a statewide basis, no such basin plans are applicable to NM. For the same reason, the CPP requirement in 40 CFR 130.5(b)(2) to describe "the process for incorporating elements of any applicable areawide waste treatment plans under section 208, and applicable basin plans under section 209" does not apply to NM.

Although the State conducts water quality planning on a statewide level, implementation and restoration efforts focus on the watershed level. A successful watershed protection approach must be founded on cooperative interaction between the federal, state, and local levels of government, and between the public and private sectors.

Throughout the state, local government organizations and citizens are working to address local water issues relating to both quantity and quality. These organizations include voluntary watershed groups, soil and water conservation districts, county and municipal governments, and concerned citizens.

B. Strategy

The WQCC will continue water quality management planning on a statewide basis via this WQMP/CPP. SWQB will work with and encourage participation by local, state and federal organizations, watershed groups, other nongovernmental organizations, and concerned citizens in the development and implementation of strategies to address specific regional or watershed concerns.

NMED Exhibit 3

XII. GROUNDWATER

[As required by 40 CFR 130.6(c)(9)]

A. Groundwater Pollution Prevention Program

The WQCC has adopted comprehensive regulations (20.6.1 through 20.6.7 NMAC), including ground WQS and a discharge permitting program, for the protection of groundwater quality under the authority of the WQA. The *Ground and Surface Water Protection* regulations are codified at 20.6.2 NMAC, with supplemental permitting requirements for dairy facilities at 20.6.6 NMAC and for copper mines at 20.6.7 NMAC. In accordance with the WQA at NMSA 1978, Section 74-6-4, the WQCC has delegated responsibility for administering its regulations regarding groundwater protection to NMED and OCD. The WQCC reviews and changes its regulations as it deems appropriate.

The GWQB reviews and approves discharge permits for discharges that have the potential to impact groundwater quality. Ground water discharge permits address discharges from a wide variety of facilities, including large and small-scale domestic wastewater treatment plants, septic tank/leachfields, industrial facilities, power generating plants, mining facilities, dairies, food processing plants, commercial landfarms for remediation of contaminated soil, UIC wells and groundwater remediation systems. The program also addresses unauthorized discharges such as spills; performs enforcement actions to ensure compliance with permit requirements; and requires abatement of groundwater contamination related to permitted facilities. The discharge permitting process includes public notification, a public comment period and a public hearing in situations where there is substantial public interest. Permits are issued for five-year terms and must be renewed to provide continuous coverage. Currently, GWQB manages approximately 675 active permits.

The Underground Injection Control (UIC) Program is a federal groundwater protection program established by the SDWA. The purpose of the UIC Program is to prevent groundwater contamination by regulating the discharge of wastes into UIC wells. New Mexico has authority for administration of the UIC Program, which is jointly implemented by GWQB and OCD. These divisions administer the UIC Program under authority granted by the WQA (NMSA 1978, Section 74-6-4), the *Ground and Surface Water Protection* regulations (20.6.2 NMAC), the New Mexico Oil and Gas Act (NMSA 1978, Section 70-2-12(B)), OCD's *Oil and Gas Injection* regulations (19.15.26 NMAC), and the New Mexico Geothermal Resources Act (NMSA 1978, Sections 71-9-1 to 71-9-11).

UIC wells include:

- Any dug hole or well that is deeper than its largest surface dimension, where the principal function of the hole is emplacement of fluids,
- Any septic tank or cesspool used by generators of hazardous waste, or by owners or operators of hazardous waste management facilities, to dispose of fluids containing hazardous waste, or

NMED Exhibit 3

- Any subsurface distribution system, cesspool or other well which is used for the injection of wastes.

EPA has grouped UIC wells into five classes (Class I, II, III, IV and V), according to the type of fluid they inject and where the fluid is. *See* https://www.epa.gov/uic.

New Mexico administers the federal UIC Program through the groundwater discharge permits required by 20.6.2 NMAC. Facilities that discharge fluids into UIC wells are required to have groundwater discharge permits approved by either GWQB or OCD, depending on the type of operation. Discharge permits contain operational, monitoring, contingency, and closure plans with specific requirements to prevent and remediate any negative impacts that UIC wells may have on groundwater quality. GWQB permits and oversees the operation, monitoring, and closure of Class I, III, IV, and V wells. OCD regulates Class II wells, and also Class I, III, and V wells related to oil and gas development activities, geothermal activities, and brine solution mining.

B. Planning Strategy for Groundwater Protection

The WQCC will update its water protection regulations as necessary to address emerging issues. NMED and OCD will continue to administer the state regulations for groundwater protection in accordance with the WQCC's delegation of responsibilities.

NMED Exhibit 3

XIII. DETERMINATION OF COMPLIANCE WITH WATER QUALITY STANDARDS FOR THE PROTECTION OF HUMAN HEALTH CRITERIA

[As required by 20.6.4.12 NMAC]

A. Background

In accordance with 20.6.4.12(D) NMAC:

> *Compliance with the human health-organism only criteria shall be determined from the analytical results of representative grab samples, as defined in the water quality management plan. Human health-organism only criteria shall not be exceeded.*

The procedures and methods used in the scientific studies necessary to make compliance determinations are found in several documents developed by SWQB. These documents include the WQS (20.6.4 NMAC) and the Surface Water Quality Bureau's QAPP for Water Quality Management Programs, which are reviewed and approved by EPA. The Water Quality Management Programs QAPP specifically addresses both laboratory and field procedures, including data interpretation approaches and field sampling techniques. The 2002 action by WQCC concerning human health priority toxic pollutants relies on grab sample techniques to determine standards compliance. Accordingly, specification of this technique is appropriate.

SWQB interprets a grab sample as a discrete, individual sample taken within a short period of time (usually less than 15 minutes) and is representative of the conditions at the time of sampling. This definition is operationally sufficient for perennial, intermittent and ephemeral waters. As stated in the Bureau's QAPP, SWQB relies on standard procedures and laboratory quality assurance to ensure the repeatability of the data. Procedures used for the evaluation of quality assurance and quality control are found in the QAPP. The analytical results of the representative grab samples shall be used for the determination of compliance with applicable human health criteria.

B. Process for Determination of Compliance

The following procedures apply to determining compliance for enforcement purposes; they do not apply for purposes of determining attainment of designated uses. Sampling for determination of compliance with WQS human health criteria shall be accomplished as follows:

- A minimum of three individual grab samples, separated in time by no less than 15 minutes each, shall be taken during the same sampling/storm event from the same location. For the purpose of determining non-compliance, the analytical results of two or more of these samples must be greater than the applicable human health criteria. Results of all grab samples shall be recorded and reported.

Sampling and analysis shall be in accordance with SWQB's current QAPP and SOPs.

NMED Exhibit 3

XIV. PUBLIC PARTICIPATION

A. Requirements for Public Participation

This section applies to the CWA and WQA programs administered by SWQB described herein.

General public awareness and stakeholder involvement is crucial to the successful implementation of CWA programs. By seeking and considering invaluable public input and involvement, SWQB can more effectively promote best management practices and increase public involvement to produce better decisions, as well as greater public acceptance and support for these decisions.

Public participation requirements under the CWA are specified in 40 CFR 25.4. The rule requires agencies to "…conduct a continuing program for public information and participation in development and implementation of activities…" and includes the following provisions:

- Design informational documents and activities to encourage and facilitate public participation for meaningful involvement (40 CFR 25.4(b)(1));
- Provide at least one central location of reports, studies, plans, and other documents (40 CFR 25.4(b)(3));
- Develop and maintain a list of potentially affected and interested parties and engage with them under public consultation as outlined under 40 CFR 25.4(d) (40 CFR 25.4(b)(5);
- Provide notification generally within no less than 30 days of any action to allow time for public response (40 CFR 25.4(c)).

The specifics for adhering to these requirements are outlined in greater detail for each section in Table XIV-1. In addition to the federal requirements identified above, the agency has additional outreach requirements, which include:

- Tribal engagement in accordance with NMED's *Tribal Consultation and Collaboration Policy* (NMED Office of the Secretary 2020),
- Development of PIPs in accordance with *NMED's Limited English Proficiency (LEP) Accessibility and Outreach Policy 07-11, Non-Employee Disability Accessibility and Outreach Policy 07-10* and *Public Participation Policy 07-13*.
- Provide public notification consistent with the public participation and outreach activities outlined in the associated PIP.

NMED Exhibit 3

Table XIV-1. Public Participation Requirements

Program Element	Public Participation Actions
WQMP/CPP - All Updates	• Stakeholder identification and outreach to gather information and identify potential updates • Conduct public meetings (Optional*) • Minimum 30-day public comment period • Publish notice of public comment period and meetings in newspaper(s) or alternative media in affected area(s) (Optional*) • Email notice to SWQB mailing list (Optional*) • Post on NMED website (Optional*) • Present updates/revisions at a WQCC meeting which is open to public participation • Post WQCC and EPA approved WQMP/CPP on NMED website
Water Quality Standards at 20.6.4 NMAC & Ground and Surface Water Protection regulations at 20.6.2 NMAC	• Stakeholder identification and outreach to gather information and identify potential updates • Conduct public meetings (Optional*) • Minimum 30-day public comment period for draft proposal • Petition the WQCC at a public meeting to request a hearing for the proposed changes to the regulations (NMSA 1978, Section 74-6-6(A)) • Publish hearing notice in the New Mexico Register, in one newspaper of general circulation, in one newspaper in the affected area (as applicable) and mailed to the WQCC mailing list (NMSA 1978, Section 74-6-6(C)) 60 days prior to hearing date; (45-day notice requirement in 40 CFR 25.5, 30-day notice requirement in NMSA 1978, Section 74-6-6, 60-day notice requirement in 20.1.6.201 NMAC) • Publish hearing notice in additional newspapers or through alternative media in affected area(s) (Optional*) • Email hearing notice to SWQB mailing list (Optional*) • Post rulemaking information on NMED website (State Rules Act, NMSA 1978, § 14-4-2(E)) • Post rulemaking information on State's Sunshine Portal (State Rules Act) • Provide electronic mail notification of hearing notice with links to supporting documentation for proposed rulemaking to NMED's district managers to make available at NMED field offices (State Rules Act) • Send rulemaking information and notice of hearing by electronic mail (if provided) to persons who have identified as a stakeholder, participated in the rulemaking, or specifically made a request for notice (State Rules Act)

NMED Exhibit 3

Program Element	Public Participation Actions
	• Send written notice that includes, at a minimum, an internet and street address where the information may be found to persons who provide a postal address (State Rules Act) • Provide notice of hearing to the New Mexico legislative council for distribution to appropriate legislative committees (State Rules Act) • Public hearing before WQCC (20.1.6 NMAC) • Publication of approved regulation in the New Mexico Register with effective date of rule (1.24.10 NMAC) • Post WQCC and EPA approved regulations on NMED website •
Water Quality Surveys	• Conduct pre-monitoring community meetings prior to conducting the study to inform stakeholders in affected area about upcoming study plan, obtain contacts, and obtain watershed specific information from those living/working within the watershed (Optional*) • Post field sampling plans on NMED website (Optional*)
TMDL Documents	• Minimum 30-day public comment period (40 CFR 130.7) • Conduct public meeting(s) in affected watershed(s) (Optional*) • Publish notice of public comment period and meetings in newspaper(s) and/or alternative media in affected area(s) (Optional*) • Email notice to SWQB mailing list (Optional*) • Post on NMED website (Optional*) • Present updates/revisions at WQCC meeting which is open to public participation • Post WQCC and EPA approved TMDL on NMED website
Appendix B-2 of this WQMP/CPP	• Post on NMED website as new TMDLs with WLA are approved, existing WLA are revised, or new WLA are added to existing TMDLs.
State of New Mexico CWA §303(d) List (Appendix A of the §303(d)/§305(b) Integrated Report)	• Minimum 30-day public comment period (40 CFR 130.7) • Publish notice of comment period in newspaper(s) or alternative media in affected area(s) (Optional*) • Email notice to SWQB mailing list (Optional*) • Post on NMED website (Optional*) • Public participation at WQCC meeting • Post WQCC and EPA approved Integrated Report on NMED website

NMED Exhibit 3

Program Element	Public Participation Actions
CWA §303(d)/§305(b) Listing Methodology	• Minimum 30-day public comment period (Optional*) • Publish notice of comment period in newspaper(s) or alternative media in affected area(s) (Optional*) • Email notice of comment period to SWQB mailing list (Optional*) • Post final listing methodology on NMED website (Optional*)
Nonpoint Source Management Plan	• Stakeholder identification and outreach to gather information and identify potential updates • Conduct public meetings (Optional*) • Minimum 30-day public comment period • Publish notice of public comment period and meetings in newspaper(s) or alternative media in affected area(s) (Optional*) • Email notice to SWQB mailing list (Optional*) • Post on NMED website (Optional*) • Present updates/revisions at public WQCC meeting • Post WQCC and EPA approved NPSMP on NMED website
Request for Proposals (RFPs)	• Publish notice in at least three newspapers of general circulation within the state at least 20 calendar days before proposals are due (1.4.1 NMAC). • NMED Press Release (Optional*) • Post on NMED website (Optional*) • Email notice to SWQB mailing list (Optional*)
Competitive Sub-Grant Awards: Solicitation for Applications (SFAs)	• NMED Press Release (Optional*) • Post on NMED website (Optional*) • Email to SWQB mailing list (Optional*)

Program Element	Public Participation Actions
401 Certifications of 402 Federal Permits (NPDES)	Joint Notice with EPA Region 6 (40 CFR 124.10(c) and 20.6.2.2001 NMAC): • Minimum 30-day public comment period • Publish notice in one newspaper of general circulation (in area of discharge if individual permit) • Send notice to the applicant; appropriate local, state, tribal and federal agencies; and all parties who have specifically requested copies of public notices. • Post notice on NMED website • Email notice to SWQB mailing list (Optional*) When joint notice is impractical, NMED shall provide notice according to 20.6.2.2001 NMAC: • Minimum 30-day public comment period • Publish notice in one newspaper of general circulation (in area of discharge if individual permit) • Post notice on NMED website • Email notice to applicant (except for general permits), SWQB mailing list, and affected government agencies or interested parties
401 Certifications of 404 Federal Permits (Dredge and Fill)	Joint Notice with US Army Corps of Engineers (33 CFR 325.3; 33 CFR 330.5; 20.6.2001 NMAC): • Minimum 15-day public comment period • Send notice to the applicant; adjoining property owners; affected local, state, tribal and federal agencies; and all parties who have specifically requested copies of public notices. • Post notice on NMED website • Email notice to SWQB mailing list (Optional*) When joint notice is impractical, NMED shall provide notice according to 20.6.2.2002 NMAC: • Minimum 15-day public comment period • Publish notice in one newspaper of general circulation (in area of discharge if individual permit) • Post notice on NMED website • Email notice to applicant (except for general permits); SWQB mailing list; and affected government agencies or interested parties

B. Planning Strategy for Fulfilling Public Participation Requirements

SWQB will satisfy public participation requirements in accordance with appropriate law/regulation/policy by:

- Developing PIPs that take into consideration the composition and English language proficiency of the affected community or area.
- Accommodating persons with a disability that desire to participate in NMED activities.
- Providing the public with the information necessary for meaningful involvement and informing the public of how they can obtain pertinent documents/information. This information is provided in public notices, at public meetings or hearings, available upon request, or can be obtained from the SWQB website at www.nmenv.state.nm.us/swqb. Brochures, newsletters, fact sheets, press releases, and other media are also utilized, as appropriate, to provide the public with the pertinent documents/information. This information includes appropriate information and documents as well as guidelines on how public meetings or hearings will be conducted.
- Providing a central location of reports, studies, plans, and other documents. SWQB maintains an administrative record, including all study plans and associated documentation (i.e. data, field sheets, etc.). A library of all intensive water quality survey reports is maintained, and reports are available to the public upon request.
- Maintaining a stakeholder list of affected/interested parties. SWQB maintains a database of affected/interested parties. This list includes the WQCC mailing list, environmental organizations, the regulated community, watershed groups, and numerous individuals who sign up to receive information. The list is currently operated through Govdelivery and individuals can subscribe to SWQB News at the bottom of every SWQB webpage.
- Properly notifying stakeholders and interested parties in accordance with laws/statutes/policies of any upcoming program activities. SWQB uses a variety of tools to disseminate information to the public, including publishing notices in the required newspapers (and the New Mexico Register, if necessary), emailing notices to the Bureau's interested parties list and encouraging them to post and/or forward to other interested parties, issuing NMED press releases, and posting pertinent documents and public notices on SWQB's website (https://www.env.nm.gov/surface-water-quality/).

Whenever practical and possible, SWQB will expand outreach efforts to maximize public participation by seeking out innovative ways of informing and involving the public such as through social media, webinars, etc. SWQB will provide the public with information on their role in the public participation process by documenting public input and providing a response to public input by explaining how the input was taken into consideration through the public participation process. This information is attached to final documents and provided individually to those who participated in the public comment process.

Glossary

Alternatives Analysis: An evaluation of possible cost-effective, reasonable alternatives to regulated discharges that might degrade water quality, including less-degrading alternatives, non-degrading alternatives, and no-discharge alternatives, such as treatment process changes, relocated discharge facilities, land application, reuse, and subsurface discharges. The evaluation must provide substantive information pertaining to the cost and environmental impacts associated with the proposed discharge and the alternatives being evaluated, so that alternatives that are cost-effective and reasonable and least degrading are identified.

Antidegradation: A regulatory policy and implementation procedure approved by EPA and the WQCC to protect existing uses of surface waters and to specify how the WQCC will determine, on a case-by-case basis, whether and to what extent, existing water quality may be lowered in a surface water.

Assimilative Capacity: The difference between the baseline water quality concentration for a pollutant and the most stringent applicable water quality criterion for that pollutant.

Baseline Water Quality (BWQ): A characterization of selected pollutants in a perennial surface water as measured and expressed during a specified time period. Once established, baseline water quality is a fixed quantity/quality unless it is updated by NMED to reflect changes in water quality.

Bio-accumulative Pollutant: a pollutant, such as pesticides or other chemicals, that accumulates in aquatic organisms when ingestion and absorption rates are faster than metabolic and excretion rates (*see* human health-organism only criteria in 20.6.4.900 NMAC).

Degradation: A decline in the chemical, physical, or biological conditions of a surface water or other decline in water quality as measured on a pollutant-by-pollutant basis.

Detection Limit: The minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results.

Designated Use: A use of a surface water specified in the *Standards for Interstate and Intrastate Surface Waters* (20.6.4 NMAC). Designated uses include domestic water supply, irrigation and irrigation storage, primary contact, secondary contact, livestock watering, wildlife habitat, aquatic life, and fish culture and water supply.

Effluent-Dependent Water: An effluent-dependent water is a surface water that without the point source discharge of wastewater would be an ephemeral water.

Ephemeral Surface Water: A surface water that contains water briefly only in direct response to precipitation; its bed is always above the water table of the adjacent region.

Existing Use: A use and the water quality necessary to support the use that has been attained in a surface water on or after November 28, 1975, whether or not it is a designated use in the surface water quality standards (20.6.4 NMAC) or if it is currently attaining the quality required for that use.

Existing Water Quality: Baseline water quality.

High Quality Water: A surface water with water quality that is better than the applicable water quality standard as determined on a pollutant by pollutant basis.

Intermittent Surface Water: A surface water that contains water for extended periods only at certain times of the year, such as when it receives seasonal flow from springs or melting snow.

Less-Degrading Alternative: A cost-effective, reasonable alternative to a proposed discharge that would result in fewer detrimental changes to water quality as characterized by the baseline water quality evaluation.

Loading Capacity: total assimilative capacity of a waterbody for the pollutant of concern at critical flow. The loading capacity is the maximum amount of pollutant loading that a waterbody can receive and still meet water quality standards.

Minimal Degradation: A deterioration or decline in water quality that results in the consumption of less than 10 percent of the available assimilative capacity for a pollutant.

National Pollutant Discharge Elimination System [NPDES]: The point source discharge permit program established by Section 402 of the Clean Water Act (33 U.S.C. § 1342).

Non-Degrading Alternative: A cost-effective, reasonable alternative to a proposed discharge that would result in no significant degradation of water quality as characterized by the baseline water quality evaluation.

Outstanding National Resource Water (ONRW): A surface water that is classified as an outstanding national resource water under 20.6.4.9 NMAC.

Perennial Surface Water: A surface water that typically contains water throughout the year and rarely experiences dry periods.

Regulated Discharge: A point source discharge regulated under Section 402 of the CWA, a discharge for Dredge and Fill material regulated under Section 404 of the CWA, and any discharged authorized by a federal permit or license that is subject to state water quality certification under Section 401 of the CWA.

Relative Percent Difference (RPD): RPD is an expression of the degree of variation between two water quality samples taken under similar conditions. RPD is calculated using the following equation, where S represents the concentration of the pollutant in the original sample and D represents the concentration of the pollutant in the new sample.

$$\boldsymbol{RPD = \frac{|S - D|}{(S + D)/2}\ x\ 100}$$

Short-Term Degradation: Degradation that is six months or less in duration, i.e., water quality returns to baseline water quality within six months after the discharge commences.

Significant Degradation: The consumption of 10 percent or more of the available assimilative capacity for any pollutant of concern at critical flow conditions or any consumption of assimilative capacity that exceeds a cumulative cap of 50% of assimilative capacity.

Significantly Improved Water Quality: For purposes of a BWQ re-evaluation, significantly improved water quality compares the original baseline water quality data to new water quality data acquired or submitted to the Department and calculates the relative percent difference (RPD) between the two data points. If the RPD is greater than or equal to 20% and sampling technique, sample processing and transport, and laboratory analyses are comparable, a new baseline characterization may be warranted.

Surface Waters of New Mexico: All surface waters situated wholly or partly within or bordering upon the state, including lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, reservoirs or natural ponds. Surface waters of the state also means all tributaries of such waters, including adjacent wetlands, any manmade bodies of water that were originally created in surface waters of the state or resulted in the impoundment of surface

waters of the state, and any "waters of the United States" as defined under the Clean Water Act that are not included in the preceding description.

Temporary Degradation: Degradation that is six months or less in duration, i.e., water quality returns to baseline water quality within six months after the discharge commences; short-term degradation.

Tier 1 Protection: Policies and procedures that prohibit degradation which results in the loss of an existing use, or violation of water quality criteria; and prohibit degradation of existing water quality where pollutants of concern do not meet applicable water quality standards. Tier 1 defines the minimum level of protection for all waters and requires that water quality be maintained such that the existing and designated uses of the water are supported. This applies to waters that do not meet or meet but are not better than the water quality standards for existing or designated uses. Surface waters with this protection may already be of lower quality.

Tier 2 Protection: Policies and procedures that prohibit significant degradation of a surface water unless a review of reasonable alternatives and social and economic considerations shows that the lowering of water quality is necessary for important social and economic considerations in the area where the water is located. Tier 2 protection level applies to perennial and intermittent waters where data confirm high quality water (i.e., where existing water quality is better than applicable water quality standards as determined on a pollutant-by-pollutant basis).

Tier 3 Protection: Policies and procedures that prohibit any lowering of water quality in Outstanding New Mexico Waters as identified under 20.6.4.9 NMAC unless impacts are minimized and temporary.

Toxic Pollutant: A pollutant or combination of pollutants, including disease-causing agents, that after discharge and upon exposure, ingestion, inhalation or assimilation into any organism, either directly from the environment or indirectly by ingestion through food chains, will cause death, shortened life spans, disease, adverse behavioral changes, reproductive or physiological impairment or physical deformations in such organisms or their offspring.

Translator: Methodologies to guide the calculation of site-specific numeric targets (not criteria) based on a given narrative standard.

Water Contaminant: Any substance that, if discharged or spilled, could alter the physical, chemical, biological or radiological qualities of water.

Water Pollutant: A water contaminant in such quantity and of such duration as may with reasonable probability injure human health, animal or plant life or property, or to unreasonably interfere with the public welfare or the use of property. Pollutants may include liquid, solid, gaseous, or hazardous substances such as contaminants, toxic pollutants, solid waste, chemicals, pesticides, herbicides, fertilizers, incinerator residue, sewage, garbage, sewage sludge, munitions, petroleum products, biological materials, radioactive materials, heat, wrecked or discarded equipment, rock, sand, dirt, and mining, industrial, municipal and agricultural wastes.

Water Quality Criteria: Elements of water quality standards that are expressed as pollutant concentrations, levels, or narrative statements representing a water quality that supports a designated use.

1 Overview of New Mexico's Antidegradation Approach

Water quality standards (WQS) are the foundation for a wide range of programs under the Clean Water Act (CWA). WQS consist of designated uses such as aquatic life and recreation, water quality criteria necessary to protect those uses, and antidegradation requirements. Each State must develop, adopt, and retain a statewide antidegradation policy regarding water quality standards and establish procedures for its implementation through the water quality management process. Antidegradation implementation is based on a set of procedures to be followed when evaluating activities that may impact the quality of New Mexico's surface waters. Antidegradation implementation is an integral component of a comprehensive approach to protecting and enhancing surface water quality.

Antidegradation protections consist of three levels, or tiers, of protection defined by New Mexico's water quality standards in 20.6.4.8 NMAC. Tier 1 protections provide a floor of protection, ensuring that existing instream water uses and the level of water quality necessary to protect those existing uses are maintained and protected. Tier 2 protections maintain and protect water quality that exceeds water quality numeric and narrative criteria, prohibiting any lowering of water quality unless necessary to accommodate social or economic need. Tier 3 protections are afforded to waters designated by the Water Quality Control Commission (WQCC) as Outstanding National Resource Waters (ONRWs). In ONRWs, no degradation is permitted except in limited, specifically defined instances, such as to accommodate public health or safety activities or to enable activities to restore or maintain water quality.
Antidegradation applies to all activities with the potential to adversely affect water quality or existing or designated uses, including:

- Any proposed new or increased point source or nonpoint source discharge of pollutants that would lower water quality or affect the existing or designated uses.
- Any proposed increase in pollutant loadings to a waterbody when the proposal is associated with existing activities.
- Any increase in flow alteration over an existing alteration.
- Any hydrologic modifications, such as dam construction and water withdrawals.

This document has been drafted to provide guidance to persons responsible for regulated discharges that may degrade water quality in New Mexico. Regulated discharges include those that require a permit and/or a water quality certification under Section 401 of the Clean Water Act (CWA) pursuant to state or federal law. The Nonpoint Source Management Plan, a separate document incorporated by reference into the WQMP/CPP, describes antidegradation implementation procedures applicable to nonpoint source discharges. The information contained in this document is intended to provide guidance only and is not a substitute for the provisions of any other laws, rules, or regulations.

The guidance that follows addresses implementation procedures for New Mexico's antidegradation rule at 20.6.4.8 NMAC, and the federal antidegradation policy at 40 CFR 131.12. NMED is required by 40 CFR 131.12(a) to develop and adopt a statewide antidegradation policy and to identify methods for implementing that policy. The guidance generally includes:

- Processes for identifying the antidegradation protection level (i.e., the "*tier*") that applies to a surface water;
- Procedures for determining baseline water quality (BWQ);

- Approaches for evaluating water quality degradation;
- Procedures for identifying and evaluating less degrading or non-degrading alternatives*;*
- Procedures for determining the importance of economic or social development to support significant degradation of high quality surface waters; and,
- Information on intergovernmental coordination and public participation processes*.*

1.1 DESIGNATED USES AND WATER QUALITY CRITERIA

Water quality standards, including designated uses and associated water quality criteria can be found at 20.6.4 NMAC. Under the Clean Water Act (CWA) and New Mexico's surface water quality standards, various uses are assigned to surface waters. Designated uses include domestic water supply, irrigation and irrigation storage, primary contact, secondary contact, livestock watering, wildlife habitat, aquatic life, and fish culture and water supply. Designated uses are accompanied by an established set of *water quality criteria* designed to ensure that the designated uses are achieved. In accordance with state regulations, designated uses can be established or changed only through administrative rulemaking. Most surface waters have several designated uses. Where more than one use exists, or has been designated for a surface water, the use with the most stringent water quality criteria must be maintained and protected.

1.2 COVERAGE AND GENERAL APPLICABILITY

In general, the antidegradation implementation procedures described in this guidance apply to every proposal for a new or increased permitted discharge of a pollutant to a "surface water of the State." Permitted discharges are those discharges regulated under the authority of the CWA and discharges regulated pursuant to 20.6.2 NMAC that have the potential to impact surface water quality. These include National Pollutant Discharge Elimination System (NPDES) point source discharges regulated under Section 402 of the CWA; discharges which result in the placement of dredged or fill material into surface waters regulated under Section 404 of the CWA; and any discharge authorized by federal permits and licenses that are subject to state water quality certification under Section 401 of the CWA.

These procedures do not apply to non-point sources (NPS). In instances when significant degradation is determined to be a concern and NPS sources are impacting water quality, NMED will work with stakeholders to identify and implement best management practices, as described in the Nonpoint Source Management Plan.

These procedures also do not apply to other water quality-related actions, including revision of Commission documents (e.g., New Mexico Water Quality Standards, Continuing Planning Process, Statewide Water Quality Management Plan, and New Mexico Nonpoint Source Management Plan); the Commission's establishment of Total Maximum Daily Loads (TMDLs); or the conduct of studies, including use attainability analyses, by any party, including NMED. These types of water quality-related actions already are subject to extensive requirements for review and public participation, as well as various limitations on degradation imposed by state and federal law.

Section 3 summarizes the antidegradation review approach used in New Mexico, which is based on the type of regulated discharge under consideration (e.g., by permit type), the receiving water, and the BWQ for relevant pollutants of concern in the receiving surface water.

1.3 COORDINATION WITH ASSESSMENT AND IMPAIRMENT LISTING

Section 305(b) of the CWA requires each state to prepare and submit to the U.S. Environmental Protection Agency (EPA) a biennial report describing water quality of all surface waters in the state. Each state must monitor water quality and review available data to determine if water quality standards are being met. From the assessment, the CWA Section 303(d) List ("303(d) list") is created which identifies surface waters that do not meet water quality standards. These waters are known as water quality limited waters or impaired waters. Identification of a surface water as impaired may be based on a violation of a numeric or narrative water quality criterion. NMED's antidegradation policy implementation procedure (i.e., this appendix) assigns a protection category for the receiving water based on whether water quality standards are being met.

To coordinate antidegradation reviews with the 305(b) reporting and 303(d) listing activities, NMED will implement the following protections:

- *Tier 1 Protection (applicable to all waters):* No further degradation is permitted in a surface water where the most current water quality for that criterion does not meet, or meets but is not better than, the applicable water quality standards. Impaired waters are identified on New Mexico's 303(d) list and targeted for future water quality management planning (e.g., TMDLs, Watershed Based Plans (WBPs), etc.) to improve water quality and attain WQS.
- *Tier 2 Protection (applicable to perennial and intermittent waters where data confirm high-quality water is present):* Where possible, NMED may award priority points for grant or other funding programs that target water quality protection and restoration and support actions needed to protect and restore water quality. NMED may also revise the BWQ based upon more recent water quality data included in the biennial assessment of surface waters.
- *Tier 3 Protection (applicable to all waters designated as an ONRW):* No degradation is allowed in an ONRW, except in limited, specifically defined instances, such as to accommodate public health or safety activities or to enable activities to restore or maintain water quality, as outlined in 20.6.4.8(A)(3) and 20.6.4.8(A)(4) NMAC. For activities that may cause short-term degradation, NMED may award priority points for grant or other funding programs that target water quality protection and support actions needed to protect and restore water quality.

In addition, NMED participates in reviews for Clean Water State Revolving Funding. Applications are reviewed for compliance with water quality standards for both surface and groundwater, and projects that directly implement a fix to a water quality problem are awarded priority points to allow more rapid implementation of those projects. This results in a more proactive approach from the Department to restore or maintain water quality in surface waters across the state.

1.4 INTERGOVERNMENTAL COORDINATION AND REVIEW PROCESS

Federal and state regulations require intergovernmental coordination and public participation for Tier 2 reviews and public participation in decisions that may result in water quality degradation. Coordinating antidegradation reviews among various agencies and other interested parties will involve significant cooperation in gathering data, conducting evaluations, analyzing alternatives and evaluating potential social and economic impacts. A list of agencies that may be involved in the intergovernmental coordination and review process is included as Appendix A.5 of this document.

For comprehensive Tier 2 reviews on perennial waters, determining BWQ, evaluating projected impacts, analyzing possible alternatives, and evaluating economic or social benefits, if applicable, must occur prior to issuing an individual NPDES permit. Therefore, it is recommended that an applicant discharging into a perennial water meet with NMED in a pre-application conference at least one year prior to permit issuance. Timely notification and early consultation with NMED will help ensure that the issuance of permits can proceed without disruption to facility design, construction, or other activities planned by the applicant.

1.5 PUBLIC NOTIFICATION AND PARTICIPATION

Information on BWQ, designated uses, water quality standards, applicability of protection tiers, impact analyses, alternatives analyses, agency decisions, and other matters related to antidegradation reviews will be documented by NMED and made part of the public record. Public notification of proposed actions and requests for public comment will be made in accordance with Chapter 8 of this appendix.

2 Tiered Protection Levels

2.1 TIER DEFINITIONS

Federal law requires that surface waters be protected from discharges that might degrade water quality. To implement this requirement, it is necessary to identify antidegradation protection levels, or tiers, appropriate to each surface water. The state antidegradation rule at 20.6.4.8 NMAC delineates three tiers of protection for New Mexico surface waters. These tiers are applied on a pollutant-by-pollutant basis. Although Tiers are defined on a pollutant-by-pollutant basis, ONRWs are identified on a waterbody basis as described further below in this section and in NMAC 20.6.4.9(D) NMAC. Under this approach, surface water quality might degrade for one or more pollutants of concern but be unaffected for other pollutants. Degradation may be further described as *de minimis* (consumption of less than 10% of the assimilative capacity for a pollutant of concern) or significant (consumption of 10% or more of the assimilative capacity for a pollutant). Minimal (*de minimis*) degradation is permitted under the antidegradation rule and does not trigger comprehensive Tier 2 antidegradation review requirements. Significant degradation triggers the comprehensive Tier 2 antidegradation implementation procedures described below. The tiered protection levels are applied as follows:

> **Tier 1** – Applies as the default protection level for all surface waters, including intermittent waters, ephemeral waters, effluent dependent waters, and other surface waters and requires that water quality be maintained such that the existing and designated uses of the water are supported. Tier 1 prohibits further degradation of existing water quality where a pollutant of concern does not meet or meets but water quality is <u>not</u> better than applicable water quality criteria. Tier 1 protection for impaired waters apply only to those pollutants that resulted in the 303(d) listing**.**
>
> **Tier 2** – Applies to perennial surface waters with high quality water (i.e., where existing water quality is better than applicable water quality standards as determined on a pollutant-by-pollutant basis). Tier 2 requires that existing high-quality water be maintained but allows for limited (*de-minimis*) degradation. The Tier 2 protection level prohibits significant degradation unless a review of reasonable alternatives and social and economic considerations supports a lowering of water quality. Tier 2 may also apply to intermittent waters if data are available and indicate a high-quality water (i.e., water quality better than applicable WQS). Tier 2 is the default protection level for all high-quality perennial and intermittent waters (i.e., water quality is better than the applicable WQS).
>
> **Tier 3** – Applies only to New Mexico Outstanding National Resource Waters (ONRWs) identified in 20.6.4.9(D) NMAC. Tier 3 prohibits any degradation and lowering of water quality in an ONRW unless impacts are minimal and temporary. Approval for any degradation must be obtained according to the process outlined in 20.6.4.8(A)(3) and 20.6.4.8(A)(4) NMAC.

Antidegradation is more about levels of protection than it is about levels of quality. In fact, for Tier 3 it could be said that antidegradation is all about protection, as the outstanding character may have little to do with actual water quality in the traditional sense of pollutant concentrations (e.g., waters may have particularly high ecological value). Numeric water quality criteria are considered in an antidegradation analysis, however NMED takes other considerations into account as warranted. For example, Tier 3 (ONRWs) analyses require consideration of the essential character or special use that makes the water an ONRW, such as high ecological or recreational value.

Most of the involvement in the antidegradation policy is regarding Tier 2 waters. This tier is where antidegradation procedures can work to maintain high quality water and is also where dischargers may have to expend extra effort to reduce their proposed degradation of water quality or demonstrate that allowing lower water quality is necessary to accommodate important economic and social development in the area in which the water is located.

2.2 DESIGNATION OF TIER CATEGORY

At a minimum, all surface waters in New Mexico are protected in accordance with Tier 1 antidegradation requirements. Tier 1 applies categorically to all intermittent and ephemeral streams, effluent dependent waters, and all surface waters on the 303(d) list on a pollutant-by-pollutant basis. Where a surface water is listed on the state's 303(d) list for one or more pollutants, and where existing water quality for other pollutants is better than water quality standards, the surface water will be afforded Tier 1 and Tier 2 protection on a pollutant-by-pollutant basis. That is, Tier 1 protection for the pollutants not meeting water quality standards and Tier 2 protection for pollutants that are better than water quality standards.

Perennial waters, and possibly some intermittent waters, that are found to have existing water quality better than applicable water quality standards are protected at the Tier 2 level. For Tier 2 protection, determinations regarding the significance of degradation are based on BWQ and the relative change in water quality projected to result from the discharge under review. In general, BWQ, as discussed in Chapter 4 of this appendix, defines existing water quality for purposes of antidegradation reviews. BWQ can be established for surface waters through monitoring and water quality assessments conducted by NMED, regulated entities, or by others (e.g., contractors). Tier 3 protection applies to ONRWs listed in 20.6.4.9(D) NMAC. Tier 3 protection will be afforded for all pollutants of concern in an ONRW.

Where a perennial water has been assessed but has not been listed as an impaired water or as an ONRW, the presumed antidegradation protection level is Tier 2 for all pollutants of concern. If a protection tier has not already been determined for a perennial surface water, NMED will establish the tier by identifying the use(s) of the segment, determining BWQ, and comparing the attributes of the surface water under study to the criteria for the tiers as cited above.

Upon establishing the appropriate tier(s) for a surface water, NMED will document its findings along with BWQ characterization and make this information available as part of the public record. Tier levels established by NMED may be revised, or alternate tier assignments may be assigned when waters are added or removed from the 303(d) list or are added to the list of ONRWs (see 20.6.4.9(D) NMAC).

Table 2-1 summarizes decision criteria for assigning protection tiers and the antidegradation requirements for each. More information on conducting the antidegradation reviews for waters requiring Tier 2 and Tier 3 protection can be found in Chapter 3 of this document.

Table 2-1. Tier Descriptions and Summary of Antidegradation Protection Requirements

Tier	Waters Included	Protection Requirements
1	All surface waters that meet but are not better than applicable water quality criteria, i.e., not considered "high quality," as determined on a pollutant by pollutant basis. All surface waters on the state's 303(d) list of impaired waters for the pollutant that resulted in the listing. Intermittent waters.[1] All ephemeral waters. All effluent dependent waters.	The minimum level of protection necessary to maintain the existing and designated uses of a surface water. Where a surface water is impaired or meets, but water quality is not better than, applicable water quality criteria, there shall be no lowering of the water quality with respect to the pollutant causing the impairment. Tier 1 protection applies regardless of any economic or social benefits associated with a proposed discharge.
2	For intermittent[1] and perennial waters reflecting high-quality waters, i.e., where the level of water quality is better than applicable water quality criteria as determined on a pollutant-by-pollutant basis. Tier 2 is the default protection level for high-quality perennial and intermittent waters that are not ONRWs or on the 303(d) list.	High-quality water in perennial and intermittent (if known) streams and lakes must be protected at a level that minimizes degradation of that water quality. No significant degradation of the Tier 2 pollutants in the surface water is allowed unless a comprehensive antidegradation review of reasonable alternatives demonstrates that the lowering of water quality is necessary for important social and economic considerations in the area in which the waters are located.
3	ONRWs.	No new or expanded direct discharges. No lowering of water quality allowed unless it is minimized and temporary, *and* degradation is approved according to 20.6.4.8 NMAC.

[1] For intermittent waters, if water quality data are available and assessable, and indicate a high-quality water (i.e., water quality better than applicable WQS), then Tier 2 protection applies on a pollutant-by-pollutant basis.

3 Antidegradation Review Requirements

The antidegradation review procedure is based on the protection tier assigned to the receiving water, the type of receiving water, existing (i.e., baseline) water quality in the receiving water, the projected impacts, and nature of the proposed discharge.

In general, the antidegradation review requirements described in this guidance apply to regulated discharges that have the potential to degrade water quality. These include NPDES point source discharges regulated under Section 402 of the CWA; discharges which result in the placement of dredged or fill material into surface waters regulated under Section 404 of the CWA; and any discharge authorized by federal permits and licenses that are subject to state water quality certification under Section 401 of the CWA.

3.1 ANTIDEGRADATION REVIEW REQUIREMENTS BY TIER

Tier 1: Reviews to Protect Existing Uses

Tier 1 reviews must ensure that the level of water quality necessary to protect existing uses is maintained and protected. In general, the "level of water quality necessary to protect existing uses" is defined by state-adopted surface water quality standards.

General Applicability

Tier 1 protection applies to all surface waters. In determining whether a surface water is afforded only Tier 1 protection, NMED will focus on whether the surface water meets or fails to meet applicable WQS.

Impaired Waters

For surface waters listed as impaired on the 303(d) list and for those waters that meet but are not better than the water quality criteria for a particular designated use, Tier 1 protection will be provided for the listed pollutants. Non-listed pollutants in 303(d) listed waters and those surface waters that are of high-quality may be afforded Tier 2 protection. Under Tier 1, no discharges will be permitted to cause further degradation for pollutants that do not meet applicable water quality standards. Where existing uses of a surface water are impaired, there will be no lowering of the water quality with respect to the pollutant(s) of concern causing the impairment.

Non-Perennial and Effluent Dependent Waters

Lack of flow in ephemeral and intermittent waters makes it difficult to characterize BWQ and conduct Tier 2 antidegradation reviews. Similarly, lack of flow and/or the nature of flow in effluent dependent waters also makes these waters difficult to characterize, other than simply characterizing the effluent being discharged. These non-perennial waters will receive Tier 1 protection for all pollutants of concern unless there is sufficient BWQ data to demonstrate a high-quality water for intermittent waters to which a Tier 2 evaluation would be appropriate. Applicable WQS must be maintained and protected for these surface waters.

For example, certain individual and general permit applicants will likely discharge to a non-perennial stream segment where there is no other existing discharge to the segment, little or no flow in the channel beyond the immediate area of the discharge, and no available ambient water quality data. No BWQ

evaluation will be required for these discharges. Antidegradation reviews for most discharges to non-perennial waters will focus on requirements that applicable WQS be met end-of-pipe (unless ambient water quality data are available for a BWQ evaluation), and technology-based requirements, e.g., best available technology (BAT), are applied as required by permit conditions. Antidegradation review for NPDES individual municipal separate storm sewer system (MS4) and general permits as well as dredge or fill permits under Section 404 of the CWA for will focus on meeting WQS in receiving waters by ensuring compliance with the permit or state certification of the permit pursuant to Section 401 of the CWA.

General (Narrative) Criteria under 20.6.4.13 NMAC

Total Dissolved Solids (TDS) – NMED will follow the guidance laid out in the Colorado River Salinity Control Forum. Compliance with the Forum requirements will be considered to meet the intent of the narrative standard.

Plant Nutrients – NMED will evaluate nutrient discharges in accordance with available thresholds (i.e., translators) and will use applicable thresholds for the Tier 1 antidegradation review. A similar approach has been taken with Raton and Santa Fe WWTPs, capping the facilities at their current level of discharge/degradation. Depending on the data available, limits will be derived using a percentile of the data set (85^{th}, 95^{th}, etc.) that is reasonably achievable and still maintains and protects existing water quality. There are no technologically based effluent limits (TBELs) available for nutrients for publicly-owned treatment works (POTWs) at this time, but based on the type of treatment system available, NMED will work with the facility to incorporate limitations that maintain or reduce current levels of nutrient loading.

Other General Criteria – If a narrative standard does not have associated numeric thresholds or translators, NMED will not evaluate the narrative standard for antidegradation purposes due to the impracticality of such an evaluation.

Tier 2: Reviews to Protect High Quality Waters

Tier 2 protection applies to high quality perennial and intermittent (if data are available and assessable) waters with water quality better than applicable WQS, as determined on a pollutant-by-pollutant basis. Existing water quality in high quality surface waters must be maintained and protected. Tier 2 prohibits significant degradation unless a review of reasonable alternatives and social and economic considerations support a lowering of water quality, and after opportunity for intergovernmental review and public comment and hearing. If degradation is allowed, it must not result in a violation of applicable WQS.

General Applicability

Any regulated discharge to a high quality water is subject to Tier 2 antidegradation review to determine if the discharge will significantly degrade water quality. Determinations issued under these provisions will be made in accordance with the public notification process described in Chapter 8 of this appendix. If NMED determines after an initial evaluation that comprehensive Tier 2 review requirements do not apply to a proposed discharge, the discharge must still achieve the requirements of the permit or conditions of the water quality certification.

Basic vs. Comprehensive Tier 2 Review

A basic Tier 2 antidegradation review is used to determine whether or not significant degradation will occur from a regulated discharge, i.e., whether or not 10% or more of the available assimilative capacity

for any pollutant of concern will be consumed as a result of the proposed discharge during critical flow conditions or any consumption of assimilative capacity that exceeds a cumulative cap of 50% of assimilative capacity. The BWQ and applicable WQS must be reviewed as part of a basic Tier 2 antidegradation review.

A comprehensive Tier 2 antidegradation review, which includes an alternatives analysis and social and economic demonstration for the degradation, is required for any new or expanded discharge that may significantly degrade a Tier 2 protected water.

No comprehensive Tier 2 antidegradation review is required for discharges regulated under a general NPDES permit or a Section 404 dredge or fill permit. These discharges will be required to meet the conditions of the general permit or Section 401 water quality certification.

Tier 3: Reviews to Protect Outstanding New Mexico Waters

Existing water quality in ONRWs must be maintained and protected. Any discharge that would degrade existing water quality in an ONRW is prohibited, unless the applicant demonstrates that the water quality impacts are temporary and necessary for public health and safety or restoration, and the applicant receives approval for the activity according to the process in 20.6.4.8 NMAC.

General Applicability

Tier 3 protection applies only to surface waters that are classified as ONRWs and identified under 20.6.4.9(D) NMAC.

Tier 3 Review

Discharges that impact ONRWs are subject to Tier 3 antidegradation review. New or expanded discharges that may cause degradation directly to an ONRW identified under 20.6.4.9(D) NMAC are prohibited, except in limited, specifically defined and temporary events, such as to accommodate public health or safety activities or to enable activities to restore or maintain water quality, as outlined in 20.6.4.8.A(3) and (4) NMAC. In general, temporary is defined as occurring for a period of six months or less and is not recurring. In addition, NMED will impose necessary controls on indirect discharges that occur upstream or to tributaries of an ONRW to maintain and protect existing water quality in the downstream ONRW.

Determinations regarding antidegradation reviews for activities that affect ONRWs, such as public health or safety activities or activities to restore or maintain water quality, will be made on a case-by-case basis after consideration of the following factors outlined in 20.6.4.8(A)(3) and 20.6.4.8(A)(4) NMAC:

- The degradation shall be limited to the shortest possible time and shall not exceed six months;
- The degradation shall be minimized and controlled by best management practices or in accordance with permit requirements as appropriate; all practical means of minimizing the duration, magnitude, frequency and cumulative effects of such degradation shall be utilized;
- The degradation shall not result in water quality lower than necessary to protect any existing use in the ONRW; and
- The degradation shall not alter the essential character (e.g., exceptional recreational or ecological significance) or special use (e.g., state special trout water; national or state park, monument, wildlife refuge; designated wilderness or wild river) of the ONRW, as supported by the proceedings and final decision establishing the water as an ONRW.

Prior to the WQCC's decision, NMED will provide a written recommendation to the commission. This recommendation will take into account the following factors:

- Change in ambient concentrations predicted at the appropriate critical flow condition(s)
- Change in loadings (i.e., the new or expanded loadings compared to total existing loadings to the segment)
- Reduction in available assimilative capacity
- Nature, persistence and potential effects of the pollutant
- Potential for cumulative effects
- Degree of confidence in the various components of any modeling technique utilized (e.g., degree of confidence associated with the predicted effluent variability)

The antidegradation review findings must be documented and public participation activities initiated, as per the procedures in 20.6.4.8(3)(a) NMAC. If the review finds that the proposed discharge will not be temporary, the proposed discharge will be denied. In all cases, Tier 1 protection must be maintained.

Emergency Response Action

If an emergency response action is occurring in proximity to an ONRW and is necessary to mitigate an immediate threat to public health or safety, it may proceed prior to notification to the WQCC and NMED, in accordance with the following as outlined in 20.6.4.8(A)(3)(c) NMAC:

- only actions that mitigate an immediate threat to public health or safety may be undertaken pursuant to this provision; non-emergency portions of the action shall comply with the requirements of 20.6.4.8 NMAC;
- the discharger shall make best efforts to comply with requirements noted above;
- the discharger shall notify the department of the emergency response action within seven days of initiation of the action; and,
- within 30 days of initiation of the emergency response action, the discharger shall provide a summary of the action taken, including all actions taken to comply with the requirements above.

Upstream Discharges & Tier 3 Review

A discharge upstream of an ONRW is prohibited where the proposed discharge would degrade existing water quality of the downstream ONRW on a longer than temporary basis. To determine whether the proposed discharge will result in the lowering of water quality in the downstream ONRW, the following factors may be considered:

- Change in ambient concentrations predicted at the appropriate critical flow condition(s)
- Change in loadings (i.e., the new or expanded loadings compared to total existing loadings to the segment)
- Reduction in available assimilative capacity
- Nature, persistence and potential effects of the pollutant
- Potential for cumulative effects
- Degree of confidence in the various components of any modeling technique utilized (e.g., degree of confidence associated with the predicted effluent variability)

If a preliminary determination is made that the requirements above will be met, the antidegradation review findings must be documented and the applicable public participation activities must be initiated. If the review finds that the proposed discharge will result in the lowering of water quality in a downstream ONRW, the proposed discharge will be denied.

3.2 ANTIDEGRADATION REVIEW REQUIREMENT BY TYPE OF PERMIT

Antidegradation review requirements for regulated discharges that may degrade water quality vary according to 1) classification, existing uses, and condition of the receiving water; 2) the type of discharge and permit under which the discharge is conducted; and 3) the range and severity of projected impacts on the surface water. For example, antidegradation review requirements for discharges authorized under general permits differ from antidegradation review requirements for discharges regulated by individual permits. This section outlines the antidegradation review requirements for regulated discharges that may degrade water quality, including those with individual and general NPDES permits and those covered under Section 404 of the CWA (Dredge or Fill permits).

Compliance with the requirements of general permits and prompt attention to conditions that might result in water quality degradation will help ensure that discharges authorized by general permits do not cause violations of WQS. Moreover, some new or expanded discharges formerly authorized by a general permit may not be eligible for such coverage in the future if NMED believes they could significantly degrade a surface water. In those cases, applicants will be required to seek coverage under an individual permit.

In order to implement New Mexico's antidegradation policy in an efficient manner, it is recommended that persons proposing individually-permitted discharges which might degrade water quality in a perennial water notify NMED before determining BWQ (see Chapter 4 of this appendix) or applying for a permit. Such an approach will help ensure that the antidegradation review proceeds smoothly, without delay, and that planned facilities will comply with applicable statutes and rules. Figure 3-1 summarizes the Tier 2 review process for individual NPDES permit reissuance and new or expanded NPDES permits. Figure 3-2 summarizes the review requirements for individual NPDES; NPDES Stormwater Permits; general NPDES permits; individual and nationwide Section 404 permits, and federal permits and licenses subject to Section 401 water quality certification.

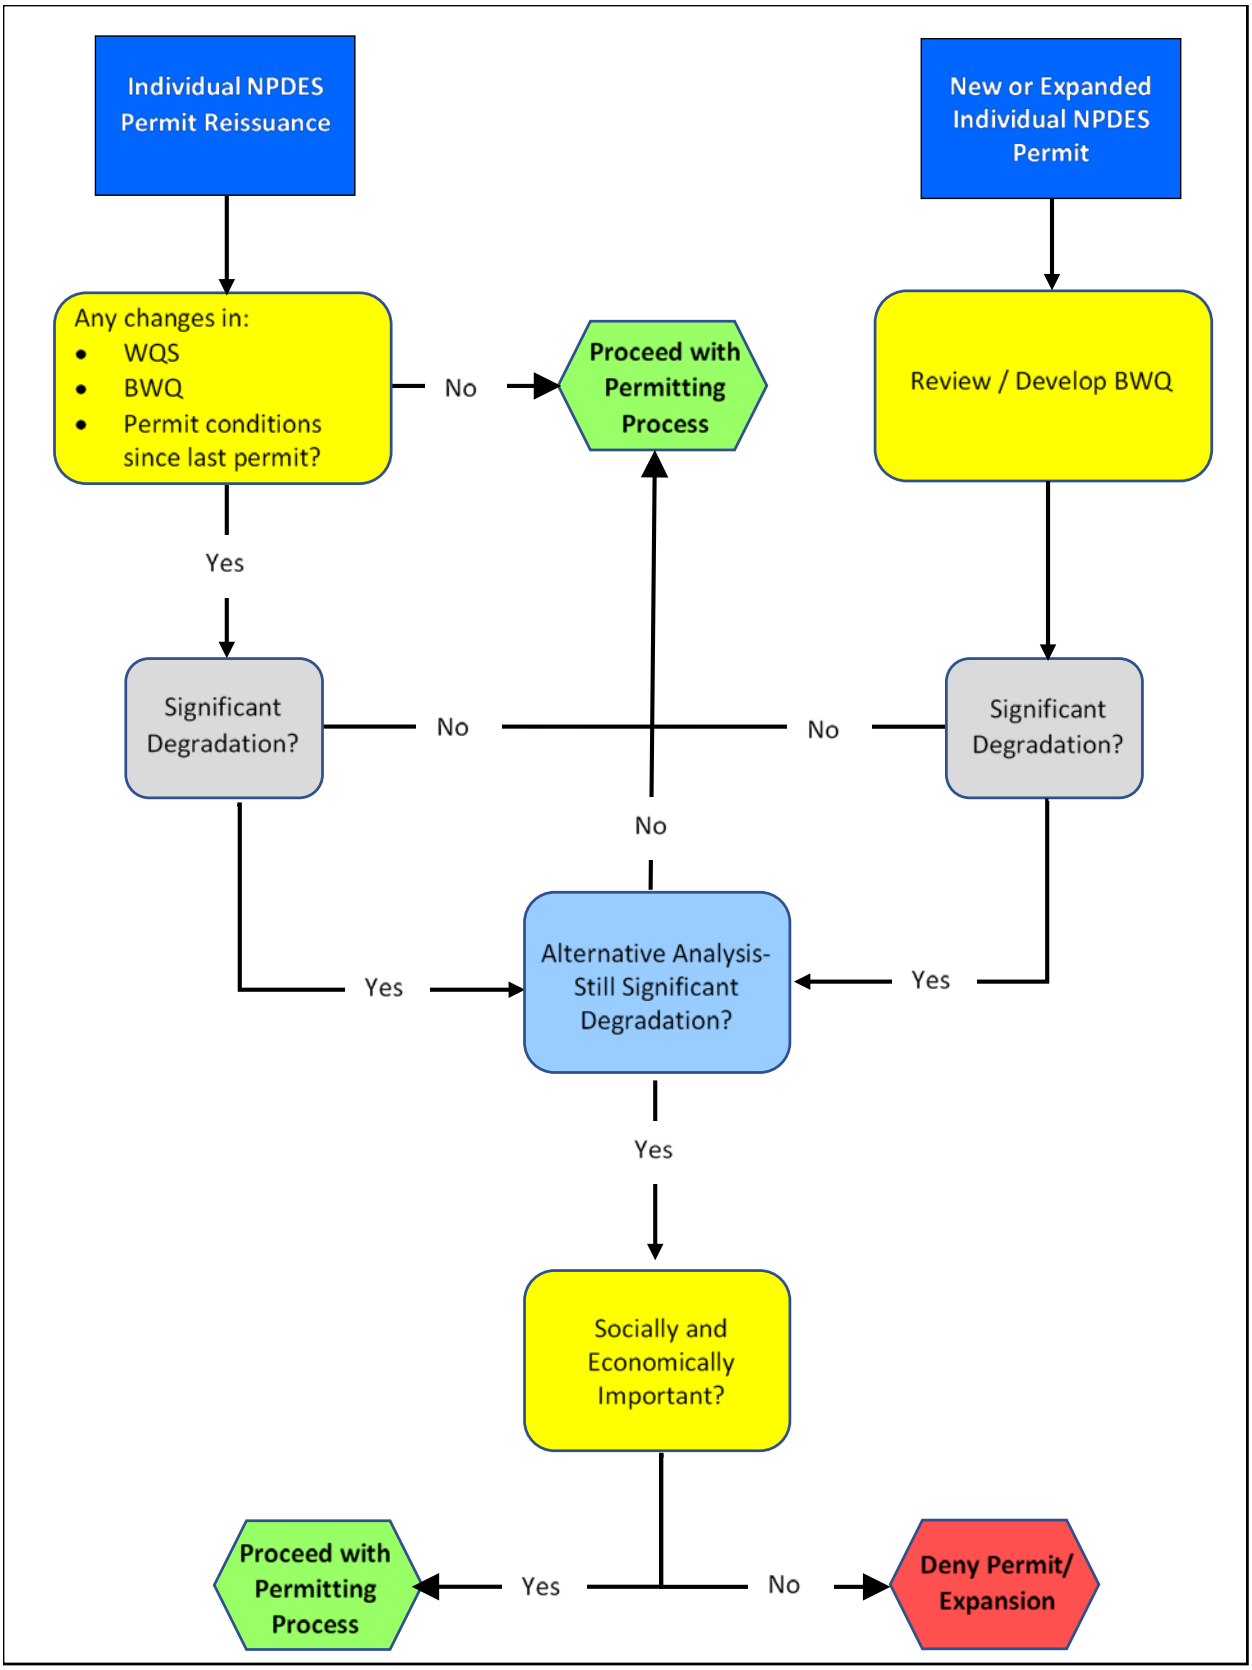

Figure 3-1. Tier 2 Antidegradation Review Process for Individual NPDES Permits

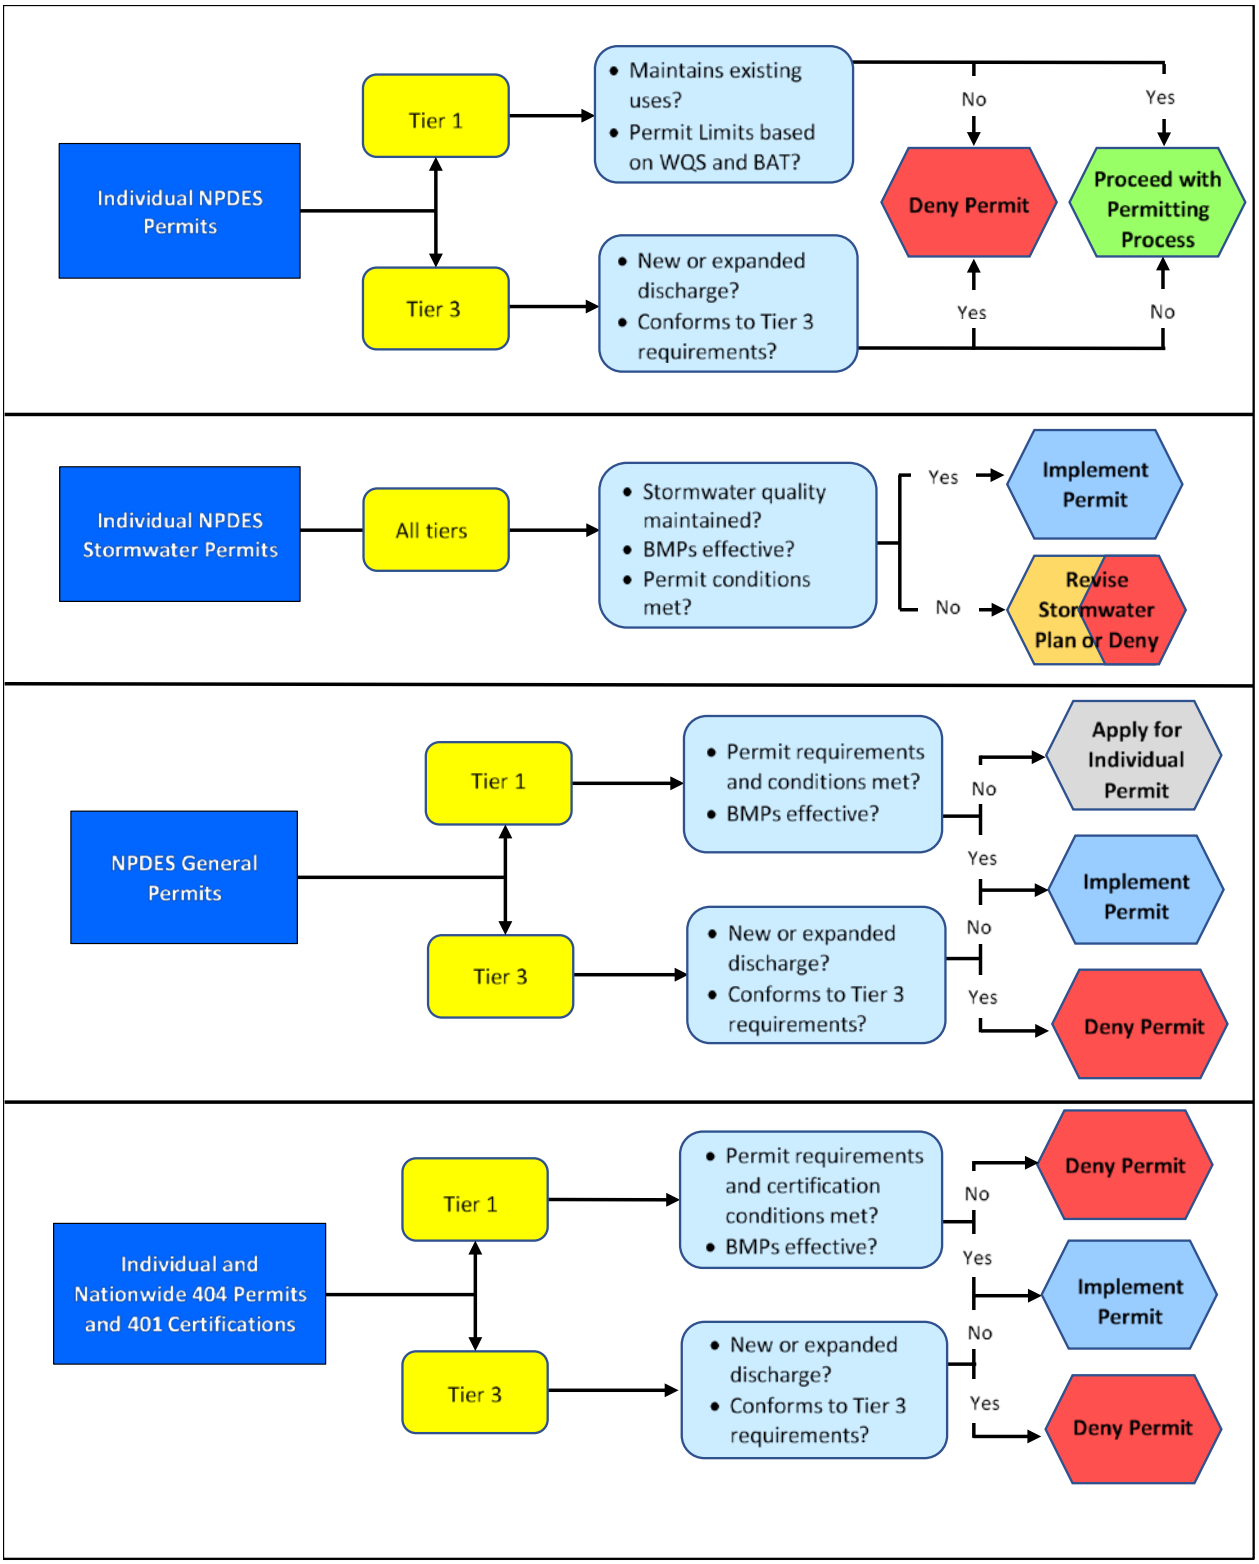

Figure 3-2. Antidegradation Review Requirements by Permit Type

3.3 INDIVIDUAL NPDES PERMITS

General Applicability

All point source discharges regulated by individual NPDES permits are subject to an antidegradation review at the time of issuance, modification, or renewal of a permit. All NPDES permits must ensure that water quality is protected at the appropriate tier based on available water quality information; however, at a minimum, the level of water quality necessary to maintain existing uses must be maintained and protected.

Reasonable Potential for Minor POTWs

Facilities less than 0.1 million gallons per day (MGD) are not required to sample or report any toxic substances on their NPDES permit applications, since studies indicated they have "no reasonable potential" to discharge toxic substances in amounts that would violate state WQS. Facilities greater than 0.1 MGD, but less than 1 MGD report some toxic substances that are present in facility discharges of that size.

Supporting information for this decision was published by EPA as "Evaluation of the Presence of Priority Pollutants in the Discharges of Minor POTW's," June 1996, and was sent to all state NPDES coordinators by EPA Headquarters. In this study, EPA collected and evaluated data on the types and quantities of toxic pollutants discharged by minor POTWs of varying sizes from less than 0.1 MGD to just under 1 MGD. The Study consisted of a query of the EPA Permit Compliance System (PCS) database from 1990 to 1996, an evaluation of minor POTW data provided by the State agencies, and on-site monitoring for selected toxics at 86 minor facilities across the nation.

Therefore, in the cases of facilities under 0.1 MGD, these facilities have already been assessed as having no reasonable potential to discharge toxic substances in toxic amounts. Additional historical records may provide information to assess reasonable potential.

Overview of the Antidegradation Review Procedure

The antidegradation review for individual NPDES permits will be based upon the assigned protection tier, the existing uses of the segment, applicable WQS, flow regime of the receiving water, pollutants of concern associated with the discharge, projected impacts on the receiving water, cumulative impacts from other pollutant sources, and the significance of any degradation that might occur as a result of the discharge.

All applicants will be required to identify pollutants reasonably expected to be in the discharge, estimate flow rates, and characterize pollutant concentrations and/or mass pollutant loads, as specified by NMED. In addition, applicants for new and expanded discharges to perennial waters under an individual permit are required to collect and submit existing or new information on BWQ needed to analyze the impact(s) of the discharge to a perennial water if ambient water quality data are not available. For the purpose of this analysis, expanded means an increase in design flow of the facility. In many cases, NMED's current water quality monitoring (conducted on a rotating basis in watersheds across the state) will provide applicable baseline data for use in these evaluations; however, for certain cases, the applicant may need to generate additional data for consideration in the antidegradation analysis if there are atypical pollutants of concern that are not normally monitored by NMED. For intermittent streams, the applicant

may choose to collect and submit water quality data for BWQ, which will help to evaluate appropriate and protective limits that may not be end-of-pipe requirements.

If feasible, it is recommended that an applicant discharging to a perennial water meet with NMED in a pre-application conference at least one year prior to individual NPDES permit issuance because of the substantial information requirements associated with development of effluent limits and, if necessary, a comprehensive Tier 2 antidegradation review.

Permit Limits and Antidegradation Requirements for Individual Permits

During the permit development process, EPA Region 6 will coordinate with NMED, who will evaluate existing water quality using both internal and applicant-supplied data, identify designated uses of the receiving water and analyze the impacts of the discharge as well as cumulative discharges that might affect the assimilative capacity of the receiving surface water for relevant pollutants of concern. Individual permit limits for discharges to perennial waters will be based upon applicable effluent guidelines, the characteristics of the discharge, and analyses designed to ensure that no significant degradation of the receiving water occurs. Permit limits for discharges to ephemeral, intermittent, and effluent dependent waters will be based on the WQS and EPA effluent guidelines and other technology-based requirements (e.g., secondary treatment requirements, BAT, MEP). Regardless of hydrology, all permit limits must ensure that existing uses are maintained and protected. NMED will use its authority under Section 401 of the Clean Water Act to conditionally certify federal permits that authorize discharges to Waters of the United States where the antidegradation analysis shows that stricter water quality controls are needed.

Proposed new or expanded discharges that may significantly degrade waters protected at the Tier 2 level must undergo a comprehensive antidegradation review to determine whether less degrading or non-degrading alternatives exist and whether significant degradation is necessary to accommodate important economic or social development in the area where the surface water is located. As it pertains to implementation of New Mexico's antidegradation policy, significant degradation is defined as the consumption of 10% or more of assimilative capacity of the receiving water for any pollutant of concern associated with the discharge during critical flow (e.g., 4Q3) conditions or any consumption of assimilative capacity that exceeds a cumulative cap of 50% of available assimilative capacity.

Early notification and consultation between the applicant, EPA, and NMED will help ensure that the NPDES permitting process proceeds efficiently. The following steps outline the general procedure for processing an NPDES permit:

- Applicant notifies NMED and EPA Region 6 of intent to apply for or renew permit coverage
- EPA determines eligibility for general permit or individual permit coverage
- Applicant consults with NMED on BWQ and available assimilative capacity in the receiving waterbody.
- NMED conducts antidegradation review and drafts a letter to document BWQ and available assimilative capacity; determination of minimal/significant degradation; and if a comprehensive Tier 2 antidegradation review is required. The letter is mailed to EPA and the permittee.
- If required, undergo comprehensive Tier 2 antidegradation review (alternatives analysis, economic/social documentation) – see Chapters 6 & 7 of this appendix.
- If significant degradation is deemed necessary based on the comprehensive Tier 2 review, conduct public participation and intergovernmental coordination consistent with Chapter 8 of this appendix.

- Applicant applies for permit after consultation with NMED.
- EPA (in consultation with NMED) develops draft permit limits based on effluent guidelines, applicable WQS, BWQ (if required), and antidegradation requirements.
- NPDES permitting process/comment period addresses both public notice requirements for antidegradation review and NPDES permitting.
- NMED prepares a Section 401 Water Quality Certification.
- Final permit drafted and issued.

Applicants seeking individual permit coverage for new or expanded discharges to a perennial surface water will be required to provide or collect BWQ information on pollutants of concern (e.g., pH, metals), if that information is not available (see Chapter 4). Data collection may be required depending on the availability of water quality data, nature of the proposed discharge, and the pollutants reasonably expected in the discharge.

Comprehensive Tier 2 Antidegradation Review Procedure for New or Expanded Discharges to Perennial Waters Requiring an Individual NPDES Permit

Degradation under Tier 2 will be deemed significant if the new or expanded discharge requiring an individual NPDES permit results in a reduction of available assimilative capacity (the difference between the BWQ and the applicable water quality criterion) of 10% or more at the defined critical flow condition(s) for the pollutant(s) of concern or any consumption of assimilative capacity that exceeds a cumulative cap of 50% of available assimilative capacity for the pollutant(s) of concern. Significant degradation will be determined on a pollutant-by-pollutant basis.

It should be noted that pollutants of concern for Tier 2 antidegradation reviews include those pollutants reasonably expected to be present in the discharge for which a numeric water quality criterion exists. If multiple water quality criteria apply, assimilative capacity will be calculated using the most stringent applicable WQS.

If a determination is made that significant degradation will occur, NMED will determine whether significant degradation is ***necessary*** by evaluating whether reasonable and cost-effective, less degrading or non-degrading alternatives to the proposed new or expanding discharge exist. The applicant will be responsible for conducting an alternatives analysis as described in this guidance. NMED will evaluate the alternatives analysis submitted by an applicant for consistency with the requirements outlined in Chapter 6. The alternatives analysis must provide substantive information on all reasonable, cost effective, less degrading or non-degrading alternative. Alternatives may include:

- Pollution prevention measures
- Reduction in scale of project
- Water reuse
- Treatment process changes
- Innovative treatment technology or technologies
- Advanced treatment technology or technologies
- Seasonal or controlled discharge options to avoid critical flow periods
- Improved operation and maintenance of existing treatment systems
- Alternative discharge locations, including subsurface discharges
- Zero discharge alternatives

As a rule of thumb, NMED will consider non-degrading or less degrading pollution control alternatives with costs that are less than 110 percent of the base costs of the pollution control measures associated with the proposed discharge to be cost-effective and reasonable (see Chapter 6.4 of this appendix).

If it is determined that reasonable, cost-effective, less degrading or non-degrading alternatives to the proposed discharge exist, the project design must be revised accordingly. In general, if such alternative(s) exist, the alternative or combination of alternatives that result in the least degradation must be implemented. If the regulated entity does not agree to adopt such reasonable and cost-effective alternatives, the alternatives analysis findings will be documented and the discharge will not be allowed. If significant degradation would occur even after application of reasonable less degrading or non-degrading alternatives, a determination must be made as to whether the proposed discharge is necessary to accommodate important economic or social development in the area in which the waters are located. NMED will evaluate the social and economic documentation for consistency with the requirements outlined in Chapter 7.

If the proposed discharge is determined to have social or economic importance in the area where the surface water is located, the basis for that preliminary determination will be documented and the Tier 2 review will continue. If significant degradation is proposed, the applicant also must show that the highest requirements for new and existing point source discharges are achieved, that all cost-effective and reasonable best management practices for non-point source pollution control are identified and effectively implemented and that Tier 1 protection is provided.

Tier 2 reviews include the public participation provisions outlined in Chapter 8. Once the intergovernmental coordination and public participation requirements are satisfied, NMED will make a final determination concerning the social or economic importance of the proposed discharge. All key determinations, including determinations to prohibit the discharge, must be documented and made a part of the public record (40 CFR 131.12 (b)).

3.4 INDIVIDUAL NPDES STORMWATER PERMITS

Urban areas with populations greater than 100,000 based on the 1990 census were considered Phase I Municipal Separate Storm Sewer Systems (MS4) communities and were required to apply for an individual NPDES stormwater permit. Urban areas as defined in the 2000 and subsequent census surveys every 10 years are considered Phase II MS4 communities. Stormwater discharges from Phase II MS4s are authorized by individual or general NPDES stormwater permits. However, neither Phase I nor Phase II MS4s authorized under individual stormwater permits are required to meet the same antidegradation requirements that apply to other individual NPDES permits outlined above.

In addition to MS4s, other entities can be required to obtain an individual NPDES stormwater permit by EPA on a case by case basis.

Overview of the Antidegradation Review for Individual Stormwater Permits

Antidegradation reviews for individual NPDES stormwater permits will be based on an adaptive management approach. This approach may include routine monitoring of stormwater quality at representative outfalls to adequately characterize stormwater discharges. The permittee will then evaluate, through effectiveness monitoring, whether storm water quality is being maintained, improving, or degrading and whether Best Management Practices (BMPs) identified in the permittee's stormwater pollution prevention plan are effective at controlling the discharge of pollutants. Future antidegradation

review of individual NPDES stormwater permits will consist of an analysis of the effectiveness of the BMPs and compliance with the requirements of the stormwater permit.

3.5 GENERAL NPDES PERMITS

A number of discharges to surface waters are authorized under general NPDES permits. These include stormwater runoff from municipalities required to comply with the Phase II MS4 stormwater permit, industrial activities covered by the stormwater program (Multi Sector General Permits), stormwater from construction sites one acre or larger (Construction General Permits), pesticide applications in or adjacent to surface waters (Pesticide General Permit), and concentrated animal feeding operations (CAFOs).

All NPDES general permits require preparation of a stormwater pollution prevention plan (SWPPP) that includes identification and control of all pollutants associated with the activities to minimize impacts to water quality. The permits also include requirements to implement site-specific interim and permanent BMPs and/or other controls to reduce (or eliminate) pollutant loading to minimize impacts to water quality. BMPs are designed to prevent to the maximum extent practicable an increase in pollutant load to the water body. BMPs also include measures to reduce flow velocity to assure that applicable water quality standards, including the antidegradation policy, are met. Compliance with the terms and conditions of the general permits is required to maintain authorization to discharge under the general permit. Discharges covered by a general permit that do not comply with general permit conditions or antidegradation requirements will be required to seek coverage under an individual permit.

Overview of the Antidegradation Review for General Permits

Regulated discharges authorized by general permits are not required to undergo a Tier 2 antidegradation review as part of the permitting process. However, new and reissued general permits must be evaluated to consider the potential for significant degradation as a result of the permitted discharges.

Discharges covered by general permits are transient or essentially non-existent (e.g., “no discharge”) with temporary or short-term impacts. Further, dischargers seeking coverage under a general permit are required in their SWPPP to identify pollutants on a pollutant-by-pollutant basis and to design and implement controls to minimize impacts to water quality. As a result, discharges that comply with general permits are not likely to cause significant degradation of water quality. In addition, activities covered under general permits (e.g., construction, industries, municipalities, dairies, feedlots, etc.) are considered to have social and economic importance to New Mexico. Therefore, antidegradation review for general permits will be based on whether or not the permit conditions are met and if the BMPs are effective at limiting (or eliminating) pollutant loading to minimize water quality impacts.

3.6 SECTION 404 PERMITS

Section 404 of the CWA regulates the placement of dredged or fill material into the “waters of the United States.” The U.S. Army Corps of Engineers (Corps) administers the permit program dealing with these discharges (e.g., wetland fills, in-stream sand/gravel work, etc.), in cooperation with the EPA and in consultation with other public agencies. Individual permits are issued for discharges with significant impacts. Discharges covered under Section 404 permits include any activity that results in the placement of dredged or fill material within the ordinary high-water mark of the waters of the U.S. or within wetlands recognized as waters of the U.S.

Overview of the Antidegradation Review for Regional or Nationwide Permits under Section 404 of the CWA

Antidegradation reviews involving the placement of dredged or fill material will be performed via the water quality certification process under Section 401 of the CWA. New Mexico manages its Section 401 water quality certification program to ensure that discharges resulting in the placement of dredged or fill material into surface waters do not cause water quality impairments or significant degradation of surface waters. New Mexico certifies general Section 404 permits ("regional" permits issued by the Albuquerque district of the Corps, and "nationwide" permits issued at the national level) in advance of individual projects that will be covered by the permits. New Mexico denied certification of the 2017 nationwide permits for projects in ONRWs, except for projects covered by Nationwide Permit 27 (for "Aquatic Habitat Restoration, Enhancement, and Establishment Activities"). Pursuant to Section 404, the Corps requires dischargers to obtain specific authorization from the Corps before commencing a discharge under a nationwide or regional permit. A Corps notification requirement (Regional Condition 2b) coupled with a state Section 401 certification condition provides NMED the opportunity to review projects proposed for authorization under a nationwide permit and confirm their consistency with the existing Section 401 certification. This review process often results in improvements in project design and BMP selection and ensures compliance with the antidegradation policy.

For new nationwide Section 404 permits, new regional Section 404 permits, or projects covered by existing Section 404 permits that have not yet received Section 401 certification (as of 2020, projects located in ONRWs and not covered by Nationwide Permit 27), NMED considers developing new Section 401 certifications. Based on this review, NMED may make one of three decisions: 1) grant the certification, 2) grant the certification with conditions, or 3) deny the certification.

NMED's Surface Water Quality Bureau (SWQB) will use the Section 401 certification process to evaluate whether a discharge will cause significant degradation to water quality. Pollutant loads from dredge or fill projects regulated under Section 404 of the CWA are often difficult or impossible to quantify in the same manner as practiced in NPDES permits. Dredge or Fill permits are often used for temporary construction measures in or near a watercourse that may result in disturbance or deposition of sediments in the water. The primary tool for limiting the discharge of pollutants (e.g., sediment and contaminated sediment) from these activities is through certification conditions mandating the installation and operation of BMPs that prevent pollutant transport to a watercourse and thereby degradation. The SWQB reviews dredge or fill projects pursuant to the State's water quality certification procedures as described under 20.6.2.2002 NMAC and Section 401of the CWA. To protect and maintain water quality, the SWQB has long employed a strategy of requiring the implementation of BMPs that are designed to prevent to the maximum extent possible the discharge of pollutants to a surface water.

Under the BMP-based approach adopted by New Mexico, regulated discharges that qualify for coverage under the Corps regional or nationwide Section 404 permits that have been certified by the state pursuant to Section 401 of the CWA will not be required to undergo a formal antidegradation review at the time of submitting a Preconstruction Notification and receiving authorization to discharge under the nationwide permit. Antidegradation requirements will be deemed to be met if all appropriate and reasonable BMPs related to erosion and sediment control, project stabilization, and prevention of water quality degradation (e.g., preserving vegetation, stream bank stability, and basic drainage hydrology) are applied and maintained. Applicants desiring to fulfill antidegradation review requirements under this approach will be responsible for ensuring that nationwide permit requirements and relevant water quality certification conditions are met.

Regulated discharges that may degrade waters protected at the **Tier 3** level must comply with the antidegradation requirements applicable to that protection level (i.e., only temporary impacts are allowed as authorized under procedures laid out in 20.6.4.8(A)(3) and 20.6.4.8(A)(4) NMAC) before a certification will be granted under Section 401 of the CWA. Any discharge authorized under an individual or nationwide permit (with the exception of Nationwide Permit 27) under Section 404 of the CWA currently requires an individual certification if it will discharge to an ONRW to ensure that impacts will be temporary.

NMED reserves the right to make case-specific determinations regarding the implementation of this approach during the Section 404 permitting or Section 401 water quality certification processes, which must be completed prior to the commencement of any discharges that result in the placement of dredged or fill material into New Mexico surface waters.

Impacts to Downstream or Adjacent Waters

It is important to note that where a discharge covered by a regional or nationwide general permit under Section 404 of the CWA, the permit only applies to the site of the fill and does not apply to activities or conditions downstream of or adjacent to the site of the fill.

Certain nationwide and regional permits require individual certification by the State of New Mexico in accordance with Section 401 of the CWA. During that individual certification process, NMED will evaluate any potential impacts to downstream waters and incorporate certification requirements to ensure compliance with all aspects of the antidegradation rule.

Overview of the Antidegradation Review for Individual Permits Under Section 404 of the CWA

The decision-making process for individual Section 404 permits is contained in the Section 404(b)(1) guidelines and contains all of the required elements for a Tier 1 and Tier 2 antidegradation review. (40 CFR Part 230). Prior to issuing a permit under the Section 404(b)(1) guidelines, the Corps must: 1) make a determination that the proposed discharges are unavoidable (i.e., necessary); 2) examine alternatives to the proposed discharge and authorize only the least damaging practicable alternative; and 3) require mitigation for all impacts associated with the discharge. A Section 404(b)(1) findings document is produced as a result of this procedure and is the basis for the permit decision. Public participation is also provided for in this process. Because the Section 404(b)(1) guidelines meet the requirements of a Tier 1 and Tier 2 antidegradation review, NMED will not conduct a separate review for the proposed discharge. Tier 1 and Tier 2 antidegradation review will be met through Section 401 certification of individual Section 404 permits and will rely upon the information contained in the Section 404(b)(1) findings document. Any discharge to a Tier 3 water authorized under an individual or nationwide permit under Section 404 (with the exception of Nationwide Permit 27) currently requires an individual Section 401 certification.

4 Determining Baseline Water Quality

Existing – or Baseline Water Quality (BWQ) – provides the reference against which predicted degradation associated with a regulated discharge is measured. This section describes how BWQ is characterized through:

- Establishment of BWQ information for perennial surface waters using existing water quality data.
- Approaches which consider the size and potential impacts of the proposed discharge when determining data needs for BWQ characterization and antidegradation review.
- Cooperative action by both NMED and the applicant to generate BWQ information where few or no data exist.

4.1 SUMMARY OF APPROACH

BWQ is used to evaluate an activity or discharge and determine whether it will degrade or lower water quality. Only an activity or discharge that might cause degradation is subject to a Tier 2 antidegradation evaluation. This evaluation is performed for each parameter or pollutant of concern for which the surface water is afforded Tier 2 protection.

In general, BWQ for perennial waters will be based upon existing data collected under NMED monitoring and assessment programs. Evaluations of BWQ will seek to gather information on pollutants of concern reasonably expected to be in discharges regulated by an individual NPDES permit, including suspended and settleable solids, sediment, nutrients, bacteria, biological oxygen demand, and metals. Information about other pollutants of concern will be handled on a case by case basis.

Where no, or few, data exist, NMED will advise the applicant on what data are needed and provide guidance to the applicant on how to collect and report the needed information to NMED. For perennial waters, the priority approach for evaluating BWQ is to use existing water quality data where available. Where adequate data are not available, the second priority approach is to collect BWQ data. Note that due to the lack of flow on intermittent, ephemeral, and effluent dependent, these types of surface waters will be subject to Tier 1 protection levels and appropriate water quality-based effluent limits designed to achieve applicable water quality standards. If ambient water quality information is available for an intermittent water, BWQ will be determined and Tier 2 requirements applied to the waterbody. Therefore, applicants proposing discharges to these surface waters will not be required to determine BWQ.

The regulated entity for a new or expanded discharge to a perennial water that will be regulated by an individual permit generally will be required to provide BWQ data for pollutants of concern that are reasonably expected to be discharged to help NMED determine BWQ, existing uses, and the applicable tier. **The regulated entity is advised to contact NMED prior to initiating an evaluation of BWQ to seek guidance and concurrence regarding the pollutants to be evaluated and the proposed sampling protocols.** This initial consultation may also be used by regulated entities to evaluate the availability of existing data that may be used as a supplement to, or in lieu of, new BWQ data.

Once BWQ is established for a surface water, it is the yardstick against which degradation is measured during all future antidegradation reviews for that surface water unless BWQ is updated by NMED to reflect changes in water quality. Antidegradation policy generally does not allow a lowering of BWQ. However, certain circumstances may allow for re-evaluation of BWQ. For example, if it is shown that there was an

NMED Exhibit 3

error in determining BWQ, then BWQ can be re-evaluated. Likewise, if water quality has improved, allowing for additional available assimilative capacity, then a request for re-evaluation of BWQ will be considered by NMED.

Table 4-1 shows the minimum BWQ information required, by size of discharge (design flow in million gallons per day), before permit development. Data collection for other pollutants may be required depending on the nature of the proposed discharge and the pollutants reasonably expected in the discharge. The BWQ requirements will be based on the surface water quality upstream of the facility.

Table 4-1. Minimum BWQ Information for Dischargers

Parameter/Pollutant	All Dischargers	Discharges >0.1 MGD	Discharges > 1.0 MGD
Flow	Y	Y	Y
Temperature	Y	Y	Y
BOD5/CBOD5/DO	Y	Y	Y
E. coli	Y	Y	Y
Total Suspended Solids	Y	Y	Y
pH	Y	Y	Y
Total Ammonia		Y	Y
Total Residual Chlorine		Y	Y
Total Nitrogen		Y	Y
Total Phosphorus		Y	Y
Total Dissolved Solids		Y	Y
Aluminum, either dissolved or TR			Y
Antimony, dissolved			Y
Arsenic, dissolved			Y
Beryllium, dissolved			Y

Hardness, dissolved – must be taken concurrently with metals sampling.			Y
Other constituents (i.e. organics, PCBs, or other applicable pollutants) based on consultation, type of facility	Y	Y	Y

4.2 BASELINE WATER QUALITY EVALUATION PROCEDURES

As needed, BWQ will be established if no BWQ characterization is available or if no information is available for a pollutant of concern reasonably expected to be discharged into the surface water. Data used for a BWQ characterization must meet the following criteria: 1) collected in accordance with an approved quality assurance project plan (QAPP); and 2) collected using specified sample collection and analysis protocols (SOP, SAP, etc.).

Given the complexity of the issue, BWQ characterizations may take some time to complete. It is recommended that regulated entities submit their BWQ monitoring plan and QAPP well in advance of any planned activities or permit application submittals, to facilitate and streamline the permitting process. In addition, environmental groups, trade organizations, the general public, and other governmental agencies may elect to generate BWQ data with the prior approval of NMED and under appropriate, documented quality assurance / quality control (QA/QC) procedures. The objective of this effort is to generate a reasonable, credible, and scientifically defensible characterization of existing water quality for antidegradation reviews.

During data generation projects by regulated entities or third parties, NMED may conduct field, laboratory, or QA/QC audits to verify that data generators are adhering to established sampling protocols, and may split samples for independent analysis. **Data generators that proceed without agency**

[2] Upon consultation, NMED may require speciation of total mercury or dissolved mercury. Methylmercury analysis may also be required.

notification and concurrence risk rejection of the data and significant delays in the permitting process. Potential generators of BWQ data are also encouraged to notify other regulated entities and stakeholders in the water quality segment or watershed of their intent to generate BWQ data. Stakeholder cooperation in the BWQ evaluation process may allow sharing of the cost of data generation and avoidance of conflict in subsequent permitting actions.

4.3 BWQ SAMPLING LOCATION

For new or expanded discharges into a perennial water where there are no existing water quality data on the surface water (i.e., where new data must be collected for evaluation of BWQ), the BWQ sampling location generally will be immediately upstream of the proposed discharge location. Determinations regarding BWQ characterization and accommodation of variations caused by seasonal impacts, water level fluctuations, or other factors will be made by NMED. Information submitted by permittees will be considered on a case-by-case basis.

Where there is adequate, existing water quality data from multiple sampling sites on a surface water, these stations can become the BWQ stations from which a composite BWQ characterization can be developed. Alternatively, NMED may choose one existing monitoring site as the BWQ station from which to characterize baseline water quality. NMED may request additional monitoring at the site if the existing data are insufficient, e.g., where no information has been collected on pollutants of concern reasonably expected in the proposed discharge. Applicants also may be required to collect BWQ data after the permit is issued to develop a BWQ profile during build-out of the activity's discharge capacity.

Sampling and Analysis Protocol

In general, BWQ will be established through existing monitoring and assessment programs sponsored or approved by NMED. NMED will consider the use of older data on a case-by-case basis, as deemed appropriate, if such data is representative of BWQ conditions. In cases where significant changes have occurred in the watershed, it may be appropriate to use a shorter period of record. The minimum elements of an acceptable BWQ monitoring plan include the collection of at least four samples (one sample per quarter) over a minimum one-year period. Data generators may sample more frequently than specified, but are expected to provide the results of all monitoring. Only NMED-approved monitoring results will be used in the establishment of BWQ. Applicants are advised to seek input from NMED prior to developing a BWQ sampling plan and/or collecting samples.

The sampling plan should address the following elements: experimental design of the sampling project; project goals and objectives; evaluation criteria for data results; background of the sampling project; identification of target conditions (including a discussion of whether any weather, seasonal variations, stream flow, lake level, or site access may affect the project); data quality objectives; types of samples scheduled for collection; sampling frequency; sampling period; sampling locations and rationale for site selection; and a list of field equipment (including tolerance range and any other specifications related to accuracy and precision).

Samples, containers, preservation techniques, holding times, and analysis should be conducted in accordance with *Guidelines Establishing Test Procedures and Analysis of Pollutants* at 40 CFR Part 136 and performed by a laboratory certified by the New Mexico Department of Health. The use of other validated analytical methodologies may be authorized where such use can be technically justified. Stream flow should be measured each time BWQ sampling is performed.

NMED Exhibit 3

It is important to note that the BWQ pollutant concentrations derived from the data generated will be assumed to be the concentration present during the normal annual low-flow period. All stream samples should be taken when there is a measurable surface flow in the segment at the BWQ sampling location. If environmental conditions prevent achieving the minimum collection requirements, the sampling period should be extended until at least 4 samples are obtained. Acceptable methods for flow measurement include those described in the *Standard Operating Procedure for Stream Flow Measurement* (NMED/SWQB 2015) or at https://www.env.nm.gov/wp-content/uploads/2017/06/ SOP_7.0_Discharge _4-7-15.pdf, or in the U.S Geologic Survey manual *Techniques of Water Resources Investigations of the United States Geologic Survey* (Chapter A8, Book 3, "Discharge Measurements at Gauging Stations") or at https://pubs.water.usgs.gov/TWRI3A8/.

4.4 POLLUTANTS OF CONCERN

Pollutants of concern are those pollutants reasonably expected to be present in a discharge and may adversely affect the water quality of a receiving water body. Not every chemical found in the discharge nor every pollutant for which there are water quality criteria will be of concern. Pollutants that rise to the level of concern will vary by discharge—its quality as well as size—and location of that discharge (i.e., quality of the receiving water).

New or expanded dischargers regulated by an individual permit may be required to generate BWQ data for any pollutants of concern associated with the proposed discharge to a perennial water. In addition to the pollutants of concern, regulated entities may also be requested to provide water quality data for parameters necessary to determine the appropriate value range of water quality criteria (e.g., pH, temperature, hardness). The applicant may also be required to collect data pertaining to impairments in the receiving waterbody. Again, the importance of consultation between BWQ data generators and NMED staff prior to BWQ data generation cannot be overstated.

4.5 INTERPRETATION OF DATA AND ESTABLISHMENT OF BWQ

Generators of BWQ data are expected to provide documentation of their adherence to approved or established protocols and certification that the submitted information is accurate and complete. NMED will review available data and determine BWQ for surface waters on a pollutant-by-pollutant basis. Data generators should make every effort to use the most sensitive, practical analytical methods available. **The use of less sensitive analytical methods may cause rejection of the data set.**

In general, NMED will calculate the geometric mean of all credible data to determine BWQ for a particular pollutant, except *E. coli* bacteria for which the geometric mean will be calculated. For data sets that contain "not detected" or "less than" analytical results, BWQ will be considered to be the detection limit where the reported detection limit is less than or equal to the applicable water quality standard for the pollutant. If at least one data point is detected above the detection limit and the rest of the data points are reported as "less than", then all the data reported as "less than" will be counted as ½ the detection limit when calculating the geometric mean for the BWQ determination.

For data sets where the detection limit is greater than the applicable standard for a pollutant and the reported data are "not detected" or "less than", NMED may request additional data that is analyzed at an appropriate detection level. If additional data are not provided, NMED will use ½ the detection limit when calculating the geometric mean for the BWQ determination.

NMED will use the initial BWQ value established for a particular pollutant in a surface water to judge the impact of all subsequent proposals for discharges involving that pollutant. BWQ re-evaluations may be appropriate if the data used in the original determination is shown to be inaccurate or invalid or if the water quality of the segment is significantly improved when compared with the original BWQ determination. Affected stakeholders may submit a request to NMED for a BWQ re-evaluation under those circumstances. Sampling and analysis will follow the approach in Section 4.3 of this policy, including collection of a minimum of four data points for the re-evaluation.

For a waterbody to show significant improvement, NMED will evaluate old versus new data using the Relative Percent Difference (RPD) of the data. In perennial waterbodies, if the RPD indicates that the water has improved (with respect to specific analytes) according to the matrix listed below, a BWQ re-evaluation may be warranted. Other considerations for a re-evaluation of BWQ include sampling techniques, sample processing and transport, and laboratory analyses.

Table 4-1

Analyte Class (as noted in 20.6.4.900 NMAC)	**Relative Percent Difference (RPD) threshold for BWQ Re-evaluation**
Persistent/Bio-accumulative (HH-OO)	No re-evaluation – NMED will consider bio-accumulative pollutants on a case by case basis
All other analytes	≥20% improvement in water quality

5 Evaluating the Level of Degradation of Proposed Discharges

Antidegradation reviews are required for all regulated discharges that have the potential to degrade water quality in New Mexico. The review procedures described in this chapter do not apply to non-point sources of pollution (addressed in the Nonpoint Source Management Plan), discharges covered under Section 404 of the CWA (addressed through certification conditions and implementation of BMPs) or NPDES general permits (addressed through the implementation of benchmarks and BMPs). The antidegradation procedures vary by the tier level of protection and by the type of surface water. For pollutants with Tier 2 protection levels, the degradation evaluation determines whether or not significant degradation will occur – i.e., whether or not 10% or more of the available assimilative capacity for any pollutant of concern will be consumed as a result of the proposed discharge during critical flow (e.g., 4Q3) conditions or the cumulative cap of 50% of available assimilative capacity is exceeded. The level of degradation will be evaluated from BWQ conditions.

For Tier 3 protection levels, the degradation evaluation must determine that no degradation will occur as a result of the proposed discharge unless the impacts are temporary. As a general rule of thumb, temporary impacts are defined as impacts of less than six months duration.

5.1 Applicability of Degradation to the Various Protection Tiers

The concept of degradation is relatively simple: any discharge that results in a decline of water quality (as determined on a pollutant-by-pollutant basis). Degradation is not allowed to cause or contribute to impairments that result in the loss of existing uses (i.e., the Tier 1 threshold), and is not allowed at all in Outstanding New Mexico Waters (ONRWs) unless it is temporary (i.e., the Tier 3 threshold) as determined by NMED and approved according to 20.6.4.8 NMAC.

Significant degradation may be allowed in surface waters protected at the Tier 2 level if the applicant for a new or expanded discharge characterizes the effluent and BWQ, completes an alternative analysis, and provides social and economic supporting documentation. For Tier 2 reviews, determining BWQ, evaluating projected impacts, analyzing possible alternatives, and evaluating economic or social benefits, if applicable, must occur ***prior to*** issuing an individual NPDES permit. Therefore, it is recommended that an applicant discharging to a perennial water meet with NMED in a pre-application conference **at least one year prior** to the anticipated date of NPDES permit issuance.

Decisions regarding significant degradation of Tier 2 protection levels will only be made after the required alternatives analysis along with economic and social benefits justification have been completed, after technology-based and nonpoint source control requirements are met, and after the intergovernmental coordination and public participation provisions in Chapter 8 have been satisfied.

NMED Exhibit 3

5.2 PROCEDURE FOR TIER 2 DEGRADATION EVALUATION

Tier 2 evaluation procedures vary by the type of surface water, as outlined below:

Discharges to Non-Perennial Waters

Many individual NPDES permit applicants will likely discharge to an ephemeral, intermittent, or effluent dependent water. Tier 2 degradation evaluation procedures do not apply to these discharges. Discharges to non-perennial waters will be required to meet applicable surface water quality standards and technology-based standards, e.g., best available technologies (BAT) at the "end-of-the-pipe" (i.e., Tier 1 degradation evaluation procedures).

In some limited cases, data may be available to determine BWQ in these non-perennial waters. If data are available and assessable and confirm a high-quality water, NMED would conduct a Tier 2 antidegradation review. Similar to perennial waters, no significant degradation of the Tier 2 pollutants would be allowed unless a comprehensive antidegradation review of reasonable alternatives and social and economic considerations supports a lowering of water quality.

Discharges to Perennial Waters

All other individually-permitted discharges to perennial waters must conduct an antidegradation review to determine whether or not significant degradation will occur, i.e., whether or not 10% or more of the available assimilative capacity for any pollutant of concern will be consumed as a result of the proposed discharge during critical flow (e.g., 4Q3) conditions or the cumulative cap of 50% of assimilative capacity is exceeded. The Tier 2 degradation review for new or expanded discharges is based on these characterizations:

- BWQ, as determined by data collected pursuant to Chapter 4
- The critical in-stream flow (e.g., 4Q3)
- The flow and pollutant loads resulting from the proposed discharge
- Projected changes in water quality that occur as a result of the proposed discharge

The results of the antidegradation review will be used to determine whether the proposed discharge will be subject to additional requirements as part of the permitting process, such as analyses of reasonable, cost-effective, less degrading or non-degrading alternatives and examination and justification of important economic and social costs and benefits (see Chapter 6 and Chapter 7, respectively).

Mixing Zones

If needed, a new or expanded facility who discharges to a perennial water may be evaluated for the applicability of a mixing zone analysis on a case by case basis.

5.3 CALCULATIONS TO DETERMINE SIGNIFICANCE OF DEGRADATION

At the Tier 2 protection levels, BWQ is better than the water quality standards for one or more pollutants. Therefore, no significant degradation from BWQ is allowed unless a comprehensive antidegradation review of reasonable alternatives and social and economic considerations supports a lowering of water quality. Degradation is generally assumed to be "significant" if a discharge consumes 10% or more of a surface water's assimilative capacity for any pollutant of

NMED Exhibit 3

concern (other than bio-accumulative pollutants as defined by the human health-organism only (HH-OO) criteria at 20.6.4.900 NMAC) under critical flow conditions or the discharge consumes any percentage of the cumulative assimilative capacity beyond 50%.

To determine if a discharge will cause significant degradation, assimilative capacity must be calculated and then evaluated under critical flow conditions. The first step in this process is to calculate the assimilative capacity and significant degradation limit. The assimilative capacity of the waterbody for any pollutant of concern under review is the difference between *observed* BWQ and the most stringent applicable water quality criterion. Figure 5-1 provides a simplified visual representation of assimilative capacity for a given pollutant (Pollutant X). In this example, the most stringent applicable water quality criterion for Pollutant X is 10 mg/L and the *observed* BWQ measurement is 3 mg/L. In Figure 5-1, the assimilative capacity of Pollutant X is the difference between the water quality criterion and the BWQ, or 10 mg/L minus 3 mg/L, and equals 7 mg/L. The "significant degradation" limit is 10% of the assimilative capacity (7 mg/L) or 0.7 mg/L. Thus, a regulated discharge undergoing a Tier 2 review would be considered *de minimis* (i.e., no significant degradation) if it did not cause the water quality in the receiving surface water to exceed the BWQ (3 mg/L) plus the significant degradation limit (0.7 mg/L), or 3.7 mg/L for Pollutant X.

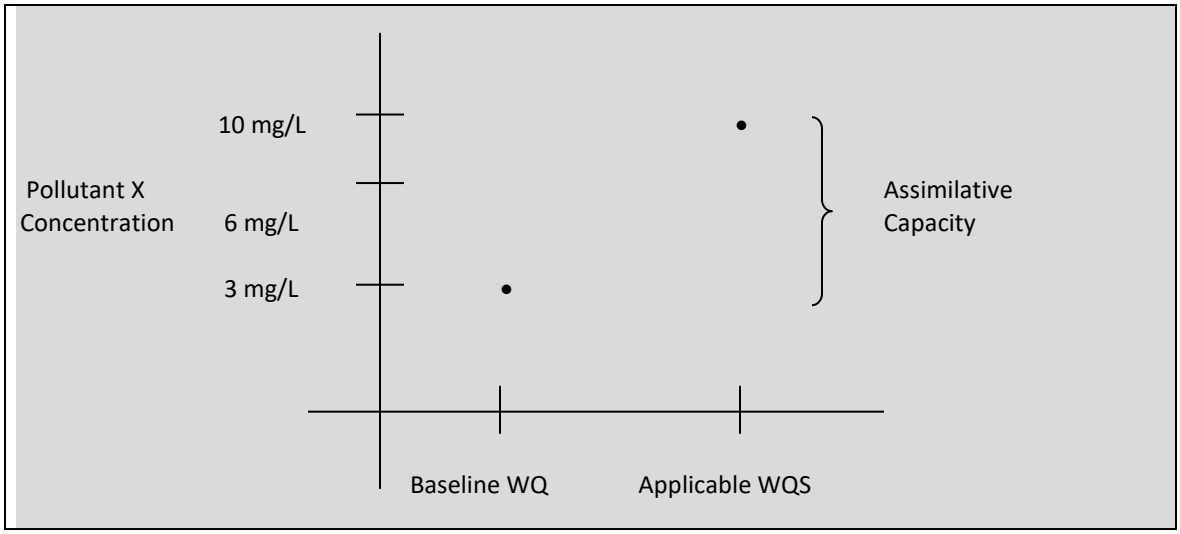

Figure 5-1. Simplified Representation of Assimilative Capacity

The second step to determine the significance of degradation is to evaluate the "significant" assimilative capacity concentration, identified in step one, under critical flow conditions. While NMED's antidegradation formula evaluates the assimilative capacity concentration similar to the example shown above in Figure 5-1, that resultant concentration is converted to a load using the receiving stream's critical flow and a conversion factor of 8.34. For example, the significant degradation concentration limit of 3.7 mg/L for Pollutant X in Figure 5-1 is converted to a loading capacity using the following formula:

$$Load\ Capacity\ \left(\frac{lbs}{day}\right) = concentration\left(\frac{mg}{L}\right) x\ flow\ (4Q3, million\ gallons\ per\ day)\ x\ 8.34$$

NMED Exhibit 3

Consideration of Multiple Discharges – 50% Cumulative Cap

To address degradation associated with multiple regulated discharges to the same receiving water over time, NMED is establishing a separate significance threshold of a 50% cumulative cap on the consumption of assimilative capacity. This approach creates a "backstop" so that multiple regulated discharges to a water body over time which individually do not consume 10% of the assimilative capacity do not result in the consumption of the majority of the assimilative capacity without NMED ever conducting a comprehensive Tier 2 antidegradation review. NMED has established this significance threshold at 50% of the assimilative capacity when BWQ is characterized. This means that once 50% of the assimilative capacity is used in a surface water for a pollutant of concern, any further lowering of water quality is considered significant degradation. NMED will conduct a comprehensive Tier 2 antidegradation review for each lowering of water quality once the 50% cumulative cap is exceeded, regardless of the amount of assimilative capacity that would be used by the regulated discharge.

Critical Flow

The calculations noted above are to be executed under critical flow conditions for the pollutants of concern. For point source discharges, critical flow for all criteria/pollutants, except HH-OO, is the minimum four consecutive day flow that occurs with a frequency of once in three years (4Q3) in the receiving water. (20.6.4.11(B)(2) NMAC). Critical lake and reservoir water levels will be determined on a case-by-case basis.

Calculations for Tier 2 Pollutants

The calculation to determine if a discharge will result in significant degradation is a variation of the mass balance equation that is used to determine water quality-based effluent limits:

$$(Q_d)(C_d) + (Q_s)(C_s) = (Q_r)(C_r)$$

Where:

Q_d =discharge flow cfs
Q_s =stream flow (4Q3)
Q_r =resulting in-stream flow (downstream of discharge, or Q_s+Q_d)
C_d =discharge concentration,
C_s =concentration in stream

C_r = resultant in-stream concentration

Solve for C_d:

$$C_d = \frac{[C_r(Q_d + Q_s)] - [(C_s)(Q_s)]}{Q_d}$$

For purposes of Tier 2 antidegradation reviews, NMED solves for the discharge concentration that uses 10% of the assimilative capacity:

Where:

C_{bwq} = BWQ
C_r = resultant in-stream concentration = [(WQS - C_{bwq}) x 0.1 + C_{bwq}]

$$C_d = \frac{[((WQS - C_{bwq}) \times 0.1 + C_{bwq})(Q_d+Q_s)] - [(C_s)(Q_s)]}{Q_d}$$

The calculated discharge concentration (C_d) is compared with the proposed discharge concentration. If the calculated concentration is greater than the proposed concentration, then a determination of "no significant degradation" is found. If the level of degradation is estimated to be less than 10% of the assimilative capacity, and less than 50% of the cumulative cap (if applicable), *and* existing uses are maintained, the antidegradation review process is complete and the permitting process may proceed.

If the discharge is found to consume more than 10% of available assimilative capacity (calculated < proposed) or exceeds the 50% cumulative cap, a comprehensive Tier 2 review is required. The regulated discharge would be required to conduct an alternatives analysis (Chapter 6) and demonstrate "important economic or social development" (Chapter 7) if allowances are sought to further reduce assimilative capacity. If such demonstrations are made, the WQCC may allow consumption of additional assimilative capacity (degradation) as long as intergovernmental and public participation processes are followed and water quality standards are not violated.

6 Identifying and Evaluating Pollution Control Alternatives for Tier 2 Protection

A regulated entity proposing a new or expanded discharge requiring an individual NPDES permit that would significantly degrade water quality in a Tier 2 surface water (i.e., consume 10% or more of the assimilative capacity or exceed the cumulative cap of 50% for any pollutant of concern) is required to prepare an evaluation of alternatives to the proposed discharge. The evaluation must provide substantive information pertaining to the cost and environmental impacts associated with the proposed discharge and the alternatives evaluated. This chapter provides guidance on how to evaluate alternatives when an impacts analysis determines that significant degradation may occur.

The intent of the alternatives analysis is to identify cost-effective and reasonable *less degrading* or *non-degrading* approaches for reducing discharge-related impacts so they do not result in significant degradation of the receiving water.

6.1 Less Degrading and Non-degrading Pollution Control Measures

Under New Mexico's antidegradation implementation procedures, applicants are required to analyze these alternatives if their proposed discharge will cause significant degradation of higher quality (i.e., Tier 2) waters. Less degrading or non-degrading pollution control alternatives identified and evaluated during this process should be reliable, demonstrated processes or practices that can be reasonably expected to result in a defined range of treatment or pollutant removal.

Applications containing proposals for new or experimental methods will be required to append information regarding likely performance results and may be approved at the discretion of NMED with the understanding that if the proposed technology does not meet projected pollutant control targets the applicant must adopt conventional or other pollution control measures that meet state antidegradation requirements.

Pollution control alternatives that may be evaluated when a proposed discharge will result in significant degradation of the receiving water segments may include the following:

- Alternative methods of production or operation
- Pollution prevention and treatment process changes
- Recycling/reusing wastewater (i.e., closed loop systems)
- Holding/transport facilities for treatment/discharge elsewhere
- Groundwater recharge (i.e., soil-aquifer treatment, injection)
- 100% reuse
- Advanced or innovative biological/physical/chemical treatment
- Pollution prevention and process changes
- Improvements in the collection system
- Improved operation and maintenance of existing treatment system

NMED Exhibit 3

- Seasonal or controlled discharges to avoid critical periods
- Alternative discharge locations, and associated water quality impacts at those locations
- Reduction in the scope of the proposed project

Applicants will be expected to address reasonable and cost-effective alternatives, or mix of alternatives, in their evaluations. NMED staff and the applicant will meet to discuss these and other issues early in the process. It is the responsibility of the applicant to screen for and propose a list of reasonable, cost-effective alternatives that will be evaluated in detail. NMED may require that additional alternatives be analyzed.

If the project results in significant degradation even after applying reasonable, cost-effective alternatives, the proposal must demonstrate 1) important social or economic development as outlined in Chapter 7; 2) the level of water quality necessary to protect existing uses is maintained (i.e., Tier 1 protection); 3) all cost-effective and reasonable BMPs for nonpoint source control are implemented; and 4) the highest statutory and regulatory requirements for all new and existing point sources are achieved (20.6.4.8(A)(2) NMAC).

6.2 IDENTIFYING COST COMPONENTS AND ASSESSING COSTS

An assessment of costs related to the alternatives summarized above is necessary to determine whether or not a prospective alternative pollution control measure is reasonable. General cost categories include:

- Capital costs
- Operating costs
- Other costs (one-time costs, savings, opportunity cost, salvage value)

In order to develop a standardized framework for projecting, evaluating, and comparing costs associated with various pollution control measures, applicants should use a "present worth" framework for generating and reporting cost information. Components of the present worth framework include:

$$P = C + O + [A * (P/A, d, n)] - S - L$$

Where:

P = Present worth,
C = Capital cost,
O = Other costs (expressed as dollars invested at the beginning of the project),
A = Annual operating cost,
d = Discount rate,
n = Useful life in years,
S = Present worth of salvage value of facilities,
L = Present worth of salvage value of land, and
$(P/A, d, n)$ = Equal series present worth factor, = $[(1 + d)^n -1] / [d (1+d)^n]$.

The present worth calculated for the alternative technologies depends on the right choice for the discount rate (d), and the useful life (n) of the equipment or facility. Recommended discount rates for New Mexico are provided by the New Mexico Water Infrastructure Finance Authority (WIFA). The useful life of the facility or equipment is based upon similar facilities or equipment handling similar wastes and flows and must be approved by NMED. Speculative costs for land, facilities,

etc., will not be allowed. For more information on the present worth calculation and other methods that may be used to assess costs, see Appendix A1, Direct Cost Comparison of Alternatives.

6.3 Evaluating Environmental Impacts Associated with Alternatives

Pollution control measures evaluated as alternatives to a proposed discharge may have environmental impacts that help define their overall value and/or desirability. Applicants are required to provide substantive information pertaining to both the cost and environmental impacts associated with pollution control alternatives evaluated for discharges that would significantly degrade Tier 2 level of protection. The information related to environmental impacts should include impacts on the natural environment (i.e., land, air, and water) resulting from implementation of the alternative. The types of impacts evaluated during this process may include:

- Sensitivity of stream uses
- Need for low-flow augmentation
- Sensitivity of groundwater uses in the area
- Potential to generate secondary water quality impacts (storm water, hydrology)
- System or technology reliability, potential for upsets/accidents
- Effect on endangered species
- Non-water quality environmental impacts
- Nature of pollutants discharged
- Dilution ratio for pollutants discharged
- Discharge timing and duration
- Siting of plant and collection facilities

Review of these impacts might be on a qualitative or quantitative basis, as appropriate. Non-water quality environmental impact analyses to be submitted by the applicant include estimations of the potential impact of the alternative(s) on odor, noise, energy consumption, air emissions, and solid waste generation. Odor and noise may be addressed qualitatively while other non-water quality impacts might need to be addressed quantitatively. The energy use, air emission, and solid waste generation impacts can be expressed as a percent increase/decrease as compared to the proposed discharge. Other factors that should be considered during the review include the technical, legal, and local considerations of the various alternatives examined. The schedule and the estimated time of completion of the project should also be provided for each alternative discussed.

6.4 Cost and Reasonableness Criteria for Alternatives Evaluation

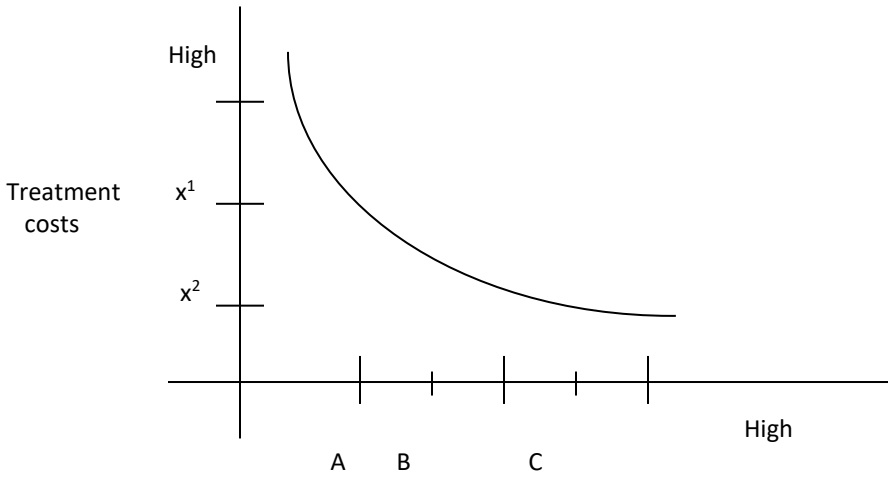
In general, an alternative or suite of alternatives is considered to be cost-effective and reasonable if it is feasible and the cost is less than 110% of the *base costs* of pollution control measures for the proposed discharge in present worth costs. It should be noted that the 110% cost-effectiveness criterion is a general rule-of-thumb – if pollution control costs for alternatives that

NMED Exhibit 3

would result in water quality benefits exceed the 110% cost threshold, those alternatives may be required if the water quality and environmental benefits outweigh the economic costs.

When calculating the cost of a proposed discharge and any less- or non-degrading alternatives, it is important to identify the base cost for required pollution control measures for any proposed discharge. The base cost for NPDES-permitted facilities is the cost of treatment to meet applicable water quality standards or the cost of meeting federal technology-based requirements, whichever is more stringent and legally applicable. The base cost for Section 404 dredge-and-fill permits (e.g., wetland fills, mining streambed fills) is the cost of pollution controls to meet minimum Section 404 permit and Section 401 water quality certification requirements.

6.5 PROCEDURE FOR COMPARING COSTS OF VARIOUS ALTERNATIVES



In reviewing costs for a variety of discharge scenarios, three reference costs can be identified (see Figure 6-1):

- The cost of treatment that results in no discharges of any pollutants of concern (the "no-discharge" cost).
- The cost of treatment that produces an effluent that results in no significant degradation of the receiving water, i.e., that does not consume more than 10% of the available assimilative capacity for any pollutant of concern.
- The cost of treating an effluent to a quality that meets specific effluent/ BAT limits or water quality criteria for any/all pollutants of concern (i.e., the conceptual minimum Tier 1 requirement).

The base cost for comparing the reasonableness and cost-effectiveness of less degrading or non-degrading alternatives is the cost of producing an effluent that meets water quality standards or the cost of meeting federally-required effluent concentration limits or best available technology, whichever is more stringent (level C in Figure 6-1).

Applicants will be required to submit cost information to NMED for base pollution control measures as defined above and alternative pollution control measures that would result in no significant degradation (level B). NMED may request cost or other information regarding preventing degradation (level A). NMED will evaluate the limitations of the alternatives analysis and may request additional analyses or information, as needed, to make a determination.

NMED Exhibit 3

A = The "no degradation" alternative
B = Activity modifications resulting in "no significant degradation," i.e., does not consume more than 10 percent of the available assimilative capacity for any other pollutant of concern (POC)
C = Activity modifications that achieve or maintain minimally required use-based water quality criteria or best available demonstrated control technology
x^1 = Costs for implementing the "no degradation" alternative
x^2 = Costs for less degrading alternative(s)

Figure 6-1. Comparison of Treatment Costs to Produce Effluents of Varying Quality

6.6 SUMMARY OF THE ALTERNATIVES ANALYSIS PROCESS

The preceding discussion describes the approach that will be followed by NMED for determining whether or not less- or non-degrading alternatives to the proposed new or expanded discharge will be required to prevent significant degradation of perennial surface water. The following steps summarize the alternatives analysis process and other relevant actions during comprehensive Tier 2 reviews:

- Based on characterizations of the new or expanded proposed discharge, BWQ, and projected impacts on the receiving water segment, NMED will determine whether or not the proposed discharge will significantly degrade water quality, i.e., consume more than 10% of the available assimilative capacity for any other pollutant of concern.
- If it is determined that significant degradation would likely occur due to the proposed discharge, an analysis of less degrading or non-degrading alternatives to the proposed discharge will be required.
- The applicant will be required to submit cost information for base pollution control measures associated with the proposed discharge, alternative pollution control measures that would result in no significant degradation, and for other less or non-degrading alternatives as appropriate.

- NMED will evaluate the proposed discharge, the less and non-degrading alternatives, and the costs and feasibility associated with each mix of options.
- NMED will approve the least degrading alternative – or mix of alternatives – that does not exceed the 110% base cost threshold (i.e., is cost-effective and reasonable).
- If the approved alternative (i.e., pollution control alternative or mix of alternatives) will not result in significant degradation of the receiving water segment, permitting of the discharge may proceed. If the approved alternative will still result in significant degradation of the receiving water, the applicant will be required to conduct an analysis of economic and social benefits so the WQCC can determine whether or not the discharge can be permitted.
- All water quality impacts in the alternatives analysis will be evaluated at the BWQ station and back-calculated to develop the upstream effluent limit (i.e., the degradation of proposed discharges including alternatives will be evaluated at the BWQ point, while permit limits and permit compliance will be developed and evaluated at the discharge point).

If the project results in significant degradation even after applying reasonable, cost-effective alternatives, in order to allow such degradation and lowering of water quality the proposal must demonstrate that the new or expanded discharge is important to economic and social development (as outlined in Chapter 7), protects existing uses (i.e., maintains Tier 1 protection), achieves the highest statutory and regulatory requirements for point sources, and implements cost-effective and reasonable BMPs for nonpoint source control (20.6.4.8(A)(2) NMAC). NMED encourages watershed planning to further protect surface water quality and CWA Section 319 grants are available for various groups to plan and implement on-the-ground improvement projects. In addition, Clean Water State Revolving Fund (CWSRF) loans are available for a wide range of wastewater or storm drainage projects that protect surface and ground water, including projects that control nonpoint source pollution.

7 Social and Economic Importance for Tier 2 Reviews

7.1 Regulatory Requirements for Social and Economic Analysis

As discussed in previous chapters, if an alternatives analysis has been conducted for a proposed new or expanded discharge to a Tier 2 protected water requiring an individual NPDES permit, and the least degrading, cost-effective alternative still results in significant degradation, an analysis of the social and economic importance of the discharge must be conducted. Under New Mexico's antidegradation policy, found at 20.6.4.8(A)(2) NMAC, the Commission may authorize a proposed discharge that would significantly lower the water quality of a Tier 2 water, if allowing lower water quality is necessary to accommodate important economic and social development in the area in which the surface water is located.

There are several steps in determining social and economic importance. First, the applicant conducts an analysis of the social and economic benefits/costs associated with the discharge. The applicant must document any social and economic benefits/costs associated with the proposed discharge and report them to NMED, including identifying and documenting general environmental justice issues in the area where the discharge will be located that may impact the benefits/costs analysis[3,4]. NMED then reviews the information and may require additional information and/or a more in-depth, substantial and widespread impact analysis if there is not enough information to make a decision or if the proposed discharge is complex. Additional information is included in Appendix A.3 and Appendix A.4. If enough information has been submitted, NMED will make a preliminary determination to deny or authorize the degradation. Finally, "after public comment and intergovernmental coordination, the WQCC analyzes all information and makes a final determination (20.6.4.8(A)(2) NMAC).

7.2 Role of the Applicant

The role of the applicant is to demonstrate the social and economic benefits of the proposed new or expanded discharge associated with allowing significant degradation of high-quality water. The report on social and economic benefits/costs (positive and negative) associated with the project is relatively simple and straightforward. NMED requires that up-to-date and accurate data are included in the report, and that estimates of job gains/losses, housing impacts, etc., be summarized completely and based on defensible estimates. Using the *Social and Economic Importance Worksheet*, Appendix A.2, the applicant must document how the proposed new or expanded discharge affects the social, economic, and environmental factors listed below.

Social, Economic, and Environmental Considerations

[3] For information on the EPA Region 6 EJ Action Plan, visit: https://www.epa.gov/environmentaljustice/region-6-new-mexico-ej-action-plan

[4] Environmental Justice Screening and Mapping Tool: https://www.epa.gov/ejscreen

NMED Exhibit 3

Below are the **economic and social** benefits/costs most commonly associated with this socio-economic analysis:

- Creating, expanding or maintaining employment
- Reducing the unemployment rate
- Increasing median household income
- Reducing the number of households below the poverty line
- Increasing needed housing supply
- Increasing the community tax base
- Providing necessary public services (e.g., fire department, school, infrastructure)
- Correcting a public health, safety, or environmental problem
- Improving quality of life for residents in the area

Below are the **environmental** benefits or costs most commonly associated with this analysis:

- Promoting/impacting fishing, recreation, and tourism industries
- Enhancing/impacting threatened and endangered species
- Providing increased flood control and sediment trapping through maintaining or creating wetlands and riparian zones or impacting wetlands and riparian zones
- Reserving assimilative capacity for future industry and development or reserving no capacity for future discharges.

The applicant may choose or may be required to describe additional factors as needed to strengthen its Social and Economic Importance Analysis. Appendix A.4, *Other Economic and Environmental Considerations*, provides examples of other issues that might be helpful to address in developing an analysis. All information provided should be based upon the most current, available data.

7.3 ROLE OF NMED

Prior to issuance of any proposed new or expanded discharge permit that would significantly lower the water quality of a Tier 2 protected water, NMED will ensure that the proposed discharge is necessary to accommodate important economic or social development in the area in which the waters are located. NMED may also collect and analyze additional information to assess the market and non-market social and economic benefits and costs of the proposed discharge, including by soliciting public information and comment where appropriate or by accessing information available from the New Mexico Community Data Collaborative (http://www.nmcdcmaps.org/), the Distressed Communities Index (https://eig.org/dci), or EPA, including EJSCREEN (https://www.epa.gov/healthresearch/tools-support-environmental-justice). In making a preliminary decision, NMED will rely primarily on the demonstration made by the applicant. NMED will analyze all information and make a preliminary determination on the facts on a case-by-case basis.

NMED Exhibit 3

If information available to NMED is not sufficient to make a preliminary determination regarding the socioeconomic importance of the proposed new or expanded discharge, NMED may require the project applicant to submit specific items of information needed to make a determination. NMED may also require use of quantitative models for large proposed discharge (e.g., major industrial wastewater treatment facility, large concentrated animal feeding operation, etc.).

Once the available information pertaining to the socioeconomic importance of the proposed new or expanded discharge has been reviewed by NMED, a preliminary determination to deny or authorize the degradation will be made. If the proposed discharge is determined to be necessary to accommodate important economic or social development in the area in which the affected waters are located, the substance and basis for that preliminary determination will be documented and the Tier 2 review will continue. NMED will make the preliminary determination available to the public and forward its preliminary determination to governmental agencies that may be impacted by the discharge.

Once the public participation and intergovernmental coordination requirements are satisfied, the WQCC will make a final determination concerning the social or economic importance of the proposed new or expanded discharge and whether to deny or authorize the discharge (20.6.4.8(A)(2) NMAC). All social and economic importance findings and other required findings, including determinations to deny issuance of a permit for a discharge, will be documented and made part of the public record.

8 Requirements for Intergovernmental Coordination and Public Participation

This chapter outlines public participation and intergovernmental coordination and review requirements. Antidegradation reviews for NPDES-permitted facilities will employ the public participation procedures that are available through the permitting process (e.g., draft permits, fact sheets, opportunities to comment, etc.). The NPDES permit fact sheet will include a discussion for the public of NMED's antidegradation review.

Once the intergovernmental coordination and public notice requirements outlined below are satisfied, NMED will make a final determination concerning the social or economic importance of the proposed new or expanded discharge in the area in which the affected receiving waters are located. All determinations, including determinations to prohibit the discharge, will be documented and made a part of the public record.

8.1 PUBLIC NOTIFICATION REQUIREMENTS

There are a number of opportunities for public participation in the review of new and increased discharges into Tier 1 waters. The WQCC adopts Total Maximum Daily Loads (TMDLs) with applicable wasteload allocations for point sources discharging to Tier 1 waters not meeting water quality objectives. This process includes public notice and comment. The EPA and Army Corps follow detailed procedures requiring public notice and comment when issuing NPDES and Section 404 dredge or fill permits. Finally, the NMED's Section 401 certifications can be appealed and a full hearing held before the WQCC.

Public notice and opportunity for public comment is also provided for all comprehensive Tier 2 reviews. NMED will publish notice and provide an opportunity to comment on the preliminary decision and statement of basis. The public comment period will be at least 30 days. Public notice and opportunity for comment may be combined with other public participation procedures, such as those related to NPDES permitting processes or intergovernmental coordination / review procedures. During the public comment period, any interested person may submit written comments and request a public hearing. A request for a public hearing must be in writing and must state the nature of the issues to be raised. If NMED determines that the request for public hearing raises issues of significant public interest within the scope of the antidegradation policy, the Department will hold a public hearing. The public hearing will be held in a location near the water affected by the discharge.

Discharges that may result in a significant degradation of water quality for Tier 2 pollutants may be approved by the WQCC, after full satisfaction of the intergovernmental coordination and public participation processes, provided that:

- The level of water quality necessary to protect existing uses is fully protected. Water quality shall be maintained and protected in all surface waters of the state (20.6.4.8(A)(1) NMAC).

NMED Exhibit 3

- The highest statutory and regulatory requirements for new and existing point sources are achieved.
- All cost-effective and reasonable best management practices for non-point source pollution control are implemented.
- Allowing lower water quality is necessary to accommodate important economic or social development in the area where the surface water is located.
- Watershed-based planning as a further means to protect surface waters is encouraged.

All comprehensive Tier 2 findings will be documented by NMED and made part of the administrative record. Review documents – including evaluations of BWQ, existing uses, the level of review conducted, alternatives analyses, social/economic studies, impacts analyses, and any decisions or findings – will be made available to the public.

For activities that may impact Tier 3 waters, NMED will publish notice and provide a 30-day public comment period. After the comment period, NMED will provide a recommendation to the Commission. NMED will provide notice of activities approved by the WQCC pursuant to 20.6.4.8(A)(3)(a) NMAC and of activities conducted pursuant to 20.6.4.8(A)(4) NMAC by posting a brief description, location, and timeframe for such activities on a dedicated Department website.

8.2 Opportunities for Public Participation

Public participation in the implementation of New Mexico's water quality antidegradation policy can be broad or specific. Opportunities for broad participation include involvement in the triennial review of the water quality standards program (i.e., use designations, water quality criteria determinations, antidegradation implementation procedures) and participation in rule development relative to permitting processes. In addition, any interested party may nominate a water segment for protection at the Tier 3 level by following the procedure for consideration outlined under 20.6.4.9 NMAC (see Chapter 2). Finally, interested groups can conduct volunteer monitoring under an NMED-approved plan to support BWQ determinations.

Wherever possible, NMED will seek to integrate public participation regarding antidegradation reviews with existing NMED public participation procedures (e.g., NPDES permitting procedures).

8.3 Intergovernmental Coordination and Review

Intergovernmental coordination is required prior to approving a new or expanded discharge requiring an individual NPDES permit that would significantly degrade a surface water protected at the Tier 2 level. This requirement seeks to ensure that all relevant public entities at the local, state, and federal levels are aware of any proposal to significantly lower water quality and are provided with an opportunity to review, seek additional information, and comment on the proposal. The intergovernmental coordination and review process occurs prior to the issuance of any final determination on the social and/or economic importance of the proposed discharge, and may occur in tandem with public notice procedures outlined in the previous section. The time period afforded to commenting agencies will be consistent with the requirements for submission of public comments.

NMED Exhibit 3

Intergovernmental coordination requirements will be satisfied by providing a written notice and request for comment to the appropriate agencies listed in Appendix A.5. Such notice will include summary information on the proposed new or expanded discharge, the receiving water segment, the BWQ of the receiving water segment, the tier designation, estimated impacts of the proposed discharge upon the receiving water, the alternatives reviewed, and the projected social or economic importance of the proposed discharge. In providing notice to these agencies, staff should note the importance of circulating the notice to local or regional constituents of the agencies involved so that NMED receives timely and complete responses from governmental entities that might have information regarding the proposal or might be affected by it.

8.4 APPEALS OF ANTIDEGRADATION REVIEW DECISIONS

Persons adversely affected by any final decision of the Department may appeal to the WQCC in accordance with the New Mexico Water Quality Act, NMSA 1978, Sections 74-6-1 to -17.

NMED Exhibit 3

Appendix A.1
Direct Comparison of Alternatives

Direct cost comparisons of alternatives are typically performed on the basis of present worth calculations or calculations of uniform annual cost (if the useful life of each alternative is different), using an applicable interest (discount) rate. The present worth calculation is a well-established method for integrating the upfront capital costs (and associated indebtedness) of a project with its ongoing annual costs of operation, and transforming the integrated costs to one equivalent value. The calculation yields the total equivalent dollars which would have to be invested at the beginning of a project in order to finance it for the life of the facility. The monetary costs considered in the calculations include the total value of the resources, which are attributable to the wastewater treatment, control, and management systems and the component parts. To determine these values, all monies necessary for capital construction costs, operational costs, and maintenance costs should be identified.

Capital construction costs used in cost comparison analysis consist of estimates of the construction costs, including overhead and profit; costs of land (including land purchased for the treatment works site and land used as part of the treatment process or for ultimate disposal of residues), relocation expenses, and right-of-way and easement acquisitions; costs of design engineering, field services (including cost of bond sales); startup costs such as operator training; financing costs and interest during construction; and the costs of any other site-related environmental controls, such as erosion and sediment control practices.

Operational and maintenance costs are usually considered on an annual basis and include operational staff salaries, cost of energy and fuels, cost of treatment chemicals, cost of routine replacement of equipment and equipment parts, and other expenditures necessary to ensure effective and dependable operation over the life of the facility. Annual operation and maintenance costs should be averaged to account for variations, which might occur, year-to-year due to varying production or wastewater volume.

The salvage value of equipment, tankage, and materials from the treatment works is part of the present worth calculation. Salvage value is estimated using straight-line depreciation during the useful life of the project and can generally only be claimed for equipment where it can be clearly demonstrated that a specific market or re-use opportunity will exist. Salvage value estimation should also take into account the costs of any restoration or decommissioning of treatment units and final disposal costs. It is possible in some cases that these costs may be high enough that the net salvage value will be negative.

Land purchased for the treatment works site is also assumed to have a salvage value at the end of the project useful life equal to its market value at the end of the analysis period. The local inflation rate for land in the use area should be used to project the market value at the end of the analysis period.

It is also important to evaluate any opportunity cost associated with different alternatives. Opportunity costs should not be considered for speculative growth or production increases claimed by an applicant. Any costs claimed should be clearly associated with integral portions of projects, which are realistically available, and are otherwise locally approvable.

The discount rate used in the present worth or uniform annual cost calculation for public sewerage projects should be that rate published by the NMED Construction Program Bureau and associated funding agencies for the planning review and evaluation of water resource projects. The rate is available from NMED. For private sector projects, the interest rate utilized should be that rate at which the applicant can borrow funds. Since the present worth calculation is being performed more to compare alternatives rather than to obtain a very accurate estimation of

actual costs, the fact that the same interest rate assumption be utilized for each alternative is more important than the actual interest rate selected.

Cost estimates have an associated level of precision. The cost estimates prepared by the project sponsor should include an estimate of the error for each alternative. The applicant is responsible for documenting and defending all cost estimates used in the analysis.

Cost estimate equations:

The equations below are the basic expressions of the present worth and equivalent annualized cost concepts. Additional mathematical factors and apportionment of costs are incorporated into the equations where appropriate.

I. The basic present worth calculation should be performed in accordance with the following equation:

$$P = C + O + [A * (P/A,d,n)] – S – L$$

where,

P = present worth

C = capital cost

A = annual operating costs

(P/A,d,n) = equal series present worth factor $[(1 + d)^n – 1] / [d (1 + d)^n]$

d = discount rate

n = useful life in years

S = present worth of salvage value of facilities

L = present worth of salvage value of land

O = other costs (if any)

A gradient factor may be added into the equations to account for inflation of annual operating costs, as opposed to using an average value throughout the project life, by simply adding the additional following term onto the right-hand side of the above equation:

$$[G * (P/G,d,n)]$$

where,

G = uniform increase in annual costs

(P/G,d,n) = present worth factor for a gradient =

$(1 – nd) [(1 + d)^n – 1] / [d^2 * (1 + d)^n]$.

II. If the alternatives have different useful lives, the cost comparison may be performed using the Equivalent Uniform Annual Cost Method. The equation for this method is:

$$EUA = (C + O) * (A/P,d,n) + A – [(S + L) * (A/F,d,n)]$$

where,

EUA = equivalent uniform annual cost

(A/P,d,n) = capital recovery factor $[(1 + d)^n – 1] / [d (1 + d)^n]$

(A/F,d,n) = uniform series sinking fund factor $d / [(1 + d)^n – 1)]$

To add a gradient factor, the following additional term is simply added to the right hand side of the above equation:

[G * (A/G,d,n)]

where,

(A/G,d,n) = EUA factor for a gradient = $[(1 + d)^n – 1 – nd] / d * [(1 + d)^n – 1]$.

Additional cost factors:

Other costs, such as opportunity costs, while presented above as one-time present losses, may also have an annual lost revenue component, which could be accounted for by apportioning the costs as both upfront and annual costs.

In general, it is the responsibility of the applicant for a permit or approval to prepare detailed cost estimates for all appropriate and approvable discharge, non-discharge, and combination discharge/non-discharge alternatives. The cost estimates may be prepared by a licensed professional engineer, accountant, economist or other professional qualified in the field, but they must be submitted under a professional engineer seal as part of the permit application.

The sources and rationale for all data and assumptions must be clearly indicated. NMED will review the cost estimates for completeness, accuracy, and validity of assumptions. Where deficiencies are discovered, NMED will either request additional information or obtain the information on its own, or both. Following the review process, NMED will advise the applicant on which alternatives (or combination discharge/non-discharge alternatives) are cost-effective, and processing of a permit application will proceed on that basis. In general, an alternative or suite of alternatives is considered to be cost-effective and reasonable if it is feasible and the cost is less than 110% of the base costs of pollution control measures for the proposed discharge (present worth costs).

Other factors:

While the basic concept behind the direct comparison is the present worth method, which has traditionally been used, other approaches and factors may be proposed by applicants and will be considered by the Department (e.g., EPA's Water Quality Standards Handbook – *Interim Economic Guidance for Water Quality Standards*, EPA-823-B-95-002, 1995).

Combined approach:

Aspects of the other approaches can be integrated or combined with the direct comparison approach. For instance, in EPA's guidance document, the 1 percent of median household income user-fee criteria can be applied as a first test of cost-effectiveness, even before the direct cost comparisons are considered. Only if the user-fees exceed the screening criteria would the direct comparison of the alternative come into play.

Where appropriate, NMED may require that the submitted demonstration of cost-effectiveness include information to support both a primary screening/affordability evaluation as well as a secondary alternative-to-alternative cost comparison.

Appendix A.2
Social and Economic Importance Worksheet

Social & Economic Worksheet

Social and Economic Benefits/Costs

Does your proposed activity:

1. Create or expand employment?

   Yes _____ Describe _____

   No _____ Describe _____

   Don't Know ___

   Not Applicable Why not? _____

2. Reduce the unemployment rate?

   Yes _____ Describe _____

   No _____ Describe _____

   Don't Know ___

   Not Applicable Why not? _____

3. Increase median family income?

   Yes _____ Describe _____

   No _____ Describe _____

   Don't Know ___

   Not Applicable Why not? _____

4. Reduce the number of households below the poverty line?

   Yes _____ Describe _____

   No _____ Describe _____

   Don't Know ___

   Not Applicable Why not? _____

5. Increase needed housing supply?

   Yes _____ Describe _____

   No _____ Describe _____

   Don't Know ___

   Not Applicable Why not? _____

6. Increase the community tax base?

   Yes _____ Describe _____

   No _____ Describe _____

   Don't Know ___

   Not Applicable Why not? _____

7. Provide necessary public services (e.g., fire department, school, infrastructure)?

   Yes _____ Describe _____

   No _____ Describe _____

   Don't Know ___

   Not Applicable Why not? _____

8. Correct a public health or environmental problem?

   Yes _____ Describe _____

   No _____ Describe _____

   Don't Know ___

   Not Applicable Why not? _____

9. Improve quality of life for residents in the area?

   Yes _____ Describe _____

   No _____ Describe _____

   Don't Know ___

   Not Applicable Why not? _____

Environmental Protection Benefits/Costs

Explain how your proposed activity positively or negatively affects the following:

1. The societal and economic benefits/costs of better health protection.

   Describe _____

   _____

   Don't Know ___

   Not Applicable Why not? _____

2. Fishing, recreation, and tourism industries.

   Describe _____

   _____

   Don't Know ___

   Not Applicable Why not? _____

3. The general societal value of maintaining the quality of the environment.

   Describe _____

   _____

   Don't Know ___

   Not Applicable Why not? _____

4. Threatened and endangered species.

   Describe _____

   _____

   Don't Know ___

   Not Applicable Why not? _____

5. Increased flood control and sediment trapping through maintaining wetlands and riparian zones.

   Describe _____

   _____

   Don't Know ___

   Not Applicable Why not? _____

6. Reservation of assimilative capacity for future industry and development.

   Describe _____

   _____

   Don't Know ___

   Not Applicable Why not? _____

If you need more space to "describe" how this discharge will impact the social, economic and environmental benefits/costs above, please attach additional sheet(s) to this form.

Likewise, if additional considerations are desired or required in your social and economic justification analysis, please refer to Appendix A.3 and Appendix A.4.

Appendix A.3
Information for Substantial and Widespread Impact Analysis (OPTIONAL)

Attachment 1 – Tier 2 Review of a Public Facility

Attachment 1 includes additional information that may be required by the Department to evaluate socio-economic factors of a public facility during a Tier 2 review. This evaluation is based on two types of impacts, referred to as "substantial" and "widespread". The Substantial Impacts analysis is found in Tables 1-3 – 1-7. The Widespread Impacts[12] analysis is found in Table 1-8.

SUBSTANTIAL IMPACTS - SUMMARY

Purpose of Substantial Impacts analysis: Determine whether a public facility can afford pollution controls in order to avoid any degradation of water quality.

The first step in a Substantial Impacts analysis is to provide data on the socio-economic factors listed in the worksheets in Tables 1-1 and 1-2. This data is then used to determine two indicators called the "Municipal Affordability Screener" (Table 1-3) and the "Secondary Affordability Test" (Tables 1-4 – 1-6). The results of these indicators are then compared in the "Assessment of Substantial Impacts Matrix" (Table 1-7) as a way to determine overall affordability to the community.

Widespread Impacts[5] - Summary

Purpose of Widespread Impacts Analysis: evaluates the social costs of pollution control requirements by: 1) defining the affected community; 2) evaluating the community's current characteristics; and 3) evaluating how community characteristics would change if discharger must avoid degradation to water quality.

If the conclusion from the Substantial Impacts analysis is "Questionable Affordability" or "Community cannot afford the pollution control", then a Widespread Impacts analysis may be completed to further resolve the affordability issue. This analysis is primarily a qualitative evaluation based on community socioeconomic factors that are expanded to a larger scale than the Substantial Impacts analysis.

[5] Widespread Impact Analysis forms derived from EPA's Water Quality Standards Academy Participant Manual Update-4, 2000 [EPA 823-B-00-005].

Table 1-3. Substantial Impacts Analysis – Part I

PART I. CALCULATING THE MUNICIPAL AFFORDABILITY SCREENER	
This screener is used to evaluate expected impacts to households. It indicates whether community households can afford to pay the total annualized pollution control costs to avoid water quality degradation.	
A. Calculate Average Annualized Cost Per Household	
1. Calculate the Total Annual Cost of the Project	
Interest Rate for Financing (*i) =*	_____(expressed as a fraction)
Time Period for Financing (*n) =*	_____(years)
Annualization Factor: $\frac{i}{(i+1)^n - 1}(+ i) =$	_____ (1)
Total Capital Cost of Project to be Financed =	_____ (2)
Annual Operating Costs of Project =	_____ (3)
Annualized Capital Cost [(1) *x* (2)] =	_____ (4)
Total Annual Cost of Project [(3) + (4)] =	_____ (5)
2. Calculate the Total Annual Cost to Households	
Total Annual Cost of Project (5) x Percentage of Total Wastewater Flow Attributable to Residential and Municipal Wastewater Flows =	_____ (6)
Total Annual Cost of Existing Plant ($) *x* Percentage of Total Wastewater Flow Attributable to Residential and Municipal Wastewater Flows =	_____ (7)
Total Annual Cost to Households [(6) + (7)] =	_____ (8)
3. Calculate the Average Annualized Cost Per Household Total Annual Cost to Households (8) = Number of Households	_____ (9)
B. Calculate Screener Value:	
Average Annualized Cost Per Household (9) (*x 100) =* Median Household Income	_____% municipal affordability screen (10)
What type of impact does the Municipal Affordability Screener Indicate in table below?	_____ impact

Little Impact	Mid-Range Impact	Large Impact
< 1.0 %	1.0% - 2.0%	> 2.0%

Explanation of Impacts:
Little Impact – high affordability; households can afford to pay pollution control costs
Mid-Range Impact – uncertain affordability
Large Impact – low affordability; pollution control costs may cause economic hardship on households

Is there a need to proceed to the Secondary Affordability Test? (yes, if large impact or mid- range impact)	_____(yes/no)

Table 1-4. Substantial Impacts Analysis – Part II

PART II. APPLYING THE SECONDARY AFFORDABILITY TEST

A. EVALUATING THE DEBT INDICATORS

Bond Rating:
This is a Measure of the Credit Worthiness of a Community

What is Bond Rating of (name of municipality)_____? _____

What is the resulting score? (assign score from table below)

Source of Bond Rating	Weak	Mid-Range	Strong
S&P	below BBB	BBB	above BBB
Moody's	below Baa	Baa	above Baa
Score	1	2	3

_____score points (11)

Overall Net Debt to Market Value of Taxable Property:
This measures Debt Burden on Residents within the Community

(municipality)_____Overall Net Debt = _____ (12)

(municipality)_____Market Value of Taxable Property = _____ (13)

Overall Net Debt (12) (x 100) = _____ % (13a)
Market Value of Taxable Property (13)

What is the resulting score? (assign score from table below)

	Weak	Mid-Range	Strong
Compare % from 13a	>5%	2% - 5%	<2%
Score	1	2	3

_____score points (14)

Explanation of Ratings:
Weak = negative effect on indicator from increased costs for pollution controls
Mid-Range = uncertain effect on indicator
Strong = indicator can withstand increased costs for pollution controls

Table 1-5. Substantial Impacts Analysis – Part II

PART II. APPLYING THE SECONDARY AFFORDABILITY TEST (continued)

B. EVALUATING THE SOCIOECONOMIC INDICATORS

Unemployment Rate:
This measures the General Economic Health of the Community

What is (municipality)_____Unemployment Rate? _____

Is this above, below, or equal to the State's rate?

What is the resulting Score? (assign score from table below)

	Weak	Mid-Range	Strong
Compare unemployment rate	Above State Average	State Average	Below State Average
Score	1	2	3

_____score points (15)

Median Household Income:
This Measure Provides an Overall Indication of Community Earning Capacity

What is (municipality) Median Household Income?

Is this above, below, or equal to the State's rate?

What is the resulting Score? (assign score from table below)

	Weak	Mid-Range	Strong
Compare median income	Below State Average	State Average	Above State Average
Score	1	2	3

score points (16)

Table 1-8. Widespread Impacts Analysis – Public Facility

1. Define the Affected Community

Evaluate the Discharger's Contribution to the Community:

- Contribution to economic base (e.g., property taxes and employment)
- Provides product or service upon which other businesses or thecommunity depend

2. Evaluate Community's Current Characteristics

Evaluate how community's current socioeconomic health may change if proposed project must avoid degradation to water quality by considering the following factors:

- Median household income
- Unemployment rate
- Rate of industrial development
- Developing and declining industries
- Percent of households below poverty line
- Ability of community to carry more debt
- Local and regional factors

Other applicable information on the local and regional economy that should also be reviewed includes:

- Annual rate of population change
- Current financial surplus as a percentage of total expenditures
- Percentage of property taxes actually collected
- Property tax revenues as a percentage of the market value of real property
- Overall debt outstanding as a percentage of market value of real property
- Overall debt per capita
- Percentage of outstanding debt due within 5 years

3. Evaluate How Community Characteristics Would Change if Discharger Must Avoid Degradation to Water Quality

Evaluate the projected adverse socioeconomic impacts of adding pollution controls to the project to meet antidegradation requirements by considering the following:

- Property Values
- Employment Rate
- Commercial Development Opportunities
- Tax Revenues
- Expenditure on Social Services
- State level impacts such as loss of revenues and increased expenditures

Attachment 2 – Tier 2 Review of a Private Facility

Attachment 2 includes additional information that may be required by the Department to evaluate socio-economic factors of a private facility during a Tier 2 review. This evaluation is based on two types of impacts, referred to as "substantial" and "widespread". The Substantial Impacts analysis is found in Table 2-2. The Widespread Impacts analysis is found in Table 2-3.

SUBSTANTIAL IMPACTS - SUMMARY

Purpose of Substantial Impacts analysis: Determine whether a private facility can afford pollution controls in order to avoid any degradation of water quality.

The first step in a Substantial Impacts analysis is to provide data on the socio-economic factors listed in the worksheet in Table 1. This data is then used to calculate four financial tests that in turn indicate the financial health of a private entity (Table 2).

WIDESPREAD IMPACTS - SUMMARY

Purpose of Widespread Impacts analysis: Evaluates the social costs of pollution control requirements by: 1) defining the affected community; 2) evaluating the community's current characteristics; and 3) evaluating how community characteristics would change if discharger must avoid degradation to water quality.

If the Substantial Impacts analysis (i.e., the four financial tests) indicates that the private entity's financial health is questionable, then a Widespread Impacts analysis may be completed to further resolve the affordability issue. This analysis is primarily a qualitative evaluation based on community socioeconomic factors that are expanded to a larger scale than the Substantial Impacts analysis.

Table 2-1. Data Worksheet for Financial Factors

Financial Factor	Data
Current Assets	
Current Liabilities	
Cash flow per given year	
Total debt of the entity	
Amount firm has borrowed (debt)	
Amount of stockholders' capital (equity)	
Pre-tax earnings	
Annualized pollution control cost	

Table 2-2. Substantial Impacts Analysis - Financial Tests Used to Measure the Financial Health of a Private Entity

1. Liquidity Test - Indicates how easily an entity can pay its short-term bills. Current Ratio = Current Assets / Current Liabilities NOTE: A ratio greater that 2 indicates affordability
2. Solvency Test - Indicates how easily an entity can pay its fixed and long-term bills. Beaver's Ratio = Cash flow per given year / Total debt of the entity NOTE: > 0.20 Indicates private entity is solvent < 0.15 Indicates private entity may go bankrupt
3. Leverage Test - Indicates how much money the entity can borrow. Debt-to-Equity Ratio = Amount firm has borrowed (debt) / Amount of Stockholders' capital (equity) NOTE: The larger the Debt-to-Equity Ratio, the less likely that the entity will be able to borrow funds
4. Earnings Test - Indicates how much the entity's profitability will change with the additional pollution control needed to avoid degradation of water quality. Earnings = Pre-tax – Annualized Pollution Control Cost NOTE: Compare earnings result with entity's revenues to measure post-compliance profit rate
Guidelines to evaluate financial tests: o Results of all four tests above should be considered jointly o Ratios and tests should be compared over several years o Financial ratios should also be compared against those of "healthy" entities o The role the entity plays in a parent firm's operations should also beconsidered

Table 2-3. Widespread Impacts Analysis – Private entity/facility

1. Define the Affected Community

Evaluate the Discharger's Contribution to the Community:

- Contribution to economic base (e.g., property taxes and employment)
- Provides product or service upon which other businesses or the community depend

2. Evaluate Community's Current Characteristics

Evaluate how community's current socioeconomic health would change if proposed project must avoid degradation to water quality by considering the following factors:

- Median household income
- Unemployment rate
- Rate of industrial development
- Developing and declining industries
- Percent of households below poverty line
- Ability of community to carry more debt
- Local and regional factors

Other applicable information on the local and regional economy that should also be reviewed includes:

- Annual rate of population change
- Current financial surplus as a percentage of total expenditures
- Percentage of property taxes actually collected
- Property tax revenues as a percentage of the market value of real property
- Overall debt outstanding as a percentage of market value of real property
- Overall debt per capita
- Percentage of outstanding debt due within 5 years

3. Evaluate How Community Characteristics Would Change if Discharger Must Avoid Degradation to Water Quality

Evaluate the projected adverse socioeconomic impacts of adding the pollution control to the project to meet antidegradation requirements by considering the following:

- Property Values
- Employment Rate
- Commercial Development Opportunities
- Tax Revenues
- Expenditure on Social Services
- State level impacts such as loss of revenues and increased expenditures

Summary of Other Economic and Environmental Impact Categories

1. **Public Need/Social Service**
   - Health/Nursing Care
   - Police/Fire Protection
   - Infrastructure Need
   - Education (primary)

2. **Consistency with Local Zoning and Planning**
   - Sewage Facility Planning
   - Zoning Requirements
   - Land Use Plans
   - Patterns of Growth/Development

3. **Quality of Life**
   - Educational (post-secondary)
   - Cultural
   - Recreational

4. **Housing**
   - Quantity
   - Affordability

5. **Employment**
   - Number and Type of Jobs Relative to Local Unemployment Rate and Local Labor Force
   - State Local Mean Qualified Income

6. **Tax Revenues**
   - Tax Revenue Income for Relative to Increased Private Demand for Services
   - Public and Private Change in Property Value or Tax Status

7. **Development Potential**
   - Potential to Spur Increased Growth

8. **Sensitivity of Water Use**
   - Presence of Threatened and Endangered Species
   - Public Water Supply Use
   - Water Contact Sports

9. **Nature of Pollutants**
   - Synthetic
   - Bioaccumulative
   - Naturally Occurring

10. **Proposed Degree of Change in Water Quality**
    - Available Dilution
    - Amount of Assimilative Capacity Used

11. Proximity to Wetlands or Floodplain

Presence of Wetlands
Location with Respect to Stream Channel

12. Duration of Discharge

Permanent
Continuous
Short-term

13. Reliability of Treatment Technology

High Tech/Experimental
Energy Intensive
Maintenance Intensive
Natural System
Overall Reliability

14. Compliance Record

Current Violations
Historical Violations
Overall Record

15. Secondary Beneficial Impacts

Groundwater Recharge
Post-Construction Storm Water
Hydromodifications
Thermal Modification
Construction on Previously Undisturbed Lands
Discharge to Previously Undegraded Waters

Appendix A.5
List of Agencies Involved in Intergovernmental Coordination

Interagency Coordination for Antidegradation Review

In accordance with 20.6.2.2001 NMAC, and to the extent practicable, the Department will provide joint public notice with the EPA that the Department is reviewing a draft NPDES permit (which contains the antidegradation review) for the purpose of preparing a state certification or denial pursuant to Section 401 of the CWA. When joint notice is impractical, the Department provides notice that it is reviewing a draft NPDES permit for purpose of preparing a state certification or denial pursuant to Section 401 of the CWA by mailing or emailing the notice, as appropriate, to:

- the NPDES permit applicant or permittee;
- any user identified in the permit application of a privately-owned treatment works;
- any affected federal agency, such as EPA Region 6, the U.S. Fish & Wildlife Service and affected federal public land managers (i.e., U.S. Forest Service, BLM, and National Park Service);
- any affected state agency, such as the NM Office of the State Engineer, New Mexico Game & Fish Department, NM State Land Office, and New Mexico State Parks - EMNRD;
- any affected tribal agency;
- any affected local agency, including each applicable county department of health, environmental services or comparable department;
- any affected Council of Government (COG);
- any federal and state agencies with jurisdiction over fish, shellfish, and wildlife resources;
- the New Mexico Historic Preservation Office;
- the U.S. Army Corps of Engineers; and,
- any person who requests public notice in writing.

Appendix A.6
Antidegradation Policy and Implementation Plan (20.6.4.8 NMAC)

20.6.4.8 ANTIDEGRADATION POLICY AND IMPLEMENTATION PLAN:

A. Antidegradation Policy: This antidegradation policy applies to all surface waters of the state.

(1) Existing instream water uses and the level of water quality necessary to protect the existing uses shall be maintained and protected in all surface waters of the state.

(2) Where the quality of a surface water of the state exceeds levels necessary to support the propagation of fish, shellfish, and wildlife, and recreation in and on the water, that quality shall be maintained and protected unless the commission finds, after full satisfaction of the intergovernmental coordination and public participation provisions of the state's continuing planning process, that allowing lower water quality is necessary to accommodate important economic and social development in the area in which the water is located. In allowing such degradation or lower water quality, the state shall assure water quality adequate to protect existing uses fully. Further, the state shall assure that there shall be achieved the highest statutory and regulatory requirements for all new and existing point sources and all cost-effective and reasonable BMPs for nonpoint source control. Additionally, the state shall encourage the use of watershed planning as a further means to protect surface waters of the state.

(3) No degradation shall be allowed in waters designated by the commission as outstanding national resource waters (ONRWs), except as provided in Subparagraphs (a) through (e) of this paragraph and in Paragraph (4) of this Subsection A.

(a) After providing a minimum 30-day public review and comment period, the commission determines that allowing temporary and short-term degradation of water quality is necessary to accommodate public health or safety activities in the area in which the ONRW is located. Examples of public health or safety activities include but are not limited to replacement or repair of a water or sewer pipeline or a roadway bridge. In making its decision, the commission shall consider whether the activity will interfere with activities implemented to restore or maintain the chemical, physical or biological integrity of the water. In approving the activity, the commission shall require that:

(i) the degradation shall be limited to the shortest possible time and shall not exceed six months;

(ii) the degradation shall be minimized and controlled by best management practices or in accordance with permit requirements as appropriate; all practical means of minimizing the duration, magnitude, frequency and cumulative effects of such degradation shall be utilized;

(iii) the degradation shall not result in water quality lower than necessary to protect any existing use in the ONRW; and

(iv) the degradation shall not alter the essential character or special use that makes the water an ORNW.

(b) Prior to the commission making a determination, the department or appropriate oversight agency shall provide a written recommendation to the commission. If the commission approves the activity, the department or appropriate oversight agency shall oversee implementation of the activity.

(c) Where an emergency response action that may result in temporary and short-term degradation to an ONRW is necessary to mitigate an immediate threat to public health or safety, the emergency response action may proceed prior to providing notification required by Subparagraph (a) of this paragraph in accordance with the following:

(i) only actions that mitigate an immediate threat to public health or safety may be undertaken pursuant to this provision; non-emergency portions of the action shall comply with the requirements of Subparagraph (a) of this paragraph;

(ii) the discharger shall make best efforts to comply with requirements (i) through (iv) of Subparagraph (a) of this paragraph;

(iii) the discharger shall notify the department of the emergency response action in writing within seven days of initiation of the action;

(iv) within 30 days of initiation of the emergency response action, the discharger shall provide a summary of the action taken, including all actions taken to comply with requirements (i) through (iv) of Subparagraph (a) of this paragraph.

(d) Preexisting land-use activities, including grazing, allowed by federal or state law prior to designation as an ONRW, and controlled by best management practices (BMPs), shall be allowed to continue so long as there are no new or increased discharges resulting from the activity after designation of the ONRW.

(e) Acequia operation, maintenance, and repairs are not subject to new requirements because of ONRW designation. However, the use of BMPs to minimize or eliminate the introduction of pollutants into receiving waters is strongly encouraged.

(4) This antidegradation policy does not prohibit activities that may result in degradation in surface waters of the state when such activities will result in restoration or maintenance of the chemical, physical or biological integrity of the water.

(a) For ONRWs, the department or appropriate oversight agency shall review on a case-by-case basis discharges that may result in degradation from restoration or maintenance activities, and may approve such activities in accordance with the following:

(i) the degradation shall be limited to the shortest possible time;

(ii) the degradation shall be minimized and controlled by best management practices or in accordance with permit requirements as appropriate, and all practical means of minimizing the duration, magnitude, frequency and cumulative effects of such degradation shall be utilized;

(iii) the degradation shall not result in water quality lower than necessary to protect any existing use of the surface water; and

(iv) the degradation shall not alter the essential character or special use that makes the water an ORNW.

(b) For surface waters of the state other than ONRWs, the department shall review on a case-by-case basis discharges that may result in degradation from restoration or maintenance activities, and may approve such activities in accordance with the following:

(i) the degradation shall be limited to the shortest possible time;

(ii) the degradation shall be minimized and controlled by best management practices or in accordance with permit requirements as appropriate, and all practical means of minimizing the duration, magnitude, frequency and cumulative effects of such degradation shall be utilized; and

(iii) the degradation shall not result in water quality lower than necessary to protect any existing use of the surface water.

(5) In those cases where potential water quality impairment associated with a thermal discharge is involved, this antidegradation policy and implementing method shall be consistent with Section 316 of the federal Clean Water Act.

(6) In implementing this section, the commission through the appropriate regional offices of the United States environmental protection agency will keep the administrator

advised and provided with such information concerning the surface waters of the state as he or she will need to discharge his or her responsibilities under the federal Clean Water Act.

B. Implementation Plan: The department, acting under authority delegated by the commission, implements the water quality standards, including the antidegradation policy, by describing specific methods and procedures in the continuing planning process and by establishing and maintaining controls on the discharge of pollutants to surface waters of the state. The steps summarized in the following paragraphs, which may not all be applicable in every water pollution control action, list the implementation activities of the department. These implementation activities are supplemented by detailed antidegradation review procedures developed under the state's continuing planning process. The department:

(1) obtains information pertinent to the impact of the effluent on the receiving water and advises the prospective discharger of requirements for obtaining a permit to discharge;

(2) reviews the adequacy of existing data and conducts a water quality survey of the receiving water in accordance with an annually reviewed, ranked priority list of surface waters of the state requiring total maximum daily loads pursuant to Section 303(d) of the federal Clean Water Act;

(3) assesses the probable impact of the effluent on the receiving water relative to its attainable or designated uses and numeric and narrative criteria;

(4) requires the highest and best degree of wastewater treatment practicable and commensurate with protecting and maintaining the designated uses and existing water quality of surface waters of the state;

(5) develops water quality based effluent limitations and comments on technology based effluent limitations, as appropriate, for inclusion in any federal permit issued to a discharger pursuant to Section 402 of the federal Clean Water Act;

(6) requires that these effluent limitations be included in any such permit as a condition for state certification pursuant to Section 401 of the federal Clean Water Act;

(7) coordinates its water pollution control activities with other constituent agencies of the commission, and with local, state and federal agencies, as appropriate;

(8) develops and pursues inspection and enforcement programs to ensure that dischargers comply with state regulations and standards, and complements EPA's enforcement of federal permits;

(9) ensures that the provisions for public participation required by the New Mexico Water Quality Act and the federal Clean Water Act are followed;

(10) provides continuing technical training for wastewater treatment facility operators through the utility operators training and certification programs;

(11) provides funds to assist the construction of publicly owned wastewater treatment facilities through the wastewater construction program authorized by Section 601 of the federal Clean Water Act, and through funds appropriated by the New Mexico legislature;

(12) conducts water quality surveillance of the surface waters of the state to assess the effectiveness of water pollution controls, determines whether water quality standards are being attained, and proposes amendments to improve water quality standards;

(13) encourages, in conjunction with other state agencies, implementation of the best management practices set forth in the New Mexico statewide water quality management plan and the nonpoint source management program, such implementation shall not be mandatory except as provided by federal or state law;

(14) evaluates the effectiveness of BMPs selected to prevent, reduce or abate sources of water pollutants;

NMED Exhibit 3

(15) develops procedures for assessing use attainment as required by 20.6.4.15 NMAC and establishing site-specific standards; and

(**16)** develops list of surface waters of the state not attaining designated uses, pursuant to Sections 305(b) and 303(d) of the federal Clean Water Act.

Hydrology Protocol

for the

Determination of Uses Supported by
Ephemeral, Intermittent, and Perennial Waters

Originally Approved May 2011
Approved Revision October 23, 2020

NMED Exhibit 3

This page intentionally left blank.

EXECUTIVE SUMMARY

The *Hydrology Protocol* provides a methodology for distinguishing among ephemeral, intermittent and perennial streams and rivers in New Mexico. The results of the *Hydrology Protocol* may also aid in the designation of appropriate designated uses supported by those waterbodies as a result of flow regime. New Mexico's water quality standards (*Standards for Interstate and Intrastate Surface Waters*, 20.6.4 NMAC) set distinct protections for unclassified ephemeral, intermittent and perennial waters (*see* 20.6.4.97 to 99 NMAC) and also identify many classified waters by their hydrology, e.g. "perennial tributaries to" or "perennial reaches of" (*see* 20.6.4.101 to 899 NMAC). Hydrological determinations are key to assuring that the appropriate designated uses and water quality criteria are applied to a particular waterbody.

The *Hydrology Protocol* was specifically developed to generate documentation of the aquatic life and recreation uses supported by the hydrology of a given stream or river. This information can then be used to provide technical support for a Use Attainability Analysis (UAA). Under particular circumstances, the use of the *Hydrology Protocol* can be used for the expedited UAA process (20.6.4.15(C) NMAC), which facilitates the efficient application of the limited aquatic life and secondary contact uses to ephemeral waters, where appropriate, prior to undergoing the full administrative rule-making process. However, the *Hydrology Protocol* cannot be used in place of the UAA.

SWQB or any other party may conduct a *Hydrology Protocol* survey as part of a UAA in accordance with UAA requirements found under 40 CFR 131.10, 20.6.4.15 NMAC and the State's approved Water Quality Management Plan/Continuing Planning Process (WQMP/CPP), therefore the user/evaluator may be a member of SWQB, another regulatory agency, a contractor, or a member of the public.

The information gained from the protocol can also be used to identify unclassified waters within an otherwise classified standards segment. The details of these specific applications are described in Section II of *New Mexico's Water Quality Management Plan and Continuing Planning Process*, to which this *Hydrology Protocol* is an appendix. Other applications where a determination of stream hydrology is necessary are possible but results of the *Hydrology Protocol* must be evaluated cautiously within the specific decision framework of the study.

The protocol relies on hydrological, geomorphic and biological indicators related to the persistence of water and is organized into two levels of evaluations: Level 1 and Level 2. Data gathered during the Level 1 Evaluation should, in most cases, provide enough information to give a clear indication of the hydrological status of the stream. The "*Hydrology Determination Field Sheets,"* a.k.a. "*Field Sheets,*" was developed to record the information collected through application of the *Hydrology Protocol* and may be used to support the UAA process. The Level 1 Evaluation Field Sheets provide some of the necessary information needed in a Use Attainability Analysis to demonstrate a stream is ephemeral, intermittent or perennial. Attainment of a specific Clean Water Act Section 101(a)(2) aquatic life and recreational use may not be feasible due to the factor identified in 40 CFR 131.10(g)(2): *natural, ephemeral, intermittent, or low flow conditions or water levels prevent the attainment of the use*. The data obtained through a Hydrology Protocol survey provides some of

the information that would be necessary to demonstrate that attainment is not achievable but, is only one of the elements required under a UAA to demonstrate the evidence to support changing a designated use.

In certain instances, additional data and supporting information are necessary to determine the hydrological condition of the stream. The methods described as part of the Level 2 Evaluation may be conducted if the Level 1 Evaluation is inconclusive (i.e. the score falls within a gray zone, see Section 2, Table 5). The Level 2 Evaluation relies on more intense and focused data collection efforts and provides the evaluator with additional data and observations to make a final hydrological determination. The Level 2 Evaluation may be used for either an expedited or regular UAA as documentation to support the proper standards classification of a given stream.

Regardless of whether a Level 1 or Level 2 Evaluation is performed, the SWQB encourages the evaluator to gather as much information as possible to make an accurate assessment of the stream. Recommendations are provided in the protocol, but other data not included in these recommendations may be gathered as well.

NMED Exhibit 3

I. INTRODUCTION

Streams are drainage features that may exhibit ephemeral, intermittent or perennial characteristics or change from ephemeral to intermittent and intermittent to perennial along a gradient or continuum—sometimes with no single distinct point demarcating these transitions. Nevertheless, all stream systems are characterized by interactions among hydrological, biological, and geomorphic (physical) processes. According to Maidment (1993), *Streamflow* can be described as flowing surface water along a defined natural channel generated by a combination of:

- *Stormflow* – streamflow resulting from the relatively rapid runoff of precipitation from the land as interflow (rapid, unsaturated, subsurface flow), overland flow, or saturated flow from raised, near surface water tables close to the stream.
- *Baseflow* – return flow from sustained groundwater discharge into the channel.
- Contributions of discharge from upstream tributaries as stormflow or baseflow.
- Contributions of discharge from point source dischargers and irrigation return flows.

The *Hydrology Protocol* uses attributes of hydrological, biological and geomorphic processes to produce a quantitative score. The score is then used to characterize the stream as "ephemeral," "intermittent," or "perennial". The term "stream", as it pertains to the *Hydrology Protocol*, refers to a wadable, lotic water body (typically 1st, 2nd, or 3rd Strahler stream order) and the term "river" refers to a non-wadable, lotic water body (generally 4th Strahler stream order or higher). Throughout this document the terms are interchangeable with one another as the same process and procedures are used regardless of whether the channel is wadable or not.

II. DEFINITIONS

The *Hydrology Protocol* is based on the definitions of "ephemeral," "intermittent" and "perennial" adopted by the WQCC in 20.6.4.7 NMAC as follows:

> ***"Ephemeral"*** *when used to describe a surface water of the state means the water body contains water briefly only in direct response to precipitation; its bed is always above the water table of the adjacent region.*
>
> ***"Intermittent"*** *when used to describe a surface water of the state means the water body contains water for extended periods only at certain times of the year, such as when it receives seasonal flow from springs or melting snow.*
>
> ***"Perennial"*** *when used to describe a surface water of the state means the water body typically contains water throughout the year and rarely experiences dry periods.*

III. HYDROLOGY DETERMINATION AND RATING FORM

A. General Information

There are two levels of evaluation for the *Hydrology Protocol* (HP). Data gathered during the Level 1 Evaluation should, in most cases, provide enough information to give a clear indication of the hydrological status of the stream. However, a more in-depth Level 2 Evaluation may be used to gather more information and data for more complex borderline cases. The *Field Sheets* are used to record the information and data collected through application of the HP.

For waterbodies where an HP is being conducted with the intent to remove a designated use that is not an existing use, as defined under 40 CFR 131.3 and 20.6.4.7(E)(3) NMAC, a UAA must be prepared. Third-party UAAs conducted in accordance with 20.6.4.15(D) NMAC, must have a workplan, approved by the Department, prior to conducting an HP UAA.

Although the HP is used as supporting evidence in a UAA, it is beyond the scope of this document to provide guidance on preparing a UAA.

B. User/Evaluator Experience

In order to distinguish ephemeral streams and rivers from non-ephemeral ones or intermittent streams and rivers from perennial ones using the information presented in this protocol, the evaluator should have experience making geomorphic, hydrological, and biological observations in New Mexico or in the semi-arid climate of the southwestern U.S.

The *Hydrology Protocol* was designed to provide the necessary supporting documentation for a UAA based on natural hydrologic flow conditions. In accordance with 20.6.4.15 NMAC, NMED or any other party may conduct a UAA, therefore the User/Evaluator for the *Hydrology Protocol* may be a member of NMED, another regulatory agency, a contractor, and/or a member of the public. It should be noted that only the Department can submit an expedited UAA using the *Hydrology Protocol* for EPA's technical review and approval, as described under 20.6.4.15(C) NMAC.

C. Drought Conditions

Spatial and temporal variations in stream attributes occur in stream systems. These variations can affect persistence and volume of streamflow. The changes to the system's flow regime can be related to seasonal precipitation and evapotranspiration patterns, as well as influenced by recent weather and interannual climate variability.

Local drought and weather data should be reviewed prior to evaluating flow conditions in the field. Perennial streams will have water in their channels year-round in the absence of drought conditions. Therefore, it is *strongly* recommended that field evaluations be conducted outside of drought conditions whenever possible.

Drought conditions, for the purposes of this *Hydrology Protocol*, are defined as any time the Standardized Precipitation Index (SPI) is less than -1.5, indicating severely to extremely dry conditions as described by the National Drought Mitigation Center (NDMC 1995). The 12-month SPI will be used to determine drought conditions and noted on the *Field Sheets*. The 12-month SPI

should be verified through other sources such as the Standardized Precipitation Evapotranspiration Index (Beguería, et al. 2014) or the United States Drought Monitor to ensure that extreme or exceptional drought conditions are not indicated for the survey location.

The 12-month SPI was chosen for use in the *Hydrology Protocol* because SPIs of this time-scale can be linked to groundwater-surface water fluctuations and reservoir storage, it can provide an early warning of drought, and it can help assess drought severity. The SPI calculation for any location in New Mexico is based on 10 climate regions of New Mexico and long-term precipitation records (both rainfall and snowpack), and has available archived maps dating back to 1996. The 12-month SPI value for a particular stream is included as another piece of evidence to be evaluated before making a final stream determination. If the evaluator believes that extreme conditions such as severe drought or abnormal precipitation are influencing the overall rating, he may want to postpone a final decision until another evaluation can take place during more normal conditions.

D. Recent Rainfall Activity

Recent (generally considered to be within 48 hours) rainfall or snowmelt can also influence scoring; therefore, it is *strongly* recommended that field evaluations be conducted at least 48 hours after the last known major rainfall or snowmelt. Field observations regarding the presence or absence of recent high flows should be made and documented on the *Field Sheets* to supplement any available local rain gauge data and to determine if field observations were made at least 48 hours following a precipitation or runoff event. To reduce this source of variability, the Level 1 Field Evaluation should occur during stable baseflow conditions which will vary by region and elevation of the sample reach but are typically between late May and mid-July (to avoid snowmelt) or mid-September and early November (to avoid monsoons). The protocol and scoring mechanism were designed with redundancy (i.e. multiple indicators) to allow for defensible scoring even within 48 hours after a recent rainfall or during drought conditions. Nevertheless, performing field evaluations during or after severe conditions, such as floods or drought, is not optimal nor is it recommended.

E. Scoring

The *Field Sheets* are used to record the score for each attribute and determine the total numeric score for the sample reach under investigation. The *Field Sheets* specifically request information regarding: date, project, evaluator, site, Assessment Unit (AU), 12-month SPI value, latitude/longitude, as well as any other pertinent observations (such as indications of recent rain events). Additional notes for the Field Sheets should include the most recent precipitation date and amount from the closest rain gage, if available, and evidence of any anthropogenic influences and modifications. The *Field Sheets* are an official record, so all pertinent observations should be recorded on it.

In order to assess the natural variability encountered when making hydrological determinations in the field, a four-tiered, weighted scale was developed for evaluating and scoring each hydrological attribute. The scores that are applied to sets of geomorphic, hydrological and biological attributes are: poor, weak, moderate, and strong. *Moderate* scores are intended as an approximate qualitative midpoint between the two extremes of *Poor* and *Strong*. The score ranges were developed to better assess the often gradual and variable transitions of streams from ephemeral

NMED Exhibit 3

to non-ephemeral. The remaining qualitative description of *Weak* represents gradations that will often be observed in the field. Definitions of poor, weak, moderate and strong are provided in **Table 1**. These definitions are intended as guidelines and the evaluator must select the most appropriate category based upon experience and observations of the sample reach under review, its watershed, and physiographic region.

The quantitative score given to each attribute reflects the evaluator's qualitative assessment of the characteristic along the sample reach. These category range within each of the characteristics allows the evaluator flexibility in assessing variable features or attributes. In addition, the incremental category gradients reduce the variability of range in scores between different evaluators. There may be circumstances where intermediary scores between the categories presented for each indicator are appropriate. In those cases, document the rationale for the intermediary score on the *Field Sheets*.

Table 1. Guide to Scoring Categories

Category	Description
Strong	The characteristic* is easily observable (i.e. observed within less than one minute of searching).
Moderate	The characteristic is present and observable with minimal (i.e. one or two minutes) searching.
Weak	The characteristic is present, but you have to search intensely (i.e., ten or more minutes) to find it.
Poor	The characteristic is not observed.

*****geomorphic, hydrological or biological

NMED Exhibit 3

F. Level 1 Evaluation: Data Collection for the Hydrology Determination of NM Streams and Rivers

1. Level 1 Office Procedures

The following information should be gathered and reviewed prior to conducting field work for a Level 1 Field Evaluation. It is important to gather as much physical and geographic information as possible by conducting reconnaissance on the stream reach prior to going out to the study site to save time, money and other resources and identify any risks or concerns.

Geographical Information System (GIS) and Remote Sensing Tools
The following is a non-exhaustive list of suggested coverages and resources that can help identify and generate informative maps of the field of study area. In addition, the aerial photographs, GIS coverages and resources listed below can be used to calculate sinuosity prior to field work (see *Indicator* #1.7 (Sinuosity) for more information).

Useful resources include:

- Google Earth
- SWQB Mapper (https://gis.web.env.nm.gov/oem/?map=swqb)
- GIS software (ArcMAP, QGIS, etc.)

Useful coverages that can be added to a GIS project include (Note, not all information listed here will be available for every stream.):

- SWQB water quality stations
- SWQB assessment units
- National Hydrography Dataset (NHD) streams
- Southwest Regional Gap Analysis (http://swregap.nmsu.edu/default.htm)
- Office of the State Engineer (OSE) data
- The United States Geological Survey (USGS) quadrangle maps
- Aerial photographs
- National Hydrography Dataset
- Digital Geologic Map of NM
- National Land Cover Dataset
- Bureau of Land Management (BLM) Land Status
- United States Department of Agriculture (USDA) or Natural Resources Conservation Service (NRCS) soil survey
- Omernik Ecoregions
- NM Roads

NMED Exhibit 3

Streamflow

Historic or recent flow data from gages such as those managed by the USGS, OSE or Los Alamos National Laboratory (LANL) should be used to make hydrological determinations. Streamgage data, if available, may clearly indicate ephemeral, intermittent, or perennial flow patterns for the available period of record and will facilitate the scoring of Indicator #1.1 *Water in Channel*.

Useful resources include:

- USGS Current Water Data for New Mexico: https://waterdata.usgs.gov/nm/nwis/rt
- OSE Real-Time Water Measurement Information System: http://meas.ose.state.nm.us/
- Los Alamos Area Environmental Data (Intellus): https://www.intellusnm.com

Drought Conditions

The following resources will help determine drought conditions and recent rainfall activity. At a minimum, the 12-month Standardized Precipitation Index (SPI) should be recorded on the *field sheets* along with the date and source the SPI was evaluated. Note, not all information listed here will be available for every stream:

- Historic or recent flow data (known sources include SWQB, OSE, USGS, or localized sources such as Los Alamos National Laboratory for waters on the Pajarito Plateau)
- Standardized Precipitation Index (SPI)
    - https://hprcc.unl.edu/maps.php?map=ACISClimateMaps
- Standardized Precipitation Evapotranspiration Index (SPEI)
    - http://spei.csic.es/index.html
- Rain gauge stations within the County
- Airport/regional climate data
- The National Weather Service:
    - https://w2.weather.gov/climate/index.php?wfo=abq
- https://w2.weather.gov/climate/xmacis.php?wfo=abqhttps://water.weather.gov/ahps/United States Drought Monitor https://droughtmonitor.unl.edu/
- PRISM Climate Data:
    - http://www.prism.oregonstate.edu/mtd

Refer to *Drought Conditions* and *Recent Rainfall Activity* on pages 6-7 for more information.

Stream Segment Identification and Sample Reach Selection

This protocol describes a method for assessing geomorphic, hydrological, and biological indicators of stream flow duration. However, flow characteristics often vary along the length of a stream, resulting in gradual transitions in flow duration. Choosing the sample reach on which to conduct an assessment can influence the resulting conclusion about

NMED Exhibit 3

flow duration. Before a determination of hydrology can be made for a stream the appropriate sample reach, within the larger stream segment to which the UAA will apply, must be identified.

For SWQB stream segments are termed **assessment units** (**AUs**). AUs are river or stream reaches defined by various factors such as hydrologic or watershed boundaries, geology, topography, incoming tributaries, surrounding land use/land management, water quality standards, etc. AUs are designed to represent waters with assumed homogeneous water quality (WERF 2007). AUs in New Mexico average 10 miles in length and are typically no more than 25 miles in length. A **sample reach**, as used in this protocol, is a length of stream (40 times the average stream bankfull width or 160 meters, whichever is larger) that is chosen to represent a uniform set of physical, chemical, and biological conditions within an AU. It is the principal sampling unit for collecting hydrological, geomorphic and biological data using this protocol. Below are several factors to look for when determining the homogeneity of the AU and the representativeness of the sample reach:

- Are there significant tributaries (2nd order or higher) entering along the reach?
- Are there any changes in geology?
- Are there any dramatic shifts in land use?
- Is there a dramatic change in slope?
- Are there changes in riparian vegetation type and amount?
- Are there any point sources discharging into the reach?
- Are there any irrigation return flows discharging into the reach?

Many of these questions may be evaluated using maps and remote sensing products (e.g. Google Earth), however field reconnaissance along the length of the AU – to evaluate potential gradients in stream hydrology and to select representative sample reach(es) for hydrologic evaluation – should also be conducted.

The sample reach(es) selected for evaluation with the Hydrology Protocol should be as representative as possible of the natural characteristics of the AU. For example, if the stream is mostly vegetated, the sample reach should be located along an area of the channel that is mostly vegetated as opposed to an area that has no vegetation or is sparsely vegetated. It is the responsibility of the assessor(s) to verify and document the homogeneity of the AU and representativeness of the sample reach. SWQB typically defines a representative sample reach for conducting data collection as 40 times the average stream width or 160 meters, whichever is larger. If there are questions regarding the homogeneity of an AU (i.e., you answered “yes” to any of the questions above) then a hydrology evaluation should be performed on multiple sample reaches to identify potential transition point(s) between flow categories and accurately characterize the AU. One approach may be to examine air photos or satellite imagery and identify those areas with the greatest vegetation as potential study reaches with the greatest likelihood for “perennial” characteristics. Using the tools and resources described above may be helpful in confirming characteristics on the ground should an AU need to be re-evaluated.

NMED Exhibit 3

2. Level 1 Field Procedures

In order to distinguish between ephemeral, intermittent, and perennial streams and rivers using the information presented in this protocol, the field evaluator should have experience making geomorphic, hydrological, and biological observations in New Mexico or the semi-arid region of the southwestern U.S. Field evaluations should be performed at least 48 hours after the last known major rainfall or snowmelt event. In addition, it is *strongly* recommended that field evaluations be conducted outside of drought conditions whenever possible.

Field Equipment and Supplies

- Copy of *Hydrology Protocol* and associated *Field Sheets*.
- Site maps and satellite imagery (1:250 scale if possible)
- Global Positioning System (GPS) – used to determine latitude and longitude
- Clipboard/pencils/sharpies
- Two Metric Rulers
- Two Measuring Tapes
- Survey rod
- Bank pins
- Laser Level/Rod Eyes/Clinometer
- Compass (if not available as part of GPS unit)
- Camera – used to photograph and document site features
- Shovel or Soil Auger
- D-frame dip net/white sorting tray
  (optional) Munsell
- Soil color chart (optional)
- Long piece of string (optional)
- Mechanical tally counter (optional)
- Sand-gauge card (optional)

Sample Reach Selection

Before selecting a location for the survey, note the character of the stream while driving to the site to verify that the reach is representative of the AU being characterized. This initial examination allows the evaluator to study the nature of the channel, observe characteristics of the watershed, and observe characteristics that indicate what source of water (stormflow, or base flow plus tributary/point source discharges, if present) may predominantly or solely contribute to flow in the AU. These initial observations also aid in determining the magnitude (poor, weak, moderate or strong) of specific parameters. In addition, the assessor can identify if the sample reach is generally uniform (i.e. "representative") or if it should be assessed as two or more distinct reaches. Hydrology evaluations must not be made at one point without first walking up and down the channel

NMED Exhibit 3

for at least 160 meters.

Ideally, the visual examination would be from the stream origin to the downstream confluence with a larger stream or until a change in characteristics such as slope or geology is observed, but this is usually not feasible or practical. Furthermore, property access issues may arise on privately held property. Make sure the site is easily and safely accessible. If the site is on private property get the land owner's approval before conducting an evaluation.

Upon finding a representative area to conduct the survey, document the latitude and longitude (origination and termination) extent of the survey reach on the *Field Sheets*, the length of the survey area should be no less than 160 meters.

Photodocumentation

It is important to explain the rationale behind any conclusions reached using this protocol and sometimes photos are just the medium in which to do that. It is essential to take several photos of the sample reach, AU and/or watershed, as appropriate, to document the environmental conditions and any disturbances or modifications that are relevant to making a final hydrology determination. Multiple and varied photos will help evaluate and verify the homogeneity of the AU as well as the representativeness of the sample reach when and if a UAA is reviewed by NMED, EPA and the WQCC. Photos that document the evaluation attributes (e.g. riparian vegetation, benthic macroinvertebrates, etc.) are also encouraged and provide excellent supporting documentation for any conclusions reached.

The assessor should include a detailed description of each photo on the *Field Sheets*, including date, description of the photo (e.g. left bank, right bank, upstream, downstream, etc.), and GPS coordinates (if different from site location), and attach the photos to the *Field Sheets* to officially document the conditions at the time of the evaluation and to support any conclusions that were reached using this protocol.

3. Level 1 Scoring

Hydrological determinations are accomplished by evaluating 14 different attributes of the sample reach and assigning a numeric score to each attribute following the four–tiered, weighted scale described in Section 1 Scoring and summarized in Table 1. Total scores reflect the persistence of water with higher scores indicating intermittent and perennial systems. **Please see Section 2 – Guidance for Overall Score Interpretation for more details.**

4. Level 1 Indicators

1.1. Water in Channel

It is necessary to distinguish stormwater inflow (resulting from precipitation within the past 48 hours) from baseflow. Flow observations preferably should be taken at least 48 hours after the last substantial rainfall or runoff event. Local weather data and drought

NMED Exhibit 3

information should be reviewed before evaluating flow conditions. Perennial systems will have water in their channels year-round in the absence of drought conditions. Therefore, it is recommended that field evaluations be conducted outside of drought conditions whenever possible. Drought conditions are defined as any time the Standard Precipitation Index (SPI) is less than -1.5, indicating severely to extremely dry conditions (NDMC 1995). The 12-month SPI should be recorded on the *Field Sheets* to indicate climatic conditions at the time of sampling, and confirmed through other sources such as the Standardized Precipitation Evapotranspiration Index (Beguería, et al. 2014) or the United States Drought Monitor to ensure that extreme conditions are not indicated for the survey location.

Evidence of recent high flows should be noted on the *Field Sheets*. Such evidence includes moist or wet sediment on plants or debris and organic drift lines at or above bankfull or in the active floodplain. Artificial (i.e. point-source) discharges should also be noted on form. Site inspections should result in visually discernible stream flows as evidence of base flow contribution between rain events, even in low flow conditions. If base flows are present during a site inspection that is more than 48 hours after a major rainfall or runoff event, the sample reach is either perennial or intermittent. However, intermittent reaches do not always have water in them. A good rule of thumb for differentiating ephemeral reaches from intermittent ones is if they have water in them during the dry season or during a drought. Look for water in pool areas in the streambed. The presence or types of plants as well as saturated sediment underneath rocks located within the channel are also good indications of the presence of water during the dry season or during a drought.

If the stream is visited during the dry season (typically defined in NM as **late May to mid-July** and **mid-September to early November**, but also varies by region and elevation of the stream) and base flows are not evident, the stream may be ephemeral or intermittent. If there is no flowing water within 48 hours of a rain or runoff event, then the stream is more than likely ephemeral. The prerequisite for a stream to be determined as ephemeral is that there must be no evidence of base flows in the stream banks.

Strong – Flow is evident throughout the sample reach. Moving water is seen in riffle areas but may not be as evident throughout the runs.

Moderate – Water is present in the channel but flow is barely discernable in areas of greatest gradient change (i.e. riffles) or floating object is necessary to observe flow.

Weak – Dry channel with standing pools. There is some evidence of base flows (e.g. riparian vegetation growing along channel, saturated sediment under rocks, etc)

Poor – Dry channel. Dry under rocks and debris. No evidence of base flows was found.

If available, historic or recent flow data from streamgages such as those managed by the USGS, OSE, or LANL may clearly indicate ephemeral, intermittent, or perennial flow patterns for the available period of record and will facilitate the scoring of Indicator #1.1 *Water in Channel*.

NMED Exhibit 3

1.2. Fish (qualitative observations)

In most cases, fish are indicators of perennial systems, since fish will rarely inhabit an intermittent stream. Fluctuating water levels of intermittent streams provide unstable and stressful habitat conditions for fish communities. When looking for fish, all available habitats should be observed, including pools, riffles, root clumps, and other obstructions (to greatly reduce surface glare, the use of polarized sunglasses is recommended). In small streams, the majority of species usually inhabit pools and runs. Fish should be easily observed within a minute or two. Also, fish will seek cover once alerted to your presence, so be sure to look for them slightly ahead of where you are walking. Check several areas along the sample reach, especially underneath undercut banks.

Strong - Found easily and consistently throughout the sample reach.
Moderate - Found with little difficulty but not consistently throughout the sample reach.
Weak - Takes 10 or more minutes of extensive searching to find.
Poor - Fish are not present (after 10 or more minutes of searching).

1.3. Benthic Macroinvertebrates (qualitative observations)

The larval stages of many aquatic insects are good indicators that a stream is perennial because a continuous aquatic habitat is required for these species to mature. Turn over the rocks and other large substrate found in areas of visible flowing water, (i.e. riffles) and scan the undersides for benthic macroinvertebrates. Also observe the newly disturbed area where the rock once was for signs of movement. This method may be more suitable for mountainous areas where riffles predominate. For lower gradient systems and other areas of slow moving water, benthic macroinvertebrates may be located in a variety of habitats including root wads, undercut banks, pools, leaf-packs, and submerged aquatic vegetation. Note that some benthic macroinvertebrates will make small debris/sand cases, which can be covered with periphyton and easily confused for
excess debris picked up from the substrate. The use of a small net to sample a variety of habitats
including water under overhanging banks or roots, accumulations of organic debris (e.g. leaves) and the substrate may be helpful.

In DRY channels, focus the search on the sandy channel margins for mussel and aquatic snail shells, any remaining pools for macroinvertebrates, and under cobbles and other larger bed materials for caddisfly casings. Casings of emergent mayflies or stoneflies may be observed on dry cobbles or on stream-side vegetation.

Strong - Found easily and consistently throughout the sample reach.
Moderate - Found with little difficulty but not consistently throughout the sample reach.
Weak - Takes 10 or more minutes of extensive searching to find.
Poor - Benthic macroinvertebrates are not present (after 10 or more minutes of searching).

1.4. Presence of Filamentous Algae and Periphyton (qualitative observations)

These forms of algae are attached to the streambed substrate and require an aquatic environment to persist. They are visible as a pigmented mass or film, or sometimes hair-

NMED Exhibit 3

like growths on submerged surfaces of rocks, logs, plants and any other structures within the channel. Periphyton growth is influenced by chemical disturbances such as increased nutrient (nitrogen or phosphorus) inputs and physical disturbances such as increased sunlight to the stream from riparian zone disturbances.

Strong - Found easily and consistently throughout the sample reach.

Moderate - Found with little difficulty but not consistently throughout the sample reach.

Weak - Takes 10 or more minutes of extensive searching to find.

Poor - Filamentous algae and/or periphyton are not present (after 10 or more minutes of searching).

1.5. Differences in Vegetation

As a rule, only perennial and intermittent systems can support riparian areas that serve the entire suite of riparian ecological functions. Ephemeral streams generally do not possess the hydrological conditions that allow true riparian vegetation to grow. Although water flows down ephemeral channels periodically, the water table does not occur sufficiently close to the soil surface to allow water loving vegetation to access the greater quantity of water they need to grow. Vegetation growing along ephemeral watercourses may occur in greater densities or grow more vigorously than vegetation in the adjacent uplands, but generally there are no dramatic compositional differences between the two. Even along those ephemeral channels where vegetation composition differs somewhat from the adjacent uplands, that vegetation does not require as much soil moisture as true riparian plants.

Note if vegetation is absent or altered due to man-made activities on the Level 1 *Field Sheet*

Strong – Dramatic compositional differences in vegetation are present between the riparian corridor and the adjacent uplands. A distinct riparian vegetation corridor exists along the entire sample reach – riparian, aquatic, or wetland species dominate the length of the reach.

Moderate – A distinct riparian vegetation corridor exists along part of the sample reach. Compositional species difference between upland and riparian corridor. Riparian vegetation is interspersed with upland vegetation along the length of the reach.

Weak – Vegetation growing along the sample reach may occur in greater densities or grow more vigorously than in the adjacent uplands, but there are minimal compositional differences between the two.

Poor – No compositional or density differences in vegetation are present between the banks and the adjacent uplands. Vegetation growing along the riparian area does not occur in greater density or grow more vigorously than in the adjacent uplands.

1.6. Absence of Rooted Upland Plants in Streambed

This attribute relates flow to the absence of rooted plants, since flow will often act as a deterrent to plant establishment by removing seeds or preventing aeration to roots. Cases where rooted upland plants are present in the streambed may indicate ephemeral or intermittent flow. Focus should be on the presence of plants in the bed or thalweg and

NMED Exhibit 3

plants growing on any part of the bank should not be considered. Note, however, there will be exceptions to this attribute. For example, rooted plants can be found in shaded perennial streams with moderate flow but in all cases these plants will be water tolerant (i.e. obligate and/or facultative wetland plants).

Additionally, in some situations (e.g., high gradient sand bedded streams located within flashy watersheds) highly erosive flows and/or depth of scour in response to extreme rainfall events may limit the presence of rooted vegetation. Under these circumstances the assessor may use

professional judgment in selecting the appropriate scoring criteria, and should document on the
Field Sheets and with photos those factors that explain any alternative scoring methodology.

Strong – Rooted upland plants are absent within the streambed/thalweg.
Moderate – There are a few rooted upland plants present within the streambed/thalweg.
Weak – Rooted upland plants are consistently dispersed throughout the streambed/thalweg.
Poor – Rooted upland plants are prevalent within the streambed/thalweg.

*** If the sample reach being evaluated has a score ≤ 2 up to this point, the reach is determined to be ephemeral. If the reach being evaluated has a score≥ 18 at this point, the reach is determined to be perennial. You can STOP the evaluation. However, if the reach has a score between 2 and 18 you should continue the Level 1 Evaluation.***

1.7. Sinuosity
Sinuosity is a measure of a channel's "crookedness." Sinuosity is the result of the stream naturally dissipating its flow forces. Intermittent systems don't have a constant flow regime and, as a result, exhibit substantially less sinuous channel morphology. While ranking, take into consideration the size of the stream (e.g. 1st, 2nd, 3rd order, etc.), which may also influence the stream sinuosity. Sinuosity is best measured using aerial photography (Rosgen 1996).

Examples of sinuosity are provided in Figure 1. To calculate sinuosity using an aerial photograph, measure the stream length and related valley length for at least two meander wavelengths. A meander wavelength is the distance of one meander, or bend, along the down- valley axis of the stream. Divide the *stream* length (SL) by the *valley* length (VL) (Figure 2). If aerial photos are not available, sinuosity can be measured using a GPS's trip computer function to measure channel length and valley length. The higher the ratio (SL/VL), the more sinuous the stream.

NMED Exhibit 3

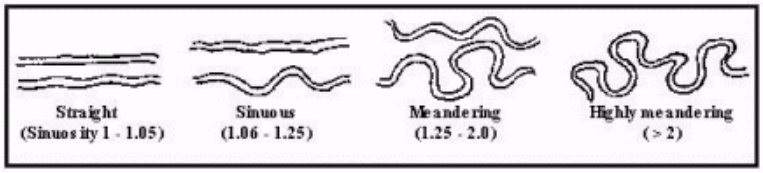

Figure 1. Examples of Stream Sinuosity (NCDWQ 2005)

In some surface waters (e.g., mountain stream settings or areas of complex and varied geology) channel sinuosity may be more reflective of external morphological factors, rather than the presence or absence of stream flow. Under these circumstances the assessor may use professional judgment in selecting the appropriate scoring criteria, and should document on the Level 1 *Field Sheets* and with photos those factors that explain any alternative scoring methodology.

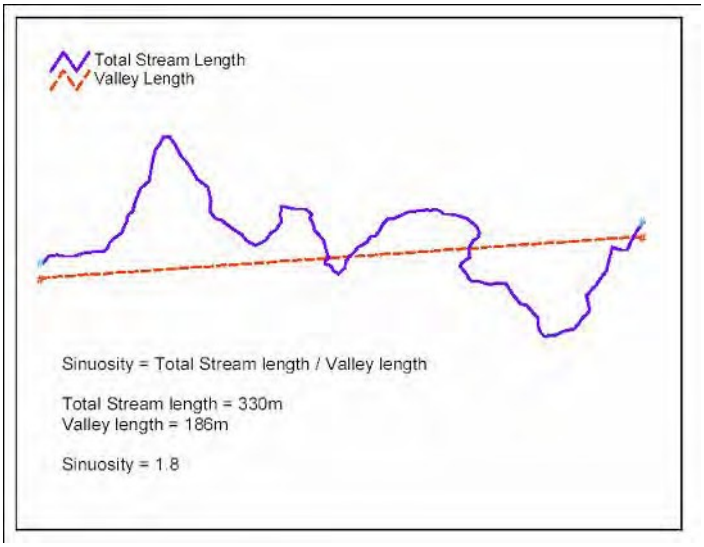

Figure 2. Stream Sinuosity (NCDWQ 2005)
******Note method used to determine sinuosity on the Field Sheets******

Strong – Stream sinuosity ratio is greater than 1.4. Stream has numerous, closely-spaced bends, few straight sections.

Moderate – Stream sinuosity ratio is between 1.4 and 1.2. Stream has good sinuosity with some straight sections.

Weak – Stream sinuosity ratio is between 1.2 and 1.0. Stream has very few bends and mostly straight sections.

Poor – Stream sinuosity ratio is equal to 1.0. Stream is completely straight with no bends.

1.8. Floodplain and Channel Dimensions

The relative importance of many fluvial processes in arid regions, especially the magnitude and frequency of their operation, differs considerably from more humid regions. As a result, channel forms also differ considerably from humid regions. Although one of the difficulties of characterizing dryland ephemeral streams is their enormous variability in form, they tend to be more incised with confined channels relative to intermittent and perennial streams (Knight et al. 1999).

When determining the vertical confinement of the stream, it is important to distinguish whether the flats adjacent to the channel are a frequent and active floodplain, terraces (abandoned floodplain), or are well outside of the flood-prone area. The ratio of the flood-prone area width to the bankfull, or active, channel width is used to determine the vertical confinement of the stream (Rosgen 1994). A larger ratio corresponds to a wide, active floodplain and a minimally confined channel, whereas a smaller ratio corresponds to a narrow or absent floodplain and a noticeably confined channel (**see scoring and "note" below*).

The flood-prone area width is measured at the elevation that corresponds to twice the maximum depth of the bankfull channel as taken from the established bankfull stage (Figure 3). The bankfull, or active, channel is defined as that which is filled with moderate sized flood events that would typically occur every one or two years and do not usually inundate the floodplain. Bankfull levels can be identified by:

- The presence of a floodplain at the elevation of initial flooding,
- The elevation associated with the *highest* depositional features,
- An obvious slope break that differentiates the channel from a relatively flat floodplain terrace higher than the channel,
- A transition from exposed sediments to terrestrial vegetation,
- Moss growth on rocks along the banks,
- Evidence of recent flooding,
- Presence of drift material caught on overhanging vegetation, and
- Transition from flood- and scour-tolerant vegetation to that which is relatively intolerant.

Field Protocol:

The evaluator(s) should start by selecting a location for the purpose of obtaining bankfull data. In general, the easiest location to measure bankfull channel width is within the narrowest segment of the sample reach. Deflectors such as rocks, logs, or unusual constrictions that make a stream especially narrow should be avoided.

1. Once a location is chosen, obtain a *rod reading* for an elevation at the "max depth" location by having one person hold a survey rod at the max depth location (thalweg) and a second person on the terrace adjacent to the stream using a clinometer and a meter stick or ski pole with one meter marked on it (if available, a surveyor's level can be used instead of a clinometer). Hold the clinometer at the one-meter mark on the ski pole, look through the clinometer holding it at zero, and read the height on the survey rod at the "max depth" location (Refer to **Figure 3**). Record the "max depth" *rod reading* on *Level 1 Field Sheets*.
2. Identify the bankfull stage using the indicators described above. Obtain a *rod reading* for an elevation at the "bankfull stage" location using the methods described in Step #1. Record the "bankfull stage" *rod reading* on Level 1 *Field Sheets*.
3. Subtract the "bankfull stage" reading from the "max depth" reading to obtain a maximum depth value. Multiply the maximum depth value by 2 for the "2x Max.

NMED Exhibit 3

Depth" value. Record the "2x Max. Depth" value on Level 1 *Field Sheets*.

4. Subtract the "2x Max Depth" value from the "max depth" *rod reading* for the "flood- prone area" location *rod reading*. Move the rod upslope, online with the cross-section, until a rod reading for the "flood-prone area" location is obtained.
5. Mark the flood-prone area (FPA) locations on each bank. Measure the distance between the two FPA locations. Record the **FPA Width** on Level 1 *Field Sheets*.
6. Measure the distance between the two Bankfull Stage locations. Record the **Bankfull Width** on Level 1 *Field Sheets*.
7. Divide the FPA Width by the Bankfull Width to calculate the Floodplain to Channel Ratio. Record the calculated ratio on Level 1 *Field Sheets*. <u>The Floodplain to Channel Ratio is used to score the stream for this indicator</u>.

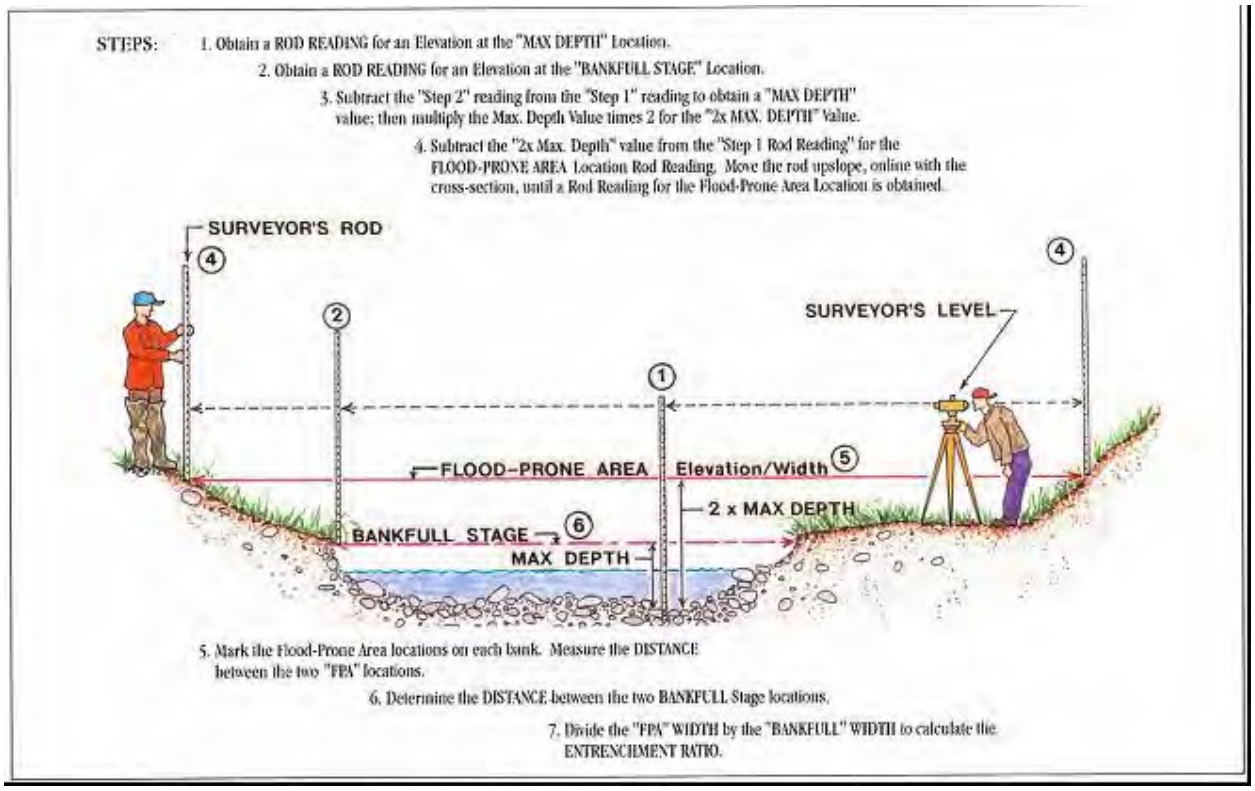

Figure 3. Determining a Flood-Prone Area elevation/width (Rosgen 1996)

In some surface waters (e.g., mountain stream settings or areas of complex and varied geology) the degree of channel confinement may be more reflective of external morphological factors rather than the presence or absence of stream flow. Under these circumstances the assessor may use professional judgment in selecting the appropriate survey location and scoring criteria and should document on the Level 1 *Field Sheets* and with photos those factors that explain the resulting 'representative' scores.

******Alternative methods for determining the Floodplain to Active Channel Ratio should be described and recorded on the Field Sheets******

NMED Exhibit 3

Strong - Ratio > 2.5*. Stream is minimally confined with a wide, active floodplain.

Moderate - Ratio between 1.2 and 2.5. Stream is moderately confined. Floodplain is present but may only be active during larger storm events.

Weak - Ratio < 1.2. Stream is incised with a noticeably confined channel. Floodplain is narrow or absent and disconnected from the channel during most storm events.

*NOTE: a larger ratio corresponds to a wide, active floodplain and a minimally confined channel, while a smaller ratio corresponds to a narrow or absent floodplain and a noticeably confined channel. If the channel is dry and bankfull stage cannot be determined, score this indicator based on your observations using the following scoring system:

Strong = stream is not incised/confined. Wide, active floodplain is connected to the channel.

Moderate = stream is moderately incised/confined. Flood-prone area width is narrow. Floodplain adjacent to the channel may be connected during large floods or represented by abandoned terraces.

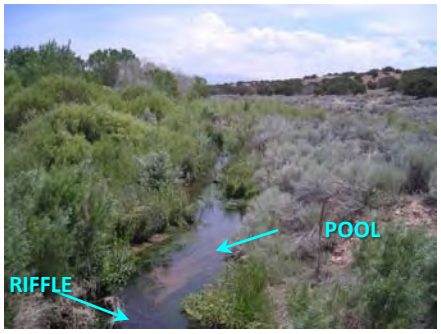
Weak = stream is undeniably incised/confined. Flats adjacent to the stream are well outside of the flood-prone area.

1.9. In-channel Structure -- Riffle-Pool Sequences

A repeating sequence of riffle/pool (riffle/run in lower gradient systems, ripple/pool in sand bed systems, or step/pool in higher gradient systems) can be observed readily in perennial systems. Riffle-run (or ripple-run) sequences in low gradient systems are often created by in-channel woody structures such as roots and woody debris. When present, these characteristics can be observed even in a dry channel by closely examining the local profile of the channel. A riffle is a zone with relatively high channel slope gradient, shallow water, and high flow velocity and turbulence. In smaller streams, riffles are defined as areas of a distinct change in gradient where flowing water can be observed. The bottom substrate material in riffles contains the largest sedimentary particles that are moved by bankfull flow (bedload). A pool is a zone with relatively low channel slope gradient, deep water, and low velocity and turbulence. Fine textured sediments generally dominate the bottom substrate material in pools. Along the sample reach, take notice of the frequency between the riffles and pools.

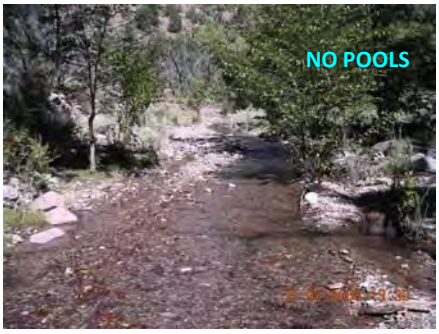
Strong - Demonstrated by a frequent number of riffles followed by pools along the entire sample reach. There is an obvious transition between riffles and pools.

Moderate - Represented by a less frequent number of riffles and pools. Distinguishing the transition between riffles and pools is difficult.



Weak - Mostly has areas of pools or of riffles.

Poor - No riffles or pools observed.



NMED Exhibit 3

Example of "**Strong**" Score – San Francisco River

Example of "**Moderate**" Score – Santa Fe River

Example of "**Weak**" Score – Mineral Creek

Example of "**Poor**" Score – Arroyo Chamiso

*** If the sample reach being evaluated has a score ≤ 5 at this point, the reach is determined to be ephemeral. If the reach being evaluated has a score ≥ 21 at this point, the reach is determined to be perennial. You can STOP the evaluation. However, if the reach has a score between 5 and 21 you should continue the Level 1 Evaluation.***

1.10. Particle size or Stream Substrate Sorting

This feature can be examined in two ways. The first is to determine if the sediment texture in the bottom of the channel is similar to the texture outside the channel. If this is the case, then there is evidence that erosive forces have not been active enough to down cut the channel and support an intermittent or perennial system. Sediment in the bed of ephemeral channels typically have the same or comparable texture (i.e. particle size) as areas close to but not in the channel. Accelerated stormflow resulting from human activities may produce deep, well-developed ephemeral or intermittent channels which have little or no coarse bottom materials indicative of upstream erosion and downstream transport. The bottom substrate of non-ephemeral systems often has accumulations of coarse sand and larger particles.

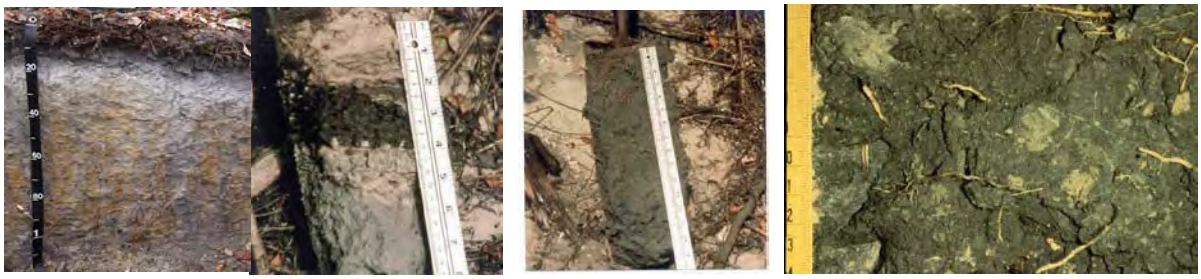
The second way this feature can be examined is to look at the distribution of the particles in the substrate in the channel. In lower-gradient, sand-bed streams one may need to look for size variations among sand grains – for instance, coarse versus fine sand. Note, however, the usefulness of this attribute may vary among ecoregions. For instance, in the plateaus or tablelands the variability in the size of substrate particles will probably be less than in the mountains.

Examples of Methods used to determine particle size and gradation:

- Sand Gauge Reference Card (best for sand dominated systems)
- Standard Sieve Analyses
- Wire Screen Method
- Pebble Count Method:
  - EPA's EMAP Pebble Count
  - Wolman Pebble Count
  - Zig Zag Pebble Count
  - USFS Pebble Count Sampling Frame

For whatever method is chosen, repeat procedure for an area close to but not in the channel for comparison purposes. Step outside the bankfull width or above the bank onto the floodplain or first terrace and repeat the procedure used in the bankfull channel. Avoid areas of dense vegetation and soil accumulation. Beware of cactus, snakes, and other hazards when "blindly" picking up particles outside of the channel or even in dry streambeds. For pebble counts, the objective is to measure at least 50 pebbles in the channel and 50 pebbles in areas close to but not in the channel for accurate distributional representations and comparisons.

Strong - Particle sizes in the channel are noticeably different from particle sizes outside the channel in the flood-prone area. There is a clear distribution of various sized substrates in the channel with finer particles accumulating in the pools, and larger particles accumulating in the riffles/runs.



Moderate - Particle sizes in the channel are moderately similar to particle sizes outside the channel in the flood-prone area. Various sized substrates are present in the channel and are represented by a higher ratio of larger particles (gravel/cobble).

Weak - Particle sizes in the channel are similar or comparable to particle sizes outside the channel in the flood-prone area. Substrate sorting is not readily observed in the channel.

1.11. Hydric Soils

One of the most reliable methods for differentiating between ephemeral and non-ephemeral stream types during drier conditions requires investigation of the stream bank (i.e. from the stream bed to the top of the bank). Ephemeral streams usually have poor channel development and lack groundwater-induced base flows that normally result in hydric soils dominating the banks of intermittent and perennial streams. The presence of hydric soil indicators above the elevation of the channel bottom in floodplain soils adjacent to the channel indicates the presence of a seasonal high water table that can provide a critical period of base flow. Non-ephemeral stream banks typically are dominated by soils with hydric indicators, such as visually confirmed oxidized rhizospheres, a matrix of gray or black soils, and reducing conditions confirmed by a redox meter. The presence of hydric soils should be determined through visual observations, pungent odors, clay, etc. Additional information on field indicators of hydric soils is available from the Natural Resources Conservation Service at https://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/use/hydric/. There are also

special considerations regarding the determination of hydric soils in arid regions. The United States Army Corps of Engineers (USACE) Wetlands Regulatory Assistance Program has divided New Mexico into three regions (Arid West, Western Mountains, and Great Plains). A regional map and regional supplements to the Corps of Engineers Wetland Delineation Manual are available at: https://www.usace.army.mil/Missions/Civil-Works/Regulatory-Program-and-Permits/reg_supp.

Examples of Hydric Soils in the Arid West – U.S. Army Corps of Engineers
(photos found at: http://www.usace.army.mil/CECW/Documents/cecwo/reg/trel08-28.pdf)

Note that hydric soil indicators may be poorly developed at the seasonal high-water table elevation in young, coarse textured, alluvial soil materials with low concentrations of clay, iron, and manganese, or floodplain soils where moving water fails to become reduced.

Present – Hydric soils are found within the sample reach.
Absent – Hydric soils are not found within the sample reach.

1.12. Sediment on Plants or Debris

The transportation and processing of sediment is a main function of streams. Therefore, evidence of sediment on plants or other debris in the channel may be an important indicator of recent high flows. Note that sediment production in stable, vegetated watersheds is considerably less than in disturbed watersheds. Are plants in the channel, on the streambank, or in the floodplain covered with sediment? Look for silt/sand accumulating in thin layers on debris or rooted aquatic vegetation in the runs and pools. Be aware of upstream land-disturbing construction activities, which may contribute greater amounts of sediments to the channel and can confound this indicator. Note these activities on the *Field Sheets* if these confounding factors are present.

Strong – Sediment found readily on plants and debris within the channel, on the streambank, and within the floodplain throughout the length of the sample reach.

Moderate – Sediment found on plants or debris within the channel although not prevalent along the sample reach. Mostly accumulated on plants and debris in pools.

Weak – Sediment on plants and debris is isolated in small amounts along the sample reach.

Poor – No sediment is present on plants or debris.

****Refer to Section 2 Overall Score Interpretation, for guidance on overall Level 1 score interpretation****

NMED Exhibit 3

Level 1 Supplemental Indicators

The following indicators do not occur consistently throughout New Mexico, which may be the reason why they were not statistically significant between waterbody types. Regardless, when they occur they are useful indicators in the determination of perenniality. Record the score on the Level 1 *Field Sheets* and include the score when calculating the total points.

1.13. Seeps and Springs

Seeps: Seeps have water dripping or slowly flowing out from the ground or from the side of a hill or incised streambank. Springs: Look for "mushy" or very wet, black decomposing leaf litter nearby in small depressions or in the channel. Springs and seeps often are present at grade controls and headcuts. The presence of this indicator suggests that groundwater is a source of streamflow except during a period of drought. Score this category based on the presence or absence of these features observed within the sample reach.

Present – Seeps and/or springs present in reach.
Absent – Seeps and/or springs were not present in reach

1.14. Iron Oxidizing Bacteria/Fungi

These features are often (although not exclusively) associated with groundwater. Iron oxidizing bacteria/fungi derive energy by oxidizing iron, originating from groundwater, in the ferrous form (Fe^{2+}) to the ferric form (Fe^{3+}). In large amounts, iron-oxidizing bacteria/fungi discolor the substrate giving it a red, rust-colored appearance. In small amounts, it can be observed as an oily sheen on the water's surface. This indicates that the stream water is derived from a groundwater source, and these features are most commonly seen in standing water on the ground's surface or in slow moving creeks and streams. Filmy deposits on the surface or banks of a stream are often associated with the greasy "rainbow" appearance of iron oxidizing bacteria. This is a naturally occurring phenomenon where there is iron in the groundwater. However, a sudden or unusual occurrence may indicate a petroleum product release from an underground fuel storage tank. One way to differentiate iron-oxidizing bacteria from oil releases is to trail a small stick or leaf through the film. If the film breaks up into small islands or clusters, it is most likely bacterial in origin. However, if the film swirls back together, it is most likely a petroleum discharge.

Present – Iron-oxidizing bacteria/fungi present in reach.
Absent – Iron-oxidizing bacteria/fungi not present in reach.

****Refer to Section 2 Overall Score Interpretation, for guidance on overall Level 1 score interpretation****

G. Level 2 Evaluation: Borderline Determinations

If, after conducting a Level 1 Evaluation, a hydrological determination cannot be made because more information is required, then a Level 2 Evaluation should be conducted between mid-August and mid-November to coincide with SWQB's biological index period.

1. Level 2 Office Procedures

Refer to the results of the **Level 1 Evaluation**. If this step was not completed in the Level 1 Evaluation or cannot be located then refer to *Drought Conditions* and *Recent Rainfall Activity* and the *Level 1 Office Procedures*, particularly *Stream Segment Identification and Sample Reach Selection*, for more information.

Additional Supporting Information

Additional supporting information may not be scored but can be used to support a Level 2 hydrological determination. Unfortunately, not all information listed here will be available for every assessment unit. Additional supporting information includes, but is not limited to:

Observation of flow:

Observation of flow under certain seasonal or hydrological conditions can directly support classifying a sample reach as perennial. Reaches with flow during the dry season or periods of drought are likely perennial. Although the presence of flow during a drought indicates perennial conditions, care must be taken in evaluating the upper limits of perenniality because some perennial systems may only contain isolated pools of water or be dry during periods of drought.

Thermograph Data:

- Historic or recent SWQB thermograph data may provide some insight on flow during certain seasonal or hydrological conditions
- Do thermograph and/or streamflow data (or lack thereof) warrant the use of equipment to estimate the onset and cessation of flow? (See *Indicator #2.1* below)

Key biological indicators:

As discussed below, the presence of aquatic organisms whose life cycle requires residency in flowing water for extended periods (especially those one year or greater) is a strong indication that a sample reach is perennial. If a reach is recognized as borderline, a qualified aquatic biologist or environmental scientist should evaluate the presence and abundance of such macroinvertebrates and vertebrates species before making a final hydrological determination.

- Current and/or historic fisheries data may be found at:
  - Natural Heritage New Mexico (https://nhnm.unm.edu/)
  - Museum of SW Biology (http://www.msb.unm.edu/index.html)
  - Sublette, James E. et al. 1990. *The Fishes of New Mexico – First Edition.* University of New Mexico Press. 393 p.
- SWQB Fisheries Data are available upon request by contacting the Surface Water Quality Bureau (505-827-0187 or https://www.env.nm.gov/surface-water-quality/).

NMED Exhibit 3

Other information that may be considered:

- Groundwater contour maps and/or nearby, local well logs.
- Information provided by a long-term resident and/or local professional who has observed the stream during various seasons and hydrological conditions.
- Review of historic information such as aerial photography.
- Professional judgment may be used in conjunction with the total score and supporting information in making the final determination.

2. **Level 2 Field Procedures**

In order to distinguish between ephemeral, intermittent, and perennial streams and rivers using the information presented in this protocol, the field evaluator should have experience making geomorphic, hydrological, and biological observations in New Mexico or the semi-arid region of the southwestern U.S. Field evaluations should be performed at least 48 hours after the last known major rainfall event or snowmelt. In addition, it is *strongly* recommended that field evaluations be conducted outside of drought conditions whenever possible. Drought conditions, for the purposes of this *Hydrology Protocol*, are defined as any time the 12-month SPI is less than -1.5, indicating severely to extremely dry conditions (NDMC 1995).

Refer to the results of the **Level 1 Evaluation**. If this step was not completed in the Level 1 Evaluation or cannot be located then refer to the *Level 1 Field Procedures*, specifically *Sample Reach Selection* and *Photodocumentation,* for more information.

NMED Exhibit 3

3. Level 2 Indicators

2.1. Water in Channel (OPTIONAL)

Observation of flow under certain seasonal or hydrological conditions can directly support classifying a sample reach as perennial. Reaches with flow during the dry season or periods of drought are likely perennial. The longer the period from the last substantial rainfall the stronger the presence of flow supports the perennial determination. Although the presence of flow during a drought indicates perennial conditions, care must be taken in evaluating the upper limits of perenniality because some perennial systems may only contain isolated pools of water or be dry during periods of drought.

If available, historic or recent flow data from streamgages such as those managed by the USGS, OSE or LANL may clearly indicate ephemeral, intermittent, or perennial flow patterns for the available period of record and will facilitate the scoring of this indicator. If streamgage data are not available, temperature sensors (or electrical resistance sensors or pressure transducers) can be used to estimate the onset and cessation of flow (Constanz et al. 2001; Lawler 2002; Blasch et al. 2002). Periods of flow are characterized by those sections of the thermograph where the amplitude of the diel temperature signal is visibly dampened (Constanz et al. 2001). When the in-stream temperature data are compared graphically to the temperature data from a nearby site out of streamflow where little dampening has occurred, a flow signal is easily identifiable.

Strong – The water sensor is decidedly different from the air sensor. The streamflow signal is easily identifiable and occurs throughout the entire time of deployment (i.e. water sensor has a diel signal that is visibly dampened compared to air sensor throughout the deployment).

Moderate – The water sensor differs from the air sensor. A flow signal is identifiable during the majority of time; however, there are short periods of time when the water sensor has a diel signal that is comparable to the air sensor indicating periods of drying.

Weak – The water sensor differs somewhat from the air sensor. A flow signal is identifiable during certain days or weeks; however, there are long periods of time when the water and air sensors have similar diel signals (i.e. no dampening) indicating dry periods.

Poor – There are no substantial differences between the water and air sensors. The two thermographs are visibly comparable to one another indicating little to no water in the channel.

**If using an electrical resistance sensor or pressure transducer, use the following ratings:

Strong – The streamflow signal is easily identifiable and occurs throughout the entire time of deployment

Moderate – A streamflow signal is identifiable during the majority of time; however, there are short periods of time when the sensor indicates periods of drying.

Weak – A streamflow signal is identifiable during certain weeks or months; however, there are long periods of time when the sensor indicates a dry channel.

Poor – There is no sustained streamflow signal from the sensor (flow signal is only for very

NMED Exhibit 3

brief periods of time – on the timescale of days – indicating a flow response due to storm events). Or there is no discernible streamflow signal.

2.2. Hyporheic Zone/Groundwater Table

Hyporheic zone: Even when there is no visible flow above the channel bottom, there may likely be slow groundwater discharge into and downstream flow in the **hyporheic zone**. The hyporheic zone is the subsurface interface beneath and adjacent to a stream or river where surface water and shallow groundwater mix. It may be recognized by the accumulation of coarse textured sediments in the bottom of the channel that may be up to 2-3 ft deep in small streams. The saturated sediment in the hyporheic zone exchanges water, nutrients, and fauna with surface flowing waters. Consequently, the hyporheic zone is the site of groundwater discharge to the stream channel, downstream flow, and biological and chemical activity associated with aquatic functions of the stream.

Indicators of a hyporheic zone can be observed by digging a bore hole in the streambed when site conditions are conducive to manually digging a bore hole. Water standing in the bore hole or saturated sediment within the bore hole indicates the presence of a hyporheic zone. If conditions are not conducive to boring a hole in the streambed, one can look under rocks. Saturated or moist sediment underneath rocks located within the channel indicates the presence of a hyporheic zone.

Groundwater Table: The presence of a seasonal high water table or groundwater discharge (i.e. seeps or springs) from the bank, above the elevation of the channel bottom, indicates a relatively reliable source of base flow to a stream. When site conditions are conducive to manually digging a bore hole, indicators of a current water table can be observed by digging a bore hole in the adjacent floodplain approximately two feet away from the streambed. The presence of water standing in the hole above the elevation of the channel bottom after waiting for at least 30 minutes (longer for clayey soils) indicates the presence of a high groundwater table.

Strong – Considerable base flow is present. Hyporheic zone and/or groundwater table is readily observable throughout sample reach.

Moderate – Some base flow is present. Hyporheic zone and/or groundwater table is present, but not abundant throughout sample reach.

Weak – Water is standing in pools and the hyporheic zone is saturated, but there is not visible flow above the channel bottom. Indicators of groundwater discharge are present but require considerable time to locate.

Poor – Little to no water in the channel. No indication of a high groundwater table or hyporheic zone.

2.3. Bivalves

Clams cannot survive outside of water, thus one should examine the streambed or look for them where plants are growing in the streambed. Also, look for empty shells washed up on the bank. Some bivalves can be pea-sized or smaller. Since clams require a fairly constant aquatic environment in order to survive, the search for bivalves can be conducted while looking for other benthic macroinvertebrates. A small net may be useful.

Present – Bivalves are found within the sample reach.

NMED Exhibit 3

Absent – Bivalves are not found within the sample reach.

2.4. Amphibians

Salamanders and tadpoles can be found under rocks, on streambanks and on the bottom of the stream channel. They may also appear in the benthic sample. Frogs will alert you of their presence by jumping into the water for cover. Frogs and tadpoles typically inhabit the shallow, slower moving waters of the pools and near the sides of the bank. Amphibian eggs, also included as an indicator, can be located on the bottom of rocks and in or on other submerged debris. They are usually observed in gelatinous clumps or strings of eggs.

Present – Amphibians are found within the sample reach.
Absent – Amphibians are not found within the sample reach.

Any collection and identification of aquatic species should be performed by a qualified aquatic biologist, environmental scientist, or other professional.

2.5. Benthic Macroinvertebrates (quantitative observations)

The larval stages of many aquatic insects are good indicators that a stream is perennial because a continuous aquatic habitat is required for these species to mature. The Arid West Water Quality Research Project has published a final report on *Aquatic Communities of Ephemeral Stream Ecosystems* (AWWQRR 2006) that may be a useful supplement to this protocol. In addition, SWQB scientists have been looking for the presence of long-lived aquatic species as reliable determinants for perennial channels, North Carolina's Division of Water Quality has developed a list of benthic macroinvertebrate taxa that are perennial stream indicators (NCDWQ 2010) and West Virginia's Department of Environmental Protection maintains a list of macroinvertebrate species that have an extended aquatic life stage (WVDEP – Watershed Assessment Branch, (304) 926-0495). Further information on life histories of specific macroinvertebrates found through the application of this protocol can be researched, if necessary.

Examples of Methods and Equipment used to collect Benthic Macroinvertebrates:

- EPA's EMAP Protocol
- SWQB's Benthic Macroinvertebrate SOP
- Kick Net
- D-Frame Dip Net
- Rectangular Dip Net
- Surber Sampler
- Hess Sampler
- Approaches:
  - Targeted Riffle
  - Reach-Wide, Multi-Habitat
    - top/bottom of riffle, undercut banks, pools/runs, snags/roots/logs

NMED Exhibit 3

The goal is to collect as many different kinds of aquatic macroinvertebrates from as many different habitats as necessary to ensure an accurate site assessment. Be aware that each habitat type has different sampling protocols, and some have a greater diversity of organisms than others (**Table 2**). If you have many habitats from which to choose, consider sampling from those with the most diversity. If your stream has a rocky bottom, sample at two separate riffle areas and at one other habitat. If your stream has a soft bottom or does not have riffles, collect samples at submerged logs, snags or undercut banks.

Table 2. Relative diversity of various habitat types

Habitat Type	Stream Type	Habitat
Riffles	Rocky bottom	Most diverse
Undercut banks Snags,	Rocky, soft bottoms	↓
tree roots, logs	Rocky, soft bottoms	Least diverse

Strong – More than one taxa of benthic macroinvertebrate that requires water for their entire life cycle (rheophilic taxa) are present as later instar larvae. Overall there is a balanced distribution of taxa. A list of benthic organisms that indicate perennial features are listed in **Tables 3 and 4**.

Moderate – Only one rheophilic taxon was found in the sample, however sample is diverse. Overall there is a balanced distribution of taxa.

Weak – Rheophilic taxa are not present in the sample; however other types of benthic macroinvertebrates are present. Both diversity and abundance are low or not distributed evenly.

Poor – Benthic macroinvertebrates are not present.

Table 3. Ephemeroptera, Plecoptera, and Trichoptera (EPT) perennial indicator taxa

	Ephemeroptera (Mayflies)	Plecoptera (Stoneflies)	Trichoptera (Caddisflies)
Family:	Caenidae Ephemerellidae Ephemeridae Heptageniidae	Peltoperlidae Perlidae Perlodidae	Hydropsychidae Lepidostomatidae Molannidae Odontoceridae Philopotamidae Polycentropodidae Psychomyiidae Rhyacophilidae

NMED Exhibit 3

Table 4. Additional indicators of perennial features

	Megaloptera	**Odonata**	**Diptera**	**Coleoptera**	**Mollusca**
Family:	Corydalidae Sialidae	Aeshnidae Calopterygidae Cordulegastridae Gomphidae	Ptychopteridae	Psephenidae Elmidae	Unionidae Ancylidae Pleuroceridae
Family & *Genus*:			Tipulidae *Tipula* sp.	Dryopidae *Helichus* sp.	

2.6. Ephemeroptera, Plecoptera, and Trichoptera (EPT) taxa

The larval stages of many species of these three orders require a period of at least a year, submerged in a constantly flowing aquatic environment before reaching maturity and therefore are commonly associated with perennial systems. Studies conducted by North Carolina State University have found that benthic samples collected in intermittent systems frequently display crustaceans (crayfish, isopods, and amphipods) as the dominant order (NCDWQ 2005). In sample reaches with more perennial characteristics, EPT taxa were collected. In highly urbanized areas, these indicators may be absent due to degradation and, therefore, may not be appropriate to evaluate perennial or intermittent flow conditions. These lists should be carefully evaluated (family or genus level ID) since some genera, such as the *Baetis* mayflies for example, are very short-lived in their aquatic life stages.

Present – EPT taxa are found within the sample reach.
Absent – EPT taxa are not found within the sample reach.

Any collection and identification of aquatic species should be performed by a qualified aquatic biologist, environmental scientist, or other professional.

2.7. Fish (quantitative observations)

Fluctuating water levels of intermittent systems provide unstable and stressful habitat conditions for fish communities. When looking for fish, all available habitats should be observed, including pools, riffles, root clumps, and other obstructions (to greatly reduce surface glare, the use of polarized sunglasses is recommended). In small streams, the majority of species usually inhabit pools and runs. Check several areas along the sample reach, especially underneath undercut banks. In most cases, fish are indicators of perennial systems, since fish will rarely inhabit an intermittent stream.

Fish should be collected, measured, and classified to verify if fish are present in a water body and to help confirm the appropriate hydrological determination. Best professional judgment should be exercised to determine sampling methodology (e.g. shocking, seining, etc.) and to ensure that safety concerns are addressed.

Strong – Fish are present in all habitats (riffles, pools, runs, root clumps, undercut banks, etc.). Multiple age classes are present and evenly represented. Large-

NMED Exhibit 3

bodied fish may be present.

Moderate – Fish are evident in fewer numbers with one age class dominating. Some habitat is not occupied. Large-bodied fish may be present.

Weak – Fish are not readily visible, require 10 or more minutes to locate, and are typically found within one habitat type (e.g. pools, runs). Very sparse.

Poor – Fish are <u>not</u> found within the sample reach.

IV. OVERALL SCORE INTERPRETATION

The final determination of whether a stream is ephemeral, intermittent, or perennial is based on a variety of information including the total score, supporting information, and professional judgment. The use of the Level 1 Evaluation should, in most cases, provide enough information to accurately distinguish between ephemeral, intermittent, and perennial systems. Scores should reflect the persistence of water with higher scores indicating intermittent and perennial systems. However, if a stream is recognized as borderline (i.e. gray zone – see **Table 5**) or if observations are made during a severe or extreme drought (12-month SPI value less than -1.5), then a Level 2 Evaluation that relies on more intensive and focused data collection can be used to make a final hydrological determination or to verify the Level 1 evaluation.

For a Level 1 Evaluation a minimum total score of 9.0 is set as a guideline to distinguish ephemeral channels from non-ephemeral ones unless there are aquatic macroinvertebrates and/or fish, in which case at least one of the Clean Water Act Section 101(a)(2) objectives is attainable and the stream is at least intermittent. In addition, a Level 1 score greater than 22.0 distinguishes perennial streams from non-perennial streams. SWQB recognizes that there is inherent variability in nature, therefore Level 1 scores between 9 and 12 may be ephemeral but will be recognized as intermittent until further data collection and analysis through a Level 2 evaluation or detailed UAA can more clearly determine that the stream is ephemeral. Similarly, Level 1 scores between 19 and 22 may be intermittent but will be recognized as perennial until further data collection and analysis indicate that the stream is intermittent. **Table 5** summarizes interpretation of Level 1 scoring. In most instances, the use of a Level 1 Evaluation should be sufficient to make a final hydrological determination. A hydrological determination does not change the designated use for a waterbody without the completion of a UAA in accordance with 40 CFR 131.10, 20.6.4.15 NMAC and the State's approved Water Quality Management Plan/Continuing Planning Process (WQMP/CPP). **If after conducting Level 1 Evaluation, a hydrological determination <u>cannot be made</u> because more information is required, then a Level 2 Evaluation which uses more intensive data collection can be conducted.**

Table 5. Summary of Level 1 Score Interpretation

Waterbody Type	Level 1 Total Score	Hydrology Determination
Ephemeral	**Less than 9.0***	**Stream is ephemeral**
≥ 9.0 and < 12.0		Stream is recognized as intermittent until further analysis indicates that the stream is ephemeral
Intermittent	**≥ 12.0 and ≤ 19.0**	**Stream is intermittent**
> 19.0 and ≤ 22.0		Stream is recognized as perennial until further analysis indicates that the stream is intermittent
Perennial	**Greater than 22.0**	**Stream is perennial**

* If there are aquatic macroinvertebrates and/or fish the stream is at least intermittent.

If a sample reach is recognized as borderline (within the gray zones), reaches upstream and

downstream of the study area should be assessed to better evaluate the changes in stream classifications along a channel. Additional supporting information can be used to help make the final determination. This supporting information may include, but is not limited to:

Observation of flow: Observation of flow under certain seasonal or hydrological conditions can directly support classifying a stream reach as intermittent or perennial. Conditions supporting a perennial stream classification include:

Stream reaches with flow during the dry season or periods of drought are likely perennial. The longer the period from the last substantial rainfall the stronger the presence of flow supports the perennial stream determination. Although the presence of flow during a drought indicates perennial conditions, care must be taken in evaluating the upper limits of perenniality because some perennial streams may only contain isolated pools of water or be dry during periods of drought.

Key biological indicators: As discussed in the Level 2 Evaluation, the presence of aquatic organisms whose life cycle requires residency in flowing water for extended periods (especially those one year or greater) is a strong indication that a stream reach is perennial. If a stream or river is recognized as borderline, a qualified aquatic biologist/environmental scientist should evaluate the presence and abundance of such macroinvertebrate and vertebrate species before determining the final stream classification.

Other additional supporting information that may be considered:

- Groundwater contour maps or nearby, local well logs.
- Information provided by a long-term resident and/or local professional who has observed the stream during the various seasons and hydrological conditions.
- Review of historic information such as aerial photography.
- Professional judgment may be used in conjunction with the total score and supporting information in making the final determination.

The total score can be affected by seasonal or hydrological conditions as well as man-made impacts such as irrigation diversions or livestock impoundments associated with activities in the watershed. For example, a sample reach may score lower in drought conditions due to the lack of biological and/or certain hydrological indicators. However, a reach may score higher on certain indicators such as drift lines and alluvial deposits if directly below a stormwater outfall. The final hydrological determination should take these factors into account.

The *Hydrology Protocol* is considered to be an evolving, living document. Current thresholds are based on data collected by SWQB during the 2008 and 2009 field seasons from 57 stream reaches throughout the state of New Mexico. An analysis of these data was performed to determine which indicators clearly differentiated the three types of streams and to identify threshold values for scoring. In the event that new data indicate the threshold values used in this protocol are not appropriate and/or if new standards are adopted, SWQB will review the protocol, the related threshold values and differentiating scores. Revisions to the protocol will be proposed to the WQCC as needed in accordance with the process for updating the Water Quality Management Plan/Continuing Planning Process.

NMED Exhibit 3

LEVEL 1 INDICATORS	Stream Condition (identify all that apply then choose most prominent score)			
	Strong	Moderate	Weak	Poor
1.1 Water In Channel	☐ Flow is evident throughout reach ☐ Flow is observed in riffles ☐ Flow may not be evident in runs	☐ Wet Channel ☐ Flow is barely discernable ☐ Floating object needed to observe flow	☐ Dry Channel with standing pools ☐ Saturated or moist sediment under rocks/debris ☐ Evidence of base flows	☐ Dry Channel ☐ Dry under rocks/debris ☐ No evidence of base flows
	6	**4**	**2**	**0**
	Notes/Comments:			
1.2 Fish in Channel	☐ Found easily ☐ Found consistently throughout reach	☐ Found with little difficulty ☐ Not consistent throughout reach	☐ Found with difficulty (10 or more minutes of searching)	☐ Not present (after 10 or more minutes of searching)
	3	**2**	**1**	**0**
	Species Observed and Notes/Comments:			
1.3 Benthic Macroinvertebrates in Channel	☐ Found easily ☐ Found consistently throughout reach	☐ Found with little difficulty ☐ Not consistent throughout reach	☐ Found with difficulty (10 or more minutes of searching)	☐ Not present (after 10 or more minutes of searching)
	3	**2**	**1**	**0**
	Species Observed and Notes/Comments:			
1.4 Filamentous Algae/Periphyton in Channel	☐ Found easily ☐ Found consistently throughout reach	☐ Found with little difficulty ☐ Not consistent throughout reach	☐ Found with difficulty (10 or more minutes of searching)	☐ Not present (after 10 or more minutes of searching)
	3	**2**	**1**	**0**
	Notes/Comments:			
1.5 Vegetation along cooridor (within floodplain)	☐ Dramatic compositional species difference between upland and riparian corridor ☐ Distinct riparian corridor exists along entire reach ☐ Riparian, aquatic or wetland species dominate entire reach	☐ Distinct riparian corridor exists but not along entire reach ☐ Compositional species difference between upland and riparian corridor ☐ Riparian species interspersed with upland species	☐ Minimal compositional species difference between upland and riparian corridor ☐ Vegetation growing along the riparian area occurs in greater density or grows more vigorously than in the adjacent uplands	☐ No compositional species difference between upland and riparian corridor ☐ Vegetation growing along the riparian cooridor does not occur in greater density or grow more vigorously than in the adjacent uplands
	3	**2**	**1**	**0**
	Species Observed and Notes/Comments:			
1.6 Rooted Upland Plants in Channel	☐ Rooted upland plants are absent within the streambed/thalweg	☐ There are a few rooted upland plants within the streambed/thalweg	☐ Rooted upland plants are consistently dispersed throughout the streambed/thalweg	☐ Rooted upland plants are prevalent within the streambed/thalweg
	3	**2**	**1**	**0**
	Species Observed and Notes/Comments:			
			SUBTOTAL (1.1-1.6)	

1.7 Sinuosity of Segment (for length no less than two meanders)	☐ Calculated ratio > 1.4 ☐ Numerous closely spaced bends ☐ Few straight sections	☐ Calculated ratio 1.4 <> 1.2 ☐ Mostly bends ☐ Some straight sections	☐ Calculated ratio 1.2 <> 1.0 ☐ Few bends ☐ Mostly straight sections	☐ Calculated ratio = 1.0 ☐ Completely straight
	3	2	1	0
	☐ Calculated ☐ Observed	Notes/Comments:		
1.8 Floodplain and Channel Dimensions	☐ Calculated ratio > 2.5 ☐ Minimally confined ☐ Wide, active floodplain	☐ Calculated ratio 2.5 <> 1.2 ☐ Moderately confined ☐ Floodplain active during larger events	☐ Calculated ratio < 1.2 ☐ Incised/confined channel ☐ Flooplain absent or narrow ☐ Floodplain not connected	
	3	1.5	0	
	☐ Calculated ☐ Observed	Notes/Comments:		
1.9 In-Channel Structure: Riffle-Pool Sequence	☐ Frequent number of riffle and pools observed throughout reach ☐ Obvious transition between riffles and pools	☐ Less frequent number of riffle and pools ☐ Transition between riffles and pools difficult to distinguish	☐ Mostly has areas of pools or of riffles	☐ No riffles or pools observed
	3	2	1	0
	Notes/Comments:			
			SUBTOTAL (1.1-1.9)	
1.10 Particle Size or Stream Substrate Sorting	☐ Particle sizes in the channel are noticeably different from particle sizes outside the channel in the flood-prone area. ☐ Clear distribution of various sized substrates in the stream channel.	☐ Particle sizes in the channel are moderately similar to particle sizes outside the channel in the flood-prone area. ☐ Various sized substrates are present in the stream channel. ☐ Higher ratio of larger particles (gravel/cobble).	☐ Particle sizes in the channel are similar or comparable to particle sizes outside the channel in the flood-prone area. ☐ Substrate sorting is not readily observed in the stream channel.	
	3	1.5	0	
	☐ Calculated ☐ Observed	Notes/Comments:		
1.11 Hydric Soils Within Flood-Prone Area	☐ Hydric soils were observed in reach		☐ Hydric soils were not observed in reach	
	3		0	
	Notes/Comments:			
1.12 Sediment on Plants and Debris	☐ Sediment found readily on plants and debris in: ☐ channel ☐ streambank ☐ floodplain	☐ Sediment found but not prevalent on plants and debris. ☐ Sediment mostly accumlated on plants and debris in pools	☐ Sediment on plants and debris is isolated in small amounts along the sample reach.	☐ No sediment is present on plants or debris.
	1.5	1	0.5	0
	Notes/Comments:			
1.13 Seeps and Springs	☐ Seeps and/or springs present in reach		☐ Seeps and/or springs not present in reach	
	1.5		0	
	Notes/Comments:			
1.14 Iron Oxidizing Bacteria/Fungi	☐ Iron-oxizing bacteria/fungi present in reach		☐ Iron-oxizing bacteria/fungi not pressent in reach	
	1.5		0	
	Notes/Comments:			
			TOTAL POINTS (1.1-1.14)	

Total <9, the stream is determined to be EPHEMERAL.
Total ≤9 and <12, the stream is determined to be INTERMITTENT until further analysis indicates otherwise
Total ≥ 12.0 and ≤ 19.0, the stream is determined to be INTERMITTENT
Total > 19.0 and ≤ 22.0, the stream is determined to be PERENNIAL until further analysis indicates otherwise
Total > 22.0, the stream is determined to be PERENNIAL.

WATER QUALITY CONTROL COMMISSION

DELEGATION OF RESPONSIBILITIES TO ENVIRONMENTAL IMPROVEMENT DIVISION AND OIL CONSERVATION DIVISION

In an effort to prevent duplication of effort and to clarify the division of responsibilities pursuant to the provisions of the Water Quality Act, NMSA Sections 74-6-1 et seq. (1978), as administered and enforced by the Water Quality Control Commission, the Commission hereby approves the following list of delegated duties and responsibilities for two of the agencies that are constituent agencies to which authority can be delegated, the Environmental Improvement Division ("EID") and the Oil Conservation Division ("OCD"). The Commission is specifically authorized to take this action by NMSA Section 74-6-4E (1978) and by other general provisions of the Water Quality Act. The Commission notes that pursuant to NMSA Section 74-6-9C (1978), constituent agencies may "report to the Commission and to other constituent agencies water pollution conditions that are believed to require action where the circumstances are such that the responsibility appears to be outside the responsibility assigned to the agency making the report." The Commission encourages OCD and EID to continue close communication and cooperation where responsibility is unclear, to ensure that water pollution is prevented or abated quickly, efficiently and consistently. In situations involving discharges or facilities under the jurisdiction of both agencies, the agencies shall mutually agree which shall be the lead agency and shall determine the method by which the discharge plan shall be evaluated and approved. In preparing this delegation statement, the Commission is cognizant of the limitations imposed on its authority by the Water Quality Act, especially NMSA Section 74-6-12G (1978) which prohibits it from taking any action which would "interfere with the exclusive authority of the Oil Conservation Commission over all persons and things necessary to prevent water pollution as a result of oil or gas operations...."

This delegation shall supersede all previous delegations to EID and OCD; reference to the dates and minutes of Commission meetings in which previous delegations were made are in parentheses and the minutes are attached. The specific grants of authority are not intended to be comprehensive. When a question of authority and jurisdiction arises, which is not specifically delegated, the general provisions below shall control.

1. General Provisions

As a general rule, OCD will administer and enforce applicable Commission regulations pertaining to surface and ground water discharges at oil and natural gas production sites, oil refineries, natural gas processing plants, geothermal installations, carbon dioxide facilities, natural gas transmission lines, and discharges

associated with activities of the oil field service industry. The Commission recognizes that OCD also administers regulations under both the Oil and Gas Act and the Geothermal Resources Act, and that OCD shall have discretion as to which regulations to enforce in any given situation. OCD shall have jurisdiction over all activities associated with exploration for or development, production, transportation before refinement, refinement, storage or treatment of unrefined oil and natural gas, or oil or gas products on refinery premises.

EID will administer and enforce Commission regulations regarding discharges from transmission, transportation and storage facilities for oil or oil by-products after refinement (including but not limited to gasoline stations), except those within refinery premises. EID will administer and enforce all Commission regulations pertaining to all other discharges to surface and ground water which are not specifically delegated to other departments and agencies. (Source: 1/13/69 and 5/8/84 Commission minutes)

2. Specific Grants of Authority

A. EID shall certify Section 404 dredge and fill material permits under the Clean Water Act ("CWA"). (Source: 1/13/76 and 6/14/83 Commission minutes)

B. EID shall administer the Wastewater Construction Grants program pursuant to Section 205 of the CWA. (Source: 6/14/83 Commission minutes)

C. EID shall certify NPDES permits pursuant to Title IV of the Federal Water Pollution Control Act Amendments of 1972 and S402 of the CWA. (Source: 10/1/74 and 8/14/84 Commission minutes)

D. EID shall certify hydropower licenses issued by the Federal Energy Regulatory Commission. (Source: 8/14/84 Commission minutes)

E. EID shall administer and enforce Commission regulations pertaining to the disposal of human excrement and bath water at oil and natural gas production sites, oil refineries, natural gas processing plants, geothermal installations, carbon dioxide facilities and natural gas transmission lines when the treatment facilities for the sewage are a separate and isolated discharge unmixed with any produced water, oil field waste or oil field service waste. (Such an isolated discharge would include: a small sewage treatment plant, package plant, or septic tank and drainfield.) If, on the other hand, sewage is in a discharge combined or mixed with produced water, oil field waste or oil field service waste, OCD shall have jurisdiction. (Source: 5/8/84 Commission minutes)

F. OCD shall administer and enforce Commission regulations at brine manufacturing operations and concerning discharges to ground or surface water at brine manufacturing operations, including all brine production wells, holding ponds and tanks. OCD shall have jurisdiction over all manufactured brine once it is transported, used or disposed of off brine plant premises for use in or directly related to oil and gas operations regulated by OCD. OCD shall regulate brine injection through its Class II Underground Injection control (UIC) Program if the brine is used in the drilling for or production of oil and gas. EID shall regulate brine injection through its UIC Program if the brine is used for other purposes. (Source: 6/23/89 Commission minutes)

G. EID shall administer and enforce all programs implemented by the state under PL 92-500 (The Federal Water Pollution Control Act) and its Amendments, unless directed otherwise by the Commission. (Source: 7/8/75 Commission minutes)

H. OCD shall have general jurisdiction over the oil field service industry. Many activities that would ordinarily be regulated by EID are regulated by OCD when those activities occur in the oil field service industry. The following list, which is not intended to be inclusive, serves to help clarify this delegation:

OCD	EID
waste oil handled or processed by oil field service companies or treating plants	used motor oil handlers
all underground and above-ground tanks on refinery premises, unless the tanks contain unmixed sewage; all underground and above-ground tanks not on refinery premises which contain crude petroleum, produced water or oil field service chemicals	all underground and above-ground tanks not on refinery premises, unless the tanks contain crude petroleum, produced water or oil field service chemicals
tanker trucks hauling, spilling or disposing of well-service chemicals, kill water, produced water, crude oil, tank bottom sludge and other oil field wastes and oil field service materials	tanker trucks spilling or disposing of non-oil and gas production wastes, non-oil and gas service materials, or refined petroleum products
washings from trucks and other equipment used in the transport, production or refining of oil and gas crude products, production wastes or service materials	washings from trucks and other equipment not used for oil and gas production related purposes

Both EID and OCD are authorized to continue to take appropriate legal action in their respective areas of delegation (including initiating proceedings in court) on behalf of the Commission on a finding of good cause to believe any person is violating or is threatening to violate a Commission regulation or the Water Quality Act. The agencies shall send a copy of each Complaint, Settlement Agreement and Judgment to the Commission Secretary for distribution to Commission members. (Source: NMSA Section 74-1-8.2(B) (1978), 2/8/71 and 1/11/83 Commission minutes)

WATER QUALITY CONTROL COMMISSION

By: Richard Mitzelfelt, Chairman

Date Aug 21, 1989

May 2, 2022

Dr. Earthea Nance
Regional Administrator
U.S. Environmental Protection Agency, Region 6
1201 Elm St., Suite 500
Dallas, TX 75270
Nance.Earthea@epa.gov

Re: Request for EPA's review and approval of the State of New Mexico's Triennial Review of Standards for Interstate and Intrastate Surface Waters (20.6.4 NMAC)

Dear Regional Administrator Nance:

Pursuant to §303(c) of the federal Clean Water Act ("CWA") and 40 CFR § 131.20, the New Mexico Environment Department ("Department" or "NMED") conducted a Triennial Review of water quality standards and hereby submits, on behalf of New Mexico's Water Quality Control Commission, the resultant amendments to New Mexico's *Standards for Interstate and Intrastate Surface Waters* 20.6.4 New Mexico Administrative Code (NMAC), which became effective for state purposes on April 23, 2022.

The Department engaged the U.S. Environmental Protection Agency ("EPA" or "Agency") Region 6 early and often in this multi-year process. The Department began outreach to tribes and identified stakeholders in January 2020, which was followed up with three stakeholder engagement meetings during the summer of 2020. The Department then submitted a petition for hearing before the New Mexico Water Quality Control Commission ("WQCC" or "Commission") on August 19, 2020. The WQCC heard the petition, set a hearing date, and appointed a hearing officer during their regularly scheduled public meeting on October 13, 2020. The Department solicited public participation on the proposed amendments from November 2, 2020 through January 6, 2021 and conducted two virtual public meetings during this period.

As provided in the supporting documentation for this submittal, the Department provided public notice of the hearing to tribes within New Mexico, identified stakeholders, subscribers to the NMED Surface Water Quality Bureau's ("SWQB") GovDelivery listserv, NMED District Managers, the New Mexico Legislative Council Service, and the New Mexico Small Business Advisory Commission. The Department also published notice on the Department's website, in the New Mexico Register, the Santa Fe New Mexican, the Albuquerque Journal, and on New Mexico's Sunshine Portal.

The WQCC held a public hearing on July 13, 14, 15, 16 and 21, 2021, during which the Department presented technical testimony in support of its proposed amendments and in response to amendments proposed by other parties. The WQCC deliberated on March 1 and 2, 2022 as detailed in the deliberation transcripts and Statement of Reasons and Decision, dated March 9, 2022. The Department filed the amended rule with the State Records and Archives on March 22, 2022, and the amendments became effective for State purposes on April 23, 2022. A corrected Statement of Reasons and Decision was issued by the WQCC on March 28, 2022, correcting some typographical errors and providing clarification of San Juan Water Commission's position on a number of topics. These corrections were non-substantiative to

the Commission's final decision. The Commission met all procedural requirements of New Mexico law for adopting water quality standards as noted in the Attorney General Certification included with this submittal.

In accordance with §303(c) of the CWA and 40 CFR § 131.20, the Department, on behalf of New Mexico's Water Quality Control Commission, hereby submits the amendments as adopted by the WQCC for EPA review and approval under the federal Clean Water Act. The Department has enclosed the following for EPA's consideration and to aid in the Agency's review:

- a list of supporting documents with publicly accessible links to the documents;
- the WQCC hearing transcripts for July 13, 14, 15, 16, and 21, 2021;
- the WQCC deliberation transcripts for March 1 and 2, 2022;
- the WQCC's Statement of Reasons and Decision supporting and approving the amendments to 20.6.4 NMAC; and
- the New Mexico Attorney General's certification that the rule was adopted in accordance with the laws of the State of New Mexico.

The NMED Cabinet Secretary delegated signatory authority to the Surface Water Quality Bureau Chief to submit surface water quality documents to EPA for approval. We look forward to hearing from you and your staff about this submission. If you have questions or concerns, please feel free to contact Jennifer Fullam at 505.946.8954 or Jennifer.Fullam@state.nm.us.

Sincerely,

Shelly Lemon

RE: New Mexico's 2020 Triennial Revisions to 20.6.4 NMAC

Dear Ms. Lemon:

I am writing in response to your letter of May 2, 2022, requesting review and action on new and revised provisions in New Mexico's *Standards for Interstate and Intrastate Surface Waters* 20.6.4 New Mexico Administrative Code (NMAC). These revisions were submitted to the U.S. Environmental Protection Agency (EPA) as required under federal regulations at 40 CFR § 131.5. The revised water quality standards were certified by Mr. John Verheul, Special Assistant Attorney General of the State of New Mexico, as having been adopted by the Commission pursuant to the laws of the state of New Mexico and became effective as state law on April 23, 2022. The EPA received your submission letter as the New Mexico Environment Department (NMED) Cabinet Secretary delegated signatory authority on May 2, 2022.

I am pleased to inform you that in today's action, the EPA is approving the majority of the new and/or revised provisions, including non-substantive provisions within its discretionary authority, pursuant to CWA § 303(c) and its implementing regulations at 40 CFR Part 131, as detailed in **Section II** of the enclosed Technical Support Document (TSD). There are provisions described in **Section III** that the EPA determined it could not act on. Please note that the provisions the EPA has not acted on are not effective for CWA purposes as specified at 40 CFR §131.21(c). The EPA is not approving the New Mexico water quality standards for those waters or portions of waters located in Indian Country, as defined in 18 U.S.C. § 1151.

The EPA's approval of new and revised WQS is subject to the consultation requirements of Section 7(a)(2) of the Endangered Species Act (ESA), 16 U.S.C. §1536. Under Section 7(a)(2) of the ESA The EPA has the obligation to ensure that its approval of revisions to New Mexico's *Standards for Interstate and Intrastate Surface Waters* 20.6.4 NMAC will not jeopardize the continued existence of threatened and endangered species and critical habitat in New Mexico. The EPA is reserving action on specific aquatic life criteria described in **Section V** of the TSD pending completion of ESA consultation with the Service.

I would like to thank the Commission, the New Mexico Environment Department and its Surface Water Quality Bureau for their commitment and hard work in reviewing and revising the state's water quality standards. We appreciate your patience with the delay in action by the EPA resulting from the extensive ESA consultation detailed in **Section III** of the TSD. If you have any questions or concerns, please contact me at (214) 665-7101, or have your staff contact Russell Nelson at (214) 665-6646 or Jasmin Diaz-Lopez at (214) 665-2733.

Sincerely,

Troy C. Hill
Acting Director
Water Division

NMED Exhibit 6

I. Introduction

Regulatory Requirements and Purpose

As described in § 303(c) of the Clean Water Act[1] (CWA) and in the standards regulation within the Code of Federal Regulations[2] (CFR) at 40 CFR § 131, specifically § 131.20(a), states and authorized tribes have primary responsibility for developing and adopting water quality standards to protect their waters. In addition, CWA § 303(c)(1) and 40 CFR § 131.20(a) require states to hold public hearings at least once every three years to review and, as appropriate, modify and adopt standards. As required by 40 CFR § 131.21, the Environmental Protection Agency (EPA) is obligated to review new and revised surface water quality standards that have been adopted by states and authorized tribes. Authority to approve or disapprove new and/or revised standards submitted to the EPA for review has been delegated to the Water Division Director at Region 6. Tribal or state water quality standards are not effective under the CWA until approved by the EPA.

The purpose of this Technical Support Document (TSD) is to provide the basis for the Environmental Protection Agency's (EPA) action on the New Mexico Water Quality Control Commission's (Commission) revisions to the *New Mexico Standards for Interstate and Intrastate Waters*[3] (20.6.4 NMAC).

Chronology of Events

The New Mexico Environment Department (NMED) initiated the state's current Triennial Review process through outreach to tribes and identified stakeholders in January 2020. The NMED's Surface Water Quality Bureau (SWQB) developed and subsequently published initial revisions to the New Mexico water quality standards at 20.6.4. NMAC and hosted two virtual informational meetings via WebEx online meeting platform to present and discuss initial proposed revisions to the New Mexico standards at 20.6.4 NMAC with interested parties and the public. The SWQB took public comment over a 30-day public comment period from November 2, 2020, to December 2, 2020, later extending that comment period to January 6, 2021. The EPA provided comments and recommendations to the SWQB on December 22, 2020, regarding significant issues that may need to be addressed in these revisions and subsequent revisions of the state's water quality standards and associated implementation.

The NMED submitted a petition for hearing before the New Mexico Water Quality Control Commission (Commission) on August 19, 2020. The Commission held a public hearing on July 13th – 16th and 21st, 2021, during which the NMED presented technical testimony in support of its proposed amendments and in response to amendments proposed by other entities. The Commission held its deliberative hearing on March 1st and 2nd 2022, adopting revisions to 20.6.4.

[1] Clean Water Act. 33 USC §§ 1251-1387.
[2] Water Quality Standards Regulation, 33 U.S.C. 1251et seq.
[3] New Mexico Administrative Code (NMAC). 2022. *State of New Mexico Standards for Interstate and Intrastate Surface Waters*. 20.6.4. New Mexico Water Quality Control Commission. As amended through April 23, 2022. (20.6.4 NMAC).

NMED Exhibit 6

NMAC. The New Mexico Attorney General's Office certified the new/revised water quality standards became effective as state law as of April 23, 2022. The revised *New Mexico Standards for Interstate and Intrastate Waters* (20.6.4 NMAC) were submitted to EPA for review and action on May 2, 2022.

Summary of Proposed Revisions

The NMED submitted revisions adopted by the Commission for the *New Mexico Standards for Interstate and Intrastate Waters* (20.6.4 NMAC) to the EPA for review and action. These revisions reflect several new and revised provisions which include, but are not limited to the following:

- Updating definitions (20.6.4.7 NMAC)
- Clarification of language under Review of Standards (20.6.4.10 NMAC)
- Clarification of language under Use Attainability Analysis (20.6.4.15 NMAC)
- Designated use revisions
    - Existing Use Analysis for nonperennial waters within Los Alamos National Laboratory currently classified under 20.6.4.128 NMAC
    - Existing Use Analysis for perennial classified waters with a secondary contact recreational use
- Updates to the numeric aquatic life and human health criteria (20.6.4.900 NMAC)
- Updates to the numeric ammonia criteria (20.6.4.900 NMAC)

Provisions that EPA is approving are discussed in **Section II** of this TSD. Those provisions the EPA has determined that it lacks adequate information to act on at this time are identified and discussed in detail in **Section III**.

Review of New/Revised Provisions

The new/revised provisions in the *New Mexico Standards for Interstate and Intrastate Waters* (20.6.4 NMAC) are presented in an underline/strikeout format to provide context to the reader. The EPA's responses to the new/revised provision may include an explanation of how the EPA interprets that particular provision in the context of (a) specific applicable federal regulation(s), policy or guidance as well as state provisions as appropriate.

The EPA has determined that some revisions adopted by the Commission did not substantively modify New Mexico's WQS at 20.6.4 NMAC. EPA considers nonsubstantive edits to existing WQS to constitute new or revised WQS that it has the authority to approve or disapprove under Section 303(c)(3). While these revisions do not substantively change the meaning or intent of the existing WQS, treating such revisions in this manner ensures public transparency as to which provisions are effective for CWA purposes. EPA notes that the scope of its review and action on nonsubstantive edits or editorial changes extends only to the edits or changes themselves. EPA is not re-opening, reconsidering, or taking any action on the underlying, previously approved WQS that are the subject of the nonsubstantive edits or editorial changes.

NMED Exhibit 6

II. New or Revised Provisions the EPA is Approving

In today's action, the EPA is approving the following new or revised provisions in the *New Mexico Standards for Interstate and Intrastate Waters* (20.6.4 NMAC) that were adopted by the Commission on March 2, 2022, and became effective as state law on April 23, 2022, pursuant to §303(c) of the CWA. The new and revised water quality standards will apply throughout the State of New Mexico, excluding areas of Indian country as defined in 18 U.S.C. §1151

20.6.4.6 Objective

D. These surface water quality standards serve to respond to the inherent threats of climate change and provide resiliency for the continued protection and enhancement of water quality.
[20.6.4.6 NMAC - Rp 20 NMAC 6.1.1006, 10/12/2000; A, 5/23/2005; A, 4/23/2022]

EPA Determination: *The amended language in this provision has been described as an effort to reflect the objective of the New Mexico WQS more accurately as they pertain to the threats from climate change consistent with the statewide climate strategy outlined in the Governor's Executive Order referenced in this provision. The EPA supports the NMED's commitment to provide resiliency in addressing threats to the state's waters posed by climate change. This provision is approved pursuant to CWA § 303(c) and is effective for CWA purposes.*

20.6.4.7. Definitions

Definitions are generally considered to be WQS in that they can affect the meaning and interpretation of a WQS provisions. The exception to this convention is when the use of a definition is limited to those provisions that are not WQS, e.g., implementation language. The EPA's decision on revisions to definitions depend on the effect the definition has on the viability of other WQS provisions in the New Mexico Standards for Interstate and Intrastate Waters (20.6.4 NMAC).

The Commission has made the following changes to 20.6.4.7 NMAC. In most instances, a change to a current definition such as structural changes e.g., renumbering of subparagraphs, etc. are considered nonsubstantive changes and are not described in detail unless relevant to understanding, interpretation or application of other provisions.

20.6.4.7 DEFINITIONS: Terms defined in the New Mexico Water Quality Act, but not defined in this part will have the meaning given in the Water Quality Act.

A. Terms beginning with numerals or the letter "A," and abbreviations for units.

[~~(7)~~](8) "Attainable Use**"** means a use that is achievable by the imposition of effluent limits required under sections 301(b) and 306 of the federal Clean Water Act and implementation of cost-effective and reasonable best management practices for nonpoint source control. An attainable use may or may not have criteria as stringent as the designated use.

***EPA Determination*:** *The revisions to this definition remain generally consistent with Chapter 2 of the EPA's Water Quality Standards Handbook.*[4] *This definition is approved pursuant to CWA § 303(c) and is effective for CWA purposes.*

C. Terms beginning with the letter "C".

(4) "Climate change" refers to any significant change in the measures of climate lasting for an extended period of time, typically decades or longer, and includes major changes in temperature, precipitation, wind patterns or other weather-related effects.

***EPA Determination*:** *The EPA considers this definition to be consistent with the CWA and Water Quality Standards regulation. This definition is approved pursuant to CWA § 303(c) and is effective for CWA purposes.*

(2) "Emerging contaminants" refer to water contaminants that may cause significant ecological or health effects at low concentrations. Emerging contaminants are generally chemical compounds recognized as having deleterious effects at environmental concentrations whose negative impacts have not been fully quantified and may not have regulatory numeric criteria.

***EPA Determination*:** *The EPA considers this definition to be consistent with the CWA and Water Quality Standards regulation. This definition is approved pursuant to CWA § 303(c) and is effective for CWA purposes.*

H. Terms beginning with the letter "H".

(1) "Hardness" means the measure of calcium and magnesium salts in water expressed as dissolved calcium carbonate (CaCO3) unless otherwise noted.

***EPA Determination*:** *The inclusion of this simple definition of "hardness" is intended to clarify the term and provide consistency when implementing New Mexico's hardness-based metals criteria for the protection of aquatic life at 20.6.4.900(I) NMAC. This definition is approved pursuant to CWA § 303(c) and is effective for CWA purposes.*

(2) "Harmonic mean flow" is the number of daily flow measurements divided by the sum of the reciprocals of the flows; that is, it is the reciprocal of the arithmetic mean of reciprocal daily flow measurements consistent with the equations in Paragraph (1) of Subsection B of 20.6.4.11 NMAC.

***EPA Determination*:** *The definition was moved from 20.6.4.11.B with minor, nonsubstantive edits. This definition is approved as a nonsubstantive revision pursuant to CWA § 303(c) and is effective for CWA purposes.*

L. Terms beginning with the letter "L".

(2) "**Limited aquatic life**" as a designated use, means the surface water is capable of supporting only a limited community of aquatic life. This subcategory includes surface waters that support aquatic species selectively adapted to take advantage of naturally occurring rapid environmental changes, [~~ephemeral or intermittent water,~~]low flow, high turbidity, fluctuating temperature, low dissolved oxygen content or unique chemical characteristics.

[4] U.S. EPA, Office of Water. (1994). Water Quality Standards Handbook. EPA-823-B-17-001 (2017). Retrieved from https://www.epa.gov/wqs-tech/water-quality-standards-handbook

EPA Determination: *Although ephemeral or intermittent waters may experience the limitations described, striking the reference to these waters, deleting the specific reference and referring to low flow broadens the application of the limited aquatic life use designation to waters that may have the limitations described although they may be intermittent or perennial. These revisions do not fundamentally alter the meaning of the revised definition. Redivisions to this definition are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

M. Terms beginning with the letter "M".

(1) "Marginal coldwater" in reference to an aquatic life use means that natural [~~intermittent or low flows, or other natural habitat~~] conditions severely limit maintenance of a coldwater aquatic life population during at least some portion of the year or historical data indicate that the temperature [~~in~~] of the surface water of the state may exceed that which could continually support aquatic life adapted to coldwater[~~25°C (77°F)~~].

EPA Determination: *Although the intent appears to be distinguishing the marginal coldwater aquatic life use designation from the coldwater aquatic life use, striking the reference to flow and natural habitat leaves this definition less specific. The reference to naturally variable conditions may be limited during the attainment of the coldwater aquatic life use "at least some portion of the year" indicates that the marginal coldwater aquatic life us can be applied as a seasonal use. While the EPA recognizes natural variability, it is important to note that establishing a seasonal or year-round marginal coldwater aquatic life use must be based on natural and not anthropogenic conditions. Striking the use-specific water temperature limitations is appropriate given temperature criteria are held in the description of the marginal coldwater aquatic life use in 20.6.4.900 NMAC. Revisions to this definition are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

P. Terms beginning with the letter "P".

(3) "Persistent toxic pollutants" means pollutants, generally organic, that are resistant to environmental degradation through chemical, biological and photolytic processes and can bioaccumulate in organisms, causing adverse impacts on human health and aquatic life.

EPA Determination: *The EPA considers this definition to be consistent with the CWA and Water Quality Standards regulationThis definition is approved pursuant to CWA § 303(c) and is effective for CWA purposes.*

S. Terms beginning with the letter "S"

(5) "Surface water(s) of the state"

(a) means all surface waters situated wholly or partly within or bordering upon the state, including the following:

(i) lakes[,];
(ii) rivers[,];
(iii) streams (including intermittent and ephemeral streams) [,];
(iv) mudflats[~~,~~];
(v) sandflats[~~,~~];
(vi) wetlands[~~,~~];
(vii) sloughs[~~,~~];
(viii) prairie potholes [~~,~~];
(ix) wet meadows[~~,~~];
(x) playa lakes[~~,~~];
(xi) reservoirs[~~,~~]; [~~or~~]and

NMED Exhibit 6

(xii) natural ponds.

(b) [~~Surface waters of the state~~] also means all tributaries of such waters, including adjacent wetlands, any manmade bodies of water that were originally created in surface waters of the state or resulted in the impoundment of surface waters of the state, and any "waters of the United States" as defined under the Clean Water Act that are not included in the preceding description.

(c) [~~Surface waters of the state~~] does not include private waters that do not combine with other surface or subsurface water or any water under tribal regulatory jurisdiction pursuant to Section 518 of the Clean Water Act. Waste treatment systems, including treatment ponds or lagoons designed and actively used to meet requirements of the Clean Water Act (other than cooling ponds as defined in 40 CFR Part 423.11(m) that also meet the criteria of this definition), are not surface waters of the state, unless they were originally created in surface waters of the state or resulted in the impoundment of surface waters of the state.

EPA Determination: *The inclusion of the term "ephemeral" in this definition clarifies that New Mexico's WQS apply to ephemeral waters. Other formatting changes, including striking the repetition of the term "Surface waters of the state" in sections (ii) and (iii) are nonsubstantive. Revisions to this definition are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

U. Terms beginning with the letter "U". ~~[RESERVED]~~

(1) **"Unclassified waters of the state"** means those surface waters of the state not identified in 20.6.4.101 through 20.6.4.899 NMAC.

EPA Determination: *The language in this definition has been drawn from 20.6.4.11(H) NMAC, which is integral to providing protection to unclassified waters in New Mexico. This new definition is approved as a nonsubstantive change to WQS pursuant to CWA § 303(c) and is effective for CWA purposes.*

(2) **"Use attainability analysis"** means a scientific study conducted for the purpose of assessing the factors affecting the attainment of a use.

EPA Determination: *This language for this definition appears to have been drawn from the provision at 20.6.4.15 NMAC. The new definition is approved as a nonsubstantive revision to WQS pursuant to CWA § 303(c) and is effective for CWA purposes.*

20.6.4.8 Antidegradation Policy and Implementation Plan

A. Antidegradation Policy: This antidegradation policy applies to all surface waters of the state.

(1) Existing [~~instream water~~] uses, as defined in Paragraph (4) of Subsection E of 20.6.4.7 NMAC, and the level of water quality necessary to protect the existing uses shall be maintained and protected in all surface waters of the state.

EPA Determination: *The reference to the definition of "existing uses" and subsequent corrections of the acronym "ONRW" are nonsubstantive. The revisions to this provision are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.9 Outstanding National Resource Waters

A. Procedures for nominating an ONRW: Any person may nominate a surface water of for designation as an ONRW by filing a petition with the commission pursuant to [~~the guidelines for water quality control commission regulation hearings~~]20.1.6 NMAC, Rulemaking Procedures - Water Quality Control Commission. A petition to designate a surface water of the state as an ONRW shall include:

EPA Determination: *The inclusion of the reference to the Commission's regulatory authority and procedures provides important clarity regarding the process for nominating waters as Outstanding National Resource Waters (ONRW). The revisions to this provision are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.10. Review of Standards; Need for Additional Studies

A. Section 303(c)(1) of the federal Clean Water Act requires that the state hold public hearings at least once every three years for the purpose of reviewing water quality standards and proposing, as appropriate, necessary revisions to water quality standards.

B. In accordance with 40 CFR 131.10(j) when an existing use is defined in 20.6.4.7 NMAC, is more stringent than the designated use and supporting evidence demonstrates the presence of that use, the designated use shall be amended to be no less stringent than the existing use.

[~~B.~~] C. It is recognized that, in some cases, numeric criteria [~~have been adopted that reflect use designations rather than existing conditions of surface waters of the state.~~]for a particular designated use may not adequately reflect the local conditions or the aquatic communities adapted to those localized conditions. In these cases, a water quality criterion may be modified to reflect the natural condition of a specific waterbody. The modification of the criterion does not change the designated use; the modification only changes the criterion for that specific waterbody. [~~Narrative criteria are required for many constituents because accurate data on background levels are lacking. More intensive water quality monitoring may identify surface waters of the state where existing quality is considerably better than the established criteria.~~]When justified by sufficient data and information, a numeric [~~the~~] water quality [~~criteria~~]criterion [~~will~~]may be adopted or modified in accordance with 20.6.4.10(F) and 20.6.4.10(G) NMAC, to protect the attainable uses of the waterbody.

D. The removal or amendment of a designated use to a designated use with less stringent criteria can only be done through a use attainability analysis in accordance with 20.6.4.15 NMAC.

The addition of the new provisions at 20.6.4.10 (B) NMAC clarifies that the existing uses may represent higher water quality than is being protected by the current designated use and associated criteria. These revisions require that the more stringent designated use be revised consistent with the requirements found in 40 CFR 131.10(i) as specified.

The revisions to 20.6.4.10 (C) NMAC also clarify the process that will use to determine conditions where a site-specific criteria analysis is warranted to supporting the designation of use that reflects the natural conditions of a waterbody. This approach is not the development of a subcategory of use as referred to in 40 CFR 131.10(k)(2) and is generally consistent with both 40 CFR §§ 131.10 and 131.11. It is worth noting that although 20.6.4.7 NMAC contains a definition for "natural causes," defining natural conditions can be very difficult to impossible without substantial historical data on habitat and water quality conditions. It is important to understand that the EPA would require extensive supporting information to support revisions based on natural causes prior to acting on such revisions.

EPA Determination: *The new provisions at 20.6.4.10(D) NMAC is a subdivision of 20.6.4.10(C) NMAC that specifies that the removal or amendment of a designated use with less stringent*

criteria can only be done through a use attainability analysis (UAA). The new provision is consistent with 40 CFR 131.10(j)(2). Subsequent revisions updating the lettering of subsequent paragraphs in this provision are not substantive. The revisions to this provision are approved pursuant to CWA § 303(c) and are effective for CWA purposes.

20.6.4.11. Applicability of Water Quality Standards

A. [RESERVED]

B. Critical low flow: The critical low flow of a stream at a particular site shall be used in developing point source discharge permit requirements to meet numeric criteria set in 20.6.4.97 through 20.6.4.900 NMAC and Subsection F of 20.6.4.13 NMAC.

(1) For human health-organism only criteria, the critical low flow is the harmonic mean flow [~~; "harmonic mean flow" is the number of daily flow measurements divided by the sum of the reciprocals of the flows; that is, it is the reciprocal of the mean of reciprocals~~]. For ephemeral waters the calculation shall be based upon the nonzero flow intervals and modified by including a factor to adjust for the proportion of intervals with zero flow. The equations are as follows:

***EPA Determination*:** *The deletion of this reference to harmonic mean flow is nonsubstantive given that the term is now defined in 20.6.4.7 NMAC. The revisions to this provision are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

H. Unclassified waters of the state: [~~Unclassified waters of the state are those surface waters of the state not identified in 20.6.4.101 through 20.6.4.899 NMAC.~~] An unclassified surface water of the state is presumed to support the uses specified in Section 101(a)(2) of the federal Clean Water Act. As such, it is subject to 20.6.4.98 NMAC if nonperennial or subject to 20.6.4.99 NMAC if perennial. The commission may include an ephemeral unclassified surface water of the state under 20.6.4.97 NMAC only if a use attainability analysis demonstrates pursuant to 20.6.4.15 NMAC that attainment of Section 101(a)(2) uses is not feasible.

EPA Determination: *Striking the first sentence of this provision referring to unclassified waters of the state that are "not identified in 20.6.4.101 through 20.6.4.899 NMAC" that has been moved to 20.6.7.7U(1) NMAC and is thus a nonsubstantive revision. This provision is approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.12. Compliance with Water Quality Standards

F. For compliance with hardness-dependent numeric criteria, [~~dissolved~~] hardness (as mg $CaCO_3$/L) shall be determined from a sample taken at the same time that the sample for the contaminant is taken.

***EPA Determination*:** *The NMED proposed, and the Commission adopted a definition of the term "hardness" to clarify the term and provide consistency when implementing New Mexico's hardness-based metals criteria for the protection of aquatic life at 20.6.4.900(I) NMAC. As described in the Commission's Statement of Reasons (SOR), the San Juan Water Commission recommended removing the word "dissolved" before "hardness" in 20.6.4.12(F) NMAC and 20.6.4.900(I) NMAC, so that it aligned with the new definition of "hardness," and to eliminate redundancy and clarify the term. The Commission agreed and approved striking the word "dissolved" in in 20.6.4.12(F) NMAC. The deletion of the word "dissolved" in this*

provision is approved as a nonsubstantive revision pursuant to CWA § 303(c) and is effective for CWA purposes.

G. Compliance schedules: [~~It shall be the policy of the commission to allow on a case-by-case basis~~ t]The commission may allow the inclusion of a schedule of compliance in a NPDES permit issued to an existing facility on a case-by-case basis. Such schedule of compliance will be for the purpose of providing a permittee with adequate time to make treatment facility modifications necessary to comply with water quality-based permit limitations determined to be necessary to implement new or revised water quality standards or wasteload allocation. Compliance schedules may be included in NPDES permits at the time of permit renewal or modification and shall be written to require compliance at the earliest practicable time. Compliance schedules shall also specify milestone dates so as to measure progress towards final project completion (e.g., design completion, construction start, construction completion, date of compliance).

EPA Determination: *The Commission previously adopted this compliance schedule authorizing provision consistent with 40 CFR 131.15. The nonsubstantive rephrasing here improves the clarity of the provisions and the intent to allow compliance schedules on a case-by-case basis. The revisions to this provision are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.13. General Criteria

F. Toxic pollutants:

(1) Except as provided in 20.6.4.16 NMAC, surface waters of the state shall be free of toxic pollutants from other than natural causes in amounts, duration, concentrations or combinations that affect the propagation of fish or that are toxic to humans, livestock or other animals, fish or other aquatic organisms, wildlife using aquatic environments for habitation or aquatic organisms for food, or that will or can reasonably be expected to bioaccumulate in tissues of fish, shellfish and other aquatic organisms to levels that will impair the health of aquatic organisms or wildlife or result in unacceptable tastes, odors or health risks to human consumers of aquatic organisms.

EPA Determination: *The inclusion of the term "duration" adds some clarity to this provision since the term refers to the averaging period, and a maximum allowable frequency of exceedance of the acute and chronic criteria. The revisions to this provision are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.14 Sampling and Analysis

F. Emerging Contaminants Monitoring: The department may require monitoring, analysis and reporting of emerging contaminants as a condition of a federal permit under Section 401 of the federal Clean Water Act.

EPA Determination: *This new subsection refers to existing authority held by the NMED to require sampling and monitoring of contaminants in NPDES permits consistent with its CWA § 401 authority. This is not a WQS that EPA has authority under CWA § 303(c) to review.*

20.6.4.15. Use Attainability Analysis

A. **Regulatory requirements for a use attainability analysis**. [~~A use attainability analysis is a scientific study conducted for the purpose of assessing the factors affecting the attainment of a use.~~] Whenever a use attainability analysis is conducted, it shall be subject to the requirements and limitations set forth in 40 CFR Part 131, Water Quality Standards; specifically, Subsections 131.3(g), 131.10(g), 131.10(h) and 131.10(j) shall be applicable. In accordance with 40 CFR 131.10(i), and 20.6.4.10 NMAC, the amendment of a designated use, based on an existing use with more stringent criteria, does not require a use attainability analysis.

(1) The commission may remove a designated use, that is not an existing use, specified in Section 101(a)(2) of the federal Clean Water Act or adopt subcategories of a use in Section 101(a)(2) of the federal Clean Water Act [~~use~~] requiring less stringent criteria only if a use attainability analysis demonstrates that attaining the use is not feasible because of a factor listed in 40 CFR 131.10(g). Uses in Section 101(a)(2) of the federal Clean Water Act [~~uses~~], which refer to the protection and propagation of fish, shellfish and wildlife and recreation in and on the water, are also specified in Subsection B of 20.6.4.6 NMAC.

(2) A designated use cannot be removed if it is an existing use unless a use requiring more stringent criteria is designated.

B. The mechanism to remove a designated use. A use attainability analysis shall assess the physical, chemical, biological, economic, or other factors affecting the attainment of a use. The analysis shall rely on scientifically defensible methods such as the methods described in the following documents:

(1) Technical Support Manual: Waterbody Surveys And Assessments For Conducting Use Attainability Analyses, volume I (November 1983) and volume III (November 1984) or latest editions, United States environmental protection agency, office of water, regulations and standards, Washington, D.C., for the evaluation of aquatic life or wildlife uses;

(2) the department's *Hydrology Protocol*, latest edition, approved by the commission, for identifying ephemeral, [~~and~~] intermittent, and perennial waters; or

(3) *Interim Economic Guidance For Water Quality Standards - Workbook*, March 1995, United States environmental protection agency, office of water, Washington, D.C. for evaluating economic impacts.

C. **Determining the highest attainable use**. If the use attainability analysis determines that the designated use is not attainable based on one of the factors in 40 CFR 131.10(g), the use attainability analysis shall then determine the highest attainable use for the protection and propagation of fish, shellfish and wildlife and recreation in and on the water based on methods described in Subsection B of this section.

D. Process to remove a designated use and establish the highest attainable use.

(1) The process for developing a use attainability analysis and petitioning the commission for removing a designated use and establishing the highest attainable use shall be done in accordance with the State's current *Water Quality Management Plan/Continuing Planning Process*.

[~~C.~~](2) If the findings of a use attainability analysis, conducted by the department, [~~based on~~] in accordance with the department's *Hydrology Protocol* (latest edition)[~~, approved by the commission,~~] demonstrates [~~to the satisfaction of the department~~]that federal Clean Water Act Section 101(a)(2) uses, that are not existing uses, are not feasible in an ephemeral water body due to the factor in 40 CFR 131.10(g)(2), the department may consider proceeding with the expedited use attainability analysis process in accordance with the State's current *Water Quality Management Plan/Continuing Planning Process*. The following elements must be met for the expedited use attainability analysis process to be authorized and implemented:

(a) The department is the primary investigator of the use attainability analysis;

(b) The use attainability analysis determined, through the application of the *Hydrology Protocol*, that the water being investigated is ephemeral and has no effluent discharges of sufficient volume that could compensate for the low-flow;

(c) The use attainability analysis determined that the criteria associated with the existing uses of the water being investigated are not more stringent than those in 20.6.4.97 NMAC;

(d) The designated uses in 20.6.4.97 NMAC have been determined to be the highest attainable uses for the water being analyzed;

(e) The department [~~shall~~]posted the use attainability analysis on its water quality standards website and [~~notify~~] notified its interested parties list of a 30-day public comment period. ;

(f) [~~After reviewing~~]The department reviewed and responded to any comments received during the 30-day public comment period, and

NMED Exhibit 6

(g) The department [~~may proceed by submitting~~]submitted the use attainability analysis and response to comments to region 6 EPA for technical approval. If EPA approves the revision under section 303(c) of the Clean Water Act [~~technical approval is granted~~], the water shall be subject to 20.6.4.97 NMAC for federal Clean Water Act purposes. The use attainability analysis, the technical support document,[~~approval,~~] and the applicability of 20.6.4.97 NMAC to the water shall be posted on the department's water quality standards website. The department shall periodically petition the commission to list ephemeral waters under Subsection C of 20.6.4.97 NMAC and to incorporate changes to classified segments as appropriate.

~~[D.]~~E. Use attainability analysis conducted by an entity other than the department. Any person may submit notice to the department stating their intent to conduct a use attainability analysis.

(1) The proponent shall provide such notice along with [~~develop~~]a work plan supporting [~~to conduct~~]the development of a use attainability analysis[~~. and shall submit the work plan]~~ to the department and region 6 EPA for review and comment.

(2) Upon approval of the work plan by the department, the proponent shall conduct the use attainability analysis in accordance with the applicable portions of Subsections A through D of this Section and implement public noticing in accordance with the approved work plan.

(3) Work plan elements. The work plan shall identify, at a minimum:

(a) the waterbody of concern and the reasoning for conducting a use attainability analysis.

(b) the [~~scope~~]source and validity of data [~~currently available and the scope of data to be gathered~~]to be used to demonstrate whether the current designated use is not attainable;[~~,~~]

(c) the factors in 40 CFR 131.10(g) affecting [~~use~~]the attainment of that use;

(d) [that will be analyzed] a description of the data being proposed to be used to demonstrate the highest attainable use;

(e) [~~and~~]the provisions for consultation with appropriate state and federal agencies;

(f) a description of how stakeholders and potentially affected tribes will be identified and engaged;

(g) a description of the public notice mechanisms to be employed; and [~~consultation with appropriate state and federal agencies~~]

(h) the expected timelines outlining the administrative actions to be taken for a rulemaking petition, pending the outcome of the use attainability analysis.

(4) [~~Upon approval of the work plan by the department, the proponent shall conduct the use attainability analysis in accordance with the approved work plan. The cost of such analysis shall be the responsibility of the proponent.~~] Upon completion of the use attainability analysis, the proponent shall submit the data, findings and conclusions to the department, and provide public notice of the use attainability analysis in accordance with the approved work plan.

(5) Pending the conclusions of the use attainability analysis and as described in the approved work plan, [~~T~~]the department or the proponent may petition the commission to modify the designated use [~~if the conclusions of the analysis support such action~~]. The cost of such use attainability analysis shall be the responsibility of the proponent. Subsequent costs associated with the administrative rulemaking process shall be the responsibility of the petitioner.

EPA Determination: *The majority of the revisions to 20.6.4.15 NMAC provide consistency with both designated use requirements in the CWA and its implementing regulations at 40 CFR 131.10 for amending a designated uses with less protective criteria. The revisions will ensure effective implementation of the UAA process as outlined in federal regulation and consistency with New Mexico's Water Quality Management Plan/Continuing Planning Process[5] (WQMP/CPP) document.*

[5] New Mexico Environment Department (2020), The NMED Statewide Water Quality Management Plan and Continuing Planning Process (WQMP/CPP). WQCC No. 20-34

NMED Exhibit 6

The EPA recommends that in its next triennial revision, the NMED amend 20.6.4.15(D)(2)(g) NMAC to clarify that the revisions must be adopted into NMAC before EPA can approve them under section 303(c) of the Clean Water Act. The provision at 20.6.4.15(D)(2)(g) NMAC does not supersede the CWA requirement that water quality standards be adopted by the state before they can be approved by the EPA as effective for CWA purposes. Any decisions on the effectiveness of new and revised water quality standards for CWA purposes will be made by the EPA following adoption by the Commission and submission by the NMED pursuant to §303(c) and 40 CFR 131. As detailed in initial comments on draft revisions to this provision, the EPA stated that it will not provide "technical approval" for any UAA to ensure that associated comments or recommendations are not misconstrued as a final decision or finding by the EPA under CWA §303(c). Although the EPA appreciates the NMED/SWQB effort to provide an opportunity for review of draft UAAs when resources allow, this subparagraph continues to state that the NMED will submit a UAA and response to comments to the EPA for technical approval.

The EPA is approving the revisions to 20.6.15 NMAC pursuant to CWA § 303(c) because they are otherwise consistent with the CWA and WQS regulations, with the caveat that the EPA will not provide "technical approval" of a UAA prior to approval by the Commission. The deletion of the first sentence defining a use attainability analysis is a nonsubstantive revision since the definition was moved to 20.6.4.7.U.(2) NMAC. The revisions to this provision are approved pursuant to CWA § 303(c) and are effective for CWA purposes.

20.6.4.97. Ephemeral Waters

20.6.4.97 EPHEMERAL WATERS: Ephemeral surface waters of the state as identified below and additional ephemeral waters as identified on the department's water quality standards website pursuant to Paragraph (2) of Subsection [~~C~~]D of 20.6.4.15 NMAC are subject to the designated uses and criteria as specified in this section. Ephemeral waters classified in 20.6.4.101-899 NMAC are subject to the designated uses and criteria as specified in those sections.

(g) the south fork of Cañon del Piojo from [~~Canon~~]Cañon del Piojo upstream 1.2 miles to an unnamed tributary.

EPA Determination: *The language in 20.6.4.97 NMAC was revised for consistency with 20.6.4.15 NMAC and is nonsubstantive. The grammatical correction in 20.6.4.97(C)(1)(g) is nonsubstantive. The revisions to this provision are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4. Rio Grande Basin

20.6.4.103 RIO GRANDE BASIN: [~~The main stem of the Rio Grande from the headwaters of Caballo reservoir upstream to Elephant Butte dam and perennial~~] Perennial reaches of tributaries to the Rio Grande in Sierra and Socorro counties not specifically identified under other sections of 20.6.4 NMAC, excluding waters on tribal lands.

A. Designated uses: irrigation, livestock watering, wildlife habitat, marginal coldwater aquatic life, secondary contact and warmwater aquatic life.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

[~~**C.** Remarks: flow in this reach of the Rio Grande main stem is dependent upon release from Elephant Butte dam.~~]

[20.6.4.103 NMAC - Rp 20 NMAC 6.1.2103, 10/12/2000; A, 5/23/2005; A, 12/1/2010; A, 4/23/2022]
[**NOTE:** This segment was divided effective 4/23/2022. The standards for the main stem of the Rio Grande from the headwaters of Caballo reservoir upstream to Elephant Butte dam, perennial reaches of Palomas creek, perennial reaches of Rio Salado, perennial reaches of Percha creek, perennial reaches of Alamosa creek, Las Animas creek, and perennial reaches of Abo arroyo are under 20.6.4.112 NMAC.]

The NMED expends significant effort as part of an ongoing process to ensure that appropriate designated uses are in place for all waters in New Mexico consistent with the CWA and the federal water quality standards regulation. As part of proposed triennial revisions in 2005, the NMED recommended and the Commission adopted designated use provisions for unclassified, waters based on hydrology through the creation of 20.6.4.97, 20.6.4.98 and 20.6.4.99 NMAC. Consistent with the CWA, 20.6.4.98 NMAC specifies that unclassified nonperennial surface waters of the state are presumed to support the uses specified in CWA § 101(a)(2). As part of these amendments, most unnamed nonperennial waters in regulatory segments 20.6.4.101 through 899 NMAC were revised to unclassified waters by adding the phrase "perennial reaches of tributaries to…" to classified regulatory segments 20.6.4.101 through 899 NMAC.

During its 2014 triennial review process, the NMED re-examined specific waters defined in 20.6.4.101-20.6.4.899 NMAC and found that some regulatory segments had not been amended consistent with the Commission's 2005 revisions and still contained language that applied perennial uses to nonperennial waters. During the Commission's 2015 hearing to review and revise the state's water quality standards, the NMED presented assessment information based on field data supporting its determination that the specified waters are capable of supporting primary contact recreation. However, the Commission did not adopt the recommended primary contact recreation use for these waters in its final 2017 order.

As part of the recent 2020 triennial revision process, in its review of classified waters within 20.6.4.101-899 NMAC the NMED again identified some regulatory segments that were not consistent with the Commission's 2005 revisions, leaving some segments with language that applied perennial designated uses to nonperennial waters. To address this, the NMED developed an Existing Use Analysis of Recreational Use for Classified Waters 20.6.4.101-20.6.4.899 NMAC (2021), focusing on classified waters in 20.6.4.103, 20.6.4.116, 20.6.4.204, 20.6.4.206, and 20.6.4.207 NMAC that retained the secondary contact recreational use. The Existing Use Analysis (EUA) was intended to allow a determination of whether there is evidence that primary contact recreation is attainable or the existing use in these waters.

The EUA explains that although the SWQB does not directly monitor or gather specific information on the actual occurrence of recreational uses. The determination of whether the primary contact use is existing or attainable was based on archived and current datasets for parameters specific to the primary contact use. Waters within these classified segments were assessed and parsed based on archived and data collected since 2010 through the NMED's Surface water Quality Information Database (SQUID). Archived and SQUID Escherichia coli (E. coli) and pH data is specifically associated with the primary contact use. To be considered for primary contact use designation, any waters must have pH data values ranging from 6.6 to 9.0 and E. coli data that fell at or below 410 cfu/100 mL in more than one sample event. Taking a conservative approach, the NMED excluded any waters that did not contain both E. coli and pH data from the analysis. The NMED determined that there was adequate

information and data to move forward with the analysis of five regulatory segments, including 20.6.4.103, 20.6.4.116, 20.6.4.204, 20.6.4.206 and 20.6.4.207 NMAC.

The EUA did not identify any available data to indicate whether the primary contact recreation use can be supported within the assessment unit (AU) specific to 20.6.4.103 NMAC that includes the perennial reaches of tributaries to the Rio Grande in Sierra & Socorro County. Thus, there is no basis to support a primary contact use designation in this AU. However, there were data available specific to other AUs within this regulatory segment for the perennial reaches of Percha creek, perennial reaches of Alamosa creek, Las Animas creek, and perennial reaches of Abo arroyo. The data indicate that these waters are capable of attaining a primary contact recreational use. Based on this data, the NMED recommended, and the Commission subdivided 20.6.4.103 NMAC, moving these perennial waters to the previously reserved regulatory segment 20.6.4.112 NMAC.

EPA Determination: *The EPA has determined that there are no data available to support designating the primary contact use for regulatory segment 20.6.4.103 NMAC. However, there are data that indicate that the primary contact recreation use is supported in the perennial reaches of Percha creek, perennial reaches of Alamosa creek, Las Animas creek, and perennial reaches of Abo arroyo in a separate regulatory segment. See the discussion specific to 20.6.4.112 NMAC below. The EPA is approving the revisions to 20.6.4.103 NMAC related to the redefinition of specific waters by subdividing regulatory segment 20.6.4.103 NMAC to ensure the appropriate designated uses are applied is consistent with the CWA and federal regulations. The revisions to this provision are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.108 RIO GRANDE BASIN: Perennial reaches of the Jemez river upstream of Soda dam near the town of Jemez Springs and [~~all its~~]perennial reaches of tributaries to the Jemez river except those not specifically identified under other sections of 20.6.4 NMAC [~~above Soda dam near the town of Jemez Springs, except San Gregorio lake and Sulphur creek above its confluence with Redondo creek~~], and perennial reaches of the Guadalupe river and perennial reaches of [~~all its~~] tributaries to the Guadalupe river, and Calaveras canyon.

A. Designated uses: domestic water supply, fish culture, high quality coldwater aquatic life, irrigation, livestock watering, wildlife habitat and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: specific conductance 400 µS/cm or less (800 µS/cm or less on Sulphur creek); the monthly geometric mean of *E. coli* bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less; and pH within the range of 2.0 to 8.8 on Sulphur creek.
[20.6.4.108 NMAC - Rp 20 NMAC 6.1.2106, 10/12/2000; A, 5/23/2005; A, 12/1/2010; A, 7/10/2012; A, 4/23/2022]

The previous discussion for 20.6.4.103 NMAC referred to the rebuttable presumption that CWA § 101(a)(2) uses are attainable and must be assigned unless there is an affirmative demonstration that such uses are not attainable. It also referred to the NMED's efforts to meet specific requirements pursuant to 40 CFR § 131.20(a) and 40 CFR § 131.10(i).

The prior discussion for 20.6.4.103 NMAC also referred to both the NMED's recommendations and the revisions adopted by the Commission in its 2005 and 2017 rulemakings and their influence on the current 2020 triennial revisions related to nonperennial waters in classified regulatory segments in 20.6.4.101 through 899 NMAC. The NMED developed a UAA entitled

NMED Exhibit 6

Use Attainability Analysis for Select Nonperennial Reaches in Classified Waters 20.6.4.101-20.6.4.899 NMAC (2021) to evaluate classified waters defined in regulatory segments 20.6.4.108, 20.6.4.115, 20.6.4.206, 20.6.4.208, 20.6.4.209, 20.6.4.215, 20.6.4.220, 20.6.4.307 and 20.6.4.309 NMAC. The UAA evaluated attainment of the aquatic life, fish culture and water supply, domestic water supply, and irrigation uses in regulatory segments that were not amended in prior Commission revisions. The UAA did not consider the primary contact recreation use with the exception of the nonperennial tributaries to the Rio Hondo downstream of Bonney Canyon,

The NMED's UAA utilized the National Hydrology Dataset (NHD) to determine if there are nonperennial tributaries included in the regulatory segments referred to above. The NHD data confirmed the presence of intermittent waters within the regulatory segments identified. Based on the NHD data, the NMED determined that the nonperennial tributaries to the Jemez River above Soda dam and nonperennial tributaries to the Guadalupe River currently defined in 20.6.4.108 NMAC are not capable of supporting the designated high quality coldwater fishery and fish culture uses apply to the named waters. The data indicate that the highest attainable uses is the marginal warmwater aquatic life, retaining the primary contact recreation use.

***EPA Determination*:** *The revisions to this regulatory segment are consistent with the federal regulation at 40 CFR § 131.10(g)(2). The EPA has determined that the data in the NMED's UAA supports the conclusion that natural intermittent conditions prevent attainment of the designated aquatic life uses that currently apply to nonperennial tributaries to the Rio Vallecitos currently defined in 20.6.4.108 NMAC. Given the supporting data and the lack of evidence that the currently defined uses are attainable or existing uses in the nonperennial tributaries the Jemez River above Soda dam and nonperennial tributaries to the Guadalupe River, the revisions redefining intermittent waters currently in 20.6.4.108 NMAC to 20.6.4.98 NMAC are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.112 ~~[RESERVED]~~ **RIO GRANDE BASIN**: - The main stem of the Rio Grande from the headwaters of Caballo reservoir upstream to Elephant Butte dam, perennial reaches of Palomas Creek, perennial reaches of Rio Salado, perennial reaches of Percha Creek, perennial reaches of Alamosa Creek, Las Animas Creek, and perennial reaches of Abo Arroyo.

A. Designated uses: irrigation, livestock watering, wildlife habitat, marginal coldwater aquatic life, primary contact and warmwater aquatic life.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

C. Remarks: flow in this reach of the Rio Grande main stem is dependent upon release from Elephant Butte dam.

[20.6.4.112 NMAC - Rp 20 NMAC 6.1.2109, 10/12/2000; A, 5/23/2005; Repealed, 12/1/2010; A, 4/23/2022]

As indicated in the discussion for regulatory segment 20.6.4.103 NMAC, the NMED reviewed classified waters within 20.6.4.101 through 899 NMAC and found that some regulatory segments were not amended consistent with the Commission's prior revisions, leaving some with language that applied perennial designated uses to nonperennial waters.

To address this, as part of the recent 2020 triennial review, the NMED developed the previously referenced EUA which provides supporting data indicating that there are waters currently

defined within regulatory segment within 20.6.4.103 NMAC that are capable of supporting the primary contact recreation use. Based on this data, the NMED proposed, and the Commission adopted the division of segment 20.6.4.103 NMAC to remove the waterbodies where the primary contact recreation use is attainable, incorporating those waters into previously reserved section 20.6.4.112 NMAC.

The revisions proposed by the NMED and subsequently adopted by the Commission subdivide regulatory segment 20.6.4.103 NMAC, retaining waters defined within the AU for tributaries to the Rio Grande in Sierra & Socorro County where inadequate or no data were available to support a designated recreational use change. Those AUs within this regulatory segment 20.6.4.103 NMAC where data indicate that the primary contact recreation use is attainable include the perennial reaches of Percha creek, perennial reaches of Alamosa creek, Las Animas creek, and perennial reaches of Abo arroyo now defined in the previously reserved 20.6.4.112 NMAC.

***EPA Determination*:** *The EPA has determined that the data in the NMED's EUA supports the conclusion that primary contact recreation is attainable in the perennial reaches of Percha creek, perennial reaches of Alamosa creek, Las Animas creek, and perennial reaches of Abo arroyo. Thus, the revisions to 20.6.4.112 NMAC related to the redefinition of specific waters and the designation of the primary contact recreation use is consistent with the CWA and federal regulations. The revisions to this provision are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.115 RIO GRANDE BASIN: The perennial reaches of Rio Vallecitos and [~~its~~]perennial reaches of tributaries to Rio Vallecitos except Hopewell lake, and perennial reaches of Rio del Oso and perennial reaches of El Rito creek above the town of El Rito.

A. Designated uses: domestic water supply, irrigation, high quality coldwater aquatic life, livestock watering, wildlife habitat and primary contact; public water supply on the Rio Vallecitos and El Rito creek.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: specific conductance 300 µS/cm or less; the monthly geometric mean of *E. coli* bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.

[20.6.4.115 NMAC - Rp 20 NMAC 6.1.2112, 10/12/2000; A, 5/23/2005; A, 12/1/2010; A, 7/10/2012; A, 4/23/2022]
[**NOTE:** The standards for Hopewell lake are in 20.6.4.134 NMAC, effective 7/10/2012]

As initially discussed in detail regarding the revisions to 20.6.4.108 NMAC, the same CWA and federal regulatory requirements are applicable here. The history of the NMED's prior recommendations and the revisions adopted by the Commission in its 2005 and 2017 rulemakings are also pertinent to the current 2020 triennial revisions for the nonperennial waters currently defined in classified regulatory segment 20.6.4.115 NMAC.

As part its 2020 triennial review, the NMED identified nonperennial reaches of tributaries in classified perennial waters defined in regulatory segments that were not revised in prior Commission rulemakings. In the previously referenced UAA, the NMED evaluated attainment of the aquatic life, fish culture and water supply, domestic water supply, and irrigation uses in regulatory segments that were not amended in prior Commission revisions. The NMED utilized NHD data to determine the highest attainable use for nonperennial reaches of tributaries to

regulatory segments including 20.6.4.115 NMAC. The NHD evaluation confirmed the presence of intermittent waters where natural low-flow, intermittent or ephemeral conditions that prevent attainment of the high quality coldwater aquatic life use nonperennial tributaries to the Rio Vallecitos. The data indicates that the highest attainable use supported in these nonperennial waters include marginal warmwater aquatic life and primary contact recreation.

EPA Determination: *The EPA has determined that the data in the NMED's UAA supports the conclusion that natural intermittent conditions prevent attainment of the designated aquatic life uses that currently apply to nonperennial tributaries to the Rio Vallecitos currently defined in 20.6.4.115 NMAC. The revisions to this regulatory segment are consistent with the federal regulation at 40 CFR § 131.10(g)(2). Given the supporting data and the lack of evidence that the currently defined uses are attainable or existing uses in these nonperennial tributaries to the Rio Vallecitos, the revisions redefining intermittent waters currently in 20.6.4.115 NMAC to 20.6.4.98 NMAC are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.116 RIO GRANDE BASIN: The Rio Chama from its mouth on the Rio Grande upstream to Abiquiu reservoir, perennial reaches of the Rio Tusas, perennial reaches of the Rio Ojo Caliente, perennial reaches of Abiquiu creek and perennial reaches of El Rito creek downstream of the town of El Rito.

A. Designated uses: irrigation, livestock watering, wildlife habitat, coldwater aquatic life, warmwater aquatic life and [~~secondary~~]primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criterion applies: temperature 31°C (87.8°F) or less.

[20.6.4.116 NMAC - Rp 20 NMAC 6.1.2113, 10/12/2010; A, 5/23/2005; A, 12/1/2010; A, 3/2/2017; A, 4/23/2022]

As discussed regarding the revisions to 20.6.4.103 NMAC the NMED's recommendations and the Commission's subsequent revisions adopted in its 2005 and 2017 rulemakings have similar implications for the 2020 triennial revisions for the nonperennial waters currently defined in classified regulatory segment 20.6.4.116 NMAC.

As initially discussed in detail regarding the revisions to 20.6.4.103, in its 2020 triennial review process the NMED reviewed classified waters within 20.6.4.101-899 NMAC and identified regulatory segments that had not been amended consistent with the Commission's prior revisions, leaving some nonperennial waters in regulatory segments defined by perennial designated uses. As discussed previously, the NMED's EUA focuses on classified waters that were designated for secondary contact recreation to determine if there is evidence that primary contact recreation is attainable or the existing use in these waters. As described in the discussion of 20.6.4.103 NMAC, the NMED utilized archived and SQUID data specifically associated with the primary contact use to determine if there was adequate information to support the designation of primary contact recreation for waters defined in multiple regulatory segments including 20.6.4.116 NMAC.

EPA Determination: *Based on an analysis of the data in the supporting EUA, the EPA has determined that waters defined within 20.6.4.116 NMAC are capable of attaining the primary contact use. The EPA also considers the Commission's revisions to this provision to be*

consistent with the CWA and federal regulations and are approved pursuant to CWA § 303(c) and are effective for CWA purposes.

20.6.4.128 RIO GRANDE BASIN: Ephemeral and intermittent [~~watercourses~~] waters within lands managed by U.S. department of energy (DOE) within LANL[ ], including but not limited to: Mortandad canyon, Cañada del Buey, Ancho canyon, Chaquehui canyon, Indio canyon, Fence canyon, Potrillo canyon, and portions of Cañon de Valle, Los Alamos canyon, Sandia canyon, Pajarito canyon and Water canyon not [~~specifically~~] identified in 20.6.4.126 NMAC or 20.6.4.140 NMAC. (Surface waters within lands scheduled for transfer from DOE to tribal, state or local authorities are specifically excluded.)

A. Designated uses: livestock watering, wildlife habitat, limited aquatic life and secondary contact.

B. Criteria: the use-specific criteria in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: the acute total ammonia criteria set forth in Subsection [~~K~~] L of 20.6.4.900 NMAC ([~~salmonids~~] *Oncorhynchus spp.* absent).

[20.6.4.128 NMAC - N, 5/23/2005; A, 12/1/2010; A, 4/23/2022]

***EPA Determination*:** *The substantive revision to 20.6.4.128 NMAC is limited to the reference to a new regulatory segment, 20.6.4.140 NMAC. The refence to 20.6.4.140 NMAC does not have any impact the applicable designated uses or supporting criteria that apply to those waters that continue to be defined within 20.6.4.128 NMAC. The strikeout of the term "watercourses" and its replacement with the word "waters" and the strikeout of the term "salmonids" and its replacement with the more specific species reference of "Oncorhynchus ssp" are nonsubstantive. These revisions are approved pursuant to CWA § 303(c) and the revised language is effective for CWA purposes.*

20.6.4.140 RIO GRANDE BASIN: Effluent canyon from Mortandad canyon to its headwaters, intermittent portions of S-Site canyon from monitoring well MSC 16-06293 to Martin spring, and intermittent portions of Twomile canyon from its confluence with Pajarito canyon to Upper Twomile canyon. (Surface waters within lands scheduled for transfer from DOE to tribal, state or local authorities are specifically excluded.)

A. Designated uses: livestock watering, wildlife habitat, marginal warmwater aquatic life and secondary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

[20.6.4.140 NMAC - N, 4/23/2022]

***EPA Determination*:** *The Commission's record for its 2015 triennial revisions included a document entitled Joint Stipulation Regarding Proposed Changes to 20.6.4.128 NMAC (WQCC 14-05(R)). This Joint Stipulation is significant because it was part of the effort to determine the appropriate designated uses for classified ephemeral and intermittent waters within regulatory segment 20.6.4.128 NMAC. The Joint Stipulation obligated the NMED, the Dept. of Energy/Los Alamos National Laboratory (DOE/LANL) and Amigos Bravos to meet, discuss and come to agreement on the appropriate level of protection for waters defined in 20.6.4.128 NMAC which lie within DOE/LANL's property. It is the EPA's understanding that if agreement was reached, the Joint Stipulation specifically obligated the NMED to petition the Commission proposing appropriate designated uses for waters defined within 20.6.4.128 NMAC no later than the next, now current (2020) triennial review. This effort is consistent with the requirements in 40 CFR 131.20(a), which requires states to re-examine any waterbody segment with standards that do not include the uses specified in CWA § 101(a)(2) every 3 years to determine if any new information has become available. If new information is available that indicate the uses specified*

NMED Exhibit 6

in CWA § 101(a)(2) may be attainable, the State is required to revise its standards accordingly. The Joint Stipulation did not preclude Amigos Bravos and DOE/LANL from filing separate petitions to revise designated uses if there was no agreement.

Consistent with the Joint Stipulation, the NMED, in coordination with the DOE/LANL and to a lesser extent Amigos Bravos conducted a number of Hydrology Protocol[6] surveys on waters within regulatory segment 20.6.4.128 NMAC from November 2016 to October 2019 to document aquatic life and recreation uses supported based on the hydrology of these waters. The NMED/SWQB's Hydrology Protocol is the only hydrologic condition survey method for surface waters approved as a component of the New Mexico Water Quality Management Plan/Continuing Planning Process (WQMP/CPP). The New Mexico WQMP/CPP has been approved by both the Commission and the EPA. See the federal regulations at 40 CFR 130.5.

The Hydrology Protocol (HP) is used to determine the hydrologic regime of surface waters based on hydrological, geomorphic, and biological indicators related to the persistence of water. Extensive information gathered and evaluated as part of an HP survey. HP assessment information can then be used to provide technical support for a UAA but cannot be used in place of a UAA. Although the initial presumption was that the waters that were assessed within 20.6.5.128 NMAC would either be intermittent or ephemeral, after conducting HP surveys, on some but not all DOE/LANL waters, it was determined that several of these waters were actually perennial, not ephemeral or intermittent as previously believed.

In testimony during the Commission's 2021 hearing, the NMED described its efforts to determine the appropriate designated uses for classified ephemeral and intermittent waters within DOE/LANL consistent with the requirements in the Joint Stipulation. Based on subset of the HP surveys discussed above, the parties concurred that portions of three tributaries within DOE/LANL currently classified as nonperennial waters in 20.6.4.128 NMAC were in fact perennial. These waterbodies include Effluent Canyon from its confluence with Mortandad Canyon to its headwaters; the upper portion of S-site Canyon from alluvial monitoring well MSC 16-06293 to Martin Spring; and Twomile Canyon from Pajarito Canyon upstream to its confluence with upper Twomile Canyon.

The hydrologic data generated in the previously referenced HP surveys indicated that there was reasonable evidence to suggest that the existing uses in these waters may support a more sensitive uses than those currently designated uses under 20.6.4.128 NMAC. Given the unexpected finding that these waters may support aquatic life and potentially recreation uses that require more stringent criteria than the current designated use, the NMED stated in its testimony to the Commission that "although a UAA is not required under federal regulations, other factors must be considered for any designated use amendment." The NMED prepared what it referred to as an "Existing Use Analysis" (EUA) to document both state and federal regulatory requirements and supporting data. Based on the presumption that a UAA as defined in 40 CFR 131.3(g) is not required, the NMED relied on 40 CFR § 131.10(i) and state provisions at 20.6.4.10(B) NMAC that require states to amend uses to be at least as stringent as existing uses. The NMED developed a EUA entitled Existing Use Analysis for Effluent Canyon, Upper S-

[6] New Mexico Environment Department (2011). New Mexico WQMP/CPP Appendix C: Hydrology Protocol.

Site Canyon and Twomile Canyon from Water Canyon upstream to its confluence with Upper Twomile Canyon (2021)[7] to support its determinations.

At the time of this analysis, Effluent Canyon, S-Site Canyon and Twomile Canyon were designated for limited aquatic life and secondary contact recreational uses. This EUA evaluated available information for the waters described. The analysis of hydrologic conditions considered stream and alluvial well hydrographs, confirmed with climatological data to determine hydrologic condition under ambient, baseflow conditions and not the result of a direct and immediate result of precipitation. In addition to considering hydrologic condition, data utilized included conventional water quality parameters for maximum water temperature, pH range, dissolved oxygen and E. coli, primarily from the DOE/LANL Intellus[8] database. This EUA was intended to provide the supporting evidence to determine if a designated use change is warranted based on existing uses.

Based on the analysis of the available data, including the presence/absence of benthic macroinvertebrates extrapolated from the Level 1 and Level 2 HP surveys, the NMED determined that the more protective marginal warmwater aquatic life is the existing use in Effluent Canyon, the upper reaches of S-Site Canyon and Twomile Canyon from its confluence with Pajarito to Upper Twomile Canyon. In evaluating recreational uses for these waters, the SWQB determined that the available data was insufficient to demonstrate whether primary contact recreation is the existing use. With no available E. coli data, no further analysis of the existing recreational was carried out. Without data available, the NMED assumed that the existing recreational use to be at least secondary contact.

Based on the data in the NMED's EUA, the EPA considers the determination that the marginal warmwater aquatic life is the existing use in Effluent Canyon, the upper reaches of S-Site Canyon and Twomile Canyon from its confluence with Pajarito to Upper Twomile Canyon to be supported. However, the EUA indicates that the available data was insufficient to demonstrate that primary contact recreation is the existing use. As a result, the NMED did not make a determination but made an assumption based on data that the existing recreational use is assumed to be "at least" secondary contact, stating in its testimony before the Commission that the secondary contact recreational use is the current designated recreational use and requires no amendment at this time. The EPA has determined that since the secondary contact use is at least as protective as designated under 20.6.4.128 NMAC, a UAA to support this presumption is not required. These revisions are approved pursuant to CWA § 303(c) and the revised language is effective for CWA purposes.

20.6.4. Pecos River Basin

20.6.4.204 PECOS RIVER BASIN: The main stem of the Pecos river from the headwaters of Avalon reservoir upstream to Brantley dam.

A. Designated uses: irrigation, livestock watering, wildlife habitat, [~~secondary~~] primary contact and warmwater aquatic life.

[7] New Mexico Environment Department. 2021. Existing Use Analysis for Effluent Canyon, Upper S-Site Canyon and Twomile Canyon from Water Canyon upstream to its confluence with Upper Twomile Canyon.

NMED Exhibit 6

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.
[20.6.4.204 NMAC - Rp 20 NMAC 6.1.2204, 10/12/2000; A, 5/23/2005; A, 12/1/2010; A, 4/23/2022]
[**NOTE:** The segment covered by this section was divided effective 5/23/2005. The standards for Avalon Reservoir are under 20.6.4.219 NMAC.]

As discussed regarding the revisions to 20.6.4.103 NMAC the NMED's recommendations and the Commission's subsequent revisions adopted in its 2005 and 2017 rulemakings have similar implications for the 2020 triennial revisions for the nonperennial waters currently defined in classified regulatory segment 20.6.4.204 NMAC.

As initially discussed in detail regarding the revisions to 20.6.4.103, in its 2020 triennial review process the NMED reviewed classified waters within 20.6.4.101-899 NMAC and identified regulatory segments that had not been amended consistent with the Commission's prior revisions, leaving some nonperennial waters in regulatory segments defined by perennial designated uses. As discussed previously, the NMED's EUA focuses on classified waters that were designated for secondary contact recreation to determine if there is evidence that primary contact recreation is attainable or the existing use in these waters. As described in the discussion of 20.6.4.103 NMAC, the NMED utilized archived and SQUID data specifically associated with the primary contact use to determine if there was adequate information to support the designation of primary contact recreation for waters defined in multiple regulatory segments including 20.6.4.204 NMAC.

EPA Determination: *Based on an analysis of the data in the supporting EUA, the EPA has determined that the waters defined in 20.6.4.204 NMAC are capable of attaining the primary contact use. The Commission's revisions designating the of primary contact recreation in 20.6.4.204 NMAC is consistent with the CWA and federal regulations. The revisions to this provision are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.206 PECOS RIVER BASIN: [~~The main stem of the Pecos river from the headwaters of Brantley reservoir upstream to Salt creek (near Acme), perennial reaches of the Rio Peñasco downstream from state highway 24 near Dunken, perennial reaches of the Rio Hondo and its~~] Perennial reaches of the Rio Felix and perennial reaches of tributaries to the Rio Hondo downstream of Bonney canyon, excluding North Spring river [~~and perennial reaches of the Rio Felix~~].

A. Designated uses: irrigation, livestock watering, wildlife habitat, secondary contact and warmwater aquatic life.

B. Criteria:

(1) The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

(2) At all flows above 50 cfs: TDS 14,000 mg/L or less, sulfate 3,000 mg/L or less and chloride 6,000 mg/L or less.

[20.6.4.206 NMAC - Rp 20 NMAC 6.1.2206, 10/12/2010; A, 5/23/2005; A, 12/1/2010; A, 3/2/2017; A, 4/23/2022]
[**NOTE:** This segment was divided effective 4/23/2022. The standards for the main stem of the Pecos river from the headwaters of Brantley reservoir upstream to Salt creek (near Acme), perennial reaches of the Rio Peñasco downstream from state highway 24 near Dunken, and perennial reaches of the Rio Hondo are under 20.6.4.231 NMAC.]

As initially discussed in detail regarding the revisions to both 20.6.4.103 and 20.6.4.108 NMAC, the same CWA and federal regulatory requirements are applicable here. The history of the

NMED's prior recommendations and the revisions adopted by the Commission in its 2005 and 2017 rulemakings are also pertinent to the current 2020 triennial revisions related to both the hydrology and designated uses for waters currently defined in classified regulatory segment 20.6.4.206 NMAC.

As part its 2020 triennial review, the NMED identified regulatory segments that had not been amended consistent with the Commission's prior revisions, leaving some nonperennial waters in regulatory segments defined by perennial designated uses. In its UAA, the NMED considered both aquatic life and recreational uses as well as other uses specific to New Mexico. The NMED utilized NHD data to determine the highest attainable use for both perennial and nonperennial reaches of waters currently defined in regulatory segment 20.6.4.206 NMAC. The NHD evaluation confirmed that natural low-flow, intermittent or ephemeral conditions prevent attainment of the warmwater aquatic life use in nonperennial tributaries to the Rio Hondo downstream of Bonney Canyon as currently defined in 20.6.4.206 NMAC. The highest attainable use supported in these nonperennial waters include marginal warmwater aquatic life and primary contact recreation.

The NMED also relied on its EUA to determine if primary contact recreation is either an attainable or existing use in classified waters that are currently designated for secondary contact recreation. As discussed previously, this EUA utilized archived and SQUID data specifically associated with the primary contact use to determine if there was adequate information to support the designation of primary contact recreation for waters defined in multiple regulatory segments including 20.6.4.206 NMAC. There were insufficient or no data available to base a contact recreation use determination for the AU for the Rio Felix (Perennial reaches Pecos River to headwaters) or the perennial reaches of tributaries to the Rio Hondo downstream of Bonney canyon. However, there were data for the remainder of the AUs within 20.6.4.206 including the main stem of the Pecos river from the headwaters of Brantley reservoir upstream to Salt creek (near Acme), perennial reaches of the Rio Peñasco downstream from state highway 24 near Dunken, and perennial reaches of the Rio Hondo. Based on this data, the NMED recommended, and the Commission subdivided 20.6.4.206 NMAC, establishing a new segment 20.6.4.231 NMAC.

EPA Determination: *The EPA has determined that the data in the NMED's UAA supports the conclusion that the primary contact recreation use is attainable in mainstem of the Pecos river from the headwaters of Brantley reservoir upstream to Salt creek (near Acme), perennial reaches of the Rio Peñasco downstream from state highway 24 near Dunken, and perennial reaches of the Rio Hondo and with the redefinition of those waters into a new regulatory segment 20.6.4.231 NMAC. Further, the EPA has determined that the data in the UAA supports the conclusion that natural intermittent conditions prevent attainment of the designated aquatic life uses that currently apply to nonperennial tributaries currently defined in 20.6.4.206 NMAC, consistent with the federal regulation at 40 CFR § 131.10(g)(2). Given the supporting data and the lack of evidence that the currently defined uses are attainable or existing uses in these nonperennial tributaries, the revisions redefining intermittent waters currently in 20.6.4.206 NMAC to 20.6.4.98 NMAC are appropriate. These revisions are consistent with the CWA and federal regulations and are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.207 PECOS RIVER BASIN: The main stem of the Pecos river from Salt creek (near Acme) upstream to Sumner dam.

A. Designated uses: irrigation, marginal warmwater aquatic life, livestock watering, wildlife habitat and [~~secondary~~]primary contact.

B. Criteria:

(1) The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

(2) At all flows above 50 cfs: TDS 8,000 mg/L or less, sulfate 2,500 mg/L or less and chloride 4,000 mg/L or less.

[20.6.4.207 NMAC - Rp 20 NMAC 6.1.2207, 10/12/2000; A, 5/23/2005; A, 12/1/2010; A, 4/23/2022]

As discussed regarding the revisions to 20.6.4.103 NMAC the NMED's recommendations and the Commission's subsequent revisions adopted in its 2005 and 2017 rulemakings have similar implications for the 2020 triennial revisions for the nonperennial waters currently defined in classified regulatory segment 20.6.4.207 NMAC.

As initially discussed in detail regarding the revisions to 20.6.4.103, in its 2020 triennial review process the NMED reviewed classified waters within 20.6.4.101-899 NMAC and identified regulatory segments that had not been amended consistent with the Commission's prior revisions, leaving some nonperennial waters in regulatory segments defined by perennial designated uses. As discussed previously, the NMED's EUA focuses on classified waters that were designated for secondary contact recreation to determine if there is evidence that primary contact recreation is attainable or the existing use in these waters. As described in the discussion of 20.6.4.103 NMAC, the NMED utilized archived and SQUID data specifically associated with the primary contact use to determine if there was adequate information to support the designation of primary contact recreation for waters defined in multiple regulatory segments including 20.6.4.207 NMAC. There were sufficient data available to support a contact recreation use determination for all AUs for the Pecos River within 20.6.4.207 NMAC.

EPA Determination: *Based on an analysis of the data in the supporting EUA, the EPA has determined that the waters defined in 20.6.4.207 NMAC are capable of attaining the primary contact use. The Commission's revisions designating the of primary contact recreation in 20.6.4.207 NMAC is consistent with the CWA and federal regulations. The revisions to this provision are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.208 PECOS RIVER BASIN: Perennial reaches of the Rio Peñasco above state highway 24 near Dunken, [~~and its~~] perennial reaches of tributaries to the Rio Peñasco above state highway 24 near Dunken, perennial reaches of Cox canyon, perennial reaches of the Rio Bonito downstream from state highway 48 (near Angus), the Rio Ruidoso downstream of the U.S. highway 70 bridge near Seeping Springs lakes, perennial reaches of the Rio Hondo upstream from Bonney canyon and perennial reaches of Agua Chiquita.

A. Designated uses: fish culture, irrigation, livestock watering, wildlife habitat, coldwater aquatic life and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: temperature 30°C (86°F) or less, and phosphorus (unfiltered sample) less than 0.1 mg/L.

[20.6.4.208 NMAC - Rp 20 NMAC 6.1.2208, 10/12/2000; A, 5/23/2005; A, 12/1/2010; A, 4/23/2022]

As initially discussed in detail regarding the revisions to 20.6.4.108 NMAC, the same CWA and federal regulatory requirements are applicable here. The history of the NMED's prior recommendations and the revisions adopted by the Commission in its 2005 and 2017 rulemakings are also pertinent to the current 2020 triennial revisions for the nonperennial waters currently defined in classified regulatory segment 20.6.4.208 NMAC.

As part its 2020 triennial review, the NMED identified nonperennial reaches of tributaries in classified perennial waters defined in regulatory segments that were not revised in prior Commission rulemakings. In the previously referenced UAA, the NMED evaluated attainment of the aquatic life, fish culture and water supply, domestic water supply, and irrigation uses in regulatory segments that were not amended in prior Commission revisions. The NMED utilized NHD data to determine the highest attainable use for nonperennial reaches of tributaries to regulatory segments including 20.6.4.208 NMAC. The NHD evaluation confirmed the presence of intermittent waters where natural low-flow, intermittent or ephemeral conditions that prevent attainment of the coldwater aquatic life and fish culture uses in nonperennial tributaries to the Rio Peñasco above state highway 24 near Dunken, NM, as currently defined in 20.6.4.209 NMAC. The data indicates that the nonperennial tributaries in 20.6.4.208 NMAC are not capable of supporting the coldwater aquatic life and fish culture uses. The highest attainable use supported in these nonperennial waters include marginal warmwater aquatic life and primary contact recreation.

***EPA Determination*:** *The EPA has determined that the data in the NMED UAA supports the conclusion that natural intermittent conditions prevent attainment of the designated coldwater aquatic life uses that currently apply to tributaries currently defined in 20.6.4.208 NMAC. The revisions to this regulatory segment are consistent with the federal regulation at 40 CFR § 131.10(g)(2). Given the supporting data and the lack of evidence that the currently defined coldwater aquatic life uses are attainable or existing uses in these tributaries, the revisions redefining intermittent waters currently in 20.6.4.208 NMAC to 20.6.4.98 NMAC are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.209 PECOS RIVER BASIN: Perennial reaches of Eagle creek upstream of Alto dam to the Mescalero Apache boundary, perennial reaches of the Rio Bonito upstream of state highway 48 (near Angus) excluding Bonito lake, [~~and its~~] perennial reaches of tributaries to the Rio Bonito upstream of state highway 48 (near Angus)[-], [~~and~~] perennial reaches of the Rio Ruidoso upstream of the U.S. highway 70 bridge near Seeping Springs lakes [~~,~~] above and below the Mescalero Apache boundary and [~~its~~] perennial reaches of tributaries to the Rio Ruidoso upstream of the U.S. highway 70 bridge near Seeping Springs lakes [~~,~~] above and below the Mescalero Apache boundary.

A. Designated uses: domestic water supply, high quality coldwater aquatic life, irrigation, livestock watering, wildlife habitat, public water supply and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: specific conductance 600 µS/cm or less in Eagle creek, 1,100 µS/cm or less in Bonito creek and 1,500 µS/cm or less in the Rio Ruidoso; phosphorus (unfiltered sample) less than 0.1 mg/L; the monthly geometric mean of *E. coli* bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.

[20.6.4.209 NMAC - Rp 20 NMAC 6.1.2209, 10/12/2000; A, 5/23/2005; A, 12/1/2010; A, 7/10/2012; A, 4/23/2022]

[**NOTE:** The standards for Bonito lake are in 20.6.4.223 NMAC, effective 7/10/2012]

As initially discussed in detail regarding the revisions to 20.6.4.108 NMAC, the same CWA and federal regulatory requirements are applicable here. The history of the NMED's prior recommendations and the revisions adopted by the Commission in its 2005 and 2017 rulemakings are also pertinent to the current 2020 triennial revisions for the nonperennial waters currently defined in classified regulatory segment 20.6.4.209 NMAC.

As part its 2020 triennial review, the NMED identified nonperennial reaches of tributaries in classified perennial waters defined in regulatory segments that were not revised in prior Commission rulemakings. In the previously referenced UAA, the NMED evaluated attainment of the aquatic life, fish culture and water supply, domestic water supply, and irrigation uses in regulatory segments that were not amended in prior Commission revisions. The NMED utilized NHD data to determine the highest attainable use for nonperennial reaches of tributaries to regulatory segments including 20.6.4.209 NMAC. The NHD evaluation confirmed the presence of intermittent waters where natural low-flow, intermittent or ephemeral conditions that prevent attainment of the high quality coldwater aquatic life and fish culture uses in nonperennial tributaries to the Rio Bonito and the Rio Ruidoso as currently defined in 20.6.4.209 NMAC. The NHD evaluation confirmed the presence of intermittent waters where natural low-flow, intermittent or ephemeral conditions that prevent attainment of the designated uses in classified waters currently defined in 20.6.4.209 NMAC. The nonperennial tributaries in 20.6.4.209 NMAC are not capable of supporting the coldwater aquatic life and fish culture uses. The highest attainable use supported in these nonperennial waters include marginal warmwater aquatic life and primary contact recreation.

EPA Determination: *The EPA has determined that the data in the NMED UAA supports the conclusion that natural intermittent conditions prevent attainment of the designated coldwater aquatic life uses that currently apply to the nonperennial tributaries to the Rio Bonito upstream of state highway 48 (near Angus, NM) and nonperennial tributaries to the Rio Ruidoso upstream of the U.S. highway 70 bridge near Seeping Springs lakes, above and below the Mescalero Apache boundary as currently defined in 20.6.4.209 NMAC. The revisions to this regulatory segment are consistent with the federal regulation at 40 CFR § 131.10(g)(2). Given the supporting data and the lack of evidence that establishes the currently defined coldwater use as an attainable or existing use in these nonperennial tributaries, the revisions redefining intermittent waters currently in 20.6.4.209 NMAC to 20.6.4.98 NMAC, which have the effect of changing the designation for the nonperennial tributaries for these waters from coldwater to marginal warmwater while maintaining the primary contact recreation use, are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.215 PECOS RIVER BASIN: Perennial reaches of the Gallinas river upstream of the diversion for the Las Vegas municipal reservoir, [~~and all its~~] perennial reaches of tributaries to the Gallinas river upstream of the diversion for the Las Vegas municipal reservoir, perennial reaches of Tecolote creek upstream of Blue creek[~~,~~] and all perennial reaches of tributaries [~~of~~]to Tecolote creek upstream of Blue creek.

A. Designated uses: domestic water supply, high quality coldwater aquatic life, irrigation, livestock watering, wildlife habitat, industrial water supply and primary contact; and public water supply on the Gallinas river.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are

NMED Exhibit 6

applicable to the designated uses, except that the following segment-specific criteria apply: specific conductance 300 µS/cm or less (450 µS/cm or less in Wright Canyon creek); the monthly geometric mean of E. coli bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.
[20.6.4.215 NMAC - Rp 20 NMAC 6.1.2212, 10/12/2000; A, 5/23/2005; A, 12/1/2010; A, 2/13/2018; A, 4/23/2022]
[**NOTE:** This segment was divided effective 2/13/2018. The standards for Tecolote creek from I-25 to Blue creek are under 20.6.4.230 NMAC.]

As initially discussed in detail regarding the revisions to 20.6.4.108 NMAC, the same CWA and federal regulatory requirements are applicable here. The history of the NMED's prior recommendations and the revisions adopted by the Commission in its 2005 and 2017 rulemakings are also pertinent to the current 2020 triennial revisions for the nonperennial waters currently defined in classified regulatory segment 20.6.4.215 NMAC.

As part its 2020 triennial review, the NMED identified nonperennial reaches of tributaries in classified perennial waters defined in regulatory segments that were not revised in prior Commission rulemakings. In the previously referenced UAA, the NMED evaluated attainment of the aquatic life, fish culture and water supply, domestic water supply, and irrigation uses in regulatory segments that were not amended in prior Commission revisions. The NMED utilized NHD data to determine the highest attainable use for nonperennial reaches of tributaries to regulatory segments including 20.6.4.215 NMAC. The NHD evaluation confirmed the presence of intermittent waters where natural low-flow, intermittent or ephemeral conditions that prevent attainment of the high quality coldwater aquatic life and fish culture uses in nonperennial tributaries to the Gallinas River as currently defined in 20.6.4.215 NMAC. The NHD evaluation confirmed the presence of intermittent waters where natural low-flow, intermittent or ephemeral conditions that prevent attainment of the coldwater designated use in classified waters currently defined in 20.6.4.215 NMAC. The nonperennial tributaries in 20.6.4.215 NMAC are not capable of supporting the coldwater aquatic life and fish culture uses. The highest attainable use supported in these nonperennial waters include marginal warmwater aquatic life and primary contact recreation.

EPA Determination: *The EPA has determined that the data in the NMED's UAA supports the conclusion that natural intermittent conditions prevent attainment of the coldwater designated aquatic life use that currently applies to the nonperennial tributaries to the Gallinas River upstream of the diversion for the Las Vegas municipal reservoir as currently defined in 20.6.4.215 NMAC. The revisions to this regulatory segment are consistent with the federal regulation at 40 CFR § 131.10(g)(2). Given the supporting data and the lack of evidence that establishes the currently defined uses as attainable or existing uses in these nonperennial tributaries, the revisions redefining intermittent waters currently in 20.6.4.215 NMAC to 20.6.4.98 NMAC, which have the effect of downgrading the aquatic life use from coldwater to marginal warmwater while maintaining primary contact recreation, are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.220 PECOS RIVER BASIN: Perennial reaches of the Gallinas river and [~~its~~] perennial reaches of tributaries to the Gallinas river from its mouth upstream to the diversion for the Las Vegas municipal reservoir, except Pecos Arroyo.

A. Designated uses: irrigation, livestock watering, wildlife habitat, marginal coldwater aquatic life use and primary contact.

B. Criteria: the use-specific criteria set forth in 20.6.4.900 NMAC are applicable to the designated use, exept that the following segment specific criterion applies; temperature 30°C (86°F) or less.
[20.6.4.220 NMAC - N, 5/23/2005; A, 12/1/2010; A, 4/23/2022]

As initially discussed in detail regarding the revisions to 20.6.4.108 NMAC, the same CWA and federal regulatory requirements are applicable here. The history of the NMED's prior recommendations and the revisions adopted by the Commission in its 2005 and 2017 rulemakings are also pertinent to the current 2020 triennial revisions for the nonperennial waters currently defined in classified regulatory segment 20.6.4.220 NMAC.

As part its 2020 triennial review, the NMED identified nonperennial reaches of tributaries in classified perennial waters defined in regulatory segments that were not revised in prior Commission rulemakings. In the previously referenced UAA, the NMED evaluated attainment of the aquatic life, fish culture and water supply, domestic water supply, and irrigation uses in regulatory segments that were not amended in prior Commission revisions. The NMED utilized NHD data to determine the highest attainable use for nonperennial reaches of tributaries to regulatory segments including 20.6.4.220 NMAC. The NHD evaluation confirmed the presence of intermittent waters where natural low-flow, intermittent or ephemeral conditions that prevent attainment of the marginal coldwater aquatic life use in nonperennial tributaries to the Gallinas River as currently defined in 20.6.4.220 NMAC. The NHD evaluation confirmed the presence of intermittent waters where natural low-flow, intermittent or ephemeral conditions that prevent attainment of the designated uses in classified waters currently defined in 20.6.4.220 NMAC. The nonperennial tributaries in 20.6.4.220 NMAC are not capable of supporting the marginal coldwater aquatic life use. The highest attainable uses in these waters include marginal warmwater aquatic life and primary contact recreation.

EPA Determination: *The EPA has determined that the data in the NMED UAA supports the conclusion that natural intermittent conditions prevent attainment of the designated marginal coldwater aquatic life uses that currently apply to the nonperennial tributaries to the Gallinas River from its mouth upstream to the diversion for the Las Vegas municipal reservoir as currently defined in 20.6.4.220 NMAC. The revisions to this regulatory segment are consistent with the federal regulation at 40 CFR § 131.10(g)(2). Given the supporting data and the lack of evidence that establishes the currently defined uses as attainable or existing uses in these nonperennial tributaries, the revisions redefining intermittent waters currently in 20.6.4.220 NMAC to 20.6.4.98 NMAC, which have the effect of downgrading the aquatic life use from coldwater to marginal warmwater while maintaining primary contact recreation, are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.231 PECOS RIVER BASIN: The main stem of the Pecos river from the headwaters of Brantley reservoir upstream to Salt creek (near Acme), perennial reaches of the Rio Peñasco downstream from state highway 24 near Dunken, perennial reaches of North Spring river and perennial reaches of the Rio Hondo downstream of Bonney canyon.

A. Designated uses: irrigation, livestock watering, wildlife habitat, primary contact and warmwater aquatic life.

B. Criteria:

(1) The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

(2) At all flows above 50 cfs: TDS 14,000 mg/L or less, sulfate 3,000 mg/L or

less and chloride 6,000 mg/L or less.
[20.6.4.231 NMAC - N, 4/23/2022]

As indicated in the discussion for regulatory segment 20.6.4.103 NMAC, the NMED's reviewed classified waters within 20.6.4.101 through 899 NMAC and found that some regulatory segments were not amended consistent with the Commission's prior revisions, leaving some with language that applied perennial designated uses to nonperennial waters.

To address this, as part of the recent 2020 triennial review, the NMED developed the previously referenced EUA that focuses on classified waters that are designated for secondary contact recreation to determine if there is evidence that primary contact recreation is attainable or the existing use in these waters. The data indicated that there are waters currently defined within regulatory segment within 20.6.4.206 NMAC that are capable of supporting the primary contact recreation use. The NMED recommended that a new regulatory segment be drawn from these waters contained in the AUs for the Pecos River (Rio Felix to Rio Hondo), Pecos River (Brantley Reservoir to Rio Penasco), Pecos River (Rio Penasco to Eagle Creek), Pecos River (Eagle Creek to Rio Felix), Rio Penasco (Perennial part Pecos River to HWY 24), Pecos River (Rio Hondo to Salt Creek), North Spring River (Rio Hondo to headwaters), Rio Hondo (Perennial prt North Spring River to Bonney Cyn), the Rio Hondo (Perennial part Pecos River to North Spring River) and the perennial reaches of tributaries to the Rio Hondo downstream of Bonney canyon,

EPA Determination: *The EPA has determined that the data in the NMED's EUA supports the conclusion that in the absence of specific data that primary contact recreation use is an attainable or existing use in Rio Felix (Perennial reaches Pecos River to headwaters) and perennial reaches of tributaries to the Rio Hondo downstream of Bonney canyon that these waters should retain the secondary contact recreation use and remain in 20.6.4.206 NMAC. The EPA has also determined that the supporting data indicate that primary contact recreation is an attainable or existing use in the Pecos river from the headwaters of Brantley reservoir upstream to Salt creek (near Acme. NM), the perennial reaches of the Rio Peñasco downstream from state highway 24 near Dunken, NM, the perennial reaches of North Spring River and perennial reaches of the Rio Hondo downstream of Bonney canyon.*

Establishing the new regulatory segment 20.6.4.231 NMAC and the designation of the primary contact recreation use for those waters defined in this regulatory segment is consistent with the CWA and federal regulations. The revisions to this provision are approved pursuant to CWA § 303(c) and are effective for CWA purposes.

20.6.4. Canadian River Basin

20.6.4.307 CANADIAN RIVER BASIN: Perennial reaches of the Mora river from the USGS gaging station near Shoemaker upstream to the state highway 434 bridge in Mora, all perennial reaches of tributaries to the Mora river downstream from the USGS gaging station at La Cueva in San Miguel and Mora counties except lakes identified in 20.6.4.313 NMAC, perennial reaches of Ocate creek downstream of Ocate, [~~and its~~] perennial reaches of tributaries to Ocate creek downstream of Ocate, and perennial reaches of Rayado creek downstream of Miami lake diversion in Colfax county.

A. Designated uses: marginal coldwater aquatic life, warmwater aquatic life, primary contact, irrigation, livestock watering and wildlife habitat.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC

are applicable to the designated uses.
[20.6.4.307 NMAC - Rp 20 NMAC 6.1.2305.3, 10/12/2000; A, 5/23/2005; A, 2/1/2010; 7/10/2012; A, 4/23/2022]

As initially discussed in detail regarding the revisions to 20.6.4.108 NMAC, the same CWA and federal regulatory requirements are applicable here. The history of the NMED's prior recommendations and the revisions adopted by the Commission in its 2005 and 2017 rulemakings are also pertinent to the current 2020 triennial revisions for the nonperennial waters currently defined in classified regulatory segment 20.6.4.220 NMAC.

As part its 2020 triennial review, the NMED identified nonperennial reaches of tributaries in classified perennial waters defined in regulatory segments that were not revised in prior Commission rulemakings. In the previously referenced UAA, the NMED evaluated attainment of the aquatic life, fish culture and water supply, domestic water supply, and irrigation uses in regulatory segments that were not amended in prior Commission revisions. The NMED utilized NHD data to determine the highest attainable use for nonperennial reaches of tributaries to regulatory segments including 20.6.4.307 NMAC. The NHD evaluation confirmed the presence of intermittent waters where natural low-flow, intermittent or ephemeral conditions that prevent attainment of the marginal coldwater aquatic life use in the nonperennial tributaries to Ocate Creek downstream of Ocate as currently defined in 20.6.4.307 NMAC. The highest attainable use supported in these nonperennial waters include marginal warmwater aquatic life and primary contact recreation.

EPA Determination: *The EPA has determined that the data in the NMED's UAA supports the conclusion that natural intermittent conditions prevent attainment of the designated marginal coldwater aquatic life uses that currently apply to the nonperennial reaches of Ocate creek downstream of Ocate as currently defined in 20.6.4.307 NMAC. The revisions to this regulatory segment are consistent with the federal regulation at 40 CFR § 131.10(g)(2). Given the supporting data and the lack of evidence establishing the currently defined uses as attainable or existing uses in these nonperennial tributaries, the revisions redefining intermittent waters currently in 20.6.4.307 NMAC to 20.6.4.98 NMAC are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.309 CANADIAN RIVER BASIN: The Mora river and perennial reaches of its tributaries upstream from the state highway 434 bridge in Mora except lakes identified in 20.6.4.313 NMAC, all perennial reaches of tributaries to the Mora river upstream from the USGS gaging station at La Cueva, perennial reaches of Coyote creek, [~~and its~~] perennial reaches of tributaries to Coyote creek, the Cimarron river above state highway 21 in Cimarron, [~~and its~~] perennial reaches of tributaries to the Cimarron river above state highway 21 in Cimarron except Eagle Nest lake, all perennial reaches of tributaries to the Cimarron river north and northwest of highway 64 except north and south Shuree ponds, perennial reaches of Rayado creek above Miami lake diversion, [~~and its~~] perennial reaches of tributaries to Rayado creek above Miami lake diversion, Ocate creek and perennial reaches of its tributaries upstream of Ocate, perennial reaches of the Vermejo river upstream from Rail canyon and all other perennial reaches of tributaries to the Canadian river northwest and north of U.S. highway 64 in Colfax county unless included in other segments.

A. Designated uses: domestic water supply, irrigation, high quality coldwater aquatic life, livestock watering, wildlife habitat, and primary contact; and public water supply on the Cimarron river upstream from Cimarron, [~~and~~] on perennial reaches of Rayado creek and on perennial reaches of [~~its~~] tributaries to Rayado creek.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are

NMED Exhibit 6

applicable to the designated uses, except that the following segment-specific criteria apply, specific conductance 500 µS/cm or less; the monthly geometric mean of *E. coli* bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.
[20.6.4.309 NMAC - Rp 20 NMAC 6.1.2306, 10/12/2000; A, 7/19/2001; A, 5/23/2005; A, 12/1/2010; A, 7/10/2012; A, 4/23/2022]
[**NOTE:** The segment covered by this section was divided effective 5/23/2005. The standards for the additional segment are under 20.6.4.310 NMAC. The standards for Shuree ponds are in 20.6.4.314 NMAC and the standards for Eagle Nest lake are in 20.6.4.315 NMAC, effective 7/10/2012]

As initially discussed in detail regarding the revisions to 20.6.4.108 NMAC, the same CWA and federal regulation requirements are applicable here. The history of the NMED's prior recommendations and the revisions adopted by the Commission in its 2005 and 2017 rulemakings are also pertinent to the current 2020 triennial revisions for the nonperennial waters currently defined in classified regulatory segment 20.6.4.309 NMAC.

As part its 2020 triennial review, the NMED identified nonperennial reaches of tributaries in classified perennial waters defined in regulatory segments that were not revised in prior Commission rulemakings. In the previously referenced UAA, the NMED evaluated attainment of the aquatic life, fish culture and water supply, domestic water supply, and irrigation uses in regulatory segments that were not amended in prior Commission revisions. The NMED utilized NHD data to determine the highest attainable use for nonperennial reaches of tributaries to regulatory segments including 20.6.4.309 NMAC. The NHD evaluation confirmed the presence of intermittent waters where natural low-flow, intermittent or ephemeral conditions that prevent attainment of the marginal coldwater aquatic life use in the nonperennial tributaries to Coyote Creek and Rayado Creek above Miami lake diversion as currently defined in 20.6.4.309 NMAC. The highest attainable use supported in these nonperennial waters include marginal warmwater aquatic life and primary contact recreation.

EPA Determination: *The EPA has determined that the data in the NMED's UAA supports the conclusion that natural intermittent conditions prevent attainment of the designated marginal coldwater aquatic life uses that currently apply to the nonperennial reaches of Ocate creek downstream of Ocate as currently defined in 20.6.4.309 NMAC. The revisions to this regulatory segment are consistent with the federal regulation at 40 CFR § 131.10(g)(2). Given the supporting data and the lack of evidence establishing the currently defined uses as attainable or existing uses in these nonperennial tributaries, the revisions redefining intermittent waters currently in 20.6.4.309 NMAC to 20.6.4.98 NMAC are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.311 **CANADIAN RIVER BASIN:** Lake Alice.
A. Designated uses: marginal coldwater aquatic life, irrigation, livestock watering, wildlife habitat, primary contact and public water supply.
B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.
[20.6.4.311 NMAC - N, 12/1/2010; A, 4/23/2022]

20.6.4.312 **CANADIAN RIVER BASIN: Lake Maloya.**
A. Designated uses: coldwater aquatic life, irrigation, livestock watering, wildlife habitat, primary contact and public water supply.
B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are

applicable to the designated uses.

[20.6.4.312 NMAC - N, 12/1/2010; A, 4/23/2022]

EPA Determination: *The revisions adding revision dates to both 20.6.4.311 and 312 NMAC are nonsubstantive and are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.318 CANADIAN RIVER BASIN: Doggett creek.

A. Designated uses: Warm water aquatic life, livestock watering, wildlife habitat and primary contact.

B. Criteria: The use-specific criteria in 20.6.4.900 NMAC are applicable to the designated uses, except that the following site specific criteria apply: the monthly geometric mean of E. coli bacteria 206 cfu/100 mL or less, single sample 940 cfu/100 mL or less.

C. Discharger-specific temporary standard:

(1) Discharger: City of Raton wastewater treatment plant

(2) NPDES permit number: NM0020273, Outfall 001

(3) Receiving waterbody: Doggett creek, 20.6.4.318 NMAC

(4) Discharge latitude/longitude: 36° 52' 13.91" N / 104° 25' 39.18" W

(5) Pollutant(s): nutrients; total nitrogen and total phosphorus

(6) Factor of issuance: substantial and widespread economic and social impacts (40 CFR 131.10(g)(6))

(7) Highest attainable condition: interim effluent condition of 8.0 mg/L total nitrogen and 1.6 mg/L total phosphorus as 30-day averages. The highest attainable condition shall be either the highest attainable condition identified at the time of the adoption, or any higher attainable condition later identified during any reevaluation, whichever is more stringent (40 CFR 131.14(b)(1)(iii)).

(8) Effective date of temporary standard: This temporary standard becomes effective for Clean Water Act purposes on the date of EPA approval.

(9) Expiration date of temporary standard: no later than 20 years from the effective date.

(10) Reevaluation period: at each succeeding review of water quality standards and at least once every five years from the effective date of the temporary standard (Paragraph (8) of Subsection H of 20.6.4.10[~~.F (8)~~] NMAC, 40 CFR 131.14(b)(1)(v)). If the discharger cannot demonstrate that sufficient progress has been made the commission may revoke approval of the temporary standard or provide additional conditions to the approval of the temporary standard. If the reevaluation is not completed at the frequency specified or the Department does not submit the reevaluation to EPA within 30 days of completion, the underlying designated use and criterion will be the applicable water quality standard for Clean Water Act purposes until the Department completes and submits the reevaluation to EPA. Public input on the reevaluation will be invited during NPDES permit renewals or triennial reviews, as applicable, in accordance with the State's most current approved water quality management plan and continuing planning process.

(11) Timeline for proposed actions. Tasks and target completion dates are listed in the most recent, WQCC-approved version of the New Mexico Environment Department, Surface Water Quality Bureau's "Nutrient Temporary Standards for City of Raton Wastewater Treatment Plant, NPDES No. NM0020273 to Doggett Creek."

[20.6.4.318 NMAC - N, 05/22/2020; A, 4/23/2022]

EPA Determination: *The revisions to 20.6.4.318 NMAC updating references in 20.6.4.10 NMAC to reflect the renumbering of subsections are nonsubstantive. These revisions are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4. San Juan River Basin

NMED Exhibit 6

20.6.4.405 SAN JUAN RIVER BASIN: The main stem of the San Juan river from [~~Canyon~~] Cañon Largo upstream to the Navajo dam.

A. Designated uses: high quality coldwater aquatic life, irrigation, livestock watering, wildlife habitat, public water supply, industrial water supply and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: specific conductance 400 µS/cm or less; the monthly geometric mean of E. coli bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.

[20.6.4.405 NMAC - Rp 20 NMAC 6.1.2405, 10/12/2000; A, 5/23/2005; A, 12/1/2010; A, 4/23/2022]

20.6.4.408 SAN JUAN RIVER BASIN: The main stem of the San Juan river from its confluence with the Animas river upstream to its confluence with [~~Canyon~~] Cañon Largo.

A. Designated uses: public water supply, industrial water supply, irrigation, livestock watering, wildlife habitat, primary contact, marginal coldwater aquatic life and warmwater aquatic life.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criterion applies: temperature 32.2°C (90°F) or less.

[20.6.4.408 NMAC - N, 5/23/2005; A, 12/1/2010; A, 4/23/2022]

EPA Determination: *The revisions to both 20.6.4.405 and 408 NMAC are nonsubstantive. These revisions are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

20.6.4.900 Criteria Applicable to Existing or Attainable Uses

20.6.4.900 CRITERIA APPLICABLE TO EXISTING, DESIGNATED OR ATTAINABLE USES UNLESS OTHERWISE SPECIFIED IN 20.6.4.97 THROUGH 20.6.4.899 NMAC:

D. Primary contact: The monthly geometric mean of E. coli bacteria of 126 cfu/100 mL or MPN/100 ml, [~~and~~] a single sample of E. coli bacteria of 410 cfu/100 mL or MPN/100 mL, a single sample of total microcystins of 8 µg/L with no more than three exceedances within a 12-month period and a single sample of cylindrospermopsin of 15 µg/L with no more than three exceedances within a 12-month period, and pH within the range of 6.6 to 9.0 apply to this use. The results for *E. coli* may be reported as either colony forming units (CFU) or the most probable number (MPN) depending on the analytical method used.

EPA Determination: *The revisions to 20.6.4.900(D) includes clarifying language on the application of E. coli bacteria and the inclusion of criteria for microcystin and cylindropermopsin at a magnitude, duration and frequency consistent with EPA recommendations.[9] The revisions, including the addition of microcystin and cylindropermopsin criteria are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

H. Aquatic life:

6) Marginal warmwater: dissolved oxygen 5 mg/L or more, pH within the range of 6.6 to 9.0 and [~~maximum temperature~~] temperatures that may routinely exceed 32.2°C (90°F). Where a segment-specific temperature criterion is indicated in 20.6.4.101-899 NMAC, it is the maximum temperature.

[9] U.S. Environmental Protection Agency (2019). Recommended Human Health Recreational Ambient Water Quality Criteria or Swimming Advisories for Microcystins and Cylindrospermopsin (EPA 822-R-19-001)

NMED Exhibit 6

***EPA Determination*:** *The NMED proposed, and the Commission has adopted clarifying language specific to the marginal warmwater aquatic life designated use in 20.6.4.900(H)(6) NMAC to be consistent with the definition in 20.6.4.7(M)(2) NMAC. The revised language is intended to address the disparity between the marginal warmwater criteria represented as a maximum temperature of 32.2°C, and definition, which states that "…water temperature routinely exceeds 32.2°C (90°F)," which created a conflict in how the appropriate water quality criteria for marginal warmwater aquatic life uses were applied. The EPA recognizes that this discrepancy has resulted in a significant number of waters with a designated marginal warmwater aquatic life use being placed on New Mexico's CWA § 303(d) list as impaired for temperature. The EPA has determined that the revisions to the numeric temperature criterion for the marginal warmwater aquatic life use are consistent with the definition and would allow the NMED to assess these waters appropriately. The revisions to this provision, including the addition of the phrase "…temperature routinely exceed" are approved pursuant to CWA § 303(c) and are effective for CWA purposes.*

I. Hardness-dependent acute and chronic aquatic life criteria for metals are calculated using the following equations. The criteria are expressed as a function of [~~dissolved~~] hardness (as mg $CaCO_3$/L). With the exception of aluminum, the equations are valid only for [~~dissolved~~] hardness concentrations of 0-400 mg/L. For [~~dissolved~~] hardness concentrations above 400 mg/L, the criteria for 400 mg/L apply. For aluminum the equations are valid only for [~~dissolved~~] hardness concentrations of 0-220 mg/L. For [~~dissolved~~] hardness concentrations above 220 mg/L, the aluminum criteria for 220 mg/L apply. Calculated criteria must adhere to the treatment of significant figures and rounding identified in *Standard Methods For The Examination Of Water And Wastewater*, latest edition, American public health association.

(1) Acute aquatic life criteria for metals: The equation to calculate acute criteria in µg/L is $\exp(m_A[\ln(\text{hardness})] + b_A)$ (CF). Except for aluminum, the criteria are based on analysis of dissolved metal. For aluminum, the criteria are based on analysis of total recoverable aluminum in a sample that has a pH between 6.5 and 9.0 and is filtered to minimize mineral phases as specified by the department. [~~The EPA has disapproved the hardness-based equation for total recoverable aluminum in waters where the pH is less than 6.5 in the receiving stream for federal purposes of the Clean Water Act.~~] The equation parameters are as follows:

(2) Chronic aquatic life criteria for metals: The equation to calculate chronic criteria in µg/L is $\exp(m_C[\ln(\text{hardness})] + b_C)(CF)$**.** Except for aluminum, the criteria are based on analysis of dissolved metal. For aluminum, the criteria are based on analysis of total recoverable aluminum in a sample that has a pH between 6.5 and 9.0 and is filtered to minimize mineral phases as specified by the department.[~~The EPA has disapproved the hardness-based equation for total recoverable aluminum in waters where the pH is less than 6.5 in the receiving stream for federal purposes of the Clean Water Act.~~] The equation parameters are as follows:

***EPA Determination*:** *The NMED proposed, and the Commission adopted a definition of the term "hardness" to clarify the term and provide consistency when implementing New Mexico's hardness-based metals criteria for the protection of aquatic life at 20.6.4.900(I) NMAC. As described in the discussion of 20.6.4.12(F) NMAC in the Commission's SOR, the SJWC recommended removing the word "dissolved" before "hardness" in 20.6.4.12(F) NMAC and 20.6.4.900(I) NMAC, so that it aligned with the new definition of "hardness," and to eliminate redundancy and clarify the term. The Commission agreed and approved striking the word "dissolved" in 20.6.4.900(I) NMAC. These revisions do not alter or establish any new processes and would not change the implementation of the aluminum criteria. In addition, the reference to*

the latest edition of Standard Methods For The Examination Of Water And Wastewater[10] is consistent with 20.6.4.14(A)(2) NMAC. The deletion of the word "dissolved" throughout this provision and the reference to the Standard Methods are approved pursuant to CWA § 303(c) and revised language is effective for CWA purposes.

In its April 2012, action, the EPA disapproved the application of the hardness-based equation in 20.6.4.900(I)(1) and (2) for waters where the pH is below 6.5 as not protective of applicable designated uses. The EPA published updated §304(a) criteria for aluminum for freshwater (Aquatic Life Ambient Water Quality Criteria for Aluminum - 2018, EPA-822-R-18-001). The updated aluminum criteria are based on the latest science on aluminum toxicity to aquatic life and apply to waters within a pH range of 5.0 – 10.5. Although the EPA recommends that states update their aluminum criteria for waters within this pH range based on the updated §304(a) aluminum criteria, the EPA also recognizes that the conditions in New Mexico waters can be highly variable with pH levels as low as 3 standard units (SU). As a result, the EPA considers it protective to retain and continue to apply the 750 and 87 µg/L aluminium criteria as the applicable water quality standards for CWA purposes in waters where the pH is at or below 6.5. The revised language here and in 20.6.4.900(J)(1) clarifies that the previously approved 750 and 87 µg/L 304(a) criteria for aluminum will remain as the applicable criteria. See section 20.6.4.900(I)(3) NMAC below. These revisions are approved pursuant to CWA § 303(c) and are effective for CWA purposes.

In that 2012 action, the EPA also recommended that the State insert a footnote specifying that the hardness-based equations only apply at a pH of 6.5 to 9.0 to resolve the prior disapproval. The current revisions mean that the language referencing the EPA's partial disapproval of the hardness-based aluminum criteria as stated in 20.6.4.900(I)(1) and 20.6.4.900(I)(2) NMAC are no longer necessary and striking this language is appropriate.

(3) Selected values of calculated acute and chronic criteria (µg/L).

Hardness as $CaCO_3$, dissolved (mg/L)		**Al**	**Cd**	**Cr III**	**Cu**	**Pb**	**Mn**	**Ni**	**Ag**	**Zn**

EPA Determination: *The revisions to the table in 20.6.4.900(I)(3) NMAC represent the EPA's national recommended aquatic life water quality criteria for metals, or in some cases, criteria developed by the NMED. The criteria for hardness-based metals are specific to the water hardness (expressed as $CaCO_3$) at the time of sample collection, accounting for the potential for variations in hardness over time resulting in fluctuations in metals criteria. As part of its 2020 triennial review, the NMED verified the calculations for the hardness-based criteria values for mathematical accuracy. These revisions include the EPA's 2016 update to recommended acute and chronic hardness-based aquatic life criteria for cadmium that represent increased bioavailabity over New Mexico's current criteria. Based on this analysis and recalculations, the NMED proposed, and the Commission adopted the revised acute and chronic hardness-based metals criteria in this table depicting the graduating hardness levels of these metals criteria as a reference. The revisions to the selected values for aluminum, chromium III, copper, lead,*

manganese, nickel, silver and zinc in this table are approved as nonsubstantive revisions pursuant to CWA § 303(c) and are effective for CWA purposes.

*The EPA approval of aquatic life criteria is subject to consultation pursuant to Section 7(a)(2) of the Endangered Species Act (ESA). The EPA is taking no action on the revised aquatic life criterion for cadmium, pending ESA consultation (**Section III**). The revised criterion for cadmium is not effective for CWA purposes until the EPA concludes consultation with the U.S. Fish and Wildlife Service (Service). See **Section V** for additional information regarding the completion of the ESA consultation.*

J. Use-specific numeric criteria.

(1) Table of numeric criteria: The following table sets forth then numeric criteria applicable to existing, designated and attainable uses. For metals, criteria represent the total sample fraction unless otherwise specified in the table. Additional criteria that are not compatible with this table are found in Subsections A through I, K and L of this section.

NOTE; This is not a compete table but only includes revisions to the use-specific criteria table for brevity:

Pollutant	**CAS Number**	**DWS**	**Irr/Irr storage**	**LW**	**WH**	**Aquatic Life**			**Type**

(2) Notes applicable to the table of numeric criteria in Paragraph (1) of this subsection.

(i) The acute and chronic aquatic life criteria for dissolved aluminum only apply when the concurrent pH is less than 6.5 or greater than 9.0 S.U. If the concurrent pH is between 6.5 and 9.0 S.U. then the hardness-dependent total recoverable aluminum criteria in Paragraphs (1) and (2) of Subsection I of 20.6.4.900 NMAC apply.

EPA Determination: *As part of its 2020 triennial review, the NMED proposed, and the Commission adopted revisions adding new criteria and updating acute and chronic criteria for the protection of aquatic life and those based on human consumption of an aquatic organism (human health-organism only). New Mexico continues to adjust criteria for carcinogenic contaminants based on based on a lifetime risk of one cancer per 100,000 exposed persons (see 20.6.4.13(F)(2)(a)) in comparison to the EPA's lifetime risk level of more than one cancer per 1,000,000 exposed persons, consistent with EPA guidance. Revisions also reincorporate the previously approved chronic and acute dissolved aluminum criteria of 87 µg/L and 750 µg/L, respectively related to the EPA's 2012 disapproval. As specified in the note at 20.6.4.900(J)(2)(i)*

NMAC. these criteria are the applicable aluminum criteria for all waters with a pH less than 6.5 SU, outside the applicable range for hardness-based aluminum criteria.

In addition to the proposed changes to the aquatic life criteria described above, the revisions include completion of missing chemical abstract service numbers for several pollutants and nonsubstantive spelling corrections. These revisions are consistent with the EPA's recommended § 304(a) criteria and with language in 40 CFR §131.20(a). The revised human health criteria in 20.6.4.900(J)(1) and notes in (J)(2)(i) NMAC are not subject to ESA consultation and are approved pursuant to CWA § 303(c) and are effective for CWA purposes.

EPA Determination: *The EPA considers the updates to the publication references important, but they are not considered a water quality standard and not subject to action under CWA § 303(c).*

III. Provisions Where the EPA has or is Taking No Action

In today's action, the EPA is taking no action on the following new or revised provisions in the *New Mexico Standards for Interstate and Intrastate Waters* (20.6.4 NMAC) pursuant to §303(c) of the CWA. The following new or revised provisions where the EPA did not have adequate information to make a determination for action are not effective for CWA purposes until approved by the EPA as specified in 40 CFR 131.21(c).

20.6.4.7 Definitions

20.6.4.7 DEFINITIONS: Terms defined in the New Mexico Water Quality Act, but not defined in this part will have the meaning given in the Water Quality Act.

A. Terms beginning with numerals or the letter "A," and abbreviations for units.
(1) "4Q3" means the critical low flow as determined by the minimum average flow over four consecutive days that occurs with a frequency of once in three years.

As described in Chapter 5 of the EPA's WQS Handbook[11]*, referring to the Technical Support Document for Water Quality Based Controls (1991) and Appendix D of that document, the EPA describes and recommends two methods for calculating acceptable critical low-flow values: the traditional hydrologically based method developed by the United States Geological Survey (USGS) and a biologically based method developed by the EPA.*

The hydrologically based critical low-flow value is determined statistically using probability and extreme values for acute and chronic criteria (1Q10 and 7Q10). The advantage of this method is that it utilizes extreme value analytical techniques (e.g., log-Pearson Type III flow estimating technique) supported by past engineering and statistical practice. The disadvantages of this method are that it is independent of biological considerations, and it cannot easily utilize site-specific durations and frequencies that are sometimes specified in aquatic life criteria. When using hydrologically based critical low-flow values for aquatic life and human health criteria, the EPA recommends that states and tribes adopt the critical low-flow values for use in steady-state analyses so that criteria are implemented appropriately. If criteria are implemented using inappropriate critical low-flow values (i.e., calculated values that are too high), the resulting control of toxic pollutants may not be fully protective because the resulting ambient concentrations could exceed criteria when such low flows occur. In the case of aquatic life, more

[11] U.S. Environmental Protection Agency (EPA). 2017. Water Quality Standards Handbook: 2nd Edition. EPA-823-B-17-001. EPA Office of Water, Office of Science and Technology, Washington, DC. https://www.epa.gov/sites/production/files/2014-10/documents/handbook-chapter3.pdf

NMED Exhibit 6

frequent excursions than are allowable (e.g., more than once in three years) could result in unacceptable effects on aquatic organisms and designated uses if the appropriate value is not used in the calculations.

The biologically based critical low flow is determined empirically using the specific duration and frequency associated with the criterion (1B3 and 4B3). The biologically-based design flow is intended to examine the duration and frequency of biological exposure. The method directly uses site-specific durations (i.e., averaging periods) and frequencies specified in the aquatic life criteria (e.g., 1 day and 3 years for CMC and 4 days and 3 years for CCC). This method is empirical, not statistical, because it deals with the actual flow record itself, not with a statistical distribution that is intended to describe the flow record. Since biologically-based design flows are based on durations and frequencies specified in water quality criteria for individual pollutants and whole effluents, they can be based on the available biological, ecological and toxicological information concerning the stresses that aquatic organisms, ecosystems and their uses can tolerate.

The EPA compared hydrologically based design flow method and biologically-based design flow methods, the 1Q10 with the 1B3 and the 7Q10 with the 4B3 in 60 rivers. In most instances, the hydrologically based design flows (i.e., 1Q10, 7Q10) resulted in more than the allowed excursions. In other instances, the 1Q10 and 7Q10 allowed substantially more or fewer excursions than the intended number of excursions. In contrast, since the biologically-based method calculates the design flows directly from the national or site-specific duration and frequency, it always provided the maximum allowed number of excursions (and never provides more or fewer excursions than allowed).
It is unclear if this new definition of 4Q3 in intended as an alternative flow to address streams with limited or no flow at 7Q10. As noted in the WQS Handbook, Chpt.5, when a criterion specifies a four-day average concentration that should not be exceeded more than once every three years, this condition should not be interpreted as implying that a 4Q3 low flow is appropriate for use as the hydrologically based critical low-flow value for assessing impacts on the receiving water.

***EPA Determination*:** *Given that some aspects of this definition make it unclear how a 4Q3 is intended to be used as the hydrologically based critical low-flow value for assessing impacts on low-flow receiving waters, the EPA has determined that it needs additional information before the Agency can take action on this definition. This definition is not effective for CWA purposes until approved by the EPA.*

20.6.4.126 Rio Grande Basin

20.6.4.126 RIO GRANDE BASIN: Perennial waters within lands managed by the U.S. department of energy (DOE) within Los Alamos National Laboratory (LANL), including but not limited to [~~portions of~~] Cañon de Valle from [~~Los Alamos national laboratory (~~]LANL[~~)~~] stream gage E256 upstream to Burning Ground spring, Sandia canyon from Sigma canyon upstream to LANL NPDES outfall 001, Pajarito canyon from 0.5 miles below Arroyo de La Delfe upstream to Homestead spring, Arroyo de la Delfe from Pajarito canyon to Kieling spring, [~~into~~] Starmers gulch and Starmers spring and Water canyon from Area-A canyon upstream to State Route 501.

NMED Exhibit 6

A. Designated uses: coldwater aquatic life, livestock watering, wildlife habitat and secondary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

[20.6.4.126 NMAC - N, 5/23/2005; A, 12/1/2010; A, 4/23/2022]

The EPA has taken into consideration the extensive history of the designation of uses for waters within the DOE/LANL in its review of the revisions to 20.6.4.126 NMAC. The following discussion considers the NMED's initial proposed revisions and determinations, and those revisions brought by the DOE/LANL, the latter of which were adopted by the Commission. An important part of the recent history is related to the Joint Stipulation Regarding Proposed Changes to 20.6.4.128 NMAC (WQCC 14-05(R)). The Joint Stipulation agreement between the NMED, DOE/LANL, and Amigos Bravos is the result of amendments initially proposed by Amigos Bravos during the NMED's 2013 triennial review to revise the designated use for all waters in 20.6.4.128 NMAC from limited aquatic life to marginal warmwater aquatic life designated use, arguing that these waters were under-protected. Amigos Bravos withdrew its proposed revisions in exchange for DOE/LANL agreeing to share information on waters within its property boundary. The Joint Stipulation is significant because it outlines commitments made in the effort to determine the appropriate designated uses for ephemeral and intermittent waters within 20.6.4.128 NMAC. This process affected the revisions to 20.6.4.126 NMAC under consideration here.

Consistent with the Joint Stipulation, the NMED, in coordination with the DOE/LANL and to a lesser extent Amigos Bravos, conducted numerous Hydrology Protocol[12] surveys on waters within regulatory segment 20.6.4.128 NMAC from November 2016 to October 2019 to document aquatic life and recreation use support of these waters. The NMED's Hydrology Protocol (HP) assessments consider hydrologic, geomorphic, and biological indicators related to the persistence of water. The NMED's HP is the only hydrologic condition survey method for surface waters that is approved by both the Commission and the EPA as a component of the New Mexico's Water Quality Management Plan/Continuing Planning Process (WQMP/CPP). See 40 CFR 130.5 and 40 CFR 130.5(c). As detailed in the WQMP/CPP, HP assessment information can then be used to provide technical support for a UAA but cannot be used in place of a UAA to make use determinations.

This effort to determine the hydrologic regime and thus the appropriate designated uses is consistent with the requirements in 40 CFR 131.20(a). This federal regulation requires states to re-examine any waterbody segment with standards that do not include the uses specified in CWA § 101(a)(2) every 3 years to determine if any new information has become available. If new information is available that indicate the uses specified in CWA § 101(a)(2) may be attainable, federal regulations require states/authorized tribes to revise their standards accordingly. Although the initial presumption by the participants was that all waters assessed within 20.6.5.128 NMAC would be ephemeral or intermittent, after conducting HP surveys on some but not all waters within 20.6.5.128 NMAC, it was determined that several are perennial. These findings were not expected but were significant since the Joint Stipulation obligated the NMED, DOE/LANL, and Amigos Bravos to meet, discuss and come to agreement on the appropriate level of protections for waters found to be perennial. If agreement was reached, the Joint

[12] New Mexico Environment Department (2011). New Mexico WQMP/CPP Appendix C: Hydrology Protocol.

Stipulation specifically obligated the NMED to petition the Commission, proposing appropriate designated uses for those waters no later than the next, now the current 2020 triennial review. The Joint Stipulation did not preclude Amigos Bravos and DOE/LANL from filing separate petitions to revise designated uses if there was no agreement.

Based on the NMED's testimony before the Commission, it appears that the three parties concurred that Ancho Canyon from the Rio Grande to Ancho Springs; Pajarito Canyon from Starmers Gulch to Homestead Spring; Pajarito Canyon from 500 meters downstream of Arroyo de la Delfe to Arroyo de la Delfe, and DP Canyon from 100 meters downstream of grade control to 400 meters upstream of grade control are perennial waters. Although the basis is unclear, it appears that DP canyon was withdrawn following further discussion. Consistent with its commitments under the Joint Stipulation, the NMED initially proposed to classify waters where there was agreement, including DP canyon, Ancho canyon, and additional perennial portions of Water canyon waters within 20.6.126 NMAC.

However, the NMED did not move forward with its initial proposals for 20.6.126 NMAC. It is the EPA's understanding that prior to petitioning the Commission for a hearing (August 2020), the NMED anticipated the need to prepare a supporting UAA for to classify those waters referred to above within 20.6.4.126 NMAC. The determination through the HP assessments that some waters assumed to have been defined in 20.6.4.128 NMAC are perennial is significant since it means that these waters were not adequately protected under this regulatory segment. In its direct testimony, the NMED noted that the resources needed to develop a UAA for waters in 20.6.4.126 NMAC would affect its ability to meet its obligation under the Joint Stipulation to provide protection for those intermittent waters identified through HP assessments in 20.6.4.128 NMAC – those proposed to be classified in 20.6.4.140 NMAC discussed previously.

Given the decision to meet its obligation under the Joint Stipulation, the NMED relied on existing provisions in 20.6.4. NMAC to ensure protections for those waters that had been identified as perennial through the HP assessments. Those waters that were identified as perennial through the HP analyses are not specifically defined 20.6.4.128 NMAC and thus are "unclassified waters of the state" that "…are not identified in 20.6.4.101 through 20.6.4.899 NMAC." In its testimony before the Commission, the NMED referred to the provision at 20.6.4.11(H) NMAC which states that "An unclassified surface water of the state is presumed to support the uses specified in Section 101(a)(2) of the federal Clean Water Act. As such, it is subject to 20.6.4.98 NMAC if nonperennial or subject to 20.6.4.99 NMAC if perennial." This provision requires that those waters that were found to be perennial through the HP analyses are subject to under 20.6.4.99 NMAC consistent with the rebuttable presumption that CWA § 101(a)(2).

The DOE/LANL opposed the NMED's determination that those waters identified as perennial through HP assessments are in fact unclassified and protected under 20.6.4.99 NMAC. In its testimony before the Commission, the DOE/LANL's contended that the NMED could not "move" waters or portions of waters defined in 20.6.4.126 and 128 NMAC because they could not be "automatically unclassified to 20.6.4.99 NMAC, without a Commission decision…" However, there is no provision in 20.6.4 NMAC that requires the Commission to affirmatively act to define unclassified waters within 20.6.4.99 NMAC – the provisions at 20.6.4.11(H) and 20.6.4.99 NMAC require these protections for unclassified waters. The NMED noted that the application of HP analyses are explicitly addressed in the WQMP/CPP section entitled Establishing or

Revising a Designated Use using the Hydrology Protocol. This section states that "For waterbodies that are perennial but have not been classified under 20.6.4.101 to 899 NMAC, the State asserts perennial protections for these waters under 20.6.4.99 NMAC. Thus, the NMED did not "move" waters to 20.6.4.99 NMAC but appears to have followed the established provision at 20.6.4.11(H) and the specific processes outlined in New Mexico's WQMP/CPP to ensure protection of those unclassified perennial waters identified through the HP analyses.

In testimony before the Commission, the DOE/LANL described its proposed revisions to 20.6.4.126 NMAC as a reclassification of two segments from 20.6.4.128 NMAC: (1) Pajarito canyon from 0.5 miles below Arroyo de la Delfe upstream to Homestead Spring (the Pajarito "Lower Section" and "Upper Section" respectively); and (2) Arroyo de la Delfe from Pajarito canyon to Kieling Spring. In that testimony, the DOE/LANL stated that it proposed the more protective cold water aquatic life designated use as potentially obtainable based on the joint HP work done with NMED and additional analysis DOE/LANL itself conducted. The DOE/LANL referred to supporting data based on HP Level-1 and HP Leve1-2 field sheets, photographs conventional water chemistry parameters and benthic taxa summary for the Pajarito Lower and Upper Sections. Macroinvertebrate taxa requiring water for their entire life cycle were identified as well as EPT (Ephemeroptera, Plecoptera, and Trichoptera) taxa. Data for the fish, amphibians and bivalves were not identified during the HP assessments. However, DOE/LANL testimony contradicts its statement that no species of bivalve was identified through laboratory examination although also stating that amphibians are known to exist in these reaches.

While the biological data derived through the HP and any additional analyses of these waters is significant, the specific processes outlined in the WQMP/CPP is specific to ensuring protection of those unclassified perennial waters identified through the HP analyses. The NMED noted in its testimony that the application of HP analyses are explicitly addressed in the WQMP/CPP section entitled Establishing or Revising a Designated Use using the Hydrology Protocol. This section states that "For waterbodies that are perennial but have not been classified under 20.6.4.101 to 899 NMAC, the State asserts perennial protections for these waters under 20.6.4.99 NMAC. A survey using the Hydrology Protocol may be used to verify the hydrological regime for these unclassified perennial waters. A revision to incorporate the results of the Hydrology Protocol survey to classify a waterbody under 20.6.4.101 to 899 NMAC is done through the UAA process." Thus, HP assessment information can only be used to provide technical support for a UAA - it cannot be used in place of a UAA to make use determinations. Thus, the basis for the Commission's adoption of the DOE/LANL proposals for 20.6.4.126 NMAC appear to be inconsistent with state's own requirements in the WQMP/CPP. The EPA considers the WQMP/CPP requirement to be an important part of a well-supported designated use determination while not specifically required under federal regulation at 40 CFR 131.10(j).

Further, the DOE/LANL does not appears to have developed any new data related to the attainable contact recreation use specific to the Pajarito canyon and Arroyo de la Delfe in its testimony and stated that there is no new data to suggest that the non-primary contact recreational use has changed from the initial the NMED's 2007 UAA. The 2007 UAA does not refer to or provide any specific data on conditions in either Pajarito canyon or Arroyo de la Delfe related to attainment of the contact recreation use. Since Pajarito canyon and Arroyo de la Delfe have not been specifically defined in 20.6.4.101 through 20.6.4.899 NMAC, to support the inclusion of these waters in 20.6.4.126 NMAC, 40 CFR 131.10(g)(j) require that DOE/LANL must provide a supporting UAA for the secondary contact use designation in these waters.

Further, the EPA considers the revised language in 20.6.4.126 NMAC referring to the defined perennial waters as "including but not limited to" inconsistent with the definition of "classified waters of the state," which specifically refers to a surface water or reach of a surface water of the state where the Commission has adopted a segment description.

***EPA Determination*:** *The EPA does not have adequate information to make a definitive determination on the Commission's revisions to 20.6.4.126 NMAC. Based on both current and revised language in 20.6.4.126 NMAC, the EPA has identified the following overarching findings and questions:*

Waters within the DOE/LANL are defined within two separate regulatory segments, 20.6.4.126 and 20.6.4.128 NMAC. Waters within both regulatory segments are broadly defined as "Classified water(s) of the state." The current regulatory segment definition at 20.6.4.126 NMAC specifically delineates perennial waters by their upstream and downstream boundaries. Regulatory segment 20.6.4.128 NMAC defines ephemeral or intermittent waters more generally as ephemeral and intermittent waters within DOE/LANL as "including but not limited to" specific waters and "those not specifically identified in 20.6.4.126 NMAC." Given the definitions of classified and unclassified waters in 20.6.7 NMAC, the rebuttable presumption of CWA § 101(a)(2) uses, the closely related state regulatory provisions at 20.6.4.11(H), the Commission and EPA approved regulatory procedures in the New Mexico WQMP/CPP, the EPA agrees with the NMED's determination that waters that are not specifically defined within a regulatory segment that have or may be determined to be perennial through HP analyses are protected under 20.6.4.99 NMAC.

The EPA considers the new phrase "including but not limited to" and the striking of the term "specifically" in the first sentence in referring to specific waters to be inconsistent with the definitions of all other regulatory segment in 20.6.4.101 through 20.6.4.899 NMAC that specifically delineate protected waters. The exceptions are 20.6.4.128 NMAC and 20.6.4.808 NMAC, the latter which the EPA previously took no action on (see below). The EPA recommends that this exception language be removed from these regulatory segment definitions. Although the supporting HP (Level-1 and Level-2) hydrologic and biological data is significant in determining the appropriate aquatic life use determination for "Pajarito canyon from 0.5 miles below Arroyo de la Delfe upstream to Homestead Spring; and Arroyo de la Delfe from Pajarito canyon to Kieling Spring," the New Mexico WQMP/CPP only allows the results of HP analyses to supplement but not substitute for a UAA. Thus, the HP Level-1 and Level-2 field data should not have been used as the basis for revisions adding the specific segments described above to 20.6.4.126 NMAC.

The EPA finds that it does not have an adequate basis to make a determination on the Commission's revisions to 20.6.4.126 NMAC. The EPA requests that the NMED provide supporting information to allow the EPA to make such a determination. The EPA anticipates that the additional information would include clarification of the basis for the Commission's actions for those waters/tributaries that are or are not now defined in 20.6.4.99 NMAC and a detailed information related to the revisions to 20.6.4.126 NMAC. The EPA anticipates that this would include a supporting UAA developed by the DOE/LANL to support the coldwater aquatic life and secondary contact recreation uses for Pajarito canyon from 0.5 miles below Arroyo de la Delfe upstream to Homestead Spring; and Arroyo de la Delfe from Pajarito canyon to Kieling Spring, now defined in 20.6.4.126 NMAC consistent with the requirements in the New Mexico WQMP.

The revisions to this provision are not approved and are not effective for CWA purposes until approved by the EPA.

20.6.4.800 Closed Basins

20.6.4.808 and 809 Water Effect Ratios (WER)

20.6.4.808 CLOSED BASINS: Perennial and intermittent watercourses within Smelter Tailing Soils Investigation Unit lands at the Chino mines company, excluding those ephemeral waters listed in 20.6.4.809 NMAC and including, but not limited to the mainstem of Lampbright draw, beginning at the confluence of Lampbright Draw with Rustler canyon, all tributaries that originate west of Lampbright draw to the intersection of Lampbright draw with U.S. 180, and all tributaries of Whitewater creek that originate east of Whitewater creek from the confluence of Whitewater creek with Bayard canyon downstream to the intersection of Whitewater creek with U.S. 180.

A. Designated uses: Warmwater aquatic life, livestock watering, wildlife habitat and primary contact.

B. Criteria: The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: the acute and chronic aquatic life criteria for copper set forth in Subsection I of 20.6.4.900 NMAC shall be determined by multiplying that criteria by the water effect ratio ("WER") adjustment expressed by the following equation:

$$WER = \frac{[10^{0.588+(0.703 \times \log DOC)+(0.395 \times \log Alkalinity)}] \times (\frac{100}{Hardness})^{0.9422}}{19.31}]$$

For purposes of this section, dissolved organic carbon (DOC) is expressed in units of milligrams carbon per liter or mg C/L; alkalinity is expressed in units of mg/L as $CaCO_3$, and hardness is expressed in units of mg/L as $CaCO_3$. In waters that contain alkalinity concentrations greater than 250 mg/L, a value of 250 mg/L shall be used in the equation. In waters that contain DOC concentrations greater than 16 mg C/L, a value of 16 mg C/L shall be used in the equation. In waters that contain hardness concentrations greater than 400 mg/L, a value of 400 mg/L shall be used in the equation. The alkalinity, hardness and DOC concentrations used to calculate the WER value are those measured in the subject water sample. [20.6.4.808 NMAC - N, 3/2/2017]

20.6.4.809 CLOSED BASINS: Ephemeral watercourses within smelter tailing soils investigation unit lands at the Chino mines company, limited to Chino mines property subwatershed drainage A and tributaries thereof, Chino mines property subwatershed drainage B and tributaries thereof (excluding the northwest tributary containing Ash spring and the Chiricahua leopard frog critical habitat transect); Chino mines property subwatershed drainage C and tributaries thereof (excluding reaches containing Bolton spring, the Chiricahua leopard frog critical habitat transect and all reaches in subwatershed C that are upstream of the Chiricahua leopard frog critical habitat); subwatershed drainage D and tributaries thereof (drainages D-1, D-2 and D-3, excluding the southeast tributary in drainage D1 that contains Brown spring) and subwatershed drainage E and all tributaries thereof (drainages E-1, E-2 and E-3).

A. Designated uses: Limited aquatic life, livestock watering, wildlife habitat and secondary contact.

B. Criteria: The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: the acute aquatic life criteria for copper set forth in Subsection I of 20.6.4.900 NMAC shall be determined by multiplying that criteria by the water effect ratio ("WER") adjustment expressed by the following equation:

$$WER = \frac{[10^{0.588+(0.703 \times \log DOC)+(0.395 \times \log Alkalinity)}] \times (\frac{100}{Hardness})^{0.9422}}{19.31}$$

NMED Exhibit 6

For purposes of this section, dissolved organic carbon (DOC) is expressed in units of milligrams carbon per liter or mg C/L; alkalinity is expressed in units of mg/L as $CaCO_3$, and hardness is expressed in units of mg/L as $CaCO_3$. In waters that contain alkalinity concentrations greater than 250 mg/L, a value of 250 mg/L shall be used in the equation. In waters that contain DOC concentrations greater than 16 mg C/L, a value of 16 mg C/L shall be used in the equation. In waters that contain hardness concentrations greater than 400 mg/L, a value of 400 mg/L shall be used in the equation. The alkalinity, hardness and DOC concentrations used to calculate the WER value are those measured in the subject water sample. [20.6.4.809 NMAC - N, 3/2/2017]

EPA Determination: *The EPA previously took no action on the amendments to 20.6.4.97.C. (6)(b)(ii)-(vi) NMAC, 20.6.4.808 and 809 NMAC– Closed Basins and Water Effects Ratios (WER) in its June 8, 2017, as described the supporting TSD. The proposed revisions were based on a 3rd party proposal developed by Freeport-McMoRan/Chino Mines Company ("Chino Mines") supported by a report entitled "Application of the Hydrology Protocol to Smelter Tailings Soils Investigation Unit (STSIU) Drainages" (Chino report). The NMED submitted the Chino Mines report to EPA Region 6 for review and technical approval as a UAA pursuant to 20.6.4.15. C. and D. NMAC to support designated use and associated criteria downgrades in five subwatersheds contained in the area that drains the STSIU.*

In the supporting TSD, the EPA stated that there was not adequate information to fully assess the downgraded use designations for the Chino STSIU waters at 20.6.4.97.C.(6)(b)(ii)-(vi) NMAC. Thus, the EPA determined that it was premature to evaluate the criteria to support those uses adopted by the Commission for regulatory segments 20.6.4.808 and 809 NMAC. The EPA outlined its concerns with the proposal in detail and described the additional information that is needed to supplement the Chino report's conclusions. In addition, the EPA recommended that the NMED provide a comparison between the WER and the results of a Biotic Ligand Model to facilitate EPA's review of the site-specific aquatic life criteria for copper. However, to date, the NMED has not addressed the concerns outlined in the EPA's TSD or provided a BLM to allow a determination if the WER specific to waters within 20.6.4.808 and 809 NMAC. The EPA did not approve the proposed revisions to 20.6.4.97.C. (6)(b)(ii)-(vi) NMAC, 20.6.4.808 and 809 NMAC. The EPA reiterates that these provisions are not effective for CWA purposes until approved by the EPA. See 40 CFR § 131.21(c).

20.6.4.900 Criteria Applicable to Existing or Attainable Uses

I. Hardness-dependent acute and chronic aquatic life criteria for metals

(3) Selected values of calculated acute and chronic criteria (µg/L).

(1) Acute aquatic life criteria for metals: The equation to calculate acute criteria in µg/L is $\exp(m_A[\ln(\text{hardness})] + b_A)$ (CF). Except for aluminum, the criteria are based on analysis of dissolved metal. For aluminum, the criteria are based on analysis of total recoverable aluminum in a sample that has a pH between 6.5 and 9.0 and is filtered to minimize mineral phases as specified by the department. [~~The EPA has disapproved the hardness-based equation for total recoverable aluminum in waters where the pH is less than 6.5 in the receiving stream for federal purposes of the Clean Water Act.~~] The equation parameters are as follows:

Metal	m_A	b_A	Conversion factor (CF)
Aluminum (Al)	1.3695	1.8308	
Cadmium (Cd)	[~~0.8968~~] 0.9789	[~~-3.5699~~] -3.866	1.136672-[(ln hardness)(0.041838)]
Chromium (Cr) III	0.8190	3.7256	0.316
Copper (Cu)	0.9422	-1.700	0.960

Lead (Pb)	1.273	-1.460	1.46203-[(ln hardness)(0.145712)]
Manganese (Mn	0.3331	6.4676	
Nickel (Ni)	0.8460	2.255	0.998
Silver (Ag)	1.72	-6.59	0.85
Zinc (Zn)	0.9094	0.9095	0.978

(2) Chronic aquatic life criteria for metals: The equation to calculate chronic criteria in µg/L is $\exp(m_C[\ln(\text{hardness})] + b_C)(CF)$**.** Except for aluminum, the criteria are based on analysis of dissolved metal. For aluminum, the criteria are based on analysis of total recoverable aluminum in a sample that has a pH between 6.5 and 9.0 and is filtered to minimize mineral phases as specified by the department.[~~The EPA has disapproved the hardness-based equation for total recoverable aluminum in waters where the pH is less than 6.5 in the receiving stream for federal purposes of the Clean Water Act.~~] The equation parameters are as follows:

Metal	**m_C**	**b_C**	**Conversion factor (CF)**
Aluminum (Al)	1.3695	1.8308	
Cadmium (Cd)	[0.7647] 0.7977	[-4.2180] -3.909	1.101672-[(ln hardness)(0.041838)]
Chromium (Cr) III	0.8190	0.6848	0.860
Copper (Cu)	0.8545	-1.702	0.960
Lead (Pb)	1.273	-4.705	1.46203-[(ln hardness)(0.145712)]
Manganese (Mn	0.3331	5.8743	
Nickel (Ni)	0.8460	0.0584	0.997
Zinc (Zn)	0.9094	0.6235	0.986

EPA Determination: *In 2016, the EPA updated its recommendations for acute and chronic hardness-based aquatic life criteria for cadmium based on toxicological studies for protection of aquatic life. Consistent with 40 CFR §131.11, the NMED proposed, and the Commission adopted the updated hardness-based criteria for cadmium resulting in the revised factors found in table 20.6.4.900(J)(1) NMAC. The EPA's approval of aquatic life criteria for cadmium is subject to consultation pursuant to Section 7(a)(2) of the Endangered Species Act (ESA). The EPA is taking no action on the revised aquatic life criterion for cadmium and the corresponding revised factors in table 20.6.4.900(J)(1), pending the conclusion of ESA consultation. The criterion for cadmium is not effective for CWA purposes until approved by the EPA. See Section V for additional information regarding the completion of the ESA consultation.*

J. Use-specific numeric criteria.

(1) Table of numeric criteria: The following table sets forth then numeric criteria applicable to existing, designated and attainable uses. For metals, criteria represent the total sample fraction unless otherwise specified in the table. Additional criteria that are not compatible with this table are found in Subsections A through I, K and L of this section.

NOTE; This is not a compete table but only includes revisions to the use-specific criteria table for brevity:[13]

Pollutant	**CAS Number**	**DWS**	**Irr/Irr storage**	**LW**	**WH**	**Aquatic Life**			**Type**
						Acute	Chronic	HH-OO	
Chloride	1688-70-06					860,000	230,000		
Iron	7439-89-6						1,000		

[13] This table has been condensed from the original table in **J(1)** to include and highlight revisions to aquatic life criteria subject to ESA consultation. Full table can be found in ***Section II***.

NMED Exhibit 6

Acrolein	107-02-8	18				3.0	3.0		
Carbaryl	63-25-2					2.1	2.1		
Chlorpyrifos	2921-88-2					0.083	0.041		
Demeton	8065-48-3						0.1		
Guthion	86-50-0						0.01		
Malathion	121-75-5						0.1		
Methoxychlor	72-43-5						0.03		
Mirex	2385-85-5						0.001		
Parathion	56-38-2					0.065	0.013		
Tributyltin (TBT)	Various					0.46	0.072		

EPA Determination: *The EPA's approval of aquatic life criteria for acrolein, cadmium, carbaryl, chloride, chlorpyrifos, demeton, iron, guthion, malathion, methoxychlor, mirex, parathion, and tributyltin are subject to consultation pursuant to Section 7(a)(2) of the ESA. The EPA is taking no action on these revised aquatic life criteria, pending the conclusion of ESA consultation. The criteria for acrolein, cadmium, carbaryl, chloride, chlorpyrifos, demeton, iron, guthion, malathion, methoxychlor, mirex, parathion, and tributyltin are not effective for CWA purposes until approved by the EPA. See Section V for additional information regarding the completion of the ESA consultation.*

K. The criteria for total ammonia consider sensitive freshwater mussel species in the family Unionidae, freshwater non-pulmonate snails, and *Oncorhynchus* spp. (a genus of fish in the family Salmonidae), hence further protecting the aquatic community. The total ammonia criteria magnitude is measured as Total Ammonia Nitrogen (TAN) mg/L. TAN is the sum of and TAN mg/L magnitude is derived as a function of pH and temperature (EPA 2013).

L. The acute aquatic life criteria for TAN (mg/L) was derived by the EPA (2013) as the one-hour average concentration of TAN mg/L that shall not be exceeded more than once every three years on average. The EPA acute criterion magnitude was derived using the following equation:

$$\text{Acute TAN Criterion Magnitude for 1-hour average} = \text{MIN}\left(\left(\frac{0.275}{1+10^{7.204-pH}}+\frac{39}{1+10^{pH-7.204}}\right),\left(0.7249\text{x}\left(\frac{0.0114}{1+10^{7.204-pH}}+\frac{1.6181}{1+10^{pH-7.204}}\right)\text{x}\left(23.12\times 10^{0.036(20-T)}\right)\right)\right)$$

T (temperature °C) and pH are defined as the paired values associated with the TAN sample

(1) Temperature and pH-dependent values of the acute TAN criterion magnitude – when *Oncorhynchus* spp. absent.

	Temperature (°C)

M. The chronic aquatic life criteria for TAN (mg/L) was derived by the EPA (2013) as a thirty-day rolling average concentration of TAN mg/L that shall not be exceeded more than once every three years on average. In addition, the highest four-day average within the 30-day averaging period should not be more than 2.5 times the CCC (e.g., 2.5 x 1.9 mg TAN/L at pH 7 and 20°C, or 4.8 mg TAN/L) more than once in three years on average. The EPA chronic criterion magnitude was derived using the following equation:

Chronic TAN Criterion Magnitude for 30-day average=

$$0.8876 \times \left(\frac{0.0278}{1+10^{7.688-pH}} + \frac{1.1994}{1+10^{pH-7.688}}\right) \times \left(2.126 \times 10^{0.028\times(20-MAX(T,7))}\right)$$

'T' (temperature °C) and pH are defined as the paired values associated with the 'TAN sample.

Temperature and pH-Dependent Values of the Chronic TAN Criterion Magnitude.

EPA Determination:

As part of its 2020 triennial review, the NMED proposed, and the Commission adopted the EPA's updated § 304(a) recommended acute and chronic aquatic life criteria for Total Ammonia Nitrogen (TAN). The associated revisions to 20.6.4.900(K), (L) and (M) NMAC, including the equations, temperature and pH-dependent values in the associated tables are all consistent with the values in EPA's current nationally recommended freshwater ammonia criteria. However, the EPA acknowledges that the value of 3.0 for pH 7.9 and 17°C in (L)(1), should be 6.0 when the equation for the Acute TAN Criterion Magnitude for 1-hour average is applied. This is a typographical error that is also present in EPA's Ammonia 2013 aquatic life criteria document and the EPA cautions NMED to beware of the difference in the criteria and correct in their next revision. Since the acute criterion equation is correct, this typographical error is nonsubstantive. These revisions are consistent with the EPA's recommended § 304(a) criteria and with language in 40 CFR §131.20(a). However, the EPA approval of aquatic life criteria is subject to consultation pursuant to Section 7(a)(2) of the ESA. The EPA is taking no action on the revised ammonia aquatic life criteria and narrative in 20.6.4.900(K), (L) and (M) NMAC and these provisions are not effective for CWA purposes until approved by the EPA. See Section V for additional information regarding the completion of the ESA consultation.

IV. Provisions the EPA Is Disapproving

[RESERVED]

V. Additional Considerations

Endangered Species Act Consultation

The EPA's approval of revised WQS and associated aquatic life criteria are subject to the consultation requirement of Section 7(a)(2) of the Endangered Species Act[14] (ESA). Under Section 7(a)(2) of the ESA, the EPA has the obligation to ensure that its approval of modifications to the *New Mexico Standards for Interstate and Intrastate Waters* (20.6.4 NMAC) will not jeopardize the continued existence of threatened and endangered species and critical habitat in New Mexico.

[14] Endangered Species Act, 16 U.S.C. §1536

NMED Exhibit 6

The EPA's current practice is to consult with the Service(s) where the EPA determines that approval of a new or revised WQS may affect federally listed species. The revisions to 20.6.4.900 (I), (J), (K), (L) and (M) NMAC being considered in today's action are subject to ESA consultation. Specifically, the EPA determined that its approval of acrolein, ammonia, cadmium, carbaryl, demeton, guthion, methoxychlor, mirex, parathion, and tributyltin criteria is subject to ESA consultation. The EPA has initiated informal consultation with the New Mexico Ecological Services Field Office (ESFO) for the approval of acrolein, ammonia, cadmium, carbaryl, demeton, guthion, methoxychlor, mirex, parathion, and tributyltin criteria and is currently reviewing comments. Once comments are fully addressed, the EPA will request written concurrence from the ESFO. The EPA anticipates formal consultation will be needed for the approval of revised iron and chloride aquatic life criteria in 20.6.4.900 (J), based on the EPA's preliminary Likely to Adversely Affect determination for some threatened and endangered aquatic dependent species residing in New Mexico.

RE: New Mexico's 2020 Triennial Revisions to 20.6.4 NMAC

Dear Ms. Lemon:

I am writing in regard to the U.S. Environmental Protection Agency's (EPA's) prior review of revisions to New Mexico's *Standards for Interstate and Intrastate Surface Waters* 20.6.4 New Mexico Administrative Code (NMAC), which were effective for state purposes on April 23, 2022, and submitted to the New Mexico Water Quality Control Commission (Commission) for EPA review on May 2, 2022 ("the 2020 Triennial Revisions").

On January 19, 2023, the EPA took action approving the majority of the new and/or revised provisions, including non-substantive provisions within its discretionary authority, pursuant to CWA § 303(c) and its implementing regulations at 40 CFR Part 131 as detailed in the accompanying Technical Support Document (TSD). However, the EPA determined it could not act on new and revised aquatic life criteria that were subject to the consultation requirements of Section 7(a)(2) of the Endangered Species Act (ESA), 16 U.S.C. §1536. Under Section 7(a)(2) of the ESA, the EPA has the obligation to ensure that its approval of revisions to New Mexico's *Standards for Interstate and Intrastate Surface Waters* 20.6.4 NMAC will not jeopardize the continued existence of threatened and endangered species and critical habitat in New Mexico. The EPA has since received concurrence on our not likely to adversely affect (NLAA) determination from the U.S. Fish and Wildlife Service (USFWS) through the New Mexico Ecological Services Field Office and is approving the aquatic life criteria for acrolein, cadmium, carbaryl, demeton, guthion, methoxychlor, mirex, parathion, and tributyltin. The EPA is reserving action on the remaining aquatic life criteria described in Section V of the TSD pending the completion of ESA formal consultation with the USFWS.

I would like to thank the Commission, the New Mexico Environment Department and its Surface Water Quality Bureau for their commitment and hard work in reviewing and revising the state's water quality standards. We appreciate your patience with the delay in action resulting from the extensive ESA consultation. If you have any questions or concerns, please contact me at (214) 665-8138, or have your staff contact Jasmin Diaz-Lopez at (214) 665-2733 or Russell Nelson at (214) 665-6646.

Sincerely,

Charles W. Maguire

RE: New Mexico's 2020 Triennial Revisions to 20.6.4 NMAC

Dear Ms. Lemon:

I am writing regarding the U.S. Environmental Protection Agency's (EPA) prior review of revisions to New Mexico's *Standards for Interstate and Intrastate Surface Waters* 20.6.4 New Mexico Administrative Code (NMAC), which were effective for state purposes on April 23, 2022. These revisions were submitted by the New Mexico Environment Department (NMED) on behalf of the New Mexico Water Quality Control Commission (Commission) for EPA review on May 2, 2022. The EPA initially took action on the majority of these revisions on January 19, 2023. The EPA has an obligation to ensure that its approval of revisions to State and Tribal water quality standards will not jeopardize the continued existence of threatened and endangered species and critical habitat in New Mexico. As such, the EPA did not approve the new and revised aquatic life criteria for acrolein, ammonia, cadmium, carbaryl, chloride, chloropyrifos, demeton, guthion, iron, malathion, methoxychlor, mirex, parathion, and tributyltin in our January 19, 2023, letter. These new and revised aquatic life criteria listed above were subject to the consultation requirements of Section 7(a)(2) of the Endangered Species Act (ESA), 16 U.S.C. §1536.

The EPA received partial concurrence from the U.S. Fish and Wildlife Service (USFWS) through the New Mexico Ecological Services Field Office on our Not Likely to Adversely Affect (NLAA) determination for threatened and endangered species. Based on this concurrence, EPA approved the aquatic life criteria for acrolein, cadmium, carbaryl, demeton, guthion, methoxychlor, mirex, parathion, and tributyltin on April 27, 2023.

However, the EPA determined that its approval of chloride and iron aquatic life criteria would likely adversely affect (LAA) the Alamosa springsnail, Chupadera springsnail, Koster's springsnail, Noel's amphipod, Pecos assiminea, Roswell springsnail, Socorro springsnail, and the Texas hornshell mussel

and designated critical habitat for Texas hornshell mussel, Chupadera springsnail, Koster's springsnail, Noel's amphipod, Pecos assiminea, and Roswell springsnail. The USFWS did not concur on the EPA's NLAA determination for the effects of ammonia aquatic life criteria on the Texas hornshell and its critical habitat. Therefore, the EPA initiated formal consultation with the USFWS on the approval of ammonia, chloride, and iron aquatic life criteria. As required under formal consultation, the USFWS prepared a biological opinion to analyze the effects of a proposed action to the listed species or designated critical habitat and determined whether an action is likely to jeopardize the continued existence of a listed species or result in the destruction or adverse modification of critical habitat.

The EPA has since received the USFWS's biological opinion which concluded that the approval of the ammonia, chloride, and iron aquatic life criteria will not jeopardize the continued existence of the threatened and endangered species or critical habitat referred to previously. The EPA is currently working with the USFWS and National Marine and Fisheries Service in nationwide consultations on several pesticides, including malathion and chloropyrifos. In the interim, the criteria New Mexico adopted for these contaminants are effective as state law. The EPA is continuing to work with the USFWS to gain concurrence on these criteria.

I would like to thank the Commission, the New Mexico Environment Department and its Surface Water Quality Bureau for their patience with the delay in action resulting from the extensive ESA consultation. If you have any questions or concerns, please contact me at (214) 665-6647, or have your staff contact Jasmin Diaz-Lopez at (214) 665-2733.

Sincerely,

NMED Exhibit 9

Preamble

The federal Clean Water Act (CWA) requires states to review Water Quality Standards (WQS) every three years, commonly known as the Triennial Review. This public review draft of 20.6.4 NMAC contains draft amendments to New Mexico's Surface WQS and initiates the 2026 Triennial Review process. The Department based these draft amendments on past Triennial Review results, CWA requirements, and monitoring and assessment information. During the Triennial Review, the CWA requires states to consider adopting the U.S. Environmental Protection Agency's (EPA) recommended CWA Section 304(a) Criteria and review segments lacking CWA Section 101(a)(2) uses (i.e., swimmable/fishable) to see if any new data would support including these uses. The Department includes a "Basis for Change" following each draft amendment to provide a rationale or citations to supporting information.

Deleted materials are indicated by strikethrough, and new text are indicated by underline. Only the portions of the rule (sections, subsections, paragraphs, etc.) with draft amendments are provided below, unless needed for context and clarity of scope. In addition to these draft amendments, the department will accept comments on any Section of 20.6.4 NMAC.

Comments may be submitted via email at michael.baca1@env.nm.gov or the Department's public comment portal (https://nmed.commentinput.com/comment/search) through October 14, 2025. More information about the Triennial Review process, including the entire WQCC and EPA approved versions of 20.6.4 NMAC may be found at https://www.env.nm.gov/surface-water-quality/wqs/.

NMED Exhibit 9

20.6.4.7 DEFINITIONS: Terms defined in the New Mexico Water Quality Act, but not defined in this part will have the meaning given in the Water Quality Act.

A. Terms beginning with numerals or the letter "A," and abbreviations for units.

(1) "4Q3" means the hydrologically based critical low flow as determined by the minimum average flow over four consecutive days that occurs with a frequency of once in three years.

BASIS FOR CHANGE: NMED proposes this amendment to clarify that the calculation utilized in New Mexico is hydrologically based. This definition was previously approved at 20.6.4.11 NMAC. However, EPA Region 6 did not approve this definition when it was moved to 20.6.4.7 NMAC during New Mexico's 2020 Triennial Review.

20.6.4.7.A(2) through 20.6.4.7.P(6) NMAC – No changes proposed.

P. Terms beginning with the letter "P".

(7) "Public water supply" means the use or storage of water to supply a public water system as defined by ~~New Mexico's Drinking Water Regulations, 20.7.10 NMAC~~ 40 CFR 141. Water provided by a public water system ~~may need to~~ shall undergo treatment to ~~achieve~~ comply with drinking water ~~quality~~ standards.

BASIS FOR CHANGE: NMED's Drinking Water Regulations at 20.7.10 NMAC, incorporate by reference the National Primary Drinking Water Regulations codified at 40 CFR Part 141. The definition for "public water system" is contained in the federal regulations and not in the NMAC as indicated in the existing language. NMED proposes an amendment to cite the federal regulation containing the definition.

The Drinking Water Regulations require disinfection, at a minimum, and filtration for most public water systems that use surface water sources or ground water sources under direct influence of surface water (See 40 CFR Part 141, Subpart H). Source water with low turbidity (< 5 NTU) and coliform concentrations (fecal < 20/100 ml and total <100/100ml) over the past six months are eligible for an exemption from filtration. NMED proposes changing "may" to "shall". While surface waters may appear clean, they can carry harmful contaminants and micro-organisms that can cause illnesses and must be treated prior to drinking. NMED proposes to amend language to indicate compliance with drinking water standards and treatment requirements.

20.6.4.7.Q through 20.6.4.7.S NMAC – No changes proposed.

T. Terms beginning with the letter "T".

(1) "TDS" means total dissolved solids, also termed "total filterable residue."

(2) "Temporary standard" means a time-limited designated use and criterion for a specific pollutant(s) or water quality parameter(s) that reflect the highest attainable condition during the term of the temporary standard.

(~~2~~3) "Toxic pollutant" means those pollutants, or combination of pollutants, including disease-causing agents, that after discharge and upon exposure, ingestion, inhalation or assimilation into any organism, either directly from the environment or indirectly by ingestion through food chains, will cause death, shortened life spans, disease, adverse behavioral changes, reproductive or physiological impairment or physical deformations in such organisms or their offspring.

(~~3~~4) "Tributary" means a perennial, intermittent or ephemeral waterbody that flows into a larger waterbody, and includes a tributary of a tributary.

(~~4~~5) "Turbidity" is an expression of the optical property in water that causes incident light to be scattered or absorbed rather than transmitted in straight lines.

NMED Exhibit 9

BASIS FOR CHANGE: NMED proposes to move the definition of "temporary standard" from 20.6.4.10.H(12) to 20.6.4.7.T(1) NMAC, to conform to State Records Center and Archives (SRCA) formatting guidelines.

20.6.4.7.U through 20.6.4.7.W(3) NMAC – No changes proposed.

W. Terms beginning with the letter "W".

(4) "Wetlands" means those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and under normal circumstances do support, ~~a prevalence of~~ vegetation, typically adapted for life in saturated soil conditions in New Mexico. Wetlands are unique surface waters of the state that vary widely because of regional and local differences in soils, topography, climate, hydrology, water chemistry, vegetation and other factors and provide distinct chemical, biological, physical, and hydrological functions within a watershed. Wetlands that are constructed outside of a surface water of the state for the purpose of providing wastewater treatment and that do not impound a surface water of the state are not included in this definition.

BASIS OF CHANGE: NMED proposes to clarify the definition of wetlands. Wetlands provide a variety of important functions, and vary regionally and locally due to their soils, topography, climate, hydrology, water chemistry, vegetation, and other factors. Recognizing these characteristics and functions will help protect and maintain these features through the implementation of Clean Water Act (CWA) and New Mexico surface water quality programs such as CWA Section 303(d)/305(b) Reporting and water quality condition assessments, evaluating antidegradation provisions and appropriate mitigation ratios, and developing permit conditions for surface water discharges, including point source and dredge and fill discharges.

20.6.4.7.W(5) through 20.6.4.7.Z NMAC – No changes proposed.

20.6.4.8 ANTIDEGRADATION POLICY AND IMPLEMENTATION PLAN:

A. Antidegradation Policy: This antidegradation policy applies to all surface waters of the state.

(1) Existing uses, as defined in Paragraph (4) of Subsection E of 20.6.4.7 NMAC, and the level of water quality or wetland condition necessary to protect the existing uses shall be maintained and protected in all surface waters of the state. Wetland condition is a measure of ecological integrity and, by inference, wetland quality (i.e., functions) and quantity (i.e., acreage).

(2) Where wetland condition or the quality of a surface water of the state exceeds levels necessary to support the propagation of fish, shellfish, and wildlife, and recreation in and on the water, that quality shall be maintained and protected unless the commission finds, after full satisfaction of the intergovernmental coordination and public participation provisions of the state's continuing planning process, that allowing lower water quality or wetland condition, including loss of wetland acreage or wetland functions, is necessary to accommodate important economic and social development in the area in which the water is located. In allowing such degradation or lower water quality, the state shall assure water quality adequate to protect existing uses fully. Further, the state shall assure that there shall be achieved the highest statutory and regulatory requirements for all new and existing point sources and all cost-effective and reasonable BMPs for nonpoint source control. Additionally, the state shall encourage the use of watershed planning as a further means to protect surface waters of the state.

(3) No degradation, including loss of wetland acreage or wetland functions, shall be allowed in waters designated by the commission as outstanding national resource waters (ONRWs), except as provided in Subparagraphs (a) through (e) of this paragraph and in Paragraph (4) of this Subsection A.

BASIS FOR CHANGE: As stated in the Objective of this Part, water quality standards consist of designated uses, criteria to support those uses, and an antidegradation policy, which collectively are used to protect and enhance surface water quality. NMED proposes new antidegradation language to incorporate wetlands antidegradation provisions. NMED equates loss of wetland

NMED Exhibit 9

condition (i.e., acreage or functions) to degradation and proposes language consistent with each Tier to provide wetland protections under New Mexico's antidegradation policy.

20.6.4.8.A(3)(a) through 20.6.4.9 NMAC – No changes proposed.

20.6.4.10 REVIEW OF STANDARDS; NEED FOR ADDITIONAL STUDIES:

20.6.4.10.A through 20.6.4.10.E NMAC – No changes proposed.

F. If the commission grants a rulemaking hearing for the amendment or adoption of a water quality standard, including ONRW nominations, site-specific criteria, use attainability analyses, and designating classified segments, the petitioner shall be responsible for the costs of the administrative rulemaking process. Costs include: venue, hearing officer, court reporter, original transcripts, translation services, interpretation services, and public notice requirements including publication in newspapers and in the New Mexico register. The petitioner shall coordinate with the commission administrator and the department on rulemaking hearing requirements.

BASIS FOR CHANGE: The Water Quality Control Commission (WQCC) historically depended on NMED, as the petitioner, to carry out administrative functions and pay the costs of a rulemaking. And, as petitioner, NMED fulfilled these responsibilities and costs to further the Department's proposed amendments. However, with more interest in water quality regulations and external parties proposing various standards amendments, NMED cannot predict when external rulemaking petitions will be filed and therefore cannot cover the hearing costs or administrative functions for these petitions. NMED cannot plan for unknown proposals in their grant workplans or request funding in their operating budget for unknown proposals, especially if the Department does not know if it will actually need the funding or if a non-NMED petitioner will complete the workplan deliverable as required. NMED proposes to clarify that the financial responsibility for the costs of the administrative rulemaking process lies with the petitioner, whether that be NMED, another state agency, or an external party. Additional costs for the development of a rulemaking petition may include technical experts, scientific reports, and additional stakeholder and public outreach, depending on public interest.

~~F~~**G. Site-specific criteria.**

(1) The commission may adopt site-specific numeric criteria applicable to all or part of a surface water of the state based on relevant site-specific conditions such as:

(a) actual species at a site are more or less sensitive than those used in the national criteria data set;

(b) physical or chemical characteristics at a site such as pH or hardness alter the biological availability and/or toxicity of the chemical;

(c) physical, biological or chemical factors alter the bioaccumulation potential of a chemical;

(d) the concentration resulting from natural background exceeds numeric criteria for aquatic life, wildlife habitat or other uses if consistent with Subsection G of 20.6.4.10 NMAC; or

(e) other factors or combination of factors that upon review of the commission may warrant modification of the default criteria, subject to EPA review and approval.

(2) Site-specific criteria must fully protect the designated use to which they apply. In the case of human health-organism only criteria, site-specific criteria must fully protect human health when organisms are consumed from waters containing pollutants.

(3) Any person may submit notice to the department stating their intent to derive site-specific criteria for a surface water of the state. The notice shall include a work plan supporting the development of site-specific criteria for the department's review and comment.

(4) Site-specific criteria shall be developed in accordance with the reviewed work plan, based on one or more of the site-specific conditions noted in paragraph 1, derived from a scientifically defensible method and protect the designated uses to which they apply.

(5) The work plan shall identify, at a minimum:

(a) the waterbody to consider and the reasoning for site-specific criteria;

(b) the methodology to be used to derive criteria;

(c) the source and validity of data to be used;

(d) the provisions for consultation with appropriate state and federal agencies;

(e) a description of how stakeholders and potentially affected Indian nations, tribes, or pueblos will be identified and engaged;

(f) a description of the public notice mechanisms to be employed; and

(g) the expected timelines and associated administrative actions to be taken for a rulemaking petition, pending the outcome of criteria development.

(6) Upon completion of site-specific criteria development, the data, findings and conclusions shall be submitted to the department, and public notice shall be provided in accordance with the approved work plan.

(~~3~~7) Any person may petition the commission to adopt site-specific criteria. A petition for the adoption of site-specific criteria shall:

(a) identify the specific waters to which the site-specific criteria would apply;

(b) explain the rationale for proposing the site-specific criteria;

(c) describe the methods used to notify and solicit input from potential stakeholders and from the general public in the affected area, and present and respond to the public input received;

(d) present and justify the derivation of the proposed criteria.

(48) A derivation of site-specific criteria shall rely on a scientifically defensible method, such as one of the following:

(a) the recalculation procedure, the water-effect ratio for metals procedure or the resident species procedure as described in the water quality standards handbook (EPA-823-B-94-005a, 2nd edition, August 1994);

(b) the streamlined water-effect ratio procedure for discharges of copper (EPA-822-R-01-005, March 2001);

(c) the biotic ligand model as described in aquatic life ambient freshwater quality criteria - copper (EPA-822-R-07-001, February 2007);

(d) the methodology for deriving ambient water quality criteria for the protection of human health (EPA-822-B-00-004, October 2000) and associated technical support documents; or

(e) a determination of the natural background of the water body as described in Subsection G of 20.6.4.10 NMAC.

BASIS FOR CHANGES: NMED proposes including work plan requirements for entities outside of the department for deriving site-specific criteria. A work plan will improve communication between outside agencies, regulated community, stakeholders, and the department. The work plan should clearly outline expectations and responsibilities for deriving criteria. Additionally, work plans are already required for conducting a Use Attainability Analysis by an entity other than NMED and this will bring more uniformity to the process of water quality standards amendments.

~~G~~H. Site-specific criteria based on natural background. The commission may adopt site-specific criteria equal to the concentration resulting from natural background where that concentration protects the designated use. The concentration resulting from natural background supports the level of aquatic life and wildlife habitat expected to occur naturally at the site absent any interference by humans. Domestic water supply, primary or secondary contact, or human health-organism only criteria shall not be modified based on natural background. A determination of natural background shall:

(1) consider natural spatial and seasonal to interannual variability as appropriate;

(2) document the presence of natural sources of the pollutant;

NMED Exhibit 9

(3) document the absence of human sources of the pollutant or quantify the human contribution; and

(4) rely on analytical, statistical or modeling methodologies to quantify the natural background.

BASIS FOR CHANGE: NMED proposes to renumber the subsection as the result of the proposed subsection at 20.6.4.10.F NMAC.

~~H~~I. **Temporary standards.**

~~**(12)** "Temporary standard" means a time-limited designated use and criterion for a specific pollutant(s) or water quality parameter(s) that reflect the highest attainable condition during the term of the temporary standard.~~

BASIS FOR CHANGE: NMED proposes to renumber the subsection as the result of the proposed subsection at 20.6.4.10.F NMAC. Additionally, NMED proposes to move the definition of "temporary standard" from 20.6.4.10.H(12) to 20.6.4.7.T(1) NMAC to conform to SRCA formatting guidelines.

20.6.4.11 APPLICABILITY OF WATER QUALITY STANDARDS:

20.6.4.11.A through 20.6.4.11.F NMAC – No changes proposed.

G. Human health-organism only criteria in Subsection J of 20.6.4.900 NMAC apply to those waters with a designated, existing or attainable aquatic life use. When limited aquatic life is a designated use, the human health-organism only criteria apply only for persistent toxic pollutants,~~if~~ unless adopted on a segment-specific basis. The human health-organism only criteria for persistent toxic pollutants, as identified in Subsection J of 20.6.4.900 NMAC, also apply to all tributaries of waters with a designated, existing or attainable aquatic life use.

BASIS FOR CHANGE: NMED proposes this amendment to remain consistent with the Limited Aquatic Life Designated Use language in 20.6.4.900(H)(7) NMAC.

20.6.4.11.H through 20.6.4.11.I NMAC – No changes proposed.

20.6.4.12 COMPLIANCE WITH WATER QUALITY STANDARDS: The following provisions apply to determining compliance for enforcement purposes; they do not apply for purposes of determining attainment of uses. The department has developed assessment protocols for the purpose of determining attainment of uses that are available for review from the department's surface water quality bureau.

20.6.4.12.A through 20.6.4.12.E NMAC – No changes proposed.

F. For compliance with ~~hardness-dependent~~ calculated numeric criteria~~,~~ that depend on water chemistry, ~~hardness (as mg $CaCO_3$/L)~~ all input parameters shall be determined from a sample taken at the same time that the sample for the contaminant is taken. If not all the input data are available to calculate a criterion, default input values may be used if justified and supported by ecoregional or other watershed data.

BASIS FOR CHANGE: NMED proposes amendments to acknowledge that New Mexico's water quality standards at 20.6.4.900.I NMAC contains numeric criteria calculations that are dependent on more than concurrent hardness as input values. NMED also proposes adding a statement regarding default input values when collection of concurrent data is not feasible and default values are justified and supported.

20.6.4.12.G through 20.6.4.12.H NMAC – No changes proposed.

NMED Exhibit 9

20.6.4.13 GENERAL CRITERIA: General criteria are established to sustain and protect existing or attainable uses of surface waters of the state. These general criteria apply to all surface waters of the state at all times, unless a specified criterion is provided elsewhere in this part. Surface waters of the state shall be free of any water contaminant in such quantity and of such duration as may with reasonable probability injure human health, animal or plant life or property, or unreasonably interfere with the public welfare or the use of property.

20.6.4.13.A through 20.6.4.13.M NMAC – No changes proposed.

N. Wetlands: Only wetlands of the state are subject to this general criterion. Wetlands shall be maintained and protected such that degradation through direct, indirect, or cumulative impacts does not result in the net loss of wetland acreage or biological, chemical, physical, and hydrological functions to the extent that such functions occur, as characterized by state-specific benchmarks. The functions of a wetland that are to be maintained and protected may include:

(1) erosion control through bank and shoreline stabilization;
(2) flood attenuation and flood protection;
(3) sediment and pollutant retention, which prevents or mitigates downstream migration;
(4) groundwater recharge and water storage for future use;
(5) low flow augmentation including baseflow maintenance;
(6) water filtration including removal or storage of nutrients and other contaminants;
(7) propagation or maintenance of aquatic and terrestrial species indigenous to wetlands;
(8) preservation of wildlife habitat including habitat for threatened or endangered species; or
(9) supporting biological diversity.

In addition, wetlands shall be suitable for recreation, wildlife habitat, and use by aquatic life and livestock.

BASIS FOR CHANGE: The above section was added to provide explicit water quality protections for New Mexico's wetlands. Wetlands are unique surface waters that provide important environmental, economic, and social benefits, such as water purification, flood control, groundwater recharge, climate change mitigation, recreation and tourism, infrastructure protection, and crucial habitat for fish, birds, mammals, and other wildlife. These benefits are the result of the unique characteristics of wetlands; however, New Mexico has lost over 50% of its wetlands. Wetlands of New Mexico remain ecologically and economically important. Providing explicit regulatory language to maintain and protect wetland condition is vital for keeping our remaining wetlands healthy and functioning for the benefit of all New Mexicans.

20.6.4.14 SAMPLING AND ANALYSIS:

20.6.4.14.A through 20.6.4.14.B NMAC – No changes proposed.

C. Sampling Procedures:

(1) Streams: Stream monitoring stations below discharges shall be located a sufficient distance downstream to ensure adequate vertical and lateral mixing.

(2) Lakes: Sampling stations in lakes shall be located at least 250 feet from a discharge.

(3) Lakes: Except for the restriction specified in Paragraph (2) of this subsection, lake sampling stations shall be located at any site where the attainment of a water quality criterion is to be assessed. ~~Water quality measurements taken at intervals in the entire water column at a sampling station shall be averaged for the epilimnion, or in the absence of an epilimnion, for the upper one-third of the water column of the lake to determine attainment of criteria, except that attainment of criteria for toxic pollutants shall be assessed during periods of complete vertical mixing, e.g., during spring or fall turnover, or by taking depth-integrated composite samples of the water column.~~

BASIS FOR CHANGE: NMED proposes striking the above section because it is more appropriate to provide this level of detail in Standard Operating Procedures (SOPs) available at:

NMED Exhibit 9

https://www.env.nm.gov/surface-water-quality/sop/. Specifically, this detailed sampling information should and does reside in "SOP 12.1 Lake Sampling," which is reviewed and updated every two years by the NMED SWQB staff with lake sampling and fisheries expertise. Removing this sampling detail from 20.6.4 NMAC to the SOPs provides flexibility to ensure NMED's lake monitoring techniques are aligned with current lake monitoring state of knowledge and best practices, based in part on resident fish species in the specific lake or reservoir being sampled when fisheries data are available.

20.6.4.14.D through 20.6.4.14.F NMAC – No changes proposed.

20.6.4.15 USE ATTAINABILITY ANALYSIS:

20.6.4.15.A NMAC – No changes proposed.

B. Methods for developing a use attainability analysis. A use attainability analysis shall assess the physical, chemical, biological, economic or other factors affecting the attainment of a use. The analysis shall rely on scientifically defensible methods such as the methods described in the following documents:

(1) the United States environmental protection agency's water quality standards handbook and use attainability analysis website for current recommendations and case studies;

(~~1~~2) *Technical Support Manual: Waterbody Surveys And Assessments For Conducting Use Attainability Analyses*, volume I (November 1983) and volume III (November 1984) or latest editions, United States environmental protection agency, office of water, regulations and standards, Washington, D.C., for the evaluation of aquatic life or wildlife uses;

(~~2~~3) the department's *Hydrology Protocol*, latest edition, approved by the commission, for identifying ephemeral, intermittent, and perennial waters; or

(~~3~~4) *Interim Economic Guidance For Water Quality Standards - Workbook*, March 1995, in conjunction with *Clean Water Act Financial Capability Assessment Guidance,* March 2024, United States environmental protection agency, office of water, Washington, D.C. for evaluating economic impacts.

BASIS FOR CHANGE: NMED proposes to add a reference to EPA's WQS Handbook and Use Attainability Analysis website that was updated in 2025. The WQS Handbook provides information on Designated Uses. The website contains information on how to conduct a UAA and provides EPA's collection of guidance documents on the topic in one area.

NMED proposes to include the updated March 2024 version of the CWA Financial Capability Assessment Guidance that was originally published by EPA in February of 2023. This guidance supplements the existing 1995 Interim Economic Guidance for WQS: Workbook and provides a framework for WQS decisions with economic considerations, like UAAs and Temporary Standards.

20.6.4.15.C NMAC – No changes proposed.

D. Process to amend a designated use through a use attainability analysis.

(1) The process for developing a use attainability analysis and petitioning the commission for removing a designated use and establishing the highest attainable use shall be done in accordance with the State's current *Water Quality Management Plan/Continuing Planning Process*.

(2) If the findings of a use attainability analysis, conducted by the department, in accordance with the department's *Hydrology Protocol* (latest edition) demonstrates that federal Clean Water Act Section 101(a)(2) uses, that are not existing uses, are not feasible in an ephemeral water body due to the factor in 40 CFR 131.10(g)(2), the department may consider proceeding with the expedited use attainability analysis process in accordance with the State's current *Water Quality Management Plan/Continuing Planning Process*. The following elements must be met for the expedited use attainability analysis process to be authorized and implemented:

NMED Exhibit 9

(a) The department is the primary investigator of the use attainability analysis;

(b) The use attainability analysis determined, through the application of the *Hydrology Protocol*, that the water being investigated is ephemeral and has no effluent discharges of sufficient volume that could compensate for the low-flow;

(c) The use attainability analysis determined that the criteria associated with the existing uses of the water being investigated are not more stringent than those in 20.6.4.97 NMAC;

(d) The designated uses in 20.6.4.97 NMAC have been determined to be the highest attainable uses for the water being analyzed;

(e) The department posted the use attainability analysis on its water quality standards website and notified its interested parties list of a 30-day public comment period;

(f) The department reviewed and responded to any comments received during the 30-day public comment period ; and

(g) The department submitted the use attainability analysis and response to comments to ~~region 6~~ EPA for technical ~~approval~~review.

(3) If EPA approves the designated use revision(s) under section 303(c) of the Clean Water Act, the water shall be subject to 20.6.4.97 NMAC for federal Clean Water Act purposes. The use attainability analysis, the technical support document, and the applicability of 20.6.4.97 NMAC to the water shall be posted on the department's water quality standards website. The department shall periodically petition the commission to list ephemeral waters under Subsection C of 20.6.4.97 NMAC and to incorporate changes to classified segments as appropriate.

BASIS FOR CHANGE: NMED proposes to remove reference to region 6 of EPA as this level of specificity is not required and does not enhance the practical application of the rule. NMED proposes to change approval to review in paragraph (2)(g). This proposal is based on EPA's recommendation in their Triennial Review Letter submitted to the department on January 19, 2023. This amended language clarifies that EPA will not provide technical approval of a Use Attainability Analysis before the Water Quality Control Commission approves and adopts standards into the NMAC.

NMED proposes to include a new paragraph (3) to conform to NMAC style and formatting guidelines. Include the term designated use and pluralize revision to clarify the element of the Water Quality Standards being amended.

E. Use attainability analysis conducted by an entity other than the department. Any person may submit notice to the department stating their intent to conduct a use attainability analysis.

(1) The ~~proponent~~ notice shall ~~provide such notice along with~~include a work plan supporting the development of a use attainability analysis ~~to~~for the department's ~~and region 6 EPA for~~ review and comment.

(2) Upon approval of the work plan by the department, ~~the proponent shall conduct~~ the use attainability analysis shall be conducted in accordance with the applicable portions of Subsections A through D of this Section and ~~implement~~ public ~~noticing~~notice provided in accordance with the approved work plan.

(3) Work plan elements. The work plan shall identify, at a minimum:

(a) the waterbody of concern and the reasoning for conducting a use attainability analysis;

(b) the source and validity of data to be used to demonstrate whether the current designated use is not attainable;

(c) the factors in 40 CFR 131.10(g) affecting the attainment of that use;

(d) a description of the data being proposed to be used to demonstrate the highest attainable use;

(e) the provisions for consultation with appropriate state and federal agencies;

(f) a description of how stakeholders and potentially affected tribes will be identified and engaged;

(g) a description of the public notice mechanisms to be employed; and

(h) the expected timelines outlining the administrative actions to be taken for a rulemaking petition, pending the outcome of the use attainability analysis.

NMED Exhibit 9

(4) Upon completion of the use attainability analysis, ~~the proponent shall submit~~ the data, findings and conclusions shall be submitted to the department, and ~~provide~~ public notice of the use attainability analysis provided in accordance with the approved work plan.

(5) Pending the conclusions of the use attainability analysis and as described in the approved work plan, the ~~department or the proponent~~ person conducting the use attainability analysis may petition the commission to modify the designated use. ~~The cost of such use attainability analysis shall be the responsibility of the proponent. Subsequent costs associated with the administrative rulemaking process shall be the responsibility of the petitioner.~~

BASIS FOR CHANGE: NMED proposes to remove the term "proponent" from the regulations as it is undefined and may cause confusion in the development of water quality petitions and the administrative rulemaking process. Additionally, all references to the costs of the administrative rulemaking process have been consolidated in 20.6.4.10(F) NMAC.

20.6.4.16 through 20.6.4.97 NMAC – No changes proposed.

20.6.4.98 INTERMITTENT WATERS: All non-perennial surface waters of the state, except those ephemeral waters included under section 20.6.4.97 NMAC, ~~or~~ classified in 20.6.4.101-899 NMAC, or wetlands protected under 20.6.4.13 NMAC.

A. Designated uses: livestock watering, wildlife habitat, marginal warmwater aquatic life and primary contact.

B. Criteria: the use-specific criteria in 20.6.4.900 NMAC are applicable to the designated uses, except that the following site-specific criteria apply: the monthly geometric mean of E. coli bacteria 206 cfu/100 mL or less, single sample 940 cfu/100 mL or less.

BASIS FOR CHANGE: NMED proposes adding clarification that wetlands are protected under proposed subsection N in 20.6.4.13 NMAC.

20.6.4.99 PERENNIAL WATERS: All perennial surface waters of the state except those classified in 20.6.4.101-899 NMAC, or wetlands protected under 20.6.4.13 NMAC.

A. Designated uses: Warmwater aquatic life, livestock watering, wildlife habitat and primary contact.

B. Criteria: The use-specific criteria in 20.6.4.900 NMAC are applicable to the designated uses, except that the following site-specific criteria apply: the monthly geometric mean of E. coli bacteria 206 cfu/100 mL or less, single sample 940 cfu/100 mL or less.

BASIS FOR CHANGE: NMED proposes adding clarification that wetlands are protected under proposed subsection N in 20.6.4.13 NMAC.

20.6.4.100 through 20.6.4.134 NMAC – No changes proposed.

20.6.4.135 RIO GRANDE BASIN: Bluewater lake and Santa Cruz lake.

A. Designated uses: coldwater aquatic life, irrigation, domestic water supply, primary contact, livestock watering and wildlife habitat.

B. Criteria: The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses except that the following segment-specific criteria apply: phosphorus (unfiltered sample) 0.1 mg/L or less for Bluewater lake; the monthly geometric mean of *E. coli* bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.

BASIS FOR CHANGE: NMED proposes to add Santa Cruz Lake to 20.6.4.135 NMAC based on available temperature, fisheries, and other water quality data; air-water temperature modeling performed during development of the 2024 approved temperature TMDL; and elevation and ecoregion data.

NMED Exhibit 9

20.6.4.136 through 20.6.4.205 NMAC – No changes proposed.

20.6.4.206 PECOS RIVER BASIN: Perennial reaches of the Rio Felix ~~and perennial reaches of tributaries to the Rio Hondo downstream of Bonney canyon, excluding North Spring river~~.

A. Designated uses: irrigation, livestock watering, wildlife habitat, secondary contact and warmwater aquatic life.

B. Criteria:

(1) The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

(2) At all flows above 50 cfs: TDS 14,000 mg/L or less, sulfate 3,000 mg/L or less and chloride 6,000 mg/L or less.

BASIS FOR CHANGE: NMED reviewed available 2021-2022 E. coli and pH data and determined a recreational use change from Secondary Contact to Primary Contact for Berrendo Creek, the only other perennial tributary to the Rio Hondo downstream of Bonney canyon, is warranted. Therefore, "perennial reaches of its tributaries" to the Rio Hondo downstream of Bonney canyon was added to 20.6.4.231 NMAC to assign Primary Contact to both perennial tributaries. No E. coli and pH data were available for perennial reaches of the Rio Felix.

20.6.4.207 NMAC – No changes proposed.

20.6.4.208 PECOS RIVER BASIN: Perennial reaches of the Rio Peñasco above ~~state highway 24 near Dunken~~Bear Canyon, perennial reaches of tributaries to the Rio Peñasco above ~~state highway 24 near Dunken~~Bear Canyon, perennial reaches of Cox canyon, perennial reaches of the Rio Bonito downstream from ~~state highway 48 (near~~ Angus canyon~~)~~, the Rio Ruidoso downstream of ~~the U.S. highway 70 bridge~~Palo Verde canyon near Seeping Springs lakes, perennial reaches of the Rio Hondo upstream from Bonney canyon and perennial reaches of Agua Chiquita.

A. Designated uses: fish culture, irrigation, livestock watering, wildlife habitat, coldwater aquatic life and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: temperature 30°C (86°F) or less, and phosphorus (unfiltered sample) less than 0.1 mg/L.

BASIS FOR CHANGE: NMED proposes changing segment breaks from "state highway 24 near Dunken" to "Bear Canyon," from "state highway 48 (near Angus Canyon)" to "Angus Canyon," and from "U.S. highway 70 bridge" to "Palo Verde Canyon" because water quality segment breaks should be described by hydrologic features rather than road crossings wherever possible.

20.6.4.209 PECOS RIVER BASIN: Perennial reaches of Eagle creek upstream of Alto dam to the Mescalero Apache boundary, perennial reaches of the Rio Bonito upstream of ~~state highway 48 (near~~ Angus canyon~~)~~ excluding Bonito lake, perennial reaches of tributaries to the Rio Bonito upstream of ~~state highway 48 (near~~ Angus canyon~~)~~, perennial reaches of the Rio Ruidoso upstream of ~~the U.S. highway 70 bridge~~Palo Verde canyon near Seeping Springs lakes above and below the Mescalero Apache boundary and perennial reaches of tributaries to the Rio Ruidoso upstream of ~~the U.S. highway 70 bridge~~Palo Verde canyon near Seeping Springs lakes above and below the Mescalero Apache boundary.

A. Designated uses: domestic water supply, high quality coldwater aquatic life, irrigation, livestock watering, wildlife habitat, public water supply and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: specific conductance 600 µS/cm or less in Eagle creek, 1,100 µS/cm or less in Bonito creek and 1,500 µS/cm or less in the Rio Ruidoso; phosphorus (unfiltered sample) less than 0.1 mg/L; the monthly geometric mean of *E. coli* bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.

NMED Exhibit 9

BASIS FOR CHANGE: NMED proposes changing segment breaks from "state highway 24 near Dunken" to "Bear Canyon," from "state highway 48 (near Angus Canyon)" to "Angus Canyon," and from "U.S. highway 70 bridge" to "Palo Verde Canyon" because water quality segment breaks should be described by hydrologic features rather than road crossings wherever possible.

20.6.4.210 through 20.6.4.212 NMAC – No changes proposed.

20.6.4.213 PECOS RIVER BASIN: McAllister lake.

A. Designated uses: coldwater aquatic life, ~~secondary~~ primary contact, livestock watering and wildlife habitat.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criterion applies: temperature 25°C (77°F) or less.

BASIS FOR CHANGE: NMED reviewed available 2001 E. coli and pH data and determined a recreational use change from Secondary Contact to Primary Contact is warranted. There is also regular recreation and public access at this lake.

20.6.4.214 through 20.6.4.218 NMAC – No changes proposed.

20.6.4.219 PECOS RIVER BASIN: Avalon reservoir.

A. Designated uses: irrigation storage, livestock watering, wildlife habitat, ~~secondary~~ primary contact and warmwater aquatic life.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

BASIS FOR CHANGE: NMED reviewed all available E. coli and pH data to determine if a recreational use change from Secondary Contact to Primary Contact is warranted. Although no data could be located, recreation occurs regularly in this lake with BLM public access. Management at nearby Brantley Lake reports that this lake has "… a lot of public use including paddle boarding and kayaking, as well as high traffic for fishing and swimming. This reservoir does have a boat ramp, but limited use for big boats due to its shallow nature." NMED is collecting E. coli and pH data.

20.6.4.220 through 20.6.4.230 NMAC – No changes proposed.

20.6.4.231 PECOS RIVER BASIN: The main stem of the Pecos river from the headwaters of Brantley reservoir upstream to Salt creek (near Acme), perennial reaches of the Rio Peñasco downstream from ~~state highway 24 near Dunken~~ Bear canyon, ~~perennial reaches of North Spring river and~~ perennial reaches of the Rio Hondo and perennial reaches of its tributaries downstream of Bonney canyon.

A. Designated uses: irrigation, livestock watering, wildlife habitat, primary contact and warmwater aquatic life.

B. Criteria:

(1) The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

(2) At all flows above 50 cfs: TDS 14,000 mg/L or less, sulfate 3,000 mg/L or less and chloride 6,000 mg/L or less.

BASIS FOR CHANGE: NMED reviewed available 2021-2022 E. coli and pH data and determined a recreational use change from Secondary Contact to Primary Contact for Berrendo Creek, the only other perennial tributary to the Rio Hondo downstream of Bonney canyon, is warranted. Therefore, "perennial reaches of its tributaries" to the Rio Hondo downstream of

NMED Exhibit 9

Bonney canyon was added, and "perennial reaches of North Spring river" was removed, to assign Primary Contact to both perennial tributaries.

NMED also proposes changing the segment break from "state highway 24 near Dunken" to "Bear Canyon" because water quality segment breaks should be described by hydrologic features rather than road crossings wherever possible.

20.6.4.232 through 20.6.4.306 NMAC – No changes proposed.

20.6.4.307 CANADIAN RIVER BASIN: Perennial reaches of the Mora river from the USGS gaging station near Shoemaker upstream to the state highway 434 bridge in Mora, all perennial reaches of tributaries to the Mora river downstream from the USGS gaging station at La Cueva in San Miguel and Mora counties except ~~lakes~~ waters identified in 20.6.4.309 NMAC or 20.6.4.313 NMAC, perennial reaches of Ocate creek downstream of Ocate, perennial reaches of tributaries to Ocate creek downstream of Ocate, and perennial reaches of Rayado creek downstream of Miami lake diversion in Colfax county.

A. Designated uses: marginal coldwater aquatic life, warmwater aquatic life, primary contact, irrigation, livestock watering and wildlife habitat.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

BASIS FOR CHANGE: NMED proposes this revision because the entire Coyote Creek was covered by both this section and section 309 as written. Coyote Creek from the Mora River to Amola Ridge is predominantly in Level 4 Ecoregion 26I (Upper Canadian Plateau) and the corresponding Xeric sedimentation class. Thermograph data (2015) met MCWALU criteria (Tmax 27.3C). AWTC modeling results (1980-2010 input dataset) indicate attainment of MCWALU criteria (Tmax 25.2C, 6T3 21.0C). Therefore, this is the appropriate segment for this reach of Coyote Creek.

20.6.4.308 CANADIAN RIVER BASIN: Charette lakes.

A. Designated uses: coldwater aquatic life, warmwater aquatic life, ~~secondary~~ primary contact, livestock watering and wildlife habitat.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

BASIS FOR CHANGE: NMED reviewed available 2015-2016 E. coli and pH data and determined a recreational use change from Secondary Contact to Primary Contact is warranted. There is also public access with regular recreation occurring at this lake.

20.6.4.309 CANADIAN RIVER BASIN: The Mora river and perennial reaches of its tributaries upstream from the state highway 434 bridge in Mora except lakes identified in 20.6.4.313 NMAC, all perennial reaches of tributaries to the Mora river upstream from the USGS gaging station at La Cueva, perennial reaches of Coyote creek~~,~~ upstream of Amola ridge and perennial reaches of tributaries to Coyote creek upstream to Amola ridge, the Cimarron river above state highway 21 in Cimarron, perennial reaches of tributaries to the Cimarron river above state highway 21 in Cimarron except Eagle Nest lake, all perennial reaches of tributaries to the Cimarron river north and northwest of highway 64 except north and south Shuree ponds, perennial reaches of Rayado creek above Miami lake diversion, perennial reaches of tributaries to Rayado creek above Miami lake diversion, Ocate creek and perennial reaches of its tributaries upstream of Ocate, perennial reaches of the Vermejo river upstream from Rail canyon and all other perennial reaches of tributaries to the Canadian river northwest and north of U.S. highway 64 in Colfax county unless included in other segments.

NMED Exhibit 9

A. Designated uses: domestic water supply, irrigation, high quality coldwater aquatic life, livestock watering, wildlife habitat, and primary contact; and public water supply on the Cimarron river upstream from Cimarron, on perennial reaches of Rayado creek and on perennial reaches of tributaries to Rayado creek.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: specific conductance 500 µS/cm or less; the monthly geometric mean of *E. coli* bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.

BASIS FOR CHANGE: NMED proposes this revision because the entire Coyote Creek was covered by both this section and section 307 as written. See segment 307 Basis for Change.

20.6.4.310 through 20.6.4.317 NMAC – No changes proposed.

20.6.4.318 CANADIAN RIVER BASIN: Doggett creek.

A. Designated uses: Warm water aquatic life, livestock watering, wildlife habitat and primary contact.

B. Criteria: The use-specific criteria in 20.6.4.900 NMAC are applicable to the designated uses, except that the following site-specific criteria apply: the monthly geometric mean of E. coli bacteria 206 cfu/100 mL or less, single sample 940 cfu/100 mL or less.

C. Discharger-specific temporary standard:

(1) Discharger: City of Raton wastewater treatment plant

(2) NPDES permit number: NM0020273, Outfall 001

(3) Receiving waterbody: Doggett creek, 20.6.4.318 NMAC

(4) Discharge latitude/longitude: 36° 52' 13.91" N / 104° 25' 39.18" W

(5) Pollutant(s): nutrients; total nitrogen and total phosphorus

(6) Factor of issuance: substantial and widespread economic and social impacts (40 CFR 131.10(g)(6))

(7) Highest attainable condition: interim effluent condition of 8.0 mg/L total nitrogen and 1.6 mg/L total phosphorus as 30-day averages. The highest attainable condition shall be either the highest attainable condition identified at the time of the adoption, or any higher attainable condition later identified during any reevaluation, whichever is more stringent (40 CFR 131.14(b)(1)(iii)).

(8) Effective date of temporary standard: ~~This temporary standard becomes~~ effective for Clean Water Act purposes on ~~the date of EPA approval~~ July 24, 2020.

(9) Expiration date of temporary standard: no later than 20 years from the effective date.

(10) Reevaluation period: at each succeeding review of water quality standards and at least once every five years from the effective date of the temporary standard (Paragraph (8) of Subsection H of 20.6.4.10 NMAC, 40 CFR 131.14(b)(1)(v)). If the discharger cannot demonstrate that sufficient progress has been made the commission may revoke approval of the temporary standard or provide additional conditions to the approval of the temporary standard. If the reevaluation is not completed at the frequency specified or the Department does not submit the reevaluation to EPA within 30 days of completion, the underlying designated use and criterion will be the applicable water quality standard for Clean Water Act purposes until the Department completes and submits the reevaluation to EPA. Public input on the reevaluation will be invited during NPDES permit renewals or triennial reviews, as applicable, in accordance with the State's most current approved water quality management plan and continuing planning process.

(11) Timeline for proposed actions. Tasks and target completion dates are listed in the most recent, WQCC-approved version of the New Mexico Environment Department, Surface Water Quality Bureau's "Nutrient Temporary Standards for City of Raton Wastewater Treatment Plant, NPDES No. NM0020273 to Doggett Creek."

BASIS FOR CHANGE: The Temporary Standard became effective upon EPA's approval on July 24, 2020. NMED proposes this amendment to reflect the now established effective date.

NMED completed its reevaluation of the Raton Temporary Standard and presented its findings to the WQCC at its regular meeting on May 13, 2025. NMED found that the social and economic impact from installing controls to meet the underlying standard remained the same (40 CFR

NMED Exhibit 9

131.10(g)(6)). Additionally, the Highest Attainable Condition (HAC), reflected by the interim effluent condition for Total Nitrogen and Total Phosphorus, remained the same and implementation of a Pollutant Minimization Program should continue. Monitoring data from 2020-2024 showed a slight improvement in nutrient levels in Doggett Creek, but not enough to meet the underlying Water Quality Standard in the future. The WQCC adopted a resolution to continue the Temporary Standard and incorporate an updated actions and implementation schedule into the NPDES permit in the renewal process expected to begin in July 2025. NMED has submitted its reevaluation to EPA and remains in communication with them. Public comment on the Raton NPDES permit renewal will occur through separate processes from EPA (permit issuance) and NMED (401 permit certification). For more information visit https://www.env.nm.gov/surface-water-quality/ts-raton/.

20.6.4.319 through 20.6.4.402 NMAC – No changes proposed.

20.6.4.403 SAN JUAN RIVER BASIN: The Animas river from its confluence with the San Juan river upstream to Estes arroyo.

A. Designated uses: Public water supply, industrial water supply, irrigation, livestock watering, wildlife habitat, coolwater aquatic life, and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses~~, except that the following segment-specific criterion applies: temperature 29°C (84.2°F) or less~~.

BASIS FOR CHANGE: NMED Proposes to remove this segment-specific criteria because this is the default temperature for Coolwater aquatic life use per 20.6.4.900.H(4) NMAC so it is unnecessary.

20.6.4.404 through 20.6.4.501 NMAC – No changes proposed.

20.6.4.502 GILA RIVER BASIN: The main stem of the Gila river from Redrock canyon upstream to the confluence of the West Fork Gila river and East Fork Gila river and perennial reaches of tributaries to the Gila river downstream of Mogollon creek.

A. Designated uses: industrial water supply, irrigation, livestock watering, wildlife habitat, marginal coldwater aquatic life, and primary contact~~ and warmwater aquatic life~~.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criterion applies: 28°C (82.4°F) or less.

BASIS FOR CHANGE: NMED proposes removing the warmwater aquatic life use based on a thorough review and analysis of existing fisheries data, thermograph data, air-water temperature correlation (AWTC) modeling, and recreational fishing information. The Gila River from Mogollon Creek to Red Rock is predominantly in Level 4 Ecoregion 23b (Madrean Lower Montane Woodlands) and the corresponding Foothills sedimentation class. Thermograph data (2007, 2019, 2020) along this reach primarily indicate attainment of the WWALU default criteria, but there was evidence of attainment of the CoolWALU default criteria in the upper reaches of the section in 2007 (TMAX ~28°C). AWTC modeling results (1980-2010 input dataset) also indicate meeting WWALU criteria.

Despite both the predicted and actual water temperature values trending warmer, fisheries species and length data from Iron Bridge, Cherokee Canyon, and Ash Canyon document a fish assemblage dominated by transitional species — those whose temperature tolerances are intermediate between warmwater and coldwater taxa. The proportion of coldwater species

NMED Exhibit 9

increased from the 1980s to the 2020s. Additionally, fish size-class data indicate that the reach supports propagation of both coldwater and transitional species.

Removing the warmwater aquatic life use results in no change to applicable criteria because the most stringent criteria is used for Clean Water Act purposes (e.g. 303(d), permitting, TMDLs, etc.).

20.6.4.503 GILA RIVER BASIN: All perennial tributaries to the Gila river upstream of and including Mogollon creek.

A. Designated uses: domestic water supply, high quality coldwater aquatic life, irrigation, livestock watering, wildlife habitat and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: specific conductance of 400 µS/cm or less for all perennial tributaries except West Fork Gila and tributaries thereto, specific conductance of 300 µS/cm or less; ~~32.2~~ 29°C (~~90~~84°F) or less in the east fork of the Gila river and Sapillo creek downstream of Lake Roberts; the monthly geometric mean of E. coli bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.

BASIS FOR CHANGE: NMED proposes lowering the segment-specific temperature criterion for East Fork Gila River and Sapillo Creek downstream of Lake Roberts of 32.2°C (90°F) to 29°C (84°F) based on a thorough review and analysis of existing fisheries data, thermograph data, air-water temperature correlation (AWTC) modeling, and recreational fishing information.

East Fork Gila River downstream of Taylor Creek is predominantly in Level 4 Ecoregion 23 (Conifer Woodlands and Savannas) and the corresponding Foothills sedimentation site class. Fisheries species and size class data for coldwater and transitional fish species Falls Spring area 1980 to present documents a predominance of transitional species, with a small proportion of propagating coldwater species no longer present post 2010. Thermograph data (2007, 2019) document attainment of the CoolWAL default criteria in 2019 (TMAX ~28°C). AWTC modeling (1980-2010 input dataset) indicate attainment of the MCWAL default criteria across the entire reach (TMAX ~28°C and 6T3 ~24°C). Recreational fishing information document presence of smallmouth bass (transitional species) and channel catfish (warmwater species).

Sapillo Creek is in Level 4 Ecoregion 23b (Madrean Lower Montane Woodlands) and the corresponding Foothills sedimentation site class. Thermograph data (2007) document attainment of HQCWAL default criteria (TMAX ~22°C). The very low temperatures are likely due to thermograph placement below the dam and may not be representative of the entire reach. AWTC modeling (1980-2010 input dataset) indicate attainment of the MCWAL default criteria (TMAX ~27°C, 6T3 ~23°C). Recreational fishing information document presence of wild brown and rainbow trout, and stocked Gila trout. The presence of wild trout indicate thermal conditions support propagation of coldwater fish species.

Thermograph data and AWTC modeling in combination with the fisheries data and recreational fishing reports indicate a segment-specific temperature criterion of 29°C (84°F) is existing and attainable for East Fork Gila River and Sapillo Creek downstream of Lake Roberts.

20.6.4.504 through 20.6.4.600 NMAC – No changes proposed.

NMED Exhibit 9

20.6.4.601 SAN FRANCISCO RIVER BASIN: The main stem of the San Francisco river from the New Mexico-Arizona line upstream to ~~state highway 12 at Reserve~~ the confluence with Largo canyon and perennial reaches of Mule creek.

A. Designated uses: irrigation, ~~marginal warmwater and~~ marginal coldwater aquatic life, livestock watering, wildlife habitat and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

BASIS FOR CHANGE: NMED proposes moving the segment break from "state highway 12 at Reserve" approximately 0.65 miles downstream to "the confluence with Largo Canyon" because water quality segment breaks should be described by hydrologic features rather than road crossings wherever possible. See the BASIS FOR CHANGE at 20.6.4.602 NMAC for additional information.

In addition, NMED proposes removing the marginal warmwater aquatic life use based on a thorough review and analysis of existing fisheries data, thermograph data, air-water temperature correlation (AWTC) modeling, and recreational fishing information. The San Francisco River running from Box Canyon to Whitewater Creek is in Level 4 Ecoregion 23b (Madrean Lower Montane Woodlands) and the corresponding Foothills sedimentation class. Thermograph data (2019 & 2020) along this reach indicate attainment of the MCWAL default criteria (TMAX ~28, 6T3 ~23). AWTC modeling results (1980-2010 input dataset) indicate attainment of the WWAL criteria (TMAX ~30). Fisheries species and size class data from near Whitewater Creek document a predominantly transitional assemblage with a smaller proportion of coldwater species. Additionally, fish size class data indicate that the reach supports propagation of both coldwater and transitional species.

Removing the warmwater aquatic life use results in no change to applicable criteria because the most stringent criteria are used for Clean Water Act purposes (e.g. 303(d), permitting, TMDLs, etc.).

20.6.4.602 SAN FRANCISCO RIVER BASIN: The main stem of the San Francisco river from ~~state highway 12 at Reserve~~ the confluence with Largo canyon upstream to the New Mexico-Arizona line.

A. Designated uses: coldwater aquatic life, irrigation, livestock watering, wildlife habitat and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criterion applies: temperature 25°C (77°F) or less.

BASIS FOR CHANGE: NMED proposes moving the segment break from "state highway 12 at Reserve" approximately 0.65 miles downstream to "the confluence with Largo Canyon" because water quality segment breaks should be described by hydrologic features rather than road crossings wherever possible.

20.6.4.603 through 20.6.4.899 NMAC – No changes proposed.

20.6.4.900 CRITERIA APPLICABLE TO EXISTING, DESIGNATED OR ATTAINABLE USES UNLESS OTHERWISE SPECIFIED IN 20.6.4.97 THROUGH 20.6.4.899 NMAC:

20.6.4.900.A through 20.6.4.900.C NMAC – No changes proposed.

NMED Exhibit 9

D. Primary contact: The monthly geometric mean of E. coli bacteria of 126 cfu/100 mL or MPN/100 ml, a single sample of E. coli bacteria of 410 cfu/100 mL or MPN/100 mL, a single sample of total microcystins of 8 µg/L ~~with no more than three exceedances within a 12-month period~~ and a single sample of cylindrospermopsin of 15 µg/L ~~with no more than three exceedances within a 12-month period~~, and pH within the range of 6.6 to 9.0 apply to this use. The results for *E. coli* may be reported as either colony forming units (CFU) or the most probable number (MPN) depending on the analytical method used.

BASIS FOR CHANGE: NMED proposes retaining the water quality criteria associated with harmful algal blooms (HABs) in the standards but removing the assessment methodology for microcsystins and cylindrospermopsin. Cyanotoxins are emerging contaminants and the science, technology, and best practices for monitoring them are evolving. Primary contact is a designated use addressing health risks during recreation on the water and criteria are critical for evaluating whether the water conditions are safe for recreation. HABs are unpredictable, are difficult to monitor, and can become a concern very quickly. Removing the assessment methodology allows NMED to keep up with the evolving science regarding cyanotoxin monitoring and assessment to ensure New Mexico's waters are safe for recreation and respond quickly to communicate potential risk to the public.

20.6.4.900.E through 20.6.4.900.G NMAC – No changes proposed.

H. Aquatic life: Surface waters of the state with a designated, existing or attainable use of aquatic life shall be free from any substances at concentrations that can impair the community of plants and animals in or the ecological integrity of surface waters of the state. Except as provided in Paragraph (7) of this subsection, the acute and chronic aquatic life criteria set out in Subsections I, J, K and L of this section and the human health-organism only criteria set out in Subsection J of this section are applicable to all aquatic life use subcategories. In addition, the specific criteria for aquatic life subcategories in the following paragraphs apply to waters classified under the respective designations.

(1) High quality coldwater: dissolved oxygen 6.0 mg/L or more, 4T3 temperature 20°C (68°F), maximum temperature 23°C (73°F), pH within the range of 6.6 to 8.8 and specific conductance a segment-specific limit between 300 µS/cm and 1,500 µS/cm depending on the natural background in the particular surface water of the state (the intent of this criterion is to prevent excessive increases in dissolved solids which would result in changes in community structure). Where a single segment-specific temperature criterion is indicated in 20.6.4.101-899 NMAC, it is the maximum temperature and no 4T3 temperature applies.

(2) Coldwater: dissolved oxygen 6.0 mg/L or more, 6T3 temperature 20°C (68°F), maximum temperature 24°C (75°F) and pH within the range of 6.6 to 8.8. Where a single segment-specific temperature criterion is indicated in 20.6.4.101-899 NMAC, it is the maximum temperature and no 6T3 temperature applies.

(3) Marginal coldwater: dissolved oxygen 6 mg/L or more, 6T3 temperature 25°C (77°F), maximum temperature 29°C (84°F) and pH within the range from 6.6 to 9.0. Where a single segment-specific temperature criterion is indicated in 20.6.4.101-899 NMAC, it is the maximum temperature and no 6T3 temperature applies.

(4) Coolwater: dissolved oxygen 5.0 mg/L or more, maximum temperature 29°C (84°F) and pH within the range of 6.6 to 9.0.

(5) Warmwater: dissolved oxygen 5 mg/L or more, maximum temperature 32.2°C (90°F) and pH within the range of 6.6 to 9.0. Where a segment-specific temperature criterion is indicated in 20.6.4.101-899 NMAC, it is the maximum temperature.

(6) Marginal warmwater: dissolved oxygen 5 mg/L or more, pH within the range of 6.6 to 9.0 and temperatures that may routinely exceed 32.2°C (90°F). Where a segment-specific temperature criterion is indicated in 20.6.4.101-899 NMAC, it is the maximum temperature.

(7) Limited aquatic life: pH within the range of 6.0 to 9.0. The acute aquatic life criteria of Subsections I and J of this section apply to this subcategory. Chronic aquatic life criteria do not apply unless adopted on a segment-specific basis. Human health-organism only criteria apply only for persistent toxic pollutants unless adopted on a segment-specific basis.

NMED Exhibit 9

BASIS FOR CHANGE: NMED proposes including a default pH range for limited aquatic life within 6.0 to 9.0 SU in agreement with Technology Based Effluent Limits included in National Pollutant Discharge Elimination System (NPDES) Permits. Limited Aquatic life applies to waters listed in sections 97, 124, 128,136 and 809 of 20.6.4 NMAC. Section 136 waters include Primary Contact designated use and have existing pH criteria of 6.6 – 9.0 per 20.6.4.900.D NMAC. The most stringent criteria apply to waters with criteria for the same parameter for multiple designated uses; therefore, 6.6 – 9.0 would remain the applicable criteria for Section 136. In addition, literature shows that a pH range of 6.0 to 9.0 provides adequate protection for the life of freshwater fish and bottom-dwelling macroinvertebrates and a pH range of 5.0-9.0 is not directly lethal. Outside this range, aquatic life populations would be reduced and growth or reproduction impacted until lethal levels are reached (USEPA 1986; Robertson-Bryan, Inc. 2004). For more information regarding pH criteria see US EPA Quality Criteria for Water at https://www.epa.gov/sites/production/files/2018-10/documents/quality-criteria-water-1986.pdf and Road, W., and E. Grove. 2004. pH Requirements of Freshwater Aquatic Life. Technical Memorandum, Robertson-Bryan Inc., Central Valley California Water Resources Control Board.

20.6.4.900.I NMAC – No changes proposed.

J. Use-specific numeric criteria.

(1) Table of numeric criteria: The following table sets forth the numeric criteria in µg/L, unless otherwise indicated, applicable to existing, designated and attainable uses. For metals, criteria represent the total sample fraction unless otherwise specified in the table. Additional criteria that are not compatible with this table are found in Subsections A through I and K through M of 20.6.4.900 NMAC.

(2) Notes applicable to the table of numeric criteria in Paragraph (1) of this subsection.

(a) Where the letter "a" is indicated in a cell, the criterion is based on receiving water characteristics and can be referenced in Subsection I of 20.6.4.900 NMAC.

(b) Where the letter "b" is indicated in a cell, the criterion can be referenced in Subsection C of 20.6.4.900 NMAC.

~~**(c)** Criteria are in µg/L unless otherwise indicated.~~

(~~d~~c) Abbreviations are as follows: CAS - chemical abstracts service (see definition for "CAS number" in 20.6.4.7 NMAC); DWS - domestic water supply; Irr/Irr storage- irrigation and irrigation storage; LW - livestock watering; WH - wildlife habitat; HH-OO - human health-organism only; C – criteria based on cancer-causing endpoint; P - persistent toxic pollutant.

(~~e~~d) The criteria are based on analysis of an unfiltered sample unless otherwise indicated. The acute and chronic aquatic life criteria for aluminum are based on analysis of total recoverable aluminum in a sample that is filtered to minimize mineral phases as specified by the department.

NMED Exhibit 9

(~~f~~e) The criteria listed under human health-organism only (HH-OO) are intended to protect human health when aquatic organisms are consumed from waters containing pollutants. These criteria do not protect the aquatic life itself; rather, they protect the health of humans who ingest fish or other aquatic organisms.

(~~g~~f) The dioxin criteria apply to the sum of the dioxin toxicity equivalents expressed as 2,3,7,8-TCDD dioxin.

(~~h~~g) The criteria for polychlorinated biphenyls (PCBs) apply to the sum of all congeners, to the sum of all homologs or to the sum of all aroclors.

(~~i~~h) The acute and chronic aquatic life criteria for dissolved aluminum only apply when the concurrent pH is less than 6.5 or greater than 9.0 S.U. If the concurrent pH is between 6.5 and 9.0 S.U. then the hardness-dependent total recoverable aluminum criteria in Paragraphs (1) and (2) of Subsection I of 20.6.4.900 NMAC apply.

(i) Selenium water column criteria include 30-day mean dissolved selenium concentrations for lentic systems, including lakes and impoundments, and lotic systems, including rivers and streams.

BASIS FOR CHANGE: NMED proposes several non-substantive changes to more prominently and uniformly display units for the table. Scientific notation applied to values less than 0.0001 and equal to or greater than 100,000 for ease of reading and uniformity with existing criteria in scientific notation. Changes to lettering as the result of moving note 2(c) to paragraph (1) proceeding the table.

New aquatic life use criteria

Per- and poly- fluoroalkyl substances (PFAS): NMED proposes to adopt EPA recommended acute and chronic 304(a) criteria for perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS) aquatic life uses. EPA published final freshwater aquatic life criteria for acute and chronic PFOA and PFOS exposure (Federal Register Vol. 89, pp 81077-81079, October 7, 2024). EPA developed chronic and acute freshwater-based criteria and chronic tissue-based criteria for PFOA and PFOS. Chronic freshwater-based and chronic tissue-based criteria are independently applicable and no one criterion takes primacy.

PFAS, including PFOA and PFOS, are human-made organic chemicals that are persistent in the environment and are found in environmental samples worldwide. At elevated concentrations, PFOA and PFOS are toxic to aquatic species, including fish. Due to the widespread distribution and toxic effects of PFOA and PFOS, NMED recommends adoption of EPA's recommended criteria to protect aquatic life.

Selenium: NMED proposes to adopt EPA recommended 304(a) chronic criteria for selenium aquatic life uses. EPA published selenium aquatic life criteria in 2016 (Federal Register Vol. 81, pp 45285-45287, July 13, 2016), but NMED elected not to adopt new criteria during previous triennial review due to lack of EPA implementation guidance to states or tribes. In 2024, EPA published technical support documents for the adoption and implementation of selenium water quality standards.

Selenium is a naturally occurring element that can enter surface waters from natural or anthropogenic sources. Selenium bioaccumulates in aquatic organisms and at high concentrations can cause reproductive impairment of egg-laying species like fish. Due to the negative effects of high concentrations of selenium to aquatic organisms, including fish

NMED Exhibit 9

propagation. NMED recommends adoption of EPA's recommended criteria to protect aquatic life.

New criteria for Domestic Water Supply (DWS) designated use proposed based on an EPA Maximum Contaminant Level (MCL) or Treatment Technique established under the National Primary Drinking Water Regulations. DWS criteria are only adopted for chemicals with an EPA recommended 304(a) criteria.

NMED proposes to review and update designations of persistent toxic pollutants in the numeric criteria table.

20.6.4.900.K NMAC – No changes proposed.

L. The acute aquatic life criteria for TAN (mg/L) was derived by the EPA (2013) as the one-hour average concentration of TAN mg/L that shall not be exceeded more than once every three years on average. The EPA acute criterion magnitude was derived using the following equation:

Acute TAN Criterion Magnitude for 1-hour average=

$$\text{MIN}\left(\left(\frac{0.275}{1+10^{7.204-pH}}+\frac{39}{1+10^{pH-7.204}}\right),\left(0.7249\text{x}\left(\frac{0.0114}{1+10^{7.204-pH}}+\frac{1.6181}{1+10^{pH-7.204}}\right)\text{x}\left(23.12\times 10^{0.036(20-T)}\right)\right)\right)$$

*T (*temperature C) and *pH* are defined as the paired values associated with the TAN sample.

(1) Temperature and pH-dependent values of the acute TAN criterion magnitude -when *Oncorhynchus* spp. absent.

BASIS FOR CHANGE: NMED proposes to remove unnecessary language in the initial paragraph of Section 901. NMED proposes adding the most recent edition of Standard Methods

NMED Exhibit 9

for the Examination of Water and Wastewater. This addition results in the re-lettering of the subsequent references to 20.6.4.901.F through 20.6.4.901.O NMAC. NMED proposes to update the Colorado River Basin Salinity Control Forum to the most recent version.

NMED Exhibit 9

From: New Mexico Environment Department
To: Baca, Michael, ENV
Subject: 2026 Triennial Review – Draft Amendments and Public Comment Period
Date: Friday, August 15, 2025 12:05:45 PM

Surface Water Quality Bureau

SWQB logo

Our mission is to preserve, protect, and improve New Mexico's surface water quality for present and future generations.

Oficina de Calidad de Aguas Superficiales

Nuestra misión es preservar, proteger y mejorar la calidad de las aguas superficiales de Nuevo México para las generaciones presentes y futuras.

The New Mexico Environment Department's (NMED) Surface Water Quality Bureau (SWQB) invites the public to comment on NMED's draft amendments to the State's Standards for Interstate and Intrastate Surface Waters, 20.6.4 New Mexico Administrative Code (NMAC). **The 60-day public comment period for the draft amendments begins August 15, 2025 and closes October 14, 2025.**

Please note that comments submitted to NMED SWQB on the Public Review Draft are for further developing the draft amendments prior to petitioning the Water Quality Control Commission for a rulemaking hearing. An additional public comment period will be held in conjunction with the rulemaking hearing pursuant to 20.1.6.204(B) NMAC.

Background

It is the objective of the federal Clean Water Act (CWA) to restore and maintain the chemical, physical, and biological integrity of the nation's waters, including those in New Mexico. As part of upholding the objective of the CWA, the State of New Mexico is required by statute to adopt water quality standards that protect the public health or welfare and enhance the quality of water, and are consistent with and serve the purposes of the New Mexico Water Quality Act (WQA) and the federal CWA. New Mexico's surface water quality standards are codified under 20.6.4 NMAC.

In accordance with Section 303(c)(1) of the CWA and 20.6.4.10 NMAC, States are required to hold public hearings at least once every three years to review, amend, and adopt water quality standards, as applicable. This is referred to as a "Triennial Review." Pursuant to Section 74-6-4(F) of the WQA, the Water Quality Control Commission (WQCC) delegated NMED the responsibility for organizing and proposing amendments to the state's surface water quality standards.

The last Triennial Review of the state's surface water quality standards was approved by the U.S. Environmental Protection Agency in January 2023. Therefore, NMED is initiating the current Triennial Review process by providing NMED's draft amendments to the public for comment. NMED intends to consider public comments and petition the WQCC by the end of 2025 for a hearing in the second half of 2026.

How to participate

Comments will be accepted via mail, email, and NMED's smart comment portal at https://nmed.commentinput.com/comment/search. The public review draft and all other related information may be found on NMED's website through the Smart Comment Portal or at https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. The public review draft contains draft amendments to the regulatory language along with rationale for each amendment.

For more information and to submit comments contact Michael Baca, Water Quality Standards Coordinator, NMED SWQB, P.O. Box 5469, Santa Fe, NM, 87502, (505) 470-1652 or michael.baca1@env.nm.gov. To stay up to date with the latest news from NMED, please sign up for our listserv at https://public.govdelivery.com/accounts/NMED/subscriber/new?topic_id=NMED_4.

Public Meeting

In addition, NMED SWQB will be hosting a virtual informational meeting via WebEx to present and discuss the draft amendments to the State's Standards for Interstate and Intrastate Surface Waters, 20.6.4 NMAC, and provide a forum for interested parties and the public to ask questions. Information regarding this meeting is as follows:

Wednesday, September 10, 2025 at 5:30 pm

To connect via video conference, go to: https://nmed-oit.webex.com/nmed-oit/j.php?MTID=mcef4d38bc6992f8d56094eb92a5cbe4d

Meeting number/access code:2861 793 5532
Password: XFer7qTYf32
Join by phone:+1-415-655-0001 US Toll

If you have difficulties logging on to the meeting at the scheduled time, please contact Lynette Guevara at 505-629-8811 or lynette.guevara@env.nm.gov.

Persons having a disability or requiring assistance or auxiliary aid to participate in this public process should contact the NMED Human Resources Bureau at least 10 days before any scheduled meeting, by mail at P.O. Box 5469, 1190 St. Francis Drive, Santa Fe, New Mexico, 87502, telephone 505-487-0348. TDD or TDY users please access HRB via the New Mexico Relay Network at 1-800-659-8331.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, you may contact:

Kate Cardenas, Non-Discrimination Coordinator
New Mexico Environment Department
1190 St. Francis Dr., Suite N4050
P.O. Box 5469
Santa Fe, NM 87502
(505) 827-2855

If you believe that you have been discriminated against with respect to a NMED program or activity, you may contact the Non-Discrimination Coordinator identified above.

La Oficina de Calidad de Aguas Superficiales (SWQB, por sus siglas en inglés) del Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés) invita al público a que hagan comentarios sobre las enmiendas propuestas por el NMED a los Estándares Estatales para Aguas Superficiales Interestatales y Estatales, 20.6.4 Código Administrativo de Nuevo México (NMAC, por

sus siglas en inglés). **El período de 60 días de comentarios públicos para las enmiendas propuestas comienza el 15 de augusto de 2025 y se cierra el 14 de octubre de 2025.**

Tenga en cuenta que los comentarios presentados a NMED SWQB sobre el Borrador de Comentarios Públicos son para la consideración de NMED SWQB en el desarrollo adicional de las enmiendas propuestas antes de las fechas límite de la audiencia preliminar para presentar testimonios técnicos. Los comentarios destinados a formar parte del registro de audiencia de la WQCC 20-51 (R) deberán enviarse al administrador de audiencias de la WQCC de conformidad con el 20.1.6.204(B) NMAC.

El objetivo de la Ley Federal de Agua Limpia (CWA, por sus siglas en inglés) es restaurar y mantener la integridad química, física y biológica de las aguas del país, incluidas las de Nuevo México. Como parte de la defensa del objetivo de la CWA, el Estado de Nuevo México está obligado por ley a adoptar normas de calidad del agua que protejan la salud o el bienestar público y mejoren la calidad del agua, y que sean consistentes y sirvan a los propósitos de la Ley de Calidad del Agua de Nuevo México (WQA, por sus siglas en inglés) y la CWA federal. Los Estándares de calidad de las aguas superficiales de Nuevo México están codificadas en 20.6.4 NMAC.

De conformidad con la Sección 303 (c)(1) de la CWA y 20.6.4.10 NMAC, los estados están obligados a celebrar audiencias públicas al menos una vez cada tres años para revisar, enmendar y adoptar estándares de calidad del agua, según proceda. Esto se conoce como "Revisión Trienal". De conformidad con la Sección 74-6-4(F) de la WQA, la Comisión de Control de la Calidad del Agua (WQCC, por sus siglas en inglés) delegó al NMED la responsabilidad de organizar y proponer enmiendas a los Estándares de calidad de las aguas superficiales del estado.

La última revisión trienal de los Estándares de calidad de las aguas superficiales del estado fue aprobada por la Agencia de Protección Ambiental de los Estados Unidos en enero de 2023. Por lo tanto, el NMED inicio el actual proceso de Revisión Trienal y proporcionando las enmiendas propuestas por el NMED al público para comentarios. NMED entendía solicitar a la WQCC en diciembre de 2025 una fecha de audiencia en la segunda mitad de 2026.

Cómo participar

Los comentarios se aceptarán por correo postal, correo electrónico y el portal de comentarios inteligente de NMED en https://nmed.commentinput.com/comment/search. Las enmiendas propuestas, abiertas a comentarios públicos en este momento, se pueden encontrar en: https://www.env.nm.gov/surface-water-quality/wqs/.

Para más información y presenta comentarios contacta con Michael Baca, Water Quality Standards Coordinator, NMED SWQB, P.O. Box 5469, Santa Fe, NM, 87502, (505) 470-1652 ormichael.baca1@env.nm.gov. Regístrese para recibir actualizaciones del NMED, haga clic aquí https://public.govdelivery.com/accounts/NMED/subscriber/new?topic_id=NMED_4.

Además, NMED-SWQB organizará dos reuniones informativas virtuales a través de WebEx para presentar y discutir las enmiendas propuestas a los Estándares Estatales para Aguas Superficiales Interestatales y Estatales, 20.6.4 NMAC, y proporcionar un foro para que las partes interesadas y el público hagan preguntas. La información sobre estas reuniones es la siguiente:

Miércoles, 10 de septiembre, 2025 a las 5:30 pm

Para conectarse a través de videoconferencia, vaya a: https://nmed-oit.webex.com/nmed-oit/j.php?MTID=mcef4d38bc6992f8d56094eb92a5cbe4d

2026 Triennial Review-Public Meeting
SWQB - Standards and Outreach Team
September 10, 2025

NMED Exhibit 11

What is a Triennial Review?

- Required by Clean Water Act (CWA)
- Review of Surface Water Quality Standards (WQS)
  - 20.6.4 New Mexico Administrative Code (NMAC)
  - consider adopting EPA-recommended CWA Section 304(a) criteria to protect human health and aquatic life
  - review waters lacking CWA Section 101(a)(2) fishable/swimmable uses
    - i.e., Are there new data to support swimmable or fishable uses?
- Modify and adopt WQS as appropriate
- Must occur at least once every three years
- Public hearing in front of the NM Water Quality Control Commission (WQCC)

Water Quality Standards

NMED Exhibit 11

Designated Uses

Images courtesy of U.S. EPA https://www.epa.gov/wqs-tech/designated-uses

- Clean Water Act (CWA) designated uses:
  - Protection and propagation of fish, shellfish, and wildlife
  - Recreation in and on the water
  - Public water supply
  - Agriculture, industry, and navigation
- New Mexico's Designated Uses:
  - Aquatic Life – seven subcategories
  - Recreation - Primary and Secondary Contact
  - Wildlife Habitat
  - Water Supply – Industrial, Domestic, and Public
  - Livestock watering, irrigation/irrigation storage, and fish culture.

NMED Exhibit 11

Criteria

- Numeric Criteria
  - limit or range for a pollutant or physical condition
  - Derived from scientific toxicological studies
  - 20.6.4.900 NMAC – Default values by Designated Use
  - 20.6.4.97 - .899 NMAC - waterbody-specific values

- Narrative Criteria
  - Expressed a verbal statement
  - Referred to as General Criteria at 20.6.4.13 NMAC

Antidegradation

- Framework for maintaining and protecting water quality
  - Tier 1- All Waters of the State
  - Tier 2- Exceptional water quality
  - Tier 3- ONRW

Resources

- 2026 Triennial Review Webpage
  - https://www.env.nm.gov/surface-water-quality/2026-triennial-review/
  - Public Review Draft and supporting documents
  - Links to SmartComment, WQS and WQS Amendments webpages
  - Updated throughout rulemaking process
- Public Review Draft
  - Includes Table of Contents with Sections that include proposed amendments
  - Does not include sections where no amendments are being proposed
  - Track Changes shows proposed amendments then a “Basis for Change” explains the rationale for the amendment

Proposed Amendments - Overview

- 2026 Triennial Review Amendments:
  - Provide clarity and conform to NMAC style and formatting guidelines
  - Add or change definitions
  - Update administrative process
  - Revise designated uses
    - Required to review CWA Section 101(a)(2) fishable/swimmable goals
  - Revise/Adopt criteria
    - CWA Section 304(a) – EPA Recommended criteria

Proposed Amendments-Wetlands

- Definition of "wetlands" (20.6.4.7 NMAC)
  - Recognize wetlands unique functions and features
    - ecological, hydrological, and economic services.
- Narrative standard (20.6.4.13 NMAC)
  - Protect and maintain wetland function and size, and
  - State Permitting – support program development and implementation.
- Antidegradation policy and implementation plan (20.6.4.8 NMAC)

Proposed Amendments-Designated Uses

- Update recreational uses (20.6.4.213, 20.6.4.219, 20.6.4.231, 20.6.4.308 NMAC)
  - Pecos and Canadian River Basins
  - Secondary contact to Primary Contact Use
- Remove warmwater aquatic life use (20.6.4.502, 20.6.4.601 NMAC)
  - Gila and San Francisco river basins
    - Reviewed "dual" aquatic life use segments (cold and warm);
  - Available data support coldwater aquatic life use
    - Fisheries, temperature, and modeling data

Proposed Amendments-Petitioner's Responsibilities

- Administrative rulemaking costs (20.6.4.10 NMAC)
  - Specify "petitioners" are responsible
  - NMED or a third-party can be a petitioner

- Site-specific Criteria (20.6.4.10 NMAC)
  - Third-party demonstrations and requirements
  - In line with other processes to amend standards

Proposed Amendments – Criteria

- PFOA and PFOS (20.6.4.900.J NMAC)
  - CWA Section 304(a) recommended criteria - Aquatic Life Use
    - Water column concentrations,
    - Whole-body tissue concentrations for invertebrates,
    - Whole-body tissue concentrations for fish, and
    - Muscle tissue-only concentrations for fish.

Proposed Amendments - Criteria

- Selenium - Aquatic Life (20.6.4.900.J NMAC)
  - EPA recommended CWA Section 304(a) criteria
- Lead - Domestic Water Supply (20.6.4.900.J NMAC)
  - EPA recommended action level
- pH - Limited Aquatic Life (20.6.4.900.H NMAC)
  - Range supports aquatic life, and
  - in line with technology-based limits
    - NPDES Permitting
- 2,4-D, methoxychlor, and Silvex - Domestic Water Supply (20.6.4.900 NMAC)
  - EPA maximum contaminant level (MCL)

How You Can Participate

- Provide Public Comment to SWQB
  - August 15, 2025 – October 14, 2025
  - Public Comment Portal or email
- Attend WQCC meetings
- Anticipated public notice in newspaper and *NM Register*
  - Winter/Spring 2026
- Provide written or oral comment at WQCC meetings
  - Rulemaking Petition expected late 2025
  - Requesting a 2026 hearing
- Provide expert testimony at WQCC hearing
  - Instructions provided in the public notice of rulemaking
- Provide written comment to WQCC
  - Notice will provide more detail.

Smart Comment Demonstration

https://nmed.commentinput.com/comment/search

Tentative Timeline

- Oct 14, 2025: Public comment period closes
- Dec 9, 2025: Petition WQCC for hearing
- Spring 2026: Provide public notice of hearing
  - WQCC comment period
- Late Summer / Early Fall 2026: Triennial Review hearing

2026 Triennial Review Team

Many people at NMED provided help in preparing and reviewing the proposed amendments including: Lynette Guevara, Nate Reynolds, Emily Miller, Stephani Clark Barkalow, the Watershed Protection Section - Wetlands Team, Brecken Scott, Shelly Lemon.

REGION 6
DALLAS, TX 75270

October 9, 2025

Michael Baca
Standards, Planning & Reporting Team Leader
Surface Water Quality Bureau
New Mexico Environment Department
1190 S. St. Francis Dr.
Santa Fe, NM 87505

Re: New Mexico Environment Department 2026 Triennial Review Public Draft – 20.6.4 NMAC

Dear Mr. Baca:

In response to the New Mexico Environment Department (NMED) announcement and extended public comment period on proposed revisions to the New Mexico *Standards for Interstate and Intrastate Surface Waters*, 20.6.4 New Mexico Administrative Code (NMAC), the Environmental Protection Agency (EPA) Region 6 would like provide comments and recommendations as part of the state's 2026 triennial review process.

The NMED's proposal includes both substantive and non-substantive revisions to New Mexico's water quality standards. The EPA has provided comments and recommendations on the substantive revisions where appropriate. The substantive revisions included definitions that influence implementation, regulatory segment and designated use determinations, and a number of new and revised criteria. The comments and recommendations provided in the enclosed document are intended to address these and other complex issues that may need to be addressed in incremental stages through the state's water quality standards and associated implementation over time. We would like to encourage discussions about these recommendations and suggestions as part the current and future water quality standards program-related planning. Where non-substantive revisions occur, typically grammatical, renumbering or other minor changes that do not alter the context or meaning of a provision, comments are typically not necessary.

It should be noted that the recommendations and suggestions provided here are preliminary and do not represent a finding under §303(c) of the Clean Water Act or Standards Regulation (40 CFR 131). Any decisions on new and revised water quality standards will be made by the EPA Region 6 following their adoption by the New Mexico Water Quality Control Commission and submission to the Region. The EPA would also like to take this opportunity to commend the NMED and the Surface Water Quality Board's efforts in the continuing development of New Mexico's water quality standards program. I look

forward to continuing work with you and your staff on the protection of New Mexico's water resources. If you have any questions, please contact Jasmin Diaz-Lopez at diazlopez.jasmin@epa.gov or (214) 665-2733.

Sincerely,

SELENA MEDRANO

Selena Medrano
Acting Section Supervisor

Enclosure: EPA COMMENTS ON THE NEW MEXICO ENVIRONMENT DEPARTMENT'S PROPOSED TRIENNIAL REVISIONS TO THE STANDARDS FOR INTERSTATE AND INTRASTATE SURFACE WATERS (20.6.4 NMAC)

cc: Shelly Lemon, Chief, Surface Water Quality Bureau, New Mexico Environment Department (Shelly.Lemon@env.nm.gov)
Lynette Guevera, Program Manager - Monitoring, Assessment, and Standards Section, New Mexico Environment Department, (lynette.guevara@env.nm.gov)

EPA COMMENTS ON THE NEW MEXICO ENVIRONMENT DEPARTMENT'S PROPOSED TRIENNIAL REVISIONS TO THE STANDARDS FOR INTERSTATE AND INTRASTATE SURFACE WATERS (20.6.4 NMAC)

The following detail the Environmental Protection Agency's (EPA) comments and recommendations on the New Mexico Environment Department's (NMED) proposed revisions to the state's Standards for Interstate and Intrastate Surface Waters (20.6.4 NMAC). It should be noted that the comments and recommendations provided here or in any enclosures are preliminary and do not represent a finding under Section 303(c) of the Clean Water Act (CWA) or the Standards Regulation (40 CFR 131). Any decisions on new and revised water quality standards will be made by the EPA following their adoption and submission to Region 6 for review by the New Mexico Water Quality Control Commission (WQCC or Commission).

General Comments

As cited in new proposed language at NMAC 20.6.4.10(A), § 303(c)(1) of the CWA requires that "the Governor of a State or the State water pollution control agency of such State shall from time to time (but at least once each three year period beginning with October 18, 1972) hold public hearings for the purpose of reviewing applicable water quality standards and, as appropriate, modifying and adopting standards." The CWA requirement means that for a state's review to be considered a triennial review, the state must open the entirety of a state's water quality standard(s) (WQS) and solicit comments on the entire document.

For future triennial reviews, the EPA recommends that the NMED ensure a hearing that is open to the general public for the purpose of reviewing New Mexico's WQS is held three years from the date of the state's prior hearing to review its WQS to meet the requirement in § 303(c)(1) of the CWA. The purpose of this review is to, at a minimum, identify WQS changes necessary to meet the requirements of the CWA. This includes the requirement in 40 CFR § 131.20(a) to re-examining any waterbody segment with designated uses less than the CWA § 101(a)(2) uses to determine if those designations are still appropriate.

TITLE 20 ENVIRONMENTAL PROTECTION
CHAPTER 6 WATER QUALITY
PART 4 STANDARDS FOR INTERSTATE AND INTRASTATE SURFACE WATERS

20.6.4.7 DEFINITIONS: Terms defined in the New Mexico Water Quality Act, but not defined in this part will have the meaning given in the Water Quality Act.

A. Terms beginning with numerals or the letter "A," and abbreviations for units.

(1) "4Q3" means the hydrologically based critical low flow as determined by the minimum average flow over four consecutive days that occurs with a frequency of once in three years.

The EPA previously commented on the need to clarify this definition in its January 2023 303(c) Action Letter regarding its applicability. Given that the 4Q3 is hydrologically based for NMED, the proposed revision in appropriate.

T. Terms beginning with the letter "T".

(1) "TDS" means total dissolved solids, also termed "total filterable residue."

(2) "Temporary standard" means a time-limited designated use and criterion for a specific pollutant(s) or water quality parameter(s) that reflect the highest attainable condition during the term of the temporary standard.

(~~2~~3) "Toxic pollutant" means those pollutants, or combination of pollutants, including disease-causing agents, that after discharge and upon exposure, ingestion, inhalation or assimilation into any organism, either directly from the environment or indirectly by ingestion through food chains, will cause death, shortened life spans, disease, adverse behavioral changes, reproductive or physiological impairment or physical deformations in such organisms or their offspring.

(~~3~~4) "Tributary" means a perennial, intermittent or ephemeral waterbody that flows into a larger waterbody, and includes a tributary of a tributary.

(45) "Turbidity" is an expression of the optical property in water that causes incident light to be scattered or absorbed rather than transmitted in straight lines.

The EPA recommends adding "or water quality variance as defined by 40 CFR 131.3(o)" to the end of the definition for "temporary standard".

W. Terms beginning with the letter "W".

(4) "Wetlands" means those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and under normal circumstances do support, ~~a prevalence of~~ vegetation, typically adapted for life in saturated soil conditions in New Mexico. Wetlands are unique surface waters of the state that vary widely because of regional and local differences in soils, topography, climate, hydrology, water chemistry, vegetation and other factors and provide distinct chemical, biological, physical, and hydrological functions within a watershed. Wetlands that are constructed outside of a surface water of the state for the purpose of providing wastewater treatment and that do not impound a surface water of the state are not included in this definition.

The EPA has no comment on this revision.

20.6.4.8 ANTIDEGRADATION POLICY AND IMPLEMENTATION PLAN:

A. Antidegradation Policy: This antidegradation policy applies to all surface waters of the state.

(1) Existing uses, as defined in Paragraph (4) of Subsection E of 20.6.4.7 NMAC, and the level of water quality or wetland condition necessary to protect the existing uses shall be maintained and protected in all surface waters of the state. Wetland condition is a measure of ecological integrity and, by inference, wetland quality (i.e., functions) and quantity (i.e., acreage).

(2) Where wetland condition or the quality of a surface water of the state exceeds levels necessary to support the propagation of fish, shellfish, and wildlife, and recreation in and on the water, that quality shall be maintained and protected unless the commission finds, after full satisfaction of the intergovernmental coordination and public participation provisions of the state's continuing planning process, that allowing lower water quality or wetland condition, including loss of wetland acreage or wetland functions, is necessary to accommodate important economic and social development in the area in which the water is located. In allowing such degradation or lower water quality, the state shall assure water quality adequate to protect existing uses fully. Further, the state shall assure that there shall be achieved the highest statutory and regulatory requirements for all new and existing point sources and all cost-effective and reasonable BMPs for nonpoint

source control. Additionally, the state shall encourage the use of watershed planning as a further means to protect surface waters of the state.

(3) No degradation, including loss of wetland acreage or wetland functions, shall be allowed in waters designated by the commission as outstanding national resource waters (ONRWs), except as provided in Subparagraphs (a) through (e) of this paragraph and in Paragraph (4) of this Subsection A.

The EPA has no comment on this revision.

20.6.4.10 REVIEW OF STANDARDS; NEED FOR ADDITIONAL STUDIES:

~~F~~G. **Site-specific criteria.**

(1) The commission may adopt site-specific numeric criteria applicable to all or part of a surface water of the state based on relevant site-specific conditions such as:

(a) actual species at a site are more or less sensitive than those used in the national criteria data set;

(b) physical or chemical characteristics at a site such as pH or hardness alter the biological availability and/or toxicity of the chemical;

(c) physical, biological or chemical factors alter the bioaccumulation potential of a chemical;

(d) the concentration resulting from natural background exceeds numeric criteria for aquatic life, wildlife habitat or other uses if consistent with Subsection G of 20.6.4.10 NMAC; or

(e) other factors or combination of factors that upon review of the commission may warrant modification of the default criteria, subject to EPA review and approval.

(2) Site-specific criteria must fully protect the designated use to which they apply. In the case of human health-organism only criteria, site-specific criteria must fully protect human health when organisms are consumed from waters containing pollutants.

(3) Any person may submit notice to the department stating their intent to derive site-specific criteria for a surface water of the state. The notice shall include a work plan supporting the development of site-specific criteria for the department's review and comment.

(4) Site-specific criteria shall be developed in accordance with the reviewed work plan, based on one or more of the site-specific conditions noted in paragraph 1, derived from a scientifically defensible method and protect the designated uses to which they apply.

(5) The work plan shall identify, at a minimum:

(a) the waterbody to consider and the reasoning for site-specific criteria;

(b) the methodology to be used to derive criteria;

(c) the source and validity of data to be used;

(d) the provisions for consultation with appropriate state and federal agencies;

(e) a description of how stakeholders and potentially affected Indian nations, tribes, or pueblos will be identified and engaged;

(f) a description of the public notice mechanisms to be employed; and

(g) the expected timelines and associated administrative actions to be taken for a rulemaking petition, pending the outcome of criteria development.

(6) Upon completion of site-specific criteria development, the data, findings and conclusions shall be submitted to the department, and public notice shall be provided in accordance with the approved work plan.

(~~3~~7) Any person may petition the commission to adopt site-specific criteria. A petition for the adoption of site-specific criteria shall:

(a) identify the specific waters to which the site-specific criteria would apply;

(b) explain the rationale for proposing the site-specific criteria;

(c) describe the methods used to notify and solicit input from potential stakeholders and from the general public in the affected area, and present and respond to the public input received;

(d) present and justify the derivation of the proposed criteria.

(48) A derivation of site-specific criteria shall rely on a scientifically defensible method, such as one of the following:

(a) the recalculation procedure, the water-effect ratio for metals procedure or the resident species procedure as described in the water quality standards handbook (EPA-823-B-94-005a, 2nd edition, August 1994);

(b) the streamlined water-effect ratio procedure for discharges of copper (EPA 822R-01-005, March 2001);

(c) the biotic ligand model as described in aquatic life ambient freshwater quality criteria - copper (EPA-822-R-07-001, February 2007);

(d) the methodology for deriving ambient water quality criteria for the protection of human health (EPA-822-B-00-004, October 2000) and associated technical support documents; or

(e) a determination of the natural background of the water body as described in Subsection G of 20.6.4.10 NMAC.

The EPA supports the proposed revisions to 20.6.4.10 G that clarify the required process the NMED will use in establishing site-specific criteria.

The EPA continues to have concerns with subsection 20.6.4.10 G.(1)(e) from the state's 2011 triennial revisions and previously took no action on this definition under CWA § 303(c), meaning that it is not effective for CWA purposes. The EPA continues to have concerns with the undefined factors or combination of factors that may warrant modifications to default criteria. The EPA welcomes additional information that explains how additional factors will be considered when reviewed by the commission and how they will be applied to existing federal regulatory structure to assist in its determination.

20.6.4.11 APPLICABILITY OF WATER QUALITY STANDARDS:

G. Human health-organism only criteria in Subsection J of 20.6.4.900 NMAC apply to those waters with a designated, existing or attainable aquatic life use. When limited aquatic life is a designated use, the human health-organism only criteria apply only for persistent toxic pollutants, ~~if~~ unless adopted on a segment-specific basis. The human health-organism only criteria for persistent toxic pollutants, as identified in Subsection J of 20.6.4.900 NMAC, also apply to all tributaries of waters with a designated, existing or attainable aquatic life use.

The EPA supports the proposed revisions to 20.6.4.11.G to remain consistent with language in 20.6.4.900(H)(7)NMAC.

20.6.4.12 COMPLIANCE WITH WATER QUALITY STANDARDS: The following provisions apply to determining compliance for enforcement purposes; they do not apply for purposes of determining attainment of uses. The department has developed assessment protocols for the purpose of determining attainment of uses that are available for review from the department's surface water quality bureau.

F. For compliance with ~~hardness dependent~~ calculated numeric criteria~~,~~ that depend on water chemistry, ~~hardness (as mg CaCO3/L)~~ all input parameters shall be determined from a sample taken at the same time that the sample for the contaminant is taken. If not all the input data are available to calculate a criterion, default input values may be used if justified and supported by ecoregional or other watershed data.

The EPA supports the proposed revisions to 20.6.4.12.F to remain consistent language in 20.6.4.900.I NMAC.

20.6.4.13 GENERAL CRITERIA: General criteria are established to sustain and protect existing or attainable uses of surface waters of the state. These general criteria apply to all surface waters of the state at all times, unless a specified criterion is provided elsewhere in this part. Surface waters of the state shall be free of any water contaminant in such quantity and of such duration as may with reasonable probability injure human health, animal or plant life or property, or unreasonably interfere with the public welfare or the use of property.

N. Wetlands: Only wetlands of the state are subject to this general criterion. Wetlands shall be maintained and protected such that degradation through direct, indirect, or cumulative impacts does not result in the net loss of wetland acreage or biological, chemical, physical, and hydrological functions to the extent that such functions occur, as characterized by state-specific benchmarks. The functions of a wetland that are to be maintained and protected may include:

(1) erosion control through bank and shoreline stabilization;
(2) flood attenuation and flood protection;
(3) sediment and pollutant retention, which prevents or mitigates downstream migration;
(4) groundwater recharge and water storage for future use;
(5) low flow augmentation including baseflow maintenance;
(6) water filtration including removal or storage of nutrients and other contaminants;
(7) propagation or maintenance of aquatic and terrestrial species indigenous to wetlands;
(8) preservation of wildlife habitat including habitat for threatened or endangered species; or
(9) supporting biological diversity.

In addition, wetlands shall be suitable for recreation, wildlife habitat, and use by aquatic life and livestock.

In the last sentence of the proposed revision for 20.6.4.13, the EPA suggests that NMED clarify whether wetlands are being assigned these uses (recreation, wildlife habitat, aquatic life, and livestock) or that wetlands may be assigned any one of these uses.

20.6.4.15 USE ATTAINABILITY ANALYSIS:

B. Methods for developing a use attainability analysis. A use attainability analysis shall assess the physical, chemical, biological, economic or other factors affecting the attainment of a use. The analysis shall rely on scientifically defensible methods such as the methods described in the following documents:

(1) the United States environmental protection agency's water quality standards handbook and use attainability analysis website for current recommendations and case studies;

(~~1~~2) *Technical Support Manual: Waterbody Surveys And Assessments For Conducting Use Attainability Analyses*, volume I (November 1983) and volume III (November 1984) or latest editions, United States environmental protection agency, office of water, regulations and standards, Washington, D.C., for the evaluation of aquatic life or wildlife uses;

(~~2~~3) the department's *Hydrology Protocol*, latest edition, approved by the commission, for identifying ephemeral, intermittent, and perennial waters; or

(~~3~~4) *Interim Economic Guidance For Water Quality Standards - Workbook*, March 1995, in conjunction with *Clean Water Act Financial Capability Assessment Guidance*, March 2024, United States environmental protection agency, office of water, Washington, D.C. for evaluating economic impacts.

The EPA supports the proposed revisions to 20.6.4.15.B which includes additional reference material for developing a use attainability analysis. However, the EPA recommends that NMED repeats the "latest edition" language for all of their reference documents, including bullet (4), for the purposes of minimizing updates in this section.

20.6.4.15 USE ATTAINABILITY ANALYSIS:

D. Process to amend a designated use through a use attainability analysis.

(1) The process for developing a use attainability analysis and petitioning the commission for removing a designated use and establishing the highest attainable use shall be done in accordance with the State's current *Water Quality Management Plan/Continuing Planning Process*.

(2) If the findings of a use attainability analysis, conducted by the department, in accordance with the department's *Hydrology Protocol* (latest edition) demonstrates that federal Clean Water Act Section 101(a)(2) uses, that are not existing uses, are not feasible in an ephemeral water body due to the factor in 40 CFR 131.10(g)(2), the department may consider proceeding with the expedited use attainability analysis process in accordance with the State's current *Water Quality Management Plan/Continuing Planning Process*. The following elements must be met for the expedited use attainability analysis process to be authorized and implemented:

(a) The department is the primary investigator of the use attainability analysis;

(b) The use attainability analysis determined, through the application of the *Hydrology Protocol*, that the water being investigated is ephemeral and has no effluent discharges of sufficient volume that could compensate for the low-flow;

(c) The use attainability analysis determined that the criteria associated with the existing uses of the water being investigated are not more stringent than those in 20.6.4.97 NMAC;

(d) The designated uses in 20.6.4.97 NMAC have been determined to be the highest attainable uses for the water being analyzed;

(e) The department posted the use attainability analysis on its water quality standards website and notified its interested parties list of a 30-day public comment period;

(f) The department reviewed and responded to any comments received during the 30-day public comment period ; and

(g) The department submitted the use attainability analysis and response to comments to ~~region 6~~ EPA for technical ~~approval~~review.

(3) If EPA approves the designated use revision(s) under section 303(c) of the Clean Water Act, the water shall be subject to 20.6.4.97 NMAC for federal Clean Water Act purposes. The use attainability analysis, the technical support document, and the applicability of 20.6.4.97 NMAC to the water shall be posted on the department's water quality standards website. The department shall periodically petition the commission to list ephemeral waters under Subsection C of 20.6.4.97 NMAC and to incorporate changes to classified segments as appropriate.

The EPA supports the proposed revisions to 20.6.4.15.D which includes clarifying language for amending a designated used through a use attainability analysis.

20.6.4.135 RIO GRANDE BASIN: Bluewater lake and Santa Cruz lake.

A. Designated uses: coldwater aquatic life, irrigation, domestic water supply, primary contact, livestock watering and wildlife habitat.

B. Criteria: The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses except that the following segment-specific criteria apply: phosphorus (unfiltered sample) 0.1 mg/L or less for Bluewater lake; the monthly geometric mean of *E. coli* bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.

The EPA supports the proposed revisions to 20.6.4.135 which adds Santa Cruz Lake to the Rio Grande Basin with primary contact use. However, EPA recommends the following edits to clarify the distinction in criteria between Bluewater lake and Santa Cruz lake:

*"**B. Criteria:** The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses except that the following segment-specific criteria apply: phosphorus (unfiltered sample) 0.1 mg/L or less is applicable to Bluewater lake only; the monthly geometric mean of E. coli bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less is applicable to both lakes."*

20.6.4.206

PECOS RIVER BASIN: Perennial reaches of the Rio Felix ~~and perennial reaches of tributaries to the Rio Hondo downstream of Bonney canyon, excluding North Spring river.~~

A. Designated uses: irrigation, livestock watering, wildlife habitat, secondary contact and warmwater aquatic life.

B. Criteria:

(1) The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

(2) At all flows above 50 cfs: TDS 14,000 mg/L or less, sulfate 3,000 mg/L or less and chloride 6,000 mg/L or less.

According to 40 CFR 131.10(k) a UAA is not required when designating uses that include the uses specified in CWA Section 101(a)(2), when designating a subcategory of a 101(a)(2) use that requires criteria at least as stringent as previously applicable, or when removing or revising a non-101(a)(2) use. Since the use change from secondary contact to primary contact is more stringent, the EPA supports the proposed revisions to 20.6.4.206 which removes perennial reaches of tributaries to the Rio Hondo downstream of Bonney canyon from this segment and adds them to 20.6.4.231 NMAC which has a primary contact designated use.

20.6.4.213 PECOS RIVER BASIN: McAllister lake.

A. Designated uses: coldwater aquatic life, ~~secondary~~ primary contact, livestock watering and wildlife habitat.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criterion applies: temperature 25°C (77°F) or less.

The EPA supports the proposed revisions to 20.6.4.213 which changes the designated use from secondary contact to primary contact for McAllister lake. Similar to proposed revisions in 20.6.4.206, no UAA is necessary for this change.

20.6.4.219 PECOS RIVER BASIN: Avalon reservoir.

A. Designated uses: coldwater aquatic life, ~~secondary~~ primary contact, livestock watering and wildlife habitat.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criterion applies: temperature 25°C (77°F) or less.

The EPA supports the proposed revisions to 20.6.4.219 which changes the designated use from secondary contact to primary contact for Avalon reservoir. Similar to proposed revisions in 20.6.4.206 and 20.6.4.213 no UAA is necessary for this change.

20.6.4.231 PECOS RIVER BASIN: The main stem of the Pecos river from the headwater of Brantley resrvoir upstream to Salt creek (near Acme), the perennial reaches of the Rio Peñasco downstream from ~~state highway 24 near Dunken~~ Bear canyon, ~~perennial reaches of North Spring river and~~ perennial reaches of the Rio Hondo and perennial reaches of its tributaries downstream of Bonney canyon.

A. Designated uses: irrigation, livestock watering, wildlife habitat, primary contact and warmwater aquatic life.

B. Criteria:

(1) The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

(2) At all flows above 50 cfs: TDS 14,000 mg/L or less, sulfate 3,000 mg/L or less and chloride 6,000 mg/L or less.

The EPA supports the proposed revisions to 20.6.4.231 which results from changes to the designated use from secondary contact to primary contact for all perennial reaches of Rio Hondo and tributaries downstream of Bonney canyon. Similar to proposed revisions in 20.6.4.206, 20.6.4.213, and 20.6.4.219 no UAA is necessary for this change.

20.6.4.307 CANADIAN RIVER BASIN: Perennial reaches of the Mora river from the USGS gaging station near Shoemaker upstream to the state highway 434 bridge in Mora, all perennial reaches of tributaries to the Mora river downstream from the USGS gaging station at La Cueva in San Miguel and Mora counties except ~~lakes~~ waters identified in 20.6.4.309 NMAC or 20.6.4.313 NMAC, perennial reaches of Ocate creek downstream of Ocate, perennial reaches of tributaries to Ocate creek downstream of Ocate, and perennial reaches of Rayado creek downstream of Miami lake diversion in Colfax county.

A. Designated uses: marginal coldwater aquatic life, warmwater aquatic life, primary contact, irrigation, livestock watering and wildlife habitat.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

The EPA supports this revision which clarifies this segment of Coyote Creek, from Mora River to Amola Ridge, is meeting the marginal coldwater aquatic life use in 20.6.4.307 while the segment of Coyote Creek upstream of Amola Ridge in 20.6.4.309 is meeting high quality coldwater aquatic life use.

20.6.4.308 CANADIAN RIVER BASIN: Charette lakes.

A. Designated uses: coldwater aquatic life, warmwater aquatic life, ~~secondary~~ primary contact, livestock watering and wildlife habitat.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

The EPA supports the proposed revisions to 20.6.4.308 which results from changes to the designated use from secondary contact to primary contact for Charette lakes. Similar to the proposed revisions in 20.6.4.206, 20.6.4.213, 20.6.4.219, and 20.6.4.231, no UAA is necessary for this use change.

20.6.4.309 CANADIAN RIVER BASIN: The Mora river and all perennial reaches of its tributaries upstream from the state highway 434 bridge in Mora except lakes identified in 20.6.4.313 NMAC, all perennial reaches of tributaries to the Mora river upstream from the USGS gaging station at La Cueva, perennial reaches of Coyote creek, upstream of Amola ridge and perennial reaches of tributaries to Coyote creek upstream to Amola ridge, the Cimarron river above state highway 21 in Cimarron, perennial reaches of tributaries to the Cimarron river above state highway 21 in Cimarron except Eagle Nest lake, all perennial reaches of tributaries to the Cimarron river north and northwest of highway 64 except north and south Shuree ponds, perennial reaches of Rayado creek above Miami lake diversion, perennial reaches of tributaries to Rayado creek above Miami lake diversion, Ocate creek and perennial reaches of its tributaries upstream of Ocate, perennial reaches of the Vermejo river upstream from Rail canyon and all other perennial reaches of tributaries to the Canadian river northwest and north of U.S. highway 64 in Colfax county unless included in other segments.

A. Designated uses: domestic water supply, irrigation, high quality coldwater aquatic life, livestock watering, wildlife habitat, and primary contact; and public water supply on the Cimarron river upstream from Cimarron, on perennial reaches of Rayado creek and on perennial reaches of tributaries to Rayado creek.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: specific conductance 500 µS/cm or less; the monthly geometric mean of *E. coli* bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.

The EPA supports this revision which clarifies this segment of Coyote Creek, perennial reaches and tributaries upstream of Amola ridge, are meeting high quality coldwater aquatic life use and should be excluded from 20.6.4.307.

20.6.4.502 GILA RIVER BASIN: The main stem of the Gila river from Redrock canyon upstream to the confluence of the West Fork Gila river and East Fork Gila river and perennial reaches of tributaries to the Gila river downstream of Mogollon creek.

A. Designated uses: industrial water supply, irrigation, livestock watering, wildlife habitat, marginal coldwater aquatic life, and primary contact ~~and warmwater aquatic life~~.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criterion applies: 28°C (82.4°F) or less.

The EPA agrees with the NMED's basis for removing warmwater aquatic life. As specified in 40 CFR 131.10(k)(2) a UAA is not required when designating a subcategory of a 101(a)(2) use that requires criteria at least as stringent as previously applicable. Removing the less stringent warmwater criteria use will result in no changes to the applicable 101(a)(2) criteria given that the more stringent criteria, coldwater aquatic life, remains. However, the EPA suggests adding "temperature" before "28°C", to remain consistent with other segment specific criteria.

20.6.4.503 GILA RIVER BASIN: All perennial tributaries to the Gila river upstream of and including Mogollon creek.

A. Designated uses: domestic water supply, high quality coldwater aquatic life, irrigation, livestock watering, wildlife habitat and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: specific conductance of 400 µS/cm or less for all perennial tributaries except West Fork Gila and tributaries thereto, specific conductance of 300 µS/cm or less; ~~32.2~~ 29°C (~~90~~84°F) or less in the east fork of the Gila river and Sapillo creek downstream of Lake Roberts; the monthly geometric mean of E. coli bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.

The EPA supports the revision to 20.6.4.503 given that existing data indicates segment-specific temperature criterion of 29°C (84°F) is existing and attainable for East Fork Gila River and Sapillo Creek

downstream of Lake Roberts. As specified in 40 CFR 131.10(k)(2) a UAA is not required when designating a subcategory of a 101(a)(2) use that requires criteria at least as stringent as previously applicable. However, the EPA suggests adding "temperature" before "29°C", to remain consistent with other segment specific criteria.

20.6.4.900 CRITERIA APPLICABLE TO EXISTING, DESIGNATED OR ATTAINABLE USES UNLESS OTHERWISE SPECIFIED IN 20.6.4.97 THROUGH 20.6.4.899 NMAC:

D. Primary contact: The monthly geometric mean of E. coli bacteria of 126 cfu/100 mL or MPN/100 ml, a single sample of E. coli bacteria of 410 cfu/100 mL or MPN/100 mL, a single sample of total microcystins of 8 µg/L ~~with no more than three exceedances within a 12 month period~~ and a single sample of cylindrospermopsin of 15 µg/L ~~with no more than three exceedances within a 12 month period~~, and pH within the range of 6.6 to 9.0 apply to this use. The results for *E. coli* may be reported as either colony forming units (CFU) or the most probable number (MPN) depending on the analytical method used.

The EPA recommends NMED consider retaining the language in 20.6.4.900 D. proposed for deletion. The frequency and duration aspects of criteria are important to help define the desired condition of the state's waters and ensure that the designated use is protected by the criteria. If NMED finds that its current frequency and duration are not appropriate, it should provide a scientifically sound basis for a revised frequency and duration that are protective of New Mexico's primary contact designated use. For example, please see the EPA's 2019 Recommended Human Health Recreational Ambient Water Quality Criteria or Swimming Advisories for Microcystins and Cylindrospermopsin, which explains how the frequency and duration aspects of the EPA's 304(a) recommended criteria are protective of primary contact recreation. The EPA welcomes discussions with NMED to develop a revised frequency and duration, and recognizes that these water quality standards can always be revised in future rulemakings if NMED determines that evolving science or new data suggest that a revision is necessary.

20.6.4.900

H. Aquatic life: Surface waters of the state with a designated, existing or attainable use of aquatic life shall be free from any substances at concentrations that can impair the community of plants and animals in or the ecological integrity of surface waters of the state. Except as provided in Paragraph (7) of this subsection, the acute and chronic aquatic life criteria set out in Subsections I, J, K and L of this section and the human health- organism only criteria set out in Subsection J of this section are applicable to all aquatic life use subcategories. In addition, the specific criteria for aquatic life subcategories in the following paragraphs apply to waters classified under the respective designations.

(7) Limited aquatic life: pH within the range of 6.0 to 9.0. The acute aquatic life criteria of Subsections I and J of this section apply to this subcategory. Chronic aquatic life criteria do not apply unless adopted on a segment-specific basis. Human health-organism only criteria apply only for persistent toxic pollutants unless adopted on a segment-specific basis.

The EPA supports the proposed pH criteria applicable to limited aquatic life.

20.6.4.900.

J. Use-specific numeric criteria.

Pollutant	CAS Number	DWS	Irr/Irr storage	LW	WH	Aquatic Life			Type
						Acute	Chronic	HH-OO	
Chromium III, dissolved	16065-83-1					a	a		
Chromium VI, dissolved	18540-29-9					16	11		
Chromium, dissolved	7440-47-3	100	100	1,000					
Cobalt, dissolved	7440-48-4		50	1,000					
Copper, dissolved	7440-50-8	1300	200	500		a	a		
Cyanide, total recoverable	57-12-5	200			5.2	22.0	5.2	400	
Iron	7439-89-6						1,000		
Lead, dissolved	7439-92-1	~~15~~10	5,000	100		a	a		
Manganese, dissolved	7439-96-5					a	a		
Mercury	7439-97-6	2		10	0.77				P
Mercury, dissolved	7439-97-6					1.4	0.77		P
Methylmercury	22967-92-6							0.3 mg/kg in fish tissue	P
Molybdenum, dissolved	7439-98-7		1,000						
Molybdenum, total recoverable	7439-98-7					7,920	1,895		
Nickel, dissolved	7440-02-0	700				a	a	4,600	P
Nitrate as N (mg/L)		10 ~~mg/L~~							
Nitrite + Nitrate (mg/L)				132 ~~mg/L~~					
Selenium, dissolved	7782-49-2	50	b	50			1.5 in lentic water, i 3.1 in lotic water, i	4,200	P
Selenium, total recoverable	7782-49-2				5.0	~~20.0~~	~~5.0~~ 8.5 mg/kg Dry Weight in Whole-Body Fish Tissue 11.3 mg/kg Dry Weight in Fish Muscle Tissue		
Silver, dissolved	7440-22-4					a			
Thallium, dissolved	7440-28-0	2						0.47	P

The EPA's national CWA section 304(a) recommended selenium criterion is composed of four criterion elements: two fish tissue criterion elements (i.e., egg-ovary and whole-body and/or muscle tissue) and two water column criterion elements (i.e., 30-day average and intermittent exposure). Currently, NMED is proposing to adopt the fish whole-body and muscle criteria, which together make up one of the two fish tissue criterion elements.

The EPA recommends that NMED considers adopting the egg ovary criterion and the intermittent exposure criterion elements. The egg-ovary criterion element supersedes all other criterion elements because it was derived directly from toxicity data and served as the basis for deriving all the other criterion elements. This hierarchy can be described in a state or authorized Tribe's WQS, in footnotes accompanying the criterion. For example, NMED can use the footnotes provided with the national CWA section 304(a) recommended selenium criterion (Table 1) to clearly and accurately describe the hierarchical structure. Another possibility is adopting the selenium criteria table as a separate section within 20.6.4.900 NMAC for clarity.

Pollutant	CAS Number	DWS	Irr/Irr storage	LW	WH	Aquatic Life			Type
						Acute	Chronic	HH-OO	
Heptachlor epoxide	1024-57-3	0.20				0.52	0.0038	0.00032	C

Nitrobenzene	98-95-3	18						600	
Nitrosamines	Various							12.4	C
Nitrosodibutylamine	924-16-3							2.2	C
Nitrosodiethylamine	55-18-5							12.4	C
N-Nitrosodimethylamine	62-75-9	0.0069						30	C
N-Nitrosodi-n-propylamine	621-64-7	0.050						5.1	C
N-Nitrosodiphenylamine	86-30-6	71						60	C
N-Nitrosopyrrolidine	930-55-2							340	C
Nonylphenol	84852-15-3					28	6.6		
Parathion	56-38-2					0.065	0.013		
Pentachlorobenzene	608-93-5							0.1	
Pentachlorophenol	87-86-5	1.0				19	15	0.4	C
Perfluorooctane sulfonate (PFOS)	Various					71	0.25 in water 0.028 mg/kg Wet Weight in Invertebrate Whole-Body Tissue 0.201 mg/kg Wet Weight in Fish Whole-Body Tissues 0.087 mg/kg Wet Weight in Fish Muscle Tissue		P

Pollutant	CAS Number	DWS	Irr/Irr storage	LW	WH	Aquatic Life			Type
						Acute	Chronic	HH-OO	
Perfluorooctanoic acid (PFOA)	Various					3,100	100 in water 1.18 mg/kg Wet Weight in Invertebrate Whole-Body Tissue 6.49 mg/kg Wet Weight Fish Whole-Body Tissue 0.133 mg/kg Wet Weight Fish Muscle Tissue		P

The EPA supports the proposed adoption of 304(a) aquatic life criteria for PFOS and PFOA. However, the EPA suggests that NMED consider designating a separate Subsection within 20.6.4.900 NMAC for these criteria in an effort to retain consistency with the criteria units and clarity between the different chronic values. Additionally, NMED could include a footnote that notes all five of these water column and tissue criteria are intended to be independently applicable and one criterion does not take primacy.

RE: Comments on the New Mexico Environment Department's Proposed Amendments to New Mexico's Water Quality Standards (20.6.4 NMAC) – 2026 Triennial Review

Dear Mr. Baca,

The undersigned organizations submit the following comments in response to the New Mexico Environment Department Surface Water Quality Bureau's ("NMED") request for comments on draft proposed changes to 20.6.4 NMAC as part of the 2026 Triennial Review of Water Quality Standards. Collectively we represent thousands of New Mexicans that care about protecting clean water in New Mexico for drinking, irrigation, wildlife, recreation, and spiritual practices and traditions. We have come together to submit these comments with a common goal of ensuring that New Mexico's water quality standards are protective enough to support the diverse human and non-human uses of our state's water resources.

Generally, we note that the State's obligations pursuant to the Clean Water Act ("CWA") are to "protect the public health or welfare, enhance the quality of water," and wherever possible, to ensure that water quality allows for the "protection and propagation of fish, shellfish, and wildlife and provides for recreation in and on the water." 33 U.S.C. § 1313(c)(2)(A); 33 U.S.C. § 1251(a)(2). Similarly, the New Mexico Water Quality Act ("WQA") directs the Commission to adopt standards that "shall at a minimum protect the public health or welfare, enhance the quality of water and serve the purposes of the Water Quality Act." NM Stat. 74-6-4(D). These goals, in particular the emphasis on standards that enhance the quality of water, represent what is a fundamental truth in New Mexico—that water is the lifeblood of our communities, ecosystems, economy, and way of life. We thank the Surface Water Quality Bureau of the New Mexico Environment Department (NMED) for all your ongoing work to implement these goals and to protect our state's water quality.

Below, we provide both comments on priorities we would like NMED to consider during this Triennial Review as well as specific comments on NMED's proposed amendments.

NMED Exhibit 13

I. PRIORITY ISSUES TO ADD TO NMED's PETITION DURING THE 2026 TRIENNIAL REVIEW

While we understand that NMED is constrained by staffing shortages and a heavy workload that includes multiple concurrent rulemaking processes, there are numerous issues that we urge NMED to add to your Triennial Review petition.

A. Outstanding Waters (20.6.4.8 NMAC and 20.6.4.9 NMAC)

i. Change "Outstanding National Resource Waters" to "Outstanding Waters"

The unwieldy name of Outstanding National Resource Waters (ONRWs) is constantly being confused and mixed up. People consistently call them Outstanding *Natural* Resource Waters or mix up the order of the letters in the acronym and call them ORNWs or some other combination. We suggest that NMED consider advocating for a change in name from "Outstanding National Resource Waters" to "Outstanding Waters". Not only will this make the name easier to remember, but it will also clear up the common misconception that ONRW protections are a federal designation, when in fact ONRWs are designated at the state level by the New Mexico Water Quality Control Commission. While there may be some argument for maintaining the existing name due to the fact that ONRW protections are laid out in the federal Clean Water Act and associated regulations, (specifically in Tier III of the federal antidegradation policy), these federal requirements and connections will not disappear by changing the name to something more approachable and easier to remember. This is especially the case if it is explicitly stated in 20.6.4 NMAC that Outstanding Waters are protected under Tier III of the federal antidegradation policy. Other states have adopted different names for their Tier III waters, Pennsylvania for example calls their Tier III waters "Exceptional Value Waters". Alternatively, instead of replacing the name completely, NMED could consider a different abbreviation of Outstanding National Resource Waters. Instead of "ONRW," the abbreviation could be changed to "Outstanding Waters" throughout the 20.6.4 NMAC

Recommendation: Replace the name "Outstanding National Resource Waters" or "ONRW" or both with "Outstanding Waters".

ii. Strengthen Outstanding Waters Implementation

Changes to the antidegradation policy and implementation plan are needed to ensure that if degradation is found in Outstanding Waters, appropriate steps are taken to address the degradation. Currently the Outstanding Waters language found at 20.6.4.8.A(3)(a) and (4)(a) NMAC includes primarily guidance on how to degrade Outstanding Waters on a short-term basis. While these components of the standards are important to ensure that restoration and responses to emergencies can occur, they should not be the only component of the Outstanding Waters protections found at 20.6.4.8 NMAC. Policy to protect the state's most precious waters should not primarily focus on avenues to degrade such waters. We recommend adopting specific requirements and steps in 20.6.4.8 NMAC to ensure that degradation is not occurring in New Mexico's designated Outstanding Waters. Currently, all of the Outstanding Waters in New Mexico are on United States Forest Service (USFS) lands. A good place to start in terms of implementation guidance would be to

set up steps and requirements for cross agency consultation and engagement. 20.6.4.8.B could also outline how implementation of Outstanding Waters protection shall be assessed and summarized in the 303d/305b Report. It is also essential to create a process that will be undertaken if degradation is found in Outstanding Waters. For example, there could be requirements in 20.6.4.8. to sample more frequently in any Outstanding Water where degradation has been detected. Other such actions could include engaging with landowners and other stakeholders to identify sources of degradation, prioritizing restoration dollars in these waters, and prohibiting all short and temporary degradation besides that associated with restoration.

Recommendation: Add language to 20.6.4.8 and 9 NMAC that outline steps the Department will take if increased degradation is detected in an ONRW.

B. Mixing Zones (20.6.4.11.E and F NMAC)

Climate change is creating massive, previously unseen, fluctuations of flow in New Mexico's rivers and streams, making it impossible to ensure that mixing zones are not harming public health or aquatic resources. If the flow in a receiving waterbody swings from large flood events to very low flows, as we can expect, and in fact are already seeing in a changing climate, it is difficult to determine the dilution factor to calculate a mixing zone. In addition, increased flooding events can result in increased pollutant loads in receiving waters from many different sources, making mixing zones all the more inappropriate. Therefore, a concrete step to make New Mexico standards more responsive to climate change is to stop allowing mixing zones. In addition, it is unclear how NMED enforces 20.6.4.11.E(5), which requires that a continuous passage either through or around a mixing where all standards are met be maintained at all times. Again, with climate change and extreme fluctuations of flows and temperatures meeting this requirement and demonstrating this requirement is met is extremely challenging. It would be simpler, safer, and easier for both NMED and permittees to demonstrate compliance if mixing zones were eliminated entirely. Alternatively, if mixing zones aren't prohibited outright, we urge NMED to put additional limitations on mixing zones, such as no mixing zones allowed in either impaired waterbodies, Outstanding Waters (ONRWs), or anywhere that domestic water supply or primary contact is designated.

Recommendation: Eliminate mixing zones in New Mexico as an appropriate step in response to the massive changes and fluctuations in flow we are seeing and expect to see as a result of a changing climate. Alternatively, if mixing zones are prohibited full scale, eliminate mixing zones in impaired waterbodies, Outstanding Waters, and anywhere with a domestic water supply or primary contact use is designated.

C. Applicability of Water Quality Standards – Exceptions (20.6.4.11.I.(1))

How are increased storm events due to climate change considered in this section? It appears that this section of the standards could be read to exempt climate change impacts, such as increased intensity of storm events and faster spring runoff, from applicability of water quality standards. Even without considering climate change impacts, this section is inappropriately broad, and we recommend deleting it. NMED itself has identified stormwater as "a leading cause of water pollution" in New Mexico.[1] It does not make sense to have a whole exception for the applicability of water quality standards during storm events. Fish still swim in our rivers during storm events and

[1] New Mexico Environment Department/Surface Water Quality Bureau (NMED/SWQB). 2024. 303d/305b Report for 2024-2026. Santa Fe, NM. Pg. 61.

NMED Exhibit 13

need dissolved oxygen to breathe. People boat and swim in waters that have stormflow impacts. In some cases, these impacts can be seen hours or even up to a day after a storm event. In addition, it is difficult to understand how this exception is implemented. For example, how does NMED determine what contaminants in stormwater runoff are from natural causes? Many of the contaminants we see in stormwater are from poor land use management, which certainly is not "natural". Climate change adds another layer of complexity and difficulty in implementing this exception, because with a changing climate we are likely to see increased intensity of storm events that will result in increased pollutant loading. Climate change is not a natural event, and water quality impacts from climate change should not be folded into this exception. While we strongly recommend deleting this section, if it remains in the standards, language could be added to constrain this section so that designated uses are better protected. This is especially important as climate change impacts to our water resources in New Mexico become the norm rather than the exception. Communities impacted by post wildfire flooding should be able to access the state resources such as state monitoring and identification of impairments, writing TMDLs, and applying section 319 restoration monies to impacted waterbodies, without the risk of those impairments falling under the exception at 20.6.4.11.I(1) NMAC.

Recommendation: Delete section (20.6.4.11.I(1)) in its entirety.

D. Compliance with Water Quality Standards (20.6.4.12.G. NMAC)

We recommend putting constraints on compliance schedules to guard against overuse and abuse of this important tool. For example, we suggest adding a time limit of 5-years and requirements for revisiting compliance schedules during permit renewals. In addition, if a permit is administratively extended, any compliance schedule included in the permit should be reviewed 5-years after issuance of the permit.

Recommendation: Include time constraints and review requirements for compliance schedules.

E. Incorporate Produced Water Constituents into 20.6.4.900 NMAC

With the passage of HB 546 and recent rulemakings considering the discharge of treated produced water to our state's surface water resources, it is imperative that NMED take steps to identify and propose numeric criteria for the numerous contaminants that do not currently have numeric water quality criteria standards in 20.6.4 NMAC. We urge NMED to look at the list submitted by the Environmental Defense Fund ("EDF") on 12/9/20, as part of the triennial review comment period for the 2020 Triennial Review, to see if there are available data and information that would enable NMED to propose criteria for toxic pollutants found in produced water for which we currently do not have a standard. EDF's 2020 comments clearly outline the need and the ability to adopt standards for toxic pollutants found in produced water:

> Through an extensive literature review, EDF has identified approximately 1,360 chemicals that can be found in produced water nationally and therefore have the potential to be found in New Mexico produced waters. An estimated 88 of those already have New Mexico surface water quality standards that could be immediately applied in a potential pilot testing or preliminary permitting program. Of the remainder, about 180 chemicals…… have an approved standard method associated with them,

NMED Exhibit 13

> and toxicity values that could be used to conduct human health or aquatic life risk assessments that are the prelude to developing water quality criteria to adopt into a WQS. In other words, EDF estimates that at least 180 potential produced water chemicals have the type of tools and data necessary to begin a process of considering associated water quality criteria and standard updates *today*.

On January 6, 2021, twenty NGO groups - many of whom have signed onto this letter - cited the EDF comment letter and called on NMED in to develop standards for toxic pollutants found in produced water.

It is through the development and adoption of specific criteria for the toxic substances typically found in produced water that we will get closer to safely discharging treated produced water, a goal that has been repeatedly expressed by this state administration. If the state is serious about discharging produced water to our surface waters, then the appropriate water quality criteria must be developed and adopted.

Specifically, as outlined in EDF's letter, there are data available, including in many cases approved analytical methods for developing standards for 180 constituents found in produced water for which New Mexico currently does not have standards. While we realize that developing numeric criteria can be a long and arduous process, it is essential that the standards are robust enough to protect the existing and designated uses of New Mexico's water resources *before* produced water is discharged into surface waterbodies. To help identify priority pollutants among the 180 identified by EDF, more work should be done to characterize produced water in New Mexico.

> *Recommendation: Identify several constituents found in produced water in New Mexico for which there are available data for inclusion in 20.6.4.900 NMAC during the 2026 Triennial Review. In addition, start now to develop numeric criteria for all 180 constituents common in produced water nationwide, for which there is an approved standard method and toxicity values and for which we do not currently have a standard, for adoption at a later date. NMED should also encourage and support increased characterization of produced water in New Mexico to help identify which of the 180 constituents are most common in New Mexico's produced water and therefore should be prioritized for standard development.*

II. COMMENTS ON NMED'S PROPOSED AMENDMENTS

We thank NMED for adding to the wetland definition; proposing a wetland general criterion; including wetland conditions in the antidegradation policy; and proposing new aquatic life use criteria for PFOA, PFOS, and selenium. Standards for wetlands, PFAS, and selenium are critical for implementing a state surface water permitting program, and we appreciate NMED's efforts and work on these topics. Our specific comments below are organized by overarching topic area:

A. Wetlands

i. Wetland Definition at 20.6.4.7.W NMAC

We support NMED's proposed language to this section and believe it will help in the development of the surface water permitting program.

NMED Exhibit 13

ii. Wetland General Criterion at 20.6.4.13.N NMAC

We support the creation of wetland water quality standards and believe they are necessary in the development and implementation of the surface water permitting program. However, we do not believe that a criterion to protect wetlands of the state belongs in the general criteria because all of the other criteria in that section are pollutants or conditions, not aquatic features or functions. The list of general criteria are often called the "free-froms", because general criteria typically call for waters to be "free-from" specific pollutants. In contrast, the proposed general criteria for wetlands outlines wetland conditions and functions that must be protected.

Instead, we suggest adding some of the proposed language for 20.6.4.13.N into the antidegradation policy and implementation sections at 20.6.5.8 and 9 NMAC because the language is about preventing degradation and maintaining and protecting wetlands. In addition, we also suggest creating a statewide wetland segment at 20.6.4.96 NMAC that includes all of the language currently proposed for 20.6.4.13.N. We also suggest adding carbon sequestration to the proposed list of some of the possible wetland functions.

The water quality standards must provide a way to determine whether wetlands have physical, biological, or chemical impairments. The narrative general criterion lists functions, but it provides no metrics or tools for such a determination. In EPA guidance for developing wetland water quality standards and in many states, numeric criteria are identified as indicators of wetland functional health or impairment. For example, base flow, dissolved oxygen, conductivity, pH, salinity, species diversity, water levels, and conditions such as water temperature variations, sedimentation patterns, and wetland hydroperiod can all be used to help determine quality and impacts to wetland functions.

We recommend establishing a section for wetlands, as there is for ephemeral waters and intermittent waters, listing wetland functions, designated uses, and relevant narrative and numeric criteria to be used along with functional assessments. This new section in the water quality standards will provide NMED the framework to assess and determine the health or impairment of wetland functions as needed for the purposes of the biennial Integrated Report as well as for the implementation of the state surface water permitting program.

Resources include (with links):

- Wetland Water Quality Standards: Resources (pdf)
- EPA Wetland Water Quality Standards: Program Building Activities Menu (pdf) - 2023
- Impacts on Quality of Inland Wetlands of the United States: A Survey of Indicators, Techniques, and Applications of Community Level Biomonitoring Data

Recommendation: Incorporate the narrative criterion language related to preventing degradation into the antidegradation policy and implementation sections, create a new statewide wetland segment at 20.6.4.96 NMAC, add carbon sequestration to the functions, and add a section that provides metrics and procedures to assess functions and determine impairments.

iii. Wetland Language in Antidegradation Policy and Implementation Plan.

We support the inclusion of wetlands in the antidegradation policy and implementation plan, especially the reference to wetland conditions as a measure of ecological integrity, as demonstrated by wetland functions.

NMED Exhibit 13

In addition to the proposed language, we recommend that NMED incorporate language in 20.6.4.8.A(2) that tracks with NMED's proposed language in the draft surface water quality regulations requiring avoidance and minimization of impacts to aquatic resources through an assessment of functions and any potential impacts to them. If degradation of aquatic resources is allowed through dredge and fill projects, we also recommend including language requiring compensatory mitigation. In addition, we recommend that NMED move the following language currently proposed for 20.6.4.13.N to 20.6.4.8 NMAC: "Wetlands shall be maintained and protected such that degradation through direct, indirect, or cumulative impacts does not result in the net loss of wetland acreage or biological, chemical, physical, and hydrological functions to the extent that such functions occur, as characterized by state-specific benchmarks."

The Antidegradation Policy must set the standards for preventing degradation. These rules should reference the wetlands that are high quality or exceptional in some way, and it must reference the process for determining when degradation is proposed or occurring.

> *Recommendation: Develop and include language that requires avoidance and minimization of impacts to aquatic resources including wetland functions using functional assessments as part of the antidegradation policy. Identify categories of exceptional wetlands and methods to determine how high quality will be determined. Move language about no net loss of wetlands from degradation from the new proposed general criterion section to the antidegradation policy.*

B. PFAS

PFOA, PFOS, PFBS, and thousands more compounds belong to a large class of synthetic chemicals known as per- and polyfluoroalkyl substances, or PFAS. PFAS contamination is a major water quality issue facing New Mexico that has resulted in economic losses to our state's dairy industry and substantial impacts to public health and wildlife populations. Developing standards for PFAS chemicals is essential to protect New Mexico's surface water resources.

We support NMED's proposal to adopt numeric criteria for PFOA and PFOS. In addition, we recommend NMED adopt the numeric human health criteria proposed by EPA in December 2024 for PFOA, PFOS and PFBS:

Table 1. Draft Human Health Criteria (HHC) for Three PFAS.

PFAS	Water + Organism HHC (ng/L; ppt)[1]	Organism Only HHC (ng/L; ppt)[1]
PFOA	0.0009	0.0036
PFOS	0.06	0.07
PFBS	400	500

[1] Values are provided in ng/L units to aid in comparison to method detection limit (MDL).

(From EPA's Technical Fact Sheet on Draft National Recommended Human Health Ambient Water Quality Criteria for PFOA, PFOS, and PFBS December 2024[2])

[2] https://www.epa.gov/system/files/documents/2024-12/draft-hhc-pfas-tech-fact-sheet.pdf

NMED Exhibit 13

Recommendation: We support NMED's proposed aquatic life criteria for PFOA and PFOS and urge NMED to also propose numeric Human Health criteria for PFOA, PFOS and PFBS as proposed by EPA in December 2024.

C. Site-Specific Criteria

We support the requirements of (notice to the department and submission of a workplan before an entity outside the department may develop site-specific criteria and petition the commission for their adoption. The draft rule doesn't provide any timeframes in this process. We recommend that the notice and workplan should be required at least 6 months before the commission is petitioned.

Recommendation: We recommend that entities outside of the department notice the department and provide a workplan for their intended development of site-specific criteria at least 6 months prior to petitioning the commission.

D. Use Attainability Analysis

EPA has not yet updated their Water Quality Standards Handbook. The changes proposed to three chapters in 2025 are still draft, however, reference to the handbook is appropriate.

The references to the Interim Economic Guidance for Water Quality Standards – Workbook, March 1995 and the Clean Water Act Financial Capability Assessment Guidance, March 2024 must be qualified to indicate that those documents do not adequately include metrics or tools to calculate the benefits of controlling pollution to communities or the costs of not controlling pollution to communities. Proponents of removing designated uses must include those considerations when employing factor 40 CFR 131.10(g)(6).

Recommendation: We recommend that the list of methods to be relied upon for developing use attainability analyses also include resources to assess and calculate the benefits of water pollution control and the costs of not controlling pollution.

Thank you for your consideration of our recommendations. Please don't hesitate to contact us if you have any questions.

Sincerely,

Rachel Conn

NMED Exhibit 13

2026 Triennial Review
Amigos Bravos' 10/14/25 red(green)line of proposed changes to 20.6.4 NMAC

Markup Key:

- NMED's proposed changes appear in red underline and ~~strikethrough~~
- Amigos Bravos' proposed changes appear in green underline and ~~strikethrough~~
- Amigos Bravos' comments on NMED changes and basis for Amigos Bravos proposed changes appear in *black italics* below specific sections for which changes are proposed.

20.6.4.7 DEFINITIONS: Terms defined in the New Mexico Water Quality Act, but not defined in this part will have the meaning given in the Water Quality Act.

A. Terms beginning with numerals or the letter "A," and abbreviations for units.

(1) "4Q3" means the hydrologically based critical low flow as determined by the minimum average flow over four consecutive days that occurs with a frequency of once in three years.

P. Terms beginning with the letter "P".

(7) "Public water supply" means the use or storage of water to supply a public water system as defined by ~~New Mexico's Drinking Water Regulations, 20.7.10 NMAC~~ 40 CFR 141. Water provided by a public water system ~~may need to~~ shall undergo treatment to ~~achieve~~ comply with drinking water ~~quality~~ standards.

T. Terms beginning with the letter "T".

(1) "TDS" means total dissolved solids, also termed "total filterable residue."

(2) "Temporary standard" means a time-limited designated use and criterion for a specific pollutant(s) or water quality parameter(s) that reflect the highest attainable condition during the term of the temporary standard.

(~~2~~3) "Toxic pollutant" means those pollutants, or combination of pollutants, including disease-causing agents, that after discharge and upon exposure, ingestion, inhalation or assimilation into any organism, either directly from the environment or indirectly by ingestion through food chains, will cause death, shortened life spans, disease, adverse behavioral changes, reproductive or physiological impairment or physical deformations in such organisms or their offspring.

(~~3~~4) "Tributary" means a perennial, intermittent or ephemeral waterbody that flows into a larger waterbody, and includes a tributary of a tributary.

(~~4~~5) "Turbidity" is an expression of the optical property in water that causes incident light to be scattered or absorbed rather than transmitted in straight l

W. Terms beginning with the letter "W".

(4) "Wetlands" means those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and under normal circumstances do support, ~~a prevalence of~~ vegetation, typically adapted for life in saturated soil conditions in New Mexico. Wetlands are unique surface waters of the state that vary widely because of regional and local differences in soils, topography, climate, hydrology, water chemistry, vegetation and other factors and provide distinct chemical, biological, physical, and hydrological functions within a watershed. Wetlands that are constructed outside of a surface

water of the state for the purpose of providing wastewater treatment and that do not impound a surface water of the state are not included in this definition.

Amigos Bravos Comment on Section 20.6.7.W(4): *Amigos Bravos supports the changes to the Wetlands definition.*

20.6.4.8 ANTIDEGRADATION POLICY AND IMPLEMENTATION PLAN:

A. Antidegradation Policy: This antidegradation policy applies to all surface waters of the state.

(1) Existing uses, as defined in Paragraph (4) of Subsection E of 20.6.4.7 NMAC, and the level of water quality or wetland conditions necessary to protect the existing uses shall be maintained and protected in all surface waters of the state. Wetland conditions are ~~is a~~ measures of ecological integrity and, by inference, wetland quality (i.e., functions) and quantity (i.e., acreage).

(2) Where wetland conditions or the quality of a surface water of the state exceeds levels necessary to support the propagation of fish, shellfish, and wildlife, and recreation in and on the water, those conditions and that quality shall be maintained and protected unless the commission finds, after full satisfaction of the intergovernmental coordination and public participation provisions of the state's continuing planning process, that allowing lower water quality or degraded wetland conditions, including loss of wetland acreage or wetland functions, is necessary to accommodate important economic and social development in the area in which the water is located. In allowing such degradation or lower water quality, the state shall assure wetland conditions and water quality adequate to protect existing uses fully. Further, the state shall assure that there shall be achieved the highest statutory and regulatory requirements for all new and existing point sources, that impacts to surface waters, including wetlands have been avoided and minimized to the maximum extent practicable for all new and existing dredge and fill projects, and that all cost-effective and reasonable BMPs for nonpoint source control have been implemented. Wetlands shall be maintained and protected such that degradation through direct, indirect, or cumulative impacts does not result in the net loss of wetland acreage or biological, chemical, physical, and hydrological functions to the extent that such functions occur, as characterized by state-specific benchmarks. Additionally, the state shall encourage the use of watershed planning as a further means to protect surface waters of the state.

(3) No degradation, including loss of ~~wetland~~ acreage or ~~wetland~~ functions of surface waters, including wetlands, shall be allowed in waters designated by the commission as outstanding national resource waters (ONRWs), except as provided in Subparagraphs (a) through (e) of this paragraph and in Paragraph (4) of this Subsection A

(4) This antidegradation policy does not prohibit activities that may result in degradation in surface waters of the state when such activities will result in restoration or maintenance of the chemical, physical or biological integrity of the water.

(b) For surface waters including wetlands of the state other than ONRWs, the department shall review on a case-by-case basis discharges that may result in degradation from permissible restoration or maintenance activities, and may approve such activities in accordance with the following:

(i) the degradation shall be limited to the shortest possible time;

(ii) the degradation shall be minimized and controlled by best management practices or in accordance with permit requirements as appropriate, and all practical means of minimizing the duration, magnitude, frequency and cumulative effects of such degradation shall be utilized; and

(iii) the degradation shall not result in water quality lower than necessary to protect any existing use of the surface water.

(5) If degradation, besides the short-term degradation allowed under Subsection A(3)(a) through (e) and Subsection A(4) of this Section, is detected in an Outstanding Water:

(a) increased monitoring of the Outstanding Water by the Department at a frequency of at least once a year shall be conducted; and

(b) additional actions as outlined in the continuing planning process shall be initiated to determine the source of the degradation and to identify mitigating measures.

~~(5)~~ **(6)** In those cases where potential water quality impairment associated with a thermal discharge is involved, this antidegradation policy and implementing method shall be consistent with Section 316 of the federal Clean Water Act.

~~(6)~~ **(7)** In implementing this section...

B. Implementation Plan: The department, acting under authority delegated by the commission, implements the water quality standards, including the antidegradation policy, by describing specific methods and procedures in the continuing planning process and by establishing and maintaining controls on the discharge of pollutants to surface waters of the state. The steps summarized in the following paragraphs, which may not all be applicable in every water pollution control action, list the implementation activities of the department. These implementation activities are supplemented by detailed antidegradation review procedures developed under the state's continuing planning process. The department:

(1) obtains information pertinent to the impact of the effluent on the receiving water and advises the prospective discharger of requirements for obtaining a permit to discharge;

(2) reviews the adequacy of existing data and conducts a water quality survey of the receiving water in accordance with an annually reviewed, ranked priority list of surface waters of the state requiring total maximum daily loads pursuant to Section 303(d) of the federal Clean Water Act;

(3) assesses the probable impact of the effluent on the receiving water relative to its ~~attainable~~ existing or designated uses and numeric and narrative criteria;

(16) develops list of surface waters including wetlands of the state not attaining designated uses, pursuant to Sections 305(b) and 303(d) of the federal Clean Water Act; and

(17) develops list of designated Outstanding Waters where degradation has been detected and identifies potential sources of pollution, enforcement actions to be taken, and BMPs to be implemented to halt or remedy the degradation.

Amigos Bravos Basis for Change for Section 20.6.4.8 NMAC:

Amigos Bravos supports the wetland language that NMED has proposed to add to 20.6.4.8 NMAC. In addition to NMED's proposed language, Amigos Bravos proposes to incorporate the language related to degradation that NMED has proposed for a new Section 20.6.4.13.N (General Criterion for Wetlands) into 20.6.4.8.A(2) as we believe the antidegradation section is a more appropriate place for that language. Amigos Bravos also proposes to include "wetlands" and language about dredge and fill permits into 20.6.4.8 NMAC to provide a consistent dredge and fill complement to the point source language currently included in this section.

Changes to the antidegradation policy and implementation plan are needed to ensure that if degradation is found in Outstanding Waters, appropriate steps are taken to address the degradation. Currently the Outstanding Waters language found at 20.6.4.8.A(3)(a) and (4)(a) NMAC includes primarily guidance on how to degrade Outstanding Waters on a short-term basis. While these components of the standards are important to ensure that restoration and responses to emergencies can occur, they should not be the only component of the Outstanding Waters protections found at 20.6.4.8 NMAC. Policy to protect the state's most precious waters should not primarily focus on avenues to degrade such waters. We recommend adopting specific requirements and steps in 20.6.4.8 NMAC to ensure that degradation is not occurring in New Mexico's designated Outstanding Water, and if it is found that there are adequate steps taken to

address it.

20.6.4.9 No changes proposed

20.6.4.10 REVIEW OF STANDARDS; NEED FOR ADDITIONAL STUDIES:

~~**F.** If the commission grants a rulemaking hearing for the amendment or adoption of a water quality standard, including ONRW nominations, site-specific criteria, use attainability analyses, and designating classified segments, the petitioner shall be responsible for the costs of the administrative rulemaking process. Costs include: venue, hearing officer, court reporter, original transcripts, translation services, interpretation services, and public notice requirements including publication in newspapers and in the New Mexico register. The petitioner shall coordinate with the commission administrator and the department on rulemaking hearing requirements.~~

F. Site-specific criteria.

(1) The commission may adopt site-specific numeric criteria applicable to all or part of a surface water of the state based on relevant site-specific conditions such as:

(a) actual species at a site are more or less sensitive than those used in the national criteria data set;

(b) physical or chemical characteristics at a site such as pH or hardness alter the biological availability and/or toxicity of the chemical;

(c) physical, biological or chemical factors alter the bioaccumulation potential of a chemical;

(d) the concentration resulting from natural background exceeds numeric criteria for aquatic life, wildlife habitat or other uses if consistent with Subsection G of 20.6.4.10 NMAC; or

(e) other factors or combination of factors that upon review of the commission may warrant modification of the default criteria, subject to EPA review and approval.

(2) Site-specific criteria must fully protect the designated use to which they apply. In the case of human health-organism only criteria, site-specific criteria must fully protect human health when organisms are consumed from waters containing pollutants.

(3) Any person may submit notice to the department stating their intent to derive site-specific criteria for a surface water of thestate no less than six months prior to petitioning the commission to adopt such criteria. The notice shall include a work plan supporting the development of site- specific criteria for the department's review and comment.

(4) Site-specific criteria shall be developed in accordance with the reviewed work plan, based on one or more of the site-specific conditions noted in paragraph 1, derived from a scientifically defensible method and protect the designated uses to which they apply.

(5) The work plan shall identify, at a minimum:

(a) the waterbody to consider and the reasoning for site-specific criteria;

(b) the methodology to be used to derive criteria;

(c) the source and validity of data to be used;

(d) the provisions for consultation with appropriate state and federal agencies;

(e) a description of how stakeholders and potentially affected Indian nations, tribes, or pueblos will be identified and engaged;

(f) a description of the public notice mechanisms to be employed; and

(g) the expected timelines and associated administrative actions to be taken for a rulemaking petition, pending the outcome of criteria development.

(6) Upon completion of site-specific criteria development, the data, findings and conclusions shall be submitted to the department, and public notice shall be provided in accordance with the approved work plan.

G. Site-specific criteria based on natural background. The commission may adopt site-specific criteria equal to the concentration resulting from natural background where that concentration protects the designated use. The concentration resulting from natural background supports the level of aquatic life and wildlife habitat expected to occur naturally at the site absent any interference by humans. Domestic water supply, primary or secondary contact, or human health-organism only criteria shall not be modified based on natural background. A determination of natural background shall:

H. Temporary standards.

~~**(12)** "Temporary standard" means a time-limited designated use and criterion for a specific pollutant(s) or water quality parameter(s) that reflect the highest attainable condition during the term of the temporary standard.~~.

Amigos Bravos Comments and Basis for Change for Section 20.6.4.10 NMAC:
While Amigos Bravos understands NMED's desire to limit the potential economic burden of lots of petitions and proposed changes to 20.6.4 NMAC, NMED's proposed change creates a pay to play situation where only the wealthier stakeholders in the state will have the ability to petition to change standards. Unfortunately, the wealthier stakeholders in the state are often dischargers that have a vested interest in weakening the standards of the waters into which they discharge. Amigos Bravos therefore opposes the proposed blanket requirement that petitioners pay for the hearings. Alternatively, we suggest that NMED add the requirement to pay for the hearing to the UAA and temporary standards sections to ensure that hearings related to those two procedures are paid for by the petitioner.

Amigos Bravos has also added a timeframe for the notice of development of site-specific criteria and workplan to assure that it is provided well before a petition is presented to the commission.

20.6.4.10 REVIEW OF STANDARDS

20.6.4.11 APPLICABILITY OF WATER QUALITY STANDARDS

~~**D**. Mixing zones: A limited mixing zone, contiguous to a point source wastewater discharge, may be allowed in any stream receiving such a discharge. Mixing zones serve as regions of initial dilution that allow the application of a dilution factor in calculations of effluent limitations. Effluent limitations shall be developed that will protect the most sensitive existing, designated or attainable use of the receiving water.~~

~~**E.** Mixing zone limitations: Wastewater mixing zones, in which the numeric criteria set under Subsection F of 20.6.4.13 NMAC, 20.6.4.97 through 20.6.4.899 NMAC or 20.6.4.900 NMAC may be exceeded, shall be subject to the following limitations:~~

~~**(1)** Mixing zones are not allowed for discharges to lakes, reservoirs, or playas; these effluents shall meet all applicable criteria set under Subsection F of 20.6.4.13 NMAC, 20.6.4.97 through 20.6.4.899 NMAC and 20.6.4.900 NMAC at the point of discharge.~~

~~**(2)** The acute aquatic life criteria, as set out in Subsection I, Subsection J, and Subsection K of 20.6.4.900 NMAC, shall be attained at the point of discharge for any discharge to a~~

~~surface water of the state with a designated aquatic life use.~~

~~**(3)** The general criteria set out in Subsections A, B, C, D, E, G, H and J of 20.6.4.13 NMAC, and the provision set out in Subsection D of 20.6.4.14 NMAC are applicable within mixing zones.~~

~~**(4)** The areal extent and concentration isopleths of a particular mixing zone will depend on site-specific conditions including, but not limited to, wastewater flow, receiving water critical low flow, outfall design, channel characteristics and climatic conditions and, if needed, shall be determined on a case-by-case basis. When the physical boundaries or other characteristics of a particular mixing zone must be known, the methods presented in Section 4.4.5, "Ambient-induced mixing," in "Technical support document for water quality-based toxics control" (March 1991, EPA/505/2-90-001) shall be used.~~

~~**(5)** All applicable water quality criteria set under Subsection F of 20.6.4.13 NMAC, 20.6.4.97 through 20.6.4.899 NMAC and 20.6.4.900 NMAC shall be attained at the boundaries of mixing zones. A continuous zone of passage through or around the mixing zone shall be maintained in which the water quality meets all applicable criteria and allows the migration of aquatic life presently common in surface waters of the state with no effect on their populations.~~

Alternatively, incorporate the following changes to 20.6.4.11.E NMAC:

E. Mixing zone limitations: Wastewater mixing zones, in which the numeric criteria set under Subsection F of 20.6.4.13 NMAC, 20.6.4.97 through 20.6.4.899 NMAC or 20.6.4.900 NMAC may be exceeded, shall be subject to the following limitations:

(1) Mixing zones are not allowed for discharges to lakes, reservoirs, or playas; these effluents shall meet all applicable criteria set under Subsection F of 20.6.4.13 NMAC, 20.6.4.97 through 20.6.4.899 NMAC and 20.6.4.900 NMAC at the point of discharge.

(2) Mixing zones are not allowed in Outstanding National Resource Waters; these effluents shall meet all applicable criteria set under Subsection F of 20.6.4.13 NMAC, 20.6.4.97 through 20.6.4.899 NMAC and 20.6.4.900 NMAC at the point of discharge.

(3) In impaired waterbodies mixing are not allowed for parameters that are causing impairment.

~~(2)~~ (4) The acute aquatic life criteria, as set out in Subsection I, Subsection J, and Subsection K of 20.6.4.900 NMAC, shall be attained at the point of discharge for any discharge to a surface water of the state with a designated aquatic life use.

~~(3)~~ (5) The general criteria set out in Subsections A, B, C, D, E, G, H and J of 20.6.4.13 NMAC, and the provision set out in Subsection D of 20.6.4.14 NMAC are applicable within mixing zones.

~~(4)~~ (6) The areal extent and concentration isopleths of a particular mixing zone will depend on site-specific conditions including, but not limited to, wastewater flow, receiving water critical low flow, outfall design, channel characteristics and climatic conditions and, if needed, shall be determined on a case-by-case basis.

~~(5)~~ (7) All applicable water quality criteria set under Subsection F of 20.6.4.13 NMAC, 20.6.4.97 through 20.6.4.899 NMAC and 20.6.4.900 NMAC shall be attained at the boundaries of mixing zones. A continuous zone of passage through or around the mixing zone shall be maintained in which the water quality meets all applicable criteria and allows the migration of aquatic life presently common in surface waters of the state with no effect on their populations.

F. Human health-organism only criteria in Subsection J of 20.6.4.900 NMAC apply to those waters with a designated, existing or attainable aquatic life use. When limited aquatic life is a designated use, the human health-organism only criteria apply only for persistent toxic pollutants, ~~if~~ unless adopted on a segment-specific basis. The human health-organism only criteria for persistent toxic pollutants, as identified in Subsection J of 20.6.4.900 NMAC, also apply to all tributaries of waters with a designated, existing or attainable aquatic life use.

G. Unclassified Waters of the State

H. Exceptions: Numeric criteria for temperature, dissolved solids, dissolved oxygen, sediment or turbidity adopted under the Water Quality Act do not apply when changes in temperature, dissolved solids, dissolved oxygen, sediment or turbidity in a surface water of the state are attributable to:

(1) natural causes (water quality impacts from climate change including post wildfire storm flooding and discharges from municipal separate storm sewers are not covered by this exception.); or

Amigos Bravos Basis for Change for Section 20.6.4.11: *Climate change is creating massive, previously unseen, fluctuations of flow in New Mexico's rivers and streams, making it impossible to ensure that mixing zones are not harming public health or aquatic resources. If the flow in a receiving waterbody swings from large flood events to very low flows, as we can expect, and in fact are already seeing in a changing climate, it is difficult to determine the dilution factor to calculate a mixing zone. In addition, increased flooding events can result in increased pollutant loads in receiving waters from many different sources, making mixing zones all the more inappropriate. Therefore, a concrete step to make New Mexico standards more responsive to climate change is to stop allowing mixing zones. In addition, it is unclear how NMED enforces 20.6.4.11.E(5), which requires that a continuous passage either through or around a mixing where all applicable criteria are met. Again, with climate change and extreme fluctuations of flows and temperature, demonstrating this requirement is met is extremely challenging. It would be simpler, safer, and easier for both NMED and permittees to demonstrate compliance if mixing zones were eliminated entirely. Alternatively, if mixing zones aren't prohibited outright, we urge NMED to put additional limitations on mixing zones, such prohibiting mixing zones in impaired waterbodies, Outstanding Waters (ONRWs), or anywhere that domestic water supply or primary contact is designated to ensure, at the very least, these special and sensitive waters are adequately protected.*

20.6.4.12 COMPLIANCE WITH WATER QUALITY STANDARDS: The following provisions apply to determining compliance for enforcement purposes; they do not apply for purposes of determining attainment of uses. The department has developed assessment protocols for the purpose of determining attainment of uses that are available for review from the department's surface water quality bureau.

F. For compliance with ~~hardness-dependent~~ calculated numeric criteria, that depend on water chemistry, ~~hardness (as mg CaCO3/L)~~ all input parameters shall be determined from a sample taken at the same time that the sample for the contaminant is taken. If not all the input data are available to calculate a criterion, default input values may be used if justified and supported by ecoregional or other watershed data.

G. Compliance schedules may be included in NPDES permits at the time of permit renewal or modification and shall be written to require compliance at the earliest practicable time, but not longer than 5-years. Compliance schedules shall also specify milestone dates so as to measure progress towards final project completion (e.g., design completion, construction start, construction completion, date of compliance). If a permit is administratively continued, a facility with a compliance schedule must show compliance at the end of the initial 5-year permit period.

Amigos Bravos Basis for Change for Section 20.6.4.12: *We recommend putting constraints on compliance schedules to guard against overuse and abuse of this important tool. For example, we suggest adding a time limit of 5-years and requirements for revisiting compliance schedules during permit renewals. In addition, if a permit is administratively extended, any compliance*

schedule included in the permit should be reviewed 5-years after issuance of the permit.

20.6.4.13 GENERAL CRITERIA: General criteria are established to sustain and protect existing or attainable uses of surface waters of the state. These general criteria apply to all surface waters of the state at all times, unless a specified criterion is provided elsewhere in this part. Surface waters of the state shall be free of any water contaminant in such quantity and of such duration as may with reasonable probability injure human health, animal or plant life or property, or unreasonably interfere with the public welfare or the use of property.

~~**N. Wetlands:** Only wetlands of the state are subject to this general criterion. Wetlands shall be~~ maintained and protected such that degradation through direct, indirect, or cumulative impacts does not result in the net loss of wetland acreage or biological, chemical, physical, and hydrological functions to the extent that such functions occur, as characterized by state-specific benchmarks. The functions of a wetland that are to be maintained and protected may include:

~~(1) erosion control through bank and shoreline stabilization;~~
~~(2) flood attenuation and flood protection;~~
~~(3) sediment and pollutant retention, which prevents or mitigates downstream migration;~~
~~(4) groundwater recharge and water storage for future use;~~
~~(5) low flow augmentation including baseflow maintenance;~~
~~(6) water filtration including removal or storage of nutrients and other contaminants;~~
~~(7) propagation or maintenance of aquatic and terrestrial species indigenous to wetlands;~~
~~(8) preservation of wildlife habitat including habitat for threatened or endangered species; or~~
~~(9) supporting biological diversity.~~

~~In addition, wetlands shall be suitable for recreation, wildlife habitat, and use by aquatic life and livestock.~~

Amigos Bravos Basis for Change for Section 20.6.4.13: *Amigos Bravos supports and appreciates NMED's specific proposed language for a wetland standard, however we believe that there are more appropriate places for this language. Specifically, we proposed to move this language to both the antidegradation policy (20.6.4.8 NMAC) and to a new wetland specific segment of the standards at 20.6.4.96 NMAC. We do not believe that a criterion to protect wetlands of the state belongs in the general criteria because all of the other criteria in that section are pollutants or conditions, not aquatic features or functions. The list of general criteria are often called the "free-froms", because general criteria typically call for waters to be "free-from" specific pollutants. In contrast, the proposed general criteria for wetlands outlines wetland conditions and functions that must be protected. Another concern with keeping this language in the general criteria section is that general criteria are very difficult to implement or enforce.*

20.6.4.14 SAMPLING AND ANALYSIS:

C. Sampling Procedures:

(1) Streams: Stream monitoring stations below discharges shall be located a sufficient distance downstream to ensure adequate vertical and lateral mixing.

(2) Lakes: Sampling stations in lakes shall be located at least 250 feet from a discharge.

(3) Lakes: Except for the restriction specified in Paragraph (2) of this

subsection, lake sampling stations shall be located at any site where the attainment of a water quality criterion is to be assessed. ~~Water quality measurements taken at intervals in the entire water column at a sampling station shall be averaged for the epilimnion, or in the absence of an epilimnion, for the upper one-third of the water column of the lake to determine attainment of criteria, except that attainment of criteria for toxic pollutants shall be assessed during periods of complete vertical mixing, e.g., during spring or fall turnover, or by taking depth-integrated composite samples of the water column.~~

20.6.4.15 USE ATTAINABILITY ANALYSIS:

A. Methods for developing a use attainability analysis. A use attainability analysis shall assess the physical, chemical, biological, economic or other factors affecting the attainment of a use. The analysis shall rely on scientifically defensible methods such as the methods described in the following documents:

(1) the United States environmental protection agency's water quality standards handbook and use attainability analysis website for current recommendations and case studies;

(~~1~~2) *Technical Support Manual: Waterbody Surveys And Assessments For Conducting Use Attainability Analyses*, volume I (November 1983) and volume III (November 1984) or latest editions, United States environmental protection agency, office of water, regulations and standards, Washington, D.C., for the evaluation of aquatic life or wildlife uses;

(~~2~~3) the department's *Hydrology Protocol*, latest edition, approved by the commission, for identifying ephemeral, intermittent, and perennial waters; ~~or~~

(~~3~~4) *Interim Economic Guidance For Water Quality Standards - Workbook*, March 1995, in conjunction with *Clean Water Act Financial Capability Assessment Guidance,* March 2024, United States environmental protection agency, office of water, Washington, D.C. for evaluating economic impacts; or

(5) Analysis of and analytical tools to calculate the benefits of pollution control such as:

(a) EPA's site on calculating impacts of Pollution Prevention Grants. https://www.epa.gov/p2/pollution-prevention-tools-and-calculators

(b) Benefit of Water Pollution Control on Property; Values, https://www.epa.gov/sites/default/files/2017-12/documents/ee-0009.pdf;

(c) Measuring the social benefits of water quality improvements to support regulatory objectives: Progress and future directions, https://www.pnas.org/doi/10.1073/pnas.2120247120#sec-4;

(d) A more comprehensive estimate of the value of water; or quality, https://www.sciencedirect.com/science/article/abs/pii/S0047272722000020

D. Process to amend a designated use through a use attainability analysis.

(1) The process for developing a use attainability analysis and petitioning the commission for removing a designated use and establishing the highest attainable use shall be done in accordance with the State's current *Water Quality Management Plan/Continuing Planning Process*.

(2) If the findings of a use attainability analysis, conducted by the department, in accordance with the department's *Hydrology Protocol* (latest edition) demonstrates that federal Clean Water Act Section 101(a)(2) uses, that are not existing uses, are not feasible in an ephemeral water body due to the factor in 40 CFR 131.10(g)(2), the department may consider proceeding with the expedited use attainability analysis process in accordance with the State's current *Water Quality Management Plan/Continuing Planning Process*. The following elements must be met for the expedited use attainability analysis process to be authorized and implemented:

(a) The department is the primary investigator of the use attainability

analysis;

(b) The use attainability analysis determined, through the application of the *Hydrology Protocol*, that the water being investigated is ephemeral and has no effluent discharges of sufficient volume that could compensate for the low-flow;

(c) The use attainability analysis determined that the criteria associated with the existing uses of the water being investigated are not more stringent than those in 20.6.4.97 NMAC;

(d) The designated uses in 20.6.4.97 NMAC have been determined to be the highest attainable uses for the water being analyzed;

(e) The department posted the use attainability analysis on its water quality standards website and notified its interested parties list of a 30-day public comment period;

(f) The department reviewed and responded to any comments received during the 30-day public comment period ; and

(g) The department submitted the use attainability analysis and response to comments to ~~region 6~~ EPA for technical ~~approval~~review.

(3) If EPA approves the designated use revision(s) under section 303(c) of the Clean Water Act, the water shall be subject to 20.6.4.97 NMAC for federal Clean Water Act purposes. The use attainability analysis, the technical support document, and the applicability of 20.6.4.97 NMAC to the water shall be posted on the department's water quality standards website. The department shall periodically petition the commission to list ephemeral waters under Subsection C of 20.6.4.97 NMAC and to incorporate changes to classified segments as appropriate.

E. Use attainability analysis conducted by an entity other than the department. Any person may submit notice to the department stating their intent to conduct a use attainability analysis.

(1) The ~~proponent~~ notice shall ~~provide such notice along with~~include a work plan supporting the development of a use attainability analysis ~~to~~for the department's ~~and region 6 EPA for~~ review and comment.

(2) Upon approval of the work plan by the department, ~~the proponent shall conduct~~ the use attainability analysis shall be conducted in accordance with the applicable portions of Subsections A through D of this Section and ~~implement~~ public ~~noticing~~notice provided in accordance with the approved work plan.

(3) Work plan elements. The work plan shall identify, at a minimum:

(a) the waterbody of concern and the reasoning for conducting a use attainability analysis;

(b) the source and validity of data to be used to demonstrate whether the current designated use is not attainable;

(c) the factors in 40 CFR 131.10(g) affecting the attainment of that use;

(d) a description of the data being proposed to be used to demonstrate the highest attainable use; identified and engaged;

(e) the provisions for consultation with appropriate state and federal agencies;

(f) a description of how stakeholders and potentially affected tribes will be

(g) a description of the public notice mechanisms to be employed; and

(h) the expected timelines outlining the administrative actions to be taken for a rulemaking petition, pending the outcome of the use attainability analysis.

(4) Upon completion of the use attainability analysis, ~~the proponent shall submit~~ the data, findings and conclusions shall be submitted to the department, and ~~provide~~ public notice of the use attainability analysis provided in accordance with the approved work plan.

(5) Pending the conclusions of the use attainability analysis and as described in the approved work plan, the ~~department or the proponent~~ person conducting the use attainability analysis may petition the commission to modify the designated use. ~~The cost of such use attainability analysis shall be the responsibility of the proponent. Subsequent costs associated with the administrative rulemaking process shall be the responsibility of the petitioner.~~

Amigos Bravos Basis for Change for Section 20.6.4.15: *EPA has not yet updated their Water Quality Standards Handbook. The changes proposed to three chapters in 2025 are still draft, however, Amigos Bravos agrees that reference to the handbook is appropriate.*

The references to the Interim Economic Guidance for Water Quality Standards – Workbook, March 1995 and the Clean Water Act Financial Capability Assessment Guidance, March 2024 must be qualified to indicate that those documents do not adequately include metrics or tools to calculate the benefits of controlling pollution to communities or the costs of not controlling pollution to communities. Proponents of removing designated uses must include those considerations when employing factor 40 CFR 131.10(g)(6).

Amigos Bravos recommends that the above references and/or similar state-of-the-art economic analysis and tools be included in the list of required scientifically defensible methods that shall be relied upon to develop a Use Attainability Analysis.

20.6.4.16 through 20.6.4.97 NMAC – No changes proposed

20.6.4.96 WETLANDS: All wetlands of the state, except those wetlands classified in other segments.

A. Designated uses: secondary contact, wildlife habitat, aquatic life, livestock.

B. Criteria: wetlands shall be maintained and protected such that degradation through direct, indirect, or cumulative impacts does not result in the net loss of wetland acreage or biological, chemical, physical, and hydrological functions to the extent that such functions occur, as characterized by state-specific benchmarks. The functions of a wetland that are to be maintained and protected may include: erosion control through bank and shoreline stabilization; flood attenuation and flood protection; sediment and pollutant retention, which prevents or mitigates downstream migration; groundwater recharge and water storage for future use; low flow augmentation including baseflow maintenance; water filtration including removal or storage of nutrients and other contaminants; propagation or maintenance of aquatic and terrestrial species indigenous to wetlands; preservation of wildlife habitat including habitat for threatened or endangered species; ~~or~~ supporting biological diversity; **or sequestering carbon.** The use-specific criteria in 20.6.4.900 NMAC, except for criteria set forth in Subsection I, J, K, L, are applicable to the designated uses until wetland-specific numeric criteria are developed.

Amigos Bravos Basis for Change for Section 20.6.4.96: *Amigos Bravos suggests creating a new segment for wetlands that would apply to all wetlands of the state until such a time that specific wetland segments or standards are developed for specific types of wetlands. Specifically, we recommend establishing a section for wetlands similar to those for ephemeral, intermittent, and perennial waters, that lists wetland functions, designated uses, and relevant narrative and numeric criteria to be used along with functional assessments.*

Water quality standards must provide a way to determine whether wetlands have physical, biological, or chemical impairments. The narrative general criterion lists functions, but it provides no metrics or tools for such a determination. In EPA guidance for developing wetland water quality standards and in many states, numeric criteria are identified as indicators of wetland functional

health or impairment. For example, base flow, dissolved oxygen, conductivity, pH, salinity, species diversity, water levels, and conditions such as water temperature variations, sedimentation patterns, and wetland hydroperiod can all be used to help determine quality and impacts to wetland functions. This new section will provide a way to apply a few of these parameters now and provide a place for additional parameters to be added later. In addition, this new section in the water quality standards will provide NMED the framework to assess and determine the health or impairment of wetland functions as needed for the purposes of both the biennial Integrated Report and the implementation of the state surface water permitting program.

20.6.4.98 INTERMITTENT WATERS: All non-perennial surface waters of the state, except those ephemeral waters included under section 20.6.4.97 NMAC, ~~or~~ classified in 20.6.4.101-899 NMAC, or wetlands protected under 20.6.4.~~13~~ 96 NMAC.

A. Designated uses: livestock watering, wildlife habitat, marginal warmwater aquatic life and primary contact.

B. Criteria: the use-specific criteria in 20.6.4.900 NMAC are applicable to the designated uses, except that the following site-specific criteria apply: the monthly geometric mean of E. coli bacteria 206 cfu/100 mL or less, single sample 940 cfu/100 mL or less.

20.6.4.99 PERENNIAL WATERS: All perennial surface waters of the state except those classified in 20.6.4.101-899 NMAC, or wetlands protected under 20.6.4.~~13~~ 96 NMAC.

A. Designated uses: Warmwater aquatic life, livestock watering, wildlife habitat and primary contact.

B. Criteria: The use-specific criteria in 20.6.4.900 NMAC are applicable to the designated uses, except that the following site-specific criteria apply: the monthly geometric mean of E. coli bacteria 206 cfu/100 mL or less, single sample 940 cfu/100 mL or less.

20.6.4.100 through 20.6.4.134 NMAC – No changes proposed.

20.6.4.135 RIO GRANDE BASIN: Bluewater lake and Santa Cruz lake.

A. Designated uses: coldwater aquatic life, irrigation, domestic water supply, primary contact, livestock watering and wildlife habitat.

B. Criteria: The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses except that the following segment-specific criteria apply: total phosphorus (unfiltered sample) 0.1 mg/L or less for Bluewater lake; the monthly geometric mean of *E. coli* bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.

Amigos Bravos Basis for Change for All Sections with a Phosphorus Standard: *There is inconsistency in the terms used for phosphorus throughout NMAC 20.6.4 and the proposed amendments. Please use the term "total phosphorus" throughout the document instead of "phosphorus" in some sections, and "total phosphorus" in other sections. For example, 20.6.4.318 Canadian River Basin: Doggett Creek specifies "total phosphorus" in the pollutant and highest attainable condition, but in several sections including 20.6.4.135 Rio Grande Basin: Bluewater Lake, the term "phosphorus" is used and we have confirmed with NMED staff that this is referring to total phosphorus. We have adjusted the amendments document to show where this should be modified in green underlines. There are six more places in NMAC 20.4.6 NMAC that weren't included for amendments in NMED's proposal that need the term "phosphorus" changed to "total phosphorus". Instead of pasting them all in this document we have identified them here: are sections: 20.6.4.109; 20.6.4.123;20.6.4.129; 20.6.4.223; 20.6.4.403; 20.6.4.406, and 20.6.4.40.*

20.6.4.206 PECOS RIVER BASIN: Perennial reaches of the Rio Felix ~~and perennial reaches of tributaries to the Rio Hondo downstream of Bonney canyon, excluding North Spring river~~.

A. Designated uses: irrigation, livestock watering, wildlife habitat, secondary contact and warmwater aquatic life.

B. Criteria:

(1) The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

(2) At all flows above 50 cfs: TDS 14,000 mg/L or less, sulfate 3,000 mg/L or less and chloride 6,000 mg/L or less.

20.6.4.207 NMAC – No changes proposed.

20.6.4.208 PECOS RIVER BASIN: Perennial reaches of the Rio Peñasco above ~~state highway 24 near Dunken~~Bear Canyon, perennial reaches of tributaries to the Rio Peñasco above ~~state highway 24 near Dunken~~Bear Canyon, perennial reaches of Cox canyon, perennial reaches of the Rio Bonito downstream from ~~state highway 48 (near~~ Angus canyon), the Rio Ruidoso downstream of ~~the U.S. highway 70 bridge~~Palo Verde canyon near Seeping Springs lakes, perennial reaches of the Rio Hondo upstream from Bonney canyon and perennial reaches of Agua Chiquita.

A. Designated uses: fish culture, irrigation, livestock watering, wildlife habitat, coldwater aquatic life and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: temperature 30°C (86°F) or less, and total phosphorus (unfiltered sample) less than 0.1 mg/L.

20.6.4.209 PECOS RIVER BASIN: Perennial reaches of Eagle creek upstream of Alto dam to the Mescalero Apache boundary, perennial reaches of the Rio Bonito upstream of ~~state highway 48 (near~~ Angus canyon) excluding Bonito lake, perennial reaches of tributaries to the Rio Bonito upstream of ~~state highway~~ ~~48 (near~~ Angus canyon), perennial reaches of the Rio Ruidoso upstream of ~~the U.S. highway 70 bridge~~Palo Verde canyon near Seeping Springs lakes above and below the Mescalero Apache boundary and perennial reaches of tributaries to the Rio Ruidoso upstream of ~~the U.S. highway 70 bridge~~Palo Verde canyon near Seeping Springs lakes above and below the Mescalero Apache boundary.

A. Designated uses: domestic water supply, high quality coldwater aquatic life, irrigation, livestock watering, wildlife habitat, public water supply and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: specific conductance 600 µS/cm or less in Eagle creek, 1,100 µS/cm or less in Bonito creek and 1,500 µS/cm or less in the Rio Ruidoso; total phosphorus (unfiltered sample) less than 0.1 mg/L; the monthly geometric mean of *E. coli* bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.

20.6.4.210 through 20.6.4.212 NMAC – No changes proposed.

20.6.4.213 PECOS RIVER BASIN: McAllister lake.

A. Designated uses: coldwater aquatic life, ~~secondary~~ primary contact, livestock watering and wildlife habitat.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criterion applies: temperature 25°C (77°F) or less.

20.6.4.214 through 20.6.4.218 NMAC – No changes proposed.

20.6.4.219 PECOS RIVER BASIN: Avalon reservoir.

A. Designated uses: irrigation storage, livestock watering, wildlife habitat, ~~secondary~~ primary contact and warmwater aquatic life.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

20.6.4.220 through 20.6.4.230 NMAC – No changes proposed.

20.6.4.231 PECOS RIVER BASIN: The main stem of the Pecos river from the headwaters of Brantley reservoir upstream to Salt creek (near Acme), perennial reaches of the Rio Peñasco downstream from ~~state highway 24 near Dunken~~ Bear canyon, ~~perennial reaches of North Spring river and~~ perennial reaches of the Rio Hondo and perennial reaches of its tributaries downstream of Bonney canyon.

A. Designated uses: irrigation, livestock watering, wildlife habitat, primary contact and warmwater aquatic life.

B. Criteria:

(1) The use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

(2) At all flows above 50 cfs: TDS 14,000 mg/L or less, sulfate 3,000 mg/L or less and chloride 6,000 mg/L or less.

20.6.4.232 through 20.6.4.306 NMAC – No changes proposed.

20.6.4.307 CANADIAN RIVER BASIN: Perennial reaches of the Mora river from the USGS gaging station near Shoemaker upstream to the state highway 434 bridge in Mora, all perennial reaches of tributaries to the Mora river downstream from the USGS gaging station at La Cueva in San Miguel and Mora counties except ~~lakes~~ waters identified in 20.6.4.309 NMAC or 20.6.4.313 NMAC, perennial reaches of Ocate creek downstream of Ocate, perennial reaches of tributaries to Ocate creek downstream of Ocate, and perennial reaches of Rayado creek downstream of Miami lake diversion in Colfax county.

A. Designated uses: marginal coldwater aquatic life, warmwater aquatic life, primary contact, irrigation, livestock watering and wildlife habitat.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

20.6.4.308 CANADIAN RIVER BASIN: Charette lakes.

A. Designated uses: coldwater aquatic life, warmwater aquatic life, ~~secondary~~ primary contact, livestock watering and wildlife habitat.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

20.6.4.309 CANADIAN RIVER BASIN: The Mora river and perennial reaches of its tributaries upstream from the state highway 434 bridge in Mora except lakes identified in 20.6.4.313 NMAC, all perennial reaches of tributaries to the Mora river upstream from the USGS gaging station at La Cueva, perennial reaches of Coyote creek, upstream of Amola ridge and perennial reaches of tributaries to Coyote creek upstream to Amola ridge, the Cimarron river above state highway 21 in Cimarron, perennial reaches of tributaries to the Cimarron river above state highway 21 in Cimarron except Eagle Nest

lake, all perennial reaches of tributaries to the Cimarron river north and northwest of highway 64 except north and south Shuree ponds, perennial reaches of Rayado creek above Miami lake diversion, perennial reaches of tributaries to Rayado creek above Miami lake diversion, Ocate creek and perennial reaches of its tributaries upstream of Ocate, perennial reaches of the Vermejo river upstream from Rail canyon and all other perennial reaches of tributaries to the Canadian river northwest and north of U.S. highway 64 in Colfax county unless included in other segments.Designated uses: domestic water supply, irrigation, high quality coldwater aquatic life, livestock watering, wildlife habitat, and primary contact; and public water supply on the Cimarron river upstream from Cimarron, on perennial reaches of Rayado creek and on perennial reaches of tributaries to Rayado creek.

A. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: specific conductance 500 µS/cm or less; the monthly geometric mean of *E. coli* bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.

20.6.4.310 through 20.6.4.317 NMAC – No changes proposed.

20.6.4.318 CANADIAN RIVER BASIN: Doggett creek.

A. Designated uses: Warm water aquatic life, livestock watering, wildlife habitat and primary contact.

B. Criteria: The use-specific criteria in 20.6.4.900 NMAC are applicable to the designated uses,
except that the following site-specific criteria apply: the monthly geometric mean of E. coli bacteria 206 cfu/100 mL or less, single sample 940 cfu/100 mL or less.

C. Discharger-specific temporary standard:

(1) Discharger: City of Raton wastewater treatment plant

(2) NPDES permit number: NM0020273, Outfall 001

(3) Receiving waterbody: Doggett creek, 20.6.4.318 NMAC

(4) Discharge latitude/longitude: 36° 52' 13.91" N / 104° 25' 39.18" W

(5) Pollutant(s): nutrients; total nitrogen and total phosphorus

(6) Factor of issuance: substantial and widespread economic and social impacts (40 CFR
131.10(g)(6))

(7) Highest attainable condition: interim effluent condition of 8.0 mg/L total nitrogen and
1.6 mg/L total phosphorus as 30-day averages. The highest attainable condition shall be either the highest attainable condition identified at the time of the adoption, or any higher attainable condition later identified during any reevaluation, whichever is more stringent (40 CFR 131.14(b)(1)(iii)).

(8) Effective date of temporary standard: ~~This temporary standard becomes~~ effective for Clean Water Act purposes on ~~the date of EPA approval~~ July 24, 2020.

(9) Expiration date of temporary standard: no later than 20 years from the effective date.

(10) Reevaluation period: at each succeeding review of water quality standards and at least once every five years from the effective date of the temporary standard (Paragraph (8) of Subsection H of 20.6.4.10 NMAC, 40 CFR 131.14(b)(1)(v)). If the discharger cannot demonstrate that sufficient progress has been made the commission may revoke approval of the temporary standard or provide additional conditions to the approval of the temporary standard. If the reevaluation is not completed at the frequency specified or the Department does not submit the reevaluation to EPA within 30 days of completion, the underlying designated use and criterion will be the applicable water quality standard for Clean

Water Act purposes until the Department completes and submits the reevaluation to EPA. Public input on the reevaluation will be invited during NPDES permit renewals or triennial reviews, as applicable, in accordance with the State's most current approved water quality management plan and continuing planning process.

(11) Timeline for proposed actions. Tasks and target completion dates are listed in the most recent, WQCC-approved version of the New Mexico Environment Department, Surface Water Quality Bureau's "Nutrient Temporary Standards for City of Raton Wastewater Treatment Plant, NPDES No. NM0020273 to Doggett Creek.".

20.6.4.319 through 20.6.4.402 NMAC – No changes proposed.

20.6.4.403 SAN JUAN RIVER BASIN: The Animas river from its confluence with the San Juan river upstream to Estes arroyo.

A. Designated uses: Public water supply, industrial water supply, irrigation, livestock watering, wildlife habitat, coolwater aquatic life, and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses~~, except that the following segment-specific criterion applies: temperature 29°C (84.2°F) or less~~.

20.6.4.404 through 20.6.4.501 NMAC – No changes proposed.

20.6.4.502 GILA RIVER BASIN: The main stem of the Gila river from Redrock canyon upstream to the confluence of the West Fork Gila river and East Fork Gila river and perennial reaches of tributaries to the Gila river downstream of Mogollon creek.

A. Designated uses: industrial water supply, irrigation, livestock watering, wildlife habitat, marginal coldwater aquatic life, and primary contact~~ and warmwater aquatic life~~.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criterion applies: 28°C (82.4°F) or less.

20.6.4.503 GILA RIVER BASIN: All perennial tributaries to the Gila river upstream of and including Mogollon creek.

A. Designated uses: domestic water supply, high quality coldwater aquatic life, irrigation, livestock watering, wildlife habitat and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criteria apply: specific conductance of 400 µS/cm or less for all perennial tributaries except West Fork Gila and tributaries thereto, specific conductance of 300 µS/cm or less; ~~32.2~~ 29°C (~~90~~84°F) or less in the east fork of the Gila river and Sapillo creek downstream of Lake Roberts; the monthly geometric mean of E. coli bacteria 126 cfu/100 mL or less, single sample 235 cfu/100 mL or less.

20.6.4.504 through 20.6.4.600 NMAC – No changes proposed.

20.6.4.601 SAN FRANCISCO RIVER BASIN: The main stem of the San Francisco river from the New Mexico-Arizona line upstream to~~ state highway 12 at Reserve~~ the confluence with Largo canyon and perennial reaches of Mule creek.

A. Designated uses: irrigation,~~ marginal warmwater and~~ marginal coldwater aquatic life, livestock watering, wildlife habitat and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses.

20.6.4.602 SAN FRANCISCO RIVER BASIN: The main stem of the San Francisco river from ~~state highway 12 at Reserve~~ the confluence with Largo canyon upstream to the New Mexico-Arizona line.

A. Designated uses: coldwater aquatic life, irrigation, livestock watering, wildlife habitat and primary contact.

B. Criteria: the use-specific numeric criteria set forth in 20.6.4.900 NMAC are applicable to the designated uses, except that the following segment-specific criterion applies: temperature 25°C (77°F) or less.

20.6.4.603 through 20.6.4.899 NMAC – No changes proposed.

20.6.4.900 CRITERIA APPLICABLE TO EXISTING, DESIGNATED OR ATTAINABLE USES UNLESS OTHERWISE SPECIFIED IN 20.6.4.9~~7~~ 96 THROUGH 20.6.4.899 NMAC:

20.6.4.900.A through 20.6.4.900.C NMAC – No changes proposed.

D. Primary contact: The monthly geometric mean of E. coli bacteria of 126 cfu/100 mL or MPN/100 ml, a single sample of E. coli bacteria of 410 cfu/100 mL or MPN/100 mL, a single sample of total microcystins of 8 µg/L ~~with no more than three exceedances within a 12-month period~~ and a single sample of cylindrospermopsin of 15 µg/L ~~with no more than three exceedances within a 12-month period~~, and pH within the range of 6.6 to 9.0 apply to this use. The results for *E. coli* may be reported as either colony forming units (CFU) or the most probable number (MPN) depending on the analytical method used.

20.6.4.900.E through 20.6.4.900.G NMAC – No changes proposed.

H. Aquatic life: Surface waters of the state with a designated, existing or attainable use of aquatic life shall be free from any substances at concentrations that can impair the community of plants and animals in or the ecological integrity of surface waters of the state. Except as provided in Paragraph (7) of this subsection, the acute and chronic aquatic life criteria set out in Subsections I, J, K and L of this section and the human health- organism only criteria set out in Subsection J of this section are applicable to all aquatic life use subcategories. Total phosphorus (unfiltered sample) of .1mg/L apply to all surface waters of the state with a designated, existing or attainable use of aquatic life. In addition, the specific criteria for aquatic life subcategories in the following paragraphs apply to waters classified under the respective designations.

Amigos Bravos Comments and Basis for Change for Section 20.6.4.900.H NMAC: *While we commend the NMED for their current total phosphorous numeric standards of 0.1mg/L (100ug/L) for several specific water segments, all surface waters of the State should be monitored for total phosphorus levels in order to reduce the occurrences of eutrophication, low dissolved oxygen, and harmful algal blooms. We request that the NMED establish a 0.1mg/L (100ug/L), or similar, standard for total phosphorus in all surface waters of New Mexico to support the aquatic life use. This request is supported by the fact that phosphorus is the limiting nutrient for plant and algal growth in most freshwater systems, and research has shown that concentrations between 0.05 and 0.1mg/L can indicate eutrophic waters. Several scientific studies provide evidence for the link between total phosphorus levels and eutrophication in specific ecosystems, including:*

> ***ACS Publications (2016):*** *An article in Environmental Science & Technology titled "Reducing Phosphorus to Curb Lake Eutrophication is a Success" reviews case studies, including chemical treatment of lakes, that demonstrate controlling phosphorus is key to reversing eutrophication.*

In one example, total phosphorus declined from 500 to 30–40 µg/L (0.5 to 0.03-0.04mg/L) after treatment, suggesting a significant ecological response to low concentrations.

Elsevier (2024): *A study on wetlands in the UK found that total phosphorus concentrations frequently exceeded the Common Standards Monitoring (CSM) environmental quality standard of 0.1 mg/L, with significant spikes that may have adverse biological impacts. This research highlighted how exceeding this threshold can lead to ecological damage.*

We request that the NMED look to Minnesota and Wisconsin for examples of approaches to establish total phosphorus standards in all streams and lakes in New Mexico.

Minnesota has set numeric criteria for total phosphorus in streams ranging from 0.05mg/L (50ug/L) for northern streams to 0.15mg/L (150ug/L) for southern streams. For lakes, the range is from 0.012mg/L (12ug/L) to 0.09mg/L (90 ug/L).

Wisconsin has a similar set of criteria, with stream criteria ranging from 0.075mg/L (75ug/L) to 0.1mg/L (100ug/L) based on stream classification. For lakes, the criteria range from 0.015mg/L (15ug/L) to 0.04mg/L (40ug/L).

(1) **High quality coldwater:** dissolved oxygen 6.0 mg/L or more, 4T3 temperature 20°C (68°F), maximum temperature 23°C (73°F), pH within the range of 6.6 to 8.8 and specific conductance a segment- specific limit between 300 µS/cm and 1,500 µS/cm depending on the natural background in the particular surface water of the state (the intent of this criterion is to prevent excessive increases in dissolved solids which would result in changes in community structure). Where a single segment-specific temperature criterion is indicated in 20.6.4.101-899 NMAC, it is the maximum temperature and no 4T3 temperature applies.

(2) **Coldwater:** dissolved oxygen 6.0 mg/L or more, 6T3 temperature 20°C (68°F), maximum temperature 24°C (75°F) and pH within the range of 6.6 to 8.8. Where a single segment-specific temperature criterion is indicated in 20.6.4.101-899 NMAC, it is the maximum temperature and no 6T3 temperature applies.

(3) **Marginal coldwater:** dissolved oxygen 6 mg/L or more, 6T3 temperature 25°C (77°F), maximum temperature 29°C (84°F) and pH within the range from 6.6 to 9.0. Where a single segment-specific temperature criterion is indicated in 20.6.4.101-899 NMAC, it is the maximum temperature and no 6T3 temperature applies.

(4) **Coolwater:** dissolved oxygen 5.0 mg/L or more, maximum temperature 29°C (84°F) and pH within the range of 6.6 to 9.0.

(5) **Warmwater:** dissolved oxygen 5 mg/L or more, maximum temperature 32.2°C (90°F) and pH within the range of 6.6 to 9.0. Where a segment-specific temperature criterion is indicated in 20.6.4.101-899 NMAC, it is the maximum temperature.

(6) **Marginal warmwater:** dissolved oxygen 5 mg/L or more, pH within the range of 6.6 to 9.0 and temperatures that may routinely exceed 32.2°C (90°F). Where a segment-specific temperature criterion is indicated in 20.6.4.101-899 NMAC, it is the maximum temperature.

(7) **Limited aquatic life:** pH within the range of 6.0 to 9.0. The acute aquatic life criteria of Subsections I and J of this section apply to this subcategory. Chronic aquatic life criteria do not apply unless adopted on a segment-specific basis. Human health-organism only criteria apply only for persistent toxic pollutants unless adopted on a segment-specific basis.

20.6.4.900.I NMAC – No changes proposed.

J. Use-specific numeric criteria.

(1) Table of numeric criteria: The following table sets forth the numeric criteria in µg/L, unless otherwise indicated, applicable to existing, designated and attainable uses. For metals, criteria represent the total sample fraction unless otherwise specified in the table. Additional criteria that are not compatible with this table are found in Subsections A through I and K through M of 20.6.4.900 NMAC.

(2) Notes applicable to the table of numeric criteria in Paragraph (1) of this subsection.

(a) Where the letter "a" is indicated in a cell, the criterion is based on receiving water characteristics and can be referenced in Subsection I of 20.6.4.900 NMAC.

(b) Where the letter "b" is indicated in a cell, the criterion can be referenced in Subsection C of 20.6.4.900 NMAC.

(c) Criteria are in µg/L unless otherwise indicated.

(~~d~~c) Abbreviations are as follows: CAS - chemical abstracts service (see definition for "CAS number" in 20.6.4.7 NMAC); DWS - domestic water supply; Irr/Irr storage- irrigation and irrigation storage; LW - livestock watering; WH - wildlife habitat; HH-OO - human health-organism only; C – criteria based on cancer-causing endpoint; P - persistent toxic pollutant.

(~~e~~d) The criteria are based on analysis of an unfiltered sample unless otherwise indicated. The acute and chronic aquatic life criteria for aluminum are based on analysis of total recoverable aluminum in a sample that is filtered to minimize mineral phases as specified by the department.

(~~f~~e) The criteria listed under human health-organism only (HH-OO) are intended to protect human health when aquatic organisms are consumed from waters containing pollutants. These criteria do not protect the aquatic life itself; rather, they protect the health of humans who ingest fish or other aquatic organisms.

(~~g~~f) The dioxin criteria apply to the sum of the dioxin toxicity equivalents expressed as 2,3,7,8-TCDD dioxin.

(~~h~~g) The criteria for polychlorinated biphenyls (PCBs) apply to the sum of all congeners, to the sum of all homologs or to the sum of all aroclors.

(~~i~~h) The acute and chronic aquatic life criteria for dissolved aluminum only apply when the concurrent pH is less than 6.5 or greater than 9.0 S.U. If the concurrent pH is between 6.5 and 9.0 S.U. then the hardness-dependent total recoverable aluminum criteria in Paragraphs (1) and (2) of Subsection I of 20.6.4.900 NMAC apply.

(h) Selenium water column criteria include 30-day mean dissolved selenium concentrations for lentic systems, including lakes and impoundments, and lotic systems, including rivers and streams.

Amigos Bravos Comments and Basis for Change for Section 20.6.4.900.J:

Comments and basis related to PFAS:

Amigos Bravos applauds and supports NMED's proposal to adopt PFAS standards. In addition, we recommend NMED add to their petition the numeric human health criteria proposed by EPA in December 2024 for PFOA, PFOS and PFBS.

PFOA, PFOS, PFBS, and thousands more compounds belong to a large class of synthetic chemicals known as per- and polyfluoroalkyl substances, or PFAS. PFAS contamination is a major water quality issue facing New Mexico that has resulted in economic losses to our state's dairy industry and substantial impacts to public health and wildlife populations. Developing standards

for PFAS chemicals is essential to protect New Mexico's surface water resources.

Amigos Bravos Comments and Basis for Change for Nitrate as N:
Strong nutrient standards are vital for protecting surface from eutrophication, harmful algae blooms, low dissolved oxygen levels, loss of biodiversity, contaminated drinking water, risks to human health, and economic losses in tourism and property values. The following comments focus on changes to the NMAC 20.6.4 that we believe would strengthen the State's ability to keep nutrient levels low in New Mexico's waters.

There is considerable science suggesting that the drinking water standard should be below 10mg/L, and that the water quality standard to protect aquatic life in surface water should be to 3mg/L as an indicator of potential pollution and environmental risk. We request that the NMED propose a numeric Nitrate as N standard of 3mg/L on all surface waters in New Mexico that have an aquatic life use. The following review peer-reviewed articles are just a few examples of data over the last 25 years to support this request:

i. ***Weyer et al. (2001)**: A groundbreaking study in the Environmental Health Perspectives journal showed an increased risk of bladder and ovarian cancer in older women drinking public drinking water with long-term average nitrate levels exceeding 2.46 mg/L (NO3-N), well below the 10 mg/L regulatory limit.*

ii. ***Dubrovsky et al. (2010)**: A national USGS study found that nitrate concentrations over 1 mg/L in groundwater were indicative of human activity and supported the idea that a 3 mg/L benchmark is a common threshold that signals a departure from natural background levels.*

iii. ***Ward et al. (2018)**: This updated review in the International Journal of Environmental Research and Public Health synthesizes numerous studies examining the health effects of drinking water nitrate, confirming associations with conditions like colorectal cancer, thyroid disease, and birth defects, even at levels below the current 10mg/L limit.*

iv. ***Springer study (2021)**: The paper "Fertilizers and nitrate pollution of surface and ground water" details how increases in nitrogen flow from human sources drive coastal eutrophication, which threatens biodiversity and fisheries.*

Comments related to the need to adopt standards for constituents found in produced water:
With the passage of HB 546 and recent rulemakings considering the discharge of treated produced water to our state's surface water resources, it is imperative that NMED take steps to identify and propose numeric criteria for the numerous contaminants that do not currently have numeric water quality criteria standards in 20.6.4 NMAC. We urge NMED to look at the list submitted by the Environmental Defense Fund ("EDF") on 12/9/20, as part of the triennial review comment period for the 2020 Triennial Review, to see if there are available data and information that would enable NMED to propose criteria for toxic pollutants found in produced water for which we currently do not have a standard. EDF's 2020 comments clearly outline the need and the ability to adopt standards for toxic pollutants found in produced water:

> *Through an extensive literature review, EDF has identified approximately 1,360 chemicals that can be found in produced water nationally and therefore have the potential to be found in New Mexico produced waters. An estimated*

> *88 of those already have New Mexico surface water quality standards that could be immediately applied in a potential pilot testing or preliminary permitting program. Of the remainder, about 180 chemicals…… have an approved standard method associated with them, and toxicity values that could be used to conduct human health or aquatic life risk assessments that are the prelude to developing water quality criteria to adopt into a WQS. In other words, EDF estimates that at least 180 potential produced water chemicals have the type of tools and data necessary to begin a process of considering associated water quality criteria and standard updates today.*

On January 6, 2021, twenty NGO groups - many of whom have signed onto this letter - cited the EDF comment letter and called on NMED in to develop standards for toxic pollutants found in produced water.

It is through the development and adoption of specific criteria for the toxic substances typically found in produced water that we will get closer to safely discharging treated produced water, a goal that has been repeatedly expressed by this state administration. If the state is serious about discharging produced water to our surface waters, then the appropriate water quality criteria must be developed and adopted.

Specifically, as outlined in EDF's letter, there are data available, including in many cases approved analytical methods for developing standards for 180 constituents found in produced water for which New Mexico currently does not have standards. While we realize that developing numeric criteria can be a long and arduous process, it is essential that the standards are robust enough to protect the existing and designated uses of New Mexico's water resources before produced water is discharged into surface waterbodies. To help identify priority pollutants among the 180 identified by EDF, more work should be done to characterize produced water in New Mexico.

Amigos Bravos recommends that NMED identify several constituents found in produced water in New Mexico for which there are available data for inclusion in 20.6.4.900 NMAC during the 2026 Triennial Review. In addition, start now to develop numeric criteria for all 180 constituents common in produced water nationwide, for which there is an approved standard method and toxicity values and for which we do not currently have a standard, for adoption at a later date. NMED should also encourage and support increased characterization of produced water in New Mexico to help identify which of the 180 constituents are most common in New Mexico's produced water and therefore should be prioritized for standard development.

20.6.4.900.K NMAC – No changes proposed.

L. The acute aquatic life criteria for TAN (mg/L) was derived by the EPA (2013) as the one-hour average concentration of TAN mg/L that shall not be exceeded more than once every three years on average. The EPA acute criterion magnitude was derived using the following equation:

Acute TAN Criterion Magnitude for 1-hour average=

$$\text{MIN}\left(\left(\frac{0.27}{1+10^{7.204-pH}}+\frac{39}{\quad}\right),\ \left(0.7249x\left(\frac{0.0114}{1+10^{\quad}}+\frac{1.6181}{1+10^{pH-7.204}}\right)x\left(23.12\times 10^{0.036(20-T)}\right)\right)\right)$$

T (temperature C) and *pH* are defined as the paired values associated with the TAN sample.

(1) Temperature and pH-dependent values of the acute TAN criterion magnitude - when *Oncorhynchus* spp. absent.

Re: New Mexico Mining Association's Comments on the New Mexico Environment Department's Proposed Amendments to Standards for Interstate and Intrastate Surface Waters (20.6.4 NMAC) – Triennial Review

Dear Bureau Chief Lemon:

In accordance with the public notice the New Mexico Environment Department's ("NMED") Surface Water Quality Bureau ("SWQB") issued on August 15, 2025, the New Mexico Mining Association ("NMMA") hereby submits its comments on the SWQB's proposed amendments to the State's standards for interstate and intrastate surface waters (20.6.4 NMAC). NMMA appreciates the opportunity to provide comments on the proposed amendments.

The following comments are based on the Public Comment Draft of NMED's Proposed Amendments to 20.6.4 NMAC, issued August 15, 2025.

1. **Proposed Change to "Wetlands" Definition**

NMED proposes in 20.6.4.7.W(4) NMAC to delete from the definition of wetlands the provision regarding "the prevalence of" wetlands. NMED also proposes to add the following to the definition: "Wetlands are unique surface waters of the state that vary widely because of regional and local differences in soils, topography, climate, hydrology, water chemistry, vegetation and other factors and provide distinct chemical, biological, physical, and hydrological functions within a watershed."

NMMA opposes the modification to this definition for several reasons. First, the federal definition of wetlands emphasizes that wetlands are "areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, *a prevalence of* vegetation typically adapted for life in saturated soil conditions." 40 C.F.R. § 230.41 (emphasis added). By removing "the prevalence of", NMED's proposed definition omits the biological indicator (vegetation prevalence) that has long been a core diagnostic criterion used by the Corps of Engineers for determining whether an area qualifies as a wetland. This omission would create inconsistency with federal standards and introduce uncertainty to the method by which wetlands would be identified at the state level, since existing federal guidance

might no longer apply. In that case, NMED would have to develop new separate technical guidance or make determinations regarding what areas constitute "wetlands" on a case-by-case basis. Note that, if NMED chooses to base a revised definition on new technical guidance, then under the State Rules Act, Section 14-4-5.2.A(7), NMSA 1978, at the time of publication of the notice of the proposed rulemaking, NMED must provide "a citation to technical information, if any, that served as a basis for the proposed rule, and information on how the full text of the technical information may be obtained." That would have to include any information specified in section 74-6-4.D, NMSA 1978, to be utilized as a basis for the change to the definition of "wetlands" in 20.6.4 NMAC. If NMED is proposing to make all determinations regarding application of a new definition of wetlands on a case-by-case basis, NMMA is very concerned that such an approach would overwhelm NMED's capacity to make determinations in a timely manner, resulting in potential delays in permitting economic development, transportation and other projects within New Mexico.

Additionally, with regard to "wetlands" as defined in 20.6.4 in the context of federal law, the federal determination of wetlands has been narrowed by *Sackett v. EPA*, 598 U.S. 651 (2023), which held that wetlands are only subject to federal jurisdiction if they have a continuous surface connection to relatively permanent waters such that it is difficult to determine where the "water" ends, and the "wetland" begins. NMED's proposed definition arguably broadens the scope of wetlands contemplated by *Sackett* by focusing on their distinct biological, chemical, and hydrological functions rather than their hydrological connectivity to jurisdictional waters. This may lead to regulatory inconsistencies, as areas considered "wetlands" under New Mexico's definition may not qualify as wetlands under federal Clean Water Act jurisdiction. NMMA acknowledges that there is some divide at the federal level regarding the definition of wetlands, which is subject to ongoing litigation. However, it should be noted that even pre-*Sackett*, NMED's proposed definition would encompass areas not traditionally recognized as wetlands, such as ephemeral drainages, isolated playas, arroyo bottoms, or other riparian areas that exhibit hydric soils only seasonally or after storm events. Accordingly, the proposed definition exceeds the bounds of federal precedent and introduces a level of regulatory ambiguity that is neither supported by law nor practicable for implementation. This will result in complicating permitting, enforcement, and project coordination between federal and state agencies.

Recommendation: NMMA opposes the proposed definition of wetlands and suggests keeping the definition of wetlands as it is currently written in 20.6.4.7 (W)(4) NMAC.

2. No Net Loss of Wetlands

NMED proposes in 20.6.4.13.N NMAC to add a section providing water quality protections for New Mexico wetlands. This includes that "direct, indirect, or cumulative impacts, does not result in the net loss of wetland acreage or biological, chemical, physical, and hydrological functions…" NMMA opposes the Department's proposed section, as it goes beyond the legislative intent and plain-meaning definition of compensatory mitigation contained within Senate Bill 21[1] ("SB 21") and the Water Quality Act, NMSA 1978 Chapter 74, Article 6.

[1] SB 21 amended the Water Quality Act in 2025, which included the addition of the definition of compensatory mitigation.

NMED Exhibit 13

Compensatory mitigation is defined as "the process of restoring, establishing, enhancing or preserving wetlands, streams or other aquatic resources to offset unavoidable adverse impacts that remain after appropriate and practicable avoidance and minimization measures have been achieved." NMSA 1978 § 74-6-2 (F) (2025). Per the Water Quality Act, the Water Quality Control Commission ("WQCC") "shall not adopt or promulgate a standard or rule that exceeds a grant of rulemaking authority listed in the statutory section of the Water Quality Act authorizing the standard or rule." NMSA 1978 § 74-6-4 (C) (2025). By proposing that water quality protection results in no net loss of wetlands, the Department is requesting the WQCC to exceed its rulemaking authority and go beyond the bounds of statutory requirements. The statutory definition of compensatory mitigation does not include a provision for "no net loss" of wetlands, rather the standard is to "offset unavoidable adverse impacts that remain." NMED's proposed section shifts the regulatory focus from achieving practicable mitigation to achieving a specific measurable outcome, which the legislation did not authorize and is inconsistent with the intent and limits of SB 21.

Additionally, a "no net loss" standard implies a quantifiable accounting of wetland acreage, but the Department has not proposed a methodology for how such an accounting would occur. Without clear criteria regarding this standard, this requirement risks delays and uncertainty with permits as applicants would be unable to predict how mitigation or impacts would be evaluated. Moreover, the Department would have the obligation to comply with the State Rules Act, cited above, and the Water Quality Act, section 74-6-4.D, NMSA 1978, concerning the identification and availability of technical information on which a "no net loss" standard is founded and would be applied.

Recommendation: NMMA opposes section 20.6.4.13.N NMAC as it is proposed and suggests that the Department omit it from the proposed changes to the surface water quality standards or modify the language to ensure consistency with statutory definitions, including removal of "no net loss." Corresponding changes should be made where 20.6.4.13.N is referenced elsewhere, such as the proposed changes to 20.6.4.98 and 20.6.4.99 NMAC.

3. Additional Comments

Public Water Supply: NMMA questions the proposed change to the definition of "Public water supply." First, because the federal rules are incorporated into the New Mexico Drinking Water Regulations ("NMDWR"), we see no need to refer to 40 CFR 141. Also, NMMA believes that the second sentence of the definition is misplaced and unnecessary as part of the surface water quality standards and should be deleted, rather than edited. The language of that sentence as edited also falls outside the lawful scope of the surface water quality standards and would, at best, duplicate and, at worst, conflict with, requirements in the NMDWR.

Antidegradation Policy and Implementation Plan: For reasons discussed above relating to the proposed change in the definition of "wetlands," and because they are unnecessary, unclear and lacking in statutory authority, NMMA opposes all of the proposed changes to 20.6.4.8 NMAC.

NMED Exhibit 13

The New Mexico Mining Association appreciates the Department's efforts in developing the proposed rule and the opportunity to provide input through this public comment process. NMMA looks forward to continued collaboration with the Department to ensure that the final rule is clear, practicable, and consistent with legislative intent.

Sincerely,

Matt Thompson
Executive Director

Re: San Juan Water Commission's Comments on Public Review Draft of Proposed Amendments to Water Quality Standards, 20.6.4 NMAC (2026 Triennial Review)

Dear Mr. Baca:

Pursuant to the New Mexico Environment Department's ("NMED") notice of a public comment period for the proposed amendments to the State's Standards for Interstate and Intrastate Surface Waters, 20.6.4 NMAC ("2026 Triennial Review"), I hereby provide the following comments on behalf of the San Juan Water Commission ("SJWC"). These comments are based on our review of NMED's August 25, 2025, Public Review Draft for the 2026 Triennial Review, as well as the information provided by NMED personnel at the virtual meeting held on September 10, 2025. SJWC appreciates the opportunity provided by NMED to comment on the Public Review Draft.

Substantive Comments

1. Selenium Criteria – 20.6.4.900(J)(1) NMAC. NMED proposes adoption of chronic criteria for selenium for aquatic life uses based on criteria adopted by EPA in 2016. The proposal includes both fish tissue-based and water-based criteria, but NMED has not indicated which type of criteria it intends to primarily apply when determining (i) whether to adopt or modify a TMDL, (ii) whether a state surface water is impaired, or (iii) what effluent limits to apply to an NPDES permit. As EPA has given primacy to the fish tissue-based criteria over the water-based criteria, NMED should indicate which criteria it intends to apply most frequently. *See* EPA's Aquatic Life Ambient Water Quality Criterion for Selenium in Freshwater 2016-Fact Sheet, EPA 822-F-16-005 (June 2016), at 2, n.1 ("EPA Fact Sheet"). Further, EPA's 2016 selenium criteria include a value for fish egg-ovary concentrations, and EPA recommends that it be included in state standards. NMED should explain why it has elected not to propose the fish egg-ovary criteria.

The proposed chronic water-based criteria for aquatic life (1.5 µg/L lentic and 3.1 µg/L lotic) are much stricter than existing water-based criteria, such as for domestic water supply and livestock watering (both 50 µg/L). As NMED is aware, some waters in the San Juan Basin have high natural background levels of selenium. In fact, NMED prepared a TMDL for selenium in Gallegos Canyon (San Juan River to Navajo Boundary) in 2005. Selenium was last addressed in depth during the1999 Triennial Review. At that time, SJWC presented evidence that studies conducted in the Upper Colorado River Basin showed that hatching success for the razorback sucker occurred in waters where average concentrations of selenium were higher than the criteria proposed by NMED. Further, SJWC presented evidence that application of a sediment-based selenium toxicity model capable of accounting for the organic content of streams indicated an allowable level of 31 µg/L of dissolved selenium in the San Juan Basin based on the potential for selenium uptake in the food chain. Put simply, the model reflected the reduced opportunity for food chain uptake of selenium in low organic, moving streams in the San Juan Basin. When data from high organic content water bodies was applied to the model, the model predicted allowable selenium levels in the range of 3-5 µg/L dissolved. As noted in EPA's Fact Sheet (at 1), "the latest scientific knowledge . . . indicates that selenium toxicity to aquatic life is primarily based on organisms consuming selenium-contaminated food rather than by being exposed only to selenium dissolved in water."

For these reasons, NMED should not propose state-wide chronic aquatic life standards for selenium, whether water-based or fish tissue-based. Rather, NMED should collect data specific to regions of the state, like the San Juan region, where there are high natural background selenium levels. Based on that data, NMED can propose site-specific criteria accounting for differing local conditions. In fact, EPA supports such site-specific criteria:

> States and authorized Tribes also have the additional option of adopting site-specific water column criterion elements, if desired . . . . The relationship between the concentration of selenium in the tissues of fish and the concentration of selenium in the water column can differ substantially between different aquatic systems. The chemical form of selenium, species of fish, the species and proportion of prey, and a variety of site-specific biogeochemical factors affect selenium bioaccumulation and thus determine the allowable concentration of selenium in ambient water that is protective of aquatic life.

EPA Technical Support for Adopting and Implementing the EPA's 2016 Selenium Criterion in Water Quality Standards, EPA 820-R-24-001 (April 2024), at 12-13.

Adoption of an unnecessarily strict selenium standard could have significant economic impacts in the San Juan region as the cost of reducing selenium discharges can be quite high. Such costs may reduce opportunities for future economic development and also negatively impact existing municipal and industrial projects.

2. Definition of "Wetlands" – 20.6.4.7(W)(4). NMED proposes modifying the definition of "wetlands" to add a sentence to "clarify" that: "Wetlands are unique surface waters of the state that vary widely because of regional and local differences in soils, topography, climate, hydrology, water chemistry, vegetation and other factors and provide distinct chemical, biological, physical, and hydrological functions within a watershed." SJWC objects to this proposal as unnecessary because this same statement applies equally to all types of surface waters of the state. NMED also proposes removing the requirement that wetlands contain "a prevalence of" vegetation typically adapted for life in saturated soil conditions in New Mexico. SJWC objects to this proposal on the ground that it makes the definition of a wetland too ambiguous for both NMED and permittees and provides permit writers with too much discretion in determining the existence and boundaries of a wetland.

3. Wetlands—Antidegradation Policy – 20.6.4.8(A) NMAC. NMED proposes several modifications to the antidegradation policy to add references to "wetland condition," "wetland acreage," and "wetland functions." SJWC objects to these proposals as unnecessary. The existing antidegradation policy "applies to all surface waters of the state," 20.6.4.8(A)(1) NMAC, and wetlands fall within the definition of "surface waters of the state," 20.6.4.6(S)(5)(a)(vi) NMAC.

4. General Criterion for Wetlands – 20.6.4.13(N) NMAC. NMED proposes adoption of a "general" criterion for wetlands:

> N. Wetlands: Only wetlands of the state are subject to this general criterion. Wetlands shall be maintained and protected such that degradation through direct, indirect, or cumulative impacts does not result in the net loss of wetland acreage or biological, chemical, physical, and hydrological functions to the extent that such functions occur, as characterized by state-specific benchmarks. The functions of a wetland that are to be maintained and protected may include:
>
> (1) erosion control through bank and shoreline stabilization;
> (2) flood attenuation and flood protection;
> (3) sediment and pollutant retention, which prevents or mitigates downstream migration;
> (4) groundwater recharge and water storage for future use;
> (5) low flow augmentation including baseflow maintenance;
> (6) water filtration including removal or storage of nutrients and other contaminants;
> (7) propagation or maintenance of aquatic and terrestrial species indigenous to wetlands;
> (8) preservation of wildlife habitat including habitat for threatened or endangered species; or
> (9) supporting diversity.
>
> In addition, wetlands shall be suitable for recreation, wildlife habitat, and use by aquatic life and livestock.

SJWC objects to this proposal as unnecessary, ambiguous, overbroad, and outside the scope of authority under the New Mexico Water Quality Act. As already noted, wetlands are protected to the same extent as any other water of the state, and therefore this section is unnecessary. Further, NMED's proposal is ambiguous with respect to its references to "indirect or cumulative impacts," "net loss of wetlands acreage," "hydrological functions," "state-specific benchmarks," and the wetland functions that "may" be included in the list of functions to be maintained and protected.

Under the Water Quality Act, the Water Quality Control Commission ("WQCC") has authority to adopt water quality standards to support designated uses assigned to a water body. The WQCC also may adopt regulations to prevent or abate water pollution. NMSA 1978, §§ 74-6-4(D), (E). "Water pollution" means "introducing or permitting the introduction into water, either directly or indirectly, of one or more water contaminants in such quantity and of such duration as may with reasonable probability injure human health, animal or plant life or property, or to unreasonably interfere with the public welfare or the use of property." *Id.*, §74-6-2(C). A "water contaminant" is "any substance that could alter, if discharged or spilled, the physical, chemical, biological or radiological qualities of water." *Id.*, § 74-6-2(B). SJWC submits that most of the functions listed by NMED, including erosion control, water storage and low flow augmentation, are outside the WQCC's authority under the Water Quality Act as they are unrelated to the introduction of water contaminants. Further, the WQCC has no authority to modify property rights in water, and the

mandated protection of functions such as water storage and low flow augmentation likely will impinge on the use of water rights. *Id.*, § 74-6-12(A).

5. Rulemaking – 20.6.4.10(F) NMAC. NMED proposes shifting all costs of rulemaking hearings to the petitioner, including paying for the venue, the hearing officer, the court reporter, transcripts, translation services, interpretation services, and public notice requirements. As NMED notes, the WQCC historically has covered these costs through NMED's budget. The WQCC has done so even when NMED was not the petitioner. Section 74-6-6 of the Water Quality Act requires a public hearing before a regulation or water quality standard is adopted. As hearings are a statutory function of the WQCC, it is the responsibility of the WQCC to fund those hearings. Indeed, that is a basic function of government. If funding is required to be provided from NMED's budget by virtue of the fact that the WQCC is administratively attached to that agency, then it is the duty of the WQCC and NMED to ensure that adequate rulemaking funding is sought from the Legislature. In fact, as an "administratively attached agency," the WQCC is authorized to submit its budgetary requests through NMED. NMSA 1978, § 9-1-7(A)(2). Requiring a non-NMED petitioner to bear the costs of a hearing will have a severe chilling effect on potential petitioners and leave NMED entirely in control of the WQCC's rulemaking agenda.

Timing of the Triennial Review Hearing

Given NMED's intent to "petition the WQCC by the end of 2025 for a hearing in the second half of 2026," SJWC requests that NMED seek a hearing date no earlier than September 2026. Several other significant WQCC rulemakings are in the pipeline, including the WATR Alliance produced water reuse petition and the anticipated rulemaking on the new state permitting program. Those rulemakings, together with the Triennial Review rulemaking, will require the expenditure of substantial time and expense resources by the WQCC, NMED, and the participating parties. In order to ensure a full and fair opportunity to participate, the Triennial Review should not be rushed, and parties should be given enough time to obtain expert witnesses and prepare direct and rebuttal expert reports and supporting exhibits.

Thank you for the opportunity to comment on NMED's proposed revisions to the State's surface water quality standards. SJWC reserves the right to supplement these comments, and to comment on any additional proposed changes, as the Triennial Review process proceeds.

Sincerely,

Aaron Chavez

Subject: Comments of Triad National Security, LLC, Operator of the Los Alamos National Laboratory, on New Mexico Environment Department Public Review Draft for the 2026 Triennial Review and 20.6.4 NMAC

Dear Mr. Baca,

Triad National Security, LLC, the management and operating contractor for the Los Alamos National Laboratory, submits the enclosed comments in response to the New Mexico Environment Department's (NMED) Public Review Draft for the 2026 Triennial Review, which proposes changes to surface water quality standards in New Mexico Administrative Code Section 20.6.4.

The Los Alamos National Laboratory executes work across numerous missions, including national security, science, artificial intelligence, environmental monitoring, and energy. The Laboratory achieves its missions when it also protects the environment, complies with environmental requirements, and reduces or eliminates environmental risk. To support its missions, the Laboratory gathers wastewater from various generators, treats the wastewater, and discharges treated water to Rio Grande tributary waters. The Laboratory discharges clean water in compliance with federal and state regulations and permits, and through use of control technology and best practices. The Laboratory also compliantly manages stormwater and actions affecting wetlands.

Protecting the environment requires clear regulatory requirements and efficient regulatory processes. The Triennial Review provides an opportunity to clarify requirements and improve processes. In this Triennial Review, NMED is reviewing and proposing changes to surface water quality standards. NMED is accepting public comments and will incorporate comments, as appropriate, into draft regulations. Comments can help clarify regulatory requirements and improve regulatory processes.

The Laboratory appreciates the opportunity to provide comments for NMED's consideration and hopes the comments may be useful to NMED.

Sincerely,

SARAH HOLCOMB

Date: 10/14/2025

INTRODUCTION

Triad National Security, LLC manages and operates the Los Alamos National Laboratory on behalf of the United States Department of Energy National Nuclear Security Administration. The Los Alamos National Laboratory is a Federally Funded Research and Development Center and National Security Laboratory that executes work across numerous missions, including national security, science, artificial intelligence, and energy. In support of its missions, certain Laboratory facilities receive, treat, and discharge clean water to various Rio Grande tributary waters. The Laboratory also manages stormwater discharges to various Rio Grande tributary waters, adopting control technologies and best practices. The Laboratory's discharges comply with federal and state law and with federal and state permits.

The Laboratory achieves its missions when it also protects the environment, complies with environmental requirements, and reduces or eliminates environmental risk. To protect the environment and to compliantly and effectively operate requires clear regulatory requirements and efficient regulatory processes.

Comment 1:

Many of the waters to which the Los Alamos National Laboratory discharges are federal jurisdictional waters or point sources. These waters are tributaries of, and connected and contribute flow to, a traditional navigable water - the Rio Grande. The waters form, individually and collectively, an integrated and cohesive river network. A river network is a hierarchical, interconnected group of channels that drains surface and subsurface water from a watershed to a river and includes the river itself. The waters are an integral, indistinguishable part of the Rio Grande's tributary system or river network.

Comment 2:

The language added in the "wetlands" definition in 20.6.4.7.W(4) NMAC is vague, and its intent and application are unclear.

- **What is included in, and what is exempt from the "wetlands" definition?**

  The new sentence states that wetlands are "unique" and "vary widely because of regional and local differences." While the "BASIS OF CHANGE" explanation states that recognizing wetlands' "characteristics and functions will help protect and maintain these features, it is not clear how the additional language will accomplish this. The new terms could be interpreted to either restrict or broaden the definition. How does the uniqueness and variety of wetlands impact interpretation of the existing definition which defines wetlands "under normal circumstances"? If wetlands "vary widely," how much can their features vary before they are no longer considered wetlands?

  Further, it is unclear whether the definition includes wetlands created or supported by human activities, such as discharges. If it does, what if the human activities cease? Does the definition include wetlands created or supported by drainage ditches or canals? By artificially irrigated areas? By recharge features? By environmental monitoring or remedial activities? By temporary sedimentation basins or ponds? By safety improvements? Is a feature a wetland if only human activities can maintain it as such? Wetlands created by, or whose continued functioning is contingent on, human activities should not be defined as wetlands or should be exempt from regulation.

- **The new language does not address changes to wetlands caused naturally, such as by reduced precipitation, or by changes in the timing or intensity of precipitation, or by changes to an adjacent watercourse.**

NMED Exhibit 13

- **Are wetlands regulated by the U.S. Army Corps of Engineers also going to be regulated by the State? Are there other "wetlands" that should be exempt from the "wetlands" definition?**

- **The wetland definition does not reference parameters or methods to determine how an area is determined to be a wetland.**

  The definition notes that wetlands "provide distinct chemical, biological, physical, and hydrologic functions within a watershed," but does not explain what functions may be indicative of a wetland; what functions may be associated with something that is not a wetland; or what functions require protection. For comparison, see e.g. the U.S. Army Corps of Engineers Wetland Delineation Manual.

  Consider adding the following language: "Wetlands identification/delineation shall rely on analysis of wetland hydrology indicators, hydrophytic vegetation and hydric soils through scientifically defensible methods as described in U.S. Army Corps of Engineers (USACE) Wetland Delineation Manual, latest edition, appropriate USACE Regional Supplement manuals, latest editions."

- **The addition of wetlands to the draft document does not provide enough guidance on types of waters to exempt from dredge/fill and wetland authorization requirements. Please consider expanding the types of waters to exclude from dredge/fill and wetland authorization requirements such as the following:**

  - Drainage ditches designed for at least the partial purpose of increasing drainage of a particular land area or infrastructure for purposes including agriculture, transportation (e.g., roadside), and stormwater management.
  - Stormwater control features that are constructed to convey, treat, or detain stormwater.
  - Artificially irrigated areas that would revert to uplands (any land area that, under normal circumstances, is not a wetland and does not lie below the ordinary high watermark) if irrigation ceased.
  - Wetlands that are adjacent to a ditch or canal and supported by water in the adjacent ditch or canal.
  - Recharge features, including ponds, for the purpose of facilitating recharge of aquifers or streams.
  - Construction of temporary sedimentation basins/ponds on a construction site, with construction that does not include placement or fill material into state waters.

- **The draft document also does not provide enough guidance on types of activities in wetlands and floodplains exempt from dredge/fill and wetland authorization requirements. Please consider adding the types of activities to exclude from dredge/fill and wetland authorization requirements such as the following:**

  - Site characterization, environmental monitoring, or environmental research activities (e.g., sampling and surveying of water, air, flora and fauna abundance, soil properties) in a floodplain or wetland.
  - Maintenance of drainage ditches or dikes, embankments, impoundments, water control features, and other water conveyance features that are human-made and intended to be maintained.
  - Maintenance of stormwater control features that are constructed to convey, treat, or temporarily store stormwater.

NMED Exhibit 13

- Maintenance, including emergency reconstruction of recently damaged parts, of currently serviceable structures, such as dikes, dams, riprap, culverts, bridge abutments or approaches, and transportation structures. Maintenance also includes minor deviations in a structure's configuration or filled area to accommodate changes in materials, construction techniques, regulatory requirements, or construction codes or safety standards.
- Routine maintenance of existing facilities and structures in a floodplain or wetland. Maintenance is routine when it is needed to maintain and preserve the facility of structure for its designated purpose (e.g., activities such as reroofing, plumbing repair, door and window replacement).
- Minor modification (e.g., upgrading lighting, heating, ventilation, air conditioning systems, installing or improving alarm and surveillance systems, adding environmental monitoring or control systems, adding) of an existing facility or structure in a floodplain or wetland to improve safety or environmental conditions unless the modification would involve draining, dredging, channelizing, filling, diking, impounding, or related activities.
- Activities for the purpose of providing emergency response to, preventative mitigation of, or recovery from damage caused by a fire, a flood, or other natural disasters so long as the activity is conducted in a manner that minimizes the loss of state waters to the extent practicable and in accordance with best management practices that do not interfere with efforts to address the underlying emergency.

Please see also Comment 3, incorporated here by reference.

Comment 3:

In 20.6.4.8.A, the definition of "wetland condition" is vague and the antidegradation policy's implementation is not clear.

- **What is meant by "by inference, wetland quality (i.e., functions) and quantity (i.e., acreage)"?**

  What is being inferred, and for what purpose is it being inferred? What functions are considered in evaluating wetland quality? What is the importance of "quantity" or "acreage"?

  How will the New Mexico Environment Department quantify or measure degradation specific to wetlands? Is there a "level" of wetland condition that is necessary to protect existing uses? If so, how is that level calculated? If "wetland condition" is meant as a descriptive or qualitative term, what "conditions" are considered in evaluating the "wetland condition"? Is that limited to a measure of the wetland's ecological integrity? If so, how is a wetland's ecological integrity measured?

- **The "loss of wetland acreage" is not defined.**

  How will loss of quantity or acreage be quantified on a year-to-year basis? How will a wetland's natural expansion or reduction based on precipitation or other natural events be accounted for? Is there a quantity or acreage below which wetlands will not be regulated, or is there some amount of lost quantity or acreage that will be accepted before there is an impact to wetlands requiring regulation?

NMED Exhibit 13

The State should provide quantifiable bounding limits on incidental loss of wetland acreage (e.g. greater than three-tenths of an acre of unavoidable adverse impacts to wetlands; OR greater than five-hundredths of an acre of unavoidable adverse impacts to streams).

The "loss of wetland acreage" does not acknowledge any difference between human-caused degradation and loss due to natural processes such as reduced annual precipitation or timing and intensity of received precipitation. This implies human intervention will be required to preserve wetlands that simply no longer receive enough rainfall to persist and further implies the need to supply another water source, such as pumped groundwater, to support such wetlands.

- **The New Mexico Environment Department's Water Quality Management Plan and Continuing Planning Process has not been updated to include how antidegradation analysis will be conducted for wetlands or how this may impact the permitting process.**

  When will any such updates be made? Will there be certain water quality standards applicable to each wetland or will water quality standards be applicable to all wetlands?

- **The antidegradation section does not provide for compensatory mitigation measures.**

  The current antidegradation section would benefit from greater clarity regarding implementation and from the inclusion of compensatory mitigation mechanisms. This would strengthen environmental protection and provide clear pathways for compliance.

  Every site has limitations, and it may not be practicable to avoid wetlands. The rule should include a means for compensatory mitigation measures to offset unavoidable adverse impacts that may remain after all appropriate and practicable avoidance and minimization has been achieved. Inclusion of means that create, enhance, restore, rehabilitate, or preserve wetlands should be considered as a means to avoid loss of wetland quantity or acreage on a State scale. Compensatory mitigation could include purchase of mitigation bank credits, an in-lieu fee program, or permittee-responsible mitigation.

  Please see also Comment 4, incorporated here by reference.

Comment 4:

Proposed Rule 20.6.4.10.F should be reconsidered.

- **The New Mexico Environment Department should not shift to the public the cost of correcting deficiencies in water quality standards.**

  Requiring petitioners to pay for administrative rulemaking processes will stifle efforts by the public to improve water quality standards. The proposed rule likewise creates a potential disincentive for New Mexico Environment Department to itself pursue necessary regulatory changes. Correcting deficiencies in water quality standards should be encouraged, not impeded. Petitioners should not be penalized for attempting to correct deficiencies in regulatory requirements or processes. Such corrections are in the public interest and are the costs of having, administering, and improving an environmental regulatory program.

NMED Exhibit 13

- **Potential costs to petitioners, moreover, are unclear and may be prohibitive.**

  The rule includes a non-exhaustive list of costs, several of which could be substantial. In its "BASIS FOR CHANGE" explanation, the New Mexico Environment Department identifies other additional costs, including actions that might be taken by persons other than petitioners. And costs could increase further "depending on public interest." These are the costs of having, administering, and improving an environmental regulatory program. These are costs incurred in the public's interest. These are not costs that should be borne by petitioners.

  At minimum, petitioners' costs should be clearly defined and should be limited to costs over which petitioners have control. For example, petitioners should not be required to cover the costs of a venue, Hearing Officer, or court reporter where parties other than petitioners decide to present argument or evidence, nor should petitioners be required to cover the costs of technical experts or scientific reports used or developed by parties other than petitioners.

Comment 5:

Some terms in proposed rule 20.6.4.10.G are ambiguous.

- **Subsection G(3)'s reference to "…their intent to derive…" is not clear.**

  Should this read "…their intent to develop…"?

- **In subsection G(4), should site-specific criteria be developed in accordance with a "reviewed" work plan or in accordance with an "approved" work plan?**

  Subsection G(6) contemplates an "approved" work plan, but it is not clear where or how in the process the work plan will be approved.[1]

The Laboratory agrees that work plan requirements will improve communication and should "clearly outline expectations *and responsibilities*"[2] for developing site-specific criteria. Clarifying the ambiguities in the proposed rule furthers these benefits.

Comment 6:

- **Proposed rule 20.6.4.13.N is unclear.**

  What are "wetlands *of the state*"? It is not clear how "of the state" qualifies "wetlands." Are any wetlands within the state excluded from this definition? What is an "indirect" impact? How far removed does an impact have to be, or how unforeseeable does an impact have to be, before it is no longer considered an "indirect" impact? Presuming "net loss" qualifies both acreage and functions, what is meant by the "net loss of…biological, chemical, physical, and hydrological functions to the extent that such functions occur"? What are the "state-specific benchmarks"? How is suitability for "recreation, wildlife habitat, and use by aquatic life and livestock" evaluated? What "recreational use" must wetlands be suitable for?

[1] For comparison, please see rule 20.6.4.15.E(2), which provides that "[u]pon approval of the work plan by the department, the proponent shall conduct the use attainability analysis…."

[2] Clearly defining responsibilities is a means of easing NMED's concern that rulemakings may result in unanticipated costs.

NMED Exhibit 13

Comment 7:

In proposed rules 20.6.4.98 and 20.6.4.99, the insertion of the exception for "wetlands protected under 20.6.4.13 NMAC" is confusing, in part because of the statement in 20.6.4.13 NMAC that "Only wetlands of the state are subject to this general criterion." If there are wetlands which are not wetlands of the state, are they now somehow subject to the criteria covering intermittent and perennial waters?

Comment 8:

It would be helpful to understand if the New Mexico Environment Department has the capacity and resources necessary to implement the proposed water quality standards efficiently and effectively. Additionally, clarification on how the Department plans to engage and collaborate with stakeholders, including the Los Alamos National Laboratory, would support successful implementation of the program. A transparent approach to coordination and resource planning will help ensure that the program is both effective and practical to all parties involved.

CONCLUSION

The Los Alamos National Laboratory is committed to improving regulatory requirements and processes. Such improvements can both protect water quality and facilitate compliance. The Laboratory appreciates the opportunity to comment on the Public Review Draft for the 2026 Triennial Review and hopes the New Mexico Environment Department may find its comments useful.

Re: New Mexico's 2026 Triennial Review: Public Review Draft for the 2026 Triennial Review

On behalf of Western Resource Advocates, I submit the following comments on the Public Review Draft for the 2026 Triennial Review posted by the New Mexico Environment Department (NMED). Western Resource Advocates is a nongovernmental organization that has, for decades, worked to protect and promote the water quality, stream flows, and the habitat health of and equitable access to New Mexico's surface waters. The proposed changes to New Mexico's Water Quality Standards (WQS) proposed by NMED, as well as those we recommend below will help ensure that the state's surface waters, including its wetlands, are safe for humans, wildlife and aquatic ecosystems and provide invaluable services to the people of the state.

I. Recommendations for Additions to New Mexico Water Quality Standards

WRA encourages NMED to, as part of the triennial review process, propose and adopt numeric criteria for numerous contaminants for which there are no numerical WQS. We propose several pollutants for NMED consideration but encourage NMED to look beyond this subset to address additional contaminants that are impairing or impacting the designated or existing uses of New Mexico's surface water.

Additional Forms of PFAS Chemicals

WRA commends NMED for its proposal to add to its WQS aquatic life criteria for certain PFAS chemicals. However, NMED is recommending the adoption of only the of EPA acute and chronic aquatic life water quality criteria for perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS).[1] In addition to these two PFAS chemicals, WRA recommends that NMED include standards for other PFAS chemicals based on the benchmarks developed by EPA at the same time it finalized its recommended criteria for PFOA and PFOS. These additional chemicals are:

- Perfluorobutanoic acid (PFBA)
- Perfluorohexanoic acid (PFHxA)
- Perfluorononanoic acid (PFNA)
- Perfluorodecanoic acid (PFDA)
- Perfluorobutanesulfonic acid (PFBS)
- Perfluorohexanesulfonic acid (PFHxS)

[1] 89 Fed. Reg. 81078 (October 7, 2024).

- Hexadecafluoro-2-decenoic acid (8:2 FTUCA), and
- Pentadecafluorodecanoic acid (7:3 FTCA).

The EPA's *Acute Freshwater Aquatic Life Benchmarks for Eight Data-Limited PFAS* establishes maximum concentrations for these eight PFAS.[2] The analysis provides information, based on best available science, that New Mexico should consider as it sets acute water quality criteria for these chemicals to protect waters designated for use as aquatic ecosystems.

We also note that NMED has announced its efforts to comply with the 2024 EPA rule establishing drinking water standards for the same two kinds of PFAS: PFOA and PFOS. However, the final April 2024 EPA rule also included National Primary Drinking Water Regulations (NPDWRs) for PFHxS, PFNA, HFPO-DA (commonly known as GenX), and a Hazard Index based on a mixture of these three PFAS plus PFBS, 89 Fed. Reg. 32532 (April 26, 2024), although the current administration is reconsidering these standards.[3] The EPA standards are based on the best available science examining the health impacts of PFAS chemicals in drinking water.

Since adopting the drinking water standard for PFOA and PFOS, NMED has monitored the levels of PFAS chemicals in some of New Mexico's surface and ground waters that serve as public water supplies.[4] These data show fairly high levels of PFBS and levels of PFHxS approaching the NPDWR. Some monitored surface waters were also contaminated by PFNA, PFBA, and PFHxA. For some surface waters, levels of PFAS chemicals plus PFBS approached the EPA's Hazard Index Value of 1.0 ng/l. Of course, the drinking water supplies data are limited and many surface waters that support aquatic life were not subject to testing.[5]

These data show first that monitoring for PFHxS, PFNA, HFPO-DA, PFBA, PFHxA and PFBS is available and cost effective. Moreover, they indicated that to protect drinking water supplies, standards for PFHxS, PFNA, HFPO-DA and PFBS are appropriate – standards that will protect both aquatic life and human health. Finally, the monitoring data shows that in what are likely some of New Mexico's cleanest, most protected surface waters, levels of PFHxS, PFNA, PFBA, PFHxA and PFBS, individually and in combination with other PFAS, are cause for concern.

While PFOA and PFOS are the most prevalent PFAS chemicals in the environment, their use has largely been phased out by manufacturers.[6] Many additional forms of PFAS chemicals, including those recommended here, are still in use today in household products, food packaging, clothing, firefighting foam, and hydraulic fracturing fluids.[7] Moreover, without standards in place to protect surface waters

[4] https://cloud.env.nm.gov/resources/_translator.php/YzQ0ODBjZDZjNGMxZjIwNWRmYTVhZWY1N18xODI2Njc~.pdf

[5] Monitoring data of wells likewise shows concerning levels of PFHxS, PFNA, HFPO-DA and PFBS individually or in combination. There is no question that polluted surface waters can contamination wells.

[6] https://www.epa.gov/assessing-and-managing-chemicals-under-tsca/fact-sheet-20102015-pfoa-stewardship-program

[7] https://psr.org/new-report-fracking-with-forever-chemicals/

from these contaminants, it is likely that manufacturers will not make efforts to move away from using these dangerous chemicals, and indeed, will find incentives to use chemicals that are not regulated by New Mexico. All of the PFAS chemicals listed above have been linked to human or animal health impacts, including in vitro impacts, and often both, in numerous scientific studies.[8]

New Mexico's Holloman Lake has some of the highest contamination of PFAS ever recorded in the world, which not only effects the wildlife in the area but also the surrounding communities that traditionally rely on the lake for fishing and hunting waterfowl.[9] Given PFAS chemicals toxicity for both humans and animals, their bioaccumulation in tissues, and extreme persistence and prevalence in the environment, it is essential that New Mexico establish stringent WQS for additional PFAS chemicals, especially in the event of anticipated rollbacks at the federal level.

Alkylphenols and Alkylphenol Ethoxylates

Alkylphenols and their precursors, alkylphenol ethoxylates, are common industrial surfactants used in a variety of products and practices, including the industrial processing of textiles and materials and the production of oil and gas. Several alkylphenols and alkylphenol ethoxylates, including nonylphenol and octylphenol, have been identified as endocrine disruptors and can have a significant negative effect on fish and other aquatic species reproduction when present in the environment.[10] Both of these chemicals have been shown to cause acute and chronic toxicity to fish, invertebrates, and algae at various contamination levels. Although information related to the impact of these chemicals on human health is incomplete, these chemicals have been shown to mimic estrogenic potential and adversely impact the nervous system, cognitive function, immune system, and reproductive potential for a variety of species when present in the environment.[11]

While the presence of alkylphenols and their ethoxylates in the environment has decreased over recent years, these chemicals remain prevalent in oil and gas operations, both from naturally occurring sources and as additives to hydraulic fracturing fluids.[12] Specifically, octylphenol and nonylphenol and their ethoxylates have been the subject of ongoing regulatory scrutiny, with multiple states, including Connecticut,[13] Minnesota,[14] and Washington[15] establishing WQS for nonylpheno, and Minnesota establishing WQS for octylphenol.[16] Both variants are regulated by the European Union's Water Framework Directive legislation.[17]Furthermore, the U.S. EPA has published Water Quality Criteria for ambient aquatic life for nonylphenol,[18] Given the evidence of the negative impacts of alkylphenols and alkylphenol ethoxylates on aquatic species and the potential for adverse consequences for public health,

WRA recommends that NMED establish WQS for nonylphenol and octylphenol as part of this triennial review. These New Mexico-specific standards can readily be based on those adopted by other states.

Polycyclic Aromatic Hydrocarbons (PAHs)

Polycyclic Aromatic Hydrocarbons (PAHs) are a group of chemicals, widely distributed in the environmental, with significant adverse impacts on humans and animals. PAHs can occur in the environment from numerous sources, including natural processes, such as forest fires, and from industrial sources, such as tailpipe emissions, discharges from various manufacturing processes, and from hazardous material spills. Under current regulations, New Mexico has already established WQS for several PAH variants. However, the list is incomplete. The U.S. Government includes 17 PAHs in its public health profile, the following six of which are not regulated in New Mexico's Water Quality Standards:

- Acenaphthylene
- Anthracene
- Benzo[e]pyrene
- Benzo[g,h,i]perylene
- Benzo[j]fluoranthene
- Phenanthrene

The government's public health profile identifies 17 PAHs, including the preceding six, because there is significant information available on the toxicity of these chemicals. These PAHs are suspected to be more harmful than other PAHs, there is a greater chance of exposure to these chemicals than other forms, and they occur at higher concentrations at National Priorities List hazardous waste sites.[19] PAHs are known to be carcinogenic, can cause reproductive and birth defects, and have been linked to adverse impacts to immunological and neurological functioning in humans and animals.[20] Furthermore, several PAHs have been shown to persist in the environment, particularly in aquatic sediments,[21] and to have significant impacts on the health and fitness of important aquatic species.[22]As such, WRA recommends that NMED establish WQS for these additional six PAHs to protect human health and the environment from adverse impacts caused by potential exposure to these chemicals.

Formaldehyde and Acetone

Recognizing that toxics such as acetone and formaldehyde adversely impact human health, states like Pennsylvania have adopted human health criteria to protect public health from the adverse impacts of these chemicals. Pennsylvania's criteria were updated in 2022 based on EPA's 2015 human health criteria exposure inputs, which included new values for body weight, drinking water intake and fish consumption.[23] Pennsylvania also relied on EPA's recent health risk factors and current toxicity data to inform its recently adopted water quality standards for acetone and formaldehyde.

[23] https://files.dep.state.pa.us/PublicParticipation/Public%20Participation%20Center/PubPartCenterPortalF

There is no question that the presence of these toxic pollutants in New Mexico's surface waters could reasonably be expected to interfere with the designated uses of those waters. Pennsylvania has included effluent limits for acetone and formaldehyde in its NPDES discharge permits and has recorded substantial concentrations of acetone in surface water monitoring samples. Therefore, because acetone and formaldehyde pose a threat to human health, because defensible WQS and reasonable monitoring protocols exist for these toxics and because the presence of these chemicals would interfere with the protection of the designated uses of New Mexico's waters, WRA recommends that NMED adopt WQS for acetone and formaldehyde based on Pennsylvania's human health criteria.

II. Proposed Additions to New Mexico WQS to Protect Wetlands

Many of the proposed changes to the New Mexico WQS identify the values and services provided by the state's wetlands and are intended to conserve and even improve the condition and function of these critical surface waters. WQS are the foundation of effective water quality-based pollution control. Initially, WQS designate the highest attainable uses for a water body, set criteria that reflect the current and evolving body of scientific information to protect those uses, and establish provisions to protect water bodies from further degradation. As surface waters of the state, wetlands are covered by the same safeguards that WQS provide for streams, rivers, ponds and lakes. WRA strongly supports the proposed amendments to New Mexico's WQS aimed at specifically extending WQS protections to wetlands.

As the proposed amendments to the WQS acknowledge, in addition to providing wildlife habitat, supporting biological diversity, and propagating and maintaining aquatic and terrestrial species, wetlands promote erosion control, flood attenuation and protection, sediment and pollutant retention, ground water recharge, flow augmentation and water filtration. The NMED proposal acknowledges that wetlands, due to their specific functions and sensitivities, are best protected by WQS directed at the role they play in the ecosystem. WRA appreciates and strongly supports NMED's recognition of the crucial role wetlands play in providing clean water, healthy aquatic ecosystems, recreation opportunities and flood control.

Given the invaluable ways that wetlands benefit water quality and natural systems, it is highly appropriate that NMED is proposing that wetlands of the state be maintained and protected so that direct, indirect and cumulative impacts do not result in a net loss of wetlands or adverse impacts to wetland function. *See* Draft 20.6.4.13.N. WRA also strongly supports the proposed changes to 20.6.4.8 that specifically incorporate wetlands into the state's antidegradation rule. These proposed amendments properly interject wetland-specific water quality standards into NMED decision-making.

However, safeguarding New Mexico's wetlands will require WQS that protect their ecological condition and the full range of wetland functions. To this end, NMED has proposed narrative, rather than numeric criteria as an initial step for developing WQS for wetlands. The draft WQS also apparently excluded wetlands from the protections of 20.6.4.900. However, as with water quality criteria for other surface waters, criteria for wetlands can and often should be numeric. Because numeric standards are typically more straight forward to monitor and enforce, we recommend that New Mexico adopt numeric standards in addition to the narrative standard whenever possible. For example, the current numeric standard for selenium for wildlife habitat is appropriate for wetlands that provide habitat for waterbirds. In this case,

---

iles/Environmental%20Quality%20Board/2023/July_11_2023/04a_7-577_TR10_Proposed_HHcriteria_Rationale.pdf

a numeric standard for selenium is necessary to protect the function of wetlands as wildlife habitat as described in the proposed 20.6.4.13. Therefore, we recommend that rather than excluding wetlands from the 20.6.4.900 criteria for wildlife habitat, that those criteria also be applied to these crucial surface waters.

Thank you for this opportunity to comment on the Public Review Draft for the 2026 Triennial Review.

Brittany Fallon, PhD
Policy Manager
Western Resource Advocates.

Michael Ketterer

Today is the anniversary of an event that transpired to change European history at the Battle of Hastings. The elapsed 959 years since that fateful day is a time period exceeding the longevity of most human civilizations, and most endeavors throughout our recorded history. It takes substantial faith in the human condition to look forward another 959 years, and wonder what our technogenic landscape will look like, in say, the year 2984, as the next millennium nears.

Yet on this October 14, it is a mere eight decades since the reckless, negligent disposal of plutonium laden wastes at Acid Canyon, and other locations, was conducted by the present-day occupants of the Pajarito Plateau. Since the day in the early to mid 1940's, when manual laborers did as they told under the purview of compartmentalization, the riparian zone below the present-day Los Alamos Aquatic Center remains significantly contaminated with wastes abandoned under the exigency of the Manhattan Project. The sediment in present-day Acid Canyon remains contaminated to the extreme such that water samples collected in July 2024 contained in excess of 50 picocuries per liter of plutonium-239+240 (Pu).

The levels of Pu in the summer 2024 monsoon waters do not even meet the Federal gross alpha standard (sum of all alpha emitting isotopes) of 50 picocuries per liter. Said another way, the sediments in Acid Canyon and similar areas are still "too dirty" so that the monsoon flow in Acid Canyon and affected downstream areas, cannot ever meet as low as possible/appropriate drinking water standards. As a result, neither USEPA, the State of New Mexico, nor the current occupants of the Pajarito Plateau have shown any interest in addressing this localized but extreme problem of riparian zone contamination, which has been hiding in plain sight for decades.

In New Mexico, there is no relevant enforceable water standard that is specific for plutonium; nevertheless, Acid Canyon waters are out of compliance due to their non-specific alpha emitting content; New Mexico upholds a guidance/advisory recommended standard of 1.5 pCi/L for the Rio Grande and its tributaries; the Summer 2024 water samples exceeded this advisory level by more than an order of magnitude. However, it is reasonable for New Mexicans to receive the same level of protection by regulations from polluters such as the Department of Energy, as exist in all states.

In Colorado, where the US Department of Energy formerly operated the Rocky Flats plutonium pit production facility from 1952 to 1989, the remediation conducted in the early 2000's resulted in a tripartite agreement between DOE, USEPA, and the State of Colorado. In this agreement, the DOE agreed to comply with an enforceable standard for Pu in water of 0.15 pCi/L.

New Mexicans, as your vecino from Colorado who is familiar with DOE's obfuscations and lack of clarity in addressing Rocky Flats's neighbors, I urge you to adapt the same enforceable standards for plutonium, neptunium, americium and other substances as appropriate, as the DOE is legally obligated to comply with in Colorado. You deserve no less. You need to recognize that It is shameful that the Pajarito Plateau's current occupants, who consider themselves to be atop the summit of US scientific prowess, must make an argument that "80 picocuries per gram in the sediments are OK" and that this writer is the one who is off base. The presence of this contamination in the center of the US's alleged nuclear prowess shows our adversaries how non-serious we are about handling special nuclear materials.

A state that has plans to host the next Pu pit production enterprise had best consider adopting the standard in effect at the previous pit factory, which serves to protect the Rocky Flats downstreamers. Why should downstreamers in New Mexico settle for less? Even the passage of another millennium won't make a dent in the Pu inventory.

Michael E. Ketterer

NEW MEXICO WATER QUALITY CONTROL COMMISSION
NOTICE OF PUBLIC RULEMAKING HEARING

The New Mexico Water Quality Control Commission (Commission) will hold a public hearing beginning at 9:00 a.m. on September 28, 2026, and continuing through October 1, 2026, as necessary. The Commission may continue the hearing thereafter to hear all testimony, evidence, and public comments. The hearing will be held at the State Capitol Building, 490 Old Santa Fe Trail, Santa Fe, New Mexico 87501. Additionally, a virtual participation option will be provided with meeting links and details posted on the events calendar at https://www.env.nm.gov/events-calendar. The purpose of the hearing is to consider the docketed matter of WQCC 25-75 (R) to amend 20.6.4 NMAC, *Standards for Interstate and Intrastate Surface Waters*. The petitioner for this proposed regulatory change is the New Mexico Environment Department (NMED).

The federal Clean Water Act (CWA) requires states to evaluate existing water quality standards (WQS), consider new scientific information, provide public participation opportunities, and amend WQS as necessary, every three years. This process is commonly referred to as the Triennial Review and culminates in a public hearing. NMED proposed amendments in this matter based on public comments on 20.6.4 NMAC, communication with the Environmental Protection Agency (EPA), federal guidance documents, monitoring and fish data, as well as internal comments and implementation concerns. The amendments include new and revised definitions, clarification of third-party rulemaking procedures and costs, revisions to segment descriptions to match hydrological breaks, WQS for wetlands, clarification of implementation language, updated references, as well as new or revised designated uses, criteria, and antidegradation requirements.

The hearing will be conducted in accordance with the Water Quality Act, Sections 74-6-4 and 74-6-6 NMSA 1978, the State Rules Act, Section 14-4-5.3 NMSA 1978, 20.1.6 NMAC (*Rulemaking Procedures – Water Quality Control Commission)*, the Pre-Hearing Order for WQCC 25-75 (R), and other applicable procedures and authorities. The Commission may make a decision on the proposed rule at the conclusion of the hearing.

All interested persons will be given reasonable opportunity at the hearing to submit data, views or arguments orally or in writing, and examine witnesses testifying at the hearing. Persons wishing to present technical testimony must file a written notice of intent (NOI) with the Commission. The NOI shall:

(1) identify the person for whom the witness(es) will testify;
(2) identify each technical witness the person intends to present and state the qualifications of that witness, including a description of their educational and work background;
(3) include a copy of the direct testimony of each technical witness in narrative form;
(4) include the text of any recommended modifications to the proposed regulatory change; and
(5) list and attach all exhibits anticipated to be offered by that person at the hearing, including any proposed statement of reasons for adoption of rules.

Entries of appearance and NOIs for direct testimony must be filed with the Commission Administrator no later than 5:00 p.m. on July 30, 2026, and should reference the docket number, WQCC 25-75 (R), and the date of the hearing. Notices of intent to present technical testimony shall be filed electronically with the Commission Administrator at pamela.jones@env.nm.gov.

Persons wishing to present rebuttal testimony, shall file an NOI electronically with the Commission Administrator no later than 5:00 p.m. on August 28, 2026. Rebuttal NOIs should include a narrative of rebuttal testimony and the other required elements of a direct NOI, as detailed in items (1) – (5) above.

One paper copy of all NOIs for the Hearing Officer's use shall be delivered by 12:00 p.m. (noon) on September 25, 2026, to:

Pamela Jones, Commission Administrator
Water Quality Control Commission

P.O. Box 5469
Santa Fe, NM 87502

The Hearing Officer will provide an opportunity for non-technical public comment each day of the hearing in a manner that accommodates the public pursuant to 20.1.6.204 NMAC. Public comment sessions will be reserved for 4:00 p.m. each day, until the close of the hearing record.

Members of the public wishing to offer non-technical public comment may do so only once either in person or on the virtual platform with access provided and managed by the Administrator. Oral public comment is limited to 3 minutes; written public comment submitted to the Administrator is unlimited and must be received prior to adjournment of the hearing. Written public comments may be submitted electronically or as a single original document to the Administrator at the above address. Please submit electronic written comments regarding the proposed rule prior to adjournment of the hearing via the Smart Comment Portal at https://nmed.commentinput.com/comment/search or through email to pamela.jones@env.nm.gov with reference to WQCC 25-75 (R).

NMED based the proposed rule on a variety of technical information, including NMED monitoring data , CWA Section 304(a) guidance documents, past CWA 303(d)/305(b) Integrated Lists/Integrated Reports, and fish surveys. The proposed rule may be reviewed during regular business hours at the NMED Surface Water Quality Bureau, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, at NMED Field Offices, or on NMED's web site at https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. For copies of the proposed rule, how to obtain technical information, or questions about participating in the hearing, please contact Michael Baca at (505) 470-1652 or michael.baca1@env.nm.gov or Pamela Jones at (505) 660-4305 or pamela.jones@env.nm.gov.

Persons requiring assistance, an interpreter, or any other form of auxiliary aid or service (i.e., reader, amplifier, qualified sign language interpreter, etc.) to attend or participate in the hearing should contact Pamela Jones no later than September 14, 2026 at (505) 660-4305 or pamela.jones@env.nm.gov.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non- discrimination programs, policies or procedures, you may contact: Kate Cardenas, NMED Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 or nd.coordinator@env.nm.gov. If you believe that you have been discriminated against with respect to an NMED program or activity, please contact the Non-Discrimination Coordinator.

COMISIÓN DE CONTROL DE CALIDAD DEL AGUA DE NUEVO MÉXICO
AVISO DE AUDIENCIA PÚBLICA DE REGLAMENTACIÓN

La Comisión de Control de Calidad del Agua de Nuevo México (la Comisión) celebrará una audiencia pública la cual comenzará a las 9:00 a.m. del 28 de septiembre de 2026 y continuará hasta el 1 de octubre de 2026, según sea necesario. La Comisión podrá continuar la audiencia posteriormente con el fin de escuchar todos los testimonios, pruebas y comentarios públicos. La audiencia se llevará a cabo en el edificio del Capitolio del Estado, 490 Old Santa Fe Trail, Santa Fe, Nuevo México 87501. Además, habrá disponible una opción de participación virtual con enlaces a las reuniones e información publicados en el calendario de eventos en https://www.env.nm.gov/events-calendar. El propósito de la audiencia es considerar el asunto registrado en WQCC 25-75 (R) con el objetivo de enmendar 20.6.4 NMAC, *Estándares de Aguas Superficiales Interestatales e Intraestatales*. El peticionario de esta enmienda regulatoria propuesta es el Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés).

La Ley de Agua Limpia (CWA) federal exige que los estados evalúen los estándares de calidad del agua (WQS) existentes, consideren la información científica más reciente, brinden oportunidades de participación pública y modifiquen los WQS según sea necesario, cada tres años. Este proceso se conoce generalmente como Revisión Trienal y culmina con una audiencia pública. El NMED propuso enmiendas en este asunto con base en comentarios públicos sobre 20.6.4 NMAC, comunicado con la Agencia de Protección Ambiental (EPA, por sus siglas en inglés), documentos de orientación federales, datos de peces y monitoreo, así como los comentarios internos y preocupaciones sobre la implementación. Las enmiendas incluyen definiciones nuevas y revisadas, aclaración de los procedimientos y costos de la reglamentación de terceros, revisiones de las descripciones de los segmentos con el fin de que coincidan con las rupturas hidrológicas, los WQS correspondientes a los humedales, la aclaración del lenguaje de implementación, las referencias actualizadas, así como los usos designados, criterios y requisitos de anti-degradación nuevos o revisados.

La audiencia se llevará a cabo de acuerdo con la Ley de Calidad del Agua, Secciones 74-6-4 y 74-6-6 NMSA 1978, Ley de Reglas Estatales, Sección 14-4-5.3 NMSA 1978, 20.1.6 NMAC, *Procedimientos de Reglamentación – Comisión de Control de Calidad del Agua*, la Orden previa a la audiencia para WQCC 25-75 (R) y otros procedimientos y autoridades aplicables. La Comisión puede decidir sobre la norma propuesta al concluir la audiencia.

A todas las personas interesadas se les dará una oportunidad razonable durante la audiencia para presentar datos, puntos de vista o argumentos de forma oral o por escrito, y examinar a los testigos que testifiquen en la audiencia. Las personas que deseen presentar un testimonio técnico deben presentar una notificación de intención (NOI) por escrito ante la Comisión. La NOI deberá:

(1) identificar a la persona por quien los testigos testificarán;
(2) identificar cada testigo técnico que la persona pretende presentar y declarar las calificaciones de ese testigo, incluyendo una descripción de sus antecedentes educativos y laborales;
(3) incluir una copia del testimonio directo de cada testigo técnico en forma narrativa;
(4) incluir el texto de cualquier modificación recomendada al cambio regulatorio propuesto; y
(5) enumerar y adjuntar todas las pruebas que se prevé que ofrecerá esa persona en la audiencia, incluyendo cualquier declaración propuesta de motivos para la adopción de reglas.

Las anotaciones de comparecencia y las NOI para un testimonio directo deben ser recibidas por el Administrador de la Comisión a más tardar a las 5:00 p.m. el 30 de julio de 2026, y debe hacer referencia al número de expediente, WQCC 25-75 (R) y la fecha de la audiencia. Las notificaciones de intención que incluyan un testimonio técnico se archivarán de manera electrónica ante el Administrador de la Comisión en pamela.jones@env.nm.gov.

Las personas que deseen presentar un testimonio de refutación deberán presentar una NOI vía electrónica ante el Administrador de la Comisión a más tardar a las 5:00 p.m. el 28 de agosto de 2026. Las NOI de refutación

deben incluir una narrativa del testimonio de refutación y los demás elementos requeridos de una NOI directa como se detalla en los puntos (1) a (5) anteriores.

Se entregará una copia impresa de todas las NOI para uso del funcionario de audiencias antes de las 12:00 p.m. el 25 de septiembre de 2026, a:

Pamela Jones, Administradora de la Comisión
Comisión de Control de Calida del Agua
P.O. Box 5469
Santa Fe, NM 87502

El funcionario de audiencias se ofrecerá una oportunidad para el público haga comentarios cada día de la audiencia se llevará a cabo de acuerdo con 20.1.6.204 NMAC. Se reserva las oportunidades de comentarios públicos a las 4:00 p.m. cada día hasta la conclusión de la audiencia.

Los miembros del público que deseen ofrecer comentarios públicos no técnicos podrán hacerlo solo una vez, ya sea en persona o en la plataforma virtual con acceso proporcionado y administrado por el Administrador. Los comentarios públicos orales se limitan a 3 minutos; Los comentarios públicos escritos presentados al Administrador son ilimitados y deben recibirse antes del aplazamiento de la audiencia. Los comentarios públicos escritos podrán presentarse por vía electrónica o como un documento original único. Favor de enviar sus comentarios electrónicos por escrito sobre la norma propuesta antes del aplazamiento de la audiencia a través del Portal de Comentarios Inteligentes en https://nmed.commentinput.com/comment/search o envíe un correo electrónico a pamela.jones@env.nm.gov con referencia a WQCC 25-75 (R).

El NMED utilizó una variedad de información técnica con el objetivo de respaldar la norma propuesta, incluyendo datos de monitoreo del NMED, documentos de orientación de la Sección 304(a) de CWA, listas integradas/informes integrados de CWA 303(d)/305(b) anteriores y estudios de peces. La norma propuesta puede revisarse durante el horario laboral habitual en la Oficina de Calidad del Agua Superficial del NMED, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, en los oficinas exteriores del NMED, o en el sitio web del NMED en https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. Si desea obtener copias de la norma propuesta, información técnicos, o preguntas acerca de la participación en la audiencia, comuníquese con Michael Baca al (505) 470-1652 o michael.baca1@env.nm.gov o Pamela Jones al (505) 660-4305 o pamela.jones@env.nm.gov.

Los individuos que requieran asistencia, un intérprete o cualquier otra forma de ayuda o servicio auxiliar (es decir, un lector, amplificador, intérprete de lenguaje de señas calificado, etc.) para poder asistir o participar en la audiencia deben comunicarse con Pamela Jones a más tardar el 14 de septiembre de 2026 al (505) 660-4305 o pamela.jones@env.nm.gov.

El NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo requerido por las leyes y regulaciones aplicables. El NMED es responsable de coordinar los esfuerzos de cumplimiento y recibir consultas relacionadas con los requisitos de no discriminación implementados por 40 C.F.R. Partes 5 y 7, incluyendo el Título VI de la Ley de Derechos Civiles de 1964, tal como estuviere modificada; Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, el Título IX de las Enmiendas a la Educación de 1972 y la Sección 13 de las Enmiendas a la Ley Federal de Control de la Contaminación del Agua de 1972. Si tiene alguna pregunta sobre este aviso o cualquiera de los programas, políticas o procedimientos de no discriminación del NMED, puede comunicarse con: Kate Cardenas, Coordinadora de No Discriminación del NMED, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 o nd.coordinator@env.nm.gov. Si cree que ha sido discriminado con respecto a un programa o actividad del NMED, comuníquese con la Coordinadora de No Discriminación.

Affidavit of Publication in New Mexico Register

I, Matthew Ortiz, certify that the agency noted on Invoice # SRCA - 8884 has published legal notice of rulemaking or rules in the NEW MEXICO REGISTER, VOLUME XXXVI, that payment has been assessed for said legal notice of rulemaking or rules, which appears on the publication date and in the issue number noted on Invoice # SRCA - 8884, and that Invoice # SRCA - 8884 has been sent electronically to the person(s) listed on the *Billing Information Sheet* provided by the agency.

NEW MEXICO WATER QUALITY CONTROL COMMISSION
NOTICE OF PUBLIC RULEMAKING HEARING

The New Mexico Water Quality Control Commission (Commission) will hold a public hearing beginning at 9:00 a.m. on September 28, 2026, and continuing through October 1, 2026, as necessary. The Commission may continue the hearing thereafter to hear all testimony, evidence, and public comments. The hearing will be held at the State Capitol Building, 490 Old Santa Fe Trail, Santa Fe, New Mexico 87501. Additionally, a virtual participation option will be provided with meeting links and details posted on the events calendar at https://www.env.nm.gov/events-calendar. The purpose of the hearing is to consider the docketed matter of WQCC 25-75 (R) to amend 20.6.4 NMAC, Standards for Interstate and Intrastate Surface Waters. The petitioner for this proposed regulatory change is the New Mexico Environment Department (NMED).

The federal Clean Water Act (CWA) requires states to evaluate existing water quality standards (WQS), consider new scientific information, provide public participation opportunities, and amend WQS as necessary, every three years. This process is commonly referred to as the Triennial Review and culminates in a public hearing. NMED proposed amendments in this matter based on public comments on 20.6.4 NMAC, communication with the Environmental Protection Agency (EPA), federal guidance documents, monitoring and fish data, as well as internal comments and implementation concerns. The amendments include new and revised definitions, clarification of third-party rulemaking procedures and costs, revisions to segment descriptions to match hydrological breaks, WQS for wetlands, clarification of implementation language, updated references, as well as new or revised designated uses, criteria, and antidegradation requirements.

The hearing will be conducted in accordance with the Water Quality Act, Sections 74-6-4 and 74-6-6 NMSA 1978, the State Rules Act, Section 14-4-5.3 NMSA 1978, 20.1.6 NMAC (Rulemaking Procedures Water Quality Control Commission), the Pre-Hearing Order for WQCC 25-75 (R), and other applicable procedures and authorities. The Commission may make a decision on the proposed rule at the conclusion of the hearing.

All interested persons will be given reasonable opportunity at the hearing to submit data, views or arguments orally or in writing, and examine witnesses testifying at the hearing. Persons wishing to present technical testimony must file a written notice of intent (NOI) with the Commission. The NOI shall:

(1) identify the person for whom the witness(es) will testify;
(2) identify each technical witness the person intends to present and state the qualifications of that witness, including a description of their educational and work background;
(3) include a copy of the direct testimony of each technical witness in narrative form;
(4) include the text of any recommended modifications to the proposed regulatory change; and
(5) list and attach all exhibits anticipated to be offered by that person at the hearing, including any proposed statement of reasons for adoption of rules.

Entries of appearance and NOIs for direct testimony must be filed with the Commission Administrator no later than 5:00 p.m. on July 30, 2026, and should reference the docket number, WQCC 25-75 (R), and the date of the hearing. Notices of intent to present technical testimony shall be filed electronically with the Commission Administrator at pamela.jones@env.nm.gov.

Persons wishing to present rebuttal testimony, shall file an NOI electronically with the Commission Administrator no later than 5:00 p.m. on August 28, 2026. Rebuttal NOIs should include a narrative of rebuttal testimony and the other required elements of a direct NOI, as detailed in items (1) (5) above.

One paper copy of all NOIs for the Hearing Officer's use shall be delivered by 12:00 p.m. (noon) on September 25, 2026, to:

Pamela Jones, Commission Administrator
Water Quality Control Commission
P.O. Box 5469
Santa Fe, NM 87502

The Hearing Officer will provide an opportunity for non-technical public comment each day of the hearing in a manner that accommodates the public pursuant to 20.1.6.204 NMAC. Public comment sessions will be reserved for 4:00 p.m. each day, until the close of the hearing record.

Members of the public wishing to offer non-technical public comment may do so only once either in person or on the virtual platform with access provided and managed by the Administrator. Oral public comment is limited to 3 minutes; written public comment submitted to the Administrator is unlimited and must be received prior to adjournment of the hearing. Written public comments may be submitted electronically or as a single original document to the Administrator at the above address. Please submit electronic written comments regarding the proposed rule prior to adjournment of the hearing via the Smart Comment Portal at https://nmed.commentinput.com/comment/search or through email to pamela.jones@env.nm.gov with reference to WQCC 25-75 (R).

NMED based the proposed rule on a variety of technical information, including NMED monitoring data , CWA Section 304(a) guidance documents, past CWA 303(d)/305(b) Integrated Lists/Integrated Reports, and fish surveys. The proposed rule may be reviewed during regular business hours at the NMED Surface Water Quality Bureau, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, at NMED Field Offices, or on NMED's web site at https://www.env.nm.gov/surface-water-quality/2026-triennial-review-/. For copies of the proposed rule, how to obtain technical information, or questions about participating in the hearing, please contact Michael Baca at (505) 470-1652 or michael.baca1@env.nm.gov or Pamela Jones at (505) 660-4305 or pamela.jones@env.nm.gov.

Persons requiring assistance, an interpreter, or any other form of auxiliary aid or service (i.e., reader, amplifier, qualified sign language interpreter, etc.) to attend or participate in the hearing should contact Pamela Jones no later than September 14, 2026 at (505) 660-4305 or pamela.jones@env.nm.gov.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non- discrimination programs, policies or procedures, you may contact: Kate Cardenas, NMED Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 or nd.coordinator@env.nm.gov. If you believe that you have been discriminated against with respect to an NMED program or activity, please contact the Non-Discrimination Coordinator.

COMISION DE CONTROL DE CALIDAD DEL AGUA DE NUEVO MEXICO
AVISO DE AUDIENCIA PUBLICA DE REGLAMENTACION

La Comision de Control de Calidad del Agua de Nuevo Mexico (la Comision) celebrara una audiencia publica la cual comenzara a las 9:00 a.m. del 28 de septiembre de 2026 y continuara hasta el 1 de octubre de 2026, segun sea necesario. La Comision podra continuar la audiencia posteriormente con el fin de escuchar todos los testimonios, pruebas y comentarios publicos. La audiencia se llevara a cabo en el edificio del Capitolio del Estado, 490 Old Santa Fe Trail, Santa Fe, Nuevo Mexico 87501. Ademas, habra disponible una opcion de participacion virtual con enlaces a las reuniones e informacion publicados en el calendario de eventos en https://www.env.nm.gov/events-calendar. El proposito de la audiencia es considerar el asunto registrado en WQCC 25-75 (R) con el objetivo de enmendar 20.6.4 NMAC, Estandares de Aguas Superficiales Interestatales e Intraestatales. El peticionario de esta enmienda regulatoria propuesta es el Departamento de Medio Ambiente de Nuevo Mexico (NMED, por sus siglas en ingles).

La Ley de Agua Limpia (CWA) federal exige que los estados evaluen los estandares de calidad del agua (WQS) existentes, consideren la informacion cientifica mas reciente, brinden oportunidades de participacion publica y modifiquen los WQS segun sea necesario, cada tres anos. Este proceso se conoce generalmente como Revision Trienal y culmina con una audiencia publica. El NMED propuso enmiendas en este asunto con base en comentarios publicos sobre 20.6.4 NMAC, comunicado con la Agencia de Proteccion Ambiental (EPA, por sus siglas en ingles), documentos de orientacion federales, datos de peces y monitoreo, asi como los comentarios internos y preocupaciones sobre la implementacion. Las enmiendas incluyen definiciones nuevas y revisadas, aclaracion de los procedimientos y costos de la reglamentacion de terceros, revisiones de las descripciones de los segmentos con el fin de que coincidan con las rupturas hidrologicas, los WQS correspondientes a los humedales, la aclaracion del lenguaje de implementacion, las referencias actualizadas, asi como los usos designados, criterios y requisitos de anti-degradacion nuevos o revisados.

La audiencia se llevara a cabo de acuerdo con la Ley de Calidad del Agua, Secciones 74-6-4 y 74-6-6 NMSA 1978, Ley de Reglas Estatales, Seccion 14-4-5.3 NMSA 1978, 20.1.6 NMAC, Procedimientos de Reglamentacion Comision de Control de Calidad del Agua, la Orden previa a la audiencia para WQCC 25-75 (R) y otros procedimientos y autoridades aplicables. La Comision puede decidir sobre la norma propuesta al concluir la audiencia.

A todas las personas interesadas se les dara una oportunidad razonable durante la audiencia para presentar datos, puntos de vista o argumentos de forma oral o por escrito, y examinar a los testigos que testifiquen en la audiencia. Las personas que deseen presentar un testimonio tecnico deben presentar una notificacion de intencion (NOI) por escrito ante la Comision. La NOI debera:

(1) identificar a la persona por quien los testigos testificaran;
(2) identificar cada testigo tecnico que la persona pretende presentar y declarar las calificaciones de ese testigo, incluyendo una descripcion de sus antecedentes educativos y laborales;
(3) incluir una copia del testimonio directo de cada testigo tecnico en forma narrativa;
(4) incluir el texto de cualquier modificacion recomendada al cambio regulatorio propuesto; y
(5) enumerar y adjuntar todas las pruebas que se preve que ofrecera esa persona en la audiencia, incluyendo cualquier declaracion propuesta de motivos para la adopcion de reglas.

Las anotaciones de comparecencia y las NOI para un testimonio directo deben ser recibidas por el Administrador de la Comision a mas tardar a las 5:00 p.m. el 30 de julio de 2026, y debe hacer referencia al numero de expediente, WQCC 25-75 (R) y la fecha de la audiencia. Las notificaciones de intencion que incluyan un testimonio tecnico se archivaran de manera electronica ante el Administrador de la Comision en pamela.jones@env.nm.gov.

Las personas que deseen presentar un testimonio de refutacion deberan presentar una NOI via electronica ante el Administrador de la Comision a mas tardar a las 5:00 p.m. el 28 de agosto de 2026. Las NOI de refutacion deben incluir una narrativa del testimonio de refutacion y los demas elementos requeridos de una NOI directa como se detalla en los puntos (1) a (5) anteriores.

Se entregara una copia impresa de todas las NOI para uso del funcionario de audiencias antes de las 12:00 p.m. el 25 de septiembre de 2026, a:

Pamela Jones, Administradora de la Comision
Comision de Control de Calida del Agua
P.O. Box 5469
Santa Fe, NM 87502

El funcionario de audiencias se ofrecera una oportunidad para el publico haga comentarios cada dia de la audiencia se llevara a cabo de acuerdo con 20.1.6.204 NMAC. Se reserva las oportunidades de comentarios publicos a las 4:00 p.m. cada dia hasta la conclusion de la audiencia.

Los miembros del publico que deseen ofrecer comentarios publicos no tecnicos podran hacerlo solo una vez, ya sea en persona o en la plataforma virtual con acceso proporcionado y administrado por el Administrador. Los comentarios publicos orales se limitan a 3 minutos; Los comentarios publicos escritos presentados al Administrador son ilimitados y deben recibirse antes del aplazamiento de la audiencia. Los comentarios publicos escritos podran presentarse por via electronica o como un documento original unico. Favor de enviar sus comentarios electronicos por escrito sobre la norma propuesta antes del aplazamiento de la audiencia a traves del Portal de Comentarios Inteligentes en https://nmed.commentinput.com/comment/search o envie un correo electronico a pamela.jones@env.nm.gov con referencia a WQCC 25-75 (R).

El NMED utilizo una variedad de informacion tecnica con el objetivo de respaldar la norma propuesta, incluyendo datos de monitoreo del NMED, documentos de orientacion de la Seccion 304(a) de CWA, listas integradas/informes integrados de CWA 303(d)/305(b) anteriores y estudios de peces. La norma propuesta puede revisarse durante el horario laboral habitual en la Oficina de Calidad del Agua Superficial del NMED, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, en los oficinas exteriores del NMED, o en el sitio web del NMED en https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. Si desea obtener copias de la norma propuesta, informacion tecnicos, o preguntas acerca de la participacion en la audiencia, comuniquese con Michael Baca al (505) 470-1652 o michael.baca1@env.nm.gov o Pamela Jones al (505) 660-4305 o pamela.jones@env.nm.gov.

Los individuos que requieran asistencia, un interprete o cualquier otra forma de ayuda o servicio auxiliar (es decir, un lector, amplificador, interprete de lenguaje de senas calificado, etc.) para poder asistir o participar en la audiencia deben comunicarse con Pamela Jones a mas tardar el 14 de septiembre de 2026 al (505) 660-4305 o pamela.jones@env.nm.gov.

El NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administracion de sus programas o actividades, segun lo requerido por las leyes y regulaciones aplicables. El NMED es responsable de coordinar los esfuerzos de cumplimiento y recibir consultas relacionadas con los requisitos de no discriminacion implementados por 40 C.F.R. Partes 5 y 7, incluyendo el Titulo VI de la Ley de Derechos Civiles de 1964, tal como estuviere modificada; Seccion 504 de la Ley de Rehabilitacion de 1973; la Ley de Discriminacion por Edad de 1975, el Titulo IX de las Enmiendas a la Educacion de 1972 y la Seccion 13 de las Enmiendas a la Ley Federal de Control de la Contaminacion del Agua de 1972. Si tiene alguna pregunta sobre este aviso o cualquiera de los programas, politicas o procedimientos de no discriminacion del NMED, puede comunicarse con: Kate Cardenas, Coordinadora de No Discriminacion del NMED, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 o nd.coordinator@env.nm.gov. Si cree que ha sido discriminado con respecto a un programa o actividad del NMED, comuniquese con la Coordinadora de No Discriminacion.

NEW MEXICO WATER QUALITY CONTROL COMMISSION NOTICE OF PUBLIC RULEMAKING HEARING

The New Mexico Water Quality Control Commission (Commission) will hold a public hearing beginning at 9:00 a.m. on September 28, 2026, and continuing through October 1, 2026, as necessary. The Commission may continue the hearing thereafter to hear all testimony, evidence, and public comments. The hearing will be held at the State Capitol Building, 490 Old Santa Fe Trail, Santa Fe, New Mexico 87501. Additionally, a virtual participation option will be provided with meeting links and details posted on the events calendar at https://www.env.nm.gov/events-calendar. The purpose of the hearing is to consider the docketed matter of WQCC 25-75 (R) to amend 20.6.4 NMAC, ***Standards for Interstate and Intrastate Surface Waters.*** The petitioner for this proposed regulatory change is the New Mexico Environment Department (NMED).

The federal Clean Water Act (CWA) requires states to evaluate existing water quality standards (WQS), consider new scientific information, provide public participation opportunities, and amend WQS as necessary, every three years. This process is commonly referred to as the Triennial Review and culminates in a public hearing. NMED proposed amendments in this matter based on public comments on 20.6.4 NMAC, communication with the Environmental Protection Agency (EPA), federal guidance documents, monitoring and fish data, as well as internal comments and implementation concerns. The amendments include new and revised definitions, clarification of third-party rulemaking procedures and costs, revisions to segment descriptions to match hydrological breaks, WQS for wetlands, clarification of implementation language, updated references, as well as new or revised designated uses, criteria, and antidegradation requirements.

The hearing will be conducted in accordance with the Water Quality Act, Sections 74-6-4 and 74-6-6 NMSA 1978, the State Rules Act, Section 14-4-5.3 NMSA 1978, 20.1.6 NMAC (***Rulemaking Procedures – Water Quality Control Commission***), the Pre-Hearing Order for WQCC 25-75 (R), and other applicable procedures and authorities. The Commission may make a decision on the proposed rule at the conclusion of the hearing.

All interested persons will be given reasonable opportunity at the hearing to submit data, views or arguments orally or in writing, and examine witnesses testifying at the hearing. Persons wishing to present technical testimony must file a written notice of intent (NOI) with the Commission. The NOI shall:

(1) identify the person for whom the witness(es) will testify;
(2) identify each technical witness the person intends to present and state the qualifications of that witness, including a description of their educational and work background;
(3) include a copy of the direct testimony of each technical witness in narrative form;
(4) include the text of any recommended modifications to the proposed regulatory change; and
(5) list and attach all exhibits anticipated to be offered by that person at the hearing, including any proposed statement of reasons for adoption of rules.

Entries of appearance and NOIs for direct testimony must be filed with the Commission Administrator no later than 5:00 p.m. on July 30, 2026, and should reference the docket number, WQCC 25-75 (R), and the date of the hearing. Notices of intent to present technical testimony shall be filed electronically with the Commission Administrator at pamela.jones@env.nm.gov.

Persons wishing to present rebuttal testimony, shall file an NOI electronically with the Commission Administrator no later than 5:00 p.m. on August 28, 2026. Rebuttal NOIs should include a narrative of rebuttal testimony and the other required elements of a direct NOI, as detailed in items (1) – (5) above.

One paper copy of all NOIs for the Hearing Officer's use shall be delivered by 12:00 p.m. (noon) on September 25, 2026, to:

Pamela Jones, Commission Administrator
Water Quality Control Commission
P.O. Box 5469
Santa Fe, NM 87502

The Hearing Officer will provide an opportunity for non-technical public comment each day of the hearing in a manner that accommodates the public pursuant to 20.1.6.204 NMAC. Public comment sessions will be reserved for 4:00 p.m. each day, until the close of the hearing record.

Members of the public wishing to offer non-technical public comment may do so only once either in person or on the virtual platform with access provided and managed by the Administrator. Oral public comment is limited to 3 minutes; written public comment submitted to the Administrator is unlimited and must be received prior to adjournment of the hearing. Written public comments may be submitted electronically or as a single original document to the Administrator at the above address. Please submit electronic written comments regarding the proposed rule prior to adjournment of the hearing via the Smart Comment Portal at https://nmed.commentinput.com/comment/search or through email to pamela.jones@env.nm.gov with reference to WQCC 25-75 (R).

NMED based the proposed rule on a variety of technical information, including NMED monitoring data , CWA Section 304(a) guidance documents, past CWA 303(d)/305(b) Integrated Lists/Integrated Reports, and fish surveys. The proposed rule may be reviewed during regular business hours at the NMED Surface Water Quality Bureau, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, at NMED Field Offices, or on NMED's web site at https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. For copies of the proposed rule, how to obtain technical information, or questions about participating in the hearing, please contact Michael Baca at (505) 470-1652 or michael.baca1@env.nm.gov or Pamela Jones at (505) 660-4305 or pamela.jones@env.nm.gov.

Persons requiring assistance, an interpreter, or any other form of auxiliary aid or service (i.e., reader, amplifier, qualified sign language interpreter, etc.) to attend or participate in the hearing should contact Pamela Jones no later than September 14, 2026 at (505) 660-4305 or pamela.jones@env.nm.gov.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, you may contact: Kate Cardenas, NMED Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 or nd.coordinator@env.nm.gov. If you believe that you have been discriminated against with respect to an NMED program or activity, please contact the Non-Discrimination Coordinator.

COMISIÓN DE CONTROL DE CALIDAD DEL AGUA DE NUEVO MÉXICO AVISO DE AUDIENCIA PÚBLICA DE REGLAMENTACIÓN

La Comisión de Control de Calidad del Agua de Nuevo México (la Comisión) celebrará una audiencia pública la cual comenzará a las 9:00 a.m. del 28 de septiembre de 2026 y continuará hasta el 1 de octubre de 2026, según sea necesario. La Comisión podrá continuar la audiencia posteriormente con el fin de escuchar todos los testimonios, pruebas y comentarios públicos. La audiencia se llevará a cabo en el edificio del Capitolio del Estado, 490 Old Santa Fe Trail, Santa Fe, Nuevo México 87501. Además, habrá disponible una opción de participación virtual con enlaces a las reuniones e información publicados en el calendario de eventos en https://www.env.nm.gov/events-calendar. El propósito de la audiencia es considerar el asunto registrado en WQCC 25-75 (R) con el objetivo de enmendar 20.6.4 NMAC, ***Estándares de Aguas Superficiales Interestatales e Intraestatales***. El peticionario de esta enmienda regulatoria propuesta es el Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés).

La Ley de Agua Limpia (CWA) federal exige que los estados evalúen los estándares de calidad del agua (WQS) existentes, consideren la información científica más reciente, brinden oportunidades de participación pública y modifiquen los WQS según sea necesario, cada tres años. Este proceso se conoce generalmente como Revisión Trienal y culmina con una audiencia pública. El NMED propuso enmiendas en este asunto con base en comentarios públicos sobre 20.6.4 NMAC, comunicado con la Agencia de Protección Ambiental (EPA, por sus siglas en inglés), documentos de orientación federales, datos de peces y monitoreo, así como los comentarios internos y preocupaciones sobre la implementación. Las enmiendas incluyen definiciones nuevas y revisadas, aclaración de los procedimientos y costos de la reglamentación de terceros, revisiones de las descripciones de los segmentos con el fin de que coincidan con las rupturas hidrológicas, los WQS correspondientes a los humedales, la aclaración del lenguaje de implementación, las referencias actualizadas, así como los usos designados, criterios y requisitos de antidegradación nuevos o revisados.

La audiencia se llevará a cabo de acuerdo con la Ley de Calidad del Agua, Secciones 74-6-4 y74-6-6 NMSA 1978, Ley de Reglas Estatales, Sección 14-4-5.3 NMSA 1978, 20.1.6NMAC, ***Procedimientos de Reglamentación – Comisión de Control de Calidad del Agua***, la Orden previa a la audiencia para WQCC 25-75 (R) y otros procedimientos y autoridades aplicables. La Comisión puede decidir sobre la norma propuesta al concluir la audiencia.

A todas las personas interesadas se les dará una oportunidad razonable durante la audiencia para presentar datos, puntos de vista o argumentos de forma oral o por escrito, y examinar a los testigos que testifiquen en la audiencia. Las personas que deseen presentar un testimonio técnico deben presentar una notificación de intención (NOI) por escrito ante la Comisión. La NOI deberá:

(1) identificar a la persona por quien los testigos testificarán;
(2) identificar cada testigo técnico que la persona pretende presentar y declarar las calificaciones de ese testigo, incluyendo una descripción de sus antecedentes educativos y laborales;
(3) incluir una copia del testimonio directo de cada testigo técnico en forma narrativa;
(4) incluir el texto de cualquier modificación recomendada al cambio regulatorio propuesto; y
(5) enumerar y adjuntar todas las pruebas que se prevé que ofrecerá esa persona en la audiencia, incluyendo cualquier declaración propuesta de motivos para la adopción de reglas.

Las anotaciones de comparecencia y las NOI para un testimonio directo deben ser recibidas por el Administrador de la Comisión a más tardar a las 5:00 p.m. el 30 de julio de 2026, y debe hacer referencia al número de expediente, WQCC 25-75 (R) y la fecha de la audiencia. Las notificaciones de intención que incluyan un testimonio técnico se archivarán de manera electrónica ante el Administrador de la Comisión en pamela.jones@env.nm.gov.

Las personas que deseen presentar un testimonio de refutación deberán presentar una NOI vía electrónica ante el Administrador de la Comisión a más tardar a las 5:00 p.m. el 28 de agosto de 2026. Las NOI de refutación deben incluir una narrativa del testimonio de refutación y los demás elementos requeridos de una NOI directa como se detalla en los puntos (1) a (5) anteriores.

Se entregará una copia impresa de todas las NOI para uso del funcionario de audiencias antes de las 12:00 p.m. el 25 de septiembre de 2026, a:

Pamela Jones,
Administradora de la Comisión
Comisión de Control de Calida del Agua
P.O. Box 5469
Santa Fe, NM 87502

El funcionario de audiencias se ofrecerá una oportunidad para el público haga comentarios cada día de la audiencia se llevará a cabo de acuerdo con 20.1.6.204 NMAC. Se reserva las oportunidades de comentarios públicos a las 4:00 p.m. cada día hasta la conclusión de la audiencia.

Los miembros del público que deseen ofrecer comentarios públicos no técnicos podrán hacerlo solo una vez, ya sea en persona o en la plataforma virtual con acceso proporcionado y administrado por el Administrador. Los comentarios públicos orales se limitan a 3 minutos; Los comentarios públicos escritos presentados al Administrador son ilimitados y deben recibirse antes del aplazamiento de la audiencia. Los comentarios públicos escritos podrán presentarse por vía electrónica o como un documento original único. Favor de enviar sus comentarios electrónicos por escrito sobre la norma propuesta antes del aplazamiento de la audiencia a través del Portal de Comentarios Inteligentes en https://nmed.commentinput.com/comment/search o envíe un correo electrónico a pamela.jones@env.nm.gov con referencia a WQCC 25-75 (R).

El NMED utilizó una variedad de información técnica con el objetivo de respaldar la norma propuesta, incluyendo datos de monitoreo del NMED, documentos de orientación de la Sección 304(a) de CWA, listas integradas/informes integrados de CWA 303(d)/305(b) anteriores y estudios de peces. La norma propuesta puede revisarse durante el horario laboral habitual en la Oficina de Calidad del Agua Superficial del NMED, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, en los oficinas exteriores del NMED, o en el sitio web del NMED en https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. Si desea obtener copias de la norma propuesta, información técnicos, o preguntas acerca de la participación en la audiencia, comuníquese con Michael Baca al (505) 470-1652 o michael.baca1@env.nm.gov o Pamela Jones al (505) 660-4305 o pamela.jones@env.nm.gov.

Los individuos que requieran asistencia, un intérprete o cualquier otra forma de ayuda o servicio auxiliar (es decir, un lector, amplificador, intérprete de lenguaje de señas calificado, etc.) para poder asistir o participar en la audiencia deben comunicarse con Pamela Jones a más tardar el 14 de septiembre de 2026 al (505) 660-4305 o pamela.jones@env.nm.gov.

El NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo requerido por las leyes y regulaciones aplicables. El NMED es responsable de coordinar los esfuerzos de cumplimiento y recibir consultas relacionadas con los requisitos de no discriminación implementados por 40 C.F.R. Partes 5 y 7, incluyendo el Título VI de la Ley de Derechos Civiles de 1964, tal como estuviere modificada; Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, el Título IX de las Enmiendas a la Educación de 1972 y la Sección 13 de las Enmiendas a la Ley Federal de Control de la Contaminación del Agua de 1972. Si tiene alguna pregunta sobre este aviso o cualquiera de los programas, políticas o procedimientos de no discriminación del NMED, puede comunicarse con: Kate Cardenas, Coordinadora de No Discriminación del NMED, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 o nd.coordinator@env.nm.gov. Si cree que ha sido discriminado con respecto a un programa o actividad del NMED, comuníquese con la Coordinadora de No Discriminación.

NMED Exhibit 14

NEW MEXICO WATER QUALITY CONTROL COMMISSION
NOTICE OF PUBLIC RULEMAKING HEARING

The New Mexico Water Quality Control Commission (Commission) will hold a public hearing beginning at 9:00 a.m. on September 28, 2026, and continuing through October 1, 2026, as necessary. The Commission may continue the hearing thereafter to hear all testimony, evidence, and public comments. The hearing will be held at the State Capitol Building, 490 Old Santa Fe Trail, Santa Fe, New Mexico 87501. Additionally, a virtual participation option will be provided with meeting links and details posted on the events calendar at https://www.env.nm.gov/events-calendar. The purpose of the hearing is to consider the docketed matter of WQCC 25-75 (R) to amend 20.6.4 NMAC, Standards for Interstate and Intrastate Surface Waters. The petitioner for this proposed regulatory change is the New Mexico Environment Department (NMED).

The federal Clean Water Act (CWA) requires states to evaluate existing water quality standards (WQS), consider new scientific information, provide public participation opportunities, and amend WQS as necessary, every three years. This process is commonly referred to as the Triennial Review and culminates in a public hearing. NMED proposed amendments in this matter based on public comments on 20.6.4 NMAC, communication with the Environmental Protection Agency (EPA), federal guidance documents, monitoring and fish data, as well as internal comments and implementation concerns. The amendments include new and revised definitions, clarification of third-party rulemaking procedures and costs, revisions to segment descriptions to match hydrological breaks, WQS for wetlands, clarification of implementation language, updated references, as well as new or revised designated uses, criteria, and antidegradation requirements.

The hearing will be conducted in accordance with the Water Quality Act, Sections 74-6-4 and 74-6-6 NMSA 1978, the State Rules Act, Section 14-4-5.3 NMSA 1978, 20.1.6 NMAC (Rulemaking Procedures – Water Quality Control Commission), the Pre-Hearing Order for WQCC 25-75 (R), and other applicable procedures and authorities. The Commission may make a decision on the proposed rule at the conclusion of the hearing.

All interested persons will be given reasonable opportunity at the hearing to submit data, views or arguments orally or in writing, and examine witnesses testifying at the hearing. Persons wishing to present technical testimony must file a written notice of intent (NOI) with the Commission. The NOI shall:

(1) identify the person for whom the witness(es) will testify;
(2) identify each technical witness the person intends to present and state the qualifications of that witness, including a description of their educational and work background;
(3) include a copy of the direct testimony of each technical witness in narrative form;
(4) include the text of any recommended modifications to the proposed regulatory change; and
(5) list and attach all exhibits anticipated to be offered by that person at the hearing, including any proposed statement of reasons for adoption of rules.

Entries of appearance and NOIs for direct testimony must be filed with the Commission Administrator no later than 5:00 p.m. on July 30, 2026, and should reference the docket number, WQCC 25-75 (R), and the date of the hearing. Notices of intent to present technical testimony shall be filed electronically with the Commission Administrator at pamela.jones@env.nm.gov.

Persons wishing to present rebuttal testimony, shall file an NOI electronically with the Commission Administrator no later than 5:00 p.m. on August 28, 2026. Rebuttal NOIs should include a narrative of rebuttal testimony and the other required elements of a direct NOI, as detailed in items (1) – (5) above.

One paper copy of all NOIs for the Hearing Officer's use shall be delivered by 12:00 p.m. (noon) on September 25, 2026, to:

Pamela Jones, Commission Administrator
Water Quality Control Commission
P.O. Box 5469
Santa Fe, NM 87502

The Hearing Officer will provide an opportunity for non-technical public comment each day of the hearing in a manner that accommodates the public pursuant to 20.1.6.204 NMAC. Public comment sessions will be reserved for 4:00 p.m. each day, until the close of the hearing record.

Members of the public wishing to offer non-technical public comment may do so only once either in person or on the virtual platform with access provided and managed by the Administrator. Oral public comment is limited to 3 minutes; written public comment submitted to the Administrator is unlimited and must be received prior to adjournment of the hearing. Written public comments may be submitted electronically or as a single original document to the Administrator at the above address. Please submit electronic written comments regarding the proposed rule prior to adjournment of the hearing via the Smart Comment Portal at https://nmed.commentinput.com/comment/search or through email to pamela.jones@env.nm.gov with reference to WQCC 25-75 (R).

NMED based the proposed rule on a variety of technical information, including NMED monitoring data , CWA Section 304(a) guidance documents, past CWA 303(d)/305(b) Integrated Lists/Integrated Reports, and fish surveys. The proposed rule may be reviewed during regular business hours at the NMED Surface Water Quality Bureau, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, at NMED Field Offices, or on NMED's web site at https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. For copies of the proposed rule, how to obtain technical information, or questions about participating in the hearing, please contact Michael Baca at (505) 470-1652 or michael.baca1@env.nm.gov or Pamela Jones at (505) 660-4305 or pamela.jones@env.nm.gov.

Persons requiring assistance, an interpreter, or any other form of auxiliary aid or service (i.e., reader, amplifier, qualified sign language interpreter, etc.) to attend or participate in the hearing should contact Pamela Jones no later than September 14, 2026 at (505) 660-4305 or pamela.jones@env.nm.gov.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non- discrimination programs, policies or procedures, you may contact: Kate Cardenas, NMED Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 or nd.coordinator@env.nm.gov. If you believe that you have been discriminated against with respect to an NMED program or activity, please contact the Non-Discrimination Coordinator.

COMISION DE CONTROL DE CALIDAD DEL AGUA DE NUEVO MEXICO
AVISO DE AUDIENCIA PÚBLICA DE REGLAMENTACIÓN

La Comisión de Control de Calidad del Agua de Nuevo México (la Comisión) celebrará una audiencia pública la cual comenzará a las 9:00 a.m. del 28 de septiembre de 2026 y continuará hasta el 1 de octubre de 2026, según sea necesario. La Comisión podrá continuar la audiencia posteriormente con el fin de escuchar todos los testimonios, pruebas y comentarios públicos. La audiencia se llevará a cabo en el edificio del Capitolio del Estado, 490 Old Santa Fe Trail, Santa Fe, Nuevo México 87501. Además, habrá disponible una opción de participación virtual con enlaces a las reuniones e información publicados en el calendario de eventos en https://www.env.nm.gov/events-calendar. El propósito de la audiencia es considerar el asunto registrado en WQCC 25-75 (R) con el objetivo de enmendar 20.6.4 NMAC, Estándares de Aguas Superficiales Interestatales e Intraestatales. El peticionario de esta enmienda regulatoria propuesta es el Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés).

La Ley de Agua Limpia (CWA) federal exige que los estados evalúen los estándares de calidad del agua (WQS) existentes, consideren la información científica más reciente, brinden oportunidades de participación pública y modifiquen los WQS según sea necesario, cada tres años. Este proceso se conoce generalmente como Revisión Trienal y culmina con una audiencia pública. El NMED propuso enmiendas en este asunto con base en comentarios públicos sobre 20.6.4 NMAC, comunicado con la Agencia de Protección Ambiental (EPA, por sus siglas en inglés), documentos de orientación federales, datos de peces y monitoreo, así como los comentarios internos y preocupaciones sobre la implementación. Las enmiendas incluyen definiciones nuevas y revisadas, aclaración de los procedimientos y costos de la reglamentación de terceros, revisiones de las descripciones de los segmentos con el fin de que coincidan con las rupturas hidrológicas, los WQS correspondientes a los humedales, la aclaración del lenguaje de implementación, las referencias actualizadas, así como los usos designados, criterios y requisitos de anti-degradación nuevos o revisados.

La audiencia se llevará a cabo de acuerdo con la Ley de Calidad del Agua, Secciones 74-6-4 y 74-6-6 NMSA 1978, Ley de Reglas Estatales, Sección 14-4-5.3 NMSA 1978, 20.1.6 NMAC, Procedimientos de Reglamentación – Comisión de Control de Calidad del Agua, la Orden previa a la audiencia para WQCC 25-75 (R) y otros procedimientos y autoridades aplicables. La Comisión puede decidir sobre la norma propuesta al concluir la audiencia.

A todas las personas interesadas se les dará una oportunidad razonable durante la audiencia para presentar datos, puntos de vista o argumentos de forma oral o por escrito, y examinar a los testigos que testifiquen en la audiencia. Las personas que deseen presentar un testimonio técnico deben presentar una notificación de intención (NOI) por escrito ante la Comisión. La NOI deberá:

(1) identificar a la persona por quien los testigos testificarán;
(2) identificar cada testigo técnico que la persona pretende presentar y declarar las calificaciones de ese testigo, incluyendo una descripción de sus antecedentes educativos y laborales;
(3) incluir una copia del testimonio directo de cada testigo técnico en forma narrativa;
(4) incluir el texto de cualquier modificación recomendada al cambio regulatorio propuesto; y
(5) enumerar y adjuntar todas las pruebas que se prevé que ofrecerá esa persona en la audiencia, incluyendo cualquier declaración propuesta de motivos para la adopción de reglas.

Las anotaciones de comparecencia y las NOI para un testimonio directo deben ser recibidas por el Administrador de la Comisión a más tardar a las 5:00 p.m. el 30 de julio de 2026, y debe hacer referencia al número de expediente, WQCC 25-75 (R) y la fecha de la audiencia. Las notificaciones de intención que incluyan un testimonio técnico se archivarán de manera electrónica ante el Administrador de la Comisión en pamela.jones@env.nm.gov.

Las personas que deseen presentar un testimonio de refutación deberán presentar una NOI vía electrónica ante el Administrador de la Comisión a más tardar a las 5:00 p.m. el 28 de agosto de 2026. Las NOI de refutación deben incluir una narrativa del testimonio de refutación y los demás elementos requeridos de una NOI directa como se detalla en los puntos (1) a (5) anteriores.

Se entregará una copia impresa de todas las NOI para uso del funcionario de audiencias antes de las 12:00 p.m. el 25 de septiembre de 2026, a:

Pamela Jones, Administradora de la Comisión
Comisión de Control de Calida del Agua
P.O. Box 5469
Santa Fe, NM 87502

El funcionario de audiencias se ofrecerá una oportunidad para el público haga comentarios cada día de la audiencia se llevará a cabo de acuerdo con 20.1.6.204 NMAC. Se reserva las oportunidades de comentarios públicos a las 4:00 p.m. cada día hasta la conclusión de la audiencia.

Los miembros del público que deseen ofrecer comentarios públicos no técnicos podrán hacerlo solo una vez, ya sea en persona o en la plataforma virtual con acceso proporcionado y administrado por el Administrador. Los comentarios públicos orales se limitan a 3 minutos; Los comentarios públicos escritos presentados al Administrador son ilimitados y deben recibirse antes del aplazamiento de la audiencia. Los comentarios públicos escritos podrán presentarse por vía electrónica o como un documento original único. Favor de enviar sus comentarios electrónicos por escrito sobre la norma propuesta antes del aplazamiento de la audiencia a través del Portal de Comentarios Inteligentes en https://nmed.commentinput.com/comment/search o envíe un correo electrónico a pamela.jones@env.nm.gov con referencia a WQCC 25-75 (R).

El NMED utilizó una variedad de información técnica con el objetivo de respaldar la norma propuesta, incluyendo datos de monitoreo del NMED, documentos de orientación de la Sección 304(a) de CWA, listas integradas/informes integrados de CWA 303(d)/305(b) anteriores y estudios de peces. La norma propuesta puede revisarse durante el horario laboral habitual en la Oficina de Calidad del Agua Superficial del NMED, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, en los oficinas exteriores del NMED, o en el sitio web del NMED en https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. Si desea obtener copias de la norma propuesta, información técnicos, o preguntas acerca de la participación en la audiencia, comuníquese con Michael Baca al (505) 470-1652 o michael.baca1@env.nm.gov o Pamela Jones al (505) 660-4305 o pamela.jones@env.nm.gov.

Los individuos que requieran asistencia, un intérprete o cualquier otra forma de ayuda o servicio auxiliar (es decir, un lector, amplificador, intérprete de lenguaje de señas calificado, etc.) para poder asistir o participar en la audiencia deben comunicarse con Pamela Jones a más tardar el 14 de septiembre de 2026 al (505) 660-4305 o pamela.jones@env.nm.gov.

El NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo requerido por las leyes y regulaciones aplicables. El NMED es responsable de coordinar los esfuerzos de cumplimiento y recibir consultas relacionadas con los requisitos de no discriminación implementados por 40 C.F.R. Partes 5 y 7, incluyendo el Título VI de la Ley de Derechos Civiles de 1964, tal como estuviere modificada; Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, el Título IX de las Enmiendas a la Educación de 1972 y la Sección 13 de las Enmiendas a la Ley Federal de Control de la Contaminación del Agua de 1972. Si tiene alguna pregunta sobre este aviso o cualquiera de los programas, políticas o procedimientos de no discriminación del NMED, puede comunicarse con: Kate Cardenas, Coordinadora de No Discriminación del NMED, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 o nd.coordinator@env.nm.gov. Si cree que ha sido discriminado con respecto a un programa o actividad del NMED, comuníquese con la Coordinadora de No Discriminación.

NEW MEXICO WATER QUALITY CONTROL COMMISSION NOTICE OF PUBLIC RULEMAKING HEARING

The New Mexico Water Quality Control Commission (Commission) will hold a public hearing beginning at 9:00 a.m. on September 28, 2026, and continuing through October 1, 2026, as necessary. The Commission may continue the hearing thereafter to hear all testimony, evidence, and public comments. The hearing will be held at the State Capitol Building, 490 Old Santa Fe Trail, Santa Fe, New Mexico 87501. Additionally, a virtual participation option will be provided with meeting links and details posted on the events calendar at https://www.env.nm.gov/events-calendar. The purpose of the hearing is to consider the docketed matter of WQCC 25-75 (R) to amend 20.6.4 NMAC, *Standards for Interstate and Intrastate Surface Waters.* The petitioner for this proposed regulatory change is the New Mexico Environment Department (NMED).

NMED Exhibit 14

The federal Clean Water Act (CWA) requires states to evaluate existing water quality standards (WQS), consider new scientific information, provide public participation opportunities, and amend WQS as necessary, every three years. This process is commonly referred to as the Triennial Review and culminates in a public hearing. NMED proposed amendments in this matter based on public comments on 20.6.4 NMAC, communication with the Environmental Protection Agency (EPA), federal guidance documents, monitoring and fish data, as well as internal comments and implementation concerns. The amendments include new and revised definitions, clarification of third-party rulemaking procedures and costs, revisions to segment descriptions to match hydrological breaks, WQS for wetlands, clarification of implementation language, updated references, as well as new or revised designated uses, criteria, and antidegradation requirements.

The hearing will be conducted in accordance with the Water Quality Act, Sections 74-6-4 and 74-6-6 NMSA 1978, the State Rules Act, Section 14-4-5.3 NMSA 1978, 20.1.6 NMAC (Rulemaking Procedures – Water Quality Control Commission), the Pre-Hearing

Order for WQCC 25-75 (R), and other applicable procedures and authorities. The Commission may make a decision on the proposed rule at the conclusion of the hearing.

All interested persons will be given reasonable opportunity at the hearing to submit data, views or arguments orally or in writing, and examine witnesses testifying at the hearing. Persons wishing to present technical testimony must file a written notice of intent (NOI) with the Commission. The NOI shall:

(1) identify the person for whom the witness(es) will testify;
(2) identify each technical witness the person intends to present and state the qualifications of that witness, including a description of their educational and work background;
(3) include a copy of the direct testimony of each technical witness in narrative form;
(4) include the text of any recommended modifications to the proposed regulatory change; and
(5) list and attach all exhibits anticipated to be offered by that person at the hearing, including any proposed statement of reasons for adoption of rules.

Entries of appearance and NOIs for direct testimony must be filed with the Commission Administrator no later than 5:00

Administrator no later than 5:00 p.m. on July 30, 2026, and should reference the docket number, WQCC 25-75 (R), and the date of the hearing. Notices of intent to present technical testimony shall be filed electronically with the Commission Administrator at pamela.jones@env.nm.gov.

Persons wishing to present rebuttal testimony, shall file an NOI electronically with the Commission Administrator no later than 5:00 p.m. on August 28, 2026. Rebuttal NOIs should include a narrative of rebuttal testimony and the other required elements of a direct NOI, as detailed in items (1) – (5) above.

One paper copy of all NOIs for the Hearing Officer's use shall be delivered by 12:00 p.m. (noon) on September 25, 2026, to:

Pamela Jones, Commission Administrator
Water Quality Control Commission
P.O. Box 5469
Santa Fe, NM 87502

The Hearing Officer will provide an opportunity for non-technical public comment each day of the hearing in a manner that accommodates the public pursuant to 20.1.6.204 NMAC. Public comment sessions will be reserved for 4:00 p.m. each day, until the close of the hearing record.

hearing record.

Members of the public wishing to offer non-technical public comment may do so only once either in person or on the virtual platform with access provided and managed by the Administrator. Oral public comment is limited to 3 minutes; written public comment submitted to the Administrator is unlimited and must be received prior to adjournment of the hearing. Written public comments may be submitted electronically or as a single original document to the Administrator at the above address. Please submit electronic written comments regarding the proposed rule prior to adjournment of the hearing via the Smart Comment Portal at https://nmed.commentinput.com/comment/search or through email to pamela.jones@env.nm.gov with reference to WQCC 25-75 (R).

NMED based the proposed rule on a variety of technical information, including NMED monitoring data , CWA Section 304(a) guidance documents, past CWA 303(d)/305(b) Integrated Lists/Integrated Reports, and fish surveys. The proposed rule may be reviewed during regular business hours at the NMED Surface Water Quality Bureau, 1190 St. Frances Dr., Suite N2000,

Santa Fe, NM 87505, at NMED Field Offices, or on NMED's web site at https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. For copies of the proposed rule, how to obtain technical information, or questions about participating in the hearing, please contact Michael Baca at (505) 470-1652 or michael.baca1@env.nm.gov or Pamela Jones at (505) 660-4305 or pamela.jones@env.nm.gov.

Persons requiring assistance, an interpreter, or any other form of auxiliary aid or service (i.e., reader, amplifier, qualified sign language interpreter, etc.) to attend or participate in the hearing should contact Pamela Jones no later than September 14, 2026 at (505) 660-4305 or pamela.jones@env.nm.gov.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975,

Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, you may contact: Kate Cardenas, NMED Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 or nd.coordinator@env.nm.gov. If you believe that you have been discriminated against with respect to an NMED program or activity, please contact the Non-Discrimination Coordinator.

COMISIÓN DE CONTROL DE CALIDAD DEL AGUA DE NUEVO MÉXICO
AVISO DE AUDIENCIA PÚBLICA DE REGLAMENTACIÓN

La Comisión de Control de Calidad del Agua de Nuevo México (la Comisión) celebrará una audiencia pública la cual comenzará a las 9:00 a.m. del 28 de septiembre de 2026 y continuará hasta el 1 de octubre de 2026, según sea necesario. La Comisión podrá continuar la audiencia posteriormente con el fin de escuchar todos los testimonios, pruebas y comentarios públicos. La audiencia se llevará a cabo en el edificio del Capitolio del Estado, 490 Old Santa Fe Trail, Santa Fe, Nuevo México 87501. Además, habrá disponible una opción de participación virtual con enlaces a las reuniones e información publicados en el calendario de eventos en https://www.env.nm.gov/events-calendar. El propósito de la audiencia es considerar el asunto registrado en WQCC 25-75 (R) con el objetivo de enmendar 20.6.4 NMAC,

Estándares de Aguas Superficiales Interestatales e Intraestatales. El peticionario de esta enmienda regulatoria propuesta es el Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés).

La Ley de Agua Limpia (CWA) federal exige que los estados evalúen los estándares de calidad del agua (WQS) existentes, consideren la información científica más reciente, brinden oportunidades de participación pública y modifiquen los WQS según sea necesario, cada tres años. Este proceso se conoce generalmente como Revisión Trienal y culmina con una audiencia pública. El NMED propuso enmiendas en este asunto con base en comentarios públicos sobre 20.6.4 NMAC, comunicado con la Agencia de Protección Ambiental (EPA, por sus siglas en inglés), documentos de orientación federales, datos de peces y monitoreo, así como los comentarios internos y preocupaciones sobre la implementación. Las enmiendas incluyen definiciones nuevas y revisadas, aclaración de los procedimientos y costos de la reglamentación de terceros, revisiones de las descripciones de los segmentos con el fin de que coincidan con las rupturas hidrológicas, los WQS correspondientes a los

humedales, la aclaración del lenguaje de implementación, las referencias actualizadas, así como los usos designados, criterios y requisitos de anti-degradación nuevos o revisados.

La audiencia se llevará a cabo de acuerdo con la Ley de Calidad del Agua, Secciones 74-6-4 y 74-6-6 NMSA 1978, Ley de Reglas Estatales, Sección 14-4-5.3 NMSA 1978, 20.1.6 NMAC, Procedimientos de Reglamentación – Comisión de Control de Calidad del Agua, la Orden previa a la audiencia para WQCC 25-75 (R) y otros procedimientos y autoridades aplicables. La Comisión puede decidir sobre la norma propuesta al concluir la audiencia.

A todas las personas interesadas se les dará una oportunidad razonable durante la audiencia para presentar datos, puntos de vista o argumentos de forma oral o por escrito, y examinar a los testigos que testifiquen en la audiencia. Las personas que deseen presentar un testimonio técnico deben presentar una notificación de intención (NOI) por escrito ante la Comisión. La NOI deberá:

(1) identificar a la persona por quien los testigos testificarán;
(2) identificar cada testigo técnico que la persona pretende presentar y declarar

pretende presentar y declarar las calificaciones de ese testigo, incluyendo una descripción de sus antecedentes educativos y laborales;
(3) incluir una copia del testimonio directo de cada testigo técnico en forma narrativa;
(4) incluir el texto de cualquier modificación recomendada al cambio regulatorio propuesto; y
(5) enumerar y adjuntar todas las pruebas que se prevé que ofrecerá esa persona en la audiencia, incluyendo cualquier declaración propuesta de motivos para la adopción de reglas.

Las anotaciones de comparecencia y las NOI para un testimonio directo deben ser recibidas por el Administrador de la Comisión a más tardar a las 5:00 p.m. el 30 de julio de 2026, y debe hacer referencia al número de expediente, WQCC 25-75 (R) y la fecha de la audiencia. Las notificaciones de intención que incluyan un testimonio técnico se archivarán de manera electrónica ante el Administrador de la Comisión en pamela.jones@env.nm.gov.

Las personas que deseen presentar un testimonio de refutación deberán presentar una NOI vía electrónica ante el Administrador de la Comisión a más tardar a las 5:00 p.m. el 28 de agosto de 2026. Las NOI de refutación deben incluir una

refutación deben incluir una narrativa del testimonio de refutación y los demás elementos requeridos de una NOI directa como se detalla en los puntos (1) a (5) anteriores.

Se entregará una copia impresa de todas las NOI para uso del funcionario de audiencias antes de las 12:00 p.m. el 25 de septiembre de 2026, a:

Pamela Jones, Administradora de la Comisión
Comisión de Control de Calida del Agua
P.O. Box 5469
Santa Fe, NM 87502

El funcionario de audiencias se ofrecerá una oportunidad para el público haga comentarios cada día de la audiencia se llevará a cabo de acuerdo con 20.1.6.204 NMAC. Se reserva las oportunidades de comentarios públicos a las 4:00 p.m. cada día hasta la conclusión de la audiencia.

Los miembros del público que deseen ofrecer comentarios públicos no técnicos podrán hacerlo solo una vez, ya sea en persona o en la plataforma virtual con acceso proporcionado y administrado por el Administrador. Los comentarios públicos orales se limitan a 3 minutos; Los comentarios públicos escritos presentados al Administrador son ilimitados y deben recibirse

antes del aplazamiento de la audiencia. Los comentarios públicos escritos podrán presentarse por vía electrónica o como un documento original único. Favor de enviar sus comentarios electrónicos por escrito sobre la norma propuesta antes del aplazamiento de la audiencia a través del Portal de Comentarios Inteligentes en https://nmed.commentinput.com/comment/search o envíe un correo electrónico a pamela.jones@env.nm.gov con referencia a WQCC 25-75 (R).

El NMED utilizó una variedad de información técnica con el objetivo de respaldar la norma propuesta, incluyendo datos de monitoreo del NMED, documentos de orientación de la Sección 304(a) de CWA, listas integradas/informes integrados de CWA 303(d)/305(b) anteriores y estudios de peces. La norma propuesta puede revisarse durante el horario laboral habitual en la Oficina de Calidad del Agua Superficial del NMED, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, en los oficinas exteriores del NMED, o en el sitio web del NMED en https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. Si desea obtener copias de la norma propuesta, información técnicos, o preguntas acerca de la participación en la audiencia,

comuníquese con Michael Baca al (505) 470-1652 o michael.baca1@env.nm.gov o Pamela Jones al (505) 660-4305 o pamela.jones@env.nm.gov.

Los individuos que requieran asistencia, un intérprete o cualquier otra forma de ayuda o servicio auxiliar (es decir, un lector, amplificador, intérprete de lenguaje de señas calificado, etc.) para poder asistir o participar en la audiencia deben comunicarse con Pamela Jones a más tardar el 14 de septiembre de 2026 al (505) 660-4305 o pamela.jones@env.nm.gov.

El NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo requerido por las leyes y regulaciones aplicables. El NMED es responsable de coordinar los esfuerzos de cumplimiento y recibir consultas relacionadas con los requisitos de no discriminación implementados por 40 C.F.R. Partes 5 y 7, incluyendo el Título VI de la Ley de Derechos Civiles de 1964, tal como estuviere modificada; Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, el Título IX de las Enmiendas a la Educación de 1972 y la Sección 13 de las Enmiendas a la Ley Federal de

Enmiendas de la Ley Federal de Control de la Contaminación del Agua de 1972. Si tiene alguna pregunta sobre este aviso o cualquiera de los programas, políticas o procedimientos de no discriminación del NMED, puede comunicarse con: Kate Cardenas, Coordinadora de No Discriminación del NMED, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 o nd.coordinator@env.nm.gov. Si cree que ha sido discriminado con respecto a un programa o actividad del NMED, comuníquese con la Coordinadora de No Discriminación.

STATE OF NEW MEXICO
COUNTY OF CHAVEZ
FIFTH JUDICIAL DISTRICT COURT

NG SOLUTIONS, LLC,

Plaintiff,

v. No. D-504-CV-2024-00397

DANIEL PORRAS, DREAMSPRING, INC., WESST CORP, INC., DAVID AMADOR BAIL BONDS, ONEMAIN FINANCIAL, INC., BANK OF THE SOUTHWEST N.A., SECRETARY OF HOUSING AND URBAN DEVELOPMENT NEW MEXICO DEPARTMENT OF WORKFORCE SOLUTIONS, and DIANA RAMIREZ,

Defendants.

NOTICE OF SALE

NOTICE IS HEREBY GIVEN that on July 8, 2026, at the hour of 11 :30am, the undersigned Special Master, David Washburn, or his designee, will, at the east entrance of the Chaves County Courthouse, at 400 N. Virginia Ave, Roswell, NM 88201, sell all of the rights, title, and interests of the above-named Defendant(s), in and to the hereinafter described real property to the highest bidder for cash. The property to be sold is located at 26 Mark Road, Roswell, NM 88201, and is more particularly described as follows:

S1/2SE1/4NE1/4SE1/4 OF SECTION 33, TOWNSHIP 10 SOUTH, RANGE 23 EAST, N.M.P.M., IN THE COUNTY OF CHAVES AND STATE OF NEW MEXICO

including any improvements, fixtures, and attachments, such as, but not limited to, mobile homes, (hereinafter the "Property"). If there is a conflict between the legal description and the street address, the legal description shall control.

The foregoing sale will be made to satisfy a foreclosure judgment rendered by this Court in the above-entitled and numbered cause on April 1 6, 2026 being an action to foreclose a mortgage on the Property. Plaintiffs judgment is in the amount of $341,692.57, and the same bears interest at the rate of 3.875% per annum, accruing at the rate of$36.28 per diem, from April 16, 2026 to the date of sale. The Court reserves entry of final judgment against Defendant(s), Daniel Porras, for the amount due after foreclosure sale, including interest, costs, and fees as may be assessed by the Court. Plaintiff has the right to bid at the foregoing sale in an amount equal to its judgment, and to submit its bid either verbally or in writing. Plaintiff may apply all or any part of its judgment to the purchase price in lieu of cash.

In accordance with the Court's decree, the proceeds of sale are to be applied first to the costs of sale, including the Special Master's fees, and then to satisfy the above-described judgment, including interest, with any remaining balance to be paid into the Court Registry in order to satisfy any future adjudication of priority lienholders.

NOTICE IS FURTHER GIVEN that in the event that the subject Note and Mortgage is not sooner paid off or reinstated, the undersigned Special Master will, as set forth above, offer for sale and sell the Property to the highest bidder for cash or equivalent, for the purpose of satisfying, in the adjudged order of priorities, the judgment and decree of foreclosure described herein, together with any additional costs and attorney's fees, including the costs of advertisement and publication for the foregoing sale, and, reasonable receiver and Special Master's fees in an amount to be fixed by the Court. The amount of Plaintiff's judgment due is $341,692.57, bearing interest at the rate of 3.875% per annum, accruing at the rate of $36.28 per diem, from April16, 2026 to the date of sale.

The foregoing sale may be postponed and rescheduled at the discretion of the Special Master, and is subject to all taxes, utility liens and other restrictions and easements of record, and subject to a one (1) month right of redemption held by the Defendant Daniel Porras upon entry of an order approving sale, and subject to the entry of an order of the Court approving the terms and conditions of sale.

Witness my hand this June 8, 2026.

NOTICE TO OFFERORS
CITY OF ROSWELL
RFP NO. 26-008
ON-CALL CONSTRUCTION SERVICES & REPAIRS

The City of Roswell, New Mexico, is soliciting sealed proposals from qualified construction contractors to establish on-call construction contracts for renovation, repair, new construction, remodeling, and related construction services for City-owned facilities and infrastructure.

The City of Roswell has transitioned to a new eBid/RFP software system powered by OpenGov. All solicitations will be released electronically through OpenGov, and responses must be submitted electronically through this online platform. By using OpenGov, prospective offerors will receive all information regarding the solicitation, including addenda and changes to project requirements. OpenGov is a free service for all respondents.

Prior to submitting a proposal, respondents are required to set up a free OpenGov account. Register your company and access the solicitation at the City's eProcurement Portal:
https://procurement.opengov.com/portal/roswellnm or through the City of Roswell website at: www.roswell-nm.gov > Business & Development > OpenGov.

Only electronically submitted proposals will be accepted; the system will not accept proposals submitted after the due date and time.

Proposals are due no later than 2:00 p.m. on Tuesday, July 21, 2026. All questions must be submitted through the OpenGov portal by 5:00 p.m. on Wednesday, July 8, 2026.

All proposals received are subject to approval by the appropriate governing authority. Notice is hereby given that the City reserves the right to reject any or all proposals received and to determine the proposal(s) that best serve the interests of the City of Roswell.

Meeting and Sale...

Publish June 18, 25, 2026

NOTICE OF SPECIAL MEETING AND SALE
DEXTER CONSOLIDATED SCHOOL DISTRICT NO. 8

PUBLIC NOTICE IS HEREBY GIVEN that the Board of Education of the Dexter Consolidated School District No. 8, Dexter, New Mexico ("Board"), will meet in special session at the School Board Room, Central Office, Dexter, New Mexico at 6:00 a.m. on July 6, 2026, to consider a resolution granting final approval of a lease-purchase arrangement for the lease-purchase of education technology equipment in an amount not to exceed $650,000 as authorized by the Education Technology Equipment Act, NMSA 1978, §§ 6-15A-1 through 6-15A-17 ("Act").

It is the present intention of the Board that the lease-purchase arrangement contemplated hereby will be entered into and issued at a private sale to the New Mexico Finance Authority ("Finance Authority"), and be structured pursuant to the recommendations of the District's Municipal Advisor. The terms of the Lease-Purchase Agreement, which will be utilized in the lease-purchase arrangement, are summarized as follows:

The Lease-Purchase Agreement amount shall be $650,000 payable at closing for the purchase of education technology equipment. Payments shall begin on August 1, 2027, and be paid annually thereafter until paid in full according to the following schedule provided that in no event shall the term of the Lease-Purchase Agreement exceed five years:

2027	$305,000
2028	85,000
2029	90,000
2030	90,000
2031	80,000

The interest component of such payments shall be paid at the rate not to exceed the maximum rate provided by law.

The source of the funds for the lease shall be derived from an annual levy of ad valorem taxes sufficient to meet the payments of principal and interest due, provided the District may apply any other funds that may be in its general fund or investment income actually received from investments and available for that purpose to the payments due.

The District covenants that the Lease-Purchase Agreement shall at all times be free from taxation by the State, except for estate or gift taxes and taxes on transfers.

NEW MEXICO WATER
QUALITY CONTROL COMMISSION
NOTICE OF PUBLIC RULEMAKING HEARING

The New Mexico Water Quality Control Commission (Commission) will hold a public hearing beginning at 9:00 a.m. on September 28, 2026, and continuing through October 1, 2026, as necessary. The Commission may continue the hearing thereafter to hear all testimony, evidence, and public comments. The hearing will be held at the State Capitol Building, 490 Old Santa Fe Trail, Santa Fe, New Mexico 87501. Additionally, a virtual participation option will be provided with meeting links and details posted on the events calendar at https://www.env.nm.gov/events-calendar. The purpose of the hearing is to consider the docketed matter of WQCC 25-75 (R) to amend 20.6.4 NMAC, Standards for Interstate and Intrastate Surface Waters. The petitioner for this proposed regulatory change is the New Mexico Environment Department (NMED).

The federal Clean Water Act (CWA) requires states to evaluate existing water quality standards (WQS), consider new scientific information, provide public participation opportunities, and amend WQS as necessary, every three years. This process is commonly referred to as the Triennial Review and culminates in a public hearing. NMED proposed amendments in this matter based on public comments on 20.6.4 NMAC, communication with the Environmental Protection Agency (EPA), federal guidance documents, monitoring and fish data, as well as internal comments and implementation concerns. The amendments include new and revised definitions, clarification of third-party rulemaking procedures and costs, revisions to segment descriptions to match hydrological breaks, WQS for wetlands, clarification of implementation language, updated references, as well as new or revised designated uses, criteria, and antidegradation requirements.

The hearing will be conducted in accordance with the Water Quality Act, Sections 74-6-4 and 74-6-6 NMSA 1978, the State Rules Act, Section 14-4-5.3 NMSA 1978, 20.1.6 NMAC (Rulemaking Procedures – Water Quality Control Commission), the Pre-Hearing Order for WQCC 25-75 (R), and other applicable procedures and authorities. The Commission may make a decision on the proposed rule at the conclusion of the hearing.

All interested persons will be given reasonable opportunity at the hearing to submit data, views or arguments orally or in writing, and examine witnesses testifying at the hearing. Persons wishing to present technical testimony must file a written notice of intent (NOI) with the Commission. The NOI shall:
(1) identify the person for whom the witness(es) will testify;
(2) identify each technical witness the person intends to present and state the qualifications of that witness, including a description of their educational and work background;
(3) include a copy of the direct testimony of each technical witness in narrative form;
(4) include the text of any recommended modifications to the proposed regulatory change; and
(5) list and attach all exhibits anticipated to be offered by that person at the hearing, including any proposed statement of reasons for adoption of rules.

Entries of appearance and NOIs for direct testimony must be filed with the Commission Administrator no later than 5:00 p.m. on July 30, 2026, and should reference the docket number, WQCC 25-75 (R), and the date of the hearing. Notices of intent to present technical testimony shall be filed electronically with the Commission Administrator at pamela.jones@env.nm.gov.

Persons wishing to present rebuttal testimony, shall file an NOI electronically with the Commission Administrator no later than 5:00 p.m. on August 28, 2026. Rebuttal NOIs should include a narrative of rebuttal testimony and the other required elements of a direct NOI, as detailed in items (1) – (5) above.

One paper copy of all NOIs for the Hearing Officer's use shall be delivered by 12:00 p.m. (noon) on September 25, 2026, to:

Pamela Jones, Commission Administrator
Water Quality Control Commission
P.O. Box 5469
Santa Fe, NM 87502

The Hearing Officer will provide an opportunity for non-technical public comment each day of the hearing in a manner that accommodates the public pursuant

LEGALS

to 20.1.6.204 NMAC. Public comment sessions will be reserved for 4:00 p.m. each day, until the close of the hearing record.

Members of the public wishing to offer non-technical public comment may do so only once either in person or on the virtual platform with access provided and managed by the Administrator. Oral public comment is limited to 3 minutes; written public comment submitted to the Administrator is unlimited and must be received prior to adjournment of the hearing. Written public comments may be submitted electronically or as a single original document to the Administrator at the above address. Please submit electronic written comments regarding the proposed rule prior to adjournment of the hearing via the Smart Comment Portal at https://nmed.commentinput.com/comment/search or through email to pamela.jones@env.nm.gov with reference to WQCC 25-75 (R).

NMED based the proposed rule on a variety of technical information, including NMED monitoring data , CWA Section 304(a) guidance documents, past CWA 303(d)/305(b) Integrated Lists/Integrated Reports, and fish surveys. The proposed rule may be reviewed during regular business hours at the NMED Surface Water Quality Bureau, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, at NMED Field Offices, or on NMED's web site at https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. For copies of the proposed rule, how to obtain technical information, or questions about participating in the hearing, please contact Michael Baca at (505) 470-1652 or michael.baca1@env.nm.gov or Pamela Jones at (505) 660-4305 or pamela.jones@env.nm.gov.

Persons requiring assistance, an interpreter, or any other form of auxiliary aid or service (i.e., reader, amplifier, qualified sign language interpreter, etc.) to attend or participate in the hearing should contact Pamela Jones no later than September 14, 2026 at (505) 660-4305 or pamela.jones@env.nm.gov.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non- discrimination programs, policies or procedures, you may contact: Kate Cardenas, NMED Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 or nd.coordinator@env.nm.gov. If you believe that you have been discriminated against with respect to an NMED program or activity, please contact the Non-Discrimination Coordinator.

Aviso de Audiencia...

Publicado el 25 de junio de 2026

COMISIÓN DE CONTROL DE CALIDAD DEL AGUA DE NUEVO MÉXICO
AVISO DE AUDIENCIA PÚBLICA DE REGLAMENTACIÓN

La Comisión de Control de Calidad del Agua de Nuevo México (la Comisión) celebrará una audiencia pública la cual comenzará a las 9:00 a.m. del 28 de septiembre de 2026 y continuará hasta el 1 de octubre de 2026, según sea necesario. La Comisión podrá continuar la audiencia posteriormente con el fin de escuchar todos los testimonios, pruebas y comentarios públicos. La audiencia se llevará a cabo en el edificio del Capitolio del Estado, 490 Old Santa Fe Trail, Santa Fe, Nuevo México 87501. Además, habrá disponible una opción de participación virtual con enlaces a las reuniones e información publicados en el calendario de eventos en https://www.env.nm.gov/events-calendar. El propósito de la audiencia es considerar el asunto registrado en WQCC 25-75 (R) con el objetivo de enmendar 20.6.4 NMAC, Estándares de Aguas Superficiales Interestatales e Intraestatales. El peticionario de esta enmienda regulatoria propuesta es el Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés).

La Ley de Agua Limpia (CWA) federal exige que los estados evalúen los estándares de calidad del agua (WQS) existentes, consideren la información científica más reciente, brinden oportunidades de participación pública y modifiquen los WQS según sea necesario, cada tres años. Este proceso se conoce generalmente como Revisión Trienal y culmina con una audiencia pública. El NMED propuso enmiendas en este asunto con base en comentarios públicos sobre 20.6.4 NMAC, comunicado con la Agencia de Protección Ambiental (EPA, por sus siglas en inglés), documentos de orientación federales, datos de peces y monitoreo, así como los comentarios internos y preocupaciones sobre la implementación. Las enmiendas incluyen definiciones nuevas y revisadas, aclaración de los procedimientos y costos de la reglamentación de terceros, revisiones de las descripciones de los segmentos con el fin de que coincidan con las rupturas hidrológicas, los WQS correspondientes a los humedales, la aclaración del lenguaje de implementación, las referencias actualizadas, así como los usos designados, criterios y requisitos de anti-degradación nuevos o revisados.

La audiencia se llevará a cabo de acuerdo con la Ley de Calidad del Agua, Secciones 74-6-4 y 74-6-6 NMSA 1978, Ley de Reglas Estatales, Sección 14-4-5.3 NMSA 1978, 20.1.6 NMAC, Procedimientos de Reglamentación – Comisión de Control de Calidad del Agua, la Orden previa a la audiencia para WQCC 25-75 (R) y otros procedimientos y autoridades aplicables. La Comisión puede decidir sobre la norma propuesta al concluir la audiencia.

A todas las personas interesadas se les dará una oportunidad razonable durante la audiencia para presentar datos, puntos de vista o argumentos de forma oral o por escrito, y examinar a los testigos que testifiquen en la audiencia. Las personas que deseen presentar un testimonio técnico deben presentar una notificación de intención (NOI) por escrito ante la Comisión. La NOI deberá:

(1) identificar a la persona por quien los testigos testificarán;
(2) identificar cada testigo técnico que la persona pretende presentar y declarar las calificaciones de ese testigo, incluyendo una descripción de sus antecedentes educativos y laborales;
(3) incluir una copia del testimonio directo de cada testigo técnico en forma narrativa;
(4) incluir el texto de cualquier modificación recomendada al cambio regulatorio propuesto; y
(5) enumerar y adjuntar todas las pruebas que se prevé que ofrecerá esa persona en la audiencia, incluyendo cualquier declaración propuesta de motivos para la adopción de reglas.

Las anotaciones de comparecencia y las NOI para un testimonio directo deben ser recibidas por el Administrador de la Comisión a más tardar a las 5:00 p.m. el 30 de julio de 2026, y debe hacer referencia al número de expediente, WQCC 25-75 (R) y la fecha de la audiencia. Las notificaciones de intención que incluyan un testimonio técnico se archivarán de manera electrónica ante el Administrador de la Comisión en pamela.jones@env.nm.gov.

Las personas que deseen presentar un testimonio de refutación deberán presentar una NOI vía electrónica ante el Administrador de la Comisión a más tardar a las 5:00 p.m. el 28 de agosto de 2026. Las NOI de refutación deben incluir una narrativa del testimonio de refutación y los demás elementos requeridos de una NOI directa como se detalla en los puntos (1) a (5) anteriores.

Se entregará una copia impresa de todas las NOI para uso del funcionario de audiencias antes de las 12:00 p.m. el 25 de septiembre de 2026, a:

Pamela Jones, Administradora de la Comisión
Comisión de Control de Calida del Agua
P.O. Box 5469
Santa Fe, NM 87502

El funcionario de audiencias se ofrecerá una oportunidad para el público haga comentarios cada día de la audiencia se llevará a cabo de acuerdo con 20.1.6.204 NMAC. Se reserva las oportunidades de comentarios públicos a las 4:00 p.m. cada día hasta la conclusión de la audiencia.

Los miembros del público que deseen ofrecer comentarios públicos no técnicos podrán hacerlo solo una vez, ya sea en persona o en la plataforma virtual con acceso proporcionado y administrado por el Administrador. Los comentarios públicos orales se limitan a 3 minutos; Los comentarios públicos escritos presentados al Administrador son ilimitados y deben recibirse antes del aplazamiento de la audiencia. Los comentarios públicos escritos podrán presentarse por vía electrónica o como un documento original único. Favor de enviar sus comentarios electrónicos por escrito sobre la norma propuesta antes del aplazamiento de la audiencia a través del Portal de Comentarios Inteligentes en https://nmed.commentinput.com/comment/search o envíe un correo electrónico a pamela.jones@env.nm.gov con referencia a WQCC 25-75 (R).

El NMED utilizó una variedad de información técnica con el objetivo de respaldar la norma propuesta, incluyendo datos de monitoreo del NMED, documentos de orientación de la Sección 304(a) de CWA, listas integradas/informes integrados de CWA 303(d)/305(b) anteriores y estudios de peces. La norma propuesta puede revisarse durante el horario laboral habitual en la Oficina de Calidad del Agua Superficial del NMED, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, en los oficinas exteriores del NMED, o en el sitio web del NMED en https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. Si desea obtener copias de la norma propuesta, información técnicos, o preguntas acerca de la participación en la audiencia, comuníquese con Michael Baca al (505) 470-1652 o michael.baca1@env.nm.gov o Pamela Jones al (505) 660-4305 o pamela.jones@env.nm.gov.

Los individuos que requieran asistencia, un intérprete o cualquier otra forma de ayuda o servicio auxiliar (es decir, un lector, amplificador, intérprete de lenguaje de señas calificado, etc.) para poder asistir o participar en la audiencia deben comunicarse con Pamela Jones a más tardar el 14 de septiembre de 2026 al (505) 660-4305 o pamela.jones@env.nm.gov.

El NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo requerido por las leyes y regulaciones aplicables. El NMED es responsable de coordinar los esfuerzos de cumplimiento y recibir consultas relacionadas con los requisitos de no discriminación implementados por 40 C.F.R. Partes 5 y 7, incluyendo el Título VI de la Ley de Derechos Civiles de 1964, tal como estuviere modificada; Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, el Título IX de las Enmiendas a la Educación de 1972 y la Sección 13 de las Enmiendas a la Ley Federal de Control de la Contaminación del Agua de 1972. Si tiene alguna pregunta sobre este aviso o cualquiera de los programas, políticas o procedimientos de no discriminación del NMED, puede comunicarse con: Kate Cardenas, Coordinadora de No Discriminación del NMED, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 o nd.coordinator@env.nm.gov. Si cree que ha sido discriminado con respecto a un programa o actividad del NMED, comuníquese con la Coordinadora de No Discriminación.

COMISIÓN DE CONTROL DE CALIDAD DEL AGUA DE NUEVO MÉXICO
AVISO DE AUDIENCIA PÚBLICA DE REGLAMENTACIÓN

La Comisión de Control de Calidad del Agua de Nuevo México (la Comisión) celebrará una audiencia pública la cual comenzará a las 9:00 a.m. del 28 de septiembre de 2026 y continuará hasta el 1 de octubre de 2026, según sea necesario. La Comisión podrá continuar la audiencia posteriormente con el fin de escuchar todos los testimonios, pruebas y comentarios públicos. La audiencia se llevará a cabo en el edificio del Capitolio del Estado, 490 Old Santa Fe Trail, Santa Fe, Nuevo México 87501. Además, habrá disponible una opción de participación virtual con enlaces a las reuniones e información publicados en el calendario de eventos en https://www.env.nm.gov/events-calendar. El propósito de la audiencia es considerar el asunto registrado en WQCC 25-75 (R) con el objetivo de enmendar 20.6.4 NMAC, Estándares de Aguas Superficiales Interestatales e Intraestatales. El peticionario de esta enmienda regulatoria propuesta es el Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés).

La Ley de Agua Limpia (CWA) federal exige que los estados evalúen los estándares de calidad del agua (WQS) existentes, consideren la información científica más reciente, brinden oportunidades de participación pública y modifiquen los WQS según sea necesario, cada tres años. Este proceso se conoce generalmente como Revisión Trienal y culmina con una audiencia pública. El NMED propuso enmiendas en este asunto con base en comentarios públicos sobre 20.6.4 NMAC, comunicado con la Agencia de Protección Ambiental (EPA, por sus siglas en inglés), documentos de orientación federales, datos de peces y monitoreo, así como los comentarios internos y preocupaciones sobre la implementación. Las enmiendas incluyen definiciones nuevas y revisadas, aclaración de los procedimientos y costos de la reglamentación de terceros, revisiones de las descripciones de los segmentos con el fin de que coincidan con las rupturas hidrológicas, los WQS correspondientes a los humedales, la aclaración del lenguaje de implementación, las referencias actualizadas, así como los usos designados, criterios y requisitos de anti-degradación nuevos o revisados.

La audiencia se llevará a cabo de acuerdo con la Ley de Calidad del Agua, Secciones 74-6-4 y 74-6-6 NMSA 1978, Ley de Reglas Estatales, Sección 14-4-5.3 NMSA 1978, 20.1.6 NMAC, Procedimientos de Reglamentación – Comisión de Control de Calidad del Agua, la Orden previa a la audiencia para WQCC 25-75 (R) y otros procedimientos y autoridades aplicables. La Comisión puede decidir sobre la norma propuesta al concluir la audiencia.

A todas las personas interesadas se les dará una oportunidad razonable durante la audiencia para presentar datos, puntos de vista o argumentos de forma oral o por escrito, y examinar a los testigos que testifiquen en la audiencia. Las personas que deseen presentar un testimonio técnico deben presentar una notificación de intención (NOI) por escrito ante la Comisión. La NOI deberá:

(1) identificar a la persona por quien los testigos testificarán;
(2) identificar cada testigo técnico que la persona pretende presentar y declarar las calificaciones de ese testigo, incluyendo una descripción de sus antecedentes educativos y laborales;
(3) incluir una copia del testimonio directo de cada testigo técnico en forma narrativa;
(4) incluir el texto de cualquier modificación recomendada al cambio regulatorio propuesto; y
(5) enumerar y adjuntar todas las pruebas que se prevé que ofrecerá esa persona en la audiencia, incluyendo cualquier declaración propuesta de motivos para la adopción de reglas.

Las anotaciones de comparecencia y las NOI para un testimonio directo deben ser recibidas por el Administrador de la Comisión a más tardar a las 5:00 p.m. el 30 de julio de 2026, y debe hacer referencia al número de expediente, WQCC 25-75 (R) y la fecha de la audiencia. Las notificaciones de intención que incluyan un testimonio técnico se archivarán de manera electrónica ante el Administrador de la Comisión en pamela.jones@env.nm.gov.

Las personas que deseen presentar un testimonio de refutación deberán presentar una NOI vía electrónica ante el Administrador de la Comisión a más tardar a las 5:00 p.m. el 28 de agosto de 2026. Las NOI de refutación deben incluir una narrativa del testimonio de refutación y los demás elementos requeridos de una NOI directa como se detalla en los puntos (1) a (5) anteriores.

Se entregará una copia impresa de todas las NOI para uso del funcionario de audiencias antes de las 12:00 p.m. el 25 de septiembre de 2026, a:

Pamela Jones, Administradora de la Comisión
Comisión de Control de Calida del Agua
P.O. Box 5469
Santa Fe, NM 87502

El funcionario de audiencias se ofrecerá una oportunidad para el público haga comentarios cada día de la audiencia se llevará a cabo de acuerdo con 20.1.6.204 NMAC. Se reserva las oportunidades de comentarios públicos a las 4:00 p.m. cada día hasta la conclusión de la audiencia.

Los miembros del público que deseen ofrecer comentarios públicos no técnicos podrán hacerlo solo una vez, ya sea en persona o en la plataforma virtual con acceso proporcionado y administrado por el Administrador. Los comentarios públicos orales se limitan a 3 minutos; Los comentarios públicos escritos presentados al Administrador son ilimitados y deben recibirse antes del aplazamiento de la audiencia. Los comentarios públicos escritos podrán presentarse por vía electrónica o como un documento original único. Favor de enviar sus comentarios electrónicos por escrito sobre la norma propuesta antes del aplazamiento de la audiencia a través del Portal de Comentarios Inteligentes en https://nmed.commentinput.com/comment/search o envíe un correo electrónico a pamela.jones@env.nm.gov con referencia a WQCC 25-75 (R).

El NMED utilizó una variedad de información técnica con el objetivo de respaldar la norma propuesta, incluyendo datos de monitoreo del NMED, documentos de orientación de la Sección 304(a) de CWA, listas integradas/informes integrados de CWA 303(d)/305(b) anteriores y estudios de peces. La norma propuesta puede revisarse durante el horario laboral habitual en la Oficina de Calidad del Agua Superficial del NMED, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, en los oficinas exteriores del NMED, o en el sitio web del NMED en https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. Si desea obtener copias de la norma propuesta, información técnicos, o preguntas acerca de la participación en la audiencia, comuníquese con Michael Baca al (505) 470-1652 o michael.baca1@env.nm.gov o Pamela Jones al (505) 660-4305 o pamela.jones@env.nm.gov.

Los individuos que requieran asistencia, un intérprete o cualquier otra forma de ayuda o servicio auxiliar (es decir, un lector, amplificador, intérprete de lenguaje de señas calificado, etc.) para poder asistir o participar en la audiencia deben comunicarse con Pamela Jones a más tardar el 14 de septiembre de 2026 al (505) 660-4305 o pamela.jones@env.nm.gov.

El NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo requerido por las leyes y regulaciones aplicables. El NMED es responsable de coordinar los esfuerzos de cumplimiento y recibir consultas relacionadas con los requisitos de no discriminación implementados por 40 C.F.R. Partes 5 y 7, incluyendo el Título VI de la Ley de Derechos Civiles de 1964, tal como estuviere modificada; Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, el Título IX de las Enmiendas a la Educación de 1972 y la Sección 13 de las Enmiendas a la Ley Federal de Control de la Contaminación del Agua de 1972. Si tiene alguna pregunta sobre este aviso o cualquiera de los programas, políticas o procedimientos de no discriminación del NMED, puede comunicarse con: Kate Cardenas, Coordinadora de No Discriminación del NMED, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 o nd.coordinator@env.nm.gov. Si cree que ha sido discriminado con respecto a un programa o actividad del NMED, comuníquese con la Coordinadora de No Discriminación.

COMISIÓN DE CONTROL DE CALIDAD DEL AGUA DE NUEVO MÉXICO AVISO DE AUDIENCIA PÚBLICA DE REGLAMENTACIÓN

La Comisión de Control de Calidad del Agua de Nuevo México (la Comisión) celebrará una audiencia pública la cual comenzará a las 9:00 a.m. del 28 de septiembre de 2026 y continuará hasta el 1 de octubre de 2026, según sea necesario. La Comisión podrá continuar la audiencia posteriormente con el fin de escuchar todos los testimonios,

NMED Exhibit 14

NEW MEXICO WATER QUALITY CONTROL COMMISSION
NOTICE OF PUBLIC RULEMAKING HEARING

The New Mexico Water Quality Control Commission (Commission) will hold a public hearing beginning at 9:00 a.m. on September 28, 2026, and continuing through October 1, 2026, as necessary. The Commission may continue the hearing thereafter to hear all testimony, evidence, and public comments. The hearing will be held at the State Capitol Building, 490 Old Santa Fe Trail, Santa Fe, New Mexico 87501. Additionally, a virtual participation option will be provided with meeting links and details posted on the events calendar at https://www.env.nm.gov/events-calendar. The purpose of the hearing is to consider the docketed matter of WQCC 25-75 (R) to amend 20.6.4 NMAC, *Standards for Interstate and Intrastate Surface Waters*. The petitioner for this proposed regulatory change is the New Mexico Environment Department (NMED).

The federal Clean Water Act (CWA) requires states to evaluate existing water quality standards (WQS), consider new scientific information, provide public participation opportunities, and amend WQS as necessary, every three years. This process is commonly referred to as the Triennial Review and culminates in a public hearing. NMED proposed amendments in this matter based on public comments on 20.6.4 NMAC, communication with the Environmental Protection Agency (EPA), federal guidance documents, monitoring and fish data, as well as internal comments and implementation concerns. The amendments include new and revised definitions, clarification of third-party rulemaking procedures and costs, revisions to segment descriptions to match hydrological breaks, WQS for wetlands, clarification of implementation language, updated references, as well as new or revised designated uses, criteria, and antidegradation requirements.

The hearing will be conducted in accordance with the Water Quality Act, Sections 74-6-4 and 74-6-6 NMSA 1978, the State Rules Act, Section 14-4-5.3 NMSA 1978, 20.1.6 NMAC (*Rulemaking Procedures – Water Quality Control Commission)*, the Pre-Hearing Order for WQCC 25-75 (R), and other applicable procedures and authorities. The Commission may make a decision on the proposed rule at the conclusion of the hearing.

All interested persons will be given reasonable opportunity at the hearing to submit data, views or arguments orally or in writing, and examine witnesses testifying at the hearing. Persons wishing to present technical testimony must file a written notice of intent (NOI) with the Commission. The NOI shall:

(1) identify the person for whom the witness(es) will testify;
(2) identify each technical witness the person intends to present and state the qualifications of that witness, including a description of their educational and work background;
(3) include a copy of the direct testimony of each technical witness in narrative form;
(4) include the text of any recommended modifications to the proposed regulatory change; and
(5) list and attach all exhibits anticipated to be offered by that person at the hearing, including any proposed statement of reasons for adoption of rules.

Entries of appearance and NOIs for direct testimony must be filed with the Commission Administrator no later than 5:00 p.m. on July 30, 2026, and should reference the docket number, WQCC 25-75 (R), and the date of the hearing. Notices of intent to present technical testimony shall be filed electronically with the Commission Administrator at pamela.jones@env.nm.gov.

Persons wishing to present rebuttal testimony, shall file an NOI electronically with the Commission Administrator no later than 5:00 p.m. on August 28, 2026. Rebuttal NOIs should include a narrative of rebuttal testimony and the other required elements of a direct NOI, as detailed in items (1) – (5) above.

One paper copy of all NOIs for the Hearing Officer's use shall be delivered by 12:00 p.m. (noon) on September 25, 2026, to:

Pamela Jones, Commission Administrator
Water Quality Control Commission
P.O. Box 5469
Santa Fe, NM 87502

The Hearing Officer will provide an opportunity for non-technical public comment each day of the hearing in a manner that accommodates the public pursuant to 20.1.6.204 NMAC. Public comment sessions will be reserved for 4:00 p.m. each day, until the close of the hearing record.

Members of the public wishing to offer non-technical public comment may do so only once either in person or on the virtual platform with access provided and managed by the Administrator. Oral public comment is limited to 3 minutes; written public comment submitted to the Administrator is unlimited and must be received prior to adjournment of the hearing. Written public comments may be submitted electronically or as a single original document to the Administrator at the above address. Please submit electronic written comments regarding the proposed rule prior to adjournment of the hearing via the Smart Comment Portal at https://nmed.commentinput.com/comment/search or through email to pamela.jones@env.nm.gov with reference to WQCC 25-75 (R).

NMED based the proposed rule on a variety of technical information, including NMED monitoring data , CWA Section 304(a) guidance documents, past CWA 303(d)/305(b) Integrated Lists/Integrated Reports, and fish surveys. The proposed rule may be reviewed during regular business hours at the NMED Surface Water Quality Bureau, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, at NMED Field Offices, or on NMED's web site at https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. For copies of the proposed rule, how to obtain technical information, or questions about participating in the hearing, please contact Michael Baca at (505) 470-1652 or michael.baca1@env.nm.gov or Pamela Jones at (505) 660-4305 or pamela.jones@env.nm.gov.

Persons requiring assistance, an interpreter, or any other form of auxiliary aid or service (i.e., reader, amplifier, qualified sign language interpreter, etc.) to attend or participate in the hearing should contact Pamela Jones no later than September 14, 2026 at (505) 660-4305 or pamela.jones@env.nm.gov.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non- discrimination programs, policies or procedures, you may contact: Kate Cardenas, NMED Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 or nd.coordinator@env.nm.gov. If you believe that you have been discriminated against with respect to an NMED program or activity, please contact the Non-Discrimination Coordinator.

COMISIÓN DE CONTROL DE CALIDAD DEL AGUA DE NUEVO MÉXICO
AVISO DE AUDIENCIA PÚBLICA DE REGLAMENTACIÓN

La Comisión de Control de Calidad del Agua de Nuevo México (la Comisión) celebrará una audiencia pública la cual comenzará a las 9:00 a.m. del 28 de septiembre de 2026 y continuará hasta el 1 de octubre de 2026, según sea necesario. La Comisión podrá continuar la audiencia posteriormente con el fin de escuchar todos los testimonios, pruebas y comentarios públicos. La audiencia se llevará a cabo en el edificio del Capitolio del Estado, 490 Old Santa Fe Trail, Santa Fe, Nuevo México 87501. Además, habrá disponible una opción de participación virtual con enlaces a las reuniones e información publicados en el calendario de eventos en https://www.env.nm.gov/events-calendar. El propósito de la audiencia es considerar el asunto registrado en WQCC 25-75 (R) con el objetivo de enmendar 20.6.4 NMAC, *Estándares de Aguas Superficiales Interestatales e Intraestatales*. El peticionario de esta enmienda regulatoria propuesta es el Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés).

La Ley de Agua Limpia (CWA) federal exige que los estados evalúen los estándares de calidad del agua (WQS) existentes, consideren la información científica más reciente, brinden oportunidades de participación pública y modifiquen los WQS según sea necesario, cada tres años. Este proceso se conoce generalmente como Revisión Trienal y culmina con una audiencia pública. El NMED propuso enmiendas en este asunto con base en comentarios públicos sobre 20.6.4 NMAC, comunicado con la Agencia de Protección Ambiental (EPA, por sus siglas en inglés), documentos de orientación federales, datos de peces y monitoreo, así como los comentarios internos y preocupaciones sobre la implementación. Las enmiendas incluyen definiciones nuevas y revisadas, aclaración de los procedimientos y costos de la reglamentación de terceros, revisiones de las descripciones de los segmentos con el fin de que coincidan con las rupturas hidrológicas, los WQS correspondientes a los humedales, la aclaración del lenguaje de implementación, las referencias actualizadas, así como los usos designados, criterios y requisitos de anti-degradación nuevos o revisados.

La audiencia se llevará a cabo de acuerdo con la Ley de Calidad del Agua, Secciones 74-6-4 y 74-6-6 NMSA 1978, Ley de Reglas Estatales, Sección 14-4-5.3 NMSA 1978, 20.1.6 NMAC, *Procedimientos de Reglamentación – Comisión de Control de Calidad del Agua*, la Orden previa a la audiencia para WQCC 25-75 (R) y otros procedimientos y autoridades aplicables. La Comisión puede decidir sobre la norma propuesta al concluir la audiencia.

A todas las personas interesadas se les dará una oportunidad razonable durante la audiencia para presentar datos, puntos de vista o argumentos de forma oral o por escrito, y examinar a los testigos que testifiquen en la audiencia. Las personas que deseen presentar un testimonio técnico deben presentar una notificación de intención (NOI) por escrito ante la Comisión. La NOI deberá:

(1) identificar a la persona por quien los testigos testificarán;
(2) identificar cada testigo técnico que la persona pretende presentar y declarar las calificaciones de ese testigo, incluyendo una descripción de sus antecedentes educativos y laborales;
(3) incluir una copia del testimonio directo de cada testigo técnico en forma narrativa;
(4) incluir el texto de cualquier modificación recomendada al cambio regulatorio propuesto; y
(5) enumerar y adjuntar todas las pruebas que se prevé que ofrecerá esa persona en la audiencia, incluyendo cualquier declaración propuesta de motivos para la adopción de reglas.

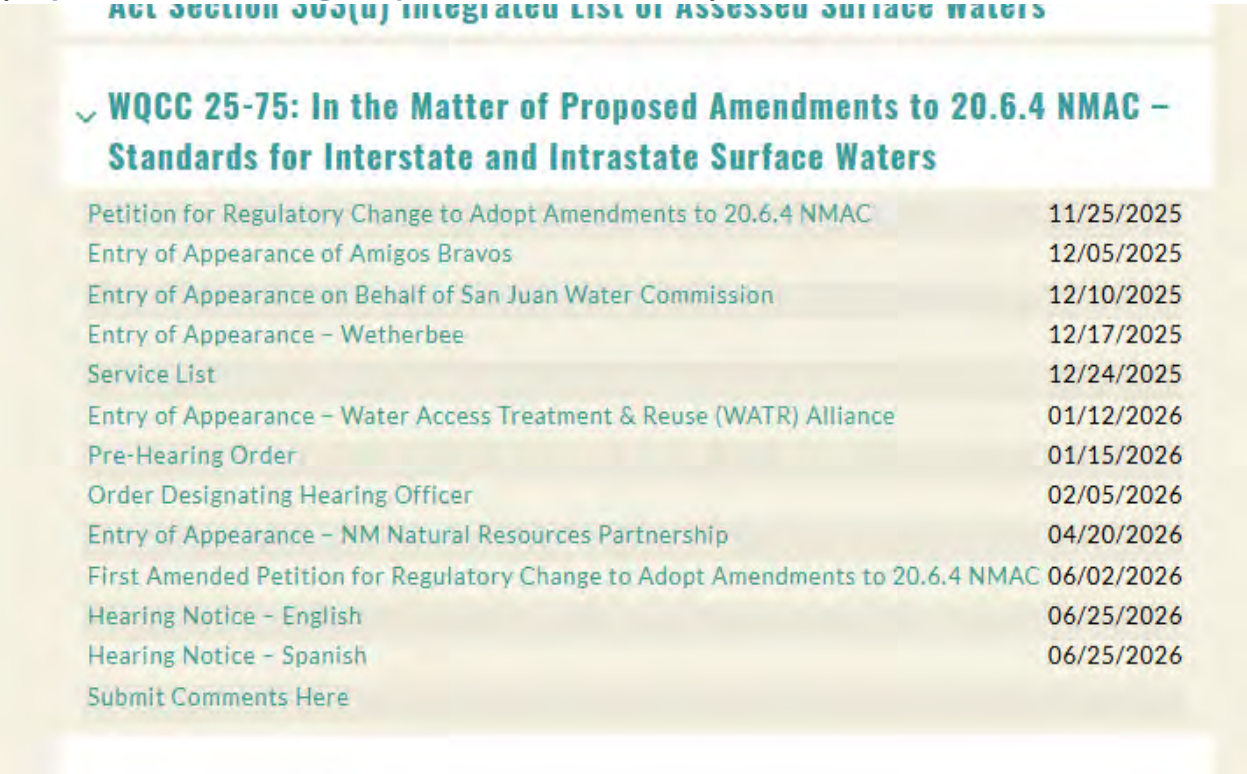
Las anotaciones de comparecencia y las NOI para un testimonio directo deben ser recibidas por el Administrador de la Comisión a más tardar a las 5:00 p.m. el 30 de julio de 2026, y debe hacer referencia al número de expediente, WQCC 25-75 (R) y la fecha de la audiencia. Las notificaciones de intención que incluyan un testimonio técnico se archivarán de manera electrónica ante el Administrador de la Comisión en pamela.jones@env.nm.gov.

Las personas que deseen presentar un testimonio de refutación deberán presentar una NOI vía electrónica ante el Administrador de la Comisión a más tardar a las 5:00 p.m. el 28 de agosto de 2026. Las NOI de refutación deben incluir una narrativa del testimonio de refutación y los demás elementos requeridos de una NOI directa como se detalla en los puntos (1) a (5) anteriores.

Se entregará una copia impresa de todas las NOI para uso del funcionario de audiencias antes de las 12:00 p.m. el 25 de septiembre de 2026, a:

Pamela Jones, Administradora de la Comisión
Comisión de Control de Calida del Agua
P.O. Box 5469
Santa Fe, NM 87502

El funcionario de audiencias se ofrecerá una oportunidad para el público haga comentarios cada día de la audiencia se llevará a cabo de acuerdo con 20.1.6.204 NMAC. Se reserva las oportunidades de comentarios públicos a las 4:00 p.m. cada día hasta la conclusión de la audiencia.



Los miembros del público que deseen ofrecer comentarios públicos no técnicos podrán hacerlo solo una vez, ya sea en persona o en la plataforma virtual con acceso proporcionado y administrado por el Administrador. Los comentarios públicos orales se limitan a 3 minutos; Los comentarios públicos escritos presentados al Administrador son ilimitados y deben recibirse antes del aplazamiento de la audiencia. Los comentarios públicos escritos podrán presentarse por vía electrónica o como un documento original único. Favor de enviar sus comentarios electrónicos por escrito sobre la norma propuesta antes del aplazamiento de la audiencia a través del Portal de Comentarios Inteligentes en https://nmed.commentinput.com/comment/search o envíe un correo electrónico a pamela.jones@env.nm.gov con referencia a WQCC 25-75 (R).

El NMED utilizó una variedad de información técnica con el objetivo de respaldar la norma propuesta, incluyendo datos de monitoreo del NMED, documentos de orientación de la Sección 304(a) de CWA, listas integradas/informes integrados de CWA 303(d)/305(b) anteriores y estudios de peces. La norma propuesta puede revisarse durante el horario laboral habitual en la Oficina de Calidad del Agua Superficial del NMED, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, en las oficinas exteriores del NMED, o en el sitio web del NMED en https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. Si desea obtener copias de la norma propuesta, información técnicos, o preguntas acerca de la participación en la audiencia, comuníquese con Michael Baca al (505) 470-1652 o michael.baca1@env.nm.gov o Pamela Jones al (505) 660-4305 o pamela.jones@env.nm.gov.

Los individuos que requieran asistencia, un intérprete o cualquier otra forma de ayuda o servicio auxiliar (es decir, un lector, amplificador, intérprete de lenguaje de señas calificado, etc.) para poder asistir o participar en la audiencia deben comunicarse con Pamela Jones a más tardar el 14 de septiembre de 2026 al (505) 660-4305 o pamela.jones@env.nm.gov.

El NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo requerido por las leyes y regulaciones aplicables. El NMED es responsable de coordinar los esfuerzos de cumplimiento y recibir consultas relacionadas con los requisitos de no discriminación implementados por 40 C.F.R. Partes 5 y 7, incluyendo el Título VI de la Ley de Derechos Civiles de 1964, tal como estuviere modificada; Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, el Título IX de las Enmiendas a la Educación de 1972 y la Sección 13 de las Enmiendas a la Ley Federal de Control de la Contaminación del Agua de 1972. Si tiene alguna pregunta sobre este aviso o cualquiera de los programas, políticas o procedimientos de no discriminación del NMED, puede comunicarse con: Kate Cardenas, Coordinadora de No Discriminación del NMED, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855 o nd.coordinator@env.nm.gov. Si cree que ha sido discriminado con respecto a un programa o actividad del NMED, comuníquese con la Coordinadora de No Discriminación.

MENU

2026 Triennial Review

In accordance with Section 303(c)(1) of the Clean Water Act and 20.6.4.10 New Mexico Administrative Code, states are required to hold public hearings at least once every three years to review water quality standards, as applicable. This is referred to as a "Triennial Review. Pursuant to Section 74-6-4(F) of the State's Water Quality Act, the Water Quality Control Commission delegated the New Mexico Environment Department the responsibility for organizing and proposing amendments to the surface water quality standards, codified under 20.6.4 NMAC. The U.S. Environmental Protection Agency approved the 2020 Triennial Review on January 20, 2023.

NMED released a Public Review Draft for the 2026 Triennial Review and accepted comments on the standards and proposed amendments from August 15, 2025 – October 14, 2025. Additionally, SWQB held a virtual public meeting on September 10, 2025. After considering public comment, NMED petitioned the WQCC at their December 09, 2025 regular meeting. The WQCC granted the petition and appointed a hearing officer to preside over a rulemaking hearing from September 28 – October 1, 2026. The hearing officer issued a Pre-hearing Order on January 15, 2026 to govern the proceeding and set a schedule for participation.

Please see the table below for important documents, links to more information and resources, and a link to NMED's events calendar. You may also sign up for the SWQB's email listserv at: https://www.env.nm.gov/surface-water-quality and click on the "Subscribe to SWQB News" button on the bottom of the home page. SWQB will be updating this website throughout the process with rulemaking information and notifying listserv subscribers about public participation opportunities and rulemaking actions related to the Triennial Review. For additional information, contact Michael Baca, WQS Coordinator, at michael.baca1@env.nm.gov or (505) 470-1652.

Please visit the WQCC Docketed Matters webpage for the official rulemaking record including pre-hearing orders, technical testimony, and exhibits.

Hello District Managers,

The Water Quality Control Commission is holding a Rulemaking Hearing for the Triennial Review of Water Quality Standards at 20.6.4 NMAC. We are "providing to the pubic" notice of the rulemaking through NMED's offices and need your help distributing the attached notices and proposed amendments. Please have staff post the notices in the district and field offices under your purview. The proposed rule should also be available for review if requested by the public. The material should be available through the end of the hearing, which is currently scheduled for October 1. Also, staff may direct the public to me or the Triennial Review website for more information or copies of materials.

Please let me know if you have any questions. As always, we appreciate EHB's assistance in this important matter.

Best,

Mike

Surface Water Quality Bureau

SWQB logo

Our mission is to preserve, protect, and improve New Mexico's surface water quality for present and future generations.

Oficina de Calidad de Aguas Superficiales

Nuestra misión es preservar, proteger y mejorar la calidad de las aguas superficiales de Nuevo México para las generaciones presentes y futuras.

The New Mexico Water Quality Control Commission (Commission) will hold a public hearing beginning at 9:00 a.m. on September 28, 2026, and continuing through October 1, 2026, as necessary. The Commission may continue the hearing thereafter to hear all testimony, evidence, and public comments. The hearing will be held at the State Capitol Building, 490 Old Santa Fe Trail, Santa Fe, New Mexico 87501. Additionally, a virtual participation option will be provided with meeting links and details posted on the events calendar at https://www.env.nm.gov/events-calendar. The purpose of the hearing is to consider the docketed matter of WQCC 25-75 (R) to amend 20.6.4 NMAC, *Standards for Interstate and Intrastate Surface Waters*. The petitioner for this proposed regulatory change is the New Mexico Environment Department (NMED).

The federal Clean Water Act (CWA) requires states to evaluate existing water quality standards (WQS), consider new scientific information, provide public participation opportunities, and amend WQS as necessary, every three years. This process is commonly referred to as the Triennial Review and culminates in a public hearing. NMED proposed amendments in this matter based on public comments on 20.6.4 NMAC, communication with the Environmental Protection Agency (EPA), federal guidance documents, monitoring and fish data, as well as internal comments and implementation concerns. The amendments include new and revised definitions, clarification of third-party rulemaking procedures and costs, revisions to segment descriptions to match hydrological breaks, WQS for wetlands, clarification of implementation language, updated references, as well as new or revised designated uses, criteria, and antidegradation requirements. NMED based the proposed rule on a variety of technical information, including NMED monitoring data , CWA Section 304(a) guidance documents, past CWA 303(d)/305(b) Integrated Lists/Integrated Reports, and fish surveys.

All interested persons will be given reasonable opportunity at the hearing to submit data, views or arguments orally or in writing, and examine witnesses testifying at the hearing.

The Hearing Officer will provide an opportunity for non-technical public comment each day of the hearing in a manner that accommodates the public pursuant to 20.1.6.204 NMAC. Public comment sessions will be reserved for 4:00 p.m. each day, until the close of the hearing record.

Members of the public wishing to offer non-technical public comment may do so only once either in person or on the virtual platform with access provided and managed by the Administrator. Oral public comment is limited to 3 minutes; written public comment submitted to the Administrator is unlimited and must be received prior to adjournment of the hearing. Written public comments may be submitted electronically or as a single original document to the Administrator at the above address. Please submit electronic written comments regarding the proposed rule prior to adjournment of the hearing via the Smart Comment Portal at https://nmed.commentinput.com/comment/search or through email to pamela.jones@env.nm.gov with reference to WQCC 25-75 (R).

Persons wishing to present technical testimony must file a written notice of intent (NOI) with the Commission. Entries of Appearance and NOIs for direct testimony must be filed with the Commission Administrator no later than 5:00 p.m. on July 30, 2026. The entire public notice of rulemaking and the proposed rule may be reviewed during regular business hours at the NMED Surface Water Quality Bureau, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, at NMED Field Offices, or on NMED's web site at https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. For copies of the proposed rule, how to obtain technical information, or questions about participating in the hearing, please contact Michael Baca at (505) 470-1652 or michael.baca1@env.nm.gov or Pamela Jones at (505) 660-4305 or pamela.jones@env.nm.gov.

Persons requiring assistance, an interpreter, or any other form of auxiliary aid or service (i.e., reader, amplifier, qualified sign language interpreter, etc.) to attend or participate in the hearing should contact Pamela Jones no later than September 14, 2026 at (505) 660-4305 or pamela.jones@env.nm.gov.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. La Comisión de Control de Calidad del Agua de Nuevo México (la Comisión) celebrará una audiencia pública la cual comenzará a las 9:00 a.m. del 28 de septiembre de 2026 y continuará hasta el 1 de octubre de 2026, según sea necesario. La Comisión podrá continuar la audiencia posteriormente con el fin de escuchar todos los testimonios, pruebas y comentarios públicos. La audiencia se llevará a cabo en el edificio del Capitolio del Estado, 490 Old Santa Fe Trail, Santa Fe, Nuevo México 87501. Además, habrá disponible una opción de participación virtual con enlaces a las reuniones e información publicados en el calendario de eventos en https://www.env.nm.gov/events-calendar. El propósito de la audiencia es considerar el asunto registrado en WQCC 25-75 (R) con el objetivo de enmendar 20.6.4 NMAC, *Estándares de Aguas Superficiales Interestatales e Intraestatales*. El peticionario de esta enmienda regulatoria propuesta es el Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés).

La Ley de Agua Limpia (CWA) federal exige que los estados evalúen los estándares de calidad del agua (WQS) existentes, consideren la información científica más reciente, brinden oportunidades de participación pública y modifiquen los WQS según sea necesario, cada tres años. Este proceso se conoce generalmente como Revisión Trienal y culmina con una audiencia pública. El NMED propuso enmiendas en este asunto con base en comentarios públicos sobre 20.6.4 NMAC, comunicado con la

Agencia de Protección Ambiental (EPA, por sus siglas en inglés), documentos de orientación federales, datos de peces y monitoreo, así como los comentarios internos y preocupaciones sobre la implementación. Las enmiendas incluyen definiciones nuevas y revisadas, aclaración de los procedimientos y costos de la reglamentación de terceros, revisiones de las descripciones de los segmentos con el fin de que coincidan con las rupturas hidrológicas, los WQS correspondientes a los humedales, la aclaración del lenguaje de implementación, las referencias actualizadas, así como los usos designados, criterios y requisitos de anti-degradación nuevos o revisados. El NMED utilizó una variedad de información técnica con el objetivo de respaldar la norma propuesta, incluyendo datos de monitoreo del NMED, documentos de orientación de la Sección 304(a) de CWA, listas integradas/informes integrados de CWA 303(d)/305(b) anteriores y estudios de peces.

A todas las personas interesadas se les dará una oportunidad razonable durante la audiencia para presentar datos, puntos de vista o argumentos de forma oral o por escrito, y examinar a los testigos que testifiquen en la audiencia.

El funcionario de audiencias se ofrecerá una oportunidad para el público haga comentarios cada día de la audiencia se llevará a cabo de acuerdo con 20.1.6.204 NMAC. Se reserva las oportunidades de comentarios públicos a las 4:00 p.m. cada día hasta la conclusión de la audiencia.

Los miembros del público que deseen ofrecer comentarios públicos no técnicos podrán hacerlo solo una vez, ya sea en persona o en la plataforma virtual con acceso proporcionado y administrado por el Administrador. Los comentarios públicos orales se limitan a 3 minutos; Los comentarios públicos escritos presentados al Administrador son ilimitados y deben recibirse antes del aplazamiento de la audiencia. Los comentarios públicos escritos podrán presentarse por vía electrónica o como un documento original único. Favor de enviar sus comentarios electrónicos por escrito sobre la norma propuesta antes del aplazamiento de la audiencia a través del Portal de Comentarios Inteligentes en https://nmed.commentinput.com/comment/search o envíe un correo electrónico a pamela.jones@env.nm.gov con referencia a WQCC 25-75 (R)

Las personas que deseen presentar un testimonio técnico deben presentar una notificación de intención (NOI) por escrito ante la Comisión. Las anotaciones de comparecencia y las NOI para un testimonio directo deben ser recibidas por el Administrador de la Comisión a más tardar a las 5:00 p.m. el 30 de julio de 2026. El aviso de audiencia pública completa y la norma propuesta puede revisarse durante el horario laboral habitual en la Oficina de Calidad del Agua Superficial del NMED, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, en las oficinas exteriores del NMED, o en el sitio web del NMED en https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. Si desea obtener copias de la norma propuesta, información técnicos, o preguntas acerca de la participación en la audiencia, comuníquese con Michael Baca al (505) 470-1652 o michael.baca1@env.nm.gov o Pamela Jones al (505) 660-4305 o pamela.jones@env.nm.gov.

Los individuos que requieran asistencia, un intérprete o cualquier otra forma de ayuda o servicio auxiliar (es decir, un lector, amplificador, intérprete de lenguaje de señas calificado, etc.) para poder asistir o participar en la audiencia deben comunicarse con Pamela Jones a más tardar el 14 de septiembre de 2026 al (505) 660-4305 o pamela.jones@env.nm.gov.

NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo exigen las leyes y regulaciones aplicables. NMED es responsable de la coordinación de los esfuerzos de cumplimiento y la recepción de consultas sobre los requisitos de no discriminación implementados por 40 C.F.R. Partes 5 y 7, incluido el Título VI de la Ley de Derechos Civiles de 1964, según enmendada; Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, el Título IX de las Enmiendas de Educación de 1972 y la Sección 13 de las Enmiendas de la Ley de Control de la Contaminación del Agua de 1972. The New Mexico Water Quality Control Commission (Commission) will hold a public hearing beginning at 9:00 a.m. on September 28, 2026, and continuing through October 1, 2026, as necessary. The Commission may continue the hearing thereafter to hear all testimony, evidence, and public comments. The hearing will be held at the State Capitol Building, 490 Old Santa Fe Trail, Santa Fe, New Mexico 87501. Additionally, a virtual participation option will be provided with meeting links and details posted on the events calendar at https://www.env.nm.gov/events-calendar. The purpose of the hearing is to consider the docketed matter of WQCC 25-75 (R) to amend 20.6.4 NMAC, *Standards for Interstate and Intrastate Surface Waters*. The petitioner for this proposed regulatory change is the New Mexico Environment Department (NMED).

The federal Clean Water Act (CWA) requires states to evaluate existing water quality standards (WQS), consider new scientific information, provide public participation opportunities, and amend WQS as necessary, every three years. This process is commonly referred to as the Triennial Review and culminates in a public hearing. NMED proposed amendments in this matter based on public comments on 20.6.4 NMAC, communication with the Environmental Protection Agency (EPA), federal guidance documents, monitoring and fish data, as well as internal comments and implementation concerns. The amendments include new and revised definitions, clarification of third-party rulemaking procedures and costs, revisions to segment descriptions to match hydrological breaks, WQS for wetlands, clarification of implementation language, updated references, as well as new or revised designated uses, criteria, and antidegradation requirements. NMED based the proposed rule on a variety of technical information, including NMED monitoring data , CWA Section 304(a) guidance documents, past CWA 303(d)/305(b) Integrated Lists/Integrated Reports, and fish surveys.

All interested persons will be given reasonable opportunity at the hearing to submit data, views or arguments orally or in writing, and examine witnesses testifying at the hearing.

The Hearing Officer will provide an opportunity for non-technical public comment each day of the hearing in a manner that accommodates the public pursuant to 20.1.6.204 NMAC. Public comment sessions will be reserved for 4:00 p.m. each day, until the close of the hearing record.

Members of the public wishing to offer non-technical public comment may do so only once either in person or on the virtual platform with access provided and managed by the Administrator. Oral public comment is limited to 3 minutes; written public comment submitted to the Administrator is unlimited and must be received prior to adjournment of the hearing. Written public comments may be submitted electronically or as a single original document to the Administrator at the above address. Please submit electronic written comments regarding the proposed rule prior to adjournment of the hearing via the Smart Comment Portal at https://nmed.commentinput.com/comment/search or through email to pamela.jones@env.nm.gov with reference to WQCC 25-75 (R).

Persons wishing to present technical testimony must file a written notice of intent (NOI) with the Commission. Entries of Appearance

and NOIs for direct testimony must be filed with the Commission Administrator no later than 5:00 p.m. on July 30, 2026. The entire public notice of rulemaking and the proposed rule may be reviewed during regular business hours at the NMED Surface Water Quality Bureau, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, at NMED Field Offices, or on NMED's web site at https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. For copies of the proposed rule, how to obtain technical information, or questions about participating in the hearing, please contact Michael Baca at (505) 470-1652 or michael.baca1@env.nm.gov or Pamela Jones at (505) 660-4305 or pamela.jones@env.nm.gov.

Persons requiring assistance, an interpreter, or any other form of auxiliary aid or service (i.e., reader, amplifier, qualified sign language interpreter, etc.) to attend or participate in the hearing should contact Pamela Jones no later than September 14, 2026 at (505) 660-4305 or pamela.jones@env.nm.gov.

La Comisión de Control de Calidad del Agua de Nuevo México (la Comisión) celebrará una audiencia pública la cual comenzará a las 9:00 a.m. del 28 de septiembre de 2026 y continuará hasta el 1 de octubre de 2026, según sea necesario. La Comisión podrá continuar la audiencia posteriormente con el fin de escuchar todos los testimonios, pruebas y comentarios públicos. La audiencia se llevará a cabo en el edificio del Capitolio del Estado, 490 Old Santa Fe Trail, Santa Fe, Nuevo México 87501. Además, habrá disponible una opción de participación virtual con enlaces a las reuniones e información publicados en el calendario de eventos en https://www.env.nm.gov/events-calendar. El propósito de la audiencia es considerar el asunto registrado en WQCC 25-75 (R) con el objetivo de enmendar 20.6.4 NMAC, *Estándares de Aguas Superficiales Interestatales e Intraestatales.* El peticionario de esta enmienda regulatoria propuesta es el Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés).

La Ley de Agua Limpia (CWA) federal exige que los estados evalúen los estándares de calidad del agua (WQS) existentes, consideren la información científica más reciente, brinden oportunidades de participación pública y modifiquen los WQS según sea necesario, cada tres años. Este proceso se conoce generalmente como Revisión Trienal y culmina con una audiencia pública. El NMED propuso enmiendas en este asunto con base en comentarios públicos sobre 20.6.4 NMAC, comunicado con la Agencia de Protección Ambiental (EPA, por sus siglas en inglés), documentos de orientación federales, datos de peces y monitoreo, así como los comentarios internos y preocupaciones sobre la implementación. Las enmiendas incluyen definiciones nuevas y revisadas, aclaración de los procedimientos y costos de la reglamentación de terceros, revisiones de las descripciones de los segmentos con el fin de que coincidan con las rupturas hidrológicas, los WQS correspondientes a los humedales, la aclaración del lenguaje de implementación, las referencias actualizadas, así como los usos designados, criterios y requisitos de anti-degradación nuevos o revisados. El NMED utilizó una variedad de información técnica con el objetivo de respaldar la norma propuesta, incluyendo datos de monitoreo del NMED, documentos de orientación de la Sección 304(a) de CWA, listas integradas/informes integrados de CWA 303(d)/305(b) anteriores y estudios de peces.

A todas las personas interesadas se les dará una oportunidad razonable durante la audiencia para presentar datos, puntos de vista o argumentos de forma oral o por escrito, y examinar a los testigos que testifiquen en la audiencia.

El funcionario de audiencias se ofrecerá una oportunidad para el público haga comentarios cada día de la audiencia se llevará a cabo de acuerdo con 20.1.6.204 NMAC. Se reserva las oportunidades de comentarios públicos a las 4:00 p.m. cada día hasta la conclusión de la audiencia.

Los miembros del público que deseen ofrecer comentarios públicos no técnicos podrán hacerlo solo una vez, ya sea en persona o en la plataforma virtual con acceso proporcionado y administrado por el Administrador. Los comentarios públicos orales se limitan a 3 minutos; Los comentarios públicos escritos presentados al Administrador son ilimitados y deben recibirse antes del aplazamiento de la audiencia. Los comentarios públicos escritos podrán presentarse por vía electrónica o como un documento original único. Favor de enviar sus comentarios electrónicos por escrito sobre la norma propuesta antes del aplazamiento de la audiencia a través del Portal de Comentarios Inteligentes en https://nmed.commentinput.com/comment/search o envíe un correo electrónico a pamela.jones@env.nm.gov con referencia a WQCC 25-75 (R).

Las personas que deseen presentar un testimonio técnico deben presentar una notificación de intención (NOI) por escrito ante la Comisión. Las anotaciones de comparecencia y las NOI para un testimonio directo deben ser recibidas por el Administrador de la Comisión a más tardar a las 5:00 p.m. el 30 de julio de 2026. El aviso de audiencia pública completa y la norma propuesta puede revisarse durante el horario laboral habitual en la Oficina de Calidad del Agua Superficial del NMED, 1190 St. Frances Dr., Suite N2000, Santa Fe, NM 87505, en las oficinas exteriores del NMED, o en el sitio web del NMED en https://www.env.nm.gov/surface-water-quality/2026-triennial-review/. Si desea obtener copias de la norma propuesta, información técnicos, o preguntas acerca de la participación en la audiencia, comuníquese con Michael Baca al (505) 470-1652 o michael.baca1@env.nm.gov o Pamela Jones al (505) 660-4305 o pamela.jones@env.nm.gov.

Los individuos que requieran asistencia, un intérprete o cualquier otra forma de ayuda o servicio auxiliar (es decir, un lector, amplificador, intérprete de lenguaje de señas calificado, etc.) para poder asistir o participar en la audiencia deben comunicarse con Pamela Jones a más tardar el 14 de septiembre de 2026 al (505) 660-4305 o pamela.jones@env.nm.gov.

Importance:	High

Good afternoon,

Thank you for providing comment on the Surface Water Quality Bureau's draft amendments to 20.6.4 NMAC for the 2026 Triennial Review (August 2025-Public Review Draft). We considered comments and at the end of last year, we successfully petitioned the Water Quality Control Commission (WQCC) for a rulemaking hearing that is scheduled to start at 9:00 am on September 28, 2026, at the State Capitol Building in Santa Fe. A virtual option will be available each day of the hearing with a link provided on NMED's events calendar.

After further consideration of comments, we filed an amended petition at the beginning of this month that included the current version of the proposed rule (attached). The WQCC is currently accepting written comment on the proposed rule through our Comment Portal or the Commission Administrator at pamela.jones@env.nm.gov. Oral public comment periods will be provided by the hearing officer at 4:00 p.m. each day of the hearing. Please keep in mind that all comments must be received by the WQCC before the adjournment of the hearing, which could occur earlier than the scheduled date of October 1. Finally, Entries of Appearance and NOIs are due to the Commission Administrator (pamela.jones@env.nm.gov) by July 30 at 5:00 p.m. Additional information and deadlines may apply, and full participation details should be consulted in the attached notices.

For more information about the rulemaking visit our 2026 Triennial Review webpage and the WQCC's Docketed Matters webpage. Please let me know if you have any questions or concerns regarding this hearing or if you would like to discuss any issues further.

Respectfully,

Michael Baca | WQS Coordinator

Good morning,

In accordance with the State Rules Act, please see the attached notice of rulemaking hearing and proposed amendments to 20.6.4 NMAC, *Standards for Interstate and Intrastate Surface Waters*. The hearing is scheduled to start at 9:00 am on September 28, 2026 at the Capitol Building (virtual available). The Surface Water Quality Bureau of the New Mexico Environment Department proposed the amendments as part of the federally required Triennial Review of Water Quality Standards. The amendments were the result of early public comments on draft amendments, communication with the Environmental Protection Agency, federal guidance documents, as well as internal data, comments, and concerns with implementation of the standards. For more information about the rulemaking please visit our 2026 Triennial Review webpage.

Please let me know if you have any questions or concerns regarding this rulemaking hearing.

Respectfully,

Michael Baca | WQS Coordinator

Attachments:	20.6.4 NMAC - 2026 TR Public Review Draft .pdf 2026 TR - Tribal Environmental Directors (Final).pdf
Importance:	High

Greetings Tribal Environmental Directors and Natural Resource Managers,

The New Mexico Environment Department (NMED) Surface Water Quality Bureau (SWQB) is initiating its Triennial Review of Water Quality Standards (WQS) at 20.6.4 NMAC. As required by the Clean Water Act every three years, the SWQB drafted amendments the WQS and we are holding a 60-day public comment period from August 15 – October 14, 2025. We plan on holding a public meeting regarding the Triennial Review on September 10, 2025 at 5:30 PM. The public meeting will be held virtually and may be accessed through this link: https://nmed-oit.webex.com/nmed-oit/j.php?MTID=mcef4d38bc6992f8d56094eb92a5cbe4d. Please see the attached letter, Public Review Draft, and our website (https://www.env.nm.gov/surface-water-quality/2026-triennial-review/) for more information.

The SWQB will consider all stakeholder feedback and comments and revise the draft amendments appropriately prior to petitioning for a rulemaking hearing. The SWQB plans on petitioning the Water Quality Control Commission in December 2025 for a summer/fall 2026 public rulemaking hearing.

Please note: *this action is separate from NMED SWQB efforts to develop a state permitting program*. If you have any questions or would like to schedule a meeting to discuss the Triennial Review, please do not hesitate to email or call. If you would like to stay informed regarding this or other SWQB actions or projects, please visit our website and subscribe to our email lists.

Respectfully,

Re: Notice of proposed amendments to 20.6.4 NMAC *Standards for Interstate and Intrastate Surface Waters*, Water Quality Control Commission Docketed Matter No. WQCC 25-75(R)

Dear Council Members,

The New Mexico Environment Department (NMED) has petitioned the Water Quality Control Commission (WQCC) proposing adoption of amendments to 20.6.4 NMAC, *Standards for Interstate and Intrastate Surface Waters*, as part of the Triennial Review as required by federal and state law. At its December 9, 2025 meeting, the WQCC granted a public hearing to hear NMED's proposal and docketed the matter as WQCC 25-75(R). NMED filed these proposed rule changes pursuant to Sections 74-6-4(R), 74-6-5, and 74-6-6 of the New Mexico Water Quality Act and 20.1.6.200 NMAC. NMED filed an amended petition with a revised proposed rule on June 2, 2026.

The federal Clean Water Act (CWA) requires states to evaluate existing water quality standards (WQS), consider new scientific information, provide public participation opportunities, and amend WQS as necessary, every three years. This process is commonly referred to as the Triennial Review and culminates in a public hearing. NMED proposed amendments in this matter based on early public comments on 20.6.4 NMAC, communication with the U.S. Environmental Protection Agency (EPA), federal guidance documents, monitoring and fish data, as well as internal comments and implementation concerns. The amendments include new and revised definitions, clarification of third-party rulemaking procedures and costs, revisions to segment descriptions to match hydrological breaks, WQS for wetlands, clarification of implementation language, updated references, as well as new or revised designated uses, criteria, and antidegradation requirements. NMED does not anticipate the proposed rules to have an adverse effect on small business, however, NMED has considered regulatory methods that accomplish the proposed rules' objectives while minimizing adverse effects on small business.

The public rulemaking hearing for this matter is scheduled for September 28 - October 1, 2026. The original petition, amended petition, proposed rules, pre-hearing order(s), entries of appearance, notices of intent to present testimony, public comments, and other related documents can be found on the WQCC Docketed matters webpage at: https://www.env.nm.gov/opf/docketed-matters/ under docketed matter

WQCC 25-75(R). The proposed rules and rulemaking timeline can also be found on a SWQB dedicated webpage at: https://www.env.nm.gov/surface-water-quality/2026-triennial-review/.

Pursuant to Section 14-4A-4 of the New Mexico Small Business Regulatory Relief Act, I have included a copy of the entire rule, including the proposed regulatory change to 20.6.4 NMAC attached to NMED's amended petition filed with the WQCC. Note that the WQCC may further amend this proposal as the rulemaking process moves forward and it considers adopting all parties proposed amendments and alternative regulatory language. Please let me know if SBRAC has any concerns or questions regarding the proposed rule change, or if they would like to have further discussions with NMED regarding the Surface Water Quality Bureau's 2026 Triennial Review.

Sincerely,

Brecken Scott

I. Introduction

a. Background

The objective of the Clean Water Act (CWA) is "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters."[1] Municipal discharges that violate the CWA can pose significant threats to public health and the environment. When a community is out of compliance with the CWA, the Agency's expectation is that the community will achieve compliance with the CWA as soon as practicable.[2] Financial capability is one of many factors EPA considers when evaluating schedules for implementation of long-term CWA control plans; the Agency also considers the need to expeditiously restore water quality in communities that may have suffered from years of CWA violations. The public health and environmental considerations that EPA assesses when developing CWA implementation schedules include environmental justice and mitigation of environmental and public health impacts in low-income and overburdened communities.

Communities, in consultation with regulators and the public, are responsible for evaluating and selecting pollution controls that will meet CWA requirements. EPA encourages communities to utilize integrated planning[3] and innovative technologies, such as green infrastructure,[4] to achieve CWA compliance in a timely, flexible, and cost-effective manner. After controls have been selected, a financial capability assessment (FCA) is used to aid in assessing a community's financial capability as a part of negotiating implementation schedules under both permits and enforcement agreements. Elements of the same methodology can also be used to understand the economic impacts of installing the pollution controls needed to meet CWA requirements to determine if a variance can be granted, if degradation of high-quality water is warranted, or, in some cases, if a designated use cannot be attained. The updated Financial Capability Assessment Guidance (FCA Guidance) is intended to: 1) standardize what EPA will generally consider when determining a community's financial capability to implement control measures needed to meet CWA requirements and 2) assist states and authorized tribes in assessing the degree of economic and social impact of potential water quality standards (WQS) decisions. It is not a methodology for defining water affordability.

The FCA Guidance sets forth two alternatives that communities can choose to employ to assess financial capability when negotiating compliance schedules. Alternative 1 considers metrics that measure the financial

[1] 33 U.S.C. § 1251.

[2] Compliance schedules included in NPDES permits must "require compliance as soon as possible, but not later than the applicable statutory deadline under the CWA." 40 C.F.R. § 122.47(a)(1). The CSO Control Policy requires that "each long-term CSO control plan . . . should [] include both fixed-date project implementation schedules (which may be phased) and a financing plan to design and construct the project as soon as practicable." 59 Fed. Reg. 18688, 18691 (April 19, 1994).

[3] For more information about integrated planning for municipal stormwater and wastewater, see https://www.epa.gov/npdes/integrated-planning-municipal-stormwater-and-wastewater.

[4] Section 502 of the CWA defines green infrastructure as "...the range of measures that use plant or soil systems, permeable pavement or other permeable surfaces or substrates, stormwater harvest and reuse, or landscaping to store, infiltrate, or evapotranspirate stormwater and reduce flows to sewer systems or to surface waters."

NMED Exhibit 18

impact of the current and proposed CWA controls on residential users, the financial capability of the community, and the lowest quintile income and poverty prevalence within the community's service area. Alternative 2 utilizes dynamic financial and rate models that evaluate the impacts of debt service on customer bills. Additional information such as a community's total water costs (i.e., costs for wastewater, stormwater, and drinking water infrastructure investment) may also be submitted and considered when negotiating the length of an implementation schedule for a community's CWA requirements.

Additionally, EPA recommends the application of the methodologies from Alternative 1 of the FCA Guidance for the consideration of economic impacts to public entities when making decisions on WQS variances and antidegradation reviews. In appropriate cases, these methodologies also inform decisions about revisions to designated uses, subject to additional analyses.

EPA is committed to working with state, tribal, local, and non-government partners to assist communities in meeting CWA requirements in a manner that recognizes unique local financial challenges. We strongly encourage additional subsidy or grant consideration from governmental funding sources for entities that are seeking extended schedules because of financial capability constraints. Federal funding initiatives and programs such as the Bipartisan Infrastructure Law (BIL), American Rescue Plan Act (ARPA), State Revolving Fund (SRF) loans, Water Infrastructure Finance and Innovation Act (WIFIA), and others provide billions of dollars for state, local, territorial, and tribal governments. The BIL has provided $11.7 billion in additional funds to the Clean Water State Revolving Fund (CWSRF). The state match requirement has been reduced to 10% for the first two years and 49% of the money will be provided as grants or principal forgiveness loans to communities. These resources create a historic opportunity for communities to address long-standing clean water needs.

EPA plans to work with communities to identify funding sources and financing strategies that can be used to reduce costs to complete necessary projects. In addition, state, local, and tribal governments' equitable support of communities with limited resources can help those communities meet the challenges of funding necessary water infrastructure improvements, especially where there are disadvantaged and lower income communities with environmental justice, compliance, enforcement, and other concerns. EPA's review of our SRFs and WIFIA, for example, indicate that disadvantaged community funding can substantially improve compliance and mitigate pollution by getting needed projects underway while maintaining affordable water service. EPA, in accordance with Executive Order 14008, is working towards a goal to direct 40 percent of the overall benefits of federal investments in the development of critical clean water infrastructure to disadvantaged communities.

EPA has a responsibility to ensure that recipients and subrecipients of federal financial assistance from EPA—including states, municipalities, and other public and private entities—comply with federal civil rights laws that prohibit discrimination on the basis of race, color, national origin (including limited English proficiency), disability, sex, and age,[5] including Title VI of the Civil Rights Act of 1964. Whenever a community receives

[5] Title VI of the Civil Rights Act of 1964, 42 U.S.C. §§ 2000(d) et seq. (Title VI); Section 504 of the Rehabilitation Act of 1973, as amended, 29 U.S.C., 29 U.S.C. § 794, Title IX of the Education Amendments of 1972, as amended, 20 U.S.C. §§ 1681 et seq.; Age Discrimination Act of 1975, 42 U.S.C. §§ 6101 et seq.; Federal Water Pollution Control Act Amendments of 1972, Pub. L. 92 500 § 13, 86 Stat. 903 (codified as amended at 33 U.S.C. § 1251 (1972)); 40 C.F.R. Parts 5 and 7.

NMED Exhibit 18

funding from EPA, including through the CWSRF and the Drinking Water State Revolving Fund, EPA intends to ensure compliance with civil rights laws by recipients of such funding. It is EPA's obligation to ensure no community is excluded from receiving or denied benefit of EPA funding based on race, color, national origin (including limited English proficiency), age, disability, or sex.[6]

b. History of Relevant Guidance

1. FCA Guidance and FCA Framework

EPA's 1997 *Combined Sewer Overflows – Guidance for Financial Capability Assessment and Schedule Development* (1997 FCA Guidance) sets forth a two-phased approach for evaluating a National Pollutant Discharge Elimination System (NPDES) permittee's financial capability to fund combined sewer overflow (CSO) controls in accordance with the CSO Control Policy.[7] In the first phase, the Residential Indicator (RI) calculates the cost per household as a percentage of median household income (MHI) for the service area of the permittee. In the second phase, the Financial Capability Indicators (FCI) evaluates the municipality or wastewater utility's overall fiscal health and local demographics relative to national norms. The Residential Indicator and Financial Capability Indicators results are brought together in a matrix that evaluates the impact a proposed CWA program imposes on the municipality or utility ("high," "medium," or "low"). This two-phased approach is referred to as the FCA. While developed for use in assessing a community's capability to fund CSO controls, EPA has also used the 1997 FCA Guidance to inform schedules to implement sanitary sewer overflow (SSO) and other CWA control measures.

EPA developed the 2014 *Financial Capability Assessment Framework for Municipal Clean Water Act Requirements* (2014 FCA Framework) to encourage the use of the flexibility available under the 1997 FCA Guidance. Both the 1997 FCA Guidance and the 2014 FCA Framework were developed with extensive public input. The results of the FCA analyses provide an important benchmark for EPA decision-makers to consider in CWA permitting and enforcement actions to support consistency across the country. EPA has used both the 1997 FCA Guidance and the 2014 FCA Framework to support consent decree negotiations with over 100 wastewater utilities throughout the United States and U.S. territories.

2. Integrated Planning Framework

In 2012, EPA developed the *Integrated Municipal Stormwater and Wastewater Planning Approach Framework* (Integrated Planning Framework) that offers a voluntary opportunity for a municipality to develop an integrated plan to meet multiple CWA requirements. Integrated planning is a process that municipalities can use to achieve clean water and human health goals while addressing aging infrastructure, changing

[6] For more information about the federal civil rights laws enforced by EPA, including Title VI, please visit https://www.epa.gov/ocr/title-vi-laws-and-regulations and https://www.epa.gov/ogc/external-civil-rights-compliance-office-title-vi.

[7] Through the NPDES program, EPA established a national framework for controlling CSOs, called the CSO Control Policy. 59 Fed. Reg. 18688 (April 19, 1994). CWA § 402(q) requires that each permit, order, or decree for a discharge from a municipal combined storm and sanitary sewer conform to the CSO Control Policy. Communities with CSOs must comply with the CSO Control Policy and have a permit to discharge. See https://www.epa.gov/npdes/combined-sewer-overflows-csos.

NMED Exhibit 18

population and precipitation patterns, and competing priorities for funding. With the release of the Integrated Planning Framework, the Agency clarified that an FCA could include the following costs: stormwater and wastewater; ongoing asset management or system rehabilitation programs; existing CWA related capital improvement programs; collection systems and treatment facilities; and other CWA obligations required by state or other regulators. On January 14, 2019, the Water Infrastructure Improvement Act (WIIA) (H.R. 7279) added a new section 402(s) to the CWA to include the 2012 Integrated Planning Framework.

3. Interim Economic Guidance for Water Quality Standards

The 1995 *Interim Economic Guidance for Water Quality Standards* (1995 WQS Guidance) is used for developing supporting analyses for revisions to designated uses, justifications for WQS variances, and antidegradation reviews to allow lowering of water quality. The public sector portion of the 1995 WQS Guidance uses a substantively identical two-phased approach, data, and metrics as the 1997 FCA Guidance. However, the terminology used in the two guidance documents is different.

The first step of the public sector analysis of the 1995 WQS Guidance involves determining a Municipal Preliminary Screener Score (MPS) to assess the impact of the cost to households of the pollution control technology needed to meet water quality-based requirements. The MPS is the cost as a percentage of the median household income (i.e., the ratio of the total per-household costs and the median household income). In the 1997 FCA Guidance, this same ratio is called the Residential Indicator.

The second step of the public sector analysis of the 1995 WQS Guidance involves determining the Secondary Score to evaluate the community's financial capability, using six measures of a community's financial health - bond rating, net debt as a percent of the full market property value, unemployment rate, median household income, property tax revenues as a percent of full market property value, and property tax collection rate. In the 1997 FCA Guidance, these same six measures are used to calculate the Financial Capability Indicators.[8]

In the 1995 WQS Guidance, the MPS and the Secondary Score are brought together into a matrix to determine the degree of economic and social impact to support a binary (i.e., yes/no) WQS decision, whereas the matrix in the 1997 FCA Guidance is used to determine a community's financial capability to support schedule negotiations.

Because the 1995 WQS Guidance and the 1997 Guidance are substantially aligned, the FCA Guidance supplements the public sector sections of the 1995 WQS Guidance to assist states and authorized tribes in assessing the degree of economic and social impact of potential WQS decisions. The FCA Guidance does not revise the recommended methodology in the private sector sections of the 1995 WQS Guidance. Section III of the FCA Guidance applies to the consideration of economic impacts to public entities when evaluating WQS variances and antidegradation reviews. In appropriate cases, these methodologies also inform decisions about revisions to designated uses, subject to the additional analyses described in Section III.

[8] One difference is that the 1995 Economic Guidance's Secondary Score compares the community's median household income to the state median household income, whereas the 1997 FCA Guidance's Financial Capability Indicator compares the community's median household income to the national median household income.

NMED Exhibit 18

c. Use of the Updated FCA Guidance

The FCA Guidance advances the ability of communities to demonstrate financial impacts, increases the transparency of EPA's consideration of these impacts, and will improve the agency's ability to consistently apply FCA methodologies across the country. The FCA Guidance helps communities submit consistent and comprehensive information relevant to the entire community's capability to fund CWA control measures and programs. Specifically, the FCA Guidance includes templates and calculations that communities can use to submit information regarding lowest quintile income (LQI), drinking water costs, financial models or studies, and other relevant information. The templates and calculations include references to applicable publicly available data sources that can be used in compiling this information. The Residential Indicator and Financial Capability Indicators are based on factors for consideration of financial capability as identified in the CSO Control Policy.[9] The development of the Lowest Quintile Poverty Indicator was guided by the following criteria:

1. Readily available from publicly available data sources;
2. Clearly defined and understood;
3. Simple, direct, and consistent;
4. Valid and reliable measures, according to conventional research standards; and
5. Applicable for comparative analyses among permittees.[10]

EPA also encourages communities to submit any additional documentation that would create a more accurate and complete picture of their financial capability that may affect the conclusion of the analyses described in this guidance.

When used for schedule development, EPA does not view or use the FCA Guidance as a rigid metric that points to a given schedule length or threshold over which the costs are deemed unaffordable. It is a common misconception that the FCA Guidance can be used to cap spending on CWA programs or projects at a percentage of MHI. The FCA Guidance does not remove obligations to comply with the CWA nor does it reduce regulatory requirements. Rather, EPA uses the FCA Guidance to assess a community's financial capability for the purpose of developing a reasonable implementation schedule for necessary improvements that will not burden the community. In practice, EPA considers each community's financial capability on a holistic case-by-case basis. Where appropriate, EPA has and will continue to consider supplemental information submitted by the community (as encouraged by the 2014 FCA Framework) and may agree to

[9] These factors are: i) Median household income; ii) Total annual wastewater and CSO control costs per household as a percent of median household income; iii) Overall net debt as a percent of full market property value; iv) Property tax revenues as a percent of full market property value; v) Property tax collection rate; vi) Unemployment; and vii) Bond rating. 59 Fed. Reg. at 18894. While allowing for consideration of these listed factors in developing implementation schedules, the CSO Policy also explains that NPDES authorities should ensure that "CWA requirements are complied with as soon as practicable." Id. at 18690.

[10] See National Academy of Public Administration, *Developing a New Framework for Community Affordability of Clean Water Services* (2017).

NMED Exhibit 18

implementation schedules that are different than the schedules suggested by the FCA Guidance's baseline analysis.

The updated FCA Guidance incorporates aspects of EPA's 1997 FCA Guidance and EPA's 2014 FCA Framework. Going forward, the FCA Guidance replaces the 1997 FCA Guidance to evaluate a community's capability to fund CWA control measures in both the permitting and enforcement context.

In addition, as described in Section I.b of this guidance, the 1997 FCA Guidance is substantively identical to the public sector sections of the 1995 WQS Guidance, which is used for evaluating WQS decisions, including revisions to designated uses, WQS variances, and antidegradation reviews for high-quality waters. Going forward, the FCA Guidance (particularly Section III) supplements, and should be used in conjunction with, the public sector sections of the 1995 WQS Guidance to assist states and authorized tribes in assessing the degree of economic impact of potential WQS decisions. The FCA Guidance does not revise the recommended methodology in the private sector sections of the 1995 WQS Guidance.

Worksheets for calculation of the Residential Indicator and Financial Capability Indicators are included as Appendices A and B. These Appendices include standardized instructions and practice tips, such as costs that can be included when considering CWA costs per household as a percent of MHI. MHI represents the mid-point of income in a geographical area determined by the American Community Survey (ACS). The median is generally used to derive a central tendency since it is not largely affected by outlier values. However, EPA recognizes that there can also be significant impacts on customers at the low end of the income spectrum. For communities with households that have difficulty paying for their water services, these challenges can be indicated by looking at the community's LQI and other poverty indicators along with its MHI.

When considering an extended schedule for addressing sewer overflows, Section II.8 of EPA's longstanding CSO Control Policy states that implementation schedules should incorporate consideration of grant and loan availability, user fees and rate structures, and other viable funding mechanisms and sources of funding. 59 Fed. Reg. 18688, 18694 (April 19, 1994). As outlined in Section II.a.4 of this guidance, the Financial Alternatives Analysis walks communities through these considerations and how certain steps may mitigate financial impacts. This step should inform EPA's consideration of an extended CWA schedule or WQS revision related to economic impacts, particularly those that may be driven by lowest quintile income and/or poverty considerations. For example, a community's Residential Indicator and Financial Capability Indicators may show that the community as a whole has the resources to invest in water infrastructure, but those investments could potentially impose a significant burden on lower-income households unless steps are taken to avoid that result. In such cases, Appendix C of this guidance describes measures communities can implement to reduce that burden. To the extent that financial burdens remain for the community and its low-income households, EPA will work with the community and/or utility to develop an appropriate schedule length as suggested by the recommended implementation schedule benchmarks in Exhibit 9.

Appendices C and D provide information related to accessing federal funding as well as other sources of water infrastructure financing. These types of programs can help a community come into compliance more quickly and reduce the financial impacts on ratepayers. As described below, the assessment of availability of such funding should be part of a community's FCA, and a community should consider available subsidized funding and other financing arrangements as part of a financing plan to achieve compliance as soon as

NMED Exhibit 18

practicable.[11] EPA's Water Finance Clearinghouse (https://clearinghouse.epa.gov/wfc) can also be used to identify federal, state, and non-governmental sources of funding and financing that may help communities access capital to meet their water infrastructure needs. The Water Finance Clearinghouse can provide information on rate structures, financial plans, and customer assistance programs. In addition, EPA's Municipal Ombudsman (https://www.epa.gov/ocir/municipal-ombudsman) serves as a resource for communities seeking to comply with the Clean Water Act and will coordinate with the appropriate EPA offices to assist communities with information on federal financial assistance, technical assistance, and integrated planning.

II. Updated FCA Guidance for Schedule Development

The FCA Guidance encourages communities to provide information under either Alternative 1 or Alternative 2 to evaluate financial capability for CWA implementation schedules. Alternative 1 of the FCA Guidance involves evaluating a NPDES permittee's financial capability to fund CWA controls by calculating the Residential Indicator and the Financial Capability Indicators. The Residential Indicator considers the cost per household as a percentage of MHI for the service area of the permittee using data collected by the U.S. Census Bureau. The Financial Capability Indicators evaluate the municipality or wastewater utility's overall fiscal health and local demographics relative to national norms. The FCA Guidance adds a new critical metric: the Lowest Quintile Poverty Indicator (LQPI) Score. These critical metrics are considered in accordance with the Expanded FCA Matrix (Exhibit 5) and supplemented by a Financial Alternatives Analysis. The FCA Guidance includes recommended implementation schedule benchmarks applicable to Alternative 1 (Exhibit 9). Alternative 2 of the FCA Guidance involves analyzing financial and rate models in addition to calculating the LQPI Score and performing a Financial Alternatives Analysis.

It should be emphasized that these alternatives might not present the most complete picture of a community's financial capability to fund its CWA requirements. However, these metrics do provide a common basis for financial impact discussions among the community, the state or tribe, and EPA. Communities are encouraged to submit any additional documentation (Other Metrics) for consideration that would create a more accurate and complete picture of their financial capability. The FCA Guidance includes Other Metrics with Standardized Instructions and Other Metrics with Submission of Information to be Determined by the Community. Both alternatives permit consideration of Other Metrics and may support an extended implementation schedule as suggested by Exhibit 9's recommended implementation schedule benchmarks. See Sections II.c and II.d for more information on additional metrics.

[11] The CSO Control Policy requires that "each long-term CSO control plan . . . should [] include both fixed-date project implementation schedules (which may be phased) and a financing plan to design and construct the project as soon as practicable." 59 Fed. Reg. at 18691.

NMED Exhibit 18

Alternative 1: Critical Metrics

- Residential Indicator – cost per household as a percentage of MHI
- Financial Capability Indicators – six socioeconomic, debt, and financial indicators used to benchmark a community's financial strength
- Lowest Quintile Poverty Indicator – one lowest quintile income element (weighted at 50%) and five poverty elements (weighted at 10% each) used to benchmark the severity and prevalence of poverty within the community's service area
- Financial Alternatives Assessment – consideration of feasible alternatives to reduce costs and address impacts to low-income households

Alternative 2: Critical Metrics

- Financial and Rate Models
- Lowest Quintile Poverty Indicator
- Financial Alternatives Analysis

Other Metrics with Standardized Instructions

- Drinking Water Costs
- Water Affordability Programs
- Asset Management Costs
- Stormwater Management Costs
- Comparisons to County, State, and National Data

Other Metrics with Submission Information Determined by the Community (see Appendix E for examples)

a. Alternative 1: Critical Metrics and Instructions

1. Residential Indicator

The first step of Alternative 1 is to calculate the Residential Indicator by following the instructions for Worksheets 1 and 2 in Appendix A. This indicator is the community's average cost per household (CPH) for wastewater treatment (WWT) and CWA controls as a percentage of the local MHI. It reflects the residential share of current and planned controls needed to meet the requirements of the CWA. The value range for this indicator characterizes whether the costs impose a "low," "mid-range," or "high" financial impact on residential users.

NMED Exhibit 18

Exhibit 1. Residential Indicator Score

RESIDENTIAL INDICATOR FINANCIAL IMPACT	RESIDENTIAL INDICATOR (CPH AS % MHI)[12]
Low	Less than 1.0 Percent of MHI
Mid-Range	1.0 to 2.0 Percent of MHI
High	Greater than 2.0 Percent of MHI

2. Financial Capability Indicators

The second step of Alternative 1 is to calculate the Financial Capability Indicators by following the instructions for Worksheets 3 to 9 in Appendix B. The six Financial Capability Indicators are used to evaluate the debt, socioeconomic, and financial conditions that affect a community's financial capability to implement the CWA controls. These indicators help characterize the community's financial capability as "weak," "mid-range," or "strong."

Exhibit 2. Financial Capability Indicators Score

FINANCIAL CAPABILITY INDICATORS SCORE	SOCIOECONOMIC, DEBT, AND FINANCIAL INDICATORS
Weak	Below 1.5
Mid-Range	1.5 to 2.5
Strong	Above 2.5

3. Lowest Quintile Poverty Indicator Score

The third step of Alternative 1 is to calculate the Lowest Quintile Poverty Indicator Score. EPA recognizes that considering lowest quintile income is an important measure to supplement the Residential Indicator and Financial Capability Indicators, as MHI does not account for the variability of income distribution from community to community. The calculation of the Lowest Quintile Poverty Indicator aids in assessing the severity and prevalence of poverty in a community's service area.

A Lowest Quintile Poverty Indicator Score can be calculated by using the list of indicators in Exhibit 3 to benchmark the severity and prevalence of poverty within the community's service area. These indicators (other than "Trend in Household Growth") are evaluated using a ±25% benchmark to national values, like the

[12] In the mid-1990s EPA developed the 1% and 2% Residential Indicator benchmarks after conducting an analysis of the costs of wastewater services as a percentage of household income using EPA's Municipality's Ability to Pay Model (MABEL) database. The analysis also examined the National Wastewater User Fee Study of the Construction Grants program database, which captured annual residential expenditures as a percentage of median household income. The 2% benchmark was calculated to be two standard deviations above the average expenditure per household.

NMED Exhibit 18

methodology used to calculate the FCI. For instance, if the national Percentage of Population with Income Below 200% of Federal Poverty Level is 32%, then a community with a value less than 24% would equal a "strong" score for this indicator, a value of 24% to 40% would equal a "mid-range" score, and a value above 40% would equal a "weak" score. Using a ±25% benchmark closely aligns with the middle quintile of data for the parameter, which can characterize the "middle class" of Americans. This bracketing of the middle 50% is a commonly used methodology to characterize outliers on either end of the data distribution.

"Trend in Household Growth," the fifth indicator, is evaluated using >1%, 0-1%, and <0% benchmarks.[13] To calculate "Trend in Household Growth":

- Collect total number of occupied housing units (i.e., households) data, based on the 5-year ACS, for the most recent year and five years earlier from Census Table B25002.
    - Refer to https://data.census.gov/cedsci/all?q=B25002.
- Enter historical household data into the Geometric Average Growth Rate formula below to calculate the five-year trend.

$$5-Year\ Geometric\ Average\ Growth\ Rate = (1 + (HH_n - HH_{n-5})/HH_{n-5})^{1/5} - 1$$

$$HH = Number\ of\ Occupied\ Housing\ Units$$

$$n = Most\ Recent\ Census\ Data\ Year$$

For example, if a community had 15,500 occupied housing units in the most recent census data year and had 15,000 occupied units five census data years prior, the 5-year average geometric growth rate would be 0.66%.

$$5-Year\ Geometric\ Average\ Growth\ Rate = (1 + (15{,}500 - 15{,}000)/15{,}000)^{\frac{1}{5}} - 1 = 0.66\%$$

If the community's service area includes more than one jurisdiction, the LQPI indicators should be weighted based the number of households in each jurisdiction throughout the community's entire service area. For an example of how to calculate a weighted average, see Appendix A.

[13] This indicator is "strong" if the five-year average household growth is greater than 1 percent. The indicator is "weak" if the five-year average household growth is negative (less than 0 percent). The indicator is "mid-range" if the five-year average household growth is 0 percent to 1 percent.

NMED Exhibit 18

Exhibit 3. Instructions for Calculation of the Lowest Quintile Poverty Indicator Score

Determine Lowest Quintile Poverty Indicator Score using the template below.

INDICATOR (CENSUS DATA CODE)	STRONG (SCORE = 3)	MID-RANGE (SCORE = 2)	WEAK (SCORE = 1)	WEIGHT	ACTUAL VALUE	SCORE
LQPI #1 Upper Limit of Lowest Quintile Income (B19080)	More than **25%** above national LQI	**±25%** of national LQI	More than **25%** below national LQI	50%		
LQPI #2 Percentage of Population with Income Below 200% of Federal Poverty Level (S1701)	More than **25%** below national value	**±25%** of national value	More than **25%** above national value	10%		
LQPI #3 Percentage of Households Receiving Food Stamps/SNAP Benefits (S2201)	More than **25%** below national value	**±25%** of national value	More than **25%** above national value	10%		
LQPI #4 Percentage of Vacant Housing Units (B25002)	More than **25%** below national value	**±25%** of national value	More than **25%** above national value	10%		
LQPI #5 Trend in Household Growth (B25002)	>1%	0%-1%	<0%	10%		
LQPI #6 Percentage of Unemployed Population 16 and Over in Civilian Labor Force[14] (DP03)	More than **25%** below national value	**±25%** of national value	More than **25%** above national value	10%		
Score for LQPI #1						
Average Score for LQPI #2 to #6 (Sum of 2 through 6 divided by 5)						
Lowest Quintile Poverty Indicator Score (Sum of two lines above divided by 2)						
Lowest Quintile Poverty Indicator Benchmarks Low Impact (Above 2.5) Medium Impact (1.5 to 2.5) High Impact (Below 1.5)						

EPA strongly encourages additional subsidy or grant consideration from governmental funding sources for entities that show a "medium" or "high" impact LQPI Score.

[14] The Financial Capability Indicators and Poverty Indicators both evaluate unemployment rate for the population in the civilian labor force, although using two different standards for evaluation. The Financial Capability Indicators bounds for unemployment rate are +/- 1 percentage point of the national average (e.g., for a national average of 4 percent, the lower bound would be 3 percent and the higher bound would be 5 percent). The Poverty Indicators bounds for unemployment rate are +/- 25% of the national average. It can be useful to evaluate the same variable with different bounding methods, especially for years when unemployment rates spike across the country. On the other hand, when unemployment rates are low, the two should have a similar result. As part of the Financial Capability Indicators assessment, the unemployment rate is relevant to the general economic well-being of residential users in the permittee's service area. The unemployment rate is also relevant as a Poverty Indicator for benchmarking the prevalence of poverty within the service area.

NMED Exhibit 18

4. Financial Alternatives Analysis: Grant and Loan Availability; Previous and Current Residential, Commercial, and Industrial Sewer User Fees and Rate Structures; and Other Viable Funding Mechanisms and Sources of Financing

Another step of Alternative 1 is to perform a Financial Alternatives Analysis.[15] The goal of this step is to seek ways to minimize financial impacts while ensuring residents also enjoy the benefits of infrastructure investments and improved water quality. Where CWA compliance costs impact residents, particularly low-income households, a longer schedule may not always be the best solution to address impacts to those residents. In particular, if a community shows strong economic indicators in other categories, there may be better options for the community to address the potential financial burden faced by its residents or take other steps to reduce the costs of needed CWA controls. If the intended goal is to help impacts to residents, an extended CWA schedule may, in fact, have the opposite effect if it delays addressing pollution in the neighborhoods where they live. Nonetheless, EPA understands the significant impacts that additional costs can pose to communities, especially underserved and lower-income communities.

A Financial Alternatives Analysis should document whether the community has considered feasible steps to reduce costs and address impacts to low-income households, including use of variable rate structures, customer assistance programs (CAPs), and applications for grants or subsidies from the CWSRF. This demonstration should provide the results of the "checklist" of financing and funding considerations in Appendix C and describe the specific programs being implemented. The community should provide a list of the programs or steps considered, the actions that would be necessary to put such measures into place, and the plan for taking those actions. Where available tools are not included in the community's plans, the requester should provide a written explanation of why those approaches are not being pursued. EPA has provided an Example Financial Alternatives Worksheet in Appendix C that can help document this information.

Financial Alternatives Already Implemented

Most communities will have already considered or implemented some or many of the financial alternatives as general good practices of utility management. Performing the Financial Alternatives Analysis at the beginning of an FCA may help provide the community with a clearer understanding of all costs associated with the implementation of CWA controls, such as reduced costs associated with low-interest loans, increased revenue from utility fees, or the costs associated with programs that assist low-income households. Where a community has implemented certain financial alternatives, the associated costs or cost savings from those alternatives can be accounted for in the Residential Indicator under Alternative 1 and as part of a Financial and Rate Model analysis under Alternative 2. Communities should demonstrate how the CWA work

[15] The Financial Alternatives Analysis expands on the Secondary Financial Considerations in EPA's 1997 FCA Guidance and provides a template for the CSO Control Policy's additional construction and financing schedule considerations of: grant and loan availability; previous and current residential, commercial, and industrial sewer user fees and rate structures; and other viable funding mechanisms and sources of financing. See 59 Fed. Reg. at 18694. This analysis is also consistent with the Integrated Planning Framework, which states that integrated plans should include a financial strategy and capability assessment that ensures investments are sufficiently funded, operated, maintained and replaced over time and include consideration of current and planned rates and fees.

NMED Exhibit 18

included as costs in an FCA will be implemented, including appropriate assurances that those expenditures will be made.

Consideration of Additional Feasible Financial Alternatives[16]

Extended CWA compliance schedules or WQS revisions that lower the goals for a water body potentially widen water quality and health disparities among communities, creating environmental justice concerns. On one hand, low-income households may be paying a higher percentage of their total income for basic services and clean water, but on the other hand, if the community is out of compliance with the CWA, overburdened and/or low-income neighborhoods will likely continue to suffer impacts to human health and the environment from raw sewage overflows and inadequately controlled stormwater discharges. Residents in low-income communities also may be more dependent on nearby waters for recreation, fishing, and drinking water. The first-line responsibility for balancing financial impacts while achieving clean water improvements rests with the local community. However, EPA is committed to carefully reviewing financial impacts and using the tools and technical assistance at the Agency's disposal to help local communities mitigate environmental—and related financial and societal—impacts of CWA noncompliance for communities.

Use of variable rate structures, CAPs, and applications for grants or subsidies from the CWSRF are all potential tools to enable shorter compliance schedules by allowing increased total spending on compliance without burdening low-income customers. Shorter compliance schedules provide water quality and public health improvements that deliver important social, environmental, and economic benefits to the community. Communities can demonstrate through the Financial Alternatives Analysis that it has taken or is pursuing feasible steps included in Appendix C to lower costs of compliance, reduce or mitigate the financial impact of water service costs on the community's low-income households, and to achieve compliance as expeditiously as possible.[17]

In evaluating this demonstration, EPA expects to look comprehensively at the community's financial strategy, including, but not limited to, an analysis of the community's approach to covering costs through rate structure and design as well as its other initiatives to assist low-income customers while assuring necessary and timely compliance with environmental requirements. As described in Exhibit 9, this analysis can support longer compliance schedules where there is a holistic financial strategy to balance the financial and environmental impacts of extended CWA compliance schedules. Without the types of information developed in a Financial Alternatives Analysis, it will likely be more difficult for EPA to assess possible financial impacts and whether those impacts might outweigh the environmental impacts of extended noncompliance, so the recommendations for compliance schedules for communities that have not performed a Financial

[16] A financial or funding consideration listed in Appendix C may be prohibited by state law. Other mechanisms to achieve the same goals may be feasible alternatives. There are examples, which can be found in Appendix C, of communities that have implemented similar or analogous mechanisms to reduce financial impacts within the limits of the relevant legal boundaries. Note that for municipalities subject to federal civil actions, CWA Section 309(e) provides that to the extent that the laws of a State prevent the municipality from raising revenues needed to comply with any resulting judgement, then the State "shall be liable for payment of any judgment, or any expenses incurred as a result of complying with any judgment."

[17] In particular, NPDES permittees with long-term CSO control plans are "ultimately responsible for aggressively pursuing financial arrangements" for the implementation of such plans. 59 Fed. Reg. at 18690.

NMED Exhibit 18

Alternatives Analysis are shorter than for those communities that have developed a comprehensive Financial Alternatives Analysis.

Considerations for Sanitary Districts and Sewer Authorities

Whether a particular financial alternative is feasible may be different for entities such as a sanitary district or sewer authority. For instance, a utility may not be the rate setting authority for its entire service area if it serves wholesale customers. Certain utilities may need to work with the municipality or municipalities it serves to obtain the information to complete the Financial Alternatives Analysis. Users of this guidance should document any relevant differences in feasibility or practicality (see, e.g., Column B of the Example Financial Alternatives Worksheet) for consideration by EPA. Understanding such differences allows for development of schedules that are responsive to circumstances unique to each community while advancing the mutual goal to protect clean water.

Considerations for Resource Constraints, In Particular for Small Communities

Not all communities have the capability to fully evaluate the tools identified in Appendix C. If there are resource concerns with completing a Financial Alternatives Analysis, the community should seek support through EPA's Water Finance Center by sending an email to WaterTA@epa.gov. If resource constraints remain, the community should provide information on current and planned efforts to reduce costs and relieve impacts on low-income residential households in a format that represents a good-faith effort relative to the size of the community's service area. EPA understands that for small communities, particularly those serving less than 3,000 persons, it may not be feasible to make a good faith effort to document the financial alternatives in Appendix C. The agency will be mindful of those resource constraints when developing compliance schedules.

5. Expanded Financial Capability Assessment Matrix

The final step of Alternative 1 uses the Expanded FCA Matrix to incorporate the critical metrics described above to provide a framework for understanding the overall financial impact to the community's service area. First, combine the Residential Indicator Score and Financial Capability Indicators Score in the Financial Capability Matrix (Exhibit 4) to determine an FCA Score, then combine FCA Score and Lowest Quintile Poverty Indicator Score in the Expanded FCA Matrix (Exhibit 5). As explained above, a "high" impact or "medium" impact Expanded FCA Matrix result does not mean that CWA compliance is unaffordable; rather, it means that it may be appropriate for the community's CWA compliance schedule to be extended beyond a normal engineering/construction schedule, as suggested by the recommended implementation schedule benchmarks in Exhibit 9.

Financial Capability Matrix

The Financial Capability Matrix determines the FCA Score by combining the Residential Indicator Score and Financial Capability Indicators Score. The matrix is included below as Exhibit 4.

NMED Exhibit 18

Exhibit 4. Financial Capability Matrix

FINANCIAL CAPABILITY INDICATORS SCORE	RESIDENTIAL INDICATOR SCORE		
	LOW IMPACT (BELOW 1.0%)	MID-RANGE (1.0% TO 2.0%)	HIGH IMPACT (ABOVE 2.0%)
Strong (Above 2.5)	Low Impact	Low Impact	Medium Impact
Mid-Range (1.5 to 2.5)	Low Impact	Medium Impact	High Impact
Weak (Below 1.5)	Medium Impact	High Impact	High Impact

Expanded FCA Matrix

The Expanded FCA Matrix determines the community's overall impact level when combining the FCA Score (from Exhibit 4) and the LQPI Score (from Section II.a.3). The Expanded FCA Matrix is included below as Exhibit 5.

Exhibit 5. Expanded Financial Capability Assessment Matrix

FCA SCORE (RI AND FCI)	LOWEST QUINTILE POVERTY INDICATOR SCORE		
	LOW IMPACT	MEDIUM IMPACT	HIGH IMPACT
Low Impact	Low Impact	Low Impact	Medium Impact
Medium Impact	Low Impact	Medium Impact	High Impact
High Impact	Medium Impact	High Impact	High Impact

The results of the Expanded FCA Matrix correspond to the recommended implementation schedules in Exhibit 9. Showing a "medium" or "high" impact in the Expanded FCA Matrix does not mean that capital investments in critical infrastructure projects should stop. Communities should continue to make capital investments to meet water quality standards even where the Expanded FCA Matrix results indicate a "medium" or "high" impact, though extensions of schedules as suggested by Exhibit 9's recommended implementation schedule benchmarks may offer flexibility for communities. While EPA is committed to taking financial capability into consideration, it is also critically important that all communities—including low-income communities—are ensured the protections of the CWA and the benefits of safe, clean water. To achieve both goals, communities may sequence projects beyond a normal engineering/construction schedule where the community shows these impacts cannot be addressed through measures such as alternative rate structures, assistance programs, or other sources of funding.[18] EPA's Integrated Planning Framework might

[18] The length of financing can be just as important as the length of a construction implementation schedule when trying to keep rates low for a community's low-income households. For instance, a community could fund a 20-year implementation schedule with a 30-year or more loan, and in some cases, with low interest or negative interest loans and debt forgiveness from state revolving funds.

NMED Exhibit 18

be instructive in these circumstances. As noted above, an FCA should not be used to cap spending on CWA programs or projects at a percentage of MHI or LQI.

See Section II.e (Schedule Development) to see how the Expanded FCA Matrix score may be used in the CWA compliance schedule development process. See Section III for equivalent tables for evaluating economic impacts of WQS decisions for the public sector.

b. Alternative 2: Critical Metrics and Instructions

1. Financial and Rate Models

Alternative 2 provides an opportunity for communities that wish to use financial and rate model analyses to submit this more detailed information to assist in developing an appropriate schedule for implementing CWA control measures.

Cash flow forecasting is a useful tool that allows communities to determine, on an annual basis, the revenue necessary to cover costs (including the costs of compliance projects) and to meet debt covenants over the implementation period. The community should plan and allow for uncertainty when deciding how to adjust water and sewer rates to finance its major capital improvements. Communities should decide how much should be financed through debt and how much should be directly paid for by sewer rates as costs are incurred. In evaluating potential rate increases, communities should also balance revenue requirements against the likelihood that users will reduce usage or cease paying utility bills, causing the yield of the revenues from the rate increase to be less than expected or desired, potentially causing the community to experience "rate shock."[19] In addition, within limits, communities have significant discretion regarding the timing of sewer rate increases. For example, communities may elect to raise rates more than the absolute minimum necessary in early years, thereby creating a cushion against economic uncertainties in later years and providing a strong financial base for bond financing. These model calculations inform the annual rate increases and can help a community evaluate a suite of potential compliance schedules. EPA has provided a list of resources related to water infrastructure financing and rate setting in Appendix D.

While useful, financial and rate models may be complicated or costly to develop, particularly for mid-size or small communities, and may be difficult for a regulator to evaluate. For this reason, submission of this information is at the discretion of a community. This type of information can be used as an analytic tool to assist in developing schedules for implementing CWA control measures in lieu of the critical metrics and schedule benchmarks set forth under Alternative 1. Alternative 2 may be particularly useful in situations where the community already uses such modeling for its internal financial planning or where multiple constraints affect the community's ability to achieve compliance with the CWA (in terms of costs or timing). However, EPA does not recommend the use of financial and rate model analysis under Alternative 2 in lieu of Alternative 1 for WQS decisions. Instead, for evaluating economic impacts of WQS decisions for the public sector, the use of financial and rate models could be used in a manner similar to the Other Metrics in

[19] Rate shock can increase the difficulty of managing program implementation schedules, because financing is contingent on an adequate revenue stream to support the debt service and additional coverage.

NMED Exhibit 18

Sections II.c and II.d of the FCA Guidance, i.e., as additional information for consideration in conjunction with the use of the Alternative 1 critical metrics.

Communities can provide forward-looking, year-by-year financial modeling of capital expenditures to support a proposed schedule for completing projects necessary to come into compliance with the CWA. Such modeling is commonly used to determine the revenues and rate increases necessary to support the financing of operations and major projects. The typical steps in this process include:

- Determining revenue requirements based on operating costs, debt service payments, asset management, and necessary capital expenditures;
- Allocating the costs of service to customer classes; and
- Developing a schedule of rates and charges necessary to meet revenue requirements.

Financial and rate models provided in the context of CWA compliance are normally in spreadsheet form with multiple tabs, including inputs and assumptions, debt service schedules, operations and maintenance costs, and schedule of necessary capital improvements. The model then determines the "revenue requirements" necessary to support the proposed or alternative compliance plans, including financing and rate increases. The models are set up so that it is possible to evaluate alternative scenarios in terms of cost, length of time to complete a program, or assumptions related to financing strategies. Simpler modeling for smaller communities is possible based on the same concepts, if percentage revenue increases will be passed through to a typical residential customer bill at the same rate of increase.

To assist EPA's review of modeling analyses, EPA recommends that communities using Alternative 2 submit the following supporting data and documentation:

- The last three years of financial reports for the wastewater system.
- A summary of historical rate increases for the past five years.
- The most recent approved Budget and Capital Improvement Plan for the wastewater system.
- Model documentation (e.g., creator, peer review status, version).
- A summary of all model input assumptions and their bases, for example: bond rating, ability to borrow, legislative caps on ability to borrow, selected funding mechanism, access to CWSRF financing, ability to pay back debt, the current operating cost and debt service baseline, current revenue, growth in customers, and inflation in costs and household income.
- An identification of dollar values as either constant (year) or nominal dollars.
- A summary of the model results, explaining the community's view of the conclusions relevant to its financial capability to implement the necessary work to achieve compliance.
- A fully functional model of the scenarios presented, with all formulas and interactions among separate worksheets intact. The model should include a tab that clearly describes the input assumptions used.

NMED Exhibit 18

- A clear description of the baseline financial status and data in terms of year and source documents that the modeling is built from. This should include the basis for the current residential bill that is used to evaluate impacts on households with median income levels. In general, this will be similar to the results in the Residential Indicator analysis but analyzes only current costs.[20]
- All source and supporting documentation that was relied upon when developing the model, including certified financial statements.
- Evaluation of multiple scenarios in terms of program length or other key assumptions and uncertainties.

Communities and EPA have found a summary of scenarios such as the example shown below in Exhibit 6 to be useful. Other examples would yield different results. To develop year-by-year forward-looking rate model scenarios, such as those shown in Exhibit 6, a community should:

1. Include calculation of the service area Residential Indicator based on the percentage of residential flow and households (not the number of accounts). Current costs (operations and maintenance expenses, debt service at present time, and other recurring asset management costs) should be included and consistent with the model inputs for the current year. Future costs should include the total capital expenditures and changes in operations and maintenance costs as a result of the required work, and also reflect the community's financing plan, again consistent with model assumptions.
2. Determine whether the modeling will be in current dollars or inflated dollars. If inflated, the modeled costs, including proposed capital expenditures, should be adjusted over time. In addition, MHI values should be escalated using the historic rate of increase of MHI or the Consumer Price Index (CPI). The community should provide the basis for all escalation factor assumptions applied in the model.
3. Define a proposed end year for the completion of investments needed to meet CWA requirements. Examining several alternative scenarios is preferred to better understand the impact of various program lengths.
4. Incorporate existing debt service schedules as well as the assumed financing approach for the proposed program costs. This would likely include a mix of already available reserves, cash from incoming revenues, and new debt financing from either the municipal bond market or state-subsidized funding sources.
5. Iterate through proposed capital investment schedules to develop model scenarios and related revenue requirements.

[20] In general, EPA is finding that per household billed usage is in the range of 5 to 6 CCF (centum cubic feet, or one hundred cubic feet). If the community serves a significant number of households in multi-family structures, then the usage will likely be lower. EPA may accept the community's current "typical bill" usage assumption, if consistent with nationwide averages, or real information on usage from actual billing. A community's inability to obtain per household usage information for families living in multi-family structures that are not billed separately for utilities does not preclude consideration of usage information from actual billing.

NMED Exhibit 18

6. Translate the revenue requirements into annual increases in rates and bills for customers. Apply the annual percentage increases to the baseline or current average household bill.

Where local data are available, communities are encouraged to implement Alternative 2 using local data. For EPA to consider this information, a community should submit all supporting data and documentation, as described above.

Exhibit 6. Examples of Rate Increase Scenarios and Median Household Impacts for Each Scenario

SCENARIO:	COMMUNITY PROPOSED SCENARIO				OTHER SCENARIOS

Scenario End Year 2036
Scenario End Year 2041

NMED Exhibit 18

EPA intends to use this information, along with the LQPI Score and information from the Financial Alternatives Analysis, when developing schedules for implementing control measures. The goal is to work with communities to reduce rate shock and to avoid wastewater utility rates that represent an overly burdensome percentage of household income. In addition, a community should consider the public health and environmental impacts described in Section II.e.1 when determining the sequencing and priority of projects. Unlike Alternative 1, EPA has not recommended benchmark percentages of household income for Alternative 2. However, EPA intends to keep the percentage of household income spent on wastewater utility bills within reasonable bounds when establishing compliance schedules. Where drinking water costs are substantial and impacting households, a community may submit information on those costs as part of its financial and rate model. See Section II.c.1 for more direction. Schedules developed using Alternative 2 should be generally consistent with the recommended scheduling boundaries in Exhibit 9. Communities are encouraged to provide local information to EPA to support any predictions of a likely occurrence of rate shock. Other Metrics, such as drinking water costs, may also impact rate shock.

Another analysis that EPA and communities have found helpful, shown below by example in Exhibit 7, evaluates the maximum potential bill impact relative to household size. Typically, as household size increases, monthly water usage increases.[21] One-person households generally use significantly less water than three- or four-person households, but also have on average fewer financial resources. Displaying data in this manner (i.e., by household size) provides a more nuanced view of the impact of costs based on likely usage.

The data in Exhibit 7 is an example of how a community can evaluate the feasibility of a capital improvement program relative to various household sizes, using the results of a modeling program. This can provide information about the specific impact of program costs relative to household size by comparing a table that shows the impacts of current rates on various household sizes to a table that shows the impacts of future rates (incorporating required program costs) on various household sizes. Tables like the ones shown in Exhibit 7 can be created by following the below steps:

- To develop a table showing current rate impacts (see example in Exhibit 7.a):
    - Obtain current data for Percent of Service Area per household size (column 2) and MHI by household size (column 3), available in the ACS database.
    - Using current rates, calculate the monthly household bill for each centum cubic feet (CCF) usage column (top portion of each row).
    - Calculate impact for each CCF usage column (bottom portion of each row) by multiplying the household bill by 12 to arrive at an annual bill, then dividing the annual bill by the MHI for each household size.

[21] A Water Research Foundation study found that as of 2016 the average household (2.65 people) daily water use was 138 gallons, while the average per capita usage was 58.6 gallons. The report notes that there is considerable range in usage across the United States due to the influence of climate and weather patterns. See, Water Research Foundation, *Residential End Uses of Water, Version 2: Executive Report*, April 2016. Accessed at https://www.waterrf.org/research/projects/residential-end-uses-water-version-2.

Low Impact	Mid-Range Impact	High Impact

- To develop a table showing modeled future rate impacts (see example in Exhibit 7.b):
  - As part of the community's modeling, escalate MHI based on an inflationary adjustment to the year at the end or highest point of the model (in the example in Exhibit 7.b, this is 2047).
  - Calculate the monthly household bill for each CCF usage column based on the rates at the end or highest cost point in the community's model (in the example in Exhibit 7.b, this is the example community's 2047 modeled rates).
  - Calculate impact for each CCF usage column by multiplying the household bill by 12 to arrive at an annual bill, then dividing the annual bill by the MHI for each household size.

EPA views these data as additional ways for communities to understand the impacts of program costs on various sizes of households. The results can be informative to the rate setting and design process. It can also help identify the segments of customers likely to require customer assistance support.

As mentioned above, EPA does not recommend the use of financial and rate model analysis under Alternative 2 in lieu of Alternative 1 in WQS decisions. Instead, for evaluating economic impacts of WQS decisions for the public sector, the use of financial and rate models could be used in a manner similar to the Other Metrics in Sections II.c and II.d of the FCA Guidance, i.e., as additional information for consideration in conjunction with the use of the Alternative 1 critical metrics.

2. Lowest Quintile Poverty Indicator and Financial Alternatives Analysis

In addition to the Financial and Rate Model analysis, a community or EPA should calculate an LQPI Score to benchmark the severity and prevalence of poverty within the service area. The community should also perform a Financial Alternatives Analysis to document whether the community has considered feasible steps to reduce costs and address impacts to low-income households (as identified in Appendix C), including use of variable rate structures, CAPs, and applications for grants or subsidies from the CWSRF. Without the information provided by a Financial Alternatives Analysis, it will likely be more difficult for EPA to assess possible financial impacts and whether those impacts might outweigh the environmental impacts of extended noncompliance, so the recommendations for compliance schedules for communities that have not performed a Financial Alternatives Analysis are shorter than for those communities that have developed a comprehensive Financial Alternatives Analysis.

c. Other Metrics with Standardized Instructions

The FCA Guidance provides standardized instructions to increase transparency and clarity regarding how EPA considers the following factors, discussed in detail below: drinking water costs, a community's water affordability programs, asset management costs, stormwater management costs, and comparisons to county, state, and national data.[23] As noted above, Other Metrics may be considered under Alternative 1 or Alternative 2 and may support an extended implementation schedule generally consistent with Exhibit 9's

[23] Where the costs of multiple CWA obligations are included in an FCA, each of those costs should be enumerated separately to provide an understanding of how each contributes to the overall analysis.

NMED Exhibit 18

recommended implementation schedule benchmarks. Additionally, use of these Other Metrics may be considered in evaluating economic impacts of WQS decisions for the public sector.

1. Drinking Water Costs

EPA recognizes that both clean water and drinking water costs are often paid for through charges on a single bill. For this reason, the FCA Guidance more explicitly provides guidance on incorporating a community's drinking water requirements into an FCA evaluation. Given the widespread, increasing costs of delivering reliable drinking water in communities, EPA is providing standardized instructions along with an explanation of how it intends to develop implementation schedules that will account for impacts of drinking water requirements, when significant.

Consideration of Drinking Water Costs under Alternative 1

Drinking water information can be used in Alternative 1 to supplement the critical metrics and the results of the Expanded FCA Matrix. If information on significant drinking water costs is submitted and supported by the documentation detailed below, under Alternative 1, EPA in its discretion may permit a community to move from a "low" impact to a "medium" impact, or from a "medium" impact to a "high" impact in the FCA Guidance Implementation Schedule Benchmarks (Exhibit 9). Or, if a community is already experiencing a "high" impact, EPA may use this additional information to support an extended schedule as suggested by the recommended schedule benchmarks in Exhibit 9. Similarly, significant drinking water costs may be taken into account in evaluating economic impacts of WQS decisions for the public sector.

If a community submits information on drinking water costs under Alternative 1, EPA requests that the community provide detailed descriptions and cost estimates for the drinking water requirements. The community should submit the following supporting documentation:

1. Describe the specific improvements and costs required.
2. Describe the underlying requirements for the drinking water improvements (for example, whether the drinking water improvements are required by a state or federal permit, regulation, or enforcement action).
3. Describe the relationship of the wastewater system service area to the drinking water system service area(s) geographically and in terms of households served, specifically the overlap of drinking water system service area relative to wastewater system service area.
4. If the drinking water system and wastewater system are operated by the same utility, identify and explain any issues related to future financing and financial capability expected.
5. Provide the last three years of financial reports for the drinking water system.
6. Provide the current and approved future rate schedules for the drinking water system.
7. In addition to the Residential Indicator for wastewater costs, provide a cost per household analysis for drinking water costs following the Residential Indicator worksheets in Appendix A.
8. Propose an implementation schedule that integrates the CWA improvements and drinking water improvements, including a detailed description of the proposed sequencing of the improvements.

NMED Exhibit 18

Consideration of Drinking Water Costs under Alternative 2

Drinking water information can be used in Alternative 2 to evaluate the impacts of rates for both wastewater and drinking water on household bills. Schedules developed using Alternative 2 should be generally consistent with the recommended scheduling boundaries in Exhibit 9. If a community submits information on drinking water costs as part of its financial and rate model, EPA requests that the community provide detailed descriptions and cost estimates for the drinking water requirements. The community should submit the following supporting documentation:

1. Describe the specific improvements and costs required.
2. Describe the underlying requirements for the drinking water improvements (for example, whether the drinking water improvements are required by a state or federal permit, regulation, or enforcement action).
3. Describe the relationship of the wastewater system service area to the drinking water system service area(s) geographically and in terms of households served, specifically the overlap of drinking water system service area relative to wastewater system service area.
4. If the drinking water system and wastewater system are operated by the same utility, identify and explain any issues related to future financing and financial capability expected.
5. Provide the last three years of financial reports for the drinking water system, the current approved budget, and the most recent approved Capital Improvement Program budget.
6. Provide the current and approved future rate schedules for the drinking water system.
7. Provide a drinking water rate model analysis.
8. Provide all source and supporting documentation that was relied upon when developing the drinking water rate model, including certified financial statements.
9. Propose an implementation schedule that integrates the CWA improvements and drinking water improvements, including a detailed description of the proposed sequencing of the improvements.

2. Water Affordability Programs

Households on fixed or lower incomes, as well as households that face a temporary crisis such as a job loss or illness, may have difficulty paying water and sewer bills. Many communities are implementing a variety of tools to assist low-income customers. These programs can include bill discount programs, arrearage forgiveness, and emergency assistance. Additionally, some utilities seek to distribute revenue responsibilities equitably within customer classes. Some of those programs include nontraditional rate structures that are designed to send a more precise pricing signal or to approach the economics of water service differently. EPA encourages the establishment of these innovative programs that help households address issues with affordability and help protect public health throughout the community. At the same time, these programs help ensure the utility can sustainably provide its core services, price services appropriately, and preserve a broad customer base. See Appendix C for a more detailed description of these types of programs. EPA's Compendium of Drinking Water and Wastewater Customer Assistance Programs (https://www.epa.gov/waterfinancecenter/compendium-drinking-water-and-wastewater-customer-

NMED Exhibit 18

assistance-programs) describes the benefits, implementation, and examples of water affordability programs throughout the country.

Water affordability programs can allow utilities to meet specific customer needs while also meeting the utility's financial needs and obligations. These programs can improve on-time-payment rates and reduce debt collection costs, as well as the administrative and legal costs associated with disconnection and reconnection of water services. However, these programs can sometimes result in increased costs and decreased revenues for wastewater utilities.

If a community has developed a rate structure or assistance program to assist individual households, the community may provide information on costs needed to administer the program as well as the revenue lost from the assistance provided. If affordability program costs are included in an FCA as CWA costs, the community should provide appropriate assurances that the program has been and will continue to be implemented (e.g., applicable board certification, local ordinance, or other appropriate documentation). EPA also recommends that the following information should be submitted to assist in documenting costs and benefits:

- Type of program;
- Program eligibilities;
- Number of customers participating in the program;
- Number of customers eligible for the program (if known);
- Program costs;[24]
- Revenue lost (e.g., discounted rates, collection fees foregone);
- How the program is funded;
- Program benefits; and
- Number of disconnections prevented (if known).

Submission of the above information should allow EPA to confirm that the appropriate program costs are being included as part of a community's FCA. Such costs can be included in the calculation of the Residential Indicator[25] under Alternative 1 and as part of a Financial and Rate Model analysis under Alternative 2. To be considered, EPA requests that the community clearly identify if water affordability program costs have been included in these sections of the FCA, the line items in which these costs appear, and the amounts. Additionally, use of this additional analysis in the same manner may be considered in evaluating economic impacts of WQS decisions for the public sector.

[24] The University of North Carolina Environmental Finance Center's Water Utility Customer Assistance Program Cost Estimation Tool is designed to help water utilities estimate the costs of implementing a water affordability program. See https://efc.sog.unc.edu/resource/bill-payment-assistance-program-cost-estimation-water-utilities.

[25] As current and projected CWA related expenses. See Appendix A, Worksheet 1, Lines Number 100 and 103.

NMED Exhibit 18

3. Asset Management Costs

Asset management is a critical foundation for understanding near- and long-term operational and capital needs. This information forms the basis for capital planning and a capital funding strategy. Asset management is the practice of managing infrastructure capital assets to minimize the total cost of owning and operating them, while delivering the service level required. It helps answer the following three core questions for long-term infrastructure planning:

1. What assets do you have and where are they located?
2. When do your assets need to be repaired or replaced?
3. How much is each asset going to cost you in the near-term and the long-term?

By implementing asset management practices, a community should have a clearer picture of infrastructure-related expenses and future investment needs, which should inform the financial planning process.

A community may provide the following information on its asset management costs if the community can verify that asset management practices are being implemented. These include:

- Implementing projects in the community's Capital Improvement Program;
- Inventorying assets;
- Linking maintenance schedules to the asset inventory;
- Assessing the condition and remaining useful life of the assets in the inventory;
- Determining the capital expenditures needed to replace assets; and
- Planning a funding and financing strategy for operation and maintenance and capital expenditures.

Submission of information verifying the above practices should allow EPA to confirm that the appropriate asset management costs are being included as part of a community's FCA. Such costs may be reflected in the Residential Indicator under Alternative 1 and as part of a Financial and Rate Model analysis under Alternative 2. To be considered, EPA requests that the community clearly identify when asset management costs have been included in these sections of the FCA, the line items in which these costs appear, and the amounts. Additionally, use of this additional analysis in the same manner may be considered in evaluating economic impacts of WQS decisions for the public sector.

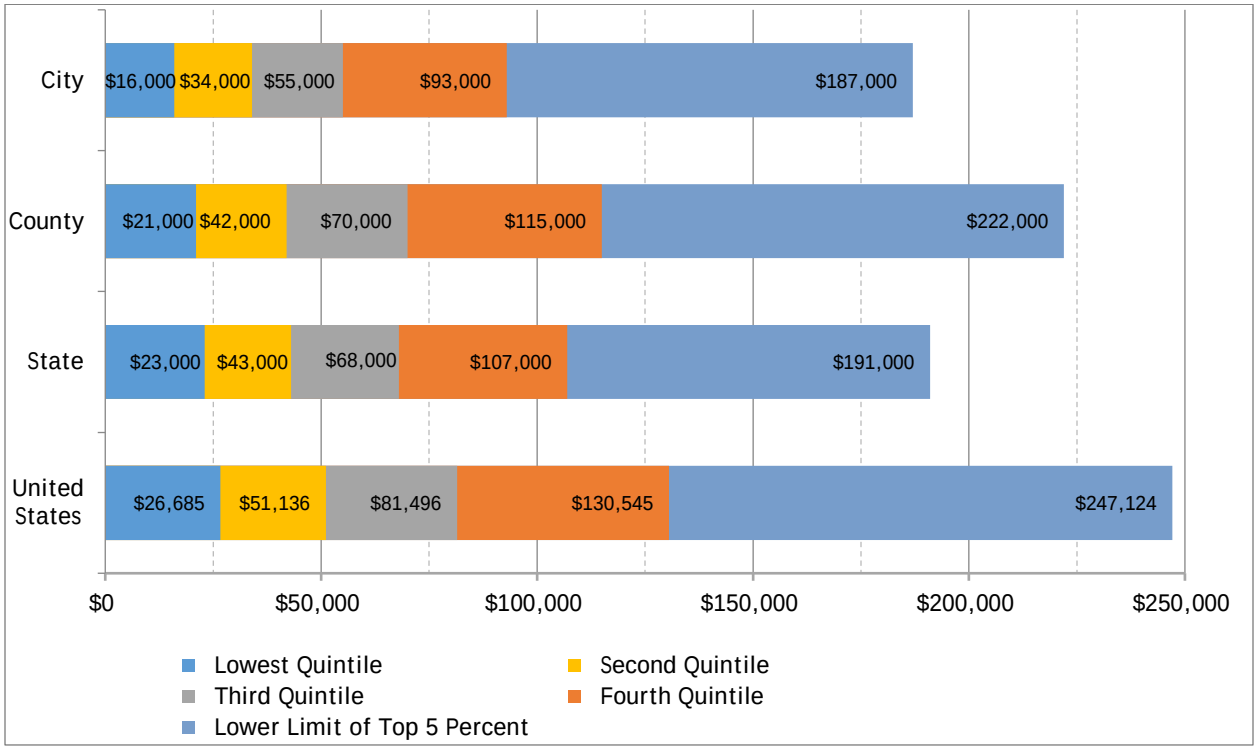
4. Stormwater Management Costs

EPA's continued commitment to integrated planning recognizes that many local governments and authorities have increased investments in their stormwater infrastructure through capital projects to rehabilitate existing systems, improve operation and maintenance, reduce impermeable surfaces, make use of green infrastructure, and address additional regulatory requirements. As programs are implemented to improve water quality and attain CWA objectives, many state and local government partners find themselves facing difficult economic challenges with limited resources and financial capability.

NMED Exhibit 18

For inclusion as part of an FCA, EPA recommends that municipalities explicitly separate stormwater costs from wastewater costs. The following information should be submitted to verify that submitted stormwater costs are not within a community's wastewater-related funds:

- Identify the municipal fund that the stormwater activity is conducted within (for example, identify whether stormwater management is in a separate stormwater enterprise fund, incorporated into the wastewater enterprise fund, or conducted within the general fund).
- Describe the specific stormwater activities and associated costs (for example, provide costs for stormwater program development, implementation, and enforcement as well as costs for designing, building, and maintaining stormwater infrastructure).
- Include supporting documentation for cost estimates.
- Describe the underlying requirement for the stormwater activities and costs (for example, whether it is required by a state or federal permit, regulation, or enforcement action).
- Identify projected, current, and historical stormwater fees.



Submission of the above information should allow EPA to confirm that the appropriate stormwater costs are included as part of a community's FCA and provide EPA with the appropriate assurances that those expenditures will be made. Such costs may be incorporated in the Residential Indicator under Alternative 1 and as part of a Financial and Rate Model analysis under Alternative 2. EPA requests that the community clearly identify when stormwater management costs have been included in these sections of the FCA, the line items in which these costs appear, and the amounts. Additionally, use of this additional analysis in the same manner may be considered in evaluating economic impacts of WQS decisions for the public sector.

5. Comparisons to County, State, and National Data

For any of the Other Metrics submitted by a community, the community can provide a graphic or chart that shows the community's data compared with county, state, and national data. An example is shown below in Exhibit 8. This information could be used to assist EPA in assessing a community's circumstances in relation to national averages and as compared to other benchmark communities. Such a comparison can be used to highlight a community's unique or atypical circumstances. Additionally, use of such comparisons in the same manner may be considered in evaluating economic impacts of WQS decisions for the public sector.

NMED Exhibit 18

Exhibit 8. Comparison of Quintile Distribution in City to County, State, and Nation

d. Other Metrics with Submission of Information Determined by the Community

EPA continues to encourage communities to provide additional financial and demographic information regarding the community's financial capability to implement CWA requirements or to evaluate economic impacts of WQS decisions for the public sector. This information would supplement the information provided under either Alternative 1 or Alternative 2.

Additional examples of Other Metrics that may be submitted are listed in Appendix E. The examples described in Appendix E are not intended to be a complete list, nor a list of factors that will be relevant in every community. Rather, they provide an illustration of information that may prove useful in some instances. For such information to illustrate that a community's situation is atypical, EPA encourages communities to compare any additional information on their circumstances to national averages or to that of other communities in their state or geographic area (see example in Exhibit 8).

e. Schedule Development

When developing implementation schedules to construct control measures to meet CWA requirements, a community should consider public health, environmental justice, and environmental impacts as well as financial capability. The community should first develop a tentative implementation schedule based on logical engineering sequencing and normal construction practices. The community should complete a critical

NMED Exhibit 18

path analysis to identify the shortest implementation schedule that will achieve required control objectives. As a result of negotiations with state NPDES and EPA authorities, it may be appropriate to modify the tentative design and construction schedule based on the environmental and financial considerations listed in the FCA Guidance. In addition to completing an analysis under Alternative 1 or 2, a community should consider the following public health and environmental impacts when determining the sequencing and priority of projects.[26]

1. Environmental and Public Health Considerations

Discharges to Sensitive Areas: The CSO Control Policy states that a community's long-term control plan (LTCP) should give the highest priority to "sensitive areas." Sensitive areas, as determined by NPDES permitting authorities in coordination with state and Federal agencies, as appropriate, include the following: Outstanding National Resource Waters; National Marine Sanctuaries; waters with threatened or endangered species and their habitat; waters with primary contact recreation; public drinking water intakes and their designated protection areas; and shellfish beds. For discharges to sensitive areas, the CSO Control Policy states that LTCPs should: prohibit new or significantly increased overflows; eliminate or relocate overflows; or, where elimination or relocation is not feasible, provide treatment to meet WQS and regularly assess the feasibility of prohibition, relocation, or elimination.[27]

During the LTCP planning process, a community should characterize existing CSO conditions and identify receiving waters that are sensitive areas. The LTCP should give priority to sensitive areas and any implementation schedule should sequence projects to mitigate impacts on sensitive areas as early as possible. Giving highest priority to sensitive areas might mean in some cases that discharges to non-sensitive areas would be addressed later in the implementation schedule than would be the case under a normal engineering and construction schedule.

The identification of an area as "sensitive" is based on the designated use of a water body established by a state or authorized tribe as part of its water quality standards. If a use is not attainable for one of the reasons in 40 CFR 131.10(g) and is not an existing use (as defined in 40 CFR 131.3), a state or authorized tribe may revise the designated use with a supporting use attainability analysis (UAA) and must then adopt the highest attainable use.

Use Impairment: LTCPs should also give priority to receiving waters that experience recurring adverse impacts on aquatic life, human health, or aesthetics. Such waters may be the subject of public concern. As a result of public participation and discussion with the permitting authority, the community should develop an implementation schedule that gives highest priority to waters with impaired uses and addresses them as soon as possible. As is the case with sensitive areas, giving highest priority to certain use-impaired waters might mean that discharges to other waters would be addressed later in the implementation schedule than would be the case under a normal engineering and construction schedule.

[26] In addition, in accordance with the Integrated Planning Framework, integrated plans that are incorporated into permits and enforcement actions should prioritize the most significant human health and environmental needs first.

[27] See 59 Fed. Reg. at 18696.

NMED Exhibit 18

Public Health: While SSOs cannot be permitted, they can be the subject of CWA enforcement actions. Even where an SSO does not reach a water of the United States, it can be a violation of a permit obligation to properly maintain and operate a sanitary sewer system. Accordingly, where basement backups of raw sewage and the ejection of raw sewage from manholes onto streets are CWA permit violations, reducing exposure to this raw sewage should be a priority in any schedule that is negotiated with the community to protect public health.

Environmental Justice: The guiding principle of environmental justice is the fair treatment and involvement of all people regardless of race, color, culture, national origin, income, and educational levels with respect to the development, implementation, and enforcement of protective environmental laws, regulations, and policies. Communities can use EPA's EJSCREEN tool[28] when assessing whether there may be environmental justice concerns within their service area, such as areas with: people of color and/or low-income households; potential environmental quality issues; and/or existing environmental quality impairments in an area with demographic factors that suggest the community is sensitive to environmental pollution.[29] Any implementation schedule should sequence projects to mitigate public health and environmental impacts to areas with potential environmental justice concerns as early as possible. For WQS decisions, in addition to completing an economic analysis under Section III and considering any other financial metrics, a community or state is strongly encouraged to consider opportunities to mitigate impacts of WQS decisions on areas with potential environmental justice concerns. See Section III for additional discussion. Before seeking an to extend a CWA compliance schedule, EPA also encourages communities to actively involve the affected public by holding public meetings. The affected public includes rate payers, industrial users of the sewer system, persons who reside downstream from the CSOs, persons who use and enjoy these downstream waters, community organizations, and any other interested persons (including low-income communities, people of color, and immigrant populations). For any change to WQS, a public hearing is required per 40 CFR 131.20.

2. Alternative 1 Schedule Development

This guidance does not dictate specific implementation schedules based on financial capability. It does, however, provide recommended implementation schedule benchmarks in Exhibit 9 to aid all parties in negotiating reasonable and effective schedules for implementation of CWA controls. Exhibit 9 should be used after all critical metrics in Alternative 1 have been calculated to determine the community's overall impact level using the Expanded FCA Matrix and a Financial Alternatives Analysis has been performed, where appropriate.

The results of the Expanded FCA Matrix correspond to the recommended implementation schedule benchmarks in Exhibit 9, below. EPA has developed these schedule benchmarks to account for the consideration of the LQPI Score and the Financial Alternatives Analysis. Based on EPA's experience

[28] EPA has developed an environmental justice mapping and screening tool called EJSCREEN. It is based on nationally consistent data and an approach that combines environmental and demographic indicators in maps and reports. Screening results should be supplemented with additional information and local knowledge to get a better understanding of the issues in a selected location. EJSCREEN is available at https://www.epa.gov/ejscreen.

[29] Overview of Demographic Indicators in EJSCREEN is available at https://www.epa.gov/ejscreen/overview-demographic-indicators-ejscreen.

NMED Exhibit 18

considering financial capability for enforcement-related compliance schedules over the past nearly three decades, EPA has found that, absent the consideration of Other Metrics, it is financially feasible for communities to implement measures for compliance with the CWA that would have a "medium" impact within 15 years and to implement measures that would have a "high" impact within 20 years. In unusually high impact situations, implementation schedules generally up to 25 years have been negotiated with state NPDES and EPA authorities based on consideration of Other Metrics.

CWA compliance schedules should seek to achieve the earliest practicable compliance date considering physical and financial feasibility.[30] Where a community has not completed a comprehensive Financial Alternatives Analysis, the recommendations for compliance schedules are shorter than for those communities that have developed a comprehensive Financial Alternatives Analysis. This is because, without the types of information developed in a Financial Alternatives Analysis, it will likely be more difficult for EPA to assess possible financial impacts and whether those impacts might outweigh the environmental impacts of extended noncompliance. Where communities seek to extend compliance schedules based on an updated FCA, the environmental, public health, environmental justice, and additional financial considerations discussed in Appendix C and throughout this Section II.e (Schedule Development) should be key elements of any such updated analysis. In addition, reopening a previously approved compliance schedule to seek a schedule extension also involves consideration of whether additional control measures may be required for compliance with the CWA.

Exhibit 9. Recommended Implementation Schedule Benchmarks for Alternative 1

EXPANDED FCA MATRIX RESULT	RECOMMENDED IMPLEMENTATION SCHEDULE BENCHMARKS
Low Impact	Normal Engineering/Construction Schedule
Medium Impact	Total schedule generally up to 10 years
Medium Impact with Comprehensive Financial Alternatives Analysis	Total schedule generally up to 15 years
High Impact	Total schedule generally up to 15 years (or 20 years based on further negotiation with EPA and state NPDES authorities)
High Impact with Comprehensive Financial Alternatives Analysis	Total schedule generally up to 20 years (or 25 years based on further negotiation with EPA and state NPDES authorities)

It is important to note that EPA evaluates financial capability on a continuum and that each decision is subject to consideration of unique facts at issue for the community. Although the Expanded FCA Matrix categorizes impact as "high," "medium," or "low," this does not necessarily mean that communities will be given the specified number of years within that category or that schedules will be rigidly set according to the break points between the categories. For example, two communities whose total residential household costs are 1.1% and 1.9% of MHI are both categorized in the FCA Guidance as having a "mid-range" impact for the Residential Indicator. All other things being equal, the appropriate schedules for those communities are likely to be different. Similarly, all other things being equal, two communities whose LQIs are 24% below the

[30] See 59 Fed. Reg. at 18690.

NMED Exhibit 18

national LQI and 26% below the national LQI would be more likely to have similar overall compliance timeframes, even though one community is ranked as having a "mid-range" score and the other as having a "weak" score. Where schedules of work are phased, the goal should still be to complete the project within the recommended time frames and prioritize the most environmentally important projects as early as possible. In addition, communities should continue to make capital investments to meet water quality standards even if they are "high" impact communities.

Finally, the types of data described in the FCA Guidance are not exhaustive. Other Metrics submitted by the community may affect the length of the schedule regardless of where the community is on the "high," "medium," and "low" continuum. Consistent with previous policy, EPA plans to consider any relevant financial or demographic information presented that illustrates unique or atypical circumstances faced by a community. Where appropriate, this information can result in schedules that are different than the schedules suggested by the baseline analysis in the FCA Guidance.

Exhibit 10 below describes four hypothetical schedule determinations where the critical metrics, Other Metrics, and environmental considerations were assessed together to develop implementation schedules.

Exhibit 10. Example Schedule Development for Hypothetical Communities

SCHEDULING CONSIDERATION	COMMUNITY #1	COMMUNITY #2	COMMUNITY #3	COMMUNITY #4
Engineering/Construction Schedule	9 years	9 years	9 years	9 years
Sensitive Areas	n/a	2 years to remove discharges from sensitive areas	n/a	n/a
Use Impairment	n/a	2 years to remove discharges from waters with impaired uses	n/a	n/a
Environmental Justice	Potential EJ concerns identified	n/a	n/a	Potential EJ concerns identified
Financial Capability	FCA Result = Low Impact	FCA Result = Medium Impact	FCA Result = High Impact	FCA Result = High Impact
Significant Drinking Water Costs	n/a	2 additional years	2 additional years	2 additional years
Comprehensive Financial Alternatives Analysis	No	Yes	No	Yes
Schedule:	9 years (reduction of discharges in areas with EJ concerns within first 3 years)	17 years (removal of discharge from sensitive area and waters with impaired uses within first 2 years)	17 years	22 years (reduction of discharges in areas with EJ concerns within first 5 years)

NMED Exhibit 18

3. Alternative 2 Schedule Development

Under Alternative 2, EPA plans to consider the impacts on households as well as the LQPI Score and Financial Alternatives Analysis when approving implementation schedules that seek to avoid rates that represent an overly burdensome percentage of household income.

Under Alternative 2, communities are encouraged to submit any additional documentation (Other Metrics) that would create a more accurate and complete picture of their financial capability. Any Other Metrics that have been submitted for consideration should supplement the financial and rate model, LQPI Score, and Financial Alternatives Analysis. In addition, communities should consider the public health and environmental impacts described in Section II.e.1 when determining the sequencing and priority of projects. Schedules developed using Alternative 2 should be generally consistent with Exhibit 9's recommended implementation schedule benchmarks.

III. Updated FCA Guidance for Economic Impact Analysis for WQS Decisions for the Public Sector

In addition to recommending analyses communities can use to assess financial capability when negotiating compliance schedules, the FCA Guidance supplements the public sector sections of the 1995 WQS Guidance to assist states and authorized tribes in assessing the degree of economic and social impact of potential WQS decisions. The FCA Guidance does not revise the recommended methodology in the private sector sections of the 1995 WQS Guidance.

EPA recommends the following expanded multi-step approach to evaluate economic impacts for WQS decisions:

1. Determine the Initial Economic Impact using the Municipal Preliminary Screener (MPS) and Secondary Score (SS) as recommended by the 1995 WQS Guidance.
2. Determine the Lowest Quintile Poverty Indicator (LQPI) score.
3. Perform a Financial Alternatives Analysis.
4. Combine the results of the Initial Economic Impact and the LQPI score in an Expanded Economic Impact Matrix.

EPA intends for the FCA Guidance to supplement the public sector portion of the 1995 WQS Guidance. Specifically, the FCA Guidance supplements the calculations and analyses in the public sector portion of the 1995 WQS Guidance[31] with additional analyses, an Expanded Economic Impact Matrix, and recommendations to consider when making WQS decisions. EPA intends the FCA Guidance, together with the text in the public sector sections of the 1995 WQS Guidance, to guide states and authorized tribes in evaluating the economic

[31] Online spreadsheet tools for the public sector can be found at https://www.epa.gov/wqs-tech/spreadsheet-tools-evaluate-economic-impacts-public-sector. EPA may update these online tools in the future.

NMED Exhibit 18

impact of potential WQS decisions related to financial capability. EPA is also recommending certain additional analyses or actions when considering revisions to designated uses that are based on economic impacts.

WQS decisions relevant to this document include revisions to designated uses, WQS variances, and antidegradation reviews. The WQS regulations at 40 CFR 131.10(g)(6), commonly referred to as "Factor 6," allow revisions to designated uses or the adoption of WQS variances if a state or authorized tribe can demonstrate that attaining the use is not feasible because controls more stringent than the technology-based requirement would result in both substantial and widespread economic and social impacts.[32] In addition, the WQS regulations at 40 CFR 131.12(a)(2) allow lowering of water quality if it is necessary to accommodate important economic or social development in the area in which the high-quality waters are located.[33] Although the analyses recommended in the 1995 WQS Guidance to support WQS decisions and the 1997 FCA Guidance to determine the length of compliance schedules are essentially the same, as explained in Section I.b, there is an important difference in the way the information from those analyses were applied: the 1997 FCA Guidance was intended for development of implementation schedules to construct control measures to meet CWA requirements, whereas the 1995 WQS Guidance was intended to support binary "yes or no" decisions.

This section is organized as follows:

- Section III.a describes the Agency's rationale and expectations for the use of this guidance as it relates to Factor 6 for WQS variances and revisions to designated uses and why there are additional considerations for changes to designated uses.
- Section III.b discusses the consideration of other opportunities to mitigate the negative impacts of WQS decisions that may affect communities with potential environmental justice concerns.
- Section III.c describes consideration of any additional information and documentation to better understand a community's financial capability.
- Section III.d describes the multi-step approach to evaluate economic impacts of WQS decisions on the public sector. Importantly, Section III.d.5 describes how application of the results from the Financial Alternatives Analysis are combined with the results of the Expanded Economic Impact Matrix.

[32] The analysis in this guidance only serves to determine if impacts are "substantial." A state or authorized tribe would still need to conduct an analysis to demonstrate the substantial impacts are "widespread."

[33] The analysis is this guidance only serves to determine whether the economic or social development in the area in which the waters are located is "important." A state or authorized tribe would still need to conduct an analysis of pollution control alternatives, consistent with 40 CFR 131.12(a)(2)(ii), to determine if such a lowering is "necessary."

NMED Exhibit 18

a. Rationale and Expectations for the Use of this Guidance as it Relates to Factor 6 for WQS Variances and Revisions to Designated Uses

Unlike the revision of a designated use, a WQS variance is time-limited, is for a specific pollutant from a specific source(s) or a specific water body, and reflects the highest attainable condition for a specified period. A WQS variance provides a transparent mechanism to allow states and authorized tribes to make water quality improvements towards the eventual attainment of the designated use with timeframes that are justified and enforceable in NPDES permits. The metrics and thresholds in the 1997 FCA Guidance, 1995 WQS Guidance, and Alternative 1 of this FCA Guidance are based on an analysis of financial and economic data that reflect conditions during a particular period of time and are dynamic – i.e., a "snapshot" of financial and socio-economic data. As such, the metrics and analyses of the FCA Guidance are well-suited and most appropriate for evaluating requests for WQS variances under 40 CFR 131.10(g)(6) because the time-limited nature of a WQS variance ensures that changes in financial conditions would be considered if and when there is a request for a subsequent variance or at the time of reevaluation for a WQS variance with a duration longer than five years.

EPA has had considerable experience and success negotiating the schedule of water quality improvements under CWA consent decrees using the analytical approach in the 1997 FCA Guidance and evaluating time-limited WQS variances based on 40 CFR 131.10(g)(6) using the analytical approach in the 1995 WQS Guidance; however, the same cannot be said for revisions of designated uses (including revisions to less stringent use subcategories). While the analyses and metrics of Alternative 1 recommended in this FCA Guidance may be considered in evaluating requests for use revisions or a change to a less stringent use subcategory, EPA recommends caution in doing so because the analyses and metrics do not include a temporal component. To that end, EPA recommends states and authorized tribes first explore whether there are other factors under 40 CFR 131.10(g) that preclude attainment of the designated use when considering a revision to a designated use or a change to a less stringent use subcategory. These other factors involve evaluating environmental conditions that are less likely to change over time and are more likely to impact all segments of a community evenly, as opposed to evaluating economic conditions that are dynamic and more likely to be unevenly distributed within in a community.

When states and authorized tribes choose to pursue a use change or a change to a less stringent use subcategory based on 40 CFR 131.10(g)(6), they must first demonstrate the use is not an existing use as defined in 40 CFR 131.3. Additionally, an appropriate demonstration supporting a revision to a use or a change to a less stringent use subcategory must satisfy all the requirements in the WQS regulations at 40 CFR part 131, including those at 40 CFR 131.10, and would include the expanded multi-step approach to evaluate economic impacts as described in Section III.d. Further, there are additional analyses and actions EPA recommends when considering a revision to a designated use or a change to a less stringent use subcategory: 1) a trend analysis of the LQPI Score (see Section II.a.3) over the most recent 10-year period to ensure that the prevalence and severity of poverty is representative of the community's low-income households over time; and 2) an evaluation of up-to-date economic information (including consideration of future debt capacity) when evaluating an initial request or when conducting triennial reviews in accordance with WQS

NMED Exhibit 18

regulations[34] to determine whether the original designated use or more stringent use subcategory is now attainable.

b. WQS Decisions with Potential Environmental Justice Concerns

In addition to completing an economic analysis that includes the Financial Alternatives Analysis described in Section III.d.3 and the consideration of any other applicable financial metrics, a community, state, or authorized tribe is strongly encouraged to consider other opportunities to mitigate the negative impacts of WQS decisions that may affect areas with potential environmental justice concerns. For example, EPA recommends activities required in a WQS variance be sequenced in a manner that mitigates impacts to areas with potential environmental justice concerns as early as possible. In addition, EPA recommends the state or authorized tribe provide opportunities for public comments on potential environmental justice concerns during the public hearings required by the WQS regulations when proposing changes to designated uses and during subsequent triennial reviews.

c. Consideration of Additional Community-Specific Information

Because the critical metrics and analysis EPA recommends in the FCA Guidance may not always provide a complete picture of a community's financial capability, EPA encourages states and authorized tribes to include any additional information and documentation they deem relevant to understanding the economic impacts of potential WQS decisions on a community. In addition to the recommended critical metrics in Alternative 1, financial and rate models in Alternative 2 (as discussed in Section II.b.1) and Other Metrics (as discussed in Sections II.c and II.d) may provide additional information for consideration in WQS decision-making. However, EPA does not recommend the use of financial and rate models alone for supporting WQS decisions. Although financial and rate models may provide information on the impact of different rate scenarios over time that may be useful for determining a compliance schedule or the appropriate term of a WQS variance, these models alone do not provide sufficient information to determine if required wastewater treatment projects would result in substantial economic and social impacts. Nor do they indicate whether lowering of water quality would be necessary to accommodate important economic or social development. Furthermore, the binary "yes or no" decision-making associated with WQS actions would be difficult using financial and rate models alone because Alternative 2 does not include specific thresholds for determining reasonable rates that would be uniformly applicable across all communities.

[34] 40 CFR 131.20(a): "The State shall from time to time, but at least once every 3 years, hold public hearings for the purpose of reviewing applicable water quality standards adopted pursuant to §§ 131.10 through 131.15 and federally promulgated water quality standards and, as appropriate, modifying and adopting standards. The State shall also re-examine any waterbody segment with water quality standards that do not include the uses specified in section 101(a)(2) of the Clean Water Act every 3 years to determine if any new information has become available. If such new information indicates that the uses specified in section 101(a)(2) of the Act are attainable, the State shall revise its standards accordingly …".

NMED Exhibit 18

d. Steps to Evaluate Potential Economic Impacts on Public Entities

1. Determine the Initial Economic Impact

Calculate the Municipal Preliminary Screener (MPS) and Secondary Score (SS) for use in this step as recommended in the 1995 Guidance and the online tools at: https://www.epa.gov/wqs-tech/spreadsheet-tools-evaluate-economic-impacts-public-sector. Then, apply the MPS and SS results to Exhibit 11 below to determine the initial economic impact on the public entity. Exhibit 11 below is effectively the same as Table 2-2 in the public sector section of the 1995 WQS Guidance.

Exhibit 11. Initial Economic Impact

SECONDARY SCORE (SS)	MUNICIPAL PRELIMINARY SCREENER (MPS) (COST AS A PERCENT OF MEDIAN HOUSEHOLD INCOME)		
	BELOW 1.0%	1.0% TO 2.0%	ABOVE 2.0%
Below 1.5 (Weak Economy)	Impact Unclear	Substantial Impact	Substantial Impact
1.5 to 2.5 (Mid-Range Economy)	Impact Not Likely to be Substantial	Impact Unclear	Substantial Impact
Above 2.5 (Strong Economy)	Impact Not Likely to be Substantial	Impact Not Likely to be Substantial	Impact Unclear

2. Determine the Lowest Quintile Poverty Indicator Score

Calculate the Lowest Quintile Poverty Indicator (LQPI) score as described in Section II.a.3.

3. Perform a Financial Alternatives Analysis

EPA recommends performance of a Financial Alternatives Analysis. The goal of this step is to seek ways to minimize financial impacts while ensuring residents also enjoy the benefits of infrastructure investments and improved water quality. WQS revisions that lower the goals for a water body may create environmental justice concerns by potentially widening water quality and health disparities among communities. On one hand, low-income households may be paying a higher percentage of their total income for basic services and clean water, but on the other hand, if WQS decisions lower the water quality goals of a community, overburdened and/or low-income neighborhoods will likely continue to suffer impacts to human health and the environment from lower water quality.

When CWA compliance costs impact residents (particularly low-income households), WQS variances, designated use changes, or lowering water quality through antidegradation reviews may not be the best solution to address impacts to those residents. In particular, if a community shows strong economic indicators in other categories, there may be better options for the community to address the potential financial burden faced by its residents or take other steps to reduce the costs of needed CWA controls. If the intended goal is to address impacts to residents, allowing lowering of water quality may have the opposite

NMED Exhibit 18

effect by increasing pollution in the neighborhoods where they live. Nonetheless, EPA understands the significant impacts that additional costs can pose to communities, especially underserved and lower-income communities.

A Financial Alternatives Analysis can support lowering of water quality where there is a holistic financial strategy to balance the financial and environmental impacts. The analysis should document whether the community has considered feasible steps to reduce costs and address impacts to low-income households, including use of variable rate structures, CAPs, and applications for grants or subsidies from the CWSRF. Use of variable rate structures, CAPs, and grants or subsidies from the CWSRF are all potential tools to enable meeting water quality standards or avoiding the lowering of water quality associated with antidegradation reviews without burdening low-income customers. The demonstration of a comprehensive Financial Alternatives Analysis should include the results of the "checklist" of financing and funding considerations in Appendix C[35] and describe the specific programs being implemented. The community[36] should provide a list of the programs or steps considered, the actions that would be necessary to put such measures into place, and the plan for taking those actions. Where available tools are not included in the community's plans, it should provide a written explanation of why those approaches are not being pursued. EPA has provided an Example Financial Alternatives Worksheet in Appendix C that can help document this information. A community can demonstrate through the Financial Alternatives Analysis that it has taken or is pursuing feasible steps included in Appendix C to lower costs of compliance and reduce or mitigate the financial impact of water service costs on the community's low-income households. The first-line responsibility for balancing financial impacts while achieving clean water improvements rests with the local community. However, EPA is committed to carefully reviewing financial impacts and using the tools and technical assistance at the Agency's disposal to help local communities mitigate environmental (and related financial and societal) impacts of CWA noncompliance for communities.

EPA recognizes that whether a particular financial alternative is feasible may be different for entities such as a sanitary district or sewer authority. For instance, a utility may not be the rate setting authority for its entire service area if it serves wholesale customers. Certain utilities may need to work with the municipality or municipalities it serves as well as their state or authorized tribe to obtain the information to complete the Financial Alternatives Analysis. Users of this guidance should document any relevant differences in feasibility or practicality (see, e.g., Column B of the Example Financial Alternatives Worksheet) for consideration by EPA. Understanding such differences allows for WQS decisions that are responsive to circumstances unique to each community while advancing the goal of protecting clean water.

Performing the Financial Alternatives Analysis, especially at the beginning of an economic impact analysis for WQS decisions, may help provide the community with a clearer understanding of all costs associated with the

[35] A financial or funding consideration listed in Appendix C may be prohibited by state law. Other mechanisms to achieve the same goals may be feasible alternatives. There are examples, which can be found in Appendix C, of communities that have implemented similar or analogous mechanisms to reduce financial impacts within the limits of the relevant legal boundaries.

[36] For WQS decisions, a community may perform the Financial Alternatives Analysis and provide it to the state or authorized tribe. However, regardless of who performs the Financial Alternatives Analysis, the state or authorized tribe is responsible for evaluating the information and documenting how the information supports the WQS decision. Where required, the state or authorized tribe would also provide this information to EPA.

NMED Exhibit 18

implementation of CWA controls, such as reduced costs associated with low-interest loans, increased revenue from utility fees, or the costs associated with programs that assist low-income households. Where a community has implemented certain financial alternatives, the associated costs or cost savings from those alternatives could be accounted for in the Municipal Preliminary Screener and Secondary Score. Communities should demonstrate how the CWA-associated costs in the financial capability assessment will be implemented, including appropriate assurances that those expenditures will be made. Without the types of information developed in the Financial Alternatives Analysis, it will likely be more difficult for EPA to assess possible economic impacts and whether those impacts might outweigh the environmental impacts of a WQS variance, the revision of a designated use, or the lowering of water quality through an antidegradation review. Thus, recommendations for WQS decisions, as shown in Exhibit 13, are more conservative without a Financial Alternatives Analysis.

Considerations for Resource Constraints, In Particular for Small Communities

EPA recognizes that not all communities have the capability to fully evaluate the tools identified in Appendix C. If there are resource concerns with completing a Financial Alternatives Analysis, the community should seek support in completing a Financial Alternatives Analysis through EPA's Water Finance Center by sending an email to WaterTA@epa.gov. If resource constraints remain, the community should provide information on current and planned efforts to relieve impacts on low-income residential households in a format that represents a good-faith effort relative to the size of the community's service area. Without the types of information developed in a Financial Alternatives Analysis, it will likely be more difficult for EPA to assess likely impacts to low-income households and determine whether those impacts outweigh the environmental impacts of lower water quality from WQS revisions or antidegradation reviews. EPA understands for small communities, particularly those serving a population less than 3,000, it may not be feasible to make a good faith effort. The Agency will be mindful of those resource constraints when evaluating WQS decisions. In addition, the Agency recommends that the NPDES permitting authority be mindful of such constraints when conducting antidegradation reviews.

4. Combine the Initial Economic Impact and LQPI Score

Use the Expanded Economic Impact Matrix in Exhibit 12 below to combine the results from the Initial Economic Impact (Exhibit 11) and the LQPI score (from Step 2).

Exhibit 12. Expanded Economic Impact Matrix

INITIAL ECONOMIC IMPACT (MPS AND SS)	LOWEST QUINTILE POVERTY INDICATOR (LQPI) SCORE		
	LOW IMPACT	MEDIUM IMPACT	HIGH IMPACT
Impact Not Likely to be Substantial	Impact Not Likely to be Substantial	Impact Not Likely to be Substantial	Impact Unclear
Impact Unclear	Impact Not Likely to be Substantial	Impact Unclear	Substantial Impact
Substantial Impact	Impact Unclear	Substantial Impact	Substantial Impact

NMED Exhibit 18

5. Recommendations for Making WQS Decisions Related to Economic Impacts for the Public Sector

Exhibit 13 shows EPA's recommendations for making WQS decisions after applying the Expanded Economic Impact Matrix from Exhibit 12, including consideration of financial alternatives where appropriate and additional analyses when evaluating changes to designated uses. EPA notes that Exhibit 13 does not indicate that WQS decisions should be rigidly determined according to the break points between the categories. Information on Other Metrics or analysis of financial and rate models may provide additional information that could influence WQS decisions. Further, EPA recommends that in addition to completing the economic analyses recommended in this section and considering any other financial metrics, opportunities to mitigate impacts of WQS decisions to areas with potential environmental justice concerns should be considered (see Section III.b).

The Financial Alternatives Analysis provides especially critical information to facilitate WQS decisions that strive to restore and maintain water quality to the greatest extent possible consistent with the objectives of the CWA. Performance of a Financial Alternatives Analysis in accordance with Section III.d.3 and Appendix C including loans, grants, customer assistance programs, and alternative rate structures may reveal the ability to attain the designated use or avoid the need to lower water quality, and the ability to mitigate impacts to low-income communities. An appropriate economic justification for a WQS variance, revision of a designated use, or lowering of water quality associated with an antidegradation review should demonstrate that implementation of feasible financial alternatives under current or reasonably expected future economic conditions (including consideration of future debt capacity) would still result in substantial economic impact that would preclude the designated use from being attained[37] or would justify lowering water quality to accommodate important economic or social development.

Performance of a Financial Alternatives Analysis provides important information when interpreting the outcome of Exhibit 12. As previously noted, without the types of information developed in a Financial Alternatives Analysis, it will likely be more difficult for EPA to assess possible economic impacts and whether those impacts might outweigh the environmental impacts of a WQS variance, the revision of a designated use, or the lowering of water quality through an antidegradation review. Thus, as shown in Exhibit 13, recommendations for WQS decisions are more conservative without a Financial Alternatives Analysis.

[37] The regulations at 40 CFR 131.10(g) require adoption of the highest attainable use when adopting a new or revised water quality standard based on the required use attainability analysis. A Financial Alternatives Analysis could inform the determination of the highest attainable use.

NMED Exhibit 18

Exhibit 13. Recommendations for Making WQS Decisions for the Public Sector

RESULTS OF EXPANDED ECONOMIC IMPACT MATRIX	DID NOT PERFORM A FINANCIAL ALTERNATIVES ANALYSIS[38]	PERFORMED A COMPREHENSIVE FINANCIAL ALTERNATIVES ANALYSIS
IMPACT NOT LIKELY TO BE SUBSTANTIAL	**WQS variances and designated use revisions:** Not likely to demonstrate substantial economic impacts (40 CFR 131.10(g)(6)).[39] **Antidegradation reviews:** Not likely that economic or social development in the area in which the waters are located is important (40 CFR 131.12(a)(2)).[40]	
IMPACT UNCLEAR	**WQS variances and designated use revisions:** Not likely to demonstrate substantial impacts (40 CFR 131.10(g)(6)). **Antidegradation reviews:** Not likely that economic or social development in the area in which the waters are located is important (40 CFR 131.12(a)(2)).	**WQS variances:** Substantial impact (40 CFR 131.10(g)(6)) is likely unclear. Consider evaluation of other metrics (described in Sections II.c and II.d) or financial and rate models (Alternative 2 in Section II.b.1). **Designated use revisions:** Consider the Expanded Economic Matrix results in concert with the results of the Financial Alternatives Analysis and additional analyses and actions described in Section III.a for use changes. Also, consider evaluation of other metrics (described in Sections II.c and II.d) or financial and rate models (Alternative 2 in Section II.b.1). If substantial impacts remain unclear, consider whether a use change is appropriate at this time. **Antidegradation reviews:** Unclear that economic or social development in the area in which the waters are located is important (40 CFR 131.12(a)(2)). Consider evaluation of other metrics (described in Sections II.c and II.d) or financial and rate models (Alternative 2 in Section II.b.1).
SUBSTANTIAL IMPACT	**WQS variances:** Substantial impact is unclear (40 CFR 131.10(g)(6)). Consider evaluation of other metrics (described in Sections II.c and II.d) or financial and rate models (Alternative 2 in Section II.b.1). **Designated use revision:** Substantial impact is unclear (40 CFR 131.10(g)(6)). Consider additional analyses and actions described in Section III.a. Consider evaluation of other metrics (described in Sections II.c and II.d) or financial and rate models (Alternative 2 in Section II.b.1). Depending on result of such additional analyses, consider whether a use change is appropriate at this time. **Antidegradation reviews:** Unclear that economic or social development in the area in which the waters are located is important (40 CFR 131.12(a)(2)). Consider evaluation of other metrics (described in Sections II.c and II.d) or financial and rate models (Alternative 2 in Section II.b.1).	**WQS variances:** Substantial impacts likely (40 CFR 131.10(g)(6)). **Designated use revision:** Consider the results of the Expanded Economic Matrix in concert with the results of the Financial Alternatives Analysis and additional analyses and actions described in Section III.a for use changes to determine whether overall results continue to support a demonstration of substantial impact (40 CFR 131.10(g)(6)). **Antidegradation reviews:** Likely that economic or social development in the area in which the waters are located is important (40 CFR 131.12(a)(2)).

[38] EPA understands small communities, particularly those serving a population less than 3,000, may have resource constraints to make a good faith effort to conduct a Financial Alternatives Analysis. The Agency will be mindful of those resource constraints when evaluating WQS decisions. In addition, the Agency recommends that the NPDES permitting authority be mindful of such constraints when conducting antidegradation reviews.

[39] The analysis in this guidance only serves to determine if impacts are "substantial." A state or authorized tribe would still need to conduct an analysis to demonstrate the substantial impacts are "widespread."

[40] The analysis is this guidance only serves to determine whether the economic or social development in the area in which the waters are located is "important." A state or authorized tribe would still need to conduct an analysis of pollution control alternatives, consistent with 40 CFR 131.12(a)(2)(ii), to determine if such a lowering is "necessary."

Appendix D. Resource Reference Guide for Utility/Community Financial Assistance

Appendix E. Examples of Other Metrics Relevant to Consideration of Financial Capability

NMED Exhibit 18

Appendix A. Residential Indicator Worksheets

Residential Indicator Worksheets UPDATED (2023)

This appendix contains an updated version of the steps necessary to prepare the Residential Indicator. The worksheets and instructions are largely identical to EPA's 1997 *Combined Sewer Overflows – Guidance for Financial Capability Assessment and Schedule Development*. Since data sources have evolved, this update recognizes the inputs that can be found today. In addition, "Practice Tips" in text boxes are incorporated to provide additional guidance on aspects of the Residential Indicator calculation that EPA has found are common questions and can benefit from additional direction.

CRITICAL METRIC: THE RESIDENTIAL INDICATOR

The Residential Indicator measures the financial impact of the current and proposed Clean Water Act (CWA) controls on residential users. Development of this indicator starts with the determination of the current and proposed wastewater system control costs per household (CPH). Second, the service area's CPH estimate and the median household income (MHI) are used to calculate the Residential Indicator. Finally, the Residential Indicator is compared to established financial impact ranges to determine whether required CWA controls will produce a possible "high," "mid-range," or "low" financial impact on the permittee's residential users. Worksheets are provided to aid in developing the Residential Indicator.

Developing CPH Estimate

The first step in developing the CPH is to determine the permittee's total wastewater treatment (WWT) and collection system costs by adding together the current costs for existing wastewater treatment operations and the projected costs for any proposed CWA controls. The next step is to calculate the residential share of the total system costs. The final step is to calculate the CPH by dividing the residential share of total costs by the number of households in the permittee's total wastewater service area.

PRACTICE TIP: The total wastewater service area should include all retail and wholesale areas served.

Current wastewater system costs are defined as current annual wastewater operating and maintenance expenses (excluding depreciation) plus current annual debt service (principal and interest). This fairly represents cash expenses for current wastewater treatment operations. (Expenses for funded depreciation, capital replacement funds, or other types of capital reserve funds are not included in current WWT costs, because they represent a type of savings account rather than an actual operation and maintenance expense.)

NMED Exhibit 18

PRACTICE TIPS:

For a service area with wholesale customers, current costs should also include the wholesale customers' operations and maintenance (O&M) and debt service incurred to provide retail service and delivery of wastewater to the primary community. This information can be inserted as an explicit line item so that the calculation is transparent.

The community may provide more detailed breakout of O&M costs as sub-parts. These may include historical average asset management and payment-in-lieu of taxes (PILOT). Note that the community should perform a sensitivity analysis on the addition of PILOT to determine the overall impact on residential households with and without PILOT.

Estimates of total projected costs are made for any proposed CWA controls. Any concerns about including specific proposed WWT projects, combined sewer overflow (CSO) or other CWA controls in the projected costs, or the length of the planning period, should be discussed with the appropriate NPDES permitting and enforcement authorities. These costs should be provided in consistent year dollars and include projected increased operation and maintenance expenses plus projected debt service costs for any proposed WWT and CWA controls. The information and calculations used to develop the CPH and the Residential Indicator are presented in Worksheets 1 and 2 and their instructions.

Worksheet 1 Instructions

Current Costs: Enter the requested data on lines 100 through 109 of Worksheet 1. The operation and maintenance costs on lines 100 and 103 should include all significant cost categories, such as labor, chemicals, utilities, administration, and equipment replacement. Do not include depreciation on line 100 or line 103.

PRACTICE TIP: Divide lines 100 and 103 into sub-lines to further break out costs (e.g., 100a: O&M Expenses for Core Service Area City; 100b: O&M Expenses for Wholesale Community). An additional line item can be provided for asset management, along with an explanation of the basis for the value.

Projected Costs: Projected costs for compliance are identified on Lines 103 and 104. Costs should be provided in current dollars, preferably consistent with the year of the most recent demographic and current financial data. Adjust the projected annual WWT and CWA costs to current dollars using the appropriate cost indices, preferably for the geographical region of permittee.

PRACTICE TIP: Future capital costs should be in the same year dollars as the current cost data. Use the appropriate engineering construction cost index to adjust projected capital costs or related increased operations costs as necessary.

The annualized debt service cost information for the projected WWT facilities and projected CWA controls (Line 104) can be calculated using an annualization factor, which reflects the local borrowing interest rate and

NMED Exhibit 18

borrowing term of the permittee. For example, if the adjusted projected debt costs (current dollars) are $25,000,000 and typical borrowing terms include an interest rate of eight percent over 20 years, then costs can be annualized with the following calculation:

$$Annual\ Debt\ Service\ Costs = Adjusted\ Debt\ Costs\ \times Annualization\ Factor$$

$$Annual\ Debt\ Service\ Costs = \$25{,}000{,}000\ \times\ .1019 = \$2{,}547{,}500$$

The annualization factor for the example is calculated using the following formula:

$$Annualization\ Factor = \frac{Interest\ Rate}{(1\ +\ Interest\ Rate)^{years}\ -\ 1} + Interest\ Rate$$

$$Annualization\ Factor = \frac{.08}{(1 + .08)^{20} - 1} + .08 = .1019$$

Alternatively, annual debt service costs can be calculated in Excel spreadsheets using the following formula:

$$= -PMT(Interest\ Rate, Term\ of\ Loan\ in\ Years, Present\ Value\ of\ Projected\ Costs)$$

The annualized debt service cost for the projected CWA controls is entered on line 104. Line 104 should include future cash-financed capital. Divide lines 101 and 104 into sub-lines to further categorize debt service costs (e.g., 104a: Annual Revenue Bond Debt Service; 104b: Annual Pay-Go Costs). Add the current and projected wastewater treatment and projected CWA control costs to estimate the total WWT and CWA costs (line 102 + line 105).

PRACTICE TIP: The debt service should be estimated based on the source and type of debt or other financing expected to be used to pay for necessary capital expenditures, including state clean water revolving and pooled funds.

Residential Share: Calculate the residential share of the total cost (line 106) and enter on line 107. The residential share of total costs (line 107) is computed by multiplying the percent of total wastewater flow including infiltration and inflow attributable to residential users by the total costs (line 106).

For example, for a permittee with the following characteristics:

Total Costs:	$12,000,000
Residential Flow:	10.5 Million Gallons per Day
Total Flow:	13.1 Million Gallons per Day

NMED Exhibit 18

PRACTICE TIPS:

The residential share represents costs for all households, whether in single-family homes or in multi-unit condominiums or apartment buildings. Residential costs exclude the portion of expenses attributable to commercial, governmental, and industrial customers. Permittees that treat multi-unit household as commercial accounts within the billing system need to estimate the flows attributable to those households.

In general, the residential share is based on billed flow for residential households. If supported by documentation, the residential share may be adjusted for infiltration and inflow (I&I) based on how the permittee addresses I&I in its bills.

The residential share of the total cost is:

$$Residential\ Share\ of\ Costs = Total\ Costs\ \ x\ \frac{Residential\ Wastewater\ Flow}{Total\ Wastewater\ Flow}$$

$$Residential\ Share\ of\ Costs = \$12{,}000{,}000\ \times \frac{10.5\ Million\ Gallons\ per\ Day}{13.1\ Million\ Gallons\ per\ Day}\ = \$9{,}600{,}000$$

Calculate the CPH (line 109) by dividing total residential share costs (line 107) by the total number of households (line 108) in the permittee's total wastewater service area. The Residential Share percentage in this example is 80.2 percent.

Data Sources

The permittee's latest audited Annual Comprehensive Financial Report should be available to develop the current wastewater treatment costs.[1] In order to comply with accounting requirements, most permittees develop a combined statement of revenues, expenses, and changes in fund balance. These Annual Comprehensive Financial Reports should be available directly from the permittee, or, in some states, from central records kept by the state auditor or other state offices. The permittee may have a separate financial report, or its financial data may be incorporated into a municipality's report.

[1] For many communities, this Financial Report was previously characterized as a Comprehensive Annual Financial Report (CAFR), but the Governmental Accounting Standards Board has since indicated that the CAFR should now be referred to as the "Annual Comprehensive Financial Report."

NMED Exhibit 18

Projected costs in the wastewater service area should be available through the permittee's planning documents. Wastewater service area boundaries also should be available from the permittee, frequently in electronic format. The Census Bureau annually collects American Community Survey (ACS) data on the number of households by Census-designated place. If the permittee's service area is relatively contiguous with political boundaries, then do a search for "Census QuickFacts" with the name of the town or county. Alternatively, Census Table B25002 (refer to https://data.census.gov/cedsci/all?q=B25002) is a resource if a more nuanced estimate is required. Note that "occupied housing units" equals households. The permittee should use the most recent 5-Year ACS Household data in its FCA calculations.

PRACTICE TIPS:

Note that the volume of residential usage may not only include volume for residential customer accounts, but residential households may also be served through multi-unit structures in commercial accounts, such as apartment buildings. Census data can provide information on the number of households in multi-family structures, providing a basis for adjusting the residential usage. The residential share tends to be lower for communities with more commercial or industrial customers, and generally higher in suburban, predominately residential areas.

Particularly for more complex service areas, electronic Geographic Information System (GIS) shapefiles can be analyzed with census electronic files to better characterize the service area households. Many utilities already have GIS mappings of the service area to assist in management of the system. In addition, note that in Census terminology, a "household" is equal to an "occupied housing unit," so data characterizing occupied housing units may be helpful to understanding the nature of the permittee's service area. In addition, the permittee should not use "residential customer" counts to estimate households, as more than one household may occupy a residential customer site, and households may live in commercial multi-unit customer properties.

Residential Share of Total WWT and CWA Costs		107
Total Number of Households in Service Area		108
Cost per Household (Line 107 ÷ Line 108)		109

NMED Exhibit 18

Developing the MHI Estimate

The second step in developing the Residential Indicator is to determine the median household income (MHI) for the permittee's entire wastewater service area. Information and calculations used to develop the MHI value are presented in Worksheet 2 and its instructions.

Worksheet 2 Instructions

Enter the requested information on Worksheet 2, lines 201 through 203. If the permittee's service area is relatively contiguous with political boundaries, then do a search for "Census QuickFacts" with the name of the town or county. Alternatively, Census Table B19013 (refer to https://data.census.gov/cedsci/all?q=B19013) is a resource if a more nuanced estimate is required. The permittee should use the most recent 5-Year Average MHI data in its FCA calculations.

PRACTICE TIP: For more complex service areas, electronic Geographic Information System (GIS) shapefiles can be analyzed with census electronic shapefiles, allowing a more precise characterization of the MHI for service area households. Many permittees already have GIS mappings of the service area to assist in management of the system.

On Worksheet 2, calculate the adjusted MHI by entering the most recent 5-Year census MHI value on line 201. Then enter the MHI Adjustment Factor, if any, on line 202. Finally, multiply the MHI (line 201) by the Adjustment Factor (line 202) and enter the Adjusted MHI on line 203.

PRACTICE TIP: In general, an adjustment factor is not required given that the Census data is the most up-to-date information available. Identify the year of the Census data, and if an adjustment is made, provide an explanation.

If the permittee's service area includes more than one jurisdiction, it may be necessary to develop a weighted MHI for the entire service area. The Bureau of Census's designated MHI areas generally encompass most permittee's service areas. For this reason, the calculation of a weighted MHI usually will not be necessary to reasonably represent the permittee's MHI. When a weighted MHI must be calculated, a weight would be assigned to each jurisdiction to reflect its share of the total households.

NMED Exhibit 18

The following example illustrates how to develop a weighted MHI value. If a permittee is a regional authority that serves three local jurisdictions, the weighted average MHI would be calculated as follows:

JURISDICTION	MHI	NUMBER OF HOUSEHOLDS (HH)
A	$30,000	100,000
B	$45,000	25,000
C	$25,000	50,000
		175,000

$$Weighted\ MHI = MHI_A \left(\frac{HH_A}{Total\ HH}\right) + MHI_B \left(\frac{HH_B}{Total\ HH}\right) + MHI_C \left(\frac{HH_C}{Total\ HH}\right)$$

$$\$30{,}000\left(\frac{100{,}000}{175{,}000}\right) + \$45{,}000\left(\frac{25{,}000}{175{,}000}\right) + \$25{,}000\left(\frac{50{,}000}{175{,}000}\right)$$

$$\$17{,}143 + \$6{,}429 + \$7{,}143 = \$\mathbf{30{,}715}$$

Data Sources

Median household income is available for most communities from the latest annual Census ACS data collection. In the few cases where a local jurisdiction's MHI is not available, the surrounding county's MHI may be sufficient. The Census Bureau provides annual 5-Year Average Median Household Income data in Table B19013.

Developing the Residential Indicator

Worksheet 2 Instructions

To calculate the Residential indicator (line 205 of Worksheet 2), divide the total annual control cost per household (line 109 transferred to line 204) by the Adjusted MHI (line 203) and multiply by 100.

Analyzing the Residential Indicator

The Residential Indicator will be used in the Expanded Financial Capability Matrix to help permittees, and EPA and state NPDES authorities determine reasonable and workable long-term wastewater system control schedules.

NMED Exhibit 18

To assess the financial impact CWA controls may have on the permittee's residential users, the Residential Indicator is compared to the financial impact ranges that reflect EPA's previous experience with water pollution control programs. These ranges are as follows:

FINANCIAL IMPACT	RESIDENTIAL INDICATOR (CPH AS % MHI)
Low	Less than 1.0 Percent of MHI
Mid-Range	1.0 to 2.0 Percent of MHI
High	Greater than 2.0 Percent of MHI

When the Residential Indicator is less than 1.0 percent, 1.0 to 2.0 percent, and greater than 2.0 percent, the financial impact on residential users to implement the CWA controls will be characterized as "low," "mid-range," and "high," respectively. Unless there are significant weaknesses in a permittee's financial and socioeconomic conditions, second phase reviews for permittees that have a low residential indicator score (less than 1.0) are unlikely to result in longer implementation schedules. Permittees with low residential indicators may wish to forego the second phase analysis and proceed with the normal engineering and construction implementation schedule developed as part of the planning process.

In situations where a permittee believes that there are unique circumstances that would affect the conclusion of the first phase, the permittee may submit documentation of its unique financial conditions to the appropriate state NPDES and EPA authorities for consideration.

NMED Exhibit 18

RESIDENTIAL INDICATOR: Worksheet 2

NMED Exhibit 18

Appendix B. Financial Capability Indicators Worksheets

Financial Capability Indicator Worksheets UPDATED (2023)

This appendix contains an updated version of the steps necessary to prepare the Financial Capability Indicators. The worksheets and instructions are largely identical to EPA's 1997 *Combined Sewer Overflows – Guidance for Financial Capability Assessment and Schedule Development*. Since data sources have evolved, this update recognizes the inputs that can be found today. In addition, "Practice Tips" in text boxes are incorporated to provide additional guidance on aspects of the Financial Capability Indicators that EPA has found are common questions and can benefit from additional direction.

CRITICAL METRIC: PERMITTEE FINANCIAL CAPABILITY INDICATORS

Selected indicators are assessed to evaluate the financial capability of the permittee. These indicators will examine the permittee's debt burden, socioeconomic conditions, and financial operations. The second-phase review examines three general categories of financial capability indicators for the permittee:

- **Debt Indicators.** Assess current debt burden of the permittee or the communities within the permittee's service area and their ability to issue additional debt to finance the CWA controls. The indicators selected for this purpose are:
    - Bond Ratings (General Obligation and/or Revenue Bond Fund)
    - Overall Net Debt as a Percent of Full Market Property Value
- **Socioeconomic Indicators.** Assess the general economic well-being of residential users in the permittee's service area. The indicators selected for this purpose are:
    - Unemployment Rate
    - Median Household Income
- **Financial Management Indicators.** Evaluate the permittee's overall ability to manage financial operations. The indicators selected for this purpose are:
    - Property Tax Revenue Collection Rate
    - Property Tax Revenues as a Percent of Full Market Property Value

Even though the financial capability analysis reflects current conditions, pending changes in the service area should be considered in development of the second phase indicators. For example, if the current unemployment rate is high, but there is a new plant opening that will stimulate economic growth, the unemployment indicators for the service area would need to be modified to reflect the projected impact of

NMED Exhibit 18

the new plant. The permittee should submit documentation of such conditions to the appropriate EPA and state NPDES authorities for consideration. When the permittee is a sanitary district, sewer authority or similar entity, the second phase indicators related to property values and tax revenues may not be applicable. In those circumstances, the permittee may simply use the remaining indicators or submit other related documentation that will help assess its financial capability to implement the necessary wastewater system controls.

DEBT INDICATORS

The debt indicators described below were selected to assess the current debt burden conditions and the ability to issue new debt. These indicators are the bond rating and overall net debt as a percent of full market property value. When these indicators are not available for the permittee, other financial data which illustrates debt burden and debt issuing capacity may be used to assess the permittee's financial capability in this area.

Bond Rating (Worksheet 3)

The information needed to evaluate the bond ratings is presented in Worksheet 3. Recent bond ratings for the permittee and service area communities summarize a bond rating agency's assessment of a permittee's or community's credit capacity. General obligation (G.O.) bonds are bonds issued by a local government and repaid with taxes (usually property taxes). They are the primary long-term debt funding mechanism in use by local governments. General obligation bond ratings reflect financial and socioeconomic conditions experienced by the community as a whole.

"Revenue bond" ratings, by comparison, reflect the financial conditions and management capability of the wastewater utility. They are repaid with revenues generated from user fees. Revenue bonds are sometimes referred to as water or sewer bonds. In some cases, these bonds may have been issued by the state on behalf of local communities.

Bond ratings normally incorporate an analysis of a wide variety of quantitative and qualitative financial capability indicators. These analyses evaluate the long-term trends and current conditions for the indicators. The ultimate bond ratings reflect a general assessment of the permittee's current financial conditions. However, if security enhancements like bond insurance have been used for a revenue bond issue, the bond rating may be higher than justified by the local conditions.

PRACTICE TIP: If the permittee's or community's rating was enhanced through bond insurance, the uninsured rating should be stated in the bond prospectus, and that value should be provided in the FCA analysis.

Many small and medium-sized communities have not used debt financing for projects and, as a result, have no bond rating. The absence of bond rating does not indicate strong or weak financial health. When a bond rating is not available, this indicator may be excluded from the financial analysis.

NMED Exhibit 18

Worksheet 3 Instructions

Enter the most recent bond ratings on Worksheet 3, lines 301 and 302. Note that ratings are requested for general obligation bonds and revenue bonds. When there are several different bond ratings, enter the most recent bond rating on Line 303 as the summary bond rating.

Data Sources

Municipal bond reports from rating agencies (e.g., Moody's Bond Record, Standard & Poor's Corporation, and Fitch) provide recent ratings. Municipal bond prospectuses typically list the bond rating in the upper-right corner of the cover page and within the “Ratings” section of the report. General Obligation and Revenue Bond prospectuses are available at: https://emma.msrb.org/. Municipalities also may have reports from rating agencies summarizing updates of the rating status.

NMED Exhibit 18

BOND RATING: Worksheet 3

		LINE NUMBER
Most Recent General Obligation Bond Rating		
Date		
Rating Agency		
Rating		301
Most Recent Revenue (Water/Sewer or Sewer) Bond

Benchmarks

Moody's Investor Services

"Baa" is the minimum investment grade rating. See *Moody's on Municipals – an Introduction to Issuing Debt* for a description of bond ratings.

Moody's Investor Services' Rating

- Weak: Ba, B, Caa, Ca, C
- Mid-Range: Baa
- Strong: Aaa, AA, A

Standard & Poor's; Fitch

"BBB" is the minimum investment grade rating. See Standard & Poor's *Municipal Finance Criteria* and Fitch's *Rating Definitions* for a description of bond ratings.

Standard & Poor's and Fitch Ratings

- Weak: BB, B, CCC, CC, C, D
- Mid-Range: BBB
- Strong: AAA, AA, A

NMED Exhibit 18

Overall Net Debt as a Percent of Full Market Property Value

Description

Overall net debt is debt repaid by property taxes in the permittee's service area. It excludes debt which is repaid by special user fees (e.g., revenue debt). This indicator provides a measure of the debt burden on residents within the permittee's service area and measures the ability of local governmental jurisdictions to issue additional debt. It includes the debt issued directly by the local jurisdiction and debt of overlapping entities, such as school districts. This indicator compares the level of debt owed by the service area population with the full market value of real property used to support that debt and serves as a measure of financial wealth in the permittee's service area. Information needed to develop overall net debt as a percent of full market value is identified on Worksheet 4.

Worksheet 4 Instructions

Enter requested data on Worksheet 4, lines 401 - 405.

- Line 401 - Direct Net Debt - Enter the amount of each jurisdiction's general obligation debt outstanding that is supported by the property in the permittee's service area. General obligation bonds are secured by the “full faith and credit” of the community and are payable from general tax revenues. This debt amount excludes general obligation bonds that are payable from some dedicated user fees or specific revenue source other than the general tax revenues. These general obligation bonds are called “double-barreled bonds.”
- Line 402 - Debt of Overlapping Entities - The Statistical Section of the permittee’s Annual Comprehensive Financial Report (ACFR) generally lists the outstanding debt attributable to the permittee’s service area. If not, calculate the permittee's service area's share of any debt from overlapping entities using the process illustrated below:
    - Identify in Column A below each overlapping entity that has incurred debt that must be partially supported by the permittee's service area. (Check the Statistical Section of the permittee’s ACFR or State assessor's office for this information).
    - Identify the total amount of tax-supported outstanding debt for each overlapping entity in Column B. Money in a sinking fund is not included in the outstanding debt since it represents periodic deposits into an account to ensure the availability of sufficient monies to make timely debt service payments.
    - Identify the percentage of each overlapping entity's outstanding debt charged to persons or property in the permittee's service area in Column C. The percentage is based on the estimated full market value of real property of the respective jurisdictions.
    - Multiply the total outstanding debt of each overlapping entity by the percentage identified for the permittee’s service area (Column B x C).
    - Add the figures in Column D to arrive at total overlapping debt for permittee's service area.

NMED Exhibit 18

(A) OVERLAPPING ENTITIES	(B) OUTSTANDING DEBT (LESS SINKING FUND)	(C) PERCENT CHARGEABLE TO PERMITTEE'S SERVICE AREA	(D) OUTSTANDING DEBT ATTRIBUTABLE TO PERMITTEE'S SERVICE AREA
County	$10,500,000	25%	$2,625,000
School District	$16,800,000	95%	$15,960,000
Total Overlapping Debt			$18,585,000

- Line 403 - Overall Net Debt - Add lines 401 and 402.
- Line 404 - Market Value of Property - The property value should reflect the full market value of real property excluding personal property within the permittee's service area. It is possible that the tax assessed property value will not reflect full market value. This occurs when the tax assessment ratio is less than one. In such cases the full market value of property is computed by dividing the total tax assessment value by the assessment ratio (the assessment ratio represents the percentage of the full market value that is taxed at the established tax rate). For example, if the assessed value is $1,000,000 and the assessment ratio is 50 percent then the full market value of real property is $1,000,000/.50 = $2,000,000.
- Line 405 - Overall Net Debt as a Percent of Full Market Property Value - Divide line 403 by line 404 and multiply by 100.

Data Sources

Debt information is generally available in the Statistical Section of the community's Annual Comprehensive Financial Report. In most cases the most recent Annual Comprehensive Financial Report is on file in the finance department of the community's website. Overlapping debt is also generally provided in a community's Annual Comprehensive Financial Report. Market value of real property is available in the Statistical Section of the community's Annual Comprehensive Financial Report. If not, the property assessment data should be readily available through the community, county, or State's assessor office. The boundary of most permittee's service areas generally conforms to one or more community boundaries. Therefore, prorating community data to reflect specific service area boundaries is not normally necessary for evaluating the general financial capability of the permittee.

NMED Exhibit 18

OVERALL NET DEBT AS A PERCENT OF FULL MARKET PROPERTY VALUE: Worksheet 4

		LINE NUMBER
Direct Net Debt (G.O. Bond Excluding Double-Barreled Bonds)		401
Debt of Overlapping Entities (Proportionate Share of Multijurisdictional Debt)		402
Overall Net Debt (Lines 401 + 402)		403
Full Market Value of Property		404
Overall Net Debt as a Percent of Full Market Property Value (Line 403 divided by Line 404 x 100)		405

Benchmarks

- Weak: Above 5%
- Mid-range: 2-5%
- Strong: Below 2%

NMED Exhibit 18

SOCIOECONOMIC INDICATORS

The socioeconomic indicators are used to assess the general economic well-being of residential users in the permittee's service area. The indicators used to assess economic conditions are unemployment rate and median household income. When the permittee has additional socioeconomic data, it may want to submit the data to the appropriate EPA and state NPDES authorities to facilitate a better understanding of the permittee's unique economic conditions. Several examples of this type of socioeconomic data could be poverty rate, population growth, and employment projections.

Unemployment Rate

Unemployment information is entered on Worksheet 5. The unemployment rate is defined as the percent of a permittee's service area residents on the unemployment rolls.

Worksheet 5 Instructions

Unemployment values are entered on lines 501 - 503 on Worksheet 5. If the unemployment rate for a permittee's service area is not available, the unemployment rate for the county in which the service area is located may be used as a substitute. On line 503, enter the average national unemployment rate.

Data Sources

The Bureau of Labor Statistics (BLS) maintains current unemployment rate figures for municipalities and counties with a population over 25,000. National and state unemployment data are also available for comparison purposes. This information can be obtained from the BLS Data Tools webpage at https://www.bls.gov/data. The most recent year of unemployment data should be used.

NMED Exhibit 18

UNEMPLOYMENT RATE: Worksheet 5

		LINE NUMBER
Unemployment Rate – Permittee		501
Source		
Unemployment Rate – County (use if permittee's rate is unavailable)		502
Source		
Benchmark		
Average National Unemployment Rate:		503
Source		

Benchmarks

Compare the permittee's unemployment values with the national average values. National averages are readily available through the Bureau of Labor Statistics.

- Weak: More than 1 percentage point above the National Average
- Mid-range: ± 1 percentage point of the National Average
- Strong: More than 1 percentage point below National Average

For example, if the national average unemployment rate is 6 percent, an unemployment rate greater than 7 percent would be considered weak, while an unemployment rate less than 5 percent would be considered strong.

NMED Exhibit 18

Median Household Income

Median household income (MHI) is defined as the median amount of total income dollars received per household during a calendar year in a given area. It serves as an overall indicator of community earning capacity. Worksheet 6 is used to present information for this indicator.

Worksheet 6 Instructions

Median household income was discussed during the first phase assessment and is presented on Worksheet 2. On line 601 of Worksheet 6, enter the adjusted MHI from Worksheet 2 (line 203). Enter the national MHI value for the same year on Line 602.

Data Sources

Median household income is available through Census Bureau ACS data at the following website: https://data.census.gov/. Refer to Table B19013: "Median Household Income in the Past 12 Months (in [Current Year] Inflation-Adjusted Dollars)."

NMED Exhibit 18

MEDIAN HOUSEHOLD INCOME: Worksheet 6

		LINE NUMBER
Median Household Income – Permittee (Line 203, Worksheet 2)		601
Source		
Benchmark		
National MHI		602
Source		
Relationship to Benchmark		
Permittee MHI Relationship to National MHI ((Line 601-Line 602)/Line 602)		603

Benchmarks

Compare the permittee's MHI to the adjusted national MHI:

- Weak: More than 25% below National MHI
- Mid-Range: ± 25% of the National MHI
- Strong: More than 25% above National MHI

FINANCIAL MANAGEMENT INDICATORS

The financial management indicators used to evaluate a permittee's financial management ability are property tax revenue as a percent of full market value of real property and property tax revenue collection rate.

Property Tax Revenues as a Percent of Full Market Property Value

This indicator can be referred to as the "property tax burden" since it indicates the funding capacity available to support debt based on the wealth of the community. It also reflects the effectiveness of management in providing community services.

Worksheet 7 Instructions

Property tax burden is computed on Worksheet 7. The full market value of real property was calculated in Worksheet 4, line 404. Enter the full market value on line 701. Enter the most recent year's property tax revenue on line 702. General fund revenues are primarily property tax receipts.

PRACTICE TIP: Property tax revenues should include both current year collections and collections of payments in arrears from prior year assessments.

Data Sources

Property tax revenue collection data and market value of real property are generally available in the Statistical Section of the community's Annual Comprehensive Financial Report. If not, property assessment and tax revenue collection data should be readily available through the community, county, or state assessor's office. Occasionally, the assessment and tax revenue data of communities partially serviced by the permittee may have to be prorated to provide a clearer picture of the permittee's property tax burden.

NMED Exhibit 18

PROPERTY TAX REVENUES AS A PERCENT OF FULL MARKET PROPERTY VALUE: Worksheet 7

		LINE NUMBER
Full Market Value of Real Property (Line 404)		701
Total Property Tax Revenues		702
Property Tax Revenue as a Percent of Full Market Property Value (702 ÷ 701 × 100)		703

Benchmarks

- Weak: Above 4%
- Mid-range: 2-4%
- Strong: Below 2%

NMED Exhibit 18

Property Tax Revenue Collection Rate

The property tax revenue collection rate is an indicator of the efficiency of the tax collection system and the acceptability of tax levels to residents.

Worksheet 8 Instructions

The property tax revenue collection rate is calculated on Worksheet 8. Total property tax revenues collected was listed in Worksheet 7, Line 702. Enter this value on line 801. Enter the property taxes levied on line 802. Divide the property tax revenue collected by the property taxes levied and multiply by 100 to present the collection rate as a percentage on line 803.

Data Sources

Property taxes levied and property tax revenues are available in a community's Annual Comprehensive Financial Report. Property taxes levied can also be computed by multiplying the assessed value of real property (see Worksheet 4, Line 404) by the property tax rate, both of which are available from a community's financial statements or the state assessor's office. Occasionally, the assessment and tax revenue data of communities partially serviced by the permittee may have to be prorated to provide a clearer picture of the permittee's property tax revenue collection rate.

NMED Exhibit 18

PROPERTY TAX REVENUE COLLECTION RATE: Worksheet 8

		LINE NUMBER
Property Tax Revenue Collected (Line 702)		801
Property Taxes Levied		802

Benchmarks

- Weak: Below 94%
- Mid-range: 94-98%
- Strong: Above 98%

NMED Exhibit 18

Analyzing Permittee Financial Capability Indicators

This section describes how the indicators in the second phase may be used to generate an overall score of a permittee's financial capability. The indicators are compared to national benchmarks to form an overall assessment of the permittee's financial capability and its effect on implementation schedules in the long-term CWA control plan.

In situations where a permittee believes that there are unique circumstances that would affect the conclusion of the second phase, the permittee may submit documentation of its unique financial conditions to the appropriate EPA and state NPDES authorities for consideration. The purpose of additional information is to clarify unique circumstances which are not fairly represented by the overall scores of the selected indicators. An example could be where a state or community imposes restrictions on property taxes.

Worksheet 9 Instructions

The indicators generated from the worksheets are compared to the state, national, or industry benchmarks presented in Table B-1. Information compiled from Worksheets 3 through 8 is summarized in Column A on Worksheet 9. Score each of these values using the rating standards in Table B-1 and the following score benchmarks and enter the appropriate number in Column B. The score definitions are:

Benchmarks	**Score**
• Weak:	1
• Mid-Range:	2
• Strong:	3

To calculate an average score for the indicators, total the values in Column B and divide by the number of entries. Enter the average score on Line 907.

If it is not possible to develop one or more of the six indicators, the permittee should explain why the indicator is inappropriate or unavailable. Since the point of the analysis is to measure the overall financial impact of the wastewater system controls, the debt and socioeconomic indicators are generally better measures of this impact than the financial management indicators. Consequently, if one of the debt or socioeconomic indicators is not available, the two financial management indicators should be averaged and used as a single indicator to average with the available debt and socioeconomic indicators. This averaging is necessary so that undue weight is not given to the financial management indicators.

NMED Exhibit 18

Table B-1. Summary of Financial Capability Indicators Benchmarks

INDICATOR	STRONG	MID-RANGE	WEAK
Bond Rating	AAA – A (S&P) or Aaa – A (Moody's) or AAA – A (Fitch Ratings)	BBB (S&P) or BAA (Moody's) or BBB (Fitch Ratings)	BB - D (S&P) or Ba – C (Moody's) or BB - D (Fitch Ratings)
Overall Net Debt as a Percent of Full Market Property Value	Below 2%	2% - 5%	Above 5%
Unemployment Rate	More than 1 Percentage Point Below the National Average	± 1 Percentage Point of National Average	More than 1 Percentage Point Above the National Average
Median Household Income	More than 25% Above National MHI	± 25% of National MHI	More than 25% Below National MHI
Property Tax Revenues as a Percent of Full Market Property Value	Below 2%	2% - 4%	Above 4%
Property Tax Collection Rate	Above 98%	94% - 98%	Below 94%

Appendix C. Financial Alternatives Analysis Checklist and Example Worksheet

Water infrastructure projects are a major undertaking for communities of all sizes and economic status. The Financial Capability Assessment (FCA) Guidance can serve as a planning tool for evaluating the financial resources a community has available to implement Clean Water Act (CWA) controls. It has been developed to assist in negotiating implementation schedules for CWA controls and in making certain water quality standards (WQS) decisions for public entities. Navigating the complex process of investing in water infrastructure is challenging, especially if financial resources are limited or if customers have difficulty paying their bills. This guidance is intended to help facilitate that process.

CWA compliance schedules should consider available subsidized funding and other financing arrangements as part of a financing plan to achieve compliance as soon as practicable.[1] Determining the costs and thoroughly planning how to fund and finance a project will help a community manage this process. Communities should also consider approaches that can be used to reduce or mitigate the financial impact of water services on low-income households, while still allowing the community to complete critical infrastructure improvements within a reasonable schedule. When developing an FCA, communities should complete a Financial Alternatives Analysis documenting whether the community has considered feasible steps to reduce costs and address impacts to low-income households. These steps include use of variable rate structures, customer assistance programs (CAPs), and applications for grants or subsidies from the Clean Water State Revolving Fund (CWSRF).

A Financial Alternatives Analysis demonstration should provide the results of the "checklist" of financing and funding considerations below and describe the specific programs being implemented to reduce financial burdens. The community should provide a list of the programs or steps already implemented or being considered, the actions that would be necessary to put such measures into place, and the plan for taking those actions. Where available tools are not included in the community's plans to mitigate financial impacts, the requester should provide a written explanation of why those approaches are not being pursued. Attached is an Example Financial Alternatives Worksheet that can help document this information. Finally, Appendix D: Resource Reference Guide provides useful links, explanations, and descriptions of alternative funding and financing approaches.

[1] Compliance schedules included in National Pollutant Discharge Elimination System (NPDES) permits must "require compliance as soon as possible, but not later than the applicable statutory deadline under the CWA." 40 C.F.R. § 122.47(a)(1). The CSO Control Policy requires that "each long-term CSO control plan . . . should [] include both fixed-date project implementation schedules (which may be phased) and a financing plan to design and construct the project as soon as practicable." 59 Fed. Reg. 18688, 18691 (April 19, 1994). In addition, EPA's Integrated Planning Framework states that integrated plans should include a financial strategy and capability assessment that ensures investments are sufficiently funded, operated, maintained and replaced over time and include consideration of current and planned rates and fees. See *Integrated Municipal Stormwater and Wastewater Planning Approach Framework*.

NMED Exhibit 18

Whether a particular financial alternative is feasible may be different for entities such as a sanitary district or sewer authority. For instance, a utility may not be the rate setting authority for its entire service area if it serves wholesale customers. Certain utilities may need to work with the municipality or municipalities it serves to obtain the information to complete the Financial Alternatives Analysis. Users of this guidance should document any relevant differences in feasibility or practicality (see, e.g., Column B of the Example Financial Alternatives Worksheet) for consideration by EPA. Understanding such differences allows for development of schedules that are responsive to circumstances unique to each community while advancing the mutual goal to protect clean water. Communities are also expected to work within the boundaries of applicable legal requirements or restrictions, including state regulations, when pursuing alternative funding approaches for their infrastructure projects.[2] In the event that a financial or funding consideration listed below is prohibited by state law or simply not possible, some version of the financial alternative may still be feasible if there are other avenues of reducing financial impacts that can be implemented within the limits of the relevant legal boundaries or state authorities. A summary of state regulatory policies related to customer assistance programs and innovative ways such programs have been funded in communities is available at https://efc.sog.unc.edu/resource/navigating-legal-pathways-rate-funded-customer-assistance-programs-guide-water-and/.

If a community needs assistance evaluating feasible options for funding and financing, EPA can provide technical assistance upon request to help complete the Financial Alternatives Analysis. Through the Water Infrastructure and Resiliency Finance Center (https://www.epa.gov/waterfinancecenter) and support from the Environmental Finance Centers (EFCs) and other EPA contractors and partners, EPA can provide technical assistance. This technical assistance is funded, in part, through the Bipartisan Infrastructure Law (BIL) and other EPA infrastructure assistance programs. It can include support to complete the Financial Alternatives Analysis and other more specific requests, such as completing State Revolving Fund applications, identifying funding options, assisting with rate design and analysis, and helping with asset management planning. Communities can request assistance with the Financial Alternatives Analysis and BIL-related funding by emailing WaterTA@epa.gov. States that need assistance with the review of completed Financial Alternatives Analysis may also contact the Water Finance Center by sending an email to WaterTA@epa.gov.

[2] For municipalities that are subject to federal civil actions, CWA Section 309(e) provides that "the State in which such municipality is located shall be joined as a party." To the extent that the laws of that State prevent the municipality from raising revenues needed to comply with any resulting judgement, then the State "shall be liable for payment of any judgment, or any expenses incurred as a result of complying with any judgment."

NMED Exhibit 18

Financial Alternatives "Checklist"

1. Financing Options for Capital Costs

Reducing overall capital costs through low interest rate loans, flexible loan terms, grants, etc. can help lessen the burden on low-income residents in a water utility's service area. The below questions can help identify potential lower cost alternatives to a community's current financing approach while still allowing for progress on capital improvement projects.

a) Has the community discussed financing options, including timing, terms, and potential grants or forgiveness, with the responsible State Revolving Fund?

More information on CWSRF projects and accessing these funds can be found in Appendix D: Resources Reference Guide.

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *The Clean Water State Revolving Fund (CWSRF) is a federal-state partnership that provides communities low-cost financing for a wide range of water quality infrastructure projects. These loans, which could be offered as grants or principal forgiveness loans, can help bring down the overall financing needs of an infrastructure project. Information about the CWSRF is available at https://www.epa.gov/cwsrf.*
- *Contacts for the State CWSRF programs are available at https://www.epa.gov/cwsrf/state-cwsrf-program-contacts.*
- *The Subsidized Loan Calculator Tool allows a utility to compare a loan through a State Revolving Fund program to a commercial loan at the market rate. The tool offers 3 different ways to look at savings: the interest savings in nominal dollars; the total cost of each option in nominal dollars; and the total cost of each option in real dollars. The tool is available at https://efc.sog.unc.edu/resource/what-value-srf-loan-subsidized-loan-calculator/.*
- *The Financing Alternatives Comparison Tool (FACT) is a financial analysis tool that helps municipalities, utilities, and environmental organizations identify the most cost-effective method to fund a wastewater or drinking water management project. FACT produces a comprehensive analysis that compares financing options for these projects by incorporating financing, regulatory, and other important costs. FACT is available at https://www.epa.gov/cwsrf/financing-alternatives-comparison-tool.*

NMED Exhibit 18

b) What additional funding sources beyond the SRF including non-SRF grants from states, EPA, and other federal agencies, grants, low-cost loans, or extended term loans has the community considered?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *By looking at all possible grants or low-cost loans, communities can obtain additional funding to cover their capital costs without increasing the burden on their customers. Many states have dedicated funds for wastewater projects. Check your state's environmental and/or public health agency website to find state specific loan and grant information to fund wastewater infrastructure projects.*
- *Numerous potential funding sources can be found in Appendix D: Resources Reference Guide. This section explains the types of funding available (including grants, loans, private sector funding, etc.) and includes links. Additionally, funding sources can be searched for in the Water Finance Clearinghouse database by state, eligible borrower, and funding type at https://www.epa.gov/waterdata/water-finance-clearinghouse.*

c) Has the community considered special assessment districts to finance geographically defined project work?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *Special assessments are used to provide and fund projects for a specific geographic area. Special assessment districts provide the legal arrangement to charge those receiving the service for capital and/or operating costs of the project. CWA projects may be funded with special assessments. For example, in Michigan, neighborhoods with significant basement flooding problems have approved the use of special assessments to fund corrections to their wastewater collection system that include correction of combined sewer overflow problems.*

NMED Exhibit 18

d) Has the community considered other revenue sources to reduce the direct burden on ratepayers such as sales or property taxes, rental income from water tower leases, or other potential sources of support?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *Many utilities have created additional revenue streams to pay for new infrastructure investments to reduce rate increases for their customers. Non-rate-based revenue can help to improve the organization's overall financial health by creating new sources of income for unexpected expenses and diversifying the utility's income in communities with decreasing volumes of water sold and collected (e.g., due to declining populations or water conservation programs). Examples of approaches communities have used to successfully bring in additional revenue can be found in Appendix D: Resources Reference Guide. Review this section and explore if any of these, or other approaches, could be used by your community to generate additional revenue.*

e) Has the community evaluated how it can reduce overall operating and program costs?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *A case study of a community that successfully reduced operating costs to free up revenue for capital improvements is available at https://efc.sog.unc.edu/resource/small-town-financial-viability-case-study-town-of-ahoskie-north-carolina/.*
- *Examples of strategies used by utilities with resource constraints to reduce costs, increase municipal capacity, and capture cost efficiencies by exploiting economies of scale can be found at https://graham.umich.edu/water/cs-managing-public-water.*

NMED Exhibit 18

2. Rate Design

Management of water systems is often sustained by customer revenues. Developing a rate structure that best supports the system's priorities and objectives will help systems meet their CWA obligations and reduce the burden on its customers. In completing this Financial Alternatives Analysis, communities should review how they currently set rates and review ways, within the boundaries of any applicable legal requirements or restrictions, including their state regulations, that rate design could be adjusted to offset costs to their most vulnerable residents while still making progress on their capital infrastructure projects. Options might include percentage of income plans, lifeline rates, payment restructuring programs, and customer charge waivers. Communities that need assistance with rate review and alternative approaches can contact EPA's Water Infrastructure and Resiliency Finance Center for technical assistance. Communities may also consult the Utility Financial Sustainability Tools and Rates Dashboards available at https://efc.sog.unc.edu/dashboards/ developed by the Environmental Finance Center at the University of North Carolina Chapel Hill. Communities can also use the Affordability Tool that is based in Tableau to provide a user-friendly experience of assessing a utility's water and wastewater rates. This tool is available at https://efcnetwork.org/tools-publications/water-and-wastewater-residential-rates-affordability-assessment-tool-tableau/.

For some communities, there may be legal restrictions related to rate-setting. When exploring alternative rate design approaches, communities should cite any legislative barriers, for example, in the "Challenges" section of the Example Financial Alternatives Worksheet. Even where there are legal barriers to certain types of financial alternatives, there may be other pathways to help low-income customers. Case studies of innovative approaches used by some communities to assist low-income residents beyond rate design can be found at https://efc.sog.unc.edu/wp-content/uploads/sites/1172/2021/06/Navigating-Pathways-to-Rate-Funded-CAPs.pdf, along with state specific regulations related to establishing customer assistance programs.

a) Describe the rate structure currently being used in the community. In what ways has the community evaluated modifications to its rate structure that could increase revenue and/or reduce burden on the lowest income residents?

Answers to this question serve to provide baseline information on rate approaches currently used by the community and highlight where alternative approaches could be used, if practical, to increase revenue or reduce burdens on lowest income residents.

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *EPA has information on rate designs available at https://www.epa.gov/waterfinancecenter/financial-technical-assistance-and-tools-water-infrastructure. Additionally, the EFC's Rate Dashboard available at https://efc.sog.unc.edu/dashboards/ is a tool that can be used to compare rate approaches.*
- *Communities can use the Affordability Tool developed by the EFC to assess a utility's water and wastewater rates. See https://efcnetwork.org/tools-publications/water-and-wastewater-residential-rates-affordability-assessment-tool-tableau/.*

NMED Exhibit 18

b) Has the community prepared a forward-looking financial plan and rate analysis within the last five years? If so, was the plan implemented?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *Forward looking financial planning and rate reviews should be part of every utility's best management practices. There are several online tools available including the EFC's online tools:*
  - *https://efc.sog.unc.edu/resource/plan-pay-scenarios-fund-your-capital-improvement-plan/*
  - *https://efcnetwork.org/tools-publications/water-and-wastewater-residential-rates-affordability-assessment-tool-tableau/*
- *Communities who need additional assistance in conducting a rate review or financial plan can contact the EPA's Water Infrastructure and Resiliency Finance Center for technical assistance (WaterTA@epa.gov).*

c) Has the community assessed the water use across its industrial, commercial, and residential customer base? If so, has the community/utility allocated wastewater costs to reflect the demands of each user group on the collection and treatment system? For example, does the community have separate rate structures for commercial, industrial, and wholesale customers reflecting their particular demands on the collection and treatment system? Has the community considered established tiered or conservation rates?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *Multiple rate structures allow the utility to recover the costs of various types of commercial and industrial customers. For some communities, there may be legal restrictions related to rate-setting. If these exist for your community, cite any legislative barriers in the "Challenges" section of the Example Financial Alternatives Worksheet (or other form of documentation you are providing for the Financial Alternatives Analysis).*

NMED Exhibit 18

d) Does the community use inclining block rates for residential customers that charge higher per gallon rates for higher increments of use?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *Utilities should seek to understand who their high-water users are and what the household structure and income-level of these customers are. Utilities can learn more about rate setting at https://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=901U1200.TXT.*
- *Communities can also assess their rates and compare two rate structures side-by-side, enabling the utility to assess the affordability of its current rates alongside alternative rates using this tool developed by the EFCs: https://efcnetwork.org/tools-publications/water-and-wastewater-residential-rates-affordability-assessment-tool-tableau/.*

e) If charging a flat fee, has the community considered switching to a volumetric fee so that high-output customers pay for the wastewater they generate?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *While simple to implement, a flat fee charge for sanitary sewer service does not create any incentive for users to manage their water use, which is usually the basis for a wastewater bill. There are situations, especially with smaller utilities, where a flat charge is used because there is no water meter, or because of the costs of implementing a more sophisticated rate structure.*
- *Communities can use the rate analysis model available at https://efc.sog.unc.edu/resource/water-and-wastewater-rates-analysis-model to help evaluate water and/or wastewater rates for the next year by projecting the utility's expenses, revenues from rates, and fund balance.*

NMED Exhibit 18

3. Ratepayer Support Options for Lower Income Residential Customers

Utilities have adopted a variety of strategies to help residential customers with low or fixed incomes pay water or wastewater bills they cannot afford. Rate design, discussed above, can provide a sustainable approach for utilities that can allow lower income customers to consistently pay bills in full and on time. Some utilities have set up CAPs to help lower bills. CAPs can vary from utility to utility and can be particularly useful for households with a temporary need for assistance. Any utility that is concerned about the affordability of its rates on their low-income residential customers and is considering starting a CAP to provide financial assistance to these households can help determine costs by using the tool available at https://efc.sog.unc.edu/resource/bill-payment-assistance-program-cost-estimation-water-utilities/. Detailed summaries of regulatory policies on the design and funding of CAPs in each of the 50 states, the District of Columbia, and Puerto Rico can be found at https://efc.sog.unc.edu/wp-content/uploads/sites/1172/2021/06/Navigating-Pathways-to-Rate-Funded-CAPs.pdf. This document also includes case studies that demonstrate what can be done under a supportive regulatory environment or when a utility would like to create a robust, high-impact CAP within the limits of a more restrictive regulatory framework.

a) Has the community implemented, or considered implementing, a CAP?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *Households with low and/or fixed incomes, or households facing a temporary crisis such as job loss or illness may have difficulty paying water and sewer bills. Local not-for-profit or governmental organizations also may have short- or longer-term assistance for utility bills. Many wastewater and drinking water utilities use CAPs to meet specific customer needs and the financial needs of their drinking water delivery and/or wastewater management services.*
- *EPA produced a document of current CAP programs at water utilities. This document is designed to help drinking water and wastewater utilities build on their existing CAPs or adopt new CAPs by learning from the experiences of other utilities. Compendium of Drinking Water and Wastewater Customer Assistance Programs (EPA) is available at https://www.epa.gov/sites/production/files/2016-04/documents/dw-ww_utilities_cap_combined_508.pdf.*
- *Navigating Legal Pathways to CAPs (Environmental Finance Center at UNC Chapel Hill) is available at https://efc.sog.unc.edu/project/navigating-legal-pathways-rate-funded-customer-assistance-programs.*
- *Low Income Household Water Assistance Program (LIHWAP) provides funds to assist low-income households with water and wastewater bills. LIHWAP grants are available to states, the District of Columbia, the Commonwealth of Puerto Rico, U.S. Territories, and federally and state-recognized Indian tribes and tribal organizations that received fiscal year 2021 Low Income Household Energy Assistance Program (LIHEAP) grants. More information about LIHWAP is available at https://www.acf.hhs.gov/ocs/programs/lihwap.*

NMED Exhibit 18

b) If you have a CAP, what is the enrollment rate? What efforts have been made to ensure low-income households are informed about the program and enroll? Are there ways to make the application process easier for customers to enroll, e.g., by providing for enrollment in-person, online, and mail, in multiple languages, if appropriate; partnering with local organizations to help with outreach and enrollment; allowing for automatic enrollment or using proof of eligibility for other income-qualified benefits?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *Guidance on Developing CAPs (Water Research Foundation) is available at https://www.waterrf.org/research/projects/customer-assistance-programs-multi-family-residential-and-other-hard-reach.*
- *Best Practices in Customer Payment Assessment Programs (Water Research Foundation), is a review of best practices in utility programs to assist payment-troubled customers, assembled into a reference guide for use by utility management teams in developing and improving such programs. It is available at https://aquadoc.typepad.com/files/water_affordability_4004.pdf.*

c) Has the community considered other types of customer support beyond a CAP for lower income residential customers? Has the utility considered methods to include renters with water bill assistance?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *Utilities have implemented a variety of programs to provide households with short-term or long-term reductions through a Bill Discount, Flexible Terms, Lifeline Rate, Temporary Assistance, Income-based rates, and water conservation assistance. Example customer support approaches are found below. In the Example Financial Alternatives Worksheet or other form of documentation, identify if these examples or other types of programs are being used or explored. These might be feasible in your community or there might be legal or regulatory constraints to their implementation. Examples and case studies of these approaches are available at https://www.epa.gov/sites/default/files/2016-04/documents/dw-ww_utilities_cap_combined_508-front2.pdf.*
- *Example Customer Assistance Approaches:*
  - ***Lifeline Rate**—A low flat rate for an initial amount of usage to cover most or all of a household's basic needs such as drinking, cooking, and sanitation. Water consumption above the lifeline amount could be charged at a higher rate. May be applied to all customers or just low-income customers. For example, a community could charge a low flat rate for the first 50 gallons per person per day and a higher for usage beyond 50 gallons per person per day. Communities could evaluate household size of their low-income customers using Census data or use a default household size of between 1 and 2 people and consumption allowance between 1.5 and 3 kgal for fixed income households.*
  - ***Percentage-of-Income Payment Plan**—Rate design that prevents water bills from exceeding a certain percentage of the customer's income. Case studies of how this has been done in other communities can be found at https://waterassistanceprograms.org/.*

NMED Exhibit 18

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- ***Bill Discount***—*Reduces an eligible low-income customer's bills by a flat dollar amount or a percent discount. This approach can be used to reduce the fixed service charge, the volumetric consumption charge, or both. Additionally, discounts can be tiered by income. Review barriers for your state at https://efc.sog.unc.edu/wp-content/uploads/sites/1172/2021/06/Navigating-Pathways-to-Rate-Funded-CAPs.pdf*
- ***Water Conservation Programs***—*Programs that reduce water use can lower utility operating costs and reduce customer bills. More information about these programs is available at https://www.epa.gov/system/files/documents/2021-07/ws-assistance-that-saves-efficiency-and-affordability.pdf. An analysis of the impact of these approaches in California is available at https://www.calwater.com/docs/conservation/Economic-Value-of-Water-Efficiency-Lower-Water-Bills.pdf.*

d) Are there policies in place to protect customers, including vulnerable populations, from shutoffs?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *Some utilities have developed programs and policies to prevent shutoffs. Examples of these programs include:*
  - *Chicago Utility Billing Relief Program. https://chicago.docugateway.com/main/quest/billing_relief/.*
  - *Philadelphia's Assistance Programs to ensure that residents who cannot pay bills will still have water services. https://www.phila.gov/2022-05-31-avoid-a-water-shutoff-new-protection-policies-and-expanded-assistance/.*

e) Does the community have reduced rates for vulnerable populations, such as seniors on fixed incomes?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *Some utilities have developed programs and policies to provide lower rates for seniors and/or low-income customers. Examples of these programs include:*
  - *Ayer, MA. https://www.ayer.ma.us/department-public-works/pages/sr-citizen-water-sewer-bill-discount-policy.*
  - *Acton, MA. https://www.actonwater.com/customer-service/senior-citizen-water-bill-discount-policy.*
  - *Revere, MA. https://www.revere.org/departments/water-and-sewer-billing#discount.*
  - *Examples from WA State. https://mrsc.org/Home/Explore-Topics/Public-Works/General-Utility-Topics/Senior-and-Low-Income-Utility-Rate-Discounts.aspx.*

NMED Exhibit 18

4. Financial and Utility Management

Effective utility management practices are the foundation for building and sustaining the financial capacity of water infrastructure systems. Management practices should address all aspects of a system's operations and maintenance. EPA's Effective Utility Management (EUM) Initiative takes a broad look at all aspects of water sector system sustainability from product quality to customer satisfaction. It is supported through the collaboration of EPA and professional associations across the water sector. The case studies, webinars, and frameworks developed under EUM can help inform communities on overall utility and financial management and assist in completing this section. EPA's Effective Water Utility Management Practices website is available at https://www.epa.gov/sustainable-water-infrastructure/effective-water-utility-management-practices.

a) Is the utility accounted for as a proprietary/enterprise fund or a separate independent utility?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *It is important that the utility is operated as a separate financial and business entity either within a broader governmental entity (i.e., city or county), or as an independent utility district. The wastewater utility may be effectively combined with the water utility, sharing administrative costs of billing, management, and staff. However, the financial results of the wastewater operation should be separable from the water operation.*

b) Are all rate revenues or other user charges used to fund the utility's operations? Do the rates charged recover the full cost of providing wastewater services (taking into consideration capital costs, operation and maintenance expenses, and environmental costs)?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *It is important that the utility's revenues are dedicated to the functions of the utility. If revenues are being transferred to other purposes, the utility is likely to be unable to meet its mission efficiently because of financial constraints.*

NMED Exhibit 18

c) Does the utility have programs to optimize maintenance and asset management to reduce life cycle costs?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *Systems implementing asset management develop detailed asset inventories, perform operation and maintenance tasks, conduct long-range financial planning, and undertake other activities that build system capacity. Asset management is a key element of long-term sustainability. EPA has a guide for state staff and technical assistance providers to assist small- and medium-sized drinking water or wastewater systems in identifying resources to implement asset management practices. This guide can assist in establishing an asset management plan in your community. The* Reference Guide for Asset Management Tools *is available at https://www.epa.gov/dwcapacity/reference-guide-asset-management-tools.*
- *The EFCs have also produced several tools and documents related to asset management in the water sector (https://www.efc.csus.edu/asset-management/).*
- *Technical Assistance is available for asset management plans from the EPA Water Technical Assistance page (*https://www.epa.gov/water-infrastructure/water-technical-assistance-waterta).

d) Are partnerships with other utilities, including joint procurement, or shared management and staffing arrangements, regionalization, or consolidations options to provide economies of scale and reduce per customer costs feasible in this community?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *Water system partnerships address common challenges that water systems face, leading to reduced overall operating costs through economies of scale and leveraging of existing resources. EPA has a website to find cooperative tools to address their drinking water challenges available at https://www.epa.gov/dwcapacity/learn-about-water-system-partnerships. It explores the different types of partnerships to consider, and outlines examples of successful partnerships across the country*
- *Case studies and analysis of strategies used by utilities with resource constraints to partner to reduce costs, increase municipal capacity, and capture cost efficiencies by exploiting economies of scale can be found at https://graham.umich.edu/water/cs-managing-public-water.*
- *Agricultural-municipal partnerships offer another innovative approach to reduce nutrients in a watershed at a potentially lower cost than traditional infrastructure upgrades. The Water Finance Center hosted a webinar on the potential benefits of these types of partnerships and will release a learning module highlighting the financing approaches used in the case studies available at https://www.epa.gov/system/files/documents/2021-07/ag-muni-partnerships-webinar-slides.pdf.*

NMED Exhibit 18

e) Has the utility or related municipality instituted a stormwater management program when evaluating long-term control plan schedules? If so, are impervious area-based stormwater fees used to fund the stormwater compliance costs?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- *Many communities around the country are establishing separate stormwater enterprise funds through utility fees or other separate funding mechanisms to create sustainable funding revenues for stormwater costs. The Western Kentucky University Stormwater Utility Survey provides a summary of these utilities at https://digitalcommons.wku.edu/cgi/viewcontent.cgi?article=1003&context=seas_faculty_pubs.*
- *There are different approaches to establishing more equitable stormwater rates. An overview of these approaches can be found at https://efc.sog.unc.edu/stormwater-fee-structure-design-is-one-fee-structure-more-equitable/ and can provide context of approaches that might be used in your community.*
- *EPA's Sewer Overflow and Stormwater Reuse Grant Program is available at https://www.epa.gov/cwsrf/sewer-overflow-and-stormwater-reuse-municipal-grants-program.*
- *Section 319 Grant Program for Nonpoint Source Pollution Control Efforts is available at https://www.epa.gov/nps/319-grant-program-states-and-territories.*

f) Does the utility provide direct financial assistance (through rebates, upfront subsidies, or direct replacement of fixtures) for efficiency improvements including leak repairs or replacement of inefficient fixtures or appliances?

KEY RESOURCES, TOOLS, AND INFORMATION SOURCES

- ***Water Conservation Programs** -Programs that reduce water use can lower utility operating costs and reduce customer bills. More information about these programs is available at https://www.epa.gov/system/files/documents/2021-07/ws-assistance-that-saves-efficiency-and-affordability.pdf. Analysis of the impact of these approach in California is available at https://www.calwater.com/docs/conservation/Economic-Value-of-Water-Efficiency-Lower-Water-Bills.pdf.*

g) Does the wastewater collection system and adjoined publicly owned treatment works pay a property tax to the city? Paying property taxes (i.e., a payment in lieu of taxes or PILOT) should be examined as it can erode the utility's financial capability to implement necessary improvements.

NMED Exhibit 18

EXAMPLE FINANCIAL ALTERNATIVES WORKSHEET: This worksheet can be used to help document completion of a Financial Alternatives Analysis to support developing implementation schedules for CWA controls and making certain water quality standards (WQS) decisions for public entities. Communities can list actions that they have taken and planned commitments for each alternative. Descriptions of resources and case studies related to financial alternatives are described in Appendix C.

FINANCIAL ALTERNATIVES ANALYSIS	DESCRIBE HOW FINANCIAL ALTERNATIVE HAS BEEN IMPLEMENTED OR CONSIDERED. WHERE CONSIDERED, INCLUDE ANY PLANS FROM COMMUNITY TO PURSUE ALTERNATIVE	WHERE TOOLS NOT PURSUED, DESCRIBE ANY ASSOCIATED CHALLENGES WITH THE ALTERNATIVE (E.G., IMPACT TO BOND RATING, INTEREST RATE NOT FAVORABLE)	DESCRIBE OUTCOMES OF ALTERNATIVE (E.G., GRANT APPLIED FOR, LOAN NOT PURSUED)
1. Financing Options for Capital Costs:			
a) Has the community discussed financing options, including timing, terms, and potential grants or forgiveness, with the responsible State Revolving Fund?			
b) What additional funding sources beyond the SRF such as grants, low-cost loans, or extended term loans has the community considered?			
c) Has the community considered special assessment districts to finance geographically defined project work?			
d) Has the community considered other revenue sources such as sales or property taxes, rental income from water tower leases, or other potential sources of support?			
e) Has the community evaluated how it can reduce overall operating and program costs?			
Other Considerations:			

NMED Exhibit 18

FINANCIAL ALTERNATIVES ANALYSIS	DESCRIBE HOW FINANCIAL ALTERNATIVE HAS BEEN IMPLEMENTED OR CONSIDERED. WHERE CONSIDERED, INCLUDE ANY PLANS FROM COMMUNITY TO PURSUE ALTERNATIVE	WHERE TOOLS NOT PURSUED, DESCRIBE ANY ASSOCIATED CHALLENGES WITH THE ALTERNATIVE (E.G., IMPACT TO BOND RATING, INTEREST RATE NOT FAVORABLE)	DESCRIBE OUTCOMES OF ALTERNATIVE (E.G., GRANT APPLIED FOR, LOAN NOT PURSUED)
2. Rate Design:			
a) In what ways has the community evaluated modifications to its rate structure that could increase revenue and/or reduce burden on the lowest income residents?			
b) Has the community prepared a forward-looking financial plan and rate analysis within the last five years? If so, was the plan implemented?			
c) Does the community have identified separate rate structures for commercial, industrial, and wholesale customers reflecting their particular demands on the collection and treatment system? Has the utility considered tiered based rates?			
d) Does the community use inclining block rates that charge higher per gallon rates for higher increments of use?			
e) If charging a flat fee, has the community considered switching to a volumetric fee so that high-output customers pay for the wastewater they generate?			
Other Considerations:

e) Has the utility or related municipality instituted a stormwater management program when evaluating long-term control plan schedules? If so, are impervious area-based stormwater fees used to fund the stormwater compliance costs?			
f) Does the utility provide direct financial assistance (through rebates, upfront subsidies, or direct replacement of fixtures) for efficiency improvements including leak repairs or replacement of inefficient fixtures or appliances?			
Other Considerations:			

Appendix D. Resource Reference Guide for Utility / Community Financial Assistance

Resource Topic Areas

1. EPA Provided Technical Assistance
2. Public Funding and Financing Sources
3. Regional Specific Funding Sources
4. Community Funding and Financing Sources

Summary of Funding and Financing Resources

1. EPA Provided Technical Assistance

I. Environmental Finance Centers

Grants; https://www.epa.gov/waterfinancecenter/efcn

The Environmental Finance Centers (EFCs) deliver targeted technical assistance to local governments, states, tribes, and non-governmental organizations to protect public health, safeguard the environment, and mitigate environmental justice concerns. The EFCs serve an important role in helping to ensure that communities that have difficulty in securing public funding receive the help they need to access resources to support infrastructure improvements. The most up-to-date information on each EFC and areas of specialization can be found at: https://www.epa.gov/waterfinancecenter/efcn. Requests for technical assistance can be made by emailing WaterTA@epa.gov.

II. EPA - Training and Technical Assistance for Small Systems Funding

Grants; https://www.epa.gov/dwcapacity/training-and-technical-assistance-small-systems-funding

EPA provides technical assistance through national providers via grant funding to support small drinking water and wastewater systems that serve small and rural communities. EPA is committed to helping communities across America upgrade and maintain water infrastructure that is essential to public health and environmental protection.

III. EPA - Environmental Justice Small Grants Program

Grants; https://www.epa.gov/environmentaljustice/environmental-justice-small-grants-program

EPA's Environmental Justice Small Grants Program supports and empowers communities working on solutions to local environmental and public health issues. The program is designed to help communities understand and address exposure to multiple environmental harms and risks.

NMED Exhibit 18

2. Public Funding and Financing Sources

I. EPA/State Clean Water State Revolving Fund (CWSRF)

Loans; Grants; https://www.epa.gov/cwsrf

Many communities explore national- and state-level sources when seeking financial support for infrastructure projects. The most common sources considered are the CWSRF and Drinking Water State Revolving Fund (DWSRF), which are federal funds distributed to the states for distribution. These federal-state partnerships provide low-cost financing to help communities address water infrastructure needs. Communities can restructure existing SRF loans and take out multiple SRF loans. SRFs can offer: below market interest rates, in some cases as low as 0%; possible "additional subsidization" (i.e., money that does not need to be repaid); possible negative interest rates; possible principal forgiveness or grants; up to 30-year repayment for clean water projects and 40-year repayment for drinking water projects; possible loans for planning and design of infrastructure projects. States develop CWSRF priority lists as part of their Intended Use Plans, but do not have to fund in priority order.

II. EPA Water Infrastructure Finance and Innovation Act (WIFIA)

Loans; https://www.epa.gov/wifia

The WIFIA program provides long-term, low-cost supplemental financing for the planning, design, and implementation of water infrastructure projects of national or regional significance. Eligible public, private, and public-private borrowers can utilize WIFIA loans to finance a wide variety of wastewater, drinking water, water reuse, stormwater, nonpoint source pollution prevention, and other water quality improvement capital projects. The anticipated total eligible project costs must be at least $20 million, or $5 million for small communities (population of 25,000 or less). WIFIA loans are designed to provide supplemental financing for water infrastructure projects. The WIFIA loan can finance up to 49 percent of eligible project costs, or 80 percent for small communities. WIFIA loans can be paired with a variety of other funding sources, including State Revolving Fund loans and municipal bonds, and offer distinct benefits that are not readily available in the capital markets. The WIFIA program is borrower-focused, with flexible terms for credit assistance to stimulate investment while minimizing costs for ratepayers. It offers credit assistance with terms of up to 35 years after completion of project construction. It also offers borrowers the advantage of developing customized terms, including sculpted repayment terms to match the specific needs of a project, payment deferment for up to 5 years after completion of project construction, and interest-only payment periods. Additionally, the WIFIA program lends at a low, fixed interest rate equal to the Treasury rate for a comparable maturity.

NMED Exhibit 18

III. EPA – Environmental Justice Collaborative Problem-Solving (CPS) Cooperative Agreement Program

Grants; https://www.epa.gov/environmental-justice/environmental-justice-collaborative-problem-solving-cooperative-agreement-0

EPA's Environmental Justice CPS Cooperative Agreement Program provides funding for eligible applicants for projects that address local environmental and public health issues within an affected community. The CPS Program assists recipients in building collaborative partnerships to help them understand and address environmental and public health concerns in their communities.

IV. U.S. Department of Agriculture (USDA) – Rural Utility Services (RUS) Water and Environment Program (WEP)

Loans; Grants; https://www.rd.usda.gov/programs-services/all-programs/water-environmental-programs

WEP provides funding for the construction of water and waste facilities in rural communities and is the only Federal program exclusively focused on rural water and waste infrastructure needs of rural communities with populations of 10,000 or less. WEP also provides funding to organizations that provide technical assistance and training to rural communities in relation to their water and waste activities.

V. U.S. Housing and Urban Development (HUD) – Community Development Block Grant (CDBG) State Program

Grants; https://www.hudexchange.info/programs/cdbg-state/

Under the State CDBG Program, states award grants to smaller units of general local government that do not receive CDBG funds directly from HUD. These are called non-entitlement areas. Eligible activities include construction of public facilities and improvements, such as water and sewer facilities, streets, neighborhood centers, and the conversion of school buildings for eligible purposes. Not less than 70 percent of CDBG funds must be used for activities that benefit low- and moderate-income persons. Eligible grantees are as follows: non-entitlement areas are cities with populations of less than 50,000 people (except cities that are designated principal cities of Metropolitan Statistical Areas); counties with populations of less than 200,000 people.

VI. HUD – Community Development Block Grant (CDBG) Entitlement Program

Grants; https://www.hudexchange.info/programs/cdbg-entitlement/cdbg-entitlement-program-eligibility-requirements/

The CDBG Entitlement Program awards grants to entitlement community grantees to carry out a wide range of community development activities directed toward revitalizing neighborhoods, economic development, and providing improved community facilities and services. Eligible activities include construction of public facilities and improvements, such as water and sewer facilities, streets, neighborhood centers, and the conversion of school buildings for eligible purposes. Not less than 70 percent of CDBG funds must be used for activities that benefit low- and moderate-income persons. Eligible grantees include: principal cities of Metropolitan Statistical Areas (MSAs); other metropolitan

NMED Exhibit 18

cities with populations of at least 50,000; qualified urban counties with populations of at least 200,000 (excluding the population of entitled cities).

VII. U.S. Department of Commerce – Economic Development Administration (EDA)- Investments for Public Works and Economic Adjustment Assistance Programs

Grants; https://www.eda.gov/funding/programs

The role of wastewater service providers working with their local economic development office has grown in recent years. Increasing a community's rate base through community economic development can improve the ability to attract capital for utility infrastructure projects. Most communities have an economic development office or a representative whose specific mission is to attract new businesses to the area. EDA invests in traditional public works projects, including water and sewer systems improvements, industrial parks, business incubator facilities, expansion of port and harbor facilities, skill-training facilities, and brownfields redevelopment. This empowers distressed communities to revitalize, expand, and upgrade their physical infrastructure, and generate or retain long-term, private sector jobs and investment.

VIII. U.S. Department of Commerce – Economic Development Administration (EDA)- Planning Program and Local Technical Assistance Program

Grants; https://www.eda.gov/funding/funding-opportunities

EDA assists eligible recipients in developing economic development plans and studies designed to build capacity and guide the economic prosperity and resiliency of an area or region. The Local Technical Assistance program strengthens the capacity of local or State organizations, institutions of higher education, and other eligible recipients to undertake and promote effective economic development programs through projects such as feasibility studies and impact analyses.

3. Regional Specific Funding Sources

I. Appalachian Regional Commission (ARC) Grants

Grants; https://www.arc.gov/funding/ARCGrantsandContracts.asp

ARC awards grants and contracts from funds appropriated to the Commission annually by Congress. Program grants are awarded to state and local agencies and governmental entities (such as economic development authorities), local governing boards (such as county councils), and nonprofit organizations (such as schools and organizations that build low-cost housing). ARC provides funds for basic infrastructure services, including water and sewer facilities, that enhance economic development opportunities or address serious health issues for residential customers.

NMED Exhibit 18

II. Federal Emergency Management Agency (FEMA) – Building Resilient Infrastructure and Communities (BRIC)

Grants; https://www.fema.gov/grants/mitigation/building-resilient-infrastructure-communities

BRIC will support states, local communities, tribes, and territories as they undertake hazard mitigation projects, reducing the risks they face from disasters and natural hazards. BRIC is a new FEMA pre-disaster hazard mitigation program that replaces the existing Pre-Disaster Mitigation program.

4. Community Funding Sources

I. Municipal Bonds

A bond is a debt obligation issued by a nonprofit organization (state, city, county, or other) to finance its capital expenditures. It is a debt investment in which an investor loans money to an entity (state, city, county, or other), which borrows the funds for a defined period at a variable or fixed interest rate. The interest paid on municipal bonds is tax-exempt, making them an attractive low-cost way to obtain capital.

II. Utility Revenue Streams

Utilities fund most their infrastructure investments through local revenue-generating mechanisms (e.g., customer rates and other fees for water, wastewater, and stormwater services). See the *Progressive Rate Structures* section below.

Many utilities have also created additional revenue streams to pay for new infrastructure investments to reduce rate increases for their customers. Non-rate-based revenue can help to improve the organization's overall financial health by creating new sources of income for unexpected expenses and diversifying the utility's income in communities with decreasing volumes of water sold and collected (e.g., due to declining populations or water conservation programs). Some examples of how utilities have approached this include:

- ***Leasing space on water towers****:* Water towers are valuable real estate because they are often located in or near towns. Because of their proximity to population centers, water utilities have been able to sell space on their towers for cellphone antennas and advertising.
- ***Selling grid service to a local electric utility:*** Grid service refers to an arrangement where a local electric utility pays the water utility for agreeing to temporarily curtail some of its electric load when needed to help the electric utility match supply to demand. The water utility is still paid for agreeing to this arrangement even if it is never asked to shed load.
- ***Selling water and wastewater line protection:*** Homeowners own the lateral service lines that connect the main distribution lines to their home. Replacement cost is generally $2,500–$3,500, and is the responsibility of the homeowner. Some utilities have sold a service that acts as an "insurance" for customers, guaranteeing the utility will fix their lateral service lines when

NMED Exhibit 18

necessary. This can make use of the utility's existing expertise and resources to provide a sought-after service to the customer.

- ***Other sources of revenue generated from taxes*:** Other sources of local revenue can include general revenues appropriated to support wastewater services and portions of payroll taxes, property taxes, sales taxes, and toll severance taxes devoted to support wastewater services.
- ***Your elected officials:*** Consider talking to your elected officials about your infrastructure needs.

Additional examples of how communities have implemented these revenue building strategies is available in EPA's *Water Infrastructure Financial Leadership Successful Financial Tools for Local Decision Makers* document, available at https://www.epa.gov/sites/production/files/2017-09/documents/financial_leadership_practices_document_final_draft_9-25-17_0.pdf.

III. Taxes (Income Taxes, Sales Taxes, Property Taxes)

Taxes may be used as a limited funding source for annual wastewater system costs. Options include income taxes, sales taxes, and property taxes. Taxes may not be used to pay operating costs for some projects funded through the SRFs. However, user charge regulations do not require that capital outlays or debt service be covered in the user charge system. As a result, taxes can be used to repay bonds or loans for CWA projects that are subject to CWA Title II requirements. Projects funded with other sources such as local bonds, state loans, etc. do not have these restrictions.

- **Income taxes:** Individual or corporate income taxes have historically had less applicability to environmental program funding than other taxes such as property taxes, and targeted sales taxes. Income taxes are used to fund environmental programs, but their use is largely at the state level.
- **Sales taxes**: Many local jurisdictions raise funds through sales taxes. Communities may dedicate a portion of local option sales tax revenues to water pollution control, or may impose a local option sales tax on a specific product or service.
- **Property taxes**: Local governments use ad valorem property taxes as the primary source of funding for general government operations. Ad valorem property taxes are based on the value of property. As a result, residents with larger and/or more expensive homes pay more in properly taxes than residents with less expensive homes.

NMED Exhibit 18

Appendix E. Examples of Other Metrics Relevant to Consideration of Financial Capability

Examples of Information Related to Residential Impacts:

1. Income distribution by quintile, geography, or other breakdown, illustrating how income distribution in the service area differs from comparable data on the national level or for similar cities.
2. Where cities have adopted differential rates for low-income customers, the income distribution that led to that rate structure.
3. Information about service area poverty rates and trends.
4. Projected, current, and historical sewer and stormwater fees as a percentage of household income, quintile, geography or other breakdown.
5. Information on sewer and water usage for various classes of ratepayers or by type of dwelling unit.
6. Information on the percent of households who own versus rent.

Examples of Information Related to Financial Strength:

1. Historical population trends or population projections.
2. Service area unemployment data and trends, or other labor market indicators, including unemployment on an absolute basis.
3. Rate or revenue models, including dynamic financial planning models showing the projections of impacts over the program period. All revenue sources tied to CWA obligations may be included as appropriate.
4. Rate determination studies used to develop and support recent rate increases.
5. Data and trends on late payments, disconnection notices, service terminations, uncollectable accounts, or revenue collection rates.
6. Historical increases in rates or other dedicated revenue streams.
7. State or local legal restrictions or limitations on property taxes, other revenue streams or debt levels.
8. Other costs or financial obligations, such as those that relate to drinking water or other infrastructure, that significantly affect a permittee's ability to raise revenue.
9. Circumstances that may affect a permittee's bond rating. For instance, incurring debt beyond certain thresholds may negatively impact the permittee's bond rating, thus reducing the ability to raise capital.
10. Financial plans that show the implications of incurring additional debt for a permittee's ability to secure financing, including projections of metrics such as debt ratios, debt service coverage, debt per

NMED Exhibit 18

customer, days of cash on hand, days of working capital, and other metrics used by rating agencies. Such data should be benchmarked to metrics such as rating agency medians and relative to similar entities. This will be especially relevant where the permittee does not have a bond rating.

11. Extraordinary stressors such as those from natural disasters, municipal bankruptcies, unusual capital market conditions, or other situations which impact a permittee's ability to raise revenue or acquire needed financing. When such stressors occur, they may also provide support for making changes to existing schedules.

NMED Exhibit 18

STATE OF NEW MEXICO
WATER QUALITY CONTROL COMMISSION

IN THE MATTER OF:

PETITION FOR REGULATORY CHANGE TO
ADOPT AMENDMENTS TO 20.6.4 NMAC –
Standards For Interstate and Intrastate Surface Waters **WQCC 25-75 (R)**

DIRECT TECHNICAL TESTIMONY OF SHELLY LEMON

I. INTRODUCTION

My name is Shelly Lemon and I am the Bureau Chief of the New Mexico Environment Department ("NMED" or "Department") Surface Water Quality Bureau ("SWQB"). I present this written direct testimony **(NMED Exhibit 19)** on behalf of the SWQB concerning the Bureau's proposed amendments to the State of New Mexico's Standards for Interstate and Intrastate Surface Waters ("Standards"), codified as Title 20, Chapter 6, Part 4 of the New Mexico Administrative Code (20.6.4 NMAC) , as submitted in NMED's First Amended Petition filed June 2, 2026 and proposed for adoption by the Water Quality Control Commission ("Commission" or "WQCC") at the hearing scheduled to commence on Monday, September 28, 2026 (WQCC 25-75(R)). Section 303(c)(1) of the federal Clean Water Act ("CWA") requires that the State hold public hearings at least once every three years to review and amend, as appropriate, its water quality standards. The Department proposes amendments to the Standards consistent with 20.6.4 NMAC, Section 303(c)(1) of the CWA, and Title 40 of the Code of Federal Regulations ("C.F.R.") Section 131.20. 40 C.F.R. § 131.20. This process is known as the State's "Triennial Review."

My testimony provides the supporting evidence and reasoning behind the following proposed changes related to wetlands, including:

- amending the definition of "wetlands";

- amending New Mexico's antidegradation policy to explicitly protect wetlands; and
- adding a new narrative, general criterion specific to wetlands to recognize that wetlands are different from other surface waters and warrant distinct considerations.

II. QUALIFICATIONS

I hold a Bachelor of Science degree in Biology from the University of Arizona, and a Master of Science degree in Hydrology from the University of Arizona. Before joining the Department, I was a Research Assistant for the Center for Sustainability of Semi-Arid Hydrology and Riparian Areas, a former National Science Foundation Science and Technology Center at the University of Arizona, and have also been a high school and middle school science teacher. I have been with the Surface Water Quality Bureau since 2004, serving first as a Total Maximum Daily Load ("TMDL") Scientist, and then the Nutrients and Lake Team Supervisor, Monitoring Team Supervisor, and Program Manager of the Monitoring, Assessment, and Standards Section, as well as the Municipal Team Supervisor for the Point Source Regulation Section.

I have held the position of Bureau Chief of the Department's Surface Water Quality Bureau since March of 2017 and was the acting Bureau Chief prior to that for eight months. As Bureau Chief, I manage and oversee three technical sections and 47 FTE who fulfill the state's responsibilities under the federal Clean Water Act and New Mexico Water Quality Act, including developing and revising water quality standards; collecting water quality data; assessing and reporting on the status of water quality; developing planning documents to improving water quality-limited waterbodies; managing and implementing projects that reduce nonpoint source pollution, protect and restore wetlands, and improve water quality; certifying federal NPDES and 404 dredge and fill permits to ensure they meet New Mexico's laws and regulations; and

implementing surface water protection regulations related to point source discharges, discharges of dredge or fill materials, and spills or refuse in surface waters.

Related to water quality standards amendments, I have served as an expert witness for the Department in both the 2013 and 2020 Triennial Reviews (WQCC 14-05 and WQCC 20-51), a temporary standard for Doggett Creek related to the Raton Wastewater Treatment Plant (WQCC 19-46), and a third-party Hydrology Protocol (HP) Use Attainability Analysis (UAA) for San Isidro Arroyo and its tributaries (WQCC 19-03). I have also provided technical support and participated in the rulemaking hearings for recent third-party proposals related to copper site-specific criteria for the Pajarito Plateau (WQCC 24-31), a UAA for Sandia Canyon (WQCC 24-65), and a HP-UAA for Tijeras Arroyo (WQCC 25-28). I have also provided technical expertise and review for several other amendments, including the Department's Santa Fe River HP-UAA (WQCC 12-07) and two third-party Outstanding National Resource Water (ONRW) proposals—the Upper Pecos River ONRWs (WQCC 21-51) and the Upper Rio Grande-Jemez ONRWs (WQCC 21-62).

In addition, since 2020 I have served on the Association of Clean Water Administrators (ACWA) Board of Directors representing New Mexico, other Region 6 States (Texas, Oklahoma, Arkansas, and Louisiana), and the National Association, including serving as Vice President in 2025 and President in 2026. I have included a copy of my resume as **NMED Exhibit 23**.

III. "WETLANDS" DEFINITION – 20.6.4.7(W)(4) NMAC

The Department proposes to amend the definition of "wetlands" in Subsection W of 20.6.4.7 NMAC to provide clarity and maintain consistency with other state or federal regulations. The Department proposes to rearrange the first and last sentences to be more succinct and clearer, but the proposed changes still mirror the existing definition:

"Wetlands mean those areas that are inundated by surface or ground water at a frequency and duration that typically support vegetation adapted for life in saturated soil conditions in New Mexico…"

"…Wetlands constructed for wastewater treatment outside of, and do not impound, a surface water of the state are not included in the definition."

The Department also proposes to add language to the definition to reflect established science and acknowledge the unique characteristics of New Mexico's landscape, as follows:

"…Wetlands are unique surface waters of the state that vary widely because of regional and local differences in soils, topography, climate, hydrology, water chemistry, vegetation and other factors and provide distinct chemical, biological, physical, and hydrological functions within a watershed. For certain types of wetlands, like playa lakes, water may only be present at certain times of the year, resulting in a cyclic nature of drying and refilling..."

Scientific studies overwhelmingly confirm that wetlands provide essential functions. Wetlands improve water quality by trapping sediment, transforming nutrients, and filtering pollutants. They also store floodwaters, reduce peak flows, and recharge groundwater, maintaining surface water systems during dry periods. **(NMED Exhibit 20)**. These hydrological and chemical functions occur even in non-floodplain (e.g., isolated) wetlands, which research shows are physically and chemically connected to downstream waters and contribute to water availability and quality over large distances. **(NMED Exhibit 25)**.

The definition's explicit inclusion of wetlands that vary seasonally, such as playa lakes, is critical. Despite their temporary nature, playas and other intermittent and ephemeral wetlands provide habitat for migratory birds, amphibians, and other wildlife, and they support biodiversity. In eastern New Mexico, playas are also a primary pathway for recharging the Ogallala Aquifer, a vital water source for rural communities and agriculture. **(NMED Exhibit 21)**.

Statewide, wetlands play an important role in the ecology of the landscape. They support hundreds of species and offer recreational, economic, and water-quality benefits. **(NMED Exhibit 24)**. The proposed definition aligns with New Mexico's long-term wetland management

goals, which emphasize protecting and restoring naturally functioning wetlands and developing a narrative standard specific to wetlands. **(NMED Exhibit 22)**.

Adopting the amended definition will ensure robust, scientifically grounded protection of New Mexico's diverse wetland resources and support their essential role in sustaining water quality, watershed health, wildlife habitat, and community resilience. Adopting this definition will also provide clear guidance with implementing various surface water quality programs, such as identifying outstanding national resource waters (ONRWs), conducting functional assessments to identify baseline conditions, determining temporary standards, analyzing the risk to water quality degradation and establishing discharge limitations and requirements, calculating a project's functional loss or lift, and evaluating restoration and mitigation effectiveness.

IV. ANTIDEGRADATION POLICY – 20.6.4.8(A) NMAC

The Department proposes to amend New Mexico's antidegradation policy in Subsection A of 20.6.4.8 NMAC to explicitly include wetland considerations and provide consistency with the surface water permitting regulations in 20.6.2 NMAC (e.g., protecting functions and acreage). Federal law requires that surface waters be protected from discharges that might degrade water quality. 40 C.F.R. § 131.12. To implement this requirement, it is necessary to identify antidegradation protection levels, or tiers, appropriate to each surface water.

At a minimum, all surface waters including wetlands in New Mexico are protected in accordance with "Tier 1" antidegradation requirements. S*ee* 20.6.4.8(A)(1) NMAC. Tier 1 requires that existing uses be maintained and protected. Tier 1 prohibits further degradation of a surface water. For wetlands, the Department proposes to protect "wetland condition" (i.e., functions and acreage) under the State's antidegradation policy. Research shows that wetlands are integral to maintaining water quality and there are noticeable benefits of intact wetland function: wetlands

filter and remove pollutants, improve flood-control capacity and climate resilience, contribute to ground water recharge and buffer streamflow variability, and support wildlife and migratory species alongside recreational and economic benefits for nearby communities. These facts reinforce that wetland condition directly influences water quality as well as a variety of ecological and social values and underscores the importance of preventing wetland loss and degradation. **(NMED Exhibit 26)**.

The Department proposes to add "wetland condition" to the Tier 2 protection level. "Tier 2" applies to surface waters with high-quality water, that is where existing water quality *or wetland condition* is better than applicable Standards. *See* 20.6.4.8(A)(2) NMAC. Tier 2 requires that existing high-quality surface waters be maintained but allows for limited degradation; however, the Tier 2 protection level prohibits significant degradation unless a review of reasonable alternatives and social and economic considerations supports a lowering of water quality *or wetland condition, including loss of wetland acreage or functions*. The Department also proposes a few other changes to streamline and clarify this Paragraph to, "…ensure the highest statutory and regulatory requirements for all new and existing point sources and implementation of all cost-effective and reasonable best management practices for nonpoint source control." Finally, the Department proposes to include wetlands under the Tier 3 level of protection. "Tier 3" applies to Outstanding National Resource Waters (ONRWs) and prohibits any degradation and lowering of water quality, *including loss of wetland acreage or functions*, in an ONRW unless impacts are minimal and temporary. *See* 20.6.4.8(A)(3) NMAC.

By clarifying that degradation includes loss of wetland acreage and functions, the proposed amendments ensure protection of the full suite of ecosystem services wetlands provide. This approach aligns with current scientific understanding and research, and strengthens New

Mexico's ability to safeguard surface water resources, wildlife habitat, community resilience, and economic vitality.

V. GENERAL CRITERION FOR WETLANDS – 20.6.4.13(N) NMAC

The Department proposes a new general criterion for wetlands in Subsection N of 20.6.4.13 NMAC. General criteria are established to sustain and protect existing or attainable uses of surface waters. The proposed criterion is specific to wetlands and clearly mandates that wetlands be maintained and protected from direct, indirect, and cumulative impacts that would lead to a net loss of acreage or essential biological, chemical, physical, and hydrological functions.

Wetlands provide important ecological and hydrological services when they are healthy. New Mexico's wetlands control and weaken floods and contribute to bank stabilization; improve water quality by filtering pollutants and sediment from water; provide a home and nursery for many species of animals and plants and create habitat that is less vulnerable to wildfire and drought; provide breeding, feeding, and stopover grounds for migratory birds and serve as migration corridors for other wildlife; create opportunities for fishing, hunting, birding and wildlife viewing, nature photography, camping, and hiking; recharge aquifers and store water for future uses; absorb water and slowly release it, helping to maintain baseflows; and accumulate carbon in the soil, helping to reduce the amount of carbon reaching the atmosphere.

In addition, robust, science-based wetland protection provides broad economic benefits. Healthy wetlands support agriculture and grazing, municipal water supplies, recreation and tourism, economic development, and property values. Degraded or lost wetlands, by contrast, impose costs related to sedimentation, flood and wildfire risk, drinking water treatment, and crop losses. Every dollar invested in wetland protection typically yields multiple dollars in avoided damage and boosted local economic activity. Collectively, New Mexico's wetlands strengthen

local economic activity from ranching and farming to outdoor recreation and tourism while reducing public costs associated with flood damage, wildfires, water treatment, and habitat loss.

The Department's proposed criterion ensures that wetlands and their essential ecosystem services and economic benefits are protected statewide. This criterion is necessary for the maintenance, protection, and enhancement of New Mexico's wetlands because it establishes water quality goals for these unique surface waters and highlights the fact that wetlands provide essential ecosystem services (for free!) and act as natural infrastructure critical to watershed and climate resilience, water sustainability, and New Mexico's long-term economic well-being.

VI. CONCLUSION

The Department recommends that the Commission adopt the proposed amendments to the Standards, filed with the Department's First Amended Petition (NMED Exhibit 27) and based upon the testimony of the SWQB's witnesses. This concludes my direct testimony.

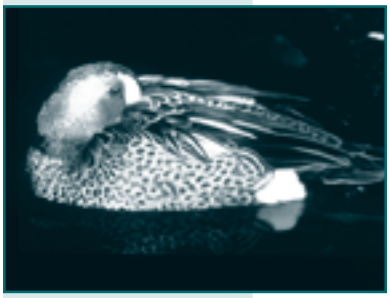
Functions and Values of Wetlands

Dave Davis

Long regarded as wastelands, wetlands are now recognized as important features in the landscape that provide numerous beneficial services for people and for fish and wildlife. Some of these services, or functions, include protecting and improving water quality, providing fish and wildlife habitats, storing floodwaters, and maintaining surface water flow during dry periods. These beneficial services, considered valuable to societies worldwide, are the result of the inherent and unique natural characteristics of wetlands.



Wetlands are considered valuable because they clean the water, recharge water supplies, reduce flood risks, and provide fish and wildlife habitat. In addition, wetlands provide recreational opportunities, aesthetic benefits, sites for research and education, and commercial fishery benefits.

Functions Versus Values

Wetland functions include water quality improvement, floodwater storage, fish and wildlife habitat, aesthetics, and biological productivity. The value of a wetland is an estimate of the importance or worth of one or more of its functions to society. For example, a value can be determined by the revenue generated from the sale of fish that depend on the wetland, by the tourist dollars associated with the wetland, or by public support for protecting fish and wildlife.

Although large-scale benefits of functions can be valued, determining the value of individual wetlands is difficult because they differ widely and do not all perform the same functions or perform functions equally well. Decision-makers must understand that impacts on wetland functions can eliminate or diminish the values of wetlands.

Water storage. Wetlands function like natural tubs or sponges, storing water and slowly releasing it. This process slows the water's momentum and erosive potential, reduces flood heights, and allows for ground water recharge, which contributes to base flow to surface water systems during dry periods. Although a small wetland might not store much water, a network of many small wetlands can store an enormous amount of water. The ability of wetlands to store floodwaters reduces the risk of costly property damage and loss of life—benefits that have economic value to us. For example, the U.S. Army Corps of Engineers found that protecting wetlands along the Charles River in Boston, Massachusetts, saved $17 million in potential flood damage.

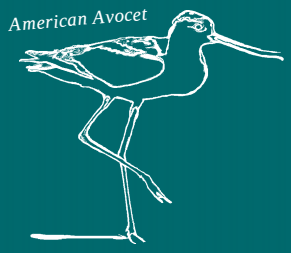
Water filtration. After being slowed by a wetland, water moves around plants, allowing the suspended sediment to drop out and settle to the wetland floor. Nutrients from fertilizer application, manure, leaking septic tanks, and municipal sewage that are dissolved in the water are often absorbed by plant roots and microorganisms in the soil. Other pollutants stick to soil particles. In many cases, this filtration process removes much of the water's nutrient and pollutant load by the time it leaves a wetland. Some types of wetlands are so good at this filtration function that environmental managers construct similar artificial wetlands to treat storm water and wastewater.

Red-osier dogwood

Biological productivity. Wetlands are some of the most biologically productive natural ecosystems in the world, comparable to tropical rain forests and coral reefs in their productivity and the diversity of species they support. Abundant vegetation and shallow water provide diverse habitats for fish and wildlife. Aquatic plant life flourishes in the nutrient-rich environment, and energy converted by the plants is passed up the food chain to fish, waterfowl, and other wildlife and to us as well. This function supports valuable commercial fish and shellfish industries.

The Great Flood of 1993 in the upper Mississippi River Basin caused billions of dollars in property damage and resulted in 38 deaths. Historically, 20 million acres of wetlands in this area had been drained or filled, mostly for agricultural purposes. If the wetlands had been preserved rather than drained, much property damage and crop loss could have been avoided.

DID YOU KNOW?



- In 1991 wetland-related ecotourism activities such as hunting, fishing, bird-watching, and photography added approximately $59 billion to the national economy.
- According to the Pacific Coast Federation of Fishermen's Associations, almost $79 billion per year is generated from wetland-dependent species, or about 71 percent of the nation's entire $111 billion commercial and recreational fishing industry in 1997.
- An acre of wetland can store 1–1.5 million gallons of floodwater.
- Up to one-half of North American bird species nest or feed in wetlands.
- Although wetlands keep only about 5 percent of the land surface in the conterminous United States, they are home to 31 percent of our plant species.

Steve Delaney

Seventy-five percent of commercially harvested fish are wetland-dependent. Add shellfish species and that number jumps to 95 percent.

PLAYA LAKES: Understanding Their Importance and How to Protect Them and Improve Their Function

Rossana Sallenave and Amy Ganguli[1]

aces.nmsu.edu/pubs • Cooperative Extension Service • Guide W-107

The College of Agricultural, Consumer and Environmental Sciences is an engine for economic and community development in New Mexico, improving the lives of New Mexicans through academic, research, and Extension programs.

New Mexico State University
aces.nmsu.edu

***Figure 1*. Playa lakes, like this one near Portales, NM, provide critical habitat for migratory waterfowl and shorebirds.** (Photo courtesy of William Jaremko-Wright, New Mexico Highlands University.)

WHAT ARE PLAYA LAKES?

Playa lakes are one of the most important types of ephemeral or temporary wetlands in the arid Southwest (Figure 1). These shallow, generally circular depressions with clay-lined basins form at the lowest point in an enclosed watershed. They can range in size from a few acres to up to 200 acres. Because they are closed basins, the only water playas receive is from precipitation and catchment runoff, while water is lost via evaporation from soil and vegetation and recharge of the underlying aquifer. Playa lakes can remain dry for several years—even decades (Figure 2). Then, after a rainfall event, they can fill with up with water and create temporary wetlands. In New Mexico, ephemeral or non-perennial waters make up over 80% of the state's waters and are expressly protected by the state's water quality standards. Although playas exist in arid regions throughout the world, the High Plains of the U.S. has the world's highest number of playas (as many as 50,000), of which 85% are found on the Llano Estacado, a portion of the Southern High Plains spanning the Texas–New Mexico border. In the Southern High Plains region, playas are the principal source of surface water.

Because playas store water in parts of the country that receive very little rainwater and where there are no permanent rivers or streams, they are vital to communities, ranchers, and rural agricultural economies, and support a vast array of wildlife. Despite their ephemeral nature, these water resources provide critical

[1]Respectively, Extension Aquatic Ecology Specialist, Department of Extension Animal Sciences and Natural Resources, New Mexico State University; former Associate Professor, Department of Animal and Range Sciences, New Mexico State University and currently National Program Leader, National Institute of Food and Agriculture, U.S. Department of Agriculture.

NMED Exhibit 21

ecosystem services, such as recharging groundwater supplies for a growing population; providing habitat for migratory birds, waterfowl, and other wildlife; and supporting a growing wildlife-related recreational industry.

PLAYAS PROVIDE ECOSYSTEM SERVICES

The term "ecosystem services" refers to the many different benefits provided to humans by ecosystems. Examples of ecosystems include agroecosystems, grassland ecosystems, and aquatic ecosystems. Healthy playa wetlands provide numerous ecosystem services that benefit society, including wildlife habitat, clean water, floodwater storage, and groundwater recharge.

Wildlife and biodiversity

Playas are sources of great plant and animal biodiversity, providing critical habitat for millions of migratory birds and waterfowl, as well as providing essential habitat for amphibians, reptiles, mammals, and several species of unique invertebrates (MacKay et al., 1990; Haukos and Smith, 1994). In New Mexico, ephemeral playas have been identified by the New Mexico Department of Game and Fish (2016) as one of ten key aquatic habitats, and they provide habitat for several threatened and endangered species and species of concern in New Mexico. In the Southern High Plains, playa wetlands are essential staging and feeding areas in one of the most important inland migratory corridors in North America for birds, including waterfowl, shorebirds, and many other migratory and resident birds (Figures 3A–3C). They also provide cover and habitat for native species during dry cycles.

In addition to their importance to birds, playas support a remarkable variety of invertebrate species that have evolved to exploit the extreme hydrological conditions of these wetlands. Tadpole shrimp and fairy shrimp (Figures 4A and 4B) are primitive branchiopod crustaceans that bridge periods of drought by laying drought-resistant, resting eggs or cysts that can lie dormant and viable for years in unflooded soil (Brendonck, 1996; Brendonck and Meester, 2003). Soon after being immersed in water, a portion of the eggs will hatch, and within a few weeks adult tadpole and fairy shrimp lay eggs before the ephemeral waterbodies dry up again. These crustaceans are important sources of food for some insects, amphibians, and waterfowl, making them an extremely important link in the food web, particularly as a supply of energy for migratory birds (Smith, 2003).

Playa wetlands also provide critical habitat for a number of amphibian species native to the Southwest, particularly anurans (frogs and toads). During most of the year, desert anurans are underground in burrows. However, immediately after the summer monsoon rains, they emerge from their burrows and can be heard calling from newly filled sites. Anuran species that have been observed in both natural playas and human-made cattle tanks in New Mexico include the Mexican spadefoot (*Spea multiplicata*), plains spadefoot (*Spea bombifrons*), Couch's spadefoot (*Scaphiopus couchii*), Great Plains toad (*Anaxyrus cognatus*), and green toad (*Anaxyrus debilis*) (Figures 5A and 5B).

Aquifer recharge and water quality

Playas have been shown to be a primary source of groundwater recharge in arid regions. In the High Plains, playas are critical zones of recharge for the Ogallala Aquifer (also known as the High Plains Aquifer) as the water filters through cracks in the playas' clay lining and back into

NMED Exhibit 21

the aquifer. The Ogallala Aquifer is a vast underground water-bearing formation that spans 174,000 square miles in parts of eight states, including six counties in eastern New Mexico. The aquifer provides almost all the water used in the region. However, current usage far outpaces its ability to recharge. Recharge occurs from within the playa basins as well as along the perimeters of undisturbed playas. Although the exact amount of recharge attributable to any single playa or group of playas is unknown, some studies suggest that recharge rates in unaltered playa basins may be greater than 3 inches per year (Gurdak and Roe, 2009).

In addition to contributing to the significant recharge of aquifers, healthy playas also improve the quality of that water. Studies have shown that playa lakes in their natural state surrounded by buffers of native grasses and vegetation can catch and filter sediments and slow runoff, which allows salts and contaminants to be intercepted before entering the playas. These natural buffers also intercept sediments and prevent them from clogging playas' natural clay bottoms, which affects infiltration of water.

THREATS TO THE ECOSYSTEM SERVICES PROVIDED BY PLAYAS

Changes in land use, primarily as a result of agriculture and urbanization, have led to widespread losses and deterioration of playa wetlands (Haukos and Smith, 1994; Hall et al., 2004). Common impairments to playas include sedimentation (considered to be the greatest threat) and contamination from urban and agricultural runoff, both of which affect playas' integrity and function. Urban expansion has resulted in many playas being filled, leveled, and bisected with roads. Urban playas have often been used to store stormwater accumulation from urban runoff. Common contaminants in urban runoff include heavy metals, hydrocarbons, pesticides, fertilizers, and chemicals associated with automobiles. Because urban playas rarely have adequate vegetative buffers to intercept surface runoff, these pollutants become concentrated in playas, and can contaminate underlying aquifers.

Rural playas are often altered by creating pits within the playas to hold water long enough to provide drinking water for livestock and to use for irrigation water. Over 70% of playas in the Southern High Plains larger than 10 acres have pits. Other playas have been plowed and cultivated during dry cycles to increase acreage. Modifying the playas in these ways breaks up the clay soils lining the bottom of unaltered playas and removes the grassy buffers along the playa perimeters, leading to increased sedimentation and erosion. This increased sedimentation, coupled with the breakup of the clay layer, prevents cracks from forming in the bottoms of playas, thereby reducing or restricting water infiltration and aquifer recharge. In other areas, such as West Texas, playas are often used to catch runoff from oil and gas operations.

***Figures 3A–C*. Playa wetlands are essential staging and feeding areas for migrating waterfowl, such as northern pintail (A), and shorebirds, such as long-billed curlew (B) and American avocet (C).** (Photos courtesy of William Jaremko-Wright, New Mexico Highlands University.)

NMED Exhibit 21

***Figures 4A and 4B*. Tadpole shrimp (held in hand on left) and fairy shrimp (orange-colored in left photo, in upper right-hand corner in right photo) collected from a playa lake near Las Cruces, NM.**

***Figures 5A and 5B*. Playa wetlands provide critical habitat for a number of amphibian species, including Mexican spadefoot (A) and Great Plains toad (B).** (Photos courtesy of Dr. Wiebke Boeing, New Mexico State University.)

Unsustainable rangeland management practices, such as poorly managed grazing, have also led to the deterioration of many rural playa wetlands. If not managed properly, grazing can result in reduced water quality through a reduction of the valuable filtering capacity of playa vegetation. In addition, heavy use by livestock can result in soil erosion and sedimentation, as well as soil compaction. Higher levels of grazing result in a shift from perennial and more intact plant communities toward annuals.

Protecting these ephemeral wetlands is further complicated by the fact that they are almost entirely located on privately owned lands, leading to a lack of consistent management strategies among playas.

HOW CAN WE PROTECT AND IMPROVE PLAYA LAKES?

Conservation practices

Because unsustainable land use practices and activities surrounding playa wetlands have led to their deterioration, playas should be actively managed in order to maintain and improve their functions, the critical wetland habitat they provide, and groundwater recharge. A number of conservation practices can be implemented by playa owners to help improve natural playa functions.

- Practice improved grazing management. Both forage production and playa fillings are linked to wetter climatic cycles, and therefore overlap. During these grazing windows, the negative effects of intense livestock use of playas can be mitigated through practices such as herding, or implementing grazing systems that allow for deferrals so livestock can be moved to other areas during these critical times. Other strategies include developing alternative upland watering systems, and fencing to manage livestock around a playa.

NMED Exhibit 21

- Plant and protect vegetative buffers around playas to filter sediments and prevent other contaminants from reaching the playa.
- Remove exotic/invasive plants and promote natural plant communities.
- Remediate (fill) pits with appropriate soils in playa bottoms.

These management practices aimed at conserving and restoring playa wetlands all help create wildlife habitat and natural playa plant communities, improve natural playa function, and promote groundwater recharge. Another important consideration regarding playa restoration is that most playas are on private property, and the impacts of playa wetland deterioration may cross landowner property boundaries. Therefore, restoration efforts will require collaborative partnerships between landowners, conservationists, and funding entities to adequately address playa impairments. Examples of collaborative playa restoration projects in eastern New Mexico are detailed in the *Wetlands Action Plan for Playa Lakes, Curry County, New Mexico* (Martin, 2014).

Get involved, become informed, and spread the word!

In comparison to other wetlands, playas and the role they play are not well understood. As a result, they are underappreciated and often overlooked, even by some playa landowners. Outreach efforts play a critical role in informing and educating the public on the importance of playa wetlands, as well as in engaging and maintaining community support for conservation efforts of playas. Conservation efforts focus on reducing sedimentation, improving water quality, and restoring playa function and ecological integrity. A great place to begin learning more about playas is by visiting the non-profit organization Playa Lakes Joint Venture (https://pljv.org/), a regional partnership of federal and state agencies, conservation groups, and private industry whose purpose is to conserve bird habitat throughout the western Great Plains, where playas (more than 80,0000) are the most abundant wetland in the region.

AVAILABLE PLAYA ASSESSMENT AND RESTORATION RESOURCES

A number of federal and state programs exist that provide technical and financial assistance to landowners interested in restoring playas on their properties and protecting the land from future development.

The USDA-Natural Resources Conservation Service (NRCS) provides technical and financial support to landowners with wetland restoration efforts through the Wetlands Reserve Program (WRP; https://www.nrcs.usda.gov/wps/portal/nrcs/detail/national/home/?cid=STELPRDB1049327). This voluntary program assists landowners who wish to protect, restore, and enhance wetlands on their property. Although not all playas meet the wetland criteria required by WRP, many playas may be eligible for the program, and landowners are encouraged to consider the program to enhance their wetland.

The WRP also offers landowners the opportunity to protect, restore, and enhance wetlands on their property through the purchase of a wetland reserve easement. Wetland reserve easements are designed to provide landowners with a financial incentive to restore degraded wetlands. NRCS pays an easement fee and the entire cost to restore the wetland; the owner retains title, access control, and hunting rights, but must protect the wetland for future generations. More information on wetland easement programs, eligibility, and how to enroll can be found at https://www.nrcs.usda.gov/wps/portal/nrcs/detail/null/?cid=nrcseprd416653.

The Environmental Quality Incentives Program (EQIP; https://www.nrcs.usda.gov/wps/portal/nrcs/main/national/programs/financial/eqip/) is another NRCS voluntary program available to agricultural producers who want to improve and protect the condition of their land. The program provides financial and technical assistance to implement structural and conservation practices that address natural resource (soil, water, plants, animals) concerns. The costs are typically shared by the landowner and NRCS, with landowners providing 25% and NRCS providing 75%. Requests by landowners are awarded based on a ranking system and availability of funds.

In New Mexico

The Wetlands Program of the New Mexico Environment Department's (NMED) Surface Water Quality Bureau (SWQB) (https://www.env.nm.gov/surface-water-quality/wetlands/) promotes the protection and restoration of different types of wetland ecosystems throughout New Mexico, including ephemeral wetlands such as playas. The program assists communities, local governments, stakeholders, and others with technical information, planning, training, and other guidance in their wetlands restoration efforts. Examples of playa restoration projects in eastern New Mexico that involved collaborative efforts of landowners, local government, NMED, and the Nature Conservancy are detailed in the *Wetlands Action Plan for Playa Lakes, Curry County, New Mexico* (Martin, 2014). This wetland action plan provides a summary of programs available to help landowners utilize their playas while protecting their natural functions and ecological integrity. Other programs and sources of funding that have been used by playa landowners in eastern New Mexico to restore playas include the U.S. Fish and Wildlife Service (USFWS) Private Stewardship Grants Program (https://training.fws.gov/courses/csp/csp3115/resources/ESA_Folder/private_stewardship5_04.pdf) and the USFWS North American Wetlands Conservation Act (NAWCA;

NMED Exhibit 21

https://www.fws.gov/birds/grants/north-american-wetland-conservation-act/standard-grants.php).

The New Mexico Rapid Assessment Method (NMRAM) Playa Wetland Field Guide (Muldavin et al., 2017) is a useful guide for resource managers to help assess funding needs of any playa restoration project. It provides procedures for conducting a rapid assessment of playa wetlands in the Southern High Plains of eastern New Mexico. This should help NMED prioritize wetlands in need of restoration, identify causes of degradation, and help develop methods for protecting playas. Details of the field guide can be found at https://www.env.nm.gov/wp-content/uploads/sites/25/2018/04/Playa-RAM-Field-Guide-with-Appendices.pdf.

SUMMARY

Playa lakes are one of the most important types of ephemeral or temporary wetlands in the arid and semi-arid Southwest. Despite their ephemeral nature, these critical water resources recharge groundwater supplies for a growing population; provide habitat for migratory birds, waterfowl, and other wildlife; and support a growing wildlife-related recreational industry. In the Southern High Plains region, playas are the principal source of surface water and are vital to communities, ranchers, and rural agricultural economies. Unfortunately, changes in land use, primarily as a result of agriculture and urbanization, have led to widespread losses and deterioration of playa wetlands. Common impairments to playas include sedimentation (considered to be the greatest threat), pits (deep holes excavated in the basin of the playa), and contamination from urban and agricultural runoff, all of which affect the integrity and function of playas.

Active management of playas is needed to maintain and improve their functions, groundwater recharge, and the critical wetland habitat they provide. A number of conservation practices can be implemented by playa owners to help improve natural playa functions. These management practices all help create wildlife habitat and natural playa plant communities, improve natural playa function, and promote groundwater recharge. Since most playas are on private property, restoration efforts will require collaborative partnerships between landowners, conservationists, and funding entities to adequately address playa impairments.

A number of federal and state programs exist that provide technical and financial assistance to landowners interested in restoring playas on their properties and protecting the land from future development. The USDA-Natural Resources Conservation Service (NRCS) and U.S. Fish and Wildlife Service (USFWS) have a number of programs and grants available for the restoration and protection of playa wetlands. In New Mexico, the Wetlands Program of the New Mexico Environment Department's (NMED) Surface Water Quality Bureau (SWQB) promotes the protection and restoration of different types of wetland ecosystems throughout New Mexico, including playas.

WETLANDS PROGRAM PLAN FOR NEW MEXICO

(Previously EPA Approved 4.9.2019)

Since 2003, the New Mexico Environment Department Surface Water Quality Bureau (SWQB) Wetlands Program and its partners have made substantial progress in the development of a robust program that focuses on measures that will restore and protect New Mexico wetlands. This updated Wetlands Program Plan describes the achievements made since this Plan was approved in 2010 by EPA and previously updated in 2012, 2015, 2017 and 2019. It also lays out a pathway to continue program development for the next five years. This current version of the Wetlands Program Plan for New Mexico incorporates revisions described in the March 2020 Revised Draft of the ESTP Core Elements Framework. Through this updated 5-year Wetlands Program Plan we hope to continue progress towards a comprehensive and sustainable Wetlands Program for New Mexico.

WETLANDS PROGRAM GOALS

The Mission of the SWQB Wetlands Program is to protect, restore and increase self-sustaining and naturally functioning wetlands and riparian areas. The Wetlands Program emphasizes the role of wetlands in preventing and reducing water quality impairments and providing habitat and life requirements for wildlife. To this end the Wetlands Program has formulated the following long-term objectives:

1. Promote wetland protection and restoration as a goal of established watershed groups and other partnerships.

2. Increase wetland area (no net loss) as well as restore wetland functions and ecological services and develop a system for tracking gains and losses by wetland type.

3. Assist communities, agencies, tribes, stakeholders, local governments and others with wetlands technical information, project design and planning, training and other guidance.

4. Develop protection, adaptation and mitigation strategies for wetland resources threatened by the effects of a drying climate in the west, including drying of wetlands in the landscape, loss of mountain snowpack, increased large-scale catastrophic fires and subsequent flooding, scour and sediment delivery.

NMED Exhibit 22

5. Develop and refine narrative water quality standards for wetlands and for specific wetland types and use these standards to promote more effective CWA §401 Certification.

6. Develop a toolbox of successful restoration techniques that are specific to wetland types and ecoregions.

PARTNERSHIP GOALS

The principal goal which informs the work of the SWQB Wetlands Program and its many public and private partners is a desire to restore and maintain wetlands, allowing them to fully function as natural systems. This goal can be accomplished through collaborative partnerships that contribute to completing large-scale major restoration projects, and to restoring numerous wetlands within a watershed an acre at a time.

A second overarching goal is to create a sustainable wetlands plan of action by developing sustainable funding sources. SWQB Wetlands Program and its partners are considering ways to achieve sustainability through potential funding, programs, and management activities such as wetlands banks, in lieu fee programs, state-sponsored programs such as the River Stewardship Program, participation in NGO-sponsored programs such as the Rio Grande Water Fund, through partnerships associated with the New Mexico Mapping Consortium, Geospatial Advisory Committee, and our Northern and Southern Wetlands Roundtables, by continuing to obtain matching grants through foundations, by organizing and assisting voluntary programs, and by obtaining in-kind resources and assistance through the efforts of watershed groups, NGOs and their volunteers.

The priority technical goals within the next five years are to identify and maintain simple, effective and efficient methods for monitoring wetlands, to work with our partners towards a complete inventory and baseline assessment of New Mexico's wetland resources, and to share these data for the benefit of wetlands.

Partnerships can aid in the protection of wetlands on the regional and local level. SWQB Wetlands Program can assist partners in the implementation of wetlands protection on the regional and local level by providing information, training and data that supports local efforts to protect wetlands.

SWQB WETLANDS PROGRAM EFFORTS

Currently SWQB Wetlands Program development is primarily supported by EPA Wetlands Program Development Grants competitively awarded by EPA Region 6 under the CWA §104(b)(3). The State of New Mexico provides a portion of funding for Wetlands Program staff through the Corrective Action Fund Program. The SWQB Wetlands Program and its core elements are

NMED Exhibit 22

included in the comprehensive update to the Water Quality Management Plan (WQMP) and Continuing Planning Process (CPP) which was approved by the New Mexico Water Quality Control Commission and EPA Region 6 in October 2020 https://www.env.nm.gov/surface-water-quality/wqmp-cpp/.

In 2003, the SWQB Wetlands Program began the development of a wetland restoration program (Wetlands Action Plan Program), which is part of a larger mission to improve and protect the state's watersheds and water quality. Through the CWA §319(h) Nonpoint Source Management Program (NPS), SWQB provides funding for watershed groups to develop Watershed Based Plans to reduce pollutants in their watersheds. The Wetlands Action Plan Program provides an opportunity and support for these established watershed groups to broaden their planning and resource improvement efforts to include wetlands, riparian and buffer areas within their watersheds. To this end, the SWQB Wetlands Program is incorporated into the NPS Management Plan for New Mexico, and implementation activities and projects are eligible to compete for funding under CWA Section 319 so long as those activities/projects meet the established watershed management and water quality protection objectives of CWA Section 319 and are described in a completed Wetlands Action Plan.

The State has incorporated wetlands monitoring and assessment into SWQB's Water Quality Monitoring and Assessment Program and wetlands assessment into the 10-year Monitoring Strategy. Wetlands monitoring and assessment contributes to progress toward meeting two overarching national goals of "No Net Loss" in wetlands extent and an "Overall Increase" in wetlands extent, functions, and quality. Effective wetland monitoring and assessment enables New Mexico to meet federal Clean Water Act requirements under Section 305(b) to assess the condition of all navigable waters, including wetlands. The SWQB Wetlands Program has focused its efforts on establishing wetlands assessment and monitoring that can be implemented with the assistance of its many partners. The assessment and monitoring goals of the SWQB Wetlands Program include:

- Continue to expand an inventory and classification of wetlands resources statewide;
- Develop and utilize assessment protocols to verify wetland condition, degradation, impacts and the causes of stress, and recovery;
- Document wetland gains and losses;
- Identify vulnerable wetland types, develop strategies to anticipate potential sources of stress and to create/maintain resilience of these wetland/riparian systems confronted by the effects of a drying climate;
- Document results of wetland restoration projects and innovative techniques for restoration;
- Assess wetland resources to determine potential strategies for recovery of wildlife habitat and wildlife corridors;

NMED Exhibit 22

- Use information generated by wetlands assessment to prioritize wetlands projects and protection within specific watersheds or regions;
- Use information generated by wetlands assessment to assist the United States Department of the Army Corps of Engineers (USACE) in developing meaningful Before-After Mitigation Impact (BAMI) documentation of wetland compensatory mitigation and to use these data to establish mitigation credits and ratios;
- Identify ecologically important and high-quality wetlands through wetlands mapping and assessment for future Outstanding National Resource Waters (ONRW) nomination and protection;
- Monitor ONRW wetlands to identify pollution and degradation, and to use these data to ensure that degradation is prevented, and sources of pollution are abated;
- Assist partners and programs in using SWQB Wetlands assessment tools and generating data to protect and restore wetlands.

The State's regulatory program applies to all surface waters of the State including wetlands. These regulations provide for certification of CWA §402 NPDES permits, and CWA §404 dredge and fill permits under CWA §401, establishing water quality standards under CWA §303 (c) and reporting under CWA §§303(d) and 305(b). The Wetlands Program is currently working with the USACE, Albuquerque District to complete and adopt a regulatory module of the New Mexico Rapid Assessment Method (NMRAM) to assist and improve evaluation of compensatory mitigation through the BAMI procedures. Overall, New Mexico is making progress towards establishing a baseline for wetlands in the state to provide a picture of wetland types and condition. A rapid assessment protocol for the State's wetland resources is under development and use, which focuses on vulnerable and threatened wetland types. The protocol will be used consistently by the SWQB Wetlands Program and participating partners. Mapping and classifying wetlands in the state is progressing through partnerships and projects by SWQB Wetlands Program and others, and numerous demonstration restoration efforts using innovative techniques are in progress or in place.

New Mexico's wetlands including isolated wetlands are incorporated within the water quality standards definitions and are considered "surface waters of the State" (20.6.4.7 NMAC). Isolated and ephemeral wetlands (such as playas) are included in the definition. The interests of the state are critically linked both economically, ecologically and culturally to good water quality in all of the state's waters including isolated wetlands. Non-perennial waters make up over 80% of the state's waters and are expressly protected by the State's standards. Currently, the SWQB Wetlands Program is working to protect and restore vulnerable isolated wetlands, and development of water quality standards specific to wetland types including isolated and ephemeral wetlands is ongoing.

NMED Exhibit 22

The SWQB nominated and the Water Quality Control Commission (WQCC) adopted all naturally occurring wetlands within US Forest Service Wilderness Areas in New Mexico as Outstanding National Resource Waters (ONRW) in 2009. Although wetlands have been included in previous ONRW nominations in the Valle Vidal and the Rio Santa Barbara areas, this action was New Mexico's first success in applying Best Management Practices and improved anti-degradation policy to ONRW wetlands. The SWQB Wetlands Program will continue to identify ecologically important wetlands in other parts of the State. Updating and expanding a directory of Reference Standard Wetlands (best condition), and wetlands in ecologically important or threatened areas to which ONRW status or other protective measures should apply will help aid in these efforts.

WETLANDS PROGRAM PROGRESS

In 2020, the Covid-19 pandemic has caused a snow-ball effect that delayed our well-developed plans. NMED staff travel was restricted in 2020 by order of the New Mexico Governor, so that field work was pushed back to Spring 2021. Our COVID-safe field practices now allow us to work with multiple safety measures, and as we ramp up for field work, we are dealing with competition for field vehicles, over-booked contractor schedules, and weather issues. NMED employees and most state employees have been teleworking since March 16, 2020. However, the SWQB Wetlands Program has still made significant achievements in the last two years and has made some positive and productive changes from lessons learned during the pandemic.

Since the Wetlands Program Plan was developed in 2010 and subsequently updated in 2012, 2015 2017, and 2019 progress has been made on activities that expand the capacity of the Wetlands Program. Below is a list that highlights some of these accomplishments.

- Since 2015, the Wetlands Program has expanded its New Mexico Wetlands Roundtable to include a Southern Wetlands Roundtable that is exclusively geared towards southern New Mexico issues and needs. Both the New Mexico Northern and Southern Wetlands Roundtables meet semiannually. Before pandemic safety precautions were implemented in March 2020, the Southern Wetlands Roundtable was conducted in the southern part of New Mexico in Las Cruces to include those partners more proactively and to address wetlands issues unique to the more arid conditions of southern New Mexico. The Northern Wetlands Roundtable was conducted in the northern part of the New Mexico principally in Santa Fe. Both the Southern and Northern Wetland Roundtables include agency, tribal and NGO participants, as well as students, watershed group members, and others interested in New Mexico wetlands. In March 2020, the scheduled in-person Southern and Northern Wetlands Roundtables were cancelled and subsequently conducted as virtual meetings using WEBEX. This change was remarkably successful in attracting participants that cannot travel to Wetlands Roundtable meetings, including out-of-state presenters and attendees. The Roundtables will continue as hybrid of in-person and webinar-based meetings in the

NMED Exhibit 22

future to engage as many partners as possible in wetlands and water resources issues, information sharing, technical transfer and resource protection.

- Mapping and classification of wetlands within nearly 20 million acres in the Canadian River basin and Dry Cimarron watersheds, Jemez Mountains and the Upper Rio Grande and adjacent areas, in the Sacramento Mountains and adjacent areas, and all wetlands on USFS Wilderness Areas is complete and included in the National Wetlands Inventory (NWI) database and on-line mapper. Mapping of wetlands in the Middle Rio Grande and surrounding areas in the mid-eastern portion of the state, in the Gila Region, in the Lower Rio Grande, in northwestern New Mexico surrounding the San Juan-Animas watersheds and the Estancia Basin, in the bootheel region in southwestern New Mexico and the eastern plains are currently in progress. In addition to polygonal and linear wetland feature mapping, the landscape position, landform, water body type, water flow path classification and descriptors (LLWW) are being applied to all wetlands mapped, and wetland functions are being identified and ranked. The wetlands are also being classified according to the Hydrogeomorphic (HGM) classification in order to prepare for NMRAM data collection and to identify classified segments for wetlands narrative water quality standards. In early 2020, the NWI began requiring any new mapping submitted to the NWI database to conform to new standards (NWI Version 2.0). The current ongoing mapping projects and the completed Sacramento Mountains project are all undergoing updates to conform to the new standards for inclusion in NWI. Participation in the New Mexico Geospatial Advisory Committee and the New Mexico Wetlands Roundtables assists in coordination of wetlands mapping throughout the State. Sixteen Map Book PDFs and instructions for making additional map books were created for use by watershed groups and others. These map books succinctly show map overlays of the different wetland classifications and wetland functions in a given area and are usable by those without GIS capability. The first SWQB Wetlands Program on-line Story Map (ESRI) for the Sacramento Mountains area is complete and can be found at: Sacramento Story Map and a Story Map for the entire state is in progress.

- The New Mexico Rapid Assessment Method (NMRAM) provides procedures, rationale and the metric measurement protocols for conducting a rapid assessment of wetlands. The assessment is a multi-step process including delineating a target Wetland of Interest and one or more Sampling Areas to be assessed. For each Sampling Area, metrics grouped into three attribute categories, Landscape Context, Biotic, and Abiotic are measured and rated. Landscape Context metrics are assessed using maps and/or a geographic information system (GIS) and preferably completed before going into the field to help familiarize the team with the site. The Biotic and Abiotic attributes are evaluated in the field along with a set of field-based stressor checklists and documentary photographs. Worksheets are provided to guide the taking and recording of data.

NMED Exhibit 22

The worksheets together with maps and photographs make up the *NMRAM Assessment Package* that becomes the supporting record of a project. The NMRAM is designed so that scores of individual metrics can be considered together, weighted, and rolled up into a single rank score representing the overall condition and function of a Wetland of Interest.

The Wetlands Program has completed the development of current versions of NMRAM for Montane Riverine Wetlands (Version 2.4), Lowland Riverine Wetlands (Version 2.3), Playa Wetlands (Version 1.2), and Springs Ecosystems (Version 1.0). The Field Guides and data collection worksheets are available at https://www.env.nm.gov/surface-water-quality/wetlands-rapid-assessment-methods/.

- The Montane Riverine Wetlands NMRAM was initially developed for montane riverine wetlands in the Upper Rio Grande watershed. SWQB Wetlands Program and its partners updated and validated the method for montane riverine wetlands in the Gila and Mimbres watersheds, and the Canadian and Dry Cimarron watershed for Montane Riverine Wetlands Version 2.4.
- The development of NMRAM Lowland Riverine Wetlands Version 1.1 was completed on the Gila and Mimbres watersheds – watersheds that are considered relatively intact. The Wetlands Program and its partners updated versions from data analyses in the Rio Grande and Lower Pecos, lowland riverine systems that have considerable alteration, for Lowland Riverine Wetlands Version 2.3. The Wetlands Program will further refine lowland riverine methods in the San Juan/Animas watersheds in the northwestern part of New Mexico to increase the reference domain for its use and to test its efficacy for supporting water quality standards development for lowland riverine wetlands.
- Development of NMRAM for Springs Ecosystems Version 1.0 in southwestern New Mexico is complete. Further refinement and utility of NMRAM for Spring Ecosystems in other reference domains in New Mexico is a future goal of the Wetlands Program.
- The Playa Wetlands NMRAM was developed for the thousands of playas of the Southern High Plains in eastern New Mexico. Through the Wetlands Program mapping efforts, depressional wetlands termed “playas” span the entire state but have a variety of unique hydrologic and hydrogeomorphic attributes as well as distinctive vegetation and other attributes. A future goal of the wetlands Program is to characterize New Mexico depressional wetlands and mineral flats so that NMRAM can be accurately applied.
- NMRAM development for confined valley riverine wetlands, and for headwater slope wetlands are in progress.
- A Version of NMRAM for Riverine Wetlands for Regulatory use (Version 1.3) by the Corps of Engineers and the regulated public is complete and will undergo final approval for use by the Corps of Engineers. The NMRAM Riverine Wetlands Regulatory Version 1.3 is still applicable and essential under the newest Waters of the US (WOTUS) rules.

NMED Exhibit 22

The Wetlands Program engages partners with expertise and local knowledge in development and refinement of these NMRAM versions through the assistance of an advisory committee for each subclass of NMRAM. Future versions of NMRAM will include episodic riverine wetlands, more subclasses of springs and other high-altitude and slope wetland types, as well as depressional and mineral flat wetlands.

A Statewide database for NMRAM data is currently being prepared for integration with other water quality databases (Surface Water Quality Information Database) (SQUID)) at NMED and is nearly ready for data input and on-line access for montane riverine wetlands, lowland riverine wetlands, confined valley riverine wetlands and playas NMRAM data. Electronic data collection worksheets have been developed for NMRAM, and development of Sampling Area reports is underway. The SWQB Wetlands Program is also developing SOPs for data entry into SQUID that describes the Verification and Validation process completed for data entry by SWQB.

- Wetlands perform ecological functions that help improve and maintain environmental quality. Healthy natural wetland ecosystems typically provide functions most effectively in terms of cost and performance. Twelve wetland ecological functions (WEFs) were identified as most pertinent for New Mexico. The NMRAM focuses on evaluating wetland condition as a measure of ecological integrity and, by inference, the natural functional capacity of wetlands. A cross walk between NMRAM metrics and WEFs was developed in 2019 including the rationale behind each metric and how it applies to the designated functions. The goal is to provide the relationship for using NMRAM to help develop wetlands standards aimed at minimizing loss and protecting wetlands acreage, quality, and function for the different subclasses of wetlands in New Mexico.

- A Wetlands Vegetation Index of Biotic Integrity (VIBI) for montane riverine wetlands was completed in 2013. The results of this project demonstrate the use of detailed vegetation data to assess the ecological condition of Montane Riverine wetlands. Wetlands restoration and management can then be improved to prevent disturbance and provide protection to suites of plants known to correlate with the lowest levels of human disturbance (reference sites). In turn, the VIBI can also be used to improve management of wetlands based on vegetation attributes and habitat characteristics. VIBI is another important tool that improves the State's ability to protect, manage, and restore its wetlands resources.

NMED Exhibit 22

- Our 10-year Strategy for Wetlands Assessment and Monitoring was completed in 2012, incorporated into the Monitoring and Assessment Strategy for New Mexico and is available at SWQB. The SWQB Wetlands Program is currently updating and refining this Strategy for the next ten years as part of the current five-year program commitment.

- Eighteen Wetlands Action Plans have been completed since the program started in 2003 and three new WAPS are underway. They are currently available on the SWQB Wetlands Program website at https://www.env.nm.gov/surface-water-quality/wap/ . They can also be accessed along with other watershed-based plans at https://www.env.nm.gov/surface-water-quality/wbp/ . The most current Wetlands Action Plan, "Arid-Land Spring Cienegas of New Mexico" describes a strategy for locating, restoring and protecting arid-land spring cienegas, important unique groundwater-supported wetlands that provide habitats for rare and unique plants and aquatic animals and are essential sources of water and pasture in arid regions throughout New Mexico.

- Progress toward implementing WAPs in priority watersheds is reported in the NPS Annual Report to EPA. In 2020, the NMED SWQB Watershed Protection Section incorporated WAPs into the Solicitation for Applications for Watershed Project Implementation. Applicants were allowed to apply for funding under watershed-based plans as well as completed Wetland Action Plans found at https://www.env.nm.gov/surface-water-quality/wap to implement activities and projects identified in the current WAP as well as update existing WAPs.

- One more Wetlands Demonstration Restoration Project was completed by SWQB Wetlands Program since 2019. "Keyline Design for Restoration of Headwater Slope Wetlands in the Holman Creek Wetlands Complex" demonstrated the application of Keyline Design principles to slope wetlands in a headwater ecosystem. These types of wetlands have precipitation-driven and groundwater-driven hydrologic characteristics. These wetlands are also important sinks for atmospheric carbon. Careful planning and integrated restoration techniques are highlighted using Keyline Design principles, and monitoring groundwater-supported wetlands is still ongoing at the project site. Other projects around the state are reported by our partners at the New Mexico Wetlands Roundtables and special projects by our partners are featured as the "NGO Spotlight". Thus far, New Mexico Wetlands Program has completed 10 Wetlands Demonstration Restoration Projects improving and expanding the State's wetlands restoration techniques toolbox that is shared and used statewide and nationally. Details of these projects can be found at https://www.env.nm.gov/surface-water-quality/wetlands-projects/ .

- Five Technical Guides are completed. The newest Technical Guide, "Applying Keyline Design Principles to Slope Wetland Restoration in a Headwater Ecosystem," is available from the SWQB Wetlands Program. Other Technical Guides include 1)

NMED Exhibit 22

"Exploring Springs and Wetlands and their Relationship with Surface Flows, Geology, and Groundwater in the La Cienega Area, Santa Fe County, New Mexico" 2) "New Mexico Wetlands Technical Guide: Wetland Functions"; 3) "Characterization and Restoration of Slope Wetlands in New Mexico"; 4) "The Plug and Pond Treatment: Restoring Sheet Flow to High Elevation Slope Wetlands in New Mexico," are also available in hard copy from SWQB and at New Mexico Environment Department Surface Water Quality. In addition, a landowner's guide, "Healthy Streamside Wetlands, A Guide to Good Stewardship for Southwestern Bosque and Riparian Wetlands," is available at New Mexico Environment Department Surface Water Quality and in hard copy from SWQB.

- In addition to our Wetlands Roundtables, the Wetlands Program provides workshops and training sessions to our partners and others. These workshops and trainings engage and inform partners, enhance partners capacity to proactively monitor and restore wetlands, influence stakeholders to be more involved in wetland issues, and increase the role and capacity of the Wetlands Program. In 2020 annual NMRAM trainings available to watershed groups, agencies, contractors, tribes and others were postponed due to Covid restrictions but are expected to resume in summer 2021. As a supplement to the NMRAM trainings, Botany Booster trainings are held to improve the technical expertise of participants to collect biotic data and will also resume in 2021. The Keyline Design Project was highlighted in a half day conference workshop by the Quivira Coalition in November 2019. The Wetlands Program staff also participated in the 2021 ASWM-sponsored Annual State/Tribal/Federal Coordination Virtual Meeting serving on a panel for sharing wetland mapping for a variety of uses. Weekend restoration workshops at the East Fork of the Jemez River on the Valles Caldera National Preserve are also planned to resume in 2021. Participants at the workshops learn about and implement innovative wetlands restoration techniques. These techniques included building innovative restoration structures of natural and on-site materials that re-direct flow, spread water, arrest erosion, raise the water table in wetlands, and attract beaver and other wildlife, as well as constructing barriers in strategic locations to protect sensitive wetlands from livestock and wildlife grazing.

  The SWQB Wetlands Program conducted a three-day "Wetlands Across Borders, Playas of the Southern High Plains" workshop in Clovis, New Mexico in late 2017. The meeting consisted of one and one-half days of presentations and panel discussions about playa ecology, conservation, restoration and other important topics about playas. The meeting was followed by three track options – New Mexico Rapid Assessment Method Training for Playa Wetlands, a Playas and Roads workshop, or a half-day field trip to look at local playas. The meeting was advertised to over 1600 potential participants through the local SWCDs and through contacts in Texas, Colorado and Oklahoma since those states have Southern High Plains playas and their communities are facing similar critical water issues.

NMED Exhibit 22

Two two-and-a-half day workshops targeting tribal, NMDOT, other agency and county roads staff in the playa region of the Southern High Plains and the San Juan region in northwestern New Mexico were conducted in 2017 and 2018 to provide the principals of geomorphology and natural channel design to roads construction and maintenance. The workshops updated the participants on new techniques, best management practices and construction specifications for successful playa, stream and riparian restoration integrated with road design and maintenance techniques. The workshops demonstrated that highway construction projects have the potential to not only "do no harm" but even to improve the health of the waterbody or watercourse, introducing a new paradigm of road design and maintenance. The SWQB Wetlands Program will continue to demonstrate new techniques for restoring playas and playa clusters as the focus of partner planning restoration and monitoring efforts.

A workshop to organize the first "All Hands" monitoring effort was conducted and on-site monitoring with volunteer groups was initiated only to be postponed by Covid restrictions in 2020. Currently "All Hands Phase 2" is being planned and promoted and will use virtual training modules to supplement on-the-ground training techniques and certification of participants to use NMRAM. "Restoration Crew Leader" training was completed in 2019 providing trainees the skills to manage restoration teams and complete restoration in a safe and efficient manner. These efforts will increase participation by agencies and volunteers in restoration and data collection for wetlands.

- Review of our current Water Quality Standards to identify ways to improve and update regulations to be more applicable to wetlands and wetland subclasses is underway. Completing a review of other State's wetland regulations and participating with the Association of State Wetland Managers (ASWM) in a wetlands water quality standards project has augmented this effort. In 2016, the Wetlands Program participated in the Association of Clean Water Administrators (ACWA) development of templates for wetlands narrative water quality standards and provided a webinar on how New Mexico is using those templates and the steps taken to develop meaningful and defensible narrative wetlands water quality standards.

  The Wetlands Program has developed a nine-step process for the development of wetlands water quality standards for New Mexico.

  1. Mapping and classification update
  2. Identifying wetland functions by wetland type (designated uses)

NMED Exhibit 22

3. Hydrogeomorphic classification applied to mapped wetlands
4. Measuring the condition of wetlands by wetland type
5. Identifying stressors that affect wetland condition (impairments)
6. Database development
7. Unique identifiers for each wetland (Assessment Units)
8. Using these data to develop a defensible narrative standard by wetlands type
9. Plan for outreach to the public regarding the development and uses of wetland water quality standards.

A draft white paper describing water quality standards for Playas of the Southern High Plains in New Mexico is under development and review and incorporates the template for wetlands narrative water quality standards. Since the 2001 Supreme Court decision known as SWANCC (Solid Waste Agency of Northern Cook County v. U.S. Army Corps of Engineers, 531 U.S. 159), playas are not jurisdictional waters under the federal Clean Water Act. Even with the current state standards, the New Mexico Environment Department would currently not be able to enforce any permit conditions in the absence of a state surface water quality permitting system. However, the development of the standard paves the way for future protection of playas as the principal natural source of surface water and groundwater recharge on the Southern High Plains of New Mexico.

The SWQB Wetlands Program will develop wetlands water quality standards for other subclasses of wetlands including Montane Riverine Wetlands and Headwater Slope Wetlands as well as other isolated wetland types in need of state protection. The Wetlands Program will use data generated through assessment and monitoring to evaluate stressor load reductions that will improve wetland condition (Total maximum levels of stress (TMLS). The goal is to develop and refine narrative water quality standards for wetlands to be more applicable to and protective of subclasses of wetlands in New Mexico.

OVERVIEW OF FIVE-YEAR GOALS AND OBJECTIVES

To effectively develop basic program functions that form the foundation of wetlands management and protection, the following outlines core elements, actions and activities to protect and restore New Mexico's wetlands over the next five-year period. The completion of these activities is dependent on financial, staffing and other resources available to the Wetlands Program and its partners.

NMED Exhibit 22

Program Development Activities for BUILDING AND MAINTAINING PARTNERSHIPS

Overall Objective: The SWQB Wetlands Program relies on a substantial number of partners to implement the work on the ground. A core function of the five-year plan is to continue building and maintaining partnerships to implement the Wetlands Program Plan, and to train and inform partners at all levels.

Action: Continue to build and maintain partnerships							
Activity	**2021**	**2022**	**2023**	**2024**	**2025**	**Partners**	**Activity Lead**
Maintain and expand participation in State Wetlands Roundtables (presently in its 15th year) composed of governmental, NGO, watershed group and tribal partners to address challenges to New Mexico's wetlands resources. Update and refine Roundtables' venues to include hybrid in-person and virtual meetings.	x	x	x	x	x	State, federal, NGO, watershed group and tribal government partners on Roundtable	SWQB Wetlands Program
Maintain the Northern Wetlands Roundtable meetings to discuss resources for developing and maintaining initiatives, and addressing challenges to monitoring, restoring and protecting New Mexico's wetlands.	x	x	x	x	X	Governmental, tribal, NGO partners on Northern Roundtable	SWQB Wetlands Program, NGO co-sponsorship
Maintain the Southern Wetlands Roundtable to discuss regulations, restoration, monitoring, challenges and partnerships unique to the southern part of the state.	x	x	x	x	x	Governmental, tribal and NGO partners on Southern Roundtable	SWQB Wetlands Program, NGO co-sponsorship
Work with Roundtables to ensure cooperation to achieve Wetlands Program Plan goals. Develop annual actions and dialogue to further the goals of this Plan.	x	x	x	x	x	Wetlands Roundtables	SWQB Wetlands Program

NMED Exhibit 22

Continue to identify and participate in public/private partnerships such as the Rio Grande Water Fund with the goal of generating sustainable funding for restoration, protection, education, research and policy.	x	x	x	x	x	Foundations, private businesses, water utilities, tribal, federal, state and private partners	The Nature Conservancy, NMED signatory
Action: **Identify and maintain simple, effective and efficient methods for monitoring wetlands through partnerships**							
Activity	**2021**	**2022**	**2023**	**2024**	**2025**	**Partners**	**Activity Lead**
Identify long-term sustainable wetlands monitoring strategy for watershed wetlands that can be maintained by local government, citizen science or watershed groups.	x	x	x			Local governments and Watershed Groups, Roundtables	Roundtables, WAP-participating Watershed Groups
Work collectively with all partners towards a long-term solution to wetlands monitoring, particularly the funding of long-term monitoring.	x	x	x	x	x	Roundtables	Northern and Southern Roundtables
Create a toolbox of wetlands monitoring metrics and protocols for partners to determine restoration success and adaptive management that can be scalable to support both large-scale and small-scale projects.		x	x	x	x	Roundtables, Project Contractors, Watershed Groups	SWQB Wetlands Program, Watershed Groups
Engage group participation through a demonstration "All Hands Phase 2" monitoring effort to collect NMRAM data. Continue effort each year at select sites.	x	x	x	x		Agencies, NGOs, trained technicians	SWQB Wetlands Program
Develop tools (i.e., story maps, map books, field guides, virtual training modules, mobile apps) to teach and disseminate wetlands assessment and mapping products to partners, watershed groups and local governments.	x	x	x	x	x	Local governments and Watershed Groups, Roundtables	SWQB Wetlands Program

NMED Exhibit 22

Action: Identify opportunities to create sustainable ways to fund and accomplish wetlands restoration and protection work.							
Activity	**2021**	**2022**	**2023**	**2024**	**2025**	**Partners**	**Activity Lead**
Investigate the feasibility of creating a "short term funding source" that will support funding of small-scale restoration projects. This source could make funds available up front to landowners who receive grants as reimbursement for expense incurred.	x	x	x	x	x	Roundtables, Foundations, Banks, State Revolving Fund (SRF), River Stewardship Program	SWQB Wetlands Program, Roundtables
Create Strategy to coordinate and leverage multiple funding sources. Encourage partners to work towards a large-scale project with a large impact supported by numerous funding sources, such as accomplished in the Bitter Lakes area. eg. Middle Rio Grande - Inter-Mountain West Joint Venture, Rio Grande Water Fund	x	x	x	x	x	Northern and Southern Roundtable participants	Agencies and NGOs at Roundtables

NMED Exhibit 22

Program Development Activities for MONITORING AND ASSESSMENT Core Element

Overall Objective: Develop a full and complete wetlands assessment and monitoring strategy consistent with *Elements of a State Water Quality Monitoring and Assessment Program for Wetlands* (EPA, 2006) that the State can use to inform management decisions and achieve goals that protect and restore wetlands resources.

Action: Continue to develop Elements of a State Water Quality Monitoring and Assessment Strategy for Wetlands							
Activity	**2021**	**2022**	**2023**	**2024**	**2025**	**Partners**	**Activity Lead**
Continue to develop monitoring design and sample sites that best serve the State's assessment and wetland management objectives.	x	x	x	x	x	Roundtables, UNM Natural Heritage, State Agencies, EPA, federal land management agencies.	SWQB MASS and Wetlands Program
Participate in National Wetlands Monitoring and Assessment Work Group (NWMAWG) to stay abreast of new developments in wetland monitoring, assessment, and data analysis. Participate in 2021 NWCA.	x	x	x	x	x	NWMAWG, EPA	SWQB Wetlands Program
Update the State of New Mexico 2012 Wetlands Assessment and Monitoring Strategy.	x	x	x	x		SWQB Staff, Agencies and Roundtables	SWQB Wetlands Program
Action: Assess and monitor wetland resources by the development and use of Landscape, Rapid Assessment and Intensive Monitoring tools							
Activities	**2021**	**2022**	**2023**	**2024**	**2025**	**Partners**	**Activity Lead**
Participate in the State Mapping Consortium, Geospatial Advisory Committee, and National Wetlands Mapping Consortium, and on the NHD update representing wetlands until New Mexico has, at a minimum, National Wetlands Inventory coverage, classification and functional descriptors of all wetlands resources.	x	x	x	x	x	USFWS NWI, USFS, Geospatial Advisory Committee, Roundtables, Tribes, ASWM	SWQB Wetlands Program, Geospatial Advisory Committee

NMED Exhibit 22

Complete mapping and classification of all non-tribal lands in New Mexico, including quadrangles in central New Mexico "checkerboard area" adjacent to Navajo Tribal lands, along the Rio Grande, and in southern and eastern New Mexico, including the bootheel area, and the Pecos mainstem until statewide coverage is complete. Ensure edge matching between project areas and checkerboard areas.	x	x	x	x	x	USFWS, SLO, ACOE, NMBGMR, Department Homeland Security, ASWM, USFS, BLM, USFWS, private stakeholders and counties	SWQB Wetlands Program, mapping contractors
Complete application of NWI 2.0 to all New Mexico mapped areas. Review and ensure all wetlands in USFS wilderness and roadless areas are updated. Complete mapping gaps analyses to ensure current mapping and application of wetland classifications are complete.	x	x	x	x	x	USFWS, SLO, NMBGMR, Department Homeland Security, ACOE, ASWM, USFS, BLM, USFWS, private stakeholders and counties	SWQB Wetlands Program, mapping contractors
Using mapping and classification products to identify depressional wetlands and mineral flats that are considered "playas" and describe and categorize these waterbodies into subclasses throughout New Mexico.						USFWS, SLO, NMBGMR, Department Homeland Security, ACOE, ASWM, USFS, BLM, USFWS, private stakeholders and counties	SWQB Wetlands Program

NMED Exhibit 22

Assist in comprehensive vegetation mapping for wetlands and riparian areas statewide, collaborate with tribes and include new areas not mapped.	x	x	x	x	x	USFS, USFWS, BLM, NWI, UNM Natural Heritage, NMDGF, BOR Mapping Advisory Com.	SWQB Wetlands Program, NMDGF, UNM Natural Heritage
Continue to develop and promote the use of the New Mexico Rapid Assessment Method (NMRAM) for other wetlands subclasses through training and other venues. (Conduct one training per year) Organize one "all hands" data collection by trained partners each year. Conduct Botany Booster trainings as needed.	x	x	x	x	x	UNM Natural Heritage, ACOE, NMDOT, EPA, NMDGF, Tribes, Consultants, Watershed Groups, Others.	SWQB Wetlands Program
Revise and apply NMRAM to other wetland types and to other parts of the State. Continue to collect NMRAM data following the SWQB Water Quality Assessment Rotational Schedule at least every other year. Continue to revise NMRAM subclass modules as new data validates current NMRAM metrics and NMRAM analyses suggest the need for metric and scoring revisions. (See NMRAM development schedule below.)	x	x	x	x	x	SWQB Wetlands Program, UNM Natural Heritage, NMRAM Advisory Committees, consultants, others.	SWQB Wetlands Program
Test NMRAM to ensure that designated uses and proposed narrative standards for wetland subclasses are aligned to NMRAM condition rank scoring (Rank A (supporting), rank B (Supporting at Risk) and C or D (Non-Supporting).		x	x	x	x	UNM Natural Heritage	SWQB Wetlands Program
Update and expand database of reference standard wetlands using newly mapped wetland areas and classification as a basis for preliminary selection. Encourage volunteers and partners to assess reference standard wetlands using NMRAM.	x	x	x	x	x	UNM Natural Heritage and mapping contractors	SWQB Wetlands Program

NMED Exhibit 22

Update the State's Quality Assurance Project Plan to include common wetland monitoring methods and protocols.	x	x	x	x		SWQB and EPA quality assurance officers	SWQB Wetlands Program
Develop a strategy and identify sample areas to sample repeatedly for wetlands status and trends.		x	x	x	x	UNM Natural Heritage Program	SWQB Wetlands Program
Develop monitoring methods and indicators of carbon sequestration and carbon and nitrogen exchange in response to wetland restoration.		x	x	x	x	UNM Natural Heritage, NMSU and other partners	SWQB Wetlands Program
Support NMRAM metrics and methods through level three data (e.g., Indicators of Ecological Integrity.)				x	x	UNM Natural Heritage	SWQB Wetlands Program
Action: Track Monitoring data in a system that is accessible, updated on a timely basis, and integrated with other water quality data							
Activity	**2021**	**2022**	**2023**	**2024**	**2025**	**Partners**	**Activity Lead**
Continue development of web-based database for wetlands coordinated with other SWQB databases (Surface Water Quality Information Database (SQUID)) and data. Share data with agencies and through statewide information portal.	x	x	x	x	x	NMED OIT, UNM Natural Heritage, NM Water Data Collaborative	SWQB Wetlands Program and NMED OIT
Develop a system for geo-referencing data and displaying data collection sites for reporting and analysis.	x	x	x	x	x	NMED OIT and geospatial staff	SWQB Wetlands Program and NMED OIT
Develop and implement verification and validation packet for transferring data to SWQB, so data can be used for assessment against WQS, enforcement of WQS under the NM Water Quality Act (74-6-10 NMSA), development of the Integrated List, TMDL development, or WQS amendments.	x	x	x			Watershed Groups, Consultants, volunteer teams collecting NMRAM data.	SWQB Wetlands Program and SWQB Standards Section, SWQB QA/QC Officer EPA QA Officer.

NMED Exhibit 22

Program Development Activities for WETLANDS REGULATORY PROGRAM Core Element

Overall Objective: Promote the use of new and proven methods to protect and restore wetlands by regulated project proponents.

Action: Adopt procedures and strengthen processes that protect wetlands through regulatory measures							
Activity	**2021**	**2022**	**2023**	**2024**	**2025**	**Partners**	**Activity Lead**
Maintain and improve the State's wetlands resources through development of sufficient mitigation ratios when mitigation is the only option. Include "no net loss" of function.	x	x	x	x	x	USACE, BUR, NMDOT, regulated community	USACE
Improve regulatory programs like the certification of Dredge and Fill under CWA § 401 that provide mechanisms for regulation of wetlands activities. Work more closely with USACE to provide input from §§404/401 public interest reviews.	x	x	x	x	x	USACE	SWQB 401 Cert Program and SWQB Wetlands Program
Explore the feasibility, find sites and sponsors of In-Lieu Fee Programs, and Mitigation Banks	x	x	x	x	x	USACE, NMDOT, Roundtable, NGOs	USACE
Expand the activities and content reported for wetlands in the combined CWA §§303(d) and 305(b) report, and in the NPS Management Plan.	x	x	x			Agencies	SWQB staff, SWQB Wetlands Program
Develop and improve ordinances and jurisdiction that protect wetlands/riparian areas/ buffer at the local level, and that ensure that vulnerable and isolated wetlands are protected from impacts. Use WAPs to help accomplish this.	x	x	x	x	x	County governments, local governments, watershed groups with WAPs	SWQB Wetlands Program, Roundtables

NMED Exhibit 22

Develop a tracking process to track wetlands gains and losses from a variety of activities that either impact or restore wetlands.			x	x	x	USACE, NRCS	SWQB Wetlands Program
Continue development, training and use of USACE NMRAM in BAMI procedures.	x	x	x	x	x	USACE, UNM Natural Heritage, regulated community	USACE, SWQB Wetlands Program
Contribute to CWA updates, revision, and initiatives that assures the CWA protects all wetlands.	x	x	x	x	x	ASWM, EPA, USACE, other states.	SWQB Wetlands Program

Program Development Activities for VOLUNTARY RESTORATION AND PROTECTION Core Element

Overall Objective: Meet the wetlands goals in the watershed restoration activities established in the State's Non-Point Source Management Plan.

Action: Expand and improve Wetlands Action Plan (WAP) Program							
Activity	**2021**	**2022**	**2023**	**2024**	**2025**	**Partners**	**Activity Lead**
Work with other agencies and organizations to coordinate wetlands restoration, activities and funding through development of WAPs. Incorporate potential mitigation sites into WAPs and include information on updating ordinances or other protection at the local level.	x	x	x	x	x	USFS, NMDGF, BOR, BLM, USACE, other agencies, Roundtables, SWQB WPS	SWQB Wetlands Program and Watershed Groups
Integrate WAPs and watershed-based plans intended to implement NPS TMDLs and incorporate wetlands objectives in NPS pollution abatement.	x	x	x	x	x	SWQB WPS, Watershed Groups	SWQB Wetlands Program
Develop and demonstrate innovative designs and techniques for restoring wetlands.	x	x	x	x	x	Consultants, NGOs, NMDGF, Roundtables, NRCS, restoration contractors.	SWQB Wetlands Program

NMED Exhibit 22

Seek out, develop and demonstrate improved methods for protecting wetlands i.e., headwaters, slope, alluvial fans, high elevation wetlands, springs, cienegas, playas and depressional wetlands as high priority areas.			x	x	x	NGOs, BLM, USFS, SLO, NMDGF, USFWS, NRCS, landowners, watershed groups, local government.	SWQB Wetlands Program, Roundtables.
Research, develop and demonstrate re-establishment techniques and innovative designs for lentic wetlands around lakeshores, ponds and man-made tanks.			x	x	x	BLM, USFS, SLO, NRCS, NMDGF, USFWS, NGOs, Universities.	SWQB Wetlands Program,
Develop and demonstrate innovative designs and protocols for restoration of at-risk wetlands and aquatic resources with wetland dependent priority species. Improve resilience and protection of at-risk wetland resources from flooding, fire and drought.	x	x	x	x	x	Federal, state and local agencies, tribes, NMDGF, USFWS	SWQB Wetlands Program
Encourage WAP partners to locate and protect slope wetlands (seeps and springs) and depressional wetlands in their watersheds and include information in WAPs.			x	x	x	NGOs, Watershed groups.	SWQB Wetlands Program
Update and improve SWQB Wetlands Website to augment communication with WAP partners, provide technical transfer of restoration techniques and guidance, display new WAPs, create links, and update with relevant activities of Wetlands Program.	x	x	x	x	x	Watershed groups, agencies, stakeholders, project contractors.	SWQB Wetlands Program
Integrate mapping and classification products into existing and future WAPs. Encourage the use of NMRAM to assess the condition of wetlands identified in watershed based WAPs and regional WAPs and include NMRAM data in WAPs. Provide mapping, classification and NMRAM training at least once per year to partners creating WAPs.	x	x	x	x	x	Watershed groups, consultants, NGO and Agency Roundtables, Tribes	SWQB Wetlands Program, UNM Natural Heritage, mapping contractors

NMED Exhibit 22

Action: Create strategies that build capacity on public lands in New Mexico							
Activity	**2021**	**2022**	**2023**	**2024**	**2025**	**Partners**	**Activity Lead**
Develop strategies that shape policy for land and water use on public lands to promote restoration of wetlands.	x	x	x	x	x	Agencies. NMDGF, EMNRD, USFS, BLM, BOR, SLO.	SWQB Wetlands Program
Promote the preservation of wildlife habitat, wildlife corridors, and keystone species habitat related to wetlands and consistent with the State Wildlife Action Plan.	x	x	x	x	x	Agencies, NM DGF, Local Governments	SWQB Wetlands Program
Develop demonstration projects that emphasize pro-active climate change resilience activities including restoration and protection of wetlands and riparian corridors on federal lands.			x	x	x	USFS, USFWS, NPS, BLM	SWQB Wetlands Program,
Encourage federal agencies to monitor and protect ONRW wetlands.	x	x	x	x	x	Government Agencies, Agency Roundtables	SWQB Wetlands Program
Action: Create strategies that build capacity at the local level							
Activity	**2021**	**2022**	**2023**	**2024**	**2025**	**Partners**	**Activity Lead**
Develop strategies for working with private landowners and develop incentives for private landowners through watershed groups to restore, protect wetlands. Target isolated wetlands (e.g., cienegas, playas, springs) on private lands.	x	x	x	x	x	NRCS, NGOs, Agencies, Consultants	Southern and Northern Roundtables, Watershed Groups
Create technical materials and disseminate information to private landowners, tribes and others on incentives, methods and trainings to restore and protect wetlands.	x	x	x	x	x	NRCS, NGOs, Agencies, Consultants, Tribes, Roundtables.	SWQB Wetlands Program

NMED Exhibit 22

Continue to refine information that provides economic justification and other value, including cultural/traditional and aesthetic for restoring wetlands.	x	x	x			ASWM, Tribes, watershed groups and others	SWQB Wetlands Program
Develop avenues for outreach to different groups who could be involved in wetlands as part of Wetlands Roundtable, Quivira Coalition Conference workshops, or other venue. Conduct statewide and interstate wetlands workshops. Reach out to new partners, new opportunities, at new venues.		x	x	x		SWQB WPS, Quivira Coalition, Roundtables, irrigation districts, Prairie Partnerships, other states' groups, others.	SWQB Wetlands Program
Assist partners by building their volunteer labor base and creating match opportunities. Train volunteer crew leaders in restoration techniques so that more volunteers are accommodated and are more productive on-site.	x	x	x	x	x	NGOs, Agencies, watershed groups.	SWQB Wetlands Program
Assist partners in finding match opportunities by participating in development and organization of large-scale wetland restoration/protection projects.	x	x	x	x	x	Local Governments, IWJV, PLJV, TNC, NM Wildlife Federation, USFWS Partners for Wildlife, others.	SWQB Wetlands Program
Develop and use incentives for landowners, road agencies and others within and adjacent to depressional wetlands (e.g., playas) watersheds to improve watershed conditions that benefit landowners and wetland resources.	x	x	x	x		USFWS Partners for Fish and Wildlife, NGOs, County Roads, NMDOT, private landowners, municipalities.	SWQB Wetlands Program

NMED Exhibit 22

Program Development Activities for WATER QUALITY STANDARDS FOR WETLANDS Core Element

Overall Objective: Prepare for the future adoption of water quality standards for specific wetland types and ensure that ONRW wetlands are appropriately protected.

Action: Develop water quality standards for wetlands							
Activity	**2021**	**2022**	**2023**	**2024**	**2025**	**Partners**	**Activity Lead**
Review wetlands data to identify criteria that define physical, chemical and biological condition that is expected in wetlands.	x	x	x	x	x	ASWM, ACWA, other states.	Wetlands Program, SWQB Standards Team, EPA
Assess results of NMRAM data and other current state resources, data and information to develop and substantiate draft wetlands narrative standards by subclass (montane riverine, lowland riverine, confined riverine and playas).	x	x	x	x	x	ASWM, SWQB Staff, NMDGF, EPA, UNM Natural Heritage, others.	SWQB Wetlands Program
Assign functions to all mapped wetland subclasses; and develop appropriate wetland specific designated uses for four wetland subclasses (montane riverine, lowland riverine, confined riverine and playas).	x	x	x	x	x	NMDGF, Playa Lakes Joint Venture, Roundtables, Watershed Groups, stakeholders, others.	SWQB Wetlands Program, SWQB Standards Team, EPA
Assign Water Quality Classified Segments to wetlands using wetland mapping and classification information as a basis.	x	x	x	x	x	Wetland mapping contractors, SWQB MASS.	Wetlands Program SWQB Standards Team, EPA

NMED Exhibit 22

Draft narrative criteria that qualitatively describe the condition that must be achieved to support the designated uses. Use data from reference standard sites (best obtainable) for the montane riverine, lowland riverine, confined riverine and playas subclasses.	x	x	x	x	x	SWQB Staff, technical advisory committee, others.	Wetlands Program, SWQB Standards Team, EPA
Draft narrative water quality standards for wetlands for subclasses – montane riverine, lowland riverine, confined riverine and playas.	x	x	x	x	x	SWQB Staff, technical advisory committee, others.	Wetlands Program, SWQB Standards Team, EPA
Develop technical documents to support the narrative criteria that will be used in determining attainment of the standard.	x	x	x	x	x	SWQB Staff, technical advisory committee, others.	Wetlands Program, SWQB Standards Team, EPA
Scope venues and communities for Wetlands WQS outreach.		x	x	x	x	Watershed Groups, NGOs and Roundtable partners	SWQB Wetlands Program
Identify ecologically important and high-quality wetlands through wetlands mapping and assessment for future Outstanding National Resource Waters (ONRW) nomination and protection. Assist partners in developing ONRW nominations.	x	x	x	x	x	UNM Natural Heritage Program, Watershed Groups, NGOs and Roundtable partners	SWQB Wetlands Program, SWQB Standards Team
Action: Apply anti-degradation policies for ONRW wetlands							
Activity	**2021**	**2022**	**2023**	**2024**	**2025**	**Partners**	**Activity Lead**
Work with USFS liaison to NMED to continue to appropriately protect and maintain condition and functions of ONRW wetlands	x	x	x	x	x	SWQB Staff, USFS liaison to NMED	SWQB Wetlands Program

NMED Exhibit 22

Review Anti-Degradation Implementation Policy to determine if additional language related to wetlands functions, condition and hydrologic regime is appropriate.			x	x	x	SWQB Staff	SWQB Standards Team and SWQB Wetlands Program

This Diagram shows the progression of New Mexico Rapid Assessment Method (NMRAM)development by the SWQB Wetlands Program. The update dates in yellow are proposed updates to the current NMRAM Versions. Lowland Riverine Wetland NMRAM is proposed to be tested and updated for the San Juan/Animas watersheds in Northwestern New Mexico. The Playas NMRAM will be tested, and supplemental metrics added to ensure applicability to the Playas of the Southern High Plains narrative water quality standard currently under development. The Springs NMRAM will be updated and applied to spring ecosystems in other parts of New Mexico to expand the reference domain. The NMRAM subclasses in green are proposed modules for future development.

EDUCATION

M.S. Hydrology
University of Arizona – Tucson, AZ

B.S. Biology
Minor in Chemistry/Math
University of Arizona – Tucson, AZ

PROFESSIONAL EXPERIENCE

Bureau Chief – Surface Water Quality Bureau, NM Environment Department

August 2016 – Present (Full-Time) NMED – Surface Water Quality Bureau, Santa Fe, NM

- Manage the Surface Water Quality Bureau of the New Mexico Environment Department by planning, setting, and achieving goals set forth in the Department's Strategic Plan, EPA approved work plans, and program planning documents.
- Contribute to and implement Department strategic goals, objectives, and actions.
- Develop and respond to legislative proposals and develop regulatory initiatives to promote and enhance surface water quality protections in New Mexico.
- Served as an expert witness during the 2025 NM Legislative Session; testified at five (5) legislative committee hearings; provided technical support and professional opinions; and supported the bill sponsors during both the House and Senate floor votes to advocate for the passage of Senate Bill 21.
- Collaborate with the public, stakeholders, and decision makers (legislators, Governor's Office, etc.) to ensure that the goals of the Department are achieved.
- Oversee an operating budget of approximately $15 million dollars that requires administration of general funds, special revenue funds, interagency transfers, and federal grants, including oversight of the Bureau's grants and contracts management.
- Develop, tailor, and implement administrative, programmatic, and financial operation procedures to ensure accountability and facilitate successful completion of projects.
- Directly or indirectly supervise 47 technical and administrative staff including hiring, work performance evaluations, and discipline, if needed. Ensure performance goals are met and activities are conducted in accordance with applicable statutes, policies, rules, permits, orders, and grant commitments.
- Provide leadership and substantive expertise on technical and policy working groups, particularly in support of Department priority initiatives.
- Periodically meet with managers and staff to evaluate program effectiveness, identify strengths, weaknesses, and opportunities, and develop strategies to improve Bureau programmatic operating functions.
- Facilitate coordination between EPA, and other public and private entities involved in surface water quality protection, management, and regulation.
- Ensure that information requests are responded to in a timely and professional manner.
- Oversee short-term investigations in response to citizen complaints, accidental spills, and other emergencies.
- Work with the Bureau's webmaster to create, update, and maintain webpages, resources, and links associated with activities of the Bureau.

Program Manager for Monitoring, Assessment and Standards

June 2015 – October 2016 (Full-Time) NMED – Surface Water Quality Bureau, Santa Fe, NM

- Managed the Surface Water Quality Bureau's monitoring, assessment, and standards programs including writing, submitting, and managing the Clean Water Act Section 106 grants on an annual basis with semi-annual updates.
- Oversaw and evaluated the performance of 15 staff.
- Participated in the development and revision of state surface water quality standards and regulations including the 2013 Triennial Review presented during the Water Quality Control Commission's October 2015 hearing and subsequent deliberations.
- Planned water quality surveys throughout New Mexico that met budgetary constraints and data quality objectives.
- Reviewed, integrated, and assessed data for use in Clean Water Act required activities.
- Prepared water quality reports (e.g. watershed survey summaries, use attainability analyses, TMDLs, etc.) for the public and as a deliverable to EPA.
- Reviewed, updated, and developed protocols to standardize tasks including sample collection, data assessment, and report writing.
- Represented the Bureau at meetings, professional conferences, workshops, and Water Quality Control Commission meetings.
- Conducted short-term investigations in response to citizen complaints, accidental spills, and other emergencies.
- Maintained analytical results in the Bureau's water quality database, prepared retrievals of stored data, and scheduled uploads of data to EPA's national database.
- Worked with the Bureau's webmaster to create, update, and maintain webpages, resources, and links associated with activities of the Section and Bureau.

Municipal Team Leader – Point Source Regulation Section

March 2014 – May 2015 (Full-Time) NMED – Surface Water Quality Bureau, Santa Fe, NM

- Reviewed and evaluated the performance of the Municipal Team by providing meaningful, frequent, and ongoing input on work performance and prioritization of workloads.
- Cooperated with and supported the efforts of other Bureau sections. Facilitated positive working relationships with other state and federal agencies, stakeholders, and cooperators involved in National Pollutant Discharge Elimination System (NPDES) permitting activities.
- Reviewed, analyzed data, and prepared comments on NPDES permits submitted to the Bureau for certification under Section 401 of the Federal Clean Water Act. Ensured consistency in NPDES permit certifications.
- Investigated regulated facilities for compliance/non-compliance with applicable state and federal surface water quality laws, standards, and regulations, and prepared and submitted comprehensive inspection reports that documented the status of the facilities regarding the federal NPDES permit program and regulations.
- Collected accurate and detailed information and useable evidence during site investigations to supplement information contained in NPDES permits, to evaluate violations of state surface water quality standards and regulations, and to assist EPA with enforcement.

- Reviewed, analyzed, and prepared well-written, clear, concise, and factual comments on proposed or new amended federal and state agency policies and procedures, regulations, and technical recommendations.
- Developed standard operating procedures for wastewater sampling and compliance sampling. Evaluated and acquired sampling equipment necessary for monitoring NPDES permitted facilities.

Reviewed, analyzed data, and prepared comments relevant to regulatory requirements and surface water quality studies and findings on Environmental Assessments (EA) and Environmental Impact Statements (EIS) submitted to SWQB for review.

Acting Program Manager for Monitoring, Assessment and Standards

July 2012 – July 2013 (Full-Time) NMED – Surface Water Quality Bureau, Santa Fe, NM

- Managed the Surface Water Quality Bureau's monitoring, assessment, and standards programs including writing, submitting, and managing the Clean Water Act Section 106 Monitoring Initiative grant on an annual basis with semi-annual updates.
- Oversaw and evaluated the performance of 15 staff.
- Participated in the development and revision of state surface water quality standards and regulations.
- Planned water quality surveys throughout New Mexico that met budgetary constraints and data quality objectives.
- Reviewed, integrated, and assessed data for use in Clean Water Act required activities.
- Prepared water quality reports (e.g. watershed survey summaries, use attainability analyses, TMDLs, etc.) for the public and as a deliverable to EPA.
- Developed protocols to standardize tasks including sample collection, data assessment, and report writing.
- Represented the Bureau at meetings, professional conferences, workshops, and Water Quality Control Commission meetings.
- Conducted short-term investigations in response to citizen complaints, accidental spills, and other emergencies.
- Maintained analytical results in the Bureau's water quality database, prepared retrievals of stored data, and scheduled uploads of data to the EPA's national database.
- Worked with the Bureau's webmaster to create, update, and maintain webpages, resources, and links associated with activities of the Section and Bureau.

Monitoring Team Leader – Monitoring, Assessment and Standards

April 2011 – July 2013 (Full-Time) NMED – Surface Water Quality Bureau, Santa Fe, NM

- Managed the statewide ambient monitoring program for the Bureau. The Monitoring Team is responsible for collecting water quality data and associated flow measurements in surface waters of the state. Data collected by the Monitoring Team is used to determine if the water body meets water quality standards and ensure designated uses are supported.
- Oversaw and evaluated the performance of 5 staff.
- Planned water quality surveys throughout New Mexico that met budgetary constraints and data quality objectives.
- Ensured adequate and appropriate data were collected to support a variety of Clean Water Act required activities (e.g., water quality standards amendments, TMDL development, NPDES permits, nonpoint source monitoring effectiveness, etc.).

- Prepared watershed survey summaries for the public and as a deliverable to EPA.
- Developed protocols to standardize tasks including sample collection, data assessment, and report writing. Specifically, responsible for developing, updating, and revising the *Field Sampling Plan* and *Physical Habitat* standard operating procedures.
- Maintained analytical results in the Bureau's water quality database, prepared retrievals of stored data, and scheduled uploads of data to EPA's national database.
- Conducted short-term investigations in response to citizen complaints, accidental spills, and other emergencies.
- Worked with the Bureau's webmaster to create, update, and maintain monitoring webpages, resources, and links.
- Represented the Bureau at meetings, professional conferences, and workshops.

Nutrients and Lakes Team Leader & TMDL Writer – Monitoring and Assessment

August 2004 – April 2011 (Full-Time) NMED – Surface Water Quality Bureau, Santa Fe, NM

- Prepared watershed planning documents (i.e., TMDLs) to improve water quality and conducted public meetings to address stakeholder comments and concerns.
- Presented the final draft documents to the NM Water Quality Control Commission for inclusion and adoption into the State's Water Quality Management Plan.
- Oversaw the nutrient criteria development program for NM's streams, rivers, and lakes.
- Headed efforts in hydrology and monitoring design to develop a *Hydrology Protocol* that distinguishes between ephemeral, intermittent, and perennial waters in New Mexico and to create a practical yet thorough 10-year monitoring and assessment strategy for the Bureau.
- Managed and evaluated the performance of 3 technical staff.

Graduate Research Assistant – Sustainability of semi-Arid Hydrology and Riparian Areas

January 2002 – January 2004 (20 hrs/wk) SAHRA – University of Arizona, Tucson, AZ

- Designed, coordinated, and implemented a hydrologic research project to determine the influence of land use and regional hydrology on surface water quality in a semi-arid stream.
- Organized and prepared an objective, scientifically sound thesis describing the methods, results, conclusions, and management implications of this research.
- Co-authored the journal article, "Spatial variability in dissolved organic matter and inorganic nitrogen concentrations in a semiarid stream, San Pedro River, Arizona" for the *Journal of Geophysical Research* Volume: 112, Issue: G3.

Graduate Teaching Assistant

January 2002 – December 2003 (20 hrs/wk) University of Arizona, Tucson, AZ

- Assisted in the instruction of an "Introduction to Global Change" class for undergraduates and a "Fundamentals of Water Quality" class for graduates.
- Developed hands-on activities to enhance global awareness and environmental stewardship.
- Designed and facilitated a final project to encourage critical analysis and informed decision-making.

OTHER PROFESSIONAL EXPERIENCE

Middle School Science Teacher

August 2013 – March 2014 (Full-Time) Academy of Technology and the Classics, Santa Fe, NM

- Taught life science and physical science in a traditional high school setting.
- Provided students with awareness, knowledge, and appreciation of science through activities, laboratories, simulations, and web-based experiences.
- Applied a variety of teaching and assessment strategies to properly evaluate the diversity of learning styles and abilities of 130 students.
- Maintained a website and an electronic gradebook to inform students and parents of lesson plans, class progress, and individual achievement.
- Provided students and parents with the opportunity for feedback and personal attention during phone calls, weekly tutorials, and conferences.
- Designed and implemented a rigorous yet age-appropriate curriculum that met New Mexico's state standards for middle school science.
- Created and implemented a classroom management plan that promoted student learning, mutual respect, and a healthy classroom environment.

High School Science Teacher

August 1998 – June 2001 (Full-Time) Chino Valley High School, Chino Valley, AZ

- Instructed biology, hydrology, and marine science in a traditional high school setting.
- Provided students with science-based experiences through laboratory activities, class field trips, and field research.
- Applied a variety of teaching and assessing strategies to adapt to a diversity of learning styles and abilities.
- Created a marine science curriculum to meet the requirements of a laboratory science.
- Prepared an Arizona Public Service mini-grant proposal that funded an environmental project at the school.

Science Instructor

Summer 1997; Summer 1998 Nizhoni/Upward Bound Summer Academy, Flagstaff, AZ
(Full-Time, 6 weeks each summer)

- Taught a summer program to low income, first-generation college students on the NAU campus to introduce them to collegiate life and promote a successful transition from high school to post-secondary education.
- Integrated humanities, math, and science content through the problem-solving process. Interdisciplinary approach focused on the study of environmental problems in the Verde River area near Cottonwood, Arizona, specifically drafting, revising, editing, and publishing an environmental impact statement about a proposed housing project.

Naturalist

January – May 199 (Full-Time) San Joaquin Outdoor Education, La Honda, CA
September 1995 – May 1996 (Full-Time)

- Residential outdoor education program for 5th and 6th graders that focused on exploring the natural world.
- Incorporated an interdisciplinary, multi-sensory, discovery-oriented approach to learning consistent with California State Standards.

- Led theme-oriented, educational hikes to help students gain an appreciation of and sense of responsibility for the earth's natural resources.
- Modeled responsible social participation in the cabin and camp community by creating and incorporating group understanding and respect.

Science Instructor and Dive Master

June 1993 – December 1994 (Full-Time) Catalina Island Marine Institute, Avalon, CA
Summer 1995, Summer 1996 (Full-Time, 10 weeks each summer)

- Taught groups of 4th – 12th grade students a marine science, oceanography, and island ecology curriculum.
- Implemented an active, hands-on, experientially oriented program that included snorkeling, kayaking, marine labs, hiking, and a variety of evening programs.
- Increased science literacy and created excitement about science through a combination of labs, aquariums, and touch tanks on land and snorkeling, kayaking, and collecting data in the field.
- Taught SCUBA and science classes at a residential enrichment summer camp with an emphasis on ocean-related activities.

New Mexico
Wetland Resources

Wetlands cover about 482,000 acres (0.6 percent) of New Mexico, a reduction of about 33 percent from the wetland acreage that existed about 200 years ago (Dahl, 1990). New Mexico's wetland acreage places the State 34th in total wetland acreage among the 48 conterminous States.

Wetlands are ecologically important and economically valuable to the State. Wetlands provide important wildlife habitat. For example, in the Rio Grande Valley, wetlands provide habitat for 246 species of birds, 10 species of amphibians, 38 species of reptiles, and 60 species of mammals (U.S. Fish and Wildlife Service, 1990). Wetlands also provide stopover, feeding, and breeding grounds for migratory waterfowl (fig. 1).

Riparian (streamside) wetlands along perennial streams are important as migration corridors for a variety of waterfowl and other wildlife. The playa lakes in eastern New Mexico are vital links in a chain of wetlands along the Central Flyway, which extends from central Canada to the coast of Texas. Areas of springs and marshes provide essential habitat for many rare and endangered species and for indigenous fish and wildlife in the western part of the State.

Wetlands contribute to flood attenuation, bank stabilization, and improved water quality. New Mexico's tourist industry benefits from the beauty of the State's diverse wetlands. These wetlands provide opportunities for recreational activities that include fishing, hunting, bird watching, nature photography, camping, and hiking.

TYPES AND DISTRIBUTION

Wetlands are lands transitional between terrestrial and deepwater habitats where the water table usually is at or near the land surface or the land is covered by shallow water (Cowardin and others, 1979). The distribution of wetlands and deepwater habitats in New Mexico is shown in figure 2*A*; only wetlands are discussed herein.

Wetlands can be vegetated or nonvegetated and are classified on the basis of their hydrology, vegetation, and substrate. In this summary, wetlands are classified according to the system proposed by Cowardin and others (1979), which is used by the U.S. Fish and Wildlife Service (FWS) to map and inventory the Nation's wetlands. At the most general level of the classification system, wetlands are grouped into five ecological systems: Palustrine, Lacustrine, Riverine, Estuarine, and Marine. The Palustrine System includes only wetlands, whereas the other systems comprise wetlands and deepwater habitats. Wetlands of the systems that occur in New Mexico are described below.

System	Wetland description
Palustrine	Wetlands in which vegetation is predominantly trees (forested wetlands); shrubs (scrub-shrub wetlands); persistent or nonpersistent emergent, erect, rooted, herbaceous plants (persistent- and nonpersistent-emergent wetlands); or submersed and (or) floating plants (aquatic beds). Also, intermittently to permanently flooded open-water bodies of less than 20 acres in which water is less than 6.6 feet deep.
Lacustrine	Wetlands within an intermittently to permanently flooded lake or reservoir. Vegetation, when present, is predominantly nonpersistent emergent plants (nonpersistent-emergent wetlands), or submersed and (or) floating plants (aquatic beds), or both.
Riverine	Wetlands within a channel. Vegetation, when present, is same as in the Lacustrine System.

Figure 1. Bosque del Apache National Wildlife Refuge. These riparian wetlands provide habitat for migratory and resident waterfowl, fish, and other wildlife. *(Photograph by Lisa Carter, U.S. Geological Survey.)*

Although wetlands occur in all areas of New Mexico, they are most numerous in the eastern and northern areas of the State (fig. 2*A*). In the Southern Rocky Mountains (fig. 2*B*), wetlands are mostly in high mountain valleys and intermountain basins. In the Great Plains, wetlands occur along the flood plains of the Canadian and Pecos Rivers and in association with playa lakes. In the Colorado Plateaus and Basin and Range, wetlands are sparsely distributed, with the exception of wetlands associated with the San Juan, San Francisco, and Gila Rivers.

Palustrine wetlands are distributed statewide. In New Mexico, palustrine wetlands include forested wetlands in river flood plains and near springs and seeps; scrub-shrub wetlands such as bottomland shrubland; emergent wetlands, such as marshes, fens, alpine snow glades, and wet and salt meadows; aquatic bed wetlands in shallow ponds and small lakes; and sparsely or nonvegetated wetlands such as playa lakes. Palustrine wetlands along rivers, streams, springs, lakes, and ponds are called riparian wetlands. Riparian wetlands along the State's major rivers provide habitat for fish, wildlife, and diverse plant life. They also provide habitat for migrating, overwintering, and nesting waterfowl. One of the more notable riparian wetlands in New Mexico is in the Bosque del Apache National Wildlife Refuge. The 57,191-acre refuge lies along 9 miles of the Rio Grande in south-central New Mexico. Marshes within the refuge are ideal winter habitat for migratory birds, including ducks, geese, sandhill cranes, and whooping cranes. Efforts are being made to maintain and restore native riparian cottonwood habitat in the refuge for a variety of birds and other wildlife. Many western species of riparian trees and shrubs, such as willows and cottonwoods, have been lost because of nonnatural streamflow regimes (Howe and Knopf, 1991). The nonnatural flows followed the completion of water projects in the first half of the 20th century, resulting in rapid colonization and expansion of the exotic Russian-olive and salt cedar.

The playa lakes of eastern New Mexico provide habitat for migrating, overwintering, and nesting waterfowl in the Central Flyway (U.S. Fish and Wildlife Service, 1990). The estimated number of playa lakes in the State is 1,700, and they range in area from less than 1 acre to more than 600 acres (Nelson and others, 1983). The

NMED Exhibit 24

playa lakes range in wetness from dry lake bed to shallow lake and can be fresh or saline. The freshwater playas are numerous, small to medium in size, and serve as zones of recharge to the underlying aquifer (Osterkamp and Wood, 1987). The saline playas are larger and fewer than the freshwater playas and are areas of discharge from the underlying aquifer. Most playa lakes in New Mexico are palustrine. However, playa lakes larger than 20 acres are classified as lacustrine wetlands, as are the shallow areas of large reservoirs.

Riverine wetlands occur in the shallow river channels of perennial streams. There are about 3,500 miles of streams in New Mexico (Ong and others, 1993).

HYDROLOGIC SETTING

Wetlands form where a persistent water supply is at or near the land surface. The location and persistence of the supply of water is a function of precipitation and runoff patterns, evaporation potential, topography, and the presence of a shallow water table.

Precipitation and runoff rates differ annually and with location and season. Average annual precipitation in New Mexico (fig. 2*C*) ranges from about 8 inches in the northwestern corner of the State and in the southern Rio Grande Valley to 24 inches in the mountains of the northern and southern parts of the State. Runoff (fig. 2*D*) is greatest in the northern mountains and smallest in the desert areas of the southern and eastern parts of the State. Much of the runoff from the mountains occurs during concurrent snowmelt and rainfall in the spring and summer.

Average annual pan evaporation varies across the State and ranges from about 40 to 112 inches per year (Nelson and others, 1983). Most evaporation occurs from March through September and decreases with increasing altitude. Because annual evaporation exceeds annual rainfall, most of the State has a net annual moisture deficit. The moisture deficit is a limiting factor in the formation of wetlands and to the continued existence of some of the more fragile wetlands. Even those areas of the State having the highest precipitation and lowest evaporation (high mountain regions) can be unfavorable for development of wetlands because of steep topography, shifting stream channels, and unfavorable soil conditions (Cooper, 1986).

Shallow water tables and groundwater discharge into topographic depressions, streams, and springs maintain wetlands in many areas of New Mexico. These wetlands can be along small streams that have perennial flow in only short reaches or along larger, perennial streams. In intermountain basins, wetlands are maintained by a shallow water table and springs whose source is recharge from precipitation and runoff that occur during spring and summer.

Climatic, topographic, and hydrologic characteristics differ among and sometimes within the physiographic provinces. New Mexico's diverse physiography, climate, and topography result in diverse hydrologic settings for wetland formation.

In the Colorado Plateaus and Basin and Range Provinces (fig. 2*B*), wetlands occur in springs and seeps, around oxbow lakes, along streams and rivers, around reservoirs, and in other areas where the water table is near the land surface. The arid climate of this region results in a low density and acreage of wetlands. Wetlands, although few in number, are vital to wildlife of these physiographic provinces.

In the Great Plains, wetlands occur in riparian zones along perennial streams, around oxbow lakes, in isolated natural depressions with permanent or seasonal water supply, in playa lakes, and in association with other lakes, reservoirs, channelized streams, rivers, and irrigation ditches. Playa lakes make up the largest area of wetlands in this province.

The area of playa lakes has topography classified as either smooth plains, irregular plains, or tablelands (Nelson and others, 1983). Smooth plains are largely on upland terrain, and irregular plains and tablelands are mostly on lowland terrain. Because of the flatness of the terrain, there is generally little stream drainage, and playa lakes collect most of the surface runoff. The playa lakes are

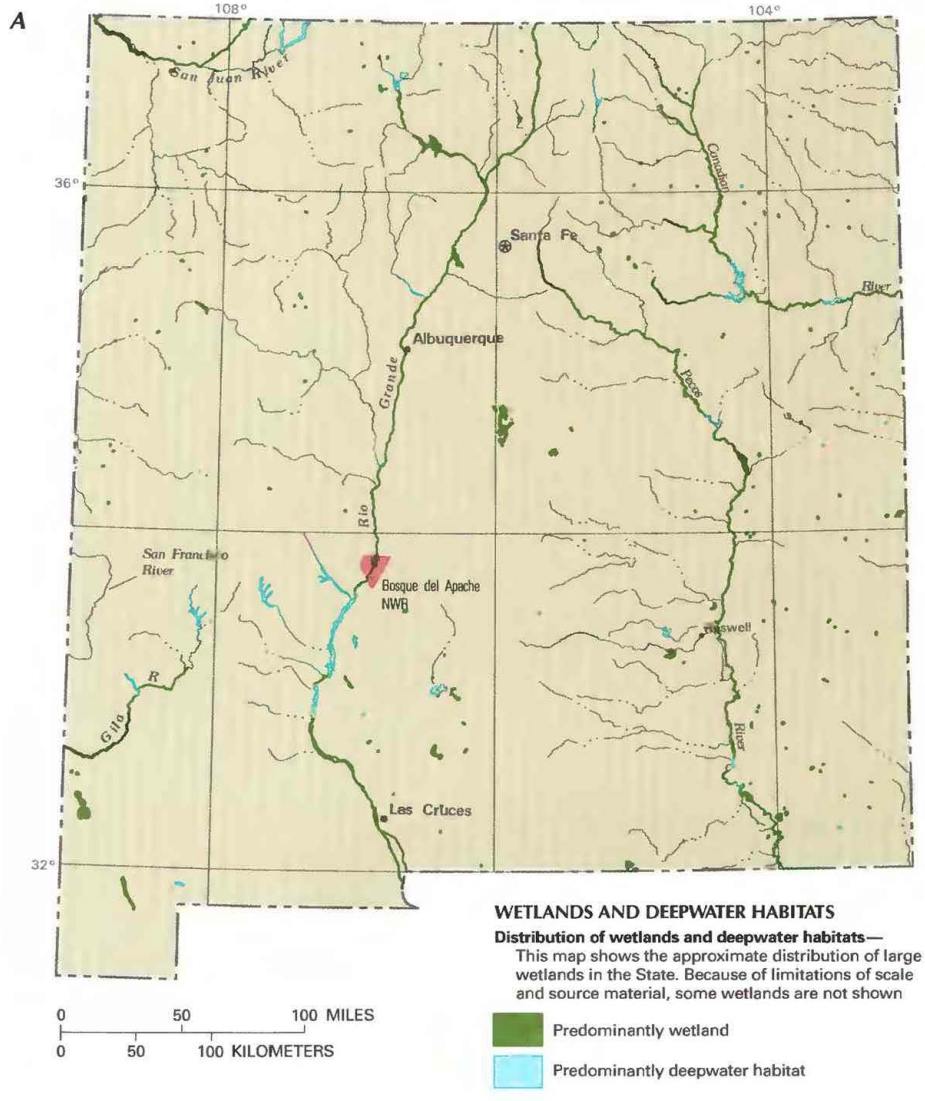

Figure 2. Wetland distribution in New Mexico and physical and climatological features that control wetland distribution in the State. ***A***, Distribution of wetlands and deepwater habitats. *(Sources: A, T.E. Dahl, U.S. Fish and Wildlife Service, unpub. data, 1991.)*

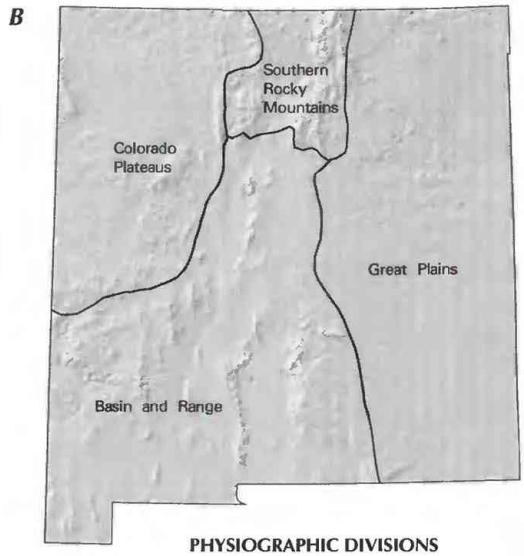
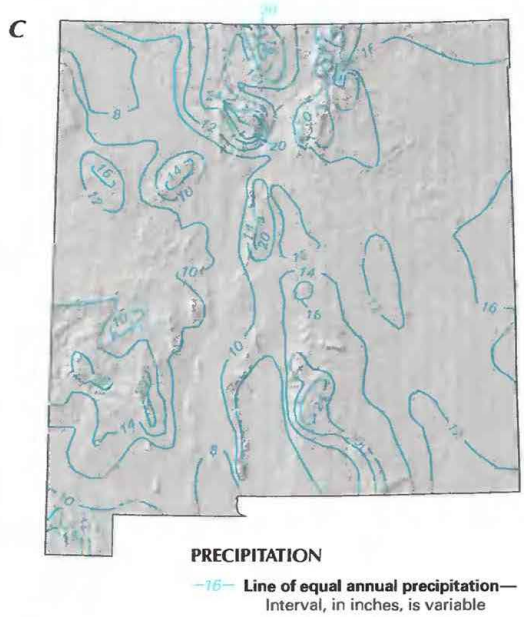
NMED Exhibit 24

usually shallow depressions that have large surface area relative to the total volume of water contained in them. Consequently, most playa lakes have small storage capacities.



Studies by Osterkamp and Wood (1987) indicate that freshwater playa lakes in the Great Plains of New Mexico originate wherever surface depressions collect precipitation runoff. The lakes enlarge as a result of dissolution of carbonates by water infiltrating the unsaturated zone above the underlying aquifer and subsequent subsidence of the lake bed. Over time, the older central lake acquires a layer of clay-rich deposits that largely restricts water movement from the playa lake to the underlying aquifer. Water probably is removed from freshwater playa lakes primarily by recharge to the underlying aquifer from the areas around the lake where lake-bed sediments have not yet accumulated (Osterkamp and Wood, 1987) and by evaporation that in some years ranges as high as 96 to 112 inches per year (Nelson and others, 1983). There is no general agreement on the origin of saline playa lakes; however, Wood and Jones (1990) propose that the source of the salinity is from the concentration by evaporation of runoff and shallow, fresh ground water that discharges from the underlying aquifer.



In the Southern Rocky Mountains, wetlands occur in two physiographically and climatically distinct settings, mountain valleys and intermountain basins. Generally, mountain valleys are geologically young and therefore steep. The valleys have been shaped over time either by running water throughout their entire length or by glaciers at higher altitudes and running water at lower altitudes. At high altitudes in some mountain valleys, glaciation formed large cirque basins in which remnant glaciers or late-melting snow maintains spring, seep, and snow-bed wetlands. Also, at these high altitudes, ponds form in depressions behind slumping saturated soils or in depressions caused by the weight of accumulated snow. Below the cirque basins, wetlands occur in the glaciated, U-shaped valleys, on saturated cliff faces, at the sloping floor near the sides of the valley, in glacial kettle ponds, in oxbow lakes, in depressions on glacial moraines, in lakes created by terminal or lateral moraines, in landslide-formed lakes, in seeps and springs, and in beaver ponds. In steep, V-shaped, nonglaciated areas of mountain valleys, wetlands occur as narrow riparian wetlands, near seeps and springs, and in beaver ponds (Windell and others, 1986).

Intermountain basins were filled by sediments derived from erosion of the surrounding mountains. The large, flat valleys are drained by low-gradient meandering streams and rivers. Intermountain-basin wetlands occur along these streams and rivers, in constructed and natural impoundments, around oxbow lakes, and in other areas where the water table is near the land surface. The shallow water table is maintained by underlying aquifers, impermeable substrates, or annual floods (Windell and others, 1986).

TRENDS

The FWS has estimated that from the 1780's to the 1980's, wetland acreage in New Mexico decreased by 33 percent—from about 720,000 to 482,000 acres (Dahl, 1990). Much of the decrease is attributable to the loss of native vegetation along streams because

NMED Exhibit 24

of a change in streamflow resulting from reservoir construction or agricultural water diversions. The loss of native vegetation along streams alters riparian-wetland functions and allows the proliferation of nonnative vegetation (Howe and Knopf, 1991).

Wetland losses in rural areas can be attributed to conversion to cropland, dewatering or diverting water for irrigation, and overgrazing by livestock. Development of urban areas has caused wetland loss or degradation owing to encroachment of residential and commercial construction, dewatering for municipal and industrial water supply, channelization, and contamination from inadequately treated sewage and industrial waste. Other causes of wetland loss or degradation are clear cutting, burning, hard-rock mining and related activities that produce toxic acidic or alkaline runoff, placer mining, erosion and sedimentation, sand and gravel mining, road and railroad construction, and dam and reservoir construction in wetland areas (Windell and others, 1986).

Some human activities have helped to form wetlands or enlarge existing ones. The construction of reservoirs between 1916 and 1985, which provided for storage of more than 5.9 million acre-feet of surface water (Garrabrant and Garn, 1990), resulted in the formation of wetlands along the edge of those water bodies. However, such gains are at the expense of the original, natural riparian wetlands. Farm-pond construction also contributes to the formation of wetlands around the edge of the pond. More than one-half of the State's cropland is irrigated (Garrabrant and Garn, 1990), and leaking ditches and seeps and return flow associated with irrigation have contributed to the formation of wetlands.

CONSERVATION

Many government agencies and private organizations participate in wetland conservation in New Mexico. The most active agencies and organizations and some of their activities are listed in table 1.

Federal wetland activities.—Development activities in New Mexico wetlands are regulated by several Federal statutory prohibitions and incentives that are intended to slow wetland losses. Some of the more important of these are contained in the 1899 Rivers and Harbors Act; the 1972 Clean Water Act and amendments; the 1985 Food Security Act; the 1990 Food, Agriculture, Conservation, and Trade Act; and the 1986 Emergency Wetlands Resources Act.

Section 10 of the Rivers and Harbors Act gives the U.S. Army Corps of Engineers (Corps) authority to regulate certain activities in navigable waters. Regulated activities include diking, deepening, filling, excavating, and placing of structures. The related section 404 of the Clean Water Act is the most often-used Federal legislation protecting wetlands. Under section 404 provisions, the Corps issues permits regulating the discharge of dredged or fill material into wetlands. Permits are subject to review and possible veto by the U.S. Environmental Protection Agency, and the FWS has review and advisory roles. Section 401 of the Clean Water Act grants to States and eligible Indian Tribes the authority to approve, apply conditions to, or deny section 404 permit applications on the basis of a proposed activity's probable effects on the water quality of a wetland.

Most farming, ranching, and silviculture activities are not subject to section 404 regulation. However, the "Swampbuster" provision of the 1985 Food Security Act and amendments in the 1990 Food, Agriculture, Conservation, and Trade Act discourage (through financial disincentives) the draining, filling, or other alteration of wetlands for agricultural use. The law allows exemptions from penalties in some cases, especially if the farmer agrees to restore the altered wetland or other wetlands that have been converted to agricultural use. The Wetlands Reserve Program of the 1990 Food, Agriculture, Conservation, and Trade Act authorizes the Federal Government to purchase conservation easements from landowners who agree to protect or restore wetlands. The Consolidated Farm Service Agency (formerly the Agricultural Stabilization and Conservation Service) administers the Swampbuster provisions and Wetlands Reserve Program. The Natural Resources Conservation Service (formerly the Soil Conservation Service) determines compliance with Swampbuster provisions and assists farmers in the identification of wetlands and in the development of wetland protection, restoration, or creation plans.

The 1986 Emergency Wetlands Resources Act encourages wetland protection through funding incentives. The act requires States to address wetland protection in their Statewide Comprehensive Outdoor Recreation Plans to qualify for Federal funding for State recreational land; the National Park Service provides guidance to States in developing the wetland component of their plans.

The U.S. Forest Service (FS) manages five National Forests in New Mexico that contain diverse wetlands and riparian ecosystems. The FS also coordinates with State agencies and private landowners on wetland-conservation activities.

The FWS manages six National Wildlife Refuges in New Mexico that provide habitat for migrating birds, endangered species, and other wildlife and wildlife-oriented public recreation. Under the 1986 Emergency Wetlands Resources Act, the FWS evaluated eight priority wetland sites in the State for acquisition (U.S. Fish and Wildlife Service, 1990).

A goal of the Bureau of Land Management (BLM) is to restore, maintain, and improve riparian wetland area conditions on public land in New Mexico. The BLM is responsible for the management of 12.8 million acres of public land in the tristate area of New Mexico,

NMED Exhibit 24

Oklahoma, and Kansas, which includes 27,600 acres of riparian wetland (Bureau of Land Management, 1990).

State wetland activities.—The principal State agencies in New Mexico that regulate or manage wetlands are the Department of Game and Fish, Environment Department, and the State Engineer Office. Also involved is the State Park and Recreation Division of the Energy, Mineral, and Natural Resources Department, which developed the New Mexico Wetlands Priority Conservation Plan (New Mexico Energy, Minerals, and Natural Resources Department, 1988). This plan is a component of the 1986 Statewide Comprehensive Outdoor Recreation Plan. The goals of agencies managing wetlands in New Mexico are to provide habitat for fish and wildlife and for diverse plant species, to maintain wetlands for erosion and flood control, and to enhance wetlands as agricultural, recreational, and scenic resources.

State management of wetlands in New Mexico began with an assessment of State wetlands by the State Park and Recreation Division (New Mexico Energy, Minerals, and Natural Resources Department, 1988). The steps in the assessment were to locate wetlands, determine their types, assess their quality, prioritize them according to their value and benefit, and rate the probable effect on them of each of the major causes of wetland losses. The Division considers the seven major causes of loss or degradation of wetlands in New Mexico to be (1) municipal water development, (2) natural water-table fluctuation, (3) development of land surfaces, (4) pollution, (5) erosion, tree cutting, or siltation, (6) invasion by nonnative plant species, and (7) poor management. The assessment of the quality of wetlands is based on habitat conditions, the dominance of native or rare species, the presence of terrestrial animals, and the uniqueness of the wetland in New Mexico. State government acquisition of wetlands will be based on whether the public values and benefits of wetlands can be maintained or realized under present ownership (New Mexico Energy, Minerals, and Natural Resources Department, 1988).

County and local wetland activities.—The Open Space Division of the city of Albuquerque acquires, manages, and restores wetlands. The Division also conducts feasibility studies and inventories wetlands in areas under its jurisdiction. The county of Santa Fe is involved in research and inventory of wetlands in the county.

Private wetland activities.—Private organizations involved in wetland management and conservation in New Mexico include the National Audubon Society, the Sierra Club, and The Nature Conservancy. A principal activity of the National Audubon Society and the Sierra Club is the restoration and creation of wetlands. The Sierra Club also conducts research in wetlands. The Nature Conservancy acquires wetlands and other ecologically valuable habitats for conservation. A major goal of these private organizations is to inform the public about the value of wetlands.

Abstract

We reviewed the scientific literature on non-floodplain wetlands (NFWs), freshwater wetlands typically located distal to riparian and floodplain systems, to determine hydrological, physical, and chemical functioning and stream and river network connectivity. We assayed the literature for source, sink, lag, and transformation functions, as well as factors affecting connectivity. We determined NFWs are important landscape components, hydrologically, physically, and chemically affecting downstream aquatic systems. NFWs are hydrologic and chemical sources for other waters, hydrologically connecting across long distances and contributing compounds such as methylated mercury and dissolved organic matter. NFWs reduced flood peaks and maintained baseflows in stream and river networks through hydrologic lag and sink functions, and

sequestered or assimilated substantial nutrient inputs through chemical sink and transformative functions. Landscape-scale connectivity of NFWs affects water and material fluxes to downstream river networks, substantially modifying the characteristics and function of downstream waters. Many factors determine the effects of NFW hydrological, physical, and chemical functions on downstream systems, and additional research quantifying these factors and impacts is warranted. We conclude NFWs are hydrologically, chemically, and physically interconnected with stream and river networks though this connectivity varies in frequency, duration, magnitude, and timing.

connectivity; function; non-floodplain; river networks; wetlands

INTRODUCTION

Wetlands are landscape elements existing along a continuum of connectivity, climatically and hydrologically interacting with other landscape elements through space and time (Ward 1989; Cohen et al. 2016). Instream, riparian, and floodplain wetlands experience fast and/or near-continuous hydrologically mediated connections and interactions. Wetlands are also connected through extremely slow or diffuse pathways (e.g., deep groundwater or atmospherically connected; Rains et al. 2015; Cohen et al. 2016). Researchers are using increasingly advanced and novel methods to quantify wetland locations along this conceptual connectivity continuum (e.g., Jones 2015; Klaus et al. 2015; Vanderhoof et al. 2016; Brooks et al. 2018; Thorslund et al., unpublished data).

Wetlands are functionally part of the landscape, performing hydrological, chemical, and biological functions affecting downstream systems (e.g., Marton, Creed, et al. 2015; Rains et al. 2015; Cohen et al. 2016; Biggs et al. 2017; Schofield et al. 2018). Paradoxically, some functional contributions of wetlands might be inversely related to their rate of connectivity or position along the connectivity continuum (i.e., slower connections could result in larger effects). For instance, wetlands that intercept storm runoff store water and process entr materials (e.g., nutrients). While the subsequent connection with downstream waters may be slow or diffuse (e.g., via groundwater or atmospheric), the functional effect of retaining nutrients and stormwater may be great.

However, functional connections for wetlands are challenging to quantify, requiring elucidation of both the connection pathway and the variable of interest. Descriptors of connectivity include the frequency, duration, magnitude, timing, and rate of change of fluxes to, and exchanges with, downstream waters (Poff et al. 1997; Poff et al. 2007). Current estimates are that ~45 million wetland hectares exist in the conterminous United States (U.S.) (Dahl 2011), and each hectare exists along a continuum of connectivity. There is thus a need to analyze and synthesize the available peer-reviewed scientific literature on the connectivity and quantifiable functional effects of wetlands on other waters to establish a baseline understanding of the interchange of materials, organisms, and energy among and between landscape elements (e.g., Hynes 1975; Forman 1995). This information, the connectivity and effects of wetlands on other waters, provides management agencies and

EPA Author Manuscript EPA Author Manuscript EPA Author Manuscript

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

stakeholders with information germane to the sustainable use and management of aquatic resources. Armed with sufficiently robust scientific information, federal, state, and local agencies can endeavor to establish and promulgate guidelines and regulations designed to safeguard aquatic resource integrity while concurrently providing guidance on wise management and growth.

To address this data need, the USEPA (2015) analyzed and synthesized over 1,300 peer-reviewed publications in a 408-page report, summarizing the state of science on the connectivity between streams, wetlands, and downgradient systems, which is the topic of this featured collection (Alexander et al. 2018). Connectivity as used by USEPA (2015, A-2; Leibowitz et al. 2018) and maintained here in this updated review refers to "[t]he degree to which components of a river system are joined by various transport mechanisms; … determined by the characteristics of both the physical landscape and the biota of the specific system." The primary transport mechanisms considered in this expanded and updated review are surface water and shallow groundwater flows and the transport and transformation of physical and chemical materials, all of which connect watersheds in four dimensions (i.e., longitudinal, lateral, vertical, and temporal, Ward 1989; see also Covino 2017).

This contribution, as well as others (e.g., Alexander et al. 2018; Fritz et al. 2018; Goodrich et al. 2018; Leibowitz et al. 2018; Schofield et al. 2018), builds on the findings of USEPA (2015) with updated literature and scientific advances in quantifying aquatic system connectivity. While USEPA (2015) addresses wetlands in riparian and floodplain areas as well as wetlands not so situated, this review is specifically focused on hydrological, physical, and chemical connectivity of non-floodplain wetlands (NFWs), freshwater wetlands not spatially located within riparian areas or floodplains of river networks, further described below. In the U.S., NFWs may cover more than 6.6 million hectares and comprise >16% of the total freshwater wetland acreage (Lane and D'Amico 2016; Figure 1). Biological connectivity and functions of NFWs are covered in a separate review (Schofield et al. 2018). The review is organized into the following sections: (1) Definitions and Conceptual Approach; (2) Hydrological, Physical, and Chemical Functions of NFWs; and (3) Synthesis and Implications.

EFINITIONS AND CONCEPTUAL APPROACH

Floodplain and Non-Floodplain Wetlands: Definitions

All rivers and streams have riparian areas, defined as transitional zones between terrestrial and aquatic ecosystems distinguished by gradients in biophysical conditions, ecological processes, and organisms. However, not all portions of river and stream networks — the hierarchical, interconnected populations of perennial, intermittent, and ephemerally flowing channels that drain water to a river — have floodplains. Floodplains are level areas bordering stream or river channels that are formed by sediment deposition from those channels under present climatic conditions. Floodplain and associated river channel forms (e.g., meandering, braided, anastomosing) are determined by interacting fluvial factors, including sediment size and supply, channel gradient, and streamflow (Church 2002, 2006). As stream channels increase in size and decrease in slope, a mixture of erosion and deposition processes usually is at work. At some point in the lower portions

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

EPA Author Manuscript

of river networks, sediment deposition becomes the dominant process and floodplains form. Floodplains are inundated during moderate to high water events (Leopold 1994; Osterkamp 2008).

Like riparian areas, wetlands are transitional areas between terrestrial and aquatic ecosystems. Wetlands include areas such as swamps, bogs, fens, marshes, ponds, and pools (Mitsch et al. 2009). According to Cowardin et al. (1979), an area is classified as a wetland if it has one or more of the following three attributes: (1) the area supports predominantly hydrophytes (i.e., water-loving plants) at least periodically; (2) the land has substrate that is predominantly undrained hydric soil; or (3) the land has nonsoil substrate that is saturated with water or covered by shallow water at some time during the growing season of each year. Note that the Cowardin et al. (1979) definition requires only one of these characteristics, in contrast to the U.S. federal regulatory definition, which requires all three (33 Code of Federal Regulations 328.3(b); see also USACE 1987). Thus, as used in this review, a wetland need not meet the U.S. federal regulatory definition.

Floodplain wetlands are portions of floodplains that meet the aforementioned Cowardin et al. (1979) definition of a wetland. Floodplain wetlands have hydrologic connections to streams and rivers that are predominantly bidirectional (i.e., from wetlands to streams and rivers and vice versa) through lateral movement of surface water and groundwater between the channel and floodplain areas, either through overbank flooding (i.e., lateral expansion of the network) or hyporheic flow (USEPA 2015).

NFWs are found in landscape settings where the potential exists for predominantly unidirectional, lateral hydrologic flows from wetlands (sensu Cowardin et al. 1979) to the river network through surface water or groundwater. Such a setting would typically include upgradient areas such as hillslopes or upland areas outside of the floodplain (e.g., Lane et al. 2017). Any wetland setting where water could normally only flow from the wetland toward a river network (i.e., unidirectionally) would be considered a non-floodplain setting, regardless of the magnitude and duration of flows and of travel times (sensu Ward 1989).

Thus, the terms “floodplain” and “non-floodplain” are meant to describe the landscape setting in which wetlands occur and do not refer to a particular Cowardin et al. (1979) wetland type or class. Many wetland types occur in both settings. For example, a palustrine emergent wetland (Cowardin et al. 1979) could be located outside a floodplain, or it could be located within a floodplain and subject to bidirectional hydrologic flows. A wetland that is classified as depressional in the hydrogeomorphic approach could have any combination of inlets and outlets or none at all (Smith et al. 1995). Such a wetland would be grouped with floodplain wetlands if it had both an input and output channel, since it would have bidirectional flow. A depressional wetland with a surface outlet channel and no inlet or with no outlets and inlets, however, would be considered non-floodplain because water could flow downgradient only from the wetland to the river network, and not from a stream to the wetland. For instance, wetlands that serve as origins for streams are grouped with NFWs because they have unidirectional flow through their outlet channel.

NMED Exhibit 25

EPA Author Manuscript EPA Author Manuscript EPA Author Manuscript

Hence, the hydrologic connections with river networks fundamentally differ for floodplain wetlands and NFWs. Hydrologic connections between NFWs and river networks originate via surface water spillage or merging, or near-surface groundwater flow when water inputs exceed outputs (e.g., evapotranspiration, deep groundwater loss) and available storage. A major consequence of the two different landscape settings is that while waterborne materials can be transported only from the NFW to the river network, waterborne materials can be transported both from the floodplain wetland to the river network and from the river network to the floodplain wetland (see Fritz et al. 2018). In the latter case, there is a mutual, interacting effect on the structure and function of both the floodplain wetland and river network. In contrast, a NFW can materially affect a river through the transport of waterborne materials, but the opposite is generally not true. Note that we limit our use of floodplain and non-floodplain landscape settings to the direction of hydrologic flow; the terms cannot be used to describe directionality of geochemical or biological flows. For example, mobile organisms can move between a stream and NFW and vice versa (e.g., Subalusky et al. 2009a, b; Mushet et al. 2013). In Alaska, transport of live salmon or their carcasses from streams to riparian areas by brown bears (*Ursus arctos*) accounts for more than 20% of riparian nitrogen budgets (Helfield and Naiman 2006). Although this example is in a floodplain setting, it shows how geochemical fluxes can be decoupled from hydrologic flows. Furthermore, we recognize that there may be exceptions to our unidirectional flow paradigm. For instance, flooding events may create conditions that belie the typical unidirectional flow regime. We consider the “normal” or typical flow patterning in determining the flow regime, though that, too, is replete with qualifiers.

Wetland Functions in This Review

Leibowitz et al. (2008) identified three functions by which wetlands (and streams) influence material fluxes into downstream waters: source, sink, and refuge. USEPA (2015) expanded on this framework to include two additional functions: lag and transformation (Leibowitz et al. 2018). These five functions (summarized and defined in Table 1) provide the conceptual framework for understanding how physical and chemical connections between NFWs and downstream waters influence river systems. This rubric similarly provides a framework to link other landscape elements (Forman 1995) within watersheds (i.e., providing a means to compare functions between streams, floodplain wetlands, and NFWs; USEPA 2015). This review focused on four of the five functions: source, sink, transformation, and lag in NFWs. Schofield et al. (2018) analyze biological connectivity and the refuge function of streams, floodplain wetlands, and NFWs.

Literature Review Approach

We focused entirely on peer-reviewed, publicly accessible sources of information about surface water and shallow (or near-surface) groundwater connections and interactions of NFWs that influence the function and condition of downstream surface waters. We conducted keyword searches using terms including the types of waters, connections, and downstream effects of interest (e.g., [wetland* AND [river* OR stream*] AND [connect* OR isolat*]]). We used science citation databases and search engines available through Web of Science and Google Scholar to search primary (original research) and secondary (review) literature. These searches included references citing or cited in relevant publications

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

EPA Author Manuscript

obtained through initial searches. We additionally reviewed and included citations provided by peer-review panels and in public comments on drafts of the USEPA (2015) report, which we co-authored. In addition, we expanded and updated the findings from USEPA (2015) by incorporating recently published material in this review. Finally, as most authors do not use the aforementioned term “non-floodplain wetland” in describing their study objects, we ascribed wetland typology and setting based on information in the paper and/or our knowledge of the study areas available in the peer-reviewed literature.

HYDROLOGICAL, PHYSICAL, AND CHEMICAL FUNCTIONS OF NFWS

We examined the NFW literature and herein report findings demonstrating source, sink, transformation, and lag functions with potential links to downstream systems. We then review the hydrologic and physical pathways by which NFWs may affect downstream waters. Finally, we couple the two, providing updated analyses and syntheses of our findings from the literature on the individual and cumulative effects of NFWs on downstream waters.

NFW Source Function

Hydrologic Source.—An NFW functions as a hydrologic source to downgradient ecosystems when total water inputs minus outputs (e.g., evapotranspiration, groundwater recharge) exceed the storage capacity of the wetland basin and subsequent outflow connects it via surface water to another aquatic system. This occurs when water inputs to the wetland — contributing area precipitation (including snowmelt) and saturation excess flow or near-surface groundwater discharge — fill the available soil pore space and topographic volume of NFWs. Subsequent inputs minus outputs exceed total wetland storage capacity and flow through a surface or near-surface water pour-point downgradient in what has been termed “fill-and-spill” hydrology (Spence and Woo 2003; Tromp-van Meerveld and McDonnell 2006).

NFWs can serve as the hydrologic sources or origins of headwater streams (Fergus et al. 2017; Fritz et al. 2018) when the unidirectional excess flow continues directly into an adjacent, downgradient stream system (USEPA 2015; Figure 2a). These surface connections can be perennial, intermittent, ephemeral, or episodic. White and Crisman (2016) reported that 90% of headwater streams analyzed across Florida originated from wetlands and seeps (a type of NFW). Perennial streams emanated from wetlands more frequently than impermanent streams, while the opposite was found for seeps (White and Crisman 2016). Seeps, springs, and some wetlands are expressions of groundwater at the surface (e.g., Winter and Rosenberry 1995; Euliss et al. 2004; Hayashi et al. 2016). Morley et al. (2011) reported that NFWs primarily supplied by groundwater discharge (i.e., seeps) provided 40%–80% of the water volume for the streams to which they were connected via perennial surface flow. Tufford (2011) monitored four headwater seepage wetlands in the South Carolina Coastal Plain and found that the water table dynamics varied seasonally and annually, intermittently creating hydrologic sources that connected NFW seeps to a downgradient floodplain through swales (i.e., landscape features lacking defined beds and banks or channels that convey flow especially during storm events or snowmelt; USEPA 2015; e.g., Figure 2b).

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

EPA Author Manuscript

In addition to a wetland filling and spilling and reaching the stream network, wetlands can also fill-and-merge within a basin (Huang et al. 2011; Barton et al. 2013; Leibowitz et al. 2016; Wu and Lane 2016), creating NFW complexes that frequently exchange materials within and among the surface water–connected wetland systems (Figure 3; Wu and Lane 2016; Calhoun et al. 2017). Like fill-and-spill wetlands, fill-and-merge wetlands are hydrologic sources when the maximum capacity of the bounding basin is exceeded and the wetland complex connects via continuous surface water to another aquatic system (Shaw et al. 2012; Wu and Lane 2017). That is, fill-and-merge wetlands become fill-and-spill systems when the internal storage is exceeded and no additional merging can occur within a given basin (see also the discussion on NFW Hydrologic Lag Functions, below).

While part of the hydrologic cycle (see Cohen et al. 2016), water in these wetland complexes may or may not eventually connect as surface water or near-surface groundwater into a stream network. For instance, Wilcox et al. (2011) found that nearly 20% of precipitation that fell on a Texas Gulf Coast complex of depressional wetlands spilled into a nearby water body, the Armand Bayou, over a four-year study period. By contrast, Vanderhoof and Alexander (2016) examined two nonadjacent Landsat imagery path/row combinations in the Prairie Pothole Region (PPR) across both drought and deluge conditions over a 21-year period and reported that under wet conditions, 21% of the wetlands merged with at least one other wetland and 7% of wetlands connected with lakes and streams, most via connecting to other “stepping-stone” wetlands (Vanderhoof and Alexander 2016). Vanderhoof et al. (2016) and Vanderhoof et al. (2017) showed that filling and merging of wetlands, and of wetlands and streams, was a function of landscape position relative to other aquatic systems as well as antecedent and prevailing hydrologic conditions. Brooks et al. (2018) conducted a water isotope analysis of surface water origins in a watershed within the PPR, determining that NFWs cumulatively contributed water to streamflow in 11 of 12 sampling events (based on the surface water evaporative enrichment signal in the stream). They furthermore determined that the surface (or near-surface) water connections between the NFWs and the stream networks occurred year-round and that landscape storage and subsequent downgradient flow sustained flow in the stream network.

The scientific literature we found focused primarily on wetland-to-wetland connectivity, not wetland-to-stream. Nevertheless, the literature on wetland-to-wetland connectivity demonstrates NFWs exhibiting surface water connections with other water bodies, while illustrating the variable nature of these hydrologic connections. For instance, Leibowitz and Vining (2003) reported that fill-and-spill dynamics affected 28% of NFWs within a 40-km^2 area in the PPR of North America, including 22 wetland complexes (i.e., two or more connected wetlands) during a wetter-than-average year. Conversely, none of the connections observed by Leibowitz and Vining (2003) existed in a drier year. Bowling et al. (2003) analyzed a 471 km^2 Alaskan watershed using synthetic aperture radar and reported inundation and connectivity of wetlands and tundra varied between 15% and 67% over two years, depending on available antecedent surface water storage. Leibowitz et al. (2016) explored longer term connectivity in the PPR, determining that some wetlands were filling and spilling to other wetlands over days to weeks, whereas others connected via fill-and-merge hydrology were surficially connected over decades. Kahara et al. (2009) analyzed typological changes in the abundance of different NFW basins, reporting that wetland

NMED Exhibit 25

EPA Author Manuscript EPA Author Manuscript EPA Author Manuscript

merging increased with increasing annual precipitation and this changed the abundance of different NFW types (e.g., temporary, seasonal, and semipermanently inundated or saturated wetlands). For instance, one area of the PPR showed decreases in the areal extent of temporary (−47%) and seasonal (−25%) NFWs with increased precipitation, but these losses were offset by concomitant increases in semipermanent wetland area (+185%).

Hydrologically connected wetlands have different physical and hydrologic source properties than relatively unconnected systems. Cook and Hauer (2007) found wetlands that merged due to snowmelt in a Montana prairie setting had longer hydroperiods and volume, as well as higher specific conductance and primary productivity, than nonmerged wetlands. Similarly, Leibowitz et al. (2016) reported differences in dissolved ions, water levels, and macroinvertebrates between merged wetlands and those that did not merge but connected over shorter durations via fill-and-spill hydrology. These field-based measures may inform future connectivity assessments. For instance, Ali et al. (2017) recently developed an electrical conductivity (EC) indicator of potential groundwater-driven wetland-to-stream connectivity. Similarly, Thorslund et al. (unpublished data) analyzed stream and NFW chloride concentrations across several North American study sites; a mass-balance analysis demonstrated NFWs were active sites of catchment-scale flow-generation, though with abundant local to regional heterogeneity.

NFWs can recharge near-surface and deeper groundwater (see Figure 2c), or function simply as an aquatic system embedded within an upland or terrestrial area and not as a vertical or lateral hydrologic “source” for any other waters (e.g., see Figure 2d, Hayashi et al. 2016; but see Cohen et al. 2016). For instance, Hayashi et al. (1998a, b) demonstrated that a NFW received 30%–60% of snowmelt runoff from its basin, but that summer evapotranspiration at the wetland margin effectively removed an abundance of the runoff into the wetland, leaving little water for deep-groundwater recharge (see NFW Sink Function, below).

Much of the literature on NFWs as hydrologic sources has focused on stream baseflow. Groundwater discharge wetlands connected via overland/near-surface flow to streams, such as fens or seeps (e.g., Tufford 2011), are important sources of stream baseflow (Morley et al. 2011). Moreover, as noted, wetlands can be focal points for groundwater recharge, which may contribute to baseflow. Rains (2011), for example, found that perched and flow-through wetland ponds in southwestern Alaska were sites of net groundwater recharge. Given the high prevalence of ponds on the landscape (Rains 2011), these wetlands could substantially affect stream baseflow via groundwater inputs (see Groundwater Connectivity below).

In summary, NFWs are hydrologically dynamic, and are frequently sources of surface waters to other wetlands and other aquatic bodies. NFWs serve as the hydrologic origins or sources of headwater streams (White and Crisman 2016; Fritz et al. 2018). An abundance of research in the North American PPR has demonstrated fill-and-spill and fill-and-merge behaviors, as well as surface water connections to stream and lake systems (e.g., Vanderhoof and Alexander 2016; Vanderhoof et al. 2016; Vanderhoof et al. 2017; Brooks et al. 2018). NFW fill-and-spill behavior occurs in other physiographic regions (e.g., California vernal pools, Rains et al. 2006; Delmarva Ponds, Jones et al. 2018) suggesting similar controlling landscape and climatological factors. Wetlands that merge or connect with other systems

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

EPA Author Manuscript

were found to substantially affect the physical and chemical characteristics of the receiving water (e.g., Cook and Hauer 2007; Leibowitz et al. 2016; Ali et al. 2017; Brooks et al. 2018).

Chemical Source.—NFWs can be major chemical sources to other waters, contributing dissolved organic compounds (e.g., Mulholland and Kuenzler 1979; Urban et al. 1989; Eckhardt and Moore 1990; Koprivnjak and Moore 1992; Kortelainen 1993; Clair et al. 1994; Hope et al. 1994; Dillon and Molot 1997; Gergel et al. 1999), methylated mercury (MeHg) (St. Louis et al. 1994; Ullrich et al. 2001), nutrients (e.g., phosphorus, Flaig and Reddy 1995; Lane and Autrey 2016), and salts (e.g., Hayashi et al. 1998a, b; Euliss et al. 2004; Heagle et al. 2013; Nachshon et al. 2014; Ali et al. 2017). For instance, boreal forest basins composed of NFWs in central Ontario, Canada, exported between 11.4 and 31.5 kg C/ha/yr as dissolved organic carbon to downstream waters (Creed et al. 2003). While dissolved organic materials such as carbon are important sources of energy for aquatic communities (Hobbie 1992; Reddy and DeLaune 2008), they can have negative effects on downstream waters because contaminants, such as MeHg (see below) can adsorb to dissolved organic matter (Thurman 1985; Driscoll et al. 1995) and under some conditions dissolved organic compound exports can increase the acidity of downstream waters. For instance, Gorham et al. (1986) addressed watershed factors associated with lake and forest acidification in Nova Scotia, Canada. In addition to atmospheric deposition of acid precipitates, they found that the ratio of non-floodplain muskeg peatlands to lakes was significantly correlated with lake acidification, as muskeg wetland–dominated watersheds exported high-molecular-weight organic acids via either overland or shallow groundwater flow. Further linking NFWs to lakes, Gorham et al. (1986) reported that even small amounts of dissolved organic carbon can greatly affect lake water pH; the pH of waters with a dissolved organic carbon value of 4.5 mg/L (the log-normal mean) was 100 times more acidic than waters with a dissolved organic carbon value of <1 mg/L (the minimum concentration).

Wetland soils are important sources of methylmercury, a particularly toxic and mobile form of the element frequently entrained and transferred downgradient with dissolved organic compounds (Grigal 2002). Mercury enters the global atmosphere primarily through waste incineration and coal combustion; it can directly enter wetland systems or can be deposited on terrestrial areas and then transported into riparian areas and wetlands via rainfall and runoff (St. Louis et al. 1994). Ullrich et al. (2001) noted that methylmercury production was linked to low pH, low salinity, and presence of decomposable organic matter in reducing environments, factors that are present in wetlands. The redox conditions found in the presence of a fluctuating water table are thought to be a strong driver of mercury methylation (Heyes et al. 2000; Branfireun and Roulet 2002; Branfireun 2004). Once formed through microbial or other processes in wetlands, mercury and methylmercury export is controlled by the export of organic matter, such as dissolved organic compounds and humic and fulvic acids (Linqvist et al. 1991; Mierle and Ingram 1991; Driscoll et al. 1995). For example, Branfireun et al. (1996) reported 58% of MeHg-laden peat porewater leaving a headwater catchment study area occurred during stormflow, 41% during baseflow, and 1% transported via groundwater. St. Louis et al. (1994) found that boreal forest catchments in Minnesota with NFWs had lower total mercury concentrations than catchments lacking

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

EPA Author Manuscript

NFWs, but had yields of MeHg from wetlands that were 26–79 times higher than upland areas. This yielded 1.84–5.55 mg MeHg/ha/yr to streams in the Great Lakes basin, where mercury could be incorporated into lake-wide food webs. Porvari and Verta (2003) found that bioaccumulating methylmercury export from non-floodplain peatlands to downstream waters ranged from 0.03 to 3.8 ng MeHg/L, and that catchments with greater wetland abundances had greater methylmercury export.

Nutrients that are mobilized into wetlands via near-surface runoff may create high concentrations in the wetland soils (Flaig and Reddy 1995; Reddy and DeLaune 2008; Hoffmann et al. 2009). The nutrients may stay absorbed to (or bonded with) the soils until a rainfall or precipitation event creates a concentration gradient in the wetland such that the nutrients, such as phosphorus, are released from the soil into the water column (see Chemical Sink function, below). For example, a suggested agricultural nutrient runoff management practice to decrease nutrient loading to Lake Okeechobee, Florida, suggested by Flaig and Reddy (1995) is to use NFWs for phosphorus assimilation. However, they note that the capacity is finite and, furthermore, that the NFWs could become nutrient sources if loading rates are high enough and the wetlands are subsequently connected (e.g., via ditches or major precipitation events). Lane and Autrey (2016, 45) analyzed phosphorus (P) concentrations in NFWs across Florida and concluded that NFWs "… have high potential to retain P, but that the entrained P may be remobilized … depending on storm and groundwater input P concentrations." Hoos et al. (2013) found nitrate-nitrogen concentrations in streams to be positively associated with the abundance of a likely NFW type (East Gulf Coastal Plain Near-Coast Pine Flatwoods) in their application of the SPARROW (Spatially Referenced Regression on Watershed Attributes) model. They hypothesized that the short-term hydroperiod of the NFWs created aerobic conditions for nitrate formation in wetland soils, and (similar to phosphorus example above) the nutrients were mobilized during precipitation events that connected the wetland to the stream (including shallow groundwater flows).

NFWs can also be sources of elevated salts which, like mercury, can originate in wetland catchments and be entrained or dissolved and hydrologically transported to NFWs. Hayashi et al. (1998a, b) noted that snowmelt in a PPR non-floodplain basin transported 4–5 kg/yr of chloride from the surrounding area to the wetland, suggesting a sink function. However, with growing-season evapotranspiration, the solute also moved from the wetland into the surrounding upland; mass balance equations suggested that 0.1–0.6 kg/yr of chloride was lost to deep groundwater. Nachshon et al. (2014) analyzed 20 years of surface and near-surface salinity data in an upland/NFW setting in Canada's PPR. They found that NFWs existed across a continuum of salinities (e.g., Euliss et al. 2004), ranging from diluted freshwater systems with EC of <500 μS/cm to brackish systems (EC between 500 and 5,000 μS/cm) to brackish-saline wetlands (EC > 5,000 μS/cm). Summer rainfall flushed accumulated salts from the landscape to NFWs along surface and near-surface flowpaths. Some NFWs became salinity sources to other wetlands when fill-and-spill dynamics (noted above) or near-surface potentiometric heads forced high-density waters downgradient; terminal or receiving wetlands could be considered a chemical sink for high-salinity waters (see Chemical Sink functions, below). These findings suggest that NFWs can be salinity sinks at the landscape scale, but at the local or wetland scale, they may be sources of

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

EPA Author Manuscript

elevated chloride to the proximal upland areas (Hayashi et al. 1998a, b; Nachshon et al. 2014) or to other systems if they merge (as noted above; see Cook and Hauer 2007; Vanderhoof et al. 2016; Vanderhoof et al. 2017). Interestingly, Nachshon et al. (2014, 1261) noted that if a series of extremely wet years in the PPR was followed by extreme drought, "… salt concentrations in the upper soil horizons of the wetlands [could be found] at concentrations that were never measured before …" with potential impacts on other waters if or when connectivity subsequently occurred through merging or filling.

In summary, biogeochemical characteristics (e.g., high microbial activity in anoxic soils with available carbon) and physical characteristics (e.g., evapotranspiration) in NFWs create conditions conducive to chemical source functions. Examples from the literature on MeHg and salinity, hydrologically exported through dissolved organic matter entrainment or dissolution, demonstrate some of the mechanisms by which processes and functions internal to NFWs may affect other systems (see Factors Affecting Hydrologic Connectivity of NFWs, below). Conditions such as drainage ditches or subsurface tiling that expedite the delivery of NFW-sourced compounds can have negative consequences on receiving systems (e.g., Nair et al. 2015).

NFW Sink Function

Hydrologic Sink.—In addition to serving as a hydrologic source, NFWs can serve as hydrologic sinks when the storage capacity is not exceeded by net inflows (e.g., surface water and groundwater) minus outflows from evaporation or transpiration (e.g., Haan and Johnson 1968; Boelter and Verry 1977; Bullock and Acreman 2003). Storage volumes in NFWs can vary greatly. Field-measured storage volume in 10 NFWs in southern Florida ranged from 900 to 20,488 m^3 and averaged 6,836 ± 7,163 m^3 (Haag et al. 2005). Lane and D'Amico (2010) used light detection and ranging (LIDAR) data and calculated that over 8,500 NFWs in central Florida had a median storage value of 876 m^3 (1,619 m^3 average), and that this varied by Cowardin et al. (1979) wetland type. However, Evenson et al. (2016) calculated that ~50% of the >24,000 NFWs in the ~1,800 km^2 Pipestem Creek, North Dakota watershed had small storage capacities (<100 m^3). Wu and Lane (2016) used LIDAR collected during drought conditions to identify over 12,000 NFW depressions in a North Dakota watershed. They found that surface area in NFWs with standing water averaged over 2 ha and these wetlands currently stored, on average, ~32,000 m^3 of water despite a drought during the data collection period. Dry wetlands (74% of the total) averaged two orders of magnitude less storage per wetland, ~366 m^3 (Wu and Lane 2016).

Rainfall and snowmelt runoff can flow into NFWs where high evaporation and low discharge rates, coupled with high surface storage capacity, can result in large hydrologic sink functioning at the watershed scale (Shaw et al. 2012). The proportion of NFW area to wetland catchment area (A_w/A_c) is a proxy measure to account for NFW hydrologic sink functions: higher A_w/A_c values suggest greater potential hydrologic sink functioning as more precipitation would be routed to NFWs. Wu and Lane (2017) reported A_w/A_c of ~14% in a study of over 30,000 depressions in the PPR using LIDAR. A large-scale analysis by Watmough and Schmoll (2007) reported A_w/A_c of 8% in the Canadian PPR, similar to the 9% reported by Hayashi et al. (2016). NFWs stored from 11% to 20% of the precipitation

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

EPA Author Manuscript

in their respective watersheds in a PPR region study by Gleason et al. (2007). Hayashi et al. (2004, 95) analyzed isotopic signatures in a 152 km^2 basin in the PPR and found that, "… the majority of [over-winter precipitation storage] is probably stored in wetlands (i.e. fens and bogs) covering 30% of the basin …" Bowling et al. (2003) reported that 24%–42% of snowpack in an Alaskan watershed could be maintained in surface storage (i.e., stored in NFWs).

Evaporation and transpiration losses in particular can be substantial in NFWs. For instance, Lide (1997) estimated that evaporation accounted for 78% of water losses from a wetland system; Duever et al. (1994) noted that evapotranspiration can account for 70%–90% of input precipitation. Van der Kamp et al. (1999) reported that ~75% of input precipitation to a studied Canadian NFW was lost to evapotranspiration at the wetland margins. Bowling et al. (2003) estimated ~50% of snowmelt in an Alaskan basin was evaporated from open water areas (i.e., NFWs).

It is the aboveground volume in NFW wetlands that makes them so effective at landscape water storage. Wetlands effectively store water because their aboveground portions frequently contain a largely empty volume for water storage, in contrast to belowground water storage which is only partly available for water storage due to the presence of soil particles (Johnson 1967; McLaughlin et al. 2014). As noted, stored surface water is acted upon by evaporation, transpiration, and deep groundwater recharge sink functions that result in the water being, in essence, removed from the local — and landscape — hydrologic processes. Among the benefits of water storage in NFWs is that this reduces streamflow (Vining 2002) and the downstream flooding associated with peak streamflow (e.g., Hubbard and Linder 1986; Evenson et al. 2015, 2016; Fossey and Rousseau 2016; Evenson et al., in press). Hubbard and Linder (1986), for example, calculated the water retention capacity of more than 200 non-floodplain prairie pothole wetlands in northeastern South Dakota. They observed that a large amount of snowmelt and precipitation could be cumulatively held by many small wetlands, reducing the potential for flooding at downstream locations. Jones et al. (2018) analyzed NFWs in the Delmarva region (Delaware, Maryland, and Virginia) and identified that 48% of 102,000 depressional NFWs were affected by some sort of ditch; plugging or filling those ditches could increase landscape-scale water storage capacity by 80%. Vanderhoof et al. (in press) analyzed Landsat imagery between 1985 and 2015 covering over 300,000 km^2 of the PPR (North and Northwest Drift Plains) and the Northwestern Great Plains (NGP). The NFWs of the PPR had 2.6 times the surface water extent of the NGP (under median climatic conditions), demonstrating that the PPR wetlands were serving, "… a surface water storage function during wet periods, reducing the amount of water contributing to downstream flooding." Evenson et al. (in press) modeled the hydrologic effects of 13,000 NFWs in the PPR and found that NFWs attenuated peak flows; increased flooding likelihood came from wetland area (and concomitant volume) losses.

Hayashi et al. (1998a, b) determined that NFWs received 30%–60% of snowmelt runoff in their Canadian study area. Similarly, a U.S. Geological Survey study in the PPR found that wetlands, including both depressional (including NFWs) and nondepressional types, stored about 11%–20% of the precipitation that fell in a given watershed, and that storage could be increased by wetland restoration (Gleason et al. 2007). Evenson et al. (2015) simulated the

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

EPA Author Manuscript

effects of 280 NFWs on watershed hydrology in a North Carolina watershed, finding that NFWs decreased peak flows through the lag function (see below). Vining (2002) concluded that wetland storage in the Starkweather Coulee Subbasin of North Dakota likely resulted in decreased streamflow. Fossey and Rousseau (2016) modeled both riparian and NFW effects, finding NFWs decreased peak flows by 7%–16% depending on the severity of flow (2-, 20-, or 100-year return interval stormflows); NFWs were found to maintain baseflows under drought conditions. Rovansek et al. (1996) found snowmelt to be the most important source of water for wetlands and ponds in the Alaskan Arctic Coastal Plain, and that these wetlands and ponds functioned as surface storage, thereby removing water from snowmelt floods. In contrast, both Roulet and Woo (1986) and Ford and Bedford (1987) found surface storage in cold-weather regions to be limited by frozen soils and ice, limiting the lag (and sink) function in wetlands.

Regression equations developed to predict peak flows during flooding events frequently use lake and wetland storage areas as variables. Using this approach for Wisconsin watersheds, Novitzki (1979) estimated that peak flood flows were only 20% as large in watersheds with 40% lake and wetland area relative to watersheds without lakes or wetlands. Johnston et al. (1990) found that small losses of wetlands in watersheds with <10% wetlands could have major effects on flood flow in basins around Minneapolis, Minnesota. Wang et al. (2010) modeled the influence of wetlands on hydrologic processes in Manitoba and Minnesota and found that the loss of 10%–20% of the wetlands in the study basins would increase peak discharge by 40%. Similarly, Yang et al. (2010) calculated restoration of 600 ha of wetlands in a ~25,000-ha watershed would decrease peak stream discharge by 23%. Peak streamflows were shown to be negatively correlated with lake and wetland storage in Minnesota (Jacques and Lorenz 1988), although a later study found peak flows to be correlated with lake storage only and not wetland storage (Lorenz et al. 2010).

Though NFWs affect floodwaters through hydrologic sink functions, there is a finite capacity to this function. Shaw et al. (2012, 3148) observed, “[h]ighfrequency, low runoff volume [precipitation or snowmelt] events … can be completely or partially attenuated through impoundment by landscape depressions ….” However, Shaw et al. (2012) continued and noted that once a NFW and soil macropore storage volume capacity threshold is exceeded by precipitation and downgradient connections are created by runoff, the contributing area of the basin is substantially increased and storage in wetland depressions has little effect on downstream flood severity. Shaw et al. (2012) found that only 39% of NFWs in a PPR study area contributed to the basin pour-point flow during snowmelt; the remaining 61% of NFWs acted as hydrologic sinks. In a modeling analysis, Evenson et al. (in press) found larger NFWs served as gate-keepers (i.e., wetlands with a high water storage capacity threshold), storing surface runoff and attenuating peak flows in a downstream network. Modeled loss of the larger systems by Evenson et al. (in press) led to larger contributing areas affecting streamflow. Smaller wetlands (<3.0 ha) in Evenson et al. (in press) comprised 95% of the study wetlands but only 35% of the cumulative storage capacity. The modeled effects of losses in small wetland landscape storage resulted in a 90% decrease in landscape residence time, as surface flow following precipitation or snowmelt events drained across the landscape essentially unimpeded by depression water storage.

In summary, the literature regarding hydrologic sink functioning of NFWs is abundant (e.g., Shaw et al. 2012; Shook et al. 2015; Vanderhoof et al., in press). With seasonally dependent high evapotranspiration rates and basin storage, NFWs perform hydrologic sink functions that affect downstream systems, particularly by reducing peak flows. The effects of this function are similar to the lag function (below), which also affects water flow to downgradient pour points. Structural limitations, such as the maximum storage capacity of a NFW or NFW complex, create thresholds affecting hydrologic sink functioning (e.g., Roulet and Woo 1986; Ford and Bedford 1987; Shaw et al. 2012; Evenson et al., in press).

Chemical Sink.—NFWs retain compounds through chemical (and physical) processes such as denitrification, ammonia volatilization, microbial and plant biomass assimilation, sedimentation, sorption and precipitation reactions, biological uptake, and long-term storage in plant detritus (Reddy et al. 1999; Reddy and DeLaune 2008). Marton, Creed, et al. (2015) reviewed the literature on sediment, carbon, phosphorus, and nitrogen storage and transformation in geographically isolated (i.e., non-floodplain) wetlands, concluding (and titling their review) that, “Geographically isolated wetlands are important biogeochemical reactors on the landscape.” Storage or sink rates for NFWs reported from the literature by Marton, Creed, et al. (2015) were: sediment (230–3,600 $g/m^2/yr$), carbon (21–317 $g/m^2/yr$), and phosphorus (0.01–5.0 $g/m^2/yr$) (see NFW Chemical Transformation Function, below for nitrogen findings). The substantial rate variation reported by Marton, Creed, et al. (2015; see also Marton, Chowdhury, et al. 2015) was ascribed to spatial (i.e., size, shape, landscape position) and temporal (i.e., temperature, soil moisture, redox, etc.) variables.

Many studies have addressed chemical sink functions of wetlands, with an abundance of papers focusing on nutrients, namely nitrogen and phosphorus. NFWs inundated with human sewage were shown to remove more than 95% of the phosphorus, nitrate, ammonium, and total nitrogen (Dierberg and Brezonik 1984; Ewel and Odum 1984 and chapters therein). Craft and Chiang (2002) determined that wetland soils stored a disproportionately large share of nitrogen compared with upland soils in spite of uniform soil organic matter across the landscape. A bog NFW in Massachusetts was reported to sequester nearly 80% of the system’s various nitrogen inputs, including precipitation that had a range of 1.2–1.9 mg N/L (Hemond 1983). Hoos et al. (2013) modeled nitrogen and phosphorus dynamics in the southeast U.S. using the SPARROW model and reported the abundance of two typical NFW types (Atlantic Coastal Plain Peatland Pocosin and Southern Coastal Plain Nonriverine Cypress Dome) were factors significantly associated with decreased transport of those nutrients. According to Heagle et al. (2013), the repeated wet–dry cycling of closed-basin NFWs in their PPR study area resulted in substantial subsurface accumulation of sulfate; up to 10^7 kg was estimated in the soils of a 5-ha PPR NFW. Craft and Chiang (2002) quantified sediment accumulation rates between floodplain and non-floodplain wetlands in southwestern Georgia (951 and 1,289 g/m^2, respectively); no difference was found between accumulation rates for organic carbon, total nitrogen, or total phosphorus. Craft et al. (2017) summarized published mean nutrient and sediment storage functions from nine NFW studies and 17 floodplain wetlands; NFW storage of organic carbon was 152% that of floodplain wetlands, but 12%–14% of nitrogen and phosphorous and ~25% that of sediment, though no meta-analysis statistics were conducted. Lane and Autrey (2017) reported that nitrogen

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

EPA Author Manuscript

and carbon soil accumulation rates in NFWs, measured using cesium-137 radioisotope concentrations in three ecoregions in the U.S., averaged 3.1 ± 3.1 g N/m^2/yr and 43.4 ± 39.0 g organic C/m^2/yr, respectively. Sediment accretion averaged 0.6 ± 0.4 mm/yr and did not differ by ecoregion, whereas phosphorus accumulation in NFWs was significantly greater in the Erie Drift Plain (0.10 ± 0.10 g P/m^2/yr) vs. the Middle Atlantic Coastal Plain (0.01 ± 0.01 g P/m^2/yr) or Southern Coastal Plain wetlands (0.04 ± 0.04 g P/m^2/yr) (Lane and Autrey 2017). Lane and Autrey (2016) found that phosphorus-sorption capacity varied by Cowardin et al. (1979) wetland type, with forested NFWs having three times the sorption capacity of emergent marsh NFWs (1,275 mg P/kg soil and 418 mg P/kg soil, respectively). In another example, phosphorus retention in NFW marshes of the lower Lake Okeechobee, Florida Basin ranged from 0.3 to 8.0 mg soluble reactive P/m^2/day (Dunne et al. 2006). This retention represents a sizeable amount of phosphorus removal, because only about 7% of the watershed was comprised of NFWs. Similarly, NFWs in the Lake Okeechobee Basin were found to have greater storage of total phosphorus than the uplands in which they were embedded (236 kg/ha and 114 kg/ha, respectively; Cheesman et al. 2010). Marton et al. (2014) found that NFWs in Ohio had greater phosphorus-sorption capacities than uplands (297 mg P/kg soil and 86 mg P/kg soil, respectively). These findings were echoed by Dunne et al. (2007), who reported that more phosphorus was stored in NFW plant biomass and soil than in corresponding upland compartments, with wetland surface soils (0–10 cm) representing the largest phosphorus reservoir (>87%) and soil organic matter accounting for >69% of the soil total phosphorus variability. They further suggested that restoring 5%–20% of the NFW area in priority basins draining to Lake Okeechobee, Florida could increase phosphorus storage in NFWs by up to 13 kg P/ha (Dunne et al. 2007). However, Bhadha et al. (2011) found that NFW phosphorus losses from infiltration to groundwater accounted for 14% of phosphorus flux, which suggests that near-surface flow dynamics are also important to managing phosphorus at the landscape level (and reiterating that NFWs may be chemical and hydrologic sources to other systems; Nair et al. 2015). Marton et al. (2014) reported that natural NFWs outperformed both restored and riparian systems in phosphorus retention. However, other studies have also shown that floodplain wetlands have a higher sink capacity than NFWs for phosphorus retention (Craft and Casey 2000; Cohen et al. 2007). Wolf et al. (2013) found greater sedimentation and nitrogen sedimentation in floodplain wetlands vs. NFWs, but reported phosphorus mineralization did not differ between types in floodplain and non-floodplain settings.

Cheng and Basu (2017) conducted a meta-analysis using over 600 published reports on wetland, lake, and reservoir nutrient retention rates. Smaller wetlands were more reactive (i.e., greater retention rates) than larger wetlands and the ratio of sediment contact area to volume was critical to these findings. Cohen et al. (2016, 1980) reported that NFWs are “unambiguously small” and that each order of magnitude increase in wetland size decreases the likelihood that a wetland is a NFW by a factor of three to eight times depending on the ecoregional setting. McCauley et al. (2015) noted that consolidation drainage in the PPR results in landscape changes from many, smaller wetlands to fewer, larger wetlands. Van Meter and Basu (2015), Serran and Creed (2016), and Serran et al. (2017) found that smaller wetlands have been disproportionately lost across the Prairie Pothole landscape. Evenson et al. (in press) found that small NFW removal resulted in decreased inundation time at the

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

EPA Author Manuscript

landscape scale. Integrating the findings from Marton, Creed, et al. (2015), McCauley et al. (2015), Cohen et al. (2016), Cheng and Basu (2017), and Evenson et al. (in press) suggests biogeochemical functions are affected by the loss of NFWs.

Other pollutants and compounds can be mitigated by NFW sink processes (and/or transformation; see below). For example, microbial methanogenesis completely removed the pesticide atrazine from a mountainous bog in North Carolina (Kao et al. 2002). The environmental contaminants cobalt (Co) and nickel (Ni) were remediated by wetland plants common in forested NFWs; plant concentrations were found to range from 1 to 530 mg Co/kg and up to 250 mg Ni/kg (Brooks et al. 1977). An extensively studied NFW bog in Massachusetts annually stored 54 mg/m^2 magnesium, 36 mg/m^2 potassium, and 46 mg/m^2 lead; the bog also provided acid rain buffering for downstream waters (Hemond 1980).

In summary, the literature is replete with examples of substantive chemical sink functions performed by NFWs. The studies reviewed focused on nutrient compounds (i.e., nitrogen and phosphorus) describing the rates and associated mechanisms across a wide range of NFW types and ecoregions. Factors affecting processing rates include source concentrations and biogeochemical conditions (frequently determined by temporal and spatial conditions and characteristics; e.g., Cheng and Basu 2017; Evenson et al., in press). The collective implication of these studies is that the sink function of NFWs is significant. For instance, in a meta-analysis of NFW biogeochemical functions, Marton, Creed, et al. (2015, 415) estimated that NFW losses in the PPR have negatively affected downstream systems due to lost sink functionality, resulting in "… an increase of between 5 and 140 Tg per year (1 Tg = 10^{12} g) of sediment entering surface waters and decreases of 0.84–13 Tg per year C sequestration, 0.00040–0.20 Tg per year P storage, and 0.032–0.21 Tg per year [in lost] denitrification potential." However, intact NFWs, such as the >1.2 million ha identified by Lane et al. (2012) in the southeastern U.S., "… have the potential to sequester 0.25–3.8 Tg of organic C each year … 1.4–42.7 Tg of sediment, [and] 0.00012–0.059 Tg of P …" (Marton, Creed, et al. 2015, 415).

NFW Chemical Transformation Function

Freshwater wetlands and peatlands are active areas for microbially mediated transformations (Boon 2000, 2006) such as the aforementioned mercury methylation and reactive nitrogen (Nr) transformation to N_2 through denitrification. Galloway and Cowling (2002, 71) define Nr as, "… biologically active, photochemically reactive, and radiatively active N compounds in the atmosphere and biosphere … [including] inorganic reduced forms of N (e.g., NH_3, NH_4^+), inorganic oxidized forms (e.g., NO_x, HNO_3, N_2O, NO_3^-), and organic compounds (e.g., urea, amines, proteins)." Transformations of Nr to N_2 are prevalent in wetlands that are exposed to Nr and have anoxic conditions, labile carbon, and facultative microbial communities (Reddy and DeLaune 2008). Jordan et al. (2011) reported ~20% of the Nr load reaching wetlands in the contiguous U.S. was removed through plant uptake, denitrification, absorption, burial, and anaerobic ammonium oxidation. As noted, Cohen et al. (2016) determined that wetlands typifying non-floodplain systems (e.g., vernal pools, prairie potholes, etc.) were typically small. With this small size, they found, came a high perimeter length per unit area; since wetland edges are areas of most active biogeochemical

NMED Exhibit 25

EPA Author Manuscript EPA Author Manuscript EPA Author Manuscript

processing, these wetland systems are of particular importance in landscapelevel functioning (such as transformative processes; see Cohen et al. 2016; Holgerson and Raymond 2016). Indeed, Ghermandi et al. (2010) found that water quality exported from wetlands was inversely related to size. Cheng and Basu (2017) constructed a nutrient-removal model in wetland systems based on over 600 published studies and found that 50% of the total nitrogen load was removed by wetlands smaller than ~0.03 ha (~300 m^2) in size. Losing smaller wetlands, they conclude, "… will lead to a greater fraction of the landscape removal potential lost because of the higher reactivity of smaller wetlands" (5051).

Marton, Creed, et al. (2015) reviewed the literature on biogeochemical processes in NFWs, reporting that denitrification rates ranged from 0.8 to 2.0 $g/m^2/yr$ and varied with spatial and temporal variables; input NO_3^- concentrations were found to also control transformation rates. Racchetti et al. (2011) reported that 60%–100% of NO_3^- inputs to geographically isolated (i.e., non-floodplain) wetlands were transformed. NFWs in Michigan were found by Whitmire and Hamilton (2008) to remove nitrate-nitrogen (NO_3-N) and sulfate (SO_4^{2-}) at rates of 0.04–0.55 mg NO_3-N/L/ha and 0.06–0.30 mg SO_4^{2-}/L/ha. These rates are significant, considering that nitrate concentration in Michigan groundwater was reported to average 0.5 mg NO_3-N/L (Whitmire and Hamilton 2008), though groundwater concentrations >3 mg NO_3-N/L are considered contaminated (Madison and Brunett 1985). Prairie pothole NFWs in the upper Midwest removed >80% of the nitrate load via denitrification (Moraghan 1993). A large marsh NFW removed 86% of nitrate, 78% of ammonium, and 20% of phosphate through assimilation and sedimentation, sorption, and other mechanisms, including transformation (Davis et al. 1981). In a study of NFWs of North Carolina and Florida, Lane et al. (2015) reported average denitrification rates of 6.89 ± 5.02 μg N/kg soil dry weight (DW)/h; differences were found based on vegetation structure, with emergent marsh NFWs denitrifying at almost triple the rate of forested NFWs. This was hypothesized to result from the greater abundance of labile carbon in the marsh wetlands (Lane et al. 2015). Marton, Chowdhury, et al. (2015) analyzed NFWs in Indiana and found denitrification rates of 88.8 μg N/kg DW/h. NFWs studied in Maryland and Delaware had microbially mediated denitrification rates of 0.06–0.76 mg N/kg soil/day (Jordan et al. 2007). Because these NFWs comprised >70% of the wetland area in the study basin, this value indicates a significant watershed denitrification capacity. Marton, Chowdhury, et al. (2015) found that NFWs denitrified at twice the rate of upland systems, 12.3 ± 4.5 ng N/g soil/h vs. 5.3 ± 1.7 ng N/g soil/h. NFW samples amended with carbon, nitrogen, or both have been found to dramatically increase the denitrification rate (e.g., Lane et al. 2015; Marton, Chowdhury, et al. 2015) suggesting that NFWs have substantial chemical transformation functioning that may be limited by inputs (see also Ullah and Faulkner 2006; Dodla et al. 2008). Using spatial data from Lane et al. (2012), Marton, Creed, et al. (2015) estimated that the intact NFWs of the southeastern U.S. collectively transform, or denitrify, 0.0095–0.063 Tg N/yr.

In summary, NFWs perform substantial chemical transformation functions, the rates of which frequently depend on factors such as temperature, available energy sources, soil characteristics (e.g., anaerobic or aerobic conditions), and chemical compound concentration (e.g., Marton, Creed, et al. 2015; Marton, Chowdhury, et al. 2015). Much of the literature we

NMED Exhibit 25

found focuses on transformation of nitrogen species to N_2, though other compounds were also discussed (e.g., SO_4^{2-}; MeHg in the chemical source functions, above).

NFW Hydrologic Lag Function

While hydrologic sinks discussed above affect the volume of water on the landscape due to processes such as evapotranspiration, hydrologic lags delay water delivery without substantially affecting quantity through temporary storage or by routing water through flowpaths with long travel times. The lag, sink, and source functions work in conjunction with one another. In essence, the lag function can be viewed as the time-integrated sink and source functions. That is, water initially stored by wetlands can be released over time, reducing peak flows and increasing low or baseflows. Fossey and Rousseau (2016) modeled both riparian and NFW effects, finding NFWs decreased peak flows by 7%–16% depending on the severity of flow (2-, 20-, or 100-year return interval stormflows), while maintaining baseflows under drought conditions. Fossey and Rousseau (2016) concluded that, "… at any event scale any type of wetlands [e.g., floodplain and non-floodplain wetlands] plays a role in reducing peak flows … and sustaining low flows." As noted above, Evenson et al. (2015) simulated the effects of 280 NFWs on the hydrology in a North Carolina watershed, finding that NFWs decreased peak flows through the lag function.

The lag function is a result of two mechanisms affecting flow. First, a lag occurs when surface and near-surface groundwater inputs to a NFW fill available space below a spill elevation. With lag functions (vs. sink functions), the wetland storage capacity is ultimately exceeded resulting in surface runoff or near-surface flow. When storage capacity is exceeded by storm events during otherwise dry periods, watersheds containing extensive wetlands can require more time for water discharge to rise and fall in response to storm events due to the lag function (Lindsay et al. 2004). Second, a lag occurs through the routing of water to near-surface groundwater and then to stream systems. Water routed through near-surface groundwater-to-stream systems, as opposed to movement via surface water, would be expected to take longer (i.e., to lag) due to the tortuous pathways required by soil particles (and rocks, roots, etc.) — see Groundwater Connectivity, below.

The ability of wetlands to reduce flooding via storage and the lag function varies, with topography exerting an influence (e.g., slope). Using stable hydrogen and oxygen isotopes of water, McEachern et al. (2006) found that snowmelt in boreal forests was discharged rapidly in a sloped watershed. In contrast, in a lowland watershed, much of the snowmelt was stored by wetlands, particularly by bog NFWs with headwater stream channel outlets. In northern Canada, stream runoff was positively correlated with slope and the presence of channel fens, but negatively correlated with lowland depressional NFWs (Quinton et al. 2003). A literature review of wetlands having no direct inlets or outlets to a river system concluded that those wetlands reduced or delayed flooding (Bullock and Acreman 2003). Findings by Bullock and Acreman (2003) were more varied for slope wetlands with direct connectivity to a river: 26 of 62 studies found reduced flooding, while 27 of the 62 studies concluded that those wetlands increased flooding.

Antecedent moisture conditions and currently available wetland storage also affect the lag function. Boelter and Verry (1977) noted that two storms of nearly equal volume and

EPA Author Manuscript EPA Author Manuscript EPA Author Manuscript

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

EPA Author Manuscript

intensity produced different runoff responses from the same peatland. One storm occurring in the spring at a time of already high water tables led to runoff. The other, in midsummer at a time of low water tables, increased the water depth in the NFW but did not exceed the wetland's water storage capacity, precluding runoff. This mechanism has been observed in simulations of prairie pothole wetland hydrology, in which wetlands reduced streamflow until storage capacity was exceeded (Haan and Johnson 1968; Shaw et al. 2012). Thus, NFWs can function as a sink in dry periods if storage capacity is not exceeded and evaporation rates surpass groundwater recharge (see Hydrologic Sink function, above). These same wetlands can function as sources in wet periods if NFW storage capacity has been exceeded. Finally, the same wetlands can create a lag during the filling process in advance of the spilling event by initially storing inputs but producing surface runoff if their storage capacity is exceeded. This phenomenon explains in part how wetlands can both increase and decrease streamflows (Bullock and Acreman 2003) — see also Factors Affecting Hydrologic Connectivity of NFWs, below.

Thus, NFWs provide hydrologic lag functions when depressions fill with precipitation, snowmelt, or other surface and near-surface inputs. The lag functional is dependent on a NFW basin spill threshold; after such a point is passed, the contributing area transitions from terminating at the NFW to affecting flow in downstream systems (e.g., Boelter and Verry 1977; Shaw et al. 2012; Jones et al. 2018; Brooks et al. 2018; Evenson et al., in press). Hydrologic models have demonstrated that when contributing area flow terminates at a NFW, near-surface and groundwater recharge functions maintain baseflow in downgradient streams (e.g., Evenson et al. 2015; Fossey and Rousseau 2016). Similarly, basin filling from overland or near-surface inputs creates a temporal lag that can decouple stormflow events, even in systems where pervasive overland flow connects landscape elements within watersheds to a downgradient pour-point (Bullock and Acreman 2003; Brooks et al. 2018). However, when NFW storage volume is at capacity, the lag function is effectively bypassed (Shaw et al. 2012).

Factors Affecting Hydrologic Connectivity of NFWs

Surface Water Connectivity.—Multiple factors affect whether a potential surface connection exists between a NFW and another water body and, if and when actualized, the duration, frequency, and magnitude of that connection. These factors can be organized into three major categories: (1) those characteristic of the intervening area between the NFW and the receiving water body; (2) those intrinsic to the NFW or NFW complex itself; and (3) exogenous forcing factors, such as climate. In the first category, intervening distance is a first-order factor (Cohen et al. 2016). Le and Kumar (2014) analyzed NFWs in five study areas across the U.S. and found that potential hydrologic connectivity, as determined by nearest-neighbor distances, followed a universal power law distribution, with most wetlands connecting over short distances. The short intervening distances between wetlands can cause rapid increases in hydrologic connectivity during precipitation/snowmelt events as different parts of the watershed connect (or fill, merge, and spill) and the watershed contributing area increases quickly (Le and Kumar 2014). Neff and Rosenberry (2017) found that the quantity of modeled NFW groundwater provided to the stream network decreased with increasing distance from the network. Vanderhoof et al. (2016) and Vanderhoof and Alexander (2016)

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

EPA Author Manuscript

found that hydrologic connections between NFWs and streams were positively correlated with stream density, suggesting that connections increase with decreasing distances between wetlands and streams. However, with wet conditions, wetlands were observed connecting to streams over long distances (up to 37 km; Vanderhoof and Alexander 2016). Ameli and Creed (2017) found that both surface water and groundwater inputs from NFWs contributed to river flows, with surface inputs affecting flows up to 8 km from the river system (and groundwater flows affecting the river system up to 30 km away). Human activity can alter this relationship. Historical loss of NFWs in Iowa has increased distances between wetlands that remain (e.g., McCauley et al. 2015; Van Meter and Basu 2015). For example, human activities have also increased the mean distance of Iowa and Nebraska NFWs to streams due to relatively higher rates of drainage and loss of upland-embedded NFWs farther away from the stream network (Uden et al. 2014; Van Meter and Basu 2015).

Other characteristics of the intervening area between NFWs and the stream network include topography, vegetation, soil, and human alterations, all of which can affect flow characteristics. For instance, slope has been positively correlated with streamflow (McEachern et al. 2006), as areas of lower slope typically have a lower potentiometric head. Quinton et al. (2003) reported that stream runoff was negatively correlated with the abundance of lowland bog NFWs. Precipitation events on soils with low infiltration capacity are more likely to result in overland flow whereas soils with higher infiltration capacity are more likely to result in groundwater flowpaths. In their literature review, Bullock and Acreman (2003) found that studies of NFWs with no direct surface water connectivity reduced or delayed flooding downstream. However, 42% (i.e., 26 of 62) of the slope (NFW) wetland studies that were reviewed resulted in reduced flooding and 44% (i.e., 27 of 62) of those increased downstream flooding, which suggest antecedent moisture conditions, wetland storage, and characteristics of the connection between the NFWs and another system (e.g., vegetation, roughness, pore space, hydraulic conductance, etc.) affect connectivity dynamics.

Storage is a function intrinsic to NFWs, affecting connectivity via the fill-and-spill or fill-and-merge of surface waters. As described above, spilling or runoff from a wetland occurs when wetland storage minus losses (via evaporation or groundwater recharge) are exceeded by inputs (via precipitation, groundwater discharge, or overland flow). The inputs and losses are driven in part by climate. Everything being equal, under wetter conditions, wetland storage capacity is more likely to be exceeded. In the PPR, temporary overland connectivity between NFWs has been observed in wet years (e.g., Leibowitz and Vining 2003; Cook and Hauer 2007; Leibowitz et al. 2016). Brooks et al. (2018) found that on average, 33% of the Missouri Coteau (part of the PPR) was connected using Landsat imagery analyses, and determined that this was mostly via the fill-and-merge process between NFWs as the stream network was poorly developed in their study area. Although these studies focused on NFW-to-NFW connections, their findings illustrate that connectivity is a dynamic process, and that NFWs can exhibit temporary surface water connections with other water bodies during wet periods (e.g., Wilcox et al. 2011; Vanderhoof and Alexander 2016; Vanderhoof et al. 2016; Brooks et al. 2018).

NMED Exhibit 25

EPA Author Manuscript EPA Author Manuscript EPA Author Manuscript

Research into the frequency, duration, magnitude, and timing of surface connections of NFWs to river networks has received less attention than those of riparian and floodplain wetlands (see Fritz et al. 2018), though this has changed markedly in recent years through advances in hydrologic modeling, statistical approaches, and remote sensing and geostatistical analyses, especially in the North American PPR and portions of the Atlantic Coastal Plain (e.g., Wilcox et al. 2011; Lang et al. 2012; Golden et al. 2014; Golden et al. 2015; Huang et al. 2014; Evenson et al. 2015; Shook et al. 2015; Fossey and Rousseau 2016; Vanderhoof et al. 2016; Vanderhoof et al. 2017; Ameli and Creed 2017; Jin et al. 2017; Thorslund et al., unpublished data). Where connections have been reported, the duration of a connection is more often described (i.e., whether the connection is perennial, intermittent, or ephemeral). The frequency of a connection, in the case of intermittent or ephemeral flows, or the magnitude of that connection (i.e., the amount of flow between a wetland and a river network) has been less empirically studied or reported due in part to the difficulties in attributing source waters (but see McDonough et al. 2015; Vanderhoof et al. 2016; Brooks et al. 2018; Thorslund et al., unpublished data). A combination of small-scale field-based studies coupled with larger scale remote sensing applications and modeling will effectively quantify surface water connectivity of non-floodplain systems (Golden et al. 2017; see Brooks et al. 2018).

Groundwater Connectivity.—In addition to surface water connections, groundwater flow can connect NFWs with other water bodies, potentially over great distances (e.g., 30 km; Ameli and Creed 2017). Studies have shown NFWs can receive groundwater discharge, contribute to groundwater recharge, or connect via both pathways (Lide et al. 1995; Devito et al. 1996; Matheney and Gerla 1996; Rosenberry and Winter 1997; Pyzoha et al. 2008). For example, a study of four North Dakota prairie NFWs by Arndt and Richardson (1989) demonstrated groundwater connections as one wetland recharged groundwater, one was a flow-through wetland, and one was a groundwater discharge system (Euliss et al. 2004). Using stable isotopes, Matheney and Gerla (1996) concluded that although most of the water in a depressional NFW came from precipitation, groundwater connections accounted for the high salinity of the wetland soil. High salinity can be indicative of net groundwater discharge to a wetland (Brinson 1993; Ali et al. 2017). Min et al. (2010) reported that 38% of rainfall that entered four NFWs in Florida was recharged to groundwater. Bullock and Acreman (2003) found 69 studies making reference to groundwater recharge from wetlands; of these, 32 observed groundwater recharge from a wetland whereas 18 did not. Rosenberry and Winter (1997) determined that groundwater mounding may prevent connections that would otherwise follow topography. Neff and Rosenberry (2017) conducted a model analysis suggesting that groundwater mounding could be short-circuited by the presence of sand layers promoting lateral conductivity or drought conditions decreasing the presence of the water table mounds.

Groundwater flow-through wetlands are sites of both groundwater discharge and recharge, in essence a surface expression of the groundwater system (Richardson et al. 1992; Kehew et al. 1998; Ferone and Devito 2004). This dynamic has been shown in many locations, including prairie pothole NFWs (Richardson et al. 1992), NFWs in glacially formed landscapes in southwest Michigan (Kehew et al. 1998), Alaskan pond NFWs (Rains 2011),

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

Florida cypress dome NFW systems (Sun et al. 1995), and small Wisconsin lakes (Born et al. 1979). The lakes and NFWs of the Nebraska Sand Hills are also predominantly flow-through and an expression of a large regional groundwater system (Winter 1999).

Like surface water, groundwater connections can vary in duration, frequency, and magnitude, and these connections can be affected by a number of factors. Whether a wetland recharges groundwater, is a site of groundwater discharge, or both, is determined by topography, geology, soil features, and seasonal position of the water table relative to the wetland (Neff and Rosenberry 2017). Shedlock et al. (1993), for example, concluded that groundwater discharged into a NFW bog along Lake Michigan through a breach in the sediments underlying the wetland. In dry periods when water tables are low, water tends to move from wetlands into the groundwater, while in wetter periods with higher water tables, water can flow in the opposite direction from shallow groundwater into the wetlands (Phillips and Shedlock 1993; Pyzoha et al. 2008; McLaughlin et al. 2014). Lide et al. (1995) observed both groundwater flow into and from a Carolina bay NFW, with discharge to the wetland when the water table was high and recharge to the groundwater when the water table was low. Sun et al. (1995) observed similar phenomena in a Florida cypress dome NFW. This exchange and temporary storage of water represents a lag function (see NFW Hydrologic Lag Function, above; see also McLaughlin et al. 2014) that can make NFWs particularly important for groundwater recharge during dry periods. Rosenberry and Winter (1997) indicated that groundwater discharge to a wetland often alternates with flow from the wetland to groundwater, and the direction of flow is controlled by the balance of recent precipitation with current evapotranspiration demands.

The magnitude and transit time of groundwater flow from a wetland to other surface waters depends on the intervening distance and the properties of the rock or unconsolidated sediments between the water bodies (i.e., the hydraulic conductivity of the material). In some carbonate or volcanic rocks, for example, groundwater can flow relatively freely through large openings; while in unconsolidated material, such as gravel, sand, silt, or clay, the spaces between particles determine the time required for water to flow a given distance (Winter et al. 2003). In porous material, such as gravel, water can travel a kilometer in a few days; in fine-textured materials, such as silt or clay, hundreds to thousands of years might be required for water to travel the same distance (Winter and LaBaugh 2003).

In agricultural regions, the transit time of subsurface flows is increased substantially by artificial subsurface drainage pipes, known as tile drains (Schiller et al. 2012). Wetlands in these areas are sometimes fitted with inlets that connect directly to tile drains, quickly moving temporarily ponded water through the subsurface and to outlets that discharge directly to ditches or streams (Tomer et al. 2010). Ditching wetlands can not only make them into sources of water but also sources of nutrients and ions from their legacy performing sink functions on the landscape (e.g., Brunet and Westbrook 2012; Nair et al. 2015).

In summary, NFWs can recharge groundwater, receive discharging groundwater, or be flow-through wetlands, and sometimes all three in a given water-year (Sun et al. 1995). Impermeable layers underlying some NFWs may create perched systems with low groundwater connectivity to other systems; these layers may also be breached or be

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

EPA Author Manuscript

discontinuous underneath larger wetlands, permitting connections to near-surface or deeper groundwater. NFW connections to groundwater encompass sink, source, and lag functions affecting downgradient base and stormflows; groundwater connections can be relatively quick, or ponderously slow. Further examinations into the NFW groundwater connections and factors affecting these interactions and subsequent connections to downstream systems require additional analyses and research, especially in areas outside of the North American PPR.

SYNTHESIS AND IMPLICATIONS: HYDROLOGICAL, PHYSICAL, AND CHEMICAL EFFECTS OF NFWS ON DOWNSTREAM WATERS

NFWs lack well-defined surface water inlets and/or outlets to other water bodies and may include depressions, slopes, flats, and other similar wetland types, as well as regionally described systems such as some Prairie Potholes, playa lakes, vernal pools, and Carolina bays (e.g., Tiner 2003). NFWs are abundant aquatic systems throughout the U.S.; Lane and D' (2016) conducted a coterminous U.S. spatial analysis using a geospatial floodplain proxy to identify more than 8.4 million potential NFWs covering more than 6.6 million hectares (see Figure 1). Hydrologic flows through NFWs are predominantly unidirectional, in contrast to bidirectional flows that occur in riparian and floodplain wetlands. Much of the updated literature we examined on NFWs indicates that these systems have important hydrologic and water quality functions that affect downstream waters and rivers (Creed et al. 2017). In USEPA (2015), the literature did not sufficiently support a definitive conclusion regarding non-floodplain connectivity of particular groups or classes of wetlands, though USEPA (2015) acknowledged that NFWs which intersect surficial and near-surface runoff can perform substantive chemical sink and transformative functions. Recent scientific contributions to the literature, additional sources now included in this updated review, and advances in hydrologic modeling (e.g., Evenson et al. 2015, 2016; Fossey and Rousseau 2016; Ameli and Creed 2017; Cheng and Basu 2017; Evenson et al., in press; Thorslund et al., unpublished data), remote sensing analyses (e.g., Vanderhoof et al. 2016; Vanderhoof et al. 2017; Jones et al. 2018), field-based observations (e.g., Shaw et al. 2012; Ali et al. 2017), and emerging coupled field and remote sensing studies (e.g., Brooks et al. 2018) have further informed our analyses and synthesis of the literature such that we now conclude all NFWs are interconnected with stream and river networks (Cohen et al. 2016), though this connectivity varies in frequency, duration, magnitude, and timing (Ward 1989; Covino 2017). This complex landscape-scale connectivity, in turn, affects water and material fluxes — the resultants of substantial hydrological, physical, and chemical functioning in NFWs — that modify the characteristics and function of downstream waters (e.g., Marton, Creed, et al. 2015; Rains et al. 2015; Cohen et al. 2016; Calhoun et al. 2017).

It is evident that NFWs that are connected to the river network through surface water are hydrologic sources and will have an influence on downstream waters, regardless of whether the outflow is permanent, intermittent, ephemeral, or episodic (e.g., Wilcox et al. 2011; Rains et al. 2015; Calhoun et al. 2017; Brooks et al. 2018). Such NFWs include wetlands that are the origins of streams or are connected downstream to the river network through ditches, as well as those connected through swales. It is the quality (i.e., concentrations

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

EPA Author Manuscript

of entrained or dissolved compounds) and quantity of surface water exports from NFWs that informs this conclusion. The finding may have important research and management implications. For instance, White and Crisman (2016) concluded that NFWs are headwaters to ~90% of mapped streams they studied in Florida, and Nadeau and Rains (2007) estimated that up to 60% of stream km in the conterminous U.S. may be first- or second-order systems (i.e., headwaters). However, the most highly refined spatial stream data available for the U.S., the National Hydrography Dataset (NHD; 1:24,000), does not typically identify stream systems of <1.6 km, and there are significant omission errors. For instance, Lang et al. (2012) reported that the NHD identified 66% of stream length compared with a product developed using higher resolution LIDAR data. Thus, it is evident that NFWs serve as abundant stream origins in certain parts of the country, though the origins of the vast majority of streams in the U.S. are unmapped and hence unreported.

NFWs that do not connect to the river network through surface water can still be a source of water (or be connected) through local, intermediate, or regional groundwater flows, often covering great distances (e.g., over 30 km, Ameli and Creed 2017) and providing meaningful hydrologic inputs that maintain baseflows (e.g., 313 m^3/day modeled to provide to river flow from groundwater recharging NFWs; Ameli and Creed 2017). Connectivity between these NFWs and downstream waters will vary within a watershed as a function of local factors (e.g., position, topography, and soil characteristics) as well as time, as the river network and water table expand and contract in response to local climate (e.g., Vanderhoof et al. 2016; Vanderhoof et al. 2017).

NFWs that lack a surface or near-surface/groundwater hydrologic connection to other water bodies also influence downstream systems by acting as sinks, creating lags, and/or transforming material. These wetlands can effectively reduce peak flow and flooding, while potentially increasing low flows. The physical storage of water in NFWs, dependent on available volume (e.g., not affected by volume storage reductions due to frozen soils or ice), is incontrovertibly and empirically occurring across the landscape (e.g., Boelter and Verry 1977; Shaw et al. 2012; Brooks et al. 2018). However, once a NFW (or complex) has reached capacity, the storage capacity and impact on downgradient flow mitigation is effectively negligible.

Chemical sink and transformation functions of NFWs have effects on the water quality of downstream waters when these wetlands intersect the flowpath between pollutant source and downstream waters. Wetland chemical sink functions are likely to be greatest when the wetland is located downgradient from pollutant sources and upgradient from a stream or river. The ability of NFWs to perform sink functions is such that maintaining, restoring, and protecting these wetlands have been promulgated as part of watershed nutrient management plans (e.g., Zhang et al. 2009). The literature demonstrates that transformation and sink functions in NFWs provide significant removal of certain pollutants (e.g., transformation of nitrogen species; sink of phosphorus species; but see MeHg studies noted above). The rates depend on pollutant source-area contributions, modes of transportation (i.e., entrained or dissolved), as well as hydrology, temperature, available carbon, and other factors (Marton, Creed, et al. 2015; Marton, Chowdhury, et al. 2015; Cohen et al. 2016; Cheng and Basu 2017).

EPA Author Manuscript

The updated literature we reviewed provides ample evidence that NFWs can and do provide hydrologic and chemical functions that affect material fluxes to other waters, including other wetlands within a basin, streams and lakes, and groundwater. These results suggest the cumulative influence of many individual NFWs within watersheds can strongly affect the spatial scale, magnitude, frequency, and duration of hydrologic and chemical fluxes or transfers of water and materials to downstream waters.

Caveats associated with this review include the fact that the term “non-floodplain wetland” was infrequently used in the literature, and our designation as such was frequently based on the context, study location, or other information available in the published research that may have resulted in errors of commission. Errors of omission occurred in this review, as the welcome increase in scientific literature on NFW functions portends a better understanding of their downstream effects. Increasing the spatial distribution of NFW studies to encompass the full breadth of ecoregions and wetland typologies will result in increased certainty of the conclusions. Contributions were dominated by studies from researchers of the North American PPR; our understanding will be further improved by additional studies in other areas and ecoregions.

The updated literature supports the following conclusions in this review on the hydrological, physical, and chemical functions of NFWs and their effects on downstream systems:

1. NFWs exist across a gradient of connectivity from poorly connected systems to well-connected wetlands and wetland complexes.
2. All NFWs are therefore interconnected with stream and river networks, though this connectivity varies in frequency, duration, magnitude, and timing. This complex landscape-scale connectivity affects water and material fluxes — the resultants of substantial hydrological, physical, and chemical functioning in NFWs — that modify the characteristics and function of downstream waters.
3. NFWs can be hydrologically connected directly to river networks through natural or constructed channels, nonchannelized surface flows, or subsurface flows, the latter of which can travel long distances to affect downstream waters. Through this connection, NFWs act as a source of water and other materials to downstream waters.
4. Water storage by NFWs well outside of riparian or floodplain areas affects streamflow through the sink and lag functions.
5. NFWs act as sinks, sources, and transformers for various pollutants, especially nutrients.
6. The connectivity of NFWs with other systems, as well as the relative size of their contributing area, may vary in space and time along with their functions that affect watershed-scale hydrodynamics and chemical fluxes.
7. There are a number of factors that influence the magnitude, frequency, and duration of connections between wetlands and streams. These include spatial proximity, wetland storage capacity, climate, and characteristics of intervening area between wetlands and the stream (e.g., soil permeability).

NMED Exhibit 25

EPA Author Manuscript

EPA Author Manuscript

NFWs are abundant landscape elements important for multiple functions taking place across temporal and spatial scales that contribute to watershed integrity (e.g., Creed et al. 2017). The connectivity of NFWs with other systems, as well as the relative size of their contributing area, may vary in space and time along with their functions that affect watershed-scale hydrodynamics and chemical fluxes. We agree with Shook et al. (2015), as well as Cohen et al. (2016) who in particular note that, "[w]atershed discharge integrates the entire continuum of hydrologic connectivity, not just rapid or surface-connected flow paths." A corollary to this conclusion is that as hydrology mediates and facilitates much of the physical and chemical functions of NFWs, the material concentration of watershed discharge reflects the time and space-varying contributions and effects of all landscape elements, including NFWs (cf. Hynes 1975).

ACKNOWLEDGMENTS

This review benefited from discussions held at the "North American Analysis and Synthesis on the Connectivity of 'Geographically Isolated Wetlands' to Downstream Waters" Working Group supported by the John Wesley Powell Center for Analysis and Synthesis, funded by the U.S. Geological Survey and the U.S. Environmental Protection Agency (USEPA) Office of Research and Development, National Exposure Research Laboratory. We greatly appreciate the technical reviews conducted by Rose Kwok of the USEPA Office of Water. The views expressed in this manuscript are solely those of the authors and do not necessarily reflect the views or policies of the USEPA. Any use of trade, firm, or product names is for descriptive purposes only and does not imply endorsement by the U.S. Government.

TABLE 1.

Functions by which NFWs affect material and energy fluxes to downstream waters.

Function	Definition	Wetland examples
	Net increase in a material or energy flux (exports > imports)	Phytoplankton production from floodplain (Schemel et al. 2004; Lehman et al. 2008)
	Net decrease in a material or energy flux (exports < imports)	Sediment deposition, denitrification (Johnson 1991)
	Avoidance of a nearby sink function, thereby preventing a net decrease in material or energy flux (exports = imports)	Riparian wetlands as aquatic refuges in dryland rivers (Leigh et al. 2010)
	Temporary storage and subsequent release of materials or energy without affecting cumulative flux (exports = imports); delivery is delayed and can be prolonged	Flood attenuation (Bullock and Acreman 2003)
	Conversion of a material or energy into a different form; the amount of the base material or energy is unchanged (base exports = base imports), but its composition (e.g., mass of the different forms) can vary	Mercury methylation (Galloway and Branfireun 2004; Selvendiran et al. 2008)

Source: Table reproduced from USEPA (2015).

Note: This review focused on source, sink, lag, and transformation functions; see Schofield et al. (2018) for refuge functions.

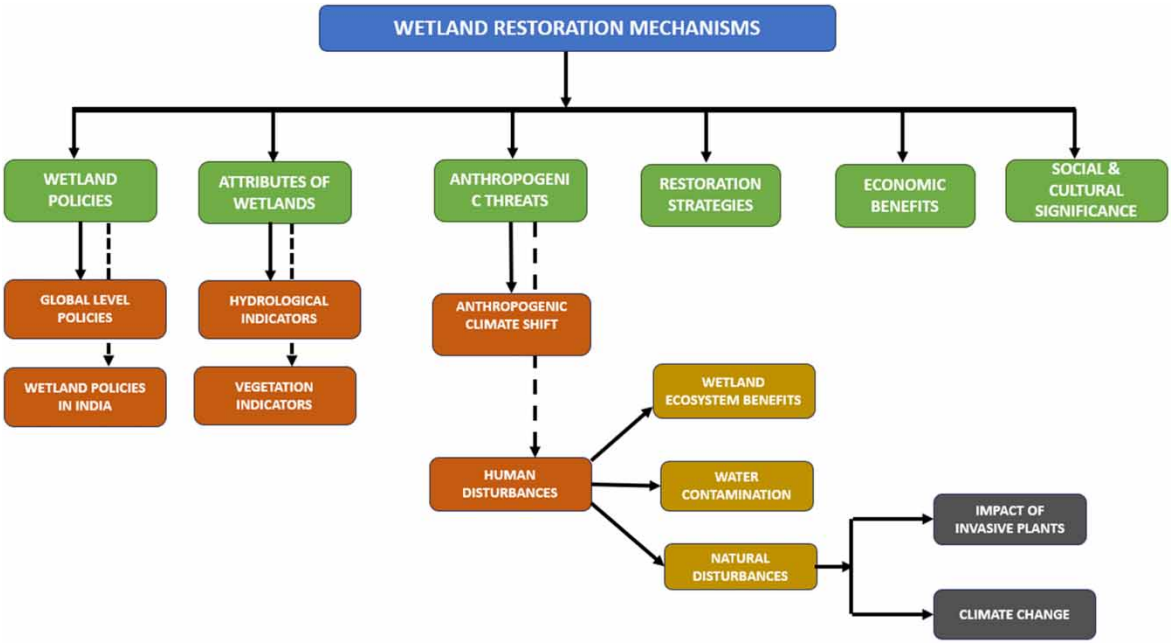
ABSTRACT

Our Earth has given many ecosystems that will heal themselves from the degradations. One of those ecosystems is the wetland, which is a precious natural sponge, naturally purifying and replenishing the water, heading off floods, and mainly giving tremendous biodiversity to the flora and fauna. However, human activities are degrading the wetlands and polluting them indiscriminately with solid wastes and domestic and industrial wastewater discharge. With the Ramsar Convention on Wetlands, nations around the world have acknowledged the critical benefits of wetland restoration and development. In this review article, we contributed to address the general wetland policies in the world, both nationally (India) and regionally (Tamil Nadu). In this paper, we will be discussing the reviews on the characteristics of wetland ecosystems, indices of biodiversity, risks to the wetland's restoration tactics, its main obstacle, and the financial advantages of wetlands. After clearly analyzing 226 previous research and review articles, a clear coherence between the explored hypothesis of wetland restoration mechanisms and the resulting economic and social benefits was arrived. Our findings indicate that effective restoration not only enhances ecosystem services but also leads to significant economic gains and improved community well-being. This alignment underscores the importance of investing in wetland restoration for sustainable development.

Key words: financial benefits, Indian wetlands, indicators, wetland management, wetland policies

HIGHLIGHTS



- Wetlands ecosystems influence climate change.
- Human activities are degrading the wetlands and polluting them indiscriminately.
- Wastewater discharge in wetlands is a regular phenomenon.
- We contributed to address the general wetland policies in the global, national (India), and regional (Tamil Nadu) level.

GRAPHICAL ABSTRACT

1. INTRODUCTION

Wetlands, which include bogs, marshes, and swamps, are essential habitats that are defined by the presence of water (Mitsch & Gosselink 2015). Ecologically, they support a rich biodiversity, providing habitat for numerous plant and animal species crucial for global biodiversity (MEA 2005). Socially, wetlands offer recreational opportunities and cultural significance, serving as venues for birdwatching, fishing, and traditional practices (MEA 2005). Economically, wetlands contribute to livelihoods through activities such as fisheries, agriculture, and tourism, generating income and supporting local economies (Barbier *et al.* 1997). In addition, they play a vital role in water purification, flood regulation, and carbon sequestration, providing essential ecosystem services that benefit both nature and society (Zedler & Kercher 2005). Currently, there are more than 2,400 Ramsar Sites worldwide. They cover an area of over 2.5 million km^2, which is larger than Mexico (Ramsar Convention on Wetlands 2018). Wetlands are home to a third or more of all threatened and endangered species. Wetland management strategies involve legal protections and restoration projects to conserve and enhance ecosystem functions while promoting sustainable use and involving local communities to balance ecological health with human needs. After all, the constant monitoring of the functions is the most important thing to retain its natural form. Many publishers are facing issues related to ecological restoration, cutting-edge technology, and policies since new technologies necessitate the use of novel approaches (Wei *et al.* 2023). Globally, wetlands have been degraded by about 35% since 1970 (Darrah *et al.* 2019; Let & Pal 2023). Worldwide up to 90% of the wetlands are considered as most threatened and demolished due to illegal land reclamations, encroachments, and pollution (Abramovitz 1996; Casazza *et al.* 2021).

As per the United Nations (UN) Millennium Ecosystem Assessment (2005), compared to other natural ecosystems, wetlands are the most degraded system in our earth (Murali 2021). Agenda 15 for 2030 (Sustainable Development Goal (SDG)15) of the UN outlines the objectives of stopping and reversing land degradation, stopping biodiversity loss, combating desertification, protecting, restoring, and promoting sustainable use of terrestrial ecosystems. Most of the literature studies have shown the impacts of socioecological aspects on the wetlands globally (Barbier *et al.* 1997; MEA 2005; Zedler & Kercher 2005). There is still a need for increased public awareness of environmental monitoring, sophisticated instruments, and data to be able to stop the loss of wetland habitat (Darrah *et al.* 2019). Though some unique wetlands have been recognized as Ramsar sites, people are not aware of the wetlands and their ecosystem functioning, and still, many wetlands are considered wastelands and getting polluted and degraded. According to Kexin *et al.* (2022), wetlands' degradation areas are divided or named into some classifications such as undegraded, lightly degraded, moderately degraded, and extremely

NMED Exhibit 26

Downloaded from http://iwaponline.com/wpt/article-pdf/19/11/4355/1513682/wpt2024241.pdf
by guest

degraded. Nearly some indicators were denoted from three main factors: hydrology indicators, soil indicators, and biota indicators (Fennessy *et al.* 2007). These factors are the main indicators for the well-function analysis of the wetlands (Barbier *et al.* 1997).

Due to a lack of vulnerability assessments, many wetlands in India are still unrecognized by the local population. The wetlands provide an important environmental resource by regulating the climates and giving opportunities for some benefits like fishing, irrigation, and some recreation (Engelhardt & Ritchie 2001; Adekola & Mitchell 2011; Malekmohammadi & Jahanishakib 2017). A framework for the assessment of wetland ecological risk has been presented by Duan *et al.* (2022). It includes factors related to abiotic characteristics for both internal and external hazards. Many ecological restoration solutions have been tried and implemented in the last 10 years, but there are still some gaps in the systematic planning, problem-solving after the restoration is successful, and overall process of the study that needs to be identified and investigated. The main challenge for wetland managers is clinching of long-term sustainability through the securing of wetlands ecological values against the socioecological activities (Pirali Zefrehei *et al.* 2022).

Mostly socioeconomic developments play a critical role in the degradation of wetlands' landscape dynamics (Jian *et al.* 2022) as shown in Figure 1; the wetlands have provided supporting, regulating, provisioning, and cultural ecosystem services (Tamil Nadu Wetland Mission). An Overview of the wetland and health was discussed by Dale & Connelly (2012). The authors have discussed the health issues related to wetlands in three different categories: constructed wetlands, manipulated wetlands, and the specific diseases associated with them. They have discussed mosquito-borne diseases like the Ross River virus, Barmah River virus, and West Nile River Virus and water-borne diseases such as schistosomiasis and cholera (Dale & Connelly 2012). Human health will continue to deteriorate as wetlands continue to deteriorate, particularly for vulnerable populations in emerging nations where water quality and quantity are declining. The water quality of the Vembanad Lake specifically in the Kumarakom area was analyzed (Rajan & Pradeep Kumar 2012). So, a wetland must be protected and restored at any cost. After the successful restoration process, constant monitoring and maintenance are the most important things to the conservation of wetlands. By capturing sediments, nutrients, and pollutants through processes including sedimentation, microbial activity, and plant uptake, wetlands serve as natural filters that enhance the quality of water (Mitsch & Gosselink 2015). However, excessive nutrients, heavy metals, and organic contaminants can be introduced into wetland ecosystems by increased agricultural runoff, industrial discharges, and urbanization. This can result in eutrophication, a loss of biodiversity, and a degradation of ecosystem services (Zedler & Kercher 2005). Effective management and restoration efforts are essential to maintain the water quality and ecological integrity of wetlands, ensuring they continue to provide critical services such as

Figure 1 | Ecosystem services of wetlands (*Source:* Tamil Nadu Wetland Mission).

by guest

water purification and habitat support (Kadlec & Wallace 2009). Remote sensing spatiotemporal analysis of water quality and the relationship of water quality and land use were studied by Sun *et al.* (2023). One of the world's most high-yielding environments is wetlands; they support a rich biodiversity with interconnection of species of plants and high concentrations of fauna.

The objective of this review is to explore various wetland restoration mechanisms and evaluate their economic and social benefits. It aims to highlight how effective restoration can enhance ecosystem services and support sustainable community development.

2. WETLAND POLICIES

2.1. Global level policies

Global wetland policies are crucial frameworks for protecting and maintaining these important ecosystems, which offer crucial services including preventing flooding, removing pollutants from water, and preserving biodiversity. The cornerstone of global efforts to conserve wetlands is the Ramsar Convention, which was created in 1971 and encourages the prudent use and sustainable management of wetlands everywhere (Ramsar Convention Secretariat). The Convention encourages member countries to designate Ramsar sites wetlands of international importance and implement measures to protect and restore them. Furthermore, as a crucial component of global environmental management, the 1992 Convention on Biological Diversity (CBD) highlights the preservation and sustainable use of biodiversity, including wetlands. CBD member countries commit to integrating biodiversity considerations into national policies and promoting ecosystem resilience, crucial for wetland ecosystems facing threats from climate change and human activities.

In this world, many people depend on wetlands and rivers for their daily livelihoods (Ramsar 2018; CIFOR 2021; Nygren & Lounela 2023), which will affect the natural balance. The UN Environment Programme Executive Director claims that fast degradation and loss of wetlands worldwide is caused by policies and actions that frequently fail to take into account the multitude of functions that wetlands offer (UNEP State of Finance for Nature Report 2023). In light of the warnings issued by international scientists that biodiversity loss, ecosystem degradation, and climate destabilization all exacerbate wetland loss, which represents a global emergency, new strategies are required to ensure that wetlands are protected and that their benefits to people are sustained (Davies *et al.* 2020). People from the United States started to recognize that the wetlands had plenty of benefits among the other natures (Votteler & Muir 2002). Some of the management practices applied to wetlands by the Conservation Foundation is shown in Table 1.

Table 1 | The management practices applied to wetlands

Physical way	Chemical way	Biological way
• Filling	• Changing nutrient levels	• Grazing
• Draining	• Introducing toxics	• Disrupting natural populations
• Excavating	• Chemical water treating	• Invasive plants
• Diverting water away		
• Clearing		
• Flooding		

Source: Votteler & Muir (2002).

Section 404 of the US Environment Protection Act (US EPA) controls the discharge of dredged or fill material, which is classed as a pollutant, into US waterways by requiring potential dischargers to obtain a permit for such actions (Ainslie 1994). According to a study of wetland mitigation methods in eight states, more wetland acreage was lost in the USA than was required to be created or restored, resulting in a net loss of acreage when mitigation was included in a wetlands permit (Kentula *et al.* 1992). In the past 300 years, Canada has faced terrific wetland loss (Austen & Hanson 2007) and without rules, individuals working for government agencies are left to use their best judgment, which results in inconsistent policy application (Farnese & Belcher 2006; Austen & Hanson 2007). Canada's policy goals are to maintain the biological and socioeconomic systems for the time being and to encourage the preservation of wetlands in the country going forward (Austen & Hanson 2007). The 'Wetland

NMED Exhibit 26

Protection Law' (WPL) was enacted on 24 December 2021, following three National People's Congress discussions, and it went into effect on 1 June 2022 with Wetland restoration, supervision, inspection, and legal obligations, as well as the preservation and use of wetland resources (Mo *et al.* 2023). Ahmed & Haque (2023) analyzed the effects of Bangladesh's wetland management and policy on the rights and means of subsistence of nearby wetland-dependent populations. Nongovernmental organizations (NGOs), Indigenous people, and local communities have worked to recognize the rights of nature; on occasion, courts, local and national legislatures, and international organizations have also provided support (La Follette & Maser 2020).

Recognizing wetlands is made possible by a special wetland policy. Other sectoral management objectives do not cover ecosystems and require specific management and conservation measures (Ramsar 2010). Capitalism is a method of growth in which economic benefits and commercialism are emphasized over wetland preservation and management (NUWAGABA 2023). Sectoral objectives for wetland management increasingly reflect the UN's inclusive requirements for sustainable development agendas. These goals are in line with the SDGs, especially those concerning life below water (SDG 14), life on land (SDG 15), and clean water and sanitation (SDG 6). They also make sure that social justice, ecological preservation, and economic viability are incorporated into management practices (Ramsar 2010).

2.2. Wetland policies in India

The primary legislative framework for wetland protection in India includes The National Plan for Conservation of Aquatic Ecosystems, the Ramsar Convention, the Wetlands (Conservation & Management) Rules (2017), and the National Wetland Inventory and Assessment (NWIA). Wetlands Rules (2017) rules provide guidelines for identifying and notifying wetlands, restricting certain activities, and empowering state governments to manage and protect wetlands (Sinha & Mohanty 2002). The rules also set up a Central Wetlands Regulatory Authority and State Wetlands Authorities. These rules emphasize involving local communities in wetland management, recognizing the traditional knowledge and practices that support sustainable wetland use. The NWIA program, funded by ISRO, provides a scientific basis for wetland management (Attri 2017). These data aid in the formulation of management plans and monitoring efforts. India's commitment to the Ramsar Convention reflects its dedication to international standards of wetland conservation. The designation of Ramsar sites helps attract global attention and funding for wetland conservation (Prasad *et al.* 2002). Despite these robust frameworks, several challenges persist. The effectiveness of policies often varies due to differences in state-level execution and monitoring capacities (Devabalane 2015). Rapid urbanization, industrial activities, and agricultural runoff contribute to wetland degradation. Public awareness and involvement in wetland conservation are often limited, affecting community participation.

The EPA 1986, in India, plays a crucial role in wetland conservation by empowering the government to enforce regulations against pollution and habitat destruction. It facilitates formulating and implementing policies aimed at preserving wetland ecosystems and maintaining their ecological balance. This Act underscores the importance of protecting wetlands for environmental and socioeconomic benefits. In India, the National Forest Commission stressed the significance of protecting wetlands as essential parts of forest ecosystems. It recommended integrated management practices and stricter regulations to protect wetlands from degradation and encroachment. These recommendations have been pivotal in shaping policies for wetland conservation in India (National Forest Commission, 2006). The National Environment Policy 2006 in India underscores the need for wetland conservation to maintain ecological balance and support biodiversity. It advocates for sustainable management practices, legal protection, and community involvement in wetland preservation. The strategy offers a thorough framework for addressing risks and encouraging wetland restoration (MoEF 2006). In India, the National Policy and Macro Level Action Strategy on Biodiversity (1999) aims to conserve biological diversity through sustainable use and equitable sharing of benefits (MoEF 2006). It emphasizes the protection of natural habitats, including wetlands, and integrates biodiversity considerations into sectoral planning (MoEF 2006). A strategic framework for national biodiversity protection is provided by this policy.

To safeguard marine resources, foreign vessels' fishing operations in India's exclusive economic zone are governed by the Maritime Zones of India (Regulation of Fishing by Foreign Vessels, Act 1981). It establishes guidelines and restrictions to prevent overfishing and ensure sustainable exploitation of marine life. This act is crucial for conserving India's maritime biodiversity and ensuring national jurisdiction over marine resources. The Territorial Waters Continental Shelf Exclusive Economic Zone & Other Maritime Zones Act (1976) defines India's maritime boundaries and regulates the use of marine resources. To explore, exploit, and conserve marine

NMED Exhibit 26

Downloaded from http://iwaponline.com/wpt/article-pdf/19/11/4355/1513682/wpt2024241.pdf
by guest

resources, it gives India sovereign powers over its exclusive economic zone, continental shelf, and territorial waters. This Act is fundamental for managing India's maritime jurisdiction and protecting its marine environment. In India, the Wildlife (Protection) Amendment Act (2022) strengthened the measures for wildlife conservation by enhancing penalties for offenses and expanding protected areas. It aimed to combat wildlife crime and regulate trade in endangered species more effectively. This amendment significantly contributed to the preservation of India's diverse wildlife heritage.

Figure 2 shows the locations of wetlands in India which got international importance as of 2023. Among all the States, Tamil Nadu has more Ramsar sites. The international importance of the wetland is very necessary to conserve and protect, which will increase not only the richness of biodiversity but also the country's economic growth. The government of India must enhance legislation awareness and try to improvise among the other NGOs, private institutions, and citizens. Global and national wetland policy development should be the primary focus of wetlands conservation awareness and development. According to Devabalane (2015), conservation and sustainable development is the need of the hour. Participation from the community can assist in achieving these goals, which will be beneficial for the successful implementation of policies and long-term strategic initiatives with action plans for sustainable management. The historical, religious, and intellectual lives of the Indian people are intertwined with the biodiversity of India (Devabalane 2015; Nomani 2019).

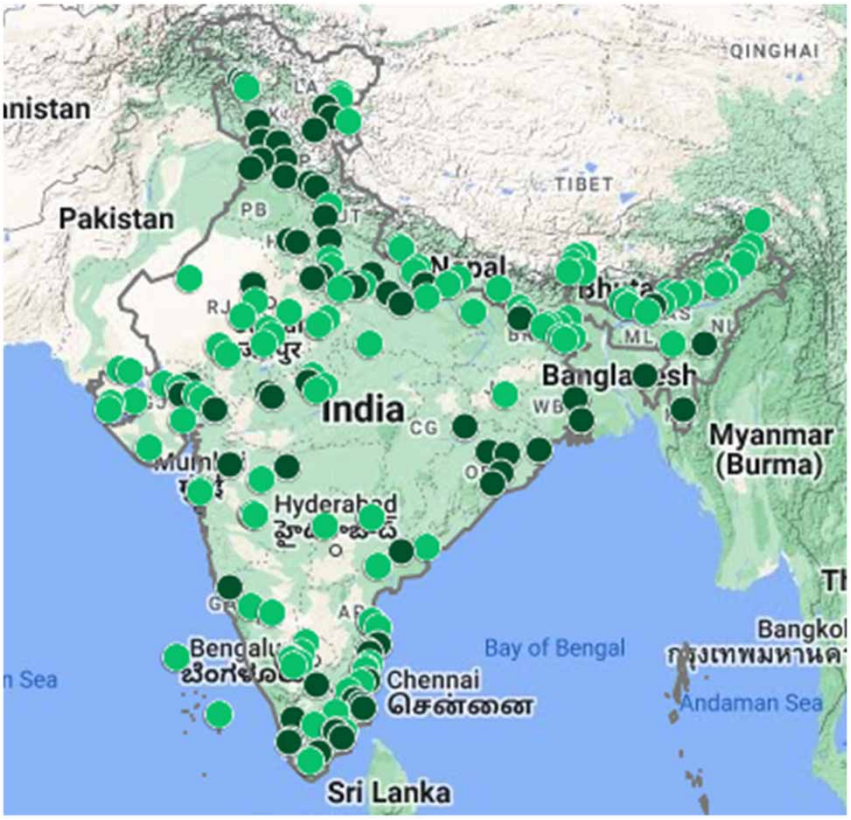

Figure 2 | Ramsar wetlands of India (*Source:* Wetlands of India Portal 2023).

India, like the USA, has a robust regulatory framework, but enforcement and compliance remain challenging. The EU's integrated approach could serve as a model for better coordination across different sectors. India's emphasis on community participation is notable, aligning with Australia's approach, but more efforts are needed to enhance local engagement. India's use of remote sensing and GIS technologies is on par with global practices, yet the application of these data for effective management needs improvement. India's active participation in the Ramsar Convention is commendable, similar to practices in Australia and the EU.

3. ATTRIBUTES OF WETLANDS – INDICATORS

Wetlands are vital ecosystems characterized by attributes such as hydrology, soil type, and vegetation, which serve as key indicators of their health and functionality. Hydrology, the presence and movement of water, is crucial for sustaining wetland ecosystems (Mitsch & Gosselink 2015). Soil type, often hydric soils, indicates prolonged saturation and supports wetland plant species (USDA NRCS 2010). Vegetation, including hydrophytic plants, provides habitat, stabilizes soil, and contributes to water quality (Tiner 1999). These indicators collectively help assess wetland conditions and guide conservation efforts.

3.1. Hydrological indicators

As the wetlands are interconnected with the biotic and abiotic factors together, the hydrological connectivity with the wetland is more important. Billah *et al.* (2022) have found more than 200 indicators that provide the complex of biodiversity in the Salt Marsh. The 'Ecological Character' of wetlands and the 'Wise Use' notion are specified by the Ramsar Convention, suggesting that wetland ecosystem services may be utilized to some degree. There has been lot of research on hydrological indicators to study the wetland (Table 2).

Table 2 | Hydrological indicators and the successful methods/technologies

S. No	Hydrological indicators	Methods/technologies	References
1.	Water salinity, water depth, water temperature, salt marsh diversity, soil water content, soil redox, soil conductivity, soil organic matter, sediment texture, soil bulk density, soil conductivity, soil pH, soil salinity, pore water salinity, soil organic matter	–	Billah *et al.* (2022)
2.	Wetland depth, consistency in water appearance, stability of hydrology, eco deficit, and failure	Remote sensing (NDWI, MNDWI – range of variability approach and flow duration curve methods, FDC curve, range of variability approach (RVA) approach)	Pal & Sarda (2020)
3.	Land–water threshold dynamics, hydro-potential zones, hydro-geomorphic dynamics, hydro-period, and water presence frequency	The satellite imagery based remote sensing indices (NDWI and NDVI have been calculated using the Landsat imageries, MNND)	Mukherjee & Pal (2021)
4.	Land–water threshold dynamics, hydro-potential zones, hydro-geomorphic dynamics, hydro-period, and water presence frequency	The satellite imagery based remote sensing indices (NDWI and NDVI have been calculated using the Landsat imageries, MNND)	Mukherje & Pal (2021)
5.	Hydrological variability	Time series remote sensing data (image-based hydrological attributes integration, histogram comparison approach (HCA), RVA)	Pal & Sarda (2021)
6.	Net wetness and water depth wetness over a period Shoreline dynamics	NDWI Theil–Sen estimator slope hydrogeomorphic (HGM)	Singh & Sinha (2021)
7.	Index of hydrological connectivity (IHC), root parameters, and soil properties	Field dye-tracing experiments, back propagation (BP) neural networks, global sensitivity and uncertainty analyses, and statistical analysis	Zhang *et al.* (2021)
8.	Hydro-period, water presence frequency, water depth calculation	Time series Satellite Images – Landsat	Khatun *et al.* (2021)
10.	Hydrological connectivity composite index (average annual precipitation, artificial influence rate, water area rate)	LANDSAT – (eCognition developer, ArcGIS, ENVI)	Xia *et al.* (2021)

Remote sensing using machine learning methods is a highly used method to determine the hydrological indicators in the wetlands, reflecting the divergence in accuracy. The hydrological parameters listed in the above table have been studied using a variety of remote sensing approaches, including field dye-tracing studies, histogram comparison approach, and time series remote sensing data. To determine the basic hydrological parameters simple cluster analysis and ANOVA (Santoro *et al.* 2023) could be used. Time series analysis was carried out

NMED Exhibit 26

Downloaded from http://iwaponline.com/wpt/article-pdf/19/11/4355/1513682/wpt2024241.pdf
by guest

to study the hydrological parameters in three water bodies meant for fish culture in East Kolkata Wetlands (Roy *et al.* 2016). The increased load of these parameters adversely impacted the population of phytoplankton standing stock.

3.2. Vegetation indicators

By providing food for the wetland's animals and enhancing the water quality, the flora of the wetland performs a crucial function. Hence, the vegetation in the wetland is one of the biological indicators and could be used to monitor the hydrological changes, nitrogen content, silt, and turbidity and even the concentration of the metals and other contaminants (Table 3). Zonal variation of the flora can change due to the drainage and flooding (EPA, United States). How plants use water in different water settings is crucial to understanding the patterns of wetland vegetation and undertaking ecological regulation of wetlands (Zhang *et al.* 2023a, 2023b).

Table 3 | Vegetation indicators and the successful methods/technologies

S. No.	Vegetation indicators	Methods/technologies	References
1.	Wetland ecological index (WEI), improved hyperspectral image-based vegetation index	LANDSAT, Mann–Kendall test, and Theil–Sen median trend analysis	Zhang *et al.* (2023a, 2023b)
2.	Macrophyte community	SNAP – ESA Sentinel Application Platform v8, ML algorithms	Piaser & Villa (2023)
3.	Vegetation species	GEOBIA, UAV, spatial scale, aerial images, resampled images, machine learning classifier	Chen *et al.* (2023)
4.	Vegetation phenology (bud burst, canopy growth, flowering, and senescence)	ENVI 5.6, NDVI time series	Gao *et al.* (2023)
5.	Relationships between vegetation cover and water quality indexes	Self-organizing map (SOM) and geographically and temporally weighted regression (GTWR)	Feng *et al.* (2023)
6.	ENDVI, EVSI, NDVI, and WAVI	PlanetScope and RapidEye images – LANDSAT 5 TM	Zhang *et al.* (2022)
7.	Vegetation cover, stem density, stem height	–	Billah *et al.* (2022)
8	3D vegetation structure (vegetation height, biomass)	Airborne laser scanning (ALS)	Koma *et al.* (2021)
9.	Mean biomass, sedge, grass, perennial plan, annual plant, total number of species, species richness index, Pielou evenness index, and Simpson diversity index	Pearson correlation, remote sensing	Luo *et al.* (2022)

As a result of changes in the external environment, plants can modify their water sources to satisfy their growing needs (Yue *et al.* 2021). According to Yamanaka *et al.* (2020), wetland vegetation is made up of hygrophytes and hydrophytes, which are aquatic macrophytes that are free-floating and adaptable with sunken leaves. Compared to channelized watercourses, the drainage pumping station, remnant ponds, and flood control basins each had significantly higher levels of species richness and wetland plant coverage. While phenology features are so effective at resolving identical spectral conditions, phenology events are very helpful for classifying different types of vegetation, notably coastal wetland vegetation properties of the diverse species of plants (Gao *et al.* 2023). The value of high-resolution satellite photographs, such as Planet Scope and Rapid Eye, was that they supported distinct phases of scientific inquiry (Mejia Avila *et al.* 2023). Based on its flexibility and quantitative adaptability, the Soil Quality Index may be compared more precisely in various vegetation species of wetland habitats (Zhang *et al.* 2022).

The above general overview of the vegetation indicators shows that this will help understand the evaluation of functional indicators. Water bodies should be purified by the natural flora in the ecosystem, which controls the discharge of pollutants (Feng *et al.* 2023). The flora of the wetland progressively evolved tactics of survival, such as altering its life cycle and morphology through long-term evolution, controlling the physiological mechanism

NMED Exhibit 26

(Yao *et al.* 2020). Due to their sedentary nature, wetland plants have a significant potential for use as indicators of the health of the ecosystem (Dybiec *et al.* 2020).

4. ANTHROPOGENIC THREATS FACED BY WETLANDS

4.1. The impact of anthropogenic climate shifts on wetland health

In just 50 years since 1970, 35% of the world's wetlands have vanished. Because they sustain a wide range of species populations and ecosystems and carry out ecological, hydrological, physiographic, and cultural functions, wetlands are essential to many forms of life (Ramsar Convention on Wetlands 2018). For the last two decades, the wetlands faced much destruction on their landscapes, hydrological connectivity, and quality of water due to both anthropogenic activities and natural causes (Nahlik & Fennessy 2016). Wetlands provide water storage, act as a buffer against inland and coastal storms, cool the surrounding areas, and store floodwaters, making them essential to the more immediate and localized aspects of climate resilience. One of the key driving mechanisms for landscape change is human disturbance. Due to growing human activity and global climate change, many wetlands have seen substantial degradation; their extent has decreased, they have deteriorated, and their value and purpose have lost significance (Davidson *et al.* 2019; Zhu *et al.* 2022a, 2022b). Although it is widely accepted that climate variability and human activity both contribute significantly to the process of wetland degradation, their respective contributions may change over time (Zhu *et al.* 2022a, 2022b). Wetlands play a crucial regulatory role in helping aquatic creatures adapt to the effects of climate change. Among the places most affected by climate change globally are aquatic ecosystems, and wetlands are no exception (Choudhury *et al.* 2021). Due to climate change, which causes such wetlands to dry out in certain months and some years, the wetlands are currently experiencing an intense drought (Melaki *et al.* 2021). Multiple contaminants released by human activity have always entered natural watersheds, triggering physiochemical and biological alterations to waterbodies (Zhu *et al.* 2022a, 2022b). Therefore, investigating the origins, distribution, and exposure risk of the water characteristics requires the application of water quality evaluation (Wu *et al.* 2021; Zhu *et al.* 2022a, 2022b).

Wetland conservation is promoted by the Ramsar Convention, which has produced a report on the declining and threatening state of wetlands (Finlayson & Gardner 2020). The threats shown in Figure 3 affect the wetland heavily. A variety of social and economic forces interact to cause wetland loss or deterioration. The often-cited human-caused reasons of wetland loss and degradation include wetland draining and conversion for crop production; aquaculture; conversion for logging; construction of canals, dykes, and dams; and urbanization.

4.2. Human disturbances on wetlands

One of the key driving mechanisms for landscape change is human disturbance. The regional ecological processes and functions are influenced by the regional landscape pattern, which also dictates the shape of the spatial distribution of its resources and environment (Cui *et al.* 2021). Liu *et al.* (2021) said that from the standpoint of structure process function coupling, essential ecological aspects of regional wetland restoration were quantified, including healthy and dynamic intertidal wetland systems and they derived a conceptual ecological model of regional wetland restoration. The wetlands begin to degrade severely when a combination of internal pressure sources, external key drivers, ecological effect, and ecological features is present. The degradation and loss of wetlands have been related to a number of variables, including overfishing and overexploitation, global climate change, infrastructure expansion, land conversion, eutrophication and pollution, infrastructure growth, infrastructure withdrawal, and population growth (Chen *et al.* 2019).

Numerous coastal wetlands have degraded because of increased urbanization and climate change, compromising the ecosystem services they provide. Few studies, particularly in quickly emerging regions, have examined how these historical degradation trends will persist in the future (Hu *et al.* 2020). Human activity, particularly aquaculture and urbanization, was found to be substantially connected with wetland deterioration. Illegal encroachments often happen near the wetlands. Contributing problems include inadequate drainage systems, stormwater drain encroachment, blockages from negligent construction debris and solid waste management, loss of natural flood-storage sites, and loss of pervious space in urbanizing landscapes (Ramachandra *et al.* 2012). Sediments are a naturally occurring substrate that aids in the cycling of nutrients, assists the growth of aquatic plants, and increases biological productivity (Dar *et al.* 2022); hence, the people do not think about the disturbance of wetland sediment. Furthermore, due to unplanned urbanization, industry, and encroachments that cause degradation, wetlands are among the most vulnerable habitats in the world (Murali 2021).

NMED Exhibit 26

Downloaded from http://iwaponline.com/wpt/article-pdf/19/11/4355/1513682/wpt2024241.pdf
by guest

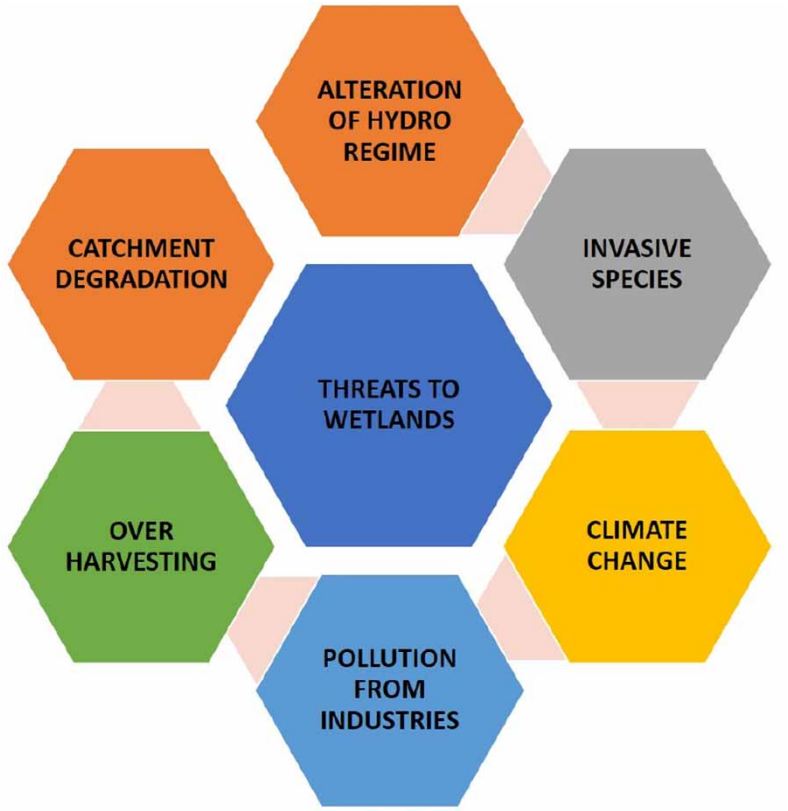

Figure 3 | Threats to the wetlands.

The non-human entity's legal personality may be necessary for the effective enforcement or defense of its rights (Cadaru 2019).

Pollution caused by the discharge of garbage into aquatic habitats endangers all life forms both directly and indirectly (Bhat *et al.* 2022). The human disturbance score protocol technique, which takes into account pollution levels (chemical, physical, and biological contamination), hydrological alterations (water abstraction, drainage, and dams), and changes in land use (urbanization, agriculture, and industry) is used to determine the extent of human disturbance to the wetlands. These factors collectively assess the extent of anthropogenic pressure on ecosystems was utilized (Krishnaraj & Mathesh 2022). Sewage water disposal is the main problem in the urban wetlands as people are thinking it as a wasteland so that thought should be changed by giving awareness about the benefits and services of urban wetlands. If immediate action is not taken, the hydrological and edaphic characteristics will be vanished completely. Hence, human disturbances in wetlands have to be avoided.

4.2.1. Wetland ecosystem benefits

Because they offer so many advantages on an ecological, economic, and social level, wetland ecosystems are extremely valued. Wetlands provide habitat to a diverse range of plant and animal species, many of which are uncommon or endangered, and thus sustain high biodiversity ecologically (Mitsch & Gosselink 2015). They act as natural water filters, improving water quality by trapping pollutants, sediments, and nutrients (Zedler & Kercher 2005). Wetlands play a crucial role in flood regulation, absorbing excess water during heavy rains and releasing it slowly, which reduces the impact of floods and erosion downstream (Costanza *et al.* 1997). Economically, wetlands contribute to livelihoods through activities such as fishing, agriculture, and tourism (Barbier *et al.* 1997). Socially, they offer recreational opportunities and cultural value to local communities (MEA 2005). Furthermore, according to Brigham *et al.* (2006), wetlands function as carbon sinks, storing carbon dioxide and reducing the effects of climate change. Their ability to store and release water also supports groundwater recharge, ensuring a sustainable supply of fresh water (Carter 1996). Overall, wetlands are essential for maintaining environmental health and resilience, supporting human well-being, and providing critical ecosystem services.

Downloaded from http://iwaponline.com/wpt/article-pdf/19/11/4355/1513682/wpt2024241.pdf
by guest

4.2.2. Contaminations of water in wetlands

Wetlands are highly susceptible to various forms of water contamination due to their role as natural filters for surface and groundwater. One of the primary sources of contamination is agricultural runoff, which often carries pesticides, herbicides, and fertilizers into wetland areas. These chemicals can be toxic to aquatic life, reducing biodiversity and disrupting ecosystem functions (Ritter *et al.* 2002). Increased levels of nitrogen and phosphorus in particular can lead to eutrophication, which can result in toxic algal blooms that lower oxygen levels and produce dead zones (Smith *et al.* 1999; Balakumar & Das 2015). In addition, industrial discharges, including heavy metals and other pollutants, can accumulate in wetland sediments, posing long-term environmental and health risks (Forstner & Wittmann 2012).

Urbanization significantly contributes to wetland water contamination through stormwater runoff, which collects pollutants from roads, rooftops, and other impermeable surfaces. Common contaminants include oil, grease, heavy metals, and debris, which can severely impact water quality and aquatic habitats (Paul & Meyer 2001). Untreated sewage and landfill leachate are two examples of improper waste disposal that can introduce a variety of contaminants into wetland habitats, including infections, medications, and personal care items (Kinney *et al.* 2006). These contaminants threaten wildlife and pose significant risks to human health, particularly when wetlands are used for recreational purposes or as a source of drinking water. The research work carried on various pollutants is shown in Table 4.

Table 4 | Pollutants found in wetland waters along with their sources

Pollutant	Source	Reference
Nitrogen (N)	Agricultural runoff, wastewater, atmospheric deposition	Smith (2003)
Phosphorus (P)	Fertilizers, detergents, sewage	Sharpley & Wang (2014)
Heavy metals	Industrial discharge, mining, urban runoff	Alloway (2013)
Pesticides	Agricultural runoff, urban runoff	Stehle & Schulz (2015)
Sediments	Soil erosion, construction activities, deforestation	Wood & Armitage (1997)
Pathogens	Sewage, livestock waste, wildlife excrement	Gerba & Smith (2005)
Organic matter	Wastewater, agricultural runoff, decaying vegetation	Correll (1998)
Pharmaceuticals	Human and veterinary drug waste, wastewater treatment plants	Kümmerer (2009)

By changing hydrological cycles and raising the frequency of extreme weather events like heavy rains and floods, which can wash additional pollutants into wetlands, climate change exacerbates the contamination of wetlands (Erwin 2009). Rising temperatures can enhance the release and mobility of contaminants, such as mercury and other persistent organic pollutants, from sediments (Obrist *et al.* 2018). Emerging contaminants, including microplastics and endocrine-disrupting chemicals, are increasingly being detected in wetland environments, presenting new challenges for water quality management (Rochman *et al.* 2013). Wetland ecosystems are susceptible to complex and unpredictable effects from these contaminants, which emphasizes the need for careful monitoring and adaptive management techniques to save these essential habitats.

4.3. Natural disturbances on wetlands

4.3.1. Climate change

Wetlands are vulnerable to both direct and indirect effects of climate change, including changes in temperature, the intensity and frequency of rainfall, and the frequency of extreme weather phenomena like drought, flooding, and storms. Environment change is predicted to hasten the loss and degradation of many wetlands because of the intricate relationships that exist between wetlands and the environment. As a result of their extensive inundation and high temperatures, tropical and subtropical wetlands produce more than 80% of the natural sources and at least 50% of the total wetland methane emissions (Meng *et al.* 2016). Climate change significantly impacts wetland dynamics by altering hydrological cycles, increasing temperature, and causing sea-level rise, which can lead to changes in wetland areas, shifts in species composition, and reduced water quality (Erwin 2009). The

NMED Exhibit 26

Downloaded from http://iwaponline.com/wpt/article-pdf/19/11/4355/1513682/wpt2024241.pdf
by guest

equilibrium of these ecosystems is upset when extreme weather events occur more frequently and intensely (IPCC 2014). In addition, changes in precipitation patterns can affect the seasonal availability of water, further stressing wetland environments (Erwin 2009). Sea-level rise particularly affects coastal wetlands, causing habitat loss and saltwater intrusion, which further stress plant and animal communities (Nicholls 2004). These factors collectively threaten the ecological integrity and functioning of wetlands, making their conservation increasingly challenging (Junk *et al.* 2013). If wetlands are destroyed, burned, or drained, millions of years' worth of carbon dioxide could be released into the sky, turning them into a carbon source. Wetlands are essential to comprehending how climate change impacts the ecosystem because they have the inherent capacity to regulate the amount of greenhouse gasses in the atmosphere. Climate change affects the wetland's aerobic and anaerobic conditions, which in turn affects the pace at which methane and carbon dioxide are generated (Salimi *et al.* 2021). The UN General Assembly and the Ramsar Convention have recognized that coastal 'blue carbon' habitats have the potential to be instrumental in reducing climate change through carbon sequestration (Australian Govt, Dept of Environmental & Energy) and also stated that around 10% of annual global emissions of carbon dioxide from fossil fuels come from peatlands that have been burned and drained. Mangrove wetlands are responsible for the sea-level rising and atmospheric CO_2 concentration (Wang & Gu 2021). Sea-level rise, coral bleaching, and altering hydrology all influence wetlands, putting Arctic and montane wetlands in particular danger (Convention on Wetlands 2021). It will be crucial to ascertain the precise anticipated future changes in each region's climate as well as to carry out appropriate monitoring to find out how well actual conditions match the climate change model for that location (Erwin 2009). Many investigations have been done based on the greenhouse gas emissions and nutrient releases caused by a natural wetland, a peatland, and a man-made wetland in reaction to climate change (Salimi *et al.* 2021). The impact of urban development (Li *et al.* 2022a, 2022b) around the wetland ecosystem will cause climate change and hydrological effects.

4.3.2. Impact of invasive plants

Typically, invasive species are hazardous because they change the ecosystems they invade; however, recent research has revealed that some well-established invasive species can improve some ecological services. The mean yearly denitrification rates of the invasive *Phragmites australis* sediments were higher than those of native marsh species. The potential health and socio-ecological risks are caused by invasive alien plant species (Rai & Singh 2020) as well as it affects the synergistic consequences of habitat fragmentation, climate change, and altered land use. Some of the invasive species commonly found in the wetlands are shown in Figure 4.

The invasion of invasive species into wetland ecosystems is influenced by multiple mechanisms, prominently driven by eutrophication. By increasing nutrient availability and changing the competitive dynamics of native flora and fauna, eutrophication, which is mainly brought on by excessive nutrient inputs from agricultural runoff, sewage discharge, and atmospheric deposition of nitrogen and phosphorus compounds, accelerates the growth of invasive species (Smith *et al.* 1999; Hilt *et al.* 2006). Invasive plants like *P. australis* and *Typha* spp. proliferate due to this nutrient enrichment, outcompeting native species that have adapted to lower nutrient levels (Chambers *et al.* 1999; Meyerson *et al.* 2000). Furthermore, eutrophication-induced changes in water quality and habitat structure can create favorable conditions for invasive species establishment and spread, disrupting the ecological balance of wetland ecosystems (Davis *et al.* 2000; Gordon *et al.* 2005).

Clonal fragmentation and floatability (Roiloa *et al.* 2020) have been discussed as successful dispersal strategies for invasive species. There are some chances that the removal of invasive plants can increase species and phylogenetic diversity in the wetlands (Lishawa *et al.* 2019). Harvesting of the invasive plants will reduce the loads of heavy nutrients and produce new more biomass (Carson *et al.* 2018). Plant invasion increased yearly N_2O emission rates in grasslands but did not affect forests. According to some contextual methods (Bezabih Beyene *et al.* 2022), invaded coastal wetlands had the largest increases in annual CH_4 emission rates, while invaded grasslands had the highest increases in annual CH_4 uptake rates. Native woody species of wetlands would particularly experience habitat loss, while non-native, non-wetland species would gain from climate change and see an expansion in their ranges (Zhong *et al.* 2022). Effective management strategies must therefore prioritize reducing nutrient inputs and restoring natural hydrological regimes to mitigate the impacts of eutrophication and curb the spread of invasive species in wetlands.

5. RESTORATION STRATEGIES FOR WETLANDS

Since each type of wetland has a unique ecology marshland, mangroves, peat lands, and bogs, for example, restoration tactics will also differ depending on the wetland's characteristics, landscape, hydrological connectivity, and types of anthropogenic activity surrounding it. The United States conducted the first research on rebuilding and restoring damaged wetlands (Zhou *et al.* 2020). Between 1970 and 2015, over 35% of the world's natural wetlands disappeared (An *et al.* 2019). Assistance and administration are the two primary responsibilities. The process of restoring wetlands involves putting them back in their natural state after being disturbed or altered by human activity, restoring the hydrological conditions and ecological system while giving priority to the balance of various organisms in wetlands, temperature, and plants using natural and ecological laws (Cai *et al.* 2021). The following strategies are used for ecological restoration of wetlands:

- Plant restoration
- Animal restoration
- Microorganism restoration (Cai *et al.* 2021).

In India, ecological plant restoration strategies for wetlands typically involve a combination of approaches aimed at enhancing biodiversity, improving ecosystem functions, and restoring hydrological regimes. Key strategies include the establishment of native plant species through seed banking and propagation programs, such as those undertaken by organizations like the Salim Ali Centre for Ornithology and Natural History (SACON) and the National Biodiversity Authority (NBA) (SACON 2020; NBA n.d.). These efforts focus on selecting species that are adapted to local environmental conditions and are crucial for maintaining habitat structure and supporting native fauna. In addition, community-based initiatives play a significant role, involving local stakeholders in wetland restoration activities to ensure sustainable management practices and promote socioeconomic benefits (Gupta *et al.* 2019). Restoration projects also integrate measures to control invasive species and mitigate anthropogenic impacts, such as pollution and habitat degradation, which threaten wetland

NMED Exhibit 26

by guest

ecosystems across the country (Menon *et al.* 2021). By implementing these strategies, India aims to conserve and restore its wetland biodiversity while safeguarding the ecological services these vital ecosystems provide.

The strategies for animal restoration primarily focus on habitat restoration and conservation measures aimed at supporting native fauna populations. Key approaches include creating protected areas and wildlife sanctuaries, such as the Chilika Lake Wildlife Sanctuary in Odisha and the Bharatpur Bird Sanctuary in Rajasthan, which provide essential habitats and breeding grounds for diverse bird species (Sundar 2009; Sivaperuman *et al.* 2017). In addition, efforts are made to control invasive species that threaten local wildlife, as seen in initiatives to manage invasive fish species in wetland ecosystems such as the Vembanad-Kol Wetland in Kerala (Easa & Shaji 2004). Community participation is integral to these restoration efforts, with local stakeholders engaged in monitoring and conservation activities to ensure sustainable management practices and

Table 5 | Various restoration strategies and technologies

S. No.	Restoration strategies	Description	Reference
1.	Artificial water replenishment	This method is modeled using a code model for environmental fluid dynamics with the help of water quality indicators	Liu *et al.* (2022)
2.	i. Tree planting	i. The post-planting development of trees is dependent on external circumstances, and the process takes significantly longer than other restoration strategies	Karim *et al.* (2022)
	ii. Tallgrass prairie planting	ii. The regeneration of tallgrass prairie from an agricultural site provides numerous benefits to soil microbial populations and the ecosystem services they provide	
	iii. Wetland creations	iii. This will aid in preventing the extinction of aquatic and riparian species in wetland ecosystems	
3.	Reshaping channel morphology	To reclaim the original form of a river/flood plain, which including straightening a channel shape into a plea/meander	Cai *et al.* (2021)
4.	Marsh terracing – remote sensing	Soil berms constructed within small coastal ponds to increase marsh area and reduce wave energy by using Remote sensing	Osorio *et al.* (2020)
5.	Phytoremediation, microbial restoration, water replenishment, and water–soil engineering restoration	An assessment was made of wetland restoration technology development in China and other countries	Zhou *et al.* (2020)
6.	Seed-based approaches	To recreate the underlying vegetation structure and composition that underpins these critical functions and services	Kettenring & Tarsa (2020)
7.	Rainwater catchment system	The soil would be wet for a long period if rainwater collecting systems were designed for the marsh and its environs	Qaderi & Rahnama (2020)
8.	Blue carbon accounting model (BlueCAM)	Tidal barrier removal and alteration can result in large greenhouse gas mitigation benefits for coastal wetlands (mangroves, seagrass, saltmarsh, and supratidal forests)	Lovelock *et al.* (2022)
9.	Infiltration experiment	To some degrees, optimum saltwater concentrations promote soil water infiltration and circulation	Wang *et al.* (2023)
10.	Control of Invasive plants	The plants which cause various threat to wetlands has to be identified and removed	Dehez (2023), Marangi *et al.* (2023) and Marchante *et al.* (2023)
11.	Recovery of tidal exchange	Tidal exchange has been recovered and repaired by a variety of methods, including culvert building, canal and/or channel excavations	Wasser (2019) and Billah *et al.* (2022)

NMED Exhibit 26

by guest

the preservation of wetland-dependent species (Ghosh *et al.* 2020). Through these integrated approaches, India aims to safeguard its wetland biodiversity and enhance ecological resilience in the face of ongoing environmental challenges.

Microbial restoration strategies involve measures to restore natural microbial communities that play vital roles in nutrient cycling, water purification, and overall wetland resilience. Key approaches include restoring hydrological regimes to promote anaerobic conditions favorable for beneficial microbial activity, such as denitrification and organic matter decomposition (Singh *et al.* 2018). Various restoration strategies and technologies are shown in Table 5. In addition, efforts are made to reduce nutrient pollution and control invasive species that can disrupt microbial communities, as seen in initiatives targeting nutrient runoff and invasive aquatic plants in wetlands like the Keoladeo National Park in Rajasthan (Bhatnagar *et al.* 2007; Kundu *et al.* 2014). Integrated management plans also emphasize monitoring microbial biodiversity and ecosystem function to assess restoration success and inform adaptive management strategies (Mandal *et al.* 2016). Through these efforts, India aims to restore and sustain the ecological functions of its wetland microbial communities while mitigating threats to their integrity.

Every restoration project is different, and there is no 'prescription' for restoring wetlands (Zhu *et al.* 2019). Many approaches to conservation have been applied, but there are very less methods to remove and control invasive plants. Even though we are given many possibilities to restore the wetlands, the success of the restoration is based on how we monitor and develop the wetlands.

6. KEY CHALLENGES OF WETLAND RESTORATION

Early theories of ecosystem deterioration and restoration understate the complexity of wetland restoration (Zedler 2000). Restoration of wetlands and bays is complicated by several issues that are more social, cultural, economic, and stakeholder than ecological (Root-Bernstein & Frascaroli 2016). The natural ecological environment is under a lot of pressure because of the overconsumption of natural resources and severe environmental pollution brought on by urban sprawl and modernization. While using various wetland restoration strategies, there are some challenges we are going to face. The evaluation techniques and index systems utilized in ecology security evaluation are variable as a result of various ecosystem kinds, research objectives, and disciplinary backgrounds (Fan & Fang 2020). Degradation and restoration, for instance, have been shown as straight arrows traveling along parallel courses in opposite directions (Dobson *et al.* 1997; Zedler 2000). In some wetlands, the weak legal system and unclear system are the main obstacles in the restoration process. The lack of awareness in people quietly leads to some failures after the successful restoration. The difficulty of establishing long-term protection of compensation zones presents another legal challenge (Blicharska *et al.* 2022). In quite a while, there have been few science-based recommendations for how to make decisions on what to avoid, as well as standards for locations where avoidance is most crucial (Bigard *et al.* 2020). Clarke *et al.* (2021) recorded the viewpoints of environmental organizations, individuals who use and travel to the area for environmentally friendly activities, as well as locals engaged in fishing operations. Hughes *et al.* (2016) encountered an assortment of practical difficulties, such as the requirement for high levels of varying expertise, high prices, incommensurate monitoring outputs, and the requirement for careful control of monitoring outcomes. To target wetland restoration areas more effectively, ecological health, water quality improvement, and hydrological health should be considered (Clare & Creed 2022). Addo-Bankas *et al.* (2022) observed that the chemical processes offer a threat to the environment and may result in secondary pollutants like sludge, and in terms of mechanical techniques, the high installation costs as well as the long-term environmental effects that have been seen make them undesirable.

7. OVERALL ECONOMIC BENEFITS OF WETLANDS

The contribution of wetlands to the Earth is not enough to detail, but the local and national economies are getting benefitted throughout the year. Wetlands provide significant economic advantages to a variety of industries, including agriculture, fisheries, water supply, tourism, and the control of nitrogen cycles and water tables. It also contributed in the retention of floodplains, production of timber, energy resources (plant matter and peat), wildlife resources, and chances for leisure and tourism (Lambert 2003). They contain some of the most productive ecosystems on the planet and provide ecological services (Gardner & Finlayson 2018). The water quality, flood control, fisheries, and some recreational activities (EPA, United States) are the major values from wetlands. Wetlands provide several nonmonetary benefits in addition to their numerous economic ones. To find out more

NMED Exhibit 26

Downloaded from http://iwaponline.com/wpt/article-pdf/19/11/4355/1513682/wpt2024241.pdf
by guest

about how much drainage practices benefit farmers financially, researchers are examining the productivity of agriculture in drained wetland basins (Clare *et al.* 2021). The constructed wetlands are more profitable (Canning *et al.* 2022) for the fresh water biodiversity in the field of agricultural productivity. Wetlands have a critical part in the idea of climate change because they both reduce greenhouse gas emissions and preserve long-term carbon storage (Malerba *et al.* 2022). Wetlands provide recreational opportunities as well as touristic incentives (Gardner & Finlayson 2018). Socioeconomic assessment techniques are quite useful for assessing elements such as the feasibility and economic effectiveness of several adaption alternatives (Riera-Spiegelhalder *et al.* 2023). Using the soil and water assessment tool (SWAT) model (Scott-Shaw *et al.* 2022), the hydrological advantage of wetland rehabilitation was ascertained.

The Environment, Climate Change & Forests (FR.9) Department is aiming to restore 100 targeted wetland areas and calculating the total economic value of wetland ecosystems helping local communities throughout the state (Dept. of Environment, Climate Change & Forests 2022). Wetland pricing is a method of estimating habitat benefits and services and enables financial specialists to perform a cost–benefit analysis that may encourage environmental investment (Lambert 2003). Parameterization and modeling used stable isotope data to derive the economic value (Taylor *et al.* 2018) so that we can express the model outputs and commercial values of a wetland. A mixed-method approach, such as semistructured questionnaires, remote sensing and GIS, and focused group discussions, might be used occasionally (Huq *et al.* 2020). To choose the best course of action for financial results, Dominici *et al.* (2022) integrated a number of multimethodological techniques, including the SWOT (strengths, weaknesses, opportunities, and threats) analysis, holistic diagnosis (HD), and systemic design (SD) (Battistoni *et al.* 2020). If decision-makers in the area are aware of the significance of wetlands for carbon sequestration, they may be able to adopt policies to manage wetlands in a way that maximizes their value and stops more wetland losses (Gallant *et al.* 2020). The market price method (Aryal *et al.* 2021) was used to calculate the market price and average home consumption. The great degree of local diversity, such as the closeness to metropolitan areas, the amount of waterfowl, and the demographics of the local people, presents a hurdle for estimating the recreational value of wetlands (Pattison-Williams *et al.* 2018). Only two of the ecosystem services offered by wetlands are direct benefits to the community, such as increased fish stock richness because of reduced nitrogen concentrations in the natural wetland and the availability of clean water (Ranjan 2021). It is imperative for the stakeholders to preserve the socioeconomic significance of the wetlands, especially without compromising the surrounding ecosystem and aquatic habitat.

8. EXPLORING THE SOCIAL AND CULTURAL SIGNIFICANCE OF WETLAND ECOSYSTEMS

Wetland ecosystems serve as integral spaces for various social and cultural activities worldwide, including in India, where they play significant roles in local traditions and livelihoods. These ecosystems provide essential resources such as fishing grounds, agricultural lands, and water sources crucial for communities' sustenance and economic activities (Biswas *et al.* 2017). In cultural contexts, wetlands often hold spiritual significance, serving as sites for rituals and ceremonies among indigenous and local communities (Nayak & Tripathy 2020). In addition, wetlands contribute to recreational activities like birdwatching, boating, and ecotourism, generating income and promoting environmental awareness (Gopal 2013). The East Kolkata Wetlands exemplify such dual-use scenarios, where traditional wastewater treatment practices coexist with biodiversity conservation and cultural practices (Ghosh *et al.* 2020). Recognizing these social and cultural dimensions is crucial for developing sustainable management strategies that balance conservation with human needs and traditions, ensuring the continued benefits of wetlands for generations to come.

9. CONCLUSION

The review on wetland restoration strategies and economic benefits underscores the efficacy of restoration efforts in enhancing ecosystem health and resilience while emphasizing the substantial economic returns from restored wetlands, demonstrating their value for sustainable development. This review conducted on studies and their evidence showcases the intensity of previous literature on the wetlands.

- The global wetland policies display the combined overall functions of wetland policies around the world, technologies and methods used in wetland conservation, and the economic benefits derived from them. From the earlier studies, it is understood that despite robust policy frameworks, challenges persist in implementing and

NMED Exhibit 26

Downloaded from http://iwaponline.com/wpt/article-pdf/19/11/4355/1513682/wpt2024241.pdf
by guest

enforcing wetland conservation measures at a global level. Variations in national priorities, capacities, and financial resources hinder uniform adherence to conservation goals.

- India has established a comprehensive legislative framework for wetland conservation. These frameworks provide a structured approach to identify, conserve, and manage wetlands, supported by institutional mechanisms such as the Central Wetlands Regulatory Authority and State Wetlands Authorities. Despite the existence of strong policy frameworks, India faces issues such as inadequate funding, conflicting development priorities, and varying enforcement capacities across states hinder the full realization of conservation goals. Addressing these challenges requires enhanced coordination among stakeholders, capacity building at the local level, and greater public participation to ensure sustainable management and protection of India's diverse wetland ecosystems.
- Monitoring hydrological and vegetation indicators helps identify changes in wetland health over time and informs management strategies aimed at preserving or restoring these vital habitats.
- Hence, integrated management with stakeholder engagement helps address multiple anthropogenic threats simultaneously. Planning land use, pollution management, community involvement, and legislative interventions are all important components of effective conservation methods that aim to lessen human impacts on wetlands and guarantee their long-term survival.

Based on the above studies, further research can be focused on selection of most degraded wetlands, identifying anthropogenic activities such as pollution around the wetlands, finding the relationship between hydrological indicators and vegetation indicators, recognizing the invasive plants and suitable plans to remove them, integrated management and restoration plan for wetlands to achieve sustainability, and constant monitoring of the wetlands to evaluate their health. Wetland restoration is not only the role of the government but also lies in the understanding of its importance and sustainable measures to be taken by the local network and environmentalists. Proper monitoring systems should be used to conserve the wetland ecosystems and can act as a good tool for the sustainability of the natural ecosystems.

TITLE 20 ENVIRONMENTAL PROTECTION
CHAPTER 6 WATER QUALITY
PART 4 STANDARDS FOR INTERSTATE AND INTRASTATE SURFACE WATERS

20.6.4.1 ISSUING AGENCY: Water Quality Control commission.
[20.6.4.1 NMAC - Rp 20 NMAC 6.1.1001, 10/12/2000]

20.6.4.2 SCOPE: Except as otherwise provided by statute or regulation of the water quality control commission, this part governs all surface waters of the state of New Mexico, which are subject to the New Mexico Water Quality Act, Sections 74-6-1 through 74-6-17 NMSA 1978.
[20.6.4.2 NMAC - Rp 20 NMAC 6.1.1002, 10/12/2000; A, 5/23/2005]

20.6.4.3 STATUTORY AUTHORITY: This part is adopted by the water quality control commission pursuant to Subsection C of Section 74-6-4 NMSA 1978.
[20.6.4.3 NMAC - Rp 20 NMAC 6.1.1003, 10/12/2000]

20.6.4.4 DURATION: Permanent.
[20.6.4.4 NMAC - Rp 20 NMAC 6.1.1004, 10/12/2000]

20.6.4.5 EFFECTIVE DATE: October 12, 2000, unless a later date is indicated in the history note at the end of a section.
[20.6.4.5 NMAC - Rp 20 NMAC 6.1.1005, 10/12/2000]

20.6.4.6 OBJECTIVE:

A. The purpose of this part is to establish water quality standards that consist of the designated use or uses of surface waters of the state, the water quality criteria necessary to protect the use or uses and an antidegradation policy.

B. The state of New Mexico is required under the New Mexico Water Quality Act (Subsection C of Section 74-6-4 NMSA 1978) and the federal Clean Water Act, as amended (33 U.S.C. Section 1251 *et seq*.) to adopt water quality standards that protect the public health or welfare, enhance the quality of water and are consistent with and serve the purposes of the New Mexico Water Quality Act and the federal Clean Water Act. It is the objective of the federal Clean Water Act to restore and maintain the chemical, physical and biological integrity of the nation's waters, including those in New Mexico. This part is consistent with Section 101(a)(2) of the federal Clean Water Act, which declares that it is the national goal that wherever attainable, an interim goal of water quality that provides for the protection and propagation of fish, shellfish and wildlife and provides for recreation in and on the water be achieved by July 1, 1983. Agricultural, municipal, domestic and industrial water supply are other essential uses of New Mexico's surface water; however, water contaminants resulting from these activities will not be permitted to lower the quality of surface waters of the state below that required for protection and propagation of fish, shellfish and wildlife and recreation in and on the water, where practicable.

C. Pursuant to Subsection A of Section 74-6-12 NMSA 1978, this part does not grant to the water quality control commission or to any other entity the power to take away or modify property rights in water.

D. These surface water quality standards serve to respond to the inherent threats of climate change and provide resiliency for the continued protection and enhancement of water quality.
[20.6.4.6 NMAC - Rp 20 NMAC 6.1.1006, 10/12/2000; A, 5/23/2005; A, 4/23/2022]

20.6.4.7 DEFINITIONS: Terms defined in the New Mexico Water Quality Act, but not defined in this part will have the meaning given in the Water Quality Act.

A. Terms beginning with numerals or the letter "A," and abbreviations for units.

(1) **"4Q3"** means the hydrologically based critical low flow as determined by the minimum average flow over four consecutive days that occurs with a frequency of once in three years.

(2) **"4T3 temperature"** means the temperature not to be exceeded for four or more consecutive hours in a 24-hour period on more than three consecutive days.

(3) **"6T3 temperature"** means the temperature not to be exceeded for six or more consecutive hours in a 24-hour period on more than three consecutive days.

(4) **Abbreviations** used to indicate units are defined as follows:

NMED Exhibit 27

(a) **"cfu/100 mL"** means colony-forming units per 100 milliliters; the results for *E. coli* may be reported as either colony forming units (CFU) or the most probable number (MPN), depending on the analytical method used;

(b) **"cfs"** means cubic feet per second;

(c) **"dw"** means dry weight;

(d) **"iwbt"** means invertebrate whole body tissue;

(e) **"fmt"** means fish muscle tissue;

(f) **"fwbt"** means fish whole body tissue;

[~~(c)~~]**g** **"µg/L"** means micrograms per liter, equivalent to parts per billion when the specific gravity of the solution equals 1.0;

[~~(d)~~] **(h)** **"µS/cm"** means microsiemens per centimeter; one µS/cm is equal to one µmho/cm;

[~~(e)~~] **(i)** **"mg/kg"** means milligrams per kilogram, equivalent to parts per million;

[~~(f)~~] **(j)** **"mg/L"** means milligrams per liter, equivalent to parts per million when the specific gravity of the solution equals 1.0;

[~~(g)~~] **(k)** **"MPN/100 mL"** means most probable number per 100 milliliters; the results for *E. coli* may be reported as either CFU or MPN, depending on the analytical method used;

[~~(h)~~] **(l)** **"NTU"** means nephelometric turbidity unit;

[~~(i)~~] **(m)** **"pCi/L"** means picocuries per liter;

[~~(j)~~] **(n)** **"pH"** means the measure of the acidity or alkalinity and is expressed in standard units (su);

(o) **"ww"** means wet weight.

(5) **"Acute toxicity"** means toxicity involving a stimulus severe enough to induce a response in 96 hours of exposure or less. Acute toxicity is not always measured in terms of lethality, but may include other toxic effects that occur within a short time period.

(6) **"Adjusted gross alpha"** means the total radioactivity due to alpha particle emission as inferred from measurements on a dry sample, including radium-226, but excluding radon-222 and uranium. Also excluded are source, special nuclear and by-product material as defined by the Atomic Energy Act of 1954.

(7) **"Administrative rulemaking costs"** include expenses related to providing a venue, hearing officer, court reporter, transcripts, translation services, interpretation services, and public notice requirements including publication in newspapers and in the New Mexico register in relation to holding a public rulemaking hearing. For petitioners other than the department, these costs do not include publishing in the New Mexico register, posting information to state websites, securing a venue, hiring a hearing officer, or filing adopted rules.

[~~(7)~~]**(8)** **"Aquatic life"** means any plant or animal life that uses surface water as primary habitat for at least a portion of its life cycle, but does not include avian or mammalian species.

[~~(8)~~]**(9)** **"Attainable Use"** means a use that is achievable by the imposition of effluent limits required under sections 301(b) and 306 of the federal Clean Water Act and implementation of cost-effective and reasonable best management practices for nonpoint source control. An attainable use may or may not have criteria as stringent as the criteria for the designated use.

B. Terms beginning with the letter "B".

(1) **"Best management practices" or "BMPs":**

(a) for national pollutant discharge elimination system (NPDES) permitting purposes means schedules of activities, prohibitions of practices, maintenance procedures and other management practices to prevent or reduce the pollution of "waters of the United States;" BMPs also include treatment requirements, operating procedures and practices to control plant site runoff, spillage or leaks, sludge or waste disposal or drainage from raw material storage; or

(b) for nonpoint source pollution control purposes means methods, measures or practices selected by an agency to meet its nonpoint source control needs; BMPs include but are not limited to structural and nonstructural controls and operation and maintenance procedures; BMPS can be applied before, during and after pollution-producing activities to reduce or eliminate the introduction of pollutants into receiving waters; BMPs for nonpoint source pollution control purposes shall not be mandatory except as required by state or federal law.

(2) **"Bioaccumulation"** refers to the uptake and retention of a substance by an organism from its surrounding medium and food.

(3) "Bioaccumulation factor" is the ratio of a substance's concentration in tissue versus its concentration in ambient water, in situations where the organism and the food chain are exposed.

(4) "Biomonitoring" means the use of living organisms to test the suitability of effluents for discharge into receiving waters or to test the quality of surface waters of the state.

C. Terms beginning with the letter "C".

(1) "CAS number" means an assigned number by chemical abstract service (CAS) to identify a substance. CAS numbers index information published in chemical abstracts by the American chemical society.

(2) "Chronic toxicity" means toxicity involving a stimulus that lingers or continues for a relatively long period relative to the life span of an organism. Chronic effects include, but are not limited to, lethality, growth impairment, behavioral modifications, disease and reduced reproduction.

(3) "Classified water of the state" means a surface water of the state, or reach of a surface water of the state, for which the commission has adopted a segment description and has designated a use or uses and applicable water quality criteria in 20.6.4.101 through 20.6.4.899 NMAC.

(4) "Climate change" refers to any significant change in the measures of climate lasting for an extended period of time, typically decades or longer, and includes major changes in temperature, precipitation, wind patterns or other weather-related effects.

(5) "Closed basin" is a basin where topography prevents the surface outflow of water and water escapes by evapotranspiration or percolation.

(6) "Coldwater" in reference to an aquatic life use means a surface water of the state where the water temperature and other characteristics are suitable for the support or propagation or both of coldwater aquatic life.

(7) "Coolwater" in reference to an aquatic life use means the water temperature and other characteristics are suitable for the support or propagation of aquatic life whose physiological tolerances are intermediate between and may overlap those of warm and coldwater aquatic life.

(8) "Commission" means the New Mexico water quality control commission.

(9) "Criteria" are elements of state water quality standards, expressed as constituent concentrations, levels or narrative statements, representing a quality of a [~~water~~] waterbody that supports a use. When criteria are met, water quality will protect the designated use.

D. Terms beginning with the letter "D".

(1) "DDT and derivatives" means 4,4'-DDT (CAS number 50293), 4,4'-DDE (CAS number 72559) and 4,4'-DDD (CAS number 72548).

(2) "Department" means the New Mexico environment department.

(3) "Designated use" means a use specified in 20.6.4.97 through 20.6.4.899 NMAC for a surface water of the state whether or not it is being attained.

(4) "Dissolved" refers to the fraction of a constituent of a water sample that passes through a 0.45-micrometer pore-size filter. The "dissolved" fraction is also termed "filterable residue."

(5) "Domestic water supply" means a surface water of the state that could be used for drinking or culinary purposes after disinfection.

E. Terms beginning with the letter "E".

(1) "E. coli" means the bacteria Escherichia coli.

(2) "Emerging contaminants" refer to water contaminants that may cause significant ecological or human health effects at low concentrations. Emerging contaminants are generally chemical compounds recognized as having deleterious effects at environmental concentrations whose negative impacts have not been fully quantified and may not have regulatory numeric criteria.

(3) "Ephemeral" when used to describe a surface water of the state means the [~~water body~~] waterbody contains water briefly only in direct response to precipitation; its bed is always above the water table of the adjacent region.

(4) "Existing use" means a use actually attained in a surface water of the state on or after November 28, 1975, whether or not it is a designated use.

F. Terms beginning with the letter "F".

(1) "Fish culture" means production of coldwater or warmwater fishes in a hatchery or rearing station.

(2) "Fish early life stages" means the egg and larval stages of development of fish ending when the fish has its full complement of fin rays and loses larval characteristics.

G. Terms beginning with the letter "G" [RESERVED]

NMED Exhibit 27

H. Terms beginning with the letter "H".

(1) "Hardness" means the measure of dissolved calcium and magnesium salts in water expressed in units of dissolved calcium carbonate (CaCO3) concentration unless otherwise noted.

(2) "Harmonic mean flow" is the number of daily flow measurements divided by the sum of the reciprocals of the flows; that is, it is the reciprocal of the arithmetic mean of reciprocal daily flow measurements consistent with the equations in Paragraph (1) of Subsection B of 20.6.4.11 NMAC.

(3) "High quality coldwater" in reference to an aquatic life use means a perennial surface water of the state in a minimally disturbed condition with considerable aesthetic value and superior coldwater aquatic life habitat. A surface water of the state to be so categorized must have water quality, stream bed characteristics and other attributes of habitat sufficient to protect and maintain a propagating coldwater aquatic life population.

(4) "Human health-organism only" means the health of humans who ingest fish or other aquatic organisms from waters that contain pollutants.

I. Terms beginning with the letter "I".

(1) "Industrial water supply" means the use or storage of water by a facility for process operations unless the water is supplied by a public water system. Industrial water supply does not include irrigation or other agricultural uses.

(2) "Intermittent" when used to describe a surface water of the state means the [~~water body~~] waterbody contains water for extended periods only at certain times of the year, such as when it receives seasonal flow from springs or melting snow.

(3) "Interstate waters" means all surface waters of the state that cross or form a part of the border between states.

(4) "Intrastate waters" means all surface waters of the state that are not interstate waters.

(5) "Irrigation" means application of water to land areas to supply the water needs of beneficial plants.

(6) "Irrigation storage" means storage of water to supply the needs of beneficial plants.

J. Terms beginning with the letter "J". [**RESERVED**]

K. Terms beginning with the letter "K". [**RESERVED**]

L. Terms beginning with the letter "L".

(1) "LC-50" means the concentration of a substance that is lethal to fifty percent of the test organisms within a defined time period. The length of the time period, which may vary from 24 hours to one week or more, depends on the test method selected to yield the information desired.

(2) "Limited aquatic life" as a designated use, means the surface water is capable of supporting only a limited community of aquatic life. This subcategory includes surface waters that support aquatic species selectively adapted to take advantage of naturally occurring rapid environmental changes, low-flow, high turbidity, fluctuating temperature, low dissolved oxygen content or unique chemical characteristics.

(3) "Livestock watering" means the use of a surface water of the state as a supply of water for consumption by livestock.

M. Terms beginning with the letter "M".

(1) "Marginal coldwater" in reference to an aquatic life use means that natural habitat conditions severely limit maintenance of a coldwater aquatic life population during at least some portion of the year or historical data indicate that the temperature of the surface water of the state may exceed that which could continually support aquatic life adapted to coldwater.

(2) "Marginal warmwater" in reference to an aquatic life use means natural intermittent or low flow or other natural habitat conditions severely limit the ability of the surface water of the state to sustain a natural aquatic life population on a continuous annual basis; or historical data indicate that natural water temperature routinely exceeds 32.2°C (90°F).

(3) "Maximum temperature" means the instantaneous temperature not to be exceeded at any time.

(4) "Minimum quantification level" means the minimum quantification level for a constituent determined by official published documents of the United States environmental protection agency.

N. Terms beginning with the letter "N".

(1) "Natural background" means that portion of a pollutant load in a surface water resulting only from non-anthropogenic sources. Natural background does not include impacts resulting from historic or existing human activities.

(2) "Natural causes" means those causal agents that would affect water quality and the effect is not caused by human activity but is due to naturally occurring conditions.

(3) "Nonpoint source" means any source of pollutants not regulated as a point source that degrades the quality or adversely affects the biological, chemical or physical integrity of surface waters of the state.

O. Terms beginning with the letter "O".

(1) "Organoleptic" means the capability to produce a detectable sensory stimulus such as odor or taste.

(2) "Oversight agency" means a state or federal agency, such as the United States department of agriculture forest service, that is responsible for land use or water quality management decisions affecting nonpoint source discharges where an outstanding national resource water is located.

P. Terms beginning with the letter "P".

(1) "Playa" means a shallow closed basin lake typically found in the high plains and deserts.

(2) "Perennial" when used to describe a surface water of the state means the [~~water body~~] waterbody typically contains water throughout the year and rarely experiences dry periods.

(3) "Persistent toxic pollutants" means pollutants, generally organic, that are resistant to environmental degradation through chemical, biological and photolytic processes and can bioaccumulate in organisms, causing adverse impacts on human health and aquatic life.

(4) "Point source" means any discernible, confined and discrete conveyance from which pollutants are or may be discharged into a surface water of the state, but does not include return flows from irrigated agriculture.

(5) "Practicable" means that which may be done, practiced or accomplished; that which is performable, feasible, possible.

(6) "Primary contact" means any recreational or other water use in which there is prolonged and intimate human contact with the water, such as swimming and water skiing, involving considerable risk of ingesting water in quantities sufficient to pose a significant health hazard. Primary contact also means any use of surface waters of the state for cultural, religious or ceremonial purposes in which there is intimate human contact with the water, including but not limited to ingestion or immersion, that could pose a significant health hazard.

(7) "Public water supply" means the use or storage of water to supply a public water system, as defined by [~~New Mexico's Drinking Water Regulations,~~] 40 CFR Part 141, and incorporated by reference into 20.7.10 NMAC, Drinking Water. Drinking [~~Water~~] water provided by a public water system [~~may need to~~] using surface water as a supply, shall undergo treatment to [~~achieve~~] comply with drinking water [~~quality~~] standards.

Q. Terms beginning with the letter "Q". [**RESERVED**]

R. Terms beginning with the letter "R". [**RESERVED**]

S. Terms beginning with the letter "S".

(1) "Secondary contact" means any recreational or other water use in which human contact with the water may occur and in which the probability of ingesting appreciable quantities of water is minimal, such as fishing, wading, commercial and recreational boating and any limited seasonal contact.

(2) "Segment" means a classified water of the state described in 20.6.4.101 through 20.6.4.899 NMAC. The water within a segment should have the same uses, similar hydrologic characteristics or flow regimes, and natural physical, chemical and biological characteristics and exhibit similar reactions to external stresses, such as the discharge of pollutants.

(3) "Specific conductance" is a measure of the ability of a water solution to conduct an electrical current.

(4) "State" means the state of New Mexico.

(5) "Surface water(s) of the state"

(a) means all surface waters situated wholly or partly within or bordering upon the state, including the following:

(i) lakes;

(ii) rivers;

(iii) streams (including intermittent and ephemeral streams);

(iv) mudflats;

(v) sandflats;

(vi) wetlands;

(vii) sloughs;

(viii) prairie potholes;

(ix) wet meadows;
(x) playa lakes;
(xi) reservoirs; and
(xii) natural ponds.

(b) also means all tributaries of such waters, including adjacent wetlands, any manmade bodies of water that were originally created in surface waters of the state or resulted in the impoundment of surface waters of the state, and any "waters of the United States" as defined under the Clean Water Act that are not included in the preceding description.

(c) does not include private waters that do not combine with other surface or subsurface water or any water under tribal regulatory jurisdiction pursuant to Section 518 of the Clean Water Act. Waste treatment systems, including treatment ponds or lagoons designed and actively used to meet requirements of the Clean Water Act (other than cooling ponds as defined in 40 CFR Part 423.11(m) that also meet the criteria of this definition), are not surface waters of the state, unless they were originally created in surface waters of the state or resulted in the impoundment of surface waters of the state.

T. Terms beginning with the letter "T".

(1) "TDS" means total dissolved solids, also termed "total filterable residue."

(2) "Temporary standard" means a time-limited designated use and criterion for a specific pollutant(s) or water quality parameter(s) that reflect the highest attainable condition during the term of the temporary standard or water quality variance as defined by 40 CFR 131.3(o).

[~~(2)~~](3) **"Toxic pollutant"** means those pollutants, or combination of pollutants, including disease-causing agents, that after discharge and upon exposure, ingestion, inhalation or assimilation into any organism, either directly from the environment or indirectly by ingestion through food chains, will cause death, shortened life spans, disease, adverse behavioral changes, reproductive or physiological impairment or physical deformations in such organisms or their offspring.

[~~(3)~~](4) **"Tributary"** means a perennial, intermittent or ephemeral waterbody that flows into a larger waterbody, and includes a tributary of a tributary.

[~~(4)~~](5) **"Turbidity"** is an expression of the optical property in water that causes incident light to be scattered or absorbed rather than transmitted in straight lines.

U. Terms beginning with the letter "U".

(1) "Unclassified waters of the state" means those surface waters of the state not identified in 20.6.4.101 through 20.6.4.899 NMAC.

(2) "Use attainability analysis" means a scientific study conducted for the purpose of assessing the factors affecting the attainment of a use.

V. Terms beginning with the letter "V" [RESERVED]

W. Terms beginning with the letter "W".

(1) "Warmwater" with reference to an aquatic life use means that water temperature and other characteristics are suitable for the support or propagation or both of warmwater aquatic life.

(2) "Water contaminant" means any substance that could alter if discharged or spilled the physical, chemical, biological or radiological qualities of water. "Water contaminant" does not mean source, special nuclear or by-product material as defined by the Atomic Energy Act of 1954, but may include all other radioactive materials, including but not limited to radium and accelerator-produced isotopes.

(3) "Water pollutant" means a water contaminant in such quantity and of such duration as may with reasonable probability injure human health, animal or plant life or property, or to unreasonably interfere with the public welfare or the use of property.

(4) "Wetlands" means those areas that are inundated or saturated by surface or ground water at a frequency and duration [~~sufficient to~~] that typically support [~~, and under normal circumstances do support, a prevalence of~~] vegetation [~~typically~~] adapted for life in saturated soil conditions in New Mexico. Wetlands are unique surface waters of the state that vary widely because of regional and local differences in soils, topography, climate, hydrology, water chemistry, vegetation and other factors and provide distinct chemical, biological, physical, and hydrological functions within a watershed. For certain types of wetlands, like playa lakes, water may only be present at certain times of the year, resulting in a cyclic nature of drying and refilling. Wetlands [~~that are~~] constructed [~~outside of a surface water of the state~~] for [~~the purpose of providing~~] wastewater treatment outside of, and [~~that~~] do not impound, a surface water of the state are not included in this definition.

(5) "Wildlife habitat" means a surface water of the state used by plants and animals not considered as pathogens, vectors for pathogens or intermediate hosts for pathogens for humans or domesticated livestock and plants.

X. Terms beginning with the letters "X" through "Z". [RESERVED]

[20.6.4.7 NMAC - Rp 20 NMAC 6.1.1007, 10/12/2000; A, 7/19/2001; A, 5/23/2005; A, 7/17/2005; A, 8/1/2007; A, 12/1/2010; A, 1/14/2011; A, 3/2/2017; A, 4/23/2022; A, MM/DD/YYYY]

20.6.4.8 ANTIDEGRADATION POLICY AND IMPLEMENTATION PLAN:

A. Antidegradation Policy: This antidegradation policy applies to all surface waters of the state.

(1) Existing uses, as defined in Paragraph (4) of Subsection E of 20.6.4.7 NMAC, and the level of water quality or wetland condition necessary to protect the existing uses shall be maintained and protected in all surface waters of the state. Wetland condition is a measure of ecological integrity and, by inference, wetland quality (i.e., functions) and quantity (i.e., acreage).

(2) Where wetland condition or the quality of a surface water of the state exceeds levels necessary to support the propagation of fish, shellfish, and wildlife, and recreation in and on the water, that quality shall be maintained and protected unless the commission finds, after full satisfaction of the intergovernmental coordination and public participation provisions of the state's continuing planning process, that allowing lower water quality or wetland condition, including loss of wetland acreage or wetland functions, is necessary to accommodate important economic and social development in the area in which the water is located. In allowing such degradation or lower water quality, the state shall assure water quality adequate to protect existing uses fully. Further, the state shall [~~assure that there shall be achieved~~]ensure the highest statutory and regulatory requirements for all new and existing point sources and implementation of all cost-effective and reasonable best management practices (BMPs) for nonpoint source control. Additionally, the state shall encourage the use of watershed planning as a further means to protect surface waters of the state.

(3) No degradation, including loss of wetland acreage or wetland functions, shall be allowed in waters designated by the commission as outstanding national resource waters (ONRWs), except as provided in Subparagraphs (a) through (e) of this paragraph and in Paragraph (4) of [~~this~~] Subsection A of 20.6.4.8 NMAC.

(a) After providing a minimum 30-day public review and comment period, the commission determines that allowing temporary and short-term degradation of water quality is necessary to accommodate public health or safety activities in the area in which the ONRW is located. Examples of public health or safety activities include but are not limited to replacement or repair of a water or sewer pipeline or a roadway bridge. In making its decision, the commission shall consider whether the activity will interfere with activities implemented to restore or maintain the chemical, physical or biological integrity of the water. In approving the activity, the commission shall require that:

(i) the degradation shall be limited to the shortest possible time and shall not exceed six months;

(ii) the degradation shall be minimized and controlled by [~~best management practices~~]BMPs or in accordance with permit requirements as appropriate; all practical means of minimizing the duration, magnitude, frequency and cumulative effects of such degradation shall be utilized;

(iii) the degradation shall not result in water quality lower than necessary to protect any existing use in the ONRW; and

(iv) the degradation shall not alter the essential character or special use that makes the water an ONRW.

(b) Prior to the commission making a determination, the department or appropriate oversight agency shall provide a written recommendation to the commission. If the commission approves the activity, the department or appropriate oversight agency shall oversee implementation of the activity.

(c) Where an emergency response action that may result in temporary and short-term degradation to an ONRW is necessary to mitigate an immediate threat to public health or safety, the emergency response action may proceed prior to providing notification required by Subparagraph (a) of this paragraph in accordance with the following:

(i) only actions that mitigate an immediate threat to public health or safety may be undertaken pursuant to this provision; non-emergency portions of the action shall comply with the requirements of Subparagraph (a) of this paragraph;

(ii) the discharger shall make best efforts to comply with requirements (i) through (iv) of Subparagraph (a) of this paragraph;

(iii) the discharger shall notify the department of the emergency response action in writing within seven days of initiation of the action;

NMED Exhibit 27

(iv) within 30 days of initiation of the emergency response action, the discharger shall provide a summary of the action taken, including all actions taken to comply with requirements (i) through (iv) of Subparagraph (a) of this paragraph.

(d) Preexisting land-use activities, including grazing, allowed by federal or state law prior to designation as an ONRW, and controlled by [~~best management practices (~~]BMPs[~~)~~], shall be allowed to continue so long as there are no new or increased discharges resulting from the activity after designation of the ONRW.

(e) Acequia operation, maintenance, and repairs are not subject to new requirements because of ONRW designation. However, the use of BMPs to minimize or eliminate the introduction of pollutants into receiving waters is strongly encouraged.

(4) This antidegradation policy does not prohibit activities that may result in degradation in surface waters of the state when such activities will result in restoration or maintenance of the chemical, physical or biological integrity of the water.

(a) For ONRWs, the department or appropriate oversight agency shall review on a case-by-case basis discharges that may result in degradation from restoration or maintenance activities, and may approve such activities in accordance with the following:

(i) the degradation shall be limited to the shortest possible time;

(ii) the degradation shall be minimized and controlled by [~~best management practices~~]BMPs or in accordance with permit requirements as appropriate, and all practical means of minimizing the duration, magnitude, frequency and cumulative effects of such degradation shall be utilized;

(iii) the degradation shall not result in water quality lower than necessary to protect any existing use of the surface water; and

(iv) the degradation shall not alter the essential character or special use that makes the water an ONRW.

(b) For surface waters of the state other than ONRWs, the department shall review on a case-by-case basis discharges that may result in degradation from restoration or maintenance activities, and may approve such activities in accordance with the following:

(i) the degradation shall be limited to the shortest possible time;

(ii) the degradation shall be minimized and controlled by [~~best management practices~~]BMPs or in accordance with permit requirements as appropriate, and all practical means of minimizing the duration, magnitude, frequency and cumulative effects of such degradation shall be utilized; and

(iii) the degradation shall not result in water quality lower than necessary to protect any existing use of the surface water.

(5) In those cases where potential water quality impairment associated with a thermal discharge is involved, this antidegradation policy and implementing method shall be consistent with Section 316 of the federal Clean Water Act.

(6) In implementing this section, the commission through the appropriate regional offices of the United States environmental protection agency will keep the administrator advised and provided with such information concerning the surface waters of the state as he or she will need to discharge his or her responsibilities under the federal Clean Water Act.

B. Implementation Plan: The department, acting under authority delegated by the commission, implements the water quality standards, including the antidegradation policy, by describing specific methods and procedures in the continuing planning process and by establishing and maintaining controls on the discharge of pollutants to surface waters of the state. The steps summarized in the following paragraphs, which may not all be applicable in every water pollution control action, list the implementation activities of the department. These implementation activities are supplemented by detailed antidegradation review procedures developed under the state's continuing planning process. The department:

(1) obtains information pertinent to the impact of the effluent on the receiving water and advises the prospective discharger of requirements for obtaining a permit to discharge;

(2) reviews the adequacy of existing data and conducts a water quality survey of the receiving water in accordance with an annually reviewed, ranked priority list of surface waters of the state requiring total maximum daily loads pursuant to Section 303(d) of the federal Clean Water Act;

(3) assesses the probable impact of the effluent on the receiving water relative to its attainable or designated uses and numeric and narrative criteria;

NMED Exhibit 27

(4) requires the highest and best degree of wastewater treatment practicable and commensurate with protecting and maintaining the designated uses and existing water quality of surface waters of the state;

(5) develops water quality based effluent limitations and comments on technology based effluent limitations, as appropriate, for inclusion in any federal permit issued to a discharger pursuant to Section 402 of the federal Clean Water Act;

(6) requires that these effluent limitations be included in any such permit as a condition for state certification pursuant to Section 401 of the federal Clean Water Act;

(7) coordinates its water pollution control activities with other constituent agencies of the commission, and with local, state and federal agencies, as appropriate;

(8) develops and pursues inspection and enforcement programs to ensure that dischargers comply with state regulations and standards, and complements EPA's enforcement of federal permits;

(9) ensures that the provisions for public participation required by the New Mexico Water Quality Act and the federal Clean Water Act are followed;

(10) provides continuing technical training for wastewater treatment facility operators through the utility operators training and certification programs;

(11) provides funds to assist the construction of publicly owned wastewater treatment facilities through the wastewater construction program authorized by Section 601 of the federal Clean Water Act, and through funds appropriated by the New Mexico legislature;

(12) conducts water quality surveillance of the surface waters of the state to assess the effectiveness of water pollution controls, determines whether water quality standards are being attained, and proposes amendments to improve water quality standards;

(13) encourages, in conjunction with other state agencies, implementation of the [~~best management practices~~]BMPs set forth in the New Mexico statewide water quality management plan and the nonpoint source management program, such implementation shall not be mandatory except as provided by federal or state law;

(14) evaluates the effectiveness of BMPs selected to prevent, reduce or abate sources of water pollutants;

(15) develops procedures for assessing use attainment as required by 20.6.4.15 NMAC and establishing site-specific standards;[~~and~~]

(16) develops list of surface waters of the state not attaining designated uses, pursuant to Sections 305(b) and 303(d) of the federal Clean Water Act[~~.~~]; and

(17) develops list of ONRWs where impairment has been documented and potential sources of impairment.

[20.6.4.8 NMAC - Rp 20 NMAC 6.1.1101, 10/12/2000; A, 5/23/2005; A, 8/1/2007; A, 1/14/2011; A, 4/23/2022; A, MM/DD/YYYY]

20.6.4.9 OUTSTANDING NATIONAL RESOURCE WATERS:

A. Procedures for nominating an ONRW: Any person may nominate a surface water of the state for designation as an ONRW by filing a petition with the commission pursuant to 20.1.6 NMAC, Rulemaking Procedures - Water Quality Control Commission. A petition to designate a surface water of the state as an ONRW shall include:

(1) a map of the surface water of the state, including the location and proposed upstream and downstream boundaries;

(2) a written statement and evidence based on scientific principles in support of the nomination, including specific reference to one or more of the applicable ONRW criteria listed in Subsection B of this section;

(3) water quality data including chemical, physical or biological parameters, if available, to establish a baseline condition for the proposed ONRW;

(4) a discussion of activities that might contribute to the reduction of water quality in the proposed ONRW;

(5) any additional evidence to substantiate such a designation, including a discussion of the economic impact of the designation on the local and regional economy within the state of New Mexico and the benefit to the state; and

(6) affidavit of publication of notice of the petition in a newspaper of general circulation in the affected counties and in a newspaper of general statewide circulation.

NMED Exhibit 27

B. Criteria for ONRWs: A surface water of the state, or a portion of a surface water of the state, may be designated as an ONRW where the commission determines that the designation is beneficial to the state of New Mexico, and:

(1) the water is a significant attribute of a state special trout water, national or state park, national or state monument, national or state wildlife refuge or designated wilderness area, or is part of a designated wild river under the federal Wild and Scenic Rivers Act; or

(2) the water has exceptional recreational or ecological significance; or

(3) the existing water quality is equal to or better than the numeric criteria for protection of aquatic life and contact uses and the human health-organism only criteria, and the water has not been significantly modified by human activities in a manner that substantially detracts from its value as a natural resource.

C. Pursuant to a petition filed under Subsection A of this section, the commission may classify a surface water of the state or a portion of a surface water of the state as an ONRW if the criteria set out in Subsection B of this section are met.

D. Waters classified as ONRWs: The following waters are classified as ONRWs:

(1) Rio Santa Barbara, including the west, middle and east forks from their headwaters downstream to the boundary of the Pecos Wilderness; and

(2) the waters within the United States forest service Valle Vidal special management unit including:
