MEMORANDUM

TO: Michelle Miano, New Mexico Environment Department (NMED/Environmental Protection Division (EPD), Division Director

FROM: Eastern Research Group, Inc. (ERG)
2677 Prosperity Avenue, Suite 450
Fairfax, VA 22031

SUBJECT: Clean Air Act Permitting Research and Technical Engineering Support
Yucca Growth Infrastructure, LLC Clean Air Act Construction Permit Public Comment Review

DATE: 1 October 2026

Eastern Research Group, Inc. (ERG) is under contract with the New Mexico Environment Department - Air Quality Bureau (NMED-AQB) to provide air quality permitting and technical engineering assistance to NMED-AQB in a manner consistent with technical direction received. Under NMED Contract ID# 25-667-4091-44019, PO# 66700-0000047692, ERG received Notice to Proceed for ERG to provide Clean Air Act (CAA) Permitting Research and Technical Engineering Support for specific matters as identified by NMED-AQB.

Consistent with the direction received from NMED-AQB, ERG initiated technical engineering support for CAA stationary source permitting in relation to sources that have recently submitted construction permit applications in the state of New Mexico. Specifically, ERG was directed to develop responses to public comments received by NMED-AQB on New Source Review (NSR) Permit No. 10883 ("the permit") for Yucca Growth Infrastructure, LLC's proposed facility "YGI Microgrid."

NMED-AQB provided sets of comments to ERG on August 17 and 19. NMED-AQB received 23,753 total submissions from the public. The comments were first analyzed by SmartComment prior to receipt by ERG. SmartComment's analysis identified 17,109 submissions as form letters. 2,822 were identified as either non-substantive, support non-substantive, or oppose non-substantive comments. 3,822 "remaining" comments remained unclassified and were interpreted as substantive based on SmartComment's analysis.

In the following sections of the enclosed technical memorandum, ERG has included the following sections:

- Background on the proposed project and emissions from the proposed project,
- A summary of the enforceable limits and compliance demonstration requirements in the draft permit, and
- Brief summaries of the public comments received and responses to those comments.

Responses have been drafted based on the original permit application and additional information provided by the applicant and included in the Administrative Record for the Permit as of August 24, 2026.

DRAFT

BACKGROUND

The Proposed Project

The YGI Microgrid will use solid oxide fuel cells (SOFC) to generate electricity. Unlike conventional electric generating units, like engines and turbines, fuel cells do not generate electricity through fuel combustion. Instead, they use an electrochemical process that converts natural gas into electricity. Because this process does not rely on combustion in the traditional sense, emissions of many pollutants are significantly lower per unit of electricity generated than emissions associated with conventional fossil-fuel-fired power generation technologies.

The YGI Microgrid will utilize Bloom Energy SOFC Servers, which will consist of up to 6,925 325-kW Energy Servers and up to 813 260-kW Energy Servers. The following fuel cell Energy Servers ("units") are proposed for installation at the YGI Microgrid:

	Count	Capacity
Energy Server – 325 kW	6,925	2,250.625
Energy Server – 260 kW	813	211.38
	Total	2,462.005

Emissions from the Proposed Project

For permitting purposes, individual units are grouped into emitting "clusters," because exhaust from several units will be routed to each "cluster" stack before being emitted into the atmosphere. The process produces regulated air pollutants, as described below:

Nitrogen oxides (NO_x) can form as a result of high-temperature processes associated with fuel cell unit operation and supporting equipment.

CO_2, a greenhouse gas, is generated and emitted because the natural gas used as fuel contains carbon that is ultimately converted to CO_2 during operation.

Carbon monoxide (CO) is generated during the steam reformation process and will be oxidized to carbon dioxide (CO_2) during the electrochemical reaction in the fuel cell unit. Each SOFC unit consists of an internal anode tail gas oxidizer that will convert more than 99% of the CO to CO_2.

Volatile organic compounds (VOCs), hazardous air pollutants (HAPs), and methane are present in the natural gas fuel. The steam methane reforming process will break down complex hydrocarbons and trace organic compounds into simpler gas components, such as hydrogen (H_2) and CO. Nearly all the VOCs, HAPs, and methane remaining in the reformed gas entering the fuel cell unit are expected to be electrochemically or thermally oxidized by the fuel cell system. Unreacted VOC, HAP, and methane will be emitted to the atmosphere from the cluster stack. Additionally, VOC, HAP, and methane will be emitted through natural gas piping leaks and natural gas venting.

Particulate matter (PM), including PM_{10} and $PM_{2.5}$, may be emitted from fuel cell system. The equipment vendor maintains that there are zero PM emissions from its equipment. Stack testing indicates that particulate matter emissions from the electrochemical process are extremely low and were measured at concentrations that were indistinguishable from ambient background levels within the uncertainty of the applicable test methods. The following was stated by the vendor that performed the stack testing for PM:

"The results from the stack samplings and the ambient air samplings are the same within the

uncertainty of the measurements. The Montrose Antioch office has decades of practice in measurement of PM emissions near or below the uncertainty limits of Methods 5 and 202. The results from both the Stack and Ambient Air test runs are at 0.0002 gr/dscf, which is the practical measurement limit for 240-minute test runs. The practical uncertainty of these results is approximately 0.0001 to 0.0002 gr/dscf. Therefore, there is no discernable difference between the Stack and the Ambient Air test results; the actual concentrations of the Stack Emissions and the Ambient Air are likely far below the measurement limits of these EPA Reference Methods."

These results suggest that PM emissions from the fuel cell system are below the practical detection level of the applicable EPA reference methods. As a result, the corresponding PM emission factors are likely conservative and may reflect ambient background particulate concentrations in addition to any actual fuel cell unit process emissions.

Sulfur dioxide (SO_2) may be emitted from fuel cell operation. Natural gas – even pipeline quality natural gas – contains trace amounts of sulfur compounds. The centralized desulfurization system (CDS) will remove nearly all the fuel bound sulfur. Residual sulfur will be oxidized to SO_2 in the fuel cell system. The applicant asserts that the desulfurized fuel will contain no more than 5 parts per billion by volume (ppbv) of sulfur. According to statements submitted by the applicant to NMED-AQB, sulfur concentrations above this value will poison the fuel cell electrolyte and cause the fuel cell unit to shut down.

DRAFT PERMIT ENFORCEABLE CONDITIONS

NMED-AQB issued draft NSR Permit No. 10883 on July 29, 2026. The draft permit establishes permit limits and monitoring, recordkeeping, and reporting requirements to make the permitted emission limits enforceable. The permitted emission limits and enforceable permit conditions which require the facility to verify compliance with those limits are summarized in this section. This section is referenced in the comment responses where the draft permit addresses commenter concerns.

Facility-wide Emission Limits

Condition A106 of the draft permit includes facility-wide emission limits, which were established based on these emission factors and the YGI Microgrid's maximum permitted operating capacity. The permittee will be required to demonstrate compliance with the emission limits in Table 106.A using the monitoring, testing, recordkeeping, and reporting requirements established in the permit.

Startup, Shutdown, and Maintenance (SSM) activities

Condition A107 of the draft permit limits SSM emissions of VOC during desulfurization bed media and desulfurization filter replacement.

Electricity Production

Condition A108.C of the draft permit limits the total, facility-wide electricity production (MW-hr/yr)

Emissions from the Fuel Cell Units - NOx, CO, VOC, PM and HAP

Condition A601.D of the draft permit establishes initial stack testing requirements for a representative number of fuel cell clusters installed during each calendar quarter. At least one percent of the fuel cell clusters installed during a quarter must undergo testing. If fewer than 600 fuel cell clusters are installed during a quarter, a minimum of six fuel cell clusters must be tested. To ensure testing occurs under representative operating conditions, a fuel cell cluster becomes subject to testing only after it has either

reached maximum normal production for at least 60 days or has operated for at least 180 days. This requirement ensures that emissions testing is performed after fuel cell units have achieved stable operation while also preventing testing from being indefinitely deferred.

Condition A601.E of the draft permit establishes ongoing periodic stack testing requirements. Under this condition, one percent of the fuel cell clusters installed during each calendar year must be tested during every subsequent calendar year. The condition also requires testing to be conducted on a rotating basis so that all fuel cell clusters within a given installation year are tested before any fuel cell cluster is retested.

Condition A601.D of the draft permit allows for a reduced testing frequency when testing demonstrates that emissions remain below 75 percent of the values used to calculate the YGI Microgrid's potential emissions, or below the applicable detection limit of the reference test method. This provision recognizes circumstances in which demonstrated emissions are substantially lower than permitted levels while still retaining periodic testing requirements to confirm continued performance.

Condition A601.F of the draft permit requires actual emissions to be calculated using the YGI Microgrid's total electrical output (MWh/month) and the highest emission factor derived from the most recent stack tests (lb/MW-hr). This is a conservative methodology because the single highest test result must be applied to all fuel cell clusters when calculating emissions. Given that the installed fuel cell units are composed of standardized 65-kW modules operating under the same fundamental design and process, it is reasonable to assume that any fuel cell cluster could potentially emit at the highest measured rate. This approach ensures that actual emissions are not underestimated and provides NMED-AQB with a conservative basis for evaluating compliance with permit limits.

Emissions from the Fuel Cell Units - SO_2

Condition A110.A of the draft permit limits the natural gas used to no more than 0.75 grains of total sulfur per 100 dry standard cubic foot. Condition A110.A also requires that all natural gas consumed by a fuel cell unit must be first processed by the CDS.

Condition A110.A of the draft permit requires sulfur content testing. Annual testing must be performed at the outlet of at least five percent of the installed CDS units. Test samples must be collected from representative grab samples and tested on a rotating basis such that every CDS unit is sampled before any unit is re-sampled.

Condition A601.F of the draft permit requires the permittee to calculate annual SO_2 emissions using the highest sulfur concentration measured during the most recent CDS sampling event and the total natural gas consumption of the fuel cell units. By requiring the use of the maximum measured sulfur concentration and assuming complete conversion of sulfur to SO_2, the permit incorporates a conservative methodology that is intended to ensure SO_2 emissions are not underestimated.

Emissions from Natural Gas Leaks

Condition A601.A of the draft permit requires the permittee to continuously monitor gas pressure and temperature within each fuel cell unit. The fuel cell units must be equipped with automated controls that initiate immediate shutdown and isolation of the affected unit following detection of the out-of-range parameters which indicate that atmospheric venting may be occurring. The parameter ranges will be established in the comprehensive monitoring plan required under Condition A601.H.

Condition A110.A of the draft permit requires an annual gas analysis to be conducted at the outlet of at least five percent of the installed CDS. Samples must be collected from representative grab samples, and the CDS units must be tested on a rotating basis such that all installed units are evaluated before any unit

is re-sampled. These analyses verify the performance of the desulfurization systems, which are designed to remove sulfur compounds from the incoming natural gas before it is supplied to the fuel cell units.

Condition A108.B requires continuous measurement of the natural gas flow entering the YGI Microgrid, while Condition A601.G requires continuous measurement of the total natural gas flow supplied to the fuel cell units. Under Condition A601.G, the total measured flow to the fuel cell units must be at least 98 percent of the measured inlet gas flow. The flow comparison requirement serves as a compliance mechanism for identifying potential losses of gas within the YGI Microgrid and triggering further evaluation where appropriate. A discrepancy greater than two percent constitutes a permit deviation and must be reported in accordance with the permit's reporting requirements.

Comprehensive Monitoring Plan

Condition A601.H requires the permittee to prepare and implement a comprehensive monitoring plan subject to NMED-AQB approval. At a minimum, the plan must address monitoring of:

- CDS SSM events (Conditions A107.D and A107.E);
- Natural gas flow rates (Condition A108.B);
- Electrical output measurements (Condition A108.C);
- Outlet sulfur concentration measurements (Condition A110.A);
- Temperature and pressure measurements (Condition A601.A); and
- Natural gas losses and leak monitoring requirements associated with the fuel cell units (Condition A601.G).

NMED-AQB's review of the monitoring plan will provide a detailed understanding of the methods, instrumentation, and procedures the YGI Microgrid will use to demonstrate ongoing compliance with permit requirements. During inspections and compliance evaluations, NMED-AQB will review the monitoring systems, records, and operational practices to determine whether the YGI Microgrid is operating in accordance with the approved monitoring plan and applicable permit conditions.

General Recordkeeping

Condition B109 of the draft permit requires the YGI Microgrid to maintain records sufficient to demonstrate compliance with permit requirements. These records include, at a minimum, emissions testing results, monitoring data, sampling information, equipment inspections, maintenance activities, and emissions associated with startup, shutdown, and maintenance events. All required records must be retained for at least five years and made available to NMED-AQB upon request.

General Reporting

Condition B110 requires the YGI Microgrid to report excess emissions and permit deviations. If monitoring, testing, calculations, or other information indicate that an applicable emission limitation has been exceeded, the permittee must notify NMED-AQB in accordance with the reporting requirements contained in the permit and applicable regulations.

PUBLIC COMMENTS AND RESPONSES

The public comments have been organized into the nine sections shown below and further grouped into specific topics.

1. Air Emissions and Potential Environmental Impacts
2. Health and Community Impacts
3. Practical Enforceability

4. Operations and Permitting
5. Extension for Public Comments and Public Hearing Requirements
6. Support for Project
7. Water Usage
8. Hazardous Waste
9. Safety Concerns Related to Catastrophic Failures

1. AIR EMISSIONS AND POTENTIAL ENVIRONMENTAL IMPACTS

The comments in this category raise concerns regarding the YGI Microgrid's emissions, the methods used to estimate those emissions, and the potential impacts on nearby communities and the environment. Specific topics include emissions calculations, stack testing, greenhouse gases, HAPs, fuel characterization, startup and malfunction emissions, and the adequacy of the assumptions and data used to evaluate the YGI Microgrid's potential emissions. Responses are developed for the following air quality emissions and potential impact comments:

1.1. General impact of emissions from the YGI Microgrid
1.2. Emission calculation methodology
1.3. Carbon dioxide emissions and climate change
1.4. Methane emissions from natural gas supply
1.5. Stack tests as an indicator of emissions during real-world fuel cell operation
1.6. Average stack test results in potential emission calculations
1.7. HAP emission estimates
1.8. Limited data used to develop potential emissions
1.9. Stack test data for fuel cells at existing facilities
1.10. Safety margin used in potential emission calculations
1.11. Fuel testing
1.12. Potential fuel cell operating efficiency decline
1.13. Potential startup, shutdown, maintenance, and malfunction emissions
1.14. Emissions from catastrophic failure

1.1 General impact of emissions from the YGI Microgrid

Commenters express concerns regarding air emissions and potential impacts on nearby residents, schools, and the surrounding community. Commenters state that fuel cells are not clean energy because they generate significant quantities of pollutants like NO_x, CO, VOC, and HAP. As part of its review of the permit, NMED-AQB evaluated the YGI Microgrid potential emissions to ensure that they represent the maximum that the YGI Microgrid would emit upon operation and that emissions would not exceed applicable standards.

The NMED-AQB permitting process has been established to ensure that sources of air pollution will not emit pollution in quantities which exceed the applicable standards. Potential emissions from the YGI Microgrid are less than the prevention of significant deterioration (PSD) thresholds established in 20.2.74.501 New Mexico Administrative Code (NMAC). Therefore, the YGI Microgrid is not subject to major source construction permitting under 20.2.74 NMAC and is instead subject to minor NSR permitting under 20.2.72.200.A(1) NMAC. The draft permit includes emission limits, monitoring, recordkeeping, and reporting requirements designed to ensure that the YGI Microgrid will not exceed the PSD major source thresholds. These requirements are described in the “Draft Permit Enforceable Conditions” section of this document.

Potential emissions of CO and VOC from the YGI Microgrid are greater than the emission thresholds established in 20.2.70 NMAC, so the YGI Microgrid will be a major source under the Title V operating permit program and will be required to apply for a Title V operating permit. NMED-AQB will issue a Title V permit, which will include all applicable requirements. The Title V permit is anticipated to include monitoring, recordkeeping, and reporting requirements which will be designed to ensure that the applicable limits are not exceeded. Under the Title V permitting program, the YGI Microgrid will be required to submit annual compliance certifications and semi-annual monitoring reports which will require the YGI Microgrid to track, record, and disclose compliance for all permit requirements.

Additionally, the YGI Microgrid will be required to submit an annual estimate of facility-wide actual emissions in accordance with 20.2.73.300 NMAC.

The National Ambient Air Quality Standards (NAAQS) and New Mexico Ambient Air Quality Standards (NMAAQS) establish the threshold for concentrations above which adversely impact health and/or the environment. NMED-AQB has reviewed the ambient impacts of the proposed project and determined that the proposed project will not cause or contribute to an exceedance of the NAAQS or NMAAQS. A more detailed discussion of ambient impacts is provided in the response in Section 2.2.

1.2. Emission calculation methodology

Commenters express concerns regarding the methodology used to calculate emissions from the proposed project. This response describes methodology used to calculate potential emissions.

For most pollutants, emissions were calculated using emission factors derived from stack testing of the same fuel cell unit model proposed for installation at the facility. These emission factors are expressed in pounds of pollutant emitted per megawatt-hour of electricity generated (lb/MW-hr). Potential annual emissions were calculated by multiplying these emission factors by the maximum amount of electricity the facility is authorized to produce each year. The draft permit establishes limits on both electricity generation and facility-wide emissions, as described in the "Draft Permit Enforceable Conditions" section of this document.

Potential NO_x, CO, VOC, PM, and HAP emissions are calculated based on recent stack test results for the Bloom Energy Server model proposed to be installed at the YGI Microgrid, the Energy Server 6.5. NO_x, CO, VOC, and HAP potential emissions are based on stack test results from 2023, and PM potential emissions are based on stack test results from 2026. The average emission rate in pounds per hour measured in the exhaust concentration during the stack test and the energy output measured during the stack test were combined to produce an emission factor in terms of lb/MW-hr.

Results of PM stack testing from the fuel cell system are below the practical detection level of the applicable EPA reference methods. As a result, the corresponding PM emission factors are likely conservative and may reflect ambient background particulate concentrations in addition to any actual fuel cell unit process emissions.

The draft permit requires the YGI Microgrid to test new and existing fuel cell units at the facility and calculate annual emissions based on the maximum values of the most recent stack test results, as described in the "Draft Permit Enforceable Conditions" section of this document.

Potential SO_2 emissions are calculated assuming a sulfur content of 5 ppbv in desulfurized natural gas and that all sulfur is oxidized to SO_2. This equates to an emission factor of 6.14 lb SO_2/MW-hr. The draft permit requires actual SO_2 emissions to be calculated based on the actual sulfur content of the desulfurized fuel, measured on an annual basis, and the total natural gas consumption of the fuel cells units. Sulfur testing and calculations requirements are described in the "Draft Permit Enforceable Conditions" section of this document.

Carbon dioxide emissions are calculated based on the total carbon present in the natural gas used in the fuel cell units. The standard value of 53.06 kg CO_2 / MMBTU is converted to lb/MW-hr, using an applicant-provided operating efficiency of 54%. A facility-wide allowable emission limit is not established for CO_2, because it is not a regulated pollutant under New Mexico's air permitting program. Calculated actual emissions of CO_2 will need to be reported on an annual basis in accordance with 20.2.73.300 NMAC.

1.3 Carbon dioxide emissions and climate change

NMED acknowledges the commenters' concerns regarding the magnitude of the YGI Microgrid's projected CO_2 emissions and the potential implications for New Mexico's greenhouse gas reduction goals.

New Mexico has established statewide greenhouse gas reduction objectives through Executive Order 2019-003 and the New Mexico Climate Action Plan. These initiatives seek to reduce statewide emissions of greenhouse gas, including CO_2, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride, by 45 percent below 2005 levels by 2030. The Climate Action Plan identifies a range of measures across multiple economic sectors intended to help achieve these statewide goals, including actions related to electricity generation, transportation, oil and gas operations, buildings, industry, and waste management.

While NMED recognizes the importance of these greenhouse gas reduction goals, neither Executive Order 2019-003 nor the Climate Action Plan establishes source-specific greenhouse gas emission limits or permitting criteria applicable to this construction permit action. In fact, page 4 of the Executive Order expressly states that it does not create a private right of action or mandate any particular regulatory action. Rather, the Climate Action Plan serves as a policy framework intended to guide the development and evaluation of future emission reduction measures.

NMED also recognizes that efforts have been made to codify statewide greenhouse gas reduction targets. For example, Senate Bill 18 (the Clear Horizons Act) would have established statutory greenhouse gas reduction targets and additional regulatory authorities related to greenhouse gas emissions from stationary sources. However, the legislation was not enacted. As a result, New Mexico's greenhouse gas reduction goals remain policy objectives rather than enforceable permitting standards applicable to individual sources under the construction permitting program.

Permit decisions under the Air Quality Control Act and 20.2.72 NMAC must be based on applicable statutory and regulatory requirements. NMED's review is therefore limited to determining which air quality requirements currently apply to the YGI Microgrid and what appropriate permit conditions can be established to ensure compliance. Neither the Air Quality Control Act nor 20.2.72 NMAC authorizes NMED to deny a construction permit because a facility emits greenhouse gases or because those emissions may affect progress toward statewide greenhouse gas reduction goals.

Although CO_2 emissions are not subject to source-specific limits under this permitting action, greenhouse gas emissions from the YGI Microgrid remain subject to applicable state and federal regulatory programs. The YGI Microgrid will be required to quantify and report greenhouse gas emissions as required by applicable reporting and permitting regulations, including New Mexico's emissions inventory requirements. Consequently, greenhouse gas emissions from the YGI Microgrid will continue to be tracked and reported under existing regulatory programs.

Accordingly, while NMED acknowledges the commenters' concerns regarding climate change and the State's greenhouse gas reduction objectives, those concerns do not provide a regulatory basis for denying the permit. NMED's permit decision must be based on the requirements established by applicable state and federal air quality regulations, and NMED has evaluated the proposed YGI Microgrid in accordance with those requirements.

1.4 Methane emissions from natural gas supply

Commenters express concerns with methane emissions associated with the upstream natural gas supply chain, including emissions from natural gas extraction, processing, transmission, and distribution activities. Commenters express concerns that since methane is a greenhouse gas, upstream leakage may reduce the climate advantage of gas-based fuel cells.

NMED acknowledges that methane emissions from upstream natural gas production, processing, transmission, and distribution can be relevant considerations in broader discussions regarding greenhouse gas emissions and lifecycle climate impacts. However, the scope of this permitting action is limited to emissions from the YGI Microgrid and the emission units that are part of the permitted source. The construction permit requirements in 20.2.72 NMAC apply to persons who intend to construct or modify a source, and NMED-AQB 's review is focused on determining whether emissions from the YGI Microgrid will comply with applicable air quality requirements.

Emissions occurring at upstream natural gas production, processing, transmission, or distribution facilities are not emissions from the YGI Microgrid and are therefore outside the scope of this permitting action. These activities occur at separate facilities that are independently regulated and, where applicable, are subject to their own permitting, monitoring, and compliance requirements under the Clean Air Act, the New Mexico Air Quality Control Act (NMSA 1978, Sections 74-2-1 et seq.), and implementing regulations, including 20.2.72 NMAC and other applicable state and federal air quality programs.

Consistent with applicable permitting requirements, NMED-AQB evaluated emissions reasonably attributable to the YGI Microgrid, including emissions associated with the use of natural gas at the YGI Microgrid and other emission sources that are part of the permitted operation. NMED-AQB's permit review evaluates whether emissions from the YGI Microgrid can comply with applicable requirements and whether the YGI Microgrid is expected to cause or contribute to an exceedance of any applicable ambient air quality standard.

1.5 Stack test results as an indicator of emissions during real-world fuel cell operation

Commenters express concern regarding the use of stack tests conducted in a laboratory setting for the purpose of estimating emissions at an operational facility. All stack test results used to calculate emission factors were from a Bloom Energy Server 6.5, which is the model proposed for use at the YGI Microgrid. The stack tests were conducted on individual 65-kW modules of an Energy Server 6.5. Each Energy Server proposed to be installed at the YGI Microgrid is comprised of four or five 65-kW modules.

The modules tested in the laboratory are the same design and configuration as those authorized for installation under the permit. Because the tested units are identical in design and operation to those proposed for installation, and because the permitted emissions are based on output-specific emission rates, NMED-AQB expects actual emissions from the installed units to be represented by the laboratory-based test results. To address the uncertainty associated with applying laboratory test data to a full-scale operating facility, the draft permit requires the YGI Microgrid to test new and existing fuel cell units at the facility and calculate annual emissions based on the maximum values of the most recent stack test results, as described in the “Draft Permit Enforceable Conditions” section of this document. These requirements will allow NMED to verify, under actual operating conditions, that emissions from the installed fuel cell units remain consistent with the assumptions used to establish the permit limits.

1.6 Average stack test results in potential emission calculations

Commenters express concern regarding the use of average stack test results to develop the emission factors used to calculate the YGI Microgrid's potential emissions. Commenters also question whether the

variability observed in the limited set of stack test runs introduces significant uncertainty into the emissions estimates.

NMED recognizes that a larger dataset would provide greater certainty regarding emissions variability. However, NMED reviewed the available stack test data and notes that emissions for many pollutants were extremely low and, in several cases, at or near the detection limits of the applicable test methods. In particular, testing for NO_x, PM, and HAPs resulted in some non-detect measurements. When emissions are present at very low concentrations, small absolute differences between test runs can appear as relatively large percentage differences even though the actual variation in emissions is minimal. Therefore, the variability identified by commenters does not necessarily indicate significant uncertainty in the emissions performance of the fuel cell units.

Based on the available emissions data, the applicant determined that the emission factors derived from the stack testing, coupled with a 15 percent compliance margin, represent a conservative estimate of the YGI Microgrid's potential emissions. NMED agrees that this approach is reasonable for permitting purposes. The 15 percent adjustment was included to provide an additional margin of conservatism and to ensure that the calculation of potential emissions reflects a reasonable worst-case estimate.

The draft permit requires the YGI Microgrid to test new and existing fuel cell units at the facility and calculate annual emissions based on the maximum values of the most recent stack test results, as described in the "Draft Permit Enforceable Conditions" section of this document. By requiring the highest measured emission factor to be applied to all YGI Microgrid generation, the permit incorporates a conservative methodology that helps ensure actual emissions are not underestimated. These requirements are designed to ensure that emissions remain below the allowable limits established in Table 106.A and allow NMED to evaluate the YGI Microgrid's emissions under actual operating conditions.

1.7 HAP emission estimates

Commenters express concerns regarding HAPs, including questions about why only three HAPs were included in the YGI Microgrid's potential emissions calculations and whether additional HAPs, particularly formaldehyde, should have been evaluated.

Hazardous air pollutants are regulated under Section 112 of the Clean Air Act and are incorporated into New Mexico's air permitting program through applicable state and federal requirements. During permit review, NMED-AQB evaluates available emissions information to determine which HAPs are expected to be emitted by a source and whether those emissions are subject to applicable regulatory requirements.

For the proposed fuel cell units, the potential HAP emissions calculations include methanol, benzene, and xylene because these were the only HAPs detected during stack testing performed on the proposed fuel cell technology. The testing included an analysis for a broad range of organic compounds using EPA Method TO-15. Approximately 97 HAPs were evaluated during the testing program, and only methanol, benzene, and xylene were detected above analytical detection limits. In other words, the remaining HAPs tested were not detected. Based on the available testing data, the applicant reasonably concluded that those compounds are not emitted in measurable quantities from normal operation of the fuel cell units and therefore were not included in the potential emissions calculations.

Several commenters specifically questioned the absence of formaldehyde from the potential emission calculations. NMED-AQB notes that formaldehyde is commonly associated with combustion processes, where it is formed through incomplete combustion of hydrocarbon fuels. Unlike combustion units like engines, boilers, and turbines, the proposed fuel cell units generate emissions through an electrochemical process and catalytic oxidation. Natural gas is first converted to a hydrogen-rich fuel stream within the integrated reforming system, and electricity is subsequently produced through electrochemical reactions

within the fuel cell units. Because there is no flame-based combustion process, formation of combustion byproducts such as formaldehyde is not expected.

Based on the available stack testing data, the design and expected operation of the fuel cell units, the absence of detectable concentrations of most tested HAPs, and the monitoring and testing requirements included in the draft permit, NMED-AQB concludes that the permit application adequately characterizes HAP emissions from the YGI Microgrid.

1.8 Limited data used to develop potential emissions

Commenters express concern over the use of only one stack test with three runs to develop the emission factors used to calculate potential emissions from the fuel cell units. Commentors suggest that extrapolating this limited data fails to provide credible empirical evidence.

Although the test dataset is limited to three test runs, the results represent the best available emissions data for the specific fuel cell technology proposed in the application and are consistent with longstanding and accepted air permitting practices. The use of manufacturer-supported stack testing data and source-specific emissions factors is consistent with accepted air permitting practices, particularly for emerging technologies and source categories for which extensive field-testing data are not yet available.

The YGI Microgrid consists of standardized fuel cell units manufactured to common design specifications and operating under substantially similar conditions. Because the units are designed to perform consistently, it is reasonable to apply emission factors developed from representative testing of the proposed model across the installed fleet of units. The permit's emissions calculations are further based on maximum electrical generation capacity, thereby evaluating the YGI Microgrid under worst-case operating assumptions.

As part of its review, NMED-AQB evaluated existing air permits for similar fuel cell facilities and found that emissions testing data are generally limited because such permits do not typically require periodic stack testing after installation. This permitting approach is consistent with the design and operation of fuel cell technology. Unlike combustion-based sources, fuel cells generate electricity through an electrochemical process rather than the burning of fuel, substantially reducing the formation of combustion-related pollutants such as NO_x, PM, VOC, and HAP. Because fuel cells are designed as standardized systems and generally have lower emissions profiles than combustion-based technologies, air permits for similar facilities have often relied on representative performance testing, operational monitoring, and manufacturer-supplied emissions data rather than periodic emissions testing.

The draft permit requires the YGI Microgrid to test new and existing fuel cell units at the facility and calculate annual emissions based on the maximum values of the most recent stack test results, as described in the “Draft Permit Enforceable Conditions” section of this document.

The draft permit also establishes facility-wide emission limits calculated based on the YGI Microgrid’s maximum electricity generation and the emission factors derived from stack testing which are used to calculate potential emissions. If future stack testing demonstrates emissions that differ significantly from those represented in the permit application, NMED-AQB retains the authority to require additional analyses, permit revisions, corrective actions, or other actions authorized under applicable state and federal regulations. Exceedances of stack testing must be reported to NMED-AQB in accordance with 20.2.7 NMAC and could result in enforcement action.

1.9 Stack test data for fuel cells at existing facilities

Commenters expressed concerns regarding publicly available stack test results from a fuel cell facility in Delaware and the observation that the reported CO and VOC emission rates are higher than those used to calculate potential emissions for the YGI Microgrid.

NMED-AQB reviewed the Delaware stack test results referenced by commenters and agrees that they provide useful information regarding the performance of an earlier-generation fuel cell installation. However, the Delaware testing was conducted on January 22, 2015, using Bloom Energy's Energy Server 5 (ES5), whereas the YGI Microgrid will utilize Bloom Energy's newer Energy Server 6.5 (ES6.5) model. The emissions estimates in the permit application are based on stack testing performed on the specific fuel cell model proposed to be installed at the YGI Microgrid. Because emissions performance can vary between equipment generations as a result of design improvements, operating characteristics, and manufacturer modifications, NMED-AQB determined that the more recent testing conducted on the ES6.5 model provides the most appropriate basis for estimating emissions from the YGI Microgrid.

The draft permit requires the YGI Microgrid to test new and existing fuel cell units at the facility and calculate annual emissions based on the maximum values of the most recent stack test results, as described in the "Draft Permit Enforceable Conditions" section of this document.

1.10 Safety margin used in potential emission calculations

Commenters express concerns over the 15% "safety margin" used in the potential emission factor submitted by the applicants. Commentors suggest that safety margins are not added if a company is confident in the accuracy of pollution estimates.

A safety margin is used in the air permitting process to ensure that normal variations in operation, manufacturing tolerances, environmental conditions, and testing uncertainty do not result in actual emissions exceeding the levels evaluated during permit review. The applicant proposed a 15% safety factor for the potential emission factor for all pollutants to account for potential variability in operating conditions. NMED-AQB evaluated the appropriateness of this approach on a pollutant-specific basis. For pollutants other than CO_2, the approved emission calculations incorporate the additional 15% margin, resulting in more conservative emission estimates and reducing the likelihood that actual emissions would exceed permitted levels. NMED-AQB determined that an additional safety factor was not necessary for CO_2 calculations because CO_2 emissions are directly dependent on fuel consumption and carbon mass balance. CO_2 emissions are directly related to the amount of natural gas consumed and are inherently constrained by the fuel input rate.

The safety factor was added not because the applicant lacked confidence in the emissions estimates; rather, the margin was included because air permitting analyses are based on the estimation of YGI Microgrid's potential emissions. Potential emissions, by definition, represent a conservative, worst-case estimate of the maximum emissions the YGI Microgrid could reasonably generate. While the selection of a safety factor involves engineering judgment, NMED-AQB determined it provides a reasonable and conservative margin for purposes of estimating potential emissions from the YGI Microgrid.

1.11 Fuel testing

Commenters ask whether there will be fuel testing of methane (natural gas) to anticipate the composition of fuel cell unit emissions.

The draft permit requires annual characterization of the natural gas delivered to the YGI Microgrid and the stream at the outlet of the CDS, as described in the "Draft Permit Enforceable Conditions" section of this document.

NMED-AQB notes that the composition of fuel cell unit emissions is influenced not only by the composition of the incoming natural gas, but also by the operation of the desulfurization systems, the integrated fuel reforming process, and the electrochemical reactions occurring within the fuel cell units. For this reason, the draft permit includes both fuel characterization requirements and direct emissions testing requirements. The stack testing requirements provide the most direct and reliable measurement of pollutant emissions and allow NMED-AQB to confirm that emissions remain consistent with the assumptions used during permit review.

1.12 Potential fuel cell operating efficiency decline

Commenters expressed concerns that fuel cell efficiency may decrease over time and that declining performance could result in increased emissions. NMED-AQB acknowledges that equipment performance can change as equipment ages. However, a decrease in fuel cell efficiency does not necessarily result in a corresponding increase in emissions. The relationship between equipment efficiency and emissions depends on the specific operating characteristics of the fuel cell units and must be evaluated using actual operating data and emissions testing.

The draft permit requires the YGI Microgrid to test new and existing fuel cell units at the facility and calculate annual emissions based on the maximum values of the most recent stack test results, as described in the "Draft Permit Enforceable Conditions" section of this document. The testing requirements will allow NMED-AQB to evaluate emissions under actual operating conditions and determine whether emissions remain consistent with the assumptions used during permit review and within the applicable emission limits. If future testing indicates that emissions differ materially from those represented in the permit application, NMED-AQB may require corrective actions or take other actions authorized under applicable permit conditions and regulations.

Based on the periodic testing requirements, conservative emissions calculation methodology, and other monitoring, recordkeeping, and reporting requirements included in the draft permit, NMED-AQB has determined that the permit contains appropriate provisions to evaluate emissions performance over time and to ensure continued compliance with applicable emission limitations throughout the life of the YGI Microgrid.

1.13 Potential startup, shutdown, maintenance, and malfunction emissions

Commenters expressed concerns that SSM and malfunction emissions are not included in the potential emissions calculation for the YGI Microgrid.

SSM emissions

In addition to emissions associated with normal operations, facilities must evaluate whether emissions during SSM activities could exceed permitted emission limits. If such activities result in emissions greater than those associated with normal operations, the applicant must provide supporting calculations and establish appropriate permit limitations.

Fuel will not be introduced until the fuel cell units have reached operating temperature. Once operating temperature is achieved, normal operation will begin. During shutdown, the fuel supply will be isolated, and the electrochemical reaction is allowed to cease. As a result, based on the design and operation of the fuel cell units, startup and shutdown activities are not expected to produce emissions greater than those associated with normal operations.

The replacement of fuel cell units will not result in startup, shutdown, or maintenance emissions. The modules and supporting equipment contained within the fuel cell unit are hot-swapable. If a failure

occurs, a module can be replaced with no natural gas venting. The applicant estimates that power modules may need to be replaced approximately once every five years.

The only identified SSM emission source is the periodic replacement of the desulfurization media. Emissions from natural gas venting during desulfurization bed media and desulfurization filter replacement are addressed in Condition A107 of the draft permit. Although the calculated emissions were below the exemption threshold in 20.2.72.202.B(5) NMAC, NMED-AQB determined that permit conditions were warranted to ensure that emissions remain below those levels and to provide a mechanism for tracking and demonstrating compliance. Without a condition, NMED-AQB could not confirm that potential emissions will remain below 0.5 tpy, because there is no inherent limit to the number of maintenance activities or the number of purges per event that may be required. The permittee is required to track these emissions and limit VOC emissions to 0.34 tons per year.

Malfunction emissions

Malfunction emissions are not typically included in potential-to-emit calculations because potential emissions are intended to represent emissions associated with a source operating as designed, taking into account enforceable limitations. Unexpected malfunctions are addressed through separate reporting and compliance requirements under 20.2.7 NMAC. Malfunctions are defined under 20.2.7 NMAC as "any sudden and unavoidable failure of air pollution control equipment or process equipment beyond the control of the owner or operator, including malfunction during startup or shutdown. A failure that is caused entirely or in part by poor maintenance, careless operation, or any other preventable equipment breakdown shall not be considered a malfunction." These events are required to be reported to the NMED-AQB in accordance with 20.2.7 NMAC.

To minimize the potential for such releases, Condition A601.A of the draft permit requires the applicant to automatically shut down a unit if temperature and pressure measurements indicate that atmospheric venting may be occurring, as described in the "Draft Permit Enforceable Conditions" section of this document.

Accordingly, the draft permit contains provisions to monitor, calculate, record, and report emissions associated with applicable SSM and malfunction events. These requirements provide NMED-AQB with a mechanism to evaluate emissions from non-routine operations and ensure compliance with applicable permit conditions and regulations

1.14 Emissions from catastrophic failures

Commenters express concerns regarding potential equipment failures at the YGI Microgrid and whether additional fuel cell units may be required in the future as a result of those failures.

The draft permit establishes an enforceable limit on the maximum number of units that may be installed and operated at the YGI Microgrid. The YGI Microgrid may not exceed this permitted equipment inventory without obtaining any required permit revisions or approvals. As a result, the emissions analysis and compliance demonstrations associated with this permitting action are based on the maximum number of units authorized by the permit and the corresponding maximum emissions that could be generated by those units.

NMED-AQB cannot speculate regarding future permit actions or whether additional fuel cell units may be proposed in the future. Any future physical or operational change that constitutes a modification under applicable regulations would be evaluated in accordance with 20.2.72 NMAC and any other applicable permitting requirements based on the information submitted at that time.

2. HEALTH AND COMMUNITY IMPACTS

The comments in this category raise concerns regarding the potential health, environmental, and community impacts associated with emissions and operation of the YGI Microgrid. Commenters expressed concerns about effects on nearby residents, including medically vulnerable populations, children, senior citizens, individuals with disabilities, and low-income households; the cumulative impacts of existing and proposed sources in the area; potential exposure to CO_2 and ozone-forming pollutants; the effects of heat generated by the YGI Microgrid on local temperatures and ozone formation; and environmental justice considerations. Responses are developed for the following public health and wildlife comments:

2.1. General concern about potential impacts to medically vulnerable individuals, children, senior citizens, individuals with disabilities, and low-income households
2.2. Cumulative air and non-air quality impacts
2.3. CO_2 emissions and health impacts
2.4. Ozone contributions
2.5. Impact of waste heat on surrounding region
2.6. Environmental justice

2.1 General concern about potential impacts to medically vulnerable individuals, children, senior citizens, individuals with disabilities, and low-income households

Commenters expressed concerns regarding potential impacts to medically vulnerable individuals, children, senior citizens, individuals with disabilities, and low-income households. NMED-AQB recognizes that these populations may be particularly sensitive to air quality concerns and therefore evaluated the YGI Microgrid to determine whether it can operate in compliance with applicable air quality regulations that are designed to protect public health, including sensitive populations.

HAPs are regulated under Section 112 of the Clean Air Act because of their potential to cause adverse human health and environmental effects. EPA has established regulatory programs for HAPs to reduce public exposure to these pollutants and their associated health risks. NMED-AQB evaluates HAP emissions as part of its air permitting review to ensure that applicable regulatory requirements are met.

NMED-AQB has a responsibility to ensure that new sources seeking construction permits comply with applicable air quality requirements and demonstrate that emissions will remain below applicable regulatory standards established to protect public health and welfare. The ambient air quality standards, emissions limitations, and permitting requirements applied during NMED-AQB's review are intended to protect the general public, including sensitive populations such as children, older adults, individuals with pre-existing health conditions, and other potentially vulnerable groups.

The permit application relies on emissions data developed from manufacturer testing and emissions testing of the fuel cell technology proposed for use at the YGI Microgrid. Although the proposed project is larger than existing individual installations of this technology, the fuel cell units themselves are standardized and manufactured to the same specifications as the fuel cell units used to develop the emissions estimates. The draft permit requires the YGI Microgrid to test new and existing fuel cell units at the facility and calculate annual emissions based on the maximum values of the most recent stack test results, as described in the “Draft Permit Enforceable Conditions” section of this document.

As part of the application, the applicant also conducted air dispersion modeling to evaluate the impact of the YGI Microgrid's emissions on the surrounding area. The dispersion modeling analysis, including its assumptions, results, and conclusions, is discussed further in Section 2.2.

The YGI Microgrid must comply with all applicable permit limits at all times. If monitoring or testing indicates noncompliance with permit requirements, the YGI Microgrid would be subject to the applicable enforcement provisions of state and federal law.

2.2 Cumulative air and non-air quality impacts

Commenters raised concerns regarding cumulative impacts from the proposed project, including air quality impacts and other potential community impacts such as noise, heat generation, water use, wastewater generation, land use, and electrical service reliability. NMED-AQB acknowledges these concerns. However, NMED-AQB's review under the Air Quality Control Act and 20.2.72 NMAC is limited to air quality impacts and compliance with applicable air quality requirements.

To evaluate potential air quality impacts from the YGI Microgrid, NMED-AQB reviewed the applicant's air dispersion modeling analysis. Air dispersion modeling is a regulatory tool used to estimate ambient pollutant concentrations resulting from emissions from a proposed source and to assess compliance with applicable air quality standards. The modeling analysis utilized source characteristics, emission rates, stack parameters, local terrain, meteorological data, and, where required, emissions from nearby sources. NMED-AQB's air modeling team reviewed the modeling methodology, assumptions, input data, and results as part of the permit review process.

The modeling analysis evaluated potential offsite air quality impacts from emissions of CO, nitrogen dioxide (NO_2), SO_2, PM_{10} and $PM_{2.5}$. Potential impacts from ozone precursors and selected hazardous air pollutants were also evaluated. Consistent with applicable modeling guidance, nearby emission sources within the modeling domain were included where required.

The modeling results demonstrated that emissions from the YGI Microgrid are not expected to cause or contribute to an exceedance of any applicable NAAQS or PSD increment. For CO, NO_2, and SO_2, modeled concentrations were below the applicable Significant Impact Levels (SILs), indicating that project impacts were not significant. For PM_{10} and $PM_{2.5}$, cumulative analyses were performed using nearby source impacts and representative background concentrations. The resulting cumulative concentrations remained below the applicable NAAQS and PSD increment limits.

Specifically, the highest predicted 24-hour PM_{10} concentration, including background concentrations, was approximately 52 percent of the applicable NAAQS. The highest predicted 24-hour $PM_{2.5}$ concentration was approximately 79 percent of the applicable NAAQS, while the highest predicted annual $PM_{2.5}$ concentration was approximately 68 percent of the applicable NAAQS. All modeled concentrations remained below the applicable air quality standards established to protect public health and welfare.

Based on its review of the modeling analysis, emissions calculations, application materials, and supporting documentation, NMED-AQB determined that emissions from the YGI Microgrid will not cause or contribute to exceedances of applicable air quality standards. The draft permit also contains emission limits, monitoring requirements, testing requirements, recordkeeping requirements, and reporting requirements that provide a means of demonstrating and verifying ongoing compliance.

To the extent commenters raised concerns regarding cumulative impacts associated with noise, heat generation, water use, wastewater management, land use, electrical service reliability, or other non-air-quality issues, those matters are generally outside the scope of NMED-AQB's permitting authority and are not regulated through this air quality permit.

Accordingly, NMED-AQB evaluated cumulative air quality impacts to the extent required by applicable air quality regulations and modeling guidance and determined that the YGI Microgrid is predicted to comply with applicable air quality standards and permitting requirements.

2.3. CO_2 emissions and health impacts

Commenters expressed concerns about the greenhouse gas potential emissions of more than ten million tons per year of CO_2e and associated health concerns with CO_2 exposure. Comments references 2025 and 2026 research that links elevated CO_2 to permanent changes in human blood chemistry, oxidative stress, and cognitive decline.

NMED-AQB reviewed the commenters' concerns regarding potential health effects associated with CO_2 exposure. However, the permit review process evaluates whether emissions from the YGI Microgrid comply with applicable air quality regulations and standards. CO_2 is not regulated through a NAAQS, NMAAQS, or HAP standard applicable to this permitting action. Accordingly, there are no regulatory ambient concentration limits for CO_2 that NMED-AQB can apply in evaluating this permit application.

As described previously, EPA established air modeling guidance for criteria air pollutants, HAPs and TAPs[1]. Air Quality Dispersion Model (AERMOD) is the agency preferred and recommended dispersion modeling system, which the applicant used for evaluating its impact on its application. CO_2 is not subject to a National Ambient Air Quality Standard and is not evaluated through the same air dispersion modeling framework used for criteria pollutants and hazardous air pollutants."

Comments also expressed concerns regarding broader environmental impacts on the surrounding community. To the extent these concerns relate to air quality, NMED-AQB addressed them through its review of the YGI Microgrid's emissions, applicable regulatory requirements, and air dispersion modeling analysis. To the extent the concerns relate to issues other than air quality, such as land use, community planning, facility siting, or localized temperature effects, those matters are outside the scope of NMED-AQB's air permitting authority and will be addressed separately in Section 3 of this response document.

Accordingly, based on NMED-AQB's technical review, including evaluation of the YGI Microgrid's emissions and air quality impacts, the YGI Microgrid complies with the applicable air quality regulations and permitting requirements governing this permitting action.

2.4 Ozone contributions

Commenters expressed concerns that the YGI Microgrid will emit large quantities of ozone precursor pollutants near existing EPA ozone nonattainment areas. Commentors implore NMED-AQB to study whether the project's emissions of NO_x and VOC will contribute to ozone violations.

Nonattainment areas are geographic regions where outdoor air quality is worse than the NAAQS for specific pollutants. El Paso-Las Cruces, TX-NM, located approximately 4 miles from the YGI Microgrid, is listed as in marginal nonattainment with the 2015 8-hour ozone standard. In accordance with 20.2.72.208 NMAC, NMED-AQB is required to deny an application for an air quality permit if the pollution "will cause or contribute to air contaminant levels in excess of" the ozone NAAQS "unless ambient air impact is offset." NMED reviewed the applicant's ambient impact analysis and found that it demonstrates that the YGI Microgrid will not cause or contribute to air contaminant levels in excess of the ozone NAAQS.

Pollutants formed through chemical reactions in the atmosphere are referred to as secondary pollutants. Ground-level ozone is a secondary pollutant formed through "complicated, nonlinear process that depends on meteorological conditions in addition to VOC and NO_x concentrations (Seinfeld and Pandis, 2012). Warm temperatures, clear skies (abundant levels of solar radiation), and stagnant air masses (low wind speeds) increase O_3 formation potential (Seinfeld and Pandis, 2012)."[2] EPA's approved air dispersion model, AERMOD, cannot calculate ozone concentrations downwind of NO_x and VOC sources because it

[1] Air Dispersion Modeling. Available at: https://www.epa.gov/air-research/air-quality-modeling#air-dispersion

lacks the photochemical grid mechanisms required to track secondary pollutant formation. As a result, EPA and NMED recommend a two-tiered approach to evaluate ozone impacts.

NMED-AQB's regulatory guideline indicates that, in most cases, PSD major sources can demonstrate compliance with ozone standards using the Tier 1 demonstration tool, modeled emission rates for Precursors (MERP). However, NMED-AQB does not require that the MERP analysis be performed for minor PSD sources, such as the YGI Microgrid, because NMED previously determined that these facilities will not cause or contribute to concentrations above the ozone NAAQS. Section 2.6.5.2 of the NMED guideline, Ozone compliance demonstration for PSD minor sources, states:

> *Any source that emits over 250 tons/year of* NO_x *or VOCs is classified as a major source in the PSD program. (Some categories have lower thresholds than this, but all above 250 are PSD major.) The MERP values presented in Table 10 and Table 11 that produce the highest concentrations indicate that facilities emitting no more than 250 tons/year of* NO_x *and no more than 250 tons/year of VOCs will cause less formation of O3 than the O3 significance level. The calculation follows.*
>
> $$[O_3]_{8-hour} = \left(\frac{250 \frac{ton}{yr}}{340_{MERP_{NOX}}} + \frac{250 \frac{ton}{yr}}{4679_{MERP_{VOC}}} \right) \times 1.96\ \mu g/m^3$$
> $=1.546\ \mu g/m^3$, which is below the significance level of $1.96\ \mu g/m^3$.
>
> *This calculation demonstrates that any source that may be categorized as minor with respect to PSD will produce concentrations below the ozone SIL documented above. (Some PSD major sources may also have impacts below SILs.) Sources that produce concentrations below SILs do not cause or contribute to air contaminant levels in excess of any air quality standards or PSD increments.*

However, the applicant voluntarily performed the MERPs analysis for the YGI Microgrid. This analysis resulted in an 8-hour ozone concentration of 0.0915 ppb, which is less than the EPA significance threshold of 1.0 ppb.

The following were the inputs for the MERPs analysis:

NO_x (ton/yr)	$MERP_{NOX}$	VOCs (ton/yr)	$MERP_{VOC}$	$[O_3]_{8\text{-hour}}$
37.20	413.5	124.01	82121	0.0915 ppb

For the analysis, the applicant selected MERP values using EPA's "MERPs View Qlik" for a hypothetical source in Otero County, NM based on the criteria provided in the MERPs guidance, which include proximity, terrain and land use, climate, regional sources of pollutants, and background pollutant concentrations. Otero County's proximity to the YGI Microgrid along with similarities in terrain were the primary reasons for selecting it as a hypothetical source. The applicant selected MERPs values for a hypothetical source with a 10-meter-tall stack and an emission rate of 500 tons/yr (the closest value to the project's annual emissions).

2.5 Impact of waste heat on surrounding region

Commenters expressed concerns that heat released from the YGI Microgrid, including elevated stack exhaust temperatures, could increase local temperatures and contribute to ozone formation.

NMED-AQB notes that ozone formation is primarily driven by photochemical reactions involving ozone precursor pollutants, including NO_x and VOCs, in the presence of sunlight. Evaluation of ozone impacts

associated with emissions of these precursor pollutants is within the scope of the air permitting review and was addressed through the ozone precursor analysis conducted for the YGI Microgrid.

Consistent with EPA and NMED guidance, the applicant evaluated potential ozone impacts using the MERPs approach. The MERPs methodology is based on EPA photochemical modeling analyses that evaluated the relationship between precursor emissions and downwind ozone formation under a range of source and meteorological conditions. Based on this analysis, emissions of ozone precursors from the YGI Microgrid were determined to be below the applicable levels of concern for ozone impacts.

To the extent commenters are concerned that heat released by the YGI Microgrid could increase ambient temperatures and thereby influence ozone formation, localized temperature effects are not evaluated under the air quality modeling requirements applicable to this permitting action. NMED-AQB's review is focused on emissions of regulated air pollutants and compliance with applicable air quality requirements.

2.6 Environmental justice

Commenters expressed concerns regarding environmental justice, including allegations that communities in southern Doña Ana County have historically borne disproportionate environmental burdens and that approval of an additional industrial facility could further affect nearby communities. Commenters also raised concerns regarding meaningful public participation, language accessibility, and consideration of potentially affected low-income, minority, and limited-English-proficiency populations.

NMED-AQB recognizes that environmental justice includes both the fair treatment of all people and meaningful involvement in environmental decision-making regardless of race, color, national origin, income, tribal affiliation, or language proficiency. Consistent with these principles, NMED-AQB evaluated the YGI Microgrid's air quality impacts through its technical review process and implemented public involvement measures intended to facilitate participation by potentially affected communities.

As part of the permitting review, NMED-AQB evaluated emissions from the YGI Microgrid and reviewed air quality analyses, including air dispersion modeling, to determine whether the YGI Microgrid is expected to comply with applicable air quality requirements. The purpose of this review is to evaluate whether emissions from the proposed source will comply with applicable state and federal air quality regulations and standards established to protect public health and welfare. The results of NMED-AQB's technical review are discussed elsewhere in this response document, including the sections addressing air quality impacts, cumulative air quality impacts, and impacts to sensitive populations.

NMED-AQB also recognizes that environmental justice concerns may encompass issues beyond air quality, including historical patterns of development, community conditions, land use, infrastructure, and cumulative environmental burdens. However, NMED-AQB's authority in this permitting action is limited to implementation of the Air Quality Control Act and applicable air quality regulations. Accordingly, NMED-AQB's review is focused on evaluating emissions from the proposed source, compliance with applicable air quality requirements, and the permit conditions necessary to ensure such compliance.

To promote meaningful public participation, NMED-AQB implemented a Public Involvement Plan (PIP) and Limited English Proficiency (LEP) Plan for this permitting action. These plans were developed using demographic information and environmental justice screening tools to identify communities that could benefit from enhanced outreach and communication. The PIP and LEP processes are intended to facilitate participation by potentially affected populations, including low-income communities, minority populations, and individuals with limited English proficiency.

As part of these efforts, NMED-AQB provided public notice to surrounding communities and governmental entities, including jurisdictions beyond the minimum notification area typically required for construction permitting actions. NMED-AQB also provided notice to numerous Tribes, Pueblos, or Nations and

distributed information through mailings, electronic notifications, and established mailing lists for interested persons and organizations.

In addition, NMED-AQB has committed to providing language assistance and translation services for public hearings and other public participation opportunities associated with this permitting action. Permit-related documents, notices, and hearing information have been made available in both English and Spanish to facilitate participation by limited-English-proficiency populations. These measures were implemented to help ensure that members of the public have meaningful opportunities to review information, submit comments, and participate in the permitting process.

3. PRACTICAL ENFORCEABILITY

The comments in this category raise concerns regarding the adequacy of the draft permit's monitoring, recordkeeping, reporting, and testing requirements and whether those requirements are sufficient to ensure compliance with applicable emission limits. Commenters questioned the enforceability of emissions limits for YGI Microgrid as a whole, the ability to verify emissions from the fuel cell system, the mechanisms for detecting and quantifying potential natural gas leaks or venting events, and whether CEMS should be required. The responses below explain the monitoring, testing, recordkeeping, reporting, and operational requirements included in the draft permit, as well as NMED-AQB's basis for determining that the permit contains practically enforceable conditions that provide reasonable assurance of compliance with applicable air quality requirements. Responses are developed for the following practical enforceability comments:

3.1. Insufficient monitoring requirements in the permit application
3.2. Enforceability of emissions from the YGI Microgrid
3.3. Potential use of CEMS to ensure compliance

3.1 Insufficient monitoring requirements in the permit application

Commenters suggest that the permit should be found to be incomplete because it does not include monitoring, recordkeeping and reporting requirements to ensure compliance. Consistent with this requirement, 20.2.72.210 NMAC authorizes NMED-AQB to establish permit conditions necessary to ensure compliance with applicable air quality requirements. Specifically, 20.2.72.210(C)(3) NMAC authorizes NMED-AQB to require instrumentation to monitor and record emissions-related data, including continuous emission monitoring where appropriate; 20.2.72.210(C)(4) NMAC authorizes NMED-AQB to require reasonable sampling, testing, monitoring, and associated protocols; and 20.2.72.210(C)(5) NMAC authorizes NMED-AQB to require periodic emissions testing. In addition, 20.2.72.210(E) NMAC requires permittees to establish and maintain records regarding the nature and volume of emissions as well as submitting periodic reports as necessary to carry out the purposes of the Air Quality Control Act. Further, 20.2.72.210(D) NMAC provides that permit terms and conditions imposed by NMED-AQB are enforceable to the same extent as a regulation adopted by the Environmental Improvement Board.

NMED-AQB has developed a comprehensive set of monitoring, testing, recordkeeping, reporting, and operational requirements for the proposed YGI Microgrid. The draft permit includes periodic monitoring of key operating parameters, representative stack testing, emissions calculations, record retention, deviation reporting, excess emissions reporting, and implementation of an NMED-approved monitoring plan. Key permit conditions are described in the “Draft Enforceable Conditions” section of this document. Together, these requirements provide multiple separate mechanisms for demonstrating compliance and identifying departures from permit requirements.

3.2 Enforceability of emissions from the YGI Microgrid

Commenters raised concerns regarding the agency's ability to assess and verify emissions from the fuel cells and from natural gas leaking or venting at the YGI Microgrid after installation and operation. Commenters also questioned whether NMED-AQB can effectively enforce compliance under 20.2.72 NMAC across a large number of fuel cell units without add-on pollution control equipment or CEMS for pollutants such as PM, VOC, and CO_2.

Key permit conditions are described in the “Draft Enforceable Conditions” section of this document.

To assess and verify emissions from fuel cells, the draft permit requires ongoing testing of representative fuel cell clusters to verify that actual emissions remain consistent with the emissions used to establish the permit limits. This approach ensures that a representative sample of clusters from each installation year continues to be evaluated. As a result, NMED can verify that emissions performance remains consistent over time and that the fuel cell system continues to comply with permitted emission limits. This approach allows NMED to assess the ongoing performance of the fuel cells over time and provides a mechanism for identifying any degradation or changes in emissions characteristics as equipment ages.

To assess and verify emissions from natural gas leaking or venting, the draft permit contains specific monitoring requirements designed to detect natural gas losses that could indicate leaks within the YGI Microgrid’s gas handling systems. By comparing the total natural gas entering the facility with the combined flow delivered to the fuel cell units, the permit establishes a mechanism for identifying unexplained gas losses that may be indicative of leaks within facility piping or associated equipment. This requirement is intended to provide ongoing verification that natural gas is being conveyed to the process as intended and is not being released to the atmosphere.

NMED will review the comprehensive monitoring plan required under Condition A601.H of the draft permit to ensure that all required monitoring is conducted effectively.

NMED-AQB's review of permits for similar fuel cell facilities did not identify in-field stack testing or facility-wide gas balance monitoring requirements comparable to those included in the draft permit.

Consistent with NMED-AQB's authority under 20.2.72 NMAC, these monitoring provisions provide a reasonable and enforceable mechanism for detecting potential leaks, responding to abnormal operating conditions, and documenting compliance. Combined with the permit's recordkeeping, reporting, and deviation notification requirements, the monitoring conditions provide information that can be used by NMED-AQB to evaluate compliance and facility performance during inspections and compliance reviews.

3.5 Potential use of CEMS to ensure compliance

Commenters assert that emissions from the fuel cell clusters should be combined into a smaller number of exhaust systems to allow installation of CEMS.

NMED-AQB recognizes that commenters view CEMS as a superior means of providing continuous emissions data and additional compliance assurance. However, practical enforceability does not require that every emission unit be equipped with a CEMS or that emissions be monitored continuously at each exhaust point. Rather, permit conditions must contain sufficient monitoring, recordkeeping, reporting, and testing requirements to allow both the permittee and NMED to determine compliance with applicable emission limits.

The YGI Microgrid is not subject to any specific regulatory requirement that would mandate the installation of CEMS for fuel cell unit exhaust streams. The draft permit contains multiple separate compliance assurance mechanisms that provide a reasonable and enforceable means of demonstrating compliance. The draft permit requires the YGI Microgrid to test new and existing fuel cell units at the

facility and calculate annual emissions based on the maximum values of the most recent stack test results, as described in the "Draft Permit Enforceable Conditions" section of this document. NMED-AQB determined that the monitoring requirements included in the draft permit are appropriate for the proposed source and the pollutants being regulated.

Furthermore, centralizing emissions from thousands of fuel cell clusters into a small number of common exhaust stacks would constitute a fundamentally different facility design than the one proposed by the applicant. NMED-AQB's responsibility is to evaluate the facility as proposed and determine whether the applicant has demonstrated compliance with applicable regulatory requirements. Neither 20.2.70.302.B NMAC nor 20.2.72 NMAC requires an applicant to redesign a project to facilitate installation of CEMS when other practically enforceable compliance mechanisms are available.

4. OPERATIONS AND PERMITTING

The comments in this category raise concerns regarding the design, operation, and technical characteristics of the YGI Microgrid and the fuel cell technology it employs. Commenters questioned the reliability and scalability of the proposed fuel cell systems, the adequacy of controls to prevent fugitive emissions, the operating temperature range of the equipment, and the basis for excluding emissions associated with the nearby data center from the permit application. Commenters also requested information regarding the types of emission units included in the project and whether alternative technologies for electricity generation were considered. Responses are developed for the following practical operations and permitting comments:

4.1. General reliability
4.2. On-site controls for fugitives
4.3. Technical feasibility of scalability of fuel cell technology
4.4. Alternatives to fuel cell electricity generation
4.5. Emission unit types
4.6. Exclusion of emissions from the nearby data center
4.7. Operating temperature range

4.1. General reliability

Commenters expressed concerns regarding the reliability of the YGI Microgrid and whether the fuel cells will consistently provide sufficient power for the associated data center.

NMED-AQB acknowledges these concerns. However, the purpose of this permitting action under the Air Quality Control Act and 20.2.72 NMAC is to evaluate air emissions from the proposed source and determine compliance with applicable air quality requirements. Questions regarding electrical reliability, business continuity, or whether the fuel cell system will meet the data center's operational needs are not permitting criteria under 20.2.72 NMAC.

NMED-AQB notes that the permit application does not include backup generators, turbines, or other combustion-based power sources. The applicant stated that the proposed fuel cell systems are intended to provide both primary and backup power for the data center and that additional combustion-based backup equipment is not anticipated. To further ensure that emissions remain consistent with those evaluated in the permit application, Condition A108.C limits power generation to the fuel cell system only.

If the YGI Microgrid proposes to install additional emission units in the future, those units would be subject to evaluation under the applicable requirements of 20.2.72 NMAC and may require permit revisions or additional permitting actions before construction or operation.

4.2. On-site controls for fugitives

Commenters expressed concerns regarding the potential for methane emissions resulting from leaks of natural gas or reformed fuel gas within the YGI Microgrid. NMED-AQB evaluated the fugitive emissions information provided in the permit application and requested additional information from the applicant regarding the monitoring and detection of potential gas losses. Based on its review of the application materials and supplemental information, NMED-AQB incorporated monitoring and compliance requirements into the draft permit pursuant to 20.2.72 NMAC to provide a means of identifying abnormal operating conditions and ensuring compliance with applicable air quality requirements.

Potential leaks of methane-containing natural gas or reformed fuel gas within the fuel cell system are expected to be identified through continuous monitoring of key operating parameters, including pressure and temperature. Each fuel cell unit is required to be equipped with independent sensors, controls, and automated shutdown capabilities. The use of this system is made enforceable under Condition A601.A, as described in the "Draft Permit Enforceable Conditions" section of this document.

The draft permit also includes monitoring requirements designed to identify potential losses of natural gas within the YGI Microgrid's distribution system before the gas reaches the fuel cell units, as described in the "Draft Permit Enforceable Conditions" section of this document.

NMED-AQB evaluated whether a leak detection and repair (LDAR) program should be required for the YGI Microgrid. During permit development, NMED-AQB reviewed the applicability of the Department's VOC/HAP Fugitive Monitoring Decision Tree (April 19, 2017). Based on that review, NMED-AQB determined that an LDAR program was not required because the YGI Microgrid is not subject to applicable federal LDAR requirements under New Source Performance Standards (NSPS) or National Emission Standards for Hazardous Air Pollutants (NESHAP), the permit does not rely on enforceable fugitive emission limits for compliance demonstrations, and estimated fugitive emissions are below 25 tons per year.

4.3. Technical feasibility of scalability of fuel cell technology

Commenters expressed concerns that the scale of the proposed project is unprecedented and unproven. Commenters noted that the YGI Microgrid would be substantially larger than other Bloom Energy fuel cell installations currently in operation.

NMED-AQB acknowledges that the proposed project represents a larger deployment of this technology than currently exists at a single site and that publicly available operating data for comparable facilities are limited. Regardless of the technology utilized or the scale of the installation, the applicant remains subject to all applicable federal and state air quality requirements and must demonstrate compliance with the permit conditions and emission limitations established through this permitting action.

NMED-AQB does not expect facility size alone to affect the emissions performance of individual fuel cell units. The fuel cell units authorized under the draft permit are identical in design and operation to the units used to develop the emissions factors and to the units that will undergo compliance testing after installation. Emissions are evaluated on a unit-specific basis and then aggregated to determine facility-wide impacts.

Because the emissions data available during permit review were derived primarily from laboratory testing and limited field-testing information, NMED-AQB included permit conditions requiring verification of emissions under actual operating conditions. The draft permit requires the YGI Microgrid to test new and existing fuel cell units at the facility and calculate annual emissions based on the maximum values of the most recent stack test results, as described in the "Draft Permit Enforceable Conditions" section of this document. These requirements will allow NMED-AQB to evaluate emissions performance under actual

field conditions and verify that emissions remain consistent with the assumptions used during permit review.

4.4 Alternatives to fuel cell electricity generation

Commenters asserted that viable alternatives to the proposed fuel cell facility exist, including renewable energy resources, utility-supplied electricity, energy storage technologies, and other forms of electric generation. Commenters suggested that these alternatives may result in lower environmental impacts than the proposed project and therefore should be pursued in lieu of the YGI Microgrid proposed in the permit application.

Concerns related to broader energy planning, renewable energy development, electricity market decisions, project economics, infrastructure planning, or questions regarding whether alternative technologies may provide different environmental benefits, are generally outside the scope of this air permitting action. NMED-AQB's authority in this proceeding is limited to evaluating the proposed source under the applicable requirements of the Air Quality Control Act and 20.2.72 NMAC. The purpose of a construction permit review under the New Mexico Air Quality Control Act and 20.2.72 NMAC is to evaluate the specific source proposed by the applicant and determine whether that source can comply with applicable air quality requirements.

NMED-AQB's review is focused on evaluating the emissions associated with the YGI Microgrid, determining the applicability of state and federal air quality regulations, and establishing permit conditions necessary to ensure compliance with those requirements. Accordingly, the relevant question for this permitting action is not whether other technologies may be available, but whether the proposed source can be operated in compliance with applicable air quality regulations and permit conditions.

Based on its review of the permit application, supporting technical information, air quality analyses, and the conditions included in the draft permit, NMED-AQB determined that the YGI Microgrid can comply with the applicable air quality requirements when operated in accordance with the draft permit. Accordingly, the existence of other potential technologies or project alternatives does not provide a regulatory basis for denying the permit.

4.5 Emission unit types

Commenters expressed concerns that emissions from diesel engines were not included in the permit application or the YGI Microgrid's potential emissions calculations.

NMED-AQB evaluated the equipment identified in the permit application and notes that the YGI Microgrid does not include diesel-fired engines as emission units subject to this permitting action. Under 20.2.72 NMAC, an applicant is required to identify the sources and emission units proposed for construction or modification and provide information sufficient for NMED-AQB to evaluate emissions from those units and determine compliance with applicable air quality requirements. NMED-AQB's review is therefore limited to the emission units and activities that are part of the proposed source described in the permit application.

Based on the information submitted by the applicant, the YGI Microgrid's electrical power generation, including backup power requirements, will be supplied by the fuel cell system that are the subject of this permitting action. Because no diesel-fired engines or generators were proposed as part of the YGI Microgrid, emissions from such equipment were not included in the YGI Microgrid's potential emissions calculations, air quality analyses, or draft permit conditions.

To the extent commenters are concerned that diesel engines may be added in the future, any future installation of diesel-fired generators, engines, or other emission units would be subject to review under

the applicable requirements of 20.2.72 NMAC. Depending on the emissions potential and regulatory applicability of the proposed equipment, a permit revision or additional permitting action may be required before such equipment could be constructed or operated.

4.6 Exclusion of emissions from the nearby data center

Commenters express concerns that emissions associated with the proposed data center may not have been adequately addressed in the permit application.

The applicant has confirmed that the data center will not include any separate air emission sources requiring evaluation under this permitting action. Based on the permit application and information provided by the applicant, no additional prime power generation units, emergency generators, boilers, turbines, engines, or other combustion sources are proposed for installation at the data center. All electrical power, including both primary and backup power, will be supplied by the microgrid equipment evaluated in the permit application and addressed by the draft permit.

Accordingly, based on the information submitted in the permit application, NMED-AQB determined that the air quality impacts associated with supplying power to the proposed data center are adequately represented by the emissions from the microgrid evaluated in this permitting action.

4.7 Operating parameter temperature range

Commenters express concerns that the conditions at the YGI Microgrid may exceed the operating temperature range of -4 °F to 113 °F provided in the Bloom Energy Data Sheet included in the air permit application. Commentors note that the application does not include information about what happens to the fuel cell units when ambient temperatures exceed their operating limit.

NMED-AQB's review under the Air Quality Control Act and the air permitting regulations is focused on evaluating potential air emissions and determining whether the YGI Microgrid can comply with applicable air quality requirements. The draft permit does not establish or approve the manufacturer's equipment specifications, nor does it evaluate equipment performance for purposes unrelated to air quality compliance. However, to the extent that operating conditions could affect emissions or compliance with permit requirements, the draft permit includes provisions to ensure that such conditions are identified and addressed.

As described in the "Draft Permit Enforceable Conditions" section of this document, the draft permit requires the permittee to develop and implement a comprehensive monitoring plan that establishes appropriate operating parameter ranges for the fuel cell systems. The permit further requires continuous monitoring of key operating parameters, including temperature, and requires each fuel cell unit to be equipped with automated controls capable of initiating immediate shutdown and isolation of the affected unit when monitored parameters fall outside approved operating ranges.

These requirements are intended to ensure that fuel cell units operate within established parameters that are demonstrated to be representative of compliant operation. If operating conditions occur that could affect emissions performance, the YGI Microgrid's monitoring and control systems must identify those conditions and take corrective action, including automatic shutdown of affected units when necessary.

5. EXTENSION FOR PUBLIC COMMENTS AND PUBLIC HEARING REQUESTS

Commenters raised concerns regarding the adequacy of the public comment period, requested additional opportunities for public participation, and requested that public hearings be conducted in a manner that facilitates meaningful involvement by potentially affected communities. Other commenters expressed concerns regarding the completeness of information provided in support of the permit application.

NMED-AQB recognizes the importance of meaningful public participation in the permitting process. Public notice for this permitting action was provided in accordance with applicable regulatory requirements, and opportunities for public review and comment were made available throughout the permitting process. In addition, NMED-AQB developed and implemented a PIP and LEP Plan to facilitate participation by potentially affected communities.

The permitting process was subsequently affected by judicial proceedings that resulted in a stay of the permitting action and the cancellation of a previously scheduled public hearing. Because the hearing did not occur as originally scheduled, additional time has elapsed since the original public notice and comment period. Information regarding future hearing schedules and opportunities for public participation will be made available through NMED-AQB's public notice website.

NMED-AQB also provides multiple avenues for public participation, including submission of written comments, participation in public hearings, and review of permit-related documents. Consistent with the PIP and LEP processes, language assistance and translation services are available to facilitate participation by limited-English-proficiency populations.

6. SUPPORT FOR PROJECT

Comments argue that the permit must be denied only if the proposed project will fail to meet applicable regulations or cause or contribute to the exceedance of a NAAQS or NMAAQS, or otherwise violate the Air Quality Control Act. Commenters expressed support for the proposed project, citing anticipated benefits such as employment opportunities, economic investment, and potential contributions to local infrastructure, public services, and utility systems.

NMED-AQB agrees that a permit may be issued only when a proposed facility complies with all applicable air quality requirements, does not cause or contribute to an exceedance of a NAAQS or NMAAQS, and does not otherwise violate the Air Quality Control Act or the requirements of Title 20, Chapter 2 NMAC.

NMED-AQB conducted a comprehensive review of the permit application to determine the applicability of all relevant regulatory requirements. Based on that review, NMED-AQB concluded that the YGI Microgrid can comply with those requirements when operated in accordance with the permit. Accordingly, NMED-AQB developed the draft permit to incorporate the emissions limitations, operational requirements, and other conditions necessary to ensure compliance with all applicable regulations. The draft permit also includes monitoring, recordkeeping, reporting, and notification requirements that provide a mechanism for demonstrating and verifying ongoing compliance throughout the life of the YGI Microgrid.

While NMED-AQB acknowledges commenters' support for the project and the potential benefits identified, permit decisions must be based on the criteria established in the Air Quality Control Act and Title 20, Chapter 2 NMAC.

7. WATER USAGE

Commenters expressed concerns regarding the quantity of water that may be consumed by the overall project and the potential impacts of that water use on local water resources. Several commenters questioned the sustainability of locating the project in an arid region and cited differing estimates regarding anticipated water consumption. Other commenters expressed concerns regarding potential impacts on regional groundwater resources and the Rio Grande.

NMED-AQB acknowledges these concerns. However, the purpose of this permitting action is to evaluate emissions from the proposed source and determine compliance with applicable air quality requirements under the Air Quality Control Act and 20.2.72 NMAC. Water withdrawals, water rights, water supply,

wastewater management, and other water-resource issues are regulated through separate statutory and regulatory programs and are administered by agencies with jurisdiction over those matters.

Accordingly, NMED-AQB's review of this permitting action is limited to air emissions from the proposed source and compliance with applicable air quality requirements. Water consumption and water-resource issues, while important public concerns, are outside the scope of the air quality permitting authority being exercised in this action.

8. HAZARDOUS WASTE

Commenters expressed concerns regarding allegations that Bloom Energy has improperly managed or disposed of hazardous waste at other facilities and questioned whether similar issues could occur at the YGI Microgrid. Commenters also raised concerns regarding potential environmental releases associated with wastes generated during operation of the fuel cell systems.

NMED-AQB acknowledges these concerns. However, hazardous waste generation, characterization, storage, transportation, treatment, and disposal are regulated under separate state and federal hazardous waste management programs, including the Resource Conservation and Recovery Act (RCRA), and are outside the scope of this air quality permitting action. The purpose of this permit review is to evaluate air emissions from the proposed source and determine compliance with applicable air quality requirements under the Air Quality Control Act and 20.2.72 NMAC.

Accordingly, NMED-AQB's review of this permitting action is limited to air emissions from the proposed source and compliance with applicable air quality requirements. Hazardous waste generation, storage, and disposal, while important public concerns, are outside the scope of the air quality permitting authority being exercised in this action.

Commenters also requested denial of the permit based on concerns regarding Bloom Energy's operating history. NMED-AQB reviewed these comments but notes that they did not identify specific information alleged to have been omitted from the application or explain how such information would affect the air quality review for this permitting action. To the extent the comments relate to matters outside the scope of this air quality permit review, including issues regulated under other environmental programs, those matters are addressed under the applicable regulatory authorities and are not determinative of this permit decision.

9. SAFETY CONCERNS RELATED TO CATASTROPHIC FAILURES

Commenters expressed concerns regarding the potential consequences of catastrophic equipment failures and the handling of hydrogen-containing fuel streams within the YGI Microgrid.

The purpose of a construction permit review under the New Mexico Air Quality Control Act and 20.2.72 NMAC is to evaluate whether a proposed source can comply with applicable air quality requirements and whether emissions from the source will meet applicable regulatory standards. Consistent with that authority, NMED-AQB evaluated the emissions associated with the YGI Microgrid and developed permit conditions intended to ensure compliance with applicable air quality requirements. The permit review does not constitute an approval of equipment design, nor does it serve as an evaluation of every potential accident, failure scenario, or operational contingency that could occur during the life of the YGI Microgrid.

NMED-AQB notes that the YGI Microgrid does not include a stand-alone hydrogen production, storage, or distribution system. Rather, natural gas is supplied to the fuel cell units, where it is converted within the integrated fuel reforming process into a hydrogen-rich fuel stream that is used within the fuel cell system to generate electricity. The YGI Microgrid operations do not involve the storage or transportation of large quantities of pure hydrogen in the manner described by some commenters.

Several commenters expressed concerns that equipment failures could occur because of the large size of the proposed facility and suggested that the permit should therefore be denied.

Under the Air Quality Control Act and 20.2.72 NMAC, permit decisions must be based on whether the proposed facility can comply with applicable air quality requirements and permit conditions. The draft permit includes several conditions which will ensure that emissions resulting from abnormal operating conditions are identified and reported. As described in the "Draft Permit Enforceable Conditions" section of this document, the draft permit requires continuous monitoring of key operating conditions and automatic shutdown of affected fuel cell units if abnormal conditions are detected. The permit also requires monitoring of natural gas flow rates throughout the facility to identify natural gas leaks.

STATE OF NEW MEXICO
BEFORE THE SECRETARY OF ENVIRONMENT

AQB 26-57(P)

IN THE MATTER OF: THE APPLICATION OF YUCCA GROWTH INFRASTRUCTURE, LLC FOR AN AIR QUALITY PERMIT, NO. NSR 10883

AMENDED NOTICE OF PUBLIC HEARING

The New Mexico Environment Department ("Department" or "NMED") announces a hybrid public hearing to take evidence on the application for an air quality construction permit for a facility located in Doña Ana County pursuant to the New Mexico Air Quality Control Act, NMSA 1978 Sections 74-2-1 through 74-2-17 ("Act"), and regulations within Part 20.2.72 NMAC. The permit application to be considered in this hearing pertains to the YGI Microgrid as submitted by Yucca Growth Infrastructure, LLC ("Yucca").

This Amended Notice of Public Hearing is provided pursuant to the Hearing Officer's July 29, 2026, Amended Scheduling Order and the provisions of 20.1.4.200 NMAC. Additionally, this Amended Notice of Public Hearing supersedes and serves to retract the initial the Notice of Public Hearing. The English language version of which was published in the Albuquerque Journal on July 17, 2026, and Las Cruces Sun on July 17, 2026, and the Spanish language version was published in the Las Cruces Sun on July 17, 2026, and in the Albuquerque Journal on July 18, 2026.

A copy of the Amended Scheduling Order, as well as all other filings in this matter may be obtained on the Department's website at the following location: go to https://www.env.nm.gov/opf/docketed-matters/; scroll to and select "Environment Department Cabinet Secretary"; then scroll to and select "AQB 26-57(P): Yucca Growth Infrastructure, LLC YGI Microgrid."

Brief Description of Permit Application:
Yucca has submitted a New Source Review permit application No. NSR 10883 to construct the YGI Microgrid which would consist of Bloom Energy Solid Oxide Fuel Cells ("SOFC") to generate 2,462 MW to power a nearby data center. Yucca's application requests that the YGI Microgrid be permitted to operate as Title V major source under the Act and Part 20.2.72 NMAC, and that it may operate continuously (8,760 hours per year). The YGI Microgrid is a new facility that intends to be located at latitude and longitude decimal degrees: 31.8183, -106.6792 Datum: WGS 84. To aid in locating this facility, the approximate location is 3.6 miles South of Santa Teresa in Doña Ana County, NM.

An electronic version of the permit application, its revisions, the Department's Draft Permit, the Department's Statement of Basis, as well as other previous materials and notices may be reviewed on the Department's website at the following location: go to https://www.env.nm.gov/public-notices/; scroll to and select Doña Ana County; then find and select the header labeled "Yucca Growth Infrastructure, LLC YGI Microgrid." If an individual is unable to obtain a copy of the draft permit at the above website or is seeking additional information, they may contact:

Applicant Contact Information:
Yucca Growth Infrastructure, LLC
600 Congress Ave, Suite 15041, Austin, TX 78701
(336) 339-2363
notices@borderplexdigital.com

Hearing Date, Time, and Location:
The hearing will begin at 9:00 a.m. on September 14, 2026, and will be conducted on consecutive days as needed or continued upon order of the Hearing Officer. The hearing will be conducted both virtually via Webex (see the link posted online in the Department's Calendar at https://www.env.nm.gov/events-calendar/) and in person at the following physical location in Sunland Park in Doña Ana County, New Mexico: Sunland Park Multi-Generational Center, 4700 McNutt Road, Sunland Park, New Mexico 88063. The hearing will have Spanish interpreters available on Webex.

Providing Non-Technical or General Public Comment:
The Hearing Officer will accept non-technical or general public comment in writing prior to the beginning of the hearing or in writing or verbally while the hearing record is open. Members of the public who wish to provide non-technical or general comment are encouraged to submit their comments in writing by using NMED's Public Comment Portal, including relevant evidence, data, views, arguments, written statements in lieu of oral testimony at the hearing, or public comment. Access the Public Comment Portal via a link on the Department's docketed matters web page www.env.nm.gov/opf/docketed-matters/. Look under the Environment Department Cabinet Secretary dropdown for "AQB 26-57(P): Yucca Growth Infrastructure, LLC YGI Microgrid". The direct link to the Public Comment Portal is http://nmed.commentinput.com.

Verbal non-technical testimony or general comment will be accepted at the hearing while the record is open. Pursuant to the Amended Scheduling Order individuals intending to provide non-technical verbal testimony or general public comment will be sworn in and allowed to submit comments throughout the first day of the hearing on September 14, 2026, and at various times throughout the hearing. Members of the public will have up to three (3) minutes to offer verbal non-technical testimony or general comment per individual, unless otherwise ordered by the Hearing Officer. The hearing will be conducted in accordance with the Environment Department Permitting Procedures, 20.1.4 NMAC, the procedures in Air Quality Construction Permits, 20.2.72 NMAC, and other applicable hearing procedures.

Entry of Appearance:
Any person who wishes to be a party in this proceeding must file with the Hearing Clerk at the address below an Entry of Appearance on or before August 24, 2026. A timely and complete Statement or Notice of Intent to Present Technical Testimony shall be considered an Entry of Appearance if the person filing such statement has not previously filed a separate Entry of Appearance.

Luis Lopez
Hearing Clerk
Office of Public Facilitation
New Mexico Environment Department
1190 St. France Drive
P.O. Box 5469
Santa Fe, New Mexico 87502
Luis.lopez@env.nm.gov

A person's failure to file a timely Statement of Intent or Entry of Appearance substantially complying with these requirements shall preclude the person from becoming a party but shall not preclude a person from presenting written or oral non-technical testimony or general public comments.

Statement of Intent to Present Technical Testimony:
Any person who intends to present technical evidence or technical testimony at the public hearing must file a Statement or Notice of Intent ("NOI") to Present Technical Testimony with the Hearing Clerk on or before August 24, 2026, and serve an electronic copy of the foregoing on all other parties. The NOI must be filed with the Hearing Clerk at the following email:

Luis Lopez
Hearing Clerk
Office of Public Facilitation
New Mexico Environment Department
Luis.lopez@env.nm.gov

The NOI to Present Technical Testimony shall: (i) identify the person filing the statement; (ii) state whether the person filing the statement supports or opposes the Draft Permit, Application, or Petition; (iii) identify each witness, including name, address, affiliation(s), and educational and work background; (iv) estimate the length of the direct testimony of each witness; (v) identify all exhibits which are part of the Record Proper and, for exhibits not part of the Record Proper, attach a copy; (vi) list or make available all technical materials relied upon by each witness in making the statement of technical fact or opinion contained in his or her direct testimony; (vii) attach a complete narrative of the direct testimony of each witness, stating any opinion(s) to be offered by such witness, and an explanation of the basis for such opinion(s); and (vii) comport with provisions 20.1.2.200 NMAC and the Amended Scheduling Order. Unless otherwise ordered by the Hearing Officer, NOIsto Present Rebuttal Technical Testimony, if any,shall be filed on or before September 3, 2026, and comport with the same requirements as the preceding NOIs as described above.

Failure to file a timely and complete NOI will preclude a person from presenting technical evidence or testimony sought to be offered. All exhibits must be properly marked to be accepted, including the party name and exhibit number on the top or bottom of the exhibit, and include consecutively numbered pages.

Permit Hearing Procedures:
The public hearing, as well as all pre-hearing and post-hearing activity, will be conducted in accordance with the Permit Procedures of the Environment Department (20.1.4 NMAC), the Act, and applicable construction permit rules and regulations. The Permit Procedures may be accessed electronically at https://nmonesource.com/nmos/nmac/en/item/18058/index.do#t20c1p4 or by contacting the Hearing Clerk. The construction permit rules (20.2.72 NMAC) may be accessed electronically at https://nmonesource.com/nmos/nmac/en/item/18058/index.do#t20c2p72.

Notice of Non-Discrimination:
NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. You may also visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

AQB 26-57(P)

EN EL ASUNTO DE:
LA SOLICITUD DE YUCCA GROWTH INFRASTRUCTURE, LLC PARA UN PERMISO DE CALIDAD DEL AIRE, NO. NSR 10883

AVISO ENMENDADO DE AUDIENCIA PÚBLICA

El Departamento de Medio Ambiente de Nuevo México ("Departamento" o "NMED") anuncia una audiencia pública híbrida para recibir pruebas sobre la solicitud de un permiso de construcción de calidad del aire para una instalación ubicada en el condado de Doña Ana, de conformidad con la Ley de Control de la Calidad del Aire de Nuevo México, NMSA 1978, Secciones 74-2-1 a 74-2-17 (la "Ley"), y los reglamentos contenidos en la Parte 20.2.72 del Código Administrativo de Nuevo México (NMAC). La solicitud de permiso que será considerada en esta audiencia corresponde al Microgrid de YGI, presentada por Yucca Growth Infrastructure, LLC ("Yucca").

Este Aviso Enmendado de Audiencia Pública se emite de conformidad con la Orden Enmendada de Programación del Funcionario de Audiencias, de fecha 29 de julio de 2026, y con las disposiciones de la Sección 20.1.4.200 del Código Administrativo de Nuevo México (NMAC). Asimismo, este Aviso Enmendado de Audiencia Pública sustituye y deja sin efecto el Aviso de Audiencia Pública inicial. La versión en inglés de dicho aviso fue publicada en el Albuquerque Journal el 17 de julio de 2026 y en el Las Cruces Sun el 17 de julio de 2026; la versión en español fue publicada en el Las Cruces Sun el 17 de julio de 2026 y en el Albuquerque Journal el 18 de julio de 2026.

Se puede obtener una copia de la Orden Enmendada de Programación, así como de todos los demás documentos presentados en este asunto, en el sitio web del Departamento, en la siguiente dirección https://www.env.nm.gov/opf/docketed-matters/; Desplácese hacia abajo y seleccione "Environment Department Cabinet Secretary"; luego desplácese hacia abajo y seleccione "AQB 26-57(P): Yucca Growth Infrastructure, LLC YGI Microgrid".

Breve Descripción de la Solicitud de Permiso:
Yucca ha presentado la solicitud de permiso de Revisión de Nuevas Fuentes (New Source Review) N.o NSR 10883 para construir el YGI Microgrid, el cual estará compuesto por celdas de combustible de óxido sólido Bloom Energy (Solid Oxide Fuel Cells, "SOFC") para generar 2,462 MW de energía destinada a abastecer un centro de datos cercano. La solicitud de Yucca pide que el YGI Microgrid sea autorizado para operar como una fuente mayor del Título V, de conformidad con la Ley y la Parte 20.2.72 del Código Administrativo de Nuevo México (NMAC), y que pueda operar de manera continua (8,760 horas al año). El YGI Microgrid es una instalación nueva que se proyecta ubicar en las siguientes coordenadas geográficas (grados decimales de latitud y longitud): 31.8183, -106.6792, Datum: WGS 84. Para facilitar la ubicación de esta instalación, se indica que estará aproximadamente a 3.6 millas al sur de Santa Teresa, en el condado de Doña Ana, Nuevo México.

Una versión electrónica de la solicitud de permiso, sus revisiones, el Proyecto de Permiso del Departamento, la Declaración de Fundamentos del Departamento, así como otros materiales y avisos previamente emitidos, puede consultarse en el sitio web del Departamento, en la siguiente dirección: https://www.env.nm.gov/public-notices/; Desplácese hacia abajo y seleccione Doña Ana County; luego busque y seleccione el encabezado titulado "Yucca Growth Infrastructure, LLC YGI Microgrid". Si alguna persona no puede obtener una copia del proyecto de permiso en el sitio web indicado anteriormente o desea información adicional, puede comunicarse con:

Julia Kuhn
Sección de Permisos
Oficina de Calidad del Aire
Departamento de Ambiente de Nuevo México
525 Camino de los Marquez, Suite 1A
Santa Fe, New Mexico 87505-1816
(505) 476-4300

Yucca Growth Infrastructure, LLC
600 Congress Ave, Suite 15041, Austin, TX 78701
(336) 339-2363
notices@borderplexdigital.com

Fecha, Hora y Lugar de la Audiencia:
La audiencia comenzará a las 9:00 a. m. del 14 de septiembre de 2026 y se llevará a cabo en días consecutivos, según sea necesario, o podrá continuarse por orden del Funcionario de Audiencias. La audiencia se celebrará de forma híbrida, tanto de manera virtual a través de Webex (consulte el enlace publicado en el calendario del Departamento en https://www.env.nm.gov/events-calendar/) y de manera presencial en el siguiente lugar físico en Sunland Park, condado de Doña Ana, Nuevo México: Sunland Park Multi-Generational Center, 4700 McNutt Road, Sunland Park, New Mexico 88063. La audiencia contará con intérpretes de español disponibles a través de Webex.

Presentación de Comentarios No Técnicos o del Público en General:
El Funcionario de Audiencias aceptará comentarios no técnicos o del público en general por escrito antes del inicio de la audiencia, así como por escrito o verbalmente mientras el expediente de la audiencia permanezca abierto. Se recomienda a los miembros del público que deseen presentar comentarios no técnicos o de carácter general que los envíen por escrito mediante el Portal de Comentarios Públicos del NMED, incluyendo las pruebas, datos, opiniones, argumentos o declaraciones escritas pertinentes en lugar de testimonio oral durante la audiencia, o bien como comentario público. Se puede acceder al Portal de Comentarios Públicos mediante el enlace disponible en la página web del Departamento correspondiente a los asuntos incluidos en el expediente www.env.nm.gov/opf/docketed-matters/. Busque en el menú desplegable del Secretario del Gabinete del Departamento de Medio Ambiente ("Environment Department Cabinet Secretary") "AQB 26-57(P): Yucca Growth Infrastructure, LLC YGI Microgrid". El enlace directo al Portal de Comentarios Públicos es http://nmed.commentinput.com.

El testimonio verbal no técnico o los comentarios generales del público serán aceptados durante la audiencia mientras el expediente permanezca abierto. De conformidad con la Orden Enmendada de Programación, las personas que tengan la intención de proporcionar testimonio verbal no técnico o comentarios generales del público serán juramentadas y se les permitirá presentar comentarios durante todo el primer día de la audiencia, el 14 de septiembre de 2026, así como en diversos momentos durante el desarrollo de la audiencia. Los miembros del público tendrán hasta tres (3) minutos para ofrecer testimonio verbal no técnico o comentarios generales por persona, a menos que el Funcionario de Audiencias ordene lo contrario. La audiencia se llevará a cabo de conformidad con los Procedimientos de Permisos del Departamento de Medio Ambiente, 20.1.4 NMAC, los procedimientos aplicables a los Permisos de Construcción de Calidad del Aire, 20.2.72 NMAC, y otros procedimientos de audiencia aplicables.

Comparecencia:
Toda persona que desee ser parte en este procedimiento deberá presentar ante el Secretario de Audiencias, en la dirección indicada a continuación, una Comparecencia a más tardar el 24 de agosto de 2026. Una Declaración o Aviso de Intención de Presentar Testimonio Técnico presentada oportunamente y que esté completa se considerará una Comparecencia si la persona que presenta dicha declaración no ha presentado previamente una Comparecencia por separado.

Luis Lopez
Secretario de Audiencia
Oficina de Facilitación Pública
Departamento de Ambiente de Nuevo México
1190 St. France Drive
P.O. Box 5469
Santa Fe, New Mexico 87502
Luis.lopez@env.nm.gov

La falta de presentación, en tiempo y forma, de una Declaración de Intención o de una Notificación de Comparecencia que cumpla sustancialmente con estos requisitos impedirá que la persona adquiera la condición de parte, pero no le impedirá presentar testimonios no técnicos ya sean escritos u orales ni formular comentarios de interés público general.

Declaración de Intención de Presentar Testimonio Técnico:
Toda persona que tenga la intención de presentar pruebas técnicas o testimonio técnico durante la audiencia pública deberá presentar ante el Secretario de Audiencias una Declaración o Aviso de Intención ("NOI") de Presentar Testimonio Técnico a más tardar el 24 de agosto de 2026, y deberá enviar una copia electrónica de dicho documento a todas las demás partes. El NOI deberá presentarse ante el Secretario de Audiencias en el siguiente correo electrónico:

Luis Lopez
Secretario de Audiencia
Oficina de Facilitación Pública
Departamento de Ambiente de Nuevo México
Luis.lopez@env.nm.gov

La Declaración de Intención de Presentar Testimonio Técnico (NOI) deberá: (i) identificar a la persona que presenta la declaración; (ii) indicar si la persona que presenta la declaración apoya u objeta el Proyecto de Permiso, la Solicitud o la Petición; (iii) identificar a cada testigo, incluyendo su nombre, dirección, afiliación(es), y antecedentes educativos y laborales; (iv) estimar la duración del testimonio directo de cada testigo; (v) identificar todos los anexos que forman parte del Expediente Oficial y, para los anexos que no formen parte del Expediente Oficial, adjuntar una copia; (vi) enumerar o poner a disposición todos los materiales técnicos en los que se basó cada testigo al formular la declaración de hechos u opiniones técnicas contenidas en su testimonio directo; (vii) adjuntar una narrativa completa del testimonio directo de cada testigo, indicando cualquier opinión que dicho testigo ofrecerá y una explicación de la base de dichas opiniones; y (viii) cumplir con las disposiciones de la Sección 20.1.2.200 del Código Administrativo de Nuevo México (NMAC) y con la Orden Enmendada de Programación. Salvo que el Funcionario de Audiencias ordene lo contrario, las Declaraciones de Intención de Presentar Testimonio Técnico de Refutación, si las hubiera, deberán presentarse a más tardar el 3 de septiembre de 2026 y deberán cumplir con los mismos requisitos establecidos anteriormente para las NOI previas.

La falta de presentación oportuna y completa de una NOI impedirá que una persona presente las pruebas técnicas o el testimonio técnico que pretenda ofrecer. Todos los anexos deberán estar debidamente identificados para ser aceptados, incluyendo el nombre de la parte y el número del anexo en la parte superior o inferior del mismo, y deberán incluir páginas numeradas consecutivamente.

Procedimientos de la Audiencia de Permiso:
La audiencia pública, así como todas las actividades previas y posteriores a la audiencia, se llevarán a cabo de conformidad con los Procedimientos de Permisos del Departamento de Medio Ambiente (20.1.4 NMAC), la Ley y las normas y reglamentos aplicables a los permisos de construcción. Los Procedimientos de Permisos pueden consultarse electrónicamente en https://nmonesource.com/nmos/nmac/en/item/18058/index.do#t20c1p4 o comunicándose con el Secretario de Audiencias. Las normas sobre permisos de construcción (20.2.72 NMAC) pueden consultarse electrónicamente en: https://nmonesource.com/nmos/nmac/en/item/18058/index.do#t20c2p72.

Aviso de No Discriminación:
El NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo exigen las leyes y reglamentos aplicables. El NMED es responsable de coordinar los esfuerzos de cumplimiento y de recibir consultas relacionadas con los requisitos de no discriminación implementados conforme al Título 40 del Código de Reglamentos Federales (C.F.R.), Parte 7, incluyendo el Título VI de la Ley de Derechos Civiles de 1964, según enmendada; la Sección 504 de la Ley de Rehabilitación de 1973; la Ley contra la Discriminación por Edad de 1975; el Título IX de las Enmiendas Educativas de 1972; y la Sección 13 de las Enmiendas a la Ley Federal de Control de la Contaminación del Agua de 1972. Si tiene alguna pregunta sobre este aviso o sobre cualquiera de los programas, políticas o procedimientos de no discriminación del NMED, o si considera que ha sido objeto de discriminación en relación con un programa o actividad del NMED, puede comunicarse con: Coordinador de No Discriminación, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. También puede visitar nuestro sitio web en https://www.env.nm.gov/non-employee-discrimination-complaint-page/ para obtener información sobre cómo y dónde presentar una queja por discriminación.

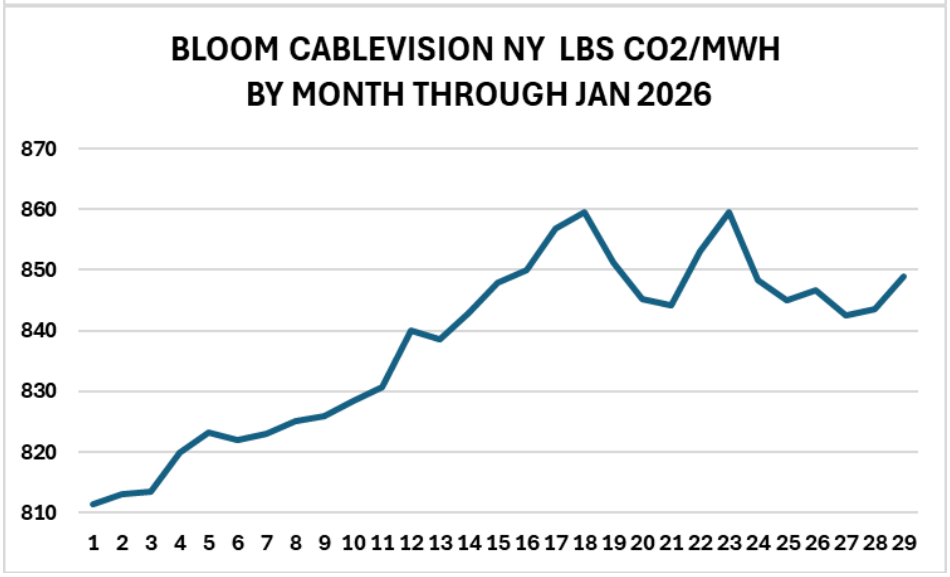
Ms. Kuhn and Ms. Romero



Bloom fuel cells suffer from ORDINARY DEGRADATION. Bloom claims their fuel cell stacks have a life of five years or more. Public data that I have followed and provided to the EPA, FBI, SEC, FTC and FERC show the stack life is approximately two years. The capacity factor decreases and the efficiency decreases as the stacks degrade. Below are some charts of data available to the public for systems in NY, DE, and CA. I strongly suggest that New Mexico demand data from Bloom that detail the the performance of all their fuel cells over time to make sure that the massive project does not become a white elephant where Bloom sells a Porsche that over a short period of time becomes a Ford Escort. Bloom has a history of LYING about their fuel cell performance and the cleanliness and reliability of their electrons.

> Ms. Kuhn and Ms. Romero
>
> The permit application should be rejected because the NOX and other pollutant data is based on a test of 65 kilowatt unit for a few hours. Bloom wants to build a power plant with 2,462,000 kilowatts and run it for twenty years. This is a power plant larger than the Hoover Dam ! They used fake data years ago in Dealware based on a sample size of 3 data points and where the standard deviation was greater than the mean and the California Air Resources Board and DNREC (both are corrupt) bought this nonsense. Now New Mexico must refuse to buy nonsense. 2,462,000 kilowatts is 37,877 times as large as 65 kilowatts.
>
> Also the consultant was a little nervous using Bloom pollutant values and added 15% to the values Bloom gave them. For NOX the consultant used 0.00345 pounds per megawatt hour. Interestingly this is double the amount in the DE DNREC permit,
>
> The consultant showed natural gas usage of 15.61 million scf per hour with 1,020 BTUs per

scf for 2,462 megawatts. This means a heat rate of 6.4672 million BTUs per mwh. The EPA uses 117 pounds of CO2 per million BTUs of gas. So multiply 6.4672 by 117 and we get 756.66 pounds of CO2 per mwh. But elsehwere in the submission the consultant revealed 818 pounds of CO2 per megawatt hour. The natural gas usage is TOO LOW and the whole application is not worth the paper it is written on.

Attached are screenshots I made from the pdf document that is the submission.

I am available anytime you wish to discuss this further.

Mr. Zeldin and Special Agent Rotell of the EPA CID. END THE BLOOMDOGGLE !

>
> I am the informant to the US EPA on Bloom Energy mishandling HAZMAT and on Bloom Energy lying to Delaware DNREC regarding NOX and CO2 emissions.
>
> I found the permit application Bloom's consultant submitted to you for the 2,462 megawatts of fuel cells at the proposed data center in your state. The application lists natural gas usage of 136,782.34 million scf per year with a sulfur content of 0.75 grains per 100 scf.
>
> All of sulfur excepting for a minuscule amount is filtered out of the natural gas before the gas enters the fuel cell stack. The sulfur together with benzene, chromium, arsenic and lead stays on the filtering media with the desulfurization canisters that Bloom uses. Doing the math we have 0.75 grains times 136,782,340,000 divide 100 we have 1,025,867,550 grains a year of sulfur. There are 7,000 grains in a pound so we have 146,552.5 pounds a year of sulfur. So we have 73 tons a year of sulfur that is trapped on the desiccant within the steel canisters. All of the desiccant is dangerous and the sealed steel canisters are shipped to Shoremet in Indiana where the canisters are opened and the desiccant is pickled in hydrochloric acid to recover copper. I estimate that the sulfur is 10% of the total mass of the desiccant plus steel housing. Therefore 730 tons a year of dangerous material will be shipped out as solid waste from New Mexico to Indiana. This is 2 tons a day.
>
> The corrupt EPA under Wheeler and Pruit decided the dangerous toxins can be shipped without manifest but that does not make the HAZMAT disappear.
>
> The consultant also admits there will be 0.003 pounds of NOX per megawatt hour. Bloom LIED in Delaware that they emitted only 0.0017 pounds of NOX per megawatt hour and

DNREC placed hourly and running 12 month limits on NOX that Bloom has far exceeded.

Bloom also LIED to DE DNREC that their natural gas only emits 112.9 pounds of CO2 per million BTUs. Weall know it emits 117 pounds of CO2 per million BTUs

In your permit application the Bloom consultant states that site will emit 10,144,115 tons per year of CO2. I assume these are short tons with 2,000 pounds,

The consultant stated that the natural gas in NM has 1,020 BTU per scf. Let's multiply 136,782.34 million scf by 1,020 and 117 pounds per million BTUs and divide by 2,000 pounds in a ton and we have 8,161,802.2 tons a year of CO2 This is less than the 10,144,115 tons of CO2 stated in the same permit application. Therefore there is a lot of natural gas missing from the permit application.

I believe the permit application must be rejected,

To the EPA CID

The NM permit application shows Bloom did testing on NOX in December 2023 and that is when they changed their claim of the 0.0017 pounds of NOX per megawatt hour to the 0.003 pounds per megawatt hour. You know that Bloom is submitting fraudulent invoices to Delmarva Power and fraudulent pollutant reports to DE DNREC. You have to end the BLOOMDOGGLE that I estimate has caused Delmarva ratepayers in Delaware to pay $150 million too much in subsidies since Bloom came to town in DE in 2012.

The BLOOMDOGGLE Bloom wants to pull in New Mexico is 89.5 times larger than Delaware. it is 2,462 megawatts versus 27.5 megawatts. I will be assisting Mr. Cox, Ms. Locke and Ms. Hovden to make sure that no environmental crimes happen in New Mexico. Theranos was the Bloom of Blood and Bloom is the Theranos of Thermodynamics.

Ms. Kuhn and Ms. Romero

The permit application should be rejected because the NOX and other pollutant data is based on a test of 65 kilowatt unit for a few hours. Bloom wants to build a power plant with 2,462,000 kilowatts and run it for twenty years. This is a power plant larger than the Hoover Dam ! They used fake data years ago in Dealware based on a sample size of 3 data points and where the standard deviation was greater than the mean and the California Air Resources Board and DNREC (both are corrupt) bought this nonsense. Now New Mexico must refuse to buy nonsense. 2,462,000 kilowatts is 37,877 times as large as 65 kilowatts.

Also the consultant was a little nervous using Bloom pollutant values and added 15% to the values Bloom gave them. For NOX the consultant used 0.00345 pounds per megawatt hour. Interestingly this is double the amount in the DE DNREC permit,

The consultant showed natural gas usage of 15.61 million scf per hour with 1,020 BTUs per scf for 2,462 megawatts. This means a heat rate of 6.4672 million BTUs per mwh. The EPA uses 117 pounds of CO2 per million BTUs of gas. So multiply 6.4672 by 117 and we get 756.66 pounds of CO2 per mwh. But elsehwere in the submission the consultant revealed 818 pounds of CO2 per megawatt hour. The natural gas usage is TOO LOW and the whole application is not worth the paper it is written on.

Attached are screenshots I made from the pdf document that is the submission.

I am available anytime you wish to discuss this further.

Mr. Zeldin and Special Agent Rotell of the EPA CID. END THE BLOOMDOGGLE !

On Wed, May 13, 2026 at 4:47 PM Lindsay Leveen <lleveen@gmail.com> wrote:

> Ms. Kuhn and Ms. Romero

I am Lindsay Leveen of Sausalito, California. Tel 415 336 5508

I am an award winning chemical engineer and an award winning journalist and am considered by many to be an expert in Thermodynamics and fuel cells.

I am the informant to the US EPA on Bloom Energy mishandling HAZMAT and on Bloom Energy lying to Delaware DNREC regarding NOX and CO2 emissions.

I found the permit application Bloom's consultant submitted to you for the 2,462 megawatts of fuel cells at the proposed data center in your state. The application lists natural gas usage of 136,782.34 million scf per year with a sulfur content of 0.75 grains per 100 scf.

All of sulfur excepting for a minuscule amount is filtered out of the natural gas before the gas enters the fuel cell stack. The sulfur together with benzene, chromium, arsenic and lead stays on the filtering media with the desulfurization canisters that Bloom uses. Doing the math we have 0.75 grains times 136,782,340,000 divide 100 we have 1,025,867,550 grains a year of sulfur. There are 7,000 grains in a pound so we have 146,552.5 pounds a year of sulfur. So we have 73 tons a year of sulfur that is trapped on the desiccant within the steel canisters. All of the desiccant is dangerous and the sealed steel canisters are shipped to Shoremet in Indiana where the canisters are opened and the desiccant is pickled in hydrochloric acid to recover copper. I estimate that the sulfur is 10% of the total mass of the desiccant plus steel housing. Therefore 730 tons a year of dangerous material will be shipped out as solid waste from New Mexico to Indiana. This is 2 tons a day.

The corrupt EPA under Wheeler and Pruit decided the dangerous toxins can be shipped without manifest but that does not make the HAZMAT disappear.

The consultant also admits there will be 0.003 pounds of NOX per megawatt hour. Bloom LIED in Delaware that they emitted only 0.0017 pounds of NOX per megawatt hour and DNREC placed hourly and running 12 month limits on NOX that Bloom has far exceeded.

Bloom also LIED to DE DNREC that their natural gas only emits 112.9 pounds of CO2 per million BTUs. Weall know it emits 117 pounds of CO2 per million BTUs

In your permit application the Bloom consultant states that site will emit 10,144,115 tons per year of CO2. I assume these are short tons with 2,000 pounds,

The consultant stated that the natural gas in NM has 1,020 BTU per scf. Let's multiply 136,782.34 million scf by 1,020 and 117 pounds per million BTUs and divide by 2,000 pounds in a ton and we have 8,161,802.2 tons a year of CO2 This is less than the 10,144,115 tons of CO2 stated in the same permit application. Therefore there is a lot of natural gas missing from the permit application.

I believe the permit application must be rejected,

To the EPA CID

The NM permit application shows Bloom did testing on NOX in December 2023 and that is

when they changed their claim of the 0.0017 pounds of NOX per megawatt hour to the 0.003 pounds per megawatt hour. You know that Bloom is submitting fraudulent invoices to Delmarva Power and fraudulent pollutant reports to DE DNREC. You have to end the BLOOMDOGGLE that I estimate has caused Delmarva ratepayers in Delaware to pay $150 million too much in subsidies since Bloom came to town in DE in 2012.

The BLOOMDOGGLE Bloom wants to pull in New Mexico is 89.5 times larger than Delaware. it is 2,462 megawatts versus 27.5 megawatts. I will be assisting Mr. Cox, Ms. Locke and Ms. Hovden to make sure that no environmental crimes happen in New Mexico. Theranos was the Bloom of Blood and Bloom is the Theranos of Thermodynamics.

Mr. Kenney

I have shared a lot of data with Ms. Kuhn and Ms.Romero that show Bloom Energy to be Gangrene and not green.

I was the informant to the US EPA on Bloom's mishandling of HAZMAT. I have informed the EPA CID and the FBI that Bloom lies in Delaware that they invented a form of natural gas that emits less CO2 than normal natural gas and that Bloom lies each month in pollutant reports to DE DNREC about NOX emissions. THEY DO THIS TO STEAL EXTRA SUBSIDIES FROM DELAMARVA RATEPAYERS IN DELAWARE.

I have pointed out to Ms. Kuhn and Ms. Romaro that there are several errors in the permit application recently made to Env NM for the Bloom fuel cells at Project Jupiter data center.

This email is to alert you that Bloom could be bringing huge problems to NM.

I am probably the only person on earth to have gotten Breitbart and NBC to agree on something. That something is that Bloom GREENWASHES.

I expect your department to thoroughly vet Bloom and demand real data from them regarding pollutant levels as well as the truth about how their fuel cells degrade over time. I have evidence that their stacks degrade twice as fast as Bloom claims. You should chat with Ms. Kuhn and Ms. Romara and then the three of you should have a call with me. Note I do not trade Bloom stock up or down and I stand to gain nothing from my work in exposing Bloom as the Theranos of Thermodynamics.

Thank you.

Mr. Kenney

I see you hold degrees in Engineering

https://www.env.nm.gov/general/james-c-kenney/

Therefore I expect proper engineering scrutiny of the Bloom permit application. Right now my opinion of it as an award-winning chemical engineer is that it is GARBAGE.

Mr. Kenney

I suggest you call Mr. Patterson of Delaware DNREC and ask him about Bloom LYING to DNREC about emitting only 0.0017 pounds of NOX per megawatt hour and how DNREC believes this LIE. Bloom is DEFRAUDING Delmarva Power and Light Ratepayers out of hundreds of millions of dollars while DNREC turns a blind eye to NOX emissions. Bloom also LIED in the same permit application about CO2 emissions and having developed a form of natural gas that emits less CO2 than normal natural gas. Of course the low carbon natural gas was PURE BS.

Now Bloom wants to build a power station in New Mexico that is 90 times larger than the BLOOMDOGGLE in Delaware. THE PROPOSED POWER STATION IN NM IS MORE POWERFUL THAN THE POWER STATION AT THE HOOVER DAM.

I don't think it is wise for ENV MN to believe the nonsense that Bloom provided in their garbage permit application. It is as full of holes as the DNREC permit application that DNREC believed even after we alerted DNREC to the FRAUD.

I have asked the FBI and US DOJ to investigate fraud by Bloom and Corruption at DNREC. As far as I know that investigation is ongoing. The EPA CID involved the FBI after the EPA CID told me I had provided sufficient credible evidence of fraud.

Mr. Zeldin

After Bloom hyped their AI Data Center business and deals like in New Mexico, the stock zoomed up and now the leaders on Wall Street are dumping their stock. See the screenshot.

Bloom is making Enron look like small potatoes.

At least Enron did not GREENWASH and LIE about CO2 and NOX emissions.

Subject: BLOOM HAS HUGE PROBLEMS

Read this

http://www.greenexplored.com/2026/05/bloom-energy-has-huge-problems.html

From: Lindsay Leveen
To: amy.harder@axios.com; Kenney, James, ENV; Kuhn, Julia, ENV; Romero, Rhonda, ENV; Region Three; Watanabe, Noelle; Rotell, Sawyer; Attorney.General; Katz, Natalie; Kyle E Gay; matthew.meyer@delaware.gov
Subject: [EXTERNAL] Fwd: BLOOM HAS HUGE PROBLEMS
Date: Sunday, May 17, 2026 8:36:18 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Amy

Axios needs to report on Bloom's NOX emissions and how the lied, cheated and stole in Delaware. Hunter Biden's laptop showed he played a central role in Bringing Bloom to Delaware. The DE DOJ under Beau Biden helped Bloom hide Hazmat in the protected coastal zone of Delaware. The Bloom Fraud on Delmarva Ratepayers goes back to 2012.

Let's see if Axios has any guts

Special Agent Screen and Special Agent Rotell

Have you read Dickens' A tale of Two Cities? It was the best of times and the worst of times. For Bloom their best of times is that their stock is now trading near $300 a share. For Bloom their worst of times is that they lied about NOX emissions and have stolen over $150 million from Delmarva ratepayers in Delaware.

Here is the link to the permit application in New Mexico for the huge AI data center power plant.

https://cloud.env.nm.gov/resources/_translator.php/ZWM3Njk5ZGQ3MjNjNzZiMjRmZmU1Zjgy

Interestingly Bloom's consultant that filed the New Mexicopermit application did not believe the pollutant data Bloom gave them and added a 15% safety factor to calculate the yearly emissions of NOX, CO2 and other pollutants. This makes the claimed emissions of NOX in the Dover DE DNREC half of the claimed NOX emissions in Sante Fe New Mexico.. A REAL TALE OF TWO CITIES

The FBI and EPA CID must not sweep the NOX under the rug and Bloom and their partners in crime must be prosecuted to the full extent of the Law. Colin Powell saved Bloom in the HAZMAT crime but he passed away from covid. I am sure that some big figure will pop up to try to pull Bloom out of their NOX Nightmare but maybe the EPA has stopped being corrupt and this time Bloom won't be given a slight tap on their wrist.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Ms. Kuhn

Bloom's consultant claimed in the permit application that natural gas use would be 136,782.34 million scf per year. But their CO2 emissions they claimed are for much higher gas usage that I calculate to be 170,003.27 million scf per year.

It is very strange that the permit application has this discrepancy of 24.28%. This kind of makes me worry that there are other mistakes in the permit application.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Ms. Kuhn

When Bloom uses 170,003.27 million scf a year of natural gas with 0.75 grains of sulfur per 100 scf they will need to remove 500 pounds a day of sulfur in the desulfurization systems before the natural gas enters the fuel cell stacks. Please get an analysis of all the impurities in the natural gas. Bloom has admitted they trap Benzene, Chromium, Arsenic and Lead onto the desulfurization filtering media. I am sure there are other hazardous substances besides these.

No permit should be issued until the solid waste that is a massive amount is fully understood. There will be over a million pounds a year of solid waste hauled off the site.

Please respond to this email and let's make sure we have a plan on how to analyze this waste.

Interestingly Bloom's consultant that filed the New Mexicopermit application did not believe the pollutant data Bloom gave them and added a 15% safety factor to calculate the yearly emissions of NOX, CO2 and other pollutants. This makes the claimed emissions of NOX in the Dover DE DNREC half of the claimed NOX emissions in Sante Fe New Mexico.. A REAL TALE OF TWO CITIES

The FBI and EPA CID must not sweep the NOX under the rug and Bloom and their partners in crime must be prosecuted to the full extent of the Law. Colin Powell saved Bloom in the HAZMAT crime but he passed away from covid. I am sure that some big figure will pop up to try to pull Bloom out of their NOX Nightmare but maybe the EPA has stopped being corrupt and this time Bloom won't be given a slight tap on their wrist.

Special Agent Screen and Special Agent Rotell

Have you read Dickens' A tale of Two Cities? It was the best of times and the worst of times. For Bloom their best of times is that their stock is now trading near $300 a share. For Bloom their worst of times is that they lied about NOX emissions and have stolen over $150 million from Delmarva ratepayers in Delaware.

Here is the link to the permit application in New Mexico for the huge AI data center power plant.

https://cloud.env.nm.gov/resources/_translator.php/ZWM3Njk5ZGQ3MjNjNzZiMjRmZmU1

Interestingly Bloom's consultant that filed the New Mexicopermit application did not believe the pollutant data Bloom gave them and added a 15% safety factor to calculate the yearly emissions of NOX, CO2 and other pollutants. This makes the claimed emissions of NOX in the Dover DE DNREC half of the claimed NOX emissions in Sante Fe New Mexico.. A REAL TALE OF TWO CITIES

The FBI and EPA CID must not sweep the NOX under the rug and Bloom and their partners in crime must be prosecuted to the full extent of the Law. Colin Powell saved Bloom in the HAZMAT crime but he passed away from covid. I am sure that some big figure will pop up to try to pull Bloom out of their NOX Nightmare but maybe the EPA has stopped being corrupt and this time Bloom won't be given a slight tap on their wrist.

Senator Murkowski

Do you have any comment regarding Patrick McCormick and his time at Bloom Energy?

Subject: [EXTERNAL] PROJECT JUPITER NATURAL GAS USE PER YEAR
Date: Tuesday, May 19, 2026 7:22:23 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Ms. Kuhn

Bloom's consultant claimed in the permit application that natural gas use would be 136,782.34 million scf per year. But their CO2 emissions they claimed are for much higher gas usage that I calculate to be 170,003.27 million scf per year.

It is very strange that the permit application has this discrepancy of 24.28%. This kind of makes me worry that there are other mistakes in the permit application.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Ms. Kuhn

When Bloom uses 170,003.27 million scf a year of natural gas with 0.75 grains of sulfur per 100 scf they will need to remove 500 pounds a day of sulfur in the desulfurization systems before the natural gas enters the fuel cell stacks. Please get an analysis of all the impurities in the natural gas. Bloom has admitted they trap Benzene, Chromium, Arsenic and Lead onto the desulfurization filtering media. I am sure there are other hazardous substances besides these.

No permit should be issued until the solid waste that is a massive amount is fully understood. There will be over a million pounds a year of solid waste hauled off the site.

Please respond to this email and let's make sure we have a plan on how to analyze this waste.

Today Bloom announced a new AI Data Center project with Nebius. To guarantee 250 megawatts of available power a ound the clock they will actually build a 328 megawatt power station. The term of the power supply agreement is 10 years

This means approximately 24% of the name[late capacity is lost to ordinary degradation.

We have to find out what level of degradation Bloom is planning for NM

Ms. Kuhn

Bloom just announced another project for an AI data center with a company called Nebius. They will install 328 megawatts of fuel cells but will only guarantee they deliver 250 megawatts. They only guarantee 76% of their nameplate. This may be the reason the consultant lowered the gas usage by 24% because the 2,462 megawatts is only going to deliver 1,876 megawatts.

You need to find this out???

Wow

Bloom claims to be "always on". But the news is that for the AI data center they will build for NEBIUS they have to install 328 megawatts of their dirty Bloom Boxes to guarantee Nebius 250 megawatts of always available power.

Bloom is 24% NOT ON

Attachments:	US EPA 120800 POUNDS CO2 PER MILLION CUBIC FEET GAS.PNG BLOOM POLLUTANT REPORT DNREC MARCH 2026.PNG

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Ms. Gerner

How is the investigation into the disbarment of the Bloom lawyer Marissa Blackshire going?

Under FOIA I received records that John Nichols got from DE DNREC. Bloom is using a fake factor of 116,215.3 pounds of CO2 per million feet of natural gas. The EPA uses a factor of 120,800 pounds of CO2 per million cubic feet of natural gas. The BLOOMDOGGLE factor is a made up story to stay below the hourly and twelve month limits of CO2 emissions in the DNREC permits. There is no doubt that Marissa Blackshire is involved in submitting fake pollutant reports to DNREC.

Therefore I suggest you speed up her disbarment. I made a complaint about her TO THE CALIFORNIA BAR years ago. She should have been disbarred years ago, but she was protected by Tiffany Sorensen and others.

Subject: Re: Carb and bloom

Bloom claims to have used CARB Method 100 for NOX emissions. The PRA request is very important as I believe Bloom may have stolen in excess of $100 million in subsidies from Delmarva ratepayers in Delaware.

I expect a prompt response from the California ARB

To the California ARB

Bloom Energy of San Jose, California must have provided you with data obtained from samples of their exhaust for you to certify their fuel cell. I have data back from 2018 that Bloom included in a permit application in Delaware, where Bloom claimed to emit 0.0017 pounds of NOX per megawatt hour. Bloom's recent applications in Connecticut and New Mexico have NOX emissions of 0.003 pounds per megawatt hour based on tests conducted in December 2023.

Can you please provide me under the California Public Records Act all the emissions tests the California Air Resources Board has on Bloom fuel cells?

Thanks

Subject: [EXTERNAL] GOVERNOR MEYER ON CLIMATE CHANGE

Date: Monday, May 25, 2026 1:12:17 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Governor Meyer

Do you still believe what you said in January on climate change?

https://news.delaware.gov/2026/01/07/delaware-publishes-updated-plan-to-combat-climate-change-and-protect-communities/

If you do then END THE BLOOMDOGGLE !

Bloom did not invent a form of natural gas that emits less CO2 than normal natural gas and Bloom is emitting much more NOX per hour than they are allowed.

GREEN LIES MATTER IF WE ARE TO DEAL WITH CLIMATE CHANGE AND NOT BULLSHIT THE PUBLIC

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Ms. Vest and Ms. Marconi

We warned you years ago that BLOOM LIED ABOUT HOW MUCH CO2 THEIR NATURAL GAS EMITS. You both bought the lie to assist Bloom in stealing extra subsidies from Delmarva Ratepayers. I suggest you consult lawyers because what Bloom did and continues to do is FRAUD and the two of you are deeply involved in allowing the fraud to have happened and to continue to happen.

Read this

https://www.eia.gov/environment/emissions/co2_vol_mass.php

I even took a screenshot for you that is attached.

ONE MILLION CUBIC FEET OF NATURAL GAS EMIT 120,850 POUNDS OF CO2. The 116,215.3 pounds that Bloom uses in pollutant reports is MADE UP BULLSHIT that only DNREC believes. The ACTUAL HOURLY CO2 EMISSIONS ARE 3.96% HIGHER THAN WHAT BLOOM REPORTS.

To the California Bar Association

Marissa Blackshire must be DISBARRED and she too should lawyer up with a CRIMINAL DEFENSE ATTORNEY.

To the folks in New Mexico and New Jersey

Be very careful in how you approve any permits for Bloom. BLOOM IS THE THERANOS OF THERMODYNAMICS. You do not need AI to know that Bloom is a GREENWASHED Scam

Subject: [EXTERNAL] THE DELAWARE WAY = TO LIE CHEAT AND STEAL

Date: Wednesday, May 27, 2026 8:53:06 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

THE BLOOM ENERGY BLOOMDOGGLE IN DELAWARE AND THE DELAWARE WAY

1990s Joe Biden and his friends invent THE DELAWARE WAY to enrich their families and friends

2001 Lying Sridhar invents his bullshit Bloom Box

2011 Bloom engages Hunter Biden to help bring his scam to Delaware

Chris Coons, Tom Carper, John Carney, Jack Markell, Matt Denn, Alan Levine, and the very CROOKED Collin O'Mara welcome the scam to Delaware using RATEPAYER and TAXPAYER money to subsidize the GREENWASHED enterprise.

Bloom hides HAZMAT in the protected coastal zone of Delaware.

Beau Biden's DE DOJ lets Bloom and DNREC HIDE HAZMAT without prosecution. This is part of the Delaware WAY. Hip Hip Hurray For The Delaware Way it's working for the OLIGARCHS in Silly Con Valley.

Bloom GREENWASHES that the dirty Box emits only 773 pounds of CO2 per megawatt hour. They emit 884 pounds of CO2 per megawatt hour and Leveen pens in June 2012 IS 884 BLOOM'S FATAL NUMBER? and wins a nation journalism prize

Bloom GREENWASHES that the dirty Bloom Box emits only 0.0021 pounds of NOX per

megawatt hour

Bloom lets all 135 of their first dirty Boxes degrade such that they have to be replaced in their entirety.

2018 Bloom GREENWASHES even more to gain DNREC permits by now LYING the Boxes are improved and emit only 700 pounds of CO2 per megawatt hour and 0.0017 pounds of NOX per megawatt hour. The sleaze at DNREC buy the lie and they granted permits to rebuild the dirty power stations in Red Lion and Brookside Delaware. Part of the LIE in Bloom's permit application is that their natural gas emits less CO2 than normal natural gas. This is pure BULLSHIT, but DNREC applauds the "scientific breakthrough" because it's the DELAWARE WAY to bend science.

Who gets screwed while LYING SRIDHAR gets RICH? The little DELMARVA ratepayers get screwed out of over $400 million in subsidies of which $150 million are FRAUDULENT subsidies.

The question now is whether ROBERT STORCH the new INSPECTOR GENERAL in Delaware will be a clown or will he END THE BLOOMDOGGLE?

GREEN LIES MATTER AND THEY ARE THE OPPOSITE OF THE DELAWARE WAY

THERANOS WAS THE BLOOM OF BLOOD AND BLOOM IS THE THERANOS OF THERMODYNAMICS

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Ms. Kuhn and Ms. Romero

I am Lindsay Leveen of Sausalito, California. Tel 415 336 5508

I am an award winning chemical engineer and an award winning journalist and am considered by many to be an expert in Thermodynamics and fuel cells.

I am the informant to the US EPA on Bloom Energy mishandling HAZMAT and on Bloom Energy lying to Delaware DNREC regarding NOX and CO2 emissions.

I found the permit application Bloom's consultant submitted to you for the 2,462 megawatts of fuel cells at the proposed data center in your state. The application lists natural gas usage of 136,782.34 million scf per year with a sulfur content of 0.75 grains per 100 scf.

All of sulfur excepting for a minuscule amount is filtered out of the natural gas before the gas enters the fuel cell stack. The sulfur together with benzene, chromium, arsenic and lead stays on the filtering media with the desulfurization canisters that Bloom uses. Doing the math we have 0.75 grains times 136,782,340,000 divide 100 we have

1,025,867,550 grains a year of sulfur. There are 7,000 grains in a pound so we have 146,552.5 pounds a year of sulfur. So we have 73 tons a year of sulfur that is trapped on the desiccant within the steel canisters. All of the desiccant is dangerous and the sealed steel canisters are shipped to Shoremet in Indiana where the canisters are opened and the desiccant is pickled in hydrochloric acid to recover copper. I estimate that the sulfur is 10% of the total mass of the desiccant plus steel housing. Therefore 730 tons a year of dangerous material will be shipped out as solid waste from New Mexico to Indiana. This is 2 tons a day.

The corrupt EPA under Wheeler and Pruit decided the dangerous toxins can be shipped without manifest but that does not make the HAZMAT disappear.

The consultant also admits there will be 0.003 pounds of NOX per megawatt hour. Bloom LIED in Delaware that they emitted only 0.0017 pounds of NOX per megawatt hour and DNREC placed hourly and running 12 month limits on NOX that Bloom has far exceeded.

Bloom also LIED to DE DNREC that their natural gas only emits 112.9 pounds of CO2 per million BTUs. Weall know it emits 117 pounds of CO2 per million BTUs

In your permit application the Bloom consultant states that site will emit 10,144,115 tons per year of CO2. I assume these are short tons with 2,000 pounds,

The consultant stated that the natural gas in NM has 1,020 BTU per scf. Let's multiply 136,782.34 million scf by 1,020 and 117 pounds per million BTUs and divide by 2,000 pounds in a ton and we have 8,161,802.2 tons a year of CO2 This is less than the 10,144,115 tons of CO2 stated in the same permit application. Therefore there is a lot of natural gas missing from the permit application.

I believe the permit application must be rejected,

To the EPA CID

The NM permit application shows Bloom did testing on NOX in December 2023 and that is when they changed their claim of the 0.0017 pounds of NOX per megawatt hour to the 0.003 pounds per megawatt hour. You know that Bloom is submitting fraudulent invoices to Delmarva Power and fraudulent pollutant reports to DE DNREC. You have to end the BLOOMDOGGLE that I estimate has caused Delmarva ratepayers in

Delaware to pay $150 million too much in subsidies since Bloom came to town in DE in 2012.

The BLOOMDOGGLE Bloom wants to pull in New Mexico is 89.5 times larger than Delaware. it is 2,462 megawatts versus 27.5 megawatts. I will be assisting Mr. Cox, Ms. Locke and Ms. Hovden to make sure that no environmental crimes happen in New Mexico. Theranos was the Bloom of Blood and Bloom is the Theranos of Thermodynamics.

Subject: [EXTERNAL] SOUTHERN POWER SUBMITS ANOTHER FRAUDULENT INVOICE TO DELMARVA POWER AND LIGHT

Date: Wednesday, May 27, 2026 7:14:23 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

The docket at the DE PSC with the April 2026 invoice Southern Power submitted to Delmarva for the Fuel Cell subsidy is now online. Bloom generated 17,347.431 megawatt hours in the month with 720 hours. With NOX emissions of 0.003 pounds per megawatt hour as Bloom now admits to some 0.072281 pounds of NOX were emitted per hour for the Red Lion and Brookside combined sites in Delaware. The permitted amount is only 0.04675 pounds of NOX per hour. The Invoiced billed $2,311,540.98 for the month of April 2026. Due to the excess NOX there was a FRAUDULENT billing of $816,478.70 of TOO MUCH billing.

Ms. Vest and Ms. Marconi

Did Bloom call you on December 4, 2023 to tell you that they had LIED to you about the level of NOX emissions from their boxes there in Delaware?

Of course the sleaze at Bloom kept on telling you EVEN UNTIL THIS MONTH that they only emit 0.0017 pounds of NOX per megawatt hour when tests done by Blue Sky Environmental performed on December 4, 2023 that the 0.0017 was out of the window and the real results were in the range of 0.004 pounds of NOX per megawatt hour.

I found this on page 321 of the recent submission for the Bloom boxes at project Jupiter in New Mexico.

To the EPA CID and FBI add this to the criminal investigation file.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

TO THE EPA CID AND THE FBI

With the new evidence I discovered about the real NOX emissions that were reported by Blue Sky on December 4, 2023 I have created a table of the OVERCHARGE that Diamond State Generation Partners made upon Delmarva Ratepayers going back to the beginning of the BLOOMDOGGLE in Delaware. The FRAUD has reached $189,192,404.41. This is without interest and penalties. The consequential damages resulting from an extra unpermitted 4,942.87 pounds of NOX going into the atmosphere are also enormous and could be A BILLION DOLLARS.

Please add this to THE CRIMINAL INVESTIGATION FILE.

Mr. Storch

When will you start work as the INSPECTOR GENERAL of Delaware?

Ending the BLOOMDOGGLE should be your job number one.

Thanks

Lindsay Leveen

To The Cal Bar

Marisa Blackshire, the corrupt lawyer I demanded that you disbar, was the person who executed the Permit Application for the Bloom Fuel Cells in New Mexico. See the screenshot of page 648 of 648.

She certified with her "professional expertise" that the NOX emissions in New Mexico in pounds per megawatt hour were of the order of 0.004. See screenshot of page 321 of 648 of the same permit application.

Yet each month Marisa tells DNREC in the pollutant report that NOX emissions are only 0.0017 pounds per megawatt hour. She cannot claim that she is unaware of the true NOX emissions because she signed the New Mexico permit application.

I would say that Marisa is in DEEP SHIT. The California Bar must disbar her immediately

To The Folks at ENV NM

Given that the person who submitted the permit application for project Jupiter is untrustworthy you need to scrutinize each and every number in the application. Also given that the Bly Sky December 4, 2023 data for NOX emissions (page 321) had two of the three data points equal to or more than 0.004 pounds of NOX per megawatt hour, I believe the hourly and yearly NOX emissions could be understated as the consultant only used 0.00345 pounds per megawatt hour.

My professional opinion is the entire permit application should be rejected. My professional opinion matters as I am one the leading experts in the world on fuel cells and hydrogen and Bloom has a history of GREENWASHING. Even NBC and Breitbart agree on that.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Several years ago Bloom admitted in Delaware that for 3 to 4% of the time they have to de coke the fuel cell stacks. Ask Bloom what is emitted into the air during de coking? Solid oxide fuel cells are prone to coking up the catalyst

Ms. Kuhn

Bloom stated they have a five year life for their power modules. I do not believe this statement is accurate. The data I have analyzed from NYSERA, Delaware, ACTransit in Oakland CA and Santa Clara County point to a power modules life of 2 to 2.5 years

Bloom must provide you with real data on theirs power module life. I would love to review the data on their power module life. This is important because CO2 emissions increase as the power modules degrade

Note here are some source documents on Bloom Energy's decoking. AG Becerra and US EPA must also investigate the Bay Area Air Quality Management District who was made aware of the decoking by me. It seems like Al Gore, John Doerr, Colin Powell and the Bloomdogglers also own the BAAQMD.

There are sleaze in every swamp that protect the Crooks at Bloom.

Yes even the California Department of Toxic Substances Control is in bed with Bloom Energy.

Ms. Katz

In numerous monthly docket filings in the past by Delmarva Power and Light to the DE PSC Bloom admitted to decoking. After I pointed this out to DE DNREC Bloom stopped reporting decoking. Something very fishy here.

EPA has a duty to protect the environment not Bloomdogglers.

I expect your follow up phone call in days not weeks,

Lindsay Leveen

Dear John Nichols:

This email is to acknowledge that the Delaware Department of Natural Resources and Environmental Control (DNREC) received your Freedom of Information Act (FOIA) request on January 09, 2019. You requested:

> *" Please forward all written and electronic communications between all DNREC agencies and Bloom Energy's "decoking" processes. Please begin the search starting April 2012 until today"*

In accordance with Delaware's FOIA statute, within 15 business days you will receive a further response from DNREC substantively responding to your FOIA request or otherwise responding consistent with Delaware's FOIA statute.

If you have any questions, feel free to contact me at Lee.Sobocinski@delaware.gov .

Thank you for your FOIA inquiry to DNREC.

Subject: [EXTERNAL] BLOOM SOLID WASTE FROM SULFUR IN NEW MEXICO

Date: Friday, May 29, 2026 6:16:51 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Bloom has filed with the NM.authorities a supplement to their permit application for project Jupiter. 190 desulfurization tanks each with 1,370 cubic feet of capacity

I sent the following to the NM authorities re the desulfurizing system for project Jupiter

95 times 2 tanks each with say 1,100 cubic feet of filtering media with a bulk density of 150 pounds per cubic feet means 31,350,000 pounds of hazardous waste must be removed each 2 years or 730 days

This is 21.5 tons a day of crap that has to be vacuumed out of the tanks and into a hauling truck

This 10 times worse than I first estimated

Also when they purge the tank so they can open it to vacuum out the filtering media then there will be entrained emissions of benzene, toluene, xylene and dozens of other chemicals that were present in the natural gas and became trapped in the sulfur filtering media

This submission does not provide a detailed enough description of what dangers will be happening.

Unless NM is as corrupt as DE I imagine a lot of answers will be needed before the Bloomdoggle comes to NM.

Subject: BLOOM GENERATES 80 POUNDS OF SOLID WASTE FOR EACH POUND OF SULFUR IN NATURAL GAS

I was the tipster to the EPA on Bloom mishandling their solid waste they generate in desulfurizing the sulfur in natural gas. The corrupt EPA under Pruitt and Wheeler settled Bloom's sulfur problem in secret and with a minor fine.

But now that we have the permit filing for the 2,462 megawatt power plant in

New Mexico. The natural gas they use to generate their dirty power has approximately 500 pounds a day of sulfur. The solid waste they will generate is approximately 43,000 pounds a day. There is 80 times the mass of solid waste generated than the mass of sulfur. Bloom LIES and call themselves a generator of clean energy.

Scum in government and sleaze on Wall street buy this shit and sell it to the little people nicely packaged.

I JUST DID THE MATH. 190 DESULFURIZATION TANKS EACH WITH 1,370 CUBIC FEET OF VOLUME EQUALS 3 OLYMPIC SIZED SWIMMING POOLS. THIS MEANS IF THE FILTERING MEDIA IS CHANGED EVERY TWO YEARS BLOOM WILL HAVE TO HAUL ONE AND HALF OLYMPIC SIZED SWIMMING POOLS OF SOLID WASTE WITH LEAD, CHROMIUM, ARSENIC AND BENZENE EACH YEAR FROM NEW MEXICO TO INDIANA.

Now we know why John Chambers dumped 50,000 shares and Sridhar dumped 200,000 shares in Bloomrisma Energy. They know that the sixteenth element could end their GANGRENE Ponzi Scheme.

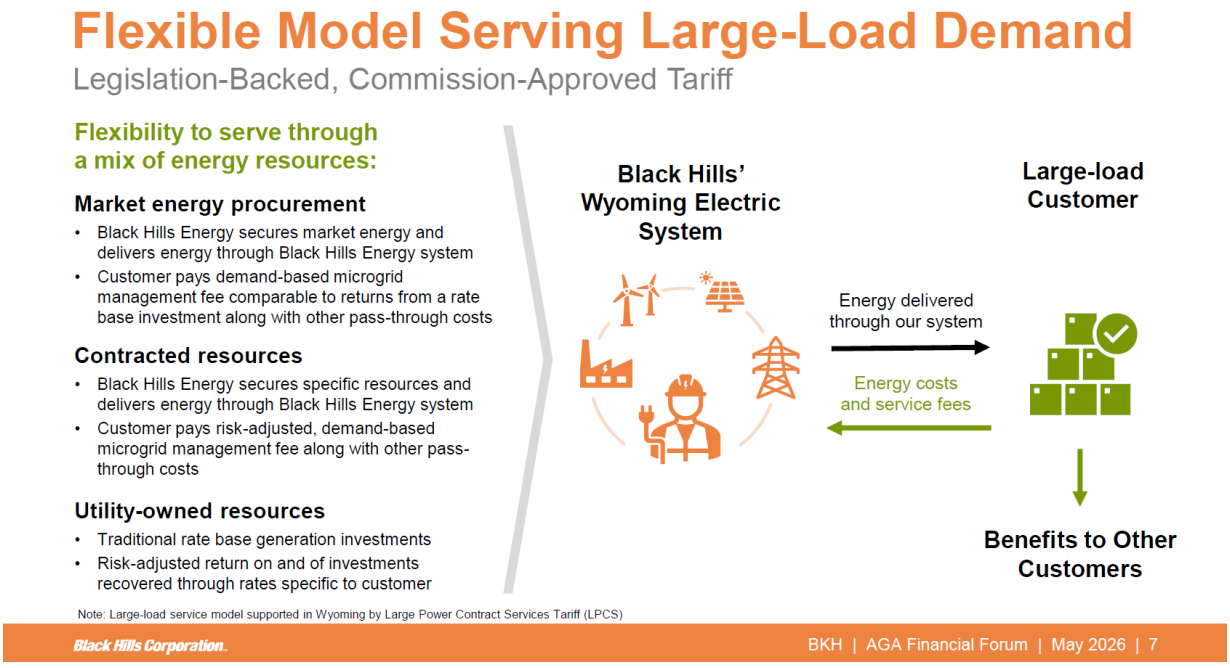
Hi thanks for the response. This was helpful. I was the tipster to the US EPA on HAZMAT solid waste from Bloom Energy Fuel Cells in their desulfurization systems. The EPA fined Bloom in secret $1.37 million for mishandling the sulfur waste. Bloom has a huge Sulfur Problem. The pipeline natural gas has to be desulfurized from something like 25 parts per million of Sulfur to 5 parts per billion of Sulfur before the gas can enter the fuel cell stacks. In New Mexico where Bloom hopes to build 2.462 gigawatts for Project Jupiter there will be 190 desulfurization vessels each with 1,370 cubic feet of volume. Bloom will need to remove something like 45,000 pounds a day of solid waste that has sulfur, benzene, lead, chromium and arsenic in New Mexico. If you go with fuel cells in Wyoming and have 1.8 gigawatts of fuel cells you will have something like 33,000 pounds a day of horrible solid waste that has to be transported out.. Note I have copied the folks in Wyoming as well as New Mexico that issue permits. Also copied are folks at the US EPA.



I suggest you be very careful about selecting Bloom Fuel Cells for your project. All the public data I have shows that the fuel cell stacks degrade far quicker than five years. More like two to three years between stack replacement. As the stacks degrade their capacity factor drops like a stone and the CO2 per megawatt hour soars like a helium balloon.

Thanks

> Which Data Center in Cheyenne are you referring to? If it's the 1.8-GW project, Black Hills has not disclosed exactly what generation technology will be used. The slide below in our investor deck shows the different ways we can serve energy needs of large-load customers. Contracted resources could include fuel cells or natural gas generation from third-party providers. You can look through announcements made by Tallgrass on the type of turbines they will use.

Hi

I am trying to find out which power generation technology will be used for the Data Center in Cheyenne Wyoming?

There is a lot of conflicting informations whether it is fuel cells or a combustion turbine.

Thanks

Lindsay Leveen

Subject: [EXTERNAL] BLOOM"S CONFLICTING CLAIMS ON AIR EMISSIONS

Date: Saturday, June 20, 2026 12:21:48 PM

Attachments: BLOOMS CONFLICTING CLAIMS ON EMISSIONS.PNG

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

On Thursday Bloom's stock hit an all time high and their market cap now exceeds ENRON'S that was reached in 1999 before ENRON collapsed as a ponzi scheme.

WE know that Bloom and Southern Company have committed massive fraud in Delaware by LYING about CO2 and NOX air emissions in their monthly pollutant reporting to Delaware DNREC.

I created the attached table comparing the Delaware pollutant reports to the claimed air emissions Bloom has used in recent Permit Filings in Texas, New Mexico and Wyoming. The pollutants into the air (CO2, NOX, SO2, VOCs and CO) are all over the map. This proves that Bloom will simply GREENWASH and LIE no matter the geography they do business in.via

Ms. Gerner at the California Bar Association

Marisa Blackshire Bloom's VP of Regulatory and Environment approved all of the conflicting data. Why has she not yet been disbarred as a lawyer in the once Golden State?

BLOOM'S CONFLICTING CLAIMS ON EMISSIONS

	LBS CO2/MWH	LBS NOX/MWH	LBS SO2/MWH	LBS CO/MWH	LBC VOCS/MWH	LBS CO2/MILLION BTUS	SOURCE
DELAWARE	700.0	0.00170	0.0001020	0.03400	0.0160	112.9	MONTHLY POLLUTANT REPORT
TEXAS	833.0	0.00300	0.0058000	0.01300	0.0100	117.0	PERMIT APPLICATION
WYOMING	833.0	0.00300	0.0000061	0.01300	0.0100	117.0	PERMIT APPLICATION

On Thursday Bloom's stock hit an all time high and their market cap now exceeds ENRON'S that was reached in 1999 before ENRON collapsed as a ponzi scheme.

WE know that Bloom and Southern Company have committed massive fraud in Delaware by LYING about CO2 and NOX air emissions in their monthly pollutant reporting to Delaware DNREC.

I created the attached table comparing the Delaware pollutant reports to the claimed air emissions Bloom has used in recent Permit Filings in Texas, New Mexico and Wyoming. The pollutants into the air (CO2, NOX, SO2, VOCs and CO) are all over the map. This proves that Bloom will simply GREENWASH and LIE no matter the geography they do business in.via

Ms. Gerner at the California Bar Association

Marisa Blackshire Bloom's VP of Regulatory and Environment approved all of the conflicting data. Why has she not yet been disbarred as a lawyer in the once Golden State?

BLOOM'S CONFLICTING CLAIMS ON EMISSIONS

Subject: [EXTERNAL] BLOOM SOURCE TEST SHOWS 0.003 POUNDS OF NOX PER MEGAWATT HOUR
Date: Thursday, June 25, 2026 9:20:31 AM
Attachments: bloom wyoming Emissions calcs (1).pdf

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

TO THE FOLKS ON WALL STREET HYPING BLOOM ENERGY

In Delaware Bloom claims to emit only 0.0017 pounds of NOX per megawatt hour in their month POLLUTANT reporting to DNREC. They do this to JUSTIFY the number of megawatt hours they generate each month in Delaware and to EXTRACT a subsidy of $166.87 from Delmarva RATEPAYERS.

They know this is FRAUD as they know they EMIT 0.003 pounds of NOX per megawatt hour. The California AG, the Santa Clara DA, and the Delaware AG know this is FRAUD. The EPA knows this is FRAUD. The FBI knows this is FRAUD. Robert Storch, the new INSPECTOR GENERAL FOR THE STATE OF DELAWARE, knows this is FRAUD. The California Bar Association knows that a licensed lawyer working for Bloom is committing this FRAUD.

So tell me WHO ARE PROTECTING BLOOM? Perhaps the same sleaze that makes lots of

money investing in Bloom? Even Donlad Trump's BLIND TRUST is invested in Bloom. Yes Mr. Storch the guy who FIRED YOU is making money out of Bloom and their GREENWASHING.

BUT GREEN LIES MATTER AND THE BLOOMDOGGLE WILL END JUST LIKE ENRON ENDED

Subject:	[EXTERNAL] Fwd: Bloom says desulfurization waste is dangerous if canisters are opened at the power station site
Date:	Saturday, July 11, 2026 6:49:51 PM
Attachments:	pe1264_filing_meriden.pdf

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To the folks in New Mexico Dept of the environment

For many years Bloom claimed that the safest and best method to deal with the hazardous solid waste in fuel cell desulfurization is to use multiple small sealed canisters in each fuel cellthat never get opened at the power plant site

They told Connecticut that their competitors who opened the desulfurization tanks at the power plant site had a more dangerous operation that needs special government oversight. Seen the attached petition Bloom filed with the CT Siting Council

Yet for project Jupiter in New Mexico they intend to have 190 large desulfurization tanks that they will open at least once every two years to remove the hazardous contents

For this very reason their permit should not be granted

New Mexico must require Bloom to use the much safer system of four small canisters for each 325 kilowatt fuel cell. This is the best practice for handling the solid waste that by Bloom's own admission is laden with lead, chromium, arsenic and Benzene

I believe there are myriad hydrocarbons and halogen containing compounds that will be emitted into the air when the tanks are opened at the power station with 190 tanks. The compounds include but are not limited to benzene, toluene, xylene, methyl chloride, chloroform, methyl bromide and radon gas

The EPA should not allow Bloom to use this terrible system for desulfurization of natural gas. It is a disaster waiting to happen. I am sure that Congressmen Khanna and Huffman agree.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To the Folks in New Mexico

As you know I am reviewing the permit application that Yucca made for project Jupiter. I have real concern about personal safety because of emissions with heavily depleted oxygen.

Based on the December 2023 emissions testing results I estimate there will be 6,382,827 dry standard cubic feet of exhaust with only 13% of oxygen coming out of the fuel cells that generate 2,462,000 kilowatts. Even if the cells are spread over 20 acres this means the exhaust would cover a height of 8 feet each minute until the exhaust is mixed with ambient air. Bloom is not proposing a very high exhaust stack like one sees in traditional gas fired power plants to deal with oxygen depleted exhaust.

Since this proposed fuel cell power plant is so massive it will be prudent for public safety and the safety of those working on servicing the power plant that we have a complete third party study of what oxygen level there will be for people in close proximity to the fuel cells under the worst conditions of a very still hot or cold day in New Mexico.

I believe that if the oxygen level is below 19.5% then people will experience serious effects from trying to breathe such oxygen depleted air. People with breathing problems might even die.

Thanks

To the folks in New Mexico

You referenced Bloom doing business in Delaware and Texas. I checked what they said in their air emissions of NOX as lbs/megawatt hour in Texas and Delaware. They told New Mexico that they will emit twice the rate of NOX in your state versus Delaware. They told you your emissions rate of NOX will be almost 60% higher than Texas. See the table below.

NEW MEXICO MUST HOLD BLOOM'S FEET TO THE FIRE AND ONLY PERMIT AN EMISSIONS RATE OF 0.0017 POUNDS PER MWH NOT 0.00345.

Lindsay Leveen
GREEN LIES MATTER

NOX EMISSIONS BY BLOOM IN VARIOUS STATES

	RATE LBS NOX/MEGAWATT HOUR
DELAWARE	0.0017
TEXAS	0.0021964
NEW MEXICO	0.00345

WHY IS BLOOM SO HIGH IN NEW MEXICO ????
NEW MEXICO MUST DEMAND THAT BLOOM MATCH NOX IN DELAWARE

Attachments:	bloom 700 pounds CO2 delaware.PNG

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To the Folks in New Mexico

You referenced Bloom doing business in Delaware as Diamond State Generation Partners.

Back in October 2018 Bloom under penalty of perjury told DE DNREC they emit 700 pounds of CO2 per megawatt hour. DNREC set the hourly and yearly CO2 emissions limits based on the 700 pound quantity.

For the past eight years Bloom's CEO has repeatedly to;d investors and the SEC that his fuel cells are becoming more efficient.

But recently Bloom informed you in New Mexico that they needed a permit to emit 940 pounds of CO2 per megawatt hour; this included a 15% safety factor. You wisely told Bloom to get rid of the 15% safety factor and you intend to permit 818 pounds of CO2 per megawatt hour and limit the yearly CO2 to 8,820.952 short tons a year.

Sadly this is not good enough given that in Delaware the emissions rate of CO2 is 700 pounds per mwh not 818.

You must limit yearly emissions of CO2 for the 2,462,000,000 watts of dirty power to 2,462*700*8760/2000 = 7,548,492 tons per year to simply match what Bloom claimed 8 years ago in Delaware. Yes 2.462 gigawatts is 2.462 billion watts of power. That is a lot of watts.

Based on the claims the Bloom CEO made to investors and the SEC about the improvements each year in his technology, it would be prudent to set CO2 emissions to only 5 million short tons a year. The Bloom CEO became a billionaire making such claims and just a couple of days ago in his earnings call he stated that communities are welcoming Bloom to power their data centers.

I can only hope that New Mexico does a better job of vetting the air and solid waste permits than Wyoming and other communities with less stringent or zero permitting scrutiny.

Good reporting ! I suggest the folks in New Mexico chat with you. In Delaware Bloom has an 88% capacity factor but it actually should be even lower. Because BLOOM lies their gas emits only 112.9 pounds of CO2 per million BTUS they prop up the capacity factor to 87% from 84% where it should be. Southern Power then submits fraudulent invoices to Delmarva based on Bloom's (Marisa Blackshires') LIES. Southern is copied. Ask Southern about Bloom's performance guarantees for Diamond State Generation Partners? Also ask Rob Bonta AG of California why he does not end the BLOOMDOGGLE. Maybe because Bloom contributed to his campaigns. Ask Kathy Jennings the AG of Delaware the same question. Bloom also contributed to her campaign.

For a data center in Vineland NJ Bloom will install 327 megawatts of cells to deliver only 250 megawatts of power. This means almost a quarter of the nameplate capacity "disappears".

To the folks in New Mexico I bet the same fraction of the 2,462 megawatts they want to

permit for Project Jupiter will also DISAPPEAR.

PLEASE WATCH THIS

https://www.youtube.com/watch?v=hcNjKbyxBaw&t=1008s

To The Folks in New Mexico

Bloom now claims to have an efficiency of 60% on converting natural gas into power.

There are 3.412 million BTUs in a megawatt hour.

The heat rate should be 3.412 divided by 0.6 = 5.68666 million BTUS on natural gas per megawatt hour power. Using the EPA emissions of CO2 per million BTUS of natural gas of 117 pounds we have Bloom claiming that each megawatt hour of power they deliver to data centers has only 665.3 pounds of CO2.

But in New Mexico the authorities are suggesting to use 818 pounds of CO2 per megawatt hour when Bloom tells Europeans and the world they emit only 665.3 pounds. WHY SHOULD BLOOM BE ALLOWED TO POLLUTE MORE IN NEW MEXICO THAN SPAIN?

I say HELL NO DON"T ALLOW THIS !

Also we now have the Hunterbrook report that Bloom Fuel Cells lose power rapidly. The 2,462 megawatt plant is actually only capable of something like 2,000 megawatts.

The yearly limits on CO2 in New Mexico should be calculated as follows:

2000 times 665.3 times 8760 hours divided by 2000 pounds per ton EQUALS 5,828,378 TONS A YEAR OF CO2.

If New Mexico allows emissions of anything more than 5,828,378 short tons a year of CO2 at project Jupiter, we know that New Mexico has been bought.

Bloom swears on a bible that NOX emissions in Delaware are only 0.0017 pounds per megawatt hour. Therefore, New Mexico must limit yearly NOX emissions to 2000 times 8760 times 0.0017 divided 2000 = 14,89 short tons per year.

In the youtube Bloom says that NO N2 is in the anode exhaust. New Mexico claims the anode exhaust is 95% CO2. Therefore, the other 5% of the Anode exhaust must be methane and or hydrogen. Both methane and hydrogen are terrible greenhouse gases. We need DISCOVERY from Yucca which is Bloom to know about Methane and Hydrogen emissions.

These are not stated in the permit application. WHY?????

Thanks

Lindsay Leveen

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To the FBI and EPA CID and DA Rosen and AG Bonta

I am doing a lot of review of the permit application that Yucca (Bloom) has just submitted in New Mexico. Attached is the December 2023 analysis of the emissions testing that is very different from the 2014 CARB testing that Bloom used to get the 2019 FAKE permits from DE DNREC for Diamond State Generation Partners which is also attached.

In 2014 Bloom measured they only had 2.055 dry cubic feet of exhaust per kilowatt hour of power (124 divided by 60.33) . By 2023 the volume of exhaust increased to 2.5925 dry cubic feet per kilowatt hour (174.4 divided by 67.27). More natural gas and more air per kilowatt in 2023 than 2014 all the while the LYING BILLIONAIRE CEO of Bloom LIED his fuel cells were improving every year.

Now the zinger in this data. The 2014 data has 2.809% by volume on a dry basis of CO2. Let's multiply 124 dry cubic feet a minute by 60 minutes in an hour and by .02809 and convert it to lbs of CO2 by dividing by 8.74 scf per pound. This equals 23.92 pounds per hour of CO2 for 60.33 kilowatt. This equals only 0.396 pounds of CO2 per kilowatt hour or only 396 pounds of CO2 per megawatt hour. The EPA states that a million BTUs of natural gas emits 117 pounds of CO2 so the scum at CARB and DNREC believed that Bloom only needed 3.387 million BTUs of gas to generate a megawatt hour of power. But we know by DEFINITION a megawatt hour equals 3.412 million BTUs. SO we have Bloom violating the laws of thermodynamics in the CRAP data that CARB believed and DNREC used to assist Bloom in STEALING HUNDREDS OF MILLIONS OF $$$$$$ in subsidies from Delmarva ratepayers in Delaware.

Governor Meyer

Place Angela Marconi and Lisa Vest on administrative leave. These two clowns who pretend to work for the people of Delaware while drawing paychecks at DNREC allowed all of this FRAUD to happen.

To the folks in New Mexico

Theranos was the Bloom of Blood and Bloom is the Theranos of Thermodynamics. You do not want a BLOOMDOGGLE in your state.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

TO THE FBI AND EPA CID

In March 2026 Bloom submitted a pollutant report to Delaware DNREC for the operations in that month at Brookside.

They stated they used 0.0155 million cubic feet per hour of natural gas and they emitted 1,798 pounds of CO2 per hour.

The EPA has a calculation sheet online that states 0.0155 million cubic feet of gas which is 15.5 thousand cubic feet of natural gas emits 1,873 pounds of CO2.

Bloom LIED they have a low carbon natural gas because the hourly limit on CO2 in the DNREC permit is 1,820 pounds of natural gas.

The LIE was used to STEAL additional subsidies from Delmarva Ratepayers in Delaware.

To the California Bar.

Please disbar Marisa Blackshire who blessed this FAKE pollutant report,

To the Folks in New Mexico

The same Marisa Blackshire attested to the accuracy of the permit application for the massive 2,462 megawatt power plant for Project Jupiter. I suggest you check the accuracy of each and every piece of data in that permit application.

To Governor Meyer and IG Storch
The BLOOMDOGGLE in Delaware has to END.

Folks in New Mexico

The real story behind Project Jupiter is the $300 million or so VERY QUICK profit Oracle has on Bloom Energy stock for signing up to use the dirty Bloom Boxes for project Jupiter.

I did not hear back from Oracle re the status of the warrant or the sale of the shares under the warrant. I suggest you report on this angle of the project. The sale of fuel cells for the project was TIED INTO giving Oracle a warrant that they knew would be in the money as soon as they announced the mega deal for Project Jupiter.

Mahesh

A few weeks back I asked you to confirm the trades Oracle might have or might not have made on Bloom Energy stock based on the CHEAP warrant Sridhar at Bloom gave you all. You ignored my request for this information.

Maybe you can give Rep Sarah Silva an answer, she is copied.

I took a look at Oracle's 10K and it seems like there is quite a bit of profit in 2026 in two non ordinary income categories. Perhaps some of this EXTRAORDINARY income came from trades in Bloom Energy Stock?

Rep Silva

If Oracle does not tell us about the profits they might have made on trading Bloom Energy stock, I suggest you have a hearing to compel them to testify why they chose to have Bloom's GANGRENE fuel cells? The reason is not the 92% supposed reduction in NOX emissions. Bloom LIED in Ohio and Delaware that NOX reductions were 97%. Maybe the reason that Oracle loves Bloom is that the 2,462 megawatts of Bloom Fool Cells in New Mexico will generate approximately 45,000 pounds a day of solid waste with lead, chromium, arsenic and benzene?

Remember Theranos was the Bloom of Blood and Bloom is the Theranos of Thermodynamics.

Subject: [EXTERNAL] DRAFT ADMINISTRATIVE RECORD PROJECT JUPITER

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Ms. Kuhn

I have started to review the Draft Administrative Record you have posted for Project Jupiter.

I believe that Table 2-H is in error by a factor of TEN TOO HIGH when it comes to Dry Standard Cubic Feet Per Second of exhaust flow from each of the 2,275 by 30 foot stacks.

I came to this conclusion by the following math

Each stack is for 1.08219 megawatts on average
Yucca claimed each megawatt hour emits 818 pounds of CO2
1.08219 megawatts would emit 818 times 1,08219 divided by 3,600 pounds per second = 0.2459 pounds of CO2 per second. A pound of CO2 has a volume of 8.74 scf. 0.2459 pounds per second of CO2 has a volume of 2.149 cubic feet per second. The source

test claimed there is 4.55% volume% CO_2 on a dry basis. Divide 2.149 by 0.0455 we have an exhaust flow of only 47.234 dry standard cubic feet per second. But Table 2-H has a volumetric flow of exhaust of 514.46 dry standard cubic feet per second out of each of the stacks.

Divide 514.46 by 47.234 and we have a factor of 10.89 times too much exhaust flow out of each stack.

The stack velocity will be almost stagnant if 8.16 feet in diameter stacks are used. The whole air dispersion model is nonsense.

I strongly suggest you contact Marissa Blackshire the VP of Regulatory of Bloom as well as the VP of Regulatory of Yucca to explain the data in Table 2-H. When you get the real data please advise us and post this to the revised administrative record. I will then review the revised data.

I have reported on Bloom's GREENWASHING for over 14 years and this is not the first time they have fake data in air permit applications. Ms. Blackshire of Bloom submits monthly pollutant reports to Delaware DNREC in which she claims to have invented a form of natural gas that emits less CO_2 than normal natural gas. I have alerted the world to this false claim.

Thanks

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To Delaware DNREC

Did you ever review the claimed stack flow rate of exhaust in the permit application versus the stack flow rate in the CARB certification test? They are completely different when one accounts for flow in scfm per kilowatt of power. See the table below.

I am now 100% convinced that the permits for Brookside and Red Lion are NULL AND VOID based on a person just looking at all the LIES Bloom told DNREC. Southern Power should stop issuing fraudulent invoices to steal subsidies from Delmarva Ratepayers.

To the folks in New Mexico

The exhaust flow data in the Jupiter permit application is equally flawed and is ten times greater than what 2.462 gigawatt combined cycle power station would emit.

To All

So you understand the scope of the desulfurization planned for Jupiter. The Bloom fuel cells will use 400 million standard cubic feet a day of natural gas that needs its sulfur content reduced from 15 parts per million to 5 parts per billion expressed as SO2. 400 million standard cubic feet a day of natural gas is what 1.8 million homes would use for heating and cooking.

Bloom's standard practice is to use something like 30,000 small sealed canisters to do the desulfurization. The small sealed canisters are normally housed inside a fuel cell server. But now Bloom/Oracle want to use a centralized desulfurization system with 190 tanks each of 1,370 cubic feet in volume and they want to empty one tank every four days to remove the spent sulfur filtering material. This is the same scale as the Billion cubic foot a day hydrogen facility that Exxon had planned to build in Texas.

We better have a very robust analysis of the desulfurization system else we will have a second Bhopal or an Aliso Canyon Natural Gas Storage disaster on our hands.

Lindsay Leveen
GREEN LIES MATTER

1. Purely Residential (Heating & Cooking)

- **Scale: ~1.8 million homes**
- **The Math:** An average American home that uses natural gas consumes roughly 80,000 cubic feet of gas per year. 400 MMscf/day equates to **146 billion cubic feet (Bcf) per year**. This is enough to provide direct gas utilities to a city the size of **Houston, TX** or **Phoenix, AZ**

On Fri, Sep 25, 2026 at 8:10 AM Lindsay Leveen <lleveen@gmail.com> wrote:

> Mr. Kenney

We need to know in detail how the desulfurization filtering solid waste will be removed from each of the 190 tanks each with a volume of 1,370 cubic feet.? What chemicals will desorb and float into the air and where the solid waste will go for "TREATMENT"?

Bloom claims they use adsorption as the method to remove the sulfur from the pipeline natural gas. Surely when the pressure is relieved and the desulfurization tanks are opened there is desorption. What desorbs? I believe benzene, toluene, xylene and myriad other TOXIC CHEMICALS desorb. The EPA particularly Region 3 knows what is in the desulfurization tanks. Just ask them.

Lindsay Leveen,

Thank you for your interest in protecting human health and the environment and for sharing your concerns regarding the proposed Bloom Energy project in New Mexico. Sonya Sasseville forwarded your email to me, and I am happy to help answer your questions.

EPA appreciates public interest in the proper management of materials that may be subject to hazardous waste requirements. As you note in your email, EPA previously addressed a site-specific matter in its April 21, 2017, letter concerning Bloom Energy and the ShoreMet facility in Indiana. That letter described a particular recycling operation involving spent copper oxide catalyst media and noted that determinations under the hazardous waste regulations are highly dependent on the specific facts and circumstances of a given facility and process. In that instance, EPA recognized the role of the authorized state in evaluating the site-specific circumstances and administering the applicable program and concurred with that state determination, based on the facts presented.

More generally, hazardous waste determinations under the Resource Conservation and Recovery Act are made based on the particular material and processes involved. Where a state is authorized by EPA to administer and enforce the hazardous waste program, the state is the appropriate

authority to evaluate site-specific questions and to determine how the regulations apply to a proposed operation within its jurisdiction.

Accordingly, for questions regarding the proposed New Mexico facility, including whether any material from that operation would be subject to hazardous waste requirements, the most appropriate agency to contact would be the New Mexico Environment Department, which administers the hazardous waste program for the State of New Mexico. They would be best positioned to evaluate the proposed process, operational details, and any applicable permitting or waste management requirements.

Thank you again for your engagement on this important issue.

Bill Noggle

There is a typo. The proposed power plant Bloom wants in New Mexico is 2,462 megawatts not 2,262 megawatts. It is called PROJECT JUPITER, because it is so large.

On Mon, Aug 24, 2026 at 11:02 AM Lindsay Leveen <lleveen@gmail.com> wrote:

Thanks

I was the tipster to the EPA on HAZMAT that Bloom Energy of San Jose CA mishandled. The EPA fined Bloom energy a total of $1.37 million in 2020. In 2017 somehow Bloom got the EPA to agree that Bloom could ship their desulfurization HAZMAT without manifests because Bloom used small sealed canisters that were never opened in the field and that the canisters were shipped to Shoremet in Indiana to recycle copper out of the filtering material.

It is now 2026 and Bloom wants to build a power station in New Mexico with more capacity than the Hoover Dam. Bloom is intending to have 2,262 megawatts of fuel cells made up of thousands of 325 and 260 kilowatt units. There will be something like 30,000 small canisters but Bloom wants to save money and build 190 fixed permanent centralized tanks each with a volume of 1,370 cubic feet to achieve the desulfurization of natural gas prior to entry of the gas into the fuel cells. The pipeline gas has 0.75 grains of sulfur per 100 scf and the gas that must enter the fuel cells has to be at 5 parts per billion expressed as SO2. I estimate each tank will have approximately 180,000 pounds of filtering material and one tank will need to opened and emptied every 4 days and the 180,000 pounds of solid waste with lead, chromium, arsenic and benzene as well as many other toxic compounds will be sucked out the tank and placed in a truck to haul it away. I am worried that when the tanks are opened at the site of the power plant many vapors will be emitted and there is a massive danger of fire igniting.

Did the 2017 waiver that Barnes Johnson of your office at that time gave Bloom ever intend to allow 180,000 pounds of solid hazardous waste every four days to be sucked out of large tanks and the shipping of this dangerous material to have no manifest? I doubt this was contemplated.

Note Bloom intends to desulfurize 400 million standard cubic feet a day of natural gas to power their fuel cells. This is as much gas as Exxon was contemplating to reform in Baytown Texas for their now abandoned Blue hydrogen project. I expect a reply from EPA as to how you all believe the solid waste with lead, chromium, arsenic and benzene that Bloom intends to have in New Mexico should be permitted, handled and then transported.

Thanks

Lindsay Leveen

Lindsay Leveen,

Thank you for your interest in protecting human health and the environment and for sharing your concerns regarding the proposed Bloom Energy project in New Mexico. Sonya Sasseville forwarded your email to me, and I am happy to help answer your questions.

EPA appreciates public interest in the proper management of materials that may be subject to hazardous waste requirements. As you note in your email, EPA previously addressed a site-specific matter in its April 21, 2017, letter concerning Bloom Energy and the ShoreMet facility in Indiana. That letter described a particular recycling operation involving spent copper oxide catalyst media and noted that determinations under the hazardous waste regulations are highly dependent on the specific facts and circumstances of a given facility and process. In that instance, EPA recognized the role of the authorized state in evaluating the site-specific circumstances and administering the applicable program and concurred with that state determination, based on the facts presented.

More generally, hazardous waste determinations under the Resource Conservation and Recovery Act are made based on the particular material and processes involved. Where a state is authorized by EPA to administer and enforce the hazardous waste program, the state is the appropriate authority to evaluate site-specific questions and to determine how the regulations apply to a proposed operation within its jurisdiction.

Accordingly, for questions regarding the proposed New Mexico facility, including whether any material from that operation would be subject to hazardous waste requirements, the most appropriate agency to contact would be the New Mexico Environment Department, which administers the hazardous waste program for the State of New Mexico. They would be best positioned to evaluate the proposed process, operational details, and any applicable permitting or waste management requirements.

Thank you again for your engagement on this important issue.

Bill Noggle

Acting Director, OLEM/ORCR/WINGD

There is a typo. The proposed power plant Bloom wants in New Mexico is 2,462 megawatts not 2,262 megawatts. It is called PROJECT JUPITER, because it is so large.

On Mon, Aug 24, 2026 at 11:02 AM Lindsay Leveen <lleveen@gmail.com> wrote:

> Thanks
>
> I was the tipster to the EPA on HAZMAT that Bloom Energy of San Jose CA mishandled. The EPA fined Bloom energy a total of $1.37 million in 2020. In 2017 somehow Bloom got the EPA to agree that Bloom could ship their desulfurization HAZMAT without manifests because Bloom used small sealed canisters that were never opened in the field and that the canisters were shipped to Shoremet in Indiana to recycle copper out of the filtering material.
>
> It is now 2026 and Bloom wants to build a power station in New Mexico with more capacity than the Hoover Dam. Bloom is intending to have 2,262 megawatts of fuel cells made up of thousands of 325 and 260 kilowatt units. There will be something like 30,000 small canisters but Bloom wants to save money and build 190 fixed permanent centralized tanks each with a volume of 1,370 cubic feet to achieve the desulfurization of natural gas prior to entry of the gas into the fuel cells. The pipeline gas has 0.75 grains of sulfur per 100 scf and the gas that must enter the fuel cells has to be at 5 parts per billion expressed as SO2. I estimate each tank will have approximately 180,000 pounds of filtering material and one tank will need to opened and emptied every 4 days and the 180,000 pounds of solid waste with lead, chromium, arsenic and benzene as well as many other toxic compounds will be sucked out the tank and placed in a truck to haul it away. I am worried that when the tanks are opened at the site of the power plant many vapors will be emitted and there is a massive danger of fire igniting.
>
> Did the 2017 waiver that Barnes Johnson of your office at that time gave Bloom ever intend to allow 180,000 pounds of solid hazardous waste every four days to be sucked out of large tanks and the shipping of this dangerous material to have no manifest? I doubt this was contemplated.

Note Bloom intends to desulfurize 400 million standard cubic feet a day of natural gas to power their fuel cells. This is as much gas as Exxon was contemplating to reform in Baytown Texas for their now abandoned Blue hydrogen project. I expect a reply from EPA as to how you all believe the solid waste with lead, chromium, arsenic and benzene that Bloom intends to have in New Mexico should be permitted, handled and then transported.

Thanks

Lindsay Leveen

Date:	Saturday, September 26, 2026 11:42:02 AM
Attachments:	Bloom brookside new permit application oct 2018.pdf

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I reread the Bloom permit application for Brookside Delaware and it is emphatic that they do not have thermal oxidizers. See 12.9 Control Devices Thermal Oxidizer.

Yet in my review of the information provided to ENV N.M. Bloom claims to have a catalytic thermal oxidizer on each power module to oxidize unused fuel exiting the anode. They even describe that the catalytic thermal oxidizer operates at 900 degrees C.

Mr. Storch here is another case of FRAUD by Bloom in Delaware and corruption by DNREC.

Mr. Storch end the Bloomdoggle in Delaware. It is outright fraud.

Michael Boskin

You sit on both Bloom's and Oracle's board of directors. You muct have been part of the engineering of the deal for Oracle to buy Bloom boxes in exchange for a HUGE MONEY

MAKING warrant for over 3.5 million shares of Bloom.

Do you have a statement to make on why Bloom submits FRAUDULENT AND FAKE pollutant reports to Delaware DNREC so that they and Southern Power can STEAL extra subsidies from Delmarva ratepayers?

How much profit did you make on Bloom stock?

If my memory is correct, way back when you were the economic advisor to president Bush Senior and you were opposed to the CLEAN AIR ACT.

AI Overview

As Chairman of the Council of Economic Advisers under President George H.W. Bush, Michael Boskin pushed for rigorous cost-benefit analysis and flexibility during the formulation of the **Clean Air Act Amendments of 1990**. [1, 2, 3]

Michael Boskin's Role and Perspective

- **Cost Concerns:** Boskin and the Council of Economic Advisers (CEA) worried that the initial regulatory compliance costs proposed for the Clean Air Act would place an immense burden on the U.S. economy. [1]
- **Veto Strategy:** He advised President George H.W. Bush to threaten a veto if the legislative costs exceeded specific economic thresholds estimated by the CEA rather than the EPA. [1]
- **Market Flexibility:** Boskin advocated for flexible performance targets and market-based mechanisms rather than rigid, costly command-and-control mandates. [1, 2]

Senator Pettyjohn

There was another crooked Bloom VP named Mark Mesler who signed off on the Air Permit Application to Delaware DNREC in 2018. I exposed him for his LIES and he was either fired or resigned from Bloom shortly after DNREC issued the permits for Red Lion and Brookside. He had worked for Bloom for many years before he disappeared. He went on to become the CFO of Archer Aviation and I got him fired from that job. He should be called to the DE State Senate hearing on the FRAUD going on there in your state. I bet he can spill the beans about the CEO and board of directors of Bloom.

Another BLOOMDOGGLER who should testify is one Patrick McCormick. In 2018, US Senator Murkowski had Patrick as her General Counsel of the US Senate Energy Committee. She loaned Patrick to Bloom for two years for Patrick to CLEAN UP the hazmat story with the US EPA. He was also involved in the DNREC permits for the rebuilding of the dilapidated power plants in Red Lion and Brookside. In 2020, as soon as the EPA was off Bloom's back Patrick returned to the loving arms of Lisa Murkowski to be a special counsel to the US Senate energy committee.

In 2018 Patrick was middle class with minor investments in traded stocks and funds. Senate filings in 2022 show he was a RICH MAN.

To the folks in New Mexico

Bloom has very powerful people behind them and I am certain they will pull every lever to get their dirty power plant that has more capacity than the Hoover Dam, to be built in your state.

Senator Pettyjohn

Your AG and IG know that Bloom submits fraudulent pollutant reports to DE DNREC each month to steal extra subsidies from Delmarva Ratepayers. The FBI and the EPA CID also know of the fraud but all of them have done nothing to stop the fraud that I estimate is well over $100 million in excess subsidies since January 2020 and approaching $200 million since June 2012 when the SCAM began.

Why not ask Special Agent Screen at the FBI who copied why the fraud is allowed to continue. No doubt Bloom is being protected by the very deep STATE.

Maybe Ro Khanna and Jared Huffman, two gangrene congressmen from California can opine on how Bloom invented a form of natural gas that emits less CO2 than all other natural gas? Of course this is pure GREENWASHED BULLSHIT used to defraud Delmarva Ratepayers.

CA AG Rob Bonta who is owned by Bloom knows that the fraud starts on North First Street San Jose. So does Santa Clara County DA Rosen. Ask them why Bloom is allowed to steal?

To the folks in New Mexico

I hope that the new hearing officer will allow us discovery of why the emissions factors Bloom gave N.M. ENV are miles apart from the factors Bloom submits to Delaware DNREC each month. Just as I told DNREC back in 2019 that Bloom was faking emissions for their DNREC permits I have told New Mexico, Ohio, Pennsylvania, and Ohio that Bloom is simply making up stories to gain air permits. If the former federal judge is fair, this permit hearing will expose Bloom as the Theranos of Thermodynamics. I can only pray that he is not like Lisa Vest, the DNREC Hearing Officer back in 2019 who was DEAF.

Bloom Can Afford a Sixers Jersey, but Delmarva Customers Are Still Paying the Bill

On Monday, the Philadelphia 76ers announced a multi-year partnership and jersey patch deal with Bloom Energy. Good for the Sixers. NBA jersey patches don't come cheap, and Bloom obviously has the money to spend on one.

Here's my problem with it. Every Delmarva Power customer in Delaware is still paying a charge on their electric bill that goes to Bloom Energy. It's been there since 2012, and under the deal Delaware signed, it stays there until 2033.

For anyone who wasn't around in 2011, here's how we got here. The General Assembly passed Senate Bill 124, which redefined Bloom's natural gas fuel cells as "renewable" energy so Delmarva could install 30 megawatts of them and bill ratepayers for 21 years. In exchange, Bloom promised 900 manufacturing jobs at the old Chrysler site in Newark by 2017. The state added a $12 million grant on top of that.

Ratepayers were told it would cost them about a dollar a month. It ended up costing several times that.

The jobs didn't show up on schedule either. When the 2017 deadline hit, Bloom had roughly 300 Delaware workers, about a third of what was promised. The company paid back part of its state grant and forfeited another piece.

To be fair, Bloom's workforce in Newark has grown in recent years, and I'm glad for every Delawarean working there. But the deal was never "900 jobs someday." It was 900 jobs by 2017, and ratepayers were locked in for two decades based on that promise. The state got some grant money back. Delmarva customers never got a dime back on the surcharge.

My colleagues and I called this a sweetheart deal back in 2020, and nothing since has changed my mind. Bloom's own federal filings show the Delmarva project bringing in roughly $36 million a year.

I'm not rooting against Bloom. I want them to succeed and keep hiring in Newark. But a company that can put its name on an NBA jersey is not a company that needs a subsidy from a retiree in Seaford or a young family in Millsboro trying to keep the lights on while Delmarva Power asks for yet another rate increase.

So, here's my ask. Bloom should come to the table and voluntarily end or reduce this surcharge. If they're doing well enough to sponsor the Sixers, they're doing well enough to stop charging Delaware families for a promise they didn't keep on time.

ABC Legislative Panel

Thank you to ABC Delaware for inviting me to participate in Thursday's legislative forum and join a panel discussion on the importance of political engagement.

One of the points I emphasized is how important it is for those in the construction industry, and the private sector as a whole, to build relationships with their elected officials. When legislation is introduced that could help or hurt your industry, legislators need to hear directly from the people who understand its real-world impact.

Good public policy starts with open communication, and I appreciate ABC Delaware for helping strengthen that connection between its members and those serving in Dover.

Delaware Department of Human Resources Hosts Statewide Career Fair at Stockley Campus in Georgetown

The Delaware Department of Human Resources will host its fourth and final statewide career fair of the year on Wednesday, October 7, 2026, at the Stockley Campus in Georgetown. The event, scheduled from 12:00 p.m. to 4:00 p.m., will link youth, adult, and justice-involved job seekers with rewarding career opportunities in state government. Registration is now open at statejobs.delaware.gov.

Subject: Fwd: [External] FUEL CELL AIR PERMITS IN PENNSYLVANIA
Date: Wednesday, October 7, 2026 8:43:55 AM

To the Folks in Ohio

We will soon see what Bloom told Pennsylvania about their emissions factors. They just make up stories as they move their BLOOMDOGGLE from state to state. Each permit application in Delaware, Texas, Ohio and New Mexico has different emission factors and rates for pollutants.

To the Folks in Pennsylvania

Every month Bloom Energy submits Pollutant Reports to Delaware DNREC using FALSE emission factors for CO2 and NOX. They do this for them and their partner Southern Power to STEAL extra subsidies from Delmarva Ratepayers. I have informed the FBI and the EPA CID of the fraud as well as the new IG of Delaware Mr. Storch.

The data Bloom and the data center operators must have provided for the project in Shippingport and or other locations in your State may provide further evidence of the FRAUD Bloom is committing in Delaware.

It is therefore important that you provide me this information ASAP.

Thanks

Back in 2020 the EPA (region 3 in Philly) fined Bloom $1.37 for dumping hazmat with lead, chromium, arsenic and benzene in common landfills. The Wheeler EPA kept the fine a secret and was bought off by Bloom to settle their problem for a very low fine.. I sued the United States.
>
> In the New Mexico permit application for Project Jupiter which is of similar size to the Shippingport project Bloom will have 190 tanks each with 1,370 cubic feet of volume generating similar solid waste in the desulfurization of the pipeline natural gas. I estimate that Bloom will generate 180,000 pounds of such solid waste with lead, chromium, arsenic and benzene every four days that will have to be removed from the data center in New Mexico for "treatment". There could be similar amounts of dangerous solid waste in Shippingport. My concern is that every time a desulfurization tank is opened at the data center, myriad toxic vapors will desorb from the filtering material. I have alerted New Mexico authorities to the danger of the whole desulfurization system Bloom is proposing for Project Jupiter.

Hi

I am Lindsay Leveen of Sausalito California. I am an award winning chemical engineer as well as an award winning journalist. I exposed Bloom Energy of San Jose California for GREENWASHING and ENVIRONMENTAL FRAUD. I am an informant to the FBI and EPA CID in an ongoing investigation of fake pollutant reports being submitted by Bloom to Delaware DNREC.

It seems like Bloom has a contract for the power station for the huge data center that will be built in Shippingport PA.

Have air permit applications been filed for this project?

If they were filed please provide me electronic copies of these permit applications.

I have reviewed the air permit application for the huge Project Jupiter in New Mexico. It is a pile of garbage and I will testify at the hearings to make sure that New Mexico is not the site of a BLOOMDOGGLE.

Senator Pettyjohn

Your AG and IG know that Bloom submits fraudulent pollutant reports to DE DNREC each month to steal extra subsidies from Delmarva Ratepayers. The FBI and the EPA CID also know of the fraud but all of them have done nothing to stop the fraud that I estimate is well over $100 million in excess subsidies since January 2020 and approaching $200 million since June 2012 when the SCAM began.

Why not ask Special Agent Screen at the FBI who copied why the fraud is allowed to continue. No doubt Bloom is being protected by the very deep STATE.

Maybe Ro Khanna and Jared Huffman, two gangrene congressmen from California can opine on how Bloom invented a form of natural gas that emits less CO2 than all other natural gas? Of course this is pure GREENWASHED BULLSHIT used to defraud Delmarva Ratepayers.

CA AG Rob Bonta who is owned by Bloom knows that the fraud starts on North First Street San Jose. So does Santa Clara County DA Rosen. Ask them why Bloom is allowed to steal?

To the folks in New Mexico

I hope that the new hearing officer will allow us discovery of why the emissions factors Bloom gave N.M. ENV are miles apart from the factors Bloom submits to Delaware DNREC each month. Just as I told DNREC back in 2019 that Bloom was faking emissions for their DNREC permits I have told New Mexico, Ohio, Pennsylvania, and Ohio that Bloom is simply making up stories to gain air permits. If the former federal judge is fair, this permit hearing will expose Bloom as the Theranos of Thermodynamics. I can only pray that he is not like Lisa Vest, the DNREC Hearing Officer back in 2019 who was DEAF.

Bloom Can Afford a Sixers Jersey, but Delmarva Customers Are Still Paying the Bill

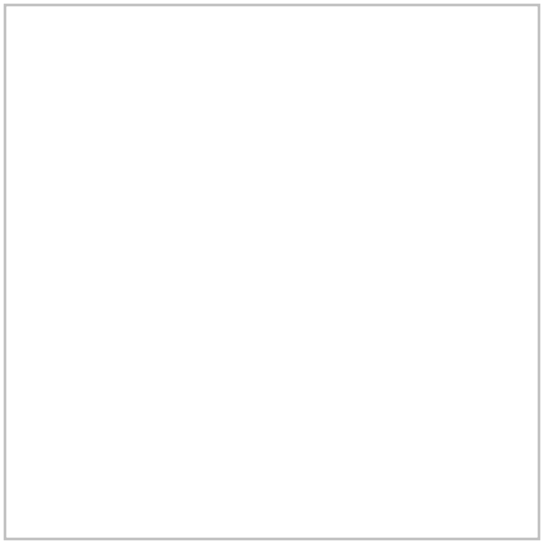
On Monday, the Philadelphia 76ers announced a multi-year partnership and jersey patch deal with Bloom Energy. Good for the Sixers. NBA jersey patches don't come cheap, and Bloom obviously has the money to spend on one.

Here's my problem with it. Every Delmarva Power customer in Delaware is still paying a charge on their electric bill that goes to Bloom Energy. It's been there since 2012, and under the deal Delaware signed, it stays there until 2033.

For anyone who wasn't around in 2011, here's how we got here. The General Assembly passed Senate Bill 124, which redefined Bloom's natural gas fuel cells as "renewable" energy so Delmarva could install 30 megawatts of them and bill ratepayers for 21 years. In exchange, Bloom promised 900 manufacturing jobs at the old Chrysler site in Newark by 2017. The state added a $12 million grant on top of that.

Ratepayers were told it would cost them about a dollar a month. It ended up costing several times that.

The jobs didn't show up on schedule either. When the 2017 deadline hit, Bloom had roughly 300 Delaware workers, about a third of what was promised. The company paid back part of its state grant and forfeited another piece.



To be fair, Bloom's workforce in Newark has grown in recent years, and I'm glad for every Delawarean working there. But the deal was never "900 jobs someday." It was 900 jobs by 2017, and ratepayers were locked in for two decades based on that promise. The state got some grant money back. Delmarva customers never got a dime back on the surcharge.

My colleagues and I called this a sweetheart deal back in 2020, and nothing since has changed my mind. Bloom's own federal filings show the Delmarva project bringing in roughly $36 million a year.

I'm not rooting against Bloom. I want them to succeed and keep hiring in Newark. But a company that can put its name on an NBA jersey is not a company that needs a subsidy from a retiree in Seaford or a young family in Millsboro trying to keep the lights on while Delmarva Power asks for yet another rate increase.

So, here's my ask. Bloom should come to the table and voluntarily end or reduce this surcharge. If they're doing well enough to sponsor the Sixers, they're doing well enough to stop charging Delaware families for a promise they didn't keep on time.

ABC Legislative Panel

Thank you to ABC Delaware for inviting me to participate in Thursday's legislative forum and join a panel discussion on the importance of political engagement.

One of the points I emphasized is how important it is for those in the construction industry, and the private sector as a whole, to build relationships with their elected officials. When legislation is introduced that could help or hurt your industry, legislators need to hear directly from the people who understand its real-world impact.

Good public policy starts with open communication, and I appreciate ABC Delaware for helping strengthen that connection between its members and those serving in Dover.

Delaware Department of Human Resources Hosts Statewide Career Fair at Stockley Campus in Georgetown

The Delaware Department of Human Resources will host its fourth and final statewide career fair of the year on Wednesday, October 7, 2026, at the Stockley Campus in Georgetown. The event, scheduled from 12:00 p.m. to 4:00 p.m., will link youth, adult, and justice-involved job seekers with rewarding career opportunities in state government. Registration is now open at statejobs.delaware.gov.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Senator Pettyjohn

It looks like DNREC lied to you back in February 2020 that they take air emissions seriously and that Bloom was under their permitted limits of CO2 emissions. Of course the reason that Bloom was "under" the permitted amount was that Bloom invented CH4.1 a form of natural gas that emits 3.5% less CO2 per million BTUS than all the other natural gas in the universe.

Bloom continues to LIE each month about their natural gas being cleaner by using a fictitious emissions factor for natural gas that only DNREC believes to be true. DNREC continues to believe the LIE is TRUTH for only one reason. That is to cover their own asses in THE BLOOMDOGGLE.

I strongly suggest you ask IG Storch to end the CORRUPTION AT DNREC and bring about the criminal prosecution of Lisa vest, Angela Marconi, Gregory Patterson and of course Shawn Garvin who composed the attached letter to you back in February 2020.

In my 53 years of being a Chemical Engineer, I have never seen such a blatant LIE that one atom of carbon can have 4.1 atoms hydrogen bonded to it.

Perhaps you should call the White House and ask President Trump why he fired Robert Storch if Mr, Storch continues to sit on his ass and let this FRAUD continue.

Analysis of Leveen Comments on Yucca Growth Infrastructure, LLC Application

Item 1. Sulfur in desiccant

Comment: *"The application lists natural gas usage of 136,782.34 million scf per year with a sulfur content of 0.75 grains per 100 scf.*

Table 2-J: Fuel

Specify fuel characteristics and usage. Unit and stack numbering must correspond throughout the application package.

Unit No.	Fuel Type (low sulfur Diesel, ultra low sulfur diesel, Natural Gas, Coal, …)	Fuel Source: purchased commercial, pipeline quality natural gas, residue gas, raw/field natural gas, process gas (e.g. SRU tail gas) or other	Specify Units				
			Lower Heating Value	Hourly Usage	Annual Usage	% Sulfur	% Ash
SOFC	Natural Gas	Pipeline Quality Natural Gas / Purchased Commercial	1,020 Btu/scf	15.61 MMscf/h	136,782.34 MMSCF/yr	0.75 gr S /100 scf	0.0%

All of sulfur excepting for a minuscule amount is filtered out of the natural gas before the gas enters the fuel cell stack. The sulfur together with benzene, chromium, arsenic and lead stays on the filtering media with the desulfurization canisters that Bloom uses. Doing the math we have 0.75 grains times 136,782,340,000 divide 100 we have 1,025,867,550 grains a year of sulfur. There are 7,000 grains in a pound so we have 146,552.5 pounds a year of sulfur. So we have 73 tons a year of sulfur that is trapped on the desiccant within the steel canisters. All of the desiccant is dangerous and the sealed steel canisters are shipped to Shoremet in Indiana where the canisters are opened and the desiccant is pickled in hydrochloric acid to recover copper. I estimate that the sulfur is 10% of the total mass of the desiccant plus steel housing. Therefore 730 tons a year of dangerous material will be shipped out as solid waste from New Mexico to Indiana. This is 2 tons a day.

The corrupt EPA under Wheeler and Pruit decided the dangerous toxins can be shipped without manifest but that does not make the HAZMAT disappear."

Action Required: None.

Rationale: This specific concern is a hazardous waste issue and not an air quality issue and may be outside of the scope of the NSR permitting process. Questions related to the air quality impacts of the desulfurization process were included in Questions #21 and 22 sent to the applicant. Question #22.b does request information on the quantity of hazardous waste generated by the proposed fuel cell system.

It should be noted that that desulfurization process is not mentioned at all in the NSR application. However, information regarding concerns about this process at Bloom's existing facilities is readily available, specifically the operation in Delaware discussed in the above

DRAFT

comment. Based on the available public information, it expected that this issue will continue to come up in public comments regarding the overall project.

Item 2. NOx emissions

Comment: *"The consultant also admits there will be 0.003 pounds of NOX per megawatt hour. Bloom LIED in Delaware that they emitted only 0.0017 pounds of NOX per megawatt hour and DNREC placed hourly and running 12 month limits on NOX that Bloom has far exceeded." "The NM permit application shows Bloom did testing on NOX in December 2023 and that is when they changed their claim of the 0.0017 pounds of NOX per megawatt hour to the 0.003 pounds per megawatt hour. You know that Bloom is submitting fraudulent invoices to Delmarv Power and fraudulent pollutant reports to DE DNREC. You have to end the BLOOMDOGGLE that I estimate has caused Delmarva ratepayers in Delaware to pay $150 million too much in subsidies since Bloom came to town in DE in 2012."*

Safety Factor: 15%

Criteria Pollutant Emissions

Pollutant	Emission Factor	Emission Rate (lb/hr)	Emission Rate (tpy)

1 Bloom Energy Server System (SOFC) uses no add-on controls for regulated pollutants. Uncontrolled equal controlled emissions.
The Energy Server System equipment vendor maintains that there are zero PM emissions from its equipment. Extant reference method testing has been used by the applicant to conservatively estimate emissions, given test method limitations. Vendor indicates that extant testing may exhibit positive sampling method bias and reflects filterable particulate matter from intake air passed through the system. For that reason, the fuel cell system equipment vendor does not specify particulate emission factors.
Fuel cells are not a "combustion source" of PM2.5. Pursuant to 20.2.2.7, 20.2.74.7(AS)(6), and 20.2.72.203.A(3) NMAC, particulate emissions are a "regulated new source review pollutant" which include certain "gaseous emissions from a source or activity" and applicant must submit "all emissions information, calculations and computations" for computing "maximum" particulate matter emissions from the source. To be conservative, applicant uses an emission factor for condensable particulate matter based on available source test data.

Source Test Report
for 2026 In-House Engineering Testing
TPM Emissions, Santa Cruz Unit
Bloom Energy
Fremont, California

Prepared For:
Bloom Energy
44408 Pacific Commons Boulevard
Fremont, CA 94538

Prepared By:
Montrose Air Quality Services, LLC
2825 Verne Roberts Circle
Antioch, CA 94509

Document Number: W005AS-066959-RT-4562
Test Dates: April 7 & 8, 2026
Submittal Date: April 21, 2026

Action required: None.

Rationale: The NOx emissions included in the NSR application are based on the most recent stack test results, which is appropriate. NOx emissions for existing Bloom facilities are based on an older, lower NOx emission factor. The origin of this older factor is unknown. This is a concern that should be brought up with the permitting authorities for the existing Bloom facilities, not NMED. That said, the changing information on NOx emissions does raise concerns about the limited data available for NOx emissions from fuel cells, due to the relatively new use of this application on a larger scale. Information about the NOx formation process is requested in Question #24 to the applicant. Additional information about the NOx emission factor used in the PTE calculations is requested in Question #26 to the applicant. NMED will also require and enforce monitoring in order to ensure that the facility meets the established emission limit once operational.

Item 3. CO2 emissions

Comment: *"Bloom also LIED to DE DNREC that their natural gas only emits 112.9 pounds of CO2 per million BTUs. We all know it emits 117 pounds of CO2 per million BTUs*
In your permit application the Bloom consultant states that site will emit 10,144,115 tons per year of CO2. I assume these are short tons with 2,000 pounds,
The consultant stated that the natural gas in NM has 1,020 BTU per scf. Let's multiply 136,782.34 million scf by 1,020 and 117 pounds per million BTUs and divide by 2,000 pounds in a ton and we have 8,161,802.2 tons a year of CO2 This is less than the 10,144,115 tons of CO2 stated in the same permit application. Therefore there is a lot of natural gas missing from the permit application."

DRAFT

Table 2-P: Greenhouse Gas Emissions

Applications submitted under 20.2.70, 20.2.72, & 20.2.74 NMAC are required to complete this Table. Power plants, Title V major sources, and PSD major sources must report and calculate all GHG emissions for each unit. Applicants must report potential emission rates in short tons per year (see Section 6.a for assistance). Include GHG emissions during Startup, Shutdown, and Scheduled Maintenance in this table. For minor source facilities that are not power plants, are not Title V, or are not PSD, there are three options for reporting GHGs 1) report GHGs for each individual piece of equipment; 2) report all GHGs from a group of unit types, for example report all combustion source GHGs as a single unit and all venting GHG as a second separate unit; OR 3) check the following box ☐ By checking this box, the applicant acknowledges the total CO2e emissions are less than 75,000 tons per year.

		CO_2 ton/yr	N_2O ton/yr	CH_4 ton/yr	SF_6 ton/yr	PFC/HFC ton/yr[2]									Total GHG Mass Basis ton/yr[4]	Total CO_2e ton/yr[5]
Unit No.	$GWPs$ [1]	1	265	28	22,800	footnote 3										
SOFC	mass GHG	10,144,115	-	-											10,144,115	
	CO_2e	10,144,115	-	-												10,144,115
	mass GHG															
	CO_2e															

"The consultant showed natural gas usage of 15.61 million scf per hour with 1,020 BTUs per scf for 2,462 megawatts. This means a heat rate of 6.4672 million BTUs per mwh. The EPA uses 117 pounds of CO2 per million BTUs of gas. So multiply 6.4672 by 117 and we get 756.66 pounds of CO2 per mwh. But elsehwere in the submission the consultant revealed 818 pounds of CO2 per megawatt hour. The natural gas usage is TOO LOW and the whole application is not worth the paper it is written on."

GHG Emissions

Pollutant	Emission Factor	Emission Rate (tpy)
CO_2	8.18E+02 lb/MW-hr	10,144,115 tpy
CH_4	0.00E+00 lb/MW-hr	0 tpy
Total GHG (CO_2eq)		10,144,115 tpy

Notes

1. Emission Factors from CARB certification and other reference method testing performed in Dec. 2023 and Apr. 2026

Action Required: None.

Rationale: This specific question is based on fundamentally incorrect assumptions. The 117 lb CO2/MMBtu is the emission factor for CO2 emissions generated from natural gas combustion. See the natural gas combustion factor in EIA's Carbon Dioxide Coefficients here: https://www.eia.gov/environment/emissions/co2_vol_mass.php. This factor does not apply to CO2 emissions generated from natural gas use in a fuel cell technology. CO2 is formed in different ways in a natural gas combustion unit and a fuel cell.

The emission factor used to calculate CO2 emissions is 818 lb/MW-hr, which is based on test results at existing Bloom fuel cells. It is appropriate to use test results from similar sources to calculate potential emissions. However,concerns about the use of the 818 lb/MW-hr emission factor are included in Question #31 sent to the applicant.

Iem No. 4. Basis of Emissions Estimæs

Comment: *"The permit application should be rejected because the NOX and other pollutant data is based on a test of 65 kilowatt unit for a few hours. Bloom wants to build a power plant with 2,462,000 kilowatts and run it for twenty years. This is a power plant larger than the Hoover Dam ! They used fake data years ago in Dealware based on a sample size of 3 data points and where the standard deviation was greater than the mean and the California Air Resources Board and DNREC (both are corrupt) bought this nonsense. Now New Mexico must refuse to buy nonsense. 2,462,000 kilowatts is 37,877 times as large as 65 kilowatts.*

Table 2-A: Regulated Emission Sources

Unit and stack numbering must correspond throughout the application package. If applying for a NOI under 20.2.73 NMAC, equipment exemptions under 2.72.202 NMAC do not apply.

Unit Number[1]	Source Description	Make	Model #	Serial #	Manufacturer's Rated Capacity[3] (Specify Units)	Requested Permitted Capacity[3] (Specify Units)	Date of Manufacture[2] / Date of Construction/ Reconstruction[2]	Controlled by Unit # / Emissions vented to Stack #	Source Classification Code (SCC)	For Each Piece of Equipment, Check One	RICE Ignition Type (CI, SI, 4SLB, 4SRB, 2SLB)[4]	Replacing Unit No.
SOFC	Energy Server System	Bloom	Energy Server 6.5	TBD	2,462 MW	2,462 MW	TBD / TBD	N/A / SOFC	20100201	☐ Existing (unchanged) ☐ To be Removed ☑ New/Additional ☐ Replacement Unit ☐ To Be Modified ☐ To be Replaced	N/A	N/A
										☐ Existing (unchanged) ☐ To be Removed ☐ New/Additional ☐ Replacement Unit		

Table 2-E: Requested Allowable Emissions

Unit & stack numbering must be consistent throughout the application package. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41, 1.41, or 1.41E-4).

Unit No.	NOx		CO		VOC		SOx		PM[1]		PM10[1]		PM2.5[1]		H_2S		Lead	
	lb/hr	ton/yr	lb/hr	ton/yr	lb/hr	ton/yr	lb/hr	ton/yr	lb/hr	ton/yr	lb/hr	ton/yr	lb/hr	ton/yr	lb/hr	ton/yr	lb/hr	ton/yr
SOFC	8.49	37.20	36.81	161.21	28.31	124.01	0.02	0.08	17.21	75.40	17.21	75.40	17.21	75.40	-	-	-	-

Also the consultant was a little nervous using Bloom pollutant values and added 15% to the values Bloom gave them. For NOX the consultant used 0.00345 pounds per megawatt hour. Interestingly this is double the amount in the DE DNREC permit."

source impacts, consistent with local practice. For example, VOC emissions for a hypothetical 2,462.005 MW unit can be calculated as follows:

ER = MW× EF×(1+15%)

0.01 lb VOC/MW-hr × 2,462.005 MW×(1+15%) = 28.31 lb/hr

The CO_2 emission factor indicated in the vendor data has been used. The vendor represents that the fuel cells do not emit detectable amounts of other GHGs.

Action Required: None.

Rationale: It is apparent from information included in the application that the stack tests were conducted on an individual fuel cell "unit" which produces 65 kW of electricity. YGI is proposing to install thousands of individual fuel cell units. The stack test results are converted to lb/MW-hr and then used to calculate total system emissions based on total system MW capacity. This is appropriate.

Information included in the application indicates that the stack tests were conducted on the same model fuel cell as the ones proposed to be installed at the proposed YGI facility. However, the application indicates that YGI is proposing to install a fuel cell system consisting of 7,576 325-kW units. Question #23 to the applicant ask for clarification regarding the 65 kW vs. 325 kW size difference. Question #33 to the applicant requests additional clarification on the total number of units proposed to be installed at the facility.

Regarding the 15% safety factor, utilization of a safety factor is standard practice used to account for potential variability in testing data, especially when limited testing data is available.

Item No. 5. Equipment Life

Comment: *"Bloom fuel cells suffer from ORDINARY DEGRADATION. Bloom claims their fuel cell stacks have a life of five years or more. Public data that I have followed and provided to the EPA, FBI, SEC, FTC and FERC show the stack life is approximately two years. The capacity factor decreases and the efficiency decreases as the stacks degrade. Below are some charts of data available to the public for systems in NY, DE, and CA. I strongly suggest that New Mexico demand data from Bloom that detail the the performance of all their fuel cells over time to make sure that the massive project does not become a white elephant where Bloom sells a Porsche that over a short period of time becomes a Ford Escort. Bloom has a history of LYING about their fuel cell performance and the cleanliness and reliability of their electrons."*

Action Required: None.

Rationale: Additional information on degradation of the fuel cell systems has been requested in Question #13.e and 13.f of the questions submitted to YGI.

Ms. Kuhn

It looks like Bloom did some retesting on April 8, 2026

I did the math for the lbs of CO2 per megawatt hour and they equal 1,006.72 pounds. Another data point that is very different from the 818. lbs per megawatt hour Here is my math and also the screenshot of the Test.

You simply have to reject all of the source test data from all the dates testing was done.. The entire draft permit needs to be rescinded until we get real data. All the data in the permit application is statistically meaningless and highly compromised.

APRIL 8 2026 TEST	
FLOW DRY SCF PER MINUTE	243.50
KILOWATTS	70.68
VOL% CO2	4.20%
SCF CO2 PER MINUTE	10.23
SCF CO2 PER HOUR	613.62
LBS CO2/HOUR	70.21
LBS CO2/KWH	1
LBS CO2 PER MWH	1,006.72

You are welcome to contact me as it seems like once again Bloom is using fake data to get certification and permits. Their fake data started in 2014 with the CARB certification tests that violated the laws of thermodynamics and now we have them wanting to build a HUGE 2.462 gigawatt power station with tables of data that are simply meaningless..

I strongly suggest that DER NM hire a real consultant or even ask the US EPA to become involved before Bloom is allowed to start construction.

> 1.08219 megawatts would emit 818 times 1,08219 divided by 3,600 pounds per second = 0.2459 pounds of CO2 per second. A pound of CO2 has a volume of 8.74 scf. 0.2459 pounds per second of CO2 has a volume of 2.149 cubic feet per

second. The source test claimed there is 4.55% volume% CO2 on a dry basis. Divide 2.149 by 0.0455 we have an exhaust flow of only 47.234 dry standard cubic feet per second. But Table 2-H has a volumetric flow of exhaust of 514.46 dry standard cubic feet per second out of each of the stacks.

Divide 514.46 by 47.234 and we have a factor of 10.89 times too much exhaust flow out of each stack.

The stack velocity will be almost stagnant if 8.16 feet in diameter stacks are used. The whole air dispersion model is nonsense.

I strongly suggest you contact Marissa Blackshire the VP of Regulatory of Bloom as well as the VP of Regulatory of Yucca to explain the data in Table 2-H. When you get the real data please advise us and post this to the revised administrative record. I will then review the revised data.

I have reported on Bloom's GREENWASHING for over 14 years and this is not the first time they have fake data in air permit applications. Ms. Blackshire of Bloom submits monthly pollutant reports to Delaware DNREC in which she claims to have invented a form of natural gas that emits less CO2 than normal natural gas. I have alerted the world to this false claim.

Thanks

Lindsay Leveen

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Ms. Kuhn

I have started to review the Draft Administrative Record you have posted for Project Jupiter.

I believe that Table 2-H is in error by a factor of TEN TOO HIGH when it comes to Dry Standard Cubic Feet Per Second of exhaust flow from each of the 2,275 by 30 foot stacks.

I came to this conclusion by the following math

Each stack is for 1.08219 megawatts on average
Yucca claimed each megawatt hour emits 818 pounds of CO2
1.08219 megawatts would emit 818 times 1,08219 divided by 3,600 pounds per second = 0.2459 pounds of CO2 per second. A pound of CO2 has a volume of 8.74 scf. 0.2459 pounds per second of CO2 has a volume of 2.149 cubic feet per second. The source test claimed there is 4.55% volume% CO2 on a dry basis. Divide 2.149 by 0.0455 we have an exhaust flow of only 47.234 dry standard cubic feet per second. But Table 2-H has a volumetric flow of exhaust of 514.46 dry standard cubic feet per second out of each of the stacks.

Divide 514.46 by 47.234 and we have a factor of 10.89 times too much exhaust flow out of each stack.

The stack velocity will be almost stagnant if 8.16 feet in diameter stacks are used. The whole air dispersion model is nonsense.

I strongly suggest you contact Marissa Blackshire the VP of Regulatory of Bloom as well as the VP of Regulatory of Yucca to explain the data in Table 2-H. When you get the real data please advise us and post this to the revised administrative record. I will then review the revised data.

I have reported on Bloom's GREENWASHING for over 14 years and this is not the first time they have fake data in air permit applications. Ms. Blackshire of Bloom submits monthly pollutant reports to Delaware DNREC in which she claims to have invented a form of natural gas that emits less CO2 than normal natural gas. I

have alerted the world to this false claim.

Subject: [EXTERNAL] DRAFT ADMINISTRATIVE RECORD PROJECT JUPITER

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Ms. Kuhn

I have started to review the Draft Administrative Record you have posted for Project Jupiter.

I believe that Table 2-H is in error by a factor of TEN TOO HIGH when it comes to Dry Standard Cubic Feet Per Second of exhaust flow from each of the 2,275 by 30 foot stacks.

I came to this conclusion by the following math

Each stack is for 1.08219 megawatts on average
Yucca claimed each megawatt hour emits 818 pounds of CO2
1.08219 megawatts would emit 818 times 1,08219 divided by 3,600 pounds per second = 0.2459 pounds of CO2 per second. A pound of CO2 has a volume of 8.74 scf. 0.2459 pounds per second of CO2 has a volume of 2.149 cubic feet per second. The source test claimed there is 4.55% volume% CO2 on a dry basis. Divide 2.149 by 0.0455 we have an exhaust flow of only 47.234 dry standard cubic feet per second. But

Table 2-H has a volumetric flow of exhaust of 514.46 dry standard cubic feet per second out of each of the stacks.

Divide 514.46 by 47.234 and we have a factor of 10.89 times too much exhaust flow out of each stack.

The stack velocity will be almost stagnant if 8.16 feet in diameter stacks are used. The whole air dispersion model is nonsense.

I strongly suggest you contact Marissa Blackshire the VP of Regulatory of Bloom as well as the VP of Regulatory of Yucca to explain the data in Table 2-H. When you get the real data please advise us and post this to the revised administrative record. I will then review the revised data.

I have reported on Bloom's GREENWASHING for over 14 years and this is not the first time they have fake data in air permit applications. Ms. Blackshire of Bloom submits monthly pollutant reports to Delaware DNREC in which she claims to have invented a form of natural gas that emits less CO2 than normal natural gas. I have alerted the world to this false claim.

Thanks

Lindsay Leveen

Subject: [EXTERNAL] JUPITER EXHAUST FLOW MASSIVE ERROR

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Ms. Kuhn

I informed you a while back that the 2,275 stacks had far too much exhaust flow.

Has the applicant given you new real information on the flow of exhaust from the stacks? They may be too busy writing OPEDs about how great and green they are.

I performed a mass balance on the hydrogen that comes in with the natural gas and goes out as water. And again I am certain the flow of exhaust is TEN TIMES too many in the permit

application. See my spreadsheet below.

Please let me know if changes have been made to the permit application as I cannot find any on your website. I am preparing my report for presentation when you eventually have a hearing. It is disgraceful that Bloom could submit data in a permit application that implies they will use over 4% of all the natural gas used in the United States. Given what has happened in Delaware they have a history of simply lying about emission factors.

Lindsay

Jesse,

For items 2–3, I'll have Bloom get the breakdown for us and get back to you ASAP.
That will be great. Thank you!

For item 1, the stack testing was done as described in the report. It's representative of emissions from the system but its purpose was not to measure flow rate or temperature of the type of system being constructed.
If it is representative of the emissions from the system, we would also like to know what other "air streams" are contributing to the overall exhaust and if those are tested too?

For item 4, the CO_2 concentration can be calculated from the materials in the application. In fact, the calculation you provided appears to be the correct framework. Just back calculate to obtain the % CO_2 in the exhaust. I don't believe Bloom has performed a test on this configuration to empirically measure % CO_2 but I will ask.
Agree. It comes out to ~0.45% and not 4.5% by that logic (basically 90% reduction). We would like to know where and how does the stream become 0.45% instead of the 4.5% exhaust that is measured. From general principles, if that reduction is due to dilution from outside air, it requires a thermodynamic calculation to calculate the overall exhaust temperature and how it will be 350 F in the exhaust stream.

Thank you,
Sagar

Subject: Re: [EXTERNAL] RE: YGI Permit: CO2 emissions question

Hi Jesse,

Thank you for the information. Would you be able to explain to us in some more detail:

1. How the testing was done and if it is representative of the overall exhaust that is modeled here?
2. What are the "air streams other than the CO2-rich anode exhaust"? What is their source, properties, composition, temperature, etc? I am also curious to see how the exhaust gas maintains 350 F.
3. What is the breakdown of the 514 dscsf in each stack in terms of the source. How much comes from what component of the SOFC?

4. Does the manufacturer have a testing sheet outlining the exact CO_2 concentrations in the final exhaust? I see values around 4-5% CO_2 in all the testing sheets in the permit but would like to know the exact CO_2 % in the exhaust (after considering all the other air streams you mentioned). If it is already in the permit somewhere, I would appreciate you pointing us to the exact page number or maybe pasting a screenshot here.

Thank you for your assistance in clarifying these questions.
Sagar

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Hi Sagar,

It is not correct to assume a 4.55% CO2 concentration in the exhaust flue gas. The test reports sample cathode exhaust while the release points to be constructed will have a higher flow rate that includes air streams other than the CO2-rich anode exhaust.

Therefore, the “bottom-up” methodology is the correct one and the alternate method you have outlined would not be valid.

Let me know if you need anything else!

Cheers,

Subject: YGI Permit: CO2 emissions question

Hi Jesse and Jaimy,

My name is Sagar and I am a modeler with NM Environment Department. We are in the process of reviewing public comments on the YGI permit and one of the questions focused on the CO_2 emissions calculations.

Question: Total CO_2 emissions calculated using the bottom-up methodology is mentioned to be ~10,114,115 Tons per year CO_2 across all stacks and Bloom energy 'servers'. The bottom-up methodology involves multiplying the installation capacity in MW (2462 MW) and the lb CO_2 per MW-hr operation emission factor (~818 lb CO_2/MW-hr) and a 15% safety factor.

The alternate method includes estimating CO_2 emissions using stack flow rate and amount of CO_2 in the exhaust gas.
The stack flow rate is mentioned to be 514.46 ft3/sec (dry standard cubic ft/sec). Assuming a ~4.55% CO_2 concentration in the exhaust flue gas (Montrose and Blue Sky Environmental testing sheets in the permit application), it leads to about 96,074,822 tons/yr CO_2, a factor of 9 higher than estimated using the bottom-up methodology.

The second calculation is as follows
Exhaust rate per stack = 514.460 ft3/sec (Dry std cubic ft/sec)
Exhaust rate for the whole facility per year = 514.46 * 2275 (stacks) * 3600 (sec/hr) * 24 (hrs/day) * 365 (days/yr) = 3.69e13 ft3/yr
CO_2 concentration in exhaust = 4.55% (dry basis)
CO_2 density = 1/8.74 (lbs CO_2 / SCF CO_2)
CO_2 emissions per year = 3.69e13 (total exhaust, ft3/yr) * 0.0455 (CO_2 conc in exhaust, ft3 CO_2 / ft3 exhaust) * 1/8.74 (lbs CO_2/ft3 CO_2) = 1.92e11 lbs CO_2/yr
CO_2 emissions per year (in tons) = 1.92e11 * 1/2000 (lbs to tons) = 96,074,822 tons CO_2/yr

Company estimated CO_2 emissions in permit = 10,114,115 tons CO_2/yr

Difference (as ratio) = 96,074,822 / 10,114,115 = 9.5

Since this is a public comment of high concern, we would appreciate it if you could please clarify the discrepancy in the above calculation by the 2pm of Monday, August 31 2026. Please be thorough in how it may affect the GHG emissions calculations and/or dispersion modeling (if stack parameters are required to be adjusted).

Please let us know if you have any questions.
Thank you,
Sagar

Importance: High

Hi Jesse,

We are internally discussing the modeling submission and how will this impact the application and current permit draft. I know you've submitted revisions to tables 2G and 2H, but I think we need additional revisions. For example, it is my understanding the emissions will increase by 2% from what was initially submitted. If this is the case, tables 2D and 2E must be updated. I also ask for statistical analysis to determine if the 2% increase is statistically significant.

Also, tables 2D and 2E, as well as table 2A would need to reflect the 3 different configurations of the fuel cells power modules. In other words, if for example we have 2500 HP, 3000 HP, and 5000 HP engines, we would certainly reflect this information in the permit as three different engines even if all of them are Caterpillar. Thus, the application should reflect configurations A, B, and C (20, 18, 10 power modules per stacks) and associated emissions, calculations, and kW. Can you please clarify if these configurations are different than the 260 kW and 325 kW clusters configurations you've described in your initial application?

Any other update provided to NMED in the recent modeling corrections that would be impacting the application must be reflected and updated in the application, including emission calculations. Thus, my request is not limited to the tables above. For example, will Section 10 be impacted by the changes? Any changes that need to be updated in table 2P regarding GHG? Etc.

Thank you for your prompt attention in this matter. Please submit all updates by 10/5/2026.

Fuel Cells

Emission Unit: SOFC

Source Description: Solid Oxid Fuel System

Make/Model	Bloom Energy Server 6.5
Fuel Type:	Natural Gas

Total Installed Capacity	2,462.005 MW

Safety Factor: **15%**

Criteria Pollutant Emissions

Pollutant	Emission Factor	Emission Rate (lb/hr)	Emission Rate (tpy)
NOX	3.00E-03 lb/MW-hr	8.494 lb/hr	37.20 tpy
CO	1.30E-02 lb/MW-hr	36.807 lb/hr	161.21 tpy
VOC	1.00E-02 lb/MW-hr	28.313 lb/hr	124.01 tpy
SO2	6.13E-06 lb/MW-hr	0.017 lb/hr	0.08 tpy
PM_{10}	6.08E-03 lb/MW-hr	17.214 lb/hr	75.40 tpy
$PM_{2.5}$	6.08E-03 lb/MW-hr	17.214 lb/hr	75.40 tpy

Notes:

1. Emission Factors from CARB certification and other reference method testing performed in Dec. 2023 and Apr. 2026

The Energy Server System equipment vendor maintains that there are zero PM emissions from its equipment. Extant reference method testing has been used by the applicant to conservatively estimate emissions, given test method limitations. Vendor indicates that extant testing may exhibit positive sampling method bias and reflects filterable particulate matter from intake air passed through the system. For that reason, the fuel cell system equipment vendor does not specify particulate emission factors.

Fuel cells are not a "combustion source" of PM2.5. Pursuant to 20.2.2.7, 20.2.74.7(AS)(6), and 20.2.72.203.A(3) NMAC, particulate emissions are a "regulated new source review pollutant" which include certain "gaseous emissions from a source or activity" and applicant must submit "all emissions information, calculations and computations" for computing "maximum" particulate matter emissions from the source. To be conservative, applicant uses an emission factor for condensable particulate matter based on available source test data.

Speciated HAP Emissions

Pollutant	Emission Factor	Emission Rate (lb/hr)	Emission Rate (tpy)
Methanol	9.31E-05 lb/MW-hr	0.264 lb/hr	1.15 tpy
Benzene	1.62E-05 lb/MW-hr	0.046 lb/hr	0.20 tpy
Xylenes	5.33E-06 lb/MW-hr	0.015 lb/hr	0.07 tpy
Total HAPs		0.325 lb/hr	1.42 tpy

Notes:

1. Emission Factors from CARB certification and other reference method testing performed in Dec. 2023 and Apr. 2026

GHG Emissions

Pollutant	Emission Factor	Emission Rate (tpy)
CO_2	8.18E+02 lb/MW-hr	10,144,115 tpy
CH_4	0.00E+00 lb/MW-hr	0 tpy
Total GHG (CO_2eq)		10,144,115 tpy

Notes

1. Emission Factors from CARB certification and other reference method testing performed in Dec. 2023 and Apr. 2026

Julie's Notes

Solid oxide fuel cells (SOFCs) running on fossil natural gas typically emit around 350 to 450 kg of CO2 per 1 MWh of electricity generated.
350 kg/MWh = 771.6 lb/MWh
450 kg/MWh = 992.1 lb/MWh
Yucca: 371 kg/MWh = 818 lb/MWh

Good morning Dr. Melendrez,

Please see the attached letter on behalf of the Pueblo of Isleta regarding the YGI Microgrid and Project Jupiter. I have seen news this morning that the NM Supreme Court has intervened on the permitting process, however, we would like our position to remain on the record.

Thank you for your time,

Re: Invitation for Tribal Consultation Regarding Yucca Growth Infrastructure, LLC (YGI) Microgrid Air Quality Permit Applications

Dr. Melendrez and the Air Quality Department of the New Mexico Environment Department (NMED),

The Pueblo of Isleta ("Pueblo") is pleased to have received NMED's Invitation for Tribal Consultation Regarding YGI Microgrid Air Quality Permit in Dona Ana County. Although the Pueblo of Isleta is a considerable distance to the North of Dona Ana County, air quality impacts cannot be isolated and will impact the Pueblo of Isleta and Tribes throughout New Mexico and neighboring states. When considering support or opposition for a project, the Pueblo of Isleta takes several factors into consideration: impact to the Pueblo (if any), impact to other Tribes and communities (if any), is the project suited for its proposed ecoregion, the record and integrity of the parties involved, the ability for NMED to enforce permit requirements, and the impacts to the local community. Therefore, the Pueblo of Isleta stands in opposition to the issuance of any permits allowing for the continued construction of the East and West YGI Microgrids and Project Jupiter.

The Pueblo of Isleta has flourished in what is now called New Mexico since time immemorial. The Pueblo maintains a strong agricultural tradition and therefore prioritizes clean air and water for the physical and cultural wellbeing of the Tribal community. There is no sustainable future when New Mexico entertains industry and corporations that would dramatically increase air pollution, water quality impacts, and water drawdown. These effects cannot be isolated to Dona Ana County and will therefore negatively impact the Pueblo of Isleta. The Pueblo has considered the cumulative impacts and finds the dissemination of the project into various components to be disingenuous in terms of reporting total emissions and water use. Multiple estimations and YGI's own calculations of emissions in the NMED Air Quality Permit Application No. 10883 – Agency Interest No. 41351 – PRN2026001 would far exceed the total annual emissions of the City of Albuquerque and Las Cruces combined. AI's drawbacks far exceeds their benefits; as a whole this project does not provide adequate justification for its total impact to air and water quality across the state.

Dona Ana County already faces water insecurity and air quality concerns with many local families already relying on bottled water for municipal uses due to arsenic contamination and aging infrastructure of their local water delivery systems. To permit industry to operate when it would dramatically amplify existing public health and environmental concerns is irresponsible. While industry may check the boxes on a permit, there is a broader question that should be answered: is this industry sustainable and appropriate for a desert community? As New Mexico continues to advance in renewable energy and initiatives that result in reductions to adverse air and water quality impacts, it must divest from industry that impedes progress

towards those goals and invest in industry that is more aligned with a flourishing desert ecosystem. The Pueblo of Isleta supports advances in industry that protect the air, water, plants, and animals that also call New Mexico home.

Furthermore, as AI Data Centers are being constructed throughout the country, adverse health effects are being reported that directly result from living in proximity to these data centers. Emissions, noise, and light pollution contribute to human impacts such as respiratory issues, cardiovascular issues, insomnia, anxiety, and tinnitus including hearing loss. See articles "the Health Divide: The AI data center boom will harm the health of communities that can least afford it" by Fran Smith published by USC Anneberg Center for Health Journalism, and "'Living in Hell': Data Center Neighbors Grapple With Noise, Air Pollution" by Cecelia Smith-Schoenwalder, published by U.S. News as a couple of examples of many articles reporting the emerging health concerns. Considering nothing happens in a vacuum, we can be sure to expect research to emerge regarding additional environmental impacts beyond the current air and water quality concerns. It is well documented that such projects disproportionately impact Indigenous, people of color, and low-income communities and therefore, the Pueblo of Isleta must stand in solidarity with the local community in its opposition to this data center development. For Indigenous communities, a large influx of workers without local community connections results in increases in incidents of violence. These patterns are well-documented in similar resource-extraction industries and out of concern for the well-being of all Tribal members and the local community, the Pueblo of Isleta cannot support such a project.

The manner in which this project has progressed is of concern to the Pueblo of Isleta. The insensitivity of appropriating Acoma identity in the company name (Acoma, LLC now YGI, LLC) in the initial batch of permit submissions is not forgotten. Additionally, this project has progressed prior to receiving the appropriate clearances and despite receiving overwhelming negative feedback from the local community. Further, the Pueblo is concerned about the lack of information in the permit application(s) tied to CO emissions, whether or not the facility will emit toxic air pollutants, its basis for its expected formaldehyde emissions, and the project's basis for emissions estimates generally. Residents of Granbury, Texas have filed lawsuits and obtained significant signatures for a petition to remove Granbury city officials for the role the City of Granbury has played in annexing land and fast-tracking the development of the Project Patriot data center and power plant. The Pueblo of Isleta disapproves of the manner in which these data centers have been navigating the construction and permitting processes before their health effects on the communities they occupy are understood, before there are regulations specific to the nature of this industry, and providing insufficient analysis of their operational emissions and impacts. If the AI industry expects to be considered to be a public utility, then its development should progress with ample public comment opportunity, with the required Tribal consultation, and thorough analysis of emissions and environmental impacts. We ask the New Mexico Environment Department how it intends to meaningfully collaborate, trust data results, and expect reliable compliance corrections from YGI when those involved have already demonstrated a desire to circumnavigate community engagement and skew emissions estimation by initially applying for two permits. These questions are particularly important to address for a project that is anticipated to emit more greenhouse gases than the state's two largest cities combined. New Mexico communities deserve honest process and involved parties to act with integrity.

The cost to New Mexico over the life-span of Project Jupiter and its various components will be extensive and diverse. Therefore, The Pueblo of Isleta asks NMED to deny YGI Microgrid – Air Quality Permit Application no. 10883 – Agency Interest No. 41351 – PRN20260001 as this project is not sustainable for the New Mexican environment and its many communities.

Sincerely,

Eugene Jiron

Good morning,

I'm not exactly sure who I should send this to in Air Quality Bureau, so I went through the contact list and added the best candidates according to the topic. Please let me know the correct contact(s) that I should forward the concerns regarding Project Jupiter to.

We received the following message from a very concerned citizen by the name of William (630) 536-6012. He called regarding the Project Jupiter in Dona Ana County. He stated that he very much prefers that the New Mexico Environment Department does not issue an AQB permit for this project. He also stated that everyone knows that it's a massive pollutant for air and water, as well as using too much water. He expressed his concern that it's too noisy and intrusive for the community as well.

He's also requesting that New Mexico Environment Department work with Senator Steinborn on this issue.

Thank you,

Roberta Benavides

I'm concerned that voters in both parties are not supportive of the project Jupiter data center. Oracle has now declared force majeure as some kind of insurance. I think New Mexico needs to slow down.
The way technology is growing this data center might be obsolete in 10 years. Promises of big money make our leaders deaf to the concerns of people. Please listen to the people that you govern.

Sims Mesa Central Delivery Point

Title V Permit Number: P026-R2
Issued by the New Mexico Environment Department
Air Quality Bureau

Petition Number: VI-2011-
Filed by WildEarth Guardians and San Juan Citizens Alliance

RESPONSE OF NEW MEXICO ENVIRONMENT DEPARTMENT, AIR QUALITY BUREAU, TO ORDER GRANTING PETITION FOR OBJECTION TO PERMIT

I. INTRODUCTION

On July 29, 2011, EPA Administrator Jackson issued an Order responding to Petition VI-2011-XX (Petition) filed by WildEarth Guardians and San Juan Citizens Alliance (collectively Petitioners) on April 14, 2010. The Petitioners objected to the New Mexico Environment Department, Air Quality Bureau's (NMED) issuance of Title V Renewal Operating Permit No. P026-R2 (Permit) to Williams Four Corners, LLC (WFC) for its Sims Mesa Central Delivery Point Compressor Station (Sims Mesa). Sims Mesa is a natural gas compression facility located approximately 17 miles Northeast of Blanco, New Mexico in Rio Arriba County.

The Petition was filed pursuant to section 505(b)(2) of the Clean Air Act (CAA or Act), 42 U.S.C. § 7661d(b)(2), requesting that EPA object to issuance of the Permit. The Petitioners claim that the Permit: (1) fails to ensure compliance with the Prevention of Significant Deterioration (PSD) and title V requirements; (2) fails to require prompt reporting of deviations; (3) fails to require sufficient periodic monitoring; and (4) includes a condition that is contrary to applicable requirements.

A. BACKGROUND

Sims Mesa is a natural gas compression facility, as defined under Standard Industrial Classification (SIC) Code 4922 – Natural Gas Transmission. Gas is received from a wellhead gathering point known as a Central Delivery Point (CDP), which is located approximately one-half mile away from the facility. Note that the CDP is not owned or operated by WFC and is not at the same physical location as any compressor station. The Sims Mesa facility performs gravity separation of the inlet gas/water/petroleum condensate stream, recompresses the gas using natural gas fired internal combustion engines, routes the gas through triethylene glycol dehydrators, and sends the gas via pipeline to a WFC-operated natural gas processing plant.

The CDP that currently supplies approximately 7.6 MMscfd of natural gas received at the Sims Mesa inlet is owned and operated by Devon Energy Production Company, L.P. (Devon), and gathers natural gas from the Sims Mesa area of the Northeast Blanco Unit (NEBU) of the San Juan Basin, New Mexico. In the Sims Mesa area of NEBU, Devon operates sixty-one (61) natural gas wells producing from four (4) different geologic formations. The gas is marketable at the wellhead. The gas from each of the 61 wellheads is owned by various combinations of twenty-six (26) different companies, which are collectively known as the NEBU Sims Mesa Working Interest Owners Group (WIO). Devon is a member of the WIO with various percentages of ownership in the gas produced from wellheads located in each of the 4 NEBU Sims Mesa geologic formations. WFC is not a member of the WIO and has no ownership of any of the natural gas collected at the Devon Sims Mesa CDP and routed to the WFC Sims Mesa facility.

On July 23, 2008, WFC submitted an application to NMED for the renewal of the Permit. A copy of the draft Permit was submitted for a 30-day public comment period beginning November 25, 2009. On December 18, 2009, Petitioners submitted comments to NMED raising concerns related to the draft Permit. NMED provided a copy of the proposed Permit to EPA, Region 6, on December 29, 2009. EPA did not object to final issuance of the Permit within the mandatory 45-day review period, in accordance with 40 C.F.R. § 70.8(c). If EPA does not object to a permit on its own initiative, section 505(b)(2) of the CAA provides that any person who provided specific comments during the 30-day public comment period, may petition the Administrator, within 60 days of expiration of EPA's 45-day review period, to object to the permit. NMED prepared a response to comments (RTC) dated March 19, 2010 and issued the Permit on the same day. On April 14, 2010, Petitioners submitted an electronic copy of the Petition to EPA, requesting that EPA object to the issuance of the Permit.

In a July 29, 2011 Order (Order), EPA Administrator Jackson granted the objection as related to specific issues raised by the Petitioners, claiming that the Permit did not comply with 40 C.F.R Part 70. The Petitioners claims are summarized below:

1. The Permit failed to assure compliance with PSD and title V requirements because NMED failed to consider whether emissions from adjacent and interrelated pollutant emitting activities triggered PSD review, specifically the natural gas wells that supply natural gas to Sims Mesa. (Claim I)
2. The Permit failed to include prompt reporting for all deviations in the permit conditions. (Claim II)
3. The Permit failed to require adequate periodic monitoring for compliance with nitrogen oxides (NOx) and carbon monoxide (CO) emission limits (Claim III.A.1); the Permit allowed for exemptions to monitoring frequency (Claim III.A.2); and the Permit failed to require any monitoring for compliance with Volatile Organic Compound (VOC) emission limits (Claim III.B).
4. The Permit included a condition that is contrary to applicable requirements related to compliance with the National Ambient Air Quality Standards (NAAQS) (Claim IV).

In the Order, EPA grants request for objection to the above Claims to the extent described below:

Claim I: Source Definition for Purposes of PSD and Other Requirements

EPA determined that the NMED RTC and permit record did not adequately address whether Sims Mesa and the Devon-owned and operated facilities should be considered a single stationary source under the PSD, nonattainment New Source Review, and the title V programs of the CAA. In consideration of a single source determination, the following three criteria must be satisfied: (1) the facilities are located on one or more contiguous or adjacent properties; (2) they share the same two-digit (Major group) SIC code; and (3) they are under common control. Specifically, the Administrator states in the Order:

"I grant the Petitioners' request for an objection to Claim I, and direct NMED to establish a more thorough permit record as described in this section [reference to Claim I of the Order], and to make any appropriate or necessary changes in the permit. If in the course of supplementing its record, NMED determines that Williams [reference to WFC] is indeed under common control with other pollutant-emitting activities, then it will also need to examine whether any of those activities are adjacent to the Sims Mesa CDP [reference to Sims Mesa] in order to complete its source determination. But if NMED reaffirms its decision that no other pollutant-emitting activities are under common control with Sims Mesa CDP [Sims Mesa], it would not need to complete the "contiguous or adjacent" component of its analysis."

Claim II: Prompt Reporting of Deviations

EPA determined that the RTC and permit record did not adequately document or explain conditions in the Permit regarding prompt reporting of deviations. Specifically, the Administrator states in the Order:

"I grant this claim [reference to Claim II"] based on the lack of justification in the permit record for NMED's decisions regarding reporting of permit deviations, in accordance with the requirements of 40 C.F.R § 70.6(a)(3)(iii)(B). I direct NMED *(* to consider whether the permit conditions for reporting of deviations are consistent with the requirements of 40 C.F.R. § 70.6(a)(3)(iii)(B) for all permit deviations and provide further explanation of its conclusions, in the Statement of Basis ("SoB") or elsewhere in the permitting record, to make appropriate changes to the permit to ensure prompt reporting consistent with the Act and implementing regulations"

Claim III.A.1: Frequency of monitoring for NOx and CO emission limits

The Permit requires annual portable analyzer testing for NOx and CO for the internal combustion compressor engines. In addition, the Permit indirectly calls for proper operation and maintenance of the engines, as included in the Startup, Shutdown, and Maintenance (SSM) Plan required by New Mexico State regulation 20.2.7.14.A of the New Mexico Administrative Code (NMAC). This regulation is listed as an applicable requirement in the Permit. The SSM Plan was required for the Sims Mesa facility, effective January 29, 2009, and prior to issuance of the Permit. EPA determined that the RTC does not explain what permit terms or conditions ensure "proper operation and maintenance" of the engines. Specifically, the Administrator states in the Order:

"For the reasons given above, I grant the petition on this issue [reference to Claim III.A.1]. NMED must provide an adequate response to the comment that the annual monitoring in the permit is not adequate for assuring compliance with the engines' CO and NOx limits. In responding to this Order, NMED should respond fully to Petitioners' comment concerning the frequency of the permit's monitoring for NOx and CO. In that regard, NMED should offer further explanation of why it believes that steady state operations and proper operation and maintenance of the units are valid assumptions here, in light of the permit's terms and conditions, or make appropriate changes to the permit to ensure it includes monitoring requirements consistent with the Act and implementing regulations."

Claim III.A.2: Monitoring Exemptions

The Permit contains the following language that allows monitoring to be waived: if an emissions unit operates 25% or less of a monitoring period, monitoring is not required. The maximum number of successive waived monitoring periods cannot exceed two, unless the emissions unit is operated for less than 10% of the period. In this case, the period is not counted as a successive

period. A minimum of one of each type of monitoring activity must be conducted during the five-year term of the title V permit. EPA determined that the SoB for the Permit does not explain the rationale for these monitoring exemptions. Specifically, the Administrator states in the Order:

"Accordingly, I grant the Petitioners' objection on this issue [reference to Claim III.A.2] because the permit lacks adequate justification in the record to explain NMED's decisions regarding the exemptions from compliance monitoring for the compressor engines. In addressing this objection, NMED must discuss the adequacy of the permit monitoring requirements in support of the permit's exemption for low operation periods, or make appropriate changes to the permit to ensure it includes monitoring requirements consistent with the Act and implementing regulations."

Claim III.B: VOC Monitoring

The Permit contains language to the effect that compliance with NOx and CO portable analyzer testing demonstrates compliance with the VOC emission limit for the internal combustion compressor engines. EPA determined that the RTC and permit record did not adequately explain the assertion that NOx and CO emission rates are proper indicators for the VOC emission rates for these engines. Specifically, the Administrator states in the Order:

"Accordingly, I grant the Petitioners' request for an objection on this issue [reference to Claim III.B]. In responding to this Order, NMED must provide a clear rationale and technical basis to justify this surrogacy monitoring, or make appropriate changes to the permit to ensure it includes monitoring requirements consistent with the Act and implementing regulations."

Claims III.A.1, III.A.2, and III.B: Summary

In summary for the above three Claims related to monitoring (Claims III.A.1, III.A.2, and III.B), the Administrator states in the Order:

"In responding to this Order, I direct NMED to ensure it has: (1) satisfied the monitoring requirements of 40 C.F.R § 70.6(a)(3)(i)(A) and (B) and (c)(1); (2) provided a rationale for the monitoring requirements placed in the permit (*see* 40 C.F.R. § 70.7(a)(5)); and (3) responded to significant comments."

Claim IV: Condition 6.1.1 and Applicable Requirements

The Permit contains the following language at Condition 6.1.1:

"For sources that have submitted air dispersion modeling that demonstrates compliance with federal ambient air quality standards, compliance with the terms and conditions of this permit regarding source emissions and operation shall be deemed to be compliance with federal ambient air quality standards specified at 40 CFR 50 NAAQS."

The Permit also contains the following language at Condition 1.8:

"The permittee will continue to comply with all applicable requirements. For applicable requirements that will become effective during the term of the permit, the permittee will meet such requirements on a timely basis. This condition is pursuant to sections 300.D.11.c and 302.G.3 of 20.2.70 NMAC."

EPA determined that the RTC and permit record did not provide adequate response to the Petitioners' claim that NMED automatically concluded that compliance with a title V permit assures compliance with the National Ambient Air Quality Standards (NAAQS). The EPA also determined that the RTC and permit record did not adequately explain the possible conflict between Conditions 6.1.1 and 1.8. Specifically, the Administrator states in the Order:

"In responding to this Order, NMED must fully respond to the Petitioners' comment. In so doing, I also suggest that NMED consider the basis for Condition 6.1.1 and clarify the purpose and scope of Condition 6.1.1, considering whether the term should be removed or revised for clarity, in accordance with the appropriate permit revision requirements. NMED may additionally wish to consider the relationship between Condition 6.1.1 and Condition 1.8, and as necessary, revise the permit to ensure that these terms will not conflict with one another."

II. RESPONSE TO CLAIM I

In accordance with page 9 of the Order, NMED will address only the Common Control issue:

"If in the course of supplementing its record, NMED determines that Williams [reference to WFC] is indeed under common control with other pollutant-emitting activities, then it will also need to examine whether any of those activities are adjacent to the Sims Mesa CDP [reference to Sims Mesa] in order to complete its source determination."

To determine the proper scope of the source for the purpose of Title V, NMED retains its discretion to apply the regulations and to reach different conclusions from EPA guidance. For single source determinations, NMED evaluates the criteria set forth in the memorandum from Gina McCarthy, Assistant Administrator, to Regional Administrators, "Withdrawal of Source Determinations for Oil and Gas Industries" (September 22, 2009).

> Permitting authorities should…rely foremost on the three regulatory criteria for identifying emissions activities that belong to the same "building," "structure," "facility," or "installation." These are (1) whether the activities are under the control of the same person (or person under common control); (2) whether the activities are located on one or more contiguous or adjacent properties; and (3) whether the activities belong to the same industrial grouping. 40 C.F.R. 52.21(b)(6).

The McCarthy memorandum explains that these criteria are evaluated on a case-by-case basis, in which the permitting authority retains the discretion to consider the specific circumstances of the permitted activities. In making this evaluation, EPA has emphasized that the touchstone should be the boundaries established by the D.C. Court of Appeals decision in Alabama Power v. Costle:

> [T]he court in Alabama Power sets the following boundaries on the definition for PSD purposes of the component terms of "source": (1) it must carry out reasonably the purposes of PSD; (2) it must approximate a common sense notion of "plant"; and (3) it must avoid aggregating pollutant-emitting activities that as a group would not fit within the ordinary meaning of "building," "structure," "facility," or "installation."

So the 'common sense notion of a plant' must be the result of applying the 3 criteria in the definition of source.

NMED has adopted a definition (20.2.70.7.Q NMAC) of major source for Title V that is substantially similar to the federal term in 40 C.F.R. 52.21(b)(6):

> Any stationary source (or any group of stationary sources that are located on one or more contiguous or adjacent properties, and are under common control of the same person(s)) in which all of the pollutant emitting activities at such source

belong to the same major group (i.e., all have the same two-digit code), as described in the standard industrial classification manual, 1987.

Under this definition, all criteria must be met for a source or group of sources to be considered a part of the same stationary source. If any one of these criteria is not met, by definition the source or sources are not part of the same stationary source.

After evaluating information contained in attached documents prepared by DCP Midstream (Attachment 1), New Mexico Oil and Gas Association (Attachment 2), and the State of Colorado (Attachment 3) regarding the oil and gas industry, some conclusions are apparent.

The oil and gas industry is unique in terms of applying EPA guidance about single source determinations that places special significance on whether different sources are connected. Whereas in many industries, connections between various activities are a meaningful and distinguishing factor in making a single source determination, oil and gas fields typically are large and complex with convoluted flows of natural gas. Pipes extend from wells through various processing activities to residential and commercial users, and these connections do not imply that any two or more facilities should be considered part of one emission source. Pipeline connections are an inherent part of the industry, so previous EPA case by case determinations that hinge on connectivity in other industries are less likely to be appropriate.

Locations of various oil and gas facilities are more a function of engineering aspects, such as flows and pressures, as well as geographical considerations, such as rights of way and leases, rather than business considerations that would lead to establishment of a single source.

Business relationships between different companies are typically based on contracts that do not provide for one party to control the activities of the other and lead to a conclusion of no common control.

RELEVANT REFERENCES PERTAINING TO NATURAL GAS INDUSTRY

1. July 14, 2010 Response of Colorado Department of Public Health and Environment (CDPHE) to USEPA regarding Order VIII-2008-02 dated October 8, 2009 granting Petition for Objection.

Although the primary focus of this document was whether natural gas wells that sent gas to a compressor station were adjacent to the compressor station, the CDPHE response (Colorado Response) addresses important aspects of natural gas production and midstream transmission that are equally applicable to New Mexico. The Colorado Response dated 7/14/10 resulted in a new petition by WEG (Petition 3), which was denied by USEPA in Order VIII-2010-4 dated 2/2/11. NMED reiterates the following portions of the Colorado Response because they reflect the state of the natural gas industry in New Mexico.

"II. UNIQUE COMPLEXITIES OF OIL AND GAS OPERATIONS

In responding to EPA's Order on the Frederick Station Title V permit, it is first useful to consider the unique nature of oil and gas operations and how the characteristics of these operations affect how a stationary source or plant within this industry could be defined. It is also helpful to better understand how emission sources in the oil and gas industry operate and why and where they are located with respect to each other, and how these factors can differ from those associated with emission sources in other regulated industrial sectors, such as power generation and manufacturing..."

"In essence and by definition, the entire natural gas production, gathering, processing and transportation system is connected via a network of pipes. This network of pipes extends from the wells where the gas is initially recovered to the ultimate end-users, i.e., the residential, commercial and industrial customers. Because natural gas would quickly disperse in to the atmosphere if not contained at all times in the process, it must constantly be held through a series of pipes, equipment and storage vessels…"

"Ultimately, the facilities within the natural gas production and delivery system, from a single well in the field to a residential customer's house, are all connected in some way via a set of pipelines. It is inherent to this type of operation, and does not, by itself, establish an unusual circumstance or compelling factor regarding the interdependency of two facilities. For the natural gas production and delivery system, it is not primarily a business decision but rather the nature of the industry; i.e., wells are drilled where the gas resource is found and the support systems like the gas processing and compressor systems are constructed based on gas delivery needs.

Similarly, the locations of natural gas wells and surface facilities are determined by a variety of factors. Many of the factors are not specifically controlled or dictated by the oil and gas production companies that drill and develop the wells and then move and process the gas. Beyond the obvious need to locate gas wells in an area where natural gas reserves are present, the spacing requirements for gas wells are established and regulated by a number of different entities in Colorado, including the Colorado Oil and Gas Conservation Commission on private and state-owned lands, Federal agencies such as the Bureau of Land Management on Federal lands, and Tribal authorities on Tribal lands.

Oil and gas production companies must also negotiate surface use agreements, pipeline agreements and rights-of-way with surface right owners in the areas where wells are being drilled and developed. These agreements, which often focus on minimizing the surface footprint and impact of the oil and gas operations, dictate the locations of surface facilities, minimum offsets from adjoining boundaries and the number of well pads allowed. Geological, topographical and engineering considerations, along with logistical factors such as access restrictions and the availability of power, also drive siting decisions…"

"In addition to the unique set of factors that influence where oil and gas facilities are located, the business relationships between parties involved in oil and gas operations

are highly complex and quite specific to this industry. The ownership structure of the oil and gas resources themselves (i.e., the mineral rights) can take many forms, and for even just one well, can involve the interaction of multiple royalty owners, changes in ownership between geological formations, various working interests in the well, and joint operating agreements ("JOAs") among owners and lessees that dictate the terms and conditions under which the mineral resources will be developed. In some cases, the owner(s) of the mineral rights may extract the resources themselves, and in other cases, a separate party may do so under a lease/royalty arrangement.

JOAs govern how the production activities are conducted for a well, but do not address how the gas produced is gathered and moved through the natural gas delivery system. Separate contracts in the form of gas gathering agreements between exploration and production and gas gathering companies specify how and under what terms and conditions gathering services will be provided. **Based on information received from a number of different oil and gas companies, the Division has concluded that gas gathering companies do not typically dictate or control the production operations at natural gas wells. From a business standpoint, there appears to be a very clear demarcation between oil and gas production and gas gathering functions.** (emphasis added)

In many oil and gas production areas, the surface rights are severed from the mineral rights, meaning that one party owns the surface property and another (or several others) owns the minerals located below the surface. In these cases, agreements must be reached between the surface land owners and the oil and gas exploration and production companies, in order to provide the necessary access and surface facilities to drill wells and produce oil and gas. The distinctions between mineral and surface ownership further add to the complexity of assessing oil and gas sources…"

NMED also reiterates the following excerpt from the Colorado Response:

"The Division has determined that gathering companies generally do not control the operations of oil and gas wells. A gathering company simply accepts the gas provided by the production company, as long as it meets certain quality and other contractual requirements. Except in very limited and unusual circumstances, a gathering company does not control or affect the operations of the wells that are the subject of the gathering contract. It is entirely the decision of the oil and gas production company regarding how and when it operates its wells. For instance, if the production company decides to shut-in a particular well because of market conditions or other reasons, the gathering company cannot override that decision.

The Division also has concluded that, in many instances, oil and gas wells are operated by entities that are unrelated to the gathering company operating the compressor stations and other facilities associated with gathering operations. Because many oil and gas leases have several working interest owners, the operations of a well may be governed by a JOA between these owners and the oil and gas production company/lessee. Additionally, because typical oil and gas leases allow each working interest owner to take

its portion of the produced gas in-kind, the produced gas may be subject to "split stream" gas distribution. In split stream situations, working interest owners may decide to have their gas conveyed via different gathering companies, resulting in one well being connected to more than one gathering system."

2. 29 March 2010, Letter of New Mexico Oil and Gas Association to Sandra Ely, NMED, re: Comments on Western Climate Initiative's Issue Paper on Defining the Reporting Entity and Threshold

Although this letter was written in the context of reporting greenhouse gas emissions, it provides an explanation of the operational aspects of the oil and gas industry in New Mexico, and it supports Colorado's finding that there is not common control when different companies operate wells and compressor stations.

Although there are some differences between the Colorado Wattenberg Field and the New Mexico NEBU, many attributes of the Oil and Gas Industry operations in Colorado are identical or very similar to those in New Mexico. Most importantly:

- Gas from the Sims Mesa area of NEBU is owned by Working Interest Owners (WIOs).
- The midstream compressor station(s) generally accept all of the gas provided by the production company, pursuant to contract with WIOs.
- Gas flow on a wellhead-by-wellhead basis is highly variable. Flow rates at each pipe intersection are continuously adjusted by the production company to ensure downstream pressure is lower than upstream pressure.

ANALYSIS OF SIMS MESA SITE-SPECIFIC OPERATING CONDITIONS AND CIRCUMSTANCES

NMED has performed an in-depth analysis of all contractual information regarding the relationship between the wellhead operator, Devon, and WFC midstream compressor station, Sims Mesa. Relevant facts specific to Sims Mesa:

- Devon operates 61 natural gas wellheads in the Sims Mesa area of NEBU.
- All gas is marketable at the wellhead.
- Ownership of the wellhead and produced natural gas is established at each wellhead.
- The natural gas at each wellhead is owned by various combinations of 26 different companies that collectively comprise the WIO.
- The decision-making body is termed the WIO Advisory Board, and each WIO member has one representative.
- Decisions are made on a wellhead-by-wellhead basis; voting interest is proportional to ownership percentage of the gas at each wellhead. However,

any decision requires a 65% affirmative vote, and such a vote cannot be cast by a single WIO member regardless of the ownership percentage.

- Each WIO member is free to choose either WFC or Enterprise Field Services LLC (Enterprise) for natural gas midstream transmission and gas plant processing. The gas is eventually sold at the tailgate of either a WFC or Enterprise gas plant.
- Devon is contracted by the WIO to operate the wellheads. NMED has thoroughly reviewed these contracts and concludes that there is no existing contractual relationship between Devon and WFC.
- Each member of the WIO has an individual contract with either WFC or Enterprise for gas transmissions and processing.
- Devon is a member of the WIO, but chooses to contract with Enterprise to process 100% of Devon-owned gas. Devon has no direct contract with WFC.
- WFC is not a member of the WIO.

Devon has clarified their overall relationship with WFC in letters sent to NMED dated August 25, 2011 and November 9, 2011 (see Attachment 4). These documents clarify that Devon has some ownership in the gas produced from all four of the primary geologic formations that comprise the Sims Mesa area of NEBU as follows:

Fruitland Coal Formation: ~ 24.79%
Mesa Verde Formation: ~ 5.56%
Dakota Formation: ~ 18.87%
Pictured Cliffs Formation: ~ 32.60%

Devon has estimated that the Fruitland Coal Formation accounts for approximately 90% of the gas received at the Devon CDP, with approximately 52% of the CDP outlet sent to the Enterprise compressor station and 48% sent to the WFC Sims Mesa compressor station. Devon is contracted by the WIO to operate the CDP but has no involvement in the contractual relationships between WFC and individual WIO members.

Devon is responsible to ensure the proper quantity of gas flows to the proper compressor station, as based on the contracts of all 26 companies in the WIO. The flowrate at each wellhead is continuously monitored and a quantity of gas assigned ownership. The flow percentage sent to the WFC and Enterprise compressor stations is adjusted on a monthly basis and reconcilable on an annual basis. Devon maintains continuous records of the flow rate at each wellhead and the percent ownership by each member of the WIO (a 26 x 61 data point spreadsheet, with 1586 separate and continuously-varying gas volumes). The percent ownership of gas at each wellhead for each WIO member is normally specified by contract to the nearest 0.0001%.

In the event of planned routine maintenance or malfunction/emergency events that result in temporary closure of either the WFC Sims Mesa or Enterprise compressor station, the remaining station can accept a portion of the excess gas exiting the Devon CDP. Acceptance of a quantity of gas that exceeds contractual obligations is strictly voluntary on the part of WFC or Enterprise. This is an unwritten reciprocal agreement between Devon, WFC, and Enterprise. The quantity of gas that cannot be received by the active compressor station would force a shut-in of some wellhead production activities. Devon reports to the WIO Advisory Board the quantity of gas that cannot be received; the decision of which wellheads to shut-in is decided by the WIO and is based in part on the flow dynamics of the gathering system occurring at the time of the maintenance/malfunction/emergency event. Only the WIO members with WFC processing/marketing contracts can participate in decisions that determine which wellheads to shut-in during a Sims Mesa shutdown; this is not a singular decision made by Devon, WFC, or Enterprise. The temporary reduced production is integrated into the monthly flow calculation at the Devon CDP, and any adjustments made are ultimately reconciled annually so that each member of the WIO has the proper quantity of gas transmitted and processed by the proper midstream company.

Decisions authorized to be made by the WIO Advisory Board include exploration. Again, ownership of any new wellheads is decided in advance of production. Even if Devon became a partial or full owner of any new site that feeds the Devon CDP, Devon has established a contractual relationship exclusively with Enterprise for gas transmission and processing; therefore Devon could not exert indirect control over the WFC Sims Mesa facility as there is no existing contractual relationship. Conversely, WFC cannot participate in any decision to select Devon-operated wellheads for temporary shut-in, because WFC is not a member of the WIO Advisory Board.

Devon cannot make any decision that would influence production levels at the WFC Sims Mesa facility, because Devon’s vote on a wellhead-by-wellhead basis would only apply to those wellheads that have some component of Devon ownership. Devon does not have any wellhead ownership percentage in natural gas that is sent to the WFC Sims Mesa facility. Zero percent of Devon-owned gas is delivered to Sims Mesa and there are no existing contractual relationships between Devon and WFC.

For the Sims Mesa CDP, a different company - Devon Energy - operates the wells, and does not have a contract with WFC. WFC does not exercise control over any equipment owned or operated by any natural gas producer upstream of the Sims Mesa CDP facility. Natural gas producers contract with WFC to transport natural gas from the well head to downstream customers. During periods of emergency, failure or scheduled major maintenance, WFC can request that producers curtail operations on a short term basis. This very limited contractual provision, however, does not meet the level of control anticipated by the EPA in a “same stationary source” determination. WFC otherwise has no control over any upstream natural gas

operation and is contractually obligated to accept the gas volumes that non-WFC producers deliver onto its system.

The contracts do not allow well owner/operators to have any decision making power or control of any kind over environmental compliance measures at Williams' compressor station, nor does Williams have any influence or control over environmental compliance at the owner/operators locations.

Based on the Sims Mesa specific facts, aggregation of the midstream Sims Mesa compressor station with wellhead operations does not conform to the "common sense notion of a plant". As suggested in the letter from EPA Region 8 to Montana DHES, dated March 22, 1990, RE; Comments on the Draft permit for Conoco Coker and Sulfur Recovery Facility,

> **"If the Department's decision is to issue one permit, how will the liability issue be handled should an enforcement action prove necessary as a result of possible violations** (emphasis added) at Karley? For example, if Karley's emissions over exceed permitted limits, would the Department take an enforcement action against Conoco? Will Conoco have the authority to control emissions from the ATS plant such that an existing violation could be eliminated and/or a potential violation could be avoided?"

NMED would find it extremely difficult to address permit violations for more than two dozen companies under one permit.

Consequently, NMED believes that WFC has correctly represented the source as indicated in the Title V application, and no additional sources should be aggregated with Sims Mesa CDP.

NMED CONCLUSIONS – COMMON CONTROL

Based on the above discussion, extensive research, and prior EPA decisions and guidance, NMED makes the following conclusions using the authority under its state implementation plan:

1. Devon and WFC have no direct contractual obligations with each other.
2. The fact that Devon chooses to have 100% of their gas processed by Enterprise means that, on a wellhead-by-wellhead basis, Devon cannot exert any degree of indirect control over the WFC Sims Mesa compressor station.
3. WFC is not a member of the WIO and thus has no authority to exert control of any kind over Devon-operated facilities with respect to wellhead shut-in and other activities.
4. **The new information obtained by NMED from Devon and WFC following issuance of the Order reveals that no conflicting information exists related to WFC common control as suggested by the Petitioners and detailed in the Order beginning at 5. NMED has thoroughly**

researched documents describing the relationship or interaction between WFC and the upstream wells as recommended in the Order at 8. Furthermore, NMED has satisfied the requirements of the Order at 9 by reviewing all relevant contracts and agreements.

NMED therefore concludes that there is no common control, direct or indirect, between WFC and any other pollutant-emitting activity.

NMED furthermore concludes that none of the Devon-operated wellheads nor the Devon CDP should be aggregated with the WFC Sims Mesa facility as a single source for purposes of PSD applicability.

NMED agrees to supplement the Sims Mesa permit record with this discussion of the common control issue. NMED has proposed some changes to the Sims Mesa permit, but not with respect to the aggregation issue of Claim I.

III. RESPONSE TO CLAIM II

NMED Response- Prompt Reporting of Deviations:

The deviation reporting requirements at 20.2.70.302.E NMAC reflect the Department's belief that not all deviations from Title V permit conditions warrant the expeditious reporting required by 20.2.7 NMAC.

Since all Title V sources are subject to the excess emissions rule at 20.2.7 NMAC, any deviations from Title V permit requirements that resulted in excess emissions would be reported in accordance with the timelines at 20.2.7.110 NMAC.

The excess emissions rule at 20.2.7 NMAC applies to Title V emergencies as well, since they also meet the definition of excess emissions at 20.2.7.7.D NMAC. The timelines in 20.2.7.110 NMAC are more stringent than the reporting timelines for emergencies at 20.2.70.304.B.4 NMAC.

20.2.70.302.E NMAC requires that all deviations resulting in excess emissions (including those classified as Title V emergencies) would be reported in accordance with the timelines at 20.2.7.110 NMAC, and all deviations that did not result in excess emissions would be reported every six months as part of the monitoring reports required by Title V permits.

This reporting schedule is in accordance with the federal requirement at 40 C.F.R. § 70.6(a)(3)(iii)(B) which states in relevant part, "…The permitting authority shall define

"prompt" in relation to the degree and type of deviation likely to occur and the applicable requirements."

The NMED has determined that deviations resulting in excess emissions require a much more stringent reporting time frame than deviations that do not result in excess emissions. Deviations resulting in excess emissions have a potential impact on public health, whereas deviations that do not result in excess emissions do not.

The NMED believes that it is unnecessary to make more specific distinctions such as whether or not the deviation was from monitoring requirements, performance standards, etc. Any deviation from a monitoring requirement, performance standard, etc. that results in excess emissions is required to be reported in accordance with the timelines at 20.2.7.110 NMAC. **The NMED believes that it is sufficient to make the distinction between those deviations that result in excess emissions and those that do not.**

However, the NMED acknowledges that the above discussion regarding the intent is not obvious to those outside the agency who read the regulatory requirement at 20.2.70.302.E NMAC or the permit conditions in previous and current Title V permit templates.

In order to clarify this, the NMED proposes to revise the Title V permit template language and re-open and change the Simms Mesa Permit regarding reporting of deviations as follows:

"5.1 General Reporting Requirements

5.1.2. The permittee shall submit reports of all deviations from permit requirements, including those attributable to upset conditions as defined in the permit, the probable cause of such deviations, and any corrective actions or preventive measures taken. (20.2.70.302.E.2 NMAC)

5.1.2.1 Deviations resulting in excess emissions as defined in 20.2.7.7 NMAC (including those classified as emergencies) shall be reported in accordance with the timelines specified by 20.2.7 NMAC and in the semi-annual reports required in Condition 5.1.1. (20.2.70.302.E.2 NMAC)

5.1.2.2 All other deviations shall be reported in the semi-annual reports required in Table 5.1.1. (20.2.70.302.E.2 NMAC)."

The NMED believes that the less stringent reporting timeframe for deviations that do not result in excess emissions is consistent with the justification used by the EPA in the preamble to the final version of the Federal Operating Permit rule at 40 CFR 71 (61 FR 34219, July 1, 1996), reproduced in relevant part as follows;

"…Two commenters requested that part 71 clarify prompt reporting requirements for deviations other than those associated with hazardous, toxic, or regulated air pollutants, as described in sections 71.6(a)(3)(iii)(B)(1) and (2). The Agency believes that the requirement contained in section 71.6(a)(3)(iii)(A), in which sources are to report all instances of deviations from permit requirements at least every 6 months, provides the basis for prompt reporting of all other deviations. However, the Agency is willing to clarify this reporting requirement and has modified section 71.6(a)(3)(iii)(B) by adding a statement that directs sources to submit all other deviation reports in accordance with the timeframe given in section 71.6(a)(3)(iii)(A). … ."

In addition, the NMED also believes that the proposed revision to the deviation reporting language in the NMED Title V permit template and re-opened Sims Mesa Permit is consistent with that found in the Federal Operating Permit Program at 40 CFR § 71.6(a)(3)(iii)(A) and (B) (reproduced as follows);

(a) Standard permit requirements. Each permit issued under this part shall include the following elements:

(3) Monitoring and related recordkeeping and reporting requirements. (i) Each permit shall contain the following requirements with respect to monitoring:

(iii) With respect to reporting, the permit shall incorporate all applicable reporting requirements and require the following:

(A) Submittal of reports of any required monitoring at least every 6 months. All instances of deviations from permit requirements must be clearly identified in such reports. All required reports must be certified by a responsible official consistent with §71.5(d).

(B) Prompt reporting of deviations from permit requirements, including those attributable to upset conditions as defined in the permit, the probable cause of such deviations, and any corrective actions or preventive measures taken. Where the underlying applicable requirement contains a definition of prompt or otherwise specifies a time frame for reporting deviations, that definition or time frame shall govern. Where the underlying applicable requirement fails to address the time frame for reporting deviations, reports of deviations shall be submitted to the permitting authority based on the following schedule:

(1) For emissions of a hazardous air pollutant or a toxic air pollutant (as identified in an applicable regulation) that continue for more than an hour ***in excess of permit requirements*** *(emphasis added), the report must be made with 24 hours of the occurrence.*

(2) For emissions of any regulated air pollutant, excluding those listed in paragraph (a)(3)(iii)(B)(1) of this section, that continue for more than two hours ***in excess of permit requirements*** *(emphasis added), the report must be made within 48 hours.*

(3) For all other deviations from permit requirements, the report shall be contained in the report submitted in accordance with the timeframe given in paragraph (a)(3)(iii)(A).

IV. RESPONSE TO CLAIM III.A.1

Summary of Petitioners Comments and EPA Response – III.A.1 Frequency of monitoring for NOx and CO emission limits:

Petitioners state that Conditions 3.4.2 and 3.4.2.2 of the Sims Mesa permit require only once-per-year portable analyzer monitoring for units 1-6 and 11-14, the compressor engines, stating that "[t]his monitoring is too infrequent to ensure compliance with NOx and carbon monoxide emission limits" since the NOx and CO permit emission limits are on an hourly basis. Petitioners argue that "monitoring only once annually for the units cannot possibly ensure continuous compliance with these hourly emission limits, and it is questionable whether once-per-[year]-monitoring can ensure continuous compliance with the annual emission limits.

EPA's response granted the Petitioners' request for an objection on this issue because NMED did not adequately respond to Petitioners' comments. The March 19, 2009 response to comments (RTC) indicates that NMED is relying on proper operation and maintenance of the engines in addition to the annual monitoring requirement in the permit, to show that the existing engines maintain their uncontrolled NOx and CO emissions levels at the permitted limits. However, NMED's RTC does not explain what permit terms or conditions ensure "proper operation and maintenance of" the engines. NMED's RTC does not adequately explain how the monitoring in the permit is sufficient. NMED should respond fully to Petitioner's comment and should offer further explanation of why it believes that steady state operations and proper operation and maintenance of the units are valid assumptions here, in light of the permit's terms and conditions or make appropriate changes to the permit to ensure it includes monitoring requirements consistent with the Act and implementing regulations.

NMED Response – III.A.1 Frequency of monitoring for NOx and CO emission limits:

The regulatory requirement in 20.2.70.302.C(2) New Mexico Administrative Code (NMAC) requires periodic, not continuous, monitoring sufficient to yield reliable data from the relevant time period that are representative of the source's compliance with the permit…. Such monitoring requirements shall assure use of terms, test methods, units, averaging periods, and other statistical conventions consistent with the applicable requirement.

As indicated in EPA's order responding to Petitioners' request, a case by case technical analysis considering site-specific factors is necessary to determine the most appropriate monitoring for a source. Factors may include, among others, the variability of emissions from the unit; the capacity at which the unit will be operated; if add-on emissions controls are used; any monitoring, process, maintenance, or control equipment data that is already available or already being conducted by the permittee; the likelihood of a violation of a federal emission standard or the emission rates used to demonstrate compliance with National Ambient Air Quality Standards

(NAAQS); the type and frequency of monitoring required for similar units at other facilities; and/or prior emissions test data.

To explain this technical analysis, we offer two examples. The first considers the appropriate monitoring frequency for particulate matter (PM) emissions controls at a rock crushing facility. One method used to control PM emissions from the crushing, screening, and conveying of rock material are water sprays. Two issues to consider when determining the appropriate monitoring frequency of these add-on controls, are that the water spray bar and nozzles are exposed to the natural elements and rigors of the crushing and screening process and so can be suddenly impaired or damaged (e.g. water spray nozzles can be broken, clogged, or misdirected) and PM emissions can be significant when the water sprays are not properly working. In this example, the factors considered to determine the appropriate monitoring frequency, are that add-on controls must be used to reduce emissions, emissions are highly variable depending on the effectiveness of the controls, and so if impaired, there is a high likelihood that the PM10 or PM2.5 NAAQS will be violated. For these reasons, it is necessary to require frequent, at a minimum daily, monitoring or inspections of these water spray controls.

Another example already mentioned in the March 19, 2010 RTC, are the monitoring (called compliance requirements) in 40 CFR 60, Subpart JJJJ, the New Source Performance Standards (NSPS) for Spark Ignition Internal Combustion Engines (SI ICE). The regulation requires manufacturers to certify the NOx, CO, and VOC emission rates which correspond to the emissions standards in Table 1 of the NSPS. EPA determined that to demonstrate compliance with the gr/hp-hr or ppmvd short term emission standards in Table 1, the following periodic monitoring is sufficient (76 FR 37966, June 28, 2011). Monitoring in 40 CFR 60.4243 for natural gas fueled engines between 100 hp to 500 hp and greater than 500 hp requires a maintenance plan and records, and requires maintaining and operating the engine in a manner consistent with good air pollution control practice for minimizing emissions. Additional monitoring includes performance testing (emissions stack tests), but only if the engine is non-certified. If the non-certified engine capacity is greater than 500 hp, monitoring consists of a performance test within the first year of start up and every 8760 hours or 3 years thereafter. If the non-certified engine capacity is between 100 hp to 500 hp, only one performance test is required within a year of startup. In this case, it appears that some factors EPA may have considered to determine sufficient periodic monitoring are the certification of emission rates (or prior emissions test data), that proper operation and maintenance is sufficient for the engine to continue meeting the certified emission rates (the variability of emissions), and the size of the engine (or size of emissions and environmental impact).

The two requirements that apply to NOx and/or CO emissions from the Sims Mesa engines include 40 CFR 50, National Ambient Air Quality Standards (NAAQS) and 40 CFR 63, Subpart ZZZZ, the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Reciprocating Internal Combustion Engines. The factors considered when determining sufficient periodic monitoring to meet these applicable requirements, were that the NOx and CO permit

emission limits were determined using the engine's maximum site rated capacity and manufacturer's guaranteed emission rates specific to those engines; the engines do not use add-on controls, such as a catalytic converter, to meet any applicable emission limits; and engines without add-on controls typically do not experience significant variability in emission rates over short periods of time. Also, the New Source Review (NSR) permit that permitted these engines required initial compliance tests using EPA Methods 7e for NOx and 10 for CO on 4 out of the 10 engines within 180 days after initial startup of the engine. It should be noted that only 2 of the authorized engines are installed.

It is important to recognize the significance of the fact that the engines' emission limits represent the maximum capacity to emit. EPA recognizes this in its June 13, 1989 memorandum, "Guidance on Limiting potential to Emit in new Source Permitting". Summarizing EPA's pages 5 and 6, to appropriately limit potential to emit, permits must contain production or operational limits in addition to emission limits if the emission limits do not reflect the maximum emissions of the source operating at full design capacity without control equipment.

Due to the factors listed above, the existing periodic monitoring consisting of annual portable analyzer testing of NOx and CO and proper operation and maintenance of the engines are sufficient to demonstrate compliance with the NOx and CO pound per hour emission limits used to demonstrate compliance with the NAAQS and meet the requirements of 20.2.70.302.C(1) and 20.2.70.302.C(2) NMAC. The existing monitoring combined with the initial EPA Method tests are consistent with the requirements in NSPS JJJJ. Extrapolating the pound per hour portable analyzer test results over the year, assuming non-stop operation of the engine, also indicates if the ton per year emission limits are met. The basis for this monitoring is that if the engines are properly operated and maintained, short term, uncontrolled emission rates over a year's time will not vary to the extent that an emission limit would be exceeded. NMED also determined, in accordance with 20.2.70.302.C(2) NMAC, that it was not necessary to supplement any applicable monitoring or compliance demonstration required by the NESHAP ZZZZ. **NMED does agree, and Conditions 1.10, 3.4.2.4, and 4.2.3 will be added to the re-opened permit, that explicitly requires proper operation, maintenance, and corresponding records rather than relying on the requirements in 20.2.7 NMAC Excess Emissions and standard industry practice. Also, Condition 3.3 will be changed to refer back to the requirements in Condition 1.10 that requires operation consistent with good air pollution control practice to minimize emissions. NMED is also adding condition 3.4.2.2 to the Title V re-opened permit requiring the NOx and CO EPA Method Tests on engines 3 and 5.** The NOx and CO EPA Method tests have not been completed on these two engines (currently the only 2 installed at the facility), because they are identical units replaced in 2003 as part of a routine preventative-maintenance program implemented by Williams Four Corner's compression contractor.

V. RESPONSE TO CLAIM III.A.2

Summary of Petitioners Comments and EPA Response – III.A.2 – Monitoring Exemptions:

Petitioners additionally allege the title V Permit allows for even less frequent monitoring for the engines since Condition 3.4.1.3.2 "allows the source to avoid monitoring for NOx, and carbon monoxide altogether if a unit has been operated for less than 25% of a monitoring period." Petitioners believe this condition is "wholly inappropriate and as a practical matter would allow the operator to violate hourly emission limits in the permit for up to three months, which is 25% of the annual monitoring period."…. Petitioners claim this is not sufficient monitoring under title V and note that this requirement does not even apply if a source operates less than 10% of any annual monitoring period. Petitioners state that in "essence, this [monitoring exemption] requirement allows [Williams] to avoid monitoring altogether so long as it only operates its engines 36.5 days annually." Petitioners conclude that this monitoring requirement "hardly serves to ensure compliance with hourly NOx and carbon monoxide emission limits." Citing 40 C.F.R. §§ 70.6(a)(3)(i)(B) and 70.6(c)(i), Petitioners assert title V requires that monitoring shall provide reliable data from the relevant time period which is representative of the source's compliance with provisions of permit in order to ensure compliance.

EPA granted Petitioners' objection on this issue because the permit lacks adequate justification in the record to explain NMED's decisions regarding the exemptions from compliance monitoring for the compressor engines. In addressing this objection, NMED must discuss the adequacy of the permit monitoring requirements in support of the permit's exemption for low operation periods, or make appropriate changes to the permit to ensure it includes monitoring requirements consistent with the Act and implementing regulations.

NMED Response – III.A.2 Monitoring Exemptions:

For reference, the following conditions are related to Petitioners' comments and to NMED's response.

Condition 3.4.1.3.2 of Permit No. P026R2:

> "If the emission unit has operated for 25% or less of a monitoring period then the monitoring is not required. After two successive periods without monitoring, the permittee shall conduct monitoring during the next period regardless of the time operated during that period, except that for any monitoring period in which a unit has operated for less than 10% of the monitoring period, the period will not be considered as one of the two successive periods. However, to invoke monitoring exemptions at 3.4.1.3.2, hours of operation shall be monitored and recorded."

Condition 3.4.1.3.3 of Permit No. P026R2:

> "A minimum of one of each types of monitoring activity shall be conducted during the five year term of this permit."

The intent of Condition 3.4.1.3.2 is to avoid requiring that equipment be operated for the sole purpose of conducting monitoring when a unit is shut down during a monitoring period or when the actual hours of operation are reduced to the extent that completing the required monitoring during the monitoring period becomes impractical. It is not the intent of Condition 3.4.1.3.2 to reduce the frequency of monitoring or to exempt a source from conducting periodic monitoring, but to re-classify the monitoring period in terms of actual time operated in cases where the operating hours of a unit are reduced.

Providing the option to define the monitoring period in terms of 1) actual operating time or, 2) the amount of time that has passed since monitoring was last conducted, is consistent with NSPS JJJJ at 40 CFR 60.4243(a)(2)(iii) which states "…and conduct subsequent performance testing every 8,760 hours or 3 years, whichever comes first, thereafter to demonstrate compliance". Again, as stated at 76 FR 37966, June 28, 2011, this frequency of testing is sufficient to ensure compliance.

In consideration of Petitioners' comments, NMED did apply the language in Condition 3.4.1.3.2 to the Sims Mesa annual portable analyzer monitoring requirement and found that, using the condition's current language, an engine could be operated for more than 12 months before monitoring was conducted, allowing an exceedance of the annual monitoring period. Therefore to correct this deficiency, we will be revising Condition 3.4.1.3.3, to state:

> "If invoking the monitoring **period** exemption in 3.4.1.3.2, the actual operating time of a unit shall not exceed the monitoring period required by this permit before the required monitoring is performed. For example, if the monitoring period is annual, the operating hours of the unit shall not exceed 8760 hours before monitoring is conducted. Regardless of the time that a unit actually operates, a minimum of one of each type of monitoring activity shall be conducted at a minimum of at least once every 3 years."

With this change to Condition 3.4.1.3.3, the Sims Mesa portable analyzer engine testing must be completed at least once a calendar year, or, if the monitoring period exemption at Condition 3.4.1.3.2 is invoked, at least once every 12 months or 8760 hours that an engine operates. An annual monitoring period is consistent with EPA's approach in NSPS JJJJ and with NMED's determination in Section III.A.1 of this response, which concluded that annual NOx and CO portable analyzer tests and proper operation and maintenance of the engines is sufficient to assure and verify compliance with the terms and conditions of the permit and with applicable requirements in accordance with 20.2.70.302.C(1) and 20.2.70.302.C(2) NMAC.

VI. RESPONSE TO CLAIM III.B

Summary of Petitioners Comments and EPA Response – III.B VOC Monitoring:

The Permit contains language to the effect that compliance with NOx and CO portable analyzer testing demonstrates compliance with the VOC emission limit for the internal combustion compressor engines. EPA determined that the RTC and permit record did not adequately explain the assertion that NOx and CO emission rates are proper indicators for the VOC emission rates for these engines.

NMED Response – III.B VOC Monitoring:

In past permits, NMED stated "…compliance with NOx and CO portable analyzer testing demonstrates compliance with the VOC emission limit…". NMED has recognized that NOx should be deleted from the statement.

From NMED's Engine Monitoring Protocol dated November 4, 2011: For Periodic Emissions Testing: "Test results that demonstrate compliance with the CO emission limits shall also be considered to demonstrate compliance with the VOC emission limits." The rationale for this statement is that the portable analyzers do not speciate VOC compounds and the cost of a separate EPA method test is significant; therefore, AQB relies on CO monitoring to demonstrate compliance with VOC limits. Taking into account that the manufacturer tests the equipment and specifies the expected NOx, CO, and VOC emissions for a unit operating properly, as well as basic principles of combustion chemistry, if an engine test demonstrates that CO concentration falls within the emission limits, then VOC also falls within the emission limits, and the engine is performing as represented in the application.

CO and VOC are products of combustion and increase due to poor combustion. NMED concludes that using CO as a surrogate for VOC would reasonably demonstrate that the actual VOC emissions were well below the VOC emission limit if the CO emission rate is met.

In the data sheets provided by Waukesha for Sims Mesa, VOCs make up 10-20% of the non-burned Non Methane Hydrocarbons (NMHCs). Williams, like most companies we reviewed, uses the emission factor for the NMHC to estimate its VOC emission.

EPA in developing the RICE MACT, 40 CFR 63.6580, Subpart ZZZZ [69 FR 33506, June 15, 2004, as amended at 75 FR 9676, Mar. 3, 2010] and in the 12/2007 response to comments for the new Subpart JJJJ ("Response to Public Comments on Proposed Standards of Performance for Stationary Spark Ignition Internal Combustion Engines and National Emission Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines") focused on looking at CO as a surrogate for HAP for lean burn engines, chiefly formaldehyde, although formaldehyde is a VOC. The information EPA gathered when it originally wrote the stationary engine and turbine NESHAP back in the early 2000's was focused on looking at CO reduction as

a surrogate for HAP reduction - so if a catalyst reduced CO, it also reduced HAP. This is referenced at 40 CFR 63.6620 that speaks to testing for CO as a surrogate for formaldehyde.

In the Statement of Basis Section 13, New/Modified/Unique Conditions (Format: Condition#: Explanation) of each Title V Operating permit, NMED states the names of each Monitoring Protocol and its version date. This incorporates by reference the basis for the new or modified monitoring conditions in the current permit. The monitoring protocols are provided when requested.

Specifically for Sims Mesa, NMED requested Williams obtain site-specific emissions factors from Waukesha for the L7042GL (Lean Burn) engines because we determined the field gas burned as fuel at Sims Mesa didn't meet the definition of "commercial quality natural gas, CQNG" as defined by Waukesha in their development of the spec-sheet emission factors. Even though the Sims Mesa gas contains almost 20% CO_2 as compared with 3% max. for CQNG, the site-specific emission factors were unchanged for CO and NMHC (2.7 g/bhp-hr and 1.0 g/bhp-hr, respectively). The emissions factor for Non-methane, Non-ethane Hydrocarbons (NM, NEHC) did increase from 0.25 to 0.3 g/bhp-hr. To be conservative, Williams based their VOC emission calculations on the higher NMHC value. Therefore, NMED has determined that no adjustment needs to be made to the Sims Mesa permitted VOC emission limits.

As required by previous permits, Williams conducted two annual portable analyzer tests, June 2010 and May 2011, that measured CO and averaged 56% (19.9 tpy) of the allowable CO emission limit of 35.6 tpy. From the Waukesha's Sims Mesa site specific emission factors, we compared the NMHC to CO emission factor and got the ratio of 1/2.7 (37%) NMHC to CO. The resulting NMHC is estimated to be 7.4 tpy. Per Waukesha, the VOCs are 20% of the NMHC; so the estimated VOCs would be 1.5 tpy, well below the emission limit of 13.3 tpy.

Given the precedent set by EPA in the RICE MACT and the very low emissions of VOCs relative to the emission limit, CO emissions are an appropriate and proper indicator of VOC emissions.

VII. RESPONSE TO CLAIM IV

Summary of Petitioners Comments and EPA Response – IV Condition 6.1.1 and Applicable Requirements:

Petitioners assert that permit Condition 6.1.1 is contrary to the Clean Air Act in that NMED cannot automatically conclude that compliance with a title V permit assures compliance with the National Ambient Air Quality Standards (NAAQS).

The EPA granted Petitioners' objection on this issue because the NMED failed to fully respond to Petitioners' comments relating to permit Condition 6.1.1.

NMED Response – IV Condition 6.1.1 and Applicable Requirements:

The NMED considered the basis for Condition 6.1.1 and offers in our response that the basis of Condition 6.1.1 was to provide assurance that the facility will maintain compliance with the NAAQS that were applicable during the previous NSR permitting action which required an air dispersion modeling analysis. As we explained in the RTC, the NMED's mechanism for facilities to demonstrate compliance with the NAAQS typically occurs in the NSR permitting process and in this instance Condition 6.1.1 was meant only to apply to those NAAQS that were effective at the time of the previous NSR permitting action which required a modeling demonstration. The Department agrees that Condition 6.1.1, as written, does appear contrary to the Clean Air Act in that the NMED cannot automatically provide that compliance with the terms and conditions of the Title V permit assures compliance with the NAAQS. The Department did not intend to create a condition that ensured compliance with all NAAQS through compliance with terms and conditions of the Title V permit.

Upon review, the NMED finds the language in Condition 6.1.1 unnecessary and further finds that this condition should be removed from the permit to deter further misunderstanding of the intent and purpose of this condition. The Title V permit for Sims Mesa will be re-opened to remove Condition 6.1.1.

VIII. SUMMARY

Based on the above arguments, NMED will take the following actions in response to Claims I – IV by the Petitioners:

Re-opening of Title V Permit P026R2 (see Attachment 5: Draft re-opened Permit P026R2M1). The following is a summary of proposed changes:

1) Claim I – No action
2) Claim II – Re-open and revise Condition 5.1 as cited in the above response
3) Claim III.A.1 - New conditions (numbers 1.10, 3.4.2.4, and 4.2.3) will be added to the re-opened permit that explicitly requires proper operation, maintenance, and corresponding records rather than relying on the requirements in 20.2.7 NMAC Excess Emissions and standard industry practice. Condition 3.3 will be changed to refer back to the requirements in Condition 1.10. NMED is also adding a new condition (number 3.4.2.2) to the Title V re-opened permit requiring NOx and CO EPA Method Tests on engines 3 and 5.
4) Claim III.A.2 – Re-open and revise Condition 3.4.1.3.3
5) Claim III.B – Re-open and revise Condition 3.4.2.2 (now Condition number 3.4.2.3) to remove the statement that compliance with NOx emission limits demonstrates compliance with VOC emission limits.
6) Claim IV – Re-open and remove of Condition 6.1.1

Supplementation of permit record only:

1) Claim I – The prior discussion concerning common control will be summarized in a revised Statement of Basis for the re-opened permit.

NMED will supplement the permit record in the Statement of Basis for the re-opened permit to address final actions on all Claims.

This Response to Order constitutes a full response by NMED to EPA's July 29, 2011 Order.

Re: Request for General Information on DCP's Colorado Operations

Dear Ms. King:

This responds to your February 5, 2010 letter regarding an Order EPA issued in October 2009 that directs the Division to re-evaluate its determination that Kerr-McGee Gathering's Frederick Compressor Station in Weld County, Colorado is a single stationary source for air permitting purposes. The Division is preparing its response to the Order and, in so doing, is seeking to further develop its understanding of the relationship between oil and natural gas producers and natural gas processors whose operations are located downstream of production lease sites. Our response highlights certain elements of the producer/processor relationship the Division should be aware of when applying the factors to be considered when determining what potentially related emitting activities constitute a single stationary source (i.e., common industrial grouping, contiguous and adjacent property, and common control). As such, the discussion below is limited to DCP's natural gas gathering and processing operations.[1]

DCP is a "midstream" natural gas company. We do not own or operate any oil or natural gas leases, production wells or production lease sites. Our operations are separate from oil and natural gas production because they occur on property that is geographically separate from production lease sites. Our operations, and those of our producer customers, are solely and exclusively owned and controlled by each of us, respectively, such that neither we, nor any producer we serve, has the power to direct or cause the direction of the management or policies of the other's operations whether through contract, ownership of voting shares, or otherwise.

DCP presently serves 75 individual producers in the Denver-Julesburg Basin under 400 separate contracts that govern thousands of individually producing oil and gas wells that flow to 5,700 individual wellhead gas meters that connect to our gas gathering system. While the

[1] The scope of this response is also limited to the application of the terms "major stationary source" and "major source" as they are defined under 40 C.F.R. §§ 51.166(b)(6) and 70.2, and Regulation No. 3, Part A, Sections I.B.23 and 41, and Regulation No. 3, Part D, Section II.A.24 (5 CCR 1001-5) to DCP's operations.

Administrative Record NSR 10833_01157

specifics of any individual gas processing contract are confidential, the substantial majority of our 400 processing agreements have us take title to the gas at the point at which it flows through a wellhead gas meter. In a minority of cases we take custody of but not title to the gas. In neither case does any DCP producer customer retain the right to govern or control, in any way, how we operate or the emitting activities that relate to those operations. With respect to oil and natural gas producers, DCP does not:

- share common workforces, plant managers, security forces, corporate executive officers, board of executives, equipment, real property, or pollution control equipment;
- contract for or share pollution control responsibilities;
- make decisions affecting pollution control equipment used by producers;
- accept responsibility for compliance with air quality control requirements, or the violation of such requirements, of any upstream producer;
- share common payroll activities, employee benefits, health plans, retirement funds, insurance coverage, or other administrative functions; or
- share intermediates, products, byproducts, or other processing manufacturing.

As depicted in the aerial photograph in ***Attachment A*** to this letter, production lease sites include a well (or series of wells) that produce natural gas (or gas associated with oil) and a "wellhead" meter (or series of meters) that measures the volume of gas sent from the production leasehold to a gas processor's natural gas gathering system. The wellhead meter demarcates the line that separates production operations that occur upstream of the meter on the production leasehold from those that occur downstream of the meter after the gas enters a gas gathering system for processing by a midstream company like DCP.

Prior to flowing gas to a wellhead meter for gathering by a natural gas processor, producers will remove oil, condensate, water and other contaminants from the produced gas. See ***Attachment B***. Therefore the majority of the oil and gas production lease sites provide at least some level of mechanical separation of the basic gas and liquids produced from wells on the lease. The separation typically occurs naturally by gravity in closed storage tanks, or can be accelerated by employing a heater treater, vertical separator or horizontal separator. While these activities involve emissions to the air, they all occur prior to entering the gathering system "upstream" of the wellhead meter on property that is physically separate from that on which the processing plant is located and prior to coming under the control of the gas processor.

Gas processing holds the pivotal position between the exploration and production segment of the industry located on the production leasehold and downstream end users, including utilities, interstate pipelines, fuel distribution businesses, the petrochemical industry and

residential users. Natural gas processing plants operate to extract the heavier hydrocarbon molecules such as ethane, propane, butane and natural gasoline into constituent liquid products ("NGLs"). Natural gas processing plant economics are driven by the market risk of the gas-to-liquid (NGL) volumes and gas-to-liquid (NGL) price spread or, more simply stated, the volume and relative market price for a liquid Btu versus a gas Btu. Even though liquid prices historically have been higher than gas prices, there have been periods of "price inversion," when gas prices exceed liquid prices on a Btu basis. This is why the so-called percent-of-proceeds or "POP" processing fee arrangement between gas producers and gas processors is the most popular because this type of fee arrangement allows the parties to share the market-price risk. In a "keep-whole" processing fee arrangement the gas processor assumes all of the market-price risk, while in a "fixed fee" arrangement all market-price risk is assumed by the producer.

Accordingly, any given natural gas processing plant will have a variety of processing fee structures that will reflect the varying commercial goals and interests of each individual producer and the gas processor, all of which the gas processor must ideally manage to hedge its exposure to the price-risks inherent in commercial petroleum hydrocarbon commodity markets. These economic considerations not only dominate the arms-length contract negotiations between producers and processors, they create the conditions that commercially segregate the operational prerogatives of gas processors in the midstream segment of the industry from upstream production operations that occur on the leasehold.

There are two basic types of commercial contracts used by natural gas processors and natural gas producers. The first provides for the sale and passing of title to the natural gas by a producer to a processor at the wellhead meter on the leasehold to the processor's gathering lines prior to the gas entering or being processed at a gas processing plant. See ***Attachments A and B***. Under this sales arrangement the gas processor acquires title to the natural gas and all of its constituents, including an unconditional right to process the gas and extract and sell all of the NGLs. The substantial majority of DCP's 400 processing contracts in the Denver-Julesburg Basin have DCP take title to the gas, at which point the ownership and control of the producer over the resource ceases. The second type of processing contract is one in which the gas processor takes custody of but not title to a producer's gas, processes it in the gas processing plant, and redelivers to the producer both the NGLs extracted and the residue gas at the tailgate of the processing plant.

Fee structures that apply to contracts under which the gas processor takes title to the gas can be based on percent of proceeds ("POP") or percent of market index. A POP fee arrangement is one in which the producer receives a wellhead price based on a percent of the proceeds received by the processor at the tailgate of the processing plant. Again, the substantial majority of DCP's contracts in the Denver-Julesburg Basin incorporate the POP fee structure. The percent of index fee arrangement is based on the downstream spot market index price for the mainline that the natural gas processing plant is tied into, with some percent retained by the plant for its cost of operation and profit.

Administrative Record NSR 10833_011558

Administrative Record NSR 10833_01559

Contracts in which custody of but not title to the gas passes to the processor typically include "keep-whole" or "fixed fee" payment arrangements. In a "keep-whole" deal, the processor will charge the producer a gathering fee plus fuel costs and promise to return to the producer at the plant tailgate all of the gas Btu's delivered at the wellhead. Because of the "shrink" in gas from processing (the gas stream "shrinks" as gas molecules liquefy and as some gas is consumed as plant fuel), the processor has to acquire sufficient "make-up" gas to make up the lost energy content or Btu's (the make-up is accounted for on an equivalent Btu basis - not a volume basis). Depending on the contract, the producer may be "kept whole" in kind or in cash equivalent to a tailgate gas sale. In a "fixed fee" arrangement the producer is granted a right to have its gas processed for liquids and to thereby enjoy the upside and downside risk of prevailing and/or forecast liquid prices. The processor's fee or toll for processing is generally expressed as a flat fee of cents per mcf or MMBtu. This arrangement represents the least amount of risk for the processing plant. Under a fixed fee arrangement, all the risk of the gas-to-liquid price spread is on the producer.

There are only two very limited circumstances when a gas processor might exert some degree of control over the producer on the production lease site. Most natural gas processing contracts, including those under which DCP operates, grant the processor the right to unilaterally suspend the processing of a producer's natural gas if the processing becomes uneconomic or there is a *force majeure*. "Unprofitability" contract provisions typically contain the following features: (1) a precise definition of what constitutes "unprofitability"; (2) a minimum notice period; (3) a requirement that gas be released back to the producer during the period the processor is refusing to process the gas for economic reasons; and (4) a requirement for permanent release of the gas if processor does not resume processing within a reasonable period of time. *Force majeure* provisions in gas processing contracts apply to events or acts that are not reasonably within the control of the party that is claiming the *force majeure*. In addition to natural disasters, accidents, labor unrest, and war, a *force majeure* can also include compliance with any present or future law, statute or regulation. Unprofitability and *force majeure* are the only instances under which a processor may take an action that could possibly affect emitting activities upstream of a wellhead meter. In DCP's experience, the exercise of either such provision will generally cause the shut in of the producing operations and a related cessation of emitting activities upstream of the wellhead meter on the production leasehold and a concurrent reduction in the volume of gas being gathered and processed downstream of the meter (i.e. reduced emissions from each segment).

Under the federal Clean Air Act and Colorado's federally-approved State Implementation Plan ("SIP"), otherwise different air emitting activities can be aggregated and considered a single stationary source for air permitting purposes if they: (1) belong to the same industrial grouping; (2) are located on contiguous or adjacent property; and (3) are under common control. All three criteria must be present to aggregate. The lack of any one requires that the emitting activities be permitted separately. Colorado, as a delegated state, has the ultimate authority and broad discretion to determine whether the source aggregation criteria are met in any given case. As discussed above, there is a clear line of demarcation between emitting activities that occur on oil and natural gas production lease sites upstream of wellhead gas meters and those that occur

downstream of those meters after the gas enters a midstream gathering system. The physically separate location of producer operations from those at a natural gas processing plant in addition to the terms that drive the commercial relationship between producers and processors that preclude shared or common control over emitting activities that occur on the separate properties, demonstrate that at least two of the required three criteria needed to aggregate emitting activities are lacking.

I hope the Division finds the above discussion useful as it formulates its response to EPA's Order. Should you have any questions regarding anything set forth above (or in the attachments to this letter) please do not hesitate to call me at (303) 605-2160.

Thank you.

Sincerely yours,

Joshua B. Epel

RE: Comments on Western Climate Initiative's Issue Paper on Defining the Reporting Entity and Threshold

NMOGA appreciates the opportunity to provide comments to the Western Climate Initiative (WCI) concerning WCI's Issue Paper on Defining the Reporting Entity and Threshold. The tone of this paper raises serious concerns for NMOGA members for several significant reasons.

As with the other issue papers we recently commented on, it appears this issue paper shows a complete change in the direction taken by WCI with respect to its Greenhouse Gas (GHG) reporting program. Initially it appeared and WCI represented that its goal was to provide non-jurisdictional oversight to ensure that progress is made in understanding and quantifying GHG emissions and implementing a cap and trade program.

With respect to the oil and gas industry, the WCI direction now seems to be more command and control with the result that nearly every oil and gas operation, regardless of size, will be required to report GHG emissions and ultimately be captured under WCI's cap and trade program. NMOGA submits that this result is not what WCI or the state of New Mexico initially intended.

NMOGA's comments on this issue paper are specific with respect to individual points within the issues paper that cause us concern. Each key point is called out separately more or less in the order that they are presented in the issue paper.

The second portion of our comments provides detailed information about the business structure of the midstream industry. The purpose of this information is to help WCI understand how the proposed issues addressed in this paper are not feasible with respect to the midstream segment of the oil and gas industry.

Administrative Record NSR 10833_011567

Based on all of the comments that follow, NMOGA basically concurs with the approach taken by WRAP/TCR as presented in the issue paper. The following sentence taken from this section of the issue paper clearly outlines how oil and gas facilities should be treated for GHG reporting and cap and trade purposes:

> *"Large sources that meet the definition of a standalone facility must be reported separately to maintain transparency. Reporting thresholds would be established at the field level for small sources and at the facility level for sources meeting the traditional definition of a facility"*

Under the federal Clean Air Act and New Mexico's federally-approved State Implementation Plan ("SIP"), different air emitting activities can be aggregated and considered a single stationary source for air permitting purposes if they: (1) belong to the same industrial grouping; (2) are located on contiguous or adjacent property; and (3) are under common control. All three criteria must be present to aggregate. The lack of any one requires that the emitting activities be permitted separately. This makes it clear that individual booster stations, tank batteries, gas plants, and other discreet operational entities are, by definition, individual facilities and, therefore, individual reporting entities. This is the underlying basis for air permitting and any reporting that is required under the Clean Air Act. Emissions from each location are determined and for those that exceed the appropriate threshold, appropriate permitting and reporting requirements must be met. Those that do not meet or exceed any threshold do not require a permit and are not required to report.

This proposed definition of "Oil and Natural Gas Facility" is problematic on several different levels. First, the definition is entirely too broad and negates the long-standing definition of facility that is the basis for permitting and emissions reporting under the Clean Air Act. The proposed definition completely erases the line of distinction that forms the basis for permitting and reporting and unfairly places the oil and gas industry in a position in which, potentially, all individual operations/locations must report GHG emissions, regardless of their size if they are part of an aggregated group that exceeds any reporting threshold. With the added emphasis on small operations, companies must focus a disproportionate amount of valuable time and resources on monitoring, measurement, calculation, and reporting of GHG emissions that form an extremely small percentage of the total for any reporting grouping, regardless of how it is defined.

One of the bases of the Clean Air Act is the New Source Review (NSR) Program under which facilities or entities must evaluate emissions whenever they are newly constructed or modified to the extent that there is an emissions rate increase and, when required obtain or modify a permit. The creation of an "Oil and Gas Reporting Entity", as proposed in this issue paper, contradicts this fundamental of the NSR Program and directly conflicts with federal law. EPA is advocating making CO_2 (and other GHGs) a regulated pollutant under the Clean Air Act. Once GHGs become regulated pollutants under the federal Clean Air Act, they must be regulated in the same manner as other regulated pollutants. This includes how facilities and entities are defined under the Act.

NMOGA is concerned about the potential impact of a formal aggregation requirement on other programs that have, as their basis, the definition of discreet facilities. The idea of having to obtain a NSR and/or Title V permit for multiple small and widely dispersed operations that have been aggregated into one entity that exceeds the appropriate permitting threshold poses numerous problems, especially when GHGs become regulated pollutants:

1. It will require all existing "facilities" to be re-evaluated to determine where they fit in the new entity definition and, subsequently, require re-permitting.
2. NSR and Title V permits will decrease in number and significantly increase in complexity. For example, under the proposed aggregation requirements, all compressor stations, tank batteries, gas plants, etc. in an individual basin would be aggregated as one "Oil and Natural Gas Facility". This would require one NSR permit and one or more Title V permits. This would cause extreme hardship on industrial and agency resources and greatly complicate the permitting process while providing little or no added environmental benefit.
3. The number of PSD permits would increase. Most "aggregated entities" would be PSD major facilities and, therefore, exceeding the significance levels for any pollutant would trigger PSD. Such normally simple permitting actions as adding a compressor engine or a turbine or building a new small compressor station would trigger PSD. The effect of this would be to drastically slow the permitting process, increase the burden on state and federal agencies, and create business roadblocks for the oil and gas industry.
4. NAAQS and NMAAQS compliance demonstration would have to be re-evaluated completely or the definition of ambient air would have to be changed. Currently each discreet facility is usually surrounded by ambient air. Under the proposed definition of facility and current definition of ambient air, impacts would be determined at the boundaries of mega-facilities that encompass many square miles. It is entirely possible that this could result in operations closures and/or the prohibition of expansion. This poses an unfair disadvantage to the oil and gas industry.

WCI is proposing that the aggregation requirements "apply to all oil and gas emissions sources covered under EPA Subpart W and those emissions sources not included in Subpart W but to be included in the WCI Oil and Gas Essential Requirement". This is inconsistent with the WCI's stated desire to harmonize its requirements with those of EPA and another example of WCI drastically changing its apparent intentions. Harmonizing with EPA does not mean extending the requirements to sources and operations that EPA does not include. More problematic is the disparity that this potentially creates for those facilities that are subject to both the EPA and WCI requirements. Since Subpart W will not be promulgated until late summer 2010, it is premature to take any position on which sources the proposed aggregation requirement will include.

Based on this issue paper, WCI appears to be wavering on the defined threshold for GHG reporting. Otherwise the paper would not have four different threshold options to consider and would not state, as it does under WCI Subcommittee Comments and Recommendation that *"It is possible that a recommendation may emerge that the existing thresholds (10,000 and 25,000 metric tons CO_2e) be used until such time as data demonstrates (in combination with any emission sources not captured in the quantification) that more than 90 percent of emissions are covered"* (emphasis added). From the industrial perspective this level of uncertainty about what will have to be done to meet the requirements creates undue hardship from a budgetary and resource commitment perspective.

Companies do not budget for what might happen but rather for what they know is required. Companies are already operating on their 2010 budgets and by mid- to late-summer 2010 will be initiating their 2011 budget cycles. EPA's Subpart W will likely not be finalized by then which means that compliance

with WCI's requirements will be even more uncertain. This creates a budgetary dilemma that is unacceptable and places companies at a severe disadvantage as they attempt to comply with ill-defined requirements. In the best of economic climates, companies do not add staff and pad their budgets for what might happen. To require that they plan for uncertainty, as this issue paper advocates, in the current economic climate is completely unreasonable.

The concept of a screening approach to determine whether or not an "entity" is subject to the GHG requirements is another portion of this issue paper that is very troubling to the oil and gas industry. EPA's GHG Reporting Rule at 40 CFR Part 98 is prescriptive about how GHG emissions must be calculated. However, not all of Part 98 is final; specifically as noted, Subpart W is yet to be finalized. New Mexico Environment Department's Notification – NMED's 2010 Greenhouse Gas Reporting Requirements Guidance is also prescriptive but, in some cases, requires or allows calculation methodologies that are different from those required by Part 98. The oil and gas industry has been developing emission inventories for many years and the calculation methodologies are well defined. GHG reporting is another form of emission inventory and the emission calculation methodologies are either in place or soon will be at the state and Federal levels. However, with this issue paper WCI is now proposing a third set of calculations that is likely different in some or all respects from either Part 98 and/or NMED's Guidance. In essence, the amount of effort that must be expended to calculate GHG emissions is potentially three times that required for criteria pollutant emission inventories that are required for SIP compliance. It seems counterproductive and an over commitment of resources that are already stretched thin to require this level of effort to calculate emissions of pollutants that may not even be regulated pollutants.

Another problem with a prescriptive screening program is the potential disparity between the screening calculation methodologies and those necessary for required quantification. The WCI issue paper does speak to the conservative nature of any suggested screening approaches. However, unless WCI has conducted some type of comparative analysis to determine that there are no significant differences, whether conservative or not, between the proposed screening approaches and actual required calculation methodologies, any additional calculations aren't reasonable or practical until they are vetted for consistency with those that are already required.

Under the "Possible Quantification Methodology" section of this issue paper, Item v. reads as follows:

> *"To provide sufficient information to understand distribution of emission sources, to determine potential facility splitting and to determine whether equitable coverage is occurring, provide at a minimum disaggregated reporting for each individual facility within the aggregated 'Oil and Gas Reporting Entity'. Determination of reporting and verification thresholds would be from the aggregated 'Oil and Gas Facility' total, including the facilities reported individually."*

Once again there is inconsistency between what this issue paper is trying to convey and what this statement says. On one hand the paper is promoting aggregation of operations to calculate aggregated GHG emissions. On the other hand, as in this example, the paper is promoting the calculation of GHG emissions at each "individual facility". If aggregation of operations is going to be required, calculation of aggregate emissions should be allowed. There is no need to calculate emissions at each "individual facility". However, the Air Emission Inventory Reporting (AEIR) tool developed by NMED requires calculating and reporting of GHG emissions on an individual piece of equipment basis. These examples

clearly illustrate the mass confusion that exists between WCI, NMED, and the regulated community about how and at what level GHG emissions must be calculated and reported. Once again, for all the reasons previously stated, this level of uncertainty is unreasonable and places the oil and gas industry at a disadvantage.

In addition to the above concerns, there are those that are somewhat unique to the midstream segment of the oil and gas industry. The information that follows attempts to explain how the midstream segment functions from a processing and contractual perspective and how the proposed re-definition of facility and aggregation procedures are completely inconsistent with the manner in which midstream companies typically operate and do business.

Many midstream companies do not own or operate any oil or natural gas leases, production wells or production lease sites. Their operations are separate from oil and natural gas production because they occur on property that is geographically separate from production lease sites. Their operations, and those of their producer customers, are solely and exclusively owned and controlled by each, respectively, such that neither has the power to direct or cause the direction of the management or policies of the other's operations whether through contract, ownership of voting shares, or otherwise. In most cases the wellhead meter demarcates the line that separates production operations that occur upstream of the meter on the production leasehold from those that occur downstream of the meter after the gas enters a gas gathering system for processing by a midstream company.

Prior to flowing gas to a wellhead meter for gathering by a natural gas processor (see ***Attachment A***), producers will remove oil, condensate, water and other contaminants from the produced gas. Therefore the majority of the oil and gas production lease sites provide at least some level of mechanical separation of the basic gas and liquids produced from wells on the lease. The separation typically occurs naturally by gravity in closed storage tanks, or can be accelerated by employing a heater treater, vertical separator or horizontal separator. While these activities involve emissions to the air, they all occur prior to entering the gathering system "upstream" of the wellhead meter on property that is physically separate from that on which the processing plant is located and prior to coming under the control of the gas processor.

Gas processing holds the pivotal position between the exploration and production segment of the industry located on the production leasehold and downstream end users, including utilities, interstate pipelines, fuel distribution businesses, the petrochemical industry and residential users. Natural gas processing plants operate to extract the heavier hydrocarbon molecules such as ethane, propane, butane and natural gasoline into constituent liquid products ("NGLs"). Natural gas processing plant economics are driven by the market risk of the gas-to-liquid (NGL) volumes and gas-to-liquid (NGL) price spread or, more simply stated the volume and relative market price for a liquid Btu versus a gas Btu.

Even though liquid prices historically have been higher than gas prices, there have been periods of "price inversion," when gas prices exceed liquid prices on a Btu basis. This is why the so-called percent-of-proceeds or "POP" processing fee arrangement between gas producers and gas processors is the most popular because this type of fee arrangement allows the parties to share the market-price risk. In a "keep-whole" processing fee arrangement the gas processor assumes all of the market-price risk, while in a "fixed fee" arrangement all market-price risk is assumed by the producer.

Accordingly, any given natural gas processing plant will have a variety of processing fee structures that will reflect the varying commercial goals and interests of each individual producer and the gas processor, all of which the gas processor must ideally manage to hedge its exposure to the price-risks inherent in commercial petroleum hydrocarbon commodity markets. These economic considerations not only dominate the arms-length contract negotiations between producers and processors, they create the conditions that commercially segregate the operational prerogatives of gas processors in the midstream segment of the industry from upstream production operations that occur on the leasehold.

There are two basic types of commercial contracts used by natural gas processors and natural gas producers. The first provides for the sale and passing of title to the natural gas by a producer to a processor at the wellhead meter on the leasehold to the processor's gathering lines prior to the gas entering or being processed at a gas processing plant. Under this sales arrangement the gas processor acquires title to the natural gas and all of its constituents, including an unconditional right to process the gas and extract and sell all of the NGLs. The second type of processing contract is one in which the gas processor takes custody of but not title to a producer's gas, processes it in the gas processing plant, and redelivers to the producer both the NGLs extracted and the residue gas at the tailgate of the processing plant.

Fee structures that apply to contracts under which the gas processor takes title to the gas can be based on percent of proceeds ("POP") or percent of market index. A POP fee arrangement is one in which the producer receives a wellhead price based on a percent of the proceeds received by the processor at the tailgate of the processing plant. The percent of index fee arrangement is based on the downstream spot market index price for the mainline that the natural gas processing plant is tied into, with some percent retained by the plant for its cost of operation and profit.

Contracts in which custody of but not title to the gas passes to the processor typically include "keep-whole" or "fixed fee" payment arrangements. In a "keep-whole" deal, the processor will charge the producer a gathering fee plus fuel costs and promise to return to the producer at the plant tailgate all of the gas Btu's delivered at the wellhead. Because of the "shrink" in gas from processing (the gas stream "shrinks" as gas molecules liquefy and as some gas is consumed as plant fuel), the processor has to acquire sufficient "make-up" gas to make up the lost energy content or Btu's (the make-up is accounted for on an equivalent Btu basis - not a volume basis). Depending on the contract, the producer may be "kept whole" in kind or in cash equivalent to a tailgate gas sale. In a fixed fee arrangement the producer is granted a right to have its gas processed for liquids and to thereby enjoy the upside and downside risk of prevailing and/or forecast liquid prices. The processor's fee or toll for processing is generally expressed as a flat fee of cents per mcf or MMBtu. This arrangement represents the least amount of risk for the processing plant. Under a fixed fee arrangement, all the risk of the gas-to-liquid price spread is on the producer.

There are only two very limited circumstances when a gas processor might exert some degree of control over the producer on the production lease site. Most natural gas processing contracts grant the processor the right to unilaterally suspend the processing of a producer's natural gas if the processing becomes uneconomic or there is a *force majeure*. "Unprofitability" contract provisions typically contain the following features: (1) a precise definition of what constitutes "unprofitability"; (2) a minimum notice period; (3) a requirement that gas be released back to the producer during the period the processor is refusing to process the gas for economic reasons; and (4) a requirement for permanent

release of the gas if processor does not resume processing within a reasonable period of time. *Force majeure* provisions in gas processing contracts apply to events or acts that are not reasonably within the control of the party that is claiming the *force majeure*. In addition to natural disasters, accidents, labor unrest, and war, a *force majeure* can also include compliance with any present or future law, statute or regulation. Unprofitability and *force majeure* are the only instances under which a processor may take an action that could possibly affect emitting activities upstream of a wellhead meter. It is the experience of the midstream industry that the exercise of either such provision will generally cause the shut in of the producing operations and a related cessation of emitting activities upstream of the wellhead meter on the production leasehold and a concurrent reduction in the volume of gas being gathered and processed downstream of the meter (i.e. reduced emissions from each segment).

In summary, the proposed redefinition of "facility" and corresponding aggregation policy are very problematic for the oil and gas industry, potentially conflict with state and Federal law, do conflict with other GHG programs to which facilities in New Mexico are already subject, and are far too broad to apply across an industry as diverse as the oil and gas industry. The drastic changes that the issue paper proposes put us at a significant disadvantage over other industries in the state. It seems counterproductive to the State of New Mexico and the oil and gas industry that operates within its boundaries that WCI should have the opportunity to exert such broad and unreasonable influence.

If you have any questions, please feel free to contact me.

Sincerely;

Deborah Seligman
Interim President

7/14/10 Colorado Response to EPA Order

BEFORE THE ADMINISTRATOR
UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

IN THE MATTER OF
Kerr-McGee/Anadarko Petroleum Corporation,
Frederick Compressor Station

Permit Number: 95OPWE035
Issued by the Colorado Department of Public Health and Environment
Air Pollution Control Division

Petition Number: VIII-2008-02
Filed by WildEarth Guardians

RESPONSE OF COLORADO DEPARTMENT OF PUBLIC HEALTH AND ENVIRONMENT, AIR POLLUTION CONTROL DIVISION, TO ORDER GRANTING PETITION FOR OBJECTION TO PERMIT

I. INTRODUCTION

On October 8, 2009, EPA Administrator Jackson issued an Order responding to Petition VIII-2008-0002 filed by Rocky Mountain Clean Air Action (now "WildEarth Guardians") on August 14, 2008. *See* Attachment 1. WildEarth Guardians objected to the Colorado Department of Public Health and Environment ("CDPHE"), Air Pollution Control Division's ("Division") issuance of Title V Renewal Operating Permit No. 95OPWE035 to Kerr-McGee Gathering, LLC ("Kerr-McGee Gathering") for its Frederick Compressor Station ("Frederick Station"). The Frederick Station is located in the Wattenberg natural gas field ("Wattenberg Field"), northeast of the Denver, Colorado metropolitan area.

WildEarth Guardians' 2008 petition was its second petition under subsection 505(b)(2) of the Clean Air Act ("CAA"), 42 U.S.C. § 7661d(b)(2), relating to the Frederick Station Title V renewal permit. In its first petition, WildEarth Guardians alleged that the Division had failed to assure compliance with applicable Prevention of Significant Deterioration ("PSD") requirements of Title I of the Act and applicable Colorado PSD regulations for the Frederick Station. WildEarth Guardians argued that the Division had "failed to aggregate emissions from all adjacent and interrelated pollutant emitting activities, namely the natural gas wells that supply natural gas to the Frederick Station."[1]

[1] "Petition for Objection to Issuance of Operating Permit for Kerr-McGee Frederick Compressor Station," January 3, 2007, Petition No. R8-06-002-0216-OPRA-AR ("WEG Petition for Objection"), p. 6.

Administrative Record NSR 10833_011578

In a February 7, 2008 Order, former EPA Administrator Johnson granted the objection. EPA's Order stated that the Division had "failed to adequately respond to [WildEarth Guardians] initial comments, which raised the PSD and title V source definition issues and the compliance schedule issue" and that the Division had not obtained the necessary information "to evaluate the PSD and title V source definition issue."

The Division responded to EPA's Order on April 29, 2008 by issuing an addendum to the January 1, 2007 Technical Review Document in support of the Title V renewal permit. In that response, the Division concluded that no other sources met all three elements of the three-part test because they were not contiguous or adjacent to the Frederick Station.2 Therefore, the Division concluded that no other sources would be aggregated with the Frederick Station.

On August 14, 2008, WildEarth Guardians filed another objection with EPA, alleging that the Division had still not adequately responded to its argument regarding aggregation. In the October 8, 2009 Order that resulted, Administrator Jackson stated that:

> … I grant the Petitioner's request for an objection to the permit on the issue of CDHPE's failure to provide an adequate basis in the permit record for its determination of the source for PSD and title V purposes. CDPHE must supplement the permit record and, as necessary, make appropriate changes to the permit. In responding to this Order, I recommend that CDPHE conduct a source determination analysis based on the three regulatory criteria discussed above.
>
> In order to do a thorough analysis, I recommend that CDPHE evaluate Kerr-McGee's complete system map showing all emission sources owned or operated by the Company in the Wattenberg gas field (located primarily in Weld County, Colorado) and determine whether the various pollution emitting activities are contiguous or adjacent to, and under common control with, the Frederick Compressor Station. . . . I also recommend that CDPHE obtain from Kerr-McGee/Anadarko a flow diagram showing the movement of gas from the well sites to the various facilities in the Wattenberg field operated by both Kerr-McGee/Anadarko and other companies in the field, so that CDPHE may determine the nature of the sources' emissions and determine whether or not the process units associated with those emission sources are interdependent on the operation of the Frederick Compressor Station. Finally, I recommend that CDPHE obtain from Kerr-McGee/Anadarko business information regarding the nature of control of the Frederick Station and nearby wells between the Company and other companies in the field to determine whether various

2 *See* Attachment 2.

> pollution emitting activities should be considered under common control for purposes of making the source determination.
>
> * * * *
>
> As stated above, CDPHE failed to adequately support its determination of the source for PSD and title V purposes. As such, I grant the Petitioner's claim and I order that CDPHE establish a more thorough permit record as Ordered in Section I. above, and make any appropriate changes to the permit. In doing so, I am not concluding that the source determination for the Frederick Compressor Station should include any additional pollutant emitting activities nor that the existing title V permit is necessarily in violation of any PSD or title V requirements, only that the present permit record does not supply the public with sufficient information to understand why, or why not, additional sources of emissions should or should not be included in the source determination for the Frederick Compressor Station.

Attachment 1 at pp. 8-9.

Consistent with EPA's Order, the Division is supplementing the permit record through this response, comprising an Addendum to the Technical Review Document for the state-issued operating permit. As recommended by EPA, the Division has utilized the three regulatory criteria to determine whether to aggregate other emission sources with the Frederick Station; specifically, sources such as storage tanks and dehydrators associated with exploration and production wells. As further recommended by EPA to develop the record to respond to the Administrator's Order, the Division has formally requested and obtained more information from Kerr-McGee Gathering, including a complete system map of its production and midstream natural gas emission sources, and a flow diagram indicating the movement of gas from Kerr-McGee Oil & Gas Onshore, LP's ("KMOGO") wells owned and operated by KMOGO to various Kerr-McGee Gathering compressor stations, and to other companies operating in the Wattenberg field. [3] The Division also obtained from KMOGO copies of typical oil and gas exploration and production leases and midstream contracts. Moreover, the Division also evaluated information from several other gas production and midstream companies operating in the Wattenberg field. This documentation, acquired to develop the record in this instance to

---

3 EPA's Order refers to "Kerr-McGee/Anadarko Gathering, LLC." The permittee for the Frederick Station is Kerr-McGee Gathering, LLC. Kerr-McGee Gathering, LLC is a wholly-owned subsidiary of Anadarko Petroleum Company, as is KMOGO. Therefore, this Addendum refers to "Kerr-McGee Gathering" as the entity from whom the Division obtained information in connection with the Frederick Station permit. However as described below, for the purposes of this response and discussion, the Division considers Kerr-McGee Gathering, LLC; KMOGO (which operates certain oil and gas wells and associated emission sources in the Wattenberg Field, such as storage tanks and dehydrators), and Anadarko Petroleum Corporation to be under the control of the same entity, or entities under common control.

respond to the Administrator's Order, includes information regarding ownership of exploration and production leases, operation of gas wells and compressor stations, and relevant provisions of midstream contracts.

The Division's actions in connection with this response reflect an extraordinary amount of effort. Not surprisingly, the Division's analysis reveals the highly complex and unique nature of oil and gas production operations. This is particularly true in mature, large gas plays such as the Wattenberg Field. Oil and gas fields often comprise a labyrinth of gas flows, ownership and operational interests and other components that are in a constant state of flux. Such large, complex and dynamic processes generally do not fit consistently within the common sense notion of a plant. The Division does not anticipate that the level of analysis accompanying this response to the Administrator's Order is necessarily warranted or appropriate in other oil and gas source determinations.

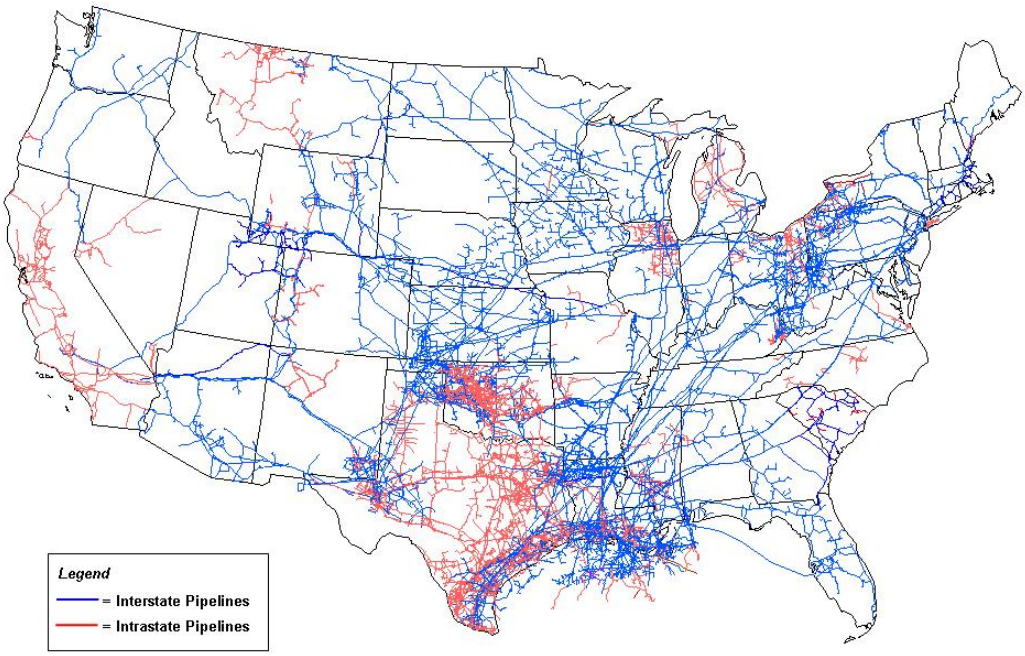
This Addendum provides a specific and complete response to Petitioner's comments, as directed by EPA. As reflected in the following discussion, the Frederick Station renewal permit conclusions reached by the Division in the final permit were correct. As such, the Division has determined that no changes to the permit are warranted.

II. UNIQUE COMPLEXITIES OF OIL AND GAS OPERATIONS

In responding to EPA's Order on the Frederick Station Title V permit, it is first useful to consider the unique nature of oil and gas operations and how the characteristics of these operations affect how a stationary source or plant within this industry could be defined. It is also helpful to better understand how emission sources in the oil and gas industry operate and why and where they are located with respect to each other, and how these factors can differ from those associated with emission sources in other regulated industrial sectors, such as power generation and manufacturing.

In support of this objective, as explained above, the Division requested additional information from Kerr-McGee Gathering regarding its operations at the Frederick Station and within the Wattenberg Field. The Division also collected and reviewed information from publicly-available sources and from other oil and gas companies to gain a broader sense of how oil and gas operations are conducted in Colorado.

According to the U.S. Energy Information Administration (EIA), in 2008, just over 41,000 oil and gas wells in Colorado produced approximately 1.4 trillion cubic feet of natural gas and 25 million barrels of oil.[4] These production activities encompass a



[4] http://www.eia.doe.gov/oil_gas/natural_gas/info_glance/natural_gas.html. The following general observations come from this on-line source as well as the information the Division has gathered over a number of years from oil and gas sources in the Wattenberg Field, and more recently from Kerr-McGee Gathering and three other oil and gas production and midstream companies operating in the Wattenberg Field.

substantial area in Colorado, including the San Juan Basin in the southwest portion of the state, the Piceance Basin in the western part of the state along the Interstate-70 corridor, and the Denver-Julesburg Basin in northeast Colorado.

In essence and by definition, the entire natural gas production, gathering, processing and transportation system is connected via a network of pipes. This network of pipes extends from the wells where the gas is initially recovered to the ultimate end-users, i.e., the residential, commercial and industrial customers. Because natural gas would quickly disperse in to the atmosphere if not contained at all times in the process, it must constantly be held through a series of pipes, equipment and storage vessels.

As described by the EIA, the U.S. natural gas pipeline network is a highly integrated transmission and distribution grid that can transport natural gas to and from nearly any location in the lower 48 states. The natural gas pipeline grid is comprised of more than 210 natural gas pipeline systems and 305,000 miles of interstate and intrastate transmission pipelines (this total does not include field production and gathering lines). A map of this network is provided below:

U.S. Natural Gas Pipeline Network, 2009

Source: Energy Information Administration, Office of Oil & Gas, Natural Gas Division, Gas Transportation Information System

The simple fact that a pipe connects two physically separate oil and gas facilities or emission units does not, by itself, imply that these two facilities or units should be considered to be a part of the same emission source. While the interconnection of two facilities through a dedicated physical conveyance such as a railroad spur, channel or pipeline historically has been a part of EPA's determinations in some cases to consider two facilities to be part of the same emission source for air quality permitting purposes, it

is not a primary or sole determining factor, especially considering the complex nature of the oil and gas industry. While a physically dedicated connection between two facilities (such as a pipeline) could be an overwhelming factor in a source determination in a different industry, in part because of its uniqueness within that particular industry,[5] it is not a distinguishing feature in the natural gas production and gathering sector of the oil and gas industry.

Ultimately, the facilities within the natural gas production and delivery system, from a single well in the field to a residential customer's house, are all connected in some way via a set of pipelines. It is inherent to this type of operation, and does not, by itself, establish an unusual circumstance or compelling factor regarding the interdependency of two facilities. For the natural gas production and delivery system, it is not primarily a business decision but rather the nature of the industry; i.e., wells are drilled where the gas resource is found and the support systems like the gas processing and compressor systems are constructed based on gas delivery needs.

Similarly, the locations of natural gas wells and surface facilities are determined by a variety of factors. Many of the factors are not specifically controlled or dictated by the oil and gas production companies that drill and develop the wells and then move and process the gas. Beyond the obvious need to locate gas wells in an area where natural gas reserves are present, the spacing requirements for gas wells are established and regulated by a number of different entities in Colorado, including the Colorado Oil and Gas Conservation Commission on private and state-owned lands, Federal agencies such as the Bureau of Land Management on Federal lands, and Tribal authorities on Tribal lands.

Oil and gas production companies must also negotiate surface use agreements, pipeline agreements and rights-of-way with surface right owners in the areas where wells are being drilled and developed. These agreements, which often focus on minimizing the surface footprint and impact of the oil and gas operations, dictate the locations of surface facilities, minimum offsets from adjoining boundaries and the number of well pads allowed. Geological, topographical and engineering considerations, along with logistical factors such as access restrictions and the availability of power, also drive siting decisions.

The decisions on where to locate natural gas gathering facilities, such as compressor stations, are subject to the same type of criteria. The movement of gas within the gathering system is accomplished by creating pressure differentials in the system in

---

[5] *See, e.g.*, EPA's source aggregation determinations for dedicated conveyances between two plants or stations in General Motors (railroad dedicated solely to two GM plants, ESCO (plants for metal cast casings shipped several blocks to plant applying coatings to those casings), Great Salt Lake Minerals Plant (brine pump station supporting plant connected by pipe), American Soda Commercial Mine (processing facility connected by slurry pipeline connection), and Anheuser-Busch brewery production facility (landfarm for wastewater disposal connected by pipeline). These cases are discussed more fully in Section III.C below.

accordance with the principles of physics to enable gas to flow through a pipe from areas of higher pressure to areas of lower pressure. In addition to the natural pressure of the gas in the reservoir and the well, compression of the gas must occur along the transportation path to help overcome pressure loss and facilitate the continued movement of the gas. From an engineering perspective, the spacing (i.e., location) of compressor stations and their associated level of compression capability must provide sufficient pressure boost on both the suction and discharge sides of the stations to keep the natural gas flowing along the desired paths.

Between well spacing requirements and surface use and engineering considerations, the specific places where oil and gas facilities are ultimately located are often not primarily at the discretion of the oil and gas companies. It does not appear to the Division that the locations of oil and gas exploration, production and gathering sites are typically chosen for the purpose of avoiding air quality requirements, or to define an emission source in one manner versus another. The siting considerations in the oil and gas industry are unique and inherent to the industry and do not necessarily establish a conclusion on the relationship between two facilities that might apply in a different industrial sector. These considerations must be evaluated within this context as a part of any source aggregation determination made for facilities in the oil and gas industry.

In addition to the unique set of factors that influence where oil and gas facilities are located, the business relationships between parties involved in oil and gas operations are highly complex and quite specific to this industry. The ownership structure of the oil and gas resources themselves (i.e., the mineral rights) can take many forms, and for even just one well, can involve the interaction of multiple royalty owners, changes in ownership between geological formations, various working interests in the well, and joint operating agreements ("JOAs") among owners and lessees that dictate the terms and conditions under which the mineral resources will be developed. In some cases, the owner(s) of the mineral rights may extract the resources themselves, and in other cases, a separate party may do so under a lease/royalty arrangement.

JOAs govern how the production activities are conducted for a well, but do not address how the gas produced is gathered and moved through the natural gas delivery system. Separate contracts in the form of gas gathering agreements between exploration and production and gas gathering companies specify how and under what terms and conditions gathering services will be provided. Based on information received from a number of different oil and gas companies, the Division has concluded that gas gathering companies do not typically dictate or control the production operations at natural gas wells. From a business standpoint, there appears to be a very clear demarcation between oil and gas production and gas gathering functions.

In many oil and gas production areas, the surface rights are severed from the mineral rights, meaning that one party owns the surface property and another (or several others) owns the minerals located below the surface. In these cases, agreements must be reached between the surface land owners and the oil and gas exploration and production companies, in order to provide the necessary access and surface facilities to drill wells

and produce oil and gas. The distinctions between mineral and surface ownership further add to the complexity of assessing oil and gas sources.

Ownership structure also tends to change as oil and gas fields are developed and mature. In some cases, exploration and production companies must initially install their own infrastructure to gather gas in newly developed areas, because of the uncertainty related to the amount of gas that will recovered in that area. Once sufficient, economically viable reserves are identified in an area, the gas gathering companies generally become more willing to make the necessary investments to build their own gathering systems and/or to acquire the gathering systems built by the original exploration and production companies. As gas fields mature over time, ownership in both the production and gathering operations tend to frequently change. The complicated and changing business relationships and ownership structures differentiate the oil and gas industry from other industries, and should also be an important and highly relevant consideration in any case-by-case source determination that is made.

Given the above-described complexities, changing conditions, and variables in the oil and gas sector related to its infrastructure and commercial framework, to not recognize these factors when making source determinations for this sector would inherently lead to the type of detailed, cumbersome and fine-grained analyses that are not practicable for the volume of permits managed by the Division. Moreover, EPA has expressly determined in the 1980 Preamble to its prevention of significant deterioration regulations that state air quality permitting agencies and EPA itself should avoid these types of detailed, complex, and fine-grained analyses when making source determinations.6 Further, to require such a detailed and complex aggregation analysis on every oil and gas permitting decision would require permit engineers to analyze every possible natural gas flow permutation potentially connected to the source being permitted as well as to other ancillary operating equipment, no matter how tangential and contingent that pipeline connection might be, while simultaneously requiring that attorneys working with the permitting representatives similarly analyze commercial, royalty and gathering contracts to determine how natural gas is owned and controlled. This would be significantly subjective, and is in any event not practicable.

III. THE THREE-PART TEST FOR SOURCE DETERMINATIONS

A. The Federal Regulatory Scheme

The Clean Air Act ("CAA") Amendments Act of 1990 amended the CAA, 42 U.S.C. 7401 *et seq.*, by enacting Title V. Title V requires facilities that are "major sources" of pollutants to obtain operating permits from state-run permitting programs that have been approved by EPA. All major sources that emit certain thresholds of federally regulated pollutants must apply for and obtain a Title V operating permit, which consolidates all pollutant emitting activities into the permit. 42 U.S.C. §§ 7661-7661f.

---

6 *See* discussion below in Section III.A.

Such permits must include, among other things, enforceable emission limitations and standards, monitoring data that is submitted to the state permitting authority, a schedule of compliance, and other conditions to ensure compliance with applicable requirements of the CAA. 42. U.S.C. § 7661a, c(a). Title V regulations define "major source" as a "stationary source (or any group of stationary sources that are located on one or more contiguous or adjacent properties, and are under common control of the same person (or persons under common control)) belonging to a single major industrial grouping. . . ." 40 C.F.R. § 70.2.

Earlier, in the 1977 amendments to the CAA, Congress enacted the PSD statutory scheme in Title I, Part C of the CAA, 42 U.S.C. §§ 7470-7492. The PSD program requires that State Implementation Plans ("SIPs") contain emission limitations to prevent significant deterioration of air quality in attainment and unclassifiable areas. 42 U.S.C. § 7471. PSD requirements apply to the construction of major stationary sources and/or major modifications of major stationary sources of air pollution in areas designated as attainment. *See* 42 U.S.C. § 7475; 40 C.F.R. § 51.166(a)(7).

The aggregation issue is dependent upon a determination of what facilities, structures, or installations constitute a "source." Facilities and equipment that are properly construed as part of a single source should have their emissions aggregated or combined to determine whether the source is a major source of air pollution for either or both Title V and nonattainment New Source Review (NSR)/PSD purposes. EPA defines "stationary source" for PSD purposes as any "building, structure, facility, or installation which emits or may emit a regulated NSR pollutant." *See* 40 C.F.R. § 52.21 (b)(5); *see also* 40 C.F.R. §§ 51.165, 70.2, 71.2 (stationary source definition in nonattainment NSR and Title V regulations).7

In *Alabama Power Company v. Costle*, 636 F. 2d 323 (D.C. Cir. 1980), the Court rejected EPA's initial, broad application of the term "source" in the PSD regulations. The Court then directed EPA as follows:

> EPA cannot treat contiguous and commonly owned units as a single source unless they fit within the four permissible statutory terms. To allow an entire plant or other appropriate grouping of industrial activity to be subject as a single unit to PSD, as Congress clearly intended, EPA should devise regulatory definitions of the terms "structure," "building," "facility," and "installation" to provide for the aggregation, where appropriate, of industrial activities according to considerations such as proximity and ownership.

---

7 Because the definitions of "source" for PSD and Title V are essentially the same in EPA regulations, this memorandum will treat EPA and state determinations of "source" in either context as applying to the other. *See* discussion of EPA's practice of using the same aggregation analysis for both the Title V and PSD programs in *MacClarence v. EPA*, 396 F.3d 1123, 1126-27 (9th Cir. 2010).

* * * * * * *

> EPA's new definitions should also provide explicit notice as to whether (and on what statutory authority) EPA construes the term source, as divided into its constituent units, to include . . . "long-line" operations such as pipelines, railroads, and transmission lines. We agree with industry that EPA has not yet given adequate notice as to whether it considers those industrial activities to be subject to PSD.

636 F.2d at 397.

In response to the *Alabama Power* Court's directive, EPA promulgated a revised definition of source for PSD purposes. In the Preamble to its 1980 PSD regulations ("1980 Preamble"), EPA described what the phrase "building, structure, facility, or installation" means in the PSD context:

> The court [in *Alabama Power*, 636 F.2d at 397] added that that "a plant is to be viewed as a source" and that the Agency "should" provide for the aggregation of pollutant-emitting activities "according to considerations such as proximity and ownership." But it warned that "EPA cannot treat contiguous and commonly owned units as a single source unless they fit within the four permissible statutory terms."
>
> In EPA's view, the December opinion of the court in *Alabama Power* sets the following boundaries on the definition for PSD purposes of the component terms of "source:" (1) it must carry out reasonably the purposes of the PSD; (2) it must approximate a common sense notion of "plant;" (3) it must avoid aggregating pollutant-emitting activities that as a group would not fit within the ordinary meaning of "building," "structure," "facility," or "installation."
>
> * * * * * * * *
>
> EPA has stated in the past and now confirms that it does not intend "source" to encompass activities that would be many miles apart along a long-line operation. For instance, EPA would not treat all of the pumping stations along a multistate pipeline as one "source."
>
> * * * * * * * *
>
> One commenter asked, however, if EPA would treat a surface coal mine and an electrical generator separated by 20 miles and linked by a railroad as one "source," if the mine, the generator, and the

Administrative Record NSR 10833_011587

> railroad were all under common control. EPA confirms that it would not.

45 Fed. Reg. at 52694-95 (August 9, 1980).

In the PSD regulations promulgated with the 1980 Preamble, EPA established the following three-part test to determine what buildings, structures, facilities and installations should be considered a single source. This three-part test is currently codified at 40 C.F.R. § 52.21(b)(6):

> [A]ll of the pollutant-emitting activities which belong to the same industrial grouping, are located on one or more contiguous or adjacent properties, and are under the common control of the same person (or persons under common control). . . . Pollutant-emitting activities shall be considered as part of the same industrial grouping if they belong to the same "Major Group" (i.e., which have the same first two digit code) as described in the *Standard Industrial Classification Manual, 1972,* as amended by the 1977 Supplement (U.S. Government Printing Office stock numbers 4101-0066 and 003-005-00176-0, respectively).

However, notwithstanding the Court's directive, other than the general statements in the 1980 Preamble and the two specific examples quoted above, EPA did not provide guidance on, or define whether, when, or to what extent, long line operations such as "pipelines, railroads, and transmission lines" would be considered a "source" for PSD purposes.

On January 12, 2007, EPA Acting Assistant Administrator Wehrum issued a memorandum titled "Source Determinations for Oil and Gas Industries" ("Wehrum Memorandum"). The Wehrum Memorandum provided guidance to EPA regional offices and states when making aggregation determinations with respect to the oil and gas sector, and included a discussion on the role of proximity in assessing whether sources should be considered contiguous or adjacent.[8] On September 22, 2009, EPA Assistant Administrator McCarthy withdrew the Wehrum Memorandum and gave the following guidance to states:

> Permitting authorities should therefore rely foremost on the three regulatory criteria for identifying emissions activities that belong to the same "building," "structure," "facility," or "installation." These are (1) whether the activities are under the control of the same person (or person under common control); (2) whether the activities are located on one or more contiguous or adjacent properties; and (3) whether the activities belong to the same industrial grouping. 40 C.F.R. 52.21(b)(6). In applying

---

[8] The Division partially relied on the Wehrum Memorandum in its earlier Title V aggregation analyses for the Frederick Station.

> these criteria, permitting authorities should also remain mindful of the explanation we provided in the 1980 Preamble. See 45 FR 52676, 52694-95 (August 7, 1980).
>
> I agree with the previous memorandum's conclusion that whether or not a permitting authority should aggregate two or more pollutant-emitting activities into a single major stationary source for purposes of NSR and Title V remains a case-by-case decision in which permitting authorities retain the discretion to consider the factors relevant to the specific circumstances of the permitted activities. After conducting the necessary analysis, it may be that, in some cases, "proximity" may serve as the overwhelming factor in a permitting authority's source determination decision. However, such a conclusion can only be justified through reasoned decision making after examining whether other factors are relevant to the analysis.

Memo from Gina McCarthy, Assistant Administrator, to Regional Administrators, "Withdrawal of Source Determinations for Oil and Gas Industries" (September 22, 2009) (hereafter "McCarthy Memo"). Attachment 3.

EPA has not specifically defined in regulation the terms "proximity" or "ownership." Instead, as noted in the McCarthy Memo, EPA has left such determinations to the discretion of its regional offices and state authorities. Nor has EPA ever defined either "proximity" or "long line operations" for PSD or Title V source determinations in its regulations implementing these programs. The Division is also mindful of the statements in the McCarthy Memo that, in applying the definition of "source" in the oil and gas exploration, production, and delivery context, EPA will give the Division discretion to make such source determinations on a case-by case basis.

B. The Colorado Regulatory Scheme

EPA has delegated full permitting and enforcement authority for implementation of the CAA to the Colorado Department of Public Health and Environment, Air Quality Control Commission ("AQCC"). Colorado is a SIP-approved state for both PSD and Title V permitting, not just a delegated state. *See* 40 C.F.R. § 53.230, Subpart G.

The Colorado Air Pollution Prevention and Control Act ("Act"), in the establishment of the Title V program, incorporates EPA's definition of "Major Source" in § 25-7-114(3), C.R.S. The AQCC restates this definition in Regulation 3, Part A, Section I.B.23, defining "Major Source," in relevant part, as:

> Any stationary source or group of sources belonging to the same industrial grouping (see Section 1.B.41 of this Part A), that are located on one or more contiguous or adjacent properties and are under common control of the same person (or persons under common control) that:

Administrative Record NSR 10833_011589

* * * * * * * * * *

> Directly emits, or has the potential to emit, one hundred tons per year or more of any air pollutant.

AQCC Regulation No. 3, Part D (5 CCR 1001-5), establishes a PSD air quality program in attainment areas in Colorado. The AQCC definitions of "stationary source" and "major source" parallel EPA's definition of these terms in the PSD and Title V regulations, respectively. The AQCC's definition of a "stationary source," in relevant part, is:

> Any building, structure, facility, or installation, or any combination thereof belonging to the same industrial grouping that emits or may emit any air pollutant subject to regulation under the Federal Act, that is located on one or more contiguous or adjacent properties and that is owned or operated by the same person or by persons under common control. . . . . Building, structures, facilities, equipment, and installations shall be considered to belong to the same industrial grouping if they belong to the same major groups (i.e., have the same two-digit codes).

5 C.C.R. 1001-5, Regulation 3, Part A, § I.B.41.

Under the three-part test established in federal and Colorado regulations, to be considered a single stationary source in Colorado, the pollutant-emitting activities in question must be:

1. in the same industrial grouping as described by their two-digit SIC code;
2. located on one or more contiguous or adjacent properties; and
3. under the control of the same person (or persons under common control).

All three of these conditions must be met in order for sources/emission units to be considered to be a part of the same stationary source for PSD and Title V purposes under both EPA and AQCC regulations. *Compare* 40 C.F.R. §§ 52.21(b)(6) *with* AQCC Regulation 5 C.C.R. 1001-5, Regulation 3, Part A, § I.B.41(definition of stationary source for PSD determinations) and 40 C.F.R. §§ 70.2, 71.2 *with* § 25-7-114(3), C.R.S., and 5 C.C.R. 1001-5, Regulation No. 3, Part A, § I.B.23 (definitions of major source for Title V purposes). Correspondingly, if any one of the three conditions of the test is not met, the sources/emission units are, by definition, not part of the same stationary source.

The McCarthy Memo reiterates the importance of the three-part test. The McCarthy Memo also emphasizes the need to review the three regulatory criteria in 40 C.F.R. § 52.21(b)(6), the explanation in the 1980 Preamble adopting those regulatory criteria, and past case-by-case determinations applying these criteria. The Division has carefully and thoroughly considered the three-part test established by EPA and Colorado in their respective PSD and Title V regulations, the 1980 Preamble, past EPA regional

and headquarters case-by-case determinations, guidance from other oil and gas states, and a recent court decision, *MacClarence v. Environmental Protection Agency*, 596 F.3d 1123 (9th Cir. 2010), in reaching its aggregation determination in this case.

In addition, the Division has applied the guidelines established in the 1980 Preamble that, to be considered a source for aggregation purposes in the PSD and Title V context, the source must (1) further the purposes of the PSD program, (2) meet a common sense idea of plant, and (3) not include pollutant activities that do not come within an ordinary concept of what constitutes a "building, structure, facility or installation." These additional considerations must also be met in order for pollutant-emitting activities to be properly aggregated.

C. The Contiguous or Adjacent Element of the Three-Part Test

As will be discussed below, while the analysis of all three elements of the three-part test are highly fact-specific and conducted on a case-by-case basis, the analysis of the "located on one or more contiguous or adjacent properties" element can be highly challenging, particularly within the context of the oil and gas industry. EPA has considered the "contiguous or adjacent" factor in source determinations across a wide range of industries, and has reached various conclusions based on the case-specific facts.

For example, EPA Regional Offices and Headquarters have determined that pollutant emitting activities as far apart as forty-four miles are contiguous or adjacent for a particular source aggregation determination. Yet, EPA has also determined that pollutant-emitting activities as close as one-quarter of a mile apart, or even physically within the same parcel, are not contiguous or adjacent.9 In some cases, these analyses also considered the concept of contiguous or adjacent within the framework of deciding if one facility supported the primary activity of another facility and assessing if the two activities should both be described by the same two-digit SIC code.

Moreover, the concept of "interdependency," which many individual EPA determinations consider, is not discussed in the 1980 Preamble or mentioned in the federal PSD or Title V regulations defining "source." Rather, it is a concept that has been developed over time by various EPA offices in case-by-case determinations. Therefore,

---

9 *Compare* April 20, 1999 letter from Richard Long, Air and Radiation Program, EPA Region VIII, to Dennis Myers, Colorado Air Pollution Control Division (discussed below in Section III.D.ii.) to August 2, 1996 Memorandum from John Seitz, Director, EPA Office of Air Planning and Standards, "Major Source Determinations for Military Installations under the Air Toxics, New Source Review and Title V Operating Permit Programs of the Clean Air Act (Act)." That memo explains that Department of Defense military installations often have co-located facilities grouped under the major SIC code 97 within the same geographic unit, but that they should only be aggregated by distinct branches of the military, because they are not under "common control." The memo further indicates that they should only be aggregated by "functionally distinct groupings" on a case specific basis, using the "common sense notion of a plant." *Id.* at pp. 2-4.

Administrative Record NSR 10833_011591

while the Division has thoughtfully considered "interdependency" as part of its contiguous or adjacent analysis, given the unique engineering and commercial complexities in the oil and gas production and midstream sector, the Division will not necessarily look to interdependency as a determining factor in this or other similar cases.

The Division also notes that, because EPA has not promulgated a definition of "proximate" in the PSD or Title V regulations, the weight to be given individual EPA office determinations regarding what constitutes proximate, similar to interdependency, is not binding on the Division. Further, because EPA has never directly addressed the specific "adjacency" issue presented by the Frederick Station and the gas produced from wells that can and does flow to the Frederick Station, EPA should allow a reasonable amount of discretion to the Division in making this determination and similar determinations.10

As noted above, the McCarthy Memo concludes that an aggregation determination "remains a case-by-case decision in which permitting authorities retain the discretion to consider the factors relevant to the specific circumstances of the permitted activities."

In evaluating the terms "contiguous" or "adjacent" within EPA's "common sense notion of plant," the Division first considers the plain meaning of the two terms. The online edition of the Merriam-Webster dictionary provides the following definitions:

Contiguous: Being in actual contact; touching along a boundary or at a point.

Adjacent: Not distant; nearby; having a common endpoint or border.

Based on this definition of "contiguous," an oil and gas well that is located on land that is geographically separated from a compressor station site would not be "contiguous" within the plain meaning of that term.

The more difficult assessment is determining whether such a non-contiguous well might be considered "adjacent" to the compressor station. EPA's source aggregation determinations consistently state that assessment of the adjacent nature of activities must be determined on a case-by-case basis. *See* 1980 Preamble, 45 Fed. Reg. at 52695. *See also* 58 Fed. Reg. 42760, 42766-67 (August 11, 1993) (comprising EPA's discussion related to source determinations for hazardous air pollutants). Moreover, EPA has not established a specific distance between activities in assessing whether such activities are adjacent.

---

10 The Division discusses *MacClarence v. EPA* , 596 F.3d 1123 (9th Cir. 2010) below. While there are some factual similarities in this case with the Wattenberg Field and those at issue in Alaska's Prudhoe Bay Unit, there are also significant differences, as further discussed below.

D. EPA Contiguous or Adjacent Determinations

Several of EPA's case-by-case determinations directly address adjacency in the context of oil and gas exploration, production, processing and treatment activities. EPA has made these case-by-case determinations during federal permitting processes and in response to requests by state agencies or regulated entities.[11]

i. Region VIII Gas Production and Midstream Determinations

In July 1999, EPA Region VIII evaluated whether emitting units at compressor stations along a pipeline should be aggregated together as a single source for Title V permitting purposes.[12] Region VIII concluded that, based on the information provided, each compressor station with its associated emitting units comprised an independent single source, but did not require aggregation of the various compressor stations as a single stationary source. *See* letter from Richard Long, Director of the Air and Radiation Program, EPA Region VIII to EnerVest San Juan Operating Co., July 8, 1999.

Region VIII again evaluated the term "adjacent" in December 1999 when determining whether the oil and gas wells, pumps, line heaters, dehydration equipment, combustion equipment and tank batteries within an oil and gas production field should be aggregated together as a single source for Title V permitting purposes. EPA concluded that each individual tank battery with its associated emitting units comprised an independent single source, but did not require aggregation of the various tank batteries located within the oil and gas field as a single stationary source. *See* letter from Richard Long, Director of the Air and Radiation Program, EPA Region VIII to Citation Oil and Gas Corporation, December 9, 1999.

In these two determinations, EPA Region VIII did not aggregate oil and gas production equipment located on different parcels of land within an oil and gas field.

ii. Other EPA Contiguous or Adjacent and Support Facility Determinations

In the context of a gathering system and a gas transmission line owned and operated by the same parent company and on contiguous properties, EPA concluded that they should be aggregated. *See* November 3, 1986 letter from Allen Bell, Director, Air,

---

11 The Division found these aggregation determinations by searching, among other sources, EPA's "Applicability Determination Database," found on EPA's Clean Air Act Compliance Monitoring web pages; EPA Region VII's "Air Program Policy and Guidance Index;" and the NSR and Title V Policy Guidance Databases developed by Region VII, available on Region VII's Air Program web pages.

12 As explained above, the definition of a major source for Title V purposes contains the same regulatory criteria as the definition of stationary source for PSD purposes. Accordingly, EPA's case-by-case determinations with respect to Title V also apply in making aggregation determinations in the PSD context.

Administrative Record NSR 10833_011593

Pesticides and Toxics Division, U.S. EPA, to the Executive Director of the Texas Air Control Board. While EPA briefly addressed the issue of contiguous or adjacent, the focus of this determination was on the relationship between the gathering system and the gas transmission line, and whether the two activities should be grouped under the same two-digit SIC code (i.e., did one facility support the other). In this case, the determining factor was the dependence of the gathering system on the transmission system to get the product to market. The transmission system was a support facility for the gas gathering system, and the gathering system could not otherwise introduce its product into commerce. However, the adjacency of the two systems was not at issue because they were located on contiguous properties. That situation is different from the one at issue in this case, where the Division must determine whether pollution-emitting activities from oil and gas exploration and production sites that are not contiguous with a midstream compressor station should be aggregated with that compressor station.

In a related context for an offshore oil and gas drilling operation, the EPA Environmental Appeals Board recently held that a source determination by EPA Region 10 lacked an adequate record basis to support EPA's aggregation decision. EPA had determined that two drilling ships owned by Shell that were not connected could operate within 500 feet of each other and should not be aggregated. *See, In re Shell Offshore, Inc., Kulluk Drilling Unit and Frontier Discoverer Drilling Unit*, (OCS Appeal Nos. 07-01 and 07-02, September 14, 2007). However, in remanding the case, the Appeals Board rejected the appellants' argument that potential drill locations should be aggregated even if they were many miles apart yet located on contiguous lease blocks owned by the same company. In doing so, the Board reasoned as follows:

> The phrase 'contiguous or adjacent properties' must be understood as connoting a more substantial connectedness, proximity, or continuity that would correspond to a common understanding of building, structure, facility, installation, or plant.

Id. at 39-40.

Earlier, EPA Region 10 determined that an offshore oil and gas platform and an onshore production facility located 2.8 miles apart and connected by pipelines should be aggregated as a single source. *See* August 21, 2001 letter from Douglas Hardesty, Manager, Federal and Delegated Air Programs, EPA Region 10 to John Kuterbach, Chief, Air Quality Management, Alaska Department of Environmental Conservation. In this case, these two Forest Oil sites were exclusively dependent on each other because pipelines transported all the oil, gas and produced water from the offshore site to the onshore site and the onshore site transported treated produced water back to the offshore site. In addition, electrical power produced at the onshore site was provided to the offshore site via electrical cables and communication cables were used to coordinate efforts between the two sites. Finally, personnel from the onshore site would perform maintenance activities at the offshore site. Because of the mutual interdependency of the two sites, EPA Region 10 determined that the two sites were adjacent and, because they met the other two elements of the three-part test, should be aggregated as one source.

Other individual EPA aggregation determinations have expanded upon the concept of "adjacency." These determinations generally involve other types of industrial activities, but they support the above decisions related to typical oil and gas exploration and production activities and, by extension, their relation to midstream activities, including compressor stations. In those case-by-case determinations, EPA evaluated three factors in assessing whether an activity was adjacent as part of the three-part test identified in the above source determination regulations. Those three factors developed and utilized by EPA are connectedness, proximity and interdependence. The Division considered all of these aggregation analyses and determinations in deciding whether to aggregate any other compressor stations and wells in the Wattenberg Field with the Frederick Station. Some of these case-by-case determinations are discussed below.

For example, EPA evaluated whether to aggregate sections of Shell Oil Company's Wilmington, Delaware, refinery complex for PSD purposes in 1980. The sections were located 1.8 miles apart, interconnected by twenty pipelines transferring intermediary products back and forth, and managed as a single refinery. In that case, EPA determined that the sections of the refinery complex constituted one source for PSD purposes. EPA's determination focused on the fact that the sections were interconnected by pipelines, that those pipelines transported intermediary products from one site to the other, and that they were operated as a single refinery. *See* Letter from E. Reich, Director, Division of Stationary Source Enforcement to C. Eller, Director, Enforcement Division, Region IX, May 16, 1980.

Similarly, in June 1981, EPA evaluated whether two General Motors facilities constituted one source for PSD purposes. The facilities were located one mile apart, with a dedicated railroad line between them, and were programmed together to produce one line of automobiles transported by the dedicated railroads back and forth between the facilities for assembly and painting. As in the *Shell Refinery* case above, EPA's determination was based on interconnectedness and interdependence. The railroad served only the General Motors facilities, parts were transported back and forth between the facilities, and the plants were less than one mile apart. EPA concluded that the two facilities were adjacent and should be treated as one source for PSD purposes. *See* June 8, 1981, Memorandum "Defining Two Separate Plants as One Source," from Steve Rothblatt, Chief, Air Programs Branch, Region V EPA, to Edward E. Reich, Director, Stationary Source Enforcement Division, Region V EPA.

In determining whether Anheuser-Busch's Fort Collins, Colorado brewery and land farm constituted a single stationary source for PSD purposes, EPA again looked closely at the interdependency of the operations both within the context of a support facility relationship (i.e., same two-digit SIC code) and for determining if the activities were located on contiguous or adjacent properties. The brewery and land farm were six miles apart but physically connected by a pipeline. EPA focused on the fact that (1) the land farm operation was an integral part of the brewery operations and (2) the brewery needed the land farm to dispose of its waste water. As in the *Shell* and *General Motors* analyses above, EPA concluded that the two facilities constituted one stationary source

Administrative Record NSR 10833_011595

for PSD purposes, because of the interdependency of the two operations. *See* Letter from R. Kellam, Acting Director, Information Transfer & Program Integration Division to R. Long, Director, Air Program, Region VIII, August 27, 1996.

EPA has also considered whether two ESCO plants (the Main Plant and Plant 3) should be considered adjacent for Title V aggregation purposes. Plant 3 produced metal castings, and the castings were all coated at the Main Plant. EPA Region X concluded that this interdependency of the plants caused them to be contiguous or adjacent and subject to aggregation for Title V purposes. Region X utilized EPA's "common sense notion of a plant" to conclude that, because Plant 3 was entirely dependent on the Main Plant for production of the finished product, both plants constituted one source under Title V. Through this conclusion, Region X also disagreed with ESCO's arguments that a support facility relationship could not form the basis for a contiguous or adjacent determination. *See* Letter from J. Cabreza, Permits Team Leader, Office of Air Quality, to Oregon Department of Environmental Quality, August 7, 1997.

In evaluating whether a Great Salt Lake Minerals plant and pump station should be considered one source for PSD purposes, EPA Region VIII focused on the fact that the pump station did not have its own primary economic activity but only supported the activity of the plant, even though the pump station was twenty miles from the plant. The pump station supported brine transfer for the plant. EPA stated:

> Distance between the operations is not nearly as important in determining if the operations are part of the same source as the possible support that one operation provides for another.

EPA did not specifically examine or draw a conclusion on distance with regard to the contiguous or adjacent element of the three-part test, it instead focused on determining if a support facility relationship existed between the two activities. EPA opined that the pump station and plant constituted one source for PSD purposes. However, EPA also stated as follows:

> Our position on this rather unique situation is only provided as guidance, as it remains the State's primary responsibility to make the final determination under your SIP-approved PSD regulations.

See Letter from R. Long, Director, Air Program, EPA Region VIII to Division of Air Quality, Utah Department of Environmental Quality, August 8, 1997. Utah ultimately decided not to aggregate these two pollutant-emitting activities. In the Title V permit for the minerals plant, Utah stated as follows:

> The collective pump station operations located on the west side of the Great Salt Lake are not included in this permit since it has been designated as a separate source.13

In responding to a request from the Utah Division of Air Quality about whether two Utility Trailer Manufacturing Company facilities on non-contiguous sites should be considered adjacent and aggregated as a single source, EPA Region 8 did not make a specific determination. EPA Region 8 reiterated the 1980 Preamble statements regarding the fact-specific nature of aggregation decisions, described several existing EPA source determinations for non-contiguous sites, and recommended that Utah consider several factual issues in making its source determination. These issues included evaluating whether the location of the new facility was chosen because of its proximity to the existing facility, whether materials would routinely be transferred back and forth between the two facilities, whether managers and other workers would be shared between the two facilities, and whether the production process itself would be split between the two facilities. *See* May 21, 1998, letter from Richard Long, Director, Air Program, EPA Region 8 to Lynn Menlove, Manager, New Source Review Section, Utah Division of Air Quality.

Finally, in considering whether to aggregate the pollutant emitting activities at a mine and a processing facility owned and operated by American Soda, EPA Region VIII decided that these two facilities should be aggregated. The facilities were located forty-four miles apart and connected via a pipeline. EPA made its determination based on its analysis that the two facilities were interdependent because the mine, via a slurry pipeline, produced an intermediate product for the processing plant, while a return pipeline conveyed spent brine from the processing plant back to the mine. The facilities were thus exclusively interdependent upon each other and served no other purpose. EPA concluded that in this case, given their integral connectedness, the distance between the two facilities alone did not preclude them from being considered adjacent. *See* April 20, 1999 letter from Richard Long, Air and Radiation Program, EPA Region VIII, to Dennis Myers, Colorado Air Pollution Control Division.

In contrast to most of the above determinations, where EPA determined that the connectedness or interdependency between facilities was such that they should be aggregated either because they were contiguous or adjacent or because of a support facility relationship, EPA Region IV concluded that two bulk gasoline terminals located in close proximity did not constitute a single stationary source for Title V purposes. Although the two terminals were only about nine-tenths of a mile apart on a public road, they were not connected by pipelines or other utilities and were not support facilities for each other. EPA concluded that the two terminals did not constitute a single stationary source for PSD purposes because the terminals could and did operate independently, neither terminal was a support operation for the other, and the terminals were not physically connected by a structure such as a pipeline dedicated to the transfer of material or energy between the two terminals. EPA reached this conclusion even though the

13 *See* http://www.airquality.utah.gov/Permits/DOCS/10917pmt.20060803.pdf.

facilities occupied most of the land area between the two terminals and the facilities shared some employees. *See* letter from W. Smith, Director, Air, Pesticides and Toxics, Management Division, EPA Region IV to Mecklenburg County Department of Environmental Protection, May 19, 1999.

An assessment of these case-by-case determinations reveals the fact-specific nature of each determination. However, a general pattern among the cases indicates that there should be a high level of connectedness and interdependence between two activities for EPA to consider them adjacent. In particular, it appears that interdependence requires that the two activities rely on each other – not just that one activity relies on the other activity. In addition, reliance means that one activity cannot operate or occur without the other. If the activities operate independently or the activities do not act solely as a support operation for each other, the activities are generally not considered adjacent for source determination purposes.

E. State Guidance Documents

In addition to the above EPA case-by-case source determinations, several states have developed guidance on aggregation of activities associated with oil and gas exploration, production, and distribution. These guidance documents focus specifically on the contiguous or adjacent portion of the three-part test. The State of Colorado sees the guidance as informative of how this element of the test can be viewed, but not dispositive or binding on the state in its application of the pertinent regulatory factors. In Texas, Oklahoma and Louisiana, state air quality agencies have used the interdependency tests applied by EPA in the above examples to help form their aggregation analysis policies for oil and gas as well as other activities. Moreover, Wyoming, another state with significant oil and gas exploration and production activity, has articulated a reasonable position regarding pipeline connections between oil and gas wells and compressor stations, and whether pipelines should be considered in source aggregation analyses. Each of these states is SIP-Approved for its respective Title V and PSD permit programs.

The Texas Council on Environmental Quality ("TCEQ") has concluded that "[c]ontiguous or adjacent properties are adjoining except for an intervening road, railroad, right-of-way, waterway, or the like." 14 In establishing a distance to determine whether one pollutant-emitting activity is contiguous or adjacent to another pollutant emitting activity, TCEQ relies primarily upon a proximity test, stating that "[p]roperties located less than ¼ mile apart are considered contiguous."

However, TCEQ also states that "interdependent properties located more than ¼ mile apart may also be considered contiguous." Similar to the EPA case-by case determinations discussed above, TCEQ defines interdependent properties as properties that are "*mutually* dependent." (emphasis added). According to the TCEQ guidance, "a

14 *See* Attachment 4 "Definition of Site," also found at http://www.tceq.state.tx.us/assets/public/permitting/air/Guidance/Title_V/site.doc.

mutually dependent property either supports or is supported by another property (or properties) and *cannot function independently*." *Id.* (emphasis added).

Similarly, the Oklahoma Department of Environmental Quality ("ODEQ"), Air Quality Division, has established guidance to evaluate the contiguous and adjacent nature of activities. ODEQ guidance states that "[a] physical separation of property does not in itself constitute separate sources; for example, the fact that some property at a plant site is divided by a highway or a railroad right-of-way does not create separate and distinct sources." 15 In addition, like TCEQ, ODEQ considers "within a contiguous area" as any source located within a quarter (¼) mile of another commonly owned source. ODEQ acknowledges that this proximity-based approach is a simplification of EPA guidance and may not adequately deal with situations with extenuating circumstances "such as when sources are not within a quarter (¼) mile of each other, but operationally support each other and are 'connected' by some means of transportation." *Id.* In these cases, ODEQ undertakes a case-by-case determination and considers: 1) whether the entities are located in different counties and located more than five miles apart; 2) whether the facilities operationally support each other; and 3) whether the facilities are physically joined in any manner. If the facilities are located in different counties and more than five miles apart, ODEQ does not consider them contiguous and adjacent. If the facilities are either located in the same county or less than five miles apart, then ODEQ focuses on whether the facilities operationally support each other and are physically joined in any manner.

The Louisiana Department of Environmental Quality ("LDEQ") also provides guidance regarding whether oil and gas production operations should be considered contiguous. LDEQ treats sites separated by a quarter (¼) mile or less as contiguous.16 However, LDEQ makes clear that the facilities to be considered contiguous are limited to those within a quarter (¼) mile of the target facility. Facilities should not be "daisy-chained" together to establish a contiguous grouping. *Id*. Thus, similar to Texas and Oklahoma, LDEQ relies upon a proximity-based method unless the "particular circumstances for a given case (e.g., interdependency)" warrant a contiguous determination. *Id*.

The Wyoming Department of Environmental Quality ("WDEQ") recently made a presentation to EPA regarding its position on aggregation of oil and gas wells and, among other things, compressor stations in that state. WDEQ's position is that a pipeline connecting a well(s) to a compressor station does not, by itself, meet the contiguous or adjacent criteria to aggregate the two types of facilities. WDEQ further notes that aggregating oil and gas production and distribution facilities will result in "additional

---

15 *See* Attachment 5, "Air Permitting Collocated Facilities," also found at http://www.deq.state.ok.us/factsheets/air/PermittingCollocated.pdf.
16 *See* Attachment 6, "Interpretation of Contiguous for Oil and Gas Production Facilities," http://www.deq.louisiana.gov/portal/tabid/2347/Default.aspx.

permitting timelines/burden with little or no environmental benefit."17 Finally, WDEQ notes that the interdependency test is not one that has been established in statute or EPA-promulgated regulations, and it urges EPA to rely instead on the statutory definition of source.18

As is evident from the above, Texas, Louisiana, and Oklahoma all have developed proximity-based criteria for assessing whether activities are contiguous or adjacent. Each state uses a quarter (¼) mile distance as a general guideline to determine contiguousness/adjacency, though all retain case-by-case analysis to evaluate other facts if extenuating circumstances warrant. Wyoming urges EPA to focus on the statutory and regulatory definitions of source contained in the *Alabama Power* decision and the 1980 Preamble in making source determinations in the natural gas production and distribution context.

F. Non-Aggregation of Oil and Gas Facilities for Hazardous Air Pollutants

Finally, it is significant that, in the hazardous air pollutant ("HAP") arena, EPA has expressly determined, consistent with Congress' statutory mandate in the CAA, 42 U.S.C. § 7412(n)(4)(A), oil and gas production field facilities are typically *not* industrial facilities that should be aggregated. Such facilities generally are not "in close proximity to or co-located with one another (contiguous) and located within an area boundary, the entirety of which (other than roads, railroads, etc.), is under the physical control of the same owner." Oil and Natural Gas Maximum Achievable Control Technology Standard, 63 Fed. Reg. 6288, 6303 (Feb. 6, 1998). For HAP major source determinations, the EPA-promulgated definition of "facility" states that "pieces of production equipment or groupings of equipment located on different oil and gas leases, mineral fee tracts, lease tracts . . . or separate surface sites, whether or not connected by a road, waterway, power line or pipeline, shall not be considered part of the same facility." 64 Fed. Reg. 32610, 32630 (June 17, 1999).19

IV. THE THREE-PART TEST APPLIED TO OIL AND GAS SOURCES

All three parts of the "building, structure, installation or facility" test can present challenges in assessing their applicability within the unique and complex framework of

---

17 *See* Attachment 7, "Aggregation in Wyoming," PowerPoint Presentation to EPA, February 23, 2010.

18 *Id*.

19 *See also* 42 U.S.C. § 7412(n)(4)(A): "Emissions from any pipeline compressor or pump station shall not be aggregated with emissions from other similar units, whether or not such units are in a contiguous area or under common control, to determine whether such units or stations are major sources, and in the case of any oil or gas exploration or production well (with its associated equipment), such emissions shall not be aggregated for any purpose under this section."

Administrative Record NSR 10833_011600

oil and gas production, gathering and processing operations. Evaluating the contiguous or adjacent portion of the test can be especially complex[20] given the geographical distribution of emission sources across large areas in the oil and gas industry in general, including the Wattenberg Field, where the Frederick Station is located. In addition to the EPA oil and gas aggregation determinations previously described, the Division further discusses the three-part test as applied to the Wattenberg Field generally and as recently applied in Alaska's Prudhoe Bay.

A. Gas Production in Colorado, including the Wattenberg Field

Consistent with EPA's recommendations in its October 8, 2009 Order, the Division obtained information from Kerr-McGee Gathering regarding the physical, contractual, engineering and operational characteristics of oil and gas wells and compressor stations owned or operated by Kerr-McGee Gathering and others in the Wattenberg Field.[21] The Division also obtained and analyzed similar categories of information from other oil and gas exploration, production and distribution companies in the Wattenberg Field.[22]

The Division has carefully analyzed this information in relation to the recent *MacClarence* decision, the source determinations that EPA has made over a number of years, and the guidance documents from other oil and gas producing states. Based on all this information and guidance, the Division has determined that certain guidelines can be applied to oil and gas production and gathering systems in Colorado generally, and specifically to the Wattenberg Field.

Based upon its analysis, the Division has determined that oil and gas exploration, production and gathering systems are fundamentally different from other sources, such as manufacturing operations, for purposes of aggregation analyses. Oil and gas exploration and production areas have unique physical and ownership characteristics. Significantly, the fields usually cover large surface areas. For example, the Division estimates that

---

20 As explained above and below, while the Division has developed considerable information and has carefully and thoroughly analyzed this information in this response, the Division does not see the need for and does not intend to engage in such in-depth information gathering and analysis every time it processes an oil and gas permit application. The Division will, however, utilize the information gathered and the case-by-case analysis performed as a part of this response in making future source determinations in this area.

21 *See* Attachment 8, January 14, 2010 letter from the Division's Roland Hea, Permitting Section Supervisor, Stationary Sources Program, to Korby Bracken, Anadarko Petroleum Corporation.

22 *See* Attachment 9, February 5, 2010 letter from the Division's Kirsten King, Manager, Stationary Sources Program to Curtis Rueter, Environmental Manager, Noble Energy, Inc.; Attachment 10, February 5, 2010 letter from Kirsten King to Jill Cooper, Group Lead Environment, EnCana Oil and Gas (USA), Inc.; Attachment 11, February 5, 2010 letter from Kirsten King to Joshua Epel, Assistant General Counsel, DCP Midstream.

there are approximately 24,000 wells scattered over 2,000 square miles in the Wattenberg Field that are owned and operated by numerous oil and gas companies.

Moreover, compressor stations and well operations are typically not located on contiguous properties, i.e., the properties on which they are located do not touch. The question is how to determine which, if any, compressor stations and oil and gas wells and their associated pollutant-emitting activities scattered over a large geographic area should be considered "adjacent" for purposes of the three-part test. Mature fields, like the Wattenberg Field, consist of a network of wells, gathering lines, condensate tanks, glycol dehydrators and compressor stations. In the Wattenberg Field, according to the Division's permit and emission point tracking database, there are many exploration and production companies that are operating.

Based upon its review of information provided by the oil and gas companies operating in the Wattenberg Field, the Division has concluded that gas production companies have the ability to send and do send produced gas to a number of different compressor stations. Some of these compressor stations are owned and operated by the same or a related entity, while others are not owned or operated by the same or a related entity.23 Moreover, in most instances production companies do not own the surface land or the underlying oil and gas resources. They have only a limited right to produce the oil and gas resources (sometimes only at certain depths or in certain formations while other entities may have the right through lease or ownership to produce gas at other levels) and to disturb a reasonable amount of surface as part of their exploration, production, and distribution activities.24

The Division has determined that gathering companies generally do not control the operations of oil and gas wells. A gathering company simply accepts the gas provided by the production company, as long as it meets certain quality and other contractual requirements. Except in very limited and unusual circumstances, a gathering company does not control or affect the operations of the wells that are the subject of the gathering contract. It is entirely the decision of the oil and gas production company regarding how and when it operates its wells. For instance, if the production company

---

("EnCana") to Kirsten King, Program Manager, Stationary Sources Program, Colorado Air Pollution Control Division (hereafter "EnCana letter"), at pp. 2-6; Attachment 14, March 12, 2010 letter and attachments from Joshua B. Epel, Associate General Counsel, DCP Midstream to Kirsten King, Manager, Stationary Sources Program (hereafter "DCP letter"); and Attachment 15, March 17, 2010 letter and attachments from Chris Martinez, Air Quality Manager, Noble Energy to Kirsten King, Manager, Stationary Sources Program (hereafter "Noble letter").

24 *See* Kerr-McGee letter at p. 1-2; EnCana letter at p. 2; Noble letter at p. 2.

decides to shut-in a particular well because of market conditions or other reasons, the gathering company cannot override that decision. 25

The Division also has concluded that, in many instances, oil and gas wells are operated by entities that are unrelated to the gathering company operating the compressor stations and other facilities associated with gathering operations. Because many oil and gas leases have several working interest owners, the operations of a well may be governed by a JOA between these owners and the oil and gas production company/lessee. Additionally, because typical oil and gas leases allow each working interest owner to take its portion of the produced gas in-kind, the produced gas may be subject to "split stream" gas distribution. In split stream situations, working interest owners may decide to have their gas conveyed via different gathering companies, resulting in one well being connected to more than one gathering system. 26

As noted above, pursuant to contract, a gathering company generally accepts all of the gas provided by a production company for specific wells, whenever that gas is available. However, short-term maintenance, poor well gas quality or force majeure events may require a particular well to be shut-in.27 Moreover, the Division has found that, in most instances in Colorado and always in the Wattenberg Field, once gas from a particular well is metered and flows into the gathering lines of a gathering company, that gas becomes commingled with other gas flowing through those lines from other wells and other companies. It is not possible to distinguish, track, or "brand" the gas from a particular well once it enters the gathering lines of the gathering companies.28

Further, specific compressor stations, like the Frederick Station, are not addressed or identified individually in gathering contracts. This gives the gathering company flexibility to allow the gas from a particular well to flow to a different compressor station connected to the gathering system as conditions warrant. For instance, if the Frederick Station is not operating because of maintenance, repair, or new equipment installation, the gas from a well that normally would flow to the Frederick Station will instead flow to another compressor station.29

Information gathered by the Division reflects that the engineering and construction aspects of a mature field, including the Wattenberg Field, result in a spider web of gathering lines, compressor stations and wells. Within this maze, gathering and distribution lines overlap, run parallel, and cross at different depths. The gas produced at

individual wells may flow to several compressor stations depending on conditions within the gathering system, and the flow of the gas can change from day to day. The changes in flow patterns can result from any number of factors, including the pressure and hydraulics of individual compressor stations, wells and gathering lines. 30

Finally, the Division also notes that the age and production capacity of different wells and fields affects the amount of gas flowing to a particular compressor station on a particular day (or time of day). As wells age, the pressure in the well will decrease, thereby reducing the amount of gas that can be produced from that well. Conversely, if an older well is re-completed, its gas production will likely increase, providing the gathering system with more gas than before. Moreover, new wells are drilled and connected periodically within the same field, including the Wattenberg Field. Over time, these dynamic changes can necessitate new compressor stations, new gathering lines, or increased capacity at existing compressor stations.31

B. The *MacClarence* Decision

A recent case, *MacClarence v. Environmental Protection Agency*, 596 F.3d 1123 (9th Cir. 2010), addresses aggregation of sources in an oil and gas production and distribution context. In *MacClarence*, the Court affirmed an EPA decision not to object to a final permit issued under Title V by Alaska's Department of Environmental Conservation ("ADEC"). ADEC issued the Title V permit to British Petroleum ("BP") for a production center in Prudhoe Bay. The production center is one of six operated by BP that services 38 well pads located on tundra across a 300 square mile area. The production centers separate the oil, water and hydrocarbon gases, and then pump the processed crude oil to the Trans-Alaska Pipeline for sale.

MacClarence petitioned EPA under section 505(b)(2) of the CAA, 42 U.S.C. § 7661d(b)(2), to object to ADEC's Title V permit, which aggregated six well pads with one production center. *Id.* at 1126-27. MacClarence argued that ADEP should have aggregated the entire Prudhoe Bay Unit, including the facilities at all the well pads and all the production centers. *Id.*

ADEC, in the Statement of Basis accompanying the permit, found that extending the Title V permit to the entire Prudhoe Bay Unit would be unprecedented, would "severely stretch the concept of proximity," and would be unduly complex to administer and operate. *Id.* at 1128. ADEC also concluded that such a result would not fit within the "common sense notion of a plant," and would not have any "clear corresponding environmental benefit." *Id.* 32

---

30 *See* Kerr-McGee letter at pp. 6-8; *see also* EnCana letter at pp. 2-3; Noble letter at pp. 6-7.
31 *See* Kerr-McGee letter at p. 9 and attached Exhibit 5; *see also* EnCana letter at p. 6.
32 *See also* Attachment 16, ADEC's Final Title V Permit No. 182TVP01, Revision I, February 17, 2004, "Statement of Basis," at pp.4-7 ("ADEC Decision").

ADEC also identified some of the problems that would arise if the entire Prudhoe Bay Unit were aggregated as one source:

> a) Netting analyses conducted over such a large stationary source could lead to avoiding all PSD reviews.
>
> b) De-bottlenecking analysis would be more difficult.
>
> c) Tracking cause and effect of activities within the unit would be difficult; calculation of associated emission effects would become more complicated.
>
> d) Permit maintenance burden would be greater; both Title I and Title V permits would be in a constant state of revision.
>
> e) Scope of review and analysis could discourage discrete facility upgrades. If ADEC were required to evaluate all air-related issues across the entire PBU at the same time, agency resources could be overwhelmed resulting in permitting delays. 33

ADEC also concluded that pipelines alone should not be the sole factor in determining adjacency, explaining:

> [I]n the oil and gas industry pipelines connect everything. Pipelines are used throughout the [Prudhoe Bay] operating unit as the preferred method for transferring fluids between facilities. To only consider the connectivity of operations via pipelines to determine proximity and to not also consider the concept of a common sense notion of a plant would result in one stationary source extending from the North Slope oil fields all the way to the Valdez Marine Terminal.34

EPA denied MacClarence's petition for EPA to object to the permit. EPA held that MacClarence "failed to provide adequate information to support his claim that the entire PBU should be aggregated and has also failed to demonstrate that the failure to aggregate all facilities within the PBU has led to a deficiency in the content of the permit." 35 EPA also noted favorably that ADEC "provided a detailed explanation of its aggregation decision in the statement of basis for the final permit for GC1. [and that] ADEC discussed in great detail why it decided, based on the applicable statutes, regulations, and EPA guidance and the specific facts before the ADEC, that it was not appropriate to aggregate all facilities within the entire PBU."36

---

33 ADEC Decision at p. 6.
34 *Id.*
35 *See* Attachment 17, *In the Matter of BP Exploration , Inc., Gathering Center #1, Permit No. 182TVP01 (Revision 1)*, "Order Denying Petition for Objection," pp. 7-8.
36 *Id.* at p. 8.

In affirming EPA's decision not to object, the Ninth Circuit Court of Appeals held that under section 505(b) of the CAA, the burden to prove that the Title V permit did not comply with the requirements of the CAA was on the petitioner, and that he had not met that burden. 596 F.3d at 1131-1132. The Court further noted affirmatively that ADEC had compiled a substantial administrative record that supported its decision. The Court determined that ADEC's use of a "hub-and-spoke" model in its aggregation analysis was reasonable and supported by the administrative record. *Id*. at 1133. The Court thus held that EPA's decision not to object was not an impermissible interpretation of the term "demonstrate" in section 505(b)2) to place the burden on the objector to show non-compliance with the CAA arbitrary or capricious, the applicable standard of review of an EPA section 505(b)(2) decision. *Id.*

C. The Wattenberg Field Differs Significantly from Prudhoe Bay

Gas production and distribution in Colorado differs substantially from the production and distribution of oil in the Prudhoe Bay Unit described in the *MacClarence* decision. For example, the Prudhoe Bay Unit covers about 300 square miles while the Wattenberg Field is much larger, covering 2,000 square miles. In the Prudhoe Bay Unit, only 6 production centers service a total of about 38 well pads; the Wattenberg Field includes over 24,000 wells.

In the Prudhoe Bay Unit, BP owns 26-50 percent of all the facilities and, under an agreement with the other oil and gas lessees, operates all the wells and production equipment. In the Wattenberg Field, ownership of the gas is fragmented; and ownership and operation of the wells, compressor stations, and various interstitial and ancillary equipment is dispersed among at least fifty different exploration and production companies and several midstream companies. The surface and mineral estate is, in many instances, split. The gathering lines are owned by a number of companies and cross over, run parallel to, or beneath each other. The produced gas can and does flow to one compressor station one day and to another compressor station the next. The compressor stations to which gas flows may be owned and operated by the same company, or by different companies.37 As previously described, midstream companies do not control the operations of the wells.

In light of the significant differences between the Wattenberg Field and the Prudhoe Bay Unit, the Division has determined that the "hub and spoke" model utilized by Alaska is unsuitable in the Wattenberg Field. The Division has reached this conclusion because midstream companies, except perhaps in some very limited circumstances, cannot physically or by contract control the operations of oil and gas wells. A midstream company could not, for example, have any authority to tell a well operator that it is required to install a flare on a battery of condensate tanks or glycol dehydrators that are associated with the well. Without this authority to require the installation of certain types of pollution control equipment or institute operational

37 Kerr-McGee letter at pp. 1-2; EnCana letter; Noble letter at p. 4; DCP letter at p. 1.

controls, a midstream company could not enforce any permit conditions that the Division might include within the midstream company's air quality permit related to the well(s).

Moreover, the changing conditions and participants in oil and gas field production and distribution, including changes in ownership, contracts, gas production, and engineering, would cause the Division's permitting process to be in a constant state of flux and uncertainty.38 By the time an "aggregated" compressor station and wells permit was reviewed and issued by the Division, the owners of the wells and compressor station, the engineering associated with those particular wells and compressor station, and the production conditions related to the facilities covered by the permit could, and in many cases would, be different from the conditions that existed when the permit application was first submitted. 39 This would make both permitting and enforcement of such permits difficult if not impossible to administer and result in the kind of fine-grained analysis that EPA declared was not practicable or necessary in the 1980 Preamble.

D. General Considerations for Assessing Contiguous or Adjacent in the Wattenberg Field

In addition to considerations of proximity, given all of the foregoing variables, including the fact that midstream companies do not control oil and gas well operations to any significant extent; unless (1) particular wells and compressor stations are solely owned and operated by the same entity or under common control with the same entity, and (2) are solely dedicated to or dependent upon a single compressor station, and the compressor station receives all of its gas from those particular wells, the level of "interdependency" necessary to find that a compressor station and non-contiguous wells should be considered adjacent does not appear to exist in the Wattenberg Field. Therefore, except in very narrow circumstances, the Division does not anticipate determining that compressor stations should be considered adjacent to non-contiguous oil and gas wells in the Wattenberg Field.

V. THE THREE-PART TEST APPLIED TO KERR-MCGEE GATHERING'S FREDERICK STATION TITLE V PERMIT RENEWAL

In its October 8, 2009 Order, EPA required the Division to supplement the permit record and, as necessary, make appropriate changes to the permit. In doing so, EPA

---

38 The *MacClarence* court noted favorably that ADEC's reasoning in its final Title V permit decision for the production station at issue included the following statement: "The complexity of administering . . . and operating . . . a stationary source as large as the PBU without clear corresponding environmental benefit argues against" the aggregation of the entire PBU. 596 F.3d at 1133.

39 *See, e.g.,* the many and varied types of services and engineering scenarios described in the EnCana letter at pp. 4-6.

recommended that the Division conduct a source determination analysis which could include the following:

- An evaluation of Kerr-McGee's complete system map showing all emission sources owned or operated by the Company in the Wattenberg Field and determine whether the various pollution emitting activities are contiguous or adjacent to and under common control with the Frederick Station.
- An evaluation of a flow diagram showing the movement of gas from the well sites to the various facilities in the Wattenberg Field operated by both Kerr-McGee/Anadarko and other companies in the field, so that CDPHE may determine the nature of the sources' emissions and determine whether or not the process units associated with those emission sources are interdependent on the operation of the Frederick Compressor Station.
- Obtain from Kerr-McGee/Anadarko business information regarding the nature of control of the Frederick Station and nearby wells between the Company and other companies in the field to determine whether various pollution emitting activities should be considered under common control for purposes of making the source determination.

As recommended by EPA, the Division requested additional information from Kerr-McGee Gathering in a January 14, 2010 letter in order to provide a more detailed stationary source determination analysis for the Frederick Station. *See* Attachment 8. Kerr-McGee Gathering responded to the Division request through a submittal transmitted to the Division on February 4, 2010. *See* Attachment 12. Kerr-McGee Gathering also submitted additional information on March 9, 2010, including an updated list of well sites, which correlates to the 3-section by 3-section map delivered with its February response.[40] *See* Attachment 18. This smaller map includes all of Kerr-McGee Gathering's emission sources within the subject range, along with possible gas flow directions. Gas will flow along the path of least resistance within the gathering system, and thus it is not possible to guarantee flow directions along some gathering lines. This is indicated on the detailed map with bi-directional flow lines. In addition, Kerr-McGee Gathering submitted a larger map of its "Wattenberg Gathering System" dated February 23, 2010. *See* Attachment 19. The Division has thoroughly reviewed and evaluated all of the information submitted by Kerr-McGee Gathering to respond to EPA's Order.

---

[40] *See* March 9, 2010 e-mail from Korby Bracken to Matt Burgett with an attached table showing, among other things, distances of KMOGO wells/pollutant-emitting equipment from the Frederick Station within the three section-by-three section area surrounding the plant (this updated table replaced a similar table included as Exhibit 6 in the February 4, 2010 submittal). Attachment 18.

A. Other Kerr-McGee Gathering Compressor Stations in the Wattenberg Field

As described in the Division's April 29, 2008 Addendum to the January 1, 2007 Technical Review Document ("Addendum"), the Division has previously considered the relationship between the Frederick Station and other Kerr-McGee Gathering compressor stations in the Wattenberg Field, namely the Hudson, Fort Lupton, Dougan, Brighton, and Hambert Compressor Stations.41 In our analysis in the April 29, 2008 addendum, the Division concluded that the Frederick Station should not be aggregated with any of these other Kerr-McGee Gathering compressor stations. While the primary focus of this response to the October 8, 2009 Order has been on the relationship between the Frederick Station and oil and gas well pollutant-emitting activities in the Wattenberg Field, the Division has considered whether the additional information submitted by Kerr-McGee Gathering in the current context materially affects the aggregation analysis previously done for the other Kerr-McGee Gathering compressor stations in the Wattenberg Field.42

As discussed above in Section III.D.i., Region VIII determined in 1999 that while all the pollutant-emitting sources within a compressor station should be aggregated, gas compressor stations connected by pipeline in the same gas field were not required to be aggregated. *See* letter from Richard Long, Director of the Air and Radiation Program, EPA Region VIII to EnerVest San Juan Operating Co., July 8, 1999. This determination by Region VIII is consistent with the Division's analysis in the Addendum. In that Addendum, the Division found that the closest Kerr-McGee Gathering compressor station to the Frederick Station is the Dougan Compressor Station, which is approximately 7.2 miles from the Frederick Station. The other Kerr-McGee Gathering compressor stations in the Wattenberg field and their approximate distances from the Frederick Station are as follows: Hudson Compressor Station—13.6 miles; Hambert

---

41 Compressor stations in the Wattenberg Field owned and operated by companies other than Kerr-McGee Gathering (i.e., companies outside the Kerr-McGee/Anadarko corporate structure) were not considered further in this analysis because they are not controlled by or under common control with Kerr-McGee Gathering's compressor stations and therefore, do not meet this element of the three-part test. *See* March 9, 2010 e-mail from Korby Bracken to Matt Burgett, Attachment 18.

42 The Division notes that, in its second objection to the Division's aggregation analysis for the Frederick Station, WildEarth Guardians did not raise an objection to the Division's previous analysis in the Addendum regarding whether other Kerr-McGee Gathering compressor stations in the Wattenberg Field should be aggregated with the Frederick Station. Nor did Administrator Jackson in her October 8, 2009 Order expressly object to the compressor station analysis and non-aggregation determination contained in the Division's Addendum. Nevertheless, in the interest of developing a comprehensive source determination analysis for the Frederick Station, the Division has re-evaluated the analysis and conclusion in its Addendum to determine if any new facts warrant possible aggregation of Kerr-McGee Gathering's other compressor stations in the Wattenberg Field with the Frederick Station.

Compressor Station—17 miles; Brighton Compressor Station—13.8 miles; Ft. Lupton Compressor Station—9.0 miles.43

Because all the Kerr-McGee Gathering compressor stations in the Wattenberg Field are owned by the same corporate entity (i.e., are under control of the same person) and perform the same function/activity (i.e., same industrial grouping), the Division's analysis focused primarily on assessing if the compressor stations were on contiguous or adjacent properties. After noting that EPA "chose not to aggregate the (other Kerr-McGee Gathering compressor stations) during the (previous EPA) PSD permit process," and determining that none of the other Kerr-McGee Gathering compressor stations in the Wattenberg Field were in close proximity to the Frederick Station, and that they are separate surface sites, the Division determined that none of the other compressor stations operated by Kerr-McGee Gathering should be aggregated with the Frederick Station.44

After reviewing the additional information submitted by Kerr-McGee Gathering, the Division has concluded that the case-specific facts for the compressor stations are unaltered from the analysis in the Addendum, and that the determination not to aggregate other Kerr-McGee Gathering compressor stations with the Frederick Station in the Addendum is still valid. In fact, the additional facts submitted in the Kerr-McGee letter further support the determination in the Addendum. As with KMOGO owned or operated oil and gas wells, Kerr-McGee Gathering's gas gathering agreements do not specify that collected gas will be moved through any specific compressor station, including the Frederick Station. Gas entering and leaving Kerr-McGee Gathering's system is not owned by Kerr-McGee Gathering.

There are no separate contractual arrangements between Kerr-McGee Gathering's Frederick Station and Kerr-McGee Gathering's other compressor stations in the Wattenberg field. Multiple streams of gas from oil and gas wells can pass through different compressor stations on the way to the delivery points, with a portion of the gas collected from a well passing through the Frederick Station, and with some passing through other compressor stations that are part of Kerr-McGee Gathering's system. Gathering system pressures determine how collected gas moves through the system's network of pipes and compressor stations, not contractual or other arrangements.

Gathering systems, including the portion of Kerr-McGee Gathering's system connected to the Frederick Station, are complex and subject to many variables that impact the gathering system dynamics. Variables can include gas production changes at wells due to age or well stimulation (e.g., re-completions), connection of new wells, addition of new compressor stations, and equipment changes at existing compressor stations. All of these changes can influence the gas flow dynamics of the gathering system and impact

43 Addendum, p. 9.
44 *Id.*

how collected gas moves to a delivery point. The consequence of these intrinsic variables is a system that is rarely stable.45

All these factors argue against the application of an interdependency concept so as to consider other compressor stations owned and operated by Kerr-McGee Gathering in the Wattenberg Field to be part of the same source with the Frederick Station. Moreover, as described above, since the closest Kerr-McGee Gathering compressor station, the Dougan Station, is 7.2 miles from the Frederick Station, this distance also argues against aggregating any of these other compressor stations with the Frederick Station when considering proximity and the common sense notion of plant. As a result, the Division does not consider the other Kerr-McGee Gathering compressor stations to be contiguous or adjacent to the Frederick Compressor Station.

Given the above facts, the Division has determined that none of the other Kerr-McGee Gathering compressor stations in the Wattenberg Field should be aggregated with the Frederick Station.

B. KMOGO Oil and Gas Wells in the Wattenberg Field

The following subsections describe the Division's analysis under the three-part test as it applies to the Frederick Compressor Station and surrounding oil and gas wells:

i. Industrial Grouping

The first element in completing an analysis using the three-part test is to determine whether particular air pollutant-emitting activities share the same industrial grouping; i.e., the same two-digit SIC code. In this case, the assessment of this element is relatively straightforward. In the oil and gas industry, compressor stations and exploration and production wells and their associated equipment (such as storage tanks) share the same two-digit SIC code. The SIC code for Crude Petroleum and Natural Gas is 1311 and includes oil and gas well operations and gathering compressor stations. Under the Regulation No. 3 definition, since they belong to the same major group (i.e., have the same initial two-digit code, "13") as described in the 1987 SIC Manual, a compressor station and wells are considered to belong to the same industrial grouping. Therefore, in this case, the first requirement of the three-part test for the Frederick Compressor Station and any potentially associated wells is met.

45 For the factual information discussed in the above three-paragraphs and the sources of these facts, *see* notes and accompanying text in footnotes 47 through 56 below.

ii. Common Control

A second requirement of the three-part test is to determine whether the pollutant-emitting sources are controlled by the same entity (or entities under common control). Because Kerr-McGee Gathering and KMOGO are both wholly-owned subsidiaries of Anadarko, the Division considers that for the purposes of this analysis, the oil and gas exploration and production facilities owned or controlled by KMOGO that are connected via pipeline to the Frederick Station are controlled by, or are entities under common control with, the same entity, Anadarko.[46]

Conversely, pollutant-emitting sources, such as wells, condensate tanks or glycol dehydrators at the well head, that are owned and operated by a third party, are not considered under the common control of Kerr-McGee Gathering, and the Division has determined that it is not appropriate to consider them for possible inclusion in the Frederick Station, even if they would otherwise meet the other two parts of the test (i.e., the same two-digit SIC code and the contiguous or adjacent criteria). The Division has reached this conclusion because, as discussed further below, Kerr-McGee Gathering does not control the oil and gas production activities at such third party owned or operated sites.

iii. Contiguous or Adjacent – Relationships Between Pollutant-Emitting Activities

The Division must also analyze the third criteria for source aggregation; namely, whether and to what extent the Frederick Station and KMOGO-operated wells are adjacent or contiguous. As previously discussed, for this analysis the Division will consider not only the distance between emission sources, but potentially the interdependency of those sources.

The Division notes that it does not typically consider a well itself to be a pollutant-emitting activity. However, wells are commonly associated with production equipment such as storage tanks and glycol dehydrators, which are considered pollutant-emitting activities. In some cases, the pollutant-emitting equipment (e.g., a condensate storage tank) may be located right next to a particular wellhead; in other cases it may be located in a more centralized place to serve multiple wells. While the use of the term "well" in this document often refers to the well and the pollutant-emitting activities associated with the well, for the discussion of the contiguous or adjacent element, the Division will be more specific to avoid possible confusion.

As described above, the Division will not aggregate the Frederick Station with any wells or pollutant-emitting activities that are owned or operated by third parties, since Kerr-McGee Gathering has no control over these wells/activities. However, there are

---

[46] While this part of the test is relatively straightforward in this case, whether a compressor station or gas plant is owned or controlled by the same entity or under common control with the same entity remains a case-by-case determination.

numerous wells and associated pollutant-emitting equipment owned or operated by KMOGO which the Division considers, for the purposes of this analysis, to be under common control with Kerr-McGee Gathering. The information submitted by Kerr-McGee Gathering identifies twenty-nine condensate tank batteries owned or operated by KMOGO within the area represented in the submitted detailed map. The closest pollutant-emitting activity is a condensate storage tank located 0.3 mile from the Frederick Station. The Division has determined that none of the KMOGO-operated wells or associated pollutant-emitting activities are contiguous to (touching) the Frederick Station site. 47

The Division has evaluated the KMOGO wells/pollutant-emitting equipment connected to Kerr-McGee Gathering's gathering system to determine if they should be considered adjacent to the Frederick Station. Regarding the concept of adjacency, when making its own determinations or responding to determinations made or questions posed by other permitting authorities, EPA has to varying degrees considered the roles of proximity (i.e., distance) and interdependency in assessing what constitutes adjacent. Proximity is a factor raised specifically in the 1980 Preamble, while interdependency is a factor that has evolved over time in various case-by-case determinations.

While interdependency is a consideration, it is not an express element of the actual three-part test set forth in regulations, and in the context of oil and gas infrastructure, it may have reduced relevance to an agency determination. As stated in the McCarthy Memo:

> After conducting the necessary analysis, it may be that, in some cases, "proximity" may serve as the overwhelming factor in a permitting authority's source determination decision. However, such a conclusion can only be justified through reasoned decision making after examining whether other factors are relevant to the analysis.

The role of proximity is, in the Division's view, highly pertinent in the oil and gas sector for all the reasons set forth above.

In order to evaluate the factors of proximity and potential interdependency, the Division reviewed information describing the Wattenberg Field gathering system and the role of the Frederick Station. The Division further analyzed other case-by-case source determinations as part of its analysis, as reflected herein. The Division's assessment of these case-by-case determinations indicates that there should be a high level of connectedness and interdependence between two activities for them to be considered contiguous or adjacent if that is an element to be applied. In particular, a determination of interdependence requires that the two activities rely upon each other exclusively; i.e., one activity cannot operate or occur without the other. The case-by-case determinations indicate that if activities operate independently and one activity does not act solely as a support operation for the other, the activities should not be deemed contiguous or

47 Kerr-McGee letter at p.10.

adjacent. Moreover, as discussed above, interdependence is but one consideration for the Division to determine adjacency, and for reasons stated earlier, interdependence may have limited relevance and applicability in the oil and gas context in general and the Wattenberg Field in particular.

Kerr-McGee Gathering's business is to transport gas produced at wells owned by exploration and production companies. The wells can be owned either by independent third parties or by KMOGO. Kerr-McGee Gathering enters into contracts to move its customers' gas from receipt points (wells) to delivery points. Kerr-McGee Gathering must design its gathering system in such a way to accomplish these contractual agreements. Gas entering and leaving Kerr-McGee Gathering's system is not owned by Kerr-McGee Gathering.48

Kerr-McGee Gathering has explained that volumetric control (gas production) of a well is directly controlled by the owner/operator of the well, not the Frederick Station or Kerr-McGee Gathering.49 While under certain circumstances and as explained above, Kerr-McGee Gathering could require a certain well, either owned/operated by KMOGO or a third party, to be shut-in for pipeline maintenance, a force majeure event, or due to poor gas quality from the well, these types of shut-ins occur only rarely.50 Because these types of shut-ins occur only infrequently and under unusual circumstances, the Division has determined that neither the Frederick Station nor Kerr-McGee Gathering have operational control over these wells and their associated pollutant-emitting equipment, either the KMOGO owned/operated wells/equipment or those owned/operated by third parties. As described above, the Division does recognize that, within the context of this analysis, while Kerr-McGee Gathering may not exert operational control over KMOGO wells/equipment, they are controlled by the same corporate entity (i.e., Anadarko) for business purposes.

Kerr-McGee Gathering's gas gathering agreements do not specify that collected gas will be moved through any specific compressor station, including the Frederick Station. 51 Gathering system pressures determine how collected gas moves through the system's network of pipes and compressor stations. 52 The Petitioner argues that wells under common control with Kerr-McGee/Anadarko (and connected to the Frederick Compressor Station) depend upon the Frederick Station for their operations.53 This does not appear to be the case, based upon the Division's evaluation of information obtained from Kerr-McGee Gathering and other oil and gas production and midstream companies operating in the Wattenberg Field. Should the Frederick Station be shut down for maintenance, equipment replacement or other reasons, gas can flow to other compressor stations with available capacity based upon system pressures. This is true both for

48 Kerr-McGee letter at p. 5.
49 Kerr-McGee letter at pp. 6-7.
50 Kerr-McGee letter at p.7.
51 *Id*.
52 *Id*. at pp. 6, 7-9.
53 *See* WEG Petition for Objection at pp. 11-21.

compressor stations that are owned and operated by Kerr-McGee Gathering, and compressor stations that are operated by other midstream companies in the Wattenberg Field.[54] Similarly, if wells located near the Frederick Station were to be offline, the Frederick Station would pull an amount of gas from more distant wells until a hydraulic equilibrium was established.[55] The KMOGO owned or operated wells and associated pollutant-emitting equipment are not solely dependent on the Frederick Station and the Frederick Station is not solely dependent on particular KMOGO owned or operated wells/equipment.[56] Therefore, these facts do not support a determination that the Frederick Station and the wells connected to the Frederick Station (and their associated pollutant-emitting equipment) are interdependent.

Gas accepted into the gathering system near the Frederick Station will have a natural preference to flow to the Frederick Station due to hydraulics, but close proximity to the Frederick Station does not necessarily cause the gas produced from these wells to flow to the Frederick Station in every instance. Such gas can and does flow to other Kerr-McGee Gathering compressor stations in the Wattenberg Field. There is even less confidence that collected gas will pass through the Frederick Station as the distance from the Frederick Station increases. In fact, it is very likely that collected gas from some more distant wells will be split into multiple streams due to system dynamics. These multiple streams could pass through different compressor stations on the way to the delivery points, with a portion of the gas collected from a well passing through the Frederick Station, and with some passing through other compressor stations that are part of Kerr-McGee Gathering's system.[57] This inherent uncertainty in gas flows on a day to day basis argues against aggregating any KMOGO wells with the Frederick Station, since gas flow from a specific well can and does pass through various compressor stations as it is moved to delivery points.

Moreover, gathering systems, including the portion of Kerr-McGee Gathering's system connected to the Frederick Station, are complex and subject to many variables that impact the gathering system dynamics. As described above, variables can include gas production changes at wells due to age or well stimulation (e.g., recompletions), connection of new wells, addition of new compressor stations, and equipment changes at existing compressor stations. All of these changes can influence the gas flow dynamics of the gathering system and impact how collected gas moves to a delivery point. The consequence of these intrinsic variables is a system that is rarely stable.[58]

Taking into consideration the uncertain pathways that gas takes in the Wattenberg Field, along with the regular changes that take place on gathering systems, it is not reasonable to conclude that any specific well and associated pollutant-emitting equipment

---

54 *Id*. at pp. 7-8; *see also* Noble letter at pp. 6-7.
55 Kerr-McGee letter at p. 8.
56 *See* Kerr-McGee letter at p. 9, where Kerr-McGee states that 60% of the gas flowing to the Frederick Station is from third party wells.
57 *See* Kerr-McGee letter at p. 8; *see also* Noble letter at pp. 6-7.
58 *See* Kerr-McGee letter at pp. 6-9; *see also* Noble letter at pp. 5-7.

owned or operated by KMOGO should be aggregated with the Frederick Station as a single source. There is no guarantee that gas collected from any KMOGO well will pass through the Frederick Station on any particular day (or portion of a day). Gathering system changes (e.g., addition of new wells, addition of a new compressor station) could dramatically affect the gas flow from any well. If any particular well or wells and their associated pollutant-emitting equipment were aggregated with the Frederick Station, the result would be a permit covering emission causing activities that could change on a monthly, weekly or even daily basis, resulting in a permit whose emission parameters are not stable. The Division has determined that these facts make determinations to broadly aggregate sources in the oil and gas exploration, production and midstream distribution industry generally unjustifiable because of the inherent unknown gas flow pathways and the common changes to the gathering systems dynamics on a day to day basis.

In most cases in the Wattenberg Field, oil and gas wells and gathering facilities do not have the level of interdependency that would be relevant to justify considering non-contiguous wells to be adjacent to compressor stations. The ownership, contractual, engineering, and operating realities of the Wattenberg Field support few, if any, instances of interdependency among wells and compressor stations that would require or suggest that individual well sites should be aggregated with specific compressor stations, including the Frederick Station.

Applied to the complex legal, engineering and operational situations that exist in the oil and gas industry, as a general rule, upstream oil and gas activities (such as well production, condensate storage and dehydration) are not reliant on only one gathering facility (such as a compressor station). In fact, there often may be many gathering facilities, including a number of compressor stations, which act to transport produced oil and gas from a particular well to a specific receipt point. Similarly, a given gathering facility may support numerous operators and areas of upstream oil and gas activities. As such, it would be inappropriate, unwieldy, complex, and operationally and administratively difficult to conclude that a particular compressor station is dependent on any specific well or that a particular well or wells are dependent on, and thus adjacent to, the Frederick Station. Based on the foregoing, the Division concludes that there is not a sufficiently high level of connectedness and interdependence between these two activities to consider them adjacent, based on the concept of interdependency.

iv. Contiguous or Adjacent – Proximity

Proximity (i.e., distance) is another important factor, and for the reasons set forth above, the Division concludes is a highly relevant factor to consider when evaluating if two emission units are adjacent. Frederick Station is clearly physically connected via gas pipelines to a number of wells. As discussed previously, other oil and gas producing states have developed proximity guidelines to inform their contiguous or adjacent determinations. Generally, these states consider oil and gas operations located within a quarter (¼) mile of each other to be contiguous or adjacent. This distance is consistent with the practical meaning of the term adjacent. Units separated by larger distances

could still be considered adjacent based upon a case-by-case evaluation of distance and significant interdependency.

The Division has not developed any specific distance threshold that would be used to determine adjacency for the oil and gas industry. However, it is informative to note that KMOGO does not operate any pollutant-emitting activities within a quarter (¼) mile of the Frederick Station. The closest KMOGO pollutant-emitting equipment is a condensate storage tank and a water storage tank located 0.3 mile from the Station, and is the only KMOGO pollutant-emitting equipment located within a half (½) mile of the Station. There are four KMOGO condensate and water storage tank pairs located within three quarters (¾) of a mile of the Station, and eleven KMOGO condensate and water storage tank pairs located within one mile of the Station.

As explained above, the nature and extent of connectedness via pipeline in the oil and gas industry is unique when compared with other industries. A typical manufacturing entity may connect operations via pipeline for convenience of production whereas operations in the oil and gas industry are connected via pipeline out of necessity. The Frederick Station must be connected to wells via pipeline in order to move the gas produced at wells to delivery points. The Division has determined that this necessary connectedness should be viewed differently from connectedness in other industries, and therefore will be given less weight in a source determination.59

Proximity is also distinctive in the oil and gas industry, including locations of the wells in the Wattenberg Field that are connected to the Frederick Station. As observed above, wells must be placed where the natural gas resource is located. KMOGO cannot place wells at convenient locations to reduce distance to a compressor station, or to try to avoid single source issues. In the Wattenberg Field, the spacing and density of wells is regulated by the Colorado Oil and Gas Conservation Commission whose mission is to promote the responsible development of Colorado's oil and gas resources. Well locations can also be controlled by land agreements, access issues, geologic formations, terrain, and, in other situations, by federal or state land management agencies, such as the Bureau of Land Management for oil and gas production on federal lands.

The locations of wells surrounding the Frederick Station and their associated pollutant-emitting equipment are not chosen primarily because of their proximity to the station. The Division has determined that nearby wells and their associated pollutant-emitting equipment are not necessarily dependent on this station nor is the Frederick Station dependent on certain nearby wells. Moreover, as distance from the Frederick Station increases, the commercial interests and engineering/process flows and dynamics associated with the wells, their associated pollutant-emitting activities and the station quickly become more complex. Within the context of the oil and gas industry, the lack of proximity between the Frederick Station and the wells/pollutant emitting-equipment strains the common sense notion of plant.

---

59 *See MacClarence*, *supra*, 396 F.3d at 1128, and the ADEC decision, Attachment 16 at pp. 4-7.

v. Contiguous or Adjacent – Conclusion

In the present case, the Division's analysis of the information contained in the administrative permit record demonstrates a lack of interdependency, to the extent that element of the test is relevant, between the Frederick Station and nearby emission sources. Considering proximity in combination with the lack of dedicated relationships between those pollutant-emitting activities owned and/or controlled by Kerr-McGee Gathering and KMOGO, the Division has determined that no additional sources should be considered contiguous or adjacent to the Frederick Station. This part of the three-part test is not met. Therefore, based on this additional analysis to supplement the Technical Review Document, the Division concludes that no additional sources should be aggregated with the Frederick Station at this time.

vi. Other Source Determination Considerations

While it is not directly considered in the three-part test, it is worth noting that the Division does not believe that there would be a significant benefit to the environment from any aggregation of wells with the Frederick Station. This facility is already considered a Major Source for purposes of Title V, and a Major Stationary Source for purposes of PSD and Non-Attainment New Source Review. Aggregation with any wells would not change these designations. In addition, Colorado Regulation No. 7 requires emission controls at oil and gas exploration and production operations and natural gas compressor stations located statewide and in the ozone nonattainment area, including the Frederick Station, other compressor stations owned and operated by Kerr McGee Gathering, and KMOGO owned or operated wells and pollutant-emitting equipment associated with these wells.60 These regulations control emissions from condensate storage tanks, glycol dehydrators, natural gas-actuated pneumatic controllers and natural gas-fired reciprocating internal combustion engines at wells and compressor stations.

Also, KMOGO must control VOC emissions from condensate tanks in this area emitting greater than two tons per year and achieve a specific reduction percentage on a system-wide basis. The exact reduction percentage is based upon the calendar date and increases over time. During the 2009 summer ozone season, KMOGO was required to reduce VOC emissions from these tanks by 81%.61 KMOGO reported a weekly average of 87.8% control for this time period, with no weeks out of compliance.62 The Division would not anticipate a large, or necessarily any, reduction in air emissions from a Division decision to aggregate some KMOGO wells with the Frederick Station, since the storage tanks in this area are already well controlled on a system-wide basis.63

---

60 *See* 5 CCR 1001-9, Regulation No. 7, Sections XII, XVI, XVII, and XVIII.
61 *See* 5 CCR 1001-9, Regulation No. 7, Section XII.D.2.
62 Data obtained from the Division's 2009 system-wide control strategy compliance summary.
63 *See* Kerr-McGee letter at p.11; *see also* EnCana letter at p. 6; Noble letter at p. 7.

Finally, the Division also recognizes that some unintended consequences could result from the aggregation of wells with the Frederick Station. Kerr-McGee Gathering would be allowed to consider emission changes at any aggregated wells during a hypothetical future netting analysis at the Frederick Station. This could, in some cases, result in Kerr-McGee Gathering avoiding future PSD reviews at the Frederick Station.[64]

VI. CONCLUSION

For all of the foregoing reasons and, after considering all the facts, relevant applicability determinations, legal precedent, regulations and the record provided herein, the Division has determined that it is not appropriate to aggregate Kerr-McGee Gathering's Frederick Station with other emission sources in the Wattenberg Field for purposes of the Title V permit renewal. The Division will update the Technical Review Document for the Frederick Station Title V permit with this additional analysis to respond to EPA's Order. This Response to Order constitutes a full response by CDPHE to EPA's October 8, 2009 Order. The Title V renewal operating permit as issued by CDPHE for the Frederick Station, with this supplementation to the record pursuant to the Order, is valid and will not be revised by CDPHE.

Re: Sims Mesa Operating Information
Devon Energy Production Company, L.P.

Dear Mr. Goodyear:

Pursuant to our telephone conversation and electronic mail exchanges, Devon Energy Production Company, L.P. ("Devon") provides the following description of our operations and interactions with midstream companies in the Sims Mesa area of the Northeast Blanco Unit ("NEBU") of the San Juan Basin, New Mexico. In the Sims Mesa area of NEBU, Devon operates 61 wells producing from four (4) formations which are owned by various combinations of 26 different companies (i.e., working interest owners, "WIOs"), with Devon, British Petroleum ("BP"), and ConocoPhillips ("COP") being the most dominant. Gas from each well is measured; and the ownership percentages of each well are used to assign an amount of gas to each WIO (Devon, BP, COP, etc.). The wells produce from conventional natural gas or coal bed natural gas (CBNG) formations.

Gas from the Devon-operated NEBU Sims Mesa wells (see the maps provided as Attachments 1-6 and the large map included as Exhibit 1) ultimately flows to the Enterprise Compressor Station ("Enterprise") or the Williams Field Services Compressor Station ("Williams"). The wells identified on the maps in blue flow directly to Enterprise without going through the Devon Sims Mesa CDP; and the wells identified on the maps in green flow to the Devon Sims Mesa CDP and then to either Williams or Enterprise. The Devon Sims Mesa CDP is basically the consolidation point where the flow lines from the wells identified on the maps in green in the Sims Mesa Area come together. The Devon Sims Mesa CDP equipment consists of separators, a slug catcher for pigging operations, 500-barrel (bbl) produced water tanks, lines, valves, flanges, and flow measurement devices. The gas flowing through the lines, valves, and flanges primarily consists of methane, ethane, carbon dioxide, and nitrogen.

Generally, the NEBU gas is marketable at the wellhead and sold at the tailgates of the gas plants in the area. Physically, at the Devon Sims Mesa CDP, gas from the wells identified in green is delivered through a flow meter to the nearby the nearby Williams Compressor Station or the Enterprise Compressor Station (see Attachments 2-4). The wells identified in blue on Attachments 5-6 flow directly to Enterprise. As explained in more detail below, the typical volumetric split of produced gas from Devon Sims Mesa CDP is approximately 48 percent to Enterprise and approximately 52 percent to Williams, with 100% of the gas owned by Devon being delivered to Enterprise either directly or through the CDP.

The Enterprise Compressor Station is located across County Road 363 south of the Devon Sims Mesa CDP; and the Williams Compressor Station is located approximately ½ mile northeast of the Devon Sims Mesa CDP. The Devon Sims Mesa CDP and Williams Compressor Station are separated by a ½ mile of undeveloped land; the Devon Sims Mesa CDP and the Enterprise Compressor Station are separated by County Road 363 (see Attachment 2). Both the Enterprise and Williams compressor stations compress gas and send it to those companies' respective natural gas plants near Bloomfield, New Mexico.

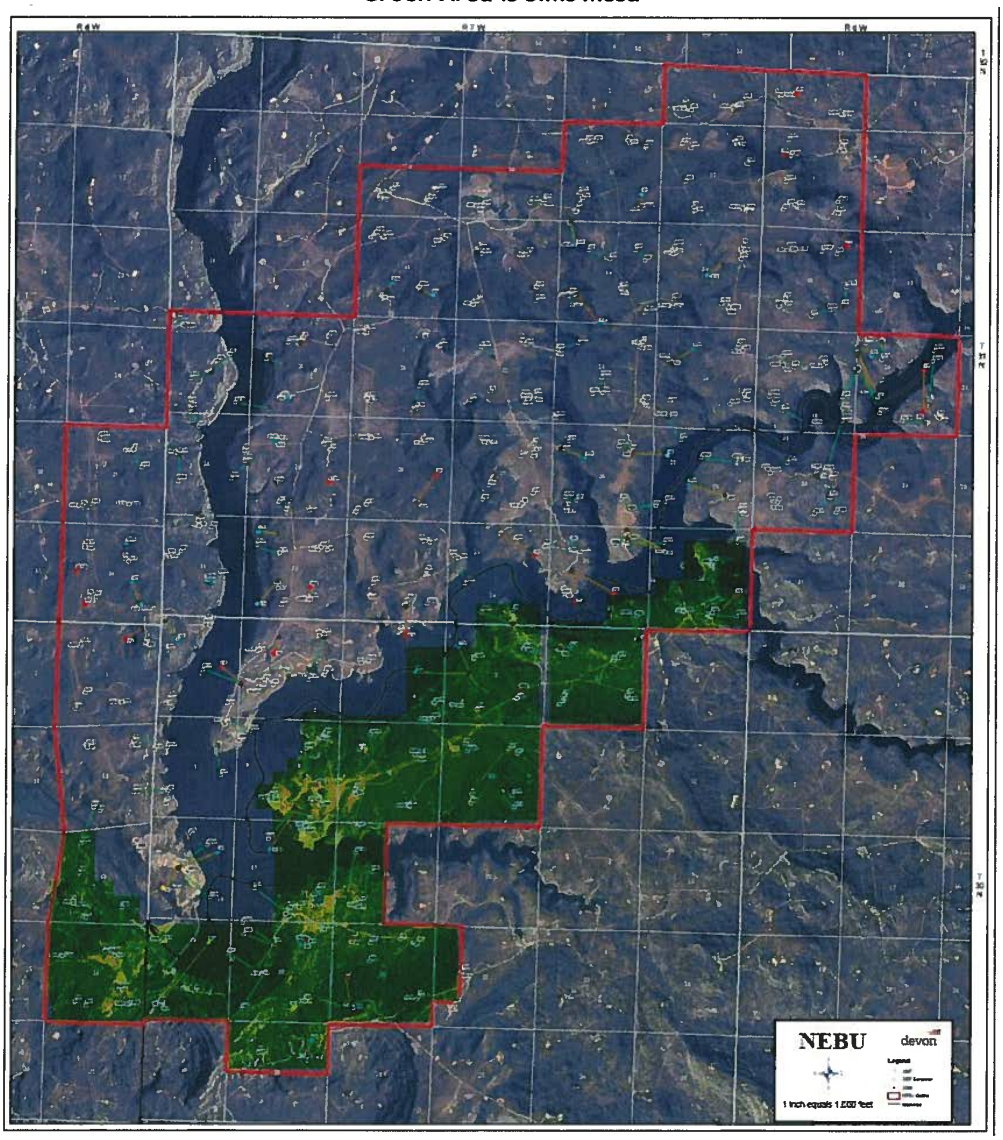
Devon delivers 100 percent of the gas it owns to Enterprise via a contractual arrangement (see Attachment 7, which is considered Business Confidential Information). The other WIOs (such as BP and COP) have sole and exclusive control regarding the marketing and disposition of their proportionate share of gas from the Sims Mesa Unit as provided for in Section 23 of the NEBU Unit Operating Agreement (see Attachment 8, which is considered Business Confidential Information). As such, each WIO has its own separate and distinct contractual relationship with either Williams or Enterprise with Devon having no knowledge of such WIO's marketing arrangement. The only instance when Devon is involved in a WIO's marketing arrangement is through the gas nomination process when the WIO instructs and directs Devon to nominate volumes of the WIO's gas at certain delivery points or CDPs for delivery on the pipeline facilities in the area (whether to Williams or Enterprise).

In those instances when either the Williams or Enterprise systems experience operational issues, or gas flow curtailments, gas delivered to the Devon Sims Mesa CDP (see the green wells on Attachments 2-4) can be split to allow wells to continue to produce and flow. Each system can take over 50 percent of the total volumes produced from the Devon-operated Sims Mesa wells into the Devon Sims Mesa CDP. Should only Enterprise experience operational issues, the wells flowing directly to Enterprise (see the blue wells on Attachments 5-6) have to be shut in. The gas split between the Enterprise and Williams systems is balanced monthly to ensure that all parties' marketing arrangements are fulfilled.

As noted above, Attachments 7 and 8 are confidential contractual documents between Devon and other parties (i.e., confidential business information). Devon treats these documents as confidential, and we do not disclose them to third-parties. The disclosure of these contractual agreements could impact our ability to negotiate other, similar agreements in the future, and may also subject us to liability from the other parties to the contract for violating any confidentiality provisions that may be in the contracts. Your cooperation in maintaining the business confidentiality of the documents is greatly appreciated.

Should you have any questions, or need additional information, please feel free to call me at (405) 552-4516.

Sincerely,



Ronald D. Truelove
Manager, Environmental, Health, and Safety
Western Division

Re: Additional Sims Mesa Operating Information
Devon Energy Production Company, L.P.

Dear Mr. Smith:

Pursuant to our several telephone conversations and electronic mail exchanges, Devon Energy Production Company, L.P. ("Devon") provides the following additional information regarding our operations and interactions with other companies in the Sims Mesa area of the Northeast Blanco Unit ("NEBU") of the San Juan Basin, New Mexico.

As previously provided, in the Sims Mesa area of NEBU, Devon operates 61 wells producing from four (4) formations which are jointly owned by various combinations of 26 different companies (i.e., working interest owners, "WIOs"), with Devon, British Petroleum ("BP"), and ConocoPhillips ("COP") being the most dominant. Gas from each well is measured; and the ownership percentages of each well are used to assign an amount of gas to each WIO (Devon, BP, COP, etc.) at the wellhead.

The wells produce from conventional natural gas or coal bed natural gas (CBNG) formations. The four primary formations and approximate Devon ownership in each of these primary formations is provided below:

- Fruitland Coal (CBNG formation): ~24.79%
- Mesaverde (conventional formation): ~5.56%
- Dakota (conventional formation): ~18.87%
- Pictured Cliffs: ~32.60%

Overall, approximately 90% of the gas produced in the Sims Mesa area comes from the Fruitland Coal formation.

As previously provided, gas from the Devon-operated NEBU Sims Mesa wells ultimately flows to the Enterprise Compressor Station ("Enterprise") or the Williams Field Services Compressor Station ("Williams"). Some wells flow directly to Enterprise without going through the Devon Sims Mesa CDP. Other wells flow to the Devon Sims Mesa CDP and then to either Williams or Enterprise. The Devon Sims Mesa CDP is basically the consolidation point where the flow lines from the wells come together.

Generally, the NEBU gas is marketable at the wellhead and sold at the tailgates of the gas plants in the area. Physically, at the Devon Sims Mesa CDP, gas is delivered through flow meters and a gas chromatograph to the nearby Williams Compressor Station or the Enterprise Compressor Station. The typical volumetric split of produced gas from Devon Sims Mesa CDP is approximately 52 percent to Enterprise and approximately 48 percent to Williams, with 100% of the gas owned by Devon being delivered to Enterprise either directly from wells or through the CDP. No gas owned by Devon flows to Williams. In fact, Devon has no contractual relationship with Williams. Williams only processes gas owned by companies other than Devon.

Devon delivers 100 percent of the gas it owns to Enterprise via a contractual arrangement. The other WIOs (such as BP and COP) have sole and exclusive control regarding the marketing and disposition of their proportionate share of gas from the Sims Mesa Unit. As such, each WIO has its own separate and distinct contractual relationship with either Williams or Enterprise with Devon having no knowledge of such WIO's marketing arrangement. The only instance when Devon is involved in a WIO's marketing arrangement is through the gas nomination process when the WIO instructs and directs Devon to nominate volumes of the WIO's gas at certain delivery points or CDPs for delivery on the pipeline facilities in the area (whether to Williams or Enterprise).

In those instances when either the Williams or Enterprise systems experience operational issues or gas flow curtailments, gas delivered to the Devon Sims Mesa CDP can be split to allow wells to continue to produce and flow. Each system can take over 50 percent of the total volumes produced from the Devon-operated Sims Mesa wells into the Devon Sims Mesa CDP. Should only Enterprise experience operational issues, the wells flowing directly to Enterprise have to be shut in. The gas split between the Enterprise and Williams systems is balanced monthly to ensure that all parties' marketing contractual arrangements are fulfilled.

You have raised questions regarding decisions by the WIOs to drill new wells or send additional gas to Williams. First of all, any decisions regarding new wells are made by the particular WIOs in the area and formation to be drilled. A 65% affirmative vote is required of the WIOs to make a decision. As stated above, depending on the specific formation, Devon's working interest varies from approximately 5.56% to 32.60%, with the majority of the gas from the unit being from the Fruitland Coal formation, where Devon has approximately 24.79% ownership. Therefore, Devon cannot singularly control the decision to drill a new well.

Additionally, all decisions regarding new flow lines, gas movement, etc. are made by the owners impacted by the decision, with each given a voting percentage equal to the their percentage of gas present at that point in the process. Again, a 65% affirmative vote is required to make a decision; and Devon cannot singularly control that decision.

Finally, Devon has no control on whether or not to increase or decrease flow to Williams due to the fact that Devon has no contractual relationship with Williams to process its gas. All gas owned by Devon is delivered to Enterprise. Other specific WIOs have relationships with Williams. Again, Devon has no knowledge of their relationships. Devon only delivers gas to Williams as directed by those other WIOs.

I hope this letter answers your questions. Should you have additional questions, or need additional information, please feel free to call me at (405) 552-4516.

Sincerely,

Ronald D. Truelove
Manager, Environmental, Health, and Safety
Mid-Continent Division

Tempo/IDEA ID No.: 1040–PRT20120002
AIRS No. 35-039-0078
FACILITY NAME: Sims Mesa Central Delivery Point

PERMITTEE: Williams Four Corners LLC
P. O. Box 2400
Tulsa, OK 74101-2400

ISSUED BY: New Mexico Environment Department

TV Permit Expiration Date: 3/19/2015
TV Renewal Application Due: 3/19/2014

Richard L. Goodyear, PE **Date of Issuance**
Acting Bureau Chief
Air Quality Bureau

Template vsn: 7/14/09

INTRODUCTION

Operating Permit Number P026R2M1 is issued by the Air Quality Bureau of the New Mexico Environment Department ("Department") to Williams Four Corners LLC pursuant to the federal Clean Air Act ("federal Act"), the New Mexico Air Quality Control Act ("state Act") and regulations adopted pursuant to the state and federal Acts, including Title 20, New Mexico Administrative Code, Chapter 2, Part 70 (20.2.70 NMAC) - Operating Permits. This permit authorizes the operation of this facility located at UTM Zone 13, UTMH 272.25 km, UTMV 4075.62 km, approximately 17 miles Northeast of Blanco, New Mexico in Rio Arriba County.

This permit is valid only for the named permittee, owner, and operator. A permit modification is required to change any of those entities. This facility is a natural gas compressor station. The major processes associated with the facility are the compression and dehydration of natural gas.

The term of this permit is five (5) years. It will expire five years from the date of issuance, pursuant to 20.2.70.302.B NMAC. Application for renewal of this permit is due twelve (12) months prior to the date of expiration, pursuant to 20.2.70.300.B.2 NMAC.

Pursuant to 20.2.70.302.A.1 NMAC, the Department specifies with this permit, terms and conditions upon the operation of this facility to assure compliance with all applicable requirements, as defined in 20.2.70 NMAC at the time this permit is issued.

Pursuant to the New Mexico Air Quality Control Act NMSA 1978, Chapter 74, Article 2, all terms and conditions in this permit, including any provisions designed to limit this facility's potential to emit, are enforceable by the Department. Pursuant to 20.2.70.302.A.5 NMAC, all terms and conditions are enforceable by the Administrator of the United States Environmental Protection Agency ("EPA") and citizens under the federal Act, unless the term or condition is specifically designated in this permit as not being enforceable under the federal Act.

PERMIT SHIELD

Pursuant to 20.2.70.302.J NMAC, compliance with the conditions of this permit shall be deemed to be compliance with any applicable requirements existing as of the date of permit issuance and identified in Table A.1 of Appendix A. The requirements in Table A.1 are applicable to this facility with specific requirements identified for individual emission units.

The Department has determined that the requirements in Table A.2 of Appendix A as identified in the permit application are not applicable to this source, or they do not impose any conditions in this permit.

This permit shield does not extend to administrative amendments, to minor permit modifications, to changes made under Section 502(b)(10) of the federal Act, or to permit terms for which notice has been given to reopen or revoke all or part.

TOTAL POTENTIAL EMISSIONS

The total potential emissions from this facility, excluding insignificant or trivial activities, are shown in the following table. Emission limitations for individual units are shown in section 3.2.

Table 1, Total Potential Criteria Pollutant Emissions from Entire Facility (for information only, not an enforceable condition):

Pollutant	**Emissions** (tons per year)
Nitrogen Oxides (NOx)	194.8
Carbon Monoxide (CO)	356.8
Volatile Organic Compounds (VOC)*	170.6
Sulfur Dioxide (SO2)	1.4
Total Suspended Particulates	4.4
Particulate Matter less than 10 microns (PM_{10})	4.4
Particulate Matter less than 2.5 microns ($PM_{2.5}$)	4.4

Table 2, Total Potential HAPS that exceed 0.5 ton per year (for information only, not an enforceable condition):

Pollutant	**Emissions** (tons per year)
Formaldehyde	22.0
Xylenes	4.8
Benzene	2.8
Toluene	9.6
Total HAPs**	**39.6**

* HAP Emissions are already included in VOC emissions.

** The total HAP emissions may not agree with the sum of individual HAPs because only individual HAPs greater than 0.5 tons per year are listed here.

PERMIT TERMS AND CONDITIONS

1.0 GENERAL CONDITIONS

1.1 The following permit terms and conditions are placed upon the permittee in accordance with 20.2.70.7, 201.B, 300, 301.B, 302, 405 NMAC.

1.1.1 The permittee shall abide by all terms and conditions of this permit, except as allowed under Section 502(b)(10) of the federal Act, and 20.2.70.302.H.1 NMAC. Any permit noncompliance is grounds for enforcement action, and significant or repetitious noncompliance may result in termination of this permit. Additionally, noncompliance with federally enforceable conditions of this permit constitutes a violation of the federal Act.

1.1.2 It shall not be a defense for the permittee in an enforcement action to claim that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

1.1.3 If the Department determines that cause exists to modify, reopen and revise, revoke and reissue, or terminate this permit, this shall be done in accordance with 20.2.70.405 NMAC.

1.1.4 The permittee shall furnish any information the Department requests in writing to determine if cause exists for reopening and revising, revoking and reissuing, or terminating the permit, or to determine compliance with the permit. This information shall be furnished within the time period specified by the Department. Additionally, the permittee shall furnish, upon request by the Department, copies of records required by the permit to be maintained by the permittee.

1.1.5 A request by the permittee that this permit be modified, revoked and reissued, or terminated, or a notification by the permittee of planned changes or anticipated noncompliance, shall not stay any conditions of this permit.

1.1.6 This permit does not convey property rights of any sort, or any exclusive privilege.

1.1.7 In the case where an applicant or permittee has submitted information to the Department under a claim of confidentiality, the Department may also require the applicant or permittee to submit a copy of such information directly to the Administrator of the EPA.

1.2 The issuance of this permit, or the filing or approval of a compliance plan, does not relieve the permittee from civil or criminal liability for failure to comply with the state or federal Acts, or any applicable state or federal regulation or law. This condition is pursuant to 20.2.70.302.A.6 NMAC and the New Mexico Air Quality Control Act NMSA 1978, Chapter 74, Article 2.

1.3 If any part of this permit is challenged or held invalid, the remainder of the permit terms and

conditions are not affected and the permittee shall continue to abide by them. This condition is pursuant to 20.2.70.302.A.1.d NMAC.

1.4 The permittee shall pay fees to the Department consistent with the fee schedule in 20.2.71 NMAC - Operating Permit Emission Fees. The fees will be assessed and invoiced separately from this permit. This condition is pursuant to 20.2.70.302.A.1.e NMAC.

1.5 A responsible official (as defined in 20.2.70.7.AD NMAC) shall certify the accuracy, truth and completeness of every report and compliance certification submitted to the Department as required by this permit. These certifications shall be part of each document. This condition is pursuant to 20.2.70.300.E NMAC.

1.6 Revocation or termination of this permit by the Department terminates the permittee's right to operate this facility. This condition is pursuant to 20.2.70.201.B NMAC.

1.7 The permittee shall submit an emissions inventory for this facility annually. The emissions inventory shall be submitted by the later of April 1 or within 90 days after the Department makes such request. This condition is pursuant to 20.2.73 NMAC and 20.2.70.302.A.1 NMAC.

1.8 The permittee will continue to comply with all applicable requirements. For applicable requirements that will become effective during the term of the permit, the permittee will meet such requirements on a timely basis. This condition is pursuant to sections 300.D.11.c and 302.G.3 of 20.2.70 NMAC.

1.9 Compliance with this operating permit is sufficient to comply with all NSR permits listed in Table A.1. This condition is pursuant to 20.2.70.302.A.1 NMAC.

1.10 At all times, including periods of startup, shutdown, and malfunction, owners and operators shall, to the extent practicable, maintain and operate the source including associated air pollution control equipment in a manner consistent with good air pollution control practice for minimizing emissions. (20.2.7.109, 20.2.72.210.A, 20.2.72.210.B, 20.2.72.210.C, 20.2.72.210.E NMAC) The establishment of allowable malfunction emission limits does not supersede this requirement.

2.0 FACILITY INFORMATION

Conditions of 2.0 are pursuant to 20.2.70.302.A.7 NMAC and NSR Permit 874M3.

2.1 All of the process equipment authorized for this facility is listed in the table(s) shown below (emission units that were identified as insignificant or trivial, and equipment not regulated pursuant to the Act are not included):

Table 2.1, Compressor Engines:

Emission Unit No.	Equipment Type	Equipment Manufacturer & Model	Serial Number
001	Natural Gas Fueled Internal Combustion Engine	Waukesha 7042GL	Not installed to date
002	Natural Gas Fueled Internal Combustion Engine	Waukesha 7042GL	Not installed to date
003	Natural Gas Fueled Internal Combustion Engine	Waukesha 7042GL	76779
004	Natural Gas Fueled Internal Combustion Engine	Waukesha 7042GL	Not installed to date
005	Natural Gas Fueled Internal Combustion Engine	Waukesha 7042GL	X00244

Table 2.1.1, Glycol Dehydrator:

Emission Unit No.	Equipment Type	Equipment Manufacturer & Model	Serial Number
007	Glycol Dehydrator	TEG Dehydrator	40451
008	Glycol Dehydrator	TEG Dehydrator	Not installed to date
009	Glycol Dehydrator	TEG Dehydrator	40450
010	Glycol Dehydrator	TEG Dehydrator	40105

2.2 All the pollution control equipment required for this facility is listed in the table shown below. Each emission point is identified by the same number that was assigned to it in the permit application:

Table 2.2, Emission Control Equipment:

Control Unit No.	Control Equipment Type	Control Equipment Mfg & model (or equivalent)	Control For Unit(s)
Not Applicable	All Flash Tanks Emissions shall at all times be recovered and routed to the facility fuel system		Glycol Dehydrators Units 7-10

3.0 REQUIREMENTS FOR INDIVIDUAL EMISSIONS UNITS

Information regarding applicable requirements, emission limits, operational limitations and requirements, work practices, and monitoring, testing and recordkeeping requirements is provided below for each emissions unit or set of similar units.

3.1 Applicable Requirements
All applicable requirements for this facility are listed in Appendix A, Table A.1. This condition is pursuant to 20.2.70.302.A.1 NMAC.

3.2 Emissions Limits
Table 3.2 lists the emission units, and their allowable emission limits. This condition is pursuant to 40 CFR 50; Paragraphs 1, 7, and 8 of 20.2.70.302.A NMAC and NSR Permit 874M3.

Table 3.2: Maximum Allowable Emission Rates in lb/hr and ton/y*

Emission Unit No.	NO_x lb/hr	NO_x tons/y	CO lb/hr	CO tons/y	VOC lb/hr	VOC tons/y
1	4.5	19.4	8.1	35.6	3.1	13.3
2	4.5	19.4	8.1	35.6	3.1	13.3
3	4.5	19.4	8.1	35.6	3.1	13.3
4	4.5	19.4	8.1	35.6	3.1	13.3
5	4.5	19.4	8.1	35.6	3.1	13.3
6	4.5	19.4	8.1	35.6	3.1	13.3
7a (Still Vent)					2.2	9.4
8a (Still Vent)					2.2	9.4
9a (Still Vent)					2.2	9.4
10a (Still Vent)					2.2	9.4

11	4.5	19.4	8.1	35.6	3.1	13.3
12	4.5	19.4	8.1	35.6	3.1	13.3

14	4.5	19.4	8.1	35.6	3.1	13.3
Total Allowables**		**194.8**		**356.8**		**170.6**

* Pounds per hour/tons per year
** Total Allowables are for information, not enforceable conditions, and used to determine annual Operating Fees.

3.3 Operational Requirements
This section does not contain any requirements at this time, except as required in Condition 1.10.

3.4 Emissions Monitoring and Testing Requirements
Conditions of 3.4 are pursuant to 20.2.70.302.A and C NMAC, and NSR Permit 874M3.

3.4.1 General Monitoring Requirements
These requirements do not supersede or relax requirements of federal regulations.

3.4.1.1 The following monitoring and/or testing requirements shall be used to determine compliance with applicable requirements and emission limits. Any sampling, whether by portable analyzer or EPA reference method, that measures an emission rate over the applicable averaging period greater than an emission limit in this permit constitutes noncompliance with this permit. The Department may require, at its discretion, additional tests pursuant to EPA Reference Methods at any time, including when sampling by portable analyzer measures an emission rate greater than an emission limit in this permit; but such requirement shall not be construed as a determination that the sampling by portable analyzer does not establish noncompliance with this permit and shall not stay enforcement of such noncompliance based on the sampling by portable analyzer.

3.4.1.2 If the emission unit is shutdown at the time when periodic monitoring is due to be accomplished, the permittee is not required to restart the unit for the sole purpose of performing the monitoring. Using electronic or written mail, the permittee shall notify the Department's Enforcement Section of a delay in emission tests prior to the deadline for accomplishing the tests. Upon recommencing operation, the permittee shall submit any pertinent pre-test notification requirements set forth in the current version of the Department's Standard Operating Procedures For Use Of Portable Analyzers in Performance Test, and shall accomplish the monitoring.

3.4.1.3 The requirement for monitoring during any monitoring period is based on the percentage of time that the unit has operated as follows:

3.4.1.3.1 If the emission unit has operated for more than 25% of a monitoring period, then the

permittee shall conduct monitoring during that period.

3.4.1.3.2 If the emission unit has operated for 25% or less of a monitoring period then the monitoring is not required. After two successive periods without monitoring, the permittee shall conduct monitoring during the next period regardless of the time operated during that period, except that for any monitoring period in which a unit has operated for less than 10% of the monitoring period, the period will not be considered as one of the two successive periods. However, to invoke monitoring exemptions at 3.4.1.3.2, hours of operation shall be monitored and recorded.

3.4.1.3.3 If invoking the monitoring **period** exemption in 3.4.1.3.2, the actual operating time of a unit shall not exceed the monitoring period required by this permit before the required monitoring is performed. For example, if the monitoring period is annual, the operating hours of the unit shall not exceed 8760 hours before monitoring is conducted. Regardless of the time that a unit actually operates, a minimum of one of each type of monitoring activity shall be conducted at least once every 3 years.

3.4.1.4 The permittee is not required to report a deviation for any monitoring or testing required in section 3.4.2 if the deviation was authorized in the General Monitoring Requirements section 3.4.1.

3.4.1.5 For all periodic monitoring events, except when a federal or state regulation is more stringent, three test runs shall be conducted at 90% or greater of the unit's capacity as stated in this permit, or in the permit application if not in the permit, and at additional loads when requested by the Department. If the 90% capacity cannot be achieved, the monitoring will be conducted at the maximum achievable load under prevailing operating conditions except when a federal or state regulation requires more restrictive test conditions. The load and the parameters used to calculate it shall be recorded to document operating conditions and shall be included with the monitoring report that is required to be furnished to the Department.

3.4.1.6 When requested by the Department, the permittee shall provide schedules of testing and monitoring activities. Compliance tests from previous NSR and Title V permits may be re-imposed if it is deemed necessary by the Department to determine whether the source is in compliance with applicable regulations or permit conditions.

3.4.1.7 Monitoring shall become effective 120 days after the date of permit issuance if the monitoring is new or in addition to monitoring imposed by an existing applicable requirement. Any pre-existing monitoring requirements incorporated in this permit shall continue to be in force from the date of permit issuance.

3.4.1.8 Startup, Shutdown and Malfunction Conditions:

This facility is subject to the requirement for a Startup, Shutdown and Malfunction Plan (SSM) under 40 CFR 63.6(e)(3). This condition is pursuant to 20.2.70.302.A.1 and A.4 NMAC.

3.4.1.9 Startup, Shutdown, and Maintenance Conditions: The permittee shall operate in accordance with the procedures set forth in the plan to minimize emissions during routine or predictable start up, shut down, and scheduled maintenance (SSM work practice plan). This condition is pursuant to 20.2.7.14.A NMAC.

3.4.2 Unit Specific Monitoring Requirements: The following table lists emission units and their required monitoring. Descriptions of required monitoring follow the table.

Table 3.4.2, Required Monitoring

Emission unit Nos.	Parameters To Monitor	To Comply With	Monitoring Required	Monitoring Conditions
General Monitoring				
1-6, 7b-10b and 11-14	Visible emissions	20.2.61 NMAC and NSR 874M3 conditions 2b and 3a	20% Opacity	3.4.2.1
Monitoring for IC Engines				
1-6 and 11-14	NOx, CO, VOC	Emission Limits specified in Table 3.2	Periodic Emission Tests (Annual)	3.4.2.3
1-6 and 11-14	NOx, CO, VOC	Emission Limits specified in Table 3.2	Maintenance	3.4.2.4
Monitoring for Glycol Dehydrators				
7-10	VOC	40 CFR 63.760, Subpart HH and NSR Permit 874M3, Condition 3.b	Specific requirements of 40 CFR 63.760, Subpart HH	3.4.2.5
7-10	Records of Equipment Inspection for Leaks and Corrosion	Emission limits specified in Table 3.2	Equipment Inspection (Semiannual)	3.4.2.6
7-10	Maintenance and Repair Activities	Emission limits specified in Table 3.2	Maintenance and Repair	3.4.2.7
7a-10a	Flash Tank	NSR Permit Condition 1.f	Flash Tank Emissions	3.4.2.8
7-10	Extended Field Gas Analysis	VOC, Benzene, Total HAP Emissions and NSR 874M3 Permit Condition 4.d	Annual Field Gas Analysis	3.4.2.9

Note: The numbering of conditions in this table are in the same sequence for the next three major Sections of the permit: Monitoring, Recordkeeping, and Reporting.

3.4.2.1 Opacity Monitoring (For Units 1-6, 7b-10b and 11-14): Use of natural gas fuel constitutes compliance with 20.2.61 NMAC unless opacity exceeds 20% averaged over a 10-minute period. When any visible emissions are observed during steady state operation, opacity shall be measured over a 10-minute period, in accordance with the procedures at 40 CFR 60, Appendix A, Method 9 as required by 20.2.61.114 NMAC. This condition was brought forward from NSR Permit 874M3, Condition 2b and 3a.

3.4.2.1.1 Natural gas is defined as a naturally occurring fluid mixture of hydrocarbons that contains 20.0 grains or less of total sulfur per 100 standard cubic feet (scf) and is either composed of at least 70% methane by volume or has a gross calorific value between 950 and 1100 Btu per standard cubic foot. This definition is from 40 CFR 60.331.

3.4.2.1.2 Natural gas compressor engines, Units 1-6 and 11-14, and dehydrator reboilers, Units 7b - 10b, shall only combust natural gas. This condition was brought forward from NSR Permit 874M3, Condition 1.d.

3.4.2.2 Initial Compliance Tests (For Engines, Units 3 and 5): The permittee shall test for NOx and CO in accordance with EPA Method Tests 1-4 (stack gas flowrate), 7E (NOx) and 10 (CO) and in accordance with 40 CFR 60, Subpart A, General Provisions and Appendix A. The permittee shall also follow the initial compliance test procedures in Condition 3.6.

3.4.2.3 Periodic Emissions Test Monitoring (For Engines, Units 1-6 and 11-14): The permittee shall test using a portable analyzer subject to the requirements and limitations of section 3.4.1, General Monitoring Requirements. For periodic testing NOx and CO emissions tests shall be carried out as described below. Test results that demonstrate compliance with the CO emission limits shall be considered to demonstrate compliance with the VOC emission limits.

(a) The monitoring period shall be annually, starting on December 1 and ending November 30.

(b) Initial monitoring shall occur within the first monitoring period occurring after permit issuance.

(c) All subsequent monitoring shall occur in each succeeding monitoring period. No two monitoring events shall occur closer together in time than 25% of a monitoring period.

(d) Follow the portable analyzer requirements and test procedures in section 3.5.

3.4.2.4 Maintenance (For Engines 1-6 and 11-14): The permittee shall at a minimum, conduct the following engine maintenance:

(a) Change the oil and oil filter every 1008 hours of operation or annually, whichever

comes first.

(b) Replace the spark plugs every 1008 hours of operation or annually, whichever comes first.

(c) Inspect the air cleaner; and inspect all guards, belts, hoses, and fans at least once every 1008 hours or operation or annually, whichever comes first, and replace as necessary.

3.4.2.5 NESHAP Subpart HH Monitoring (For Dehydrators, Unit 7 - 10): The specified glycol dehydrators are subject to NESHAP Subpart HH (40 CFR 63.760) and shall meet the monitoring requirements of 40 CFR 63.773.

3.4.2.5.1 The permittee shall demonstrate compliance with 40 CFR 63, Subpart HH monitoring requirements for each glycol dehydrator in accordance with § 63.772(b) to demonstrate compliance with General standards exemptions found in § 63.764 (d). This condition was brought forward from NSR Permit 874M3, Condition 3.b.

3.4.2.5.2 Units 7a, 8a, 9a, and 10a TEG Dehydrators, are subject to federal National Emission Standards for Hazardous Air Pollutants (NESHAP) found in 40 CFR 63, Subpart A – General Provisions, and Subpart HH – NESHAP for Oil and Natural Gas Production Facilities. The permittee shall comply with the applicable notification requirements in both 40 CFR 63 Subparts A and HH, and with the specific requirements of Subpart HH. This condition was brought forward from NSR Permit 874M3, Condition 1.e.

3.4.2.6 Equipment Inspection Monitoring (For Dehydrator, Units 7 - 10): The permittee shall examine each glycol dehydrator semi-annually and any VOC control equipment for corrosion and gas leaks and shall note whether any repairs or maintenance were made.

3.4.2.7 Maintenance and Repair Records Monitoring (For Dehydrator, Unit 7 - 10): Maintenance and repair shall meet the minimum manufacturer's or permittee's recommended maintenance schedule. Maintenance and repair activities that involve adjustment, replacement, or repair of functional components with the potential to affect operation of an emission unit shall be documented as they occur for the following events:

(a) Routine Maintenance that takes a unit out of service for more than two hours during any twenty-four hour period.

(b) Unscheduled repairs that require a unit to be taken out of service for more than two hours in any twenty-four hour period.

3.4.2.8 Flash Tank Monitoring (For Dehydrator, Unit 7 - 10): All Flash Tank emissions from Units 7a, 8a, 9a, and 10a shall, at all times, be recovered and routed to the Facility fuel system for combustion. This condition was brought forward from NSR Permit 874M3, Condition 1.f.

3.4.2.8.1 The permittee shall conduct visual inspections, at least quarterly, of the TEG Dehydrator Units Unit 7 - 10, to ensure that the Flash Tank emissions are routed to the Facility fuel system at all times. All necessary repairs shall be completed immediately to ensure compliance with this operating condition. This condition was brought forward from NSR Permit 874M3, Condition 3.c.

3.4.2.9 Extended Field Gas Analysis (For Dehydrator, Unit 7 - 10): Every twelve months, an extended field gas analysis shall be completed on the gas processed by the TEG Dehydrator Units. VOC, Benzene, and Total HAPs emissions, in tons per year, from each TEG Dehydrator Flash Tank and Still Vent shall be determined using input parameters from the most recent gas analysis and GRI-GLYCalc 4.0, or higher numbered version of the program. This condition was brought forward from NSR Permit 874M3, Condition 4.d.

3.5 Portable Analyzer Requirements and Test Procedures (For Engines, Units 1-6 and 11-14):

3.5.1 Portable Analyzer Requirements: A portable analyzer that is used for periodic emissions tests must meet the requirements of ASTM D 6522-00. However, if a facility has met a previously approved Department criterion for portable analyzers, the analyzer may be used until it is replaced.

3.5.2 Portable Analyzer Test Procedures

3.5.2.1 The permittee shall use a portable analyzer, subject to the requirements and limitations of Section 3.4.1. Periodic testing is required for total nitrogen oxides (NOx) and carbon monoxide (CO).

3.5.2.2 The portable emissions analyzer shall be setup and operated in accordance with the manufacturer's instructions, with the requirements of ASTM D-6522-00, or with the criterion of an analyzer previously approved by the Department, and with the following conditions:

(a) Equipment shall be tested in the "as found" condition. Equipment may not be adjusted or tuned prior to any test for the purpose of lowering emissions, and then returned to previous settings or operating conditions after the test is complete.

(b) During emissions tests, pollutant, O_2 concentration and fuel flow rate shall be monitored and recorded. This information shall be included with the test report furnished to the Department.

(c) Pollutant emission rate shall be calculated in accordance with 40 CFR 60, Appendix A, Method 19 utilizing fuel flow rate (scf) and fuel heating value (Btu/scf) obtained during the test.

3.6 Initial Compliance Test Requirements and Test Procedures (For Engines, Units 1-6 and 11-14):

(a) Compliance tests shall be conducted within sixty (60) days after the unit(s) achieve the maximum normal production rate after the issue date of Permit P026R2M1. If the maximum normal production rate does not occur within one hundred twenty (120) days, then the tests must be conducted no later than one hundred eighty (180) days after the issue date of Permit P026R1M1.

(b) Unless otherwise indicated by Specific Conditions or regulatory requirements, the default time period for each test run shall be at least 60 minutes and each performance test shall consist of three separate runs using the applicable test method. For the purpose of determining compliance with an applicable emission limit, the arithmetic mean of results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances, beyond the owner or operator's control, compliance may, upon the Department approval, be determined using the arithmetic mean of the results of the two other runs.

(c) Testing of emissions shall be conducted with the emissions unit operating at 90 to 100 percent of the maximum operating rate allowed by the permit. If it is not possible to test at that rate, the source may test at a lower operating rate, subject to the approval of the Department. Testing performed at less than 90 percent of permitted capacity will limit emission unit operation to 110 percent of the tested capacity until a new test is conducted. If conditions change such that unit operation above 110 percent of tested capacity is possible, the permittee must submit a protocol to the Department within 30 days of such change to conduct a new emissions test.

(d) The permittee shall notify the Department’s Program Manager, Compliance and Enforcement Section at least thirty (30) days before the test date and allow a representative of the Department to be present at the test.

(e) Equipment shall be tested in the "as found" condition. Equipment may not be adjusted or tuned prior to any test for the purpose of lowering emissions, and then returned to previous settings or operating conditions after the test is complete.

(f) Contents of test notifications, protocols and test reports shall conform to the format specified by the Department’s Universal Test Notification, Protocol and Report Form and Instructions. Current forms and instructions are posted to NMED’s Air Quality web site under Compliance and Enforcement Testing.

(g) The permittee shall provide sampling ports adequate for the test methods applicable to the facility; safe sampling platforms; safe access to sampling platforms; and utilities for sampling and testing equipment.

(h) The stack shall be of sufficient height and diameter and the sample ports shall be located so that a representative test of the emissions can be performed in accordance with the requirements of EPA Method 1 or ASTM D 6522-00 as applicable.

(i) Where necessary to prevent cyclonic flow in the stack, flow straighteners shall be installed

(j) Unless otherwise indicated by Specific Conditions or regulatory requirements, test reports shall be submitted to the Department no later than 30 days after completion of the test.

4.0 RECORDKEEPING
Conditions of 4.0 are pursuant to 20.2.70.302.D NMAC.

4.1 General Recordkeeping Requirements:
Conditions of 4.1 are pursuant to 20.2.70.302.D.1 NMAC.

4.1.1 All sampling and measured data required by this permit for the emissions units in this facility shall be recorded. The minimum information to be included in these records is:

4.1.1.1 equipment identification (include make, model and serial number for all tested equipment and emission controls);
4.1.1.2 date(s) and time(s) of sampling or measurements;
4.1.1.3 date(s) analyses were performed;
4.1.1.4 the company or entity that performed the analyses;
4.1.1.5 analytical or test methods used;
4.1.1.6 results of analyses or tests; and
4.1.1.7 operating conditions existing at the time of sampling or measurement.

4.1.2 The permittee shall keep copies of all records of monitoring and measurement data, equipment calibration and maintenance, Data Acquisition and Handling System (DAHS) if used, other supporting information, and reports required by this permit for at least five (5) years from the time the data was gathered or the reports written. Each record shall show clearly to which emissions unit and/or piece of monitoring equipment it applies, and the date the data was gathered. This condition is pursuant to 20.2.70.302.D.2 NMAC.

4.1.3 Routine and predictable emissions during startup, shutdown, and maintenance: The

permittee shall keep records of all events subject to the plan required by 20.2.7.14.A NMAC to minimize emissions during routine or predictable start up, shut down, and scheduled maintenance (SSM).

4.1.4 The permittee shall keep a record describing off permit changes made at this source that result in emissions of a regulated air pollutant subject to an applicable requirement, but not otherwise regulated under this permit, and the emissions resulting from those changes. This condition is pursuant to 20.2.70.302.I.2 NMAC.

4.2 Unit Specific Recordkeeping Requirements:
Conditions are pursuant to Subsection C and Paragraph D(1) of 20.2.70.302 NMAC.

4.2.1 Opacity Recordkeeping (For Units 1-6, 7b-10b and 11-14): The permittee shall record dates of any opacity measurements and the corresponding opacity readings as required by 3.4.2.1.

4.2.2 Periodic Emissions Test Recordkeeping (For Engines, Units 1-6 and 11-14): The permittee shall maintain periodic emissions test records for the reciprocating engines in accordance with Condition 4.1.1. Records shall be maintained on-site or at the nearest field office for unmanned sites and made available within 24 hours upon request.

4.2.3 Maintenance (For Engines, Units 1-6 and 11-14): Records shall be kept of the engine maintenance required by Condition 3.4.2.4 and of any other maintenance activities that are completed on the engines. Records shall include the dates and the number of operating hours the engine has operated when the maintenance is completed.

4.2.4 NESHAP Subpart HH Recordkeeping (For Units 7 - 10 TEG Dehydrators): The specified glycol dehydrators shall comply with the recordkeeping requirements of 40 CFR 63.774.b.10 and 40 CFR 63.774.b.11.

4.2.4.1 The permittee shall generate and maintain the records required by 40 CFR 63, Subpart HH recordkeeping requirements in accordance with 63.774(d)(1) for each glycol dehydrator to demonstrate compliance with General Standards exemptions found in § 63.764 (d) as required by condition 3.4.2.5.

4.2.5 Equipment Inspection Recordkeeping (For Dehydrators, units 7- 10): The permittee shall keep a record of the results of all equipment inspections as required by 3.4.2.6.

4.2.6 Maintenance and Repair Recordkeeping (For Dehydrators, units 7- 10): Records of Maintenance and repair activities shall be maintained for the dehydrators as required by 3.4.2.7.

4.2.7 The permittee shall keep records of the quarterly, visual inspections for the TEG Dehydrator Units Unit 7 - 10, ensuring that the Flash Tank emissions are routed to the Facility

fuel system at all times as required by 3.4.2.8.

4.2.8 Extended Field Gas Analysis Recordkeeping (For Dehydrator, Unit 7 - 10): The permittee shall generate and maintain records of the annual extended field gas analysis completed on the gas processed by the TEG Dehydrator Units. The records shall contain the VOC, Benzene, and Total HAPs emissions, in tons per year, from each TEG Dehydrator Flash Tank and Still Vent determined using input parameters from the most recent gas analysis and GRI-GLYCalc 4.0, or higher numbered version of the program as required by 3.4.2.9.

5.0 REPORTING

Conditions of 5.0 are pursuant to 20.2.70.302.E NMAC.

5.1 General Reporting Requirements:

5.1.1 Reports shall clearly identify the subject equipment showing the emission unit ID number according to this operating permit. In addition, all instances of deviations from permit requirements, including those that occur during emergencies, shall be clearly identified in the required reports. Reports of all required monitoring activities for this facility shall be submitted to the Department on the following schedule. This condition is pursuant to 20.2.70.302.E.1 NMAC.

Table 5.1.1, Schedule of Monitoring Activity Report Submittal:

Report for Emissions Unit Nos.	Submittal Date
1 to 14	Within 45 days following the end of every 6-month period starting on 12/01/1998.

5.1.2 The permittee shall submit reports of all deviations from permit requirements, including those attributable to upset conditions as defined in the permit, the probable cause of such deviations, and any corrective actions or preventive measures taken. (20.2.70.302.E.2 NMAC)

5.1.2.1 Deviations resulting in excess emissions as defined in 20.2.7.7 (including those classified as emergencies) shall be reported in accordance with the timelines specified by 20.2.7 NMAC and in the semi-annual reports required in Condition 5.1.1 (20.2.70.302.E.2 NMAC)

5.1.2.2 All other deviations shall be reported in the semi-annual reports required in Table 5.1.1. (20.2.70.302.E.2 NMAC)

5.1.3 Results of emission tests and monitoring for each pollutant (except opacity) shall be reported in pounds per hour (unless otherwise specified) and tons per year. Opacity shall be reported in percent. Reported numerical values shall not be truncated or rounded, and shall be recorded and reported to the number of significant figures corresponding to the full accuracy inherent in the testing instrument or Method test used to obtain the data.

5.1.4 At such time as new units are installed as authorized by NSR Permit 874M3, the permittee shall fulfill the notification requirements of condition 5.a, in the NSR permit, no later than fifteen (15) days after the installation of the equipment. This condition was brought forward from NSR Permit 874M3, Condition 5.a.

5.1.5 The permittee shall submit reports of excess emissions in accordance with 20.2.7.110.A NMAC.

5.2 Unit Specific Monitoring Reports:
Conditions of 5.2 are pursuant to 20.2.70.302.E NMAC.

5.2.1 Opacity Reporting (For Units 1 - 14): The permittee shall maintain report dates of any opacity measurements and the corresponding opacity readings on site for five years and summarize the reports in the semi-annual certification required by condition 5.1.1.

5.2.2 Periodic Emissions Test Reporting and Initial Compliance Test Reporting (For Engines, Units 1-6 and 11-14):

(a) The permittee shall report semi-annually a summary of the periodic emissions test results.

(b) Stack Test Protocols and Initial Compliance Stack Test Reports shall be submitted electronically to Stacktest.AQB@state.nm.us.

5.2.3 Maintenance (For Engines, Units 1-6 and 11-14): The permittee shall report semi-annually a summary of engine maintenance that was completed during the past 6 months.

5.2.4 NESHAP Subpart HH Reporting (For Units 7 - 10): The permittee shall comply with the reporting requirements of 40 CFR 63.775 for the specified glycol dehydrators as required by condition 3.4.2.5.

5.2.5 Dehydrator Equipment Inspections Reporting (For Units 7-10): Reports of equipment inspections shall be kept on site and briefly summarize in chronological order the results of all dehydrator inspections noting any maintenance or repairs needed to bring the dehydrator into compliance with permit conditions. The semi-annual submittal required by condition 5.1.1 shall summarize these reports for the past 6 months.

5.2.6 Dehydrator Maintenance and Repair Reporting (For Units 7-10): Maintenance and Repair reports shall be summarized in the semi-annual report required by condition 5.1.1. This report shall include a summary of the activities in paragraph 4.2.6, including a copy of the manufacturer's or permittee's recommended maintenance schedule. The permittee shall also submit the following information for each dehydrator on the first reporting period following

reconfiguration of the dehydrator system:

(a) Simplified flow schematic of the glycol dehydrator for each reconfigured dehydrator showing all major components;

(b) Glycol type (EG, DEG or TEG);

(c) Glycol pump: type (electric or gas-driven), rated capacity, make and model no.

5.2.7 The permittee shall maintain on site reports of the quarterly, visual inspections for the TEG Dehydrator Units Unit 7 - 10, ensuring that the Flash Tank emissions are routed to the Facility fuel system at all times, and summarized in the semi-annual certification required by condition 5.1.1.

5.2.8 Extended Field Gas Analysis Reporting (For Dehydrator, Unit 7 - 10): The permittee shall submit reports of the annual extended field gas analysis completed on the gas processed by the TEG Dehydrator Units. The reports shall contain the VOC, Benzene, and Total HAPs emissions, in tons per year, from each TEG Dehydrator Flash Tank and Still Vent determined using input parameters from the most recent gas analysis and GRI-GLYCalc 4.0, or higher numbered version of the program and summarized in the semi-annual certification required by condition 5.1.1.

6.0 COMPLIANCE

6.1 The conditions of Section 6.1 are pursuant to 20.2.70.302.E.3 NMAC. The permittee shall submit compliance certification reports certifying the compliance status of this facility with respect to all permit terms and conditions, including applicable requirements. These reports shall be made on the pre-populated Compliance Certification Report Form provided by the Department, and shall be submitted to the Department and EPA at least every 12 months. For the most current form, contact the Compliance Reports Group at email: reportsgroup.aqb@ state.nm.us. The annual report is due no later than 30 days after the first of the month, December 01. For additional reporting guidance see,
http://www.nmenv.state.nm.us/aqb/enforce_compliance/TitleVReporting.htm.

6.2 Conditions of 6.2 are pursuant to 20.2.70.302.G.1 NMAC. The permittee shall allow representatives of the Department, upon presentation of credentials and other documents as may be required by law, to do the following:

6.2.1 enter the permittee's premises where a source or emission unit is located, or where records that are required by this permit to be maintained are kept;

6.2.2 have access to and copy, at reasonable times, any records that are required by this permit to be maintained;

6.2.3 inspect any facilities, equipment (including monitoring and air pollution control equipment), work practices or operations regulated or required under this permit; and

6.2.4 sample or monitor any substances or parameters for the purpose of assuring compliance with this permit or applicable requirements or as otherwise authorized by the federal Act.

6.3 A copy of this permit shall be kept at the permitted facility or at the local administrative office (for unmanned sites) and shall be made available to Department personnel for inspection upon request. This condition is pursuant to 20.2.70.302.G.3 NMAC.

7.0 EMERGENCIES

Conditions of 7.0 are pursuant to 20.2.70.304 NMAC.

7.1 An "emergency" means any situation arising from sudden and reasonably unforeseeable events beyond the control of the permittee, including acts of God, which situation requires immediate corrective action to restore normal operation, and that causes the source to exceed a technology-based emission limitation under the permit due to unavoidable increases in emissions attributable to the emergency. An emergency shall not include noncompliance to the extent caused by improperly designed equipment, lack of preventive maintenance, or careless or improper operation.

7.2 An emergency constitutes an affirmative defense to an action brought for noncompliance with technology-based emission limitations contained in this permit if the permittee has demonstrated through properly signed, contemporaneous operating logs, or other relevant evidence that:

(a) An emergency occurred and that the permittee can identify the cause(s) of the emergency;

(b) This facility was at the time being properly operated;

(c) During the period of the emergency the permittee took all reasonable steps to minimize levels of emissions that exceeded the emission standards or other requirements in this permit; and

(d) The permittee submitted notice of the emergency to the Department within 2 working days of the time when emission limitations were exceeded due to the emergency. This notice fulfills the requirement of 20.2.70.302.E(2) NMAC. This notice must contain a description of the emergency, any steps taken to mitigate emissions, and corrective actions taken.

7.3 In any enforcement proceeding, the permittee seeking to establish the occurrence of an emergency has the burden of proof.

7.4 This provision is in addition to any emergency or upset provision contained in any applicable requirement.

8.0 PERMIT REOPENING AND REVOCATION

8.1 This permit will be reopened and revised when any one of the following conditions occurs, and may be revoked and reissued when 8.1.3 or 8.1.4 occurs. Conditions of 8.1 are pursuant to 20.2.70.405.A.1 NMAC.

8.1.1 Additional requirements under the federal Act become applicable to this source three (3) or more years before the expiration date of this permit. If the effective date of the requirement is later than the expiration date of this permit, then the permit is not required to be reopened unless the original permit or any of its terms and conditions has been extended due to the Department's failure to take timely action on a request by the permittee to renew this permit.

8.1.2 Additional requirements, including excess emissions requirements, become applicable to this source under Title IV of the federal Act (the acid rain program). Upon approval by the Administrator, excess emissions offset plans will be incorporated into this permit.

8.1.3 The Department or the Administrator determines that the permit contains a material mistake or that inaccurate statements were made in establishing the terms and conditions of the permit.

8.1.4 The Department or the Administrator determines that the permit must be revised or revoked and reissued to assure compliance with an applicable requirement.

8.2 Proceedings to reopen or revoke this permit shall affect only those parts of this permit for which cause to reopen or revoke exists. Emissions units for which permit conditions have been revoked shall not be operated until new permit conditions have been issued for them. This condition is pursuant to 20.2.70.405.A.2 NMAC.

APPEAL PROCEDURES

Any person who participated in this permitting action before the Department and who is adversely affected by the action taken by the Department concerning this permit, may file a petition for a hearing before the Environmental Improvement Board ("board"). The petition must be made in writing to the board within thirty (30) days from the date notice is given of the Department's action.

This petition must specify the portions of the permitting action to which the petitioner objects and certify that a copy of the petition has been mailed or hand-delivered as required by 20.2.70.403.A.2 NMAC; a copy of the permitting action for which review is sought must be attached to the petition. Upon receipt of the appeal notice, the petitioner must mail or deliver a copy of the petition to the Department, and to the applicant or permittee if the petitioner is not the applicant/permittee. Requests for a hearing shall be sent to:

Secretary, New Mexico Environmental Improvement Board
1190 St. Francis Drive, Runnels Bldg. Rm N2153
P.O. Box 5469
Santa Fe, New Mexico 87502

Unless a timely request for a hearing is made, the decision of the Department will be final. If a timely request for hearing is made, the board will hold a hearing within sixty (60) days of receipt of the petition in accordance with the New Mexico Air Quality Control Act NMSA 1978 § 74-2-7 and 20.2.70.403.A.3 NMAC.

Any person who is adversely affected by an administrative action taken by the board pursuant to 20.2.70.403.A NMAC may appeal to the Court of Appeals in accordance with New Mexico Air Quality Control Act NMSA 1978 § 74-2-9. Petitions for judicial review must be filed no later than thirty (30) days after the administrative action. This condition is pursuant to 20.2.70.403.B NMAC and New Mexico Air Quality Control Act NMSA 1978 § 74-2-9.

SUBMITTAL OF REPORTS AND CERTIFICATIONS

Test protocols, excess emission forms, test reports, Compliance Certification Reports, monitoring results and reports, emissions sampling and measurement data, monitoring activity reports, compliance schedule progress reports, and any other compliance status information required by this permit shall be certified by the responsible official and submitted to:

Program Manager, Compliance & Enforcement Section
New Mexico Environment Department
Air Quality Bureau
1301 Siler Road, Building B
Santa Fe, NM 87507-3113

In accordance with 20.2.70.302.E.3 NMAC, Compliance Certification Reports shall be submitted to the Administrator at the address below:

Chief, Air Enforcement Section
US EPA Region-6, 6EN-AA
1445 Ross Avenue, Suite 1200
Dallas, TX 75202-2733

Questions about this permit should be referred to Coleman Smith of the Air Quality Bureau in Santa Fe at (505) 476-5550.

Copies of the following documents can be downloaded from the NMED web site at URL **http://www.nmenv.state.nm.us/aqb/permit/app_form.html** for your convenience, or requested from the Bureau.

Documents:
1) Excess Emission Form (for reporting deviations and emergencies)
2) Compliance Certification Report Form
3) Acronyms
4) SOP for Stack Test Protocol (if applicable)
5) SOP for Use of Portable Analyzers in Performance Tests (if applicable)
6) SOP for Contents of Stack Test Reports (if applicable)

APPENDIX A

Table A.1: APPLICABLE REQUIREMENTS FOR THIS FACILITY

The permittee shall comply with all applicable sections of the requirements listed in the following table.

Applicable Requirements	Federally Enforceable	Entire Facility	Unit No.
20.2.7 NMAC Excess Emissions	X	X	
20.2.61 NMAC Control of Smoke and Visible Emissions	X		Units 1-14
20.2.70 NMAC Operating Permits	X	X	
20.2.71 NMAC Operating Permit Emission Fees	X	X	
20.2.72 NMAC Construction Permit, Air Quality Bureau Permit No: **0874M3**	X	X	
20.2.73 NMAC Notice of Intent and Emissions Inventory Requirements	X	X	
20.2.74 NMAC Prevention of Significant Deterioration	X	X	
20.2.82 MACT Standards for Source Categories of HAP's			Units 1-14
40 CFR 50 National Ambient Air Quality Standards	X	X	
40CFR63 Oil and Natural Gas Production Facilities, Subparts A and HH	X		Dehydrators Units 7-10
40 CFR 63.6580, Subpart ZZZZ, RICE MACT (20.2.82 NMAC)	X		Units 1-6 and 11-14

APPENDIX A

Table A.2: The Department has determined that the following requirements identified in the permit application are not applicable requirements for this facility, or the requirement does not impose any conditions in this permit.

Requirements identified in the Permit Application as applicable	(1) See Below	(2) See Below	Justification For Non-Applicability
20.2.75 NMAC Permit Fees		X	See note (2) below
20.2.80 NMAC Stack Heights		X	
40 CFR 52 Approval and Promulgation of Implementation Plans		X	
40 CFR 70 State Operating Permit Programs	X		

(1) **Not Applicable For This Facility:** No existing or planned operation/activity at this facility triggers the applicability of these requirements.

(2) **No Requirements:** Although these regulations may apply, they do not impose any specific requirements on the operation of the facility as described in this permit.

	)	

ORDER GRANTING PETITION FOR OBJECTION TO PERMIT

The United States Environmental Protection Agency ("EPA") received a Petition to Object to the Issuance of a State Title V Operating Permit ("Petition") on April 14, 2010, from WildEarth Guardians and San Juan Citizens Alliance (collectively "Petitioners"). The Petitioners request that EPA object, pursuant to section 505(b)(2) of the Clean Air Act ("CAA" or "the Act"), 42 U.S.C. § 7661d(b)(2), to the renewal, by the New Mexico Environment Department, Air Quality Bureau ("NMED") of the title V operating permit issued to Williams Four Corners, LLC ("Williams") for the Sims Mesa Central Delivery Point ("Sims Mesa CDP" or "Sims Mesa"), a natural gas gathering and compression plant located approximately 17 miles Northeast of Blanco, New Mexico in Rio Arriba County.

Specifically, the Petitioners claim that the Sims Mesa title V permit ("Permit" or "Sims Mesa permit"): (1) fails to ensure compliance with the Prevention of Significant Deterioration ("PSD") and title V requirements; (2) fails to require prompt reporting of deviations; (3) fails to require sufficient periodic monitoring; and (4) includes a condition that is contrary to applicable requirements.

Based on a review of the petition and other relevant materials, including the Permit and permit record, and relevant statutory and regulatory authorities, I grant the petition requesting that EPA object to the Permit.

STATUTORY AND REGULATORY FRAMEWORK

Section 502(d)(1) of the Act, 42 U.S.C. § 7661a(d)(1), calls upon each state to develop and submit to EPA an operating permit program to meet the requirements of title V. EPA granted interim approval to the title V operating permit program submitted by the State of New Mexico, effective December 19, 1994. *See* 59 Fed. Reg. 59656 (November 18, 1994). Subsequently, EPA granted full approval of the New Mexico title V operating permit program, effective December 26, 1996, and approved a revision to the program in 2004. *See* 40 C.F.R. Part 70, Appendix A; *see also* 61 Fed. Reg. 60032, 60034 (November 26, 1996) and 69 Fed. Reg. 54244, 54247 (September 8, 2004). New Mexico State Implementation Plan ("SIP") revisions related to references from the Sims Mesa permit terms include approval of 20.2.7 NMAC - Excess Emissions. *See* 74 Fed. Reg. 46910 (September 14, 2009).

All major stationary sources of air pollution and certain other sources are required to apply for title V operating permits that include emission limitations and such other conditions as are necessary to assure compliance with applicable requirements of the Act, including requirements of the applicable SIP. *See* CAA sections 502(a) and 504(a), 42 U.S.C. §§ 7661a(a) and 7661c(a).

The Title V operating permits program does not generally impose new substantive air quality control requirements (referred to as "applicable requirements"), but it does require permits to contain monitoring, recordkeeping, reporting, and other requirements to assure compliance by sources with applicable requirements. *See* 57 Fed. Reg. 32250 (July 21, 1992) (EPA final action promulgating 40 C.F.R. Part 70).

One purpose of the Title V program is to "enable the source, states, EPA and the public to better understand the requirements to which the source is subject, and whether the source is meeting those requirements." 57 Fed. Reg. 32250, 32251 (July 21, 1992). Thus, the Title V operating permits program is a vehicle for ensuring that air quality control requirements are appropriately applied to facility emission units and that compliance with these requirements is assured.

Under CAA section 505(a), 42 U.S.C. § 7661d(a), and the relevant implementing regulations found at 40 C.F.R. § 70.8(a), states are required to submit each proposed title V operating permit to EPA for review. Upon receipt of a proposed permit, EPA has 45 days to object to final issuance of the permit, if it is determined not to be in compliance with applicable requirements or requirements under 40 C.F.R. Part 70. 40 C.F.R. § 70.8(c).

If EPA does not object to a permit on its own initiative, section 505(b)(2) of the Act provides that any person may petition the Administrator, within 60 days of expiration of EPA's 45-day review period, to object to the permit. 42 U.S.C. § 7661d(b)(2) and 40 C.F.R. § 70.8(d).

The petition must "be based only on objections to the permit that were raised with reasonable specificity during the public comment period provided by the permitting agency (unless the petitioner demonstrates in the petition to the Administrator that it was

Administrative Record NSR 10833_011662

impracticable to raise such objections within such period or unless the grounds for such objection arose after such period)." CAA section 505(b)(2), 42 U.S.C. § 7661d(b)(2).

In response to such a petition, the CAA requires the Administrator to issue an objection if a petitioner demonstrates that a permit is not in compliance with the requirements of the CAA. 42 U.S.C. § 7661d(b)(2). *See also* 40 C.F.R. § 70.8(c)(1); *New York Public Interest Research Group v. Whitman*, 321 F.3d 316, 333 n. 11 (2d Cir. 2003) ("*NYPIRG 2003*").

Under CAA section 505(b)(2), the burden is on the petitioner to make the required demonstration to EPA. *E.g., Sierra Club v. Johnson*, 541 F.M. 1257, 1266-67 (11th Cir. 2008); *Citizens Against Ruining the Environment v. EPA*, 535 F.3d 670, 677-78 (7th Cir. 2008); *Sierra Club v. EPA*, 557 F.3d 401, 406 (6th Cir. 2009) (discussing the burden of proof in title V petitions); *see also NYPIRG 2003*, 321 F.3d at 333 n. 11. In evaluating petitioners' claims, EPA considers, as appropriate, the adequacy of the permitting authority's rationale in the permitting record, including the response to comment.

BACKGROUND

I. The Facility

The Williams Sims Mesa CDP is a natural gas gathering and compression facility, as defined under Standard Industrial Classification 4922 - Natural Gas Transmission. Gas is compressed to specification for transmission to sales pipelines using natural gas fired internal combustion engines to power the compressor units. Other activities conducted onsite include dehydration of the gas through contact with triethylene glycol, and gravity separation of condensates. Four permitted triethylene dehydrators have built-in flash tanks and still vents, which are routed to the fuel system as a control method, primarily for control of volatile organic compound ("VOC") emissions and other criteria pollutants. Some fugitive VOC emissions also result from equipment leaks.

II. The Sims Mesa Title V Permit Renewal Action and Petition to Object

On July 23, 2008, Williams submitted an application to NMED for the renewal of the Sims Mesa title V operating permit - Permit Number P026R2. A copy of the draft permit for renewal was submitted for a 30-day public comment period beginning November 25, 2009. On December 18, 2009, Petitioners submitted comments to NMED on the draft permit for renewal, raising concerns with the draft Sims Mesa permit. NMED also submitted the proposed permit to EPA, and EPA did not object. NMED prepared a response to comments ("RTC"), dated March 19, 2010, and issued the renewed Sims Mesa permit on the same date. On April 14, 2010, Petitioners submitted an electronic copy of the Petition to EPA, requesting that EPA object to the renewal of the Sims Mesa permit.

The Petition claims that the Sims Mesa permit does not comply with 40 C.F.R. Part

Administrative Record NSR 10833_011663

70 in that: (1) the title V permit failed to assure compliance with PSD and title V requirements because NMED failed to consider whether emissions from adjacent and interrelated pollutant emitting activities triggered PSD review, specifically Devon Energy-owned natural gas wells that supply natural gas to the Sims Mesa CDP; (2) NMED failed to include prompt reporting for all deviations in the permit conditions; (3) NMED failed to require specific periodic monitoring for compliance with nitrogen oxides ("NOx") and carbon monoxide ("CO") limits, and any monitoring for compliance with VOC limits; and (4) the title V permit included a condition that is contrary to applicable requirements related to compliance with the NAAQS.

ISSUES RAISED BY PETITIONER

I. Source Definition for Purposes of PSD and Other Requirements

Petitioners' Claim: Petitioners claim that NMED failed to properly assess the stationary source that is being permitted under the Sims Mesa title V permit and therefore failed to assure that the permit includes all applicable PSD requirements, failed to ensure compliance with PSD, failed to ensure compliance with the title V permitting requirements, and failed to include a compliance schedule to bring the source into compliance with applicable requirements, including PSD. *See* Petition at 3-8. In particular, Petitioners allege that NMED failed to consider emissions from all adjacent and interrelated pollutant emitting activities, namely the natural gas wells and associated equipment that supply natural gas to the Sims Mesa CDP. The Petitioners claim that NMED's determination that there is no common control between the Sims Mesa CDP and any contiguous or adjacent polluting activities is baseless, arguing that NMED did not request, obtain, or review information that Petitioners believe is necessary for such an analysis and which they mentioned during the public comment period on the proposed permit, such as system maps showing emission sources, flow diagrams, and business information regarding the nature of control. Instead, Petitioners assert, NMED apparently relied on two pieces of company correspondence, and it is not clear whether this correspondence was from a responsible official. Thus, Petitioners argue that EPA must object to the Sims Mesa title V permit on the basis that NMED did not adequately support its analysis for its source determination and did not appropriately address PSD requirements and whether common control exists between the Sims Mesa CDP and the upstream wells and associated equipment.

Petitioners also challenge NMED's ultimate conclusion that Williams does not exert control over the natural gas wells that supply the CDP and which NMED believed were owned and operated by another company, Devon Energy. Petitioners assert that NMED overlooked relevant EPA guidance in making its common control determination. In particular, relying on guidance that pertains to military installations, Memorandum from John S. Seitz, Office of Air Quality Planning and Standards, *Major Source Determinations for Military Installations under the Air Toxics, New Source Review, and Title V Operating Permits Programs of the Clean Air Act* (August 2, 1996), Petitioners argue that indirect natural control exists between the Sims Mesa CDP and the upstream natural gas production operations, since the product of the wells is "integral to" and "contributes to" the output provided by the separately owned Sims Mesa CDP,

Administrative Record NSR 10833_011664

and contract-for-service arrangements clearly exist between Williams and its upstream suppliers. *See* Petition at 6-7.[1]

Petitioners further contend that a finding of common control is compelled here. They assert that Devon Energy's upstream wells appear to entirely support the Sims Mesa CDP and likely rely on the Sims Mesa CDP to process all or most of their gas, although Petitioners provide no citations to the permit record for these assertions. Petitioners also argue that information provided in NMED's common control determination suggests that Williams exerts control over Devon Energy's operations. Petitioners claim that Williams admits it exerts direct control during "'periods of emergency, failure or scheduled major maintenance, [when Williams] can request that producers curtail operations on a short term basis.'" Petition at 7 (quoting RTC at 3). Petitioners argue that it would be highly unusual if Williams did not exert control over other relevant aspects of the performance of Devon Energy's operations through the terms of its contracts with Devon Energy. Because Williams admits that it has a contractual obligation to accept gas that upstream producers deliver, Petitioners assert that it is doubtful that such a term would exist without terms and conditions that ensured a meaningful level of common control. Petitioners further claim that NMED appears to incorrectly assume that common control requires full and total control over contiguous and adjacent activities, and that it hinges upon "routine management." *Id.* at 8. Petitioners contend that NMED's assertion that "'none of the individual well owner/operators can influence the activities at the compressor station'" is simply unsupported. *Id.* (quoting RTC at 4).

Petitioners thus conclude that NMED failed to appropriately assess whether common control exists between the Sims Mesa CDP and upstream natural gas production operations and their associated equipment.

EPA's Response: I grant this request for an objection to the extent described below. As explained in detail above, Petitioners argue that an objection to the Sims Mesa title V permit is required because NMED failed to appropriately assess whether common control exists between the Sims Mesa CDP and upstream natural gas production operations and associated equipment. Thus, Petitioners allege, NMED failed to ensure that the permit includes all applicable PSD requirements and failed to ensure compliance with the title V permitting requirements.

After a review of Petitioners' claims, and the permit record, including NMED's explanation of its common control decision in the RTC, I grant the Petitioners' request for an objection, because NMED's record, including the RTC, fails to provide an adequate basis and

---

[1] As noted above, Petitioners refer to a memorandum concerning military installations. *See* Petition at 6 (citing Memorandum from John S. Seitz, Office of Air Quality Planning and Standards, *Major Source Determinations for Military Installations under the Air Toxics, New Source Review, and Title V Operating Permits Programs of the Clean Air Act* (August 2, 1996)). As stated on page 1 of that memorandum, its purpose is to provide guidance on "major source" determinations at military installations. The facilities and activities at issue in this case, of course, are not located at a military installation, and thus the memorandum is not directly applicable to the analysis at issue here. Nevertheless, there are some aspects of the 1996 memorandum that may be useful in making non-military source determinations, such as examination of the relationship between the various emission-producing activities under consideration. As explained later in this response, contracts and agreements can be relevant to the determination of whether common control exists at a site.

Administrative Record NSR 10833_011665

rationale for NMED's determination of the source for title V purposes and PSD review. *See In the Matter of Kerr-McGee/Anadarko Petroleum Corporation, Frederick Compressor Station*, Petition VIII-2008-02 at 5 (October 8, 2009) (granting petition to object where permitting authority's permit record failed to provide an adequate rationale for its determination of the source for PSD and title V purposes after receiving public comments on that point) (*"2009 Kerr-McGee/Anadarko Order"*).

Whether various emission units should be considered as a single source is informed by the regulatory definitions of "major source" and "stationary source." The title V regulations define "major source" to mean "any stationary source (or any group of stationary sources that are located on one or more contiguous or adjacent properties, and are under common control of the same person (or persons under common control)), belonging to a single major industrial grouping" and that are major sources as defined by certain provisions of the Clean Air Act. *See* 40 C.F.R. § 70.2; *see also* CAA section 501(2), 42 U.S.C. § 7661(2). EPA's PSD regulations define "stationary source" as "any building, structure, facility, or installation which emits or may emit a regulated [New Source Review] pollutant." 40 C.F.R. § 52.21(b)(5). The PSD regulations go on to define "building, structure, facility, or installation" as "all of the pollutant-emitting activities which belong to the same industrial grouping, are located on one or more contiguous or adjacent properties, and are under the control of the same person (or persons under common control)." 40 C.F.R. § 52.21(b)(6). In promulgating the title V major source definition found at 40 C.F.R. § 71.2, EPA indicated that the language and application of the title V definition was to be consistent with the PSD definition contained in section 52.21. *See* 61 Fed. Reg. 34202, 34210 (July 1, 1996).

Accordingly, for facilities to constitute a single stationary source under the PSD, nonattainment New Source Review, and the title V programs of the Clean Air Act, all three of the following criteria must be satisfied: (1) the facilities are located on one or more contiguous or adjacent properties; (2) they share the same two-digit (major group) SIC code; and (3) they are under common control. *See* 40 C.F.R. §§ 70.2, 71.2, 51.165(a)(1)(i) and (ii), 51.166(b)(5) and (6), and 52.21(b)(5) and (6).

In a recent memorandum, EPA provided further guidance for determining when permitting authorities should consider two or more pollutant-emitting activities in the oil and gas industries to be a single stationary source for purposes of the New Source Review ("NSR") program and the related major source definitions in the title V permitting program. *See* Memorandum from Gina McCarthy, Assistant Administrator, to Regional Administrators, *Withdrawal of Source Determination for Oil and Gas Industries* (September 22, 2009) ("McCarthy Memorandum"). The McCarthy Memorandum explained that:

> Permitting authorities should ... rely foremost on the three regulatory criteria for identifying emissions activities that belong to the same "building," "structure," "facility," or "installation." These are (1) whether the activities are under the control of the same person (or person under common control); (2) whether the activities are located on one or more contiguous or adjacent properties; and (3) whether the activities belong to the same industrial grouping. 40 C.F.R. 52.21(b)(6). In applying these criteria, permitting

Administrative Record NSR 10833_011666

> authorities should also remain mindful of the explanation we provided in the 1980 preamble.[2] *See* 45 Fed. Reg. 52676, 52694-95 (August 7, 1980).

See McCarthy Memorandum at 2 (footnote supplied). The McCarthy Memorandum also explained that prior source determinations in EPA's own permitting actions and EPA's guidance to other permitting authorities making such determinations collectively provide illustrations of the "kind of reasoned decision-making that is necessary to justify adequately a permitting authority's source determination decision," while recognizing that these are highly fact-specific, case-by-case determinations such that "no single determination can serve as an adequate justification for how to treat any other source determination for pollutant-emitting activities with different fact-specific circumstances." *Id.*

NMED examined whether the Sims Mesa CDP was a single source in its RTC, responding to a comment by Petitioners. Citing the McCarthy Memorandum and the definition of stationary source at 20.2.70.7.Q NMAC, NMED structured its analysis around the three regulatory criteria and determined that: (1) the upstream wells and compressor station did have the same SIC code; (2) the wells were not contiguous with the compressor station (but NMED did not reach a final determination regarding adjacency given its conclusion on common control); and (3) Williams does not maintain common control of the compressor station and wells. *See* RTC at 2-4. NMED stated that all three criteria had to be met in order for a source or group of sources to be part of the same stationary source. *Id.* at 3.

In making this determination, NMED requested and considered additional information from Williams, submitted on February 26 and March 10, 2010, as well as considering information in the permit application. *Id.* NMED focused its common control analysis on "'who has the power to manage the pollutant-emitting activities of the facilities at issue, including the power to make or veto decisions to implement major emission-control measures or to influence production levels or compliance with environmental regulations.'" *Id.* (quoting an August 25, 1999 letter from Robert Miller, Chief of Region V Permits and Grants Section, to William Baumann, Chief, Combustion and Forest Products Section, Wisconsin Department of Natural Resources, regarding the Oscar Mayer Foods facility in Madison, Wisconsin ["Oscar Mayer Letter"]).[3] NMED stated that a different company, Devon Energy, owns and operates the

---

[2] In the 1980 preamble, EPA explained that a PSD source "must approximate a common sense notion of 'plant'" and "must avoid aggregating pollutant-emitting activities that as a group would not fit within the ordinary meaning of 'building,' 'structure,' 'facility,' or 'installation.'" 45 Fed. Reg. 52676, 52694-95 (August 7, 1980).

[3] NMED's common control analysis in the RTC references the Oscar Mayer letter. As an initial matter, the discussion of common control in the Oscar Mayer letter generally relies on the August 2, 1996, military installation memorandum discussed above, and thus may not be instructive for the same reasons as discussed above. *See* n. 2, *supra.* In addition, the second page of the Oscar Mayer letter discusses whether the various units under consideration should be considered to be in the same major industrial group based on the existence of a support facility relationship. As discussed in the letter, we analyze whether one facility acts as a support facility for another when entities at a site are initially determined to fall within different major industrial groups; thus, the support facility analysis as described in the Oscar Mayer letter is distinct from the analysis of whether facilities are under common control. Moreover, the factors cited in the support facility analysis of the Oscar Mayer letter were taken from draft preamble provisions that were never finalized. Accordingly, it may be more helpful to consider other guidance documents in responding to this Order.

Administrative Record NSR 10833_011667

upstream wells. *Id.* NMED then excerpted a few paragraphs from information submitted by Williams. According to the excerpted information, "'[n]atural gas producers contract with [Williams] to transport natural gas from the well head to downstream customers'" and Williams "'is contractually obligated to accept the gas volumes that non-[Williams] producers deliver onto its system.'" *Id.* (quoting Williams' February 26, 2010 letter to NMED). While Williams acknowledged that it "'can request that producers curtail operations on a short term basis'" during "'periods of emergency, failure, or scheduled major maintenance,'" Williams denied exercising "'control over any equipment owned or operated by any [upstream] natural gas producer,'" including over environmental compliance measures at the wells. *Id.* (quoting Williams' February 26, 2010 letter to NMED). Williams further stated that the "'contracts do not allow well owners/operators ... [to] influence or exercise any degree of control over the compressor station,'" including over environmental compliance measures at the compressor station. *Id.* at 4 (quoting Williams' March 10, 2010 email to NMED, alterations in original).

These representations led NMED to conclude that Williams' "statements indicate that there is no common control when measured against the Oscar Mayer determination." *Id.* at 4. NMED further explained that Williams did not have the power to "routinely manage" the activities of Devon Energy's wells, that "request" did not constitute "making decisions," and that none of the individual well owner/operators can influence the activities at the compressor station. *Id.*

In light of the statements relied upon in the RTC, I find that the present permit record does not supply EPA or the public with sufficient information to understand whether additional emissions sources should, or should not, be included in the stationary source in this permit. It appears that NMED relied on Williams' representations in the February 26 and March 10 communications in making its common control determination, but those representations included potentially conflicting information and raised additional questions that NMED did not address or resolve. For example, NMED quotes Williams' assertion in the February 26 letter that it is "contractually obligated to accept the gas volumes that non-[Williams] producers deliver onto its system." RTC at 3. But NMED also quotes Williams' March 3 email stating that the "contracts do not allow the well owners/operators ... [to] influence or exercise any degree of control over the compressor station." *Id.* at 4 (alterations in original). Aside from the material described above, no other aggregation analysis is included or referenced in the RTC. It thus appears that NMED relied on Williams' representations in making its common control determination, which included potentially conflicting information, but NMED did not obtain additional documentation from Williams cited in those representations in order to examine the potential conflict.

Further, without additional information, it is not clear how to reconcile Williams' representations that it is contractually obligated to accept any or all gas that is delivered and that a contractual provision allows Williams to request that producers curtail operations on a short-term basis during periods of emergency, failure, or scheduled major maintenance. These potentially conflicting statements should have prompted NMED to probe deeper into the relationship or interaction between Williams and the upstream wells by examining documents that describe or embody the relationship between Williams and the upstream wells, including the relevant contracts and agreements between them.

Administrative Record NSR 10833_011668

Importantly, my decision in this Order is not intended to suggest that a permitting authority may not consider an applicant's representations of facts in its permitting analyses and decisions when appropriate. Instead, I decide only that because the permitting record in this case shows that NMED relied on statements which contained potentially conflicting information about the nature of the control relationship, NMED could not reasonably rely primarily on those assertions in its common control decision without, at minimum, examining the relevant contracts and agreements.[4] *See* Letter from William A. Spratlin, Director, Air, RCRA, and Toxics Division, U.S. EPA Region 7, to Peter R. Hamlin, Chief, Air Quality Bureau, Iowa Dept. of Natural Resources, at 2 (September 18, 1995) ("Spratlin Letter") ("If after asking the obvious control questions the permit[ting] authority has any remaining doubts, it may be necessary to look at contracts, lease agreements, and other relevant information."); *see also* Letter from Ronald J. Borsellino, Acting Director, Division of Environmental Planning and Protection, U.S. EPA Region 2, to Scott Salisbury, President, Manchester Renewable Power Corp./LES and Lawrence C. Hesse, President, Ocean County Landfill Corp., at 1 (May 11, 2009) ("OCLC Letter") (noting that similar types of information were reviewed by EPA in making its common control determination).

Accordingly, for the reasons discussed above, I grant Petitioners' request for an objection in Claim I, and I direct NMED to establish a more thorough permit record as described in this section and to make any appropriate or necessary changes in the permit. If in the course of supplementing its record, NMED determines that Williams is indeed under common control with other pollutant-emitting activities, then it will also need to examine whether any of those activities are adjacent to the Sims Mesa CDP in order to complete its source determination. But if NMED reaffirms its decision that no other pollutant-emitting activities are under common control with Sims Mesa CDP, it would not need to complete the "contiguous or adjacent" component of its analysis. *See* Letter from Judith M. Katz, Region III, Director Air Protection Division, to Gary E. Graham, Environmental Engineer, Virginia Department of Environmental Quality, at 4 (May 1, 2002) (noting that EPA would not consider the two activities as one source after concluding that they were not under common control, without further analyzing industrial grouping).

---

[4] To the extent that Petitioners argue that NMED was required by my 2009 decision in *Kerr-McGee/Anadarko Petroleum Corporation Frederick Compressor Station* to request, obtain, and review information "such as systems maps showing emissions sources, flow diagrams, and business information regarding the nature of control," Petition at 5-6, they fail to understand the nature of that Order. In an Order on a later title V petition relating to the same source, I emphasized that while the *2009 Kerr-McGee/Anadarko Order recommended* various information that might be useful in making the source determination in that case, it was only a recommendation and that the permitting authority "had the authority to request different or additional information in determining whether the various pollution emitting activities are contiguous or adjacent to, and under common control with [the source at issue]." *In the Matter of Anadarko Petroleum Corporation, Frederick Compressor Station*, Petition VIII-2010-4, at 5 (February 2, 2011) ("*2011 Kerr McGee/Anadarko Order*"). Moreover, these *Kerr McGee/Anadarko* Orders primarily concerned the "contiguous or adjacent" component of the source determination analysis, and not the common control analysis that is the focus of the analysis here. *See 2011 Kerr McGee/Anadarko Order* at 9 (noting that pollutant-emitting sources owned and operated by wholly owned subsidiaries of the same entity and connected via pipeline to the source at issue were considered under common control by the permitting authority); *see also In the Matter of Kerr-McGee Gathering, LLC, Frederick Compressor Station*, Petition VIII-2007-__, at 2 (February 7, 2008) (noting that in that matter petitioners alleged that the permitting authority failed to consider whether emissions from co-owned natural gas wells that supplied the compressor station triggered PSD review).

See response to SOB on Middle Mesa

Administrative Record NSR 10833_011669

II. Prompt Reporting of Deviations

Petitioners' Claim: The Petitioners claim that the Sims Mesa permit fails to require prompt reporting of all permit deviations, in accordance with the CAA and EPA's part 70 regulations. Petition at 8-9. In particular, Petitioners allege that "Condition 5.1.2 of the Title V Permit requires reporting of permit deviations only once every six months," regardless of the nature of the deviation, which, according to the Petitioners, is not "prompt reporting of permit deviations, as required by the Clean Air Act, 42 USC 7661b(b)(2), and Title V regulations, 40 CFR § 70.6(a)(3)(iii)(B)." *Id.* at 8, 9. Citing 40 C.F.R. § 70.6(a)(3)(iii)(B), Petitioners state that prompt reporting is typically defined "in relation to the degree and type of deviation likely to occur and the applicable requirements." *Id.* at 8. Petitioners assert that in explaining the meaning of "prompt," the House Report for CAA Amendments of 1990 stated "'the permittee would presumably be required to report that violation without delay.'" *Id.* (quoting H.F. Rep. No. 101-490, pt. 1, at 348 (1990)).[5] Petitioners further assert that semiannual reporting of permit deviations does not constitute prompt reporting, arguing that in *New York Public Interest Group v. Johnson*, 427 F.3d 172 (2d Cir. 2005) ("*NYPIRG 2005*"), the court held that "prompt" for purposes of prompt reporting of permit deviations must be at least less than every six months depending on the source's compliance history and public health risk. *Id.* at 9.

Petitioners also challenge assertions NMED made in the RTC. In full, NMED's RTC on this point reads as follows:

> Section 7 addresses Emergencies, and Condition 7.2 specifies the time for submitting notice to NMED. These requirements are in addition to the semi-annual reporting requirements of Section 5. To clarify these requirements, NMED has added the following excess emissions reporting requirement: "5.[1].5 The permittee shall submit reports of excess emissions in accordance with 20.2.7.110.A NMAC." That regulation specifies the following:
>
> 20.2.7.110.A NMAC
> A. The owner or operator of a source having an excess emission shall report the following information to the department on forms provided by the department. The department may authorize the submittal of such reports in electronic format.
> (1) Initial report: the owner or operator shall file an initial report, no later than the end of the next regular business day after the time of discovery of an excess emission that includes all available information for each item in Subsection B of

[5] Petitioners state that "'[i]n general EPA believes that 'prompt' should be defined as requiring reporting within two to ten days for deviations that may result in emissions increases. Two to ten days is sufficient time in most cases to protect public health and safety as well as to provide a forewarning of potential problems.'" Petition at 8-9 (quoting Clean Air Act Proposed Interim Approval of Operating Permits Program: State of New York, 61 Fed. Reg. 39617-39602 [sic] (July 30, 1996)). As explained in *In the Matter of GCC Dacotah Cement Manufacturing Plant*, Petition VIII-2006-3 at 11, n. 5 (June 15, 2007): "To the extent Petitioners believe that EPA's position is currently that 'prompt reporting' should generally be defined as within 2-10 days, I note that, as reflected in the *NYPIRG* case and other title V orders, EPA's experience with the Title V program since 1996 has led EPA to the conclusion that such a limited time frame for reporting is not necessary for all deviations."

Administrative Record NSR 10833_011670

20.2.7.110 NMAC.
(2) Final report: the owner or operator shall file a final report that contains specific and detailed information for each item in Subsection B of 20.2.7.110 NMAC, no later than ten (10) days after the end of the excess emission.

RTC at 4. In response, Petitioners note that Condition 7.2 only applies to "Emergencies," as defined by Condition 7.1, and the specific reporting therein only states that "in the event of an emergency, 'where emission limitations were exceeded,' a notice shall be proved to NMED within 2 days." Petition at 9 (citing the Permit at 18). Petitioners claim that prompt reporting applies to "all permit deviations," not just those tied to emergencies, and that it is unclear how Condition 7.2's blanket two-day notification requirement is sufficient to ensure prompt reporting "'in relation to the degree and type of deviation likely to occur and the applicable requirements.'" *Id.* (quoting 40 C.F.R. § 70.6(a)(3)(iii)(B)).

In addition, Petitioners acknowledge that NMED added Condition 5.1.5 to the Sims Mesa title V permit in response to Petitioners' comments on this issue, but contend that Condition 5.1.5 still fails to ensure compliance with the prompt reporting requirements. Condition 5.1.5 requires that reports of excess emissions be submitted in accordance with 20.2.7.110.A NMAC, "which requires initial reporting 'no later than the end of the next regular business day after the time of discovery of an excess emission.'" *Id.* (quoting the language of 20.2.7.110.A NMAC). Petitioners claim this requirement fails to assure that all deviations, including deviations from "monitoring requirements, performance standards, etc." are promptly reported, and that it is unclear how this requirement suffices to ensure prompt reporting "'in relation to the degree and type of deviation likely to occur and the applicable requirements,' in accordance with 40 CFR § 70.6(a)(3)(iii)(B)." *Id.* Petitioners further claim the CAA is clear that all permit deviations, not just excess emissions, must be reported promptly. *Id.* Petitioners conclude that the Administrator must object to the issuance of the Sims Mesa permit on the basis that it "fails to ensure prompt reporting of permit deviations in accordance with 42 USC 7661b(b)(2), and 40 CFR § 70.6(a)(3)(iii)(B)." *Id.*

EPA's Response: I grant this request for an objection on the basis that the permit record does not adequately document or explain NMED's decisions regarding prompt reporting of permit deviations. Petitioners claim that the Sims Mesa title V permit does not provide for prompt reporting of all deviations in agreement with the regulations and the Act, specifically referencing Conditions 5.1.2, 5.1.5, and 7.2. CAA section 503(b)(2), 42 U.S.C. § 7661b(b)(2), provides that EPA's regulations must require permittees "to promptly report any deviations from permit requirements to the permitting authority." Part 70 provides that title V permits must require prompt reporting of deviations from permit requirements, and directs permitting authorities to "define 'prompt' in relation to the degree and type of deviation likely to occur and the applicable requirements." 40 C.F.R. § 70.6(a)(3)(iii)(B). Permitting authorities may specify prompt reporting requirements for each permit term on a case-by-case basis, or may adopt general reporting requirements by rule, or both. *See, e.g., In the Matter of Onyx Environmental Services*, Petition V-2005-1, at 15 (February 1, 2006) ("*Onyx Order*"). Condition 5.1.2 addresses deviation reporting by generally requiring semiannual reporting for "all deviations from permit requirements." Permit at 15. As indicated in NMED's RTC, in addition to the semiannual

Administrative Record NSR 10833_011671

reporting requirements of Section 5, the permit also specifies the time for submitting notice to NMED when emission limitations are exceeded due to an emergency (Condition 7.2). The RTC also notes that NMED added permit Condition 5.1.5 to clarify that the permittee must submit reports of excess emissions as required under 20.2.7.110A NMAC, a provision of the federally enforceable New Mexico SIP. While, as noted, NMED included permit conditions providing for deviation reporting of excess emissions under the SIP including due to emergencies and incorporated other deviation reporting requirements in Section 5 of the permit, the RTC does not explain NMED's decisions on what constitutes "prompt" reporting of permit deviations in relation to the degree and type of deviation likely to occur and the applicable requirements. *See, e.g., In the Matter of GCC Dacotah Cement Manufacturing Plant*, PetitionVIII-2006-3, at 11 (June 15, 2007) (granting where a permitting authority failed to adequately explain its prompt reporting decisions). For example, NMED does not explain why it believes semiannual reporting is "prompt" for some permit deviations but why another timeframe is justified for others; nor does the RTC expressly reference any such analysis that NMED might have provided elsewhere.

In response to Petitioners' point about *NYPIRG 2005*, I note that the *NYPIRG 2005* decision is not controlling in New Mexico. Moreover, although I am granting on Claim II of this Petition, EPA is not subscribing to Petitioners' view that, in light of *NYPIRG 2005*, prompt reporting must be less than every six months. Instead, as explained above, I am granting due to inadequacies in NMED's permitting record on prompt reporting of permit deviations.

Accordingly, I grant this claim based on the lack of justification in the permit record for NMED's decisions regarding reporting of permit deviations, in accordance with the requirements of 40 C.F.R. § 70.6(a)(3)(iii)(B). I direct NMED to consider whether the permit conditions for reporting of deviations are consistent with the requirements of 40 C.F.R. § 70.6(a)(3)(iii)(B) for all permit deviations and provide further explanation of its conclusions, in the Statement of Basis ("SoB") or elsewhere in the permitting record, or make appropriate changes to the permit to ensure prompt reporting consistent with the Act and implementing regulations.

III. Sufficiency of Periodic Monitoring

Petitioners begin by citing CAA section 504(c), 42 U.S.C. § 7661c(c), and the implementing regulations at 40 C.F.R. §§ 70.6(c)(1) and 70.6(a)(3)(i)(B), asserting that permitting authorities must ensure that a title V permit contain monitoring that assures compliance with the terms and conditions of the permit. Petition at 10. Specifically, Petitioners assert that the D.C. Circuit Court of Appeals has held that "even when the underlying applicable requirements require monitoring, permitting authorities must supplement this monitoring if it is inadequate to ensure compliance with the terms and conditions of the permit." *Id.* (citing *Sierra Club v. EPA*, 536 F.3d 673,680 (D.C. Cir. 2008)).

Petitioners allege that the Sims Mesa permit fails to contain monitoring requirements that ensure compliance with underlying NOx, CO, and VOC emission limits. Petitioners argue that in some cases, the Sims Mesa permit altogether lacks monitoring requirements and in other cases, fails to require monitoring that is sufficiently frequent and/or of sufficient quality necessary to ensure compliance with applicable emission limits. *Id.* The specific claims are discussed below.

Administrative Record NSR 10833_011672

Petitioners' Claim III.A.1 - Frequency of monitoring for NOx and CO emission limits.[6]

Petitioners state that Conditions 3.4.2 and 3.4.2.2 of the Sims Mesa permit require only once-per-year portable analyzer monitoring for units 1-6 and 11-14, the compressor engines. *Id.* Petitioners claim they commented on the proposed Sims Mesa permit stating that "[t]his monitoring is too infrequent to ensure compliance with NOx and carbon monoxide emissions limits." *Id.* Petitioners explain that the Sims Mesa permit limits NOx and CO emissions on an hourly basis, pointing out, as an example, that Condition 3.2 limits NOx emissions, from all the compressor engines, to "no more than 4.5 pounds per hour." *Id.* Petitioners argue that "monitoring only once annually for the engines units cannot possibly ensure continuous compliance with these hourly emission limits, and it is questionable whether once-per-[year]-monitoring can ensure continuous compliance with the annual emission limits." *Id.*

EPA's Response: I grant the Petitioners' request for an objection on this issue because NMED did not adequately respond to Petitioners' comment that the annual portable analyzer monitoring in Conditions 3.4.2 and 3.4.2.2 of the Permit[7] "is too infrequent to ensure compliance with NOx and carbon monoxide emissions limits. . . . Monitoring only once annually for the engines units cannot possibly ensure continuous compliance with these hourly emission limits." Comments on Draft Title V Permit for Williams Four Corners, LLC's Sims Mesa Central Delivery Point, Rio Arriba County, NM, Permit No. P026R2, at 6 (December 18, 2009). The RTC indicates that NMED is relying on proper operation and maintenance of the engines, as specified by the engine manufacturer, in addition to the annual monitoring requirement in the permit, to show that the existing engines maintain their uncontrolled NOx and CO emissions levels at the permitted limits. *See* RTC at 5. However, NMED's RTC does not explain what permit terms or conditions ensure "proper operation and maintenance of" the engines. NMED has an obligation to respond adequately to significant comments on the draft title V permit and to ensure that monitoring is adequate to assure compliance with the terms and conditions of the permit. Section 502(b)(6) of the Act, 42 U.S.C. § 7661a(b)(6), requires that all title V permit programs include adequate procedures for public notice regarding the issuance of title V operating permits, "including offering an opportunity for public comment." *See also,* 40 C.F.R.

---

[6] I have divided what was Claim III.A in the Petition into Claim III.A.1 and Claim III.A.2 in this response for purposes of clarity.

[7] Condition 3.4.2 describes Unit Specific Monitoring Requirements in table form. For the compressor engines it lists NOx, CO and VOC as the parameters monitored to comply with the allowable lbs per hour and tons per year (TPY) limits in table 3.2, according to the monitoring requirement described as periodic annual emissions testing per Condition 3.4.2.2. Specifically, Condition 3.4.2.2. provides for:

> Periodic Emissions Test Monitoring (For Engines, Units 1-6 and 11-14): The permittee shall test using a portable analyzer subject to the requirements and limitations of section 3.4.1, General Monitoring Requirements. For periodic testing NOx and CO emissions tests shall be carried out as described below. Test results that demonstrate compliance with the NOx and CO emission limits shall be considered to demonstrate compliance with the VOC emission limits.
>
> (a) The monitoring period shall be annually.
>
> (b) Initial monitoring shall occur within the first monitoring period occurring after permit issuance.
>
> (c) All subsequent monitoring shall occur in each succeeding monitoring period. No two monitoring events shall occur closer together in time than 25% of a monitoring period.
>
> (d) Follow the portable analyzer requirements and test procedures in section 3.5.

Administrative Record NSR 10833_011673

§ 70.7(h). It is a general principle of administrative law that an inherent component of any meaningful notice and opportunity for comment is a response by the regulatory authority to significant comments. *Home Box Office v. FCC,* 567 F.2d 9, 35 (D.C. Cir. 1977) ("the opportunity to comment is meaningless unless the agency responds to significant points raised by the public."). *See also, In the Matter of Louisiana Pacific Corporation,* Petition V-2006-3, at 4-5 (November 5, 2007).

Under Title V, even when the underlying applicable requirement requires monitoring, permitting authorities must supplement this monitoring if it is inadequate to ensure compliance with the terms and conditions of the permit. As Petitioners note, *Sierra Club,* 536 F.3d at 678, makes it clear that CAA section 504(c) requires all title V permits to contain monitoring requirements to assure compliance with permit terms and conditions. EPA discussed the Part 70 periodic monitoring and sufficiency of monitoring requirements at length in two title V orders issued on May 28, 2009. *See In the Matter of CITGO Refining and Chemicals Company L.P.*, Petition VI-2007-01 (May 28, 2009) ("*CITGO Order*"); *In the Matter of Premcor Refining Group, Inc.*, Petition VI-2007-2 (May 28, 2009) ("*Premcor Order*"). EPA's title V monitoring rules (40 C.F.R. §§ 70.6(a)(3)(i)(A) and (B) and 70.6(c)(1)) are designed to address the statutory requirement that "[e]ach permit issued under [title V] shall set forth . . . monitoring . . . requirements to assure compliance with the permit terms and conditions." CAA section 504(c), 42 U.S.C. § 7661c(c). As a general matter, permitting authorities must take three steps to satisfy the monitoring requirements in EPA's part 70 regulations. First, under 40 C.F.R. § 70.6(a)(3)(i)(A), permitting authorities must ensure that monitoring requirements contained in applicable requirements are properly incorporated into the title V permit. *See CITGO Order* at 7; *Premcor Order* at 7. Second, if the applicable requirement contains no periodic monitoring, permitting authorities must add "periodic monitoring sufficient to yield reliable data from the relevant time period that are representative of the source's compliance with the permit." 40 C.F.R. § 70.6(a)(3)(i)(B); *see CITGO Order* at 7; *Premcor Order* at 7. Third, if there is some periodic monitoring in the applicable requirement, but that monitoring is not sufficient to assure compliance with permit terms and conditions, permitting authorities must supplement monitoring to assure such compliance. 40 C.F.R. § 70.6(c)(l). *E.g., CITGO Order* at 6-7; *In the Matter of Wheelabrator Baltimore, L.P.,* at 13 (April 14, 2010). Further, permitting authorities have a responsibility to respond to significant comments. *See, e.g., Onyx Order* at 7 ("It is a general principle of administrative law that an inherent component of any meaningful notice and opportunity for comment is a response by the regulatory authority to significant comments.") (citing *Home Box Office*, 567 F.2d at 35). This principle applies to significant comments on the adequacy of monitoring. *CITGO Order* at 7.

The determination of whether the monitoring is adequate in a particular circumstance generally will be made on a case-by-case basis considering site-specific factors. *See CITGO Order* at 7; *see also, In the Matter of United States Steel Corporation – Granite City Works*, Petition V-2009-3, at 7 (January 31, 2011) ("*US Steel Order*"). However, in many cases, monitoring from the applicable requirement will be sufficient to assure compliance with permit terms and conditions; consequently, EPA recommends the monitoring analysis should begin by assessing whether the monitoring required in the applicable requirement is sufficient. *See CITGO Order* at 7; *US Steel Order* at 7. Some factors that permitting authorities may consider in

Administrative Record NSR 10833_011674

determining appropriate monitoring are (1) the variability of emissions from the unit in question; (2) the likelihood of a violation of the requirements; (3) whether add-on controls are being used for the unit to meet the emission limit; (4) the type of monitoring, process, maintenance, or control equipment data already available for the emissions unit; and (5) the type and frequency of the monitoring requirements for similar emission units at other facilities.[8] *See CITGO Order* at 7-8. In addition, the rationale for the monitoring requirements selected by a permitting authority must be clear and documented in the permit record. *Id.* at 7 (citing 40 C.F.R. § 70.7(a)(5)).

In responding to Petitioners' comment questioning the frequency of the permit's compliance monitoring for the engines' NOx and CO limits, NMED stated that "[20.2].70.302.C (2) NMAC requires periodic monitoring, not continuous monitoring, sufficient to yield reliable data that are representative of the source's compliance with the permit." RTC at 5. As an example of periodic monitoring required by EPA, NMED's RTC presents the testing requirements for new or reconstructed engines greater than 500 hp under New Source Performance Standards ("NSPS") for Stationary Spark Ignition Internal Combustion Engines, Subpart JJJJ.[9] *Id.* The RTC does not elaborate on this point, but proceeds to state that NMED's "monitoring protocol for engines requires quarterly portable analyzer testing on engines with catalytic converters and annual testing on units without controls."[10] *Id.* The RTC then concludes that "[b]ecause the portable analyzer test is a short term test, it demonstrates compliance with the emission limits for that time period. Due to the steady state operation of these engines, NMED believes that the portable analyzer testing along with proper operation and maintenance of the units provides reasonable demonstration of compliance with annual and hourly NOx and CO emission limits." *Id.*

Although NMED states that it included NOx and CO monitoring in accordance with its monitoring protocols for engines, NMED's RTC does not adequately explain how the monitoring in the permit is sufficient, for example by considering factors that affect the frequency of monitoring such as those described above, including facility specific factors (e.g., fuel type, equipment age and condition, prior testing data, etc.). As explained, NMED is relying on the portable analyzer test results as a snap shot sampling of emissions to confirm annually whether the engines continue to meet their short term (i.e., hourly) limits. Between annual portable analyzer tests NMED relies on assumptions of steady state operation and "proper operation and

---

[8] EPA has also advised that "[s]everal rules and guidelines may prove helpful to States in establishing monitoring for compliance assurance purposes in title V permits. Examples include the monitoring design criteria (appropriate data representativeness, frequency, and measures of quality assurance) outlined in the CAM rule, monitoring under several Maximum Achievable Control Technology ('MACT') standards (40 C.F.R. Part 63), and certain monitoring provided by acid rain rules (40 C.F.R. Parts 72-78)." *Premcor Order* at 8.

[9] *See, e.g.*, 40 C.F.R. §§ 60.4243(a)(1) and (b)(2)(ii); *see also*, 73 Fed. Reg. 3591 (January 18, 2008). According to the permit record, NSPS Subpart JJJJ does not apply to the two Waukesha 7042 GL 4-stroke lean burn engines currently operating at the Sims Mesa facility. *See* SoB at 5-6.

[10] The SoB at 8 references NMED's use of a Monitoring Protocol, dated April 2, 2009, for the engines. In addition, the SoB includes qualitative information regarding emissions from engine start-up and shutdown periods, but generally does not include information on required operation and maintenance procedures for the engines. *See* SoB at 3-4.

Administrative Record NSR 10833_011675

maintenance of the units" to provide a "reasonable" demonstration of compliance with annual NOx and CO emission limits. The RTC, however, does not clarify the permitting requirements that assure proper operation and maintenance of the units are satisfied, nor does it provide an explanation (or appropriate citation to the technical discussion) of such requirements, nor explain how those requirements, in conjunction with an annual emissions test, constitute monitoring that demonstrates compliance with a short term limit.

For the reasons given above, I grant the petition on this issue. NMED must provide an adequate response to the comment that the annual monitoring in the permit is not adequate for assuring compliance with the engines' CO and NOx limits. In responding to this Order, NMED should respond fully to Petitioners' comment concerning the frequency of the permit's monitoring for NOx and CO. In that regard, NMED should offer further explanation of why it believes that steady state operations and proper operation and maintenance of the units are valid assumptions here, in light of the permit's terms and conditions, or make appropriate changes to the permit to ensure it includes monitoring requirements consistent with the Act and implementing regulations.

Petitioners' Claim III.A.2 - Monitoring Exemptions. Petitioners additionally allege the title V Permit allows for even less frequent monitoring for the engines since Condition 3.4.1.3.2 "allows the source to avoid monitoring for NOx, and carbon monoxide altogether if a unit has been operated for less than 25% of a monitoring period." Petition at 10.[11] Petitioners believe this condition is "wholly inappropriate and as a practical matter would allow the operator to violate hourly emission limits in the permit for up to three months, which is 25% of the annual monitoring period." *Id.* at 10-11. Petitioners explain that even if an engine operates for less than three months, it could still exceed hourly NOx and carbon monoxide limits, which, according to Petitioners, demonstrates that this condition fails to ensure adequate monitoring. *Id.* at 11. Petitioners acknowledge that Condition 3.4.1.3.2 would require monitoring after two successive monitoring periods without monitoring, but, Petitioners assert that "at most this [Condition 3.4.1.3.2] means that an emission unit consistently operating less than 25% of the monitoring period monitor [sic] once every three years." *Id.* Petitioners claim this is not sufficient monitoring under title V and note that this requirement does not even apply if a source operates less than 10% of any annual monitoring period. *Id.* Petitioners state that in "essence, this [monitoring exemption] requirement allows [Williams] to avoid monitoring altogether so long as it only operates its engines 36.5 days annually." *Id.* Petitioners conclude that this monitoring requirement "hardly serves to ensure compliance with hourly NOx and carbon monoxide emission limits." *Id.*

Citing 40 C.F.R. §§ 70.6(a)(3)(i)(B) and 70.6(c)(i), Petitioners assert title V requires that monitoring shall provide reliable data from the relevant time period which is representative of the source's compliance with provisions of permit in order to ensure compliance. *Id.* Petitioners conclude that "once-per-year portable analyzer monitoring, which can be altogether ignored, does not assure compliance with the annual and hourly NOx and carbon monoxide limits." *Id.*

[11] Under permit Condition 3.4.2.2, the monitoring period is annually for Engines, Units 1-6 and 11-14. Permit at 11.

Administrative Record NSR 10833_011676

EPA's Response: I grant the Petitioners' request for an objection on the basis that NMED's permit record, including the SoB, does not adequately document the rationale for NMED's permitting decision supporting the monitoring exemptions contained in Condition 3.4.1.3.2. In response to Petitioners' comments regarding the monitoring exemptions under Condition 3.4.1.3.2, NMED provides the following justification for this condition:

> The intent of this exemption is to reduce the possibility that equipment that is not operating must be started up for the sole purpose of monitoring. For a permittee to invoke this exemption, it must be able to produce records of the hours of operation for the specified semi-annual reporting period. This requirement, which previously was not explicit, has been clarified at Condition 3.4.1.3 by stating: "However, to invoke monitoring exemptions at 3.4.1.3.2, hours of operation shall be monitored and recorded." (It should also be noted that if a unit qualifies for the exemption and operates less than 25% of the period, the unit will by default emit 75% less of the permitted emissions.)
>
> Per Condition 3.4.1.3.3 "A minimum of one of each type of monitoring activity shall be conducted during the five year term of this permit." Thus, regardless of the facility's operating frequency, a minimum of one of each type of monitoring activity shall be conducted during the five year period.

RTC at 6.

The permit exempts an engine from having to conduct the CO and NOx portable analyzer test based on the percentage of time that the engine has operated during an annual monitoring period. *See, e.g.*, Conditions 3.4.1.3. and 3.4.1.3.1–3.4.1.3.3. However, NMED has not adequately explained how the exemptions provided for in the monitoring provisions are consistent with the title V requirements. In particular, NMED's explanation in the RTC regarding the need for an exemption is not adequate because it does not provide NMED's engineering basis to support the decision that the frequency of portable analyzer monitoring, considering exemption periods, is sufficient to assure compliance with the annual and hourly NOx and CO permit limits. The rationale for the monitoring requirements selected by a permitting authority must be clear and documented in the SoB or elsewhere in the permit record. 40 C.F.R. § 70.7(a)(5). Accordingly, I grant Petitioners' objection on this issue because the permit lacks adequate justification in the record to explain NMED's decisions regarding the exemptions from compliance monitoring for the compressor engines. In addressing this objection, NMED must discuss the adequacy of the permit monitoring requirements in support of the permit's exemption for low operation periods, or make appropriate changes to the permit to ensure it includes monitoring requirements consistent with the Act and implementing regulations.

Petitioners' Claim III.B- VOC Monitoring. Petitioners first argue that the Sims Mesa permit fails to require "any monitoring whatsoever of VOC emissions from the compressor engines, or Units 1-6 and 11-14." Petition at 11. Second, Petitioners argue that the permit asserts, without support, that "[t]est results that demonstrate compliance with the NOx and CO … emission limits shall also be considered to demonstrate compliance with the VOC emission limits." *Id.* Petitioners claim that neither the SoB nor the title V permit provide any information

Administrative Record NSR 10833_011677

or analysis supporting NMED's claim that compliance with NOx and CO limits automatically indicates compliance with VOC emission limits. *Id.*

Petitioners further allege that in the RTC, NMED admits that there is no rationale for relying on NOx and CO monitoring to demonstrate compliance with VOC limits, since NMED states that the rationale would be provided in the engine monitoring protocols. *Id.* Petitioners allege that it is "impossible to understand how NMED can assert that the [Sims Mesa] Permit provides for sufficient periodic monitoring to assure compliance when the rationale has yet to be provided." *Id.*

Petitioners go on to assert that NMED's RTC reflects an unsupported assertion that NOx and CO monitoring is sufficient to ensure compliance with VOC limits, and that NMED relies on NOx and CO monitoring to show compliance with VOC limits because "'portable analyzers do not speciate VOC compounds and the cost of a separate EPA method test is significant.'" *Id.* (quoting RTC at 7). Petitioners conclude that NMED's justification in the RTC does not absolve NMED from ensuring that the permit contains sufficient monitoring to assure compliance with applicable limits. *Id.* at 11-12.

Petitioners claim that NMED believes VOC limits will be met based on the manufacturer's specification of the expected NOx, CO, and VOC emissions for a properly operating unit. Petitioners concede that manufacturer's specifications are relevant information, but argue that such specifications alone are not sufficient periodic monitoring and do not ensure that the applicable hourly and annual VOC limits for the compressor engines will be continuously met. *Id.* at 12.

Petitioners conclude by noting the assertion in NMED's RTC that if an engine test shows that NOx and CO fall within the emission limits, then VOC also falls within the limits, but, according to Petitioners, NMED provides no information or analysis to support this conclusion except to point to "basic principles of combustion chemistry." *Id.* Petitioners dispute that "basic principles of combustion chemistry" support NMED's assertion that compliance with NOx and CO limits automatically ensures compliance with VOC limits at these units. *Id.*

EPA's Response: I grant this claim on the basis that the permit record fails to provide adequate technical information or explanation to support the surrogate monitoring provision in Condition 3.4.2.2 (which provides that monitoring that demonstrates compliance with NOx and CO emission limitations for the engines also demonstrates compliance with VOC emission limitations). As an initial matter, the VOC monitoring in the Sims Mesa permit is based on NOx and CO monitoring for the engines that is itself in question because it is based upon an inadequate record which does not include an adequate response to all the issues raised in the public comments. *See* EPA's Response to Claim III.A.1, *supra.* In addition, as previously mentioned, the rationale for the selected monitoring requirements must be clear and documented in the statement of basis or elsewhere in the permitting record. 40 C.F.R. § 70.7(a)(5); *see also, CITGO Order* at 7.

Administrative Record NSR 10833_011678

NMED's RTC discusses the factors NMED considered for its decision to use NOx and CO monitoring as a surrogate for VOC monitoring, such as cost and test issues. RTC at 7. However, EPA agrees with Petitioners that NMED's reasons for dismissing portable analyzers and "a separate EPA method test" does not adequately explain why NMED's chosen option of surrogacy monitoring is sufficient for title V purposes. Moreover, NMED's RTC explanation that "taking into account that the manufacturer tests the equipment and specifies the expected NOx, CO, and VOC emissions for a unit operating properly, as well as basic principles of combustion chemistry, if an engine test demonstrates that NOx and CO concentrations fall within the emission limits, then VOC also falls within the emission limits, and the engine is performing as represented in the application," RTC at 7, does not provide an adequate technical explanation to support NMED's assertion that annual NOx and CO levels are proper indicators of VOC levels for these engines. Accordingly, I grant the Petitioners' request for an objection on this issue. In responding to this Order, NMED must provide a clear rationale and technical basis to justify this surrogacy monitoring, or make appropriate changes to the permit to ensure it includes monitoring requirements consistent with the Act and implementing regulations.

In summary, the Petition sets out three instances in the Sims Mesa title V permit where the Petitioners claim NMED has failed to include sufficient monitoring to assure compliance and/or where NMED has failed to justify the required monitoring for the compressor engines. In responding to this Order, I direct NMED to ensure it has: (1) satisfied the monitoring requirements of 40 C.F.R. § 70.6(a)(3)(i)(A) and (B) and (c)(l); (2) provided a rationale for the monitoring requirements placed in the permit (*see* 40 C.F.R. § 70.7(a)(5)); and (3) responded to significant comments.

IV. Condition 6.1.1 and Applicable Requirements

Petitioners' Claim: Petitioners assert that permit Condition 6.1.1 is contrary to the Clean Air Act in that NMED cannot automatically conclude that compliance with a title V permit assures compliance with the National Ambient Air Quality Standards (NAAQS). Petition at 12. Petitioners state that Condition 6.1.1 of the Sims Mesa permit provides: "For sources that have submitted air dispersion modeling that demonstrated compliance with federal ambient air quality standards, compliance with the terms and conditions of this permit regarding source emissions and operation shall be deemed in compliance with federal ambient air quality standards specified at 40 CFR 50 NAAQS." *Id.* In order to make such a finding, the Petitioners argue that NMED must first prepare an analysis and assessment of emissions on a source-by-source basis, both individually and cumulatively. *Id.* Because the NAAQS are revised every five years, Petitioners believe that Condition 6.1.1 is inappropriate given that permit terms and conditions are rarely revised and are not required to be revised as the NAAQS are revised. *Id.* Petitioners note that the construction permits for the Sims Mesa CDP were issued in 1991, which predates the 1997 8-hour ozone NAAQS, the 1997 annual and 24-hour $PM_{2.5}$ NAAQS, the 2006 annual and 24-hour $PM_{2.5}$ NAAQS, the 2008 8-hour ozone NAAQS, and the 2010 annual and hourly NO_2 NAAQS. *Id.* Therefore, Petitioners contend that the Sims Mesa title V permit cannot include a provision that automatically concludes operation of the source in compliance with the permit will protect any and all NAAQS specified at 40 C.F.R. Part 50. *Id.* at 13.

Administrative Record NSR 10833_011679

EPA's Response: I grant this claim on the basis that NMED failed to fully respond to Petitioners' comments relating to permit Condition 6.1.1. Appearing in the section titled "6.0 Compliance," of the Sims Mesa permit, Condition 6.1.1 states:

> For sources that have submitted air dispersion modeling that demonstrates compliance with federal ambient air quality standards, compliance with the terms and conditions of this permit regarding source emissions and operation shall be deemed to be compliance with federal ambient air quality standards specified at 40 CFR 50 NAAQS.

Permit at p.17.

During the public comment period, Petitioners submitted comments asserting, among other things, that Condition 6.1.1 was inappropriate and that NMED could not automatically conclude that compliance with a title V permit assures compliance with the NAAQS. *See* Comments on Draft Title V Permit for Williams Four Corners, LLC's Sims Mesa Central Delivery Point, Rio Arriba County, NM, Permit No. P026R2, at 8 (December 18, 2009). Rather, the public comments argued, NMED must first prepare an analysis and assessment of emissions on a source-by-source basis, both individually and cumulatively to make such a finding. *Id.* In its RTC addressing Condition 6.1.1, NMED discusses the NSR permitting requirements, stating that they require construction permit applicants to conduct air dispersion modeling to demonstrate that the source's proposed emissions will comply with applicable NAAQS. RTC at 9. The RTC continues by noting that after review and approval, NMED incorporates modeled emission rates that demonstrate compliance into the NSR permit, and the title V permit then incorporates the applicable requirements of the NSR permit together with additional monitoring, recordkeeping, and reporting as necessary to ensure compliance with the permit. *Id.* NMED also states Sims Mesa CDP submitted a permit renewal application and thus is "only required to certify compliance with the applicable requirements in its NSR permit" for this application. *Id.* In addition, the RTC states that under Condition 1.8 of the Sims Mesa permit, the permittee is required to comply with "all applicable requirements, including those requirements that become effective during the term of the permit." *Id.* Finally, in response to Petitioners' comment asserting that "the Title V Permit cites '40 CFR 50 NAAQS' as authority for this Condition," NMED states, "Condition 6.1.1 is an accurate statement. The reference to 40 CFR 50 NAAQS is not intended to be a citation." *Id.* However, the RTC does not address Petitioners' comment that Condition 6.1.1 was inappropriate because NMED could not automatically conclude that compliance with a title V permit assures compliance with the NAAQS.

Permitting authorities have a responsibility to respond to significant comments. *See, e.g., Onyx Order* at 7 ("It is a general principle of administrative law that an inherent component of any meaningful notice and opportunity for comment is a response by the regulatory authority to significant comments.") (citing *Home Box Office*, 567 F.2d at 35). This principle applies to significant comments on the appropriateness of a term or condition in a title V permit. *See CITGO Order* at 7. While NMED's RTC provides a detailed discussion of the process by which emission limitations from underlying SIP permits are carried forward into the source's title V permit, NMED failed to adequately respond to Petitioners' specific comment that Condition 6.1.1

Administrative Record NSR 10833_011680

was contrary to the Clean Air Act in that NMED cannot automatically provide that compliance with the terms and conditions of the title V permit shall be deemed compliance with the NAAQS. Because of NMED's failure to respond to this comment, I grant the petition on this issue. Furthermore, NMED's reference in the RTC to Condition 1.8 of the Sims Mesa permit (stating that the permittee is required to comply with all applicable requirements, including those requirements that become effective during the term of the permit) creates additional confusion as Condition 6.1.1 and Condition 1.8 could be read to conflict with one another, yet NMED does not explain the relationship between these two conditions.

In responding to this Order, NMED must fully respond to the Petitioners' comment. In so doing, I also suggest that NMED consider the basis for Condition 6.1.1 and clarify the purpose and scope of Condition 6.1.1, considering whether the term should be removed or revised for clarity, in accordance with the appropriate permit revision requirements. NMED may additionally wish to consider the relationship between Condition 6.1.1 and Condition 1.8, and as necessary, revise the permit to ensure that these terms will not conflict with one another.

CONCLUSION

For the reasons set forth above and pursuant to section 505(b)(2) of the Clean Air Act and 40 C.F.R. § 70.8(d), I hereby grant the petition from WildEarth Guardians and San Juan Citizens Alliance requesting that EPA object to the title V Permit issued to Williams Four Corners, LLC for the Sims Mesa Central Delivery Point natural gas gathering and compression plant.

Cc Mustafa, Sufi A., ENV <sufi.mustafa@env.nm.gov>; Kuhn, Julia, ENV <Julia.Kuhn@env.nm.gov>

Sagar,

Thanks for the summary. I had no luck getting the request expedited by TCEQ but perhaps they will do a favor for Sufi.

John and I will make preparations to perform the runs once we receive the information from TCEQ.

Subject: Re: [EXTERNAL] RE: YGI Permit: CO2 emissions question

Hi all,

To summarize our today's call: Trinity will submit the Texas CEQ surrounding sources inventory request and Sufi will request Chad Dumas (TCEQ) to expedite the request. After the TCEQ surrounding sources are obtained, Trinity will re-run the AERMOD simulations on the facility and submit the results for NMED review.

Please let us know if you have any questions about the model re-run.

Thank you,
Sagar

Subject: Re: [EXTERNAL] RE: YGI Permit: CO2 emissions question

Hi Jesse,

Thank you for your reply and the information.

Yucca Growth Infrastructure, LLC YGI Microgrid

Table 2-H: Stack Exit Conditions

Unit and stack numbering must correspond throughout the application package. Include the stack exit conditions for each unit that emits from a stack, including tank emissions. If the facility has multiple operating scenarios, complete a separate Table 2-H for each scenario and, for each, type scenario name here:

Stack Number	Serving Unit Number(s) from Table 2-A	Orientation (H-Horizontal V=Vertical)	Rain Caps (Yes or No)	Height Above Ground (ft)	Temp. (F)	Flow Rate (acfs)	Flow Rate (dscfs)	Moistu Volu (%
SOFC-1	SOFC	V	N	30	350	857.12	514.46	7.9%
SOFC-2	SOFC	V	N	30	350	857.12	514.46	7.9%
SOFC-3	SOFC	V	N	30	350	857.12	514.46	7.9%
SOFC-4	SOFC	V	N	30	350	857.12	514.46	7.9%

Comments/questions (in no specific order):

1. Would you be able to send us an updated snippet (just 1 line) of the Table 2-H with all the updated values. I pasted the permit application snippet above. Please also show full calculations used to reach these updated values.

2. I did a quick calculation on the concentration of CO_2 in the final exhaust. The actual hotbox emissions constitute about 44% of acfm by simple ratio (of course, correcting for temperature will make the overall mass contribution go down slightly). Even assuming the hotbox emissions make up ~30% of the final exhaust by mass, the %CO_2 would go down to about 1.5%; it does not go down to 0.6% in the final exhaust to match the 10,114,115 tpy CO_2 calculated using the bottom-up method. I assumed ambient air to 415ppm or about 0.0415% CO_2. Please clarify this using appropriate equations/values/calculations. Please also specify the moisture % in each of the air streams to calculate the dscfs.

3. Do every 24 power modules make up one "cluster" and emit through a shared plenum or "stack"?

4. I will leave it to Julia to discuss with you the 857 acfs in the original permit vs the updated 651 acfs.

5. Would you be able to meet Sufi and I via a Teams call sometime tomorrow afternoon? 2pm MT works best for us. We can meet here: https://teams.microsoft.com/l/meetup-join/19%3ameeting_N2NmMjQ1YWUtZWQ2YS00ZTg5LWJhNGUtYjY0ZmViOGI5NDgy%40thread.v2/0?context=%7b%22Tid%22%3a%2204aa6bf4-d436-426f-bfa4-04b7a70e60ff%22%2c%22Oid%22%3a%22f0e573c8-977d-4316-afb7-d790fd7669d5%22%7d

Thanks,
Sagar

Subject: RE: [EXTERNAL] RE: YGI Permit: CO2 emissions question

Sagar,

To summarize our correspondence so far, you had four outstanding questions related to the vent stream from the Bloom Energy Server system. I'm going to address them in the order they were initially presented with captioning updated to reflect the current focus of the questions based on your follow ups.

John and I can visit with you via video call whenever is convenient for you if you'd like to discuss any of the information further.

1. *… we would also like to know what other "air streams" are contributing to the overall exhaust and if those are tested too?*
   The "air streams" are cabinet ventilation and DC module ventilation. These are air streams that do not come into contact with process streams and only serve to ventilate system components. Their composition is not different from ambient air, but is of higher temperature.
2. What are the "air streams other than the CO_2-rich anode exhaust"? What is their source, properties, composition, temperature, etc? I am also curious to see how the exhaust gas maintains 350 F.
   Here is the breakdown we have received from Bloom showing the flow rate and temperature of each stream:

Stream	Composition	Design Flow Rate (per power module)	Design Temperature
Hotbox (emission stream) contains both anode and cathode exhaust	Represented by stack test stream	717 acfm	440 °C
Cabinet ventilation	Air	499 acfm	61 °C
DC module ventilation	Air	416 acfm	64 °C
Total Stream per power module	Permitted stream	1628 acfm	164 °C
Flow rate per Energy Server "cluster" (24 power modules)	Permitted stream	651.2 acfs	164 °C (327 °F)

   We also received more detailed information about the plenum associated with a cluster. It has a total superficial area of 28.50 ft.^{2} for an effective diameter of 6.02 ft.

   As you can see the current design information is showing a slightly lower temperature, flow rate, and stack diameter and slightly higher overall plume energy.

3. What is the breakdown of the 514 dscsf in each stack in terms of the source. How much comes from what component of the SOFC?
   See answer above.
4. We would like to know where and how does the stream become 0.45% instead of the 4.5% exhaust that is measured. From general principles, if that reduction is due to dilution from outside air, it requires a thermodynamic calculation to calculate the overall exhaust temperature and how it will be 350 F in the exhaust stream.
   You are correct. Bloom performed an energy balance to obtain the final stream temperature. As you can see above the ventilation streams are cooler than the hotbox exhaust stream and they do depress the final temperature slightly below 350 °F.

Thanks,

Hi Jesse,

Would like to follow up on the stack and CO_2 emissions and exhaust flow rate calculation discussion. John Ke called me yesterday saying that you are talking with Bloom. In my first email, I asked Monday afternoon, but I understand that I sent that email on Friday morning and one business day might not be enough.
Since this is a time-sensitive matter, could you please give your replies to the questions by tomorrow afternoon 2pm MT at the latest. Please be very thorough in the reply and provide all the calculations and justifications necessary.

Thank you,
Sagar

Sagar,

Sounds good, I have forwarded the inquiry about total stream make-up and temperature to Bloom and will get right back to you.

Subject: Re: [EXTERNAL] RE: YGI Permit: CO2 emissions question

Jesse,

For items 2–3, I'll have Bloom get the breakdown for us and get back to you ASAP.

That will be great. Thank you!

For item 1, the stack testing was done as described in the report. It's representative of emissions from the system but its purpose was not to measure flow rate or temperature of the type of system being constructed.
If it is representative of the emissions from the system, we would also like to know what other "air streams" are contributing to the overall exhaust and if those are tested too?

For item 4, the CO_2 concentration can be calculated from the materials in the application. In fact, the calculation you provided appears to be the correct framework. Just back calculate to obtain the % CO_2 in the exhaust. I don't believe Bloom has performed a test on this configuration to empirically measure % CO_2 but I will ask.
Agree. It comes out to ~0.45% and not 4.5% by that logic (basically 90% reduction). We would like to know where and how does the stream become 0.45% instead of the 4.5% exhaust that is measured. From general principles, if that reduction is due to dilution from outside air, it requires a thermodynamic calculation to calculate the overall exhaust temperature and how it will be 350 F in the exhaust stream.

Thank you,
Sagar

Subject: Re: [EXTERNAL] RE: YGI Permit: CO2 emissions question

Hi Jesse,

Thank you for the information. Would you be able to explain to us in some more detail:

1. How the testing was done and if it is representative of the overall exhaust that is modeled here?
2. What are the "air streams other than the CO_2-rich anode exhaust"? What is their source, properties, composition, temperature, etc? I am also curious to see how the exhaust gas maintains 350 F.
3. What is the breakdown of the 514 dscsf in each stack in terms of the source. How much comes from what component of the SOFC?
4. Does the manufacturer have a testing sheet outlining the exact CO_2 concentrations in the final exhaust? I see values around 4-5% CO_2 in all the testing sheets in the permit but would like to know the exact CO_2 % in the exhaust (after considering all the other air streams you mentioned). If it is already in the permit somewhere, I would appreciate you pointing us to the exact page number or maybe pasting a screenshot here.

Thank you for your assistance in clarifying these questions.
Sagar

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Hi Sagar,

It is not correct to assume a 4.55% CO2 concentration in the exhaust flue gas. The test reports sample cathode exhaust while the release points to be constructed will have a higher flow rate that includes air streams other than the CO2-rich anode exhaust.

Therefore, the “bottom-up” methodology is the correct one and the alternate method you have outlined would not be valid.

Let me know if you need anything else!

Cheers,

Subject: YGI Permit: CO2 emissions question

Hi Jesse and Jaimy,

My name is Sagar and I am a modeler with NM Environment Department. We are in the process of reviewing public comments on the YGI permit and one of the questions focused on the CO_2 emissions calculations.

Question: Total CO_2 emissions calculated using the bottom-up methodology is mentioned to be ~10,114,115 Tons per year CO_2 across all stacks and Bloom energy 'servers'. The bottom-up methodology involves multiplying the installation capacity in MW (2462 MW) and the lb CO_2 per MW-hr operation emission factor (~818 lb CO_2/MW-hr) and a 15% safety factor.

The alternate method includes estimating CO_2 emissions using stack flow rate and amount of CO_2 in the exhaust gas.
The stack flow rate is mentioned to be 514.46 ft3/sec (dry standard cubic ft/sec). Assuming a ~4.55% CO_2 concentration in the exhaust flue gas (Montrose and Blue Sky Environmental testing sheets in the permit application), it leads to about 96,074,822 tons/yr CO_2, a factor of 9 higher than estimated using the bottom-up methodology.

The second calculation is as follows
Exhaust rate per stack = 514.460 ft3/sec (Dry std cubic ft/sec)
Exhaust rate for the whole facility per year = 514.46 * 2275 (stacks) * 3600 (sec/hr) * 24 (hrs/day) * 365 (days/yr) = 3.69e13 ft3/yr
CO_2 concentration in exhaust = 4.55% (dry basis)
CO_2 density = 1/8.74 (lbs CO_2 / SCF CO_2)
CO_2 emissions per year = 3.69e13 (total exhaust, ft3/yr) * 0.0455 (CO_2 conc in exhaust, ft3 CO_2 / ft3 exhaust) * 1/8.74 (lbs CO_2/ft3 CO_2) = 1.92e11 lbs CO_2/yr
CO_2 emissions per year (in tons) = 1.92e11 * 1/2000 (lbs to tons) = 96,074,822 tons CO_2/yr

Company estimated CO_2 emissions in permit = 10,114,115 tons CO_2/yr

Difference (as ratio) = 96,074,822 / 10,114,115 = 9.5

Since this is a public comment of high concern, we would appreciate it if you could please clarify the discrepancy in the above calculation by the 2pm of Monday, August 31 2026. Please be thorough in how it may affect the GHG emissions calculations and/or dispersion modeling (if stack parameters are required to be adjusted).

Please let us know if you have any questions.
Thank you,
Sagar

1 attachment (260 KB)
Stack_Flow 2026 0921.xlsx;

Sagar,
I'm reproducing your questions below and adding replies in **green** to address your specific questions with this framework in mind, including the stack-parameter calculation you requested.

QUESTION 1: "Can you also add a calculation via the stack parameters? Your stack parameters have since been update, correct? Please also show a simple Stack area * exit velocity * CO2 percent in the total (HB+vents) = total CO2 emissions per stack calculation. This is the crux of the question — we do not know how the 1755 tpy from a stack matches with the stack flow rates (area * velocity * concentration). Please share your updated stack parameters and ALL the flows that get in/out of each stack — from HB and other cooling vents, as you mentioned previously."

The calculations provided in the spreadsheet on Friday supplied the flow rate per hotbox, which is the information you requested to estimate CO_2 per stack based on flow. The hotbox stream is the only stream associated with CO_2 from the fuel cell operation. None of the other streams (e.g., cabinet ventilation or DC module ventilation) are used or necessary to calculate CO_2.
The CO_2 exhaust values calculated in the spreadsheet are based on the following:
CO_2 Emissions (tpy) = HB Exhaust Flow (scfh) * CO_2 Volume Percent (%) * (1 lb CO_2 / 8.74 scf)* (1- Moisture Content (%)) * (1 ton / 2000 lb) * (8760 hr / yr)

I've added columns to the Exhaust Flow and CO_2 Emissions tab of the workbook so that you can see them alongside the hotbox flow rates. As an example, for Stack Type A, the standard flow per hotbox stream (i.e, for the combined 10 hotboxes in the Stack Type A) is 176,905 scf/hr whereas the flow for the total stream (labeled Total Power Module Std Flow) is 167.61 scf/s or 603,396 scf/hr. In all three stack types, the hotbox stream flow is 29.3% of the overall power module flow (e.g., 176,905 scf/hr / 603,396 scf/hr = 0.293).

I also added a new box in Cell K1 which is the Total Stream Implied CO_2 Volume %. This value depends on the hotbox CO_2 Volume % as well as a comparison of hotbox flow to total flow. As there are multiple streams combining to form the modeled stream, only one of which contains appreciable CO_2 concentrations, Cell K1 will always be lower than the hotbox CO_2 Volume percentage.
YGI previously provided detailed information on calculated total flow and temperature values per power module (please refer to my email sent on 9/2, attached for reference) including each component stream. Note that these figures were provided by Bloom; Trinity did not calculate them. For your convenience I am repeating the table below:

Stream	Composition	Design Flow Rate (per power module)	Design Temperature
Hotbox (emission stream) contains both anode and cathode exhaust	Represented by stack test stream	717 acfm	440 °C
Cabinet ventilation	Air	499 acfm	61 °C
DC module ventilation	Air	416 acfm	64 °C
Total Stream per power module	Permitted stream	1628 acfm	164 °C
Flow rate per Energy Server "cluster" (24 power modules)	Permitted stream	651.2 acfs	164 °C (327 °F)

QUESTION 2: "As I mentioned previously, please cite all values. For example, what is the cell reference for B1 and D1 below in the 'Exhaust Flow and CO2 calculations' sheet? The moisture in B1 was submitted to be 9% in the original application but is shown to be 1% here. The same for G7-9 and H7-9 cells. PLEASE show all the underlying calculations and assumptions — clarify the vent flows, cooling flows, their parameters, and assumed CO2 concentrations, moisture, etc."

There are two values in the provided calculations requiring external citation: the flowrate per hotbox and the temperature of the hotbox stream. The source of the hotbox total flow and temperature can be found in my 9/2 email as noted above and reattached above. The original application (Table 2-H) has 7.9 vol.% moisture and this figure has not changed. Cell G1 (B1 in prior version) has been updated to match it.

Cells G1 and I1 (formerly B1 and D1) were originally given as unit values (i.e., 1%) and designated as user inputs. The 1% value included in each was simply a placeholder to allow the user to enter specified moisture content and CO_2 Volume Percent and was not intended to represent any quantity of the project design. We have included 4% CO_2 Volume Percent as indicated in your previous email as a placeholder. As noted before, we do not believe this flow-rate based methodology is the appropriate methodology for estimating CO_2 emissions. Other values introduced to respond to your first question are described in the notes to the spreadsheet.

Administrative Record NSR 10833_011690

QUESTION 3: "Can you clarify "efficiency" here? Is this the energy generation efficiency or Co2 conversion efficiency? If it is 50%, does that mean of the total input carbon in fuel, 50% got converted to CO_2? Or does that mean that the molecular energy (enthalpy heat and misc) of natural gas got 50% utilized by the HB?"

The fuel cells convert 100% of fuel-bound carbon to CO_2. CO_2 conversion efficiency is not what we mean by "efficiency."

"Efficiency" in my September 18, 2026 e-mail instead refers to the conversion from chemical energy to electrical energy. The factor 3,412 Btu/kW-hr is a physical thermochemical conversion (3.6 million Joules per kW-hr divided by 1055 Joules per Btu). Thus, a 100% efficient machine would consume 3,412 Btu to generate 1 kW-hr of work (electrical energy). When we use a figure of 54% efficiency, this means that the Energy Servers have an average fuel consumption of 3,412 / 0.54 = 6,319 Btu/kW-hr at that efficiency level.

Please refer to conditions A108.B and A108.C of the draft permit as they limit the fuel input to 136,782 MMscf per year and the electrical output to 21,567,164 MW-hr per year. Because fuel cell units convert 100% of fuel-bound carbon to CO_2, and given the draft permit's limitation on fuel throughput, the total CO_2 emission rate will be limited not by the actual efficiency, but rather by the amount of fuel consumed and no other design parameter. Regardless of the as-built efficiency realized, the system's CO_2 emissions will be limited to the following amount of CO_2 based on the annual fuel consumption limits in condition A108.B and using EPA's accepted average carbon content of natural gas:

136,782 MMscf/yr * 1,020 MMBtu/MMscf * 53.06 kg CO_2 / MMBtu = 7,402 million kg/yr = 8.16 million tons/yr

53.06 kg CO_2/MMBtu is the national average carbon content of natural gas used to calculate CO_2 emissions per 40 CFR Part 98 (Table C-1).

QUESTION 4: "Modeling: Are the stack numbers same as submitted previously?"

Yes. There have been no changes to the stack numbers when compared to the original submittal. However, each stack number has three separate, notional Model IDs (which were included at NMED's request and identified solely for modeling purposes) in the AERMOD input files (e.g., stack BL_1 corresponds to release points BL_1A, BL_1B, and BL_1C). The SO block of each AERMOD input file shows the Model IDs and the modeling files and results were submitted on September 21, 2026.

QUESTION 5: "Modeling: If there are any other structures in the facility such as an admin office or maintenance shed, please model them using BPIP-PRIME or justify their exclusion using downwash screening equations."

There are no administrative offices, maintenance sheds, or other buildings within the area of influence and none were included in the modeling. The nearest structure to any stack is more than 200′ away which exceeds the 5L threshold for a structure with 35′ as its shortest L/W dimension (200' > 5×35').

QUESTION 6: "Modeling: Can you also describe your updated methodology to treat a high aspect ratio rectangular stack as circular? Please show updated calcs and figures."

There is no change in methodology for characterizing a rectangular release point. The current aspect ratio of each of the three notional Model IDs associated with the stack in the AERMOD files (BL_1A, BL_1B, BL_1C, etc.) is 6.33 ft by 1.5 ft.

The POINT source type in AERMOD assumes a circular release point represented by a diameter. For non-circular release points an effective diameter is specified referring to a circle with the same area as the superficial area of the actual release point.

Additional details have been added to the Exhaust Flow and CO_2 Emissions tab of the spreadsheet. This includes the calculation of how the rectangular ducts were converted to the modeled effective diameter. We have included a figure for reference as well. An example calculation is also included below:

Cross Sectional Area of Plenum (the total area includes the three rectangular ducts) = 6'4" x 1'6" x 3 = (6.333 ft x 1.500 ft x 3) = 28.5 ft^2
We use the area of a circle to convert this area into an effective diameter:
$A = \pi r^2$ or $A = \pi (d/2)^2$
Solving for d, we get: $d = (4A/\pi)^{1/2}$
Solving for $d = ((4*(28.5\ ft^2/3))/ \pi)^{1/2} = 3.48$ ft
We divide the area by 3 in the above equation because the 28.5 ft^2 value represents the area of the entire plenum, not of each rectangular duct.

QUESTION 7: "[(Our prior responsive comment in red)] *Though we do not have measurements of CO_2 volumes in the hotboxes from the to-be-installed units, I created a variable in cell D1 of the Exhaust Flow and CO_2 Emissions tab that allows you to see the effect of adjusting this variable on emissions of CO_2 from each release point. You can use this spreadsheet as a tool and adjust it to address various scenarios with different hotbox CO_2 volume percentages (though this is not how Part 98 calculates GHG emissions).*
At 4%, it comes out to 13.5 million tpy CO2, which is higher the permit value.
Natural gas throughputs at the limit contained in the draft permit ensure that the system cannot emit 13.5 million tpy of CO_2 (see response to Question #3, above).
QUESTION 8: "[(Our prior responsive comment in red)] *Instead of using multiple variables that vary based on operational conditions to calculate CO_2 emissions, Part 98 relies upon an established methodology and a fuel consumption rate, which depends on a generator's average assumed efficiency (in this case 54%).*
'Average' over a period of?"
40 CFR Part 98 is an annual reporting scheme so the averaging period is one year.
QUESTION 9: "[(Our prior responsive comment in red)] *As shown in the CO_2 Emission Factors tabs of the spreadsheet, using a flow-based approach requires information on the CO_2 Volume Percentage, flow rate, and output (kW). These values are interrelated and vary from each source test. It is also important to note that a higher CO_2 percentage does not always result in higher emissions. For example, the Montrose test had the lowest CO_2 Volume % of 4.2% and resulted in the highest calculated EF of 993 lb/MW-hr.*
Agreed. Looking at the values, an 818 lb CO_2/MW-hr would roughly be also around 4-5% since the efficiencies are the same. Can you also share the volume, flowrate, etc values for the Bloom testing that led to 818 lb CO_2/MW-hr?"

The 818 lb CO_2/MW-hr emission factor is not based on stack testing, rather it's a calculation based on the electricity produced and the fuel consumed. Please see calculation below using 40 CFR § 98.33(a)(1)(i):
Based on Bloom's average efficiency (54%), the equation is as follows:
818-lb-CO_2/MW-hr = 53.06 kg-CO_2/MMBtu * 2.20462 lbs/kg * 3412 Btu/kWhr * 1.1078 LHV/HHV * 1/54% LHV * MMBtu/10^6 Btu * 1000 kW-hr/MW-hr
An emission factor does not allow for the calculation of CO_2 volume percentage unless the flow rate is also known. While 818 lb CO_2/MW-hr implies 4–5% at the flow rate given in one of the stack tests, it implies other values at different flow rates. This is why we do not agree with utilizing CO_2 volume percentages and flow rates to attempt to determine CO_2 emissions and the reason we left the CO_2 volume percentages as user inputs in the spreadsheet (they are degrees of freedom).
QUESTION 10: "[(Our prior responsive comment in red)] *...however, as the CO_2 Vol% is updated, the flow rate would change (as shown in the CO_2 Emission factor tab).* The flow rate, however, is held constant for purposes of these calculations...
What is the expected variability in CO_2 Vol% and flow rate over short and long term?"
Bloom does not track CO_2 volume percentage and flow rate simultaneously in a manner that would allow for determination of CO_2 emissions over variable periods of time. And, as stated previously, the Part 98 methodologies for calculating CO_2 emissions reflect the most appropriate and acceptable methodologies for estimating CO_2 emissions. Consistent with standard practice, we used the design parameters provided by the equipment vendor as model inputs. Further, the permit conditions outline specific requirements regarding fuel consumption and electricity generated. Based on these operational safeguards, the total amount of CO_2 that can be emitted by the units is limited to a value less than what was reflected in the air permit application.

Subject: Re: [EXTERNAL] RE: YGI Modeling: status updates?

Hi Jesse,

Thank you for this email and the information. This is helpful.

A few questions:

1. Can you also add a calculation via the stack parameters? Your stack parameters have since been update, correct? Please also show a simple Stack area * exit velocity * CO2 percent in the total (HB+vents) = total CO2 emissions per stack calculation. This is the crux of the question — we do not know how the 1755 tpy from a stack matches with the stack flow rates (area * velocity * concentration). Please share your updated stack parameters and ALL the flows that get in/out of each stack — from HB and other cooling vents, as you mentioned previously.

2. As I mentioned previously, please cite all values. For example, what is the cell reference for B1 and D1 below in the 'Exhaust Flow and CO2 calculations' sheet? The moisture in B1 was submitted to be 9% in the original application but is shown to be 1% here. The same for G7-9 and H7-9 cells. PLEASE show all the underlying calculations and assumptions — clarify the vent flows, cooling flows, their parameters, and assumed CO2 concentrations, moisture, etc.

3. Can you clarify "efficiency" here? Is this the energy generation efficiency or Co2 conversion efficiency? If it is 50%, does that mean of the total input carbon in fuel, 50% got converted to CO2? Or does that mean that the molecular energy (enthalpy heat and misc) of natural gas got 50% utilized by the HB?

4. Modeling: Are the stack numbers same as submitted previously?

5. Modeling: If there are any other structures in the facility such as an admin office or maintenance shed, please model them using BPIP-PRIME or justify their exclusion using downwash screening equations.

6. Modeling: Can you also describe your updated methodology to treat a high aspect ratio rectangular stack as circular? Please show updated calcs and figures.

Though we do not have measurements of CO2 volumes in the hotboxes from the to-be-installed units, I created a variable in cell D1 of the Exhaust Flow and CO2 Emissions tab that allows you to see the effect of adjusting this variable on emissions of CO2 from each release point. You can use this spreadsheet as a tool and adjust it to address various scenarios with different hotbox CO2 volume percentages (though this is not how Part 98 calculates GHG emissions).
At 4%, it comes out to 13.5 million tpy CO2, which is higher the permit value.

Instead of using multiple variables that vary based on operational conditions to calculate CO2 emissions, Part 98 relies upon an established methodology and a fuel consumption rate, which depends on a generator's average assumed efficiency (in this case 54%).
'Average' over a period of?

As shown in the CO2 Emission Factors tabs of the spreadsheet, using a flow-based approach requires information on the CO2 Volume Percentage, flow rate, and output (kW). These values are interrelated and vary from each source test. It is also important to note that a higher CO2 percentage does not always result in higher emissions. For example, the Montrose test had the lowest CO2 Volume % of 4.2% and resulted in the highest calculated EF of 993 lb/MW-hr.
Agreed. Looking at the values, an 818 lb CO2/MW-hr would roughly be also around 4-5% since the efficiencies are the same. Can you also share the volume, flowrate, etc values for the Bloom testing that led to 818 lb CO2/MW-hr?

...however, as the CO_2 Vol% is updated, the flow rate would change (as shown in the CO_2 Emission factor tab). The flow rate, however, is held constant for purposes of these calculations...
What is the expected variability in CO_2 Vol% and flow rate over short and long term?

Please address these questions at the earliest.

14	353,809 scfh	7,021 tpy
15	176,905 scfh	3,511 tpy
16	176,905 scfh	3,511 tpy

Stack Type	Hotboxes	Flow per HB	Temp	Std Flow per Stack
A	10	717 acfm	824 deg F	176,905 scfh
B	18	717 acfm	824 deg F	318,428 scfh
C	20	717 acfm	824 deg F	353,809 scfh

The flow rate for each stack provided in these calculations is based on a specific efficiency. In practice, as the CO_2 Vol% is updated, the flow rate would change (as shown in the CO_2 Emission factor tab). The flow rate is held constant for purposes of these calculations as flow rate is treated as a constant for each defined source in a standard modeling run

Using an average efficiency (as shown in the provided 40 CFR Part 98 calculation) is preferred as it is not based on a single snapshot in time.

Thank you,
Sagar

Subject: RE: [EXTERNAL] RE: YGI Modeling: status updates?

Sagar,
I wanted to start off by apologizing for any confusion that my prior responses may have caused and for us having to revisit some of these topics more than once. We understand that some of the intricacies of the emission sources and air dispersion modeling are complex and we are committed to ensuring that we answer your questions as directly as possible. As our e-mail thread has gotten extended, I thought it would be helpful to provide a summary of the main items we have discussed so far and provide some additional context to aid in your review.

First, I wanted to address the CO_2 calculation methodology. In short, the application uses an emission factor approach consistent with other pollutants. However, it is not based on a source test, it is based on 40 CFR Part 98 methodology, which is the primary and most defensible way to estimate CO_2 emissions. 40 CFR Part 98 provides a standard methodology in calculating CO_2 emissions for various source types. This primary method is preferred for consistency, and it is also the method that various sources use when reporting under EPA's Mandatory Reporting Rule, and also when calculating GHG emissions that are disclosed under various third-party verified sustainability reporting requirements. Additional details were provided in correspondence with NMED on May 19, 2026 (Response to Question No. 32) and are provided below.

Second, in discussing potential alternative approaches to estimating CO_2 emissions with NMED, we agreed to revisit the estimates of modeling input parameters (flow rate, release area, and temperature). The changes we've been discussing, incorporating refined design details not yet available when the application was filed, make the modeling exercise more refined and more conservative. While YGI strongly believes that the original modeling remains valid, YGI also supports responding to NMED questions and its responsiveness to public comments and questions, and sees no issues with running a more refined model. Specifically, we've used more refined flow and temperature data from the hot box inside each module to capture variations in flow rates between each of the > 2,000 release points in the model. The latest update represents the most detailed possible accounting of the model parameters, and we do not anticipate any further refinements. Once again, additional details are provided below.

CO_2 Calculations

CO_2 emissions are a function of carbon content in the gas, gas consumed, and efficiency. Because efficiency has a range, potential emissions are calculated based on efficiency over time instead of a snapshot source test (the original commenter in your August 28 email also incorrectly performed the emission rate calculation). In other words, the CO_2 emission rate for a snapshot in time is not representative for any source, absent additional information. 40 CFR Part 98 contains the most established and reliable methods for calculating CO_2 that we are aware of. NMED's Universal Air Permit Application Section 6.a references Part 98 for calculating GHG emissions. At least six states have adopted or incorporated 40 CFR Part 98 into their state level GHG emissions reporting regulations as a source of robust and well-vetted methodologies. Examples include: New York, Washington, Oregon, Massachusetts, Colorado, and California. For this application and for all other relevant purposes including third-party verified GHG emission reporting, Bloom has consistently leveraged the methodology contained at 40 CFR Section 98.33(a)(1)(i). Calculating the emission rate for Energy Servers operating at Bloom's average efficiency (54%), the equation is as follows: 818-lb-CO2e/MWhr = 53.06 kg-CO2e/MMBTU * 2.20462 lbs/kg * 3412 BTU/kWhr * 1.1078 LHV/HHV * 1/54% LHV * MMBTU/10^6 BTU * 1000 kWhr/MWhr

This is the same equation provided in response to NMED Question No. 32 on May 19, 2026. The average efficiency of 54% is based on average fleet values and is consistent with the efficiency provided in Bloom's vendor specification sheet provided in the application.

We are not aware of any state that uses limited duration stack tests to estimate GHG emissions. We are also not aware of NMED using underlying test results for calculating GHG emissions from other sources such as turbines and engines that rely on Part 98 to estimate GHG emissions. In sum, an appropriate CO_2 emission rate is based on the efficiency of the Energy Server, *i.e.,* it is not measured via the same source testing methods as criteria pollutants nor is the CO_2 emission information contained in stack test reports (conducted for different pollutants and purposes) relevant for the reasons set forth above.

Last, I would note that remote monitoring and maintenance procedures ensure that Energy Servers continue to function under operational conditions that both ensure the necessary efficiency and output but also ensure that CO_2 emissions are minimized. Submitting data collected via the monitoring procedures required to meet draft permit conditions will allow NMED to document the aforementioned and appropriate calculation methodology. This is true even though CO_2 is not technically "regulated" under the permit or applicable regulations. Though YGI anticipates that the above should resolve the CO_2 calculation methodology questions, YGI provides further calculations and responses below and attached.

Modeling Updates

We've taken your feedback and refined all of the flow rates that will go into the modeling based on your request. This involved categorizing each of the 2,275 release points in the layout depending on the actual number of power modules that would generate flow. Recall that the original approach communicated in my May 26 letter to Julia was to assume the same flowrate from each stack, dividing the total emissions equally among all the stacks. What we have done to address your comment is determine how many active 65 kW modules or hotboxes will be contributing flow to each of the 2,275 release points. The specific configurations – involving 325 kW and 260 kW Energy Servers -- were explained in my May 26 letter to NMED.

Equipment, capacity, unit count, and layout remain as proposed in the application. The exact size and configuration given in April-May are maintained (i.e., the same units with the same capacity are proposed to be built in the same configurations). The application used design-target exhaust values applied uniformly. Bloom has since supplied as-designed values and temperature is slightly lower (327°F versus 350°F), and flow is now assigned per release point and is reduced.

By taking account of this extra detail, we can also show a flow-rate based GHG calculation proposed by the commenter (see Exhaust Flow and CO_2 Emissions tab in the attached) – although we disagree that it is an appropriate methodology for the reasons discussed below and noted in the spreadsheet.

Here are the steps we took to determine flow rate per release point and cross-check the CO_2 calculation (which we again contend is not the accepted approach for measuring CO_2):

- There are three configuration types having 10, 18, and 20 hotboxes (As explained in my 5/27 letter, Energy Servers have either 4 or 5 active power modules of 65 kW each, so these correspond to 2, 3, or 4 energy servers).
- The flow rate and temperature from each hotbox is given in my 9/2 e-mail. The total hotbox exhaust flows for each release point is a function of these values and the total hotboxes associated with each release point. The attached spreadsheet shows the total hotbox exhaust flow from each stack.
- The flows are converted to dry flow and then CO_2 is estimated understanding there are 8.74 lb CO_2 per scf.

The reason we look at hotbox flow rather than total stack flow (which includes the two air streams – cabinet ventilation and DC module ventilation – described more fully in my 9/2 e-mail) is to be able to compare the figures with the stack test measurements shown in the application. Total flow at each release point using this more refined procedure will be the same used in the updated modeling that we are currently running.

While the three stack tests included in the application were not conducted for purposes of certifying CO_2 emissions, they imply emission factors ranging from 810–993 lb/MW-hr, respectively, as the attached spreadsheet shows (see CO_2 Emission Factors tab). I laid out a table showing this calculation for each stack test along with the page number in the application PDF containing the figures in the table. Though we do not have measurements of CO_2 volumes in the hotboxes from the to-be-installed units, I created a variable in cell D1 of the Exhaust Flow and CO_2 Emissions tab that allows you to see the effect of adjusting this variable on emissions of CO_2 from each release point. You can use this spreadsheet as a tool and adjust it to address various scenarios with different hotbox CO_2 volume percentages (though this is not how Part 98 calculates GHG emissions).

As shown in the CO_2 Emission Factors tabs of the spreadsheet, using a flow-based approach requires information on the CO_2 Volume Percentage, flow rate, and output (kW). These values are interrelated and vary from each source test. It is also important to note that a higher CO_2 percentage does not always result in higher emissions. For example, the Montrose test had the lowest CO_2 Volume % of 4.2% and resulted in the highest calculated EF of 993 lb/MW-hr. Similarly, a particular EF is not necessarily correlated with a specific CO_2 volume. Instead of using multiple

variables that vary based on operational conditions to calculate CO_2 emissions, Part 98 relies upon an established methodology and a fuel consumption rate, which depends on a generator's average assumed efficiency (in this case 54%).

In using this methodology to estimate exhaust flow for each stack, it is important to note that the flow rate for each stack provided in these calculations is based on a specific efficiency. In practice; however, as the CO_2 Vol% is updated, the flow rate would change (as shown in the CO_2 Emission factor tab). The flow rate, however, is held constant for purposes of these calculations as flow rate is treated as a constant for each defined source in a standard modeling run. Using an average efficiency (as shown in the provided 40 CFR Part 98 calculation) is preferred as it is not based on a single snapshot in time.

Once we stratified all of the 2,275 clusters by active power modules it closed the perceived gap on CO_2 raised by the comment and will also lead to the most refined modeling possible. We expect to be able to complete that modeling by Monday if you don't have any further feedback. Please let me know if this information addresses your questions. We are dedicated to responding to NMED's questions, seek to be as responsive as possible, and if we are not addressing any outstanding question, please do let us know and we would be glad to set up a meeting to make sure we fully understand any remaining, outstanding questions.

Subject: Re: [EXTERNAL] RE: YGI Modeling: status updates?

Hi Jesse,

Thank you for your reply.

The Montrose test implies a CO2 emission rate of 1,080 lb/MW-hr on a 65-kW nominal output basis. If 4.2 vol.% CO2 were present in the hotbox flow rate I gave you on 9/2, then there would be 1,307 lb/MW-hr of CO2, again on a 65-kW nominal output basis. I trust you can reproduce these figures yourself. These differ from the 818 lb/MW-hr figure which was actually targeted for measuring CO2 and used for permitting.
Can you explain why the Montrose and Blue Sky tests give a higher CO2 emission factor compared to the 818 lb/MW-hr used for permitting? Provide exact citations/tests as to why the two tests do not represent the "hotbox" emissions and the 818 lb/MW-hr does.

Some structures have fewer power modules in them, so using the structure drawing we have implies a greater flow rate. Thus, while we are permitting 2,462 MW total output spread over 2,270 structures (Energy Server "clusters"), if there were actually 24 power modules operating in each such cluster (as we discussed, the energy servers have a nominal output based on 5 power modules but the structures contain space for up to 6 power modules, the total power output would be 3,541 MW. The difference here is simply between how the clusters are being built along with some variability in how many energy servers (and what type) are in each structure—see my 5/26/2026 letter to Julia on this.
This is a bit confusing -- It is still unclear how the power modules, ventilation exhaust, etc contribute to the total CO2 emissions. Can you provide these calculations in an Excel sheet with exact configurations and emissions? As I requested in my previous email, please be thorough in your explanations and provide all necessary calculations.

I did the calculations using 2275 "stacks" and the stack parameters. If different number of power modules vent their exhaust to a "stack", they should be modeled accordingly and not assume that all the 2275 stacks have the same flow rate or emission parameters — this affects the pollutant dispersion as well.

I understand the variability in proposed vs constructed (probably more of a permitting question for Julia) but use one standard configuration and please show the CO2 emissions totals calculated using stack parameters, as the public comment requested.

It also occurs to me that it would be preferable to use 20 power modules per cluster of four Energy Servers rather than 24 as I stated in my 9/2 e-mail. The latter figure is based on the physical cabinets being constructed, while the former is based on the nominal output of each Energy Server. Since I used a nominal output basis in explaining the cluster

construction to Julia in my 5/26 letter, I think it's preferable to use a design flow rate per cluster of 542.7 acfs rather than 651.2 acfs (temperature and effective diameter are the same).
I am not sure about this one and will let Julia comment on these changes and if it will affect permitting. @Kuhn, Julia, ENV

Thank you,
Sagar

Subject: RE: [EXTERNAL] RE: YGI Modeling: status updates?

Hi Sagar,

I wanted to follow up on the issue of reconciling CO_2 emissions, using the hypothetical where we stipulate that hotbox exhaust has 4.2 vol.% CO_2 (figure from Montrose test report). There are two reasons why your "bottom-up" (emission factor and output-based) and "top-down" (stack flow and concentration based)-figures differ:

1. The Montrose test implies a CO_2 emission rate of 1,080 lb/MW-hr on a 65-kW nominal output basis. If 4.2 vol.% CO2 were present in the hotbox flow rate I gave you on 9/2, then there would be 1,307 lb/MW-hr of CO2, again on a 65-kW nominal output basis. I trust you can reproduce these figures yourself. These differ from the 818 lb/MW-hr figure which was actually targeted for measuring CO_2 and used for permitting.
2. Some structures have fewer power modules in them, so using the structure drawing we have implies a greater flow rate. Thus, while we are permitting 2,462 MW total output spread over 2,270 structures (Energy Server "clusters"), if there were actually 24 power modules operating in each such cluster (as we discussed, the energy servers have a nominal output based on 5 power modules but the structures contain space for up to 6 power modules, the total power output would be 3,541 MW. The difference here is simply between how the clusters are being built along with some variability in how many energy servers (and what type) are in each structure—see my 5/26/2026 letter to Julia on this.

The two factors compound so that you get a factor of 2 difference if you try to estimate CO2 based on exhaust flow and non-CO2 directed test results. Let me know if this is the explanation you were looking for.

It also occurs to me that it would be preferable to use 20 power modules per cluster of four Energy Servers rather than 24 as I stated in my 9/2 e-mail. The latter figure is based on the physical cabinets being constructed, while the former is based on the nominal output of each Energy Server. Since I used a nominal output basis in explaining the cluster construction to Julia in my 5/26 letter, I think it's preferable to use a design flow rate per cluster of 542.7 acfs rather than 651.2 acfs (temperature and effective diameter are the same).

Let John and me know if you'd like to visit about either topic (CO2 emission rate or discharge parameters) before we submit the model.

Subject: [EXTERNAL] YGI Modeling Resubmittal

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Hi Sagar,

As discussed previously, we are updating the modeling submittal for YGI to incorporate edits that were in our email last Friday, specifically modeling individual airflows and emission rates for each stack, splitting each stack into three separate release points, modeled side-by-side, and including TCEQ nearby sources in the model.

I've included as an attachment the following items below:

- Updated Table 2-G
- Updated Table 2-H
- UA-4 Form
- Documentation for changes to NMED nearby source data
- Modeling files
  - Input files
  - Output files
  - AERMAP files
  - BPIP files
  - TCEQ Nearby Source data

Please let us know if you're able to access the files, or if there is a different way you would prefer to receive the submittal.

For the other questions that you sent today, our response will be coming in a separate email. Please let us know if you have any questions regarding this submittal, thanks!

Subject: RE: [EXTERNAL] RE: YGI Microgrid - requesting electronic files

Hi Jesse and Jaimy:

Thank you for providing the responses dated 5/19/26.

The Department still needs a few items of information or documentation to satisfy our due diligence in asserting that we have all of the necessary information to rule the YGI Microgrid application administratively complete. In order for the Department to make an affirmative administrative completeness determination by 5/27/26, please provide the following additional information/clarification (and updated application materials where relevant) by 12pm MT on 5/27/26. Note that these correspond to the questions in our letter dated 5/12/26.

- (Question 11) The updated process summary in Section 3 of the application states that depleted anode exhaust is approximately 95 percent carbon dioxide. **What compounds comprise the remaining 5% of the exhaust?**

- (Question 13.d) Please **provide the calculation of SSM emissions from hot swap of power modules**.

- (Question 14.a) Was leak detection of natural gas and/or hydrogen considered? Please **provide report(s) on leaks detected by the leak monitoring systems of operational Bloom systems**.

- (Question 23) We need to confirm that the conditions in the R&D facility are representative of the conditions in the field where the fuel cells will be operated. It appears that the testing was conducted on a 65-kW module, not the 325- or 260-kW units that will be installed at the facility.

  Representativeness of Testing Conditions
  Please describe the operating conditions at the research and development (R&D) facility where the 65-kW module was tested and explain how these conditions are representative of actual field operating conditions for the proposed units.

  Applicability of Module-Level Testing
  Based on the information provided, testing appears to have been conducted on a single 65-kW module rather than on the full 260-kW or 325-kW systems proposed for installation. Please provide a detailed justification for why emissions data from a single module are representative of emissions from the fully integrated systems, which consist of four or five modules and additional components.

  Impact of Additional System Components
  The full system includes additional equipment such as a fuel processing module and an AC module. Please confirm whether these components generate emissions or affect system efficiency, and explain how their inclusion was accounted for in developing emission factors.

  Scaling to System-Level Emission Rates
  Please describe the methodology used to scale emissions from a 65-kW module to a system-level emission rate (e.g., lb/MW-hr). In your response, address whether efficiency losses or operational differences in the larger, integrated systems could result in higher emissions per unit of power output compared to a single module.

  Field or Full-System Testing
  Has any stack testing been conducted on a fully assembled 260-kW or 325-kW system under field conditions? If so, please provide those data. If

not, please explain why module-level testing is sufficient to characterize emissions for the proposed units.

- (Question 24.a) The measured concentration of 0.20 ppm is two times the 1-hr NO2 standard of 100 ppb, so it does not appear that the NOx measured in the stack test is an ambient concentration. Based on the measured concentration, it appears that thermal NOx may be generated at low levels at the temperatures in the fuel cell. While these levels are very low, NMED needs to consider them due to the large scale of the proposed operation. **What is the source of the NOx measured in the source test, if not the Energy Server unit?**

- (Question 29.a) We need to understand more about the anode tailgas oxidizer. **Why is the anode tailgas oxidizer required? What is the control efficiency? How often does the catalyst need to be replaced?**

- (Question 32) Please **provide the referenced vendor's data sheet** that is used to generate the submitted emission factor.

- (Question 34) Based on the response to this question, the PTE for each stack shown in Table 2-G of the application appears to be incorrect. The 5-module stacks will have higher emissions than what is shown, and the 4-module stacks will have lower emissions than what is shown and what was modeled. The actual stacks to be constructed will receive exhaust from an unknown combination of 2 or 4 Energy Servers with outputs of 325-kW or 260-kW. **Please confirm that this emission allocation is appropriate and conservative. To support this confirmation, please provide the number of 325-kW stacks and the number of 260-kW stacks to be installed, and identify the stacks on the facility plot plan and in Table 2-G.**

Please let me and Julie know if any questions - thank you!

Hi Abra and Julie,

Please find attached the response to AQB's questions and updated pages to the application.

The following items are attached:

1. YGI Letter Response
2. Updated Table 2-B
3. Updated Table 2-D
4. Updated Section 3
5. Updated Section 10
6. Updated Page 620
7. Updated Page 638
8. SSM Calculations
9. Fuel Tariff

Please let us know if you have any additional questions.

Hi Jesse-

Please find attached a list of questions to support AQB's review of Yucca Growth Infrastructure, LLC's YGI Microgrid permit application.

In order to facilitate a timely determination of the permit application's administrative completeness, please revert with responses by a date that allows adequate time for AQB to evaluate the responses prior to the end of the 30-day application administrative review period (May 27).

Please let me and Julie know if you have any questions.

Thank you!

2026 Minor Source Emissions Inventory

Notice: The New Mexico Environment Department – Air Quality Bureau (Bureau) will conduct a Minor Source Emissions Inventory pursuant to 20.2.73.300 NMAC for calendar year 2026. This inventory applies to all facilities with air quality construction permits issued under 20.2.72 NMAC, including General Construction Permits (GCPs), as well as facilities registered under a Notice of Intent (NOI) pursuant to 20.2.73 NMAC. Owners, operators, and/or permittees are required to calculate and report actual tons per year of air pollutant emissions from individual equipment and from the facility as a whole. Facility-wide emissions for calendar year 2026 must be reported to the Bureau using the Bureau's online reporting tool during the submittal period of January 1 through April 1, 2027.
Facilities are encouraged to sign up for Minor Source Emissions Inventory bulletins through the New Mexico Environment Department to receive updates and guidance regarding this requirement.

Subject: YGI Microgrid - requesting electronic files

Good afternoon, Jesse,

Can you please submit the electronic files for the YGI Microgrid application? Files should include pdf full application file, excel UA2 and calculations files, Word UA1, UA3, and UA4, modeling files, and other supporting documents.

NSR regulations 20.2.72.203.A(3) require that the computations are provided. See below:

(3) Provide all information, including all calculations and computations, to describe the specific chemical and physical nature and to estimate the maximum quantities of any regulated air contaminants the source will emit through routine operations after construction, modification or installation is completed, and estimate maximum potential emissions during malfunction, startup, shutdown. With respect to a toxic air pollutant as defined by Subsection H of 20.2.72.401 NMAC this requirement only applies when the toxic air pollutant is emitted in such a manner that a permit is required under the provisions of 20.2.72.400 NMAC - 20.2.72.499 NMAC;

Also, would you please let us know when you will send us the Spanish translated application?

Thank you!

Universal Application 4

Air Dispersion Modeling Report

Refer to and complete Section 16 of the Universal Application form (UA3) to assist your determination as to whether modeling is required. If, after filling out Section 16, you are still unsure if modeling is required, e-mail the completed Section 16 to the AQB Modeling Manager for assistance in making this determination. If modeling is required, a modeling protocol would be submitted and approved prior to an application submittal. The protocol should be emailed to the modeling manager. A protocol is recommended but optional for minor sources and is required for new PSD sources or PSD major modifications. Fill out and submit this portion of the Universal Application form (UA4), the "Air Dispersion Modeling Report", only if air dispersion modeling is required for this application submittal. This serves as your modeling report submittal and should contain all the information needed to describe the modeling. No other modeling report or modeling protocol should be submitted with this permit application.

16-A: Identification

1	Name of facility:	YGI Microgrid
2	Name of company:	Yucca Growth Infrastructure, LLC (YGI)
3	Current Permit number:	TBD
4	Name of applicant's modeler:	John Ke, Trinity Consultants
5	Phone number of modeler:	505-266-6611
6	E-mail of modeler:	jke@trinityconsultants.com

16-B: Brief

1	Was a modeling protocol submitted and approved? A modeling protocol has not been submitted for this permit application.	Yes☐	No☒
2	Why is the modeling being done?	New Facility	
3	Describe the permit changes relevant to the modeling.		
	This application is being submitted for a new facility, under a 20.2.72 NMAC application.		
4	What geodetic datum was used in the modeling?	WGS84	
5	How long will the facility be at this location?	More than 1 year	
6	Is the facility a major source with respect to Prevention of Significant Deterioration (PSD)?	Yes☐	No☒

Administrative Record NSR 10833_011714

7	Identify the Air Quality Control Region (AQCR) in which the facility is located	153	
8	List the PSD baseline dates for this region (minor or major, as appropriate).		
	NO2	8/2/1995	
	SO2	N/A	
	PM10	6/16/2000	
	PM2.5	N/A	
9	Provide the name and distance to Class I areas within 50 km of the facility (300 km for PSD permits).		
	N/A – There are no Class I areas within 50 km of the facility.		
10	Is the facility located in a non-attainment area? If so describe below	Yes☐	No☒
	N/A		
11	Describe any special modeling requirements, such as streamline permit requirements.		
	N/A		

16-C: Modeling History of Facility

Describe the modeling history of the facility, including the air permit numbers, the pollutants modeled, the National Ambient Air Quality Standards (NAAQS), New Mexico AAQS (NMAAQS), and PSD increments modeled. (Do not include modeling waivers).

1	Pollutant	Latest permit and modification number that modeled the pollutant facility-wide.	Date of Permit	Comments
	CO	N/A	N/A	This application is an initial permit application.
	NO_2	N/A	N/A	This application is an initial permit application.
	SO_2	N/A	N/A	This application is an initial permit application.
	H_2S	N/A	N/A	This application is an initial permit application.
	PM2.5	N/A	N/A	This application is an initial permit application.
	PM10	N/A	N/A	This application is an initial permit application.
	Lead	N/A	N/A	This application is an initial permit application.
	Ozone (PSD only)	N/A	N/A	This application is an initial permit application.
	NM Toxic Air Pollutants (20.2.72.402 NMAC)	N/A	N/A	This application is an initial permit application.

16-D: Modeling performed for this application

For each pollutant, indicate the modeling performed and submitted with this application.
Choose the most complicated modeling applicable for that pollutant, i.e., culpability analysis assumes ROI and cumulative analysis were also performed.

1	Pollutant	ROI	Cumulative analysis	Culpability analysis	Waiver approved	Pollutant not emitted or not changed.
	CO	☒	☐	☐	☐	☐

	NO_2	☐	☒	☒	☐	☐
	SO_2	☒	☐	☐	☐	☐
	H_2S	☐	☐	☐	☐	☒
	PM2.5	☐	☒	☐	☐	☐
	PM10	☐	☒	☐	☐	☐
	Lead	☐	☐	☐	☐	☒
	Ozone	☐	☐	☐	☐	☒
	State air toxic(s) (20.2.72.402 NMAC)	☐	☐	☐	☐	☒

16-E: New Mexico toxic air pollutants modeling

1 List any New Mexico toxic air pollutants (NMTAPs) from Tables A and B in 20.2.72.502 NMAC that are modeled for this application.
N/A – there are no NMTAPs at this facility.

2 List any NMTAPs that are emitted but not modeled because stack height correction factor. Add additional rows to the table below, if required. N/A – there are no NMTAPs at this facility.

Pollutant	Emission Rate (pounds/hour)	Emission Rate Screening Level (pounds/hour)	Stack Height (meters)	Correction Factor	Emission Rate/ Correction Factor

16-F: Modeling options

1	Was the latest version of AERMOD used with regulatory default options? If not explain below.	Yes☒	No☐

16-G: Surrounding source modeling

1	Date of surrounding source retrieval	9/17/25

2 If the surrounding source inventory provided by the Air Quality Bureau was believed to be inaccurate, describe how the sources modeled differ from the inventory provided. If changes to the surrounding source inventory were made, use the table below to describe them. Add rows as needed.

AQB Source ID	Description of Corrections
TCEQ Sources	Per request from NMED, YGI is including nearby sources in Texas, which were provided by TCEQ. This are included as part of the submittal package.
TCEQ Sources: 730090 730095 730100 730103	These sources (RN100220276) are located in Houston, TX and should have not been provided with the TCEQ files.
26582@1	$PM_{2.5}$, PM_{10}: For the Rinker Santa Teresa Pipe (AI# 26582) facility, PM_{10} and $PM_{2.5}$ emission rates were based off 95 tpy total suspended particulate from the GCP-5 #3602 permit for concrete batch plants. The emissions rates for PM_{10} and $PM_{2.5}$ were ratioed based on particle size multiplier constants taken

		from AP-42 Chapter 13.2.4 for Aggregate Handling and Storage Piles. The new values are 10.28 lb/hr PM_{10} and 1.55 lb/hr $PM_{2.5}$.
	38354@1	$PM_{2.5}$, PM_{10}: For the MiniConcrete Materials Concrete Batch Plant – No 7 (AI# 38354) facility, PM_{10} and $PM_{2.5}$ emission rates were based off 95 tpy total suspended particulate from the GCP-5 #7756 permit for concrete batch plants. The emissions rates for PM_{10} and $PM_{2.5}$ were ratioed based on particle size multiplier constants taken from AP-42 Chapter 13.2.4 for Aggregate Handling and Storage Piles. The new values are 20.56 lb/hr PM_{10} and 3.11 lb/hr $PM_{2.5}$.
	28823E1 28823E2 28823E3 28823E9 28823R1	All pollutants: For the NM SunTower facility (AI# 28823), the permitted source (NSR permit 4171, solar thermal) was never constructed. The project defaulted in 2010 and no equipment is present in satellite imagery at the permitted location. Sources removed from the inventory.
	133A9	$PM_{2.5}$, PM_{10}, CO: For the FXI Holdings – Santa Teresa Plant (AI# 133), the emission rate and discharge parameters were updated from permit 0624M5R7 (issued June 13, 2014) and the 2013 permit application (Table 2-H). The new emission rate for PM_{10} and $PM_{2.5}$ is 1.7 lb/hr and CO is 2.2 lb/hr, modeled as a 100-ft capped point source in place of the 10-m volume source.
	28218E1 28218E2 28218E3 28218E4 28218E8 28218R1 28218R2	All pollutants: For the Johnson Plate and Tower – Santa Teresa Facility (AI# 28218), the facility permanently closed following a 2014 bankruptcy and the paint booth and oven line were auctioned. No active source is listed in RSMT or EPA ECHO. Sources removed from the inventory.
	131A1	All pollutants: For the Hydro Conduit facility (AI# 131), the facility no longer exists and the site has been redeveloped as a residential subdivision. The successor operation is separately inventoried as AI# 26582. Source removed from the inventory.
	154A1	$PM_{2.5}$, PM_{10}: For the Georgia-Pacific Vista Corrugated Paper Plant (AI# 154), the source (waste paperboard particulate control device) was updated with Table 39 discharge parameters, and PM_{10} and $PM_{2.5}$ were ratioed from published emission factors for the same source type (NCASI trim and scrap handling cyclone testing, as adopted in ORCAA permit 21SMO1535). The new values are 0.51 lb/hr PM_{10} and 0.0086 lb/hr $PM_{2.5}$.

16-H: Building and structure downwash

1	How many buildings are present at the facility?	425		
2	How many above ground storage tanks are present at the facility?	0		
3	Was building downwash modeled for all buildings and tanks? If not explain why below.		Yes☒	No☐
	N/A – downwash was modeled for all buildings.			
4	Building comments	Downwash structures represent the modules that house the Bloom Energy Server System.		

16-I: Receptors and modeled property boundary

1	"Restricted Area" is an area to which public entry is effectively precluded. Effective barriers include continuous fencing, continuous walls, or other continuous barriers approved by the Department, such as rugged physical terrain with a steep grade that would require special equipment to traverse. If a large property is completely enclosed by fencing, a restricted area within the property may be identified with signage only. Public roads cannot be part of a Restricted Area. A Restricted Area is required in order to exclude receptors from the facility property. If the facility does not have a Restricted Area, then receptors shall be placed within the property boundaries of the facility. Describe the fence or other physical barrier at the facility that defines the restricted area.		
	The facility is enclosed by continuous fencing.		
2	Receptors must be placed along publicly accessible roads in the restricted area. Are there public roads passing through the restricted area?	Yes☐	No☒
3	Are restricted area boundary coordinates included in the modeling files?	Yes☒	No☐

4 Describe the receptor grids and their spacing. The table below may be used, adding rows as needed.

Grid Type	Shape	Spacing	Start distance from restricted area or center of facility	End distance from restricted area or center of facility	Comments
Variable Density	Square	100 m	0 m	500 m from ambient air boundary	Receptors located outside of the United States are not included in this analysis.
Variable Density	Square	500 m	500 m from ambient air boundary	5,000 m from ambient air boundary	Receptors located outside of the United States are not included in this analysis.
Variable Density	Square	1,000 m	5,000 m from ambient air boundary	20,000 m from ambient air boundary	Receptors located outside of the United States are not included in this analysis.
Variable Density	Square	1,250 m	20,000 m from ambient air boundary	50,000 m from center of facility	Receptors located outside of the United States are not included in this analysis.

5	Describe receptor spacing along the fence line. 25-m resolution along the ambient air boundary.
6	Describe the PSD Class I area receptors. N/A – There are no Class I areas within 50 km of the facility.

16-J: Modeling Scenarios

1	Identify, define, and describe all modeling scenarios. Examples of modeling scenarios include using different production rates, times of day, times of year, simultaneous or alternate operation of old and new equipment during transition periods, etc. Alternative operating scenarios should correspond to all parts of the Universal Application and should be fully described in Section 15 of the Universal Application (UA3). There are no alternative modeling scenarios.
2	Which scenario produces the highest concentrations? Why?

	N/A – there are no alternative modeling scenarios.		
3	Were emission factor sets used to limit emission rates or hours of operation? (This question pertains to the "SEASON", "MONTH", "HROFDY" and related factor sets, not to the factors used for calculating the maximum emission rate.)	Yes☐	No☒
4	If so, describe factors for each group of sources. List the sources in each group before the factor table for that group. (Modify or duplicate table as necessary. It's ok to put the table below section 16-K if it makes formatting easier.) Sources:		

5	Hour of Day	Factor	Hour of Day	Factor								
	1		13									
	2		14									
	3		15									
	4		16									
	5		17									
	6		18									
	7		19									
	8		20									
	9		21									
	10		22									
	11		23									
	12		24									

	If hourly, variable emission rates were used that were not described above, describe them below.		
	N/A – no variable emission rates were used.		
6	Were different emission rates used for short-term and annual modeling? If so describe below.	Yes☐	No☒
	N/A – emission rates match those presented in table 2-G.		

16-K: NO_2 Modeling

1	Which types of NO_2 modeling were used? Check all that apply.	
	☒	ARM2
	☐	100% NO_X to NO_2 conversion
	☐	PVMRM
	☐	OLM
	☐	Other:
2	Describe the NO_2 modeling.	
	The ARM2 methodology was used with the default maximum and minimum ambient ratios.	
3	Were default NO_2/NO_X ratios (0.5 minimum, 0.9 maximum or equilibrium) used? If not describe and justify the ratios used below.	Yes☒ No☐

4	Describe the design value used for each averaging period modeled.
	1-hour: High eighth high Annual One Year Annual Average:

16-L: Ozone Analysis

1	NMED has performed a generic analysis that demonstrates sources that are minor with respect to PSD do not cause or contribute to any violations of ozone NAAQS. The analysis follows. The basis of the ozone SIL is documented in *Guidance on Significant Impact Levels for Ozone and Fine Particles in the Prevention of Significant Deterioration Permitting Program*, EPA, April 17, 2018 and associated documents. NMED accepts this SIL basis and incorporates it into this permit record by reference. Complete documentation of the ozone concentration analysis using MERPS is included in the New Mexico Air Quality Bureau Air Dispersion Modeling Guidelines (Revised June 2024).
2	The MERP values presented in Table 10 and Table 11 of the NM AQB Modeling Guidelines that produce the highest concentrations indicate that facilities emitting no more than 250 tons/year of NO_X and no more than 250 tons/year of VOCs will cause less formation of O_3 than the O_3 significance level. $$[O_3]_{8-hour} = \left(\frac{250 \frac{ton}{yr}}{340_{MERP_{NOX}}} + \frac{250 \frac{ton}{yr}}{4679_{MERP_{VOC}}} \right) \times 1.96\ \mu g/m^3$$ =1.546 µg/m³, which is below the significance level of 1.96 µg/m³. Sources that produce ozone concentrations below the ozone SIL do not cause or contribute to air contaminant levels exceeding the ozone NAAQS. Notwithstanding, permit applicants routinely perform hypothetical modeling calculations using the MERPs tool and the Dispersion Guidelines in order to demonstrate that the project will not cause or contribute to an ozone NAAQS. Such a project-specific calculation is presented in items 3–5, below, even though the facility will not emit more than 250 tons/year of NOx and 250 tons/year of VOC.

3	Does the facility emit at least 250 tons per year of NO_X or at least 250 tons per year of VOCs? Sources that emit at least 250 tons per year of NO_X or at least 250 tons per year of VOCs are covered by the analysis above and require an individual analysis.	Yes☐	No☒

5

For new PSD Major Sources or PSD major modifications, if MERPs were used to account for ozone fill out the information below. If another method was used describe below. The facility is not a PSD Major source. It is a minor source and is providing MERPS information voluntarily in accordance with EPA's most recent MERP guidance.

NO_X (ton/yr)	$MERP_{NOX}$	VOCs (ton/yr)	$MERP_{VOC}$	$[O_3]_{8\text{-hour}}$
37.20	413.5	124.01	82121	0.0915 ppb

Secondary formation of ozone from the YGI Microgrid is estimated using Equation 2 from "Guidance on the Development of Modeled Emission Rates for Precursors (MERPs) as a Tier 1 Demonstration Tool for Ozone and $PM_{2.5}$ under the PSD Permitting Program" from EPA (MERPs guidance). Equation 2 is equivalent to the equation preceding Table 10 in the NM AQB Modeling Guidelines, understanding that the MERP (see below) is the inverse of the quotient in equation 2, and the ozone impact is the linear combination of the expressions for the NO_X and VOC-specific impacts, which result may be expressed in units of either ppb or µg/m³. Equation 2 was computed for NO_X and VOC-specific impacts; the results were added; and a final result was compared to the EPA-recommended de minimis level of 1.0 ppb. The hypothetical source in Otero County, NM was selected based on the criteria provided in the MERPs guidance, which include proximity, terrain and land use, climate, regional sources of pollutants, and background pollutant concentrations. Otero County's proximity to the East Microgrid along with similarities in terrain were the primary reasons for selecting it as a hypothetical source. Under EPA's guidance, the modeled air quality impact from a hypothetical source of 500 tons/yr (the closest value to the project's

annual emissions) is 1.209116 ppb for a 500 tpy NOX source and 0.0006089 ppb for a 500 tpy VOC source. Comparing these results with the project emission rates, the project impact for ozone would be 0.0915 ppb, which is below the significance threshold of 1.0 ppb.

Eq. 2: $Project\ Impact = Project\ emission\ rate \times \frac{Modeled\ Air\ Quality\ Impact\ from\ Hypothetical\ Source}{Modeled\ emission\ rate\ from\ Hypothetical\ Source}$

The Modeled Air Quality Impact for NOx and VOC were provided by EPA's MERPs View Qlik tool. YGI is using MERP values from the hypothetical source in Otero County, NM. Based on the range of stack heights, the modeled impacts associated with a 10 m stack were used from this analysis. To calculate the MERP value listed above, YGI used the following equation:

$$MERP = \frac{500\ tpy}{Modeled\ Air\ Quality\ Impact}$$

16-M: Particulate Matter Modeling

1	Select the pollutants for which plume depletion modeling was used.	
	☐	PM2.5
	☐	PM10
	☒	None
2	Describe the particle size distributions used. Include the source of information.	
	N/A	
3	Does the facility emit at least 40 tons per year of NO_X or at least 40 tons per year of SO_2? Sources that emit at least 40 tons per year of NO_X or at least 40 tons per year of SO_2 are considered to emit significant amounts of precursors and must account for secondary formation of PM2.5.	Yes☐ / No☒
4	Was secondary PM modeled for PM2.5?	Yes☐ / No☒

5 — If MERPs were used to account for secondary PM2.5 fill out the information below. If another method was used describe below. N/A – the source emits less than 40 tons per year of NOx and SO2.

Pollutant	NO_X	SO_2		$[PM2.5]_{24\text{-hour}}$
$MERP_{annual}$	N/A	N/A		N/A
$MERP_{24\text{-hour}}$	N/A	N/A		$[PM2.5]_{annual}$
Emission rate (ton/yr)	N/A	N/A		N/A

N/A

16-N: Setback Distances

1	Portable sources or sources that need flexibility in their site configuration requires that setback distances be determined between the emission sources and the restricted area boundary (e.g. fence line) for both the initial location and future locations. Describe the setback distances for the initial location.
	N/A

2	Describe the requested, modeled, setback distances for future locations, if this permit is for a portable stationary source. Include a haul road in the relocation modeling.
	N/A

16-O: PSD Increment and Source IDs

1	The unit numbers in the Tables 2-A, 2-B, 2-C, 2-E, 2-F, and 2-I should match the ones in the modeling files. Do these match? If not, provide a cross-reference table between unit numbers if they do not match below.	Yes☐	No☒
	Unit Number in UA-2	Unit Number in Modeling Files	
	SOFC	See attachment for Unit Number in Modeling Files	
2	The emission rates in the Tables 2-E and 2-F should match the ones in the modeling files. Do these match? If not, explain why below.	Yes☐	No☒
	SOFC emissions are split across 6,825 stacks. Refer to Table 2-G of the application for details regarding the stack configuration and associated emissions.		
3	Have the minor NSR exempt sources or Title V Insignificant Activities" (Table 2-B) sources been modeled?	Yes☐	No☒

4	Which units consume increment for which pollutants?				
	Unit ID	NO_2	SO_2	PM10	PM2.5
	SOFC (All stacks)	X		X	

5	PSD increment description for sources. (for unusual cases, i.e., baseline unit expanded emissions after baseline date).	YGI is planning to install a energy server system.

6	Are all the actual installation dates included in Table 2A of the application form, as required? This is necessary to verify the accuracy of PSD increment modeling. If not please explain how increment consumption status is determined for the missing installation dates below.	Yes☐	No☒
	All units at this facility have not yet been constructed; therefore, no installation dates have occurred. All units are assumed to be increment consumers for pollutants that have a minor source baseline date established.		

16-P: Flare Modeling

1	For each flare or flaring scenario, complete the following			
	Flare ID (and scenario)	Average Molecular Weight	Gross Heat Release (cal/s)	Effective Flare Diameter (m)
	N/A			

16-Q: Volume and Related Sources

1	Were the dimensions of volume sources different from standard dimensions in the Air Quality Bureau (AQB) Modeling Guidelines? If not please explain how increment consumption status is determined for the missing installation dates below.	Yes☐	No☐
	N/A – no volume sources were modeled as part of this facility.		
2	Describe the determination of sigma-Y and sigma-Z for fugitive sources.		
	N/A – no fugitive sources were modeled as part of this facility.		

3	Describe how the volume sources are related to unit numbers. Or say they are the same.
	N/A – no volume sources were modeled as part of this facility.
4	Describe any open pits.
	N/A – there are no open pits as part of this facility.
5	Describe emission units included in each open pit.
	N/A – there are no open pits as part of this facility.

16-R: Background Concentrations

1	Were NMED provided background concentrations used? Identify the background station used below. If non-NMED provided background concentrations were used describe the data that was used.	Yes☒	No☐
	CO: Choose an item.		
	NO_2: US-Mexico Border Crossing (350130021)		
	PM2.5: N/A – See comment below		
	PM10: N/A – See comment below		
	SO_2: Choose an item.		
	Other:		
	Comments: YGI is utilizing the PM_{10} 24-hour second high background concentration for the 6ZM Desert View monitor and the $PM_{2.5}$ 24-hour 98th %ile background concentration and the $PM_{2.5}$ Annual background concentration for the 6ZN, Santa Teresa monitor.		
2	Were background concentrations refined to monthly or hourly values? If so describe below.	Yes☐	No☒

16-S: Meteorological Data

1	Was NMED provided meteorological data used? If so select the station used. Sunland Park (Desert View)	Yes☒	No☐
2	If NMED provided meteorological data was not used describe the data set(s) used below. Discuss how missing data were handled, how stability class was determined, and how the data were processed.		
	N/A – NMED provided meteorological data was used.		

16-T: Terrain

1	Was complex terrain used in the modeling? If not, describe why below.	Yes☒	No☐
	N/A		
2	What was the source of the terrain data?		
	Terrain was incorporated into the modeling analysis through the use of AERMAP with the most recent 1/3 degree NED Data currently available from https://apps.nationalmap.gov/downloader		

16-U: Modeling Files

1

Describe the modeling files:

Significant Impact Models
- Input file name format "YGIMG_Poll AvgPer_SIL Input.inp"
- Output file name format "YGIMG_Poll AvgPer_SIL Output.out"
- "Poll" = NO2 (nitrogen oxides), CO (carbon monoxide), PM10 (particulate matter, PM_{10}), PM2.5 (particulate matter, $PM_{2.5}$), SO2 (sulfur dioxide), NH3 (ammonia)
- "AvgPer" = averaging period. 1hr = 1 hour, etc. Ann = annual
- "SIL" – SIL designator
- Files may contain multiple SIL for short-term, annual, and increment averaging periods and multiple scenarios.

NM/NAAQS and Increment Models
- Input file name format "YGIMG_Poll AvgPer_Standard Input.inp"
- Output file name format "YGIMG_Poll AvgPer_Standard Output.out"
- "Poll" = NO2 (nitrogen oxides), CO (carbon monoxide), PM10 (particulate matter, PM_{10}), PM2.5 (particulate matter, $PM_{2.5}$), SO2 (sulfur dioxide), NH3 (ammonia)
- "AvgPer" = averaging period. 1hr = 1 hour, etc. Ann = annual
- "Standard" = air quality standard. PSD = PSD Increment Class II, NAAQS = NAAQS

BPIP files have also been included with this submittal. Due to size constraints, the modeling file was split into 14 sectors, in order to run BPIP. YGI is providing 14 sets of BPIP files.

AERMAP files have also been included with this submittal. Due to size constraints, the modeling file was split into 4 sectors in order to run AERMAP. YGI is providing 4 sets of AERMAP files. In this model, each stack is modeled as three release points, side-by-side, due to the aspect ratio of the original stack. However, each release point is assumed to have the same elevation. Thus, for the AERMAP files that are submitted, these represent the elevation for each stack, and this elevation is taken to be the same for each individual release point for each stack. All elevations for sources, buildings, and receptors in the modeled files are based on these sets of files.

File name (or folder and file name)	Pollutant(s)	Purpose (ROI/SIA, cumulative, culpability analysis, other)
YGIMG_CO 1-hr 8-hr_SIL Input.inp	CO	ROI/SIA

16-V: PSD New or Major Modification Applications – N/A

1	A new PSD major source or a major modification to an existing PSD major source requires additional analysis. Was preconstruction monitoring done (see 20.2.74.306 NMAC and PSD Preapplication Guidance on the AQB website)?	Yes☐	No☐
2	If not, did AQB approve an exemption from preconstruction monitoring?	Yes☐	No☐
3	Describe how preconstruction monitoring has been addressed or attach the approved preconstruction monitoring or monitoring exemption.		
4	Describe the additional impacts analysis required at 20.2.74.304 NMAC.		
5	If required, have ozone and secondary PM2.5 ambient impacts analyses been completed? If so describe below.	Yes☐	No☐

Administrative Record NSR 10833_011726

16-W: Modeling Results

1	If ambient standards are exceeded because of surrounding sources, a culpability analysis is required for the source to show that the contribution from this source is less than the significance levels for the specific pollutant. Was culpability analysis performed? If so describe below.	Yes☒	No☐
	For NO_2 1-hr, a culpability analysis was done on 5 receptors that were over the NAAQS. The year-by-year paired-by-time analysis showed that for all exceedances, YGI is not above the SIL. This analysis is included as an attachment.		
2	Identify the maximum concentrations from the modeling analysis. Rows may be modified, added and removed from the table below as necessary.		

Pollutant, Time Period and Standard	Modeled Facility Concentration (µg/m3)	Modeled Concentration with Surrounding Sources (µg/m3)	Secondary PM (µg/m3)	Background Concentration (µg/m3)	Cumulative Concentration (µg/m3)	Value of Standard (µg/m3)	Percent of Standard	Location		
								UTM E (m)	UTM N (m)	Elevation (ft)
CO 8-hr SIL	31.88	-	-	-	31.88	500	6.4%	340557.1	3521981	4117.8

16-X: Summary/conclusions	
1	A statement that modeling requirements have been satisfied and that the permit can be issued.
	YGI has demonstrated that the YGI Microgrid will neither cause nor contribute to an exceedance of any applicable standards for CO, NO_2, $PM_{2.5}$, PM_{10}, and SO_2.

Stack Type	Hotboxes	Flow per HB	Temp	Std Flow per Stack
A	10	717 acfm	824 deg F	176,905 scfh
B	18	717 acfm	824 deg F	318,428 scfh
C	20	717 acfm	824 deg F	353,809 scfh

The flow rate for each stack provided in these calculations is based on a specific efficiency. In practice, as the CO_2 Vol% is updated, the flow rate would change (as shown in the CO_2 Emission factor tab). The flow rate is held constant for purposes of these calculations as flow rate is treated as a constant for each defined source in a standard modeling run

Using an average efficiency (as shown in the provided 40 CFR Part 98 calculation) is preferred as it is not based on a single snapshot in time.

CO_2 Emission Factors[1]

Source	CO_2_Vol%[2]	Flow	Output	Efficiency[3]	EF
Bloom EF				54%	818 lb/MW-hr
Montrose [169]	4.2%	243.5 dscfm	70.68 kW	45%	993 lb/MW-hr
Blue Sky [321]	4.55%	174.4 dscfm	67.27 kW	55%	810 lb/MW-hr
Blue Sky [485]	4.53%	183.1 dscfm	67.48 kW	52%	844 lb/MW-hr

[1]The Emission Factor (EF) is a function of more than just CO_2 Volume %. A higher CO_2 vol. % does not always equate to higher CO_2 emissions. The EF is also dependent on output (kW) and flow. Similarly, a particular Emission Factor is not necessarily correlated with a specific CO2 volume.

[2]YGI is not aware of any preference to use stack source test result CO_2 volume % values to calculate reportable CO_2 emissions in lieu of using 40 CFR Part 98. Part 98 is the preferred methodology.

[3]These CO_2 calculations are based on a snapshot of efficiency, as shown above. For instance, the 993 lb/MW-hr translates to a 45% efficiency. This snapshot is not an accurate estimate of the manufacturer's estimated average efficiency of 54%. The 40 CFR Part 98 calculation provided uses an average efficiency.

Moisture Content per Table 2-H	7.9%	Select a CO_2_Vol% (hotbox) value	4.00%	CO2_Vol% (total stream) implied	1.17%

Notes:
The flow rate for each stack provided in these calculations is based on a specific efficiency. In practice, as the CO_2 Vol% is updated, the flow rate would change (as shown in the CO_2 Emission factor tab). The flow rate is held constant for purposes of these calculations as flow rate is treated as a constant for each defined source in a standard modeling run

Using an average efficiency (as shown in the provided 40 CFR Part 98 calculation) is preferred as it is not based on a single snapshot in time.

All flow rates and stream temperatures provided by Bloom (see 9/2 e-mail from Trinity to NMED)

Release point consists of (3) rectangular ducts each 6'4" x 1'6". Diameter is effective diameter of each duct. Flow rate is for entire release point.

CO2 concentrations are not known. Cell I2 can be manipuated to show diffferent results. Cell K1 depends only on cell I1.

CO_2 Emission Factors[1]

Source	CO_2_Vol%[2]	Flow	Output	Efficiency[3]	EF
Bloom EF				54%	818 lb/MW-hr
Montrose [169]	4.2%	243.5 dscfm	70.68 kW	45%	993 lb/MW-hr
Blue Sky [321]	4.55%	174.4 dscfm	67.27 kW	55%	810 lb/MW-hr
Blue Sky [485]	4.53%	183.1 dscfm	67.48 kW	52%	844 lb/MW-hr

[1]The Emission Factor (EF) is a function of more than just CO_2 Volume %. A higher CO_2 vol. % does not always equate to higher CO_2 emissions. The EF is also dependent on output (kW) and flow. Similarly, a particular Emission Factor is not necessarily correlated with a specific CO2 volume.

[2]YGI is not aware of any preference to use stack source test result CO_2 volume % values to calculate reportable CO_2 emissions in lieu of using 40 CFR Part 98. Part 98 is the preferred methodology.

[3]These CO_2 calculations are based on a snapshot of efficiency, as shown above. For instance, the 993 lb/MW-hr translates to a 45% efficiency. This snapshot is not an accurate estimate of the manufacturer's estimated average efficiency of 54%. The 40 CFR Part 98 calculation provided uses an average efficiency.

Table 2-G: Stack Exit and Fugitive Emission Rates for Special Stacks

☐ I have elected to leave this table blank because this facility does not have any stacks/vents that split emissions from a single source or combine emissions from more than one source listed in table 2-A. Additionally, the emission rates of all stacks match the Requested allowable emission rates stated in Table 2-E.

Use this table to list stack emissions (requested allowable) from split and combined stacks. List Toxic Air Pollutants (TAPs) and Hazardous Air Pollutants (HAPs) in Table 2-I. List all fugitives that are associated with the normal, routine, and non-emergency operation of the facility. Unit and stack numbering must correspond throughout the application package. Refer to Table 2-E for instructions on use of the "-" symbol and on significant figures.

The Energy Server System equipment vendor maintains that there are zero PM emissions from its equipment. Extant reference method testing has been used by the applicant to conservatively estimate emissions, given test method limitations. Vendor indicates that extant testing may exhibit positive sampling method bias and reflects filterable particulate matter from intake air passed through the system. For that reason, the fuel cell system equipment vendor does not specify particulate emission factors.

Notes:

1. Each stack is modeled as three release points side-by-side, each having one-third of the emission rate indicated for the total stack.

Administrative Record NSR 10833_011851

Table 2-H: Stack Exit Conditions

Unit and stack numbering must correspond throughout the application package. Include the stack exit conditions for each unit that emits from a stack, including blowdown venting parameters and tank emissions. If the facility has multiple operating scenarios, complete a separate Table 2-H for each scenario and, for each, type scenario name here:

Notes
1. Release point consists of (3) rectangular ducts each 6'4" x 1'6". Diameter is effective diameter of each duct. Flow rate is for entire release point.

Administrative Record NSR 10833_011908

Table 2-H: Stack Exit Conditions

Unit and stack numbering must correspond throughout the application package. Include the stack exit conditions for each unit that emits from a stack, including blowdown venting parameters and tank emissions. If the facility has multiple operating scenarios, complete a separate Table 2-H for each scenario and, for each, type scenario name here:

Good afternoon, Jennifer,

Thank you for speaking with me earlier. This email is confirming that the NMED's Air Quality Bureau technical staff and legal team have reviewed the information provided by Yucca Growth Infrastructure, LLC (YGI) and are prepared to have a discussion concerning the batch of information YGI provided to the Air Quality Bureau through September 22.

As a reminder, under 20.2.72.203(E)(1) NMAC, air permit applicants have a continuing duty to promptly supplement and correct their applications, including with relevant information subsequently acquired or determined as relevant. This responsibility applies regardless of whether the Air Quality Bureau separately requests information necessary to evaluate or take final action on an application and regardless of whether the application has already been determined administratively complete. 20.2.72.203(E)(2) NMAC. NMED may require, and if it does the applicant must comply, updated emissions calculations, equipment descriptions, operating schedules, control information, or compliance analyses where those materials are necessary to evaluate the changed information. See 20.2.72.203(A)(3)–(4), (7)–(11), and (E)(2) NMAC. Furthermore, NMED has an obligation to review public comments for material concerns bearing on regulatory compliance and evaluate the same to be able to issue a reasoned permitting decision based on the administrative record. See 20.2.72.206(B)–(C), 207(D)–(E) NMAC. As you are aware, ultimately, "[t]he applicant has the burden of demonstrating that a permit or permit revision should be approved." 20.2.72.207(D) NMAC.

The Air Quality Bureau received YGI's permit application on April 27, 2026, and revision in May 2026. In May 2026, in response to questions about the application by the Air Quality Bureau, YGI and Bloom Energy – through Trinity Consultants – provided additional information on the fuel cells, related emissions and emission assumptions, including an affirmative statement that a more exact source characterization would have had no noticeable effect on the results as the stacks are spaced closely together and have the same dispersion characteristics. NMED's current draft permit and accompanying modeling report is based on YGI's statements in response to those inquiries.

Based on the Air Quality Bureau's review of public comments, the Air Quality Bureau then sought additional information from YGI regarding the accuracy of emissions testing, exhaust flow and composition, and CO2 calculation methodology. As part of YGI's responses, YGI provided additional information. Specifically, YGI provided the exact design of the stacks and resulting exhaust. This new information leads to different results than the original permit

materials.

In the most recent modeling compared to the original modeling, there is an approximately 2% increase in emissions but, more significantly, the modeled pollutant concentrations doubled although it still appears to be under NAAQS and PSD increment thresholds. And, the new modeling calls into question whether the original use of assumptions is a defensible and conservative approach.

The Air Quality Bureau must now assess the significance of YGI's specific updates, particularly as a new Hearing Officer has been appointed and the November 23, 2026, decision deadline for the agency is rapidly approaching.

To discuss the above, the Air Quality Bureau requests YGI and its technical and legal team meet in-person at the Watson Building (5401 Watson Dr SE, Bldg. B, Albuquerque, NM 87106) on Monday, October 5, 2026, at 1pm. NMED will also bring its technical and legal team to further discuss the information YGI provided.

Thank you,

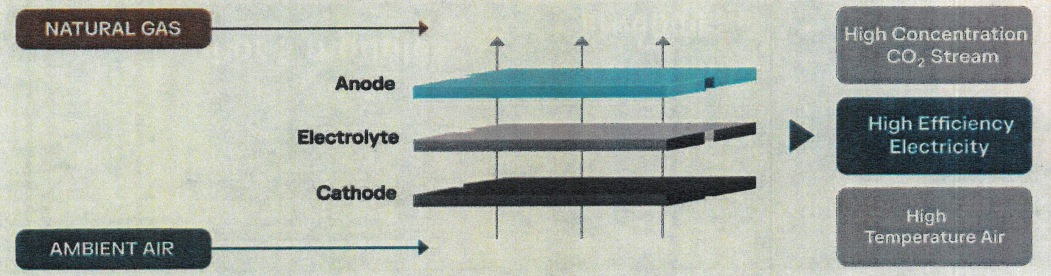
YGI MICROGRID · PERMIT NO. 10883 · AQB 26-57

How the fuel-cell system is built



Fuel cells are grouped into power modules, power modules form Energy Servers, and Energy Servers form clusters. The clusters sit on two levels. Each cluster's servers exhaust through small ducts into one plenum, which connects to the cluster's single stack.

FROM CELL TO CLUSTER

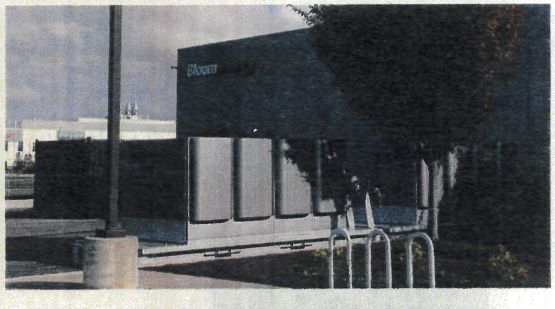
Building Block 1: Inside a Fuel Cell

Fuel Cell stack inside a single bloom power module contains ceramic layers that turn gas and air into DC power, with no flame. [Application §10; May 19 Resp. Q33]

FROM CELL TO CLUSTER

Building Block 2: Power Module

A **Bloom Power Module (PM)** is the electricity-generating component of a Bloom Energy Server. It contains the solid oxide fuel cell stacks (referenced in the last slide) that convert fuel into **direct-current (DC) electricity** without combustion or no flame. It also regulates the DC output.



Administrative Record NSR 10833_011970

FROM CELL TO CLUSTER

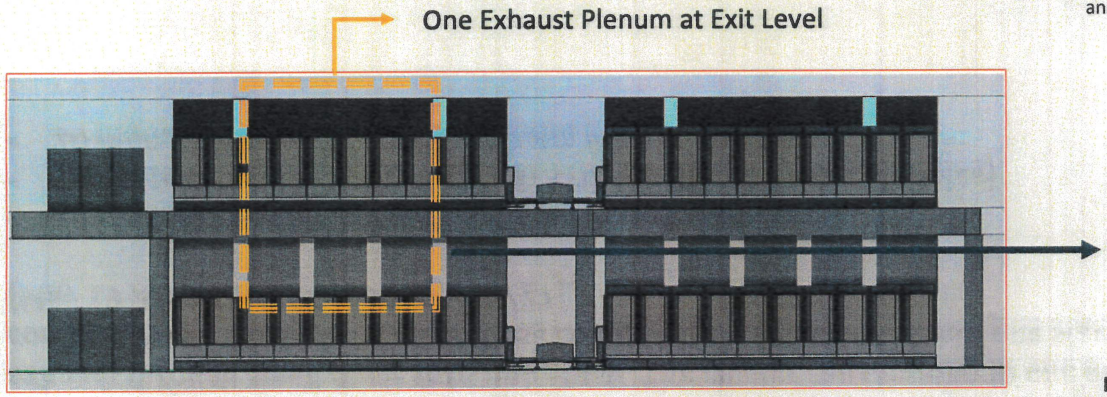
Building Block 3: Energy Server

Bloom Energy Server is a modular configuration that combines **4 (260kw) or 5 (325kw)**

Administrative Record NSR 10833_011971

FROM CELL TO CLUSTER

Building Block 4: Cluster (Slide 1 of 3)



A cluster is a configuration of Energy Servers that can be placed together. All the servers in a cluster will exhaust through small ducts **into one stack**. The cluster can be setup in one of the following three configurations but any and all of these configuration still exhaust into one stack.
[May 19 Resp. Q34; Ke to Rathod, 8/27].

- 10 module cluster (2x5x65kw Bloom Power Modules)
- 18 module cluster (2x5x65kw + 2x4x65kw Bloom Power Modules)
- 20 module cluster (4x5x65kw Bloom Power Modules)

FROM CELL TO CLUSTER

Ms. Bradfute,

Thank you and Yucca Growth Infrastructure, LLC ("YGI"), Bloom Energy, and Trinity Consulting for meeting with the Air Quality Bureau's technical and legal team this past Monday, October 5, 2026.

At the meeting, the Air Quality Bureau listened to YGI's explanation of its latest air dispersion modeling and reviewed with YGI how different configurations of energy servers into clusters result in different ambient air pollutant concentrations.

As discussed, the configuration and operating conditions described in the permit application must accurately represent the physical and operational design of the YGI Microgrid's energy server and cluster composition. This information must, in turn, correspond to the parameters used for air dispersion modeling, including the associated exhaust flows and velocities within each stack as described by YGI.

The Air Quality Bureau understood from the meeting that YGI may not use its most current air dispersion modeling design with the three different cluster compositions (*i.e.*, the 10/18/20 configuration) and will submit updated air dispersion modeling reflecting the permit application.

As part of this forthcoming air dispersion modeling submission, the Air Quality Bureau asks that YGI provide the following to ensure that the Air Quality Bureau can adequately review and confirm the information YGI provides:

1. Incorporation of TCEQ emissions data.
2. Specific emissions per stack and how the emissions relate to the number of clusters, servers, and power modules for each respective stack.
3. The flow rate, temperature, and other stack parameters with respect to flow composition (*i.e.* how much flow is from the hotbox, ventilation, and DC inverter modules), as well as any additional blowers or fans YGI intends to use.
4. All supporting calculations used to justify the parameters and associated emissions.
5. A detailed description as to the specific changes that YGI is making compared to its 10/18/20 configuration.

We also understand that YGI may be amenable to an extension of the November 23 decision deadline; however, the Air Quality Bureau cannot properly evaluate extending the decision deadline without the above information.

Thank you,
