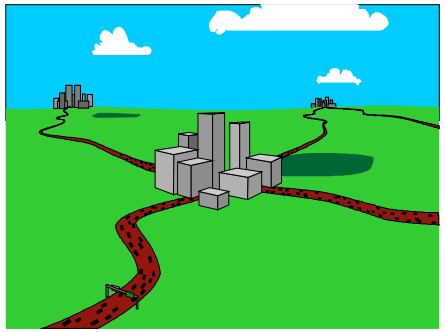
ANTHRO EMISSION DATA SOURCES



- 2014 anthropogenic emissions from 2014v2 scenario of the WRAP/WAQS RH modeling
  - Onroad emissions generated using SMOKE-MOVES processing for the 4-km domain
  - O&G emissions based on state-of-the-science WRAP OGWG emission estimates
  - NMED found a generator engine missing in 2014v2 inventory (94 tpy NOx)
  - Consistent emissions data between the Regional Haze and OAI studies
- 2028 anthropogenic emissions based on the WRAP/WAQS 2028 on-the-books scenario (2028OTBa2 only with actual 2014 fires)
  - O&G emissions based on inventory developed by Ramboll (presented in Jan 11th meeting)
  - Onroad emissions created using SMOKE-MOVES
  - Fixed double counting of NM sources
  - Updated San Juan Generating Station (NOx 7,391 TPY) and added Lordsburg Generating Station
  - Updated three O&G sources: Chaco Gas Plant (NOx 2,053 tpy), Carlsbad CS, and Mountainair CS (NOx 645 tpy)

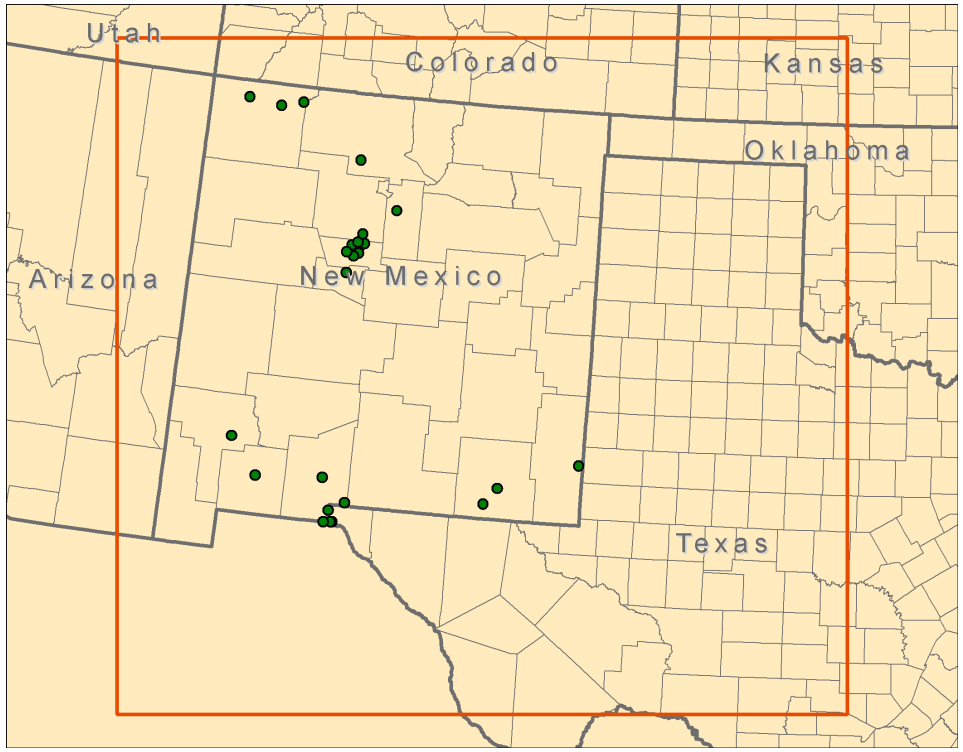
CAMX 2014 NM OAI STUDY MODEL CONFIGURATION



- Episode: May-August 2014
  - 16-day spin-up before first high ozone day in NM
    - 68 ppb on May 17
- 36/12/4-km Modeling Domains
  - 36/12-km domains same as WRAP Regional Haze
  - New 4-km New Mexico domain
- Boundary Conditions (BC) WRAP 2014 GEOS-Chem
- Four Meteorological Diagnostic Sensitivity tests
  - Selected WRF/NAM with Kv=CMAQ
- WRAP 2014v2 base year emissions
  - EPA NEI2014v2 w/ western state updates
- WRAP 2028OTBa2 for future year w/ 2014 actual fires and new 2028 NM O&G

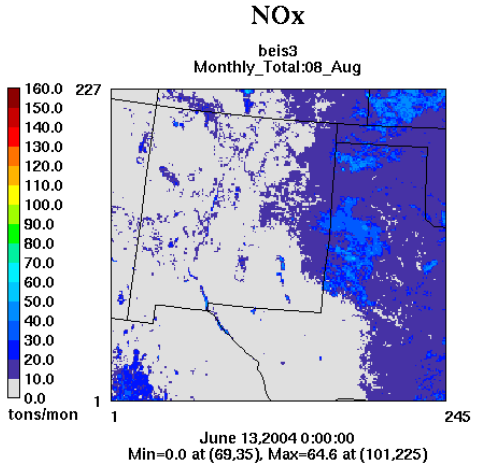
RAMBOLL

ORIGINAL CAMX CONFIGURATION

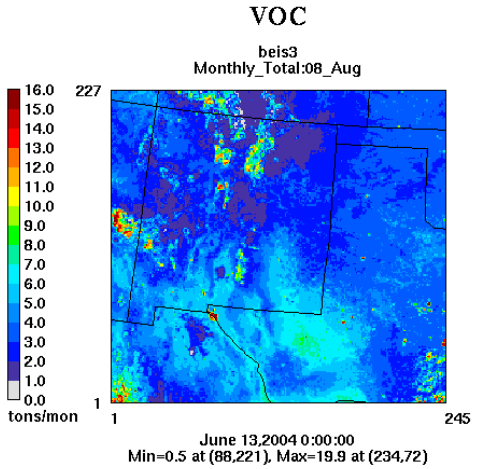
- Similar to WRAP CAMx 36/12-km Regional Haze set-up w/ 4-km NM domain added
- Two changes in revised 2014v2 Base Case:
  - Use CAMx v7.1
  - Use BEIS biogenic emissions

Science Options	CAMx	Comment
Model Codes	CAMx v7.0	Latest version of CAMx made publicly available May 2020 (www.camx.com)
Horizontal Grid Mesh	36/12/4-km	
36-km grid	148 x 112 cells	36US domain
12-km grid	227 x 215 cells	12WUS2 domain. Includes buffer cells
4-km grid	245 x 227 cells	New Mexico 4-km domain. Includes buffer cells
Vertical Grid Mesh	25 vertical layers, defined by WRF	Layer 1 ~20 m. Model top at 50 mb (~19 km). Layer collapsing from 35 vertical layers in WRF
Grid Interaction	36/12/4 km two-way nesting	
Initial Conditions	Start on May 1, 2014	First high ozone day is May 17, 2014
Boundary Conditions	WRAP 2014 GEOS-Chem	For 36US domain lateral boundaries
Emissions		
Emissions Processing	SMOKE, SMOKE-MOVES2014, MEGAN	WRAP/WAQS 2014v2 emissions and EPA 2023fh for future year
Sub-grid-scale	Plume-in-Grid (PiG)	NOx > threshold
Chemistry		
Gas Phase	CB6r4	(Yarwood et al., 2010)
Meteorological Processor	WRFCAMx	Compatible with CAMx v7.0
Horizontal Diffusion	Spatially varying	K-theory with Kh dependence
Vertical Diffusion	CMAQ-like Kv	Evaluated YSU Kv scheme
Diffusivity Min	Kv-min = 0.1 to 1.0 m^2/s in lowest 100 m	Urban land use fraction
Deposition Schemes		
Dry Deposition	Zhang dry deposition scheme	(Zhang et. al, 2001; 2003)

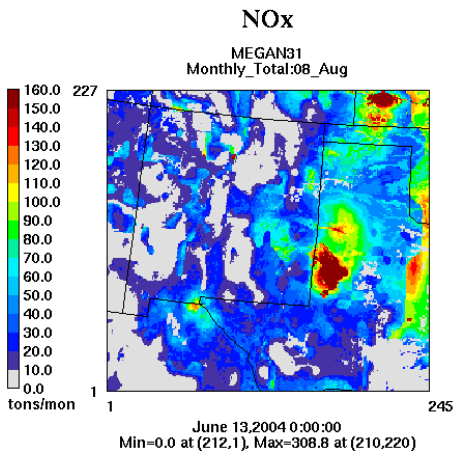
NMED Exhibit 23 - 0004



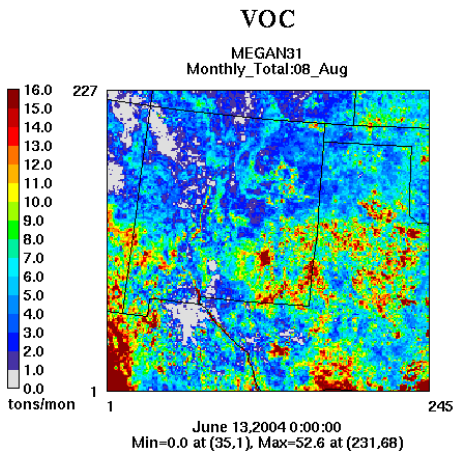
REVISED CAMx 2014v2 BASE CASE SIMULATION



RAMBOLL



REVISED CAMX 2014V2 36/12/4-KM BASE CASE AND MPE



- Two changes between original CAMx 36/12/4-km 2014 and revised 2014v2 base cases
  - Use CAMx v7.1 instead of CAMx v7.0
    - Bugs in source apportionment tools in CAMx v7.0 necessitated change
    - Little change expected in ozone results due to model version
  - Switched from MEGAN v3.1 to BEIS biogenic emissions in 4-km domain
    - MEGAN v3.1 very new and turned out to be not ready to run out of the box
    - MEGAN v3.1 missing LAI in urban areas so has zero biogenic emissions unless extra work is performed to do data filling
    - MEGAN v3.1 has much higher (~3x) biogenic NOx than BEIS, and previous versions of MEGAN
    - WRAP 2014/RepBase/2028 regional haze modeling is using BEIS
    - Denver 2020 Serious ozone SIP used MEGAN but for follow-on 2023 and 2026 modeling switched to BEIS because of zero urban biogenic emissions and biogenic NOx that seemed high

BEIS V3.7 VS. MEGAN V3.1 BIOGENIC EMISSIONS - AUGUST

BEIS

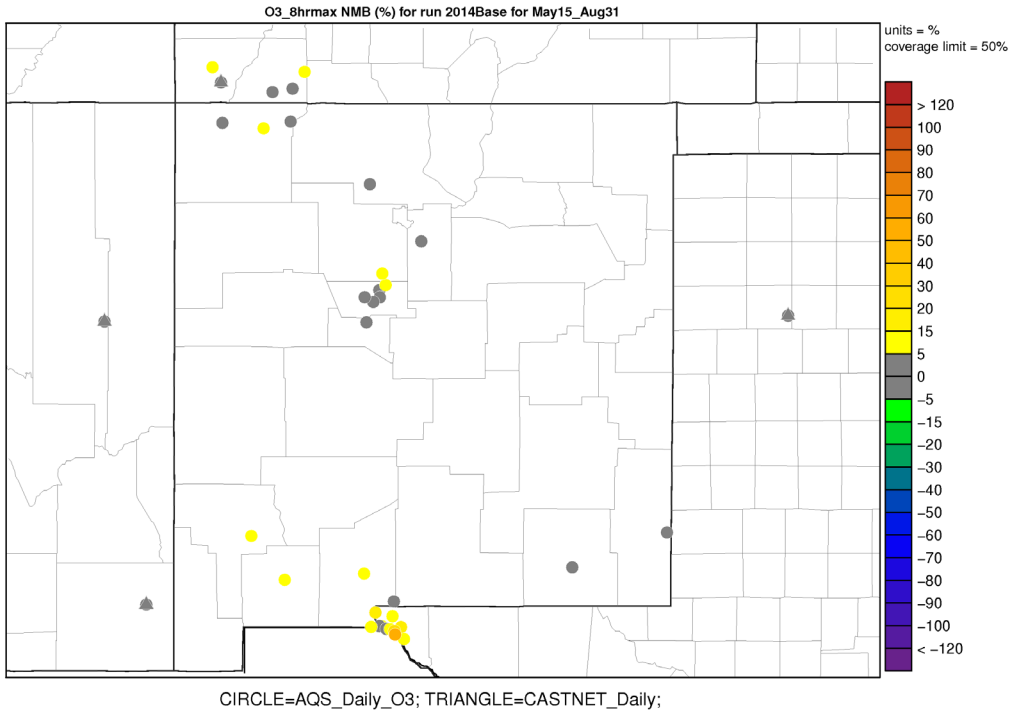
Tons/month		MEGAN	BEIS3	Abs Diff (BEIS3-MEGAN)	Ratio (BEIS3/MEGAN)
May	NOX	35,050	10,602	-24,448	0.30
	VOC	128,323	159,809	31,486	1.25
Jun	NOX	42,445	13,134	-29,311	0.31
	VOC	267,055	256,379	-10,676	0.96
Jul	NOX	51,639	12,838	-38,801	0.25
	VOC	317,697	251,562	-66,135	0.79
Aug	NOX	41,002	11,923	-29,079	0.29
	VOC	354,570	216,032	-138,538	0.61

MEGAN

RAMBOLL

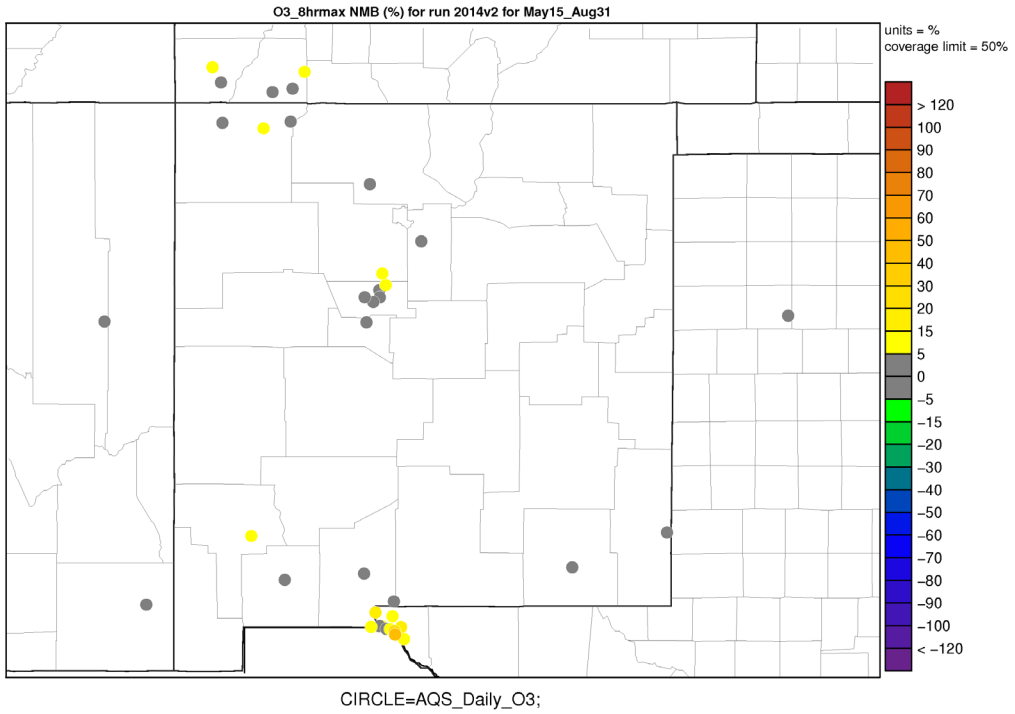
2014 (MEGAN) AND 2014V2 (BEIS) BASE CASE MPE

- Used EPA's AMETv1.4 MPE tool
- Model evaluated against EPA AQS and CASTNet Surface Air Quality Data for 2014
- Model performance compared with standard PGM goals and criteria values (Emery et al., 2016)
- "Goals" - statistical value that the best model can be expected to achieve
- "Criteria" - statistical value that majority of models have achieved



Species	NMB		NME	
	Goal	Criteria	Goal	Criteria
1-hr & MDA8 Ozone	<±5%	<±15%	<15%	<25%

RAMBOLL



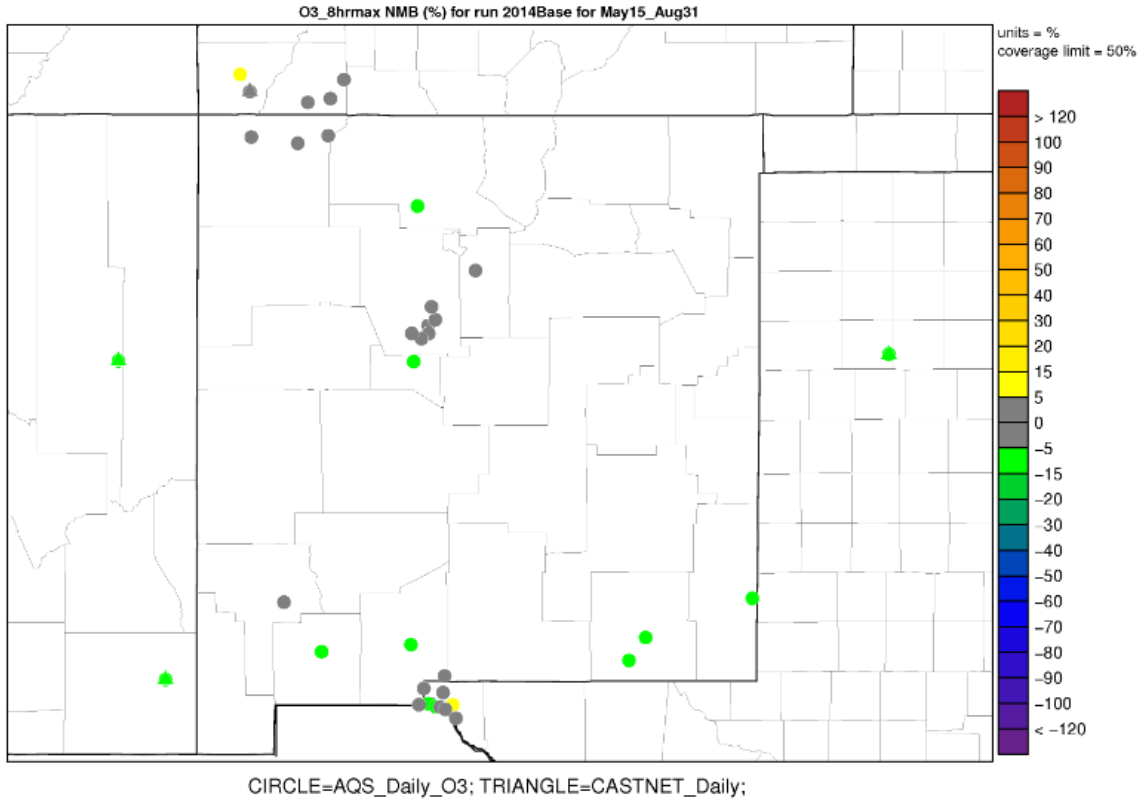
NMED Exhibit 23 - 0008

NMB (BIAS) WITHOUT 60 PPB CUTOFF

2014Base (MEGAN)

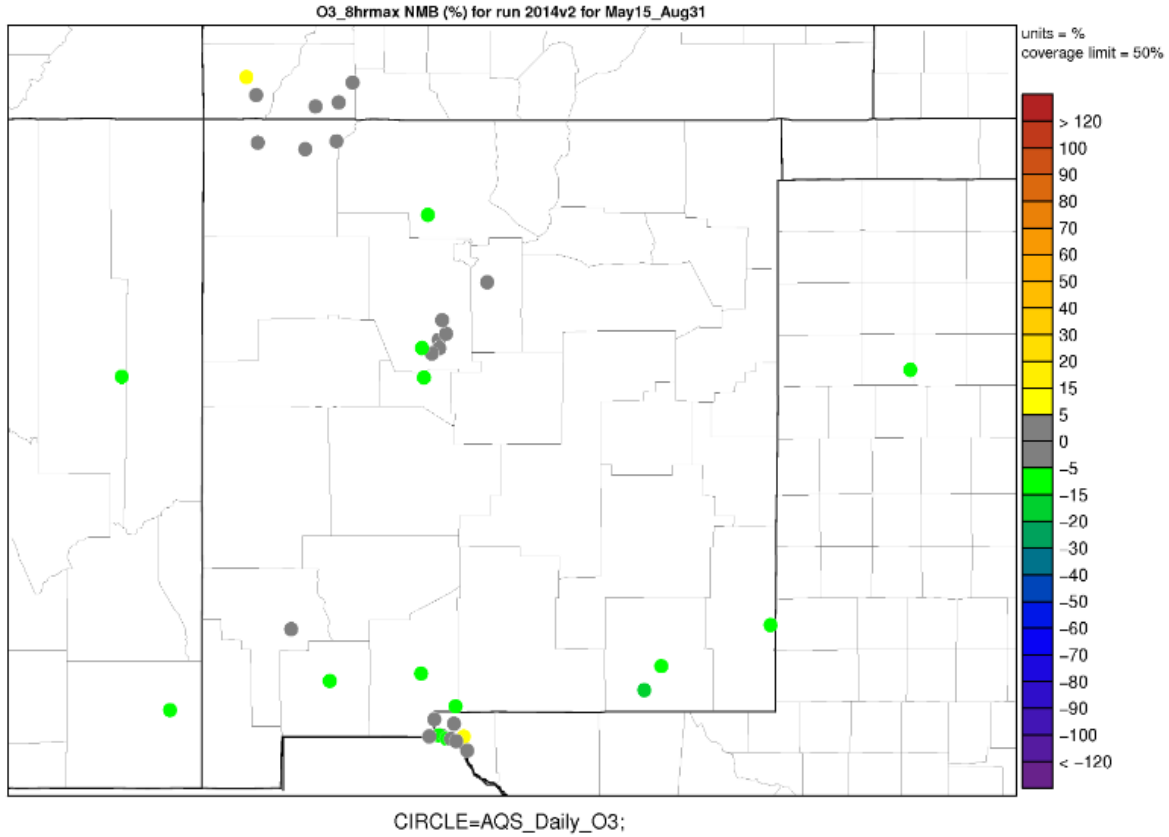
2014v2 (BEIS)

Both 2014 Base and 2014v2 meet ozone Performance Criteria at all sites but one in El Paso



2014v2 has more sites achieving Performance Goals (grey)

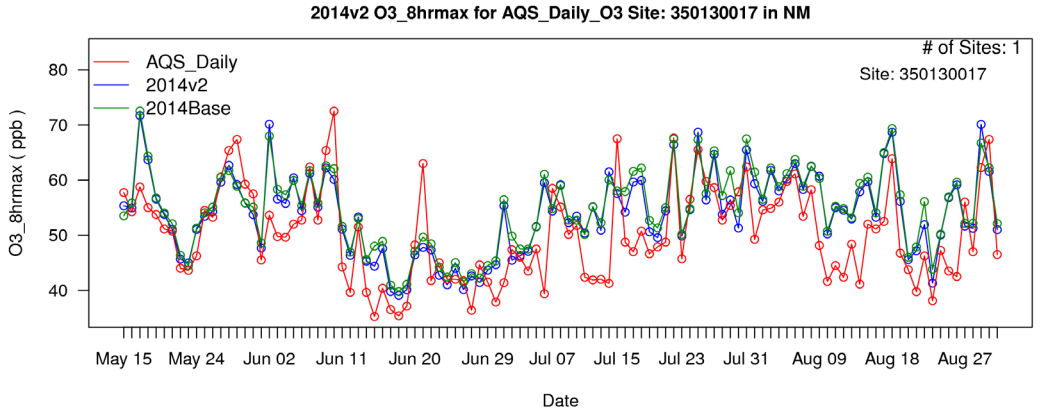
RAMBOLL



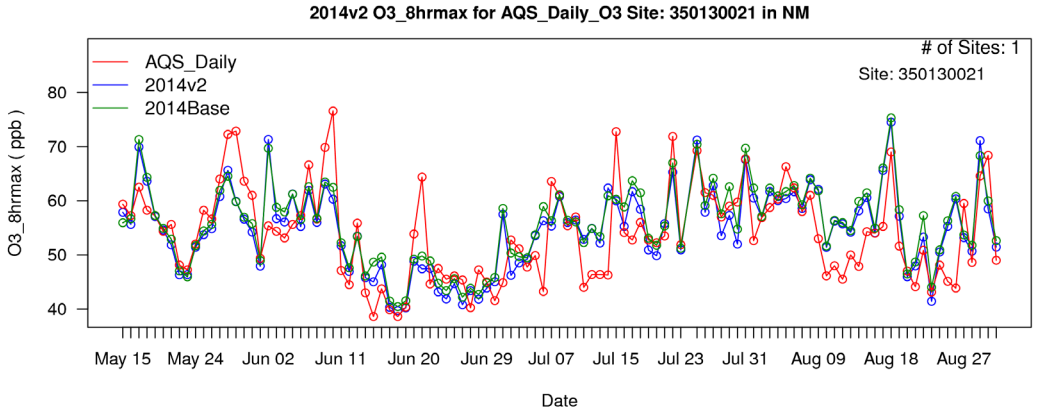
NMED Exhibit 23 - 0009

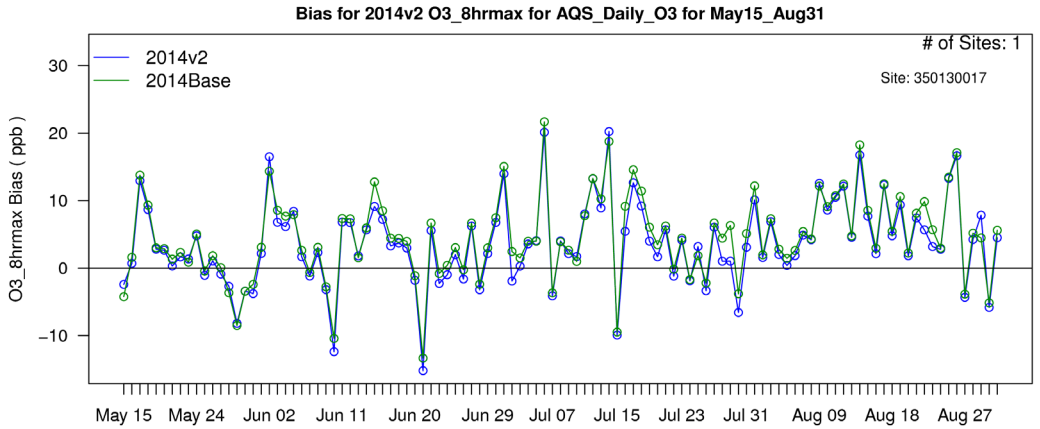
NMB (BIAS) WITH 60 PPB CUTOFF

2014Base (MEGAN)



2014v2 (BEIS)





2014v2 larger underestimation at a few sites with 60ppb cutoff compared to 2014Base but still achieves Performance Criteria

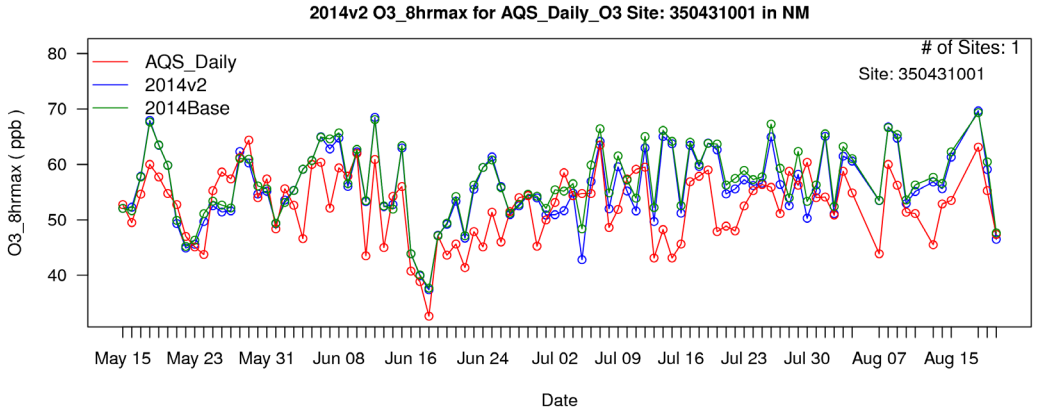
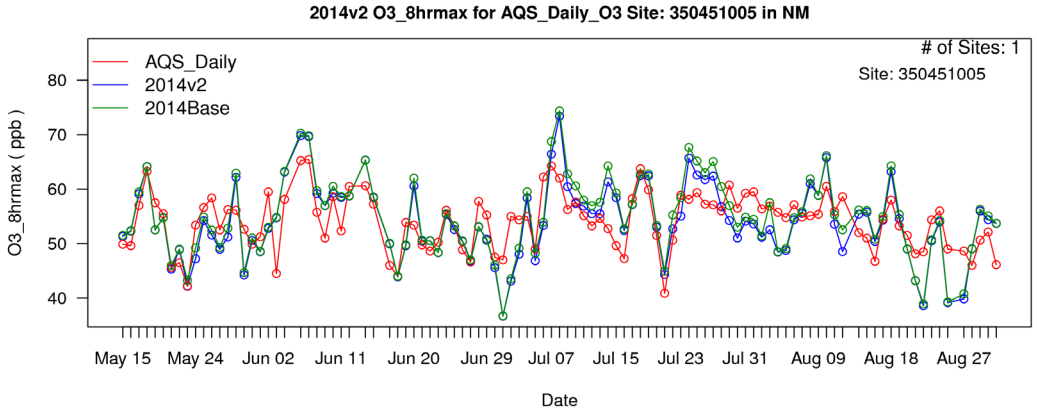
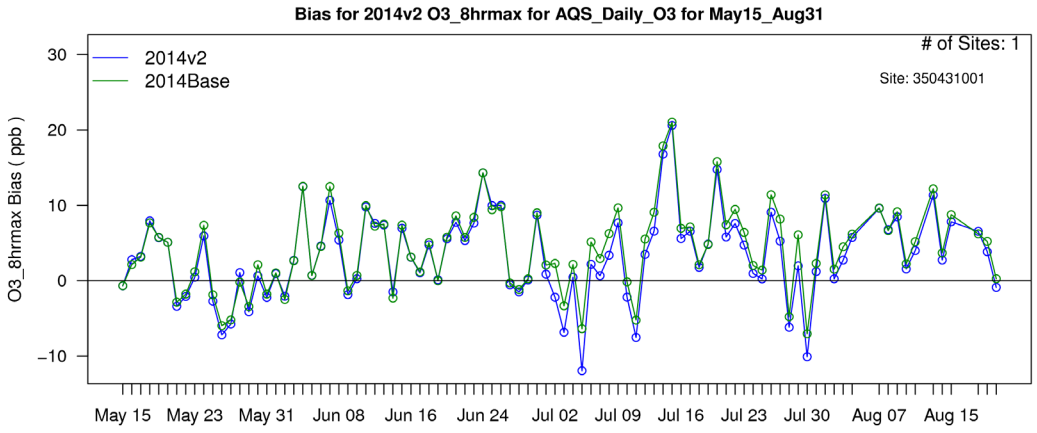
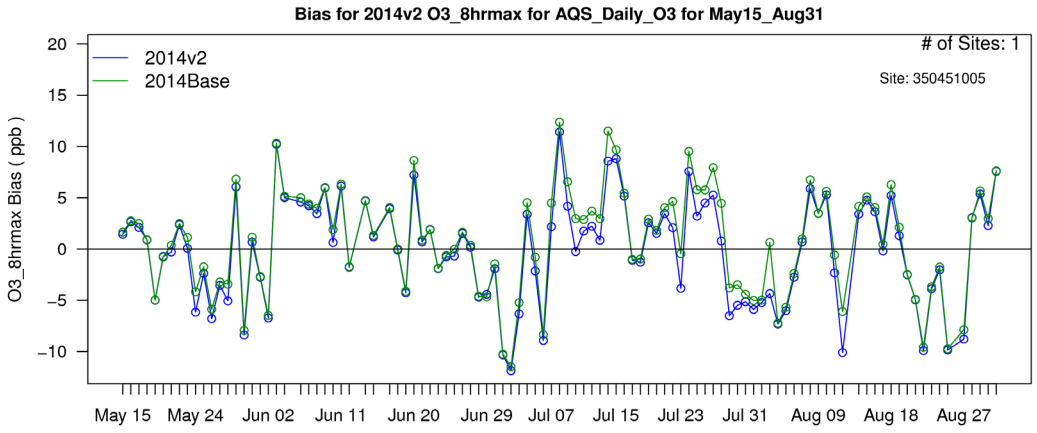
SUNLAND PARK AND DESERT VIEW (DONA ANA COUNTY)









RAMBOLL

BERNALILLO (SANDOVAL CTY) & SUB STATION (SAN JUAN CTY)

RAMBOLL

OZONE MPE BY NEW MEXICO SUBREGIONS

- Original 2014 Base Case

	Nocutoff		Withcutoff	
Region	**NMB(%)**	**NME(%)**	**NMB(%)**	**NME(%)**
North NM	4.3	9.1	0	6.4
Bernalillo	4.3	9.4	-2.8	7.1
South NM	5.8	10.5	-6.1	8.5

- Revised 2014v2 Base Case

	Nocutoff		Withcutoff	
Region	**NMB(%)**	**NME(%)**	**NMB(%)**	**NME(%)**
North NM	2.6	8.6	-1.0	6.6
Bernalillo	2.6	9.6	-4.3	8.5
South NM	3.5	10.2	-7.8	9.9

- Consistent with MEGAN v3.1 having higher NOx emissions than BEIS v3.7, CAMx revised 2014v2 base has slight lower ozone than original 2014 base
  - Also consistent with time series plots
- Results in slight improvement in ozone performance statistics when no cutoff is used
- Results in a slight degradation in ozone performance statistics when 60 ppb observed ozone cutoff is used
- Very similar ozone model performance

RAMBOLL

RAMBOLL

CONCLUSIONS: REVISED CAMX 2014V2 BASE CASE

- With lower biogenic emissions, the CAMx revised 2014v2 base case (BEIS) produces slightly lower ozone concentrations that the original CAMx 2014 base case (MEGAN)
  - Slightly improves ozone performance when overestimated (e.g., when not using ozone cutoff)
  - Slightly degrades ozone performance when underestimated (e.g., when using 60 ppb ozone cutoff)
  - Overall ozone model performance is comparable and basic MPE features nearly identical
- How to document in the NMED OAI Study?
  - 2014 database development and model evaluation report for original CAMx 2014 base case posted to NMED OAI website
    - https://www.wrapair2.org/pdf/NM_OAI_2014_BaseCase_MPE_v3.pdf
  - Ozone performance not appreciably changed

RAMBOLL

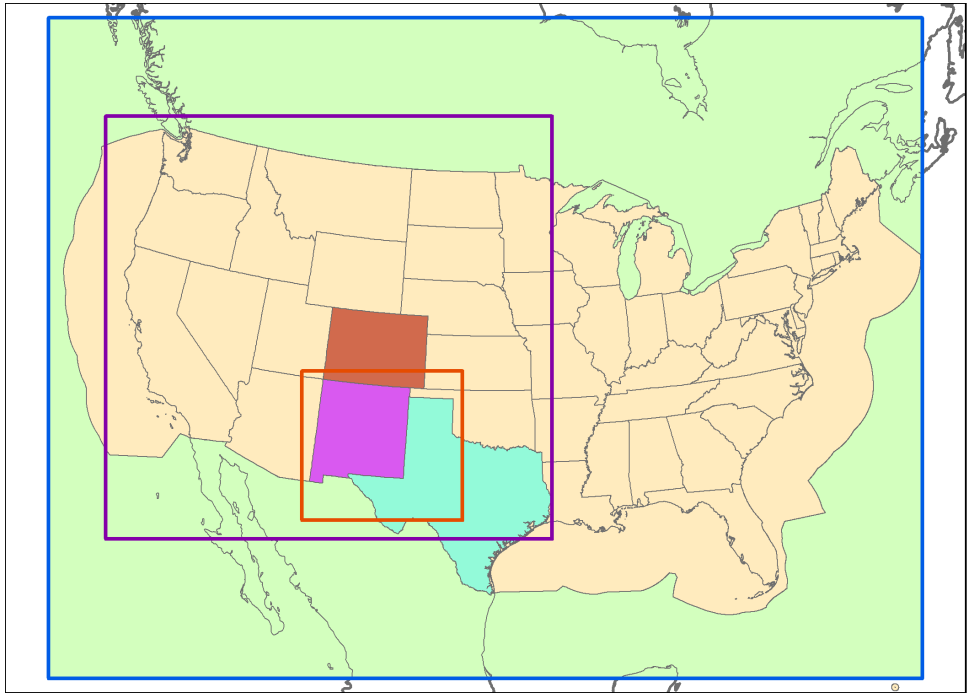
NMED Exhibit 23 - 0034

CAMX 2028 NM O&G CS APCA OZONE SOURCE APPORTIONMENT

- Purpose: To determine contributions of 9 Source Categories within New Mexico and rest of U.S. as well as international anthropogenic emissions to ozone concentrations in New Mexico under the 2028 NM O&G CS emissions scenario.
- Approach:
  - Model: CAMX version 7.1 (released December 2020)
  - Domains: NMED OAI Study 36/12/4-km
  - Period: May – August 2014
  - Boundary Conditions: WRAP 2014 GEOS-Chem
  - Emissions Scenario: WRAP 2028OTBa2 except:
    - Actual 2014 Fire Emissions (U.S. WF, Rx and Ag)
    - 2028 New Mexico Oil and Gas Control Strategy (2028 NM O&G CS)
  - Source Apportionment: Anthropogenic Precursor Culpability Assessment (APCA) version of CAMx ozone source apportionment tool.

RAMBOLL



CAMX 2028 NM O&G CS APCA OZONE SOURCE APPORTIONMENT

- CAMx Ozone Source Apportionment Technology (OSAT) ozone source apportionment tool:
  - Ozone contributions are obtained for user-defined Source Groups:
    - A Source Group typically consists of a Source Category emitting from a geographic Source Region
    - For example, on-road mobile source emissions from New Mexico
  - OSAT uses reactive tracers for ozone (O3V and O3N) and precursors (e.g., VOC and NOx) and intermediate species (e.g., NO3 and PAN) that run in parallel to the host model
  - When ozone is formed in the host model, OSAT determines whether ozone formation is more VOC-limited or NOx-limited and assigns the ozone formed to Source Groups O3V or O3N based on the relative contribution of the Source Groups' limiting precursor to the total precursor concentration
- CAMx Anthropogenic Precursor Culpability Assessment (APCA) ozone source apportionment tool:
  - APCA differs from OSAT in that it recognizes that natural emissions are not controllable so only allocates ozone to natural emissions Source Groups when it is due to natural NOx interacting with natural VOC
  - When ozone is formed due to natural VOC and anthropogenic NOx under VOC-limited conditions, a case OSAT would assign to the natural Source Group, APCA redirects the ozone formed to the anthropogenic Source Group
  - APCA provides more control-strategy relevant information

RAMBOLL

CAMX 2028 NM O&G CS APCA OZONE SOURCE APPORTIONMENT

- **Definition of Source Groups**
  - Boundary Conditions (BCs) from 2014 GEOS-Chem runs:
    - BC_{Intl} - International anthropogenic emissions
    - BC_{USA} – U.S. anthropogenic emissions
    - $BC_{Natural}$ – Natural sources
    - BC_{Top} – BC above the top of domain
  - Source Categories (9):
    1. Natural (biogenic, lightning NOx, etc.);
    2. Fires (WF, Rx, Ag, other);
    3. Oil and gas point sources (surrogate for midstream);
    4. Oil and gas non-point sources (surrogate for upstream;
    5. EGU point;
    6. Non-EGU point;
    7. On-road mobile;
    8. Non-road mobile; and
    9. Remainder anthropogenic.
  - Source Regions (5):
    - New Mexico
    - Texas
    - Colorado
    - Remainder U.S.
    - International (Mex, Can, CMV > 200 nmi)
  - 50 Source Groups (50 = 5 x 9 + 5)

CAMX 2014 NM OAI STUDY MODEL CONFIGURATION

- Episode: May-August 2014
  - 16-day spin-up before first high ozone day in NM
    - 68 ppb on May 17
- 36/12/4-km Modeling Domains
  - 36/12-km domains same as WRAP Regional Haze
  - New 4-km New Mexico domain
- Boundary Conditions (BC) WRAP 2014 GEOS-Chem
- Four Meteorological Diagnostic Sensitivity tests
  - Selected WRF/NAM with Kv=CMAQ
- WRAP 2014v2 base year emissions
  - EPA NEI2014v2 w/ western state updates
- WRAP 2028OTBa2 for future year w/ 2014 actual fires and new 2028 NM O&G

RAMBOLL

FUTURE YEAR OZONE DESIGN PROJECTION APPROACH

- EPA's Ozone Modeling Guidance (2018) recommends making future year ozone Design Value (DVF) projections using the relative change in modeling results between the base (2014) and future (2028) years to scale the current year ozone design value (DVC)
  - The model derived scaling factors are called Relative Response Factors (RRFs) and are the ratio of the future to current year CAMx modeling results averaged across the 10 highest modeled MDA8 ozone days > 60 ppb in the current (2014) year base case near the monitor:

$$RRF = \sum MDA8\ Ozone_{2028} / \sum MDA8\ Ozone_{2014}$$

$$DVF = RRF \times DVC$$

  - By "near the monitor," the maximum 2014 modeled MDA8 ozone within a 3x3 array of 4-km grid cells centered on the monitor from the 2014 is used
  - If there are not 10 modeled MDA8 ozone days in the 2014 base case > 60 ppb for the RRFs, then you can use less than 10 days, but EPA guidance recommends there be at least 5 days
  - EPA recommends that the observed current year design value (DVC) be based on the average of 3 years of ozone DVs over 5-years centered on the base modeling year (2014):

$$DVC_{2012\text{-}2016} = 1/3 \times (DV_{2012\text{-}2014} + DV_{2013\text{-}2015} + DV_{2014\text{-}2016})$$

RAMBOLL

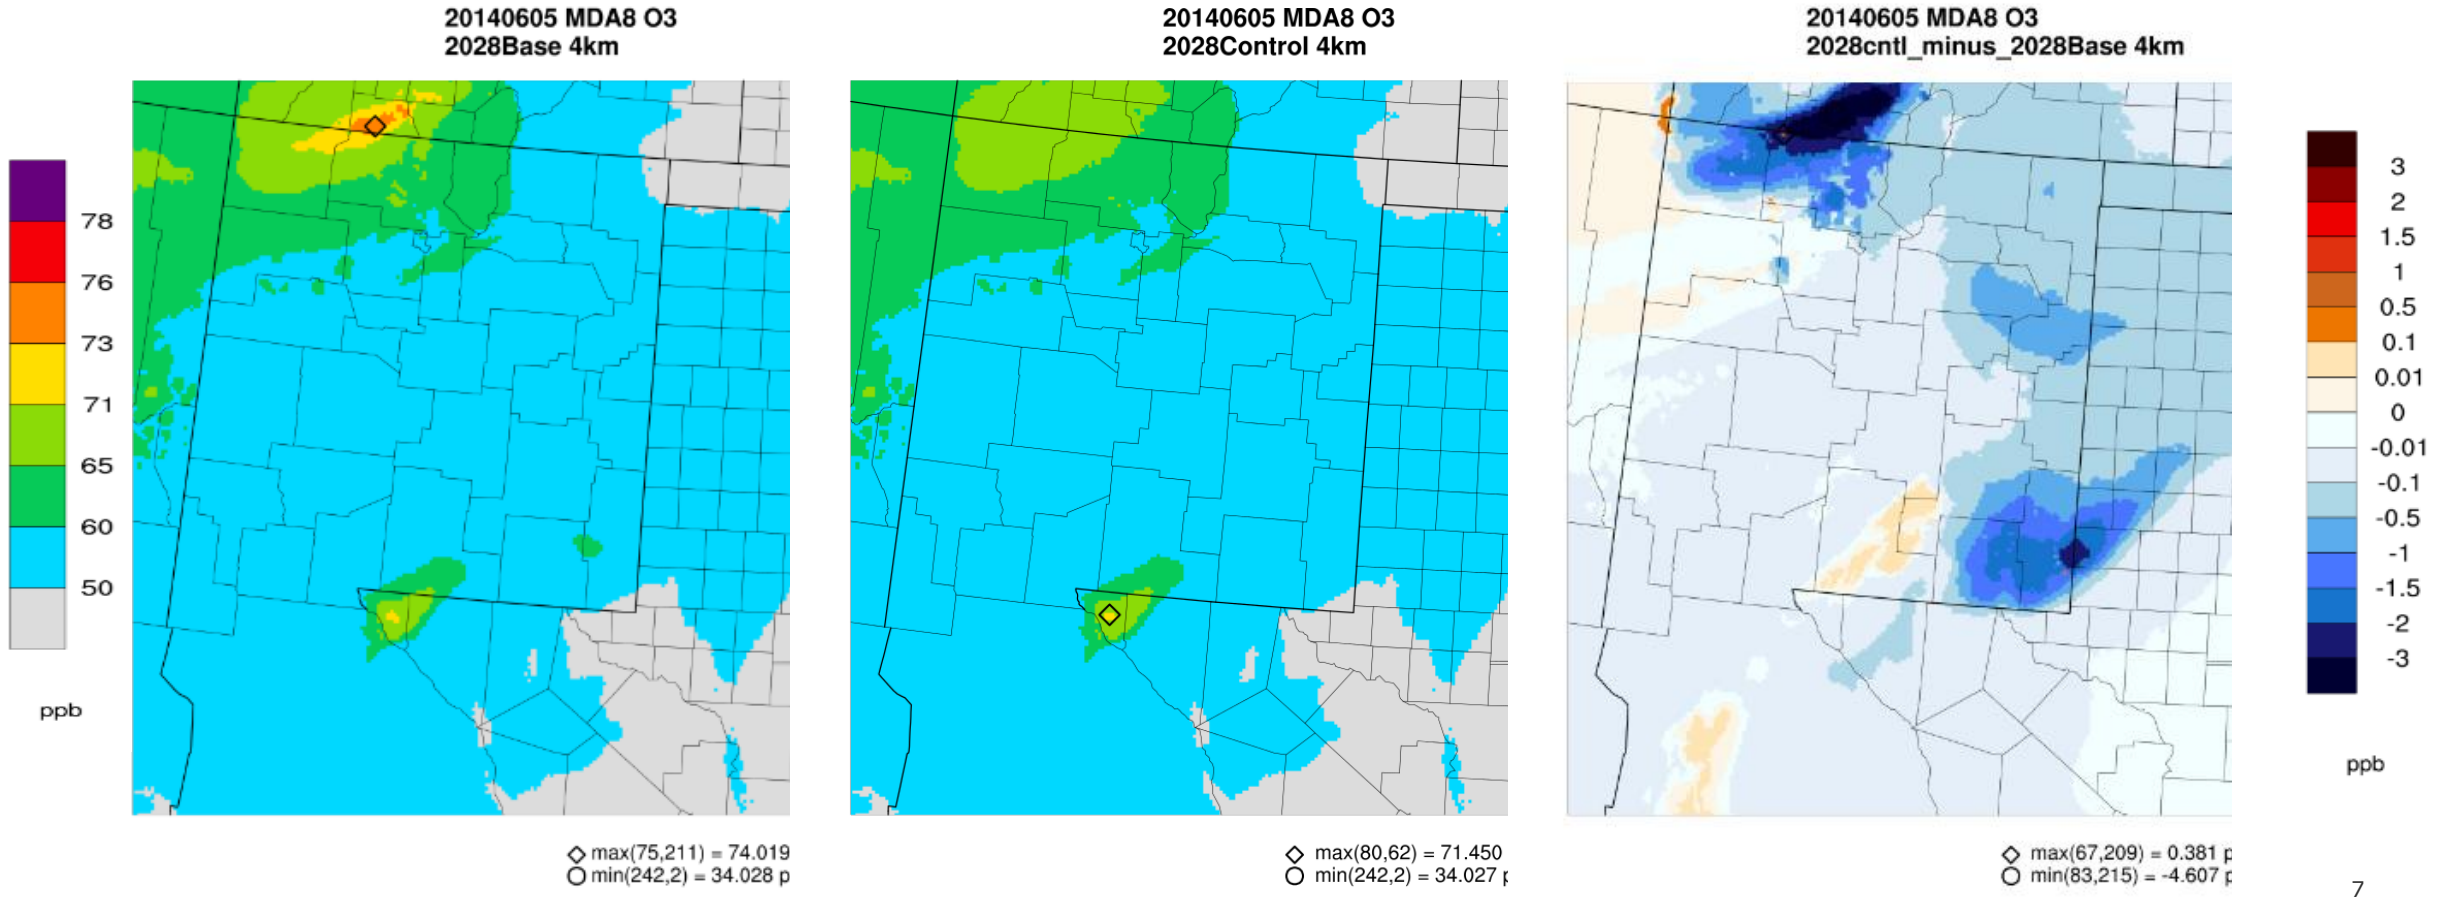
NMED Exhibit 24 - 0004

FUTURE YEAR OZONE DESIGN PROJECTION APPROACH

- EPA has codified their recommended future year ozone DVF projection technique in the Software for Modeled Attainment Test (SMAT)
- SMAT was applied using default settings, with one exception, and the 2014v2 and 2028 Base Case and 2028 O&G Control Strategy CAMx modeling results to obtain projected 2028 ozone DVF projections:
  - Use 3x3 array of 4-km cells centered on monitor for "near the monitor"
  - Use 10 days for RRFs with CAMx 2014 MDA8 ozone > 60 ppb
    - If less than 10 days with MDA8 ozone > 60 ppb use 4 days minimum (exception)
    - Default minimum number of days is 5, needed to relax to pick up Hobbs monitor in Lea County
  - Use current year design value based on average of 3 DVs centered on 2014
    - $DVC_{2012\text{-}2016}$
- SMAT Unmonitored Area Analysis (UAA) to obtain 2028 ozone DVF projections throughout 4-km New Mexico modeling domain
  - Recommend use spatial interpolation of monitoring site DVC without using modeled concentration gradients

RAMBOLL

PROJECTED 2028 OZONE DVFS FOLLOWING EPA GUIDANCE



- Two sites have current year $DVC_{2012-2016}$ above the 2015 ozone NAAQS:
  - Desert View = 72.0 ppb
  - Santa Teresa = 71.3 ppb
- Using EPA guidance, all sites have 2028 ozone DVF below NAAQS
- 2028 O&G Control Strategy reduces 2028 ozone DVF by:
  - -0.3 to -1.5 ppb North NM Sites
  - -0.2 to -0.5 ppb Bernalillo County
  - -0.1 to -0.3 ppb South NM Sites

AQS_ID	2012-16	Projected 2028 DVF			Site Name	State

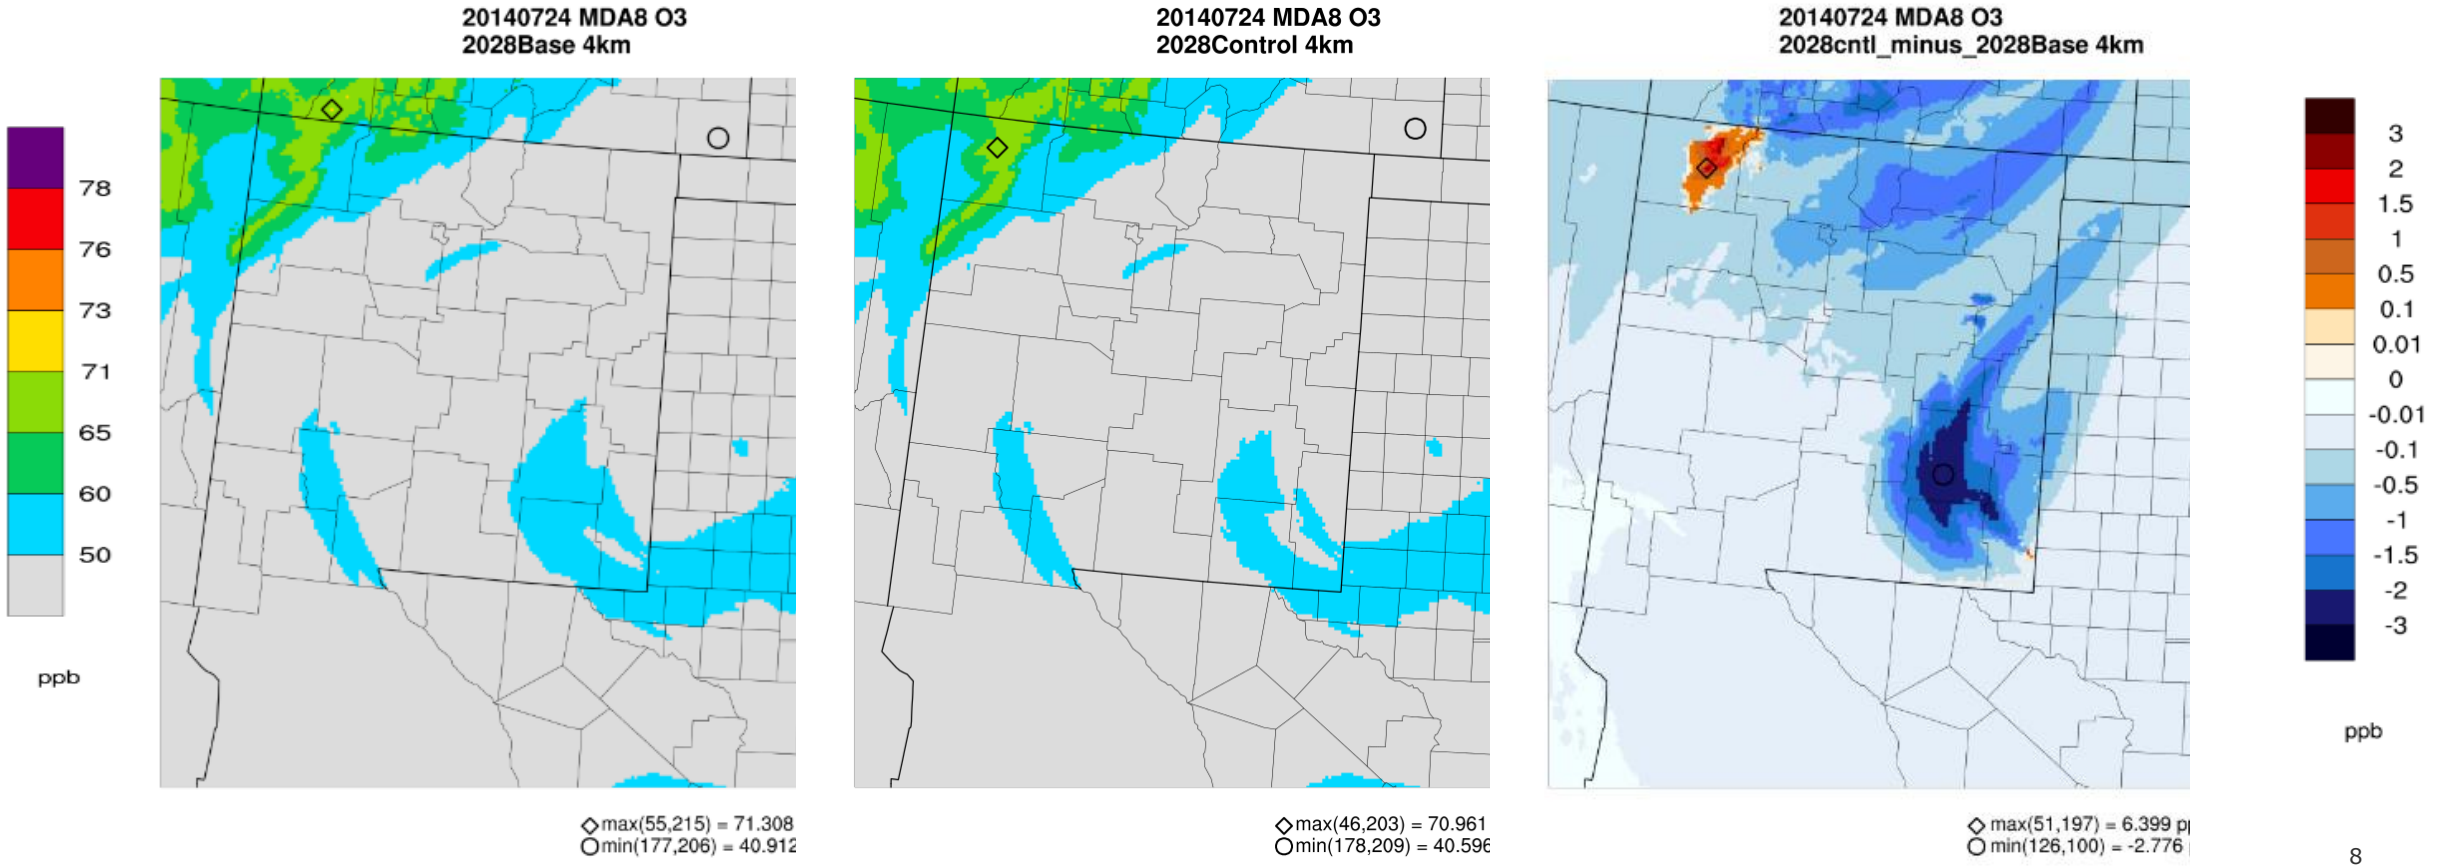
RAMBOLL



2028 BASE AND O&G CONTROL MDA8 OZONE ON JUNE 5, 2014

- Day with 2028 Base Case MDA8 ozone above 70 ppb 2015 ozone NAAQS in San Juan County that is reduced to below the NAAQS in 2028 O&G Control Strategy

2028 BASE AND O&G CONTROL MDA8 OZONE ON JULY 24, 2014

- Day in which NOx Disbenefits due to 2028 O&G Control Strategy is sufficient to increase a single 4-km grid cell in San Juan County that was below the ozone NAAQS in 2028 Base Case to barely above (71.0 ppb) the 2015 ozone NAAQS in 2028 O&G Control Strategy

INCREASING OZONE AT NEW MEXICO SITES

- More recent years have higher ozone DVs at some New Mexico sites:
  - Red > 75 ppb 2008 NAAQS
  - Yellow > 70 ppb 2015 NAAQS
  - Green > 67 ppb (95th percentile)
- Latest 2017-2019 ozone design value ($DV_{2017-2019}$) has 6 sites that exceed the 2015 ozone NAAQS:
  - Carlsbad = 79 ppb
  - Desert View = 77 ppb
  - Santa Teresa = 76 ppb
  - Chaparral = 73 ppb
  - Hobbs = 71 ppb
  - Foothills = 71 ppb

2028 OZONE PROJECTIONS SENSITIVITY ANALYSIS TO DVC

- Given increased ozone concentrations in more recent years, a sensitivity analysis of the 2028 ozone projections to current year ozone design value (DVC) starting point for the projections was conducted
- 2028 ozone DVF projection sensitivity analysis was conducted using two alternative definitions of current year design value (DVC):
  - $DVC_{2015\text{-}2019} = (DV_{2015\text{-}2017} + DV_{2016\text{-}2018} + DV_{2017\text{-}2019}) / 3$
    - Consistent with EPA guidance to use average of 3-years of ozone DVs for DVC to modulate year-to-year variability, but centered on 2017 instead of 2014
  - $DV_{2017\text{-}2019}$ (the latest design value based on validated data)
- Still using CAMx 2014v2 and 2028 modeling results, so not accounting for changes in emissions from 2014 to 2017-2019 in 2028 ozone projections:
  - Where emissions went down (e.g., mobile source dominated), may understate 2028 ozone DVFs
  - Where emissions went up (e.g., Permian Basin O&G), may overstate 2028 ozone DVFs

RAMBOLL

2028 OZONE DVF SENSITIVITY TO DVC USING $DVC_{2015\text{-}2019}$

- Four monitoring sites have 2015-2019 current year $DVC_{2015\text{-}2019}$ greater than the 2015 ozone NAAQS:
  - Desert View = 74.3 ppb
  - Santa Teresa = 74.0 ppb
  - Carlsbad = 73.7 ppb
  - Carlsbad NP* = 71.0 ppb
- 2028 Base Case has one site with 2028 ozone DVF > NAAQS using $DVC_{2015\text{-}2019}$:
  - Carlsbad = 71.2 ppb
- 2028 O&G Control Strategy sufficient that all 2028 ozone DVFs are below the NAAQS when using $DVC_{2015\text{-}2019}$:
  - Carlsbad = 70.9 ppb

AQS_ID	2015-19	Projected 2028 DVF			Site Name	County

NMED Exhibit 24 - 0011

2028 OZONE DVF SENSITIVITY TO DVC USING $DV_{2017-2019}$

- Six monitoring sites have $DV_{2017-2019}$ greater than the 2015 ozone NAAQS:
  - Carlsbad = 79.0 ppb
  - Desert View = 77.0 ppb
  - Santa Teresa = 76.0 ppb
  - Chaparral = 73.0 ppb
  - Hobbs = 71.0 ppb
  - Foothills = 71.0 ppb
- 2028 Base Case two sites DVF > NAAQS:
  - Carlsbad = 76.4 ppb
  - Desert View = 71.6 ppb
- 2028 O&G Control, both DVF > NAAQS:
  - Carlsbad = 76.0 ppb
  - Desert View = 71.4 ppb

PROJECTED 2028 OZONE DVFS FOLLOWING EPA GUIDANCE

- Future Year 2028 ozone design value (DVF) projections following EPA guidance using 2012-2016 DVC:
  - 2028 DVF = RRF x $DVC_{2012\text{-}2016}$
- Two sites have current year $DVC_{2012\text{-}2016}$ above the 2015 ozone NAAQS:
  - Desert View = 72.0 ppb
  - Santa Teresa = 71.3 ppb
- Using EPA guidance, all sites have 2028 ozone DVF below NAAQS for both 2028 Base and 2028 O&G Control Strategy:
  - Desert View = 67.0 and 66.8 ppb
  - Santa Teresa = 66.1 and 66.0 ppb

INCREASING OZONE AT NEW MEXICO SITES

- More recent years have higher ozone DVs at some New Mexico sites:
  - Red > 75 ppb 2008 NAAQS
  - Yellow > 70 ppb 2015 NAAQS
  - Green > 67 ppb (95th percentile)
- Latest 2017-2019 ozone design value ($DV_{2017-2019}$) has 6 sites that exceed the 2015 ozone NAAQS
- Conducted sensitivity analysis of 2028 ozone DVF projections to current year DVC
  - $DVC_{2015-2019}$
  - $DVC_{2017-2019}$

RAMBOLL

NMED Exhibit 25 - 0035

CAMX 2028 O&G CS OSAT OZONE SOURCE APPORTIONMENT

- Use the OSAT version of CAMx ozone source apportionment tool
  - OSAT O3V and O3N tracers give indication of amount of VOC-limited and NOx-limited ozone formation
- Definition of Source Groups
  - Source Regions (5):
    - Use same 5 Source Regions as APCA SA run
  - Source Categories (3):
    - Anthropogenic Emissions
    - Natural (Biogenic, lightning NOx, WBD, oceanic)
    - Fires (WF, Rx, Ag and other)
  - 17 Source Groups (5 x 3 + 2 [IC,BC])
    - Will run faster than CAMx APCA SA Run (50 Source Groups)

- Post-Processing
  - Amount of VOC-limited vs. NOx-limited ozone across 4-km domain from New Mexico sources alone, and all sources

RAMBOLL

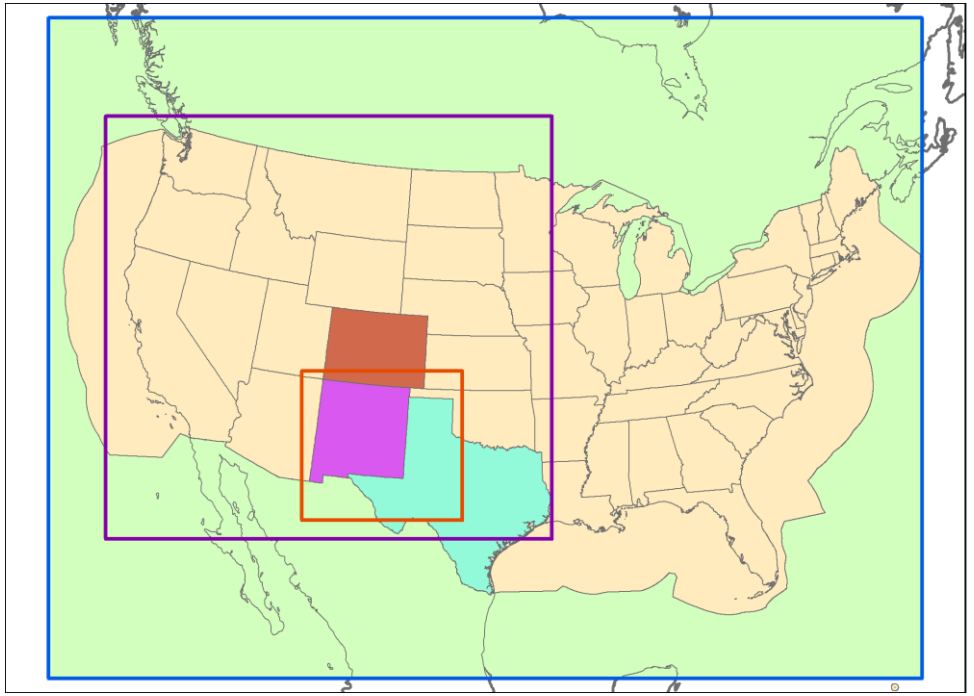
CAMX OZONE SOURCE APPORTIONMENT TOOLS

- **Ozone Source Apportionment Technology (OSAT)**
  - OSAT uses tagged species/reactive tracers to calculate contributions of VOC and NOx emissions from user-defined Source Groups to ozone concentrations that are VOC sensitive (O3V) and ozone concentrations that are NOx sensitive (O3N)
    - Accounting system that operates in parallel to host model extracting ozone source apportionment information
    - User-defined Source Groups can be Source Regions and/or Source Categories and includes all sources (including BCs) of ozone (e.g., on-road mobile sources from New Mexico)
  - When ozone is formed, OSAT determines whether ozone formation is more sensitive to VOC or NOx emissions and allocates it to Source Group's ozone tracers (O3V or O3N) based on the relative contribution of the more sensitive ozone precursor (VOC or NOx)
- 10 Reactive Tracers used for each Source Group
  - V_i = VOC emissions
  - NIT_i = Nitric oxide (NO) & nitrous acid (HONO) emissions
  - RGN_i = Nitrogen dioxide (NO2), nitrate radical (NO3) and dinitrogen pentoxide (N2O5)
  - TPN_i = Peroxyl acetyl nitrate (PAN), analogues of PAN and peroxy nitric acid (PNA)
  - NTR_i = Organic nitrates (RNO3)
  - $HN3_i$ = Gaseous nitric acid (HNO3)
  - $O3N_i$ = Ozone formed under NOx-limited conditions from Ni
  - $O3V_i$ = Ozone formed under VOC-limited conditions from Vi
  - OON_i = Odd-oxygen in NO2 formed from O3Ni
  - OOV_i = Odd-oxygen in NO2 formed from O3Vi



RAMBOLL

CAMX OZONE SOURCE APPORTIONMENT TOOLS

- **Anthropogenic Precursor Culpability Assessment (APCA)**
  - APCA differs from OSAT in that it only allocates ozone formed to the Natural (e.g., biogenic) Source Groups when it is due to Natural VOC reacting with Natural NOx
    - For example, ozone formed due to biogenic VOC reacting with anthropogenic NOx under VOC emissions sensitive conditions, a case OSAT assigns to Natural Source Group O3V, APCA redirects ozone formed to anthropogenic Source Group O3N
  - APCA provides more control strategy relevant information and is used in ozone contribution assessments, while OSAT provides information on whether ozone formation is more sensitive to VOC or NOx emissions
    - APCA used in EPA's Cross State Air Pollution Rule (CSAPR) to identify when an upwind state's anthropogenic emissions contributes significantly to nonattainment in a downwind state
    - APCA also used in NMED OAI Study 2028 Local Source APCA ozone source apportionment modeling
  - If analyzing whether ozone formation is more sensitive to VOC or NOx emissions, then OSAT source apportionment or a sensitivity method (e.g., DDM/HDDM or Brute Force) must be used
    - NM OAI Study 2028 VOC/NOx sensitivity OSAT ozone source apportionment modeling

CAMX 2028 O&G CS SOURCE SECTOR APCA OZONE SA

- **Definition of Source Groups**
  - Boundary Conditions (BCs) from WRAP 2014 GEOS-Chem runs:
    - BC_{Intl} - International anthropogenic emissions
    - BC_{USA} – U.S. anthropogenic emissions
    - $BC_{Natural}$ – Natural sources
    - BC_{Top} – BC above the top of domain
  - Source Categories (9):
    1. Natural (biogenic, lightning NOx, etc.);
    2. Fires (WF, Rx, Ag, other);
    3. Oil and gas point sources (surrogate for midstream);
    4. Oil and gas non-point sources (surrogate for upstream;
    5. EGU point;
    6. Non-EGU point;
    7. On-road mobile;
    8. Non-road mobile; and
    9. Remainder anthropogenic.
  - Source Regions (5):
    - New Mexico
    - Texas
    - Colorado
    - Remainder U.S.
    - International (Mex, Can, CMV > 200 nmi)
  - 50 Source Groups (50 = 5 x 9 + 5)

CONCLUSIONS VOC/NOX SENSITIVE OZONE OSAT SA

- The OSAT source apportionment suggests that ozone formation leading to elevated ozone concentrations in New Mexico is primarily NOx sensitive
  - Consistent with regional ozone modeling studies (e.g., OTAG) that found regional NOx emissions controls most effective at reducing regional ozone concentrations and ozone transport
    - VOC controls can also be effective in urban areas and other areas with concentrated emissions
- There are locations and days when there are higher amounts of VOC sensitive ozone formation:
  - San Juan Basin, El Paso-Juarez, Albuquerque and, to a lesser extent, Permian Basin
- The OSAT source apportionment provides a general indication of potential relative effectiveness of NOx vs. VOC controls for reducing ozone concentrations. It is not a substitute for actual control strategy modeling with explicit emission reductions of targeted sources.
  - Ozone formation is complex and reducing emissions changes the chemistry from the previous state that can cause non-linear responses in ozone concentrations

STATE OF NEW MEXICO
ENVIRONMENTAL IMPROVEMENT BOARD

IN THE MATTER OF PROPOSED NEW REGULATION,
20.2.50 NMAC – *Oil and Gas Sector – Ozone Precursor Pollutants* **No. EIB 21-27 (R)**

DIRECT TESTIMONY OF BRENT ELLINGTON

My name is Brent Ellington, and I am an Environmental Scientist Specialist with the Ambient Air Monitoring Section of the New Mexico Environment Department's ("Department" or "NMED") Air Quality Bureau ("Bureau"). I am presenting this written testimony on behalf of the Department in this proceeding on proposed new air quality regulations at 20.2.50 NMAC ("Part 50"). My testimony will address the following topics: ozone monitoring, methods and procedures, and federal requirements for monitoring equipment.

I. QUALIFICATIONS

I have been employed by the Bureau for approximately 7 years as an ambient air quality monitoring section operator and supervisor. I have over 17 years of experience as an environmental scientist for the State of New Mexico, having worked for the New Mexico Office of the State Engineer and the New Mexico Interstate Stream Commission prior to joining the Department.

My full background and qualifications are set forth in my resume, which is marked as NMED Exhibit 28.

II. AMBIENT AIR QUALITY MONITORING

The NMED Ambient Air Quality Monitoring Network

The Department is responsible for collecting ambient air data to document present air quality and significant trends in pollutant concentrations. This data must be of high quality because its use may have significant health, social, and economic impacts. The data collected is

used to determine the State's status with regard to compliance with federal National Ambient Air Quality Standards ("NAAQS"), which are designed to protect the public health and avoid secondary effects such as damage to vegetation or property, or the reduction of public values such as visibility. The Bureau's public awareness programs are designed to provide current air quality information to the public.

New Mexico consists of eight Air Quality Control Regions ("AQCRs") located in 33 counties covering a total area of 120,000 square miles. Three of these AQCRs encompass areas with surrounding states, and five lie entirely within New Mexico.

The NMED ambient air quality monitoring network ("NMED Air Monitoring Network") consists of State and Local Air Monitoring Stations ("SLAMS") and Special Purpose Monitors ("SPMs"). The purpose of the network is to support the NAAQS, and the Bureau is designated by EPA to operate the monitors. The network is designed to: (1) determine highest pollutant concentrations expected to occur in the area covered by the network; (2) determine representative pollutant concentrations in areas of high population density; (3) determine the impact on ambient pollution levels of significant sources or source categories; and (4) determine general background concentration levels. The monitoring locations are appropriately sited to determine highest concentrations expected to occur.

Overview of the NMED Air Monitoring Network

The existing NMED Air Monitoring Network includes monitors in the areas of highest population density: Dona Ana, Santa Fe, and Sandoval Counties. The monitors in the network are sited to determine the impact on ambient pollution levels of significant sources and source categories, in particular those in San Juan County, a region of concentrated energy development

and generation. The network includes sites that measure general background concentrations, including sites in San Juan County and in Carlsbad, La Union, and Santa Teresa.

The current network is capturing data that enables NMED to determine the extent of regional pollutant transport among populated areas. The Navajo Lake site serves this purpose for transport between San Juan County and Southwestern Colorado. The monitoring objective of the Coyote Ranger District site is to determine regional ozone transport. The monitoring objective of the Las Cruces site is to determine regional PM 2.5 transport.

Data gathered from the current network of monitoring sites can be used to determine welfare-related impacts in rural and remote areas. Data from the network is being used by citizen groups in both the Four Comers Region and the Border Region of New Mexico/US and Mexico. There are currently 14 ozone analyzers deployed at various monitoring stations throughout New Mexico. *See* NMED Air Quality Bureau Air Monitoring Quality Assurance Project Plan 2020, Section A.

Federal Regulations Governing the NMED Air Monitoring Network

The locations of the SLAMS and SPMs meet the general ambient monitoring site types specified in the U.S. Environmental Protection Agency's ("EPA") regulations at 40 CFR Part 53 and 58. The Bureau maintains air monitoring instruments in such a manner as to attain 95% probability goals for accuracy and precision within EPA's required limits. The Bureau adheres to the Measurement Quality Objectives and Validation Templates as published in Appendix D of the EPA QA Handbook for Air Pollution Measurement Systems, Vol. II (EPA-454/B-17-001) (January 2017).[1]

[1] Available at https://www.epa.gov/sites/production/files/2020-10/documents/app_d_validation_template_version_03_2017_for_amtic_rev_1.pdf

Air Pollutants Required to be Monitored

The Department monitors sulfur dioxide (SO^2), nitrogen dioxide (NO^2), ozone (O^3), and particulate matter (PM10 and PM 2.5) in areas of New Mexico where the respective pollutants are expected to occur at significant levels, such as in and near cities and near coal-fired power plants, mining operations, oil and gas operations, and petroleum refineries. The data collected are compared to the NAAQS and the New Mexico Ambient Air Quality Standards, both of which are health-based standards developed for protection of the general public. *See* NMED Exhibit 29, Ambient Air Monitoring Quality Assurance Project Plan 2020, Section A ("Monitoring QA Plan 2020").

Ambient air data collected by the Bureau is submitted to EPA for inclusion in the Air Quality System ("AQS") and is used to determine compliance with state and federal air quality regulations. Also submitted to AQS are quality assurance data showing precision and accuracy comparisons, which are used for compiling statistics on data quality.

The majority of data collected by the Bureau is obtained continuously by automated methods. This data describes the current air quality conditions in New Mexico and is disseminated to the public. The Bureau's ozone and fine particulate matter data is also submitted automatically every hour to the EPA's AirNow program, which publishes maps of pollutant concentrations for the country. The Bureau also makes air pollutant data available via its Air Quality Index and Monitoring Data Website.[2] Information on this site includes the pollutant concentration values and Air Quality Indices that provide a common scale for comparison and interpretation of air quality. Also included are maps and locations of the

[2] Available at: https://www.nmaqinow.net/

various monitoring sites.

Equipment Used to Monitor Ozone Pollution

The Bureau currently utilizes the Thermo Fisher Model 49i Ultra-Violet Photometric Ozone Analyzer ("Model 49*i*") to monitor ozone. Model 49*i* is designated by EPA as a Federal Equivalent Method ("FEM") for the measurement of ambient concentrations of ozone pursuant with the federal regulations at Title 40, Part 53. A FEM is an EPA approved method to determine the concentration of air pollutants and is required by EPA. EPA developed standard monitoring and calculation methods such as the FEM to ensure consistency at monitoring stations and how pollutant concentrations are determined across states. Equipment utilized to maintain the calibration of the 49i ozone analyzer are a Thermo 146i Dynamic Gas Calibrator and a Thermo 49iQPS Ozone Primary Standard. Calibrations are required by EPA to ensure that the ambient pollutant data is accurate by verifying the analyzer is operating within manufacturer specifications. The ozone analyzer and the calibrators are operated according to manufacturer specifications and Bureau Standard Operating Procedures ("SOPs").

Monitoring of Ambient Ozone Levels

The Thermo 49i ozone analyzer calculates the ambient air concentration of ozone at a monitoring station by counting the molecules of ozone that are present as they pass by an ultraviolet (UV) lamp inside the analyzer over a defined period of time. The calculated ozone concentration is then reported to the station datalogger computer and is available on the Bureau's Air Quality Index and Monitoring Data website for public review.

Auditing and Calibration Requirements of Ozone Monitors

Weekly calibration checks, referred to by the Bureau as "QC checks," are performed by the in-station data logger computer and calibration systems. The Bureau evaluates the results of

the QC checks as part of the data validation process. Results are reported to EPA through the AQS. Station operators perform unscheduled calibrations of the ozone analyzer whenever the results of a scheduled calibration check exceed the thresholds specified in 40 CFR part 58. SOPs have been adopted by the Bureau for the operation/calibration of the 49i, 49iQPS, and146i equipment. These SOP's are followed by all operations staff to maintain uniform practices and quality control at each of the AQB ambient air monitoring stations.

EDUCATION

Eastern New Mexico University, Portales NM
Bachelor of Science - May 2002
Major: Biology Minor: Chemistry

Eastern New Mexico University-Roswell, Roswell, NM
Associate of Arts - December 1997

RESEARCH EXPERIENCE

Undergraduate Research, 1/01- 5/02
Eastern New Mexico University
Project: **Multiple Antibiotic Resistant (MAR) Enteric Bacteria from Dairy Farm Topsoil.** Bacteria collected from the dairy farms were identified genotypically as well as phenotypically. MICs were determined by antibiotic resistance assays. The presence of the MAR operon in the enteric bacteria was determined by PCR and gel electrophoresis.

EMPLOYMENT EXPERIENCE

Environmental Scientist/Specialist Supervisor-Laboratory Manager 09/18 – Present
New Mexico Environment Department-Air Quality Bureau
Responsibilities: Supervise Northern NM operations staff in order to provide the NMED AQB with accurate and complete air monitoring data in accordance with Title 40 Code of Federal Regulations Parts 50 and 58. Coordinate special projects in support of NMED and AQB State and Federal initiatives. Perform the duties of an AQB operator in order to maintain a high level of data capture within the statewide ambient air monitoring network. Train operations staff in State /Federal methodologies relative to National Ambient Air Quality Standards and evaluate operations staff performance. Maintain a working knowledge of the theory of operation for Thermo 42i, 43i, and 49i continuous pollutant gas monitors, calibration equipment, and BAM1020, TEOM, and Partisol samplers.

Water Resource Specialist Senior-Field Coordinator and Well Field Operations Manager 4/15 – 09/18
New Mexico Interstate Stream Commission-Pecos River Bureau
Responsibilities: Assist in oversight of operation of the ISC Pecos River augmentation well fields, including well field equipment installation, operation, maintenance, repair and replacement; gathering of water use data from totalizing meters, ensuring proper implementation of operations agreement and plans with private entities. Develop work plans and work budgets and present to the commission for approval. Maintain professional contracts within a fiscal year by processing and approving invoicing for payment. Assist in the development and protection of ISC water rights designated to meet the requirements of the Pecos River Decree, Carlsbad Irrigation District Settlement Agreement, and state law. Research and observe the configuration and use of water

rights to determine the potential impacts on ISC programs. Gather, compile and disseminate stream flow data through downloading of stream gage data loggers and perform field measurement of live stream flow and electrical conductivity for water quality analysis. Work with federal and state agencies related to biological opinions of endangered aquatic species in order to comply with Endangered Species Act requirements. Serve as point of contact in the Lower Pecos River are for local, state, and federal agencies providing field and technical assistance as needed. Conduct public meetings as required. Develop and implement Health and Safety Program for field operations. Coordinate training of staff and contractors to comply with OSHA 1910 and ANSI requirements. Maintain OSHA certificate as competent person for confined space entry programs as well as electrical hazard and lock out tag out certifications.

Adjunct Instructor of Biology/Geology, 06/04- Present
Eastern New Mexico University-Roswell
Responsibilities: Conduct lecture and laboratory courses in an online and on-campus setting in the subjects of Biology, Wildlife Biology, Geology, and Environmental Geology at ENMU-R. Instruction includes fall, spring and summer semesters.

Environmental Scientist/Specialist Supervisor 8/13 – 4/15
New Mexico Environment Department-Air Quality Bureau
Responsibilities: Supervise Southern NM operations staff in order to provide the NMED AQB with accurate and complete air monitoring data in accordance with Title 40 Code of Federal Regulations Parts 50 and 58. Coordinate special projects in support of NMED and AQB State and Federal initiatives. Perform the duties of an AQB operator in order to maintain a high level of data capture within the statewide ambient air monitoring network. Train operations staff in State /Federal methodologies relative to National Ambient Air Quality Standards and evaluate operations staff performance. Maintain a working knowledge of the theory of operation for Thermo 42i, 43i, and 49i continuous pollutant gas monitors, calibration equipment, and BAM1020, TEOM, and Partisol samplers.

Environmental Scientist/Specialist Operational 8/11 – 08/13
New Mexico Environment Department-Air Quality Bureau
Responsibilities: Operate, calibrate and maintain continuous pollutant gas and particulate monitors. Operate, collect filters, calibrate and maintain Partisol Plus PM 2.5 and Wedding PM 10 particulate samplers. Monitor and maintain operational status of automated data logger and calibration systems at multiple ambient air monitoring sites. Maintain multiple software and hardware systems as they relate to the continuous operation and function of ambient air quality gas and particulate monitors. Maintain an uninterrupted annual air quality sampling schedule at multiple sites in SE NM.

Probation/Parole Officer, 04/10- 8/11
New Mexico Department of Corrections
Responsibilities: Supervise caseload of 120 felony offenders. Ensure public safety by conducting arrests of said felons for violations of State Statutes and court orders, prepare court documents and testify in District and Magistrate Court.

Certified New Mexico State Police Officer, 08/09- 04/10
New Mexico State Police

Responsibilities: Conduct patrols for public safety in rural and municipal areas. General duties of a certified police officer to include enforcement of State Statutes, apprehension and arrest of criminal offenders and attend judicial/court proceedings as required.

Roswell Artesian Basin Supervisor, 3/07 – 8/09
Office of the State Engineer District II, Roswell, NM
Responsibilities: Perform duties of water resource specialist listed below. In addition to those duties, responsible for coordinating all applications for permit that pertain to the Roswell Artesian Basin consisting of 11,000 square miles in southeast NM.

Water Resource Specialist, 6/03- 8/09
Office of the State Engineer District II, Roswell, NM
Responsibilities: Administration of NMSA 1978 Chapter 72: Water Law. Assist public in research of water rights information; in addition to performing the same duties as technician. Conduct investigations into water right applications as submitted by individuals to the OSE District II for approval. Investigations include hydrogeologic analyses and review of effects on groundwater and surface sources within the jurisdiction of District II. Process all relevant documents with each water right investigation. Maintain proficiency in the use of GIS technology and associated hardware and software in hydrogeologic analyses of water right applications submitted to the OSE District II.

Water Resource Technician, 9/02- 06/03
Office of the State Engineer District II, Roswell, NM
Responsibilities: Compile and interpret water right permits and well logs; enter data into the Water Administration Technical Engineering Resource System. Research/abstract water right files, adjudication and associated maps. Work independently in an office environment with occasional fieldwork. Fieldwork includes identifying well locations using GIS and measuring well depths.

History of This Document

From October 2003 to October 2004, and continuing to the present with upgrades, the Air Quality Bureau (AQB) has worked on automating its ambient air and meteorological monitoring systems, and using data acquisition software ("DAS"). The automation was applied to both the operational processes at the monitoring stations and the management of ambient air and meteorological data collected at these stations.

The Ambient Air Monitoring Quality Assurance Project Plan submittal was revised in 2018 to conform with the standardized elements set forth in EPA Requirements for Quality Assurance Project Plans (EPA QA/R-5) (EPA/240/B-01-003 March 2001).

A3: Distribution List

The individuals listed below will receive copies of this approved Quality Assurance Project Plan. Supervisory staff of the Air Quality Bureau Ambient Air Monitoring Section will distribute or make available all appropriate sections of the plan to all staff responsible for implementation. The document is also available electronically to all staff within the Air Quality Bureau by its storage within the Bureau's shared file system.

Name	Position	Organization
Donna Intermont	Operations Section Chief	NMED AQB
Andrew Ahr	Staff Manager, Quality Assurance Unit	NMED AQB
Mary Hilbert	QA Data Handling Specialist	NMED AQB
Ryan Maxfield	QA Auditor	NMED AQB
Vacant	QA Auditor	NMED AQB
Roman Szkoda	Staff Manager, Ambient Air Monitoring Unit	NMED AQB
Brent Ellington	Supervisor, Ambient Air Monitoring Unit	NMED AQB
Michaela Lane-Sanchez	Supervisor, Ambient Air Monitoring Unit	NMED AQB
Phillip Adams	Chemistry Bureau Chief	NM DOH, Scientific Laboratory Division
Allison Treloar	Director, Office of Quality, Safety, Security and Emergency Preparedness	NM DOH, Scientific Laboratory Division
Frank See	Supervisor Air & Heavy Metals	NM DOH, Scientific Laboratory Division
Mariama Mitchell	Project Officer	EPA Region 6, Air, State and Tribal Operations Section

Table A3: Distribution List

A4: PROJECT/TASK ORGANIZATION

The structure of the Air Quality Bureau's Quality Assurance and Ambient Air Monitoring Units is shown in Figure A4.1 A current personnel roster for the two sections is given in Table A4.1.

A. Air Quality Bureau

The Air Quality Bureau is part of the New Mexico Environment Department's Environmental Protection Division, one of four divisions within the Department. The Bureau is composed of four major Sections: Planning, Compliance and Enforcement, Permitting and Operations. The Air Quality Bureau Chief is responsible for overseeing all activities and personnel within the Bureau. Directly reporting to the Bureau Chief are the Section Chiefs who are in charge of the four major Sections in the Bureau.

B. Operations Section

The Operations Section Chief is responsible for overseeing all activities and personnel within the Operations Section, which includes managing the operations of the administrative staff, the statewide air quality monitoring network, the quality assurance of monitoring data, the invoicing and collection of the Bureau's Permitting fees, and oversees Bureau's budgets and EPA grants.

C. Ambient Air Monitoring Unit

Upon hire and annually thereafter, all Ambient Air Monitoring staff are required to review the current Ambient Air Monitoring QAPP and Appendices, and the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance, and submit a signed statement to the Staff Manager that they have done so. This document is also available electronically to all staff within the Air Quality Bureau by its storage within the Bureau's shared file system.

Monitoring Manager: This is the program manager responsible for overseeing the work performed by the Ambient Air Monitoring Unit. In addition to working with Unit personnel to assign duties and evaluate their performance, specific duties include:

1. Manage monitoring operations so that 75% data capture and other EPA grant conditions are met.
2. Provide or delegate staff to give necessary information to QA staff to assist in evaluating monitor operations and data validation.
3. Prepare or delegate staff to assemble and update SOPs for ambient air monitoring.
4. Develop training schedules to ensure that Unit personnel are provided with up-to-date information concerning their job duties.
5. Create and maintain a monitor replacement schedule to ensure that monitoring equipment is kept technically current.
6. Work with Operations Chief and financial staff to identify resources to meet Unit priorities such as equipment purchase, supplies and contracts for sample analyses.
7. Conduct monitoring network reviews to identify trends, redundancy or special needs to recommend to Operations Section Chief.
8. Oversee special monitoring projects.

9. Prepare yearly Network Review and 5-year Network Assessments according to EPA requirements.

Environmental Scientist & Specialist - Supervisor: The Environmental Scientist & Specialist - Supervisor is responsible for the performance of automated analyzers operated by the Air Quality Bureau. Currently, there are two Supervisors for the respective north and south geographic areas of the state. Specific duties include:

1. Supervise, train, and evaluate the respective northern network site operators and southern network site operators.
2. Install and test new equipment at monitoring sites. Repair sampling equipment when necessary.
3. Set up and operate special purpose monitors as required by Department/Bureau priorities or public health emergencies.
4. Maintain an inventory of spare parts, tools, and supplies required to service continuous and non-continuous analyzers. Distribute these items to operators throughout the state as needed to maintain daily operations and achieve the greatest data capture.
5. Keep informed of data acquisition software upgrades to allow for full utilization of the product and expansion of its functionality. Share this information with site operators.
6. Provide technical information to QA staff as needed for validation of data.
7. Maintain contact with data acquisition system contractor and download data acquisition software upgrades to allow for full utilization of the product and expansion of its functionality. Share this information with site operators.

Site Operators Advanced and Operational: Site operators are based in field offices around the state to run the monitoring sites in their areas. Specific duties include:

1. Oversee operation of all analyzers and all supporting equipment at assigned monitoring sites. Each Monday morning review results of qc checks performed by calibrators on gas monitors by viewing the DAS calibration reports for one's assigned sites. Take action on invalid or out-of-range results.
2. Perform quarterly multipoint calibrations on automated analyzers and calibrators/transfer standards operated by the Air Quality Bureau.
3. Perform manual precision checks, zero/span checks on gas monitors as needed. Perform regularly scheduled flow checks and maintenance on particulate monitors. Make adjustments necessary to maintain instruments within prescribed operational limits.
4. Document in detail in the DAS site log all site visits and instrument repairs, calibrations, and adjustments performed on monitoring equipment and calibrators. This information is used for subsequent repairs and also by QA to document data gaps and monitor malfunctions.
5. Report equipment malfunctions immediately to the supervisor and Monitoring Manager for corrective action.
6. Provide assistance to the Quality Assurance staff as needed for validation of data.

7. Maintain cleanliness and order at assigned monitoring sites. Follow safety rules.
8. Perform monitor repairs as needed.
9. Assist QA Auditor in performing semi-annual audits and repairs as needed on meteorological equipment in the field.
10. Set up and operate special purpose monitors as required by Department/Bureau priorities or public health emergencies.

D. Quality Assurance Unit

Upon hire and annually thereafter, all Quality Assurance Unit staff are required to review the current Ambient Air Monitoring QAPP and Appendices, and the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance, and submit a signed statement to the QA Manager that they have done so.

QA Manager: The Quality Assurance Manager is responsible for coordinating all quality assurance activities. This position does not generate any data. In addition to working with Unit personnel to assign duties and evaluate their performance, specific duties include:

1. Write, update and obtain yearly approval for all Bureau quality assurance documents required by EPA. These documents include the Bureau's Quality Management Plan (QMP) and Quality Assurance Project Plans (QAPPs) for any projects within the Bureau that collect environmental data. For QAPPs dealing with projects outside the Ambient Monitoring Unit, the QA Manager will enlist assistance from staff members directly related to the projects, such as the Emissions Inventory Project and the Four Corners Modeling Project.
2. Write, update, and obtain yearly EPA approval for the Quality Assurance Plan for Ambient Air Monitoring. Maintain updated SOP appendices for monitoring and quality assurance activities and obtain SOPs from SLD (DOH State Laboratory Division) for filter-weighing to determine particulate deposition.
3. Ensure that quality control checks are performed on schedule and that quality control procedures are observed. Confirm that standards and reference materials required for the quality assurance program are certified on schedule.
4. Ensure that Monitor Siting Criteria Audits are conducted periodically throughout the year. Report site criteria deficiencies and provide recommendations to the Operations Section Chief and Monitoring Manager.
5. Investigate training opportunities for the Quality Assurance Unit.
6. Oversee any corrections to the ambient air data including the updating of the in-house DAS database and the EPA/AQS database.
7. Manage quality assurance to ensure that 75% data capture is met. Report instances of data loss to Operations Section Chief who reports instances of data loss to EPA Region 6 Air Quality Analysis Chief.
8. Ensure that hourly data is being submitted to EPA's AIRNOW.

9. Consult with the Operations Section Chief and the Data Handling Specialist to review and officially certify to EPA the Ambient Monitoring Data for previous year by May 1 of the following year. Official certification includes AQS AMP600 report, AMP450NC report, and an official letter sent to both Region 6 and OAQPS.

QA Auditor: The QA Auditor performs accuracy audits on ambient air monitoring instruments using independent and separate equipment and gases; performs semi-annual audits on meteorological equipment and annual audits on federal siting criteria. Specific duties include:

1. Conduct accuracy audits on ambient air pollution monitors in accordance with federal requirements and an auditing schedule that ensures that all gas monitors are audited annually and particulate monitors audited semi-annually according to EPA requirements. Monitors showing extreme problems or requiring in-depth repairs will be audited more frequently. It is NMED's intention to perform audits on instruments to be removed and on replacement instruments within a week of each action. If a problem with an instrument indicates that it needs to be replaced/repaired, then an audit shall be conducted within a week on the failing unit before it is removed and an audit within a week on the replacement instrument once it is installed.
2. Work with Monitoring Manager to evaluate and document air pollution monitoring sites to ensure that EPA guidelines are followed and federal siting criteria are met by conducting siting criteria audits annually and upon request.
3. Coordinate, schedule and perform semiannual field audits of meteorological monitoring equipment with the assistance of field operators.
4. Assist site operators in understanding and performing quality control procedures as necessary to ensure high quality data results.
5. At the time of meteorological audits, update the site Digi Modems (if applicable) modems with latest Preferred Roaming List (PRL). Also update site computer with latest version of DAS.
6. Develop, maintain, and/or update QA SOPs as needed.
7. Document in detail in the DAS site log all site visits and any operations performed on monitoring equipment or auxiliary equipment.
8. Assist Data Handling Specialist with review of questionable data.
9. Maintain all local primary standards used by the Bureau keeping them in excellent working condition.
10. Certify transfer standards on schedule.
11. Keep track of and order gas cylinders as needed.
12. Maintain records of all certifications and verifications.
13. Perform acceptance tests on new equipment.
14. Order needed replacement parts for the meteorological audits and various other items.

Data Handling Specialist: The Data Handling Specialist is responsible for processing and verifying all ambient air data generated by the Air Quality Bureau. Specific duties include:

1. Collect, review and edit continuous ambient air data through the entire process from raw data through submittal to AIRS/AQS.
2. Retrieve all non-continuous particulate data from SLD and perform calculations on blanks and particulate concentrations. Load non-continuous particulate data into the DAS database. Format and report these data to EPA/AQS.
3. Provide feedback to field operators and the Scientific Laboratory Division concerning problems or changes in data collection matters.
4. Report precision and accuracy results to EPA/AQS. Retrieve precision results from DAS calibration reports and format them through DR-DAS Reporter. Enter accuracy results on spreadsheet provided by AQS and report these results to AQS.
5. With assistance of QA Auditor, validate all meteorological data.
6. Assist the QA Manager in filling data requests and preparing reports.
7. Flag data appropriately to reflect Exceptional Events situations. See Appendix F: Exceptional Events Flow Chart.
8. Ensure that hourly data is being submitted and backfill data if a system has gone offline.

C. Scientific Laboratory Division Organization

The Air Quality Bureau uses the analytical services of the Chemistry Bureau of the Scientific Laboratory Division (SLD) of the New Mexico Department of Health located in Albuquerque, New Mexico. A basic organizational chart of the Scientific Laboratory Division is illustrated in Figure A4.2. The Chemistry Bureau is divided into six sections; the Air and Heavy Metals Section is the only section that provides services to the Air Quality Bureau. It prepares and weighs particulate PM_{10} and $PM_{2.5}$filters before and after sampling.

Appendix B to this QAPP contains detailed descriptions of the procedures used by SLD in weighing the particulate filters.

Figure A4.2: New Mexico Department of Health Scientific Laboratory Division (Simplified)

A5: PROBLEM DEFINITION

The Air Quality Bureau (AQB) of the New Mexico Environment Department (NMED) is responsible for collecting ambient air data to document present air quality and significant trends in pollutant concentrations. This data must be of high quality because its use may have significant health, social, and economic impacts. The data collected is used to determine the State's status with regard to compliance with National Ambient Air Quality Standards (NAAQS) designed to protect the public health and avoid secondary effects such as damage to vegetation or property, or the reduction of public values such as visibility. The AQB's public awareness programs are designed to provide current air quality information to the public.

New Mexico consists of eight Air Quality Control Regions (AQCRs) located in 33 counties covering a total area of 120,000 square miles (Figure A6.1). Three of these AQCRs are shared with surrounding states, and five are completely within New Mexico.

The NMED/AQB network consists of State and Local Air Monitoring Stations (SLAMS) and Special Purpose Monitors (SPMs). The purpose of the network is to support the National Ambient Air Quality Standards (NAAQS). It is designed to:

- determine highest concentrations expected to occur in the area covered by the network
- determine representative concentrations in areas of high population density
- determine the impact on ambient pollution levels of significant sources or source categories
- determine general background concentration levels.

Based on United States Census estimates for 2018, the population of New Mexico is about 2.09 million. Approximately 679,701, or 32.4%, of these people reside in Bernalillo County. The Albuquerque Environmental Health Department is a separate reporting agency responsible for air programs within Bernalillo County. The Air Quality Bureau is responsible for monitoring ambient air quality in all other counties of New Mexico. The three next population-dense counties within the State are Doña Ana County with 10.4% of the State's total population, Santa Fe County with 7.2% of the State's total population, and Sandoval County with 6.9% of the State's total population.

The Air Quality Bureau monitors sulfur dioxide (SO_2), nitrogen dioxide (NO_2), ozone (O_3), and particulate matter (PM_{10} and $PM_{2.5}$) in areas of New Mexico where the respective pollutants are expected to occur at significant levels, e.g. in and near cities, near coal-fired power plants, mining operations, and petroleum refineries. As designated by the US Environmental Protection Agency (EPA), the Bureau operates SLAMS. The data collected are compared to the NAAQS and the New Mexico Ambient Air Quality Standards (NMAAQS). These health-based standards were developed for protection of the general public.

Ambient air data collected by the State is submitted to the EPA for inclusion in the Air Quality System (AQS) and is used to determine compliance with state and federal air quality regulations. Also submitted to AQS are quality assurance data showing precision and accuracy comparisons, which are used for compiling statistics on data quality.

The majority of data collected by AQB is obtained continuously by automated methods. This data describes the current air quality conditions in New Mexico and is disseminated to the public. AQB's ozone and fine particulate data is also submitted automatically every hour to the EPA's AirNow program that publishes pollution maps for these pollutants. The AQB also makes pollution data available via AQB's Air Quality Index and Monitoring Data Website (http://nmaqinow.net/). Information on this site includes the concentration values and Air Quality Indices that provide a common scale for comparison and interpretation of air quality. Also included are maps and locations of the various monitoring sites.

To evaluate sites for continuation, relocation or termination, the Bureau performs an annual review of the network. The document is submitted to the EPA and the results of the review are conveyed to NMED. The Bureau considers federal requirements, federal recommendations, changes in nearby sources, changes in demographics, and expressed public interest or concern.

The five-year assessment of the ambient air monitoring network submitted to the EPA by NMED provides an opportunity to evaluate the network and the monitoring data at each location, consider emerging monitoring needs and consider changes to the network, as well as recommend special projects that would provide useful information to NMED.

A6: PROJECT/TASK DESCRIPTION

The overall purpose of the Bureau's Quality Assurance Unit is to ensure both the scientific and legal integrity of all ambient air data collected by the State. The purpose of this Quality Assurance Project Plan (QAPP) is to document the procedures of the AQB's Ambient Air Monitoring and Quality Assurance Units in obtaining quality data for this air quality monitoring project. This QAPP documents the specific responsibilities, activities and procedures employed by the Bureau. This plan complies with EPA's QA requirements (EPA QA/R-5 EPA/240/B-01/003).

All measurements reported to the EPA are considered critical and so all procedures used are approved EPA reference or equivalent methods. The specific equipment and methods are listed in Section B of this QAPP. Because of the importance of these measurements, the entire project, technical methods for monitoring, sample collection and analysis and data management are reviewed and audited on a regular basis as described in Section B5: Quality Control and Section D1: Data Review Validation, and Verification Requirements and Methods.

The monitoring described in this project plan is designed to directly support regulatory and policy decisions. As such it is considered to be a Use Category I project. The EPA, the State of New Mexico and the public are the customers for this project.

The NMED/AQB air monitoring network is comprised of eight air quality control regions (AQCRs). These regions are noted in Table A6.1 below.

New Mexico AQCR	EPA Region	Counties in AQCR	Monitors in AQCR
1	014	San Juan	1H; 1NL; 1ZB
2	152	Sandoval; Valencia	2LL; 2ZJ
3	157	Santa Fe; Taos; Rio Arriba	3SFA; 3ZD; 3CRD
4	154	San Miguel, Mora, Colfax, Union, Harding; Torrance	None
5	155	Eddy; Lea	5ZR; 5ZS
6	153	Doña Ana	6CM; 6O; 6Q; 6WM; 6ZK; 6ZL; 6ZM; 6ZN; 6ZQ
7	012	Luna	7E
8	156	Socorro, Catron, Cibola	None

Table A6.1: Air Quality Control Regions

Depending on the site, parameters monitored are ozone, sulfur dioxide, nitrogen dioxide, PM_{10}, and $PM_{2.5}$. The continuous monitoring sites also monitor meteorological data. Pertinent site information can be found in Appendix C: Network Elements Spreadsheet. Maps of these areas and their respective sites are found in Figures A6.1, A6.2 and A6.3. The public can retrieve hourly data from the continuous sites at the following site: http://nmaqinow.net/

The five-year assessment of the NMED ambient air quality network was submitted to the EPA on October 8, 2015. Appendix C: Network Element Spreadsheet contains detailed descriptions of each site, and an evaluation of the data collected at each site.

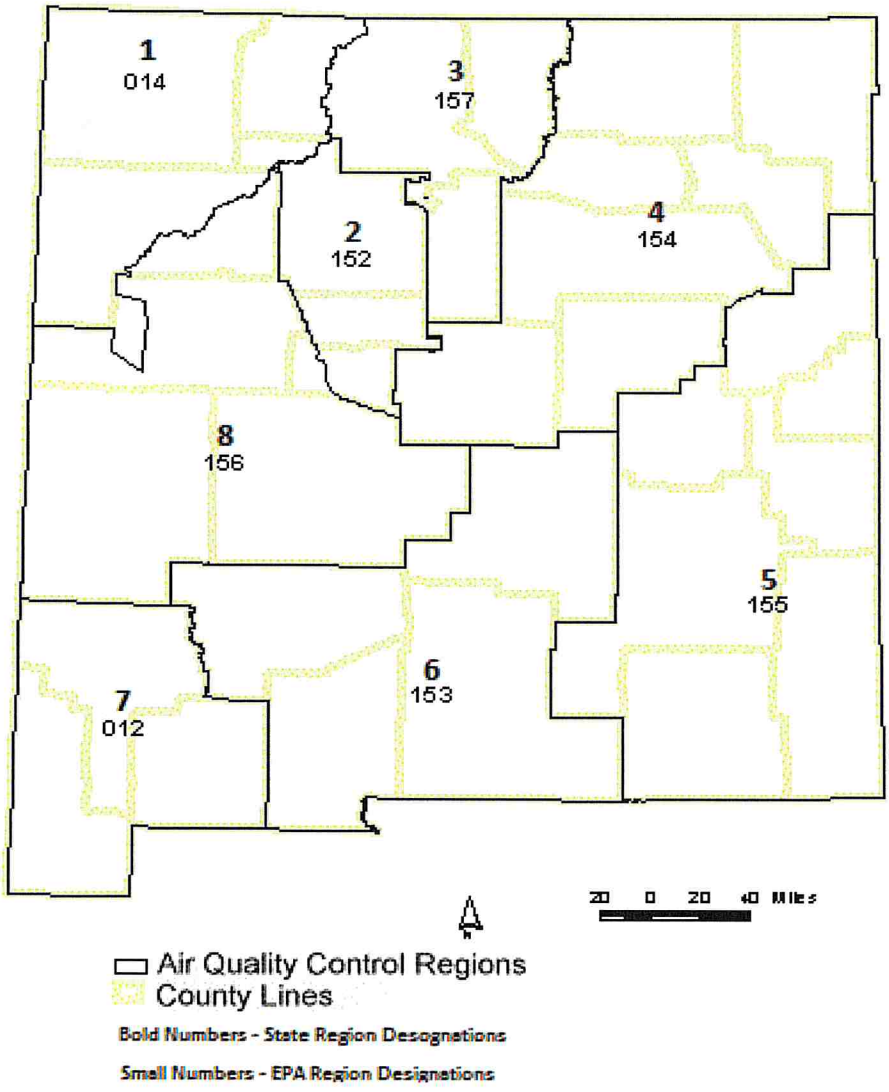

Figure A6.1: Air Quality Control Regions in New Mexico

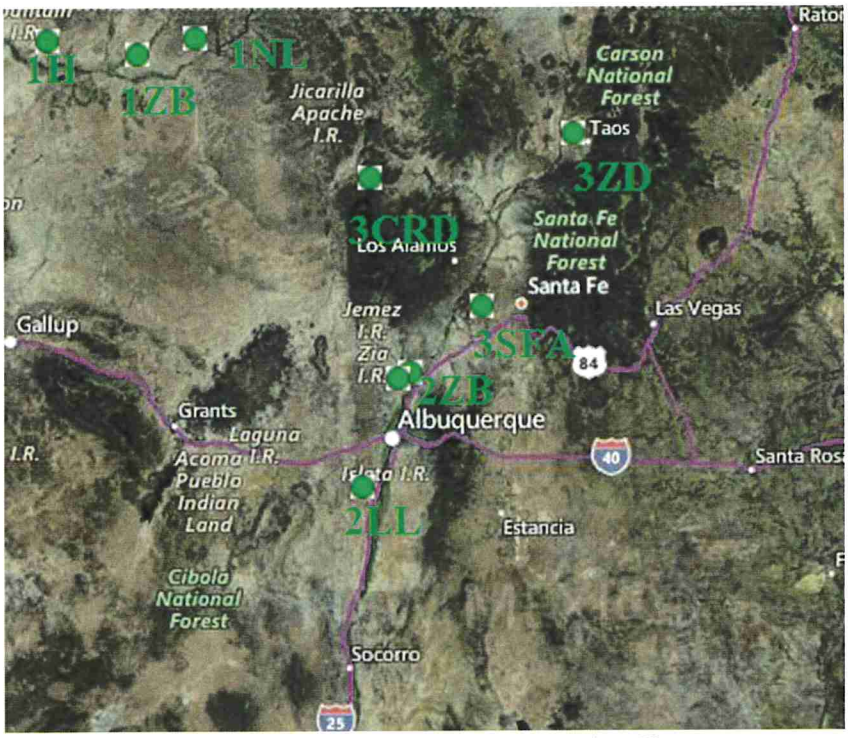

Figure A6.2: NMED Northern Sampling Sites

Figure A6.3: NMED Southern Sampling Sites

Code	Site Name	Code	Site Name	Code	Site Name
1H	San Juan Substation	3ZD	Taos Fire Station	6ZK	Chaparral
1NL	Navajo Lake	5ZR	Carlsbad	6ZL	Holman Road
1ZB	Bloomfield	5ZS	Hobbs Jefferson	6ZM	Desert View
2LL	Los Lunas	6CM	Anthony	6ZN	Santa Teresa
2ZJ	Bernalillo	6O	La Union	6ZQ	Solano Road
3CRD	Coyote Ranger District	6Q	Las Cruces ED	7E	Deming Airport
3SFA	Santa Fe Airport	6WM	West Mesa		

Table A6.2: Monitoring Site Codes

The NMED network of SLAMS and SPMs meets the six general site types put forth in 40 CFR Part 58, Appendix D 1.1.1:

a. The monitoring locations are appropriately sited to determine highest concentrations expected to occur. See Appendix C: Network Elements Spreadsheet.
b. The existing network includes monitors in the areas of high population density: Doña Ana, Santa Fe, and Sandoval Counties.
c. The monitors in the network are sited to determine the impact on ambient pollution levels of significant sources and source categories, in particular, those in San Juan County, a region of concentrated energy development and generation.
d. The network includes sites that adequately measure general background concentrations, including sites in San Juan County and the sites of Carlsbad, La Union, and Santa Teresa.
e. The current network is capturing data that enables NMED to determine the extent of regional pollutant transport among populated areas. The Navajo Lake site serves this purpose for transport between San Juan County and Southwestern Colorado. The monitoring objective of the Coyote Ranger District site is to determine regional ozone transport. The monitoring objective of the Las Cruces site is to determine regional $PM_{2.5}$ transport.
f. Data gathered from the current network of monitoring sites can be used to determine welfare-related impacts in rural and remote areas. Data from the network is being used by citizen groups in both the Four Corners Region and the Border Region of New Mexico/US and Mexico.

A7: Quality Objectives and Criteria

It is the intention of the Air Quality Bureau to provide accurate, complete, representative, and comparable air pollution monitoring data to accomplish the following specific objectives:

1. Ensure that New Mexico and Federal Air Quality Standards are met.

2. Detect sources that may cause violations of National Ambient Air Quality Standards.

3. Establish background concentrations for criteria pollutants.

4. Evaluate air pollution trends in order to project impacts and make judgments on land use planning, industrial growth, transportation planning, population growth, and to develop future Air Quality Control Regulations.

The Air Quality Bureau expects to maintain air monitoring instruments in such a manner as to attain 95% probability goals for accuracy and precision within the EPA required limits. The Air Quality Bureau adheres to the Measurement Quality Objectives and Validation Templates as published in Appendix D of the EPA QA Handbook for Air Pollution Measurement Systems, Vol. II (EPA-454/B-17-001) January 2017.

A data capture rate of over 75% is expected. Typically, AQB data capture rates are in the 90% range. For representativeness, only EPA approved methods and procedures are used to collect and evaluate ambient air monitoring data. For comparability, all parameters will be reported in standard units (e.g. $\mu g/m^3$, ppm, etc.) and EPA recommended formats.

When the Bureau detects sources that may cause exceedances of NAAQS, the QA staff review logs, meteorological data and data on the performance of the specific monitors to ensure that the data is reliable. The QA staff confers with staff in Policy and Planning. Sometimes special studies are performed to gather more information, for example, the Paso del Norte particulate monitoring study in Dona Ana County conducted in 2009.

To ensure that Federal Air Quality standards are met, the Bureau works with local and regional groups, for example, the U.S.-Mexico Border Joint Advisory Committee in Dona Ana County and the Four Corners Air Quality Task Force in San Juan County.

New Mexico has standards for ambient air quality (20.2.3. NMAC, see below, hereinafter referred to as "NMAAQS"). NMAAQS are used for air quality permitting purposes, and differ from NAAQS as follows:

- The size of total suspended particulates is not differentiated in NMAAQS as it is in NAAQS (PM_{10} and $PM_{2.5}$).
- NMAAQS has 24-hour and annual averages for sulfur dioxide, while NAAQS has 1- and 3-hour.
- NMAAQS has standards for hydrogen sulfide and total reduced sulfur, while NQAAS has none.
- NMAAQS has 8-hour and 1-hour averages for carbon monoxide as 8.7 ppm and 13.1 ppm respectively, while NAAQS are 9ppm and 35 ppm.
- NMAAQS has 24-hour and annual arithmetic averages for nitrogen dioxide as 0.10 ppm and 0.05 ppm respectively. NAAQS are 100 ppb and 53 ppb for 1-hour and 1-year averaging times.

Below is an excerpt from Title 20, "Environmental Protection", of the New Mexico Administrative Code regarding the NMAAQS.

20.2.3.108 PREAMBLE: Ambient Air Quality Standards are not intended to provide a sharp dividing line between air of satisfactory quality and air of unsatisfactory quality. They are, however, numbers which represent objectives that will preserve our air resources. It is understood that at certain times, due to unusual meteorological conditions, these standards may be exceeded for short periods of time without the addition of specific pollutants into the atmosphere. The adoption of these statewide ambient air quality standards does not prohibit the promulgation of standards for specific areas, functions, and conditions within the state such as air sheds, municipalities, and certain counties, as authorized under the Act. As scientific data accumulates on the effects of a contaminant, these standards may be revised or additional standards added.
[11/30/95; 20.2.3.108 NMAC - Rn, 20 NMAC 2.3.108 10/31/02]

20.2.3.109 TOTAL SUSPENDED PARTICULATES: The maximum allowable concentrations of total suspended particulate in the ambient air are as follows:

A. 24-hour average: 150 ug/m3;
B. 7-day average: 110 ug/m3;
C. 30-day average: 90 ug/m3;
D. Annual geometric mean: 60 ug/m3.

[11/30/95; 20.2.3.109 NMAC - Rn, 20 NMAC 2.3.109 10/31/02]

20.2.3.110 SULFUR COMPOUNDS: The maximum allowable concentrations of the following sulfur-containing air contaminants in the ambient air are as follows:

A. Sulfur Dioxide:

(1) For the state except on the area within 3.5 miles of the Chino Mines Company smelter furnace stack at Hurley:

(a) 24-hour average: 0.10 ppm;
(b) Annual arithmetic average: 0.02 ppm;

(2) For the area within 3.5 miles of the Chino Mines Company smelter furnace stack at Hurley:

(a) 24-hour average, not be exceeded more than once per year: 0.14 ppm;
(b) 3-hour average, not to be exceeded more than once per year: 0.50 ppm;
(c) Annual arithmetic average: 0.03 ppm.

B. Hydrogen Sulfide:

(1) For the state, except the Pecos-Permian Basin Intrastate Air Quality Control Region (1-hour average, not to be exceeded more than once per year): 0.010 ppm;

(2) For the Pecos-Permian Basin Intrastate Air Quality Control Region (1/2 hour average): 0.100 ppm;

(3) For within corporate limits of municipalities within the Pecos-Permian Basin Intrastate Air Quality Control Region (1/2 hour average): 0.030 ppm;

(4) For within five miles of the corporate limits of municipalities having a population of greater than twenty thousand and within the Pecos-Permian Basin Intrastate Air Quality Control Region (1/2 hour average): 0.030 ppm.

C. Total Reduced Sulfur:

(1) For the state, except the Pecos-Permian Basin Intrastate Air Quality Control Region except for hydrogen sulfide (1/2 hour average): 0.003 ppm;

(2) For the Pecos-Permian Basin Intrastate Air Quality Control Region, except for hydrogen sulfide (1/2 hour average): 0.010 ppm;

(3) For within corporate limits of municipalities within the Pecos-Permian Basin Intrastate Air Quality Control Region, except for hydrogen sulfide (1/2 hour average): 0.003 ppm;

(4) For within five miles of the corporate limits of municipalities having a population of greater than twenty thousand and within the Pecos-Permian Basin Intrastate Air Quality Control Region, except for hydrogen sulfide (1/2 hour average): 0.003 ppm.
[11/30/95; 20.2.3.110 NMAC - Rn, 20 NMAC 2.3.110 10/31/02]

20.2.3.111 OTHER AIR CONTAMINANTS: The maximum allowable concentrations of the following air contaminants in the ambient air are as follows:

A.	Carbon Monoxide:	
(1)	8-hour average:	8.7 ppm;
(2)	1-hour average:	13.1 ppm;
B.	Nitrogen Dioxide:	
(1)	24-hour average:	0.10 ppm;
(2)	Annual arithmetic average:	0.05 ppm.

A8: Special Training/Certification

All staff working with monitoring and data collection are hired through the New Mexico State Personnel Office (SPO). The SPO positions of staff involved with this project are Natural Science Manager and Environmental Scientist & Specialist (Operational, Advanced, and Supervisor). The distinguishing characteristics of the Technical Occupation Group are found in Appendix A: New Mexico Personnel Board Technical Occupation Group Descriptors for Environmental Scientists and Specialists, Including Health, which list minimum education and experience qualifications for all employees who can be considered for these positions. It is the responsibility of the State Personnel Office to screen applicants for the minimum qualifications.

In addition to the formal schooling required to obtain air quality positions, all staff are required to review and adhere to the Air Quality Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance. The manual is updated as equipment is added to or removed from the network, and as procedures are refined. A list of the Standard Operating Procedures currently in the Manual is attached hereto as Appendix G.

New staff receive on-the-job training from co-workers. They are supervised in sampling, monitor audits and data collection and review until they can perform these tasks independently.

All staff may attend any applicable courses presented by EPA's Air Pollution Training Institute. They also attend conferences and workshops sponsored by the EPA, NMED, Air and Waste Management Association, WESTAR, and other groups. Vendors of equipment used by the QA and Monitors staff provide specialized training. With supervisor approval, any staff member is encouraged to take pertinent courses that are presented by local academic institutions. Computer systems training is encouraged due to the many automated procedures in use to collect, review, and report the data.

There is no special certification required for these positions; however, the Operations Section Chief and Quality Assurance Manager, who will certify the data, review and revise the QMP and QAPP, must have the proper training. The QMP and QAPP training certificates can be

found in Appendix E. New QA Manager, Andrew Ahr, will receive QMP and QAPP training in 2020.

A9: Documents and Records

All data is submitted to EPA's national database, the Air Quality System (AQS), after validation. The validation path and procedures are described more fully in Section D2. The procedures for documents and records are listed in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance. The formatting for these submittals is prescribed by AQS and accomplished through the DAS Reporter software.

Details of operation of the continuous monitors and manual samplers at all of the sites are documented by the operators in the electronic logbook within the DAS application. The operator or auditor may access the electronic logbook through the site computer or remotely using a laptop. The electronic logbook is accessed through the DAS "Operational" menu option. In the "Log Book" tab, "Add" is selected to enter information, or "Report" is selected to review entries at a site for a designated time period.

Figure A9.1: DAS Menu for Entering and Reviewing Log Book Notes

The site operator can choose "Log Book - Add" and enter information in the "Generic List" box. The operator selects the appropriate instrument selection (e.g., NO2 or O3) from the drop down list, and enters his or her name, the type of visit (i.e. scheduled weekly, monthly), and details of the visit in the space provided. Log notes include dates and times of all calibrations, precision and accuracy audits as well as details of unusual operation or repair. The log notes are saved before exiting or starting a second set of log notes.

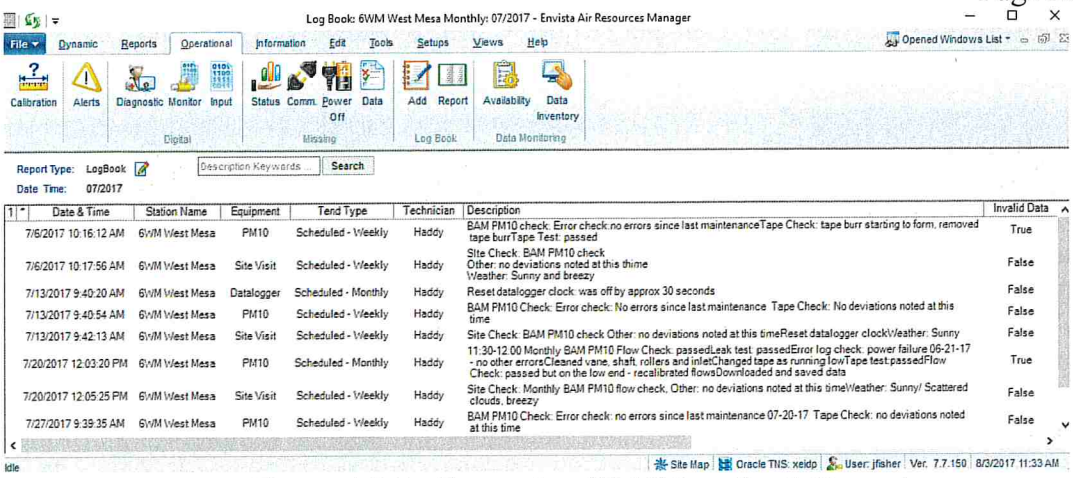

Figure A9.2: Example of DAS Log Book Report

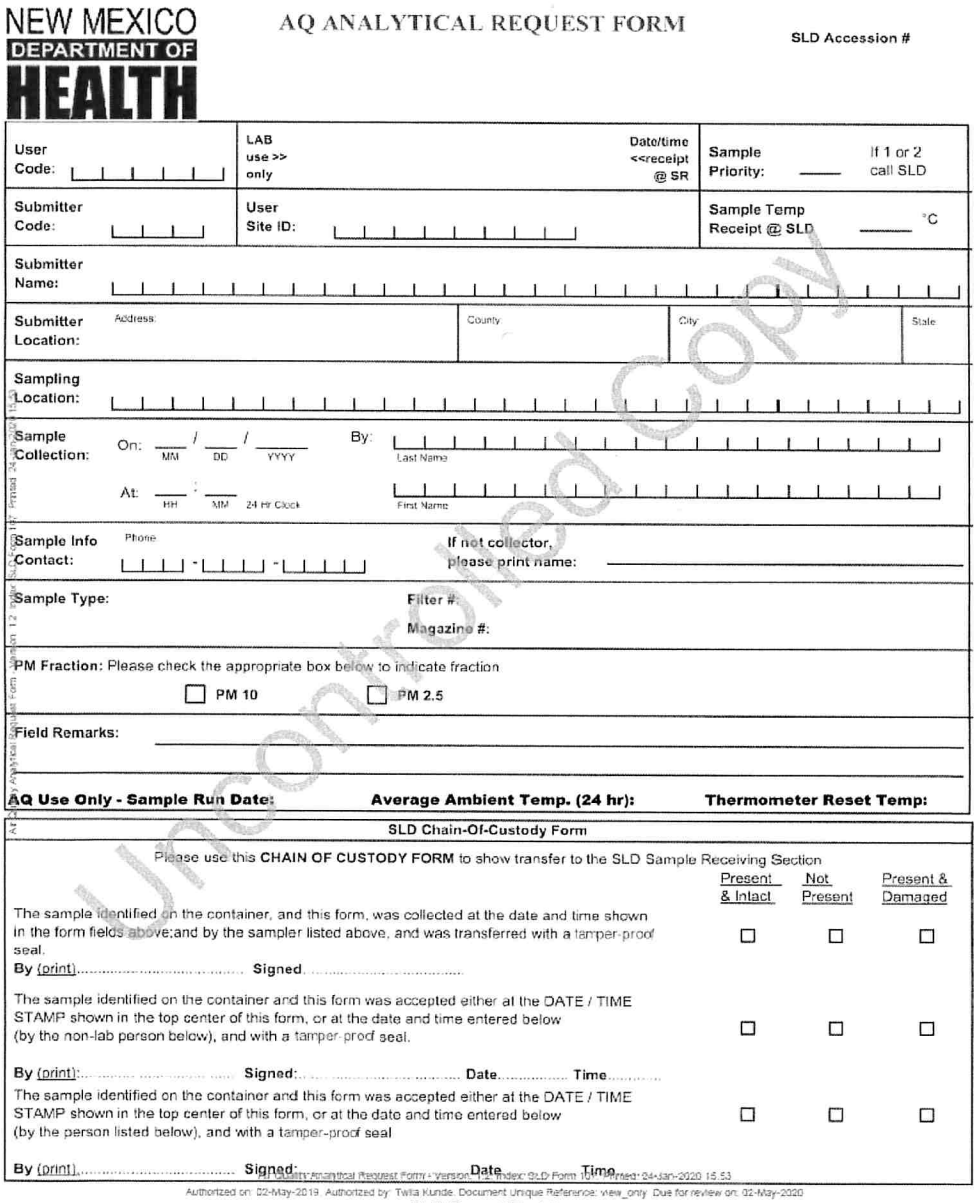
Staff can access log book events by selecting "Report" and entering site information. Figure A9.2 shows a Report of entries made concerning a monitoring site.

The DAS maintains a record of all automatic precision and zero/span checks, referred to as qc checks, which are performed on the continuous gas monitors every Sunday. Qc check reports are used to review validity of data produced by each gas monitor. Operators may perform additional qc checks to check on a monitor at other times. These results are also maintained in the DAS.



Monitor calibrations on both gaseous and particulate matter continuous monitors are performed quarterly by the site operators. The dates and times of these calibrations are noted in the electronic log. The actual concentrations are entered on an Excel spreadsheet for calculating results. QA auditors record dates, times and general results of accuracy audits in the electronic log, and use a separate Excel spreadsheet to calculate the audit results. Both the monitor calibrations and the accuracy audits made available to the Data Handling Specialist, who verifies associated data. The Data Handling Specialist enters the audit results into AQS.

Filter tapes used by the BAM-1020 particulate matter monitors are discarded after use, as there is no federal requirement to archive or retain the filter tapes from continuous FEM monitors.

For manual samplers, SLD provides an AQ Analytical Request and Chain of Custody Form (see Figure A9.3) for each filter sent to the site operator for the specific manual sampling equipment. User Code 55600 indicates a PM_{10} sample filter, and Use Code 55625 indicates a PM2.5 sample filter. Submitter Code 304 identifies NMED-AQB. The User Site ID, the Alpha-Numeric code assigned to the monitoring location, is also entered by SLD.

After the filters have collected the particulate samples, original field records are annotated by the site operators with the sample collection time and priority. In the Sample Priority section, operators enter "3" to indicate a normal priority. The Field Remarks section is used by the site

operator to note any voided filters due to equipment issues or power failures, conditions at the site, or problems such as flows or temperatures. This is important information that after analysis may deem a sample filter as void per determination by the SLD, Data Handling Specialist or QA Manager. The field records are sent to the SLD as hard-copy forms along with the exposed filters. Copies of the completed Chain of Custody forms are sent to the QA Manager by SLD monthly. The QA Manager reviews the forms for notations regarding the filters that may warrant further review by the Data Handling Specialist or QA Manager. This Standard Operating Procedure for Chain of Custody Forms is in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance.

Figure A9.3: AQ Analytical Request and Chain of Custody Form

The SLD maintains data in a secure LabWare LIMS data base, and extracts data in crystal reports from the LIMS and exports them to a spreadsheet for AQB's use. AQB's Data Handling Specialist employs a macro that brings the SLD's initial and final weights into AQB's Excel spreadsheet for the calculation of particulate concentrations. The results are uploaded from Excel to the main DAS database.

After weighing, the 47-mm filters are archived at SLD. In accordance with 40 CFR 58.16(f), SLD archives all sample filters in the laboratory for a minimum of five years. The archiving period includes cold storage of the filters after post-sampling laboratory analyses for at least twelve months.

AQB's main DAS database contains monitoring data as well as electronic logbook and qc check data for access, review and retention. Ten years of data are retained in the DAS database.

B Data Generation and Acquisition

B1: Sampling Process Design

The monitoring performed in this project is to determine ambient concentrations of criteria air pollutants. These air pollutants have been determined to be injurious to the health and welfare of the public, and ambient standards have been established on the state and federal levels. The National and New Mexico Ambient Air Quality Standards have been developed to protect the public from excessive exposure. The design of the project follows strict federal guidance as found in 40 CFR Part 58 and the *Quality Assurance Handbook for Air Pollution Measurement Systems Volume II: Ambient Air Quality Monitoring Program* (EPA-454/B-17-001) ("QA Handbook").

Data from the monitors in the AQB network are used to determine attainment status defined in the Federal Clean Air Act. Because of the importance of the results of the monitoring, only EPA Reference and Equivalent Methods are reported to AQS. Sampling time intervals, 1-hour for continuous monitors and 24-hour for non-continuous monitors, are used to generate data that relate to the time period of the applicable standards.

Note: Values for ambient air quality standards are collected to the decimal precision in which the standard is promulgated plus one decimal place. Measurement values are truncated to the level of precision of the standard for reporting purposes.

The network has been designed to monitor suspected pollutants in areas where they may be reasonably expected to occur at relatively high levels. Financial and logistical constraints may limit the number of actual locations. The Air Quality Bureau prefers to locate monitors on public properties in order to assure continued permission to operate. New monitoring sites are established in several stages: identifying a possible air quality problem or responding to public concern, finding and evaluating potential sampling sites, and selecting the best site. Among the criteria used to select sites are monitoring objectives, location of the highest expected concentration, and the availability of power, space, and security specified in 40 CFR Part 58, Appendix D, the siting regulations set forth in 40 CFR Part 58, Appendix E, and relevant EPA guidance. The Ambient Air Monitoring Program Manager collaborates with other Operations Section staff, the Operations Section Chief and the Air Quality Bureau Chief to determine locations of new monitoring sites when needed.

All procedures are described in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance and are based on guidelines obtained from EPA, including the QA Handbook.

All automated instruments are housed in clean, insulated, and air-conditioned shelters. All manual analyzers are inherently weatherproof.

B2: Sampling Methods

To ensure that air quality measurements are made with methods proven to be accurate and reliable, only EPA reference or equivalent methods for collection and analysis are used. Criteria used to select monitoring instruments are price, noise, drift, linearity, accuracy and long-term reliability. All equipment is prepared in accordance with manufacturer's instructions. The continuous monitors analyze samples immediately so there is no relevant sample preservation or custody issues. For non-continuous monitors, the sampling methods are discussed in the in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance. Table B2 below lists the current monitoring instrumentation employed in this network and the respective sampling methods utilized.

Pollutant	Manufacturer	Model	Principle	EPA Method Code	Method Type
SO2	Thermo Fisher	43i	Pulsed Fluorescence	060	FEM
SO2	Thermo Fisher	43i	Pulsed Fluorescence	009	FEM
NO2	Thermo Fisher	42i	Chemiluminescence	074	FRM
O3	Thermo Fisher	49i	UV Photometry	047	FEM
PM_{10}	Thermo Fisher Partisol	2025i	Low Volume, Size Selective Inlet	127	FRM
PM_{10}	MET One BAM	1020	Beta Attenuation	122	FEM
$PM_{2.5}$	Thermo Fisher Partisol	2025i	Low Volume, Size Selective Inlet	145	FRM
$PM_{2.5}$	MET One BAM	1020	Beta Attenuation	170	FEM

Table B2: Current Monitoring Instrumentation and EPA Methods

B3: Sample Handling and Custody

Continuous Monitors (Electronic Data)

The software for data acquisition and control ("DAS") is installed on a PC set up at each station except stations with only meteorological sensors. The DAS communicates over serial communications lines to obtain data. A Moxa 4 or 8 serial port PCI expansion card is added to each PC to expand the total serial port count on the PC to 6 or 10 as needed. DAS units communicate serially with the existing Campbell Scientific data loggers at the station.

Meteorological sensor signals and analog outputs from analyzers are connected to the Campbell units. For newer analyzers with their own serial ports the DAS will interface serially to obtain data and diagnostics. Elimination of digital-to-analog and analog-to digital circuits with serial communications improves the quality of the measurements by reducing signal conversion errors.

Campbell Scientific CR1000 data loggers are installed at each site where continuous monitors are employed and maintain their own local data storage buffers.

Each DAS data logger in the system is programmed to record sensor inputs from the Campbell data loggers every second and process each signal to form 5, 15, and 60-minute averages. Serial interfaces to analyzers are programmed to sample the analyzer every 15 seconds.

The DAS offers comprehensive in-station support and communications options. All configuration and remote access functions are password-protected. Analyzer status conditions are monitored and the data flagged if the analyzer is reporting a fault. In-station and central location reports allow review of all analyzer status changes. Manual flagging of data can also be performed. Operators can toggle data channels to OFF, and OFF SCAN modes. OFF SCAN continues to report the data values but flags the data. OFF channels do not report values. If a monitor is removed from the station the channel is set to OFF. For maintenance and other quality checks not otherwise tracked by the system the channel is set to OFF SCAN. If the operator were to accidentally fail to return the channel to ON the data can always be recovered by just editing the status flag. Remote access via modem to the station PC allows an oversight such as this to be quickly corrected.

The DAS interfaces serially to the on-site calibrator. The calibrators may be controlled serially or via digital control lines. Calibration control sequences can flag data with zero, span and 5 other span level flags corresponding to the desired dilution levels.

The station data is collected hourly from all stations. Polling PCs running the CommServ communications program are located in Santa Fe. The DAS data loggers hold 10 years of historical data with automatic data recovery in the event communications with a site is interrupted for a period. An operator can also copy data sets to files for upload to the central database by QA staff.

The data collection process writes the data for all the stations to the Department's Oracle Server. Data values and status as initially collected and as edited are stored in separate data tables for each station. These are referred to as the Raw and Standard data tables. The DAS data logger collects and stores the results of automated Zero, Span, and Precision Checks as well as station faults.

Manual Monitors (Filter Based)

Site operators collect filters from non-continuous particulate samplers in the field on a 3-day schedule for $PM_{2.5}$ and a 6-day schedule for PM_{10}. The actual days in the schedules are prescribed by EPA and uniform across the country, so that measurements may be comparable across regions. Special schedules such as every-day sampling may be put into place for problematic areas.

The New Mexico State Scientific Laboratory Division (SLD) provides an AQ Analytical Request and Chain of Custody Form (see Figure A9.3) for each filter sent to the site operator for

the specific manual sampling equipment. User Code 55600 indicates a PM_{10} sample filter, and User Code 55625 indicates a $PM_{2.5}$ sample filter. Submitter Code 304 identifies NMED-AQB. The User Site ID, the Alpha-Numeric code assigned to the monitoring location, is also entered by SLD. In the Sample Priority section, operators enter "3" to indicate a normal priority.

After the filters have collected the particulate samples, original field records are annotated by the site operators with the sample collection time and priority. The Field Remarks section is used by the site operator to note any voided filters due to equipment issues or power failures, conditions at the site, or problems such as flows or temperatures. This is important information that after analysis may deem a sample filter as void per determination by the SLD, Data Handling Specialist or QA Manager.

The field records are sent to the SLD as hard-copy forms along with the exposed filters. in suitable shipping containers via United Parcel Service. The filters are weighed at the SLD to determine particulate concentrations.

Copies of the completed Chain of Custody forms are sent to the QA Manager by SLD monthly. The QA Manager reviews the forms for notations regarding the filters that may warrant further review by the Data Handling Specialist or QA Manager. The Standard Operating Procedure for Chain of Custody Forms is in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance.

B4: Analytical Methods

The analytical methods employed by the ambient air monitors used in this project may be found in Table B.2: Current Monitoring Instrumentation and EPA Methods.

B5: Quality Control

A. Automated Gas Analyzers

Weekly zero/span/precision checks, referred to by the Air Quality Bureau as qc checks, are performed by the in-station data logger and calibration systems. At stations with other gas analyzer combinations, a gas dilution calibrator and zero air supply are used in conjunction with the station data logger to conduct the qc checks. Except for Ozone, the equipment used for these checks is the same equipment as used for calibrations. Qc check results are available in tabular form as a report from the DAS. The Air Quality Bureau evaluates the results of the qc checks as part of the data validation process. Results for precision points are reported to EPA through AQS, where they are used to calculate precision statistics.

The operators perform unscheduled, confirmatory zero/span/precision checks whenever the results of a scheduled zero/span/precision check exceed the thresholds as set forth in Table B5.

QC Check Measurement	Adjust Monitor if Value is greater than:
Zero Drift	± 2 ppb
Span Drift	± 5% of actual span concentration
Precision Point	± 5% of actual precision concentration

Table B5: AQB QC Check Thresholds Requiring Adjustment

Appendix D of the EPA QA Handbook includes precision and zero and span drift criteria for analyzer adjustments, recalibrations and data invalidation. The Air Quality Bureau follows this guidance.

Monitors are adjusted and a subsequent zero/span check is run after any minor maintenance that might affect the calibration. These zero/span checks are initiated on demand from the automated station data logger, and may also be initiated remotely.

B. Continuous Particulate Monitors (BAM 1020s)

Site operators perform monthly precision flow checks on these monitors using Alicat mass flow meters. Per the manufacturer's recommendation as well as seasonal changes, the site operator performs a BAM 1020 quarterly check to ensure proper flow and operating parameters, such as temperature and pressure. The check performed in the second quarter is recorded as the annual check to conform with the QA Handbook requirements. The results of these precision checks are to determine the quality of monitor operation, and are uploaded to the AQS database.

The QA auditor performs semi-annual accuracy audits on these monitors, auditing the flow, temperature and pressure using instruments dedicated to QA.

C. Manual Particulate Analyzers (Partisols)

Operators perform monthly checks on these instruments. A monthly check consists of a flow audit against a mass flow meter, leak checks, verification of the ambient temperature, filter temperature, filter compartment temperature, and pressure. Annual multi-point flow, temperature and pressure calibrations are also performed, in accordance with the QA Handbook. The results of these precision checks are to determine the quality of monitor operation, and are uploaded to the AQS database.

The QA auditor performs semi-annual accuracy audits on these monitors, auditing the flow, temperature and pressure with instruments dedicated to QA.

D. Corrective Action

When a problem is identified, either during a precision check, accuracy audit, or daily observation of data, the Site Operator is usually the first in line to attempt analysis of the problem. Upon initial failure of any one-point flow or temperature verification failure, Site Operators are directed to trouble shoot and recheck the equipment before calibrating in order to minimize the number of calibrations.

When further information is needed, the Instrumentation Specialist, QA Auditor, or manufacturer might be consulted, and the site operator can review previously completed Corrective Action Reports (CARs) on same or similar instruments as a learning devise. The completed CARs can be accessed by the Site Operators and/or QA Auditors in a common folder. The QA Auditors always inform the Site Operator, Instrumentation Specialist, and Monitoring Manager of any problems found. The QA Manager and Data Handling Specialist review problems resulting in data falling outside of acceptance criteria as set forth in the QA Handbook Volume II, Appendix D to decide whether it is appropriate to invalidate or qualify accompanying data. If deletion of data is necessary due to a problem that falls outside of our routine procedures and preventative maintenance schedules, a CAR will be completed. CARs are generally not used unless the problem resulted in data invalidation or qualification greater than 120 hours. The procedure for Corrective Action Reports is fully outlined in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance.

Quality assurance statistics are calculated both in-house and in the AQS database and are relied upon for performance determinations.

B6: Instrument/Equipment Testing, Inspection and Maintenance

All analyzers in the field are inspected on the routine site visits by site operators and before their quarterly calibrations. Additionally, the Data Handling Specialist will notify the Site Operator or Environmental Specialist Supervisor in the event of suspicious monitor output. The Site Operators test, adjust and clean monitors as a part of the calibration procedure.

The purpose of preventive maintenance is to increase system reliability, increase data completeness, and minimize analyzer down time. Spare parts inventory of the items most likely to fail are maintained for all analyzers and support equipment. Preventive maintenance procedures and frequencies correspond to those recommended by each instrument manufacturer. All routine preventive maintenance is performed at each individual monitoring site and takes place quarterly unless a prior problem is detected. Maintenance for manual analyzers takes place as needed. All Scientific Laboratory Division instruments used for analysis are on a maintenance contract, which includes both corrective and preventive maintenance.

Details of maintenance requirements and procedures for each type of equipment may be found in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance.

It is Bureau policy to have one backup monitor of each type available at all times in case of monitor failure. This obviates the necessity of maintaining a large inventory of spare parts.

AQB site operators use the DAS software program's electronic log book to record air monitoring operations. The electronic log book is used to document maintenance, calibrations, and repair of equipment. The electronic log book entries are available for viewing by all Monitoring or QA staff members on the DAS reports.

B7: Instrument/Equipment Calibration and Frequency

All calibrations are performed following the procedures and acceptance criteria of the EPA *QA Handbook for Air Pollution Measurement Systems, Vol. II (EPA-454/B-17-001)* ("QA Handbook").

A. Monitoring Equipment

Continuous Gas Monitors

Calibrations are performed on continuous gas monitors quarterly and following major repairs. A calibration is defined as the introduction of reference concentrations to a monitor and comparison with the response of the monitor to determine if the monitor response is linear. Calibration may involve adjustment as necessary to achieve linearity. A calibration sequence includes a zero, span and four additional reference concentrations.

During calibration, the analyzer is operated in the normal sampling mode. Test gases pass through all filters, scrubbers, conditioners, and other components of the normal sampling system.

A gas monitor is considered linear if the concentration response of all points is < + 2.1 % or < +1.5 ppb difference of best-fit straight line whichever is greater and Slope 1 + .05, per QA Handbook Volume II, Appendix D.

In accordance with the QA Handbook Appendix D, acceptance criteria for the certification/verification of a transfer standard is the relative standard deviation (RSD) of six slopes ≤ 3.7%; and standard deviation of 6 intercepts ≤ 1.5. In accordance with the QA Handbook Volume II, Appendix D, acceptance criteria for the recertification/reverification of a transfer standard is that the new slope is within ± 0.05 of the previous; and the relative standard deviation of six slopes ≤ 3.7%; and standard deviation of 6 intercepts ≤ 1.5.

Calibration equipment used for continuous monitors consists of API and Thermo Fisher brand gas dilution calibrators and ozone transfer standards permanently installed at each site. The performance of the calibration is coordinated through the station DAS data logger. The following methods are used for station calibrations:

Pollutant	Method
SO_2	Dynamic dilution of a gas standard (NIST traceable SO2 or SO2/NO blended gas)
NO_2	Gas-phase titration of NO and O3(NIST traceable NO or SO2/NO blended gas)
O_3	Ultraviolet photometry using either the station calibrator or a separate O_3 transfer standard

Table B7.1: List of Field Calibration Methods

Particulate Monitors

Calibrations are performed on continuous particulate monitors at least twice a year and following major repairs.

Calibrations of non-continuous particulate monitors are performed at least yearly or after any maintenance that could affect flow rate, or after the results of a flow rate check indicate a difference greater than ±4.1% between sampler calibrations as specified in the QA Handbook Volume II and the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance. Quality Assurance Auditors conduct independent audits on a semiannual basis.

Details on calibrations of each type of particulate sampler are in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance.

B. Verification of Audit Equipment and Station Calibration Equipment

Equipment used to conduct accuracy audits and calibrations is subject to verification requirements. Accuracy audit equipment is generically referred to as transfer standards. These are verified on a fixed schedule against local primary standards. The transfer standards used by the Bureau are given in Table B7.2 along with verification intervals and superior standards against which they are verified. Acceptance ranges for all transfer standards conform with the QA Handbook or, if not specified in the QA Handbook, the recommendation of the transfer standard's manufacturer.

Standard	Parameter	Interval	Verified Against
Thermo Fisher 49iPS (Level 2)	O_3	1 year	EPA's Transfer Standard
Thermo Fisher 49iPS (Level 3)	O_3	6 months	Thermo Fisher 49iPS (Level 2)

Thermo Fisher 49iQPS (Level 3)	O_3	6 months	Thermo Fisher 49iPS (Level 2)
API T703/703E	O_3	6 months	Thermo Fisher 49iPS
API T700 Photometer	O_3	Quarterly	Thermo Fisher 49iPS and 49iQPS
API T700 Gas Calibrator	Gas flows	Quarterly	Alicat Flow Meter
Thermo Fisher 146i Calibrator	Gas flows	Quarterly	Alicat Flow Meter
Thermo Fisher 146iQ Calibrator	Gas flows	Quarterly	Alicat Flow Meter
Alicat Flow Meter	Gas and air flows	1 year	Fluke Calibration molbloc-L and molbox+1
Fluke Calibration molbloc and molbox (NIST traceable)	Gas and air flows	1 year	Fluke Calibration
Druck DPI 800	Pressure	1 year	Fluke Calibration molbloc-L and molbox+1
Digi-Sense ThermistorThermometer, NIST-Traceable Calibration	Temperature	1 year	Fluke Temperature Calibration Bath
Fluke Temperature Calibration Bath (NIST-Traceable(	Thermistor Thermometer	1 year	Fluke Calibration

Table B7.2: Transfer Standards

When necessary, gas cylinders are verified according to procedures outlined in EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards (EPA-600/R93/224, Revised September 1993). However, this is not done as standard practice. Cylinders that are out of certification are returned to vendor for re-certification or replacement.

Verification audit procedures are detailed in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance.

C. Scientific Laboratory Division

Particulate filter weighing is done at the Scientific Laboratory Division (SLD) in Albuquerque. The procedures followed by the SLD are detailed in Appendix B.

B8: Inspection/Acceptance of Supplies and Consumables

Filters, analyzers, calibration gases and monitoring equipment are ordered in accordance with State purchasing rules with exact specifications relating to minimum performance, quality, and acceptable tolerances. The QA Auditor assigned to the QA Lab and the Monitoring Unit Staff Manager order and receive the supplies. Included in the monitoring supplies ordered by AQB are filters for Met One BAM particulate monitors. Filter tapes for the BAM-1020 samplers are of the glass fiber type and used for both PM_{10} and $PM_{2.5}$ monitoring. The BAM-1020 does not contain filters that require pre-weighing by a laboratory since the particulate is indirectly weighed within the monitor. The procedures for inspection and acceptance of supplies and consumables are detailed in are in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance.

Filters for non-continuous particulate measurements are provided by EPA. EPA provides 47mm Teflon filters for Partisols, which are used for both PM_{10} and $PM_{2.5}$ monitoring. The Teflon filters undergo acceptance inspections regarding consistent thickness and weight at EPA's RTP laboratories, and are sent to the New Mexico Health Department Scientific Laboratory Division (SLD). There, a laboratory staff member checks in the filters, visually inspects them, and weighs each filter using procedures set forth in Appendix B: Gravimetric Analysis of 47mm Air Filters – AHM Method 41710.

Calibration gases purchased by the Bureau are certified by the vendor and are NIST-traceable. The QA Auditor assigned to the QA Lab distributes cylinder gases to monitoring sites in the most efficient manner in order not to have gases existing in the cylinder longer than the period of valid certification. In cases where the period of certification has expired and a substantial amount of gas is still in the cylinder, the cylinders may be returned to the manufacturer for a re-certification of the gas.

When new analyzers are received, they are unpacked and checked for loose fittings, loose electrical connections, and damage during shipment. The instruments are then assembled and acceptance-tested by the QA Auditor assigned to the QA Lab and Monitoring Staff Manager before use at a monitoring site.

C Assessment and Oversight

C1: Assessments and Response Actions

A. Internal Audits

1. Continuous Monitors

Quality Assurance Auditors perform accuracy audits using a calibrator and transfer standard reserved for exclusive QA use. 40 CFR Part 58, Appendix A 3.1.2.1(a), identifies ten audit levels for each gaseous pollutant:

"3.1.2.1 The evaluation is made by challenging the monitor with audit gas standards of known concentration from at least three audit levels. One point must be within two to three times the method detection limit of the instruments within the PQAOs network, the second point will be less than or equal to the 99th percentile of the data at the site or the network of sites in the PQAO or the next highest audit concentration level. The third point can be around the primary NAAQS or the highest 3-year concentration at the site or the network of sites in the PQAO. An additional 4th level is encouraged for those agencies that would like to confirm the monitors' linearity at the higher end of the operational range. ..."

Accuracy audits on gas monitors are performed by challenging each analyzer with known concentration from the selected ranges as listed in Table C1. The analyzer's response is observed using either the station's DAS data logger or directly reading from the monitor.

Audit level	O3 Range, ppm	Range Selected	SO2 Range, ppm	Range Selected	NO2 Range, ppm	Range Selected
Zero						
1	0.004-0.0059		0.00030-0.0029	X	0.0003-0.0029	
2	0.006-0.019	X	0.0030-0.0049		0.0030-0.0049	X
3	0.020-0.039	X	0.0050-0.0079	X	0.0050-0.0079	X
4	0.040-0.069	X	0.0080-0.0199	X	0.0080-0.0199	X
5	0.070-0.089	X	0.0200-0.0499	X	0.0200-0.0499	X
6	0.090-0.119	X	0.0500-0.0999	X	0.0500-0.0999	X
7	0.120-0.139	X	0.1000-0.1499		0.1000-0.2999	X
8	0.140-.0169		0.1500-0.2599		0.3000-0.4999	
9	0.170-0.189		0.2600-0.7999		0.5000-0.7999	
10	0.190-0.259		0.8000-1.000		0.8000-1.000	

Table C1 - Concentration Ranges for Accuracy Audits in PPM

Audits are performed on one-fourth of the gaseous analyzers for each gaseous criteria pollutant each quarter, or at a minimum at least once per year.

The results of these audits are used to identify problems or inconsistencies within the monitoring network. If a certain monitor has significantly different responses to the auditing equipment of the Quality Assurance Auditor and the Site Operator, it points to either monitor malfunction or a possible problem with the calibration of auditing equipment or standards. The auditor or operator notifies the Environment Scientist & Specialist - Supervisor and or Monitoring Operator responsible for the site to discuss additional investigation, re-calibrations or other appropriate actions.

The QA Auditors perform semiannual audits concerning flow, temperature, and pressure on the BAM analyzers. Only the flow audit, which is performed with an Alicat mass flow meter, is reported to EPA.

For Met One BAM 1020 accuracy audits, the QA Auditor begins with an external leak check. If a leak is discovered, the audit is aborted and the site operator is notified immediately. If the leak check passes, the audit continues with a comparison of the flow of the Met One BAM 1020 monitors to the reading on the Alicat flow meter. The Met One BAM 1020's design flow rate is 16.67 liters/minute. Comparisons of the flow rates are submitted to EPA as the accuracy audit for these monitors. Criteria for the comparison of actual flow rates with transfer standard flow rates are ± 4.1%, consistent with the QA Handbook Appendix D. When these criteria are not met, the auditor or operator notifies the Site Operator and Monitoring Supervisor responsible for the site to discuss appropriate actions.

2. Manual Analyzers

Partisol ($PM_{2.5}$ and PM_{10})

The QA Auditors perform semiannual audits on flow, temperature, and pressure on the Partisol analyzers. Only the flow audit, which is performed with an Alicat mass flow meter, is reported to EPA.

The QA Auditor does accuracy audits of flow rates on a semiannual basis for each $PM_{2.5}$ and PM_{10} sampler in the system. These comparisons are reported to EPA as the accuracy audit.

Site operators do similar flow checks once a month on each sampler. The results are used for validation of data and as a check on the calibration. The results of these flow checks are submitted to EPA through AQS.

Precision for particulate samplers is estimated from duplicate samples collected by co-located pairs of samplers. Each sampler in a co-located pair is calibrated, operated and audited identically. During calibrations, flow checks, and audits of each of these samplers, the other sampler is left running to mimic actual operating conditions. The pair of samplers is sited such that they are at least 1 meter but no more than 4 meters apart, in accordance with the requirements set forth at 40 CFR 58, Appendix A, 3.2.3.4(c). At each co-location site, one sampler is designated

as the primary sampler, and the other is designated as the duplicate sampler. The exposed filters from each member of the pair are processed identically and the relative differences incorporated into the quarterly precision and accuracy report.

B. Systems Audit

Once every three years or as EPA budget allows, the Air Quality Bureau undergoes a systems audit performed by staff from the EPA Region 6 Office in Dallas, Texas EPA evaluates the entire ambient air monitoring program against the systems audit criteria listed in the EPA QA Handbook Volume II.

C. National Performance Audit Program and Performance Evaluation Program

The Air Quality Bureau participates to the maximum extent possible in the National Performance Audit Program (NPAP) and Performance Evaluation Program (PEP), both sponsored by the EPA. Currently, NPAP TTP (through the probe) audits are performed on gaseous monitors by a contractor with the EPA. The same contractor performs audits on the particulate monitors. The PEP is a quality assurance activity which will be used to evaluate measurement system bias of the PM2.5 monitoring network. The goal is to audit 20% of the network each year. Scheduling of the audits is managed by EPA Region 6.

D. Other Assessments

1. A Corrective Action Report (CAR) will be filled out any time a problem has been discovered at any monitoring site and that falls outside of our routine procedures and preventative maintenance schedules and results in data loss or qualification of 120 hours or greater, or 2 or more filters. The reports are intended to be used as a tracking, documenting, and learning device for internal review. The internal procedures for Corrective Action Reports are in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance. Each CAR is identified and tracked with a unique identifying number. It contains a standard set of questions and will capture specific details about each situation. The person most directly tied to the situation will fill out the CAR within five business days of discovering the problem and it will be filled out as completely as possible. The CAR will be reviewed and approved by the direct supervisor, Monitoring Manager, QA Data Handling Specialist, QA Manager, with final approval given by the Operations Section Chief. Once a CAR has been completed, it will be filed in a central location retrievable by the QA and Monitoring staff. In addition, it may be presented at internal section meetings to serve as a learning tool for coworkers. These reports are retained for a minimum of three years.

2. Many of the assessments are informal. For example, the result of each accuracy audit is distributed with the QA and Monitoring Units. Informal peer reviews take place regularly among the QA staff.

E. Reconciliation with Data Quality Objectives

Detailed procedures of the statistical equations and procedures as they relate to the collection of valid ambient air data are found in 40 CFR Part 58, Appendix A. These procedures are followed in order to assess precision, accuracy and completeness of the collected data. Often the solution to poor precision and accuracy results is repair and replacement of aging and failing monitoring and calibration equipment. Resources available are allocated to remedy the problems identified in the QA process.

C2: Reports to Management

The primary method of informing management of current monitoring performance and results is through data reports retrievable from both DAS and AQS. After quarterly data is uploaded to AQS, a variety of reports may be obtained. Standard reports of interest are the Quicklook Report, Maximum Values Report, Data Completeness Report, Precision/Accuracy Reporting Organization Summary, and the Air Quality Index (AQI) Report. The AQI Report is currently being used as a Bureau performance measure within the NM Environment Department.

Since October 2004 with the inception of the Data Acquisition System, a variety of reports are available as part of the software. The reports most utilized are:

- Station Reports, which retrieve pollutant data from any of the monitoring sites, obtainable in 5 minute, 1 hour, 8 hour, or 24 hour averages
- Calibration Reports, which show actual and indicated results of weekly quality control tests on the gas monitors performed by an automatic calibrator, referred to internally as "QC Reports"
- Wind Reports, which correlate pollutant concentrations with wind speed and direction, to gain an understanding of origin of pollutants or wind speeds that cause high particulate concentrations
- Edit History Reports, which indicate reasons for any data that has been invalidated such as for monitor malfunctions or change of status flags
- Logbook Reports, which retrieve electronic logbook entries for any of the monitoring sites where operators have made electronic entries on the site computers explaining their work to maintain monitors or perform checks on monitor performance when at the monitoring site

D Data Validation and Usability

D1: Data Review, Verification, and Validation

A. Continuous Monitors

DAS software for data acquisition and control is installed on a PC set up at each station. The DAS communicates over serial communications lines to obtain data from the equipment at the station.

The DAS software offers comprehensive in-station support and communications options. All configuration and remote access functions are password-protected. Analyzer status conditions are monitored and the data is flagged if the analyzer is reporting a fault. In-station and central location reports allow review of all analyzer status changes. Manual flagging of data can also be performed. Site operators can toggle data channels to OFF, and OFF SCAN modes. OFF SCAN continues to report the data values but flags the data. OFF channels do not report values. If a monitor is removed from the station, the channel is set to OFF. For maintenance and other quality checks not otherwise tracked by the system, the channel is set to OFF SCAN. If the operator were to accidentally fail to return the channel to ON the data can always be recovered by just editing the status flag. Remote access via modem to the station PC allows an oversight such as this to be quickly corrected.

DAS interfaces serially to the on-site calibrator. The calibrators may be controlled serially or by digital control lines. Calibration control sequences can flag data with zero, span and 5 other span level flags corresponding to the desired dilution levels.

The station data is collected hourly from all stations. Polling PC running the CommServ communications program from the DAS is located in Santa Fe. Cellular modem connections are utilized. The DAS data loggers hold 10 years of historical data with automatic data recovery in the event communications with a site is interrupted for a period. An operator can also copy data sets to files for update to the central database by QA staff.

The data collection process writes the data for all the stations to the Department's Oracle Server. Data values and status as initially collected and as edited are stored in separate data tables for each station. These are referred to as the Raw and Standard data tables. The DAS data logger collects and stores the results of automated Zero, Span, and Precision Checks as well as station faults.

The data collected is subject to quality review at four levels.

(1) Station data loggers flag values recorded in the field to indicate that the values are considered invalid. Samples used from 5 minute and hourly values are invalidated when instrument maintenance is being performed. Maintenance includes calibrations. All stations are equipped with DAS data logger software, enabling the service or audit staff to flag any data channel in the logger as Off Scan when maintenance or audits are being performed. A defective instrument is flagged as Off to indicate no data are available. In addition the DAS checks for data samples as being above or below the range of the meteorological sensor are excluded from the averages.
(2) All data averages collected from the monitoring locations are examined contemporaneously by the data collection software to check for outlier values and values that either change too radically or exhibit too little change. The criteria used are based on manufacturer's recommendation, AQB experience and EPA guidelines.
(3) The QA staff performs a daily visual review of data. This review is supported by the creation of statistical and graphical data presentations that facilitate and highlight data of interest. Data are invalidated whenever there is verifiable evidence of instrument malfunction or departure from the operating specifications.
(4) Staff members from any of the sections involved in air quality monitoring may access the standard database records and provide information to the QA Section that may facilitate and/or inform the data validation process.

Validity criteria are implemented within the station logger, QA criteria, daily data review procedures and statistical tests. Whenever data needs to be edited (including validity changes) only the QA Data Handling Specialist or QA Manager may do so. Validity criteria and editing procedures are described in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance.

Note: If suspicious data are observed by QA Staff, it is reported to the Air Monitoring Manager. The manager shall assign staff to investigate the apparent problem and make repairs as needed. The staff's finding shall be reported to the QA Manager for determination of whether data needs to be adjusted, invalidated, or re-validated.

Data within the database is further reviewed whenever the Data Handling Specialist receives information regarding new maintenance actions that have been performed. These records are examined and compared to data collected and checked from the field to determine if data for the documented maintenance periods were in fact flagged correctly. Any apparent differences are submitted to the QA Manager for review and a decision on what if any edits of the database are warranted.

After editing and all validation procedures have been completed, the data is converted into AQS format using the DAS and uploaded to the EPA AQS database. This is accomplished quarterly.

B. Manual Analyzers

Site operators collect filters from particulate samplers in the field on a 3-day schedule for $PM_{2.5}$ and a 6-day schedule for PM_{10}. The actual days in the schedules are prescribed by EPA and uniform across the country so that measurements may be comparable across regions. Special schedules such as every-day sampling may be put into place for problematic areas.

The filters are enclosed in suitable shipping containers and sent along with the Chain of Custody (COC) forms to the Scientific Laboratory Division (SLD) in Albuquerque via UPS. In accordance with 40 CFR 50, Appendix L at 10.13, to protect the integrity of the sample during transport and storage, the filters are maintained as cool as practical and continuously protected from exposure to temperatures over 25 °C. At the SLD, the filters are weighed for determining particulate concentrations. After the filters have been weighed, the SLD sends copies of the completed COC forms to AQB, where they are reviewed in accordance with the Chain of Custody Forms SOP for completeness and adherence to handling criteria set forth in the QA Handbook Volume II, Appendix D.

SLD tabulates exposed PM_{10} and $PM_{2.5}$ filter weights in a spreadsheet, which is then sent to the Data Handling Specialist. (See Appendice B for SLD's procedures.) The Data Handling Specialist uses an Excel macro to obtain the particulate weights and insert them into an Excel spreadsheet combined with flow data downloaded from Partisol samplers so that particulate concentrations may be calculated. A second macro is used to format the concentration results so that they may be uploaded to the main database.

Operators maintain Excel spreadsheets for each analyzer with flow data, slopes, and intercepts and make these spreadsheets available to the Data Handling Specialist.

Data uploaded to the database are subjected to the quality review procedures, which are detailed in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance. Data passing all quality review checks are uploaded to AQS.

Data review, validation and verification take place at four levels in the data collection and data processing activities. These were discussed previously in Section D1.A. Detailed procedures, requirements and methods for data review, validation and verification are given in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance. These sections provide the criteria used within the data collection and management system to conduct automated review and validation.

D2: Verification and Validation Methods

Verification is not automated. Verification consists of confirming that the validity assigned to data is correct. This necessitates independent review of the data, validity criteria and other information to verify that the validity criteria have been properly applied.

A. Continuous Monitors

At the DAS data logger, the values received are subject to quality examinations. As the data is collected, the RAW data values are subjected to random checks. These are detailed in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance.

The Quality Assurance staff review data daily. Details of this review are presented in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance. QA staff also review the results of the weekly Zero/Span and Precision checks of the continuous gas monitors. General invalidation criteria for each pollutant for these checks are provided in the Quality Assurance Handbook Volume II, Appendix D. These criteria are applied routinely, although decisions on all questions of data editing and invalidation are ultimately the responsibility of the QA Manager.

B. Manual Monitors

The manual monitors in the AQB network measure particulate matter. As described in Section A.9, data from the exposed filters from the manual monitors and Chain of Custody forms are sent to the AQB for analysis. The Chain of Custody forms are reviewed in accordance with the procedure detailed in the Bureau's Standard Operating Procedure Manual for Ambient Air Monitoring and Quality Assurance.

General validation criteria for particulate matter are provided in the Quality Assurance Handbook Volume II, Appendix D. These criteria are applied routinely, although decisions on all questions of data editing and invalidation are ultimately the responsibility of the QA Manager.

D3: Reconciliation with User Requirements

In the case of ambient air monitoring which is required by the EPA, the data quality objectives are to collect data that is accurate, complete, representative and comparable for inclusion in the national database, AQS and also for verification that the state has met all state and federal air quality standards. The ambient air monitoring project is unlike uniquely designed projects, which are devised for making specific decisions. Thus, we consider that data quality objectives have been met when we successfully complete all EPA-approved quality assurance requirements for monitor calibrations, audits, precision checks and data validation.

Santa Fe, New Mexico 87505-0127

Classification Description

ENVIROMENTAL SCIENSTISTS AND SPECIALISTS, INCLUDING HEALTH

Class Title	Class Code	Pay Band	Alt Pay Band*
Environmental Scientists & Spec-B	F2041B	55	65
Environmental Scientists & Spec-O	F2041O	60	70
Environmental Scientists & Spec-A	F2041A	65	75

**In accordance with SPB Rule 1.7.4.10 NMAC, the assignment to alternative pay bands shall be reviewed annually to determine their appropriateness.*

Occupation Description

Conduct research or perform investigation for the purpose of identifying, abating or eliminating sources of pollutants or hazards that affect either the environment or the health of the population. Utilizing knowledge of various scientific disciplines may collect, synthesize, study, report and take action based on data derived from measurements or observations of air, food, soil, water and other sources.

Nature of Work

Environmental scientists and specialists use their knowledge of the natural sciences to protect the environment by identifying problems and finding solutions that minimize hazards to the health of the environment and the population. They analyze measurements or observations of air, food, water, and soil to determine the way to clean and preserve the environment. Understanding the issues involved in protecting the environment degradation, conservation, recycling, and replenishment is central to the work of environmental scientists. They often use this understanding to design and monitor waste disposal sites, preserve water supplies, and reclaim contaminated land and water. They also write risk assessments, describing the likely affect of construction and other environmental changes; write technical proposals; and give presentations to managers and regulators.

Distinguishing Characteristics of Levels

Note: Examples of Work are intended to be cumulative for each progressively higher level of work. The omission of specific statements does not preclude management from assigning other duties which are reasonably within the scope of the duties.

Basic

- Employees in this Role perform routine investigations into environmental problems.
- Employees collect and submit samples for laboratory or field analysis; assist in making inspections; conduct routine field and office project reviews; may compile project-oriented engineering, social, economic and other technical data necessary for public hearings.

ENVIRONMENTAL SCIENSTISTS AND SPECIALISTS, INCLUDING HEALTH

New Mexico State Personnel Office

2600 Cerrillos Road
Santa Fe, New Mexico 87505-0127

Classification Description

Recommended Education and Experience for Full Performance
Bachelor's Degree in Physical, Natural, or Environmental Science, Soil Science, or Engineering.

Minimum Qualifications
Bachelor's Degree in Physical, Natural, or Environmental Science, Soil Science, or Engineering. Any combination of education from an accredited college or university in a related field and/or direct experience in this occupation totaling four (4) years may substitute for the required education and experience.

Operational

- Employees in this Role review applications, preliminary and final plans, and specifications for proposed plants, facilities, and/or equipment to determine completeness, technical feasibility, engineering accuracy, and compliance.
- Employees conduct supplementary investigations, research and surveys as needed; announce and conduct public hearings; issue permits and approvals and notify concerned public of the action; participate in inspections, cost estimates, progress reports, and design change orders; perform tests and audits test results to determine conformity; and compile findings and technical data for reports and projections.

Recommended Education and Experience for Full Performance
Bachelor's Degree in Physical, Natural, or Environmental Science, Soil Science, or Engineering and four (4) years of work experience in public/environmental health, environmental science, Air Quality Management, Biology, Engineering, Chemistry, Geology, Hazardous Waste Management, Wildlife Management, and/or Water Resources.

Minimum Qualifications
Bachelor's Degree in Physical, Natural, or Environmental Science, Soil Science, or Engineering and two (2) years of work experience in public/environmental health, environmental science, Air Quality Management, Biology, Engineering, Chemistry, Geology, Hazardous Waste Management, Wildlife Management, and/or Water Resources. Any combination of education from an accredited college or university in a related field and/or direct experience in this occupation totaling six (6) years may substitute for the required education and experience.

Advanced

- Employees in this Role determine adverse and beneficial environmental, social, and economic effects of highway proposals, archaeological sites and excavations.
- Employees coordinate environmental and archaeological activities with project development and design; analyze and generate procedural changes; determine manpower needs; review and authorize mitigation contracts for ongoing and completed projects; assemble data for planning; engage in or monitor research; develop public information programs; assist management in planning objectives, budget, records, and reports; prepare complex scientific reports and advanced analysis of data.

Recommended Education and Experience for Full Performance
Bachelor's Degree in Physical, Natural, or Environmental Science, Soil Science, or Engineering and six (6) years of work experience in public/environmental health, environmental science, Air Quality Management, Biology, Engineering, Chemistry, Geology, Hazardous Waste Management, Wildlife Management, and/or Water Resources.

ENVIRONMENTAL SCIENSTISTS AND SPECIALISTS, INCLUDING HEALTH

New Mexico State Personnel Office

2600 Cerrillos Road

Santa Fe, New Mexico 87505-0127

Classification Description

Minimum Qualifications

Bachelor's Degree in Physical, Natural, or Environmental Science, Soil Science, or Engineering and five (5) years of work experience in public/environmental health, environmental science, Air Quality Management, Biology, Engineering, Chemistry, Geology, Hazardous Waste Management, Wildlife Management, and/or Water Resources. Any combination of education from an accredited college or university in a related field and/or direct experience in this occupation totaling nine (9) years may substitute for the required education and experience.

Knowledge and Skills

*Note: This information has been produced by compiling information and documentation provided by O*NET. O*NET™ is a trademark of the U.S. Department of Labor, Employment and Training Administration.*

Knowledge

English Language — Knowledge of the structure and content of the English language including the meaning and spelling of words, rules of composition, and grammar.

Chemistry — Knowledge of the chemical composition, structure, and properties of substances and of the chemical processes and transformations that they undergo. This includes uses of chemicals and their interactions, danger signs, production techniques, and disposal methods.

Mathematics — Knowledge of arithmetic, algebra, geometry, calculus, statistics, and their applications.

Biology — Knowledge of plant and animal organisms, their tissues, cells, functions, interdependencies, and interactions with each other and the environment.

Law and Government — Knowledge of laws, legal codes, court procedures, precedents, government regulations, executive orders, agency rules, and the democratic political process.

Engineering and Technology — Knowledge of the practical application of engineering science and technology. This includes applying principles, techniques, procedures, and equipment to the design and production of various goods and services.

Geography — Knowledge of principles and methods for describing the features of land, sea, and air masses, including their physical characteristics, locations, interrelationships, and distribution of plant, animal, and human life.

Customer and Personal Service — Knowledge of principles and processes for providing customer and personal services. This includes customer needs assessment, meeting quality standards for services, and evaluation of customer satisfaction.

Persuasion — Persuading others to change their minds or behavior.

Negotiation — Bringing others together and trying to reconcile differences.

Social Perceptiveness — Being aware of others' reactions and understanding why they react as they do.

Instructing — Teaching others how to do something.

Physics — Knowledge and prediction of physical principles, laws, their interrelationships, and applications to understanding fluid, material, and atmospheric dynamics, and mechanical, electrical, atomic and sub- atomic structures and processes.

New Mexico State Personnel Office
2600 Cerrillos Road
Santa Fe, New Mexico 87505-0127

Time Management — Managing one's own time and the time of others.

Skills

Classification Description

Science — Using scientific rules and methods to solve problems.

Critical Thinking — Using logic and reasoning to identify the strengths and weaknesses of alternative solutions, conclusions or approaches to problems.

Reading Comprehension — Understanding written sentences and paragraphs in work related documents.

Speaking — Talking to others to convey information effectively.

Active Listening — Giving full attention to what other people are saying, taking time to understand the points being made, asking questions as appropriate, and not interrupting at inappropriate times.

Writing — Communicating effectively in writing as appropriate for the needs of the audience.

Complex Problem Solving — Identifying complex problems and reviewing related information to develop and evaluate options and implement solutions.

Coordination — Adjusting actions in relation to others' actions.

Judgment and Decision Making — Considering the relative costs and benefits of potential actions to choose the most appropriate one.

Active Learning — Understanding the implications of new information for both current and future problem-solving and decision-making.

Statutory Requirements: N/A

Conditions of Employment: Working Conditions for individual positions in this classification will vary based on each *agency's utilization*, *essential functions*, and the *recruitment needs* at the time a vacancy is posted. All requirements are subject to possible modification to reasonably accommodate individuals with disabilities.

Default FLSA Status: Exempt. FLSA status may be determined to be different at the agency level based on the agency's utilization of the position.

Bargaining Unit: This position may be covered by a collective bargaining agreement and all terms/conditions of that agreement apply and must be adhered to.

Established: 07/07/2001 **Revised:** 9/4/2014

**Adapted from the United States Bureau of Labor Statistics and are intended to illustrate the typical education and experience required for this occupation.*

Note: Classification description subject to change. Please refer to the SPO website www.spo.state.nm.us to ensure this represents the most current copy of the description.

GRAVIMETRIC ANALYSIS of 47mm Air Filters

Effective date: February 28th, 2018

Prepared by Patricia Murphy and Frank See

1. SCOPE AND APPLICATION

NMED Exhibit 29 - 0059

1.1 This method is a gravimetric analysis for the mass determination of particulates suspended in air. Particle size can vary by the type of particle-size discriminator used on the sampling equipment. The most common have an aerodynamic diameter of less than or equal to either 2.5 or 10 microns; this method is applicable to either size. These fine particulates are collected on 47-mm Teflon filters. The method covers the conditioning and weighing of the filters, data handling and reporting.

2. SUMMARY OF METHOD

2.1 Clean filters are conditioned under precisely controlled conditions of temperature and relative humidity until stable for weighing on a microbalance. Filters are weighed to the nearest microgram (10^{-6} gram) at the lab, and then sent to clients for exposure. Exposed filters are returned to SLD, where they are again conditioned and weighed to the nearest microgram. The difference of exposed weight minus clean weight yields the net mass loading on the filter

3. DEFINITIONS

3.1 National Institute of Standards and Tests: (NIST) US Dept of Commerce Laboratory measurement standards laboratory.
3.2 Accuracy -The degree to which a measurement relates to its actual (true) value. For digital scales, expressed as a percent deviation of actual reading (%AR)
3.3 American Society for Testing and Materials: (ASTM) international standards program.
3.4 $PM_{2.5}$: Particulate Matter (PM) ≤ 2.5 microns in diameter.
3.5 PM_{10}: Particulate Matter (PM) ≤ 10.0 microns in diameter.
3.6 Gravimetric analysis: Analysis determined by the measurement of mass (weight).
3.7 Filter: 47-mm diameter Teflon. Each filter as supplied has a unique identifier (alphanumeric).
3.8 Primary mass reference standards: Certified ASTM class 1 or better mass standards (weights), 200, 300 & 500 mg. Verified annually by a certified technician.
3.9 Working mass reference standards: 200, 300 & 500 mg. mass standards (ASTM Class 2 or better) used for routine filter weighings. The working standards are calibrated against the primary mass standards every 6 months.
3.10 Laboratory Information Management System (LIMS): This is the database of record for SLD. All samples are logged into the facility and tracked through each step needed to properly analyze and report out on samples submitted.
3.10.1 Pre-accessioning: This process is used to create samples in the LIMS system for the purpose of pre-sampling prior to sending filters out into the field.
3.11 Pre-sampling: Weighing of filter media before exposure (tare weight).
3.12 Post-sampling: Weighing of filter media after exposure (exposed).
3.13 Filter loading: the amount of particulates, in micrograms, entrained on the filter medium.
3.14 Filter lot: A single shipment of filters received from EPA or manufacturer. Identified by lot number.

3.15 Filter exposure lot blanks: 3 filters randomly selected from each filter exposure lot, used to assess the conditioning time necessary for the given lot.
3.16 Lab blank (LB): A conditioned, unsampled filter, used to assess contamination in the lab and microbalance environment. Filters should be weighed in the pre-sampling session and again in a post-sampling session. Enough filters should be weighed to represent 10% of filters in a batch per weighing session.
3.17 Field blank (FB): A conditioned, unsampled filter sent to the field, used to assess possible contamination during sampling. The field blank is placed in the sampler but not exposed. Field blanks are conditioned, stored, and weighed the same as sampled filters
3.18 Duplicate: The duplicate measurement (weighing) of a filter, used to assess the precision of the weighing and conditioning procedures.
3.19 Precision (also Repeatability): A measure of random variation among individual measurements of the same property under prescribed identical conditions. For microbalance measurements, precision is the measure of the ability to display the same result in repetitive weighings of the same mass under the same measurement conditions. ASTM: American Society of Testing and Materials.
3.20 Bias: The systematic or persistent distortion of a measurement process that causes errors in one direction. The lack of accuracy associated with a specific measurement.
3.21 Filter Integrity Check: Examination of each pre-sampled (unexposed) filter against a defined set of criteria before conditioning. Filters that do not pass the filter integrity check must not be used.
3.22 Qualifier: A 3-letter description giving further explanation of a particular filter. See table 15.2 for a list of qualifiers and their meanings.
3.23 Readability: (also Resolution, Scale Division, Scale Interval, Increment, Digit) – On electronic and digital scales, this is the smallest change in mass that corresponds to a change in displayed value. In other words, this is the amount that the scale will increment by as weight is added or removed.
3.24 Reproducibility: This is the scale's ability to show consistent results under changed conditions.

4. SAMPLE COLLECTION, PRESERVATION AND STORAGE

4.1 Pre-sampled (clean) filters

4.1.1 Filters are "pre-accessioned" in LIMS. Each filter is given a unique SLD number and request form that is tracked with the barcode label that is affixed to filter storage container and each request form is printed with the same information. At this point, each filter and its unique identifier is associated with a unique SLD number in LIMS and tracked with a barcode reading system.
4.1.2 All Supplied filters are conditioned, weighed, and checked for integrity before being sent to clients for exposure.
4.1.3 To ensure that contamination and/or static charge is not a problem, the analyst must wear static-free, non-powdered gloves and clean lab coats when handling filters. Long sleeve garments are discouraged (dust build up).
4.1.4 Filters shall ONLY be weighed in the designated, conditioned environment.

Uncontrolled Copy

NMED Exhibit 29 - 0061

4.1.5 Clean filters are removed from the shipping material and retained in their original boxes (usually 50 filters per box). Boxes of clean filters are stored in the Air Quality Weight Room 2348A until filters are set out for conditioning. Refer to section 9.2 for clean filter conditioning procedure.

4.1.6 Upon completion of weighing, the filters are packaged and prepared as described in Section 9 of this SOP and are then available for pickup or being shipped to the client.

4.1.7 **Note:** Pre-sampled filters must be exposed (sampled) within 30 days from the date of weighing.

4.2 **Exposed filters**

4.2.1 Exposed filters upon being returned to SLD are brought into the Specimen and Receiving (SR) area of the Laboratory and accessioned through LIMS. Refer to section 9.5 for exposed filter check-in and handling.

4.2.2 The SR area of the Laboratory is responsible for checking and maintaining proper Chain of Custody. Each exposed filter's unique identifier is matched with paperwork and prepared for conditioning and weighing.

5. INTERFERENCES

5.1 Static charge will cause delays and inaccuracies in balance measurements. The analyst must take proper precautions to minimize static charge.

5.2 Insufficient conditioning of unexposed filters may result in erroneous filter loading calculations. Unexposed filters need sufficient time for the support ring to de-gas before pre-sample weighing and equilibrate with the laboratory environment.

5.3 Filter exposure in the presence of NO_x and SO_2 vapors (primarily from nitric and sulfuric acids, respectively) may cause the agglomeration of nitrate and/or sulfate containing particles on high-alkalinity filter media, resulting in a falsely high result.

6. APPARATUS AND EQUIPMENT

6.1 Microbalance: Capable of 1 µg (0.001 mg) readability and 0.0008 mg repeatability.(See Appendix A for currently used equipment.)

6.2 Conditioning & Weighing Room: Room 2348A and 2348B. The conditioning and weighing rooms must be maintained at a mean temperature of 20.0-23.0 ^{0}C, with <± 2.0 ^{0}C variation in the 24-hour period preceding filter weighing. The mean relative humidity in the same rooms must be maintained between 30.0%-40.0 % with <± 5.0% variation in the 24-hour period preceding filter weighing. The climate control equipment should be able to read both the room temperature and relative humidity in the room frequently and adjust such that these conditions are maintained. The room is equipped with Johnson Controls data logging that tracks the environmental parameters.

6.3 Hygrometer/temperature sensor: A separate hygrometer & temperature sensor [Dickenson THDX with chart recorder, and battery backup should be located near the

microbalance. Relative humidity must be measured to the nearest 1 percent, while temperature must be measured to the nearest 1 °C.

6.4 Computer with microbalance interfaced to LIMS.

6.5 Bar code label maker and scanner: interfaced to LIMS to make and read bar code labels for filter storage container.

6.6 Balance table: Stone or other heavy (stable) surface for microbalance.

6.7 Damping pads/slab: Isolate balance table from floor.

6.8 Primary and Working Mass standards: 200 mg, 300mg and 500 mg standards certified to ASTM or NIST class 1 or better.

6.9 ^{210}Polonium strips: Strips used to neutralize static electricity. Strips should contain no more than 500 Picocuries of radiation.

6.10 Anti-static brush: Small brush, used to clean the microbalance-weighing pan.

6.11 Filter: 47-mm diameter Teflon. With unique alphanumeric identifier. Available from US EPA through the national $PM_{2.5}$ contract.

6.12 Filter cassette: Handling device attached to each filter ring, which holds the filter in place in the sampler. Two pieces (top and bottom half) to each cassette. Filter cassettes: Various, depending on filter manufacturer. Reusable.

6.13 Filter storage containers: Storage containers used to store the filter during conditioning. Each container must be labeled with the enclosed filter number on the lid. The dish should be large enough to accommodate the filter easily but with minimal extra room, to prevent filter movement inside the dish.

6.14 Cassette protective containers: This may be a Petri dish plus foam blocks (manual sampler) or sampling magazine holding several filter cassettes and solid spacers (automated sequential sampler).

6.15 Magazine Protective Container: Padded metal box used for additional protection, used to ship the filter plus cassette

6.16 Forceps: Smooth, non-serrated. A different pair is used to handle the filters (**filter**) and mass standards (**standard**).

6.17 ^{210}Po: Polonium 210, an alpha emitter used to neutralize static charge build-up.

6.18 Magazine Pump: Pneumatic tool to push filter cassettes through the magazine.

6.19 Filter cassette separator tool: Used to separate the top & bottom cassette halves for filter retrieval.

6.20 Shipping Coolers: Picnic coolers with leak proof ice substitute, for shipping filters.

6.21 Min-Max Thermometers: Thermometers for recording the minimum and maximum temperatures inside the shipping coolers.

6.22 Earth-ground flooring: used to drain away static charge.

6.23 Tacky mats: Adhesive mats, used to trap dust and other particulate contamination from analysts' shoes; placed outside of the balance room.

6.24 Kim Wipes: Lint free wipes used to remove debris and solution from apparatus.

6.25 Alcohol Wipes: Used to clean the inside of the filter magazines.

6.26 Anti-Static Solution: Spray-on type, applied to weighing areas to minimize static charge accumulation.

6.27 Alconox or similar detergent to clean filter cassettes.

6.28 Methanol: Used to clean forceps.

Uncontrolled Copy

NMED Exhibit 29 - 0063

7. REAGENTS -NA

8. CALIBRATION

8.1 The microbalance calibration must be verified annually by a certified technician.
8.2 The microbalance calibration must be checked before each weighing session, using both the 300 and 500 mg. working mass standards.
8.3 Utilize any calibration programs that may be installed in the analytical balance as needed.

9. PROCEDURE

9.1 General

9.1.1 Wash hands thoroughly before entering the outer room (Rm. 2348).
9.1.2 Before entering the balance room, the analyst must walk across a tacky mat with both feet, to remove as must dust as possible from their feet.
9.1.3 Before entering the balance room, the analyst must discharge any static charge on their person to an earth ground by touching the ground with both hands for 2 seconds.
9.1.4 If contamination and/or static charge has been proven to be a concern, the analyst must wear non-static, powder-free gloves and a clean lab coat. Gloves and lab coats are put on in the outer room.
9.1.5 The analyst must verify via the balance room data recorders that the required conditions for temperature and relative humidity have been achieved over the previous 24 hours. See section 12.7 for requirements. If the conditions are outside the allowable range, weighing should not be done until the requirements are met. If the temperature and humidity cannot be controlled to requirements, then a notation must be entered into the batch under LIMS Batch Manager and be made available to the client
9.1.6 The weighing rooms (2348A and 2348B) are controlled environments. Access should be limited to people that have a need to work in the weight rooms.

9.2 Clean Filter Conditioning

9.2.1 All new filters must be checked for integrity, conditioned, and weighed before being sent to clients for exposure.
9.2.2 Filters meeting the integrity criteria are to be pre-logged into LabWare© LIMS.
9.2.2.1 Click on **Sample Interface Icon**. A **Sample Login Window** will appear.
9.2.2.2 Select **File>Open Template**. A **LIMS Browser Window** will appear
9.2.2.3 Click on **Template ID:** Select **Air Quality Sample Pre-Log**. Click **OK**.
9.2.2.4 In the **AQ Sample Pre-log Window** on the **Summary Tab** Select **Specimen Source** and from the Drop Down Menu **Air Filter (47mm)**
9.2.2.5 Enter the Filter Lot # from the EPA supplied filter box.

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

Uncontrolled Copy

9.2.2.6 In the upper-right hand corner of the **AQ Sample Pre-log Window** type in the appropriate amount of filters to be clean conditioned and Click the **Log Button**. Please confirm by hitting **Yes** when asked "Logging XX samples OK to continue"?

9.2.2.7 Select **File>Exit**.

9.2.2.8 Select **File>Folder Manager**

9.2.2.9 In the **Folder Manager Window** select **File>Open**.

9.2.2.10 When the **Folder Prompt Dialogue Window** appears, select the browse icon and then highlight the **AQ_Clean_Condition_XX Folder**

9.2.2.11 When the **SAMPLE Folder: Air Quality – Clean Condition Window** appears select **File>Rebuild .** The samples created in Login Interface previous step should be present in the left column.

9.2.2.12 Select **NMDOH>Clean Condition**. In the **AQ Clean Condition Window** type in the first filter number and then highlight the remaining cells in the column.

9.2.2.13 Using **NMDOH>Increment Filter Down**.

9.2.2.14 When done **File>Save; and Exit.** This will enter the filter numbers into the batch.

9.2.2.15 Select **File>Save.**

9.2.2.16 Select **Folder>Print Sample Labels.**

9.2.2.17 Select **NMDOH>Clean Condition**.

9.2.2.18 In the **AQ Clean Condition Window** enter the date in the Clean Condition Date Column.

9.2.2.19 Select **Edit>Propagate** down to fill all filter samples **.**

9.2.2.20 **Select File >Save** and then **Exit.**

9.2.2.21 Select rebuild folder.

9.2.2.22 Select **File> Save** and then **Exit.**

9.2.2.23 The created labels are then affixed to the bottom of the petri dishes.

9.2.3 Remove all filters from their original boxes. Perform the filter integrity check (see section 12.1 and table 15.1). If all criteria in table 15.1 are not satisfied, the filter is rejected. Rejected filters are voided in LIMS. If a large number of filters from a given lot do not meet the defined criteria, the entire lot is returned to the vendor for replacement.

9.2.4 Each filter that successfully passes the filter integrity check is placed in a clean petri dish. Handle the filter only by the support ring using the **filter** forceps; do NOT handle the filter directly. Filters have a unique identifier (alphanumeric filter number) that is printed above the LIMS sample number on the printed labels (see 9.2.2.16) and affixed to the bottom half of the petri dish (filter container). Place all filters in the bottom half of the petri dish, and partially cover with the top. Record the current date in LIMS (9.2.2.18).

9.2.5 Three (3) filters are randomly selected from the initial filter exposure lot (3.12) of each filter lot (3.11) and designated as Exposure Lot Blanks. The 3 filters are conditioned for a minimum of 24 hours, and then weighed on consecutive days until such time that the 24-hour weight change is less than 15 µg. While conditioning, the petri dishes must be open. Remaining filters in this exposure lot

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

Uncontrolled Copy

NMED Exhibit 29 - 0065

must not be weighed until this criterion is met. Record the Exposure Lot Blank filter numbers, dates of weighing, and weights in an Excel file.

9.2.6 The next group of clean filters set out to condition (filter exposure lot) following the initial exposure lot (9.2.5) must repeat the Exposure Lot Blank study. After clean filters have conditioned for at least the same period of time as determined by 9.2.5, subsequent weighings must agree within 15 µg.

9.2.6.1 If the Exposure Lot Blanks satisfy the criterion in 9.2.5, the amount of conditioning time has been established for the entire filter lot, and no new Exposure Lot Blanks need be weighed. All remaining clean filters in the given lot must condition for at least this amount of time.

9.2.6.2 If the Exposure Lot Blanks do not satisfy the criterion in 9.2.5, the blanks are conditioned for a longer period of time. Once the consecutive daily weighings agree within 15 µg, the clean filters in that specific Exposure Lot may be weighed. The Exposure Lot Blank study must again be conducted on the next group of clean filters set out to condition (filter exposure lot). The procedure is repeated until successive Exposure Lot Blank studies yield consistent results.

9.3 Pre-sampled (clean) filters

9.3.1 See section 9.2 for required filter conditioning.

9.3.2 Verify the required room conditions have been achieved (section 12.7); if the requirements cannot be achieved, the filters are flagged with the appropriate qualifiers.

9.3.3 Click on the Results Tab of the Batch window that you've just created. Enter the values for Humidity and Temperature Data in the lower left prompt in the window.

9.3.4 Select the appropriate clean filters for weighing, placing within easy reach of the balance. The following criteria must be satisfied:

a) Filters have been conditioning for the appropriate time; the Exposure Lot Blanks (9.2.5) determine this.
b) Filters have successfully passed the filter integrity check. See table 15.1.
c) Filters have been pre-logged as described in section 9.2.2

9.3.5 Designate three filters as Lab Blanks (LB) every time pre-sampled (unexposed) filters are weighed, and label the appropriate petri dishes. Label as filter number followed by LB or FB (as appropriate). **Ex:** T8197000(LB).

9.3.6 For weighing more than 30 clean filters in any one session, designate one lab blank for each block of ten filters. **Ex:** 35 clean filters are to be weighed; designate 4 lab blanks.

9.3.7 Clean the microbalance weighing-chamber with a fine-bristled, anti-static brush.

9.3.8 Clean the surfaces near the microbalance with methanol-moistened Kim Wipes or anti-static cleaner and Kim-Wipes.

9.3.9 Clean both pairs of forceps (mass standards and filters) with methanol-moistened Kim Wipes. It is very important that the forceps be dry before handling standards.

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

Uncontrolled Copy

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

Tare (zero) the balance by pushing the "re-zero" key before each weighing session.

Note: The microbalance will autozero between weighings, however, the balance should be re-zeroed when drift causes the zero reading (between filter weighings) to read other than 0.000 mg.

9.3.10 Open the balance software and check for connection.

9.3.11 Log into the LabWare LIMS. The analyst should have an account with the _TECH_AQ role and should log in under that role.

9.3.12 Click on **File >Batch Manager** (or use Batch Manager Icon): -A new window will appear. Click on **File >New** (or use New Batch Icon): Click on the **Template Browser** search icon and select the **AQ_47_Clean option**. Click OK and Save. This will create a new Batch

9.3.13 Select the Scan Icon and scan the barcode on the label printed out in section 9.2.2.16.

9.3.14 After scanning in the filter numbers select save.

9.3.15 Note: After every ten filters, you must add a duplicate and 300mg QC weighing into the batch.

9.3.16 Select **Options.Enter Results by Test**

9.3.17 You will see RS/232 Result Entry window.

9.3.18 Weigh lab blanks before other filters in any given session.

9.3.19 Pick up each filter, using the designated forceps for filters, by the support ring only. Pass every filter over the ^{210}Po strips for 15-30 seconds before placing in the weighing pan for measurement. Center each filter in the middle of the balance pan when weighing. Close the weighing chamber.

9.3.20 Press print on the scale. The weight will then be recorded and appear in the clean Weight cell when a stable reading is achieved.

9.3.21 After the measurement is transferred, open the weighing chamber and return each filter to its designated petri dish after weighing.

> **NB:** For each filter, ensure that the filter number matches against the label on the petri dish.

9.3.22 One filter in each group of ten filters is weighed in duplicate. Weigh the filter, remove the filter from the weighing pan, and again weigh the filter. See section 12.12 for acceptance criterion.

9.3.23 Repeat until all filters have been weighed. Then Select **Save,** then **Exit**.

9.3.24 Select **NMDOH>Modify Samples**. This is where qualifiers are added. This is the first step of Shipping Out.

9.3.25 You will see an AQ Batch Sample Edit Window. This is where you will enter the Cassette # and Magazine; Sample type (SAM, LB, FB)

9.3.26 Entering Site ID: The Site ID is demographic data provided by the client and is linked to, tables in LIMS that populate other information fields associated with it.

9.3.26.1 Site ID is entered by using a drop-down menu.

9.3.26.1.1 Select the appropriate Site ID based upon the client's request.

Uncontrolled Copy

NMED Exhibit 29 - 0067

9.3.26.1.2 Once the appropriate Site ID is selected, the analyst should confirm that the correct location information populates.

NB: IF you notice that you have selected the wrong Site ID from the drop down menu. STOP.
Exit the batch and DO NOT SAVE.
Go back in and enter the correct Site ID.

NB: If the Site ID does not match up with the location provided by the client, Immediately STOP and notify your supervisor.

Then Ship Date

9.3.27 NOTE Never hit the **Save** option until all data is entered and verified by the analyst.
9.3.28
9.3.29 When complete hit **Save. Then Exit**.
9.3.30 Enter the Serial Numbers of the Working Standards and any qualifiers. Save Data before exiting
9.3.31 When the batch sheet requires, weigh the 300 and 500 mg working standards using the **standard** forceps.
9.3.31.1 Place the appropriate mass standard in the center of the pan. Close the weighing chamber door. Press print on the scale. The software will transfer the measurement to the LIMS automatically when the measurement is stable.
9.3.32 Each standard must agree with the verified mass ± 3 µg. If not, reweigh the standard(s). If the mass still does not fall within the acceptable range, take appropriate corrective actions (see section 12.6).
9.3.33 Select NMDOH > Print paperwork to print out request forms for each filter.
9.3.34 The batch is now ready to be reviewed in LIMS by the AQ_Sup

9.4 Packaging Clean Filters for Shipment

9.4.1 Filters are shipped to NMED via UPS Ground; the City of Albuquerque (COA) picks up filters at SLD. Package filters such that clients receive them no later than the day previous to the day needed (check the appropriate client sample schedule). UPS usually takes one day.

Uncontrolled Copy

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

9.4.2 The deadline for packages sent via UPS is 1:30 p.m. each day. Packaged filters must be taken to Specimen Receiving by this time. Check with Specimen Receiving personnel should you not be able to meet this deadline, as they may be able to delay UPS pickup. Also check with Specimen Receiving for UPS holiday schedules.

9.4.3 Retrieve the appropriate client shipping labels; these are in the balance room.

9.4.4 Secure the necessary number of Pre-sampled (clean) filters (see section 9.3) to load one magazine at a time.

9.4.5 Complete the shipping label. **Note:** Magazines are loaded bottom to top; complete the shipping label in the exact order that filters and spacers are packed.

9.4.6 For NMED, the bottom cassette (first into the magazine) is a solid spacer. For COA, the first is a sample (filter).

9.4.7 Check the fit of the top and bottom halves for each cassette before loading a filter. The fit MUST be tight. If not, try another cassette half. Note that the screen will decrease the tightness; if there is any doubt regarding the fit, load a screen and check the fit again.

9.4.8 Spacers have no designated top or bottom.

9.4.9 Filter screens must be loaded with the number facing down.

9.4.10 The top half of each cassette has a beveled edge. The beveled edge faces up when loaded into the magazine.

9.4.11 Load the magazine. Push each successive cassette into the magazine such that the top of the cassette is even with the top of the magazine.

9.4.12 Place an orange-colored cap over the top of the magazine when loading is completed.

9.4.13 Repeat steps 9.4.3-9.4.12 as needed.

9.4.14 Load the magazine into a metal shipping container as each one is completed, and tape both ends of the shipping label to the top (lid) of the metal shipping container. Repeat for the remaining magazines.

9.4.15 For NMED samples, proceed to step 9.4.16. For COA samples, go to step 9.4.21.

9.4.16 Package no more than four metal shipping containers per Styrofoam cooler. Group by submitter. Place the metal shipping container(s) on the cooler bottom, and pack liberally with ice-substitute blocks.

9.4.17 Include one thermometer into the cooler, The paperwork to accompany the filters should be placed into the cooler and then covered with the Styrofoam lid. **Note:** Most coolers have an outer cardboard protective carton.

9.4.18 Place a sticky note on the outer cardboard protective carton, indicating the submitter code, submitter city, and client name. This info is found on the list posted on the wall.

9.4.19 Repeat steps 9.4.16-9.4.18 for the remaining metal shipping containers.

9.4.20 Take the packages to Shipping and Receiving for shipping by 1:30 p.m. for NMED samples.

9.4.21 Take the COA shipping containers to Specimen Receiving. COA pickup is before close of business on Wednesday afternoon, unless otherwise requested by COA.

9.5 Exposed filter check-in

Uncontrolled Copy

9.5.1 Filter receipt and check in by Specimen Receiving.

9.5.1.1 NMSLD Specimen Receiving personnel receive shipping/transport container(s); typically, this will be an insulated picnic cooler for NMED filters. The cooler is opened and the filter magazine protective container(s) (metal shipping box) and accompanying request form(s) are retrieved.

9.5.1.2 NMSLD Specimen Receiving personnel note the maximum temperature indicated on the min/max thermometer contained in the cooler and record on the request form to the nearest °C. For filter samples received not in a cooler, record the ambient temperature on the appropriate data sheet(s).

9.5.1.3 One form is required for each filter.

9.5.1.4 Upon receipt, collect the *Filter Chain of Custody Record(s)*. **Note:** The *Filter Chain of Custody Record(s)* must not be packaged inside the filter magazine.

9.5.1.5 **Note:** Filter magazines must only be opened by authorized AHM personnel.

9.5.1.6 NMSLD Specimen Receiving personnel return the metal shipping boxes back into their respective coolers and deliver to the AHM section facility. **Note:** NMSLD is a designated secure area; therefore, no internal custody transfers need be documented.

9.5.2 Filter receipt and check in by Air & Heavy Metals.

9.5.2.1 The filters are brought to AHM room 2366A still in the coolers and their protective containers (metal shipping boxes).

9.5.2.2 Retrieve the magazine from the metal shipping container. The magazines should not be wet from melting ice. If they are wet, flag as "questionable".

9.5.2.3 Remove the shipping label from the top of the metal shipping container and tape the shipping label to the orange cap. Leave the magazine in room 2348 for 24 hours before opening for thermal equilibration.

9.5.2.4 After thermal equilibration, take the magazines into Room 2348A, remove all solid spacers and filter cassettes from the filter magazine, and inspect the inside of the magazine for particulate matter and/or debris. If particulate matter and/or debris is found, all filters contained in the magazine are flagged as questionable.

9.5.2.5 Carefully separate the 2 halves of the cassette container to remove the filter sample. Inspect for and note any debris or filter compromise in LIMS. Flag all filters that have obvious signs of damage to either the filter or filter cassette as questionable in the LIMS Lab field remarks.

9.5.2.5.1 Damaged filters are voided and not weighed. Explain all voided filters in the LIMS field remarks.

9.5.2.6 Set the cassette halves and screens to wash.

9.5.2.6.1 Cassettes are reusable and shall be cleaned between uses. Wash with Alconox in warm water; rinse thoroughly with tap water, followed by deionized water after washing. Let dry at room temperature completely.

9.5.2.7 Retrieve the appropriate petri dishes previously used for clean filter conditioning, and place the exposed filter in the dish, exposed side up.

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

Uncontrolled Copy

Double check that the filter and LIMS numbers match up. Partially cover with the petri dish top half.

9.5.2.8 The filter in the open dish should be conditioned for a minimum of 24 hours before weighing.

9.5.2.9 Verify the user code, submitter code, priority, and sample location, site ID and analytical request fields are completed by the submitter. If not, the analyst completes these fields. Initial all changes to the request form. Do not add filter number unless there is only one filter per magazine (determine from shipping label).

9.5.2.10 Verify that each request form corresponds to the appropriate cassette and filter. Investigate and document all discrepancies.

9.5.2.11 Upon receiving the exposed filters back into SLD, Shipping and Receiving personnel record the filter temperatures and any field remarks into LIMS. Filters are delivered to the section as described above are and forms are returned to the AHM section.

9.5.2.12 With respect to the 47mm $PM_{2.5}$ filters If any are received at 4 ^{0}C they must be weighed within 30 calendar days from receipt. Filters received at > 4 ^{0}C, but < 25 ^{0}C must be weighed within 10 calendar days from receipt. Filters received at > 25 ^{0}C are weighed within 10 calendar days from receipt but are flagged as questionable. This rule does not pertain to 47mm PM_{10} filters.

9.6 Exposed Filter Weighing

9.6.1 The analyst must wear static-free, non-powdered gloves when handling filters.

9.6.2 Use the same balance for exposed weighing as was used for the unexposed weighing.

9.6.3 Clean the microbalance weighing-chamber with a fine-bristled, anti-static brush.

9.6.4 Clean the surfaces near the microbalance with methanol-moistened Kim Wipes or anti-static cleaner and Kim-Wipes.

9.6.5 Clean both pairs of forceps (mass standards and filters) with methanol-moistened Kim Wipes. It is very important that the forceps be dry before handling standards or filters.

9.6.6 Tare (zero) the balance by pushing the "re-zero" key before each weighing session.

Note: The microbalance will autozero between weighings, however, the balance should be re-zeroed when drift causes the zero reading (between filter weighings) to read other than 0.000 mg.

9.6.7 Start the balance software and confirm connection.

9.6.8 Start LIMS software. Go to Batch Manager and create a new Exposed Batch.

9.6.9 Record the room temperature and relative humidity in LIMS Results Tab as described in section 9.3.3.

9.6.10 Weigh the 500 and 300 mg. working standards using the **standard** forceps.

9.6.10.1 Open the weighing chamber and place the 500-mg mass standard in the center of the pan. Close the weighing chamber door. Press the print button on

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

Uncontrolled Copy

NMED Exhibit 29 - 0071

the scale. LIMS software will transfer the measurement automatically when the measurement is stable.

9.6.10.2 Repeat using the 300-mg mass standard.

9.6.11 Each standard must agree with the verified mass ± 3 µg. If not, reweigh the standard(s). If the mass still does not fall within the acceptable range, take appropriate corrective actions (see section 12.6).

9.6.12 Select an appropriate number of conditioned filters to weigh, placing within easy reach of the balance.

9.6.13 Exposed filters and cassettes must be inspected for signs of damage before weighing. Flag all filters that have obvious signs of damage to either the filter or filter cassette as questionable.

9.6.14 Weigh a Lab Blank (LB) filter first, then all exposed filters defined by the blank, including appropriate Field Blanks (FB). Pick up each filter, using the **exposed filter forceps** by the support ring only. Pick up each filter, using the designated forceps for filters, by the support ring only. Pass each filter over the ^{210}Po strips for 30-60 seconds before placing in the weighing pan for measurement. Center each filter in the middle of the balance pan when weighing.

9.6.15 Close the weighing chamber. Press the print button on the scale. The software will transfer the measurement when a stable reading is achieved (after the symbol ° disappears from the upper left corner of the balance display).

9.6.16 After the measurement is transferred, open the weighing chamber and return each filter to its designated petri dish after weighing, double checking filter numbers on the filters and petri dishes.

9.6.17 One filter in each group of ten filters is weighed in duplicate. Weigh the filter, remove the filter from the weighing pan, and again weigh the filter. See section 12.12 for acceptance criterion.

9.6.18 Reweigh the 300 mg. working standard after every duplicate filter, using the **standard** forceps. Each standard must agree with the verified mass ± 3 µg.

9.6.19 Repeat steps 9.6.12 through 9.6.19 until all necessary filters are weighed.

9.6.20 After all filters are weighed, reweigh the 300 mg working standard twice and then the 500 mg. working standard. Handle the mass standards using the **standard** forceps. Resume the macro.

9.6.21 The batch is now ready to be reviewed in LIMS by the "AQ_Sup."

10. CALCULATIONS AND REPORTING

10.1 The net filter loading is calculated by the following equation:

$$M_{2.5} = (M_f - M_I) \times 10^3$$

Where $M_{2.5}$ = total mass of particulates collected during the sampling period, in µg.
M_f = final mass of the equilibrated filter after sample collection, in mg
M_i = initial mass of the equilibrated filter before sample collection, in mg
10^3 = units conversion (10^3 µg/mg)

Uncontrolled Copy

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

NMED Exhibit 29 - 0072

10.2 Record filter weights in **milligrams** (mg).
10.3 Report the net difference (final weight – initial weight) in **micrograms** (µg).
10.4 Additional information for filters are noted as 3-digit qualifiers; see table 15.2.
10.5 Completed filter data is archived for a period of three (3) years following completion.

11. METHOD PERFORMANCE

11.1 The accuracy of the microbalance is assessed every 6 months, more often if indicated, using the certified Class 1 mass standards (200, 300 & 500 mg). The balance measurement must agree within ± 25 µg of the certified value.
11.2 The precision of the microbalance is assessed every 6 months, more often if indicated, using the certified Class 1 mass standards (200, 300 & 500 mg). The standard deviation of replicate measurements of each standard is compared to a pre-defined
11.3 Each working standard is verified against the appropriate certified class 1 primary mass standard every 6 months. The working standard must agree with the certified value within 25 µg.
  11.3.1 The acceptable range for the 200-mg working standard is 199.975 – 200.025 mg.
  11.3.2 The acceptable range for the 300-mg working standard is 299.975 – 300.025 mg.
  11.3.3 The acceptable range for the 500-mg working standard is 499.975 – 500.025
11.4 The precision of filter measurements is evaluated by replicate weighings of one filter out of every 10 filters weighed. Replicate weighings must agree within 15 µg.

12. QUALITY CONTROL

12.1 Filter Integrity Check: Before any filter can be weighed, either as a pre-sampled (unexposed) or post-sampled (exposed), the integrity of the filter and support ring must be examined. Refer to table 15.1 for parameters and criteria.
12.2 The calibration of the microbalance is checked yearly by a certified technician.
12.3 Class 1 primary mass standards are **certified** annually by a certified metrologist. These standards are used to verify the working standards.
12.4 Class 1 primary mass standards are **weighed** every 6 months, to assess balance accuracy and precision. Weigh each standard in duplicate and record in the appropriate file.
12.5 Working standards (200, 300 & 500 mg.) are verified against the Class 1 primary mass standards every 6 months. The measured value must be within 25 µg of the certified value. Record these values.
12.6 Working standards (300 & 500 mg.) are used to verify the balance calibration before every weighing session. The acceptable range is verified ± 3 µg. If the working standards are outside these limits, re-weigh the working standards. If the standards are still outside these limits, take corrective actions, including taring (zeroing) the balance, weighing the primary standards, passing the standards over the ^{210}Po strips, or other measures.

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

Uncontrolled Copy

NMED Exhibit 29 - 0073

12.7 Weighing should only be done when the balance room conditions meet the following criteria:

The mean relative humidity should be between 30.0-40.0%, with control of not more than ± 5.0% change in the 24 hours immediately prior to weighing.
The mean temperature should be between 20.0-23.0^{0}C, with control of not more than ± 2.0^{0}C change in the 24 hours immediately prior to weighing.

Control of both temperature and humidity may be demonstrated by calculating the arithmetic mean (AM) and standard deviation (SD) of the values taken from the data logger for the twenty-four hours prior to weighing.

$$AM = \frac{1}{n}\sum_{i=1}^{n} a_i = \frac{1}{n}(a, \mid a_2 \mid \cdots a_n)$$

$$SD = \sqrt{\frac{1}{N}\sum_{i=1}^{N}(x-\mu)^2}$$

12.7.1 If these conditions cannot be achieved, the data must be flagged appropriately. Investigate and document possible causes and solutions.

12.8 Filter Exposure Lot Blank (Section 3.15): Three (3) filters are randomly selected from each filter lot and designated as Exposure Lot Blanks. The 3 filters are conditioned for a minimum of 24 hours, then weighed on consecutive days until such time that the 24-hour weight change is less than 15 µg. While conditioning, the petri dishes must be open. If the exposure lot blanks do not agree within ± 15 µg, return the blanks for further conditioning. When three (3) consecutive daily weighings agree within ± 15 µg, all filters of the same lot as the exposure lot blanks may be pre-sampled once they have conditioned for the same length of time as did the blanks.

12.9 Lab Blank (Section 3.16): Weigh a minimum of three (3) Lab Blank (LB) filters at each pre-sampling weighing session. One lab blank filter must be weighed at each post-sampling weighing session. Do NOT use a lab blank for more than one post-sampling weighing session. The acceptable weight difference (post-sampling minus pre-sampling) must be within ± 15 µg.

12.9.1 If the difference is > 15 µg, contamination in the conditioning and/or weighing areas should be suspected. The analyst must take appropriate corrective actions,

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

Uncontrolled Copy

NMED Exhibit 29 - 0074

including: Reweigh the working mass standards and verify they are within acceptable range; weigh a second lab blank. If a second lab blank also shows > 15 µg difference, do not proceed with filter weighing, but advise the section supervisor. If a second lab blank also shows < 15 µg difference, proceed with filter weighing, but investigate possible sources of contamination and take corrective actions to eliminate them.

12.10 Field Blank (Section 3.14): Weigh all Field Blanks (FB) submitted with the group(s) of filters to be weighed at each post-sampling (exposed filter) weighing session. The acceptable weight difference (post-sampling minus pre-sampling) must be within ± 30 µg.

12.10.1 If the difference is > 30 µg, but the lab blanks are within acceptable range, the analyst should return the filters to the conditioning area, as the filters may have not had adequate time to condition.

12.10.2 After further conditioning, if the difference is > 30 µg, but the lab blanks are within acceptable range, contamination in the field/sampling process should be suspected. The sample filters defined by the specific field blank that is out of acceptable range should be flagged.

12.10.3 If the difference is > 30 µg, and the lab blanks are out of the acceptable range, contamination in the conditioning and/or weighing areas should be suspected. The analyst must take appropriate corrective actions.

12.11 Post-sampled (exposed) $PM_{2.5}$ filters should weigh approximately 110-160 mg. Exposed filters outside this range should be investigated by the client or an independent party.

12.12 Replicate measurements of the filter selected for duplicate weighing (section 9.3.15 and 9.6.18) should agree within 2 µg. If the difference is greater than 2 µg, reweigh the filter. If the difference is still greater than ± 2 µg, reweigh both working standards. If the standards are within the acceptable range (section 12.5), reweigh the last group of filters (since the last measurement of the 300-mg. working standard).

12.13 DI water is obtained from the SLD house DI water system and is filtered to 18 megaohms resistance prior to use.

12.14 The tacky mat outside the balance room shall be changed at least once each week, more often if indicated.

12.15 The Dickson Hygrometer/Thermometer is the environmental monitor of record for the filters processed. The circular data charts record continuous data for 1-week periods and the charts are kept on file for a period of 3 years.

13. SAFETY

13.1 ^{210}Po strips are alpha emitters and should not be touched directly.

13.2 Analysts must not be in the 2348A balance room when they have compromises to their skin (cuts, abrasions, etc.) that are exposed to the ^{210}Po strips. In all such cases, the analyst must cover the compromised skin with bandages, clothing, or gloves as appropriate.

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

Uncontrolled Copy

NMED Exhibit 29 - 0075

13.3 Appropriate PPE should be worn in the balance rooms to minimize and protect against exposure from α-particle emissions from Po^{210}. Minimum PPE includes safety glasses, lab coat, and gloves.

15. TABLES

15.1 Filter Integrity Check

Each pre-sampled (unexposed) filter must be inspected for, and pass the criteria described in the table below.

Filter Integrity Checklist	
Filter Defect.	Defect description
Pinhole	A small hole appearing as: a distinct and obvious bright point of light when examined over a light table or a dark spot when viewed over a dark surface.
Separation of ring	Any separation or lack of seal between the filter and filter border reinforcing the ring.
Chaff or flashing	Any extra material on the reinforcing ring or on the heat seal area that would prevent an airtight seal during sampling.
Loose Material	Any extra loose material or dirt particles on the filter.
Discoloration	Any obvious discoloration that might be evidence of contamination.
Filter nonuniformity	Any obvious nonuniformity in the appearance of the filter when viewed over a light or dark surface that might indicate gradations in porosity or density across the face of the filter.
Other	A filter with any imperfection not described above, such as irregular surfaces or other indications of poor manufacture.

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

Uncontrolled Copy

15.2 Qualifiers

The following qualifiers are used to provide additional information regarding the conditioning and/or weighing processes.

Code	Definition	Description
ALT	Alternate Measurement	The subject parameter was determined using an alternate measurement method. Value is believed be accurate but could be suspect.
AVG	Average Value	Average value-used to report a range of values.
CAN	Canceled	The analysis of this parameter was canceled and r performed.
FFB	Failed Field Blank	Field blank samples exceeded acceptance criteria limits.
FLB	Failed Laboratory Blank	Laboratory blank samples exceeded acceptance criteria limits.
FLD	Failed Laboratory Duplicate	Laboratory duplicate samples exceeded acceptanc criteria limits.
FLH	Failed Laboratory Humidity	Laboratory humidity exceeded acceptance criteria limits.
FLT	Failed Laboratory Temperatu	Laboratory temperature exceeded acceptance crit limits.
FQC	Failed Quality Control	The analysis result is not reliable because quality control criteria were exceeded when the analysis was conducted. Numeric field, if present, is estimated value.
GSI	Good Shipping Integrity	Integrity of filter upon receipt by shipping/receivi looked good.
HTE	Holding Time Exceeded	Filter holding time exceeded acceptance criteria limits.
ISP	Improper Sample Preservatic	Due it improper preservation of the sample, it wa rendered not suitable for analysis.
INV	Invalid Sample	Due to a single or multiple flags or events, the sample was determined to be invalid.
LAC	Laboratory Accident	There was an accident in the laboratory that eithe destroyed the sample or rendered it not suitable fo analysis.
OTH	Other	Miscellaneous event(s) occurred requiring further explanation.
REJ	Rejected	The analysis results have been rejected for an unspecified reason by the laboratory. For any resu where a mean is being determined, this data was r utilized in the calculation of the mean.

Appendix B: Archiving of 47mm air filters.

This appendix describes the procedure for archiving filters used in the EPA ambient air program. Filters require storage under controlled conditions and should be available for reanalysis if needed. Filters that have been exposed, returned to SLD and conditioned for weighing to determine the net gravimetric difference need to be properly stored as described below.

1. **Equipment**:
   - 1.1. SR walk in refrigerator (SLD room G392B) maintained at 0-4˚C with Reese™ computer monitored temperature control. One storage shelf is reserved for AHM.
   - 1.2. AHM Prep-lab storage area for ambient storage of 47 filters (SLD Room2366A)
   - 1.3. Analyslide™ Petri-Dishes with storage boxes
   - 1.4. 47mm Teflon Filters
   - 1.5. Aluminum foil rolls, 12" in width
   - 1.6. Plastic wrap rolls, 12" in width.
   - 1.7. Electronic Filter Logbook
2. **Procedure for Preparing Filters for Archival Storage**
   - 2.1. In preparation for storage, the filters should be placed in Analyslide™ Petri Dishes used to house the filters during conditioning, weighing, and handling in the laboratory. Each Petri Dish is labeled with the manufacturer's filter number as well as the SLD accession number, (with barcode) and allows for ease of tracking and retrieval during storage. Each filter is also recorded onto an electronic logbook (Excel spreadsheet) (See Figure 2). The logbook documents the storage time and dates and location so that filters can be stored, retrieved and disposed of according to EPA requirements.
   - 2.2. When filter placement in the Petri Dishes is complete, the filters are then placed in storage boxes as described below.
   - 2.3. The Analyslide™ Petri Dishes come in boxes of 25 and these boxes will be used for storage. Each box will have a label affixed that contains the following information:

CY	20*XX*
Box *X*	
Zm	Cold Disp Date Jan-Year
Ambient Storage Disp. Date Jan-Year	

Where:

CY 20*XX* is the Calendar Year that the filter was exposed.
Box *X* is a unique serial number assigned to each box. For each calendar year the Box x is reset to Box 1.
*Z*m is the particle fraction determined at the time of exposure. (2.5m or 10m.)

NMED Exhibit 29 - 0080

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

Cold Disp Date: Jan-Year. For 2.5m particulate fractions, this is the date after which filters may be removed from cold storage.
Ambient Storage Disp. Date Jan-Year. For 2.5m and 10m particulate fractions, this is the date after which filters may be discarded.

2.4. Logbook for tracking filters

2.4.1. The Filter Logbook will contain the following fields for each filter.

2.4.1.1. Year the sample was exposed. (Year)
2.4.1.2. SLD accession number assigned to each filter. (SLD#)
2.4.1.3. The manufacturer's filter number (Filter #)
2.4.1.4. Sampling Site (Site)
2.4.1.5. User Code used for billing purposes (User Code)
2.4.1.6. Box 1 (Box #)
2.4.1.7. Information on void status (Void)
2.4.1.8. Analyst (Analyst)
2.4.1.9. Position of the filter in the Analyslide™ Petri Dish box (Box Position)
2.4.1.10. Particle Size (Particle Size)

2.5 Filters from the 2.5m and 10m size particle fractions will be stored in separate boxes and not intermingled. Filters will be stored sequentially in their respective boxes based upon the SLD number assigned to them. An example of a logbook page is represented by Figure 2 below. The Filter Logbook will be kept electronically on the AHM drive @ F:\Air Filter Storage Archive

Year	SLD #	Filter #	Site	User code	Box #	Void	Analyst	Box position	Particle size
2013	2013022083	T2658588	6Q	55625	1	X	RSF	1	2.5
2013	2013022084	T2658589	6Q	55625	1		RSF	2	2.5
2013	2013022085	T2658590	6ZG	55625	1		RSF	3	2.5
2013	2013022086	T2658591	6ZG	55625	1		RSF	4	2.5
2013	2013022087	T2658592	6ZG	55625	1		RSF	5	2.5
2013	2013022088	T2658593	6ZG	55625	1		RSF	6	2.5
2013	2013022089	T2658594	6ZG	55625	1		RSF	7	2.5
2013	2013022090	T2658595	6ZG	55625	1		RSF	8	2.5

Figure 2. A sample of the Filter Logbook page that contains all the required fields.

2.6 PM2.5 and PM10 Filter Storage: All PM filters will require storage in a refrigerated environment. The storage temperature should be maintained 0-4˚C. They are to be placed in the Analyslide™ Petri Dish box and then wrapped with a single layer of plastic wrap followed by a single layer of aluminum foil wrap. Each box will have a label affixed on the end and a label on the outer aluminum foil wrap. They will be stored

Uncontrolled Copy

under refrigerated conditions in Shipping and Receiving Section Refrigerated Storage room G392B

3. Filter Storage Time Limits

3..1. PM2.5 and PM10 filters will be stored in cold storage during the calendar year in which they were exposed plus one additional calendar year. After that they may be stored at ambient temperature for an additional four years.

Uncontrolled Copy

Gravimetric Analysis of 47mm Air Filters - AHM Method 41710 - Version: 3.0. Index: CB AHM 104. Printed: 05-Dec-2018 15:10

Revision 2.1 February 20, 2011

- Eliminated milligram, microgram, and millimeter definitions from definitions sections.
- Defined LIMS as the database system of record for AQ gravimetric analysis
- Defined the business procedures that are appropriate for carrying out LIMS operations.
- Moved description of filters and related equipment from definitions to equipment section.
- Moved references to specific equipment to Appendix A.
- Referenced rooms now currently in use in the new SLD building for AQ gravimetric analysis.
- Consolidated 47mm PM_{10} into this document.

Revision 2.2 August 27th, 2013

- Added Appendix B which describes archiving procedure for 47mm filters.

Revision 3.0 March 26, 2018

- Added changes requested by EPA through NMED AQB.
    - Revise acceptance ranges for temperature, relative humidity weighing checks, field blank checks to reflect precision to decimal criteria recommended in EPA QAH App D. and change definition of Lab Control to be determined by mean and standard deviation of values in the previous 24-hour period per 40 CFR 58. Method 2.12 Section 10.4.1.3.
- Revised Appendix B to reflect EPA recommendation to follow 40 CFR 58.16(f) requirement to store all 47mm filters in cold storage for 1 year and ambient storage for an additional 4 years.
- Update EPA reference material to reflect most current EPA documentation and guidance.

QUALITY ASSURANCE PROJECT PLAN FOR AMBIENT AIR MONITORING

2020

NEW MEXICO ENVIRONMENT DEPARTMENT

AIR QUALITY BUREAU

Ozone Validation Template

1) Requirement (O_3)	2) Frequency	3) Acceptance Criteria	Information /Action
CRITICAL CRITERIA-OZONE			
Monitor	NA	***Meets requirements listed in FRM/FEM designation***	1) 40 CFR Part 58 App C Sec. 2.1 2) NA 3) 40 CFR Part 53 & FRM/FEM method list
One Point QC Check Single analyzer	***Every 14 days***	< ±7.1% (percent difference) or < ±1.5 ppb difference whichever is greater	1 and 2) 40 CFR Part 58 App A Sec. 3.1 3) Recommendation based on DQO in 40 CFR Part 58 App A Sec. 2.3.1.2. QC Check Conc range 0.005 - 0.08 ppm and 05/05/2016 Technical Note on AMTIC
Zero/span check	Every 14 days	Zero drift < ± 3.1 ppb (24 hr) < ± 5.1 ppb (>24hr-14 day) Span drift < ± 7.1 %	1 and 2) QA Handbook Volume 2 Sec. 12.3 3) Recommendation and related to DQO
OPERATIONAL CRITERIA -OZONE			
Shelter Temperature Range	Daily (hourly values)	20.0 to 30.0° C. (Hourly avg) or per manufacturers specifications if designated to a wider temperature range	1, 2 and 3) QA Handbook Volume 2 Sec. 7.2.2 Generally, the 20-30.0° C range will apply but the most restrictive operable range of the instruments in the shelter may also be used as guidance. FRM/FEM list found on AMTIC provides temp. range for given instrument. FRM/FEM monitor testing is required at 20-30° C range per 40 CFR Part 53.32
Shelter Temperature Control	Daily (hourly values)	< 2.1° C SD over 24 hours	1, 2 and 3) QA Handbook Volume 2 Sec. 7.2.2
Shelter Temperature Device Check	Every 182 days and 2/ calendar year	<± 2.1° C of standard	1, 2 and 3) QA Handbook Volume 2 Sec. 7.2.2
Annual Performance Evaluation Single analyzer	***Every site every 365 days and 1/ calendar year within period of monitor operation,***	Percent difference of audit levels 3-10 < ±15.1% Audit levels 1&2 < ± 1.5 ppb difference or <± 15.1%	1 and 2) 40 CFR Part 58 App A Sec. 3.1.2 3) Recommendation- 3-audit concentrations not including zero. AMTIC guidance 2/17/2011 AMTIC Technical Memo
Federal Audits (NPAP)	***20% of sites audited in calendar year***	Audit levels 1&2 < ± 1.5 ppb difference all other levels percent difference < ± 10.1%	1 and 2) 40 CFR Part 58 App A Sec. 3.1.3 3) NPAP QAPP/SOP
Verification/Calibration	Upon receipt/adjustment/repair/ installation/moving and repair and recalibration of standard of higher level Every 182 day and 2/ calendar year if manual zero/span performed biweekly Every 365 day and 1/ calendar year if continuous zero/span performed daily	All points < ± 2.1 % or ≤ ±1.5 ppb difference of best-fit straight line whichever is greater and Slope 1 ± .05	1) 40 CFR Part 50 App D 2) Recommendation 3) 40 CFR Part 50 App D Sec 4.5.5.6 Multi-point calibration (0 and 4 upscale points) Slope criteria is a recommendation
Zero Air/Zero Air Check	Every 365 days and 1/calendar year	Concentrations below LDL	1) 40 CFR Part 50 App D Sec. 4.1 2 and 3) Recommendation
Ozone Level 2 Standard			

NMED Exhibit 29 - 0091

NMED Exhibit 29 - 0092

1) Requirement (O_3)	2) Frequency	3) Acceptance Criteria	Information /Action
Certification/recertification to Standard Reference Photometer (Level 1)	Every 365 days and 1/calendar year	single point difference < ± 3.1%	1) 40 CFR Part 50 App D Sec. 5.4 2 and 3) Transfer Standard Guidance EPA-454/B-10-001 Level 2 standard (formerly called primary standard) usually transported to EPA Regions SRP for comparison
Level 2 and Greater Transfer Standard Precision	Every 365 days and 1/calendar year	***Standard Deviation less than 0.005 ppm or 3.0% whichever is greater***	1) 40 CFR Part 50 Appendix D Sec. 3.1 2) Recommendation, part of reverification 3) 40 CFR Part 50 Appendix D Sec. 3.1
(if recertified via a transfer standard)	Every 365 days and 1/calendar year	Regression slopes = 1.00 ± 0.03 and two intercepts are 0 ± 3 ppb	1, 2 and 3) Transfer Standard Guidance EPA-545/B-10-001
Ozone Transfer standard (Level 3 and greater)			
Qualification	Upon receipt of transfer standard	< ±4.1% or < ±4 ppb (whichever greater)	1, 2 and 3) Transfer Standard Guidance EPA-545/B-10-001
Certification	After qualification and upon receipt/adjustment/repair	RSD of six slopes ≤ 3.7% Std. Dev. of 6 intercepts ≤ 1.5	1, 2 and 3) Transfer Standard Guidance EPA-545/B-10-001 1
Recertification to higher level standard	Beginning and end of O3 season or every 182 days and 2/calendar year whichever less	New slope = ± 0.05 of previous and RSD of six slopes ≤3.7% Std. Dev. of 6 intercepts ≤ 1.5	1, 2 and 3) Transfer Standard Guidance EPA-545/B-10-001 recertification test that then gets added to most recent 5 tests. If does not meet acceptability certification fails
Detection (FEM/FRMs) Noise and Lower Detectable Limits (LDL) are part of the FEM/FRM requirements. It is recommended that monitoring organizations perform the LDL test to minimally confirm and establish the LDL of their monitor. Performing the LDL test will provide the noise information.			
Noise	Every 365 days and 1/ calendar year	***≤ 0.0025 ppm (standard range)*** ***≤ 0.001 ppm (lower range)***	1) 40 CFR Part 53.23 (b) (definition & procedure) 2) Recommendation- info can be obtained from LDL 3) 40 CFR Part 53.20 Table B-1
Lower detectable limit	Every 365 days and 1/calendar year	***≤ 0.005 ppm (standard range)*** ***≤ 0.002 ppm (lower range)***	1) 40 CFR Part 53.23 (b) (definition & procedure) 2) Recommendation 3) 40 CFR Part 53.20 Table B-1
SYSTEMATIC CRITERIA-OZONE			
Standard Reporting Units	***All data***	***ppm (final units in AQS)***	1, 2 and 3) 40 CFR Part 50 App U Sec. 3(a)
Rounding convention for design value calculation	***All routine concentration data***	***3 places after decimal with digits to right truncated***	1, 2 and 3) 40 CFR Part 50 App U Sec. 3(a) The rounding convention is for averaging values for comparison to NAAQS not for reporting individual hourly values.
Completeness (seasonal)	***3-Year Comparison***	***≥ 90% (avg) daily max available in ozone season with min of 75% in any one year.***	1,2,3) 40 CFR Part 50 App U Sec 4(b)
	8- hour average	***≥ if at least 6 of the hourly concentrations for the 8-hour period are available***	1) 40 CFR Part 50 App U 2 and 3) 40 CFR Part 50 App U Sec. 3(b)
	Valid Daily Max	***≥ if valid 8-hour averages are available for at least 13 of the 17 consecutive 8-hour periods starting from 7:00 a.m. to 11:00 p.m***	1) 40 CFR Part 50 App U 2,3) 40 CFR Part 50 App U Sec. 3(d)
Sample Residence Time Verification	Every 365 days and 1/calendar year	***≤ 20 Seconds***	1) 40 CFR Part 58 App E, Sec. 9 (c) 2) Recommendation

1) Requirement (O_3)	2) Frequency	3) Acceptance Criteria	Information /Action
			3) 40 CFR Part 58 App E, Sec. 9 (c)
Sample Probe, Inlet, Sampling train	***All sites***	***Borosilicate glass (e.g., Pyrex®) or Teflon®***	1) 40 CFR Part 58 App E, Sec. Sec. 9 (a) 2) Recommendation 3) 40 CFR Part 58 App E, Sec. Sec. 9 (a) FEP and PFA have been accepted as an equivalent material to Teflon. Replacement or cleaning is suggested as 1/year and more frequent if pollutant load or contamination dictate
Siting	Every 365 days and 1/calendar year	***Meets siting criteria or waiver documented***	1) 40 CFR Part 58 App E, Sec. 2-6 2) Recommendation 3) 40 CFR Part 58 App E, Sec. 2-6
EPA Standard Ozone Reference Photometer (SRP) Recertification (Level 1)	Every 365 days and 1/calendar year	Regression slope = 1.00 ± 0.01 and intercept < 3 ppb	1, 2 and 3) Transfer Standard Guidance EPA-454/B-10-001 This is usually at a Regional Office and is compared against the traveling SRP
Precision (using 1-point QC checks)	***Calculated annually and as appropriate for design value estimates***	**90% CL CV < 7.1%**	1) 40 CFR Part 58 App A 2.3.1.2 & 3.1.1 2) 40 CFR Part 58 App A Sec. 4 (b) 3) 40 CFR Part 58 App A Sec. 4.1.2
Bias (using 1-point QC checks)	***Calculated annually and as appropriate for design value estimates***	**95% CL < ± 7.1%**	1) 40 CFR Part 58 App A 2.3.1.2 & 3.1.1 2) 40 CFR Part 58 App A Sec. 4 (b) 3) 40 CFR Part 58 App A Sec. 4.1.3

NMED Exhibit 29 - 0094

NO_2, NOx, NO Validation Template

1) Requirement (NO_2)	2) Frequency	3) Acceptance Criteria	Information /Action
CRITICAL CRITERIA- NO_2			
Sampler/Monitor	***NA***	***Meets requirements listed in FRM/FEM designation***	1) 40 CFR Part 58 App C Sec. 2.1 2) NA 3) 40 CFR Part 53 & FRM/FEM method list
One Point QC Check Single analyzer	***Every 14 days***	< ±15.1% (percent difference) or < ± 1.5 ppb difference whichever is greater	1 and 2) 40 CFR Part 58 App A Sec. 3.1.1 3) Recommendation based on DQO in 40 CFR Part 58 App A Sec. 2.3.1.5 QC Check Conc range 0.005 - 0.08 ppm and 05/05/2016 Technical Note on AMTIC
Zero/span check	Every 14 days	Zero drift < ± 3.1 ppb (24 hr) < ± 5.1 ppb (>24hr-14 day) Span drift < ± 10.1 %	1 and 2) QA Handbook Volume 2 Sec. 12.3 3) Recommendation and related to DQO
Converter Efficiency	During multi-point calibrations, span and audit Every 14 days	***(≥96%)*** 96% – 104.1%	1) 40 CFR Part 50 App F Sec. 1.5.10 and 2.4.10 2) Recommendation 3) 40 CFR Part 50 App F Sec. 1.5.10 and 2.4.10 Regulation states ≥96%, 96 – 104.1% is a recommendation.
OPERATIONAL CRITERIA- NO_2			
Shelter Temperature Range	Daily (hourly values)	20.0 to 30.0° C. (Hourly avg) or per manufacturers specifications if designated to a wider temperature range	1, 2 and 3) QA Handbook Volume 2 Sec. 7.2.2 Generally, the 20-30.0 ° C range will apply but the most restrictive operable range of the instruments in the shelter may also be used as guidance. FRM/FEM list found on AMTIC provides temp. range for given instrument. FRM/FEM monitor testing is required at 20-30 ° C range per 40 CFR Part 53.32
Shelter Temperature Control	Daily (hourly values)	< 2.1° C SD over 24 hours	1, 2 and 3) QA Handbook Volume 2 Sec. 7.2.2
Shelter Temperature Device Check	every 182 days and 2/calendar year	< ± 2.1° C of standard	1, 2 and 3) QA Handbook Volume 2 Sec. 7.2.2
Annual Performance Evaluation Single Analyzer	***Every site every 365 days and 1/ calendar year***	Percent difference of audit levels 3-10 < ±15.1% Audit levels 1&2 < ± 1.5 ppb difference or < ±15.1%	1) 40 CFR Part 58 App A Sec. 3.1.2 2) 40 CFR Part 58 App A Sec. 3.1.2 3) Recommendation - 3-audit concentrations not including zero. AMTIC Technical Memo
Federal Audits (NPAP)	20% of sites audited in calendar year	Audit levels 1&2 < ± 1.5 ppb difference all other levels percent difference < ± 15.1%	1 & 2) 40 CFR Part 58 App A Sec. 3.1.3 3) NPAP QAPP/SOP

1) Requirement (NO_2)	2) Frequency	3) Acceptance Criteria	Information /Action
Verification/Calibration	Upon receipt/adjustment/repair/ installation/moving Every 182 day and 2/ calendar year if manual zero/span performed biweekly Every 365 day and 1/ calendar year if continuous zero/span performed daily	Instrument residence time ≤ 2 min Dynamic parameter ≥ 2.75 ppm-min All points <± 2.1 % or ≤ ± 1.5 ppb difference of best-fit straight line whichever is greater and Slope 1 ± .05	1) 40 CFR Part 50 App F 2 and 3) Recommendation Multi-point calibration (0 and 4 upscale points) Slope criteria is a recommendation
Gaseous Standards	All gas cylinders	**NIST Traceable** (e.g., EPA Protocol Gas) 50-100 ppm of NO in Nitrogen with < 1 ppm NO_2	1) 40 CFR Part 50 App F Sec. 1.3.1 2) NA Green Book 3) 40 CFR Part 50 App F Sec. 1.3.1. A technical memo may change the concentration requirment. Gas producer used must participate in EPAAmbient Air Protocol Gas Verification Program 40 CFR Part 58 App A Sec. 2.6.1
Zero Air/ Zero Air Check	Every 365 days and 1/ calendar year	Concentrations below LDL	1) 40 CFR Part 50 App F Sec. 1.3.2 2 and 3) Recommendation
Gas Dilution Systems	Every 365 days and 1/ calendar year or after failure of 1 point QC check or performance evaluation	Accuracy < ± 2.1 %	1, 2 and 3) Recommendation based on SO2 requirement in 40 CFR Part 50 App A-1 Sec. 4.1.2
Detection (FEM/FRMs) Noise and Lower Detectable Limits (LDL) are part of the FEM/FRM requirements. It is recommended that monitoring organizations perform the LDL test to minimally confirm and establish the LDL of their monitor. Performing the LDL test will provide the noise information.			
Noise	Every 365 days and 1/ calendar year	***≤ 0.005 ppm***	1) 40 CFR Part 53.23 (b) (definition & procedure) 2) Recommendation- info can be obtained from LDL 3) 40 CFR Part 53.20 Table B-1
Lower detectable level	Every 365 days and 1/ calendar year	***≤ 0.01 ppm***	1) 40 CFR Part 53.23 (c) (definition & procedure) 2) Recommendation 3) 40 CFR Part 53.20 Table B-1
SYSTEMATIC CRITERIA- NO_2			
Standard Reporting Units	***All data***	***ppb (final units in AQS)***	1, 2 and 3) 40 CFR Part 50 App S Sec. 2 (c)
Rounding convention for data reported to AQ S	***All routine concentration data***	***1 place after decimal with digits to right truncated***	1, 2 and 3) 40 CFR Part 50 App S Sec. 4.2 (a) The rounding convention is for averaging values for comparison to NAAQS not for reporting individual hourly values.
Completeness	***Annual Standard***	***≥ 75% hours in year***	1) 40 CFR Part 50 App S Sec. 3.1(b) 2) 40 CFR Part 50 App S Sec. 3.1(a) 3) 40 CFR Part 50 App S Sec. 3.1(b)
	1-hour standard	***1) 3consecutive calendars years of complete data 2) 4 quarters complete in each year 3) ≥75% sampling days in quarter 4) ≥ 75% of hours in a day***	1) 40 CFR Part 50 App S Sec. 3.2(b) 2) 40 CFR Part 50 App S Sec. 3.2(a) 3) 40 CFR Part 50 App S Sec. 3.2(b) More details in 40 CFR Part 50 App S

$PM_{2.5}$ Filter Based Local Conditions Validation Template

1) Criteria (PM2.5 LC)	2) Frequency	3) Acceptable Range	Information /Action
CRITICAL CRITERIA- $PM_{2.5}$ Filter Based Local Conditions			
Field Activities			
Sampler/Monitor	NA	*Meets requirements listed in FRM/FEM/ARM designation*	1) 40 CFR Part 58 App C Sec. 2.1 2) NA 3) 40 CFR Part 53 & FRM/FEM method list
Filter Holding Times			
Pre-sampling	*all filters*	*≤ 30 days before sampling*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.3.5
Sample Recovery	*all filters*	*≤ 7 days 9 hours from sample end date*	1, 2 and 3) 40 CFR Part 50, App. L 10.10
Sampling Period (including multiple power failures)	*all filters*	*1380-1500 minutes, or if value < 1380 and exceedance of NAAQS* 1/ *midnight to midnight local standard time*	1, 2 and 3) 40 CFR Part 50 App L Sec. 3.3 and 40 CFR Part 50 App N Sec. 1 for the midnight to midnight local standard time requirement See details if less than 1380 min sampled
Sampling Instrument			
Average Flow Rate	*every 24 hours of op*	*average within 5% of 16.67 liters/minute*	1, 2 and 3) Part 50 App L Sec. 7.4.3.1
Variability in Flow Rate	*every 24 hours of op*	*CV ≤ 2%*	1, 2 and 3) 40 CFR Part 50, App L Sec. 7.4.3.2
One-point Flow Rate Verification	*every 30 days each seperated by 14 days*	*< ± 4.1% of transfer standard* < ± 5.1% of flow rate design value	1, 2 and 3) 40 CFR Part 50, App L, Sec. 9.2.5 and 7.4.3.1 and 40 CFR Part 58, Appendix A Sec. 3.2.1
Design Flow Rate Adjustment	*After multi-point calibration or verification*	*< ± 2.1% of design flow rate*	1, 2 and 3) 40 CFR Part 50, App. L, Sec. 9.2.6
Individual Flow Rates	*every 24 hours of op*	*no flow rate excursions > ±5% for > 5 min.* 1/	1, 2 and 3) 40 CFR Part 50, App. L Sec. 7.4.3.1
Filter Temp Sensor	*every 24 hours of op*	*no excursions of > 5° C lasting longer than 30 min* 1/	1, 2 and 3) 40 CFR Part 50, App. L Sec. 7.4.11.4
External Leak Check	***Before each flow rate verification/calibration*** and before and after $PM_{2.5}$ separator maintenance	*< 80.1 mL/min* (see comment #1)	1) 40 CFR Part 50 App L, Sec. 7.4.6.1 2) 40 CFR Part 50 App L Sec. 9.2.3 and Method 2-12 Sec. 7.4.3 3) 40 CFR Part 50, App. L, Sec. 7.4.6.1
Internal Leak Check	If failure of external leak check	*< 80.1 mL/min*	1) 40 CFR Part 50, App. L, Sec. 7.4.6.2 2) Method 2-12, Sec. 7.4.4 3) 40 CFR Part 50, App. L, Sec. 7.4.6.2
Laboratory Activities			

1) Criteria (PM2.5 LC)	2) Frequency	3) Acceptable Range	Information /Action
Post-sampling Weighing	*all filters*	*Protected from exposure to temperatures above 25C from sample retrieval to conditioning* *≤10 days from sample end date if shipped at ambient temp, or* *≤ 30 days if shipped below avg ambient (or 4° C or below for avg sampling temps < 4° C) from sample end date*	1, 2 and 3) 40 CFR Part 50 App L Sec. 8.3.6 and L Sec. 10.13. See technical note on holding time requirements at : https://www3.epa.gov/ttn/amtic/pmpolgud.html
Filter Visual Defect Check (unexposed)	*all filters*	*Correct type & size and for pinholes, particles or imperfections*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 10.2
Filter Conditioning Environment			
Equilibration	*all filters*	*24 hours minimum*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.2.5
Temp. Range	*all filters*	*24-hr mean 20.0-23.0° C*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.2.1
Temp. Control	*all filters*	*< 2.1° C SD* over 24 hr.*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.2.2 SD use is a recommendation
Humidity Range	*all filters*	*24-hr mean 30.0% - 40.0% RH or Within ±5.0 % sampling RH but ≥ 20.0%RH*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.2.3
Humidity Control	*all filters*	*< 5.1 % SD* over 24 hr.*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.2.4 SD use is recommendation
Pre/post Sampling RH	*all filters*	*difference in 24-hr means < ± 5.1% RH*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.3.3
Balance	*all filters*	*located in filter conditioning environment*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.3.2
Microbalance Auto-Calibration	*Prior to each weighing session*	Manufacturer's specification	1) 40 CFR Part 50, App. L, Sec. 8.1 2) 40 CFR Part 50, App. L, Sec. 8.1 and Method 2.12 Sec. 10.6 3) NA
OPERATIONAL EVALUATIONS TABLE $PM_{2.5}$ Filter Based Local Conditions			
Field Activities			
One-point Temp Verification	every 30 days	< ± 2.1°C	1) 40 CFR Part 50, App. L, Sec. 9.3 2) Method 2.12 Sec. 7.4.5 and Table 6-1 3) Recommendation
Pressure Verification	every 30 days	< ± 10.1 mm Hg	1) 40 CFR Part 50, App. L, Sec. 9.3 2) Method 2.12 Sec. 7.4.6 and Table 6-1 3) Recommendation
Annual Multi-point Verifications/Calibrations			
Temperature multi-point Verification/Calibration	on installation, then every 365 days and once a calendar year	< ± 2.1°C	1) 40 CFR Part 50, App. L, Sec. 9.3 2 and 3) Method 2.12 Sec. 6.4.4 Table 6-1

NMED Exhibit 29 - 0101

NMED Exhibit 29 - 0102

1) Criteria (PM2.5 LC)	2) Frequency	3) Acceptable Range	Information /Action
Pressure Verification/Calibration	on installation, and on one-point verification failure	< ± 10.1 mm Hg	1) 40 CFR Part 50, App. L, Sec. 9.3 2 and 3) Method 2.12 Sec. 6.5 Sampler BP verified against independent standard verified against a lab primary standard that is certified as NIST traceable 1/year
Flow Rate Multi-point Verification/ Calibration	***Electromechanical maintenance or transport*** or every 365 days and once a calendar year	< ± 2.1% of transfer standard	1) 40 CFR Part 50, App. L, Sec. 9.2. 2) 40 CFR Part 50, App. L, Sec. 9.1.3, Method 2.12 Sec. 6.3 & Table 6-1 3) Recommendation
Other Monitor Calibrations	per manufacturers' op manual	per manufacturers' operating manual	1, 2 and 3) Recommendation
Precision			
Collocated Samples	***every 12 days for 15% of sites by method designation***	CV < 10.1% of samples ≥ 3.0 µg/m^3	1) and 2) Part 58 App A Sec. 3.2.3 3 Recommendation based on DQO in 40 CFR Part 58 App A Sec. 2.3.1.1
Accuracy			
Temperature Audit	every 180 days and at time of flow rate audit	< ± 2.1°C	1, 2 and 3) Method 2.12 Sec. 11.2.2
Pressure Audit	every 180 days and at time of flow rate audit	< ±10.1 mm Hg	1, 2 and 3) Method 2.12 Sec. 11.2.3
Semi Annual Flow Rate Audit	***Twice a calendar year and between 5-7 months apart***	< ± 4.1% of audit standard < ± 5.1% of design flow rate	1 and 2) Part 58, App A, Sec. 3.2.2 3) Method 2.12 Sec. 11.2.1
Monitor Maintenance			
$PM_{2.5}$ Separator (WINs)	every 5 sampling events	cleaned/changed	1, 2, and 3) Method 2.12 Sec. 8.2.2
$PM_{2.5}$ Separator (VSCC)	every 30 days	cleaned/changed	1, 2 and 3) Method 2.12 Sec. 8.3.3
Inlet Cleaning	every 30 days	cleaned	1, 2 and 3) Method 2.12 Sec. 8.3
Downtube Cleaning	every 90 days	cleaned	1, 2 and 3) Method 2.12 Sec. 8.4
Filter Housing Assembly Cleaning	every 30 days	cleaned	1, 2 and 3) Method 2.12 Sec. 8.3
Circulating Fan Filter Cleaning	every 30 days	cleaned/changed	1, 2 and 3) Method 2.12 Sec. 8.3
Manufacturer-Recommended Maintenance	per manufacturers' SOP	per manufacturers' SOP	
Laboratory Activities			
Filter Checks			
Lot Blanks	9 filters per lot	< ±15.1 µg change between weighings	1, 2, 3) Recommendation and used to determine filter stability of the lot of filters received from EPA or vendor. Method 2.12 Sec. 10.5
Exposure Lot Blanks	3 filters per lot	< ±15.1 µg change between weighings	1, 2 and 3) Method 2.12 Sec. 10.5 Used for preparing a subset of filters for equilibration
Filter Integrity (exposed)	each filter	no visual defects	1, 2 and 3) Method 2.12 Sec. 10.7 and 10.3
Lab QC Checks			

1) Criteria (PM2.5 LC)	2) Frequency	3) Acceptable Range	Information /Action
Field Filter Blank	10% or 1 per weighing session	<± 30.1 µg change between weighings	1) 40 CFR Part 50, App. L Sec. 8.3.7.1 2 and 3) Method 2.12 Table 7-1 & Sec.10.5
Lab Filter Blank	10% or 1 per weighing session	<± 15.1 µg change between weighings	1) 40 CFR Part 50, App. L Sec. 8.3.7.2 2 and 3) Method 2.12 Sec. 10.5
Balance Check (working standards)	beginning, 10th sample, end	< ±3.1 µg from certified value	1, 2 and 3) Method 2.12 Sec. 10.6 Standards used should meet specifications in Method 2.12, Sec. 4.3.7
Routine Filter re-weighing	1 per weighing session	<± 15.1 µg change between weighings	1, 2 and 3) Method 2.12 Sec. 10.8
Microbalance Audit	every 365 days and once a calendar year	<± 0.003 mg or manufacturers specs, whichever is tighter	1, 2 and 3) Method 2.12 Sec. 11.2.7
Lab Temp Check	Every 90 days	< ± 2.1°C	1, 2 and 3) Method 2.12 Sec. 10.10
Lab Humidity Check	Every 90 days	< ± 2.1%	1, 2 and 3) Method 2.12 Sec. 10.10
Verification/Calibration			
Microbalance Calibration	***At installation*** every 365 days and once a calendar year	Manufacturer's specification	1) 40 CFR Part 50, App. L, Sec. 8.1 2) 40 CFR Part 50, App. L, Sec. 8.1 and Method 2.12 Sec. 10.11 3) NA
Lab Temperature Certification	every 365 days and once a year	< ± 2.1°C	1, 2 and 3) Method 2.12 Sec. 4.3.8 and 9.4
Lab Humidity Certification	every 365 days and once a year	< ± 2.1%	1, 2 and 3) Method 2.12 Sec. 4.3.8 and 9.4
Calibration & Check Standards -			
Working Mass Stds. Verification Compared to primary standards	Every 90 days	< ± 2.1 ug	1, 2 and 3) Method 2.12 Sec. 9.7
Primary standards certification	every 365 days and once a calendar year	0.025 mg tolerance (Class 2)	1, 2 and 3) Method 2.12 Sec. 4.3.7
SYSTEMATIC CRITERIA -$PM_{2.5}$ Filter Based Local Conditions			
Siting	every 365 days and once a calendar year	***Meets siting criteria or waiver documented***	1) 40 CFR Part 58 App E, Sec. 2-5 2) Recommendation 3) 40 CFR Part 58 App E, Sec. 2-5
Data Completeness	***Annual Standard***	***≥ 75% scheduled sampling days in each quarter***	1, 2 and 3) 40 CFR Part 50, App. N, Sec. 4.1 (b) 4.2 (a)
	24- Hour Standard	***≥ 75% scheduled sampling days in each quarter***	1, 2 and 3) 40 CFR Part 50, App. N, Sec. 4.1 (b) 4.2 (a)

Continuous PM2.5 Local Conditions Validation Template

NOTE: This validation template attempts to provide the critical criteria, annual multipoint verifications/calibrations, and verification/calibration standards recertification frequencies and acceptable ranges for PM2.5 continuous FEMs and ARMs. At the time this validation template was most recently updated (January 2016) there were eleven continuous monitors designated as a Federal Equivalent Method (FEM) and none designated as an Approved Regional Method (ARM). For the most widely used continuous FEMs we have added select method specific operational criteria. However, due to limited available information, we do not have operational criteria for all approved FEMs, especially those methods with just a handful or less of monitors that have been implemented. Where we do list operational criteria for a specific method, we only list the criteria believed to be the most important. More detailed information on operational criteria is available for the most widely used PM2.5 continuous FEMs in Technical System Audit Supplementary Checklists for PM Continuous Monitors. These files are available on the web at: https://www3.epa.gov/ttn/amtic/contmont.html.

Technical Systems Audit Checklists

- PM continuous TSA checklist – Met One BAM – Draft (PDF)
- PM continuous TSA checklist – Thermo TEOM-FDMS – Draft (PDF)

Where appropriate, 40 CFR Part 58 App A and 40 CFR Part 50 App L requirements apply to Continuous PM2.5 FEMs; however, not all criteria may apply to each continuous FEM and ARM due to the nature of the measurement principle and design of the instrument. Also, while this validation template is designed to apply to PM2.5 continuous FEMs and ARMs, it may also apply to PM2.5 continuous methods that are not specifically approved as FEMs or ARMs and used to meet SLAMS monitoring requirements in support of the AQI, but not the NAAQS.

1) Criteria (PM2.5 Cont)	2) Frequency	3) Acceptable Range	Information /Action
CRITICAL CRITERIA- $PM_{2.5}$ Continuous, Local Conditions			
Sampler/Monitor Designation	NA	***Meets requirements listed in FRM/FEM/ARM designation*** Confirm method designation on front panel or just inside instrument.	1) 40 CFR Part 58 App C Sec. 2.1 2) NA 3) 40 CFR Part 53 & FRM/FEM method list
Firmware of monitor	At setup	1. Must be the firmware (or later version) as identified in the published method designation summary. ***2. Firmware settings must be set for flowrate to operate and report at "local conditions" (i.e., not STP).***	40 CFR Part 50 App N. sec. 1 (c)
Data Reporting Period	Report every hour	1. The calculation of an hour of data is dependent on the design of the method. ***2. A 24-hour period is calculated in AQS if 18 or more valid hours are reported for a day*** [1/].	See operator's manual. Hourly data are always reported as the start of the hour on local standard time 40 CFR Part 50 App N. Sec 3 (c)

1) Criteria (PM2.5 Cont)	2) Frequency	3) Acceptable Range	Information /Action
Sampling Instrument			
PM10 Inlet (if applicable to method designated)	At Setup	Must be a Louvered PM10 size selective inlet as specified in 40 CFR 50 appendix L, Figures L-2 through L-19	
PM2.5 second stage separator (if applicable to method designated)	At Setup	Must be a BGI Inc. Very Sharp Cut Cyclone (VSCC™) or equivalent second stage separator approved for the method.	The other approved second stage separator option for select FEMs is the Dichot. Only the GRIMM 180 and Teledyne T640 and T640X are known to not have a second stage seperator as part of the method.
Average Flow Rate	***every 24 hours of operation; alternatively, each hour can be checked***	***average within 5% of 16.67 liters/minute at local conditions***	1, 2 and 3) Part 50 App L Sec. 7.4.3.1
Variability in Flow Rate	***every 24 hours of op***	***CV ≤ 2%***	1, 2 and 3) 40 CFR Part 50, App L Sec. 7.4.3.2
One-point Flow Rate Verification	***every 30 days each seperated by 14 days***	***< ± 4.1% of transfer standard*** < ± 5.1% of flow rate design value	1, 2 and 3) 40 CFR Part 50, App.L, Sec. 9.2.5, 40 CFR Part 58, Appendix A Sec. 3.2.3 & 3.3.2
Design Flow Rate Adjustment	***After multi-point calibration or verification***	***< ± 2.1% of design flow rate***	1,2 and 3) 40 CFR Part 50, App. L, Sec. 9.2.6
External Leak Check	***Before each flow rate verification/calibration*** and before and after $PM_{2.5}$ separator maintenance	Method specific. See operator's manual.	1) 40 CFR Part 50 App L, Sec. 7.4.6.1 2) 40 CFR Part 50 App L Sec.t 9.2.3 and Method 2-12 Sec. 7.4.3 3) 40 CFR Part 50, App. L, Sec. 7.4.6.1
Internal Leak Check	If failure of external leak check	Method specific. See operators manual.	1) 40 CFR Part 50, App. L, Sec. 7.4.6.2 2) Method 2-12 7.4.4 3) 40 CFR Part 50, App. L, Sec. 7.4.6.2
Annual Multi-point Verifications/Calibrations			
Leak Check	every 30 days	< 1.0 lpm BAM (Not Thermo BAMS) ± 0.15 lpm TEOM	1) 40 CFR Part 50 App L, Sec. 7.4.6.1 2) Recommendation 3) BAM SOP Sec. 10.1.2 TEOM SOP Sec. 10.1.6 Thermo BAM leak check should not be attempted. Foils could be ruptured.
Temperature multi-point Verification/Calibration	on installation, then Every 365 days and 1/ calendar year	< ± 2.1°C	1) 40 CFR Part 50, App.L, Sec. 9.3 2 and 3) Method 2.12 Sec. 6.4.4
One-point Temp Verification	every 30 days	< ± 2.1°C	1) 40 CFR Part 50, App.L, Sec. 9.3 2) Method 2.12 Sec. 7.4.5 and Table 6-1 3) Recommendation
Pressure Verification/Calibration	on installation, then Every 365 days and 1/ calendar year	< ± 10.1 mm Hg	1) 40 CFR Part 50, App.L, Sec. 9.3 2 and 3) Method 2.12 Sec. 6.5 BP verified against independent standard verified against a lab primary standard that is certified NIST traceable 1/year

NMED Exhibit 29 - 0108

1) Criteria (PM2.5 Cont)	2) Frequency	3) Acceptable Range	Information /Action
Flow Rate Multi-point Verification/ Calibration	***Electromechanical maintenance or transport or*** Every 365 days and 1/ calendar year	< ± 2.1% of transfer standard	1) 40 CFR Part 50, App.L, Sec. 9.2. 2) 40 CFR Part 50, App.L, Sec. 9.1.3, Method 2.12 Sec. 6.3 & Table 6-1 3) Recommendation
Other Monitor Calibrations/checks	per manufacturers' op manual	Annual zero test on Met One BAM 1020 and BAM 1022	per manufacturers' operating manual. Note: more frequent zero tests may be appropriate in areas with seasonal changes in dew-points.
Precision			
Collocated Samples	***every 12 days for 15% of sites by method designation***	CV < 10.1% of samples ≥ 3 $\mu g/m^3$	1) and 2) Part 58 App A Sec. 3.2.3 3 Recommendation based on DQO in 40 CFR Part 58 App A Sec. 2.3.1.1
Accuracy			
Temperature Audit	every 180 days and at time of flow rate audit	< ± 2.1°C	1, 2 and 3) Method 2.12 Sec. 11.2.2
Pressure Audit	every 180 days and at time of flow rate audit	< ±10.1 mm Hg	1, 2 and 3) Method 2.12 Sec. 11.2.3
Semi Annual Flow Rate Audit	***Twice a calendar year and 5-7 months apart***	< ± 4.1% of audit standard < ± 5.1% of design flow rate	1 and 2) Part 58, App A, Sec. 3.3.3 3) Method 2.12 Sec. 11.2.1
Shelter Temperature			
Temperature range	At setup	per operator manual	
Temperature Control	Daily (hourly values)	< 2.1° C SD over 24 hours	1, 2 and 3) QA Handbook Volume 2 Sec. 7.2.2
Temperature Device Check	every 180 days and twice a calendar year	< ± 2.1° C	1, 2 and 3) QA Handbook Volume 2 Sec. 7.2.2
Monitor Maintenance			
$PM_{2.5}$ Separator (WINS)	every 5 sampling events	cleaned/changed	1, 2,and 3) Method 2.12 Sec. 8.2.2
$PM_{2.5}$ Separator (VSCC)	every 30 days	cleaned/changed	1,2 and 3) Method 2.12 Sec. 8.3.3
Inlet Cleaning	every 30 days	cleaned	1,2 and 3) Method 2.12 Sec. 8.3
Downtube Cleaning	every 90 days	cleaned	1,2 and 3) Method 2.12 Sec. 8.4
Filter Housing Assembly Cleaning	every 30 days	cleaned	1, 2 and 3) Method 2.12 Sec. 8.3
Circulating Fan Filter Cleaning	every 30 days	cleaned/changed	1, 2 and 3) Method 2.12 Sec. 8.3
Manufacturer-Recommended Maintenance	per manufacturers' SOP	per manufacturers' SOP	
TEOM-FDMS Specific Operational Criteria			
Total Flow Verification	every 30 days	Sum of flow rates from 3 paths equal design flow rate < ± 5.1%	1,2 and 3) TEOM SOP Sec. 10.1.2
Bypass leak check (TEOM)	every 30 days	± 0.60 lpm	1,2 and 3) TEOM SOP Sec. 10.1.6 or TEOM Operating Manual Sec. 5-4
Replace TEOM filters	as needed	Change TEOM filter as filter loading approaches 90%, but must be changed before reaching 100%.	1,2 and 3) TEOM SOP Sec. 10.1.8
Replace the 47-mm FDMS (Purge) filters	every 30 days or any time TEOM filters are replaced	replaced	1,2 and 3) TEOM SOP Sec. 10.1.10

1) Criteria (PM2.5 Cont)	2) Frequency	3) Acceptable Range	Information /Action
Internal/External Data Logger Data	Every 30 days 10 randomly selected values	agree exactly (digital) and $\pm$ 1 $\mu g/m^3$ (analog). Note: digital is expected and should be used unless there is no capacity to utilize digital in the monitoring agencies' data system.	1, 2 and 3) TEOM SOP Sec. 10.1.24
Replace In-line filters	every 180 days and twice a calendar year	replaced	1, 2 and 3) TEOM SOP Sec. 10.2
Clean cooler assembly	every 365 days and once a calendar year	cleaned	1, 2 and 3) TEOM SOP Sec. 10.3.1
Clean/Maintain switching valve	every 365 days and once a calendar year	cleaned	1, 2 and 3) TEOM SOP Sec. 10.3.2
Clean air inlet system of mass transducer enclosure	every 365 days and once a calendar year	cleaned	1, 2 and 3) TEOM SOP Sec. 10.3.3
Replace the dryers	1/yr or due to poor performance	Review dryer dew point data to determine acceptable performance of dryer	1, 2 and 3) TEOM SOP Sec. 10.3.4
Calibration (KO) constant verification	every 365 days and once a calendar year	Pass or Fail ($\leq$ 2.5%)	1, 2 TEOM SOP Sec. 10.3.6 3) 1405-DF operating guide. Verification software either passes or fails the verification. Acceptance criteria is $\leq$ 2.5 %
Rebuild sampling pump	18 months	< 66% of local pressure	1, 2 and 3) TEOM SOP Sec. 10.4
GRIMM Specific Operational Criteria			
Internal rinsing air filter	After a few years	Changed	1, 2 and 3) GRIMM SOP Sec. 12.4 May require a trained service staff to change. May only require changing if a message reads "check nozzle and air inlet"
Change Dust Filter	Every 365 days and 1/ calendar year	Changed	1, 2 and 3) GRIMM SOP Sec. 12.3
Relative Humidity Setting	At Setup	Per Operators manual (55%) unless otherwise directed and approved to use at a different value	
Calibration of spectrometer	Yearly	+/- 5% for mass	Operators' Manual section 5.2
Cleaning or changing of the Nafion in inlet	As needed	We are seeking clarification from GRIMM on this	Operators' Manual section 11.4.2
Thermo BAM Specific Operational Criteria			
Cleaning Nozzle and Vane (BAM)	Minimally every 30 days	cleaned	1, 2 and 3) BAM SOP Sec. 10.1.3
Leak Check	every 30 days	$\leq$ 0.42 L/min	1) BAM 5014i Instruction Manual 2) 3) BAM 5014i Instruction Manual
Replace or clean pump muffler	every 180 days and twice a calendar year	Cleaned or changed

Continuos PM10 STP Conditions Validation Template

NOTE: There are a number of continuous PM10 monitors that are designated as FEM. These monitors may have different measurement or sampling attributes that cannot be identified in this validation template. Monitoring organizations should review specific instrument operating manuals and augment the validation template with QC information specific to their EPA reference or equivalent method designation and instrument (https://www3.epa.gov/ttn/amtic/criteria.html). In general, 40 CFR Part 58 App A and 40 CFR Part 50 App J requirements apply to Continuous PM10. Since a guidance document was never developed for continuous PM10, many of the requirements reflect a combination of manual and continuous PM2.5 requirements and are therefore considered recommendations.

1) Criteria (PM_{10} Cont)	2) Frequency	3) Acceptable Range	Information /Action
CRITICAL CRITERIA- PM_{10} Continuous			
Sampler/Monitor	NA	***Meets requirements listed in FRM/FEM/ARM designation***	1) 40 CFR Part 58 App C Sec. 2.1 2) NA 3) 40 CFR Part 53 & FRM/FEM method list
Sampling Period	**all filters**	**1440 minutes ± 60 minutes midnight to midnight local standard time**	1, 2 and 3) 40 CFR Part 50 App J Sec. 7.1.5
Average Flow Rate	every 24 hours of op	Average within < ± 5.1% of design	recommendation

PM_{10} Low Volume STP Filter-Based Local Conditions Validation Template

Monitoring organizations can use low-volume PM instruments for PM_{10} monitoring. However, PM_{10} data collection for NAAQS purposes must be reported in standard temperature and pressure (STP). 40 CFR Part 50 App J describes the reference method for PM_{10} but this method was promulgated for dichot and high volume methods that have improved over the years. Since monitoring organization may be able to use the low volume methods for multiple uses (PM_{10c}, PM_{10}-Pb) it is suggested that the validation criteria for this method follow the method requirements associated with the $PM_{2.5}$ which is Appendix L. Where there are particular requirement directly related to the NAAQS evaluation App J will be used.

1) Criteria (PM10 Lo-Vol STP)	2) Frequency	3) Acceptable Range	Information /Action
CRITICAL CRITERIA- PM_{10} Lo-Vol Filter Based STP			
Field Activities			
Sampler/Monitor	NA	*Meets requirements listed in FRM/FEM/ARM designation*	1) 40 CFR Part 58 App C Sec. 2.1 2) NA 3) 40 CFR Part 53 & FRM/FEM method list
Sample Recovery	*all filters*	*≤7 days 9 hours from sample end date*	1, 2 and 3) 40 CFR Part 50 App L Sec. 10.10
Pre-sampling	*all filters*	*≤ 30 days before sampling*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.3.5
Sampling Instrument			
Average Flow Rate	*every 24 hours of op*	*average within < 5.1% of 16.67 liters/minute*	1, 2 and 3) Part 50 App L Sec. 7.4.3.1
Variability in Flow Rate	*every 24 hours of op*	*CV < 2.1%*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 7.4.3.2
One-point Flow Rate Verification	*every 30 days each seperated by 14 days*	*< ± 4.1% of transfer standard* < ± 5.1% of flow rate design value	1) 40 CFR Part 50, App. L, Sec. 9.2.5, 40 CFR Part 58, App A Sec. 3.3.1 2) Part 58, App A, Sec. 3.3.1 3) 40 CFR Part 50, App. L, Sec. 9.2.5 & 7.4.3.1
Design Flow Rate Adjustment	*at one-point or multi-point verification/calibration*	*< ± 2.1% of design flow rate*	1, 2 and 3) 40 CFR Part 50, App. L, Sec. 9.2.6
Individual Flow Rates	*every 24 hours of op*	*no flow rate excursions > ±5.1% for > 5 min.* 1/	1, 2 and 3) 40 CFR Part 50, App. L Sec. 7.4.3.1
Filter Temp Sensor	*every 24 hours of op*	*no excursions of > 5° C lasting longer than 30 min* 1/	1, 2 and 3) 40 CFR Part 50, App. L Sec. 7.4.11.4
External Leak Check	*Before each flow rate verification/calibration* and before and after maintenance	*< 80.1 mL/min* (see comment #1)	1) 40 CFR Part 50 App L, Sec. 7.4.6.1 2) 40 CFR Part 50, App. L Sec. 9.2.3 Method 2-12 Sec. Table 8-1 3) 40 CFR Part 50, App. L, Sec. 7.4.6.1
Internal Leak Check	every 5 sampling events	*< 80.1 mL/min*	1) 40 CFR Part 50, App. L, Sec. 7.4.6.2 2) Method 2-12 Table 8-1 3) 40 CFR Part 50, App. L, Sec. 7.4.6.2
Laboratory Activities			

1) Criteria (PM10 Lo-Vol STP)	2) Frequency	3) Acceptable Range	Information /Action
Post-sampling Weighing	*all filters*	*Protected from exposure to temperature ≤10 days from sample end date if shipped at ambient temp, or ≤30 days if shipped below avg ambient (or 4° C or below for avg sampling temps < 4° C) from sample end date*	1, 2 and 3) 40 CFR Part 50 App L Sec. 8..3.6
Filter Visual Defect Check (unexposed)	*all filters*	*Correct type & size and for pinholes, particles or imperfections*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 10.2
Filter Conditioning Environment			
Equilibration	*all filters*	*24 hours minimum*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.2.5
Temp. Range	*all filters*	*24-hr mean 20.0-23.0° C*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.2.1
Temp.Control	*all filters*	*< 2.1° C SD* over 24 hr*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.2.2 SD use is recommendation
Humidity Range	*all filters*	*24-hr mean 30.0% - 40.0% RH or <5.1% sampling RH but ≥ 20.0%RH*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.2.3
Humidity Control	*all filters*	*< 5.1% SD* over 24 hr.*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.2.4 SD use is recommendation
Pre/post Sampling RH	*all filters*	*difference in 24-hr means < ± 5.1% RH*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.3.3
Balance	*all filters*	*located in filter conditioning environment*	1, 2 and 3) 40 CFR Part 50, App. L Sec. 8.3.2
OPERATIONAL EVALUATIONS TABLE PM_{10} Lo-Vol Filter Based STP

STATE OF NEW MEXICO
ENVIRONMENTAL IMPROVEMENT BOARD

IN THE MATTER OF PROPOSED NEW REGULATION,
20.2.50 NMAC – *Oil and Gas Sector – Ozone Precursor Pollutants* **No. EIB 21-27 (R)**

DIRECT TESTIMONY OF ANDREW AHR

My name is Andrew Ahr, and I am the Quality Assurance Staff Manager for the Air Quality Bureau ("Bureau") of the New Mexico Environment Department ("Department"). I have been asked to provide testimony in support of the Department's proposed new air quality regulations at 20.2.50 NMAC ("Part 50"). My testimony will address the following topics: how design values for ozone are calculated, quality assurance ("QA") of the data, and how the data is submitted to the U.S. Environmental Protection Agency ("EPA").

I. QUALIFICATIONS

I have been employed with the Bureau for over four years and have held the positions of Permit Writer and Compliance Inspector prior to becoming the QA Staff Manager. Before coming to the Department, I worked in the chemical industry for approximately 18 years at EKC Technology, Inc., DuPont, and SBA Materials. I also have 15 years of experience working in various engineering positions within the semiconductor manufacturing industry.

My full background and qualifications are set forth in my resume, which is marked as NMED Exhibit 31.

II. DESIGN VALUES

Overview

A design value is a statistic that describes the air quality status of a given location relative to the level of the National Ambient Air Quality Standards ("NAAQS"). Design values are

typically used to designate and classify nonattainment areas, as well as to assess progress towards meeting the NAAQS. Design values are computed and published annually by EPA's Office of Air Quality Planning and Standards, and reviewed in conjunction with the EPA Regional Offices. Some of these design values can change after the date of publication for a variety of reasons, including but not limited to:

- EPA agreement that certain data were influenced by exceptional events and therefore not subject for comparison with the NAAQS;
- States retroactively entering or changing erroneous data based on later findings; and/or
- Notification of a monitoring issue (e.g. network design, site combination, change in the regulatory status of a monitor) that would prompt a revision.

Ozone Design Values

The primary and secondary NAAQS for ozone are met at an ambient air monitoring site when the 3-year average of the annual fourth-highest daily maximum 8-hour average ozone concentration (i.e., the design value) is less than or equal to 0.070 ppm. This ozone design value has been in effect since October 26, 2015. *See* 40 CFR Part 50, Appendix U.

The form of the ozone NAAQS requires the use of a 3-year period (as opposed to a 2-year period for other criteria pollutants) to determine the average number of exceedances per year. In its simplest form, the ozone standard requires that the average number of exceedances during a 3-year period cannot be greater than 1.0. An area with four exceedances during a 3-year period, therefore, does not meet the ozone standard because four exceedances in 3 years averages out to more than once per year. If the fourth highest value was equal to the level of the ozone standard, i.e. 0.070 ppm, then the area would have no more than three exceedances during the 3-year period and the average number of exceedances per year would be less than one. This

assumes no missing data, and is how the fourth highest value in 3-years came to be used as the design value. An example is given at the end of the section titled Minimum Data Capture Requirements (Data Completeness).

Calculation of Ozone Design Values

Ozone season for most states is generally considered to be from May through September (the warmest months of the year). However, New Mexico's ozone season is designated as all 12 months, unlike many parts of the country. *See* 40 CFR Part 50, Table D-3 to Appendix D - Ozone Monitoring Season by state. Hourly average ozone concentrations are reported at each ozone monitor in parts per million (ppm) to the third decimal place, with digits to the right of the third decimal place truncated. Each hour is identified using local standard time.

The daily maximum 8-hour average ozone concentration for a given day is the highest of the 17 consecutive 8-hour averages beginning with the 8-hour period from 7:00 a.m. to 3:00 p.m., followed by 8:00 a.m. to 4:00 p.m. and ending with the 8-hour period from 11:00 p.m. to 7:00 a.m. the following day (i.e., the 8-hour averages for 7:00 a.m. to 11:00 p.m.). Daily maximum 8-hour average ozone concentrations are determined each day with ambient ozone monitoring data, including days outside the ozone monitoring season if those data are available. *See* 40 CFR Part 50, Appendix U.

The primary and secondary ozone design value statistic is the annual fourth-highest daily maximum 8-hour ozone concentration, averaged over three years, expressed in ppm. The 3-year average is computed using the three most recent, consecutive years of ambient ozone monitoring data. Design values are also reported in ppm to three decimal places, with digits to the right of the third decimal place truncated.

III. DATA GATHERING AND QUALITY ASSURANCE

Minimum Data Capture Requirements (Data Completeness)

Both the daily maximum 8-hour average ozone concentration data and the design value data, must meet specific requirements to be considered valid:

(1) A daily maximum 8-hour average ozone concentration shall be considered valid if valid 8-hour averages are available for at least 13 of the 17 consecutive 8-hour periods starting from 7:00 a.m. to 11:00 p.m. In the event that fewer than 13 valid 8-hour averages are available, a daily maximum 8-hour average ozone concentration shall also be considered valid if it is greater than the NAAQS. Hourly ozone concentrations that have been approved under 40 CFR § 50.14 as having been affected by exceptional events shall be included when determining whether these criteria have been met. *See* 40 CFR Part 50, Appendix U.

(2) A design value less than or equal to the level of the NAAQS must meet minimum data completeness requirements in order to be considered valid. However, a design value greater than the level of the NAAQS is always considered to be valid.

(3) These requirements are met for a 3-year period at a site if valid daily maximum 8-hour average ozone concentrations are available for at 90% of the days within the ozone monitoring season, on average, for the 3-year period, with a minimum of at least 75% of the of the days within the ozone monitoring season in any one year. *See* 40 CFR Part 50, Appendix U.

See the examples below:

EXAMPLE 1—SITE MEETING THE PRIMARY AND SECONDARY O_3 NAAQS

Year	Percent valid days within O_3 monitoring season (Data completeness)	1st highest daily max 8-hour O_3 (ppm)	2nd highest daily max 8-hour O_3 (ppm)	3rd highest daily max 8-hour O_3 (ppm)	4th highest daily max 8-hour O_3 (ppm)	5th highest daily max 8-hour O_3 (ppm)
2014	100	0.082	0.080	0.075	0.069	0.068
2015	96	0.074	0.073	0.065	0.062	0.060
2016	98	0.070	0.069	0.067	0.066	0.060
Average	98				0.065	

As shown in Example 1, this site meets the primary and secondary O_3 NAAQS because the 3-year average of the annual fourth-highest daily maximum 8-hour average O_3 concentrations (*i.e.,* 0.065666 ppm, truncated to 0.065 ppm) is less than or equal to 0.070 ppm. The minimum data completeness requirements are also met (*i.e.,* design value is considered valid) because the average percent of days within the O_3 monitoring season with valid ambient monitoring data is greater than 90%, and no single year has less than 75% data completeness.

EXAMPLE 2—SITE FAILING TO MEET THE PRIMARY AND SECONDARY O_3 NAAQS

Year	Percent valid days within O_3 monitoring season (Data completeness)	1st highest daily max 8-hour O_3 (ppm)	2nd highest daily max 8-hour O_3 (ppm)	3rd highest daily max 8-hour O_3 (ppm)	4th highest daily max 8-hour O_3 (ppm)	5th highest daily max 8-hour O_3 (ppm)
2014	96	0.085	0.080	0.079	0.074	0.072
2015	74	0.084	0.083	0.072	0.071	0.068
2016	98	0.083	0.081	0.081	0.075	0.074
Average	89				0.073	

As shown in Example 2, this site fails to meet the primary and secondary O_3 NAAQS because the 3-year average of the annual fourth-highest daily maximum 8-hour average O_3 concentrations (*i.e.,* 0.073333 ppm, truncated to 0.073 ppm) is greater than 0.070 ppm, even

though the annual data completeness is less than 75% in one year and the 3-year average data completeness is less than 90% (*i.e.,* design value would not otherwise be considered valid). *See* 40 CFR Part 50, Appendix U.

QA Requirements for Design Value Data

Before daily 8-hour average ozone concentration data is submitted to the EPA, the data is reviewed by QA personnel at the Bureau to meet validity requirements as described below:

(1) Ozone monitoring equipment must pass an annual accuracy audit performed by a QA Auditor to ensure that all flows, pressures, lamp intensities, temperatures and instrument response to ozone concentrations are within instrument specifications.

(2) Quarterly calibrations (four times per year) are performed on all ozone monitoring instruments by personnel from the Bureau's Monitoring Section.

(3) Ozone monitoring instruments must pass weekly 1-point quality control ("QC") checks. These checks are performed automatically on Sunday mornings. If any ozone monitors do not pass this weekly check, Monitoring personnel make required adjustments/fixes to the failing instrument to bring it back within specification in order to pass the weekly check. QA personnel verify that all ozone monitoring instruments pass this check within a 14-day span and then submit the weekly 1-point QC check data to EPA through the Air Quality System ("AQS") website as per precision and accuracy requirements.

(4) Daily checks are performed everyday by Monitoring Section personnel to ensure ozone monitoring equipment is reporting and operating within specifications. They also look for any equipment alarms and note any unusual or high value concentrations above 0.070 ppm. The QA Data Steward also performs a daily check of ozone data each morning to ensure that instruments are reporting and takes note of any data abnormalities.

(5) Lastly, an Annual Data Certification is performed on all monitoring data by QA personnel. A certification letter and related AQS reports are submitted to EPA by May 1st of each year by the Bureau's QA Staff Manager. EPA then sends an acknowledgement letter to the Bureau.

III. SUBMISSION OF DATA TO EPA

Following review by the Bureau's QA personnel to ensure that the data meets all validity requirements, the data is submitted to and processed by EPA as follows:

(1) On a quarterly basis, hourly ozone data is submitted using XLM Reporter software to EPA through the AQS website. The submittal of data is performed by the Bureau's QA Data Steward.

(2) Once the hourly ozone data is submitted, EPA uses it to calculate the 8-hour average ozone concentrations for each day.

(3) From the 8-hour average ozone concentration data, the EPA determines the 1st, 2nd, 3rd and 4th highest daily maximum 8-hour ozone concentrations for the entire year.

(4) Design values are produced by the EPA (not the Bureau) based on the annual fourth-highest daily maximum 8-hour ozone concentration, averaged over three years, expressed in ppm. The 3-year average is computed using the three most recent, consecutive years of ambient ozone monitoring data.

Theodore Andrew Ahr
2844 Pueblo Bonito
Santa Fe, New Mexico 87507-2533

Career Summary: Technically oriented professional who brings a skill set consisting of applications/process engineering, technical sales, customer service and management from the areas of semiconductor manufacturing, chemical materials applications and environmental science. A positive attitude, attention to detail, imaginative problem solving, along with high level of integrity and self-confidence have made for a successful career.

Work Experience

State of New Mexico, Environment Department, Air Quality Bureau (AQB) – **Quality Assurance Staff Manager** – Sep. 2019 to present. Manage Quality Assurance Auditors to perform field audits of all air monitoring site equipment to insure it is reporting data as accurately as possible. Manage a Data Handling Specialist to produce periodic air monitoring reports and certification of data to the EPA. Write the AQB's annual Quality Assurance Project Plan, Quality Management Plan, ICIS – Air Quality Assurance Project Plan, and quality assurance standard operating procedures. Perform annual data certification of the AQB's air monitoring data that is submitted to the EPA.

State of New Mexico, Environment Department, Air Quality Bureau – **Compliance Inspections Specialist** - Sep. 2018 – Sep. 2019; Santa Fe, NM
Perform onsite inspections of oil/gas facilities, construction product facilities, landfills and other types of industrial facilities throughout the state of New Mexico. Review permits, regulations and reports associated with the facility. Write detailed reports along with Areas of Concern documents if irregularities are discovered during inspection of facility or regulatory documents.

State of New Mexico, Environment Department, Air Quality Bureau – **Major Source Permit Writer** - Jul. 2017 to Sep. 2018; Santa Fe, NM
Performed technical and regulatory review of complex air quality permit applications. This includes verifying emissions calculations, determining applicable state and federal regulations and drafting legally enforceable air permits and technical support documents.

SBA Materials, Inc. - **Process Engineer and Facility Manager** – Dec. 2010 to Jul. 2016
Albuquerque, NM and San Jose, CA
Assured and maintained the operation of all laboratory/facility equipment and material stocks used in the product formulation and development of spin-on ultra-low-κ dielectric materials. Performed engineering studies on low-k films using a wide variety of laboratory equipment. Researched and applied state and federal environmental regulations for storage, use, shipment and disposal of dangerous chemicals. Other duties include evaluation of test data, purchasing, writing of specifications (SOPs), training new personnel, facility maintenance and the international shipping of dangerous goods.

DuPont **/** EKC Technology, Inc. - **Senior Field Applications Engineer** – Dec. 1997 to Jul. 2009
Albuquerque, NM / Hayward, CA
Performed engineering and sales support for chemical cleaning and surface preparation products to semiconductor and electronics manufacturers throughout North America. Developed wafer cleaning processes at the in-house lab to plug and play at the customer's facility with minimal adjustments. Frequently used process problem solving skills to unravel issues at customer sites associated with plasma etch tools and chemical cleaning systems. These included automated spray / rinse /dry tools and wet benches. Acted as the main point of contact for customer technical questions about products and services. Worked with internal

sales/marketing teams, R&D engineers, quality control engineers and customer development teams to design, evaluate and characterize new products. Designed manufacturing processes that were both more environmentally friendly and lower in cost of ownership. My efforts helped acquire new accounts and expand business at existing customer sites. Prepared reports and presented technical information directly to customers. Used my superior interpersonal communication skills to resolve difficult issues at customer meetings. Primarily used Microsoft Office Suite software for the generation of technical reports. Compiled and prepared application data for use in technical marketing materials. Traveled up to 80% of the time when required for business purposes.

Philips Semiconductors - **Senior Process Engineer** (metal etch) – Mar. 1996 to Dec. 1997 and from Aug. 1991 to Mar. 1994 – Albuquerque, NM
Developed and maintained plasma etch and wet etch processes on aluminum, tungsten and titanium metals using Lam 9600 TCP and Applied Materials 8330 plasma metal etch systems. Used manual and automated wet benches for wet etch processes. SPC disciplines were used to maintain process control and to consistently drive for improved results. Inspected metal profiles with a scanning electron microscope.

High Yield Technology - **Senior Field Applications Engineer** – Mar. 1994 to Mar. 1996
Albuquerque, NM
Installed and developed in-situ particle monitors using laser light scattering /detection technology on a wide variety of high vacuum semiconductor process equipment at customer sites in the U.S., Ireland and Israel. Wrote application notes and lead training sessions for technicians and engineers. Performed field service engineering of the sensors.

Signetics Fab 22 & Fab 23 - **Defect Density Engineer** - Mar. 1986 to Aug. 1991
Albuquerque, NM
Helped establish and supervise this new engineering group which collected defect data from key fab process areas. The statistical data was graphed and reported weekly. Defect data was analyzed so correlations to particular tool events could be understood. Defect data was collected through the use of a KLA-2028 wafer inspection system and optical microscopes.

Signetics Fab 22 - **Quality Assurance Coordinator** – Feb. 1983 to Mar. 1986
Albuquerque, NM
Supervised a group of up to six operators to perform incoming acceptance inspections on all masks and reticles. Other duties included specification distribution and checking all measurement equipment for proper calibration and functionality.

U.S. Navy (Reserve) – **Lieutenant (junior grade)** – Oct. 1980 to Nov. 1986
Pensacola, FL and Corpus Christi, TX
Student Naval Aviator and later became an assistant air operations officer for the Chief of Naval Air Training. Scheduled aircraft for cargo missions and air show appearances.

Education

Bachelor of Science degree from the University of New Mexico in Albuquerque, NM
Majored in Biology with a minor in Chemistry

Graduated from the U.S. Navy's Aviation Officer Candidate School in Pensacola, FL
Earned a commission as an officer in the U.S. Navy (Reserve)

Master of Business Administration degree from New Mexico Highlands University branch in Albuquerque, NM

STATE OF NEW MEXICO
ENVIRONMENTAL IMPROVEMENT BOARD

IN THE MATTER OF PROPOSED NEW REGULATION,
20.2.50 NMAC – *Oil and Gas Sector – Ozone Precursor Pollutants* **No. EIB 21-27 (R)**

DIRECT TESTIMONY OF ELIZABETH BISBEY-KUEHN AND BRIAN PALMER

Elizabeth Bisbey Kuehn

My name is Elizabeth Bisbey-Kuehn. I am the Bureau Chief of the Air Quality Bureau ("Bureau") of the New Mexico Environment Department ("NMED" or "Department"). I am presenting this written testimony on behalf of the Department in this proceeding before the Environmental Improvement Board ("Board") on the Department's proposed new air quality regulation at 20.2.50 NMAC ("Part 50"). This part of my direct testimony will address the following topics:

- Facility and equipment data compiled for this rulemaking from the Bureau's TEMPO database (Part II. of this testimony);
- Key exhibits referred to throughout my and Mr. Palmer's testimony on the proposed rule requirements (Part III of this testimony);
- The proposed provisions in Sections 20.2.50.1 through 20.2.50.112, and 20.2.50.127 of Part 50; and
- The proposed provisions in Sections 20.2.50.113 through 20.2.50.124 of Part 50 with respect to applicability, description of equipment or process, control options, and proposed rule requirements. Mr. Palmer's testimony will cover Sections 20.2.50.113 through 20.2.50.124 with respect to the basis for the proposed requirements, estimated reductions, and estimated costs.

I will also be presenting direct testimony on other topics in this rulemaking in separate pieces of pre-filed testimony.

Brian Palmer

My name is Brian Palmer and I am a Senior Environmental Scientist with Eastern Research Group, Inc. ("ERG"). I have been asked to provide testimony on behalf of NMED in this proceeding regarding Part 50. I am part of a team from ERG that was contracted to assist the Department in developing the requirements in Part 50 and to provide testimony before the Board at the hearing on the proposed rule. My testimony covers Sections 20.2.50.113 through 20.2.50.124 with respect to the basis for the proposed requirements in those Sections, the estimated emissions reductions from compliance with those requirements, and estimated costs of compliance.

I. QUALIFICATIONS

A. Elizabeth Bisbey-Kuehn

A summary of my background and qualifications is provided in my other pre-filed testimony at NMED Exhibit 5. My full background and qualifications are set forth in my resume, which is marked as NMED Exhibit 6.

B. Brian Palmer

I have been a Senior Environmental Scientist with ERG since 1996. Prior to that, I was an Environmental Scientist with Radian International LLC for five years. My experience at ERG has included development of proposed amendments to EPA's regulations at 40 CFR Part 98, Subpart W – Mandatory Greenhouse Gas Reporting for Petroleum and Natural Gas systems; leading regulatory development projects for fifteen source categories, including baseline emission

inventories and estimating emission reductions; and supporting numerous projects related to the mandatory greenhouse gas reporting regulations at 48 CFR Part 98.

My full background and qualifications are set forth in my resume, which is marked as NMED Exhibit 33.

II. FACILITY AND EQUIPMENT DATA FOR PROPOSED PART 50

The Bureau utilizes a database called "TEMPO" to record, monitor, and track information about equipment and facilities regulated by the Department under the New Mexico Air Quality Control Act ("AQCA") and the Board's air quality regulations at Title 20, Chapter 2 of the New Mexico Administrative Code ("NMAC"). This information is collected from different types of submittals, including notice of intent registrations, air quality permit applications, compliance reports, report submittals required by state and federal air quality regulations, settlement requirements, and emissions inventories.

In TEMPO, a facility-level entry is referred to as the "Agency Interest" or the acronym "AI." Each facility entered in TEMPO includes: the company that owns, operates, and is the billing party for the facility; the person designated as the main contact or consultant for air permitting submittals; the estimated, potential, and actual quantities of facility-wide emissions; location information; applicable air quality regulations; the reported NAICS and SIC codes; and general information related to the facility. The general information includes identifying numbers assigned by the Bureau, the general category of industry type (such as compressor station, tank battery, or refinery), and the source classification status for facilities with air quality permits or registrations.

Additionally, TEMPO maintains information about individual equipment, which is referred to as the "Subject Item" or the acronym "SI." The information maintained for individual equipment will depend on the particular state and federal regulations that apply. Facilities with an

issued air quality permit have extensive information about emitting equipment entered in TEMPO. At the equipment-level, at a minimum, TEMPO captures the following: equipment stack parameters (including diameter, height, velocity, flow rate, and temperature); operating hours; permitted hourly and annual air emission limits for all regulated air contaminants; air increment consumption; control device if used and control efficiency; fuel type, heating value, and fuel use rates; general information such as serial numbers, manufacturer and construction dates, operating or capacity rates; applicable federal regulations and subparts; and source classification codes ("SCCs").

The Bureau maintains the SI level of information for equipment at facilities with air quality permits but does not enter the SI level of information for facilities operating with a notice of intent, which is not an air quality permit.

The Bureau uses TEMPO and the equipment and emissions data in the database in multiple ways. Electronic copies of public records and documents related to permit applications, compliance reports, emissions inventory, and a variety of submittal requirements are maintained in TEMPO. The emissions data in TEMPO is used to assess annual emission fees and annual permitting fees. The Bureau reports federally mandated regulatory information to EPA via TEMPO. Companies, regulated facilities, consultants, and the Bureau use the information in TEMPO to determine surrounding sources for air dispersion modeling analyses required for air permit applications. AQB uses TEMPO data to track prevention of significant deterioration increment consumption and/or expansion. TEMPO is also used as a project management tool to track action dates and deadlines for multiple sections within the Bureau.

Since TEMPO is a database, the Bureau has many options for compiling information according to business need. The data extracted from TEMPO is normally returned as spreadsheets.

The Bureau commonly uses reports to analyze emission trends, analyze application submittal trends, respond to Inspection of Public Records Act requests, generate lists of historical permit actions, generate lists of active or closed facilities, and track open actions. The Bureau can create custom reports based on any information in TEMPO.

To provide underlying data and information for this rulemaking on proposed Part 50, the Department downloaded the following information from TEMPO and provided it to ERG: owner, facility name, AI ID, source type, county, latitude, longitude, source classification, equipment type, category, designation, description, manufacturer, model number, serial number, manufactured date, construction date, operating rating capacity, maximum rating capacity, type of pollutant, quantity of hourly emissions, quantity of annual emissions, primary and secondary control devices, type of fuel, hours of operation, applicable federal air quality regulations, and SCC information. ERG used this data to develop the equipment spreadsheets used to evaluate the emissions reductions and costs of Part 50. The NMED data pulled from TEMPO and provided to ERG is included in a tab in each equipment spreadsheet, and is referred to throughout this testimony as the "NMED Equipment Data." The ERG spreadsheets generated from the TEMPO data are provided as exhibits in electronic format as Microsoft Xcel files.

III. KEY EXHIBITS

The Department and its consultants at ERG developed and/or relied upon a number of key documents in developing the proposed rule and the supporting technical information, and these documents are referred to throughout this testimony. The following list contains the exhibit number, name as referred to in the testimony, and description or citation information for each key document:

- **NMED Exhibit 34** – "**EPA CTG"**: EPA Office of Air and Radiation, *Control Techniques Guidelines for the Oil and Natural Gas Industry*, EPA-453/B-16-001 (October 2016)
- **NMED Exhibit 35 – "NSPS Subpart OOOO"**: EPA New Source Performance Standards at 40 C.F.R. Part 60, Subpart OOOO - Standards of Performance for Crude Oil and Natural Gas Facilities for Which Construction, Modification, or Reconstruction Commenced After August 23, 2011 and on or before September 18, 2015.
- **NMED Exhibit 36 – "NSPS Subpart OOOOa"**: EPA New Source Performance Standards at 40 C.F.R. Part 60, Subpart OOOOa - Standards of Performance for Crude Oil and Natural Gas Facilities for which Construction, Modification or Reconstruction Commenced After September 18, 2015.
- **NMED Exhibit 37 – "Pennsylvania GP-5"**: Pennsylvania GP-5, GENERAL PLAN APPROVAL AND/OR GENERAL OPERATING PERMIT BAQ-GPA/GP-5 for Natural Gas Compression Stations, Processing Plants, and Transmission Stations.
- **NMED Exhibit 38 – "Pennsylvania GP-5A"**: Pennsylvania GP-5A, GENERAL PLAN APPROVAL AND/OR GENERAL OPERATING PERMIT BAQ-GPA/GP-5A for Unconventional Natural Gas Well Site Operations and Remote Pigging Stations.
- **NMED Exhibit 39 – "Colorado Reg. 7"**: Colorado Regulation Number 7 - CONTROL OF OZONE VIA OZONE PRECURSORS AND CONTROL OF HYDROCARBONS VIA OIL AND GAS EMISSIONS (EMISSIONS OF VOLATILE ORGANIC COMPOUNDS AND NITROGEN OXIDES). All citations to Colorado Reg. 7 in this testimony are to Part D of that regulation unless expressly identified otherwise.

- **NMED Exhibit 40 ("Wyoming Permitting Guidance") –** Wyoming Department of Environmental Quality, Air Quality Division – *Oil and Gas Production Facilities Chapter 6, Section 2 Permitting Guidance* (Revised through May 2016).

IV. REVISIONS TO MAY 6, 2021 VERSION OF PART 50

The Department has made a number of editorial and clarifying revisions to the May 6, 2021 version of proposed Part 50. The new proposed version of Part 50 with these changes to the May 6, 2021 version shown in redline strikeout format is attached as NMED Exhibit 41. The revisions address inconsistencies in verbiage, clarify terms and definitions in the definition and applicability sections of each section and throughout the rule, correct punctuation errors, and edit text to clarify the Department's intent. The revisions to the proposed rule are explained as follows:

1) The term "wellhead site" is replaced with "well site" in the definition of "commencement of operation" (20.2.50.7.G); the definition "gathering and boosting station" (20.2.50.7.Q); the definition of "wellhead site" (20.2.50.7.TT); and in the other sections of Part 50 where that term appears. The new term "well site" is more consistent with the federal definition of well site. The term "wellhead" is narrowly defined in NSPS Subpart OOOOa, Section 60.5430a, and excludes equipment that the Department intended to include within the requirements of Part 50. The new terminology more accurately reflects the Department's intent and better aligns Part 50 with other federal air quality regulations.
2) The term "air fuel ratio controller" ("AFRC") is removed from the definition of "control device" at 20.2.50.7.L. The Department did not analyze AFRCs as potential control devices under Part 50, and did not intend for them to be an option for compliance with the emission standards under the rule. AFRCs are typically required when other control devices are in use, such as catalytic converters. The removal of AFRCs clarifies that the Department did

not analyze these types of equipment for potential application under Part 50, and did not intend to include them in the definition of control device.

3) The definition of "gathering and booster station" in 20.2.50.7.Q is revised to clarify the segment of the oil and gas industry intended to be included in this term. The new definition is "a facility, including all equipment and compressors, located downstream of well sites, designed to compress natural gas from well pressure to gathering system pressure prior to the inlet of a natural gas processing plant."

4) The definition of "natural gas compressor station" in 20.2.50.7.W is revised to add the following language: "Natural gas compressor stations include transmission compressor stations." This additional language clarifies the Department's intent to include transmission compressor stations within the meaning of a natural gas compressor station.

5) A definition of "transmission compressor station" is added at 20.2.50.7.SS to clarify the segment of the oil and gas industry included in this term, as used in the revised definition of "natural gas compressor station" at 20.2.50.7.W. Under the new definition, the term "transmission compressor station" means "a facility, including all equipment and compressors, that moves natural gas at elevated pressure from well sites or natural gas processing facilities in transmission pipelines to natural gas distribution pipelines or into storage. Transmission compressor stations may include equipment for liquids separation, natural gas dehydration, and tanks for the storage of water and hydrocarbon liquids." The definition of "Well Workover" is renumbered to 20.2.50.7.TT, and the definition of "Well Site" is renumbered to 20.2.50.7.UU to accommodate the addition of the definition for "transmission compressor station".

6) The term "gathering and boosting sites" is replaced with "gathering and boosting stations" in Section 20.2.50.111 and throughout the other sections of the rule where the term "gathering and boosting sites" was used. The replacement provides consistency in the terminology throughout Part 50, and aligns the language in the definitions section with the remaining sections of the rule.

7) The term "transmission compressor stations" is replaced with "natural gas compressor stations" in Section 20.2.50.111 and throughout the other sections of the rule where the term "transmission compressor station" was used. The replacement provides consistency in the terminology throughout Part 50, and aligns the language in the definitions section with the remaining sections of the rule.

8) A sentence was added in Subsection B of Section 20.2.50.111 to clarify that an owner or operator may not account for the effects of compliance with the requirements of Part 50 in calculating the potential to emit ("PTE") of a source for purposes of determining if the source is subject to Part 50. The following sentence was added: "Owners and operators may not include emissions reductions from compliance with this Part in calculating the PTE of a source for purposes of this Section, or in determining whether a source is subject to the requirements of this Part."

9) A sentence was added in 20.2.50.116(A) to clarify that an owner or operator may account for compliance with the requirements of Part 50 in the PTE calculations under Section 20.2.50.116, and in determining the monitoring frequency for a facility required in that Section. The following sentence was added: "Compliance with the requirements of this Part may be accounted for in determining a facility's PTE under this Section for purposes of determining applicable monitoring frequencies."

10) The phrase "an artificial lift engine" in 20.2.50.117.B(3)(b) was changed to "artificial lift." This revision clarifies the Department's intent that artificial lift is an option to comply with Section 20.2.50.117.

11) The words "during normal operation" were added to the end of the requirement in 20.2.50.118.B(3)(c) to read: "still vent and flash tank emissions shall not be vented to the atmosphere *during normal operation*." (Emphasis added). The additional language addresses a conflict with language in 20.2.50.118.B(3)(b) which requires owners and operators using a VRU to comply with the emission standards to meet a minimum capture and control efficiency of 95%. The revision addresses the conflict by clarifying under what conditions venting to the atmosphere may occur, while maintaining the minimum 95% emission reduction requirement.

12) The language in 20.2.50.120(B)(1) was revised to require owners and operators using vapor balancing or vapor recovery to control emissions by 100% when transferring liquid from a storage vessel to a transfer vessel, or when transferring liquid from a transfer vessel to a storage vessel. The language further clarifies that the 98% control requirement applies to owners and operators using a control device to comply with this emission standard when transferring liquid from a storage vessel to a transfer vessel, or when transferring liquid from a transfer vessel to a storage vessel.

13) The language in 20.2.50.120(B)(6) was revised to replace the word "prevents" with the word "minimizes." This revision clarifies the Department's intent to have owners and operators minimize emissions after a liquid leak has occurred. The revision resolves a conflict in the original proposed language that was problematic because a liquid leak by definition involves emissions to the atmosphere, so emissions from a liquid leak cannot be

entirely prevented, but they can be minimized in the cleaning and disposal of the leaked liquid.

14) The requirement in 20.2.50.120(C)(3) to conduct vapor testing on trucks used for hydrocarbon liquid transfers was removed. This revision clarifies the equipment and operations intended to be covered under Part 50. Tanker trucks and tanker rail cars transporting hydrocarbon liquids are not subject to Part 50 and were not analyzed by the Department during the development of the requirements in Part 50. The Department did not intend to impose testing and inspection requirements on equipment not subject to Part 50. The removal of 20.2.50.120(C)(3) also requires the deletion of the phrase "and testing" from 20.2.50.120(D)(2) and D(2)(a) through (d). This deletion is necessary in order to align the recordkeeping requirements with the revisions made to 20.2.50.120(C).

15) The colon at the end of the requirement in 20.2.50.120(D)(1) was replaced with a period to correct a drafting error.

16) The requirement in 20.2.50.122(B)(4)(c)(v) was revised to clarify that if an owner or operator meets at least a 75% total of non-emission controllers by January 1, 2025, the owner or operator is not subject to the requirements of Tables 1 and 2 of 20.2.50.122(B)(3). The phrase "has satisfied" was replaced by "is not subject to."

17) The word "in" was deleted from the requirement in 20.2.50.123.D(2) to correct a drafting error.

V. PROPOSED RULE PROVISIONS

Section 20.2.50.1 – Issuing Agency

The Board is the issuing agency pursuant to the AQCA.

Section 20.2.50.2 - Scope

This section explains the areas of the State that are subject to, or may become subject to, Part 50. As explained in the testimony of NMED witness Michael Baca, the Department developed the proposed rule as part of its Ozone Attainment Initiative, according to the directives of the AQCA at NMSA 1978, Section 74-2-5. *See* NMED Exhibit 1 at p. 4-5.

In accordance with the AQCA, Part 50 establishes emissions standards for oil and gas production and processing sources located in areas of the State within the Board's jurisdiction that, as of the effective date of the rule or anytime thereafter, are causing or contributing to ambient ozone concentrations that exceed ninety-five percent of the national ambient air quality standard ("NAAQS") for ozone, as measured by a design value calculated and based on data from one or more Department monitors.[1] Those areas currently include Chaves, Eddy, Lea, Rio Arriba, San Juan, Sandoval, and Valencia Counties (hereinafter referred to as the "Subject Counties"). Once a source becomes subject to Part 50, the requirements of Part 50 are irrevocably effective unless the source obtains a federally enforceable air permit limiting the potential to emit to below such applicability thresholds established in Part 50.

Section 20.2.50.3 – Statutory Authority

The Environmental Improvement Board ("Board") is authorized to adopt Part 50 pursuant to the New Mexico Environmental Improvement Act ("EIA"), NMSA 1978, §§ 74-1-1 to -17, and the AQCA. Section 74-1-8(A) of the EIA provides that the Board, as part of its responsibility for environmental management, shall promulgate rules and standards governing air quality management as provided in the AQCA (74-1-8(A)(4)), and nuisance abatement (74-1-8(A)(7)).

[1] Discussion regarding ozone monitoring in New Mexico is presented in the direct testimony of NMED witness Brent Ellington. *See* NMED Exhibit 28.

The Board's statutory authority under the AQCA is addressed in the direct testimony of NMED witness Michael Baca. *See* NMED Exhibit 1, at p. 4-5.

Section 20.2.50.4 – Duration

The Department proposes to for Part 50 to be permanently in effect from the effective date established in Section 20.2.50.5.

Section 20.2.50.5 – Effective Date

This section establishes the date on which the regulation becomes effective and is required by the New Mexico State Records Center and Archives. The effective date depends on when the final regulation is published in the New Mexico Register.

Section 20.2.50.6 - Objective

This section identifies the purpose of Part 50 and is required by the New Mexico State Records Center and Archives. The stated objective of Part 50 is "to establish emission standards for volatile organic compounds (VOC) and oxides of nitrogen (NOx) for oil and gas production, processing, and transmission sources."

Section 20.2.50.7 - Definitions

Section 20.2.50.7 contains definitions of terms used throughout Part 50. The proposed definitions are derived from state and federal regulations, and other technical glossaries used as part of standard practice by the regulated community and environmental regulatory agencies.

Subsection A. – "Approved instrument monitoring method" means an optical gas imaging ("OGI"); EPA reference method 21, 40 CFR § 60, Appendix B (NMED Exhibit 42); or other instrument-based monitoring method or program approved by the Department in advance and in accordance with Part 50. This definition establishes the types of monitoring methods that may be

used to monitor fugitive emissions and that are approved or may be approved by the Department. This definition was derived from Colorado Reg. 7, Section I.L.8.

Subsection B. – "Auto-igniter" means a device that automatically attempts to relight the pilot flame in the combustion chamber of a control device in order to combust VOC emissions, or a device that will automatically attempt to combust the VOC emission stream. This definition was derived in part from Colorado Reg. 7, Section I.B.5.

Subsection C. – "Bleed rate" means the rate in standard cubic feet per hour at which natural gas is continuously or intermittently vented from a pneumatic controller. This definition was derived in part from NSPS Subpart OOOOa, 40 CFR § 60.5430a.

Subsection D. – "Calendar year" means a year beginning January 1 and ending December 31. This definition implements the commonly accepted interpretation of a calendar year.

Subsection E. – "Centrifugal compressor" means a machine used for raising the pressure of natural gas by drawing in low-pressure natural gas and discharging significantly higher-pressure natural gas by means of a mechanical rotating vane or impeller. Screw, sliding vane, and liquid ring compressors are not centrifugal compressors. This definition was derived in part from NSPS Subpart OOOOa, 40 CFR § 60.5430a.

Subsection F. – "Closed vent system" means a system that is designed, operated, and maintained to route the VOC emissions from a source or process to a process stream or control device with no loss of VOC emissions to the atmosphere. This definition was derived in part from language in Colorado Reg. 7, Section I.J, and NSPS Subpart OOOOa, 40 CFR § 60.5411a(a).

Subsection G. – "Commencement of operation" means for an oil and natural gas wellhead, the date any permanent production equipment is in use and product is consistently flowing to sales lines, gathering lines, or storage vessels from the first producing well at the stationary source, but

no later than the end of well completion operation. This definition describes when operation of a production well may be presumed to have begun and was derived in part from Colorado Reg. 7, Section I.B.7.

Subsection H. – "Component" means a pump seal, flange, pressure relief device (including thief hatch or other opening on a storage vessel), connector or valve that contains or contacts a process stream with hydrocarbons, except for components where process streams consist solely of glycol, amine, produced water or methanol. This definition was derived in part from Colorado Reg. 7, Section I.B.10.

Subsection I – "Connector" means flanged, screwed, or other joined fittings used to connect pipe line segments, tubing, pipe components (such as elbows, reducers, "T's" or valves) to each other; or a pipe line to a piece of equipment; or an instrument to a pipe, tube, or piece of equipment. A common connector is a flange. Joined fittings welded completely around the circumference of the interface are not considered connectors for the purpose of this Part. This definition was derived in part from Colorado Reg. 7, Section I.B.11.

Subsection J. – "Construction" means fabrication, erection, installation or relocation of a stationary source, including but not limited to temporary installations and portable stationary sources. This definition describes the types of activities that constitute construction and was taken from the Board's regulations at 20.2.72 NMAC – *Construction Permits*.

Subsection K. – "Custody transfer" means the transfer of oil or natural gas after processing or treatment in the producing operation, or from a storage vessel or automatic transfer facility or other processing or treatment equipment including product loading racks, to a pipeline or any other form of transportation. This definition describes the concept of custody transfer and was derived in part from Colorado Reg. 7, Part B, Section IV.A.2.c.

Subsection L. – "Control device" means air pollution control equipment or emission reduction technologies that thermally combust, chemically convert, or otherwise destroy or recover air contaminants. Examples of control devices include but are not limited to open flares, enclosed combustion devices ("ECDs"), thermal oxidizers ("TOs"), vapor recovery units ("VRUs"), fuel cells, condensers, air fuel ratio controllers ("AFRs"), catalytic converters (oxidative, selective, and non-selective), or other emission reduction equipment. A control device may also include any other air pollution control equipment or emission reduction technologies approved by the department to comply with emission standards in this Part. This definition was derived in part from Colorado Reg. 7, Part A, Section II.A.7.

Subsection M. – "Department" means the New Mexico Environment Department.

Subsection N. – "Downtime" means the period of time when equipment is not in operation, or when a well is producing, and the control device is not in operation. This definition was derived in part from Merriam-Webster dictionary.

Subsection O. – "Enclosed combustion device" or "ECD" means a combustion device where gaseous fuel is combusted in an enclosed chamber. This may include, but is not limited to an enclosed flare, reboiler, and heater. This definition describes the types of equipment that are considered ECDs and the theory of ECD operation. Enclosed combustion device is a common term used in oil and gas regulatory provisions. *See, e.g.*, NSPS Subpart OOOOa, 40 CFR § 60.5412(d)(1). The definition in Part 50 was developed during rule drafting based on the knowledge and experience of NMED technical staff.

Subsection P. – "Existing" means constructed or reconstructed before the effective date of this Part and has not since been modified or reconstructed. This definition is required because the

applicability of numerous requirements and timeframes in Part 50 is based on whether a source is "existing" or "new".

Subsection Q. – "Gathering and boosting station" means a facility, including all equipment and compressors, located downstream of well sites, designed to compress natural gas from well pressure to gathering system pressure prior to the inlet of a natural gas processing plant. This definition was derived in part from NSPS Subpart OOOOa, 40 CFR § 60.5430a.

Subsection R. – "Glycol dehydrator" means a device in which a liquid glycol absorbent, including ethylene glycol, diethylene glycol, or triethylene glycol, directly contacts a natural gas stream and absorbs water. This definition was derived in part from Colorado Reg. 7, Section I.B.15.

Subsection S. – "Hydrocarbon liquid" means any naturally occurring, unrefined petroleum liquid and can include oil, condensate, and intermediate hydrocarbons. This definition was derived in part from Colorado Reg. 7, Section I.B.16.

Subsection T. – "Liquid unloading" means the removal of accumulated liquid from the wellbore that reduces or stops natural gas production. This definition derived from general information on EPA's Natural Gas STAR website and the EPA publication "Options for Removing Accumulated Fluid and Improving Flow in Gas Wells" (NMED Exhibit 44).

Subsection U. – "Liquid transfer" means the loading and unloading of a hydrocarbon liquid or produced water between a storage vessel and tanker truck or tanker rail car for transport. This definition was derived from general information from EPA's website and EPA's AP-42 Chapter 5.2 Transportation and Marketing of Petroleum Liquids, Section 5.2.2 (NMED Exhibit 43).

Subsection V. – "Local distribution company custody transfer station" means a metering station where the local distribution ("LDC") company receives a natural gas supply from an

upstream supplier, which may be an interstate transmission pipeline or a local natural gas producer, for delivery to customers through the LDC's intrastate transmission or distribution lines. This definition was derived from NSPS Subpart OOOOa, 40 CFR § 60.5430a.

Subsection W. – "Natural gas compressor station" means a facility, including all equipment and compressors, designed to compress natural gas from well pressure to gathering system pressure before the inlet of a natural gas processing plant, or to move compressed natural gas through a transmission pipeline. Natural gas compressor stations include transmission compressor stations. This definition was derived in part from Colorado Reg. 7, Section I.B.19, and the EPA CTG, Section C.7.

Subsection X. – "Natural gas-fired heater" means an enclosed device using a controlled flame and with a primary purpose to transfer heat directly to a process material or to a heat transfer material for use in a process. This definition was derived in part from Colorado Reg. 7., Part E, section II.A.3.p.

Subsection Y. – "Natural gas processing plant" means the processing equipment engaged in the extraction of natural gas liquid from natural gas or fractionation of mixed natural gas liquid to a natural gas product, or both. A Joule-Thompson valve, a dew point depression valve, or an isolated or standalone Joule-Thompson skid is not a natural gas processing plant. This definition was derived from the NSPS Subpart OOOOa, 40 CFR § 60.5430a.

Subsection Z. – "New" means constructed or reconstructed on or after the effective date of this Part. This definition is required because the applicability of numerous requirements and timeframes in Part 50 is based on whether a source is "existing" or "new".

Subsection AA. – "Operator" means the person or persons responsible for the overall operation of a stationary source. The definition was derived in part from the CAA at 42 U.S.C Section 7411.

Subsection BB. – "Optical gas imaging" or ("OGI") means an imaging technology that utilizes a high-sensitivity infrared camera designed for and capable of detecting hydrocarbons. This definition was derived in part from Colorado Reg. 7, Section I.B.17, and NSPS Subpart OOOOa, 40 CFR § 60.5397a.

Subsection CC. – "Owner" means the person or persons who own a stationary source or part of a stationary source. This definition was derived in part from the CAA at 42 U.S.C Section 7411.

Subsection DD. – "Permanent pit" means a pit used for collection, retention, or storage of produced water or brine and is installed for longer than one year. This definition was derived in part from the New Mexico Oil Conservation Commission's ("OCC") regulations at 19.15.17 NMAC.

Subsection EE. – "Pneumatic controller" means an instrument that is actuated using pressurized gas and used to control or monitor process parameters such as liquid level, gas level, pressure, valve position, liquid flow, gas flow, and temperature. The definition was derived in part from Colorado Reg. 7, Section III.B.10.

Subsection FF. – "Pneumatic diaphragm pump" means a positive displacement pump powered by pressurized natural gas that uses the reciprocating action of flexible diaphragms in conjunction with check valves to pump a fluid. A pump in which a fluid is displaced by a piston driven by a diaphragm is not considered a diaphragm pump. A lean glycol circulation pump that

relies on energy exchange with the rich glycol from the contactor is not considered a diaphragm pump. This definition was derived in part from NSPS Subpart OOOOa, 40 CFR § 60.5430a.

Subsection GG. – "Potential to emit" or ("PTE") means the maximum capacity of a stationary source to emit an air contaminant under its physical and operational design. The physical or operational limitation on the capacity of a source to emit an air pollutant, including air pollution control equipment and a restriction on the hours of operation or on the type or amount of material combusted, stored or processed, shall be treated as part of its design if the limitation is federally enforceable. The PTE for nitrogen dioxide shall be based on total oxides of nitrogen. This definition was derived from the Board's air quality operating permit regulations at 20.2.70 NMAC.

Subsection HH. – "Produced water" means a fluid that is an incidental byproduct from drilling for or the production of oil and gas. This definition describes what is meant by the term produced water and was derived from the OCC's regulations at 19.15.2 NMAC.

Subsection II. – "Produced water management unit" means a recycling facility or a permanent pit that is a natural topographical depression, man-made excavation, or diked area formed primarily of earthen materials (although it may be lined with man-made materials), which is designed to accumulate produced water and has a design storage capacity equal to or greater than 50,000 barrels. This definition describes what is meant by the term produced water management unit and was derived in part from the OCC's regulations at 19.15.2, 19.15.17, and 19.15.34 NMAC.

Subsection JJ. – "Qualified Professional Engineer" means an individual who is licensed by a state as a professional engineer to practice one or more disciplines of engineering and who is qualified by education, technical knowledge, and experience to make the specific technical

certifications required under this Part. This definition was derived in part from NSPS Subpart OOOOa, 40 CFR § 60.5430a.

Subsection KK. – "Reciprocating compressor" means a piece of equipment that increases the pressure of process gas by positive displacement, employing linear movement of a piston rod. This definition was derived from Colorado Reg. 7, Section I.B.24.

Subsection LL. – "Reconstruction" means a modification that results in the replacement of the components or addition of integrally related equipment to an existing source, to such an extent that the fixed capital cost of the new components or equipment exceeds fifty percent of the fixed capital cost that would be required to construct a comparable entirely new facility. This definition was derived from the Board's regulations at 20.2.72 NMAC.

Subsection MM. – "Recycling facility" means a stationary or portable facility used exclusively for the treatment, re-use, or recycling of produced water and does not include oilfield equipment such as separators, heater treaters, and scrubbers in which produced water may be used. This definition was derived from the OCC's regulations at 19.15.34 NMAC.

Subsection NN. – "Responsible official" means one of the following: (1) for a corporation: president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or a duly authorized representative of the corporation if the representative is responsible for the overall operation of the source, or (2) for a partnership or sole proprietorship: a general partner or the proprietor, respectively. This definition was derived from the Board's operating permit regulations at 20.2.70 NMAC.

Subsection OO. – "Small business facility" means, for the purposes of this Part, a source that is independently owned or operated by a company that is a not a subsidiary or a division of

another business, that employs no more than employees at any time during the calendar year, and that has a gross annual revenue of less than $250,000. Employees include part-time, temporary, or limited service workers. This definition was developed during rule drafting by NMED technical staff and contractors. An in-depth discussion of the basis for this definition is provided in the testimony of NMED witnesses Elizabeth Bisbey-Kuehn and Susan Day.

Subsection PP. – "Startup" means the setting into operation of air pollution control equipment or process equipment. This definition was derived from the Board's regulations at 20.2.7 NMAC – *Excess Emissions*.

Subsection QQ. – "Stationary Source" or "source" means any building, structure, equipment, facility, installation (including temporary installations), operation, process, or portable stationary source that emits or may emit any air contaminant. Portable stationary source means a source that can be relocated to another operating site with limited dismantling and reassembly. This definition was derived from the Board's air quality construction permit regulations at 20.2.72 NMAC.

Subsection RR. – "Storage vessel" means a single tank or other vessel that is designed to contain an accumulation of hydrocarbon liquid or produced water and is constructed primarily of non-earthen material including wood, concrete, steel, fiberglass, or plastic, which provide structural support, or a process vessel such as a surge control vessel, bottom receiver, or knockout vessel. A well completion vessel that receives recovered liquid from a well after commencement of operation for a period that exceeds 60 days is considered a storage vessel. A storage vessel does not include a vessel that is skid-mounted or permanently attached to a mobile source and located at the site for less than 180 consecutive days, such as a truck railcar, or a pressure vessel designed to operate in excess of 204.9 1 kilopascals without emissions to the atmosphere. This definition

describes was derived in part from Colorado Reg. 7, Section I.B.27, and NSPS Subpart OOOOa, 40 CFR § 60.5365a.

Subsection SS. – "Transmission Compressor Station" means a facility, including all equipment and compressors, that moves natural gas at elevated pressure from well sites or natural gas processing facilities in transmission pipelines to natural gas distribution pipelines or into storage. Transmission compressor stations may include equipment for liquids separation, natural gas dehydration, and tanks for the storage of water and hydrocarbon liquids.

Subsection TT. – "Well workover" means the repair or stimulation of an existing production well for the purpose of restoring, prolonging, or enhancing the production of hydrocarbons. This definition was derived from the MAP report.

Subsection UU. – "Wellhead site" means the equipment directly associated with one or more oil wells or natural gas wells upstream of the natural gas processing plant. A wellhead site may include equipment used for extraction, collection, routing, storage, separation, treating, dehydration, artificial lift, combustion, compression, pumping, metering, monitoring, and product piping. This definition was derived from Colorado Reg. 7, Section I.B.30, and NSPS Subpart OOOOa, 40 CFR § 60.5430a.

Section 20.2.50.111 - Applicability

Subsection A of Section 20.2.50.111 outlines the specific sources of air pollutants that are covered under Part 50. The rule applies to crude oil and natural gas production and processing equipment, including equipment and operations that extract, collect, separate, dehydrate, store, process, transport, transmit, handle hydrocarbon liquids or produced water in areas of the state specified in Section 20.2.50.2 and located at wellhead sites, tank batteries, gathering and boosting sites, natural gas processing plants, and transmission compressor stations located up to the point

of the local distribution company custody transfer station. Part 50 applies to state, federal, and privately owned land, but does not apply to tribal lands or Bernalillo County.

Subsection B of Section 20.2.50.111 specifies how to determine whether a source is subject to Part 50; specifically, owners and operators must calculate the PTE of each potentially affected source to determine if it is subject to requirements under the rule. The PTE calculation must be certified by a qualified profession engineer. This certification is critical to ensuring the potential air emissions from equipment and processes are properly calculated and representative of the source, and present a true and accurate representation of the source's potential emissions. Without this certification, emission calculations may be performed based on process, emission, or operational inputs that are not accurate or representative, which then underestimate the true potential emissions and result in a determination that equipment is not subject to this part. The PTE calculation is the foundation of determining applicability of this part and the certification of the PTE calculation ensures the integrity of how that fundamental calculation is performed.

Subsection C of Section 20.2.50.111 provides that owners and operators of small business facilities as defined in 20.2.50.7.OO are subject to the requirements of Section 20.2.50.125. A full discussion of Section 20.2.50.125

Subsection D of Section 20.2.50.111 provides that petroleum refiners and transmission pipelines are not subject to Part 50.

Section 20.2.50.112 – General Provisions

<u>General Requirements</u>

Subsection A of Section 20.2.50.112 outlines general provisions that establish a universal set of requirements applicable to all owners and operators of sources of emissions subject to emissions standards and other requirements of Part 50. Owners and operators of all affected

sources must meet the general operational, monitoring, recordkeeping, and reporting requirements set forth in Subsection A.

Paragraph (1) of Subsection (A) establishes work practice standards requiring equipment to be operated consistent with manufacturer specifications, for those specifications to be kept on file. For older equipment, it is often the case that equipment specifications provided by the equipment manufacturer is outdated, cannot be located, or in some cases does not exist. Thus, for equipment constructed prior to 1980 for which there is no manufacturer specification, NMED requires owners and operators to develop and follow a maintenance schedule sufficient to operate and maintain the sources in good working order.

Paragraph (2) of Subsection A establishes a requirement that equipment be operated a manner that minimizes emissions of air contaminants, including NOx and VOC. This is a standard operational requirement intended to ensure that equipment is used for its intended purpose only; that equipment is maintained in good working order such that it operates within its normal operating parameters, loads, and process and throughput rates; and that owners and operators proactively address any operational issues to avoid excess emissions due to equipment failures, malfunctions, or lack of proper maintenance and operation.

Paragraphs (3) through (9) of Subsection A establishes requirements for owners and operators to install an Equipment Monitoring Tag ("EMT") on certain equipment. The EMT is a tag that interacts with a company's equipment database and is used to track equipment information and compliance monitoring events and data. This section outlines what equipment data and compliance monitoring information are required to be maintained for each source subject to Part 50. The EMT is required to be scanned by owners and operators prior to compliance monitoring events, which certifies that owners and operators have initiated a compliance event. After the

compliance monitoring event concludes, owners and operators must complete a final scan of the EMT, which concludes event. The data required to be maintained includes a unique identification number, location, source type, the potential to emit; make, model, serial number; and a link to the manufacturer's maintenance and repair schedule. This section also outlines the general requirements for maintaining and operating the EMT; requirements for the owner and operator to manage the sources' record of data in a database that can generate a compliance database report in a format determined by the department; requirements to contemporaneously track compliance events for each subject source and requirements for timely uploads of monitoring or testing event data; and requirements for maintaining those records for a period of at least five years.

The EMT requirements will significantly improve the Department's ability to receive, review, and analyze compliance monitoring data for subject sources. In addition, these requirements will help improve and increase the public's confidence that required compliance monitoring is in fact occurring as required, because the contemporaneous scanning and recordkeeping during the monitoring and testing events ensures that owners and operators are fulfilling the monitoring requirements of the rule.

Paragraph (10) of Subsection A establishes a requirement for owners and operators to retain a third party at their own expense to verify any information collected, reported, or recorded pursuant to Part 50, if requested by the Department. The third party must conduct an assessment and make recommendations to correct or improve the data collected. The owner or operator is required to share the third party assessment and recommendations with the Department and implement them in a manner approved by the Department. The third-party compliance verification requirement provides a critical new auditing option if the Department suspects or finds that an owner or operator is failing to meet requirements under Part 50. Such verification will benefit the

Department's compliance program in significant ways. Having a compliance assessment conducted and a report prepared by an outside third party results in a considerable time and resource savings for the Department, which already operates under limited staffing and financial resources. The Department can review the compliance assessment report highlighting any issues and recommendations, and approve is the manner in which the recommendations are implemented. This approach will improve and increase the public's confidence in the company's compliance with Part 50. In sum, the ability of the Department to require a third-party compliance audit strengthens the overall rule; saves limited staffing resources; improves the public's confidence in compliance with the rule; will result in overall better compliance; and provides owners and operators with targeted recommendations on how to improve any compliance issues identified in the report.

General Monitoring Requirements

Subsection B of 20.2.50.112 specifies general monitoring requirements for sources subject to Part 50. Monitoring of equipment, processes, and emissions provides owners and operators with information they can use to evaluate the equipment operation and performance relative to the requirements of the rule, and assist them in determining proper corrective actions when necessary. Equipment monitoring provides the basis for most on-going compliance demonstrations and provides documentation to support the required compliance certification. The provisions in Subsection B establish a monthly inspection requirement for sources subject to emissions standards and monitoring under Part 50; a process for submitting an alternative monitoring strategy for the Department's consideration; and requirements for EMT scanning and reporting of certain required data and information obtained during the monitoring event.

Paragraph (1) of Subsection (B) requires owners and operators to inspect affected sources at least monthly to ensure proper operation and maintenance of such sources, unless a different schedule is specified under another Section of Part 50. This monthly inspection is the minimum periodic monitoring requirement for sources subject to Part 50 and requires owners and operators to evaluate the overall operation of the source. There are different types of source monitoring required under the other sections of the rule, and this requirement establishes the baseline monthly inspection. In the source-specific subparts, additional types of monitoring, including parametric monitoring, emissions stack testing, and other types of inspections are required.

Paragraph (2) of Subsection (b) provides a process by which owners and operators can propose an equally effective, enforceable, and equivalent alternative monitoring strategy to the Department for consideration. This is a critical option for both the Department and affected owners and operators, as it provides a process by which new and innovative monitoring approaches and technologies can be used to comply with the monitoring requirements of Part 50. As new monitoring technology becomes available and technically feasible, it is important for operators to have flexibility in the performance of compliance monitoring required under the rule. For instance, fence line air monitoring and aerial surveillance technologies are quickly evolving and both approaches can improve real time emissions data collection and enable faster compliance assessments covering multiple sources.

An alternative monitoring strategy must first be reviewed and approved in writing by the Department prior to implementation. The Department will provide an alternative monitoring strategy request form, which will outline the criteria for demonstrating that the proposed alternative meets the requirements of the rule that it be equally effective, enforceable, and equivalent. At a minimum, the proposal must effectively monitor the source for the pollutants of

concern and establish sufficient monitoring, recordkeeping, and reporting requirements such that the requirements are legally and practically enforceable.

Paragraph (3) of Subsection B provides that monitoring events for equipment required to have an EMT must be initiated and completed by scanning the unit's EMT. As previously discussed, requiring an affirmative scanning of the EMT prior to and after the conclusion of any monitoring event provides assurance that the monitoring event actually occurred and will reduce the incidences of missed compliance monitoring requirements and inaccurate monitoring records. The minimum set of data required to be uploaded to the company database includes: the date and time of the monitoring event, name of the personnel conducting the event, ID and type of unit, description of any maintenance or repair conducted, and the results of the event as required under Part 50.

General Recordkeeping Requirements

Subsection C of Section 20.2.50.112 establishes minimum universal recordkeeping requirements that owners and operators of sources subject to Part 50 must comply with. These include a requirement to upload monitoring data within three business days of any monitoring event; to maintain all records required under this part for at least five years; and to complete a full compliance evaluation of sources subject to this part prior to any transfer of ownership.

The requirement for a full compliance evaluation prior to any transfer of ownership will have significant and positive benefits for public health and the environment, as well as for the Department and its air compliance program. This requirement obligates owners and operators to conduct and document a full evaluation of all affected sources' compliance with the full requirements of Part 50. The documentation must include a certification by a responsible official as to the compliance status of all affected sources with respect to the emission standards,

monitoring, recordkeeping, and reporting requirements of Part 50. The compliance evaluation must be conducted at least three months prior to any transfer of ownership, and the documentation must be kept by the new owner or operator for at least five years. This provision is important as it requires owners and operators to perform a preemptive compliance determination, which can highlight potential compliance issues for the current owner, future owner, and the Department. The report will also provide important compliance status information to the Department, which may be used in the development of enforcement cases and can provide a compliance baseline from which to reference and compare the new owner's compliance progress and improvement, or decline.

General Reporting Requirements

Subsection D of Section 20.2.50.111 establishes general reporting requirements for sources subject to Part 50. Owners and operators are required to make any reports required to be generated under Part 50 available to the Department within 24 hours of the Department's request. Those reports must be made available in an electronic format and submitted to the Department's secure extranet portal or by other means or formats as specified by the Department.

Section 20.2.50.113 – Engines and Turbines

Section 20.2.50.113 applies to portable and stationary natural gas-fired spark ignition engines; compression ignition engines; and natural gas-fired combustion turbines located at well sites, tank batteries, gathering and boosting stations, natural gas processing plants, and natural gas compressor stations with a rated horsepower greater than those shown in Tables 1, 2, and 3 of Section 113.

Description of Equipment and Process

Engines and turbines are used in the oil and gas industry to power compressors that maintain natural gas pressures at levels sufficient to move gas through gathering and transmission pipelines. Compressors at gathering compressor stations move the gas from the wellhead to gas processing plants. Compressors at gas processing plants move the gas from the processing plants to transmission pipelines, and compressors at transmission compressor stations maintain pressure and move the gas along the transmission pipelines to the ultimate user of the processed gas.

In addition to driving compressors, engines may also be used as the driver for power generators that provide electrical power to sites that are not connected to the commercial electrical grid or may be used as backup power supply in case of a power outage. Engines are also used to drive pumpjacks in the oil production sector. Pumpjacks are used to mechanically lift liquid out of the well if bottom hole pressure is not high enough to allow liquid to flow to the surface.

Two kinds of reciprocating internal combustion engines are used in the oil and gas industry: spark ignition and compression ignition. In a spark ignition engine, fuel mixes with air and is introduced during the intake process. After compression of the fuel-air mixture, it is ignited by a spark from a spark plug to cause combustion. The combustion gases expand and push the piston during the power stroke. In compression ignition engines, typically diesel, only air is inducted into the engine then highly compressed. Fuel is injected or sprayed into the hot, compressed air, causing it to ignite without the need for an external spark.

The work cycle of both types of engines may either be two-stroke or four-stroke. A four-stroke spark ignition engine consists of the following: the suction or intake stroke, compression

stroke, combustion and power stroke, and exhaust stroke, each consisting of 180 degrees of crankshaft rotation. A two-stroke cycle completes its power cycle with only two strokes of the piston. In a two-stroke engine, the end of the combustion stroke and the beginning of the compression stroke occur simultaneously, with the intake and exhaust occurring at the same time. Reciprocating internal combustion engines are generally used to power reciprocating compressors, and often the engine and compressor share the same crankshaft in what is known as an integral compressor.

A combustion turbine consists of an upstream rotating combustion gas compressor, a combustor, and a downstream turbine on the same shaft as the combustion gas compressor. During operation, the combustion turbine compresses atmospheric air and mixes it with fuel that is burned at extremely high temperatures, creating a hot gas. This hot mixture moves through blades in the turbine, causing them to spin quickly. These blades rotate the turbine drive shaft, which powers the combustion gas compressor.

Control Options

Control Options for NOx – Engines

Readily available options for controlling NOx on two-stroke and four stroke lean burn[2] engines include low emissions controls, selective catalytic reduction, and non-selective catalytic reduction.

Low Emissions Controls ("LEC")[3] is a NOx emissions reduction method that can be retrofitted on most fuel injected two-stroke lean burn engines. NOx emissions increase with

[2] The difference between a rich-burn or lean-burn engine lies in the air-to-fuel ratio. A rich-burn engine has excess fuel in the combustion chamber, while a lean-burn engine has excess air in the combustion chamber.

[3] LEC consist of a combination of combustion controls in which various engine modifications, upgrades, and tuning methods result in lower combustion emissions. One upgrade includes increasing the air-to-fuel (AFR) ratio to reduce thermal NO_X formation by diluting combustion gases and lowering peak flame temperature, that would require upgrades to the AFR controller and turbocharger (a device that increases an engine's power output by forcing extra compressed air - and proportionally more fuel - into the combustion chamber). Another modification associated with

higher combustion temperature. LEC engine retrofit modifications reduce NOx by adding excess air in the combustion zone to reduce combustion temperature, thereby reducing NOx emissions. This change in the air-to-fuel ratio may require other changes to an engine's combustion process. Variation in the amount of NOx emission reduction, required modifications, and cost will depend on the make, model, and vintage of the engine.

Selective catalytic reduction ("SCR") is a post-combustion NOx control for lean-burn engines that utilizes a catalyst and a reducing agent to reduce the concentration of NOx in the exiting combustion gas. The reagent, typically ammonia or urea is injected into the exhaust stream of the engine where the ammonia (or urea, that decomposes to produce ammonia in the exhaust stream) passes over a catalyst and combines with oxygen to enhance the conversion of NO_X and ammonia into nitrogen and water. An oxidation catalyst must be added to the SCR design if hydrocarbons and carbon monoxide need to be controlled in addition to NOx on a lean-burn engine. Oxidation catalysts consist of precious metals, such as platinum, palladium or rhodium, or metal oxides containing chlorinated compounds, impregnated on high surface area carriers (e.g., a honeycomb structure referred to as a catalyst bed) placed in the exhaust stream. An oxidation catalyst promotes the oxidation of CO and hydrocarbons (HCs) to carbon dioxide and water as the gas stream passes through the catalyst bed. The CO_2, water, and NOx then enter the SCR catalyst where the NOx reacts with the ammonia.

Catalyst selection is partly based on the expected range of the engine exhaust, and is sized to achieve the desired amount of NO_X reduction. The reagent injection system is comprised

LEC is adjusting ignition timing to delay ignition in the power stroke when the chamber is below its maximum pressure. This results in ignition at a lower temperature and lower thermal NO_X formation during combustion. Other LEC options include installing cylinder heads fitted with pre-combustion chambers (a space in which combustion gases are ignited a combustion commenced ahead of the main combustion chamber, resulting in complete combustion of the fuel), larger intercooling applications, and enhanced mixing of air and fuel.

of a storage tank, reagent injector(s), reagent pump, pressure regulator and electronic controls to accurately meter the quantity of reagent injected as a function of engine load, speed, temperature, and NOx emissions. The Ozone Transport Commission's[4] final technical document, *Technical Information - Oil and Gas Sector – Significant Stationary Sources of NOx Emissions* (October 17, 2012) (NMED Exhibit 45),[5] indicates that NOx reductions of up to 95% may be achieved using SCR. The energy and non-air environmental impacts should be evaluated on a case-by-case basis to determine the suitability of SCR. SCR requires ammonia and catalyst replacements, generating waste that must be disposed of, and there is some increase in electric input to operate the system. SCR systems also emit unreacted ammonia in the process, referred to as ammonia slip. This ammonia can combine with sulfur dioxide and nitrogen oxides in the atmosphere to form ammonium sulfate and ammonium nitrate as fine particulate matter.

Non-selective catalytic reduction ("NSCR"), or three-way catalyst, is a potential control option for reducing NOx, CO, and VOC emissions from rich burn engines. Exhaust from the engine is passed through a metallic or ceramic honeycomb covered with a platinum group metal catalyst. The catalyst promotes the low temperature (approximately 850^0F) reduction of NO_X into N_2, the oxidation of CO into CO_2, and the oxidation of VOCs into water and CO_2. The catalyst efficiency is directly related to the air/fuel mixture and temperature of the exhaust. To maintain the proper exhaust gas oxygen concentration across the operating range of the engine, an air/fuel ratio controller[6] must be installed for varying engine load, engine speed conditions, and varying ambient conditions. *See* NMED Exhibit 45 at p. 32.

[4] The Ozone Transport Commission is a multi-state organization created under the CAA that develops regional solutions for ozone in the Northeast and mid-Atlantic states.

[6] Air fuel ratio controllers-To obtain the proper exhaust gas O_2 across the operating range, an air/fuel ratio controller is installed that measures the oxygen concentration in the exhaust and adjusts the inlet air/fuel ratio to meet the

Control Options for NOx – Turbines

Readily available NO_X control options for turbines include water or steam injection, dry low-NO_X burners, and SCR.

Water or steam injection involves injecting water into the combustion zone of a turbine to lower peak flame temperatures, which subsequently lowers the amount of thermal NO_X formation during combustion. Water may be injected directly into the turbine combustor or may be converted to steam using waste heat recovered from turbine exhaust with a heat recovery steam generator, and then injected into the combustor as steam. More steam than water is required to achieve a comparable reduction of NO_X. *See* NMED Exhibit 45 at p. 62.

Dry Low NO_X Burners ("DLNB"), also referred to as improved combustion technology, reduce the peak flame temperature and residence time of fuel in the combustor, thereby reducing thermal NO_X formation by increasing the air-to-fuel ratio in the combustion chamber. Not all turbine designs can accommodate a DLNB, and this technology may not be available for all makes and models of combustion turbines. In addition to the replacement of the turbine's combustors, the installation of this technology may require modifications or replacement of associated piping and turbine control modification or replacement.

SCR technology, described above, is also a potential control option for turbines.

Control Options for VOC – Engines

Readily available VOC control options for engines include NSCR and catalytic oxidation. The control of VOCs using NSCR for rich burn engines to control CO and VOC, as well as NOx, is explained above in the discussion of using NSCR for NOx control. The use of catalytic

proper 0.5% O_2 exhaust requirement for varying engine load conditions, engine speed conditions, and ambient conditions.

oxidation for VOC and CO emissions control for lean burn engines is explained above in the discussion of SCR systems for lean burn engines.

Control Options for VOC – Turbines

A readily available VOC control option for turbines is catalytic oxidation. The control of VOCs using catalytic oxidation is explained above under the control options for VOC from engines.

Proposed Rule Requirements

Section 20.2.50.113 requires owners and operators of new and existing portable and stationary engines and turbines equal to or exceeding specified horsepower ratings to meet NOx, CO, and VOC emission limits.

For existing spark ignited engines, owners and operators are required to develop an inventory of those engines and meet the emission limits over a specified timeline. This timeline requires a certain percentage of the inventoried fleet to meet the requirements by specified deadlines. The timeline allows owners and operators sufficient time to come into compliance with the requirements of this subpart. In lieu of meeting the emissions limits, owners and operators may reduce the number of hours of operation in order to reduce emissions to rates similar to the emissions reduction requirements achieved by utilizing emission control devices. This option provides an alternative method of compliance for engines that are difficult to retrofit, while ensuring equivalent emission reductions.

New spark ignited engines must meet the emission limits upon startup. New and existing compression ignited engines must meet specified emission limitations depending upon the construction date of the units. New and existing turbines must meet specified emission limitations depending upon the construction date of the units. Owners and operators are required

to meet the minimum recommended maintenance schedule; document when those units are taken out of service for more than two hours; operate emission control devices per the manufacturer specifications; perform initial and annual emissions testing; monitor the hours of operation for certain units; and install an EMT on all units subject to this subpart. Owners and operators are required to maintain records of certain information on units subject to this Section, including the make, model, and serial number; a copy of the engine, turbine, and control device manufacturer specifications; information on the initial and annual emissions testing; hours of operation; and information documenting that emissions reductions realized through the reduction in hours of operation is equivalent to a 95% reduction in NOx and VOC emissions. Owners and operators are required to report in accordance with the requirements of Section 20.2.50.112.

Basis for Proposed Regulatory Requirements

Natural Gas-Fired Spark-Ignition Engines

The proposed NOx limit of 0.50 grams per brake horsepower per hour (g/bhp-hr) for existing lean burn engines greater than 1,000 bhp is based on the use of low emission combustion retrofit on existing engines, or the addition of a SCR control system.

This is the same limit as that used in Section C of Pennsylvania GP-5 for natural gas-fired spark ignition engines greater than 500 hp authorized to operate on or after February 2, 2013. A less stringent standard (2.0 g/bhp-hr) applies to all spark ignition engines authorized to operate between March 10, 1997, and February 2, 2013. A more stringent standard (0.30 g/bhp-hr) applies to engines greater than or equal to 2,370 hp authorized to operate on or after August 8, 2018. *See* NMED Exhibit 37.

Cooper Machinery Services advertises that they offer engine upgrades that will allow engines to meet a NOx limit of 0.5 g/bhp-hr NOx for all Clark, Cooper-Bessemer, and Ingersoll

Rand slow speed engine models. *See* NMED Exhibit 46 – Cooper Machinery Services webpage visited 07/26/2021.[7] The modifications include a combination of adding a forced air delivery system using either a turbocharger or a blower, and completing electronic system upgrades for fuel, ignition, air/fuel ratio control, diagnostics, and combustion cylinder balancing. Cooper Machinery lists examples of 41 units in nine states that have already been retrofitted to meet 0.5 g/bhp-hr NOx, and are either operating at 0.5 g/bhp-hr or are capable of operating at 0.5 g/bhp-hr.

The California South Coast Air Quality Management District Rule 1110.2, attached as NMED Exhibit 47,[8] specifies a NOx emission limit, effective July 1, 2011, applicable to all existing stationary spark and compression ignition engines (i.e., making no distinction by engine type) with a nameplate rating of 50 hp or greater of 11 parts per million by volume, dry basis (ppmvd) NOx at 15% O_2. This is equal to approximately 0.15 g/bhp-hr, assuming a conversion factor of 1 g/bhp-hr for a lean burn engine controlled by low emission combustion technology.

EPA's *Stationary Reciprocating Internal Combustion Engines Updated Information on NOx Emissions and Control Techniques*, Publication No. EPA-457/R-00-001 (September 2000), summarized the results of 476 individual tests conducted from 1991 to 1998 of lean-burn engines fitted or retrofitted with low emission combustion technology either by the original equipment manufacturer ("OEM") or a third-party vendor. In these tests, NOx emissions ranged from 0.1 g/bhp-hr to 4.8 g/bhp-hr. Ninety-seven percent (97%) of these tests (460) measured emissions less than or equal to 2 g/bhp-hr. Almost 75 percent (356) of the tests measured emissions less

[7] Available at: https://www.cooperservices.com/engines-and-compressors/upgrades/0-5-gbhp-hr-nox-solution%E2%80%8B/
[8] http://www.aqmd.gov/docs/default-source/rule-book/reg-xi/rule-1110-2.pdf

than or equal to 1 g/bhp-hr, and 25 percent (120) measured emissions of less than or equal to 0.5 g/bhp-hr. *See* NMED Exhibit 48 at p. 2-2.

The same EPA report summarized test results for lean burn engines controlled by SCR. Summary data obtained for 1997 emission tests were of three 3,130-bhp, 4-stroke, lean-burn SI engines equipped with SCR control systems and subject to a permit emission limit for NOx of 15 ppmv (on a dry basis corrected to 15 percent oxygen), corresponding to about 0.2 g/bhp-hr. During 20 individual test runs in 1997 on these three engines, NOx emissions ranged between 0.11 g/bhp-hr and 0.21 g/bhp-hr. *See id.* at p. 4-15.

The proposed limits for CO (47 ppmvd at 15 percent O_2 or 93% reduction) and non-methane non-ethane hydrocarbon ("NMNEHC") (0.70 g/bhp-hr, as propane) for existing lean burn engines greater than 1,000 bhp are based on the addition of an oxidation catalyst control. This CO limit is also the same as the operating limit specified in the federal regulations at 40 CFR 63, Subpart ZZZZ, for non-emergency and non-remote existing 4SLB engines greater than 500 hp using an oxidation catalyst.[9]

The proposed CO limit (47 ppmvd at 15 percent O_2 or 93% reduction) is the same limit as that set forth in Pennsylvania GP-5 for natural gas-fired spark ignition engines greater than 500 hp authorized to operate on or after February 2, 2013. This is also the same limit specified in 40 CFR Part 63, Subpart ZZZZ, for existing natural gas fired spark ignition non-emergency lean burn engines rated greater than 500 bhp, located at an area source of hazardous air pollutants ("HAP"). *See* NMED Exhibit 49. A less stringent CO standard (2.0 g/bhp-hr) in Pennsylvania GP-5 applies to all spark ignition engines authorized to operate between March 10, 1997 and February 2, 2013. A more stringent standard (0.30 g/bhp-hr) in GP-5 applies to engines greater

[9] See 40 CFR part 63, subpart ZZZZ, See Table 2c, row #10; Table 2d, row #9; Table 5, #13; Table 6, Row #14.

than or equal to 2,370 hp authorized to operate on or after August 8, 2018. The proposed CO limit of 47 ppmvd at 15 percent O_2 is approximately equal to 0.50 g/bhp-hr, assuming a conversion factor of 95 ppmvd per 1.0 g/bhp-hr. *See* NMED Exhibit 37, at p. 12-13.

The proposed limit for NMNEHC is the same as the VOC limit in Table 1 to 40 CFR 60, Subpart JJJJ, for engines greater than 500 hp and manufactured after July 1, 2010. *See* NMED Exhibit 50.

Existing Rich Burn Engines greater than 1,000 bhp

The proposed limits for NOx (0.50 g/bhp-hr), CO (0.70 g/bhp-hr), and NMNEHC (0.70 g/bhp-hr as propane) for existing rich burn engines greater than 1,000 bhp are all based on the addition of NSCR controls.

The proposed NOx limit is less stringent than the limits in the PA GP-5 and GP-5A (0.20 g/bhp-hr) for rich burn engines authorized to operate on or after February 2, 2013. The proposed NOx limit is more stringent than the New Source Performance Standard (NSPS) limit in 40 CFR 60, Subpart JJJJ, for engines with a manufacture date after July 1, 2007 (2.0 g/bhp-hr) and after July 1, 2010 (1.0 g/bhp-hr), although the NSPS applies the same NOx limit to both lean burn and rich burn engines.

The proposed NOx limit is more stringent than the numerical NOx limits specified in Colorado Reg. 7, Part E:

- Section I.D.3.b: "State only" requirements for new, modified or relocated engines ≥ 500 Hp:
    - Constructed or relocated on or after January 1, 2007: 2.0 g/hp-hr; and
    - Constructed or relocated on or after January 1, 2010: 1.0 g/hp-hr).

- Section I.D.5.b: "State only" requirements for new, modified or relocated engines ≥ 1,000 Hp:
    - In service on or before November 14, 2020: 0.8 g/hp-hr.
    - Placed in service, modified, or relocated after November 14, 2020: 0.5 g/hp-hr.

All new and existing rich burn engines located in the Colorado 8-hour ozone control area are required to use NSCR. *See* Colorado Reg. 7, Part E, Sections I.A and I.B (NMED Exhibit 39).

The proposed CO limit is less stringent than the limits in Pennsylvania GP-5 and GP-5A (0.30 g/bhp-hr) for rich burn engines authorized to operate on or after February 2, 2013. The proposed CO limit is more stringent than the NSPS limit in 40 CFR 60, Subpart JJJJ, for engines with a manufacture date after July 1, 2007 (4.0 g/bhp-hr) and after July 1, 2010 (2.0 g/bhp-hr), although the NSPS applies the same NOx limit to both lean burn and rich burn engines. The proposed CO limit is also more stringent than the limits specified in Colorado Reg. 7 for engines constructed or relocated after July 1, 2007 (4.0 g/bhp-hr) and after July 1, 2020 (2.0 g/bhp-hr) (Part E, Section I.D.3.b) and before and after November 14, 2020 (2.0 g/bhp-hr) (Part E, Section I.D.5.b).

The proposed NMNEHC limit is less stringent than the limits in Pennsylvania GP-5 and GP-5A (0.20 g/bhp-hr, excluding formaldehyde) for rich burn engines authorized to operate on or after February 2, 2013. The proposed NMNEHC limit is more stringent than the limit in NSPS Subpart JJJJ for engines with a manufacture date after July 1, 2007 (1.0 g/bhp-hr), and is the same as the limit for engines with a manufacture data after July 1, 2010 (0.7 g/bhp-hr). The proposed NMNEHC limit is more stringent than the VOC limits specified in Colorado Reg. 7

for engines constructed or relocated after July 1, 2007 (1.0 g/bhp-hr), and is the same (0.7 g/bhp-hr) for engines constructed or relocated after July 1, 2010 (Part E, Section I.D.3.b) and for engines constructed or relocated after November 14, 2020 (Part E, Section I.D.5.b).

The Ohio EPA provides on-line emission test summaries for many emission tests for the years 2003 to 2016.[10] These include many emission tests of reciprocating internal combustion engines and turbines. These Ohio EPA test data show that the proposed emission limits for existing lean burn and rich burn engines are readily achievable. The Ohio data for NOx, CO, and VOC (as surrogate for NMNEHC) emissions from engines and turbines are presented in the Engines and Turbines OH Stack Tests Spreadsheet at NMED Exhibit 51.

New Spark Ignition Engines

The proposed NOx emission limits for new lean burn and rich burn engines are the same as those in Pennsylvania GP-5 and GP-5A for engines authorized to operate on or after August 8, 2018. These limits are based on vendor guarantees and other information collected by the Pennsylvania Department of Environmental Protection ("PA DEP") and summarized in the June 2018 Technical Support Document for Pennsylvania GP-5 and GP-5A ("PA TSD 2018"), attached as NMED Exhibit 52. The NOx limits for lean burn engines are based on low emission combustion designs for engines greater than 500 bhp but less than 1,000 bhp, and based on low emission combustion designs or the use of add-on SCR for engines equal to or greater than 1,000 bhp.

The CO and NMNEHC limits for lean burn engines greater than 500 bhp are the same limits as for existing lean and rich burn engines greater than 1,000 bhp and are based on the use of add-on oxidation catalysts.

[10] *See* https://www.epa.ohio.gov/dapc/engineer/stackg#123883452-test-summaries.

The NOx, CO, and NMEHC limits for rich burn engines greater than 500 bhp are based on the use of add-on NSCR.

The Ohio EPA's on-line emission test summaries include many emission tests of reciprocating internal combustion engines and turbines. The Ohio test data show that the proposed emission limits for new lean burn and rich burn engines are readily achievable. The data for NOx, CO and VOC (as surrogate for NMNEHC) are presented in the Engines and Turbines OH Stack Tests Spreadsheet at NMED Exhibit 51.

New Compression Ignition Engines

The proposed NOx emission limit for new compression ignition engines equal to or greater than 500 hp of 9 g/bhp-hr is the same limit as Colorado Reg. 7 Part E, Section II.A.4.e. The emission limit is based on the use of add-on SCR controls.

The proposed rule does not include proposed emission limits for existing compression ignition engines.

Stationary Combustion Turbines

The proposed requirements for both existing and new turbines apply to turbines with rated bhp greater than or equal to 1,000 bhp.

The proposed emission limits and applicability thresholds for turbines are based on the PA TSD 2018 (NMED Exhibit 52), except that the proposed NOx limits for existing turbines are based on EPA Office of Air and Radiation's *Alternative Control Techniques Document – Nox Emissions from Stationary Gas Turbines*, EPA-453/R-93-007 (January 1993) ("EPA 1993 ACT"), included as NMED Exhibit 53.

The proposed NOx emission limits of 50 ppmvd at 15% O_2 for existing turbines, as set forth in Table 3 of Section 20.2.50.113, are based on the use of water or steam injection control

technology. The EPA 1993 ACT for NOx emissions from stationary combustion turbines reported that water or steam injection can commonly achieve 70 to 90 percent NOx emission reductions and vendor guaranteed controlled emission rates of 25 to 75 ppmvd, with many vendors offering a guarantee of 42 ppmvd. *See id.*, at Table 5-5. The Ozone Transport Commission recommended the following NOx limits for existing natural gas pipeline compressor prime mover turbines:

- Turbines less than 2,000 hp – 150 ppmvd at 15% O_2
- Turbines equal to or greater 2,000 hp and less than 5,000 hp – 50 ppmvd at 15% O_2
- Turbines equal to or greater than 5,000 hp – 25 ppmvd at 15% O_2

See NMED Exhibit 54 – OTC Stationary and Area Sources Committee, *OTC Regulatory and Technical Guideline for Control of Nitrogen Oxides (NOx) Emissions from Natural Gas Pipeline Compressor Fuel-Fired Prime Movers* (May 14, 2019), at p. 8-9.

The proposed CO and NMNEHC emission limits in Table 3 of Section 20.2.50.113 for existing turbines are based on the same limits in Pennsylvania GP-5 for turbines authorized to operate on or after February 1, 2013, but prior to August 8, 2018. For turbines between 1,000 and 15,000 HP, Pennsylvania GP-5 establishes a CO limit of 50 ppmvd at 15% O_2 and a NMNEHC limit of 9 ppm NMNEHC at 15% O_2. These limits were identified as achievable for turbines using good combustion practices and without the use of oxidation catalysts. These limits are based on vendor data for uncontrolled turbines, and the vendor data showed that oxidation catalysts were not cost effective for turbines in this size range to achieve a lower emission level, according to the 2018 TSD for GP-5/GP-5A. *See* NMED Exhibit 52, at p. 75.

For turbines greater than or equal to 15,000 HP and authorized to operate under GP-5 on or after February 1, 2013, but prior to August 8, 2018, PA DEP determined that oxidation

catalysts were cost effective to achieve a CO limit of 50 ppmvd at 15% O_2 (or a 93% reduction) and a NMNEHC emission limit of 5 ppm NMNEHC at 15% O_2 (or a 50% reduction). *See id*.

The proposed NOx, CO, and NMNEHC limits for new turbines in Table 3 of Section 20.2.50.113 are almost identical those in the Pennsylvania GP-5 for turbines authorized to operate on or after August 8, 2018. According to the PA DEP's 2018 TSD for GP-5/GP-5A, vendor data for turbines greater than or equal to 1,000 bhp but less than 5,000 bhp indicated uncontrolled emission rates of 25 ppm NOx, 25 ppm CO, and 25 ppm THC as methane, with the THC emission rate converted to NMNEHC as propane, establishing an emission rate of 9 ppm NMNEHC as propane. The standards in GP-5 for these new turbines are based on good combustion engineering and turbine design, and not on the use of add-on controls for turbines greater than 1,000 hp and less than 5,000 hp. *See id*.

According to the PA DEP's 2018 TSD for GP-5/GP-5A, vendor data for turbines greater than or equal to 5,000 bhp but less than 15,900 bhp indicated uncontrolled emission rates of 25 ppm NOX, 25 ppm CO, and 25 ppm THC as methane, with the THC emission rate converted to NMNEHC as propane, establishing an emission rate of 9 ppm NMNEHC as propane. However, based on stack test results, the limit for NOx was established at 15 ppm, for CO at 10 ppm, and for NMNEHC at 5 ppm as achievable without control. The PA DEP determined that oxidation catalyst was not cost effective for turbines in the 5,000 to 15,900 bhp range. *See id*. The Department has proposed a NMNEHC limit for new turbines greater than 1,000 bhp and less than 15,900 bhp of 9 ppmvd, instead of 5 ppmvd, as indicated in Table 3 of Section 20.2.50.113 NMAC.

According to the PA 2018 TSD, vendor data for new turbines greater than or equal to 15,900 bhp indicated uncontrolled emission rates of 25 ppm NOx, 25 ppm CO, and 25 ppm THC

as methane (9 ppm NMNEHC as propane). The PA DEP determined limits of 15 ppm for NOx, 10 ppm for CO, and 5 ppm for NMNEHC were achievable without controls based on stack test data, and also determined that that oxidation catalysts were cost effective for turbines greater than or equal to 15,900 bhp for CO and NMNEHC. Pennsylvania GP-5 includes CO limits of 10.0 ppmvd for turbines without controls and 1.75 (rounded to 1.8) ppmvd for turbines with controls, and a single limit for NMNEHC of 5.0 ppmvd (whether controlled or uncontrolled). *See id.*, at p. 77.

According to the PA 2018 TSD, recent permits and plan approvals showed that turbines greater than or equal to 15,900 bhp could achieve 9.0 ppmvd NOx without controls. The PA 2018 TSD also noted that SCR vendors typically guaranteed 90% reductions, and that stack tests for turbines in Pennsylvania controlled by SCR have achieved NOx emissions ranging from 1.6 to 1.8 ppmvd. As a result, PA DEP included NOx limits for turbines greater than or equal to 15,900 bhp of 9.0 ppmvd if uncontrolled and 2.0 ppmvd if controlled. *See id.*, at p. 72. The proposed NOx limits for new turbines equal to greater than 15,900 bhp in Table 3 of Section 20.2.50.113 are the same as those in the Pennsylvania GP-5; i.e., 9.0 ppmvd if uncontrolled and 2.0 ppmvd if controlled.

Emission Reductions

NOx Reductions – Engines

Data from the NMED Equipment Report indicates there are 4,718 active internal combustion engines with records for NO_2 located in Chaves, Eddy, Lea, Rio Arriba, San Juan, Sandoval, and Valencia Counties (collectively, the "Subject Counties"), or designated as 'Portable.' These 4,718 engines are situated at 1,463 unique locations.[11] Of these, 1,950 engines

[11] Engines located at refineries were removed from the analysis.

have a horsepower rating greater than 1,000 bhp. 1,866 engines lacked add-on NOx controls and may require additional NOx control (either add-on controls or low emission combustion retrofits) to meet the proposed standards. ERG estimated reductions in NOx for the various engine types as shown in the following Table.

Percent Reduction By Engine Type			
NG	Controlled by SCR / NSCR		0%
NG	Uncontrolled	Lean Burn 4-stroke >1000	49%
NG	Uncontrolled	Lean Burn 2-stroke >1000	78%
NG	Uncontrolled	Rich Burn >1000	81%
NG	NSPS JJJJ Before 2011	Lean Burn 4-stroke >1000	49%
NG	NSPS JJJJ Before 2011	Lean Burn 2-stroke >1000	75%
NG	NSPS JJJJ Before 2011	Rich Burn >1000	75%
NG	NSPS JJJJ 2011 +	Lean Burn 4-stroke >1000	49%
NG	NSPS JJJJ 2011 +	Lean Burn 2-stroke >1000	50%
NG	NSPS JJJJ 2011 +	Rich Burn >1000	50%
Diesel	Controlled	>1000 hp	55%

In cases where the engine type was unknown, ERG assumed the engine was lean burn 4-stroke because that is the most common engine type for those over 1,000 hp.

The percent reductions by engine type were estimated as either (1) the difference between uncontrolled emission factors from the U.S. EPA's AP-42 Compilation of Air Emissions Factors for gas and diesel industrial engines (NMED Exhibit 55) and the proposed limits in 20.2.50.113 NMAC for engines not subject to NSPS; or (2) the difference between the NSPS emission limits in 40 CFR 60, Subpart JJJJ ("NSPS Subpart JJJJ"), and the proposed emission limits in 20.2.50.113 NMAC for engines currently subject to NSPS Subpart JJJJ because some of the proposed emission limits in 20.2.50.113 NMAC are more stringent than those in NSPS Subpart JJJJ.

ERG estimated total baseline allowable NOx emissions from all 4,718 operating internal combustion engines located in the Subject Counties, or designated as "Portable." Allowable NOx

emissions from those units were 62,005 tpy. ERG then estimated the NOx emission reductions from implementing the proposed regulations on existing engines. For the 1,866 uncontrolled engines and partially controlled engines that are subject to NSPS Subpart JJJJ, ERG estimated reductions of NOx based on the NOX control technologies discussed above by applying the 'Percent Reduction By Engine Type' shown in the table above.

Adding controls to uncontrolled engines would reduce NOx emissions by 17,905 tpy, leading to a 28.9% overall reduction in NOx emissions from operating engines from the baseline emissions. See NMED Exhibit 56 - ICE Reductions and Costs NO_2 Spreadsheet.

VOC Reductions - Engines

Data from the NMED Equipment Report indicates there are 4,276 active internal combustion engines with records for allowable VOC emissions located in the Subject Counties, or designated as "Portable". These 4,276 engines are situated at 1,339 unique locations.[12] Of these, 2,041 engines have a horsepower rating great than 1,000 bhp. Engines with VOC controls (catalytic oxidation, catalytic converter, flare, NSCR); engines subject to NSPS (40 CFR 60, Subpart IIII or Subpart JJJJ); and engines subject to National Emission Standards for Hazardous Air Pollutants ("NESHAP") (40 CFR 63, Subpart ZZZZ) were considered to have adequate VOC controls to meet the proposed standards. For the remaining 186 uncontrolled engines, ERG calculated VOC emission reductions using the following considerations: (1) if the engine was uncontrolled and not subject to an NSPS or NESHAP for engines, a 90% VOC emission reduction for lean-burn spark ignition engines was calculated based on adding catalytic oxidation; and (2) if the engine was uncontrolled and not subject to an NSPS or NESHAP for engines, a 90% VOC emission reduction for rich-burn spark ignition engines and compression

[12] Engines located at refineries were removed from the analysis.

ignition engines was calculated based on adding SNCR. In cases where the engine type was unknown, ERG assumed the engine was lean burn 4-stroke because that is the most common engine type for those over 1,000 hp.

ERG estimated emissions from the entire inventory of 4,276 operating internal combustion engines located in the Subject Counties or designated as "Portable" at 24,224 tpy of VOC. ERG then estimated the VOC emission reductions that would be achieved by implementing the proposed requirements for existing engines. For the 186 uncontrolled engines, ERG estimated reductions of 1,663 tpy of VOC based on the use of an add-on control to achieve the required emission reduction to meet the proposed standard, leading to a 6.8% overall reduction in VOC emissions from existing engines. See NMED Exhibit 57 – ICE Reductions and Costs VOC Spreadsheet.

Emission reductions were estimated for VOC instead of NMNEHC because the allowable emissions data are for VOC, the limits for NMNEHC are a surrogate for VOC, and the two are nearly equal.

Emission reductions were not estimated for CO. The limits for CO are intended to ensure good combustion practices that will lead to further VOC reductions.

NOx Reductions - Turbines

Data from the NMED Equipment Report indicates there are 160 active combustion turbines in the O&G industry with records for NOx located in the Subject Counties. These 160 turbines are situated at 44 unique locations. Of these, 136 turbines have a horsepower rating equal to or greater than 1,000 bhp. ERG filtered out turbines that are regulated by NSPS (40 CFR 60, Subpart GG Subpart KKKK) from the analysis, as these federal rules already limit NOx

emissions. The remaining 51 combustion turbines were then evaluated for appropriate NOx reduction measures.

For turbines with a horsepower rating less than 15,900, ERG applied water or steam injection as NOx control. This is based on Tables 6-1 and 6-6 of the EPA 1993 ACT. *See* NMED Exhibit 53 at pp. 6-3 and 6-15. Using water or steam injection on an uncontrolled combustion turbine results in 71% control of NOx. For turbines with a horsepower rating greater than 15,900, ERG applied SCR as NOx control. This is based on the PA TSD 2018. Using SCR on an uncontrolled combustion turbine results in 90% control of NOx.

ERG calculated the allowable NOx emissions from the entire inventory of 160 active combustion turbines located in the Subject Counties. Emissions from these units total 10,313 tpy of allowable NOx. ERG then examined the effect of implementing the proposed regulations on the 51 unregulated and uncontrolled combustion turbines with a horsepower rating greater than 1,000. Applying controls to these units results in a reduction of 3,377 tpy of allowable NOx. The reductions are based on the percent reductions by engine horsepower rating as indicated above. Adding controls to uncontrolled combustion turbines with horsepower ratings greater than 1,000 would result in a 32.7% overall reduction in NOx emissions. See NMED Exhibit 58 – Turbines Reductions and Costs NO_2 Spreadsheet.

VOC Reductions - Turbines

Data from the NMED Equipment Report indicates there are 144 active combustion turbines in the O&G industry with records for allowable VOC emissions located in the Subject Counties. These 144 turbines are situated at 39 unique locations. The estimated baseline allowable VOC emissions from the current inventory of 144 active combustion turbines located in the Subject Counties is 707 tpy of VOC.

Of these, 122 turbines have a horsepower rating equal to or greater than 1,000 bhp. ERG filtered out turbines that: (1) have VOC controls (catalytic oxidation); or (2) are regulated by NESHAP 40 CFR 63, Subpart YYYY ("NESHAP Subpart YYYY"). ERG filtered out turbines that are subject to NESHAP Subpart YYYY because turbines complying with this NESHAP would likely be using oxidation catalysts, so no additional reductions would be achieved.

Of the remaining 115 uncontrolled and unregulated combustion turbines, ERG determined that, for 76 combustion turbines, the allowable VOC emissions in the permit data provided by NMED was lower than the NMNEHC tpy emissions allowed under the proposed NMHEHC limits. The PA DEP 2018 TSD included emission factors (lb NMNEHC/MMBtu heat input) and equations to calculate MMBtu/hr from horsepower. *See* NMED Exhibit 52 at p. 75. These were used to calculate the allowed NMNEHC in tpy under the NMED proposed NMNEHC emission limits (9 ppm and 5 ppm). For these 76 turbines, it was assumed that no additional controls or reductions would be needed to meet the proposed standard, so no costs or reductions were assigned.

ERG estimated the emission reductions from 39 turbines without controls as the difference between the allowable VOC emissions in the permit data and the estimated NMNEHC emissions under the proposed emission limits. The emission reductions are based on the use of an add-on control (oxidation catalyst) to achieve the VOC (NMNEHC) emission limits in the proposed NM standards.

Adding controls to these 39 combustion turbines would reduce VOC emissions by 353 tpy, leading to a 49.9% overall reduction in VOC emissions from combustion turbines. *See* NMED Exhibit 59 – Turbines Reductions and Costs VOC Spreadsheet.

Emission reductions were estimated for VOC instead of NMNEHC because the allowable emissions data are for VOC, the limits for NMNEHC are a surrogate for VOC, and the two are nearly equal.

Emission reductions were not estimated for CO. The limits for CO are intended to ensure good combustion practices that will lead to further VOC reductions.

Costs of Reductions

Costs of NOx Reductions - Engines

The annualized costs of NOx emission reductions for the 1,866 uncontrolled and partially controlled natural gas-fired spark-ignition engines were estimated by applying cost equations for the different types and sizes of engines. In cases where the engine type was unknown, ERG assumed the engine was a lean burn 4-stroke because that is the most common engine type for those over 1,000 hp.

For 2-stroke and 4-stroke lean-burn engines, costs were calculated for adding Low Emission Combustion ("LEC") Technology as a retrofit. As described previous, LEC consists of retrofits that allow engines to operate on extremely lean fuel mixtures to minimize NOx emissions. The LEC retrofit may include: (1) redesign of cylinder head and pistons to improve mixing (on smaller engines), (2) Precombustion chamber (on larger engines), (3) Turbocharger, (4) High energy ignition system, (5) Aftercooler, and (6) Air-to-fuel ratio controller. Cost information for LEC retrofits for lean burn engines rated less than 3,000 bhp comes from a NOx emission control assessment prepared for the EPA Cross State Air Pollution Rule for the 2008 Ozone NAAQS. *See* NMED Exhibit 60 – EPA Office of Air and Radiation, *Final Technical Support Document (TSD) for the Cross-State Air Pollution Rule for the 2008 Ozone NAAQS – Assessment of Non-EGU NOx Emission Controls, Cost of Controls, and Time for Compliance*

Final TSD, Docket ID No. EPA-HQ-OAR-2015-0500 (August 2016), at Appendix A, p. 5-5. Cost information for LEC retrofits for lean burn engines rated equal to or greater than 3,000 bhp comes from a document prepared for the Interstate Natural Gas Association of America ("INGAA") titled "Availability and Limitations of NOx Emission Control Resources for Natural Gas-Fired Reciprocating Engine Prime Movers Used in the Interstate Natural Gas Transmission Industry." *See* NMED Exhibit 61 – INGAA Foundation Final Report No. 2014.03, at p. 25-29.

Cost information for adding NSCR to control NOx from rich-burn engines comes from a 2006 memo prepared for the U.S. EPA to support development of the NSPS and NESHAP for stationary spark ignition engines. NMED Exhibit 62 – Alpha-Gamma Technologies, Inc., *Control Costs for Reciprocating Internal Combustion Engines at Major and Area Sources*, EPA Docket Item No. EPA-HQ-OAR-2005-0030-0005 (April 28, 2006). Cost information for adding NSCR to control NOx from rich-burn engines also comes from a 2010 memo prepared for EPA to support amendments to the NSPS and NESHAP for stationary spark ignition engines. NMED Exhibit 63 – EC/R, Inc., *Control Costs for Existing Stationary RICE*, EPA Docket Item No. EPA-HQ-OAR-2008-0708-0554 (June 29, 2010) ("2010 RICE Memo"). Because the two memos presented different cost equations for controlling NOx from rich burn engines using NSCR, ERG compared the NSCR costs using the two equations for different size engines. The equation in the 2010 RICE Memo estimated higher capital costs but lower annual costs for NSCR for rich burn engines greater than 1,000 bhp, so the more recent 2010 annual cost equation was used for the cost analysis for rich-burn engines.

Costs were scaled from 2005 dollars (2005$) to 2019 dollars (2019$) for SCR, and from 2001$ (for engines less than 3,000 hp) or 2013$ (for engines equal to or greater than 3,000 hp)

for LEC using the Chemical Engineering Plant Cost Index ("CEPCI"), which is an index used to adjust cost estimates from one year to a different year.[13]

Full details on how these cost equations were applied is set forth in NMED Exhibit 56 – ICE Reductions and Costs NO_2 Spreadsheet.

Because the proposed NOx emission limit for compression ignition engines applies only to new engines, no costs were estimated for existing compression ignition engines.

The total annualized costs of adding LEC to lean-burn spark ignition engines and NSCR to rich-burn spark ignition engines was estimated to be $120,267,152 per year, at an average annual cost per engine of $64,452 and a cost per ton of NOx reduced of $6,717.

Costs of VOC Reductions - Engines

ERG estimated the cost of adding VOC controls to those engines that are not already controlled with either SNCR for rich burn engines or oxidation catalyst for lean burn engines. ERG assumed that engines subject to NSPS Subpart ZZZZ would already have VOC controls in order to comply with the limits required under those regulations.

The costs of adding NSCR for VOC control for rich burn engines were already accounted for in the NOx cost estimates (NSCR controls NOX, CO, and VOC emissions), and no further control costs were added for rich burn engines. Therefore, these cost control estimates only include the cost of adding catalytic oxidizers to control VOC emissions from uncontrolled lean burn engines that lack oxidation catalysts and that are not subject to NSPS Subpart ZZZZ.

[13] The CEPCI is published monthly and annually by *Chemical Engineering* and is described on the magazine's website (https://www.chemengonline.com/pci-home) as follows: "The CEPCI consists of a composite index assembled from a set of four sub-indexes: Equipment; Construction Labor; Buildings; and Engineering & Supervision. Each index and subindex is the weighted sum of several components. Most of these components correspond to Producer Price Indexes (PPIs), updated and published monthly by the U.S. Department of Labor's Bureau of Labor Statistics."

In cases where the engine type was unknown, ERG assumed the engine was lean burn 4-stroke because that is the most common engine type for those over 1,000 hp.

Costs information for adding oxidation catalysts to control VOC emissions from 2-stroke lean-burn engines and 4-stroke lean-burn engines comes from equations from the 2010 RICE Memo. *See* NMED Exhibit 63 at Section 4.0.

Costs were scaled from 2009$ to 2019$ using the CEPCI.

Full details on how ERG applied these cost equations is set forth in the ICE Reductions and Costs VOC Spreadsheet at NMED Exhibit 57.

The annualized costs of VOC emission reductions for natural gas-fired spark-ignition engines were calculated by applying the control costs for adding oxidation catalysts to 172 uncontrolled lean burn engines. Total annualized costs for these 172 engines would be approximately $1,626,842 per year at an average annual cost per engine of $9,458 and a cost per ton of VOC reduced of $990.

Costs of NOx Reductions - Turbines

The annualized costs of NOx emission reductions were estimated for the 51 uncontrolled natural gas-fired combustion turbines. The cost for NOx emission reductions for the 48 uncontrolled turbines with horsepower rating less than 15,900 were estimated by applying cost estimates for steam injection from Tables 6-1 and 6-6 of the EPA 1993 ACT. *See* NMED Exhibit 53, at pp. 6-3 and 6-15. The cost for NOx emission reductions for the 3 uncontrolled turbines with horsepower rating greater than 15,900 were estimated by applying cost equations for adding SCR from Table 19 of the PA TSD 2018. Costs were scaled from 2016$ to 2019$ using the CEPCI.

Full details on how ERG applied these cost equations is available in the Turbine Reductions and Costs NO_2 Spreadsheet at NMED Exhibit 58.

The total annualized costs of NOx emission reductions for these 51 natural gas-fired turbines is approximately $13,764,391 per year at an average annual cost per turbine of $269,890 and a cost per ton of NOx reduced of $4,076.

Costs of VOC Reductions - Turbines

To estimate costs of VOC reductions for turbines, ERG assumed that an oxidation catalyst is added as a control device to 39 uncontrolled turbines that are unregulated by an NSPS or NESHAP, and that have allowable VOC emissions that exceed the proposed limits.

Cost information for adding oxidation catalysts to control VOC emissions from 39 turbines are from the PA TSD 2018. Costs were scaled from 2016$ to 2019$ using the Chemical Engineering Plant Cost Index.

Full details on how these ERG applied theses cost equations is available in the Turbine Reductions and Costs VOC Spreadsheet at NMED Exhibit 59.

The total annualized costs of VOC emission reductions for 39 natural gas-fired turbines are estimated at $3,392,186 per year, with an average annual cost per turbine of $86,979 and a cost per ton of VOC reduced of $9,608.

Section 20.2.50.114 – Compressor Seals

Applicability

Section 20.2.50.114 applies to centrifugal compressors using wet seals and reciprocating compressors located at tank batteries, gathering and boosting stations, natural gas processing plants, and natural gas compressor stations. Centrifugal compressors and reciprocating compressors located at well sites are not subject to the requirements of Section 20.2.50.114.

Description of Equipment and Process

Compressors are used throughout the oil and natural gas industry to compress gas for processing, movement through pipelines, and other needs. Compressors are mechanical devices that increase the pressure of natural gas and allow the natural gas to be transported in pipelines from the production site, through the processing and supply chain, and to the consumer. Vented emissions from compressors occur from seals (wet seal compressors) or packing surrounding the mechanical compression components (reciprocating compressors) of the compressor. These emissions typically increase over time as the compressor components begin to wear and degrade.

Reciprocating Compressors

In a reciprocating compressor, natural gas enters the suction manifold, and then flows into a compression cylinder where it is compressed by a piston driven in a reciprocating motion by the crankshaft powered by a reciprocating internal combustion engine. Emissions occur when natural gas leaks around the compressor piston rod when pressurized natural gas is in the cylinder. The compressor piston rod packing system consists of a series of flexible rings that create a seal around the piston rod to prevent gas from escaping between the rod and the inboard cylinder head. Over time, the rings become worn and the packaging system needs to be replaced to prevent excessive leaking from the compression cylinder. See Figure 1 for a depiction of a typical rod compressor packing system configuration.

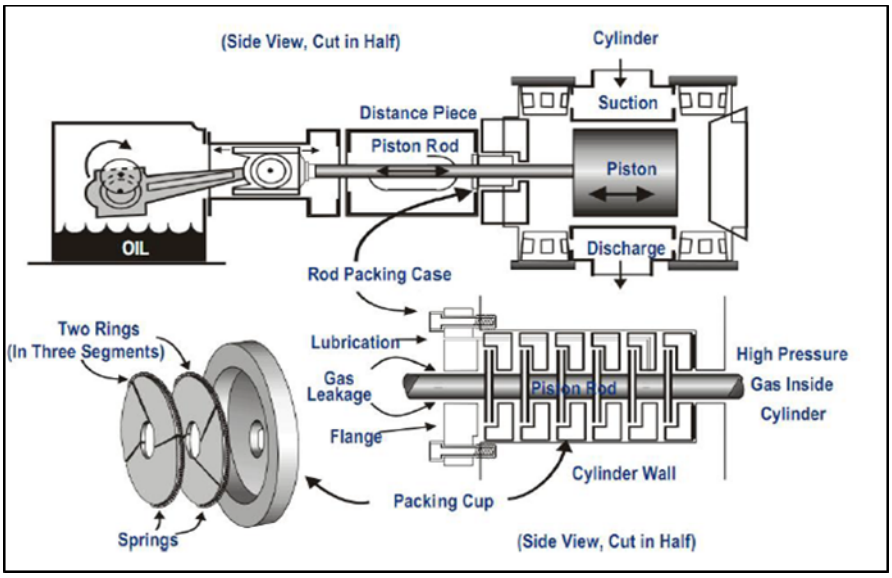

Figure 1. Typical Reciprocating Compressor Rod Packing System Diagram

Centrifugal Compressors

Centrifugal compressors use a rotating disk or impeller to increase the velocity of the natural gas where it is directed to a divergent duct section that converts the velocity energy to pressure energy. These compressors are primarily used for pipeline transport of natural gas in the natural gas processing and transmission segments of the industry. These compressors require seals around the rotating shaft to prevent high pressure gases from escaping where the shaft exits the compressor casing. Many centrifugal compressors use wet (i.e., oil-filled) seals around the rotating shaft to prevent natural gas from escaping where the compressor shaft exits the compressor casing. Other compressors, including most newer compressors, use a dry seal with a mechanical barrier around the rotating shaft to prevent natural gas from escaping.

Wet seals use a specialty oil that is circulated between rings around the compressor shaft under higher pressure than the gas in the adjacent compressor case, forming a barrier against compressed gas leakage. In the wet seal design shown in Figure 2, the center ring is attached to the rotating shaft, while the two rings on each side are stationary in the seal housing and pressed

against a thin film of oil flowing between the rings to both lubricate and act as a leak barrier. "O-ring" rubber seals prevent leakage around the stationary rings. Very little gas escapes through the oil barrier; however, gas is entrained in the oil that comes in direct contact with the high-pressure gas at the "inboard" (compressor side) interface, thus contaminating the seal oil. Prior to recirculation, the seal oil must be purged of natural gas in a process called "seal oil degassing." The gas is primarily methane, but also contains some VOC; the fraction of VOC depends on the point in the production chain the compressor is located. Methane and VOC released during seal oil degassing are commonly vented to the atmosphere with vent outlets usually located in elevated areas that are not easily accessible to operators for inspection or maintenance (e.g., roof vent stacks). As a result, the majority of methane and VOC emissions from a centrifugal compressor often go undetected by operators.

Figure 2 displays a typical centrifugal compressor wet seal. The seal oil enters through the inlet (top) and provides a barrier to gas attempting to escape by forming two thin films under higher pressure between the center rotating ring and the two stationary rings (seen with surrounding O-rings).

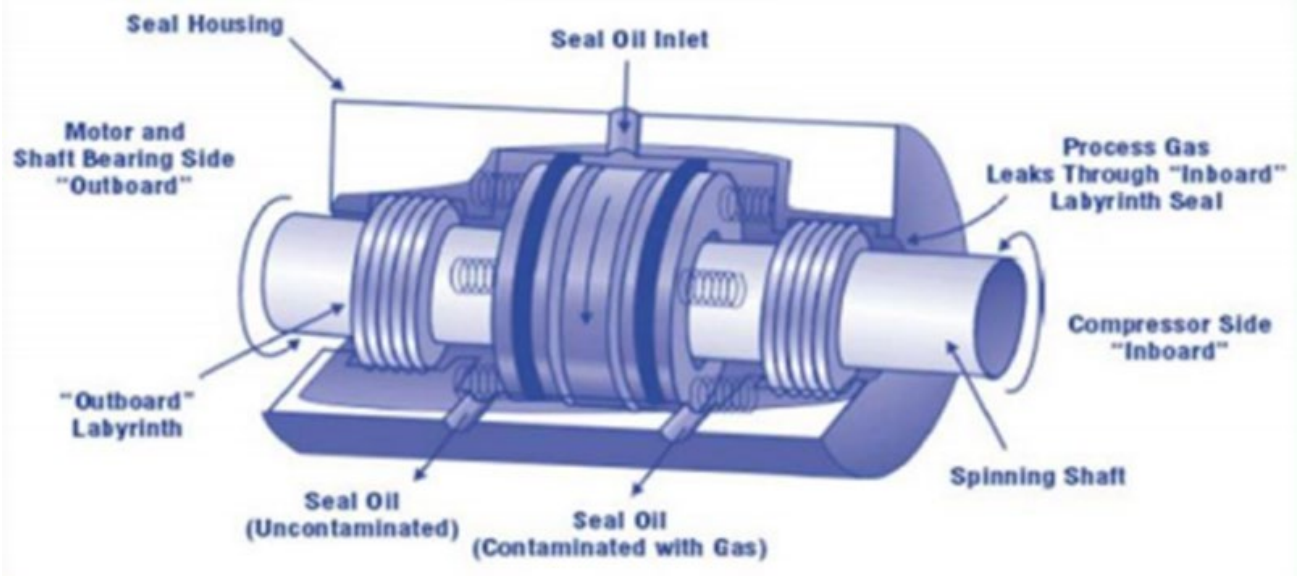

Figure 2. Typical Centrifugal Compressor Wet Seal

Control Options for Compressor Seals

Reciprocating Compressors

VOC emissions from reciprocating compressor rod packing can be minimized by replacing the rod packing on a regular basis before it becomes excessively worn. A typical regulatory schedule is to replace the rod packing seals after every 26,000 hours of operation or every 36 months, whichever is later. A second control option is to collect emissions from the rod packing under negative pressure and route them via a closed vent system to a control device, a recovery system, a fuel cell, a process stream, or to be used as fuel. Figure 3 shows a general diagram of a closed vent collection and control or recovery system.

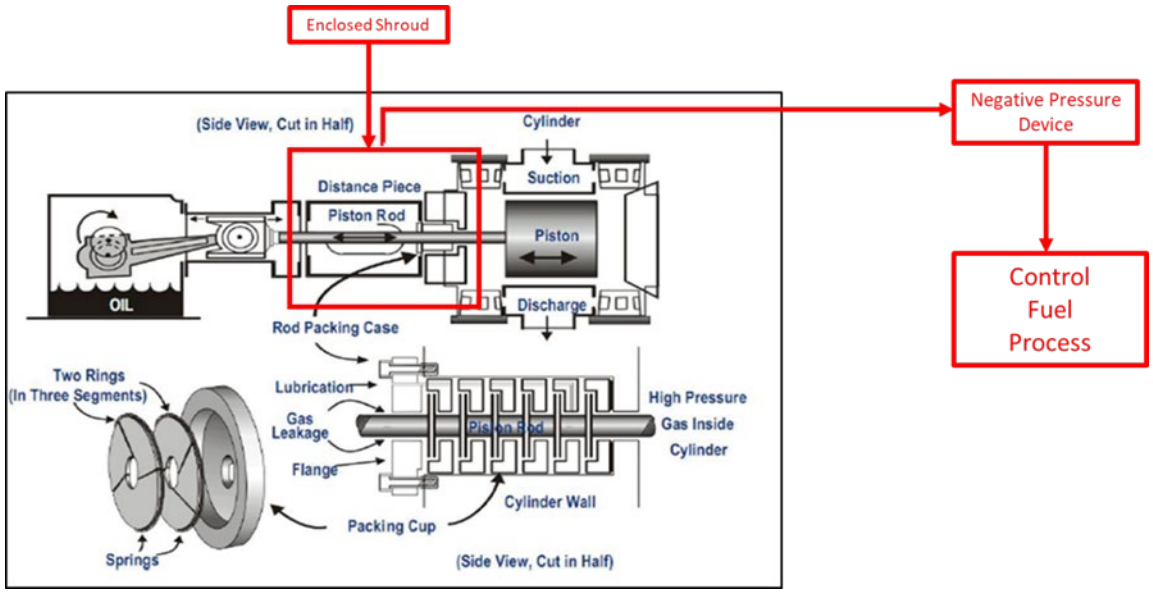

Figure 3. General Flow Process for a Closed Vent System. (Existing equipment shown in black and new equipment for closed vent system and control or recovery shown in red)

Centrifugal Compressors

Centrifugal compressor seal oil that is contaminated with entrained gas is typically routed directly to an atmospheric pressure degassing tank in which the entrained gas (methane and VOC) will evaporate from the seal oil and is then vented to the atmosphere. A wet seal fluid degassing system that is designed to capture the released methane and VOC is shown in Figure 4. In the capture system, the contaminated seal oil separated from entrained gas in a separator operating at seal oil pressure with gas flow controlled by a critical orifice. The entrained gas captured from the seal oil is routed to a seal oil demister to remove entrained seal oil before routing the gas to a control device, a process, for use as a fuel, or to the suction side of a compressor to be pressurized and put back into the pipeline or another use. The seal oil from the bottom of the high-pressure seal oil degassing separator flows to the atmospheric degassing separator where the remaining, but now reduced, volume of entrained/dissolved gas is removed and vented to the atmosphere. The regenerated seal oil is then recirculated back to the compressor seal oil system.

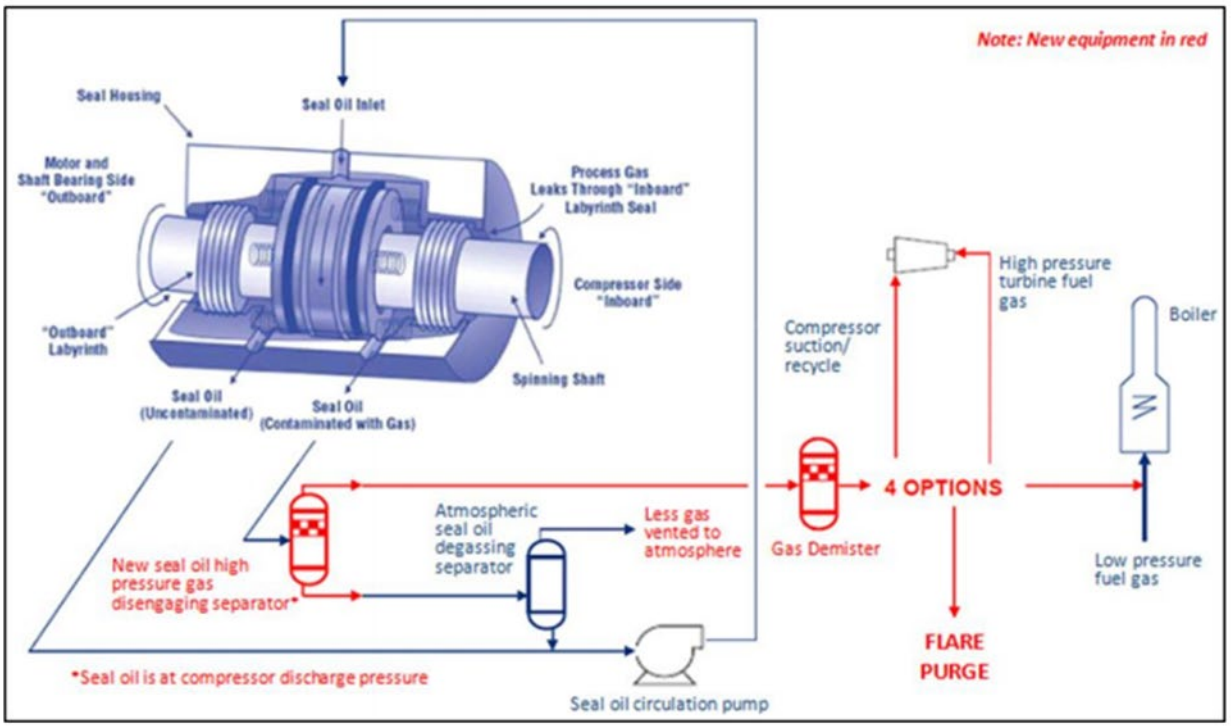

Figure 4. General process flow of wet seal degassing recovery system. (Existing equipment shown in blue and new equipment for seal oil degassing recovery shown in red)

Proposed Rule Requirements for Compressor Seals

Section 20.2.50.114 requires owners and operators of existing centrifugal compressors to control VOC emissions from centrifugal compressor wet seal fluid degassing systems by at least 95 percent within two years of the effective date of Part 50. Emissions must be captured and routed through a closed vent system to a control device, recovery system, fuel cell, or a process stream. Owners and operators of new centrifugal compressors are required to control VOC emissions from wet seal fluid degassing systems by at least 98 percent upon startup, capturing and routing emissions through a closed vent system to a control device, recovery system, fuel cell, or process stream.

Owners and operators of existing reciprocating compressors must either replace the rod packing after every 26,000 hours of compressor operation or every 36 months, whichever is

later, or collect VOC emissions from the rod packing under negative pressure and route them through a closed vent system to a control device, recovery system, fuel cell, or a process stream. Rod packing for new reciprocating compressors must be replaced after every 26,000 hours of operation or every 36 months, whichever is later, or emissions must be collected from the rod packing using a closed vent system to a control device, a recovery system, fuel cell or a process stream.

All centrifugal and reciprocating compressors must be equipped with an EMT in accordance with Section 20.2.50.112, and the owner or operator must comply with the general monitoring, recordkeeping, and reporting requirements in that Section. An owner or operator complying with the emission standards in Section 20.2.50.114 through the use of a closed vent system and control device, including a wet seal fluid degassing system, must also comply with the closed vent system and control device monitoring, recordkeeping, and reporting requirements in Section 20.2.50.115.

Owners and operators complying with the emission standards for new or existing reciprocating compressors are required to continuously monitor the hours of operation with a non-resettable hour meter, and track the number of hours from initial startup or from the previous reciprocating compressor rod packing replacement. Owners and operators of reciprocating compressors who are collecting emissions under negative pressure and routing those emissions through a closed vent system to a control device, a recovery system, fuel cell or a process stream are required to monitor the collection system semi-annually to ensure that it continues to operate under negative pressure.

Owners and operators of centrifugal compressors using wet seal fluid degassing systems are required to maintain records of the following: location of the compressor; date of

construction, reconstruction, or modification of the compressor; required monitoring data; and the type, make, model and identification number of the control device used to comply with the emission standards.

Owners and operators of reciprocating compressors are required to maintain a record of the following: location of the compressor; date of construction, reconstruction, or modification of the compressor; and the required monitoring data.

Basis for Proposed Requirements

Compressor Seals on Centrifugal Compressors

The proposed requirement in Section 20.2.50.114.B(1) to control VOC emissions from a centrifugal compressor wet seal fluid degassing system by at least 95 percent is based on NSPS Subpart OOOOa at 40 CFR § 60.5380a(a)(1)-(2), which requires that owners and operators reduce methane and VOC emissions from each centrifugal compressor wet seal fluid degassing system by 95.0 percent. The federal rule requires the wet seal degassing system to be equipped with a cover and closed vent system that routes the gas to a control system or a process.

Compressor Seals on Reciprocating Compressors

The proposed requirement in Section 20.2.50.114.B(2)(a) to control VOC emissions from a reciprocating compressor by replacing the reciprocating compressor rod packing after every 26,000 hours of compressor operation or every 36 months is based on NSPS Subpart OOOOa at 40 CFR § 60.5385a(a)(1)-(2), which requires that owners and operators replace the rod packing on or before the compressor has operated for 26,000 hours or prior to 36 months from the date of the most recent rod packing replacement.

The proposed requirement in Section 20.2.50.114.B(2)(b) to collect emissions from the rod packing under negative pressure and route them via a closed vent system to a control device,

recovery system, fuel cell, or a process stream is based on NSPS Subpart OOOOa at 40 CFR § 60.5385a(a)(3), which requires that owners and operators collect emissions from the rod packing with a system under negative pressure and route to a process through a closed vent system.

Estimated Emissions Reductions

Reciprocating Compressors

The NMED Equipment Data indicates that there are 3,740 active oil and gas industry reciprocating engines located in the Subject Counties, or designated as "Portable." Engines located at refineries, mining, onsite remediation, reinjection sites, and wellheads were removed from the analysis. Engines identified as "generators" or "pump jack" engines in the emission unit description were also removed from the analysis. Engines whose capacity was stated in units of "kW" (kilowatts) were removed from the analysis under the assumption that they were used to power generators. ERG assumed that each of the remaining reciprocating engines is powering a reciprocating compressor. These 3,740 active reciprocating compressors are located at 1,193 unique locations. Of these, 2,612 reciprocating compressors are not already regulated by NSPS Subpart OOOO or OOOOa, based on their manufacture date, construction date, or the "Sub-Program Information" in the NMED Equipment Data.

ERG estimated emissions from the compressor seals of these 2,612 reciprocating compressors using the emission factor from Tables 5-2 and 5-3 of the EPA CTG. *See* NMED Exhibit 34. For reciprocating compressors located at gathering and boosting stations, the emission factor is 3.42 tpy of VOC. For reciprocating compressors located at gas processing sites, the emission factor is 6.12 tpy of VOC. ERG used the emission factor for gathering and boosting stations for all facility types (including production facilities and compression stations) other than natural gas processing plants. The CTG does not contain a separate emission factor for

reciprocating compressors at natural gas compression stations. However, because larger compression stations are generally located downstream from a gas processing plant, and the gas therefore has a lower VOC content, ERG assumed for this analysis that the emission factor for gathering and boosting would also be representative for compression stations. Total baseline VOC emissions before controls for these 2,612 reciprocating compressors are estimated at 9,260 tpy of VOC.

ERG estimated annual emission reductions from the reciprocating compressor seals by increasing the frequency of replacing the rod packing using the estimated emission reductions (tpy VOC per compressor) from Table 5-4 of the CTG. The CTG estimated the reductions achieved by increasing the replacement frequency from every 4 years to every 3 years. For reciprocating compressors located at gathering and boosting stations, this estimated emission reduction is 1.9 tpy VOC, and for reciprocating compressors located at processing sites the estimated emission reduction is 4.89 tpy VOC. For the 2,612 reciprocating compressors in the NMED data, total annual emission reductions with increased rod packing replacement were estimated to be 5,325 tpy VOC, a 57.5 percent reduction, and emissions after replacement of rod packing were estimated to be 3,935 tpy VOC. *See* NMED Exhibit 64 – Compressor Seals - Reciprocating Engines Spreadsheet.

Centrifugal Compressors

The NMED Equipment Data indicates there are 160 active oil and gas industry combustion turbines located in the Subject Counties. ERG removed from the analysis 25 turbines located at refineries and wellheads or designated as generators. ERG assumed that each of the remaining 135 turbines is powering a centrifugal compressor. These 135 centrifugal compressors are situated at 36 unique locations. Of these, 116 centrifugal compressors are not already

regulated by NSPS Subparts OOOO or OOOOa, based on their manufacture date, construction date, or "Sub-Program Information" in the NMED Equipment Data.

ERG assumed that each of these 116 compressors is equipped with wet seals, based on an applicable EPA 2014 Natural Gas Star Program document which states that "most new compressors [are] equipped with [a] dry seal." *See* NMED Exhibit 65 – Partner Reported Opportunities (PROs) for Reducing Methane Emissions, *Wet Seal Degassing Recovery System for Centrifugal Compressors* (2014) ("Centrifugal Compressors Technical Document").[14] ERG assumed that the remaining 19 compressors had dry seals.

ERG estimated baseline emissions from the compressor seals of the 116 wet seal and 19 dry seal centrifugal compressors using the emission factors from Tables 5-2 and 5-3 of the EPA CTG. *See* NMED Exhibit 34. The EPA CTG includes VOC emission factors for centrifugal compressors located only at natural gas processing sites, and these emission factors are 19.1 tpy VOC for centrifugal compressors with wet seals and 2.4 tpy VOC for compressors with dry seals. The EPA CTG did not include separate VOC emission factors for centrifugal compressors located at other types of facilities (e.g., gathering and boosting stations or natural gas compression stations). As a result, ERG used the same emission factors (19.1 tpy of VOC per compressor with wet seals and 2.4 tpy VOC for dry seals) for estimating baseline VOC emissions for all centrifugal compressors, depending on whether or not they were subject to the NSPS. Total VOC emissions before controls for the 116 centrifugal compressors that predate the NSPS are estimated at 2,197 tpy of VOC, and the VOC for the other 19 centrifugal compressors that are likely subject to the NSPS are estimated at 46 tpy. Total baseline VOC emissions from all centrifugal compressors are 2,243 tpy VOC.

[14] Available at: https://www.epa.gov/natural-gas-star-program/wet-seal-degassing-recovery-system-centrifugal-compressors

ERG estimated emission reductions from the compressor seals on centrifugal compressors after installation of a wet seal degassing recovery and re-use system. The estimated emission reductions after installation of a wet seal degassing recovery and re-use system is from the CTG, which assumed "that routing VOC emissions from a wet seal fluid degassing system to a process reduces VOC emissions greater than or equal to a combustion device (i.e., greater than or equal to 95 percent)." A 95% reduction in VOC emissions is equivalent to 1.0 tpy VOC after control. Total emissions after installation of a wet seal degassing recovery and re-use system for these 116 centrifugal compressors are therefore estimated at 110 tpy VOC.

Requiring centrifugal compressors to install a wet seal degassing recovery and re-use system would result in a 95 percent reduction in VOC emissions for these previously unregulated sources. Overall VOC reductions would be 2,087 tpy VOC, and the overall percent VOC emission reduction would be 93%. *See* NMED Exhibit 66 – Compressor Seals - Turbines Spreadsheet.

Estimated Costs

Reciprocating Compressors

ERG estimated the annualized costs of VOC emission reductions for the 2,612 uncontrolled reciprocating compressors by applying cost estimates from Table 5-5 of the CTG. Costs were scaled from 2012$ to 2019$ using the CEPCI. Since rod packing replacement is done every three years, the capital costs of replacement were annualized over three years, assuming an interest rate of 7%. The resulting annual cost per compressor for rod packing replacement is $2,237 per year for a compressor in the gathering and boosting sector, and $1,695 per year for a compressor in the processing sector. These annual costs are incremental costs compared to the

annual costs of replacing the rod packing every four years. The total cost for replacing rod packing every three years for all 2,612 reciprocating compressors is $5,778,289.

Full details on how these cost equations were applied can be found in the Compressor Seals – Reciprocating Engines Spreadsheet. *See* NMED Exhibit 64.

Centrifugal Compressors

ERG estimated the annualized costs of VOC emission reductions for the 116 uncontrolled centrifugal compressors located at 36 unique locations by applying the cost estimates from Exhibit 3 of the Centrifugal Compressors Technical Document. *See* NMED Exhibit 65. Costs were scaled from 2011$ to 2019$ using the CEPCI. Because some of the equipment for a degassing system can be shared across all compressors at a site, the capital cost of installing these systems per compressor decreases with an increasing number of compressors at a site. EPA estimated the cost for sites with one compressor and four compressors in the Centrifugal Compressors Technical Document. ERG adopted the same procedure to calculate the capital and annual costs for different numbers of compressors, as presented in the following table. The capital costs of installing the degassing system were annualized over a period of five years, assuming an interest rate of 7%.

# of Compressors at a Site	Total Capital Cost ($2019)	Annualized Cost ($2019)
1 Compressor	$34,228	$8,348
2 Compressors	$53,935	$13,154
3 Compressors	$73,643	$17,961
4 Compressors	$93,350	$22,767
5 Compressors	$113,057	$27,574
6 Compressors	$132,764	$32,380
7 Compressors	$152,471	$37,186
8 Compressors	$172,179	$41,993
9 Compressors	$191,886	$46,799
10 Compressors	$211,593	$51,606

ERG calculated the annualized cost for installing a degassing system at each of the 36 locations with centrifugal compressors that would be affected by Part 50 based on the number of compressors at that site, not for each individual compressor. The total initial capital cost for installing a degassing system at the 36 compressor sites is $2,735,150 and the annualized cost of installing a degassing system at the 36 compressor sites is $667,078.

Full details on how these cost equations were applied can be found in the Compressor Seals – Turbines Spreadsheet. *See* NMED Exhibit 66.

Section 20.2.50.115 – Control Devices

The requirements of Section 20.2.50.115 apply to control devices used to comply with the emission standards and emission reduction requirements found in Part 50.

Description of Process

A control device is any mechanical, thermo, or chemical means to capture, convert, destroy, or recover air contaminants. The purpose of control devices as defined in Part 50 is the reduction of VOCs and NOx. Some control devices are specific to a particular process or type of equipment, while others can be used for multiple processes or types of equipment. The discussion below focuses on those controls outlined in Part 50 and commonly used in oil and gas operations. A brief overview of control devices is provided in this section; for additional discussions of controls for specific processes or types of equipment covered by Part 50, see the testimony for the section of Part 50 that covers the specific process or type of equipment.

Examples of control devices include, but are not limited to, open flares, enclosed combustion devices ("ECDs"), thermal oxidizers ("TOs"), vapor recovery units ("VRUs"), fuel cells, condensers, and catalytic converters (oxidative, selective, and non-selective). A control

device may also include any other air pollution control equipment or emission reduction technologies approved by the Department to comply with emission standards in Part 50.

Open Flares

Open flares or "flaring" refers to the routing of natural gas from anywhere in the process to a device where the gas is combusted as it leaves the tip of the flare. Flaring is a high-temperature oxidation process used to burn or incinerate waste gases containing combustible components such as VOCs, natural gas (methane), carbon monoxide (CO), and hydrogen (H2). Flares convert, or destroy, waste gases into less harmful components (ideally, water vapor and carbon dioxide).

The flare system consists of a header, stack, tip, and ignition system. Gas is sent to the flare through a header system and is combusted as it exits the flare stack at the tip. The flare tip is designed to ensure the proper mixing of gas and air to achieve the proper burn efficiency. Ignition of the gas stream is through the use of a continuously burning pilot or auto-ignition system. Flaring is a necessary part of drilling and completion activities, oil and natural gas field production, pipeline gas gathering, and facility processing of oil and natural gas because of safety considerations (personnel and equipment) and its effectiveness in combusting harmful emissions (environmental).

Enclosed Combustion Devices

Enclosed combustion devices use a high-temperature oxidation process to control VOCs in many industrial settings because the enclosed combustor can normally handle fluctuations in concentration, flow rate, heating value, and unreactive (i.e., non-combustible) compounds found in the gas stream. For this analysis, it is assumed that the types of combustors installed in the oil and natural gas industry can achieve at least a 95 percent control efficiency on a continuous

basis. Combustion devices can be designed to meet a 98 percent control efficiency, and can control emissions by 98 percent on average, or more in practice when properly operated. Combustion devices that are designed to meet a 98 percent control efficiency may not continuously meet this efficiency in practice, due to factors such as variability of field conditions. A typical combustor used to control emissions from storage vessels in the oil and natural gas sector is an enclosed combustion system. The basic components of an enclosed combustion system include (1) piping for collecting emission source gases; (2) a single- or multiple-burner unit; (3) a stack enclosure; (4) a pilot flame to ignite the mixture of emission source gas and air; and (5) combustor fuel/piping (as necessary). Figure 1 presents a schematic of a typical dual-burner enclosed combustion system.

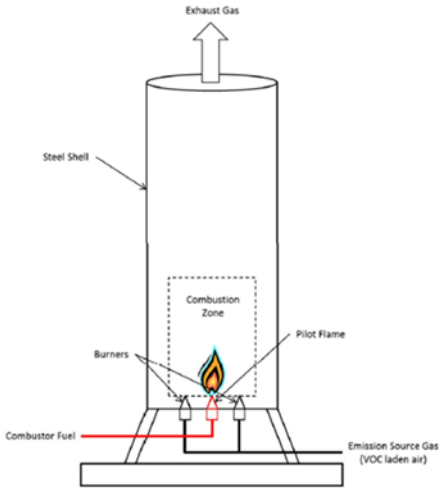

Figure 1 Schematic of a Typical Enclosed Combustion System

Thermal oxidizers – also referred to as direct flame incinerators, thermal incinerators, or afterburners – can also be used to control VOC emissions. Similar to a basic enclosed combustion device, a thermal oxidizer uses burner fuel to maintain a high temperature (typically 800-850°C) within a combustion chamber. The VOC-laden emission source gas is injected into

the combustion chamber where it is oxidized (burned), and then the combustion products are exhausted (i.e. vented) to the atmosphere. *See* NMED Exhibit 34 (EPA CTG).

Vapor Recovery Units

Vapor recovery units ("VRUs") route vapors from an emission source back to the inlet line of a separator, to a sales gas line, or to another process line for beneficial use, such as use as a fuel. A VRU is often referred to as a compressor that is used to boost recovered vapors back into the line. In a typical VRU, hydrocarbon vapors are drawn out of the storage vessel under low pressure and are piped to a separator or suction scrubber to collect any condensed liquids, which are recycled back to the storage vessel. Vapors from the separator flow through a compressor that provides the low-pressure suction for the VRU system where the recovered hydrocarbons can be transported to various places, including a sales line and/or for use onsite.

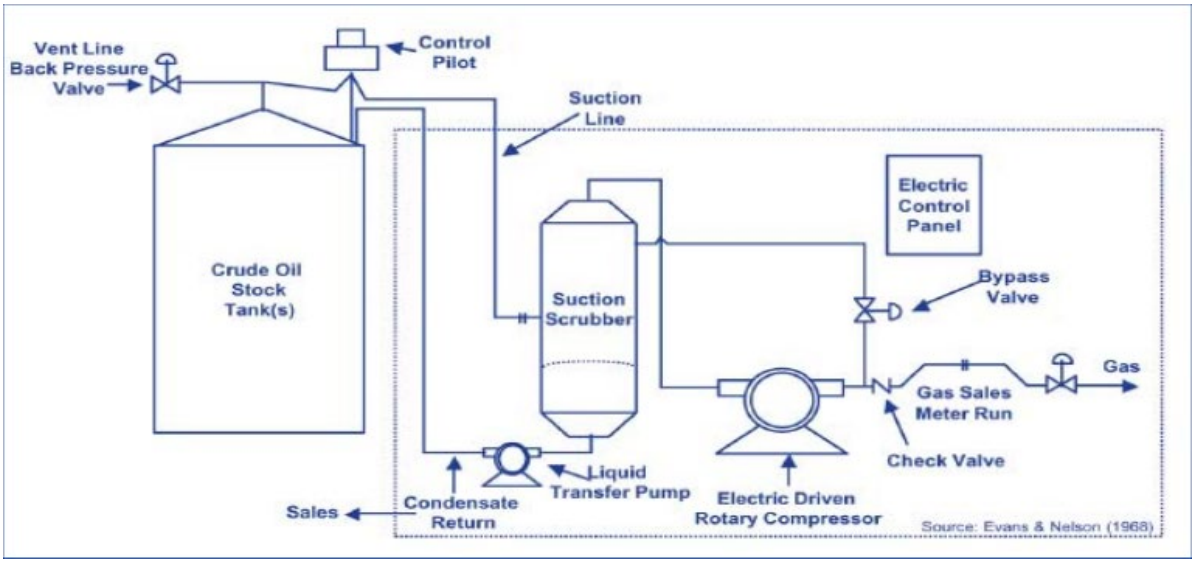

Figure 2 Conventional Vapor Recovery System

Condensers

A condenser is a heat exchanger used to condense a gaseous substance into a liquid state through cooling. Condensers are often used to control VOC emissions from glycol dehydration units by condensing the organic vapors from the regenerator still vent.

Fuel Cells

A fuel cell is an electrochemical cell that converts the chemical energy of a fuel (typically hydrogen but may also be methane or organic vapors) and an oxidizing agent (commonly oxygen) into electricity through oxidation and reduction reactions that convert the fuel into water vapor (in the case of hydrogen fuel) or into carbon dioxide and water vapor (in the case of methane or organic vapors). The use of fuel cells has been investigated as a potential VOC emission control option for the surface coating industry, but has not yet been demonstrated for controlling VOC emissions from oil and natural gas production operations.

Gaseous Emission Control of Stationary Internal Combustion Engines

Gas compressor operations are an essential element of oil and gas production. To produce oil and natural gas and keep natural gas pressures at the level required to move gas from the wellhead to the consumer, compressors and the associated driver are found at multiple locations in the natural gas value chain. In addition to driving compressors, engines may also be used as the driver for power generators that provide electrical power to sites that are not connected to the commercial electrical grid.

Catalytic Converters (oxidative, selective, and non-selective)

Stationary engines, typically fueled by natural gas or propane, are widely used for prime power and for gas compression. In gas compression, the types of engines are either rich-burn or lean-burn. The difference between rich-burn and lean-burn engine operation lies in the air-to-fuel

ratio: a rich-burn engine is characterized by excess fuel in the combustion chamber during combustion, while a lean-burn engine is characterized by excess air in the combustion chamber during combustion. For gas transmission, engines are typically lean-burning. Gas engines are also used for prime power applications, especially where it is convenient to connect a natural gas line to the engine. Depending on the application, engines in oil and natural gas operations range in size from relatively small (approximately 50 hp) for certain types of pumps and generators to thousands of horsepower for natural gas compressors at transmission compression stations.

Different emission control technologies have to be applied to engines depending on their air-to-fuel ("A/F") ratio. This is because the exhaust gas composition differs depending on whether the engine is operated in a rich, lean, or stoichiometric burn[15] condition. See the previous testimony regarding control options for engines (Section 20.2.50.113) for a discussion of selective catalytic reduction and non-selective catalytic reduction as effective NOx control technologies for engines.

Proposed Rule Requirements for Control Devices

General Requirements (Subsection B)

Section 20.2.50.115 requires control devices to be designed, sized, installed, operated, and maintained in order to minimize emissions and achieve the emission standards required by Part 50. Each device must operate as a closed vent system, have an EMT installed, and a monthly inspection is required to ensure proper operation. Closed vent systems must be designed and

[15] In an internal combustion engine or industrial furnace, the air-fuel ratio is an important measure for anti-pollution and performance-tuning reasons. If exactly enough air is provided to completely burn all of the fuel, the ratio is known as the stoichiometric mixture, often abbreviated to stoich. Ratios lower than stoichiometric are considered "rich." Rich mixtures are less efficient, but may produce more power and burn cooler. Ratios higher than stoichiometric are considered "lean." Lean mixtures are more efficient but may cause higher temperatures, which can lead to the formation of nitrogen oxides. Some engines are designed with features to allow lean-burn. For precise air-fuel ratio calculations, the oxygen content of combustion air should be specified because of different air density due to different altitude or intake air temperature, possible dilution by ambient water vapor, or enrichment by oxygen additions.

certified by a professional engineer or an in-house engineer. Manufacturer specifications for control devices must be kept on file by the owner or operator and include identifying information, specific operational parameters (e.g., maximum rated capacity) and control efficiency.

Open Flares (Subsection C)

Owners and operators using open flares are required to install a continuous pilot, auto-igniter, or require manual ignition upon start up for new flares, and one year after the effective date of Part 50 for existing flares. All gas sent to the flare must be combusted. For existing flares at facilities with an average daily production of 10 bbls/day of oil or 60,000 scf/day of natural gas, owners and operators are required to install an auto-igniter, continuous pilot, or flare malfunction alarm technology upon replacement or reconstruction. Flares must be operated with no visible emissions, as determined by visual observations or continuous monitoring technology, and all repairs must be completed within three days of an alarm activation.

Flares with a continuous pilot must be monitored continuously for the presence of a pilot flame. When an auto igniter is used, the presence of a flame must be continuously monitored during flaring using a thermocouple or alternative equivalent technology approved by the Department. Manually ignited flares must be continuously visually monitored during a flaring event to ensure the flare is lit. Owners and operators are required to perform quarterly EPA Method 22 (40 CFR Part 60, Appendix A) observations to ensure compliance with visible emissions and opacity limits. *See* NMED Exhibit 67 – EPA Reference Method 22 – *Visual determination of Fugitive Emissions from Material Sources and Smoke from Flares* (January 14, 2019).

Owners and operators of open flares are required to keep records of alarm activation, cause of the alarm, corrective actions, name of personnel conducting the action, and any maintenance activities performed.

Owners and operators of open flares must comply with the general reporting requirements in Section 20.2.50.112.

Enclosed Combustion Devices and Thermal Oxidizers (Subsection D)

Enclosed combustion devices and thermal oxidizers ("ECD/TOs") must be operated within the maximum rated capacity and must combust all gas sent to the equipment. Continuous pilot flames or auto-igniters must be installed upon startup for new ECD/TOs, or within one year for existing ECD/TOs. All ECD/TOs must operate with a continuous flame present and with no visible emissions during flaring events.

ECD/TOs with a continuous pilot must be monitored continuously for the presence of a pilot flame. When an auto igniter is used, the presence of a flame must be continuously monitored during flaring using a thermocouple or alternative equivalent technology approved by the Department. Owners and operators are required to perform quarterly EPA Method 22 observations to ensure compliance with visible emissions and opacity limits.

Owners and operators of ECD/TOs are required to keep records of alarm activation, cause of the alarm, corrective action taken, name of personnel conducting the inspection, and any maintenance activities performed. Additionally, owners and operators must record the results of the quarterly EPA Method 22 observations. Gas analysis results must be recorded for the combustion gas to include the VOC content and heating value.

Owners and operators of ECD/TOs must comply with the general reporting requirements in Section 20.2.50.112.

Vapor Recovery Units

All VRUs must be operated as a closed vent system that captures and routes VOC emissions back to the process or to a sales pipeline. Venting to the atmosphere is prohibited and a backup control device (e.g. ECD/TO) or a redundant VRU is required during periods of startup, shutdown, maintenance, or other downtime such as malfunctions.

Owners and operators of VRUs must comply with the monitoring requirements for equipment leaks as specified in Section 20.2.50.116, or implement a program that meets the requirements of NSPS Subpart OOOOa.

For each VRU inspection or monitoring event, the owner or operator must record the result of the event, including the name of the personnel conducting the inspection, and any maintenance or repair activities required. The owner or operator must also record the type of redundant control device used during VRU downtime.

The owner or operator of a VRU must comply with the general reporting requirements in Section 20.2.50.112.

Basis for Proposed Requirements for Control Devices

The proposed general requirements for control devices in 20.2.50.115.B(1) through (5) are based on similar rules for closed vent systems and control devices in Pennsylvania GP-5 and GP-5A (NMED Exhibits 37 and 38), Colorado Reg. 7, Section II.C.5 (NMED Exhibit 39), NSPS Subpart OOOOa (NMED Exhibit 36), and EPA's NSPS regulations at 40 CFR 60, Subpart A – General Provisions ("NSPS Subpart A").

The proposed requirements for closed vent systems for centrifugal compressor wet seal fluid degassing systems in 20.2.50.115.B(6) are based on Colorado Reg. 7, Section I.J.1; and NSPS Subpart OOOOa, Section 60.5380a.

The proposed requirements for open flares in 20.2.50.115.C are based on NSPS Subpart OOOOa, Section 60.5412a; and NSPS Subpart A, Section 60.18(b).

The proposed requirements for enclosed combustion devices and thermal oxidizers in 20.2.50.115.D are based on Pennsylvania GP-5, Section J; Colorado Reg. 7, Sections I.C.1 and II.B.2; NSPS Subpart OOOOa, Section 60.5412a; and NSPS Subpart A, Section 60.18(b).

The proposed requirements for VRUs in Section 20.2.50.115.E are based on Pennsylvania GP-5, Section J; and NSPS Subpart OOOOa, Section 60.5412a.

Estimated Emissions Reductions

The estimated reductions in VOC and NOx emissions from oil and gas operations are discussed in the testimony regarding the proposed requirements for the specific equipment and processes addressed in Part 50. Details on the emissions and emissions reductions are found in the 'Reductions and Costs' spreadsheets for each of the various equipment and process categories regulated under the proposed rule.

Estimated Costs

The estimated annualized costs of the VOC and NOx emissions reductions resulting from implementation of Part 50 are discussed in the testimony regarding the proposed requirements for the specific equipment and processes addressed in Part 50. Details on the emissions, costs, and reductions are found in the 'Reductions and Costs' spreadsheets for each of the various equipment and process categories regulated under the proposed rule. These costs are specific to the particular equipment/process and the pollutant being controlled.

Section 20.2.50.116 – Equipment Leaks and Fugitive Emissions

Section 20.2.50.116 applies to well sites; tank batteries; gathering and boosting stations; gas processing plants; natural gas compressor stations; and associated piping and components.

Description of Equipment and Process

The processing of natural gas includes the removal of natural gas liquids from field gas and/or the fractionation of mixed liquids to natural gas products. There are a number of potential sources of equipment leaks during production and processing, such as pumps, pressure relief devices, valves, flanges, and other connectors that have a leak potential due to seal failure. In addition, leaks can occur from open-ended lines and valves as well as from corrosion of welded connections, flanges, and valves. The large number of valves, pumps, and other equipment associated with natural gas production and processing can be a significant sources of VOC emissions.

There are also a number of potential sources of fugitive emissions throughout the oil and gas sector. These can occur from poorly fitted connection points or deterioration of seals and gaskets. Fugitive emissions can also be caused by changes in pressure, temperature, or mechanical stresses. A "fugitive emissions component" may be defined as any component that has the potential to emit fugitive emissions at any of the sources previously identified, including valves; connectors; pressure relief devices; open-ended lines; access doors; flanges; closed vent systems; thief hatches or other openings on storage vessels; agitator seals; distance pieces; crankcase vents; blowdown vents; pump seals or diaphragms; compressors; separators; pressure vessels; dehydrators; heaters; instruments; and meters. Devices that would naturally vent as part of normal operations, such as natural gas-driven pneumatic controllers or pumps, are not included as fugitive emissions components. *See* NMED Exhibit 34 (EPA CTG)

Control Options for Equipment Leaks and Fugitive Emissions

Emissions from fugitive emission sources such as leaking valves, connectors, and flanges can be controlled through implementation of an emission leak detection and repair ("LDAR")

program. In simple terms, LDAR programs reduce emissions by requiring owners and operators to inspect their facilities to find and repair leaks. Leak detection methods include:

- Audio, visual, and olfactory ("AVO") inspections;
- Instrument monitoring according to EPA Reference Method 21, 40 CFR Part 60, Appendix A-7 ("EPA Method 21"); and
- Monitoring using optical gas imaging ("OGI").

AVO inspections rely on the use of sight, sound, and smell to identify leaking components by listening for hissing or unusual sounds coming from equipment (audio); looking for cracks, holes, visible liquids leaks, or staining (visual); and smelling for unusual or strong odors (olfactory).

EPA Method 21 is an established reference method that identifies leaks using a portable instrument that can detect the presence of organic gases and measure their volumetric concentration in parts per million (ppm). The method also allows for the use of a soap solution applied to components that will form bubbles if there is a leak present.

OGI is a newer method for leak detection that utilizes forward-looking infrared ("FLIR") cameras to conduct inspections of equipment components to identify leaks. OGI infrared cameras are highly specialized thermal cameras that can identify methane using its infrared absorption characteristics. OGI cameras can be used to survey large numbers of components in a short amount of time, whereas EPA Method 21 inspections require inspecting one component at a time with the instrument probe.

When using EPA Method 21, a leak is detected whenever the measured concentration exceeds the defined concentration threshold standard. In Section 20.2.50.116.C.(4)(c), this is specified as 500 ppm. When using OGI, a leak is detected if the emission images recorded by the

OGI instrument are not associated with normal equipment operation. An owner or operator also has the option of proposing an alternative equipment leak monitoring plan for approval by the department.

The control effectiveness of an LDAR program is based on the frequency of monitoring and the leak definition. More frequent monitoring means that leaks are detected and repaired sooner, so that they emit for a shorter time period, and possibly while they are still small and before they grow larger. A lower ppm leak definition will mean that a larger number of leaks must be repaired than with a higher ppm definition.

Proposed Rule Requirements for Equipment Leaks and Fugitive Emissions

Section 20.2.50.116 sets forth default monitoring requirements that apply to the inspections of thief hatches, closed vent systems, pumps, compressors, pressure relief devices, open-ended valves or lines, valves, flanges, connectors, piping, and associated equipment to identify defects and leaking components. Owners and operators of facilities with an annual average daily production greater than 10 barrels of oil (bbls) per day, or an average daily production greater than 60,000 standard cubic feet per day of natural gas, are required to conduct AVO inspections at least weekly. Facilities with an annual average daily production equal to or less than 10 bbls per day, or an average daily production equal to or less than 60,000 standard cubic feet per day of natural gas, are required to conduct an AVO inspection at least monthly.

Owners or operators of the following facilities must perform inspections using EPA Method 21 (explained above) OGI according to the following schedules:

- **Well sites and tank battery facilities:** annually at facilities with a PTE less than two tpy VOC; semi-annually at facilities with a PTE equal to or greater than two tpy and

less than five tpy VOC; and quarterly at facilities with a PTE equal to or greater than five tpy VOC.

- **Gathering and boosting stations, gas processing plants, and natural gas compressor stations:** quarterly at facilities with a PTE less than 25 tpy VOC; and monthly at facilities with a PTE equal to or greater than 25 tpy VOC.

Inspections using EPA Method 21 require daily calibration of instruments before use. Regulated leaks are those with a measurement of 500 ppm or greater of hydrocarbons and that not associated with normal operations.

Inspections using OGI must comply with the requirements in EPA's regulations at 40 CFR Section 60.18. A leak is detected if the emission images recorded by the OGI instrument are not associated with normal equipment operation. Components that are difficult, unsafe, or inaccessible to monitor are not required to be inspected until it becomes feasible to do so.

As an equivalent means of compliance with Subsection C of 20.2.50.116, an owner or operator can submit an alternative monitoring plan. The plan must be approved by the Department and can be terminated by the Department if the owner/operator fails to comply with elements of the plan, or fails to correct or disclose a violation within 15 days of discovery.

For leaks detected under Section 20.2.50.116, the component must be visibly tagged until repaired and the leak must be repaired within 15 days of discovery, except those detected leaks using OGI, which must be repaired within 7 days of discovery. Equipment must be re-monitored no later than 15 days after discovery of a leak to demonstrate that the leak has been repaired. For leaks that cannot be repaired in the required timeframes above without a process shutdown, the leak may be designated as "Repair Delayed" and repaired before the end of the next process unit shutdown.

Owners or operators are required to keep records of the following for all AVO, EPA Method 21, OGI, or alternative equipment leak monitoring inspections conducted pursuant to Section 20.2.50.116: facility location; date of inspection; monitoring method; name of the personnel performing the inspection; description of any leak requiring repair or a note that no leak was found; and whether a visible flag was placed on the leak or not. The owner or operator is required to record any leak detected, the date of detection, and the date of attempted repair. For leaks designated "repair delayed," the owner or operator must record the reason for delay for leaks not repaired within the allowed time frame, and an authorized representative's signature who determined the leak could not be implemented without process unit shutdown. The owner or operator must also record information regarding repair and follow-up monitoring. For a leak detected using OGI, the owner or operator must keep records as specified in EPA regulations at 40 CFR Section 60.18(i)(1)-(3).

Subsection G of 20.2.50.116 requires owners and operators to certify the use of an alternative equipment leak monitoring plan under Subsection D, if used, to the Department annually, and comply with the general reporting requirements in Section 20.2.50.112.

Basis for Proposed Rule

The requirements in Section 20.2.50.116 are based on similar rules for LDAR programs for oil and gas sources adopted by Colorado and Pennsylvania, and in NSPS Subparts OOOO and OOOOa.

Colorado Reg. 7 (NMED Exhibit 39) specifies the following LDAR frequencies for different types of facilities:

- Natural gas processing plants must comply with the LDAR provisions in NSPS Subpart OOOO, regardless of the age of the facility, unless the facility is subject to NSPS Subpart OOOOa. (Section .I.G).
- Natural gas compressor stations must perform quarterly instrument monitoring. (Section I.L.1).
- Well production facilities must perform annual instrument monitoring if uncontrolled actual VOC emissions are equal to or greater than 1 tpy of VOC, but less than or equal to 6 tpy VOC, and must perform semiannual instrument monitoring if uncontrolled actual VOC emissions are greater than 6 tpy VOC. (Section I.L.2).

Under Pennsylvania GP-5 and GP-5A for oil and gas operations, all owners and operators of unconventional natural gas well sites, remote pigging stations, natural gas compressor stations, processing plants, and transmission stations must conduct monthly AVO inspections and quarterly inspections using EPA Method 21 or OGI. When using EPA Method 21, a leak is defined as 500 ppm. *See* NMED Exhibits 37 and 38, at pp. 3, 18-19.

The equipment leak provisions in NSPS Subpart OOOO apply only to onshore natural gas processing plants and incorporate the provisions of 40 CFR 60, Subpart KKK (Standards of Performance for Equipment Leaks of VOC From Onshore Natural Gas Processing Plants for Which Construction, Reconstruction, or Modification Commenced After January 20, 1984, and on or Before August 23, 2011), which in turn incorporate the provisions of 40 CFR 60, Subpart VV (Standards of Performance for Equipment Leaks of VOC in the Synthetic Organic Chemicals Manufacturing Industry for which Construction, Reconstruction, or Modification Commenced After January 5, 1981, and on or Before November 7, 2006).

The fugitive emission (i.e., equipment leak) provisions in NSPS Subpart OOOOa, 40 CFR § 60.5397a and 60.5400a, require semi-annual inspections using EPA Method 21 or OGI at well-sites, and quarterly inspections at compressor stations and gas processing plants. Well sites that contain only wellheads are exempt from the fugitive emission requirements.

Estimated Emissions Reductions

Based on the NMED Equipment Data and oil and gas well data from OCD,[16] ERG estimated that there are 23,969 wellhead facilities (based a total well count of 47,937 in the Subject Counties, and assuming an average of 2 wells per wellhead facility), and another 1,950 non-wellhead facilities involved in collecting, processing, and transmitting oil and gas. ERG estimated that the non-wellhead facilities have fugitive equipment leak emissions of 7,131 tons per year of VOC, and the wellhead facilities have fugitive equipment leak emissions of 18,894 tons per year of VOC. The baseline VOC emissions from equipment leaks at the wellhead facilities and non-wellhead facilities are based on the *Baseline 2014-2016 Oil and Gas Emission Inventory for the WESTAR-WRAP Region* (June 2019) ("2014 Oil and Gas Emission Inventory") attached as NMED Exhibit 68. *See* NMED Exhibit 69 – LDAR Reductions and Costs VOC Spreadsheet.

ERG then evaluated the effect of the proposed requirements on VOC emissions. For non-wellhead facilities, ERG examined the list of 1,950 facilities to determine which facilities were currently implementing an LDAR program under existing federal regulations, which facilities would be required to implement a new LDAR program under Part 50, and what the required frequency of inspection would be for those facilities required to implement a new LDAR

[16] Petroleum Recovery Research Center, GO-TECH website. Oil and gas production data on the PRRC website has been provided primarily by the New Mexico Oil Conservation Division, and is updated on a monthly basis. http://gotech.nmt.edu/gotech/Petroleum_Data/allwells.aspx

program under Part 50, based on the facility type and the facility's total allowable VOC emissions. The total allowable VOC emissions were used as a surrogate for the facility's PTE of VOC. Under NSPS Subparts OOOO and OOOOa, many oil and gas facilities are already required to conduct LDAR. ERG assumed no additional emission reductions would occur at these sources as a result of the proposed rule. The emission reductions expected for each facility implementing a new LDAR program was then estimated based on the following frequency of Method 21 or OGI inspections:

Frequency	**Average Percent Reduction (assuming facilities will use a mix of OGI and Method 21)**	**Inspection Technology**
Monthly	92%	Method 21
Quarterly	82%	Method 21/OGI
Semiannually	68%	Method 21/OGI
Annually	54%	Method 21/OGI

These reduction percentages are based on data compiled by EPA in developing updated standards for reducing emissions from equipment leaks for oil and natural gas production sources. *See* NMED Exhibit 70 – EPA, *Background Technical Support Document for the Final New Source Performance Standards (40 CFR Part 60, Subpart OOOOa)*, EPA-HQ-OAR-2010-0505-7631 (May 2016), at page 41 for EPA Method 21 and page 42 for OGI). As a result of this analysis, ERG estimated total emission reductions of 4,654 tons per year of VOC for non-wellhead facilities. *See* NMED Exhibit 69 – LDAR Reductions and Costs VOC Spreadsheet.

For well sites facilities, emission reductions were estimated assuming semi-annual inspections would be required at well sites not currently conducting inspections under existing federal requirements in NSPS Subpart OOOOa. Estimated VOC reductions for well sites that

would be required to implement a new LDAR program under the proposed rule are based on EPA estimates of reductions associated with an LDAR program to be:

Facility Type	**Annual VOC Emission Reduction (tpy)**
NG Well Site (GOR > 100,000)	0.917
Oil Well Site (GOR < 300)	0.199
Oil Well Site (GOR > 300, < 100,000)	0.451

See NMED Exhibit 34 – EPA CTG, at Table 9-12. As a result of this analysis, ERG estimates total emission reductions of 14,896 tons per year of VOC for well site facilities. *See* NMED Exhibit 69 – LDAR Reductions and Costs VOC Spreadsheet. This approach would result in total VOC reductions of 14,896 tpy of VOC, which is 79% of the baseline VOC emissions from the New Mexico oil and gas inventory.

Costs of Proposed Requirements

The costs of implementing an LDAR program to reduce fugitive equipment leak emissions are those associated with labor required to conduct inspections and repair leaking components. ERG estimated the costs required to implement a new LDAR program under the proposed rule for well sites based on estimates for well sites from the EPA CTG (NMED Exhibit 34) and from the cost analysis for the 2014 amendments to Colorado Reg. 7. *See* NMED Exhibit 71 – Colorado Dept. of Public Health and Environment, *Regulatory Analysis for Proposed Revisions to Colorado Air Quality Control Commission Regulation Numbers 3, 6 and 7 (5 CCR 1001-5, 5 CCR 1001-8, and CCR 1001-9)*, (February 11, 2014) ("2014 Colorado Regulatory Analysis"). The LDAR costs for each type of facility were estimated as follows:

Well sites: ERG assumed that all well sites would have two wells, and that all would use semiannual OGI LDAR monitoring. The cost per well site, based on a model plant analysis, was

taken from Table 9-12 of the EPA CTG (NMED Exhibit 34). The cost per LDAR inspection was scaled from 2012$ to 2019$ using the CEPCI for an annual cost of $2,375 per site.

Gathering and Boosting Stations: The cost per gathering and boosting station for quarterly LDAR inspections using OGI, based on a model plant analysis, was taken from Table 9-13 of the EPA CTG. The cost per LDAR inspection was scaled from 2012$ to 2019$ using the CEPCI for an annual cost of $26,030 per site.

The cost per gathering and boosting station for monthly LDAR inspections was based on the weighted average cost per inspection for LDAR inspections (Table 23) and repairs (Table 24) of the 2014 Colorado Regulatory Analysis. For 359 inspections, the total LDAR costs were $1,007,064 and the total repair costs were $523,071. Costs do not include any credit for recovered gas volume. The cost per inspection was multiplied by 12 to obtain the annual LDAR cost. The costs were scaled to 2019$ using the CEPCI.

Natural Gas Compressor Stations: The costs for quarterly and monthly LDAR inspections for compressor stations were estimated using the same methodology as that used to estimate the costs of monthly LDAR inspections for gathering and boosting stations as described in the previous paragraph. The annual costs per station were estimated to be $18,256 for quarterly inspections and $54,768 for monthly inspections.

Tank batteries: The cost per LDAR inspection per tank battery includes costs for three elements: (1) a cost per inspection of the closed vent system inspection; (2) a cost per inspection of the tank battery; and (3) the average cost of repairs per inspection. Costs were estimated based on the 2014 Colorado Regulatory Analysis. Costs for storage tank closed vent system inspections are based on 2 hours of a contractor at $134 per hour per tank battery using EPA Reference Method 21 or an OGI camera. Costs for the tank battery inspection were based on a weighted

average cost per inspection in Table 27 of the 2014 Colorado Regulatory Analysis. Costs were scaled from 2013$ to 2019$. Costs for repairs were based on the weighted average repair cost per inspection using the total repair cost from Table 28, and the total number of inspections from Table 27, in the 2014 Colorado Regulatory Analysis. *See* NMED Exhibit 71. Costs were in 2013$ and they were scaled to 2019$ using the CEPCI. The cost per inspection was multiplied by the estimated number of inspections per year required for each tank battery to obtain the total annual cost for each facility of $1,160 for annual inspections, $2,319 for semiannual inspections, and $4,638 for quarterly inspections.

Natural Gas Plants: The average total number of components (5,947) at a gas plant was taken from Table 8-2 in the EPA CTG (NMED Exhibit 34). The cost per LDAR inspection was estimated assuming a check of 120 components per hour at a cost of $110/hour for company labor, assuming a "loaded" rate that includes benefits, overhead, vehicle costs, and estimated hourly cost for a purchased EPA Method 21 detector. The hourly labor rate of $110/hour is from Table 20 on page 41 of the 2014 Colorado Regulatory Analysis (NMED Exhibit 71). The rate of $103/hr in Table 20 was scaled from 2013$ to 2019$ using the CEPCI. The cost per LDAR inspection was multiplied by the estimated number of inspections per year to obtain the total annual cost for each facility of $21,806 for quarterly inspections and $65,417 for monthly inspections.

The total annualized costs of implementing the LDAR requirements in Part 50 are estimated to be $2,847,945 for non-wellhead facilities, and $52,220,185 for well site facilities. Given the emissions reductions expected as a result of the proposed rule, ERG estimated the cost effectiveness of reducing emissions from non-wellhead facilities at $5,100 per ton of VOC, and $3,506 per ton of VOC for well site facilities.

Section 20.2.50.117 – Natural Gas Well Liquid Unloading

Applicability

The requirements of Section 20.2.50.117 apply to liquid unloading operations including down-hole well maintenance events at natural gas wells.

Process Description and Control Options for Natural Gas Well Liquid Unloading

Liquids unloading is used to remove accumulated fluids in the wellbore of a natural gas production well. Managing wellbore liquid build-up in gas wells is fundamental to maintaining production, avoiding early abandonment of wells, and maximizing resource recovery. Wells and reservoirs follow a continuum of flow regimes in their economic life as the reservoir depletes, production declines, wellbore (tubing) velocity goes down, and liquid loading begins to occur in the wellbore. Liquid loading begins when the gas velocity up the production string is not sufficient to lift liquids up to the surface at a pressure that will allow gas production to overcome the surface equipment and flow out of the wellbore. While pressure is a factor, it is generally a lack of velocity that causes liquids to accumulate in the wellbore (i.e., to "load" or "load up").

New wells typically have sufficient production rates and flowing velocity so that liquids loading is not an issue. As the portion of the reservoir accessed by a well depletes, the production rate and velocity declines and eventually a point is reached where liquids loading begins to be an issue. The time at which liquids loading occurs is dependent on the reservoir characteristics, and varies from well to well.

At the onset of liquids unloading, techniques that rely on the reservoir energy are typically used to remove liquids. The following techniques can be used individually or in combination to manage wellbore liquids and maintain production:

- **Intermitting:** Shutting in a well (i.e., stopping or reducing production) for a period of time to allow the reservoir near the wellbore to "refill" the pressure and volume "void" so that when the well is restarted the production rate and velocity are higher and the well can "unload" liquids through the normal production route to sales;
- **Velocity strings:** Installing a smaller diameter tubing string in the well that increases the flow velocity at a given production rate sufficiently to drag liquids up the wellbore and prevent liquid loading; and
- **Surfactants and foaming agents**: Introducing surfactants and foaming agents to the bottom of a well (various techniques are used) creating foam with lower specific gravity which enables liquids to be carried up the wellbore at lower velocities.

Eventually a well will reach a point where the reservoir energy is not sufficient to remove the liquids from the well and adding energy to the well is necessary to continue production. Three common methods are:

- Installing a plunger lift system, which uses differential pressure between the bottom-hole and the surface/gas collection line instead of velocity to remove liquids. A plunger lift consists of a plunger that is dropped down the well bore when the gas pressure declines to a predetermined set point. A valve on the plunger allows gas and liquid to pass through the plunger as if falls. When the plunger reaches the bottom, the valve is automatically closed, and gas pressure in the well below the plunger accumulates until the plunger and fluid column above it are lifted to the top of the well bore. The plunger is caught at the top of the well bore and held until the gas pressure decreases to the point the plunger is released down into the well, and the cycle is repeated. The plunger lift can be operated automatically, and it eliminates the need to vent the well unload fluids.

- Installing wellhead compression that lowers the surface back-pressure on a well to increase the differential pressure between the reservoir and the collection/sales line, and therefore increase production rate and flow velocity.
- Installing a downhole positive displacement reciprocating rod pump with a surface pumping unit to pump liquids from the well bore, or installing a submersible electric liquids pump. These options (sometimes referred to as "artificial lift") are generally used when there is insufficient pressure to operate a plunger lift. These pumping units can eliminate the need to vent the well to unload fluids.

There are a number of different pump types and gas lift systems, each more effective in some respects than others. Installation of a system to add energy to a well is an economic decision based on whether the continuing production will be sufficient to support the costs of installing and operating a pump or gas lift system.

VOC emissions from liquids unloading operations occur when the well is vented to the atmosphere to unload fluids or when the liquids are unloaded through atmospheric tanks and the gas mixed with the liquid is vented to the atmosphere. To reduce emissions and waste of gas during manual (i.e., non-automated) liquids unloading activities, operators can monitor manual liquids unloading events onsite within close proximity to the well or via remote telemetry to ensure that the well returns to normal production operation as soon as possible.

<u>Proposed Rule Requirements for Liquids Unloading</u>

Section 20.2.50.117 requires the owner or operator of a natural gas well to use the following best management practices during liquid unloading to minimize emissions, consistent with well site conditions and good engineering practices:

- Reduce wellhead pressure before blowdown;

- Monitor manual liquid unloading in close proximity to the well or via remote telemetry; and
- Close well head vents to the atmosphere and return the well to normal production operation as soon as practicable.

The owner or operator of a natural gas well is required to use one of the following methods to reduce emissions during an unloading event:

- Installation and use of a plunger lift;
- Installation and use of artificial lift (e.g., a positive displacement rod pump or a submersible pump); or
- Installation and use of a control device.

Monitoring, recordkeeping, and reporting requirements are proposed to ensure the owner or operator is properly performing liquid unloading operations and down-hole well maintenance in a manner that meets the emissions reduction requirements in Part 50. The monitoring requirements include monitoring well-head parameters and performing VOC volume and mass calculations during an unloading event. Owners and operators are required to maintain records of well location and ID number, liquid unloading dates, wellhead pressure, vented gas flow rate (to the extend feasible), duration of venting event, VOC management practice used before and during liquid unloading, device used to control VOC emissions during unloading, and calculation of VOC emissions vented during unloading. The VOC calculation is based on the duration, volume, and mass of the VOC.

Owners and operators must also comply with the general monitoring, recordkeeping, and reporting requirements in Section 20.2.50.112.

Basis for Proposed Requirements

The proposed operational requirements and best management practices for limiting VOC emissions during natural gas well liquids unloading events are based on requirements in Colorado Reg. 7, Pennsylvania GP-5 and GP-5A, and the Wyoming Permitting Guidance.

Colorado Reg. 7, Sec. II.G.1, requires owners and operators to "use best management practices to minimize hydrocarbon emissions and the need for emissions from the well associated with …, well liquids unloading, … unless emitting is necessary for safety." The owner/operator must first use any means of creating differential pressure to attempt to unload the liquids from the well without emitting; if these methods are not successful, the well is permitted to emit to the atmosphere in order to create the necessary differential pressure to bring the liquids to the surface. The owner/operator is required to "be present on-site during any planned well liquids unloading and must ensure that any emissions from the well associated with the event are limited to the maximum extent practicable." Finally, the owner/operator is required to keep records of the unloading event, as well as an estimate of the amount of emissions. *See* NMED Exhibit 39.

Pennsylvania GP-5 and GP-5A, Condition 2.L.1, requires the owner/operator conducting wellbore liquids unloading operations to:

> [U]se best management practices including, but not limited to, plunger lift systems, soaping, swabbing, unless venting is necessary for safety to mitigate emissions during liquids unloading activities. In all cases, where technically feasible and safe, the owner or operator shall direct the gas generated during liquids unloading to a control device, a gas production line or existing separator or storage vessel which is controlled.

The owner or operator is also required to keep records of each liquids unloading operation, including the technique used, the disposition of the associated gas, the duration of the event, and an estimate of the emissions. *See* NMED Exhibits 37 and 38.

The Wyoming Permitting Guidance requires that owners/operators minimize VOC emissions to the extent practicable during manual and automated blowdown/venting episodes associated with liquids unloading. Personnel are required to remain on site to ensure minimal gas venting occurs during manual blowdown or venting. The Guidance states that permits will include requirements to keep records of the unloading event, as well as an estimate of the emissions. *See* NMED Exhibit 40, at p. 13.

Estimated Emissions Reductions

Emission estimates for liquid unloading operations were included in the emissions inventory used in the ozone modeling conducted as part of this rulemaking. The inventory estimated 13,020 tpy of VOC emitted from gas well liquids unloading events. No data on liquid unloading operations are found in the NMED Equipment Data.

A review of EPA's 2019 Greenhouse Gas Reporting Program Data (40 CFR part 98, Subpart W) indicated that 97% of gas wells in the Permian and San Juan basins that require liquids unloading currently employ plunger lifts.[17] These data are summarized in the following table.

[17] GHGRP data available at: https://enviro.epa.gov/index.html

Subpart W-2019 Liquids Unloading Data for San Juan and Permian Basins in New Mexico

Parameter	San Juan - NM	Permian – NM	Totals
Total # Gas Wells	17,536	2,929	
% of gas wells requiring liquids unloading	26.4%	2.2%	
% of gas wells requiring liquids unloading - Vent Using Plunger Lifts	25.9%	0.3%	
% of gas wells requiring liquids unloading - Vent Without Using Plunger Lifts	0.5%	1.9%	
Wells that require liquids unloading that have a plunger lift			
# Wells With Plunger Lift	4,544	10	4554
% With Plunger Lift	98%	15%	97.1%
Wells that require liquids unloading that do not have a plunger lift			
# Wells - Non-Plunger Lift	82	55	137
% Non-Plunger Lift	2%	85%	2.9%

A 2016 analysis estimated that installation of plunger lifts would reduce emissions by 95%. *See* NMED Exhibit 72 - ICF International, *Economic Analysis of Methane Emission Reduction Potential from Natural Gas Systems*, (May 2016) ("ICF Economic Analysis"). Using this estimated percentage reduction, ERG estimated that installation of plunger lifts on the remaining 2.9% of wells requiring liquids unloading that currently do not employ this technology would result in reductions of 4,272 tpy of VOC, or 36% of the baseline VOC emissions.

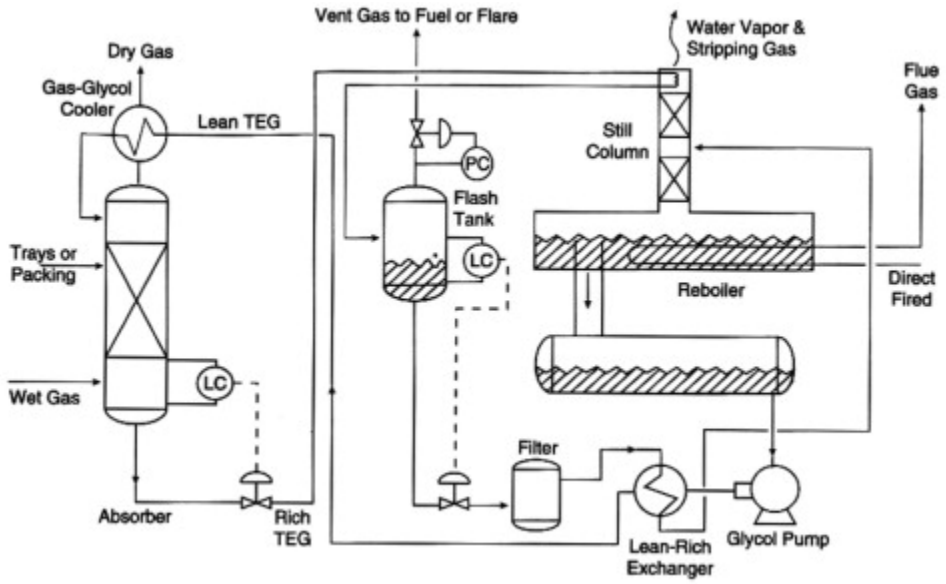
No estimates are available to quantify the reductions expected from implementation of the proposed best management practices requirements under Part 50.

Estimated Costs

Section 20.2.50.117 requires the use of best management practices to minimize the frequency of and emissions from natural gas well liquids unloading events. The rule also requires an owner or operator to use plunger lifts, artificial lift (i.e., positive displacement pumps or submersible pumps), or a control device during liquids unloading events to minimize emissions. The ICF Economic Analysis estimated that costs associated with installation of a plunger lift include capital costs of $20,000 and operating costs of $2,400. *See* NMED Exhibit 72, at p. 2-8.

In a 2011 report, EPA estimated that the payback period for installing a plunger lift could be from 1 to 8 years, depending on the value of natural gas and well-specific parameters. *See* NMED Exhibit 73 – EPA report, *Lessons Learned from Natural Gas STAR Partners – Options for Removing Accumulated Fluid and Improving Flow in Gas Wells* (2011). EPA has further found that the advantages of a plunger lift, in addition to reduced VOC and methane emissions, include increased productivity and reduced well maintenance, such as treatments to remove scale and paraffin. *See* NMED Exhibit 74 – EPA report, *Lessons Learned from Natural Gas STAR Partners – Installing Plunger Lift Systems in Gas Wells* (2006).

Section 20.2.50.118 – Glycol Dehydrators



Applicability

Section 20.2.50.118 applies to glycol dehydrators with a PTE equal to or greater than two tons per year of VOC and are located at well sites, tank batteries, gathering and boosting stations, natural gas processing plants, and natural gas compressor stations.

Description of Glycol Dehydrator

A glycol dehydrator is a liquid desiccant system for the removal of water from natural gas and natural gas liquids. Triethylene glycol is the most commonly used desiccant in these systems. Failure to remove water results in formation of crystalline hydrates at the high pressures used to transport the gas. Hydrates can block pipelines, jam valves, and can generally wreak havoc on pipeline equipment and instrumentation. In the glycol dehydrator, the triethylene glycol absorbs water and VOCs from the gas. The triethylene glycol is then regenerated by heating it to release the absorbed compounds. The reboiler from a large glycol dehydrator can discharge more than one hundred tons per year of VOCs, including benzene, toluene, ethylbenzene and xylene (collectively known as "BTEX").

The actual setup of a glycol dehydrator system can vary amongst manufacturers, but the following description outlines the basics. Wet gas typically passes first through an inlet separator to remove natural gas liquids, which are then stored prior to further processing to separate the components of the gas. The wet gas is introduced into the bottom of a contact tower, and dry, lean glycol flows down the tower from the top. Contact of the two streams is enhanced through the use of tower trays or packing material. The inlet gas is stripped of water and VOCs as it travels up the tower, and becomes drier as it rises. The glycol absorbs more water as it travels down the tower, becoming "rich" or wet glycol. The dehydrated gas, may at this point, pass through a heat exchanger with lean glycol to reduce the temperature of the dry, lean glycol from the surge tank before it is introduced to the contact tower. The dry gas is returned to the pipeline as pipeline-quality natural gas, or goes to other processing units for the recovery of natural gas liquids. The rich glycol exits the tower at the bottom and passes through a filter prior to entering the glycol pump to help reduce wear on the glycol pump.

(Image from ScienceDirect.com)

After leaving the glycol pump, the rich glycol may enter a phase separator, also referred to as a flash tank. As the rich glycol enters the flash tank, its pressure is reduced to atmospheric pressure, and the glycol is separated from contaminants, lubricating oil, free water and condensate. The flashed gas, comprised of VOCs, exits through a vent to atmosphere, or is used as fuel, flared, or used as a stripping gas to aid in the regeneration process.

The glycol regenerator, or reboiler, is comprised of two pieces – the reboiler and surge tank. The reboiler is gas-fired, and is equipped with a baffle to ensure that the glycol contained inside covers the fire tube. Burner exhaust is vented to the atmosphere, and consists of products of combustion.

The rich glycol enters the regenerator through a packed still column. The rich glycol hits the preheated glycol in the reboiler, and water flashes off as steam and goes back through the still column, while the glycol drops back into the reboiler. The regenerated glycol then flows over the baffle and into the surge tank. From the surge tank, the lean glycol is pumped back to contact tower for reuse.

The regenerator off-gas is either vented to the atmosphere, or sent to a condenser or thermal oxidizer. Because of their high solubility, most of the BTEX compounds are not flashed from the glycol at the flash tank, but instead are separated from the glycol in the regenerator.

Control Options for Glycol Dehydrators

There are a number of options available to owners and operators of glycol dehydrators for controlling emissions. Still vent and flash tank emissions can be routed at all times to the reboiler firebox (for use as fuel), a condenser, combustion control device, to a process point that either recycles or recompresses the emissions or uses the emissions as fuel, or to a vapor recovery unit (VRU) that reinjects the VOC emissions back into the process stream or a natural gas gathering

pipeline. See testimony regarding control devices (Section 20.2.50.115) for a discussion of VRUs. A combustion control device is either a flare or an enclosed combustor. A condenser uses water, air, or another coolant to lower the temperature of the vent gases and cause the vapors to condense from gas to liquid phase where they can be collected. Costs were estimated for condensers and combustion control devices because existing cost estimates are readily available and are more universally applicable. Costs for other control options are more site-specific and standardized cost estimating methods are not readily available.

Proposed Rule Requirements for Glycol Dehydrators

Section 20.2.50.118 requires owners and operators of existing dehydrators with a PTE greater than 2 tpy VOC are required to reduce VOC emissions from the still vent and flash tank by at least 95% no later than two years after the effective date of the rule. Owners and operators of new glycol dehydrators with a PTE greater than 2 tpy VOC are required to reduce VOC emissions from the still vent and flash tank by at least 95% upon startup. For both new and existing dehydrators, the combustion device (if used) must meet a minimum 98% destruction efficiency.

Still vent and flash tank emissions must be routed to a control device, a process point that either recycles or recompresses the emissions or uses the emissions as fuel, or to a VRU that reinjects the VOC emissions back into the process stream or natural gas gathering pipeline. If a VRU is used, the VRU must be operational at least 95% of the time, resulting in a minimum combined capture and control efficiency of 95%. The requirements of Section 20.2.50.118 cease to apply when the uncontrolled actual annual VOC emissions from a new or existing glycol dehydrator are less than 2 tpy VOC.

Section 20.2.50.118 contains monitoring, recordkeeping, and reporting requirements that ensure affected sources are being properly operated and maintained in a manner that meets the emissions reduction requirements in Part 50. The monitoring requirements include conducting an annual extended gas analysis to determine the composition of the gas being processed by the dehydrator. Owners and operators are required to use this gas analysis to calculate the uncontrolled and controlled emissions from the dehydrator. This calculation will demonstrate whether the 95% emission reduction requirement is met.

Owners and operators are required to inspect dehydrators and control devices or processes semi-annually to ensure integrity of the equipment and that the equipment is being operated as initially designed and in accordance with manufacturers specifications.

Owners and operators must also meet the monitoring requirements of Sections 20.2.50.112 (general requirements) and 20.2.50.115 (control devices).

Records of equipment throughput data, emissions calculations and supporting documentation, inspection results, and manufacturer information are required to be maintained onsite and submitted to the Department upon request.

Basis for Proposed Requirements

The proposed requirements in Section 20.2.50.118 are based on similar requirements for dehydrators adopted by Colorado and Pennsylvania, as well as federal regulations. The applicability threshold of 2 tpy of VOC is based on the applicability threshold for individual dehydrators in Colorado Reg. 7, Sec. II.D). However, Section 20.2.50.118 does not incorporate the Colorado applicability specification that the total VOC from all dehydrators at a site (counting only those with VOC emissions greater than or equal to 1 tpy) must also be greater than or equal to 15 tpy. If the site-wide applicability threshold of 15 tpy used in Colorado were

adopted in Part 50, the number of sites with glycol dehydrators subject to regulation would be reduced by about 60 percent, but the total VOC from glycol dehydrators subject to regulation would be reduced by 25 percent. Therefore, the Department is proposing an applicability threshold of 2 tpy VOC emissions per dehydrator in order to maximize potential VOC reductions. *See* NMED Exhibit 75 – Dehydrator 15 tpy Cutoff Analysis Spreadsheet.

Pennsylvania GP-5 and GP-5A, both at Section B, have a threshold of greater than or equal to 2.7 tpy for dehydrators. *See* NMED Exhibit 37, at p. 11; NMED Exhibit 38. at p. 10. The proposed capture and control efficiency of 95% for emissions from an uncontrolled dehydrator's still vent and flash tank is taken from the federal National Emissions Standards for Hazardous Air Pollutants ("NESHAP") regulations for emissions from glycol dehydrators, 40 CFR Part 63, Subpart HH ("NESHAP Subpart HH"), Section 63.765, requiring controls for VOCs.

Emissions from dehydrators are typically controlled with either a condenser or a combustor (enclosed flare).

Estimated Emissions Reductions

The NMED Equipment Data indicates that there are 571 active glycol dehydrators located in the Subject Counties, or that are considered "Portable" units. Of these dehydrators, 341 glycol dehydrators at 230 unique sites have allowable emissions equal to or greater than 2 tpy of VOC. The NMED Equipment Data indicates that 199 of these dehydrators currently do not have VOC emissions controls, and of these 199 dehydrators, 93 are not subject to NESHAP Subpart HH; thus, those 93 dehydrators would be required to control emissions under Part 50. For uncontrolled dehydrators that are subject to NESHAP Subpart HH, ERG assumed that these facilities are complying with those regulations by optimizing the glycol recirculation rate, which

the background document for NESHAP Subpart HH assumed would reduce emissions by 48%. ERG assumed that facilities without add-on controls and not subject to NESHAP Subpart HH would achieve a 95% emission reduction, and the uncontrolled facilities subject to NESHAP Subpart HH would achieve an incremental emission reduction of 47% (i.e., 95% - 48%) by installing add-on controls. An emission reduction of 0% was assumed for dehydrators that already have add-on controls for VOC. *See* NMED Exhibit 76 – Memo from Heather Brown, P.E., to Greg Nizich, *Impacts of Applying Management Practices to a Single Oil and Natural Gas Production Area Source Facility*, EPA Docket No. EPA-HQ-OAR-0238-0061 (December 21, 2006) at Table 1.

Adding controls to dehydrator units would reduce emissions by 1,865 tpy, leading to a 46.2% overall reduction in VOC emissions from dehydrators. These reductions are calculated starting from a baseline calculated as the total allowable emissions for all 577 dehydrators. *See* NMED Exhibit 77 – Dehydrators Reductions and Costs Spreadsheet.

Estimated Costs

The annualized costs of emission reductions for glycol dehydrators were calculated by applying the control costs for either condensers or combustors to each of the 199 uncontrolled dehydrators. Condenser costs are taken from two memos in the EPA rulemaking docket for the 2007 amendments that added regulations for dehydrators at lower emitting "area" source facilities to the existing regulations for higher emitting "major" source facilities, codified at 40 CFR 63, Subpart HH. *See* NMED Exhibit 78 – Memo from Heather Brown, P.E., to Greg Nizich, *Revised Impacts from Area Sources in the Oil and Natural Gas Production Source Category*, EPA Docket No. EPA-HQ-OAR-2004-0238-0002 (June 25, 2005); NMED Exhibit 79 – Memo from Heather Brown, P.E., to Greg Nizich, *Impacts of the Final Standards for Oil and Natural Gas Production*

Area Sources, EPA Docket No. EPA-HQ-OAR-2004-0238-0055 (December 21, 2006). Those costs were updated to 2019 costs using the CEPCI. Combustor costs are taken from the 2018 Technical Support Document for the rulemaking proceedings on Pennsylvania GP-5 and GP-5A. *See* NMED Exhibit 52. These costs were updated to 2019 costs using the CEPCI.

Based on ERG's research and analysis, the annualized cost for installing and operating a condenser is estimated to be $21,560. The annualized cost for installing and operating a combustor is estimated to be $10,583. The total annualized costs of adding condensers to the 199 dehydrator units would be approximately $4,300,000 per year, while the total annualized costs of adding combustors to the 199 dehydrator units would be approximately $2,100,000 per year. Costs for both condensers and combustion controls are presented for information purposes, although for each dehydrator the owner of operator would install either a condenser or a combustor, not both.

Section 20.2.50.119 – Heaters

Applicability

Section 20.2.50.119 applies to natural gas-fired heaters with a rated heat input equal to or greater than 10 MMBtu/hour including heater treaters, heated flash separators, evaporator units, fractionation column heaters, and glycol dehydrator reboilers in use at well sites, tank batteries, gathering and boosting stations, natural gas processing plants, and natural gas compressor stations.

Description of Equipment and Process

Natural gas-fired heaters are used throughout the oil and gas production and processing sectors to prevent equipment from freezing and being blocked by the formation of ice or hydrates; to improve the separation of well products into oil, water, and natural gas; and in certain types of process equipment, such as glycol dehydrators.

A 'heater treater' is a heated vessel that separates the natural gas and liquids coming from a well into a natural gas stream, an oil/condensate stream, and a produced water stream. The heater treater uses heat to break the oil/condensate-water emulsion coming from the well so the oil/condensate can be accepted by the pipeline or for tanker transport.

Heaters may also be used to prevent the formation of ice and natural gas hydrates that can form under the high pressures associated with the gas well production process. These solids can plug the wellhead and other equipment where there is a drop in pressure and/or temperature as the liquids and gas are removed from the well and processed downstream. Since the wellhead is fitted with a device (a "choke") to restrict the flow of the oil and gas from the well, temperatures within the wellhead may drop due to the pressure changes caused by the choke – i.e., as the gas pressure drops, the temperature of the equipment also drops and can reach temperatures well below freezing. This may cause the water or hydrates to freeze and plug the wellhead, resulting in slowing or stopping the condensate and gas production.

Heaters are also used to regenerate certain process materials used in oil and gas production so they can be used again. For example, a heater is used in ethylene glycol dehydrators to remove water from the glycol by heating the glycol and causing the water to evaporate from the glycol. Heaters are also used to regenerate dry desiccants (water absorbing materials) that are used in some types of natural gas dehydrators in place of ethylene glycol.

Natural gas-fired hot oil (or thermal) heaters may be used in combination with heat exchangers to warm a secondary fluid that may be gas or liquid, for example amine that is used in gas processing plants for the removal of H_2S and CO_2 from field gas. Hot oil heaters may also be used to provide heat for regenerative gas heaters which are used to drive water from molecular sieves within the gas dehydration process.

Control Options for Heaters

NO_X emissions from heaters may be controlled through combustion modifications that reduce the formation of NO_X; through the use of add-on controls to control NOx in the exhaust stack; or through a combination of combustion modifications and add-on controls. Combustion modifications include low-NO_X burners ("LNBs"), ultra-low NO_X burners ("ULNBs"), and flue gas recirculation ("FGR"). Add-on controls include selective noncatalytic reduction ("SNCR") and selective catalytic reduction ("SCR"). In addition to combustion modifications and add-on controls, many regulatory programs require periodic equipment tune-ups and good combustion practices to keep heaters operating at maximum efficiency in order to reduce emissions. Good combustion practices are also important in controlling CO and VOC emissions.

Proposed Rule Requirements for Heaters

Section 20.2.50.119 limits existing and new natural gas-fired heaters to 30 ppmvd NO_X at 3% oxygen, and 300 ppmvd CO at 3% oxygen. Existing heaters must comply with these standards no later than one year after the effective date of Part 50, while new heaters must comply upon startup. Owners and operators of heaters subject to this Section are required to install an EMT on the heaters in accordance with Section 20.2.50.112.

Owners and operators are required to conduct emission testing for NO_X and CO within 180 days of the applicable compliance date, and at least every two years thereafter. The equipment must be inspected, maintained, and repaired in accordance with the manufacturer's specifications at least once every two years after the applicable compliance date. An owner or operator may deviate from the specified periodic testing procedures by submitting a written request to use an alternative procedure to the Department at least 60 days prior to performing the periodic testing, but must receive written approval from the Department prior to conducting periodic testing using an alternative procedure.

Owners and operators are required to maintain records of the following information: location of the heater; summary of the complete test report and results of periodic testing; and inspections, testing, maintenance, and repairs. The owner or operator must comply with the general reporting requirements in Section 20.2.50.112.

Basis for Proposed Requirements

The proposed NO_X and CO limits are based on limits adopted by the State of Pennsylvania and EPA for natural gas fired combustion units. The NO_X limits are the same as those in the Pennsylvania GP-5 requirements for natural gas-fired combustion units. *See* NMED Exhibit 37 at Section L, p. 24. The CO limits are the same as those in the federal regulations at 40 CFR 63, Subpart DDDDD, *National Emission Standards for Hazardous Air Pollutants for Major Sources: Industrial, Commercial, and Institutional Boilers and Process Heaters* ("NESHAP Subpart DDDDD"). *See* NMED Exhibit 80. CO is commonly regulated as a surrogate for VOC or organic hazardous air pollutants ("HAP") because CO is a good indicator of incomplete combustion and VOC and HAP are products of incomplete combustion. EPA used CO limits instead of hazardous air pollutant limits in NESHAP Subpart DDDDD because it "concluded that CO, which is less expensive to test for and monitor, is appropriate for use as a surrogate for non-dioxin organic HAP." *See id.*, at p. 52210.

Estimated Emissions Reductions

Based on the NMED Equipment Data, ERG identified 337 facilities with heaters in the Subject Counties, and heaters that are listed as portable heaters. These heaters include separator heaters, heater treaters, glycol dehydrator reboilers, and fractionation column heaters. The data include 698 heaters with annual allowable NO_X emission limits that were used to estimate emissions reductions. The total allowable NO_X emissions from these 698 heaters are 1,355 tpy NO_X, and this was considered the baseline. Of the 698 heaters, 82 have a heat input equal to or

greater than 10 MMBtu/hour and would be subject to Part 50. These 82 heaters have total allowable NO_X emissions of 799 tpy.

ERG then examined the effect of implementing the proposed regulations on reducing NOx emissions. For purposes of this analysis, ERG assumed that there would be no additional reductions for units already subject to a federal New Source Performance Standard ("NSPS"). For any non-NSPS units, ERG estimated NO_X reductions of 50%, based on the use of low-NOx burners ("LNB"). *See* NMED Exhibit 81 – EPA, *Technical Bulletin: Nitrogen Oxides (NOx), Why and How They Are Controlled* (November 1999), at Table 16.

As a result of this analysis, ERG estimated total reductions of 216 tons per year of NO_X for an overall reduction of 16% from the baseline of 1,355 tpy NOx. *See* NMED Exhibit 82 – Heaters Reductions and Costs NO2 Spreadsheet.

Estimated Costs

ERG calculated estimated annualized costs to meet the proposed emission limits by assuming that all non-NSPS units would need to install LNB technology at an estimated average total annual cost of $9,250 ($1991) per heater, according to the EPA's Alternative Control Techniques Document – NOx Emissions from Process Heaters, Table 6-2 – NOx Emissions from Process Heaters *See* NMED Exhibit 109, EPA Office of Air Quality and Standards, *Alternative Control Techniques Document – NOx Emissions from Process Heaters*, EPA 453/R-93-034 (September 1993) (excerpt), p. 6-13. These costs were updated to reflect 2019 costs of $15,553 per heater using the CPECI of 361.3 for 1991 and 607.5 for 2019. The 2019 annualized cost per heater is therefore estimated as:

$9,250 per heater * (607.5/361.3) = $15,533 per heater.

Based on the NMED Equipment Data, a total of 44 units would require this technology, for a total annualized cost of approximately $684,341. Based on the emissions reductions of 216.4 tons per year of NO_X, the cost effectiveness of reducing emissions through the use of LNB to meet the required emission limits would be $3,162 per ton of NO_X reduced.

Section 20.2.50.120 – Hydrocarbon Liquid Transfers

Applicability

Section 20.2.50.120 is applicable to hydrocarbon liquid transfer operations (or hydrocarbon liquid loading) at well sites, tank batteries, gathering and boosting stations, natural gas processing plants, and natural gas compressor stations.

Description of Process

Hydrocarbon liquid transfers involve moving hydrocarbon liquid from a transfer vessel to a storage tank, or from a storage tank to a transfer vessel. There are three primary methods of vessel loading: splash loading, submerged fill pipe,[18] and bottom loading. For splash loading, the fill pipe is lowered only part way into the vessel, and the resultant splashing generates VOC emissions. In submerged fill pipe loading, the fill pipe will extend close to the bottom of the vessel. In bottom loading, a permanent fill pipe is connected at the bottom of the vessel. Both submerged fill pipe loading and bottom loading reduce the generation of VOC emissions. During the transfer of hydrocarbon liquids from one vessel to another, the remaining VOC-containing vapor from the previous contents of the vessel will also be vented as the vessel is filled.

Control Options for Hydrocarbon Liquid Transfers

The options typically used to reduce VOC emissions from hydrocarbon liquid transfers are similar those for storage tanks, and include:

[18] A pipe inserted into a tank to facilitate loading.

(1) route emissions from the storage vessel through an enclosed system to a process where emissions are recycled, recovered, or reused in the process – "route to a process" (e.g., by installing a vapor recovery unit (VRU) that recovers vapors from the storage vessel) for reuse in the process or for beneficial use of the gas onsite; and/or

(2) route emissions from the storage vessel to a combustion device.

In practice, many operators use a single, common VRU system or combustion device to control emissions from both hydrocarbon liquid transfers and storage tanks.

In addition to these control options, emissions from hydrocarbon liquid transfers are also commonly controlled using vapor balancing service, whereby the vapors in the tanker truck or railcar are routed back into the storage vessel as the liquids in the storage vessel are emptied into the receiving vessel (the truck or railcar). Vapor balancing requires a pipe or hose connected between the storage vessel and the receiving vessel prior to transfer. Bottom loading and submerged filling are additional best management practices used to reduce emissions from hydrocarbon liquid transfers.

Proposed Rule Requirements for Hydrocarbon Liquid Transfers

Section 20.2.50.120 requires owners or operators to control VOC emissions by at least 98% via vapor balance, vapor recovery, or a control device.

If using vapor balance, the rule at 20.2.50.120.B(2)(a) through (e) imposes the following requirements: owners and operators must load displaced vapor back to the vessel being emptied via pipe or hose connected before the start of the transfer operation; transfer cannot begin until the vapor collection and return systems are properly connected; connector pipes, hoses, couplers, valves and pressure relief devices must be free of leaks; liquid and vapor line connections must

be checked for proper connection prior to commencing the transfer operation; and the transfer equipment must be operated at a pressure that is less than the pressure relief valve setting of the receiving vehicle or vessel.

Bottom loading or submerged filling are required; splash loading is not an acceptable method of transfer under the rule.

For all transfer operations, hose and pipe connections must be supported on drip trays to collect any leaks, and the materials collected must be returned to the process or properly disposed of. Leaks must be cleaned and disposed of in a manner that minimizes emissions to the atmosphere, and the material collected must be returned to the process or properly disposed of.

Owners and operators employing a control device to comply with the emission standards of Section 20.2.50.120 are required to comply with the control device requirements in Section 20.2.50.115.

Owners or operators are required to visually inspect the transfer equipment during a transfer operation to ensure that components are not leaking. If leaks are discovered, they must be repaired prior to the next transfer operation. Operations employing a control device must follow the manufacturer's recommend operation and maintenance procedures. An owner or operator using vapor balance, vapor recovery, or a control device to minimize VOC emissions must comply with the monitoring requirements contained in Section 20.2.50.115. All owners and operators shall comply with the general monitoring requirements in Section 20.2.50.112.

Owners or operators of a storage vessel subject to Section 20.2.50.120 must maintain a record of the storage vessel and, if using a control device, records of the type, make and model. The owner or operator must also maintain a record of all required inspections. Records must also be maintained of the annual total hydrocarbon liquid transferred and annual VOC emissions from

each site. On an annual basis, the owner or operator is required to create a company-wide record summarizing the total annual hydrocarbon liquid transferred and the total annual calculated VOC emissions.

Owners and operators must also comply with the general recordkeeping and reporting requirements in Section 20.2.50.112.

Basis for Proposed Rule Requirements

The proposed control and operational requirements are based on requirements in Colorado's Reg. 7, Section II.C.5 (NMED Exhibit 39); Pennsylvania GP-5 and GP-5A (NMED Exhibits 37 and 38); Utah's Rule R307-504 – Oil and Gas Industry: Tank Truck Loading, (NMED Exhibit 83); and Wyoming's presumptive BACT for oil and gas truck loading operations, found in the Wyoming Permitting Guidance (NMED Exhibit 40). As described below, these other states require various best management practices and/or the use of control devices such as enclosed combustors to control emissions from hydrocarbon liquid transfers.

The proposed emission standard in 20.2.50.120.B(1) requiring all hydrocarbon liquid transfer operations to use vapor balance, vapor recovery, or a control device to control VOC emissions by at least ninety-eight percent is based on the following:

1) Colorado Reg. 7, Section II.C.5.a, which requires control of loadout emissions from controlled storage tanks to transport vehicles by using (a) submerged fill and (b) a vapor collection and return system and/or air pollution control equipment;
2) Pennsylvania GP-5A, Section F, which requires use of a vapor balancing system when removing liquids from the storage vessel;
3) Utah's Rule R307-504-4, which requires using a vapor capture line connected to a control of process with 95% destruction efficiency; and

4) Wyoming's Permitting Guidance, Chapter 6, Sec. 2, which requires a vapor capture line with a collection efficiency of 70% connected to a control device with a destruction efficiency of 98%.

The proposed standard in 20.2.50.120.B(2)(a) through (e) for owners and operators using the vapor balance option (see proposed requirements section above) is based on Colorado Reg. 7, part D, Section II.C.5.a.(iii)(A)-(E). The proposed emission standard in 20.2.50.120.B(3) requiring liquid transfers to use bottom loading or submerged filling is similar to Utah's Rule R307-504-4(1). The proposed emission standards in 20.2.50.120.B(4) and (5) requiring connector pipes and couplers be maintained in a leak-free condition and connections be supported on drip trays during transfer operations is similar to Colorado Reg. 7, part D, Section II.C.5.a.(iii)(E). The emission standards in 20.2.50.120.B(6) requiring liquid leaks be cleaned and disposed in a manner that minimizes emissions to the atmosphere is based on good engineering practices.

Because vapor balancing during transfers from storage vessels to transport vessels returns all vapors displaced from the tanker truck or railcar back into the storage vessel, and because all emissions from storage vessels with a PTE equal to or greater than 2 tpy of VOC are required to be controlled, the emissions attributed to vapor balancing are controlled at the storage tank by the requirements for storage vessels in Section 20.2.50.123. During liquid transfers from trucks and railcars to storage vessels, the vapor balancing requirements would require transfer of displaced vapors back to the trucks/railcars up to the pressure relief limits of these vessels, at which point excess emissions would be controlled by the storage tank control devices. Thus, any excess emissions generated during liquid transfers are controlled.

Estimated Emissions Reductions

Based on the NMED Equipment Data, ERG identified 684 active hydrocarbon liquid transfer operations in the Subject Counties with annual allowable VOC emission limits that allow for emissions reductions estimates. These 684 operations are located at 637 unique facilities. The total allowable VOC emissions from these 684 operations are 4,911 tpy. Of these 684 operations, there are 537 without controls. To estimate reductions, a 98% control efficiency was applied to these operations, resulting in total emissions reductions of 4,263 tpy of VOC for an overall reduction of 86.8%. *See* NMED Exhibit 84 – Transfers Reductions and Costs Spreadsheet.

Estimated Costs

Based on the NMED Equipment Data, ERG identified 537 affected hydrocarbon liquid transfer operations in the Subject Counties that require additional controls. For purposes of estimating costs, ERG assumed that each unique facility with operations requiring control would only require one control device that would be used to control emissions from all affected operations at that facility. There are 493 such facilities. As mentioned previously, many facilities use a common control device to control emissions from both storage tanks and liquid transfer operations. Therefore, ERG assumed that the only facilities that would require controls for purposes of complying with the hydrocarbon liquid transfer operations requirements are those facilities without a current control device and that would not already be required to install a new control device under the storage tank provisions in 20.2.50.123 NMAC. There are 130 such facilities, and the total estimated annualized costs of installing controls at these facilities is $2,283,886. These costs result in an overall cost effectiveness of $536/ton of VOC controlled. The annualized cost includes capital and installation costs, as well as operation and maintenance

costs for installing combustors at the 130 affected facilities. The capital and annual costs per combustor are based on cost figures in the EPA CTG. *See* NMED Exhibit 34 at Table 4-5 – *Total Capital Investment and Total Annual Costs of a Combustor*. Costs were updated to reflect 2019 costs using the CEPCI of 584.6 for 2012$ and 607.5 for 2019$. The 2019 to 2012 cost ratio is therefore estimated as:

607.5/584.6 = 1.04

A detailed breakdown of costs for hydrocarbon liquids transfers is provided in the Transfers Reductions and Costs Spreadsheet (NMED Exhibit 84).

Section 20.2.50.121 – Pig Launching and Receiving

Applicability

Section 20.2.50.121 applies to owners and operators of pipeline pig launching and receiving operations located within or outside of the property boundary of well sites, tank batteries, gathering and boosting stations, natural gas processing plants, and natural gas compressor stations.

Description of Process

Natural gas passing through gathering pipelines contains VOCs, as well as other impurities such as water and carbon dioxide. As this gas passes through the pipeline system, any change in temperature or pressure may result in development of natural gas condensates in a liquid phase in the pipeline. These natural gas condensates can accumulate in low elevation segments of the gathering pipelines, impeding the flow of natural gas. To maintain gas flow and operational integrity of these pipelines, operators insert a device called a "pig" into the pipeline which is swept along the pipeline by the pressure of the existing gas flow. Condensate and any other solid or liquid materials that have formed in the pipeline are pushed along in front of the

pig until it reaches a "receiver," at which point the pig is isolated in an offshoot pipeline segment and any condensates and liquids are drained out of the pipeline. The pig is then reinserted and swept along the next segment of pipeline. Pigs may also be used to create physical separation between different fluids flowing through the pipeline, for cleaning the internal surfaces of the pipelines, inspection of the condition of pipeline walls, and recording information relating to pipelines (e.g., size, location).

Emissions to the atmosphere may occur at both the pig launcher and receiver when the pipeline is opened to insert or extract the pig. Emissions from pigging operations depend on factors such as the launcher or receiver volume, pipeline pressure, the amount of liquid trapped in the pig receiver barrel prior to depressurization, frequency of pigging, and gas composition.

A conventional pig receiver is shown in Figure 1.[19] Pig launchers are very similar in design.

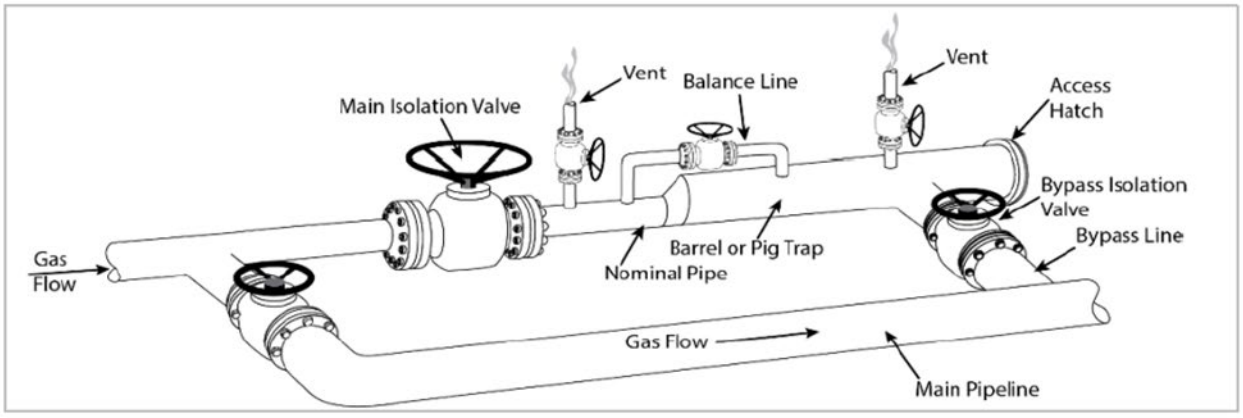


Figure 1 Conventional Pig Receiver

[19] "EPA Observes Air Emissions from Natural Gas Gathering Operations in Violation of the Clean Air Act". Publication no. EPA 325-F-19-001. September 2019.

Control Options for Pig Launching and Receiving

Emissions from pigging operations may be controlled through process modifications, through the use of add-on controls such as a flare, enclosed combustor or thermal oxidizer, or by using a vapor recovery unit (VRU). Process modifications identified by EPA to minimize emissions include:

- *Installing pig ball valves* - Pig ball valves are designed with a smaller sized barrel (or chamber) that launches and receives the pig which reduces the volume of gas that may be vented when the pig launcher or receiver is opened.
- *Receiver Barrel Design: Pig Ramps* - A pig ramp is a device that minimizes the accumulation of condensate in the receiver by directing the movement of the pig and liquid in the barrel to direct the flow of liquid into a bypass line. As part of a recent EPA settlement with midstream operator MarkWest, pig ramps were installed at hundreds of barrels in its wet gas midstream pipeline systems. *See* NMED Exhibit 85 – Consent Decree – *U.S. v. MarkWest Liberty Midstream & Resources, LLC*, No. 2:18-cv-00520-LPL (W.D. Penn., April 24, 2018) ("MarkWest Consent Decree").
- *Route High Pressure Systems to Lower Pressure Lines (Install Jumper Lines)* – Emissions from the opening of pig launchers and receivers can be reduced by routing high pressure gases in the unopened barrel to a lower pressure system before venting the remaining gases to the atmosphere or to control equipment.
- *Barrel Pump-down Systems* - Small fixed or portable compressors are used to pump gases in the receiver or a launcher barrel back into the main pipeline prior to opening the barrel. Barrel pump-down systems can recover greater than 99% of the depressurization vapors from pig launchers and receivers.

- *Enhanced Liquid Containment* - Liquids remaining in a receiver barrel after depressurization can be emptied into a container fitted with an impermeable material to reduce evaporative emissions from the liquids emptied from the barrel.

Additional technical details on pig launching and receiving emissions and mitigation strategies may be found in the MarkWest Consent Decree.

Proposed Rule Requirements for Pig Launching and Receiving

Section 20.2.50.121 requires affected facilities to comply with best management practices and emission limits. Owners and operators of pigging operations with a PTE equal to or greater than 1.0 tons VOC per year are required to capture and reduce VOC emissions by 98%. In addition, owners and operators must employ a suite of best management practices and equipment modifications during pigging operations to prevent or reduce emissions.

Basis for Proposed Requirements

The proposed requirements for pigging operations are based on Pennsylvania GP-5 and GP-5A, and Ohio's General Permit 21.1 for Title V and non-Title V pigging operations ("Ohio General Permits").[20] *See* NMED Exhibits 37, 38, and 86, respectively.

Pennsylvania GP-5A is applicable to sources located at unconventional natural gas well site operations and remote pigging stations, and Pennsylvania GP-5 is applicable to sources located at natural gas compression stations, processing plants, and transmission stations. The best management practices required in the Pennsylvania General Permits are required for all pigging operations. The same best management practices are also recommended in EPA's PRO Fact Sheet No. 505, *Recover Gas from Pipeline Pigging Operations* ("EPA Fact Sheet No. 505") (NMED Exhibit 87),[21] and a September 2019 EPA Enforcement Alert, EPA Publication No.

[20] Available at: https://www.epa.ohio.gov/dapc/genpermit/ngcs/GP_211
[21] Available at: https://www.epa.gov/sites/production/files/2016-06/documents/pigging.pdf

325-F-19-001 (NMED Exhibit 88).[22] The VOC emissions limit in Pennsylvania GP-5 and GP-5A apply to pigging operations that still have emissions equal to or greater than 2.7 tpy after employing best management practices. The Pennsylvania emission limit requires the owner or operator to control VOC emissions from all pigging operations by at least 95% with a control device. *See* NMED Exhibit 37 and 38 at p. 24.

Ohio has similar emission limits for pigging operations in its General Permits. Both general permits limit VOC emissions from one discrete pig launcher or receiver to less than 0.27 tons per month, averaged over a rolling 12-month period (equivalent to less than 3.24 tpy). The Ohio General Permits require use of an add-on control device to control emissions if needed to comply with the VOC emission limitations. *See* NMED Exhibit 86 at p. 4.

Estimated Emissions Reductions

Based on the NMED Equipment Data, ERG identified 10 facilities with pigging operations. However, this is not a complete inventory of pigging operations because they are most often located within other facilities and are not identified separately in NMED's permitting and facility databases. Further, pigging operations are also not quantified separately in the data from EPA's Greenhouse Gas Reporting Program for Petroleum and Natural Gas Systems, 40 CFR § 98, Subpart W.

Of the 10 facilities determined from NMED data, four facilities have five pigging operations with allowable VOC emissions equal to or greater than 1 tpy VOC each. Based on the applicability threshold of 1 tpy VOC, these operations would be required to implement reductions of 98% pursuant to 20.2.50.121.B(1). Total allowable VOC emissions from these five operations are 24.1 tpy, so the total reductions would be 23.6 tpy VOC based on the 98% control

[22] Available at: https://www.epa.gov/sites/default/files/2019-09/documents/naturalgasgatheringoperationinviolationcaa-enforcementalert0919.pdf

requirement. Total emissions from the pigging operations with emissions below the 1 tpy VOC 98% control applicability threshold are 1.6 tpy VOC, resulting in an overall control efficiency of 92%.

Estimated Costs

EPA Fact Sheet No. 505 provides an estimate of the costs and benefits of capturing liquids and gas from pigging operations. *See* NMED Exhibit 87. According to that document, best management practices for recovery of liquids and gas would require separating pigged liquids from the gas, storing the liquids temporarily at gathering system pressure, and then sending them to a low-pressure storage tank. These liquids (recovered at pipeline pressure) would flash and vent light hydrocarbon gases from the storage tanks. The flash emissions would be recovered by installing a dedicated vapor recovery system on the vessel where the liquids are depressurized. The recovered gas would then be sent to the sales line. This process would reduce emissions and add more gas to the sales line. The EPA 505 Fact Sheet states:

> The required equipment to be installed includes an electric or a gas engine driven vapor recovery compressor. A liquid/vapor flash vessel and low-pressure liquid pump may also be required depending on system design and/or ambient temperature and pressure. It is assumed that a pig launcher and receiver on gathering lines, vapor/liquid separation and pressurized liquid storage vessels, and low-pressure liquid storage tanks would already be present on site.

Id. at p. 1-2.

The cost estimates presented in EPA Fact Sheet No. 505 would be appropriate for launching and receiving stations located adjacent to processing plants or pipeline compressor stations that may already have the equipment needed for recovery on-site. In a presentation titled "Vapor Recovery and Gathering Pipeline Pigging" at the July 2008 Producers and Processors Technology Transfer Workshop in Midland, Texas, EPA provided an example from one Natural Gas STAR Program partner that purchased equipment and implemented this process. *See* NMED

Exhibit 89, Slide 35. This company installed a dedicated vapor recovery unit with an electric compressor at an installed cost of $24,000 and an annual operating cost of $40,000 (mostly for electricity). However, based on the value of the condensate recovered, the payback period for the same installation was estimated to be approximately 4 months.

Alternatively, companies may choose to use a temporary skid-mounted flare to meet the control standard for remote pigging operations or pigging operations where the existing infrastructure does not support product recovery. EPA Natural Gas STAR Program's PRO Fact Sheet No. 904, *Install Flares* (2011), provided costs to install and operate a flare at a remote site. *See* NMED Exhibit 90. The estimated implementation cost of a skid-mounted flare is $21,000 and the operating costs per year are $3,000, plus any fuel needed for a pilot light. If the flare were portable, it could be moved to sites on an as-needed basis, with additional cost for transport and set-up added for each pigging operation.

Section 20.2.50.122 – Pneumatic Controllers and Pumps

Applicability

The requirements of Section 20.2.50.122 apply to natural gas-driven pneumatic controllers and pumps, as defined in Section 20.2.50.7, that are located at well sites, tank batteries, gathering and boosting stations, natural gas processing plants, and natural gas compressor stations.

Description of Equipment and Process

Pneumatic controllers are process control devices used throughout the oil and natural gas industry as part of the instrumentation to control the position of valves. Natural gas-powered pneumatic controllers use natural gas as motive force to operate valves that regulate safety shut-down, position, fluid level, pressure, temperature and flow rate in oil and natural gas production

and processing. *See* NMED Exhibit 34 (EPA CTG). Pneumatic controllers may also be powered by compressed air instead of natural gas.

Pneumatic controllers are used to control multiple processes based on a sensed process parameter, such as liquid level in a tank or oil-water separator. Pneumatic controllers can be used as emergency shutoff devices, to regulate flow or liquid levels, or as temperature and pressure regulators. An example of the function of a pneumatic controller would be to control the liquid level in a separator. When the liquid level reaches a high set-point in the separator based on the setting of a level gauge, the associated pneumatic controller sends a signal to open the control valve between the separator and the tank. For an emitting pneumatic controller, this signal would consist of pressurized pneumatic gas turning the valve from the "closed" to the "open" position. When the level in the separator reaches a low level, the pneumatic controller sends a signal to the control valves to close and to stop flow from the separator to the tank. *See* NMED Exhibit 10 (MAP Technical Report).

VOC and methane emissions occur from natural gas-powered pneumatic controllers when the pressurized gas is directed to atmosphere after the control action is performed. *See* NMED Exhibit 34 (EPA CTG).

Pneumatic pumps are used to inject chemicals into the wellbore, to circulate glycol in cold climates, and to move liquids from one place to another (sump pumps). Pneumatic pumps range from chemical injection pumps which may inject a few tablespoons of corrosion inhibitor to a well bore, to large diaphragm pumps which move thousands of gallons of product per hour from one tank to another, to pump water out of containment areas after wet weather, or for heat trace to protect pipes from freezing in cold weather. *See* NMED Exhibit 34 (EPA CTG); NMED Exhibit 10 (MAP Technical Report).

VOC and methane emissions occur from pneumatic pumps when the pressurized natural gas used to drive the pumping action is released to atmosphere after being used for the pumping action. The quantity of VOCs emitted is dependent on the type of pump employed and the concentration of VOCs in the gas stream. *See* NMED Exhibit 10 (MAP Technical Report). Depending on their intended use, natural gas-driven pneumatic controllers and pumps are available in a variety of designs, but may be characterized by their bleed rate, which is a measure of how much natural gas is used to operate the pneumatic controller or pump, and therefore the emissions from the pneumatic controller or pump.

Continuous bleed pneumatic controllers have a continuous supply of natural gas to the process controller (e.g., liquid level control, temperature control, or pressure control) and emit or "bleed" natural gas continuously while the natural gas pressure in the controller is balanced against the process condition (e.g., liquid level, temperature, and pressure), and compared with the associated process set-point. When the process condition rises or falls above or below that set point, the pneumatic controller responds to return the process to that predetermined set point. Continuous bleed controllers may either be low bleed (with a bleed or emissions rate less than or equal to 6 standard cubic feet per hour (scfh), or high bleed (with a bleed or emissions rate greater than 6 scfh).

Intermittent pneumatic controllers do not vent continuously, but instead release gas only when they open or close a valve, or as they throttle (i.e, adjust) gas flow. The bleed rate from these controllers depends on the amount of gas vented per actuation (i.e., each opening or closing of a valve or adjustment of gas flow) and the frequency of actuation.

Zero bleed pneumatic controllers do not bleed natural gas at all. They are self-contained units that release gas to a downstream pipeline. *See* NMED Exhibit 91 – EPA Office of Air

Quality Planning and Standards, *Oil and Natural Gas Sector Pneumatic Devices: Report for Oil and Natural Gas Sector Pneumatic Devices Review Panel as part of the President's Climate Action Plan: a Strategy to Reduce Methane Emissions* (April 2014) ("EPA 2014 O&G Pneumatic Devices Report").

Control Options for Pneumatic Controllers and Pumps

There are several ways to reduce emissions from pneumatic controllers, including replacing high bleed controllers with low bleed or zero bleed models, using instrument air rather than natural gas to drive controllers, and using non-gas-driven controllers such as mechanical or electric controllers, including solar-powered controllers. Regular maintenance and proper adjustment of pneumatic controllers can also be used to minimize emissions by repairing leaks and optimizing the amount of gas needed to operate the device. Options for reducing emissions from pneumatic pumps include using instrument air rather than natural gas to drive pumps, using non-gas-driven pumps, such as electric pumps, or routing emissions to a control device or process. *See* NMED Exhibit 92 – EPA Office of Air and Radiation, *Options for Reducing Methane Emissions from Pneumatic Devices in the Natural Gas Industry* (October 2006).

Proposed Rule Requirements for Pneumatic Controllers and Pumps

All new natural gas-driven pumps are required to comply with the emission standards of 20.2.50.122 upon startup. Owners or operators of existing natural gas-driven pneumatic pumps must comply with the emission standards in Section 20.2.50.122 within three years of the effective date of Part 50.

The schedules and targets for replacing existing natural gas-driven pneumatic controllers with non-emitting controllers are contained in Table 1: Well Sites, Tank Batteries, Gathering and Boosting Stations, and Table 2: Natural Gas Compressor Stations and Gas Processing Plants.

The target is based on the number of pneumatic controllers at all of the owner or operator's affected facilities that commenced construction before the effective date of Part 50. The total controller count must include all emitting pneumatic controllers and all non-emitting pneumatic controllers, except pneumatic controllers that are necessary for a safety or process purpose that cannot otherwise be met without emitting natural gas.

New pneumatic controllers are required to have an emission rate of zero, as are existing pneumatic controllers with access to commercial line electrical power. Pneumatic controllers with a bleed rate exceeding six standard cubic feet per hour are allowed if the owner or operator has demonstrated to the satisfaction of the Department that a higher bleed rate is required based on functional needs. Natural gas-driven pumps located at natural gas processing plants must have an emission rate of zero. Natural gas-driven pumps located at well sites, tank batteries, gathering and boosting stations, or natural gas compressor stations with access to commercial power must have an emission rate of zero.

Owners and operators of pneumatic pumps at well sites, tank batteries, gathering and boosting stations, or natural gas compressor stations without access to commercial line electrical power are required to reduce VOC emissions from this equipment by 95 percent if it is technically feasible to route those emissions to a control device, fuel cell, or process. If an existing on-site control device is not capable of achieving a 95 percent reduction of VOC emissions, and it is not technically feasible to route pneumatic pump emissions to a fuel cell or process, the owner or operator must route the emissions to the existing control device.

Owners and operators of pneumatic controllers or pumps must install an EMT on each device in accordance with Section 20.2.50.112.

Section 20.2.50.122 contains monitoring, recordkeeping, and reporting requirements that ensure the owner or operator is properly operating and maintaining the affected pumps and controllers in a manner that meets the emissions reduction requirements in the rule. Pneumatic controllers or pumps with a natural gas bleed rate equal to zero are not subject to the monitoring or recordkeeping requirements of Section 20.2.50.122. The owner or operator of any controller subject to the deadlines in this section must monitor the compliance status of each controller at each facility and must develop and record the schedule and compliance status for each controller so that it meets the compliance deadlines.

The monitoring requirements for controllers or pumps with a gas bleed rate greater than zero include monthly AVO, mechanical inspections, and maintenance to ensure VOC emissions are minimized. The owner or operator must maintain an electronic record for each affected controller or pump that contains the ID number, controller type, design continuous bleed rate for continuous controllers, bleed volume per bleed for intermittent controllers, each controller's design annual bleed rate, inspection dates, name of personnel conducting the inspection, AVO inspection result, AVO level discrepancy in continuous or intermittent bleed rate, maintenance date and activity, and a record of the justification for use of a controller with a bleed rate greater than six scfh.

Owners and operators are required to maintain a total count of all emitting and non-emitting pneumatic controllers at affected facilities that commenced operation prior to the effective date of Part 50 and maintain a total count of units necessary for safety or process purposes that cannot be met without emitting VOC.

Electronic records must be maintained for natural gas-driven pneumatic pumps and the associated pump numbers that have emission rates greater than zero. The record must include the

dates of operation for any pump operating less than 90 days per calendar year; any control device designed to achieve at least 95% emission reduction, including an evaluation or the manufacturer specifications indicating percent reduction the control device is designed to achieve; and documents of engineering assessments and certifications from a qualified professional engineer stating that routing pneumatic pump emissions to a control device, fuel cell, or process is technically infeasible.

The owner or operator must also meet the monitoring, recordkeeping, and reporting requirements in Section 20.2.50.112.

Basis for Proposed Rule Requirements

The proposed rule is based on similar rules for new and existing pneumatic controllers and pneumatic pumps in Colorado Reg. 7, Sections I.K, III.C, and III.D. *See* NMED Exhibit 39.

The emission standard in 20.2.50.122.B(4)(a) requiring all new pneumatic controllers to have an emission rate of zero is based on Colorado Reg 7, Section III.C.1-3. The proposed standard is stricter than the Colorado standard in that it requires all new pneumatic controllers to have a bleed rate of zero. Both rules allow for exceptions where a pneumatic controller with a non-zero bleed rate is required for safety and/or process considerations.

The emission standard in 20.2.50.122.B(4)(b) requiring all existing pneumatic controllers with access to electrical power to have an emission rate of zero is based on Colorado Reg. 7, Section III.C.3.a.(i). Both rules allow for exceptions where this is not technically feasible.

The emission standard in 20.2.50.122.B(4)(c) requiring that a percentage of a company's total number of existing pneumatic controllers be replaced with non-emitting controllers by a certain date is based on a similar provision in Colorado Reg. 7, Section III.C.4. The requirement in 20.2.50.122.B(3) and (4)(c) that a company's "fleet" of pneumatic controllers must be

replaced over time with non-emitting or low-emitting controllers is based on the fact that many high bleed, low bleed, and intermittent bleed devices can be replaced with either non-emitting devices or lower-emitting devices, while allowing for continued use of those non-zero emitting controllers that cannot be replaced for safety and/or process considerations. This approach provides owners and operators flexibility to assess their total operations and reduce emissions from pneumatic controllers in ways they deem most cost-effective.

In 2017, the Colorado Air Quality Control Commission ("COAQCC") established the Statewide Hydrocarbon Emission Reduction ("SHER") team and the Pneumatic Controller Task Force ("PCTF"). The SHER team and the PCTF worked for two years and produced a report on pneumatic controllers in June 2020. *See* NMED Exhibit 93, *PCTF Report to the Air Quality Control Commission: Pneumatic Controller Field Study and Recommendations* (June 1, 2020) ("2020 PCTF Report"). In 2019, the Colorado Legislature passed Senate Bill 19-181 directing the COAQCC to consider requirements to reduce emissions from pneumatic devices. On February 18, 2021, COAQCC amended Colorado Reg. 7, Section III ("2021 Reg. 7 Amendments") to require more stringent standards to reduce VOC emissions from pneumatic controllers. *See* NMED Exhibit 39 (Colorado Reg. 7, Section III). The February 2021 rulemaking was informed by the 2020 PCTF Report.

Among other things, the 2021 Reg. 7 Amendments require the use of non-emitting controllers at new well production facilities and new natural gas compressor stations. *See* Colorado Reg. 7, Section III.C.4.a. The 2021 Reg. 7 Amendments also require companies to develop and submit company-wide plans to convert most of their pneumatic controllers at existing facilities to non-emitting controllers over a two-year period. Colorado Reg. 7, Section III.C.4.b. The percentage of controllers that must be converted is based on the historic percentage

of non-emitting controllers in that company, determined by the company as part of developing their plan. Companies with a lower percentage of non-emitting controllers will have to meet a lower final percentage of non-emitting controllers, but will need to achieve a higher percentage of additional controllers converted to non-emitting. Conversely, companies with a higher percentage of non-emitting controllers will have to meet a higher final percentage of non-emitting controllers but will need to achieve a lower percentage of additional controllers converted to non-emitting. Section 20.2.50.122 proposes similar requirements for controllers at new and existing facilities.

The emission standard proposed in 20.2.50.122.B(4)(d), which allows use of pneumatic controllers with a bleed rate greater than 6 scfm in operations where the controller's use is "required based on functional needs, including response time, safety, and positive actuation," is similar to the exceptions allowed in NSPS Subpart OOOOa, 40 CFR §6 0.5390a(a), and Colorado Reg. 7, Section III.C.3.a.(ii).

The emission standard proposed in 20.2.50.122.B(5)(a), which requires all new and existing pneumatic pumps located at natural gas processing plants to have an emission rate of zero, is similar to the requirement in Colorado Reg. 7, Section I.K.1.

The emission standard proposed in 20.2.50.122.B(5)(b), which requires all new and existing pneumatic pumps located at a well sites, tank batteries, gathering and boosting stations, or natural gas compressor stations with access to commercial line electrical power to have an emission rate of zero, is similar to the requirement in Colorado Reg. 7, Section I.K.1. This requirement is also based on an assumption that, at sites with access to electrical power, it is feasible to replace emitting pumps with non-emitting pumps. This assumption is supported by the fact that data from EPA's Greenhouse Gas Reporting Program ("GHGRP") for Petroleum

and Natural Gas Systems (40 CFR 98, subpart W) indicate that natural gas processing plants, which all have access to electrical power, already have 100-percent non-emitting controllers and pumps.

The emission standard proposed in 20.2.50.122.B(5)(c), which requires all new and existing pneumatic pumps located at a well sites, tank batteries, gathering and boosting stations, or natural gas compressor stations without access to commercial line electrical power to route emissions to a control device, fuel cell, or process if it is technically feasible, is similar to the requirement in CO Reg 7, Sec.I.K.2. Both rules allow exceptions if the requirement is not technically feasible.

The proposed requirement in 20.2.50.122.B(6) that all pneumatic controllers and pumps be tagged with an EMT is similar to the requirement in Colorado Reg 7, Section III.D.2.a, which requires pneumatic controllers located at a natural gas processing plant with a natural gas bleed rate greater than zero must be physically tagged by the owner or operator identifying it with a unique pneumatic controller number that is assigned and maintained by the owner or operator.

Estimated VOC Emissions Reductions

Data for the number of pneumatic devices at oil and gas operations in New Mexico was derived from well data providing the number and age of wells, permit data providing the number of other types of (non-well) facilities, and technical papers estimating the number of pneumatic controllers and pumps found at each type of facility and their average VOC emission rates. Although NMED does not have an equipment inventory listing pneumatic controllers or pumps, estimates for the number of pneumatic devices at well sites, tank batteries, gathering and boosting stations, natural gas processing plants, and compression/transmission sites were derived

by combining data on the number of each type of site in New Mexico with EPA data on the number of controllers and pumps found at each type of site in the Permian and San Juan Basins.

Well count data came from the Petroleum Recovery Research Center ("PRRC"), which is an organization that provides up to date information on oil and gas production data for New Mexico.[23] Oil and gas production data on the PRRC website has been provided primarily by the New Mexico Oil Conservation Division and is updated on a monthly basis. The data downloaded from the PRRC site represents all producing oil and gas wells in the Subject Counties for the year 2020. See NMED Exhibit 94 – 2020 Producing Wells Spreadsheet. Although NMED has permit data for some wells and storage tanks, these data were not used in the analysis of pneumatic controllers and pumps as it was deemed incomplete because many wells and tanks do not require a permit from NMED. Tank batteries were combined with well sites and both were treated as one site for pneumatic device emission purposes, as these facilities are typically found together at the upstream end of the oil and gas production operations. Facility count data for gathering and boosting stations, natural gas processing plants, and transmission/compression stations came from the NMED Equipment Data. NMED permit data categorizes both gathering/boosting stations and transmission/compression sites as "Compressor Stations," so these two categories were disaggregated by assuming that a "Compressor Station" with a Title V permit is a transmission/compression station and all other "Compressor Stations" are gathering and boosting stations. This assumption was based on the fact that pipeline transmission/compression stations typically have several operating compressor engines or turbines onsite, and therefore are typically major sources of NOx which would require a Title V permit.

[23] Available at: http://gotech.nmt.edu/gotech/Petroleum_Data/allwells.aspx

Based on the NM well count and NMED permit data, there are 27,489 wellheads in the Permian Basin and 20,448 wellheads in the San Juan Basin; 570 gathering/boosting stations in the Permian Basin and 345 gathering/boosting stations in the San Juan Basin; 40 natural gas processing plants in the Permian Basin and 8 natural gas processing plants in the San Juan Basin; and 29 transmission/compression stations in the Permian Basin and 39 transmission/compression stations in the San Juan Basin. See NMED Exhibit 95 – Pneumatics Reductions and Costs Spreadsheet, "Facility Data" tab.

The number of devices per site for low-bleed, intermittent-bleed, and high bleed pneumatic controllers, as well as pneumatic pumps at each of these types of sites, was determined using EPA's GHGRP, Subpart W data for 2019. These counts are based on producer-reported data for the Permian and San Juan Basins. *See* NMED Exhibit 96 – NM Pneumatics Data Subpart W Spreadsheet, "Facility Data" tab. Based on data in Table 2-2 of the EPA 2014 O&G Pneumatic Devices Report, ERG assumed that all controllers and pumps at natural gas processing plants are non-emitting. *See* NMED Exhibit 91.

ERG also assumed that for well sites/tank batteries, gathering/boosting stations, and transmission/compression stations, 20% of all pneumatic devices are already non-emitting. This assumption was made to account for the fact that some non-emitting devices have already been put into service, and to avoid overestimating emission reductions. However, the actual frequency at which non-emitting controllers are used in New Mexico is not known. EPA indicated in the EPA 2014 Pneumatic Devices Report that it has not obtained any information on the prevalence of "zero-bleed" controllers in the field. *See* NMED Exhibit 91 at p. 41. The 2020 PCTF Report indicated that non-emitting controllers were not included in the scope of the 2018 PCTF field study of controllers in the Denver-Julesburg (DJ) Basin because the intent of the study was only

to examine emissions associated with natural gas-driven controllers. *See* NMED Exhibit 93 at p. 6.

The uncontrolled emission rates (also referred to as "emission factors") for low-bleed, intermittent-bleed, and high-bleed controllers, as well as pneumatic pumps, were based on four EPA sources. The emission rate of intermittent bleed devices and the data for VOC emissions from pneumatic devices at gathering and boosting stations comes from Subpart W of 40 CFR Part 98, Table W-1A – *Default Whole Gas Emission Factors for Onshore Petroleum and Natural Gas Production Facilities and Onshore Petroleum and Natural Gas Gathering and Boosting Facilities*. *See* NMED Exhibit 97 – 80 Fed. Reg. 64262, *Greenhouse Gas Reporting Rule: 2015 Revisions and Confidentiality Determinations for Petroleum and Natural Gas Systems* (October 22, 2015). The data for VOC emission rates from low-bleed and high-bleed controllers in the production segment comes from Table 6-2 of the EPA CTG (NMED Exhibit 34). The data for the VOC emission rate from low-bleed and high-bleed controllers in the transmission segment is from Table 5-2 of U.S. EPA's Technical Support Document for Subpart OOOOa (NMED Exhibit 70). The data for the VOC emission rate from intermittent bleed controllers in the transmission segment comes from Table W–3B to Subpart W of 40 CFR Part 98. *See* NMED Exhibit 98 – 81 Fed. Reg. 86517, *Greenhouse Gas Reporting Rule: Leak Detection Methodology Revisions and Confidentiality Determinations for Petroleum and Natural Gas Systems* (November 30, 2016).

The fraction of wells subject to either NSPS Subpart OOOO or OOOOa were determined based on well production dates found in the PRRC well data in the 2020 Producing Wells Spreadsheet. *See* NMED Exhibit 94. NSPS Subparts OOOO and OOOOa require certain pneumatic devices at oil and gas sites constructed after a certain date to be low-emitting or non-

emitting. The NM OCD well data were used to adjust the estimates of current emissions to reflect the fact that certain percentages of sites in the Subject Counties are subject to federal regulations, and thus have lower emissions as a result.

The fraction of pneumatic controllers that cannot be replaced for safety and/or process reasons (12.5%) is based on two technical documents. First, the regulatory analysis for the 2014 amendments to Colorado Reg. 7 assumed that 95% of high-bleed pneumatic controllers could eventually be replaced and 5% are needed for safety or process reasons. *See* NMED Exhibit 71. Second, the Technical Support Document for NSPS Subpart OOOOa assumed an 80% replacement rate for high-bleed pneumatic controllers and 20% are needed for safety or process reasons. *See* NMED Exhibit 70. The estimate of 12.5% of high-bleed controllers that cannot be replaced is the midpoint between the Colorado and the EPA estimates.

The formulas for the emissions calculations for baseline VOC emissions and the VOC emission reductions using the factors described above that would result from the requirements in Section 20.2.50.122 are detailed in the Pneumatics Reductions and Costs VOC Spreadsheet. *See* NMED Exhibit 95.

ERG researched the technical literature and determined the types of replacement pneumatic devices needed to reduce VOC emissions. A primary determinant of the suitability of a replacement device is whether a site already has electric power. ERG estimated the percentage of well sites, gathering/boosting stations, and transmission/compression stations sites in the Subject Counties that have existing electrical power using the NMED Equipment Data. That data indicates that 10.9% of wellhead/tank battery sites, 3.9% of gathering/boosting stations, and 100% of transmission/compression stations have electrical generator engines onsite. Because not all 47,937 well sites are reflected in the NMED Equipment Data, ERG's assumption regarding

access to electrical power at wells is likely an over-estimate of the fraction of wells with access to electric power.

For sites with electric power onsite, information suggests the least expensive option for retrofitting pneumatic devices onsite is to install instrument air. *See* NMED Exhibit 99 – EPA OAR: Natural Gas Star, *Lessons Learned: Convert Gas Pneumatic Controls to Instrument Air* (October 2006). This involves installing a compressor, air dryer, air tanks, controls, and plumbing to replace the available compressed natural gas that currently powers the onsite pneumatic devices with compressed atmospheric air. Existing pneumatic devices are left in place and the site is re-plumbed to bring compressed air to each pneumatic device. Reductions in VOC emissions resulting from replacement of existing natural gas-powered pneumatic devices with instrument air-powered pneumatic devices are assumed to be 100% because the instrument air is compressed ambient air. ERG assumed that intermittent bleed, low bleed, and high-bleed pneumatic devices could be powered with instrument air systems. This latter assumption is supported by data in the EPA GHGRP for Petroleum and Natural Gas Systems (40 CFR 98, Subpart W) indicating that natural gas processing plants, which all have access to electrical power, already have 100-percent non-emitting controllers and pumps.

For sites without electric power onsite, available information indicates that the least expensive option for retrofitting pneumatic devices onsite is to install solar electric controller systems or solar-powered pumps. This approach is based on: (1) a technical paper prepared by Carbon Limits for EPA's Office of Air Quality Standards, *Zero Emissions Technologies for Pneumatic Controllers in the USA* (2016), attached as NMED Exhibit 110; and (2) EPA's Technical Support Document for NSPS Subpart OOOOa (NMED Exhibit 70). Solar electric systems involve installing solar panels, battery banks and a system controller, and replacing the

pneumatic controllers with electric powered controllers. Reductions in VOC emissions resulting from replacement of existing pneumatic devices with solar electric controllers and pumps are assumed to be 100%. ERG assumed that intermittent bleed, low bleed, and high-bleed pneumatic devices could be powered with solar electric systems. This latter assumption is supported by data from the EPA GHGRP for Petroleum and Natural Gas Systems (40 CFR 98, subpart W) indicating that natural gas processing plants, which all have access to electrical power, already have 100-percent non-emitting controllers and pumps and that commercial line electrical power is equivalent to solar electric power.

The Pneumatics Reductions and Costs Spreadsheet compiled by ERG allows the user to select which reduction options they wish to model for both VOC reductions (tpy) and costs of replacements ($). *See* NMED Exhibit 95, "Emissions and Costs" tab. For each scenario in the spreadsheet (i.e., combinations of Permian/San Juan; Wellhead/Gathering and Boosting/Natural Gas Processing/Transmission and Compression; Low-bleed/intermittent-bleed/high-bleed/pump; Sites with electric/Sites without electric), the user can choose whether to add new replacement controls by selecting '1' or '0' in the spreadsheet. The spreadsheet then generates estimates of the percent reduction in VOC emissions and the cost of that option. This flexibility and programmability allowed ERG to estimate the reductions and costs as the requirements in 20.2.50.122.B(4)(c) are phased in over time. Although there is no single set of choices that fulfils those proposed requirements, ERG modeled a set of choices that roughly approximate the long-term objective of the requirements, specifically, an 80% or greater reduction in the number of emitting controllers at well sites, tank batteries, and gathering/boosting stations and a 98% reduction in the number of emitting controllers at natural gas compression/transmission stations and natural gas processing plants.

Costs of VOC Reductions from Pneumatic Controllers and Pneumatic Pumps

ERG estimated the annualized costs of reducing VOC emissions from the estimated 112,500 emitting pneumatic devices to meet the January 1, 2030 standard proposed in Tables 1 and 2 of 20.2.50.122.B(3) (approximately a 95% reduction in the number of emitting pneumatic devices) is estimated at $86,038,000 per year. ERG estimated that the proposed standard will reduce VOC emissions from pneumatic devices by 90.6% from the baseline of 34,600 tpy VOC.

In estimating costs and emission reductions for emitting pneumatic devices, it is important to note that the estimated total number of pneumatic devices at well sites/tank batteries is essentially an order of magnitude higher than the estimated total number of pneumatic devices at gathering and boosting stations, which is essentially an order of magnitude higher than the estimated total number of pneumatic devices at transmission/compression stations, and it is estimated that there are no emitting pneumatic devices currently in use at natural gas processing plants. Thus, achieving significant reductions in VOC emissions will require replacement of emitting devices primarily at the upstream end of the production chain.

Section 20.2.50.123 – Storage Vessels

Applicability

Section 20.2.50.123 applies to new and existing storage vessels with a PTE equal to or greater than 2 tpy of volatile organic compounds (VOC) and located at well sites, tank batteries, gathering and boosting stations, natural gas processing plants, or natural gas compressor stations.

Description of Equipment and Process

Storage vessels, commonly referred to as “storage tanks” or “tanks,” are used throughout the oil and gas industry for storing a variety of liquids including crude oil, condensates, and produced water. These tanks are associated with oil and gas production, gathering, processing,

and disposal and are significant sources of VOC emissions. Storage vessels can be installed as a single unit or in a grouping of similar or identical vessels, commonly referred to as a "tank battery." The reason for temporary storage is for feasibility of takeaway via pipeline or truck.

While underground and at reservoir pressure, crude oil contains many lighter hydrocarbons in solution. When the oil is brought to the surface, many of the dissolved lighter hydrocarbons (as well as water) are removed through a series of separators. Crude oil is passed through either a two-phase separator (where the associated gas is removed, and any oil and water remain together) or a three-phase separator (where the associated gas is removed, and the oil and water are also separated). The remaining oil is then directed to a storage vessel where it is stored for a period of time before being transported off-site. Much of the remaining hydrocarbon gases in the oil are released as vapors in the storage vessels.

Hydrocarbon emissions from storage vessels are a function of flash, breathing (or standing), and working losses. Flash losses occur when a liquid with entrained gases is transferred from a vessel with higher pressure to a vessel with lower pressure, thus allowing entrained gases or a portion of the liquid to vaporize or flash. In the oil and natural gas industry, flashing losses occur when crude oils or condensates flow into a storage vessel at atmospheric pressure from a processing vessel (e.g., a separator) operated at a higher pressure. In general, the larger the pressure drop, the more flash emissions will occur in the storage vessel. The temperature of the liquid may also influence the amount of flash emissions. Breathing losses are the release of gas associated with temperature fluctuations and the expansion and contraction of stored fluids resulting from increased or decreased pressures associated with environmental and weather-related fluctuations. Working losses occur when vapors are displaced due to the emptying and filling of a storage vessel.

The mass of gas vapor emitted from a storage vessel depends on many factors. Lighter crude oils flash more hydrocarbons than heavier crude oils. In storage vessels where the oil is frequently cycled and the throughput is high, working losses are higher. Additionally, the operating temperature and pressure of oil in the separator dumping into the storage vessel will affect the volume of flashed gases coming off of the oil. The composition of the vapors from storage vessels varies, and the largest component is methane, but may also include ethane, butane, propane, and hazardous air pollutants such as benzene, toluene, ethylbenzene and xylenes (commonly referred to as BTEX), and n-hexane.

Control Options for Storage Vessels

The methods typically used to reduce VOC emissions from storage tanks are:

(1) route emissions from the storage vessel through an enclosed system to a process where emissions are recycled or recovered (e.g., by installing a vapor recovery unit (VRU) that recovers vapors from the storage vessel) for reuse in the process or for beneficial use of the gas onsite; and/or

(2) route emissions from the storage vessel to a combustion device.

One of the clear advantages the "recycling and recovery" option has over the combustion device option is that it results in a cost savings associated with the recycled, recovered, and reused natural gas and other hydrocarbon vapor, rather than the loss and destruction of the natural gas and vapor by combustion. Combustion and partial combustion of organic pollutants also create secondary pollutants including nitrogen oxides, carbon monoxide, sulfur oxides, carbon dioxide and smoke/particulates.

The emission control methods are described below along with their emission reduction control effectiveness.

Routing Emissions to a Process via a Vapor Recovery Unit

One option for controlling storage vessel emissions is to route vapors from the storage vessel back to the inlet line of a separator, to a sales gas line, or to some other line carrying hydrocarbons for beneficial use, such as use as a fuel. Where a compressor is used to boost the recovered vapors into the line, it is often referred to as a vapor recovery unit ("VRU"). With a typical VRU, hydrocarbon vapors are drawn out of the storage vessel under low pressure and then piped to a separator or suction scrubber to collect any condensed liquids, which are usually recycled back to the storage vessel. Vapors from the separator flow through a compressor that provides the low-pressure suction for the VRU system where the recovered hydrocarbons can be transported to various end uses such as a sales line or for use onsite as fuel.

Types of VRUs include conventional VRUs, venturi ejector vapor recovery units ("EVRUTM"), and vapor jet VRUs. Decisions on what type of VRU to use are based on the applicability needs (e.g., an EVRUTM is recommended where there is a high-pressure gas compressor with excess capacity, whereas a vapor jet VRU is recommended where there is produced water, less than 75 million cubic feet (MMcf)/day gas, and discharge pressures below 40 pounds per square inch gauge (psig)). The reliability and integrity of the compressor and suction scrubber and the integrity of the lines that connect the tank to the compressor will impact the effectiveness of the VRU system to collect and recycle vapors. A conventional VRU is equipped with a control pilot to shut down the compressor and allow the back flow of vapors into the tank in order to prevent the creation of a vacuum in the top of a tank when liquid is withdrawn and the liquid level drops. Vapors are then either sent to the pipeline for sale or used as onsite fuel. Figure 1 presents a diagram of a conventional VRU installed on a single crude oil storage vessel (multiple tank installations are also common).

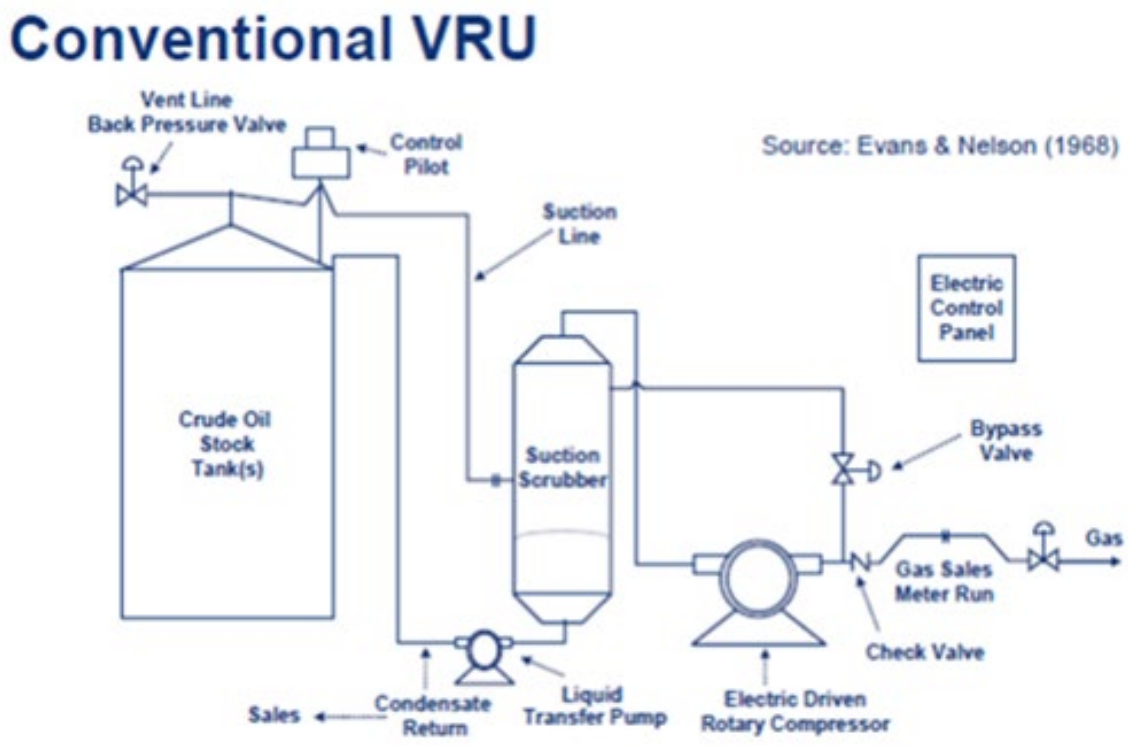

Figure 1. Conventional Vapor Recovery System

Routing Emissions to a Combustion Device

Combustors (e.g., enclosed combustion devices, thermal oxidizers, and flares) are also used to control emissions from storage vessels. Combustors are used to control VOC in many industrial settings, since the combustor can normally handle fluctuations in concentration, flow rate, heating value, and the fraction of inert (i.e., noncombustible or unreactive) gas species. For purposes of this analysis, it was assumed that the types of combustors installed in the oil and natural gas industry can achieve at least a 95% control efficiency on a continuing basis. Note that combustion devices can be designed to meet 98% control efficiencies, and can control on average emissions by 98% on average, or more in practice when properly operated. Combustion devices that are designed to meet a 98% control efficiency may not continuously meet this efficiency in practice, due to factors such as variability of field conditions. A typical combustor

used to control emissions from storage vessels in the oil and natural gas industry is an enclosed combustion system. The basic components of an enclosed combustion system include: (1) piping for collecting emission source gases; (2) a single- or multiple-burner unit; (3) a stack enclosure; (4) a pilot flame to ignite the mixture of emission source gas and air; and (5) combustor fuel/piping (as necessary). Figure 2 presents a schematic of a typical dual-burner enclosed combustion system.

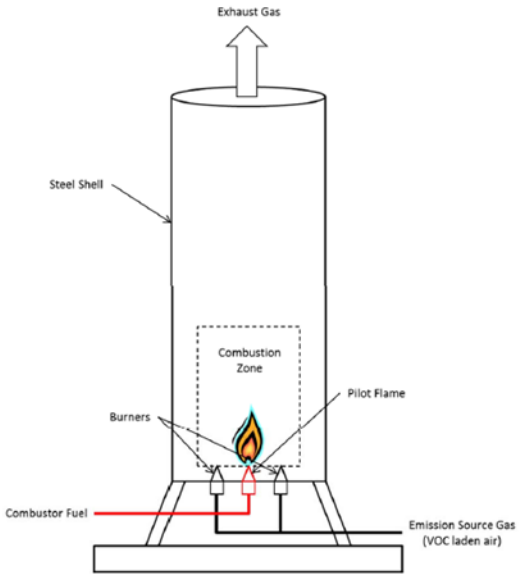

Figure 2. Schematic of a Typical Enclosed Combustion System

Thermal oxidizers, also referred to as direct flame incinerators, thermal incinerators, or afterburners, are also used to control VOC emissions. Similar to a basic enclosed combustion device, a thermal oxidizer uses burner fuel to maintain a high temperature (typically 800-850°C) within a combustion chamber. The VOC-laden emission source gas is injected into the combustion chamber where it is oxidized (burned), and then the combustion products are exhausted (i.e., vented) to the atmosphere. *See* NMED Exhibit 34 (EPA CTG).

Proposed Rule Requirements for Storage Vessels

Section 20.2.50.123 requires owners and operators of existing storage vessels with a PTE equal to or greater than 2 tpy and less than 10 tpy of VOCs to maintain a combined VOC capture and control efficiency of at least 95% no later than three years after the effective date of Part 50. Owners and operators of existing storage vessels with a PTE equal to or greater than 10 tpy are required to maintain a combined VOC capture and control efficiency of at least 98% no later than one year after the effective date of Part 50.

Owners and operators of new storage vessels with a PTE equal to or greater than 2 tpy and less than 10 tpy of VOCs are required to maintain a combined VOC capture and control efficiency of at least 95% percent upon startup. Owners and operators of new storage vessels with a PTE equal to or greater than 10 tpy are required to maintain a combined VOC capture and control efficiency of at least 98% upon startup.

The requirements of Section 20.2.50.123 will cease to apply if the uncontrolled actual annual VOC emissions decrease to less than 2 tpy.

Should an owner or operator fail to install a control device by the specified dates, they may comply with the emission standards by shutting in the well supplying the storage vessel by the applicable date, and not resuming production from the well until the control device has been installed and operational.

Owners or operators that employ a control device to comply with the emission standards of Section 20.2.50.123 NMAC are also required to comply with the control device operational requirements of 20.2.50.115 NMAC.

Owners or operators of a new or existing storage vessel equipped with a thief hatch are required to install a device that allows the thief hatch to open sufficiently to relieve vessel

overpressure, and to automatically close once the vessel overpressure has been relieved. The thief hatch must be equipped with a manual lock-open safety device to ensure that the hatch remains open during times of human ingress, and shall only be engaged when an owner or operator is present and during active human ingress.

Owners or operators of any storage vessel subject to this Section must install an EMT on the storage vessel in accordance with Section 20.2.50.112 NMAC.

Owners or operators of a storage vessel subject to Part 50 must comply with certain monitoring requirements, including monthly monitoring of the total monthly liquid throughput and the upstream separator pressure; conducting an AVO inspection on a weekly basis; monthly inspections of the vessel to ensure compliance with Section 20.2.50.123; scanning the EMT and entering the required monitoring data in accordance with the requirements in Section 20.2.50.112; complying with the monitoring requirements in Section 20.2.50.115 if using a control device; and complying with the general monitoring requirements in Section 20.2.50.112.

The recordkeeping requirements in Section 20.2.50.123 include: monthly records of the vessel location and identification number; monthly liquid throughput and the most recent date of measurement; average monthly upstream separator pressure; data and methodology used to calculate the PTE of VOCs; the controlled and uncontrolled VOC emissions; and the type, make, model, and identification number of any control device.

A record of liquid throughput must be verified by a dated delivery receipt from the purchaser of the hydrocarbon liquid, the metered volume of hydrocarbon liquid sent downstream, or other proof of transfer.

An owner or operator is required to maintain records of inspections conducted in accordance with Section 20.2.50.123; records required by Section 20.2.50.115 if using a control

device to comply with the emission standards of this Section; and the recordkeeping requirements contained in Section 20.2.50.112.

An owner or operator must comply with the general reporting requirements in Section 20.2.50.112, and must also comply with the reporting requirements of Section 20.2.50.115 if using a control device.

Basis for Proposed Rule Requirements

The proposed requirements are based on similar rules for new and existing storage vessels in Pennsylvania GP-5 and GP-5A, Colorado Reg. 7, and NSPS Subpart OOOOa.[24] *See* NMED Exhibits 37, 38, and 39, respectively.

The applicability threshold in Section 20.2.50.123 is based on Colorado Reg. 7, Section I.D.1.a. The proposed emission standard in 20.2.50.123.B(1) and (3), requiring all existing and new storage vessels with a PTE equal to or greater than 2 tpy VOC to have a combined capture and control efficiency of 95 percent for VOC emissions, is based on Pennsylvania GP-5A, Section E.1.(b) and Colorado Reg. 7, Section I.D.3.a.(i). Pennsylvania GP-5 and GP-5A require an owner or operator to equip the storage vessel with a cover and route all vapor through a closed vent system to a control device that reduces VOC emissions by 95% or more. Colorado Reg. 7 requires owners and operators of existing and new storage vessels with uncontrolled actual emissions of VOCs equal to or greater than 2 tpy to collect emissions and route them to pollution control equipment that achieves a VOC control efficiency of 95%. If a combustion device is used, it must have a design destruction efficiency of at least 98% for VOC. NSPS Subpart OOOOa has similar requirements, requiring owners or operators of storage vessels with a PTE

[24] U.S. EPA, New Source Performance Standards for Crude Oil and Natural Gas Facilities for Which Construction, Modification, or Reconstruction Commenced after September 18, 2015, June 2016. Available at: https://www.epa.gov/stationary-sources-air-pollution/crude-oil-and-natural-gas-facilities-which-construction

equal to or greater than 6 tpy of VOC to reduce VOC emissions by 95%. *See* NMED Exhibit 36, at Sections 60.5365a(e) and 60.5395a(a)(2).

The proposed emission standards in Section 20.2.50.123.B(2) and (4) require that existing and new storage vessels with a PTE equal to or greater than 10 tpy of VOC have a combined capture and control efficiency of 98% for VOC emissions. The standards are based on the requirements of the Pennsylvania GP-5A, Section E.1.(b) and Colorado Reg. 7, Section I.D.3.a.(i), but were adjusted to require additional VOC emissions reductions for those storage vessels with higher VOC emissions (PTE greater than 10 tpy VOC).

Estimated Emissions Reductions

Based on the NMED Equipment Data, ERG identified 3,921 affected storage tanks in the Subject Counties for the year 2020. Of these, 2,059 are uncontrolled and unregulated by NSPS Subpart OOOO and NSPS Subpart OOOOa. Of these 2,059 storage vessels, 53% (1,040 storage vessels) have allowable emissions equal to or greater than 2 tpy of VOC and would be subject to the requirement to control emissions under Part 50.

The proposed rule requires a 95% reduction of VOC emissions for tanks with a PTE equal to or greater than 2 tpy of VOC, and a 98% reduction for tanks with a PTE equal to or greater than 10 tpy of VOC. Emission reductions were not calculated for those tanks that already have a VOC control device (e.g., condenser, VRU, or flare), that are already subject to NSPS Subparts OOOO or OOOOa, or that have allowable VOC emissions less than 2 tpy. Applying these emission reductions results in estimated VOC emission reductions of 8,585 tons per year for an overall reduction of 53%. See NMED Exhibit 100 – Storage Tanks Reductions and Costs VOC Spreadsheet.

Costs of VOC Reductions from Storage Vessels

The annualized costs of reducing VOC emissions from the estimated 2,059 uncontrolled and unregulated storage vessels is approximately $16,039,252. This annualized cost includes capital and installation costs, as well as operation and maintenance costs for installing combustors at 495 sites, and also includes the costs for retrofitting tanks to add the vent system and piping to route emissions to the control device. Because multiple tanks are typically installed at one location, the services of a combustor are assumed to be shared amongst all the tanks.

The capital and annual costs per combustor are based on cost figures provided in Table 4-5 - Total Capital Investment and Total Annual Costs of a Combustor in the EPA CTG (NMED Exhibit 34). The cost effectiveness estimates (measured in cost per ton of VOC reduced) for routing VOC emissions from an existing uncontrolled storage vessel to a combustion device are based on cost figures in Table 4-6 of EPA CTG.

Costs were updated to reflect 2019 costs using the CEPCI of $584.6 for 2012 and $607.5 for 2019. The 2019 annualized cost ratio is therefore estimated as:

607.5/584.6 = 1.04

The Storage Tanks Reductions and Costs Spreadsheet provides a detailed breakdown of costs. *See* NMED Exhibit 100.

Section 20.2.50.124 – Well Workovers

Applicability

Section 20.2.50.124 applies to workovers performed at oil and natural gas wells.

Description of Process

Some wells require supplementary maintenance to maintain production or minimize the decline in production. These operations are referred to as workovers. Typical workovers include

rod, tubing and casing repairs; siphon string or artificial lift installation paraffin removal; and pump repairs.

Workovers are performed on wells that have previously been completed and have produced some reservoir fluids (water, oil, and/or natural gas). These wells have to be prepared before workover operations can begin. If the well is still producing and/or has pressure, the well will need to be blown down (i.e., vented) before it is safe to remove the tubing head and install the blowout preventers ("BOPs"). The well pressure can be decreased by venting to the atmosphere or by opening the casing to the sales line or the suction of a wellsite compressor. In many cases, the fluids in the wellbore will build up to the point the well "dies" – this refers to the instance where the hydrostatic pressure of the accumulated fluids is equal to the reservoir pressure. In some cases, it will be necessary to pump water or other fluids into the wellbore to "kill" the well. As a safety precaution, after the BOPs are installed, the well is usually vented to atmosphere via a tank.

Workovers are usually short duration projects that only last a few days or weeks at the most. After the well is prepared (i.e., blown down and BOPs installed), the workover operations can begin. For the safety of the rig crew, the well is usually allowed to vent to atmosphere via a tank for the duration of the workover. Since these operations are typically performed during daylight hours, the well is shut in or returned to the sales line at the end of the day.

Control Options

Best management practices are the best means of reducing emissions during well workovers. These include reducing wellhead pressure before blowdown to minimize the volume of natural gas vented; monitoring manual venting at the well until the venting is complete; and routing natural gas to the sales line, whenever possible.

Proposed Rule Requirements for Well Workovers

The owner or operator of an oil or natural gas well must use the following best management practices during a workover to minimize emissions, consistent with the well site condition and good engineering practices: (1) reduce wellhead pressure before blowdown to minimize the volume of natural gas vented; (2) monitor manual venting at the well until the venting is complete; and (3) route natural gas to the sales line, if possible.

During a well workover, an owner or operator is required to monitor wellhead pressure, natural gas venting flow rate, and elapsed venting time in order to calculate the volume and mass of VOC vented during a well workover. For each workover, the owner or operator must record the identification number and location of the well; date; wellhead pressure; flow rate or maximum potential flow rate; duration of venting; best management practices used; and the quantity of VOC emissions released. When venting cannot be avoided, the owner and operator must notify all residents located within one-quarter mile of the well at least three days before the workover by certified mail. In addition, the owner or operator shall comply with the general monitoring, recordkeeping, and reporting requirements in Section 20.2.50.112.

Basis for Proposed Rule Requirements

The proposed requirements for workover operations are based on requirements in Colorado Reg. 7 and Wyoming's Permitting Guidance. *See* NMED Exhibits 39 and 40, respectively.

Colorado Reg. 7, Section II.G requires owners and operators to use best management practices to minimize hydrocarbon emissions associated with downhole well maintenance, well liquids unloading, and well plugging unless emitting is necessary for safety. The Colorado rule

also requires the owner or operator be present onsite and minimize emissions to the maximum extent practicable.

Wyoming's Permitting Guidance requires minimizing emissions to the extent practicable during manual and automated blowdown/venting episodes associated with liquids unloading, wellbore depressurization in preparation for maintenance or repair, and other well operations. The guidance requires personnel to remain onsite to ensure minimal gas venting occurs, and also requires that operators estimate the duration of venting episodes and the amount of VOC emitted during such events. *See* NMED Exhibit 40, at pp. 13, 19, and 24.

EPA did not regulate emissions from well workovers or blowdown operations in NSPS Subparts OOOO or OOOOa. The EPA CTG did not address emissions from these operations. *See* NMED Exhibit 34.

Estimated Emissions Reductions

Emission estimates for workover operations are not currently available in the modeling emissions inventory or found in the NMED Equipment Data. Therefore, no estimate of emissions reductions is currently available.

Estimated Costs

Section 20.2.50.124 specifies certain best management practices that must be used when conducting well workover operations, but does not require the use of emission control devices. It is expected that these practices will require personnel to manage the well during the workover operation, but no capital costs are anticipated. Costs associated with well workover best management practices are expected to be minimal as personnel will already be onsite conducting the well workover and any additional training may be incorporated into existing personnel training programs.

Section 20.2.50.126 – Produced Water Management Units

Applicability

Section 20.2.50.126 applies to produced water management units ("PWMU"), which are defined in Section 20.2.50.7.II as follows:

> [A] recycling facility or a permanent pit that is a natural topographical depression, man-made excavation, or diked area formed primarily of earthen materials (although it may be lined with man-made materials), which is designed to accumulate produced water and has a design storage capacity equal to or greater than 50,000 bbls.

Description of Process

The majority of oil- and gas-bearing formations also contain naturally occurring water, often referred to as "formation" or "connate" water. When oil or gas is extracted, this "produced water" is also extracted as a by-product. The actual amount of produced water varies widely depending on factors such as location or stage in the lifetime of a particular well. In addition to reflecting the chemical makeup of the geologic formation from which it is extracted, produced water will also contain suspended solids, dissolved solids, varying amounts of oil residues and organics containing VOCs, and the various chemicals used in the production process. Produced water from gas production typically has higher contents of low molecular-weight aromatic hydrocarbons, such as benzene, toluene, ethylbenzene, and xylene ("BTEX") than produced water from oil production.

Conventional Oil and Gas

On average, about 7 to 10 barrels, or 280 to 400 gallons, of water are produced for every barrel of crude oil. Oil reservoirs commonly contain larger volumes of water than gas reservoirs

because gas is stored and produced from less porous reservoirs that contain source rock with a lower water capacity. Produced water generation commonly increases over time in conventional reservoirs as the oil and gas is depleted during hydrocarbon production. *See* U.S. Dept. of Interior, Bureau of Reclamation Science and Technology Program Report No. 157, *Oil and Gas Produced Water Management and Beneficial Use in the Western United States* (September 2011).[25]

Unconventional Oil and Gas

Produced water from most unconventional resources, besides coal bed methane, is minimal due to tighter reservoir formations such as tight sands, oil shale, and gas shale reservoirs. Producers commonly import water to these operations for onsite use in drilling, fracturing, and production. Fresh water used in drilling applications for fracturing is contaminated by the saline water in the reservoir. Fresh water brought onsite for use in operations, such as flow back or water returning from fracturing applications ("frac water"), also is managed as a waste stream. This waste stream is commonly associated with the initial phase of well development and production. In most unconventional oil and gas operations, frac water is considered the largest waste stream of production.

Control Options

VOC emissions from PWMU can be reduced by treating the produced water to remove hydrocarbons before the water enters the recycling facility or impoundment. The emissions are reduced when produced water is processed through three-phase separators and storage vessels, which separates the hydrocarbons from the produced water prior to sending to a PWMU.

Proposed Rule Requirements for Produced Water Management Units

[25] Available at: https://www.usbr.gov/research/dwpr/reportpdfs/report157.pdf

Section 20.2.50.126 requires owners and operators to employ best management and good engineering practices to minimize emissions of VOC from produced water management units. VOC emissions must be controlled to less than two tons per year.

Owners and operators must also comply with monitoring, recordkeeping, and reporting requirements that ensure the affected units are being properly operated and maintained in a manner that meets the emissions reduction requirements in the rule. The monitoring requirements include calculating a monthly rolling 12-month total of VOC emissions from each unit. Owners and operators are required to use this monthly rolling total to control VOC emissions to less than two tons per year. The proposed rule requires monthly monitoring of best management and engineering practices applied at each unit to ensure reduced emissions and effectiveness of the practice.

Owners and operators are required to maintain records for each produced water unit including its name or identification number; UTM coordinates; county in which its located; description of best management and engineering practices used to minimize VOC releases; and a record of the monthly rolling 12-month total VOC emissions.

Produced water management units are also subject to the general monitoring, recordkeeping and reporting requirements in Section 20.2.50.112.

Estimated Emission Reductions and Cost

Section 20.2.50.126 specifies that best management practices and good engineering practices must be used to minimize VOC emissions at PWMUs, but does not require the use of emission control devices. It is expected that these practices will require personnel to manage the minimization of emissions PWMUs, but no capital costs are anticipated. Costs associated with best management and good engineering practices are expected to be minimal as personnel will

already be onsite at the facility, and any additional training may be incorporated into existing personnel training programs.

PWMUs are unregulated under the federal Clean Air Act and its implementing regulations, and EPA has not published emission factors specific to this type of operation.

NMED's Ongoing Review

The Department continues to review scientific and technical information in published literature, engage in discussions with EPA, and review data submitted by owners and operators of PWMUs to determine the most effective and enforceable control strategy to reduce VOC emissions, while preventing unintended public health and environmental consequences that could arise from disincentivizing the recycling and reuse of produced water in the oil and gas industry. NMED is evaluating alternative emission standards to achieve important emissions reductions while continuing to encourage the use of produced water instead of freshwater resources throughout the industry.

Section 20.2.50.127 – Credible Evidence Provisions

Section 20.2.50.127 contains provisions regarding enforcement for violations of Part 50. Subsection A expressly states what is implicit in any mandatory requirement of an air quality regulation under the CAA or the AQCA: that failure to comply with any of the requirements in Part 50 within the specified timeframes constitutes a violation of Part 50 that is subject to enforcement action under the AQCA. This Section provides clear notice to the regulated community that failure to comply with the provisions of Part 50 will be subject to enforcement.

Subsection B provides that if the Department obtains credible information indicating that a source is not in compliance with Part 50, the source will be presumed to be in violation unless and until the owner or operator provides credible evidence or information demonstrating that

there is no violation. Subsection C establishes a similar presumption of violation if the Department receives credible information from a member of the public. These provisions establish a presumption of a violation of Part 50 when the Department comes into possession of credible information – either obtained by the Department pursuant to an inspection or records request, or provided to the Department by an outside person – that indicates noncompliance. This presumption can then be rebutted by the owner or operator through credible evidence or information showing that no violation occurred.

By placing the burden on the regulated entity to affirmatively show that it is in compliance with Part 50, the provisions of Section 20.2.50.127 give the Department an important tool in ensuring that the public health and the environmental protections of Part 50 are actually realized. Regulations have little benefit if they cannot be enforced. These provisions help alleviate the staffing and resource constraints that limit the Department's ability to physically inspect sources and identify violations. Further, Subsection C allows the Department to take advantage of the increasing access that the public has to advanced emissions monitoring technologies that can be used to monitor and record a facility's operations and that can be used as evidence in enforcement cases. Such technologies include infrared cameras. Surveillance monitoring and infrared imaging conducted by non-governmental organizations can be compelling, and has been used by the Department to support allegations of air quality violations in past enforcement actions.

Importantly, the provisions of Section 20.2.50.127 do ***not*** establish that any evidence or information received or obtained by the Department is presumed to be credible. The Department still has the authority to determine that information is "credible" before any violation will be presumed based on that information. The term "credible evidence" is widely used throughout

environmental and other regulatory provisions. As used in Subsection 20.2.50.127, the term "credible" is intended to have the same meaning as explained by EPA in the background to its "Credible Evidence Rule" at 62 Fed. Reg. 8314. *See* NMED Exhibit 101. As explained by EPA in pertinent part:

> The Federal Rules of Evidence govern the admission of evidence in all federal district court litigation, including CAA enforcement actions . . . . Similar evidentiary rules govern federal administrative and state environmental actions. Our legal system provides that a federal or administrative law judge will be the ultimate, independent arbitrator of the evidence's admissibility and credibility.
>
> Credible evidence is far from a new concept in judicial and administrative actions. In private lawsuits such as contract disputes, and in governmental and citizen enforcement actions brought under environmental laws other than the CAA, litigants can and do use a wide variety of information to prove their claims, or to refute the claims of opposing parties. In all these lawsuits, the judge acts as the final, independent arbitrator of what constitutes credible and admissible evidence.
>
> It should be emphasized that the determination that evidence or information is credible is merely a threshold determination that the evidence or information in question is technically relevant, and therefore, legally admissible in an enforcement action. In light of [Clean Air Act] section 113(a) providing that the Administrator may bring an enforcement action based on "any information", EPA believes that Congress intended this threshold to be a low one.

Id. at 8317-8318.

Like the Clean Air Act, the AQCA provides that the Secretary of the Department may bring an enforcement action based on "any information." *See* NMSA 1978, § 74-2-12(A).

Brian Palmer
Senior Scientist

A experienced scientist with expertise in characterizing and managing emissions from the oil and gas (O&G) sector

- Since May 2020, has been developing a proposed rule to reduce VOC and NOx emissions from oil and gas production and transmission operations in New Mexico.
- Developed proposed amendments to 40 CFR part 98, subpart W, Mandatory Greenhouse Gas Reporting for Petroleum and Natural Gas Systems.
- Led regulatory development projects for 15 source categories, including developing baseline emission inventories and estimating emission reductions.
- Has supported numerous projects related to 40 CFR part 98, Mandatory Greenhouse Gas Reporting.

RELEVANT PROJECTS

New Mexico Ozone Precursor Rule for the Oil and Natural Gas Sector
Client: New Mexico Environment Department (NMED). Developing a proposed rule to reduce emissions of VOC and NOx from oil and natural gas production in New Mexico. Identifying achievable control levels for each emission source types using federal NSPS, CTGs, and other state rules. The proposed rule will cover engines and turbines, compressor seals, equipment leaks, gas well liquids unloading, glycol dehydrators, process heaters, liquid transfers from storage tanks to trucks and rail cars, pig launching and receiving, pneumatic controllers and pumps, storage tanks, well workovers, and evaporation ponds for produced water disposal. For each source type, estimating the potential percent emission reductions and the control costs, accounting for the number of sources that already have controls or that are already subject to a NSPS or NESHAP that would require the same level of control as the proposed rule. Analyzed equipment data for permitted facilities provided by NMED. For the cost and emission reductions, reviewed pre-existing cost and emission reduction analyses completed for other federal and state rulemakings, and adapted them for the information available in the equipment data sheets from the NMED. Coordinated the QA of the emission reduction and cost impact analyses and prepared the documentation for the control technology, emission reduction, and cost impact analyses.

Oil and Natural Gas Systems (40 CFR 98, Subpart W) Amendments
Client: EPA/CCD. Oil and Natural Gas Systems (40 CFR 98, Subpart W) Amendments. Directed the preparation of two proposal packages to amend subpart W. In the first package, directed the completion of a proposed rule to amend Subpart W to revise certain calculation methods, monitoring methods, and data reporting requirements. The changes also clarified terms and definitions and corrected certain technical and editorial errors. Directed the completion of the preamble and amendatory text and the technical support documents. Directed the initiation of a second rulemaking to add GHG reporting requirements for completions and workovers of hydraulically fractured oil wells, the natural gas gathering and boosting segment (including equipment located on gathering pipelines, such as compressors, acid gas removal units, dehydrators, metering and valve stations), natural gas transmission pipeline blow downs, and the addition of API Well Numbers to the reporting requirements.

Federal Implementation Plan (FIP) for Oil and Gas Development in Indian Tribal Areas.

Client: EPA/OAQPS/SPPD. Oversaw the development of control options to reduce emissions from oil and gas development on tribal lands to be used as the basis for a FIP and to provide a streamlined permitting option for oil and gas development on tribal lands to avoid the burden on oil and gas developers and permitting agencies of case-by-case permits associated with NSR or PSD. The FIP also considered additional controls for wells located on tribal areas that were in ozone non-attainment areas. Control options were developed for the following oil and gas sources: oil and gas well completions with hydraulic fracturing; oil, gas, and water separators; heater treaters, amine treatment systems; glycol dehydration systems; centrifugal compressors; pneumatic controllers and pneumatic pumps; blowdown venting; equipment leaks; flash tanks; storage tanks; flares (including pit flares, utility flares, and enclosed combustors); truck loading; reciprocating internal combustion engines; external combustion units and process heaters. Controls included the use of flares and closed vent systems, and leak detection and repair programs. Emissions were estimated using data on the actual number of wells on tribal lands compiled from the Drilling Info database using API Well Numbers and well production data. Costs were estimated using cost efficiency data developed from the NSPS for oil and gas development (40 CFR 60, subpart OOOO).

Support for Compliance Monitoring and Assistance for the GHG Reporting Program

Client: EPA/CCD. Coordinates all support activities related to compliance monitoring and assistance for the entire GHGRP, including tracking of expected reporters and dropped reporters, analyzing applicability for expected reporters and comparing them to reporting thresholds, performing outreach to expected and dropped reporters to help bring them into compliance, and performing QA of data and analyses related to compliance monitoring to identify expected and dropped reporters (including comparisons between non-EPA lists of GHG emitting facilities and the EPA database of expected reporters and facilities already reporting to the GHGRP).

Electronics Manufacturing (40 CFR 98, Subpart I) Amendments and Implementation

Client: EPA/CCD. Directed the preparation of a proposed and final rule to amend Subpart I to address the issues raised by the Semiconductor Industry Association (SIA) in a petition for reconsideration. The amendments removed the requirement for certain large facilities to develop and use recipe-specific emission factors for fluorinated GHG (F-GHG) and N_2O emissions from semiconductor manufacturing facilities. The amendments also added a new method for determining emissions from all electronics facilities using stack testing methods, including FTIR, to measure emissions. Developed and presented a Microsoft PowerPoint webinar to explain the new rule amendments to industry GHG reporters.

Implementation included working with other EPA contractors to develop and test the calculation tool and reporting form used by reporters, and developing and testing validation checks for completed forms, and verification checks for reported data. Verification of the data submitted under subpart I in the 2011 to 2013 reporting years, including checks that reporting forms were completed correctly, emissions were estimated and reported consistent with subpart I, and communicating with facilities to ensure that verification issues were resolved. Implementation also included analysis of reported data to identify trends in the data, comparing reported data to other publicly available data sources, identifying variables that could predict emissions, and determining the fraction of total industry emissions represented by the reported emissions, and extrapolating the reported data to the whole industry.

Coordinated the design and testing of a new web-based reporting form to replace the existing spreadsheet-based reporting form. Worked with another EPA contractor to develop a design requirements document, a mock-up of the web form in Excel, and then test the new web form in an EPA staging environment and provide feedback. Developed and presented a PowerPoint webinar explaining to GHG reporters how to use the new web-based form.

GHG Emission Reductions

Client: EPA/CCD. Directed a task in which ERG scientists estimated the potential for future GHG emission reductions from several energy intensive source categories, including pulp and paper plants, refineries, and iron and steel mills. The team estimated potential emission reductions based on recent and forecasted trends in energy consumption for each category and an evaluation of emerging technologies that could affect energy consumption and GHG emitting processes in each category. Estimates included the lower and upper bounds of the emission estimates.

Air Emission Standard Regulatory Development Support

Client: EPA/OAQPS/SPPD. Directed the development of national air emission standards for numerous source categories, including National Emission Standards for Hazardous Air Pollutants, New Source Performance Standards, National VOC Rules, and Control Techniques Guideline Documents. Directed development of new

emission standards for 11 source categories and also risk and technology reviews of standards for 10 source categories that had already been developed and implemented. Has provided technical support for development and implementation of standards for multiple other source categories.

Collected information on each source category from visits to industrial facilities and in meetings between industry representatives and the EPA. Directed the development of an inventory of emission sources and an estimate of baseline emissions. Identified add-on control technologies, work practices, and process modifications that can be used to reduce emissions. Estimated the cost and potential emission reductions of those options. Documented the methodology and results of each analysis. Developed supporting documentation for proposed and final rules, and the preamble and regulatory language. Summarized public comments on proposed rule and developed final rules and supporting preambles.

1.0 INTRODUCTION

Section 172(c)(1) of the Clean Air Act (CAA) provides that state implementation plans (SIPs) for nonattainment areas must include "reasonably available control measures" including "reasonably available control technology" (RACT), for existing sources of emissions. CAA Section 182(b)(2)(A) provides that for Moderate ozone nonattainment areas, states must revise their SIPs to include RACT for each category of volatile organic compound (VOC) sources covered by control techniques guidelines (CTG) documents issued between November 15, 1990, and the date of attainment. Section 182(c) through (e) applies this requirement to states with ozone nonattainment areas classified as Serious, Severe, and Extreme. CAA Section 184(b) requires that states in ozone transport regions must revise their SIPs to implement RACT with respect to all sources of VOC in the state covered by a CTG issued before or after November 15, 1990. CAA Section 184(a) establishes a single Ozone Transport Region (OTR) comprised of the states of Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont and the Consolidated Metropolitan Statistical Area (CMSA) that includes the District of Columbia.

The U.S. Environmental Protection Agency (EPA) defines RACT as "the lowest emission limitation that a particular source is capable of meeting by the application of control technology that is reasonably available considering technological and economic feasibility." 44 FR 53761 (September 17, 1979).

This CTG provides recommendations to inform state, local, and tribal air agencies (hereafter, collectively referred to as air agencies) as to what constitutes RACT for select oil and natural gas industry emission sources. Air agencies can use the recommendations in the CTG to inform their own determination as to what constitutes RACT for VOC for the emission sources presented in this document in their Moderate or higher ozone nonattainment area or state in the OTR. The information contained in this document is provided only as guidance. This guidance does not change, or substitute for, requirements specified in applicable sections of the CAA or the EPA's regulations; nor is it a regulation itself. This document does not impose any requirements on facilities in the oil and natural gas industry. It provides only recommendations for air agencies to consider in determining RACT. Air agencies may implement other

NMED Exhibit 34

technically-sound approaches that are consistent with the CAA, the EPA's implementing regulations, and policies on interpreting RACT.

The recommendations contained in this CTG are based on data and information currently available to the EPA. The EPA evaluated the sources of VOC emissions in the oil and natural gas industry and the available control approaches for addressing these emissions, including the costs of such approaches. The recommendations contained in this CTG may not be appropriate for every situation based upon the circumstances of a specific source (e.g., VOC content of the gas, safety concerns/reasons). Regardless of whether an air agency chooses to adopt rules implementing the recommendations contained herein, or to issue rules that adopt different approaches for RACT for VOC from oil and natural gas industry sources, air agencies must submit their RACT rules to the EPA for review and approval using the SIP process. The EPA will evaluate the RACT determinations and determine, through notice and comment rulemaking, whether these determinations in the submitted rules meet the RACT requirements of the CAA and the EPA's regulations. To the extent an air agency adopts any of the recommendations in this guidance into its RACT rules, interested parties can raise questions and objections about the appropriateness of the application of this guidance to a particular situation during the development of these rules and the EPA's SIP process. Such questions and objections can relate to the substance of this guidance.

Section 182(b)(2) of the CAA requires that a CTG document issued between November 15, 1990, and the date of attainment include the date by which states subject to CAA section 182(b) must submit SIP revisions. Accordingly, the EPA is setting forth a 2-year period, from the date of publication of the notice of availability of this CTG in the *Federal Register* for the required SIP submittal.

NMED Exhibit 34

2.0 BACKGROUND AND OVERVIEW

There have been several federal and state actions to reduce VOC emissions from certain emission sources in the oil and natural gas industry. A summary of these actions is provided below.

2.1 History of New Source Performance Standards that Regulate Emission Sources in the Oil and Natural Gas Industry

In 1979, the EPA listed crude oil and natural gas production on its priority list of source categories for promulgation of NSPS (44 FR 49222, August 21, 1979). Since the 1979 listing, the EPA has promulgated performance standards to regulate VOC emissions from production, processing, transmission, and storage as well as sulfur dioxide (SO_2) emissions from natural gas processing emission sources and, more recently, greenhouse gases (GHG). On June 24, 1985 (50 FR 26122), the EPA promulgated an NSPS for natural gas processing plants that addressed VOC emissions from leaking components (40 CFR part 60, subpart KKK). On October 1, 1985 (50 FR 40158), a second NSPS was promulgated for natural gas processing plants that regulated SO_2 emissions (40 CFR part 60, subpart LLL). On August 16, 2012 (77 FR 49490) (2012 NSPS), the EPA finalized its review of NSPS standards for the listed oil and natural gas source category and revised the NSPS for VOC from leaking components at natural gas processing plants, and the NSPS for SO_2 emissions from natural gas processing plants. At that time, the EPA also established standards for certain oil and natural gas emission sources not covered by the existing standards. In addition to the emission sources that were covered previously, the EPA established new standards to regulate VOC emissions from hydraulically fractured gas wells, centrifugal compressors, reciprocating compressors, pneumatic controllers, and storage vessels. In 2013 (78 FR 58416) (2013 NSPS Reconsideration) and 2014 (79 FR 79018), the EPA amended the standards set in 2012 in order to improve implementation of the standards. In 2016 (81 FR 35824, June 3, 2016), the EPA finalized new standards to regulate GHG and VOC emissions across the oil and natural gas source category. Specifically, the EPA finalized both GHG standards (in the form of limitations on methane emissions) and VOC standards for several emission sources not previously covered by the NSPS (i.e., hydraulically fractured oil well completions, pneumatic pumps, and fugitive emissions from well sites and compressor stations).

In addition, the EPA finalized GHG standards for certain emission sources that were regulated for only VOC (i.e., hydraulically fractured gas well completions, centrifugal compressors, reciprocating compressors, pneumatic controllers and equipment leaks at natural gas processing plants). With respect to certain equipment that are used across the industry, 40 CFR part 60 subpart OOOO regulates only a subset of these equipment (pneumatic controllers, centrifugal compressors, reciprocating compressors). The final amendments established GHG standards (40 CFR part 60 subpart OOOOa) for these equipment and extended the current VOC standards to previously unregulated equipment. Although not regulated under the oil and natural gas NSPS, stationary reciprocating internal combustion engines and combustion turbines used in the oil and natural gas industry are covered under separate NSPS specific to engines and turbines (40 CFR part 60, subparts IIII, JJJJ, GG, KKKK).

In addition to NSPS issued to regulate VOC emissions from the oil and gas industry, the EPA also published a CTG document that recommended the control of VOC emissions from equipment leaks from natural gas processing plants in 1983 (1983 CTG; 49 FR 4432; February 6, 1984).[1] This 2016 CTG is the only CTG document issued since 1983 for the oil and natural gas industry.

2.2 State and Local Regulations

Several states regulate VOC emissions from storage vessels in the oil and natural gas industry. There are also a few states (e.g., Colorado, Wyoming, and Montana) that have established specific permitting requirements or regulations that control VOC emissions from emission sources in the oil and natural gas industry (e.g., compressors, pneumatics, fugitive emission components):

(1) The Colorado Department of Public Health and Environment, Air Quality Control Commission has developed emission regulations 3, 6, and 7 that apply to oil and natural gas industry emission sources in Colorado. (https://www.colorado.gov/pacific/cdphe/summary-oil-and-gas-emissions-requirements.)

(2) Montana requires oil and gas well facilities to control emissions from the time the well is completed until the source is registered or permitted (Registration of Air Contaminant

[1] U.S. Environmental Protection Agency, Office of Air Quality Planning and Standards, Research Triangle Park, NC, 27711. *Guideline Series. Control of Volatile Organic Compound Equipment Leaks from Natural Gas/Gasoline Processing Plants.* December 1983. EPA-450/3-83-007.

Sources Rule, Rule 17.8.1711, Oil or Gas Well Facilities Emission Control Requirements). (http://www.mtrules.org/gateway/ruleno.asp?RN=17%2E8%2E1711.)

(3) The Wyoming Department of Environmental Quality limits VOC emissions from existing sources in ozone nonattainment areas and has issued specific permitting guidance that apply to oil and natural gas facilities. (Chapter 6, Section 2 Permitting Guidance, last revised in September 2013).

(4) The San Joaquin Valley Air Pollution Control District requires control of VOC emissions from several VOC oil and natural gas emission sources, including, but not limited to, (a) storage vessels, (b) crude oil production sumps, (c) components at light crude oil production facilities, natural gas production facilities and natural gas processing facilities, and (d) in-situ combustion well vents.

In some states, general permits have been developed for oil and natural gas facilities. General permits are permits where all the terms and conditions of the permit are developed for a given industry and authorize the construction, modification, and/or operation of facilities that meet those terms and conditions. For example, West Virginia, Ohio, and Pennsylvania have developed General Air Permits for the oil and natural gas industry. The Pennsylvania Department of Environmental Protection has issued a General Permit, General Plan Approval and Permit Exemption 38 for natural gas dispensing facilities and oil and gas exploration, development, and production operations. Pennsylvania also applies conditions on flaring of emissions. Under the Permit 38 exemptions, there are criteria set out for the oil and natural gas industry that include unconditionally exempt and conditionally exempt criteria. Unconditionally exempt operations/equipment include conventional wells, conventional wellheads and associated equipment, well drilling, completion and work-over activities, and non-road engines. Unconventional wells, wellheads and associated equipment (including equipment components, storage vessels) are conditionally exempt. Conditions include compliance with 40 CFR part 60, subpart OOOO and Pennsylvania's General Permit 5 (GP-5) and a demonstration that the combined VOC emissions from all sources at a facility are less than 2.7 tons per year

NMED Exhibit 34

(tpy) on a 12-month rolling basis. For oil and natural gas facilities that do not meet these conditions, a case-by-case plan approval is required.[2]

There may also be local permit requirements for control of VOC emissions from existing sources of VOC emissions in the oil and natural gas industry, such as those required by the Bay Area Air Quality Management District (BAAQMD) for pneumatic controllers. The BAAQMD requires that a permit to operate applicant provide the number of high-bleed and low-bleed pneumatic devices in their permit application. Facilities that use high-bleed devices might be required to provide device-specific bleed rates and supporting documentation for each high-bleed device. In cases where emissions are high from high-bleed devices, BAAQMD might require that the facility conduct fugitive monitoring and/or control requirements under conditions of their permit to operate[3] on a case-by-case basis.

We conducted a search of the EPA's RACT/BACT/LAER Clearinghouse (RBLC) and identified several draft and final permits that covered some of the sources evaluated for RACT in this CTG. The controls specified in these permits are similar to the control options evaluated in this CTG.[4]

We considered these existing state and local requirements limiting VOC emissions from the oil and natural gas industry in preparing this guideline.

2.3 Development of this CTG

As discussed in section 2.1 of this chapter, the NSPS established VOC emission standards for certain new and modified sources in the oil and gas industry. This CTG addresses existing sources of VOC emissions and provides recommendations for RACT for the oil and natural gas industry. We developed our RACT recommendations after reviewing the 1983 CTG document, the oil and natural gas NSPS, existing state and local VOC emission reduction approaches, and information on costs, emissions and available VOC emission control technologies. In April 2014, the EPA released five technical white papers on potentially significant sources of emissions in the oil and natural gas industry. The white papers focused on

NMED Exhibit 34

technical issues covering emissions and mitigation techniques that target methane and VOC. We reviewed the white papers, along with the input we received from the peer reviewers and the public, when evaluating and recommending RACT.

This CTG reflects the evaluation of potential RACT options for emission sources that are regulated under the oil and natural gas NSPS. This CTG did not evaluate hydraulically fractured oil and natural gas well completions performed on existing wells because these operations are addressed in the NSPS.

Several of the technical support documents (TSDs) prepared in support of the NSPS actions for the oil and natural gas industry include data and analyses considered in developing RACT recommendations in this CTG. To the extent that the data and analyses are also relevant to control options for existing sources, they are referred to throughout this guidance document as follows:

(1) The TSD for the 2011 NSPS proposal, published in July, 2011 is referred to as the "2011 NSPS TSD".[5]

(2) The supplemental TSD for the 2012 final NSPS standards, published in April, 2012, is referred to as the "2012 NSPS TSD" or "2012 NSPS STSD"[6]

(3) The TSD for the 2015 proposal NSPS standards, published August, 2015, is referred to as the "2015 NSPS TSD".[7]

(4) The TSD for the 2016 final NSPS standards, published in May, 2016, is referred to as the "2016 NSPS TSD"[8]

Additionally, emission information and counts for various emission sources were summarized from facility-level data submitted to the Greenhouse Gas Reporting Program

NMED Exhibit 34

(GHGRP)[9] and data used to calculate national emissions in the Inventory of U.S. Greenhouse Gas Emissions and Sinks (GHG Inventory).[10] For the purposes of this document, these data sources are referred to as the "GHGRP" and the "GHG Inventory". The most recent published data from the GHG Inventory when we prepared the draft CTG was for 2013, and was used for some of the analyses included in this document. Between the time we issued the draft CTG and the final CTG, GHGRP data was released that covers 2011 through 2014 and the most recent available GHG Inventory covers data from 1990 through 2014. These new activity data have been reviewed for this CTG and incorporated into our RACT analyses, as appropriate.

Most of the VOC emission estimates presented in this document are based on methane emissions data because we only had methane emissions information for the evaluated sources. We calculated VOC emissions using ratios of methane to VOC in the gas for the different segments of the industry. These ratios, and the procedures used to calculate them, are documented in a memorandum characterizing gas composition developed during the NSPS process. [11] Herein, we refer to this memorandum as the "2011 Gas Composition Memorandum". Because methane emissions are the basis for most of our VOC emission estimates, in several instances where we provide VOC emissions per source/model plant, we also provide the methane emissions that are the basis for our VOC emission estimates.

The remainder of this document is divided into seven chapters and an appendix. Chapter three describes the oil and natural gas industry and a summary of our RACT recommendations presented in this CTG. Chapters four through nine describe the oil and natural gas emission sources that we evaluated for our RACT recommendations (i.e., storage vessels, compressors, pneumatic controllers, pneumatic pumps, equipment component leaks from natural gas processing plants, and fugitive emissions from well sites and gathering and boosting stations), available control and regulatory approaches (including existing federal, state and local requirements) and the potential emission reductions and costs associated with available control and regulatory approaches for a given emission source. The appendix provides example model

rule language that can be used by air agencies as a starting point in the development of their SIP rules if they choose to adopt the recommended RACT presented in this document.

NMED Exhibit 34

3.0 OVERVIEW OF THE OIL AND NATURAL GAS INDUSTRY AND SOURCES SELECTED FOR RACT RECOMMENDATIONS

Section 3.1 presents an overall description of the oil and natural gas industry and section 3.2 presents the VOC emission sources for which we are recommending RACT within the oil and natural gas industry. Table 3-1 provides a summary of recommendations for controlling VOC emissions from oil and natural gas industry emission sources.

3.1 Overview of the Oil and Natural Gas Industry

The oil and natural gas industry includes oil and natural gas operations involved in the extraction and production of crude oil and natural gas, as well as the processing, transmission, storage, and distribution of natural gas. For oil, the industry includes all operations from the well to the point of custody transfer at a petroleum refinery. For natural gas, the industry includes all operations from the well to the customer. For purposes of this document, the oil and natural gas operations are separated into four segments: (1) oil and natural gas production, (2) natural gas processing, (3) natural gas transmission and storage, and (4) natural gas distribution. We briefly discuss each of these segments below. For purposes of this CTG, oil and natural gas production includes only onshore operations.

Production operations include the wells and all related processes used in the extraction, production, recovery, lifting, stabilization, and separation or treating of oil and/or natural gas (including condensate). Production components may include, but are not limited to, wells and related casing head, tubing head, and "Christmas tree" piping, as well as pumps, compressors, heater treaters, separators, storage vessels, pneumatic devices, and dehydrators. Production operations also include well drilling, completion, and recompletion processes, which include all the portable non-self-propelled apparatus associated with those operations. Production sites include not only the "pads" where the wells are located, but also include stand-alone sites where oil, condensate, produced water and gas from several wells may be separated, stored and treated. The production segment also includes the low-pressure, small diameter, gathering pipelines and related components that collect and transport the oil, natural gas, and other materials and wastes from the wells to the refineries or natural gas processing plants.

NMED Exhibit 34

There are two basic types of wells: oil wells and natural gas wells. Oil wells can have "associated" natural gas that is separated and processed or the crude oil can be the only product processed. Crude oil production includes the well and extends to the point of custody transfer to the crude oil transmission pipeline. Once the crude oil is separated from water and other impurities, it is essentially ready to be transported to the refinery via truck, railcar, or pipeline. The oil refinery sector is considered separately from the oil and natural gas industry. Therefore, at the point of custody transfer at the refinery, the oil leaves the oil and natural gas sector and enters the petroleum refining sector.

Natural gas is primarily made up of methane. It commonly exists in mixtures with other hydrocarbons. They are sold separately and have a variety of uses. The raw natural gas often contains water vapor, hydrogen sulfide (H_2S), carbon dioxide (CO_2), helium, nitrogen, and other compounds. Natural gas processing consists of separating certain hydrocarbons and fluids from the natural gas to produce "pipeline quality" dry natural gas. While some of the processing can be accomplished in the production segment, the complete processing of natural gas takes place in the natural gas processing segment. Natural gas processing operations separate and recover natural gas liquids (NGL) or other non-methane gases and liquids from a stream of produced natural gas through components performing one or more of the following processes: oil and condensate separation, water removal, separation of natural gas liquids, sulfur and CO_2 removal, fractionation of natural gas liquid, and other processes such as the capture of CO_2 separated from natural gas streams for delivery outside the facility.

The pipeline quality natural gas leaves the processing segment and enters the transmission and storage segment. Pipelines in the natural gas transmission and storage segment can be interstate pipelines that carry natural gas across state boundaries or intrastate pipelines, which transport the gas within a single state. While interstate pipelines may be of a larger diameter and operated at a higher pressure than intrastate pipelines, the basic components are the same. To ensure that the natural gas flowing through any pipeline remains pressurized, compression of the gas is required periodically along the pipeline. This is accomplished by compressor stations usually placed between 40 and 100 mile intervals along the pipeline. At a compressor station, the natural gas enters the station, where it is compressed by reciprocating or centrifugal compressors.

NMED Exhibit 34

In addition to the pipelines and compressor stations, the natural gas transmission and storage segment includes aboveground and underground storage facilities. Underground natural gas storage includes subsurface storage, which typically consists of depleted gas or oil reservoirs and salt dome caverns used for storing natural gas. One purpose of this storage is for load balancing (equalizing the receipt and delivery of natural gas). At an underground storage site, there are typically other processes, including compression, dehydration, and flow measurement.

The distribution segment is the final step in delivering natural gas to customers. The natural gas enters the distribution segment from delivery points located on interstate and intrastate transmission pipelines to business and household customers. Natural gas distribution systems consist of thousands of miles of piping, including mains and service pipelines to the customers. Distribution systems sometimes have compressor stations, although they are considerably smaller than transmission compressor stations. Distribution systems include metering stations, which allow distribution companies to monitor the natural gas in the system. Essentially, these metering stations measure the flow of natural gas and allow distribution companies to track natural gas as it flows through the system.

Emissions can occur from a variety of processes and points throughout the oil and natural gas industry. Primarily, these emissions are organic compounds such as methane, ethane, VOC, and organic hazardous air pollutants (HAP). Figure 3-1 presents a schematic of oil and natural gas sector operations.

NMED Exhibit 34

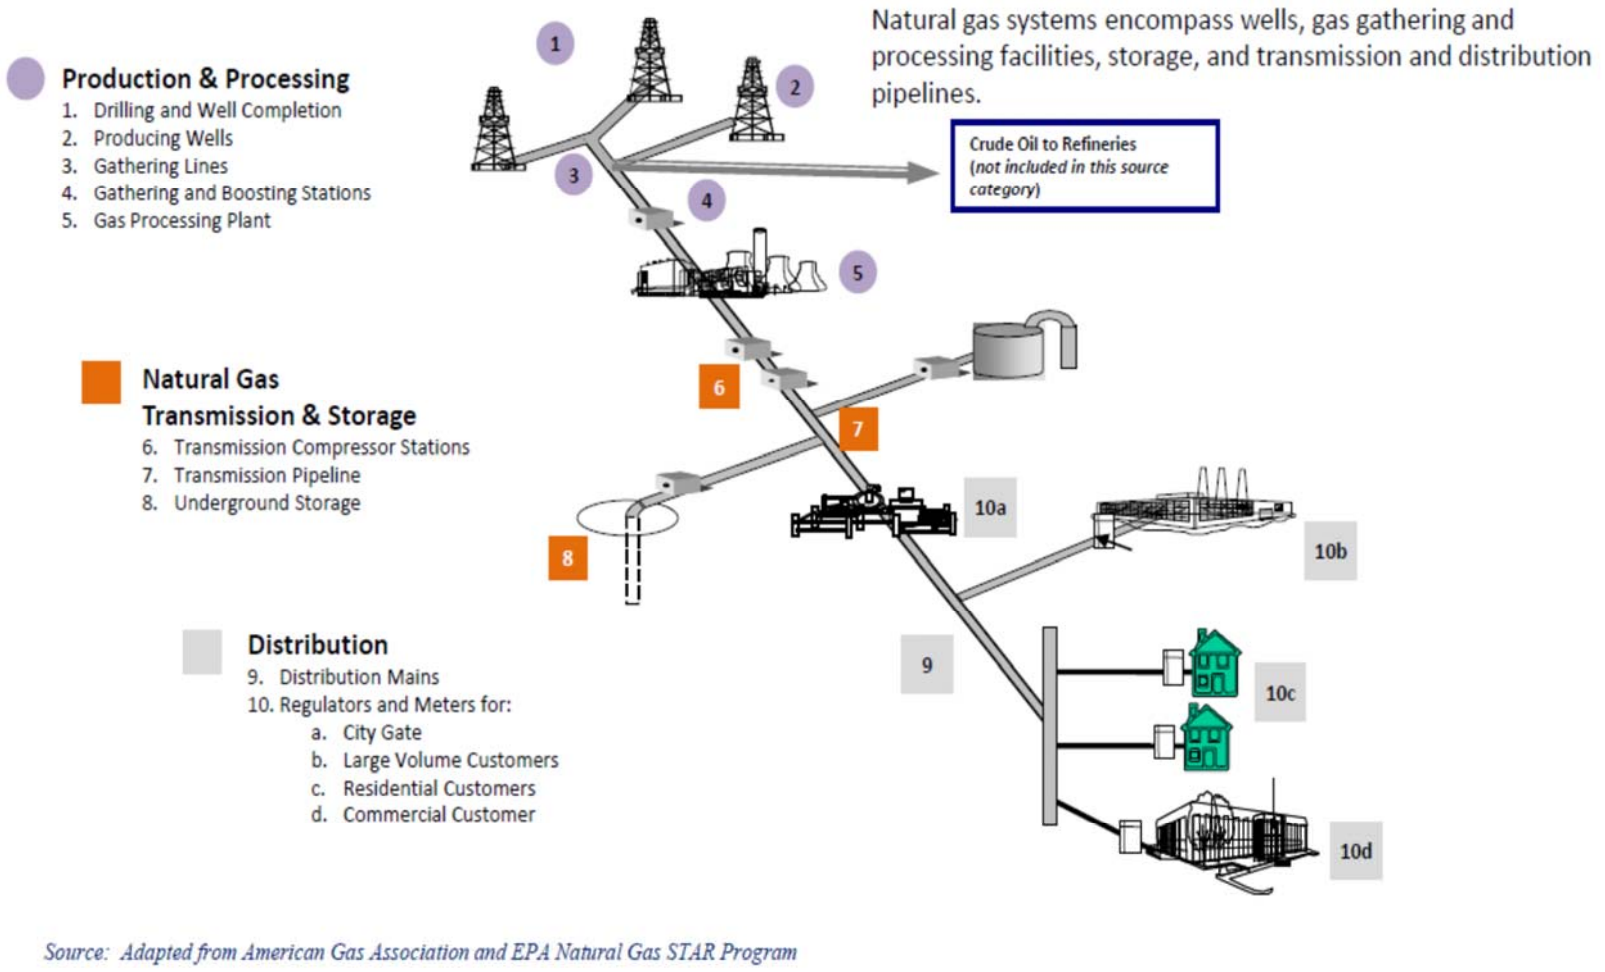

Figure 3-1. Oil and Natural Gas Sector Operations

3.2 Sources Selected For RACT Recommendations

This CTG covers select sources of VOC emissions in the onshore production and processing segments of the oil and natural gas industry (i.e., pneumatic controllers, pneumatic pumps, compressors, equipment leaks, fugitive emissions) and storage vessel VOC emissions in all segments (except distribution) of the oil and natural gas industry. These sources were selected for RACT recommendations because current information indicates that they are significant sources of VOC emissions. As mentioned in section 2.3, the VOC RACT recommendations contained in this document were made based on the review of the 1983 CTG document, the oil and natural gas NSPS, existing state and local VOC emission reduction approaches, and information on emissions, available VOC emission control technologies, and costs.

In considering costs, we compared control options and estimated costs and emission impacts of multiple emission reduction options under consideration. Recommendations are presented in this CTG for the subset of existing sources in the oil and natural gas industry where the application of controls is judged reasonable, given the availability of demonstrated control technologies, emission reductions that can be achieved, and the cost of control.

Table 3-1 presents a summary of the oil and natural gas emission sources and recommended RACT included in this CTG.

NMED Exhibit 34

Table 3-1. Summary of the Oil and Natural Gas Industry Emission Sources and Recommended RACT Included in this CTG

Emission Source	Applicability	RACT Recommendations
Storage Vessels	Individual storage vessel with a potential to emit (PTE) greater than or equal to 6 tpy VOC.	95 percent reduction of VOC emissions from storage vessels. OR Maintain less than 4 tpy uncontrolled actual VOC emissions after having demonstrated that the uncontrolled actual VOC emissions have remained less than 4 tpy, as determined monthly, for 12 consecutive months.
Pneumatic Controllers	Individual continuous bleed, natural gas-driven pneumatic controller located at a natural gas processing plant.	Natural gas bleed rate of 0 scfh (unless there are functional needs including, but not limited to, response time, safety and positive actuation, requiring a bleed rate greater than 0 scfh).
	Individual continuous bleed natural gas-driven pneumatic controller located from the wellhead to the natural gas processing plant or point of custody transfer to an oil pipeline.	Natural gas bleed rate less than or equal to 6 scfh (unless there are functional needs including, but not limited to, response time, safety and positive actuation, requiring a bleed rate greater than 6 scfh).
Pneumatic Pumps	Individual natural gas-driven diaphragm pump located at a natural gas processing plant.	Zero VOC emissions.
	Individual natural gas-driven diaphragm pump located at a well site.	Require routing of VOC emissions from the pneumatic pump to an existing onsite control device or process.
		Require 95 percent control unless the onsite existing control device or process cannot achieve 95 percent.
		If onsite existing device or process cannot achieve 95 percent, maintain documentation demonstrating the percent reduction the control device is designed to achieve.

NMED Exhibit 34

Emission Source	Applicability	RACT Recommendations
		If there is no existing control device at the location of the pneumatic pump, maintain records that there is no existing control device onsite.
	Individual natural gas-driven diaphragm pump located at a well site that is in operation for any period of time each calendar day for less than a total of 90 days per calendar year.	RACT would not apply.
Compressors (Centrifugal and Reciprocating)	Individual reciprocating compressor located between the wellhead and point of custody transfer to the natural gas transmission and storage segment.	Reduce VOC emissions by replacing reciprocating compressor rod packing on or before 26,000 hours of operation or 36 months since the most recent rod packing replacement. Alternatively, route rod packing emissions to a process through a closed vent system under negative pressure.
	Individual reciprocating compressor located at a well site, or an adjacent well site and servicing more than one well site.	RACT would not apply.
	Individual centrifugal compressor using wet seals that is located between the wellhead and point of custody transfer to the natural gas transmission and storage segment.	Reduce VOC emissions from each centrifugal compressor wet seal fluid gassing system by 95 percent.
	Individual centrifugal compressor using wet seals located at a well site, or an adjacent well site and servicing more than one well site.	RACT would not apply.
	Individual centrifugal compressor using dry seals.	RACT would not apply.
Equipment Leaks	Equipment components in VOC service located at a natural gas processing plant.	Implement the 40 CFR part 60, subpart VVa leak detection and repair (LDAR) program for natural gas processing plants.
Fugitive Emissions	Individual well site with wells with a gas to oil ratio (GOR) greater than or equal to 300, that produce, on average, greater than 15 barrel equivalents per well per day.	Develop and implement a semiannual optical gas imaging (OGI) monitoring and repair plan that covers the collection of fugitive emissions components at well sites within a company defined area. Method 21 can be

NMED Exhibit 34

Emission Source	Applicability	RACT Recommendations
		used as an alternative to OGI at a 500 ppm repair threshold level.
	Individual gathering and boosting station located from the wellhead to the point of custody transfer to the natural gas transmission and storage segment or point of custody transfer to an oil pipeline.	Develop and implement a quarterly OGI monitoring and repair plan that covers the collection of fugitive emissions components at gathering and boosting stations within a company defined area. Method 21 can be used as an alternative to OGI at a 500 ppm repair threshold.
	Individual well site with a GOR less than 300.	RACT would not apply.

NMED Exhibit 34

4.0 STORAGE VESSELS

Storage vessels are significant sources of VOC emissions in the oil and natural gas industry. This chapter provides a description of the types of storage vessels present in the oil and natural gas industry, and provides VOC emission estimates for storage vessels, in terms of mass of emissions per throughput, for both crude oil and condensate storage vessels. This chapter also presents control techniques used to reduce VOC emissions from storage vessels, along with their costs and potential emission reductions. Finally, this chapter provides a discussion of our recommended RACT for storage vessels.

4.1 Applicability

For purposes of this CTG, the emissions and emission controls discussed herein would apply to a tank or other vessel in the oil and natural gas industry that contains an accumulation of crude oil, condensate, intermediate hydrocarbon liquids, or produced water, and that is constructed primarily of non-earthen materials (such as wood, concrete, steel, fiberglass, or plastic) that provide structural support. The emissions and emission controls discussed herein would not apply to the following vessels:

(1) Vessels that are skid-mounted or permanently attached to something that is mobile (such as trucks, railcars, barges, or ships), and are intended to be located at a site for less than 180 consecutive days.

(2) Process vessels such as surge control vessels, bottoms receivers, or knockout vessels.

(3) Pressure vessels designed to operate in excess of 204.9 kilopascals (29.7 pounds per square inch) and without emissions to the atmosphere.[12]

4.2 Process Description and Emission Sources

4.2.1 Process Description

Storage vessels in the oil and natural gas industry are used to hold a variety of liquids including crude oil, condensates, produced water, etc. While still underground and at reservoir pressure, crude oil contains many lighter hydrocarbons in solution. When the oil is brought to the

[12] It is acknowledged that even pressure vessels designed to operate without emissions have a small potential for fugitive emissions at valves. Valves are threaded components that would be subject to leak detection and repair requirements.

NMED Exhibit 34

surface, many of the dissolved lighter hydrocarbons (as well as water) are removed through a series of separators. Crude oil is passed through either a two-phase separator (where the associated gas is removed and any oil and water remain together) or a three-phase separator (where the associated gas is removed and the oil and water are also separated). The remaining oil is then directed to a storage vessel where it is stored for a period of time before being transported off-site. Much of the remaining hydrocarbon gases in the oil are released from the oil as vapors in the storage vessels. Storage vessels are typically installed with similar or identical vessels in a group, referred to in the industry as a tank battery.

Emissions of the hydrocarbons from storage vessels are a function of flash, breathing (or standing), and working losses. Flash losses occur when a liquid with entrained gases is transferred from a vessel with higher pressure to a vessel with lower pressure, thus allowing entrained gases or a portion of the liquid to vaporize or flash. In the oil and natural gas industry, flashing losses occur when crude oils or condensates flow into an atmospheric storage vessel from a processing vessel (e.g., a separator) operated at a higher pressure. Typically, the larger the pressure drop, the more flash emissions will occur in the storage vessel. The temperature of the liquid may also influence the amount of flash emissions. Breathing losses are the release of gas associated with temperature fluctuations and other equilibrium effects. Working losses occur when vapors are displaced due to the emptying and filling of storage vessels. The volume of gas vapor emitted from a storage vessel depends on many factors. Lighter crude oils flash more hydrocarbons than heavier crude oils. In storage vessels where the oil is frequently cycled and the overall throughput is high, working losses are higher. Additionally, the operating temperature and pressure of oil in the separator dumping into the storage vessel will affect the volume of flashed gases coming out of the oil.

The composition of the vapors from storage vessels varies, and the largest component is methane, but also may include ethane, butane, propane, and HAP such as benzene, toluene, ethylbenzene and xylenes (commonly referred to as BTEX), and n-hexane.

4.2.2 Emissions Data

4.2.2.1 Summary of Major Studies and Emissions

There are numerous studies and reports available that estimate storage vessel emissions. We consulted several of these studies and reports to evaluate the emissions and emission

NMED Exhibit 34

reduction options for storage vessels. Table 4-1 presents a summary of the references for these reports, along with an indication of the type of information available in each reference.

[e] An "X" in this column does not necessarily indicate that the EPA has received comprehensive data on control options from any one of these reports. The type of emissions control information that the EPA has received from these reports varies substantially from report to report.

4.2.2.2 Representative Storage Vessel Baseline Emissions

Storage vessels vary in size and throughputs. In support of the 2013 NSPS Reconsideration,[13] average storage vessel emissions, in terms of mass of emissions per throughput, were developed for both crude oil and condensate storage vessels.[14] We also developed mass emissions per throughput estimates using the American Petroleum Institute's (API's) E&P TANKS program and more than 100 storage vessels across the country with varying characteristics.[15] The VOC emissions per throughput estimates used for this analysis are:

(1) Uncontrolled VOC Emissions from Crude Oil Storage Vessels = 0.214 tpy VOC/barrel per day (bbl/day); and

(2) Uncontrolled VOC Emissions from Condensate Storage Vessels = 2.09 tpy VOC/bbl/day.

On a nationwide basis, there are a wide variety of storage vessel sizes, as well as rates of throughput for each tank. Emissions are directly related to the throughput of liquids for a given storage vessel; therefore, in support of the 2013 NSPS Reconsideration, we adopted production rate brackets developed by the U.S. Energy Information Administration (U.S. EIA) for our emission estimates. To estimate the emissions from an average storage vessel within each production rate bracket, we developed average production rates for each bracket. This average was calculated using the U.S. EIA published nationwide production per well per day for each production rate bracket from 2006 through 2009. Table 4-2 presents the average oil production and condensate production in barrels per well per day. For this analysis, we considered the liquid produced (as reported by the U.S. EIA) from oil wells to be crude oil and from gas wells to be condensate. Table 4-2 presents the average VOC emissions for each storage vessel within each production rate bracket calculated by applying the average production rate (bbl/day) to the VOC emissions per throughput estimates (tpy VOC/bbl/day).

4.3 Available Controls and Regulatory Approaches

In analyzing available controls for storage vessels, we reviewed information obtained in support of the 2012 NSPS[17] and the 2013 NSPS Reconsideration actions, control techniques identified in the Natural Gas STAR program, and existing state regulations that require control of VOC emissions from storage vessels in the oil and natural gas industry. Section 4.3.1 presents a non-exhaustive discussion of available VOC emission control methods for storage vessels. Section 4.3.2 includes a summary of the federal, state, and local regulatory approaches that control VOC emissions from crude oil and condensate storage vessels.

4.3.1 Available VOC Emission Control Options

The options generally used as the primary means to limit the amount of VOC vented are to: (1) route emissions from the storage vessel through an enclosed system to a process where emissions are recycled, recovered, or reused in the process – "route to a process" (e.g., by installing a vapor recovery unit (VRU) that recovers vapors from the storage vessel) for reuse in the process or for beneficial use of the gas onsite and/or (2) route emissions from the storage vessel to a combustion device. While EPA explored these options within the document, there may be other emission controls that sources may wish to employ to ensure continuous compliance with EPA's RACT recommendation. Regardless of the type of emission control method that a source may choose to utilize, the recommended RACT level of control explained more fully below is meant to apply at all times. One of the clear advantages the first option has over the second option is that it results in a cost savings associated with the recycled, recovered and reused natural gas and other hydrocarbon vapor, rather than the loss and destruction of the natural gas and vapor by combustion. Combustion and partial combustion of organic pollutants also creates secondary pollutants including nitrogen oxides, carbon monoxide, sulfur oxides, carbon dioxide and smoke/particulates. These emission control methods are described below along with their emission reduction control effectiveness as they apply to storage vessels in the industry and the potential costs associated with their installation and operation.

NMED Exhibit 34

4.3.1.1 Routing Emissions to a Process via a Vapor Recovery Unit (VRU)

Description

One option for controlling storage vessel emissions is to route vapors from the storage vessel back to the inlet line of a separator, to a sales gas line, or to some other line carrying hydrocarbon fluids for beneficial use, such as use as a fuel. Where a compressor is used to boost the recovered vapors into the line, this is often referred to as a VRU.[18] Typically with a VRU, hydrocarbon vapors are drawn out of the storage vessel under low pressure and are piped to a separator, or suction scrubber, to collect any condensed liquids, which are usually recycled back to the storage vessel. Vapors from the separator flow through a compressor that provides the low-pressure suction for the VRU system where the recovered hydrocarbons can be transported to various places, including a sales line and/or for use onsite.

Types of VRUs include conventional VRUs and venturi ejector vapor recovery units (EVRU^{TM}) or vapor jet systems.[19] Decisions on the type of VRU to use are based on the applicability needs (e.g., an EVRU^{TM} is recommended where there is a high-pressure gas compressor with excess capacity and a vapor jet VRU is suggested where there is produced water, less than 75 million cubic feet (MMcf)/day gas and discharge pressures below 40 pounds per square inch gauge (psig)). The reliability and integrity of the compressor and suction scrubber and integrity of the lines that connect the tank to the compressor will affect the effectiveness of the VRU system to collect and recycle vapors.[20]

A conventional VRU is equipped with a control pilot to shut down the compressor and permit the back flow of vapors into the tank in order to prevent the creation of a vacuum in the top of a tank when liquid is withdrawn and the liquid level drops. Vapors are then either sent to the pipeline for sale or used as onsite fuel. Figure 4.1 presents a diagram of a conventional VRU installed on a single crude oil storage vessel (multiple tank installations are also common).[21]

[21] Ibid.

NMED Exhibit 34

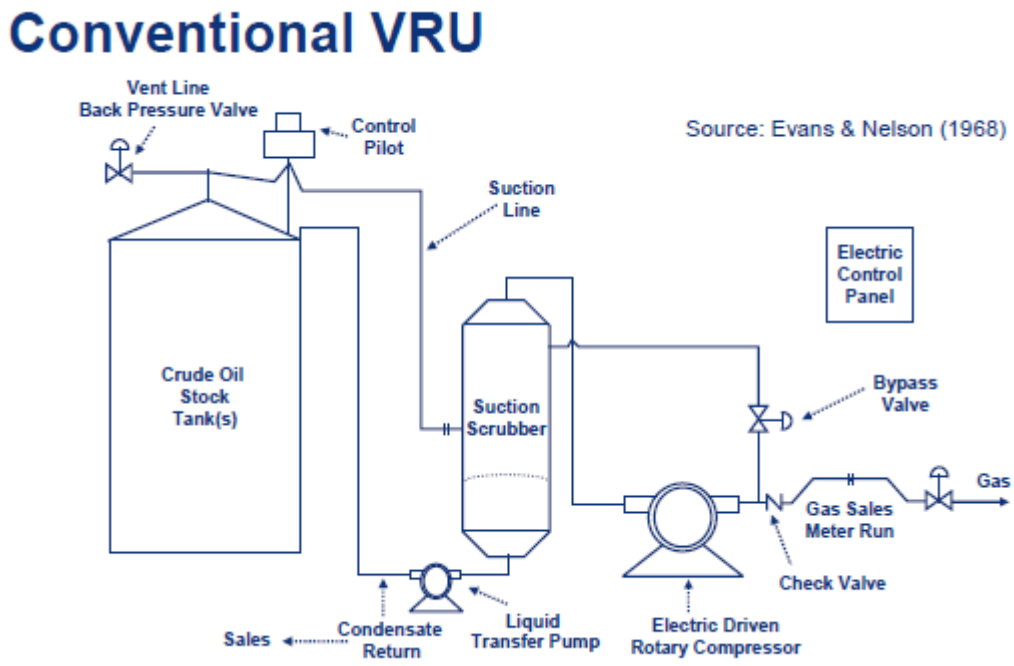

Figure 4-1. Conventional Vapor Recovery System

Control Effectiveness

Vapor recovery units have been shown to reduce VOC emissions from storage vessels by over 95 percent.[22] When operating properly, VRUs generally approach 100 percent efficiency. We recognize that VRUs may not continuously meet this efficiency in practice. Therefore, our analysis assumes a 95 percent reduction in VOC emissions for a VRU. A VRU recovers hydrocarbon vapors that potentially can be used as supplemental burner fuel, or the vapors can be condensed and collected as condensate that can be sold. If natural gas is recovered, it can be sold as well, as long as a gathering line is available to convey the recovered salable gas product to market or to further processing. A VRU cannot be used in all instances. Conditions that affect the feasibility of the use of a VRU include: the availability of electrical service sufficient to power the compressor; fluctuations in vapor loading caused by surges in throughput and flash emissions from the storage vessel; potential for drawing air into condensate storage vessels causing an explosion hazard; and lack of appropriate destination or use for the vapor recovered.

[22] Ibid.

Cost Impacts

Cost data for a VRU obtained from an initial economic impact analysis prepared for proposed state-only revisions to a Colorado regulation are presented here.[23] We assumed cost information contained in the Colorado economic impact analysis to be given in 2012 dollars. According to the Colorado economic impact analysis, the cost of a VRU was estimated to be $90,000. Including costs associated with freight and design, and the cost of VRU installation, we estimated costs to be $102,802 ($90,000 plus $12,802). We also added an estimated storage vessel retrofit cost of $68,736 assuming that the cost of retrofitting an existing storage vessel was 75 percent of the purchased equipment cost (i.e., VRU capital cost and freight and design cost).[24] Based on these costs, we estimated the total capital investment of the VRU to be $171,538. These cost data are presented in Table 4-3. We estimated total annual costs using 2012 dollars to be $28,230 per year without recovered natural gas savings. The uncontrolled emissions from a storage vessel are largely dependent on the bbl/year throughput (see Table 4-2), which greatly influences both the controlled emissions and the cost of control per ton of VOC reduced. Costs may vary due to VRU design capacity, system configuration, and individual site needs and recovery opportunities.

In order to assess the cost of control of a VRU for uncontrolled storage vessels that emit differing emissions, we evaluated the cost of routing VOC emissions from an existing uncontrolled storage vessel to a VRU for a storage vessel that emits 2 tpy, 4 tpy, 6 tpy, 8 tpy, 10 tpy, 12 tpy, and 25 tpy. We estimated the cost of control without savings by dividing the total annual costs without savings by the tpy reduced assuming 95 percent control. The cost of control with savings is calculated by assuming a 95 percent reduction of VOC emissions by the VRU and converting the reduced VOC emissions to natural gas savings. Table 4-4 presents the estimated natural gas savings and the VOC cost per ton of VOC reduced with and without savings.

NMED Exhibit 34

Table 4-3. Total Capital Investment and Total Annual Costs of a Vapor Recovery Unit System

Cost Item[a]	Cost ($2012)
Capital Cost Items	
VRU[a]	$90,000
Freight and Design[a]	$1,648
VRU Installation[a]	$11,154
Storage Vessel Retrofit[b]	$68,736
Total Capital Investment	$171,538
Annual Cost Items	
Maintenance	$9,396
Capital Recovery (7 percent interest, 15 year equipment life) ($/yr)	$18,834
Total Annual Costs w/o Savings ($/yr)	***$28,230***

[a] Cost data from the Initial Economic Impact Analysis for proposed revisions to Colorado Air Quality Control Commission Regulation Number 7, Submitted with Request for Hearing Documents on November 15, 2013.
[b] Assumes the storage vessel retrofit cost is 75 percent of the purchased equipment price (assumed to include vent system and piping to route emissions to the control device). Retrofit assumption from Exhibit 6 of the EPA Natural Gas Star Lessons Learned, *Installing Vapor Recovery Units on Storage Tanks*. October 2006.

Table 4-4. Cost of Routing Emissions from an Existing Uncontrolled Storage Vessel to a VRU ($/ton of VOC Reduced)

Uncontrolled Storage Vessel Emissions (tpy)	Cost per Ton of VOC Reduced ($2012)		
	Without Savings	Natural Gas Savings (Mscf/yr)[a]	With Savings[b]
2	$14,858	59	$14,734
4	$7,429	118	$7,305
6	$4,953	177	$4,828
8	$3,714	236	$3,590
10	$2,972	295	$2,847
12	$2,476	353	$2,352
25	$1,189	736	$1,065

[a] The natural gas savings was calculated by assuming 95 percent VOC recovery and 31 Mscf/yr natural gas savings per ton of VOC recovered.
[b] Assumes a natural gas price of $4.00 per Mcf.

Additionally, if a VRU is used to control VOC emissions from multiple storage vessels, the VOC emissions cost of control would be reduced because the cost for the additional storage vessel(s) would only include the storage vessel retrofit costs, and the overall VOC emission reductions would increase.

4.3.1.2 Routing Emissions to a Combustion Device

Description and Control Effectiveness

Combustors (e.g., enclosed combustion devices, thermal oxidizers and flares that use a high-temperature oxidation process) are also used to control emissions from storage vessels. Combustors are used to control VOC in many industrial settings, since the combustor can normally handle fluctuations in concentration, flow rate, heating value, and inert species content.[25] For this analysis, we assumed that the types of combustors installed in the oil and natural gas industry can achieve at least a 95 percent control efficiency on a continuing basis.[26] We note that combustion devices can be designed to meet 98 percent control efficiencies, and can control, on average, emissions by 98 percent or more in practice when properly operated.[27] We also recognize that combustion devices that are designed to meet a 98 percent control efficiency may not continuously meet this efficiency in practice, due to factors such as variability of field conditions.

A typical combustor used to control emissions from storage vessels in the oil and natural gas industry is an enclosed combustion system. The basic components of an enclosed combustion system include (1) piping for collecting emission source gases, (2) a single- or multiple-burner unit, (3) a stack enclosure, (4) a pilot flame to ignite the mixture of emission source gas and air and (5) combustor fuel/piping (as necessary). Figure 4-2 presents a schematic of a typical dual-burner enclosed combustion system.

[26] U.S. Environmental Protection Agency. *Air Pollution Control Technology Fact Sheet: FLARE*. Clean Air Technology Center.

[27] The EPA has currently reviewed performance tests submitted for 19 different makes/models of combustor control devices and confirmed that they meet the performance requirements in NSPS subpart OOOO and NESHAP subparts HH and HHH. All reported control efficiencies were above 99.9 percent at tested conditions. The EPA notes that the control efficiency achieved in the field is likely to be lower than the control efficiency achieved at a bench test site under controlled conditions, but we believe that these units should have no problem meeting 95 percent control continuously and 98 percent control on average when designed and properly operated to meet 98 percent control.

NMED Exhibit 34

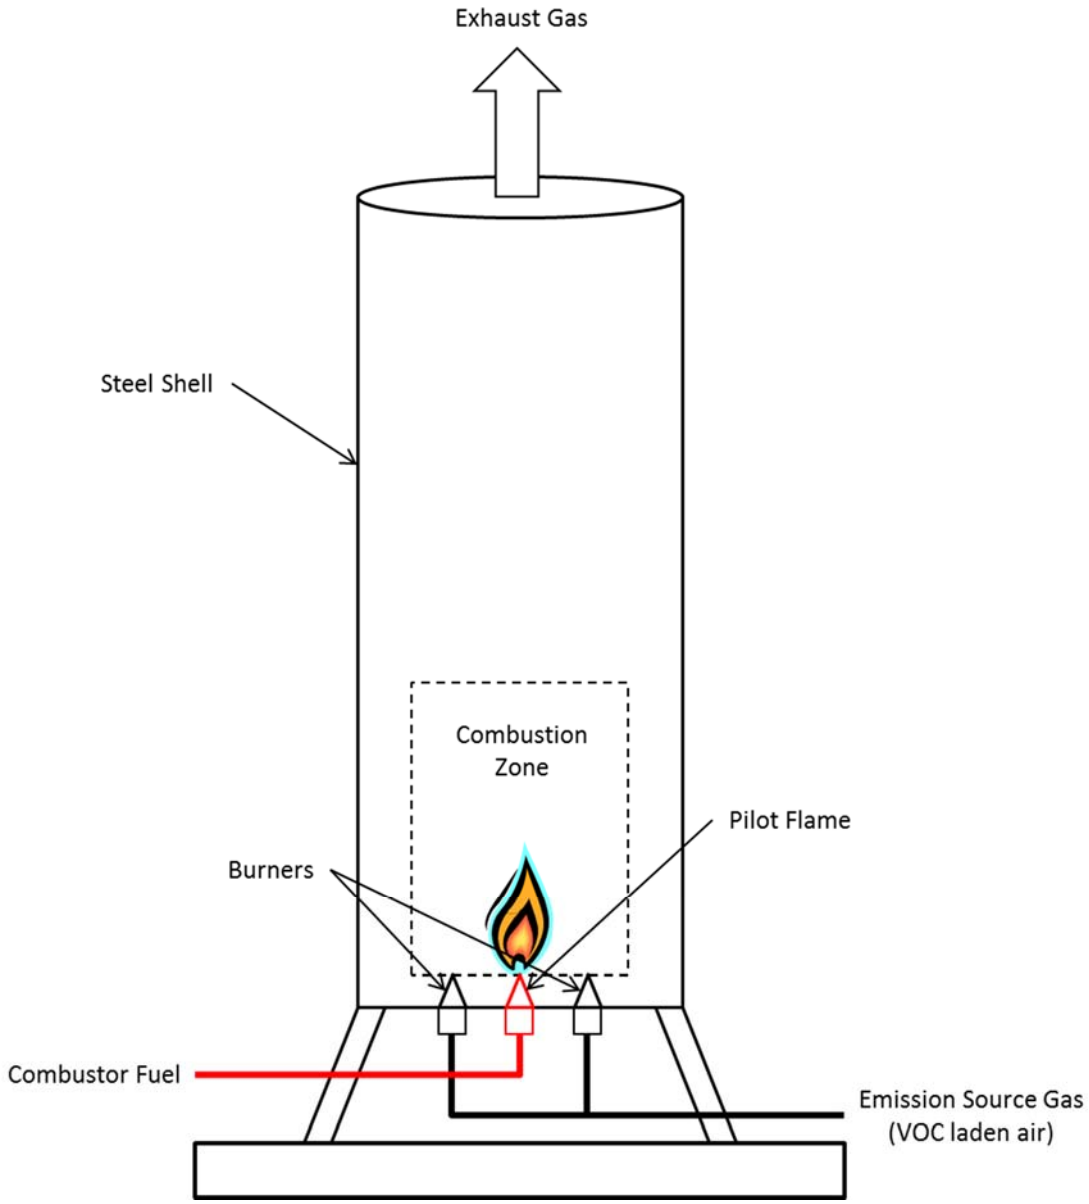

Figure 4-2. Schematic of a Typical Enclosed Combustion System

Thermal oxidizers, also referred to as direct flame incinerators, thermal incinerators, or afterburners, could also be used to control VOC emissions. Similar to a basic enclosed combustion device, a thermal oxidizer uses burner fuel to maintain a high temperature (typically 800-850°C) within a combustion chamber. The VOC laden emission source gas is injected into the combustion chamber where it is oxidized (burned), and then the combustion products are exhausted to the atmosphere. Figure 4-3 provides a basic schematic of a thermal oxidizer.[28]

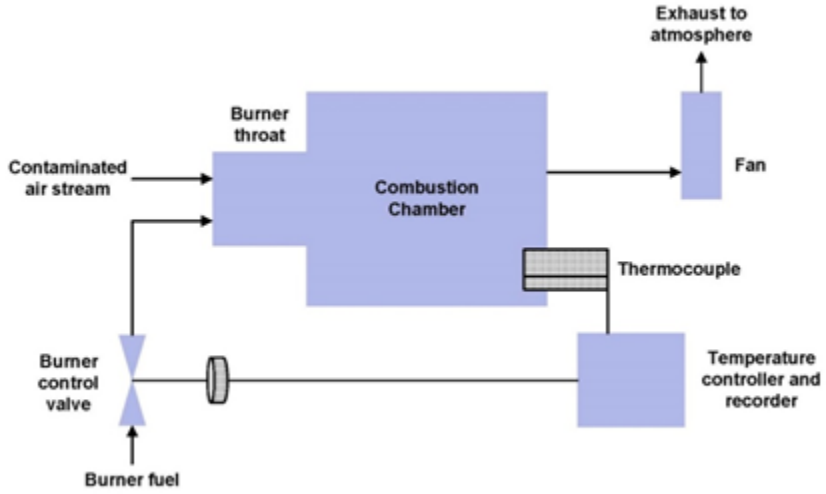

Figure 4-3. Basic Schematic of a Thermal Oxidizer

Cost Impacts

For combustion devices, we obtained cost data from the initial economic impact analysis prepared for state-only revisions to the Colorado regulation.[29] In addition to these cost data, we added line items for operating labor, a surveillance system and data management. This is consistent with the guidelines outlined in the EPA's Office of Air Quality Planning and Standards (OAQPS) Control Cost Manual (OCCM) for combustion devices and the cost analysis prepared for the 2012 NSPS.[30,31] However, OCCM guidelines specify 630 operating labor hours

[28] U.S. Environmental Protection Agency. Technology Transfer Network. Clearinghouse for Inventories and Emission Factors. *Thermal Oxidizer*. Website: https://cfpub.epa.gov/oarweb/mkb/contechnique.cfm?ControlID=17.

per year for a combustion device, which we believe is unreasonable because many of these sites are unmanned and would most likely be operated remotely. Therefore, we assumed that the operating labor would be more similar to that estimated for a condenser in the OCCM, 130 hours per year. We estimated a total capital investment of $100,986 and total annual costs of $25,194 per year. The total capital investment cost includes a storage vessel retrofit cost of $68,736 (as discussed previously for VRUs) to accommodate the use of a combustion device. These cost data are presented in Table 4-5.

Table 4-5. Total Capital Investment and Total Annual Costs of a Combustor[32]

Cost Item[a]	Cost ($2012)

[d] Cost obtained from 2012 NSPS TSD and escalated using the change in GDP: Implicit Price Deflator from 2008 to 2012 (percent)(which was 5.69 percent). Source: FRED GDP: Implicit Price Deflator from Jan 2008 to Jan 2012 (http://research.stlouisfed.org/fred2/series/GDPDEF/#).
[e] Retrofit cost obtained from Storage Vessel Retrofit in Table 4-3 (assumed to include vent system and piping to route emissions to the control device).
[f] Operating labor consists of labor resources for technical operation of device (130 hr/yr) and supervisory labor (15 percent of technical labor hours). Maintenance labor hours are assumed to be the same as operating labor (130 hr/yr). Labor rates are $32.00/hr (for technical and maintenance labor) and $51.03 (supervisory labor) and were obtained from the U.S. Department of Labor, Bureau of Labor Statistics, Employer Costs for Employee Compensation, December 2012. Labor rates account for total compensation (wages/salaries, insurance, paid leave, retirement and savings, supplemental pay and legally required benefits).

As noted previously, storage vessels vary in size and throughputs and the uncontrolled emissions from a storage vessel are largely dependent on the bbl/year throughput (see Table 4-2), which greatly influences both the controlled emissions and cost of control. In order to assess the cost of control of combustion for uncontrolled storage vessels that emit differing emissions, we evaluated the costs of routing VOC emissions from an existing storage vessel to a combustion device for an existing uncontrolled storage vessel that emits 2 tpy, 4 tpy, 6 tpy, 8 tpy, 10 tpy, 12 tpy and 25 tpy. We estimated the cost of control without savings by dividing the total annual costs without savings by the tpy reduced assuming 95 percent control. Table 4-6 presents these costs. The VOC emissions cost of control per ton of VOC reduced would be less if a combustion device is used to control uncontrolled VOC emissions from multiple storage vessels because the cost for the additional storage vessel(s) would only include storage vessel retrofit costs, and the overall VOC emission reductions would increase.

Table 4-6. Cost of Routing Emissions from an Existing Uncontrolled Storage Vessel to a Combustion Device ($/ton of VOC Reduced)

Uncontrolled Storage Vessel Emissions (tpy)	Cost per Ton of VOC Reduced ($2012)
2	$13,260
4	$6,630
6	$4,420
8	$3,315

NMED Exhibit 34

Uncontrolled Storage Vessel Emissions (tpy)	Cost per Ton of VOC Reduced ($2012)
10	$2,652
12	$2,411
25	$2,210

4.3.1.3 Routing Emissions to a VRU with a Combustion Device as Backup

Industry practice also includes the primary operation of a VRU and secondary operation of a combustion device during VRU maintenance and other times requiring VRU downtime. Using the costs for a VRU and combustion device presented in sections 4.3.1.1 and 4.3.1.2, and assuming the VRU is operated 95 percent of the year and a combustion device is operated 5 percent of the year, we estimated total annual costs using 2012 dollars to be $32,006 per year without recovered natural gas savings. As stated previously, the uncontrolled emissions from a storage vessel are largely dependent on the bbl/year throughput (see Table 4-2), which greatly influences both the controlled emissions and the cost of control per ton of VOC reduced. Costs may vary due to VRU design capacity, system configuration, and individual site needs and recovery opportunities, as well as the percent of time that a VRU is down during the year where emissions are routed to a combustion device. In order to assess the cost of control of a VRU with the use of a combustion device during downtime for uncontrolled storage vessels that emit differing emissions, we evaluated the costs of routing VOC emissions from an existing storage vessel to a VRU/combustion device for an existing uncontrolled storage vessel that emits 2 tpy, 4 tpy, 6 tpy, 8 tpy, 10 tpy, 12 tpy and 25 tpy. We estimated the cost of control without savings by dividing the total annual costs without savings by the tpy reduced assuming 95 percent control. The cost of control with savings is calculated by assuming a 95 percent reduction of VOC emissions by the VRU (used 95 percent of the year) and converting the reduced VOC emissions to natural gas savings. Table 4-7 presents these costs. The VOC emissions cost of control per ton of VOC reduced would be less if a VRU/combustion device is used to control uncontrolled VOC emissions from multiple storage vessels because the cost for the additional storage vessel(s) would only include storage vessel retrofit costs, and the overall VOC emission reductions would increase.

Table 4-7. Cost of Routing Emissions from an Existing Uncontrolled Storage Vessel to a VRU/Combustion Device ($/ton of VOC Reduced)

Uncontrolled Storage Vessel Emissions (tpy)	Cost per Ton of VOC Reduced ($2012)		
	Without Savings	Natural Gas Savings (Mscf/yr)[a]	With Savings[b]
2	$16,845	56	$16,728
4	$8,423	112	$8,305
6	$5,615	168	$5,497
8	$4,211	224	$4,094
10	$3,369	280	$3,251
12	$2,808	336	$2,690
25	$1,348	699	$1,230

[a] The natural gas savings was calculated by assuming 95 percent VOC recovery and 31 Mscf/yr natural gas savings per ton of VOC recovered.
[b] Assumes a natural gas price of $4.00 per Mcf.

4.3.2 Existing Federal, State and Local Regulations

4.3.2.1 Federal Regulations that Specifically Require Control of VOC Emissions

Under the 2012 NSPS and 2013 NSPS Reconsideration, new or modified storage vessels with PTE VOC emissions of 6 tpy or more must reduce VOC emissions by at least 95 percent, or demonstrate emissions from a storage vessel have dropped to less than 4 tpy of VOC without emission controls for 12 consecutive months.

4.3.2.2 State and Local Regulations that Specifically Require Control of VOC Emissions[33]

States may have permitting restrictions on VOC emissions that may apply to an emissions source as a result of an operating permit, or preconstruction permit based on air quality maintenance or improvement goals of an area. Permits specify what construction is allowed, what emission limits must be met, and how the source must be operated. To ensure that sources

[33] Brown, Heather, EC/R Incorporated. Memorandum prepared for Bruce Moore, EPA/OAQPS/SPPD/FIG. *Revised Analysis to Determine the Number of Storage Vessels Projected to be Subject to New Source Performance Standards for the Oil and Natural Gas Sector.* 2013.

follow the permit requirements, permits also contain monitoring, recordkeeping and reporting requirements.

The environmental regulations in nine of the top oil and natural gas producing states (sometimes with varying local ozone nonattainment area/concentrated area development requirements) (see Table 4-8) require the control of VOC emissions from storage vessels in the oil and natural gas industry. These states include California, Colorado, Kansas, Louisiana, Montana, North Dakota, Oklahoma, Texas, and Wyoming. All except Wyoming require 95 percent emission control with the application of a VRU or combustion (Wyoming requires 98 percent control of emissions using a VRU or combustion).

Existing state regulations that apply to storage vessels in the oil and natural gas industry apply to all storage vessels in a tank battery, or include an applicability threshold based on (1) capacity, (2) the vapor pressure of liquids contained in a storage vessel of a specified capacity, and (3) the PTE of an individual storage vessel. Table 4-8 presents a brief summary of the storage vessel emission control applicability cutoffs in regulations from these nine states. Four states (Colorado, Montana, Texas, and Wyoming) have applicability thresholds in terms of VOC emissions. The remaining five states have storage vessel regulations that are in terms of tank characteristics, such as vapor pressure, tank size, or tank contents. Equivalency of applicability thresholds based on tank and stored liquid characteristics and applicability thresholds based on VOC emissions cannot be determined. We analyzed the varying state VOC emission thresholds (based on a range of 2 tpy to 25 tpy) as part of our cost of control analysis for VRUs and combustion devices in section 4.3.1 of this chapter.

Table 4-8. Summary of Storage Vessel Applicability Thresholds from Nine States

State/Local Authority	Applicability Threshold
Texas	Applies to storage vessels with VOC emissions greater than 25 tpy.
California Bay Area AQMD	Applies to storage vessels with capacity greater than 264 gallons.
California Feather River AQMD	Applies to storage vessels with capacity greater than 39,630 gallons.
California Monterey Bay Unified APCD	Applies to storage vessels with capacity greater than 39,630 gallons.

NMED Exhibit 34

State/Local Authority	Applicability Threshold
California Sacramento Metropolitan AQMD	Applies to storage vessels with capacity greater than 40,000 gallons.
California San Joaquin Valley Unified APCD	Applies to storage vessels with capacity greater than 1,100 gallons.
California Santa Barbara County APCD	Applies to all storage vessels in tank battery (including wash tanks, produced water tanks, and wastewater tanks).
California South Coast AQMD	Applies to storage vessels with capacity greater than 39,630 gallons with a true vapor pressure of 0.5 psia or greater and storage vessels with a capacity greater than 19,815 gallons with a true vapor pressure of 1.5 psia or greater.
California Ventura County APCD	Applies to all storage vessels. Requirements depend on gallon capacity and true vapor pressure of material contained in vessel.
California Yolo-Solano AQMD	Applies to storage vessels with capacity greater than 40,000 gallons.
North Dakota	NDAC 33-15-07: submerged filling requirements to control VOC for tanks >1,000 gallons.
Federal Implementation Plan (FIP): Fort Berthold Indian Reservation	Applies to all storage vessels (except those covered by NSPS subpart OOOO). There is no minimum threshold under the final FIP.
Louisiana	Applies to storage vessels more than 250 gallons up to 40,000 gallons with a maximum true vapor pressure of 1.5 psia or greater.
Oklahoma	Applies to storage vessels with capacity greater than 40,000 gallons (in ozone nonattainment areas).
Wyoming – Statewide	Applies to storage vessels with greater than or equal to 10 tpy VOC within 60 days of startup/modification.
Wyoming – Concentrated Development Area	Applies to storage vessels with greater than or equal to 8 tpy VOC within 60 days of startup/modification.
Kansas	Permanent fixed roof storage tanks >40,000 gallons and external floating roof storage tanks.
Colorado	Condensate tanks with uncontrolled VOC emissions > 20 tpy (2 tpy located at gas processing plants in ozone non-attainment areas).

State/Local Authority	Applicability Threshold
Montana	Applies to oil or condensate storage tanks with a PTE greater than 15 tpy VOC.

4.4 Recommended RACT Level of Control

As discussed in section 4.3.2 of this chapter, existing federal and state and local regulations already require the reduction of VOC emissions from storage vessels in the oil and natural gas industry at or greater than 95 percent. Further, we note that combustion devices can be designed to meet 98 percent control efficiencies and can control, on average, emissions by 98 percent or more in practice when properly operated.[34] We also recognize that combustion devices designed to meet 98 percent control efficiency may not continuously meet this efficiency in practice, due to factors such as the variability of field conditions. Therefore, the recommendations specify that devices should be required to continuously meet at least 95 percent VOC control efficiency. In light of the above considerations, a continuous 95 percent reduction of VOC emissions from storage vessels in the oil and natural gas industry is a reasonable recommended RACT level of control.

Although sources may have a choice on how they meet the recommended RACT level of control, if air agencies choose to adopt the recommended RACT contained in this CTG, the technologies that may be used to meet the recommended RACT level of control for oil and natural gas industry storage vessels are capturing and routing emissions to the process via a VRU and/or routing emissions to a combustion device.

As discussed in section 4.2.2 of this chapter, the VOC emissions from storage vessels vary significantly, depending on the rate of liquid entering and passing through the vessel (i.e., its throughput), the pressure of the liquid as it enters the atmospheric pressure storage vessel, the liquid's volatility, and temperature of the liquid. Some storage vessels have negligible emissions, such as those with very little throughput and/or handling heavy liquids entering at atmospheric

[34] The EPA has currently reviewed performance tests submitted for 19 different makes/models of combustor control devices and confirmed they meet the performance requirements in NSPS subpart OOOO and NESHAP subparts HH and HHH. All reported control efficiencies were above 99.9 percent at tested conditions. EPA notes that the control efficiency achieved in the field is likely to be lower than the control efficiency achieved at a bench test site under controlled conditions, but we believe that these units should have no problem meeting 95 percent control continuously and 98 percent control on average when designed and properly operated to meet 98 percent control.

NMED Exhibit 34

pressure where it would not be cost-effective to require emission control requirements. Existing state regulations that apply to storage vessels in the oil and natural gas industry apply to all storage vessels in a tank battery, or include an applicability threshold based on (1) capacity, (2) the vapor pressure of liquids contained in a storage vessel of a specified capacity, and (3) the PTE of an individual storage vessel. Based on information gathered under the 2012 NSPS, [35] throughput and capacity of a storage vessel is not always the best indicator of a storage vessel's emissions, and we believe that the PTE of an individual storage vessel is preferable to use as an applicability threshold for storage vessels.

Based on our analyses conducted in support of the 2012 NSPS, 6 tpy was determined to be the applicability threshold for requiring 95 percent control of VOC emissions from new storage vessels (estimated to cost, on average, approximately $3,400 per ton of VOC reduced). Our analyses conducted for our RACT recommendation also found 6 tpy to be the applicability threshold for requiring 95 percent control of VOC emissions from existing storage vessels (estimated to cost, on average, between $4,400 and $5,000 per ton of VOC reduced). Based on these analyses, we recommend that the 95 percent VOC emission control of storage vessels only apply to storage vessels that have a PTE greater than or equal to 6 tpy of VOC emissions. The VOC cost of control per ton of VOC reduced would be less if a combustion device or VRU is used to control VOC emissions from multiple storage vessels because the cost for the additional storage vessels would only include storage vessel retrofit costs, and the overall VOC emission reductions would increase.

We recommend an alternative RACT level of control for storage vessels that have a PTE VOC at or greater than 6 tpy that have actual emissions less than that on a continuing basis. For these storage vessels, if it can be demonstrated that the storage vessel has actual emissions less than 4 tpy for 12 consecutive months, we recommend that they be allowed to maintain and show continued compliance that their emissions are below 4 tpy in lieu of requiring 95 percent control. This alternative recommendation acknowledges that there are storage vessels that have a PTE greater than or equal to 6 tpy whose actual emissions have declined over time, usually because of declining production. This alternative RACT recommendation is informed by the 2012 NSPS, where we concluded that, based on "the cost-effectiveness, the secondary environmental impacts

[35] 77 FR 49490, August 16, 2012.

NMED Exhibit 34

and the energy impacts…BSER for reducing VOC emissions from storage vessel affected facilities is not represented by continued control when their sustained (i.e., for 12 consecutive months) uncontrolled emission rates fall below 4 tpy."[36]

In summary, we recommend the following as RACT for storage vessels in the oil and natural gas industry:

(1) RACT for Condensate Storage Vessels: Reduce emissions by 95 percent continuously from condensate storage vessels with a PTE ≥ 6 tpy of VOC; or demonstrate (based on 12 consecutive months of uncontrolled actual emissions) and maintain uncontrolled actual VOC emissions from storage vessels with a PTE greater than or equal to 6 tpy at less than 4 tpy.[37]

(2) RACT for Crude Oil Storage Vessels: Reduce emissions by 95 percent continuously from crude oil storage vessels with a PTE ≥ 6 tpy of VOC; or demonstrate (based on 12 consecutive months of uncontrolled actual emissions) and maintain uncontrolled actual VOC emissions from storage vessels with a PTE greater than or equal to 6 tpy at less than 4 tpy.[38]

4.5 Factors to Consider in Developing Storage Vessel Compliance Procedures

4.5.1 Compliance Recommendations When Using a Control Device

Improper design or operation of the storage vessel and its control system can result in occurrences where peak flow overwhelms the storage vessel and its capture systems, resulting in emissions that do not reach the control device, effectively reducing the control efficiency. We believe that it is essential that operators employ properly designed, sized, and operated storage vessels to achieve effective emission control. We believe that such efforts on the part of owners and operators can result in more effective control of VOC emissions from storage vessels.

In order to ensure that VOC emissions are reduced by at least 95 percent (the recommended RACT level of control) from a storage vessel when using a control device or other

[36] Oil and Natural Gas Sector: Reconsideration of Certain Provisions of New Source Performance Standards Final Amendments. Federal Register Notice. (78 FR 58429, September 23, 2013).
[37] We recommend that, prior to allowing the use of the uncontrolled 4 tpy actual VOC emissions rate for compliance purposes, air agencies require sources demonstrate that the uncontrolled actual VOC emissions have remained less than 4 tpy for 12 consecutive months. After such demonstration, we recommend that air agencies require that sources demonstrate continued compliance with the uncontrolled actual VOC emission rate each month.
[38] See footnote 37.

NMED Exhibit 34

control measure (such as routing to a process), the storage vessel should be equipped with a cover that is connected through a closed vent system that captures and routes emissions to the control device (or process). We recommend cover, closed vent system and control device design and compliance measures to ensure that control measures meet the RACT level of control. Recommended cover and closed vent system design and operation measures are specified in sections 4.5.1.1 and 4.5.1.2. Recommended control device operation and monitoring provisions for specified controls to ensure compliance are presented in sections 4.5.1.3 and 4.5.1.4. The appendix to this document presents example model rule language that incorporates the compliance elements recommended in this section that air agencies may choose to use in whole or in part.

4.5.1.1 Recommendations for Cover Design

The cover and all openings on the cover (e.g., access hatches, sampling ports, pressure relief valves, and gauge wells) should form a continuous impermeable barrier over the entire surface area of the liquid in the storage vessel. Each cover opening should be secured in a closed, sealed position (gasket lid or cap) whenever material is in the unit except when it is necessary to open as follows:

(1) To add material to or remove material from the unit (including openings necessary to equalize or balance the internal pressure of the unit following changes in the level of material in the unit);

(2) To inspect or sample the material in the unit;

(3) To inspect, maintain, repair, or replace equipment located in the unit; or

(4) To vent liquids, gases or fumes from the unit through a closed vent system designed and operated in accordance with specified closed vent system requirements (see section 4.5.1.2) or to a process.

It is recommended that air agencies require the storage vessel thief hatch be equipped, maintained and operated with a weight, or other mechanism, to ensure that the lid remains properly seated. It is recommended that air agencies require the gasket material for the hatch be selected based on composition of the fluid in the storage vessel and weather conditions.

It is also recommended that air agencies require monthly olfactory, visual and auditory inspections of covers for defects that could result in air emissions. Any detected defects should be required to be repaired as soon as practicable.

NMED Exhibit 34

4.5.1.2 Recommendations for Closed Vent Systems

The closed vent system should be designed and operated with no detectable emissions (which can be monitored by monthly olfactory, visual and auditory inspections). It is recommended that air agencies require that any detected defects be repaired as soon as practicable.

With the exception of low leg drains, high point bleeds, analyzer vent, open-ended valves and safety devices, if the closed vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device or to a process, it is recommended that air agencies require owners and operators either:

(1) Install, calibrate, maintain and operate a flow indicator at the inlet to the bypass device that could divert the stream away from the control device or process to the atmosphere that sounds an alarm, or initiates notification via remote alarm to the nearest field office, when the bypass device is open such that the stream is being, or could be, diverted away from the control device or process to the atmosphere; or

(2) Secure the bypass device valve installed at the inlet to the bypass device in the non-diverting position using a car-seal or a lock-and-key type configuration.

4.5.1.3 Recommendations When "Routing to a Process" or to a VRU

Routing to a process would entail routing emissions via a closed vent system to any enclosed portion of a process unit where the emissions are predominantly recycled and/or consumed in the same manner as a material that fulfills the same function in the process and/or transformed by chemical reaction into materials that are not regulated materials and/or incorporated into a product and/or recovered. Vapor recovery units and flow lines that "route emissions to a process" would be considered part of the process and would not be considered control devices that are subject to standards, but the recommended cover and closed vent system design, operation and monitoring requirements specified in sections 4.5.1.1 and 4.5.1.2 would apply.

4.5.1.4 Recommendations for Control Device Operation and Monitoring

If a control device is used to comply with the recommended 95 percent VOC emission reduction RACT level of control, it is recommended that air agencies require that the device

NMED Exhibit 34

operate at all times when gases, vapors, and fumes are vented from the storage vessel subject to VOC emission requirements through the closed vent system to the control device.

For control devices used to meet the recommended RACT, it is recommended that air agencies require owners and operators follow the manufacturer's written operating instructions, procedures and maintenance schedule to ensure good air pollution control practices for minimizing emissions.

If an owner or operator complies with the recommended RACT by using a combustion device, it is recommended that air agencies require initial and periodic performance testing (no later than 60 months after the initial performance test) to demonstrate initial and continued compliance with the recommended RACT level of control. Additionally, for each combustion device used to comply with the recommended continuous 95 percent VOC emission reduction, it is recommended that air agencies require owners and operators conduct the following control device compliance assurance measures: (1) Monthly visual inspections or monitoring to confirm that the pilot is lit when vapors are routed to it. (2) Monthly inspections to monitor for visible emissions from the combustion device using section 11 of EPA Method 22 of appendix A of part 60. It is recommended that the observation period be 15 minutes and that devices be operated with no visible emissions, except for periods not to exceed a total of one minute during any 15-minute period. (3) Monthly olfactory, visual and auditory inspections associated with the combustion device to ensure system integrity.

4.5.2 Compliance Recommendations When Complying with the 4 tpy VOC Emissions Alternative Limitation

If the alternative RACT recommendation to determine and maintain the uncontrolled actual VOC emissions from a storage vessel that has a PTE to emit greater than or equal to 6 tpy at less than 4 tpy without considering control is used, it is recommended that air agencies first require that a source demonstrate that the uncontrolled actual VOC emissions have remained less than 4 tpy as determined monthly for 12 consecutive months. After such demonstration, it is recommended that air agencies require that the source determine the uncontrolled actual VOC emission rate each month using a generally accepted model or calculation methodology. It is also recommended that such calculations be based on the average throughput for the month. If the monthly emissions determination indicates that VOC emissions from a storage vessel subject to VOC emission control requirements increases to 4 tpy or greater and the increase is not

NMED Exhibit 34

associated with fracturing or refracturing of a well feeding the storage vessel, it is recommended that air agencies require that the source comply with the 95 percent VOC emission reduction RACT level of control recommendation or that emissions be routed to a VRU.

NMED Exhibit 34

5.0 COMPRESSORS

Compressors are mechanical devices that increase the pressure of natural gas and allow the natural gas to be transported from the production site, through the supply chain, and to the consumer. The types of compressors that are used by the oil and natural gas industry as prime movers are reciprocating and centrifugal compressors. This chapter discusses the sources of VOC emissions from these compressors. This chapter also provides control techniques used to reduce VOC emissions from these compressors, along with costs and emission reductions. Finally, this chapter provides a discussion of our recommended RACT and the associated VOC emission reductions and costs for both reciprocating and centrifugal compressors.

5.1 Applicability

For the purposes of this CTG, the emissions and emission reductions discussed herein would apply to centrifugal and reciprocating compressors in the oil and natural gas industry located between the wellhead and point of custody transfer to the natural gas transmission and storage segment. As noted in section 3.2 of this document, we did not evaluate RACT for compressors located at a well site, or an adjacent well site and servicing more than one well site.

5.2 Process Description and Emission Sources

5.2.1 Process Description

5.2.1.1 Reciprocating Compressors

In a reciprocating compressor, natural gas enters the suction manifold, and then flows into a compression cylinder where it is compressed by a piston driven in a reciprocating motion by the crankshaft powered by an internal combustion engine. Emissions occur when natural gas leaks around the piston rod when pressurized natural gas is in the cylinder. The compressor rod packing system consists of a series of flexible rings that create a seal around the piston rod to prevent gas from escaping between the rod and the inboard cylinder head. However, over time, during operation of the compressor, the rings become worn and the packaging system needs to be

NMED Exhibit 34

replaced to prevent excessive leaking from the compression cylinder. See Figure 5-1 for a depiction of a typical rod compressor packing system configuration.[39]

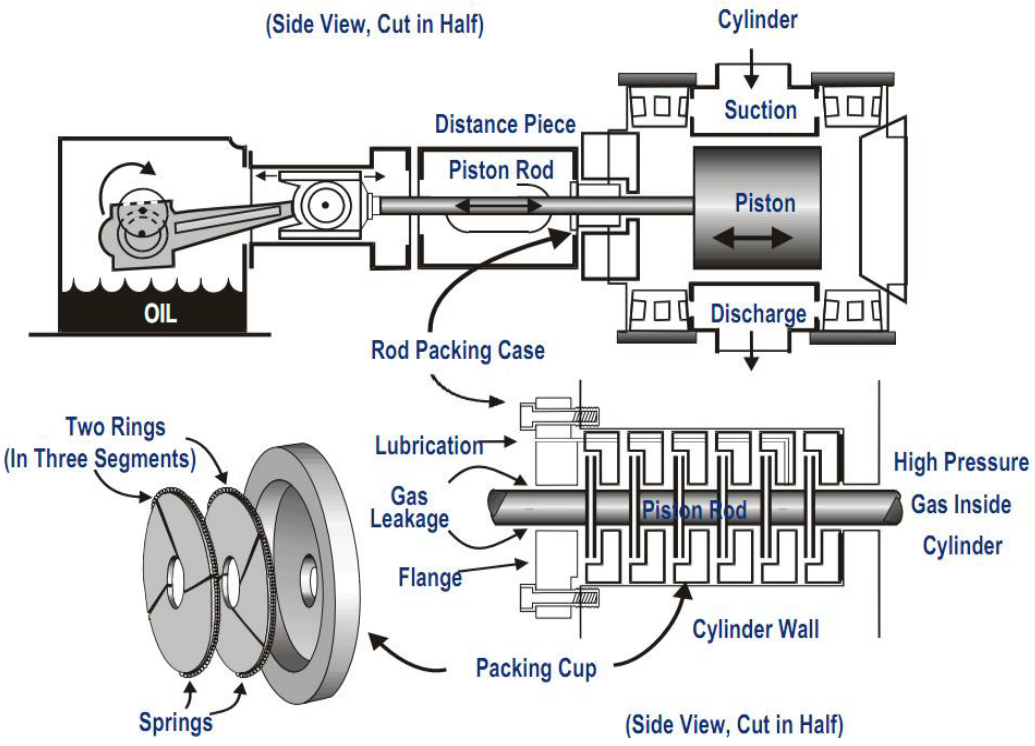

Figure 5-1. Typical Reciprocating Compressor Rod Packing System Diagram

5.2.1.2 Centrifugal Compressors

Centrifugal compressors use a rotating disk or impeller to increase the velocity of the natural gas where it is directed to a divergent duct section that converts the velocity energy to pressure energy. These compressors are primarily used for continuous, stationary transport of natural gas in the processing and transmission systems. Many centrifugal compressors use wet (meaning oil) seals around the rotating shaft to prevent natural gas from escaping where the compressor shaft exits the compressor casing. The wet seals use oil which is circulated at high pressure to form a barrier against compressed natural gas leakage. The circulated oil entrains and

[39] U.S. Environmental Protection Agency. Lessons Learned from Natural Gas STAR Partners. *Reducing Methane Emissions from Compressor Rod Packing Systems*. Natural Gas STAR Program. 2006.

NMED Exhibit 34

adsorbs some compressed natural gas that may be released to the atmosphere during the seal oil recirculation process. Figure 5-2 illustrates the wet seal compressor configuration.[40]

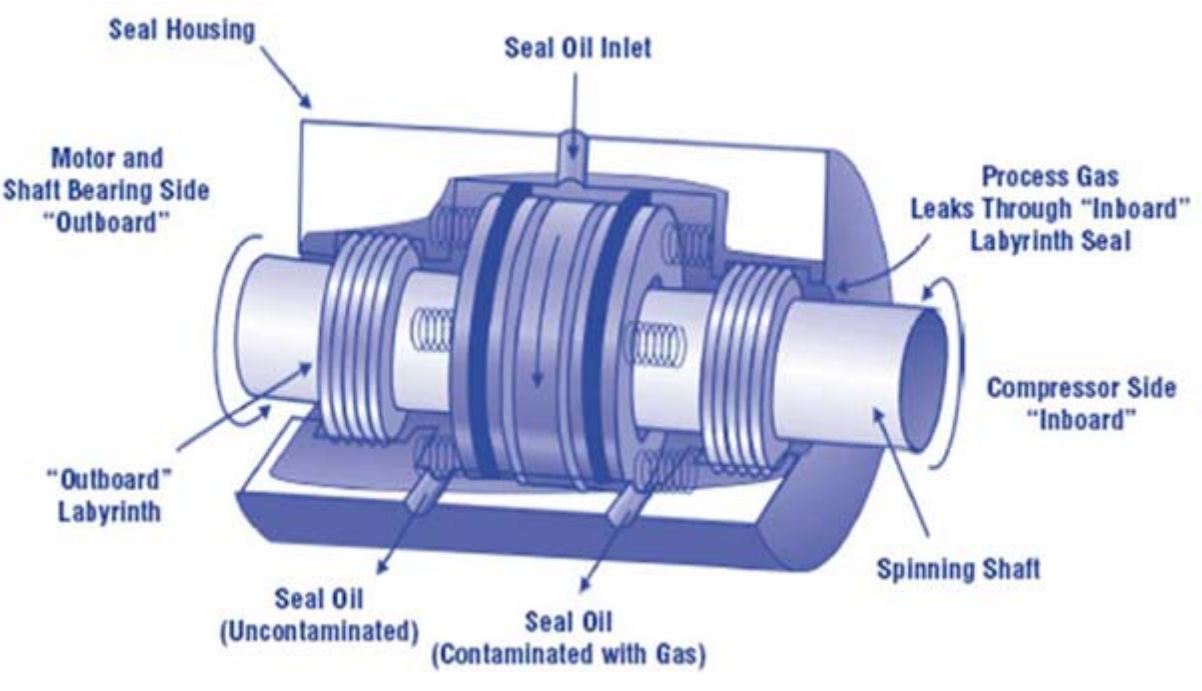

Figure 5-2. Typical Centrifugal Compressor Wet Seal

Alternatively, dry seals can be used in place of wet seals in centrifugal compressors. Dry seals prevent leakage by using the opposing force created by hydrodynamic grooves and springs (see Figure 5-3). The hydrodynamic grooves are etched into the surface of the rotating ring affixed to the compressor shaft. When the compressor is not rotating, the stationary ring in the seal housing is pressed against the rotating ring by springs. When the compressor shaft rotates at high speed, compressed natural gas has only one pathway to leak down the shaft, and that is between the rotating and stationary rings. This natural gas is pumped between the grooves in the rotating and stationary rings. The opposing force of high-pressure natural gas pumped between the rings and springs trying to push the rings together creates a very thin gap between the rings through which little natural gas can leak. While the compressor is operating, the rings are not in

[40] U.S. Environmental Protection Agency. Lessons Learned from Natural Gas STAR Partners. *Replacing Wet Seals with Dry Seals in Centrifugal Compressors*. Natural Gas STAR Program. October 2006.

NMED Exhibit 34

contact with each other and, therefore, do not wear or need lubrication. O-rings seal the stationary rings in the seal case.[41]

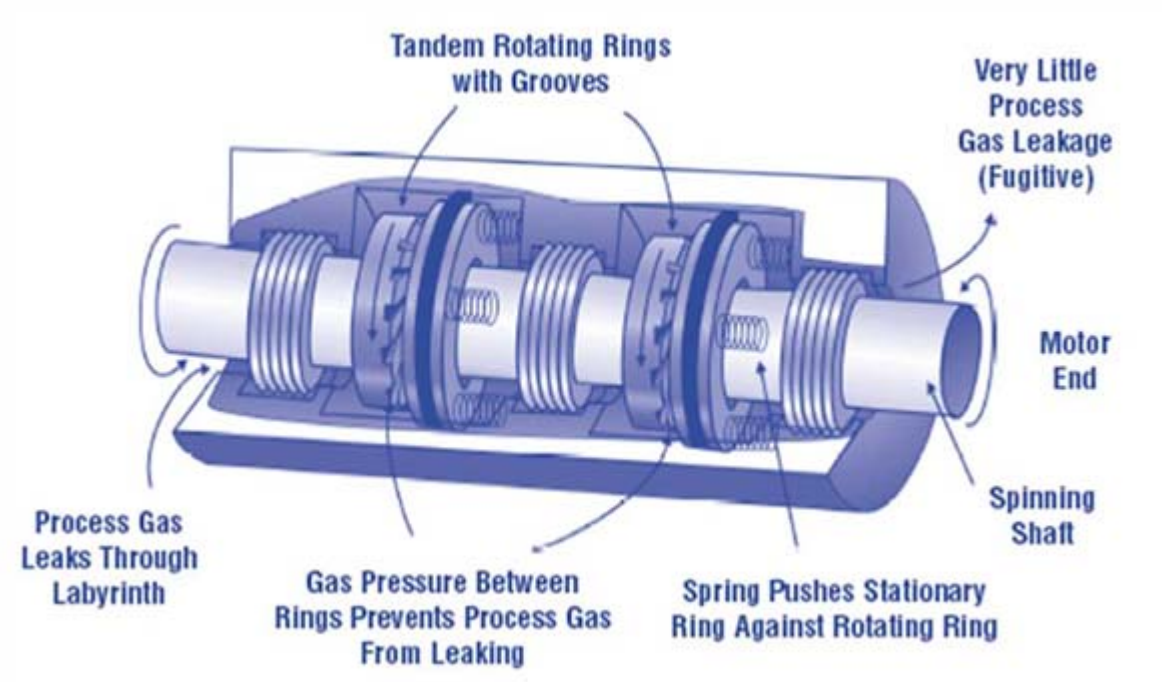

Figure 5-3. Typical Centrifugal Compressor Tandem Dry Seal

Natural gas emissions from wet seal centrifugal compressors have been found to be higher than dry seal compressors primarily due to the off-gassing of the entrained natural gas from the oil. This natural gas is not suitable for sale and is either released to the atmosphere, flared, or routed back to a process. In addition to lower natural gas leakage (and therefore lower emissions), dry seals have been found to have lower operation and maintenance costs than wet seal compressors because they are a mechanically simpler design, require less power to operate, and are more reliable. For the same reasons we explained in the 2012 NSPS and the 2015 NSPS proposal, we are not recommending RACT for dry seal compressors and instead include the use of a dry seal in place of a wet seal system as an available control option for reducing VOC emissions from wet seal centrifugal compressors (discussed in section 5.3.1.2 of this chapter). During the rulemakings for the 2012 NSPS and 2016 NSPS, we found that the dry seal system and the option of routing to a process both had at least a 95 percent control efficiency.

NMED Exhibit 34

5.2.2 Emissions Data

5.2.2.1 Summary of Major Studies and Emissions

Several studies have been conducted that provide leak estimates from reciprocating and centrifugal compressors. Table 5-1 lists these studies, along with the type of information contained in the study. In addition to these sources, we evaluated the peer reviewer and public comments received on the EPA's white paper, "Oil and Natural Gas Sector Compressors."[42]

5.2.2.2 Representative Reciprocating and Centrifugal Compressor Emissions

The centrifugal compressor methane emission factors used for processing are based on emission factor data for wet seals and dry seals from a sampling of wet seal and dry seal centrifugal compressor data that was used to calculate emissions in the GHG Inventory.

For gathering and boosting station reciprocating compressors, the 2011 NSPS TSD emission factors were used because they are considered to be the best representative emission factors at this time. Emission factors in the Clearstone study,[44] which are expressed in thousand standard cubic feet per cylinder, were multiplied by the average number of cylinders per gathering and boosting station reciprocating compressor. The volumetric methane emission rate was converted to a mass emission rate using a density of 41.63 pounds of methane per thousand cubic feet. This conversion factor was developed assuming that methane is an ideal gas and using the ideal gas law to calculate the density. A summary of the reciprocating compressor methane

[44] Clearstone Engineering Ltd. *Cost-Effective Directed Inspection and Maintenance Control Opportunities at Five Gas Processing Plants and Upstream Gathering Compressor Stations and Well Sites*. 2006.

NMED Exhibit 34

emission factors used for this analysis is presented in Table 5-2. Once the mass methane emission rate was calculated, ratios were used to estimate VOC emissions using the methane to VOC pollutant ratios developed in the 2011 Gas Composition Memorandum. The specific ratio that was used to convert methane emissions to VOC emissions is 0.278 pounds VOC per pound of methane for the production and processing segments. Table 5-3 presents a summary of the estimated methane and VOC emissions per reciprocating and centrifugal compressor (in tpy) for the production and processing segments.

Processing	210.53	19.1
Centrifugal Compressors (Dry seals)		
Processing	26	2.4

[a] For centrifugal compressors, it was assumed that 75 percent of the natural gas that is compressed is pipeline quality gas and 25 percent of the natural gas is production quality.

5.3 Available Controls and Regulatory Approaches

5.3.1 Available VOC Emission Control Options

Available controls for reducing VOC emissions from reciprocating and centrifugal compressors are presented in sections 5.3.1.1 and 5.3.1.2 of this chapter.

5.3.1.1 Reciprocating Compressors

Potential control options for reducing emissions from reciprocating compressors include control techniques that limit the leaking of natural gas past the piston rod packing. These options include: (1) increasing or specifying the frequency of the replacement of the compressor rod packing, (2) increasing or specifying the frequency of the replacement of the piston rod, (3) specifying the refitting or realignment of the piston rod, and (4) routing of emission to a process through a closed vent system under negative pressure. In addition to these options, there are emerging control techniques where specific analyses have not yet been conducted. For example, there may be potential for reducing VOC emission by updating rod packing components made from newer materials which can help improve the life and performance of the rod packing system (economic rod packing replacement) and capturing gas from the reciprocating compressor and routing it back to the compressor engine to be used as fuel. These emerging VOC emissions control techniques are discussed briefly below, along with our

NMED Exhibit 34

evaluation of the frequency of compressor rod packing/piston rod replacement and piston rod refitting and realignment control options.

We do not believe that combustion is a technically feasible control option because, as detailed in the 2011 NSPS TSD, routing of emissions to a control device can cause positive back pressure on the packing, which can cause safety issues due to gas backing up in the distance piece area and engine crankcase in some designs. While considering the option of routing of emissions to a process through a closed vent system under negative pressure, we determined that the negative pressure requirement not only ensures that all the emissions are conveyed to the process, it also avoids the issue of inducing back pressure on the rod packing and the resultant safety concerns. Although this option can be used in some circumstances, it cannot be applied in every installation. As a result, these options (i.e., routing of emissions to a control device, routing of emissions to a process through a closed vent system under negative pressure) were not further considered under this CTG.

Frequency of Rod Packing Replacement

For reciprocating compressors, one of the options for reducing VOC emissions is a maintenance task that would increase or specify the frequency of replacement of the rod packing in order to reduce the leakage of natural gas past the piston rod. Over time, the packing rings wear and allow more natural gas to escape around the piston rod. Regular replacement of these rings reduces VOC emissions. Therefore, this control technique is considered to be an available VOC emission control technique for reciprocating compressors.

Description

As noted previously, reciprocating compressor rod packing consists of a series of flexible rings that fit around a shaft to create a seal against leakage. As the rings wear, they allow more compressed natural gas to escape, increasing rod packing emissions. Rod packing emissions typically occur around the rings from slight movement of the rings in the cups as the rod moves, but can also occur through the "nose gasket" around the packing case, between the packing cups, and between the rings and shaft. If the fit between the rod packing rings and rod is too loose, more compressed natural gas will escape. Periodically replacing the packing rings ensures the correct fit is maintained between packing rings and the rod. [46]

[46] U.S. Environmental Protection Agency. Lessons Learned from Natural Gas STAR Partners. *Reducing Methane Emissions from Compressor Rod Packing Systems*. Natural Gas STAR Program. 2006.

NMED Exhibit 34

Control Effectiveness

As discussed above, regular replacement of the reciprocating compressor rod packing can reduce the leaking of natural gas across the piston rod. The potential emission reductions for gathering and boosting stations and the processing segment were calculated by comparing the average rod packing emissions with the average emissions from newly installed and worn-in rod packing.

Based on industry information from the Natural Gas STAR Program, we have determined that the additional cost of shortening the replacement period more frequently than every three years or every 26,000 hours would not be justified based on the additional emission reductions that would be achieved.[47] Therefore, we analyzed emission reductions that would result from replacing worn packing with newly installed packing at a frequency of every three years or every 26,000 hours. For the baseline, we assumed that rod packing is replaced every four years. The analysis uses Equation 1 for estimating gathering and boosting station emission reductions, and Equation 2 for estimating processing segment emission reductions that would result from replacing worn packing with newly installed packing at a frequency of every 3 years or every 26,000 hours.[48]

Equation 1

$$R_{WP}^{G\&B} = \frac{Comp_{Existing}^{G\&B}\left(E_{G\&B} - E_{New}\right) \times C \times O \times 8760}{10^6}$$

Where:

$R_{WP}^{G\&B}$ = Potential methane emission reductions from gathering and boosting stations by replacing worn packing with newly installed packing, in million cubic feet per year (MMcf/year);

$Comp_{Existing}^{G\&B}$ = Number of existing gathering and boosting station compressors;

$E_{G\&B}$ = Methane emission factor for gathering and boosting stations, in cubic feet per hour per cylinder (25.9 scfh-cylinder);

NMED Exhibit 34

E_{New} = Average emissions from a newly installed rod packing, assumed to be 11.5 cubic feet per hour per cylinder[49] for this analysis;

C = Average number of cylinders for gathering and boosting stations (i.e., 3.3);

O = Percent of time during the calendar year the average gathering and boosting station is in the operating and standby pressurized modes, 79.1 percent;

8760 = Number of hours in a year;

10^6 = Number of cubic feet in a million cubic feet.

Equation 2 $$R_P = \frac{Comp^P_{Existing}(E_P - E_{New}) \times C \times O \times 8760}{10^6}$$

Where:

R_P = Potential methane emission reductions from processing compressors replacing worn packing to newly installed packing, in million cubic feet per year (MMcf/year);

$Comp^P_{Existing}$ = Number of existing processing compressors;

E_P = Methane emission factor for processing compressors, in cubic feet per hour per cylinder, 57 scfh-cylinder;

E_{New} = Average emissions from a newly installed rod packing, assumed to be 11.5 cubic feet per hour per cylinder[50] for this analysis;

C = Average number of cylinders for processing compressors (i.e., 2.5);

O = Percent of time during the calendar year the average processing compressor is in the operating and standby pressurized modes, 89.7 percent;

8760 = Number of hours in a year;

10^6 = Number of cubic feet in a million cubic feet.

Table 5-4 presents a summary of the potential emission reductions for reciprocating compressor rod packing replacement for gathering and boosting stations and processing segment compressors based on the percent natural gas reduction calculated from the above equations. The emissions of VOC were estimated using the methane emissions calculated

[49] U.S. Environmental Protection Agency. Lessons Learned from Natural Gas STAR Partners. *Reducing Methane Emissions from Compressor Rod Packing Systems*. Natural Gas STAR Program. 2006.

above and the methane-to-VOC ratio developed for each of the segments in the 2011 Gas Composition Memorandum.

Table 5-4. Estimated Annual Reciprocating Compressor Emission Reductions from Increasing the Frequency of Rod Packing Replacement

Oil and Natural Gas Segment	Individual Compressor Emission Reductions (tons/compressor-year)	
	Methane	VOC
Gathering and Boosting	6.84	1.9
Processing	17.58	4.89

Cost Impacts

Costs for the specified frequency of replacement of reciprocating compressor rod packing documented in the 2011 NSPS TSD were obtained from a Natural Gas STAR Lessons Learned document which estimated the cost to replace the packing rings to be $1,712 per cylinder (converted from 2008 dollars to 2012 dollars). It was assumed that rod packing replacement would occur during planned shutdowns and maintenance and, therefore, no additional travel costs would be incurred for implementing the rod packing replacement program. In addition, no costs were included for monitoring because the rod packing replacement is based on the number of hours that the compressor operates or the period of time since the previous replacement. The 2011 NSPS TSD analysis assumed that, at baseline, the replacement of rod packing for reciprocating compressors occurs on average every four years based on industry information from the Natural Gas STAR Program. The cost impacts are based on the replacement frequency of the rod packing every 26,000 hours that the reciprocating compressor operates in the pressurized mode.

The 26,000 hour replacement frequency used for the cost impacts in the 2011 NSPS TSD was determined using a weighted average of the annual percentage that the reciprocating compressors are pressurized. The weighted average percentage was calculated to be 98.9 percent. This percentage was multiplied by the total number of hours in 3 years to obtain a value of 26,000 hours. Assuming an interest rate of 7 percent, the capital recovery factors (based on replacing the rod packing every 3 years or 26,000 hours) were calculated to be 0.3122 and 0.3490 for gathering and boosting stations and the processing segment, respectively. The capital

NMED Exhibit 34

costs were calculated using the average rod packing cost of $1,712 (converted from $1,620 in 2008 dollars to 2012 dollars) and the average number of cylinders per compressor (assumed to be 3.3 cylinders for gathering and boosting stations and 2.5 cylinders for processing segment compressors).[51] The annual costs were calculated using the capital costs and the capital recovery factors. Table 5-5 presents a summary of the capital and annual costs for gathering and boosting stations and the processing segment.

There are monetary savings associated with the amount of gas saved with reciprocating compressor rod packing replacement. Monetary savings associated with the amount of gas saved with reciprocating compressor rod packing replacement was estimated using a natural gas price of $4.00 per Mcf.[52] Table 5-5 presents the annual costs with savings and cost of control for reciprocating rod packing replacement for gathering and boosting stations and the processing segment.

Reciprocating compressor rod packing replacement prevents the escape of natural gas from the piston rod. In addition to reducing VOC emissions, there would be a co-benefit of reducing other emissions (such as methane) as a result of increasing the frequency of rod packing replacement.

Table 5-5. Cost of Control for Increasing the Frequency of Reciprocating Compressor Rod Packing Replacement

Oil and Gas Segment	Capital Cost ($2012)[a]	Annual Costs per Compressor ($/compressor-year)		VOC Cost of Control ($/ton)	
		Without Savings	With Savings	Without Savings	With Savings
Gathering and Boosting	$5,650	$2,153	$566	$1,131	$298
Processing	$4,280	$1,631	($2,443)	$334	($500)

NMED Exhibit 34

Frequency of Replacement and/or Realignment/Retrofitting of the Piston Rod

Like the packing rings, piston rods on reciprocating compressors also deteriorate. Piston rods, however, wear more slowly than packing rings, having a life of about 10 years.[53] Rods wear "out-of-round" or taper when poorly aligned, which affects the fit of packing rings against the shaft (and therefore the tightness of the seal) and the rate of ring wear. An out-of-round shaft not only seals poorly, allowing more leakage, but also causes uneven wear on the seals, thereby shortening the life of the piston rod and the packing seal. Replacing or upgrading the rod can reduce reciprocating compressor rod packing emissions. Also, upgrading piston rods by coating them with tungsten carbide or chrome reduces wear over the life of the rod. We assume that operators will choose, at their discretion, when to replace/realign or retrofit the rod as part of regular maintenance procedures and replace the rod when appropriate when the compressor is out of service for other maintenance such as rod packing replacement. Therefore, we did not consider this option any further.

Updated Rod Packing Material

Although specific analyses have not been conducted, there may be potential for reducing VOC emissions by updating rod packing components made from newer materials, which can help improve the life and performance of the rod packing system. One option is to replace the bronze metallic rod packing rings with longer lasting carbon-impregnated Teflon rings. Compressor rods can also be coated with chrome or tungsten carbide to reduce wear and extend the life of the piston rod.[54] Although changing the rod packing material has been identified as a potential VOC emission reduction option for reciprocating compressors, there is insufficient information on its emission reduction potential and use throughout the industry.

Economic Rod Packing Replacement

Another option facilities can use that has the potential to reduce costs and emissions is for facilities to use specific financial objectives and monitoring data to determine emission levels at which it is cost-effective to replace rings and rods. Benefits of calculating and utilizing this "economic replacement threshold" include VOC emission reductions and natural gas cost savings. Using this approach, one Natural Gas STAR partner reportedly achieved savings of over

[53] U.S. Environmental Protection Agency. Lessons Learned from Natural Gas STAR Partners. *Reducing Methane Emissions from Compressor Rod Packing Systems*. Natural Gas STAR Program. 2006.
[54] Ibid.

NMED Exhibit 34

$233,000 annually at 2006 gas prices. An economic replacement threshold approach would also result in operational benefits, including a longer life for existing equipment, improvements in operating efficiencies, and long-term savings.[55]

Gas Recovery (Routing of Emissions to a Process)

Description

Another control option for reciprocating compressors includes control techniques that recover natural gas leaking past the piston rod packing. We are aware of a system that captures the natural gas that would otherwise be vented and routes it back to the compressor engine to be used as fuel.[56] The vent gases are passed through a valve train that includes a demister and then are injected into the engine intake air after the air filter. In general, the technology consists of recovering vented emissions from the rod packing under negative pressure and routing these emissions of otherwise vented gas to the air intake of a reciprocating internal combustion engine that would burn the gas as fuel to augment the normal fuel supply. The system's computerized air/fuel control system would then adjust the normal fuel supply to accommodate the increased fuel made available from the recovered emissions and thereby take advantage of the recovered emissions while avoiding an overly rich fuel mixture.

Subpart OOOO, as well as subpart OOOOa, provide a compliance option for reciprocating compressors that allows collecting emissions from the rod packing using a rod packing emissions collection system which operates under negative pressure and routing the rod packing emissions to a process through a closed vent system. Both of the above systems, if installed using a cover and closed vent system meeting the subpart OOOO and subpart OOOOa requirements, could potentially be used for this compliance option.

Control Effectiveness

One estimate obtained by the EPA states that the gas recovery system can result in the elimination of over 99 percent of VOC emissions that would otherwise occur from the venting of the emissions from the compressor rod packing.[57] The emissions that would have been vented are combusted in the compressor engine to generate power.

[57] REM Technology Inc., et al. *Profitable Use of Vented Emission in Oil & Gas Production*. Prepared with support from the Climate Change and Emissions Management Corporation (CCEMC). 2013.

NMED Exhibit 34

If the facility is able to route rod packing vents to a VRU system, it is possible to recover approximately 95-100 percent of emissions. If the gas is routed to a flare, approximately 95 percent of the VOC emissions could be reduced.

Cost Impacts

One estimate reported that the cost per engine would be approximately $12,000 (does not include installation costs). Some costs would be mitigated by fuel gas savings, as using the captured gas to displace some of the purchased fuel would require less fuel to be purchased in order to run the compressor engine. The fuel cost saving based on a 4-throw compressor with moderate leak rate would be an estimated $6,500 per year.[58] This technique is discussed further in the Natural Gas STAR PRO Fact Sheet titled "Install Automated Air/Fuel Ratio Controls".[59] This document reported an average fuel gas savings of 78 Mcf/day per engine with the gas recovery system installed. Based on our review of information on this technology, we conclude that this technology has merit and would provide better emission reductions than increasing the replacement of rod packing from every 4 years to every 3 years since the emissions would be captured under negative pressure, allowing all emissions to be routed to the engine. It is our understanding that this technology may not be applicable to every compressor installation and situation.

For a VRU, assuming the proper equipment is already available at the facility, capturing the rod packing emissions would require minimal costs. The investment would only need to include the cost of piping and installation. While we have not obtained a cost estimate specifically for routing rod packing vents to a VRU, this process has been studied for dehydrators and would be similar for rod packing systems. According to the Natural Gas STAR PRO Fact Sheet titled "Pipe Glycol Dehydrator to Vapor Recovery Unit,"[60] the cost for planning and installing additional piping is approximately $2,000. Routing to a VRU also provides additional incentive as there is a value associated with recovered gas. However, the installation of a VRU to only capture rod packing emissions may not be economically viable if an additional compressor system is required. If the VRU is already present at the facility, the incremental cost

NMED Exhibit 34

to capture the rod packing vent gas can be recovered from the value of the additional captured natural gas.

Although gas recovery has been identified as a potential VOC emission reduction option for reciprocating compressors, there is insufficient information on its availability as a reasonably available control option for reducing reciprocating compressor VOC emissions. However, we recommend that air agencies consider this technology as a compliance option when considering the RACT recommendations presented in section 5.4 of this chapter.

5.3.1.2 Centrifugal Compressors Equipped with Wet Seals

Potential control options to reduce emissions from centrifugal compressors equipped with wet seals include control techniques that limit the leaking of natural gas across the rotating shaft, and capture and destruction of the emissions by routing emissions to a process (e.g., a compressor or fuel gas system) or to a combustion device (discussed in detail in sections 4.3.1.2 of chapter 4). We evaluate below three available control options: (1) converting wet seals to dry seals, (2) routing emissions to a fuel gas system or compressor (process), and (3) routing emissions to a combustion device.

Converting Wet Seals to Dry Seals

Description

We evaluated the use of centrifugal compressor dry seals as an available VOC control option for wet seal centrifugal compressors. As noted in section 5.2 of this chapter, the VOC emission profile from the use of dry seals is considerably less than from the use of wet seals. Replacing wet seals with dry seals can, therefore, substantially reduce VOC emissions across the rotating shaft compared to wet seals, while simultaneously reducing operating costs and enhancing compressor efficiency compared to wet seals. During normal operation, dry seals leak at a rate of 6 scfm methane per compressor.[61] While this is equivalent to a wet seal's leakage rate at the seal face, wet seals generate additional emissions during degassing of the circulating oil. Gas separated from the seal oil before the oil is recirculated is usually vented to the atmosphere,

[61] U.S. Environmental Protection Agency. Lessons Learned Document. *Replacing Wet Seals with Dry Seals in Centrifugal Compressors*. October 2006.

NMED Exhibit 34

bringing the total leakage rate for tandem wet seals to 47.7 scfm methane per compressor.[62,63] It is not practical or feasible in all situations, however, to retrofit an existing wet seal compressor with a dry seal compressor. We have received information that indicates that the conversion process requires a significant period of time to complete and the compressor would need to be out of commission for the conversion period.

Control Effectiveness

The emission reductions that would occur by replacing wet seal compressors with a dry seal compressor were calculated by subtracting the dry seal emissions from the emissions from a centrifugal compressor equipped with wet seals. We used the centrifugal compressor emission factors in Table 5-2 and estimated that VOC emissions would be reduced by 16.7 tpy per compressor.

Cost Impacts

The Natural Gas STAR Program estimated the cost of retrofitting dry seals on a centrifugal compressor equipped with wet seals to be $324,000 ($342,439 in 2012 dollars) for a two-seal dry seal system, which includes the cost of both seals and the dry gas conditioning, monitoring, control console and installation.[64] The annual costs were calculated as the capital recovery of the capital cost assuming a 20-year equipment life and 7 percent interest, which is approximately $32,324 per compressor. The Natural Gas STAR Program estimated that the annual operation and maintenance savings from the installation of a dry seal compressor is $88,300 ($93,325 in 2012 dollars) in comparison to a wet seal compressor. In addition, the installation of dry seals reduces natural gas emissions by 10,721 Mscf/yr[65] which results in an estimated natural gas savings of $42,883 per year assuming a natural gas price of $4/Mcf. A summary of the capital and annual costs for replacing a wet seal compressor with a dry seal compressor is presented in Table 5-6 along with the VOC cost of control. As noted above, we

[63] U.S Environmental Protection Agency. *Methodology for Estimating CH4 and CO2 Emissions from Natural Gas Systems*. *Inventory of U.S. Greenhouse Gas Emission and Sinks: 1990-2012*. Washington, DC. Annex 3. Table A-129.

[64] U.S. Environmental Protection Agency. Lessons Learned Document. *Replacing Wet Seals with Dry Seals in Centrifugal Compressors*. October 2006.

[65] The natural gas savings was calculated by using the 16.7 tpy VOC reduction and dividing by the VOC/methane weight ratio of 0.278 to determine the amount of methane reduction that would be reduced (60.1 tpy). The methane emission reductions were converted to volumetric natural gas reductions assuming a natural gas density of 0.02082 tons/Mcf and an 82.9 volume percent conversion factor of methane to natural gas.

NMED Exhibit 34

have received information that indicates that the conversion process requires a significant period of time to complete and the compressor would need to be out of commission during the conversion period. Because of this, a facility may have to provide a temporary compressor in the interim that would add additional costs to the cost estimates we present in Table 5-6.

Table 5-6. Cost of Control of Replacing a Wet Seal Compressor with a Dry Seal Compressor

Oil & Natural Gas Segment	Capital Cost ($2012)	Annual Costs Per Compressor ($/compressor-year)		VOC Cost of Control ($/ton)	
		Without Savings [a]	With O&M and Natural Gas Savings [b]	Without Savings	With O&M and Natural Gas Savings
Processing	$342,439	$32,324	($103,884)	$1,931	($6,205)

[a] Includes only the annualized capital cost of the retrofit of the dry seal system (20 years, 7 percent interest).
[b] Includes the annualized capital cost, annual operation and maintenance (O&M) savings and annual natural gas savings.

Routing Emissions to a Compressor or Fuel Gas System (Process)

Description

One option for reducing VOC emissions from the compressor wet seal fluid degassing system is to route the captured emissions back to the compressor suction or fuel system or other beneficial use (referred to collectively as routing to a process). Routing to a process would entail routing emissions via a closed vent system to any enclosed portion of a process unit (e.g., compressor or fuel gas system) where the emissions are predominantly recycled, consumed in the same manner as a material that fulfills the same function in the process, transformed by chemical reaction into materials that are not regulated materials, incorporated into a product, or recovered. Emissions that are routed to a process can result in the same or greater emission reductions as would have been achieved had the emissions been routed through a closed vent system to a combustion device. Table 5-7 presents a summary of the estimated emission reductions from routing emissions from the wet seal fluid degassing system to a process. For purposes of this analysis, we assume that routing VOC emissions from a wet seal fluid degassing

NMED Exhibit 34

system to a process reduces VOC emissions greater than or equal to a combustion device (i.e., greater than or equal to 95 percent).

Table 5-7. Estimated Annual Centrifugal Compressor VOC Emission Reductions for Routing Wet Seal Fluid Degassing System to a Process[66,67]

Oil & Gas Segment	Individual Compressor VOC Emission Reductions (tons/compressor-year)
Processing	≥ 18.1

Cost Impacts

The capital cost of a system to route the seal oil degassing system to a process is estimated to be $23,252,[68] converting to 2012 dollars using the Federal Reserve Economic Data GDP Price Deflater (Change in GDP: Implicit Price Deflator from 2008 to 2012 (5.69 percent)).[69] The estimated costs include an intermediate pressure degassing drum, new piping, gas demister/filter, and a pressure regulator for the fuel line. The annual costs were estimated to be $2,553 assuming a 15-year equipment life at 7 percent interest.

Potential natural gas savings for this option were estimated to be 12 Mcf/yr and assumes that greater than or equal to 95 percent of the 47.7 scfm methane emissions are controlled, an annual operating factor of 43.6 percent, and the 82.9 volume percent conversion factor of methane to natural gas. Assuming a natural gas savings of $4/Mcf, the natural gas savings equates to approximately $47,553 per year. Table 5-8 presents a summary of the cost of control for routing emissions to a process.

Routing Emissions to a Combustion Device

Description

Combustion devices are commonly used in the oil and natural gas industry to combust VOC emission streams. Typical combustion devices used in the oil and natural gas industry to control VOC emissions and their control efficiency are discussed in greater detail in section 4.3.1.2 of chapter 4 of this document. Similar to the analysis of storage vessels, for this analysis, we assumed that the entrained natural gas from the seal oil that is removed in the degassing process would be directed to a combustion device that achieves a 95 percent reduction of VOC. The wet seal emissions in Table 5-2 were used along with the control efficiency to calculate the emission reductions. Table 5-9 presents a summary of the estimated emission reductions from routing emissions from the wet seal to a combustion device.

NMED Exhibit 34

Cost Impacts

Routing the captured gas from the centrifugal compressor wet seal degassing system to an existing combustion device or installing a new combustion device has associated capital and operating costs. The capital and annual costs of the combustion device (an enclosed flare for the analysis) were calculated using the methodology in the EPA Control Cost Manual.[72] The heat content of the gas stream was calculated using information from the 2011 Gas Composition Memorandum. Table 5-10 presents a summary of the capital and annual costs for wet seals routed to a flare, as well as the VOC cost of control. There is no cost savings estimated for this option because the recovered natural gas is combusted.

Table 5-10. Cost of Control for Routing Wet Seal Fluid Degassing System to a Combustion Device

Industry Segment	Capital Cost ($)		Annual Cost per Compressor ($/compressor-year)		VOC Cost of Control New CD ($/ton)	VOC Cost of Control Existing CD ($/ton)
	New CD	Existing CD	New CD	Existing CD		
Processing	$71,783	$23,252	$114,146	$3,311	$6,292	$183

5.3.2 Existing Federal, State and Local Regulations

5.3.2.1 Federal Regulations that Specifically Require Control of VOC Emissions

Under the 2012 NSPS and 2016 NSPS, reciprocating compressors are required to limit VOC emissions by replacing the rod packing on or before 26,000 hours of operation or 36 months since the previous rod packing replacement. Alternatively, an owner or operator is allowed to route rod packing emissions to a process through a closed vent system under negative pressure. For centrifugal compressors in the processing segment, the 2012 NSPS and 2016 NSPS require that VOC emissions be reduced from each centrifugal compressor wet seal fluid degassing system by 95 percent.

[72] U.S. Environmental Protection Agency. *OAQPS Control Cost Manual: Sixth Edition* (EPA 452/B-02-001). Research Triangle Park, NC.

NMED Exhibit 34

5.3.2.2 State and Local Regulations that Specifically Require Control of VOC Emissions

States may have permitting restrictions on VOC emissions that may apply to an emissions source as a result of an operating permit, or preconstruction permit based on air quality maintenance or improvement goals of an area. Permits specify what construction is allowed, what emission limits must be met and, often, how the source must be operated. To ensure that sources follow the permit requirements, permits also contain monitoring, recordkeeping and reporting requirements.

Montana requires oil and natural gas well facilities to control emissions from the time the well is completed until the source is registered or permitted. Each piece of oil or natural gas well facility equipment, with VOC vapors of 200 Btu/scf or more with a PTE greater than 15 tpy, is required to (1) capture and route emissions to a natural gas pipeline, (2) route to a smokeless combustion device equipped with an electronic ignition device or a continuous burning pilot system meeting the requirements of 40 CFR 60.18 and operating at 95 percent or greater control efficiency, or (3) route to air pollution control equipment with equal or greater control efficiency than a smokeless combustion device. This includes the control of emissions from compressor engines used for transmission of natural gas (Registration of Air Contaminant Sources, Rule 17.8.1711 Oil or Gas Well Facilities Emission Control Requirements).

Colorado (Regulation 7, XVII.B.3.b and c) requires that uncontrolled actual hydrocarbon emissions from wet seal fluid degassing systems on wet seal centrifugal compressors be controlled by at least 95 percent, unless the centrifugal compressor is subject to 40 CFR part 60, subpart OOOO. Additionally, Regulation 7 requires that rod packing on any reciprocating compressor located at a natural gas compressor station be replaced every 26,000 hours of operation or every 36 months, unless the reciprocating compressor is subject to 40 CFR part 60, subpart OOOO.

5.4 Recommended RACT Level of Control

For reciprocating compressors, there are federal and state regulations that require the periodic replacement of reciprocating compressor packing. The federal regulations (the 2012 NSPS and 2016 NSPS) require the replacement of reciprocating compressor rod packing every 3 years or on or before 26,000 hours of operation. The state regulation (Colorado) requires the

NMED Exhibit 34

replacement of reciprocating compressor rod packing every 26,000 hours of operation or every 36 months. The 2012 NSPS and 2016 NSPS also provide the alternative of routing rod packing emissions to a process via a closed vent system under negative pressure.

As noted in section 5.3 of this chapter, the most significant volume of VOC emissions are associated with piston rod packing systems. We found that, under the best conditions, regular rod packing replacement, when carried out approximately every three years, effectively controls emissions and helps prevent excessive rod wear. The cost of control for requiring the replacement of reciprocating packing at this frequency was estimated to be $1,132 per ton of VOC reduced without savings and $298 per ton of VOC reduced considering savings for gathering and boosting station compressors, and about $334 per ton of VOC reduced without savings, and an overall net savings per ton of VOC reduced for processing segment reciprocating compressors considering savings. Based on the emission reductions, costs (considering gas savings) and existing and currently implemented regulations that require the replacement of the reciprocating compressor packing every 36 months or on or before 26,000 hours of operation, we recommend this control option as RACT for reciprocating compressors in the production and processing segments (excluding compressors at the well site). We also recommend that air agencies provide operators the compliance alternative of routing rod packing emissions to a process via a closed vent system under negative pressure.

For centrifugal compressors, there are already federal, state and local regulations that require the capture and 95 percent control of emissions from wet seal fluid degassing systems from centrifugal compressors. Although dry seal systems have low VOC emissions and the option of routing to a process has at least a 95 percent control efficiency, the replacement of wet seals with dry seals and routing to a process may not be technically feasible or practical options for some centrifugal compressors. The integration of a centrifugal compressor into an operation may require a certain compressor size or design that is not available in a dry seal model, and, in the case of capture of emissions with routing to a process, there may not be downstream equipment capable of handling a low-pressure fuel source. As a result of our evaluation of the technical feasibility and practicality of existing available controls, we recommend RACT be 95 percent control of emissions from the wet seal degassing system, which can be achieved by using a closed vent system and routing emissions to a combustor or routing the emissions back to the compressor or fuel line (routing to the process). For the processing segment, we assume that

NMED Exhibit 34

there is an existing combustion device onsite and the estimated cost of control would be about $183 per ton of VOC reduced for facilities to route emissions to the existing combustion device, or about $141 per ton of VOC reduced for facilities to route the captured emissions back to the compressor or fuel line.

In summary, we recommend the following as RACT for compressors:

(1) RACT for Reciprocating Compressors Located Between the Wellhead and Point of Custody Transfer to the Natural Gas Transmission and Storage Segment (Excludes the Well Site): We recommend that each reciprocating compressor reduce VOC emissions by replacing the rod packing on or before 26,000 hours of operation or 36 months since the last rod packing replacement. We also recommend that an alternative be provided to allow routing of rod packing emissions to a process via a closed vent system under negative pressure in lieu of the specified rod packing replacement periods. We do not recommend that RACT apply to individual reciprocating compressors located at a well site, or an adjacent well site and servicing more than one well site.

(2) RACT for Centrifugal Compressors Using Wet Seals Located Between the Wellhead and Point of Custody Transfer to the Natural Gas Transmission and Storage Segment (Excludes the Well Site): We recommend that each centrifugal compressor using wet seals reduce VOC emissions from each wet seal fluid gassing system by reducing VOC emissions by 95 percent. We do not recommend that RACT apply to individual centrifugal compressors using wet seals located at a well site, or an adjacent well site and servicing more than one well site.

5.5 Factors to Consider in Developing Compressor Compliance Procedures

5.5.1 Reciprocating Compressor Compliance Recommendations

In order to ensure and demonstrate compliance with the recommended RACT for reciprocating compressors, we recommend that air agencies require facilities to maintain a record of the date of the most recent reciprocating compressor rod packing replacement, monitor and keep records of the number of hours of operation and/or track the number of months since the last rod packing replacement for each reciprocating compressor (to meet the requirement that the packing is changed out on or before the total number of hours of operation reaches 26,000 hours

or the number of months since the most recent rod packing replacement reaches 36 months) and maintain records of instances where the reciprocating compressor was not operated in compliance with RACT. This may require the installation of an operating hours meter on the engine to track the number of hours of operation. We also recommend that air agencies require annual reports of the cumulative hours of operation or number of months since packing replacement for each reciprocating compressor and instances when there were deviations where the reciprocating compressor was not operated in compliance with the recommended RACT.

For applications in which operators choose to opt for the alternative of routing of rod packing emissions to a process via a closed vent system under negative pressure, it is recommended that air agencies require facilities to maintain records of the date of installation of a rod packing emissions collection system and closed vent system and maintain records of instances of deviations in cases where the reciprocating compressor was not operated in compliance with requirements. We also recommend that air agencies require annual reports for each reciprocating compressor complying with this option indicating when there were deviations where the reciprocating compressor was not operated in compliance with the recommended RACT. Recommended cover and closed vent system design and operation measures are specified in sections 5.5.3 and 5.5.4.

The appendix to this document presents example model rule language that incorporates compliance elements recommended in this section that air agencies may choose to use in whole or in part.

5.5.2 Centrifugal Compressor Equipped with a Wet Seal Recommendations

In order to ensure that VOC emissions are reduced by at least 95 percent (the recommended RACT level of control) from a centrifugal compressor equipped with a wet seal when using a control device or other control measure (such as routing to a process), the centrifugal compressor should be equipped with a cover that is connected through a closed vent system that routes emissions to the control device (or process) that meets the RACT level of control. Recommended cover and closed vent system design and operation measures are specified in sections 5.5.3 and 5.5.4. Recommended control device operation and monitoring provisions for specified controls to ensure compliance are presented in section 5.5.5.

NMED Exhibit 34

The appendix of this document presents example model rule language that incorporates the compliance elements recommended in this section that air agencies may choose to use in whole or in part.

5.5.3 Recommendations for Cover Design

The cover and all openings on the cover should form a continuous impermeable barrier over the entire surface area of the liquid in the wet seal fluid degassing system (for centrifugal compressors), and of the rod packing emissions collection system (for reciprocating compressors). Each cover opening should be secured in a closed, sealed position (e.g., covered by a gasketed lid or cap) except during those times when it is necessary to use an opening as follows:

(1) To inspect, maintain, repair, or replace equipment; or

(2) To vent gases or fumes from the unit, through a closed vent system designed and operated in accordance with closed vent system requirements (see section 5.5.4), to a control device or to a process.

It is recommended that air agencies require olfactory, visual and auditory inspections of covers for defects that could result in air emissions on a monthly basis. We recommend air agencies require that any detected defects be repaired as soon as practicable.

5.5.4 Recommendations for Closed Vent Systems

The closed vent system should be designed and operated with no detectable emissions (using a 500 ppm detection level, as measured using Method 21 of appendix A-7 of Part 60, and ongoing monthly olfactory, visual and auditory inspections). It is recommended that air agencies require that any detected defects be repaired as soon as practicable.

With the exception of low leg drains, high point bleeds, analyzer vent, open-ended valves and safety devices, if the closed vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device or to a process, air agencies should require that owners or operators either:

(1) Install, calibrate, maintain and operate a flow indicator at the inlet to the bypass device that could divert the stream away from the control device or process to the atmosphere that is capable of taking periodic readings and either sounds an alarm, or initiates notification via remote alarm to the nearest field office, when the bypass device is open

such that the stream is being, or could be, diverted away from the control device or process to the atmosphere; or

(2) Secure the bypass device valve installed at the inlet to the bypass device in the non-diverting position using a car-seal or a lock-and-key type configuration.

5.5.5 Recommendations for Control Device Operation and Monitoring

If a control device is used to comply with the recommended 95 percent VOC emission reduction RACT level of control, we advise that the device be required to operate at all times when gases, vapors, and fumes are vented from the wet seal fluid degassing system through the closed vent system to the control device. The following paragraphs present select emission control options and suggested operation and monitoring requirements, as appropriate to ensure compliance with the recommended RACT level of control.

Enclosed Combustion Devices

If an enclosed combustion device (e.g., thermal vapor incinerator, catalytic vapor incinerator, boiler, or process heater) is used to meet the 95 percent VOC emission reduction RACT level of control, it should be designed to reduce the mass content of VOC emissions by 95 percent or greater and be: (1) maintained in a leak free condition, (2) installed and operated with a continuous burning pilot flame, and (3) operated with no visible emissions.

It is recommended that the visible emissions test (using section 11 of EPA Method 22, 40 CFR part 60, appendix A-7) be performed at least once every calendar month. If a combustion device fails the visible emissions test, sources should be required to follow manufacturer's repair instructions, if available, or best combustion engineering practice as outlined in the unit inspection and maintenance plan, to return the unit to compliant operation. It is recommended that all inspection, repair and maintenance activities for each unit be recorded in a maintenance and repair log that can be made available for inspection. Following return to operation from maintenance or repair activity, each device should be required to pass a Method 22, 40 CFR part 60, appendix A-7 visual emissions test.

It is recommended that air agencies require that sources meeting the 95 percent VOC emission reduction RACT level of control by routing emissions to a combustion device conduct performance tests and/or design analyses that demonstrate that the combustion device being used meets the required 95 percent VOC emission reduction RACT level of control (see section F of

the appendix to this document for performance testing procedures for control devices that we recommend be used to demonstrate performance requirements).

Routing to a Process

Routing to a process would entail routing emissions via a closed vent system to any enclosed portion of a process unit where the emissions are predominantly recycled, consumed in the same manner as a material that fulfills the same function in the process, transformed by chemical reaction into materials that are not regulated materials, incorporated into a product, or recovered. Vapor recovery units and flow lines that "route emissions to a process" would be considered part of the process and would not be considered control devices that are subject to standards, but the recommended cover and closed vent system design, operation and monitoring requirements specified in sections 5.5.3 and 5.5.4 would apply.

NMED Exhibit 34

6.0 PNEUMATIC CONTROLLERS

The oil and natural gas industry uses a variety of process control devices to operate valves that regulate pressure, flow, temperature and liquid levels. Most instrumentation and control equipment falls into one of three categories: (1) pneumatic, (2) electrical, or (3) mechanical. Of these, only pneumatic devices are direct sources of air emissions. Pneumatic controllers are pneumatic devices used throughout the oil and natural gas industry as part of the instrumentation to control the position of valves and may be actuated using pressurized natural gas (natural gas-driven) or may be actuated by another means such as a pressurized gas other than natural gas, solar, or electric. This chapter describes pneumatic controllers that are used in the oil and natural gas industry, including their function and associated emissions. This chapter also presents control techniques used to reduce VOC emissions from these pneumatic controllers, along with costs and emission reductions. Finally, this chapter discusses our recommended RACT and the associated VOC emission reductions and costs for pneumatic controllers.

6.1 Applicability

For the purposes of this CTG, a pneumatic controller is an automated instrument used to maintain a process condition such as liquid level, pressure, pressure differential and temperature. The emissions and emission controls discussed herein would apply to natural gas-driven pneumatic controllers in the oil and natural gas industry located from the wellhead to a natural gas processing plant (including the natural gas processing plant) or from the wellhead to the point of custody transfer to an oil pipeline.

NMED Exhibit 34

6.2 Process Description and Emission Sources

6.2.1 Process Description[73]

Natural gas-driven pneumatic controllers come in a variety of designs for a variety of uses. For the purposes of this CTG, they are characterized primarily by their emission characteristics:

(1) *Continuous bleed pneumatic controllers* are used to modulate flow, liquid level, or pressure, and gas is vented continuously at a rate that may vary over time. Continuous bleed controllers are further subdivided into two types based on their bleed rate:

   a. *Low-bleed*, having a bleed rate of less than or equal to 6 standard cubic feet per hour (scfh).

   b. *High-bleed*, having a bleed rate of greater than 6 scfh.

(2) *Intermittent bleed or snap-acting pneumatic controllers* release gas only when they open or close a valve or as they throttle the gas flow.

(3) *Zero-bleed pneumatic controllers* do not bleed natural gas to the atmosphere. These natural gas-driven pneumatic controllers are self-contained devices that release gas to a downstream pipeline instead of to the atmosphere.

Pneumatic controllers often make use of available high-pressure natural gas to operate or control a valve. The supply gas pressure is modulated by a process condition, and then flows to the valve controller where the signal is compared with the process set point to adjust gas pressure in the valve actuator. In these natural gas-driven pneumatic controllers, natural gas may be released intermittently with every actuation of the valve. In other designs, natural gas may be released continuously from the valve control pilot. The rate at which the continuous release occurs is referred to as the bleed rate. Bleed rates are dependent on the design and operating characteristics of the device. Similar designs will have similar steady state rates when operated under similar conditions. It is our understanding that self-contained devices that release natural gas to a downstream pipeline instead of to the atmosphere have no emissions. "Closed loop" systems are applicable only in instances with very low pressure[74] and may not be suitable to

[73] U.S. Environmental Protection Agency. *Lessons Learned: Options for Reducing Methane Emissions From Pneumatic Devices in the Natural Gas Industry*. Office of Air and Radiation: Natural Gas STAR Program. Washington, DC. October 2006.

NMED Exhibit 34

replace many applications of continuous or intermittent bleed pneumatic devices. Therefore, this CTG does not address these self-contained devices further.

Intermittent controllers are devices that only emit gas during actuation and do not have a continuous bleed rate. The actual amount of emissions from an intermittent controller is dependent on the amount of natural gas vented per actuation and how often it is actuated. Bleed devices also vent an additional volume of gas during actuation, in addition to the controller's bleed stream. Since actuation emissions serve the controller's functional purpose and can be highly variable, the emissions characterized for high-bleed and low-bleed devices in this analysis (as described in section 6.2.2) account for only the continuous flow of emissions (i.e., the bleed rate) and do not include emissions directly resulting from actuation. Intermittent controllers are assumed to have zero bleed emissions. For most applications (but not all), intermittent controllers serve functionally different purposes than bleed devices. Therefore, because the total emissions are dependent on the application in which they are used, we do not consider their use to be a technically practical control option for all continuous bleed controllers.

As previously indicated, not all pneumatic controllers are natural gas driven. At sites with a continuous and reliable source of electricity, controllers can be actuated by an instrument air system that uses compressed air instead of natural gas. These sites may also use mechanical or electrically powered pneumatic controllers. In some instances, solar-powered controllers may be feasible. Because these devices are not natural gas driven, they do not directly release natural gas or VOC. However, electrically powered systems have energy impacts, with associated secondary impacts related to generation of the electrical power required to drive the instrument air compressor system. To our knowledge, natural gas processing plants are the only facilities in the oil and natural gas industry that are likely to have electrical service sufficient to power an instrument air system, and most existing natural gas processing plants use instrument air instead of natural gas-driven devices.[75]

6.2.2 Emissions Data

6.2.2.1 Summary of Major Studies and Emissions

In the evaluation of the emissions from pneumatic controllers and the potential options available to reduce VOC emissions, numerous studies were consulted. Table 6-1 lists these references with an indication of the type of relevant information contained in each reference. In addition to these sources, we evaluated the peer reviewer and public comments received on the EPA's white paper, "Oil and Natural Gas Sector Pneumatic Devices."[76]

[1] An "X" in this column does not necessarily indicate that the EPA has received comprehensive data on control options from any one of these reports. The type of emissions control information that the EPA has received from these reports varies substantially from report to report.

6.2.2.2 Representative Pneumatic Controller Device Emissions

For purposes of this CTG, continuous bleed pneumatic controllers are classified into two types based on their emissions rates: (1) high-bleed controllers, and (2) low-bleed controllers. A controller is considered to be high-bleed when the continuous bleed emissions are in excess of 6 scfh, while low-bleed devices bleed at a rate less than or equal to 6 scfh.[77]

In support of the development of the 2012 NSPS and 2016 NSPS, and this CTG, we consulted information in the appendices of the Natural Gas STAR Lessons Learned document on pneumatic devices, subpart W of the GHGRP, the GHG Inventory, as well as pneumatic controller vendor information used during the development of the 2012 NSPS.[78] The data obtained from vendors included emission rates, costs, and any other pertinent information for each pneumatic controller model (or model family). All pneumatic controllers that a vendor offered were itemized and inquiries were made into the specifications of each device and whether it was applicable to oil and natural gas operations. High-bleed and low-bleed devices were differentiated using the 6 scfh threshold.

Although, by definition, a low-bleed device can emit up to 6 scfh, through vendor research, a typical low-bleed device available currently on the market emits lower than the maximum rate allocated for the device type. Specifically, low-bleed devices on the market today have bleed rates from 0.2 scfh up to 5 scfh. Similarly, the available bleed rates for a high-bleed device vary significantly from venting as low as 7 scfh to as high as 100 scfh.[79,80] While the vendor data provided useful information on specific makes and models, it did not yield sufficient information about the prevalence of each model type in the population of devices in the oil and

[77] The classification of high-bleed and low-bleed devices originated from a report by Pacific Gas & Electric (PG&E) and the Gas Research Institute (GRI) in 1990 titled "Unaccounted for Gas Project Summary Volume." This classification was adopted for the October 1993 Report to Congress titled "Opportunities to Reduce Anthropogenic Methane Emissions in the United States". As described on page 2-16 of the report, "devices with emissions or 'bleed rates' of 0.1 to 0.5 cubic feet per minute are considered to be 'high-bleed' types (PG&E 1990)." This range of bleed rates is equivalent to 6 to 30 cubic feet per hour.

NMED Exhibit 34

natural industry, which is an important factor in developing a representative emission factor. Therefore, in support of this CTG, we have determined that the best available emission estimates for pneumatic controllers in the production segment are from the GHGRP. For the natural gas processing segment, we determined that the quantified representative methane emissions from a continuous bleed pneumatic controller based on natural gas emission rates presented in Volume 12 of the EPA/GRI report used in the 2012 NSPS TSD is the best available emissions information.[81]

The basic approach used for this analysis of emissions from pneumatic controllers was to first approximate the natural gas emissions from an average high-bleed and low-bleed pneumatic controller in the production and processing segments and then estimate methane and VOC emissions using a representative gas composition from the 2011 Gas Composition Memorandum. A bleed rate of 1.39 scfh was used for a low-bleed controller, and a bleed rate of 37.3 scfh was used for a high-bleed controller. The specific gas composition ratio used for the production and processing segments was 0.278 pounds VOC per pound methane. Table 6-2 summarizes the estimated bleed emissions for a representative pneumatic controller by industry segment (for production and processing segments) and device type.

Table 6-2. Average Emission Rates for High-Bleed and Low-Bleed Pneumatic Controllers in the Oil and Natural Gas Industry[a]

Industry Segment	High-Bleed (tpy)		Low-Bleed (tpy)	
	Methane	VOC	Methane	VOC
Oil and Natural Gas Production[b,c]	5.3	1.47	0.2	0.06
Natural Gas Processing[d]	1.00	0.28	1.0	0.28

[a] The conversion factor used in this analysis is 1 Mcf of methane is equal to 0.0208 tons methane.
[b] Natural gas production methane emissions are derived from the GHGRP (subpart W).
[c] Oil production methane emissions are derived from the GHGRP (subpart W). It is assumed only continuous bleed devices are used in oil production.
[d] Natural gas processing segment methane emissions are derived from Volume 12 of the 1996 EPA/GRI report. Emissions from devices in the processing segment were determined based on data available for snap-acting and continuous bleed devices. Further distinction between high-

[81] GRI/EPA Research and Development. Methane Emissions from the Natural Gas Industry; Volume 12: Pneumatic Devices. (1996) EPA-600/R-96-0801. Table 4-11, page 56.

NMED Exhibit 34

and low-bleed could not be determined based on available data. For the natural gas processing segment, it is assumed that existing natural gas plants have already replaced pneumatic controllers with other types of controls (i.e., an instrument air system) and any high-bleed devices that remain are safety related.

For the natural gas processing segment, this analysis assumes that existing natural gas plants have already replaced pneumatic controllers with other types of controls (i.e., an instrument air system) and any high-bleed devices that remain are safety related.

6.3 Available Controls and Regulatory Approaches

6.3.1 Available VOC Emission Control Options

Although pneumatic controllers have relatively small emissions individually, due to the large population of these devices, the cumulative VOC emissions for the industry are significant. We are not aware of any add-on controls that are or can be used to reduce VOC emissions from gas-driven pneumatic controllers. The following sections provide a summary of options for reducing VOC emissions from pneumatic controllers including: (1) replacing high-bleed controllers with low-bleed controllers or zero-bleed controllers; (2) driving controllers with instrument air rather than natural gas, using non-gas-driven controllers; and (3) enhanced maintenance.

Sections 6.3.1.1 and 6.3.1.2 discuss the control of VOC emissions by replacing a high-bleed device with a low-bleed device, and driving controllers with instrument air rather than natural gas, including the estimated costs of these options. Given applicability, efficiency and the expected costs, other options (i.e., mechanical controls and enhanced maintenance) are only briefly discussed in sections 6.3.1.3 and 6.3.1.4.

6.3.1.1 Install a Low-Bleed Device in Place of a High-Bleed Device

Description

As discussed previously, low-bleed controllers generally provide the same operational function as a high-bleed controller, but have lower continuous bleed emissions.

Control Effectiveness

We estimate on average that 1.41 tons of VOC will be reduced annually per device in the production segment from installing a low-bleed device in place of a high-bleed device. There are certain situations in which replacing and retrofitting devices are not feasible, such as instances where a minimal response time is needed, cases where large valves require a high-bleed rate to

NMED Exhibit 34

actuate, or a safety isolation valve is involved. Based on criteria provided by the Natural Gas STAR Program, we assumed about 80 percent of high-bleed devices can be replaced with low-bleed devices throughout the production segment.

Applicability of low-bleed controllers may depend on the function carried out by the controller. Low-bleed pneumatic controllers may not be applicable for replacement of high-bleed devices because a process condition may require a fast or precise control response to minimize deviation from the desired set point. A slower acting low-bleed controller could potentially result in damage to equipment and/or become a safety issue because it may not be able to respond as quickly as a high-bleed controller. An example of this is a compressor where pneumatic controllers may monitor the suction and discharge pressure and actuate a recycle when one or the other is out of the specified target range. Other scenarios for fast and precise control include transient (non-steady state) situations where a gas flow rate may fluctuate widely or unpredictably. This situation requires a responsive high-bleed device to ensure that the gas flow can be controlled in all situations. Temperature and level controllers are typically present in control situations that are not prone to fluctuate as widely or where the fluctuation can be readily and safely accommodated by the equipment. Therefore, such processes can typically accommodate control from a low-bleed device, which is slower acting and less precise.

Cost Impacts

Costs were based on vendor research as a result of updating and expanding upon the information given in the appendices of the Natural Gas STAR Lessons Learned document on pneumatic controllers.[82] As Table 6-3 indicates, the average cost for a low-bleed pneumatic controller is $2,698, while the average cost for a high-bleed pneumatic controller is $2,471.[83] In order to analyze cost impacts, the average cost to install a new low-bleed pneumatic controller was annualized for a 15-year period using a 7 percent interest rate. This equates to an annualized cost of around $271 per low-bleed device for the production segment.

[82] U.S. Environmental Protection Agency. Lessons Learned from Natural Gas STAR Partners. *Options for Reducing Methane Emissions from Pneumatic Devices in the Natural Gas Industry*. Office of Air and Radiation: Natural Gas STAR Program. Washington, DC. October 2006.
[83] Costs are estimated in 2012 U.S. dollars.

NMED Exhibit 34

Table 6-3. Cost Projections for Representative Pneumatic Controllers[a]

Device	Minimum Cost ($2012)	Maximum Cost ($2012)	Average Cost ($2012)
High-Bleed Controller	$387	$7,398	$2,471
Low-Bleed Controller	$554	$9,356	$2,698

[a] 2011 NSPS TSD 2008 dollars converted to 2012 dollars using the Federal Reserve Economic Data GDP Price Deflater (5.69 percent). During the development of the 2012 NSPS, major pneumatic controller vendors were surveyed for costs, emission rates and any other pertinent information.

Monetary savings associated with retaining natural gas that would have been emitted was estimated based on a natural gas value of $4.00 per Mcf.[84] The use of a low-bleed pneumatic controller is estimated to reduce methane emissions by 5.1 tpy (245 Mcf/yr) (using the conversion factor of 0.0208 tons methane per 1 Mcf) over the use of a high-bleed pneumatic controller. Assuming natural gas in the production segment is 82.8 percent methane by volume, this equals 296 Mcf natural gas recovered per year. Therefore, the value of recovered natural gas from one pneumatic controller in the production segment is approximately $1,184. Table 6-4 presents the estimated cost of control per ton of VOC reduced for replacing a high-bleed pneumatic controller with a new low-bleed pneumatic controller in the production segment of the oil and natural gas industry.

Table 6-4. VOC Cost of Control for Replacing an Existing High-Bleed Pneumatic Controller with a New Low-Bleed Pneumatic Controller

Segment	Average Capital Cost per Unit ($2012)[a,c]	Total Annual Costs per Unit ($2012/yr)[b,c]		VOC Cost of Control ($2012/ton)[c]	
		Without Savings	With Savings	Without Savings	With Savings
Oil and Natural Gas Production	$2,698	$296	($886)	$209	($625)

[a] Average capital cost of a low-bleed device as summarized in Table 6-3.
[b] Annualized cost assume a 7 percent interest rate over a 15-year equipment lifetime.

6.3.1.2 Instrument Air Systems

Description

The major components of an instrument air conversion project include the compressor, power source, dehydrator and volume tank. The following is a description of each component as described in the Natural Gas STAR document, "Lessons Learned: Convert Gas Pneumatic Controls to Instrument Air":[85]

(1) Compressors used for instrument air delivery are available in various types and sizes, from centrifugal (rotary screw) compressors to reciprocating piston (positive displacement) types. The size of the compressor depends on the size of the facility, the number of control devices operated by the system, and the typical bleed rates of these devices. The compressor is usually driven by an electric motor that turns on and off, depending on the pressure in the volume tank. For reliability, a full spare compressor is normally installed. A minimum amount of electrical service is required to power the compressors.

(2) A critical component of the instrument air control system is the power source required to operate the compressor. Since high-pressure natural gas is abundant and readily available, natural gas pneumatic systems can run uninterrupted on a 24-hour, 7-day per week schedule. The reliability of an instrument air system, however, depends on the reliability of the compressor and electric power supply. Most large natural gas plants have either an existing electric power supply or have their own power generation system. For smaller facilities and in remote locations, however, a reliable source of electric power can be difficult to ensure. In some instances, solar-powered, battery-operated air compressors can be cost-effective for remote locations, and reduce both VOC emissions and energy consumption. Small natural gas-driven fuel cells are also being developed.

(3) Dehydrators, or air dryers, are also an integral part of the instrument air compressor system. Water vapor present in atmospheric air condenses when the air is pressurized and cooled, and can cause a number of problems to these systems, including corrosion of the instrument parts and blockage of instrument air piping and controller orifices.

[85] U.S. Environmental Protection Agency. Lessons Learned from Natural Gas STAR Partners. *Convert Gas Pneumatic Controls to Instrument Air*. Office of Air and Radiation: Natural Gas STAR Program. Washington, DC. 2006.

(4) The volume tank holds enough air to allow the pneumatic control system to have an uninterrupted supply of high-pressure air without having to run the air compressor continuously. The volume tank allows a large withdrawal of compressed air for a short time, such as for a motor starter, pneumatic pump, or pneumatic tools without affecting the process control functions.

Compressed air may be substituted for natural gas in pneumatic systems without altering any of the parts of the pneumatic controller. The use of instrument air eliminates natural gas emissions from natural gas-driven pneumatic controllers. All other parts of a natural gas pneumatic system will operate the same way with instrument air as they do with natural gas. The conversion of natural gas pneumatic controllers to instrument air systems is applicable to all natural gas facilities with electrical service available. Figure 6-1 illustrates a diagram of a natural gas pneumatic control system. Figure 6-2 illustrates a diagram of a compressed instrument air control system. [86]

Control Effectiveness

The use of instrument air eliminates natural gas emissions from the pneumatic controllers; however, the system is only applicable in locations with access to a sufficient and consistent supply of electrical power. Instrument air systems are also usually installed at facilities where there is access to high Btu gas, a high concentration of pneumatic control valves and the presence of an operator who can ensure the system is properly functioning.[87]

For natural gas processing plants, we believe that instrument air systems are typically used to power pneumatic controllers and that any natural gas-driven pneumatic controllers in use are required for safety and functional reasons. The use of an instrument air system would reduce VOC emissions from a natural gas-driven pneumatic controller by 100 percent.

Cost Impacts

Instrument air conversion requires additional equipment to properly compress and control the pressurized air. The size of the compressor depends on the number of control loops present at a location. A control loop consists of one pneumatic controller and one control valve. The volume of compressed air supply for the pneumatic system is equivalent to the volume of gas

[86] Ibid.
[87] Ibid.

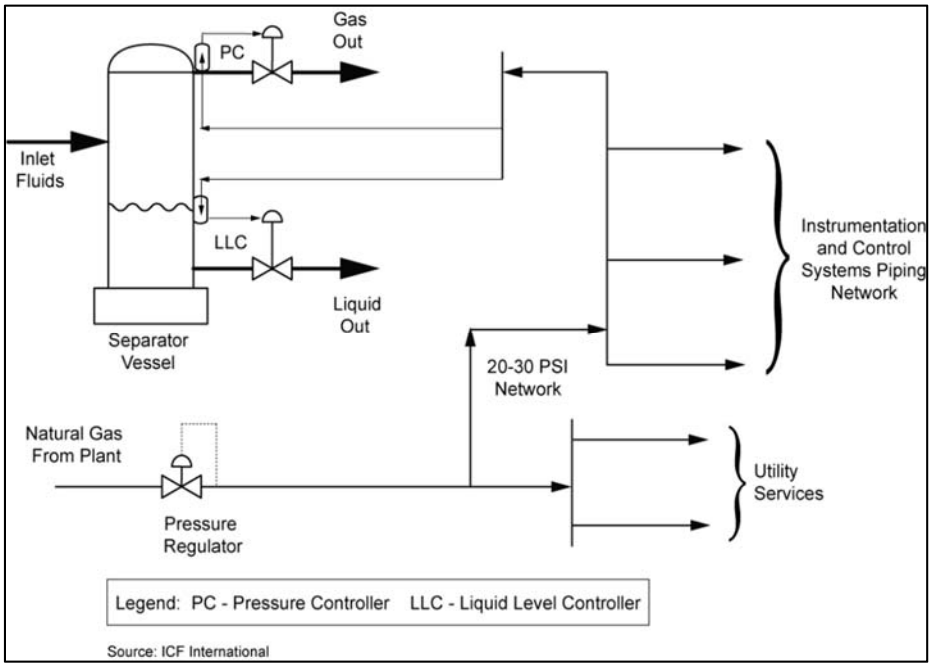

Figure 6-1. Natural Gas Pneumatic Control System

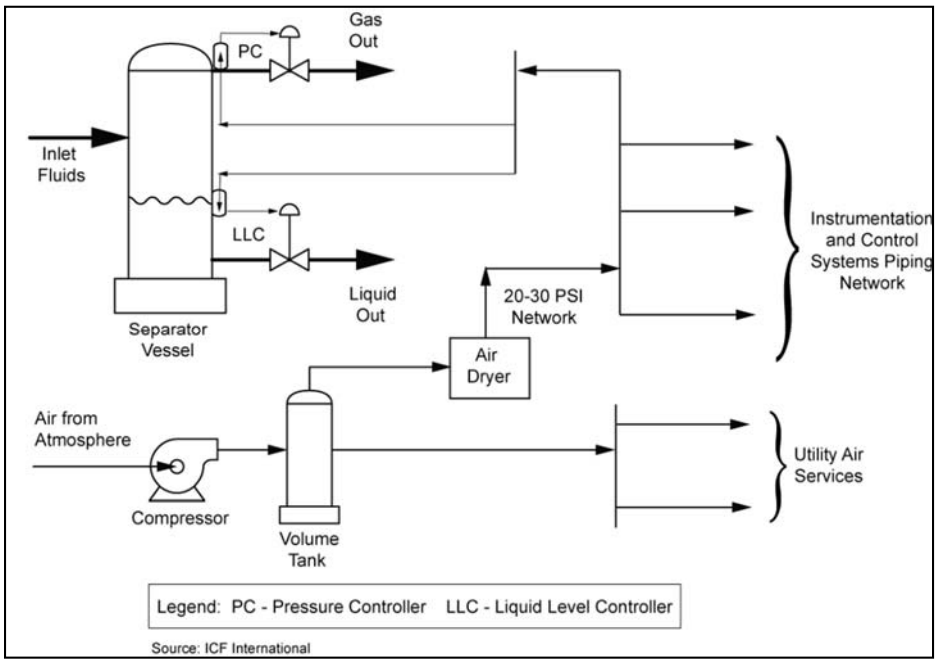

Figure 6-2. Compressed Instrument Air Control System

used to run the existing instrumentation, adjusted for air losses during the drying process. The current volume of gas usage can be determined by direct metering if a meter is installed. Otherwise, an alternative rule of thumb for sizing instrument air systems is one cubic foot per minute (cfm) of instrument air for each control loop. As the system is powered by electric compressors, the system requires a constant source of electrical power and a backup system to operate the controllers in the event of interruption of the electrical supply. Table 6-5 outlines three different sized instrument air systems including the compressor power requirements, the flow rate provided from the compressor, and the associated number of control loops.

Table 6-5. Compressor Power Requirements and Costs for Representative Instrument Air Systems[a]

Compressor Power Requirements[b]			Flow Rate (cfm)	Control Loops (Loops/Compressor)	Power Costs ($/yr)
Size of Unit	Hp	kW			
Small	10	13.3	30	15	$7,758
Medium	30	40	125	63	$23,332
Large	75	100	350	175	$58,329

[a] Based on rules of thumb stated in the Natural Gas STAR document, *Lessons Learned: Convert Gas Pneumatic Controls to Instrument Air*. Natural Gas STAR Program. Washington, DC. 2006.
[b] Power is based on the operation of two compressors operating in parallel (each assumed to be operating at full capacity 50 percent of the year).

The primary costs associated with conversion to instrument air systems are the initial capital expenditures for installing compressors and the related equipment and operating costs for electrical energy to power the compressor motor. This equipment includes a compressor, a power source, a dehydrator, gas supply piping, control instruments, valve actuators and a storage vessel. The total cost, including installation and labor, of three representative sizes of compressors were evaluated based on assumptions found in the Natural Gas STAR document, "Lessons Learned: Convert Gas Pneumatic Controls to Instrument Air" and are summarized in Table 6-6.[88]

[88] Ibid.

Table 6-6. Estimated Capital and Annual Costs of Representative Instrument Air Systems ($2012)

Instrument Air System Size	Compressor	Tank	Air Dryer	Total Capital Cost[a]	Annualized Capital Cost[b]	Labor Cost	Total Annual Cost[c]	Annualized Cost of Instrument Air System
Small	$3,987	$797	$2,391	$17,938	$2,554	$1,410	$9,168	$11,722
Medium	$19,928	$2,391	$7,173	$77,716	$11,065	$4,580	$27,912	$38,977
Large	$35,071	$4,783	$15,941	$143,476	$20,428	$6,340	$64,669	$85,097

[a] Total Capital Cost includes the cost for two compressors, two tanks, an air dryer and installation. Installation costs are assumed to be equal to 1.5 times the cost of capital. Equipment costs were derived from the 2012 NSPS TSD.
[b] These costs have been converted to 2012 dollars (from 2008 dollars) using the Federal Reserve Economic Data GDP Price Deflater (Change in GDP: Implicit Price Deflator from 2008 to 2012 (5.69 percent).[89]
[c] The annualized cost was estimated using a 7 percent interest rate and 10-year equipment life. Annual cost includes the cost of electrical power, as listed in Table 6-5, and labor.

[89] U.S. Bureau of Economic Analysis. *Gross Domestic Product: Implicit Price Deflator (GDPDEF]*, retrieved from FRED, Federal Reserve Bank of St. Louis. https://research.stlouisfed.org/fred2/series/GDPDEF/ March, 26, 2015.

For new natural gas processing plants, the cost-effectiveness of the three representative instrument air system sizes was evaluated in the 2015 NSPS Proposal TSD based on the emissions mitigated from the number of control loops the system can provide and not on a per device basis. This approach was chosen because we assume new processing plants will need to provide instrumentation for multiple control loops and size the instrument air system accordingly. Table 6-7 summarizes the natural gas processing segment cost of control per ton of VOC reduced for three sizes of representative instrument air systems. For existing natural gas processing plants, it is our understanding that these plants have already upgraded to instrument air unless the function has a specific need for a high-bleed pneumatic controller, which would most likely be safety related. The cost of converting the pneumatic controllers to instrument air includes the capital cost of $2,000 for the ductwork and annual cost of $285 (assuming a 10-year equipment life at 7 percent interest). The VOC cost of control for converting pneumatic controllers to instrument air for processing plants that already have instrument air ranges from $6 to $68 per ton of VOC removed, depending on the size of the instrument air system.

For natural gas processing, the cost of control of the three representative instrument air systems was evaluated based on the emissions mitigated from the number of control loops the system can provide and not on a per controller basis. This approach was chosen because we assume new processing plants will need to provide instrumentation for multiple control loops and size the instrument air system accordingly. We also assume that existing processing plants have already upgraded to instrument air unless the function has a specific need for a high-bleed pneumatic controller, which would most likely be safety related. Table 6-7 summarizes the natural gas processing segment cost of control per ton of VOC reduced for three sizes of representative instrument air systems.

NMED Exhibit 34

Table 6-7. Cost of Control of Representative Instrument Air Systems in the Natural Gas Processing Segment ($2012)

System Size	Number of Control Loops	VOC Annual Emission Reduction (tpy)[a]	Value of Product Recovered ($2012/year)[b]	Annualized Cost of System		VOC Cost of Control ($2012/ton)	
				Without Savings	With Savings	Without Savings	With Savings
Small	15	4.18	$3,485	$11,722	$8,236	$2,804	$1,970
Medium	63	17.5	$14,592	$38,977	$24,385	$2,227	$1,393
Large	175	48.7	$40,606	$85,097	$44,490	$1,747	$914

[a] Based on the emissions mitigated from the entire system, which includes multiple control loops.
[b] Value of recovered product assumes natural gas processing is 82.9 percent methane by volume. A natural gas price of $4 per Mcf was assumed.

6.3.1.3 Electrically Powered Systems in Place of Bleed Devices

Description

Mechanical controls have been widely used in the oil and natural gas industry. They operate using a combination of levers, hand wheels, springs and flow channels with the most common mechanical control device being a liquid-level float to the drain valve position with mechanical linkages.[90] Another device that is increasing in use is electrically powered controls. Small electrical motors (including solar powered) have been used to operate valves and have no VOC emissions. Solar-powered control systems are driven by solar-power cells that actuate mechanical devices using electric power. As such, solar cells require some type of backup power or storage to ensure reliability.

Control Effectiveness[91]

Application of mechanical controls is limited because the control must be located in close proximity to the process measurement. Mechanical systems may have difficulty handling larger flow fluctuations. Electrically powered valves are only reliable with a constant supply of electricity. These controllers can achieve a 100 percent reduction in VOC emissions where applicable.

Cost Impacts

Depending on supply of power, mechanical and solar-power system costs can range from below $1,000 to $10,000 for an entire system.[92]

NMED Exhibit 34

6.3.1.4 Enhanced Maintenance of Natural Gas-Driven Pneumatic Controllers

Manufacturers of pneumatic controllers indicate that emissions in the field can be higher than the reported gas consumption due to operating conditions, age and wear of the device.[93] Examples of circumstances or factors that can contribute to this increase include:[94,95]

(1) Nozzle corrosion resulting in more flow through a larger opening;

(2) Broken or worn diaphragms, springs (e.g., spring broken that holds the supply pilot plug on its seat), bellows, fittings (e.g., leaking tubing/tubing-fittings) and nozzles;

(3) Corrosives in the gas leading to erosion and corrosion of control loop internals;

(4) Improper installation;

(5) Lack of maintenance (maintenance includes replacement of the filter used to remove debris from the supply gas and replacement of O-rings and/or seals);

(6) Lack of calibration of the controller or adjustment of the distance between the flapper and nozzle;

(7) Foreign material lodged in the pilot seat;

(8) Debris/deposits on vent pilot plug. Material on the vent pilot can allow the controller to exhaust gas during the activation cycle;

(9) Debris/deposits on the supply pilot plug. Material on the supply pilot can cause the introduction of gas while the vent is open; or

(10) Wear in the seal seat.

The EPA prepared a white paper titled "Oil and Natural Gas Sector Pneumatic Devices," in 2014, requesting specific comment on available emissions data for pneumatic devices. One of the comments received regarding data presented in "Measurements of Methane Emissions at Natural Gas Production Sites in the United States"[96] was that the data set reported was dominated by extreme values. The commenter noted that the highest emitting controllers are simply controllers emitting at a large rate, regardless of their service or design type. These

NMED Exhibit 34

controllers can have high emissions because of factors, other than design, related to maintenance, malfunction, or defect.[97]

Maintenance of pneumatics can correct many of these problems and can be an effective method for reducing emissions. Cleaning and tuning, in addition to repairing leaking gaskets, tubing fittings, and seals, can save 5 to 10 scfh per device. Eliminating unnecessary valve positioners can save up to 18 scfh per device.[98]

6.3.2 Existing Federal, State and Local Regulations

6.3.2.1 Federal Regulations that Specifically Require Control of VOC Emissions

Under the 2012 NSPS and 2016 NSPS, new or modified continuous bleed natural gas-driven pneumatic controllers at natural gas processing plants are subject to a VOC emission limit of zero (equivalent to non-natural gas-driven pneumatic controllers). Continuous bleed natural gas-driven pneumatic controllers in the production segment must have a bleed rate of 6 scfh or less.

6.3.2.2 State and Local Regulations that Specifically Require Control of VOC Emissions

States may have permitting restrictions on VOC emissions that apply to an emissions source as a result of an operating permit, or preconstruction permit based on air quality maintenance or improvement goals of an area. Permits specify what construction is allowed, what emission limits must be met and, often, how the source must be operated. To ensure that sources follow the permit requirements, permits also contain monitoring, recordkeeping and reporting requirements.

For pneumatic controllers, Colorado and Wyoming have existing control requirements similar to those required under the 2012 NSPS and 2016 NSPS. Other states have permitting and

NMED Exhibit 34

registration rules for controlling fugitive VOC emissions (which would include non-bleed emissions from pneumatic controllers).

Colorado requires that no- or low-bleed pneumatic controllers with a bleed rate of 6 scfh or less be installed for all new and existing applications (unless approved for use due to safety and/or process purposes) statewide (Regulation 7, XVIII.C.2). Where technically and economically feasible, Colorado requires no-bleed pneumatic controllers at facilities that are connected to the electric grid and using electricity to power equipment.

Wyoming requires the installation of low- or no-bleed pneumatic controllers with a bleed rate of 6 scfh or less at all new facilities. Upon modification of facilities, new pneumatic controllers must be low- or no-bleed and existing controllers must be replaced with no- or low-bleed controllers (at well site facilities only and not at natural gas processing plants).

Although some local rule requirements do not specifically require the control of VOC emissions from pneumatic controllers, local permit requirements (such as those required by the Bay Area Air Quality Management District) may require that a permit to operate applicant provide the number of high-bleed and low-bleed pneumatic devices in a permit application. Under some situations where facilities use high-bleed devices, the permitting authority might require an owner or operator to provide device-specific bleed rates and supporting documentation for each high-bleed device. In cases where high-bleed devices must be used, the permitting authority may require that the facility conduct fugitive monitoring and/or implement control requirements under conditions of their permit to operate.[99]

6.4 Recommended RACT Level of Control

Sections 6.4.1 and 6.4.2 present the recommended RACT level of control for continuous bleed natural gas-driven pneumatic controllers located at natural gas processing plants and continuous bleed natural gas-driven pneumatic controllers located from the wellhead to the natural gas processing plant or point of custody transfer to an oil pipeline.

[99] Cheng, Jimmy. *Permit Handbook. Chapter 3.5 Natural Gas Facilities and Crude Oil Facilities.* Bay Area Air Quality Management District. September 16, 2013.

6.4.1 Continuous Bleed Natural Gas-Driven Pneumatic Controllers Located at a Natural Gas Processing Plant

Based on our evaluation of available data obtained in the development of the 2012 NSPS and 2016 NSPS, peer review comments received on the "Oil and Natural Gas Sector Pneumatic Devices" white paper, and existing regulations that control VOC emissions from pneumatic controllers, we recommend that VOC emissions from an individual continuous bleed natural gas-driven pneumatic controller located at a natural gas processing plant be controlled by RACT. As noted in section 6.3.2, both Colorado and Wyoming require either low- or no-bleed controllers (where a high-bleed controller is defined as emitting at least 6 scfh); and the 2012 NSPS and 2016 NSPS require that new and modified individual continuous bleed pneumatic controllers at natural gas processing plants have a natural gas bleed rate of 0 scfh (unless there are functional needs including, but not limited to, response time, safety and positive actuation, requiring a bleed rate greater than 0 scfh). For existing individual continuous bleed pneumatic controllers at natural gas processing plants, our RACT recommendation is that controllers have a natural gas bleed rate of 0 scfh (unless there are functional needs including, but not limited to, response time, safety and positive actuation, requiring a bleed rate greater than 0 scfh). Our rationale for selecting a natural gas bleed rate of 0 scfh (with functional and safety exceptions) for our recommended RACT is based on the ability of most natural gas processing plants to install and utilize an instrument air system. As discussed in section 6.3.1.2 of this chapter, by using an instrument air system, compressed air may be substituted for natural gas in pneumatic systems without altering any of the parts of the pneumatic controller. Therefore, the use of instrument air eliminates natural gas and VOC emissions from pneumatic controllers and supports a natural gas bleed rate of 0 scfh.

In order to meet an emission limit of 0 scfh, natural gas processing plants would likely need to use an instrument air system. The use of instrument air eliminates natural gas and VOC emissions from natural gas-driven pneumatic controllers. We believe that most natural gas processing plants already meet the recommended RACT level of control by driving controllers with instrument air or other non-gas-driven controls unless there is a specific need for a high-bleed pneumatic controller. Nonetheless, for those natural gas processing plants that do not have an installed instrument air system, the cost of control of installing three representative instrument air systems was evaluated under the 2012 NSPS and 2016 NSPS based on the emissions

mitigated from the number of control loops the system can provide (see section 6.3.1.2 of this chapter). Based on this analysis, the cost of this option was considered to be reasonable for natural gas processing plants (see Table 6-7 of section 6.3.1.2 of this chapter). The cost of control per ton of VOC reduced was estimated at $1,700 - $2,800 without savings and $910 - $2,000 with savings. For determining potential cost impacts, a major assumption made was that processing plants are constructed at locations with sufficient electrical service to power the instrument air compression systems.

In summary, we recommend the following RACT for each continuous bleed natural gas-driven pneumatic controller located at a natural gas processing plant:

> RACT for Each Continuous Bleed Natural Gas-Driven Pneumatic Controller Located at a Natural Gas Processing Plant:[100] Each continuous bleed natural gas driven pneumatic controller located at a natural gas processing plant must have a natural gas bleed rate of 0 scfh (unless there are functional needs including, but not limited to, response time, safety and positive actuation, requiring a bleed rate greater than 0 scfh).

6.4.2 Continuous Bleed Natural Gas-Driven Pneumatic Controllers Located from the Wellhead to the Natural Gas Processing Plant or Point of Custody Transfer to an Oil Pipeline

Based on our evaluation of available data obtained in the development of the 2012 NSPS and 2016 NSPS, peer review comments received on the "Oil and Natural Gas Sector Pneumatic Devices" white paper, and existing regulations that control VOC emissions from pneumatic controllers, we are recommending a natural gas bleed rate less than or equal to 6 scfh with limited exceptions described below as the RACT for controlling VOC emissions from continuous bleed natural gas-driven pneumatic controllers located from the wellhead to the natural gas processing plant or point of custody transfer to an oil pipeline. We are also recommending that no requirements apply under RACT for pneumatic controllers that have a natural gas bleed rate less than or equal to 6 scfh that are located from the wellhead to the natural gas processing plant or point of custody transfer to an oil pipeline.

[100] In the NSPS, we excluded from the NSPS affected facility status non-natural gas-driven pneumatic controllers located at natural gas processing plants. Natural gas-driven controllers exempt from the zero VOC emission standard under the functional needs exclusion would still be affected facilities and would have certain tagging, recordkeeping and reporting requirements.

NMED Exhibit 34

As indicated in section 6.2.2 of this chapter, low-bleed pneumatic controllers can emit up to 6 scfh. Both Colorado and Wyoming conditionally require either low- or no-bleed controllers (where a high-bleed controller is defined as emitting greater than 6 scfh); and the 2012 NSPS and 2016 NSPS require that new and modified individual continuous bleed pneumatic controllers have a bleed rate of 6 scfh or less (unless there are functional needs including, but not limited to, response time, safety and positive actuation, requiring a bleed rate greater than 6 scfh). For purposes of this CTG, and consistent with the definition of high-bleed controller used for the 2012 NSPS, 2016 NSPS, and both the Wyoming and Colorado state regulations, a high-bleed pneumatic device is defined as emitting greater than 6 scfh to the atmosphere.

Although both Wyoming and Colorado specifically require low-bleed or no-bleed pneumatic controllers in place of high-bleed controllers (where technically and economically feasible), we are recommending a RACT emission limit of 6 scfh (unless there are functional needs including, but not limited to, response time, safety and positive actuation, requiring a bleed rate greater than 6 scfh) apply to each continuous bleed pneumatic controller. This approach allows flexibility in how a source chooses to limit VOC emissions from an applicable individual pneumatic controller and acknowledges that there may be circumstances where it is not practical to meet a 6 scfh limit. By requiring a limit be met, facilities have the option of controlling emissions by one or more options presented in section 6.3.1 of this chapter (e.g., replace a high-bleed device with a low-bleed device and implement enhanced monitoring to mitigate increased VOC emissions from poor maintenance/poor operation) depending on site-specific circumstances. We are including this flexibility in our recommended RACT to address the varied control options and applicability issues (e.g., instrument air systems require access to electrical power or a backup pneumatic controller and access to electric power or backup pneumatic controllers may not be available in remote locations) presented in section 6.3.1 of this chapter.

Although facilities would have flexibility in how they meet the recommended RACT level of control, by establishing an emission limit equal to the design bleed rate for a low-bleed device (6 scfh), we believe that most facilities would likely replace high-bleed controllers with low-bleed controllers (it is assumed about 80 percent of high-bleed devices can be replaced with

NMED Exhibit 34

low-bleed devices).[101] For the production segment, we estimated that, on average, 1.41 tons of VOC would be reduced annually per device in the production segment from installing a low-bleed device in place of a high-bleed device.

As presented in section 6.3.1.1 of this chapter, the cost of replacing a high-bleed device with a new low-bleed device is on the order of $2,698 per device, and the cost of control in the production segment is estimated to be $210 per ton of VOC emissions reduced without savings. Considering the cost savings of gas recovered from installing a low-bleed device in place of a high-bleed device, it is estimated that there would be an overall net savings.

In summary, we recommend the following RACT for each single continuous bleed natural gas-driven pneumatic controller located from the wellhead to the natural gas processing plant or point of custody transfer to an oil pipeline:

> RACT for Each Single Continuous Bleed Natural Gas-Driven Pneumatic Controller Located from the Wellhead to the Natural Gas Processing Plant or Point of Custody Transfer to an Oil Pipeline: Each pneumatic controller, which is a single continuous bleed natural gas-driven pneumatic controller[102] must have a natural gas bleed rate less than or equal to 6 scfh (unless there are functional needs including, but not limited to response time, safety and positive actuation, requiring a bleed rate greater than 6 scfh).

[101] U.S. Environmental Protection Agency. Lessons Learned from Natural Gas STAR Partners. *Options for Reducing Methane Emissions from Pneumatic Devices in the Natural Gas Industry*. Office of Air and Radiation: Natural Gas STAR Program. Washington, DC. October 2006.

[102] In the NSPS, we excluded from NSPS pneumatic controller affected facility status continuous bleed natural gas-driven pneumatic controllers with a bleed rate not greater than 6 scfh (low-bleed controllers) located in the production segment. Continuous bleed natural gas-driven controllers exempt from the 6 scfh bleed rate emission standard under the functional needs exclusion would still be affected facilities and would have certain tagging, recordkeeping and reporting requirements.

NMED Exhibit 34

6.5 Factors to Consider in Developing Pneumatic Controller Compliance Procedures

6.5.1 Oil and Natural Gas Production (Individual Continuous Bleed Pneumatic Controller with a Natural Gas Bleed Rate Greater than 6 scfh Located from the Wellhead to the Natural Gas Processing Plant or Point of Custody Transfer to an Oil Pipeline)

To ensure that each continuous bleed natural gas-driven pneumatic controller located from the wellhead to the natural gas processing plant or point of custody transfer to an oil pipeline is operated with a natural gas bleed rate less than or equal to 6 scfh (the recommended RACT level of control), we recommend that regulating agencies specify operating, recordkeeping and reporting requirements to document compliance. It is recommended that air agencies require that each pneumatic controller be tagged with the month and year of installation and identification information that allows traceability to manufacturer's documentation.

It is recommended that air agencies require owners and operators of continuous bleed natural gas-driven pneumatic controllers that are subject to RACT maintain records that: (1) document the location and manufacturer's specifications of each pneumatic controller; (2) if applicable, provide a demonstration as to why the use of a pneumatic controller with a natural gas bleed rate greater than 6 scfh is required (the recommended RACT level of control); and (3) document deviations in cases where a pneumatic controller was not operated in compliance with RACT.

It is also recommended that air agencies require owners and operators to submit annual reports that include (1) if applicable, documentation that the use of a pneumatic controller with a natural gas bleed rate greater than 6 standard cubic feet per hour is required and the reasons why; and (2) the records of deviations that occurred during the reporting period.

The appendix to this document presents example model rule language that incorporates the compliance elements recommended in this section that air agencies may choose to use in whole or in part when implementing RACT.

6.5.2 Natural Gas Processing Segment (Individual Continuous Bleed Natural Gas-Driven Pneumatic Controller Located at a Natural Gas Processing Plant)

To ensure each continuous bleed natural gas-driven pneumatic controller at natural gas processing plants is operated with a natural gas bleed rate of zero (the recommended RACT level of control), we suggest that air agencies specify operating, recordkeeping and reporting requirements to document compliance. We also suggest that air agencies require that each pneumatic controller be tagged with the month and year of installation and identification information that allows traceability to the manufacturer's documentation. It is recommended that air agencies require owners and operators of pneumatic controllers maintain records that: (1) document the location and manufacturer's specifications of each pneumatic controller; (2) document that the natural gas bleed rate is zero; and (3) document deviations in cases where a pneumatic controller was not operated in compliance with RACT.

It is also recommended that air agencies require owners and operators to submit annual reports that include the records of deviations that occurred during the reporting period.

The appendix to this document presents example model rule language that incorporates the compliance elements recommended in this section that air agencies may choose to use in whole or in part when implementing RACT.

NMED Exhibit 34

7.0 PNEUMATIC PUMPS

The oil and natural gas industry uses a variety of pneumatic gas-driven pumps where there is no reliable electrical power to "control processing problems and protect equipment."[103] Pneumatic pumps are "small positive displacement, reciprocating units used throughout the oil and natural gas industry to inject precise amounts of chemicals into process streams or for freeze protection glycol circulation."[104] Most chemical injection pumps fall into two main types: (1) diaphragm pumps, generally used for heat tracing; or (2) plunger/piston, generally used for chemical and methanol injection. Pneumatic pumps driven by natural gas emit natural gas, which contains VOC. Other types of pneumatic pumps may be driven by gases other than natural gas and, therefore, do not emit VOC. The focus of this CTG is natural gas-driven pneumatic pumps. This chapter provides a description of pneumatic pumps that are used in the oil and natural gas industry, including their function and associated emissions. This chapter also provides control techniques used to reduce VOC emissions from pneumatic pumps, along with costs and emission reductions. Finally, this chapter provides a discussion of our recommended RACT for pneumatic pumps and the associated VOC emission reductions and costs.

7.1 Applicability

For the purposes of this CTG, a pneumatic pump is a positive displacement reciprocating unit used for injecting precise amounts of chemicals into a process stream or for glycol circulation. The pneumatic pump may use natural gas or another gas to drive the pump. The emissions and emission control options discussed herein would apply to natural gas-driven chemical/methanol and diaphragm pumps located at natural gas processing plants and well sites.

NMED Exhibit 34

7.2 Process Description and Emission Sources

7.2.1 Process Description

As noted above, pneumatic pumps are "positive displacement, reciprocating units used for injecting precise amounts of chemicals into a process stream or for glycol circulation."[105] Pneumatic pumps often make use of gas pressure where electricity is not readily available.[106] In the production segment, the supply gas is mostly produced natural gas, whereas in the processing segment, the supply gas may be compressed air. For natural gas-driven pneumatic pumps, characteristics that affect VOC emissions include the frequency of operation, the size of the unit, the supply gas pressure, and the inlet natural gas composition.[107]

Pneumatic pumps are generally used for one of three purposes: glycol circulation in dehydrators, hot oil circulation for heat tracing/freeze protection, or chemical injection. Glycol dehydrator pumps may recover energy from the high-pressure rich glycol/gas mixture leaving the absorber and use that energy to pump the low-pressure lean glycol back into the absorber.[108] Diaphragm pumps are commonly used to circulate hot glycol or other heat-transfer fluids in tubing covered with insulation to prevent freezing in pipelines, vessels, and tanks. Chemical injection pumps (i.e., piston/plunger pumps or small diaphragm pumps) inject small amounts of chemicals, such as methanol, to prevent hydrate formation or corrosion inhibitors into process streams to regulate operations of a plant and protect the equipment.

Pneumatic pumps have two major components, a driver side and a motive side, which operate in the same manner but with different reciprocating mechanisms. Pressurized gas provides energy to the driver side of the pump, which operates a piston or flexible diaphragm to draw fluid into the pump. The motive side of the pump delivers the energy to the fluid being moved in order to discharge the fluid from the pump. The natural gas leaving the exhaust port of

the pump is either directly discharged into the atmosphere or is recovered and used as a fuel gas or stripping gas.[109]

Chemical injection pumps are positive displacement, reciprocating units designed to inject precise amounts of chemical into a process stream. Positive displacement pumps work by allowing a fluid to flow into an enclosed cavity from a low-pressure source, trapping the fluid, and then forcing it out into a high-pressure receiver by decreasing the volume of the cavity. A complete reciprocating stroke includes two movements, referred to as an upward motion or suction stroke, and a downward motion or power stroke. During the suction stroke, the chemical is lifted through the suction check valve into the fluid cylinder. The suction check valve is forced open by the suction lift produced by the plunger and the head of the liquid being pumped. Simultaneously, the discharge check valve remains closed, thus allowing the chemical to remain in the fluid chamber. During the power stroke, the plunger assembly is forced downwards, immediately shutting off the suction check valve. Simultaneously, the chemical is displaced, forcing open the discharge check valve and allowing the fluid to be discharged.[110]

Typical chemicals injected in an oil or natural gas field are biocides, demulsifiers, clarifiers, corrosion inhibitors, scale inhibitors, hydrate inhibitors, paraffin dewaxers, surfactants, oxygen scavengers, and H_2S scavengers. These chemicals are normally injected at the wellhead and into gathering lines or at production separation facilities. Because the injection rates are typically small, the pumps are also small. They are often attached to barrels containing the chemical being injected.[111]

Diaphragm pumps are positive displacement pumps, meaning they use contracting and expanding cavities to move fluids. Diaphragm pumps work by flexing the diaphragm out of the displacement chamber. When the diaphragm moves out, the volume of the pump chamber increases and causes the pressure within the chamber to decrease and draw in fluid. The inward stroke has the opposite effect, decreasing the volume and increasing the pressure of the chamber to move out fluid.[112]

Not all pneumatic pumps are natural gas driven. At sites without electrical service sufficient or reliable enough to power an instrument air compressor control system, mechanical or electrically powered pneumatic pumps may be used. Where reliable electrical service is available, sources of power other than pressurized natural gas, such as compressed instrument air may be used. Because these devices are not natural gas driven, they do not directly release natural gas or VOC emissions. Instrument air systems are feasible only at oil and natural gas industry locations where the devices can be driven by compressed instrument air systems and have electrical service sufficient and reliable enough to power a compressor. This analysis assumes that natural gas processing plants are likely to have electrical service sufficient to power an instrument air system, and that most existing gas processing plants use instrument air instead of natural gas-driven pumps.[113] The application of electrical controls is discussed further in section 7.3 of this chapter.

7.2.2 Emissions Data

7.2.2.1 Summary of Major Studies and Emissions

In the evaluation of the emissions from pneumatic pumps and the potential options available to reduce these emissions, numerous studies were consulted. Table 7-1 lists these references with an indication of the type of relevant information contained in each reference. In addition to these sources, we evaluated the peer reviewer and public comments received on the EPA's white paper, "Oil and Natural Gas Sector Pneumatic Devices."[114]

U.S. EPA/GRI Report.[117] The GHGRP and GHG Inventory use emission factors from the U.S. EPA/GRI Report. Similarly, we determined that the best available emission factors for pneumatic pumps are presented in the U.S. EPA/GRI Report.

The basic approach used for this analysis was to first approximate methane emissions from the average pneumatic pump in the production and processing segments and then estimate VOC and HAP emissions using the gas composition factors from the 2011 Gas Composition Memorandum. The specific gas composition ratio used for this analysis was 0.278 lbs VOC per pound methane in the production and processing segment. Table 7-2 summarizes the estimated average emission factors for a representative pneumatic pump for the production and processing segments for both methane and VOC.

Table 7-2. Average Emission Estimates per Pneumatic Device

Segment/Pump Type	Emission Factor Methane (scf/day) [a]	Emission Factor Methane (Mcf/yr)[b]	Emission Factor Methane (tpy)[c]	Emission Factor VOC (tpy)[d]
Production

NMED Exhibit 34

7.3 Available Controls and Regulatory Approaches

7.3.1 Available VOC Emission Control Options

Natural gas-driven pneumatic pumps emit VOC emissions as part of their normal operation. Depending on the type of pump and the constraints of the location, companies can utilize a variety of technologies that have been developed over the years. In situations where the replacement of natural gas-driven pumps with electric, solar and instrument air pumps is not feasible, emissions can be captured and routed to a VRU or to a combustion device.

Sections 7.3.1.1 and 7.3.1.2 discuss the control of VOC emissions by replacing natural gas-driven pumps with solar pumps and electric pumps. Section 7.3.1.3 discusses the use of an instrument air system to drive the pneumatic pump in order to eliminate VOC emissions. Lastly, section 7.3.1.4 discusses reducing VOC emissions by routing emissions from the pump to a combustion device, and section 7.3.1.5 discusses capturing VOC emissions using a VRU.

7.3.1.1 Solar Pumps

Description

Solar pumps provide the same functionality as natural gas-driven pumps and can be utilized at remote sites where electricity is not available. However, peer review comments received on the EPA's white paper "Oil and Natural Gas Sector Pneumatic Devices" noted that they predominantly operated solar-powered pneumatic pumps for chemical injection and the pumps failed as early as after two to three cloudy days due to insufficient battery charge.[118] When solar pumps are properly charged, a solar-charged DC pump can handle a range of throughputs up to 100 gallons per day with maximum injection pressure around 3,000 psig and have no VOC emissions. Converting natural gas-driven chemical pumps can reduce methane emissions by an estimated 3.46 tpy per diaphragm pump and 0.38 tpy per piston pump for all segments of the oil and natural gas industry.[119] Based on the gas composition for natural gas in the production segment, we estimate that replacement of a pneumatic pump with a solar-powered pump will reduce VOC emissions by 0.96 tpy per diaphragm pump and 0.11 tpy for a piston pump.

[118] Reese, Carrie, Environmental Compliance Manager. Comments on the Oil and Natural Gas Sector Pneumatic Devices. Pioneer Natural Resources.
[119] U.S. Environmental Protection Agency. PRO Fact Sheet No. 202. *Convert Natural Gas-Driven Chemical Pumps*.

NMED Exhibit 34

Control Effectiveness

Replacing a natural gas-driven pump with a solar pump can result in 100 percent reduction in VOC emissions and is feasible in regions where there is sufficient sunlight to power the pump, and backup power is not required. Although, as stated above, solar-powered pumps are capable of pumping up to 100 gallons per day, they are typically used for low volume applications to inject methanol or corrosion inhibitors into a well with typical volumes ranging from 6 to 8 gallons per day. In addition to the low volume pumps, large volume pumps used to replace natural gas-assisted circulation pumps for glycol dehydrators can also be converted to solar.

Cost Impacts

The primary costs associated with conversion to solar pumps are the initial capital expenditures. Solar pumps generally have low maintenance costs, which are typically lower than natural gas-driven pump maintenance costs. The cost being attributed to the replacement of pneumatic pumps with solar-powered pumps includes the capital cost of the pump and its associated operating costs. The operating costs are estimated to be 10 percent of the capital cost. Based on the Natural Gas STAR document, "PRO Fact Sheet: Convert Natural Gas-Driven Chemical Pumps,"[120] the capital (purchase) cost for a solar-powered electric pump is approximately $2,000 with solar panels having a lifespan of 15 years and electric motors lasting 5 years. The total capital cost, including installation and labor is $2,227 (2012 dollars). We estimate there would be no additional annual operating costs for solar pumps above and beyond that of ordinary field personnel duties. Annualized over the life of the pump at a 7 percent discount rate, the annualized cost of replacing a pneumatic pump with a solar pump is $317. In addition, the use of solar pumps will have savings realized from the natural gas not released. We estimate that each diaphragm pump replaced will save 197 Mcf per year of natural gas from being emitted and each piston pump will have a natural gas savings of 22 Mcf per year. The value of the natural gas saved based on $4.00 per Mcf would be $786 per year per diaphragm pump and $87 per year per piston pump.

[120] U.S. Environmental Protection Agency. PRO Fact Sheet No. 202. *Convert Natural Gas-Driven Chemical Pumps*.

7.3.1.2 Electric Pumps

Description

Electric pumps provide the same functionality as natural gas-driven pumps, and are only restricted by the use of reliable power. Electric pumps have no VOC emissions, and converting a natural gas-driven pneumatic pump to an electric pump can reduce VOC emissions by an estimated 0.96 tpy per diaphragm pump and 0.11 tpy per piston pump.

Control Effectiveness

Replacing a natural gas-driven pump with an electric pump can result in 100 percent reduction in VOC emissions. However, use of electric pumps requires a sufficient and reliable source of electricity. These pumps are, therefore, more common at natural gas processing plants or large dehydration facilities that have access to reliable electric power.

Cost Impacts

The primary costs associated with converting natural gas-driven pumps to electric pumps are the initial capital expenditures, installation and ongoing operation and maintenance. Based on the Natural Gas STAR document, "PRO Fact Sheet: Convert Natural Gas-Driven Chemical Pumps,"[121] the cost of an electric pump to replace a diaphragm pump is $4,647 and to replace a piston pump is $1,819 in 2012 dollars depending on the horsepower of the unit.[122] The annual operating costs for an electric pump are estimated to be $293. Based on these costs annualized over the life expectancy of the pump at a 7 percent discount rate, the annualized cost for an electric pump to replace a diaphragm pump is $954, and $552 to replace a piston pump. In addition, the use of electric pumps will have savings realized from the natural gas not released. We estimate that each diaphragm pump replaced will save 197 Mcf per year of natural gas from being emitted and each piston pump will have a natural gas savings of 22 Mcf per year. The value of the natural gas saved based on $4.00 per Mcf would be $786 per year per diaphragm pump and $87 per year per piston pump.

7.3.1.3 Instrument Air System

Description

Instrument air systems require a compressor, power source, dehydrator, and volume tank. The same pneumatic pumps can be used for natural gas and compressed air, without altering any of the parts of the pneumatic pump, but instrument air eliminates the emissions of natural gas. All facilities that have access to an adequate and reliable source of electricity can install an instrument air system. The following, taken from the Natural Gas STAR document, "PRO Fact Sheet: Convert Gas Pneumatic Controls to Instrument Air,"[123] describes the major components of an instrument air system:

(1) Compressors used for instrument air delivery are available in various types and sizes, from rotary screw (centrifugal) compressors to positive displacement (reciprocating piston) types. The size of the compressor depends on the size of the facility, the number of control devices operated by the system, and the typical emission rates of these devices. The compressor is usually driven by an electric motor that turns on and off, depending on the pressure in the volume tank. For reliability, a full spare compressor is normally installed.

(2) A critical component of the instrument air control system is the power source required to operate the compressor. Because high-pressure natural gas is abundant and readily available, natural gas-driven pneumatic systems can run uninterrupted on a 24-hour, 7- day per week schedule. The reliability of an instrument air system, however, depends on the reliability of the compressor and electric power supply. Most large natural gas plants have either an existing electric power supply or have their own power generation system. For smaller facilities and remote locations, however, a reliable source of electric power can be difficult to ensure. In some instances, solar-powered, battery-operated air compressors can be feasible for remote locations, which would both reduce VOC emissions and energy consumption. Small natural gas-powered fuel cells are also being developed.

[123] U.S. Environmental Protection Agency. Lessons Learned from Natural Gas STAR Partners. *Convert Gas Pneumatic Controls to Instrument Air*. Office of Air and Radiation: Natural Gas STAR Program. Washington, DC. October 2006.

NMED Exhibit 34

(3) Dehydrators, or air dryers, are an integral part of the instrument air compressor system. Water vapor present in atmospheric air condenses when the air is pressurized and cooled, and can cause a number of problems to these systems, including corrosion of the instrument parts and blockage of instrument air piping and controller orifices.

(4) The volume tank holds enough air to allow the pneumatic control system to have an uninterrupted supply of high-pressure air without having to run the air compressor continuously. The volume tank allows a large withdrawal of compressed air for a short time, such as for a motor starter, pneumatic pump, or pneumatic tools, without affecting the process control functions.

Control Effectiveness

Instrument air eliminates all emissions from natural gas-driven pneumatic pumps, but can only be utilized in locations with sufficient and reliable electrical power. Furthermore, instrument air systems are more economical and, therefore, more common at facilities with a high concentration of pneumatic devices and where an operator can ensure the system is properly functioning.[124] Because all emissions can be avoided by converting natural gas-driven chemical pumps to instrument air, methane emissions can be reduced by an estimated 3.46 tpy per diaphragm pump and 0.38 tpy per piston pump. Based on the gas composition for natural gas in the production segment, we estimate that converting a natural gas-driven pneumatic pump to instrument air will reduce VOC emissions by 0.96 tpy per diaphragm pump and 0.11 tpy per piston pump.

Cost Impacts

As stated previously, instrument air conversions require a compressor with a capacity based on the number of control loops at the location. The compressor size is equivalent to the volume of gas used by the control loops after adjusting for gas losses during drying, plus any utility air necessary at the facility. This volume can either be calculated via a meter or utilizing a rule of thumb of one cubic foot per minute (cfm) of instrument air per control loop.[125]

The costs associated with instrument air systems are primarily capital costs for the compressor(s), air dryer and the volume tank, but also include operational costs for electricity to

[124] Ibid.

NMED Exhibit 34

drive the compressor motor. Other components of the instrument air system, including piping, control instruments and valve actuators, would already be in place for a gas system. We assume that existing processing plants have an instrument air system in place, including backup systems, and that the cost of increasing air load on the system would be confined to the incremental cost associated with upgrading or replacing the compressor and connecting the pumps to the system. The size of the compressor required would depend on the additional air load required for the instrument air system to handle the pneumatic pumps. Table 7-3 summarizes cost estimates to replace various size compressors in an existing instrument air system.

Table 7-3. Cost of Compressor Replacement for Existing Instrument Air System ($2012)

Compressor Size	Total Capital Cost[a]	Annualized Cost[b]	Total O&M Cost[c]	Annual Cost[d]
Small	$5,999	$854	$9,197	$10,051
Medium	$29,989	$4,270	$28,002	$32,271
Large	$52,779	$7,515	$64,880	$72,394

[a] 2016 NSPS TSD.
[b] Annualized capital cost using a 7 percent interest rate and an equipment life of 10 years.
[c] The total O&M includes both the annual labor cost and the annual power cost.
[d] The total annual cost includes the annualized capital cost and the total O&M cost.

7.3.1.4 Route Emissions to an Existing or New Combustion Device

Description

Typical combustion devices used in the oil and natural gas industry to control VOC emissions and their control efficiency are discussed in greater detail in section 4.3.1.2 of chapter 4 of this document. It is assumed that most processing plants and large dehydration facilities have at least one existing combustion device onsite.

Control Effectiveness

Routing emissions from a natural gas-driven pump to an existing combustion device, or a newly installed combustion device does not reduce the volume of natural gas discharged from the pump, but rather combusts the gas. Based on the gas composition for natural gas in the production segment, we estimated that routing emissions to a combustion device would reduce VOC emissions by an estimated 0.91 tpy per diaphragm pump and 0.1 tpy per piston pump.

NMED Exhibit 34

Cost Impacts

Routing natural gas to an existing combustion device or installing a new combustion device have associated capital and operating costs. Based on costs for a combustion device provided in the 2015 NSPS TSD, the capital cost for installing a new combustion device to control emissions is estimated to cost $34,250 and the annual operating cost is $17,001 in 2012 dollars. Based on the life expectancy for a combustion device, we estimate the annualized cost of installing a new combustion device to be approximately $21,877, using a 7 percent discount rate. The capital cost for routing emissions to an existing control device to control emissions is estimated to be $5,433 with an annualized cost of $774, using a 7 percent discount rate. Because the natural gas captured is combusted there is no gas savings associated with the use of a combustion device to reduce VOC emissions. Table 7-4 presents the estimated VOC cost of control for routing natural gas-driven pump emissions to an existing combustion device. Table 7-5 presents the cost of control for routing natural gas-driven pump emissions to a new combustion device.

Table 7-4. VOC Cost of Control for Routing Natural Gas-Driven Pump Emissions to an Existing Combustion Device

Pump Type/ Segment	VOC Emission Reductions (tpy/pump)	Annualized Cost ($2012)	VOC Cost of Control ($2012/ton)
Diaphragm Pumps			
Production	0.91	$774	$847
Processing	0.91	$774	$847
Piston Pumps			
Production	0.10	$774	$7,709
Processing	0.10	$774	$7,709

Table 7-5. VOC Cost of Control for Routing Natural Gas-Driven Pump Emissions to a New Combustion Device

Pump Type/ Segment	VOC Emission Reductions (tpy/pump)	Annualized Cost ($2012)	VOC Cost of Control ($2012/ton)
Diaphragm Pumps			
Production	0.91	$21,877	$23,944
Processing	0.91	$21,877	$23,944
Piston Pumps			
Production	0.10	$21,877	$218,017
Processing	0.10	$21,877	$218,017

7.3.1.5 Route Emissions to a Vapor Recovery Unit (VRU)

Description

Vapor recovery units capture low-pressure vapor streams, increase the pressure by means of a compressor, and then route the vapor stream to a process or other useful purpose. These systems typically include a backup compressor system to allow for shutdowns and repairs. Vapor recovery units are more economical for facilities with multiple natural gas emission sources that can be routed to the VRU. Some of these other emission sources can include tanks, dehydrators, and compressors and as a result, VRUs are more common at natural gas processing plants. Vapor recovery units are discussed in greater detail in section 4.3.1.1 of chapter 4 of this document.

Control Effectiveness

Use of a vapor recovery technology has the potential to reduce the VOC emissions from natural gas-driven pumps by 100 percent if all vapor is recovered. We recognize that VRUs may not continuously meet this efficiency in practice. Therefore, we estimate that routing emissions from a natural gas-driven pump to an existing or newly installed VRU can reduce the VOC emitted by approximately 95 percent (accounting for any reduced efficiency that may occur) while, at the same time, capturing the natural gas for beneficial use. We estimate that methane emission reductions for routing gas to a VRU to be 3.29 tpy for a diaphragm pump and 0.36 tpy for a piston pump. Based on the gas composition for natural gas in the production segment, we

estimate that routing emissions to a VRU can reduce VOC emissions by 0.91 tpy per diaphragm pump and 0.1 tpy per piston pump.

Cost Impacts

Based on costs for a VRU provided in the 2015 NSPS TSD, we estimate the capital cost of installing a VRU to be $104,111 and the annual operation and maintenance cost to be $9,932 in 2012 dollars. The total annualized cost of a new VRU is estimated to be $24,755 based on a 7 percent discount rate.

If a VRU is already onsite, then the additional costs for routing emissions from a pump are small, as the majority of costs are piping. We estimated the cost of routing emissions to an existing VRU to be $5,433 in 2012 dollars. The annualized cost of routing natural gas emissions to an existing VRU is estimated to be $774 based on a 7 percent discount rate. In addition, there is potential for beneficial use of natural gas recovered through the VRU. We estimated the annual natural gas recovered to be 187 Mcf per year per diaphragm pump and 21 Mcf per year per piston pump. The resulting natural gas savings is estimated to be $749 per diaphragm pump and $84 per piston pump, per year based on a value of $4.00 per Mcf of natural gas recovered. Table 7-6 presents the estimated VOC cost of control for routing natural gas-driven pump emissions to an existing VRU. Table 7-7 presents the estimated VOC cost of control for routing gas-driven pump emissions to a new VRU.

Table 7-6. VOC Cost of Control for Routing Natural Gas-Driven Pump Emissions to an Existing VRU

Pump Type/ Segment	VOC Emission Reductions (tpy/pump)	Annualized Cost ($2012)	VOC Cost of Control ($2012/ton)	
			Without savings	With savings
Diaphragm Pumps

Processing	0.10	$24,755	$246,697	$245,864

7.3.2 Existing Federal, State and Local Regulations

7.3.2.1 Federal Regulations that Specifically Require Control of VOC Emissions

The EPA has finalized federal requirements for natural gas-driven pneumatic pumps under subpart OOOOa. Under subpart OOOOa, each natural gas-driven diaphragm pump located at a natural gas processing plant must have zero natural gas emissions, and each natural gas-driven diaphragm pump located at a well site must capture and route emissions to a control device or process if there is an existing control device or process available onsite. Subpart OOOOa requires that VOC and methane emissions be reduced by 95 percent or greater unless the existing control device or process is not capable of reducing emissions by 95 percent or greater, unless (1) there is no control device onsite, (2) it is technically infeasible, or (3) the control device cannot achieve 95 percent control. Subpart OOOOa also includes an exemption from control requirements where a diaphragm pump operates for any period of time each calendar day for less than a total of 90 days per calendar year.

7.3.2.2 State and Local Regulations that Specifically Require Control of VOC Emissions

States may have permitting restrictions on VOC emissions that may apply to an emission source as a result of an operating permit, or preconstruction permit based on air quality maintenance or improvement goals of an area. Permits specify what construction is allowed, what emission limits must be met and, often, how the source may be operated. To ensure that

NMED Exhibit 34

sources follow the permit requirements, permits also contain monitoring, recordkeeping and reporting requirements.

At least one state (Wyoming) requires emissions associated with the discharge streams from all natural gas-operated pneumatic pumps be controlled by at least 98 percent or routed into a closed-loop system (e.g., sales line, collection line, fuel supply line). Several states also have registration rules for controlling fugitive VOC emissions (which may include fugitive emissions from pneumatic pumps).

7.4 Recommended RACT Level of Control

We evaluated available data obtained in the development of the 2016 NSPS final rule, comments received on the draft CTG and 2015 NSPS proposed rule, and peer review comments received on the EPA's white paper "Oil and Natural Gas Sector Pneumatic Devices." Based on our evaluation of these data and information, we recommend that VOC emissions from pneumatic pumps be controlled.

Our recommended RACT for an existing individual natural gas-driven diaphragm pump located at the well site is to capture and route VOC emissions to a control device or process where there is an existing control device or process available onsite. Our rationale for this recommendation is that, although the production segment includes both well sites and gathering and boosting stations, we currently only have reliable information for pumps located at well sites. We have determined that the cost of control for routing VOC emissions to an existing onsite control device or process would be reasonable. As presented in Tables 7-4 and 7-6 in sections 7.3.1.4 and 7.3.1.5 of this chapter, the VOC cost of control when an existing combustion device or VRU is available onsite was estimated to be $847 per ton of VOC reduced for diaphragm pumps, without gas savings, and $27 per ton of VOC reduced for diaphragm pumps if a VRU is used and gas savings are considered. We do not consider requiring control where there is not an existing control device or process onsite to be reasonably available technology, and the cost per ton of VOC reduced was estimated at greater than $20,000 for diaphragm pumps. While we are not recommending that the owner or operator be required to install a control device to control pneumatic pump emissions if one is not already available, we note that control devices will likely be installed onsite for other purposes under RACT or other regulations and will be available to control emissions from pneumatic pumps to a 95 percent control level.

For purposes of our recommended RACT, a natural gas-driven diaphragm pump is a positive displacement pump powered by pressurized natural gas that uses the reciprocating action of flexible diaphragms in conjunction with check valves to pump a fluid. A pump in which a fluid is displaced by a piston driven by a diaphragm is not considered a diaphragm pump for purposes of our recommended RACT. A lean glycol circulation pump that relies on energy exchange with the rich glycol from the contactor is not considered a diaphragm pump.

We do not recommend RACT apply to an existing individual natural gas-driven piston pump because currently available information (including information received on the draft CTG and 2015 NSPS proposal) indicates that piston pumps are low emitting because of their small size, design and usage patterns. We determined piston pumps have emission rates between 2.2 to 2.5 scf/hr based on a joint report from the EPA and the Gas Research Institute on methane emissions from the natural gas industry. This approach is consistent with the manner in which we addressed low-bleed pneumatic controllers. After considering the low emission rates of low-bleed pneumatic controllers, we do not recommend RACT apply to these sources. Similarly, based upon the information that we have on the low emission rates of piston pumps, we are not recommending RACT apply to these sources because VOC emissions are low and would not be reasonable to control in the same manner that we recommend for diaphragm pumps. As presented in Tables 7-4 and 7-6 in sections 7.3.1.4 and 7.3.1.5 of this chapter, the VOC cost of control when an existing combustion device or VRU is available onsite was estimated to be $7,709 per ton of VOC reduced for piston pumps, without gas savings, and $6,876 per ton of VOC reduced for piston pumps if a VRU is used and gas savings are considered. Requiring control where there is not an existing control device or process onsite was estimated to cost more than $200,000 per ton of VOC reduced for piston pumps.

For existing natural gas-driven diaphragm pumps at well sites, we recommend that air agencies require VOC emissions be controlled by 95 percent. Our rationale for recommending this level of emission reduction is supported by the control level achievable on a continuing basis by control devices and processes already located onsite or later installed onsite to control other emissions under RACT or other regulations. We expect that newly-installed control devices will achieve emission reductions because owners or operators are installing them to meet control requirements for other sources. In the unlikely circumstance where a control device that can achieve a 95 percent reduction is not available onsite, we recommend that owners and operators

still be required to control VOC emissions to the level achievable by the control device. We recommend that owners and operators in those instances be required to maintain documentation of the percent control the onsite control device is designed to achieve. We make this additional recommendation because it will achieve emission reductions with regard to pneumatic pumps even in the unlikely circumstance that the only available control device cannot achieve a 95 percent reduction.

We also recommend that air agencies allow for an exemption based on technical infeasibility. We recommend a technical infeasibility exemption be allowed based on information we received from industry that indicates that there may be circumstances where there is insufficient gas pressure or control device capacity, making it technically infeasible to capture and route pneumatic pump emissions to a control device or process.

We recommend that, at well sites, if a diaphragm pump operates for any period of time each calendar day for less than a total of 90 days per calendar year, the pump not be subject to the recommended control requirements. We make this recommendation to account for those intermittently used pumps/portable pumps where VOC emissions would be lower than assumed in our analysis (i.e., our analysis assumes that diaphragm pumps are operated 40 percent of the time evenly throughout the year) and not reasonable to control.

Our recommended RACT for existing diaphragm pumps located at natural gas processing plants is that they have zero VOC emissions (or 100 percent control) (unless there are functional needs including, but not limited to, response time, safety and positive actuation, requiring an emission rate greater than zero). Our rationale for selecting a VOC emission rate of zero (with functional and safety exceptions) for our recommended RACT is based on the ability of most natural gas processing plants to install and utilize an instrument air system. As discussed in section 7.3.1.3 of this chapter, by using an instrument air system, compressed air may be substituted for natural gas in pneumatic systems without altering any of the parts of the pneumatic system. Therefore, the use of instrument air eliminates VOC emissions from each gas-driven diaphragm pump and supports a VOC emission rate of zero.

In summary, we recommend the following RACT for pneumatic pumps in the oil and natural gas industry:

NMED Exhibit 34

(1) Each Diaphragm Pump Located at a Natural Gas Processing Plant: Require zero VOC emissions (or 100 percent control). This can be achieved by use of an instrument air system in place of natural gas-driven pump.

(2) Each Diaphragm Pump Located at a Well Site: Require that VOC emissions be captured and routed to an existing control device or process that is located onsite, unless it is technically infeasible to route emissions to the existing control device or process. Require 95 percent control of VOC emissions, unless the existing control device or process cannot achieve 95 percent control. If the existing control device cannot achieve a 95 percent control, still require the emissions to be routed to the existing onsite control device to control emissions to the extent achievable and maintain documentation of the percent control the onsite control device is designed to achieve. If there is no existing control device at the location of the pump, submit a certification that there is no device. If a control device is subsequently added to the site where the pump is located, then the VOC emissions from the pump must be captured and routed to the newly installed control device.

Although sources have a choice on how they meet the RACT level of control, the technologies that will likely be used to meet the RACT level of control for each natural gas-driven diaphragm pump at a well site are either capturing and routing the VOC emissions to an onsite existing combustion device (or a subsequently installed combustion device) or capturing and routing the VOC emissions to a process using an onsite existing VRU (or a subsequently installed VRU).

Similarly, the technology that will likely be used to meet the RACT level of control for each diaphragm pump located at a natural gas processing plant is the use of an existing instrument air system assumed to already exist onsite at natural gas processing plants.

7.5 Factors to Consider in Developing Pneumatic Pump Compliance Procedures

7.5.1 Oil and Natural Gas Production Segment Recommendations

We recommend that air agencies require owners and operators of diaphragm pumps located at well sites that meet RACT by capturing emissions and routing to a control device be connected through a closed vent system and that the closed vent system be designed with no

detectable emissions (using a 500 ppm detection level, as measured using Method 21 of appendix A-7 of part 60, and ongoing monthly, olfactory and auditory inspections). We recommend that you require that owners and operators conduct an assessment and certify that the closed vent system is of sufficient design and capacity to ensure that emissions are routed to the control device. We recommend air agencies require that any detected defects be repaired as soon as practicable.

With the exception of low leg drains, high point bleeds, analyzer vent, open-ended valves and safety devices, if the closed vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device or to a process, air agencies should require that owners or operators either:

(1) Install, calibrate, maintain and operate a flow indicator at the inlet to the bypass device that could divert the stream away from the control device or process to the atmosphere that is capable of taking periodic readings and either sounds an alarm or initiates notification via remote alarm to the nearest field office when the bypass device is open such that the stream is being, or could be, diverted away from the control device or process to the atmosphere; or

(2) Secure the bypass device valve installed at the inlet to the bypass device in the non-diverting position using a car-seal or a lock-and-key type configuration.

Secondly, we recommend that air agencies require owners and operators of diaphragm pumps at well sites provide certifications for when (1) there is no existing control device or process onsite, or (2) capturing and routing to an existing control device or process is not technically feasible.

Lastly, we recommend that air agencies require owners and operators of diaphragm pumps at well sites maintain records documenting where (1) intermittently-used/portable diaphragm pumps operate for any period of time each calendar day for less than a total of 90 calendar days per year, (2) an onsite control device or process is designed to achieve less than 95 percent reduction, and (3) a diaphragm pump is routed to a control device or a process and the control device or process is subsequently removed.

The appendix to this document presents example model rule language that incorporates the compliance elements recommended in this section that air agencies may choose to use in whole or in part when implementing RACT.

NMED Exhibit 34

7.5.2 Natural Gas Processing Segment Recommendations

We recommend that air agencies require owners and operators of diaphragm pumps located at natural gas processing plants maintain records documenting (1) the location and manufacturer's specifications of each pneumatic pump, (2) that the natural gas bleed rate is zero, and (3) deviations in cases where a pneumatic pump was not operated in compliance with RACT. We also recommend that air agencies require owners and operators submit annual reports that include records of deviations that occurred during the reporting period.

The appendix to this document presents example model rule language that incorporates the compliance elements recommended in this section that air agencies may choose to use in whole or in part when implementing RACT.

NMED Exhibit 34

8.0 EQUIPMENT LEAKS FROM NATURAL GAS PROCESSING PLANTS

This chapter presents the causes for equipment leaks from natural gas processing plants, and provides emission estimates for "model" facilities in the processing segment of the oil and natural gas industry. Methods that are designed to reduce equipment leak emissions are presented, along with our recommended RACT, and the associated VOC emission reductions and cost impacts for equipment leaks from natural gas processing plants.

This CTG and the recommended RACT included in this CTG replaces the following: *Guideline Series. Control of Volatile Organic Compound Equipment Leaks from Natural Gas/Gasoline Processing Plants.* December 1983. EPA-450/3-83-007.

8.1 Applicability

For purposes of this CTG, the emissions and emission controls discussed herein would apply to the group of all equipment (except compressors and sampling connection systems) within a process unit located at a natural gas processing plant in VOC service or in wet gas service, and any device or system that is used to control VOC emissions (e.g., a closed vent system). For a piece of equipment to be considered not in VOC service, it must be determined that the VOC content can be reasonably expected never to exceed 10.0 percent by weight. For a piece of equipment to be considered in wet gas service, the piece of equipment must contain or contact the field gas before the extraction step at a natural gas processing plant. Equipment is defined as each pump, pressure relief device, open-ended valve or line, valve, and flange or other connector that is in VOC service or in wet gas service.

8.2 Process Description and Emission Sources

8.2.1 Process Description

Natural gas processing involves the removal of natural gas liquids from field gas, fractionation of mixed natural gas liquids to natural gas products, or both. The types of process equipment used to separate the liquids are separators, glycol dehydrators, and amine treaters. In

NMED Exhibit 34

addition, centrifugal and/or reciprocating compressors are used to pressurize and move the natural gas from the processing facility to the transmission stations.

There are several potential sources of equipment leak emissions at natural gas processing plants. Equipment such as pumps, pressure relief devices, valves, flanges, and other connectors are potential sources that can leak due to seal failure. Other sources, such as open-ended lines and valves may leak for reasons other than faulty seals, such as an improperly installed cap on an open-ended line. In addition, corrosion of welded connections, flanges, and valves may also be a cause of equipment leak emissions. The following subsections describe potential equipment leak sources and the magnitude of the VOC emissions from natural gas processing plants.

Due to the large number of valves, pumps, and other equipment within natural gas processing plants, VOC emissions from leaking equipment can be significant (chapter 2.2 of the 1983 CTG[126] presents a description of these equipment components and is not repeated here).

8.2.2 Equipment Leak Emission Data and Emission Factors

8.2.2.1 Summary of Major Studies and Emission Factors

The 2012 NSPS TSD evaluated emissions data from equipment leaks collected from chemical manufacturing and petroleum production to assist in the development of control strategies for reducing VOC emissions from these sources.[127,128,129] Table 8-1 presents a list of the studies consulted along with an indication of the type of information contained in the study. In addition to these sources, we evaluated the peer reviewer and public comments received on the EPA's white paper, "Oil and Natural Gas Sector Leaks."[130]

8.2.2.2 Natural Gas Processing Model Plant

Natural gas processing plants can consist of a variety of combinations of process equipment and components. In order to conduct analyses to be used in evaluating potential options to reduce emissions from leaking equipment, the 2011 NSPS TSD and the 2012 NSPS TSD used a model plant approach.

Information related to equipment counts were obtained from a natural gas industry report.[131] This document provided average equipment counts for gas production and gas processing segments. These average counts were used to develop a model plant. These equipment counts are consistent with those contained in the EPA's analysis to estimate methane emissions conducted in support of the GHGRP. The natural gas processing model plant is discussed in the following section. A summary of the model plant production equipment counts for a gas processing facility is provided in Table 8-2.

Table 8-2. Equipment Counts for Natural Gas Processing Model Plant

Equipment	Equipment Count (non-compressor equipment)
Valves	1,392
Connectors	4,392
Open-Ended Lines (OEL)	134
Pressure Relief Valve (PRV)	29

8.2.2.3 Natural Gas Processing Model Plant Emissions

Overview of Approach

The EPA gathered equipment leak data and cost information for the development of the proposed National Uniform Emission Standards for Equipment Leaks rule (58 FR 17898, March 26, 2012). These Uniform Standards data were used to estimate baseline emissions for a natural

[131] U.S. Environmental Protection Agency/GRI. *Methane Emissions from the Natural Gas Industry, Volume 8: Equipment Leaks*. Table 4-13, June 1996. (EPA-600/R-96-080h).

NMED Exhibit 34

gas processing model plant for the 2012 NSPS STSD and provide the baseline and controlled emission options for processing plants presented in this CTG.[132,133]

The baseline emissions were defined as being equivalent to a 40 CFR part 60, subpart VV (subpart VV) leak detection and repair (LDAR) program, which represents the same set of requirements that apply to natural gas processing plants under 40 CFR part 60, subpart KKK (subpart KKK). The 2012 NSPS requires the implementation of 40 CFR part 60, subpart VVa (subpart VVa) and currently applies to natural gas processing plants constructed or modified after August 23, 2011. It is assumed that natural gas processing plants constructed, reconstructed or modified on or before August 23, 2011 currently still comply with subpart KKK, which is similar to the control level of subpart VV. We evaluated requiring a similar subpart VVa level of control to these plants as was required under the 2012 NSPS. We used leak frequency data (refers to the estimated percentage of equipment that will be found leaking at a given leak definition) to calculate emission estimates, in addition to several other sources of information (including the Protocol for Equipment Leak Emissions Estimates and industry data).[134] Table 8-3 provides a summary of the equipment leak frequency data used for the natural gas processing model plant. Emission factors are the estimated leak rates for an equipment type at a given leak definition and are normally given in kg/hr/piece of equipment. Table 8-4 provides a summary of the VOC equipment leak emission factors representing the subpart VVa level of control that was used for the natural gas processing model plant.

[b] Assumed to be equivalent to a subpart VVa LDAR program.

8.3 Available Controls and Regulatory Approaches

8.3.1 Available VOC Emission Control Options

The EPA has determined that leaking equipment, such as valves, pumps, and connectors are a significant source of VOC emissions from natural gas processing plants. The following subsections describe the techniques used to reduce emissions from these sources.

8.3.1.1 Leak Detection and Repair Program

The most commonly employed control technique for equipment leaks is the implementation of an LDAR program. Emission reductions from implementing an LDAR program can potentially reduce product losses, increase safety for workers and operators,

NMED Exhibit 34

decrease exposure of hazardous chemicals to the surrounding community, and reduce emissions fees. An effective LDAR program will target leaking equipment by establishing leak definitions and require work practices to mitigate the leaks, such as monitoring frequencies for specific types of equipment (i.e., valves, pumps, and connectors). Other elements of an effective LDAR program include:

(1) Identifying Equipment,
(2) Monitoring Equipment,
(3) Repairing Equipment,
(4) Recordkeeping, and
(5) Reporting.

The primary sources of equipment leak emissions from natural gas processing plants are valves and connectors because these are the most prevalent equipment and can number in the thousands (see Table 8-2). The major cause of emissions from valves and connectors is a seal or gasket failure due to normal wear or improper maintenance. A leak is detected whenever the measured concentration exceeds the threshold standard (i.e., leak definition) for the applicable regulation. Leak definitions vary by regulation, equipment type, and service (e.g., light liquid, heavy liquid, gas/vapor). Most NSPS regulations that were promulgated prior to 2007 have a valve leak definition of 10,000 ppm, while many National Emission Standards for Hazardous Air Pollutants (NESHAP) regulations use a 500 ppm leak definition for valves or 1,000-ppm leak definition for other equipment such as pumps. In addition, some regulations define a leak based on visual inspections and observations (such as fluids dripping, spraying, misting, or clouding from or around equipment), sound (such as hissing), and smell.

For many NSPS and NESHAP regulations with leak detection provisions, the primary method for monitoring to detect leaking equipment is EPA Reference Method 21 (40 CFR part 60, appendix A-7). Method 21 is a procedure used to detect VOC leaks from equipment using a toxic vapor analyzer (TVA) or organic vapor analyzer (OVA).

A second method for monitoring to detect leaking components is optical gas imaging (OGI) using an infrared (IR) camera. The IR camera may be passive or active. The operator uses the passive IR cameras to scan an area to produce images of equipment leaks from a number of sources. Active IR cameras point or aim an IR beam at a potential source to indicate the presence of gaseous emissions (equipment leaks). An equipment leak is any emissions that are visualized

NMED Exhibit 34

by an OGI instrument. The optical imaging camera can be very efficient in monitoring multiple pieces of equipment in a short amount of time. However, the optical imaging camera cannot quantify the amount or concentration of the equipment leak.

Acoustic leak detectors measure the decibel readings of high frequency vibrations from the noise of leaking fluids from equipment leaks using a stethoscope-type device. The decibel reading, along with the type of fluid, density, system pressure, and component type can be correlated into leak rate by using algorithms developed by the instrument manufacturer. The acoustic detector does not decrease the monitoring time because components are monitored separately, like the OVA or TVA monitoring. The accuracy of the measurements using the acoustic detector can also be questioned due to the number of variables used to determine the equipment leak emissions.

In addition, other monitoring tools, such as soap solution and electronic screening devices, can be used to find equipment leaks from certain types of equipment. Other factors that can improve the efficiency of an LDAR program include training programs for equipment monitoring personnel and tracking systems that address the cost efficiency of alternative equipment (e.g., competing brands of valves in a specific application).

Subpart VVa LDAR Program

One LDAR option to control VOC emissions from natural gas processing plant equipment leaks is the implementation of the subpart VVa LDAR program. This program is similar to the subpart VV monitoring program (requirements are cross-referenced in subpart KKK), but finds more leaks due to the lower leak definition, increased monitoring frequency, and the addition of connectors to the components being monitored, thereby achieving better emission reductions.

Description

The subpart VVa LDAR program requires the monitoring of pumps, compressors, pressure relief devices, sampling connection systems, open-ended lines, valves, and connectors. These components are monitored with an OVA or TVA to determine if a component is leaking and measures the concentration of the organics if the component is leaking. Connectors and valves have a leak definition of 500 ppm. Valves are monitored monthly, connectors are monitored annually, and open-ended lines and pressure relief valves must be monitored within five days after a pressure release event to ensure they are operating without any detectable

NMED Exhibit 34

emissions (e.g. at a concentration less than 500 ppm above background). Compressors are not included in this leak detection and repair option and are regulated separately.

Control Effectiveness

The control effectiveness of an LDAR program is based on the frequency of monitoring, leak definition, frequency of leaks, percentage of leaks that are repaired, and the percentage of reoccurring leaks. The control effectiveness of a leak program can vary from 45 to 96 percent and is dependent on the frequency of monitoring and the leak definition.[135] Descriptions of the frequency of monitoring and leak definition are described further below.

*Monitoring Frequenc*y. The monitoring frequency is the number of times each piece of equipment is checked for leaks over a given period of time. With more frequent monitoring, leaks are found and repaired sooner, thus providing higher control effectiveness.

Leak Definition. The leak definition describes the local VOC concentration at the surface of an equipment source where indications of VOC emissions are present. The leak definition is an instrument meter reading, in parts per million based on a reference compound. Decreasing the leak definition generally increases the number of leaks found during a monitoring period, which generally increases the number of leaks that are repaired.

The 2012 NSPS STSD calculated incremental emission reductions from the baseline requirements (assuming that an LDAR program equivalent to the subpart VV/subpart KKK LDAR program is currently implemented at natural gas processing plants), and the leak frequency and emission factors from a supporting document for the Equipment Leak Uniform Standards were used to calculate the emission reductions and costs. The natural gas processing plant component counts (see Table 8-2) were obtained from an EPA/GRI document.[136] The incremental VOC emission reductions for implementing a subpart VVa leak detection and repair program (as determined in the 2012 NSPS STSD) for the natural gas processing model plant was calculated to be 13 percent.

NMED Exhibit 34

Cost Impacts

Table 8-5 presents a summary of the incremental capital and annual costs and the cost of control (estimated in the 2012 NSPS STSD) from baseline (subpart VV) to implementing subpart VVa for the gas processing model plant. The costs obtained from the 2012 NSPS TSD have been converted to 2012 dollars from 2008 dollars using the Federal Reserve Economic Data GDP Price Deflater (Change in GDP: Implicit Price Deflator from 2008 to 2012 (5.69 percent)).[137]

Table 8-5. Summary of the Gas Processing Model Plant VOC Cost of Control for the Subpart VVa Option

Annual VOC Emission Reductions (tpy)	Capital Cost ($2012)	Annual Cost ($2012/year)	VOC Cost of Control ($2012/ton)	
			Without savings	With savings[a]
4.56	$8,499	$12,959	$2,844	$2,010

[a] With savings calculated assuming the natural gas (82.9 percent methane) from the methane reduction has a value of $4/Mscf. The VOC/methane ratio was assumed to be 0.278.

Table 8-6 provides a summary of the capital and annual costs and the cost of control on a component basis for the natural gas processing model plant.

Table 8-6. Summary of the Gas Processing Component VOC Cost of Control for the Subpart VVa Option

Component	Annual VOC Emission Reductions (tpy)	Capital Cost ($2012)	Annual Cost ($2012/year)	VOC Cost of Control ($2012/ton)	
				Without Savings	With Savings[a]
Valves	1.82	$5,231	$9,280	$5,095	$4,261
Connectors	2.74	$8,374	$4,405	$1,610	$776

[a] With savings calculated assuming the natural gas (82.9 percent methane) from the methane reduction has a value of $4/Mscf. The VOC/methane ratio was assumed to be 0.278.

8.3.1.2 Leak Detection and Repair Program with Optical Gas Imaging

Another option to control VOC emissions is the implementation of a program that uses OGI to detect equipment leaks. The alternative work practice for equipment leaks in §60.18(g) of

[137] U.S. Bureau of Economic Analysis, Gross Domestic Product: Implicit Price Deflator (GDPDEF), retrieved from FRED, Federal Reserve Bank of St. Louis https://research.stlouisfed.org/fred2/series/GDPDEF. March, 26, 2015.

40 CFR part 60, subpart A allows the use of an OGI instrument to monitor equipment for leaks. This option is currently available for monitoring equipment leaks from valves, pumps, connectors and other equipment that is subject to monitoring in subpart VVa.

The alternative work practice requires periodic monitoring, based on the detection sensitivity level (grams per hour), of the affected equipment using OGI and an annual monitoring survey of the affected equipment using a Method 21. Method 21 monitoring allows the facility to determine the concentration of a leak and to then use emission factors found in the EPA's emissions leak protocol to quantify emissions from equipment leaks, because the OGI system can only provide the presence of the equipment leaks.

Modeling results, conducted in support of the alternative work practice standard, showed a work practice repeated bimonthly with a detection limit of 60 g/hr range was equivalent to existing Method 21 work practices. The model generated different detection limits for the 500 and 10,000 ppm thresholds in existing rules. Based on modeling, the alternative work practice standard reflects the mass detection limit for 500 ppm, thus, providing equivalency for both 500 and 10,000 ppm thresholds.[138] The alternative work practice option is assumed to have the same control effectiveness as the subpart VVa monitoring program.

8.3.2 Existing Federal, State and Local Regulations

8.3.2.1 Federal Regulations that Specifically Require Control of VOC Emissions

Federal regulations that regulate VOC emissions from equipment leaks at natural gas processing plants include 40 CFR part 60 subpart OOOOa, subpart OOOO, and subpart KKK; and the 1983 CTG document (established a recommended RACT for VOC for natural gas processing plants at a level of control equivalent to subpart KKK).

8.3.2.2 State and Local Regulations that Specifically Require Control of VOC Emissions

States may have permitting restrictions on VOC emissions that may apply to an emissions source as a result of an operating permit, or preconstruction permit based on air quality maintenance or improvement goals of an area. Permits specify what construction is allowed,

[138] 73 FR 78199, December 22, 2008.

what emission limits must be met, and often how the source must be operated. To ensure that sources follow the permit requirements, permits also contain monitoring, recordkeeping and reporting requirements.

We assume that all states currently regulate equipment leaks at existing natural gas processing plants at the 1983 CTG document and subpart VV level of control.

8.4 Recommended RACT Level of Control for Equipment Leaks from Equipment at Natural Gas Processing Plants

As discussed in section 8.3.2 of this chapter, existing federal, state and local regulations already require the reduction of VOC emissions using an LDAR program. The 2012 NSPS requires a 40 CFR part 60 subpart VVa LDAR monitoring program for processing plants. The 2012 NSPS reported a cost of control for natural gas processing plants to be $2,844 per ton of VOC removed for the 40 CFR part 60 subpart VVa option.

Based on costs and existing LDAR programs that are already employed at natural gas processing plants, we recommend that RACT for natural gas processing plants be the implementation of an LDAR program equivalent to what is required under 40 CFR part 60 subpart VVa for equipment (with the exception of compressors and sampling connection systems) in VOC service. This RACT recommendation would increase the stringency from the currently implemented LDAR programs at most existing natural gas processing plants (that were built prior to 2012) in VOC service by lowering the leak definitions, increasing the monitoring frequency, and including additional equipment. The subpart VVa leak detection and repair program requires the annual monitoring of connectors using an OVA or TVA (500 ppm leak definition), monthly monitoring of valves (500 ppm leak definition) and requires open-ended lines and pressure relief devices to operate with no detectable emissions (less than 500 ppm above background). The estimated annual incremental VOC emission reductions for the recommended RACT for a natural gas processing plant was estimated to be 4.56 tpy (see Table 8-5 of this chapter). The annual VOC emission reductions assume a baseline level of control equivalent to the 40 CFR part 60, subpart VV LDAR program. Table 8-5 presents the gas processing model plant VOC cost of control for the recommended RACT. The costs assume a baseline level of control equivalent to the 40 CFR part 60, subpart VV LDAR program. The

recommended RACT VOC cost of control is estimated to be $2,844 per ton of VOC reduced without savings and $2,010 with savings.

In summary, we recommend the following RACT for equipment leaks at natural gas processing plants:

RACT for Equipment Leaks at Natural Gas Processing Plants: We recommend the implementation of an LDAR program equivalent to what is required under 40 CFR part 60 subpart VVa for equipment (with the exception of compressors and sampling connection systems) in VOC service.

8.5 Factors to Consider in Developing Equipment Leak Compliance Procedures

Existing natural gas processing plants that would be subject to the recommended RACT are already subject to an LDAR program and the basic elements of the LDAR program for the facility are in place. However, the LDAR program would need to be modified to increase the stringency from the currently implemented LDAR program by requiring annual monitoring of connectors using an OVA or TVA (500 ppm leak definition), and lowering the leak definition for valves (500 ppm). As with the currently implemented LDAR program, to ensure that equipment in VOC service that leak at natural gas processing plants are properly monitored and repaired under the LDAR RACT recommendations, we suggest that air agencies specify monitoring frequency, equipment repair, and recordkeeping and reporting requirements to document compliance.

Monitoring frequencies vary according to the applicable regulation, but are typically weekly, monthly, quarterly and yearly. The monitoring frequency depends on the equipment type and periodic leak rate for the equipment. For each piece of equipment that is found to be leaking, the first attempt at repair should be made within a reasonable period of time, such as no later than five calendar days after each leak is detected. First attempts at repair include, but are not limited to, the following best practices, where practicable and appropriate:

(1) Tightening of bonnet bolts,
(2) Replacement of bonnet bolts,
(3) Tightening of packing gland nuts, and
(4) Injection of lubricant into lubricated packing.

Once the equipment is repaired, it should be re-monitored over the next several days to ensure the leak has been successfully repaired. Another method that can be used to repair equipment is to replace the leaking equipment with a "leakless" equipment or other technologies.

When implementing an LDAR program, we recommend that air agencies consider including recordkeeping requirements that require owner/operators of subject facilities to maintain a list of identification numbers for all equipment subject to an equipment leak regulation. A list of equipment that is designated as "unsafe to monitor" should also be maintained with an explanation/review of conditions for the designation. Detailed schematics, equipment design specifications (including dates and descriptions of any changes), and piping and instrumentation diagrams should also be maintained with the results of performance testing and leak detection monitoring.

The appendix to this document presents example model rule language that incorporates the compliance elements recommended in this section that air agencies may choose to use in whole or in part when implementing RACT.

NMED Exhibit 34

9.0 FUGITIVE EMISSIONS FROM WELL SITES AND GATHERING AND BOOSTING STATIONS

Fugitive emissions from components in the oil and natural gas industry are a source of VOC emissions. This chapter discusses the sources of fugitive emissions, and provides VOC emission estimates for well sites and gathering and boosting stations in the production segment (located from the wellhead to the point of custody transfer to the natural gas transmission and storage segment or point of custody transfer to an oil pipeline). This chapter also presents a description of programs that are designed to reduce fugitive emissions, along with costs, and emission reductions. Finally, this chapter provides a discussion of our recommended RACT and the estimated VOC emission reductions and costs for fugitive emissions from well sites and gathering and boosting stations in the production segment.

9.1 Applicability

For purposes of this CTG, the emissions and programs to control emissions discussed herein would apply to the collection of fugitive emissions components at well sites with an average production of greater than 15 barrel equivalents per well per day (15 barrel equivalents)[139] and the collection of fugitive emissions components at gathering and boosting stations in the production segment.

For the purposes of this CTG, fugitive emission reduction recommendations would not apply to well sites that only contain wellheads.

Fugitive emissions, for the purposes of applicability of this CTG, means those emissions from a stationary source that could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening. Equipment leak emissions at natural gas processing plants are covered under chapter 8 of this document.

[139] Natural gas production converted to barrel equivalents uses the conversion of 0.178 barrels of crude oil to 1000 cubic feet of natural gas. Based upon conversion factor used for the no longer in service U.S. EIA Financial Reporting System for Major Energy Producers.

NMED Exhibit 34

9.2 Fugitive Emissions Description and Data

9.2.1 Fugitive Emissions Description

There are several potential sources of fugitive emissions throughout the oil and natural gas industry. Fugitive emissions occur when connection points are not fitted properly or when seals and gaskets start to deteriorate. Changes in pressure, temperature, or mechanical stresses can also cause components or equipment to emit fugitive emissions. Poor maintenance or operating practices, such as improperly reseated PRVs or thief hatches on controlled storage vessels that are left open after sampling, are also potential sources of fugitive emissions. Potential sources of fugitive emissions include agitator seals, connectors, pump diaphragms, flanges, instruments, meters, open-ended lines (OELs), pressure relief devices such as PRVs, pump seals, valves, or improperly controlled liquid storage tanks. These fugitive emissions do not include devices that vent as part of normal operations, such as natural gas-driven pneumatic controllers or natural gas-driven pneumatic pumps, insofar as the natural gas and associated VOC emissions discharged from the device's vent is not considered a fugitive emission.

For the purposes of our RACT analysis for fugitive emissions from components and equipment, we differentiated between the definition of "equipment" for purposes of controlling equipment leaks for oil and natural gas processing plants in subpart OOOO[140] and the definition we use for the purposes of addressing fugitive emissions from oil and natural gas well sites and gathering and boosting stations. For purposes of our RACT analysis, "fugitive emissions component(s)" are the focus of our analysis for fugitive emissions from oil and natural gas well sites and gathering and boosting stations. The definition for "fugitive emissions component" is as follows:

> *Fugitive emissions component* means any component that has the potential to emit fugitive emissions of VOC at a well site or gathering and boosting station, including but not limited to valves, connectors, pressure relief devices, open-ended lines, flanges, covers and closed vent systems not already subject to equipment and fugitive emissions monitoring, thief hatches or other openings on a controlled storage vessel, compressors, instruments and meters. Devices that vent as part of normal operations, such as natural gas-driven pneumatic controllers or natural gas-driven pumps, are not fugitive emissions

[140] The Oil and Natural Gas Sector NSPS (40 CFR 60, subpart OOOO) specifically defines "equipment" relative to standards for equipment leaks of VOC from onshore natural gas processing plants. As used in this chapter, the term "equipment" is used in a broader context and is not meant to be limited by the manner in which the term is currently used in subpart OOOO.

components, insofar as the natural gas and associated VOC emissions discharged from the device's vent is not considered a fugitive emission. Emissions originating from other than the vent, such as the thief hatch on a controlled storage vessel, would be considered fugitive emissions.

9.2.2. Emission Data and Emission Factors

9.2.2.1 Summary of Major Studies and Emission Factors

In April of 2014, we published a white paper[141] which summarized our current understanding of VOC fugitive emissions at onshore oil and natural gas production, processing and transmission and storage facilities (referred to herein as the "equipment leaks white paper"). The equipment leaks white paper also outlined our understanding of the available mitigation techniques (practices and equipment) available to reduce these emissions along with the cost and emission reduction potential of these practices and technologies.

The equipment leaks white paper provided a summary of fugitive emission studies at oil and natural gas well sites and gathering and boosting stations in the production segment. Throughout the development of this CTG, the EPA evaluated a variety of emissions data and emission reduction options for fugitive emissions. Many of the studies in the equipment leaks white paper were consulted. Table 9-1 presents a list of the studies consulted along with an indication of the type of information contained in each study.

9.2.2.2 Model Plants

Facilities in the oil and natural gas industry consist of a variety of combinations of process equipment and components. This is particularly true in the production segment of the industry, where "surface sites" can vary from sites where only a wellhead and associated piping is located to sites where a substantial amount of separation, treatment, and compression occurs. In order to conduct analyses to be used in evaluating potential options to reduce fugitive emissions from well sites and gathering and boosting stations, a model plant approach was used. The following sections discuss the creation of these model plants.

Oil and Natural Gas Production Well Sites

Oil and natural gas production varies from one site to the next. Some production sites may include only a single wellhead that is extracting oil or natural gas from the ground, while other sites may include multiple wellheads attached to a well site. A well site is a site where the production, extraction, recovery, lifting, stabilization, separation, and/or treating of petroleum and/or natural gas (including condensate) occurs. These sites include all equipment (including piping and associated components, compressors, generators, separators, storage vessels, and other equipment) that have associated components that may be sources of fugitive emissions

NMED Exhibit 34

associated with these operations. A well site can serve one well on a pad or multiple wells on a pad. Therefore, the number of components with potential for fugitive emissions can vary depending on the number of wells at the site.

Model plants were developed using the average number of wells associated with a well site using data from the Drillinginfo HPDI database.[142] Baseline fugitive emissions from well sites depend upon the quantity of equipment and components, which in turn is based on this estimate of wells per pad. To estimate the average number of wells co-located on the same site as a new well completion or recompletion, the EPA developed a pair of algorithms that identified new and existing wells within a given distance of a new well completion or recompletion. This distance was assumed to represent the distance that, if other wells were within the distance, the wells would likely be co-located with the well under examination on the same site. The algorithms were written in the open source R programming language.[143]

The HPDI well and production data used to estimate the average number of well co-located on a well site drew upon the latitude and longitude of new well completions and recompletions as well as the coordinates of all wells producing oil or natural gas in 2012. The first algorithm estimated the distances between each new completion and recompletion and all producing wells, which also includes wells newly completed and producing in 2012 within the same county as the completed well. If the distance between the completed well and producing well was less than the assumed size of a typical well site, we assumed the two wells were co-located. This algorithm progressed county by county across the U.S. where oil and natural gas production occurred in 2012 to identify all co-located wells in the U.S. The number of new well completions and recompletions in 2012 was about 44,000, which includes oil and natural gas wells whether they were hydraulically fractured or not. Wells producing in 2012 numbered about 1.27 million. The second algorithm processed the results of the first such that a well can only appear once on a modelled well site.

Once these algorithms were complete and produced a results file, we converted the results into a "kml" file that enabled the visual inspection of the results within Google Earth. We did not visually inspect every site in the U.S. linked to a 2012 completion or recompletion as

[142] Drilling Information, Inc. 2011. *DI Desktop.* 2011 Production Information Database.
[143] See the website <http://www.r-project.org/> for more information on R (The R Project for Statistical Computing). R is a free software environment for statistical computing and graphics.

NMED Exhibit 34

they numbered greater than 20,000. Instead, we examined sites randomly across a range of oil and natural gas production regions. The results of this visual examination indicated the algorithms were functioning as intended.

We estimated the number of wells per site assuming sites of one, two and three acres, based upon input from petroleum industry data analysts. Table 9-2 shows the high-level results of these analyses.

Table 9-2. Estimated Average Number of Wells per Site of New Well Completion in 2012

Assumed Well Site Size	No. of Well Sites	No. of Wells at Sites	Average of Wells Per Site
One Acre	29,213	50,599	1.73
Two Acres	28,938	52,422	1.81
Three Acres	28,710	53,981	1.88

For assumed well sites of two acres, the analysis identified 28,938 independent well sites that contained 52,422 wells (including both single and multi-well sites). The total number of wells identified as being co-located with new well completions and recompletions exceeds the total number of completions and recompletions because the sites include about 8,500 existing wells producing in 2012.

However, the high level summary presented in Table 9-3 masks variation by basins and well types. Table 9-3 presents more detail along these dimensions for the assumed two-acre well site.

The data presented in Table 9-3 indicates that the concentration of wells at production sites varies greatly by basin. However, the analysis also indicates that most wells sites have relatively few or no co-located wells, which brings the national average of wells per new completion or recompletion site to 1.81 for the two-acre well site. While the analysis shows variation by basin, at the national level, there is relatively little variation across oil and natural gas well completion sites and whether the new wells were completed or recompleted using hydraulic fracturing. For example, oil well sites averaged 1.79 wells per site while natural gas wells averaged 1.86.

As a result of this analysis, we decided to use the two-acre well site as the assumed maximum size of a site to estimate the number of wells co-located at sites of new completions and recompletions. Also, to simplify analysis of costs and emissions at well sites, we rounded the 1.81 national average wells per site to 2.

While we are confident that the assumed two-acre well site is a reasonable size to capture most co-located wells in 2012, it is by no means a perfect assumption. First, industry and state regulatory trends indicate that well drilling will likely become increasingly concentrated on sites, potentially leading to an increase in the average number of wells per well site. However, it is not possible at this point to forecast this increasing concentration, especially with the variations by

NMED Exhibit 34

fields described above. Also, it is possible that two acres is too small to accurately estimate the number of co-located wells for large well sites in some fields. As a result, the algorithms might result in an underestimate of the average number of wells at a site and identify more than one site when in actuality there is only one. Alternatively, the assumed two acres might overestimate the size of sites in some fields and, as a result, pull in more than one site, overestimating the number of wells on the site. We also noted that the latitude and longitude values on many wells were likely incorrect or exact duplicates of other wells. Despite these caveats, we believe that the well site analysis described here produces a reasonable estimate of national average of number of wells on new well completion and recompletion sites in 2012. Therefore, based on this analysis, the model plants for oil and natural gas well sites are based on a well site with 2 wells.

Baseline model plant emissions for natural gas and oil production well sites were calculated using the fugitive emissions equipment counts from the GHG Inventory, derived from GHGRP, EPA/GRI and 40 CFR part 98, subpart W tables, and the component oil and natural gas production emission factors from AP-42.[144] Annual emissions were calculated assuming 8,760 hours of operation each year. We used equipment count data from the EPA GHG Inventory to calculate the average counts of production equipment located at a well site. The types of production equipment located at a well site include: gas wellheads, separators, meters/piping, heaters, and dehydrators. The types of components that are associated with these production equipment types include: valves, connectors, open-ended lines, and pressure relief valves. Component counts for each of the equipment items were calculated using the average component counts for gas production equipment in the Eastern U.S. and the Western U.S. Fractions of components were rounded up to the nearest integer.

For natural gas well sites, the model plant was developed using the average equipment and fugitive emissions components counts for natural gas production data from the EPA/GRI report and the 2016 GHG Inventory. The average equipment count for a natural gas well was estimated by using the average equipment counts per well in the 2016 GHG Inventory (based on GHGRP data), and by weighing the average component counts per equipment for the Eastern and Western U.S. data sets for gas production equipment. This resulted in 2 separators, 3 meters/piping, 1 in-line heater, and 1 dehydrator per well. The total natural gas well site

[144] U.S. Environmental Protection Agency. *Protocol for Equipment Leak Emission Estimates*. Table 2-4. November 1995. EPA-453/R-95-017.

NMED Exhibit 34

equipment counts were calculated by multiplying the average well equipment values by the average number of wells per well site (2), and rounding the product to the nearest integer. Average component counts for each of the equipment items were calculated using the average component counts for production equipment in the Eastern U.S. and the Western U.S. from the EPA/GRI study. The total number of fugitive emissions components was calculated by multiplying the rounded equipment counts by the component count per equipment and rounding to the nearest integer. Table 9-4 presents a summary of the fugitive emissions component counts for natural gas well sites.

For oil well sites, two model plants were developed in order to account for emissions variability. One oil well model plant was developed for oil wells with a gas-to-oil ration less than 300 standard cubic feet of gas per stock barrel of oil (GOR less than 300) and another model plant was developed for oil wells with a gas-to-oil ratio greater than or equal to 300 standard cubic feet of gas per stock of barrel oil (GOR greater than or equal to 300).

The equipment count for the oil well model plant with a GOR less than 300 consists of 2 oil wellheads, 1 separator, 1 header and 1 heater/treater. These equipment counts were obtained from 2016 GHG Inventory data. The component counts for these equipment types were obtained from Table W-1C of subpart W and are the weighted average component counts for onshore production equipment in the Eastern U.S. and Western U.S.

The equipment count for the oil well model plant with a GOR greater than or equal to 300 consists of 2 oil wellheads, 1 separator, 1 header and 1 heater/treater and 3 meters/piping. These equipment counts for separators, headers, and heater/treaters were obtained from the 2016 GHG Inventory data for petroleum systems, while the meter/piping counts were obtained from the 2016 GHG Inventory data for natural gas systems to reflect gas production at the sites.

The component counts for these equipment types were obtained from Table W-1C of subpart W for all but meters/piping, which were obtained from Table W-1B of subpart W. The component counts are the weighted average component counts for onshore production equipment in the Eastern U.S. and Western U.S. The total number of fugitive emissions components for oil well sites equipment (for both model plants) was calculated by multiplying the rounded equipment counts by the component count per piece of equipment and rounding to the nearest integer. Table 9-5 presents a summary of the fugitive emissions component counts for oil well site model plants.

NMED Exhibit 34

The baseline emissions for the natural gas well site and oil well model plants were calculated using equipment counts for the natural gas well site model plant and the oil and natural gas production AP-42 total organic compound (TOC) emission factors. Annual emissions were calculated assuming 8,760 hours of operation each year. The TOC emissions were converted to VOC using VOC/TOC weight rations in the 2011 Gas Composition Memorandum.[145]. The fugitive VOC emissions for the natural gas well site model plant were determined to be 1.53 tpy of VOC. The fugitive emissions for the oil well site model plant with a GOR less than 300 was determined to be 0.33 tpy of VOC. The fugitive emissions for the oil well site model plant with a GOR greater than or equal to 300 was determined to be 0.73 tpy of VOC. The VOC emission estimates were used to evaluate the potential emission reductions and cost of control of a fugitive emission reduction program. Table 9-6 presents the emission factors for the natural gas and oil production segments. A summary of the equipment counts, average TOC emission factors and VOC emissions for natural gas well and oil well sites are provided in Tables 9-7 and 9-8, respectively.

Gathering and Boosting Stations

Gathering and boosting stations are sites that collect natural gas from well sites and direct them to the natural gas processing plants. These stations have similar equipment to well sites; however they are not directly connected to the wellheads. The EPA/GRI document does not have specific equipment counts for the gathering and boosting segment, but does include equipment counts for gathering compressors within the oil and natural gas production data. To estimate the equipment at a gathering and boosting model plant, the weighted averages of equipment counts

NMED Exhibit 34

for the Eastern and Western U.S. data sets for onshore production equipment were calculated. The weighted averages of the data sets were determined to be 11 separators, 7 meters/piping, 5 gathering compressors, 7 in-line heaters, and 5 dehydrators. These average equipment counts were used to create the model plant for gathering and boosting stations. The components for gathering compressors were included in the model plant total counts, but the compressor seals were excluded. Compressors seals are addressed in chapter 5 of this document. Table 9-9 presents a summary of the fugitive emissions component counts for oil and gas gathering and boosting stations.

Baseline emissions were calculated using the component counts and the TOC emission factors for oil and natural gas production (See Table 9-6). Table 9-10 summarizes the baseline emissions for gathering and boosting stations. The average fugitive emissions from a gathering and boosting station were determined to be 9.8 tpy of VOC. The VOC emission estimate was used to evaluate the potential emission reductions and cost of control of a fugitive emissions reduction program.

9.3 Available Controls and Regulatory Approaches

9.3.1 Available VOC Emission Control Options

The EPA has determined that fugitive emissions from components are a significant source of VOC emissions from well sites and gathering and boosting stations. Based on the review of public and peer review comments on the equipment leaks white paper and the Colorado and Wyoming state rules, the EPA has identified two options for reducing fugitive VOC emissions from components: a fugitive emissions monitoring program based on the use of OGI leak detection combined with repair of fugitive emission components, and a leak monitoring program based on individual component monitoring using Method 21 for leak detection combined with repair of fugitive emission components. These options, as currently being used by industry to reduce fugitive emissions in the oil and natural gas industry, are described below.

9.3.1.1 Fugitive Emission Detection and Repair with Optical Gas Imaging

Description

The reduction of fugitive emissions from oil and natural gas well sites and gathering and boosting stations involves the development and implementation of a fugitive emissions monitoring plan that covers the collection of fugitive emissions components at well sites or gathering and boosting stations. Under this option, monitoring is conducted using OGI, and the company develops and implements a monitoring plan that covers the collection of fugitive

NMED Exhibit 34

emissions components at well sites or compressor stations within a company-defined area. An example monitoring plan would include inspection of the collection of all fugitive emissions components, such as connectors, open-ended lines/valves, pressure relief devices, closed vent systems, compressors, and thief hatches on controlled storage vessels. The plan would include provisions to repair or replace fugitive emissions components if evidence of fugitive emissions is discovered during the OGI survey (e.g., any visible emissions from a fugitive emissions component observed using OGI).

Control Effectiveness

Potential emission reduction percentages from the implementation of an OGI monitoring program varies from 40 to 99 percent.[146] The data supporting these emission reduction percentages are based on the gathering of individual OGI surveys at various oil and natural gas industry segment sites. The variation in the percent reductions from these OGI surveys generally depended on whether large fugitive emission sources were found (e.g., open thief hatches, open dump valves, etc.) during the OGI survey and assumptions made by the authors. However, the studies supporting these emission reduction percentages did not provide information on the potential emission reductions from the implementation of an annual, semiannual, quarterly, or monthly OGI monitoring and repair program. A report was found, after the publication of the white paper, from the Colorado Air Quality Control Commission,[147] which estimated (1) 40 percent reduction for annual OGI monitoring for well production tank batteries with uncontrolled VOC emissions of greater than 6 tpy or less than or equal to 12 tpy; (2) 60 percent reduction for quarterly OGI monitoring for well production tank batteries with uncontrolled VOC emissions of greater than 12 tpy and less than or equal to 50 tpy; and (3) 80 percent reduction for monthly OGI monitoring at well production tank batteries with uncontrolled VOC emissions greater than 50 tpy.

From the review of the studies in the white paper and the Colorado Economic Impact Analysis, we expect the emission reductions from the implementation of an OGI monitoring and repair program to vary depending on the frequency of monitoring. As noted above, Colorado

[146] U.S. Environmental Protection Agency. *Oil and Natural Gas Sector Leaks*, Office of Air Quality Planning and Standards. Research Triangle Park, NC. April 2014. Available at http://www.epa.gov/airquality/oilandgas/2014papers.

[147] Colorado Air Quality Control Commission, *Cost-Benefit Analysis Submitted Per § 24-4-103(2.5), C.R.S. For Proposed Revisions to Colorado Air Quality Control Commission Regulations Number 3 (5 CCR 1001-5) and Regulation Number 7 (5 CCR 1001-9).* February 7, 2014.

estimated that monthly monitoring would achieve 80 percent at well production tank batteries with an uncontrolled VOC emission rate of greater than 50 tpy. We believe, based on our review of the studies, monthly monitoring should achieve much higher emission reductions. Based on information in the studies and EPA's engineering judgment, the potential emission reduction percentages are estimated to be 40 percent for annual monitoring, 60 percent for semiannual monitoring, and 80 percent for quarterly monitoring.

Data from the EPA Protocol document estimates monthly Method 21 monitoring to achieve 87 percent reductions at a leak definition of 10,000 ppm and 92 percent reductions at a leak definition of 500 ppm. Potential emission reductions for annual, semiannual and quarterly monitoring frequencies were calculated using the data from the EPA Protocol document.[148] For quarterly monitoring, the Method 21 data from the EPA Protocol document estimates a 67 percent reduction at a leak definition of 10,000 ppm and an 83 percent reduction at a leak definition of 500 ppm. Using Method 21 data from the EPA Protocol document, we estimated the percent reductions from semiannual monitoring to be 55 percent at a leak definition of 10,000 ppm and 75 percent reduction at a leak definition of 500 ppm. The potential emission reduction percentages for annual monitoring were calculated to be 42 percent at a leak definition of 10,000 ppm and 68 percent at a leak definition of 500 ppm. The OGI camera is capable of viewing leaks at a 500 ppm level, and achieves similar emission reductions as a Method 21 monitoring program. Based on this information, we believe the expected emission reductions from an OGI monitoring and repair program falls somewhere in the 500 and 10,000 ppm range found in the Method 21 monitoring programs, but closer to the 500 ppm level.

A study performed by ICF[149] using data from subpart W, EPA/ GRI, City of Fort Worth Natural Gas Air Quality Study, UT Study - Methane Emissions in the Natural Gas Supply Chain: Production, UT Study - Methane Emissions from Process Equipment at Natural Gas Production Sites in the United States Pneumatic Controllers, and Jonah Energy LLC WCCA Spring Meeting Presentation determined the Year 3 fugitive emission reductions from a quarterly LDAR program to be 78 percent. The data provided in the study supports 40, 60, 80 percent emission reductions for annual, semiannual and quarterly monitoring, respectively.

NMED Exhibit 34

On the basis of the analysis and the data described here, it was concluded that an OGI monitoring program in combination with a repair program can reduce fugitive methane and VOC emissions from these segments by 40 percent on an annual frequency, 60 percent on a semiannual frequency and 80 percent on a quarterly frequency, as well as minimize the loss of salable gas.

To be conservative, we performed a sensitivity analysis using the midpoint between the potential emission reductions that were calculated for each of the Method 21 monitoring frequencies at leak definitions of 10,000 ppm and 500 ppm, which were determined to be 55, 65, and 75 percent for annual, semiannual and quarterly monitoring, respectively. We then compared the potential emission reductions from 40, 60, 80 percent reductions with the Method 21 midpoint reduction percentages of 55, 65 and 75 and found that the annual methane and VOC emission reductions at each of the monitoring frequency intervals were comparable.[150]

Cost Impacts

Costs (2012 dollars) for preparing an OGI emission monitoring and repair plan for a company-defined area (i.e., field or district) were estimated using hourly estimates for each of the monitoring and repair plan elements. The costs are based on the following assumptions:

(1) Labor cost for each of the monitoring plan elements was estimated to be $57.80 per hour.
(2) Reading of the rule and instructions would take one person four hours to complete at a cost of $231.
(3) Development of a fugitive emission monitoring plan would take two and one half people a total of 60 hours to complete at a cost of $3,468.
(4) Initial activities planning are estimated to take two people a total of 8 hours per monitoring event. Cost for annual monitoring was estimated to be $925, semiannual monitoring was estimated to be $1,850, and quarterly monitoring was estimated to be $3,699.
(5) Notification of compliance status was estimated to take one person one hour to complete at a cost of $58 for gathering and boosting stations. For companies that own and operate well sites, the cost of the notification of compliance was estimated to be $58 per well site

[150] See Emission Reduction Comparison – Well Sites.xls, and Emission Reduction Comparison – Compressor Stations.xls in Docket Id. No. EPA-HQ-OAR-2015-0216 for more information.

NMED Exhibit 34

for each company defined area, which is estimated to operate 22 well sites within the defined area for a total of $1,272.

(6) Cost of a Method 21 monitoring device of $10,800; or cost for OGI monitoring using an outside contractor (assumed to be $600 for a well site and $2,300 for a gathering and boosting station for each survey).

Costs for implementing a fugitive emission monitoring plan for a company-defined area (i.e., field or district) were estimated for each of the monitoring and repair elements. The costs are based on the following assumptions:

(1) Subsequent activities planning are estimated to take two people a total of 16 hours per monitoring event for well sites and two people a total of 24 hours for gathering and boosting stations. For well sites, this cost was divided among the total number of well sites in the company-defined area.

(2) The cost for OGI monitoring using an outside contractor was assumed to be $600 for a well site and $2,300 for a gathering and boosting station for each survey.

(3) Annual repair costs were estimated to be $299 for well sites and $3,436 for gathering and boosting stations per survey. These costs were estimated assuming that 1.18 percent of the components leak and 75 percent are repaired online and 25 percent are repaired offline.

(4) Cost for resurvey of components assumes five minutes per leak at $57.80 per hour for well sites and $2.00 per leak for gathering and boosting stations. This is based on the assumption that a company purchases Method 21 instrumentation (estimated to be $10,800[151]) and is able to perform the resurvey without needing contractors.

(5) Preparation of annual reports was estimated to take one person a total of 4 hours to complete at a cost of $231.

The initial setup cost or capital cost for well sites was calculated by summing up the costs for reading the air agency rule, development of fugitive emissions monitoring plan, initial activities planning, and notification of initial compliance status. The total capital cost of these activities was calculated to be $16,696 per company-defined areas for annual monitoring,

[151] Memorandum to Jodi Howard, EPA/OAQPS from Cindy Hancy, RTI International, Analysis of Emission Reduction Techniques for Equipment Leaks, December 21, 2011. EPA-HQ-OAR-2002-0037-0180.

NMED Exhibit 34

$17,620 per company-defined areas for semiannual monitoring and $19,470 per company-defined areas for quarterly monitoring. Assuming that each company owns and operates 22 well sites within a company-defined area[152], the capital cost per well site was estimated to be $759 for annual monitoring, $801 for semiannual monitoring and $855 for quarterly monitoring. For gathering and boosting stations, the capital cost for reading the rule, development of fugitive emissions monitoring plan, initial activities planning notification of initial compliance status, and purchase of a Method 21 instrumentation device was calculated to be $16,753 per facility. For gathering and boosting stations, the capital cost was assumed to be shared with other gathering and boosting stations within the company-defined area. These stations are estimated to be approximately 70 miles apart. Therefore, within a 210 mile radius of a central location, there would be an estimated seven gathering and boosting stations, and the capital cost for each of these stations was estimated to be $2,393.

For well sites and gathering and boosting stations, the annual cost includes: subsequent activities planning, OGI survey by an outside contractor, cost of repair of fugitive emissions found, preparation and submittal of an annual report and the amortized capital cost over 8 years at 7 percent interest. For our analyses, we calculated the annual cost for annual, semiannual and quarterly OGI surveys. The annual cost for annual, semiannual, and quarterly OGI surveying (inclusive of contractor costs, cost of repair of fugitive emissions found, preparation and submittal of an annual report, and amortized capital cost over 8 years at 7 percent interest) was calculated for the production and processing segments. Tables 9-11 through 9-13 present summaries of the cost of control for VOC for the three OGI monitoring frequency options (i.e., annual, semiannual and quarterly).

[152] The number of well sites owned and operated by companies was calculated using data from the Fort Worth study.

Table 9-11. Summary of the Model Plant VOC Cost of Control for the Annual OGI Monitoring Option

Model Plant	Annual VOC Emission Reductions (tpy)[a]	Capital Cost ($2012)[b]	Annual Cost ($2012/year)[c]		Cost of Control ($2012/ton)	
			Without savings	With savings [d]	Without savings	With savings [d]
Natural Gas Well Site	0.61	$759	$1,318	$809	$2,158	$1,324
Oil Well Site (GOR < 300)	0.13	$759	$1,318	$1,204	$9,953	$9,089
Oil Well Site (GOR ≥ 300)	0.30	$759	$1,318	$1,063	$4,380	$3,533
Gathering and Boosting Station	3.91	$2,393	$7,777	$4,518	$1,990	$1,156

[a] Assumes 40 percent reduction with the implementation of annual IR camera monitoring.
[b] The capital cost for oil and natural gas production well sites includes the cost of implementing the monitoring program divided between an average of 22 well sites per company district. The capital cost for implementing the monitoring program at gathering and boosting stations was divided between seven stations within a company-defined area.
[c] Annual cost for well sites includes annual monitoring and repair cost of $1,191 and amortization of the capital cost over 8 years at 7 percent interest. Annual cost for gathering and boosting stations includes annual monitoring and repair cost of $7,736 and amortization of the capital cost over 8 years at 7 percent interest.
[d] Recovery credits for oil and natural gas production well sites and gathering and boosting stations were calculated assuming natural gas reductions based methane reductions, methane as 82.9 percent of natural gas composition, and the value of the natural gas recovered as $4 Mcf.

NMED Exhibit 34

Table 9-12. Summary of the Model Plant VOC Cost of Control for the Semiannual OGI Monitoring Option

Model Plant	Annual VOC Emission Reductions (tpy) [a]	Capital Cost ($2012)[b]	Annual Cost ($2012/year) [c]		Cost of Control ($2012/ton)	
			Without savings	With savings [d]	Without savings	With savings [d]
Natural Gas Well Site	0.917	$801	$2,285	$1,521	$2,494	$1,660
Oil Well Site (GOR < 300)	0.199	$801	$2,285	$2,114	$11,503	$10,639
Oil Well Site (GOR ≥ 300)	0.451	$801	$2,285	$1,903	$5,062	$4,215
Gathering and Boosting Station	5.86	$2,393	$13,534	$8,646	$2,309	$1,475

[a] Assumes 60 percent reduction with the implementation of semiannual IR camera monitoring.
[b] The capital cost for oil and natural gas production well sites includes the cost of implementing the monitoring program divided between an average of 22 well sites per company district. The capital cost for implementing the monitoring program at gathering and boosting stations was divided between seven stations within a company-defined area.
[c] Annual cost for well sites includes annual monitoring and repair cost of $2,151 and amortization of the capital cost over 8 years at 7 percent interest. Annual cost for gathering and boosting stations includes annual monitoring and repair cost of $13,133 and amortization of the capital cost over 8 years at 7 percent interest.
[d] Recovery credits for oil and natural gas production well sites and gathering and boosting stations were calculated assuming natural gas reductions based methane reductions, methane as 82.9 percent of natural gas composition, and the value of the natural gas recovered as $4 Mcf.

Table 9-13. Summary of the Model Plant VOC Cost of Control for the Quarterly OGI Monitoring Option

Model Plant	Annual VOC Emission Reductions (tpy) [a]	Capital Cost ($2012)[b]	Annual Cost ($2012/year) [c]		Cost of Control ($2012/ton)	
			Without savings	With savings [d]	Without savings	With savings [d]
Natural Gas Well Site	1.222	$885	$4,220	$3,201	$3,453	$2,619
Oil Well Site (GOR < 300)	0.265	$885	$4,220	$3,991	$15,929	$15,064
Oil Well Site (GOR ≥ 300)	0.602	$885	$4,220	$3,710	$7,010	$6,163
Gathering and Boosting Station	7.81	$2,393	$25,049	$18,532	$3,205	$2,371

[a] Assumes 80 percent reduction with the implementation of quarterly IR camera monitoring.
[b] The capital cost for oil and natural gas production well sites includes the cost of implementing the monitoring program of $19,470 divided between an average of 22 well sites per company. The capital cost for implementing the monitoring program at gathering and boosting stations was divided between seven stations within a company-defined area.
[c] Annual cost for well sites includes annual monitoring and repair cost of $4,071 and amortization of the capital cost over 8 years at 7 percent interest. Annual cost for gathering and boosting stations includes annual monitoring and repair cost of $24,649 and amortization of the capital cost over 8 years at 7 percent interest.
[d] Recovery credits for oil and natural gas production well sites and gathering and boosting stations were calculated assuming natural gas reductions based methane reductions, methane as 82.9 percent of natural gas composition, and the value of the natural gas recovered as $4 Mcf.

9.3.1.2 Fugitive Emission Detection and Correction with Method 21

Description

Another option that can be used to reduce fugitive emissions from well sites and gathering and boosting stations involves the development of a fugitive emissions monitoring plan using Method 21 to detect leaks from equipment and components. The plan would incorporate surveying of components at a specified interval and repair threshold using a Method 21 instrument, which also includes following the Method 21 requirements for monitoring, along with repair, recordkeeping and reporting requirements.

The plan would also include provisions for repair or replacement of components if evidence of fugitive emissions are discovered during the survey. The monitoring plan would include inspection of all fugitive emission components and would require repair where evidence

NMED Exhibit 34

of fugitive emissions is discovered (as soon as practicable, but generally no later than 30 calendar days after the Method 21 survey). In addition, all repairs or replacement of components would be re-surveyed immediately after repair or replacement to ensure the fugitive emissions are below the specified repair threshold.

A facility can use a company-defined area fugitive emissions monitoring plan that covers the collection of fugitive emission components at well sites and gathering and boosting stations. By using a company-defined area, owners and operators have flexibility in developing monitoring plans and determining which company-defined area can be covered under the specifications outlined in one monitoring plan, for ease of implementation and compliance.

Control Effectiveness

Potential control efficiencies for Method 21 monitoring were estimated to be 42 to 83 percent depending on repair threshold and monitoring frequency in the 2016 NSPS. The Method 21 control options included repair thresholds of 10,000 and 500 parts per million (ppm) and annual, semiannual, and quarterly monitoring frequencies. Tables 9-14 through 9-16 present the summaries of the estimated emission reductions for annual, semiannual and quarterly Method 21 monitoring for the two repair thresholds for the well site and the gathering and boosting station model plants.

Cost Impacts

Costs (2012 dollars) for preparing and implementing a fugitive emission monitoring plan for a company-defined area (i.e., field or district) were estimated using hourly estimates for each of the plan elements. The costs are based on the following assumptions:

(1) Labor cost for each of the monitoring plan elements was estimated to be $57.80 per hour.
(2) Reading of the air agency rule and instructions would take one person four hours to complete at a cost of $231.20.
(3) Development of a fugitive emission monitoring plan would take two and one half people a total of 60 hours to complete at a cost of $3,468.
(4) Initial activities planning are estimated to take two people a total of 16 hours per monitoring event. Cost for annual monitoring was estimated to be $925, semiannual monitoring was estimated to be $1,850, and quarterly monitoring was estimated to be $3,699.

NMED Exhibit 34

Table 9-14. Summary of the Model Plant VOC Cost of Control for the Annual Method 21 Monitoring Option

Model Plant	Annual VOC Emission Reductions (tpy) [a]	Capital Cost ($2012)[b]	Annual Cost ($2012/year)[c]		Cost of Control ($2012/ton)	
			Without savings	With savings [d]	Without savings	With savings [d]
10,000 ppm Repair Threshold						
Natural Gas Well Site	.645	$1,418	$2,300	$1,762	$3,568	$2,734
Oil Well Site (GOR < 300)	0.14	$1,418	$2,300	$2,179	$16,459	$15,595
Oil Well Site (GOR ≥ 300)	0.318	$1,418	$2,300	$2,031	$7,243	$6,396
Gathering and Boosting Station	4.12	$4,283	$9,803	$6,365	$2,378	$1,544
500 ppm Repair Threshold						
Natural Gas Well Site	1.043	$1,418	$2,300	1,430	$2,204	$1,371
Oil Well Site (GOR < 300)	0.226	$1,418	$2,300	$2,104	$10,169	$9,305
Oil Well Site (GOR ≥ 300)	0.514	$1,418	$2,300	$1,865	$4,475	$3,628
Gathering and Boosting Station	6.67	$4,283	$9,803	$4,239	$1,469	$635

[a] Assumes 42 percent reduction at 10,000 ppm repair threshold and 68 percent reduction at 500 ppm repair threshold with the implementation of annual Method 21 monitoring.
[b] The capital cost for oil and natural gas well sites and gathering and boosting stations includes the cost of implementing the monitoring program which includes reading the rule, developing and implementing a monitoring plan (including initial activities planning), notification of initial compliance status, and purchase of a Method 21 monitoring device.
[c] Annual cost for oil and natural gas well sites and gathering and boosting stations includes annual monitoring and repair cost and amortization of the capital cost over 8 years at 7 percent interest.
[d] Recovery credits for oil and natural gas well sites were calculated assuming natural gas reductions based methane reductions, methane as 82.9 percent of natural gas composition, and the value of the natural gas recovered as $4 Mcf.

Table 9-15. Summary of the Model Plant VOC Cost of Control for the Semiannual Method 21 Monitoring Option

Model Plant	Annual VOC Emission Reductions (tpy) [a]	Capital Cost ($2012)[b]	Annual Cost ($2012/year) [c]		Cost of Control ($2012/ton)	
			Without savings	With savings [d]	Without savings	With savings [d]
10,000 ppm Repair Threshold						
Natural Gas Well Site	0.837	$1,460	$3,907	$3,209	$4,667	$3,833
Oil Well Site (GOR < 300)	0.181	$1,460	$3,907	$3,750	$21,530	$20,666
Oil Well Site (GOR ≥ 300)	0.412	$1,460	$3,907	$3,558	$9,475	$8,628
Gathering and Boosting Station	5.35	$4,415	$17,292	$12,828	$3,230	$2,396
500 ppm Repair Threshold						
Natural Gas Well Site	1.152	$1,460	$3,907	$2,946	$3,392	$2,558
Oil Well Site (GOR < 300)	0.250	$1,460	$3,907	$3,691	$15,648	$14,784
Oil Well Site (GOR ≥ 300)	0.567	$1,460	$3,907	$3,426	$6,887	$6,039
Gathering and Boosting Station	7.37	$4,415	$17,292	$11,150	$2,348	$1,514

[a] Assumes 55 percent reduction at 10,000 ppm repair threshold and 75 percent reduction at 500 ppm repair threshold with the implementation of semiannual Method 21 monitoring.
[b] The capital cost for oil and natural gas well sites and gathering and boosting stations includes the cost of implementing the monitoring program, which includes reading the rule, developing and implementing a monitoring plan (including initial activities planning), notification of initial compliance status, and purchase of a Method 21 monitoring device.
[c] Annual cost for oil and natural gas well sites and gathering and boosting stations includes annual monitoring and repair cost and amortization of the capital cost over 8 years at 7 percent interest.
[d] Recovery credits for oil and natural gas well sites were calculated assuming natural gas reductions based methane reductions, methane as 82.9 percent of natural gas composition, and the value of the natural gas recovered as $4 Mcf.

Table 9-16. Summary of the Model Plant VOC Cost of Control for the Quarterly Method 21 Monitoring Option

Model Plant	Annual VOC Emission Reductions (tpy) [a]	Capital Cost ($2012)[b]	Annual Cost ($2012/year) [c]		Cost of Control ($2012/ton)	
			Without savings	With savings [d]	Without savings	With savings [d]
10,000 ppm Repair Threshold						
Natural Gas Well Site	1.030	$1,544	$7,121	$6,262	$6,196	$6,083
Oil Well Site (GOR < 300)	0.223	$1,544	$7,121	$6,928	$31,906	$31,042
Oil Well Site (GOR ≥ 300)	0.507	$1,544	$7,121	$6,691	$14,042	$13,195
Gathering and Boosting Station	6.58	$4,679	$32,271	$26,780	4,901	$4,067
500 ppm Repair Threshold						
Natural Gas Well Site	1.26	$1,544	$7,121	$6,070	$5,651	$4,817
Oil Well Site (GOR < 300)	0.273	$1,544	$7,121	$6,885	$26,067	$25,202
Oil Well Site (GOR ≥ 300)	0.621	$1,544	$7,121	$6,595	$11,472	$10,624
Gathering and Boosting Station	8.06	$4,679	$32,271	$25,550	$4,004	$3,170

[a] Assumes 67 percent reduction at 10,000 ppm repair threshold and 83 percent reduction at 500 ppm repair threshold with the implementation of quarterly Method 21 monitoring.
[b] The capital cost for oil and natural gas well sites includes the cost of implementing the monitoring program of $32,120 divided by an average of 22 well sites per company.
[c] Annual cost for oil and natural gas well sites and gathering and boosting stations includes annual monitoring and repair cost and amortization of the capital cost over 8 years at 7 percent interest.
[d] Recovery credits for oil and natural gas well sites were calculated assuming natural gas reductions based methane reductions, methane as 82.9 percent of natural gas composition, and the value of the natural gas recovered as $4 Mcf.

NMED Exhibit 34

(5) Notification of compliance status was estimated to take one person one hour to complete at a cost of $58 for gathering and boosting stations. For companies that own and operate well sites, the cost of the notification of compliance was estimated to be $58 per well site for each company-defined area, which is estimated to operate 22 well sites within the defined area for a total of $1,272.

(6) Cost of a Method 21 monitoring device and data collection system was estimated at $25, 300 per company ($10,800 for the M21 monitoring device and $14,500 for the data collection system).

Costs for implementing a fugitive emission monitoring plan for a company-defined area for well sites and gathering and boosting stations were estimated for each of the monitoring and repair elements. The costs are based on the following assumptions:

(1) Subsequent activities planning are estimated to take two people a total of 16 hours per monitoring event for well sites and two people a total of 24 hours for gathering and boosting stations. For well sites, this cost was divided among the total number of well sites in the company-defined area.

(2) Method 21 monitoring was estimated to take two people a total of 16 hours to survey a well production site at a cost of $925 per survey. For gathering and boosting stations, Method 21 monitoring was estimated to take 2 people a total of 8 hours to survey the station at a cost of $925 per survey.

(3) Annual repair costs for well sites were estimated to be $299 using a repair threshold of 10,000 ppm and $5,400 using a repair threshold of 500 ppm. These costs were estimated assuming that 1.18 percent of the components leak. The repair costs assume 75 percent are repaired online and 25 percent are repaired offline.

(4) Annual repair costs for gathering and boosting stations were estimated to be $3,436 using a repair threshold of 10,000 ppm and $52,900 using a repair threshold of 500 ppm. These costs were estimated assuming that 1.18 percent of the components leak. The repair costs assume 75 percent are repaired online and 25 percent are repaired offline.

(5) Cost for resurvey of components assumes 5 minutes per leak at $57.80 per hour for well sites and $2.00 per leak for gathering and boosting stations.

(6) Preparation of annual reports was estimated to take 1 person a total of 4 hours to complete at a cost of $231.

The initial setup cost or capital cost for oil and natural gas well sites was calculated by summing up the costs for reading the rule, development of fugitive emissions monitoring plan, initial activities planning, acquisition of a Method 21 monitoring device and data collection system and notification of initial compliance status. The total capital cost of these activities was estimated to be $31,196 for annual monitoring, $32,120 for semiannual monitoring, and $33,970 for quarterly monitoring. Assuming that each company owns and operates 22 well sites within a company-defined area, the capital cost per well site was estimated to be $1,460.

For gathering and boosting stations, the capital cost was assumed to be shared with other gathering and boosting stations within the company-defined area. These stations are estimated to be approximately 70 miles apart. Therefore, within a 210-mile radius of a central location, there would be an estimated seven gathering and boosting stations and the capital cost for these stations was estimated to be $29,982 for annual monitoring, $30,907 for semiannual monitoring, and $32,756 for quarterly monitoring. Assuming that there are 7 gathering and boosting stations in a company-defined area, the capital cost per station was estimated to be $4,283 for annual monitoring, $4,415 for semiannual monitoring, and $4,679 for quarterly monitoring.

For oil and natural gas well sites and gathering and boosting stations, the annual cost includes: subsequent activities planning, Method 21 survey, cost of repair of fugitive emissions found, preparation and submittal of an annual report, and the amortized capital cost over 8 years at 7 percent interest. The annual cost for annual, semiannual, and quarterly Method 21 surveying (inclusive of cost of repair of fugitive emissions found, preparation and submittal of an annual report, and amortized capital cost over 8 years at 7 percent interest) was calculated for each of the industry segments. Tables 9-14 through 9-16 present summaries of the cost of control for VOC at each of the repair thresholds (i.e., 10,000 and 500 ppm) for the three monitoring frequency options (i.e., annual, semiannual and quarterly).

9.3.2 Existing Federal, State and Local Regulations

9.3.2.1 Federal Regulations that Specifically Require Control of VOC Emissions

For each well site and compressor station (including gathering and boosting stations), the EPA has finalized NSPS requirements that will require the development of a fugitive emissions monitoring plan that includes semiannual monitoring for well sites and quarterly monitoring for

compressor stations by OGI and repair of leaking fugitive emission components. Method 21 can be used as an alternative to OGI at a 500 ppm repair threshold.

9.3.2.2 State and Local Regulations that Specifically Require Control of VOC Emissions

States or local air districts may have regulations or permitting restrictions on VOC emissions that may apply to an emission source as a result of an operating permit, or preconstruction permit based on air quality maintenance or improvement goals of an area. Permits specify what construction is allowed, what emission limits must be met, and often how the source must be operated. To ensure that sources follow the permit requirements, permits also contain monitoring, recordkeeping and reporting requirements. A summary of some of the existing state regulations and permit programs that apply to the oil and natural gas industry is provided below.

Colorado Regulation 7

The State of Colorado has regulations that require leak inspections at all well sites, compressor stations upstream of the processing plant and storage vessels. For well production facilities and compressor stations, the monitoring frequency is determined by the estimated uncontrolled actual VOC emissions leak from the highest emitting tank or, if no tanks are present, the controlled actual emissions from all permanent equipment. The monitoring frequency for fugitives at well production facilities varies depending on emissions. There is a one-time inspection (0-6 tpy VOC), annual inspections (6-12 tpy VOC), quarterly inspections (12-20 tpy VOC w/o tanks, 12-50 w/ tanks), or monthly inspections (> 20 TPY VOC w/o tanks, > 50 tpy VOC w/ tanks). Monthly AVO inspections are also required for well production facilities that do one-time, annual, and quarterly monitoring. For compressor stations, the monitoring frequency is annual (0-12 tpy VOC), quarterly (12-50 tpy VOC), or monthly (> 50 tpy VOC). A leak is defined as hydrocarbon concentration greater than 500 ppm. These regulations allow OGI inspections, Method 21 or other "[d]ivision approved instrument based monitoring device or method" to detect leaks (Colorado Department of Public Health and Environment, Air Quality Control Commission, Regulation Number 7). The first attempt to repair leaks found during monitoring must be made no later than five working days after discovery, unless parts are unavailable or the equipment requires shutdown to complete repair. If

parts are unavailable, they must be ordered promptly and the repair must be made within 15 working days of receipt of the parts. If a shutdown is required, the leak must be repaired during the next scheduled shutdown.

Wyoming Chapter 8

The Wyoming Department of Environmental Quality issued regulations in June 2015 for existing (as of January 1, 2014) PAD facility (location where more than one well and/or associated production equipment are located, where some or all production equipment is shared by more than one well or where well streams from more than one well are routed through individual production trains at the same location) and single-well oil and gas production facilities or sources, and all compressor stations that are located in the Upper Green River Basin (UGRB) ozone nonattainment area[153]. The rule requires operators with fugitive emissions greater than or equal to 4 tons per year of VOC to develop and implement an LDAR protocol by January 1, 2017. Operators must monitor components (flanges, connectors (other than flanges), open-ended lines, pumps, valves, and "other" components listed in Table 2-4 of the EPA's Protocol for Equipment Leak Emissions Estimates) quarterly using a combination of Method 21, IR camera, other instrument based technologies, or AVO inspections. However, an LDAR protocol consisting of only AVO inspections does not meet the requirements of the rule. No specific repair timeframes are included in the regulation.

Utah General Approval Order

The Utah Department of Environmental Quality approved a "General Approval Order for a Crude Oil and Natural Gas Well Site and/or Tank Battery" on June 5, 2014[154]. This General Approval Order (GAO) requires LDAR for equipment (e.g., valve, flange or other connection, pump, compressor, pressure relief device or other vent, process drain, open-ended valve, pump seal, compressor seal, and access door seal or other seal that contains or contacts a process stream with hydrocarbons) based on annual throughput of crude oil and condensate. Annual inspections are required for sources that have a projected annual throughput of crude oil and condensate combined that is greater than or equal to 10,000 barrels or for sources that do not

[153] Wyoming regulations are available at http://soswy.state.wy.us/Rules/RULES/9868.pdf.
[154] Utah regulations are available at http://www.deq.utah.gov/Permits/GAOs/docs/2014/6June/DAQE-AN149250001-14.pdf.

have a crude oil or condensate storage tank onsite, and quarterly inspections are required for sources that have a projected annual throughput of crude oil and condensate combined that is greater than or equal to 25,000 barrels. For sources performing quarterly monitoring, provisions are provided for less frequent monitoring if no leaks are found during a year of monitoring. Repairs must be made within 15 days of finding a leak. A delay of repair is allowed if replacement parts are unavailable (must order parts within 5 days of detection and repair leak within 15 days after receipt of the parts) or technically infeasible to repair without a shutdown (shutdown must occur within 6 months of finding leak or operators must demonstrate emissions from shutdown would be greater than the uncontrolled leaking component).

The monitoring can be performed using Method 21, a tunable diode laser absorption spectroscopy (TDLAS) or an IR camera. A leak is defined as a reading of 500 ppm with Method 21 analyzer or TDLAS, or visible leak with IR camera.

Ohio General Permit

The Ohio EPA approved two types of general permits in May 2014 for oil and gas well site production operations (small flares and large flares) and high volume horizontal hydraulic fracturing for facilities that emit less than 1 ton per year of any toxic air contaminant (not including HAP emitting sources that are subject to MACT subpart HH)[155]. Each permittee is required to develop and implement an LDAR program for ancillary equipment (pumps, compressors, pressure relief devices, connectors, valves, flanges, vents, covers, any bypass in a closed vent system, and each storage vessel) that requires monitoring using a forward looking infrared (FLIR) camera or Method 21. Leak definitions vary depending on component (most are 500 or 10,000 ppm). Quarterly monitoring is required for the first year and varies after that depending on performance. Repairs must be made within 30 days of finding a leak but if leaks cannot be repaired within that time frame, the general permit references the delay of repair provisions allowed under NSPS subpart VVa.

Ohio has also proposed a general permit for natural gas compressor stations that have the potential to leak greater than 10 tons per year of VOC. The general permit requirements for

[155] Ohio regulations available at
http://www.epa.ohio.gov/Portals/27/oil%20and%20gas/GP12.1_PTIOA20140403final.pdf.
http://epa.ohio.gov/dapc/genpermit/genpermits.aspx#127854016-available-permits.

compressor stations are similar to the LDAR requirements for oil and gas well site production operations. No emissions data were available for this LDAR program.

Pennsylvania General Permit 5 and Exemption Category No. 38

General Permit 5 is a General Plan Approval and/or General Operating Permit for midstream natural gas gathering, compression and/or processing facilities that are minor air contamination facilities[156]. Exemption Category No. 38 of the Air Quality Permit Exemption List applies to sources located at a well pad[157]. The general permit requires operators to conduct leak detection and repair programs monthly using AVO methods. Equipment to be monitored include: valves, flanges, connectors, storage vessels/storage tanks, and compressor seals. In addition, the general permit requires annual monitoring at wells and quarterly monitoring for compression and processing facilities. Operators must use a FLIR camera or approved device to detect gaseous hydrocarbons leaks. All leaks at production sites, compressor stations or processing facilities must be repaired within 15 days of finding the leak.

West Virginia Class II General Permit G70-B

General Permit G70-B is for natural gas production facilities[158]. The permit requires quarterly monitoring using AVO, Method 21 analyzers, IR cameras, or some combination. The AVO inspection shall include, but not be limited to, defects as visible cracks, holes, or gaps in piping; loose connections; liquid leaks; or broken or missing caps or other closure devices. If a Method 21 analyzer is used, a leak (fugitive emissions of regulated air pollutants) is defined as no detectable emissions (less than 500 ppm). If an IR camera is used, no detectable emissions is defined as no visible leaks detected in accordance with U.S. EPA alternative IR camera work practices (40 CFR 60, subpart A). The first attempt at repair must be made within 5 calendar days of discovering the leak, and the final repair must be made within 15 calendar days of discovering the leak. No emissions data are available for this LDAR program.

NMED Exhibit 34

San Joaquin Valley Air Pollution Control District Rule 4409

The San Joaquin Valley Air Pollution Control District requires the development of an operator management plan that establishes inspection, replacement, re-inspection requirements, maintenance, repair periods and replacement retrofit requirements for components at light crude oil production facilities, natural gas production facilities and natural gas processing plants[159].

For manned facilities, the District requires owners and operators to audio-visually inspect for leaks daily and, for unmanned sites, the District requires owners and operators to audio-visually inspect for leaks weekly. Additionally, the District requires owners and operators to conduct inspections for leaks quarterly using Method 21. Leaks discovered are required to be repaired within two to seven days of discovery, depending on the magnitude of the leak. An extension of up to seven days is allowed if the leak is minor. Owners and operators are also allowed to apply for written approval to change the Method 21 monitoring inspection frequency from quarterly to annually if they meet specified criteria. Components at oil production facilities and gas production facilities that exclusively handle gas/vapor or liquid with a VOC content of 10 percent by weight or less are exempt from requirements.

9.4 Recommended RACT Level of Control

We evaluated available data obtained in the development of the 2016 NSPS final rule, comments received on the draft CTG and 2015 NSPS proposed rule, and peer review comments received on the EPA's equipment leaks white paper. Based on our evaluation of this data and information about existing regulations that control VOC emissions from oil and natural gas production sites, this CTG provides RACT recommendations for the collection of fugitive emission components at well sites with an average production of greater than 15 barrel equivalents per well per day, and gathering and boosting stations. At this time, this CTG does not include a RACT recommendation for well sites with an average production of less than 15 barrel equivalents per well per day. However, we encourage air agencies to consider site-specific data from these sources in their RACT analyses.

We further recommend that RACT be the implementation of a monitoring plan that includes semiannual monitoring for well sites with a GOR greater than or equal to 300 and quarterly monitoring for gathering and boosting stations using OGI or Method 21 and repair of

[159] San Joaquin Valley APCD regulations available at http://www.arb.ca.gov/drdb/sju/cur.htm.

NMED Exhibit 34

components found to be leaking. The information currently available to EPA does not support applying the RACT recommendations related to fugitive monitoring contained in this chapter of the CTG to well sites with a GOR less than 300.

As discussed in section 9.3.2.2 of this chapter, some existing state and local regulations already require fugitive emissions monitoring of oil and natural gas production sites. The monitoring techniques listed in these requirements include the use of either Method 21 or OGI to locate fugitive emissions from equipment and components. In addition, peer review comments received on the equipment leaks white paper indicate that some companies are voluntarily monitoring their production sites using OGI to eliminate leaks from equipment. Monitoring and repair of equipment and components using OGI or Method 21 are the most viable methods for reducing fugitive emissions from equipment leaks in the production segment of the oil and natural gas industry.

Both Wyoming and Ohio require quarterly monitoring of components at production sites, and the cost of control per ton of VOC reduced is considered reasonable for OGI quarterly monitoring for natural gas well sites (about $3,450 per ton of VOC reduced). However, based on the information currently available regarding the necessary equipment, trained personnel and the planning necessary to implement a monitoring and repair program, we are concerned about the potential compliance burden that could be associated with quarterly monitoring of the large number of existing well sites. The VOC cost of control for semiannual monitoring using OGI was estimated to be $2,494 per ton of VOC reduced for natural gas well sites and $5,062 per ton of VOC reduced for oil wells sites with a GOR greater than or equal to 300.

We do not estimate that there would be a compliance burden associated with quarterly fugitive OGI monitoring at gathering and boosting stations because there are fewer existing gathering and boosting stations than well sites. Moreover, the cost of control per ton of VOC reduced is reasonable for quarterly OGI monitoring. The VOC cost of control for quarterly monitoring using OGI was estimated to be about $3,200 per ton of VOC reduced for gathering and boosting stations.

For well sites, the cost of control for a monitoring plan using Method 21 with a 10,000 ppm leak detection is generally more costly than the use of OGI where there are a large number of equipment components to be monitored. The cost for a natural gas well site was estimated to be $4,667 per ton of VOC reduced for semiannual monitoring. The cost for an oil well site with a

NMED Exhibit 34

GOR greater than 300 was estimated to be $9,475 per ton of VOC reduced for semiannual monitoring. As shown in section 9.3.1 of this chapter, the cost of control for the 500 ppm repair threshold options are higher than the 10,000 ppm repair threshold option. The use of a monitoring plan using Method 21 with a 10,000 ppm leak detection may, however, be a lower cost alternative to OGI where there are fewer equipment components to be monitored. For gathering and boosting stations, the cost of control for a monitoring plan using Method 21 with a 10,000 ppm leak detection is estimated to be $3,230 per ton of VOC reduced for semiannual monitoring and $3,205 for quarterly monitoring. The costs for semiannual monitoring using Method 21 for natural gas well sites, and quarterly monitoring using Method 21 for gathering and boosting stations were considered reasonable (about $4,670 for gas well sites and $3,200 for gathering and boosting stations). Based on our analyses that indicates that a monitoring plan using Method 21 at 500 ppm would meet the same level of control as semiannual monitoring using OGI, we recommend that air agencies allow owners and operators to comply by using Method 21 at 500 ppm as an alternative to semiannual monitoring using OGI.

Based on existing state and local fugitive emission requirements, economic feasibility, and the reasonableness of costs, we recommend that RACT for the collection of fugitive emission components at well sites with a GOR greater than or equal to 300 that produce, on average, greater than 15 barrel equivalents per well per day, be the implementation of a fugitive emissions monitoring and repair plan that includes semiannual monitoring using OGI or Method 21. For these same reasons, we recommend that RACT for the collection of fugitive emission components at gathering and boosting stations be the implementation of a fugitive emissions monitoring and repair plan that includes quarterly monitoring using OGI or Method 21.

In summary, we recommend the following RACT for the collection of fugitive emission components at well sites and gathering and boosting stations in the production segment:

(1) <u>RACT for the Collection of Fugitive Emission Components at Well Sites With a GOR Greater than or Equal to 300, that Produce, on Average, Greater than 15 Barrel Equivalents per Well per Day</u>: We recommend the implementation of a monitoring plan that includes semiannual monitoring using OGI and repair of components that are found to be leaking at well sites. We further recommend that air agencies allow Method 21 with a repair threshold of 500 ppm as an alternative compliance means to OGI. We also

NMED Exhibit 34

recommend that each fugitive emissions component repaired or replaced be resurveyed to ensure there is no leak after repair or replacement by the use of either Method 21 or OGI no later than 30 days of finding fugitive emissions.

(2) RACT for the Collection of Fugitive Emission Components at Gathering and Boosting Stations in the Production Segment (Located from the Wellhead to the Point of Custody Transfer to the Natural Gas Transmission and Storage Segment or Oil Pipeline): We recommend the implementation of a monitoring plan that includes quarterly monitoring using OGI and repair of components that are found to be leaking at gathering and boosting stations. We further recommend allowing Method 21 with a repair threshold of 500 ppm as an alternative to OGI. We also recommend that each fugitive emissions component repaired or replaced be resurveyed to ensure there is no leak after repair or replacement by the use of either Method 21 or OGI no later than 30 days of finding fugitive emissions.

9.5 Factors to Consider in Developing Fugitive Emissions RACT Procedures

To ensure that fugitive emissions are properly monitored and repaired (as necessary) under the RACT recommendations, we suggest that air agencies specify OGI/Method 21 monitoring and equipment repair recordkeeping and reporting requirements to document compliance. The appendix to this document presents example model rule language that incorporates the compliance elements recommended in this section that air agencies may choose to use in whole or in part when implementing RACT.

9.5.1 Monitoring Recommendations

We recommend that air agencies require a fugitive emissions OGI/Method 21 monitoring plan that covers fugitive emission component sources that includes basic required monitoring plan elements. We recommend that air agencies require the monitoring plan be developed for a company-defined area and that it cover the collection of fugitive emissions components at well sites and gathering and boosting stations.

We suggest that the fugitive emissions monitoring plan that covers the collection of fugitive emissions components at well sites and gathering and boosting stations within each company-defined area include the following minimum elements:

NMED Exhibit 34

(1) Frequency for conducting surveys.

(2) Technique for determining fugitive emissions.

(3) Manufacturer and model number of fugitive emissions detection equipment to be used.

(4) Procedures and timeframes for identifying and repairing fugitive emissions components from which fugitive emissions are detected, including timeframes for fugitive emission components that are unsafe to repair.

(5) Procedures and timeframes for verifying fugitive emission component repairs.

(6) Records that will be kept and the length of time records will be kept.

(7) If you are using OGI, you should also include the following: (i) Verification that your optical gas imaging equipment meets specification requirements (i.e., capable of imaging gases in a spectral range for the compound of highest concentration in the potential fugitive emissions, must be capable of imaging a gas that is half methane and half propane at a concentration of 10,000 ppm at a flow rate of less than or equal to 60 g/hr from a quarter inch diameter); (ii) Procedure for a daily verification check; (iii) Procedure for determining the operator's maximum viewing distance from the equipment and how the operator will ensure that this distance is maintained; (iv) Procedure for determining maximum wind speed during which monitoring can be performed and how the operator will ensure monitoring occurs only at wind speeds below this threshold; (v) Procedures for conducting surveys; (vi) Training and experience needed prior to performing surveys; including how the operator will (a) ensure an adequate thermal background is present in order to view potential fugitive emissions, (b) deal with adverse monitoring conditions such as wind, (c) deal with interferences; and (vii) Procedures for calibration and maintenance.

(8) Procedures for calibration and maintenance should comply with those recommended by the manufacturer of monitoring device used.

(9) If you are using Method 21 of appendix A-7 of part 60, you should also include the following: (i) Verification that your monitoring equipment meets the requirements specified in section 6.0 of Method 21 at 40 CFR part 60, appendix A-7; and (ii) procedures for conducting surveys.

We suggest that you also require the following minimum elements in each fugitive emissions monitoring plan:

NMED Exhibit 34

(1) Sitemap.

(2) A defined observation path that ensures that all fugitive emissions components are within sight of the path. The observation path must account for interferences.

(3) If you are using Method 21, the plan should also include a list of fugitive emission components to be monitored and method for determining location of fugitive emission components to be monitored in the field (e.g., tagging, identification on a process and instrumentation diagram, etc.).

(4) Your plan should also include the written plan developed for all of the fugitive emission components designated as difficult-to-monitor and unsafe-to-monitor.

We recommend a monitoring survey of each collection of fugitive emissions components at a well site be conducted semiannually after the initial survey and that consecutive semiannual monitoring surveys be conducted at least four months apart. We recommend a monitoring survey of each collection of fugitive emissions components at a gathering and boosting station be conducted quarterly after the initial survey and that consecutive quarterly monitoring surveys be conducted at least two months apart.

9.5.2 Repair Recommendations

We recommend that air agencies require that any identified source of fugitive emissions identified by using OGI (indicated by visual emissions) or Method 21 instrument (indicated by a concentration of 500 ppm above background) be repaired or replaced as soon as practicable, but no later than 30 calendar days after detection of the fugitive emissions. If the repair or replacement is technically infeasible, would require a vent blowdown, a compressor station shutdown, a well shutdown or well shut-in, or would be unsafe to repair during operation of the unit, the repair or replacement must be completed during the next compressor station shutdown, well shutdown, well shut-in, after an unscheduled, planned or emergency vent blowdown or within 2 years, whichever is earlier. We also recommend that repaired or replaced fugitive emission components be required to be resurveyed as soon as practicable, but no later than 30 days after completion of the repair or replacement, to ensure that there is no leak. For repairs that cannot be made during the monitoring survey when the fugitive emissions are initially found, we recommend that air agencies require that the operator resurvey the repaired fugitive emissions components using Method 21 (or alternative screening procedure based on soap bubble solution method (as specified under section 8.3.3 of Method 21)), or OGI no later than 30 days of being

NMED Exhibit 34

repaired. A fugitive emissions component is repaired when either the Method 21 instrument indicates a concentration of less than 500 ppm above background, or an OGI instrument shows no indication of visible emissions.

NMED Exhibit 34

Appendix

We include model rule language in this appendix for our recommended RACT for oil and natural gas industry sources. The intent of this language is to provide regulation language that states can use as a starting point in the development of their SIP. In some cases, the language may need to be revised to make it adequate for SIP approval purposes. Although we include model rule language for closed vent systems, control devices and performance tests (that apply across several model rule requirements for sources), it is acknowledged that states may have existing similar language in their programs that they may want to use in lieu of the model language provided. State implementation plans should specify enforceable test methods.

The model rule language does not specify rule compliance dates. These dates will be determined by air agencies (referred to within the model rule language as the "regulatory authority"). State and local government agencies are encouraged to search this model rule language for places where the "regulatory authority" will need to specify dates (e.g., compliance date) by searching for ("regulatory authority") in the model rule language.

NMED Exhibit 34

A Storage Vessels: VOC Emission Control Requirements

A.1 Applicability

(a) The VOC emissions control requirements of section A apply to each storage vessel located in the oil and natural gas industry (excluding distribution) that has the potential for VOC emissions equal to or greater than 6 tpy. The potential for VOC emissions must be calculated using a generally accepted model or calculation methodology, based on the maximum average daily throughput determined for a 30-day period of production prior to the applicable emission determination deadline established by your regulatory authority. The determination may take into account requirements under a legally and practically enforceable limit in an operating permit or other requirement established under a federal, state, local or tribal authority. Any vapor from the storage vessel that is recovered and routed to a process through a VRU designed and operated as specified in this section is not required to be included in the determination of VOC potential to emit for purposes of determining applicability, provided you comply with the requirements in section A.1(a)(i) through (a)(iv).

(i) You meet the cover requirements specified in section A.2(c).

(ii) You meet the closed vent system requirements specified in section A.2(d).

(iii) You must maintain records that document compliance with paragraphs A.2(c) and (d).

(iv) In the event of removal of apparatus that recovers and routes vapor to a process, or operation that is inconsistent with the conditions specified in paragraphs A.2(c) and (d) of this section, you must determine the storage vessel's potential for VOC emissions according to this section within 30 days of such removal or operation.

(b) A storage vessel with a capacity greater than 100,000 gallons used to recycle water that has been passed through two stage separation is not a storage vessel.

(c) The storage vessel VOC emission control requirements specified in this section do not apply to storage vessels subject to and controlled in accordance with the requirements for storage vessels in 40 CFR part 60, subpart Kb, 40 CFR part 63, subparts G, CC, HH, or WW.

NMED Exhibit 34

A.2 What VOC Emission Control Requirements Apply to Storage Vessels?

For each storage vessel, you must comply with the VOC emission control requirements of paragraphs (a) through (e) in this section by the compliance date established by your regulatory authority. Alternative requirements for storage vessels subject to VOC emission control requirements that meet certain conditions are presented in paragraph (i) of this section. Requirements for storage vessels removed from service are presented in paragraph (j) of this section.

(a) You must reduce VOC emissions from each storage vessel by 95.0 percent, unless you meet the conditions of paragraph (i) of this section.

(b) (1) Except as required in paragraph (b)(2) of this section, if you use a control device to reduce emissions, you must equip the storage vessel with a cover that meets the requirements of paragraph (c) of this section, that is connected through a closed vent system that meets the requirements of paragraph (d) of this section and route to a control device that meets the conditions specified in paragraph (e) of this section, as applicable. As an alternative to routing the closed vent system to a control device, you may route the closed vent system to a process.

(2) If you use a floating roof to reduce emissions, you must meet the requirements of 40 CFR 60.112b(a)(1) or (2) and the relevant monitoring, inspection, recordkeeping, and reporting requirements in 40 CFR part 60, subpart Kb.

(c) *Cover requirements for storage vessels.* (1) The cover and all openings on the cover (*e.g.,* access hatches, sampling ports, pressure relief valves and gauge wells) shall form a continuous impermeable barrier over the entire surface area of the liquid in the storage vessel.

(2) Each cover opening shall be secured in a closed, sealed position (*e.g.*, covered by a gasketed lid or cap) whenever material is in the unit on which the cover is installed except during those times when it is necessary to use an opening as follows:

(i) To add material to, or remove material from the unit (this includes openings necessary to equalize or balance the internal pressure of the unit following changes in the level of the material in the unit);

(ii) To inspect or sample the material in the unit;

(iii) To inspect, maintain, repair, or replace equipment located inside the unit; or

(iv) To vent liquids, gases, or fumes from the unit through a closed vent system, designed and operated in accordance with the requirements of paragraph (d) of this section to a control device or to a process.

(3) Each storage vessel thief hatch shall be equipped, maintained and operated with a weight, or other mechanism, to ensure that the lid remains properly seated and sealed under normal operating conditions, including such times when working, standing/breathing, and flash emissions may be generated. You must select gasket material for the hatch based on composition of the fluid in the storage vessel and weather conditions.

(d) *Closed vent system requirements for storage vessels*. For closed vent system requirements using a control device or routing emissions to a process, you must comply with the following:

(1) You must design the closed vent system to route all gases, vapors, and fumes emitted from the material in the storage vessel to a control device or to a process that meets the requirements specified in paragraph (e) of this section, or to a process.

(2) You must design and operate a closed vent system with no detectable emissions, as determined using olfactory, visual and auditory inspections.

(3) You must meet the requirements specified in paragraph (d)(3)(i) and (ii) of this section if the closed vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device or to a process.

(i) Except as provided in paragraph (d)(3)(ii) of this section, you must comply with either paragraph (d)(3)(i)(A) or (B) of this section for each bypass device.

(A) You must properly install, calibrate, maintain, and operate a flow indicator at the inlet to the bypass device that could divert the stream away from the control device or process to the atmosphere that sounds an alarm, or initiates notification via remote alarm to the nearest field office, when the bypass device is open such that the stream is being, or could be, diverted away for the control device or process to the atmosphere. You must maintain records of each time the alarm is activated according to section A.5(a)(9).

(B) You must secure the bypass device valve installed at the inlet to the bypass device in the non-diverting position using a car-seal or a lock-and-key type configuration.

(ii) Low leg drains, high point bleeds, analyzer vents, open-ended valves or lines, and safety devices are not subject to the requirements of paragraph (d)(3)(i) of this section.

(4) You must conduct an assessment that the closed vent system is of sufficient design and capacity to ensure that all emissions from the storage vessel are routed to the control device or to a process and that the control device is of sufficient design and capacity to accommodate all emissions from the storage vessel and have it certified by a qualified professional engineer in accordance with paragraphs (d)(4)(i) and (ii) of this section.

(i) You must provide the following certification, signed and dated by the qualified professional engineer: “I certify that the closed vent system design and capacity assessment was prepared under my direction or supervision. I further certify that the closed vent system design and capacity assessment was conducted and this report was prepared pursuant to the requirements of this rule. Based on my professional knowledge and experience, and inquiry of personnel involved in the assessment, the certification submitted herein is true, accurate, and complete. I am aware that there are penalties for knowingly submitting false information.”

(ii) The assessment shall be prepared under the direction or supervision of the qualified professional engineer who signs the certification in paragraph (d)(4)(i) of this section.

NMED Exhibit 34

(e) *Control device requirements for storage vessels*.

(1) Each control device used to meet the emission reduction standard in paragraph (a) of this section for your storage vessel must be installed according to paragraphs (e)(1)(i) through (iv) of this section, as applicable. As an alternative to paragraph (e)(1)(i) of this section, you may install a control device model tested under section F(d), which meets the criteria in section F(d)(11) and meets the continuous compliance requirements in section F(e).

(i) For each enclosed combustion device (*e.g.,* thermal vapor incinerator, catalytic vapor incinerator, boiler, or process heater) you must follow the requirements in paragraphs (e)(1)(i)(A) through (D) of this section.

(A) Ensure that each enclosed combustion device is maintained in a leak free condition.

(B) Install and operate a continuous burning pilot flame.

(C) Operate the enclosed combustion device with no visible emissions, except for periods not to exceed a total of one minute during any 15 minute period. A visible emissions test using section 11 of EPA Method 22, 40 CFR part 60, appendix A-7, must be performed at least once every calendar month, separated by at least 15 days between each test. The observation period shall be 15 minutes. Devices failing the visible emissions test must follow manufacturer's repair instructions, if available, or best combustion engineering practice as outlined in the unit inspection and maintenance plan, to return the unit to compliant operation. All inspection, repair and maintenance activities for each unit must be recorded in a maintenance and repair log and must be available for inspection. Following return to operation from maintenance or repair activity, each device must pass a Method 22, 40 CFR part 60, appendix A-7, visual observation as described in this paragraph.

(D) Each enclosed combustion control device (*e.g.*, thermal vapor incinerator, catalytic vapor incinerator, boiler, or process heater) must be designed and operated in accordance with one of the performance requirements specified in paragraphs (*1*) through (*4*) of this section.

(*1*) You must reduce the mass content of VOC in the gases vented to the device by 95.0 percent by weight or greater as determined in accordance with the requirements of section F(b).

(*2*) You must reduce the concentration of TOC in the exhaust gases at the outlet to the device to a level equal to or less than 275 parts per million by volume as propane on a wet basis corrected to 3 percent oxygen as determined in accordance with the applicable requirements of section F(b).

(*3*) You must operate at a minimum temperature of 760°Celsius, provided the control device has demonstrated, during the performance test conducted under section F(b), that combustion zone temperature is an indicator of destruction efficiency.

(*4*) If a boiler or process heater is used as the control device, then you must introduce the vent stream into the flame zone of the boiler or process heater.

(ii) Each vapor recovery device (*e.g.,* carbon adsorption system or condenser) or other non-destructive control device must be designed and operated to reduce the mass content of VOC in the gases vented to the device by 95.0 percent by weight or greater. A carbon replacement schedule must be included in the design of the carbon adsorption system.

(iii) You must design and operate a flare in accordance with the requirements of 40 CFR 60.18(b), and you must conduct the compliance determination using Method 22, 40 CFR part 60, appendix A-7, to determine visible emissions.

(iv) You must operate each control device used to comply with paragraph (a) of this section at all times when gases, vapors, and fumes are vented from the storage vessel through the closed vent system to the control device. You may vent more than one storage vessel to a control device used to comply with this subpart.

(2) For each carbon adsorption system used as a control device to meet the requirements of paragraph (a) of this section, you must manage the carbon in accordance with the requirements specified in paragraphs (e)(2)(i) and (ii) of this section.

(i) Following the initial startup of the control device, you must replace all carbon in the control device with fresh carbon on a regular, predetermined time interval that is no longer than the carbon service life established according to section F(c)(2) or (3) or according to the design required in paragraph (e)(1)(ii) of this section, for the carbon adsorption system. You must maintain records identifying the schedule for replacement and records of each carbon replacement as required in section A.5(a)(10).

(ii) You must either regenerate, reactivate, or burn the spent carbon removed from the carbon adsorption system in one of the units specified in paragraphs (e)(2)(ii)(A) through (F) of this section.

(A) Regenerate or reactivate the spent carbon in a thermal treatment unit for which you have been issued a final permit under 40 CFR part 270 that implements the requirements of 40 CFR part 264, subpart X.

(B) Regenerate or reactivate the spent carbon in a unit equipped with operating organic air emission controls in accordance with an emissions standard for VOC under a subpart in 40 CFR part 60 or part 63.

(C) Burn the spent carbon in a hazardous waste incinerator for which the owner or operator complies with the requirements of 40 CFR part 63, subpart EEE and has submitted a Notification of Compliance under 40 CFR 63.1207(j).

(D) Burn the spent carbon in a hazardous waste boiler or industrial furnace for which the owner or operator complies with the requirements of 40 CFR part 63, subpart EEE and has submitted a Notification of Compliance under 40 CFR 63.1207(j).

(E) Burn the spent carbon in an industrial furnace for which you have been issued a final permit under 40 CFR part 270 that implements the requirements of 40 CFR part 266, subpart H.

(F) Burn the spent carbon in an industrial furnace that you have designed and operated in accordance with the interim status requirements of 40 CFR part 266, subpart H.

(f) You must demonstrate initial compliance with the VOC emission reduction requirements that apply to each storage vessel as required in section A.3.

(g) You must demonstrate continuous compliance with the VOC emission control requirements that apply to each storage vessel as required by section A.4.

(h) You must perform the required recordkeeping and reporting as required by section A.5.

(i) *Alternative requirements for storage vessels*. Maintain the uncontrolled actual VOC emissions from the storage vessel subject to VOC emission control requirements at less than 4 tpy without considering control. Prior to using the uncontrolled actual VOC emission rate for compliance purposes, you must demonstrate that the uncontrolled actual VOC emissions have remained less than 4 tpy as determined monthly for 12 consecutive months. After such demonstration, you must determine the uncontrolled actual VOC emission rate each month. The uncontrolled actual VOC emissions must be calculated using a generally accepted model or calculation methodology. Monthly calculations must be based on the average throughput for the month. Monthly calculations must be separated by at least 14 days. You must comply with paragraph (i)(1) or (2) of this section.

(1) If a well feeding the storage vessel subject to VOC emission control requirements undergoes fracturing or refracturing, you must comply with paragraph (a) of this section as soon as liquids from the well following fracturing or refracturing are routed to the storage vessel.

(2) If the monthly emissions determination required in this paragraph indicates that VOC emissions from your storage vessel subject to VOC emission control requirements increases to 4 tpy or greater and the increase is not associated with fracturing or refracturing of a well feeding the storage vessel, you must comply with paragraph (a) of this section within 30 days of the monthly calculation.

(j) *Requirements for storage vessels that are removed from service or returned to service.* If you are the owner or operator of a storage vessel subject to the VOC emission control requirements that is removed from service, you must comply with paragraphs (j)(1) and (2) of

NMED Exhibit 34

this section. A storage vessel is not an affected source under this section for the period that it is removed from service.

(1) For a storage vessel to be removed from service, you must comply with the requirements of paragraph (j)(1)(i) and (ii) of this section.

(i) You must completely empty and degas the storage vessel, such that the storage vessel no longer contains crude oil, condensate, produced water or intermediate hydrocarbon liquids. A storage vessel where liquid is left on walls, as bottom clingage or in pools due to floor irregularity is considered to be completely empty.

(ii) You must submit a notification in your next annual report, identifying each storage vessel removed from service during the reporting period and the date of its removal from service.

(2) If a storage vessel subject to VOC emission control requirements identified in paragraph (j)(1) of this section is returned to service during the reporting year, you must submit a notification in your next annual report identifying each storage vessel that has been returned to service and the date of its return to service.

A.3 Initial Compliance Demonstration Requirements

You must demonstrate initial compliance with the VOC emission control requirements for each storage vessel complying with section A.2 by complying with the requirements in paragraphs (a) through (h) of this section.

(a) You determine the potential VOC emission rate as specified in section A.1(a).

(b) You reduce VOC emissions from each storage vessel subject to VOC emission control requirements by 95.0 percent or greater as required in section A.2 and as demonstrated by section F.

(c) If you use a control device to reduce emissions, you must equip your storage vessel with a cover that meets the requirements of section A.2(c) that is connected through a closed vent system that meets the requirements of section A.2(d) and is routed to a control device that

meets the requirements of A.2(e). As an alternative to routing the closed vent system to a control device, you may route the closed vent system to a process.

(d) You conduct an initial performance test as required in section F within 180 days after the compliance date established by your regulatory authority.

(e) You conduct the initial cover and closed vent system inspections according to the requirements in section A.4(d) within 180 days after the compliance date established by your regulatory authority.

(f) You submit the initial annual report for your storage vessels as required in section A.5(b).

(g) You maintain the records as specified in section A.5(a).

(h) If you comply by using a floating roof, you submit a statement that you are complying with 40 CFR 60.112b(a)(1) or (2) in accordance with section A.2(b)(2) with the initial annual report specified in section A.5(b).

A.4 Continuous Compliance Demonstration Requirements

You have demonstrated continuous compliance for each storage vessel subject to the VOC emission control requirements in section A.2 by meeting the requirements in paragraphs (a) through (f) of this section.

(a) For each storage vessel subject to VOC emission reduction requirements, you must demonstrate continuous compliance according to paragraphs (b) and (c) of this section.

(b) You must reduce VOC emissions from the storage vessel by 95.0 percent or greater.

(c) For each control device used to reduce emissions, you must demonstrate continuous compliance with the performance requirements of section A.2(e) according to paragraphs (c)(1) through (4) of this section. You are exempt from the requirements of this paragraph if you install a control device model tested in accordance with sections F(d)(2) through (10), which meets the

criteria in section F(d)(11), the reporting requirements in section F(d)(12), and the continuous compliance requirements in F(e).

(1) For each combustion device you must conduct inspections at least once every calendar month according to paragraphs (c)(1)(i) through (iv) of this section. Monthly inspections must be separated by at least 14 calendar days.

(i) Conduct visual inspections to confirm that the pilot is lit when vapors are being routed to the combustion device and that the continuous burning pilot flame is operating properly.

(ii) Conduct inspections to monitor for visible emissions from the combustion device using section 11 of EPA Method 22, 40 CFR part 60, appendix A-7. The observation period shall be 15 minutes. Devices must be operated with no visible emissions, except for periods not to exceed a total of 1 minute during any 15 minute period.

(iii) Conduct olfactory, visual and auditory inspections of all equipment associated with the combustion device to ensure system integrity.

(iv) For any absence of pilot flame, or other indication of smoking or improper equipment operation (*e.g.*, visual, audible, or olfactory), you must ensure the equipment is returned to proper operation as soon as practicable after the event occurs. At a minimum, you must perform the procedures specified in paragraphs (c)(1)(iv)(A) and (B) of this section.

(A) You must check the air vent for obstruction. If an obstruction is observed, you must clear the obstruction as soon as practicable.

(B) You must check for liquid reaching the combustor.

(2) For each vapor recovery device, you must conduct inspections at least once every calendar month to ensure physical integrity of the control device according to the manufacturer's instructions. Monthly inspections must be separated by at least 14 calendar days.

(3) Each control device must be operated following the manufacturer's written operating instructions, procedures and maintenance schedule to ensure good air pollution control practices

for minimizing emissions. Records of the manufacturer's written operating instructions, procedures, and maintenance schedule must be available for inspection as specified by A.5(a)(11).

(4) Conduct a periodic performance test no later than 60 months after the initial performance test as specified in section F(b)(5)(ii) and conduct subsequent periodic performance tests at intervals no longer than 60 months following the previous periodic performance test.

(d) If you install a control device or route emissions to a process, you must inspect each closed vent system according to the procedures and schedule specified in paragraphs (d)(1) of this section, inspect each cover according to the procedures and schedule specified in paragraph (d)(2) of this section, and inspect each bypass device according to the procedures of paragraph (d)(3) of this section. You must also comply with the requirements of (d)(4) through (7) of this section.

(1) For each closed vent system, you must conduct an inspection at least once every calendar month as specified in paragraphs (d)(1)(i) through (iii) of this section.

(i) You must maintain records of the inspection results as specified in section A.5(a)(7).

(ii) Conduct olfactory, visual and auditory inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in piping; loose connections; liquid leaks; or broken or missing caps or other closure devices.

(iii) Monthly inspections must be separated by at least 14 calendar days.

(2) For each cover, you must conduct inspections at least once every calendar month as specified in paragraphs (d)(2)(i) through (iii) of this section.

(i) You must maintain records of the inspection results as specified in section A.5(a)(8).

(ii) Conduct olfactory, visual and auditory inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the cover, or between the cover and the separator wall; broken, cracked, or otherwise damaged seals or

NMED Exhibit 34

gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices. In the case where the storage vessel is buried partially or entirely underground, you must inspect only those portions of the cover that extend to or above the ground surface, and those connections that are on such portions of the cover (*e.g.,* fill ports, access hatches, gauge wells, etc.) and can be opened to the atmosphere.

(iii) Monthly inspections must be separated by at least 14 calendar days.

(3) For each bypass device, except as provided for in section A.2(d)(3)(ii), you must meet the requirements of paragraphs (d)(3)(i) or (ii) of this section.

(i) You must properly install, calibrate and maintain a flow indicator at the inlet to the bypass device that could divert the stream away from the control device or process to the atmosphere. Set the flow indicator to trigger an audible alarm, or initiate notification via remote alarm to the nearest field office, when the bypass device is open such that the stream is being, or could be, diverted away from the control device or process to the atmosphere. You must maintain records of each time the alarm is sounded according to section A.5(a)(9).

(ii) If the bypass device valve installed at the inlet to the bypass device is secured in the non-diverting position using a car-seal or a lock-and-key type configuration, visually inspect the seal or closure mechanism at least once every month to verify that the valve is maintained in the non-diverting position and the vent stream is not diverted through the bypass device. You must maintain records of the inspections and records of each time the key is checked out, if applicable, according to section A.5(a)(9).

(4) *Repairs*. In the event that a leak or defect is detected, you must repair the leak or defect as soon as practicable according to the requirements of paragraphs (d)(4)(i) through (iii) of this section, except as provided in paragraph (d)(5) of this section.

(i) A first attempt at repair must be made no later than 5 calendar days after the leak is detected.

(ii) Repair must be completed no later than 30 calendar days after the leak is detected.

NMED Exhibit 34

(iii) Grease or another applicable substance must be applied to deteriorating or cracked gaskets to improve the seal while awaiting repair.

(5) *Delay of repair*. Delay of repair of a closed vent system or cover for which leaks or defects have been detected is allowed if the repair is technically infeasible without a shutdown, or if you determine that emissions resulting from immediate repair would be greater than the fugitive emissions likely to result from delay of repair. You must complete repair of such equipment by the end of the next shutdown.

(6) *Unsafe to inspect requirements*. You may designate any parts of the closed vent system or cover as unsafe to inspect if the requirements in paragraphs (d)(6)(i) and (ii) of this section are met. Unsafe to inspect parts are exempt from the inspection requirements of paragraphs (d)(1) and (2) of this section.

(i) You determine that the equipment is unsafe to inspect because inspecting personnel would be exposed to an imminent or potential danger as a consequence of complying with paragraphs (d)(1) or (2) of this section.

(ii) You have a written plan that requires inspection of the equipment as frequently as practicable during safe-to-inspect times.

(7) *Difficult to inspect requirements*. You may designate any parts of the closed vent system or cover as difficult to inspect, if the requirements in paragraphs (d)(7)(i) and (ii) of this section are met. Difficult to inspect parts are exempt from the inspection requirements of paragraphs (d)(1) and (2) of this section.

(i) You determine that the equipment cannot be inspected without elevating the inspecting personnel more than 2 meters above a support surface.

(ii) You have a written plan that requires inspection of the equipment at least once every 5 years.

(e) You must submit the annual reports for your storage vessels as required in section A.5(b).

NMED Exhibit 34

(f) You must maintain the records as specified in section A.5(a).

A.5 Recordkeeping and Reporting Requirements

(a) *Recordkeeping requirements.* For each storage vessel, you must maintain the records identified in paragraphs (a)(1) through (12) of this section, as applicable, either onsite or at the nearest local field office for at least five years.

(1) If required to reduce emissions by complying with section A.2(a), the records specified in paragraphs (a)(6) through (8) of this section and sections A.4(d)(6)(ii) and A.4(d)(7)(ii), as applicable.

(2) Records of each VOC emissions determination for each storage vessel made under A.1(a) including identification of the model or calculation methodology used to calculate the VOC emission rate.

(3) Records of deviations in cases where the storage vessel was not operated in compliance with the requirements specified in sections A.2 and F, as applicable.

(4) For storage vessels that are skid-mounted or permanently attached to something that is mobile (such as trucks, railcars, barges or ships), records indicating the number of consecutive days that the vessel is located at a site in the oil and natural gas production segment, natural gas processing segment or natural gas transmission and storage segment. If a storage vessel is removed from a site and, within 30 days, is either returned to or replaced by another storage vessel at the site to serve the same or similar function, then the entire period since the original storage vessel was first located at the site, including the days when the storage vessel was removed, must be added to the count towards the number of consecutive days.

(5) Records of the identification and location of each storage vessel subject to emission control requirements.

(6) Except as specified in paragraph (a)(6)(vii) of this section, you must maintain the records specified in paragraphs (a)(6)(i) through (vi) of this section for each control device tested under section F(d) which meets the criteria in section F(d)(11) and meets the continuous

compliance requirements in section F(d) (e) and used to comply with section A.2(a) for each storage vessel.

(i) Make, model and serial number of purchased device.

(ii) Date of purchase.

(iii) Copy of purchase order.

(iv) Location of the control device in latitude and longitude coordinates in decimal degrees to an accuracy and precision of five (5) decimals of a degree using the North American Datum of 1983.

(v) Inlet gas flow rate.

(vi) Records of continuous compliance requirements in section F(e) as specified in paragraphs (a)(6)(vi)(A) through (E).

(A) Records that the pilot flame is present at all times of operation.

(B) Records that the device was operated with no visible emissions except for periods not to exceed a total of 1 minute during any 15 minute period.

(C) Records of the maintenance and repair log.

(D) Records of the visible emissions test following return to operation from a maintenance or repair activity.

(E) Records of the manufacturer's written operating instructions, procedures and maintenance schedule to ensure good air pollution control practices for minimizing emissions.

(vii) As an alternative to the requirements of paragraph (a)(6)(iv) of this section, you may maintain records of one or more digital photographs with the date the photograph was taken and the latitude and longitude of the storage vessel and control device imbedded within or stored with the digital file. As an alternative to imbedded latitude and longitude within the digital

photograph, the digital photograph may consist of a photograph of the storage vessel and control device with a photograph of a separately operating GPS device within the same digital picture, provided the latitude and longitude output of the GPS unit can be clearly read in the digital photograph.

(7) Records of each closed vent system inspection required under section A.4(d)(1)(i).

(8) A record of each cover inspection required under section A.4(d)(2)(i).

(9) If you are subject to the bypass requirements of section A.4(d)(3), a record of each inspection or a record each time the key is checked out or a record of each time the alarm is sounded.

(10) For each carbon adsorber installed on a storage vessel, records of the schedule for carbon replacement (as determined by the design analysis requirements of section E.1(a)(2)) and records of each carbon replacement as specified in section E.1(c)(1).

(11) For each storage vessel subject to the control device requirements of section E.2(c) and (d), records of the inspections, including any corrective actions taken, the manufacturers' operating instructions, procedures and maintenance schedule as specified in section E.2(h). Records of section 11, EPA Method 22, 40 CFR part 60, appendix A-7 results, which include: company, location, company representative (name of the person performing the observation), sky conditions, process unit (type of control device), clock start time, observation period duration (in minutes and seconds), accumulated emission time (in minutes and seconds), and clock end time. You may create your own form including the above information or use Figure 22-1 in EPA Method 22, 40 CFR part 60, appendix A-7. Control device manufacturer operating instructions, procedures and maintenance schedule must be available for inspection.

(12) A log of records as specified in sections A.2(e)(1)(i)(C) and F(e)(4), for all inspection, repair and maintenance activities for each control device failing the visible emissions test.

NMED Exhibit 34

(b) *Reporting requirements*. For storage vessels, you must submit annual reports containing the information specified in paragraphs (b)(1) through (6) of this section.

(1) An identification, including the location, of each storage vessel subject to VOC emission control requirements. The location of the storage vessel shall be in latitude and longitude coordinates in decimal degrees to an accuracy and precision of five (5) decimals of a degree using the North American Datum of 1983.

(2) Documentation of the VOC emission rate determination according to section A.1(a).

(3) Records of deviations specified in paragraph (a)(3) of this section that occurred during the reporting period.

(4) A statement that you have met the requirements specified in section A.3(b) and (c).

(5) You must identify each storage vessel that is removed from service during the reporting period as specified in section A.2(j)(1), including the date the storage vessel was removed from service.

(6) You must identify each storage vessel returned to service during the reporting period as specified in section A.2(j)(3), including the date the storage vessel was returned to service.

A.6 Definitions

Certifying official means one of the following:

(1) For a corporation: A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or a duly authorized representative of such person if the representative is responsible for the overall operation of one or more manufacturing, production, or operating facilities applying for or subject to a permit and either:

(i) The facilities employ more than 250 persons or have gross annual sales or expenditures exceeding $25 million (in second quarter 1980 dollars); or

(ii) The Administrator is notified of such delegation of authority prior to the exercise of that authority. The Administrator reserves the right to evaluate such delegation;

(2) For a partnership (including, but not limited to, general partnerships, limited partnerships, and limited liability partnerships) or sole proprietorship: A general partner or the proprietor, respectively. If a general partner is a corporation, the provisions of paragraph (1) of this definition apply;

(3) For a municipality, State, Federal, or other public agency: Either a principal executive officer or ranking elected official. For the purposes of this part, a principal executive officer of a Federal agency includes the chief executive officer having responsibility for the overall operations of a principal geographic unit of the agency (*e.g.*, a Regional Administrator of EPA); or

(4) For affected facilities:

(i) The designated representative in so far as actions, standards, requirements, or prohibitions under title IV of the Clean Air Act or the regulations promulgated thereunder are concerned; or

(ii) The designated representative for any other purposes under part 60.

Condensate means hydrocarbon liquid separated from natural gas that condenses due to changes in the temperature, pressure, or both, and remains liquid at standard conditions.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart including, but not limited to, any emission limit, operating limit, or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

NMED Exhibit 34

(3) Fails to meet any emission limit, operating limit, or work practice standard in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is permitted by this subpart.

Completion combustion device means any ignition device, installed horizontally or vertically, used in exploration and production operations to combust otherwise vented emissions from completions. Completion combustion devices include pit flares.

Flare means a thermal oxidation system using an open (without enclosure) flame. Completion combustion devices as defined in this section are not considered flares.

Hydraulic fracturing means the process of directing pressurized fluids containing any combination of water, proppant, and any added chemicals to penetrate tight formations, such as shale or coal formations, that subsequently require high rate, extended flowback to expel fracture fluids and solids during completions.

Hydraulic refracturing means conducting a subsequent hydraulic fracturing operation at a well that has previously undergone a hydraulic fracturing operation.

Maximum average daily throughput means the earliest calculation of daily average throughput during the 30-day PTE evaluation period employing generally accepted methods.

Natural gas liquids means the hydrocarbons, such as ethane, propane, butane, and pentane that are extracted from field gas.

Natural gas processing plant (gas plant) means any processing site engaged in the extraction of natural gas liquids from field gas, fractionation of mixed natural gas liquids to natural gas products, or both. A Joule-Thompson valve, a dew point depression valve, or an isolated or standalone Joule-Thompson skid is not a natural gas processing plant.

Natural gas transmission means the pipelines used for the long distance transport of natural gas (excluding processing). Specific equipment used in natural gas transmission includes the land, mains, valves, meters, boosters, regulators, storage vessels, dehydrators, compressors, and their driving units and appurtenances, and equipment used for transporting gas from a

production plant, delivery point of purchased gas, gathering system, storage area, or other wholesale source of gas to one or more distribution area(s).

Pressure vessel means a storage vessel that is used to store liquids or gases and is designed not to vent to the atmosphere as a result of compression of the vapor headspace in the pressure vessel during filling of the pressure vessel to its design capacity.

Produced water means water that is extracted from the earth from an oil or natural gas production well, or that is separated from crude oil, condensate, or natural gas after extraction.

Qualified professional engineer means an individual who is licensed by a state as a Professional Engineer to practice one or more disciplines of engineering and who is qualified by education, technical knowledge and experience to make the specific technical certifications required under this subpart. Professional engineers making these certifications must be currently licensed in at least one state in which the certifying official is located.

Removed from service means that a storage vessel subject to the VOC control requirements has been physically isolated and disconnected from the process for a purpose other than maintenance.

Returned to service means that a storage vessel subject to the VOC requirements that was removed from service has been:

(1) Reconnected to the original source of liquids or has been used to replace any storage vessel subject to the VOC requirements; or

(2) Installed in any location covered by this rule and introduced with crude oil, condensate, intermediate hydrocarbon liquids or produced water.

Routed to a process or route to a process means the emissions are conveyed via a closed vent system to any enclosed portion of a process that is operational where the emissions are predominantly recycled and/or consumed in the same manner as a material that fulfills the same function in the process and/or transformed by chemical reaction into materials that are not regulated materials and/or incorporated into a product; and/or recovered for beneficial use.

NMED Exhibit 34

Storage vessel means a tank or other vessel that contains an accumulation of crude oil, condensate, intermediate hydrocarbon liquids, or produced water, and that is constructed primarily of nonearthen materials (such as wood, concrete, steel, fiberglass, or plastic) which provide structural support. A tank or other vessel shall not be considered a storage vessel if it has been removed from service in accordance with the requirements of section A.2(j)(1) until such time as such tank or other vessel has been returned to service. For the purposes of this rule, the following are not considered storage vessels:

(1) Vessels that are skid-mounted or permanently attached to something that is mobile (such as trucks, railcars, barges or ships), and are intended to be located at a site for less than 180 consecutive days. If you do not keep or are not able to produce records, as required by section A.5(a)(4), showing that the vessel has been located at a site for less than 180 consecutive days, the vessel described herein is considered to be a storage vessel from the date the original vessel was first located at the site.

(2) Process vessels such as surge control vessels, bottoms receivers or knockout vessels.

(3) Pressure vessels designed to operate in excess of 204.9 kilopascals (29.7 pounds per square inch) and without emissions to the atmosphere.

NMED Exhibit 34

B Pneumatic Controllers: VOC Emission Control Requirements

B.1 Applicability

The VOC emission control requirements specified in section B.2 apply to the pneumatic controllers specified in paragraphs (a) and (b) of this section.

(a) For natural gas processing plants, each pneumatic controller, which is a single continuous bleed natural gas-driven pneumatic controller.

(b) At locations from the wellhead to the natural gas processing plant or point of custody transfer to an oil pipeline, each pneumatic controller, which is a single continuous bleed natural gas-driven pneumatic controller operating at a natural gas bleed rate greater than 6 standard cubic feet per hour.

B.2 What VOC Emission Control Requirements Apply to Pneumatic Controllers?

For each pneumatic controller, you must comply with requirements for VOC, as specified in either paragraph (b)(1) or (c)(1) of this section, as applicable. Pneumatic controllers meeting the conditions in paragraph (a) of this section are exempt from these requirements.

(a) The requirements of paragraph (b)(1) or (c)(1) of this section are not required if you determine that the use of a pneumatic controller with a bleed rate greater than the applicable standard is required based on functional needs including, but not limited to, response time, safety and positive actuation. However, you must tag such pneumatic controller with the date that the pneumatic controller is required to comply with the model rule (as established by your regulatory authority) and identification information that allows traceability to the records for that pneumatic controller, as required in section B.5(a)(2).

(b)(1) Each pneumatic controller subject to VOC emissions control requirements at a natural gas processing plant must have a bleed rate of zero.

(2) Each pneumatic controller subject to VOC emissions control requirements at a natural gas processing plant, as defined in section B.1(a), must be tagged with the date that the pneumatic controller is required to comply with the model rule (as established by your regulatory authority) and identification information that allows traceability to the records for that pneumatic controller as required in section B.5(a)(3).

(c)(1) Each pneumatic controller subject to VOC emissions control requirements at a location between the wellhead and a natural gas processing plant or the point of custody transfer to an oil pipeline must have a bleed rate less than or equal to 6 standard cubic feet per hour.

(2) Each pneumatic controller subject to VOC emission control requirements at a location between the wellhead and a natural gas processing plant or the point of custody transfer to an oil pipeline, as defined in section B.1(b), must be tagged with the date that the pneumatic controller is required to comply with the model rule (as established by your regulatory authority) that allows traceability to the records for that controller as required in section B.5(a).

(d) You must demonstrate initial compliance by the compliance date established by your regulatory authority by demonstrating compliance with the VOC emission reduction requirements that apply to pneumatic controllers as required by section B.3.

(e) You must demonstrate continuous compliance with VOC emission reduction requirements that apply to pneumatic controllers as required by section B.4.

(f) You must perform the required recordkeeping as required by B.5(a) and reporting as required by section B.5(b).

B.3 Initial Compliance Demonstration Requirements

You must demonstrate initial compliance with the VOC emission control requirements for your pneumatic controller by complying with the requirements specified in paragraphs (a) through (f) of this section by the compliance date established by your regulatory authority, as applicable.

(a) You must demonstrate initial compliance by maintaining records as specified in section B.5(a)(2) of your determination that the use of a pneumatic controller with a bleed rate greater than the applicable standard is required as specified in section B.2(a).

(b) You own or operate a pneumatic controller located at a natural gas processing plant and your pneumatic controller is a non-natural gas-driven pneumatic controller that emits zero natural gas and VOC.

(c) You own or operate a pneumatic controller located between the wellhead and a natural gas processing plant and the manufacturer's design specifications indicate that the controller emits less than or equal to 6 standard cubic feet of gas per hour.

(d) You must tag each pneumatic controller according to the requirements of section B.2(b)(2) or (c)(2).

(e) You must include the information in paragraph (a) of this section and a listing of the pneumatic controller sources specified in paragraphs (b) and (c) of this section in the initial annual report according to the requirements of section B.5(b)

(f) You must maintain the records as specified in section B.5(a) for each pneumatic controller subject to VOC emission control requirements.

B.4 Continuous Compliance Demonstration Requirements

For each pneumatic controller, you must demonstrate continuous compliance according to paragraphs (a) through (c) of this section.

(a) You must continuously operate each pneumatic controller as required in section B.2(a), (b), or (c).

(b) You must submit the annual reports as required in section B.5(b).

(c) You must maintain records as required in section B.5(a).

B.5 Recordkeeping and Reporting Requirements

(a) *Recordkeeping requirements*. For each pneumatic controller, you must maintain the records identified in paragraphs (a)(1) through (4) of this section onsite or at the nearest local field office for at least five years.

(1) Records of the date, location and manufacturer specifications for each pneumatic controller.

(2) If applicable, a record of the demonstration that the use of a pneumatic controller with a natural gas bleed rate greater than the applicable standard is required and the reasons why.

(3) If the pneumatic controller is located at a natural gas processing plant, records of the documentation that the natural gas bleed rate is zero.

(4) Records of deviations in cases where the pneumatic controller was not operated in compliance with the requirements specified in section B.2.

(b) *Reporting requirements*. You must submit annual reports containing the information specified in paragraphs (b)(1) through (3) of this section.

(1) An identification of each existing pneumatic controller, including the identification information specified in section B.2(b)(2) or (c)(2).

(2) If applicable, documentation that the use of a pneumatic controller with a natural gas bleed rate greater than the applicable standard is required and the reasons why.

(3) Records of deviations specified in paragraph (a)(4) of this section that occurred during the reporting period.

B.6 Definitions

Bleed rate means the rate in standard cubic feet per hour at which natural gas is continuously vented (bleeds) from a pneumatic controller.

Continuous bleed means a continuous flow of pneumatic supply natural gas to a pneumatic controller.

Custody transfer means the transfer of natural gas after processing and/or treatment in the producing operations or from storage vessels or automatic transfer facilities or other such equipment, including product loading racks, to pipelines or any other forms of transportation.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart including, but not limited to, any emission limit, operating limit, or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Fails to meet any emission limit, operating limit, or work practice standard in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is permitted by this subpart.

Flow line means a pipeline used to transport oil and/or gas to a processing facility or a mainline pipeline.

Natural gas-driven pneumatic controller means a pneumatic controller powered by pressurized natural gas.

Natural gas processing plant (gas plant) means any processing site engaged in the extraction of natural gas liquids from field gas, fractionation of mixed natural gas liquids to natural gas products, or both. A Joule-Thompson valve, a dew depression valve, or an isolated or standalone Joule-Thompson skid is not a natural gas processing plant.

Pneumatic controller means an automated instrument used for maintaining a process condition such as liquid level, pressure, delta-pressure and temperature.

Non-natural gas-driven pneumatic controller means an instrument that is actuated using other sources of power than pressurized natural gas; examples include solar, electric, and instrument air.

Pressure vessel means a storage vessel that is used to store liquids or gases and is designed not to vent to the atmosphere as a result of compression of the vapor headspace in the pressure vessel during filling of the pressure vessel to its design capacity.

Underground storage vessel means a storage vessel stored below ground

Wellhead means the piping, casing, tubing and connected valves protruding above the earth's surface for an oil and/or natural gas well. The wellhead ends where the flow line connects to a wellhead valve. The wellhead does not include other equipment at the well site except for any conveyance through which gas is vented to the atmosphere.

NMED Exhibit 34

C Compressors: VOC Emissions Control Requirements

C.1 Applicability

(a) *Centrifugal compressors*. Each centrifugal compressor, which is a single centrifugal compressor using wet seals located between the wellhead and point of custody transfer to the natural gas transmission and storage segment. A centrifugal compressor located at a well site, or an adjacent well site and servicing more than one well site, is not a source subject to VOC requirements under this rule.

(b) *Reciprocating compressors*. Each reciprocating compressor located between the wellhead and point of custody transfer to the natural gas transmission and storage segment. A reciprocating compressor located at a well site, or an adjacent well site and servicing more than one well site, is not a source subject to VOC requirements under this rule.

C.2 What VOC Emission Control Requirements Apply to Centrifugal Compressors?

For each centrifugal compressor, you must comply with the VOC emissions control requirements in paragraphs (a) through (g).

(a) You must reduce VOC emissions from each centrifugal compressor wet seal fluid degassing system by 95.0 percent.

(b) If you use a control device to reduce emissions, you must equip the wet seal fluid degassing system with a cover that meets the requirements of section D.1(a)(1). The cover must be connected through a closed vent system that meets the requirements of section D.1(b) and the closed vent system must be routed to a control device that meets the conditions specified in paragraph (d) of this section. As an alternative to routing the closed vent system to a control device, you may route the closed vent system to a process.

(c) For each control device used to comply with the VOC emission reduction control requirements in paragraph (a), you must install and operate a continuous parameter monitoring

system for each control device as specified in section E.2(a) through (f), except as provided for in section E.2(b).

(d) You must operate each control device installed on your centrifugal compressor in accordance with the requirements specified in paragraphs (d)(1) and (2) of this section.

(1) You must operate each control device used to comply with this rule at all times when gases, vapors, and fumes are vented from the wet seal fluid degassing system through the closed vent system to the control device. You may vent more than one source to a single control device.

(2) For each control device monitored in accordance with the requirements of section E.2(a) through (f), you must demonstrate continuous compliance according to the requirements of section C.5(a)(2), as applicable.

(e) You must demonstrate initial compliance with the VOC emission reduction requirements that apply to each centrifugal compressor as required by section C.4(a).

(f) You must demonstrate continuous compliance with the VOC emission control requirements that apply to each centrifugal compressor as required by section C.5(a).

(g) You must perform the required recordkeeping and reporting as required by section C.6(a)(1) and (b)(1), as applicable.

C.3 What VOC Emission Control Requirements Apply to Reciprocating Compressors?

You must comply with the VOC emission control requirements in paragraphs (a) through (d) of this section for each reciprocating compressor.

(a) You must replace the reciprocating compressor rod packing according to either paragraph (a)(1) or (2) of this section or you must comply with paragraph (a)(3) of this section.

(1) On or before the compressor has operated for 26,000 hours. The number of hours of operation must be continuously monitored beginning on the compliance date for your

reciprocating compressor as established by your regulatory authority, or the date of the most recent reciprocating compressor rod packing replacement, whichever is later.

(2) Prior to 36 months from the date of the most recent rod packing replacement, or 36 months from the compliance date for a reciprocating compressor for which the rod packing has not yet been replaced.

(3) Route VOC emissions to a process by using a rod packing emissions collection system that operates under negative pressure and meets the cover requirements of section D.1(a)(2) and the closed vent system requirements of section D.1.(b).

(b) You must demonstrate initial compliance with requirements that apply to reciprocating compressor sources as required by section C.4(b).

(c) You must demonstrate continuous compliance with requirements that apply to reciprocating compressor sources as required by section C.5(b).

(d) You must perform the required recordkeeping and reporting as required by section C.6(a)(2) and (b)(2).

C.4 Initial Compliance Demonstration Requirements

You must demonstrate initial compliance with the VOC emission control requirements for each centrifugal compressor by complying with the requirements in paragraph (a) of this section, and for each reciprocating compressor by complying with the requirements in paragraph (b) of this section.

(a) *Centrifugal compressors*. You have achieved initial compliance with the VOC emission control requirements for each centrifugal compressor if you have complied with paragraphs (a)(1) through (7) of this section.

(1) You reduce VOC emissions from each centrifugal compressor wet seal fluid degassing system by 95.0 percent or greater as required in section C.2(a) and as demonstrated by section F.

(2) You use a control device to reduce emissions, and you equip the wet seal fluid degassing system with a cover that meet the requirements of section D.1(a) that is connected through a closed vent system that meets the requirements of section D.1(b) and is routed to a control device that meets the requirements of section E.1. As an alternative to routing the closed vent system to a control device, you may route the closed vent system to a process.

(3) You conduct an initial performance test as required in section F within 180 days after the compliance date established by your regulatory authority.

(4) You conduct the initial cover and closed vent system inspections required in section D.2 within 180 days after the compliance date established by your regulatory authority.

(5) You install and operate the continuous parameter monitoring systems in accordance with section E.2(a) through (g).

(6) You submit the initial annual report for your centrifugal compressor as required in section C.6(b)(1).

(7) You maintain the records as specified in section C.6(a)(1).

(b) *Reciprocating compressors.* You have achieved initial compliance with the VOC emission control requirements for each reciprocating compressor if you have complied with paragraphs (b)(1) through (4) of this section.

(1) If complying with section C.3(a)(1) and (2), you must continuously monitor the number of hours of operation or track the number of months since the last rod packing replacement, beginning on the compliance date established by your regulatory authority.

(2) If complying with section C.3(a)(3), you must route VOC emissions to a process by using a rod packing emissions collection system that operates under negative pressure and meets the cover requirements of section D.1(a)(2) and the closed vent system requirements of section D.1.(b) by the compliance date established by your regulatory authority.

(3) You must submit the initial annual report for your reciprocating compressor as required in section C.6(b)(2).

(4) You maintain the records as specified in section C.6(a)(2).

C.5 Continuous Compliance Demonstration Requirements

You have demonstrated continuous compliance for each centrifugal compressor by complying with the requirements of paragraph (a), and for each reciprocating compressor by complying with the requirements of paragraph (b).

(a) *Centrifugal compressors*. For each centrifugal compressor subject to VOC emission reduction requirements, you must demonstrate continuous compliance according to paragraphs (a)(1) through (4) of this section.

(1) You must reduce VOC emissions from the wet seal fluid degassing system by 95.0 percent or greater.

(2) For each control device used to reduce emissions, you must demonstrate continuous compliance with the performance requirements of section C.2(a) using the procedures specified in paragraphs (a)(2)(i) through (vii) of this section. If you use a condenser as the control device to achieve the requirements specified in section C.2(a), you may demonstrate compliance according to paragraph (a)(2)(viii) of this section. You may switch between compliance with paragraphs (a)(2)(i) through (vii) of this section and compliance with paragraph (a)(2)(viii) of this section only after at least 1 year of operation in compliance with the selected approach. You must provide notification of such a change in the compliance method in the next annual report, following the change.

(i) You must operate below (or above) the site specific maximum (or minimum) parameter value established according to the requirements of section E.2(f)(1).

(ii) You must calculate the daily average of the applicable monitored parameter in accordance with section E.2(e) except that the inlet gas flow rate to the control device must not be averaged.

(iii) Compliance with the operating parameter limit is achieved when the daily average of the monitoring parameter value calculated under paragraph (a)(2)(ii) of this section is either equal to or greater than the minimum monitoring value or equal to or less than the maximum monitoring value established under paragraph (a)(2)(i) of this section. When performance testing of a combustion control device is conducted by the device manufacturer as specified in section F(d), compliance with the operating parameter limit is achieved when the criteria in section F(e) are met.

(iv) You must operate the continuous monitoring system required in section E.2(a) at all times the source is operating, except for periods of monitoring system malfunctions, repairs associated with monitoring system malfunctions, and required monitoring system quality assurance or quality control activities (including, as applicable, system accuracy audits and required zero and span adjustments). A monitoring system malfunction is any sudden, infrequent, not reasonably preventable failure of the monitoring system to provide valid data. Monitoring system failures that are caused in part by poor maintenance or careless operation are not malfunctions. You are required to complete monitoring system repairs in response to monitoring system malfunctions and to return the monitoring system to operation as expeditiously as practicable.

(v) You may not use data recorded during monitoring system malfunctions, repairs associated with monitoring system malfunctions, or required monitoring system quality assurance or control activities in calculations used to report emissions or operating levels. You must use all the data collected during all other required data collection periods to assess the operation of the control device and associated control system.

(vi) Failure to collect required data is a deviation of the monitoring requirements, except for periods of monitoring system malfunctions, repairs associated with monitoring system malfunctions, and required quality monitoring system quality assurance or quality control activities (including, as applicable, system accuracy audits and required zero and span adjustments).

NMED Exhibit 34

(vii) If you use a combustion control device to meet the requirements of section C.2(a) and you demonstrate compliance using the test procedures specified in section F(b), or you use a flare designed and operated in accordance with 40 CFR 60.18(b), you must comply with paragraphs (a)(2)(vii)(A) through (D) of this section.

(A) A pilot flame must be present at all times of operation.

(B) Devices must be operated with no visible emissions, except for periods not to exceed a total of one minute during any 15-minute period. A visible emissions test using section 11 of Method 22, 40 CFR part 60, appendix A-7, must be performed at least once every calendar month, separated by at least 15 days between each test. The observation period shall be 15 minutes.

(C) Devices failing the visible emissions test must follow manufacturer's repair instructions, if available, or best combustion engineering practice as outlined in the unit inspection and maintenance plan, to return the unit to compliant operation. All inspection, repair and maintenance activities for each unit must be recorded in a maintenance and repair log and must be available for inspection.

(D) Following return to operation from maintenance or repair activity, each device must pass a Method 22, 40 CFR part 60, appendix A-7, visual observation as described in paragraph (a)(2)(vii)(B) of this section.

(viii) If you use a condenser as the control device to achieve the percent reduction performance requirements specified in section C.2(a)(1), you must demonstrate compliance using the procedures in paragraphs (a)(2)(viii)(A) through (E) of this section.

(A) You must establish a site-specific condenser performance curve according to section E.2(f)(2).

(B) You must calculate the daily average condenser outlet temperature in accordance with section E.2(e).

(C) You must determine the condenser efficiency for the current operating day using the daily average condenser outlet temperature calculated under paragraph (a)(2)(viii)(B) of this section and the condenser performance curve established under paragraph (a)(2)(viii)(A) of this section.

(D) You must calculate the 365-day rolling average TOC emission reduction, as appropriate, from the condenser efficiencies as determined in paragraph (a)(2)(viii)(C) of this section.

(1) If you have less than 120 days of data for determining average TOC emission reduction, you must calculate the average TOC emission reduction for the first 120 days of operation. You have demonstrated compliance with the overall 95.0 percent reduction requirement if the 120-day average TOC emission reduction is equal to or greater than 95.0 percent.

(2) After 120 days and no more than 364 days of operation, you must calculate the average TOC emission reduction as the TOC emission reduction averaged over the number of days of operation where you have data. You have demonstrated compliance with the overall 95.0 percent reduction requirement, if the average TOC emission reduction is equal to or greater than 95.0 percent.

(E) If you have data for 365 days or more of operation, you have demonstrated compliance with the TOC emission reduction if the rolling 365-day average TOC emission reduction calculated in paragraph (a)(2)(viii)(D) of this section is equal to or greater than 95.0 percent.

(3) You must submit the annual reports required by section C.6(b)(1) and maintain the records as specified in section C.6(a)(1).

(4) If you comply with this rule by equipping the wet seal fluid degassing system and route emissions to a control device or process as required by section C.2(b), you must comply with the cover and closed vent requirements in section D.1(a) and (b).

NMED Exhibit 34

(b) *Reciprocating compressors*. For each reciprocating compressor subject to VOC emission reduction requirements, you must demonstrate continuous compliance according to paragraphs (b)(1) through (4) of this section.

(1) You must continuously monitor the number of hours of operation for each reciprocating compressor or track the number of months or the date of the most recent reciprocating compressor rod packing replacement.

(2) You must submit the annual reports as required in section C.6(b)(2) and maintain records as required in section C.6(a)(2).

(3) You must replace the reciprocating compressor rod packing on or before the total number of hours of operation reaches 26,000 hours or the number of months since the most recent rod packing replacement reaches 36 months.

(4) If you comply with this rule by collecting and routing VOC emissions from the rod packing using a rod packing emissions collection system which operates under negative pressure as required by section C.3(a)(3), you must operate the rod packing emissions collection system under negative pressure and continuously comply with the closed vent system requirements in section D.1(b).

C.6 Recordkeeping and Reporting Requirements

(a) *Recordkeeping requirements*.

(1) *Centrifugal compressors*. For each centrifugal compressor, you must maintain records of the information specified in paragraphs (a)(1)(i) and (ii) of this section, and, if required to comply with section C.2(a), the records specified in paragraphs (a)(1)(iii) through (ix) of this section. These records must be maintained onsite or at the nearest local field office for at least five years.

(i) An identification of each existing centrifugal compressor using a wet seal system.

(ii) Records of deviations where the centrifugal compressor was not operated in compliance with requirements specified in section C.2. Except as specified in paragraph (a)(1)(ii)(G) of this section, you must maintain the records in paragraphs (a)(1)(ii)(A) through (F) of this section for each control device tested under section F(d) which meets the criteria in section F(d)(11) and meets continuous compliance requirements in section F(e) and used to comply with section C.2(a) for each centrifugal compressor.

(A) Make, model and serial number of purchased device.

(B) Date of purchase.

(C) Copy of purchase order.

(D) Location of the centrifugal compressor and control device in latitude and longitude coordinates in decimal degrees to an accuracy and precision of five (5) decimals of a degree using the North American Datum of 1983.

(E) Inlet gas flow rate.

(F) Records of continuous compliance requirements in section F(e) as specified in paragraphs (a)(1)(ii)(F)(*1*) through (*5*) of this section.

(*1*) Records that the pilot flame is present at all times of operation.

(*2*) Records that the device was operated with no visible emissions except for periods not to exceed a total of 1 minute during any 15 minute period.

(*3*) Records of the maintenance and repair log.

(*4*) Records of the visible emissions test following return to operation from a maintenance or repair activity.

(*5*) Records of the manufacturer's written operating instructions, procedures and maintenance schedule to ensure good air pollution control practices for minimizing emissions.

(G) As an alternative to the requirements of paragraph (a)(1)(ii)(D) of this section, you may maintain records of one or more digital photographs with the date the photograph was taken and the latitude and longitude of the centrifugal compressor and control device imbedded within or stored with the digital file. As an alternative to imbedded latitude and longitude within the digital photograph, the digital photograph may consist of a photograph of the centrifugal compressor and control device with a photograph of a separately operating GPS device within the same digital picture, provided the latitude and longitude output of the GPS unit can be clearly read in the digital photograph.

(iii) Records of each closed vent system inspection required under section D.2(a) and (b).

(iv) A record of each cover inspection required under section D.2(c).

(v) If you are subject to the bypass requirements of section D.2(d), a record of each inspection or a record each time the key is checked out or a record of each time the alarm is sounded.

(vi) If you are subject to the closed vent system no detectable emissions requirements of section D.2(a) and (b), a record of the monitoring in accordance with section D.2(e).

(vii) For each centrifugal compressor, records of the schedule for carbon replacement (as determined by the design analysis requirements of section F(c)(2) or (3)) and records of each carbon replacement as specified in section E.1(c)(1).

(viii) For each centrifugal compressor subject to the control device requirements of section E.1, records of minimum and maximum operating parameter values, continuous parameter monitoring system data, calculated averages of continuous parameter monitoring system data, results of all compliance calculations, and results of all inspections.

(ix) A log of records for all inspection, repair and maintenance activities for each control device failing the visible emissions test as specified in section C.5(a)(2)(vii)(C).

(2) *Reciprocating compressors*. For each reciprocating compressor VOC emissions source, you must maintain the records in paragraphs (a)(2)(i) through (iv) of this section. These records must be maintained onsite or at the nearest local field office for at least five years.

(i) Records of the cumulative number of hours of operation or number of months since the previous replacement of the reciprocating compressor rod packing. Alternatively, a statement that emissions from the rod packing are being routed to a process through a closed vent system under negative pressure.

(ii) Records of the date and time of each reciprocating compressor rod packing replacement, or date of installation of a rod packing emissions collection system and closed vent system as specified in section C.3(a)(3).

(iii) Records of deviations in cases where the reciprocating compressor was not operated in compliance with the requirements specified in section C.3.

(iv) If you comply by routing emissions from the rod packing to a process through a closed vent system under negative pressure. You must maintain the records in paragraphs (a)(2)(iv)(A) through (D) of this section.

(A) Records of each closed vent system inspection required under section D.2(a) and (b).

(B) If you are subject to the bypass requirements of section D.2(d), a record of each inspection or a record each time the key is checked out or a record of each time the alarm is sounded.

(C) If you are subject to the closed vent system no detectable emissions requirements of section D.2(a) and (b), a record of the monitoring in accordance with section D.2(e).

(D) A record of each cover inspection required under section D.2(c).

(b) *Reporting requirements*.

(1) *Centrifugal compressors*. For each centrifugal compressor, you must submit annual reports containing the information specified in paragraphs (b)(1)(i) through (iv) of this section.

(i) An identification of each existing centrifugal compressor using a wet seal system.

(ii) Records of deviations specified in paragraph (a)(1)(ii) of this section that occurred during the reporting period.

(iii) If required to comply with section C.2(a), the records specified in paragraphs (a)(1)(iii) through (viii) of this section.

(iv) If complying with C.2(a) with a control device tested under section F(d) which meets the criteria in section F(d)(11) and meets the continuous compliance requirements in section F(e), in the initial annual report, records specified in paragraphs (a)(1)(ii)(A) through (a)(1)(ii)(G) of this section for each centrifugal compressor using a wet seal system that is subject to this rule. In subsequent annual reports, records specified in paragraph (a)(1)(ii)(F) of this section along with information sufficient to link to the identifying information provided in the initial report.

(2) *Reciprocating compressors*. For each reciprocating compressor, you must submit annual reports containing the information specified in paragraphs (b)(2)(i) through (iii) of this section.

(i) The cumulative number of hours of operation or the number of months since the compliance date, or since the previous reciprocating compressor rod packing replacement, whichever is later. Alternatively, a statement that emissions from the rod packing are being routed to a process through a closed vent system under negative pressure.

(ii) Records of deviations specified in paragraph (a)(2)(iii) of this section that occurred during the reporting period.

(iii) If required to comply with section C.3(a)(3), the records specified in paragraphs (a)(2)(i) through (iv) of this section.

C.7 Definitions

Centrifugal compressor means any machine for raising the pressure of a natural gas by drawing in low-pressure natural gas and discharging significantly higher pressure natural gas by means of mechanical rotating vanes or impellers. Screw, sliding vane, and liquid ring compressors are not centrifugal compressors for the purposes of this rule.

Collection system means any infrastructure that conveys gas or liquids from the well site to another location for treatment, storage, processing, recycling, disposal or other handling.

Compressor station means any permanent combination of one or more compressors that move natural gas at increased pressure through gathering or transmission pipelines, or into or out of storage. This includes, but is not limited to, gathering and boosting stations and transmission compressor stations. The combination of one or more compressors located at a well site, or located at an onshore natural gas processing plant, is not a compressor station for purposes of this rule.

Custody transfer means the transfer of natural gas after processing and/or treatment in the producing operations or from storage vessels or automatic transfer facilities or other such equipment, including product loading racks, to pipelines or any other forms of transportation.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart including, but not limited to, any emission limit, operating limit, or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Fails to meet any emission limit, operating limit, or work practice standard in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is permitted by this subpart.

Flow line means a pipeline used to transport oil and/or gas to a processing facility or a mainline pipeline.

Reciprocating compressor means a piece of equipment that increases the pressure of a process gas by positive displacement, employing linear movement of the driveshaft.

Reciprocating compressor rod packing means a series of flexible rings in machined metal cups that fit around the reciprocating compressor piston rod to create a seal limiting the amount of compressed natural gas that escapes to the atmosphere, or other mechanism that provides the same function.

Routed to a process or route to a process means the emissions are conveyed via a closed vent system to any enclosed portion of a process where the emissions are predominantly recycled and/or consumed in the same manner as a material that fulfills the same function in the process and/or transformed by chemical reaction into materials that are not regulated materials and/or incorporated into a product; and/or recovered.

Surface site means any combination of one or more graded pad sites, gravel pad sites, foundations, platforms, or the immediate physical location upon which equipment is physically affixed.

Well means a hole drilled for the purpose of producing oil or natural gas, or a well into which fluids are injected.

Wellhead means the piping, casing, tubing and connected valves protruding above the earth's surface for an oil and/or natural gas well. The wellhead ends where the flow line connects to a wellhead valve. The wellhead does not include other equipment at the well site except for any conveyance through which gas is vented to the atmosphere

Well site means one or more surface sites that are constructed for the drilling and subsequent operation of any oil well, natural gas well, or injection well.

NMED Exhibit 34

D Cover and Closed Vent System Requirements

[Note: These requirements would not apply to covers and closed vent systems used on storage vessels.]

D.1 What Are My Cover and Closed Vent System Requirements?

You must meet the applicable requirements of this section for each cover and closed vent system where VOC emissions are routed to a control device or to a process.

(a) *Cover requirements*.

(1) Centrifugal compressor cover requirements.

(i) The cover and all openings on the cover shall form a continuous impermeable barrier over the entire surface area of the liquid in the wet seal fluid degassing system.

(ii) Each cover opening shall be secured in a closed, sealed position (*e.g.*, covered by a gasketed lid or cap) except during those times when it is necessary to use an opening as follows:

(A) To inspect, maintain, repair, or replace equipment; or

(B) To vent gases or fumes from the unit through a closed vent system designed and operated in accordance with the requirements of paragraph (b) of this section to a control device or to a process.

(2) Reciprocating compressor cover requirements.

(i) The cover and all openings on the cover shall form a continuous impermeable barrier over the rod packing emissions collection system.

(ii) Each cover opening shall be secured in a closed, sealed position (*e.g.*, covered by a gasketed lid or cap) except during those times when it is necessary to use an opening as follows:

(A) To inspect, maintain, repair, or replace equipment; or

(B) To vent gases or fumes from the unit through a closed vent system designed and operated in accordance with the requirements of paragraph (b) of this section to a process.

(b) *Closed vent system requirements*.

(1) (i) Centrifugal compressors. You must design the closed vent system to route all gases, vapors, and fumes emitted from the VOC emissions source to a control device or to a process. For centrifugal compressors, the closed vent system must route all gases, vapors, and fumes to a control device that meets the requirements specified in section E.1(a) through (c).

(ii) Reciprocating compressors. You must design the closed vent system to route all gases, vapors, and fumes emitted from the VOC emissions source to a process.

(2) You must design and operate the closed vent system with no detectable emissions as demonstrated by section D.2(e).

(3) You must meet the requirements specified in paragraph (b)(3)(i) and (ii) of this section if the closed vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device or process.

(i) Except as provided in paragraph (b)(3)(ii) of this section, you must comply with either paragraph (b)(3)(i)(A) or (B) of this section for each bypass device.

(A) You must properly install, calibrate, maintain, and operate a flow indicator at the inlet to the bypass device that could divert the stream away from the control device or process to the atmosphere that is capable of taking periodic readings as specified in section D.2(d)(1) and sounds an alarm, or initiates notification via remote alarm to the nearest field office, when the bypass device is open such that the stream is being, or could be, diverted away for the control device or process to the atmosphere. You must maintain records of each time the alarm is activated according to section C.6(a)(1)(v) for centrifugal compressors, C.6(a)(2)(iv)(B) for reciprocating compressors or H.5(a)(2)(ii) for pneumatic pumps, as applicable.

(B) You must secure the bypass device valve installed at the inlet to the bypass device in the non-diverting position using a car-seal or a lock-and-key type configuration.

(ii) Low leg drains, high point bleeds, analyzer vents, open-ended valves or lines, and safety devices are not subject to the requirements of paragraph (b)(3)(i) of this section.

(4) You must conduct an assessment that the closed vent system is of sufficient design and capacity to ensure that all emissions from the emission source are routed to the control device and that the control device is of sufficient design and capacity to accommodate all emissions from the emission source and have it certified by a qualified professional engineer in accordance with paragraphs (b)(4)(i) and (ii) of this section.

(i) You must provide the following certification, signed and dated by the qualified professional engineer: "I certify that the closed vent system design and capacity assessment was prepared under my direction or supervision. I further certify that the closed vent system design and capacity assessment was conducted and this report was prepared pursuant to the requirements of this rule. Based on my professional knowledge and experience, and inquiry of personnel involved in the assessment, the certification submitted herein is true, accurate, and complete. I am aware that there are penalties for knowingly submitting false information."

(ii) The assessment shall be prepared under the direction or supervision of the qualified professional engineer who signs the certification in paragraph (b)(4)(i) of this section.

D.2 What Are My Initial and Continuous Cover and Closed Vent System Inspection and Monitoring Requirements?

Except as provided in paragraphs (e)(11) and (12) of this section, you must inspect each closed vent system according to the procedures and schedule specified in paragraphs (a) and (b) of this section, inspect each cover according to the procedures and schedule specified in paragraph (c) of this section, and inspect each bypass device according to the procedures of paragraph (d) of this section.

(a) For each closed vent system joint, seam, or other connection that is permanently or semi-permanently sealed (*e.g.*, a welded joint between two sections of hard piping or a bolted and gasketed ducting flange), you must meet the requirements specified in paragraphs (a)(1) and (2) of this section.

(1) Conduct an initial inspection according to the test methods and procedures specified in paragraph (e) of this section to demonstrate that the closed vent system operates with no detectable emissions. You must maintain records of the inspection results according to section C.6(a)(1)(vi) for centrifugal compressors, C.6(a)(2)(iv)(C) for reciprocating compressors or H.5(a)(2)(iii) for pneumatic pumps, as applicable.

(2) Conduct annual visual inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in piping; loose connections; liquid leaks; or broken or missing caps or other closure devices. You must monitor a component or connection using the test methods and procedures in paragraph (e) of this section to demonstrate that it operates with no detectable emissions following any time the component is repaired or the connection is unsealed. You must maintain records of the inspection results according to section C.6(a)(1)(vi) for centrifugal compressors, C.6(a)(2)(iv)(C) for reciprocating compressors or H.5(a)(2)(iii) for pneumatic pumps, as applicable.

(b) For closed vent system components other than those specified in paragraph (a) of this section, you must meet the requirements of paragraphs (b)(1) through (3) of this section.

(1) Conduct an initial inspection according to the test methods and procedures specified in paragraph (e) of this section to demonstrate that the closed vent system operates with no detectable emissions by the date established by your regulatory authority. You must maintain records of the inspection results according to section C.6(a)(1)(vi) for centrifugal compressors, C.6(a)(2)(iv)(C) for reciprocating compressors or H.5(a)(2)(iii) for pneumatic pumps, as applicable.

(2) Conduct annual inspections according to the test methods and procedures specified in paragraph (e) of this section to demonstrate that the components or connections operate with no detectable emissions. You must maintain records of the inspection results according to section C.6(a)(1)(vi) for centrifugal compressors, C.6(a)(2)(iv)(C) for reciprocating compressors or H.5(a)(2)(iii) for pneumatic pumps, as applicable.

(3) Conduct annual visual inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in ductwork; loose

NMED Exhibit 34

connections; liquid leaks; or broken or missing caps or other closure devices. You must maintain records of the inspection results according to according to section C.6(a)(1)(vi) for centrifugal compressors, or H.5(a)(2)(i) for pneumatic pumps, as applicable.

(c) For each cover, you must meet the requirements in paragraphs (c)(1) and (2) of this section.

(1) Conduct visual inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the cover, or between the cover and the separator wall; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices.

(2) You must initially conduct the inspections specified in paragraph (c)(1) of this section following the installation of the cover. Thereafter, you must perform the inspection at least once every calendar year, except as provided in paragraphs (e)(11) and (12) of this section. For centrifugal compressors, you must maintain records of the inspection results according to section C.6(a)(1)(iv). For reciprocating compressors, you must maintain records of the inspection results according to C.6(a)(2)(iv)(D).

(d) For each bypass device, except as provided for in section D.1(b)(3)(ii), you must meet the requirements of paragraphs (d)(1) or (2) of this section.

(1) Set the flow indicator to take a reading at least once every 15 minutes at the inlet to the bypass device that could divert the stream away from the control device to the atmosphere.

(2) If the bypass device valve installed at the inlet to the bypass device is secured in the non-diverting position using a car-seal or a lock-and-key type configuration, visually inspect the seal or closure mechanism at least once every month to verify that the valve is maintained in the non-diverting position and the vent stream is not diverted through the bypass device. You must maintain records of the inspections according to section C.6(a)(1)(v) for centrifugal compressors, C.6(a)(2)(iv)(B) for reciprocating compressors or H.5(a)(2)(ii) for pneumatic pumps, as applicable.

(e) *No detectable emissions test methods and procedures.* If you are required to conduct an inspection of a closed vent system or cover as specified in paragraphs (a), (b), or (c) of this section, you must meet the requirements of paragraphs (e)(1) through (13) of this section.

(1) You must conduct the no detectable emissions test procedure in accordance with Method 21, 40 CFR part 60, appendix A-7.

(2) The detection instrument must meet the performance criteria of Method 21, 40 CFR part 60, appendix A-7, except that the instrument response factor criteria in section 8.1.1 of Method 21 must be for the average composition of the fluid and not for each individual organic compound in the stream.

(3) You must calibrate the detection instrument before use on each day of its use by the procedures specified in EPA Method 21, 40 CFR part 60, appendix A-7.

(4) Calibration gases must be as specified in paragraphs (e)(4)(i) and (ii) of this section.

(i) Zero air (less than 10 parts per million by volume hydrocarbon in air).

(ii) A mixture of methane in air at a concentration less than 10,000 parts per million by volume.

(5) You may choose to adjust or not adjust the detection instrument readings to account for the background organic concentration level. If you choose to adjust the instrument readings for the background level, you must determine the background level value according to the procedures in EPA Method 21, 40 CFR part 60, appendix A-7.

(6) Your detection instrument must meet the performance criteria specified in paragraphs (e)(6)(i) and (ii) of this section.

(i) Except as provided in paragraph (e)(6)(ii) of this section, the detection instrument must meet the performance criteria of EPA Method 21, 40 CFR part 60, appendix A-7, except the instrument response factor criteria in section 8.1.1 of EPA Method 21 must be for the average composition of the process fluid, not each individual volatile organic compound in the stream.

For process streams that contain nitrogen, air, or other inerts that are not volatile organic compounds, you must calculate the average stream response factor on an inert-free basis.

(ii) If no instrument is available that will meet the performance criteria specified in paragraph (e)(6)(i) of this section, you may adjust the instrument readings by multiplying by the average response factor of the process fluid, calculated on an inert-free basis, as described in paragraph (e)(6)(i) of this section.

(7) You must determine if a potential leak interface operates with no detectable emissions using the applicable procedure specified in paragraph (e)(7)(i) or (ii) of this section.

(i) If you choose not to adjust the detection instrument readings for the background organic concentration level, then you must directly compare the maximum organic concentration value measured by the detection instrument to the applicable value for the potential leak interface as specified in paragraph (e)(8) of this section.

(ii) If you choose to adjust the detection instrument readings for the background organic concentration level, you must compare the value of the arithmetic difference between the maximum organic concentration value measured by the instrument and the background organic concentration value as determined in paragraph (e)(5) of this section with the applicable value for the potential leak interface as specified in paragraph (e)(8) of this section.

(8) A potential leak interface is determined to operate with no detectable organic emissions if the organic concentration value determined in paragraph (e)(7) of this section is less than 500 parts per million by volume.

(9) *Repairs.* In the event that a leak or defect is detected, you must repair the leak or defect as soon as practicable according to the requirements of paragraphs (e)(9)(i) and (ii) of this section, except as provided in paragraph (e)(10) of this section.

(i) A first attempt at repair must be made no later than 5 calendar days after the leak is detected.

(ii) Repair must be completed no later than 15 calendar days after the leak is detected.

NMED Exhibit 34

(10) *Delay of repair.* Delay of repair of a closed vent system or cover for which leaks or defects have been detected is allowed if the repair is technically infeasible without a shutdown, or if you determine that emissions resulting from immediate repair would be greater than the fugitive emissions likely to result from delay of repair. You must complete repair of such equipment by the end of the next shutdown.

(11) *Unsafe to inspect requirements.* You may designate any parts of the closed vent system or cover as unsafe to inspect if the requirements in paragraphs (e)(11)(i) and (ii) of this section are met. Unsafe to inspect parts are exempt from the inspection requirements of paragraphs (a) through (c) of this section.

(i) You determine that the equipment is unsafe to inspect because inspecting personnel would be exposed to an imminent or potential danger as a consequence of complying with paragraphs (a), (b), or (c) of this section.

(ii) You have a written plan that requires inspection of the equipment as frequently as practicable during safe-to-inspect times.

(12) *Difficult to inspect requirements.* You may designate any parts of the closed vent system or cover as difficult to inspect, if the requirements in paragraphs (e)(12)(i) and (ii) of this section are met. Difficult to inspect parts are exempt from the inspection requirements of paragraphs (a) through (c) of this section.

(i) You determine that the equipment cannot be inspected without elevating the inspecting personnel more than 2 meters above a support surface.

(ii) You have a written plan that requires inspection of the equipment at least once every 5 years.

(13) *Records.* Records shall be maintained as specified in this section and in sections that reference this section.

NMED Exhibit 34

E VOC Emission Control Device Requirements

[These requirements do not apply to control devices used on storage vessels.]

E.1 Initial Control Device Compliance Requirements

You must meet the applicable requirements of this section for each control device used to comply with VOC emission reduction requirements.

(a) Each control device used to meet the VOC emission reduction requirements must be installed according to paragraphs (a)(1) through (3) of this section. As an alternative, you may install a control device model tested under section F(d), which meets the criteria in section F(d)(11) and the continuous compliance requirements in section F(e).

(1) Each combustion device (e.g., thermal vapor incinerator, catalytic vapor incinerator, boiler, or process heater) must be designed and operated in accordance with one of the performance requirements specified in paragraphs (a)(1)(i) through (iv) of this section.

(i) You must reduce the mass content of VOC in the gases vented to the device by 95.0 percent by weight or greater as determined in accordance with the requirements of section F(b), with the exceptions noted in section F(a).

(ii) You must reduce the concentration of TOC in the exhaust gases at the outlet to the device to a level equal to or less than 275 parts per million by volume as propane on a wet basis corrected to 3 percent oxygen as determined in accordance with the applicable requirements of section F(b), with the exceptions noted in section F(a).

(iii) You must operate at a minimum temperature of 760° Celsius for a control device, provided the control device has demonstrated, during the performance test conducted under section F(b), that combustion zone temperature is an indicator of destruction efficiency.

(iv) If a boiler or process heater is used as the control device, then you must introduce the vent stream into the flame zone of the boiler or process heater.

NMED Exhibit 34

(2) Each vapor recovery device (e.g., carbon adsorption system or condenser) or other non-destructive control device must be designed and operated to reduce the mass content of VOC in the gases vented to the device by 95.0 percent by weight or greater as determined in accordance with the requirements of section F(b). As an alternative to the performance testing requirements, you may demonstrate initial compliance by conducting a design analysis for vapor recovery devices according to the requirements of section F(c).

(3) You must design and operate a flare in accordance with the requirements of 40 CFR 60.18(b), and you must conduct the compliance determination using EPA Method 22 of 40 CFR part 60, appendix A-7, to determine visible emissions.

(b) You must operate each control device installed to control VOC emissions from your emissions source in accordance with the requirements specified in paragraphs (b)(1) and (2) of this section.

(1) You must operate each control device used to comply with this rule at all times when gases, vapors, and fumes are vented from your VOC emissions source through the closed vent system to the control device. You may vent more than one source to a control device used to comply with this rule.

(2) For each control device monitored in accordance with the requirements of section E.2(a) through (g), you must demonstrate continuous compliance according to the requirements of section C.5(a)(2) for centrifugal compressors, as applicable.

(c) For each carbon adsorption system used as a control device to meet the requirements of paragraph (a)(2) of this section, you must manage the carbon in accordance with the requirements specified in paragraphs (c)(1) and (2) of this section.

(1) Following the compliance date established by your regulatory authority for the source using the control device, you must replace all carbon in the control device with fresh carbon on a regular, predetermined time interval that is no longer than the carbon service life established according to section F(c)(2) or (3) or according to the design required in paragraph (a)(2) of this

NMED Exhibit 34

section, for the carbon adsorption system. You must maintain records identifying the schedule for replacement and records of each carbon replacement.

(2) You must either regenerate, reactivate, or burn the spent carbon removed from the carbon adsorption system in one of the units specified in paragraphs (c)(2)(i) through (vi) of this section.

(i) Regenerate or reactivate the spent carbon in a thermal treatment unit for which you have been issued a final permit under 40 CFR part 270 that implements the requirements of 40 CFR part 264, subpart X.

(ii) Regenerate or reactivate the spent carbon in a unit equipped with operating organic air emission controls in accordance with an emissions standard for VOC under a subpart in 40 CFR part 60 or part 63.

(iii) Burn the spent carbon in a hazardous waste incinerator for which the owner or operator complies with the requirements of 40 CFR part 63, subpart EEE and has submitted a Notification of Compliance under 40 CFR 63.1207(j).

(iv) Burn the spent carbon in a hazardous waste boiler or industrial furnace for which the owner or operator complies with the requirements of 40 CFR part 63, subpart EEE and has submitted a Notification of Compliance under 40 CFR 63.1207(j).

(v) Burn the spent carbon in an industrial furnace for which you have been issued a final permit under 40 CFR part 270 that implements the requirements of 40 CFR part 266, subpart H.

(vi) Burn the spent carbon in an industrial furnace that you have designed and operated in accordance with the interim status requirements of 40 CFR part 266, subpart H.

E.2 Continuous Control Device Monitoring Requirements

You must meet the applicable requirements of this section to demonstrate continuous compliance for each control device used to meet VOC emission control requirements.

(a) For each control device used to comply with the VOC emission reduction requirements, you must install and operate a continuous parameter monitoring system for each control device as specified in paragraphs (c) through (g) of this section, except as provided for in paragraph (b) of this section. If you install and operate a flare in accordance with section E.1(a)(3), you are exempt from the requirements of paragraphs (e) and (f) of this section.

(b) You are exempt from the monitoring requirements specified in paragraphs (c) through (g) of this section for the control devices listed in paragraphs (b)(1) and (2) of this section.

(1) A boiler or process heater in which all vent streams are introduced with the primary fuel, or used as the primary fuel.

(2) A boiler or process heater with a design heat input capacity equal to or greater than 44 megawatts.

(c) If you are required to install a continuous parameter monitoring system, you must meet the specifications and requirements in paragraphs (c)(1) through (4) of this section.

(1) Each continuous parameter monitoring system must measure data values at least once every hour and record the parameters in paragraphs (c)(1)(i) or (ii) of this section.

(i) Each measured data value.

(ii) Each block average value for each 1-hour period or shorter periods calculated from all measured data values during each period. If values are measured more frequently than once per minute, a single value for each minute may be used to calculate the hourly (or shorter period) block average instead of all measured values.

(2) You must prepare a site-specific monitoring plan that addresses the monitoring system design, data collection, and the quality assurance and quality control elements outlined in paragraphs (c)(2)(i) through (v) of this section. You must install, calibrate, operate, and maintain each continuous parameter monitoring system in accordance with the procedures in your approved site-specific monitoring plan. Heat sensing monitoring devices that indicate the

continuous ignition of a pilot flame are exempt from the calibration, quality assurance and quality control requirements in this section.

(i) The performance criteria and design specifications for the monitoring system equipment, including the sample interface, detector signal analyzer, and data acquisition and calculations.

(ii) Sampling interface (e.g., thermocouple) location such that the monitoring system will provide representative measurements.

(iii) Equipment performance checks, system accuracy audits, or other audit procedures.

(iv) Ongoing operation and maintenance procedures in accordance with provisions in 40 CFR 60.13(b).

(v) Ongoing reporting and recordkeeping procedures in accordance with provisions in 40 CFR 60.7(c), (d), and (f).

(3) You must conduct the continuous parameter monitoring system equipment performance checks, system accuracy audits, or other audit procedures specified in the site-specific monitoring plan at least once every 12 months.

(4) You must conduct a performance evaluation of each continuous parameter monitoring system in accordance with the site-specific monitoring plan. Heat sensing monitoring devices that indicate the continuous ignition of a pilot flame are exempt from the calibration, quality assurance and quality control requirements in this section.

(d) You must install, calibrate, operate, and maintain a device equipped with a continuous recorder to measure the values of operating parameters appropriate for the control device as specified in either paragraph (d)(1), (2), or (3) of this section.

(1) A continuous monitoring system that measures the operating parameters in paragraphs (d)(1)(i) through (viii) of this section, as applicable.

(i) For a thermal vapor incinerator that demonstrates during the performance test conducted under section F(b) that combustion zone temperature is an accurate indicator of performance, a temperature monitoring device equipped with a continuous recorder. The monitoring device must have a minimum accuracy of ±1 percent of the temperature being monitored in °Celsius, or ±2.5°Celsius, whichever value is greater. You must install the temperature sensor at a location representative of the combustion zone temperature.

(ii) For a catalytic vapor incinerator, a temperature monitoring device equipped with a continuous recorder. The device must be capable of monitoring temperature at two locations and have a minimum accuracy of ±1 percent of the temperature being monitored in °Celsius, or ±2.5°Celsius, whichever value is greater. You must install one temperature sensor in the vent stream at the nearest feasible point to the catalyst bed inlet, and you must install a second temperature sensor in the vent stream at the nearest feasible point to the catalyst bed outlet.

(iii) For a flare, a heat sensing monitoring device equipped with a continuous recorder that indicates the continuous ignition of the pilot flame. The heat sensing monitoring device is exempt from the calibration requirements of this section.

(iv) For a boiler or process heater, a temperature monitoring device equipped with a continuous recorder. The temperature monitoring device must have a minimum accuracy of ±1 percent of the temperature being monitored in °Celsius, or ±2.5°Celsius, whichever value is greater. You must install the temperature sensor at a location representative of the combustion zone temperature.

(v) For a condenser, a temperature monitoring device equipped with a continuous recorder. The temperature monitoring device must have a minimum accuracy of ±1 percent of the temperature being monitored in °Celsius, or ±2.5°Celsius, whichever value is greater. You must install the temperature sensor at a location in the exhaust vent stream from the condenser.

(vi) For a regenerative-type carbon adsorption system, a continuous monitoring system that meets the specifications in paragraphs (d)(1)(vi)(A) and (B) of this section.

(A) The continuous parameter monitoring system must measure and record the average total regeneration stream mass flow or volumetric flow during each carbon bed regeneration cycle. The flow sensor must have a measurement sensitivity of 5 percent of the flow rate or 10 cubic feet per minute, whichever is greater. You must check the mechanical connections for leakage at least every month, and you must perform a visual inspection at least every 3 months of all components of the flow continuous parameter monitoring system for physical and operational integrity and all electrical connections for oxidation and galvanic corrosion if your flow continuous parameter monitoring system is not equipped with a redundant flow sensor; and

(B) The continuous parameter monitoring system must measure and record the average carbon bed temperature for the duration of the carbon bed steaming cycle and measure the actual carbon bed temperature after regeneration and within 15 minutes of completing the cooling cycle. The temperature monitoring device must have a minimum accuracy of ±1 percent of the temperature being monitored in °Celsius, or ±2.5°Celsius, whichever value is greater.

(vii) For a non-regenerative-type carbon adsorption system, you must monitor the design carbon replacement interval established using a design analysis performed as specified in section F(c)(3). The design carbon replacement interval must be based on the total carbon working capacity of the control device and source operating schedule.

(viii) For a combustion control device whose model is tested under section F(d), a continuous monitoring system meeting the requirements of paragraphs (d)(1)(viii)(A) and (B) of this section. If you comply with the periodic testing requirements of F(b)(5)(ii), you are not required to continuously monitor the gas flow rate under paragraph (d)(1)(viii)(A).

(A) The continuous monitoring system must measure gas flow rate at the inlet to the control device. The monitoring instrument must have an accuracy of ±2 percent or better at the maximum expected flow rate. The flow rate at the inlet to the combustion device must not exceed the maximum or minimum flow rate determined by the manufacturer.

(B) A monitoring device that continuously indicates the presence of the pilot flame while emissions are routed to the control device.

(2) An organic monitoring device equipped with a continuous recorder that measures the concentration level of organic compounds in the exhaust vent stream from the control device. The monitor must meet the requirements of Performance Specification 8 or 9 of 40 CFR part 60, appendix B. You must install, calibrate, and maintain the monitor according to the manufacturer's specifications.

(e) You must calculate the daily average value for each monitored operating parameter for each operating day, using the data recorded by the monitoring system, except for inlet gas flow rate and data from the heat sensing devices that indicate the presence of a pilot flame. If the emissions unit operation is continuous, the operating day is a 24-hour period. If the emissions unit operation is not continuous, the operating day is the total number of hours of control device operation per 24-hour period. Valid data points must be available for 75 percent of the operating hours in an operating day to compute the daily average.

(f) For each operating parameter monitor installed in accordance with the requirements of paragraph (d) of this section, you must comply with paragraph (f)(1) of this section for all control devices. When condensers are installed, you must also comply with paragraph (f)(2) of this section.

(1) You must establish a minimum operating parameter value or a maximum operating parameter value, as appropriate for the control device, to define the conditions at which the control device must be operated to continuously achieve the applicable performance requirements of section E.1(a)(1) or (2). You must establish each minimum or maximum operating parameter value as specified in paragraphs (f)(1)(i) through (iii) of this section.

(i) If you conduct performance tests in accordance with the requirements of section F(b) to demonstrate that the control device achieves the applicable performance requirements specified in section E.1(a)(1) or (2), then you must establish the minimum operating parameter value or the maximum operating parameter value based on values measured during the performance test and supplemented, as necessary, by a condenser design analysis or control device manufacturer recommendations or a combination of both.

(ii) If you use a condenser design analysis in accordance with the requirements of section F(c) to demonstrate that the control device achieves the applicable performance requirements specified in section E.1(a)(2), then you must establish the minimum operating parameter value or the maximum operating parameter value based on the condenser design analysis and supplemented, as necessary, by the condenser manufacturer's recommendations.

(iii) If you operate a control device where the performance test requirement was met under section F(d) to demonstrate that the control device achieves the applicable performance requirements specified in section E.1(a)(1), then your control device inlet gas flow rate must not exceed the maximum or minimum inlet gas flow rate determined by the manufacturer.

(2) If you use a condenser as specified in paragraph (d)(1)(v) of this section, you must establish a condenser performance curve showing the relationship between condenser outlet temperature and condenser control efficiency, according to the requirements of paragraphs (f)(2)(i) and (ii) of this section.

(i) If you conduct a performance test in accordance with the requirements of section F(b) to demonstrate that the condenser achieves the applicable performance requirements in section E.1(a)(2), then the condenser performance curve must be based on values measured during the performance test and supplemented as necessary by control device design analysis, or control device manufacturer's recommendations, or a combination or both.

(ii) If you use a control device design analysis in accordance with the requirements of section F(c)(1) to demonstrate that the condenser achieves the applicable performance requirements specified in section E.1(a)(2), then the condenser performance curve must be based on the condenser design analysis and supplemented, as necessary, by the control device manufacturer's recommendations.

(g) A deviation for a given control device is determined to have occurred when the monitoring data or lack of monitoring data result in any one of the criteria specified in paragraphs (g)(1) through (6) of this section being met. If you monitor multiple operating parameters for the same control device during the same operating day and more than one of these operating parameters meets a deviation criterion specified in paragraphs (g)(1) through (6) of this

NMED Exhibit 34

section, then a single excursion is determined to have occurred for the control device for that operating day.

(1) A deviation occurs when the daily average value of a monitored operating parameter is less than the minimum operating parameter limit (or, if applicable, greater than the maximum operating parameter limit) established in paragraph (f)(1) of this section or when the heat sensing device indicates that there is no pilot flame present.

(2) If you meet section E.1(a)(2), a deviation occurs when the 365-day average condenser efficiency calculated according to the requirements specified in section C.5(a)(2)(viii)(D) is less than 95.0 percent.

(3) If you meet section E.1(a)(2) and you have less than 365 days of data, a deviation occurs when the average condenser efficiency calculated according to the procedures specified in section C.5(a)(2)(viii)(D)(*1*) or (*2*) is less than 95.0 percent.

(4) A deviation occurs when the monitoring data are not available for at least 75 percent of the operating hours in a day.

(5) If the closed vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device, a deviation occurs when the requirements of paragraphs (g)(5)(i) or (ii) of this section are met.

(i) For each bypass line subject to section D.1(b)(3)(i)(A), the flow indicator indicates that flow has been detected and that the stream has been diverted away from the control device to the atmosphere.

(ii) For each bypass line subject to section D.1(b)(3)(i)(B), if the seal or closure mechanism has been broken, the bypass line valve position has changed, the key for the lock-and-key type lock has been checked out, or the car-seal has broken.

(6) For a combustion control device whose model is tested under section F(d), a deviation occurs when the conditions of paragraphs (g)(6)(i) or (ii) are met.

NMED Exhibit 34

(i) The inlet gas flow rate exceeds the maximum established during the test conducted under section F(d).

(ii) Failure of the monthly visible emissions test conducted under section F(e)(3) occurs.

NMED Exhibit 34

F Performance Test Procedures

This section applies to the performance testing of control devices used to demonstrate compliance with your VOC emission control requirements. You must demonstrate that a control device achieves the performance requirements specified for your centrifugal compressor using the performance test methods and procedures specified in this section. For condensers and carbon adsorbers, you may use a design analysis as specified in paragraph (c) of this section in lieu of complying with paragraph (b) of this section. In addition, this section contains the requirements for enclosed combustion device performance tests conducted by the manufacturer, as relevant and allowed for compliance demonstration purposes.

(a) *Performance test exemptions.* You are exempt from the requirements to conduct performance tests and design analyses if you use any of the control devices described in paragraphs (a)(1) through (7) of this section.

(1) *A flare that is designed and operated in accordance with 40 CFR 60.18(b)*. You must conduct the compliance determination using EPA Method 22, 40 CFR part 60, appendix A-7, to determine visible emissions.

(2) A boiler or process heater with a design heat input capacity of 44 megawatts or greater.

(3) A boiler or process heater into which the vent stream is introduced with the primary fuel or is used as the primary fuel.

(4) A boiler or process heater burning hazardous waste for which you have either been issued a final permit under 40 CFR part 270 and comply with the requirements of 40 CFR part 266, subpart H; you have certified compliance with the interim status requirements of 40 CFR part 266, subpart H; you have submitted a Notification of Compliance under 40 CFR 63.1207(j) and comply with the requirements of 40 CFR part 63, subpart EEE; or you comply with 40 CFR part 63, subpart EEE and will submit a Notification of Compliance under 40 CFR 63.1207(j) by the date specified in the rule for submitting the initial performance test report.

(5) A hazardous waste incinerator for which you have submitted a Notification of Compliance under 40 CFR 63.1207(j), or for which you will submit a Notification of Compliance under 40 CFR 63.1207(j) by the date specified in the rule for submitting the initial performance test report, and you comply with the requirements of 40 CFR part 63, subpart EEE.

(6) A performance test is waived in accordance with 40 CFR 60.8(b).

(7) A control device whose model can be demonstrated to meet the performance requirements of section E.1(a) through a performance test conducted by the manufacturer, as specified in paragraph (d) of this section.

(b) *Test methods and procedures.* You must use the test methods and procedures specified in paragraphs (b)(1) through (5) of this section, as applicable, for each performance test conducted to demonstrate that a control device meets the requirements of section E.1(a) or A.2(e)(1). You must conduct the initial and periodic performance tests according to the schedule specified in paragraph (b)(5) of this section. Each performance test must consist of a minimum of 3 test runs. Each run must be at least 1 hour long.

(1) You must use EPA Method 1 or 1A, 40 CFR part 60, appendix A-1, as appropriate, to select the sampling sites specified in paragraphs (b)(1)(i) and (ii) of this section. Any references to particulate mentioned in EPA Methods 1 and 1A do not apply to this section.

(i) Sampling sites must be located at the inlet of the first control device and at the outlet of the final control device, to determine compliance with the control device percent reduction requirement.

(ii) The sampling site must be located at the outlet of the combustion device to determine compliance with the enclosed combustion device TOC exhaust gas concentration limit.

(2) You must determine the gas volumetric flowrate using EPA Method 2, 2A, 2C, or 2D, 40 CFR part 60, appendix A-2, as appropriate.

(3) To determine compliance with the control device percent reduction performance requirement in section E.1(a)(1)(i) or (a)(2), or section A.2(e)(1)(i)(D)(*1*) or (e)(1)(ii), you must

use EPA Method 25A at 40 CFR part 60, appendix A-7. You must use EPA Method 4 at 40 CFR part 60, appendix A-3 to convert the EPA Method 25A results to a dry basis. You must use the procedures in paragraphs (b)(3)(i) through (iii) of this section to calculate percent reduction efficiency.

(i) You must compute the mass rate of TOC using the following equations:

$$E_i = K_2 C_i M_p Q_i$$

$$E_o = K_2 C_o M_p Q_o$$

Where:

E_i, E_o = Mass rate of TOC at the inlet and outlet of the control device, respectively, dry basis, kilograms per hour.

K_2 = Constant, 2.494×10^{-6} (parts per million) (gram-mole per standard cubic meter) (kilogram/gram) (minute/hour), where standard temperature (gram-mole per standard cubic meter) is 20°Celsius.

C_i, C_o = Concentration of TOC, as propane, of the gas stream as measured by EPA Method 25A at the inlet and outlet of the control device, respectively, dry basis, parts per million by volume.

M_p = Molecular weight of propane, 44.1 gram/gram-mole.

Q_i, Q_o = Flowrate of gas stream at the inlet and outlet of the control device, respectively, dry standard cubic meter per minute.

(ii) You must calculate the percent reduction in TOC as follows:

$$R_{cd} = \frac{E_i - E_o}{E_i} * 100\%$$

Where:

NMED Exhibit 34

R_{cd} = Control efficiency of control device, percent.

$E_{i,}$ = Mass rate of TOC at the inlet to the control device as calculated under paragraph (b)(3)(i) of this section, kilograms per hour.

E_o = Mass rate of TOC at the outlet of the control device, as calculated under paragraph (b)(3)(i) of this section, kilograms per hour.

(iii) If the vent stream entering a boiler or process heater with a design capacity less than 44 megawatts is introduced with the combustion air or as a secondary fuel, you must determine the weight-percent reduction of total TOC across the device by comparing the TOC in all combusted vent streams and primary and secondary fuels with the TOC exiting the device, respectively.

(4) You must use EPA Method 25A, 40 CFR part 60, appendix A-7 to measure TOC, as propane, to determine compliance with the TOC exhaust gas concentration limit specified in section E.1(a)(1)(ii) or section A.2(e)(1)(i)(D)(*2*). You may also use EPA Method 18, 40 CFR part 60, appendix A-6 to measure methane and ethane. You may subtract the measured concentration of methane and ethane from the EPA Method 25A measurement to demonstrate compliance with the concentration limit. You must determine the concentration in parts per million by volume on a wet basis and correct it to 3 percent oxygen, using the procedures in paragraphs (b)(4)(i) through (iii) of this section.

(i) If you use EPA Method 18 to determine methane and ethane, you must take either an integrated sample or a minimum of four grab samples per hour. If grab sampling is used, then the samples must be taken at approximately equal intervals in time, such as 15-minute intervals during the run. You must determine the average methane and ethane concentration per run. The samples must be taken during the same time as the EPA Method 25A sample.

(ii) You may subtract the concentration of methane and ethane from the EPA Method 25A TOC, as propane, concentration for each run.

NMED Exhibit 34

(iii) You must correct the TOC concentration (minus methane and ethane, if applicable) to 3 percent oxygen as specified in paragraphs (b)(4)(iii)(A) and (B) of this section.

(A) You must use the emission rate correction factor for excess air, integrated sampling and analysis procedures of EPA Method 3A or 3B, 40 CFR 60, appendix A-2, ASTM D6522-00 (Reapproved 2005), or ANSI/ASME PTC 19.10-1981, Part 10 (manual portion only) (incorporated by reference as specified in §60.17) to determine the oxygen concentration. The samples must be taken during the same time that the samples are taken for determining TOC concentration.

(B) You must correct the TOC concentration for percent oxygen as follows:

$$C_c = C_m \left(\frac{17.9}{20.9 - \%O_{2m}} \right)$$

Where:

C_c = TOC concentration, as propane, corrected to 3 percent oxygen, parts per million by volume on a wet basis.

C_m = TOC concentration, as propane, (minus methane and ethane, if applicable), parts per million by volume on a wet basis.

$\%O_{2m}$ = Concentration of oxygen, percent by volume as measured, wet.

(5) You must conduct performance tests according to the schedule specified in paragraphs (b)(5)(i) and (ii) of this section.

(i) You must conduct an initial performance test within 180 days after the compliance date for your source as established by your regulatory authority.

(ii) You must conduct periodic performance tests for all control devices required to conduct initial performance tests except as specified in paragraphs (b)(5)(ii)(A) and (B) of this section. You must conduct the first periodic performance test no later than 60 months after the initial performance test required in paragraph (b)(5)(i) of this section. You must conduct

subsequent periodic performance tests at intervals no longer than 60 months following the previous periodic performance test or whenever you desire to establish a new operating limit.

(A) A control device whose model is tested under, and meets the criteria of paragraph (d) of this section. For centrifugal compressors, if you do not continuously monitor the gas flow rate in accordance with section E.2(d)(1)(viii), then you must comply with the periodic performance testing requirements of paragraph (b)(5)(ii).

(B) A combustion control device tested under paragraph (b) of this section that meets the outlet TOC performance level specified in section E.1(a)(1)(ii) and that establishes a correlation between firebox or combustion chamber temperature and the TOC performance level. For centrifugal compressors, you must establish a limit on temperature in accordance with section E.2(f) and continuously monitor the temperature as required by section E.2(d).

(c) *Control device design analysis to meet the requirements of section E.1(a).* (1) For a condenser, the design analysis must include an analysis of the vent stream composition, constituent concentrations, flowrate, relative humidity, and temperature, and must establish the design outlet organic compound concentration level, design average temperature of the condenser exhaust vent stream and the design average temperatures of the coolant fluid at the condenser inlet and outlet.

(2) For a regenerable carbon adsorption system, the design analysis shall include the vent stream composition, constituent concentrations, flowrate, relative humidity, and temperature, and shall establish the design exhaust vent stream organic compound concentration level, adsorption cycle time, number and capacity of carbon beds, type and working capacity of activated carbon used for the carbon beds, design total regeneration stream flow over the period of each complete carbon bed regeneration cycle, design carbon bed temperature after regeneration, design carbon bed regeneration time, and design service life of the carbon.

(3) For a nonregenerable carbon adsorption system, such as a carbon canister, the design analysis shall include the vent stream composition, constituent concentrations, flowrate, relative humidity, and temperature, and shall establish the design exhaust vent stream organic compound concentration level, capacity of the carbon bed, type and working capacity of activated carbon

used for the carbon bed, and design carbon replacement interval based on the total carbon working capacity of the control device and source operating schedule. In addition, these systems will incorporate dual carbon canisters in case of emission breakthrough occurring in one canister.

(4) If you and the regulatory authority do not agree on a demonstration of control device performance using a design analysis, then you must perform a performance test in accordance with the requirements of paragraph (b) of this section to resolve the disagreement. The regulatory authority may choose to have an authorized representative observe the performance test.

(d) *Performance testing for combustion control devices—manufacturers' performance test.* (1) This paragraph applies to the performance testing of a combustion control device conducted by the device manufacturer. The manufacturer must demonstrate that a specific model of control device achieves the performance requirements in paragraph (d)(11) of this section by conducting a performance test as specified in paragraphs (d)(2) through (10) of this section. You must submit a test report for each combustion control device in accordance with the requirements in paragraph (d)(12) of this section.

(2) Performance testing must consist of three one-hour (or longer) test runs for each of the four firing rate settings specified in paragraphs (d)(2)(i) through (iv) of this section, making a total of 12 test runs per test. Propene (propylene) gas must be used for the testing fuel. All fuel analyses must be performed by an independent third-party laboratory (not affiliated with the control device manufacturer or fuel supplier).

(i) 90-100 percent of maximum design rate (fixed rate).

(ii) 70-100-70 percent (ramp up, ramp down). Begin the test at 70 percent of the maximum design rate. During the first 5 minutes, incrementally ramp the firing rate to 100 percent of the maximum design rate. Hold at 100 percent for 5 minutes. In the 10-15 minute time range, incrementally ramp back down to 70 percent of the maximum design rate. Repeat three more times for a total of 60 minutes of sampling.

(iii) 30-70-30 percent (ramp up, ramp down). Begin the test at 30 percent of the maximum design rate. During the first 5 minutes, incrementally ramp the firing rate to 70 percent

of the maximum design rate. Hold at 70 percent for 5 minutes. In the 10-15 minute time range, incrementally ramp back down to 30 percent of the maximum design rate. Repeat three more times for a total of 60 minutes of sampling.

(iv) 0-30-0 percent (ramp up, ramp down). Begin the test at the minimum firing rate. During the first 5 minutes, incrementally ramp the firing rate to 30 percent of the maximum design rate. Hold at 30 percent for 5 minutes. In the 10-15 minute time range, incrementally ramp back down to the minimum firing rate. Repeat three more times for a total of 60 minutes of sampling.

(3) All models employing multiple enclosures must be tested simultaneously and with all burners operational. Results must be reported for each enclosure individually and for the average of the emissions from all interconnected combustion enclosures/chambers. Control device operating data must be collected continuously throughout the performance test using an electronic Data Acquisition System. A graphic presentation or strip chart of the control device operating data and emissions test data must be included in the test report in accordance with paragraph (d)(12) of this section. Inlet fuel meter data may be manually recorded provided that all inlet fuel data readings are included in the final report.

(4) Inlet testing must be conducted as specified in paragraphs (d)(4)(i) and (ii) of this section.

(i) The inlet gas flow metering system must be located in accordance with EPA Method 2A, 40 CFR part 60, appendix A-1 (or other approved procedure) to measure inlet gas flow rate at the control device inlet location. You must position the fitting for filling fuel sample containers a minimum of eight pipe diameters upstream of any inlet gas flow monitoring meter.

(ii) Inlet flow rate must be determined using EPA Method 2A, 40 CFR part 60, appendix A-1. Record the start and stop reading for each 60-minute THC test. Record the gas pressure and temperature at 5-minute intervals throughout each 60-minute test.

(5) Inlet gas sampling must be conducted as specified in paragraphs (d)(5)(i) and (ii) of this section.

NMED Exhibit 34

(i) At the inlet gas sampling location, securely connect a Silonite-coated stainless steel evacuated canister fitted with a flow controller sufficient to fill the canister over a 3-hour period. Filling must be conducted as specified in paragraphs (d)(5)(i)(A) through (C) of this section.

(A) Open the canister sampling valve at the beginning of each test run, and close the canister at the end of each test run.

(B) Fill one canister across the three test runs such that one composite fuel sample exists for each test condition.

(C) Label the canisters individually and record sample information on a chain of custody form.

(ii) Analyze each inlet gas sample using the methods in paragraphs (d)(5)(ii)(A) through (C) of this section. You must include the results in the test report required by paragraph (d)(12) of this section.

(A) Hydrocarbon compounds containing between one and five atoms of carbon plus benzene using ASTM D1945-03.

(B) Hydrogen (H_2), carbon monoxide (CO), carbon dioxide (CO_2), nitrogen (N_2), oxygen (O_2) using ASTM D1945-03.

(C) Higher heating value using ASTM D3588-98 or ASTM D4891-89.

(6) Outlet testing must be conducted in accordance with the criteria in paragraphs (d)(6)(i) through (v) of this section.

(i) Sample and flow rate must be measured in accordance with paragraphs (d)(6)(i)(A) and (B) of this section.

(A) The outlet sampling location must be a minimum of four equivalent stack diameters downstream from the highest peak flame or any other flow disturbance, and a minimum of one

NMED Exhibit 34

equivalent stack diameter upstream of the exit or any other flow disturbance. A minimum of two sample ports must be used.

(B) Flow rate must be measured using EPA Method 1, 40 CFR part 60, appendix A-1 for determining flow measurement traverse point location, and EPA Method 2, 40 CFR part 60, appendix A-1 for measuring duct velocity. If low flow conditions are encountered (*i.e.,* velocity pressure differentials less than 0.05 inches of water) during the performance test, a more sensitive manometer must be used to obtain an accurate flow profile.

(ii) Molecular weight and excess air must be determined as specified in paragraph (d)(7) of this section.

(iii) Carbon monoxide must be determined as specified in paragraph (d)(8) of this section.

(iv) THC must be determined as specified in paragraph (d)(9) of this section.

(v) Visible emissions must be determined as specified in paragraph (d)(10) of this section.

(7) Molecular weight and excess air determination must be performed as specified in paragraphs (d)(7)(i) through (iii) of this section.

(i) An integrated bag sample must be collected during the moisture test required by EPA Method 4, 40 CFR part 60, appendix A-3 following the procedure specified in paragraphs (d)(7)(i)(A) and (B) of this section. Analyze the bag sample using a gas chromatograph-thermal conductivity detector (GC-TCD) analysis meeting the criteria in paragraphs (d)(7)(i)(C) and (D) of this section.

(A) Collect the integrated sample throughout the entire test, and collect representative volumes from each traverse location.

(B) Purge the sampling line with stack gas before opening the valve and beginning to fill the bag. Clearly label each bag and record sample information on a chain of custody form.

NMED Exhibit 34

(C) The bag contents must be vigorously mixed prior to the gas chromatograph analysis.

(D) The GC-TCD calibration procedure in EPA Method 3C, 40 CFR part 60, appendix A-2, must be modified by using EPA Alt-045 as follows: For the initial calibration, triplicate injections of any single concentration must agree within 5 percent of their mean to be valid. The calibration response factor for a single concentration re-check must be within 10 percent of the original calibration response factor for that concentration. If this criterion is not met, repeat the initial calibration using at least three concentration levels.

(ii) Calculate and report the molecular weight of oxygen, carbon dioxide, methane, and nitrogen in the integrated bag sample and include in the test report specified in paragraph (d)(12) of this section. Moisture must be determined using EPA Method 4, 40 CFR part 60, appendix A-3. Traverse both ports with the EPA Method 4, 40 CFR part 60, appendix A-3, sampling train during each test run. Ambient air must not be introduced into the integrated bag sample required by EPA Method 3C, 40 CFR part 60, appendix A-2, sample during the port change.

(iii) Excess air must be determined using resultant data from the EPA Method 3C tests and EPA Method 3B, 40 CFR part 60, appendix A-2, equation 3B-1, or ANSI/ASME PTC 19.10-1981, Part 10 (manual portion only).

(8) Carbon monoxide must be determined using EPA Method 10, 40 CFR part 60, appendix A-4. Run the test simultaneously with EPA Method 25A, 40 CFR part 60, appendix A-7 using the same sampling points. An instrument range of 0-10 parts per million by volume-dry (ppmvd) is recommended.

(9) Total hydrocarbon determination must be performed as specified in paragraphs (d)(9)(i) through (vii) of this section.

(i) Conduct THC sampling using EPA Method 25A, 40 CFR part 60, appendix A-7, except that the option for locating the probe in the center 10 percent of the stack is not allowed. The THC probe must be traversed to 16.7 percent, 50 percent, and 83.3 percent of the stack diameter during each test run.

(ii) A valid test must consist of three EPA Method 25A, 40 CFR part 60, appendix A-7, tests, each no less than 60 minutes in duration.

(iii) A 0-10 parts per million by volume-wet (ppmvw) (as propane) measurement range is preferred; as an alternative a 0-30 ppmvw (as carbon) measurement range may be used.

(iv) Calibration gases must be propane in air and be certified through EPA Protocol 1—"EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards".

(v) THC measurements must be reported in terms of ppmvw as propane.

(vi) THC results must be corrected to 3 percent CO_2, as measured by EPA Method 3C, 40 CFR part 60, appendix A-2. You must use the following equation for this diluent concentration correction:

$$C_{corr} = C_{meas}\left(\frac{3}{CO_{2meas}}\right)$$

Where:

C_{meas} = The measured concentration of the pollutant.

CO_{2meas} = The measured concentration of the CO_2 diluent.

3 = The corrected reference concentration of CO_2 diluent.

C_{corr} = The corrected concentration of the pollutant.

(vii) Subtraction of methane or ethane from the THC data is not allowed in determining results.

(10) Visible emissions must be determined using EPA Method 22, 40 CFR part 60, appendix A-7. The test must be performed continuously during each test run. A digital color photograph of the exhaust point, taken from the position of the observer and annotated with date

and time, must be taken once per test run and the 12 photos included in the test report specified in paragraph (d)(12) of this section.

(11) *Performance test criteria.* (i) The control device model tested must meet the criteria in paragraphs (d)(11)(i)(A) through (D) of this section. These criteria must be reported in the test report required by paragraph (d)(12) of this section.

(A) Results from EPA Method 22, 40 CFR part 60, appendix A-7, results under paragraph (d)(10) of this section with no indication of visible emissions.

(B) Average EPA Method 25A, 40 CFR part 60, appendix A-7, results under paragraph (d)(9) of this section equal to or less than 10.0 ppmvw THC as propane corrected to 3.0 percent CO_2.

(C) Average CO emissions determined under paragraph (d)(8) of this section equal to or less than 10 parts ppmvd, corrected to 3.0 percent CO_2.

(D) Excess combustion air determined under paragraph (d)(7) of this section equal to or greater than 150 percent.

(ii) The manufacturer must determine a maximum inlet gas flow rate which must not be exceeded for each control device model to achieve the criteria in paragraph (d)(11)(iii) of this section. The maximum inlet gas flow rate must be included in the test report required by paragraph (d)(12) of this section.

(iii) A manufacturer must demonstrate a destruction efficiency of at least 95.0 percent for THC, as propane. A control device model that demonstrates a destruction efficiency of 95.0 percent for THC, as propane, will meet the control requirement for 95.0 percent destruction of VOC required under this rule.

(12) The owner or operator of a combustion control device model tested under this paragraph must submit the information listed in paragraphs (d)(12)(i) through (vi) in the test report. Owners or operators who claim that any of the performance test information being submitted is confidential business information (CBI) must submit a complete file including

information claimed to be CBI, on a compact disc, flash drive, or other commonly used electronic storage media to the EPA. The electronic media must be clearly marked as CBI and mailed to Attn: CBI Officer; OAQPS CBIO Room 521; 109 T.W. Alexander Drive; RTP, NC 27711. The same file with the CBI omitted must be submitted to Oil_and_Gas_PT@EPA.GOV.

(i) A full schematic of the control device and dimensions of the device components.

(ii) The maximum net heating value of the device.

(iii) The test fuel gas flow range (in both mass and volume). Include the maximum allowable inlet gas flow rate.

(iv) The air/stream injection/assist ranges, if used.

(v) The test conditions listed in paragraphs (d)(12)(v)(A) through (O) of this section, as applicable for the tested model.

(A) Fuel gas delivery pressure and temperature.

(B) Fuel gas moisture range.

(C) Purge gas usage range.

(D) Condensate (liquid fuel) separation range.

(E) Combustion zone temperature range. This is required for all devices that measure this parameter.

(F) Excess air range.

(G) Flame arrestor(s).

(H) Burner manifold.

(I) Pilot flame indicator.

NMED Exhibit 34

(J) Pilot flame design fuel and calculated or measured fuel usage.

(K) Tip velocity range.

(L) Momentum flux ratio.

(M) Exit temperature range.

(N) Exit flow rate.

(O) Wind velocity and direction.

(vi) The test report must include all calibration quality assurance/quality control data, calibration gas values, gas cylinder certification, strip charts, or other graphic presentations of the data annotated with test times and calibration values.

(e) *Continuous compliance for combustion control devices tested by the manufacturer in accordance with paragraph (d) of this section.* This paragraph applies to the demonstration of compliance for a combustion control device tested under the provisions in paragraph (d) of this section. Owners or operators must demonstrate that a control device achieves the performance requirements in (d)(11) of this section by installing a device tested under paragraph (d) of this section, complying with the criteria specified in paragraphs (e)(1) through (8) of this section and maintaining the records specified in A.5(a)(6) or E.2(a)(1)(ii).

(1) The inlet gas flow rate must be equal to or less than the maximum specified by the manufacturer.

(2) A pilot flame must be present at all times of operation.

(3) Devices must be operated with no visible emissions, except for periods not to exceed a total of 1 minute during any 15-minute period. A visible emissions test conducted according to section 11 of EPA Method 22, 40 CFR part 60, appendix A-7, must be performed at least once every calendar month, separated by at least 15 days between each test. The observation period shall be 15 minutes.

NMED Exhibit 34

(4) Devices failing the visible emissions test must follow manufacturer's repair instructions, if available, or best combustion engineering practice as outlined in the unit inspection and maintenance plan, to return the unit to compliant operation. All inspection, repair and maintenance activities for each unit must be recorded in a maintenance and repair log and must be available for inspection.

(5) Following return to operation from maintenance or repair activity, each device must pass an EPA Method 22, 40 CFR part 60, appendix A-7, visual observation as described in paragraph (e)(3) of this section.

(6) If the owner or operator operates a combustion control device model tested under this section, an electronic copy of the performance test results required by this section shall be submitted via email to Oil_and_Gas_PT@EPA.GOV unless the test results for that model of combustion control device are posted at the following Web site: epa.gov/airquality/oilandgas/.

(7) Ensure that each enclosed combustion control device is maintained in a leak free condition.

(8) Operate each control device following the manufacturer's written operating instructions, procedures and maintenance schedule to ensure good air pollution control practices for minimizing emissions.

.

G Equipment VOC Leaks at Natural Gas Processing Plants

G.1 Applicability

(a) The group of all equipment, except compressors and sampling connection systems, within a process unit located at an onshore natural gas processing plant.

(b) Equipment associated with a compressor station, dehydration unit, sweetening unit, underground storage vessel, field gas gathering system, or liquefied natural gas unit is covered by the requirements of section G.2 if it is located at an onshore natural gas processing plant. Equipment not located at the onshore natural gas processing plant site is exempt from the requirements of section G.2.

(c) The equipment within a process unit subject to VOC emission control requirements located at onshore natural gas processing plants is exempt from this section if they are subject to and controlled according to subparts VVa or GGGa of 40 CFR part 60.

G.2 What VOC Emission Requirements Apply to Equipment at a Natural Gas Processing Plant?

(a) You must comply with the requirements of sections G.5.1 through G.5.9, except as provided in section G.3.

(b) You may elect to comply with the requirements of sections G.6.1 and G.6.2, as an alternative.

(c) You must comply with the provisions of sections G.7 and G.8 of this section, except as provided in section G.3.

NMED Exhibit 34

G.3 What Exceptions Apply to the Equipment Leak VOC Emission Control Requirements for Equipment at Natural Gas Processing Plants?

(a) You may comply with the following exceptions to the provisions of section G.2.

(b)(1) Each pressure relief device in gas/vapor service may be monitored quarterly and within 5 days after each pressure release to detect leaks by the methods specified in section G.7(b) except as provided in paragraph (b)(4) of this section, and section G.5.2 of this rule.

(2) If an instrument reading of 500 ppm or greater is measured, a leak is detected.

(3)(i) When a leak is detected, it must be repaired as soon as practicable, but no later than 15 calendar days after it is detected, except as provided in section G.5.7.

(ii) A first attempt at repair must be made no later than 5 calendar days after each leak is detected.

(4)(i) Any pressure relief device that is located in a non-fractionating plant that is monitored only by non-plant personnel may be monitored after a pressure release the next time the monitoring personnel are on-site, instead of within 5 days as specified in paragraph (b)(1) of this section and section G.5.2(b)(1).

(ii) No pressure relief device described in paragraph (b)(4)(i) of this section must be allowed to operate for more than 30 days after a pressure release without monitoring.

(c) Pumps in light liquid service, valves in gas/vapor and light liquid service, pressure relief devices in gas/vapor service, and connectors in gas/vapor service and in light liquid service that are located at a non-fractionating plant that does not have the design capacity to process 283,200 standard cubic meters per day (scmd) (10 million standard cubic feet per day) or more of field gas are exempt from the routine monitoring requirements of sections G.5.3(a)(1), G.5.5(a), G.5.9(a), and paragraph (b)(1) of this section.

(d) Pumps in light liquid service, valves in gas/vapor and light liquid service, pressure relief devices in gas/vapor service, and connectors in gas/vapor service and in light liquid service within a process unit that is located in the Alaskan North Slope are exempt from the routine monitoring requirements of sections G.5.3(a)(1), G.5.5(a), G.5.9(a), and paragraph (b)(1) of this section.

(e) An owner or operator may use the following provisions instead of section G.7(e):

(1) Equipment is in heavy liquid service if the weight percent evaporated is 10 percent or less at 150°C (302°F) as determined by ASTM Method D86-96.

(2) Equipment is in light liquid service if the weight percent evaporated is greater than 10 percent at 150°C (302°F) as determined by ASTM Method D86-96.

G.4 How Do I Demonstrate Initial and Continued Compliance with the VOC Emission Control Requirements for Equipment at Natural Gas Processing Plants?

For equipment subject to VOC emission control requirements at natural gas processing plants, initial and continuous compliance with the VOC requirements is demonstrated if you are in compliance with the requirements of sections G.5.1 through G.5.9, except as provided in section G.3; G.6, as an alternative; and G.7 and G.8, except as provided in section G.3

G.5 What VOC Emission Control Requirements Apply to Equipment at Natural Gas Processing Plants

G.5.1 VOC Emission Control Requirements: General

(a) Each owner or operator subject to the provisions of this rule shall demonstrate compliance with the requirements of sections G.5.2 through G.5.8 for all equipment within 180 days and for G.5.9 within 12 months of the compliance date established by your regulatory authority.

(b) Compliance with sections G.5.2 to G.5.9 will be determined by review of records and reports, review of performance test results, and inspection using the methods and procedures specified in G.7.

G.5.2 What Equipment VOC Emission Control Requirements Apply to Pressure Relief Devices in Gas/Vapor Service?

(a) Except during pressure releases, each pressure relief device in gas/vapor service shall be operated with no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, as determined by the methods specified in section G.7(c).

(b)(1) After each pressure release, the pressure relief device shall be returned to a condition of no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, as soon as practicable, but no later than 5 calendar days after the pressure release, except as provided in section G.5.7.

(2) No later than 5 calendar days after the pressure release, the pressure relief device shall be monitored to confirm the conditions of no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, by the methods specified in section G.7(c).

(c) Any pressure relief device that is routed to a process or fuel gas system or equipped with a closed vent system capable of capturing and transporting leakage through the pressure relief device to a control device as described in section G.5.8 is exempted from the requirements of paragraphs (a) and (b) of this section.

(d)(1) Any pressure relief device that is equipped with a rupture disk upstream of the pressure relief device is exempt from the requirements of paragraphs (a) and (b) of this section, provided the owner or operator complies with the requirements in paragraph (d)(2) of this section.

(2) After each pressure release, a new rupture disk shall be installed upstream of the pressure relief device as soon as practicable, but no later than 5 calendar days after each pressure release, except as provided in section G.5.7.

G.5.3 What Equipment VOC Emission Control Requirements Apply to Pumps in Light Liquid Service?

(a)(1) Each pump in light liquid service shall be monitored monthly to detect leaks by the methods specified in G.7(b), except as provided in paragraphs (d), (e), and (f) of this section. A pump that begins operation in light liquid service after the initial startup date for the process unit must be monitored for the first time within 30 days after the end of its startup period, except for a pump that replaces a leaking pump and except as provided in paragraphs (d), (e), and (f) of this section.

(2) Each pump in light liquid service shall be checked by visual inspection each calendar week for indications of liquids dripping from the pump seal.

(b)(1) The instrument reading that defines a leak is specified in paragraphs (b)(1)(i) and (ii) of this section.

(i) 5,000 parts per million (ppm) or greater for pumps handling polymerizing monomers;

(ii) 2,000 ppm or greater for all other pumps.

(2) If there are indications of liquids dripping from the pump seal, the owner or operator shall follow the procedure specified in either paragraph (b)(2)(i) or (ii) of this section. This requirement does not apply to a pump that was monitored after a previous weekly inspection and the instrument reading was less than the concentration specified in paragraph (b)(1)(i) or (ii) of this section, whichever is applicable.

(i) Monitor the pump within 5 days as specified in G.7(b). A leak is detected if the instrument reading measured during monitoring indicates a leak as specified in paragraph (b)(1)(i) or (ii) of this section, whichever is applicable. The leak shall be repaired using the procedures in paragraph (c) of this section.

(ii) Designate the visual indications of liquids dripping as a leak, and repair the leak using either the procedures in paragraph (c) of this section or by eliminating the visual indications of liquids dripping.

(c)(1) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected, except as provided in G.5.7.

(2) A first attempt at repair shall be made no later than 5 calendar days after each leak is detected. First attempts at repair include, but are not limited to, the practices described in paragraphs (c)(2)(i) and (ii) of this section, where practicable.

(i) Tightening the packing gland nuts;

(ii) Ensuring that the seal flush is operating at design pressure and temperature.

(d) Each pump equipped with a dual mechanical seal system that includes a barrier fluid system is exempt from the requirements of paragraph (a) of this section, provided the requirements specified in paragraphs (d)(1) through (6) of this section are met.

(1) Each dual mechanical seal system is:

(i) Operated with the barrier fluid at a pressure that is at all times greater than the pump stuffing box pressure; or

(ii) Equipped with a barrier fluid degassing reservoir that is routed to a process or fuel gas system or connected by a closed vent system to a control device that complies with the requirements of G.5.8; or

(iii) Equipped with a system that purges the barrier fluid into a process stream with zero VOC emissions to the atmosphere.

(2) The barrier fluid system is in heavy liquid service or is not in VOC service.

(3) Each barrier fluid system is equipped with a sensor that will detect failure of the seal system, the barrier fluid system, or both.

(4)(i) Each pump is checked by visual inspection, each calendar week, for indications of liquids dripping from the pump seals.

NMED Exhibit 34

(ii) If there are indications of liquids dripping from the pump seal at the time of the weekly inspection, the owner or operator shall follow the procedure specified in either paragraph (d)(4)(ii)(A) or (B) of this section prior to the next required inspection.

(A) Monitor the pump within 5 days as specified in G.7(b) to determine if there is a leak of VOC in the barrier fluid. If an instrument reading of 2,000 ppm or greater is measured, a leak is detected.

(B) Designate the visual indications of liquids dripping as a leak.

(5)(i) Each sensor as described in paragraph (d)(3) is checked daily or is equipped with an audible alarm.

(ii) The owner or operator determines, based on design considerations and operating experience, a criterion that indicates failure of the seal system, the barrier fluid system, or both.

(iii) If the sensor indicates failure of the seal system, the barrier fluid system, or both, based on the criterion established in paragraph (d)(5)(ii) of this section, a leak is detected.

(6)(i) When a leak is detected pursuant to paragraph (d)(4)(ii)(A) of this section, it shall be repaired as specified in paragraph (c) of this section.

(ii) A leak detected pursuant to paragraph (d)(5)(iii) of this section shall be repaired within 15 days of detection by eliminating the conditions that activated the sensor.

(iii) A designated leak pursuant to paragraph (d)(4)(ii)(B) of this section shall be repaired within 15 days of detection by eliminating visual indications of liquids dripping.

(e) Any pump that is designated, as described in G.8(a)(5)(ii), for no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, is exempt from the requirements of paragraphs (a), (c), and (d) of this section if the pump:

(1) Has no externally actuated shaft penetrating the pump housing;

NMED Exhibit 34

(2) Is demonstrated to be operating with no detectable emissions as indicated by an instrument reading of less than 500 ppm above background as measured by the methods specified in G.7(c); and

(3) Is tested for compliance with paragraph (e)(2) of this section initially upon designation, annually, and at other times requested by the Administrator.

(f) If any pump is equipped with a closed vent system capable of capturing and transporting any leakage from the seal or seals to a process or to a fuel gas system or to a control device that complies with the requirements of G.5.8, it is exempt from paragraphs (a) through (e) of this section.

(g) Any pump that is designated, as described in G.8(a)(6)(i), as an unsafe-to-monitor pump is exempt from the monitoring and inspection requirements of paragraphs (a) and (d)(4) through (6) of this section if:

(1) The owner or operator of the pump demonstrates that the pump is unsafe-to-monitor because monitoring personnel would be exposed to an immediate danger as a consequence of complying with paragraph (a) of this section; and

(2) The owner or operator of the pump has a written plan that requires monitoring of the pump as frequently as practicable during safe-to-monitor times, but not more frequently than the periodic monitoring schedule otherwise applicable, and repair of the equipment according to the procedures in paragraph (c) of this section if a leak is detected.

(h) Any pump that is located within the boundary of an unmanned plant site is exempt from the weekly visual inspection requirement of paragraphs (a)(2) and (d)(4) of this section, and the daily requirements of paragraph (d)(5) of this section, provided that each pump is visually inspected as often as practicable and at least monthly.

NMED Exhibit 34

G.5.4 What Equipment VOC Emission Control Requirements Apply to Open-Ended Valves or Lines?

(a)(1) Each open-ended valve or line shall be equipped with a cap, blind flange, plug, or a second valve, except as provided in paragraphs (d) and (e) of this section.

(2) The cap, blind flange, plug, or second valve shall seal the open end at all times except during operations requiring process fluid flow through the open-ended valve or line.

(b) Each open-ended valve or line equipped with a second valve shall be operated in a manner such that the valve on the process fluid end is closed before the second valve is closed.

(c) When a double block-and-bleed system is being used, the bleed valve or line may remain open during operations that require venting the line between the block valves but shall comply with paragraph (a) of this section at all other times.

(d) Open-ended valves or lines in an emergency shutdown system which are designed to open automatically in the event of a process upset are exempt from the requirements of paragraphs (a) through (c) of this section.

(e) Open-ended valves or lines containing materials which would auto-catalytically polymerize or would present an explosion, serious overpressure, or other safety hazard if capped or equipped with a double block and bleed system as specified in paragraphs (a) through (c) of this section are exempt from the requirements of paragraphs (a) through (c) of this section.

G.5.5 What Equipment VOC Emission Control Requirements Apply to Valves in Gas/Vapor Service and in Light Liquid Service?

(a)(1) Each valve shall be monitored monthly to detect leaks by the methods specified in G.7(b) and shall comply with paragraphs (b) through (e) of this section, except as provided in paragraphs (f), (g), and (h) of this section and sections G.6.1 and G.6.2.

(2) A valve that begins operation in gas/vapor service or light liquid service after the compliance date for the process unit must be monitored according to paragraphs (a)(2)(i) or (ii),

except for a valve that replaces a leaking valve and except as provided in paragraphs (f), (g), and (h) of this section and sections G.6.1 and G.6.2.

(i) Monitor the valve as in paragraph (a)(1) of this section. The valve must be monitored for the first time within 30 days after the end of its startup period to ensure proper installation.

(ii) If the existing valves in the process unit are monitored in accordance with section G.6.1 or section G.6.2, count the new valve as leaking when calculating the percentage of valves leaking as described in section G.6.2(b)(5). If less than 2.0 percent of the valves are leaking for that process unit, the valve must be monitored for the first time during the next scheduled monitoring event for existing valves in the process unit or within 90 days, whichever comes first.

(b) If an instrument reading of 500 ppm or greater is measured, a leak is detected.

(c)(1)(i) Any valve for which a leak is not detected for 2 successive months may be monitored the first month of every quarter, beginning with the next quarter, until a leak is detected.

(ii) As an alternative to monitoring all of the valves in the first month of a quarter, an owner or operator may elect to subdivide the process unit into two or three subgroups of valves and monitor each subgroup in a different month during the quarter, provided each subgroup is monitored every 3 months. The owner or operator must keep records of the valves assigned to each subgroup.

(2) If a leak is detected, the valve shall be monitored monthly until a leak is not detected for 2 successive months.

(d)(1) When a leak is detected, it shall be repaired as soon as practicable, but no later than 15 calendar days after the leak is detected, except as provided in section G.5.7.

(2) A first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

NMED Exhibit 34

(e) First attempts at repair include, but are not limited to, the following best practices where practicable:

(1) Tightening of bonnet bolts;

(2) Replacement of bonnet bolts;

(3) Tightening of packing gland nuts;

(4) Injection of lubricant into lubricated packing.

(f) Any valve that is designated, as described in section G.8(a)(5)(ii), for no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, is exempt from the requirements of paragraph (a) of this section if the valve:

(1) Has no external actuating mechanism in contact with the process fluid,

(2) Is operated with emissions less than 500 ppm above background as determined by the method specified in section G.7(c), and

(3) Is tested for compliance with paragraph (f)(2) of this section initially upon designation, annually, and at other times requested by the permitting authority.

(g) Any valve that is designated, as described in section G.8(a)(6)(i), as an unsafe-to-monitor valve is exempt from the requirements of paragraph (a) of this section if:

(1) The owner or operator of the valve demonstrates that the valve is unsafe to monitor because monitoring personnel would be exposed to an immediate danger as a consequence of complying with paragraph (a) of this section, and

(2) The owner or operator of the valve adheres to a written plan that requires monitoring of the valve as frequently as practicable during safe-to-monitor times.

(h) Any valve that is designated, as described in section G.8(a)(6)(ii), as a difficult-to-monitor valve is exempt from the requirements of paragraph (a) of this section if:

NMED Exhibit 34

(1) The owner or operator of the valve demonstrates that the valve cannot be monitored without elevating the monitoring personnel more than 2 meters above a support surface.

(2) The process unit within which the valve is located either has less than 3.0 percent of its total number of valves designated as difficult-to-monitor by the owner or operator.

(3) The owner or operator of the valve follows a written plan that requires monitoring of the valve at least once per calendar year.

G.5.6 What Equipment VOC Emission Control Requirements Apply to Pumps, Valves, and Connectors in Heavy Liquid Service and Pressure Relief Devices in Light Liquid or Heavy Liquid Service?

(a) If evidence of a potential leak is found by visual, audible, olfactory, or any other detection method at pumps, valves, and connectors in heavy liquid service and pressure relief devices in light liquid or heavy liquid service, the owner or operator shall follow either one of the following procedures:

(1) The owner or operator shall monitor the equipment within 5 days by the method specified in section G.7(b) and shall comply with the requirements of paragraphs (b) through (d) of this section.

(2) The owner or operator shall eliminate the visual, audible, olfactory, or other indication of a potential leak within 5 calendar days of detection.

(b) If an instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(c)(1) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected, except as provided in section G.5.7.

(2) The first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

(d) First attempts at repair include, but are not limited to, the best practices described under sections G.5.3(c)(2) and G.5.5(e).

G.5.7 What Delay of Repair of Equipment Requirements Apply When Equipment Component Leaks Have Been Detected?

(a) Delay of repair of equipment for which leaks have been detected will be allowed if repair within 15 days is technically infeasible without a process unit shutdown. Repair of this equipment shall occur before the end of the next process unit shutdown. Monitoring to verify repair must occur within 15 days after startup of the process unit.

(b) Delay of repair of equipment will be allowed for equipment which is isolated from the process and which does not remain in VOC service.

(c) Delay of repair for valves and connectors will be allowed if:

(1) The owner or operator demonstrates that emissions of purged material resulting from immediate repair are greater than the fugitive emissions likely to result from delay of repair, and

(2) When repair procedures are effected, the purged material is collected and destroyed or recovered in a control device complying with section G.5.8.

(d) Delay of repair for pumps will be allowed if:

(1) Repair requires the use of a dual mechanical seal system that includes a barrier fluid system, and

(2) Repair is completed as soon as practicable, but not later than 6 months after the leak was detected.

(e) Delay of repair beyond a process unit shutdown will be allowed for a valve, if valve assembly replacement is necessary during the process unit shutdown, valve assembly supplies have been depleted, and valve assembly supplies had been sufficiently stocked before the supplies were depleted. Delay of repair beyond the next process unit shutdown will not be

NMED Exhibit 34

allowed unless the next process unit shutdown occurs sooner than 6 months after the first process unit shutdown.

(f) When delay of repair is allowed for a leaking pump, valve, or connector that remains in service, the pump, valve, or connector may be considered to be repaired and no longer subject to delay of repair requirements if two consecutive monthly monitoring instrument readings are below the leak definition.

G.5.8 What VOC Emission Control Requirements Apply for Closed Vent Systems and Control Devices?

(a) Owners or operators of closed vent systems and control devices used to comply with provisions of this rule shall comply with the provisions of this section.

(b) Vapor recovery systems (for example, condensers and absorbers) shall be designed and operated to recover the VOC emissions vented to them with an efficiency of 95.0 percent or greater.

(c) Each enclosed combustion device (e.g., thermal vapor incinerator, catalytic vapor incinerator, boiler, or process heater) shall be designed to reduce the mass content of VOC emissions by 95.0 percent or greater in accordance with the requirements of section F(b).

(d) Flares used to comply with this subpart shall comply with the requirements of §60.18.

(e) Owners or operators of control devices used to comply with the provisions of this rule shall monitor these control devices to ensure that they are operated and maintained in conformance with their designs.

(f) Except as provided in paragraphs (i) through (k) of this section, each closed vent system shall be inspected according to the procedures and schedule specified in paragraphs (f)(1) and (2) of this section.

(1) If the vapor collection system or closed vent system is constructed of hard-piping, the owner or operator shall comply with the requirements specified in paragraphs (f)(1)(i) and (ii) of this section:

(i) Conduct an initial inspection according to the procedures in section G.7(b); and

(ii) Conduct annual visual inspections for visible, audible, or olfactory indications of leaks.

(2) If the vapor collection system or closed vent system is constructed of ductwork, the owner or operator shall:

(i) Conduct an initial inspection according to the procedures in section G.7(b); and

(ii) Conduct annual inspections according to the procedures in section G.7(b).

(g) Leaks, as indicated by an instrument reading greater than 500 ppmv above background or by visual inspections, shall be repaired as soon as practicable except as provided in paragraph (h) of this section.

(1) A first attempt at repair shall be made no later than 5 calendar days after the leak is detected.

(2) Repair shall be completed no later than 15 calendar days after the leak is detected.

(h) Delay of repair of a closed vent system for which leaks have been detected is allowed if the repair is technically infeasible without a process unit shutdown or if the owner or operator determines that emissions resulting from immediate repair would be greater than the fugitive emissions likely to result from delay of repair. Repair of such equipment shall be complete by the end of the next process unit shutdown.

(i) If a vapor collection system or closed vent system is operated under a vacuum, it is exempt from the inspection requirements of paragraphs (f)(1)(i) and (f)(2) of this section.

(j) Any parts of the closed vent system that are designated, as described in paragraph (l)(1) of this section, as unsafe to inspect are exempt from the inspection requirements of paragraphs (f)(1)(i) and (f)(2) of this section if they comply with the requirements specified in paragraphs (j)(1) and (2) of this section:

(1) The owner or operator determines that the equipment is unsafe to inspect because inspecting personnel would be exposed to an imminent or potential danger as a consequence of complying with paragraphs (f)(1)(i) or (f)(2) of this section; and

(2) The owner or operator has a written plan that requires inspection of the equipment as frequently as practicable during safe-to-inspect times.

(k) Any parts of the closed vent system that are designated, as described in paragraph (l)(2) of this section, as difficult to inspect are exempt from the inspection requirements of paragraphs (f)(1)(i) and (f)(2) of this section if they comply with the requirements specified in paragraphs (k)(1) through (3) of this section:

(1) The owner or operator determines that the equipment cannot be inspected without elevating the inspecting personnel more than 2 meters above a support surface; and

(2) The owner or operator designates less than 3.0 percent of the total number of closed vent system equipment as difficult to inspect; and

(3) The owner or operator has a written plan that requires inspection of the equipment at least once every 5 years. A closed vent system is exempt from inspection if it is operated under a vacuum.

(l) The owner or operator shall record the information specified in paragraphs (l)(1) through (5) of this section.

(1) Identification of all parts of the closed vent system that are designated as unsafe to inspect, an explanation of why the equipment is unsafe to inspect, and the plan for inspecting the equipment.

(2) Identification of all parts of the closed vent system that are designated as difficult to inspect, an explanation of why the equipment is difficult to inspect, and the plan for inspecting the equipment.

(3) For each inspection during which a leak is detected, a record of the information specified in section G.8(a)(3).

(4) For each inspection conducted in accordance with section G.7(b) during which no leaks are detected, a record that the inspection was performed, the date of the inspection, and a statement that no leaks were detected.

(5) For each visual inspection conducted in accordance with paragraph (f)(1)(ii) of this section during which no leaks are detected, a record that the inspection was performed, the date of the inspection, and a statement that no leaks were detected.

(m) Closed vent systems and control devices used to comply with provisions of this rule shall be operated at all times when emissions may be vented to them.

G.5.9 What VOC Emission Control Requirements Apply to Connectors in Gas/Vapor Service and in Light Liquid Service?

(a) The owner or operator shall initially monitor all connectors in the process unit for leaks within12 months of the compliance date. If all connectors in the process unit have been monitored for leaks prior to the compliance date, no initial monitoring is required provided either no process changes have been made since the monitoring or the owner or operator can determine that the results of the monitoring, with or without adjustments, reliably demonstrate compliance despite process changes. If required to monitor because of a process change, the owner or operator is required to monitor only those connectors involved in the process change.

(b) Except as allowed in section G.5.7 or as specified in paragraph (e) of this section, the owner or operator shall monitor all connectors in gas and vapor and light liquid service as specified in paragraphs (a) and (b)(3) of this section.

(1) The connectors shall be monitored to detect leaks by the method specified in section G.7(b) and, as applicable, section G.7(c).

(2) If an instrument reading greater than or equal to 500 ppm is measured, a leak is detected.

(3) The owner or operator shall perform monitoring, subsequent to the initial monitoring required in paragraph (a) of this section, as specified in paragraphs (b)(3)(i) through (iii) of this section, and shall comply with the requirements of paragraphs (b)(3)(iv) and (v) of this section. The required period in which monitoring must be conducted shall be determined from paragraphs (b)(3)(i) through (iii) of this section using the monitoring results from the preceding monitoring period. The percent leaking connectors shall be calculated as specified in paragraph (c) of this section.

(i) If the percent leaking connectors in the process unit was greater than or equal to 0.5 percent, then monitor within 12 months (1 year).

(ii) If the percent leaking connectors in the process unit was greater than or equal to 0.25 percent but less than 0.5 percent, then monitor within 4 years. An owner or operator may comply with the requirements of this paragraph by monitoring at least 40 percent of the connectors within 2 years of the start of the monitoring period, provided all connectors have been monitored by the end of the 4-year monitoring period.

(iii) If the percent leaking connectors in the process unit was less than 0.25 percent, then monitor as provided in paragraph (b)(3)(iii)(A) of this section and either paragraph (b)(3)(iii)(B) or (b)(3)(iii)(C) of this section, as appropriate.

(A) An owner or operator shall monitor at least 50 percent of the connectors within 4 years of the start of the monitoring period.

(B) If the percent of leaking connectors calculated from the monitoring results in paragraph (b)(3)(iii)(A) of this section is greater than or equal to 0.35 percent of the monitored connectors, the owner or operator shall monitor as soon as practical, but within the next 6

NMED Exhibit 34

months, all connectors that have not yet been monitored during the monitoring period. At the conclusion of monitoring, a new monitoring period shall be started pursuant to paragraph (b)(3) of this section, based on the percent of leaking connectors within the total monitored connectors.

(C) If the percent of leaking connectors calculated from the monitoring results in paragraph (b)(3)(iii)(A) of this section is less than 0.35 percent of the monitored connectors, the owner or operator shall monitor all connectors that have not yet been monitored within 8 years of the start of the monitoring period.

(iv) If, during the monitoring conducted pursuant to paragraphs (b)(3)(i) through (iii) of this section, a connector is found to be leaking, it shall be re-monitored once within 90 days after repair to confirm that it is not leaking.

(v) The owner or operator shall keep a record of the start date and end date of each monitoring period under this section for each process unit.

(c) For use in determining the monitoring frequency, as specified in paragraphs (a) and (b)(3) of this section, the percent leaking connectors as used in paragraphs (a) and (b)(3) of this section shall be calculated by using the following equation:

$$\%C_L = C_L / C_t * 100$$

Where:

$\%C_L$ = Percent of leaking connectors as determined through periodic monitoring required in paragraphs (a) and (b)(3)(i) through (iii) of this section.

C_L = Number of connectors measured at 500 ppm or greater, by the method specified in G.7(b).

C_t = Total number of monitored connectors in the process unit.

(d) When a leak is detected pursuant to paragraphs (a) and (b) of this section, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected, except as

NMED Exhibit 34

provided in section G.5.7. A first attempt at repair as defined in this rule shall be made no later than 5 calendar days after the leak is detected.

(e) Any connector that is designated, as described in section G.8(a)(6)(i), as an unsafe-to-monitor connector is exempt from the requirements of paragraphs (a) and (b) of this section if:

(1) The owner or operator of the connector demonstrates that the connector is unsafe-to-monitor because monitoring personnel would be exposed to an immediate danger as a consequence of complying with paragraphs (a) and (b) of this section; and

(2) The owner or operator of the connector has a written plan that requires monitoring of the connector as frequently as practicable during safe-to-monitor times, but not more frequently than the periodic monitoring schedule otherwise applicable, and repair of the equipment according to the procedures in paragraph (d) of this section if a leak is detected.

(f) *Inaccessible, ceramic, or ceramic-lined connectors.* (1) Any connector that is inaccessible or that is ceramic or ceramic-lined (e.g., porcelain, glass, or glass-lined), is exempt from the monitoring requirements of paragraphs (a) and (b) of this section, from the leak repair requirements of paragraph (d) of this section, and from recordkeeping and reporting requirements. An inaccessible connector is one that meets any of the provisions specified in paragraphs (f)(1)(i) through (vi) of this section, as applicable:

(i) Buried;

(ii) Insulated in a manner that prevents access to the connector by a monitor probe;

(iii) Obstructed by equipment or piping that prevents access to the connector by a monitor probe;

(iv) Unable to be reached from a wheeled scissor-lift or hydraulic-type scaffold that would allow access to connectors up to 7.6 meters (25 feet) above the ground;

(v) Inaccessible because it would require elevating the monitoring personnel more than 2 meters (7 feet) above a permanent support surface or would require the erection of scaffold; or

NMED Exhibit 34

(vi) Not able to be accessed at any time in a safe manner to perform monitoring. Unsafe access includes, but is not limited to, the use of a wheeled scissor-lift on unstable or uneven terrain, the use of a motorized man-lift basket in areas where an ignition potential exists, or access would require near proximity to hazards such as electrical lines, or would risk damage to equipment.

(2) If any inaccessible, ceramic, or ceramic-lined connector is observed by visual, audible, olfactory, or other means to be leaking, the visual, audible, olfactory, or other indications of a leak to the atmosphere shall be eliminated as soon as practical.

(g) Except for instrumentation systems and inaccessible, ceramic, or ceramic-lined connectors meeting the provisions of paragraph (f) of this section, identify the connectors subject to the requirements of this rule. Connectors need not be individually identified if all connectors in a designated area or length of pipe subject to the provisions of this rule are identified as a group, and the number of connectors subject to the requirements is indicated.

G.6 Alternative Standards

G.6.1 Alternative Standards for Valves—Allowable Percentage of Valves Leaking

(a) An owner or operator may elect to comply with an allowable percentage of valves leaking of equal to or less than 2.0 percent.

(b) The following requirements shall be met if an owner or operator wishes to comply with an allowable percentage of valves leaking:

(1) An owner or operator must notify the permitting authority that the owner or operator has elected to comply with the allowable percentage of valves leaking before implementing this alternative standard, as specified in section G.8(b)(4).

(2) A performance test as specified in paragraph (c) of this section shall be conducted initially upon designation, annually, and at other times requested by the permitting authority.

NMED Exhibit 34

(3) If a valve leak is detected, it shall be repaired in accordance with section G.5.5(d) and (e).

(c) Performance tests shall be conducted in the following manner:

(1) All valves in gas/vapor and light liquid service within the natural gas processing plant subject to VOC emission control requirements shall be monitored within one week by the methods specified in section G.7(b).

(2) If an instrument reading of 500 ppm or greater is measured, a leak is detected.

(3) The leak percentage shall be determined by dividing the number of valves for which leaks are detected by the number of valves in gas/vapor and light liquid service within the natural gas processing plant subject to VOC emission control requirements.

(d) Owners and operators who elect to comply with this alternative standard shall not have a natural gas processing plant subject to the equipment component VOC emission control requirements with a leak percentage greater than 2.0 percent, determined as described in section G.7(h).

G.6.2 Alternative Standards for Valves—Skip Period Leak Detection and Repair

(a)(1) An owner or operator may elect to comply with one of the alternative work practices specified in paragraphs (b)(2) and (3) of this section.

(2) An owner or operator must notify the permitting authority before implementing one of the alternative work practices.

(b)(1) An owner or operator shall comply initially with the requirements for valves in gas/vapor service and valves in light liquid service, as described in section G.5.5.

(2) After 2 consecutive quarterly leak detection periods with the percent of valves leaking equal to or less than 2.0, an owner or operator may begin to skip 1 of the quarterly leak detection periods for the valves in gas/vapor and light liquid service.

(3) After 5 consecutive quarterly leak detection periods with the percent of valves leaking equal to or less than 2.0, an owner or operator may begin to skip 3 of the quarterly leak detection periods for the valves in gas/vapor and light liquid service.

(4) If the percent of valves leaking is greater than 2.0, the owner or operator shall comply with the requirements as described in section G.5.5 but can again elect to use this section.

(5) The percent of valves leaking shall be determined as described in section G.7(h).

(6) An owner or operator must keep a record of the percent of valves found leaking during each leak detection period.

(7) A valve that begins operation in gas/vapor service or light liquid service after the compliance date for a process unit following one of the alternative standards in this section must be monitored in accordance with section G.5.5(a)(2)(i) or (ii) before the provisions of this section can be applied to that valve.

G.7 Equipment Leak Test Methods and Procedures

(a) In conducting the performance tests, the owner or operator shall use as reference methods and procedures the test methods in appendix A of this part or other methods and procedures as specified in this section.

(b) The owner or operator shall determine compliance with the standards in sections G.5.2 through G.5.9, and as follows:

(1) EPA Method 21 shall be used to determine the presence of leaking sources. The instrument shall be calibrated before use each day of its use by the procedures specified in EPA Method 21 of appendix A-7 of this part. The following calibration gases shall be used:

(i) Zero air (less than 10 ppm of hydrocarbon in air); and

(ii) A mixture of methane or n-hexane and air at a concentration no more than 2,000 ppm greater than the leak definition concentration of the equipment monitored. If the monitoring

instrument's design allows for multiple calibration scales, then the lower scale shall be calibrated with a calibration gas that is no higher than 2,000 ppm above the concentration specified as a leak, and the highest scale shall be calibrated with a calibration gas that is approximately equal to 10,000 ppm. If only one scale on an instrument will be used during monitoring, the owner or operator need not calibrate the scales that will not be used during that day's monitoring.

(2) A calibration drift assessment shall be performed, at a minimum, at the end of each monitoring day. Check the instrument using the same calibration gas(es) that were used to calibrate the instrument before use. Follow the procedures specified in EPA Method 21 of appendix A-7 of this part, Section 10.1, except do not adjust the meter readout to correspond to the calibration gas value. Record the instrument reading for each scale used as specified in section G.8(a)(5)(v). Divide these readings by the initial calibration value and multiply by 100 to express the calibration drift as a percentage. If any calibration drift assessment shows a negative drift of more than 10 percent from the initial calibration value, then all equipment monitored since the last calibration with instrument readings below the appropriate leak definition and above the leak definition multiplied by (100 minus the percent of negative drift/divided by 100) must be re-monitored. If any calibration drift assessment shows a positive drift of more than 10 percent from the initial calibration value, then, at the owner/operator's discretion, all equipment since the last calibration with instrument readings above the appropriate leak definition and below the leak definition multiplied by (100 plus the percent of positive drift/divided by 100) may be re-monitored.

(c) The owner or operator shall determine compliance with the no-detectable-emission standards in sections G.5.2, G.5.3(e), G.5.5(f), and G.5.8(e) as follows:

(1) The requirements of paragraph (b) shall apply.

(2) EPA Method 21 of appendix A-7 of this part shall be used to determine the background level. All potential leak interfaces shall be traversed as close to the interface as possible. The arithmetic difference between the maximum concentration indicated by the instrument and the background level is compared with 500 ppm for determining compliance.

NMED Exhibit 34

(d) The owner or operator shall test each piece of equipment unless he demonstrates that a process unit is not in VOC service, i.e., that the VOC content would never be reasonably expected to exceed 10 percent by weight. For purposes of this demonstration, the following methods and procedures shall be used:

(1) Each piece of equipment is presumed to be in VOC service or in wet gas service unless an owner or operator demonstrates that the piece of equipment is not in VOC service or in wet gas service. For a piece of equipment to be considered not in VOC service, it must be determined that the VOC content can be reasonably expected never to exceed 10.0 percent by weight. For a piece of equipment to be considered in wet gas service, it must be determined that it contains or contacts the field gas before the extraction step in the process. For purposes of determining the percent VOC content of the process fluid that is contained in or contacts a piece of equipment, procedures that conform to the methods described in ASTM E169-93, E168-92, or E260-96 must be used.

(2) Organic compounds that are considered by the permitting authority to have negligible photochemical reactivity may be excluded from the total quantity of organic compounds in determining the VOC content of the process fluid.

(3) Engineering judgment may be used to estimate the VOC content, if a piece of equipment had not been shown previously to be in service. If the permitting authority disagrees with the judgment, paragraphs (d)(1) and (2) of this section shall be used to resolve the disagreement.

(e) The owner or operator shall demonstrate that a piece of equipment is in light liquid service by showing that all the following conditions apply:

(1) The vapor pressure of one or more of the organic components is greater than 0.3 kPa at 20 °C (1.2 in. H_2O at 68 °F). Standard reference texts or ASTM D2879-83, 96, or 97 shall be used to determine the vapor pressures.

(2) The total concentration of the pure organic components having a vapor pressure greater than 0.3 kPa at 20 °C (1.2 in. H_2O at 68 °F) is equal to or greater than 20 percent by weight.

(3) The fluid is a liquid at operating conditions.

(f) Samples used in conjunction with paragraphs (d), (e), and (g) of this section shall be representative of the process fluid that is contained in or contacts the equipment or the gas being combusted in the flare.

(g) The owner or operator shall determine compliance with the standards of flares as follows:

(1) EPA Method 22 of appendix A-7 of this part shall be used to determine visible emissions.

(2) A thermocouple or any other equivalent device[160] shall be used to monitor the presence of a pilot flame in the flare.

(3) The maximum permitted velocity for air assisted flares shall be computed using the following equation:

$$V_{max} = K_1 + K_2 H_T$$

Where:

V_{max} = Maximum permitted velocity, m/sec (ft/sec).

H_T = Net heating value of the gas being combusted, MJ/scm (Btu/scf).

K_1 = 8.706 m/sec (metric units) = 28.56 ft/sec (English units).

K_2 = 0.7084 m4/(MJ-sec) (metric units) = 0.087 ft^4/(Btu-sec) (English units).

[160] The equivalent device must be reviewed and approved by EPA through the SIP review process.

(4) The net heating value (H_T) of the gas being combusted in a flare shall be computed using the following equation:

$$H_T = K \sum_{i=1}^{n} C_i H_i$$

Where:

K = Conversion constant, 1.740×10^{-7} (g-mole)(MJ)/(ppm-scm-kcal) (metric units) = 4.674×10^{-6} [(g-mole)(Btu)/(ppm-scf-kcal)] (English units).

C_i = Concentration of sample component "i," ppm

H_i = net heat of combustion of sample component "i" at 25°C and 760 mm Hg (77°F and 14.7 psi), kcal/g-mole.

(5) EPA Method 18 of appendix A-6 of this part or ASTM D6420-99 (2004) (where the target compound(s) are those listed in Section 1.1 of ASTM D6420-99, and the target concentration is between 150 parts per billion by volume and 100 ppmv) and ASTM D2504-67, 77, or 88 (Reapproved 1993) shall be used to determine the concentration of sample component "i."

(6) ASTM D2382-76 or 88 or D4809-95 shall be used to determine the net heat of combustion of component "i" if published values are not available or cannot be calculated.

(7) EPA Method 2, 2A, 2C, or 2D of appendix A-7 of this part, as appropriate, shall be used to determine the actual exit velocity of a flare. If needed, the unobstructed (free) cross-sectional area of the flare tip shall be used.

(h) The owner or operator shall determine compliance with section G.6.1 or section G.6.2 as follows:

(1) The percent of valves leaking shall be determined using the following equation:

NMED Exhibit 34

$$\%V_L = (V_L / V_T) * 100$$

Where:

$\%V_L$ = Percent leaking valves.

V_L = Number of valves found leaking.

V_T = The sum of the total number of valves monitored.

(2) The total number of valves monitored shall include difficult-to-monitor and unsafe-to-monitor valves only during the monitoring period in which those valves are monitored.

(3) The number of valves leaking shall include valves for which repair has been delayed.

(4) Any new valve that is not monitored within 30 days of being placed in service shall be included in the number of valves leaking and the total number of valves monitored for the monitoring period in which the valve is placed in service.

(5) If the process unit has been subdivided in accordance with section G.5.5(c)(1)(ii), the sum of valves found leaking during a monitoring period includes all subgroups.

(6) The total number of valves monitored does not include a valve monitored to verify repair.

G.8 Recordkeeping and Reporting Requirements

(a) *Recordkeeping requirements*. Each owner or operator subject to the VOC equipment leak requirements specified in section G shall maintain the records specified in paragraphs (a)(1) through (10), as applicable, onsite or at the nearest local field office for at least five years.

(1) An owner or operator of more than one facility subject to the requirements of section G may comply with the recordkeeping requirements for these facilities in one recordkeeping system if the system identifies each record by each facility.

(2) The owner or operator shall record the information specified in paragraphs (a)(2)(i) through (v) of this section for each monitoring event required by sections G.5.3, G.5.5, G.5.6, G.5.9, and G.6.2.

(i) Monitoring instrument identification.

(ii) Operator identification.

(iii) Equipment identification.

(iv) Date of monitoring.

(v) Instrument reading.

(3) When each leak is detected as specified in sections G.5.3, G.5.5, G.5.6, G.5.9, and G.6.2, the following information shall be recorded in a log and shall be kept for 2 years in a readily accessible location:

(i) The instrument and operator identification numbers and the equipment identification number, except when indications of liquids dripping from a pump are designated as a leak.

(ii) The date the leak was detected and the dates of each attempt to repair the leak.

(iii) Repair methods applied in each attempt to repair the leak.

(iv) Maximum instrument reading measured by EPA Method 21 of appendix A-7 of this part at the time the leak is successfully repaired or determined to be non-repairable, except when a pump is repaired by eliminating indications of liquids dripping.

(v) “Repair delayed” and the reason for the delay if a leak is not repaired within 15 calendar days after discovery of the leak.

(vi) The signature of the owner or operator (or designate) whose decision it was that repair could not be effected without a process shutdown.

NMED Exhibit 34

(vii) The expected date of successful repair of the leak if a leak is not repaired within 15 days.

(viii) Dates of process unit shutdowns that occur while the equipment is unrepaired.

(ix) The date of successful repair of the leak.

(4) The following information pertaining to the design requirements for closed vent systems and control devices described in section G.5.8 shall be recorded and kept in a readily accessible location:

(i) Detailed schematics, design specifications, and piping and instrumentation diagrams.

(ii) The dates and descriptions of any changes in the design specifications.

(iii) A description of the parameter or parameters monitored, as required in section G.5.8(e), to ensure that control devices are operated and maintained in conformance with their design and an explanation of why that parameter (or parameters) was selected for the monitoring.

(iv) Periods when the closed vent systems and control devices required in sections G.5.2 and G.5.3 are not operated as designed, including periods when a flare pilot light does not have a flame.

(v) Dates of startups and shutdowns of the closed vent systems and control devices required in sections G.5.2 and G.5.3.

(5) The following information pertaining to all equipment subject to the requirements in sections G.5.1 to G.5.9 shall be recorded in a log that is kept in a readily accessible location:

(i) A list of identification numbers for equipment subject to the requirements of this rule.

(ii)(A) A list of identification numbers for equipment that are designated for no detectable emissions under the provisions of sections G.5.3(e) and G.5.5(f).

NMED Exhibit 34

(B) The designation of equipment as subject to the requirements of sections G.5.3(e) or section G.5.5(f) shall be signed by the owner or operator. Alternatively, owner or operator may establish a mechanism[161] with their permitting authority that satisfies this requirement.

(C) A list of equipment identification numbers for pressure relief devices required to comply with section G.5.2.

(iii)(A) The dates of each compliance test as required in sections G.5.2, G.5.3(e), and G.5.5(f).

(B) The background level measured during each compliance test.

(C) The maximum instrument reading measured at the equipment during each compliance test.

(iv) A list of identification numbers for equipment in vacuum service.

(v) Records of the information specified in paragraphs (a)(5)(v)(A) through (F) of this section for monitoring instrument calibrations conducted according to sections 8.1.2 and 10 of EPA Method 21 of appendix A-7 of this part and section G.7(b).

(A) Date of calibration and initials of operator performing the calibration.

(B) Calibration gas cylinder identification, certification date, and certified concentration.

(C) Instrument scale(s) used.

(D) A description of any corrective action taken if the meter readout could not be adjusted to correspond to the calibration gas value in accordance with section 10.1 of EPA Method 21 of appendix A-7 of this part.

[161] The mechanism must be reviewed and approved by EPA through the SIP review process.

NMED Exhibit 34

(E) Results of each calibration drift assessment required by section G.7(b)(2) (i.e., instrument reading for calibration at end of monitoring day and the calculated percent difference from the initial calibration value).

(F) If an owner or operator makes their own calibration gas, a description of the procedure used.

(vi) The connector monitoring schedule for each process unit as specified in section G.5.9(b)(3)(v).

(vii) Records of each release from a pressure relief device subject to section G.5.2.

(6) The following information pertaining to all valves subject to the requirements of section G.5.5(g) and (h), all pumps subject to the requirements of section G.5.3(g), and all connectors subject to the requirements of section G.5.9(e) shall be recorded in a log that is kept in a readily accessible location:

(i) A list of identification numbers for valves, pumps, and connectors that are designated as unsafe-to-monitor, an explanation for each valve, pump, or connector stating why the valve, pump, or connector is unsafe-to-monitor, and the plan for monitoring each valve, pump, or connector.

(ii) A list of identification numbers for valves that are designated as difficult-to-monitor, an explanation for each valve stating why the valve is difficult-to-monitor, and the schedule for monitoring each valve.

(7) The following information shall be recorded for valves complying with section G.6.2:

(i) A schedule of monitoring.

(ii) The percent of valves found leaking during each monitoring period.

(8) The following information shall be recorded in a log that is kept in a readily accessible location:

NMED Exhibit 34

(i) Design criterion required in section G.5.3(d)(5) and explanation of the design criterion; and

(ii) Any changes to this criterion and the reasons for the changes.

(A) The following information shall be recorded in a log that is kept in a readily accessible location for use in determining exemptions:

(*1*) An analysis demonstrating the design capacity of the natural gas processing plant,

(*2*) A statement listing the feed or raw materials and products from the processing plant(s) and an analysis demonstrating whether these chemicals are heavy liquids or beverage alcohol, and

(*3*) An analysis demonstrating that equipment is not in VOC service.

(9) Information and data used to demonstrate that a piece of equipment is not in VOC service shall be recorded in a log that is kept in a readily accessible location.

(10) The following recordkeeping requirements apply to pumps in light liquid service, pressure relief devices in gas/vapor service, valves in gas/vapor service and light liquid service, pumps, valves and connectors in light heavy liquid service and pressure relief devices in light liquid or heavy liquid service, connectors in gas/vapor service and in light liquid service, and alternative standards for valves.

(i) When each leak is detected, as specified in section G.5.2, G.5.3(b)(2), G.5.5, G.5.6, G.5.9 and G.6.2, a weatherproof and readily visible identification, marked with the equipment identification number, must be attached to the leaking equipment. The identification on the pressure relief device may be removed after it has been repaired.

(ii) When each leak is detected, as specified in section G.5.2, G.5.3(b)(2), G.5.5, G.5.6, G.5.9 and G.6.2, the following information must be recorded in a log and shall be kept for 2 years in a readily accessible location:

NMED Exhibit 34

(A) The instrument and operator identification numbers and the equipment identification number.

(B) The date the leak was detected and the dates of each attempt to repair the leak.

(C) Repair methods applied in each attempt to repair the leak.

(D) "Above 500 ppm" if the maximum instrument reading measured by the methods specified in paragraph (a) of this section after each repair attempt is 500 ppm or greater.

(E) "Repair delayed" and the reason for the delay if a leak is not repaired within 15 calendar days after discovery of the leak.

(F) The signature of the owner or operator (or designate) whose decision it was that repair could not be effected without a process shutdown.

(G) The expected date of successful repair of the leak if a leak is not repaired within 15 days.

(H) Dates of process unit shutdowns that occur while the equipment is unrepaired.

(I) The date of successful repair of the leak.

(J) A list of identification numbers for equipment that are designated for no detectable emissions under the provisions of section G.5. The designation of equipment that has no detectable emissions that is subject to the provisions of section G.5 must be signed by the owner or operator.

(b) *Reporting requirements*. Each owner or operator subject to the VOC equipment leak requirements shall comply with the reporting requirements of paragraphs (b)(1) through (5).

(1) Each owner or operator subject to the equipment leak VOC emission control requirements of section G.5 shall submit semiannual reports to the permitting authority beginning 6 months after a facility becomes subject to VOC emission control requirements of section G.5.8.

(2) The initial semiannual report to the permitting authority shall include the following information:

(i) Process unit identification.

(ii) Number of valves subject to the requirements of section G.5.5, excluding those valves designated for no detectable emissions under the provisions of section G.5.5(f).

(iii) Number of pumps subject to the requirements of section G.5.3, excluding those pumps designated for no detectable emissions under the provisions of section G.5.3(e) and those pumps complying with section G.5.3(f).

(iv) Number of connectors subject to the requirements of section G.5.9.

(v) Number of pressure relief devices subject to the requirements, except for those pressure relief devices designated for no detectable emissions under the provisions of section G.5.2 (a) and those pressure relief devices complying with section G.5.2 (c).

(3) All semiannual reports to the permitting authority shall include the following information:

(i) Process unit identification.

(ii) For each month during the semiannual reporting period,

(A) Number of valves for which leaks were detected as described in section G.5.5(b) or section G.6.2,

(B) Number of valves for which leaks were not repaired as required in section G.5.5(d)(1),

(C) Number of pumps for which leaks were detected as described in section G.5.3(b), (d)(4)(ii)(A) or (B), or (d)(5)(iii),

NMED Exhibit 34

(D) Number of pumps for which leaks were not repaired as required in section G.5.3(c)(1) and (d)(6),

(E) Number of compressors for which leaks were detected as described in section G.5.3(f),

(F) Number of connectors for which leaks were detected as described in section G.5.9(b)

(G) Number of connectors for which leaks were not repaired as required in section G.5.9(d), and

(H) The facts that explain each delay of repair and, where appropriate, why a process unit shutdown was technically infeasible.

(iii) An owner or operator must include the following information in all semiannual reports:

(A) Number of pressure relief devices for which leaks were detected; and

(B) Number of pressure relief devices for which leaks were not repaired.

(iv) Dates of process unit shutdowns which occurred within the semiannual reporting period.

(v) Revisions to items reported according to paragraph (b)(1) of this section if changes have occurred since the initial report or subsequent revisions to the initial report.

(4) An owner or operator electing to comply with the provisions of section G.6.1 or section G.6.2 shall notify the permitting authority of the alternative standard selected 90 days before implementing either of the provisions.

(5) An owner or operator shall report the results of all performance tests to the permitting authority.

NMED Exhibit 34

G.9 Definitions

As used in this model rule, all terms not defined in section G for equipment leaks at natural gas processing plants shall have the meaning given them in subpart VVa of part 60 and the following terms shall have the specific meanings given them.

Alaskan North Slope means the approximately 69,000 square-mile area extending from the Brooks Range to the Arctic Ocean.

Equipment, as used in the standards and requirements in this rule relative to the equipment leaks of VOC from onshore natural gas processing plants, means each pump, pressure relief device, open-ended valve or line, valve, and flange or other connector that is in VOC service or in wet gas service, and any device or system required by those same standards and requirements in this rule.

Field gas means feedstock gas entering the natural gas processing plant.

Field gas gathering means the system used transport field gas from a field to the main pipeline in the area.

Completion combustion device means any ignition device, installed horizontally or vertically, used in exploration and production operations to combust otherwise vented emissions from completions. Completion combustion devices include pit flares.

Flare means a thermal oxidation system using an open (without enclosure) flame. Completion combustion devices as defined in this section are not considered flares.

Gas processing plant process unit means equipment assembled for the extraction of natural gas liquids from field gas, the fractionation of the liquids into natural gas products, or other operations associated with the processing of natural gas products. A process unit can operate independently if supplied with sufficient feed or raw materials and sufficient storage facilities for the products.

In light liquid service means that the piece of equipment contains a liquid that meets the conditions specified in sections G.7(e) and G.3(e)(2).

In wet gas service means that a piece of equipment (except compressors and sampling connection systems) contains or contacts the field gas before the extraction step at a gas processing plant process unit.

Natural gas processing plant (gas plant) means any processing site engaged in the extraction of natural gas liquids from field gas, fractionation of mixed natural gas liquids to natural gas products, or both. A Joule-Thompson valve, a dew point depression valve, or an isolated or standalone Joule-Thompson skid is not a natural gas processing plant.

Non-fractionating plant means any gas plant that does not fractionate mixed natural gas liquids into natural gas products.

Onshore means all facilities except those that are located in the territorial seas or on the outer continental shelf.

Process unit means components assembled for the extraction of natural gas liquids from field gas, the fractionation of the liquids into natural gas products, or other operations associated with the processing of natural gas products. A process unit can operate independently if supplied with sufficient feed or raw materials and sufficient storage facilities for the products.

Underground storage vessel means a storage vessel stored below ground.

NMED Exhibit 34

H Pneumatic Pumps: VOC Emissions Control Requirements

H.1 Applicability

Each pneumatic pump, which is a natural gas-driven diaphragm pump located at:

(a) A natural gas processing plant; or

(b) A well site. A natural gas-driven diaphragm pump at a well site that is in operation less than 90 days per calendar year is not a source subject to VOC requirements under this rule provided that the owner/operator keeps records of the days of operation each calendar year and submits such records to the regulatory authority upon request. For the purposes of this rule, any period of operation during a calendar day counts toward the 90 calendar day threshold.

For purposes of the requirements specified in this section, we refer to these pumps as natural gas-driven pneumatic pumps.

H.2 What VOC Emission Reduction Requirements Apply to Natural Gas-Driven Pneumatic Pumps?

For each natural gas-driven pneumatic pump, you must comply with the VOC emission control requirements, based on VOC, in either paragraph (a) or (b)(1) of this section, as applicable.

(a) Each natural gas-driven pneumatic pump at a natural gas processing plant must have a VOC emission rate of zero.

(b)(1) For each natural gas-driven pneumatic pump at a well site, you must reduce natural gas emissions by 95.0 percent, except as provided in paragraphs (b)(2), (3) and (4) of this section.

(2) You are not required to install a control device solely for the purpose of complying with the 95.0 percent reduction requirement of paragraph (b)(1) of this section. If you do not

NMED Exhibit 34

have a control device installed on site by the compliance date established by your regulatory authority and you do not have the ability to route to a process, then you must comply instead with the provisions of paragraph (b)(2)(i) and (ii) of this section.

(i) Submit a certification in accordance with section H.5(b)(1)(i) in your next annual report, certifying that there is no available control device or process on site and maintain the records in section H.5(a)(1)(i) and (ii).

(ii) If you subsequently install a control device or have the ability to route to a process, you are no longer required to submit the certification in section H.2(b)(2)(i) and must submit the information in section H.5(b)(2) in your next annual report and maintain the records in sections H.5(a)(1)(i), (ii) and (iii) and H.5(a)(2). You must be in compliance with the requirements of paragraph (b)(1) of this section within 30 days of startup of the control device or within 30 days of the ability to route to a process.

(3) If the control device available on site is unable to achieve a 95.0 percent reduction and there is no ability to route the emissions to a process, you must still route the natural gas-driven pneumatic pump's emissions to that existing control device. If you route the pneumatic pump to a control device installed on site that is designed to achieve less than a 95.0 percent reduction, you must submit the information specified in section H.5(b)(1)(iii) in your next annual report and maintain the records in sections H.5(a)(1)(i), (ii) and (iii) and H.5(a)(2).

(4) If you determine, through an engineering assessment, that routing a pneumatic pump to a control device or a process is technically infeasible, the requirements specified in paragraph (b)(4)(i) through (iv) of this section must be met.

(i) You must conduct the assessment of technical infeasibility in accordance with the criteria in paragraph (b)(4)(iii) of this section and have it certified by a qualified professional engineer in accordance with paragraph (b)(4)(ii) of this section.

(ii) The following certification, signed and dated by the qualified professional engineer shall state: "I certify that the assessment of technical infeasibility was prepared under my direction or supervision. I further certify that the assessment was conducted and this report was

NMED Exhibit 34

prepared pursuant to the requirements of section H.2(b)(4)(iii) of this rule. Based on my professional knowledge and experience, and inquiry of personnel involved in the assessment, the certification submitted herein is true, accurate, and complete. I am aware that there are penalties for knowingly submitting false information."

(iii) The assessment of technical feasibility to route emissions from the pneumatic pump to an existing control device on site or to a process must include, but is not limited to, safety considerations, distance from the control device, pressure losses and differentials in the closed vent system and the ability of the control device to handle the pneumatic pump emissions which are routed to them. You must prepare the assessment of technical infeasibility under the direction or supervision of the qualified professional engineer who signs the certification in accordance with paragraph (b)(2)(ii) of this section.

(iv) You must maintain the records specified in section H.5(a)(1)(iv).

(5) If the pneumatic pump is routed to a control device or a process and the control device or process is subsequently removed from the location or is no longer available, you are no longer required to be in compliance with the requirements of paragraph (b)(1) of this section, and instead must comply with paragraph (b)(2) of this section and report the change in your next annual report in accordance with section H.5(b)(2)(iii).

(c) If you use a control device or route to a process to reduce emissions, you must connect the natural gas-driven pneumatic pump subject to VOC emission control requirements through a closed vent system that meets the requirements of section D.1(b).

(d) You must demonstrate initial compliance with standards that apply to natural gas-driven pneumatic pumps subject to VOC emission requirements as required by section H.3.

(e) You must demonstrate continuous compliance with standards that apply to natural gas-driven pneumatic pump sources subject to VOC emission requirements as required by section H.4.

NMED Exhibit 34

(f) You must perform the reporting as required by section H.5(b) and the recordkeeping as required by H.5(a).

H.3 Initial Compliance Demonstration Requirements

You must demonstrate initial compliance by the compliance date established by your regulatory authority by demonstrating compliance with the VOC emission control requirements for natural gas-driven pneumatic pumps specified in paragraphs (a) through (h) of this section, as applicable.

(a) If you own or operate a pneumatic pump located at a natural gas processing plant, your pneumatic pump must be driven by a gas other than natural gas, resulting in zero VOC emissions.

(b) If you own or operate a natural gas-driven pneumatic pump located at a well site, you must reduce emissions in accordance with section H.2(b)(1), and you must collect the pneumatic pump emissions through a closed vent system that meets the requirements of section D.1(b).

(c) If you own or operate a natural gas-driven pneumatic pump located at a well site and there is no control device or process available on site, you must submit the certification in section H.5(b)(1)(i).

(d) If you own or operate a natural gas-driven pneumatic pump located at a well site, and you are unable to route to an existing control device due to technical infeasibility, and you are unable to route to a process, you must submit the certification in section H.5(b)(1)(ii).

(e) If you own or operate a natural gas-driven pneumatic pump located at a well site and you reduce emissions in accordance with section H.2(b)(3), you must collect the pneumatic pump emissions through a closed vent system that meets the requirements of section D.1(b).

(f) If you are required to collect emissions from a natural gas-driven pneumatic pump through a closed vent system, you must conduct the initial closed vent system inspection required in section D.2 by the date established by your regulatory authority.

(g) You must include a listing of the natural gas-driven pneumatic pumps subject to VOC emission requirements specified in paragraphs (a) through (e) of this section in the initial annual report submitted for your natural gas-driven pneumatic pump according to the requirements of section H.5(b).

(h) You must maintain the records as specified in section H.5(a) for each natural gas-driven pneumatic pump subject to the VOC emission control requirements of section H.

H.4 Continuous Compliance Demonstration Requirements

For each natural gas-driven pneumatic pump you must demonstrate continuous compliance according to paragraphs (a) and (b) of this section.

(a) If you are required to collect emissions from a natural gas-driven pneumatic pump through a closed vent system, you must conduct the periodic closed vent system inspections required in section D.2, as applicable.

(b) You must submit the annual reports required by section H.5(b) and maintain the records as specified in section H.5(a).

H.5 Recordkeeping and Reporting Requirements

(a) *Recordkeeping requirements.*

(1) For each natural gas-driven pneumatic pump subject to VOC emission control requirements, you must maintain the records identified in paragraphs (a)(1)(i) through (v) of this section, as applicable, onsite or at the nearest local field office for at least five years.

(i) Records of the date that an individual natural gas-driven pneumatic pump is required to comply with the rule (as established by the regulatory authority), location and manufacturer specifications for each natural gas-driven pneumatic pump.

(ii) Records of deviations in cases where the natural gas-driven pneumatic pump was not operated in compliance with the requirements specified in section H.2.

(iii) Records on the control device used for control of emissions from a natural gas-driven pneumatic pump including the installation date, manufacturer's specifications, and if the control device is designed to achieve less than a 95.0 percent emission reduction, a design evaluation or manufacturer's specifications indicating the percentage reduction the control device is designed to achieve.

(iv) Records substantiating a claim according to H.2(b)(4) that it is technically infeasible to capture and route emissions from a pneumatic pump to a control device or process, including the qualified professional engineer certification according to H.2(b)(4)(ii) and the records of the engineering assessment of technical infeasibility performed according to H.2.(b)(4)(iii).

(v) You must retain copies of all certifications, engineering assessments and related records for a period of five years and make them available if directed by the regulatory authority.

(2) If you are required to collect emissions from a natural gas-driven pneumatic pump through a closed vent system, you must maintain the records identified in paragraphs (a)(2)(i) through (iv) of this section, as applicable, onsite or at the nearest local field office for at least five years.

(i) Records of each closed vent system inspection required under section D.2(a) and (b).

(ii) If you are subject to the bypass requirements of section D.1(b)(3), a record of each inspection or a record of each time the key is checked out or a record of each time the alarm is sounded.

(iii) If you are subject to the closed vent system no detectable emissions requirements of section D.2(e), records of the monitoring conducted in accordance with section D.2(e).

(iv) For each closed vent system routing to a control device or process, the records of the assessment conducted according to section D.1(b)(4):

(A) A copy of the assessment conducted according to section D.1(b)(4);

(B) A copy of the certification according to section D.1(b)(4)(i); and

NMED Exhibit 34

(C) The owner or operator shall retain copies of all certifications, assessments and any related records for a period of five years, and make them available if directed by the regulatory authority.

(b) *Reporting Requirements*.

For each natural gas-driven pneumatic pump subject to VOC emission control requirements, annual reports are required to include the information specified in paragraphs (b)(1) through (4) of this section.

(1) In the initial annual report, a certification that the natural gas-driven pneumatic pump meets one of the conditions described in paragraphs (b)(1)(i), (ii) or (iii) of this section.

(i) No control device or process is available on site.

(ii) A control device or process is available on site and the owner or operator has determined in accordance with H.2(b)(4) that it is technically infeasible to capture and route the emissions to the control device or process.

(iii) Emissions from the natural gas-driven pneumatic pump are routed to a control device or process. If the control device is designed to achieve less than 95.0 percent emissions reduction, specify the percent emissions reductions the control device is designed to achieve.

(2) For any natural gas-driven pneumatic pump which has been previously reported as required under paragraph (b)(1) of this section and for which a change in the reported condition has occurred during the reporting period, provide the identification of the natural gas-driven pneumatic pump and the date it was previously reported and a certification that the pneumatic pump meets one of the conditions described in paragraphs (b)(2)(i), (ii) or (iii) or (iv) of this section.

(i) A control device has been added to the location and the pneumatic pump now reports according to paragraph (b)(1)(iii) of this section.

NMED Exhibit 34

(ii) A control device has been added to the location and the pneumatic pump now reports according to paragraph (b)(1)(ii) of this section.

(iii) A control device or process has been removed from the location or otherwise is no longer available and the pneumatic pump now report according to paragraph (b)(1)(i) of this section.

(iv) A control device or process has been removed from the location or is otherwise no longer available and the owner or operator has determined in accordance with H.2(b)(4) through an engineering evaluation that it is technically infeasible to capture and route the emissions to another control device or process.

(3) Records of deviations specified in paragraph (a)(1)(ii) of this section that occurred during the reporting period.

(4) If you are required to collect emissions from a natural gas-driven pneumatic pump through a closed vent system, the records specified in paragraphs (a)(2)(i), (ii), (iii) and (iv)(B) of this section.

H.6 Definitions

Certifying official means one of the following:

(1) For a corporation: A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or a duly authorized representative of such person if the representative is responsible for the overall operation of one or more manufacturing, production, or operating facilities applying for or subject to a permit and either:

(i) The facilities employ more than 250 persons or have gross annual sales or expenditures exceeding $25 million (in second quarter 1980 dollars); or

(ii) The Administrator is notified of such delegation of authority prior to the exercise of that authority. The Administrator reserves the right to evaluate such delegation;

NMED Exhibit 34

(2) For a partnership (including, but not limited to, general partnerships, limited partnerships, and limited liability partnerships) or sole proprietorship: A general partner or the proprietor, respectively. If a general partner is a corporation, the provisions of paragraph (1) of this definition apply;

(3) For a municipality, State, Federal, or other public agency: Either a principal executive officer or ranking elected official. For the purposes of this part, a principal executive officer of a Federal agency includes the chief executive officer having responsibility for the overall operations of a principal geographic unit of the agency (*e.g.*, a Regional Administrator of EPA); or

(4) For facilities subject to requirements:

(i) The designated representative in so far as actions, standards, requirements, or prohibitions under title IV of the Clean Air Act or the regulations promulgated thereunder are concerned; or

(ii) The designated representative for any other purposes under part 60.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart including, but not limited to, any emission limit, operating limit, or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Fails to meet any emission limit, operating limit, or work practice standard in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is permitted by this subpart.

Natural gas-driven diaphragm pump means a positive displacement pump powered by pressurized natural gas that uses the reciprocating action of flexible diaphragms in conjunction

NMED Exhibit 34

with check valves to pump a fluid. A pump in which a fluid is displaced by a piston driven by a diaphragm is not considered a diaphragm pump. A lean glycol circulation pump that relies on energy exchange with the rich glycol from the contactor is not considered a diaphragm pump.

Natural gas processing plant (gas plant) means any processing site engaged in the extraction of natural gas liquids from field gas, fractionation of mixed natural gas liquids to natural gas products, or both. A Joule-Thompson valve, a dew depression valve, or an isolated or standalone Joule-Thompson skid is not a natural gas processing plant.

Qualified Professional Engineer means an individual who is licensed by a state as a Professional Engineer to practice one or more disciplines of engineering and who is qualified by education, technical knowledge and experience to make the specific technical certifications required under this subpart. Professional engineers making these certifications must be currently licensed in at least one state in which the certifying official is located.

Routed to a process or *route to a process* means the emissions are conveyed via a closed vent system to any enclosed portion of a process that is operational where the emissions are predominantly recycled and/or consumed in the same manner as a material that fulfills the same function in the process and/or transformed by chemical reaction into materials that are not regulated materials and/or incorporated into a product; and/or recovered.

Surface site means any combination of one or more graded pad sites, gravel pad sites, foundations, platforms, or the immediate physical location upon which equipment is physically affixed.

Well means a hole drilled for the purpose of producing oil or natural gas, or a well into which fluids are injected.

Well site means one or more surface sites that are constructed for the drilling and subsequent operation of any oil well, natural gas well, or injection well.

NMED Exhibit 34

I Fugitive Emissions Components VOC Emissions Control Requirements

I.1 Applicability

(a) The collection of fugitive emission components at a well site with wells that produce, on average, greater than 15 barrel equivalents per day. The fugitive emissions requirements of this section do not apply to well sites that only contain wellheads. Whether a separate tank battery surface site is subject to this rule has no effect on the status of a well site that only contains wellheads.

(b) The collection of fugitive emission components at a gathering and boosting station located from the wellhead to the point of custody transfer to the natural gas transmission and storage segment or to an oil pipeline.

I.2 What VOC Emission Control Requirements Apply to the Collection of Fugitive Emission Components at a Well Site and a Gathering and Boosting Station?

For fugitive emissions, VOC emission control requirements apply to the collection of fugitive emission components at a well site and gathering and boosting station (that is located from the wellhead to the point of custody transfer to the natural gas transmission and storage segment or to an oil pipeline), as specified in paragraphs (a) through (f) of this section for monitoring the collection of fugitive emission components. These requirements are independent of the closed vent system and cover requirements in section D. The collection of fugitive emissions at a well site with a gas to oil ratio of less than 300 scf of gas per barrel of oil produced are subject only to the requirements in paragraph (g) of this section.

(a) You must monitor all fugitive emission components, as defined in section I.6, in accordance with paragraphs (b) through (e) of this section and section I.2(a) and I.3(a). You must

NMED Exhibit 34

repair all sources of fugitive emissions in accordance with paragraph (f) of this section. You must keep records in accordance with section I.5(a) and report in accordance with section I.5(b). For purposes of this section, fugitive emissions are defined as: any visible emission from a fugitive emission component using optical gas imaging or an instrument reading of 500 ppm or greater using EPA Method 21.

(b) You must develop an emissions monitoring plan that covers the collection of fugitive emission components at well sites and gathering and boosting stations within each company-defined area in accordance with paragraphs (c) and (d) of this section.

(c) Fugitive emissions monitoring plans must include the elements specified in paragraphs (c)(1) through (c)(8) of this section, at a minimum.

(1) Frequency for conducting surveys. Monitoring surveys must be conducted at least as frequently as required by sections I.3 and section I.4 of this section.

(2) Technique for determining fugitive emissions (*i.e.*, EPA Method 21 at 40 CFR part 60, appendix A-7, or optical gas imaging).

(3) Manufacturer and model number of fugitive emission detection equipment to be used.

(4) Procedures and timeframes for identifying and fixing fugitive emission components from which fugitive emissions are detected, including timeframes for fugitive emission components that are unsafe to repair. Your repair schedule must meet the requirements of paragraph (f) of this section at a minimum.

(5) Procedures and timeframes for verifying fugitive emission component repairs.

(6) Records that will be kept and the length of time records will be kept.

(7) If you are using optical gas imaging, your plan must also include the elements specified in paragraphs (c)(7)(i) through (vii) of this section.

(i) Verification that your optical gas imaging equipment meets the specifications of paragraphs (c)(7)(i)(A) and (B) of this section. This verification is an initial verification and may be performed by the facility, by the manufacturer, or by a third party. For purposes of complying with the fugitive emissions monitoring program with optical gas imaging, a fugitive emission is defined as any visible emissions observed using optical gas imaging.

(A) Your optical gas imaging equipment must be capable of imaging gases in the spectral range for the compound of highest concentration in the potential fugitive emissions.

(B) Your optical gas imaging equipment must be capable of imaging a gas that is half methane, half propane at a concentration of 10,000 ppm at a flow rate of ≤60 g/hr from a quarter inch diameter orifice.

(ii) Procedure for a daily verification check.

(iii) Procedure for determining the operator's maximum viewing distance from the equipment and how the operator will ensure that this distance is maintained.

(iv) Procedure for determining maximum wind speed during which monitoring can be performed and how the operator will ensure monitoring occurs only at wind speeds below this threshold.

(v) Procedures for conducting surveys, including the items specified in paragraphs (c)(7)(v)(A) through (C) of this section.

(A) How the operator will ensure an adequate thermal background is present in order to view potential fugitive emissions.

(B) How the operator will deal with adverse monitoring conditions, such as wind.

(C) How the operator will deal with interferences (*e.g.*, steam).

(vi) Training and experience needed prior to performing surveys.

(vii) Procedures for calibration and maintenance. At a minimum, procedures must comply with those recommended by the manufacturer.

(8) If you are using EPA Method 21 at 40 CFR part 60, appendix A-7, your plan must also include the elements specified in paragraphs (c)(8)(i) and (ii) of this section. For the purposes of complying with the fugitive emissions monitoring program using EPA Method 21, a fugitive emission is defined as an instrument reading of 500 ppm or greater.

(i) Verification that your monitoring equipment meets the requirements specified in Section 6.0 of EPA Method 21 at 40 CFR part 60, appendix A-7. For purposes of instrument capability, the fugitive emissions definition shall be 500 ppm or greater methane using a FID-based instrument. If you wish to use an analyzer other than a FID-based instrument, you must develop a site-specific fugitive emission definition that would be equivalent to 500 ppm methane using a FID-based instrument (*e.g.*, 10.6 eV PID with a specified isobutylene concentration as the fugitive emission definition would provide equivalent response to your compound of interest).

(ii) Procedures for conducting surveys. At a minimum, the procedures shall ensure that the surveys comply with the relevant sections of EPA Method 21 at 40 CFR part 60, appendix A-7, including Section 8.3.1.

(d) Each fugitive emissions monitoring plan must include the elements specified in paragraphs (d)(1) through (d)(4) of this section, at a minimum, as applicable.

(1) Sitemap.

(2) If you are using OGI, a defined observation path that ensures that all fugitive emissions components are within sight of the path. The observation path must account for interferences.

(3) If you are using EPA Method 21, your plan must also include a list of fugitive emissions components to be monitored and the method for determining location of fugitive

emissions components to be monitored in the field (*e.g.*, tagging, identification on a process and instrumentation diagram, etc.).

(4) Your plan must also include the written plan developed for all of the fugitive emission components designated as difficult-to-monitor in accordance with section I.4(a)(3), and the written plan for fugitive emission components designated as unsafe-to-monitor in accordance with section I.4(a)(4).

(e) Each monitoring survey shall observe each fugitive emissions component, as defined section I.6, for fugitive emissions.

(f) Each identified source of fugitive emissions shall be repaired or replaced in accordance with paragraphs (f)(1) and (2) of this section. For fugitive emissions components also subject to the repair provisions of sections A.4(d)(4) through (7) and D.2(e)(9) through (12), those provisions apply instead to those closed vent system and covers, and the repair provisions of paragraphs (f)(1) and (2) of this section do not apply to those closed vent systems and covers.

(1) Each identified source of fugitive emissions shall be repaired or replaced as soon as practicable, but no later than 30 calendar days after detection of the fugitive emissions.

(2) If the repair or replacement is technically infeasible, would require a vent blowdown, a gathering and boosting station shutdown, a well shutdown or well shut-in, or would be unsafe to repair during operation of the unit, the repair or replacement must be completed during the next gathering and boosting station shutdown, well shutdown, well shut-in, after an unscheduled, planned or emergency vent blowdown or within 2 years, whichever is earlier.

(3) Each repaired or replaced fugitive emissions component must be resurveyed as soon as practical, but no later than 30 days after being repaired or replaced, to ensure that there are no fugitive emissions.

(i) For repairs that cannot be made during the monitoring survey when the fugitive emissions are initially found, the operator may resurvey the repaired fugitive emissions components using EPA Method 21 or optical gas imaging within 30 days of being repaired.

NMED Exhibit 34

(ii) For each repair or replacement that cannot be made during the monitoring survey when the fugitive emissions are initially found, a digital photograph must be taken of that component or the component must be tagged for identification purposes. The digital photograph must include the date that the photograph was taken, must clearly identify the component by location within the site (*e.g.*, the latitude and longitude of the component or by other descriptive landmarks visible in the picture).

(iii) Operators that use EPA Method 21 to resurvey the repaired fugitive emissions components, are subject to the resurvey provisions specified in paragraphs (f)(3)(iii)(A) and (B) of this section.

(A) A fugitive emissions component is repaired when the EPA Method 21 instrument indicates a concentration of less than 500 ppm above background or when no soap bubbles are observed when the alternative screening procedures specified in section 8.3.3 of EPA Method 21 are used.

(B) Operators must use the EPA Method 21 monitoring requirements specified in paragraph (c)(8)(ii) of this section or the alternative screening procedures specified in section 8.3.3 of EPA Method 21.

(iv) Operators that use optical gas imaging to resurvey the repaired fugitive emissions components, are subject to the resurvey provisions specified in paragraphs (f)(3)(iv)(A) and (B) of this section.

(A) A fugitive emissions component is repaired when the optical gas imaging instrument shows no indication of visible emissions.

(B) Operators must use the optical gas imaging monitoring requirements specified in paragraph (c)(7) of this section.

(g) For each well with less than 300 scf of gas per stock tank barrel of oil produced, you must comply with paragraphs (g)(1) and (g)(2) of this section.

(1) You must determine the gas to oil ratio of your well using generally accepted methods.

(2) You must maintain the records specified in section I.5 (a)(4)

I.3 Initial Compliance Demonstration

To achieve initial compliance with the fugitive emission standards for each collection of fugitive emissions components at a well site and each collection of fugitive emissions components at a gathering and boosting station, you must comply with paragraphs (a) through (e) or (f), if applicable, of this section.

(a) You must develop a fugitive emissions monitoring plan as required in sections I.2(b), (c), and (d).

(b) You must conduct an initial monitoring survey as required in paragraphs (b)(1) and (2), as applicable

(1) Each well site with a collection of fugitive emissions components must conduct an initial monitoring survey within 60 days of becoming subject to VOC emission control requirements of section I.

(2) Each gathering and boosting station with a collection of fugitive emissions components must conduct an initial monitoring survey within 60 days of being subject to VOC emission control requirements of section I.

(c) You must maintain the records specified in section I.5(a).

(d) You must repair or replace each identified source of fugitive emissions as required in section I.2(f).

(e) You must submit the initial annual report for each collection of fugitive emissions components at a well site and each collection of fugitive emissions components at a gathering and boosting station as required in section I.5(b).

(f) You must determine the gas to oil ratio of your well using generally accepted methods and maintain the records specified in section I.5(a)(4).

I.4 Continuous Compliance Demonstration

For each collection of fugitive emissions components at a well site and each collection of fugitive emissions components at a gathering and boosting station, you must demonstrate continuous compliance with the fugitive emission standards specified in section I.2 according to paragraphs (a) through (d) or (e), if applicable, of this section.

(a) You must conduct periodic monitoring surveys of each collection of fugitive emissions components at a well site and a gathering and boosting station subject to VOC emission control requirements under section I at the frequencies specified in paragraphs (a)(1) and (a)(2) of this section, with the exceptions noted in paragraphs (a)(3) through (a)(5) of this section.

(1) A monitoring survey of each collection of fugitive emissions components at a well site within a company-defined area must be conducted at least semiannually after the initial survey. Consecutive semiannual monitoring surveys must be conducted at least 4 months apart.

(2) A monitoring survey of the collection of fugitive emissions components at a gathering and boosting station within a company-defined area must be conducted at least quarterly after the initial survey. Consecutive quarterly monitoring surveys must be conducted at least 60 days apart.

(3) Fugitive emissions components that cannot be monitored without elevating the monitoring personnel more than 2 meters above the surface may be designated as difficult-to-monitor. Fugitive emissions components that are designated difficult-to-monitor must meet the specifications of paragraphs (a)(3)(i) through (iv) of this section.

(i) A written plan must be developed for all of the fugitive emissions components designated difficult-to-monitor. This written plan must be incorporated into the fugitive emissions monitoring plan required by sections I.2(b), (c), and (d).

(ii) The plan must include the identification and location of each fugitive emissions component designated as difficult-to-monitor.

(iii) The plan must include an explanation of why each fugitive emissions component designated as difficult-to-monitor is difficult-to-monitor.

(iv) The plan must include a schedule for monitoring the difficult-to-monitor fugitive emissions components at least once per calendar year.

(4) Fugitive emissions components that cannot be monitored because monitoring personnel would be exposed to immediate danger while conducting a monitoring survey may be designated as unsafe-to-monitor. Fugitive emissions components that are designated unsafe-to-monitor must meet the specifications of paragraphs (a)(4)(i) through (iv) of this section.

(i) A written plan must be developed for all of the fugitive emissions components designated unsafe-to-monitor. This written plan must be incorporated into the fugitive emissions monitoring plan required by sections I.2(b), (c), and (d).

(ii) The plan must include the identification and location of each fugitive emissions component designated as unsafe-to-monitor.

(iii) The plan must include an explanation of why each fugitive emissions component designated as unsafe-to-monitor is unsafe-to-monitor.

(iv) The plan must include a schedule for monitoring the fugitive emissions components designated as unsafe-to-monitor.

(5) The requirements of paragraph (a)(2) of this section are waived for any collection of fugitive emissions components at a gathering and boosting station located within an area that has an average calendar month temperature below 0°Fahrenheit for two of three consecutive calendar months of a quarterly monitoring period. The calendar month temperature average for each month within the quarterly monitoring period must be determined using historical monthly average temperatures over the previous three years as reported by a National Oceanic and Atmospheric Administration source or other source approved by the Administrator. The

NMED Exhibit 34

requirements of paragraph (a)(2) of this section shall not be waived for two consecutive quarterly monitoring periods.

(b) You must repair or replace each identified source of fugitive emissions as required in section I.2(f).

(c) You must maintain the records specified in section I.5(a).

(d) You must submit annual reports for each collection of fugitive emissions components at a well site and each collection of fugitive emissions components at a gathering and boosting station as required in section I.5(b).

(e) You must recalculate the gas to oil ratio of your well using generally accepted methods annually and maintain the records as required in section I.5(a)(4).

I.5 Recordkeeping and Reporting Requirements

(a) For each collection of fugitive emissions components at a well site and each collection of fugitive emissions components at a gathering and boosting station, the records identified in paragraphs (a)(1) through (3), and (a)(4), if applicable of this section shall be maintained onsite or at the nearest local field office for at least five years.

(1) The fugitive emissions monitoring plan as required in I.2(b), (c), and (d).

(2) The records of each monitoring survey as specified in paragraphs (a)(2)(i) through (ix) of this section.

(i) Date of the survey.

(ii) Beginning and end time of the survey.

(iii) Name of operator(s) performing survey. You must note the training and experience of the operator.

(iv) Monitoring instrument used.

(v) When optical gas imaging is used to perform the survey, one or more digital photographs or videos, captured from the optical gas imaging instrument used for conduct of monitoring, of each required monitoring survey being performed. The digital photograph must include the date the photograph was taken and the latitude and longitude of the collection of fugitive emissions components at a well site or collection of fugitive emissions components at a gathering and boosting station imbedded within or stored with the digital file. As an alternative to imbedded latitude and longitude within the digital file, the digital photograph or video may consist of an image of the monitoring survey being performed with a separately operating GPS device within the same digital picture or video, provided the latitude and longitude output of the GPS unit can be clearly read in the digital image.

(vi) Fugitive emissions component identification when EPA Method 21 is used to perform the monitoring survey.

(vii) Ambient temperature, sky conditions, and maximum wind speed at the time of the survey.

(viii) Any deviations from the monitoring plan or a statement that there were no deviations from the monitoring plan.

(ix) Documentation of each fugitive emission, including the information specified in paragraphs (a)(2)(ix)(A) through (L) of this section.

(A) Location.

(B) Any deviations from the monitoring plan or a statement that there were no deviations from the monitoring plan.

(C) Number and type of components for which fugitive emissions were detected.

(D) Number and type of difficult-to-monitor and unsafe-to-monitor fugitive emission components monitored.

(E) Instrument reading of each fugitive emissions component that requires repair when EPA Method 21 is used for monitoring.

(F) Number and type of fugitive emissions components that were not repaired as required in section I.2(f).

(G) Number and type of components that were tagged as a result of not being repaired during the monitoring survey when the fugitive emissions were initially found as required in section I.2(f)(3)(ii).

(H) If a fugitive emissions component is not tagged, a digital photograph or video of each fugitive emissions component that could not be repaired during the monitoring survey when the fugitive emissions were initially found as required in section I.2(f)(3)(ii). The digital photograph or video must clearly identify the location of the component that must be repaired. Any digital photograph or video required under this paragraph can also be used to meet the requirements under paragraph (a)(2)(v) of this section, as long as the photograph or video is taken with the optical gas imaging instrument, includes the date and the latitude and longitude are either imbedded or visible in the picture.

(I) Repair methods applied in each attempt to repair the fugitive emissions components.

(J) Number and type of fugitive emission components placed on delay of repair and explanation for each delay of repair.

(K) The date of successful repair of the fugitive emissions component.

(L) Instrumentation used to resurvey a repaired fugitive emissions component that could not be repaired during the initial fugitive emissions finding.

(3) For the collection of fugitive emissions components at a gathering and boosting station, if a monitoring survey is waived under section I.4(a)(5), you must maintain records of the average calendar month temperature, including the source of the information, for each calendar month of the quarterly monitoring period for which the monitoring survey was waived.

NMED Exhibit 34

(4) For the collection of fugitive emissions at a well site with a gas to oil ratio of less than 300 scf per stock barrel of oil produced, you must maintain:

(A) A record of the gas to oil ratio analyses documenting a gas to oil ratio of less than 300 scf per stock barrel of oil produced, conducted pursuant to sections I.3(f) and I.4(e).

(B) The location of the well and the United States Well ID Number.

(C) A record of the determination signed by the certifying official. The claim must include a certification by a certifying official of truth, accuracy, and completeness. This certification shall state that, based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate and complete.

(b) Annual reports shall be submitted for the collection of fugitive emissions components at each well site and the collection of fugitive emissions components at each gathering and boosting station within the company-defined area, that are subject to VOC emission control requirements under section I. Each annual report shall include the records of each monitoring survey including the information specified in paragraphs (b)(1) through (12) of this section. For the collection of fugitive emissions components at a gathering and boosting station, if a monitoring survey is waived under section I.4(a)(5), you must include in your annual report the fact that a monitoring survey was waived and the calendar months that make up the quarterly monitoring period for which the monitoring survey was waived. Multiple collection of fugitive emissions components at a well site or collection of fugitive emissions as a gathering and boosting station subject to VOC emission control requirements under section I may be included in a single annual report.

(1) Date of the survey.

(2) Beginning and end time of the survey.

(3) Name of operator(s) performing survey. If the survey is performed by optical gas imaging, you must note the training and experience of the operator.

(4) Ambient temperature, sky conditions, and maximum wind speed at the time of the survey.

(5) Monitoring instrument used.

(6) Any deviations from the monitoring plan or a statement that there were no deviations from the monitoring plan.

(7) Number and type of components for which fugitive emissions were detected.

(8) Number and type of fugitive emissions components that were not repaired as required in section I.2(f).

(9) Number and type of difficult-to-monitor and unsafe-to-monitor fugitive emission components monitored.

(10) The date of successful repair of the fugitive emissions component.

(11) Number and type of fugitive emission components placed on delay of repair and explanation for each delay of repair.

(12) Type of instrument used to resurvey a repaired fugitive emissions component that could not be repaired during the initial fugitive emissions finding.

I.6 Definitions

Certifying official means one of the following:

(1) For a corporation: A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or a duly authorized representative of such person if the representative is responsible for the overall operation of one or more manufacturing, production, or operating facilities applying for or subject to a permit and either:

(i) The facilities employ more than 250 persons or have gross annual sales or expenditures exceeding $25 million (in second quarter 1980 dollars); or

(ii) The Administrator is notified of such delegation of authority prior to the exercise of that authority. The Administrator reserves the right to evaluate such delegation;

(2) For a partnership (including, but not limited to, general partnerships, limited partnerships, and limited liability partnerships) or sole proprietorship: A general partner or the proprietor, respectively. If a general partner is a corporation, the provisions of paragraph (1) of this definition apply;

(3) For a municipality, State, Federal, or other public agency: Either a principal executive officer or ranking elected official. For the purposes of this part, a principal executive officer of a Federal agency includes the chief executive officer having responsibility for the overall operations of a principal geographic unit of the agency (*e.g.*, a Regional Administrator of EPA); or

(4) For facilities subject to requirements:

(i) The designated representative in so far as actions, standards, requirements, or prohibitions under title IV of the Clean Air Act or the regulations promulgated thereunder are concerned; or

(ii) The designated representative for any other purposes under part 60.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart including, but not limited to, any emission limit, operating limit, or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

NMED Exhibit 34

(3) Fails to meet any emission limit, operating limit, or work practice standard in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is permitted by this subpart.

Gathering and boosting station means any permanent combination of one or more compressors that collects natural gas from well sites and moves the natural gas at increased pressure into gathering pipelines to the natural gas processing plant or into the pipeline. The combination of one or more compressors located at a well site, or located at an onshore natural gas processing plant, is not a gathering and boosting station for purposes of this section.

Gas to oil ratio (GOR) means the ratio of the volume of gas at standard temperature and pressure that is produced from a volume of oil when depressurized to standard temperature and pressure.

Intermediate hydrocarbon liquid means any naturally occurring, unrefined petroleum liquid.

Flow line means a pipeline used to transport oil and/or gas to a processing facility or a mainline pipeline.

Fugitive emissions component means any component that has the potential to emit fugitive emissions of VOC at a well site or gathering and boosting station including, but not limited to, valves, connectors, pressure relief devices, open-ended lines, flanges, covers and closed vent systems not subject to section A.2(c) or (d) or section D, thief hatches or other openings on a controlled storage vessel not subject to section A, compressors, instruments, and meters. Devices that vent as part of normal operations, such as natural gas-driven pneumatic controllers or natural gas-driven pumps, are not fugitive emissions components, insofar as the gas discharged from the device's vent is not considered a fugitive emission. Emissions originating from other than the vent, such as the thief hatch on a controlled storage vessel, would be considered fugitive emissions.

Surface site means any combination of one or more graded pad sites, gravel pad sites, foundations, platforms, or the immediate physical location upon which equipment is physically affixed.

Well means a hole drilled for the purpose of producing oil or natural gas, or a well into which fluids are injected.

Well site means one or more surface sites that are constructed for the drilling and subsequent operation of any oil well, natural gas well, or injection well. For purposes of the fugitive emissions standards at section I.1, *well site* also means a separate tank battery surface site collecting crude oil, condensate, intermediate hydrocarbon liquids, or produced water from wells not located at the well site (*e.g.*, centralized tank batteries).

Wellhead means the piping, casing, tubing and connected valves protruding above the earth's surface for an oil and/or natural gas well. The wellhead ends where the flow line connects to a wellhead valve. The wellhead does not include other equipment at the well site except for any conveyance through which gas is vented to the atmosphere.

Publication No. EPA-453/B-16-001
September, 2016

NMED Exhibit 34

Subpart OOOO—Standards of Performance for Crude Oil and Natural Gas Facilities for Which Construction, Modification, or Reconstruction Commenced After August 23, 2011, and on or Before September 18, 2015

§60.5360 What is the purpose of this subpart?

This subpart establishes emission standards and compliance schedules for the control of volatile organic compounds (VOC) and sulfur dioxide (SO_2) emissions from affected facilities in the crude oil and natural gas production source category that commence construction, modification, or reconstruction after August 23, 2011, and on or before September 18, 2015.

[85 FR 57069, Sept. 14, 2020]

Back to Top

§60.5365 Am I subject to this subpart?

You are subject to the applicable provisions of this subpart if you are the owner or operator of one or more of the onshore affected facilities listed in paragraphs (a) through (g) of this section that is located within the Crude Oil and Natural Gas Production source category, as defined in §60.5430 for which you commence construction, modification, or reconstruction after August 23, 2011, and on or before September 18, 2015.

(a) Each gas well affected facility, which is a single natural gas well.

(b) Each centrifugal compressor affected facility, which is a single centrifugal compressor using wet seals. A centrifugal compressor located at a well site, or an adjacent well site and servicing more than one well site, is not an affected facility under this subpart.

(c) Each reciprocating compressor affected facility, which is a single reciprocating compressor. A reciprocating compressor located at a well site, or an adjacent well site and servicing more than one well site, is not an affected facility under this subpart.

(d)(1) For the oil and natural gas production segment, each pneumatic controller affected facility, which is a single continuous bleed natural gas-driven pneumatic controller operating at a natural gas bleed rate greater than 6 standard cubic feet per hour.

(2) [Reserved]

(3) For natural gas processing plants, each pneumatic controller affected facility, which is a single continuous bleed natural gas-driven pneumatic controller.

(e) Each storage vessel affected facility, which is a single storage vessel, and has the potential for VOC emissions equal to or greater than 6 tons per year (tpy) as determined according to this section by October 15, 2013, for Group 1 storage vessels and by April 15, 2014, or 30 days after startup (whichever is later) for Group 2 storage vessels, except as provided in paragraphs (e)(1) through (4) of this section. The potential for VOC emissions must be calculated using a generally accepted model or calculation methodology, based on the maximum average daily throughput determined for a 30-day period of production prior to the applicable emission determination deadline specified in this section. The determination may take into account requirements under a legally and practically enforceable limit in an operating permit or other requirement established under a Federal, State, local or tribal authority.

(1) For each new, modified or reconstructed storage vessel receiving liquids pursuant to the standards for gas well affected facilities in §60.5375, including wells subject to §60.5375(f), you must determine the potential for VOC emissions within 30 days after startup of production.

(2) A storage vessel affected facility that subsequently has its potential for VOC emissions decrease to less than 6 tpy shall remain an affected facility under this subpart.

(3) For storage vessels not subject to a legally and practically enforceable limit in an operating permit or other requirement established under Federal, state, local or tribal authority, any vapor from the storage vessel that is recovered and routed to a process through a VRU designed and operated as specified in this section is not required to be included in the determination of VOC potential to emit for purposes of determining affected facility status, provided you comply with the requirements in paragraphs (e)(3)(i) through (iv) of this section.

(i) You meet the cover requirements specified in §60.5411(b).

(ii) You meet the closed vent system requirements specified in §60.5411(c).

(iii) You maintain records that document compliance with paragraphs (e)(3)(i) and (ii) of this section.

(iv) In the event of removal of apparatus that recovers and routes vapor to a process, or operation that is inconsistent with the conditions specified in paragraphs (e)(3)(i) and (ii) of this section, you must determine the storage vessel's potential for VOC emissions according to this section within 30 days of such removal or operation.

(4) The following requirements apply immediately upon startup, startup of production, or return to service. A storage vessel affected facility that is reconnected to the original source of liquids is a storage vessel affected facility subject to the same requirements that applied before being removed from service. Any storage vessel that is used to replace any storage vessel affected facility is subject to the same requirements that apply to the storage vessel affected facility being replaced.

(5) A storage vessel with a capacity greater than 100,000 gallons used to recycle water that has been passed through two stage separation is not a storage vessel affected facility.

(f) The group of all equipment, except compressors, within a process unit is an affected facility.

(1) Addition or replacement of equipment for the purpose of process improvement that is accomplished without a capital expenditure shall not by itself be considered a modification under this subpart.

(2) Equipment associated with a compressor station, dehydration unit, sweetening unit, underground storage vessel, field gas gathering system, or liquefied natural gas unit is covered by §§60.5400, 60.5401, 60.5402, 60.5421, and 60.5422 of this subpart if it is located at an onshore natural gas processing plant. Equipment not located at the onshore natural gas processing plant site is exempt from the provisions of §§60.5400, 60.5401, 60.5402, 60.5421, and 60.5422 of this subpart.

(3) The equipment within a process unit of an affected facility located at onshore natural gas processing plants and described in paragraph (f) of this section are exempt from this subpart if they are subject to and controlled according to subparts VVa, GGG or GGGa of this part.

(g) Sweetening units located at onshore natural gas processing plants that process natural gas produced from either onshore or offshore wells.

(1) Each sweetening unit that processes natural gas is an affected facility; and

(2) Each sweetening unit that processes natural gas followed by a sulfur recovery unit is an affected facility.

(3) Facilities that have a design capacity less than 2 long tons per day (LT/D) of hydrogen sulfide (H_2S) in the acid gas (expressed as sulfur) are required to comply with recordkeeping and reporting requirements specified in §60.5423(c) but are not required to comply with §§60.5405 through 60.5407 and §§60.5410(g) and 60.5415(g) of this subpart.

(4) Sweetening facilities producing acid gas that is completely reinjected into oil-or-gas-bearing geologic strata or that is otherwise not released to the atmosphere are not subject to §§60.5405 through 60.5407, 60.5410(g), 60.5415(g), and 60.5423 of this subpart.

(h) The following provisions apply to gas well facilities that are hydraulically refractured.

(1) A gas well facility that conducts a well completion operation following hydraulic refracturing is not an affected facility, provided that the requirements of §60.5375 are met. For purposes of this provision, the dates specified in §60.5375(a) do not apply, and such facilities, as of October 15, 2012, must meet the requirements of §60.5375(a)(1) through (4).

(2) A well completion operation following hydraulic refracturing at a gas well facility not conducted pursuant to §60.5375 is a modification to the gas well affected facility.

(3) Refracturing of a gas well facility does not affect the modification status of other equipment, process units, storage vessels, compressors, or pneumatic controllers located at the well site.

(4) A gas well facility initially constructed after August 23, 2011, and on or before September 18, 2015 is considered an affected facility regardless of this provision.

[77 FR 49542, Aug. 16, 2012, as amended at 78 FR 58435, Sept. 23, 2013; 79 FR 79036, Dec. 31, 2014; 80 FR 48268, Aug. 12, 2015; 81 FR 35896, June 3, 2016; 85 FR 57069, Sept. 14, 2020]

Back to Top

§60.5370 When must I comply with this subpart?

(a) You must be in compliance with the standards of this subpart no later than October 15, 2012 or upon startup, whichever is later.

(b) At all times, including periods of startup, shutdown, and malfunction, owners and operators shall maintain and operate any affected facility including associated air pollution control equipment in a manner consistent with good air pollution control practice for minimizing emissions. Determination of whether acceptable operating and maintenance procedures are being used will be based on information available to the Administrator which may include but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.

(c) You are exempt from the obligation to obtain a permit under 40 CFR part 70 or 40 CFR part 71, provided you are not otherwise required by law to obtain a permit under 40 CFR 70.3(a) or 40 CFR 71.3(a). Notwithstanding the previous sentence, you must continue to comply with the provisions of this subpart.

(d) You are deemed to be in compliance with this subpart if you are in compliance with all applicable provisions of subpart OOOOa of this part.

[77 FR 49542, Aug. 16, 2012, as amended at 81 FR 35896, June 3, 2016]

Back to Top

§60.5375 What standards apply to gas well affected facilities?

If you are the owner or operator of a gas well affected facility, you must comply with paragraphs (a) through (f) of this section.

(a) Except as provided in paragraph (f) of this section, for each well completion operation with hydraulic fracturing begun prior to January 1, 2015, you must comply with the requirements of paragraphs (a)(3) and (4) of this section unless a more stringent state or local emission control requirement is applicable; optionally, you may comply with the requirements of paragraphs (a)(1) through (4) of this section. For each new well completion operation with hydraulic fracturing begun on or after January 1, 2015, you must comply with the requirements in paragraphs (a)(1) through (4) of this section. You must maintain a log as specified in paragraph (b).

(1) For each stage of the well completion operation, as defined in §60.5430, follow the requirements specified in paragraph (a)(1)(i) and (ii) of this section.

(i) During the initial flowback stage, route the flowback into one or more well completion vessels or storage vessels and commence operation of a separator unless it is technically infeasible for a separator to function. Any gas present in the initial flowback stage is not subject to control under this section.

(ii) During the separation flowback stage, route all recovered liquids from the separator to one or more well completion vessels or storage vessels, re-inject the liquids into the well or another well or route the recovered liquids to a collection system. Route the recovered gas from the separator into a gas flow line or collection system, re-inject the recovered gas into the well or another well, use the recovered gas as an on-site fuel source, or use the recovered gas for another useful purpose that a purchased fuel or raw material would serve. If it is infeasible to route the recovered gas as required above, follow the requirements in paragraph (a)(3) of this section. If, at any time during the

separation flowback stage, it is not technically feasible for a separator to function, you must comply with (a)(1)(i) of this section.

(2) All salable quality recovered gas must be routed to the gas flow line as soon as practicable. In cases where salable quality gas cannot be directed to the flow line, you must follow the requirements in paragraph (a)(3) of this section.

(3) You must capture and direct recovered gas to a completion combustion device, except in conditions that may result in a fire hazard or explosion, or where high heat emissions from a completion combustion device may negatively impact tundra, permafrost or waterways. Completion combustion devices must be equipped with a reliable continuous ignition source.

(4) You have a general duty to safely maximize resource recovery and minimize releases to the atmosphere during flowback and subsequent recovery.

(b) You must maintain a log for each well completion operation at each gas well affected facility. The log must be completed on a daily basis for the duration of the well completion operation and must contain the records specified in §60.5420(c)(1)(iii).

(c) You must demonstrate initial compliance with the standards that apply to gas well affected facilities as required by §60.5410.

(d) You must demonstrate continuous compliance with the standards that apply to gas well affected facilities as required by §60.5415.

(e) You must perform the required notification, recordkeeping and reporting as required by §60.5420.

(f)(1) For each gas well affected facility specified in paragraphs (f)(1)(i) and (ii) of this section, you must comply with the requirements of paragraphs (f)(2) and (3) of this section.

(i) Each well completion operation with hydraulic fracturing at a wildcat or delineation well.

(ii) Each well completion operation with hydraulic fracturing at a non-wildcat low pressure gas well or non-delineation low pressure gas well.

(2) Route the flowback into one or more well completion vessels and commence operation of a separator unless it is technically infeasible for a separator to function. Any gas present in the flowback before the separator can function is not subject to control under this section. You must capture and direct recovered gas to a completion combustion device, except in conditions that may result in a fire hazard or explosion, or where high heat emissions from a completion combustion device may negatively impact tundra, permafrost or waterways. Completion combustion devices must be equipped with a reliable continuous ignition source. You must also comply with paragraphs (a)(4) and (b) through (e) of this section.

(3) You must maintain records specified in §60.5420(c)(1)(iii) for wildcat, delineation and low pressure gas wells.

[77 FR 49542, Aug. 16, 2012, as amended at 79 FR 79037, Dec. 31, 2014]

Back to Top

§60.5380 What standards apply to centrifugal compressor affected facilities?

You must comply with the standards in paragraphs (a) through (d) of this section for each centrifugal compressor affected facility.

(a)(1) You must reduce VOC emissions from each centrifugal compressor wet seal fluid degassing system by 95.0 percent or greater.

(2) If you use a control device to reduce emissions, you must equip the wet seal fluid degassing system with a cover that meets the requirements of §60.5411(b), that is connected through a closed vent system that meets the requirements of §60.5411(a) and routed to a control device that meets the conditions specified in §60.5412(a), (b) and (c). As an alternative to routing the closed vent system to a control device, you may route the closed vent system to a process.

(b) You must demonstrate initial compliance with the standards that apply to centrifugal compressor affected facilities as required by §60.5410(b).

(c) You must demonstrate continuous compliance with the standards that apply to centrifugal compressor affected facilities as required by §60.5415(b).

(d) You must perform the required notification, recordkeeping, and reporting as required by §60.5420.

[77 FR 49542, Aug. 16, 2012, as amended at 78 FR 58436, Sept. 23, 2013]

Back to Top

§60.5385 What standards apply to reciprocating compressor affected facilities?

You must comply with the standards in paragraphs (a) through (d) of this section for each reciprocating compressor affected facility.

(a) You must replace the reciprocating compressor rod packing according to either paragraph (a)(1) or (2) of this section or you must comply with paragraph (a)(3) of this section.

(1) Before the compressor has operated for 26,000 hours. The number of hours of operation must be continuously monitored beginning upon initial startup of your reciprocating compressor affected facility, or October 15, 2012, or the date of the most recent reciprocating compressor rod packing replacement, whichever is later.

(2) Prior to 36 months from the date of the most recent rod packing replacement, or 36 months from the date of startup for a new reciprocating compressor for which the rod packing has not yet been replaced.

(3) Collect the emissions from the rod packing using a rod packing emissions collection system which operates under negative pressure and route the rod packing emissions to a process through a closed vent system that meets the requirements of §60.5411(a).

(b) You must demonstrate initial compliance with standards that apply to reciprocating compressor affected facilities as required by §60.5410.

(c) You must demonstrate continuous compliance with standards that apply to reciprocating compressor affected facilities as required by §60.5415.

(d) You must perform the required notification, recordkeeping, and reporting as required by §60.5420.

[77 FR 49542, Aug. 16, 2012, as amended at 79 FR 79037, Dec. 31, 2014]

Back to Top

§60.5390 What standards apply to pneumatic controller affected facilities?

For each pneumatic controller affected facility you must comply with the VOC standards, based on natural gas as a surrogate for VOC, in either paragraph (b)(1) or (c)(1) of this section, as applicable. Pneumatic controllers meeting the conditions in paragraph (a) of this section are exempt from this requirement.

(a) The requirements of paragraph (b)(1) or (c)(1) of this section are not required if you determine that the use of a pneumatic controller affected facility with a bleed rate greater than the applicable standard is required based on functional needs, including but not limited to response time, safety and positive actuation. However, you must tag such pneumatic controller with the month and year of installation, reconstruction or modification, and identification information that allows traceability to the records for that pneumatic controller, as required in §60.5420(c)(4)(ii).

(b)(1) Each pneumatic controller affected facility at a natural gas processing plant must have a bleed rate of zero.

(2) Each pneumatic controller affected facility at a natural gas processing plant must be tagged with the month and year of installation, reconstruction or modification, and identification information that allows traceability to the records for that pneumatic controller as required in §60.5420(c)(4)(iv).

(c)(1) Each pneumatic controller affected facility constructed, modified or reconstructed on or after October 15, 2013, at a location between the wellhead and a natural gas processing plant or the point of custody transfer to an oil pipeline must have a bleed rate less than or equal to 6 standard cubic feet per hour.

(2) Each pneumatic controller affected facility constructed, modified or reconstructed on or after October 15, 2013, at a location between the wellhead and a natural gas processing plant or the point of custody transfer to an oil pipeline must be tagged with the month and year of installation, reconstruction or modification, and identification information that allows traceability to the records for that controller as required in §60.5420(c)(4)(iii).

(d) You must demonstrate initial compliance with standards that apply to pneumatic controller affected facilities as required by §60.5410.

(e) You must demonstrate continuous compliance with standards that apply to pneumatic controller affected facilities as required by §60.5415.

(f) You must perform the required notification, recordkeeping, and reporting as required by §60.5420, except that you are not required to submit the notifications specified in §60.5420(a).

[77 FR 49542, Aug. 16, 2012, as amended at 78 FR 58436, Sept. 23, 2013; 79 FR 79038, Dec. 31, 2014]

Back to Top

§60.5395 What standards apply to storage vessel affected facilities?

Except as provided in paragraph (h) of this section, you must comply with the standards in this section for each storage vessel affected facility.

(a)(1) If you are the owner or operator of a Group 1 storage vessel affected facility, you must comply with paragraph (b) of this section.

(2) If you are the owner or operator of a Group 2 storage vessel affected facility, you must comply with paragraph (c) of this section.

(b) *Requirements for Group 1 storage vessel affected facilities.* If you are the owner or operator of a Group 1 storage vessel affected facility, you must comply with paragraphs (b)(1) and (2) of this section.

(1) You must submit a notification identifying each Group 1 storage vessel affected facility, including its location, with your initial annual report as specified in §60.5420(b)(6)(iv).

(2) You must comply with paragraphs (d) through (g) of this section.

(c) *Requirements for Group 2 storage vessel affected facilities.* If you are the owner or operator of a Group 2 storage vessel affected facility, you must comply with paragraphs (d) through (g) of this section.

(d) You must comply with the control requirements of paragraph (d)(1) of this section unless you meet the conditions specified in paragraph (d)(2) of this section.

(1) Reduce VOC emissions by 95.0 percent according to the schedule specified in (d)(1)(i) and (ii) of this section.

(i) For each Group 2 storage vessel affected facility, you must achieve the required emissions reductions by April 15, 2014, or within 60 days after startup, whichever is later, except as otherwise provided below in paragraph (f) of this section. For storage vessel affected facilities receiving liquids pursuant to the standards for gas well affected facilities in §60.5375, you must achieve the required emissions reductions within 60 days after startup of production as defined in §60.5430.

(ii) For each Group 1 storage vessel affected facility, you must achieve the required emissions reductions by April 15, 2015.

(2) Maintain the uncontrolled actual VOC emissions from the storage vessel affected facility at less than 4 tpy without considering control. Prior to using the uncontrolled actual VOC emission rate for compliance purposes, you must demonstrate that the uncontrolled actual VOC emissions have remained less than 4 tpy as determined monthly for 12 consecutive months. After such demonstration, you must determine the uncontrolled actual VOC emission rate each month. The uncontrolled actual VOC emissions must be calculated using a generally accepted model or calculation methodology. Monthly calculations must be based on the average throughput for the month. Monthly calculations must be separated by at least 14 days. You must comply with

paragraph (d)(1) of this section if your storage vessel affected facility meets the conditions specified in paragraphs (d)(2)(i) or (ii) of this section.

(i) If a well feeding the storage vessel affected facility undergoes fracturing or refracturing, you must comply with paragraph (d)(1) of this section as soon as liquids from the well following fracturing or refracturing are routed to the storage vessel affected facility.

(ii) If the monthly emissions determination required in this section indicates that VOC emissions from your storage vessel affected facility increase to 4 tpy or greater and the increase is not associated with fracturing or refracturing of a well feeding the storage vessel affected facility, you must comply with paragraph (d)(1) of this section within 30 days of the monthly calculation.

(e) *Control requirements.* (1) Except as required in paragraph (e)(2) of this section, if you use a control device to reduce emissions from your storage vessel affected facility, you must equip the storage vessel with a cover that meets the requirements of §60.5411(b) and is connected through a closed vent system that meets the requirements of §60.5411(c), and you must route emissions to a control device that meets the conditions specified in §60.5412(c) and (d). As an alternative to routing the closed vent system to a control device, you may route the closed vent system to a process.

(2) If you use a floating roof to reduce emissions, you must meet the requirements of §60.112b(a)(1) or (2) and the relevant monitoring, inspection, recordkeeping, and reporting requirements in 40 CFR part 60, subpart Kb.

(f) *Requirements for Group 1 and Group 2 storage vessel affected facilities that are removed from service or returned to service.* If you remove a Group 1 or Group 2 storage vessel affected facility from service, you must comply with paragraphs (f)(1) through (3) of this section. A Group 1 or Group 2 storage vessel is not an affected facility under this subpart for the period that it is removed from service.

(1) For a storage vessel affected facility to be removed from service, you must comply with the requirements of paragraph (f)(1)(i) and (ii) of this section.

(i) You must completely empty and degas the storage vessel, such that the storage vessel no longer contains crude oil, condensate, produced water or intermediate hydrocarbon liquids. A storage vessel where liquid is left on walls, as bottom clingage or in pools due to floor irregularity is considered to be completely empty.

(ii) You must submit a notification as required in §60.5420(b)(6)(vi) in your next annual report, identifying each storage vessel affected facility removed from service during the reporting period and the date of its removal from service.

(2) If a storage vessel identified in paragraph (f)(1)(ii) of this section is returned to service, you must determine its affected facility status as provided in §60.5365(e).

(3) For each storage vessel affected facility returned to service during the reporting period, you must submit a notification in your next annual report as required in §60.5420(b)(6)(vii), identifying each storage vessel affected facility and the date of its return to service.

(g) *Compliance, notification, recordkeeping, and reporting.* You must comply with paragraphs (g)(1) through (3) of this section.

(1) You must demonstrate initial compliance with standards as required by §60.5410(h) and (i).

(2) You must demonstrate continuous compliance with standards as required by §60.5415(e)(3).

(3) You must perform the required notification, recordkeeping and reporting as required by §60.5420.

(h) *Exemptions.* This subpart does not apply to storage vessels subject to and controlled in accordance with the requirements for storage vessels in 40 CFR part 60, subpart Kb, 40 CFR part 63, subparts G, CC, HH, or WW.

[78 FR 58436, Sept. 23, 2013, as amended at 79 FR 79038, Dec. 31, 2014]

§60.5400 What equipment leak standards apply to affected facilities at an onshore natural gas processing plant?

This section applies to the group of all equipment, except compressors, within a process unit.

(a) You must comply with the requirements of §§60.482-1a(a), (b), and (d), 60.482-2a, and 60.482-4a through 60.482-11a, except as provided in §60.5401.

(b) You may elect to comply with the requirements of §§60.483-1a and 60.483-2a, as an alternative.

(c) You may apply to the Administrator for permission to use an alternative means of emission limitation that achieves a reduction in emissions of VOC at least equivalent to that achieved by the controls required in this subpart according to the requirements of §60.5402 of this subpart.

(d) You must comply with the provisions of §60.485a of this part except as provided in paragraph (f) of this section.

(e) You must comply with the provisions of §§60.486a and 60.487a of this part except as provided in §§60.5401, 60.5421, and 60.5422 of this part.

(f) You must use the following provision instead of §60.485a(d)(1): Each piece of equipment is presumed to be in VOC service or in wet gas service unless an owner or operator demonstrates that the piece of equipment is not in VOC service or in wet gas service. For a piece of equipment to be considered not in VOC service, it must be determined that the VOC content can be reasonably expected never to exceed 10.0 percent by weight. For a piece of equipment to be considered in wet gas service, it must be determined that it contains or contacts the field gas before the extraction step in the process. For purposes of determining the percent VOC content of the process fluid that is contained in or contacts a piece of equipment, procedures that conform to the methods described in ASTM E169-93, E168-92, or E260-96 (incorporated by reference as specified in §60.17) must be used.

Back to Top

§60.5401 What are the exceptions to the equipment leak standards for affected facilities at onshore natural gas processing plants?

(a) You may comply with the following exceptions to the provisions of §60.5400(a) and (b).

(b)(1) Each pressure relief device in gas/vapor service may be monitored quarterly and within 5 days after each pressure release to detect leaks by the methods specified in §60.485a(b) except as provided in §60.5400(c) and in paragraph (b)(4) of this section, and §60.482-4a(a) through (c) of subpart VVa.

(2) If an instrument reading of 500 ppm or greater is measured, a leak is detected.

(3)(i) When a leak is detected, it must be repaired as soon as practicable, but no later than 15 calendar days after it is detected, except as provided in §60.482-9a.

(ii) A first attempt at repair must be made no later than 5 calendar days after each leak is detected.

(4)(i) Any pressure relief device that is located in a nonfractionating plant that is monitored only by non-plant personnel may be monitored after a pressure release the next time the monitoring personnel are on-site, instead of within 5 days as specified in paragraph (b)(1) of this section and §60.482-4a(b)(1) of subpart VVa.

(ii) No pressure relief device described in paragraph (b)(4)(i) of this section must be allowed to operate for more than 30 days after a pressure release without monitoring.

(c) Sampling connection systems are exempt from the requirements of §60.482-5a.

(d) Pumps in light liquid service, valves in gas/vapor and light liquid service, pressure relief devices in gas/vapor service, and connectors in gas/vapor service and in light liquid service that are located at a nonfractionating plant that does not have the design capacity to process 283,200 standard cubic meters per day (scmd) (10 million standard cubic feet per day) or more of field gas are exempt from the routine monitoring requirements of §§60.482-2a(a)(1), 60.482-7a(a), 60.482-11a(a), and paragraph (b)(1) of this section.

(e) Pumps in light liquid service, valves in gas/vapor and light liquid service, pressure relief devices in gas/vapor service, and connectors in gas/vapor service and in light liquid service within a process unit that is located in the Alaskan North Slope are exempt from the routine monitoring requirements of §§60.482-2a(a)(1), 60.482-7a(a), 60.482-11a(a), and paragraph (b)(1) of this section.

(f) An owner or operator may use the following provisions instead of §60.485a(e):

(1) Equipment is in heavy liquid service if the weight percent evaporated is 10 percent or less at 150 °C (302 °F) as determined by ASTM Method D86-96 (incorporated by reference as specified in §60.17).

(2) Equipment is in light liquid service if the weight percent evaporated is greater than 10 percent at 150 °C (302 °F) as determined by ASTM Method D86-96 (incorporated by reference as specified in §60.17).

(g) An owner or operator may use the following provisions instead of §60.485a(b)(2): A calibration drift assessment shall be performed, at a minimum, at the end of each monitoring day. Check the instrument using the same calibration gas(es) that were used to calibrate the instrument before use. Follow the procedures specified in Method 21 of appendix A-7 of this part, Section 10.1, except do not adjust the meter readout to correspond to the calibration gas value. Record the instrument reading for each scale used as specified in §60.486a(e)(8). Divide these readings by the initial calibration values for each scale and multiply by 100 to express the calibration drift as a percentage. If any calibration drift assessment shows a negative drift of more than 10 percent from the initial calibration value, then all equipment monitored since the last calibration with instrument readings below the appropriate leak definition and above the leak definition multiplied by (100 minus the percent of negative drift/divided by 100) must be re-monitored. If any calibration drift assessment shows a positive drift of more than 10 percent from the initial calibration value, then, at the owner/operator's discretion, all equipment since the last calibration with instrument readings above the appropriate leak definition and below the leak definition multiplied by (100 plus the percent of positive drift/divided by 100) may be re-monitored.

[77 FR 49542, Aug. 16, 2012, as amended at 79 FR 79038, Dec. 31, 2014]

Back to Top

§60.5402 What are the alternative emission limitations for equipment leaks from onshore natural gas processing plants?

(a) If, in the Administrator's judgment, an alternative means of emission limitation will achieve a reduction in VOC emissions at least equivalent to the reduction in VOC emissions achieved under any design, equipment, work practice or operational standard, the Administrator will publish, in the FEDERAL REGISTER, a notice permitting the use of that alternative means for the purpose of compliance with that standard. The notice may condition permission on requirements related to the operation and maintenance of the alternative means.

(b) Any notice under paragraph (a) of this section must be published only after notice and an opportunity for a public hearing.

(c) The Administrator will consider applications under this section from either owners or operators of affected facilities, or manufacturers of control equipment.

(d) The Administrator will treat applications under this section according to the following criteria, except in cases where the Administrator concludes that other criteria are appropriate:

(1) The applicant must collect, verify and submit test data, covering a period of at least 12 months, necessary to support the finding in paragraph (a) of this section.

(2) If the applicant is an owner or operator of an affected facility, the applicant must commit in writing to operate and maintain the alternative means so as to achieve a reduction in VOC emissions at least equivalent to the reduction in VOC emissions achieved under the design, equipment, work practice or operational standard.

Back to Top

§60.5405 What standards apply to sweetening units at onshore natural gas processing plants?

(a) During the initial performance test required by §60.8(b), you must achieve at a minimum, an SO_2 emission reduction efficiency (Z_i) to be determined from Table 1 of this subpart based on the sulfur feed rate (X) and the sulfur content of the acid gas (Y) of the affected facility.

(b) After demonstrating compliance with the provisions of paragraph (a) of this section, you must achieve at a minimum, an SO_2 emission reduction efficiency (Z_c) to be determined from Table 2 of this subpart based on the sulfur feed rate (X) and the sulfur content of the acid gas (Y) of the affected facility.

Back to Top

§60.5406 What test methods and procedures must I use for my sweetening units affected facilities at onshore natural gas processing plants?

(a) In conducting the performance tests required in §60.8, you must use the test methods in appendix A of this part or other methods and procedures as specified in this section, except as provided in paragraph §60.8(b).

(b) During a performance test required by §60.8, you must determine the minimum required reduction efficiencies (Z) of SO_2 emissions as required in §60.5405(a) and (b) as follows:

(1) The average sulfur feed rate (X) must be computed as follows:

$$X = KQ_aY$$

View or download PDF

Where:

X = average sulfur feed rate, Mg/D (LT/D).

Q_a = average volumetric flow rate of acid gas from sweetening unit, dscm/day (dscf/day).

Y = average H_2S concentration in acid gas feed from sweetening unit, percent by volume, expressed as a decimal.

K = (32 kg S/kg-mole)/((24.04 dscm/kg-mole)(1000 kg S/Mg)).

= 1.331×10^{-3} Mg/dscm, for metric units.

= (32 lb S/lb-mole)/((385.36 dscf/lb-mole)(2240 lb S/long ton)).

= 3.707×10^{-5} long ton/dscf, for English units.

(2) You must use the continuous readings from the process flowmeter to determine the average volumetric flow rate (Q_a) in dscm/day (dscf/day) of the acid gas from the sweetening unit for each run.

(3) You must use the Tutwiler procedure in §60.5408 or a chromatographic procedure following ASTM E260-96 (incorporated by reference as specified in §60.17) to determine the H_2S concentration in the acid gas feed from the sweetening unit (Y). At least one sample per hour (at equally spaced intervals) must be taken during each 4-hour run. The arithmetic mean of all samples must be the average H_2S concentration (Y) on a dry basis for the run. By multiplying the result from the Tutwiler procedure by 1.62×10^{-3}, the units gr/100 scf are converted to volume percent.

(4) Using the information from paragraphs (b)(1) and (b)(3) of this section, Tables 1 and 2 of this subpart must be used to determine the required initial (Z_i) and continuous (Z_c) reduction efficiencies of SO_2 emissions.

(c) You must determine compliance with the SO_2 standards in §60.5405(a) or (b) as follows:

(1) You must compute the emission reduction efficiency (R) achieved by the sulfur recovery technology for each run using the following equation:

$$R = (1005)\frac{\square}{S + E}$$

View or download PDF

(2) You must use the level indicators or manual soundings to measure the liquid sulfur accumulation rate in the product storage vessels. You must use readings taken at the beginning and end of each run, the tank geometry, sulfur density at the storage temperature, and sample duration to determine the sulfur production rate (S) in kg/hr (lb/hr) for each run.

(3) You must compute the emission rate of sulfur for each run as follows:

$$E = \frac{C_e Q_{sd}}{K_1}$$

View or download PDF

Where:

E = emission rate of sulfur per run, kg/hr.

C_e = concentration of sulfur equivalent (SO^{2+} reduced sulfur), g/dscm (lb/dscf).

Q_{sd} = volumetric flow rate of effluent gas, dscm/hr (dscf/hr).

K_1 = conversion factor, 1000 g/kg (7000 gr/lb).

(4) The concentration (C_e) of sulfur equivalent must be the sum of the SO_2 and TRS concentrations, after being converted to sulfur equivalents. For each run and each of the test methods specified in this paragraph (c) of this section, you must use a sampling time of at least 4 hours. You must use Method 1 of appendix A to part 60 of this chapter to select the sampling site. The sampling point in the duct must be at the centroid of the cross-section if the area is less than 5 m^2 (54 ft^2) or at a point no closer to the walls than 1 m (39 in) if the cross-sectional area is 5 m^2 or more, and the centroid is more than 1 m (39 in.) from the wall.

(i) You must use Method 6 of appendix A to part 60 of this chapter to determine the SO_2 concentration. You must take eight samples of 20 minutes each at 30-minute intervals. The arithmetic average must be the concentration for the run. The concentration must be multiplied by 0.5×10^{-3} to convert the results to sulfur equivalent.

(ii) You must use Method 15 of appendix A to part 60 of this chapter to determine the TRS concentration from reduction-type devices or where the oxygen content of the effluent gas is less than 1.0 percent by volume. The sampling rate must be at least 3 liters/min (0.1 ft^3/min) to insure minimum residence time in the sample line. You must take sixteen samples at 15-minute intervals.

The arithmetic average of all the samples must be the concentration for the run. The concentration in ppm reduced sulfur as sulfur must be multiplied by 1.333×10^{-3} to convert the results to sulfur equivalent.

(iii) You must use Method 16A or Method 15 of appendix A to part 60 of this chapter or ANSI/ASME PTC 19.10-1981, Part 10 (manual portion only) (incorporated by reference as specified in §60.17) to determine the reduced sulfur concentration from oxidation-type devices or where the oxygen content of the effluent gas is greater than 1.0 percent by volume. You must take eight samples of 20 minutes each at 30-minute intervals. The arithmetic average must be the concentration for the run. The concentration in ppm reduced sulfur as sulfur must be multiplied by 1.333×10^{-3} to convert the results to sulfur equivalent.

(iv) You must use Method 2 of appendix A to part 60 of this chapter to determine the volumetric flow rate of the effluent gas. A velocity traverse must be conducted at the beginning and end of each run. The arithmetic average of the two measurements must be used to calculate the volumetric flow rate (Q_{sd}) for the run. For the determination of the effluent gas molecular weight, a single integrated sample over the 4-hour period may be taken and analyzed or grab samples at 1-hour intervals may be taken, analyzed, and averaged. For the moisture content, you must take two samples of at least 0.10 dscm (3.5 dscf) and 10 minutes at the beginning of the 4-hour run and near the end of the time period. The arithmetic average of the two runs must be the moisture content for the run.

Back to Top

§60.5407 What are the requirements for monitoring of emissions and operations from my sweetening unit affected facilities at onshore natural gas processing plants?

(a) If your sweetening unit affected facility is located at an onshore natural gas processing plant and is subject to the provisions of §60.5405(a) or (b) you must install, calibrate, maintain, and operate monitoring devices or perform measurements to determine the following operations information on a daily basis:

(1) *The accumulation of sulfur product over each 24-hour period.* The monitoring method may incorporate the use of an instrument to measure and record the liquid sulfur production rate, or may be a procedure for measuring and recording the sulfur liquid levels in the storage vessels with a level indicator or by manual soundings, with subsequent calculation of the sulfur production rate based on the tank geometry, stored sulfur density, and elapsed time between readings. The method must be designed to be accurate within ±2 percent of the 24-hour sulfur accumulation.

(2) *The* H_2S *concentration in the acid gas from the sweetening unit for each 24-hour period.* At least one sample per 24-hour period must be collected and analyzed using the equation specified in §60.5406(b)(1). The Administrator may require you to demonstrate that the H_2S concentration obtained from one or more samples over a 24-hour period is within ±20 percent of the average of 12 samples collected at equally spaced intervals during the 24-hour period. In instances where the H_2S concentration of a single sample is not within ±20 percent of the average of the 12 equally spaced samples, the Administrator may require a more frequent sampling schedule.

(3) *The average acid gas flow rate from the sweetening unit.* You must install and operate a monitoring device to continuously measure the flow rate of acid gas. The monitoring device reading must be recorded at least once per hour during each 24-hour period. The average acid gas flow rate must be computed from the individual readings.

(4) *The sulfur feed rate (X).* For each 24-hour period, you must compute X using the equation specified in §60.5406(b)(1).

(5) *The required sulfur dioxide emission reduction efficiency for the 24-hour period.* You must use the sulfur feed rate and the H_2S concentration in the acid gas for the 24-hour period, as applicable, to determine the required reduction efficiency in accordance with the provisions of §60.5405(b).

(b) Where compliance is achieved through the use of an oxidation control system or a reduction control system followed by a continually operated incineration device, you must install, calibrate, maintain, and operate monitoring devices and continuous emission monitors as follows:

(1) *A continuous monitoring system to measure the total sulfur emission rate (E) of SO_2 in the gases discharged to the atmosphere.* The SO_2 emission rate must be expressed in terms of equivalent sulfur mass flow rates (kg/hr (lb/hr)). The span of this monitoring system must be set so that the equivalent emission limit of §60.5405(b) will be between 30 percent and 70 percent of the measurement range of the instrument system.

(2) Except as provided in paragraph (b)(3) of this section: A monitoring device to measure the temperature of the gas leaving the combustion zone of the incinerator, if compliance with §60.5405(a) is achieved through the use of an oxidation control system or a reduction control system followed by a continually operated incineration device. The monitoring device must be certified by the manufacturer to be accurate to within ±1 percent of the temperature being measured.

(3) When performance tests are conducted under the provision of §60.8 to demonstrate compliance with the standards under §60.5405, the temperature of the gas leaving the incinerator combustion zone must be determined using the monitoring device. If the volumetric ratio of sulfur dioxide to sulfur dioxide plus total reduced sulfur (expressed as SO_2) in the gas leaving the incinerator is equal to or less than 0.98, then temperature monitoring may be used to demonstrate that sulfur dioxide emission monitoring is sufficient to determine total sulfur emissions. At all times during the operation of the facility, you must maintain the average temperature of the gas leaving the combustion zone of the incinerator at or above the appropriate level determined during the most recent performance test to ensure the sulfur compound oxidation criteria are met. Operation at lower average temperatures may be considered by the Administrator to be unacceptable operation and maintenance of the affected facility. You may request that the minimum incinerator temperature be reestablished by conducting new performance tests under §60.8.

(4) Upon promulgation of a performance specification of continuous monitoring systems for total reduced sulfur compounds at sulfur recovery plants, you may, as an alternative to paragraph (b)(2) of this section, install, calibrate, maintain, and operate a continuous emission monitoring system for total reduced sulfur compounds as required in paragraph (d) of this section in addition to a sulfur dioxide emission monitoring system. The sum of the equivalent sulfur mass emission rates from the two monitoring systems must be used to compute the total sulfur emission rate (E).

(c) Where compliance is achieved through the use of a reduction control system not followed by a continually operated incineration device, you must install, calibrate, maintain, and operate a continuous monitoring system to measure the emission rate of reduced sulfur compounds as SO_2 equivalent in the gases discharged to the atmosphere. The SO_2 equivalent compound emission rate must be expressed in terms of equivalent sulfur mass flow rates (kg/hr (lb/hr)). The span of this monitoring system must be set so that the equivalent emission limit of §60.5405(b) will be between 30 and 70 percent of the measurement range of the system. This requirement becomes effective

upon promulgation of a performance specification for continuous monitoring systems for total reduced sulfur compounds at sulfur recovery plants.

(d) For those sources required to comply with paragraph (b) or (c) of this section, you must calculate the average sulfur emission reduction efficiency achieved (R) for each 24-hour clock interval. The 24-hour interval may begin and end at any selected clock time, but must be consistent. You must compute the 24-hour average reduction efficiency (R) based on the 24-hour average sulfur production rate (S) and sulfur emission rate (E), using the equation in §60.5406(c)(1).

(1) You must use data obtained from the sulfur production rate monitoring device specified in paragraph (a) of this section to determine S.

(2) You must use data obtained from the sulfur emission rate monitoring systems specified in paragraphs (b) or (c) of this section to calculate a 24-hour average for the sulfur emission rate (E). The monitoring system must provide at least one data point in each successive 15-minute interval. You must use at least two data points to calculate each 1-hour average. You must use a minimum of 18 1-hour averages to compute each 24-hour average.

(e) In lieu of complying with paragraphs (b) or (c) of this section, those sources with a design capacity of less than 152 Mg/D (150 LT/D) of H_2S expressed as sulfur may calculate the sulfur emission reduction efficiency achieved for each 24-hour period by:

$$R = \frac{K_2 S}{X}$$

View or download PDF

Where:

R = The sulfur dioxide removal efficiency achieved during the 24-hour period, percent.

K_2 = Conversion factor, 0.02400 Mg/D per kg/hr (0.01071 LT/D per lb/hr).

S = The sulfur production rate during the 24-hour period, kg/hr (lb/hr).

X = The sulfur feed rate in the acid gas, Mg/D (LT/D).

(f) The monitoring devices required in paragraphs (b)(1), (b)(3) and (c) of this section must be calibrated at least annually according to the manufacturer's specifications, as required by §60.13(b).

(g) The continuous emission monitoring systems required in paragraphs (b)(1), (b)(3), and (c) of this section must be subject to the emission monitoring requirements of §60.13 of the General Provisions. For conducting the continuous emission monitoring system performance evaluation required by §60.13(c), Performance Specification 2 of appendix B to part 60 of this chapter must apply, and Method 6 must be used for systems required by paragraph (b) of this section.

Back to Top

§60.5408 What is an optional procedure for measuring hydrogen sulfide in acid gas—Tutwiler Procedure?

The Tutwiler procedure may be found in the Gas Engineers Handbook, Fuel Gas Engineering practices, The Industrial Press, 93 Worth Street, New York, NY, 1966, First Edition, Second Printing, page 6/25 (Docket A-80-20-A, Entry II-I-67).

(a) When an instantaneous sample is desired and H_2S concentration is ten grains per 1000 cubic foot or more, a 100 ml Tutwiler burette is used. For concentrations less than ten grains, a 500 ml Tutwiler burette and more dilute solutions are used. In principle, this method consists of titrating hydrogen sulfide in a gas sample directly with a standard solution of iodine.

(b) *Apparatus.* (See Figure 1 of this subpart) A 100 or 500 ml capacity Tutwiler burette, with two-way glass stopcock at bottom and three-way stopcock at top which connect either with inlet tubulature or glass-stoppered cylinder, 10 ml capacity, graduated in 0.1 ml subdivision; rubber tubing connecting burette with leveling bottle.

(c) *Reagents.* (1) Iodine stock solution, 0.1N. Weight 12.7 g iodine, and 20 to 25 g cp potassium iodide for each liter of solution. Dissolve KI in as little water as necessary; dissolve iodine in concentrated KI solution, make up to proper volume, and store in glass-stoppered brown glass bottle.

(2) Standard iodine solution, 1 ml = 0.001771 g I. Transfer 33.7 ml of above 0.1N stock solution into a 250 ml volumetric flask; add water to mark and mix well. Then, for 100 ml sample of gas, 1 ml of standard iodine solution is equivalent to 100 grains H_2S per cubic feet of gas.

(3) Starch solution. Rub into a thin paste about one teaspoonful of wheat starch with a little water; pour into about a pint of boiling water; stir; let cool and decant off clear solution. Make fresh solution every few days.

(d) *Procedure.* Fill leveling bulb with starch solution. Raise (L), open cock (G), open (F) to (A), and close (F) when solutions starts to run out of gas inlet. Close (G). Purge gas sampling line and connect with (A). Lower (L) and open (F) and (G). When liquid level is several ml past the 100 ml mark, close (G) and (F), and disconnect sampling tube. Open (G) and bring starch solution to 100 ml mark by raising (L); then close (G). Open (F) momentarily, to bring gas in burette to atmospheric pressure, and close (F). Open (G), bring liquid level down to 10 ml mark by lowering (L). Close (G), clamp rubber tubing near (E) and disconnect it from burette. Rinse graduated cylinder with a standard iodine solution (0.00171 g I per ml); fill cylinder and record reading. Introduce successive small amounts of iodine thru (F); shake well after each addition; continue until a faint permanent blue color is obtained. Record reading; subtract from previous reading, and call difference D.

(e) With every fresh stock of starch solution perform a blank test as follows: Introduce fresh starch solution into burette up to 100 ml mark. Close (F) and (G). Lower (L) and open (G). When liquid level reaches the 10 ml mark, close (G). With air in burette, titrate as during a test and up to same end point. Call ml of iodine used C. Then, Grains H_2S per 100 cubic foot of gas = 100(D-C)

(f) Greater sensitivity can be attained if a 500 ml capacity Tutwiler burette is used with a more dilute (0.001N) iodine solution. Concentrations less than 1.0 grains per 100 cubic foot can be determined in this way. Usually, the starch-iodine end point is much less distinct, and a blank determination of end point, with H_2S-free gas or air, is required.

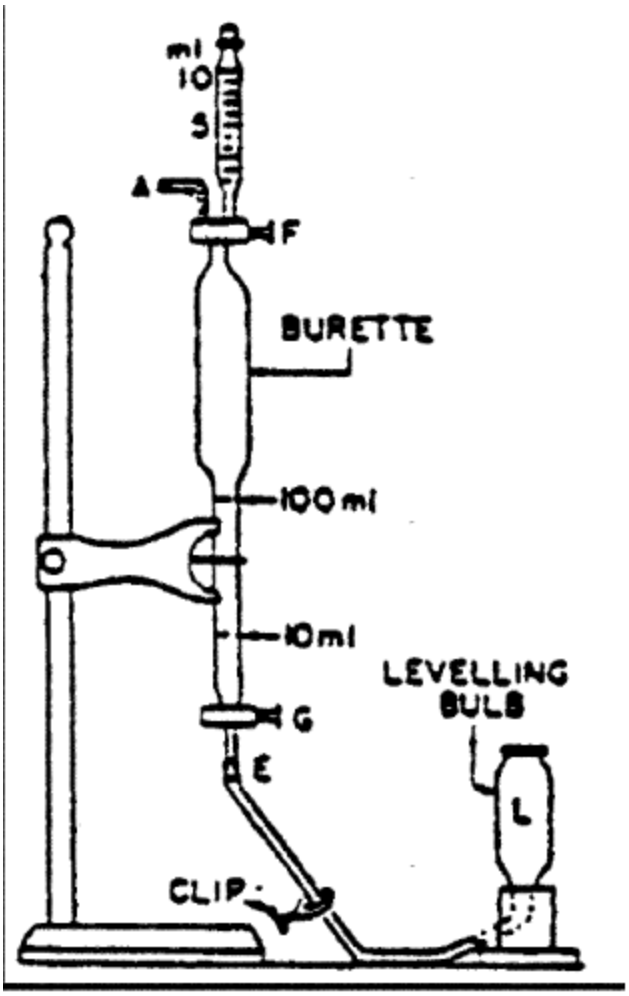

Figure 1. Tutwiler burette (lettered items mentioned in text).

§60.5410 How do I demonstrate initial compliance with the standards for my gas well affected facility, my centrifugal compressor affected facility, my reciprocating compressor affected facility, my pneumatic controller affected facility, my storage vessel affected facility, and my equipment leaks and sweetening unit affected facilities at onshore natural gas processing plants?

You must determine initial compliance with the standards for each affected facility using the requirements in paragraphs (a) through (i) of this section. The initial compliance period begins on October 15, 2012, or upon initial startup, whichever is later, and ends no later than one year after the initial startup date for your affected facility or no later than one year after October 15, 2012. The initial compliance period may be less than one full year.

(a) To achieve initial compliance with the standards for each well completion operation conducted at your gas well affected facility you must comply with paragraphs (a)(1) through (a)(4) of this section.

(1) You must submit the notification required in §60.5420(a)(2).

(2) You must submit the initial annual report for your well affected facility as required in §60.5420(b).

(3) You must maintain a log of records as specified in §60.5420(c)(1)(i) through (iv) for each well completion operation conducted during the initial compliance period.

(4) For each gas well affected facility subject to both §60.5375(a)(1) and (3), as an alternative to retaining the records specified in §60.5420(c)(1)(i) through (iv), you may maintain records of one or more digital photographs with the date the photograph was taken and the latitude and longitude of the well site imbedded within or stored with the digital file showing the equipment for storing or re-injecting recovered liquid, equipment for routing recovered gas to the gas flow line and the completion combustion device (if applicable) connected to and operating at each gas well completion operation that occurred during the initial compliance period. As an alternative to imbedded latitude and longitude within the digital photograph, the digital photograph may consist of a photograph of the equipment connected and operating at each well completion operation with a photograph of a separately operating GIS device within the same digital picture, provided the latitude and longitude output of the GIS unit can be clearly read in the digital photograph.

(b)(1) To achieve initial compliance with standards for your centrifugal compressor affected facility you must reduce VOC emissions from each centrifugal compressor wet seal fluid degassing system by 95.0 percent or greater as required by §60.5380 and as demonstrated by the requirements of §60.5413.

(2) If you use a control device to reduce emissions, you must equip the wet seal fluid degassing system with a cover that meets the requirements of §60.5411(b) that is connected through a closed vent system that meets the requirements of §60.5411(a) and is routed to a control device that meets the conditions specified in §60.5412(a), (b) and (c). As an alternative to routing the closed vent system to a control device, you may route the closed vent system to a process.

(3) You must conduct an initial performance test as required in §60.5413 within 180 days after initial startup or by October 15, 2012, whichever is later, and you must comply with the continuous compliance requirements in §60.5415(b)(1) through (3).

(4) You must conduct the initial inspections required in §60.5416(a) and (b).

(5) You must install and operate the continuous parameter monitoring systems in accordance with §60.5417(a) through (g), as applicable.

(6) [Reserved]

(7) You must submit the initial annual report for your centrifugal compressor affected facility as required in §60.5420(b)(3) for each centrifugal compressor affected facility.

(8) You must maintain the records as specified in §60.5420(c)(2).

(c) To achieve initial compliance with the standards for each reciprocating compressor affected facility you must comply with paragraphs (c)(1) through (4) of this section.

(1) If complying with §60.5385(a)(1) or (2), during the initial compliance period, you must continuously monitor the number of hours of operation or track the number of months since the last rod packing replacement.

(2) If complying with §60.5385(a)(3), you must operate the rod packing emissions collection system under negative pressure and route emissions to a process through a closed vent system that meets the requirements of §60.5411(a).

(3) You must submit the initial annual report for your reciprocating compressor as required in §60.5420(b).

(4) You must maintain the records as specified in §60.5420(c)(3) for each reciprocating compressor affected facility.

(d) To achieve initial compliance with emission standards for your pneumatic controller affected facility you must comply with the requirements specified in paragraphs (d)(1) through (6) of this section, as applicable.

(1) You must demonstrate initial compliance by maintaining records as specified in §60.5420(c)(4)(ii) of your determination that the use of a pneumatic controller affected facility with a bleed rate greater than 6 standard cubic feet of gas per hour is required as specified in §60.5390(a).

(2) You own or operate a pneumatic controller affected facility located at a natural gas processing plant and your pneumatic controller is driven by a gas other than natural gas and therefore emits zero natural gas.

(3) You own or operate a pneumatic controller affected facility located between the wellhead and a natural gas processing plant and the manufacturer's design specifications indicate that the controller emits less than or equal to 6 standard cubic feet of gas per hour.

(4) You must tag each new pneumatic controller affected facility according to the requirements of §60.5390(b)(2) or (c)(2).

(5) You must include the information in paragraph (d)(1) of this section and a listing of the pneumatic controller affected facilities specified in paragraphs (d)(2) and (3) of this section in the initial annual report submitted for your pneumatic controller affected facilities constructed, modified or reconstructed during the period covered by the annual report according to the requirements of §60.5420(b).

(6) You must maintain the records as specified in §60.5420(c)(4) for each pneumatic controller affected facility.

(e) [Reserved]

(f) For affected facilities at onshore natural gas processing plants, initial compliance with the VOC requirements is demonstrated if you are in compliance with the requirements of §60.5400.

(g) For sweetening unit affected facilities at onshore natural gas processing plants, initial compliance is demonstrated according to paragraphs (g)(1) through (3) of this section.

(1) To determine compliance with the standards for SO_2 specified in §60.5405(a), during the initial performance test as required by §60.8, the minimum required sulfur dioxide emission reduction efficiency (Z_i) is compared to the emission reduction efficiency (R) achieved by the sulfur recovery technology as specified in paragraphs (g)(1)(i) and (ii) of this section.

(i) If $R \geq Z_i$, your affected facility is in compliance.

(ii) If $R < Z_i$, your affected facility is not in compliance.

(2) The emission reduction efficiency (R) achieved by the sulfur reduction technology must be determined using the procedures in §60.5406(c)(1).

(3) You have submitted the results of paragraphs (g)(1) and (2) of this section in the initial annual report submitted for your sweetening unit affected facilities at onshore natural gas processing plants.

(h) For each storage vessel affected facility, you must comply with paragraphs (h)(1) through (5) of this section. For a Group 1 storage vessel affected facility, you must demonstrate initial compliance by April 15, 2015, except as otherwise provided in paragraph (i) of this section. For a Group 2 storage vessel affected facility, you must demonstrate initial compliance by April 15, 2014, or within 60 days after startup, whichever is later.

(1) You must determine the potential VOC emission rate as specified in §60.5365(e).

(2) You must reduce VOC emissions in accordance with §60.5395(d).

(3) If you use a control device to reduce emissions, or if you route emissions to a process, you must demonstrate initial compliance by meeting the requirements in §60.5395(e).

(4) You must submit the information required for your storage vessel affected facility as specified in §60.5420(b).

(5) You must maintain the records required for your storage vessel affected facility, as specified in §60.5420(c)(5) through (8) and §60.5420(c)(12) and (13) for each storage vessel affected facility.

(i) For each Group 1 storage vessel affected facility, you must submit the notification specified in §60.5395(b)(2) with the initial annual report specified in §60.5420(b)(6).

[77 FR 49542, Aug. 16, 2012, as amended at 78 FR 58437, Sept. 23, 2013; 79 FR 79038, Dec. 31, 2014; 81 FR 35896, June 3, 2016]

Back to Top

§60.5411 What additional requirements must I meet to determine initial compliance for my covers and closed vent systems routing materials from storage vessels, reciprocating compressors and centrifugal compressor wet seal degassing systems?

You must meet the applicable requirements of this section for each cover and closed vent system used to comply with the emission standards for your storage vessel, reciprocating compressor or centrifugal compressor affected facility.

(a) *Closed vent system requirements for reciprocating compressors and for centrifugal compressor wet seal degassing systems.* (1) You must design the closed vent system to route all gases, vapors, and fumes emitted from the material in the reciprocating compressor rod packing emissions collection system or the wet seal fluid degassing system to a control device or to a process that meets the requirements specified in §60.5412(a) through (c).

(2) You must design and operate the closed vent system with no detectable emissions as demonstrated by §60.5416(b).

(3) You must meet the requirements specified in paragraphs (a)(3)(i) and (ii) of this section if the closed vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device.

(i) Except as provided in paragraph (a)(3)(ii) of this section, you must comply with either paragraph (a)(3)(i)(A) or (B) of this section for each bypass device.

(A) You must properly install, calibrate, maintain, and operate a flow indicator at the inlet to the bypass device that could divert the stream away from the control device or process to the atmosphere that is capable of taking periodic readings as specified in §60.5416(a)(4) and either sounds an alarm, or initiates notification via remote alarm to the nearest field office, when the bypass device is open such that the stream is being, or could be, diverted away from the control device or process to the atmosphere. You must maintain records of each time the alarm is activated according to §60.5420(c)(8).

(B) You must secure the bypass device valve installed at the inlet to the bypass device in the non-diverting position using a car-seal or a lock-and-key type configuration.

(ii) Low leg drains, high point bleeds, analyzer vents, open-ended valves or lines, and safety devices are not subject to the requirements of paragraph (a)(3)(i) of this section.

(b) *Cover requirements for storage vessels and centrifugal compressor wet seal degassing systems.* (1) The cover and all openings on the cover (*e.g.,* access hatches, sampling ports, pressure relief valves and gauge wells) shall form a continuous impermeable barrier over the entire surface area of the liquid in the storage vessel or wet seal fluid degassing system.

(2) Each cover opening shall be secured in a closed, sealed position (e.g., covered by a gasketed lid or cap) whenever material is in the unit on which the cover is installed except during those times when it is necessary to use an opening as follows:

(i) To add material to, or remove material from the unit (this includes openings necessary to equalize or balance the internal pressure of the unit following changes in the level of the material in the unit);

(ii) To inspect or sample the material in the unit;

(iii) To inspect, maintain, repair, or replace equipment located inside the unit; or

(iv) To vent liquids, gases, or fumes from the unit through a closed-vent system designed and operated in accordance with the requirements of paragraph (a) or (c) of this section to a control device or to a process.

(3) Each storage vessel thief hatch shall be equipped, maintained and operated with a weighted mechanism or equivalent, to ensure that the lid remains properly seated. You must select gasket material for the hatch based on composition of the fluid in the storage vessel and weather conditions.

(c) *Closed vent system requirements for storage vessel affected facilities using a control device or routing emissions to a process.* (1) You must design the closed vent system to route all gases, vapors, and fumes emitted from the material in the storage vessel to a control device that meets the requirements specified in §60.5412(c) and (d), or to a process.

(2) You must design and operate a closed vent system with no detectable emissions, as determined using olfactory, visual and auditory inspections. Each closed vent system that routes emissions to a process must be operational 95 percent of the year or greater.

(3) You must meet the requirements specified in paragraphs (c)(3)(i) and (ii) of this section if the closed vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device or to a process.

(i) Except as provided in paragraph (c)(3)(ii) of this section, you must comply with either paragraph (c)(3)(i)(A) or (B) of this section for each bypass device.

(A) You must properly install, calibrate, maintain, and operate a flow indicator at the inlet to the bypass device that could divert the stream away from the control device or process to the atmosphere and that either sounds an alarm, or initiates notification via remote alarm to the nearest field office, when the bypass device is open such that the stream is being, or could be, diverted away from the control device or process to the atmosphere. You must maintain records of each time the alarm is activated according to §60.5420(c)(8).

(B) You must secure the bypass device valve installed at the inlet to the bypass device in the non-diverting position using a car-seal or a lock-and-key type configuration.

(ii) Low leg drains, high point bleeds, analyzer vents, open-ended valves or lines, and safety devices are not subject to the requirements of paragraph (c)(3)(i) of this section.

[77 FR 49542, Aug. 16, 2012, as amended at 78 FR 58438, Sept. 23, 2013; 79 FR 79038, Dec. 31, 2014; 81 FR 35896, June 3, 2016]

Back to Top

§60.5412 What additional requirements must I meet for determining initial compliance with control devices used to comply with the emission standards for my storage vessel or centrifugal compressor affected facility?

You must meet the applicable requirements of this section for each control device used to comply with the emission standards for your storage vessel or centrifugal compressor affected facility.

(a) Each control device used to meet the emission reduction standard in §60.5380(a)(1) for your centrifugal compressor affected facility must be installed according to paragraphs (a)(1) through (3) of this section. As an alternative, you may install a control device model tested under §60.5413(d), which meets the criteria in §60.5413(d)(11) and §60.5413(e).

(1) Each combustion device (*e.g.,* thermal vapor incinerator, catalytic vapor incinerator, boiler, or process heater) must be designed and operated in accordance with one of the performance requirements specified in paragraphs (a)(1)(i) through (iv) of this section.

(i) You must reduce the mass content of VOC in the gases vented to the device by 95.0 percent by weight or greater as determined in accordance with the requirements of §60.5413.

(ii) You must reduce the concentration of TOC in the exhaust gases at the outlet to the device to a level equal to or less than 275 parts per million by volume as propane on a wet basis corrected to 3 percent oxygen as determined in accordance with the requirements of §60.5413.

(iii) You must operate at a minimum temperature of 760 °C for a control device that can demonstrate a uniform combustion zone temperature during the performance test conducted under §60.5413.

(iv) If a boiler or process heater is used as the control device, then you must introduce the vent stream into the flame zone of the boiler or process heater.

(2) Each vapor recovery device (*e.g.,* carbon adsorption system or condenser) or other non-destructive control device must be designed and operated to reduce the mass content of VOC in the gases vented to the device by 95.0 percent by weight or greater as determined in accordance with the requirements of §60.5413. As an alternative to the performance testing requirements, you may demonstrate initial compliance by conducting a design analysis for vapor recovery devices according to the requirements of §60.5413(c).

(3) You must design and operate a flare in accordance with the requirements of §60.5413.

(b) You must operate each control device installed on your centrifugal compressor affected facility in accordance with the requirements specified in paragraphs (b)(1) and (2) of this section.

(1) You must operate each control device used to comply with this subpart at all times when gases, vapors, and fumes are vented from the wet seal fluid degassing system affected facility, as required under §60.5380(a), through the closed vent system to the control device. You may vent more than one affected facility to a control device used to comply with this subpart.

(2) For each control device monitored in accordance with the requirements of §60.5417(a) through (g), you must demonstrate compliance according to the requirements of §60.5415(b)(2), as applicable.

(c) For each carbon adsorption system used as a control device to meet the requirements of paragraph (a)(2) or (d)(2) of this section, you must manage the carbon in accordance with the requirements specified in paragraphs (c)(1) or (2) of this section.

(1) Following the initial startup of the control device, you must replace all carbon in the control device with fresh carbon on a regular, predetermined time interval that is no longer than the carbon service life established according to §60.5413(c)(2) or (3) or according to the design required in paragraph (d)(2) of this section, for the carbon adsorption system. You must maintain records identifying the schedule for replacement and records of each carbon replacement as required in §60.5420(c)(10) and (12).

(2) You must either regenerate, reactivate, or burn the spent carbon removed from the carbon adsorption system in one of the units specified in paragraphs (c)(2)(i) through (vii) of this section.

(i) Regenerate or reactivate the spent carbon in a thermal treatment unit for which you have been issued a final permit under 40 CFR part 270 that implements the requirements of 40 CFR part 264, subpart X.

(ii) Regenerate or reactivate the spent carbon in a thermal treatment unit equipped with and operating air emission controls in accordance with this section.

(iii) Regenerate or reactivate the spent carbon in a thermal treatment unit equipped with and operating organic air emission controls in accordance with an emissions standard for VOC under another subpart in 40 CFR part 60 or this part.

(iv) Burn the spent carbon in a hazardous waste incinerator for which the owner or operator has been issued a final permit under 40 CFR part 270 that implements the requirements of 40 CFR part 264, subpart O.

(v) Burn the spent carbon in a hazardous waste incinerator which you have designed and operated in accordance with the requirements of 40 CFR part 265, subpart O.

(vi) Burn the spent carbon in a boiler or industrial furnace for which you have been issued a final permit under 40 CFR part 270 that implements the requirements of 40 CFR part 266, subpart H.

(vii) Burn the spent carbon in a boiler or industrial furnace that you have designed and operated in accordance with the interim status requirements of 40 CFR part 266, subpart H.

(d) Each control device used to meet the emission reduction standard in §60.5395(d) for your storage vessel affected facility must be installed according to paragraphs (d)(1) through (3) of this section, as applicable. As an alternative to paragraph (d)(1) of this section, you may install a control device model tested under §60.5413(d), which meets the criteria in §60.5413(d)(11) and §60.5413(e).

(1) Each enclosed combustion device (*e.g.,* thermal vapor incinerator, catalytic vapor incinerator, boiler, or process heater) must be designed to reduce the mass content of VOC emissions by 95.0 percent or greater. Each flare must be designed and operated in accordance with the requirements of §60.5413(a)(1). You must follow the requirements in paragraphs (d)(1)(i) through (iv) of this section.

(i) Ensure that each enclosed combustion device is maintained in a leak free condition.

(ii) Install and operate a continuous burning pilot flame.

(iii) Operate the enclosed combustion device with no visible emissions, except for periods not to exceed a total of one minute during any 15 minute period. A visible emissions test using section 11 of EPA Method 22, 40 CFR part 60, appendix A, must be performed at least once every calendar month, separated by at least 15 days between each test. The observation period shall be 15 minutes. Devices failing the visible emissions test must follow manufacturer's repair instructions, if available, or best combustion engineering practice as outlined in the unit inspection and maintenance plan, to return the unit to compliant operation. All inspection, repair and maintenance activities for each unit must be recorded in a maintenance and repair log and must be available for

inspection. Following return to operation from maintenance or repair activity, each device must pass a Method 22, 40 CFR part 60, appendix A, visual observation as described in this paragraph.

(iv) Each enclosed combustion control device (*e.g.,* thermal vapor incinerator, catalytic vapor incinerator, boiler, or process heater) must be designed and operated in accordance with one of the performance requirements specified in paragraphs (d)(1)(iv)(A) through (D) of this section.

(A) You must reduce the mass content of VOC in the gases vented to the device by 95.0 percent by weight or greater as determined in accordance with the requirements of §60.5413.

(B) You must reduce the concentration of TOC in the exhaust gases at the outlet to the device to a level equal to or less than 275 parts per million by volume as propane on a wet basis corrected to 3 percent oxygen as determined in accordance with the requirements of §60.5413.

(C) You must operate at a minimum temperature of 760 °Celsius, provided the control device has demonstrated, during the performance test conducted under §60.5413, that combustion zone temperature is an indicator of destruction efficiency.

(D) If a boiler or process heater is used as the control device, then you must introduce the vent stream into the flame zone of the boiler or process heater.

(2) Each vapor recovery device (*e.g.,* carbon adsorption system or condenser) or other non-destructive control device must be designed and operated to reduce the mass content of VOC in the gases vented to the device by 95.0 percent by weight or greater. A carbon replacement schedule must be included in the design of the carbon adsorption system.

(3) You must operate each control device used to comply with this subpart at all times when gases, vapors, and fumes are vented from the storage vessel affected facility through the closed vent system to the control device. You may vent more than one affected facility to a control device used to comply with this subpart.

[77 FR 49542, Aug. 16, 2012, as amended at 78 FR 58438, Sept. 23, 2013; 79 FR 79039, Dec. 31, 2014; 81 FR 35897, June 3, 2016]

Back to Top

§60.5413 What are the performance testing procedures for control devices used to demonstrate compliance at my storage vessel or centrifugal compressor affected facility?

This section applies to the performance testing of control devices used to demonstrate compliance with the emissions standards for your centrifugal compressor affected facility. You must demonstrate that a control device achieves the performance requirements of §60.5412(a) using the performance test methods and procedures specified in this section. For condensers, you may use a design analysis as specified in paragraph (c) of this section in lieu of complying with paragraph (b) of this section. In addition, this section contains the requirements for enclosed combustion device performance tests conducted by the manufacturer applicable to both storage vessel and centrifugal compressor affected facilities.

(a) *Performance test exemptions.* You are exempt from the requirements to conduct performance tests and design analyses if you use any of the control devices described in paragraphs (a)(1) through (7) of this section.

(1) A flare that is designed and operated in accordance with §60.18(b). You must conduct the compliance determination using Method 22 at 40 CFR part 60, appendix A-7, to determine visible emissions.

(2) A boiler or process heater with a design heat input capacity of 44 megawatts or greater.

(3) A boiler or process heater into which the vent stream is introduced with the primary fuel or is used as the primary fuel.

(4) A boiler or process heater burning hazardous waste for which you have either been issued a final permit under 40 CFR part 270 and comply with the requirements of 40 CFR part 266, subpart H; or you have certified compliance with the interim status requirements of 40 CFR part 266, subpart H.

(5) A hazardous waste incinerator for which you have been issued a final permit under 40 CFR part 270 and comply with the requirements of 40 CFR part 264, subpart O; or you have certified compliance with the interim status requirements of 40 CFR part 265, subpart O.

(6) A performance test is waived in accordance with §60.8(b).

(7) A control device whose model can be demonstrated to meet the performance requirements of §60.5412(a) through a performance test conducted by the manufacturer, as specified in paragraph (d) of this section.

(b) *Test methods and procedures.* You must use the test methods and procedures specified in paragraphs (b)(1) through (5) of this section, as applicable, for each performance test conducted to demonstrate that a control device meets the requirements of §60.5412(a). You must conduct the initial and periodic performance tests according to the schedule specified in paragraph (b)(5) of this section.

(1) You must use Method 1 or 1A at 40 CFR part 60, appendix A-1, as appropriate, to select the sampling sites specified in paragraphs (b)(1)(i) and (ii) of this section. Any references to particulate mentioned in Methods 1 and 1A do not apply to this section.

(i) Sampling sites must be located at the inlet of the first control device, and at the outlet of the final control device, to determine compliance with the control device percent reduction requirement specified in §60.5412(a)(1)(i) or (a)(2).

(ii) The sampling site must be located at the outlet of the combustion device to determine compliance with the enclosed combustion device total TOC concentration limit specified in §60.5412(a)(1)(ii).

(2) You must determine the gas volumetric flowrate using Method 2, 2A, 2C, or 2D at 40 CFR part 60, appendix A-2, as appropriate.

(3) To determine compliance with the control device percent reduction performance requirement in §60.5412(a)(1)(i) or (a)(2), you must use Method 25A at 40 CFR part 60, appendix A-7. You must use the procedures in paragraphs (b)(3)(i) through (iv) of this section to calculate percent reduction efficiency.

(i) For each run, you must take either an integrated sample or a minimum of four grab samples per hour. If grab sampling is used, then the samples must be taken at approximately equal intervals in time, such as 15-minute intervals during the run.

(ii) You must compute the mass rate of TOC (minus methane and ethane) using the equations and procedures specified in paragraphs (b)(3)(ii)(A) and (B) of this section.

(A) You must use the following equations:

$$E_i = K_2\left(\sum_{j=1}^{n} C_{ij} M_{ij}\right) Q_i$$

$$E_o = K_2\left(\sum_{j=1}^{n} C_{oj} M_{oj}\right) Q_o$$

View or download PDF

Where:

E_i, E_o = Mass rate of TOC (minus methane and ethane) at the inlet and outlet of the control device, respectively, dry basis, kilogram per hour.

K_2 = Constant, 2.494×10^{-6} (parts per million) (gram-mole per standard cubic meter) (kilogram/gram) (minute/hour), where standard temperature (gram-mole per standard cubic meter) is 20 °C.

C_{ij}, C_{oj} = Concentration of sample component j of the gas stream at the inlet and outlet of the control device, respectively, dry basis, parts per million by volume.

M_{ij}, M_{oj} = Molecular weight of sample component j of the gas stream at the inlet and outlet of the control device, respectively, gram/gram-mole.

Q_i, Q_o = Flowrate of gas stream at the inlet and outlet of the control device, respectively, dry standard cubic meter per minute.

n = Number of components in sample.

(B) When calculating the TOC mass rate, you must sum all organic compounds (minus methane and ethane) measured by Method 25A at 40 CFR part 60, appendix A-7 using the equations in paragraph (b)(3)(ii)(A) of this section.

(iii) You must calculate the percent reduction in TOC (minus methane and ethane) as follows:

$$R_{cd} = \frac{E_i - E_o}{E_i} * 100\%$$

View or download PDF

Where:

R_{cd} = Control efficiency of control device, percent.

E_i = Mass rate of TOC (minus methane and ethane) at the inlet to the control device as calculated under paragraph (b)(3)(ii) of this section, kilograms TOC per hour or kilograms HAP per hour.

E_o = Mass rate of TOC (minus methane and ethane) at the outlet of the control device, as calculated under paragraph (b)(3)(ii) of this section, kilograms TOC per hour per hour.

(iv) If the vent stream entering a boiler or process heater with a design capacity less than 44 megawatts is introduced with the combustion air or as a secondary fuel, you must determine the weight-percent reduction of total TOC (minus methane and ethane) across the device by comparing the TOC (minus methane and ethane) in all combusted vent streams and primary and secondary fuels with the TOC (minus methane and ethane) exiting the device, respectively.

(4) You must use Method 25A at 40 CFR part 60, appendix A-7 to measure TOC (minus methane and ethane) to determine compliance with the enclosed combustion device total VOC concentration limit specified in §60.5412(a)(1)(ii). You must calculate parts per million by volume concentration and correct to 3 percent oxygen, using the procedures in paragraphs (b)(4)(i) through (iii) of this section.

(i) For each run, you must take either an integrated sample or a minimum of four grab samples per hour. If grab sampling is used, then the samples must be taken at approximately equal intervals in time, such as 15-minute intervals during the run.

(ii) You must calculate the TOC concentration for each run as follows:

$$C_{TOC} = \sum_{i=1}^{x} \frac{\left(\sum_{j=i}^{n} C_{ji}\right)}{x}$$

View or download PDF

Where:

C_{TOC} = Concentration of total organic compounds minus methane and ethane, dry basis, parts per million by volume.

C_{ji} = Concentration of sample component j of sample i, dry basis, parts per million by volume.

n = Number of components in the sample.

x = Number of samples in the sample run.

(iii) You must correct the TOC concentration to 3 percent oxygen as specified in paragraphs (b)(4)(iii)(A) and (B) of this section.

(A) You must use the emission rate correction factor for excess air, integrated sampling and analysis procedures of Method 3A or 3B at 40 CFR part 60, appendix A, ASTM D6522-00 (Reapproved 2005), or ANSI/ASME PTC 19.10-1981, Part 10 (manual portion only) (incorporated by reference as specified in §60.17) to determine the oxygen concentration. The samples must be taken during the same time that the samples are taken for determining TOC concentration.

(B) You must correct the TOC concentration for percent oxygen as follows:

$$C_c = C_m \left(\frac{17.9}{20.9 - \%O_{2d}}\right)$$

View or download PDF

Where:

C_c = TOC concentration corrected to 3 percent oxygen, dry basis, parts per million by volume.

C_m = TOC concentration, dry basis, parts per million by volume.

$\%O_{2d}$ = Concentration of oxygen, dry basis, percent by volume.

(5) You must conduct performance tests according to the schedule specified in paragraphs (b)(5)(i) and (ii) of this section.

(i) You must conduct an initial performance test within 180 days after initial startup for your affected facility. You must submit the performance test results as required in §60.5420(b)(7).

(ii) You must conduct periodic performance tests for all control devices required to conduct initial performance tests except as specified in paragraphs (b)(5)(ii)(A) and (B) of this section. You must conduct the first periodic performance test no later than 60 months after the initial performance test required in paragraph (b)(5)(i) of this section. You must conduct subsequent periodic performance tests at intervals no longer than 60 months following the previous periodic performance test or whenever you desire to establish a new operating limit. You must submit the periodic performance test results as specified in §60.5420(b)(7). Combustion control devices meeting the criteria in either paragraph (b)(5)(ii)(A) or (B) of this section are not required to conduct periodic performance tests.

(A) A control device whose model is tested under, and meets the criteria of paragraph (d) of this section.

(B) A combustion control device tested under paragraph (b) of this section that meets the outlet TOC performance level specified in §60.5412(a)(1)(ii) and that establishes a correlation between firebox or combustion chamber temperature and the TOC performance level.

(c) *Control device design analysis to meet the requirements of §60.5412(a).* (1) For a condenser, the design analysis must include an analysis of the vent stream composition, constituent concentrations, flowrate, relative humidity, and temperature, and must establish the design outlet organic compound concentration level, design average temperature of the condenser exhaust vent stream, and the design average temperatures of the coolant fluid at the condenser inlet and outlet.

(2) For a regenerable carbon adsorption system, the design analysis shall include the vent stream composition, constituent concentrations, flowrate, relative humidity, and temperature, and shall establish the design exhaust vent stream organic compound concentration level, adsorption cycle time, number and capacity of carbon beds, type and working capacity of activated carbon used for the carbon beds, design total regeneration stream flow over the period of each complete carbon bed regeneration cycle, design carbon bed temperature after regeneration, design carbon bed regeneration time, and design service life of the carbon.

(3) For a nonregenerable carbon adsorption system, such as a carbon canister, the design analysis shall include the vent stream composition, constituent concentrations, flowrate, relative humidity, and temperature, and shall establish the design exhaust vent stream organic compound concentration level, capacity of the carbon bed, type and working capacity of activated carbon used for the carbon bed, and design carbon replacement interval based on the total carbon working capacity of the control device and source operating schedule. In addition, these systems will incorporate dual carbon canisters in case of emission breakthrough occurring in one canister.

(4) If you and the Administrator do not agree on a demonstration of control device performance using a design analysis, then you must perform a performance test in accordance with the

requirements of paragraph (b) of this section to resolve the disagreement. The Administrator may choose to have an authorized representative observe the performance test.

(d) *Performance testing for combustion control devices—manufacturers' performance test.* (1) This paragraph applies to the performance testing of a combustion control device conducted by the device manufacturer. The manufacturer must demonstrate that a specific model of control device achieves the performance requirements in paragraph (d)(11) of this section by conducting a performance test as specified in paragraphs (d)(2) through (10) of this section. You must submit a test report for each combustion control device in accordance with the requirements in paragraph (d)(12) of this section.

(2) Performance testing must consist of three one-hour (or longer) test runs for each of the four firing rate settings specified in paragraphs (d)(2)(i) through (iv) of this section, making a total of 12 test runs per test. Propene (propylene) gas must be used for the testing fuel. All fuel analyses must be performed by an independent third-party laboratory (not affiliated with the control device manufacturer or fuel supplier).

(i) 90-100 percent of maximum design rate (fixed rate).

(ii) 70-100-70 percent (ramp up, ramp down). Begin the test at 70 percent of the maximum design rate. During the first 5 minutes, incrementally ramp the firing rate to 100 percent of the maximum design rate. Hold at 100 percent for 5 minutes. In the 10-15 minute time range, incrementally ramp back down to 70 percent of the maximum design rate. Repeat three more times for a total of 60 minutes of sampling.

(iii) 30-70-30 percent (ramp up, ramp down). Begin the test at 30 percent of the maximum design rate. During the first 5 minutes, incrementally ramp the firing rate to 70 percent of the maximum design rate. Hold at 70 percent for 5 minutes. In the 10-15 minute time range, incrementally ramp back down to 30 percent of the maximum design rate. Repeat three more times for a total of 60 minutes of sampling.

(iv) 0-30-0 percent (ramp up, ramp down). Begin the test at the minimum firing rate. During the first 5 minutes, incrementally ramp the firing rate to 30 percent of the maximum design rate. Hold at 30 percent for 5 minutes. In the 10-15 minute time range, incrementally ramp back down to the minimum firing rate. Repeat three more times for a total of 60 minutes of sampling.

(3) All models employing multiple enclosures must be tested simultaneously and with all burners operational. Results must be reported for each enclosure individually and for the average of the emissions from all interconnected combustion enclosures/chambers. Control device operating data must be collected continuously throughout the performance test using an electronic Data Acquisition System. A graphic presentation or strip chart of the control device operating data and emissions test data must be included in the test report in accordance with paragraph (d)(12) of this section. Inlet fuel meter data may be manually recorded provided that all inlet fuel data readings are included in the final report.

(4) Inlet testing must be conducted as specified in paragraphs (d)(4)(i) through (ii) of this section.

(i) The inlet gas flow metering system must be located in accordance with Method 2A, 40 CFR part 60, appendix A-1, (or other approved procedure) to measure inlet gas flow rate at the control device inlet location. You must position the fitting for filling fuel sample containers a minimum of eight pipe diameters upstream of any inlet gas flow monitoring meter.

(ii) Inlet flow rate must be determined using Method 2A, 40 CFR part 60, appendix A-1. Record the start and stop reading for each 60-minute THC test. Record the gas pressure and temperature at 5-minute intervals throughout each 60-minute test.

(5) Inlet gas sampling must be conducted as specified in paragraphs (d)(5)(i) through (ii) of this section.

(i) At the inlet gas sampling location, securely connect a Silonite-coated stainless steel evacuated canister fitted with a flow controller sufficient to fill the canister over a 3-hour period. Filling must be conducted as specified in paragraphs (d)(5)(i)(A) through (C) of this section.

(A) Open the canister sampling valve at the beginning of each test run, and close the canister at the end of each test run.

(B) Fill one canister across the three test runs such that one composite fuel sample exists for each test condition.

(C) Label the canisters individually and record sample information on a chain of custody form.

(ii) Analyze each inlet gas sample using the methods in paragraphs (d)(5)(ii)(A) through (C) of this section. You must include the results in the test report required by paragraph (d)(12) of this section.

(A) Hydrocarbon compounds containing between one and five atoms of carbon plus benzene using ASTM D1945-03.

(B) Hydrogen (H_2), carbon monoxide (CO), carbon dioxide (CO_2), nitrogen (N_2), oxygen (O_2) using ASTM D1945-03.

(C) Higher heating value using ASTM D3588-98 or ASTM D4891-89.

(6) Outlet testing must be conducted in accordance with the criteria in paragraphs (d)(6)(i) through (v) of this section.

(i) Sample and flow rate must be measured in accordance with paragraphs (d)(6)(i)(A) through (B) of this section.

(A) The outlet sampling location must be a minimum of four equivalent stack diameters downstream from the highest peak flame or any other flow disturbance, and a minimum of one equivalent stack diameter upstream of the exit or any other flow disturbance. A minimum of two sample ports must be used.

(B) Flow rate must be measured using Method 1, 40 CFR part 60, appendix A-1 for determining flow measurement traverse point location, and Method 2, 40 CFR part 60, appendix A-1 for measuring duct velocity. If low flow conditions are encountered (*i.e.,* velocity pressure differentials less than 0.05 inches of water) during the performance test, a more sensitive manometer must be used to obtain an accurate flow profile.

(ii) Molecular weight and excess air must be determined as specified in paragraph (d)(7) of this section.

(iii) Carbon monoxide must be determined as specified in paragraph (d)(8) of this section.

(iv) THC must be determined as specified in paragraph (d)(9) of this section.

(v) Visible emissions must be determined as specified in paragraph (d)(10) of this section.

(7) Molecular weight and excess air determination must be performed as specified in paragraphs (d)(7)(i) through (iii) of this section.

(i) An integrated bag sample must be collected during the Method 4, 40 CFR part 60, appendix A-3, moisture test following the procedure specified in (d)(7)(i)(A) through (B) of this section. Analyze the bag sample using a gas chromatograph-thermal conductivity detector (GC-TCD) analysis meeting the criteria in paragraphs (d)(7)(i)(C) through (D) of this section.

(A) Collect the integrated sample throughout the entire test, and collect representative volumes from each traverse location.

(B) Purge the sampling line with stack gas before opening the valve and beginning to fill the bag. Clearly label each bag and record sample information on a chain of custody form.

(C) The bag contents must be vigorously mixed prior to the gas chromatograph analysis.

(D) The GC-TCD calibration procedure in Method 3C, 40 CFR part 60, appendix A, must be modified by using EPA Alt-045 as follows: For the initial calibration, triplicate injections of any single concentration must agree within 5 percent of their mean to be valid. The calibration response factor for a single concentration re-check must be within 10 percent of the original calibration response factor for that concentration. If this criterion is not met, repeat the initial calibration using at least three concentration levels.

(ii) Calculate and report the molecular weight of oxygen, carbon dioxide, methane, and nitrogen in the integrated bag sample and include in the test report specified in paragraph (d)(12) of this section. Moisture must be determined using Method 4, 40 CFR part 60, appendix A-3. Traverse both ports with the Method 4, 40 CFR part 60, appendix A-3, sampling train during each test run. Ambient air must not be introduced into the Method 3C, 40 CFR part 60, appendix A-2, integrated bag sample during the port change.

(iii) Excess air must be determined using resultant data from the EPA Method 3C tests and EPA Method 3B, 40 CFR part 60, appendix A, equation 3B-1.

(8) Carbon monoxide must be determined using Method 10, 40 CFR part 60, appendix A. Run the test simultaneously with Method 25A, 40 CFR part 60, appendix A-7 using the same sampling points. An instrument range of 0-10 parts per million by volume-dry (ppmvd) is recommended.

(9) Total hydrocarbon determination must be performed as specified by in paragraphs (d)(9)(i) through (vii) of this section.

(i) Conduct THC sampling using Method 25A, 40 CFR part 60, appendix A-7, except that the option for locating the probe in the center 10 percent of the stack is not allowed. The THC probe must be traversed to 16.7 percent, 50 percent, and 83.3 percent of the stack diameter during each test run.

(ii) A valid test must consist of three Method 25A, 40 CFR part 60, appendix A-7, tests, each no less than 60 minutes in duration.

(iii) A 0-10 parts per million by volume-wet (ppmvw) (as propane) measurement range is preferred; as an alternative a 0-30 ppmvw (as carbon) measurement range may be used.

(iv) Calibration gases must be propane in air and be certified through EPA Protocol 1—"EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards," (incorporated by reference as specified in §60.17).

(v) THC measurements must be reported in terms of ppmvw as propane.

(vi) THC results must be corrected to 3 percent CO_2, as measured by Method 3C, 40 CFR part 60, appendix A-2. You must use the following equation for this diluent concentration correction:

$$C_{corr} = C_{meas}\left(\frac{3}{CO_{2meas}}\right)$$

View or download PDF

Where:

C_{meas} = The measured concentration of the pollutant.

CO_{2meas} = The measured concentration of the CO_2 diluent.

3 = The corrected reference concentration of CO_2 diluent.

C_{corr} = The corrected concentration of the pollutant.

(vii) Subtraction of methane or ethane from the THC data is not allowed in determining results.

(10) Visible emissions must be determined using Method 22, 40 CFR part 60, appendix A. The test must be performed continuously during each test run. A digital color photograph of the exhaust point, taken from the position of the observer and annotated with date and time, must be taken once per test run and the 12 photos included in the test report specified in paragraph (d)(12) of this section.

(11) *Performance test criteria.* (i) The control device model tested must meet the criteria in paragraphs (d)(11)(i)(A) through (D) of this section. These criteria must be reported in the test report required by paragraph (d)(12) of this section.

(A) Method 22, 40 CFR part 60, appendix A, results under paragraph (d)(10) of this section with no indication of visible emissions.

(B) Average Method 25A, 40 CFR part 60, appendix A, results under paragraph (d)(9) of this section equal to or less than 10.0 ppmvw THC as propane corrected to 3.0 percent CO_2.

(C) Average CO emissions determined under paragraph (d)(8) of this section equal to or less than 10 parts ppmvd, corrected to 3.0 percent CO_2.

(D) Excess combustion air determined under paragraph (d)(7) of this section equal to or greater than 150 percent.

(ii) The manufacturer must determine a maximum inlet gas flow rate which must not be exceeded for each control device model to achieve the criteria in paragraph (d)(11)(iii) of this section. The maximum inlet gas flow rate must be included in the test report required by paragraph (d)(12) of this section.

(iii) A control device meeting the criteria in paragraph (d)(11)(i)(A) through (D) of this section must demonstrate a destruction efficiency of 95 percent for VOC regulated under this subpart.

(12) The owner or operator of a combustion control device model tested under this paragraph must submit the information listed in paragraphs (d)(12)(i) through (vi) in the test report required by this section in accordance with §60.5420(b)(8).

(i) A full schematic of the control device and dimensions of the device components.

(ii) The maximum net heating value of the device.

(iii) The test fuel gas flow range (in both mass and volume). Include the maximum allowable inlet gas flow rate.

(iv) The air/stream injection/assist ranges, if used.

(v) The test conditions listed in paragraphs (d)(12)(v)(A) through (O) of this section, as applicable for the tested model.

(A) Fuel gas delivery pressure and temperature.

(B) Fuel gas moisture range.

(C) Purge gas usage range.

(D) Condensate (liquid fuel) separation range.

(E) Combustion zone temperature range. This is required for all devices that measure this parameter.

(F) Excess combustion air range.

(G) Flame arrestor(s).

(H) Burner manifold.

(I) Pilot flame indicator.

(J) Pilot flame design fuel and calculated or measured fuel usage.

(K) Tip velocity range.

(L) Momentum flux ratio.

(M) Exit temperature range.

(N) Exit flow rate.

(O) Wind velocity and direction.

(vi) The test report must include all calibration quality assurance/quality control data, calibration gas values, gas cylinder certification, strip charts, or other graphic presentations of the data annotated with test times and calibration values.

(e) *Continuous compliance for combustion control devices tested by the manufacturer in accordance with paragraph (d) of this section.* This paragraph applies to the demonstration of compliance for a combustion control device tested under the provisions in paragraph (d) of this section. Owners or operators must demonstrate that a control device achieves the performance requirements in (d)(11) of this section by installing a device tested under paragraph (d) of this section and complying with the criteria specified in paragraphs (e)(1) through (7) of this section.

(1) The inlet gas flow rate must be equal to or less than the maximum specified by the manufacturer.

(2) A pilot flame must be present at all times of operation.

(3) Devices must be operated with no visible emissions, except for periods not to exceed a total of 1 minute during any 15-minute period. A visible emissions test conducted according to section 11 of EPA Method 22, 40 CFR part 60, appendix A, must be performed at least once every calendar month, separated by at least 15 days between each test. The observation period shall be 15 minutes.

(4) Devices failing the visible emissions test must follow manufacturer's repair instructions, if available, or best combustion engineering practice as outlined in the unit inspection and maintenance plan, to return the unit to compliant operation. All repairs and maintenance activities for each unit must be recorded in a maintenance and repair log and must be available for inspection.

(5) Following return to operation from maintenance or repair activity, each device must pass an EPA Method 22, 40 CFR part 60, appendix A, visual observation as described in paragraph (e)(3) of this section.

(6) If the owner or operator operates a combustion control device model tested under this section, an electronic copy of the performance test results required by this section shall be submitted via email to *Oil____and____Gas____PT@EPA.GOV* unless the test results for that model of combustion control device are posted at the following Web site: *epa.gov/airquality/oilandgas/.*

(7) Ensure that each enclosed combustion device is maintained in a leak free condition.

[77 FR 49542, Aug. 16, 2012, as amended at 78 FR 58439, Sept. 23, 2013; 79 FR 79039, Dec. 31, 2014; 81 FR 35897, June 3, 2016]

§60.5415 How do I demonstrate continuous compliance with the standards for my gas well affected facility, my centrifugal compressor affected facility, my stationary reciprocating compressor affected facility, my pneumatic controller affected facility, my storage vessel affected facility, and my affected facilities at onshore natural gas processing plants?

(a) For each gas well affected facility, you must demonstrate continuous compliance by submitting the reports required by §60.5420(b) and maintaining the records for each completion operation specified in §60.5420(c)(1).

(b) For each centrifugal compressor affected facility, you must demonstrate continuous compliance according to paragraphs (b)(1) through (3) of this section.

(1) You must reduce VOC emissions from the wet seal fluid degassing system by 95.0 percent or greater.

(2) For each control device used to reduce emissions, you must demonstrate continuous compliance with the performance requirements of §60.5412(a) using the procedures specified in paragraphs (b)(2)(i) through (vii) of this section. If you use a condenser as the control device to achieve the requirements specified in §60.5412(a)(2), you must demonstrate compliance according to paragraph (b)(2)(viii) of this section. You may switch between compliance with paragraphs (b)(2)(i) through (vii) of this section and compliance with paragraph (b)(2)(viii) of this section only after at least 1 year of operation in compliance with the selected approach. You must provide notification of such a change in the compliance method in the next annual report, as required in §60.5420(b), following the change.

(i) You must operate below (or above) the site specific maximum (or minimum) parameter value established according to the requirements of §60.5417(f)(1).

(ii) You must calculate the daily average of the applicable monitored parameter in accordance with §60.5417(e) except that the inlet gas flow rate to the control device must not be averaged.

(iii) Compliance with the operating parameter limit is achieved when the daily average of the monitoring parameter value calculated under paragraph (b)(2)(ii) of this section is either equal to or greater than the minimum monitoring value or equal to or less than the maximum monitoring value established under paragraph (b)(2)(i) of this section. When performance testing of a combustion control device is conducted by the device manufacturer as specified in §60.5413(d), compliance with the operating parameter limit is achieved when the criteria in §60.5413(e) are met.

(iv) You must operate the continuous monitoring system required in §60.5417 at all times the affected source is operating, except for periods of monitoring system malfunctions, repairs associated with monitoring system malfunctions, and required monitoring system quality assurance or quality control activities (including, as applicable, system accuracy audits and required zero and span adjustments). A monitoring system malfunction is any sudden, infrequent, not reasonably preventable failure of the monitoring system to provide valid data. Monitoring system failures that are caused in part by poor maintenance or careless operation are not malfunctions. You are required to complete monitoring system repairs in response to monitoring system malfunctions and to return the monitoring system to operation as expeditiously as practicable.

(v) You may not use data recorded during monitoring system malfunctions, repairs associated with monitoring system malfunctions, or required monitoring system quality assurance or control activities in calculations used to report emissions or operating levels. You must use all the data

collected during all other required data collection periods to assess the operation of the control device and associated control system.

(vi) Failure to collect required data is a deviation of the monitoring requirements, except for periods of monitoring system malfunctions, repairs associated with monitoring system malfunctions, and required quality monitoring system quality assurance or quality control activities (including, as applicable, system accuracy audits and required zero and span adjustments).

(vii) If you use a combustion control device to meet the requirements of §60.5412(a) and you demonstrate compliance using the test procedures specified in §60.5413(b), you must comply with paragraphs (b)(2)(vii)(A) through (D) of this section.

(A) A pilot flame must be present at all times of operation.

(B) Devices must be operated with no visible emissions, except for periods not to exceed a total of 1 minute during any 15-minute period. A visible emissions test conducted according to section 11 of Method 22, 40 CFR part 60, appendix A, must be performed at least once every calendar month, separated by at least 15 days between each test. The observation period shall be 15 minutes.

(C) Devices failing the visible emissions test must follow manufacturer's repair instructions, if available, or best combustion engineering practice as outlined in the unit inspection and maintenance plan, to return the unit to compliant operation. All repairs and maintenance activities for each unit must be recorded in a maintenance and repair log and must be available for inspection.

(D) Following return to operation from maintenance or repair activity, each device must pass a Method 22, 40 CFR part 60, appendix A, visual observation as described in paragraph (b)(2)(vii)(B) of this section.

(viii) If you use a condenser as the control device to achieve the percent reduction performance requirements specified in §60.5412(a)(2), you must demonstrate compliance using the procedures in paragraphs (b)(2)(viii)(A) through (E) of this section.

(A) You must establish a site-specific condenser performance curve according to §60.5417(f)(2).

(B) You must calculate the daily average condenser outlet temperature in accordance with §60.5417(e).

(C) You must determine the condenser efficiency for the current operating day using the daily average condenser outlet temperature calculated under paragraph (b)(2)(viii)(B) of this section and the condenser performance curve established under paragraph (b)(2)(viii)(A) of this section.

(D) Except as provided in paragraphs (b)(2)(viii)(D)(*1*) and (*2*) of this section, at the end of each operating day, you must calculate the 365-day rolling average TOC emission reduction, as appropriate, from the condenser efficiencies as determined in paragraph (b)(2)(viii)(C) of this section.

(*1*) After the compliance dates specified in §60.5370, if you have less than 120 days of data for determining average TOC emission reduction, you must calculate the average TOC emission reduction for the first 120 days of operation after the compliance dates. You have demonstrated

compliance with the overall 95.0 percent reduction requirement if the 120-day average TOC emission reduction is equal to or greater than 95.0 percent.

(*2*) After 120 days and no more than 364 days of operation after the compliance date specified in §60.5370, you must calculate the average TOC emission reduction as the TOC emission reduction averaged over the number of days between the current day and the applicable compliance date. You have demonstrated compliance with the overall 95.0 percent reduction requirement, if the average TOC emission reduction is equal to or greater than 95.0 percent.

(E) If you have data for 365 days or more of operation, you have demonstrated compliance with the TOC emission reduction if the rolling 365-day average TOC emission reduction calculated in paragraph (b)(2)(viii)(D) of this section is equal to or greater than 95.0 percent.

(3) You must submit the annual report required by 60.5420(b) and maintain the records as specified in §60.5420(c)(2).

(c) For each reciprocating compressor affected facility complying with §60.5385(a)(1) or (2), you must demonstrate continuous compliance according to paragraphs (c)(1) through (3) of this section. For each reciprocating compressor affected facility complying with §60.5385(a)(3), you must demonstrate continuous compliance according to paragraph (c)(4) of this section.

(1) You must continuously monitor the number of hours of operation for each reciprocating compressor affected facility or track the number of months since initial startup, or October 15, 2012, or the date of the most recent reciprocating compressor rod packing replacement, whichever is later.

(2) You must submit the annual report as required in §60.5420(b) and maintain records as required in §60.5420(c)(3).

(3) You must replace the reciprocating compressor rod packing before the total number of hours of operation reaches 26,000 hours or the number of months since the most recent rod packing replacement reaches 36 months.

(4) You must operate the rod packing emissions collection system under negative pressure and continuously comply with the closed vent requirements in §60.5416(a) and (b).

(d) For each pneumatic controller affected facility, you must demonstrate continuous compliance according to paragraphs (d)(1) through (3) of this section.

(1) You must continuously operate the pneumatic controllers as required in §60.5390(a), (b), or (c).

(2) You must submit the annual report as required in §60.5420(b).

(3) You must maintain records as required in §60.5420(c)(4).

(e) You must demonstrate continuous compliance according to paragraph (e)(3) of this section for each storage vessel affected facility, for which you are using a control device or routing emissions to a process to meet the requirement of §60.5395(d)(1).

(1)-(2) [Reserved]

(3) For each storage vessel affected facility, you must comply with paragraphs (e)(3)(i) and (ii) of this section.

(i) You must reduce VOC emissions as specified in §60.5395(d).

(ii) For each control device installed to meet the requirements of §60.5395(d), you must demonstrate continuous compliance with the performance requirements of §60.5412(d) for each storage vessel affected facility using the procedure specified in paragraph (e)(3)(ii)(A) and either (e)(3)(ii)(B) or (e)(3)(ii)(C) of this section.

(A) You must comply with §60.5416(c) for each cover and closed vent system.

(B) You must comply with §60.5417(h) for each control device.

(C) Each closed vent system that routes emissions to a process must be operated as specified in §60.5411(c)(2).

(f) For affected facilities at onshore natural gas processing plants, continuous compliance with VOC requirements is demonstrated if you are in compliance with the requirements of §60.5400.

(g) For each sweetening unit affected facility at onshore natural gas processing plants, you must demonstrate continuous compliance with the standards for SO_2 specified in §60.5405(b) according to paragraphs (g)(1) and (2) of this section.

(1) The minimum required SO_2 emission reduction efficiency (Z_c) is compared to the emission reduction efficiency (R) achieved by the sulfur recovery technology.

(i) If $R \geq Z_c$, your affected facility is in compliance.

(ii) If $R < Z_c$, your affected facility is not in compliance.

(2) The emission reduction efficiency (R) achieved by the sulfur reduction technology must be determined using the procedures in §60.5406(c)(1).

[77 FR 49542, Aug. 16, 2012, as amended at 78 FR 58442, Sept. 23, 2013; 79 FR 79039, Dec. 31, 2014; 81 FR 35897, June 3, 2016]

Back to Top

§60.5416 What are the initial and continuous cover and closed vent system inspection and monitoring requirements for my storage vessel, centrifugal compressor and reciprocating compressor affected facilities?

For each closed vent system or cover at your storage vessel, centrifugal compressor and reciprocating compressor affected facility, you must comply with the applicable requirements of paragraphs (a) through (c) of this section.

(a) *Inspections for closed vent systems and covers installed on each centrifugal compressor or reciprocating compressor affected facility.* Except as provided in paragraphs (b)(11) and (12) of this section, you must inspect each closed vent system according to the procedures and schedule specified in paragraphs (a)(1) and (2) of this section, inspect each cover according to the procedures

and schedule specified in paragraph (a)(3) of this section, and inspect each bypass device according to the procedures of paragraph (a)(4) of this section.

(1) For each closed vent system joint, seam, or other connection that is permanently or semi-permanently sealed (e.g., a welded joint between two sections of hard piping or a bolted and gasketed ducting flange), you must meet the requirements specified in paragraphs (a)(1)(i) and (ii) of this section.

(i) Conduct an initial inspection according to the test methods and procedures specified in paragraph (b) of this section to demonstrate that the closed vent system operates with no detectable emissions. You must maintain records of the inspection results as specified in §60.5420(c)(6).

(ii) Conduct annual visual inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in piping; loose connections; liquid leaks; or broken or missing caps or other closure devices. You must monitor a component or connection using the test methods and procedures in paragraph (b) of this section to demonstrate that it operates with no detectable emissions following any time the component is repaired or replaced or the connection is unsealed. You must maintain records of the inspection results as specified in §60.5420(c)(6).

(2) For closed vent system components other than those specified in paragraph (a)(1) of this section, you must meet the requirements of paragraphs (a)(2)(i) through (iii) of this section.

(i) Conduct an initial inspection according to the test methods and procedures specified in paragraph (b) of this section to demonstrate that the closed vent system operates with no detectable emissions. You must maintain records of the inspection results as specified in §60.5420(c)(6).

(ii) Conduct annual inspections according to the test methods and procedures specified in paragraph (b) of this section to demonstrate that the components or connections operate with no detectable emissions. You must maintain records of the inspection results as specified in §60.5420(c)(6).

(iii) Conduct annual visual inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in ductwork; loose connections; liquid leaks; or broken or missing caps or other closure devices. You must maintain records of the inspection results as specified in §60.5420(c)(6).

(3) For each cover, you must meet the requirements in paragraphs (a)(3)(i) and (ii) of this section.

(i) Conduct visual inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the cover, or between the cover and the separator wall; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices. In the case where the storage vessel is buried partially or entirely underground, you must inspect only those portions of the cover that extend to or above the ground surface, and those connections that are on such portions of the cover (e.g., fill ports, access hatches, gauge wells, etc.) and can be opened to the atmosphere.

(ii) You must initially conduct the inspections specified in paragraph (a)(3)(i) of this section following the installation of the cover. Thereafter, you must perform the inspection at least once every calendar year, except as provided in paragraphs (b)(11) and (12) of this section. You must maintain records of the inspection results as specified in §60.5420(c)(7).

(4) For each bypass device, except as provided for in §60.5411, you must meet the requirements of paragraphs (a)(4)(i) or (ii) of this section.

(i) Set the flow indicator to take a reading at least once every 15 minutes at the inlet to the bypass device that could divert the steam away from the control device to the atmosphere.

(ii) If the bypass device valve installed at the inlet to the bypass device is secured in the non-diverting position using a car-seal or a lock-and-key type configuration, visually inspect the seal or closure mechanism at least once every month to verify that the valve is maintained in the non-diverting position and the vent stream is not diverted through the bypass device. You must maintain records of the inspections according to §60.5420(c)(8).

(b) *No detectable emissions test methods and procedures.* If you are required to conduct an inspection of a closed vent system or cover at your centrifugal compressor or reciprocating compressor affected facility as specified in paragraphs (a)(1), (2), or (3) of this section, you must meet the requirements of paragraphs (b)(1) through (13) of this section.

(1) You must conduct the no detectable emissions test procedure in accordance with Method 21 at 40 CFR part 60, appendix A-7.

(2) The detection instrument must meet the performance criteria of Method 21 at 40 CFR part 60, appendix A-7, except that the instrument response factor criteria in section 3.1.2(a) of Method 21 must be for the average composition of the fluid and not for each individual organic compound in the stream.

(3) You must calibrate the detection instrument before use on each day of its use by the procedures specified in Method 21 at 40 CFR part 60, appendix A-7.

(4) Calibration gases must be as specified in paragraphs (b)(4)(i) and (ii) of this section.

(i) Zero air (less than 10 parts per million by volume hydrocarbon in air).

(ii) A mixture of methane in air at a concentration less than 10,000 parts per million by volume.

(5) You may choose to adjust or not adjust the detection instrument readings to account for the background organic concentration level. If you choose to adjust the instrument readings for the background level, you must determine the background level value according to the procedures in Method 21 at 40 CFR part 60, appendix A-7.

(6) Your detection instrument must meet the performance criteria specified in paragraphs (b)(6)(i) and (ii) of this section.

(i) Except as provided in paragraph (b)(6)(ii) of this section, the detection instrument must meet the performance criteria of Method 21 at 40 CFR part 60, appendix A-7, except the instrument response factor criteria in section 3.1.2(a) of Method 21 must be for the average composition of the process fluid, not each individual volatile organic compound in the stream. For process streams that contain nitrogen, air, or other inerts that are not organic hazardous air pollutants or volatile organic compounds, you must calculate the average stream response factor on an inert-free basis.

(ii) If no instrument is available that will meet the performance criteria specified in paragraph (b)(6)(i) of this section, you may adjust the instrument readings by multiplying by the average

response factor of the process fluid, calculated on an inert-free basis, as described in paragraph (b)(6)(i) of this section.

(7) You must determine if a potential leak interface operates with no detectable emissions using the applicable procedure specified in paragraph (b)(7)(i) or (ii) of this section.

(i) If you choose not to adjust the detection instrument readings for the background organic concentration level, then you must directly compare the maximum organic concentration value measured by the detection instrument to the applicable value for the potential leak interface as specified in paragraph (b)(8) of this section.

(ii) If you choose to adjust the detection instrument readings for the background organic concentration level, you must compare the value of the arithmetic difference between the maximum organic concentration value measured by the instrument and the background organic concentration value as determined in paragraph (b)(5) of this section with the applicable value for the potential leak interface as specified in paragraph (b)(8) of this section.

(8) A potential leak interface is determined to operate with no detectable organic emissions if the organic concentration value determined in paragraph (b)(7) of this section is less than 500 parts per million by volume.

(9) *Repairs.* In the event that a leak or defect is detected, you must repair the leak or defect as soon as practicable according to the requirements of paragraphs (b)(9)(i) and (ii) of this section, except as provided in paragraph (b)(10) of this section.

(i) A first attempt at repair must be made no later than 5 calendar days after the leak is detected.

(ii) Repair must be completed no later than 15 calendar days after the leak is detected.

(10) *Delay of repair.* Delay of repair of a closed vent system or cover for which leaks or defects have been detected is allowed if the repair is technically infeasible without a shutdown, or if you determine that emissions resulting from immediate repair would be greater than the fugitive emissions likely to result from delay of repair. You must complete repair of such equipment by the end of the next shutdown.

(11) *Unsafe to inspect requirements.* You may designate any parts of the closed vent system or cover as unsafe to inspect if the requirements in paragraphs (b)(11)(i) and (ii) of this section are met. Unsafe to inspect parts are exempt from the inspection requirements of paragraphs (a)(1) through (3) of this section.

(i) You determine that the equipment is unsafe to inspect because inspecting personnel would be exposed to an imminent or potential danger as a consequence of complying with paragraphs (a)(1), (2), or (3) of this section.

(ii) You have a written plan that requires inspection of the equipment as frequently as practicable during safe-to-inspect times.

(12) *Difficult to inspect requirements.* You may designate any parts of the closed vent system or cover as difficult to inspect, if the requirements in paragraphs (b)(12)(i) and (ii) of this section are

met. Difficult to inspect parts are exempt from the inspection requirements of paragraphs (a)(1) through (3) of this section.

(i) You determine that the equipment cannot be inspected without elevating the inspecting personnel more than 2 meters above a support surface.

(ii) You have a written plan that requires inspection of the equipment at least once every 5 years.

(13) *Records.* Records shall be maintained as specified in this section and in §60.5420(c)(9).

(c) *Cover and closed vent system inspections for storage vessel affected facilities.* If you install a control device or route emissions to a process, you must inspect each closed vent system according to the procedures and schedule specified in paragraphs (c)(1) of this section, inspect each cover according to the procedures and schedule specified in paragraph (c)(2) of this section, and inspect each bypass device according to the procedures of paragraph (c)(3) of this section. You must also comply with the requirements of (c)(4) through (7) of this section.

(1) For each closed vent system, you must conduct an inspection at least once every calendar month as specified in paragraphs (c)(1)(i) through (iii) of this section.

(i) You must maintain records of the inspection results as specified in §60.5420(c)(6).

(ii) Conduct olfactory, visual and auditory inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in piping; loose connections; liquid leaks; or broken or missing caps or other closure devices.

(iii) Monthly inspections must be separated by at least 14 calendar days.

(2) For each cover, you must conduct inspections at least once every calendar month as specified in paragraphs (c)(2)(i) through (iii) of this section.

(i) You must maintain records of the inspection results as specified in §60.5420(c)(7).

(ii) Conduct olfactory, visual and auditory inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the cover, or between the cover and the separator wall; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices. In the case where the storage vessel is buried partially or entirely underground, you must inspect only those portions of the cover that extend to or above the ground surface, and those connections that are on such portions of the cover (*e.g.,* fill ports, access hatches, gauge wells, etc.) and can be opened to the atmosphere.

(iii) Monthly inspections must be separated by at least 14 calendar days.

(3) For each bypass device, except as provided for in §60.5411(c)(3)(ii), you must meet the requirements of paragraphs (c)(3)(i) or (ii) of this section.

(i) You must properly install, calibrate and maintain a flow indicator at the inlet to the bypass device that could divert the stream away from the control device or process to the atmosphere. Set the flow indicator to trigger an audible alarm, or initiate notification via remote alarm to the nearest

field office, when the bypass device is open such that the stream is being, or could be, diverted away from the control device or process to the atmosphere. You must maintain records of each time the alarm is activated according to §60.5420(c)(8).

(ii) If the bypass device valve installed at the inlet to the bypass device is secured in the non-diverting position using a car-seal or a lock-and-key type configuration, visually inspect the seal or closure mechanism at least once every month to verify that the valve is maintained in the non-diverting position and the vent stream is not diverted through the bypass device. You must maintain records of the inspections and records of each time the key is checked out, if applicable, according to §60.5420(c)(8).

(4) *Repairs.* In the event that a leak or defect is detected, you must repair the leak or defect as soon as practicable according to the requirements of paragraphs (c)(4)(i) through (iii) of this section, except as provided in paragraph (c)(5) of this section.

(i) A first attempt at repair must be made no later than 5 calendar days after the leak is detected.

(ii) Repair must be completed no later than 30 calendar days after the leak is detected.

(iii) Grease or another applicable substance must be applied to deteriorating or cracked gaskets to improve the seal while awaiting repair.

(5) *Delay of repair.* Delay of repair of a closed vent system or cover for which leaks or defects have been detected is allowed if the repair is technically infeasible without a shutdown, or if you determine that emissions resulting from immediate repair would be greater than the fugitive emissions likely to result from delay of repair. You must complete repair of such equipment by the end of the next shutdown.

(6) *Unsafe to inspect requirements.* You may designate any parts of the closed vent system or cover as unsafe to inspect if the requirements in paragraphs (c)(6)(i) and (ii) of this section are met. Unsafe to inspect parts are exempt from the inspection requirements of paragraphs (c)(1) and (2) of this section.

(i) You determine that the equipment is unsafe to inspect because inspecting personnel would be exposed to an imminent or potential danger as a consequence of complying with paragraphs (c)(1) or (2) of this section.

(ii) You have a written plan that requires inspection of the equipment as frequently as practicable during safe-to-inspect times.

(7) *Difficult to inspect requirements.* You may designate any parts of the closed vent system or cover as difficult to inspect, if the requirements in paragraphs (c)(7)(i) and (ii) of this section are met. Difficult to inspect parts are exempt from the inspection requirements of paragraphs (c)(1) and (2) of this section.

(i) You determine that the equipment cannot be inspected without elevating the inspecting personnel more than 2 meters above a support surface.

(ii) You have a written plan that requires inspection of the equipment at least once every 5 years.

[77 FR 49542, Aug. 16, 2012, as amended at 78 FR 58443, Sept. 23, 2013; 79 FR 79039, Dec. 31, 2014; 81 FR 35897, June 3, 2016]

Back to Top

§60.5417 What are the continuous control device monitoring requirements for my storage vessel or centrifugal compressor affected facility?

You must meet the applicable requirements of this section to demonstrate continuous compliance for each control device used to meet emission standards for your storage vessel or centrifugal compressor affected facility.

(a) For each control device used to comply with the emission reduction standard for centrifugal compressor affected facilities in §60.5380, you must install and operate a continuous parameter monitoring system for each control device as specified in paragraphs (c) through (g) of this section, except as provided for in paragraph (b) of this section. If you install and operate a flare in accordance with §60.5412(a)(3), you are exempt from the requirements of paragraphs (e) and (f) of this section.

(b) You are exempt from the monitoring requirements specified in paragraphs (c) through (g) of this section for the control devices listed in paragraphs (b)(1) and (2) of this section.

(1) A boiler or process heater in which all vent streams are introduced with the primary fuel or is used as the primary fuel.

(2) A boiler or process heater with a design heat input capacity equal to or greater than 44 megawatts.

(c) If you are required to install a continuous parameter monitoring system, you must meet the specifications and requirements in paragraphs (c)(1) through (4) of this section.

(1) Each continuous parameter monitoring system must measure data values at least once every hour and record the parameters in paragraphs (c)(1)(i) or (ii) of this section.

(i) Each measured data value.

(ii) Each block average value for each 1-hour period or shorter periods calculated from all measured data values during each period. If values are measured more frequently than once per minute, a single value for each minute may be used to calculate the hourly (or shorter period) block average instead of all measured values.

(2) You must prepare a site-specific monitoring plan that addresses the monitoring system design, data collection, and the quality assurance and quality control elements outlined in paragraphs (c)(2)(i) through (v) of this section. You must install, calibrate, operate, and maintain each continuous parameter monitoring system in accordance with the procedures in your approved site-specific monitoring plan.

(i) The performance criteria and design specifications for the monitoring system equipment, including the sample interface, detector signal analyzer, and data acquisition and calculations.

(ii) Sampling interface (e.g., thermocouple) location such that the monitoring system will provide representative measurements.

(iii) Equipment performance checks, system accuracy audits, or other audit procedures.

(iv) Ongoing operation and maintenance procedures in accordance with provisions in §60.13(b).

(v) Ongoing reporting and recordkeeping procedures in accordance with provisions in §60.7(c), (d), and (f).

(3) You must conduct the continuous parameter monitoring system equipment performance checks, system accuracy audits, or other audit procedures specified in the site-specific monitoring plan at least once every 12 months.

(4) You must conduct a performance evaluation of each continuous parameter monitoring system in accordance with the site-specific monitoring plan.

(d) You must install, calibrate, operate, and maintain a device equipped with a continuous recorder to measure the values of operating parameters appropriate for the control device as specified in either paragraph (d)(1), (2), or (3) of this section.

(1) A continuous monitoring system that measures the operating parameters in paragraphs (d)(1)(i) through (viii) of this section, as applicable.

(i) For a thermal vapor incinerator that demonstrates during the performance test conducted under §60.5413 that combustion zone temperature is an accurate indicator of performance, a temperature monitoring device equipped with a continuous recorder. The monitoring device must have a minimum accuracy of ±1 percent of the temperature being monitored in °C, or ±2.5 °C, whichever value is greater. You must install the temperature sensor at a location representative of the combustion zone temperature.

(ii) For a catalytic vapor incinerator, a temperature monitoring device equipped with a continuous recorder. The device must be capable of monitoring temperature at two locations and have a minimum accuracy of ±1 percent of the temperature being monitored in °C, or ±2.5 °C, whichever value is greater. You must install one temperature sensor in the vent stream at the nearest feasible point to the catalyst bed inlet, and you must install a second temperature sensor in the vent stream at the nearest feasible point to the catalyst bed outlet.

(iii) For a flare, a heat sensing monitoring device equipped with a continuous recorder that indicates the continuous ignition of the pilot flame.

(iv) For a boiler or process heater, a temperature monitoring device equipped with a continuous recorder. The temperature monitoring device must have a minimum accuracy of ±1 percent of the temperature being monitored in °C, or ±2.5 °C, whichever value is greater. You must install the temperature sensor at a location representative of the combustion zone temperature.

(v) For a condenser, a temperature monitoring device equipped with a continuous recorder. The temperature monitoring device must have a minimum accuracy of ±1 percent of the temperature being monitored in °C, or ±2.8 °C, whichever value is greater. You must install the temperature sensor at a location in the exhaust vent stream from the condenser.

(vi) For a regenerative-type carbon adsorption system, a continuous monitoring system that meets the specifications in paragraphs (d)(1)(vi)(A) and (B) of this section.

(A) The continuous parameter monitoring system must measure and record the average total regeneration stream mass flow or volumetric flow during each carbon bed regeneration cycle. The flow sensor must have a measurement sensitivity of 5 percent of the flow rate or 10 cubic feet per minute, whichever is greater. You must check the mechanical connections for leakage at least every month, and you must perform a visual inspection at least every 3 months of all components of the flow continuous parameter monitoring system for physical and operational integrity and all electrical connections for oxidation and galvanic corrosion if your flow continuous parameter monitoring system is not equipped with a redundant flow sensor; and

(B) The continuous parameter monitoring system must measure and record the average carbon bed temperature for the duration of the carbon bed steaming cycle and measure the actual carbon bed temperature after regeneration and within 15 minutes of completing the cooling cycle. The temperature monitoring device must have a minimum accuracy of ±1 percent of the temperature being monitored in °C, or ±2.5 °C, whichever value is greater.

(vii) For a nonregenerative-type carbon adsorption system, you must monitor the design carbon replacement interval established using a performance test performed as specified in §60.5413(b). The design carbon replacement interval must be based on the total carbon working capacity of the control device and source operating schedule.

(viii) For a combustion control device whose model is tested under §60.5413(d), a continuous monitoring system meeting the requirements of paragraphs (d)(1)(viii)(A) and (B) of this section.

(A) The continuous monitoring system must measure gas flow rate at the inlet to the control device. The monitoring instrument must have an accuracy of ±2 percent or better. The flow rate at the inlet to the combustion device must not exceed the maximum or minimum flow rate determined by the manufacturer.

(B) A monitoring device that continuously indicates the presence of the pilot flame while emissions are routed to the control device.

(2) An organic monitoring device equipped with a continuous recorder that measures the concentration level of organic compounds in the exhaust vent stream from the control device. The monitor must meet the requirements of Performance Specification 8 or 9 of 40 CFR part 60, appendix B. You must install, calibrate, and maintain the monitor according to the manufacturer's specifications.

(3) A continuous monitoring system that measures operating parameters other than those specified in paragraph (d)(1) or (2) of this section, upon approval of the Administrator as specified in §60.13(i).

(e) You must calculate the daily average value for each monitored operating parameter for each operating day, using the data recorded by the monitoring system, except for inlet gas flow rate. If the emissions unit operation is continuous, the operating day is a 24-hour period. If the emissions unit operation is not continuous, the operating day is the total number of hours of control device operation per 24-hour period. Valid data points must be available for 75 percent of the operating hours in an operating day to compute the daily average.

(f) For each operating parameter monitor installed in accordance with the requirements of paragraph (d) of this section, you must comply with paragraph (f)(1) of this section for all control devices. When condensers are installed, you must also comply with paragraph (f)(2) of this section.

(1) You must establish a minimum operating parameter value or a maximum operating parameter value, as appropriate for the control device, to define the conditions at which the control device must be operated to continuously achieve the applicable performance requirements of §60.5412(a). You must establish each minimum or maximum operating parameter value as specified in paragraphs (f)(1)(i) through (iii) of this section.

(i) If you conduct performance tests in accordance with the requirements of §60.5413(b) to demonstrate that the control device achieves the applicable performance requirements specified in §60.5412(a), then you must establish the minimum operating parameter value or the maximum operating parameter value based on values measured during the performance test and supplemented, as necessary, by a condenser design analysis or control device manufacturer recommendations or a combination of both.

(ii) If you use a condenser design analysis in accordance with the requirements of §60.5413(c) to demonstrate that the control device achieves the applicable performance requirements specified in §60.5412(a), then you must establish the minimum operating parameter value or the maximum operating parameter value based on the condenser design analysis and supplemented, as necessary, by the condenser manufacturer's recommendations.

(iii) If you operate a control device where the performance test requirement was met under §60.5413(d) to demonstrate that the control device achieves the applicable performance requirements specified in §60.5412(a), then your control device inlet gas flow rate must not exceed the maximum or minimum inlet gas flow rate determined by the manufacturer.

(2) If you use a condenser as specified in paragraph (d)(1)(v) of this section, you must establish a condenser performance curve showing the relationship between condenser outlet temperature and condenser control efficiency, according to the requirements of paragraphs (f)(2)(i) and (ii) of this section.

(i) If you conduct a performance test in accordance with the requirements of §60.5413(b) to demonstrate that the condenser achieves the applicable performance requirements in §60.5412(a), then the condenser performance curve must be based on values measured during the performance test and supplemented as necessary by control device design analysis, or control device manufacturer's recommendations, or a combination or both.

(ii) If you use a control device design analysis in accordance with the requirements of §60.5413(c)(1) to demonstrate that the condenser achieves the applicable performance requirements specified in §60.5412(a), then the condenser performance curve must be based on the condenser design analysis and supplemented, as necessary, by the control device manufacturer's recommendations.

(g) A deviation for a given control device is determined to have occurred when the monitoring data or lack of monitoring data result in any one of the criteria specified in paragraphs (g)(1) through (g)(6) of this section being met. If you monitor multiple operating parameters for the same control device during the same operating day and more than one of these operating parameters meets a deviation criterion specified in paragraphs (g)(1) through (6) of this section, then a single excursion is determined to have occurred for the control device for that operating day.

(1) A deviation occurs when the daily average value of a monitored operating parameter is less than the minimum operating parameter limit (or, if applicable, greater than the maximum operating parameter limit) established in paragraph (f)(1) of this section.

(2) If you meet §60.5412(a)(2), a deviation occurs when the 365-day average condenser efficiency calculated according to the requirements specified in §60.5415(e)(8)(iv) is less than 95.0 percent.

(3) If you meet §60.5412(a)(2) and you have less than 365 days of data, a deviation occurs when the average condenser efficiency calculated according to the procedures specified in §60.5415(e)(8)(iv)(A) or (B) is less than 90.0 percent.

(4) A deviation occurs when the monitoring data are not available for at least 75 percent of the operating hours in a day.

(5) If the closed vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device, a deviation occurs when the requirements of paragraphs (g)(5)(i) and (ii) of this section are met.

(i) For each bypass line subject to §60.5411(a)(3)(i)(A), the flow indicator indicates that flow has been detected and that the stream has been diverted away from the control device to the atmosphere.

(ii) For each bypass line subject to §60.5411(a)(3)(i)(B), if the seal or closure mechanism has been broken, the bypass line valve position has changed, the key for the lock-and-key type lock has been checked out, or the car-seal has broken.

(6) For a combustion control device whose model is tested under §60.5413(d), a deviation occurs when the conditions of paragraphs (g)(6)(i) or (ii) are met.

(i) The inlet gas flow rate exceeds the maximum established during the test conducted under §60.5413(d).

(ii) Failure of the quarterly visible emissions test conducted under §60.5413(e)(3) occurs.

(h) For each control device used to comply with the emission reduction standard in §60.5395(d)(1) for your storage vessel affected facility, you must demonstrate continuous compliance according to paragraphs (h)(1) through (h)(3) of this section. You are exempt from the requirements of this paragraph if you install a control device model tested in accordance with §60.5413(d)(2) through (10), which meets the criteria in §60.5413(d)(11), the reporting requirement in §60.5413(d)(12), and meet the continuous compliance requirement in §60.5413(e).

(1) For each combustion device you must conduct inspections at least once every calendar month according to paragraphs (h)(1)(i) through (iv) of this section. Monthly inspections must be separated by at least 14 calendar days.

(i) Conduct visual inspections to confirm that the pilot is lit when vapors are being routed to the combustion device and that the continuous burning pilot flame is operating properly.

(ii) Conduct inspections to monitor for visible emissions from the combustion device using section 11 of EPA Method 22, 40 CFR part 60, appendix A. The observation period shall be 15

minutes. Devices must be operated with no visible emissions, except for periods not to exceed a total of 1 minute during any 15 minute period.

(iii) Conduct olfactory, visual and auditory inspections of all equipment associated with the combustion device to ensure system integrity.

(iv) For any absence of pilot flame, or other indication of smoking or improper equipment operation (*e.g.,* visual, audible, or olfactory), you must ensure the equipment is returned to proper operation as soon as practicable after the event occurs. At a minimum, you must perform the procedures specified in paragraphs (h)(1)(iv)(A) and (B) of this section.

(A) You must check the air vent for obstruction. If an obstruction is observed, you must clear the obstruction as soon as practicable.

(B) You must check for liquid reaching the combustor.

(2) For each vapor recovery device, you must conduct inspections at least once every calendar month to ensure physical integrity of the control device according to the manufacturer's instructions. Monthly inspections must be separated by at least 14 calendar days.

(3) Each control device must be operated following the manufacturer's written operating instructions, procedures and maintenance schedule to ensure good air pollution control practices for minimizing emissions. Records of the manufacturer's written operating instructions, procedures, and maintenance schedule must be available for inspection as specified in §60.5420(c)(13).

[77 FR 49542, Aug. 16, 2012, as amended at 78 FR 58443, Sept. 23, 2013]

Back to Top

§60.5420 What are my notification, reporting, and recordkeeping requirements?

(a) You must submit the notifications according to paragraphs (a)(1) and (2) of this section if you own or operate one or more of the affected facilities specified in §60.5365 that was constructed, modified, or reconstructed during the reporting period.

(1) If you own or operate a gas well, pneumatic controller, centrifugal compressor, reciprocating compressor or storage vessel affected facility you are not required to submit the notifications required in §60.7(a)(1), (3), and (4).

(2)(i) If you own or operate a gas well affected facility, you must submit a notification to the Administrator no later than 2 days prior to the commencement of each well completion operation listing the anticipated date of the well completion operation. The notification shall include contact information for the owner or operator; the API well number, the latitude and longitude coordinates for each well in decimal degrees to an accuracy and precision of five (5) decimals of a degree using the North American Datum of 1983; and the planned date of the beginning of flowback. You may submit the notification in writing or in electronic format.

(ii) If you are subject to state regulations that require advance notification of well completions and you have met those notification requirements, then you are considered to have met the advance notification requirements of paragraph (a)(2)(i) of this section.

(b) Reporting requirements. You must submit annual reports containing the information specified in paragraphs (b)(1) through (6) of this section to the Administrator and performance test reports as specified in paragraph (b)(7) or (8) of this section. The initial annual report is due no later than 90 days after the end of the initial compliance period as determined according to §60.5410. Subsequent annual reports are due no later than same date each year as the initial annual report. If you own or operate more than one affected facility, you may submit one report for multiple affected facilities provided the report contains all of the information required as specified in paragraphs (b)(1) through (6) of this section. Annual reports may coincide with title V reports as long as all the required elements of the annual report are included. You may arrange with the Administrator a common schedule on which reports required by this part may be submitted as long as the schedule does not extend the reporting period.

(1) The general information specified in paragraphs (b)(1)(i) through (iv) of this section.

(i) The company name and address of the affected facility.

(ii) An identification of each affected facility being included in the annual report.

(iii) Beginning and ending dates of the reporting period.

(iv) A certification by a certifying official of truth, accuracy, and completeness. This certification shall state that, based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate, and complete.

(2) For each gas well affected facility, the information in paragraphs (b)(2)(i) through (ii) of this section.

(i) Records of each well completion operation as specified in paragraph (c)(1)(i) through (iv) of this section for each gas well affected facility conducted during the reporting period. In lieu of submitting the records specified in paragraph (c)(1)(i) through (iv), the owner or operator may submit a list of the well completions with hydraulic fracturing completed during the reporting period and the records required by paragraph (c)(1)(v) of this section for each well completion.

(ii) Records of deviations specified in paragraph (c)(1)(ii) of this section that occurred during the reporting period.

(3) For each centrifugal compressor affected facility, the information specified in paragraphs (b)(3)(i) and (ii) of this section.

(i) An identification of each centrifugal compressor using a wet seal system constructed, modified or reconstructed during the reporting period.

(ii) Records of deviations specified in paragraph (c)(2) of this section that occurred during the reporting period.

(iii) If required to comply with §60.5380(a)(1), the records specified in paragraphs (c)(6) through (11) of this section.

(4) For each reciprocating compressor affected facility, the information specified in paragraphs (b)(4)(i) through (ii) of this section.

(i) The cumulative number of hours of operation or the number of months since initial startup, since October 15, 2012, or since the previous reciprocating compressor rod packing replacement, whichever is later.

(ii) Records of deviations specified in paragraph (c)(3)(iii) of this section that occurred during the reporting period.

(5) For each pneumatic controller affected facility, the information specified in paragraphs (b)(5)(i) through (iii) of this section.

(i) An identification of each pneumatic controller constructed, modified or reconstructed during the reporting period, including the identification information specified in §60.5390(b)(2) or (c)(2).

(ii) If applicable, documentation that the use of pneumatic controller affected facilities with a natural gas bleed rate greater than 6 standard cubic feet per hour are required and the reasons why.

(iii) Records of deviations specified in paragraph (c)(4)(v) of this section that occurred during the reporting period.

(6) For each storage vessel affected facility, the information in paragraphs (b)(6)(i) through (vii) of this section.

(i) An identification, including the location, of each storage vessel affected facility for which construction, modification or reconstruction commenced during the reporting period. The location of the storage vessel shall be in latitude and longitude coordinates in decimal degrees to an accuracy and precision of five (5) decimals of a degree using the North American Datum of 1983.

(ii) Documentation of the VOC emission rate determination according to §60.5365(e) for each storage vessel that became an affected facility during the reporting period or is returned to service during the reporting period.

(iii) Records of deviations specified in paragraph (c)(5)(iii) of this section that occurred during the reporting period.

(iv) You must submit a notification identifying each Group 1 storage vessel affected facility in your initial annual report. You must include the location of the storage vessel, in latitude and longitude coordinates in decimal degrees to an accuracy and precision of five (5) decimals of a degree using the North American Datum of 1983.

(v) A statement that you have met the requirements specified in §60.5410(h)(2) and (3).

(vi) You must identify each storage vessel affected facility that is removed from service during the reporting period as specified in §60.5395(f)(1)(ii), including the date the storage vessel affected facility was removed from service.

(vii) You must identify each storage vessel affected facility returned to service during the reporting period as specified in §60.5395(f)(3), including the date the storage vessel affected facility was returned to service.

(7)(i) Within 60 days after the date of completing each performance test (see §60.8 of this part) as required by this subpart, except testing conducted by the manufacturer as specified in

§60.5413(d), you must submit the results of the performance tests required by this subpart to the EPA as follows. You must use the latest version of the EPA's Electronic Reporting Tool (ERT) (see *http://www.epa.gov/ttn/chief/ert/index.html*) existing at the time of the performance test to generate a submission package file, which documents the performance test. You must then submit the file generated by the ERT through the EPA's Compliance and Emissions Data Reporting Interface (CEDRI), which can be accessed by logging in to the EPA's Central Data Exchange (CDX) (*https://cdx.epa.gov/*). Only data collected using test methods supported by the ERT as listed on the ERT Web site are subject to this requirement for submitting reports electronically. Owners or operators who claim that some of the information being submitted for performance tests is confidential business information (CBI) must submit a complete ERT file including information claimed to be CBI on a compact disk or other commonly used electronic storage media (including, but not limited to, flash drives) to EPA. The electronic media must be clearly marked as CBI and mailed to U.S. EPA/OAPQS/CORE CBI Office, Attention: WebFIRE Administrator, MD C404-02, 4930 Old Page Rd., Durham, NC 27703. The same ERT file with the CBI omitted must be submitted to EPA via CDX as described earlier in this paragraph. At the discretion of the delegated authority, you must also submit these reports, including the confidential business information, to the delegated authority in the format specified by the delegated authority. For any performance test conducted using test methods that are not listed on the ERT Web site, the owner or operator shall submit the results of the performance test to the Administrator at the appropriate address listed in §60.4.

(ii) All reports, except as specified in paragraph (b)(8) of this section, required by this subpart not subject to the requirements in paragraph (a)(2)(i) of this section must be sent to the Administrator at the appropriate address listed in §60.4 of this part. The Administrator or the delegated authority may request a report in any form suitable for the specific case (e.g., by commonly used electronic media such as Excel spreadsheet, on CD or hard copy).

(8) For enclosed combustors tested by the manufacturer in accordance with §60.5413(d), an electronic copy of the performance test results required by §60.5413(d) shall be submitted via email to *Oil____and____Gas____PT@EPA.GOV* unless the test results for that model of combustion control device are posted at the following Web site: *epa.gov/airquality/oilandgas/.*

(c) *Recordkeeping requirements*. You must maintain the records identified as specified in §60.7(f) and in paragraphs (c)(1) through (14) of this section. All records required by this subpart must be maintained either onsite or at the nearest local field office for at least 5 years.

(1) The records for each gas well affected facility as specified in paragraphs (c)(1)(i) through (v) of this section.

(i) Records identifying each well completion operation for each gas well affected facility;

(ii) Records of deviations in cases where well completion operations with hydraulic fracturing were not performed in compliance with the requirements specified in §60.5375.

(iii) Records required in §60.5375(b) or (f) for each well completion operation conducted for each gas well affected facility that occurred during the reporting period. You must maintain the records specified in paragraphs (c)(1)(iii)(A) and (B) of this section.

(A) For each gas well affected facility required to comply with the requirements of §60.5375(a), you must record: The location of the well; the API well number; the date and time of the onset of flowback following hydraulic fracturing or refracturing; the date and time of each attempt to direct flowback to a separator as required in §60.5375(a)(1)(i); the date and time of each occurrence of returning to the initial flowback stage under §60.5375(a)(1)(i); and the date and time that the well

was shut in and the flowback equipment was permanently disconnected, or the startup of production; the duration of flowback; duration of recovery to the flow line; duration of combustion; duration of venting; and specific reasons for venting in lieu of capture or combustion. The duration must be specified in hours of time.

(B) For each gas well affected facility required to comply with the requirements of §60.5375(f), you must maintain the records specified in paragraph (c)(1)(iii)(A) of this section except that you do not have to record the duration of recovery to the flow line.

(iv) For each gas well facility for which you claim an exception under §60.5375(a)(3), you must record: The location of the well; the API well number; the specific exception claimed; the starting date and ending date for the period the well operated under the exception; and an explanation of why the well meets the claimed exception.

(v) For each gas well affected facility required to comply with both §60.5375(a)(1) and (3), if you are using a digital photograph in lieu of the records required in paragraphs (c)(1)(i) through (iv) of this section, you must retain the records of the digital photograph as specified in §60.5410(a)(4).

(2) For each centrifugal compressor affected facility, you must maintain records of deviations in cases where the centrifugal compressor was not operated in compliance with the requirements specified in §60.5380.

(3) For each reciprocating compressors affected facility, you must maintain the records in paragraphs (c)(3)(i) through (iii) of this section.

(i) Records of the cumulative number of hours of operation or number of months since initial startup or October 15, 2012, or the previous replacement of the reciprocating compressor rod packing, whichever is later.

(ii) Records of the date and time of each reciprocating compressor rod packing replacement, or date of installation of a rod packing emissions collection system and closed vent system as specified in §60.5385(a)(3).

(iii) Records of deviations in cases where the reciprocating compressor was not operated in compliance with the requirements specified in §60.5385.

(4) For each pneumatic controller affected facility, you must maintain the records identified in paragraphs (c)(4)(i) through (v) of this section.

(i) Records of the date, location and manufacturer specifications for each pneumatic controller constructed, modified or reconstructed.

(ii) Records of the demonstration that the use of pneumatic controller affected facilities with a natural gas bleed rate greater than the applicable standard are required and the reasons why.

(iii) If the pneumatic controller is not located at a natural gas processing plant, records of the manufacturer's specifications indicating that the controller is designed such that natural gas bleed rate is less than or equal to 6 standard cubic feet per hour.

(iv) If the pneumatic controller is located at a natural gas processing plant, records of the documentation that the natural gas bleed rate is zero.

(v) Records of deviations in cases where the pneumatic controller was not operated in compliance with the requirements specified in §60.5390.

(5) Except as specified in paragraph (c)(5)(v) of this section, for each storage vessel affected facility, you must maintain the records identified in paragraphs (c)(5)(i) through (iv) of this section.

(i) If required to reduce emissions by complying with §60.5395(d)(1), the records specified in §§60.5420(c)(6) through (8), 60.5416(c)(6)(ii), and 60.6516(c)(7)(ii) of this subpart.

(ii) Records of each VOC emissions determination for each storage vessel affected facility made under §60.5365(e) including identification of the model or calculation methodology used to calculate the VOC emission rate.

(iii) Records of deviations in cases where the storage vessel was not operated in compliance with the requirements specified in §§60.5395, 60.5411, 60.5412, and 60.5413, as applicable.

(iv) For storage vessels that are skid-mounted or permanently attached to something that is mobile (such as trucks, railcars, barges, or ships), records indicating the number of consecutive days that the vessel is located at the site. If a storage vessel is removed from the site and, within 30 days, is either returned to or replaced by another storage vessel at the site to serve the same or similar function, then the entire period since the original storage vessel was first located at the site, including the days when the storage vessel was removed, will be added to the count towards the number of consecutive days.

(v) You must maintain records of the identification and location of each storage vessel affected facility.

(6) Records of each closed vent system inspection required under §60.5416(a)(1) and (2) for centrifugal or reciprocating compressors or §60.5416(c)(1) for storage vessels.

(7) A record of each cover inspection required under §60.5416(a)(3) for centrifugal or reciprocating compressors or §60.5416(c)(2) for storage vessels.

(8) If you are subject to the bypass requirements of §60.5416(a)(4) for centrifugal or reciprocating compressors or §60.5416(c)(3) for storage vessels, a record of each inspection or a record each time the key is checked out or a record of each time the alarm is sounded.

(9) If you are subject to the closed vent system no detectable emissions requirements of §60.5416(b) for centrifugal or reciprocating compressors, a record of the monitoring conducted in accordance with §60.5416(b).

(10) For each centrifugal compressor affected facility, records of the schedule for carbon replacement (as determined by the design analysis requirements of §60.5413(c)(2) or (3)) and records of each carbon replacement as specified in §60.5412(c)(1).

(11) For each centrifugal compressor subject to the control device requirements of §60.5412(a), (b), and (c), records of minimum and maximum operating parameter values, continuous parameter monitoring system data, calculated averages of continuous parameter monitoring system data, results of all compliance calculations, and results of all inspections.

(12) For each carbon adsorber installed on storage vessel affected facilities, records of the schedule for carbon replacement (as determined by the design analysis requirements of §60.5412(d)(2)) and records of each carbon replacement as specified in §60.5412(c)(1).

(13) For each storage vessel affected facility subject to the control device requirements of §60.5412(c) and (d), you must maintain records of the inspections, including any corrective actions taken, the manufacturers' operating instructions, procedures and maintenance schedule as specified in §60.5417(h). You must maintain records of EPA Method 22, 40 CFR part 60, appendix A, section 11 results, which include: company, location, company representative (name of the person performing the observation), sky conditions, process unit (type of control device), clock start time, observation period duration (in minutes and seconds), accumulated emission time (in minutes and seconds), and clock end time. You may create your own form including the above information or use Figure 22-1 in EPA Method 22, 40 CFR part 60, appendix A. Manufacturer's operating instructions, procedures and maintenance schedule must be available for inspection.

(14) A log of records as specified in §§60.5412(d)(1)(iii) and 60.5413(e)(4) for all inspection, repair and maintenance activities for each control device failing the visible emissions test.

[77 FR 49542, Aug. 16, 2012, as amended at 78 FR 58445, Sept. 23, 2013; 79 FR 79039, Dec. 31, 2014; 81 FR 35897, June 3, 2016; 85 FR 57069, Sept. 14, 2020]

Back to Top

§60.5421 What are my additional recordkeeping requirements for my affected facility subject to VOC requirements for onshore natural gas processing plants?

(a) You must comply with the requirements of paragraph (b) of this section in addition to the requirements of §60.486a.

(b) The following recordkeeping requirements apply to pressure relief devices subject to the requirements of §60.5401(b)(1) of this subpart.

(1) When each leak is detected as specified in §60.5401(b)(2), a weatherproof and readily visible identification, marked with the equipment identification number, must be attached to the leaking equipment. The identification on the pressure relief device may be removed after it has been repaired.

(2) When each leak is detected as specified in §60.5401(b)(2), the following information must be recorded in a log and shall be kept for 2 years in a readily accessible location:

(i) The instrument and operator identification numbers and the equipment identification number.

(ii) The date the leak was detected and the dates of each attempt to repair the leak.

(iii) Repair methods applied in each attempt to repair the leak.

(iv) “Above 500 ppm” if the maximum instrument reading measured by the methods specified in paragraph (a) of this section after each repair attempt is 500 ppm or greater.

(v) “Repair delayed” and the reason for the delay if a leak is not repaired within 15 calendar days after discovery of the leak.

(vi) The signature of the owner or operator (or designate) whose decision it was that repair could not be effected without a process shutdown.

(vii) The expected date of successful repair of the leak if a leak is not repaired within 15 days.

(viii) Dates of process unit shutdowns that occur while the equipment is unrepaired.

(ix) The date of successful repair of the leak.

(x) A list of identification numbers for equipment that are designated for no detectable emissions under the provisions of §60.482-4a(a). The designation of equipment subject to the provisions of §60.482-4a(a) must be signed by the owner or operator.

Back to Top

§60.5422 What are my additional reporting requirements for my affected facility subject to VOC requirements for onshore natural gas processing plants?

(a) You must comply with the requirements of paragraphs (b) and (c) of this section in addition to the requirements of §60.487a(a), (b), (c)(2)(i) through (iv), and (c)(2)(vii) through (viii).

(b) An owner or operator must include the following information in the initial semiannual report in addition to the information required in §60.487a(b)(1) through (4): Number of pressure relief devices subject to the requirements of §60.5401(b) except for those pressure relief devices designated for no detectable emissions under the provisions of §60.482-4a(a) and those pressure relief devices complying with §60.482-4a(c).

(c) An owner or operator must include the following information in all semiannual reports in addition to the information required in §60.487a(c)(2)(i) through (vi):

(1) Number of pressure relief devices for which leaks were detected as required in §60.5401(b)(2); and

(2) Number of pressure relief devices for which leaks were not repaired as required in §60.5401(b)(3).

Back to Top

§60.5423 What additional recordkeeping and reporting requirements apply to my sweetening unit affected facilities at onshore natural gas processing plants?

(a) You must retain records of the calculations and measurements required in §§60.5405(a) and (b) and 60.5407(a) through (g) for at least 2 years following the date of the measurements. This requirement is included under §60.7(d) of the General Provisions.

(b) You must submit a report of excess emissions to the Administrator in your annual report if you had excess emissions during the reporting period. For the purpose of these reports, excess emissions are defined as:

(1) Any 24-hour period (at consistent intervals) during which the average sulfur emission reduction efficiency (R) is less than the minimum required efficiency (Z).

(2) For any affected facility electing to comply with the provisions of §60.5407(b)(2), any 24-hour period during which the average temperature of the gases leaving the combustion zone of an incinerator is less than the appropriate operating temperature as determined during the most recent performance test in accordance with the provisions of §60.5407(b)(2). Each 24-hour period must consist of at least 96 temperature measurements equally spaced over the 24 hours.

(c) To certify that a facility is exempt from the control requirements of these standards, for each facility with a design capacity less that 2 LT/D of H_2S in the acid gas (expressed as sulfur) you must keep, for the life of the facility, an analysis demonstrating that the facility's design capacity is less than 2 LT/D of H_2S expressed as sulfur.

(d) If you elect to comply with §60.5407(e) you must keep, for the life of the facility, a record demonstrating that the facility's design capacity is less than 150 LT/D of H_2S expressed as sulfur.

(e) The requirements of paragraph (b) of this section remain in force until and unless the EPA, in delegating enforcement authority to a state under section 111(c) of the Act, approves reporting requirements or an alternative means of compliance surveillance adopted by such state. In that event, affected sources within the state will be relieved of obligation to comply with paragraph (b) of this section, provided that they comply with the requirements established by the state.

§60.5425 What part of the General Provisions apply to me?

Table 3 to this subpart shows which parts of the General Provisions in §§60.1 through 60.19 apply to you.

Back to Top

§60.5430 What definitions apply to this subpart?

As used in this subpart, all terms not defined herein shall have the meaning given them in the Act, in subpart A or subpart VVa of part 60; and the following terms shall have the specific meanings given them.

Acid gas means a gas stream of hydrogen sulfide (H_2S) and carbon dioxide (CO_2) that has been separated from sour natural gas by a sweetening unit.

Alaskan North Slope means the approximately 69,000 square-mile area extending from the Brooks Range to the Arctic Ocean.

API Gravity means the weight per unit volume of hydrocarbon liquids as measured by a system recommended by the American Petroleum Institute (API) and is expressed in degrees.

Bleed rate means the rate in standard cubic feet per hour at which natural gas is continuously vented (bleeds) from a pneumatic controller.

Capital expenditure means, in addition to the definition in 40 CFR 60.2, an expenditure for a physical or operational change to an existing facility that:

(1) Exceeds P, the product of the facility's replacement cost, R, and an adjusted annual asset guideline repair allowance, A, as reflected by the following equation: P = R × A, where

(i) The adjusted annual asset guideline repair allowance, A, is the product of the percent of the replacement cost, Y, and the applicable basic annual asset guideline repair allowance, B, divided by 100 as reflected by the following equation:

A = Y × (B ÷ 100);

(ii) The percent Y is determined from the following equation: Y = 1.0 − 0.575 log X, where X is 2011 minus the year of construction; and

(iii) The applicable basic annual asset guideline repair allowance, B, is 4.5.

(2) [Reserved]

Centrifugal compressor means any machine for raising the pressure of a natural gas by drawing in low pressure natural gas and discharging significantly higher pressure natural gas by means of mechanical rotating vanes or impellers. Screw, sliding vane, and liquid ring compressors are not centrifugal compressors for the purposes of this subpart.

Certifying official means one of the following:

(1) For a corporation: A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or a duly authorized representative of such person if the representative is responsible for the overall operation of one or more manufacturing, production, or operating facilities applying for or subject to a permit and either:

(i) The facilities employ more than 250 persons or have gross annual sales or expenditures exceeding $25 million (in second quarter 1980 dollars); or

(ii) The Administrator is notified of such delegation of authority prior to the exercise of that authority. The Administrator reserves the right to evaluate such delegation;

(2) For a partnership (including but not limited to general partnerships, limited partnerships, and limited liability partnerships) or sole proprietorship: A general partner or the proprietor, respectively. If a general partner is a corporation, the provisions of paragraph (1) of this definition apply;

(3) For a municipality, State, Federal, or other public agency: Either a principal executive officer or ranking elected official. For the purposes of this part, a principal executive officer of a Federal agency includes the chief executive officer having responsibility for the overall operations of a principal geographic unit of the agency (*e.g.,* a Regional Administrator of EPA); or

(4) For affected facilities:

(i) The designated representative in so far as actions, standards, requirements, or prohibitions under title IV of the Clean Air Act or the regulations promulgated thereunder are concerned; or

(ii) The designated representative for any other purposes under part 60.

City gate means the delivery point at which natural gas is transferred from a transmission pipeline to the local gas utility.

Collection system means any infrastructure that conveys gas or liquids from the well site to another location for treatment, storage, processing, recycling, disposal or other handling.

Completion combustion device means any ignition device, installed horizontally or vertically, used in exploration and production operations to combust otherwise vented emissions from completions.

Compressor station means any permanent combination of one or more compressors that move natural gas at increased pressure from fields, in transmission pipelines, or into storage.

Condensate means hydrocarbon liquid separated from natural gas that condenses due to changes in the temperature, pressure, or both, and remains liquid at standard conditions.

Continuous bleed means a continuous flow of pneumatic supply natural gas to the process control device (e.g., level control, temperature control, pressure control) where the supply gas pressure is modulated by the process condition, and then flows to the valve controller where the signal is compared with the process set-point to adjust gas pressure in the valve actuator.

Crude Oil and Natural Gas Production source category means:

(1) Crude oil production, which includes the well and extends to the point of custody transfer to the crude oil transmission pipeline or any other forms of transportation; and

(2) Natural gas production and processing, which includes the well and extends to, but does not include, the point of custody transfer to the natural gas transmission and storage segment.

Custody transfer means the transfer of crude oil or natural gas after processing and/or treatment in the producing operations, or from storage vessels or automatic transfer facilities or other such equipment, including product loading racks, to pipelines or any other forms of transportation.

Dehydrator means a device in which an absorbent directly contacts a natural gas stream and absorbs water in a contact tower or absorption column (absorber).

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart including, but not limited to, any emission limit, operating limit, or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Fails to meet any emission limit, operating limit, or work practice standard in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is permitted by this subpart.

Delineation well means a well drilled in order to determine the boundary of a field or producing reservoir.

Equipment, as used in the standards and requirements in this subpart relative to the equipment leaks of VOC from onshore natural gas processing plants, means each pump, pressure relief device, open-ended valve or line, valve, and flange or other connector that is in VOC service or in wet gas service, and any device or system required by those same standards and requirements in this subpart.

Field gas means feedstock gas entering the natural gas processing plant.

Field gas gathering means the system used transport field gas from a field to the main pipeline in the area.

Flare means a thermal oxidation system using an open (without enclosure) flame. Completion combustion devices as defined in this section are not considered flares.

Flow line means a pipeline used to transport oil and/or gas to a processing facility, a mainline pipeline, re-injection, or routed to a process or other useful purpose.

Flowback means the process of allowing fluids and entrained solids to flow from a natural gas well following a treatment, either in preparation for a subsequent phase of treatment or in preparation for cleanup and returning the well to production. The term *flowback* also means the fluids and entrained solids that emerge from a natural gas well during the flowback process. The *flowback period* begins when material introduced into the well during the treatment returns to the surface following hydraulic fracturing or refracturing. The *flowback period* ends when either the well is shut in and permanently disconnected from the flowback equipment or at the startup of production. The flowback period includes the initial flowback stage and the separation flowback stage.

Gas processing plant process unit means equipment assembled for the extraction of natural gas liquids from field gas, the fractionation of the liquids into natural gas products, or other operations associated with the processing of natural gas products. A process unit can operate independently if supplied with sufficient feed or raw materials and sufficient storage facilities for the products.

Gas well or natural gas well means an onshore well drilled principally for production of natural gas.

Group 1 storage vessel means a storage vessel, as defined in this section, for which construction, modification or reconstruction has commenced after August 23, 2011, and on or before April 12, 2013.

Group 2 storage vessel means a storage vessel, as defined in this section, for which construction, modification or reconstruction has commenced after April 12, 2013, and on or before September 18, 2015.

Hydraulic fracturing or refracturing means the process of directing pressurized fluids containing any combination of water, proppant, and any added chemicals to penetrate tight formations, such as shale or coal formations, that subsequently require high rate, extended flowback to expel fracture fluids and solids during completions.

Hydraulic refracturing means conducting a subsequent hydraulic fracturing operation at a well that has previously undergone a hydraulic fracturing operation.

In light liquid service means that the piece of equipment contains a liquid that meets the conditions specified in §60.485a(e) or §60.5401(g)(2) of this part.

In wet gas service means that a compressor or piece of equipment contains or contacts the field gas before the extraction step at a gas processing plant process unit.

Initial flowback stage means the period during a well completion operation which begins at the onset of flowback and ends at the separation flowback stage.

Intermediate hydrocarbon liquid means any naturally occurring, unrefined petroleum liquid.

Intermittent/snap-action pneumatic controller means a pneumatic controller that vents non-continuously.

Liquefied natural gas unit means a unit used to cool natural gas to the point at which it is condensed into a liquid which is colorless, odorless, non-corrosive and non-toxic.

Local distribution company (LDC) custody transfer station means a metering station where the LDC receives a natural gas supply from an upstream supplier, which may be an interstate transmission pipeline or a local natural gas producer, for delivery to customers through the LDC's intrastate transmission or distribution lines.

Low pressure gas well means a well with reservoir pressure and vertical well depth such that 0.445 times the reservoir pressure (in psia) minus 0.038 times the true vertical well depth (in feet) minus 67.578 psia is less than the flow line pressure at the sales meter.

Maximum average daily throughput means the earliest calculation of daily average throughput during the 30-day PTE evaluation period employing generally accepted methods.

Natural gas-driven pneumatic controller means a pneumatic controller powered by pressurized natural gas.

Natural gas liquids means the hydrocarbons, such as ethane, propane, butane, and pentane that are extracted from field gas.

Natural gas processing plant (gas plant) means any processing site engaged in the extraction of natural gas liquids from field gas, fractionation of mixed natural gas liquids to natural gas products, or both. A Joule-Thompson valve, a dew point depression valve, or an isolated or standalone Joule-Thompson skid is not a natural gas processing plant.

Natural gas transmission means the pipelines used for the long distance transport of natural gas (excluding processing). Specific equipment used in natural gas transmission includes the land, mains, valves, meters, boosters, regulators, storage vessels, dehydrators, compressors, and their driving units and appurtenances, and equipment used for transporting gas from a production plant, delivery point of purchased gas, gathering system, storage area, or other wholesale source of gas to one or more distribution area(s).

Natural gas transmission and storage segment means the transport or storage of natural gas prior to delivery to a “local distribution company custody transfer station” (as defined in this section) or to a final end user (if there is no local distribution company custody transfer station). For the purposes of this subpart, natural gas enters the natural gas transmission and storage segment after the natural gas processing plant, when present. If no natural gas processing plant is present, natural gas enters the natural gas transmission and storage segment after the point of “custody transfer” (as defined in this section). A compressor station that transports natural gas prior to the point of “custody transfer” or to a natural gas processing plant (if present) is not considered a part of the natural gas transmission and storage segment.

Nonfractionating plant means any gas plant that does not fractionate mixed natural gas liquids into natural gas products.

Non-natural gas-driven pneumatic controller means an instrument that is actuated using other sources of power than pressurized natural gas; examples include solar, electric, and instrument air.

Onshore means all facilities except those that are located in the territorial seas or on the outer continental shelf.

Pneumatic controller means an automated instrument used for maintaining a process condition such as liquid level, pressure, delta-pressure and temperature.

Pressure vessel means a storage vessel that is used to store liquids or gases and is designed not to vent to the atmosphere as a result of compression of the vapor headspace in the pressure vessel during filling of the pressure vessel to its design capacity.

Process unit means components assembled for the extraction of natural gas liquids from field gas, the fractionation of the liquids into natural gas products, or other operations associated with the processing of natural gas products. A process unit can operate independently if supplied with sufficient feed or raw materials and sufficient storage facilities for the products.

Produced water means water that is extracted from the earth from an oil or natural gas production well, or that is separated from crude oil, condensate, or natural gas after extraction.

Reciprocating compressor means a piece of equipment that increases the pressure of a process gas by positive displacement, employing linear movement of the driveshaft.

Reciprocating compressor rod packing means a series of flexible rings in machined metal cups that fit around the reciprocating compressor piston rod to create a seal limiting the amount of compressed natural gas that escapes to the atmosphere.

Recovered gas means gas recovered through the separation process during flowback.

Recovered liquids means any crude oil, condensate or produced water recovered through the separation process during flowback.

Reduced emissions completion means a well completion following fracturing or refracturing where gas flowback that is otherwise vented is captured, cleaned, and routed to the flow line or collection system, re-injected into the well or another well, used as an on-site fuel source, or used for other useful purpose that a purchased fuel or raw material would serve, with no direct release to the atmosphere.

Reduced sulfur compounds means H_2S, carbonyl sulfide (COS), and carbon disulfide (CS_2).

Removed from service means that a storage vessel affected facility has been physically isolated and disconnected from the process for a purpose other than maintenance in accordance with §60.5395(f)(1).

Responsible official means one of the following:

(1) For a corporation: A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or a duly authorized representative of such person if the representative is responsible for the overall operation of one or more manufacturing, production, or operating facilities applying for or subject to a permit and either:

(i) The facilities employ more than 250 persons or have gross annual sales or expenditures exceeding $25 million (in second quarter 1980 dollars); or

(ii) The delegation of authority to such representatives is approved in advance by the permitting authority;

(2) For a partnership or sole proprietorship: A general partner or the proprietor, respectively;

(3) For a municipality, State, Federal, or other public agency: Either a principal executive officer or ranking elected official. For the purposes of this part, a principal executive officer of a Federal agency includes the chief executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., a Regional Administrator of EPA); or

(4) For affected facilities:

(i) The designated representative in so far as actions, standards, requirements, or prohibitions under title IV of the Clean Air Act or the regulations promulgated thereunder are concerned; or

(ii) The designated representative for any other purposes under part 60.

Returned to service means that a Group 1 or Group 2 storage vessel affected facility that was removed from service has been:

(1) Reconnected to the original source of liquids or has been used to replace any storage vessel affected facility; or

(2) Installed in any location covered by this subpart and introduced with crude oil, condensate, intermediate hydrocarbon liquids or produced water.

Routed to a process or route to a process means the emissions are conveyed via a closed vent system to any enclosed portion of a process where the emissions are predominantly recycled and/or consumed in the same manner as a material that fulfills the same function in the process and/or transformed by chemical reaction into materials that are not regulated materials and/or incorporated into a product; and/or recovered.

Salable quality gas means natural gas that meets the flow line or collection system operator specifications, regardless of whether such gas is sold.

Separation flowback stage means the period during a well completion operation when it is technically feasible for a separator to function. The *separation flowback stage* ends either at the startup of production, or when the well is shut in and permanently disconnected from the flowback equipment.

Startup of production means the beginning of initial flow following the end of flowback when there is continuous recovery of salable quality gas and separation and recovery of any crude oil, condensate or produced water.

Storage vessel means a tank or other vessel that contains an accumulation of crude oil, condensate, intermediate hydrocarbon liquids, or produced water, and that is constructed primarily of nonearthen materials (such as wood, concrete, steel, fiberglass, or plastic) which provide structural support. A well completion vessel that receives recovered liquids from a well after startup of production following flowback for a period which exceeds 60 days is considered a storage vessel under this subpart. A tank or other vessel shall not be considered a storage vessel if it has been removed from service in accordance with the requirements of §60.5395(f) until such time as such tank or other vessel has been returned to service. A tank or other vessel shall not be considered a storage vessel if it has been removed from service in accordance with the requirements of §60.5395(f) until such time as such tank or other vessel has been returned to service. For the purposes of this subpart, the following are not considered storage vessels:

(1) Vessels that are skid-mounted or permanently attached to something that is mobile (such as trucks, railcars, barges or ships), and are intended to be located at a site for less than 180 consecutive days. If you do not keep or are not able to produce records, as required by §60.5420(c)(5)(iv), showing that the vessel has been located at a site for less than 180 consecutive days, the vessel described herein is considered to be a storage vessel from the date the original vessel was first located at the site. This exclusion does not apply to a well completion vessel as described above.

(2) Process vessels such as surge control vessels, bottoms receivers or knockout vessels.

(3) Pressure vessels designed to operate in excess of 204.9 kilopascals and without emissions to the atmosphere.

Sulfur production rate means the rate of liquid sulfur accumulation from the sulfur recovery unit.

Sulfur recovery unit means a process device that recovers element sulfur from acid gas.

Surface site means any combination of one or more graded pad sites, gravel pad sites, foundations, platforms, or the immediate physical location upon which equipment is physically affixed.

Sweetening unit means a process device that removes hydrogen sulfide and/or carbon dioxide from the sour natural gas stream.

Total Reduced Sulfur (TRS) means the sum of the sulfur compounds hydrogen sulfide, methyl mercaptan, dimethyl sulfide, and dimethyl disulfide as measured by Method 16 of appendix A to part 60 of this chapter.

Total SO2 equivalents means the sum of volumetric or mass concentrations of the sulfur compounds obtained by adding the quantity existing as SO_2 to the quantity of SO_2 that would be obtained if all reduced sulfur compounds were converted to SO_2 (ppmv or kg/dscm (lb/dscf)).

Underground storage vessel means a storage vessel stored below ground.

Well means an oil or gas well, a hole drilled for the purpose of producing oil or gas, or a well into which fluids are injected.

Well completion means the process that allows for the flowback of petroleum or natural gas from newly drilled wells to expel drilling and reservoir fluids and tests the reservoir flow characteristics, which may vent produced hydrocarbons to the atmosphere via an open pit or tank.

Well completion operation means any well completion with hydraulic fracturing or refracturing occurring at a gas well affected facility.

Well completion vessel means a vessel that contains *flowback* during a well completion operation following hydraulic fracturing or refracturing. A well completion vessel may be a lined earthen pit, a tank or other vessel that is skid-mounted or portable. A well completion vessel that receives recovered liquids from a well after startup of production following flowback for a period which exceeds 60 days is considered a storage vessel under this subpart.

Well site means one or more areas that are directly disturbed during the drilling and subsequent operation of, or affected by, production facilities directly associated with any oil well, gas well, or injection well and its associated well pad.

Wellhead means the piping, casing, tubing and connected valves protruding above the earth's surface for an oil and/or natural gas well. The wellhead ends where the flow line connects to a wellhead valve. The wellhead does not include other equipment at the well site except for any conveyance through which gas is vented to the atmosphere.

Wildcat well means a well outside known fields or the first well drilled in an oil or gas field where no other oil and gas production exists.

Table 1 to Subpart OOOO of Part 60—Required Minimum Initial SO_2 Emission Reduction Efficiency (Z_i)

H_2S content of acid gas (Y), %	Sulfur feed rate (X), LT/D			
	$2.0 \leq X \leq 5.0$	$5.0 < X \leq 15.0$	$15.0 < X \leq 300.0$	$X > 300.0$
$Y \geq 50$	79.0	$88.51X^{0.0101}Y^{0.0125}$ or 99.9, whichever is smaller.		
$20 \leq Y < 50$	79.0	$88.51X^{0.0101}Y^{0.0125}$ or 97.9, whichever is smaller		97.9

$10 \leq Y < 20$	79.0	$88.51X^{0.0101}Y^{0.0125}$ or 93.5, whichever is smaller	93.5	93.5
$Y < 10$	79.0	79.0	79.0	79.0

[78 FR 58447, Sept. 23, 2013]

Back to Top

Table 2 to Subpart OOOO of Part 60—Required Minimum SO_2 Emission Reduction Efficiency (Z_c)

H_2S content of acid gas (Y), %	Sulfur feed rate (X), LT/D			
	$2.0 \leq X \leq 5.0$	$5.0 < X \leq 15.0$	$15.0 < X \leq 300.0$	$X > 300.0$
$Y \geq 50$	74.0	$85.35X^{0.0144}Y^{0.0128}$ or 99.9, whichever is smaller.		
$20 \leq Y < 50$	74.0	$85.35X^{0.0144}Y^{0.0128}$ or 97.5, whichever is smaller		97.5
$10 \leq Y < 20$	74.0	$85.35X^{0.0144}Y^{0.0128}$ or 90.8, whichever is smaller	90.8	90.8
$Y < 10$	74.0	74.0	74.0	74.0

X = The sulfur feed rate from the sweetening unit (*i.e.,* the H_2S in the acid gas), expressed as sulfur, Mg/D(LT/D), rounded to one decimal place.

Y = The sulfur content of the acid gas from the sweetening unit, expressed as mole percent H_2S (dry basis) rounded to one decimal place.

Z = The minimum required sulfur dioxide (SO_2) emission reduction efficiency, expressed as percent carried to one decimal place. Z_i refers to the reduction efficiency required at the initial performance test. Z_c refers to the reduction efficiency required on a continuous basis after compliance with Z_i has been demonstrated.

Table 3 to Subpart OOOO of Part 60—Applicability of General Provisions to Subpart OOOO

As stated in §60.5425, you must comply with the following applicable General Provisions:

General provisions citation	Subject of citation	Applies to subpart?	Explanation
§60.1	General applicability of the General Provisions	Yes.	

§60.2	Definitions	Yes	Additional terms defined in §60.5430.
§60.3	Units and abbreviations	Yes.	
§60.4	Address	Yes.	
§60.5	Determination of construction or modification	Yes.	
§60.6	Review of plans	Yes.	
§60.7	Notification and record keeping	Yes	Except that §60.7 only applies as specified in §60.5420(a).
§60.8	Performance tests	Yes	Performance testing is required for control devices used on storage vessels and centrifugal compressors.
§60.9	Availability of information	Yes.	
§60.10	State authority	Yes.	
§60.11	Compliance with standards and maintenance requirements	No	Requirements are specified in subpart OOOO.
§60.12	Circumvention	Yes.	
§60.13	Monitoring requirements	Yes	Continuous monitors are required for storage vessels.
§60.14	Modification	Yes.	
§60.15	Reconstruction	Yes.	Except that §60.15(d) does not apply to gas wells, pneumatic controllers, centrifugal compressors, reciprocating compressors or storage vessels.
§60.16	Priority list	Yes.	
§60.17	Incorporations by reference	Yes.	
§60.18	General control device requirements	Yes	Except that the period of visible emissions shall not exceed a total of 1 minute during any 15-minute period instead of 5 minutes during any 2 consecutive hours as required in §60.18(c).
§60.19	General notification and reporting requirement	Yes.

NMED Exhibit 35 - 0071

NSPS Subpart OOOOa—Standards of Performance for Crude Oil and Natural Gas Facilities for which Construction, Modification or Reconstruction Commenced After September 18, 2015

Contents

SOURCE: 81 FR 35898, June 3, 2016, unless otherwise noted.

Back to Top

§60.5360a What is the purpose of this subpart?

(a) This subpart establishes emission standards and compliance schedules for the control of the pollutant greenhouse gases (GHG). The greenhouse gas standard in this subpart is in the form of a limitation on emissions of methane from affected facilities in the crude oil and natural gas source category that commence construction, modification, or reconstruction after September 18, 2015. This subpart also establishes emission standards and compliance schedules for the control of volatile organic compounds (VOC) and sulfur dioxide (SO_2) emissions from affected facilities in the crude oil and natural gas source category that commence construction, modification or reconstruction after September 18, 2015. The effective date of the rule is August 2, 2016.

(b) *Prevention of Significant Deterioration (PSD) and title V thresholds for Greenhouse Gases.* (1) For the purposes of 40 CFR 51.166(b)(49)(ii), with respect to GHG emissions from affected facilities, the "pollutant that is subject to the standard promulgated under section 111 of the Act" shall be considered to be the pollutant that otherwise is subject to regulation under the Act as defined in 40 CFR 51.166(b)(48) and in any State Implementation Plan (SIP) approved by the EPA that is interpreted to incorporate, or specifically incorporates, §51.166(b)(48).

(2) For the purposes of 40 CFR 52.21(b)(50)(ii), with respect to GHG emissions from affected facilities, the "pollutant that is subject to the standard promulgated under section 111 of the Act" shall be considered to be the pollutant that otherwise is subject to regulation under the Clean Air Act as defined in 40 CFR 52.21(b)(49).

(3) For the purposes of 40 CFR 70.2, with respect to greenhouse gas emissions from affected facilities, the "pollutant that is subject to any standard promulgated under section 111 of the Act" shall be considered to be the pollutant that otherwise is "subject to regulation" as defined in 40 CFR 70.2.

(4) For the purposes of 40 CFR 71.2, with respect to greenhouse gas emissions from affected facilities, the "pollutant that is subject to any standard promulgated under section 111 of the Act" shall be considered to be the pollutant that otherwise is "subject to regulation" as defined in 40 CFR 71.2.

Back to Top

§60.5365a Am I subject to this subpart?

You are subject to the applicable provisions of this subpart if you are the owner or operator of one or more of the onshore affected facilities listed in paragraphs (a) through (j) of this section for which you commence construction, modification, or reconstruction after September 18, 2015.

(a) Each well affected facility, which is a single well that conducts a well completion operation following hydraulic fracturing or refracturing. The provisions of this paragraph do not affect the affected facility status of well sites for the purposes of §60.5397a. The provisions of paragraphs (a)(1) through (4) of this section apply to wells that are hydraulically refractured:

(1) A well that conducts a well completion operation following hydraulic refracturing is not an affected facility, provided that the requirements of §60.5375a(a)(1) through (4) are met. However, hydraulic refracturing of a well constitutes a modification of the well site for purposes of paragraph (i)(3)(iii) of this section, regardless of affected facility status of the well itself.

(2) A well completion operation following hydraulic refracturing not conducted pursuant to §60.5375a(a)(1) through (4) is a modification to the well.

(3) Except as provided in §60.5365a(i)(3)(iii), refracturing of a well, by itself, does not affect the modification status of other equipment, process units, storage vessels, compressors, pneumatic pumps, or pneumatic controllers.

(4) A well initially constructed after September 18, 2015, that conducts a well completion operation following hydraulic refracturing is considered an affected facility regardless of this provision.

(b) Each centrifugal compressor affected facility, which is a single centrifugal compressor using wet seals. A centrifugal compressor located at a well site, or an adjacent well site and servicing more than one well site, is not an affected facility under this subpart.

(c) Each reciprocating compressor affected facility, which is a single reciprocating compressor. A reciprocating compressor located at a well site, or an adjacent well site and servicing more than one well site, is not an affected facility under this subpart.

(d) Each pneumatic controller affected facility:

(1) Each pneumatic controller affected facility not located at a natural gas processing plant, which is a single continuous bleed natural gas-driven pneumatic controller operating at a natural gas bleed rate greater than 6 scfh.

(2) Each pneumatic controller affected facility located at a natural gas processing plant, which is a single continuous bleed natural gas-driven pneumatic controller.

(e) Each storage vessel affected facility, which is a single storage vessel with the potential for VOC emissions equal to or greater than 6 tpy as determined according to this section. The potential for VOC emissions must be calculated using a generally accepted model or calculation methodology, based on the maximum average daily throughput determined for a 30-day period of production prior to the applicable emission determination deadline specified in this subsection. The determination may take into account requirements under a legally and practically enforceable limit in an operating permit or other requirement established under a federal, state, local or tribal authority.

(1) For each new, modified or reconstructed storage vessel you must determine the potential for VOC emissions within 30 days after liquids first enter the storage vessel, except as provided in paragraph (e)(3)(iv) of this section. For each new, modified or reconstructed storage vessel receiving liquids pursuant to the standards for well affected facilities in §60.5375a, including wells subject to §60.5375a(f), you must determine the potential for VOC emissions within 30 days after startup of production of the well.

(2) A storage vessel affected facility that subsequently has its potential for VOC emissions decrease to less than 6 tpy shall remain an affected facility under this subpart.

(3) For storage vessels not subject to a legally and practically enforceable limit in an operating permit or other requirement established under federal, state, local or tribal authority, any vapor from the storage vessel that is recovered and routed to a process through a VRU designed and operated as specified in this section is not required to be included in the determination of VOC potential to emit for purposes of determining affected facility status, provided you comply with the requirements in paragraphs (e)(3)(i) through (iv) of this section.

(i) You meet the cover requirements specified in §60.5411a(b).

(ii) You meet the closed vent system requirements specified in §60.5411a(c) and (d).

(iii) You must maintain records that document compliance with paragraphs (e)(3)(i) and (ii) of this section.

(iv) In the event of removal of apparatus that recovers and routes vapor to a process, or operation that is inconsistent with the conditions specified in paragraphs (e)(3)(i) and (ii) of this section, you must determine the storage vessel's potential for VOC emissions according to this section within 30 days of such removal or operation.

(4) The following requirements apply immediately upon startup, startup of production, or return to service. A storage vessel affected facility that is reconnected to the original source of liquids is a storage vessel affected facility subject to the same requirements that applied before being removed from service. Any storage vessel that is used to replace any storage vessel affected facility is subject to the same requirements that apply to the storage vessel affected facility being replaced.

(5) A storage vessel with a capacity greater than 100,000 gallons used to recycle water that has been passed through two stage separation is not a storage vessel affected facility.

(f) The group of all equipment within a process unit is an affected facility. (1) Addition or replacement of equipment for the purpose of process improvement that is accomplished without a capital expenditure shall not by itself be considered a modification under this subpart.

(2) Equipment associated with a compressor station, dehydration unit, sweetening unit, underground storage vessel, field gas gathering system, or liquefied natural gas unit is covered by §§60.5400a, 60.5401a, 60.5402a, 60.5421a, and 60.5422a if it is located at an onshore natural gas processing plant. Equipment not located at the onshore natural gas processing plant site is exempt from the provisions of §§60.5400a, 60.5401a, 60.5402a, 60.5421a, and 60.5422a.

(3) The equipment within a process unit of an affected facility located at onshore natural gas processing plants and described in paragraph (f) of this section are exempt from this subpart if they are subject to and controlled according to subparts VVa, GGG, or GGGa of this part.

(g) Sweetening units located at onshore natural gas processing plants that process natural gas produced from either onshore or offshore wells.

(1) Each sweetening unit that processes natural gas is an affected facility; and

(2) Each sweetening unit that processes natural gas followed by a sulfur recovery unit is an affected facility.

(3) Facilities that have a design capacity less than 2 long tons per day (LT/D) of hydrogen sulfide (H_2S) in the acid gas (expressed as sulfur) are required to comply with recordkeeping and reporting requirements specified in §60.5423a(c) but are not required to comply with §§60.5405a through 60.5407a and §§60.5410a(g) and 60.5415a(g).

(4) Sweetening facilities producing acid gas that is completely re-injected into oil-or-gas-bearing geologic strata or that is otherwise not released to the atmosphere are not subject to §§60.5405a through 60.5407a, 60.5410a(g), 60.5415a(g), and 60.5423a.

(h) Each pneumatic pump affected facility:

(1) For natural gas processing plants, each pneumatic pump affected facility, which is a single natural gas-driven diaphragm pump.

(2) For well sites, each pneumatic pump affected facility, which is a single natural gas-driven diaphragm pump. A single natural gas-driven diaphragm pump that is in operation less than 90 days per calendar year is not an affected facility under this subpart provided the owner/operator keeps records of the days of operation each calendar year and submits such records to the EPA Administrator (or delegated enforcement authority) upon request. For the purposes of this section, any period of operation during a calendar day counts toward the 90 calendar day threshold.

(i) Except as provided in §60.5365a(i)(2), the collection of fugitive emissions components at a well site, as defined in §60.5430a, is an affected facility.

(1) [Reserved]

(2) A well site that only contains one or more wellheads is not an affected facility under this subpart. The affected facility status of a separate tank battery surface site has no effect on the affected facility status of a well site that only contains one or more wellheads.

(3) For purposes of §60.5397a, a "modification" to a well site occurs when:

(i) A new well is drilled at an existing well site;

(ii) A well at an existing well site is hydraulically fractured; or

(iii) A well at an existing well site is hydraulically refractured.

(j) The collection of fugitive emissions components at a compressor station, as defined in §60.5430a, is an affected facility. For purposes of §60.5397a, a "modification" to a compressor station occurs when:

(1) An additional compressor is installed at a compressor station; or

(2) One or more compressors at a compressor station is replaced by one or more compressors of greater total horsepower than the compressor(s) being replaced. When one or more compressors is replaced by one or more compressors of an equal or smaller total horsepower than the compressor(s) being replaced, installation of the replacement compressor(s) does not trigger a modification of the compressor station for purposes of §60.5397a.

Back to Top

§60.5370a When must I comply with this subpart?

(a) You must be in compliance with the standards of this subpart no later than August 2, 2016 or upon startup, whichever is later.

(b) At all times, including periods of startup, shutdown, and malfunction, owners and operators shall maintain and operate any affected facility including associated air pollution control equipment in a manner consistent with good air pollution control practice for minimizing emissions. Determination of whether acceptable operating and maintenance procedures are being used will be based on information available to the Administrator which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source. The provisions for exemption from compliance during periods of startup, shutdown and malfunctions provided for in 40 CFR 60.8(c) do not apply to this subpart.

(c) You are exempt from the obligation to obtain a permit under 40 CFR part 70 or 40 CFR part 71, provided you are not otherwise required by law to obtain a permit under 40 CFR 70.3(a) or 40 CFR 71.3(a). Notwithstanding the previous sentence, you must continue to comply with the provisions of this subpart.

Back to Top

§60.5375a What GHG and VOC standards apply to well affected facilities?

If you are the owner or operator of a well affected facility as described in §60.5365a(a) that also meets the criteria for a well affected facility in §60.5365(a) of subpart OOOO of this part, you must reduce GHG (in the form of a limitation on emissions of methane) and VOC emissions by complying with paragraphs (a) through (g) of this section. If you own or operate a well affected facility as described in §60.5365a(a) that does not meet the criteria for a well affected facility in §60.5365(a) of subpart OOOO of this part, you must reduce GHG and VOC emissions by complying with paragraphs (f)(3), (f)(4) or (g) for each well completion operation with hydraulic fracturing prior to November 30, 2016, and you must comply with paragraphs (a) through (g) of this section for each well completion operation with hydraulic fracturing on or after November 30, 2016.

(a) Except as provided in paragraph (f) and (g) of this section, for each well completion operation with hydraulic fracturing you must comply with the requirements in paragraphs (a)(1) through (4) of this section. You must maintain a log as specified in paragraph (b) of this section.

(1) For each stage of the well completion operation, as defined in §60.5430a, follow the requirements specified in paragraphs (a)(1)(i) through (iii) of this section.

(i) During the initial flowback stage, route the flowback into one or more well completion vessels or storage vessels and commence operation of a separator unless it is technically infeasible for a separator to function. Any gas present in the initial flowback stage is not subject to control under this section.

(ii) During the separation flowback stage, route all recovered liquids from the separator to one or more well completion vessels or storage vessels, re-inject the recovered liquids into the well or another well, or route the recovered liquids to a collection system. Route the recovered gas from the separator into a gas flow line or collection system, re-inject the recovered gas into the well or another well, use the recovered gas as an onsite fuel source, or use the recovered gas for another useful purpose that a purchased fuel or raw material would serve. If it is technically infeasible to route the recovered gas as required above, follow the requirements in paragraph (a)(3) of this section. If, at any time during the separation flowback stage, it is technically infeasible for a separator to function, you must comply with paragraph (a)(1)(i) of this section.

(iii) You must have a separator onsite during the entirety of the flowback period, except as provided in paragraphs (a)(1)(iii)(A) through (C) of this section.

(A) A well that is not hydraulically fractured or refractured with liquids, or that does not generate condensate, intermediate hydrocarbon liquids, or produced water such that there is no liquid collection system at the well site is not required to have a separator onsite.

(B) If conditions allow for liquid collection, then the operator must immediately stop the well completion operation, install a separator, and restart the well completion operation in accordance with §60.5375a(a)(1).

(C) The owner or operator of a well that meets the criteria of paragraph (a)(1)(iii)(A) or (B) of this section must submit the report in §60.5420a(b)(2) and maintain the records in §60.5420a(c)(1)(iii).

(2) [Reserved]

(3) If it is technically infeasible to route the recovered gas as required in §60.5375a(a)(1)(ii), then you must capture and direct recovered gas to a completion combustion device, except in conditions that may result in a fire hazard or explosion, or where high heat emissions from a completion combustion device may negatively impact tundra, permafrost or waterways. Completion combustion devices must be equipped with a reliable continuous pilot flame.

(4) You have a general duty to safely maximize resource recovery and minimize releases to the atmosphere during flowback and subsequent recovery.

(b) You must maintain a log for each well completion operation at each well affected facility. The log must be completed on a daily basis for the duration of the well completion operation and must contain the records specified in §60.5420a(c)(1)(iii).

(c) You must demonstrate initial compliance with the standards that apply to well affected facilities as required by §60.5410a(a).

(d) You must demonstrate continuous compliance with the standards that apply to well affected facilities as required by §60.5415a(a).

(e) You must perform the required notification, recordkeeping and reporting as required by §60.5420a(a)(2), (b)(1) and (2), and (c)(1).

(f) For each well affected facility specified in paragraphs (f)(1) and (2) of this section, you must comply with the requirements of paragraphs (f)(3) and (4) of this section.

(1) Each well completion operation with hydraulic fracturing at a wildcat or delineation well.

(2) Each well completion operation with hydraulic fracturing at a non-wildcat low pressure well or non-delineation low pressure well.

(3) You must comply with either paragraph (f)(3)(i) or (f)(3)(ii) of this section, unless you meet the requirements in paragraph (g) of this section. You must also comply with paragraph (b) of this section.

(i) Route all flowback to a completion combustion device, except in conditions that may result in a fire hazard or explosion, or where high heat emissions from a completion combustion device may negatively impact tundra, permafrost or waterways. Completion combustion devices must be equipped with a reliable continuous pilot flame.

(ii) Route all flowback into one or more well completion vessels and commence operation of a separator unless it is technically infeasible for a separator to function. Any gas present in the flowback before the separator can function is not subject to control under this section. Capture and direct recovered gas to a completion combustion device, except in conditions that may result in a fire hazard or explosion, or where high heat emissions from a completion combustion device may negatively impact tundra, permafrost or waterways. Completion combustion devices must be equipped with a reliable continuous pilot flame. (4) You must submit the notification as specified in §60.5420a(a)(2), submit annual reports as specified in §60.5420a(b)(1) and (2) and maintain records specified in §60.5420a(c)(1)(iii) for each wildcat and delineation well. You must submit the notification as specified in §60.5420a(a)(2), submit annual reports as specified in §60.5420a(b)(1) and (2), and maintain records as specified in §60.5420a(c)(1)(iii) and (vii) for each low pressure well.

(g) For each well affected facility with less than 300 scf of gas per stock tank barrel of oil produced, you must comply with paragraphs (g)(1) and (2) of this section.

(1) You must maintain records specified in §60.5420a(c)(1)(vi).

(2) You must submit reports specified in §60.5420a(b)(1) and (2).

Back to Top

§60.5380a What GHG and VOC standards apply to centrifugal compressor affected facilities?

You must comply with the GHG and VOC standards in paragraphs (a) through (d) of this section for each centrifugal compressor affected facility.

(a)(1) You must reduce methane and VOC emissions from each centrifugal compressor wet seal fluid degassing system by 95.0 percent.

(2) If you use a control device to reduce emissions, you must equip the wet seal fluid degassing system with a cover that meets the requirements of §60.5411a(b). The cover must be connected through a closed vent system that meets the requirements of §60.5411a(a) and (d) and the closed vent system must be routed to a control device that meets the conditions specified in §60.5412a(a), (b) and (c). As an alternative to routing the closed vent system to a control device, you may route the closed vent system to a process.

(b) You must demonstrate initial compliance with the standards that apply to centrifugal compressor affected facilities as required by §60.5410a(b).

(c) You must demonstrate continuous compliance with the standards that apply to centrifugal compressor affected facilities as required by §60.5415a(b).

(d) You must perform the reporting as required by §60.5420a(b)(1) and (3), and the recordkeeping as required by §60.5420a(c)(2), (6) through (11), and (17), as applicable.

Back to Top

§60.5385a What GHG and VOC standards apply to reciprocating compressor affected facilities?

You must reduce GHG (in the form of a limitation on emissions of methane) and VOC emissions by complying with the standards in paragraphs (a) through (d) of this section for each reciprocating compressor affected facility.

(a) You must replace the reciprocating compressor rod packing according to either paragraph (a)(1) or (2) of this section, or you must comply with paragraph (a)(3) of this section.

(1) On or before the compressor has operated for 26,000 hours. The number of hours of operation must be continuously monitored beginning upon initial startup of your reciprocating compressor affected facility, or the date of the most recent reciprocating compressor rod packing replacement, whichever is later.

(2) Prior to 36 months from the date of the most recent rod packing replacement, or 36 months from the date of startup for a new reciprocating compressor for which the rod packing has not yet been replaced.

(3) Collect the methane and VOC emissions from the rod packing using a rod packing emissions collection system that operates under negative pressure and route the rod packing emissions to a process through a closed vent system that meets the requirements of §60.5411a(a) and (d).

(b) You must demonstrate initial compliance with standards that apply to reciprocating compressor affected facilities as required by §60.5410a(c).

(c) You must demonstrate continuous compliance with standards that apply to reciprocating compressor affected facilities as required by §60.5415a(c).

(d) You must perform the reporting as required by §60.5420a(b)(1) and (4) and the recordkeeping as required by §60.5420a(c)(3), (6) through (9), and (17), as applicable.

Back to Top

§60.5390a What GHG and VOC standards apply to pneumatic controller affected facilities?

For each pneumatic controller affected facility you must comply with the GHG and VOC standards, based on natural gas as a surrogate for GHG and VOC, in either paragraph (b)(1) or (c)(1) of this section, as applicable. Pneumatic controllers meeting the conditions in paragraph (a) of this section are exempt from this requirement.

(a) The requirements of paragraph (b)(1) or (c)(1) of this section are not required if you determine that the use of a pneumatic controller affected facility with a bleed rate greater than the applicable standard is required based on functional needs, including but not limited to response time, safety and positive actuation. However, you must tag such pneumatic controller with the month and year of installation, reconstruction or modification, and identification information that allows traceability to the records for that pneumatic controller, as required in §60.5420a(c)(4)(ii).

(b)(1) Each pneumatic controller affected facility at a natural gas processing plant must have a bleed rate of zero.

(2) Each pneumatic controller affected facility at a natural gas processing plant must be tagged with the month and year of installation, reconstruction or modification, and identification information that allows traceability to the records for that pneumatic controller as required in §60.5420a(c)(4)(iv).

(c)(1) Each pneumatic controller affected facility at a location other than at a natural gas processing plant must have a bleed rate less than or equal to 6 standard cubic feet per hour.

(2) Each pneumatic controller affected facility at a location other than at a natural gas processing plant must be tagged with the month and year of installation, reconstruction or modification, and

identification information that allows traceability to the records for that controller as required in §60.5420a(c)(4)(iii).

(d) You must demonstrate initial compliance with standards that apply to pneumatic controller affected facilities as required by §60.5410a(d).

(e) You must demonstrate continuous compliance with standards that apply to pneumatic controller affected facilities as required by §60.5415a(d).

(f) You must perform the reporting as required by §60.5420a(b)(1) and (5) and the recordkeeping as required by §60.5420a(c)(4).

Back to Top

§60.5393a What GHG and VOC standards apply to pneumatic pump affected facilities?

For each pneumatic pump affected facility you must comply with the GHG and VOC standards, based on natural gas as a surrogate for GHG and VOC, in either paragraph (a) or (b) of this section, as applicable, on or after November 30, 2016.

(a) Each pneumatic pump affected facility at a natural gas processing plant must have a natural gas emission rate of zero.

(b) For each pneumatic pump affected facility at a well site you must comply with paragraph (b)(1) or (2) of this section.

(1) If the pneumatic pump affected facility is located at a greenfield site as defined in §60.5430a, you must reduce natural gas emissions by 95.0 percent, except as provided in paragraphs (b)(3) and (4) of this section.

(2) If the pneumatic pump affected facility is not located at a greenfield site as defined in §60.5430a, you must reduce natural gas emissions by 95.0 percent, except as provided in paragraphs (b)(3), (4) and (5) of this section.

(3) You are not required to install a control device solely for the purpose of complying with the 95.0 percent reduction requirement of paragraph (b)(1) or (b)(2) of this section. If you do not have a control device installed on site by the compliance date and you do not have the ability to route to a process, then you must comply instead with the provisions of paragraphs (b)(3)(i) and (ii) of this section.

(i) Submit a certification in accordance with §60.5420a(b)(8)(i)(A) in your next annual report, certifying that there is no available control device or process on site and maintain the records in §60.5420a(c)(16)(i) and (ii).

(ii) If you subsequently install a control device or have the ability to route to a process, you are no longer required to comply with paragraph (b)(2)(i) of this section and must submit the information in §60.5420a(b)(8)(ii) in your next annual report and maintain the records in §60.5420a(c)(16)(i), (ii), and (iii). You must be in compliance with the requirements of paragraph (b)(2) of this section within 30 days of startup of the control device or within 30 days of the ability to route to a process.

(4) If the control device available on site is unable to achieve a 95 percent reduction and there is no ability to route the emissions to a process, you must still route the pneumatic pump affected facility's emissions to that existing control device. If you route the pneumatic pump affected facility to a control device installed on site that is designed to achieve less than a 95 percent reduction, you must submit the information specified in §60.5420a(b)(8)(i)(C) in your next annual report and maintain the records in §60.5420a(c)(16)(iii).

(5) If an owner or operator at a non-greenfield site determines, through an engineering assessment, that routing a pneumatic pump to a control device or a process is technically infeasible, the requirements specified in paragraph (b)(5)(i) through (iv) of this section must be met.

(i) The owner or operator shall conduct the assessment of technical infeasibility in accordance with the criteria in paragraph (b)(5)(iii) of this section and have it certified by a qualified professional engineer in accordance with paragraph (b)(5)(ii) of this section.

(ii) The following certification, signed and dated by the qualified professional engineer shall state: “I certify that the assessment of technical infeasibility was prepared under my direction or supervision. I further certify that the assessment was conducted and this report was prepared pursuant to the requirements of §60.5393a(b)(5)(iii). Based on my professional knowledge and experience, and inquiry of personnel involved in the assessment, the certification submitted herein is true, accurate, and complete. I am aware that there are penalties for knowingly submitting false information.”

(iii) The assessment of technical feasibility to route emissions from the pneumatic pump to an existing control device onsite or to a process shall include, but is not limited to, safety considerations, distance from the control device, pressure losses and differentials in the closed vent system and the ability of the control device to handle the pneumatic pump emissions which are routed to them. The assessment of technical infeasibility shall be prepared under the direction or supervision of the qualified professional engineer who signs the certification in accordance with paragraph (b)(2)(ii) of this section.

(iv) The owner or operator shall maintain the records §60.5420a(c)(16)(iv).

(6) If the pneumatic pump is routed to a control device or a process and the control device or process is subsequently removed from the location or is no longer available, you are no longer required to be in compliance with the requirements of paragraph (b)(1) or (b)(2) of this section, and instead must comply with paragraph (b)(3) of this section and report the change in next annual report in accordance with §60.5420a(b)(8)(ii).

(c) If you use a control device or route to a process to reduce emissions, you must connect the pneumatic pump affected facility through a closed vent system that meets the requirements of §60.5411a(a) and (d).

(d) You must demonstrate initial compliance with standards that apply to pneumatic pump affected facilities as required by §60.5410a(e).

(e) You must perform the reporting as required by §60.5420a(b)(1) and (8) and the recordkeeping as required by §60.5420a(c)(6) through (10), (16), and (17), as applicable.

(f) Pneumatic pumps at a well site are not subject to the requirements of paragraph (d) and (e) of this section from June 2, 2017, until August 31, 2017.

[81 FR 35898, June 3, 2016, as amended at 82 FR 25733, June 5, 2017]

Back to Top

§60.5395a What VOC standards apply to storage vessel affected facilities?

Except as provided in paragraph (e) of this section, you must comply with the VOC standards in this section for each storage vessel affected facility.

(a) You must comply with the requirements of paragraphs (a)(1) and (2) of this section. After 12 consecutive months of compliance with paragraph (a)(2) of this section, you may continue to comply with paragraph (a)(2) of this section, or you may comply with paragraph (a)(3) of this section, if applicable. If you choose to meet the requirements in paragraph (a)(3) of this section, you are not required to comply with the requirements of paragraph (a)(2) of this section except as provided in paragraphs (a)(3)(i) and (ii) of this section.

(1) Determine the potential for VOC emissions in accordance with §60.5365a(e).

(2) Reduce VOC emissions by 95.0 percent within 60 days after startup. For storage vessel affected facilities receiving liquids pursuant to the standards for well affected facilities in §60.5375a(a)(1)(i) or (ii), you must achieve the required emissions reductions within 60 days after startup of production as defined in §60.5430a.

(3) Maintain the uncontrolled actual VOC emissions from the storage vessel affected facility at less than 4 tpy without considering control. Prior to using the uncontrolled actual VOC emission rate for compliance purposes, you must demonstrate that the uncontrolled actual VOC emissions have remained less than 4 tpy as determined monthly for 12 consecutive months. After such demonstration, you must determine the uncontrolled actual VOC emission rate each month. The uncontrolled actual VOC emissions must be calculated using a generally accepted model or calculation methodology, and the calculations must be based on the average throughput for the

month. You may no longer comply with this paragraph and must instead comply with paragraph (a)(2) of this section if your storage vessel affected facility meets the conditions specified in paragraphs (a)(3)(i) or (ii) of this section.

(i) If a well feeding the storage vessel affected facility undergoes fracturing or refracturing, you must comply with paragraph (a)(2) of this section as soon as liquids from the well following fracturing or refracturing are routed to the storage vessel affected facility.

(ii) If the monthly emissions determination required in this section indicates that VOC emissions from your storage vessel affected facility increase to 4 tpy or greater and the increase is not associated with fracturing or refracturing of a well feeding the storage vessel affected facility, you must comply with paragraph (a)(2) of this section within 30 days of the monthly determination.

(b) *Control requirements.* (1) Except as required in paragraph (b)(2) of this section, if you use a control device to reduce VOC emissions from your storage vessel affected facility, you must equip the storage vessel with a cover that meets the requirements of §60.5411a(b) and is connected through a closed vent system that meets the requirements of §60.5411a(c) and (d), and you must route emissions to a control device that meets the conditions specified in §60.5412a(c) or (d). As an alternative to routing the closed vent system to a control device, you may route the closed vent system to a process.

(2) If you use a floating roof to reduce emissions, you must meet the requirements of §60.112b(a)(1) or (2) and the relevant monitoring, inspection, recordkeeping, and reporting requirements in 40 CFR part 60, subpart Kb.

(c) Requirements for storage vessel affected facilities that are removed from service or returned to service. If you remove a storage vessel affected facility from service, you must comply with paragraphs (c)(1) through (3) of this section. A storage vessel is not an affected facility under this subpart for the period that it is removed from service.

(1) For a storage vessel affected facility to be removed from service, you must comply with the requirements of paragraphs (c)(1)(i) and (ii) of this section.

(i) You must completely empty and degas the storage vessel, such that the storage vessel no longer contains crude oil, condensate, produced water or intermediate hydrocarbon liquids. A storage vessel where liquid is left on walls, as bottom clingage or in pools due to floor irregularity is considered to be completely empty.

(ii) You must submit a notification as required in §60.5420a(b)(6)(v) in your next annual report, identifying each storage vessel affected facility removed from service during the reporting period and the date of its removal from service.

(2) If a storage vessel identified in paragraph (c)(1)(ii) of this section is returned to service, you must determine its affected facility status as provided in §60.5365a(e).

(3) For each storage vessel affected facility returned to service during the reporting period, you must submit a notification in your next annual report as required in §60.5420a(b)(6)(vi), identifying each storage vessel affected facility and the date of its return to service.

(d) Compliance, notification, recordkeeping, and reporting. You must comply with paragraphs (d)(1) through (3) of this section.

(1) You must demonstrate initial compliance with standards as required by §60.5410a(h) and (i).

(2) You must demonstrate continuous compliance with standards as required by §60.5415a(e)(3).

(3) You must perform the required reporting as required by §60.5420a(b)(1) and (6) and the recordkeeping as required by §60.5420a(c)(5) through (8), (12) through (14), and (17), as applicable.

(e) *Exemptions.* This subpart does not apply to storage vessels subject to and controlled in accordance with the requirements for storage vessels in 40 CFR part 60, subpart Kb, and 40 CFR part 63, subparts G, CC, HH, or WW.

Back to Top

§60.5397a What fugitive emissions GHG and VOC standards apply to the affected facility which is the collection of fugitive emissions components at a well site and the affected facility which is the collection of fugitive emissions components at a compressor station?

For each affected facility under §60.5365a(i) and (j), you must reduce GHG (in the form of a limitation on emissions of methane) and VOC emissions by complying with the requirements of paragraphs (a) through (j) of this section. These requirements are independent of the closed vent system and cover requirements in §60.5411a.

(a) You must monitor all fugitive emission components, as defined in §60.5430a, in accordance with paragraphs (b) through (g) of this section. You must repair all sources of fugitive emissions in accordance with paragraph (h) of this section. You must keep records in accordance with paragraph (i) of this section and report in accordance with paragraph (j) of this section. For purposes of this section, fugitive emissions are defined as: Any visible emission from a fugitive emissions component observed using optical gas imaging or an instrument reading of 500 ppm or greater using Method 21.

(b) You must develop an emissions monitoring plan that covers the collection of fugitive emissions components at well sites and compressor stations within each company-defined area in accordance with paragraphs (c) and (d) of this section.

(c) Fugitive emissions monitoring plans must include the elements specified in paragraphs (c)(1) through (8) of this section, at a minimum.

(1) Frequency for conducting surveys. Surveys must be conducted at least as frequently as required by paragraphs (f) and (g) of this section.

(2) Technique for determining fugitive emissions (*i.e.,* Method 21 at 40 CFR part 60, appendix A-7, or optical gas imaging).

(3) Manufacturer and model number of fugitive emissions detection equipment to be used.

(4) Procedures and timeframes for identifying and repairing fugitive emissions components from which fugitive emissions are detected, including timeframes for fugitive emission components that are unsafe to repair. Your repair schedule must meet the requirements of paragraph (h) of this section at a minimum.

(5) Procedures and timeframes for verifying fugitive emission component repairs.

(6) Records that will be kept and the length of time records will be kept.

(7) If you are using optical gas imaging, your plan must also include the elements specified in paragraphs (c)(7)(i) through (vii) of this section.

(i) Verification that your optical gas imaging equipment meets the specifications of paragraphs (c)(7)(i)(A) and (B) of this section. This verification is an initial verification and may either be performed by the facility, by the manufacturer, or by a third party. For the purposes of complying with the fugitives emissions monitoring program with optical gas imaging, a fugitive emission is defined as any visible emissions observed using optical gas imaging.

(A) Your optical gas imaging equipment must be capable of imaging gases in the spectral range for the compound of highest concentration in the potential fugitive emissions.

(B) Your optical gas imaging equipment must be capable of imaging a gas that is half methane, half propane at a concentration of 10,000 ppm at a flow rate of ≤60g/hr from a quarter inch diameter orifice.

(ii) Procedure for a daily verification check.

(iii) Procedure for determining the operator's maximum viewing distance from the equipment and how the operator will ensure that this distance is maintained.

(iv) Procedure for determining maximum wind speed during which monitoring can be performed and how the operator will ensure monitoring occurs only at wind speeds below this threshold.

(v) Procedures for conducting surveys, including the items specified in paragraphs (c)(7)(v)(A) through (C) of this section.

(A) How the operator will ensure an adequate thermal background is present in order to view potential fugitive emissions.

(B) How the operator will deal with adverse monitoring conditions, such as wind.

(C) How the operator will deal with interferences (e.g., steam).

(vi) Training and experience needed prior to performing surveys.

(vii) Procedures for calibration and maintenance. At a minimum, procedures must comply with those recommended by the manufacturer.

(8) If you are using Method 21 of appendix A-7 of this part, your plan must also include the elements specified in paragraphs (c)(8)(i) and (ii) of this section. For the purposes of complying with the fugitive emissions monitoring program using Method 21 a fugitive emission is defined as an instrument reading of 500 ppm or greater.

(i) Verification that your monitoring equipment meets the requirements specified in Section 6.0 of Method 21 at 40 CFR part 60, appendix A-7. For purposes of instrument capability, the fugitive emissions definition shall be 500 ppm or greater methane using a FID-based instrument. If you wish to use an analyzer other than a FID-based instrument, you must develop a site-specific fugitive emission definition that would be equivalent to 500 ppm methane using a FID-based instrument (*e.g.,* 10.6 eV PID with a specified isobutylene concentration as the fugitive emission definition would provide equivalent response to your compound of interest).

(ii) Procedures for conducting surveys. At a minimum, the procedures shall ensure that the surveys comply with the relevant sections of Method 21 at 40 CFR part 60, appendix A-7, including Section 8.3.1.

(d) Each fugitive emissions monitoring plan must include the elements specified in paragraphs (d)(1) through (4) of this section, at a minimum, as applicable.

(1) Sitemap.

(2) A defined observation path that ensures that all fugitive emissions components are within sight of the path. The observation path must account for interferences.

(3) If you are using Method 21, your plan must also include a list of fugitive emissions components to be monitored and method for determining location of fugitive emissions components to be monitored in the field (*e.g.* tagging, identification on a process and instrumentation diagram, etc.).

(4) Your plan must also include the written plan developed for all of the fugitive emission components designated as difficult-to-monitor in accordance with paragraph (g)(3)(i) of this section, and the written plan for fugitive emission components designated as unsafe-to-monitor in accordance with paragraph (g)(3)(ii) of this section.

(e) Each monitoring survey shall observe each fugitive emissions component, as defined in §60.5430a, for fugitive emissions.

(f)(1) You must conduct an initial monitoring survey within 60 days of the startup of production, as defined in §60.5430a, for each collection of fugitive emissions components at a new well site or by June 3, 2017, whichever is later. For a modified collection of fugitive emissions components at a well site, the initial monitoring survey must be conducted within 60 days of the first day of production for each collection of fugitive emission components after the modification or by June 3, 2017, whichever is later. Notwithstanding the preceding deadlines, for each collection of fugitive emissions components at a well site located on the Alaskan North Slope, as defined in §60.5430a, that starts up production between September and March, you must conduct an initial monitoring survey within 6 months of the startup of production for a new well site, within 6 months of the first day of production after a modification of the collection of fugitive emission components, or by the following June 30, whichever is later.

(2) You must conduct an initial monitoring survey within 60 days of the startup of a new compressor station for each new collection of fugitive emissions components at the new compressor station or by June 3, 2017, whichever is later. For a modified collection of fugitive components at a compressor station, the initial monitoring survey must be conducted within 60 days of the modification or by June 3, 2017, whichever is later.

(g) A monitoring survey of each collection of fugitive emissions components at a well site or at a compressor station must be performed at the frequencies specified in paragraphs (g)(1) and (2) of this section, with the exceptions noted in paragraphs (g)(3) and (4) of this section.

(1) Except as provided herein, a monitoring survey of each collection of fugitive emissions components at a well site within a company-defined area must be conducted at least semiannually after the initial survey. Consecutive semiannual monitoring surveys must be conducted at least 4 months apart. A monitoring survey of each collection of fugitive emissions components at a well site located on the Alaskan North Slope must be conducted at least annually. Consecutive annual monitoring surveys must be conducted at least 9 months apart.

(2) A monitoring survey of the collection of fugitive emissions components at a compressor station within a company-defined area must be conducted at least quarterly after the initial survey. Consecutive quarterly monitoring surveys must be conducted at least 60 days apart.

(3) Fugitive emissions components that cannot be monitored without elevating the monitoring personnel more than 2 meters above the surface may be designated as difficult-to-monitor. Fugitive emissions components that are designated difficult-to-monitor must meet the specifications of paragraphs (g)(3)(i) through (iv) of this section.

(i) A written plan must be developed for all of the fugitive emissions components designated difficult-to-monitor. This written plan must be incorporated into the fugitive emissions monitoring plan required by paragraphs (b), (c), and (d) of this section.

(ii) The plan must include the identification and location of each fugitive emissions component designated as difficult-to-monitor.

(iii) The plan must include an explanation of why each fugitive emissions component designated as difficult-to-monitor is difficult-to-monitor.

(iv) The plan must include a schedule for monitoring the difficult-to-monitor fugitive emissions components at least once per calendar year.

(4) Fugitive emissions components that cannot be monitored because monitoring personnel would be exposed to immediate danger while conducting a monitoring survey may be designated as unsafe-to-monitor. Fugitive emissions components that are designated unsafe-to-monitor must meet the specifications of paragraphs (g)(4)(i) through (iv) of this section.

(i) A written plan must be developed for all of the fugitive emissions components designated unsafe-to-monitor. This written plan must be incorporated into the fugitive emissions monitoring plan required by paragraphs (b), (c), and (d) of this section.

(ii) The plan must include the identification and location of each fugitive emissions component designated as unsafe-to-monitor.

(iii) The plan must include an explanation of why each fugitive emissions component designated as unsafe-to-monitor is unsafe-to-monitor.

(iv) The plan must include a schedule for monitoring the fugitive emissions components designated as unsafe-to-monitor.

(5) The requirements of paragraph (g)(2) of this section are waived for any collection of fugitive emissions components at a compressor station located within an area that has an average calendar month temperature below 0 °Fahrenheit for two of three consecutive calendar months of a quarterly monitoring period. The calendar month temperature average for each month within the quarterly monitoring period must be determined using historical monthly average temperatures over the previous three years as reported by a National Oceanic and Atmospheric Administration source or other source approved by the Administrator. The requirements of paragraph (g)(2) of this section shall not be waived for two consecutive quarterly monitoring periods.

(h) Each identified source of fugitive emissions shall be repaired or replaced in accordance with paragraphs (h)(1) and (2) of this section. For fugitive emissions components also subject to the repair provisions of §§60.5416a(b)(9) through (12) and (c)(4) through (7), those provisions apply instead to those closed vent system and covers, and the repair provisions of paragraphs (h)(1) and (2) of this section do not apply to those closed vent systems and covers.

(1) Each identified source of fugitive emissions shall be repaired or replaced as soon as practicable, but no later than 30 calendar days after detection of the fugitive emissions.

(2) If the repair or replacement is technically infeasible, would require a vent blowdown, a compressor station shutdown, a well shutdown or well shut-in, or would be unsafe to repair during operation of the unit, the repair or replacement must be completed during the next scheduled compressor station shutdown, well shutdown, well shut-in, after a planned vent blowdown or within 2 years, whichever is earlier.

(3) Each repaired or replaced fugitive emissions component must be resurveyed as soon as practicable, but no later than 30 days after being repaired, to ensure that there are no fugitive emissions.

(i) For repairs that cannot be made during the monitoring survey when the fugitive emissions are initially found, the operator may resurvey the repaired fugitive emissions components using either Method 21 or optical gas imaging within 30 days of finding such fugitive emissions.

(ii) For each repair that cannot be made during the monitoring survey when the fugitive emissions are initially found, a digital photograph must be taken of that component or the component must be tagged for identification purposes. The digital photograph must include the date that the photograph was taken, must clearly identify the component by location within the site (*e.g.,* the latitude and longitude of the component or by other descriptive landmarks visible in the picture).

(iii) Operators that use Method 21 to resurvey the repaired fugitive emissions components are subject to the resurvey provisions specified in paragraphs (h)(3)(iii)(A) and (B) of this section.

(A) A fugitive emissions component is repaired when the Method 21 instrument indicates a concentration of less than 500 ppm above background or when no soap bubbles are observed when the alternative screening procedures specified in section 8.3.3 of Method 21 are used.

(B) Operators must use the Method 21 monitoring requirements specified in paragraph (c)(8)(ii) of this section or the alternative screening procedures specified in section 8.3.3 of Method 21.

(iv) Operators that use optical gas imaging to resurvey the repaired fugitive emissions components, are subject to the resurvey provisions specified in paragraphs (h)(3)(iv)(A) and (B) of this section.

(A) A fugitive emissions component is repaired when the optical gas imaging instrument shows no indication of visible emissions.

(B) Operators must use the optical gas imaging monitoring requirements specified in paragraph (c)(7) of this section.

(i) Records for each monitoring survey shall be maintained as specified §60.5420a(c)(15).

(j) Annual reports shall be submitted for each collection of fugitive emissions components at a well site and each collection of fugitive emissions components at a compressor station that

include the information specified in §60.5420a(b)(7). Multiple collection of fugitive emissions components at a well site or at a compressor station may be included in a single annual report.

[81 FR 35898, June 3, 2016, as amended at 83 FR 10638, Mar. 12, 2018]

§60.5398a What are the alternative means of emission limitations for GHG and VOC from well completions, reciprocating compressors, the collection of fugitive emissions components at a well site and the collection of fugitive emissions components at a compressor station?

(a) If, in the Administrator's judgment, an alternative means of emission limitation will achieve a reduction in GHG (in the form of a limitation on emission of methane) and VOC emissions at least equivalent to the reduction in GHG and VOC emissions achieved under §§60.5375a, 60.5385a, and 60.5397a, the Administrator will publish, in the FEDERAL REGISTER, a notice permitting the use of that alternative means for the purpose of compliance with §§60.5375a, 60.5385a, and 60.5397a. The notice may condition permission on requirements related to the operation and maintenance of the alternative means.

(b) Any notice under paragraph (a) of this section must be published only after notice and an opportunity for a public hearing.

(c) The Administrator will consider applications under this section from either owners or operators of affected facilities.

(d) Determination of equivalence to the design, equipment, work practice or operational requirements of this section will be evaluated by the following guidelines:

(1) The applicant must collect, verify and submit test data, covering a period of at least 12 months to demonstrate the equivalence of the alternative means of emission limitation. The application must include the following information:

(i) A description of the technology or process.

(ii) The monitoring instrument and measurement technology or process.

(iii) A description of performance based procedures (*i.e.,* method) and data quality indicators for precision and bias; the method detection limit of the technology or process.

(iv) For affected facilities under §60.5397a, the action criteria and level at which a fugitive emission exists.

(v) Any initial and ongoing quality assurance/quality control measures.

(vi) Timeframes for conducting ongoing quality assurance/quality control.

(vii) Field data verifying viability and detection capabilities of the technology or process.

(viii) Frequency of measurements.

(ix) Minimum data availability.

(x) Any restrictions for using the technology or process.

(xi) Operation and maintenance procedures and other provisions necessary to ensure reduction in methane and VOC emissions at least equivalent to the reduction in methane and VOC emissions achieved under §60.5397a.

(xii) Initial and continuous compliance procedures, including recordkeeping and reporting.

(2) For each determination of equivalency requested, the emission reduction achieved by the design, equipment, work practice or operational requirements shall be demonstrated.

(3) For each affected facility for which a determination of equivalency is requested, the emission reduction achieved by the alternative means of emission limitation shall be demonstrated.

(4) Each owner or operator applying for a determination of equivalence to a work practice standard shall commit in writing to work practice(s) that provide for emission reductions equal to or greater than the emission reductions achieved by the required work practice.

(e) After notice and opportunity for public hearing, the Administrator will determine the equivalence of a means of emission limitation and will publish the determination in the FEDERAL REGISTER.

(f) An application submitted under this section will be evaluated as set forth in paragraphs (f)(1) and (2) of this section.

(1) The Administrator will compare the demonstrated emission reduction for the alternative means of emission limitation to the demonstrated emission reduction for the design, equipment, work practice or operational requirements and, if applicable, will consider the commitment in paragraph (d) of this section.

(2) The Administrator may condition the approval of the alternative means of emission limitation on requirements that may be necessary to ensure operation and maintenance to achieve the same emissions reduction as the design, equipment, work practice or operational requirements. (g) Any equivalent means of emission limitations approved under this section shall constitute a required work practice, equipment, design or operational standard within the meaning of section 111(h)(1) of the CAA.

Back to Top

§60.5400a What equipment leak GHG and VOC standards apply to affected facilities at an onshore natural gas processing plant?

This section applies to the group of all equipment, except compressors, within a process unit.

(a) You must comply with the requirements of §§60.482-1a(a), (b), and (d), 60.482-2a, and 60.482-4a through 60.482-11a, except as provided in §60.5401a.

(b) You may elect to comply with the requirements of §§60.483-1a and 60.483-2a, as an alternative.

(c) You may apply to the Administrator for permission to use an alternative means of emission limitation that achieves a reduction in emissions of methane and VOC at least equivalent to that achieved by the controls required in this subpart according to the requirements of §60.5402a.

(d) You must comply with the provisions of §60.485a except as provided in paragraph (f) of this section.

(e) You must comply with the provisions of §§60.486a and 60.487a except as provided in §§60.5401a, 60.5421a, and 60.5422a.

(f) You must use the following provision instead of §60.485a(d)(1): Each piece of equipment is presumed to be in VOC service or in wet gas service unless an owner or operator demonstrates that the piece of equipment is not in VOC service or in wet gas service. For a piece of equipment to be considered not in VOC service, it must be determined that the VOC content can be reasonably expected never to exceed 10.0 percent by weight. For a piece of equipment to be considered in wet gas service, it must be determined that it contains or contacts the field gas before the extraction step in the process. For purposes of determining the percent VOC content of the process fluid that is contained in or contacts a piece of equipment, procedures that conform to the methods described in ASTM E169-93, E168-92, or E260-96 (incorporated by reference as specified in §60.17) must be used.

Back to Top

§60.5401a What are the exceptions to the equipment leak GHG and VOC standards for affected facilities at onshore natural gas processing plants?

(a) You may comply with the following exceptions to the provisions of §60.5400a(a) and (b).

(b)(1) Each pressure relief device in gas/vapor service may be monitored quarterly and within 5 days after each pressure release to detect leaks by the methods specified in §60.485a(b) except as provided in §§60.5400a(c) and in paragraph (b)(4) of this section, and 60.482-4a(a) through (c) of subpart VVa of this part.

(2) If an instrument reading of 500 ppm or greater is measured, a leak is detected.

(3)(i) When a leak is detected, it must be repaired as soon as practicable, but no later than 15 calendar days after it is detected, except as provided in §60.482-9a.

(ii) A first attempt at repair must be made no later than 5 calendar days after each leak is detected.

(4)(i) Any pressure relief device that is located in a nonfractionating plant that is monitored only by non-plant personnel may be monitored after a pressure release the next time the monitoring personnel are onsite, instead of within 5 days as specified in paragraph (b)(1) of this section and §60.482-4a(b)(1).

(ii) No pressure relief device described in paragraph (b)(4)(i) of this section may be allowed to operate for more than 30 days after a pressure release without monitoring.

(c) Sampling connection systems are exempt from the requirements of §60.482-5a.

(d) Pumps in light liquid service, valves in gas/vapor and light liquid service, pressure relief devices in gas/vapor service, and connectors in gas/vapor service and in light liquid service that are located at a nonfractionating plant that does not have the design capacity to process 283,200 standard cubic meters per day (scmd) (10 million standard cubic feet per day) or more of field gas are exempt from the routine monitoring requirements of §§60.482-2a(a)(1), 60.482-7a(a), 60.482-11a(a), and paragraph (b)(1) of this section.

(e) Pumps in light liquid service, valves in gas/vapor and light liquid service, pressure relief devices in gas/vapor service, and connectors in gas/vapor service and in light liquid service within a process unit that is located in the Alaskan North Slope are exempt from the routine monitoring requirements of §§60.482-2a(a)(1), 60.482-7a(a), 60.482-11a(a), and paragraph (b)(1) of this section.

(f) An owner or operator may use the following provisions instead of §60.485a(e):

(1) Equipment is in heavy liquid service if the weight percent evaporated is 10 percent or less at 150 °Celsius (302 °Fahrenheit) as determined by ASTM Method D86-96 (incorporated by reference as specified in §60.17).

(2) Equipment is in light liquid service if the weight percent evaporated is greater than 10 percent at 150 °Celsius (302 °Fahrenheit) as determined by ASTM Method D86-96 (incorporated by reference as specified in §60.17).

(g) An owner or operator may use the following provisions instead of §60.485a(b)(2): A calibration drift assessment shall be performed, at a minimum, at the end of each monitoring day. Check the instrument using the same calibration gas(es) that were used to calibrate the instrument before use. Follow the procedures specified in Method 21 of appendix A-7 of this part, Section 10.1, except do not adjust the meter readout to correspond to the calibration gas value. Record the instrument reading for each scale used as specified in §60.486a(e)(8). Divide these readings by the initial calibration values for each scale and multiply by 100 to express the calibration drift as a percentage. If any calibration drift assessment shows a negative drift of more than 10 percent from the initial calibration value, then all equipment monitored since the last calibration with instrument readings below the appropriate leak definition and above the leak definition multiplied by (100 minus the percent of negative drift/divided by 100) must be re-monitored. If any calibration drift assessment shows a positive drift of more than 10 percent from the initial calibration value, then, at the owner/operator's discretion, all equipment since the last calibration with instrument readings above the appropriate leak definition and below the leak definition multiplied by (100 plus the percent of positive drift/divided by 100) may be re-monitored.

Back to Top

§60.5402a What are the alternative means of emission limitations for GHG and VOC equipment leaks from onshore natural gas processing plants?

(a) If, in the Administrator's judgment, an alternative means of emission limitation will achieve a reduction in GHG and VOC emissions at least equivalent to the reduction in GHG and VOC emissions achieved under any design, equipment, work practice or operational standard, the Administrator will publish, in the FEDERAL REGISTER, a notice permitting the use of that alternative means for the purpose of compliance with that standard. The notice may condition permission on requirements related to the operation and maintenance of the alternative means.

(b) Any notice under paragraph (a) of this section must be published only after notice and an opportunity for a public hearing.

(c) The Administrator will consider applications under this section from either owners or operators of affected facilities, or manufacturers of control equipment.

(d) An application submitted under paragraph (c) of this section must meet the following criteria:

(1) The applicant must collect, verify and submit test data, covering a period of at least 12 months, necessary to support the finding in paragraph (a) of this section.

(2) The application must include operation, maintenance and other provisions necessary to assure reduction in methane and VOC emissions at least equivalent to the reduction in methane and VOC emissions achieved under the design, equipment, work practice or operational standard in paragraph (a) of this section by including the information specified in paragraphs (d)(1)(i) through (x) of this section.

(i) A description of the technology or process.

(ii) The monitoring instrument and measurement technology or process.

(iii) A description of performance based procedures (i.e. method) and data quality indicators for precision and bias; the method detection limit of the technology or process.

(iv) The action criteria and level at which a fugitive emission exists.

(v) Any initial and ongoing quality assurance/quality control measures.

(vi) Timeframes for conducting ongoing quality assurance/quality control.

(vii) Field data verifying viability and detection capabilities of the technology or process.

(viii) Frequency of measurements.

(ix) Minimum data availability.

(x) Any restrictions for using the technology or process.

(3) The application must include initial and continuous compliance procedures including recordkeeping and reporting.

Back to Top

§60.5405a What standards apply to sweetening unit affected facilities at onshore natural gas processing plants?

(a) During the initial performance test required by §60.8(b), you must achieve at a minimum, an SO_2 emission reduction efficiency (Z_i) to be determined from Table 1 of this subpart based on the sulfur feed rate (X) and the sulfur content of the acid gas (Y) of the affected facility.

(b) After demonstrating compliance with the provisions of paragraph (a) of this section, you must achieve at a minimum, an SO_2 emission reduction efficiency (Z_c) to be determined from Table 2 of this subpart based on the sulfur feed rate (X) and the sulfur content of the acid gas (Y) of the affected facility.

Back to Top

§60.5406a What test methods and procedures must I use for my sweetening unit affected facilities at onshore natural gas processing plants?

(a) In conducting the performance tests required in §60.8, you must use the test methods in appendix A of this part or other methods and procedures as specified in this section, except as provided in §60.8(b).

(b) During a performance test required by §60.8, you must determine the minimum required reduction efficiencies (Z) of SO_2 emissions as required in §60.5405a(a) and (b) as follows:

(1) The average sulfur feed rate (X) must be computed as follows:

$$X = KQ_aY$$

Where:

X = average sulfur feed rate, Mg/D (LT/D).

Q_a = average volumetric flow rate of acid gas from sweetening unit, dscm/day (dscf/day).

Y = average H_2S concentration in acid gas feed from sweetening unit, percent by volume, expressed as a decimal.

K = (32 kg S/kg-mole)/((24.04 dscm/kg-mole)(1000 kg S/Mg)).

= 1.331×10^{-3} Mg/dscm, for metric units.

= (32 lb S/lb-mole)/((385.36 dscf/lb-mole)(2240 lb S/long ton)).

= 3.707×10^{-5} long ton/dscf, for English units.

(2) You must use the continuous readings from the process flowmeter to determine the average volumetric flow rate (Q_a) in dscm/day (dscf/day) of the acid gas from the sweetening unit for each run.

(3) You must use the Tutwiler procedure in §60.5408a or a chromatographic procedure following ASTM E260-96 (incorporated by reference as specified in §60.17) to determine the H_2S concentration in the acid gas feed from the sweetening unit (Y). At least one sample per hour (at equally spaced intervals) must be taken during each 4-hour run. The arithmetic mean of all samples must be the average H_2S concentration (Y) on a dry basis for the run. By multiplying the

result from the Tutwiler procedure by 1.62×10^{-3}, the units gr/100 scf are converted to volume percent.

(4) Using the information from paragraphs (b)(1) and (3) of this section, Tables 1 and 2 of this subpart must be used to determine the required initial (Z_i) and continuous (Z_c) reduction efficiencies of SO_2 emissions.

(c) You must determine compliance with the SO_2 standards in §60.5405a(a) or (b) as follows:

(1) You must compute the emission reduction efficiency (R) achieved by the sulfur recovery technology for each run using the following equation:

$R = (100S)/(S + E)$

(2) You must use the level indicators or manual soundings to measure the liquid sulfur accumulation rate in the product storage vessels. You must use readings taken at the beginning and end of each run, the tank geometry, sulfur density at the storage temperature, and sample duration to determine the sulfur production rate (S) in kg/hr (lb/hr) for each run.

(3) You must compute the emission rate of sulfur for each run as follows:

$E = C_e Q_{sd}/K_1$

Where:

E = emission rate of sulfur per run, kg/hr.

C_e = concentration of sulfur equivalent (SO^{2+} reduced sulfur), g/dscm (lb/dscf).

Q_{sd} = volumetric flow rate of effluent gas, dscm/hr (dscf/hr).

K_1 = conversion factor, 1000 g/kg (7000 gr/lb).

(4) The concentration (C_e) of sulfur equivalent must be the sum of the SO_2 and TRS concentrations, after being converted to sulfur equivalents. For each run and each of the test methods specified in this paragraph (c) of this section, you must use a sampling time of at least 4 hours. You must use Method 1 of appendix A-1 of this part to select the sampling site. The sampling point in the duct must be at the centroid of the cross-section if the area is less than 5 m2 (54 ft2) or at a point no closer to the walls than 1 m (39 in) if the cross-sectional area is 5 m2 or more, and the centroid is more than 1 m (39 in) from the wall.

(i) You must use Method 6 of appendix A-4 of this part to determine the SO_2 concentration. You must take eight samples of 20 minutes each at 30-minute intervals. The arithmetic average must be the concentration for the run. The concentration must be multiplied by 0.5×10^{-3} to convert the results to sulfur equivalent. In place of Method 6 of appendix A of this part, you may use

ANSI/ASME PTC 19.10-1981, Part 10 (manual portion only) (incorporated by reference as specified in §60.17).

(ii) You must use Method 15 of appendix A-5 of this part to determine the TRS concentration from reduction-type devices or where the oxygen content of the effluent gas is less than 1.0 percent by volume. The sampling rate must be at least 3 liters/min (0.1 ft3/min) to insure minimum residence time in the sample line. You must take sixteen samples at 15-minute intervals. The arithmetic average of all the samples must be the concentration for the run. The concentration in ppm reduced sulfur as sulfur must be multiplied by 1.333×10^{-3} to convert the results to sulfur equivalent.

(iii) You must use Method 16A of appendix A-6 of this part or Method 15 of appendix A-5 of this part or ANSI/ASME PTC 19.10-1981, Part 10 (manual portion only) (incorporated by reference as specified in §60.17) to determine the reduced sulfur concentration from oxidation-type devices or where the oxygen content of the effluent gas is greater than 1.0 percent by volume. You must take eight samples of 20 minutes each at 30-minute intervals. The arithmetic average must be the concentration for the run. The concentration in ppm reduced sulfur as sulfur must be multiplied by 1.333×10^{-3} to convert the results to sulfur equivalent.

(iv) You must use Method 2 of appendix A-1 of this part to determine the volumetric flow rate of the effluent gas. A velocity traverse must be conducted at the beginning and end of each run. The arithmetic average of the two measurements must be used to calculate the volumetric flow rate (Q_{sd}) for the run. For the determination of the effluent gas molecular weight, a single integrated sample over the 4-hour period may be taken and analyzed or grab samples at 1-hour intervals may be taken, analyzed, and averaged. For the moisture content, you must take two samples of at least 0.10 dscm (3.5 dscf) and 10 minutes at the beginning of the 4-hour run and near the end of the time period. The arithmetic average of the two runs must be the moisture content for the run.

Back to Top

§60.5407a What are the requirements for monitoring of emissions and operations from my sweetening unit affected facilities at onshore natural gas processing plants?

(a) If your sweetening unit affected facility is located at an onshore natural gas processing plant and is subject to the provisions of §60.5405a(a) or (b) you must install, calibrate, maintain, and operate monitoring devices or perform measurements to determine the following operations information on a daily basis:

(1) The accumulation of sulfur product over each 24-hour period. The monitoring method may incorporate the use of an instrument to measure and record the liquid sulfur production rate, or may be a procedure for measuring and recording the sulfur liquid levels in the storage vessels with a level indicator or by manual soundings, with subsequent calculation of the sulfur production rate based on the tank geometry, stored sulfur density, and elapsed time between

readings. The method must be designed to be accurate within ±2 percent of the 24-hour sulfur accumulation.

(2) The H_2S concentration in the acid gas from the sweetening unit for each 24-hour period. At least one sample per 24-hour period must be collected and analyzed using the equation specified in §60.5406a(b)(1). The Administrator may require you to demonstrate that the H_2S concentration obtained from one or more samples over a 24-hour period is within ±20 percent of the average of 12 samples collected at equally spaced intervals during the 24-hour period. In instances where the H_2S concentration of a single sample is not within ±20 percent of the average of the 12 equally spaced samples, the Administrator may require a more frequent sampling schedule.

(3) The average acid gas flow rate from the sweetening unit. You must install and operate a monitoring device to continuously measure the flow rate of acid gas. The monitoring device reading must be recorded at least once per hour during each 24-hour period. The average acid gas flow rate must be computed from the individual readings.

(4) The sulfur feed rate (X). For each 24-hour period, you must compute X using the equation specified in §60.5406a(b)(1).

(5) The required sulfur dioxide emission reduction efficiency for the 24-hour period. You must use the sulfur feed rate and the H_2S concentration in the acid gas for the 24-hour period, as applicable, to determine the required reduction efficiency in accordance with the provisions of §60.5405a(b).

(b) Where compliance is achieved through the use of an oxidation control system or a reduction control system followed by a continually operated incineration device, you must install, calibrate, maintain, and operate monitoring devices and continuous emission monitors as follows:

(1) A continuous monitoring system to measure the total sulfur emission rate (E) of SO_2 in the gases discharged to the atmosphere. The SO_2 emission rate must be expressed in terms of equivalent sulfur mass flow rates (kg/hr (lb/hr)). The span of this monitoring system must be set so that the equivalent emission limit of §60.5405a(b) will be between 30 percent and 70 percent of the measurement range of the instrument system.

(2) Except as provided in paragraph (b)(3) of this section: A monitoring device to measure the temperature of the gas leaving the combustion zone of the incinerator, if compliance with §60.5405a(a) is achieved through the use of an oxidation control system or a reduction control system followed by a continually operated incineration device. The monitoring device must be certified by the manufacturer to be accurate to within ±1 percent of the temperature being measured.

(3) When performance tests are conducted under the provision of §60.8 to demonstrate compliance with the standards under §60.5405a, the temperature of the gas leaving the incinerator combustion zone must be determined using the monitoring device. If the volumetric

ratio of sulfur dioxide to sulfur dioxide plus total reduced sulfur (expressed as SO_2) in the gas leaving the incinerator is equal to or less than 0.98, then temperature monitoring may be used to demonstrate that sulfur dioxide emission monitoring is sufficient to determine total sulfur emissions. At all times during the operation of the facility, you must maintain the average temperature of the gas leaving the combustion zone of the incinerator at or above the appropriate level determined during the most recent performance test to ensure the sulfur compound oxidation criteria are met. Operation at lower average temperatures may be considered by the Administrator to be unacceptable operation and maintenance of the affected facility. You may request that the minimum incinerator temperature be reestablished by conducting new performance tests under §60.8.

(4) Upon promulgation of a performance specification of continuous monitoring systems for total reduced sulfur compounds at sulfur recovery plants, you may, as an alternative to paragraph (b)(2) of this section, install, calibrate, maintain, and operate a continuous emission monitoring system for total reduced sulfur compounds as required in paragraph (d) of this section in addition to a sulfur dioxide emission monitoring system. The sum of the equivalent sulfur mass emission rates from the two monitoring systems must be used to compute the total sulfur emission rate (E).

(c) Where compliance is achieved through the use of a reduction control system not followed by a continually operated incineration device, you must install, calibrate, maintain, and operate a continuous monitoring system to measure the emission rate of reduced sulfur compounds as SO_2 equivalent in the gases discharged to the atmosphere. The SO_2 equivalent compound emission rate must be expressed in terms of equivalent sulfur mass flow rates (kg/hr (lb/hr)). The span of this monitoring system must be set so that the equivalent emission limit of §60.5405a(b) will be between 30 and 70 percent of the measurement range of the system. This requirement becomes effective upon promulgation of a performance specification for continuous monitoring systems for total reduced sulfur compounds at sulfur recovery plants.

(d) For those sources required to comply with paragraph (b) or (c) of this section, you must calculate the average sulfur emission reduction efficiency achieved (R) for each 24-hour clock interval. The 24-hour interval may begin and end at any selected clock time, but must be consistent. You must compute the 24-hour average reduction efficiency (R) based on the 24-hour average sulfur production rate (S) and sulfur emission rate (E), using the equation in §60.5406a(c)(1).

(1) You must use data obtained from the sulfur production rate monitoring device specified in paragraph (a) of this section to determine S.

(2) You must use data obtained from the sulfur emission rate monitoring systems specified in paragraphs (b) or (c) of this section to calculate a 24-hour average for the sulfur emission rate (E). The monitoring system must provide at least one data point in each successive 15-minute interval. You must use at least two data points to calculate each 1-hour average. You must use a minimum of 18 1-hour averages to compute each 24-hour average.

(e) In lieu of complying with paragraphs (b) or (c) of this section, those sources with a design capacity of less than 152 Mg/D (150 LT/D) of H_2S expressed as sulfur may calculate the sulfur emission reduction efficiency achieved for each 24-hour period by:

View or download PDF

Where:

R = The sulfur dioxide removal efficiency achieved during the 24-hour period, percent.

K_2 = Conversion factor, 0.02400 Mg/D per kg/hr (0.01071 LT/D per lb/hr).

S = The sulfur production rate during the 24-hour period, kg/hr (lb/hr).

X = The sulfur feed rate in the acid gas, Mg/D (LT/D).

(f) The monitoring devices required in paragraphs (b)(1), (b)(3) and (c) of this section must be calibrated at least annually according to the manufacturer's specifications, as required by §60.13(b).

(g) The continuous emission monitoring systems required in paragraphs (b)(1), (b)(3), and (c) of this section must be subject to the emission monitoring requirements of §60.13 of the General Provisions. For conducting the continuous emission monitoring system performance evaluation required by §60.13(c), Performance Specification 2 of appendix B of this part must apply, and Method 6 of appendix A-4 of this part must be used for systems required by paragraph (b) of this section. In place of Method 6 of appendix A-4 of this part, ASME PTC 19.10-1981 (incorporated by reference—see §60.17) may be used.

Back to Top

§60.5408a What is an optional procedure for measuring hydrogen sulfide in acid gas—Tutwiler Procedure?

The Tutwiler procedure may be found in the Gas Engineers Handbook, Fuel Gas Engineering practices, The Industrial Press, 93 Worth Street, New York, NY, 1966, First Edition, Second Printing, page 6/25 (Docket A-80-20-A, Entry II-I-67).

(a) When an instantaneous sample is desired and H_2S concentration is 10 grains per 1000 cubic foot or more, a 100 ml Tutwiler burette is used. For concentrations less than 10 grains, a 500 ml Tutwiler burette and more dilute solutions are used. In principle, this method consists of titrating hydrogen sulfide in a gas sample directly with a standard solution of iodine.

(b) *Apparatus.* (See Figure 1 of this subpart.) A 100 or 500 ml capacity Tutwiler burette, with two-way glass stopcock at bottom and three-way stopcock at top that connect either with inlet tubulature or glass-stoppered cylinder, 10 ml capacity, graduated in 0.1 ml subdivision; rubber tubing connecting burette with leveling bottle.

(c) *Reagents.* (1) Iodine stock solution, 0.1N. Weight 12.7 g iodine, and 20 to 25 g cp potassium iodide (KI) for each liter of solution. Dissolve KI in as little water as necessary; dissolve iodine in concentrated KI solution, make up to proper volume, and store in glass-stoppered brown glass bottle.

(2) Standard iodine solution, 1 ml=0.001771 g I. Transfer 33.7 ml of above 0.1N stock solution into a 250 ml volumetric flask; add water to mark and mix well. Then, for 100 ml sample of gas, 1 ml of standard iodine solution is equivalent to 100 grains H_2S per cubic feet of gas.

(3) *Starch solution.* Rub into a thin paste about one teaspoonful of wheat starch with a little water; pour into about a pint of boiling water; stir; let cool and decant off clear solution. Make fresh solution every few days.

(d) *Procedure*. Fill leveling bulb with starch solution. Raise (L), open cock (G), open (F) to (A), and close (F) when solutions starts to run out of gas inlet. Close (G). Purge gas sampling line and connect with (A). Lower (L) and open (F) and (G). When liquid level is several ml past the 100 ml mark, close (G) and (F), and disconnect sampling tube. Open (G) and bring starch solution to 100 ml mark by raising (L); then close (G). Open (F) momentarily, to bring gas in burette to atmospheric pressure, and close (F). Open (G), bring liquid level down to 10 ml mark by lowering (L). Close (G), clamp rubber tubing near (E) and disconnect it from burette. Rinse graduated cylinder with a standard iodine solution (0.00171 g I per ml); fill cylinder and record reading. Introduce successive small amounts of iodine through (F); shake well after each addition; continue until a faint permanent blue color is obtained. Record reading; subtract from previous reading, and call difference D.

(e) With every fresh stock of starch solution perform a blank test as follows: Introduce fresh starch solution into burette up to 100 ml mark. Close (F) and (G). Lower (L) and open (G). When liquid level reaches the 10 ml mark, close (G). With air in burette, titrate as during a test and up to same end point. Call ml of iodine used C. Then,

Grains H_2S per 100 cubic foot of gas = 100 (D-C)

(f) Greater sensitivity can be attained if a 500 ml capacity Tutwiler burette is used with a more dilute (0.001N) iodine solution. Concentrations less than 1.0 grains per 100 cubic foot can be determined in this way. Usually, the starch-iodine end point is much less distinct, and a blank determination of end point, with H_2S-free gas or air, is required.

§60.5410a How do I demonstrate initial compliance with the standards for my well, centrifugal compressor, reciprocating compressor, pneumatic controller, pneumatic pump, storage vessel, collection of fugitive emissions components at a well site, collection of fugitive emissions components at a compressor station, and equipment leaks and sweetening unit affected facilities at onshore natural gas processing plants?

You must determine initial compliance with the standards for each affected facility using the requirements in paragraphs (a) through (j) of this section. The initial compliance period begins on August 2, 2016, or upon initial startup, whichever is later, and ends no later than 1 year after the initial startup date for your affected facility or no later than 1 year after August 2, 2016. The initial compliance period may be less than one full year.

(a) To achieve initial compliance with the methane and VOC standards for each well completion operation conducted at your well affected facility you must comply with paragraphs (a)(1) through (4) of this section.

(1) You must submit the notification required in §60.5420a(a)(2).

(2) You must submit the initial annual report for your well affected facility as required in §60.5420a(b)(1) and (2).

(3) You must maintain a log of records as specified in §60.5420a(c)(1)(i) through (iv), as applicable, for each well completion operation conducted during the initial compliance period. If you meet the exemption for wells with a GOR less than 300 scf per stock barrel of oil produced, you do not have to maintain the records in §60.5420a(c)(1)(i) through (iv) and must maintain the record in §60.5420a(c)(1)(vi).

(4) For each well affected facility subject to both §60.5375a(a)(1) and (3), as an alternative to retaining the records specified in §60.5420a(c)(1)(i) through (iv), you may maintain records in accordance with §60.5420a(c)(1)(v) of one or more digital photographs with the date the photograph was taken and the latitude and longitude of the well site imbedded within or stored with the digital file showing the equipment for storing or re-injecting recovered liquid, equipment for routing recovered gas to the gas flow line and the completion combustion device (if applicable) connected to and operating at each well completion operation that occurred during the initial compliance period. As an alternative to imbedded latitude and longitude within the digital photograph, the digital photograph may consist of a photograph of the equipment

connected and operating at each well completion operation with a photograph of a separately operating GPS device within the same digital picture, provided the latitude and longitude output of the GPS unit can be clearly read in the digital photograph.

(b)(1) To achieve initial compliance with standards for your centrifugal compressor affected facility you must reduce methane and VOC emissions from each centrifugal compressor wet seal fluid degassing system by 95.0 percent or greater as required by §60.5380a(a) and as demonstrated by the requirements of §60.5413a.

(2) If you use a control device to reduce emissions, you must equip the wet seal fluid degassing system with a cover that meets the requirements of §60.5411a(b) that is connected through a closed vent system that meets the requirements of §60.5411a(a) and (d) and is routed to a control device that meets the conditions specified in §60.5412a(a), (b) and (c). As an alternative to routing the closed vent system to a control device, you may route the closed vent system to a process.

(3) You must conduct an initial performance test as required in §60.5413a within 180 days after initial startup or by August 2, 2016, whichever is later, and you must comply with the continuous compliance requirements in §60.5415a(b).

(4) You must conduct the initial inspections required in §60.5416a(a) and (b).

(5) You must install and operate the continuous parameter monitoring systems in accordance with §60.5417a(a) through (g), as applicable.

(6)]Reserved]

(7) You must submit the initial annual report for your centrifugal compressor affected facility as required in §60.5420a(b)(1) and (3).

(8) You must maintain the records as specified in §60.5420a(c)(2), (6) through (11), and (17), as applicable.

(c) To achieve initial compliance with the standards for each reciprocating compressor affected facility you must comply with paragraphs (c)(1) through (4) of this section.

(1) If complying with §60.5385a(a)(1) or (2), during the initial compliance period, you must continuously monitor the number of hours of operation or track the number of months since the last rod packing replacement.

(2) If complying with §60.5385a(a)(3), you must operate the rod packing emissions collection system under negative pressure and route emissions to a process through a closed vent system that meets the requirements of §60.5411a(a) and (d).

(3) You must submit the initial annual report for your reciprocating compressor as required in §60.5420a(b)(1) and (4).

(4) You must maintain the records as specified in §60.5420a(c)(3) for each reciprocating compressor affected facility.

(d) To achieve initial compliance with methane and VOC emission standards for your pneumatic controller affected facility you must comply with the requirements specified in paragraphs (d)(1) through (6) of this section, as applicable.

(1) You must demonstrate initial compliance by maintaining records as specified in §60.5420a(c)(4)(ii) of your determination that the use of a pneumatic controller affected facility with a bleed rate greater than the applicable standard is required as specified in §60.5390a(b)(1) or (c)(1).

(2) If you own or operate a pneumatic controller affected facility located at a natural gas processing plant, your pneumatic controller must be driven by a gas other than natural gas, resulting in zero natural gas emissions.

(3) If you own or operate a pneumatic controller affected facility located other than at a natural gas processing plant, the controller manufacturer's design specifications for the controller must indicate that the controller emits less than or equal to 6 standard cubic feet of gas per hour.

(4) You must tag each new pneumatic controller affected facility according to the requirements of §60.5390a(b)(2) or (c)(2).

(5) You must include the information in paragraph (d)(1) of this section and a listing of the pneumatic controller affected facilities specified in paragraphs (d)(2) and (3) of this section in the initial annual report submitted for your pneumatic controller affected facilities constructed, modified or reconstructed during the period covered by the annual report according to the requirements of §60.5420a(b)(1) and (5).

(6) You must maintain the records as specified in §60.5420a(c)(4) for each pneumatic controller affected facility.

(e) To achieve initial compliance with emission standards for your pneumatic pump affected facility you must comply with the requirements specified in paragraphs (e)(1) through (7) of this section, as applicable.

(1) If you own or operate a pneumatic pump affected facility located at a natural gas processing plant, your pneumatic pump must be driven by a gas other than natural gas, resulting in zero natural gas emissions.

(2) If you own or operate a pneumatic pump affected facility not located at a natural gas processing plant, you must reduce emissions in accordance §60.5393a(b)(1) or (b)(2), and you must collect the pneumatic pump emissions through a closed vent system that meets the requirements of §60.5411a(a) and (d).

(3) If you own or operate a pneumatic pump affected facility not located at a natural gas processing plant and there is no control device or process available on site, you must submit the certification in 60.5420a(b)(8)(i)(A).

(4) If you own or operate a pneumatic pump affected facility not located at a natural gas processing plant or a greenfield site, and you are unable to route to an existing control device due to technical infeasibility, and you are unable to route to a process, you must submit the certification in §60.5420a(b)(8)(i)(B).

(5) If you own or operate a pneumatic pump affected facility not located other than at a natural gas processing plant and you reduce emissions in accordance with §60.5393a(b)(4), you must collect the pneumatic pump emissions through a closed vent system that meets the requirements of §60.5411a(c) and (d).

(6) You must submit the initial annual report for your pneumatic pump affected facility required in §60.5420a(b)(1) and (8).

(7) You must maintain the records as specified in §60.5420a(c)(6), (8) through (10), (16), and (17), as applicable, for each pneumatic pump affected facility.

(8) Pneumatic pump affected facilities at a well are not subject to the requirements of (e)(6) and (7) of this section from June 2, 2017, until August 31, 2017.

(f) For affected facilities at onshore natural gas processing plants, initial compliance with the methane and VOC standards is demonstrated if you are in compliance with the requirements of §60.5400a.

(g) For sweetening unit affected facilities at onshore natural gas processing plants, initial compliance is demonstrated according to paragraphs (g)(1) through (3) of this section.

(1) To determine compliance with the standards for SO_2 specified in §60.5405a(a), during the initial performance test as required by §60.8, the minimum required sulfur dioxide emission reduction efficiency (Z_i) is compared to the emission reduction efficiency (R) achieved by the sulfur recovery technology as specified in paragraphs (g)(1)(i) and (ii) of this section.

(i) If $R \geq Z_i$, your affected facility is in compliance.

(ii) If $R < Z_i$, your affected facility is not in compliance.

(2) The emission reduction efficiency (R) achieved by the sulfur reduction technology must be determined using the procedures in §60.5406a(c)(1).

(3) You must submit the results of paragraphs (g)(1) and (2) of this section in the initial annual report submitted for your sweetening unit affected facilities at onshore natural gas processing plants.

(h) For each storage vessel affected facility, you must comply with paragraphs (h)(1) through (6) of this section. You must demonstrate initial compliance by August 2, 2016, or within 60 days after startup, whichever is later.

(1) You must determine the potential VOC emission rate as specified in §60.5365a(e).

(2) You must reduce VOC emissions in accordance with §60.5395a(a).

(3) If you use a control device to reduce emissions, you must equip the storage vessel with a cover that meets the requirements of §60.5411a(b) and is connected through a closed vent system that meets the requirements of §60.5411a(c) and (d) to a control device that meets the conditions specified in §60.5412a(d) within 60 days after startup for storage vessels constructed, modified or reconstructed at well sites with no other wells in production, or upon startup for storage vessels constructed, modified or reconstructed at well sites with one or more wells already in production.

(4) You must conduct an initial performance test as required in §60.5413a within 180 days after initial startup or within 180 days of August 2, 2016, whichever is later, and you must comply with the continuous compliance requirements in §60.5415a(e).

(5) You must submit the information required for your storage vessel affected facility in your initial annual report as specified in §60.5420a(b)(1) and (6).

(6) You must maintain the records required for your storage vessel affected facility, as specified in §60.5420a(c)(5) through (8), (12) through (14), and (17), as applicable, for each storage vessel affected facility.

(i) For each storage vessel affected facility that complies by using a floating roof, you must submit a statement that you are complying with §60.112(b)(a)(1) or (2) in accordance with §60.5395a(b)(2) with the initial annual report specified in §60.5420a(b).

(j) To achieve initial compliance with the fugitive emission standards for each collection of fugitive emissions components at a well site and each collection of fugitive emissions components at a compressor station, you must comply with paragraphs (j)(1) through (5) of this section.

(1) You must develop a fugitive emissions monitoring plan as required in §60.5397a(b)(c), and (d).

(2) You must conduct an initial monitoring survey as required in §60.5397a(f).

(3) You must maintain the records specified in §60.5420a(c)(15).

(4) You must repair each identified source of fugitive emissions for each affected facility as required in §60.5397a(h).

(5) You must submit the initial annual report for each collection of fugitive emissions components at a well site and each collection of fugitive emissions components at a compressor station compressor station as required in §60.5420a(b)(1) and (7).

§60.5411a What additional requirements must I meet to determine initial compliance for my covers and closed vent systems routing emissions from centrifugal compressor wet seal fluid degassing systems, reciprocating compressors, pneumatic pumps and storage vessels?

You must meet the applicable requirements of this section for each cover and closed vent system used to comply with the emission standards for your centrifugal compressor wet seal degassing systems, reciprocating compressors, pneumatic pumps and storage vessels except as provided in paragraph (e) of this section.

(a) Closed vent system requirements for reciprocating compressors, centrifugal compressor wet seal degassing systems and pneumatic pumps.

(1) You must design the closed vent system to route all gases, vapors, and fumes emitted from the reciprocating compressor rod packing emissions collection system, the wet seal fluid degassing system or pneumatic pump to a control device or to a process. For reciprocating and centrifugal compressors, the closed vent system must route all gases, vapors, and fumes to a control device that meets the requirements specified in §60.5412a(a) through (c).

(2) You must design and operate the closed vent system with no detectable emissions as demonstrated by §60.5416a(b).

(3) You must meet the requirements specified in paragraphs (a)(3)(i) and (ii) of this section if the closed vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device.

(i) Except as provided in paragraph (a)(3)(ii) of this section, you must comply with either paragraph (a)(3)(i)(A) or (B) of this section for each bypass device.

(A) You must properly install, calibrate, maintain, and operate a flow indicator at the inlet to the bypass device that could divert the stream away from the control device or process to the atmosphere that is capable of taking periodic readings as specified in §60.5416a(a)(4)(i) and sounds an alarm, or initiates notification via remote alarm to the nearest field office, when the bypass device is open such that the stream is being, or could be, diverted away from the control

device or process to the atmosphere. You must maintain records of each time the alarm is activated according to §60.5420a(c)(8).

(B) You must secure the bypass device valve installed at the inlet to the bypass device in the non-diverting position using a car-seal or a lock-and-key type configuration.

(ii) Low leg drains, high point bleeds, analyzer vents, open-ended valves or lines, and safety devices are not subject to the requirements of paragraph (a)(3)(i) of this section.

(b) Cover requirements for storage vessels and centrifugal compressor wet seal fluid degassing systems.

(1) The cover and all openings on the cover (*e.g.*, access hatches, sampling ports, pressure relief devices and gauge wells) shall form a continuous impermeable barrier over the entire surface area of the liquid in the storage vessel or wet seal fluid degassing system.

(2) Each cover opening shall be secured in a closed, sealed position (*e.g.*, covered by a gasketed lid or cap) whenever material is in the unit on which the cover is installed except during those times when it is necessary to use an opening as follows:

(i) To add material to, or remove material from the unit (this includes openings necessary to equalize or balance the internal pressure of the unit following changes in the level of the material in the unit);

(ii) To inspect or sample the material in the unit;

(iii) To inspect, maintain, repair, or replace equipment located inside the unit; or

(iv) To vent liquids, gases, or fumes from the unit through a closed vent system designed and operated in accordance with the requirements of paragraph (a) or (c), and (d), of this section to a control device or to a process.

(3) Each storage vessel thief hatch shall be equipped, maintained and operated with a weighted mechanism or equivalent, to ensure that the lid remains properly seated and sealed under normal operating conditions, including such times when working, standing/breathing, and flash emissions may be generated. You must select gasket material for the hatch based on composition of the fluid in the storage vessel and weather conditions.

(c) Closed vent system requirements for storage vessel affected facilities using a control device or routing emissions to a process.

(1) You must design the closed vent system to route all gases, vapors, and fumes emitted from the material in the storage vessel to a control device that meets the requirements specified in §60.5412a(c) and (d), or to a process.

(2) You must design and operate a closed vent system with no detectable emissions, as determined using olfactory, visual and auditory inspections.

(3) You must meet the requirements specified in paragraphs (c)(3)(i) and (ii) of this section if the closed vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device or to a process.

(i) Except as provided in paragraph (c)(3)(ii) of this section, you must comply with either paragraph (c)(3)(i)(A) or (B) of this section for each bypass device.

(A) You must properly install, calibrate, maintain, and operate a flow indicator at the inlet to the bypass device that could divert the stream away from the control device or process to the atmosphere that sounds an alarm, or initiates notification via remote alarm to the nearest field office, when the bypass device is open such that the stream is being, or could be, diverted away from the control device or process to the atmosphere. You must maintain records of each time the alarm is activated according to §60.5420a(c)(8).

(B) You must secure the bypass device valve installed at the inlet to the bypass device in the non-diverting position using a car-seal or a lock-and-key type configuration.

(ii) Low leg drains, high point bleeds, analyzer vents, open-ended valves or lines, and safety devices are not subject to the requirements of paragraph (c)(3)(i) of this section.

(d) Closed vent systems requirements for centrifugal compressor wet seal fluid degassing systems, reciprocating compressors, pneumatic pumps and storage vessels using a control device or routing emissions to a process.

(1) You must conduct an assessment that the closed vent system is of sufficient design and capacity to ensure that all emissions from the storage vessel are routed to the control device and that the control device is of sufficient design and capacity to accommodate all emissions from the affected facility and have it certified by a qualified professional engineer in accordance with paragraphs (d)(1)(i) and (ii) of this section.

(i) You must provide the following certification, signed and dated by the qualified professional engineer: “I certify that the closed vent system design and capacity assessment was prepared under my direction or supervision. I further certify that the closed vent system design and capacity assessment was conducted and this report was prepared pursuant to the requirements of subpart OOOOa of 40 CFR part 60. Based on my professional knowledge and experience, and inquiry of personnel involved in the assessment, the certification submitted herein is true, accurate, and complete. I am aware that there are penalties for knowingly submitting false information.”

(ii) The assessment shall be prepared under the direction or supervision of the qualified professional engineer who signs the certification in paragraph (d)(1)(i) of this section.

(2) [Reserved]

(e) Pneumatic pump affected facilities at a well site are not subject to the requirements of paragraph (a) of this section from June 2, 2017, until August 31, 2017.

[81 FR 35898, June 3, 2016, as amended at 82 FR 25733, June 5, 2017]

Back to Top

§60.5412a What additional requirements must I meet for determining initial compliance with control devices used to comply with the emission standards for my centrifugal compressor, and storage vessel affected facilities?

You must meet the applicable requirements of this section for each control device used to comply with the emission standards for your centrifugal compressor affected facility, or storage vessel affected facility.

(a) Each control device used to meet the emission reduction standard in §60.5380a(a)(1) for your centrifugal compressor affected facility must be installed according to paragraphs (a)(1) through (3) of this section. As an alternative, you may install a control device model tested under §60.5413a(d), which meets the criteria in §60.5413a(d)(11) and meet the continuous compliance requirements in §60.5413a(e).

(1) Each combustion device (*e.g.,* thermal vapor incinerator, catalytic vapor incinerator, boiler, or process heater) must be designed and operated in accordance with one of the performance requirements specified in paragraphs (a)(1)(i) through (iv) of this section.

(i) You must reduce the mass content of methane and VOC in the gases vented to the device by 95.0 percent by weight or greater as determined in accordance with the requirements of §60.5413a(b), with the exceptions noted in §60.5413a(a).

(ii) You must reduce the concentration of TOC in the exhaust gases at the outlet to the device to a level equal to or less than 275 parts per million by volume as propane on a wet basis corrected to 3 percent oxygen as determined in accordance with the applicable requirements of §60.5413a(b), with the exceptions noted in §60.5413a(a).

(iii) You must operate at a minimum temperature of 760 °Celsius, provided the control device has demonstrated, during the performance test conducted under §60.5413a(b), that combustion zone temperature is an indicator of destruction efficiency.

(iv) If a boiler or process heater is used as the control device, then you must introduce the vent stream into the flame zone of the boiler or process heater.

(2) Each vapor recovery device (*e.g.*, carbon adsorption system or condenser) or other non-destructive control device must be designed and operated to reduce the mass content of methane and VOC in the gases vented to the device by 95.0 percent by weight or greater as determined in accordance with the requirements of §60.5413a(b). As an alternative to the performance testing requirements, you may demonstrate initial compliance by conducting a design analysis for vapor recovery devices according to the requirements of §60.5413a(c).

(3) You must design and operate a flare in accordance with the requirements of §60.18(b), and you must conduct the compliance determination using Method 22 of appendix A-7 of this part to determine visible emissions.

(b) You must operate each control device installed on your centrifugal compressor affected facility in accordance with the requirements specified in paragraphs (b)(1) and (2) of this section.

(1) You must operate each control device used to comply with this subpart at all times when gases, vapors, and fumes are vented from the wet seal fluid degassing system affected facility as required under §60.5380a(a)(1) through the closed vent system to the control device. You may vent more than one affected facility to a control device used to comply with this subpart.

(2) For each control device monitored in accordance with the requirements of §60.5417a(a) through (g), you must demonstrate compliance according to the requirements of §60.5415a(b)(2), as applicable.

(c) For each carbon adsorption system used as a control device to meet the requirements of paragraph (a)(2) or (d)(2) of this section, you must manage the carbon in accordance with the requirements specified in paragraphs (c)(1) or (2) of this section.

(1) Following the initial startup of the control device, you must replace all carbon in the control device with fresh carbon on a regular, predetermined time interval that is no longer than the carbon service life established according to §60.5413a(c)(2) or (3) or according to the design required in paragraph (d)(2) of this section, for the carbon adsorption system. You must maintain records identifying the schedule for replacement and records of each carbon replacement as required in §60.5420a(c)(10) and (12).

(2) You must either regenerate, reactivate, or burn the spent carbon removed from the carbon adsorption system in one of the units specified in paragraphs (c)(2)(i) through (vi) of this section.

(i) Regenerate or reactivate the spent carbon in a unit for which you have been issued a final permit under 40 CFR part 270 that implements the requirements of 40 CFR part 264, subpart X.

(ii) Regenerate or reactivate the spent carbon in a unit equipped with an operating organic air emission controls in accordance with an emissions standard for VOC under another subpart in 40 CFR part 63 or this part.

(iii) Burn the spent carbon in a hazardous waste incinerator for which the owner or operator complies with the requirements of 40 CFR part 63, subpart EEE and has submitted a Notification of Compliance under 40 CFR 63.1207(j).

(iv) Burn the spent carbon in a hazardous waste boiler or industrial furnace for which the owner or operator complies with the requirements of 40 CFR part 63, subpart EEE and has submitted a Notification of Compliance under 40 CFR 63.1207(j).

(v) Burn the spent carbon in an industrial furnace for which you have been issued a final permit under 40 CFR part 270 that implements the requirements of 40 CFR part 266, subpart H.

(vi) Burn the spent carbon in an industrial furnace that you have designed and operated in accordance with the interim status requirements of 40 CFR part 266, subpart H.

(d) Each control device used to meet the emission reduction standard in §60.5395a(a)(2) for your storage vessel affected facility must be installed according to paragraphs (d)(1) through (4) of this section, as applicable. As an alternative to paragraph (d)(1) of this section, you may install a control device model tested under §60.5413a(d), which meets the criteria in §60.5413a(d)(11) and meet the continuous compliance requirements in §60.5413a(e).

(1) For each combustion control device (*e.g.*, thermal vapor incinerator, catalytic vapor incinerator, boiler, or process heater) you must meet the requirements in paragraphs (d)(1)(i) through (iv) of this section.

(i) Ensure that each enclosed combustion control device is maintained in a leak free condition.

(ii) Install and operate a continuous burning pilot flame.

(iii) Operate the combustion control device with no visible emissions, except for periods not to exceed a total of 1 minute during any 15 minute period. A visible emissions test using section 11 of EPA Method 22 of appendix A-7 of this part must be performed at least once every calendar month, separated by at least 15 days between each test. The observation period shall be 15 minutes. Devices failing the visible emissions test must follow manufacturer's repair instructions, if available, or best combustion engineering practice as outlined in the unit inspection and maintenance plan, to return the unit to compliant operation. All inspection, repair and maintenance activities for each unit must be recorded in a maintenance and repair log and must be available for inspection. Following return to operation from maintenance or repair activity, each device must pass a Method 22 of appendix A-7 of this part visual observation as described in this paragraph.

(iv) Each enclosed combustion control device (*e.g.*, thermal vapor incinerator, catalytic vapor incinerator, boiler, or process heater) must be designed and operated in accordance with one of the performance requirements specified in paragraphs (A) through (D) of this section.

(A) You must reduce the mass content of VOC in the gases vented to the device by 95.0 percent by weight or greater as determined in accordance with the requirements of §60.5413a(b).

(B) You must reduce the concentration of TOC in the exhaust gases at the outlet to the device to a level equal to or less than 275 parts per million by volume as propane on a wet basis corrected to 3 percent oxygen as determined in accordance with the applicable requirements of §60.5413a(b).

(C) You must operate at a minimum temperature of 760 °Celsius, provided the control device has demonstrated, during the performance test conducted under §60.5413a(b), that combustion zone temperature is an indicator of destruction efficiency.

(D) If a boiler or process heater is used as the control device, then you must introduce the vent stream into the flame zone of the boiler or process heater.

(2) Each vapor recovery device (*e.g.*, carbon adsorption system or condenser) or other non-destructive control device must be designed and operated to reduce the mass content of VOC in the gases vented to the device by 95.0 percent by weight or greater. A carbon replacement schedule must be included in the design of the carbon adsorption system.

(3) You must design and operate a flare in accordance with the requirements of §60.18(b), and you must conduct the compliance determination using Method 22 of appendix A-7 of this part to determine visible emissions.

(4) You must operate each control device used to comply with this subpart at all times when gases, vapors, and fumes are vented from the storage vessel affected facility through the closed vent system to the control device. You may vent more than one affected facility to a control device used to comply with this subpart.

Back to Top

§60.5413a What are the performance testing procedures for control devices used to demonstrate compliance at my centrifugal compressor and storage vessel affected facilities?

This section applies to the performance testing of control devices used to demonstrate compliance with the emissions standards for your centrifugal compressor affected facility or storage vessel affected facility. You must demonstrate that a control device achieves the performance requirements of §60.5412a(a)(1) or (2) or (d)(1) or (2) using the performance test methods and procedures specified in this section. For condensers and carbon adsorbers, you may use a design analysis as specified in paragraph (c) of this section in lieu of complying with paragraph (b) of this section. In addition, this section contains the requirements for enclosed combustion control device performance tests conducted by the manufacturer applicable to storage vessel and centrifugal compressor affected facilities.

(a) *Performance test exemptions.* You are exempt from the requirements to conduct performance tests and design analyses if you use any of the control devices described in paragraphs (a)(1) through (7) of this section.

(1) A flare that is designed and operated in accordance with §60.18(b). You must conduct the compliance determination using Method 22 of appendix A-7 of this part to determine visible emissions.

(2) A boiler or process heater with a design heat input capacity of 44 megawatts or greater.

(3) A boiler or process heater into which the vent stream is introduced with the primary fuel or is used as the primary fuel.

(4) A boiler or process heater burning hazardous waste for which you have been issued a final permit under 40 CFR part 270 and comply with the requirements of 40 CFR part 266, subpart H; you have certified compliance with the interim status requirements of 40 CFR part 266, subpart H; you have submitted a Notification of Compliance under 40 CFR 63.1207(j) and comply with the requirements of 40 CFR part 63, subpart EEE; or you comply with 40 CFR part 63, subpart EEE and will submit a Notification of Compliance under 40 CFR 63.1207(j) by the date specified in §60.5420(b)(9) for submitting the initial performance test report.

(5) A hazardous waste incinerator for which you have submitted a Notification of Compliance under 40 CFR 63.1207(j), or for which you will submit a Notification of Compliance under 40 CFR 63.1207(j) by the date specified in §60.5420a(b)(9) for submitting the initial performance test report, and you comply with the requirements of 40 CFR part 63, subpart EEE.

(6) A performance test is waived in accordance with §60.8(b).

(7) A control device whose model can be demonstrated to meet the performance requirements of §60.5412a(a)(1) or (d)(1) through a performance test conducted by the manufacturer, as specified in paragraph (d) of this section.

(b) *Test methods and procedures.* You must use the test methods and procedures specified in paragraphs (b)(1) through (5) of this section, as applicable, for each performance test conducted to demonstrate that a control device meets the requirements of §60.5412a(a)(1) or (2) or (d)(1) or (2). You must conduct the initial and periodic performance tests according to the schedule specified in paragraph (b)(5) of this section. Each performance test must consist of a minimum of 3 test runs. Each run must be at least 1 hour long.

(1) You must use Method 1 or 1A of appendix A-1 of this part, as appropriate, to select the sampling sites specified in paragraphs (b)(1)(i) and (ii) of this section. Any references to particulate mentioned in Methods 1 and 1A do not apply to this section.

(i) Sampling sites must be located at the inlet of the first control device and at the outlet of the final control device to determine compliance with a control device percent reduction requirement.

(ii) The sampling site must be located at the outlet of the combustion device to determine compliance with a TOC exhaust gas concentration limit.

(2) You must determine the gas volumetric flowrate using Method 2, 2A, 2C, or 2D of appendix A-2 of this part, as appropriate.

(3) To determine compliance with the control device percent reduction performance requirement in §60.5412a(a)(1)(i), (a)(2) or (d)(1)(iv)(A), you must use Method 25A of appendix A-7 of this part. You must use Method 4 of appendix A-3 of this part to convert the Method 25A results to a dry basis. You must use the procedures in paragraphs (b)(3)(i) through (iii) of this section to calculate percent reduction efficiency.

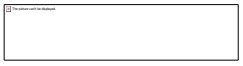
(i) You must compute the mass rate of TOC using the following equations:

$$E_i = K_2 C_i M_p Q_i$$

$$E_o = K_2 C_o M_p Q_o$$

Where:

E_i, E_o = Mass rate of TOC at the inlet and outlet of the control device, respectively, dry basis, kilograms per hour.



K_2 = Constant, 2.494×10^{-6} (parts per million) (gram-mole per standard cubic meter) (kilogram/gram) (minute/hour), where standard temperature (gram-mole per standard cubic meter) is 20 °Celsius.

C_i, C_o = Concentration of TOC, as propane, of the gas stream as measured by Method 25A at the inlet and outlet of the control device, respectively, dry basis, parts per million by volume.

M_p = Molecular weight of propane, 44.1 gram/gram-mole.

Q_i, Q_o = Flowrate of gas stream at the inlet and outlet of the control device, respectively, dry standard cubic meter per minute.

(ii) You must calculate the percent reduction in TOC as follows:

View or download PDF

Where:

R_{cd} = Control efficiency of control device, percent.

E_i, = Mass rate of TOC at the inlet to the control device as calculated under paragraph (b)(3)(i) of this section, kilograms per hour.

E_o = Mass rate of TOC at the outlet of the control device, as calculated under paragraph (b)(3)(i) of this section, kilograms per hour.

(iii) If the vent stream entering a boiler or process heater with a design capacity less than 44 megawatts is introduced with the combustion air or as a secondary fuel, you must determine the weight-percent reduction of total TOC across the device by comparing the TOC in all combusted vent streams and primary and secondary fuels with the TOC exiting the device, respectively.

(4) You must use Method 25A of appendix A-7 of this part to measure TOC, as propane, to determine compliance with the TOC exhaust gas concentration limit specified in §60.5412a(a)(1)(ii) or (d)(1)(iv)(B). You may also use Method 18 of appendix A-6 of this part to measure methane and ethane. You may subtract the measured concentration of methane and ethane from the Method 25A measurement to demonstrate compliance with the concentration limit. You must determine the concentration in parts per million by volume on a wet basis and correct it to 3 percent oxygen, using the procedures in paragraphs (b)(4)(i) through (iii) of this section.

(i) If you use Method 18 to determine methane and ethane, you must take either an integrated sample or a minimum of four grab samples per hour. If grab sampling is used, then the samples must be taken at approximately equal intervals in time, such as 15-minute intervals during the run. You must determine the average methane and ethane concentration per run. The samples must be taken during the same time as the Method 25A sample.

(ii) You may subtract the concentration of methane and ethane from the Method 25A TOC, as propane, concentration for each run.

(iii) You must correct the TOC concentration (minus methane and ethane, if applicable) to 3 percent oxygen as specified in paragraphs (b)(4)(iii)(A) and (B) of this section.

(A) You must use the emission rate correction factor for excess air, integrated sampling and analysis procedures of Method 3A or 3B of appendix A-2 of this part, ASTM D6522-00 (Reapproved 2005), or ANSI/ASME PTC 19.10-1981, Part 10 (manual portion only) (incorporated by reference as specified in §60.17) to determine the oxygen concentration. The samples must be taken during the same time that the samples are taken for determining TOC concentration.

(B) You must correct the TOC concentration for percent oxygen as follows:

View or download PDF

Where:

C_c = TOC concentration, as propane, corrected to 3 percent oxygen, parts per million by volume on a wet basis.

C_m = TOC concentration, as propane, (minus methane and ethane, if applicable), parts per million by volume on a wet basis.

$\%O_{2m}$ = Concentration of oxygen, percent by volume as measured, wet.

(5) You must conduct performance tests according to the schedule specified in paragraphs (b)(5)(i) and (ii) of this section.

(i) You must conduct an initial performance test within 180 days after initial startup for your affected facility. You must submit the performance test results as required in §60.5420a(b)(9).

(ii) You must conduct periodic performance tests for all control devices required to conduct initial performance tests except as specified in paragraphs (b)(5)(ii)(A) and (B) of this section. You must conduct the first periodic performance test no later than 60 months after the initial performance test required in paragraph (b)(5)(i) of this section. You must conduct subsequent periodic performance tests at intervals no longer than 60 months following the previous periodic performance test or whenever you desire to establish a new operating limit. You must submit the periodic performance test results as specified in §60.5420a(b)(9).

(A) A control device whose model is tested under, and meets the criteria of paragraph (d) of this section. For centrifugal compressor affected facilities, if you do not continuously monitor the gas flow rate in accordance with §60.5417a(d)(1)(viii), then you must comply with the periodic performance testing requirements of paragraph (b)(5)(ii).

(B) A combustion control device tested under paragraph (b) of this section that meets the outlet TOC performance level specified in §60.5412a(a)(1)(ii) or (d)(1)(iv)(B) and that establishes a correlation between firebox or combustion chamber temperature and the TOC performance level. For centrifugal compressor affected facilities, you must establish a limit on temperature in accordance with §60.5417a(f) and continuously monitor the temperature as required by §60.5417a(d).

(c) *Control device design analysis to meet the requirements of §60.5412a(a)(2) or (d)(2).* (1) For a condenser, the design analysis must include an analysis of the vent stream composition, constituent concentrations, flowrate, relative humidity and temperature and must establish the design outlet organic compound concentration level, design average temperature of the condenser exhaust vent stream and the design average temperatures of the coolant fluid at the condenser inlet and outlet.

(2) For a regenerable carbon adsorption system, the design analysis shall include the vent stream composition, constituent concentrations, flowrate, relative humidity and temperature and shall establish the design exhaust vent stream organic compound concentration level, adsorption cycle time, number and capacity of carbon beds, type and working capacity of activated carbon used for the carbon beds, design total regeneration stream flow over the period of each complete

carbon bed regeneration cycle, design carbon bed temperature after regeneration, design carbon bed regeneration time and design service life of the carbon.

(3) For a nonregenerable carbon adsorption system, such as a carbon canister, the design analysis shall include the vent stream composition, constituent concentrations, flowrate, relative humidity and temperature and shall establish the design exhaust vent stream organic compound concentration level, capacity of the carbon bed, type and working capacity of activated carbon used for the carbon bed and design carbon replacement interval based on the total carbon working capacity of the control device and source operating schedule. In addition, these systems shall incorporate dual carbon canisters in case of emission breakthrough occurring in one canister.

(4) If you and the Administrator do not agree on a demonstration of control device performance using a design analysis, then you must perform a performance test in accordance with the requirements of paragraph (b) of this section to resolve the disagreement. The Administrator may choose to have an authorized representative observe the performance test.

(d) *Performance testing for combustion control devices—manufacturers' performance test.* (1) This paragraph (d) applies to the performance testing of a combustion control device conducted by the device manufacturer. The manufacturer must demonstrate that a specific model of control device achieves the performance requirements in paragraph (d)(11) of this section by conducting a performance test as specified in paragraphs (d)(2) through (10) of this section. You must submit a test report for each combustion control device in accordance with the requirements in paragraph (d)(12) of this section.

(2) Performance testing must consist of three 1-hour (or longer) test runs for each of the four firing rate settings specified in paragraphs (d)(2)(i) through (iv) of this section, making a total of 12 test runs per test. Propene (propylene) gas must be used for the testing fuel. All fuel analyses must be performed by an independent third-party laboratory (not affiliated with the control device manufacturer or fuel supplier).

(i) 90-100 percent of maximum design rate (fixed rate).

(ii) 70-100-70 percent (ramp up, ramp down). Begin the test at 70 percent of the maximum design rate. During the first 5 minutes, incrementally ramp the firing rate to 100 percent of the maximum design rate. Hold at 100 percent for 5 minutes. In the 10-15 minute time range, incrementally ramp back down to 70 percent of the maximum design rate. Repeat three more times for a total of 60 minutes of sampling.

(iii) 30-70-30 percent (ramp up, ramp down). Begin the test at 30 percent of the maximum design rate. During the first 5 minutes, incrementally ramp the firing rate to 70 percent of the maximum design rate. Hold at 70 percent for 5 minutes. In the 10-15 minute time range, incrementally ramp back down to 30 percent of the maximum design rate. Repeat three more times for a total of 60 minutes of sampling.

(iv) 0-30-0 percent (ramp up, ramp down). Begin the test at the minimum firing rate. During the first 5 minutes, incrementally ramp the firing rate to 30 percent of the maximum design rate. Hold at 30 percent for 5 minutes. In the 10-15 minute time range, incrementally ramp back down to the minimum firing rate. Repeat three more times for a total of 60 minutes of sampling.

(3) All models employing multiple enclosures must be tested simultaneously and with all burners operational. Results must be reported for each enclosure individually and for the average of the emissions from all interconnected combustion enclosures/chambers. Control device operating data must be collected continuously throughout the performance test using an electronic Data Acquisition System. A graphic presentation or strip chart of the control device operating data and emissions test data must be included in the test report in accordance with paragraph (d)(12) of this section. Inlet fuel meter data may be manually recorded provided that all inlet fuel data readings are included in the final report.

(4) Inlet testing must be conducted as specified in paragraphs (d)(4)(i) and (ii) of this section.

(i) The inlet gas flow metering system must be located in accordance with Method 2A of appendix A-1 of this part (or other approved procedure) to measure inlet gas flow rate at the control device inlet location. You must position the fitting for filling fuel sample containers a minimum of eight pipe diameters upstream of any inlet gas flow monitoring meter.

(ii) Inlet flow rate must be determined using Method 2A of appendix A-1 of this part. Record the start and stop reading for each 60-minute THC test. Record the gas pressure and temperature at 5-minute intervals throughout each 60-minute test.

(5) Inlet gas sampling must be conducted as specified in paragraphs (d)(5)(i) and (ii) of this section.

(i) At the inlet gas sampling location, securely connect a Silonite-coated stainless steel evacuated canister fitted with a flow controller sufficient to fill the canister over a 3-hour period. Filling must be conducted as specified in paragraphs (d)(5)(i)(A) through (C) of this section.

(A) Open the canister sampling valve at the beginning of each test run, and close the canister at the end of each test run.

(B) Fill one canister across the three test runs such that one composite fuel sample exists for each test condition.

(C) Label the canisters individually and record sample information on a chain of custody form.

(ii) Analyze each inlet gas sample using the methods in paragraphs (d)(5)(ii)(A) through (C) of this section. You must include the results in the test report required by paragraph (d)(12) of this section.

(A) Hydrocarbon compounds containing between one and five atoms of carbon plus benzene using ASTM D1945-03 (incorporated by reference as specified in §60.17).

(B) Hydrogen (H_2), carbon monoxide (CO), carbon dioxide (CO_2), nitrogen (N_2), oxygen (O_2) using ASTM D1945-03 (incorporated by reference as specified in §60.17).

(C) Higher heating value using ASTM D3588-98 or ASTM D4891-89 (incorporated by reference as specified in §60.17).

(6) Outlet testing must be conducted in accordance with the criteria in paragraphs (d)(6)(i) through (v) of this section.

(i) Sample and flow rate must be measured in accordance with paragraphs (d)(6)(i)(A) and (B) of this section.

(A) The outlet sampling location must be a minimum of four equivalent stack diameters downstream from the highest peak flame or any other flow disturbance, and a minimum of one equivalent stack diameter upstream of the exit or any other flow disturbance. A minimum of two sample ports must be used.

(B) Flow rate must be measured using Method 1 of appendix A-1 of this part for determining flow measurement traverse point location, and Method 2 of appendix A-1 of this part for measuring duct velocity. If low flow conditions are encountered (*i.e.,* velocity pressure differentials less than 0.05 inches of water) during the performance test, a more sensitive manometer must be used to obtain an accurate flow profile.

(ii) Molecular weight and excess air must be determined as specified in paragraph (d)(7) of this section.

(iii) Carbon monoxide must be determined as specified in paragraph (d)(8) of this section.

(iv) THC must be determined as specified in paragraph (d)(9) of this section.

(v) Visible emissions must be determined as specified in paragraph (d)(10) of this section.

(7) Molecular weight and excess air determination must be performed as specified in paragraphs (d)(7)(i) through (iii) of this section.

(i) An integrated bag sample must be collected during the moisture test required by Method 4 of appendix A-3 of this part following the procedure specified in (d)(7)(i)(A) and (B) of this section. Analyze the bag sample using a gas chromatograph-thermal conductivity detector (GC-TCD) analysis meeting the criteria in paragraphs (d)(7)(i)(C) and (D) of this section.

(A) Collect the integrated sample throughout the entire test, and collect representative volumes from each traverse location.

(B) Purge the sampling line with stack gas before opening the valve and beginning to fill the bag. Clearly label each bag and record sample information on a chain of custody form.

(C) The bag contents must be vigorously mixed prior to the gas chromatograph analysis.

(D) The GC-TCD calibration procedure in Method 3C of appendix A-2 of this part must be modified by using EPA Alt-045 as follows: For the initial calibration, triplicate injections of any single concentration must agree within 5 percent of their mean to be valid. The calibration response factor for a single concentration re-check must be within 10 percent of the original calibration response factor for that concentration. If this criterion is not met, repeat the initial calibration using at least three concentration levels.

(ii) Calculate and report the molecular weight of oxygen, carbon dioxide, methane and nitrogen in the integrated bag sample and include in the test report specified in paragraph (d)(12) of this section. Moisture must be determined using Method 4 of appendix A-3 of this part. Traverse both ports with the sampling train required by Method 4 of appendix A-3 of this part during each test run. Ambient air must not be introduced into the integrated bag sample required by Method 3C of appendix A-2 of this part during the port change.

(iii) Excess air must be determined using resultant data from the EPA Method 3C tests and EPA Method 3B of appendix A-2 of this part, equation 3B-1, or ANSI/ASME PTC 19.10-1981, Part 10 (manual portion only) (incorporated by reference as specified in §60.17).

(8) Carbon monoxide must be determined using Method 10 of appendix A-4 of this part. Run the test simultaneously with Method 25A of appendix A-7 of this part using the same sampling points. An instrument range of 0-10 parts per million by volume-dry (ppmvd) is recommended.

(9) Total hydrocarbon determination must be performed as specified by in paragraphs (d)(9)(i) through (vii) of this section.

(i) Conduct THC sampling using Method 25A of appendix A-7 of this part, except that the option for locating the probe in the center 10 percent of the stack is not allowed. The THC probe must be traversed to 16.7 percent, 50 percent, and 83.3 percent of the stack diameter during each test run.

(ii) A valid test must consist of three Method 25A tests, each no less than 60 minutes in duration.

(iii) A 0-10 parts per million by volume-wet (ppmvw) (as propane) measurement range is preferred; as an alternative a 0-30 ppmvw (as carbon) measurement range may be used.

(iv) Calibration gases must be propane in air and be certified through EPA Protocol 1—"EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards," (incorporated by reference as specified in §60.17).

(v) THC measurements must be reported in terms of ppmvw as propane.

(vi) THC results must be corrected to 3 percent CO_2, as measured by Method 3C of appendix A-2 of this part. You must use the following equation for this diluent concentration correction:

View or download PDF

Where:

C_{meas} = The measured concentration of the pollutant.

CO_{2meas} = The measured concentration of the CO_2 diluent.

3 = The corrected reference concentration of CO_2 diluent.

C_{corr} = The corrected concentration of the pollutant.

(vii) Subtraction of methane or ethane from the THC data is not allowed in determining results.

(10) Visible emissions must be determined using Method 22 of appendix A-7 of this part. The test must be performed continuously during each test run. A digital color photograph of the exhaust point, taken from the position of the observer and annotated with date and time, must be taken once per test run and the 12 photos included in the test report specified in paragraph (d)(12) of this section.

(11) *Performance test criteria.* (i) The control device model tested must meet the criteria in paragraphs (d)(11)(i)(A) through (D) of this section. These criteria must be reported in the test report required by paragraph (d)(12) of this section.

(A) Results from Method 22 of appendix A-7 of this part determined under paragraph (d)(10) of this section with no indication of visible emissions.

(B) Average results from Method 25A of appendix A-7 of this part determined under paragraph (d)(9) of this section equal to or less than 10.0 ppmvw THC as propane corrected to 3.0 percent CO_2.

(C) Average CO emissions determined under paragraph (d)(8) of this section equal to or less than 10 parts ppmvd, corrected to 3.0 percent CO_2.

(D) Excess air determined under paragraph (d)(7) of this section equal to or greater than 150 percent.

(ii) The manufacturer must determine a maximum inlet gas flow rate which must not be exceeded for each control device model to achieve the criteria in paragraph (d)(11)(iii) of this section. The maximum inlet gas flow rate must be included in the test report required by paragraph (d)(12) of this section.

(iii) A manufacturer must demonstrate a destruction efficiency of at least 95 percent for THC, as propane. A control device model that demonstrates a destruction efficiency of 95 percent for

THC, as propane, will meet the control requirement for 95 percent destruction of VOC and methane (if applicable) required under this subpart.

(12) The owner or operator of a combustion control device model tested under this paragraph must submit the information listed in paragraphs (d)(12)(i) through (vi) of this section in the test report required by this section in accordance with §60.5420a(b)(10). Owners or operators who claim that any of the performance test information being submitted is confidential business information (CBI) must submit a complete file including information claimed to be CBI, on a compact disc, flash drive, or other commonly used electronic storage media to the EPA. The electronic media must be clearly marked as CBI and mailed to Attn: CBI Document Control Officer; Office of Air Quality Planning and Standards (OAQPS) CBIO Room 521; 109 T.W. Alexander Drive; RTP, NC 27711. The same file with the CBI omitted must be submitted to *Oil____and____Gas____PT@EPA.GOV*.

(i) A full schematic of the control device and dimensions of the device components.

(ii) The maximum net heating value of the device.

(iii) The test fuel gas flow range (in both mass and volume). Include the maximum allowable inlet gas flow rate.

(iv) The air/stream injection/assist ranges, if used.

(v) The test conditions listed in paragraphs (d)(12)(v)(A) through (O) of this section, as applicable for the tested model.

(A) Fuel gas delivery pressure and temperature.

(B) Fuel gas moisture range.

(C) Purge gas usage range.

(D) Condensate (liquid fuel) separation range.

(E) Combustion zone temperature range. This is required for all devices that measure this parameter.

(F) Excess air range.

(G) Flame arrestor(s).

(H) Burner manifold.

(I) Pilot flame indicator.

(J) Pilot flame design fuel and calculated or measured fuel usage.

(K) Tip velocity range.

(L) Momentum flux ratio.

(M) Exit temperature range.

(N) Exit flow rate.

(O) Wind velocity and direction.

(vi) The test report must include all calibration quality assurance/quality control data, calibration gas values, gas cylinder certification, strip charts, or other graphic presentations of the data annotated with test times and calibration values.

(e) *Continuous compliance for combustion control devices tested by the manufacturer in accordance with paragraph (d) of this section.* This paragraph (e) applies to the demonstration of compliance for a combustion control device tested under the provisions in paragraph (d) of this section. Owners or operators must demonstrate that a control device achieves the performance criteria in paragraph (d)(11) of this section by installing a device tested under paragraph (d) of this section, complying with the criteria specified in paragraphs (e)(1) through (8) of this section, maintaining the records specified in §60.5420a(c)(2) or (c)(5)(vi) and submitting the report specified in §60.5420a(b)(10).

(1) The inlet gas flow rate must be equal to or less than the maximum specified by the manufacturer.

(2) A pilot flame must be present at all times of operation.

(3) Devices must be operated with no visible emissions, except for periods not to exceed a total of 1 minute during any 15-minute period. A visible emissions test conducted according to section 11 of EPA Method 22 of appendix A-7 of this part must be performed at least once every calendar month, separated by at least 15 days between each test. The observation period shall be 15 minutes.

(4) Devices failing the visible emissions test must follow manufacturer's repair instructions, if available, or best combustion engineering practice as outlined in the unit inspection and maintenance plan, to return the unit to compliant operation. All repairs and maintenance activities for each unit must be recorded in a maintenance and repair log and must be available for inspection.

(5) Following return to operation from maintenance or repair activity, each device must pass a visual observation according to EPA Method 22 of appendix A-7 of this part as described in paragraph (e)(3) of this section.

(6) If the owner or operator operates a combustion control device model tested under this section, an electronic copy of the performance test results required by this section shall be submitted via

email to *Oil____and____Gas____PT@EPA.GOV* unless the test results for that model of combustion control device are posted at the following Web site: *epa.gov/airquality/oilandgas/*.

(7) Ensure that each enclosed combustion control device is maintained in a leak free condition.

(8) Operate each control device following the manufacturer's written operating instructions, procedures and maintenance schedule to ensure good air pollution control practices for minimizing emissions.

Back to Top

§60.5415a How do I demonstrate continuous compliance with the standards for my well, centrifugal compressor, reciprocating compressor, pneumatic controller, pneumatic pump, storage vessel, collection of fugitive emissions components at a well site, and collection of fugitive emissions components at a compressor station affected facilities, and affected facilities at onshore natural gas processing plants?

(a) For each well affected facility, you must demonstrate continuous compliance by submitting the reports required by §60.5420a(b)(1) and (2) and maintaining the records for each completion operation specified in §60.5420a(c)(1).

(b) For each centrifugal compressor affected facility and each pneumatic pump affected facility, you must demonstrate continuous compliance according to paragraph (b)(3) of this section except as provided in paragraph (b)(4) of this section. For each centrifugal compressor affected facility, you also must demonstrate continuous compliance according to paragraphs (b)(1) and (2) of this section.

(1) You must reduce methane and VOC emissions from the wet seal fluid degassing system by 95.0 percent or greater.

(2) For each control device used to reduce emissions, you must demonstrate continuous compliance with the performance requirements of §60.5412a(a) using the procedures specified in paragraphs (b)(2)(i) through (vii) of this section. If you use a condenser as the control device to achieve the requirements specified in §60.5412a(a)(2), you may demonstrate compliance according to paragraph (b)(2)(viii) of this section. You may switch between compliance with paragraphs (b)(2)(i) through (vii) of this section and compliance with paragraph (b)(2)(viii) of this section only after at least 1 year of operation in compliance with the selected approach. You must provide notification of such a change in the compliance method in the next annual report, following the change.

(i) You must operate below (or above) the site specific maximum (or minimum) parameter value established according to the requirements of §60.5417a(f)(1).

(ii) You must calculate the daily average of the applicable monitored parameter in accordance with §60.5417a(e) except that the inlet gas flow rate to the control device must not be averaged.

(iii) Compliance with the operating parameter limit is achieved when the daily average of the monitoring parameter value calculated under paragraph (b)(2)(ii) of this section is either equal to or greater than the minimum monitoring value or equal to or less than the maximum monitoring value established under paragraph (b)(2)(i) of this section. When performance testing of a combustion control device is conducted by the device manufacturer as specified in §60.5413a(d), compliance with the operating parameter limit is achieved when the criteria in §60.5413a(e) are met.

(iv) You must operate the continuous monitoring system required in §60.5417a(a) at all times the affected source is operating, except for periods of monitoring system malfunctions, repairs associated with monitoring system malfunctions and required monitoring system quality assurance or quality control activities (including, as applicable, system accuracy audits and required zero and span adjustments). A monitoring system malfunction is any sudden, infrequent, not reasonably preventable failure of the monitoring system to provide valid data. Monitoring system failures that are caused in part by poor maintenance or careless operation are not malfunctions. You are required to complete monitoring system repairs in response to monitoring system malfunctions and to return the monitoring system to operation as expeditiously as practicable.

(v) You may not use data recorded during monitoring system malfunctions, repairs associated with monitoring system malfunctions, or required monitoring system quality assurance or control activities in calculations used to report emissions or operating levels. You must use all the data collected during all other required data collection periods to assess the operation of the control device and associated control system.

(vi) Failure to collect required data is a deviation of the monitoring requirements, except for periods of monitoring system malfunctions, repairs associated with monitoring system malfunctions and required quality monitoring system quality assurance or quality control activities (including, as applicable, system accuracy audits and required zero and span adjustments).

(vii) If you use a combustion control device to meet the requirements of §60.5412a(a)(1) and you demonstrate compliance using the test procedures specified in §60.5413a(b), or you use a flare designed and operated in accordance with §60.18(b), you must comply with paragraphs (b)(2)(vii)(A) through (D) of this section.

(A) A pilot flame must be present at all times of operation.

(B) Devices must be operated with no visible emissions, except for periods not to exceed a total of 1 minute during any 15-minute period. A visible emissions test conducted according to section

11 of EPA Method 22, 40 CFR part 60, appendix A, must be performed at least once every calendar month, separated by at least 15 days between each test. The observation period shall be 15 minutes.

(C) Devices failing the visible emissions test must follow manufacturer's repair instructions, if available, or best combustion engineering practice as outlined in the unit inspection and maintenance plan, to return the unit to compliant operation. All repairs and maintenance activities for each unit must be recorded in a maintenance and repair log and must be available for inspection.

(D) Following return to operation from maintenance or repair activity, each device must pass a Method 22 of appendix A-7 of this part visual observation as described in paragraph (b)(2)(vii)(B) of this section.

(viii) If you use a condenser as the control device to achieve the percent reduction performance requirements specified in §60.5412a(a)(2), you must demonstrate compliance using the procedures in paragraphs (b)(2)(viii)(A) through (E) of this section.

(A) You must establish a site-specific condenser performance curve according to §60.5417a(f)(2).

(B) You must calculate the daily average condenser outlet temperature in accordance with §60.5417a(e).

(C) You must determine the condenser efficiency for the current operating day using the daily average condenser outlet temperature calculated under paragraph (b)(2)(viii)(B) of this section and the condenser performance curve established under paragraph (b)(2)(viii)(A) of this section.

(D) Except as provided in paragraphs (b)(2)(viii)(D)(*1*) and (*2*) of this section, at the end of each operating day, you must calculate the 365-day rolling average TOC emission reduction, as appropriate, from the condenser efficiencies as determined in paragraph (b)(2)(viii)(C) of this section.

(*1*) After the compliance dates specified in §60.5370a(a), if you have less than 120 days of data for determining average TOC emission reduction, you must calculate the average TOC emission reduction for the first 120 days of operation after the compliance date. You have demonstrated compliance with the overall 95.0 percent reduction requirement if the 120-day average TOC emission reduction is equal to or greater than 95.0 percent.

(*2*) After 120 days and no more than 364 days of operation after the compliance date specified in §60.5370a(a), you must calculate the average TOC emission reduction as the TOC emission reduction averaged over the number of days between the current day and the applicable compliance date. You have demonstrated compliance with the overall 95.0 percent reduction requirement if the average TOC emission reduction is equal to or greater than 95.0 percent.

(E) If you have data for 365 days or more of operation, you have demonstrated compliance with the TOC emission reduction if the rolling 365-day average TOC emission reduction calculated in paragraph (b)(2)(viii)(D) of this section is equal to or greater than 95.0 percent.

(3) You must submit the annual reports required by 60.5420a(b)(1) and (3) and maintain the records as specified in §60.5420a(c)(2), (6) through (11), and (17), as applicable.

(4) Pneumatic pump affected facilities at a well site are not subject to the requirements of paragraphs (b)(3) of this section from June 2, 2017, until August 31, 2017.

(c) For each reciprocating compressor affected facility complying with §60.5385a(a)(1) or (2), you must demonstrate continuous compliance according to paragraphs (c)(1) through (3) of this section. For each reciprocating compressor affected facility complying with §60.5385a(a)(3), you must demonstrate continuous compliance according to paragraph (c)(4) of this section.

(1) You must continuously monitor the number of hours of operation for each reciprocating compressor affected facility or track the number of months since initial startup or the date of the most recent reciprocating compressor rod packing replacement, whichever is later.

(2) You must submit the annual reports as required in §60.5420a(b)(1) and (4) and maintain records as required in §60.5420a(c)(3).

(3) You must replace the reciprocating compressor rod packing on or before the total number of hours of operation reaches 26,000 hours or the number of months since the most recent rod packing replacement reaches 36 months.

(4) You must operate the rod packing emissions collection system under negative pressure and continuously comply with the cover and closed vent requirements in §60.5416a(a) and (b).

(d) For each pneumatic controller affected facility, you must demonstrate continuous compliance according to paragraphs (d)(1) through (3) of this section.

(1) You must continuously operate the pneumatic controllers as required in §60.5390a(a), (b), or (c).

(2) You must submit the annual reports as required in §60.5420a(b)(1) and (5).

(3) You must maintain records as required in §60.5420a(c)(4).

(e) You must demonstrate continuous compliance according to paragraph (e)(3) of this section for each storage vessel affected facility, for which you are using a control device or routing emissions to a process to meet the requirement of §60.5395a(a)(2).

(1)-(2) [Reserved]

(3) For each storage vessel affected facility, you must comply with paragraphs (e)(3)(i) and (ii) of this section.

(i) You must reduce VOC emissions as specified in §60.5395a(a)(2).

(ii) For each control device installed to meet the requirements of §60.5395a(a)(2), you must demonstrate continuous compliance with the performance requirements of §60.5412a(d) for each storage vessel affected facility using the procedure specified in paragraph (e)(3)(ii)(A) and either (e)(3)(ii)(B) or (e)(3)(ii)(C) of this section.

(A) You must comply with §60.5416a(c) for each cover and closed vent system.

(B) You must comply with §60.5417a(h) for each control device.

(C) Each closed vent system that routes emissions to a process must be operated as specified in §60.5411a(c)(2) and (3).

(f) For affected facilities at onshore natural gas processing plants, continuous compliance with methane and VOC requirements is demonstrated if you are in compliance with the requirements of §60.5400a.

(g) For each sweetening unit affected facility at onshore natural gas processing plants, you must demonstrate continuous compliance with the standards for SO_2 specified in §60.5405a(b) according to paragraphs (g)(1) and (2) of this section.

(1) The minimum required SO_2 emission reduction efficiency (Z_c) is compared to the emission reduction efficiency (R) achieved by the sulfur recovery technology.

(i) If $R \geq Z_c$, your affected facility is in compliance.

(ii) If $R < Z_c$, your affected facility is not in compliance.

(2) The emission reduction efficiency (R) achieved by the sulfur reduction technology must be determined using the procedures in §60.5406a(c)(1).

(h) For each collection of fugitive emissions components at a well site and each collection of fugitive emissions components at a compressor station, you must demonstrate continuous compliance with the fugitive emission standards specified in §60.5397a according to paragraphs (h)(1) through (4) of this section.

(1) You must conduct periodic monitoring surveys as required in §60.5397a(g).

(2) You must repair or replace each identified source of fugitive emissions as required in §60.5397a(h).

(3) You must maintain records as specified in §60.5420a(c)(15).

(4) You must submit annual reports for collection of fugitive emissions components at a well site and each collection of fugitive emissions components at a compressor station as required in §60.5420a(b)(1) and (7).

[81 FR 35898, June 3, 2016, as amended at 82 FR 25733, June 5, 2017]

Back to Top

§60.5416a What are the initial and continuous cover and closed vent system inspection and monitoring requirements for my centrifugal compressor, reciprocating compressor, pneumatic pump, and storage vessel affected facilities?

For each closed vent system or cover at your storage vessel, centrifugal compressor, reciprocating compressor and pneumatic pump affected facilities, you must comply with the applicable requirements of paragraphs (a) through (c) of this section, except as provided in paragraph (d) of this section.

(a) Inspections for closed vent systems and covers installed on each centrifugal compressor, reciprocating compressor or pneumatic pump affected facility. Except as provided in paragraphs (b)(11) and (12) of this section, you must inspect each closed vent system according to the procedures and schedule specified in paragraphs (a)(1) and (2) of this section, inspect each cover according to the procedures and schedule specified in paragraph (a)(3) of this section, and inspect each bypass device according to the procedures of paragraph (a)(4) of this section.

(1) For each closed vent system joint, seam, or other connection that is permanently or semi-permanently sealed (e.g., a welded joint between two sections of hard piping or a bolted and gasketed ducting flange), you must meet the requirements specified in paragraphs (a)(1)(i) and (ii) of this section.

(i) Conduct an initial inspection according to the test methods and procedures specified in paragraph (b) of this section to demonstrate that the closed vent system operates with no detectable emissions. You must maintain records of the inspection results as specified in §60.5420a(c)(6).

(ii) Conduct annual visual inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in piping; loose connections; liquid leaks; or broken or missing caps or other closure devices. You must monitor a component or connection using the test methods and procedures in paragraph (b) of this section to demonstrate that it operates with no detectable emissions following any time the component is repaired or replaced or the connection is unsealed. You must maintain records of the inspection results as specified in §60.5420a(c)(6).

(2) For closed vent system components other than those specified in paragraph (a)(1) of this section, you must meet the requirements of paragraphs (a)(2)(i) through (iii) of this section.

(i) Conduct an initial inspection according to the test methods and procedures specified in paragraph (b) of this section to demonstrate that the closed vent system operates with no detectable emissions. You must maintain records of the inspection results as specified in §60.5420a(c)(6).

(ii) Conduct annual inspections according to the test methods and procedures specified in paragraph (b) of this section to demonstrate that the components or connections operate with no detectable emissions. You must maintain records of the inspection results as specified in §60.5420a(c)(6).

(iii) Conduct annual visual inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in ductwork; loose connections; liquid leaks; or broken or missing caps or other closure devices. You must maintain records of the inspection results as specified in §60.5420a(c)(6).

(3) For each cover, you must meet the requirements in paragraphs (a)(3)(i) and (ii) of this section.

(i) Conduct visual inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the cover, or between the cover and the separator wall; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices. In the case where the storage vessel is buried partially or entirely underground, you must inspect only those portions of the cover that extend to or above the ground surface, and those connections that are on such portions of the cover (*e.g.,* fill ports, access hatches, gauge wells, etc.) and can be opened to the atmosphere.

(ii) You must initially conduct the inspections specified in paragraph (a)(3)(i) of this section following the installation of the cover. Thereafter, you must perform the inspection at least once every calendar year, except as provided in paragraphs (b)(11) and (12) of this section. You must maintain records of the inspection results as specified in §60.5420a(c)(7).

(4) For each bypass device, except as provided for in §60.5411a(c)(3)(ii), you must meet the requirements of paragraphs (a)(4)(i) or (ii) of this section.

(i) Set the flow indicator to take a reading at least once every 15 minutes at the inlet to the bypass device that could divert the steam away from the control device to the atmosphere.

(ii) If the bypass device valve installed at the inlet to the bypass device is secured in the non-diverting position using a car-seal or a lock-and-key type configuration, visually inspect the seal or closure mechanism at least once every month to verify that the valve is maintained in the non-diverting position and the vent stream is not diverted through the bypass device. You must maintain records of the inspections according to §60.5420a(c)(8).

(b) No detectable emissions test methods and procedures. If you are required to conduct an inspection of a closed vent system or cover at your centrifugal compressor, reciprocating compressor, or pneumatic pump affected facility as specified in paragraphs (a)(1), (2), or (3) of this section, you must meet the requirements of paragraphs (b)(1) through (13) of this section.

(1) You must conduct the no detectable emissions test procedure in accordance with Method 21 of appendix A-7 of this part.

(2) The detection instrument must meet the performance criteria of Method 21 of appendix A-7 of this part, except that the instrument response factor criteria in section 8.1.1 of Method 21 must be for the average composition of the fluid and not for each individual organic compound in the stream.

(3) You must calibrate the detection instrument before use on each day of its use by the procedures specified in Method 21 of appendix A-7 of this part.

(4) Calibration gases must be as specified in paragraphs (b)(4)(i) and (ii) of this section.

(i) Zero air (less than 10 parts per million by volume hydrocarbon in air).

(ii) A mixture of methane in air at a concentration less than 10,000 parts per million by volume.

(5) You may choose to adjust or not adjust the detection instrument readings to account for the background organic concentration level. If you choose to adjust the instrument readings for the background level, you must determine the background level value according to the procedures in Method 21 of appendix A-7 of this part.

(6) Your detection instrument must meet the performance criteria specified in paragraphs (b)(6)(i) and (ii) of this section.

(i) Except as provided in paragraph (b)(6)(ii) of this section, the detection instrument must meet the performance criteria of Method 21 of appendix A-7 of this part, except the instrument response factor criteria in section 8.1.1 of Method 21 must be for the average composition of the process fluid, not each individual volatile organic compound in the stream. For process streams that contain nitrogen, air, or other inerts that are not organic hazardous air pollutants or volatile organic compounds, you must calculate the average stream response factor on an inert-free basis.

(ii) If no instrument is available that will meet the performance criteria specified in paragraph (b)(6)(i) of this section, you may adjust the instrument readings by multiplying by the average response factor of the process fluid, calculated on an inert-free basis, as described in paragraph (b)(6)(i) of this section.

(7) You must determine if a potential leak interface operates with no detectable emissions using the applicable procedure specified in paragraph (b)(7)(i) or (ii) of this section.

(i) If you choose not to adjust the detection instrument readings for the background organic concentration level, then you must directly compare the maximum organic concentration value measured by the detection instrument to the applicable value for the potential leak interface as specified in paragraph (b)(8) of this section.

(ii) If you choose to adjust the detection instrument readings for the background organic concentration level, you must compare the value of the arithmetic difference between the maximum organic concentration value measured by the instrument and the background organic concentration value as determined in paragraph (b)(5) of this section with the applicable value for the potential leak interface as specified in paragraph (b)(8) of this section.

(8) A potential leak interface is determined to operate with no detectable organic emissions if the organic concentration value determined in paragraph (b)(7) of this section is less than 500 parts per million by volume.

(9) *Repairs.* In the event that a leak or defect is detected, you must repair the leak or defect as soon as practicable according to the requirements of paragraphs (b)(9)(i) and (ii) of this section, except as provided in paragraph (b)(10) of this section.

(i) A first attempt at repair must be made no later than 5 calendar days after the leak is detected.

(ii) Repair must be completed no later than 15 calendar days after the leak is detected.

(10) *Delay of repair.* Delay of repair of a closed vent system or cover for which leaks or defects have been detected is allowed if the repair is technically infeasible without a shutdown, or if you determine that emissions resulting from immediate repair would be greater than the fugitive emissions likely to result from delay of repair. You must complete repair of such equipment by the end of the next shutdown.

(11) *Unsafe to inspect requirements.* You may designate any parts of the closed vent system or cover as unsafe to inspect if the requirements in paragraphs (b)(11)(i) and (ii) of this section are met. Unsafe to inspect parts are exempt from the inspection requirements of paragraphs (a)(1) through (3) of this section.

(i) You determine that the equipment is unsafe to inspect because inspecting personnel would be exposed to an imminent or potential danger as a consequence of complying with paragraphs (a)(1), (2), or (3) of this section.

(ii) You have a written plan that requires inspection of the equipment as frequently as practicable during safe-to-inspect times.

(12) *Difficult to inspect requirements.* You may designate any parts of the closed vent system or cover as difficult to inspect, if the requirements in paragraphs (b)(12)(i) and (ii) of this section are met. Difficult to inspect parts are exempt from the inspection requirements of paragraphs (a)(1) through (3) of this section.

(i) You determine that the equipment cannot be inspected without elevating the inspecting personnel more than 2 meters above a support surface.

(ii) You have a written plan that requires inspection of the equipment at least once every 5 years.

(13) *Records.* Records shall be maintained as specified in this section and in §60.5420a(c)(9).

(c) *Cover and closed vent system inspections for storage vessel affected facilities.* If you install a control device or route emissions to a process, you must inspect each closed vent system according to the procedures and schedule specified in paragraphs (c)(1) of this section, inspect each cover according to the procedures and schedule specified in paragraph (c)(2) of this section, and inspect each bypass device according to the procedures of paragraph (c)(3) of this section. You must also comply with the requirements of (c)(4) through (7) of this section.

(1) For each closed vent system, you must conduct an inspection at least once every calendar month as specified in paragraphs (c)(1)(i) through (iii) of this section.

(i) You must maintain records of the inspection results as specified in §60.5420a(c)(6).

(ii) Conduct olfactory, visual and auditory inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in piping; loose connections; liquid leaks; or broken or missing caps or other closure devices.

(iii) Monthly inspections must be separated by at least 14 calendar days.

(2) For each cover, you must conduct inspections at least once every calendar month as specified in paragraphs (c)(2)(i) through (iii) of this section.

(i) You must maintain records of the inspection results as specified in §60.5420a(c)(7).

(ii) Conduct olfactory, visual and auditory inspections for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps in the cover, or between the cover and the separator wall; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices. In the case where the storage vessel is buried partially or entirely underground, you must inspect only those portions of the cover that extend to or above the ground surface, and those connections that are on such portions of the cover (e.g., fill ports, access hatches, gauge wells, etc.) and can be opened to the atmosphere.

(iii) Monthly inspections must be separated by at least 14 calendar days.

(3) For each bypass device, except as provided for in §60.5411a(c)(3)(ii), you must meet the requirements of paragraphs (c)(3)(i) or (ii) of this section.

(i) You must properly install, calibrate and maintain a flow indicator at the inlet to the bypass device that could divert the stream away from the control device or process to the atmosphere.

Set the flow indicator to trigger an audible alarm, or initiate notification via remote alarm to the nearest field office, when the bypass device is open such that the stream is being, or could be, diverted away from the control device or process to the atmosphere. You must maintain records of each time the alarm is sounded according to §60.5420a(c)(8).

(ii) If the bypass device valve installed at the inlet to the bypass device is secured in the non-diverting position using a car-seal or a lock-and-key type configuration, visually inspect the seal or closure mechanism at least once every month to verify that the valve is maintained in the non-diverting position and the vent stream is not diverted through the bypass device. You must maintain records of the inspections and records of each time the key is checked out, if applicable, according to §60.5420a(c)(8).

(4) *Repairs.* In the event that a leak or defect is detected, you must repair the leak or defect as soon as practicable according to the requirements of paragraphs (c)(4)(i) through (iii) of this section, except as provided in paragraph (c)(5) of this section.

(i) A first attempt at repair must be made no later than 5 calendar days after the leak is detected.

(ii) Repair must be completed no later than 30 calendar days after the leak is detected.

(iii) Grease or another applicable substance must be applied to deteriorating or cracked gaskets to improve the seal while awaiting repair.

(5) *Delay of repair.* Delay of repair of a closed vent system or cover for which leaks or defects have been detected is allowed if the repair is technically infeasible without a shutdown, or if you determine that emissions resulting from immediate repair would be greater than the fugitive emissions likely to result from delay of repair. You must complete repair of such equipment by the end of the next shutdown.

(6) *Unsafe to inspect requirements.* You may designate any parts of the closed vent system or cover as unsafe to inspect if the requirements in paragraphs (c)(6)(i) and (ii) of this section are met. Unsafe to inspect parts are exempt from the inspection requirements of paragraphs (c)(1) and (2) of this section.

(i) You determine that the equipment is unsafe to inspect because inspecting personnel would be exposed to an imminent or potential danger as a consequence of complying with paragraphs (c)(1) or (2) of this section.

(ii) You have a written plan that requires inspection of the equipment as frequently as practicable during safe-to-inspect times.

(7) *Difficult to inspect requirements.* You may designate any parts of the closed vent system or cover as difficult to inspect, if the requirements in paragraphs (c)(7)(i) and (ii) of this section are met. Difficult to inspect parts are exempt from the inspection requirements of paragraphs (c)(1) and (2) of this section.

(i) You determine that the equipment cannot be inspected without elevating the inspecting personnel more than 2 meters above a support surface.

(ii) You have a written plan that requires inspection of the equipment at least once every 5 years.

(d) Pneumatic pump affected facilities at a well site are not subject to the requirements of paragraphs (a) and (b) of this section from June 2, 2017, until August 31, 2017.

[81 FR 35898, June 3, 2016, as amended at 82 FR 25733, June 5, 2017]

Back to Top

§60.5417a What are the continuous control device monitoring requirements for my centrifugal compressor and storage vessel affected facilities?

You must meet the applicable requirements of this section to demonstrate continuous compliance for each control device used to meet emission standards for your storage vessel or centrifugal compressor affected facility.

(a) For each control device used to comply with the emission reduction standard for centrifugal compressor affected facilities in §60.5380a(a)(1), you must install and operate a continuous parameter monitoring system for each control device as specified in paragraphs (c) through (g) of this section, except as provided for in paragraph (b) of this section. If you install and operate a flare in accordance with §60.5412a(a)(3), you are exempt from the requirements of paragraphs (e) and (f) of this section. If you install and operate an enclosed combustion device which is not specifically listed in paragraph (d) of this section, you must demonstrate continuous compliance according to paragraphs (h)(1) through (h)(4) of this section.

(b) You are exempt from the monitoring requirements specified in paragraphs (c) through (g) of this section for the control devices listed in paragraphs (b)(1) and (2) of this section.

(1) A boiler or process heater in which all vent streams are introduced with the primary fuel or are used as the primary fuel.

(2) A boiler or process heater with a design heat input capacity equal to or greater than 44 megawatts.

(c) If you are required to install a continuous parameter monitoring system, you must meet the specifications and requirements in paragraphs (c)(1) through (4) of this section.

(1) Each continuous parameter monitoring system must measure data values at least once every hour and record the parameters in paragraphs (c)(1)(i) or (ii) of this section.

(i) Each measured data value.

(ii) Each block average value for each 1-hour period or shorter periods calculated from all measured data values during each period. If values are measured more frequently than once per minute, a single value for each minute may be used to calculate the hourly (or shorter period) block average instead of all measured values.

(2) You must prepare a site-specific monitoring plan that addresses the monitoring system design, data collection, and the quality assurance and quality control elements outlined in paragraphs (c)(2)(i) through (v) of this section. You must install, calibrate, operate, and maintain each continuous parameter monitoring system in accordance with the procedures in your approved site-specific monitoring plan. Heat sensing monitoring devices that indicate the continuous ignition of a pilot flame are exempt from the calibration, quality assurance and quality control requirements in this section.

(i) The performance criteria and design specifications for the monitoring system equipment, including the sample interface, detector signal analyzer, and data acquisition and calculations.

(ii) Sampling interface (e.g., thermocouple) location such that the monitoring system will provide representative measurements.

(iii) Equipment performance checks, system accuracy audits, or other audit procedures.

(iv) Ongoing operation and maintenance procedures in accordance with provisions in §60.13(b).

(v) Ongoing reporting and recordkeeping procedures in accordance with provisions in §60.7(c), (d), and (f).

(3) You must conduct the continuous parameter monitoring system equipment performance checks, system accuracy audits, or other audit procedures specified in the site-specific monitoring plan at least once every 12 months.

(4) You must conduct a performance evaluation of each continuous parameter monitoring system in accordance with the site-specific monitoring plan. Heat sensing monitoring devices that indicate the continuous ignition a pilot flame are exempt from the calibration, quality assurance and quality control requirements in this section.

(d) You must install, calibrate, operate, and maintain a device equipped with a continuous recorder to measure the values of operating parameters appropriate for the control device as specified in paragraph (d)(1), (2), or (3) of this section.

(1) A continuous monitoring system that measures the operating parameters in paragraphs (d)(1)(i) through (viii) of this section, as applicable.

(i) For a thermal vapor incinerator that demonstrates during the performance test conducted under §60.5413a(b) that combustion zone temperature is an accurate indicator of performance, a

temperature monitoring device equipped with a continuous recorder. The monitoring device must have a minimum accuracy of ±1 percent of the temperature being monitored in °Celsius, or ±2.5 °Celsius, whichever value is greater. You must install the temperature sensor at a location representative of the combustion zone temperature.

(ii) For a catalytic vapor incinerator, a temperature monitoring device equipped with a continuous recorder. The device must be capable of monitoring temperature at two locations and have a minimum accuracy of ±1 percent of the temperature being monitored in °Celsius, or ±2.5 °Celsius, whichever value is greater. You must install one temperature sensor in the vent stream at the nearest feasible point to the catalyst bed inlet, and you must install a second temperature sensor in the vent stream at the nearest feasible point to the catalyst bed outlet.

(iii) For a flare, a heat sensing monitoring device equipped with a continuous recorder that indicates the continuous ignition of the pilot flame. The heat sensing monitoring device is exempt from the calibration requirements of this section.

(iv) For a boiler or process heater, a temperature monitoring device equipped with a continuous recorder. The temperature monitoring device must have a minimum accuracy of ±1 percent of the temperature being monitored in °Celsius, or ±2.5 °Celsius, whichever value is greater. You must install the temperature sensor at a location representative of the combustion zone temperature.

(v) For a condenser, a temperature monitoring device equipped with a continuous recorder. The temperature monitoring device must have a minimum accuracy of ±1 percent of the temperature being monitored in °Celsius, or ±2.5 °Celsius, whichever value is greater. You must install the temperature sensor at a location in the exhaust vent stream from the condenser.

(vi) For a regenerative-type carbon adsorption system, a continuous monitoring system that meets the specifications in paragraphs (d)(1)(vi)(A) and (B) of this section.

(A) The continuous parameter monitoring system must measure and record the average total regeneration stream mass flow or volumetric flow during each carbon bed regeneration cycle. The flow sensor must have a measurement sensitivity of 5 percent of the flow rate or 10 cubic feet per minute, whichever is greater. You must check the mechanical connections for leakage at least every month, and you must perform a visual inspection at least every 3 months of all components of the flow continuous parameter monitoring system for physical and operational integrity and all electrical connections for oxidation and galvanic corrosion if your flow continuous parameter monitoring system is not equipped with a redundant flow sensor; and

(B) The continuous parameter monitoring system must measure and record the average carbon bed temperature for the duration of the carbon bed steaming cycle and measure the actual carbon bed temperature after regeneration and within 15 minutes of completing the cooling cycle. The temperature monitoring device must have a minimum accuracy of ±1 percent of the temperature being monitored in °Celsius, or ±2.5 °Celsius, whichever value is greater.

(vii) For a nonregenerative-type carbon adsorption system, you must monitor the design carbon replacement interval established using a design analysis performed as specified in §60.5413a(c)(3). The design carbon replacement interval must be based on the total carbon working capacity of the control device and source operating schedule.

(viii) For a combustion control device whose model is tested under §60.5413a(d), a continuous monitoring system meeting the requirements of paragraphs (d)(1)(viii)(A) and (B) of this section. If you comply with the periodic testing requirements of §60.5413a(b)(5)(ii), you are not required to continuously monitor the gas flow rate under paragraph (d)(1)(viii)(A) of this section.

(A) The continuous monitoring system must measure gas flow rate at the inlet to the control device. The monitoring instrument must have an accuracy of ±2 percent or better at the maximum expected flow rate. The flow rate at the inlet to the combustion device must not exceed the maximum flow rate determined by the manufacturer.

(B) A monitoring device that continuously indicates the presence of the pilot flame while emissions are routed to the control device.

(2) An organic monitoring device equipped with a continuous recorder that measures the concentration level of organic compounds in the exhaust vent stream from the control device. The monitor must meet the requirements of Performance Specification 8 or 9 of appendix B of this part. You must install, calibrate, and maintain the monitor according to the manufacturer's specifications.

(3) A continuous monitoring system that measures operating parameters other than those specified in paragraph (d)(1) or (2) of this section, upon approval of the Administrator as specified in §60.13(i).

(e) You must calculate the daily average value for each monitored operating parameter for each operating day, using the data recorded by the monitoring system, except for inlet gas flow rate and data from the heat sensing devices that indicate the presence of a pilot flame. If the emissions unit operation is continuous, the operating day is a 24-hour period. If the emissions unit operation is not continuous, the operating day is the total number of hours of control device operation per 24-hour period. Valid data points must be available for 75 percent of the operating hours in an operating day to compute the daily average.

(f) For each operating parameter monitor installed in accordance with the requirements of paragraph (d) of this section, you must comply with paragraph (f)(1) of this section for all control devices. When condensers are installed, you must also comply with paragraph (f)(2) of this section.

(1) You must establish a minimum operating parameter value or a maximum operating parameter value, as appropriate for the control device, to define the conditions at which the control device must be operated to continuously achieve the applicable performance requirements of §60.5412a(a)(1) or (2). You must establish each minimum or maximum operating parameter value as specified in paragraphs (f)(1)(i) through (iii) of this section.

(i) If you conduct performance tests in accordance with the requirements of §60.5413a(b) to demonstrate that the control device achieves the applicable performance requirements specified in §60.5412a(a)(1) or (2), then you must establish the minimum operating parameter value or the maximum operating parameter value based on values measured during the performance test and supplemented, as necessary, by a condenser design analysis or control device manufacturer recommendations or a combination of both.

(ii) If you use a condenser design analysis in accordance with the requirements of §60.5413a(c) to demonstrate that the control device achieves the applicable performance requirements specified in §60.5412a(a)(2), then you must establish the minimum operating parameter value or the maximum operating parameter value based on the condenser design analysis and supplemented, as necessary, by the condenser manufacturer's recommendations.

(iii) If you operate a control device where the performance test requirement was met under §60.5413a(d) to demonstrate that the control device achieves the applicable performance requirements specified in §60.5412a(a)(1), then your control device inlet gas flow rate must not exceed the maximum inlet gas flow rate determined by the manufacturer.

(2) If you use a condenser as specified in paragraph (d)(1)(v) of this section, you must establish a condenser performance curve showing the relationship between condenser outlet temperature and condenser control efficiency, according to the requirements of paragraphs (f)(2)(i) and (ii) of this section.

(i) If you conduct a performance test in accordance with the requirements of §60.5413a(b) to demonstrate that the condenser achieves the applicable performance requirements in §60.5412a(a)(2), then the condenser performance curve must be based on values measured during the performance test and supplemented as necessary by control device design analysis, or control device manufacturer's recommendations, or a combination or both.

(ii) If you use a control device design analysis in accordance with the requirements of §60.5413a(c)(1) to demonstrate that the condenser achieves the applicable performance requirements specified in §60.5412a(a)(2), then the condenser performance curve must be based on the condenser design analysis and supplemented, as necessary, by the control device manufacturer's recommendations.

(g) A deviation for a given control device is determined to have occurred when the monitoring data or lack of monitoring data result in any one of the criteria specified in paragraphs (g)(1) through (6) of this section being met. If you monitor multiple operating parameters for the same control device during the same operating day and more than one of these operating parameters meets a deviation criterion specified in paragraphs (g)(1) through (6) of this section, then a single excursion is determined to have occurred for the control device for that operating day.

(1) A deviation occurs when the daily average value of a monitored operating parameter is less than the minimum operating parameter limit (or, if applicable, greater than the maximum operating parameter limit) established in paragraph (f)(1) of this section or when the heat sensing device indicates that there is no pilot flame present.

(2) If you are subject to §60.5412a(a)(2), a deviation occurs when the 365-day average condenser efficiency calculated according to the requirements specified in §60.5415a(b)(2)(viii)(D) is less than 95.0 percent.

(3) If you are subject to §60.5412a(a)(2) and you have less than 365 days of data, a deviation occurs when the average condenser efficiency calculated according to the procedures specified in §60.5415a(b)(2)(viii)(D)(*1*) or (*2*) is less than 95.0 percent.

(4) A deviation occurs when the monitoring data are not available for at least 75 percent of the operating hours in a day.

(5) If the closed vent system contains one or more bypass devices that could be used to divert all or a portion of the gases, vapors, or fumes from entering the control device, a deviation occurs when the requirements of paragraph (g)(5)(i) or (ii) of this section are met.

(i) For each bypass line subject to §60.5411a(a)(3)(i)(A), the flow indicator indicates that flow has been detected and that the stream has been diverted away from the control device to the atmosphere.

(ii) For each bypass line subject to §60.5411a(a)(3)(i)(B), if the seal or closure mechanism has been broken, the bypass line valve position has changed, the key for the lock-and-key type lock has been checked out, or the car-seal has broken.

(6) For a combustion control device whose model is tested under §60.5413a(d), a deviation occurs when the conditions of paragraphs (g)(6)(i) or (ii) of this section are met.

(i) The inlet gas flow rate exceeds the maximum established during the test conducted under §60.5413a(d).

(ii) Failure of the monthly visible emissions test conducted under §60.5413a(e)(3) occurs.

(h) For each control device used to comply with the emission reduction standard in §60.5395a(a)(2) for your storage vessel affected facility, you must demonstrate continuous compliance according to paragraphs (h)(1) through (h)(4) of this section. You are exempt from the requirements of this paragraph if you install a control device model tested in accordance with §60.5413a(d)(2) through (10), which meets the criteria in §60.5413a(d)(11), the reporting requirement in §60.5413a(d)(12), and meet the continuous compliance requirement in §60.5413a(e).

(1) For each combustion device you must conduct inspections at least once every calendar month according to paragraphs (h)(1)(i) through (iv) of this section. Monthly inspections must be separated by at least 14 calendar days.

(i) Conduct visual inspections to confirm that the pilot is lit when vapors are being routed to the combustion device and that the continuous burning pilot flame is operating properly.

(ii) Conduct inspections to monitor for visible emissions from the combustion device using section 11 of EPA Method 22 of appendix A of this part. The observation period shall be 15 minutes. Devices must be operated with no visible emissions, except for periods not to exceed a total of 1 minute during any 15 minute period.

(iii) Conduct olfactory, visual and auditory inspections of all equipment associated with the combustion device to ensure system integrity.

(iv) For any absence of the pilot flame, or other indication of smoking or improper equipment operation (*e.g.,* visual, audible, or olfactory), you must ensure the equipment is returned to proper operation as soon as practicable after the event occurs. At a minimum, you must perform the procedures specified in paragraphs (h)(1)(iv)(A) and (B) of this section.

(A) You must check the air vent for obstruction. If an obstruction is observed, you must clear the obstruction as soon as practicable.

(B) You must check for liquid reaching the combustor.

(2) For each vapor recovery device, you must conduct inspections at least once every calendar month to ensure physical integrity of the control device according to the manufacturer's instructions. Monthly inspections must be separated by at least 14 calendar days.

(3) Each control device must be operated following the manufacturer's written operating instructions, procedures and maintenance schedule to ensure good air pollution control practices for minimizing emissions. Records of the manufacturer's written operating instructions, procedures, and maintenance schedule must be available for inspection as specified in §60.5420a(c)(13).

(4) Conduct a periodic performance test no later than 60 months after the initial performance test as specified in §60.5413a(b)(5)(ii) and conduct subsequent periodic performance tests at intervals no longer than 60 months following the previous periodic performance test.

Back to Top

§60.5420a What are my notification, reporting, and recordkeeping requirements?

(a) You must submit the notifications according to paragraphs (a)(1) and (2) of this section if you own or operate one or more of the affected facilities specified in §60.5365a that was constructed, modified or reconstructed during the reporting period.

(1) If you own or operate an affected facility that is the group of all equipment within a process unit at an onshore natural gas processing plant, or a sweetening unit at an onshore natural gas processing plant, you must submit the notifications required in §60.7(a)(1), (3), and (4). If you

own or operate a well, centrifugal compressor, reciprocating compressor, pneumatic controller, pneumatic pump, storage vessel, or collection of fugitive emissions components at a well site or collection of fugitive emissions components at a compressor station, you are not required to submit the notifications required in §60.7(a)(1), (3), and (4).

(2)(i) If you own or operate a well affected facility, you must submit a notification to the Administrator no later than 2 days prior to the commencement of each well completion operation listing the anticipated date of the well completion operation. The notification shall include contact information for the owner or operator; the United States Well Number; the latitude and longitude coordinates for each well in decimal degrees to an accuracy and precision of five (5) decimals of a degree using the North American Datum of 1983; and the planned date of the beginning of flowback. You may submit the notification in writing or in electronic format.

(ii) If you are subject to state regulations that require advance notification of well completions and you have met those notification requirements, then you are considered to have met the advance notification requirements of paragraph (a)(2)(i) of this section.

(b) *Reporting requirements.* You must submit annual reports containing the information specified in paragraphs (b)(1) through (8) and (12) of this section and performance test reports as specified in paragraph (b)(9) or (10) of this section, if applicable, except as provided in paragraph (b)(13) of this section. You must submit annual reports following the procedure specified in paragraph (b)(11) of this section. The initial annual report is due no later than 90 days after the end of the initial compliance period as determined according to §60.5410a. Subsequent annual reports are due no later than same date each year as the initial annual report. If you own or operate more than one affected facility, you may submit one report for multiple affected facilities provided the report contains all of the information required as specified in paragraphs (b)(1) through (8) of this section, except as provided in paragraph (b)(13) of this section. Annual reports may coincide with title V reports as long as all the required elements of the annual report are included. You may arrange with the Administrator a common schedule on which reports required by this part may be submitted as long as the schedule does not extend the reporting period.

(1) The general information specified in paragraphs (b)(1)(i) through (iv) of this section for all reports.

(i) The company name, facility site name associated with the affected facility, US Well ID or US Well ID associated with the affected facility, if applicable, and address of the affected facility. If an address is not available for the site, include a description of the site location and provide the latitude and longitude coordinates of the site in decimal degrees to an accuracy and precision of five (5) decimals of a degree using the North American Datum of 1983.

(ii) An identification of each affected facility being included in the annual report.

(iii) Beginning and ending dates of the reporting period.

(iv) A certification by a certifying official of truth, accuracy, and completeness. This certification shall state that, based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate, and complete.

(2) For each well affected facility, the information in paragraphs (b)(2)(i) through (iii) of this section.

(i) Records of each well completion operation as specified in paragraphs (c)(1)(i) through (iv) and (vi) of this section, if applicable, for each well affected facility conducted during the reporting period. In lieu of submitting the records specified in paragraph (c)(1)(i) through (iv) of this section, the owner or operator may submit a list of the well completions with hydraulic fracturing completed during the reporting period and the records required by paragraph (c)(1)(v) of this section for each well completion.

(ii) Records of deviations specified in paragraph (c)(1)(ii) of this section that occurred during the reporting period.

(iii) Records specified in paragraph (c)(1)(vii) of this section, if applicable, that support a determination under 60.5432a that the well affected facility is a low pressure well as defined in 60.5430a.

(3) For each centrifugal compressor affected facility, the information specified in paragraphs (b)(3)(i) through (iv) of this section.

(i) An identification of each centrifugal compressor using a wet seal system constructed, modified or reconstructed during the reporting period.

(ii) Records of deviations specified in paragraph (c)(2) of this section that occurred during the reporting period.

(iii) If required to comply with §60.5380a(a)(2), the records specified in paragraphs (c)(6) through (11) of this section.

(iv) If complying with §60.5380a(a)(1) with a control device tested under §60.5413a(d) which meets the criteria in §60.5413a(d)(11) and §60.5413a(e), records specified in paragraph (c)(2)(i) through (c)(2)(vii) of this section for each centrifugal compressor using a wet seal system constructed, modified or reconstructed during the reporting period.

(4) For each reciprocating compressor affected facility, the information specified in paragraphs (b)(4)(i) and (ii) of this section.

(i) The cumulative number of hours of operation or the number of months since initial startup or since the previous reciprocating compressor rod packing replacement, whichever is later. Alternatively, a statement that emissions from the rod packing are being routed to a process through a closed vent system under negative pressure.

(ii) Records of deviations specified in paragraph (c)(3)(iii) of this section that occurred during the reporting period.

(5) For each pneumatic controller affected facility, the information specified in paragraphs (b)(5)(i) through (iii) of this section.

(i) An identification of each pneumatic controller constructed, modified or reconstructed during the reporting period, including the identification information specified in §60.5390a(b)(2) or (c)(2).

(ii) If applicable, documentation that the use of pneumatic controller affected facilities with a natural gas bleed rate greater than 6 standard cubic feet per hour are required and the reasons why.

(iii) Records of deviations specified in paragraph (c)(4)(v) of this section that occurred during the reporting period.

(6) For each storage vessel affected facility, the information in paragraphs (b)(6)(i) through (vii) of this section.

(i) An identification, including the location, of each storage vessel affected facility for which construction, modification or reconstruction commenced during the reporting period. The location of the storage vessel shall be in latitude and longitude coordinates in decimal degrees to an accuracy and precision of five (5) decimals of a degree using the North American Datum of 1983.

(ii) Documentation of the VOC emission rate determination according to §60.5365a(e) for each storage vessel that became an affected facility during the reporting period or is returned to service during the reporting period.

(iii) Records of deviations specified in paragraph (c)(5)(iii) of this section that occurred during the reporting period.

(iv) A statement that you have met the requirements specified in §60.5410a(h)(2) and (3).

(v) You must identify each storage vessel affected facility that is removed from service during the reporting period as specified in §60.5395a(c)(1)(ii), including the date the storage vessel affected facility was removed from service.

(vi) You must identify each storage vessel affected facility returned to service during the reporting period as specified in §60.5395a(c)(3), including the date the storage vessel affected facility was returned to service.

(vii) If complying with §60.5395a(a)(2) with a control device tested under §60.5413a(d) which meets the criteria in §60.5413a(d)(11) and §60.5413a(e), records specified in paragraphs

(c)(5)(vi)(A) through (F) of this section for each storage vessel constructed, modified, reconstructed or returned to service during the reporting period.

(7) For the collection of fugitive emissions components at each well site and the collection of fugitive emissions components at each compressor station within the company-defined area, the records of each monitoring survey including the information specified in paragraphs (b)(7)(i) through (xii) of this section. For the collection of fugitive emissions components at a compressor station, if a monitoring survey is waived under §60.5397a(g)(5), you must include in your annual report the fact that a monitoring survey was waived and the calendar months that make up the quarterly monitoring period for which the monitoring survey was waived.

(i) Date of the survey.

(ii) Beginning and end time of the survey.

(iii) Name of operator(s) performing survey. If the survey is performed by optical gas imaging, you must note the training and experience of the operator.

(iv) Ambient temperature, sky conditions, and maximum wind speed at the time of the survey.

(v) Monitoring instrument used.

(vi) Any deviations from the monitoring plan or a statement that there were no deviations from the monitoring plan.

(vii) Number and type of components for which fugitive emissions were detected.

(viii) Number and type of fugitive emissions components that were not repaired as required in §60.5397a(h).

(ix) Number and type of difficult-to-monitor and unsafe-to-monitor fugitive emission components monitored.

(x) The date of successful repair of the fugitive emissions component.

(xi) Number and type of fugitive emission components placed on delay of repair and explanation for each delay of repair.

(xii) Type of instrument used to resurvey a repaired fugitive emissions component that could not be repaired during the initial fugitive emissions finding.

(8) For each pneumatic pump affected facility, the information specified in paragraphs (b)(8)(i) through (iii) of this section.

(i) For each pneumatic pump that is constructed, modified or reconstructed during the reporting period, you must provide certification that the pneumatic pump meets one of the conditions described in paragraphs (b)(8)(i)(A), (B) or (C) of this section.

(A) No control device or process is available on site.

(B) A control device or process is available on site and the owner or operator has determined in accordance with §60.5393a(b)(5) that it is technically infeasible to capture and route the emissions to the control device or process.

(C) Emissions from the pneumatic pump are routed to a control device or process. If the control device is designed to achieve less than 95 percent emissions reduction, specify the percent emissions reductions the control device is designed to achieve.

(ii) For any pneumatic pump affected facility which has been previously reported as required under paragraph (b)(8)(i) of this section and for which a change in the reported condition has occurred during the reporting period, provide the identification of the pneumatic pump affected facility and the date it was previously reported and a certification that the pneumatic pump meets one of the conditions described in paragraphs (b)(8)(ii)(A), (B) or (C) or (D) of this section.

(A) A control device has been added to the location and the pneumatic pump now reports according to paragraph (b)(8)(i)(C) of this section.

(B) A control device has been added to the location and the pneumatic pump affected facility now reports according to paragraph (b)(8)(i)(B) of this section.

(C) A control device or process has been removed from the location or otherwise is no longer available and the pneumatic pump affected facility now report according to paragraph (b)(8)(i)(A) of this section.

(D) A control device or process has been removed from the location or is otherwise no longer available and the owner or operator has determined in accordance with §60.5393a(b)(5) through an engineering evaluation that it is technically infeasible to capture and route the emissions to another control device or process.

(iii) Records of deviations specified in paragraph (c)(16)(ii) of this section that occurred during the reporting period.

(9) Within 60 days after the date of completing each performance test (see §60.8) required by this subpart, except testing conducted by the manufacturer as specified in §60.5413a(d), you must submit the results of the performance test following the procedure specified in either paragraph (b)(9)(i) or (ii) of this section.

(i) For data collected using test methods supported by the EPA's Electronic Reporting Tool (ERT) as listed on the EPA's ERT Web site (*https://www3.epa.gov/ttn/chief/ert/ert____info.html*) at the time of the test, you must submit the results of the performance test to the EPA via the

Compliance and Emissions Data Reporting Interface (CEDRI). (CEDRI can be accessed through the EPA's Central Data Exchange (CDX) (*https://cdx.epa.gov/)*.) Performance test data must be submitted in a file format generated through the use of the EPA's ERT or an alternate electronic file format consistent with the extensible markup language (XML) schema listed on the EPA's ERT Web site. If you claim that some of the performance test information being submitted is confidential business information (CBI), you must submit a complete file generated through the use of the EPA's ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT Web site, including information claimed to be CBI, on a compact disc, flash drive, or other commonly used electronic storage media to the EPA. The electronic media must be clearly marked as CBI and mailed to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404-02, 4930 Old Page Rd., Durham, NC 27703. The same ERT or alternate file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described earlier in this paragraph.

(ii) For data collected using test methods that are not supported by the EPA's ERT as listed on the EPA's ERT Web site at the time of the test, you must submit the results of the performance test to the Administrator at the appropriate address listed in §60.4.

(10) For combustion control devices tested by the manufacturer in accordance with §60.5413a(d), an electronic copy of the performance test results required by §60.5413a(d) shall be submitted via email to *Oil____and____Gas____PT@EPA.GOV* unless the test results for that model of combustion control device are posted at the following Web site: *epa.gov/airquality/oilandgas/*.

(11) You must submit reports to the EPA via the CEDRI. (CEDRI can be accessed through the EPA's CDX (*https://cdx.epa.gov/)*.) You must use the appropriate electronic report in CEDRI for this subpart or an alternate electronic file format consistent with the extensible markup language (XML) schema listed on the CEDRI Web site (*https://www3.epa.gov/ttn/chief/cedri/*). If the reporting form specific to this subpart is not available in CEDRI at the time that the report is due, you must submit the report to the Administrator at the appropriate address listed in §60.4. Once the form has been available in CEDRI for at least 90 calendar days, you must begin submitting all subsequent reports via CEDRI. The reports must be submitted by the deadlines specified in this subpart, regardless of the method in which the reports are submitted.

(12) You must submit the certification signed by the qualified professional engineer according to §60.5411a(d) for each closed vent system routing to a control device or process.

(13) The collection of fugitive emissions components at a well site (as defined in §60.5430a), the collection of fugitive emissions components at a compressor station (as defined in §60.5430a), and pneumatic pump affected facilities at a well site (as defined in §60.5365a(h)(2)) are not subject to the requirements of paragraph (b)(1) of this section from June 2, 2017, until August 31, 2017.

(c) *Recordkeeping requirements*. You must maintain the records identified as specified in §60.7(f) and in paragraphs (c)(1) through (16) of this section. All records required by this subpart must be maintained either onsite or at the nearest local field office for at least 5 years. Any

records required to be maintained by this subpart that are submitted electronically via the EPA's CDX may be maintained in electronic format.

(1) The records for each well affected facility as specified in paragraphs (c)(1)(i) through (vii) of this section, as applicable. For each well affected facility for which you make a claim that the well affected facility is not subject to the requirements for well completions pursuant to 60.5375a(g), you must maintain the record in paragraph (c)(1)(vi), only.

(i) Records identifying each well completion operation for each well affected facility;

(ii) Records of deviations in cases where well completion operations with hydraulic fracturing were not performed in compliance with the requirements specified in §60.5375a.

(iii) Records required in §60.5375a(b) or (f)(3) for each well completion operation conducted for each well affected facility that occurred during the reporting period. You must maintain the records specified in paragraphs (c)(1)(iii)(A) through (C) of this section.

(A) For each well affected facility required to comply with the requirements of §60.5375a(a), you must record: The location of the well; the United States Well Number; the date and time of the onset of flowback following hydraulic fracturing or refracturing; the date and time of each attempt to direct flowback to a separator as required in §60.5375a(a)(1)(ii); the date and time of each occurrence of returning to the initial flowback stage under §60.5375a(a)(1)(i); and the date and time that the well was shut in and the flowback equipment was permanently disconnected, or the startup of production; the duration of flowback; duration of recovery and disposition of recovery (*i.e.,* routed to the gas flow line or collection system, re-injected into the well or another well, used as an onsite fuel source, or used for another useful purpose that a purchased fuel or raw material would serve); duration of combustion; duration of venting; and specific reasons for venting in lieu of capture or combustion. The duration must be specified in hours. In addition, for wells where it is technically infeasible to route the recovered gas to any of the four options specified in §60.5375a(a)(1)(ii), you must record the reasons for the claim of technical infeasibility with respect to all four options provided in that subparagraph, including but not limited to; name and location of the nearest gathering line and technical considerations preventing routing to this line; capture, reinjection, and reuse technologies considered and aspects of gas or equipment preventing use of recovered gas as a fuel onsite; and technical considerations preventing use of recovered gas for other useful purpose that that a purchased fuel or raw material would serve.

(B) For each well affected facility required to comply with the requirements of §60.5375a(f), you must maintain the records specified in paragraph (c)(1)(iii)(A) of this section except that you do not have to record the duration of recovery to the flow line.

(C) For each well affected facility for which you make a claim that it meets the criteria of §60.5375a(a)(1)(iii)(A), you must maintain the following:

(*1*) Records specified in paragraph (c)(1)(iii)(A) of this section except that you do not have to record: The date and time of each attempt to direct flowback to a separator; the date and time of

each occurrence of returning to the initial flowback stage; duration of recovery and disposition of recovery (*i.e.* routed to the gas flow line or collection system, re-injected into the well or another well, used as an onsite fuel source, or used for another useful purpose that a purchased fuel or raw material would serve.

(*2*) If applicable, records that the conditions of §60.5375a(1)(iii)(A) are no longer met and that the well completion operation has been stopped and a separator installed. The records shall include the date and time the well completion operation was stopped and the date and time the separator was installed.

(*3*) A record of the claim signed by the certifying official that no liquids collection is at the well site. The claim must include a certification by a certifying official of truth, accuracy and completeness. This certification shall state that, based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate, and complete.

(iv) For each well affected facility for which you claim an exception under §60.5375a(a)(3), you must record: The location of the well; the United States Well Number; the specific exception claimed; the starting date and ending date for the period the well operated under the exception; and an explanation of why the well meets the claimed exception.

(v) For each well affected facility required to comply with both §60.5375a(a)(1) and (3), if you are using a digital photograph in lieu of the records required in paragraphs (c)(1)(i) through (iv) of this section, you must retain the records of the digital photograph as specified in §60.5410a(a)(4).

(vi) For each well affected facility for which you make a claim that the well affected facility is not subject to the well completion standards according to 60.5375a(g), you must maintain:

(A) A record of the analysis that was performed in order the make that claim, including but not limited to, GOR values for established leases and data from wells in the same basin and field;

(B) The location of the well; the United States Well Number;

(C) A record of the claim signed by the certifying official. The claim must include a certification by a certifying official of truth, accuracy, and completeness. This certification shall state that, based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate, and complete.

(vii) For each well affected facility for which you determine according to §60.5432a that it is a low pressure well, a record of the determination and supporting inputs and calculations.

(2) For each centrifugal compressor affected facility, you must maintain records of deviations in cases where the centrifugal compressor was not operated in compliance with the requirements specified in §60.5380a. Except as specified in paragraph (c)(2)(vii) of this section, you must maintain the records in paragraphs (c)(2)(i) through (vi) of this section for each control device

tested under §60.5413a(d) which meets the criteria in §60.5413a(d)(11) and §60.5413a(e) and used to comply with §60.5380a(a)(1) for each centrifugal compressor.

(i) Make, model and serial number of purchased device.

(ii) Date of purchase.

(iii) Copy of purchase order.

(iv) Location of the centrifugal compressor and control device in latitude and longitude coordinates in decimal degrees to an accuracy and precision of five (5) decimals of a degree using the North American Datum of 1983.

(v) Inlet gas flow rate.

(vi) Records of continuous compliance requirements in §60.5413a(e) as specified in paragraphs (c)(2)(vi)(A) through (E) of this section.

(A) Records that the pilot flame is present at all times of operation.

(B) Records that the device was operated with no visible emissions except for periods not to exceed a total of 1 minute during any 15 minute period.

(C) Records of the maintenance and repair log.

(D) Records of the visible emissions test following return to operation from a maintenance or repair activity.

(E) Records of the manufacturer's written operating instructions, procedures and maintenance schedule to ensure good air pollution control practices for minimizing emissions.

(vii) As an alternative to the requirements of paragraph (c)(2)(iv) of this section, you may maintain records of one or more digital photographs with the date the photograph was taken and the latitude and longitude of the centrifugal compressor and control device imbedded within or stored with the digital file. As an alternative to imbedded latitude and longitude within the digital photograph, the digital photograph may consist of a photograph of the centrifugal compressor and control device with a photograph of a separately operating GPS device within the same digital picture, provided the latitude and longitude output of the GPS unit can be clearly read in the digital photograph.

(3) For each reciprocating compressor affected facility, you must maintain the records in paragraphs (c)(3)(i) through (iii) of this section.

(i) Records of the cumulative number of hours of operation or number of months since initial startup or the previous replacement of the reciprocating compressor rod packing, whichever is

later. Alternatively, a statement that emissions from the rod packing are being routed to a process through a closed vent system under negative pressure.

(ii) Records of the date and time of each reciprocating compressor rod packing replacement, or date of installation of a rod packing emissions collection system and closed vent system as specified in §60.5385a(a)(3).

(iii) Records of deviations in cases where the reciprocating compressor was not operated in compliance with the requirements specified in §60.5385a.

(4) For each pneumatic controller affected facility, you must maintain the records identified in paragraphs (c)(4)(i) through (v) of this section, as applicable.

(i) Records of the date, location and manufacturer specifications for each pneumatic controller constructed, modified or reconstructed.

(ii) Records of the demonstration that the use of pneumatic controller affected facilities with a natural gas bleed rate greater than the applicable standard are required and the reasons why.

(iii) If the pneumatic controller is not located at a natural gas processing plant, records of the manufacturer's specifications indicating that the controller is designed such that natural gas bleed rate is less than or equal to 6 standard cubic feet per hour.

(iv) If the pneumatic controller is located at a natural gas processing plant, records of the documentation that the natural gas bleed rate is zero.

(v) Records of deviations in cases where the pneumatic controller was not operated in compliance with the requirements specified in §60.5390a.

(5) For each storage vessel affected facility, you must maintain the records identified in paragraphs (c)(5)(i) through (vi) of this section.

(i) If required to reduce emissions by complying with §60.5395a(a)(2), the records specified in §§60.5420a(c)(6) through (8), 60.5416a(c)(6)(ii), and 60.5416a(c)(7)(ii). You must maintain the records in paragraph (c)(5)(vi) of this part for each control device tested under §60.5413a(d) which meets the criteria in §60.5413a(d)(11) and §60.5413a(e) and used to comply with §60.5395a(a)(2) for each storage vessel.

(ii) Records of each VOC emissions determination for each storage vessel affected facility made under §60.5365a(e) including identification of the model or calculation methodology used to calculate the VOC emission rate.

(iii) Records of deviations in cases where the storage vessel was not operated in compliance with the requirements specified in §§60.5395a, 60.5411a, 60.5412a, and 60.5413a, as applicable.

(iv) For storage vessels that are skid-mounted or permanently attached to something that is mobile (such as trucks, railcars, barges or ships), records indicating the number of consecutive days that the vessel is located at a site in the oil and natural gas production segment, natural gas processing segment or natural gas transmission and storage segment. If a storage vessel is removed from a site and, within 30 days, is either returned to the site or replaced by another storage vessel at the site to serve the same or similar function, then the entire period since the original storage vessel was first located at the site, including the days when the storage vessel was removed, will be added to the count towards the number of consecutive days.

(v) You must maintain records of the identification and location of each storage vessel affected facility.

(vi) Except as specified in paragraph (c)(5)(vi)(G) of this section, you must maintain the records specified in paragraphs (c)(5)(vi)(A) through (F) of this section for each control device tested under §60.5413a(d) which meets the criteria in §60.5413a(d)(11) and §60.5413a(e) and used to comply with §60.5395a(a)(2) for each storage vessel.

(A) Make, model and serial number of purchased device.

(B) Date of purchase.

(C) Copy of purchase order.

(D) Location of the control device in latitude and longitude coordinates in decimal degrees to an accuracy and precision of five (5) decimals of a degree using the North American Datum of 1983.

(E) Inlet gas flow rate.

(F) Records of continuous compliance requirements in §60.5413a(e) as specified in paragraphs (c)(5)(vi)(F)(*1*) through (*5*) of this section.

(*1*) Records that the pilot flame is present at all times of operation.

(*2*) Records that the device was operated with no visible emissions except for periods not to exceed a total of 1 minute during any 15 minute period.

(*3*) Records of the maintenance and repair log.

(*4*) Records of the visible emissions test following return to operation from a maintenance or repair activity.

(*5*) Records of the manufacturer's written operating instructions, procedures and maintenance schedule to ensure good air pollution control practices for minimizing emissions.

(G) As an alternative to the requirements of paragraph (c)(5)(vi)(D) of this section, you may maintain records of one or more digital photographs with the date the photograph was taken and the latitude and longitude of the storage vessel and control device imbedded within or stored with the digital file. As an alternative to imbedded latitude and longitude within the digital photograph, the digital photograph may consist of a photograph of the storage vessel and control device with a photograph of a separately operating GPS device within the same digital picture, provided the latitude and longitude output of the GPS unit can be clearly read in the digital photograph.

(6) Records of each closed vent system inspection required under §60.5416a(a)(1) and (2) for centrifugal compressors, reciprocating compressors and pneumatic pumps, or §60.5416a(c)(1) for storage vessels.

(7) A record of each cover inspection required under §60.5416a(a)(3) for centrifugal or reciprocating compressors or §60.5416a(c)(2) for storage vessels.

(8) If you are subject to the bypass requirements of §60.5416a(a)(4) for centrifugal compressors, reciprocating compressors or pneumatic pumps, or §60.5416a(c)(3) for storage vessels, a record of each inspection or a record of each time the key is checked out or a record of each time the alarm is sounded.

(9) If you are subject to the closed vent system no detectable emissions requirements of §60.5416a(b) for centrifugal compressors, reciprocating compressors or pneumatic pumps, a record of the monitoring conducted in accordance with §60.5416a(b).

(10) For each centrifugal compressor or pneumatic pump affected facility, records of the schedule for carbon replacement (as determined by the design analysis requirements of §60.5413a(c)(2) or (3)) and records of each carbon replacement as specified in §60.5412a(c)(1).

(11) For each centrifugal compressor affected facility subject to the control device requirements of §60.5412a(a), (b), and (c), records of minimum and maximum operating parameter values, continuous parameter monitoring system data, calculated averages of continuous parameter monitoring system data, results of all compliance calculations, and results of all inspections.

(12) For each carbon adsorber installed on storage vessel affected facilities, records of the schedule for carbon replacement (as determined by the design analysis requirements of §60.5412a(d)(2)) and records of each carbon replacement as specified in §60.5412a(c)(1).

(13) For each storage vessel affected facility subject to the control device requirements of §60.5412a(c) and (d), you must maintain records of the inspections, including any corrective actions taken, the manufacturers' operating instructions, procedures and maintenance schedule as specified in §60.5417a(h)(3). You must maintain records of EPA Method 22 of appendix A-7 of this part, section 11 results, which include: Company, location, company representative (name of the person performing the observation), sky conditions, process unit (type of control device), clock start time, observation period duration (in minutes and seconds), accumulated emission time (in minutes and seconds), and clock end time. You may create your own form including the

above information or use Figure 22-1 in EPA Method 22 of appendix A-7 of this part. Manufacturer's operating instructions, procedures and maintenance schedule must be available for inspection.

(14) A log of records as specified in §60.5412a(d)(1)(iii), for all inspection, repair and maintenance activities for each control device failing the visible emissions test.

(15) For each collection of fugitive emissions components at a well site and each collection of fugitive emissions components at a compressor station, the records identified in paragraphs (c)(15)(i) through (iii) of this section.

(i) The fugitive emissions monitoring plan as required in §60.5397a(b), (c), and (d).

(ii) The records of each monitoring survey as specified in paragraphs (c)(15)(ii)(A) through (I) of this section.

(A) Date of the survey.

(B) Beginning and end time of the survey.

(C) Name of operator(s) performing survey. You must note the training and experience of the operator.

(D) Monitoring instrument used.

(E) When optical gas imaging is used to perform the survey, one or more digital photographs or videos, captured from the optical gas imaging instrument used for conduct of monitoring, of each required monitoring survey being performed. The digital photograph must include the date the photograph was taken and the latitude and longitude of the collection of fugitive emissions components at a well site or collection of fugitive emissions components at a compressor station imbedded within or stored with the digital file. As an alternative to imbedded latitude and longitude within the digital file, the digital photograph or video may consist of an image of the monitoring survey being performed with a separately operating GPS device within the same digital picture or video, provided the latitude and longitude output of the GPS unit can be clearly read in the digital image.

(F) Fugitive emissions component identification when Method 21 is used to perform the monitoring survey.

(G) Ambient temperature, sky conditions, and maximum wind speed at the time of the survey.

(H) Any deviations from the monitoring plan or a statement that there were no deviations from the monitoring plan.

(I) Documentation of each fugitive emission, including the information specified in paragraphs (c)(15)(ii)(I)(*1*) through (*12*) of this section.

(*1*) Location.

(*2*) Any deviations from the monitoring plan or a statement that there were no deviations from the monitoring plan.

(*3*) Number and type of components for which fugitive emissions were detected.

(*4*) Number and type of difficult-to-monitor and unsafe-to-monitor fugitive emission components monitored.

(*5*) Instrument reading of each fugitive emissions component that requires repair when Method 21 is used for monitoring.

(*6*) Number and type of fugitive emissions components that were not repaired as required in §60.5397a(h).

(*7*) Number and type of components that were tagged as a result of not being repaired during the monitoring survey when the fugitive emissions were initially found as required in §60.5397a(h)(3)(ii).

(*8*) If a fugitive emissions component is not tagged, a digital photograph or video of each fugitive emissions component that could not be repaired during the monitoring survey when the fugitive emissions were initially found as required in §60.5397a(h)(3)(ii). The digital photograph or video must clearly identify the location of the component that must be repaired. Any digital photograph or video required under this paragraph can also be used to meet the requirements under paragraph (c)(15)(ii)(E) of this section, as long as the photograph or video is taken with the optical gas imaging instrument, includes the date and the latitude and longitude are either imbedded or visible in the picture.

(*9*) Repair methods applied in each attempt to repair the fugitive emissions components.

(*10*) Number and type of fugitive emission components placed on delay of repair and explanation for each delay of repair.

(*11*) The date of successful repair of the fugitive emissions component.

(*12*) Instrumentation used to resurvey a repaired fugitive emissions component that could not be repaired during the initial fugitive emissions finding.

(iii) For the collection of fugitive emissions components at a compressor station, if a monitoring survey is waived under §60.5397a(g)(5), you must maintain records of the average calendar month temperature, including the source of the information, for each calendar month of the quarterly monitoring period for which the monitoring survey was waived.

(16) For each pneumatic pump affected facility, you must maintain the records identified in paragraphs (c)(16)(i) through (v) of this section.

(i) Records of the date, location and manufacturer specifications for each pneumatic pump constructed, modified or reconstructed.

(ii) Records of deviations in cases where the pneumatic pump was not operated in compliance with the requirements specified in §60.5393a.

(iii) Records on the control device used for control of emissions from a pneumatic pump including the installation date, manufacturer's specifications, and if the control device is designed to achieve less than 95 percent emission reduction, a design evaluation or manufacturer's specifications indicating the percentage reduction achieved the control device is designed to achieve.

(iv) Records substantiating a claim according to §60.5393a(b)(5) that it is technically infeasible to capture and route emissions from a pneumatic pump to a control device or process; including the qualified professional engineer certification according to §60.5393a(b)(5)(ii)and the records of the engineering assessment of technical infeasibility performed according to §60.5393a(b)(5)(iii).

(v) You must retain copies of all certifications, engineering assessments and related records for a period of five years and make them available if directed by the implementing agency.

(17) For each closed vent system routing to a control device or process, the records of the assessment conducted according to §60.5411a(d):

(i) A copy of the assessment conducted according to §60.5411a(d)(1);

(ii) A copy of the certification according to §60.5411a(d)(1)(i); and

(iii) The owner or operator shall retain copies of all certifications, assessments and any related records for a period of five years, and make them available if directed by the delegated authority.

[81 FR 35898, June 3, 2016, as amended at 82 FR 25733, June 5, 2017]

Back to Top

§60.5421a What are my additional recordkeeping requirements for my affected facility subject to GHG and VOC requirements for onshore natural gas processing plants?

(a) You must comply with the requirements of paragraph (b) of this section in addition to the requirements of §60.486a.

(b) The following recordkeeping requirements apply to pressure relief devices subject to the requirements of §60.5401a(b)(1).

(1) When each leak is detected as specified in §60.5401a(b)(2), a weatherproof and readily visible identification, marked with the equipment identification number, must be attached to the leaking equipment. The identification on the pressure relief device may be removed after it has been repaired.

(2) When each leak is detected as specified in §60.5401a(b)(2), the information specified in paragraphs (b)(2)(i) through (x) of this section must be recorded in a log and shall be kept for 2 years in a readily accessible location:

(i) The instrument and operator identification numbers and the equipment identification number.

(ii) The date the leak was detected and the dates of each attempt to repair the leak.

(iii) Repair methods applied in each attempt to repair the leak.

(iv) "Above 500 ppm" if the maximum instrument reading measured by the methods specified in §60.5400a(d) after each repair attempt is 500 ppm or greater.

(v) "Repair delayed" and the reason for the delay if a leak is not repaired within 15 calendar days after discovery of the leak.

(vi) The signature of the owner or operator (or designate) whose decision it was that repair could not be effected without a process shutdown.

(vii) The expected date of successful repair of the leak if a leak is not repaired within 15 days.

(viii) Dates of process unit shutdowns that occur while the equipment is unrepaired.

(ix) The date of successful repair of the leak.

(x) A list of identification numbers for equipment that are designated for no detectable emissions under the provisions of §60.482-4a(a). The designation of equipment subject to the provisions of §60.482-4a(a) must be signed by the owner or operator.

Back to Top

§60.5422a What are my additional reporting requirements for my affected facility subject to GHG and VOC requirements for onshore natural gas processing plants?

(a) You must comply with the requirements of paragraphs (b) and (c) of this section in addition to the requirements of §60.487a(a), (b), (c)(2)(i) through (iv), and (c)(2)(vii) through (viii). You must submit semiannual reports to the EPA via the Compliance and Emissions Data Reporting Interface (CEDRI). (CEDRI can be accessed through the EPA's Central Data Exchange (CDX) (*https://cdx.epa.gov/*).) Use the appropriate electronic report in CEDRI for this subpart or an alternate electronic file format consistent with the extensible markup language (XML) schema listed on the CEDRI Web site (*https://www3.epa.gov/ttn/chief/cedri/*). If the reporting form specific to this subpart is not available in CEDRI at the time that the report is due, submit the report to the Administrator at the appropriate address listed in §60.4. Once the form has been available in CEDRI for at least 90 days, you must begin submitting all subsequent reports via CEDRI. The report must be submitted by the deadline specified in this subpart, regardless of the method in which the report is submitted.

(b) An owner or operator must include the following information in the initial semiannual report in addition to the information required in §60.487a(b)(1) through (4): Number of pressure relief devices subject to the requirements of §60.5401a(b) except for those pressure relief devices designated for no detectable emissions under the provisions of §60.482-4a(a) and those pressure relief devices complying with §60.482-4a(c).

(c) An owner or operator must include the information specified in paragraphs (c)(1) and (2) of this section in all semiannual reports in addition to the information required in §60.487a(c)(2)(i) through (vi):

(1) Number of pressure relief devices for which leaks were detected as required in §60.5401a(b)(2); and

(2) Number of pressure relief devices for which leaks were not repaired as required in §60.5401a(b)(3).

Back to Top

§60.5423a What additional recordkeeping and reporting requirements apply to my sweetening unit affected facilities at onshore natural gas processing plants?

(a) You must retain records of the calculations and measurements required in §§60.5405a(a) and (b) and 60.5407a(a) through (g) for at least 2 years following the date of the measurements. This requirement is included under §60.7(f) of the General Provisions.

(b) You must submit a report of excess emissions to the Administrator in your annual report if you had excess emissions during the reporting period. The excess emissions report must be submitted to the EPA via the Compliance and Emissions Data Reporting Interface (CEDRI). (CEDRI can be accessed through the EPA's Central Data Exchange (CDX) (*https://cdx.epa.gov/*).) You must use the appropriate electronic report in CEDRI for this subpart

or an alternate electronic file format consistent with the extensible markup language (XML) schema listed on the CEDRI Web site (*https://www3.epa.gov/ttn/chief/cedri/*). If the reporting form specific to this subpart is not available in CEDRI at the time that the report is due, you must submit the report to the Administrator at the appropriate address listed in §60.4. Once the form has been available in CEDRI for at least 90 days, you must begin submitting all subsequent reports via CEDRI. The report must be submitted by the deadline specified in this subpart, regardless of the method in which the report is submitted. For the purpose of these reports, excess emissions are defined as specified in paragraphs (b)(1) and (2) of this section.

(1) Any 24-hour period (at consistent intervals) during which the average sulfur emission reduction efficiency (R) is less than the minimum required efficiency (Z).

(2) For any affected facility electing to comply with the provisions of §60.5407a(b)(2), any 24-hour period during which the average temperature of the gases leaving the combustion zone of an incinerator is less than the appropriate operating temperature as determined during the most recent performance test in accordance with the provisions of §60.5407a(b)(3). Each 24-hour period must consist of at least 96 temperature measurements equally spaced over the 24 hours.

(c) To certify that a facility is exempt from the control requirements of these standards, for each facility with a design capacity less than 2 LT/D of H2S in the acid gas (expressed as sulfur) you must keep, for the life of the facility, an analysis demonstrating that the facility's design capacity is less than 2 LT/D of H_2S expressed as sulfur.

(d) If you elect to comply with §60.5407a(e) you must keep, for the life of the facility, a record demonstrating that the facility's design capacity is less than 150 LT/D of H2S expressed as sulfur.

(e) The requirements of paragraph (b) of this section remain in force until and unless the EPA, in delegating enforcement authority to a state under section 111(c) of the Act, approves reporting requirements or an alternative means of compliance surveillance adopted by such state. In that event, affected sources within the state will be relieved of obligation to comply with paragraph (b) of this section, provided that they comply with the requirements established by the state. Electronic reporting to the EPA cannot be waived, and as such, the provisions of this paragraph do not relieve owners or operators of affected facilities of the requirement to submit the electronic reports required in this section to the EPA.

§60.5425a What parts of the General Provisions apply to me?

Table 3 to this subpart shows which parts of the General Provisions in §§60.1 through 60.19 apply to you.

Back to Top

§60.5430a What definitions apply to this subpart?

As used in this subpart, all terms not defined herein shall have the meaning given them in the Act, in subpart A or subpart VVa of part 60; and the following terms shall have the specific meanings given them.

Acid gas means a gas stream of hydrogen sulfide (H_2S) and carbon dioxide (CO_2) that has been separated from sour natural gas by a sweetening unit.

Alaskan North Slope means the approximately 69,000 square-mile area extending from the Brooks Range to the Arctic Ocean.

API Gravity means the weight per unit volume of hydrocarbon liquids as measured by a system recommended by the American Petroleum Institute (API) and is expressed in degrees.

Artificial lift equipment means mechanical pumps including, but not limited to, rod pumps and electric submersible pumps used to flowback fluids from a well.

Bleed rate means the rate in standard cubic feet per hour at which natural gas is continuously vented (bleeds) from a pneumatic controller.

Capital expenditure means, in addition to the definition in 40 CFR 60.2, an expenditure for a physical or operational change to an existing facility that exceeds P, the product of the facility's replacement cost, R, and an adjusted annual asset guideline repair allowance, A, as reflected by the following equation: $P = R \times A$, where:

(1) The adjusted annual asset guideline repair allowance, A, is the product of the percent of the replacement cost, Y, and the applicable basic annual asset guideline repair allowance, B, divided by 100 as reflected by the following equation:

$A = Y \times (B \div 100)$;

(2) The percent Y is determined from the following equation: $Y = 1.0 - 0.575 \log \times$, where × is 2011 minus the year of construction; and

(3) The applicable basic annual asset guideline repair allowance, B, is 4.5.

Centrifugal compressor means any machine for raising the pressure of a natural gas by drawing in low pressure natural gas and discharging significantly higher pressure natural gas by means of mechanical rotating vanes or impellers. Screw, sliding vane, and liquid ring compressors are not centrifugal compressors for the purposes of this subpart.

Certifying official means one of the following:

(1) For a corporation: A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or a duly authorized representative of such person if the representative is responsible for the overall operation of one or more manufacturing, production, or operating facilities applying for or subject to a permit and either:

(i) The facilities employ more than 250 persons or have gross annual sales or expenditures exceeding $25 million (in second quarter 1980 dollars); or

(ii) The Administrator is notified of such delegation of authority prior to the exercise of that authority. The Administrator reserves the right to evaluate such delegation;

(2) For a partnership (including but not limited to general partnerships, limited partnerships, and limited liability partnerships) or sole proprietorship: A general partner or the proprietor, respectively. If a general partner is a corporation, the provisions of paragraph (1) of this definition apply;

(3) For a municipality, State, Federal, or other public agency: Either a principal executive officer or ranking elected official. For the purposes of this part, a principal executive officer of a Federal agency includes the chief executive officer having responsibility for the overall operations of a principal geographic unit of the agency (*e.g.*, a Regional Administrator of EPA); or

(4) For affected facilities:

(i) The designated representative in so far as actions, standards, requirements, or prohibitions under title IV of the Clean Air Act or the regulations promulgated thereunder are concerned; or

(ii) The designated representative for any other purposes under part 60.

Collection system means any infrastructure that conveys gas or liquids from the well site to another location for treatment, storage, processing, recycling, disposal or other handling.

Completion combustion device means any ignition device, installed horizontally or vertically, used in exploration and production operations to combust otherwise vented emissions from completions. Completion combustion devices include pit flares.

Compressor station means any permanent combination of one or more compressors that move natural gas at increased pressure through gathering or transmission pipelines, or into or out of storage. This includes, but is not limited to, gathering and boosting stations and transmission compressor stations. The combination of one or more compressors located at a well site, or located at an onshore natural gas processing plant, is not a compressor station for purposes of §60.5397a.

Condensate means hydrocarbon liquid separated from natural gas that condenses due to changes in the temperature, pressure, or both, and remains liquid at standard conditions.

Continuous bleed means a continuous flow of pneumatic supply natural gas to a pneumatic controller.

Crude oil and natural gas source category means:

(1) Crude oil production, which includes the well and extends to the point of custody transfer to the crude oil transmission pipeline or any other forms of transportation; and

(2) Natural gas production, processing, transmission, and storage, which include the well and extend to, but do not include, the local distribution company custody transfer station.

Custody transfer means the transfer of crude oil or natural gas after processing and/or treatment in the producing operations, or from storage vessels or automatic transfer facilities or other such equipment, including product loading racks, to pipelines or any other forms of transportation.

Dehydrator means a device in which an absorbent directly contacts a natural gas stream and absorbs water in a contact tower or absorption column (absorber).

Delineation well means a well drilled in order to determine the boundary of a field or producing reservoir.

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart including, but not limited to, any emission limit, operating limit, or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Fails to meet any emission limit, operating limit, or work practice standard in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is permitted by this subpart.

Equipment, as used in the standards and requirements in this subpart relative to the equipment leaks of GHG (in the form of methane) and VOC from onshore natural gas processing plants, means each pump, pressure relief device, open-ended valve or line, valve, and flange or other connector that is in VOC service or in wet gas service, and any device or system required by those same standards and requirements in this subpart.

Field gas means feedstock gas entering the natural gas processing plant.

Field gas gathering means the system used transport field gas from a field to the main pipeline in the area.

Flare means a thermal oxidation system using an open (without enclosure) flame. Completion combustion devices as defined in this section are not considered flares.

Flow line means a pipeline used to transport oil and/or gas to a processing facility or a mainline pipeline.

Flowback means the process of allowing fluids and entrained solids to flow from a well following a treatment, either in preparation for a subsequent phase of treatment or in preparation for cleanup and returning the well to production. The term flowback also means the fluids and entrained solids that emerge from a well during the flowback process. The flowback period begins when material introduced into the well during the treatment returns to the surface following hydraulic fracturing or refracturing. The flowback period ends when either the well is shut in and permanently disconnected from the flowback equipment or at the startup of production. The flowback period includes the initial flowback stage and the separation flowback stage.

Fugitive emissions component means any component that has the potential to emit fugitive emissions of methane or VOC at a well site or compressor station, including but not limited to valves, connectors, pressure relief devices, open-ended lines, flanges, covers and closed vent systems not subject to §60.5411a, thief hatches or other openings on a controlled storage vessel not subject to §60.5395a, compressors, instruments, and meters. Devices that vent as part of normal operations, such as natural gas-driven pneumatic controllers or natural gas-driven pumps, are not fugitive emissions components, insofar as the natural gas discharged from the device's vent is not considered a fugitive emission. Emissions originating from other than the vent, such as the thief hatch on a controlled storage vessel, would be considered fugitive emissions.

Gas processing plant process unit means equipment assembled for the extraction of natural gas liquids from field gas, the fractionation of the liquids into natural gas products, or other operations associated with the processing of natural gas products. A process unit can operate independently if supplied with sufficient feed or raw materials and sufficient storage facilities for the products.

Gas to oil ratio (GOR) means the ratio of the volume of gas at standard temperature and pressure that is produced from a volume of oil when depressurized to standard temperature and pressure.

Greenfield site means a site, other than a natural gas processing plant, which is entirely new construction. Natural gas processing plants are not considered to be greenfield sites, even if they are entirely new construction.

Hydraulic fracturing means the process of directing pressurized fluids containing any combination of water, proppant, and any added chemicals to penetrate tight formations, such as shale or coal formations, that subsequently require high rate, extended flowback to expel fracture fluids and solids during completions.

Hydraulic refracturing means conducting a subsequent hydraulic fracturing operation at a well that has previously undergone a hydraulic fracturing operation.

In light liquid service means that the piece of equipment contains a liquid that meets the conditions specified in §60.485a(e) or §60.5401a(f)(2).

In wet gas service means that a compressor or piece of equipment contains or contacts the field gas before the extraction step at a gas processing plant process unit.

Initial flowback stage means the period during a well completion operation which begins at the onset of flowback and ends at the separation flowback stage.

Intermediate hydrocarbon liquid means any naturally occurring, unrefined petroleum liquid.

Intermittent/snap-action pneumatic controller means a pneumatic controller that is designed to vent non-continuously.

Liquefied natural gas unit means a unit used to cool natural gas to the point at which it is condensed into a liquid which is colorless, odorless, non-corrosive and non-toxic.

Liquid collection system means tankage and/or lines at a well site to contain liquids from one or more wells or to convey liquids to another site.

Local distribution company (LDC) custody transfer station means a metering station where the LDC receives a natural gas supply from an upstream supplier, which may be an interstate transmission pipeline or a local natural gas producer, for delivery to customers through the LDC's intrastate transmission or distribution lines.

Low pressure well means a well that satisfies at least one of the following conditions:

(1) The static pressure at the wellhead following fracturing but prior to the onset of flowback is less than the flow line pressure at the sales meter;

(2) The pressure of flowback fluid immediately before it enters the flow line, as determined under §60.5432a, is less than the flow line pressure at the sales meter; or

(3) Flowback of the fracture fluids will not occur without the use of artificial lift equipment.

Maximum average daily throughput means the earliest calculation of daily average throughput during the 30-day PTE evaluation period employing generally accepted methods.

Natural gas-driven diaphragm pump means a positive displacement pump powered by pressurized natural gas that uses the reciprocating action of flexible diaphragms in conjunction with check valves to pump a fluid. A pump in which a fluid is displaced by a piston driven by a diaphragm is not considered a diaphragm pump for purposes of this subpart. A lean glycol circulation pump that relies on energy exchange with the rich glycol from the contactor is not considered a diaphragm pump.

Natural gas-driven pneumatic controller means a pneumatic controller powered by pressurized natural gas.

Natural gas liquids means the hydrocarbons, such as ethane, propane, butane, and pentane that are extracted from field gas.

Natural gas processing plant (gas plant) means any processing site engaged in the extraction of natural gas liquids from field gas, fractionation of mixed natural gas liquids to natural gas products, or both. A Joule-Thompson valve, a dew point depression valve, or an isolated or standalone Joule-Thompson skid is not a natural gas processing plant.

Natural gas transmission means the pipelines used for the long distance transport of natural gas (excluding processing). Specific equipment used in natural gas transmission includes the land, mains, valves, meters, boosters, regulators, storage vessels, dehydrators, compressors, and their driving units and appurtenances, and equipment used for transporting gas from a production plant, delivery point of purchased gas, gathering system, storage area, or other wholesale source of gas to one or more distribution area(s).

Nonfractionating plant means any gas plant that does not fractionate mixed natural gas liquids into natural gas products.

Non-natural gas-driven pneumatic controller means an instrument that is actuated using other sources of power than pressurized natural gas; examples include solar, electric, and instrument air.

Onshore means all facilities except those that are located in the territorial seas or on the outer continental shelf.

Pneumatic controller means an automated instrument used for maintaining a process condition such as liquid level, pressure, delta-pressure and temperature.

Pressure vessel means a storage vessel that is used to store liquids or gases and is designed not to vent to the atmosphere as a result of compression of the vapor headspace in the pressure vessel during filling of the pressure vessel to its design capacity.

Process unit means components assembled for the extraction of natural gas liquids from field gas, the fractionation of the liquids into natural gas products, or other operations associated with the processing of natural gas products. A process unit can operate independently if supplied with sufficient feed or raw materials and sufficient storage facilities for the products.

Produced water means water that is extracted from the earth from an oil or natural gas production well, or that is separated from crude oil, condensate, or natural gas after extraction.

Qualified Professional Engineer means an individual who is licensed by a state as a Professional Engineer to practice one or more disciplines of engineering and who is qualified by education, technical knowledge and experience to make the specific technical certifications required under

this subpart. Professional engineers making these certifications must be currently licensed in at least one state in which the certifying official is located.

Reciprocating compressor means a piece of equipment that increases the pressure of a process gas by positive displacement, employing linear movement of the driveshaft.

Reciprocating compressor rod packing means a series of flexible rings in machined metal cups that fit around the reciprocating compressor piston rod to create a seal limiting the amount of compressed natural gas that escapes to the atmosphere, or other mechanism that provides the same function.

Recovered gas means gas recovered through the separation process during flowback.

Recovered liquids means any crude oil, condensate or produced water recovered through the separation process during flowback.

Reduced emissions completion means a well completion following fracturing or refracturing where gas flowback that is otherwise vented is captured, cleaned, and routed to the gas flow line or collection system, re-injected into the well or another well, used as an onsite fuel source, or used for other useful purpose that a purchased fuel or raw material would serve, with no direct release to the atmosphere.

Reduced sulfur compounds means H_2S, carbonyl sulfide (COS), and carbon disulfide (CS_2).

Removed from service means that a storage vessel affected facility has been physically isolated and disconnected from the process for a purpose other than maintenance in accordance with §60.5395a(c)(1).

Returned to service means that a storage vessel affected facility that was removed from service has been:

(1) Reconnected to the original source of liquids or has been used to replace any storage vessel affected facility; or

(2) Installed in any location covered by this subpart and introduced with crude oil, condensate, intermediate hydrocarbon liquids or produced water.

Routed to a process or route to a process means the emissions are conveyed via a closed vent system to any enclosed portion of a process that is operational where the emissions are predominantly recycled and/or consumed in the same manner as a material that fulfills the same function in the process and/or transformed by chemical reaction into materials that are not regulated materials and/or incorporated into a product; and/or recovered.

Salable quality gas means natural gas that meets the flow line or collection system operator specifications, regardless of whether such gas is sold.

Separation flowback stage means the period during a well completion operation when it is technically feasible for a separator to function. The separation flowback stage ends either at the startup of production, or when the well is shut in and permanently disconnected from the flowback equipment.

Startup of production means the beginning of initial flow following the end of flowback when there is continuous recovery of salable quality gas and separation and recovery of any crude oil, condensate or produced water.

Storage vessel means a tank or other vessel that contains an accumulation of crude oil, condensate, intermediate hydrocarbon liquids, or produced water, and that is constructed primarily of nonearthen materials (such as wood, concrete, steel, fiberglass, or plastic) which provide structural support. A well completion vessel that receives recovered liquids from a well after startup of production following flowback for a period which exceeds 60 days is considered a storage vessel under this subpart. A tank or other vessel shall not be considered a storage vessel if it has been removed from service in accordance with the requirements of §60.5395a(c)(1) until such time as such tank or other vessel has been returned to service. For the purposes of this subpart, the following are not considered storage vessels:

(1) Vessels that are skid-mounted or permanently attached to something that is mobile (such as trucks, railcars, barges or ships), and are intended to be located at a site for less than 180 consecutive days. If you do not keep or are not able to produce records, as required by §60.5420a(c)(5)(iv), showing that the vessel has been located at a site for less than 180 consecutive days, the vessel described herein is considered to be a storage vessel from the date the original vessel was first located at the site. This exclusion does not apply to a well completion vessel as described above.

(2) Process vessels such as surge control vessels, bottoms receivers or knockout vessels.

(3) Pressure vessels designed to operate in excess of 204.9 kilopascals and without emissions to the atmosphere.

Sulfur production rate means the rate of liquid sulfur accumulation from the sulfur recovery unit.

Sulfur recovery unit means a process device that recovers element sulfur from acid gas.

Surface site means any combination of one or more graded pad sites, gravel pad sites, foundations, platforms, or the immediate physical location upon which equipment is physically affixed.

Sweetening unit means a process device that removes hydrogen sulfide and/or carbon dioxide from the sour natural gas stream.

Total Reduced Sulfur (TRS) means the sum of the sulfur compounds hydrogen sulfide, methyl mercaptan, dimethyl sulfide, and dimethyl disulfide as measured by Method 16 of appendix A-6 of this part.

Total SO_2 equivalents means the sum of volumetric or mass concentrations of the sulfur compounds obtained by adding the quantity existing as SO_2 to the quantity of SO_2 that would be obtained if all reduced sulfur compounds were converted to SO_2 (ppmv or kg/dscm (lb/dscf)).

Underground storage vessel means a storage vessel stored below ground.

Well means a hole drilled for the purpose of producing oil or natural gas, or a well into which fluids are injected.

Well completion means the process that allows for the flowback of petroleum or natural gas from newly drilled wells to expel drilling and reservoir fluids and tests the reservoir flow characteristics, which may vent produced hydrocarbons to the atmosphere via an open pit or tank.

Well completion operation means any well completion with hydraulic fracturing or refracturing occurring at a well affected facility.

Well completion vessel means a vessel that contains flowback during a well completion operation following hydraulic fracturing or refracturing. A well completion vessel may be a lined earthen pit, a tank or other vessel that is skid-mounted or portable. A well completion vessel that receives recovered liquids from a well after startup of production following flowback for a period which exceeds 60 days is considered a storage vessel under this subpart.

Well site means one or more surface sites that are constructed for the drilling and subsequent operation of any oil well, natural gas well, or injection well. For purposes of the fugitive emissions standards at §60.5397a, well site also means a separate tank battery surface site collecting crude oil, condensate, intermediate hydrocarbon liquids, or produced water from wells not located at the well site (e.g., centralized tank batteries).

Wellhead means the piping, casing, tubing and connected valves protruding above the earth's surface for an oil and/or natural gas well. The wellhead ends where the flow line connects to a wellhead valve. The wellhead does not include other equipment at the well site except for any conveyance through which gas is vented to the atmosphere.

Wildcat well means a well outside known fields or the first well drilled in an oil or gas field where no other oil and gas production exists.

§60.5432a How do I determine whether a well is a low pressure well using the low pressure well equation?

(a) To determine that your well is a low pressure well subject to §60.5375a(f), you must determine whether the characteristics of the well are such that the well meets the definition of

low pressure well in §60.5430a. To determine that the well meets the definition of low pressure well in §60.5430a, you must use the low pressure well equation below:

View or download PDF

Where:

(1) P_L is the pressure of flowback fluid immediately before it enters the flow line, expressed in pounds force per square inch (psia), and is to be calculated using the equation above;

(2) P_R is the pressure of the reservoir containing oil, gas, and water at the well site, expressed in psia;

(3) $L$is the true vertical depth of the well, expressed in feet (ft);

(4) q_o is the flow rate of oil in the well, expressed in cubic feet/second (cu ft/sec);

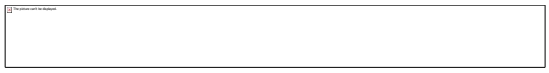
(5) q_g is the flow rate of gas in the well, expressed in cu ft/sec;

(6) q_w is the flow rate of water in the well, expressed in cu ft/sec;

(7) ρ_o is the density of oil in the well, expressed in pounds mass per cubic feet (lbm/cu ft).

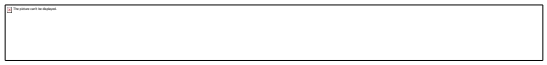
(b) You must determine the four values in paragraphs (a)(4) through (7) of this section, using the calculations in paragraphs (b)(1) through (b)(15) of this section.

(1) Determine the value of the bottom hole pressure, P_{BH} (*psia*), based on available information at the well site, or by calculating it using the reservoir pressure, P_R (*psia*), in the following equation:



View or download PDF

(2) Determine the value of the bottom hole temperature, T_{BH} (*F*), based on available information at the well site, or by calculating it using the true vertical depth of the well, *L (ft)*, in the following equation:



T_{BH} (*F*) = (0.014 × *L*) + 79.081

(3) Calculate the value of the applicable natural gas specific gravity that would result from a separator pressure of 100 psig, γ_{gs}, using the following equation with: Separator at standard conditions (pressure, *p* = 14.7 (*psia*), temperature, T = 60 (*F*)); the oil API gravity at the well site, γ_0; and the gas specific gravity at the separator under standard conditions, γ_{gp} = 0.75:

View or download PDF

(4) Calculate the value of the applicable dissolved GOR, *Rs (scf/STBO)*, using the following equation with: The bottom hole pressure, P_{BH} (*psia*), determined in (b)(1) of this section; the bottom hole temperature, T_{BH} (*F*), determined in (b)(2) of this section; the gas gravity at separator pressure of 100 psig, γ_{gs}, calculated in (b)(3) of this section; the oil API gravity, γ_o, at the well site; and the constants, C1, C2, and C3, found in Table A:

View or download PDF

Table A—Coefficients for the correlation for R_s

Constant	$\gamma_{API} \leq 30$	$\gamma_{API} > 30$
C1	0.0362	0.0178
C2	1.0937	1.1870
C3	25.7240	23.931

(5) Calculate the value of the oil formation volume factor, *Bo (bbl/STBO)*, using the following equation with: the bottom hole temperature, T_{BH} (*F*), determined in paragraph (b)(2) of this section; the gas gravity at separator pressure of 100 psig, γ_{gs}, calculated in paragraph (b)(3) of this section; the dissolved GOR, Rs (scf/STBO), calculated in paragraph (b)(4) of this section; the oil API gravity, γo, at the well site; and the constants, C1, C2, and C3, found in Table B:

View or download PDF

Table B—Coefficients for the Correlation for B_o

Constant	$\gamma_{API} \leq 30$	$\gamma_{API} > 30$
C1	4.677×10^{-4}	4.670×10^{-4}
C2	1.751×10^{-5}	1.100×10^{-5}
C3	-1.811×10^{-8}	1.337×10^{-9}

(6) Calculate the density of oil at the wellhead,

View or download PDF

using the following equation with the value of the oil API gravity, γo, at the well site:

View or download PDF

(7) Calculate the density of oil at bottom hole conditions,

View or download PDF

using the following equation with: the dissolved GOR, Rs (scf/ STBO), calculated in paragraph (b)(4) of this section; the oil formation volume factor, Bo (bbl/ STBO), calculated in paragraph (b)(5) of this section; the oil density at the wellhead,

View or download PDF

calculated in paragraph (b)(6) of this section; and the dissolved gas gravity, $\gamma_{gd} = 0.77$:

View or download PDF

(8) Calculate the density of oil in the well,

View or download PDF

using the following equation with the density of oil at the wellhead,

View or download PDF

calculated in paragraph (b)(6) of this section; and the density of oil at bottom hole conditions,

View or download PDF

calculated in paragraph (b)(7) of this section:

View or download PDF

(9) Calculate the oil flow rate, q_o (*cu ft/sec,*) using the following equation with: the oil formation volume factor, *Bo* (bbl/ STBO), as calculated in paragraph (b)(5) of this section; and the estimated oil production rate at the well head, *Qo* (STBO/ day):

View or download PDF

(10) Calculate the critical pressure, P_c (psia), and critical temperature, T_c (R), using the equations below with: Gas gravity at standard conditions (pressure, $P = 14.7$ (*psia*), temperature, $T = 60$ (*F*)), $\gamma = 0.75$; and where the mole fractions of nitrogen, carbon dioxide and hydrogen sulfide in the gas are $X_{N_2} = 0.168225$, $X_{CO_2} = 0.013163$, and $X_{H_2S} = 0.013680$, respectively:

$$P_c(psia) = 678 - 50 \cdot (\gamma_g - 0.5) - 206.7 \cdot X_{N_2} + 440 \cdot X_{CO_2} + 606.7 \cdot X_{H_2S}$$

$$T_c(R) = 326 + 315.7 \cdot (\gamma_g - 0.5) - 240 \cdot X_{N_2} - 88.3 \cdot X\mathrm{CO}_2 + 133.3 \cdot X_{H_2S}$$

(11) Calculate reduced pressure, P_r, and reduced temperature, T_r, using the following equations with: the bottom hole pressure, P_{BH}, as determined in paragraph (b)(1) of this section; the bottom hole temperature, T_{BH} (*F*), as determined in paragraph (b)(2) of this section in the following equations:

View or download PDF

View or download PDF

(12)(i) Calculate the gas compressibility factor, *Z*, using the following equation with the reduced pressure, P_r, calculated in paragraph (b)(11) of this section:

View or download PDF

(ii) The values for A, B, C, D in the above equation, are calculated using the following equations with the reduced pressure, P_r, and reduced temperature, T_r, calculated in paragraph (b)(11) of this section:

View or download PDF

(13) Calculate the gas formation volume factor,

View or download PDF

using the bottom hole pressure, P_{BH} *(psia)*, as determined in paragraph (b)(1) of this section; and the bottom hole temperature, T_{BH} *(F)*, as determined in paragraph (b)(2) of this section:

View or download PDF

(14) Calculate the gas flow rate,

View or download PDF

using the following equation with: the value of gas formation volume factor,

View or download PDF

calculated in paragraph (b)(13) of this section; the estimated gas production rate, Qg (scf/ day); the estimated oil production rate, Qo (STBO/ day); and the dissolved GOR, Rs (scf/ STBO), as calculated in paragraph (b)(4) of this section:

View or download PDF

(15) Calculate the flow rate of water in the well, q_w (*cu ft/sec*), using the following equation with the water production rate Qw (bbl/day) at the well site:

§§60.5433a-60.5499a [Reserved]

Back to Top

Table 1 to Subpart OOOOa of Part 60—Required Minimum Initial SO_2 Emission Reduction Efficiency (Z_i)

H_2S content of acid gas (Y), %	Sulfur feed rate (X), LT/D			
	2.0 < X < 5.0	**5.0 < X < 15.0**	**15.0 < X < 300.0**	**X > 300.0**
Y > 50	79.0	$88.51X^{0.0101}Y^{0.0125}$ or 99.9, whichever is smaller.		
20 < Y < 50	79.0	$88.51X^{0.0101}Y^{0.0125}$ or 97.9, whichever is smaller		97.9
10 < Y < 20	79.0	$88.51X^{0.0101}Y^{0.0125}$ or 93.5, whichever is smaller	93.5	93.5
Y < 10	79.0	79.0	79.0	79.0

Back to Top

Table 2 to Subpart OOOOa of Part 60—Required Minimum SO_2 Emission Reduction Efficiency (Z_c)

H_2S content of acid gas (Y), %	Sulfur feed rate (X), LT/D			
	2.0 < X < 5.0	**5.0 < X < 15.0**	**15.0 < X < 300.0**	**X > 300.0**
Y > 50	74.0	$85.35X^{0.0144}Y^{0.0128}$ or 99.9, whichever is smaller.		
20 < Y < 50	74.0	$85.35X^{0.0144}Y^{0.0128}$ or 97.5, whichever is smaller		97.5
10 < Y < 20	74.0	$85.35X^{0.0144}Y^{0.0128}$ or 90.8, whichever is smaller	90.8	90.8
Y < 10	74.0	74.0	74.0	74.0

X = The sulfur feed rate from the sweetening unit (*i.e.,* the H_2S in the acid gas), expressed as sulfur, Mg/D(LT/D), rounded to one decimal place.

Y = The sulfur content of the acid gas from the sweetening unit, expressed as mole percent H_2S (dry basis) rounded to one decimal place.

Z = The minimum required sulfur dioxide (SO_2) emission reduction efficiency, expressed as percent carried to one decimal place. Z_i refers to the reduction efficiency required at the initial

performance test. Z_c refers to the reduction efficiency required on a continuous basis after compliance with Z_i has been demonstrated.

As stated in §60.5425a, you must comply with the following applicable General Provisions:

Back to Top

Table 3 to Subpart OOOOa of Part 60—Applicability of General Provisions to Subpart OOOOa

General provisions citation	Subject of citation	Applies to subpart?	Explanation
§60.1	General applicability of the General Provisions	Yes	
§60.2	Definitions	Yes	Additional terms defined in §60.5430a.
§60.3	Units and abbreviations	Yes	
§60.4	Address	Yes	
§60.5	Determination of construction or modification	Yes	
§60.6	Review of plans	Yes	
§60.7	Notification and record keeping	Yes	Except that §60.7 only applies as specified in §60.5420a(a).
§60.8	Performance tests	Yes	Performance testing is required for control devices used on storage vessels, centrifugal compressors and pneumatic pumps.
§60.9	Availability of information	Yes	
§60.10	State authority	Yes	
§60.11	Compliance with standards and maintenance requirements	No	Requirements are specified in subpart OOOOa.
§60.12	Circumvention	Yes	
§60.13	Monitoring requirements	Yes	Continuous monitors are required for storage vessels.
§60.14	Modification	Yes	To the extent any provision in §60.14 conflicts with specific provisions in subpart

			OOOOa, it is superseded by subpart OOOOa provisions.
§60.15	Reconstruction	Yes	Except that §60.15(d) does not apply to wells, pneumatic controllers, pneumatic pumps, centrifugal compressors, reciprocating compressors or storage vessels.
§60.16	Priority list	Yes	
§60.17	Incorporations by reference	Yes	
§60.18	General control device and work practice requirements	Yes	
§60.19	General notification and reporting requirement	Yes

DEPARTMENT OF ENVIRONMENTAL PROTECTION

GENERAL PLAN APPROVAL AND/OR GENERAL OPERATING PERMIT
BAQ-GPA/GP-5

Natural Gas Compression Stations, Processing Plants, and Transmission Stations

SECTION A. GENERAL REQUIREMENTS

1. Statutory/Regulatory Authority and General Description

In accordance with Section 6.1(f) of the Pennsylvania Air Pollution Control Act (APCA), 35 P.S. § 4006.1(f) and 25 Pa. Code Chapter 127, Subchapter H, the Department of Environmental Protection (Department or DEP) hereby issues this General Plan Approval and/or General Operating Permit (General Permit or GP-5) for new or modified natural gas compressor stations, processing plants, and transmission stations (facility or facilities) constructed, modified, or operated in this Commonwealth.

3. Definitions

Words and terms that are not otherwise defined in this General Permit shall have the meanings set forth in Section 3 of the APCA (35 P.S. § 4003) and Title 25, Article III including 25 Pa. Code § 121.1 unless the context indicates otherwise. The meanings set forth in applicable definitions codified in the Code of Federal Regulations (CFR), including 40 CFR Part 60, Subparts KKK, JJJJ, KKKK, OOOO, and OOOOa or 40 CFR Part 63, Subparts HH and ZZZZ, shall also apply to this General Permit.

SAMPLE

Coal Bed Methane – Methane that is extracted from a coal bed and the surrounding rock strata by extraction wells drilled in advance of a mining operation, which is typically of pipeline quality.

Fugitive Emissions Component – Any component that has the potential to emit fugitive emissions of methane, Volatile Organic Compounds (VOC), or Hazardous Air Pollutants (HAP) at a natural gas compressor station, processing plant, or transmission station including, but not limited to, valves, connectors, pressure relief devices, open-ended lines, flanges, compressors, instruments, meters, covers, and closed vent systems. Devices that vent as part of normal operations are not considered fugitive sources unless the emission originates from a place other than the vent.

Gob Gas – Methane that is mixed with air from a mine ventilation system due to the mining operation reaching the area of an extraction well, which is typically below pipeline quality.

Leak – A leak is defined as any release of gaseous hydrocarbons that is detected by Auditory, Visual, or Olfactory (AVO) inspection; an optical gas imaging (OGI) camera calibrated according to 40 CFR § 60.18 and a detection sensitivity level of 60 grams/hour; a gas leak detector that meets the requirements of 40 CFR Part 60, Appendix A-7, Method 21 that detects a concentration of 500 ppm calibrated as methane or greater; or other leak detection methods approved by the Department's Division of Source Testing and Monitoring. However, a release from any equipment or component designed by the manufacturer to protect the equipment, controller, or personnel or to prevent groundwater contamination, gas migration, or an emergency situation is not considered a leak.

Natural Gas Compressor Station – A facility that compresses and/or processes natural gas, coal bed methane, or gob gas prior to the point of custody transfer using processes including, but not limited to, gas dehydration, compression, pigging, and storage.

Natural Gas Processing Plant – A facility that engages in the extraction of natural gas liquids from field gas, the fractionation of mixed natural gas liquids to natural gas products, or both extracts and fractionates natural gas liquids.

Natural Gas Transmission Station – A facility that compresses and/or processes natural gas after the point of custody transfer using processes including, but not limited to, gas dehydration, compression, pigging, and storage.

Pigging Operations – The process of removing and collecting condensed liquids including condensate, intermediate hydrocarbons, or produced water, from a pipeline using a spherical or bullet-shaped device, known as a pig, forced through the pipeline by natural gas pressure. The liquids are then collected at their eventual destination in a storage tank, often referred to as a slug tank. This process also includes an operation conducted for a pipeline integrity evaluation.

Point of Custody Transfer – The location after the processing and/or treatment of natural gas in the production sector, typically after a natural gas processing plant, where control and/or ownership of the natural gas is transferred from one owner or operator to another.

Sour Gas – Natural gas where the Hydrogen Sulfide (H_2S) content is in excess of 4 ppmv at standard temperature and pressure.

4. Applicability/Scope

(a) This General Permit authorizes the construction, modification, and/or operation of a natural gas compressor station, processing plant, or transmission station. The applicability of this General Permit may include one or more of the following operations or emission sources:

- (i) Glycol Dehydration Units
- (ii) Stationary Natural Gas-Fired Spark Ignition Internal Combustion Engines
- (iii) Reciprocating Compressors
- (iv) Storage Vessels
- (v) Tanker Truck Load-Out Operations
- (vi) Fugitive Emissions Components
- (vii) Natural Gas-Driven Pneumatic Controllers
- (viii) Natural Gas-Driven Pneumatic Pumps
- (ix) Enclosed Flares and Other Emission Control Devices
- (x) Pigging Operations

SAMPLE

(xi) Natural Gas-Fired Combustion Units
(xii) Stationary Natural Gas-Fired Combustion Turbines
(xiii) Centrifugal Compressors

(b) An Application for Authorization to Use GP-5 may be submitted for the operation of an eligible source if the source is exempted from plan approval requirements under 25 Pa. Code § 127.14.

(c) If any source located at the facility cannot be regulated under this General Permit, a plan approval and/or an operating permit issued in accordance with 25 Pa. Code, Chapter 127, Subchapter B and/or Subchapter F will be required.

5. Prohibited Use of GP-5

GP-5 may not be used for the construction, modification, or operation of any of the following air contamination sources:

(a) A proposed source located at a Title V facility including sources determined to be a single source Title V facility.

(b) A proposed source that is subject to Title V permitting requirements specified in 25 Pa. Code Chapter 127, Subchapters F and G; prevention of significant deterioration requirements specified in 25 Pa. Code Chapter 127 Subchapter D; or nonattainment new source review requirements specified in 25 Pa. Code Chapter 127 Subchapter E.

(c) A facility that produces or processes sour gas.

(d) *Circumvention.*

(i) The owner or operator of a facility may not circumvent the new source review requirements of 25 Pa. Code Chapter 127, Subchapter E by causing or allowing a pattern of ownership or development, including the phasing, staging, delaying, or engaging in incremental construction over a geographic area of a facility which, except for the pattern of ownership or development, would otherwise require a permit or submission of a plan approval application.

(ii) No person may permit the use of a device, stack height that exceeds good engineering practice, dispersion technique, or other technique that, without resulting in reduction of the total amount of air contaminants emitted, conceals or dilutes an emission of air contaminants that would otherwise be in violation of this General Permit, the APCA, or the regulations promulgated thereunder, except for those that are used for the control of malodors with the prior written approval of the Department.

6. Authorization to Use GP-5

(a) *Application for Authorization to Use GP-5.* Pursuant to 25 Pa. Code § 127.621, any person proposing to construct, operate, or modify a source listed in Section A, Condition 4 of this General Permit at a natural gas compressor station, processing plant, or transmission station shall submit an Application for Authorization to Use GP-5 to the Air Program Manager of the appropriate DEP Regional Office responsible for authorizing the use of the General Permit in the county in which the facility will be located. This application shall be submitted to DEP either through the e-Permitting system, by hand delivery, courier, or sent to DEP by certified mail, return receipt requested, in accordance with 25 Pa. Code § 127.621(b).

(b) *Terms of Authorization to Use GP-5.* This General Permit authorizes the construction and/or operation of the specific sources at the specific facility as described in the application for a term of five years from the date of authorization. The authorization to construct a source or facility will expire 18 months from the date of the authorization if the owner or operator fails to commence construction or if there is a lapse in construction of 18 months. The Department may extend the 18-month period upon an owner or operator providing satisfactory justification for an extension up to the original date of the five-year term. All requests for extension shall be submitted to the Department at least 30 days prior to the end of the 18-month period and are only valid upon receipt of written approval by the Department. The expiration of the authorization to construct will require a new Application for Authorization to Use GP-5 if an extension is not requested and granted.

(c) *Expiration of and Re-Authorization to Use GP-5.*

(i) The authorization granted by the Department to construct and/or operate under this General Permit shall terminate on the date of expiration unless a complete Application for Authorization to Use GP-5 is submitted to the Department at least 30 calendar days prior to the expiration date.

SAMPLE

(ii) Upon receipt by the Department of a timely, administratively and technically complete application for re-authorization to operate under this General Permit, the owner or operator may continue to operate the facility subject to final action by the Department provided that the sources and the facility are operated in compliance with the terms and conditions of this General Permit. The Authorization to Use GP-5 shall cease if the owner or operator fails to submit any additional information requested by the Department to process the application by the specified deadline.

(d) *Transfer of Ownership.* The Authorization to Use GP-5 may not be transferred from the owner or operator of a facility except when the change of ownership is demonstrated to the satisfaction of the Department and the Department approves the transfer in writing. Within 30 calendar days after a transfer of ownership of the facility, the new owner or operator shall submit an appropriate form or application to the Air Program Manager of the appropriate Regional Office. If the owner or operator is modifying any existing source or adding a new source at the facility currently authorized by the General Permit, the owner or operator shall submit an Application for Authorization to Use GP-5 in accordance with Condition 6(a) above. If there are equipment or activities located on the same site or on sites that share equipment and are within ¼ mile of each other, the owner or operator shall submit an Application for Authorization to use GP-5 as a General Plan Approval with a $1,000 application fee. If the owner or operator is not modifying any existing source, not adding a new source, or not subject to a new Single Source Determination based on the transfer of ownership, the owner or operator shall submit a Transfer of Ownership form with a $300 fee. The employer I.D. number (Federal IRS No.) shall be used as a test to determine if a transfer of ownership has occurred.

(e) *Administrative Amendment.* In the event of a change in the name, address, or telephone number of a person identified in the General Permit Application or a similar minor administrative change at the facility, the Department may authorize an administrative amendment. The owner or operator shall submit a brief description of the change and the date on which the change is to occur in a letter signed by the Responsible Official with the fee specified in Condition 7(e) to the Air Program Manager of the appropriate Regional Office.

(f) *Modification, Suspension, or Revocation of GP-5 or Authorizations to Use GP-5.*

(i) The Department may modify, suspend, or revoke and reissue this General Permit if it is determined that GP-5 does not comply with the Clean Air Act, the APCA, or regulations adopted under the acts.

(ii) This General Permit may be modified, suspended, or revoked if the Department determines that the natural gas compressor station, processing plant, or transmission station cannot be adequately regulated under this General Permit.

(iii) An Authorization to Use GP-5 may be suspended or revoked if the Department determines that, at any time, the owner or operator has failed to construct and/or operate the facility in compliance with the terms and conditions of this General Permit, the specifications in the Application for Authorization to Use GP-5, or the information provided in the supplemental material included with the application used to determine if the proposed sources will comply with the GP-5.

(iv) Upon suspension or revocation of an Authorization to Use GP-5, the owner or operator shall immediately cease construction and/or operation of the facility. The owner or operator of the facility shall not restart construction and/or operation prior to the receipt of written approval from the Department.

7. General Permit Fees

Each applicant seeking Authorization to Use GP-5 shall submit the applicable fees required under this Condition to the appropriate DEP Regional Office. The following fee schedules apply to this General Permit:

(a)	General Plan Approval Application Fee for Sources Subject to and Review of NSPS, payable upon submission of the application:	$1,700
(b)	General Plan Approval Application Fee with new Single Source Determination, payable upon submission of the application:	$1,000
(c)	General Operating Permit Application Fee, payable upon submission of the application:	$ 375
(d)	Annual Operating Permit Administration Fee, payable by March 1st for the previous calendar year:	$ 375
(e)	Administrative Amendment Fee, payable upon submission of the letter in Condition 6(e):	$ 300

SAMPLE

(f) The Department may increase the applicable fees for this General Plan Approval/General Operating Permit in accordance with the applicable fee schedules in 25 Pa. Code Chapter 127, Subchapter I, following notice in the *Pennsylvania Bulletin*.

8. Applicable Laws

(a) It is the duty of the Responsible Official, as defined in 25 Pa. Code § 121.1, to ensure that the facility is in compliance with all applicable federal, state, and local laws and regulations, including 25 Pa. Code, Subpart C, Article III. Nothing in this General Permit relieves the Responsible Official from this obligation to comply.

(b) Applicable federal regulations may include, but are not limited to, the following New Source Performance Standards (NSPS), codified at 40 CFR Part 60 and incorporated by reference in 25 Pa. Code § 122.3, and National Emission Standards for Hazardous Air Pollutants (NESHAP), codified at 40 CFR Part 63 and incorporated by reference in 25 Pa. Code § 127.35:

(i) **40 CFR Part 60, Subpart KKK** – Standards of Performance for Equipment Leaks of VOC from Onshore Natural Gas Processing Plants for which Construction, Reconstruction, or Modification Commenced After January 20, 1984, and on or before August 23, 2011.

(ii) **40 CFR Part 60, Subpart JJJJ** – Standards of Performance for Stationary Spark Ignition Internal Combustion Engines.

(iii) **40 CFR Part 60, Subpart KKKK** – Standards of Performance for Stationary Combustion Turbines.

(iv) **40 CFR Part 60, Subpart OOOO** – Standards of Performance for Crude Oil and Natural Gas Production, Transmission, and Distribution for which Construction, Modification, or Reconstruction Commenced after August 23, 2011, and on or before September 18, 2015.

(v) **40 CFR Part 60, Subpart OOOOa** – Standards of Performance for Crude Oil and Natural Gas Facilities for which Construction, Modification, or Reconstruction Commenced after September 18, 2015.

(vi) **40 CFR Part 63, Subpart HH** – National Emission Standards for Hazardous Air Pollutants from Oil and Natural Gas Production Facilities.

(vii) **40 CFR Part 63, Subpart ZZZZ** – National Emission Standards for Hazardous Air Pollutants for Reciprocating Internal Combustion Engines.

9. Best Available Technology Requirements

New sources are required to control the emission of air pollutants to the maximum extent, consistent with best available technology (BAT) as determined by the Department as of the date of issuance of the plan approval for the new source as required under 25 Pa. Code § 127.1. Condition 1 (BAT Compliance Requirements) of Sections B through N of this General Permit are determined to meet the BAT requirements.

10. Compliance Requirements and Compliance Certification

(a) The emissions from all sources and associated air pollution control equipment located at a natural gas compressor station, processing plant, or transmission station and other sources determined by the Department to be a single source shall not equal or exceed either of the following on a 12-month rolling sum basis:

(i) Nitrogen Oxides (NO_X) – 100 tons

(ii) Carbon Monoxide (CO) – 100 tons

(iii) Sulfur Oxides (SO_X) – 100 tons

(iv) Particulate Matter with an aerodynamic diameter less than 10 microns (PM_{10}) – 100 tons

(v) Particulate Matter with an aerodynamic diameter less than 2.5 microns ($PM_{2.5}$) – 100 tons

(vi) Volatile Organic Compounds (VOC) – 50 tons

(vii) Any individual Hazardous Air Pollutant (HAP) – 10 tons

(viii) Total Hazardous Air Pollutants (HAP) – 25 tons

SAMPLE

(ix) In addition, the emissions from all sources and associated air pollution control equipment located at a facility in Bucks, Chester, Delaware, Montgomery, or Philadelphia Counties shall not equal or exceed any of the following on a 12-month rolling sum basis:

(A) NO_X – 25 tons

(B) VOC – 25 tons

(b) The facility throughput, hours of operation, and/or emissions from sources at the facility shall be constrained as necessary to not exceed any facility-wide emissions cap required in (a) above.

(c) All sources and associated air pollution control equipment located at a facility shall be:

(i) Operated in such a manner as not to cause air pollution, as that term is defined in 25 Pa. Code § 121.1;

(ii) Operated and maintained in accordance with the manufacturer's specifications, procedures, and recommended maintenance schedule, as provided in the Application for Authorization to Use GP-5, or an alternate procedure approved by the Department that achieves equal or greater emissions reductions in accordance with 25 Pa. Code § 127.12b;

(iii) Operated and maintained in accordance with the fugitive emission requirements of 25 Pa. Code § 123.1 and § 123.2; **and**

(iv) Operated and maintained in such a manner that malodors are not detectable outside the property of the owner or operator on whose land the facility is being operated in accordance with 25 Pa. Code § 123.31.

(d) The owner or operator of an existing facility where a new source is installed or there is a modification of an existing source, shall comply with the applicable BAT requirements established in this General Permit.

(e) This General Permit cannot be used to relax BAT or other emission limitations or requirements previously established through the air quality permitting process.

(f) An owner or operator of a facility may apply to the Department for a plan approval for any air contamination source in lieu of seeking authorization to use the General Permit for natural gas compressor stations, processing plants, or transmission stations.

(g) The owner or operator authorized to use this General Permit shall comply with the specifications in the application and the terms and conditions of this General Permit.

(h) The owner or operator of the facility shall submit to the Air Program Manager of the appropriate DEP Regional Office an annual certification of compliance with the terms and conditions in the GP-5 for the previous year, including the emission limitations, standards, or work practices. This Compliance Certification Form must be included in the annual report as outlined in Condition 13(c)(vi).

11. Notification Requirements

(a) *Municipal Notification.* The facility owner or operator proposing to use this General Permit shall notify the local municipality and county where the air pollution source is to be located that they have applied for an Authorization to Use GP-5. The notification shall clearly describe the proposed sources and/or modifications.

(b) The owner or operator shall notify the Air Program Manager of the appropriate DEP Regional Office, in writing, at least five business days prior to the commencement of operation of a source of their intent to do so. The owner or operator shall also include the date of completion of construction of the source in the notice. When multiple sources at the facility are subject to different commencement of operation schedules, written notice shall be submitted to DEP prior to the commencement of operation of each source.

(c) *Malfunctions.*

(i) Any malfunction that poses an imminent danger to the public health, safety, or welfare or to the environment shall be reported by telephone to the County Emergency Management Agency and to the 24-hour Emergency Hotline at 1-800-541-2050 no later than one hour after the discovery of an incident. Following the telephone or email notification, a written notice as specified in (iv) below shall be submitted to DEP within three business days.

(ii) Any malfunction that does not pose an imminent danger to the public health, safety, or welfare or to the environment shall follow the guidance provided in the GP-5 and GP-5A Malfunction Reporting Instructions

SAMPLE

and, if required to report, shall notify the Air Program Manager of the appropriate DEP Regional Office by telephone or email within 24 hours of discovery. Following the telephone or email notification, a written notice as specified in (iv) below shall be submitted to DEP within five business days.

(iii) If the owner or operator is unable to provide notification by telephone to the Air Program Manager of the appropriate DEP Regional Office within 24 hours of the discovery of a malfunction due to a weekend or holiday, the notification shall be made to the Department no later than 4:00 pm on the first business day following the weekend or holiday.

(iv) Written notification shall include:

(A) The name, GP-5 authorization number, and location of the facility;

(B) The nature and cause of the malfunction or incident;

(C) The date and time when the malfunction, incident, or breakdown was first discovered;

(D) The expected duration of increased emissions;

(E) The estimated rate of emissions for all criteria, hazardous, and greenhouse gas pollutants; **and**

(F) Any changes to the equipment or modification of the procedures that will prevent reoccurrences of the malfunction.

(v) The owner or operator shall notify the Air Program Manager of the appropriate DEP Regional Office by telephone or email within 24 hours of when corrective measures have been implemented.

(vi) Any emissions due to a malfunction are to be reported in the annual emissions inventory report required in Condition 13(d).

12. Recordkeeping Requirements

(a) All records required must be maintained onsite or at the nearest local field office for a minimum of 5 years and may be maintained in electronic format.

(b) The owner or operator of the facility shall generate and maintain records that clearly demonstrate to the Department that the facility is not a Title V facility and that the facility is in compliance with facility-wide emission limitations. At a minimum, the records shall be maintained on a monthly basis, and the actual emissions shall be calculated on a 12-month rolling sum. The Department reserves the right to request additional information necessary to determine compliance with the General Permit.

(c) The owner or operator of the facility shall keep records of all written notifications required under permit conditions.

13. Reporting Requirements

(a) The owner or operator of a natural gas compressor station, processing plant, or transmission station shall submit to the Air Program Manager of the appropriate DEP Regional Office all requests, reports, applications, submittals, and other communications concerning applicable federal NSPS and NESHAP.

(b) In accordance with 40 CFR §§ 60.4 and 63.10, copies of all requests, reports, applications, submittals, and other communications shall also be submitted to the EPA via the Compliance and Emissions Data Reporting Interface (CEDRI) accessible at https://cdx.epa.gov unless electronic reporting is not available, in which case a copy shall be sent to the following address:

United States Environmental Protection Agency, Region III
Office of Air Enforcement and Compliance Assistance (3AP20)
1650 Arch St.
Philadelphia, PA 19103-2029

(c) The annual report is required to be submitted either in electronic format, by hand-delivery, courier, or sent by certified mail, return receipt requested, to the Air Program Manager of the appropriate DEP Regional Office, the reporting period specified by the owner/operator shall be no later than one year from the start of operations of the facility, unless otherwise approved by the Department. The initial and subsequent annual reports shall be submitted within 60 days of the end of the reporting periods. General information required on all reports includes:

(i) Company Name;

SAMPLE

(ii) Facility Site Name;

(iii) The GP-5 authorization number;

(iv) Either:

(A) The address of the site; **or**

(B) A description of the site and the location using latitude and longitude coordinates of the site in decimal degrees to an accuracy and precision of 5 decimal degrees using the North American Datum of 1983;

(v) The beginning and ending dates of the reporting period;

(vi) The Certification Form described in Condition 10(h), which must include:

(A) The statement: "Based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate, and complete."; **and**

(B) The signature of the certifying Responsible Official;

(vii) Identification of each source included in the report;

(viii) The identification of each term or condition of the GP-5 that is the basis of the certification, the compliance status, and the methods used for determining the compliance status of the source, currently and over the reporting period as identified in Sections B through N of this General Permit; **and**

(ix) The records of the facility's emissions to demonstrate compliance with Condition 12(b).

(d) In accordance with 25 Pa. Code § 135.3, the owner or operator of a facility shall submit to the Department via AES*Online or AES*XML at www.depgreenport.state.pa.us/ by March 1st of each year, a facility inventory report for the preceding calendar year for all sources regulated under this General Permit. The inventory report shall include all emissions information for all sources operated during the preceding calendar year from the annual report required in (c) above. Emissions data including, but not limited, to the following shall be reported:

(i) NO_X;

(ii) CO;

(iii) SO_X;

(iv) PM_{10};

(v) $PM_{2.5}$;

(vi) VOC;

(vii) Speciated HAP including, but not limited to, benzene, ethyl benzene, formaldehyde, n-hexane, toluene, isomers and mixtures of xylenes, and 2,2,4-trimethylpentane;

(viii) Total HAP;

(ix) CO_2;

(x) CH_4; **and**

(xi) N_2O.

14. Source Testing Requirements

(a) In addition to the specific performance testing requirements included in this General Permit, the Department may require the owner or operator to conduct a source test if it is determined that the air contaminant emissions from a source operating under this General Permit are, or may be, in excess of an applicable air contaminant emission limitation.

(b) The Department may alter the frequency of performance test requirements for reauthorization based on available performance data from the source, unless required by federal regulation.

SAMPLE

(c) All testing, with the exception of periodic monitoring, shall be performed in accordance with any applicable federal regulations, 25 Pa. Code, Chapter 139, and the current version of the Department's Source Testing Manual, or an alternative test method as approved by the Department.

(d) All submittals, with the exception of periodic monitoring data, shall meet the applicable requirements specified in the most current version of the Department's Source Testing Manual.

(e) One electronic copy **and** one printed copy of all reports, protocols, and test completion notifications, with the exception of periodic monitoring data, shall be submitted either by hand-delivery, courier, or sent by certified mail, return receipt requested, to the Air Program Manager of the appropriate DEP Regional Office **and** to the PSIMS Administrator for the Source Testing Section in DEP's Central Office.

(f) At least 60 calendar days prior to commencing an emission testing program to demonstrate compliance required by this General Permit, a Test Protocol shall be submitted in accordance with (e) above for review and approval. An operator may request an approval from the Department for a test protocol that covers testing of all currently operated sources in service at that operator's various facilities. In such a request, the operator will submit the test protocol in accordance with (e) above for review and approval and include a list of currently permitted sources. If the owner or operator has a test protocol, previously approved by the Department, a new test protocol does not need to be submitted for review/approval, provided that there are no changes, including the testing contractor, and the owner/operator agrees to comply with all conditions of acceptance in the letter approving the protocol.

(g) At least 30 calendar days prior to commencing an emission testing program to demonstrate compliance required by this General Permit, written notification of the date and time of testing shall be provided to the Department's Division of Source Testing and Monitoring and the appropriate DEP Regional Office so that an observer may be present. The Department is under no obligation to accept the results of any testing performed without adequate advance written notice to the Department of such testing.

(h) Within 15 calendar days after completion of the on-site testing portion of an emission test program to demonstrate compliance required by this General Permit, if a complete test report has not yet been submitted, an electronic notification shall be submitted in accordance with (e) above indicating the completion date of the on-site testing.

(i) A complete test report shall be submitted in accordance with (e) above no later than 60 calendar days after completion of the on-site testing portion of an emission test program required by this General Permit. The complete test report shall include a summary at the beginning of the report which includes:

(i) A statement that the owner or operator has reviewed the report from the emissions testing company and agrees with the findings;

(ii) The GP-5 authorization number and conditions that are the basis for the evaluation;

(iii) A summary of results with respect to each applicable permit condition; **and**

(iv) A statement of compliance or non-compliance with each applicable permit condition.

15. De Minimis Emission Increases

(a) Additional equipment may be installed, or currently authorized equipment may be modified at the facility without additional authorization provided that the following conditions (i) through (iii) are met. Replacement unit as defined in 25 Pa. Code § 121.1 may be installed without additional authorization provided that the following conditions (ii) through (iii) are met.

(i) The owner or operator complies with the requirements of 25 Pa. Code § 127.449(a), (b), and (d) through (i);

(ii) The equipment being installed, modified, or replaced meets the current applicable BAT Compliance Requirements;

(iii) The owner or operator submits written notification in accordance with Condition 11(b), including the following additional information:

(A) The manufacturer, model, rated capacity, and serial number of the equipment;

(B) A certification from the owner or operator that the equipment will meet all applicable terms and conditions of this General Permit, including Condition 10(a);

SAMPLE

(C) The notification shall be signed by a Responsible Official and shall acknowledge that the certifying party is aware of the penalties for unsworn falsification to governmental authorities as established under 18 Pa. C.S. § 4904. The certification shall also state that based on information and belief formed after reasonable inquiry, that the information in the notice is true, accurate, and complete; **and**

(D) The notice shall identify and describe the pollutants that will be emitted as a result of the de minimis emissions increase and provide emission rates in tons per year and in terms necessary to establish compliance with any applicable requirement.

(b) A new Authorization to Use GP-5 shall be required if an owner or operator chooses to employ Selective Catalytic Reduction (SCR) to comply with NO_X emission standards in Section C Condition 1(c) or Section M Condition 1(c).

SECTION B. GLYCOL DEHYDRATION UNITS

1. BAT Compliance Requirements

(a) For each glycol dehydration unit constructed and operated under an Authorization to Use GP-5 approved by the Department prior to February 2, 2013, with a total uncontrolled potential VOC emission rate greater than 10 tpy, the owner or operator shall control VOC emissions from the glycol dehydrator still vent stream by at least 85% with a condenser, flare, thermal oxidizer, vapor recovery unit, or other air cleaning device approved by the Department that meets the applicable requirements in Section J.

(b) For each glycol dehydration unit constructed and authorized to operate on or after February 2, 2013, but prior to August 8, 2018, with a total uncontrolled potential VOC emission rate of greater than 5 tpy, the owner or operator shall control VOC emissions from the glycol dehydrator still vent stream by at least 95% with a condenser, flare, thermal oxidizer, vapor recovery unit, or other air cleaning device approved by the Department that meets the applicable requirements in Section J.

(c) For each glycol dehydrator constructed and authorized to operate on or after August 8, 2018, with a methane emission rate of 200 tpy or greater, a VOC emission rate of 2.7 tpy or greater, a single HAP emission rate of 0.5 tpy or greater, or a total HAP emission rate of 1.0 tpy or greater, the owner or operator shall control methane, VOC, and HAP emissions from the glycol dehydrator still vent stream by at least 95% using an enclosed flare or other combustion device or other air cleaning device approved by the Department that meets the applicable requirements in Section J.

(d) Associated equipment, such as natural gas-driven pneumatic controllers (Section H), natural gas-driven pneumatic pumps (Section I), and fugitive emissions components (Section G) are subject to the requirements of their respective Sections.

(e) If any glycol dehydration unit uses triethylene glycol for the dehydration process, has a natural gas throughput greater than 3 MMscf/d, **and** emits more than 1 tpy of benzene, the owner or operator must:

(i) Determine the natural gas throughput in accordance with 40 CFR § 63.772(b)(1).

(ii) Determine the actual average benzene or benzene, toluene, ethylbenzene and xylene (BTEX) emissions in accordance with 40 CFR § 63.772(b)(2).

(iii) If the glycol dehydration unit is located at a facility located within an urbanized area plus offset or urban cluster boundary, the owner or operator shall meet the requirements of 40 CFR § 63.764(d)(1).

(iv) If the glycol dehydration unit is located at a facility that is not within an urbanized area plus offset or urban cluster boundary, the owner or operator shall meet the requirements of 40 CFR § 63.764(d)(2).

(v) If an alternate circulation rate is required, the determination must be submitted in accordance with 40 CFR § 63.764(d)(2)(ii).

2. Recordkeeping Requirements

For each glycol dehydration unit, the owner or operator shall maintain the following records in accordance with Section A Condition 12, including information on:

(a) The location of the glycol dehydration unit;

SAMPLE

(b) The calculation for the optimum glycol circulation rate or the alternative glycol circulation rate in accordance with 40 CFR § 63.775(c)(7), **if applicable**;

(c) The determination of the actual average benzene or BTEX emissions in accordance with 40 CFR § 63.774(d)(1), **if applicable**;

(d) The emissions calculations for each glycol dehydrator in accordance with 25 Pa. Code § 135.5; **and**

(e) Records of deviations and malfunctions in accordance with 40 CFR § 63.774(g), **if applicable**.

3. Reporting Requirements

In the required annual report of Section A Condition 13(c), the information about each glycol dehydration unit operated during the reporting period shall include:

(a) The records of the optimum or alternative glycol circulation rate in accordance with 40 CFR § 63.775(c)(7), **if applicable**; **and**

(b) The records of any deviations and malfunctions in accordance with 40 CFR § 63.775(c)(6), **if applicable**.

The emissions from each glycol dehydration unit operated during the reporting period must be included in the emissions inventory report of Section A Condition 13(d).

SECTION C. STATIONARY NATURAL GAS-FIRED SPARK IGNITION INTERNAL COMBUSTION ENGINES

1. BAT Compliance Requirements

(a) For each natural gas-fired spark ignition internal combustion engine constructed under and authorized to operate under GP-5 approved by the Department on or after March 10, 1997 but prior to February 2, 2013, the owner or operator shall:

(i) Operate or equip the engine with air cleaning devices to meet the following emission levels:

(A) NO_X (as NO_2) of 2.0 g/bhp-h while operating at rated bhp and speed;

(B) Non-Methane Non-Ethane Hydrocarbon (NMNEHC), as propane, excluding formaldehyde, of 2.0 g/bhp-h while operating at rated bhp and speed; **and**

(C) CO of 2.0 g/bhp-h while operating at rated bhp and speed.

(ii) Ensure that at operating conditions less than rated capacity, the engine shall on a lb/h basis emit no more than it would emit at rated bhp and speed.

(iii) Ensure the engine meets the applicable requirements of (d) below.

SAMPLE

(b) For each natural gas-fired spark ignition internal combustion engine constructed and authorized to operate under GP-5 approved by the Department on or after February 2, 2013, but prior to August 8, 2018, the owner or operator shall:

(i) Ensure the engine does not exceed the emissions standards specified in the following table:

Engine Type	Rated bhp	NO_X	CO	NMNEHC (as propane) excluding HCHO	HCHO
Lean-Burn	≤100	2.0 g/bhp-h	2.0 g/bhp-h	-	-
Lean-Burn	>100 - ≤500	1.0 g/bhp-h	2.0 g/bhp-h	0.70 g/bhp-h	-
Lean-Burn	>500	0.50 g/bhp-h	47 ppmvd @ 15% O_2 **or** 93% reduction	0.25 g/bhp-h	0.05 g/bhp-h
Rich-Burn	≤100	2.0 g/bhp-h	2.0 g/bhp-h	-	-
Rich-Burn	>100 - ≤500	0.25 g/bhp-h	0.30 g/bhp-h	0.20 g/bhp-h	-
Rich-Burn	>500	0.20 g/bhp-h	0.30 g/bhp-h	0.20 g/bhp-h	2.7 ppmvd @ 15% O_2 **or** 76% reduction

(ii) Ensure the engine meets the applicable requirements of (d) below.

(c) For each natural gas-fired spark ignition internal combustion engine constructed and authorized to operate on or after August 8, 2018, the owner or operator shall:

(i) Ensure the engine does not exceed the emission standards specified in the following table:

Engine Type	Rated bhp	NO_X	CO	NMNEHC (as propane) excluding HCHO	HCHO
Lean-Burn	<100	1.0 g/bhp-h	2.0 g/bhp-h	0.70 g/bhp-h	-
Lean-Burn	≥100 - ≤500	1.0 g/bhp-h	0.70 g/bhp-h	0.30 g/bhp-h	-
Lean-Burn	>500 - <2,370	0.50 g/bhp-h	0.25 g/bhp-h	0.25 g/bhp-h	0.05 g/bhp-h
Lean-Burn	≥2,370	0.30 g/bhp-h Uncontrolled **or** 0.05 g/bhp-h with Control	0.25 g/bhp-h	0.25 g/bhp-h	0.05 g/bhp-h
Rich-Burn	<100	1.0 g/bhp-h	2.0 g/bhp-h	0.70 g/bhp-h	
Rich-Burn	≥100 - ≤500	0.25 g/bhp-h	0.30 g/bhp-h	0.20 g/bhp-h	-
Rich-Burn	>500	0.20 g/bhp-h	0.30 g/bhp-h	0.20 g/bhp-h	2.7 ppmvd @ 15% O_2 **or** 76% reduction

(ii) Ensure that for engines that control NO_X emissions with a control technology that uses ammonia or urea as a reagent, the exhaust ammonia slip is limited to 10 ppmvd or less corrected to 15% O_2.

SAMPLE

(iii) Ensure the engine meets the applicable requirements of (d) below.

(d) The owner or operator of the engine shall also:

(i) Comply with the applicable requirements of 40 CFR Part 63, Subpart ZZZZ for engines constructed (as defined in Subpart ZZZZ) prior to June 12, 2006;

(ii) Ensure the engine meets the visible emissions standards, as determined by the methods described in 25 Pa. Code § 123.43, by not exceeding the following limitations:

(A) Equal to or greater than 10% for a period or periods aggregating more than three minutes in any one hour; **and**

(B) Equal to or greater than 30% at any time

(iii) Install, operate, and maintain a non-resettable hour meter;

(iv) Limit the engine's time spent at idle during startup or shutdown to a period appropriate for the operation of the engine and air pollution control equipment consistent with good air pollution control practices, not to exceed 30 minutes, during which time the emissions standards in (b) through (d) do not apply.

(v) Conduct performance tests and periodic monitoring for the engine as detailed in Conditions 4 and 5 of this section on the following schedule:

Engine Size hp	Initial Compliance Performance Test	Continuous Compliance Performance Test	Periodic Monitoring
<100	None Required	None Required	Every 2,500 hours of operation
≥100 - ≤500	Within 180 days of startup of the engine	Within 180 days of each reauthorization	Every 2,500 hours of operation
>500 and not subject (d)(i)	Within 180 days of startup of the engine	Every 8,760 hours of operation **or** every three years **and** within 180 days of each reauthorization	Every 2,500 hours of operation
>500 and subject to (d)(i)	Not Applicable	Every year	Every 2,500 hours of operation

(A) For an engine greater than or equal to 100 hp and less than or equal to 500 hp, if the engine is certified by the manufacturer in accordance with 40 CFR Part 60, Subpart JJJJ and the owner or operator operates and maintains the engine in accordance with the manufacturer's instructions, the performance testing requirements are waived.

(B) For an engine greater than 500 hp, if the engine is certified by the manufacturer in accordance with 40 CFR Part 60, Subpart JJJJ and the owner or operator operates and maintains the engine in accordance with the manufacturer's instructions, the continuous compliance performance testing requirements every 8,760 hours of operation or every three years are waived.

(C) The Department may alter the frequency of periodic monitoring based on the test results. The frequency of periodic monitoring may be altered upon request of the owner or operator with written Departmental approval.

2. Recordkeeping Requirements

For each engine, the owner or operator shall maintain the following records in accordance with Section A Condition 12, including information on:

(a) The GP-5 authorization number and the date each engine was authorized for use;

(b) The make, model, and serial number of each engine;

(c) Either a copy of the manufacturer's maintenance instructions **or** an alternative maintenance plan;

(d) Records of maintenance conducted on each engine and any installed air pollution control devices;

(e) A copy of the manufacturer's engine certification or vendor guarantees;

SAMPLE

(f) The results of each periodic monitoring;

(g) The summary for each complete test report described in Section A Condition 14(i); **and**

(h) The emissions calculations for each engine in accordance with 25 Pa. Code § 135.5.

3. Reporting Requirements

The emissions from each natural gas-fired spark ignition internal combustion engine operated during the reporting period must be included in the emissions inventory report of Section A Condition 13(d).

4. Engine Performance Testing Requirements

(a) When conducting a performance test for an engine, the owner or operator must submit the test protocol described in Section A. Condition 14(f) for review and approval.

(b) The owner or operator should conduct the following test procedures:

(i) Conduct three test runs of at least one hour duration within 10% of 100% peak (or the highest achievable) load.

(ii) Select the sampling port location and the number and location of traverse points at the exhaust using 40 CFR Part 60, Appendix A-1, Method 1 or 1A depending on stack diameter, or the sampling points selected according to 40 CFR Part 60, Appendix A-4, Method 7E Section 8.1.2.

(iii) Determine the effluent characteristics by either:

(A) Calculating the exhaust flow in accordance with 40 CFR Part 60, Appendix A-7, Method 19 and measuring the O_2 concentration using 40 CFR Part 60, Appendix A-2, Method 3A; **or**

(B) By measuring:

(1) The flow velocity, stack temperature, static pressure, and barometric pressure using 40 CFR Part 60, Appendix A-1, Method 2 or 2C depending on stack diameter;

(2) The gas density using 40 CFR Part 60, Appendix A-2, Method 3A; **and**

(3) The moisture content using 40 CFR Part 60, Appendix A-3, Method 4.

(iv) Simultaneous to the determination of the O_2 concentration in (iii)(A) or (B) above, determine:

(A) The NO_X concentration of the exhaust gas using 40 CFR Part 60, Appendix A-4, Method 7E;

(B) The CO concentration of the exhaust gas using 40 CFR Part 60, Appendix A-4, Method 10;

(C) The NMNEHC concentration, as propane, excluding formaldehyde of the exhaust gas using ALT-106; **and**

(D) The formaldehyde concentration of the exhaust gas, **if applicable**, using 40 CFR Part 63, Appendix A, Method 320.

(c) If at any time the owner or operator operates the engine in excess of the highest achievable load plus 10%, the owner or operator must perform a stack test within 180 days from the anomalous operation.

5. Engine Periodic Monitoring Requirements

(a) When conducting periodic monitoring on an engine, the owner or operator may follow the procedures in (b) below. If the owner or operator decides to deviate from those procedures, they must submit a request to use an alternate procedure, in writing, at least 60 days prior to performing the periodic monitoring. In the alternate procedure request, the owner or operator must demonstrate the alternate procedure's equivalence to the standard procedure to the satisfaction of the Division of Source Testing and Monitoring.

(b) *Standardized Periodic Monitoring Procedure.*

(i) Conduct three test runs of at least 20 minutes duration within 10% of 100% peak (or the highest achievable) load.

(ii) Determine NO_X and CO emissions and O_2 concentrations in the exhaust with either an electro-chemical cell portable gas analyzer used and maintained in accordance with the manufacturer's specifications and

SAMPLE

following the procedures specified in the current version of ASTM D6522 or by following the procedures in 4(b) (ii) – (iv) (A) and (B) of this section.

(iii) If the measured NO_X or CO emissions concentrations are in exceedance of the emissions limit, the owner or operator must perform a stack test in accordance with the Performance Testing Requirements of Condition 4 within 180 days of the periodic monitoring.

(c) The 2,500 hours of operation count resets after any performance test performed in accordance with Condition 4 above.

(d) For engines constructed (as defined in that subpart) prior to June 12, 2006, that installed a continuous parametric monitoring system (CPMS) to monitor the catalyst inlet temperature, the owner or operator must install, operate, and maintain the CPMS according to 40 CFR § 63.6625(b)(1) through (6).

SECTION D. RECIPROCATING COMPRESSORS

1. BAT Compliance Requirements

The owner or operator of a reciprocating compressor must meet the applicable requirements of 40 CFR § 60.5385 or 40 CFR § 60.5385a.

2. Recordkeeping Requirements

For each reciprocating compressor, the owner or operator shall maintain records in accordance with Section A Condition 12 and 40 CFR § 60.5420(c)(3) or § 60.5420a(c)(3) as applicable.

In addition, the emissions calculation for each reciprocating compressor must be kept in accordance with 25 Pa. Code § 135.5.

3. Reporting Requirements

In the required annual report of Section A Condition 13(c), the information about each reciprocating compressor operated during the reporting period shall be submitted in accordance with 40 CFR § 60.5420(b)(4) or § 60.5420a(b)(4) as applicable.

The emissions from each reciprocating compressor operating during the reporting period must be included in the emissions inventory report of Section A Condition 13(d), including the emissions from scheduled and unscheduled blowdowns.

SECTION E. STORAGE VESSELS

1. BAT Compliance Requirements

(a) For each storage vessel constructed and authorized to operate on or after August 23, 2011, but prior to August 8, 2018, the owner or operator shall meet the applicable requirements of 40 CFR §§ 60.5365(e) and 60.5395(d) and (e).

(b) For each storage vessel constructed and authorized to operate on or after August 8, 2018, with a methane emission rate of 200 tpy or greater, a VOC emission rate of 2.7 tpy or greater, a single HAP emission rate of 0.5 tpy or greater, or a total HAP emission rate of 1.0 tpy or greater, the owner or operator shall equip the storage vessel with a cover and route all vapor through a closed vent system to a control device that reduces methane, VOC, and HAP emissions by 95% or more by meeting the applicable control, cover, and closed vent system requirements of Section J Condition 1(a) through (f) or any alternative method approved by the Department.

(c) Any storage vessel returned to service must meet the requirements of 40 CFR § 60.5395(f) or § 60.5395a(c).

(d) Any storage vessel with a capacity greater than or equal to 2,000 gallons and less than or equal to 40,000 gallons must meet the requirements of 25 Pa. Code § 129.57.

(e) Any storage vessel with a capacity greater than 40,000 gallons must meet the requirements of 25 Pa. Code § 129.56, **if applicable**.

2. Recordkeeping Requirements

For each storage vessel, the owner or operator shall maintain records in accordance with Section A Condition 12 and 40 CFR § 60.5420(c)(5) or § 60.5420a(c)(5) as applicable.

SAMPLE

In addition, the emissions calculation for each storage vessel, which may be calculated using Department-approved methods such as direct measurement; modeling programs such as the most recent version of EPA TANKS, ProMax, and API E&P Tanks; process simulation software such as HYSIM, HYSIS, WINSIM, and PROSIM; or calculation methodologies such as the Vazquez-Beggs equation, must be kept in accordance with 25 Pa. Code § 135.5.

3. Reporting Requirements

In the required annual report of Section A Condition 13(c), the information about each storage vessel operated during the reporting period shall be submitted in accordance with 40 CFR § 60.5420(b)(6) or § 60.5420a(b)(6) as applicable. The emissions from each storage vessel operating during the reporting period must be included in the emissions inventory report of Section A Condition 13(d).

SECTION F. TANKER TRUCK LOAD-OUT OPERATIONS

1. BAT Compliance Requirements

(a) For all truck load-out operations that service a storage vessel with a methane emission rate of 200 tpy or greater, a VOC emission rate of 2.7 tpy or greater, a single HAP emission rate of 0.5 tpy or greater, or a total HAP emission rate of 1.0 tpy or greater, where the loading rack was constructed and authorized to operate on or after August 8, 2018, the owner or operator shall:

(i) Use a vapor balancing system when removing liquids from the storage vessel; **and**

(ii) Ensure that each tanker truck that is used to remove liquids from the storage vessel has passed one of the following annual leak tests:

(A) A tanker truck that does not indicate more than 1" H_2O pressure change within 5 minutes after being pressurized to 18" H_2O and after being depressurized to 6" H_2O vacuum has passed a MACT-level test and is assumed to have a collection efficiency of 99.2%.

(B) A tanker truck that does not indicate more than 3" H_2O pressure change within 5 minutes after being pressurized to 18" H_2O and after being depressurized to 6" H_2O vacuum has passed an NSPS-level test and is assumed to have a collection efficiency of 98.7%.

(C) A tanker truck that has passed a leak test performed in accordance with 49 CFR § 180.407 is accepted as equivalent to an NSPS-level collection efficiency of 98.7%.

(D) A tanker truck that has passed a leak test performed in accordance with 40 CFR Part 60, Appendix A-8, Method 27 is accepted as equivalent to an NSPS-level collection efficiency of 98.7%.

(iii) As an alternative to (i) and (ii), VOC emissions must be controlled with 95% or greater efficiency.

2. Recordkeeping Requirements

For each tanker truck load-out operation, the owner or operator shall maintain the following records in accordance with Section A Condition 12, including information on:

(a) The identification, location, and date of construction of each vapor recovery load-out system;

(b) Records of each tanker truck load-out operation including the date and time of the liquids load-out, the type and volume of liquids loaded, and the truck collection efficiency based on the annual leak test; and

(c) The emissions calculation for each tanker truck load-out operation in accordance with 25 Pa. Code § 135.5.

3. Reporting Requirements

The emissions from tanker truck load-out operations during the reporting period must be included in the emissions inventory report of Section A Condition 13(d).

SAMPLE

SECTION G. FUGITIVE EMISSIONS COMPONENTS

1. BAT Compliance Requirements

(a) For each fugitive emissions component constructed and authorized to operate under GP-5 approved by the Department on or after February 2, 2013, but prior to August 8, 2018, the following applies:

(i) The owner or operator of the natural gas compression and/or processing facility shall, at a minimum, on a monthly basis perform a leak detection and repair program that includes audible, visual, and olfactory (AVO) inspections.

(ii) Within 180 days after the initial startup of a source, the owner or operator of the facility shall at a minimum, on a quarterly basis, use forward looking infrared (FLIR) cameras or other leak detection monitoring devices approved by the Department for the detection of fugitive leaks. The Department may grant an extension for use of FLIR camera upon receipt of a written request from the owner or operator of the facility documenting the justification for the requested extension.

(iii) If any leak is detected, the owner or operator of the facility shall repair the leak as expeditiously as practicable, but no later than fifteen (15) calendar days after the leak is detected, except as provided in 40 CFR §§ 60.482-60.489. The owner or operator shall record each leak detected and the associated repair activity. The records shall be retained for a minimum of five (5) years and shall be made available to the Department upon request.

(b) For each fugitive emissions component constructed and authorized to operate on or after August 8, 2018, the following applies:

(i) No later than 30 days after an emission source commences operation, and at least monthly thereafter, the owner or operator of a facility shall conduct an AVO inspection.

(ii) No later than 60 days after initial startup, and quarterly thereafter, the owner or operator shall conduct an LDAR program using either an OGI camera, a gas leak detector that meets the requirements of 40 CFR Part 60, Appendix A-7, Method 21, or other leak detection methods approved by the Division of Source Testing and Monitoring.

(A) The owner or operator may request, in writing, an extension of the LDAR inspection interval from the Air Program Manager of the appropriate DEP Regional Office.

(B) Any fugitive emissions components that are difficult-to-monitor or unsafe-to-monitor must be identified in the monitoring plan described in Condition 2(a) below.

(iii) The detection devices must be operated and maintained in accordance with manufacturer-recommended procedures, as required by the test method, or a Department-approved method.

(iv) A leak is defined as:

(A) Any positive indication, whether audible, visual, or odorous, determined during an AVO inspection;

(B) Any visible emissions detected by an OGI camera calibrated according to 40 CFR § 60.18 and a detection sensitivity level of 60 grams/hour; **or**

(C) A concentration of 500 ppm calibrated as methane or greater detected by an instrument reading.

(v) For quarterly inspections using a gas leak detector in accordance with 40 CFR Part 60, Appendix A-7, Method 21, the owner or operator may choose to adjust the detection instrument readings to account for the background organic concentration level as determined according to the procedures in Section 8.3.2.

(vi) Any leak detected from a fugitive emission component shall be repaired by the owner or operator of the facility as expeditiously as practicable. A first attempt at repair must be attempted within 5 calendar days of detection, and repair must be completed no later than 15 calendar days after the leak is detected **unless**:

(A) The owner or operator must purchase parts, in which case the repair must be completed no later than 10 calendar days after the receipt of the purchased parts; **or**

(B) The repair or replacement is technically infeasible, would require a vent blowdown, a compressor station, processing plant or transmission station shutdown, or would be unsafe to repair during operation of the unit, in which case the repair or replacement must be completed during the next

SAMPLE

scheduled compressor station, processing plant or transmission station shutdown, after a planned vent blowdown or within 2 years, whichever is earlier.

(vii) Once a fugitive emission component has been repaired or replaced, the owner or operator must resurvey the component as soon as practicable, but no later than 30 calendar days after the leak is repaired.

(A) For repairs that cannot be made during the monitoring survey when the leak is initially found, either a digital photograph must be taken of the component or the component must be tagged for identification purposes.

(B) A leak is considered repaired if:

(1) There are no detectable emissions consistent with Section 8.3.2 of 40 CFR Part 60, Appendix A-7, Method 21;

(2) A leak concentration of less than 500 ppm as methane is detected when the gas leak detector probe inlet is placed at the surface of the component;

(3) There is no visible leak image when using an OGI camera calibrated at a detection sensitivity level of 60 grams/hour; or

(4) There is no bubbling at the leak interface using a soap solution bubble test specified in Section 8.3.3 of 40 CFR Part 60, Appendix A-7, Method 21.

(c) The Department determined that the VOC and methane emissions remaining after the implementation of BAT requirements, including LDAR, are of minor significance with regard to causing air pollution, and will not, on their own, be preventing or interfering with the attainment or maintenance of an ambient air quality standard.

2. Recordkeeping Requirements

For fugitive emissions components, the owner or operator shall maintain the following records in accordance with Section A Condition 12, including information on:

(a) The fugitive emissions monitoring plan in accordance with 40 CFR § 60.5397a(b) through (d).

(b) Records of each monitoring survey which must include:

(i) The facility name and location;

(ii) The GP-5 authorization number;

(iii) The date, start time, and end time of the survey;

(iv) The name of the operator(s) performing the survey;

(v) The monitoring instrument used;

(vi) The ambient temperature, sky conditions, and maximum wind speed at the time of the survey;

(vii) Any deviations from the monitoring plan or a statement that there were none; **and**

(viii) Documentation of each fugitive emission including:

(A) The identification of each component from which fugitive emissions were detected;

(B) The instrument reading of each fugitive emissions component that meets the leak definition in Condition 1(b)(iv)(C) of this section;

(C) The status of repair of each component including:

(1) The repair methods applied in each attempt to repair the component;

(2) The tagging or digital photographing of each component not repaired during the monitoring survey in which the fugitive emissions were discovered;

(3) The reasons a component was placed on delay of repair;

(4) The date of successful repair of the component; **and**

SAMPLE

(5) The information on the instrumentation or method used to resurvey the component after repair, if it was not completed during the monitoring survey in which the fugitive emissions were discovered.

3. Reporting Requirements

In the required annual report of Section A Condition 13(c), the records of each monitoring survey conducted during the reporting period shall be included.

The emissions from fugitive emissions components during the reporting period must be included in the emissions inventory report of Section A Condition 13(d).

SECTION H. NATURAL GAS-DRIVEN PNEUMATIC CONTROLLERS

1. BAT Compliance Requirements

(a) For pneumatic controllers constructed and authorized to operate on or after August 23, 2011, the owner or operator must meet the applicable requirements of 40 CFR § 60.5390(a) and (b)(1) or (c)(1) or § 60.5390a(a) and (b)(1) or (c)(1).

(b) Each controller must be tagged in accordance with 40 CFR § 60.5390(b)(2) and (c)(2) or § 60.5390a(b)(2) and (c)(2) as applicable.

2. Recordkeeping Requirements

For each controller, the owner or operator shall maintain records in accordance with Section A Condition 12 and 40 CFR § 60.5420(c)(4) or § 60.5420a(c)(4) as applicable.

In addition, the emissions calculation for each pneumatic controller must be kept in accordance with 25 Pa. Code § 135.5.

3. Reporting Requirements

In the required annual report of Section A Condition 13(c), the information about each controller during the reporting period shall be done in accordance with 40 CFR § 60.5420(b)(5) or § 60.5420a(b)(5) as applicable.

The emissions from each pneumatic controller during the reporting period must be included in the emissions inventory report of Section A Condition 13(d).

SECTION I. NATURAL GAS-DRIVEN PNEUMATIC PUMPS

1. BAT Compliance Requirements

(a) For each natural gas-driven pneumatic diaphragm pump constructed and authorized to operate on or after September 18, 2015, but prior to August 8, 2018, the owner and operator shall meet the applicable requirements of 40 CFR § 60.5365a(h)(1) and § 60.5393a(a) and (c) through (e).

(b) For each natural gas-driven pneumatic pump constructed and authorized to operate on or after August 8, 2018, the owner or operator of a pump with:

(i) A methane emission rate of less than 200 tpy, a VOC emission rate of less than 2.7 tpy, a single HAP emission rate less than 0.5 tpy, and a total HAP emission rate less than 1.0 tpy, shall meet the applicable requirements of 40 CFR § 60.5365a(h)(1) and § 60.5393a(a) and (c) through (e).

(ii) A methane emission rate of 200 tpy or greater, a VOC emission rate of 2.7 tpy or greater, a single HAP emission rate of 0.5 tpy or greater, or a total HAP emission rate of 1.0 tpy or greater, shall route all vapor through a closed vent system to a control device that reduces methane, VOC, and HAP emissions by 95% or more by meeting the applicable requirements of Section J.

2. Recordkeeping Requirements

For each natural gas-driven pneumatic diaphragm pump, the owner or operator shall maintain the following records in accordance with Section A Condition 12:

(a) The location, date of installation, and manufacturer's specifications for each pump.

(b) The emissions calculation for each pneumatic pump must be kept in accordance with 25 Pa. Code § 135.5.

SAMPLE

3. Reporting Requirements

The emissions from each natural gas-driven pneumatic diaphragm pump during the reporting period must be included in the emissions inventory report of Section A Condition 13(d).

SECTION J. ENCLOSED FLARES AND OTHER EMISSION CONTROL DEVICES

1. BAT Compliance Requirements

(a) *Enclosed Flares and Other Enclosed Combustion Control Devices.*

(i) The owner or operator of an enclosed flare or other enclosed combustion control device shall meet the requirements of 40 CFR § 60.5412(d)(1) and § 60.5415(e) or 40 CFR § 60.5412a(d)(1) and § 60.5415a(e) as applicable. The Department may allow open flares at remote locations and for infrequent operations, provided the flare is installed and operated consistent with 40 CFR § 60.18.

(ii) The owner or operator must conduct a performance test in accordance with Condition 4 within 180 days of initial startup of the affected facility **unless:**

(A) The combustion control device is a manufacturer-tested model tested in accordance with 40 CFR § 60.5413(d) or § 60.6413a(d); **or**

(B) A performance test conducted on a device of the same make and model in similar service at another facility within the Commonwealth approved by the Department may be used to satisfy this requirement.

(iii) The owner or operator must conduct performance tests in accordance with Condition 4 within 180 days of each reauthorization **unless**:

(A) The combustion control device is a manufacturer-tested model tested in accordance with 40 CFR § 60.5413(d) or § 60.5413a(d);

(B) A performance test conducted on a device of the same make and model in similar service at another facility within the Commonwealth approved by the Department may be used to satisfy this requirement;

(C) The Department uses EPA's National Stack Testing Guidance for stack test waivers. **or**

(D) The combustion control device established a correlation between the outlet TOC performance level and the firebox or combustion chamber temperature during the initial performance test.

(iv) The owner or operator of any combustion control device that is a manufacturer tested model shall meet the requirements of 40 CFR § 60.5413(e) or § 60.5413a(e) as applicable.

(b) *Vapor Recovery Devices.*

(i) The owner or operator of a vapor recovery device constructed prior to August 8, 2018, shall meet the requirements of 40 CFR § 60.5412(d)(2) and § 60.5415(e) or 40 CFR § 60.5412a(d)(2) and § 60.5415a(e) as applicable.

(ii) The owner or operator shall conduct a performance test in accordance with Condition 4 and 40 CFR § 60.5413(b)(5) or § 60.5413a(b)(5) as applicable.

(iii) The owner or operator of any vapor recovery device shall conduct a monthly AVO inspection in accordance with 40 CFR § 60.5417(h)(2) or § 60.5417a(h)(2) as applicable.

(iv) If the vapor recovery device is a carbon adsorption unit, the owner or operator shall meet the requirements of 40 CFR § 60.5412(c) or § 60.5412a(c) as applicable.

(c) *External Floating Roof.*

(i) An external floating roof shall meet the requirements of 40 CFR § 60.112b(a)(2) and 25 Pa. Code § 129.56(b) as applicable.

(ii) Perform a gap measurement test in accordance with 40 CFR § 60.113b for mechanical shoe or liquid-mounted primary seals.

SAMPLE

(iii) Perform a gap measurement test in accordance with 25 Pa. Code § 129.56(b)(iii) for a vapor-mounted primary seal.

(d) *Internal Floating Roof.*

(i) An internal floating roof shall meet the requirements of 40 CFR § 60.112b(a)(1) and 25 Pa. Code § 129.56(c) as applicable.

(ii) Visually inspect the internal floating roof, primary seal, and secondary seal (if equipped) in accordance with 40 CFR § 60.113b(a).

(e) *Covers.*

(i) The cover and all openings on the cover shall meet the requirements of 40 CFR § 60.5411(b) and § 60.5416(a)(3) or 40 CFR § 60.5411a(b) and § 60.5416a(a)(3) as applicable.

(ii) The owner or operator shall conduct AVO inspections for defects that could result in air emissions in accordance with Section G Condition 1(b)(i). Defects include, but are not limited to, visible cracks, holes, or gaps in the cover or between the cover and the separator wall; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices.

(iii) Any defect or leak detected shall be repaired in accordance with Section G Condition 1(b)(vi) and (vii).

(f) *Closed Vent Systems.*

(i) The owner or operator shall conduct an assessment in accordance with 40 CFR § 60.5411a(d), **if applicable**.

(ii) The owner or operator shall design and operate the closed vent system with no detectable emissions, as determined in accordance with 40 CFR § 60.5411(a) and (c) and § 60.5416(a) through (c) or 40 CFR § 60.5411a(a) and (c) and § 60.5416a(a) through (c) as applicable.

(iii) The owner or operator shall conduct AVO inspections for defects that could result in air emissions in accordance with Section G Condition 1(b)(i). Defects include, but are not limited to, visible cracks, holes, or gaps in ductwork; loose connections; liquid leaks; and broken or missing caps or other closure devices.

(iv) Any defect or leak detected shall be repaired in accordance with Section G Condition 1(b)(vi) and (vii).

2. Recordkeeping Requirements

For each control device, the owner or operator shall maintain the following records in accordance with Section A Condition 12, including:

(a) *Enclosed Flares and Other Enclosed Combustion Control Devices.*

(i) For non-manufacturer-tested models, the owner or operator must maintain records in accordance with 40 CFR § 60.5420(c)(13) and (14) or § 60.5420a(c)(13) and (14) as applicable.

(ii) For manufacturer-tested models, the owner or operator must maintain records in accordance with 40 CFR § 60.5413(d)(12) and (e) or § 60.5413a(d)(12) and (e) as applicable.

(iii) The summary for each complete test report described in Section A Condition 14(i) conducted, **if applicable**.

(b) *Vapor Recovery Devices.*

(i) The owner or operator must maintain records in accordance with 40 CFR § 60.5420(c)(12) through (14) or § 60.5420a(c)(12) through (14) as applicable.

(ii) The design analysis in accordance with 40 CFR § 60.5413(c) or § 60.5413a(c), as applicable.

(iii) The summary for each complete test report described in Section A Condition 14(i) conducted, **if applicable**.

SAMPLE

(c) *External Floating Roof.*

(i) The owner or operator must maintain records in accordance with 40 CFR §§ 60.115b and 60.116b as applicable; and

(ii) The owner or operator must maintain records in accordance with 25 Pa. Code § 129.56(f)(3) and (g), **if applicable**.

(d) *Internal Floating Roof.*

(i) The owner or operator must maintain records in accordance with 40 CFR §§ 60.115b and 60.116b as applicable; and

(ii) The owner or operator must maintain records in accordance with 25 Pa. Code § 129.56(f)(3) and (g), **if applicable**.

(e) *Covers.*

(i) The owner or operator must maintain records in accordance with Section G Condition 2(b).

(f) *Closed Vent Systems.*

(i) The owner or operator must maintain records in accordance with Section G Condition 2(b).

(ii) The owner or operator must maintain records in accordance with 40 CFR § 60.5420(c)(8) and (9).

(iii) The owner or operator must maintain records of the assessment, including the engineer's certification, in accordance with 40 CFR § 60.5420a(c)(17), **if applicable**.

3. Reporting Requirements

In the required annual report of Section A Condition 13(c), the information about each control device in operation during the reporting period shall be done in accordance with 40 CFR § 60.5420(b) or § 60.5420a(b) as applicable.

4. Control Device Performance Testing Requirements

When conducting a performance test, the owner or operator must submit the test protocol described in Section A. Condition 14 (f) for review and approval. The owner or operator should conduct the following test procedures:

(a) Conduct three test runs of at least one-hour duration while operating the control device within 5% of the required operating temperature.

(b) Select the sampling port location and the number and location of traverse points at the exhaust using 40 CFR Part 60, Appendix A-1, Method 1 or 1A depending on stack diameter.

(i) If demonstrating compliance with a percent reduction requirement, sampling sites must be located at the inlet of the first control device and the outlet of the final control device; **or**

(ii) If demonstrating compliance with an outlet concentration requirement, the sampling site must be located at the outlet of the control device.

(c) Determine the effluent characteristics including:

(i) The flow velocity, stack temperature, static pressure, and barometric pressure using 40 CFR Part 60, Appendix A-1, Method 2 or 2C depending on stack diameter;

(ii) The gas density using 40 CFR Part 60, Appendix A-2, Method 3A; **and**

(iii) The moisture content using 40 CFR Part 60, Appendix A-3, Method 4.

(d) To demonstrate compliance with (b)(i), use 40 CFR Part 60, Appendix A-7, Method 25A to determine the Total Organic Compounds (TOC) and then convert to dry basis using the moisture content from (c)(iii) above and calculate the inlet and outlet mass rates as propane and the percent reduction.

(e) To demonstrate compliance with (b)(ii), use 40 CFR Part 60, Appendix A-7, Method 25A to determine the TOC and 40 CFR Part 60, Appendix A-6, Method 18 to determine the methane and ethane concentration, and then correct the TOC concentration, minus methane and ethane, for percent oxygen from (c)(ii) above.

SAMPLE

5. Control Device Periodic Monitoring Requirements

The owner or operator that installs a CPMS must install, operate, and maintain the CPMS according to 40 CFR § 60.5415 and § 60.5417 or 40 CFR § 60.5415a and § 60.5417a as applicable.

SECTION K. PIGGING OPERATIONS

1. BAT Compliance Requirements

(a) The owner or operator that conducts pigging operations shall employ best management practices to minimize the liquids present in the pig receiver chamber and to minimize emissions from the pig receiver chamber including, but not limited to, installing liquids ramps, installing liquids drain, routing high-pressure chambers to a low-pressure line or vessel, using ball valve type chambers, or using multiple pig chambers. The selection of the appropriate best management practices must be documented in the application.

(b) For pigging operations with a methane emission rate of 200 tpy or greater, or a VOC emission rate of 2.7 tpy or greater, or a single HAP emission rate of 0.5 tpy or greater, or a total HAP emission rate of 1.0 tpy or greater, after employing best management practices, the owner or operator shall control methane, VOC, and HAP emissions from all pigging operations by at least 95% with a condenser, flare, thermal oxidizer, vapor recovery unit, or other air cleaning device, or any alternative method approved by the Department that meets the applicable requirements in Section J.

2. Recordkeeping Requirements

For each pigging operation, the owner or operator shall maintain the following records in accordance with Section A Condition 12, including information on:

(a) The identification, location, and date of construction of each pig launcher or receiver;

(b) Records of each pigging operation including the identification of the pig chamber used, the date and time of the pigging operation, and the type and volume of liquids cleared; **and**

(c) The emissions calculation for each pig chamber, using the Department's spreadsheet found at http://files.dep.state.pa.us/ or other equivalent method.

3. Reporting Requirements

The emissions from each pigging operation conducted during the reporting period must be included in the emissions inventory report of Section A Condition 13(d).

SECTION L. NATURAL GAS-FIRED COMBUSTION UNITS

1. BAT Compliance Requirements

(a) Combustion units including, but not limited to, heated flash separator units, evaporator units, fractionation column heaters, and glycol dehydrator reboilers constructed and authorized to operate on or after August 8, 2018, shall have a rated heat input less than 50 MMBtu/h each and only be fired on natural gas.

(b) For combustion units with a rated heat input of greater than or equal to 10 MMBtu/h, the owner or operator shall:

(i) Ensure that the emission limits in the following table are met:

Constructed or Modified After:	NO_X (ppmvd @ 3% O_2)	CO (ppmvd @ 3% O_2)	PM (lb/MMBtu)	Opacity (No more than 3 minutes in an hour)	Opacity (At any time)
December 2, 1995	30	300	0.4	20%	60%
August 8, 2018	30	130	0.4	10%	30%

(ii) Conduct a performance test for NOx and CO in accordance with Condition 4 below within 180 days of initial startup;

(iii) Conduct either a performance test in accordance with Condition 4 below within 180 days of reauthorization of the GP-5 **or** conduct periodic monitoring in accordance with Condition 5 below;

SAMPLE

(iv) Ensure the combustion unit meets the visible emissions standards, as determined by the methods described in 25 Pa. Code § 123.43; and

(v) Conduct, within 180 days of re-authorization of GP-5, a tune-up/inspection which at a minimum shall include:

(A) Inspecting the burner and cleaning or replacing any components of the burner as necessary;

(B) Inspecting the flame pattern and adjusting the burner as necessary to optimize the flame pattern consistent with the manufacturer's specifications or good combustion engineering practices;

(C) Inspecting the system air-to-fuel ratio controller and ensuring it is calibrated and functioning properly;

(D) Optimizing total emissions of CO consistent with the NO_X requirement and the manufacturer's specifications or good combustion engineering practices; **and**

(E) Measuring the concentrations in the effluent stream of CO in ppmv and O_2 in volume percent before and after adjustments are made in accordance with Condition 5 (b)(ii) below.

(c) Integrated equipment, such as natural gas-driven pneumatic controllers (Section H), natural gas-driven pneumatic pumps (Section I), and any fugitive emissions components (Section G) are subject to the requirements of their respective Sections. Emissions from these sources are not required to be included in the uncontrolled emissions calculations for the combustion units in this section.

2. Recordkeeping Requirements

For each combustion unit, the owner or operator shall maintain the following records in accordance with Section A Condition 12, including information on:

(a) The location of the combustion unit;

(b) Either the summary for each complete test report described in Section A Condition 14(i); **or** the results of each periodic monitoring;

(c) The tune-up/inspection records, which shall at a minimum include:

(i) The date the tune-up/inspection was conducted;

(ii) The concentrations in the effluent stream of CO in ppmv and O_2 in volume percent as determined in Condition 5(b)(ii); and

(iii) A description of any corrective actions taken as part of the tune-up; **and**

(d) The emissions calculations for the combustion unit in accordance with 25 Pa. Code § 135.5.

3. Reporting Requirements

The emissions from each combustion unit operated during the reporting period must be included in the emissions inventory report of Section A Condition 13(d).

4. Combustion Unit Performance Testing Requirements

(a) When conducting a performance test, the owner or operator must submit the test protocol described in Section A. Condition 14 (f) for review and approval.

(b) The owner or operator should conduct the following test procedures.

(i) Conduct three test runs of at least one-hour duration within 10% of 100% peak (or the highest achievable) load.

(ii) Select the sampling port location and the number and location of traverse points at the exhaust using 40 CFR Part 60, Appendix A-1, Method 1 or 1A depending on stack diameter.

(iii) Determine the effluent characteristics including:

(A) The flow velocity, stack temperature, static pressure, and barometric pressure using 40 CFR Part 60, Appendix A-1, Method 2 or 2C depending on stack diameter;

(B) The gas density using 40 CFR Part 60, Appendix A-2, Method 3A; **and**

SAMPLE

(C) The moisture content using 40 CFR Part 60, Appendix A-3, Method 4.

(iv) Simultaneous to the determination of the O_2 concentration in (iii)(B) above, determine:

(A) The NO_X concentration of the exhaust gas using 40 CFR Part 60, Appendix A-4, Method 7E; **and**

(B) The CO concentration of the exhaust gas using 40 CFR Part 60, Appendix A-4, Method 10.

(c) If at any time the owner or operator operates the combustion unit in excess of the highest achievable load plus 10%, the owner or operator must perform a stack test within 180 days from the anomalous operation.

5. Combustion Unit Periodic Monitoring Requirements

(a) When conducting periodic monitoring on a combustion unit, the owner or operator may follow the procedures in (b) below. If the owner or operator decides to deviate from those procedures, they must submit a request to use an alternate procedure, in writing, at least 60 days prior to performing the periodic monitoring. In the alternate procedure request, the owner or operator must demonstrate the alternate procedure's equivalence to the standard procedure to the satisfaction of the Division of Source Testing and Monitoring.

(b) *Standardized Periodic Monitoring Procedure.*

(i) Conduct three test runs of at least 20-minutes duration within 10% of 100% peak (or the highest achievable) load.

(ii) Determine NO_X and CO emissions and O_2 concentrations in the exhaust with either an electro-chemical cell portable gas analyzer used and maintained in accordance with the manufacturer's specifications and following the procedures specified in the current version of ASTM D6522 or by following the procedures in 4(b) (ii) – (iv) of this section.

(iii) If the measured NO_X or CO emissions concentrations are in exceedance of the emissions limit, the owner or operator must perform a stack test within 180 days of the periodic monitoring.

SECTION M. STATIONARY NATURAL GAS-FIRED COMBUSTION TURBINES

1. BAT Compliance Requirements

(a) For each natural gas-fired combustion turbine constructed and authorized to operate prior to February 1, 2013, the owner or operator shall abide by the terms and conditions of the applicable plan approval or operating permit under which they were authorized.

(b) For each natural gas-fired combustion turbine constructed and authorized to operate under GP-5 approved by the Department on or after February 1, 2013, but prior to August 8, 2018, the owner or operator shall:

(i) Ensure the turbine does not exceed the emissions standards specified in the following table:

Turbine Rating (bhp)	**NO_X (ppmvd @ 15% O_2)**	**CO (ppmvd @ 15% O_2)**	**NMNEHC (as propane) (ppmvd @ 15% O_2)**	**Total PM (lb/MMBtu)**
≥1,000 and <5,000	25	25	9	0.03
≥5,000 and <15,000	15	25	9	0.03
≥15,000	15	10 **or** 93% reduction	5 **or** 50% reduction	0.03

(ii) Ensure the turbine meets the requirements of (d) below.

SAMPLE

(c) For each natural gas-fired combustion turbine constructed and authorized to operate on or after August 8, 2018, the owner or operator shall:

(i) Ensure the turbine does not exceed the emission standards specified in the following table:

Turbine Rating (bhp)	**NO_X (ppmvd @ 15% O_2)**	**CO (ppmvd @ 15% O_2)**	**NMNEHC (as propane) (ppmvd @ 15% O_2)**	**Total PM (lb/MMBtu, HHV)**
≥1,000 and <5,000	25	25	9.0	0.03
≥5,000 and <15,900	15	10	5.0	0.03
≥15,900	9.0 Uncontrolled **or** 2.0 with Control	10 Uncontrolled **or** 1.8 with Control	5.0	0.03

(ii) Ensure that, for turbines that control NO_X emissions with a control technology that uses ammonia or urea as a reagent, the exhaust ammonia slip is limited to 10 ppmvd or less corrected to 15% O_2.

(iii) Demonstrate that the vendor's guarantee assures compliance with the total PM emission limits.

(iv) Ensure the turbine meets the requirements of (d) below.

(d) The owner or operator of the turbine shall also:

(i) Ensure the turbine meets the visible emissions standards, as determined by the methods described in 25 Pa. Code § 123.43, by not exceeding the following limitations:

(A) Equal to or greater than 10% for a period or periods aggregating more than three minutes in any one hour; **and**

(B) Equal to or greater than 30% at any time.

(ii) Install, operate, and maintain a non-resettable hour meter.

(iii) Limit the turbine's time spent at idle during startup or shutdown to a period appropriate for the operation of the turbine and air pollution control equipment consistent with good air pollution control practices, not to exceed 30 minutes, during which time the emissions standards in (a) through (c) do not apply.

(iv) Operate the turbine and air pollution control equipment consistent with good air pollution control practices during periods of low ambient air temperature (at or below 0 °F), during which time the emissions standards in (a) through (c) do not apply.

(v) Conduct performance tests for the turbine as detailed in Condition 4 below within 180 days of initial startup and within 180 days of reauthorization of this General Permit and periodic monitoring for the turbine every 2,500 hours of operation. The Department may alter the frequency of periodic monitoring based on the test results. The frequency of periodic monitoring may be altered upon request of the owner or operator with written Departmental approval.

2. Recordkeeping Requirements

For each turbine, the owner or operator shall maintain the following records in accordance with Section A Condition 12, including information on:

(a) The location of each turbine;

(b) The GP-5 authorization number and the date each turbine was authorized for use;

(c) The make, model, and serial number of each turbine;

(d) A copy of the manufacturer's maintenance instructions **or** an alternative maintenance plan;

(e) Records of maintenance conducted on each turbine and any installed air pollution control devices;

SAMPLE

(f) A copy of the vendor's emission guarantees;

(g) The results of each periodic monitoring;

(h) The summary for each complete test report described in Section A Condition 14(i);

(i) Representative fuel sampling data in accordance with 40 CFR § 60.4365(b);

(j) The results of all compliance calculations in accordance with 40 CFR § 60.7(f), **if applicable**; **and**

(k) The emissions calculations for each turbine in accordance with 25 Pa. Code § 135.5.

3. Reporting Requirements

The emissions from each natural gas-fired combustion turbine operated during the reporting period must be included in the emissions inventory report of Section A Condition 13(d).

4. Turbine Performance Testing Requirements

(a) When conducting a performance test, the owner or operator must submit the test protocol described in Section A. Condition 14 (f) for review and approval.

(b) The owner or operator should conduct the following test procedures:

(i) Conduct three test runs of at least one hour duration within plus or minus 25% of 100% of peak load or at the highest achievable load point.

(ii) Select the sampling port location and the number and location of traverse points at the exhaust using 40 CFR Part 60, Appendix A-1, Method 1 or 1A depending on stack diameter, or the sampling points selected in accordance with 40 CFR Part 60, Appendix A-4, Method 7E, Section 8.1.2.

(iii) Determine the effluent characteristics by either:

(A) Calculating the exhaust flow in accordance with 40 CFR Part 60, Appendix A-7, Method 19 and measuring the O_2 concentration using 40 CFR Part 60, Appendix A-2, Method 3A; **or**

(B) By measuring:

(1) The flow velocity, stack temperature, static pressure, and barometric pressure using 40 CFR Part 60, Appendix A-1, Method 2 or 2C depending on stack diameter;

(2) The gas density using 40 CFR Part 60, Appendix A-2, Method 3A; **and**

(3) The moisture content using 40 CFR Part 60, Appendix A-3, Method 4.

(iv) Simultaneous to the determination of the O_2 concentration in (iii)(A) or (B) above, determine:

(A) The NO_X concentration of the exhaust gas using 40 CFR Part 60, Appendix A-4, Method 7E;

(B) The CO concentration of the exhaust gas using 40 CFR Part 60, Appendix A-4, Method 10; **and**

(C) The NMNEHC concentration, as propane, of the exhaust gas using ALT-106.

(c) If at any time the owner or operator operates the turbine in excess of the highest achievable load plus 25%, the owner or operator must perform a stack test within 180 days from the anomalous operation.

5. Turbine Periodic Monitoring Requirements

(a) When conducting periodic monitoring on a turbine, the owner or operator may follow the procedures in (b) below. If the owner or operator decides to deviate from those procedures, they must submit a request to use an alternate procedure, in writing, at least 60 days prior to performing the periodic monitoring. In the alternate procedure request, the owner or operator must demonstrate the alternate procedure's equivalence to the standard procedure to the satisfaction of the Division of Source Testing and Monitoring.

(b) *Standardized Periodic Monitoring Procedure.*

(i) Conduct three test runs of at least 20 minutes duration within plus or minus 25% of 100% of peak load or at the highest achievable load point,

SAMPLE

(ii) Determine NO_X and CO emissions and O_2 concentrations in the exhaust with either an electro-chemical cell portable gas analyzer used and maintained in accordance with the manufacturer's specifications and following the procedures specified in the current version of ASTM D6522 or by following the procedures in 4(b) (ii) – (iv) (B) of this section.

(iii) If the measured NO_X or CO emissions concentrations are in exceedance of the emissions limit, the owner or operator must perform a stack test within 180 days of the periodic monitoring.

(c) The 2,500 hours of operation count resets after any performance test performed in accordance with Condition 4 above.

(d) For turbines that control NO_X emissions:

(i) Using water or steam injection, the owner or operator shall install, calibrate, maintain, and operate the appropriate continuous monitoring system in accordance with 40 CFR § 60.4335.

(ii) Using methods other than water or steam injection, the owner or operator shall install, calibrate, maintain, and operate the appropriate continuous monitoring system in accordance with 40 CFR § 60.4340(b).

(iii) The owner or operator that installs, calibrates, maintains, and operates a CPMS shall develop a site-specific parameter monitoring plan in accordance with 40 CFR § 60.4355.

6. Turbine Core Replacement Requirements

Turbine core replacement is allowed for a turbine, provided the following conditions are met:

(a) The owner or operator shall provide thirty (30) days written notification to the Department of a planned turbine core replacement, or within seven (7) days after an unplanned replacement is commenced.

(b) The written notice shall identify the location, the manufacturer, model, and serial number of the turbine, and the manufacturer, model, and serial number of the turbine core to be installed, or which has been installed, in the turbine and the air contaminant emission rates which will exist following the turbine core replacement, including NO_X, CO and NMNEHC.

(c) The written notice shall also contain a certification from the owner or operator that any turbine core to be installed has been manufactured by either the existing turbine manufacturer or other manufacturer and will be a lower emitting turbine core or, if the core will be replaced with an identical core, that a lower emitting core is not available. Existing turbine manufacturers shall include companies that maintain the turbine cores of the existing turbines at the facility. If the permittee decides to install a turbine core obtained from a manufacturer other than the existing turbine manufacturer, the notice shall contain a certification, signed by a "responsible official" as defined in 25 Pa. Code Section § 121.1, that the permittee has examined the turbine cores that are available from all such manufacturers and will install, or has installed, the lowest emitting turbine core available from any manufacturer.

(d) The core to be installed, or which has been installed, shall be an identical turbine core or lower emitting turbine core.

(e) The notice shall be accompanied by a vendor-provided guarantee of the achievable air contaminant emission rates of the new turbine core. If such a guarantee is not available, the notice shall include certification that the permittee attempted to obtain such guarantee and an explanation as to why the vendor will not provide such a guarantee.

(f) All certifications shall be signed by a responsible official and shall acknowledge that the certifying party is aware of the penalties for unsworn falsification to governmental authorities as established under 18 Pa.C.S. § 4904. The certification shall also state that based on information and belief formed after reasonable inquiry, that the information in the notice are true, accurate and complete.

(g) For purposes of this General Permit, a turbine core is a "Lower Emitting Turbine Core" if it is commercially available, has the same operating characteristics as the core being removed and the rate of NO_X emissions, expressed as either parts per million by volume dry basis ("ppmvd") or pounds per hour ("lb/h") would be lower than the rates of emission achievable by any commercially available alternative turbine core when the respective turbine was operating at the same level of performance. If the horsepower, firing rate and operating speed of the core being removed falls within the ranges of horsepower, firing rate, and operating speed for the Lower Emitting Turbine Core, the Lower Emitting Turbine Core is considered to have the same operating characteristics as the

SAMPLE

core being removed. A turbine core is an "Identical Turbine Core" if the rate of NO_X emissions is no higher than the emission rates of the turbine core being replaced when the respective turbine is operating at the same level of performance.

(h) After a turbine core has been replaced, the permittee shall perform NOx, CO, and NMNEHC emissions testing for the respective turbine compressor engine(s) within one-hundred twenty (120) days of completing the replacement. Stack testing shall be performed in accordance with Condition 4 of this Section.

SECTION N. CENTRIFUGAL COMPRESSORS

1. BAT Compliance Requirements

For a centrifugal compressor constructed and authorized to operate on or after August 23, 2011, the owner or operator shall meet the requirements of 40 CFR § 60.5380 or § 60.5380a as applicable.

2. Recordkeeping Requirements

For each centrifugal compressor, the owner or operator shall maintain the following records in accordance with Section A Condition 12 and 40 CFR § 60.5420(c)(2) or § 60.5420a(c)(2) as applicable.

In addition, the emissions calculation for each centrifugal compressor must be kept in accordance with 25 Pa. Code § 135.5.

3. Reporting Requirements

In the required annual report of Section A Condition 13(c), the information about each centrifugal compressor operated during the reporting period shall be done in accordance with 40 CFR § 60.5420(b)(3) or § 60.5420a(b)(3) as applicable.

The emissions from each centrifugal compressor operating during the reporting period must be included in the emissions inventory report of Section A Condition 13(d), including the emissions from scheduled and unscheduled blowdowns.

GENERAL PLAN APPROVAL AND/OR GENERAL OPERATING PERMIT
BAQ-GPA/GP-5A

Unconventional Natural Gas Well Site Operations and Remote Pigging Stations

SECTION A. GENERAL REQUIREMENTS

1. Statutory/Regulatory Authority and General Description

In accordance with Section 6.1(f) of the Pennsylvania Air Pollution Control Act (APCA), 35 P.S. § 4006.1(f) and 25 Pa. Code Chapter 127, Subchapter H, the Department of Environmental Protection (Department or DEP) hereby issues this General Plan Approval and/or General Operating Permit (General Permit or GP-5A) for new or modified unconventional natural gas well site operations and remote pigging stations (facility or facilities) constructed, modified, or operated in this Commonwealth.

3. Definitions

Words and terms that are not otherwise defined in this General Permit shall have the meanings set forth in Section 3 of the APCA (35 P.S. § 4003) and Title 25, Article III including 25 Pa. Code § 121.1 unless the context indicates otherwise. The meanings set forth in applicable definitions codified in the Code of Federal Regulations (CFR) including 40 CFR Part 60, Subparts JJJJ, OOOO, and OOOOa or 40 CFR Part 63, Subparts HH and ZZZZ shall also apply to this General Permit.

Fugitive Emissions Component – Any component that has the potential to emit fugitive emissions of methane, Volatile Organic Compounds (VOC), or Hazardous Air Pollutants (HAP) at an unconventional natural gas well site or remote pigging station including, but not limited to, valves, connectors, pressure relief devices, open-ended lines, flanges, compressors, instruments, meters, covers, and closed vent systems. Devices that vent as part of normal operations are not considered fugitive sources unless the emission originates from a place other than the vent.

Leak – A leak is defined as any release of gaseous hydrocarbons that is detected by Auditory, Visual, or Olfactory (AVO) inspection; an optical gas imaging (OGI) camera calibrated according to 40 CFR § 60.18 and a detection sensitivity level of 60 grams/hour; a gas leak detector that meets the requirements of 40 CFR Part 60, Appendix A-7, Method 21 that detects a concentration of 500 ppm calibrated as methane or greater; or other leak detection methods approved by the Department's Division of Source Testing and Monitoring. However, a release from any equipment or component designed by the manufacturer to protect the equipment, controller, or personnel or to prevent groundwater contamination, gas migration, or an emergency situation is not considered a leak.

Pigging Operations – The process of removing and collecting condensed liquids including condensate, intermediate hydrocarbons, or produced water, from a pipeline using a spherical or bullet-shaped device, known as a pig, forced through the pipeline by natural gas pressure. The liquids are then collected at their eventual destination in a storage tank, often referred to as a slug tank. This process also includes operation conducted for pipeline integrity evaluation.

Remote Pigging Station – A facility where pigging operations are conducted that is not located at an unconventional natural gas well site, natural gas compressor station, natural gas processing plant, or natural gas transmission station and which meets or exceeds the exemption criteria in Category 38(c) of the Air Quality Permit Exemptions List.

Sour Gas – Natural gas where the Hydrogen Sulfide (H_2S) content is in excess of 4 ppmv at standard temperature and pressure.

Start of Production – The beginning of initial flow following the end of flowback when there is continuous recovery of salable quality gas and separation and recovery of any crude oil, condensate, or produced water. A well whose owner or operator is selling gas through temporary equipment designed for flowback shall not be considered in production until either the sales continue through the temporary equipment for more than 30 days or the gas is routed to a permanent production separator.

Unconventional Natural Gas Well – A well drilled to produce natural gas from shale formations below the Elk Sandstone or its geologic equivalent stratigraphic interval, where recovery of the natural gas is generally not economic without the bores being stimulated by hydraulic fracturing, multilateral well bores, or other techniques to expose more of the formation to the well bore.

Unconventional Natural Gas Well Site – A location with one or more unconventional natural gas wells at which unconventional natural gas well site operations are conducted.

Unconventional Natural Gas Well Site Operations – Equipment and processes at unconventional natural gas well sites including, but not limited to, gas dehydration, tanker truck load-out, wellbore liquid unloading, gas compression, pigging, and storage.

Wellbore Liquids Unloading – The process of removing accumulated liquids from a natural gas well in order to restore well pressure and natural gas production.

SAMPLE

4. Applicability/Scope

(a) This General Permit authorizes the construction, modification, and/or operation of sources listed below at an unconventional natural gas well site or remote pigging station. The applicability of this General Permit may include one or more of the following operations or emissions sources:

- (i) Glycol Dehydration Units
- (ii) Stationary Natural Gas-Fired Spark Ignition Internal Combustion Engines

(b) An Application for Authorization to Use GP-5A may be submitted for the operation of an eligible source if the source is exempted from plan approval requirements under 25 Pa. Code § 127.14.

(c) If any source located at the facility cannot be regulated under this General Permit, a plan approval and/or an operating permit issued in accordance with 25 Pa. Code, Chapter 127, Subchapter B and/or Subchapter F will be required.

5. Prohibited Use of GP-5A

GP-5A may not be used for the construction, modification, or operation of any of the following air contamination sources:

(a) A proposed source located at a Title V facility including sources determined to be a single source Title V facility.

(b) A proposed source that is subject to Title V permitting requirements specified in 25 Pa. Code Chapter 127, Subchapters F and G; prevention of significant deterioration requirements specified in 25 Pa. Code Chapter 127 Subchapter D; or nonattainment new source review requirements specified in 25 Pa. Code Chapter 127 Subchapter E.

(c) A facility that produces or processes sour gas.

(d) *Circumvention.*

(i) The owner or operator of a facility may not circumvent the new source review requirements of 25 Pa. Code Chapter 127, Subchapter E by causing or allowing a pattern of ownership or development, including the phasing, staging, delaying, or engaging in incremental construction over a geographic area of a facility which, except for the pattern of ownership or development, would otherwise require a permit or submission of a plan approval application.

(ii) No person may permit the use of a device, stack height that exceeds good engineering practice, dispersion technique, or other technique that without resulting in reduction of the total amount of air contaminants emitted, conceals or dilutes an emission of air contaminants that would otherwise be in violation of this General Permit, the APCA, or the regulations promulgated thereunder, except for those that are used for the control of malodors with the prior written approval of the Department.

6. Authorization to Use GP-5A

(a) *Application for Authorization to Use GP-5A.* Pursuant to 25 Pa. Code § 127.621, any person proposing to construct, operate, or modify a source listed in Section A, Condition 4 of this General Permit at an unconventional natural gas well site or remote pigging station shall submit an Application for Authorization to Use GP-5A to the Air Program Manager of the appropriate DEP Regional Office responsible for authorizing the use of general permits in the county in which the facility will be located. This application shall be submitted to DEP either through the ePermitting system, by hand delivery, courier, or sent to DEP by certified mail, return receipt requested, in accordance with 25 Pa. Code § 127.621(b).

(b) *Terms of Authorization to Use GP-5A.* This General Permit authorizes the construction and/or operation of the specific sources at the specific facility as described in the application for a term of five years from the date of authorization. The authorization to construct a source or facility will expire 18 months from the date of the authorization if the owner or operator fails to commence construction or if there is a lapse in construction of 18 months. The Department may extend the 18-month period upon an owner or operator providing satisfactory justification for an extension up to the original date of the five-year term. All requests for extension shall be submitted to the Department at least 30 days prior to the end of the 18-month period and are only valid upon receipt of written approval by the Department. The expiration of the authorization to construct will require a new Application for Authorization to Use GP-5A if an extension is not requested and granted.

(c) *Expiration of and Re-Authorization to Use GP-5A.*

(i) The authorization granted by the Department to construct and/or operate under this General Permit shall terminate on the date of expiration unless a complete Application for Authorization to Use GP-5A is submitted to the Department at least 30 calendar days prior to the expiration date.

(ii) Upon receipt by the Department of a timely, administratively and technically complete application for re-authorization to operate under this General Permit, the owner or operator may continue to operate the facility subject to final action by the Department provided that the sources and the facility are operated in compliance with the terms and conditions of this General Permit. The Authorization to Use GP-5A shall cease if the owner or operator fails to submit any additional information requested by the Department to process the application by the specified deadline.
