CHANGE HISTORY SUMMARY

REVISION NUMBER	DATE ISSUED	DESCRIPTION OF CHANGES
1	06/03/11	Added steps 1.3, 1.4, 2.3, 2.4, and 2.5 to reflect process; added requirement for hearing protection for following JHA PROD-284.

INTRODUCTION [1]

This procedure provides the instructions necessary for personnel to perform the task of removing water from the leak detection sump. This process involves installation and operation of a surface-mounted utility pump.

Performance of this procedure generates the following record(s), as applicable. Any records generated are handled in accordance with departmental Records Inventory and Disposition Schedules.

- Attachment 1, Salt Storage Extension I & II Sump Water Removal Log

REFERENCES

BASELINE DOCUMENTS

- Utility Pump Users Manual
- WP 12-IS.01-5, *Industrial Safety Program - Hazardous Locations and Working Surfaces* (applicable sections)
- PROD-284, Salt Storage Extension I & II Evaporation Basin Sump Water Removal

REFERENCED DOCUMENTS

- Water Level Probe Owner's Manual
- Pump Owner's Manual

EQUIPMENT

- Utility Pump with flexible polyvinyl chloride hoses
- One-inch flow meter for volume measurement
- Radio/cell phone for communications
- Binoculars
- Personal floatation device
- Safety glasses
- Water Level Probe
- Hearing Protection
- Distilled water

PRECAUTIONS AND LIMITATIONS

- Care should be taken when working near slippery surfaces.

- Caution must be taken not to damage the synthetic liner with equipment, tools, or other devices.
- Safety glasses shall be worn to prevent eye injury.
- Hearing protection shall be worn when near utility pump.
- Personnel performing this procedure shall follow hazard controls in JHA PROD-284.

PREREQUISITE ACTIONS

NOTE

If needed, user should seek assistance when unloading equipment.
All work is to be suspended in case of inclement weather.

1.0 Perform pre-job safety briefing.

2.0 Ensure tubing has been installed to the maximum depth in the sump.

3.0 Ensure utility pump is primed before starting, and not run dry.

4.0 Inspect all connections hoses and fittings for damage and repair as needed.

PERFORMANCE

CAUTION

Running the pump with outlet pipe or nozzle closed may cause excessive back pressure and cause hoses to burst.

Pump should never be run dry, as running pump without water will cause seal failure.

NOTE

The installation process may be performed in any sequence if efficiency can be achieved and it is deemed appropriate by the technician performing the procedure.

1.0 PUMP INSTALLATION, GENERATOR SETUP, AND START-UP

- Place pump trailer as close as possible to the sump access port.
- Remove access port cover.

- Take sump water level measurement and record on Attachment 1.
- Slide intake flex hose into rigid tubing, below water level.
- Place discharge hose on pond.
- Prime pump, connect rigid tubing to intake, and direct discharge hose into graduated container.

2.0 WATER REMOVAL OPERATIONS

- Turn on pump to remove sump water.
- Record start time on Attachment 1.
- Record the time the sump water reaches the surface on Attachment 1.
- For the first 30 minutes, take flow meter readings every ten minutes; thereafter, take two flow meter readings per dewatering event.
- If sump cannot be emptied, contact Environmental Department manager for further instructions.
- Record all readings on Attachment 1.
- After sump water has been evacuated, turn off the pump, and record the time on Attachment 1.
- Obtain sump water level measurement and record on Attachment 1.

3.0 EQUIPMENT TAKEDOWN

- Remove hoses where required.
- Clean/rinse reusable equipment with distilled water.
- Store equipment accordingly.

4.0 FOLLOW-UP ACTIONS

4.1 Obtain sump water level elevation every working day for three consecutive working days.

4.2 Perform sump water evacuation as needed.

REFERENCED DOCUMENTS

- WP 12-IH.02-2, WIPP Industrial Hygiene Program - Confined Spaces

PRECAUTIONS AND LIMITATIONS

- Only personnel authorized by the Facility Shift Manager (FSM) will be allowed access into the fenced area of the Sewage Lagoon.
- The Sewage Lagoon perimeter fence gates shall remain locked during all times when the area is unoccupied.

- Operations within the Sewage Lagoon fenced area should be conducted during daylight hours, whenever possible.
- To reduce the possibility of short-cycling under-stabilized wastewater or raw sewage, discharging to the Evaporation Ponds should only be accomplished from off-service ponds, except in emergency situations.
- Operating and Maintenance personnel shall have current Tetanus immunizations. A record of Tetanus immunization must be on file with the site Health Services office.
- Protective clothing must be worn EXCEPT when performing routine discharging and maintenance.
- A minimum of two persons must be present at the work site when conducting maintenance and cleanup activities.
- All cuts, abrasions, and similar injuries must be promptly cleaned and treated by the site Health Services personnel or Emergency Services Technician.
- Eating, drinking, smoking, or chewing is prohibited within the Sewage Lagoon fenced perimeter.
- Since the Sewage Lagoon Chlorinator Pit is a permit-required confined space, compliance with WP 12-IH.02-2 is required.
- At the FSM's discretion, one set of primary and polishing pond cells along with an evaporation pond may be used and the remaining evaporative ponds placed in service as required.
- There are no required minimum levels for the evaporation ponds. The evaporation ponds should have at least one foot of freeboard.

PREREQUISITE ACTIONS

NOTE

Makeup water can be added to any pond by using domestic water hydrants DW-258-WH-001, DW-258-WH-002, OR DW-258-WH-003.

1.0 For the In Service settling and polishing ponds, maintain a depth between 30" and 42".

2.0 Verify that all overflow and underflow weir plates are properly installed into the effluent weir boxes of in-service settling and polishing ponds.

3.0 Verify following valves are in normal open condition, or that they have been aligned as directed by the FSM/Shift Manager:

- SW-258-V-011, Evaporation Pond A to Evaporation Pond B Cross-Connect Valve
- SW-258-V-012, Evaporation Pond A to Evaporation Pond C Cross-Connect Valve
- SW-258-V-013 Evaporation Pond B to Evaporation Pond C Cross-Connect Valve
- DW-258-V-001, Hydrant Isolation Valve
- DW-258-V-002, Hydrant Isolation Valve
- DW-258-V-003, Hydrant Isolation Valve

4.0 Monitor and observe operating parameters listed in Attachment 1, Operating Parameters, at LEAST weekly.

PERFORMANCE

1.0 PRIMARY CELL 1A/POLISHING CELL 1B OPERATION

1.1 Verify following valves are CLOSED:

- SW-258-V-001, Primary Cell 1A Inlet Valve
- SW-258-V-003, 1A to 2A Series Operation Valve
- SW-258-V-004, 1B to 2B Series Operation Valve
- SW-258-V-005, 1A to 1B Drain Valve

NOTE

Valve SW-258-V-006 may be left open with 1A and 1B ponds off-service as directed by FSM/Shift Manager OR as required for discharging in accordance with Section .0.

- SW-258-V-006, 1A to 1B Discharge Valve
- SW-258-V-009, 1B Discharge Valve

WARNING

Performance of following step may increase personnel health risk due to introduction of raw sewage into selected pond.

1.2 OPEN following valves:

- SW-258-V-001, Primary Cell 1A Inlet Valve
- SW-258-V-006, 1A to 1B Discharge Valve

1.3 Verify following valves are CLOSED:

- SW-258-V-002, Primary Cell 2A Inlet Valve

NOTE

Valve SW-258-V-008 may be left open with 2A and 2B ponds off-service as directed by FSM/Shift Manager OR as required for discharging in accordance with Section .0.

- SW-258-V-008, 2A to 2B Discharge Valve

2.0 PRIMARY CELL 2A/POLISHING CELL 2B OPERATION

2.1 Verify following valves are CLOSED:

- SW-258-V-002, Primary Cell 2A Inlet Valve
- SW-258-V-003, 1A to 2A Series Operation Valve
- SW-258-V-004, 1B to 2B Series Operation Valve
- SW-258-V-007, 2A to 2B Drain Valve

NOTE

Valve SW-258-V-008 may be left open with 2A and 2B ponds off-service as directed by FSM/Shift Manager OR as required for discharging in accordance with Section .0.

- SW-258-V-008, 2A to 2B Discharge Valve
- SW-258-V-010, 2B Discharge Valve

WARNING

Performance of following step may increase personnel health risk due to the introduction of raw sewage into selected pond.

2.2 OPEN following valves:

- SW-258-V-002, Primary Cell 2A Inlet Valve
- SW-258-V-008, 2A to 2B Discharge Valve

2.3 Verify following valves are CLOSED:

- SW-258-V-001, Primary Cell 1A Inlet Valve

NOTE

Valve SW-258-V-006 may be left open with 1A and 1B ponds off-service as directed by FSM/Shift Manager OR as required for discharging in accordance with Section .0.

- SW-258-V-006, 1A to 1B Discharge Valve

3.0 DISCHARGING TO EVAPORATION PONDS

3.1 **IF** lowering level of Primary Cell 1A/Polishing Cell 1B, **THEN** perform the following:

3.1.1 **GO TO** Section 2.0, place Primary Cell 2A/Polishing Cell 2B in service, secure filling Primary Cell 1A/Polishing Cell 1B, and **RETURN TO** Step 3.1.2.

3.1.2 OPEN SW-258-V-009, 1B Discharge Valve

3.1.3 **WHEN** pond levels approach 36", **THEN** CLOSE SW-258-V-009, 1B Discharge Valve.

3.2 **IF** lowering level of Primary Cell 2A/Polishing Cell 2B, **THEN** perform the following:

3.2.1 **GO TO** Step 1.1, place Primary Cell 1A/Polishing Cell 1B in service, secure filling Primary Cell 2A/Polishing Cell 2B, and **RETURN TO** Step 3.2.2.

3.2.2 OPEN SW-258-V-010, 2B Discharge Valve

3.2.3 **WHEN** pond levels approach 36", **THEN** CLOSE SW-258-V-010, 2B Discharge Valve.

Attachment 1 – Operating Parameters

OPERATING PARAMETERS

Color Indication	General Pond Condition
Dark sparkling green	Good, high pH and dissolved oxygen (DO).
Dull green to yellow	Poor, lowering pH and DO. Blue-green algae are becoming predominant.
Tan to Brown	• Fair, if due to a predominance of brown algae. • Poor, if due to silt or bank erosion.
Gray to Black	Very poor. Pond is septic with anaerobic conditions prevailing.
Wave Action	There should be good wave action when wind is blowing. The absence of good wave action may indicate anaerobic conditions or the presence of oil.
Plant Growth	There should be no plant growth in water that reduces or prevents good wave action. Plant growth along the banks which block wind must also be controlled.
Cleanliness	Inlet piping and outlet weirs must be kept clean and free of floating debris. Trash, caked scum, and debris must be broken up or removed as appropriate. Required cleanup may be accomplished as follows: • Use fire hoses attached to domestic water hydrants to break up floating debris and caked scum, and to reduce material buildup under inlet and discharge pipes. • Use garden rakes for shore maintenance. • Dispose of all removed trash in a proper container. • Notify Hazardous Waste Operations for removal of solid material.
Other	• Check condition of pond liners for evidence of leakage, abnormal wear, or tearing. • Check for erosion problems or evidence of burrowing animals. • Check condition of weir boxes and inspect visible weir plates for obvious damage. • Verify underground valves have covers properly installed. • Report any discrepancies promptly to FSM/Shift Manager.

RE: Response to Notice of Intent to Discharge; Discharge Permit Not Required for Waste Isolation Pilot Plant, DP-831

Dear Mr. Brown:

The Ground Water Quality Bureau of the New Mexico Environment Department (NMED) received a Notice of Intent from you on April 9, 2018 regarding the proposed discharge of stormwater from the Waste Isolation Pilot Plant. The proposed discharge is located at 34 Louis Whitlock Road, approximately 26 miles southeast of Carlsbad, in Sections 20, 28, and 29, Township 22S, Range 31E, Eddy County.

The notice satisfies the requirements of Subsection A of 20.6.2.1201 NMAC, Ground and Surface Water Protection Regulations, (20.6.2 NMAC).

The proposed discharge is briefly described as follows:

> Stormwater collected in Stormwater Ponds 1, 2, and 3 will be used for dust control and compaction at a project site for construction of an industrial facility and at a construction site for building a highway bypass.

Based on the information provided in your Notice of Intent, NMED has determined that a Discharge Permit is not required as long as the discharge is as described. The discharge is exempt from the Discharge Permit requirement pursuant to Subsection A of 20.6.2.3105 NMAC because, according to the analytical results provided with the Notice of Intent, the discharge conforms to the ground water standards in Section 20.6.2.3103 NMAC.

Although a Discharge Permit is not being required for this discharge at this time, you are not relieved of liability should your operation result in actual pollution of surface or ground waters. Further, this decision by NMED does not relieve you of your responsibility to comply with any other applicable federal, state, and/or local laws and regulations, zoning requirements, plumbing codes, and nuisance ordinances.

If at some time in the future you intend to change the amount, character or location of your discharge, or if observation or monitoring shows that the discharge is not as described in your Notice of Intent, you must file a revised Notice of Intent with the Ground Water Quality Bureau.

If you have any questions, please contact either Avery Young at (505) 827-2909 or Steve Pullen, Program Manager of the Ground Water Pollution Prevention Section, at (505) 827-2962.

Sincerely,

Michelle Hunter, Chief
Ground Water Quality Bureau

Subject: Discharge Permit 831 Permit Modification Renewal/Modification, Part III Additional Proposals and Conditions

Reference: Waste Isolation Pilot Plant Discharge Permit 831 Renewal/Modification Application, December 3, 2018

Dear Ms. Hunter:

The purpose of this letter is to request a modification to *Part III. Additional Proposals and Conditions* of the referenced Discharge Permit 831 (DP-831) to add a new Proposal, and to modify one Condition.

The U. S. Department of Energy, the permittee under DP-831, proposes to use storm water collected in Storm Water Ponds 1, 2, and 3 for site activities requiring non-potable fresh water. Under this proposal, the permittee would use uncontaminated storm water for dust control, soil compaction, and other construction activities, without first having to notify the Ground Water Quality Bureau (GWQB). The permittee is also requesting a modification to Condition 4, and by extension Condition 31, to include the discharge of excess storm water to the ground surface as a short-term corrective action, in the event that storm water accumulations exceed the minimum one foot of freeboard, without the need to notify the GWQB. Such discharges would occur only if analyses of storm water samples showed no ground water contaminants in excess of the standards in 20.6.2.3103 NMAC.

Discussions with Ms. Avery Young of your staff indicated that a Notice of Intent is currently needed prior to the use and/or discharge of storm water as proposed. Ms. Young suggested that the permittee request inclusion of these storm water management alternatives in the DP-831 Permit currently undergoing review by the GWQB, prior to issuance of the permit. Your consideration of this request is greatly appreciated.

If you have any questions about this request or require any additional information, please contact me at (575) 234-7476.

Sincerely,

Michael R. Brown, Director
Office of Environmental Protection

Subject: NOTICE OF INTENT TO DISCHARGE

Dear Ms. Hunter:

The purpose of this letter is to transmit to you a Notice of Intent to Discharge (NOI) storm water from Storm Water collection ponds at the Waste Isolation Pilot Plant (WIPP) facility. The Department of Energy, the permittee under Discharge Permit 831, proposes to use storm water for dust control, and soil compaction associated with on-site construction activities (e.g., construction of the new filter building and the North Access Road bypass). Discussions with Ms. Avery Young of your staff indicated that a NOI is needed prior to the use of storm water for these purposes. Your consideration of this request is greatly appreciated. Enclosed are the NOI to Discharge, and applicable analytical data for the storm water.

If you have any questions about this request or require any additional information, please contact me at (575) 234-7476.

Sincerely,

Michael R. Brown, Director
Office of Environmental Protection

3. Name of facility:

Waste Isolation Pilot Plant

4. Physical location of the discharge (if applicable, give street address, township, range, section, distance from closest town or landmark, directions to facility, location map):

Street Address: 34 Louis Whitlock Road, Carlsbad, NM 88220; 26 air miles east-southeast of Carlsbad, NM

5. Type of operation generating the discharge (e.g., agricultural facility, domestic wastewater discharge, industrial discharge, mining operation, etc.):

Construction activities at a Federal Government Industrial site

6. Source(s) of the discharge. Describe how the wastewater, sludge, or other discharges processed and/or disposed at your facility are generated. Identify all sources. Attach additional pages if needed:

Discharge will consist of storm water detained per DP-831 and used for dust control and compaction at a project site for construction of an industrial facility, and another construction site for building a highway bypass.

7. Expected contaminants in the discharge (e.g., nitrate-nitrogen, metals, organic compounds, salts, etc.) Include estimated concentration if known, and copies of results of laboratory analyses, if available:

Minerals from soil dissolved in stormwater. No hazardous constituents are present. TDS is less than 250 mg/L. See laboratory analyses enclosed.

QC Summary

Workorder: 462103

Parmname	NOM	Sample	Qual	QC	Units	RPD%	REC%	Range	Anlst	Date Time
Solids Analysis										
Batch 1815091										
QC1204142072 462103001 DUP										
Total Dissolved Solids		H 196	H	199	mg/L	0.717		(0%-5%)	KLP1	10/24/18 14:03
QC1204142071 LCS										
Total Dissolved Solids	300			287	mg/L		95.7	(95%-105%)		10/24/18 14:03
QC1204142070 MB										
Total Dissolved Solids			U	ND	mg/L					10/24/18 14:03

Notes:

The Qualifiers in this report are defined as follows:

<	Result is less than value reported
>	Result is greater than value reported
B	The target analyte was detected in the associated blank.
E	General Chemistry--Concentration of the target analyte exceeds the instrument calibration range
H	Analytical holding time was exceeded
J	Value is estimated
N/A	RPD or %Recovery limits do not apply.
N1	See case narrative
ND	Analyte concentration is not detected above the detection limit
NJ	Consult Case Narrative, Data Summary package, or Project Manager concerning this qualifier
Q	One or more quality control criteria have not been met. Refer to the applicable narrative or DER.
R	Per section 9.3.4.1 of Method 1664 Revision B, due to matrix spike recovery issues, this result may not be reported or used for regulatory compliance purposes.
R	Sample results are rejected
U	Analyte was analyzed for, but not detected above the MDL, MDA, MDC or LOD.
X	Consult Case Narrative, Data Summary package, or Project Manager concerning this qualifier
Z	Paint Filter Test--Particulates passed through the filter, however no free liquids were observed.
^	RPD of sample and duplicate evaluated using +/-RL. Concentrations are <5X the RL. Qualifier Not Applicable for Radiochemistry.
d	5-day BOD--The 2:1 depletion requirement was not met for this sample
e	5-day BOD--Test replicates show more than 30% difference between high and low values. The data is qualified per the method and can be used for reporting purposes
h	Preparation or preservation holding time was exceeded

Subject: Groundwater Discharge Permit 831 Renewal/Modification Application – Affidavit of Public Notice Completion

Reference: New Mexico Environment Department correspondence from Michelle Hunter, Chief, Ground Water Quality Bureau, to Mr. Todd Shrader, Manager, CBFO, subject: Administrative Completeness Determination and Applicant's Public Notice Requirements, DP-831, Waste Isolation Pilot Plant (WIPP), dated January 16, 2019

Dear Ms. Hunter:

The purpose of this letter is to provide the subject Affidavit of Public Notice Completion with the required enclosures. The signed Affidavit of Public Notice Completion, along with the copy of the newspaper public notice and the list of landowners who were sent the public notice flyer, are enclosed.

This affidavit is being provided pursuant to your directions in the referenced letter regarding *Administrative Completeness Determination and Applicant's Public Notice Requirements, DP-831, Waste Isolation Pilot Plant* received on January 21, 2019, and the public notice of permit modification or renewal requirements as specified in 20.6.2.3108.D NMAC.

If you have any questions regarding this transmittal, please contact me at (575) 234-7476.

Sincerely,

Michael R. Brown, Director
Office of Environmental Protection

New Permit or Permit Modification

DP-*831*

I certify, under penalty of law, that I have fulfilled the Ground Water Discharge Permit public notice requirements of Section 20.6.2.3108(B) NMAC.

✓ I posted a sign for 30 days displaying a synopsis of the public notice in English and in Spanish at or near the proposed facility in a conspicuous public location (or multiple locations) approved by NMED.

✓ I posted a public notice flyer at a conspicuous off-site location approved by NMED.

✓ I placed a synopsis of the public notice in English and in Spanish in a newspaper approved by NMED. A copy of the newspaper page containing the synopsis is enclosed.

✓ I sent the public notice flyer via 1st class mail to *(check box)*:

- ☐ owners of all properties within a 1/3 mile of the boundary of the property of the proposed discharge locations – mailing list is enclosed.
- ☒ owners of all adjacent property (if applicant owns all property within 1/3 mile) – mailing list is enclosed.

✓ I sent the public notice flyer via certified mail, return receipt requested, to *(check box)*:

- ☐ owner of the property of the proposed discharge locations (if applicant is not the owner) – mailing address is enclosed.

I am aware that there are significant penalties for false certification including the possibility of fines.

RE: Administrative Completeness Determination and Applicant's Public Notice Requirements, DP-831, Waste Isolation Pilot Plant (WIPP)

Dear Mr. Todd Shrader,

The New Mexico Environment Department (NMED) received a Groundwater Discharge Permit Application for the above referenced facility on December 3, 2018. Pursuant to Section 20.6.2.3108 NMAC of the New Mexico Ground and Surface Water Protection Regulations (20.6.2 NMAC), NMED determined on January 7, 2019, that your application is administratively complete.

Within 30 days of the date this letter, you must provide public notice. Instructions and materials needed to complete the public notice are enclosed.

After NMED receives the completed proof of public notice, a technical reviewer will contact you if additional information is needed to process your application. If you have a deadline of concern in the interim or any questions, please call the Ground Water Quality Bureau at (505) 827-2900.
Sincerely,

Michelle Hunter, Chief
Ground Water Quality Bureau

INSTRUCTIONS FOR COMPLETING PUBLIC NOTICE REQUIREMENTS

Discharge Permit DP-831 ☐ New ☒ Renewal/Modification ☐ Modification

Within 30 days of the date when the US Postal Service first makes notice to you of its possession of this letter, you must provide public notice as follows:

1. **Post sign(s) at the facility.**
   A sign 2 x 3 feet in size (or multiple signs if required) must be posted **at or near the facility for 30 days** in a conspicuous location approved by NMED. The text for the poster is enclosed. It is the responsibility of the applicant to provide the poster. NMED approves the following sign posting location(s).

   One sign to be posted at each entry point to the facility parking lot.

2. **Post a public notice flyer off-site.**
   The enclosed public notice flyer which must be posted **off-site** at a location conspicuous to the public and approved by NMED. NMED approves the following flyer posting location:

   One flyer to be placed at the Carlsbad Public Library

3. **Mail a public notice flyer to property owners within 1/3 mile.**
   A copy of the enclosed public notice flyer must be sent by 1st class mail to the owners of record of all properties within 1/3 mile from the boundary of the property where the discharge site is located. If there are no properties within 1/3 mile other than properties owned by the applicant, then the flyer must be mailed to the owners of record of the nearest adjacent properties.

   The names and addresses of property owners can be obtained from the county tax assessor's office. The list of property owners' names and addresses must be submitted to NMED.

4. **Mail a public notice flyer to the owner of the discharge site.**
   A copy of the enclosed flyer must be sent via certified mail, return receipt requested, to the owner(s) of the discharge site(s), if the applicant is not the owner. The list of owners' names and addresses and the certified mail receipts must be submitted to NMED.

5. **Place a display ad in the newspaper.**
   A display ad 3 x 4 inches in size must be published for one day in a newspaper of general circulation in the location of the proposed discharge. The ad may **not** be placed in the classified or legal section. The text for the ad is enclosed. NMED approves publishing the ad in the following newspaper:

   Carlsbad Current-Argus

PROOF OF NOTICE. Within 15 days of completing the above requirements, the applicant must submit the following items as proof of notice to NMED:

- ✓ Affidavit regarding the sign posting and mailing (form enclosed).
- ✓ List of names and addresses to whom the public notice flyer was mailed.
- ✓ List of names and addresses of owners of discharge sites.
- ✓ Certified mail receipts for mailing to discharge site owner(s), if required.
- ✓ Copy of newspaper ad.

Send to NMED Ground Water Quality Bureau, PO Box 5469, Santa Fe, NM 87502.

PUBLIC NOTICE

Receipt of Discharge Permit Application

DP-831, Waste Isolation Pilot Plant

DP-831, Waste Isolation Pilot Plant: The U.S. Department of Energy proposes to renew and modify the Discharge Permit for the discharge of up to 23,000 gallons per day of domestic wastewater and 9,586,995 gallons per day of industrial wastewater to disposal systems. Potential contaminants from this type of discharge include nitrogen compounds, dissolved solids, and chloride. The facility is located off Highway 128, approximately 26 miles southeast of Carlsbad, in Sections 20, 21, 28, and 29, T22S, R31E, Eddy County. Groundwater most likely to be affected is at a depth of approximately 100 feet and had a pre-discharge total dissolved solids concentration of 3,400 milligrams per liter.

Provided the applicant has met applicable requirements, the New Mexico Environment Department (NMED) will propose a Discharge Permit containing limitations, monitoring requirements, and other conditions intended to protect groundwater quality for present and potential future use. Information in this public notice was provided by the applicant and will be verified by NMED during the permit application review process. NMED will develop a Public Involvement Plan (PIP) to identify all communities potentially affected by the proposed permitted activity and expand public participation opportunities to accommodate the needs of those communities. The PIP will be posted online at https://www.env.nm.gov/gwqb/public-involvement-plans/ and placed at the NMED field office nearest to the proposed permitted activity. NMED will accept comments and statements of interest regarding the application and will create a facility specific mailing list for persons who wish to receive future notices.

Questions, comments, statements of interest, or requests for non-English language assistance should be directed to:

Public Notice Flyer

AVISO PÚBLICO

Recibo de la Aplicación del Permiso de Descarga

DP-831, Waste Isolation Pilot Plant

DP-831, Waste Isolation Pilot Plant: El Departamento de Energía de los Estados Unidos propone renovar y modificar el Permiso de Descarga para la descarga de hasta 23.000 galones por día de aguas residuales domésticas y hasta 9.586.995 galones por día de aguas residuales industriales a sistemas de eliminación. Los posibles contaminantes asociados con este tipo de descarga incluyen compuestos de nitrógeno, sólidos disueltos y cloruro. La instalación está ubicada junto a la carretera 128, aproximadamente a 26 millas al sureste de Carlsbad, en las Secciones 20, 21, 28, y 29, T22S, R31E, condado de Eddy. El agua subterránea que tiene más probabilidad de verse afectada se encuentra a una profundidad aproximada de 100 pies y tenía una concentración de sólidos disueltos totales antes del vertido de 3.400 miligramos por litro.

Siempre que el solicitante cumpla con los requisitos aplicables, el Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés) propondrá para su aprobación un Permiso de Descarga que contiene limitaciones, requisitos de monitoreo, y otras condiciones destinadas a proteger la calidad del agua subterránea para su uso actual y potencial uso en el futuro. La información en esta notificación pública fue provista por los solicitantes y será verificada por NMED durante el proceso de revisión de solicitudes de permiso. NMED desarrollará un Plan de Participación Pública (PIP) para identificar a todas las comunidades potencialmente afectadas por la actividad permitida propuesta y ampliar las oportunidades de participación pública para acomodar las necesidades de esas comunidades. El PIP será publicado en línea en https://www.env.nm.gov/gwqb/public-involvement-plans/ y se colocará en la oficina de campo de NMED más cercana a la actividad autorizada propuesta. El NMED aceptará comentarios y declaraciones de interés con respecto a las solicitudes y creará listas de correo específicas de las instalaciones para las personas que deseen recibir avisos en el futuro.

Todas las preguntas, comentarios, declaraciones de interés o solicitudes de asistencia en otro idioma deben dirigirse a:
Ron Strauch, DP-831
La Oficina de Calidad de Aguas Subterráneas
PO Box 5469
Santa Fe, NM 87502
(505) 827-2900

Solicitante:
U.S. Department of Energy
Waste Isolation Pilot Plant
P.O. Box 3090
Carlsbad, NM 88221

NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo exigido por las leyes y los reglamentos correspondientes. NMED es responsable de la coordinación de los esfuerzos de cumplimiento y la recepción de indagaciones relativas a los requisitos de no discriminación implementados por 40 C.F.R. Partes 5 y 7, incluido el Título VI de la Ley de Derechos Civiles de 1964, según enmendada; Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, Título IX de las Enmiendas de Educación de 1972 y la Sección 13 de las Enmiendas a la Ley Federal de Control de Contaminación del Agua de 1972. Si usted tiene preguntas sobre este aviso o sobre cualquier programa, política o procedimiento de no discriminación de NMED, usted puede comunicarse con la Coordinadora de No Discriminación: Kristine Yurdin, Non-Discrimination Coordinator, New Mexico Environment Department, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@state.nm.us. Si usted piensa que ha sido discriminado/a con respecto a un programa o actividad de NMED, usted puede comunicarse con la Coordinadora de No Discriminación antes indicada o visitar nuestro sitio web en https://www.env.nm.gov/non-employee-discrimination-complaint-page/ para aprender cómo y dónde presentar una queja de discriminación. Hay disponible asistencia telefónica de conversación sin costo alguno a través de Relay New Mexico para personas sordas, con dificultades auditivas o que tengan dificultad para hablar por teléfono, llamando al 1-800-659-1779; usuarios de TTY: 1-800-659-8331; español: 1-800-327-1857.

Public Notice Synopsis, DP-831
(for poster and newspaper display ad)

Newspaper display ad must be at least 3 inches by 4 inches in size and must be published for at least one day in a section other than the classifieds or legals.

Poster must be made to be at least 2 feet by 3 feet in size and must be posted at or near the facility, in a location approved by the department, and conspicuous to the public for a period of 30 days. For more than 640 contiguous acres of a discharge site, or when the discharge site is not located on contiguous properties, additional posters may be required.

Introduction

Facility Name: Waste Isolation Pilot Plant

GWQB – Date of Receipt
(Department Use Only)
RECEIVED
DEC 3 2018
Ground Water Quality Bureau

For Existing Discharge Permits:

DP Number: 831
Expiration Date: July 29, 2019

Type of Discharge (*check one*):

☒ Domestic
☐ Industrial
☐ Agricultural
☐ Mining

Type of Application (*check appropriate box*)

☐ New – new facility
☐ New – existing (unpermitted) facility
☐ Renewal only
☐ Modification only
"modification" includes a change in the location of a discharge, and/or increase in the quantity of the discharge, and/or a change in the quality of the discharge.
☒ Renewal and Modification

If this application is to *modify* or *renew and modify* a Discharge Permit, what is the reason for modification of the Discharge Permit? Describe the proposed changes that would result in modification, meaning a change in the location of a discharge, and/or an increase in the quantity of the discharge, and/or a change in the quality of the discharge.

This application is to renew and modify the Waste Isolation Pilot Plant Discharge Permit. The existing impoundments constitute the renewal aspect of this permit application, whereas the modification adds five new impoundments. The information provided in this permit application for Salt Cells 1, 2, and 3, Salt Storage Pond 1, and Salt Storage Pond 2/3, Storm Water Ponds 1, 2, and 3, the Facultative Sewage Treatment System (Effluent Lagoons A, B, and C, Settling Lagoons 1 and 2, and Polishing Lagoons 1 and 2), the Site Preliminary Design Validation (SPDV) Material Pile, and Evaporation Pond H-19 is for existing impoundments. These impoundments were approved in previous permit applications. No changes were made to the physical design, location, discharge quantity, or discharge quality of the Facultative Sewage Lagoon System impoundments since the last permit application submittal. No changes were made to the physical design, location, or discharge quality of the existing industrial wastewater impoundments, including the storm water ponds. However, except for Evaporation Pond H-19, the discharge quantity for the existing industrial wastewater impoundments and storm water control impoundments has increased. The previous industrial wastewater maximum daily discharge volume was based on a 24-hour, 25-year rainfall event (3.9 inches). Based on data collected at the facility, the 24-hour, 25-year rainfall event has been exceeded in recent years. Therefore, the criterion (intensity) is being modified to a 24-hour, 100-year rainfall event (5.84 inches), which will be used to estimate the industrial wastewater daily maximum discharge volume for these impoundments including storm water control. The industrial wastewater impoundment's design capacity is sufficiently large to accommodate this change (see Attachment 3 to this application for description of components including impoundment design capacities). The existing impoundments constitute the renewal aspect of this permit application. A summary table is provided below to summarize new runoff volumes from changing the design basis rainfall event.

Evaporation Pond	Drainage Area (sq. ft.)	Runoff Volumes (gallons) for 24-hr, 100-yr Storm Event (5.84 inches)	Pond Capacity (gallons)
Salt Storage Pond 1	690,100	2,512,148	4,440,128
Salt Storage Pond 2/3	1,047,800	3,814,271	26,642,264
Storm Water Pond 1	178,595	650,133	765,204
Storm Water Pond 2	387,681	1,411,262	2,612,016
Storm Water Pond 3	1,642,199	5,978,042	8,654,360

- Runoff calculations utilize the rational equation, where the runoff coefficient varies from 0 to 1 based on the composition of the surfaces. For conservatism, a runoff coefficient of 1 was used. This calculation also included the volume that falls onto the surface area of each pond, respectively.

- Pond capacity is based on Nuclear Waste Partnership, LLC (NWP) drawing 23-C-017-W1, DP-831 Discharge Permit Evaporation Ponds Depth vs Volume Tables.

- Salt Storage Pond 2 and Salt Storage Pond 3 are connected by two 12-inch polyethylene pipes to prevent overflow of Salt Storage Pond 2; therefore, these ponds act as one pond system (pond capacities on NWP drawing 23-C-017-W1 are added together).

- The value of 5.84 inches used for the 24-hour, 100-year rainfall event was taken from Technical Paper No. 40, Rainfall Frequency Atlas of the United States for Durations from 30 Minutes to 24 Hours and Return Periods from 1 to 100 Years, U.S. Department of Commerce.

This renewal application also includes a modification to the Discharge Permit to add five new impoundments: Salt Cell 5, and Salt Storage Pond 5, which are associated with Shaft 5, and Storm Water Pond 4, Brine Retention Pond East, and Brine Retention Pond West, which are associated with the Permanent Ventilation System.

Salt Cell 5 adds a new salt storage location (Latitude: 32 22 21.02, Longitude: 103 48 7.44), which will receive overburden and salt from the construction of Shaft 5 and its associated underground connecting drifts.

Salt Storage Pond 5 (Latitude: 32 22 20.25, Longitude: 103 48 13.22) will receive both the leachate and storm water in contact with mined salt located in Salt Cell 5. Salt Storage Pond 5 will increase the quantity of the current industrial wastewater maximum permitted discharge volume by 1,292,499 gallons per day (gpd), which is based on the total inflow from a 24-hour, 100-year rainfall event (5.84 inches).

Brine Retention Pond East (Latitude: 32 22 19.05, Longitude: 103 47 23.19) and Brine Retention Pond West (Latitude: 32 22 19.05, Longitude: 103 47 23.19) will receive salt brine production from the Permanent Ventilation System's Salt Reduction Building operation. Each brine retention pond is designed to hold up to 14 days of expected average monthly salt brine production. One pond will be in service, while the other pond is closed for cleaning and brine removal. The quantity of brine production discharged into the brine retention ponds is approximately 2,210 gpd. When the brine retention ponds reach their allowed capacity, the accumulated brine will be transferred to Storm Water Pond 4.

Storm Water Pond 4 (Latitude: 32 22 12.04, Longitude: 103 47 18.98) will receive storm runoff from the facility's paved areas and roofs and also provide capacity to receive brine from both Brine Retention Pond East and Brine Retention Pond West. Storm Water Pond 4 will collect non-contact storm runoff at 1,857,927 gpd, which is based on the total inflow from a 24-hour, 100-year rainfall event (5.84 inches) plus 30,940 gpd of brine from the brine retention ponds. The 30,940 gallons is a batch load (accumulated over 14 days), which would be transferred from the brine retention ponds into Storm Water Pond 4.

The maximum daily discharge for the facility is a collective sum from both domestic wastewater and industrial wastewater. Domestic wastewater discharge into the Facultative Sewage Treatment System is up to 23,000 gpd. Industrial wastewater discharge is primarily from storm water runoff from a 24-hour, 100-year rainfall event (5.84 inches), which comes into contact with salt storage locations (salt cells). This discharge is collected into salt storage ponds. Secondary industrial wastewater discharges are from miscellaneous WIPP facility operations. Brine from the salt reduction building operation will be collected in Brine Retention Ponds East and West. Other industrial wastewaters (e.g. purging groundwater monitoring wells), will be discharged into either Effluent Lagoons B or C, or the Evaporation Pond H-19.

The list of the proposed maximum daily discharge rates for each of the active existing and new impoundments is provided in Attachment 1 of this Permit application and summarized below:

Total Domestic wastewater discharge:	23,000 gpd
Total Industrial wastewater discharge:	9,586,995 gpd
A) Effluent Lagoon B or C:	27,000 gpd
B) Evaporation Pond H-19:	50,000 gpd
C) Salt Storage Pond 1:	2,512,148 gpd
D) Salt Storage Pond 2/3:	3,814,271 gpd
E) Storm Water Pond 4:	1,888,867 gpd
F) Salt Storage Pond 5:	1,292,499 gpd
G) Brine Retention Ponds East/West:	2,210 gpd

Fees Included with Application

All applicants are required to submit a **$100 Application Filing Fee**. An additional fee will be assessed prior to permit issuance. Permit fees are listed in section 20.6.2.3114 NMAC. **Make checks payable to: NMED-Ground Water Quality Bureau**

Application Checklist

The following checklist has been provided to assist in ensuring that the application is complete prior to submission (*check all that apply*):

☒	Part I. Administrative Completeness ☒ $100 Application Filing Fee ☒ A. General Information ☒ B. Public Notice Information ☒ C. Public Notice Preparation
☒	Part II. Technical Completeness ☒ A. Discharge Volume and Description ☒ B. Identification and Physical Description of Facility ☒ C. Flow Metering ☒ D. Ground Water Monitoring ☒ E. Engineering and Surveying (electronic copies) ☒ F. Land Application Area
☒	Part III. Site-Specific Proposals
☒	Part IV. Electronic (PDF) format of Maps and Logs is required (additional paper copies of maps and logs are optional and may be requested by the Department if required for review) ☒ A. Surface Soil Survey and Vadose Zone Geology

	☒ B. Location Map ☐ C. Flood Zone Map.

Copies of Application

An applicant applying for a Discharge Permit shall submit **two paper copies of the signed application, and an electronic copy of the signed application including all supporting documentation,** to the address listed below.

☒ Two paper copies – completed and signed

☒ Electronic copy in portable document format (PDF) of the signed application and all supporting documentation (designs, maps, logs), on the following media *(choose one)*:

☒ Compact disc (CD)/DVD ☐ Flash drive

Send application and fees to the following address:
Program Manager
Ground Water Pollution Prevention Section
New Mexico Environment Department
P.O. Box 5469
Santa Fe, NM 87502

Applicant's Signature

Signature must be that of the person listed as the legally responsible party on this application (Part I, 2a).

I, the applicant, attest under penalty of law to the truth of the information and supporting documentation contained in this application for a Ground Water Discharge Permit.

Signature: Todd [signature] Date: 11/29/18

Printed Name: Todd Shrader Title: Manager, Carlsbad Field Office

Part I. Administrative Completeness

General Information

1. Facility Information

See Supplemental Instructions to determine what constitutes a "facility." The physical address must be provided. If the facility does not have an address, the location can be described by road intersections, mile posts, or landmarks, as appropriate. See Supplemental Instructions for additional information.

Facility Name	Waste Isolation Pilot Plant (WIPP)
Discharge Permit #	DP-831
Physical Address	The facility is located off of the Jal Highway, approximately 26 miles southeast of Carlsbad, New Mexico; Sections 20, 28, and 29; Township 22 South; Range 31 East; Eddy County.
County	Eddy
Type of Facility	Federal Agency - U.S. Department of Energy
Driving Directions	Driving east from Carlsbad on U.S. Highway 62/180 turn onto the WIPP access road just east of mile marker 64, proceed 12.5 miles to the facility.

2. Contact Information

a) Applicant Information The applicant is the person or entity (e.g., corporation, partnership, organization, *municipality*, etc.) legally responsible for the discharge and for complying with the terms of the Discharge Permit. If the applicant is an entity, then the name and title of a contact person must be provided. This application must be signed by the applicant or contact person named here.

Applicant Name	U.S. Department of Energy, Carlsbad Field Office			Title	Federal Agency
Mailing Address	P.O. Box 3090				
	City	Carlsbad	State NM	Zip	88221
Contact Person	Mr. Todd Shrader			Title	Manager
	Office Number	575-234-7300		Fax Number	575-234-7027
Contact Information	Cell Number			E-mail	todd.shrader@cbfo.doe.gov

b) Facility Operator/Manager Information Provide the contact information for the facility operator or manager below. If the facility is required to have an operator certified by the State of New Mexico, please include the certification level of the operator named here.

Name	Mike Proctor			Title	Facility Operator
Mailing Address	P.O. Box 2078, MS 451-13				
	City	Carlsbad	State NM	Zip	88221

Contact Information	Office Number	575-234-8143	Fax Number	575-234-7027
	Cell Number		E-mail	mike.proctor@wipp.ws
	Cell Number		E-mail	
Certification Level (if applicable)	WS 2			

c) Consultant's Information (if applicable) If the consultant is a company or organization, then the name and title of a contact person must be provided here.

Company Name (1)						
Company Contact						
Mailing Address						
	City		State		Zip	
Contact Information	Office Number		Fax Number			
	Cell Number		E-mail			

Company Name (2)						
Company Contact						
Mailing Address						
	City		State		Zip	
Contact Information	Office Number		Fax Number			
	Cell Number		E-mail			

d) Permit Contact Information (if applicable) If someone other than the contacts listed above is a primary contact for this application and/or facility, list here.

Name	Mr. Mike Brown		Title	Director, Environmental Protection		
Mailing Address	P.O. Box 3090					
	City	Carlsbad	State	NM	Zip	88221
Contact Information	Office Number	575-234-7476	Fax Number	575-234-7061		
	Cell Number		E-mail	mike.brown@ cbfo.doe.gov		
Facility Affiliation	Waste Isolation Pilot Plant					

3. Ownership and Real Property Agreements [20.6.2.7HH NMAC]

The applicant owns (check as appropriate):

☒ The facility

☒ All discharge sites

☐ Some discharge sites

If someone other than the applicant owns the facility or any of the discharge sites, provide ownership information below. For any portion of the facility where the applicant is not the owner of record, the applicant shall submit a copy of any lease agreement or other agreement which authorizes the use of the real property for the duration of the term of the requested permit (typically five years). Lease prices or other prices may be redacted.

- If more than one person has ownership interest, or a partnership exists, list all persons with an ownership interest.
- If a corporate entity holds an ownership interest, provide the name of the corporate entity and the entity's registered agent as filed with the New Mexico Public Regulation Commission.

Name			Title		
Mailing Address					
	City		State		Zip
Contact Information	Office Number		Fax Number		
	Cell Number		E-mail		
Owns	☐ The facility		☐ A discharge site		
	☐ Attached – lease (or other authorized use) agreement				

Name			Title		
Mailing Address					
	City		State		Zip
Contact Information	Office Number		Fax Number		
	Cell Number		E-mail		
Owns	☐ The facility		☐ A discharge site		
	☐ Attached – lease (or other authorized use) agreement				

4. Public Notice Information

a) Proposed Maximum Daily Discharge Volume: 9,586,995 gallons per day
Note: Use the information from Part II.A.2 following its completion.

b) Depth-to-Most-Shallow Ground Water: 100 feet
Note: Use the information from Part II.A.2 following its completion.

c) Pre-Discharge Total Dissolved Solids Concentration in Ground Water
[Subsection C of 20.6.2.3106 NMAC]

Provide the concentration of total dissolved solids (TDS) in ground water prior to discharging from the facility. *Note: This information is likely the same as that submitted in the first application for a Discharge Permit for this facility.*

- Pre-discharge TDS concentration in ground water: 100,000 mg/L (ppm)
  - ☐ Attached – Copy of laboratory analysis report (if available)
- From what source was the sample collected (e.g., upgradient monitoring well, on-site supply well, nearest well within a one-mile radius of the facility)?

5. Facility Location

In the table below, describe the location for the entire facility by listing the Township, Range, and Section, and/or latitude and longitude for the locations of all components of the processing, treatment, storage, and/or disposal system. See Supplemental Instructions for additional information. [Paragraph (2) and (5) of Subsection C of 20.6.2.3106 NMAC]

Component[1] ID	Town ship	Range	Section(s)	Latitude	Longitude
See Attachment 2					

6. Processing, Treatment, Storage, and Disposal System

Briefly describe how wastewater, sludge, etc. is processed, treated, stored, and/or disposed of at your facility. Include each component listed in the table above.

Domestic Wastewater - Facultative Sewage Treatment System (Renewal)

Up to 23,000 gallons per day (gpd) of domestic wastewater is discharged to a synthetically lined impoundment system for disposal by evaporation. The WIPP facultative sewage treatment system contains parallel trains consisting of equally sized primary settling lagoons (Settling Lagoon 1 and Settling Lagoon 2) and polishing lagoons (Polishing Lagoon 1 and Polishing Lagoon 2) utilizing a passive biological treatment process. Incoming sewage enters Settling Lagoon 1 or 2 where solids settle to the bottom of the impoundment and undergo bacterial digestion. The influent to the settling lagoons is sampled twice per

[1] Components include: septic tanks, impoundments, treatment systems, irrigation sites, leachfields, monitoring wells, mine stockpiles, etc. Additional examples are listed in the Supplemental Instructions. Each component should have a unique ID, for example septic tank-1, monitoring well-3, etc.

year. The water then enters Polishing Lagoon 1 or 2 where any small particles that did not settle in the settling lagoons will settle. The effluent water from the polishing lagoons is discharged into a synthetically lined impoundment (Effluent Lagoon A) for evaporation. The water in the Effluent Lagoon A either evaporates or flows into one of two additional Effluent Lagoons (Effluent Lagoons B and/or C) as needed to control freeboard (1 foot) in Effluent Lagoon A. In the event that any sludge is removed from the system, the sludge will be disposed of in accordance with applicable local, state, and federal regulations, including 40 CFR Part 503, Standards for the Use and Disposal of Sewage Sludge. In addition to domestic wastewater, some miscellaneous industrial non-hazardous wastewater including wastewater from two compressed air systems at the facility may also be discharged into the Facultative Sewage Treatment System (Effluent Lagoon B or Effluent Lagoon C), as needed.

The following miscellaneous industrial non-hazardous wastewaters may be evaporated in Effluent Lagoon B or Effluent Lagoon C at the Facultative Sewage Treatment System:

1. Water from purging groundwater monitoring wells for sampling or occasionally developing groundwater monitoring wells. Water from the Culebra water bearing formation around the WIPP site is the predominant source of groundwater disposed of in evaporation ponds. Water from the Santa Rosa/Dewey Lake contact and the Dewey Lake Formation are also disposed of in these lagoons.

2. Water collected from the Waste Shaft Sump, Exhaust Shaft Interception Wells and other observation boreholes in the underground.

3. Condensate from the Exhaust Shaft fan ductwork on the surface. Condensate and miscellaneous water will be discharged on site only if testing proves them to be non-hazardous.

4. Miscellaneous non-hazardous wastewaters may occasionally be discharged to the Facultative Sewage Treatment System or one of the effluent lagoons. Typically, these could include small quantities of neutralized acids or bases and miscellaneous water from routine cleaning of equipment, air conditioner condensate, air compressor condensate, and water line tests.

Industrial Wastewater - Evaportation Pond H-19 (Renewal)

Brine, purge water, and miscellaneous industrial non-hazardous wastewater may be transferred to Evaporation Pond H-19, a separate, stand-alone synthetically-lined impoundment for disposal by evaporation. Miscellaneous wastewater is transported to Evaporation Pond H-19 in portable containers and discharged into the pond. The volume of waste discharged to the evaporation pond is estimated using the time/volume method (e.g. two 55-gallon drums/day, which equals 110 gallons/day). Wastewater discharged into Evaporation Pond H-19 is evaporated only, with no discharge or disposal to another facility. If sediments build up on the pond, the sediments are characterized and shipped off-site for proper disposal in accordance with applicable state and federal laws and regulations.

The following miscellaneous industrial non-hazardous wastewaters may be evaporated in Evaporation Pond H-19:

1. Water from purging groundwater monitoring wells for sampling or occasionally developing groundwater monitoring wells. Water from the Culebra water bearing formation around the WIPP site is the predominant source of groundwater disposed of in evaporation ponds. Water from the Santa Rosa/Dewey Lake contact and the Dewey Lake Formation are also disposed of in this impoundment.

2. Water collected from the Waste Shaft Sump, Exhaust Shaft Interception Wells and other observation boreholes in the underground.

3. Condensate from the Exhaust Shaft fan ductwork on the surface. Condensate and miscellaneous water will be discharged on site only if testing proves them to be non-hazardous.

Industrial Wastewater & Salt Storage Location - Salt Cell 2, Salt Cell 3, Salt Storage Pond 2/3 (Renewal and Modification)

Salt (primarily halite) and other subsurface materials mined during construction of the facility, as well as currently mined salt, are stored on the surface in stockpiles. The stockpiles that are being used to store salt currently, as it is mined out from the underground panels at the facility are Salt Cell 2 and Salt Cell 3. Up to 3,814,271 gpd of storm water runoff in contact with these salt stockpiles (based on a 24-hour, 100-year storm event - 5.84 inches) is collected in two double synthetically-lined storm water impoundments, which are connected as a single unit (Salt Storage Pond 2/3), each with a leak detection system.

Salt Cell 2 consists of a runoff area of 326,350 sq ft and Salt Cell 3 consists of a runoff area of 272,850 sq ft. Each salt cell was constructed with six inches of prepared subgrade, a 60-mil high density polyethylene (HDPE) liner, a 200-mil Geonet drainage layer, an eight ounce geotextile fabric and covered with two feet of screened native soil. Each salt cell is sloped toward the center which contains a collection trench and pipe for the conveyance of water to Salt Storage Pond 2 and Salt Storage Pond 3, respectively. Salt Storage Pond 2 and Salt Storage Pond 3 are constructed with a prepared subgrade, 60-mil HDPE liner, a 200-mil Geonet cushion/drainage layer, and a second 60-mil HDPE liner. In each of the salt storage ponds, the Geonet layer drains to a sump with an inclined riser to allow for water removal. Salt Storage Pond 2 is connected to Salt Storage Pond 3 by two 12-inch polyethylene pipes to prevent overflow of Salt Storage Pond 2. A one foot freeboard is maintained in both of these ponds. Non-hazardous brine from well testing and mine related water accumulation may be disposed of in Salt Storage Ponds 2/3. Wastewater discharged into Salt Storage Pond 2/3 is evaporated only, with no discharge or disposal to another facility.

Industrial Wastewater & Salt Storage Location - Salt Cell 1 and Salt Storage Pond 1 (Renewal)

A third salt stockpile, Salt Cell 1, is capped with a synthetic liner and earthen cover. Up to 2,512,148 gpd of storm water runoff in contact with this salt stockpile (based on a 24-hour, 100-year storm event - 5.84 inches) is collected in synthetically-lined diversion ditches, which is diverted to a synthetically-lined impoundment (Salt Storage Pond 1).

Salt Cell 1 covers approximately 18.8 acres and was used for the storage of salt from the construction of the Repository using conventional mining techniques. To cover the now unused pile, the Salt Cell 1 crown was graded to a minimum two percent slope, covered with screened sand and a 60-mil HDPE liner. The liner was covered with approximately 24 inches of native soils and seeded with approved grass mix. Salt Cell 1 is designed to divert storm water runoff to the diversion ditches, which conveys runoff to the syntehtically-lined Salt Storage Pond 1. Wastewater discharged into Salt Storage Pond 1 is evaporated only, with no discharge or disposal to another facility.

Storm Water Control - Storm Water Ponds 1, 2, and 3 (Renewal and Modification)

Storm Water Pond 1, Storm Water Pond 2, and Storm Water Pond 3 receive clean non-contact storm water from the WIPP facilities paved areas, roofs, air conditioner condensate, and from clean domestic water usage (e.g. fire hydrant testing). This runoff is not in contact with the salt stockpiles at the facility. The water collected in these ponds meets the criteria described in 20.6.2.3105 NMAC, Exemption from Discharge Permit Requirements. Water from these storm water ponds is retained for evaporation or used for industrial purposes as a recycle measure to preclude the use of fresh water. Water in Storm Water Ponds 1, 2, and 3 may be transferred within the system to alleviate freeboard concerns.

Salt Storage Location - SPDV Material Pile (Renewal)

The SPDV Material Pile is located immediately east of the WIPP facilities infrastructure. The pile was created as the shafts were excavated when construction first began at the WIPP site. The construction materials in the SPDV Material Pile included mine tailings interspersed with soil, rock and debris from the construction of the shafts and the underground excavation of connecting tunnels, exploratory tunnels, and four rooms. The SPDV Material pile encompasses approximately 10 acres and ranges in height from 7 feet to 20 feet above ground. In 1995, the SPDV Material Pile was characterized to determine the chemical nature of wastes within the pile and to support selection of reclamation alternatives ("Characterization of the Site Preliminary Design Validation Salt Pile", Daniel B. Stephens & Associates, Inc., January 5th, 1996). The investigation determined that no remedial measures were required according to New Mexico Environment Department (NMED) guidelines. As a result of the study, stabilization and reclamation were recommended to blend the salt into the surrounding environment and to prevent offsite transport of salt into the surrounding environment. The pile was closed in the year 2000 with a cover consisting of a synthetic liner installed on 6 inches of bedding material and covered with a minimum of three feet of earthen material. The reclaimed SPDV Material Pile is unlikely to discharge to the groundwater due to the capping installed during reclamation and the fact that no brine liquid was added to the pile. Three shallow sub-surface monitoring wells were placed in the vicinity of the SPDV Material Pile as a conservative measure to monitor groundwater.

Industrial Wastewater - Salt Cell 5 and Salt Storage Pond 5 (Modification - New Shaft)

Salt Cell 5 will be designed to contain 5,224,000 cubic feet of loose salt materials from the construction of Shaft 5 and the associated drifts. The cell will have a 60-mil HDPE liner with a protective soil layer on which dump trucks can place the salt without damaging the liner. The HDPE pipe will be installed to collect and transmit the leachate and runoff water within Salt Cell 5. The runoff and leachate water will drain into Salt Storage Pond 5 by gravity.

Salt Storage Pond 5 will be designed with a 60-mil HDPE geomembrane double liner with a leak detection, collection, and removal system installed between the liners. A geomembrane liner is defined as a high density polyethylene plastic liner, used for lining Salt Cell 5, and Salt Storage Pond 5 in accordance with NWP Specification E-Z-475, HDPE Geomembrane Liner, Geofabric, Geonet, and HDPE Pipe. The salt storage pond will have the capacity to hold 849,653 cu ft (6,355,404 gallons) at Elevation 3,390 feet with 24 inches of freeboard. The total inflow to the salt storage pond is based on a 24-hour, 100-year rainfall event (5.84 inches), which is estimated at 172,794 cu ft (1,292,499 gallons). The salt storage pond will be capable of containing and allowing for evaporation of the salt water solutions collected from Salt Cell 5. Wastewater discharged into Salt Storage Pond 5 will be evaporated only, with no discharge or disposal to another facility.

Industrial Wastewater - Brine Retention Pond East and West (Modification - Permanent Ventilation System)

The Brine Retention Ponds East and West will be installed in the area of the New Filter Building. Each brine retention pond will be designed to hold up to 14 days of expected average monthly production of brine (30,940 gallons) from the operations of the Salt Reduction System. The estimated daily rate of brine production is estimated at 2,210 gpd. One brine retention pond will be in service while the other brine retention pond is closed for evaporation and removing precipitated salt. To account for the 100-year rainfall event over 24 hours (5.84 inches), the brine retention ponds will be rotated approximately every two weeks, or as needed, to maintain 24 inches of freeboard during maximum inflow conditions, which allows for 6,162 cu ft (46,094 gallons) of storage in each brine retention pond. The brine retention ponds will be double lined with a 60-mil HDPE geomembrane liner with a leak detection, collection, and removal system. A geomembrane liner is defined as a high density polyethylene plastic liner, used for lining Brine Evaporation Ponds West and East, per NWP Specification E-Z-475, HDPE Geomembrane Liner, Geofabric, Geonet, and HDPE Pipe. The bottom of the brine retention ponds will have an epoxy coated concrete bottom on top of the geomembrane liner. The concrete will allow for removing the salt by mechanical means without damaging the liner. After the precipitated salt is removed, any remaining brine will be transported to Storm Water Pond 4 for evaporation.

Industrial Wastewater & Storm Water Control - Storm Water Pond 4 (Permanent Ventilation System)

Storm Water Pond 4 will be designed with a double HDPE geomembrane liner. A leak detection, collection, and removal system will be installed between the liners. The storm water runoff from the Safety Significant Confinement Ventilation System (SSCVS) area will be collected in storm drainage runoff ditches and catch basins and transferred into the storm water pond by storm drain lines. The rate of storm water runoff from the 24-hour, 100-year rainfall event (5.84 inches) is estimated at 1,857,927 gpd, which will collect in Storm Water Pond 4. The brine collected in Brine Retention Pond East and Brine Retention Pond West could also be transported to Storm Water Pond 4 for evaporation (30,940 gallons). Because the brine pond transfer could occur within one day, the maximum daily discharge rate estimated into Storm Water Pond 4 is 1,888,867 gallons (252,505 cu ft). The storm water pond has the capacity to contain 1,158,920 cu ft (8,669,324 gallons) of storm water/brine. Storm Water Pond 4 will be capable of evaporating the water and brine. In the event that brine or any brine constituents are removed from the system during cleaning/maintenance, the constituents will be disposed of in accordance with applicable laws and regulations.

7. Public Notice Preparation [20.6.2.3108 NMAC]

Once NMED has determined that your application is administratively complete, you must complete the applicant's public notice requirements of Section 20.6.2.3108 NMAC. Language for notifications will be mailed to you with an administratively complete determination. Note: Guidance and instructions for completion of applicant's public notice can also be found at the following link: *https://www.env.nm.gov/gwb/NMED-GWQB-PublicNotice.htm*. The information requested below will be used by NMED to approve or reject the proposed public notice newspaper and signage posting locations in accordance with Subsection A of 20.6.2.3108 NMAC. Note: Other requirements of Section 20.6.2.3108 NMAC not listed here, such as certified mailings to nearby landowners, may also apply.

a) Public Notice Posting Locations

Select the type of application you are submitting and provide the requested information. Language to be used in the required notifications will be included in the administratively complete packet.

☐ Renewal Application

1. Following receipt of an administrative completeness determination from NMED, the applicant is required to provide public notice of this application by placing a 2 inch by 3 inch display ad (classified or legal sections are not acceptable) in a newspaper of general circulation in the location of the proposed discharge. Indicate the newspaper in which you intend to place the ad. [Subsection C of 20.6.2.3108 NMAC]

Newspaper: ____________________

☒ New Application, Modification Application, or Renewal with Modification Application

1. Following receipt of an administrative completeness determination from NMED, the applicant is required to provide public notice of this application by placing a display ad (classified or legal

sections are not acceptable) in a newspaper of general circulation in the location of the proposed discharge. Indicate the newspaper in which you intend to place the ad. [Paragraph (4) of Subsection B of 20.6.2.3108 NMAC]

Newspaper: Carlsbad Current-Argus

2. Following receipt of an administrative completeness determination from NMED, the applicant is required to post a sign(s) (2 feet x 3 feet in size) for 30 days in a location conspicuous to the public at or near the facility. One sign must be posted for each 640 contiguous acres or less. NMED may require additional postings for facilities of more than 640 acres or when the discharge site(s) is not located on contiguous properties. Indicate the location(s) where you intend to display the sign(s). [Paragraph (1) of Subsection B of 20.6.2.3108 NMAC]

Note: Conspicuous location means a location where the sign is visible and legible to the public and the public has access (e.g., at facility entrance on public road).

- Is the entire facility (including all components and discharge sites) contained within **less than** 640 acres, and is the acreage contiguous?

  ☒ Yes - Indicate a sign location below.
  ☐ No – Indicate two sign locations below.

Sign Location(s): Entry to the facility parking lot - 2 entry points.

3. Following receipt of an administrative completeness determination from NMED, the applicant is required to post an additional notice (a flyer 8.5" X 11" or larger) for 30 days at an off-site location conspicuous to the public (e.g., public library). Indicate the location where you intend to display the flyer. [Paragraph (1) of Subsection B of 20.6.2.3108 NMAC]

Note: The U.S. Postal Service no longer allows the posting of flyers in post offices.

Flyer Location: Carlsbad Public Library

b) Mailing Instructions
a) The administrative completeness determination letter, including public notice instructions, should be sent to:

☒ Applicant ☐ Consultant

Part II. Technical Completeness

1. Discharge Volume and Description

a. Date of Initial Discharge at the Facility [Subsections A and B of 20.6.2.3106 NMAC]

Date of Initial Discharge: November 24, 1989

b. Determination of Maximum Daily Discharge Volume [Subsection C of 20.6.2.3106 NMAC]

See Supplemental Instructions for more information.

1. **Proposed maximum daily discharge volume:** 9,586,995 gallons per day.
(Note: Use this volume to complete Part I.4.a (Public Notice).

- Describe the methods and calculations used to determine this volume. Acceptable methods are described in the Supplemental Instructions. If you are relying on metered flows, attach a two-year record of meter readings.

Facultative Sewage Treatment System Capacity Calculation (Renewal):

The maximum design flow rate for the Facultative Sewage Treatment System is 23,000 gpd. The flow rate of Settling Lagoons 1 and 2 and Polishing Lagoons 1 and 2 is determined at their operating maximum depth of 6 feet and maintaining 1 foot of freeboard.

Settling Lagoons Capacity Calculations (Renewal):

At a water depth of 6 ft, the surface area of Settling Lagoons 1 and 2 is:
(252 ft) x (92 ft) x (2 lagoons) = 46,368 sq ft = 1.064 acres

At a Biochemical Oxygen Demand (BOD) loading of 40 lbs/day/acre and the available area of 1.064 acres, the BOD mass loading is:
(40 lbs/day/acre) x (1.064 acres) = 42.56 lbs/day BOD

The average daily flow rate (Q) to produce a BOD mass loading of 42.56 lbs/day is:
Q = (42.56 lbs/day) / [(8.38 lbs/Mgal/mg/l) x (220 mg/l)] = 0.023 Mgal/day
Q = 23,000 gpd

where 220 mg/l is the average Total Dissolved Solids (TDS) influent concentration and 8.38 lbs/Mgal/mg/l is a unit conversion factor for parts per million (ppm) to pounds specifically related to water.

Settling Lagoons 1 and 2 can process 23,000 gpd at an operating depth of 6 feet.
Using the flow rate of 23,000 gpd in the calculations, the average hydraulic detention time (DT) for the primary treatment cells yields the following results:

At 3 ft, DT = 20 days
At 4 ft, DT = 28 days
At 6 ft, DT = 47 days

Polishing Lagoons Capacity Calculations (Renewal):

At a BOD loading of 40 lbs/day/acre and the average daily flow rate of 23,000 gpd, the BOD mass loading is: (0.023 Mgal/day) x (8.38 lb/Mgal/mg/l) x (100 mg/l) = 19.27 lbs/day

where 100 mg/l is the average TDS concentration entering the polishing lagoons from the settling lagoons and 8.38 lbs/Mgal/mg/l is a unit conversion factor for ppm to pounds specifically related to water.

The required surface area to process 19.27 lbs/day BOD is:
(19.27 lbs/day) / (40 lbs/day/acre) = 0.48 acres = 20,909 sq ft

The available surface area of Polishing Lagoons 1 and 2 at a depth of 6 ft is:
(116 ft) x (92 ft) x (2 lagoons) = 21,344 sq ft

Therefore, the two polishing lagoons are large enough to process the 23,000 gpd average daily flow without exceeding a depth of 6 ft.

Using the flow rate of 23,000 gpd in the calculation of average hydraulic detention time (DT) for the polishing lagoons yields the following results:

At 3 ft, DT = 7.2 days
At 4 ft, DT = 9.6 days
At 6 ft, DT = 17.7 days

Effluent Lagoons B and C Capacity Calculation (Renewal)

The volume capacity of 670,208 gallons for Effluent Lagoons B and C is based on the volume of each lagoon with one foot of freeboard (NWP drawing 25-C-004-W). Conservatively, two feet of freeboard has been used in the original calculations establishing the maximum volume capacity of 500,000 gallons for each lagoon in previous permit applications. However, the proposed maximum discharge is that one foot of freeboard is maintained. Effluent Lagoons B and C have the same dimensions (224 feet in length, 92 feet wide and 6 feet deep with 3 foot horizontal to 1 foot vertical slopes).

The Effluent Lagoons B and C may receive up to 23,000 gpd from Effluent Lagoon A, as needed, to control freeboard in Effluent Lagoon A. Effluent Lagoons B and C also may receive miscellaneous industrial non-hazardous wastewaters from site operations as needed (e.g. purging groundwater monitoring wells, and water collected from the Waste Shaft Sump). These miscellaneous site operations are estimated to discharge up to an additional 27,000 gpd into these lagoons; therefore, the daily maximum discharge into Effluent Lagoons B and C is estimated at 23,000 gpd (domestic) and 27,000 gpd (industrial non-hazardous) for a total of 50,000 gpd.

Effluent Lagoon A (Renewal)

Effluent Lagoon A is smaller than Effluent Lagoons B and C, and is used mainly to receive water (23,000 gpd) from the polishing lagoons that have a low BOD load. Some non-hazardous wastewater from well testing may also be introduced into Effluent Lagoon A as well. The total volume capacity of Effluent Lagoon A is 566,610 gallons without any freeboard. One foot of freeboard establishes the maximum capacity of 427,976 gallons (NWP drawing 25-C-004-W).

Evaporation Pond H-19 (Renewal)

The volume of Evaporation Pond H-19 with one foot of freeboard (NWP drawing 23-C-012-W1) is 46,268 cubic feet (346,085 gallons). Evaporation Pond H-19 is used for miscellaneous wastewater transfer/discharge from underground experiments plus miscellaneous industrial non-hazardous wastewater from site operations (e.g. purging groundwater monitoring wells, and water collected from the Waste Shaft Sump). These discharges vary depending upon the type of underground experimentation taking place. Typical discharge volumes into

Evaporation Pond H-19 are estimated at 110 gpd with a maximum daily discharge rate up to 50,000 gpd.

Salt Storage Pond 1 (Renewal and Modification):

Drainage Area = 690,100 sq ft
Design Basis Storm Event = 5.84 in (based on the 24-hour, 100-year rainfall event)
Runoff from design basis storm event =
(690,100 sq ft) x (5.84 in) / (12 in/ft) x (7.48 gal/cu ft) = 2,512,148 gallons

Salt Storage Pond 2/3 (Renewal and Modification):

Drainage Area = 1,047,800 sq ft
Design Basis Storm Event = 5.84 in (based on the 24-hour, 100-year rainfall event)
Runoff from design basis storm event =
(1,047,800 sq ft) x (5.84 in) / (12 in/ft) x (7.48 gal/cu ft) = 3,814,271 gallons

Evaporation Pond	Drainage Area (sq. ft.)	Runoff Volumes (gallons) for 24-hr, 100-yr Storm Event (5.84 inches)	Pond Capacity (gallons)
Salt Storage Pond 1	690,100	2,512,148	4,440,128
Salt Storage Pond 2/3	1,047,800	3,814,271	26,642,264

Storm Water Infiltration Control Ponds (Renewal and Modification)

Storm Water Ponds 1, 2, and 3 and Salt Storage Pond 1 and Salt Storage Pond 2/3 collect runoff storm water from the facility site and salt storage cells respectively. These ponds were originally sized with design margin to contain water from a 24-hour, 25-year storm event (3.9 inches) and maintain one foot freeboard. Because there have been no changes to the physical design of these ponds, the following calculations are provided to ensure that the ponds are still adequately sized to handle the 24-hour, 100-year rainfall event (5.84 inches). Storm Water Ponds 1, 2, and 3 receive clean non-contact runoff. Salt Storage Pond 1 and Salt Storage Pond 2/3 receive contact runoff from Salt Storage Locations (Salt Cells).

Storm Water Pond 1 (Renewal and Modification):

Drainage Area = 178,595 sq ft
Design Basis Storm Event = 5.84 in (based on the 24-hour, 100-year rainfall event)
Runoff from design basis storm event =
(178,595 sq ft) x (5.84 in) / (12 in/ft) x (7.48 gal/cu ft) = 650,133 gallons

Storm Water Pond 2 (Renewal and Modification):

Drainage Area = 387,681 sq ft
Design Basis Storm Event = 5.84 in (based on the 24-hour, 100-year rainfall event)
Runoff from design basis storm event =
(387,681 sq ft) x (5.84 in) / (12 in/ft) x (7.48 gal/cu ft) = 1,411,262 gallons

Storm Water Pond 3 (Renewal and Modification):

Drainage Area = 1,642,199 sq ft
Design Basis Storm Event = 5.84 in (based on the 24-hour, 100-year rainfall event)
Runoff from design basis storm event =
(1,642,199 sq ft) x (5.84 in) / (12 in/ft) x (7.48 gal/cu ft) = 5,978,042 gallons

Evaporation Pond	Drainage Area (sq. ft.)	Runoff Volumes (gallons) for 24-hr, 100-yr Storm Event (5.84 inches)	Pond Capacity (gallons)
Storm Water Pond 1	178,595	650,133	765,204
Storm Water Pond 2	387,681	1,411,262	2,612,016
Storm Water Pond 3	1,642,199	5,978,042	8,654,360

Industrial Wastewater - Brine Retention Ponds East and West Capacity Calculation (Modification - Permanent Ventilation System)

Both brine retention ponds will be built side by side below existing ground elevation. They are lined with double HDPE Geomembrane liner and leak detection, collection and removal system in between liners. The liner installation shall be performed in accordance with the latest version of codes, specifications and standards from Geosynthetics Research Institute, Environmental Protection Agency, and the American Society for Testing and Materials.

The brine retention ponds will have a 14-in thick concrete bottom (on top of the liner). Each brine retention pond has 6,162 cu ft (46,094 gallons) of brine storage capacity (assuming 24 inches of freeboard). The capacity is based on a design calculation document from Cementation titled "Safety Significant Confinement Ventilation System Facility Brine Evaporation Pond East & West and Storm Water Pond 4", and Cementation drawings 101547-01-SD01-C140 and 101547-01-SD01-C440. The daily inflow to these brine retention ponds is based on the engineering design of the Salt Reduction System. While the other pond is filling, the off-use pond will be allowed to decant the salt for two to three weeks, then any remaining brine will be transported into Storm Water Pond 4 prior to cleaning. Evaporation in the ponds is negligible, since the residence time of the brine in the pond is relatively short (weeks versus months).

The brine retention pond surface area (A) receiving rain fall is 70 ft by 80 ft = 5,600 sq ft

Using the 24-hour, 100-year rainfall event, I = 5.84 inches

Assuming C = 1.0 (100% runoff)

Additional volume of water into the brine retention pond is estimated from peak discharge, calculated using the Rational Equation:

$Q = C * I * A = (1.0) \times [(5.84 \text{ in}) / (12 \text{ in/ft})] \times (5,600 \text{ sq ft}) = 2,725 \text{ cu ft}$
Reduced capacity for each brine retention pond = 6,162 cu ft - 2,725 cu ft = 3,437 cu ft

With monthly brine production = 7,386 cu ft; the brine retention pond would exceed its freeboard requirement after 14 days [capacity = (3,437 cu ft) / (7,386 cu ft) x (30 days) = 14 days].

Each brine retention pond can only be used for up to 14 days to ensure that 2 feet of freeboard is maintained when the 24-hour, 100-year rainfall event (5.84 inches) occurs on the 14th day.

Industrial Wastewater & Storm Water Control - Storm Water Pond 4 Capacity Calculation (Modification - Permanent Ventilation System)

Storm Water Pond 4 is a below existing grade pond with a berm, approximately 340 ft by 340 ft by 19 ft in depth, lined with a double HDPE geomembrane liner with a leak detection, collection, and removal system between the liners. According to Cementation NWP Drawing no. 101547-01-SD01-C150, using CAD calculation, the volume of water at Elevation 3,409 feet (12 inches of freeboard), is 1,158,920 cu ft (8,668,722 gallons) of water. This storm water pond will receive storm water runoff from the SSCVS area (watershed) of 394,782 sq ft according to SSCVS Civil Yard Drainage, Grading & Storm Water Drainage Drawings 416-C-017-W1 through W4.

Using the 24-hour, 100-year rainfall event of 5.84 inches, Storm Water Pond 4 will receive:

a. Storm water runoff from the SSCVS watershed area:
   (394,782 sq ft) x (5.84 inches) / (12 in/ft) = 192,127 cu ft (1,437,110 gal)

b. Rain fall in the 340 sq ft of pond area:
   (340 ft) x (340 ft) x (5.84 inches) / (12 in/ft) = 56,259 cu ft (420,817 gal)

The total storm water runoff into Storm Water Pond 4:
(192,127 cu ft) + (56,259 cu ft) = 248,386 cu ft (1,857,927 gal)

Annual brine production according to CB&I Federal Services, LLC, Salt Reduction Water and Material Balance, 500655-SRB-M-CAL-00012, Rev.0, Job No. 500655:
(7,386 cu ft / month) x (12 months) = 88,632 cu ft (662,967 gal)

If one year of brine is present in Storm Water Pond 4 from accumulated discharges from Brine Retention Pond East and Brine Retention Pond West (assume very low evaporation rates), the maximum volume from the design basis rainfall event (24-hour, 100-year event - 5.84 inches) plus accumulated brine, which may exist in Storm Water Pond 4 at one time:
(192,127 cu ft) + (56,259 cu ft) + (88,632 cu ft) = 337,018 cu ft (2,520,894 gallons)

Using CAD calculations, 337,018 cu ft will fill the pond up to less than 7 feet deep or just below elevation 3,399 feet. Maximum allowable water level, allowing 12 inches of freeboard is at Elevation 3,409 feet. Without counting the evaporation, Storm Water Pond 4 has the capacity to hold: (1,158,920 cu ft) / (337,018 cu ft) = 3.4 times the expected inflow (storm water runoff plus industrial wastewater discharges from one year of brine production).

Storm Water Pond 4 evaporation capability:

The total volume to be evaporated = 337,018 cu ft of water and brine.

When the water level in Pond 4 is at Elevation 3,398 feet, the surface area for pan evaporation is equal to 60,606 sq ft (according to CAD calculation).

Using NMSU Chihuahua Desert Rangeland Research Center rain gauge Evaporation data for:

July, August and September =	(14.59 in) + (12.57 in) + (9.38 in) = 36.54 in
October, November and December =	(7.71 in) + (5.45 in) + (4.42 in) = 17.58 in
January, February and March =	(4.77 in) + (5.78 in) + (9.46 in) = 20.01 in
April, May and June =	(12.49 in) + (14.47 in) + (15.76 in) = 42.72 in

Using the following Assumptions:

- Effective evaporative pan coefficient of 0.60. Studies conducted by the United States Department of Agriculture (USDA) indicate that coefficients for Class A land pans range from 0.60 to 0.82; however, a coefficient of 0.77 is recommended in the Pecos River Basin (Technical Report 54, New Mexico Water Use by Categories 2010, New Mexico Office of the State Engineer Water Use and Conservation Bureau, page 42). Because the effluent is expected to be at least 2.5% salt by volume, the lower value of 0.60 was chosen versus the recommended value of 0.77.

- Run-off coefficient 1.0 (100% runoff, 0% infiltration)

Total Coefficient = 0.60 x 1 = 0.60

Using CAD calculation based on Cementation NWP Drawing No. 101547-01-SD1-C150:

Depth (ft)	Elevation (ft)	Volume (cu ft)	Surface Area (sq ft)
0	3,392		45,630
1	3,393	46,800	47,980
2	3,394	95,979	50,388
3	3,395	147,596	52,855
4	3,396	201,708	55,380
5	3,397	258,375	57,964
6	3,398	317,655	60,606
7	3,399	379,606	63,306
8	3,400	444,287	66,066
9	3,401	511,757	68,883
10	3,402	582,073	71,760
11	3,403	655,295	74,694
12	3,404	731,482	77,688
13	3,405	810,690	80,739
14	3,406	892,980	83,850
15	3,407	978,409	87,018
16	3,408	1,067,036	90,246
17	3,409	1,158,920	93,532

At Elevation 3,398 feet, the surface water area in Storm Water Pond 4 is 60,606 sq ft.

	Evap. Rate (inches)	Evap. Area (sq ft)	Total Coefficient	Volume (cu ft)
July - Sept	36.54	60,606	0.60	110,727
Oct -Dec	17.58	60,606	0.60	53,272
Jan - Mar	20.01	60,606	0.60	60,636
Apr - Jun	42.72	60,606	0.60	129,454
			Total Annual Evaporation	354,089

Total inflow from the 24-hour, 100-year rainfall event (5.84 inches) plus accumulated brine from one year's worth of Salt Reduction System building operations into Storm Water Pond 4 is 337,018 cu ft, which is less than the total evaporation of 354,089 cu ft. This indicates that the runoff water, brine and rain collected in the pond will be evaporated when Storm Water Pond 4 is in service. The maximum water level in Storm Water Pond 4 will be below Elevation 3,399 feet and this level is 10 ft below the maximum allowable level of water at Elevation 3,409 feet to maintain a 12-inch freeboard.

New Shaft Facility Salt Cell 5 and Salt Storage Pond 5 (Modification - New Shaft)

Salt Storage Location - Salt Cell 5 (Modification - New Shaft)

Salt Cell 5 will be an above-ground facility, lined with a single HDPE geomembrane liner and a drainage and leachate collection and removal system that consists of a perforated HDPE pipe that will drain into Salt Storage Pond 5. The cell will have the capacity to store up to 5,224,000 cu ft of loose salt material (primarily halite).

Industrial Wastewater - Salt Storage Pond 5 (Modification - New Shaft)

Salt Storage Pond 5 will accept leachate and storm water runoff from Salt Cell 5 by gravity flow. The watershed area is 471 ft by 471 ft (Salt Cell 5 dimensions) added to 362 ft by 368 ft (Salt Storage Pond 5 top dimensions).
[(471 ft) x (471 ft)] + [(362 ft) x (368 ft)] = (221,841 sq ft) + (133,216 sq ft) = 355,057 sq ft

Q = C * I * A

Assuming C = 1.0 (100% runoff, 0% infiltration)
Using the 24-hour, 100-year rainfall event, I = 5.84 inches

Q = (1.0) x [(5.84 in) / (12 in/ft)] x (355,057 sq ft) = 172,794 cu ft (1,292,499 gal)

The volume required to store the storm water runoff from the 24-hour, 100-year rainfall event (5.84 inches) is 172,794 cu ft, which will only fill Salt Storage Pond 5 to about 3 feet deep or just below Elevation 3,384 feet (see table below).

From Cementation NWP WIPP Exhaust Shaft Area Ponds and Piles Salt Storage Pond 5 Plan Drawing No. 101547-01-SD01-C-130 Rev. 0, and using CAD calculation, the volume and surface area of the water at various elevations and depths are tabulated below:

and condensate from the Exhaust Shaft fan ductwork on the surface. The volume of waste discharged into the evaporation pond is estimated using the time/volume method (e.g. two 55-gallon drums/day = 110 gallons/day). Wastewaters placed in Evaporation Pond H-19 are evaporated only, with no discharge or disposal to another facility. If sediments build up on the pond, the sediments are characterized and shipped off-site for proper disposal in accordance with applicable state and federal laws and regulations.

Infiltration Controls (Renewal and Modification)

The Ground Water Quality Bureau (GWQB) determined that WIPP needed a discharge permit for discharges to the subsurface from the salt cells. The DOE developed a mitigation strategy for infiltration controls to minimize the migration of the subsurface shallow water and reduce the potential for impacts to the naturally occurring Dewey Lake water. A new salt storage area was constructed on a HDPE lined area that would divert salt contact storm water to a double lined pond with a leak collection sump. In addition to the controls proposed in the original Notice of Intent to Discharge (NOI), the DOE proposed to line three storm water retention ponds to prevent the infiltration of non-salt contact storm water to the subsurface to further minimize the potential for the migration of the subsurface shallow water. The infiltration control evaporation and storm water infiltration control ponds are sized to contain the 24-hour, 100-year rainfall design basis event of 5.84 inches. The table below identifies the area and volume of runoff collected for each individual pond.

Evaporation Pond	Drainage Area (sq ft)	Runoff Volumes (gallons) for 24-hr, 100-yr Storm Event (5.84 inches)	Pond Capacity (gallons)
Salt Storage Pond 1	690,100	2,512,148	4,440,128
Salt Storage Pond 2/3	1,047,800	3,814,271	26,642,264
Storm Water Pond 1	178,595	650,133	765,204
Storm Water Pond 2	387,681	1,411,262	2,612,016
Storm Water Pond 3	1,642,199	5,978,042	8,654,360

- Runoff calculations utilize the rational equation, where the runoff coefficient varies from 0 to 1 based on the composition of the surfaces. For conservatism, a runoff coefficient of 1 was used. This calculation also included the volume that falls onto the surface area of each pond, respectively."

- Capacity is based on NWP drawing 23-C-017-W1, DP-831 Discharge Permit Evaporation Ponds Depth vs Volume Tables.

- Salt Storage Pond 2 and Salt Storage Pond 3 are connected by two 12-inch polyethylene pipes to prevent overflow of Salt Storage Pond 2; therefore, these ponds act as one pond system. The pond capacities on NWP drawing 23-C-017-W1 are added together to better estimate the pond system capacity.

Industrial Wastewater & Salt Storage Location - Salt Cell 1 and Salt Storage Pond 1 (Renewal and Modification)

The Salt Cell 1 covers approximately 18.8 acres and was used for the storage of salt from the construction of the TRU waste repository using conventional mining techniques. The Salt Cell 1 crown was graded to a minimum two percent slope with screened sand and covered with a 60-mil HDPE liner. The liner was covered with approximately 24 inches of native soils and seeded with native grasses in accordance with applicable regulations. Salt Cell 1 has 3:1 side slopes and a two percent crown slope from the center north and west diverting storm water runoff west to the three acre Salt Storage Pond 1.

Industrial Wastewater & Salt Storage Location - Salt Cell 2, Salt Cell 3, Salt Storage Pond 2/3 (Renewal and Modification)

The current salt storage locations consist of Salt Cell 2 and Salt Cell 3. Each cell was constructed with 6 inches of soil, a 60-mil HDPE liner, 200-mil Geonet, and covered with 24 inches of screened native soil in accordance with applicable regulations. Each cell slopes two percent toward the center where there is a pipe to collect any water and divert it into Salt Storage Pond 2/3. The Salt Storage Pond 2 is constructed with a 60-mil HDPE liner, a 200-mil Geonet, and a second HDPE liner. The Geonet leak detection layer drains to a sump with an inclined riser for leak detection. The Salt Storage Pond 2 is connected via two 12-inch polyethylene pipe to the Salt Storage Pond 3. The Salt Storage Pond 3 is 560 ft long and 450 ft wide and is 22 feet in depth at the deepest point. It is constructed with a 60-mil HDPE liner over a 200-mil Geonet layer and a second HDPE 60-mil liner. The Salt Storage Pond 3 receives overflow water from Salt Storage Pond 2 to maintain 1 foot freeboard in Salt Storage Pond 2.

Storm Water Control - Non-Contact Storm Water Ponds (Renewal and Modification)

Storm Water Pond 1, Storm Water Pond 2, and Storm Water Pond 3 are each lined with 60-mil HDPE. The water collected in these ponds is clean non-salt contact storm water which meets the criteria described in 20.6.2.3105 NMAC, Exemption from Discharge Permit Requirement. Clean non-contact storm water sources from the WIPP facilities include paved roads and roofs. Other clean water sources of runoff include air conditioner condensate, and clean domestic water usage (e.g. fire hydrant testing). The storm water collected in these ponds is runoff from the WIPP Site and/or clean domestic water from testing of the fire fighting system and from broken/repaired domestic water system distribution piping. This water is retained for evaporation or used for irrigation of the Salt Cell 1 cover or other industrial/construction uses.

Salt Storage Location - SPDV Material Pile (Renewal)

The SPDV Material Pile was created during the design validation phase of the WIPP facility for placement of construction materials resulting from the drilling of two 2,150 foot shafts and the underground excavation of connecting tunnels, exploratory tunnels, and four rooms. The materials in the SPDV Material Pile include mine tailings interspersed with soil, rock, and debris from the construction of the shafts. The SPDV Material Pile encompasses approximately 10 acres and ranges in height from 7 to 20 feet above ground. The volume is approximately 168,000 cubic yards, which includes an area beneath the pile where soil was excavated prior to tailing placement.

In 1995, the SPDV Material Pile was characterized to determine the chemical nature of wastes within the pile and to support selection of reclamation alternatives ("Characterization of the Site Preliminary Design Validation Salt Pile," Daniel B. Stephens & Associates, Inc., January 5, 1996). The investigation determined that no remedial measures were required according to NMED guidelines. As a result of the study, stabilization and reclamation were recommended in order to prevent offsite transport of salt and brine into the surrounding environment, and to blend the salt into the surrounding environment.

The reclaimed SPDV Material Pile is unlikely to recharge the groundwater because of the evapotranspiration (ET) cap installed during reclamation, and the fact that no brine has been added to the pile. However, as set forth in DP-831, additional shallow sub-surface monitoring wells were installed around the SPDV Material Pile.

Salt Storage Location - Salt Cell 5 (Modification - New Shaft)

Salt Cell 5 will receive salt from the construction of Shaft 5 and the mining of associated drifts. The salt cell is designed to receive 5,224,000 cu ft of salt that will be placed in a 471 ft by 471 ft HDPE lined storge area. The maximum height of the salt cell is listed in design documents as approximately 36 ft high, but will be lower than this height once filled with the design volume of salt. Rain water from storm events will percolate through the salt pile to generate near saturated brine at the bottom of the cell. The brine at the bottom of the cell will enter a perforated HDPE pipe that diverts it into Salt Storage Pond 5.

Industrial Wastewater - Salt Storage Pond 5 (Modification - New Shaft)

Salt Storage Pond 5 is constructed in containment berms, and is double lined with 60-mil HDPE liner with leak detection, collection, and removal system installed between the liners. Salt Storage Pond 5 receives storm water that falls into the pond and into Salt Cell 5. The water from Salt Cell 5 is storm water that percolates through the salt in the cell. This water flows through a perforated HDPE pipe on the bottom of the cell, and into Salt Storage Pond 5. The brine is allowed to evaporate and is not discharged. Salt Storage Pond 5 may receive non-hazardous brine from the underground shaft sumps or Salt Storage Pond 2/3, or Storm Water Pond 4, as needed. Salt Storage Pond 5 will be maintained with a minimum 2-foot freeboard.

Industrial Wastewater - Brine Retention Ponds East and West (Modification - Permanent Ventilation System)

Both Brine Retention Ponds East and West are constructed below grade to a depth of approximately 7 ft total depth. They are lined with 60-mil HDPE double liner with an epoxy coated concrete bottom. The brine retention ponds will receive near saturated brine from the Salt Reduction System that removes salt from the air exhausted from the underground. Salt is removed from the air by a dust-reduction system. The dust reduction system panels are cleaned by water sprayed onto the panels, washing the dust/salt to storage tanks. The salt water is then allowed to drain into the brine retention ponds where it will fill one pond for approximately 14 days, then alternate to filling the other pond. The brine will be left to decant for approximately two to three weeks after which the supernatant will be transported into Storm Water Pond 4, and precipitated salt removed and taken to Salt Cell 2 or Salt Cell 3.

Industrial Wastewater & Storm Water Control - Storm Water Pond 4 (Modification - Permanent Ventilation System Renewal) Storm Water Pond 4 is bermed to prevent runoff from the area surrounding Storm Water Pond 4 to enter the pond. Storm Water Pond 4 is 340 sq ft by approximately 19 ft in depth. The pond is double lined with a 60-mil HDPE liner and a leak detection, collection, and removal system installed between the liners. Storm Water Pond 4 receives precipitation intercepted by the pond's surface, storm water from the SSCVS watershed area, and brine from Brine Retention Ponds East and West. Clean non-contact storm water sources from the WIPP facilities include paved roads and roofs. Other clean water sources of runoff include air conditioner condensate, and clean domestic water usage (e.g. fire hydrant testing). The storm water and brine are allowed to evaporate and are not discharged. Storm Water Pond 4 will be maintained with a minimum 1 foot freeboard.

2. **Identify other wastewater or stormwater discharges at the facility** not described in this application and indicate what other permits apply to them. Examples include discharges from small septic systems covered by Liquid Waste Permits, discharges to surface waters under a NPDES permit, a discharge covered by a separate Discharge Permit, etc. Be sure these other discharge locations are identified on the site map required in item Part II.B.1.

Other Discharges	Permit Number
None	

2. Identification and Physical Description of Facility

[Subsection C of 20.6.2.3106 NMAC]

a. Scaled Map

Provide a clear and legible scaled electronic map of the components of your proposed system and relevant surrounding features, indicating the location of all the following features present at the site:

- overall facility layout
- treatment units
- lagoons
- tanks
- sumps
- land application fields
- domestic wastewater re-use areas
- pits
- stockpiles
- leachfields
- sludge drying beds
- fences
- roads
- buildings
- supply wells
- monitoring wells
- extraction/injection wells
- arroyos
- nearby water bodies such as ponds or canals
- property boundaries
- other permitted discharges
- required setbacks
- north arrow

b. Description of Components

Provide descriptive details of all components of your processing, treatment, storage, and/or disposal system. Include all components listed in the table of Part I.5.

Component	Status[1]	Date of installation or construction (mm/dd/yyyy)	Description (construction material, liner type, irrigation method, capacity, dimensions, area, model number, etc.)
See Attachment 3			

[1] Status = **proposed**; **existing in use**; **existing not in use**, but proposed for use; **abandoned** without closure, not proposed for use; or **closed**

3. Flow Metering

Describe the facility's flow metering system. See Supplemental Instructions for more information.

Meter ID[1]	Proposed or Existing?	Influent or Effluent?	Location Description	Flow Type[2]	Meter Type[3]	Supporting Documents Attached
Domestic Water Meter	Existing	Influent	Influent to the Domestic Water System	Pumped	Closed-pipe	.

[1] Meter ID means the numbering or labeling system used to individually identify each meter (e.g., Meter-1, Irrigation Meter-1, etc.).
[2] Flow type - gravity flow or pressurized (pumped) flow
[3] Meter type - open channel such as a weir or flume, or a closed-pipe velocity meter such as an electromagnetic meter

4. Discharge Quality

Indicate the expected quality of the discharge (wastewater, leachate, sludge, etc.) that is generated, stored, treated, processed and/or discharged at your facility.

Note: Not all facilities need to characterize influent quality. See Supplemental Instructions for additional guidance.

Contaminants	Contaminants	
	Incoming (Influent)	Final (Effluent)
Nitrate as Nitrogen (NO_3-N, mg/L)[1]	See Attachment 4	
Total Kjeldahl Nitrogen (TKN, mg/L)[1]		
Total Dissolved Solids (TDS, mg/L)[1]		
Chloride (Cl, mg/L)[1]		
Total Suspended Solids (TSS, mg/L)[2]		
Biochemical Oxygen Demand (BOD, mg/L)[2]		
Fecal Coliform Bacteria (CFU/100 mL)[2]		
pH[3]		
Metals (attach list)[3]		
Organic Compounds (attach list)[3]		

1. Include for all domestic systems.
2. Include for domestic systems that use an advanced treatment process.
3. Include for industrial or mining systems if these are contaminants of concern. If metals or organic compounds are present in the discharge, attach a list of influent and effluent concentrations for each metal/organic compound.

5. Ground Water Monitoring

Discharge Permits typically require that ground water samples be collected quarterly from properly constructed monitoring wells located downgradient from discharge locations. The samples must be analyzed for contaminants of concern. For most domestic and agricultural Discharge Permits, the typical contaminants of concern are total Kjeldahl nitrogen (TKN), nitrate-nitrogen (NO_3-N), total dissolved solids (TDS), and chloride (Cl). For most industrial Discharge Permits, typical contaminants of concern are volatile and semi-volatile organic compounds (VOC's), polynuclear aromatic hydrocarbons (PAH's), polychlorinated biphenyls (PCB's), metals, and radionuclides. See Supplemental Instructions for additional information.

a. Depth-to-Most-Shallow Ground Water [Subsection C of 20.6.2.3106 NMAC]

1. Facilities *with* on-site monitoring wells

Provide the depth-to-most-shallow ground water from the most recent ground water levels obtained from monitoring wells at the facility. Depth-to-ground water shall be measured to the nearest 0.01 feet using standard methods and techniques [Subsection B of 20.6.2.3107 NMAC].

Depth-to-ground water is: 100 feet

Note: Use this depth to complete Part I.4.b (Public Notice).

2. **Facilities *without* on-site monitoring wells**

If a facility does not have a monitoring well intersecting most-shallow ground water, provide depth-to-most-shallow ground water for all wells on file located within one mile of the boundary of the facility. This information can be obtained from the Office of the State Engineer (http://www.ose.state.nm.us).

Depth-to-ground water is: _____ feet

Note: Use the range of depths from these records to complete Part I.4.b (Public Notice).

☐ Attached – Records from the Office of the State Engineer, including the following:
- location of each well by latitude/longitude and township, range, and section
- use of each well
- depth to ground water in each well
- total depth of each well

b. Ground Water Flow Direction [Subsection C of 20.6.2.3106 NMAC]

1. **Facilities with *three or more* on-site monitoring wells**

Provide ground water flow direction beneath the facility on a ground water elevation contour map. The ground water elevation contour map shall be developed based upon the most recent ground water levels and survey data obtained from on-site monitoring wells.

Flow Direction South

☒ Included – Ground water contour map from on-site monitoring wells

☐ Included – Monitoring well survey

☐ No survey has been conducted

☐ Survey previously submitted on _____ (date)

2. **Facilities with *less than three* on-site monitoring wells**

If a facility does not have at least three monitoring wells intersecting most-shallow ground water, provide ground water flow direction based upon either the most recent regional water level data or published hydrogeologic information. Attach the sources of information used to determine ground water flow direction. *Select all that apply.*

☐ Ground water flow direction of the most-shallow ground water beneath the facility based upon the *most recent regional water level data* is _____.
-- Reference: _____ (attach relevant portions)

☐ Attached - Survey data from nearby monitoring wells and a *ground water elevation contour map* indicating the direction of ground water flow.

☐ Ground water flow direction of the most-shallow ground water beneath the facility based upon *published hydrogeologic information* is _____.

-- Reference: _____ (attach relevant portions)

c. Monitoring Well Construction and Identification [Subsection C of 20.6.2.3106 NMAC; Subsection A of 20.6.2.3107 NMAC]

1. **For existing monitoring wells**
   Submit construction logs for all existing, on-site monitoring wells, which indicate the date of installation and well driller.

   ☐ Included - Construction logs for each existing monitoring well.

   ☒ Previously Submitted
   Date 12/20/2007

2. **For all monitoring wells** - Identify proposed and existing monitoring well (MW) locations.

MW ID[1]	Proposed or Existing?	Location Description[2] AND Latitude and Longitude	Screen Interval (ft)	Depth to Water
		See Attachment 5		

[1] MW ID (Monitoring Well ID) is the numbering or labeling system used to identify a MW (e.g., MW-1, MW-2, etc.).
[2] Example: 60 feet south of the top inside edge of the berm of Wastewater Impoundment-1

d. Past Ground Water Monitoring Results

This item applies only to existing facilities seeking renewal and/or modification of a Discharge Permit that required ground water monitoring. See Supplemental Instructions for additional information.

1. **Attach a graph or table showing all analytical results from ground water monitoring.**

e. Engineering and Surveying

Proposed New Structures or Improvements to Existing Structures

Include electronic plans and specifications for any *proposed* new structures or improvements to existing structures. All final plans and specifications must bear the stamp of a New Mexico licensed Professional Engineer.

- Proposed plans and specifications included (*Select all that apply)*

  ☒ Included for new structure(s)

  ☒ Included for improvements to an existing structure

  ☐ No proposals for new or improved structures

f. Land Application Area Information

For facilities proposing to apply reclaimed or treated wastewater to a land application area, provide calculations showing that nitrogen loading does not exceed 200 lbs/acre/year or that the amount of total nitrogen in the combined application of wastewater and fertilizer does not exceed by more than 25% the amount reasonably expected to be taken up by the crop(s) and removed by harvesting in any 12-month period. Forms to assist in these calculations can be found at: https://www.env.nm.gov/gwb/FORMS/NewMexicoEnvironmentDepartment-GroundWaterQualityBureau-Forms.htm.

☐ Attached – Nitrogen loading calculations

Part III. Additional Proposals and Conditions (if applicable)

In the space provided, propose revisions or additions to the standard Discharge Permit requirements. If you propose any revisions or additions, also provide the rational for your proposal.

Proposed modification to Condition 4, which requires that minimum of one foot of freeboard be preserved between the liquid level in the all impoundments and the elevation of the top of the impoundment liners. The proposal is to remove the one-foot freeboard requirement on Storm Water Ponds 1, 2, and 3. Clean storm water is not regulated. If these Storm Water Ponds over-top after a large rainfall event, or if the WIPP facility needs to transfer storm water from one pond to another to prevent over-topping, no formal notice to the Ground Water Quality Bureau is required. Any over-topping or transfer of water will be noted in the semi-annual reports.

Proposed modification to Condition 9, which requires measurement of the thickness of the solids blanket in storm water runoff impoundments. The proposal is to remove the requirement to measure the solids blanket in Salt Storage Pond 1, and Salt Storage Pond 2/3. The sludge generated from collection and evaporation of saturated brine is salt. The salt is hard packed and non-hazardous, and has no resemblance to the sludge blanket in the sewage lagoons. Because of the hard packed salt, a good estimate of depth is difficult to determine. Safety of personnel measuring the salt pack is a concern since it involves launching a boat down a steep, slick liner and rowing to the staff gauge to measure the depth of the salt pack.

Proposed modification to Condition 15, which requires that the volume of domestic influent discharged to the Facultative Lagoon System be measured monthly using a totalizing flow meter on the influent line of the Facultative Lagoon System. The proposal is to remove the requirement to use a totalizing meter on the influent line to the system and use the totalizing flow meter associated with the domestic water influent to the facility to determine flow to the Facultative Lagoon System.

Proposed modification to Condition 18, which requires that water samples be collected annually, after a significant storm event, from each of the storm water ponds. It is proposed that Condition 18 modified to define "significant" as storm events of 2 inches or greater in a 24-hour period. This definition removes the current ambiguity and will make Condition 18 consistent with Condition 11 in terms of the actionable criterion.

Proposed modification to Condition 22, which requires depth to the water table to be measured to the nearest hundredth of a foot (0.01 ft) quarterly in piezometers PZ-1 through PZ-13. The proposal is to remove PZ-8 from the list because PZ-8 had to be plugged and abandoned to allow continuation of a construction project at the WIPP facility. This well was no longer needed as it is not used for semi-annual groundwater sampling and will not impact the potentiometric map as there is sufficient coverage. This well also offered limited data as its water level (62.31 ft bgl) was always well below the middle of the screened interval (47.7 - 67.7 ft bgl). PZ-8 was plugged and abandoned to NMED standards on August 8th, 2018.

Proposed modification of Condition 23(b), which requires that three well volumes be purged from the well prior to sample collection well. It is proposed that Condition 23(b) be replaced with the following: Allow field-measured temperature, pH, and specific conductance to stabilize prior to sample collection. The system is considered stable when pH is within ± 0.5 pH units, and the temperature and specific conductance are within ±10% of the last three consecutive readings. The reason for this change is that 3 WBV depletes the well and stabilization typically occurs within one or two WBV. The excess water purged with 3 WBV is not beneficial. We propose to pump the well to + or - 10 % of the last three consecutive specific conductance readings.

Proposed modification to Condition 31, which prescribes actions to be taken in the event that a minimum of one foot of freeboard cannot be preserved in the impoundment(s). It is proposed that Condition 31 and 32 be modified pursuant to the desired changes to Condition 4.

Proposed modification to the Discharge Permit Summary, Page 2 of 5, Industrial Wastewater of the Discharge Permit Summary of DP-831, Type Evaporation Impoundment, and Designation Salt Storage Pond 1. Replace 1,677,633 gallons with 3,301,634 gallons (NWP DWG No 23-C-017-W1).

Proposed modification to the Discharge Permit Summary, Page 2 of 5, Industrial Wastewater of the Discharge Permit Summary of DP-831, Type Evaporation Impoundment, and Designation Salt Storage Pond 2. Replace 1,273,601 gallons with 3,402,759 gallons (NWP DWG No 23-C-017-W1).

Proposed modification to the Discharge Permit Summary, Page 2 of 5, Industrial Wastewater of the Discharge Permit Summary of DP-831, Type Evaporation Impoundment, and Designation Salt Storage Pond 3. Replace 1,273,601 gallons with 21,737,254 gallons (NWP DWG No 23-C-017-W1).

Proposed modification to the Discharge Permit Summary, Page 4 of 5, Ground Water Monitoring Locations, Type: Monitoring Well, Designation: PZ-8. Delete this monitoring well as it has been plugged and abandoned.

Part IV. Maps and Logs to be Attached

1. Surface Soil Survey and Vadose Zone Geology
[Subsection C of 20.6.2.3106 NMAC]

☒ Attached - Most recent regional soil survey map and associated descriptions identifying surface soil type(s).

☐ Attached - Lithologic logs for all existing on-site monitoring wells (if available).

2. Topographic Map [Subsection C of 20.6.2.3106 NMAC]

☒ Attached - Location map with topographic surface contours identifying all of the following features located within a one-mile radius of the facility:

- watercourses
- lakebeds
- sinkholes
- playa lakes
- springs (springs used to provide water for human consumption shall be so denoted)
- wells supplying water for a public water system
- private domestic water wells
- irrigation supply wells
- ditch irrigation systems
- acequias
- irrigation canals
- drains

3. Flood Zone Map [Subsection C of 20.6.2.3106 NMAC]

☐ Attached - Most recent 100-year flood zone map developed by the federal emergency management administration (FEMA) documenting flood potential for the facility.

Describe any engineered measures used for flood protection.

A berm currently runs the entire length of the facility on the north and east sides. This berm is designed to divert runon water around the facility, and will be extended to prevent runon for the Brine Retention Ponds.

4. Additional Information
Describe any additional relevant information.

Supplemental Instructions

Please note: Discharge Permits are required for a wide range of facilities that process, treat, store and/or dispose of wastewater, sludge, septage, leachate, contaminated soils, mine tailings, industrial waste, mine ore, waste rock, or other similar materials. For the purposes of this application form, the term "discharge" applies to any of these materials whether they are actually discharged or whether they represent only a potential discharge that could occur due to factors such as poor maintenance, improper installation, equipment failure or accidents.

Part I.1 Facility Information and Type of Facility

The "Facility" may be identified as:

- a treatment facility, such as a municipal wastewater treatment plant;
- the source of the discharge, such as a subdivision, or waste rock pile;
- a disposal facility or operation, such as for sludge or septage;
- the discharge location or end user of reclaimed wastewater, such as a golf course or cement plant;
- a storage and/or processing facility with off-site disposal;
- a collection of facilities, such as numerous comfort stations at a state park; or
- a project or operation, such as a construction project or a system to distribute reclaimed wastewater throughout a city.

Examples of a variety of facility types are categorized below. Please note, "Domestic" waste contains human excreta or originates from typical residential plumbing fixtures.

Industrial Waste

- Manufacturing
- Power plant
- Military installation
- Vehicle/equipment wash
- Mortuary
- Hydrocarbon landfarm
- Ground water remediation
- Ethanol plant
- Asphalt plant
- Remediation Systems

Mining Waste

- tailing impoundment
- mine dewatering
- waste rock pile
- smelter slag
- in-situ leach
- leach piles
- pipelines
- collection ponds
- concentrator – other beneficiation

Domestic Waste

- Municipal wastewater treatment plant
- Septage disposal
- Sludge disposal
- Mobile home/RV park
- Campground/park
- School/educational facility
- Restaurant
- Subdivision/apartment complex
- Unincorporated community
- Lodging/resort/spa
- Residential facility
- Commercial/shopping complex
- Laundromat
- Facility using reclaimed domestic wastewater

Agricultural Waste

- Dairy
- Food processing
- Slaughter facility
- Nursery/greenhouse
- Manufacture/processing of agricultural chemicals
- Feedlot
- Livestock truck washout

This listing is only a guide, as there can be crossover between categories. For example, a golf course might use treated industrial wastewater for irrigation. The type of facility in that case is "golf course" and the type of waste is "industrial." A mining operation may need a permit for its restroom and shower facilities. In that case, the type of facility is a "mining operation" and the type of discharge is "domestic waste."

Part I.5: Facility Location

The following are examples of treatment, storage, and disposal components of a wastewater system that should be included in this part.

Treatment Methods

- Septic tank
- Grease interceptor
- Oil/water separator
- Manure separator
- Wetlands
- Lagoon (indicate whether aerated and type of liner)
- Trickling filter
- Activated sludge (extended air, SBR, etc.)
- Sand filter
- Membranes
- Sludge drying bed
- Disinfection (specify type)
  - ➢ chlorination

Disposal Methods

- Leachfield
- Infiltration gallery
- Evaporation lagoon (indicate type of liner)
- Evaporation tank
- Impoundment
- Discharge to waters of the US (NPDES permit required)
- Ongoing land application (specify type)
  - ➢subsurface irrigation
  - ➢sprinkler irrigation
  - ➢flood irrigation
  - ➢drip irrigation
  - ➢surface spreading (solids)
  - ➢surface injection (solids)

- UV/ozone
- Water treatment plant
- Injection Wells
- Temporary uses of reclaimed wastewater
- Ongoing use of reclaimed wastewater for:
  - Manufacturing construction or dust control

Storage Methods

- Above/below ground tank
- Storage lagoon (indicate type of liner)
- Holding tank
- Pit toilet
- Stockpile
- Tailing impoundment

Part II.1 Proposed Maximum Daily Discharge Volume

Your Discharge Permit will allow for the treatment, processing and/or discharge of up to a specified volume, generally, a maximum number of gallons per day. The flow at your facility on any given day must not exceed this "maximum discharge volume." It is determined based on the expected contributions from the sources you identified Part II, 1, b, 1.

NMED will carefully review the basis of the maximum discharge volume you propose. Show all your calculations and assumptions.

Animal feeding operations must provide calculations based on the number of animals and water conservation practices in place.

Landfarms, disposal facilities, processing facilities typically identify the expected number of loads to be delivered.

For septic systems and wastewater treatment plants, the maximum discharge volume is also referred to as the "design flow." It includes a peaking or safety factor to guard against back-ups and overflows.

Municipal wastewater treatment facilities should identify the population served, growth assumptions, and expected per capita usage considering any contributing industries.

On-site domestic wastewater treatment facilities should rely on published design flows such as those provided in the NMED Liquid Waste Regulations (20.7.3 NMAC), the Uniform Plumbing Code or the USEPA On-site Wastewater Treatment Systems Manual.

For existing facilities, the maximum discharge volume may be based on a record of measured flows if no changes are anticipated. At least two years of flow data must be submitted, and the highest monthly discharge volume must be multiplied by a peaking factor of 1.5.
NMED will verify that your proposed or existing facility can handle maximum discharge volume you propose.

Be specific in describing all sources. Consider the following examples:

- Municipalities – identify particular industries or specialized facilities contributing wastewater.
- RV Parks – identify showers, dump stations, laundromat, etc.

- Subdivisions – identify homes, apartments, commercial developments, water softener backwash, etc.
- Landfarms or disposal facilities – specify type of materials accepted, e.g., residential septage, car wash grit trap waste, contaminated soils/water, treated municipal sludge, etc.
- Dairies – identify milking parlors, type of washdown used, sources of stormwater runoff, etc.
- Schools – identify cafeteria, gym, showers, etc.
- Truck stops – identify restaurant, showers, car wash, etc.
- Facilities receiving reclaimed wastewater – identify the treatment facility providing the reclaimed wastewater.
- Food processing and industrial facilities – describe the processes which produce the waste stream and chemicals used.
- Mines – identify processes including beneficiation, tailing, waste rock, leach facilities, pipelines, ponds, catchments, booster stations, in-situ leach facilities.

You do not need to include solid wastes, hazardous wastes or discharges being managed under other permits; however, these must be listed under Item C-7 in Part C of the application.

Part II.3: Flow Metering

You must provide a method for measuring the discharge volume (Section 20.6.2.3109.H.1 NMAC). At facilities with treatment or storage lagoons, it is necessary to measure both the volume entering the treatment system as well as the volume ultimately discharged.

If you land apply wastewater to more than one discharge location, you must be able to track the volume to each location.

If your facility is small and relies on gravity to carry wastewater to the treatment and disposal system, it may be acceptable to estimate the wastewater flow. This can be done by metering water usage and deducting the volume of water used for fresh-water irrigation, swimming pools, evaporative cooling, livestock watering or other uses that do not result in wastewater flowing to the treatment system.

Part II.4: Discharge Quality

Untreated wastewater entering a treatment facility (also referred to as "influent") must be characterized so that the treatment process can be evaluated. It is not necessary to provide influent quality for systems providing minimal treatment prior to discharge or disposal, such as systems relying on crop uptake for treatment (e.g., dairies), septic tank – leachfield systems, storage/processing facilities or evaporative systems. The final quality of the waste or wastewater disposed of or discharged must be characterized for all facilities.

For most agricultural and domestic facilities, the contaminants of concern include nitrate as nitrogen (NO_3-N), total Kjeldahl nitrogen (TKN), total dissolved solids (TDS), and chloride (Cl). For domestic facilities with advanced treatment, additional contaminants include total suspended solids (TSS), biochemical oxygen demand (BOD_5), and fecal coliform bacteria. Contaminants of concern at industrial and mining sites include pH, metals, and organic compounds. List all that apply.

Part II.E: Ground Water Monitoring

The depth to ground water beneath your facility and/or discharge site must be provided. This is true even if your facility or operation is intended to have no discharge. Discharge Permits are required for "no-discharge" lagoons, storage tanks, etc. because of the potential for a discharge to occur due to factors such as improper installation, poor maintenance, equipment failure or accidents.

The best way to determine the depth to water is to measure it in an on-site or nearby monitoring well. If a monitoring well is not available, the measurement may be from a water supply well. If there is a well but it is not possible to access it for a measurement, you could refer to the well log for that well and/or others in the vicinity. Well log information is available on the website of the State Engineer's office:

http://www.ose.state.nm.us/.

Be aware that water levels have dropped in many areas of the state, so more recent well logs in those areas are more reliable.

There may be a significant discrepancy in the depth to water in different wells, even when falling water levels is not a factor. One reason for this is that a water supply well may rely on a deep aquifer rather than water in the "first" or most shallow aquifer. Discharge Permits are intended to protect all ground water, so it is important to report the shallowest depth in the vicinity of your site.

The total dissolved solids (TDS) concentration of the ground water prior to discharge must be provided. As explained for the depth to water, this is true even if your facility or operation is intended to have no discharge. The TDS value provides a general indication of the quality of the ground water that could be affected by your operation.

The best way to obtain a pre-discharge TDS concentration is to sample an on-site or nearby well before your facility begins operating. It is better to sample a shallow rather than a deep well, if possible. It may be that a neighboring facility has existing analytical data for its Discharge Permit. (If so, be sure to obtain data from a non-impacted well.)

If there are no wells in your vicinity or it is not possible to sample them, you may find general TDS concentrations in reports available from sources such as a university, the State Engineer's Office (http://www.ose.state.nm.us/) or the US Geological Survey (http://nm.water.usgs.gov/).
If you are renewing or modifying your Discharge Permit, you may refer to the TDS concentration previously determined if there was a sound basis for it. Monitoring data or other information obtained since the permit was issued, however, may warrant listing a different value.

Part II.E.4: Past Ground Water Monitoring Results

A complete list of ground water standards can be found in Section 20.6.2.3103 NMAC. The standards for contaminants most frequently monitored under Discharge Permits are as follows:

Nitrate-nitrogen (NO_3-N)............10 mg/L
Chloride.................................... 250 mg/L
Total dissolved solids (TDS)... 1000 mg/L
Sulfate (SO_4)..............................600 mg/L
pH .... between 6 and 9

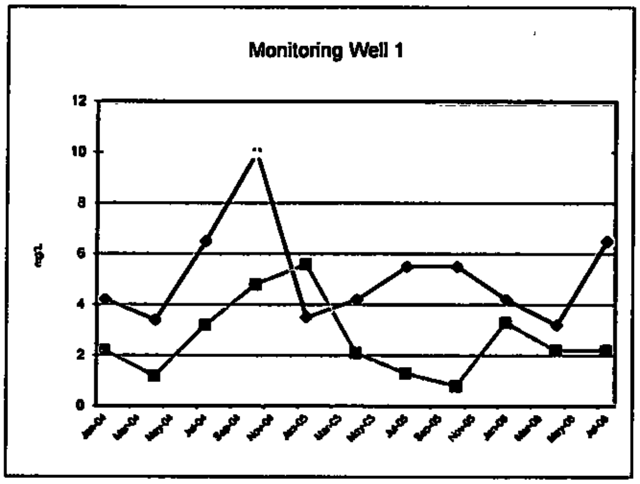
There is no ground water standard for total Kjeldahl nitrogen (TKN). Because TKN converts readily to nitrate as it moves through the vadose zone, however, concentrations approaching or exceeding 10 mg/L are of concern.

Additional parameters typically apply at mining or industrial facilities.

Some ground waters in the state have TDS or chloride concentrations that naturally exceed these standards. In that case, the standard is the naturally occurring level. You must provide documentation of such elevated natural conditions, such as analytical results from a non-impacted well.

An example table and graph follow:

	Monitoring Well 1	
Date	NO3-N	TKN
Jan-04	4.2	2.2
Apr-04	3.4	1.2
Jul-04	6.5	3.2
Oct-04	10	4.8
Jan-05	3.5	5.6
Apr-05	4.2	2.1
Jul-05	5.5	1.3
Oct-05	5.5	0.8
Jan-06	4.2	3.3
Apr-06	3.2	2.2
Jul-06	6.5	2.2



02828

Attachment 1

ATTACHMENT 1

Proposed Maximum Daily Discharge Volume

ATTACHMENT 1

Proposed Maximum Daily Discharge Volume

Receiving Body (Previously Permitted Impoundments)		Discharge Volume (gallons)
Domestic Wastewater	Settling Lagoons 1 and 2	23,000
	Polishing Lagoons 1 and 2	23,000
	Effluent Lagoon A	23,000
Domestic & Industrial Wastewater	Effluent Lagoon B	50,000 (23,000 domestic and 27,000 industrial)
	Effluent Lagoon C	50,000 (23,000 domestic and 27,000 industrial)
Industrial Wastewater	Evaporation Pond H-19	50,000
	Salt Storage Pond 1 (24-hour, 100-year rainfall event)	2,512,148
	Salt Storage Pond 2/3 (24-hour, 100-year rainfall event)	3,814,271
Storm Water Control (20.6.2.3105 NMAC)	Storm Water Pond 1 (24-hour, 100-year rainfall event)	650,133
	Storm Water Pond 2 (24-hour, 100-year rainfall event)	1,411,262
	Storm Water Pond 3 (24-hour, 100-year rainfall event)	5,978,042

Receiving Body (New Impoundments - Modifications)		Discharge Volume (gallons)
Industrial Wastewater	Storm Water Pond 4 (24-hour, 100-year rainfall event)	1,888,867 (1,857,927 non-contact storm water and 30,940 brine water)
	Salt Storage Pond 5 (24-hour, 100-year rainfall event)	1,292,499
	Brine Evaporation Pond East and West	2,210

Note 1: Settling Lagoons 1 and 2 receive the initial discharge from the WIPP facility of 23,000 gallons per day. Polishing Lagoons 1 and 2 receive water discharge from Settling Lagoons 1 and 2. Effluent Lagoon A receives discharge from the Polishing Lagoons 1 and 2. So, total discharge into the Facultative Sewage System is only 23,000 gallons per day.

Note 2: The Effluent Lagoons B and C may receive up to 23,000 gpd from Effluent Lagoon A, as needed, to control freeboard in Effluent Lagoon A. Effluent Lagoons B and C also may receive miscellaneous industrial non-hazardous wastewaters from site operations as needed (e.g. purging groundwater monitoring wells, and water collected from the Waste Shaft Sump). These miscellaneous site operations are estimated to discharge up to an additional 27,000 gpd into these lagoons; therefore, the daily maximum discharge into Effluent Lagoons B and C is estimated at 23,000 gpd (domestic) and 27,000 gpd (industrial non-hazardous) for a total of 50,000 gpd.

Note 3: Evaporation Pond H-19 is used for miscellaneous wastewater transfer/discharge from underground experiments plus miscellaneous industrial non-hazardous wastewater from site operations (e.g. purging groundwater monitoring wells, and water collected from the Waste Shaft Sump). These discharges vary depending upon the type of underground experimentation taking place. Typical discharge volumes into Evaporatation Pond H-19 are estimated at 110 gallons per day with a maximum daily discharge rate up to 50,000 gpd.

Note 4: Brine water from Brine Evaporation Pond East and Brine Evaporation Pond West may be discharged into Storm Water Pond 4 to control freeboard in the brine ponds. The brine evaporation ponds content may be discharged into Storm Water Pond 4 after 14 days as a batch operation. Because these brine evaporation ponds may generate 2,210 gpd of brine water, 30,940 gpd may be discharged as a batch load into Storm Water Pond 4 after 14 days.

Note 5: All of the water in Storm Water Pond 4 including the storm water runoff is conservatively being reported as industrial waterwater because brine water may be added to this storm water pond from the brine evaporation ponds to control freeboard in the brine ponds.

Description of Components

ATTACHMENT 3

Description of Components

Component	Status[1]	Date of Installation or construction (mm/dd/yyy)	Description (Construction material , liner type, irrigation method, capacity[2], dimensions, area, model number , etc.)
Settling Lagoon 1	Existing in use	1990	60-mil HDPE, 128,772 ft^3 (963,214 gallons)
Polishing Lagoon 1	Existing in use	1990	60-mil HDPE, 55,468 ft^3 (414,901 gallons)
Settling Lagoon 2	Existing in use	1990	60-mil HDPE, 128,772 ft^3 (963,214 gallons)
Polishing Lagoon 2	Existing in use	1990	60-mil HDPE, 55,468 ft^3 (414,901 gallons)
Effluent Lagoon A	Existing in use	1990	30-mil linear low density polyethylene (LLDP), 75,750 ft^3 (566,610 gallons)
Effluent Lagoon B	Existing in use	1992	30-mil LLDP, 113,138 ft^3 (846,257 gallons)
Effluent Lagoon C	Existing in use	1992	30-mil HDPE, 113,138 ft^3 (846,257 gallons)
Evaporation Pond H-19	Existing in use	July-95	36-mil Hypalon®, 80,457 ft^3 (601,860 gallons)
Salt Cell 2 and Salt Cell 3	Existing in use	October-06	60-mil HDPE, 200-mil Geonet Drainage layer, 2-feet of native soil cover, Cell A: 6.2 acres, Cell B: 5.2 acres, Total: 11.4 acres
Salt Storage Pond 2/3	Existing in use	Jan-04 (Pond 2) Apr-10 (Pond 3)	Each pond has a two 60-mil HDPE, 200-mil Geonet leak detection layer. The system capacity of Pond 2/3 is 3,561,553 ft^3 (26,642,264 gallons)
Salt Cell 1 (Run-off Ditches)	Closed	November-04	60-mil HDPE, 2 feet of native soil, 18.8 acres, 1.0 Acres
Salt Storage Pond 1	Existing in use	November-04	60-mil HDPE; 593,559 ft^3 (4,440,128 gallons)
Storm Water Pond 1	Existing in use	April-05	60-mil HDPE; 102,293 ft^3 (765,204 gallons)
Storm Water Pond 2	Existing in use	April-05	60-mil HDPE; 349,176 ft^3 (2,612,016 gallons)
Storm Water Pond 3	Existing in use	January-05	60-mil HDPE; 1,156,920 ft^3 (8,654,360 gallons)
Site Preliminary Design Validation Material Pile	Closed	circa 1984	Geosynthetic liner, 2 feet of native soil blended with rock, 10 acres
Storm Water Pond 4	Proposed	March 1, 2019	60-mil HDPE Geomembrane double lined; 1,158,840 ft^3 (8,668,722 gallons)
Salt Storage Pond 5	Proposed	March 1, 2019	60-mil HDPE Geomembrane double lined; 849,594 ft^3 (6,355,404 gallons)
Salt Cell 5	Proposed	March 1, 2019	60-mil HDPE Geomembrane lined, 5,224,000 ft^3
Brine Evaporation Pond East	Proposed	March 1, 2019	60-mil HDPE Geomembrane double lined; 8,338 ft^3 (62,375 gallons)
Brine Evaporation Pond West	Proposed	March 1, 2019	60-mil HDPE Geomembrane double lined; 8,338 ft^3 (62,375 gallons)

[1]Status = Proposed; Existing in use; Existing not in use, but proposed for use; Abandoned without closure, not proposed for use; or Closed

[2]Capacity = The listed capacity is the maximum physical volume of the pond(s) without freeboard.

Monitoring Well Locations

MW ID[1]	Proposed or Existing?	Location Description[2] AND Latitude and Longitude	Screen Interval (ft)	Depth to Water
PZ-1	Existing	Approximately 30' south of Building 486; 32.372369 Lat., -103.792029 Long.	42-62	41.21
PZ-2	Existing	Approximately 50' northeast of Building 413; 32.372203 Lat., -103.791407 Long.	42-62	41.75
PZ-3	Existing	Approximately 50' north of Building 489; 32.373043 Lat., -103.791671 Long.	42-65	44.03
PZ-4	Existing	Approximately 25' west of Building 413; 32.372036 Lat., -103.792033 Long.	40-60	44.79
PZ-5	Existing	Approximately 30' East of Building 253; 32.372048 Lat., -103.792223 Long.	42-65	42.58
PZ-6	Existing	Approximately 50' West of Building 482; 32.372576 Lat., -103.793028 Long.	42-62	42.56
PZ-7	Existing	Approximately 20' from Salt Storaget Pond 1 at the southeas Corner; 32.373759 Lat., -103.795669 Long.	46-71	35.93
PZ-8	Plugged and Abandoned (Aug 8th, 2018)	Inside the North-South RCRA Berm halfway between the Exhaust Shaft and the SPDV Pile; 32.371439 Lat., -103.788819 Long.	47.7-67.7	62.31
PZ-9	Existing	Outside the North-South RCRA Berm East of Salt Cell 1; 32.37429 Lat., -103.790668 Long.	45-75	58.25
PZ-10	Existing	Southeast corner of Storm Water Pond 3 approximately 20' from the edge of the pond; 32.37117 Lat., -103.795456 Long.	29-54	35.07
PZ-11	Existing	Approximately 75' northwest of Salt Storage Pond 1; 32.375299 Lat., -103.797013	42-82	43.72
PZ-12	Existing	Between Storm Water Pond 1 and Storm Water Pond 2; 32.370424 Lat., -103.793477 Long.	38-72	51.52
PZ-13	Existing	Aproximately 30' from the SPDV Pile at the Southwest Corner; 32.370099 Lat., -103.786601 Long.	61-76	64.83
PZ-14	Existing	Approximately 50' from the SPDV Pile at the Northwest Corner; 32.371722 Lat., -103.787508 Long	57-72	66.62
PZ-15	Existing	Approximately 30' from the SPDV Pile at the Southeast Corner; 32.370517 Lat., -103.785216 Long.	38.5-53.5	47.1
C-2811	Existing	Approximately 1,500' East of the Facultative Lagoon System; 32.365549 Lat., -103.793498 Long.	50-80	50.48
C-2505	Existing	Approximately 30' South of the Exhaust Shaft; 32.371545 Lat., -103.791704 Long.	44-69	44.38
C-2506	Existing	Approximately 30' East of the Exhaust Shaft; 32.371594 Lat., -103.79161 Long.	44.5-69	43.62
C-2507	Existing	Approximately 75' east of Building 245; 32.37101 Lat., -103.791707 Long.	43-73	44.22
WQSP-6A	Existing	Approximately 2,000' Southwest of the Facultative Lagoon System; 32.359831 Lat., -103.803943 Long.	152-177	168.21

[1]MW ID (Monitoting Well ID) is the numbering of labeling system used to identify a MW (e.g., MW-1, MW-2, etc.).
[2]Example: 60 feet south of the top inside edge of the Berm of Waste Water Impoundment-1

OCT 3 0 2018

RECEIVED
NOV 2 2018
Ground Water Quality Bureau

Ms. Michelle Hunter, Bureau Chief
Ground Water Quality Bureau
New Mexico Environment Department
Harold Runnels Building
P.O. Box 5469
Santa Fe, NM 87502-5469

Subject: Notification of Discharge: One Week Written Notifications and 15 Day Corrective Action Plan, Discharge Permit 831

Dear Ms. Hunter:

The purpose of this letter is to provide the New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) with the subject notifications and corrective action plan pursuant to the Contingency Plan notification requirements in Discharge Permit 831 (DP-831) issued to the U.S. Department of Energy (DOE) Carlsbad Field Office (CBFO). This notification is a follow up to the 24-hour notifications provided to Mr. R. Strauch on October 18, 2018 and October 24, 2018. This reflects the action plan verbally discussed with Mr. Strauch. The following items are being addressed per DP-831 Conditions 31 and 32, of the Permit Contingency Plan section.

Permit Condition 31

This Contingency Plan addresses the excess above freeboard in Storm Water Ponds 1, 2, and 3 with the need to discharge this excess storm water outside of Storm Water Pond 3 due to two separate storm events on October 16 – 18, 2018 and October 22 – 24, 2018. It is anticipated that this can be completed by November 7, 2018.

The October 16 – 18, 2018 Storm Event:

Rainfall ran directly into the storm water ponds and filled Storm Water Pond 2 to capacity. In order to prevent overtopping and to attain freeboard, WIPP facility personnel pumped storm water from Storm Water Pond 2 to Storm Water pond 3. Freeboard in Storm Water Pond 2 was attained, but additional rainfall caused Storm Water Pond 3 to fill to capacity and ultimately caused storm water to go over the outfall of Storm Water Pond 3. The CBFO proposes to pump storm water from Storm Water Pond 3 to the environment to attain one-foot freeboard. This will allow capacity in the Storm Water Pond 3 to be able to contain additional run-off in the event more rainfall occurs.

The October 22 – 24, 2018 Storm Event:

Before any pumping of Storm Water Pond 3 could commence, a second storm event during October 22 – 24, 2018 occurred filling Storm Water Pond 1 to above freeboard, and causing Storm Water Pond 3 to flow again through the outfall. CBFO again proposes to pump storm water from Storm Water Pond1 into Storm Water Pond 3, and to pump storm water from Storm Water Pond 3 to the environment to attain freeboard in both ponds.

CBFO:OEP:MRB:AC:18-0367:UFC 5486.00

As the current matter addresses storm water run-off only, no further corrective measures are proposed. The other evaporation ponds are associated with the sewage treatment facility and salt water containment, and these are well below freeboard.

Permit Condition 32

This report confirms the CBFO calls to Mr. Ron Strauch on October 18, 2018 notifying him of the discharge from Storm Water Pond 3, and October 24, 2018, informing the GWQB of the overflow of Storm Water Pond 3 and the need to pump storm water from Storm Water Pond 1 into Storm Water Pond 3, and then pump water from Storm Water Pond 3 to the environment to attain freeboard capacity. After freeboard is attained in the Storm Water Ponds 1 and 3, the DOE will end the discharge, and evaporation will continue to decrease water levels.

Contingency Plan Information

The following information (a-g) completes the one-week notification, required in Section 32 in the DP-831 Permit.

(a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility:

Person in charge of the facility:
Todd Shrader, Manager
P.O. Box 3090
Carlsbad, New Mexico, 88221
(575) 234-7300

Owner of the facility:
U.S. Department of Energy

Operator of the facility:
Nuclear Waste Partnership LLC

(b) Name and address of the facility:

U.S. Department of Energy
Waste Isolation Pilot Plant (WIPP)
26 miles southeast of Carlsbad, New Mexico off of State Highway 128
Carlsbad, NM 88220

(c) The date, time, location, and duration of the discharge:

Dates: October 18 – 19, 2018 and October 23 – 25, 2018
Time: N/A
Location: WIPP Facility (Latitude: 32 22.589, Longitude 103 47.746)
Duration of Discharge: October 188 –21, 2018 and
October 22 – 25, 2018

(d) The source and cause of the discharge:

Source: Runoff from the WIPP facility occurring from rainfall events October 16 - 18 and October 22 - 24, 2018.

Cause of discharge:

September 4, 2018 through September 10, 2018 the WIPP Facility received 4.61 inches of precipitation which filled Storm Water Pond 3. A report was sent to the GWQB and freeboard in Storm Water Ponds 2 and 3 were attained by pumping storm water from pond 2 to 3 and then from 3 to the environment. October 16 through October 19, 2018, the WIPP facility received an additional 1.3 inches of precipitation that caused Storm Water Pond 3 to overflow.

Then on October 22 – 24 the WIPP facility received another 1.34 inches of precipitation. On October 24, 2018, the CBFO informed the GWQB of the exceedance of freeboard in Pond 1 and the outflow of water from Storm Water Pond 3.

(e) A description of the discharge, including chemical composition:

The outflow from Storm Water Pond 3 was storm water runoff from the WIPP facility. Historical chemical sampling and analysis from storm water runoff have shown no exceedances of analyte limits (see attached recent analytical data). Samples collected consistent with DP-831 Condition 20 and the chemical composition will be noted in the next semi-annual report submitted to the GWQB.

(f) The estimated volume of the discharge:

There is no device for measuring the overflow of Storm Water Pond 3. Discharge volumes were estimated using standard stream flow calculations. Also, amounts of water outflow are conservative estimations. Storm Water Pond 3 has an engineered spillway to prevent erosion. Therefore, there is no erosion damage to pond berms or liner integrity. The estimated amount of outflow from the spillway and from pumping to the environment is as follows:

October 16-18 Storm Event
- Storm Water Pond 3 – 1,211,760 gallons.
  - This includes water from Storm Water Pond 2 pumped into Storm Water Pond 3 to attain freeboard in Storm Water Pond 2.

October 22-24 Storm Event
- Storm Water Pond 3 – 1,615,680 gallons

(g) Any actions taken to mitigate immediate damage from this discharge:

There was no damage from these discharges. To establish freeboard, excess storm water above freeboard will be pumped to the environment.

Corrective Action Plan

The following information (a-c) completes the 15-day Corrective Action Report/Plan required in Section 32 in the DP-831 Permit.

a) A description of proposed actions to prevent future unauthorized discharge.

Corrective measures include allowing Storm Water Pond 3 to overflow through the designed outflow. In addition, clean storm water will be pumped from Storm Water Ponds 1 and 3 to the environment to keep these ponds within permitted requirements. If additional rainfall occurs, the storm water will be allowed to overflow the Storm Water Ponds.

b) A description of proposed actions to prevent future unauthorized discharges of this nature.

The DOE attempts to contain as much storm water as possible in order to minimize recharge to an anthropogenic water table beneath the facility. When the rainfall amounts to more that can be managed to maintain freeboard, excess storm water is discharged.

c) A schedule for completion of proposed actions.

It is anticipated that freeboard in Storm Water Ponds 1 and 3 will be achieved by November 8, 2018.

Upon review of this matter, it is believed that this outflow of storm water runoff poses no threat to human health and environment. The corrective actions described are intended to meet all notification requirements of DP-831. No additional documentation transmittal to the GWQB is required, if events remain unchanged. If conditions or additional information changes the path forward, the NMED will be notified. Results of this effort will be included in the next semi-annual report submitted to the GWQB.

If you have any further questions regarding this matter or need additional information, please contact me at (575) 234-7476.

Sincerely,

Michael R. Brown, Director
Office of Environmental Protection

Date Samples Received by lab:	October 4, 2018 1115
Sample Receipt Condition:	Samples intact at 1.2 deg. C
WIPP Chain of Custody/Request for Analysis:	10427
Analysis Results Reviewed:	Chloride, Sulfate, TDS
Analyses Reviewed and Reported in this Document:	Chloride, sulfate by EPA Method 300.0, TDS by Standard Method No. 2540C
Chloride, Sulfate Analysis Date(s):	October 6, 2018, October 8, 2018
TDS Analysis Date(s):	October 8, 2018

Sample Discussion

The NWP sample numbers and corresponding lab sample numbers are presented in Table 2 below. The sample numbers and corresponding locations are provided in Table 3 along with the analysis results. The sample set includes duplicate samples from Storm Water Pond 3 (SWP3). The sample set also included a field blank.

Table 2. 2018 Infiltration Control Sample Cross Reference

NWP Sample No.	Lab ID	Time Collected on 10/03/2018	Analytes
WR-SWP1-20181003-1.1	1810279-001	0839	Chloride, sulfate, TDS
WR-SWP2-20181003-1.1	1810279-002	0848	Chloride, sulfate, TDS
WR-SWP3-20181003-1.2	1810279-003	0901	Chloride, sulfate, TDS
WR-SWP3-20181003-2.2	1810279-004	0901	Chloride, sulfate, TDS
WR-Blk-20181003-1.1	1810279-005	0905	Chloride, sulfate, TDS

Sample Results Summary

The analysis results for the 2018 Infiltration Control samples are presented in Table 3 below.

Table 3. 2018 Infiltration Control Analysis Results

Sample No.	Location	Cl^-	SO_4^{--}	TDS
WR-SWP1-20181003-1.1	Storm Water Pond 1	37.8	5.33	131
WR-SWP2-20181003-1.1	Storm Water Pond 2	47.1	5.13	136
WR-SWP3-20181003-1.2	Storm Water Pond 3	59.9	11.5	206
WR-SWP3-20181003-2.2	Storm Water Pond 3	60.5	11.9	214
WR-Blk-20181003-1.1	Field Blank	ND	0.348	ND

ND - Not Detected

The analysis results in Table 3 show a close range of concentrations for chloride, sulfate, and TDS. The lowest concentrations for all three target analytes were detected in Storm Water Pond 1. The only analyte detected in the field blank sample was a trace of sulfate at less than one mg/L.

QC Analysis Results Summary

A limited number of QC analyses were performed for these routine anion and TDS measurements. QC samples were analyzed according to the standard methods used for the analyses and the laboratory standard operating procedures (SOPs). This batch of samples contained Initial Calibration Verification (ICV) standards, continuing calibration verification (CCV) standards, laboratory method blank (MB) samples; and a field blank sample. A laboratory control sample (LCS), which is a blank spike, was analyzed for chloride and sulfate; a LCS was analyzed for TDS; no matrix spike/matrix spike duplicate (MS/MSD) was analyzed and a field duplicate from field blank was analyzed for TDS. No LCS duplicates (LCSDs) were analyzed for determination of precision as relative percent difference (RPD).

The ICVs and CCVs met the accuracy objective of 90 to 110 percent recovery and are not shown in the table. The method blank results were all non-detect (ND). Thus there was no adverse effect on the accuracy of the sample analyses from the method blank sample analysis results. The only target analyte detected in the field blank sample was sulfate at 0.35 mg/L, which is negligible compared to the sample concentrations.

LCS and LCSD samples are blank spikes, i.e., distilled water spiked with a known concentration of the analytes. The recoveries provide an indication of whether the analyses are in control, and the analysis of the LCSD provides an indication of the precision of the analyses. The accuracy quality assurance objective for LCS/LCSD analyses are 90 to 110 percent recovery and a relative percent difference of the sample concentrations of less than 10 RPD for anions and less than 5 RPD for TDS. (However, LCSD samples were not analyzed for the target analytes in this sample batch.)

MS/MSD analyses provide an indication of whether the matrix of the sample may affect the accuracy of the analyses for the target analytes, and they also provide an indication of the precision of the analyses. The measurement quality objectives for accuracy are recoveries of 80 to 120 percent and a relative percent difference of the sample concentrations of less than 10 for anions and less than 5 for TDS. (However, MS/MSD samples were not analyzed in this sample batch.)

There are no firm precision requirements for field duplicate samples, but a RPD of less than 10 should be expected for two samples collected at the same time.

Table 4 shows results for the QC samples associated with the infiltration control samples.

Table 4. QC Analysis Results for the Fall 2018 Infiltration Control Samples

		Concentration, mg/L				
Sample	**Parameter**	**Native**	**Spike**	**Measured**	**% Rec.**	**RPD**
LCS	Chloride	0.0	5.00	4.8	95.5	NA
LCS	Sulfate	0.0	10.0	9.4	94.4	NA
LCS	TDS	0.0	1,000	1010	101	NA
BLK	TDS	0.0	0.0	ND	NA	NA
BLK Dup	TDS	0.0	0.0	ND	NA	0

NA-not applicable

The measurement quality objectives were met for the LCS analyses of chloride and sulfate. The measurement quality objectives were met for the analyses of the LCS for TDS. The only precision analysis was only performed for TDS on the field blank sample. Since TDS was not detected in the blank sample, RPD for the duplicate analysis is zero.

<u>Overall Data Package Summary</u>

The lab's data packet contained valid and usable data and information and should meet the needs of the DP-831 Program for analysis of infiltration control samples.

RE: Corrective Action Report Approval, Waste Isolation Pilot Plant (WIPP), DP-831, Storm Water Impoundment Overflow

Dear Mr. Shrader:

On September 4, 2018, the Ground Water Quality Bureau (Bureau) of the New Mexico Environment Department received notification of proposed corrective actions to restore freeboard in storm water impoundments at the above referenced facility, as required by Condition #31 of Discharge Permit Renewal, DP-831, dated July 29, 2014. On September 10, 2018, the GWQB received oral notification that additional precipitation had rendered the freeboard restoration infeasible and that a release of storm water was occurring. The GWQB received a Corrective Action Report regarding the release on September 14, 2018. The information submitted satisfies the requirements of Condition #32 of DP-831.

According to the Corrective Action Report, due to extreme precipitation storm water impoundment freeboard limits were exceeded on September 4, 2018, and again between September 7 and 10, 2018. Storm water was pumped from Storm Water Ponds 1 and 2 to Storm Water Pond 3, which has an engineered spillway. During the period of September 7 – 14, an estimated volume of 740,000 gallons of storm water flowed over the spillway of Storm Water Pond 3 or was pumped out to the ground surface. No sampling of the released water was conducted; however, historical chemical sampling and analysis from storm water runoff have shown no exceedances of analyte limits.

No corrective actions were taken to mitigate the release as the facility believes the storm water posed no threat to human health or the environment. Sampling of the storm water ponds for sulfate, chloride, and total dissolved solids after a significant storm event is required by Condition #18 of the Discharge Permit, with results to be submitted in the next semi-annual monitoring report.

The corrective actions taken are acceptable to NMED, and the Corrective Action Report is approved.

Additional corrective actions may be required if additional information becomes available indicating that the corrective actions taken are inadequate and/or ground water contamination occurs as a result of the described discharge.

If you have any questions regarding these issues, please contact Ron Strauch at (505) 827-1046 or Steve Pullen, Program Manager of the Pollution Prevention Section, at (505) 827-2962.

Sincerely,

Michelle Hunter, Chief
Ground Water Quality Bureau

Subject: Notification of Discharge: One Week Written Notification and 15-Day Corrective Action Plan, Discharge Permit 831

Dear Ms. Hunter:

The purpose of this letter is to provide the New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) with the subject notification, and corrective action plan pursuant to the Contingency Plan notification requirements in Discharge Permit 831 (DP-831), issued to the U.S. Department of Energy (DOE) Carlsbad Field Office (CBFO). This notification is a follow-up to the 24-hour verbal notifications provided to Mr. Ron Strauch on September 4 and 10, 2018 and reflects the action plan discussed with Mr. Strauch. The following items are being addressed per DP-831 Conditions 31 and 32, of the Permit Contingency Plan section:

Permit Condition 31

Initial actions to reestablish freeboard were implemented on September 4, 2018, and were temporarily successful because additional precipitation occurred September 4 – 10, 2018.

This Contingency Plan addresses the excess above freeboard in Storm Water Ponds 2 and 3, with the intent to discharge this excess storm water outside of Storm Water Pond 3. It was anticipated that the transfer would have been completed by September 14, 2018.

Subsequent to the call to Mr. Strauch on September 4, another call was made to Mr. Strauch on September 10, after the WIPP facility received additional precipitation over the period September 7-10. With the soil saturated, this additional rainfall ran off into the storm water ponds, filling the ponds to capacity, and ultimately causing storm water to go over the outfall of Storm Water Pond 3. In addition, to maintain freeboard and prevent berm erosion around Storm Water Ponds 1 and 2, storm water was transferred to Storm Water Pond 3 as a corrective measure.

As the current matter addresses storm water runoff only, no further corrective measures are proposed. The other evaporation ponds, associated with the sewage treatment facility, and salt water containment are well below freeboard.

CBFO:OEP:MRB:AC:18-0352:UFC 5486.00

Permit Condition 32

This report confirms the call to Mr. Strauch on September 4 and September 10, 2018, informing the GWQB of the need to discharge storm water from Storm Water Pond 3 to the ground surface to maintain freeboard capacity. Storm water will be transferred from Storm Water Pond 2 to Storm Water Pond 3 to achieve the proper freeboard. After freeboard is attained in both of the Ponds, the DOE will end the discharge, and evaporation will continue to decrease water levels.

Contingency Plan Information

The following information (a-g) completes the one-week notification, required in Section 32 in the DP-831 Permit.

(a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility:

Person in charge of the facility:
Todd Shrader, Manager
P.O. Box 3090
Carlsbad, New Mexico, 88221
(575) 234-7300

Owner of the facility:
U.S. Department of Energy

Operator of the facility:
Nuclear Waste Partnership LLC

(b) Name and address of the facility:

U.S. Department of Energy
Waste Isolation Pilot Plant (WIPP)
26 miles southeast of Carlsbad, New Mexico off of State Highway 128
Carlsbad, NM 88220

(c) The date, time, location, and duration of the discharge:

Date: September 7-14, 2018
Time: N/A
Location: WIPP Facility (Latitude: 32 22.589, Longitude 103 47.746)
Duration of Discharge: September 7, 2018 – September 14, 2018.

(d) The source and cause of the discharge:

Source: Runoff from the WIPP facility occurring from high precipitation events September 4 – September 9, 2018.

Cause of discharge:

September 4, 2018 through September 10, 2018 the WIPP Facility received 4.61 inches of precipitation. On September 4, 2018, the CBFO informed the GWQB of the less-than-one foot of freeboard in Storm Water Pond 2 and outflow from Storm Water Pond 3.

(e) A description of the discharge, including chemical composition:

The outflow from Storm Water Pond 3 was storm water runoff from the WIPP facility. Historical chemical sampling and analysis from storm water runoff have shown no exceedances of analyte limits. Samples will be collected consistent with DP-831 Condition 20 and the chemical composition will be noted in the next semi-annual report submitted to the GWQB.

(f) The estimated volume of the discharge:

There is no device for measuring the overflow of Storm Water Pond 3. Discharge volumes were calculated using standard stream flow calculations. Also, amounts of water outflow are conservative estimations. Storm Water Pond 3 has an engineered spillway to prevent erosion. Therefore, there is no erosion damage to pond berms or liner integrity. The estimated amount of outflow from the spillway and from pumping to the ground surface is as follows:

Storm Water Pond 3 – 740,000 gallons

(g) Any actions taken to mitigate immediate damage from this discharge:

On September 6, 2018, water was pumped from the Storm Water Pond 2 into Storm Water Pond 3 at a rate of approximately 1,000 gallons per minute so that freeboard could be maintained in Pond 2.

Corrective Action Plan

The following information (a-c) completes the 15-day Corrective Action Report/Plan required in Section 32 in the DP-831 Permit.

a) A description of proposed actions to prevent future unauthorized discharge.

Corrective measures include allowing Storm Water Pond 3 to overflow through the designed outflow. In addition, clean storm water will be pumped from Storm Water Pond 3 to the ground surface to keep Storm Water Pond 3 within permitted requirements. If additional rainfall occurs, the storm water will be allowed to overflow the Storm Water Ponds.

b) A description of proposed actions to prevent future unauthorized discharges of this nature.

The DOE attempts to contain as much storm water as possible in order to minimize recharge to an anthropogenic water table beneath the facility. When the rainfall amounts to more that can be managed to maintain freeboard, excess storm water is discharged. Clean storm water is not regulated by the GWQB.

c) A schedule for completion of proposed actions.

Freeboard in Storm Water Ponds 1 and 2 have already been achieved. Recovery of freeboard in Storm Water Pond 3 was achieved on September 13, 2018.

Upon review of this matter, it is believed that this outflow of storm water runoff poses no threat to human health and environment. The corrective actions described are intended to meet all notification requirements of DP-831 with no additional documentation transmittal to the GWQB required, if events remain unchanged. If conditions or additional information changes the path forward, the GWQB will be notified. Results of this effort will be included in the next semi-annual report submitted to the GWQB.

If you have any further questions regarding this matter or need additional information, please contact me at (575) 234-7476.

Sincerely,

Michael R. Brown, Director
Office of Environmental Protection

RE: Corrective Action Report Approval, Waste Isolation Pilot Plant (WIPP), DP-831, Water Line Break

Dear Mr. Shrader:

On July 16, 2018, the Ground Water Quality Bureau of the New Mexico Environment Department (NMED) received oral notification of a release of water at the above referenced facility. A Corrective Action Report was received on July 24, 2018. The information submitted satisfies the requirements of Condition #32 of Discharge Permit Renewal, DP-831, dated July 29, 2014.

According to the Corrective Action Report, the water line at Building 384 ruptured, resulting in a release of approximately 36,000 gallons of uncontaminated water. The water did not flow through any waste management areas or chemical storage areas. Some portion of the flow was tracked to Storm Water Pond 3.

The corrective actions taken are described as follows:
As soon as the rupture of the water line was noticed, the fire pump was shut down and the ruptured portion of the system was isolated.

The corrective actions taken are acceptable to NMED, and the Corrective Action Report is approved.

Additional corrective actions may be required if additional information becomes available indicating that the corrective actions taken are inadequate and/or ground water contamination occurs as a result of the described discharge.

If you have any questions regarding these issues, please contact Ron Strauch at (505) 827-1046 or Steve Pullen, Program Manager of the Pollution Prevention Section, at (505) 827-2962.

Sincerely,

Michelle Hunter, Chief
Ground Water Quality Bureau

Subject: Notification of Discharge: One Week Written Notification required by Discharge Permit 831

Dear Ms. Hunter:

The purpose of this letter is to inform the New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) of an unauthorized discharge due to a ruptured fire water distribution line, as required by Discharge Permit 831 (DP-831) issued to the U.S. Department of Energy (DOE), Carlsbad Field Office (CBFO). The following items are being addressed per DP-831 Condition 32, Contingency Plan.

Permit Condition 32

This report confirms the CBFO call to Mr. Ronald Strauch on July 16, 2018, informing the GWQB of the water discharge that originated from a rupture in the water line. A portion of water did report to Storm Water Pond 3 but had no impact on pond capacity.

Contingency Plan Information

The following information (a-g) completes the one-week notification, required in Section 32 of the DP-831 Permit.

(a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility:

<u>Person in charge of the facility:</u>
Todd Shrader, Manager
U.S. Department of Energy
Carlsbad Field Office
P.O. Box 3090
Carlsbad, New Mexico, 88221
(575) 234-7300

<u>Owner of the facility:</u>
U.S. Department of Energy

<u>Operator of the facility:</u>
Nuclear Waste Partnership LLC

(b) Name and address of the facility:

U.S. Department of Energy
Waste Isolation Pilot Plant (WIPP)
26 miles southeast of Carlsbad, New Mexico, off State Highway 128
Carlsbad, NM 88220

(c) The date, time, location, and duration of the discharge:

Date: July 16, 2018
Time: 1157 hours MDT
Location: WIPP Facility (Latitude: 32 22.589, Longitude 103 47.746)
Duration of Discharge: 75 minutes

(d) The source and cause of the discharge:

Source: Water from the water line at Building 384.

Cause of discharge:

- On July 16, 2018, the water line at Building 384 ruptured. The rupture resulted in a discharge of 36,000 gallons of water before the pump could be shut down and the proper valves closed.

(e) A description of the discharge, including chemical composition:

The discharge from the water line is raw uncontaminated water from the water inlet to the WIPP facility. Raw water is supplied to the WIPP facility from the City of Carlsbad Double Eagle water field, which is provided directly to the WIPP facility. With the exception of chlorination, the water supplied to the WIPP Facility is of drinking water quality.

(f) The estimated volume of the discharge:

It is estimated the 36,000 gallons was discharged based on the water level drop in the water storage tank.

(g) Any actions taken to mitigate immediate damage from this discharge:

As soon as the rupture of the water line was noticed, and information was relayed to the Operations group, the fire pump was shut down and the ruptured portion of the system has been isolated.

Corrective Action Plan

Upon review of this matter, it is believed that this outflow of water poses no threat to human health and environment. The water did not flow through any waste management areas or chemical storage areas and therefore, did not collect contaminants. Since the water discharged was not contaminated and no damage to human health or the environment occurred, it is requested by the DOE that this matter be closed with no additional reporting necessary under the WIPP DP-831 Groundwater Permit.

If you have any further questions regarding this matter or need additional information, please contact me at (575) 234-7476.

Sincerely,

Michael R. Brown, Director
Office of Environmental Protection

Subject: Notification of Discharge: One Week Written Notification required by Discharge Permit 831

Dear Ms. Hunter:

The purpose of this letter is to inform the New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) of an unauthorized discharge due to a ruptured water line, as required by Discharge Permit 831 (DP-831) issued to the U.S. Department of Energy (DOE), Carlsbad Field Office (CBFO). The following items are being addressed per Permit Condition 32 of the permit's Contingency Plan section.

Permit Condition 32

This report confirms the CBFO call to Mr. Steven Huddleson on January 24, 2017, informing the GWQB of the fire water discharge that originated from a rupture in the fire water line during testing of the fire water pump. A portion of fire water did report to Storm Water Pond 3, but had no impact on pond capacity.

Contingency Plan Information

The following information (a-g) completes the one-week notification, required in Section 32 in the DP-831 Permit.

(a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility:

<u>Person in charge of the facility:</u>
Todd Shrader, Manager
P.O. Box 3090
Carlsbad, New Mexico, 88221
(575) 234-7300

<u>Owner of the facility:</u>
U.S. Department of Energy

Operator of the facility:
Nuclear Waste Partnership, LLC

(b) Name and address of the facility:

U.S. Department of Energy
Waste Isolation Pilot Plant (WIPP)
26 miles southeast of Carlsbad, New Mexico off of State Highway 128
Carlsbad, NM 88220

(c) The date, time, location, and duration of the discharge:

Date: January 23, 2017
Time: 1410 hours
Location: WIPP Facility (Latitude: 32 22.589, Longitude 103 47.746)
Duration of Discharge: 20 minutes

(d) The source and cause of the discharge:

Source: Fire water from the fire water line at building 971.

Cause of discharge:

On January 23, 2017, the fire water line at building 971 ruptured during a fire water pump test discharging 30,000 gallons of water before the pump could be shut down and the proper valves closed.

(e) A description of the discharge, including chemical composition:

The discharge from the fire water line is raw water from the water inlet to the WIPP facility. Raw water is supplied to the facility from the City of Carlsbad Double Eagle water field, which is provided directly to the WIPP facility. With the exception of chlorination, the water supplied to the WIPP Facility is of drinking water quality.

(f) The estimated volume of the discharge:

It is estimated that 30,000 gallons of water was discharged due to the water level drop in the fire water storage tank. This estimate of the water discharge is a conservative estimation.

(g) Any actions taken to mitigate immediate damage from this discharge:

As soon as the rupture of the fire water line was noticed and information was relayed to the Fire Engineers performing the pump test, the fire pump was shut down. The fire water system was immediately isolated in the area of the ruptured line.

Corrective Action Plan

Upon review of this matter, it is believed that this outflow of fire water poses no threat to human health and environment. The water did not flow through any waste management areas or chemical storage areas and therefore, did not collect contaminants. Since the water discharged was not contaminated and no damage to human health or the environment occurred, it is requested by the DOE that this matter be closed with no additional reporting requirement necessary under the WIPP DP-831 Groundwater Permit.

If you have any further questions regarding this matter or need additional information, please contact me at (575) 234-7488.

Subject: Notification of Intent to Discharge, Discharge Permit 831

Dear Ms. Hunter:

The purpose of this letter is to submit the Notification of Intent (NOI) to discharge storm water to the ground surface. This is a follow-up to our verbal discussion on this matter with Mr. Greg Huey, of your organization, on September 6, 2016. This information is being provided to the Ground Water Quality Bureau in accordance with NMAC 20.6.2.1201.

The action of this NOI is to dispose of some of the accumulated storm water in order to create adequate capacity for any additional precipitation that might occur. Historical sampling and chemical analysis of storm water runoff have shown analytes to be within the regulatory limits.

If you have any further questions regarding this matter or need additional information, please contact me at (575) 234-7488.

Sincerely,

George T. Basabilvazo

Email: bill.jaco@wipp.ws

3. Name of facility:

Waste Isolation Pilot Plant

4. Physical location of the discharge (if applicable, give street address, township, range, section, distance from closest town or landmark, directions to facility, location map):

Waste Isolation Pilot Plant facility, 26 miles southeast of Carlsbad, NM, 34 Louis Whitlock Road

5. Type of operation generating the discharge (e.g., agricultural facility, domestic wastewater discharge, industrial discharge, mining operation, etc.):

Treatment, Storage and Disposal Facility

6. Source(s) of the discharge. Describe how the wastewater, sludge, or other discharges processed and/or disposed at your facility are generated. Identify all sources. Attach additional pages if needed:

Rain water running off of the facility is collected in evaporation ponds and allowed to evaporate. During extended or heavy rainfall events these ponds can reach capacity. Pumping the storm water onto the land surrounding the facility in a controlled manner prevents erosion, and allows for additional capacity when impending storm events are in the forecast.

7. Expected contaminants in the discharge (e.g., nitrate-nitrogen, metals, organic compounds, salts, etc.) Include estimated concentration if known, and copies of results of laboratory analyses, if available:

A portion of the storm water is from the parking lot and could have a minute amount of petroleum products which could be expected in the discharged storm water. Suspended silt will settle out in the storm water ponds. The majority of the storm water is from WIPP facility areas such as roof tops, service roads, and areas between buildings.

For Department use Only:

Agency Interest Number________
PRD Assigned ________

8. Describe all components of wastewater processing, treatment, storage, and disposal system (e.g., pre-treatment units, impoundments(s), septic tank/leachfield, etc.). Include sizes, site layout map, plans, and specifications, etc. if available:

There is no processing associated with this discharge of storm water.

9. Estimated maximum daily discharge volume in gallons per day. Provide water usage records or system sizing criteria if available:

Approximately 200,000 gallons per day for the storm period to drain the Storm Water Ponds to collect forecasted rain.

10. Estimated depth to ground water (ft): 164 Source of information DP-831 Page 2 of 22

11. Current Total Dissolved Solids Concentration in Groundwater approximately 3,400 mg/L

Subject: Notification of Discharge: One Week Written and 15 Day Corrective Action Plan, Discharge Permit 831

Dear Ms. Hunter:

The purpose of this letter is to notify the New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) of an unauthorized discharge due to excessive precipitation and present a short-term corrective action plan as required by Discharge Permit 831 (DP-831) issued to the U.S. Department of Energy (DOE), Carlsbad Field Office (CBFO). The following items are being addressed per Permit Conditions 31 and 32, of the permit's Contingency Plan section.

Permit Condition 31

This Contingency Plan addresses the excess above freeboard in Storm Water Ponds 1 and 3 and the need to place this excess storm water into Salt Storage Ponds 1 and 3. It is anticipated that this can be completed by September 15, 2016.

As the current situation addresses storm-water run off only, the CBFO requests that no further corrective measures be implemented. The other evaporation ponds are associated with the sewage treatment facility and salt-water containment.

Permit Condition 32

This report confirms the CBFO call to Mr. Greg Huey on September 1, 2016, informing the NMED GWQB of the need to transfer storm water from Storm Water Ponds 1 and 3 to maintain freeboard capacity. Storm water will be transferred to Salt Storage Ponds 1 and/or 3 to achieve the proper freeboard in Storm Water Ponds 1 and 3. The salt storage ponds will still have freeboard capacity remaining after receiving water from the storm water ponds.

Contingency Plan Information

The following information (a-g) completes the one-week notification, required in Section 32 in the DP-831 Permit.

(a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility:

CBFO:OEP:GTB:AC:16-3306:UFC5486.00

Person in charge of the facility:
Todd Shrader, Manager
P.O. Box 3090
Carlsbad, New Mexico, 88221
(575) 234-7300

Owner of the facility:
U.S. Department of Energy

Operator of the facility:
Nuclear Waste Partnership, LLC

(b) Name and address of the facility:

U.S. Department of Energy
Waste Isolation Pilot Plant (WIPP)
26 miles southeast of Carlsbad, New Mexico off of State Highway 128
Carlsbad, NM 88220

(c) The date, time, location, and duration of the discharge:

Date: August 31 - September 1, 2016
Time: N/A
Location: WIPP Facility (Latitude: 32 22.589, Longitude 103 47.746)
Duration: August 31, 2016 - September 1, 2016

(d) The source and cause of the discharge:

Source: Runoff from the WIPP facility occurring from high precipitation events during the period August 23 - September 1, 2016.

Cause of discharge:

During the period August 23, 2016, through September 1, 2016, the WIPP Facility received approximately 11 inches of precipitation. On September 1, 2016, the CBFO informed the NMED GWQB of the less-than-one foot of freeboard in Storm Water Pond 1 and outflow from Storm Water Pond 3. The CBFO then initiated the short-term corrective measure of pumping water from Storm Water Ponds 1 and 3 into Salt Storage Pond 3.

(e) A description of the discharge, including chemical composition:

The outflow from Storm Water Pond 3 was storm water runoff from the WIPP facility. Historical sampling and chemical analysis of storm water runoff have always shown analytes to be within the regulatory limits. Samples will be collected, consistent with Permit Condition 20, and the chemical composition will be noted in the next semi-annual report submitted to the NMED GWQB.

(f) The estimated volume of the discharge:

SEP 0 8 2016

There is no device for measuring the overflow of Storm Water Pond 3. Discharge volumes were estimated using standard stream flow calculations and are conservative. The estimated amount of outflow is as follows:

Storm Water Pond 3 – 303,000 gallons

(g) Any actions taken to mitigate immediate damage from this discharge:

On August 30, 2016, water was pumped from the Storm Water Pond 1 into Storm Water Pond 3, which had sufficient spare volume to contain the water and prevent outflow. After additional significant rainfall, water was pumped from Storm Water Pond 3 into Salt Storage Pond 3 to attain a one-foot freeboard in Storm Water Pond 3. Storm Water Pond 3 has an engineered spillway to prevent erosion.

Corrective Action Plan

The following information (a-c) completes the 15-day Corrective Action Report/Plan required in Section 32 in the DP-831 Permit.

a) A description of proposed actions to prevent future unauthorized discharge.

Corrective measures include pumps and piping to transfer storm water from Storm Water Pond 3 to Salt Storage Pond 3. Salt Storage Pond 3 has the capacity of 22,881,320 gallons and currently contains approximately 13,500,000 gallons, leaving approximately 9,300,000 gallons of capacity. The amount of water to be pumped into Salt Storage Pond 3 will only be equal to the amount needed to maintain one foot of freeboard in Storm Water Ponds 1 and 3. If additional rainfall occurs, more water will need to be transferred to Salt Storage Pond 3. If more storage capacity is needed, Salt Storage Pond 1 can be used or other storm-water management strategies will be evaluated.

b) A description of proposed actions to prevent future unauthorized discharges of this nature.

The pumping system includes a pump that transfers water from Storm Water Ponds 1 and 2 into Storm Water Pond 3. Water from Storm Water Pond 3 is then transferred by another pump into Salt Storage Pond 3 to maintain a one-foot freeboard. The transfer of this storm water is anticipated to be completed by September 15, 2016.

c) A schedule for completion of proposed actions.

To prevent the reoccurrence of the overflow of the Storm Water Pond 3, a system of piping from one pond to the other has been established.

Upon review of this event, it is believed that this outflow of storm-water runoff poses no threat to human health and environment. The corrective actions described are intended to meet all notification requirements of DP-831 with no requirements for additional documentation transmittal to the NMED GWQB, should these corrective measures be successful. Any changes in conditions or to the proposed corrective actions will be communicated to the NMED

SEP 0 8 2016

GWQB in a timely manner. Results of this effort will be included in the next semi-annual report submitted to the NMED GWQB.

If you have any further questions regarding this matter or need additional information, please contact me at (575) 234-7488.

Sincerely,

George T. Basabilvazo

Subject: RE: WIPP discharge notification 9/1/2016

Steve,

In follow-up to last week's spill report, Stewart Jones (WIPP) called today to request permission to discharge stormwater from the surfaces discussed below onto bare ground surrounding the facility during upset conditions. Particularly, during the anticipated rainfall predicted to accompany Hurricane Newton this weekend. They are concerned that their impoundments are already at capacity and the predicted storms will cause additional uncontrolled discharges.

I granted his request and asked that he follow up with a summary of actions taken to prevent uncontrolled discharges through land application of stormwater from the lined impoundments to areas surrounding the facility.

Thank you,

Greg

To: Pullen, Steve, NMENV
Cc: george.basabilvazo@cbfo.doe.gov; Huddleson, Steven, NMENV
Subject: WIPP discharge notification 9/1/2016

Steve,

Representatives from WIPP called today to verbally report a discharge as required by DP-831.

Rick Chavez, Stewart Jones, and George Basabilvazo (cc) called to discuss the overtopping of lined stormwater impoundments at the facility.

WIPP has received over 9" of rain in the past week and their typically adequate impoundments are at capacity. Stormwater from the exterior of facility structures and parking lots is directed through a series of engineered ditches and culverts through spillways to stormwater impoundments. One of these impoundments overtopped and released to a road bar ditch where it infiltrated into the bare ground.

Previous sampling shows that surface runoff from these areas does not typically carry contaminants in excess of standards.

The operators will follow up with a 7-day written report as required.

Thank you,

-Greg

Subject: Corrective Action Report/Plan, Discharge Permit 831

Dear Ms. Hunter:

The purpose of this letter is to provide the New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) a description of the actions taken to restore the required freeboard for the storm water evaporation ponds as authorized in the Contingency Plan section to Discharge Permit 831 (DP-831) issued to the U.S. Department of Energy (DOE), Carlsbad Field Office (CBFO). The following items are being addressed per Permit Condition 31 of the permit's Contingency Plan section.

Permit Condition 31

On Wednesday evening October 21, 2015, the WIPP facility received approximately 2.2 inches of rain. On Thursday morning, October 22, it was discovered that Storm Water Ponds 1, 2, and 3 had exceeded their one foot freeboard levels, but did not overtop their liners. Pumping efforts began Thursday morning to lower the water level of all three ponds by pumping the clean storm water into Salt Storage Pond 3. Initial actions reestablished freeboard on Storm Water Ponds 1 and 2 within 72 hours. The one foot freeboard for Storm Water Pond 3 was achieved by Tuesday, October 27, within 128 hours by continuing to take the short-term corrective action of pumping.

The other evaporation ponds are associated with the sewage treatment facility and salt water storage ponds. These evaporation ponds are not experiencing issues with their freeboard capacity.

The short-term corrective action restored the one foot of freeboard in the storm water ponds. The corrective actions described in this report were protective of human health and the environment and are intended to meet the notification requirements and reporting/corrective action plan requirements of DP-831, Condition 31. The CBFO requests that no further corrective measures be implemented for this event as the short-term action restored the required freeboard.

If you have any further questions regarding this matter or need additional information, please contact me at (575) 234-7488.

Sincerely,

George T. Basabilvazo

RE: WIPP - Response to Notification of Discharge, Implementation of Corrective Action, and Submittal of Corrective Action Report
Discharge Permit 831

Dear Mr. Basabilvazo,

This letter responds to the U.S. Department of Energy, Carlsbad Field Office (Permittee) correspondence dated October 15, 2015, (Notification) notifying the New Mexico Environment Department (NMED) of actions to reestablish allowable freeboard in specific storm water retention ponds and actions planned to avoid future similar occurrences. The Notification was provided in accordance with Discharge Permit DP-831 (Permit) Contingency Plan requirements.

The Notification states that during the period from October 3, 2015, through October 6, 2015, exceptionally high precipitation occurred in the area contributing runoff to Storm Water Ponds 1, 2 and 3, resulting in the storm water pond system reaching capacity on October 8, 2015. At that time the one-foot freeboard limit specified at Permit Condition #4 was exceeded and approximately 100 gallons of storm water outflow occurred. Subsequent inspections of all associated ponds found no evidence of erosion or damage to the ponds.

As a result of the excessive precipitation, the exceedance of the storm water system capacity, and associated Permit requirements, the Permittee performed the following actions:

1. On October 6, 2015, fluid was pumped from Storm Water Pond 2 to Storm Water Pond 3.
2. On October 8, 2015, transfer of excess fluid in Storm Water Ponds 1, 2 and 3 to Salt Storage Ponds 1 and 3 was initiated. This action conforms to Permit Condition 31.

3. On October 9, 2015, the Permittee contacted NMED informing the agency of the necessity to maintain the applicable freeboard and to transfer fluid to Salt Storage Ponds. This action conforms to the 24 hour notification requirement of Permit Condition #32. An agency representative, Mr. Steven Huddleson, approved the preliminary action. (personal communication, October 21, 2015)
4. On October 15, 2015, the Permittee drafted the Notification to satisfy the one week written notification requirements of Permit Condition 32.

The Notification includes a Corrective Action Plan (Plan) addressing proposed actions to prevent future unauthorized discharges, a schedule to complete these actions, and a commitment to sample fluid in Storm Water Pond 1. The Plan suggests the facility has sufficient capacity in its pond system, including the Storm Water and particularly the Salt Storage Ponds, to adequately manage storm water at the facility. The Plan commits to only utilizing the Salt Storage Ponds when the Storm Water Ponds are at capacity. The Plan commits to ensuring sufficient pumps and piping are available to transfer fluids between these systems when necessary. NMED will anticipate being provided with the results of the sampling proposed on page 3 of the Notification.

NMED finds that the Permittee has appropriately conformed to DP-831. Furthermore, NMED approves the Corrective Action Plan. This approval does not relieve the Permittee of the responsibility to comply with any other applicable federal, state, and /or local laws or regulations. Also, this approval does not relieve the Permittee of any liability should associated actions result in actual pollution of ground or surface waters.

If you have any questions, please contact Steve Pullen of the Ground Water Pollution Prevention Section at 505-827-2962.

Sincerely,

Michelle Hunter, Chief
Ground Water Quality Bureau

Subject: Notification of Discharge/Corrective Action Report/Plan, Discharge Permit 831

Dear Ms. Hunter:

The purpose of this letter is to inform the New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) of Contingency Plan notification requirements as applicable to Discharge Permit 831 (DP-831) issued to the U.S. Department of Energy (DOE), Carlsbad Field Office (CBFO). The following items are being addressed per Permit Conditions 31 and 32, of the permit's Contingency Plan section.

Permit Condition 31

Initial actions to reestablish freeboard were implemented on October 8, 2015, which was temporarily successful.

This Contingency Plan addresses the excess above freeboard in Storm Water Ponds 1, 2, and 3 with the need to place this excess storm water into Salt Storage Ponds 1 and 3. It is anticipated that this can be completed Friday October 16, 2015.

As the current matter addresses storm water run-off only, the CBFO requests that no further corrective measures be implemented for this event. The other evaporation ponds are associated with the sewage treatment facility and salt water containment. These evaporation ponds are not experiencing issues with their freeboard capacity.

Permit Condition 32

This report confirms the CBFO call to Mr. Steven Huddleson on October 9, 2015, informing your office of the need to transfer storm water from Storm Water Ponds 1, 2, and 3 to maintain freeboard capacity. Storm water will be transferred to Salt Storage Ponds 1 and 3 to achieve the proper freeboard in Storm Water Ponds 1, 2, and 3. The Salt Storage Ponds have substantial freeboard capacity remaining after pumping water from the Storm Water Ponds into these ponds.

CBFO:EPD:GTB:MN:15-2241:UFC 5486.00

Contingency Plan Information

The following information (a-g) completes the one-week notification, required in Section 32 in the DP-831 Permit.

(a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility:

Person in charge of the facility:
Todd A. Shrader, Manager
4021 National Parks Highway
Carlsbad, New Mexico, 88220
PHN: (575) 234-7300

Owner of the facility:
U.S. Department of Energy

Operator of the facility:
Nuclear Waste Partnership, LLC

(b) Name and address of the facility:

U.S. Department of Energy
Waste Isolation Pilot Plant (WIPP)
26 miles southeast of Carlsbad, New Mexico off of State Highway 128
Carlsbad, NM 88220

(c) The date, time, location, and duration of the discharge:

Date: October 8, 2015
Time: N/A
Location: WIPP Facility (Latitude: 32 22.589, Longitude 103 47.746)
Duration: It is estimated that storm water pond capacity was reached on October 8, 2015.

(d) The source and cause of the discharge:

Source: Runoff from the WIPP facility occurring from extended high precipitation events beginning October 3, 2015.

Cause of discharge:

On October 3, 2015, significant rainfall events began. During this first series of precipitation events, October 3 through October 4, 2015, a total of 1.67 inches of precipitation was measured. Initially, the storm water ponds were able to contain the runoff from the WIPP facility without exceeding the one foot freeboard permit requirement. Then on October 6, 2015, additional rainfall events occurred totaling 1.89 inches. The CBFO then initiated the short-term corrective measures of pumping water from Storm Water Pond 2 into Storm Water Pond 3.

The CBFO then informed the GWQB of the less than one foot of freeboard and outflow of Storm Water Pond 1 on October 8, 2015.

(e) A description of the discharge, including chemical composition:

The outflow from Storm Water Pond 1 was storm water runoff from the WIPP facility. Historical chemical sampling and analysis from storm water runoff have shown no exceedances of the analyte limits. A sample will be collected consistent with Permit Condition 20 and the chemical composition will be noted in the next semi-annual report submitted to the GWQB.

(f) The estimated volume of the discharge:

There is no device for measuring the overflow of Storm Water Pond 1. Also, amounts of water outflow are conservative estimations. There is no evidence of erosion damage to pond berms or liner integrity. The estimated amount of outflow is as follows:

Storm Water Pond 1 – 100 gallons

(g) Any actions taken to mitigate immediate damage from this discharge:

On October 8, 2015, water was pumped from the Storm Water Ponds 1 and 2 into Storm Water Pond 3 which had sufficient spare volume to contain the water from the other ponds and not outflow. Water was pumped from Storm Water Pond 3 into Salt Storage Pond 3 to maintain a one foot freeboard on Storm Water Pond 3.

Corrective Action Plan

The following information (a-c) completes the 15-day Corrective Action Report/Plan required in Section 32 in the DP-831 Permit.

a) A description of proposed actions to prevent future unauthorized discharge.

Corrective measures include pumps and piping to transfer storm water from Storm Water Pond 3 to Salt Storage Pond 3. Salt Storage Pond 3 has the capacity of 22,881,320 gallons storage and currently has approximately 12,000,000 gallons in it. This leaves an approximate capacity of 11,000,000 gallons which is near the total capacity of all three storm water ponds combined. The amount of water to be pumped into Salt Storage Pond 3 will only be equal to the amount needed to maintain one foot of freeboard in Storm Water Ponds 1, 2, and 3. If additional rainfall occurs, more water will need to be transferred to Salt Storage Pond 3. If more storage capacity is needed, Salt Storage Pond 1 can be used.

b) A description of proposed actions to prevent future unauthorized discharges of this nature.

The pumping system includes a pump that transfers water from Storm Water Ponds 1 and 2 into Storm Water Pond 3. Water from Storm Water Pond 3 is then transferred by another pump into Salt Storage Pond 3. A one foot freeboard is maintained in all impoundments. The transfer of this storm water will be completed by October 16, 2015. After the significant storm events, inspections of all the permitted ponds were performed. These inspections found no evidence of erosion or damage to any of the ponds.

c) A schedule for completion of proposed actions.

To prevent the reoccurrence of the overflowing of the Storm Water Ponds, a system of piping from one pond to the other has been established. New water pumps will be fitted to be quickly installed so that storm water can be pumped into another pond before the water overtops the ponds.

Upon review of this matter, it is believed that this outflow of storm water runoff poses no threat to human health and environment. The corrective actions described are intended to meet all notification requirements of 20.6.2.1203 NMAC and DP-831 with no additional documentation transmittal to the GWQB required, if events remain unchanged. If additional information changes the path forward, the NMED will be notified. Results of this effort will be included in the next semi-annual report.

If you have any further questions regarding this matter or need additional information, please contact me at (575) 234-7488.

Sincerely,

George T. Basabilvazo

Subject: Supplement to the Notification of Discharge/Corrective Action Report, Discharge Permit 831

Reference: DOE Memorandum CBFO:EPD:GTB:KE:14-2612:UFC 5486.00 from George T. Basabilvazo to John Hall, NMED, dated September 25, 2014, Subject: Notification of Discharge/Corrective Action Report, Discharge Permit 831

Dear Mr. Schoeppner:

The purpose of this letter is to supplement the Notification of Discharge/Corrective Action Report sent to Mr. John Hall of the New Mexico Environment Department, Ground Water Quality Bureau (GWQB) on September 25, 2014, with the estimates of volume outflow from Storm Water Ponds 1, 2 and 3. This information is being provided as stated in the referenced September 25, 2014 letter.

There is no device for measuring the outflow of Storm Water Ponds 1, 2, and 3; therefore, the volumes are conservative estimates. The outflow estimates for Storm Water Ponds 1, 2, and 3 come from calculations of 0.52 inches of precipitation on the applicable watershed runoff areas for each individual pond. These calculations assume that all rain that fell on the drainage area ran into the pond, and no precipitation was absorbed into the ground, had not puddled in other locations, or was not directly channeled to the pond. Storm water was also pumped from Storm Water Ponds 1 and 2 into Storm Water Pond 3 to relieve the freeboard burden in those ponds. It appears wave action was a contributor to outflow of Storm Water Ponds 1 and 2 after they were filled by the runoff from the rain. The estimated amount of outflow is as follows:

Storm Water Pond 1 – 5,650 gallons
Storm Water Pond 2 – 108,900 gallons
Storm Water Pond 3 – 395,000 gallons

On September 30, 2014, we received the email sent by Mr. Hall of the GWQB to Ms. Margaret Gee of the Carlsbad Field Office approving corrective actions proposed in the reference letter to begin pumping storm water from Storm Water Ponds 1, 2, and 3 and from Salt Storage Pond 1 into Salt Storage Pond 3. These corrective measures will mitigate the excess storm water.

If you have any further questions regarding this matter or need additional information, please contact me at (575) 234-7488.

Sincerely,

George T. Basabilvazo

CERTIFIED MAIL – RETURN RECEIPT REQUESTED

July 29, 2014

Jose Franco, Manager
U.S. Department of Energy
P.O. Box 3090
Carlsbad, NM 88221

RE: Discharge Permit Renewal, DP-831, Waste Isolation Pilot Plant (WIPP)

Dear Mr. Franco:

The New Mexico Environment Department (NMED) issues the enclosed Discharge Permit Renewal, DP-831, to the Department of Energy (permittee) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978 §§74-6-1 through 74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Regulations, 20.6.2 NMAC.

The Discharge Permit contains terms and conditions that shall be complied with by the permittee and are enforceable by NMED pursuant to Section 20.6.2.3104 NMAC, WQA, NMSA 1978 §74-6-5 and §74-6-10. Please be aware that this Discharge Permit may contain conditions that require the permittee to implement operational, monitoring or closure actions by a specified deadline. Such conditions are listed at the beginning of the operational, monitoring and closure plans of this Discharge Permit.

Issuance of this Discharge Permit does not relieve the permittee of the responsibility to comply with the WQA, WQCC Regulations, and any other applicable federal, state and/or local laws and regulations, such as zoning requirements and nuisance ordinances.

Pursuant to Paragraph (4) of Subsection H of 20.6.2.3109 NMAC, the term of the Discharge Permit shall be five years from the effective date. The term of this Discharge Permit will end on July 29, 2019.

NMED requests that the permittee submit an application for renewal (or renewal and modification) at least 180 days prior to the date the Discharge Permit term ends.

An invoice for the Discharge Permit Fee of $12,650.00 is being sent under separate cover. Payment of the Discharge Permit Fee must be received by NMED within 30 days of the date the Discharge Permit is issued.

If you have any questions, please contact John Hall at (505) 827-1049. Thank you for your cooperation during this Discharge Permit review.

Sincerely,

Jerry Schoeppner, Chief
Ground Water Quality Bureau

GROUND WATER DISCHARGE PERMIT RENEWAL
Waste Isolation Pilot Plant (WIPP), DP-831

I. INTRODUCTION

The New Mexico Environment Department (NMED) issues this Discharge Permit Renewal (Discharge Permit), DP-831, to the U.S. Department of Energy (permittee) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978 §§74-6-1 through 74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Regulations, 20.6.2 NMAC.

NMED's purpose in issuing this Discharge Permit, and in imposing the requirements and conditions specified herein, is to control the discharge of water contaminants from the Waste Isolation Pilot Plant (WIPP) (facility) into ground and surface water, so as to protect ground and surface water for present and potential future use as domestic and agricultural water supply and other uses and. protect public health. In issuing this Discharge Permit, NMED has determined that the requirements of Subsection C of 20.6.2.3109 NMAC have been or will be met. Pursuant to Section 20.6.2.3104 NMAC, it is the responsibility of the permittee to comply with the terms and conditions of this Discharge Permit; failure may result in an enforcement action(s) by NMED (20.6.2.1220 NMAC).

The activities which produce the discharge, the location of the discharge, and the quantity, quality and flow characteristics of the discharge are briefly described as follows:

Up to 23,000 gallons per day (gpd) of domestic wastewater is discharged to a synthetically lined impoundment system for disposal by evaporation. The system consists of seven synthetically-lined facultative sewage lagoons (Facultative Lagoon System) that include Settling Lagoons 1 and 2, Polishing Lagoons 1 and 2, and Effluent Lagoons A, B, and C. Industrial wastewater from two compressed air systems at the facility is also discharged to the Facultative Lagoon System. Brine, purge waters, and miscellaneous industrial non-hazardous wastewater are discharged to the Effluent Lagoons B and C of the Facultative Lagoon System. In addition, brine, purge waters, and miscellaneous industrial non-hazardous wastewater are discharged to a separate synthetically-lined impoundment for disposal by evaporation (Evaporation Pond H-19).

Salt and other subsurface materials mined during construction of the facility, as well as currently mined salt, are stored on the surface in three stockpiles. The stockpiles that are being used to store salt currently, or in the future, as it is mined out from the underground panels at the facility are Salt Cells 2 and 3. Up to 2,547,202 gpd of storm water runoff in contact with these salt stockpiles (based on a 24-hour, 25-year storm event - 3.9 inches) is collected in two double synthetically-lined storm water impoundments, each with a leak detection system (Salt Storage Ponds 2 and 3). The third salt stockpile (Salt Cell 1) is capped with a synthetic liner and earthen cover. Up to 1,677,633 gpd of storm water runoff in contact with this stockpile is collected in synthetically-lined diversion ditches and is diverted to a synthetically-lined impoundment (Salt Storage Pond 1).

Additional storm water runoff from the facility's paved areas and roofs is collected in three synthetically-lined impoundments (Storm Water Ponds 1, 2, and 3). This runoff is not in contact with the salt stockpiles at the facility.

The Site and Preliminary and Design Validation (SPDV) material pile was constructed as the shafts were excavated when construction first began at the WIPP site. The SPDV material pile was closed in the year 2000 with a cover consisting of a geosynthetic liner installed on 6 inches of bedding material and covered with a minimum of three feet of earthen material.

The discharge contains water contaminants which may be elevated above the standards of Section 20.6.2.3103 NMAC and/or the presence of toxic pollutants as defined in Subsection WW of 20.6.2.7 NMAC. The facility is located off of the Jal Highway, approximately 26 miles southeast of Carlsbad, in Sections 20, 28, and 29, Township 22 South, Range 31 East, Eddy County. Ground water most likely to be affected is at a depth of approximately 164 feet and has a total dissolved solids concentration of approximately 3,400 milligrams per liter.

The Discharge Permit sets forth separate requirements for the Facultative Lagoon System, the storage of storm water runoff in contact with salt stockpiles, and storm water runoff from the facility's paved and impermeable areas.

- Part A. Applicable to All Parts
- Part B. Applicable to the Facultative Lagoon System
- Part C. Applicable to the Evaporation Pond H-19 and Storm Water Impoundments Not in Contact with Salt Stockpiles (Storm Water Ponds 1, 2, and 3)
- Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2, and 3)

The original Discharge Permit was issued on January 16, 1992, amended on August 28, 1995, renewed on July 3, 1997, amended on June 12, 1998, amended on January 24, 2000, renewed on April 29, 2003, modified on December 22, 2003, modified again on December 29, 2006, and renewed and modified on July 23, 2008. The application (i.e., discharge plan) consists of the materials submitted by the permittee dated May 10, 2013 and materials contained in the administrative record prior to issuance of this Discharge Permit. The discharge shall be managed in accordance with all conditions and requirements of this Discharge Permit.

Pursuant to Section 20.6.2.3109 NMAC, NMED reserves the right to require a Discharge Permit Modification in the event NMED determines that the requirements of 20.6.2 NMAC are being or may be violated or the standards of Section 20.6.2.3103 NMAC are being or may be violated. This may include a determination that structural controls and/or management practices approved under this Discharge Permit are not protective of ground water quality, and that more stringent requirements to protect ground water quality may be required by NMED. The permittee may be required to implement abatement of water pollution and remediate ground water quality.

Issuance of this Discharge Permit does not relieve the permittee of the responsibility to comply with the WQA, WQCC Regulations, and any other applicable federal, state and/or local laws and regulations, such as zoning requirements and nuisance ordinances.

The following acronyms and abbreviations may be used in this Discharge Permit:

Abbreviation	Explanation	Abbreviation	Explanation
CFR	Code of Federal Regulations	NO_3-N	nitrate-nitrogen
Cl	Chloride	TDS	total dissolved solids
EPA	United States Environmental Protection Agency	TKN	total Kjeldahl nitrogen
gpd	gallons per day	total nitrogen	= TKN + NO_3-N
mg/L	milligrams per liter	SO_4	Sulfate
mL	Milliliters	UPC	Uniform Plumbing Code
NMAC	New Mexico Administrative Code	WQA	New Mexico Water Quality Act
NMED	New Mexico Environment Department	WQCC	Water Quality Control Commission
NMSA	New Mexico Statutes Annotated	WWTF	Wastewater Treatment Facility

II. FINDINGS

In issuing this Discharge Permit, NMED finds:

1. The permittee is discharging effluent or leachate from the facility so that such effluent or leachate may move directly or indirectly into ground water within the meaning of Section 20.6.2.3104 NMAC.

2. The permittee is discharging effluent or leachate from the facility so that such effluent or leachate may move into ground water of the State of New Mexico which has an existing concentration of 10,000 mg/L or less of TDS within the meaning of Subsection A of 20.6.2.3101 NMAC.

3. The discharge from the facility is not subject to any of the exemptions of Section 20.6.2.3105 NMAC.

III. AUTHORIZATION TO DISCHARGE

Pursuant to 20.6.2.3104 NMAC, it is the responsibility of the permittee to ensure that discharges authorized by this Discharge Permit are consistent with the terms and conditions herein.

The permittee is authorized to discharge up to 23,000 gpd of domestic wastewater to a synthetically-lined facultative impoundment system for disposal by evaporation. The permittee is also authorized to discharge up to 4,224,835 gpd of runoff in contact with salt stockpiles to three synthetically-lined impoundments for disposal by evaporation. The Facultative Lagoon System is permitted to accept non-hazardous industrial wastewater from two compressed air systems at the facility. Up to 50,000 gpd of brine, purge waters, and miscellaneous non-hazardous process waters are permitted to be discharged into Evaporation Ponds B and C of the Facultative Lagoon System, up to the capacity of the ponds with one foot of freeboard. Up to 50,000 gpd of brine, purge waters, and miscellaneous non-hazardous process waters are permitted to be discharged into to the Evaporation Pond H-19, up to the capacity of the pond with one foot of freeboard. The permittee is also authorized to collect storm water runoff from the facility's paved areas and

roofs in Storm Water Ponds 1, 2, and 3. This runoff is not in contact with the salt stockpiles at the facility.

[20.6.2.3104 NMAC, Subsection C of 20.6.2.3106 NMAC, Subsection C of 20.6.2.3109 NMAC]

IV. CONDITIONS

NMED issues this Discharge Permit for the discharge of water contaminants subject to the following conditions:

OPERATIONAL PLAN

Part A. Applicable to All Parts

#	Terms and Conditions
1.	The permittee shall implement the following operational plan to ensure compliance with Title 20, Chapter 6, Parts 1 and 2 NMAC. [Subsection C of 20.6.2.3109 NMAC]
2.	The permittee shall operate in a manner such that standards and requirements of Sections 20.6.2.3101 and 20.6.2.3103 NMAC are not violated. [20.6.2.3101 NMAC, 20.6.2.3103 NMAC, Subsection C of 20.6.2.3109 NMAC]
3.	The permittee shall maintain the impoundment liner(s) in such a manner as to avoid conditions which could affect the structural integrity of the impoundment(s) and/or impoundment liner(s). Such conditions include or may be characterized by the following: • erosion damage; • animal burrows or other damage; • the presence of vegetation including aquatic plants, weeds, woody shrubs or trees growing within five feet of the top inside edge of a sub-grade impoundment, within five feet of the toe of the outside berm of an above-grade impoundment, or within the impoundment itself; • the presence of large debris or large quantities of debris in the impoundment; • evidence of seepage; and • evidence of berm subsidence. Vegetation growing around the impoundment shall be routinely controlled by mechanical removal in a manner that is protective of the impoundment liner. The permittee shall visually inspect the impoundment(s) and surrounding berms on a monthly basis to ensure proper maintenance. In the event that inspection reveals any evidence of damage that threatens the structural integrity of an impoundment berm or liner, or that may result in an unauthorized discharge, the permittee shall enact the

#	Terms and Conditions
	contingency plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
4.	The permittee shall preserve a minimum of one foot of freeboard between the liquid level in the all impoundments and the elevation of the top of the impoundment liners. In the event that the permittee determines that one foot of freeboard cannot be preserved in any impoundment, the permittee shall enact the contingency plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

Part B. Applicable to the Facultative Lagoon System

#	Terms and Conditions
5.	The permittee shall maintain fences around the Facultative Lagoon System to control access by the general public and animals. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. Fences shall be maintained throughout the term of this Discharge Permit. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
6.	The permittee shall maintain signs indicating that the wastewater at the facility is not potable. Signs shall be posted at the Facultative Lagoon System's entrance and other areas where there is potential for public contact with wastewater. All signs shall be printed in English and Spanish remain visible and legible for the term of this Discharge Permit. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
7.	The permittee shall utilize operators, certified by the State of New Mexico at the appropriate level, to operate the wastewater collection, treatment and disposal systems. The operations and maintenance of all or any part of the wastewater system shall be performed by, or under the direct supervision of, a certified operator. [Subsection C of 20.6.2.3109 NMAC, 20.7.4 NMAC]
8.	The permittee shall measure the thickness of the sludge blanket in each pond of the Facultative Lagoon System ***once within the effective term*** of this Discharge Permit, but before the end of 2018. When sludge accumulation exceeds 1/3 of the total depth of any pond, the permittee shall remove the sludge in a manner, which is protective of the pond liner. Removed solids shall be contained, transported, and disposed of in accordance with all local, state, and federal regulations. The permittee shall maintain solids blanket measurements and solids disposal manifests for solids transported from the facility for

#	Terms and Conditions
	off-site disposal. The permittee shall submit all measurements and manifests to NMED in the semi-annual monitoring report immediately following the solids thickness measurement. [20.6.2.3109 NMAC, 20.6.2.3107 NMAC]

Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2 and 3)

#	Terms and Conditions
9.	The permittee shall measure the thickness of the solids blanket in each impoundment ***once within the effective term*** of this Discharge Permit, but before the end of 2018. Removed solids shall be contained, transported, and disposed of in accordance with all local, state, and federal regulations. The permittee shall maintain solids blanket measurements and solids disposal manifests for solids transported from the facility for off-site disposal. The permittee shall submit all measurements and manifests to NMED in the semi-annual monitoring report immediately following the solids thickness measurement. [20.6.2.3109 NMAC, 20.6.2.3107 NMAC]
10.	The permittee shall inspect the leak detection systems for Salt Storage Ponds 2 and 3 on a monthly basis for the presence of liquid. The permittee shall keep a log of the inspection findings and repairs made. The inspection log, including a statement whether or not liquids were observed in the leak detection systems, shall be submitted to NMED in the semi-annual monitoring reports. [20.6.2.3107 NMAC]
11.	The permittee shall conduct regular maintenance of the earthen cover on the Salt Cell 1 and the SPDV material pile. Inspections shall be conducted monthly and after storm events of 2 inches or greater in a 24-hour period to evaluate potential erosion and vegetation success of the cover. In the event of significant erosion or failure of vegetative success, the permittee shall provide a plan and schedule for repair within 90 days of discovery. General observations and cover repairs shall be reported to NMED. [20.6.2.3109 NMAC]

MONITORING AND REPORTING

Part A. Applicable to All Parts

#	**Terms and Conditions**
12.	The permittee shall conduct the following monitoring, reporting, and other requirements listed below in accordance with the monitoring requirements of this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
13.	METHODOLOGY – Unless otherwise approved in writing by NMED, the permittee shall conduct sampling and analysis in accordance with the most recent edition of the following documents: a) American Public Health Association, Standard Methods for the Examination of Water and Wastewater (18th, 19th or current) b) U.S. Environmental Protection Agency, Methods for Chemical Analysis of Water and Waste c) U.S. Geological Survey, Techniques for Water Resources Investigations of the U.S. Geological Survey d) American Society for Testing and Materials, Annual Book of ASTM Standards, Part 31. Water e) U.S. Geological Survey, et al., National Handbook of Recommended Methods for Water Data Acquisition f) Federal Register, latest methods published for monitoring pursuant to Resource Conservation and Recovery Act regulations g) Methods of Soil Analysis: Part 1. Physical and Mineralogical Methods; Part 2. Microbiological and Biochemical Properties; Part 3. Chemical Methods, American Society of Agronomy h) New Mexico Environment Department, Hazardous Waste Bureau Position Paper, *Use of Low-Flow and Other Non-Traditional Sampling Techniques for RCRA Compliant Groundwater Monitoring.* [Subsection B of 20.6.2.3107 NMAC]
14.	The permittee shall submit semi-annual monitoring reports to NMED for the most recently completed semi-annual period by the 1st of February and August each year. Semi-annual monitoring shall be performed during the following periods and submitted as follows: • January 1st through June 30th (first half) – **due by August 1st** • July 1st through December 31st (second half) – **due by February 1st** [Subsection A of 20.6.2.3107 NMAC]

Part B. Applicable to the Facultative Sewage Lagoon System

#	Terms and Conditions
15.	The volume of domestic influent discharged to the Facultative Lagoon System shall be measured ***monthly*** using a totalizing flow meter on the influent line to the system or the totalizing meter that measures total domestic water usage. Volumes of other authorized discharges to the Facultative Lagoon System shall be calculated by a time/volume method or volumetric measurement of the transport container(s). NMED may require comprehensive laboratory analyses of such wastewater prior to discharge when NMED determines that additional information is needed. Monthly meter readings, the units of measurement, monthly discharge volumes and other volumetric calculations for the previous 6-month period shall be submitted to NMED semi-annually in the monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
16.	The permittee shall collect a wastewater sample on a ***semi-annual*** basis (once every six months) from the influent to the Facultative Lagoon System. The grab sample shall be analyzed for TKN, NO_3-N, SO_4, TDS and Cl. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsections C and H of 20.6.2.3109 NMAC]

Part C. Applicable to the Evaporation Pond H-19 and Storm Water Impoundments Not in Contact with Salt Stockpiles (Storm Water Ponds 1, 2, and 3)

#.	Terms and Conditions
17.	The volume and origin of all wastewater discharged to the Evaporation Pond H-19 that is derived from miscellaneous non-hazardous sources shall be measured ***monthly*** and reported to NMED. Discharge volumes to the Evaporation Pond H-19 shall be calculated by a time/volume method or volumetric measurement of the transport container(s). NMED may require comprehensive laboratory analyses of such wastewater prior to discharge when NMED determines that additional information is needed. Monthly discharge volumes and other volumetric calculations for the previous 6-month period shall be submitted to NMED semi-annually in the monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
18.	A sample shall be collected ***semi-annually*** from the Evaporation Pond H-19 and analyzed for SO_4, Cl, and TDS. Samples shall be collected ***annually*** after a significant storm event from each of the storm water ponds, Storm Water Ponds 1, 2, and 3 and analyzed for SO_4, Cl, and TDS. Samples shall be properly prepared, preserved, transported and

#	Terms and Conditions
	analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
19.	The water depth shall be measured ***monthly*** to the nearest tenth of a foot (0.1 ft) in the Storm Water Ponds 1, 2, and 3. The approximate volume of storm water shall be calculated and submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]

Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2 and 3)

#	Terms and Conditions
20.	A sample shall be collected ***annually*** after a significant storm event from each of the Salt Storage Cells 1, 2, and 3 and analyzed for SO_4, Cl, and TDS. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
21.	The water depth shall be measured monthly to the nearest tenth of a foot (0.1 ft) in the Salt Storage Ponds 1, 2, and 3. The approximate volume of storm water shall be calculated and submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]

GROUND WATER MONTIROING AND REPORTS

#	Terms and Conditions
22.	Depth to the water table shall be measured to the nearest hundredth of a foot (0.01 ft) ***quarterly*** in piezometers/monitoring wells: • PZ-1, PZ-2, PZ-3, PZ-4, PZ-5, PZ-6, PZ-7, PZ-8, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13,

#	Terms and Conditions
	PZ-14, and PZ-15 • C-2505, C-2506, C-2507, C-2811, and WQSP-6A [Subsection A of 20.6.2.3107 NMAC]
23.	The permittee shall perform ***semi-annual*** ground water sampling in the following piezometers/monitoring wells and analyze the samples for temperature, pH, specific conductance, SO_4, TDS, and Cl: • Piezometers: PZ-1, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, and PZ-13 • Monitoring Wells: C-2507, C-2811, and WQSP-6A Ground water sample collection, preservation, transport and analysis shall be performed according to the following procedure: a) Measure the depth-to-most-shallow ground water from the top of the well casing to the nearest hundredth of a foot. b) Purge three well volumes of water from the well prior to sample collection. c) Obtain samples from the well for analysis. d) Properly prepare, preserve and transport samples. e) Analyze samples in accordance with the methods authorized in this Discharge Permit. Depth-to-most-shallow ground water measurements, analytical results, including the laboratory QA/QC summary report, and a facility layout map showing the location and number of each well shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
24.	The permittee shall perform ***semi-annual*** ground water sampling from monitoring well WQSP-6A and analyzed for TKN and NO_3. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
25.	Hydrographs shall be submitted ***annually*** for all monitoring wells and piezometers covered under Condition 22 of this Discharge Permit. At a minimum, graphs shall include the previous five years of water level data, or for recently installed wells, all data since the well was installed. Data for several wells may be included on one graph.

#	Terms and Conditions
	[Subsection A of 20.6.2.3107 NMAC]
26.	A potentiometric map for facility area shall be submitted *annually*. The map shall incorporate the most recent water level data for all monitoring wells and piezometers installed in the shallow subsurface water (SSW). [Subsection A of 20.6.2.3107 NMAC]
27.	A single table in a paper and electronic format (EXCEL spreadsheet) of water level measurements and water quality data with only those constituents analyzed and water levels measured during a single event shown in columns. Tabulated field measurements to include temperature, pH, and electrical conductivity corrected to 25 degrees Celsius. Monitoring sites shall be shown in rows. The second column shall contain the date of the sampling event. Values exceeding standards shall be bolded. Any constituent not analyzed for a particular site shall be shown as "NA", any site not sampled shall be shown as "NS" with an associated reason, and any site not measured for water levels shall be shown as "NM" with an associated reason. [Subsection A of 20.6.2.3107 NMAC]
28.	A single table that includes all available ground water data to date shall be submitted annually.. For each monitoring well, the name of the well shall be entered in the far left column in a row by itself. Sampling events, beginning with the earliest event first, shall be entered in subsequent rows with the sampling date in the second column and the corresponding analytical data in columns further to the right. Each new sampling event shall be added as an additional row to the existing spreadsheet with the corresponding date of the sampling event noted in the second column next to the monitoring well name. [Subsection A of 20.6.2.3107 NMAC]

CONTINGENCY PLAN

#	Terms and Conditions
29.	In the event that ground water monitoring indicates that a ground water quality standard identified in Section 20.6.2.3103 NMAC is exceeded; the total nitrogen concentration in ground water is greater than 10 mg/L; or a toxic pollutant (defined in Subsection WW of 20.6.2.7 NMAC) is present in a ground water sample and in any subsequent ground water sample collected from a monitoring well required by this Discharge Permit, the permittee shall enact the following contingency plan: Within 60 days of the subsequent sample analysis date, the permittee shall propose measures to ensure that the exceedance of the standard or the presence of a toxic pollutant will be mitigated by submitting a corrective action plan to NMED for approval.

#	Terms and Conditions
	The corrective action plan shall include a description of the proposed actions to control the source and an associated completion schedule. The plan shall be enacted as approved by NMED. Once invoked (whether during the term of this Discharge Permit; or after the term of this Discharge Permit and prior to the completion of the Discharge Permit closure plan requirements), this condition shall apply until the permittee has fulfilled the requirements of this condition and ground water monitoring confirms for a minimum of two years of consecutive ground water sampling events that the standards of Section 20.6.2.3103 NMAC are not exceeded and toxic pollutants are not present in ground water. The permittee may be required to abate water pollution pursuant to Sections 20.6.2.4000 through 20.6.2.4115 NMAC, should the corrective action plan not result in compliance with the standards and requirements set forth in Section 20.6.2.4103 NMAC within 180 days of confirmed ground water contamination. [Subsection A of 20.6.2.3107 NMAC, Subsection E of 20.6.2.3109 NMAC]
30.	In the event that inspection findings reveal significant damage likely to affect the structural integrity of the lined impoundment(s) or its ability to contain contaminants, the permittee shall propose the repair or replacement of the impoundment liner(s) by submitting a corrective action plan to NMED for approval. The plan shall be submitted to NMED within 30 days after discovery by the permittee or following notification from NMED that significant liner damage is evident. The corrective action plan shall include a schedule for completion of corrective actions and the permittee shall initiate implementation of the plan following approval by NMED. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
31.	In the event that a minimum of one foot of freeboard cannot be preserved in the impoundment(s), the permittee shall take actions authorized by this Discharge Permit and all applicable local, state, and federal regulations to restore the required freeboard. In the event that one foot of freeboard cannot be restored within a period of 72 hours following discovery, the permittee shall propose actions to be immediately implemented to restore one foot of freeboard by submitting a short-term corrective action plan to NMED for approval. Examples of short-term corrective actions include: removing excess wastewater from the impoundment through pumping and hauling; or reducing the volume of liquid/wastewater discharged to the impoundment. The plan shall include a schedule for completion of corrective actions and shall be submitted within 15 days following the date when the one foot of freeboard limit was initially discovered. The permittee shall initiate implementation of the plan following approval by NMED. In the event that the short-term corrective actions failed to restore one foot of freeboard,

#	Terms and Conditions
	the permittee shall propose permanent corrective actions in a long-term corrective action plan submitted to NMED within 90 days following failure of the short-term corrective action plan. Examples include: the installation of an additional storage impoundment, or a significant/permanent reduction in the volume of liquid/wastewater discharged to the impoundment. The plan shall include a schedule for completion of corrective actions and implementation of the plan shall be initiated following approval by NMED. [Subsection A of 20.6.2.3107 NMAC]
32.	In the event that a release (commonly known as a "spill") occurs that is not authorized under this Discharge Permit, the permittee shall take measures to mitigate damage from the unauthorized discharge and initiate the notifications and corrective actions required in Section 20.6.2.1203 NMAC and summarized below. Within <u>24 hours</u> following discovery of the unauthorized discharge, the permittee shall verbally notify NMED and provide the following information: a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility. b) The name and address of the facility. c) The date, time, location, and duration of the unauthorized discharge. d) The source and cause of unauthorized discharge. e) A description of the unauthorized discharge, including its estimated chemical composition. f) The estimated volume of the unauthorized discharge. g) Any actions taken to mitigate immediate damage from the unauthorized discharge. Within <u>one week</u> following discovery of the unauthorized discharge, the permittee shall submit written notification to NMED with the information listed above and any pertinent updates. Within <u>15 days</u> following discovery of the unauthorized discharge, the permittee shall submit a corrective action report/plan to NMED describing any corrective actions taken and/or to be taken relative to the unauthorized discharge that includes the following: a) A description of proposed actions to mitigate damage from the unauthorized discharge. b) A description of proposed actions to prevent future unauthorized discharges of this nature. c) A schedule for completion of proposed actions. In the event that the unauthorized discharge causes or may with reasonable probability cause water pollution in excess of the standards and requirements of Section 20.6.2.4103 NMAC, and the water pollution will not be abated within 180 days after notice is required to be given pursuant to Paragraph (1) of Subsection A of 20.6.2.1203 NMAC, the permittee may be required to abate water pollution pursuant to Sections 20.6.2.4000

#	Terms and Conditions
	through 20.6.2.4115 NMAC. Nothing in this condition shall be construed as relieving the permittee of the obligation to comply with all requirements of Section 20.6.2.1203 NMAC. [20.6.2.1203 NMAC]
33.	In the event that NMED or the permittee identifies any failures of the discharge plan or this Discharge Permit not specifically noted herein, NMED may require the permittee to submit a corrective action plan and a schedule for completion of corrective actions to address the failure(s). Additionally, NMED may require a Discharge Permit modification to achieve compliance with 20.6.2 NMAC. [Subsection A of 20.6.2.3107 NMAC, Subsection E of 20.6.2.3109 NMAC]
34.	In the event of a pipeline break, pump failure, pond overflow or other system failure at the facility, discharged water shall be contained, pumped and transferred to area of the facility that impose minimal impacts to ground water quality. Failed components shall be repaired or replaced as soon as possible and no later than 72 hours from the time of failure. For good cause demonstrated, the permittee may request NMED approval of an extension of the schedule for the repair or replacement of a failed component. [20.6.2.3107A NMAC]

CLOSURE PLAN

Part A. Applicable to All Parts

#	Terms and Conditions
35.	The permittee shall close the facilities covered under this Discharge Permit in accordance with the closure plan in the March 4, 2005 discharge permit application, the closure plan in the WIPP Hazardous Waste Facility Permit (HWFP) dated November 1, 2012, and the WIPP Land Management Plan. [Subsection A of 20.6.2.3107 NMAC]
36.	The permittee shall continue ground water monitoring until the requirements of this condition have been met and ground water monitoring confirms for a minimum of two years of consecutive ground water sampling events that the standards of Section 20.6.2.3103 NMAC are not exceeded and toxic pollutants are not present in ground water. If monitoring results show that a ground water quality standard in Section 20.6.2.3103 NMAC is exceeded; the total nitrogen concentration in ground water is greater than 10

#	Terms and Conditions
	mg/L; or a toxic pollutant (defined in Subsection WW of 20.6.2.7 NMAC) is present in ground water, the permittee shall implement the contingency plan required by this Discharge Permit. Following notification from NMED that post-closure monitoring may cease, the permittee shall plug and abandon the monitoring well(s) in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011. [Subsection A of 20.6.2.3107 NMAC]

Part B. Applicable to the Facultative Sewage Lagoon System

#	Terms and Conditions
37.	In the event the Facultative Lagoon System is proposed to be permanently closed, upon ceasing discharging, the permittee shall perform the following closure measures: Within <u>60 days</u> of ceasing discharging to the Facultative Lagoon System impoundments(s), the line leading to the impoundment shall be plugged so that a discharge can no longer occur. Within <u>60 days</u> of ceasing discharging to the Facultative Lagoon System (impoundments), wastewater shall be drained or evaporated from the impoundment and any other wastewater system components and it shall be disposed of in accordance with all local, state, and federal regulations. Within <u>90 days</u> of ceasing discharging to the Facultative Lagoon System impoundment(s), the permittee shall submit a sludge removal and disposal plan to NMED for approval. The permittee shall initiate implementation of the plan within 30 days following approval by NMED. The sludge removal and disposal plan shall include the following: a) The estimated volume and dry weight of sludge to be removed and disposed, including measurements and calculations. b) Analytical results for samples of the sludge taken from the impoundment for TKN, NO_3-N, percent total solids, hazardous constituents, and any other parameters tested (reported in mg/kg, dry weight basis). c) The method(s) of sludge *removal* from the impoundment(s). d) The method(s) of *disposal* for all of the sludge (and its contents) removed from the impoundment(s). The method(s) shall comply with all local, state and federal regulations, including 40 CFR Part 503. *Note: A proposal that includes the surface disposal of sludge may be subject to Ground Water Discharge Permitting requirements pursuant to 20.6.2.3104 NMAC that are separate from the*

#	Terms and Conditions
	requirements of this Discharge Permit. e) A schedule for completion of sludge removal and disposal not to exceed two years from the date discharge to the impoundment(s) ceased. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: a) Remove all lines leading to and from the Facultative Lagoon System impoundment(s), or permanently plug and abandon them in place. b) Remove or demolish any other wastewater system components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liner(s). d) Fill the impoundment(s) with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [Subsection A of 20.6.2.3107 NMAC, 40 CFR Part 503]

Part C. Applicable to the Evaporation Pond H-19 and Storm Water Impoundments Not in Contact with Salt Stockpiles (Storm Water Ponds 1, 2, and 3)

#	Terms and Conditions
38.	Upon cessation of operation, the permittee shall close the Evaporation Pond H-19 and Storm Water Ponds 1, 2, and 3. Remaining liquids in each impoundment shall be removed and/or evaporated. All sludge shall be sampled to determine if hazardous constituents exist and managed and/or disposed of in accordance with applicable regulations. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: a) Remove or plug all piping and other ancillary components b) Remove or demolish any other components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liner(s). d) Fill the impoundment(s) with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [20.6.2.3107A(11) NMAC]

Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2 and 3)

#	Terms and Conditions
39.	Upon cessation of operation, all mined salt at the facility shall be removed from the site. The permittee is permitted to use the mined salt as backfill in shafts and as interior fill material in berms and permanent markers after closure. All mined salt remaining after backfilling and after construction of surface structures shall be removed from the site. The permittee shall submit a plan and schedule for salt tailings removal to NMED for approval within 120 days prior to the facility closure. The WIPP Land Management Plan reflects the Land Withdrawal Act's requirements for disposition of the salt. The WIPP's Hazardous Waste Facility Permit also addresses closure activities that include closure of the salt storage areas in accordance with the provisions of the WIPP Land Management Plan. The salt storage area will be reclaimed in the manner described in these documents. [20.6.2.3107A(11) NMAC]
40.	Upon cessation of operation, the permittee shall close Salt Storage Ponds 1, 2, and 3. Remaining liquids in each impoundment shall be removed and/or evaporated. All sludge shall be sampled to determine if hazardous constituents exist and managed and/or disposed of in accordance with applicable regulations. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: f) Remove or plug all piping and other ancillary components g) Remove or demolish any other components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. h) Perforate or remove the impoundment liner(s). i) Fill the impoundment(s) with suitable fill. j) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [20.6.2.3107A(11) NMAC]

E. GENERAL TERMS AND CONDITIONS

#	Terms and Conditions
41.	RECORD KEEPING - The permittee shall maintain a written record of the following information: a) Information and data used to complete the application for this Discharge Permit. b) Records of any releases (commonly known as "spills") not authorized under this Discharge Permit and reports submitted pursuant to 20.6.2.1203 NMAC.

#	Terms and Conditions
	c) Records of the operation, maintenance, and repair of all facilities/equipment used to treat, store or dispose of wastewater. d) Facility record drawings (plans and specifications) showing the actual construction of the facility and bear the seal and signature of a licensed New Mexico professional engineer. e) Copies of monitoring reports completed and/or submitted to NMED pursuant to this Discharge Permit. f) The volume of wastewater or other wastes discharged pursuant to this Discharge Permit. g) Ground water quality and wastewater quality data collected pursuant to this Discharge Permit. h) Copies of construction records (well log) for all ground water monitoring wells required to be sampled pursuant to this Discharge Permit. i) Records of the maintenance, repair, replacement or calibration of any monitoring equipment or flow measurement devices required by this Discharge Permit. j) Data and information related to field measurements, sampling, and analysis conducted pursuant to this Discharge Permit. The following information shall be recorded and shall be made available to NMED upon request: i) The dates, location and times of sampling or field measurements; ii) The name and job title of the individuals who performed each sample collection or field measurement; iii) The sample analysis date of each sample; iv) The name and address of the laboratory, and the name of the signatory authority for the laboratory analysis; v) The analytical technique or method used to analyze each sample or collect each field measurement; vi) The results of each analysis or field measurement, including raw data; vii) The results of any split, spiked, duplicate or repeat sample; and viii) A copy of the laboratory analysis chain-of-custody as well as a description of the quality assurance and quality control procedures used. The written record shall be maintained by the permittee at a location accessible during a facility inspection by NMED for a period of at least five years from the date of application, report, collection or measurement and shall be made available to the department upon request. [Subsections A and D of 20.6.2.3107 NMAC]
42.	INSPECTION and ENTRY – The permittee shall allow inspection by NMED of the facility and its operations which are subject to this Discharge Permit and the WQCC regulations. NMED may upon presentation of proper credentials, enter at reasonable times upon or through any premises in which a water contaminant source is located or in which are located any records required to be maintained by regulations of the federal government or the WQCC.

#	Terms and Conditions
	The permittee shall allow NMED to have access to and reproduce for their use any copy of the records, and to perform assessments, sampling or monitoring during an inspection for the purpose of evaluating compliance with this Discharge Permit and the WQCC regulations. Nothing in this Discharge Permit shall be construed as limiting in any way the inspection and entry authority of NMED under the WQA, the WQCC Regulations, or any other local, state or federal regulations. [Subsection D of 20.6.2.3107 NMAC, NMSA 1978, §§ 74-6-9.B and 74-6-9.E]
43.	DUTY to PROVIDE INFORMATION - The permittee shall, upon NMED's request, allow for NMED's inspection/duplication of records required by this Discharge Permit and/or furnish to NMED copies of such records. [Subsection D of 20.6.2.3107 NMAC]
44.	MODIFICATIONS and/or AMENDMENTS – In the event the permittee proposes a change to the facility or the facility's discharge that would result in a change in the volume discharged; the location of the discharge; or in the amount or character of water contaminants received, treated or discharged by the facility, the permittee shall notify NMED prior to implementing such changes. The permittee shall obtain approval (which may require modification of this Discharge Permit) by NMED prior to implementing such changes. [Subsection C of 20.6.2.3107 NMAC, Subsections E and G of 20.6.2.3109 NMAC]
45.	PLANS and SPECIFICATIONS – In the event the permittee is proposing to construct a wastewater system or change a process unit of an existing system such that the quantity or quality of the discharge will change substantially from that authorized by this Discharge Permit, the permittee shall submit construction plans and specifications to NMED for the proposed system or process unit prior to the commencement of construction. In the event the permittee implements changes to the wastewater system authorized by this Discharge Permit which result in only a minor effect on the character of the discharge, the permittee shall report such changes (including the submission of record drawings, where applicable) as of January 1 and June 30 of each year to NMED. [Subsections A and C of 20.6.2.1202 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
46.	CIVIL PENALTIES - Any violation of the requirements and conditions of this Discharge Permit, including any failure to allow NMED staff to enter and inspect records or facilities, or any refusal or failure to provide NMED with records or information, may

#	Terms and Conditions
	subject the permittee to a civil enforcement action. Pursuant to WQA 74-6-10(A) and (B), such action may include a compliance order requiring compliance immediately or in a specified time, assessing a civil penalty, modifying or terminating the Discharge Permit, or any combination of the foregoing; or an action in district court seeking injunctive relief, civil penalties, or both. Pursuant to WQA 74-6-10(C) and 74-6-10.1, civil penalties of up to $15,000 per day of noncompliance may be assessed for each violation of the WQA 74-6-5, the WQCC Regulations, or this Discharge Permit, and civil penalties of up to $10,000 per day of noncompliance may be assessed for each violation of any other provision of the WQA, or any regulation, standard, or order adopted pursuant to such other provision. In any action to enforce this Discharge Permit, the permittee waives any objection to the admissibility as evidence of any data generated pursuant to this Discharge Permit. [20.6.2.1220 NMAC, NMSA 1978, §§ 74-6-10 and 74-6-10.1]
47.	CRIMINAL PENALTIES – No person shall: 1) make any false material statement, representation, certification or omission of material fact in an application, record, report, plan or other document filed, submitted or required to be maintained under the WQA; 2) falsify, tamper with or render inaccurate any monitoring device, method or record required to be maintained under the WQA; or 3) fail to monitor, sample or report as required by a permit issued pursuant to a state or federal law or regulation. Any person who knowingly violates or knowingly causes or allows another person to violate the requirements of this condition is guilty of a fourth degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who is convicted of a second or subsequent violation of the requirements of this condition is guilty of a third degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who knowingly violates the requirements of this condition or knowingly causes another person to violate the requirements of this condition and thereby causes a substantial adverse environmental impact is guilty of a third degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who knowingly violates the requirements of this condition and knows at the time of the violation that he is creating a substantial danger of death or serious bodily injury to any other person is guilty of a second degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. [20.6.2.1220 NMAC, NMSA 1978, §§ 74-6-10.2.A through 74-6-10.2.F]
48.	COMPLIANCE with OTHER LAWS - Nothing in this Discharge Permit shall be construed in any way as relieving the permittee of the obligation to comply with all applicable federal, state, and local laws, regulations, permits or orders.

#	**Terms and Conditions**
	[NMSA 1978, § 74-6-5.L]
49.	RIGHT to APPEAL - The permittee may file a petition for review before the WQCC on this Discharge Permit. Such petition shall be in writing to the WQCC within thirty days of the receipt of postal notice of this Discharge Permit and shall include a statement of the issues to be raised and the relief sought. Unless a timely petition for review is made, the decision of NMED shall be final and not subject to judicial review. [20.6.2.3112 NMAC, NMSA 1978, § 74-6-5.O]
50.	TRANSFER of DISCHARGE PERMIT - Prior to the transfer of any ownership, control, or possession of this facility or any portion thereof, the permittee shall: 1) notify the proposed transferee in writing of the existence of this Discharge Permit; 2) include a copy of this Discharge Permit with the notice; and 3) deliver or send by certified mail to NMED a copy of the notification and proof that such notification has been received by the proposed transferee. Until both ownership and possession of the facility have been transferred to the transferee, the permittee shall continue to be responsible for any discharge from the facility. [20.6.2.3111 NMAC]
51.	PERMIT FEES - Payment of permit fees is due at the time of Discharge Permit approval. Permit fees shall be paid in a single payment or shall be paid in equal installments on a yearly basis over the term of the Discharge Permit. Single payments shall be remitted to NMED no later than 30 days after the Discharge Permit effective date. Initial installment payments shall be remitted to NMED no later than 30 days after the Discharge Permit effective date; subsequent installment payments shall be remitted to NMED no later than the anniversary of the Discharge Permit effective date. Permit fees are associated with <u>issuance</u> of this Discharge Permit. Nothing in this Discharge Permit shall be construed as relieving the permittee of the obligation to pay all permit fees assessed by NMED. A permittee that ceases discharging or does not commence discharging from the facility during the term of the Discharge Permit shall pay all permit fees assessed by NMED. An approved Discharge Permit shall be suspended or terminated if the facility fails to remit an installment payment by its due date. [Subsection F of 20.6.2.3114 NMAC, NMSA 1978, § 74-6-5.K]

V. PERMIT TERM & SIGNATURE

EFFECTIVE DATE: July 29, 2014
TERM ENDS: July 29, 2019

Discharge Permit Summary

Facility Information

Facility Name	Waste Isolation Pilot Plant (WIPP)
Discharge Permit Number	DP-831
Legally Responsible Party	Jose Franco, Manager U.S. Department of Energy P.O. Box 3090 Carlsbad, NM 88221 (575) 234-7300

Treatment, Disposal and Site Information

Primary Waste Type	Domestic and Industrial
Facility Type	Federal Agency - U.S. Department of Energy

Evaporative Impoundment Locations

Domestic Wastewater

Type	Designation	Description & Comments
Settling Impoundment	Settling Lagoon 1	Formerly known as "Settling Pond 1A"; Primary treatment; Permitted 1 foot of freeboard.
Settling Impoundment	Settling Lagoon 2	Formerly known as "Settling Pond 2A"; Primary treatment; Permitted 1 foot of freeboard.
Polishing Impoundment	Polishing Lagoon 1	Formerly known as "Polishing Pond 1B"; Passive secondary treatment; Permitted 1 foot of freeboard.
Polishing Impoundment	Polishing Lagoon 2	Formerly known as "Polishing Pond 2B"; Passive secondary treatment; Permitted 1 foot of freeboard.
Evaporation Impoundment	Effluent Lagoon A	Formerly known as "Evaporation Pond A"; Effluent storage; Disposal by evaporation; Permitted 1 foot of freeboard.
Evaporation Impoundment	Effluent Lagoon B	Formerly known as "Evaporation Pond B"; Effluent storage; Disposal by evaporation; Permitted discharges are domestic waste, brine, purge waters, and miscellaneous industrial non-hazardous wastewater; Permitted 1 foot of freeboard.
Evaporation Impoundment	Effluent Lagoon C	Formerly known as "Evaporation Pond C"; Effluent Storage; Disposal by evaporation; Permitted discharges are domestic waste, brine, purge waters, and miscellaneous industrial non-hazardous wastewater; Permitted 1 foot of freeboard.

Storm Water Control

Type	Designation	Description & Comments
Storm Water Impoundment	Storm Water Pond 1	Formerly known as "Storm Water Intrusion Pond 1"; Receives clean non-contact storm water from paved areas, roofs, air conditioner condensate, and water from domestic water lines; Disposal by evaporation.

Storm Water Impoundment	Storm Water Pond 2	Formerly known as "Storm Water Intrusion Pond 2"; Receives clean non-contact storm after from the facilities paved areas, roofs, air conditioner condensate, and draining domestic water lines; Disposal by evaporation.
Storm Water Impoundment	Storm Water Pond 3	Formerly known as "Storm Water Intrusion Pond A"; Receives clean non-contact storm after from the facilities paved areas, roofs, air conditioner condensate, and draining domestic water lines; Disposal by evaporation.

Industrial Wastewater

Type	Designation	Description & Comments
Evaporation Impoundment	Evaporation Pond H-19	Permitted discharges are brine, purge waters, and miscellaneous industrial non-hazardous wastewater; 346, 085 gallons (with one foot of freeboard); Disposal by evaporation.
Evaporation Impoundment	Salt Storage Pond 1	Formerly known as "Salt Pile Evaporation Pond"; 1,677,633 gallons (with one foot freeboard); Disposal by evaporation
Evaporation Impoundment	Salt Storage Pond 2	Formerly known as "Salt Storage Extension Basin I"; Constructed using 60-mil HDPE liner, 200-mil geonet drainage layer, and a second 60-mil HDPE liner with a leak detection system;1,273,601 gallons (with one foot of freeboard); Disposal by evaporation.
Evaporation Impoundment	Salt Storage Pond 3	Formerly known as "Salt Storage Extension Basin II"; Constructed using 60-mil HDPE liner, 200-mil geonet drainage layer, and a second 60-mil HDPE liner with a leak detection system; 1,273,601 gallons (with one foot of freeboard); Disposal by evaporation.

Salt Storage Locations

Type	Designation	Description & Comments
Salt Pile	Salt Cell 1	Formerly known as "Salt Pile"; Inactive; Approximately 18.8 acres; graded to 2% slope covered with sand and 60 mil HDPE liner and with 2 ft. of native soil; Seeded; Run-off collects in to Salt Storage Pond 1.
Salt Pile	Salt Cell 2	Formerly known as "Salt Extension Cell A"; Active; 6.2 acres; Run-off area of 326,350 sq. ft.; Constructed using of six inch prepared subgrade, 60-mil HDPE liner, 200-mil drainage layer, eight oz. geotextile fabric covered with 2 ft. of native soil; Runoff collects in Storage Pond(s) 2 and/or 3.

Salt Pile	Salt Cell 3	Formerly known as "Salt Extension Cell B"; Active; 5.2 acres; run-off area of 272,850 sq. ft.; Constructed using of six inch prepared subgrade, 60-mil HDPE liner, 200-mil drainage layer, eight oz. geotextile fabric covered with 2 ft. of native soil; Runoff collects in Storage Pond(s) 2 and/or 3.
Salt Pile	Site Preliminary Design Validation Pile	Closed in 2000; Covered with a geosynthetic liner, 6 inches of bedding material, and three feet of soil; Seeded.

Flow Metering Locations

Type	Designation	Description & Comments
Totalizing Flow Meter	Ultrasonic Flow Meter	Located at the facility Pump House – water supply; Estimates domestic wastewater discharged to the facultative sewage impoundment system.
Primary Measurement Device	Time Recorder	Estimates miscellaneous wastewater discharged to Evaporation Pond H-19 and Facultative Lagoon System.

Ground Water Monitoring Locations

Type	Designation	Description & Comments
Monitoring Well	C-2505	Quarterly depth to water measurement.
Monitoring Well	C-2506	Quarterly depth to water measurement.
Monitoring Well	C-2507	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Monitoring Well	C-2811	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Monitoring Well	WQSP-6A	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO_4, Cl, TDS, TKN and NO_3.
Piezometer	PZ-4	Quarterly depth to water measurement.
Piezometer	PZ-5	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.

Piezometer	PZ-6	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-7	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-8	Quarterly depth to water measurement.
Piezometer	PZ-9	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-10	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-11	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-12	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-13	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-14	Quarterly depth to water measurement.
Piezometer	PZ-15	Quarterly depth to water measurement.

Depth-to-Ground Water 164 feet
Total Dissolved Solids (TDS) 3,400 mg/L

Permit Information

Application Received	May 10, 2013
Public Notice Published	May 31, 2014
Discharge Permit Issued	July 29, 2014
Discharge Permit Term Ends	July 29, 2019
Permitted Discharge Volume	Domestic – 23,000 gallons per day Industrial – 4,224,835 gallons per day

Hi Orphan Person for the week,
Please print this email and the photos, and put them in the WIPP file (DP-831). We'll be talking later in the week about when to re-assign this, but I want to make sure these don't get lost. If you think it would be better to put the photos electronically in TEMPO or someplace else, I am open to suggestion. I'd like this to be as quick and easy for you as possible.
Thanks,
JJP

Subject: RE: Photos of stormwater ponds at WIPP

Here you go, Ricardo (and Jerry).

All the photos were taken along the berm to the north of the salt pile and along the edges of the two (2) lagoons/ponds west of the salt pile. I don't know their official designations, so I called them E pond and W pond. The photo names include a description of where you ae in relation to the salt pile, berms and lagoons and what direction you are facing.

Ms. Catrina Johnson took these photos. She observed a fair amount of sand, salt and other material covering the lining around the salt pile and between the salt pile and the ponds. She observed that it looked like there was a large flow from the salt piles to the ponds.

Ms. Johnson observed that the pond immediately south of the parking lot and the two (2) ponds south of the Waste Handling Building did not have large volumes of water at this time, and they did not look like they had overflowed.

If you have any questions, please feel free to contact Ms. Johnson.

NMED/DOE-OB staff were at WIPP today collecting the DPR canisters for the CY2014 Q-3 sampling event. We were able to take several photos of the evaporation, stormwater, water ponds/lagoons at the facility. I am downloading and organizing the photos.

Ricardo and Jerry, would you and/or staff like copies of the photos?

Subject: RE: Notification of Discharge/Corrective Action Report, Discharge Permit 831

Dear Ms. Gee and others,

I have reviewed the Notice of Discharge/Corrective Action Report submitted by the Department of Energy on September 25, 2014 regarding the exceedances of freeboard limits in Storm Water Ponds 1, 2, and 3 and Salt Storage Pond 1 and the outflow of excess storm water from Storm Water Ponds 1, 2, and 3.

NMED approves the corrective actions described in the September 25, 2014 Notice of Discharge/Corrective Action Report taken so far and further approves the proposed transfer of storm water from Storm Water Ponds 1, 2, and 3 and salt water from Salt Storage Pond 1 into Salt Storage Pond 3, which has sufficient extra capacity. Storm water and salt water will be transferred to return Storm Water Ponds 1, 2, and 3 and Salt Storage Pond 1 to proper freeboard conditions as required by Discharge Permit DP-831.

Thank you for your prompt attention to this matter and if you have any questions, please give myself or Jennifer Pruett (505-827-0652) a call.

Regards,

John Hall

GROUND WATER
SEP 30 2014
BUREAU

Mr. John Hall
Ground Water Quality Bureau
New Mexico Environment Department
Harold Runnels Building
P.O. Box 5469
Santa Fe, NM 87502-5469

Subject: Notification of Discharge/Corrective Action Report, Discharge Permit 831

Dear Mr. Hall:

The purpose of this letter is to inform the New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) of Contingency Plan notification requirements as applicable to Discharge Permit 831 (DP-831) issued to the U.S. Department of Energy (DOE), Carlsbad Field Office (CBFO). The following items are being addressed per Permit Conditions 31 and 32, of the permit's Contingency Plan section.

Permit Condition 31

Initial actions to reestablish freeboard were implemented on September 16, 2014, but additional precipitation prevented this from being successful within 72 hours.

This Contingency Plan addresses the excess above freeboard in Storm Water Ponds 1, 2, 3, and Salt Storage Pond 1, with the need to place this excess storm water into Salt Storage Pond 3. It is anticipated that this can be completed within 45 days of activation of the pumping effort.

As the current matter addresses storm water run-off only, the CBFO requests that no permanent corrective measures be implemented. The weather pattern that brought significant precipitation to southeastern New Mexico is rare. The other evaporation ponds associated with the sewage treatment facility and total salt water containment is well below freeboard capacity.

Permit Condition 32

This report confirms the CBFO call to you (via subcontractor) on September 16, 2014, informing your office of the need to transfer storm water among Storm Water Ponds 1, 2, and 3 to maintain freeboard capacity. This call was a voicemail and response acknowledgment was provided via voicemail from you on September 16, 2014.

In addition, a follow-up call was placed to you on September 19, 2014, informing your office of further precipitation and that additional plans would need to be implemented to transfer storm water from Storm Water Ponds 1, 2, and 3 into Salt Storage Pond 3. With the outflow of excess water from Storm Water Ponds 1, 2, and 3, the call on September 19, 2014 completed the notice of a storm water spill. Additionally, it was noted on September 22, 2014, that Salt Storage Pond 1 was nearing the freeboard level, and water transfer from this pond is now necessary. As previously noted, transfer of water to Salt Storage Pond 3 should alleviate excess water above freeboard. Salt Storage Pond 3 has substantial freeboard capacity remaining, in spite of recent precipitation.

Contingency Plan Information

(a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility:

<u>Person in charge of the facility:</u>
Jose R. Franco, Manager
4021 National Parks Highway
Carlsbad, New Mexico, 88220
PHN: (575) 234-7300

<u>Owner of the facility:</u>
U.S. Department of Energy

<u>Operator of the facility:</u>
Nuclear Waste Partnership, LLC

(b) Name and address of the facility:

U.S. Department of Energy
Waste Isolation Pilot Plant (WIPP)
30 miles east of Carlsbad, New Mexico off of State Highway 128
Carlsbad, NM 88220

(c) The date, time, location, and duration of the discharge:

Date: September 18, 2014 to September 24, 2014
Time: N/A
Location: WIPP Facility (Latitude: 32 22.589, Longitude 103 47.746)
Duration: It is estimated that storm water pond capacity was reached on September 16, 2014.

(d) The source and cause of the discharge:

Source: Runoff from the WIPP facility occurring from extended high precipitation events beginning September 5, 2014.

Cause of discharge:

On September 5, 2014, high rainfall events began. During this first series of precipitation events, September 5-7, 2014, a total of 3.73 inches was measured. The storm water ponds were able to hold the runoff from the WIPP facility without exceeding the one-foot freeboard permit requirement. Then on September 11-13, 2014, additional rainfall events occurred totaling 2.68 inches. The CBFO then initiated the short-term corrective measures of pumping water from Storm Water Pond 2 into Storm Water Pond 3. The CBFO then informed the GWQB of the less than one foot of freeboard and outflow of ponds on September 19, 2014. From September 18-22, 2014, there was an additional

4.59 inches of precipitation that exceeded the holding capacity of the ponds. As the submittal of the report is occurring, additional precipitation is forecasted. Any additional precipitation will continue to exceed the holding capacity of Storm Water Ponds 1, 2, and 3.

(e) A description of the discharge, including chemical composition:

The outflow from all three Storm Water Ponds was storm water runoff from the WIPP facility and the employee parking lot. Historical chemical sampling and analysis from storm water runoff have shown no exceedances of the analyte limits. A sample will be collected consistent with Permit Condition 20 and the chemical composition will be noted in the next semi-annual report submitted to the GWQB.

(f) The estimated volume of the discharge:

There is no device for measuring the overflow of the ponds. The values noted are rough estimates from visual observation. Also, amounts of water outflow are conservative estimations. It appears wave action was a contributor to outflow. There is no evidence of erosion damage to pond berms or liner integrity. The estimated amount of outflow is as follows:

Storm Water Pond 1 – 500 gallons
Storm Water Pond 2 – 800 gallons
Storm Water Pond 3 – 12,000 gallons

(g) Any actions taken to mitigate immediate damage from this discharge:

On September 16 and 17, 2014, water was pumped from the Storm Water Ponds 1 and 2 into Storm Water Pond 3 which had sufficient spare volume to contain the water from the other ponds. Since that date, additional precipitation has caused Storm Water Ponds 1, 2, and 3 to outflow.

The information above (a-g) completes the one-week notification.

Corrective Action Plan

The following information completes the 15-day Corrective Action Report plan.

Proposed corrective measures are to configure a pump and piping to transfer storm water from Storm Water Pond 3 to Salt Storage Pond 3, upon the GWQB's approval of these corrective measures. Salt Storage Pond 3 has the capacity of 22,881,320 gallons storage and currently has approximately 1,900,000 gallons in it. This leaves an approximate capacity of 20,000,000 gallons which exceeds the total capacity of all three storm water ponds combined. The amount of water to be pumped into Salt Storage Pond 3 will only be equal to the amount needed to maintain one foot of freeboard in Storm Water Ponds 1, 2, and 3. If additional rainfall occurs, more water will need to be transferred to Salt Storage Pond 3.

The pumping system will include pumps that transfer water from Storm Water Ponds 1 and 2 into Storm Water Pond 3. Water from Storm Water Pond 3 will then be transferred by another pump into Salt Storage Pond 3. Water from Salt Storage Pond 1 will also be transferred to Salt Storage Pond 3 to achieve the needed freeboard. A one-foot freeboard will then be maintained in all impoundments. It is estimated that the transfer of this storm water can be completed within 45 days of pumping commencement, assuming no additional precipitation events occur. There is no evidence of erosion or damage to any of the ponds due to the outflow of water from the ponds. The total rainfall amount from the combined precipitation events is about 11.00 inches.

On September 24, 2014 from 8:30 to 10:30 p.m., an additional 0.50 inches of rain was received at the the WIPP facility. A verbal notice was provided to your voicemail on September 25, 2014. We are in the process of estimating the amount of overflow from Storm Water Ponds 1, 2 and 3 and will be providing a written notice to you next week. There has been no erosion damage to the ponds or liner integrity and the corrective measures to pump the excess water from these ponds to Salt Storage Pond 3 are still applicable.

Upon review of this matter, it is believed that this outflow of storm water runoff poses no threat to human health and environment. The corrective actions described are intended to meet all notification requirements of 20.6.2.1203 NMAC and DP-831 with no additional documentation transmittal to the GWQB required, if events remain unchanged. If additional information changes the path forward, the NMED will be notified. Results of this effort will be included in the next semi-annual report.

If you have any further questions regarding this matter or need additional information, please contact me at (575) 234-7488.

Sincerely,

George T. Basabilvazo

SUBJECT: NOTICE OF PUBLIC COMMENT PERIOD AND OPPORTUNITY TO REQUEST A PUBLIC HEARING ON A DRAFT HAZARDOUS WASTE PERMIT FOR WASTE ISOLATION PILOT PLANT

Dear Interested Person:

Enclosed is a **Public Notice** regarding the draft Hazardous Waste Permit for Waste Isolation Pilot Plant (WIPP). The U.S. Department of Energy Carlsbad Field Office (**DOE**) owns and operates the Facility, and Nuclear Waste Partnership LLC (**NWP**) co-operates the Facility (collectively, the Applicants). WIPP is located north of Jal Highway (State Highway 128) in Eddy County, New Mexico, approximately 26 miles east of Carlsbad. WIPP is located at the following mailing addresses: DOE Carlsbad Field Office, P.O. Box 3090, Carlsbad, New Mexico 88221-3090; and Nuclear Waste Partnership LLC, P.O. Box 2078, Carlsbad, New Mexico 88221-2078. The Permittees' primary contact for this permitting action is: George Basabilvazo, Director, Office of Environment, Safety and Health, DOE Carlsbad Field Office, P.O. Box 3090, Carlsbad, New Mexico 88221-3090.

The enclosed Public Notice provides locations where the Administrative Record, including the Permit Modification Request, draft Permit, Fact Sheet, and supporting documentation, for this action can be reviewed, and provides procedures for submitting comments and requesting a public hearing. Comments and requests for public hearing must be received no later than **5:00 p.m. MDT on April 15, 2014.**

Any person seeking additional information regarding this notice may contact:

Trais Kliphuis, WIPP Project Manager
New Mexico Environment Department
Hazardous Waste Bureau

PUBLIC NOTICE No. 14-01

NEW MEXICO ENVIRONMENT DEPARTMENT
HAZARDOUS WASTE BUREAU
SANTA FE, NEW MEXICO
FEBRUARY 14, 2014

NOTICE OF PUBLIC COMMENT PERIOD AND OPPORTUNITY TO REQUEST A PUBLIC HEARING ON A DRAFT HAZARDOUS WASTE PERMIT FOR THE WASTE ISOLATION PILOT PLANT
EPA ID NUMBER: NM4890139088-TSDF

The New Mexico Environment Department (**NMED**) is issuing for public comment a draft Hazardous Waste Facility Permit (**draft Permit**) for the Waste Isolation Pilot Plant (**WIPP**, or **the Facility**). The U.S. Department of Energy (**DOE**) and Nuclear Waste Partnership LLC (**NWP**), the Permittees, submitted a modification request to NMED on March 20, 2013. The request includes modifications to the panel closure, repository reconfiguration of Panels 9 and 10, and the volatile organic compounds (**VOC**) target analyte list and changes to the VOC monitoring program.

WIPP is currently permitted to manage, store, and dispose of hazardous waste, and to close hazardous waste disposal units, in accordance with the New Mexico Hazardous Waste Act (**HWA**) and its implementing regulations. NMED is charged with issuing a permit that will ensure that WIPP's hazardous waste operations are managed in a manner that is protective of human health and the environment.

WIPP is located north of Jal Highway (State Highway 128) in Eddy County, New Mexico, approximately 26 miles east of Carlsbad. WIPP is a hazardous waste facility currently operating under a Permit issued by NMED authorizing the management, storage, and disposal of transuranic (**TRU**) mixed waste at the Facility. Mixed waste is radioactive waste that is also a hazardous waste as defined by the HWA, and is thus subject to regulation by NMED. The DOE owns and operates the Facility, and NWP co-operates the Facility. These entities are collectively referred to as "Permittees" or "WIPP" in the draft Permit and this public notice.

WIPP is a facility authorized by Congress to dispose TRU radioactive waste materials generated by atomic energy defense activities. WIPP manages wastes that are regulated under the federal Resource Conservation and Recovery Act (**RCRA**), the New Mexico Hazardous Waste Act Chapter 74, Article 4 NMSA 1978 (**HWA**), and their implementing regulations. WIPP received a hazardous waste facility Permit from NMED in 1999 to dispose of TRU mixed waste containers 2,150 feet below ground in a mined geologic repository within the Salado Formation. The containers of waste must undergo complete waste characterization by the generator/storage sites in compliance with requirements of the Permit prior to disposal. WIPP is permitted to accept contact-handled TRU waste containers with a surface dose of less than 200 millirem per hour that may be handled directly. WIPP is also permitted to accept remote-handled TRU waste containers with a surface dose of 200 millirem or greater that must be handled either remotely or with sufficient shielding to reduce the effective dose.

WIPP may be contacted at the following mailing addresses: DOE Carlsbad Field Office, P.O. Box 3090, Carlsbad, New Mexico 88221-3090; and Nuclear Waste Partnership LLC, P.O. Box 2078, Carlsbad, New Mexico 88221-2078. The Permittees' primary contact for this permitting action is: George Basabilvazo, Director, Office of Environment, Safety and Health, DOE Carlsbad Field Office, P.O. Box 3090, Carlsbad, New Mexico 88221-3090.

The draft Permit is a proposed modification of the existing Permit. The Permittees submitted a modification request on March 20, 2013 following a public involvement process that included pre-submittal meetings with the public to obtain comment prior to submittal. Public meetings were held in Santa Fe and Albuquerque on April 16 and 18, 2013. On July 29, 2013, NMED determined the application to be administratively complete and that it constituted a timely and complete application under the regulations. On September 20, 2013 NMED issued a Technical Incompleteness Determination, requesting clarification and additional information. WIPP provided a response on October 31, 2013. The draft Permit is based on the submitted modification request and the information requested by NMED.

NMED also announces the availability of a Fact Sheet providing the basis for its proposed action on the Permit, and the significant factual, legal, and policy questions considered in preparing the draft Permit. The Fact Sheet explains the basis for Permit changes, including applicable statutory and regulatory support.

PUBLIC REVIEW OF THE DRAFT PERMIT

The Administrative Record for this proposed action consists of the Permit Modification Request, the draft Permit, this Public Notice, the Fact Sheet, and supporting documentation. The Administrative Record may be reviewed, with prior appointment, at the following locations during the public comment period.

NMED - Hazardous Waste Bureau
2905 Rodeo Park Drive East, Building 1
Santa Fe, New Mexico 87505-6303
Phone: (505) 476-6000
Monday – Friday: 8:00 a.m. to 5:00 p.m.
Contact: Pam Allen

NMED- DOE Oversight Bureau
406 N. Guadalupe, Suite C
Carlsbad, NM 88220
Phone: (575) 885-9023
Monday – Friday: 8:00 a.m. to 5:00 p.m.
Contact: Krissie Carrasco

A copy of the draft Permit, this Public Notice, the Fact Sheet, the modification request and an index of the Administrative Record is also available on NMED's website at: www.nmenv.state.nm.us/wipp/index.html. To obtain a copy of the Administrative Record or a portion thereof, please contact Ms. Pam Allen at (505) 476-6000 or at address given above. NMED will provide copies, or portions thereof, of the Administrative Record, including the draft Permit, at a cost to the requestor.

This public notice issued on **February 14, 2014**, announces the beginning of a 60-day comment period that will end at **5:00 p.m. MST, April 15, 2014**. Any person who wishes to comment on the draft Permit or request a public hearing should submit written or electronic mail (e-mail) comment(s) with the commenter's name and mailing address to the address below. Only comments and/or requests for public hearing received before **5:00 p.m. MST** on **April 15, 2014** will be considered.

Trais Kliphuis, WIPP Project Manager
Hazardous Waste Bureau - New Mexico Environment Department
2905 Rodeo Park Drive East, Building 1
Santa Fe, New Mexico 87505-6303
Phone: (505) 476-6000
Fax: (505) 476-6060
E-mail: trais.kliphuis@state.nm.us
Ref: WIPP Draft Permit

Written comments should include, to the extent practicable, all referenced factual materials. Documents in the Administrative Record need not be re-submitted if expressly referenced by the commenter. Requests for a public hearing shall provide: (1) a clear and concise factual statement of the nature and scope of the interest of the person requesting the hearing; (2) the name and address of all persons whom the requestor represents; (3) a statement of any objections to the draft Permit, including specific references to any conditions being modified; and (4) a statement of the issues which the commenter proposes to raise for consideration at the hearing. Written comment and requests for public hearing must be filed with Ms. Trais Kliphuis on or before **5:00**

p.m. MST, April 15, 2014. NMED will provide a thirty (30) day notice of a public hearing, if scheduled.

NMED must ensure that the final Permit is consistent with the New Mexico Hazardous Waste Management Regulations. All written comments submitted will be considered in formulating a final decision and may cause the draft Permit to be modified. NMED will respond in writing to all public comments. This response will specify which provisions, if any, of the draft Permit have been changed in the final decision and the reasons for the changes. All persons presenting written comments or who requested notification in writing will be notified of the decision by mail. These responses will also be posted on the NMED's website.

After consideration of all written public comments received and all data, views, and arguments presented at the public hearing, if one is held, NMED will issue, or modify and issue, the Permit. The Applicants shall be provided by mail a copy of any relevant modified documents and a detailed written statement of reasons for the modifications.

The Secretary of the Environment Department will make the final decision publicly available and shall notify the Applicants by certified mail. The Secretary's decision shall constitute a final agency decision and may be appealed as provided by the HWA (Chapter 74, Article 4 NMSA 1978).

ARRANGEMENTS FOR PERSONS WITH DISABILITIES

Persons having a disability and needing help in being a part of this hearing process, including TTY users, should contact J. C. Borrego at least 10 days before the event at the NMED Human Resources Bureau, P.O. Box 5469, 1190 St. Francis Drive, Santa Fe, New Mexico, 87502, telephone 505-827-0402.

ASUNTO: AVISO DEL PERÍODO PARA PRESENTAR COMENTARIOS DEL PÚBLICO Y DE LA OPORTUNIDAD PARA SOLICITAR UNA AUDIENCIA PÚBLICA RELATIVA AL PROYECTO DE PERMISO PARA RESIDUOS PELIGROSOS PARA LA PLANTA PILOTO DE AISLAMIENTO DE RESIDUOS

Estimado/a interesado/a:

Adjunto encontrará un **Aviso Público** relativo al proyecto de Permiso para Residuos Peligrosos para la Planta Piloto de Aislamiento de Residuos (WIPP por su sigla en inglés). La Planta pertenece a la Oficina Local de Carlsbad del Departamento de Energía de los Estados Unidos **(DOE)** y es administrada por esa dependencia conjuntamente con Nuclear Waste Partnership LLC **(NWP)** (colectivamente, los Solicitantes). La Planta WIPP está ubicada al norte de la Carretera Jal (Carretera Estatal 128) en el condado de Eddy, Nuevo México, aproximadamente 26 millas al este de Carlsbad. La Planta WIPP tiene las siguientes direcciones postales: DOE Carlsbad Field Office, P.O. Box 3090, Carlsbad, New Mexico 88221-3090; y Nuclear Waste Partnership LLC, P.O. Box 2078, Carlsbad, New Mexico 88221-2078. Principal información de contacto con los Permisionarios para esta acción relativa a un permiso: George Basabilvazo, Director, Office of Environment, Safety and Health, DOE Carlsbad Field Office, P.O. Box 3090, Carlsbad, New Mexico 88221-3090.

El Aviso Público adjunto indica los lugares donde se puede revisar el Registro Administrativo para esta acción, incluso la Solicitud de Modificación del Permiso, el proyecto de Permiso, la Hoja de Datos y la documentación de apoyo, y proporciona los procedimientos a seguir para presentar comentarios y solicitar una audiencia pública. Los comentarios y las solicitudes de audiencia pública deben recibirse antes de las **5:00 de la tarde del 15 de abril de 2014**.

Aquellos que deseen más información sobre este aviso podrán comunicarse con:

AVISO PÚBLICO NÚM. 14-01

DEPARTAMENTO DEL MEDIO AMBIENTE DE NUEVO MÉXICO
OFICINA DE RESIDUOS PELIGROSOS
SANTA FE, NUEVO MÉXICO
14 DE FEBRERO DE 2014

AVISO DEL PERÍODO PARA PRESENTAR COMENTARIOS DEL PÚBLICO Y DE LA OPORTUNIDAD PARA SOLICITAR UNA AUDIENCIA PÚBLICA RELATIVA AL PROYECTO DE PERMISO PARA RESIDUOS PELIGROSOS PARA LA PLANTA PILOTO DE AISLAMIENTO DE RESIDUOS NÚMERO DE IDENTIFICACIÓN EPA: NM4890139088-TSDF

El Departamento del Medio Ambiente de Nuevo México (**NMED**) hace público el Proyecto de Permiso de las Instalaciones para Residuos Peligrosos (**proyecto de Permiso**) para la Planta Piloto de Aislamiento de Residuos (**WIPP**, o **las Instalaciones**) con el propósito de recibir comentarios del público. El Departamento de Energía de los Estados Unidos (**DOE**) y Nuclear Waste Partnership LLC (**NWP**), los Permisionarios, presentaron ante NMED una solicitud de modificación el 20 de marzo de 2013. La solicitud incluye modificaciones para el cierre con paneles, la reconfiguración de los Paneles 9 y 10 del repositorio, y la lista de analitos meta de compuestos orgánicos volátiles (**VOC**) y cambios en el programa de monitoreo de VOC.

La Planta WIPP tiene actualmente permiso para manejar, almacenar y depositar residuos peligrosos y para cerrar unidades de depósito de residuos peligrosos, conforme a la Ley de Nuevo México para Residuos Peligrosos (**HWA**) y los reglamentos para su implementación. NMED tiene a su cargo emitir un permiso que garantice que las operaciones con residuos peligrosos de la Planta WIPP se realicen de manera que protejan la salud de los seres humanos y el medio ambiente.

La Planta WIPP está ubicada al norte de la Carretera Jal (Carretera Estatal 128) en el condado de Eddy, Nuevo México, aproximadamente 26 millas al este de Carlsbad. WIPP es una planta para residuos peligrosos que funciona actualmente bajo un Permiso emitido por NMED, que autoriza el manejo, el almacenamiento y el depósito de residuos transuránicos (**TRU**) mixtos en la Planta. Residuos mixtos son residuos radioactivos que también son residuos peligrosos según lo definido por la HWA y están, por lo tanto, sujetos a las normas de NMED. La Planta pertenece al DOE y es administrada por ese departamento conjuntamente con NWP. Esas entidades se denominan colectivamente "Permisionarios" o "WIPP" en el proyecto de Permiso y en este aviso público.

WIPP es una planta autorizada por el Congreso para depositar materiales residuales radioactivos TRU generados por actividades de defensa con energía atómica. WIPP se ocupa de la gestión de residuos regulados por la Ley Federal de Conservación y Recuperación de Recursos (**RCRA**), la Ley de Nuevo México para Residuos Peligrosos (**HWA**), Capítulo 74, Artículo 4 NMSA 1978, y los reglamentos para su implementación. WIPP recibió un Permiso de NMED para instalaciones de residuos peligrosos en 1999 para depósito de contenedores de residuos TRU mixtos a una profundidad de 2,150 pies por debajo de la superficie de la tierra, en un repositorio geológico minado ubicado dentro de la Formación Salado. Los contenedores de residuos deben someterse a la caracterización completa de residuos en las plantas generadoras/almacenadoras, conforme a los requisitos establecidos en el Permiso, antes de su depósito. La Planta WIPP está autorizada para aceptar contenedores de residuos TRU de manejo por contacto con una dosis superficial de menos de 200 milirem por hora que pueden manipularse de manera directa. La Planta WIPP también está autorizada para aceptar contenedores de residuos TRU de manejo remoto con una dosis superficial de 200 milirem o mayor, que deben manipularse remotamente o con suficiente protección para reducir la dosis efectiva.

Los interesados en comunicarse con la Planta WIPP podrán hacerlo a través de las siguientes direcciones postales: DOE Carlsbad Field Office, P.O. Box 3090, Carlsbad, New Mexico 88221-3090; y Nuclear Waste Partnership LLC, P.O. Box 2078, Carlsbad, New Mexico 88221-2078. Principal información de contacto con los Permisionarios para esta acción relativa a un permiso: George Basabilvazo, Director, Office of Environment, Safety and Health, DOE Carlsbad Field Office, P.O. Box 3090, Carlsbad, New Mexico 88221-3090.

El proyecto de Permiso es una modificación propuesta para el Permiso existente. Los Permisionarios presentaron una solicitud de modificación el 20 de marzo de 2013, luego de un proceso con participación del público, que incluyó reuniones con el público previas a la presentación de la solicitud, para recibir comentarios previos a la presentación. Las reuniones públicas se llevaron a cabo en Santa Fe y Albuquerque el 16 y el 18 de abril de 2013. El 29 de julio de 2013, NMED determinó que la solicitud estaba administrativamente completa y que constituía una solicitud presentada de manera oportuna y completa conforme a los reglamentos. El 20 de septiembre de 2013, NMED emitió una Determinación de Información Técnica Incompleta, y solicitó aclaraciones e información adicional. La Planta WIPP proporcionó una respuesta el 31 de octubre de 2013. El proyecto de Permiso se basa en la solicitud de modificación presentada y la información solicitada por NMED.

NMED también anuncia que dispone de una Hoja de Datos que proporciona el fundamento de la acción propuesta para el Permiso y las cuestiones importantes de carácter fáctico, legal y político que se consideraron al preparar el proyecto de Permiso. La Hoja de Datos explica el fundamento de los cambios para el Permiso, incluso las correspondientes bases jurídicas y reglamentarias.

REVISIÓN PÚBLICA DEL PROYECTO DE PERMISO

El Registro Administrativo para esta acción propuesta consta de la Solicitud de Modificación de Permiso, el proyecto de Permiso, este Aviso Público, la Hoja de Datos y la documentación de apoyo. Los interesados podrán revisar el Registro Administrativo, con cita previa, en las siguientes direcciones, durante el período establecido para comentarios del público.

NMED - Hazardous Waste Bureau
2905 Rodeo Park Drive East, Building 1
Santa Fe, New Mexico 87505-6303
Teléfono: (505) 476-6000

Contacto: Pam Allen

NMED- DOE Oversight Bureau
406 N. Guadalupe, Suite C
Carlsbad, NM 88220
Teléfono: (575) 885-9023
Lunes a viernes: 8:00 a.m. a 5:00 p.m.
Contacto: Krissie Carrasco

También se dispone de la copia del proyecto de Permiso, este Aviso Público, la Hoja de Datos, la solicitud de modificación y un índice del Registro Administrativo en el sitio web de NMED: www.nmenv.state.nm.us/wipp/index.html. Quienes deseen una copia del Registro Administrativo, o de una porción del mismo, deberán comunicarse con la Srta. Pam Allen al (505) 476-6000 o en la dirección antes mencionada. NMED proporcionará copias del Registro Administrativo, o porciones del mismo, incluso del proyecto de Permiso, por una tarifa a quien lo solicite.

Este aviso público, emitido el **14 de febrero de 2014**, anuncia el inicio del período de 60 días para recibir comentarios, que finalizará a las **5 de la tarde del 15 de abril de 2014.** Quienes deseen comentar sobre el proyecto de Permiso o solicitar una audiencia pública deberán enviar sus comentarios escritos por correo o mediante un mensaje electrónico (e-mail) con el nombre y la dirección postal del autor de los comentarios a la dirección que aparece más abajo. Se considerarán solamente los comentarios y las solicitudes de audiencia pública que se reciban antes de las **5:00 de la tarde del 15 de abril de 2014.**

Trais Kliphuis, WIPP Project Manager
Hazardous Waste Bureau - New Mexico Environment Department
2905 Rodeo Park Drive East, Building 1
Santa Fe, New Mexico 87505-6303
Teléfono: (505) 476-6000
Fax: (505) 476-6060
Correo electrónico: trais.kliphuis@state.nm.us
Ref: WIPP Draft Permit

Los comentarios escritos deberán incluir, en la medida de lo posible, todos los materiales fácticos de referencia. No es necesario volver a presentar documentos del Registro Administrativo si el autor de los comentarios hace expresamente referencia a los mismos. Las solicitudes de Audiencia Pública deberán incluir: (1) una declaración fáctica clara y concisa de la naturaleza y alcance del interés de la persona que solicita la audiencia; (2) el nombre y la dirección de todas las personas a quienes representa el solicitante; (3) una declaración de todas las objeciones al proyecto de Permiso, incluso referencias específicas a cualquiera de las condiciones que se estén modificando; y (4) una declaración de los asuntos que el autor de los comentarios propone plantear para su consideración en la audiencia. Los comentarios escritos y las solicitudes de audiencia pública deben ser entregados a la Srta. Trais Kliphuis antes de las **5:00 de la tarde del 15 de abril de 2014**. NMED proporcionará un aviso de audiencia pública treinta (30) días antes de la audiencia, si fuera programada.

NMED debe garantizar que el Permiso final sea congruente con el Reglamento de Nuevo México para el Manejo de Residuos Peligrosos. Se considerarán todos los comentarios presentados por escrito para tomar la decisión final y esto podrá tener como resultado que el proyecto de Permiso sea modificado. NMED responderá por escrito a todos los comentarios recibidos del público. Esa respuesta especificará qué disposiciones, de haber alguna, del proyecto de Plan se han cambiado en la decisión final y los motivos para hacer esos cambios. Todos aquellos que presenten comentarios escritos o que hayan solicitado notificación por escrito serán notificados por correo sobre la decisión. Esas respuestas también serán publicadas en el sitio web de NMED.

Luego de considerar todos los comentarios escritos recibidos del público y todos los datos, puntos de vista y argumentos presentados en la audiencia pública, en caso de celebrarse, NMED emitirá, o modificará y emitirá, el Permiso. Los Solicitantes recibirán por correo una copia de todos los documentos pertinentes modificados y una declaración escrita detallada de los motivos de las modificaciones.

El Secretario del Departamento del Medio Ambiente pondrá a disposición del público la decisión final y notificará a los Solicitantes por correo certificado. La decisión del Secretario constituirá la decisión final del departamento y podrá apelarse conforme a la ley HWA (Capítulo 74, Artículo 4 NMSA 1978).

ADAPTACIONES PARA PERSONAS CON DISCAPACIDADES

Aquellas personas que tengan alguna discapacidad y necesiten ayuda para participar en el proceso de esta audiencia, incluso los usuarios de TTY, deberán comunicarse con J. C. Borrego por lo menos 10 días antes de la audiencia; dirección: NMED Human Resources Bureau, P.O. Box 5469, 1190 St. Francis Drive, Santa Fe, New Mexico, 87502, teléfono: 505-827-0402.

RE: Corrective Action Plan Approval, Waste Isolation Pilot Plant, DP-831

Dear Mr. Brown:

On April 16, 2021, the Ground Water Quality Bureau of the New Mexico Environment Department (NMED) received a Corrective Action Plan for the above referenced facility. The information submitted satisfies the requirements of Condition 30 of Discharge Permit Renewal, DP-831, dated July 29, 2014.

According to the submitted Corrective Action Plan, on a routine inspection of the salt cell liner on Salt Cell 2, the permittee discovered a tear in the liner due to high winds in the area. No release occurred.

The following describes the corrective actions the permittee has taken and proposes to take:
The permittee has placed sandbags on the affected area to prevent further damage from wind and continues to monitor the area during high winds. The permittee has begun the acquisition process to enable a subcontractor to repair the liner. Once the Department of Energy awards the service contract, the subcontractor will repair the liner.

The corrective actions proposed and taken are acceptable to NMED, and the Corrective Action Plan is satisfactory.

NMED may require additional corrective actions if additional information becomes available indicating that the corrective actions proposed or taken are inadequate and/or ground water contamination occurs as a result of the described discharge. The permittee may be required to abate water pollution pursuant to Sections 20.6.2.4000 through 20.6.2.4115 NMAC, if the corrective action plan will not result in compliance with the standards and requirements set forth in Section 20.6.2.4103 NMAC within 180 days of confirmation of ground water contamination.

If you have any questions regarding these issues, please contact Avery Young at (505) 699-8564 or Jason Herman, Domestic Waste Team Leader of the Pollution Prevention Section, at (575) 649-3871.

Sincerely,

MOD for

Michelle Hunter, Chief

Subject: WIPP Discharge Permit (DP-831) Condition 30 Corrective Action Plan: Repair Salt Cell 2 Impoundment Liner

Dear Ms. Young:

The purpose of this letter is to inform the New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) of a Corrective Action Plan (CAP) to repair a vertical tear in the Salt Cell 2 impoundment liner along the north berm (refer to Figures 1, 2, and 3 of the Enclosure). The CAP is required by Discharge Permit 831 (DP-831) Condition 30.

Permit Condition 30

This report confirms the Carlsbad Field Office (CBFO) call to Ms. Avery Young on March 31, 2021, informing the GWQB of the discovery of the Salt Cell 2 liner damage. No release has occurred. There is no imminent danger of a release to the environment because the tear location is at an elevated position and the current impoundment is dry.

Corrective Action Plan

1. Place sandbags around the affected area to prevent further damage from wind. This action step is complete.
2. Monitor the tear area during high winds. This action step is ongoing.
3. Initiate an Action Request (AR 2033530) to repair the liner. This action step is complete.
4. Initiate subcontractor services for liner repair. This step is in-progress.
5. Mobilize the subcontractor after awarding the service contract.
6. Repair the Salt Cell 2 impoundment liner.

If you have any further questions regarding this matter or need additional information, please contact me at (575) 706-0072.

Sincerely,

Michael Brown Digitally signed by Michael Brown Date: 2021.04.15 17:46:24 -06'00'

Attached are SRIC's comments on draft permit DP-831 and the Public Notice of October 1, 2020.

Thank you for your careful consideration of, and response to, the attached comments. As noted, they are in addition to the SRIC comments of April 22, 2020.

RE: WIPP Draft Discharge Permit (DP)-831

Dear Ms. Young:

Southwest Research and Information Center (SRIC) provides these comments on the September 24, 2020 draft Groundwater Discharge Permit, DP-831, Waste Isolation Pilot Plant, according to the Public Notice of October 1, 2020.

These comments, except as specifically noted, do not change any of SRIC's comments submitted on April 22, 2020 on the previous draft DP-831, dated March 2, 2020 and the undated Public Notice that set April 22, 2020 as the comment deadline. SRIC also is relying on the October 1, 2020 email to me from Avery Young that states: "The previous comments and requests for hearing will be combined with any we receive during this comment period. All comments will be addressed following the conclusion of the permitting action."

To reiterate, SRIC strongly opposes the inclusion in the permit of Salt Cell 5 and Salt Storage Pond 5, which are for a new shaft #5 and connecting drifts, which is an expansion of the WIPP facility that is strongly opposed by SRIC and many organizations and individuals, and has not been permitted by NMED. Salt Cell 5 and Salt Storage Pond 5 and its 1,292,499 gpd discharge volume should not be included in the renewed and modified permit.

Further, SRIC's re-affirms the request for negotiations and a public hearing on the draft permit, as provided in our April 22, 2020 comments.

Additional comments are the following:

1. <u>The current Public Notice and Fact Sheet are legally inadequate</u>
A. Neither the Public Notice of October 1, 2020, nor the Fact Sheet of September 2020 describe that the draft permit is revised and re-issued from the draft permit dated March 2, 2020. This is fundamental information that should be included in both documents. Absent that information,

NMED would apparently be in violation of Subsection F of 20.6.2.3108 NMAC that requires issuance of a draft permit or notice of intent to deny within 60 days of determining that the application is administratively complete.

B. Neither the Public Notice of October 1, 2020, nor the Fact Sheet of September 2020 describes that Salt Cell 5 and Salt Storage Pond 5 are required for the new shaft #5. That inadequacy is in violation of Subsection F(3) of 20.6.2.3108 NMAC that provides that the Public Notice shall include "a brief description of the activities that produce the discharge described in the application," and Subsection I(1) of 20.6.2.3108 NMAC that provides that the Fact Sheet and draft permit also shall provide that description. The failure to follow the regulations was pointed out in SRIC's April 22, 2020 comments at #3, so it is incomprehensible that the violation continues. The violation is especially puzzling since the draft permit was modified on page 3 of 43 to state: "Salt Cell 5 adds a new salt storage location, which will receive overburden and salt from the construction of Shaft 5 and its associated underground connecting drifts. Salt Storage Pond 5 will receive both the leachate and stormwater in contact with mined salt located in Salt Cell 5." The addition of the description that the new shaft produces the discharge in the draft permit does <u>not</u> remedy the violations of Subsection F(3) of 20.6.2.3108 NMAC and Subsection I(1) of 20.6.2.3108 NMAC. As SRIC discussed in the April 22, 2020 comments, from the Public Notice and Fact Sheet neither SRIC, nor any member of the public, would know from the Fact Sheet that the renewed and modified DP-831 relates to facilities required by the new shaft and connecting drifts.

SRIC notes that new Map 1 does show the approximate locations of Salt Cell 5 and Salt Storage Pond 5, as SRIC requested in its April 22, 2020 comments.

Nonetheless, the inadequate Public Notice and inadequate Fact Sheet must be remedied by re-issuing the Public Notice and Fact Sheet to comply with the regulations.

2. <u>Additional information since the SRIC April 22, 2020 comments</u>:
A. A Temporary Authorization (TA) for the new shaft was issued by Stephanie Stringer of NMED on April 24, 2020.[1] AR 200415.

B. SRIC strongly opposed the TA and appealed the TA decision to the New Mexico Court of Appeals on April 27, 2020. Case #: A-1-CA-38924.[2] AR 200421.

C. On June 11, 2020, the New Mexico Court of Appeals issued its Order Dismissing SRIC's Appeal because "we do not have jurisdiction over this case." ¶ 6.[3] AR 200605.5

D. On June 30, 2020, SRIC filed its Petition For A Writ Of Certiorari in the New Mexico Supreme Court. Case No. S-1-SC-38373.[4] AR 200636.

---

[1] https://www.env.nm.gov/hazardous-waste/wp-content/uploads/sites/12/2016/05/WIPP-RPD-Approval-of-WIPP-Temporary-Authorization-Request-04-24-2020.pdf
[2] https://hwbdocuments.env.nm.gov/Waste%20Isolation%20Pilot%20Plant/200421.pdf
[3] https://hwbdocuments.env.nm.gov/Waste%20Isolation%20Pilot%20Plant/200605.5.pdf
[4] https://hwbdocuments.env.nm.gov/Waste%20Isolation%20Pilot%20Plant/200636.pdf

E. On September 17, 2020, the New Mexico Supreme Court issued its Order overturning the Court of Appeals Dismissal Order and ordered that the Court of Appeal "proceed in *Southwest Research v. NM Environment Department*, Ct. App. No. A-1-CA-38924, in accordance with the Rules of Appellate Procedure," thereby finding that the Court of Appeals does have jurisdiction.[5] AR 200918. Thus, the legality of the April 24, 2020 TA remains much in question.

F. On September 9, 2020, the WIPP permittees requested a reissuance of the TA for another 180 days.[6] AR 200907.

G. On September 11, 2020, SRIC submitted comments strongly objecting to re-issuing the TA.[7] AR 200908. Among many other things, the comments noted that, regarding the draft permit for the new shaft that was issued on June 12, 2020, Public Notice 20-03, "97 percent of those commenting object to the draft permit."

H. On September 29-30, 2020, Avery Young and Ricardo Maestas of NMED conducted an inspection of the new shaft construction.[8] AR 201011.

I. On October 24, 2020, the TA expired. As of this date, it has not been re-issued, and NMED has issued a verbal direction to the permittees "to suspend shaft construction by midnight October 24th an await NMED's response." Attachment 1.

Those events support SRIC's April 22, 2020 comments that the new shaft has not been permitted by NMED and that there is very significant public interest in the new shaft because it is part of the "Forever WIPP" expansion plans. Consequently, NMED cannot issue DP-831 that allows Salt Cell 5 and Salt Storage Pond 5 which are part of new shaft #5, which is prohibited by law. NMED cannot permit an illegal facility. Because of the significant public interest, NMED must hold negotiations and a public hearing, unless the requests for public hearing are withdrawn.

3. <u>Comments on changes to the draft permit.</u>
SRIC notes that there are a few changes in the September 24, 2020 draft permit, as compared with the March 2, 2020 draft permit. However, those changes are not readily apparent since there is no redline/strikeout version of the draft permit, nor does the Fact Sheet describe changes that were made to the March 2, 2020 draft permit. The omission of such changes is inappropriate, since it requires SRIC and other members of the public to spend significant time comparing the two documents. The federal Clean Water Act specifically requires public participation:

> Public participation in the development, revision, and enforcement of any regulation, standard, effluent limitation, plan, or program established by the Administrator or any State under this chapter shall be provided for, encouraged, and assisted by the Administrator and the States.

33 U.S.C. § 1251(e).

---

[5] https://hwbdocuments.env.nm.gov/Waste%20Isolation%20Pilot%20Plant/200918.pdf
[6] https://hwbdocuments.env.nm.gov/Waste%20Isolation%20Pilot%20Plant/200907.pdf
[7] https://hwbdocuments.env.nm.gov/Waste%20Isolation%20Pilot%20Plant/200908.pdf
[8] https://hwbdocuments.env.nm.gov/Waste%20Isolation%20Pilot%20Plant/201011.pdf

Since SRIC believes that yet another Public Notice and Fact Sheet are required to comply with the regulations, as stated in #1 above, SRIC requests that the new Public Notice and revised Fact Sheet briefly describe the changes from the previous draft permit, and any other changes if the draft permit is further revised. A redline/strikeout version of the draft permit should be provided.

SRIC notes that comment #6 in its April 22, 2020 letter was apparently noted and that the typo has been fixed in the new Discharge Permit Summary, page 2 of 5 5 – Salt Storage Pond 1 – capacity.

4. Additional condition requested.
Because Administrative Record (AR) documents regarding DP-831 are not available on the Ground Water Bureau website, nor on the WIPP website, SRIC and other members of the public have great difficulty in reviewing relevant documents in the AR. Therefore, in these comments SRIC has referenced Hazardous Waste Bureau WIPP AR documents. A method to alleviate that problem would be for DP-831 to include a condition, similar to WIPP Permit Part 1.14.1, that DOE is required to post such documents on the WIPP website. SRIC requests that such a condition be included in DP-831. Such documents should include, at a minimum, the permit, permit renewal application, permit modification requests, and required monitoring reports, such as the Semi-Annual Discharge Monitoring Reports, and Notices of Discharges. Such a condition would also be consistent with 33 U.S.C. § 1251(e), cited in #3 above.

Thank you very much for your careful consideration of, and your response to, these comments.

Sincerely,

Don Hancock

Hello Don,

Again, thank you for your feedback on negotiations. We will get back to you on this topic.

With regard to the WIPP TA.
NMED is currently reviewing the Permittees' request to re-issue the Temporary Authorization. The Temporary Authorization expired on Saturday, October 24th. On Friday, October 23rd NMED verbally directed the Permittees to suspend shaft construction by midnight October 24th and await NMED's response.

Thank you.

Permittee Comments on Draft Discharge Permit Renewal and Modification, DP-831
Waste Isolation Pilot Plant

COMMENT 1 - Discharge Permit Summary, Domestic Wastewater Table: Update liner thicknesses in the summary table.

The liner thicknesses for Effluent Lagoon A, Effluent Lagoon B, and Effluent Lagoon C have been field verified as 60-mil high-density polyethylene (HDPE).

COMMENT 2 – Draft Discharge Permit Conditions #9, 13, 17, and 19: Delete the height requirement regarding fencing. The following is proposed replacement language.

> *The fences shall meet BLM standards for domestic livestock fences.~~consist of a minimum of six-foot chain link or field fencing and locking gates.~~*

The Bureau of Land Management (BLM) specifies standards for domestic livestock fences. Fencing is commonly used to control domestic livestock to achieve safety and vegetation management objectives. Fences are examples of structural improvements, which improve livestock grazing management, improve watershed conditions, and enhance wildlife habitats.

The following is proposed replacement language to the following conditions:

> Condition 9: *The Permittee shall maintain, throughout the term of this discharge permit, the Exclusive Use Area barbed wire fence that encompasses Storm Water Ponds 1, 2, and 3 to limit access by livestock. The fences shall meet BLM standards for domestic livestock fences.*

> Condition 13: *The Permittee shall maintain, throughout the term of this discharge permit, the Exclusive Use Area barbed wire fence that encompasses Brine Salt Storage Pond 4 to limit access by livestock. The fence shall meet BLM standards for domestic livestock fences.*

> Condition 17: *The Permittee shall maintain, throughout the term of this discharge permit, the barbed wire fence that encompasses Evaporation Pond H-19 to limit access by livestock. The fence shall meet BLM standards for domestic livestock fences and have a locking gate.*

> Condition 19: *The Permittee shall maintain, throughout the term of this discharge permit, the Exclusive Use Area barbed wire fence that encompasses Salt Storage Ponds 1, 2, and 3 to limit access by livestock. The fences shall meet BLM standards for domestic livestock fences.*

COMMENT 3 - Draft Discharge Permit Conditions #51, 52, 53, 54, and 55: Update the respective conditions in the Draft Permit to reflect work performed to date on the monitoring wells. A DOE status report letter (20-0296) was sent to the NMED Ground Water Quality Bureau in November 2020.

COMMENT 4 - Draft Discharge Permit Condition #51: Change “within 120 days of well completion” to “within 120 days following the effective date of this Discharge Permit (**by DATE**)”

COMMENT 5 - Draft Discharge Permit Condition #52: Change “within 120 days of well completion” to “within 120 days following the effective date of this Discharge Permit (**by DATE**)”

COMMENT 6 - Draft Discharge Permit Condition #53: Change “within 120 days of well completion” to “within 120 days following the effective date of this Discharge Permit (**by DATE**)”

COMMENT 7 - Draft Discharge Permit Condition #54 (third paragraph): Change “within 120 days of the installation of the monitoring wells” to “within 120 days following the effective date of this Discharge Permit (**by DATE**)”

COMMENT 8 - Draft Discharge Permit Condition #55: Change “within 120 days of the installation of the monitoring wells” to “within 120 days following the effective date of this Discharge Permit (**by DATE**)”

COMMENT 9 - Draft Discharge Permit Conditions #11 and 22: Update respective conditions in the Draft Permit to reflect work performed to date on the new impoundments. A DOE status report letter (20-0297) was sent to the NMED Ground Water Quality Bureau in November 2020.

PUBLIC NOTICE

October 1, 2020
Groundwater Discharge Permit Proposed for Approval
DP-831, Waste Isolation Pilot Plant
Public Comment Period Open Until November 15, 2020

The New Mexico Environment Department (NMED or department) Ground Water Quality Bureau (GWQB) provides notice that the following draft Groundwater Discharge Permit has been proposed for approval: The U.S. Department of Energy's Waste Isolation Pilot Plant (WIPP or Facility) proposes to renew and modify the groundwater discharge permit (DP-831 or Permit) for the discharge of up to 9,586,995 gallons per day of industrial wastewater and stormwater to an impoundment and disposal system and up to 23,000 gallons per day of domestic wastewater to a treatment and disposal system. The draft Permit modification consists of the addition of one new salt cell and four new impoundments that will receive industrial wastewater and stormwater.

Applicant: U.S. Department of Energy's WIPP, Reinhard Knerr, Manager, Carlsbad Field Office, P.O. Box 3090, Carlsbad, NM 88221

Facility Description: The Facility is a mined geologic repository for the disposal of transuranic (TRU) waste. The underground repository at the Facility is located 2,150 feet below land surface in the bedded salt of the Salado Formation. The draft Permit addresses discharges that are not directly associated with the storage of TRU waste.

Discharge Locations: Discharge locations at the Facility potentially affecting groundwater include an impoundment system for domestic wastewater, three active salt cells, four lined impoundments for stormwater in contact with salt cells, three lined impoundments for stormwater not in contact with salt cells, and four lined impoundments for non-hazardous, non-radioactive, industrial wastewater.

Activities that Produce the Discharge: Discharges at this Facility include stormwater collected from the Facility grounds and from active and inactive salt cells which are directed to synthetically lined impoundments. Additionally, the Facility discharges industrial wastewater from various sources including brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous, non-radioactive wastewaters, to synthetically lined impoundments. The Facility discharges domestic wastewater to a synthetically lined impoundment system for treatment and disposal by evaporation. The Facility proposes to discharge brine produced from the operations of the to be constructed Salt Reduction System to two synthetically lined impoundments.

Facility Location: The Facility is located off Highway 128, approximately 26 miles southeast of Carlsbad, in Sections 20, 21, 28, and 29, Township 22S, Range 31E, Eddy County.

Potential Contaminants: Potential contaminants from these types of discharge include nitrogen compounds, dissolved solids, and chloride.

Groundwater Most Likely to be Affected by the Discharge: Groundwater most likely to be affected is at a depth of approximately 35 to 160 feet and had a pre-discharge total dissolved solids concentration of 3,400 milligrams per liter.

Public Involvement: NMED maintains a Facility-specific Public Involvement Plan (PIP) for each permitting action so that the department can plan for providing public participation opportunities and information that may be needed for the community to participate in a permitting process. The department's issuance of this public notice (Notice) is addressed in the PIP.

How to obtain more information: To learn more about this draft Permit and the permitting process, or to obtain a copy of the draft Permit, the associated Fact Sheet, which provides a brief summary of the basis for the draft Permit conditions and is available in both English and Spanish, or the associated PIP, please contact the NMED Permit Contact, Ms. Avery Young, by telephone at (505) 827-2909 or by email at **Avery.Young@state.nm.us**. NMED will provide, at no cost, documents either by email or US mail to any community member requesting a copy. Please specify how you would like the document(s) delivered. NMED maintains a facility-specific mailing list for persons wishing to receive notices for permitting actions associated with this Facility. When requesting documents, please specify if you would like to be added to this list.

The draft Permit, Fact Sheet, and PIP may be viewed online at **https://www.env.nm.gov/gwqb/dp-831/**. For a Spanish translation of the Fact Sheet, visit **https://www.env.nm.gov/gwqb/dp-831-es/**.

NMED has placed a hard copy of the draft Permit, the Fact Sheet, the Permit application, and the PIP at the following document repository locations: Eunice Public Library (1003 Avenue N, Eunice); Carlsbad Public Library (101 S. Halagueno St, Carlsbad). As of the date of NMED's issuance of this notice, both libraries are open to the public. In the event either library restricts public access during this public comment period due to the ongoing COVID-19 public health emergency, NMED asks community members to request documents as described above.

How to submit a comment or request a hearing: NMED is allowing 45 days after the date of publication of this Notice for anyone to submit written comments and/or a request for a public hearing regarding the draft Permit. Requests for a public hearing shall be in writing and shall set forth the reasons why a hearing should be held. Comments or a request for hearing regarding the draft Permit should be addressed to the GWQB, PO Box 5469, Santa Fe, NM 87502-5469, or emailed to the NMED Permit contact, Ms. Avery Young, at **Avery.Young@state.nm.us**, reference line "DP-831 Comments."

A hearing will be held if the New Mexico Secretary of Environment (Secretary) determines that there is substantial public interest. The Secretary will appoint a hearing officer and will ensure the hearing is held in the locally affected community. During the hearing process, members of the public may file technical testimony prior to the hearing and may provide verbal and written comments during the hearing itself. Once the hearing is complete, the hearing officer will provide the Secretary with a hearing report that includes a suggested determination. The Secretary will then issue a Final Order which will complete the Administrative Record (Record) for the permitting action. After the Record for a permitting action is complete and all required information is available, NMED will approve, approve with conditions, or disapprove the Permit based on the Record and/or Final Order from the Secretary.

How to request accommodations: If you are a non-English speaker, do not speak English well, or if you have a disability, you may contact Ms. Avery Young by telephone during normal business hours at (505) 827-2909 or by email at **Avery.Young@state.nm.us** to request assistance, translation services, an interpreter, or other reasonable accommodations in order to learn more about the Permit or the permitting process, or to participate in activities associated with the permitting process. Requested translation, interpretation services, and accommodations or services for persons with disabilities will be arranged. Telephone conversation assistance is available through Relay New Mexico at no charge for people who are deaf, hard of hearing, or have difficulty speaking on the phone, by calling 1-800-659-1779; TTY users: 1-800-659-8331; Spanish: 1-800-327-1857. Telephone interpretation assistance for persons that are a non-English speaker or do not speak English well is available at no charge when calling NMED.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this Notice or any of NMED's non-discrimination programs, policies or procedures, you may contact: Kristine Yurdin, Non-Discrimination Coordinator, New Mexico Environment Department, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, **nd.coordinator@state.nm.us**. If you believe that you have been discriminated against with respect to a NMED program or activity, you may contact the Non-Discrimination Coordinator identified above or visit our website at **https://www.env.nm.gov/non-employee-discrimination-complaint-page/** to learn how and where to file a complaint of discrimination.

NEW MEXICO ENVIRONMENT DEPARTMENT

AVISO PÚBLICO

1 de octubre de 2020
Permiso de Descarga de Aguas Subterráneas propuesto para su aprobación
DP-831, Planta Piloto de Aislamiento de Residuos
Período de comentarios públicos abierto hasta el 15 de noviembre de 2020

La Oficina de Calidad de Aguas Subterráneas (GWQB, por sus siglas en inglés) del Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés) avisa que el siguiente borrador de Permiso de Descarga de Aguas Subterráneas ha sido propuesto para su aprobación: La Planta Piloto de Aislamiento de Residuos (WIPP, por sus siglas en inglés) del Departamento de Energía de los Estados Unidos propone renovar y modificar el Permiso de Descarga (DP-831) para la descarga de hasta 9,586,995 galones por día de aguas residuales industriales y aguas pluviales a un sistema de embalse y eliminación y hasta 23,000 galones por día de aguas residuales domésticas a un sistema de tratamiento y eliminación. La modificación del borrador de Permiso consiste en la adición de una nueva celda de sal y cuatro nuevos embalses que recibirán aguas residuales industriales y aguas pluviales.

Solicitante: WIPP del Departamento de Energía de los Estados Unidos, Reinhard Knerr, gerente, oficina local en Carlsbad, P.O. Box 3090, Carlsbad, NM 88221

Descripción de la Instalación: La Instalación es un depósito geológico minado para la eliminación de residuos transuránicos (TRU). El depósito subterráneo está situado a 2,150 pies por debajo de la superficie del suelo en el lecho de sal de la Formación Salado. El borrador de Permiso aborda vertidos que no están directamente relacionados con el almacenamiento de los residuos TRU.

Ubicaciones de las descargas: Los lugares de descarga en la Instalación que pueden afectar las aguas subterráneas incluyen un sistema de embalse para las aguas residuales domésticas, tres celdas de sal activas, cuatro embalses revestidos para aguas pluviales en contacto con celdas de sal, tres embalses revestidos para aguas pluviales que no están en contacto con celdas de sal y cuatro embalses revestidos para aguas residuales industriales no peligrosas y no radioactivas.

Actividades que producen la descarga: Las descargas en esta Instalación incluyen aguas pluviales recogidas de los terrenos de la Instalación y de celdas de sal activas e inactivas que se dirigen a embalses revestidos sintéticamente. Además, las instalaciones descargan aguas residuales industriales de varias fuentes, entre ellas salmuera, aguas de purga de muestreo y de pozos de monitoreo en vías de desarrollo de la Instalación, y otras aguas residuales industriales no peligrosas y no radiactivas, a embalses revestidos de material sintético. La Instalación descarga aguas residuales domésticas a un sistema de embalse revestido de material sintético para su tratamiento y eliminación por evaporación. La Instalación propone descargar la salmuera producida por las operaciones del sistema de reducción de sal a dos embalses revestidos de material sintético.

Ubicación de la instalación: La Instalación se encuentra junto a la Highway 128, aproximadamente a 26 millas al sureste de Carlsbad, en las Secciones 20, 21, 28 y 29, Municipio 22S, Rango 31E, condado de Eddy.

Posibles contaminantes: Los posibles contaminantes de estos tipos de descarga incluyen compuestos de nitrógeno, sólidos disueltos y cloruro.

Agua subterránea con más probabilidad de ser afectada por la descarga: El agua subterránea que más probablemente se verá afectada se encuentra a una profundidad de aproximadamente 35 a 160 pies y tenía una concentración de sólidos disueltos totales antes del vertido de 3,400 miligramos por litro.

Participación pública: El NMED mantiene un Plan de Participación Pública (PIP) específico de la Instalación para cada acción de permisos, de manera que el departamento pueda planificar para proporcionar oportunidades de participación pública y la información que pueda ser necesaria para que la comunidad participe en un proceso de permisos. La emisión de este aviso público (Aviso) por parte del departamento se aborda en el PIP.

Cómo obtener más información: Para aprender más acerca de este borrador de Permiso y el proceso de permiso, o para obtener una copia del borrador de Permiso, la Hoja de Datos asociada, que proporciona un breve resumen de las bases de las condiciones del borrador de permiso y está disponible tanto en inglés como en español, o el PIP asociado, comuníquese con el contacto de permisos del NMED, la Sra. Avery Young, por teléfono al (505) 827-2909 o por correo electrónico en **Avery.Young@state.nm.us**. El NMED proveerá, sin costo alguno, documentos ya sea por correo electrónico o por correo postal de los Estados Unidos a cualquier miembro de la comunidad que solicite una copia. Haga el favor de especificar cómo desea que se le entreguen los documentos. El NMED mantiene una lista de correo específica de la Instalación para las personas que deseen recibir avisos de las acciones de permiso asociadas con esta Instalación. Cuando solicite documentos especifique si desea que se le agregue a esta lista.

El borrador de Permiso, la Hoja de Datos y el PIP pueden verse en línea en **https://www.env.nm.gov/gwqb/dp-831/**. Para obtener una traducción en español de la Hoja de Datos, visite **https://www.env.nm.gov/gwqb/dp-831-es/**.

El NMED ha colocado una copia impresa del borrador de Permiso, la Hoja de Datos, la solicitud del Permiso y el PIP en las siguientes ubicaciones de depósito de documentos: Biblioteca Pública de Eunice (1003 Avenida N, Eunice); Biblioteca Pública de Carlsbad (101 S. Halagueno St, Carlsbad). A partir de la fecha de emisión de este aviso por parte del NMED, ambas bibliotecas están abiertas al público. En caso de que alguna de las dos bibliotecas restrinja el acceso del público durante este período de comentarios públicos debido a la actual emergencia de salud pública de COVID-19, el NMED pide a los miembros de la comunidad que soliciten los documentos como se ha descrito anteriormente.

PUBLIC NOTICE
October 1, 2020
Groundwater Discharge Permit Proposed for Approval
DP-831, Waste Isolation Pilot Plant
Public Comment Period Open Until November 15, 2020

The New Mexico Environment Department (NMED or department) Ground Water Quality Bureau (GWQB) provides notice that the following draft Groundwater Discharge Permit has been proposed for approval: The U.S. Department of Energy's Waste Isolation Pilot Plant (WIPP or Facility) proposes to renew and modify the groundwater discharge permit (DP-831 or Permit) for the discharge of up to 9,586,995 gallons per day of industrial wastewater and stormwater to an impoundment and disposal system and up to 23,000 gallons per day of domestic wastewater to a treatment and disposal system. The draft Permit modification consists of the addition of one new salt cell and four new impoundments that will receive industrial wastewater and stormwater.

Applicant: U.S. Department of Energy's WIPP, Reinhard Knerr, Manager, Carlsbad Field Office, P.O. Box 3090, Carlsbad, NM 88221

Facility Description: The Facility is a mined geologic repository for the disposal of transuranic (TRU) waste. The underground repository at the Facility is located 2,150 feet below land surface in the bedded salt of the Salado Formation. The draft Permit addresses discharges that are not directly associated with the storage of TRU waste.

Discharge Locations: Discharge locations at the Facility potentially affecting groundwater include an impoundment system for domestic wastewater, three active salt cells, four lined impoundments for stormwater in contact with salt cells, three lined impoundments for stormwater not in contact with salt cells, and four lined impoundments for non-hazardous, non-radioactive, industrial wastewater.

Activities that Produce the Discharge: Discharges at this Facility include stormwater collected from the Facility grounds and from active and inactive salt cells which are directed to synthetically lined impoundments. Additionally, the Facility discharges industrial wastewater from various sources including brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non--hazardous, non-radioactive wastewaters, to synthetically lined impoundments. The Facility discharges domestic wastewater to a synthetically lined impoundment system for treatment and disposal by evaporation. The Facility proposes to discharge brine produced from the operations of the to be constructed Salt Reduction System to two synthetically lined impoundments.

Facility Location: The Facility is located off Highway 128, approximately 26 miles southeast of Carlsbad, in Sections 20, 21, 28, and 29, Township 22S, Range 31E, Eddy County.

Potential Contaminants: Potential contaminants from these types of discharge include nitrogen compounds, dissolved solids, and chloride.

Groundwater Most Likely to be Affected by the Discharge: Groundwater most likely to be affected is at a depth of approximately 35 to 160 feet and had a pre-discharge total dissolved solids concentration of 3,400 milligrams per liter.

Public Involvement: NMED maintains a Facility-specific Public Involvement Plan (PIP) for each permitting action so that the department can plan for providing public participation opportunities and information that may be needed for the community to participate in a permitting process. The department's issuance of this public notice (Notice) is addressed in the PIP.

How to obtain more information: To learn more about this draft Permit and the permitting process, or to obtain a copy of the draft Permit, the associated Fact Sheet, which provides a brief summary of the basis for the draft Permit conditions and is available in both English and Spanish, or the associated PIP, please contact the NMED Permit Contact, Ms. Avery Young, by telephone at (505) 827-2909 or by email at Avery.Young@state.nm.us. NMED will provide, at no cost, documents either by email or US mail to any community member requesting a copy. Please specify how you would like the document(s) delivered. NMED maintains a facility-specific mailing list for persons wishing to receive notices for permitting actions associated with this Facility. When requesting documents, please specify if you would like to be added to this list.

The draft Permit, Fact Sheet, and PIP may be viewed online at https://www.env.nm.gov/gwqb/dp-831/. For a Spanish translation of the Fact Sheet, visit https://www.env.nm.gov/gwqb/dp-831-es/.

NMED has placed a hard copy of the draft Permit, the Fact Sheet, the Permit application, and the PIP at the following document repository locations: Eunice Public Library (1003 Avenue N, Eunice); Carlsbad Public Library (101 S. Halagueno St, Carlsbad). As of the date of NMED's issuance of this notice, both libraries are open to the public. In the event either library restricts public access during this public comment period due to the ongoing COVID-19 public health emergency, NMED asks community members to request documents as described above.

How to submit a comment or request a hearing: NMED is allowing 45 days after the date of publication of this

Notice for anyone to submit written comments and/or a request for a public hearing regarding the draft Permit. Requests for a public hearing shall be in writing and shall set forth the reasons why a hearing should be held. Comments or a request for hearing regarding the draft Permit should be addressed to the GWQB, PO Box 5469, Santa Fe, NM 87502-5469, or emailed to the NMED Permit contact, Ms. Avery Young, at Avery.Young@state.nm.us, reference line "DP-831 Comments."

A hearing will be held if the New Mexico Secretary of Environment (Secretary) determines that there is substantial public interest. The Secretary will appoint a hearing officer and will ensure the hearing is held in the locally affected community. During the hearing process, members of the public may file technical testimony prior to the hearing and may provide verbal and written comments during the hearing itself. Once the hearing is complete, the hearing officer will provide the Secretary with a hearing report that includes a suggested determination. The Secretary will then issue a Final Order which will complete the Administrative Record (Record) for the permitting action. After the Record for a permitting action is complete and all required information is available, NMED will approve, approve with conditions, or disapprove the Permit based on the Record and/or Final Order from the Secretary.

How to request accommodations: If you are a non-English speaker, do not speak English well, or if you have a disability, you may contact Ms. Avery Young by telephone during normal business hours at (505) 827-2909 or by email at Avery.Young@state.nm.us to request assistance, translation services, an interpreter, or other reasonable accommodations in order to learn more about the Permit or the permitting process, or to participate in activities associated with the permitting process. Requested translation, interpretation services, and accommodations or services for persons with disabilities will be arranged. Telephone conversation assistance is available through Relay New Mexico at no charge for people who are deaf, hard of hearing, or have difficulty speaking on the phone, by calling 1-800-659-1779; TTY users: 1-800-659-8331; Spanish: 1-800-327-1857. Telephone interpretation assistance for persons that are a non-English speaker or do not speak English well is available at no charge when calling NMED.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this Notice or any of NMED's non-discrimination programs, policies or procedures, you may contact: Kristine Yurdin, Non-Discrimination Coordinator, New Mexico Environment Department, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@state.nm.us. If you believe that you have been discriminated against with respect to a NMED program or activity, you may contact the Non-Discrimination Coordinator identified above or visit our website at https://www.env.nm.gov/non-employee-discrimination--complaint-page/ to learn how and where to file a complaint of discrimination.

AVISO PÚBLICO
1 de octubre de 2020
Permiso de Descarga de Aguas Subterráneas propuesto para su aprobación
DP-831, Planta Piloto de Aislamiento de Residuos
Período de comentarios públicos abierto hasta el 15 de noviembre de 2020

La Oficina de Calidad de Aguas Subterráneas (GWQB, por sus siglas en inglés) del Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés) avisa que el siguiente borrador de Permiso de Descarga de Aguas Subterráneas ha sido propuesto para su aprobación: La Planta Piloto de Aislamiento de Residuos (WIPP, por sus siglas en inglés) del Departamento de Energía de los Estados Unidos propone renovar y modificar el Permiso de Descarga (DP-831) para la descarga de hasta 9,586,995 galones por día de aguas residuales industriales y aguas pluviales a un sistema de embalse y eliminación y hasta 23,000 galones por día de aguas residuales domésticas a un sistema de tratamiento y eliminación. La modificación del borrador de Permiso consiste en la adición de una nueva celda de sal y cuatro nuevos embalses que recibirán aguas residuales industriales y aguas pluviales.

Solicitante: WIPP del Departamento de Energía de los Estados Unidos, Reinhard Knerr, gerente, oficina local en Carlsbad, P.O. Box 3090, Carlsbad, NM 88221

Descripción de la Instalación: La Instalación es un depósito geológico minado para la eliminación de residuos transuránicos (TRU). El depósito subterráneo está situado a 2,150 pies por debajo de la superficie del suelo en el lecho de sal de la Formación Salado. El borrador de Permiso aborda vertidos que no están directamente relacionados con el almacenamiento de los residuos TRU.

Ubicaciones de las descargas: Los lugares de descarga en la Instalación que pueden afectar las aguas subterráneas incluyen un sistema de embalse para las aguas residuales domésticas, tres celdas de sal activas, cuatro embalses revestidos para aguas pluviales en contacto con celdas de sal, tres embalses revestidos para aguas pluviales que no están en contacto con celdas de sal y cuatro embalses revestidos para aguas residuales industriales no peligrosas y no radioactivas.

Actividades que producen la descarga: Las descargas en esta Instalación incluyen aguas pluviales recogidas de los terrenos de la Instalación y de celdas de sal activas e inactivas que se dirigen a embalses revestidos sintéticamente. Además, las instalaciones descargan aguas residuales industriales de varias fuentes, entre ellas salmuera, aguas de purga de muestreo y de pozos de monitoreo en vías de desarrollo de la Instalación, y otras aguas residuales industriales no peligrosas y no radiactivas, a embalses revestidos de material sintético. La Instalación descarga aguas residuales domésticas a un sistema de embalse revestido de material sintético para su tratamiento y eliminación por evaporación. La Instalación propone descargar la salmuera producida por las operaciones del sistema de reducción de sal a dos embalses revestidos de material sintético.

Ubicación de la instalación: La Instalación se encuentra junto a la Highway 128, aproximadamente a 26 millas al sureste de Carlsbad, en las Secciones 20, 21, 28 y 29, Municipio 22S, Rango 31E, condado de Eddy.

Posibles contaminantes: Los posibles contaminantes de estos tipos de descarga incluyen compuestos de nitrógeno, sólidos disueltos y cloruro.

Agua subterránea con más probabilidad de ser afectada por la descarga: El agua subterránea que más probablemente se verá afectada se encuentra a una profundidad de aproximadamente 35 a 160 pies y tenía una concentración de sólidos disueltos totales antes del vertido de 3,400 miligramos por litro.

Participación pública: El NMED mantiene un Plan de Participación Pública (PIP) específico de la Instalación para cada acción de permisos, de manera que el departamento pueda planificar para proporcionar oportunidades de participación pública y la información que pueda ser necesaria para que la comunidad participe en un proceso de permisos. La emisión de este aviso público (Aviso) por parte del departamento se aborda en el PIP.

Cómo obtener más información: Para aprender más acerca de este borrador de Permiso y el proceso de permiso, o para obtener una copia del borrador de Permiso, la Hoja de Datos asociada, que proporciona un breve resumen de las bases de las condiciones del borrador de permiso y está disponible tanto en inglés como en español, o el PIP asociado, comuníquese con el contacto de permisos del NMED, la Sra. Avery Young, por teléfono al (505) 827-2909 o por correo electrónico en Avery.Young@state.nm.us. El NMED proveerá, sin costo alguno, documentos ya sea por correo electrónico o por correo postal de los Estados Unidos a cualquier miembro de la comunidad que solicite una copia. Haga el favor de especificar cómo desea que se le entreguen los documentos. El NMED mantiene una lista de correo específica de la Instalación para las personas que deseen recibir avisos de las acciones de permiso asociadas con esta Instalación. Cuando solicite documentos especifique si desea que se le agregue a esta lista.

El borrador de Permiso, la Hoja de Datos y el PIP pueden verse en línea en https://www.env.nm.gov/gwqb/dp-831/. Para obtener una traducción en español de la Hoja de Datos, visite https://www.env.nm.gov/gwqb/dp-831-es/.

El NMED ha colocado una copia impresa del borrador de Permiso, la Hoja de Datos, la solicitud del Permiso y el PIP en las siguientes ubicaciones de depósito de documentos: Biblioteca Pública de Eunice (1003 Avenida N, Eunice); Biblioteca Pública de Carlsbad (101 S. Halagueno St, Carlsbad). A partir de la fecha de emisión de este aviso por parte del NMED, ambas bibliotecas están abiertas al público. En caso de que alguna de las dos bibliotecas restrinja el acceso del público durante este período de comentarios públicos debido a la actual emergencia de salud pública de COVID-19, el NMED pide a los miembros de la comunidad que soliciten los documentos como se ha descrito anteriormente.

Cómo presentar un comentario o solicitar una audiencia: NMED permite 45 días después de la fecha de publicación de este Aviso para que cualquier persona pueda presentar comentarios por escrito y/o una solicitud de audiencia pública con respecto al borrador de Permiso. Las solicitudes para una audiencia pública deberán hacerse por escrito y en ellas se expondrán las razones por las que debe celebrarse una audiencia. Los comentarios o una solicitud de audiencia con respecto al borrador de Permiso deben dirigirse a GWQB, P.O. Box 5469, Santa Fe, NM 87502-5469, o por correo electrónico al contacto de permisos de NMED, la Sra. Avery Young, en Avery.Young@state.nm.us, línea de referencia "DP-831 Comentarios".

Se celebrará una audiencia si el secretario de Medio Ambiente de Nuevo México (secretario) determina que hay un considerable interés por parte del público. El secretario nombrará un funcionario de audiencias y se asegurará de que la audiencia se lleve a cabo en la comunidad local afectada. Durante el proceso de la audiencia, los miembros del público podrán presentar testimonios técnicos antes de la audiencia y podrán hacer comentarios verbales y por escrito durante la propia audiencia. Una vez concluida la audiencia, el funcionario de audiencias entregará al secretario un informe de la audiencia que incluirá una determinación sugerida. A continuación, el secretario emitirá una Orden Final que completará el Registro Administrativo (Registro) para la acción de permiso. Después de que el Registro para la acción de permiso esté completo y toda la información requerida esté disponible, NMED aprobará, aprobará con condiciones, o denegará el Permiso basado en el Registro y/o la Orden Final del secretario.

Cómo solicitar acomodaciones: Si no habla inglés, no lo habla bien o si tiene alguna discapacidad, puede ponerse en contacto con la Sra. Avery Young por teléfono durante el horario normal de oficina al (505) 827-2909 o por correo electrónico en Avery.Young @state.nm.us para solicitar asistencia, servicios de traducción, un intérprete u otras acomodaciones razonables a fin de poder aprender más sobre el permiso o el proceso de permiso, o para participar en actividades relacionadas con el proceso de permiso. Se organizarán los servicios de traducción e interpretación solicitados, así como las acomodaciones o servicios para personas con discapacidades. Hay disponible asistencia para conversaciones telefónicas a través de Relay New Mexico sin costo alguno para las personas que están sordas, tienen problemas de audición o tienen dificultades para hablar por teléfono, llamando al 1-800-659-1779; los usuarios de

TTY: 1-800-659-8331; español: 1-800-327-1857. La asistencia para una interpretación telefónica para las personas que no hablan inglés o que no lo hablan bien está disponible sin costo alguno llamando al NMED.

NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo exigido por las leyes y los reglamentos correspondientes. NMED es responsable de la coordinación de los esfuerzos de cumplimiento y la recepción de consultas relativas a los requisitos de no discriminación implementados por 40 C.F.R. Partes 5 y 7, incluido el Título VI de la Ley de Derechos Civiles de 1964, según enmendada; Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, Título IX de las Enmiendas de Educación de 1972 y la Sección 13 de las Enmiendas a la Ley Federal de Control de Contaminación del Agua de 1972. Si usted tiene preguntas sobre este aviso o sobre cualquier programa, política o procedimiento de no discriminación de NMED, usted puede comunicarse con la Coordinadora de No Discriminación: Kristine Yurdin, Non-Discrimination Coordinator, New Mexico Environment Department, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@state.nm.us. Si usted piensa que ha sido discriminado/a con respecto a un programa o actividad de NMED, usted puede comunicarse con la Coordinadora de No Discriminación antes indicada o visitar nuestro sitio web en https://www.env.nm.gov/non-employee-discrimination-complaint-page/ para aprender cómo y dónde presentar una queja de discriminación.

PUBLIC NOTICE

October 1, 2020
Groundwater Discharge Permit
Proposed for Approval
DP-831, Waste Isolation Pilot Plant
Public Comment Period Open Until November 15, 2020

The New Mexico Environment Department (NMED or department) Ground Water Quality Bureau (GWQB) provides notice that the following draft Groundwater Discharge Permit has been proposed for approval: The U.S. Department of Energy's Waste Isolation Pilot Plant (WIPP or Facility) proposes to renew and modify the groundwater discharge permit (DP-831 or Permit) for the discharge of up to 9,586,995 gallons per day of industrial wastewater and stormwater to an impoundment and disposal system and up to 23,000 gallons per day of domestic wastewater to a treatment and disposal system. The draft Permit modification consists of the addition of one new salt cell and four new impoundments that will receive industrial wastewater and stormwater.

Applicant: U.S. Department of Energy's WIPP, Reinhard Knerr, Manager, Carlsbad Field Office, P.O. Box 3090, Carlsbad, NM 88221

Facility Description: The Facility is a mined geologic repository for the disposal of transuranic (TRU) waste. The underground repository at the Facility is located 2,150 feet below land surface in the bedded salt of the Salado Formation. The draft Permit addresses discharges that are not directly associated with the storage of TRU waste.

Discharge Locations: Discharge locations at the Facility potentially affecting groundwater include an impoundment system for domestic wastewater, three active salt cells, four lined impoundments for stormwater in contact with salt cells, three lined impoundments for stormwater not in contact with salt cells, and four lined impoundments for non-hazardous, non-radioactive, industrial wastewater.

Activities that Produce the Discharge: Discharges at this Facility include stormwater collected from the Facility grounds and from active and inactive salt cells which are directed to synthetically lined impoundments. Additionally, the Facility discharges industrial wastewater from various sources including brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous, non-radioactive wastewaters, to synthetically lined impoundments. The Facility discharges domestic wastewater to a synthetically lined impoundment system for treatment and disposal by evaporation. The Facility proposes to discharge brine produced from the operations of the to be constructed Salt Reduction System to two synthetically lined impoundments.

Facility Location: The Facility is located off Highway 128, approximately 26 miles southeast of Carlsbad, in Sections 20, 21, 28, and 29, Township 22S, Range 31E, Eddy County.

Potential Contaminants: Potential contaminants from these types of discharge include nitrogen compounds, dissolved solids, and chloride.

Groundwater Most Likely to be Affected by the Discharge: Groundwater most likely to be affected is at a depth of approximately 35 to 160 feet and had a pre-discharge total dissolved solids concentration of 3,400 milligrams per liter.

Public Involvement: NMED maintains a Facility-specific Public Involvement Plan (PIP) for each permitting action so that the department can plan for providing public participation opportunities and information that may be needed for the community to participate in a permitting process. The department's issuance of this public notice (Notice) is addressed in the PIP.

How to obtain more information: To learn more about this draft Permit and the permitting process, or to obtain a copy of the draft Permit, the associated Fact Sheet, which provides a brief summary of the basis for the draft Permit conditions and is available in both English and Spanish, or the associated PIP, please contact the NMED Permit Contact, Ms. Avery Young, by telephone at (505) 827-2909 or by email at Avery.Young@state.nm.us. NMED will provide, at no cost, documents either by email or US mail to any community member requesting a copy. Please specify how you would like the document(s) delivered. NMED maintains a facility-specific mailing list for persons wishing to receive notices for permitting actions associated with this Facility. When requesting documents, please specify if you would like to be added to this list.

The draft Permit, Fact Sheet, and PIP may be viewed online at https://www.env.nm.gov/gwqb/dp-831/. For a Spanish translation of the Fact Sheet, visit https://www.env.nm.gov/gwqb/dp-831-es/.

NMED has placed a hard copy of the draft Permit, the Fact Sheet, the Permit application, and the PIP at the following document repository locations: Eunice Public Library (1003 Avenue N, Eunice); Carlsbad Public Library (101 S. Halagueno St, Carlsbad). As of the date of NMED's issuance of this notice, both libraries are open to the public. In the event either library restricts public access during this public comment period due to the ongoing COVID-19 public health emergency, NMED asks community members to request documents as described above.

How to submit a comment or request a hearing: NMED is allowing 45 days after the date of publication of this Notice for anyone to submit written comments and/or a request for a public hearing regarding the draft Permit. Requests for a public hearing shall be in writing and shall set forth the reasons why a hearing should be held. Comments or a request for hearing regarding the draft Permit should be addressed to the GWQB, PO Box 5469, Santa Fe, NM 87502-5469, or emailed to the NMED Permit contact, Ms. Avery Young, at Avery.Young@state.nm.us, reference line "DP-831 Comments."

A hearing will be held if the New Mexico Secretary of Environment (Secretary) determines that there is substantial public interest. The Secretary will appoint a hearing officer and will ensure the hearing is held in the locally affected community. During the hearing process, members of the public may file technical testimony prior to the hearing and may provide verbal and written comments during the hearing itself. Once the hearing is complete, the hearing officer will provide the Secretary with a hearing report that includes a suggested determination. The Secretary will then issue a Final Order which will complete the Administrative Record (Record) for the permitting action. After the Record for a permitting action is complete and all required information is available, NMED will approve, approve with conditions, or disapprove the Permit based on the Record and/or Final Order from the Secretary.

How to request accommodations: If you are a non-English speaker, do not speak English well, or if you have a disability, you may contact Ms. Avery Young by telephone during normal business hours at (505) 827-2909 or by email at Avery.Young@state.nm.us to request assistance, translation services, an interpreter, or other reasonable accommodations in order to learn more about the Permit or the permitting process, or to participate in activities associated with the permitting process. Requested translation, interpretation services, and accommodations or services for persons with disabilities will be arranged. Telephone conversation assistance is available through Relay New Mexico at no charge for people who are deaf, hard of hearing, or have difficulty speaking on the phone, by calling 1-800-659-1779; TTY users: 1-800-659-8331; Spanish: 1-800-327-1857. Telephone interpretation assistance for persons that are a non-English speaker or do not speak English well is available at no charge when calling NMED.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this Notice or any of NMED's non-discrimination programs, policies or procedures, you may contact: Kristine Yurdin, Non-Discrimination Coordinator, New Mexico Environment Department, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@state.nm.us. If you believe that you have been discriminated against with respect to a NMED program or activity, you may contact the Non-Discrimination Coordinator identified above or visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

AVISO PÚBLICO

1 de octubre de 2020
Permiso de Descarga de Aguas Subterráneas propuesto para su aprobación
DP-831, Planta Piloto de Aislamiento de Residuos
Período de comentarios públicos abierto hasta el 15 de noviembre de 2020

La Oficina de Calidad de Aguas Subterráneas (GWQB, por sus siglas en inglés) del Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés) avisa que el siguiente borrador de Permiso de Descarga de Aguas Subterráneas ha sido propuesto para su aprobación: La Planta Piloto de Aislamiento de Residuos (WIPP, por sus siglas en inglés) del Departamento de Energía de los Estados Unidos propone renovar y modificar el Permiso de Descarga (DP-831) para la descarga de hasta 9,586,995 galones por día de aguas residuales industriales y aguas pluviales a un sistema de embalse y eliminación y hasta 23,000 galones por día de aguas residuales domésticas a un sistema de tratamiento y eliminación. La modificación del borrador de Permiso consiste en la adición de una nueva celda de sal y cuatro nuevos embalses que recibirán aguas residuales industriales y aguas pluviales.

Solicitante: WIPP del Departamento de Energía de los Estados Unidos, Reinhard Knerr, gerente, oficina local en Carlsbad, P.O. Box 3090, Carlsbad, NM 88221

Descripción de la Instalación: La Instalación es un depósito geológico minado para la eliminación de residuos transuránicos (TRU). El depósito subterráneo está situado a 2,150 pies por debajo de la superficie del suelo en el lecho de sal de la Formación Salado. El borrador de Permiso aborda vertidos que no están directamente relacionados con el almacenamiento de los residuos TRU.

Ubicaciones de las descargas: Los lugares de descarga en la Instalación que pueden afectar las aguas subterráneas incluyen un sistema de embalse para las aguas residuales domésticas, tres celdas de sal activas, cuatro embalses revestidos para aguas pluviales en contacto con celdas de sal, tres embalses revestidos para aguas pluviales que no están en contacto con celdas de sal y cuatro embalses revestidos para aguas residuales industriales no peligrosas y no radioactivas.

Actividades que producen la descarga: Las descargas en esta Instalación incluyen aguas pluviales recogidas de los terrenos de la Instalación y de celdas de sal activas e inactivas que se dirigen a embalses revestidos sintéticamente. Además, las instalaciones descargan aguas residuales industriales de varias fuentes, entre ellas salmuera, aguas de purga de muestreo y de pozos de monitoreo en vías de desarrollo de la Instalación, y otras aguas residuales industriales no peligrosas y no radiactivas, a embalses revestidos de material sintético. La Instalación descarga aguas residuales domésticas a un sistema de embalse revestido de material sintético para su tratamiento y eliminación por evaporación. La Instalación propone descargar la salmuera producida por las operaciones del sistema de reducción de sal a dos embalses revestidos de material sintético.

.

Ubicación de la instalación: La Instalación se encuentra junto a la Highway 128, aproximadamente a 26 millas al sureste de Carlsbad, en las Secciones 20, 21, 28 y 29, Municipio 22S, Rango 31E, condado de Eddy.

Posibles contaminantes: Los posibles contaminantes de estos tipos de descarga incluyen compuestos de nitrógeno, sólidos disueltos y cloruro.

Agua subterránea con más probabilidad de ser afectada por la descarga: El agua subterránea que más probablemente se verá afectada se encuentra a una profundidad de aproximadamente 35 a 160 pies y tenía una concentración de sólidos disueltos totales antes del vertido de 3,400 miligramos por litro.

Participación pública: El NMED mantiene un Plan de Participación Pública (PIP) específico de la Instalación para cada acción de permisos, de manera que el departamento pueda planificar para proporcionar oportunidades de participación pública y la información que pueda ser necesaria para que la comunidad participe en un proceso de permisos. La emisión de este aviso público (Aviso) por parte del departamento se aborda en el PIP.

Cómo obtener más información: Para aprender más acerca de este borrador de Permiso y el proceso de permiso, o para obtener una copia del borrador de Permiso, la Hoja de Datos asociada, que proporciona un breve resumen de las bases de las condiciones del borrador de permiso y está disponible tanto en inglés como en español, o el PIP asociado, comuníquese con el contacto de permisos del NMED, la Sra. Avery Young, por teléfono al (505) 827-2909 o por correo electrónico en Avery.Young@state.nm.us. El NMED proveerá, sin costo alguno, documentos ya sea por correo electrónico o por correo postal de los Estados Unidos a cualquier miembro de la comunidad que solicite una copia. Haga el favor de especificar cómo desea que se le entreguen los documentos. El NMED mantiene una lista de correo específica de la Instalación para las personas que deseen recibir avisos de las acciones de permiso asociadas con esta Instalación. Cuando solicite documentos especifique si desea que se le agregue a esta lista.

El borrador de Permiso, la Hoja de Datos y el PIP pueden verse en línea en https://www.env.nm.gov/gwqb/dp-831/. Para obtener una traducción en español de la Hoja de Datos, visite https://www.env.nm.gov/gwqb/dp-831-es/.

El NMED ha colocado una copia impresa del borrador de Permiso, la Hoja de Datos, la solicitud del Permiso y el PIP en las siguientes ubicaciones de depósito de documentos: Biblioteca Pública de Eunice (1003 Avenida N, Eunice); Biblioteca Pública de Carlsbad (101 S. Halagueno St, Carlsbad). A partir de la fecha de emisión de este aviso por parte del NMED, ambas bibliotecas están abiertas al público. En caso de que alguna de las dos bibliotecas restrinja el acceso del público durante este período de comentarios públicos debido a la actual emergencia de salud pública de COVID-19, el NMED pide a los miembros de la comunidad que soliciten los documentos como se ha descrito anteriormente.

Cómo presentar un comentario o solicitar una audiencia: NMED permite 45 días después de la fecha de publicación de este Aviso para que cualquier persona pueda presentar comentarios por escrito y/o una solicitud de audiencia pública con respecto al borrador de Permiso. Las solicitudes para una audiencia pública deberán hacerse por escrito y en ellas se expondrán las razones por las que debe celebrarse una audiencia. Los comentarios o una solicitud de audiencia con respecto al borrador de Permiso deben dirigirse a GWQB, P.O. Box 5469, Santa Fe, NM 87502-5469, o por correo electrónico al contacto de permisos de NMED, la Sra. Avery Young, en Avery.Young@state.nm.us, línea de referencia "DP-831 Comentarios".

Se celebrará una audiencia si el secretario de Medio Ambiente de Nuevo México (secretario) determina que hay un considerable interés por parte del público. El secretario nombrará un funcionario de audiencias y se asegurará de que la audiencia se lleve a cabo en la comunidad local afectada. Durante el proceso de la audiencia, los miembros del público podrán presentar testimonios técnicos antes de la audiencia y podrán hacer comentarios verbales y por escrito durante la propia audiencia. Una vez concluida la audiencia, el funcionario de audiencias entregará al secretario un informe de la audiencia que incluirá una determinación sugerida. A continuación, el secretario emitirá una Orden Final que completará el Registro Administrativo (Registro) para la acción de permiso. Después de que el Registro para la acción de permiso esté completo y toda la información requerida esté disponible, NMED aprobará, aprobará con condiciones, o denegará el Permiso basado en el Registro y/o la Orden Final del secretario.

Cómo solicitar acomodaciones: Si no habla inglés, no lo habla bien o si tiene alguna discapacidad, puede ponerse en contacto con la Sra. Avery Young por teléfono durante el horario normal de oficina al (505) 827-2909 o por correo electrónico en Avery.Young@state.nm.us para solicitar asistencia, servicios de traducción, un intérprete u otras acomodaciones razonables a fin de poder aprender más sobre el permiso o el proceso de permiso, o para participar en actividades relacionadas con el proceso de permiso. Se organizarán los servicios de traducción e interpretación solicitados, así como las acomodaciones o servicios para personas con discapacidades. Hay disponible asistencia para conversaciones telefónicas a través de *Relay New Mexico* sin costo alguno para las personas que están sordas, tienen problemas de audición o tienen dificultades para hablar por teléfono, llamando al 1-800-659-1779; los usuarios de TTY: 1-800-659-8331; español: 1-800-327-1857. La asistencia para una interpretación telefónica para las personas que no hablan inglés o que no lo hablan bien está disponible sin costo alguno llamando al NMED.

NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo exigido por las leyes y los reglamentos correspondientes. NMED es responsable de la coordinación de los esfuerzos de cumplimiento y la recepción de consultas relativas a los requisitos de no discriminación implementados por 40 C.F.R. Partes 5 y 7, incluido el Título VI de la Ley de Derechos Civiles de 1964, según enmendada; Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, Título IX de las Enmiendas de Educación de 1972 y la Sección 13 de las Enmiendas a la Ley Federal de Control de Contaminación del Agua de 1972. Si usted tiene preguntas sobre este aviso o sobre cualquier programa, política o procedimiento de no discriminación de NMED, usted puede comunicarse con la Coordinadora de No Discriminación: Kristine Yurdin, Non-Discrimination Coordinator, New Mexico Environment Department, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@state.nm.us. Si usted piensa que ha sido discriminado/a con respecto a un programa o actividad de NMED, usted puede comunicarse con la Coordinadora de No Discriminación antes indicada o visitar nuestro sitio web en https://www.env.nm.gov/non-employee-discrimination-complaint-page/ para aprender cómo y dónde presentar una queja de discriminación.

Carlsbad, NM 88221

RE: Draft Discharge Permit Renewal and Modification, DP-831, Waste Isolation Pilot Plant

Dear Mr. Knerr:

The New Mexico Environment Department (NMED) hereby provides notice to the U.S. Department of Energy of the proposed approval of Ground Water Discharge Permit Renewal and Modification, DP-831, (copy enclosed), pursuant to Subsection H of 20.6.2.3108 NMAC. NMED will publish notice of the availability of the draft Discharge Permit in the near future for public review and comment and will forward a copy of that notice to you.

Prior to making a final ruling on the proposed Discharge Permit, NMED will allow 30 days from the date the public notice is published in the newspaper for any interested party, including the Discharge Permit applicant, i.e., yourself, to submit written comments and/or a request a public hearing. A hearing request shall set forth the reasons why a hearing is requested. NMED will hold a hearing in response to a timely hearing request if the NMED Secretary determines there is substantial public interest in the proposed Discharge Permit.

Please review the enclosed draft Discharge Permit carefully. Please be aware that this Discharge Permit may contain conditions that require the permittee to implement operational, monitoring or closure actions by a specified deadline.

NMED is taking all necessary precautions to reduce the spread of COVID-19. Given the current public health emergency, all monitoring and permit required activities must by conducted in accordance with the Governor's current Executive Orders and Public Health Orders. Please help to keep New Mexicans safe by visiting the New Mexico Department of Health's website to learn

SENDER: COMPLETE THIS SECTION

- Complete items 1, 2, and 3.
- Print your name and address on the reverse so that we can return the card to you.
- Attach this card to the back of the mailpiece, or on the front if space permits.

GROUND WATER DISCHARGE PERMIT RENEWAL and MODIFICATION
Waste Isolation Pilot Plant (WIPP), DP-831

I. INTRODUCTION

The New Mexico Environment Department (NMED) issues this groundwater Discharge Permit Renewal and Modification (Discharge Permit or DP-831) to the U.S. Department of Energy (DOE or Permittee) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978 §§74-6-1 through 74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Ground and Surface Water Protection Regulations, 20.6.2 NMAC.

NMED's purpose in issuing this Discharge Permit, and in imposing the requirements and conditions specified herein, is to control the discharge of water contaminants from the Waste Isolation Pilot Plant (WIPP or Facility) in order to protect groundwater and those segments of surface water gaining from groundwater inflow for present and potential future use as domestic and agricultural water supply and other uses, and to protect public health. It is NMED's determination in issuing this Discharge Permit that the Permittee has met the requirements of Subsection C of 20.6.2.3109 NMAC. The Permittee is responsible for complying with the terms and conditions of this Discharge Permit pursuant to Section 20.6.2.3104 NMAC; failure may result in an NMED enforcement action(s) (20.6.2.1220 NMAC).

Described below are the activities that produce the discharge, the location of the discharge, and the quantity, quality and flow characteristics:

The Permittee discharges domestic wastewater to a synthetically lined impoundment system for treatment and disposal by evaporation at a rate of up to 23,000 gallons per day (gpd). The system consists of seven synthetically lined impoundments (Facultative Lagoon System) comprised of Settling Lagoons 1 and 2, Polishing Lagoons 1 and 2, and Effluent Lagoons A, B, and C.

The Permittee may discharge non-domestic wastewater at the Facility in the following ways:

- Effluent Lagoons B and C of the Facultative Lagoon System receive industrial wastewater at a volume of up to 27,000 gpd from the following sources: wastewater from compressed air systems, brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous, non-radioactive wastewaters. The Permittee is authorized to discharge these industrial wastewaters to the Facultative Lagoon System for evaporative disposal.

- Evaporation Pond H-19 receives industrial wastewater at a volume of up to 50,000 gpd from the following sources: brine, purge waters from sampling and developing Facility monitoring wells, condensate from the Exhaust Shaft fan ductwork on the surface, and water collected from the Waste Shaft Sump, Exhaust Shaft Interception Wells, and other observation boreholes in the underground. The Permittee is authorized to discharge these industrial wastewaters to Evaporation Pond H-19 for evaporative disposal.

- The to-be-constructed Salt Reduction System will produce and discharge brine at a volume of up to 2,210 gpd. The Salt Reduction System, which is located within the Safety Significant Confinement Ventilation System (SSCVS), will discharge brine to two double synthetically lined impoundments, each with a leak detection system (Brine Retention Ponds East and West, collectively Brine Ponds). The Facility will use one brine retention pond while the other brine retention pond is closed for evaporation and removal of precipitated salt in order to maintain at least two feet of freeboard. The Permittee will transfer any remaining brine in the closed Brine Pond to Brine Salt Storage Pond 4 for evaporative disposal.

- The Permittee will mine salt and other subsurface materials during construction of the Facility. The Permittee will store this mined salt, as well as already mined salt on the surface in four stockpiles (Salt Cells 1, 2, 3, and 5). Salt Storage Ponds 2 and 3 are two double synthetically lined impoundments, each with leak detection, that collect stormwater runoff that contacts Salt Cells 2 and 3. The total storage capacity of Salt Storage Ponds 2 and 3 is 21,737,254 gallons. Salt Storage Pond 5, a double synthetically lined stormwater impoundment with a leak detection system, will collect stormwater runoff in contact with Salt Cell 5. The storage capacity of Salt Storage Pond 5 will be 6,355,404 gallons. Salt Cell 1 no longer receives salt and is capped with synthetic material and an earthen cover. Salt Storage Pond 1, a synthetically lined impoundment, collects stormwater runoff in contact with this stockpile in synthetically lined diversion ditches directed to Salt Storage Pond 1. The storage capacity of Salt Storage Pond 1 is 3,301,634 gallons. With proper operation and maintenance, the storage capacity of each salt storage pond is sufficient to contain a 24-hour, 100-year (5.84-inch rainfall) storm event.

- Brine Salt Storage Pond 4, a double synthetically lined storm water impoundment with a leak detection system, collects stormwater runoff from the SSCVS area. The storage capacity of Brine Salt Storage Pond 4 is 8,668,722 gallons. With proper operation and maintenance, the capacity of the Brine Salt Storage Pond 4 is sufficient to contain a 24-hour, 100-year (5.84-inch rainfall) storm event.

- Storm Water Ponds 1, 2, and 3, three synthetically lined impoundments, collect additional stormwater runoff from the Facility's paved areas and roofs. This runoff is not in contact with the salt stockpiles or other waste materials at the Facility and the Permittee may use the impounded water for dust control, soil compaction, and other construction activities.

The Permittee stores salt and other subsurface materials mined during construction of the Facility, as well as currently mined salt, on the surface in four stockpiles (Salt Cells 1, 2, 3, and 5). The Permittee closed Salt Cell 1 with a 60-mil HDPE synthetic liner cover and two feet of native soil, as well as a 60-mil HDPE synthetically lined drainage system for stormwater runoff collection. Salt Cells 2 and 3 were constructed with six inches of prepared subgrade, a 60-mil HDPE liner, a

200-mil Geonet drainage layer, an eight-ounce geotextile fabric, and the fabric is then covered with two feet of screened native soil. Each salt cell is sloped toward the center, which contains a collection trench and pipe for conveyance of water to Salt Storage Ponds 2 and 3. Salt Cell 5 will be constructed with a 60-mil HDPE liner on the bottom with a protective layer of native soil on top to protect the liner. The Permittee will install a HDPE pipe to collect and transmit by gravity the leachate and stormwater runoff water from Salt Cell 5 to Salt Storage Pond 5.

The Permittee constructed the Site and Preliminary Design Validation (SPDV) material pile as the Permittee excavated the shafts when construction first began at the WIPP site. The Permittee closed the SPDV material pile in the year 2000 with a geosynthetic liner cover installed on 6 inches of bedding material and covered with a minimum of three feet of earthen material.

The Permit Modification consists of the addition of one new salt storage cell and four new impoundments: Salt Cell 5, Salt Storage Pond 5, Brine Salt Storage Pond 4, Brine Retention Pond East, and Brine Retention Pond West. Salt Cell 5 adds a new salt storage location, which will receive overburden and salt from the construction of Shaft 5 and its associated underground connecting drifts. Salt Storage Pond 5 will receive both the leachate and stormwater in contact with mined salt located in Salt Cell 5.

The Facility is located near the Jal Highway (NM-128), 26 miles southeast of Carlsbad, in Sections 20, 21, 28, and 29, Township 22S, Range 31E, Eddy County.

The WIPP Facility is a mined geologic repository for the disposal of transuranic (TRU) waste. The underground repository is located 2,150 feet below land surface in the bedded salt of the Salado Formation. The WIPP first accepted waste in March 1999. In addition to this groundwater Discharge Permit, the NMED Hazardous Waste Bureau under the New Mexico Hazardous Waste Act and New Mexico's Hazardous Waste Regulations regulates the WIPP.

The WIPP Facility is geologically situated in the southeast portion of New Mexico within the Delaware Basin, which is part of the larger Permian Basin. The geologic formations below the Facility that are pertinent to this Discharge Permit, from deepest to shallowest, include: the Salado Formation (851 to 2,150 below ground surface [bgs]), the Rustler Formation (546 to 851 bgs), the Dewey Lake Formation (54 to 564 bgs), and, in the northeastern portion of the Facility, the Santa Rosa Formation (34 to 54 bgs). The Salado Formation consists predominately of polyhalite, with some halite, carbonates, anhydrites, and clay seams. The Rustler Formation consists of carbonates, anhydrites, and halites. The Dewey Lake Formation consists almost entirely of mudstone, claystone, siltstone, and interbedded sandstone, and is frequently referred to as the Dewey Lake Redbeds Formation. Geologists use the terms upper, middle, and lower Dewey Lake to describe the stratigraphic position in the formation and characteristics that related to the occurrence of saturated conditions. The upper Dewey Lake consists of a thick, generally unsaturated section. The middle Dewey Lake occurs above a sulfate cementation change, which results in saturated conditions and a natural water table in limited areas. The lower Dewey Lake is below the sulfate cementation change and has low permeability. The Santa Rosa Formation consists of gray and red sandstone with lenses of shale and conglomerate.

The vadose zone consists, from shallowest to deepest, of Quaternary dune sand (0 to 7.5 bgs), Mescalero caliche (7.5 to 17 bgs), and the Gatuña Formation (17 to 34 bgs). Recharge rates through the native soils are extremely low and there is little recharge through the vadose zone to the Santa Rosa Formation.

A discharge at this Facility is most likely to affect groundwater at a depth of approximately 34 to 160 feet. Natural groundwater is located in the middle portion of the Dewey Lake Formation at a depth of approximately 160 feet and has an average total dissolved solids concentration of approximately 3,400 milligrams per liter. The WIPP discovered a perched water zone in the lower Santa Rosa and upper Dewey Lake Formations in 1995 and determined that the probable sources of this shallow groundwater were the unlined impoundments constructed to capture stormwater runoff at the Facility and runoff from the above-ground salt piles. This shallow groundwater is contaminated with total dissolved solids, sulfate (SO_4), and chloride. After the discovery of the anthropogenically created shallow groundwater (referred to as shallow groundwater), the Permittee lined all impoundments at the Facility and installed a network of monitoring wells. The shallow groundwater has a flow direction of north to south. Natural, non-anthropogenic, groundwater occurs in the Dewey Lake Formation (referred to as natural groundwater in the Dewey Lake Formation) south of the WIPP facility at a depth of 160 feet. The Dewey Lake Formation has a relatively low hydraulic conductivity.

The first laterally continuous water-bearing zone below the Facility is within an approximately 30-foot-thick section of the Culebra Member of the Rustler Formation. Water in the Culebra Member is usually present in fractures and is confined by overlaying anhydrite and underlying clay and anhydrite beds. A network of monitoring wells monitors the Culebra Member.

NMED issued the original Discharge Permit on January 16, 1992, amended on August 28, 1995, renewed on July 3, 1997, amended on June 12, 1998 and on January 24, 2000, renewed on April 29, 2003, modified on December 22, 2003 and on December 29, 2006, renewed and modified on July 23, 2008, and last renewed on July 29, 2014. The application (i.e., discharge plan) consists of the materials submitted by the Permittee dated December 3, 2018 and materials contained in the administrative record prior to issuance of this Discharge Permit.

The Permittee shall manage the discharge in accordance with all conditions and requirements of this Discharge Permit.

NMED reserves the right to require a discharge permit modification in the event NMED determines that the Permittee is violating or may violate the requirements of 20.6.2 NMAC or are violating or may violate the standards of Section 20.6.2.3103 NMAC. NMED reserves this right pursuant to Section 20.6.2.3109 NMAC. An NMED requirement to modify the Discharge

Permit may result from a determination by NMED that structural controls and/or management practices approved under this Discharge Permit need to be more stringent to protect groundwater quality. NMED reserves the right to require the Permittee to implement abatement of water pollution and remediate groundwater quality.

NMED's issuance of this Discharge Permit does not relieve the Permittee of the responsibility to comply with the WQA, WQCC Regulations, and any other applicable federal, state and/or local laws and regulations, such as zoning requirements and nuisance ordinances.

This Discharge Permit may use the following acronyms and abbreviations.

Abbreviation	Explanation		Abbreviation	Explanation
BOD_5	biochemical oxygen demand (5-day)		NMED	New Mexico Environment Department
CFR	Code of Federal Regulations		NMSA	New Mexico Statutes Annotated
CFU	colony forming unit		NO_3-N	nitrate-nitrogen
Cl	chloride		NTU	nephelometric turbidity units
EPA	United States Environmental Protection Agency		QA/QC	Quality Assurance/Quality Control
gpd	gallons per day		TDS	total dissolved solids
HDPE	high-density polyethylene		TKN	total Kjeldahl nitrogen
LAA	land application area		total nitrogen	= TKN + NO_3-N
LADS	Land Application Data Sheet(s)		TRC	total residual chlorine
LDCRS	leak detection, collections, and recovery systems		TSS	total suspended solids
mg/L	milligrams per liter		WQA	New Mexico Water Quality Act
MPN	most probable number		WQCC	Water Quality Control Commission
NMAC	New Mexico Administrative Code		WWTF	Wastewater Treatment Facility
mL	milliliters			

II. FINDINGS

In issuing this Discharge Permit, NMED finds the following.

1. The Permittee is discharging effluent or leachate from the Facility so that such effluent or leachate may move into groundwater of the State of New Mexico that has an existing concentration of 10,000 mg/L or less of TDS, within the meaning of Subsection A of 20.6.2.3101 NMAC, without exceeding standards of 20.6.2.3103 NMAC for any water contaminant.

2. The Permittee is allowed to discharge effluent or leachate from the Facility directly or indirectly into groundwater pursuant to this Discharge Permit and Section 20.6.2.3104 NMAC.

3. The discharge from the Facility is not subject to any of the exemptions of Section 20.6.2.3105 NMAC including Subsection 20.6.2.3105.A which allows an exemption from obtaining a discharge permit if the discharge is composed of effluent or leachate which conforms to all the standards in Subsection A, B, and C of Section 20.6.2.3103 NMAC and has a total nitrogen concentration of 10 mg/L or less.

III. AUTHORIZATION TO DISCHARGE

The Permittee is responsible for ensuring that discharges authorized by this Discharge Permit are consistent with the terms and conditions herein pursuant to 20.6.2.3104 NMAC.

This Discharge Permit authorizes the Permittee to discharge up to 23,000 gpd of domestic wastewater to a synthetically lined facultative lagoon system for disposal by evaporation. The Facultative Lagoon System is authorized to accept up to 27,000 gpd of non-hazardous, non-radioactive industrial wastewater from compressed air systems at the Facility, brine, purge waters from sampling and developing Facility wells, and miscellaneous industrial non-hazardous, non-radioactive wastewater for disposal by evaporation. This Discharge Permit authorizes the Permittee to discharge up to 50,000 gpd of brine, purge waters, condensate from the Exhaust Shaft fan ductwork on the surface, and water collected from the Waste Shaft Sump, Exhaust Shaft Interception Wells, and other observation boreholes in the underground into Evaporation Pond H-19. This Discharge Permit also authorizes the Permittee to discharge up to 2,210 gpd of brine from a 3,000-gallon holding tank to Brine Retention Ponds East and West for disposal by evaporation. In order to maintain at least two feet of freeboard, the Permittee is authorized to transfer the remaining brine in the Brine Ponds to Brine Salt Storage Pond 4.

This Discharge Permit authorizes the Permittee to stockpile mined salt in four salt cells: Salt Pile 1 is closed with a cover; Salt Cells 2, 3 and 5 have authorized footprints of 6.2 acres, 5.2 acres, and 5.1 acres, respectively. The Permittee is authorized to collect stormwater runoff from these salt cells in three double synthetically lined impoundments with leak detection systems (Salt Storage Pond 2, Salt Storage Pond 3, and Salt Storage Pond 5) and one synthetically lined impoundment with a drainage system (Salt Storage Pond 1) for disposal by evaporation. This Discharge Permit authorizes the Permittee to collect stormwater runoff from the Facility's paved areas and roofs in Storm Water Ponds 1, 2, and 3, as well as Brine Salt Storage Pond 4. This runoff is not in contact with the salt stockpiles at the Facility, and runoff from Storm Water Ponds 1, 2, and 3 may be used for dust control, soil compaction, and other construction activities.

This Discharge Permit sets forth requirements for the discharge and disposal of domestic and non-domestic wastewater. Conditions in the Operational Plan, the Monitoring and Reporting, and the Closure Plan sections are categorized as follows:

- **Part A. Generally Applicable to All Discharges;**
- **Part B. Applicable to the Facultative Lagoon System;**
- **Part C. Applicable to the Evaporation Pond H-19, Brine Retention Pond East, Brine Retention Pond West, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3;**
- **Part D. Applicable to the Impoundments Containing Stormwater Runoff in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, 3, and 5) and to Salt Stockpiles (Salt Cells 1, 2, 3, and 5); and**
- **Part E. Applicable to Ground Water Monitoring.**

[20.6.2.3104 NMAC, Subsection C of 20.6.2.3106 NMAC, Subsection C of 20.6.2.3109 NMAC]

IV. CONDITIONS

NMED issues this Discharge Permit for the discharge of water contaminants subject to the following conditions.

OPERATIONAL PLAN

Part A. Generally Applicable to All Discharges

#	Operating Conditions Applicable to All Discharges
1.	The Permittee shall implement the following operational plan to ensure compliance with Title 20, Chapter 6, Parts 2 and 4 NMAC. [Subsection C of 20.6.2.3109 NMAC]
2.	The Permittee shall operate the Facility in a manner such that it does not violate the standards and requirements of Sections 20.6.2.3101 and 20.6.2.3103 NMAC. [20.6.2.3101 NMAC, 20.6.2.3103 NMAC, Subsection C of 20.6.2.3109 NMAC]
3.	The Permittee shall maintain the impoundment liners as to avoid conditions that could affect the liner or the structural integrity of the impoundments. Characterization of such conditions may include the following: • erosion damage; • animal burrows or other damage; • the presence of vegetation including aquatic plants, weeds, woody shrubs or trees growing within five feet of the top inside edge of a sub-grade impoundment, within

#	Operating Conditions Applicable to All Discharges
	five feet of the toe of the outside berm of an above-grade impoundment, or within the impoundment itself; • the presence of large debris or large quantities of debris in the impoundment; • evidence of seepage; or • evidence of berm subsidence. The Permittee shall routinely control vegetation growing around the impoundments by mechanical removal that is protective of the impoundment liner. The Permittee shall visually inspect the impoundments and surrounding berms on a monthly basis to ensure proper maintenance. In the event that inspection reveals any evidence of damage that threatens the structural integrity of an impoundment berm or liner, or that may result in an unauthorized discharge, the Permittee shall implement the Contingency Plan set forth in this Discharge Permit. The Permittee shall create and maintain a log of all impoundment inspections that describes the findings and repairs, the date of the inspection, and the name of the person responsible for the inspection. The Permittee shall make the log available to NMED upon request. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
4.	The Permittee shall preserve a minimum of one foot of freeboard between the liquid level in all the impoundments and the elevation of the top of the impoundment liner, except Brine Salt Storage Pond 4, Salt Storage Pond 5, and Brine Retention Ponds East and West shall maintain two feet of freeboard. In the event that the Permittee determines that the specified freeboard cannot be preserved in the impoundments, the Permittee shall implement the Contingency Plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

Part B. Applicable to the Facultative Lagoon System

#	Facultative Lagoon System - Operational Actions with Implementation Deadlines
5.	Within three years following the effective date of this Discharge Permit (**by DATE**), the Permittee shall measure the thickness of the settled solids in two impoundments (Settling Lagoon 1 and Settling Lagoon 2) that are part of the Facultative Lagoon System.

#	Facultative Lagoon System - Operational Actions with Implementation Deadlines
	The Permittee shall report the results of the solids thickness measurements to NMED in the subsequent required periodic monitoring report. The Permittee shall measure the thickness of settled solids in each impoundment in accordance with the following procedure. a) The division of the total surface area of the treatment impoundment into nine equal sub-areas. b) One measurement (to the nearest half foot) using a settled solids measurement device (core sampler) per sub-area. c) Calculation of the average of the nine measurements. In the event that the measured settled solids exceed one-third of the maximum liquid depth in the impoundment, the Permittee shall implement the Contingency Plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

#	Facultative Lagoon System - Operating Conditions
6.	The Permittee shall maintain fences around the Facultative Lagoon System to restrict access by wildlife, livestock, or unauthorized persons. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. The Permittee shall maintain the fences to serve the stated purpose throughout the term of this Discharge Permit. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
7.	The Permittee shall maintain signs indicating that the wastewater at the Facility is not potable. The Permittee shall post signs at the Facultative Lagoon System's entrance and other areas where there is potential for public contact with wastewater. The signs shall be printed in English and Spanish and shall remain visible and legible for the term of this Discharge Permit. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
8.	The Permittee shall utilize operators of the domestic wastewater collection, treatment and disposal systems that are certified by the State of New Mexico at the appropriate level pursuant to 20.7.4 NMAC. A certified operator or a direct supervisee of a certified operator shall perform the operations and maintenance of all or any part of the wastewater system.

#	Facultative Lagoon System - Operating Conditions
	The Permittee shall notify the NMED within 24 hours if at any time the Permittee no longer has a certified operator maintaining the system. [Subsection C of 20.6.2.3109 NMAC, 20.7.4 NMAC]

Part C. Applicable to the Evaporation Pond H-19, Brine Retention Pond East, Brine Retention Pond West, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3

#	Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Operational Actions with Implementation Deadlines
9.	Within 180 days following the effective date of this Discharge Permit (by DATE), the Permittee shall install fences around Storm Water Ponds 1, 2 and 3 to limit access by wildlife, livestock, or unauthorized persons. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. The Permittee shall maintain the fences to serve the stated purpose throughout the term of this Discharge Permit. Documentation of fence installation shall consist of a narrative statement describing the fences and gates with date-stamped photographs. The Permittee shall submit the documentation to NMED in the subsequent required periodic monitoring report. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
10.	Within two years following the effective date of this Discharge Permit (by DATE), the Permittee shall measure the thickness of the settled solids in Evaporation Pond H-19. The Permittee shall report the results of the solids thickness measurements to NMED in the subsequent required periodic monitoring report. The Permittee shall measure the thickness of settled solids in accordance with the following process. a) Measure the water level via the staff gauge located in the impoundment. b) Lower a sounding line to the top of the salt deposit and measure the length of the line from the top of the salt deposit to the water level. c) Subtract the depth to the salt deposit from the water level. In the event that the measured settled solids exceed one-third of the maximum liquid depth in the impoundment, the Permittee shall implement the Contingency Plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Operational Actions with Implementation Deadlines**
11.	Prior to discharging to Brine Retention Pond East, Brine Retention Pond West, or Brine Salt Storage Pond 4, the Permittee shall complete construction of the Ponds in accordance with the final construction plans and specifications the Permittee submitted to NMED as part of the Discharge Permit application received on December 3, 2018. The Permittee shall notify NMED prior to the commencement of construction to allow NMED personnel to be onsite for inspection during construction. [Subsections A and C of 20.6.2.1202 NMAC, Subsection C of 20.6.2.3109 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
12.	Within 30 days of construction completion of Brine Retention Pond East, Brine Retention Pond West, and Brine Salt Storage Pond 4, the Permittee shall submit record drawings to NMED that bear the seal and signature of a licensed New Mexico professional engineer (pursuant to the New Mexico Engineering and Surveying Practice Act and the rules promulgated under that authority). [Subsections A and C of 20.6.2.1202 NMAC, Subsection C of 20.6.2.3109 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
13.	Prior to discharging to Brine Salt Storage Pond 4, the Permittee shall install fences around said impoundment to limit access by wildlife, livestock, or unauthorized persons. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. The Permittee shall maintain the fences to serve the stated purpose throughout the term of this Discharge Permit. Documentation of fence installation shall consist of a narrative statement describing the fences and gates with date-stamped photographs. The Permittee shall submit the documentation to NMED in the subsequent required periodic monitoring report. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
14.	Prior to discharging to Brine Salt Storage Pond 4, the Permittee shall post signs indicating that the wastewater in the impoundment is not potable. The Permittee shall post signs at the Facility entrance and other areas where there is potential for public contact with wastewater. Posted signs shall be in English and Spanish and shall remain visible and legible during the term of this Discharge Permit. Documentation of the sign installation shall consist of a date-stamped photograph. The Permittee shall submit the documentation to NMED in the subsequent required periodic monitoring report.

#	Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Operational Actions with Implementation Deadlines
	[Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
15.	Prior to discharging to the proposed Brine Retention Pond East, the Brine Retention Pond West, or the Brine Salt Storage Pond 4, the Permittee shall submit written notification to NMED stating the date the discharge(s) is to commence. [Subsection C of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]

#	Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Operating Conditions
16.	The Permittee shall construct, maintain and operate the leak detection, collection, and recovery systems (LDCRS) for Brine Salt Storage Pond 4 and Brine Retention Ponds East and West in a manner that will result in less than one foot of hydraulic head on the secondary liners in the impoundments. In the event that the Permittee cannot maintain less than one foot of hydraulic head on the secondary liners for Brine Salt Storage Pond 4 and Brine Retention Ponds East and West, the Permittee shall notify NMED within 48 hours of discovery and shall submit a Corrective Action Plan to NMED that evaluates the primary liner leakage rate, proposes options for reducing the leakage if optimal, or otherwise proposes a means to maintain less than one foot of hydraulic head on the secondary liner. The Permittee shall submit the plan to NMED for approval within 60 days after the discovery that the hydraulic head on the secondary liner has surpassed one foot. In the event that it becomes necessary to modify a LDCRS for an impoundment, the Permittee shall submit a report describing the proposed revised methodology for NMED approval. [20.6.2.3107 NMAC]
17.	The Permittee shall maintain fences around Evaporation Pond H-19 to limit access by wildlife, livestock, or unauthorized persons. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. The Permittee shall maintain the fences to serve the stated purpose throughout the term of this Discharge Permit. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
18.	The Permittee shall maintain signs indicating that the wastewater in Evaporation Pond H-19 is not potable. The Permittee shall post signs at the impoundment entrance and other areas where there is potential for public contact with wastewater. The signs shall

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Operating Conditions**
	be printed in English and Spanish and shall remain visible and legible for the term of this Discharge Permit. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]

Part D. Applicable to the Impoundments Containing Stormwater Runoff in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, 3, and 5) and to Salt Stockpiles (Salt Cells 1, 2, 3, and 5)

#	**Salt Storage Ponds and Salt Stockpiles - Operational Actions with Implementation Deadlines**
19.	Within 90 days following the effective date of this Discharge Permit (**by DATE**), the Permittee shall install fences around Salt Storage Ponds 1, 2 and 3 to limit access by wildlife, livestock, or unauthorized persons. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. The Permittee shall maintain the fences to serve the stated purpose throughout the term of this Discharge Permit. Documentation of fence installation shall consist of a narrative statement describing the fences and gates and date-stamped photographs. The Permittee shall submit the documentation to NMED in the subsequent required periodic monitoring report. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
20.	Within 120 days following the effective date of this Discharge Permit (**by DATE**), the Permittee shall post signs indicating that the wastewater in Salt Storage Ponds 1, 2 and 3 is not potable. The Permittee shall post signs at the Facility entrance and other areas where there is potential for public contact with wastewater. Posted signs shall be in English and Spanish and shall remain visible and legible during the term of this Discharge Permit. Documentation of sign installation shall consist of date-stamped photographs. The Permittee shall submit the documentation to NMED in the subsequent required periodic monitoring report. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
21.	Within two years following the effective date of this Discharge Permit (**by DATE**), the Permittee shall measure the thickness of the settled solids in Salt Storage Pond 1, 2, and 3. The Permittee shall report the results of the solids thickness measurements to NMED in the subsequent required periodic monitoring report.

#	**Salt Storage Ponds and Salt Stockpiles - Operational Actions with Implementation Deadlines**
	The Permittee shall measure the thickness of settled solids in each Salt Storage Pond in accordance with the following procedure. a) Measure the water level via the staff gauge located in the impoundment. b) Lower a sounding line to the top of the salt deposit and measure the length of the line from the top of the salt deposit to the water level c) Subtraction of the depth to the salt deposit from the water level. In the event that the measured settled solids exceed one-third of the maximum liquid depth in the impoundment, the Permittee shall implement the Contingency Plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
22.	Prior to discharging to Salt Storage Pond 5 and prior to utilizing Salt Cell 5, the Permittee shall complete construction in accordance with the final construction plans and specifications the Permittee submitted to NMED as part of the Discharge Permit application received on December 3, 2018. The Permittee shall notify NMED prior to construction to allow NMED personnel to be onsite for inspection during construction. [Subsections A and C of 20.6.2.1202 NMAC, Subsection C of 20.6.2.3109 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
23.	Within 30 days of completing construction of Salt Storage Pond 5 and Salt Cell 5, the Permittee shall submit record final drawings to NMED that bear the seal and signature of a licensed New Mexico professional engineer (pursuant to the New Mexico Engineering and Surveying Practice Act and the rules promulgated under that authority). [Subsections A and C of 20.6.2.1202 NMAC, Subsection C of 20.6.2.3109 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
24.	Prior to discharging to Salt Storage Pond 5, the Permittee shall submit written notification to NMED stating the date the discharge is to commence. [Subsection C of 20.6.2.3107 NMAC]

#	**Salt Storage Ponds and Salt Stockpiles - Operating Conditions**
25.	The Permittee shall maintain and operate the leak detection, collection, and removal systems (LDCRS) for Salt Storage Ponds 2, 3 and 5 in a manner that will result in less than one foot of hydraulic head on the secondary liners in the ponds.

#	Salt Storage Ponds and Salt Stockpiles - Operating Conditions
	In the event that the Permittee cannot maintain less than one foot of hydraulic head on the secondary liners for Salt Storage Ponds 2, 3 and 5, the Permittee shall notify NMED within 48 hours of the discovery and shall submit a Corrective Action Plan to NMED which evaluates the primary liner leakage rate, proposes options for reducing the leakage if optimal, or otherwise proposes a means to maintain less than one foot of hydraulic head on the secondary liner. The Permittee shall submit the plan to NMED for approval within 60 days after the discovery that the hydraulic head on the secondary liner has surpassed one foot. In the event that it becomes necessary to modify a LDCRS for a pond, the Permittee shall submit a report describing the proposed revised methodology for NMED approval. [20.6.2.3107 NMAC]
26.	The Permittee shall conduct regular inspection of the earthen cover on Salt Cell 1 and the SPDV material pile. The Permittee shall conduct inspections monthly and after storm events of 2 inches or greater in a 24-hour period to evaluate the integrity of the covers, including erosional impact and vegetation success. The Permittee shall report general observations and minor cover repairs to NMED in the subsequent semi-annual report. In the event of significant erosion, such as the formation of gullies, rills, or areas where ponding is occurring, vegetative failure, or impending liner damage, the Permittee shall provide a plan and schedule for repair to NMED for approval within 90 days of discovery. [20.6.2.3107 NMAC]

MONITORING AND REPORTING

Part A. Generally Applicable to Monitoring

#	Monitoring and Reporting Conditions
27.	The Permittee shall conduct monitoring, reporting, and the other requirements listed below in accordance with the monitoring requirements of this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
28.	METHODOLOGY – Unless otherwise specified by this Discharge Permit, or approved in writing by NMED, the Permittee shall use sampling and analytical techniques that conform with the references listed in Subsection B of 20.6.2.3107 NMAC.

#	Monitoring and Reporting Conditions
	[Subsection B of 20.6.2.3107 NMAC]
29.	Semi-annual monitoring: The Permittee shall perform semi-annual monitoring during the following periods and shall submit reports to NMED by the following due dates: • January 1st through June 30th – **due by August 1st; and** • July 1st through December 31st – **due by February 1st.** [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
30.	The Permittee shall submit its "Waste Isolation Pilot Plant Annual Site Environmental Report" to NMED with the next semi-annual monitoring report following its publication. [Subsection A of 20.6.2.3107 NMAC]

Part B. Applicable to the Facultative Lagoon System

#	Facultative Lagoon System - Monitoring and Reporting Conditions
31.	The Permittee shall estimate the monthly volume of domestic wastewater discharged to the Facultative Lagoon System by obtaining readings on a monthly basis from a totalizing flow meter that measures total domestic water usage. The Permittee shall submit the monthly meter readings and calculated monthly and average daily water usage volumes to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
32.	The Permittee shall measure the total monthly volume and record the origin of all industrial wastewater discharged to Effluent Lagoons B and C. The Permittee shall calculate discharge volumes to Effluent Lagoons B and C by a time/volume method or volumetric measurement of the transport container(s). The Permittee shall submit the monthly discharge volumes or other volumetric calculations and waste origins from each month to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
33.	All flow meters shall be capable of having their accuracy verified under working (i.e., real-time, in-the-field) conditions. The Permittee shall develop a field verification method for each flow meter and shall utilize that method to check the accuracy of each respective meter. The Permittee shall perform field calibrations upon the repair or replacement of a flow measurement device and, at a minimum, once within 90 days of the effective date of this Discharge Permit **(by DATE)**.

#	Facultative Lagoon System - Monitoring and Reporting Conditions
	The Permittee shall ensure each flow meter is calibrated to its manufacturer's recommended specification which shall be no less accurate than plus or minus 10 percent of actual flow, as measured under field conditions. Field calibrations shall be performed by an individual knowledgeable in flow measurement and in the installation/operation of the particular device in use. The Permittee shall prepare a flow meter calibration report for each flow measurement device calibration event. The flow meter calibration report shall include the following information. a) The location and meter identification. b) The method of flow meter field calibration employed. c) The measured accuracy of each flow meter prior to adjustment indicating the positive or negative offset as a percentage of actual flow as determined by an in-field calibration check. d) The measured accuracy of each flow meter following adjustment, if necessary, indicating the positive or negative offset as a percentage of actual flow of the meter. e) Any flow meter repairs made during the previous year or during field calibration. f) The name of the individual performing the calibration and the date of the calibration. The Permittee shall maintain flow meter calibration reports at a location accessible for review by NMED during Facility inspections. [Subsection A of 20.6.2.3107 NMAC, Subsections C and H of 20.6.2.3109 NMAC]
34.	The Permittee shall collect a composite wastewater sample on a semi-annual basis (once every six months) from Effluent Lagoon A. The composite sample shall consist of a minimum of six equal aliquots collected at equal distances around the entire perimeter of the evaporative impoundment and thoroughly mixed. The Permittee shall analyze the composite sample for: • TKN; • NO_3-N; • TDS; • Cl; and • SO_4. The Permittee shall ensure samples are properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. The Permittee shall submit the laboratory analytical results, including the QA/QC summary and Chain of Custody, to NMED in the semi-annual monitoring reports.

#	Facultative Lagoon System - Monitoring and Reporting Conditions
	[Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
35.	In the event that the Permittee discharges any industrial wastewater to Effluent Lagoon B or C within a monitoring reporting period, the Permittee shall collect a composite wastewater sample from the impoundment(s) that received the industrial wastewater discharge. The composite sample(s) shall consist of a minimum of six equal aliquots collected at equal distances around the entire perimeter of the evaporative impoundment(s) and thoroughly mixed. The Permittee shall analyze the composite sample(s) for: • TDS; • Cl; and • SO_4. The Permittee shall ensure samples are properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. The Permittee shall submit the laboratory analytical results, including the QA/QC summary and Chain of Custody, to NMED in the semi-annual monitoring reports. NMED may require comprehensive laboratory analyses of the industrial wastewater discharged to Effluent Lagoons B and C prior to discharge when NMED determines that additional information is needed. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]

Part C. Applicable to the Evaporation Pond H-19, Brine Retention Pond East, Brine Retention Pond West, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3

#	Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Monitoring and Reporting Conditions
36.	The Permittee shall measure the total monthly volume and record the origin of all wastewater discharged to Evaporation Pond H-19. The Permittee shall calculate discharge volumes to Evaporation Pond H-19 by a time/volume method or volumetric measurement of the transport container(s). The Permittee shall submit the monthly discharge volumes or other volumetric calculations and waste origins each month to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of.20.6.2.3109 NMAC]
37.	The Permittee shall measure the total monthly volume of brine received by Brine

#	Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Monitoring and Reporting Conditions
	Retention Ponds East and West. The Permittee shall calculate discharge volumes to Brine Retention Ponds East and West by a time/volume method or volumetric measurement of the transport container(s). NMED may require comprehensive laboratory analyses of such wastewater prior to discharge when NMED determines that additional information is needed. The Permittee shall submit the monthly discharge volumes and other volumetric calculations each month to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
38.	The Permittee shall measure the total weekly volume of liquid pumped from the leak detection sumps for Brine Salt Storage Pond 4 and Brine Retention Ponds East and West. The Permittee shall calculate the total volume of liquid pumped by a totalizing flow meter. The Permittee shall submit the weekly volumes to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
39.	The Permittee shall collect a composite wastewater sample annually after a storm event of two inches or greater in a 24-hour period from Storm Water Ponds 1, 2, and 3. The composite sample shall consist of a minimum of six equal aliquots collected at equal distances around the perimeter of the evaporative impoundments and thoroughly mixed. The Permittee shall analyze the composite sample for: • SO_4; • TDS; and • Cl. The Permittee shall ensure samples are properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. The Permittee shall submit laboratory analytical results, including the QA/QC summary and Chain of Custody, to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
40.	The Permittee shall collect a composite wastewater sample on a semi-annual basis (once every six months) from Evaporation Pond H-19 and from Brine Salt Storage Pond 4, once it becomes operational. The composite sample shall consist of a minimum of six equal aliquots collected at equal distances around the perimeter of the evaporative impoundment and thoroughly mixed. The Permittee shall analyze the composite sample for: • SO_4;

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Monitoring and Reporting Conditions**
	• TDS; and • Cl. The Permittee shall ensure samples are properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. The Permittee shall submit laboratory analytical results, including the QA/QC summary and Chain of Custody, to NMED in the semi-annual monitoring reports. NMED may require comprehensive laboratory analyses of the industrial wastewater discharged to Evaporation Pond H-19 prior to discharge when NMED determines that additional information is needed. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
41.	During the first year following the effective date of the Discharge Permit (**by DATE**), the Permittee shall collect a grab sample (except as noted for pH) of wastewater from Evaporation Pond H-19 and analyze the sample for the following inorganic contaminants (dissolved fraction, except as noted): • aluminum (CAS 7429-90-5) • antimony (CAS 7440-36-0) • arsenic (CAS 7440-38-2) • barium (CAS 7440-39-3) • beryllium (CAS 7440-41-7) • boron (CAS 7440-42-8) • cadmium (CAS 7440-43-9) • chromium (CAS 7440-47-3) • cobalt (CAS 7440-48-4) • copper (CAS 7440-50-8) • cyanide CAS 57-12-5) • fluoride (CAS 16984-48-8) • iron (CAS 7439-89-6) • lead (CAS 7439-92-1) • manganese (CAS 7439-96-5) • molybdenum (CAS 7439-98-7) • total mercury (nonfiltered) (CAS 7439-97-6) • pH (instantaneous) • nickel (CAS 7440-02-0) • radioactivity: combined radium-226 & radium-228 (CAS 15262-20-1) • selenium (CAS 7782-49-2) • silver (CAS 7440-224) • sulfate (CAS 14808-79-8) • thallium (CAS 7440-28-0) • uranium (CAS 7440-61-1) • zinc (CAS 7440-66-6) The Permittee shall ensure the samples are properly collected, prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. The Permittee shall analyze the sample using analytical methods with reporting limits less than the corresponding numerical groundwater standards identified in 20.6.2.3103 NMAC.

<table>

• trichloroethene (TCE, CAS 79-01-6)
• vinyl chloride (CAS 75-01-4)
• total xylenes (CAS 1330-20-7)

The Permittee shall ensure the sample is properly collected, prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. The Permittee shall analyze samples using analytical methods with reporting</td></tr>
</table>

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Monitoring and Reporting Conditions**
	limits less than the corresponding numerical groundwater standards identified in 20.6.2.3103 NMAC. The Permittee shall submit a summary of measured concentrations compared with the corresponding groundwater standards and a copy of the laboratory report, including the laboratory analytical results, QA/QC summary, and the Chain of Custody, to NMED in the next monitoring report. [Subsection A of 20.6.2.3107 NMAC, Subsections C and H of 20.6.2.3109 NMAC]
43.	The Permittee shall measure the water depth in Storm Water Ponds 1, 2, and 3 and Brine Salt Storage Pond 4 monthly to the nearest tenth of a foot (0.1 ft). The Permittee shall calculate and submit the approximate monthly volume of water to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC and Subsection H of 20.6.2.3109 NMAC]
44.	The Permittee shall collect at least one sample quarterly rotating between Brine Retention Pond East and Brine Retention Pond West of the liquid present and analyze the sample for every constituent listed in Subsection A of 20.6.2.3103 NMAC. The Permittee shall submit the laboratory analytical results, including the QA/QC summary and Chain of Custody, to NMED in the semi-annual monitoring reports. After four consecutive quarterly sampling events, the Permittee may request a reduction in the sampling frequency and/or analyte list set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
45.	The Permittee shall submit all analytical laboratory data from Brine Retention Ponds East and West submitted to the NMED Hazardous Waste Bureau to the Ground Water Quality Bureau. [Subsection A of 20.6.2.3107 NMAC]
46.	The Permittee shall submit a copy of all records of solids (salt) removal from the Brine Retention Basins East and West and the associated disposal documentation to NMED in the subsequent semi-annual monitoring report. [Subsection A of 20.6.2.3107 NMAC]

Part D. Applicable to the Impoundments Containing Stormwater Runoff in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, 3, and 5) and to Salt Stockpiles (Salt Cells 1, 2, 3, and 5)

#	Salt Storage Ponds and Salt Stockpiles - Monitoring and Reporting Conditions
47.	The Permittee shall collect a composite wastewater sample annually after a storm event of 2 inches or greater in a 24-hour period from Salt Storage Ponds 1, 2, 3, and 5. The composite sample shall consist of a minimum of six equal aliquots collected at equal distances around the perimeter of the evaporative impoundments and thoroughly mixed. The Permittee shall analyze the composite sample for: • SO_4; • TDS; and • Cl. The Permittee shall ensure the samples are properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. The Permittee shall submit the laboratory analytical results, including the QA/QC summary and Chain of Custody, to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
48.	The Permittee shall measure the water depth monthly to the nearest tenth of a foot (0.1 ft) in the Salt Storage Ponds 1, 2, 3, and 5. The Permittee shall calculate and submit the approximate volume of water to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
49.	The Permittee shall measure the total volume of liquid pumped from the leak detection sumps for Salt Storage Ponds 2 and 3 during every pumping event. The Permittee shall calculate the total volume of liquid pumped by a volumetric measurement of the container(s) filled. The Permittee shall submit the volumetric calculations for each pumping event to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
50.	The Permittee shall measure the weekly volume of liquid pumped from the leak detection sump for Salt Storage Pond 5. The Permittee shall calculate the total volume of liquid pumped by a totalizing flow meter. The Permittee shall submit the weekly volumes to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]

Part E. Groundwater Monitoring and Reporting

#	Groundwater Monitoring Actions with Implementation Deadlines
51.	Within 60 days following the effective date of this Discharge Permit (**by DATE**), the Permittee shall install the following new monitoring wells in accordance with the Monitoring Well Proposal submitted to NMED on February 18, 2020 and approved by NMED on February 20, 2020. • One monitoring well (PZ-17) located 20 to 50 feet hydrologically downgradient of the Facultative Lagoon System in the natural groundwater of the Dewey Lake Formation and intended to monitor the Facultative Lagoon System. • One monitoring well (PZ-19) located 20 to 50 feet hydrologically downgradient of Evaporation Pond H-19 in the natural groundwater of the Dewey Lake Formation and intended to monitor Evaporation Pond H-19. The Permittee shall complete the wells in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Guidelines*, Revision 1.1, March 2011 or alternative methods submitted for approval. The Permittee shall submit construction and lithologic logs to NMED within 120 days of well completion in a cumulative well report. [Subsection A of 20.6.2.3107 NMAC]
52.	Prior to discharging to Brine Salt Storage Pond 4, Salt Storage Pond 5, and Brine Retentions Ponds East and West, the Permittee shall install the following new monitoring wells in accordance to the Monitoring Well Proposal submitted to NMED on February 18, 2020 and approved by NMED on February 20, 2020. • One monitoring well (PZ-16) located 20 to 50 feet hydrologically downgradient of Brine Salt Storage Pond 4 in the shallow groundwater and intended to monitor Brine Salt Storage Pond 4. • One monitoring well (PZ-18) located 20 to 50 feet hydrologically downgradient of Salt Storage Pond 5 in the shallow groundwater and intended to monitor Salt Storage Pond 5. The Permittee shall complete the wells in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Guidelines*, Revision 1.1, March 2011 or alternative methods submitted for approval. The Permittee shall submit construction and lithologic logs to NMED within 120 days of well completion in a cumulative well report. [Subsection A of 20.6.2.3107 NMAC]
53.	Following the installation of the monitoring wells required by this Discharge Permit, the

#	Groundwater Monitoring Actions with Implementation Deadlines
	permittee shall sample groundwater in the wells and analyze the samples for temperature, pH, specific conductance (field measured); and for SO_4, TDS, and Cl. Groundwater sample collection, preservation, transport and analysis shall be performed according to the following procedure: a) The pump intake shall be placed in the following manner: fully submerged, within the screened interval, and at least two feet above the base of the screen. b) The drawdown will be minimized such that it will maintain depression of the water level, but not exceed one liter per minute. c) Allow field-measured temperature, pH, and specific conductance to stabilize prior to sample collection. The system is considered stable when pH is within ± 0.5 pH units, temperature, and specific conductance are within ± 10% of the last three consecutive readings. d) Obtain samples from the well for analysis. e) Properly prepare, preserve and transport samples. f) Analyze samples in accordance with the methods authorized in this Discharge Permit. The Permittee shall submit a well completion report to NMED within 120 days of well completion in a cumulative well report. A well completion report shall include; the Office of the State Engineer permit, depth-to-most-shallow groundwater measurements, groundwater laboratory analytical results, including the QA/QC summary report and Chain of Custody, and a Facility layout map showing the location and number of each well. [Subsection A of 20.6.2.3107 NMAC]
54.	Within 120 days following the effective date of this Discharge Permit (**by DATE**), the Permittee shall perform a geographical survey of all newly constructed groundwater monitoring wells approved by NMED for Discharge Permit monitoring purposes in the natural groundwater of the Dewey Lake Formation and in the shallow groundwater. The survey shall be tied or referenced to a U.S. Geological Survey (USGS) or other permanent benchmark. Survey data shall include northing, easting and elevation to the nearest hundredth of a foot and shall be in accordance with the "Minimum Standards for Surveying in New Mexico" (12.8.2 NMAC). The Permittee shall utilize the survey to establish an elevation at the top-of-casing, with a permanent marking indicating the point of elevation. The survey shall bear the seal and signature of a licensed New Mexico professional surveyor (pursuant to the New Mexico Engineering and Surveying Practice Act and the rules promulgated under that authority).

#	Groundwater Monitoring Actions with Implementation Deadlines
	Depth-to-most-shallow groundwater shall be measured to the nearest hundredth of a foot in all surveyed wells and referenced to mean sea level, and the data shall be used to develop a groundwater elevation contour map showing the location of all monitoring wells and the direction and gradient of groundwater flow at the Facility. The Permittee shall submit the data and groundwater elevation contour map to NMED within 120 days of the installation of the monitoring wells in a cumulative well report. [Subsection A of 20.6.2.3107 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
55.	The Permittee shall perform aquifer testing to determine the local hydraulic properties of the aquifer near the monitoring wells required by this Discharge Permit and that contain groundwater within 60 days of the complete installation of each new monitoring well. The purpose of the aquifer testing shall be to quantify the movement of groundwaters in the vicinity of each well or piezometer. The Permittee shall perform aquifer testing in wells in both the shallow groundwater and in the natural groundwater in the Dewey Lake Formation where groundwater is present. Aquifer testing shall estimate hydraulic conductivity, transmissivity, and storage coefficient and shall be performed utilizing procedures previously utilized at the Facility so as to produce comparable results. The Permittee shall submit the measured hydraulic properties for each monitoring well to NMED within 120 days of the installation of the monitoring wells in a cumulative well report. [Subsection A of 20.6.2.3107 NMAC]

#	Groundwater Monitoring Conditions
56.	The Permittee shall measure the depth to groundwater to the nearest hundredth of a foot (0.01 ft) quarterly in the following piezometers/monitoring wells: • PZ-1, PZ-2, PZ-3, PZ-4, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13, PZ-14, PZ-15, PZ-16, PZ-17, PZ-18, and PZ-19 • C-2505, C-2506, C-2507, C-2811, and WQSP-6A The Permittee shall submit depth-to-groundwater measurements to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]

#	Groundwater Monitoring Conditions
57.	Within the first year of the permit term, the Permittee shall perform sampling in the following groundwater piezometers/monitoring wells and analyze the samples for temperature, pH, specific conductance (field measured); Uranium and combined Radium-226 and Radium-228: • PZ-1, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13, PZ-14, PZ-15, PZ-16, PZ-17, PZ-18, and PZ-19 • C-2507, C-2811, and WQSP-6A Monitoring wells WQSP-6A, PZ-17, and PZ-19 are intended to monitor the natural groundwater of the Dewey Lake Formation, which occurs in the subsurface at the southern end of the Facility. All other monitoring wells are intended to monitor the shallow groundwater. The Permittee shall perform groundwater sample collection, preservation, transport and analysis according to the following low-flow sampling procedure: a) The pump intake shall be placed in the following manner: fully submerged, within the screened interval, and at least two feet above the base of the screen. b) The drawdown will be minimized such that it will maintain depression of the water level, but not exceed one liter per minute. c) Allow field-measured temperature, pH, and specific conductance to stabilize prior to sample collection. The system is considered stable when pH is within ± 0.5 pH units, temperature, and specific conductance are within ± 10% of the last three consecutive readings. d) Obtain samples from the well for analysis. e) Properly prepare, preserve and transport samples. f) Analyze samples in accordance with the methods authorized in this Discharge Permit. The Permittee shall submit analytical results, including the laboratory QA/QC summary report and Chain of Custody, and a Facility layout map showing the location and number of each well to NMED in the next semi-annual monitoring report following sampling. [Subsection A of 20.6.2.3107 NMAC]
58.	The Permittee shall perform semi-annual groundwater sampling in the following groundwater piezometers/monitoring wells and analyze the samples for temperature, pH, specific conductance (field measured); and for SO_4, TDS, and Cl: • PZ-1, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13, PZ-14, PZ-15, PZ-16, PZ-17, PZ-18, and PZ-19

#	Groundwater Monitoring Conditions
	• C-2507, C-2811, and WQSP-6A Monitoring wells WQSP-6A, PZ-17, and PZ-19 are intended to monitor the natural groundwater of the Dewey Lake Formation, which occurs in the subsurface at the southern end of the Facility. All other monitoring wells are intended to monitor the shallow groundwater. The Permittee shall perform groundwater sample collection, preservation, transport and analysis according to the following low-flow sampling procedure: a) The pump intake shall be placed in the following manner: fully submerged, within the screened interval, and at least two feet above the base of the screen. b) The drawdown will be minimized such that it will maintain depression of the water level, but not exceed one liter per minute. c) Allow field-measured temperature, pH, and specific conductance to stabilize prior to sample collection. The system is considered stable when pH is within ± 0.5 pH units, temperature, and specific conductance are within ± 10% of the last three consecutive readings. d) Obtain samples from the well for analysis. e) Properly prepare, preserve and transport samples. f) Analyze samples in accordance with the methods authorized in this Discharge Permit. The Permittee shall submit analytical results, including the laboratory QA/QC summary report and Chain of Custody, and a Facility layout map showing the location and number of each well to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
59.	The Permittee shall perform semi-annual groundwater sampling in the following monitoring wells and analyze the samples for TKN and NO_3-N. • PZ-17, located south of the Facultative Lagoon System and intended to be located hydrologically downgradient of the Facultative Lagoon System in the natural groundwater of the Dewey Lake Formation. The Permittee shall perform groundwater sample collection, preservation, transport and analysis according to the following low-flow sampling procedure: a) The pump intake shall be placed in the following manner: fully submerged, within the screened interval, and at least two feet above the base of the screen. b) The drawdown will be minimized such that it will maintain depression of the water

#	Groundwater Monitoring Conditions
	level, but not exceed one liter per minute. c) Allow field-measured temperature, pH, and specific conductance to stabilize prior to sample collection. The system is considered stable when pH is within ± 0.5 pH units, temperature, and specific conductance are within ± 10% of the last three consecutive readings. d) Obtain samples from the well for analysis. e) Properly prepare, preserve and transport samples. f) Analyze samples in accordance with the methods authorized in this Discharge Permit. The Permittee shall submit analytical results, including the laboratory QA/QC summary report and Chain of Custody, and a Facility layout map showing the location and number of each well to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
60.	The Permittee shall develop a groundwater elevation, i.e., potentiometric surface, contour map for the shallow groundwater and for the natural groundwater in the Dewey Lake Formation on a semi-annual basis. The Permittee shall use the top of casing elevation data from the monitoring well surveys and quarterly depth-to-groundwater measurements, referenced to mean sea level, obtained during the groundwater sampling required by this Discharge Permit. The groundwater elevation contour maps shall depict the groundwater flow direction based on the groundwater elevation contours. The Permittee shall estimate groundwater elevations between monitoring well locations using common interpolation methods. The Permittee shall use a contour interval appropriate to the data, but the interval shall, in no case, be greater than two feet. Groundwater elevation contour maps shall depict the groundwater flow direction, using arrows, based on the orientation of the groundwater elevation contours, and the location and identification of each monitoring well and contaminant source, e.g., surface impoundment. The Permittee shall submit groundwater elevation contour maps to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
61.	The Permittee shall submit a single table in a paper and electronic format (i.e., EXCEL spreadsheet) of water level measurements and water quality data with only those constituents analyzed and water levels measured during a single event shown in columns to NMED in the semi-annual monitoring reports. The table shall include the following tabulated field measurements: temperature, pH, and electrical conductivity corrected to

#	Groundwater Monitoring Conditions
	25 degrees Celsius. The monitoring sites shall be shown in rows on the table, and the second column shall contain the date of the sampling event. Values exceeding standards shall be bolded. Any constituent not analyzed for at a particular site shall be shown as "NA", any site not sampled shall be shown as "NS" with an associated reason, and any site not measured for water levels shall be shown as "NM" with an associated reason. [Subsection A of 20.6.2.3107 NMAC]
62.	The Permittee shall submit a single table that includes all available groundwater data to date annually to NMED in the semi-annual monitoring reports due February 1st. For each monitoring well, the name of the well shall be entered in the far-left column in a row by itself. Sampling events, beginning with the earliest event first, shall be entered in subsequent rows with the sampling date in the second column and the corresponding analytical data in columns further to the right. Each new sampling event shall be added as an additional row to the existing spreadsheet with the corresponding date of the sampling event noted in the second column next to the monitoring well name. [Subsection A of 20.6.2.3107 NMAC]

ADDITIONAL STUDIES REQUIRED

#	Terms and Conditions
63.	The Permittee's groundwater monitoring data and reports document that the shallow groundwater beneath the site is contaminated with TDS, chloride, and sulfate above the standards of 20.6.2.3103 NMAC. This data indicates that the contaminated groundwater is primarily anthropogenic, having resulted from leaking impoundments at the Facility, and has spread laterally since the installation of impoundment liners. Within six months following the effective date of this Discharge Permit (**by DATE**), the Permittee shall submit for NMED approval a site investigation workplan and implementation schedule. The purpose of the site investigation shall be to evaluate the efficacy of existing source controls, to determine the current lateral and vertical extent of the shallow contaminated groundwater, and to identify any potential impacts to the downgradient and naturally occurring groundwater in the Dewey Lake Formation. The site investigation may build upon the previous investigations completed by Daniel B. Stephens and Associates in 2003 and 2008. The Permittee shall implement the site

#	Terms and Conditions
	investigation upon NMED approval of the workplan and shall submit a completion report no later than two years following the effective date of this Discharge Permit (**by DATE**). NMED may require the Permittee to take corrective actions pursuant to 20.6.2.1203 NMAC or to abate water pollution consistent with the requirements and provisions of Section 20.6.2.4101, Section 20.6.2.4103, Subsections C and E of 20.6.2.4106, Section 20.6.2.4107, Section 20.6.2.4108 and Section 20.6.2.4112 NMAC. [20.6.2.3107 NMAC, 20.6.2.4103 NMAC]

CONTINGENCY PLAN

#	Terms and Conditions
64.	In the event that groundwater monitoring indicates that a groundwater quality standard identified in Section 20.6.2.3103 NMAC is newly exceeded in a monitoring well with no previous exceedances at the date of issuance of this Discharge Permit, the Permittee shall collect a confirmatory sample from the monitoring well within 15 days of receipt of the initial sampling results to confirm the initial sampling results. Within 90 days of confirmation of groundwater contamination, the Permittee shall submit to NMED a Corrective Action Plan (CAP) that proposes, at a minimum, source control measures and an implementation schedule. The Permittee shall implement the CAP as approved by NMED. Once invoked (whether during the term of this Discharge Permit, or after the term of this Discharge Permit and prior to the completion of the Discharge Permit closure plan requirements), this condition shall apply until the Permittee has fulfilled the requirements of this condition and groundwater monitoring confirms for a minimum of eight (8) consecutive quarterly samples that the standards of Section 20.6.2.3103 NMAC are not exceeded in groundwater. If the groundwater standard continues to be violated 180 days after the confirmation of groundwater contamination, NMED may require the Permittee to abate water pollution consistent with the requirements and provisions of Section 20.6.2.4101, Section 20.6.2.4103, Subsections C and E of 20.6.2.4106, Section 20.6.2.4107, Section 20.6.2.4108 and Section 20.6.2.4112 NMAC. [Subsection A of 20.6.2.3107 NMAC, Subsection E of 20.6.2.3109 NMAC]

#	Terms and Conditions
65.	In the event that information available to NMED indicates that a groundwater monitoring well or piezometer is not constructed in a manner consistent with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Guidelines*, Revision 1.1, March 2011; contains insufficient water to effectively monitor groundwater quality; or is not completed in a manner that is protective of groundwater quality, the Permittee shall install a replacement well(s) within 120 days following notification from NMED. The Permittee shall survey the replacement monitoring well(s)/piezometer(s) within 150 days following notification from NMED. The Permittee shall install replacement wells at locations approved by NMED and completed in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011. The Permittee shall submit construction and lithologic logs, survey data and a groundwater elevation contour map to NMED within 60 days following well completion. The Permittee shall properly plug and abandon the monitoring well requiring replacement upon completion of the replacement monitoring well. The Permittee shall complete the well plugging and abandonment and shall document the abandonment procedures in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011, and all applicable local, state, and federal regulations. The Permittee shall submit well abandonment documentation to NMED within 60 days of completion of well plugging activities. [Subsection A of 20.6.2.3107 NMAC]
66.	In the event that groundwater flow information obtained pursuant to this Discharge Permit indicates that a monitoring well/piezometer is not appropriately located, e.g., hydrologically downgradient of the discharge location it is intended to monitor, the Permittee shall install a replacement well within 180 days following notification from NMED. The Permittee shall survey the replacement monitoring well within 30 days following well installation. The Permittee shall install replacement wells at locations approved by NMED prior to installation and completed in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011. The Permittee shall submit construction and lithologic logs, survey data and a groundwater elevation contour map within 120 days following well completion in a cumulative well report.

#	Terms and Conditions
	[Subsection A of 20.6.2.3107 NMAC]
67.	In the event that the site investigation required by this Discharge Permit or an inspection reveals significant damage has occurred or is likely to affect the structural integrity of an impoundment liner or its ability to contain contaminants, the Permittee shall propose to repair or the replacement of the impoundment liner by submitting a Corrective Action Plan (CAP) to NMED for approval. The Permittee shall ensure the CAP to NMED within 30 days after discovery of the damage or following notification from NMED that significant liner damage is evident. The Permittee shall ensure the CAP includes a schedule for completion of corrective actions and the Permittee shall initiate implementation of the CAP following approval by NMED. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
68.	In the event that the required freeboard cannot be preserved in an impoundment, the Permittee shall take actions authorized by this Discharge Permit and all applicable local, state, and federal regulations to restore the required freeboard. In the event that the required freeboard cannot be restored within a period of 72 hours following discovery, the Permittee shall propose actions to be immediately implemented to restore of the required freeboard by submitting a short-term Corrective Action Plan (CAP) to NMED for approval. Examples of short-term corrective actions include the pumping and hauling of excess wastewater from the impoundment or reducing the volume of wastewater discharged to the impoundment. The Permittee shall ensure the CAP includes a schedule for completion of corrective actions and s is submitted within 15 days following the date when exceedance was discovered. The Permittee shall implement the CAP following approval by NMED. In the event that the short-term corrective actions failed to restore the required freeboard, the Permittee shall propose permanent corrective actions in a long-term CAP submitted to NMED within 90 days following failure of the short-term CAP. Examples include the installation of an additional storage impoundment or a significant/permanent reduction in the volume of wastewater discharged to the impoundment. The Permittee shall ensure the CAP includes a schedule for completion of corrective actions and that implementation of the CAP is initiated following NMED approval. [Subsection A of 20.6.2.3107 NMAC]
69.	In the event the average solids accumulation exceeds one-third of the maximum liquid depth in an impoundment, the Permittee shall submit a plan for NMED's approval for

#	Terms and Conditions
	the removal and disposal of the solids. The Permittee shall ensure that the solids removal and disposal plan is submitted to NMED within 120 days of the determination of excess solids. The Permittee shall ensure that the solids removal and disposal plan includes the following information: a) A method for removal of the solids to a depth of less than six inches throughout the treatment impoundment in a manner that is protective of the impoundment liner. b) A description of how the Permittee will contain, transport, and dispose of the solids in accordance with all local, state, and federal regulations, including 40 CFR Part 503. c) A schedule for completion of the solids removal and disposal project. The Permittee shall initiate implementation of the plan following approval by NMED. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
70.	In the event that a release (commonly known as a "spill") occurs that is not authorized under this Discharge Permit, the Permittee shall take measures to mitigate damage from the unauthorized discharge and initiate the notifications and corrective actions required in Section 20.6.2.1203 NMAC and summarized below. Within <u>24 hours</u> following discovery of the unauthorized discharge, the Permittee shall verbally notify NMED and provide the following information. a) The name, address, and telephone number of the person or persons in charge of the Facility, as well as of the owner and/or operator of the Facility. b) The name and address of the Facility. c) The date, time, location, and duration of the unauthorized discharge. d) The source and cause of unauthorized discharge. e) A description of the unauthorized discharge, including its estimated chemical composition. f) The estimated volume of the unauthorized discharge. g) Any actions taken to mitigate immediate damage from the unauthorized discharge. Within <u>one week</u> following discovery of the unauthorized discharge, the Permittee shall submit written notification to NMED with the information listed above and any pertinent updates. Within <u>15 days</u> following discovery of the unauthorized discharge, the Permittee shall submit a corrective action report/plan to NMED describing any corrective actions taken and/or to be taken relative to the unauthorized discharge that includes the following information. a) A description of proposed actions to mitigate damage from the unauthorized discharge.

#	Terms and Conditions
	b) A description of proposed actions to prevent future unauthorized discharges of this nature. c) A schedule for completion of proposed actions. In the event that the unauthorized discharge causes or may with reasonable probability cause water pollution in excess of the standards and requirements of Section 20.6.2.4103 NMAC, and the water pollution will not be abated within 180 days after notice is required to be given pursuant to Paragraph (1) of Subsection A of 20.6.2.1203 NMAC, the Permittee may be required to abate water pollution pursuant to Sections 20.6.2.4000 through 20.6.2.4115 NMAC. The Permittee shall not construe anything in this condition as relieving them of the obligation to comply with all requirements of Section 20.6.2.1203 NMAC. [20.6.2.1203 NMAC]
71.	In the event that NMED or the Permittee identifies any failures of the discharge plan, i.e., the application, or this Discharge Permit not specifically noted herein, NMED may require the Permittee to submit a Corrective Action Plan and a schedule for completion of corrective actions to address the failure(s). Additionally, NMED may require a discharge permit modification to achieve compliance with 20.6.2 NMAC. [Subsection A of 20.6.2.3107 NMAC, Subsection E of 20.6.2.3109 NMAC]

CLOSURE PLAN

Part A. Generally Applicable to All Discharges

#	Terms and Conditions
72.	The Permittee shall close the Facility covered under this Discharge Permit, either wholly or in part, in accordance with the closure plan in the March 10, 2005 Discharge Permit application. Where that closure plan references the closure plans in the WIPP Hazardous Waste Facility Permit and the WIPP Land Management Plan, the Permittee shall use the most up-to-date version of the plans. [Subsection A of 20.6.2.3107 NMAC]
73.	For the purpose of post-closure monitoring, after the Permittee completes closure of all authorized units , the Permittee shall continue groundwater monitoring until the monitoring data confirms for a minimum of eight (8) consecutive quarterly groundwater

#	Terms and Conditions
	sampling events that the standards of Section 20.6.2.3103 NMAC are not exceeded. Total dissolved solids and chloride shall meet pre-discharge conditions. If during post-closure monitoring results show that groundwater exceeds a standard in Section 20.6.2.3103 NMAC, the Permittee shall implement the contingency plan required by this Discharge Permit. Following notification from NMED that post-closure monitoring may cease, the Permittee shall plug and abandon all monitoring wells and piezometers in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Guidelines*, Revision 1.1, March 2011. [Subsection A of 20.6.2.3107 NMAC]

Part B. Applicable to the Facultative Lagoon System

#	Terms and Conditions
74.	The Permittee shall perform the following closure measures in the event the Permittee proposes to permanently close the Facultative Lagoon System Within <u>60 days</u> of ceasing to discharge to the Facultative Lagoon System impoundments, the Permittee shall plug the line leading to the impoundments so that a discharge can no longer occur. Within <u>60 days</u> of ceasing to discharge to the Facultative Lagoon System impoundments, the Permittee shall evaporate or remove wastewater from the impoundments and any other wastewater system components and shall dispose of it in accordance with all local, state, and federal regulations. Within <u>90 days</u> of ceasing to discharge to the Facultative Lagoon System impoundments, the Permittee shall submit a sludge removal and disposal plan to NMED for approval. The Permittee shall implement the plan within 30 days following approval by NMED. The sludge removal and disposal plan shall include the following: a) The estimated volume and dry weight of sludge planned for removal and disposal, including measurements and calculations. b) Analytical results for samples of the sludge taken from the impoundment for TKN, NO_3-N, percent total solids, hazardous constituents, and any other parameters tested (reported in mg/kg, dry weight basis). c) The method(s) of sludge *removal* from the impoundments.

#	Terms and Conditions
	d) The method(s) of *disposal* for all of the sludge removed from the impoundments. The method(s) shall comply with all local, state and federal regulations, including 40 CFR Part 503. *Note: A proposal that includes the surface disposal of sludge may be subject to Ground-Water Discharge Permitting requirements pursuant to 20.6.2.3104 NMAC that are separate from the requirements of this Discharge Permit.* e) A schedule for completion of sludge removal and disposal not to exceed two years from the date discharge to the impoundments ceased. Within one year following completion of the sludge removal and disposal, the Permittee shall complete the following closure measures: a) Remove all lines leading to and from the Facultative Lagoon System impoundments, or permanently plug and abandon them in place. b) Remove or demolish any other wastewater system components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liners. d) Fill the impoundments with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [Subsection A of 20.6.2.3107 NMAC, 40 CFR Part 503]

Part C. Applicable to the Evaporation Pond H-19, Brine Retention Pond East, Brine Retention Pond West, Storm Water Ponds 1, 2, and 3, and Brine Salt Storage Pond 4

#	Terms and Conditions
75.	Upon cessation of operation, the Permittee shall close Evaporation Pond H-19 and Storm Water Ponds 1, 2, and 3. The Permittee shall evaporate or remove the remaining liquids in Storm Water Ponds and shall evaporate the remaining liquids in Evaporation Pond H-19. The Permittee shall sample all sludge to determine if it contains hazardous constituents and then manage and/or dispose of it in accordance with applicable regulations. Within one year following completion of the sludge removal and disposal, the Permittee shall complete the following closure measures: a) Remove or plug all piping and other ancillary components b) Remove or demolish any other components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liners.

#	Terms and Conditions
	d) Fill the impoundments with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [Subsection A of 20.6.2.3107 NMAC]

Part D. Applicable to the Impoundments Containing Stormwater Runoff in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, 3, and 5) and to Salt Stockpiles (Salt Cells 1, 2, 3, and 5)

#	Terms and Conditions
76.	Upon cessation of operation, the Permittee shall remove all mined salt from the Facility. The Permittee is permitted to use the mined salt as backfill in shafts and as interior fill material in berms and permanent markers after closure. The Permittee shall ensure removal from the site of all mined salt remaining after backfilling and after construction of surface structures. The Permittee shall submit a plan and schedule for salt removal to NMED for approval within 120 days prior to the Facility closure. The WIPP Land Management Plan reflects the Land Withdrawal Act's requirements for disposition of the salt. The WIPP's Hazardous Waste Facility Permit also addresses closure activities that include closure of the salt storage areas in accordance with the provisions of the WIPP Land Management Plan. The Permittee shall ensure that the salt storage area be reclaimed in the manner described in these documents. [Subsection A of 20.6.2.3107 NMAC]
77.	Upon cessation of operation, the Permittee shall close Salt Storage Ponds 1, 2, 3, and 5. The Permittee shall evaporate the remaining liquids in each impoundment. The Permittee shall sample all sludge to determine if it contains hazardous constituents and then manage and/or dispose of in accordance with applicable regulations. Within <u>one year</u> following completion of the sludge removal and disposal, the Permittee shall complete the following closure measures: a) Remove or plug all piping and other ancillary components. b) Remove or demolish any other components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liners. d) Fill the impoundments with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [Subsection A of 20.6.2.3107 NMAC]

GENERAL TERMS AND CONDITIONS

#	Terms and Conditions

78.	RECORD KEEPING - The Permittee shall maintain a written record of:
	• Information and data used to complete the application for this Discharge Permit;
	• Any releases (commonly known as "spills") not authorized under this Discharge Permit and reports submitted pursuant to 20.6.2.1203 NMAC;
	• The operation, maintenance, and repair of all facilities/equipment used to treat, store or dispose of wastewater;
	• Facility record drawings (plans and specifications) showing the actual construction of the Facility and bear the seal and signature of a licensed New Mexico professional engineer;
	• Copies of logs, inspection reports, and monitoring reports completed and/or submitted to NMED pursuant to this Discharge Permit;
	• The volume of wastewater or other wastes discharged pursuant to this Discharge Permit;
	• Groundwater quality and wastewater quality data collected pursuant to this Discharge Permit;
	• Copies of construction records (well log) for all sampled groundwater monitoring wells pursuant to this Discharge Permit;
	• The maintenance, repair, replacement or calibration of any monitoring equipment or flow measurement devices required by this Discharge Permit; and
	• Data and information related to field measurements, sampling, and analysis conducted pursuant to this Discharge Permit, including:
	  o the dates, location and times of sampling or field measurements;
	  o the name and job title of the individuals who performed each sample collection or field measurement;
	  o the sample analysis date of each sample
	  o the name and address of the laboratory, and the name of the signatory authority for the laboratory analysis;
	  o the analytical technique or method used to analyze each sample or collect each field measurement;
	  o the results of each analysis or field measurement, including raw data;
	  o the results of any split, spiked, duplicate or repeat sample; and
	  o a copy of the laboratory analysis chain-of-custody as well as a description of the quality assurance and quality control procedures used.
	
	The Permittee shall maintain the written record at a location accessible to NMED during a Facility inspection for the lifetime of the Discharge Permit. The Permittee shall make the record available to a NMED representative upon request.

#	Terms and Conditions
	[Subsections A and D of 20.6.2.3107 NMAC]
79.	INSPECTION and ENTRY – The Permittee shall allow NMED to inspect the Facility and its operations that are subject to this Discharge Permit and the WQCC regulations. NMED may upon presentation of proper credentials, enter at reasonable times upon or through any premises in which a water contaminant source is located or in which any maintained records required by this Discharge Permit, regulations of the federal government, or the WQCC are located. The Permittee shall allow NMED to have access to and reproduce for their use any copy of the records, and to perform assessments, sampling or monitoring during an inspection for the purpose of evaluating compliance with this Discharge Permit and the WQCC regulations. No person shall construe anything in this Discharge Permit as limiting in any way the inspection and entry authority of NMED under the WQA, the WQCC Regulations, or any other local, state or federal regulations. [Subsection D of 20.6.2.3107 NMAC, NMSA 1978, §§ 74-6-9.B and 74-6-9.E]
80.	DUTY to PROVIDE INFORMATION - The Permittee shall, upon NMED's request, allow for NMED's inspection/duplication of records required by this Discharge Permit and/or furnish to NMED copies of such records. [Subsection D of 20.6.2.3107 NMAC]
81.	MODIFICATIONS and/or AMENDMENTS – In the event the Permittee proposes a change to the Facility or the Facility's discharge that would result in a change in the volume discharged; the location of the discharge; or in the amount or character of water contaminants received, treated or discharged by the Facility, the Permittee shall notify NMED prior to implementing such changes. The Permittee shall obtain NMED's approval (which may require modification of this Discharge Permit) prior to implementing such changes. [Subsection C of 20.6.2.3107 NMAC, Subsections E and G of 20.6.2.3109 NMAC]
82.	PLANS and SPECIFICATIONS – In the event the Permittee proposes to construct a wastewater system or change a process unit of an existing system such that the quantity or quality of the discharge will change substantially from that authorized by this Discharge Permit, the Permittee shall submit construction plans and specifications of the

#	Terms and Conditions
	proposed system or process unit for NMED's approval prior to the commencement of construction. In the event the Permittee implements changes to the wastewater system authorized by this Discharge Permit that result in only a minor effect on the character of the discharge, the Permittee shall report such changes (including the submission of record drawings, where applicable) as of January 1 and June 30 of each year to NMED. [Subsections A and C of 20.6.2.1202 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
83.	CIVIL PENALTIES - Any violation of the requirements and conditions of this Discharge Permit, including any failure to allow NMED staff to enter and inspect records or facilities, or any refusal or failure to provide NMED with records or information, may subject the Permittee to a civil enforcement action. Pursuant to WQA 74-6-10(A) and (B), such action may include a compliance order requiring compliance immediately or in a specified time, assessing a civil penalty, modifying or terminating the Discharge Permit, or any combination of the foregoing; or an action in district court seeking injunctive relief, civil penalties, or both. Pursuant to WQA 74-6-10(C) and 74-6-10.1, civil penalties of up to $15,000 per day of noncompliance may be assessed for each violation of the WQA 74-6-5, the WQCC Regulations, or this Discharge Permit, and civil penalties of up to $10,000 per day of noncompliance may be assessed for each violation of any other provision of the WQA, or any regulation, standard, or order adopted pursuant to such other provision. In any action to enforce this Discharge Permit, the Permittee waives any objection to the admissibility as evidence of any data generated pursuant to this Discharge Permit. [20.6.2.1220 NMAC, NMSA 1978, §§ 74-6-10 and 74-6-10.1]
84.	CRIMINAL PENALTIES – No person shall: • Make any false material statement, representation, certification or omission of material fact in an application, record, report, plan or other document filed, submitted or required to be maintained under the WQA; • Falsify, tamper with or render inaccurate any monitoring device, method or record required to be maintained under the WQA; or • Fail to monitor, sample or report as required by a permit issued pursuant to a state or federal law or regulation. Any person who knowingly violates or knowingly causes or allows another person to violate the requirements of this condition is guilty of a fourth-degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who is convicted of a second or subsequent violation of the requirements of this condition is

#	Terms and Conditions
	guilty of a third-degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who knowingly violates the requirements of this condition or knowingly causes another person to violate the requirements of this condition and thereby causes a substantial adverse environmental impact is guilty of a third-degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who knowingly violates the requirements of this condition and knows at the time of the violation that he is creating a substantial danger of death or serious bodily injury to any other person is guilty of a second-degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. [20.6.2.1220 NMAC, NMSA 1978, §§ 74-6-10.2.A through 74-6-10.2.F]
85.	COMPLIANCE with OTHER LAWS - Nothing in this Discharge Permit shall be construed in any way as relieving the Permittee of the obligation to comply with any other applicable federal, state, and/or local laws, regulations, zoning requirements, nuisance ordinances, permits or orders. [NMSA 1978, § 74-6-5.L]
86.	RIGHT to APPEAL - The Permittee may file a petition for review before the WQCC on this Discharge Permit. Such petition shall be in writing to the WQCC within thirty days of the receipt of postal notice of this Discharge Permit and shall include a statement of the issues raised and the relief sought. Unless the Permittee files a timely petition for review, the decision of NMED shall be final and not subject to judicial review. [20.6.2.3112 NMAC, NMSA 1978, § 74-6-5.O]
87.	TRANSFER of DISCHARGE PERMIT - Prior to the transfer of any ownership, control, or possession of this Facility or any portion thereof, the Permittee shall: • Notify the proposed transferee in writing of the existence of this Discharge Permit; • Include a copy of this Discharge Permit with the notice; and • Deliver or send by certified mail to NMED a copy of the notification and proof the proposed transferee has received such notification. The Permittee shall continue responsibility e for any discharge from the Facility, until the Permittee transfers both ownership and possession of the Facility to the transferee. [20.6.2.3111 NMAC]
88.	PERMIT FEES – The Permittee shall be aware that the payment of permit fees is due at the time of Discharge Permit approval. The Permittee may pay the permit fees in a single

#	Terms and Conditions
	payment or they may pay the fee in equal installments on a yearly basis over the term of the Discharge Permit. The Permittee shall remit single payments to NMED no later than 30 days following the effective date of the Discharge Permit. The Permittee shall remit initial installment payments to NMED no later than 30 days following the effective date of the Discharge Permit; with subsequent installment payments remitted to NMED no later than the anniversary of the effective date of the Discharge Permit. Permit fees are associated with <u>issuance</u> of this Discharge Permit. No person shall construe anything in this Discharge Permit as relieving the Permittee of the obligation to pay all permit fees assessed by NMED. A Permittee that ceases discharging or does not commence discharging from the Facility during the term of the Discharge Permit shall pay all permit fees assessed by NMED. NMED shall suspend or terminate an approved Discharge Permit if the Permittee fails to remit an installment payment by its due date. [Subsection F of 20.6.2.3114 NMAC, NMSA 1978, § 74-6-5.K]

New Mexico Environment Department Ground Water Quality Bureau
Discharge Permit Summary

Facility Information

Facility Name — Waste Isolation Pilot Plant (WIPP)
Discharge Permit Number — DP-831

Legally Responsible Party — Reinhard Knerr, Manager
U.S. Department of Energy, Carlsbad Field Office
P.O. Box 3090
Carlsbad, NM 88221
(575) 234-7300

Treatment, Disposal and Site Information

Primary Waste Type — Domestic and Industrial
Facility Type — Federal Agency - U.S. Department of Energy

Evaporative Impoundment Locations

Domestic Wastewater

Type	Designation	Description & Comments
Settling Impoundment	Settling Lagoon 1	Primary treatment; 60-mil high-density polyethylene (HDPE) synthetically lined; permitted one foot of freeboard; capacity of 963,214 gallons.
Settling Impoundment	Settling Lagoon 2	Primary treatment; 60-mil HDPE synthetically lined; permitted one foot of freeboard; capacity of 963,214 gallons.
Polishing Impoundment	Polishing Lagoon 1	Passive secondary treatment; 60-mil HDPE synthetically lined; permitted one foot of freeboard; capacity of 414,901 gallons.
Polishing Impoundment	Polishing Lagoon 2	Passive secondary treatment; 60-mil HDPE synthetically lined; permitted one foot of freeboard; capacity of 141,901 gallons.
Evaporation Impoundment	Effluent Lagoon A	Effluent storage; 30-mil liner low-density polyethylene (LLDP) synthetically lined; disposal by evaporation; permitted one foot of freeboard; capacity of 566,610 gallons.
Evaporation Impoundment	Effluent Lagoon B	Effluent storage; 30-mil LLDP synthetically lined; disposal by evaporation; permitted discharges are domestic waste, brine, purge waters, and miscellaneous industrial non-hazardous wastewater; permitted one foot of freeboard; capacity of 846,257 gallons.
Evaporation Impoundment	Effluent Lagoon C	Effluent Storage; 30-mil HDPE synthetically lined; disposal by evaporation; permitted discharges are domestic waste, brine, purge waters, and miscellaneous industrial non-hazardous wastewater; permitted one foot of freeboard; capacity of 846,257 gallons.

Storm Water Control

Type	Designation	Description & Comments
Storm Water Impoundment	Storm Water Pond 1	Constructed using a 60-mil HDPE synthetic liner; receives clean non-contact storm water from paved areas, roofs, air conditioner condensate, and water from domestic water lines; disposal by evaporation; permitted one foot of freeboard; capacity of 626,076 gallons.
Storm Water Impoundment	Storm Water Pond 2	Constructed using a 60-mil HDPE synthetic liner; receives clean non-contact storm after from the facilities paved areas, roofs, air conditioner condensate, and draining domestic water lines; disposal by evaporation; permitted one foot of freeboard; capacity of 2,268,330 gallons.
Storm Water Impoundment	Storm Water Pond 3	Constructed using a 60-mil HDPE synthetic liner; receives clean non-contact storm after from the facilities paved areas, roofs, air conditioner condensate, and draining domestic water lines; disposal by evaporation; permitted one foot of freeboard; capacity of 7,211,967 gallons.

Non-Domestic Wastewater

Type	Designation	Description & Comments
Evaporation Impoundment	Evaporation Pond H-19	Constructed using a 36-mil Hypalon synthetic liner; permitted discharges are brine, purge waters, and miscellaneous industrial non-hazardous wastewater; disposal by evaporation; permitted one foot of freeboard; capacity of 346,085 gallons.
Evaporation Impoundment	Salt Storage Pond 1	Constructed using a 60-mil HDPE synthetic liner; disposal by evaporation; permitted one foot of freeboard; capacity of 3,301,634 gallons.
Evaporation Impoundment	Salt Storage Pond 2/3	Constructed using 60-mil HDPE liner, 200-mil geonet drainage layer, and a second 60-mil HDPE liner with a leak detection system; disposal by evaporation; permitted one foot of freeboard; capacity of 21,737,254 gallons
Evaporation Impoundment	Salt Storage Pond 5	To be constructed, 60-mil HDPE liner, 200-mil geonet drainage layer, and a second 60-mil HDPE liner with a leak detection system; disposal by evaporation; permitted two feet of freeboard; capacity of 6,355,404 gallons.

Evaporation Impoundment	Brine Salt Storage Pond 4	To be constructed, 60-mil HDPE geomembrane double liner with a leak detection system; permitted discharges are clean non-contact stormwater from the facilities paved areas, roofs, air conditioner condensate, draining domestic water lines, and brine from Brine Retention Ponds East and West; Disposal by evaporation; permitted one foot of freeboard; capacity of 8,668,722 gallons.
Retention Basin	Brine Retention Pond East	To be constructed, 60-mil HDPE geomembrane double liner with a leak detection system and an epoxy coated concrete bottom; disposal by evaporation; permitted two feet of freeboard; capacity of 46,094 gallons.
Retention Basin	Brine Retention Pond West	To be constructed, 60-mil HDPE geomembrane double liner with a leak detection system and an epoxy coated concrete bottom; disposal by evaporation; permitted two feet of freeboard; capacity of 46,094 gallons.
Holding tank	Brine Holding Tank	To be constructed, 3,000-gallon fiberglass reinforced plastic holding tank for brine prior to being discharged to either Brine Retention Pond East or West.

Salt Storage Locations

Type	Designation	Description & Comments
Salt Pile	Salt Cell 1	Inactive; approximately 18.8 acres; graded to 2% slope covered with sand and 60 mil HDPE liner and with two feet of native soil; seeded; run-off collects in Salt Storage Pond 1.
Salt Pile	Salt Cell 2	Active; 6.2 acres; run-off area of 326,350 sq. ft.; constructed using of six-inch prepared subgrade, 60-mil HDPE liner, 200-mil drainage layer, eight oz. geotextile fabric covered with two feet of native soil; runoff collects in Salt Storage Ponds 2 and/or 3.
Salt Pile	Salt Cell 3	Active; 5.2 acres; run-off area of 272,850 sq. ft.; constructed using of six-inch prepared subgrade, 60-mil HDPE liner, 200-mil drainage layer, eight oz. geotextile fabric covered with two feet of native soil; runoff collects in Salt Storage Ponds 2 and/or 3.
Salt Pile	Salt Cell 5	To be constructed; 5.09 acres; run-off area of 221,841 sq. ft.; 60-mil HDPE geomembrane liner with a protective native soil layer; runoff collects in Salt Storage Pond 5.
Salt Pile	Site and Preliminary Design Validation Pile	Closed in 2000; covered with a geosynthetic liner, six inches of bedding material, and three feet of soil; Seeded.

Flow Metering Locations

Type	Designation	Description & Comments
Totalizing Flow Meter	Ultrasonic Flow Meter	Located at the facility Pump House – water supply; estimates domestic wastewater discharged to the Facultative Lagoon system.
Primary Measurement Device		To be installed. Measures brine discharged to Brine Retention Ponds East and West from the New Filter Building.
Totalizing Flow Meters		To be installed. Four separate meters to measure the brine pumped from the leak detection sumps for Brine Salt Storage Pond 4, Brine Retention Ponds East and West, and Salt Storage Pond 5.

Ground Water Monitoring Locations

Type	Designation	Description & Comments
Monitoring Wells	C-2505, C-2506, PZ-2, PZ-3, PZ-4	Quarterly depth to water measurement; all wells drilled in the shallow groundwater.
Monitoring Wells	C-2507, C-2811, PZ-1, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13, PZ-14, PZ-15, PZ-16, PZ-18	Quarterly depth to water measurement; semi-annual collection of field parameters for temperature, pH, and specific conductance; semi-annual monitoring for SO4, Cl, TDS, Uranium, and combined Radium-226 and Radium-228; all wells drilled in the shallow groundwater.
Monitoring Well	PZ-17	Quarterly depth to water measurement; semi-annual collection of field parameters for temperature, pH, and specific conductance; semi-annual monitoring for SO_4, Cl, TDS, TKN and NO_3-N; well drilled in the shallowest, water bearing zone of the Dewey Lake Formation and intended to monitor the Facultative Lagoon System.
Monitoring Wells	PZ-19 and WQSP-6A	Quarterly depth to water measurement; semi-annual collection of field parameters for temperature, pH, and specific conductance; semi-annual monitoring for SO4, Cl, and TDS; both wells drilled in the shallowest, water bearing zone of the Dewey Lake Formation and PZ-17 is intended to monitor Evaporation Pond H-19.

Depth-to-Ground Water 34 feet
Total Dissolved Solids (TDS) 3,400 mg/L

Permit Information

Original Permit Issued	January 16, 1992
Permit Amended	August 28, 1995
Permit Renewal	July 3, 1997
Permit Amended	June 12, 1998
Permit Amended	January 24, 2000
Permit Renewal	April 29, 2003
Permit Modification	December 22, 2003
Permit Modification	December 29, 2006
Permit Renewal and Modification	July 23, 2008
Permit Renewal	July 29, 2014

Current Action	**Permit Renewal and Modification**
Application Received	December 3, 2018
Public Notice Published	[not yet published]
Permit Issued (Issuance Date)	[issuance date]
Permitted Discharge Volume	Domestic – 23,000 gallons per day Non-Domestic – 9,586,995 gallons per day

Ground Water Quality Bureau
20.6.2.3103 STANDARDS FOR GROUNDWATER

This table lists the numeric ground water standards in 20.6.2.3103 NMAC, effective as of December 21, 2018. It does not list the "toxic pollutants" for which Subsection A of 20.6.2.3103 NMAC establishes a narrative standard. The list of "toxic pollutants" can be found in Subsection T of 20.6.2.7 NMAC. The standards with an asterisk (*) take effect on July 1, 2020 for past and current water discharges occurring as of July 1, 2017. For full details, please refer to the Ground and Surface Water Protection Regulations, 20.6.2 NMAC.

Contaminant (Abbreviation) (CAS Number)	Standard
Numerical Standards (mg/l unless otherwise noted)	
Antimony (Sb) (CAS 7440-36-0)	0.006
Arsenic (As) (CAS 7440-38-2)	0.01*
Barium (Ba) (CAS 7440-39-3)	2.0
Beryllium (Be) (CAS 7440-41-7)	0.004
Cadmium (Cd) (CAS 7440-43-9)	0.005*
Chromium (Cr) (CAS 7440-47-3)	0.05
Cyanide (CN) (CAS 57-12-5)	0.2
Fluoride (F) (CAS 16984-48-8)	1.6
Lead (Pb) (CAS 7439-92-1)	0.015*
Total Mercury (Hg) (CAS 7439-97-6)	0.002
Nitrate (NO_3 as N) (CAS 14797-55-8)	10.0
Nitrite (NO_2 as N) (CAS 10102-44-0)	1.0
Selenium (Se) (CAS 7782-49-2)	0.05
Silver (Ag) (CAS 7440-224)	0.05
Thallium (Tl) (CAS 7440-28-0)	0.002
Uranium (U) (CAS 7440-61-1)	0.03
Radioactivity: Combined Radium-226 (CAS 13982-63-3) and Radium-228 (CAS 15262-20-1)	5 pCi/l*
Benzene (CAS 71-43-2)	0.005*
Polychlorinated biphenyls (PCB's) (CAS 1336-36-3)	0.0005*
Toluene (CAS 108-88-3)	1.0
Carbon Tetrachloride (CAS 56-23-5)	0.005*
1,2-dichloroethane (EDC) (CAS 107-06-2)	0.005*
1,1-dichloroethylene (1,1-DCE) (CAS 75-35-4)	0.007
tetrachloroethylene (PCE) (CAS 127-18-4)	0.005*
trichloroethylene (TCE) (CAS 79-01-6)	0.005*
ethylbenzene (CAS 100-41-4)	0.7*
total xylenes (CAS 1330-20-7)	0.62
methylene chloride (CAS 75-09-2)	0.005*
chloroform (CAS 67-66-3)	0.1
1,1-dichloroethane (CAS 75-34-3)	0.025
ethylene dibromide (EDB) (CAS 106-93-4)	0.00005*
1,1,1-trichloroethane (CAS 71-55-6)	0.2
1,1,2-trichloroethane (CAS 79-00-5)	0.005*
1,1,2,2-tetrachloroethane (CAS 79-34-5)	0.01
vinyl chloride (CAS 75-01-4)	0.002
PAHs: total naphthalene (CAS 91-20-3) plus monomethylnaphthalenes	0.03
benzo-a-pyrene (CAS 50-32-8)	0.0002*
cis-1,2-dichloroethene (CAS 156-59-2)	0.07
trans-1,2-dichloroethene (CAS 156-60-5)	0.1
1,2-dichloropropane (PDC) (CAS 78-87-5)	0.005

styrene (CAS 100-42-5)	0.1
1,2-dichlorobenzene (CAS 95-50-1)	0.6
1,4-dichlorobenzene (CAS 106-46-7)	0.075
1,2,4-trichlorobenzene (CAS 120-82-1)	0.07
pentachlorophenol (CAS 87-86-5)	0.001
atrazine (CAS 1912-24-9)	0.003
Other Standards for Domestic Water Supply	
Chloride (Cl) (CAS 16887-00-6)	250

Groundwater Discharge Permit Guidance for Synthetically Lined Lagoons – Liner Material and Site Preparation

This guidance document represents minimum liner material and site preparation requirements for wastewater treatment, storage and evaporation lagoons. These requirements do not apply to lagoons storing hazardous wastes or high strength waste. The Ground Water Quality Bureau may impose additional requirements (e.g., double-lined lagoons with leak detection) for facilities discharging hazardous or high strength waste to lagoons through the development of specific Discharge Permit conditions for such facilities.

Liner Material Requirements:

1. The liner shall be chemically compatible with any material that will contact the liner.
2. The liner material shall be resistant to deterioration by sunlight if any portion of the liner will be exposed.
3. Synthetic liner material shall be of sufficient thickness to have adequate tensile strength and tear and puncture resistance. Under no circumstances shall a synthetic liner material less than 40 mils in thickness be accepted. Any liner material shall be certified by a licensed New Mexico professional engineer and approved by the New Mexico Environment Department (NMED) prior to its installation.

Lagoon Design and Site Preparation Requirements:

1. The system shall be certified by a licensed New Mexico professional engineer and approved by NMED prior to installation.
2. Inside slopes shall be a maximum of 3 (horizontal): 1 (vertical), and a minimum of 4 (horizontal); 1 (vertical).
3. Lagoon volume shall be designed to allow for a minimum of 24 inches of freeboard.
4. The liner shall be installed with sufficient liner material to accommodate shrinkage due to temperature changes. Folds in the liner are not acceptable.
5. To a depth of at least six inches below the liner, the sub-grade shall be free of sharp rocks, vegetation and stubble. In addition, liners shall be placed on a sub-grade of sand or fine soil. The surface in contact with the liner shall be smooth to allow for good contact between liner and sub-grade. The surface shall be dry during liner installation.
6. Sub-grade shall be compacted to a minimum of 90% of standard proctor density.
7. The minimum dike width shall be eight feet to allow vehicle traffic for maintenance.
8. The base of the pond shall be as uniform as possible and shall not vary more than three inches from the average finished elevation.
9. Synthetic liners shall be anchored in an anchor trench in the top of the berm. The trench shall be a minimum of 12 inches wide, 12 inches deep and shall be set back at least 24 inches from the inside edge of the berm.
10. If the lagoon is installed over areas of decomposing organic materials or shallow groundwater, a liner vent system shall be installed.
11. Any opening in the liner through which a pipe or other fixture protrudes shall be properly sealed. Liner penetrations shall be detailed in the construction plans and record drawings.
12. A synthetic liner shall not be installed in temperatures below freezing.
13. The liner shall be installed or supervised by an individual that has the necessary training and experience as required by the liner manufacturer.
14. All manufacturer's installation and field seaming guidelines shall be followed.
15. All synthetic liner seams shall be field tested by the installer and verification of the adequacy of the seams shall be submitted to NMED along with the record drawings.
16. Concrete slabs installed on top of the synthetic liner for operational purposes shall be completed in accordance with manufacturer and installer recommendations to ensure liner integrity.

NEW MEXICO ENVIRONMENT DEPARTMENT
GROUND WATER QUALITY BUREAU
MONITORING WELL CONSTRUCTION AND ABANDONMENT GUIDELINES

Purpose: These guidelines identify minimum construction and abandonment details for installation of water table monitoring wells under groundwater Discharge Permits issued by the NMED's Ground Water Quality Bureau (GWQB) and Abatement Plans approved by the GWQB. Proposed locations of monitoring wells required under Discharge Permits and Abatement Plans and requests to use alternate installation and/or construction methods for water table monitoring wells or other types of monitoring wells (e.g., deep monitoring wells for delineation of vertical extent of contaminants) must be submitted to the GWQB for approval prior to drilling and construction.

General Drilling Specifications:

1. All well drilling activities must be performed by an individual with a current and valid well driller license issued by the State of New Mexico in accordance with 19.27.4 NMAC. Use of drillers with environmental well drilling experience and expertise is highly recommended.
2. Drilling methods that allow for accurate determinations of water table locations must be employed. All drill bits, drill rods, and down-hole tools must be thoroughly cleaned immediately prior to the start of drilling. The borehole diameter must be drilled a minimum of 4 inches larger than the casing diameter to allow for the emplacement of sand and sealant.
3. After completion, the well should be allowed to stabilize for a minimum of 12 hours before development is initiated.
4. The well must be developed so that formation water flows freely through the screen and is not turbid, and all sediment and drilling disturbances are removed from the well.

Well Specifications (see attached monitoring well schematic):

5. Schedule 40 (or heavier) polyvinyl chloride (PVC) pipe, stainless steel pipe, carbon steel pipe, or pipe of an alternate appropriate material that has been approved for use by NMED must be used as casing. The casing must have an inside diameter not less than 2 inches. The casing material selected for use must be compatible with the anticipated chemistry of the groundwater and appropriate for the contaminants of interest at the facility. The casing material and thickness selected for use must have sufficient collapse strength to withstand the pressure exerted by grouts used as annular seals and thermal properties sufficient to withstand the heat generated by the hydration of cement-based grouts. Casing sections may be joined using welded, threaded, or mechanically locking joints; the method selected must provide sufficient joint strength for the specific well installation. The casing must extend from the top of the screen to at least one foot above ground surface. The top of the casing must be fitted with a removable cap, and the exposed casing must be protected by a locking steel well shroud. The shroud must be large enough in diameter to allow easy access for removal of the cap. Alternatively, monitoring wells may be completed below grade. In this case, the casing must extend from the top of the screen to 6 to 12 inches below the ground surface; the monitoring wells must be sealed with locking, expandable well plugs; a flush-mount, watertight well vault that is rated to withstand traffic loads must be emplaced around the wellhead; and the cover must be secured with at least one bolt. The vault cover must indicate that the wellhead of a monitoring well is contained within the vault.
6. A 20-foot section (maximum) of continuous-slot, machine slotted, or other manufactured PVC or stainless steel well screen or well screen of an alternate appropriate material that has been approved for use by NMED must be installed across the water table. Screens created by cutting slots into solid casing with saws or other tools must not be used. The screen material selected for use must be compatible with the anticipated chemistry of the ground water and appropriate for the contaminants of interest at the facility. Screen sections may be joined using welded, threaded, or mechanically

locking joints; the method selected must provide sufficient joint strength for the specific well installation and must not introduce constituents that may reasonably be considered contaminants of interest at the facility. A cap must be attached to the bottom of the well screen; sumps (i.e., casing attached to the bottom of a well screen) should not be installed. The bottom of the screen must be installed no more than 15 feet below the water table; the top of the well screen must be positioned not less than 5 feet above the water table. The well screen slots must be appropriately sized for the formation materials and should be selected to retain 90 percent of the filter pack. A slot size of 0.010 inches is generally adequate for most installations.

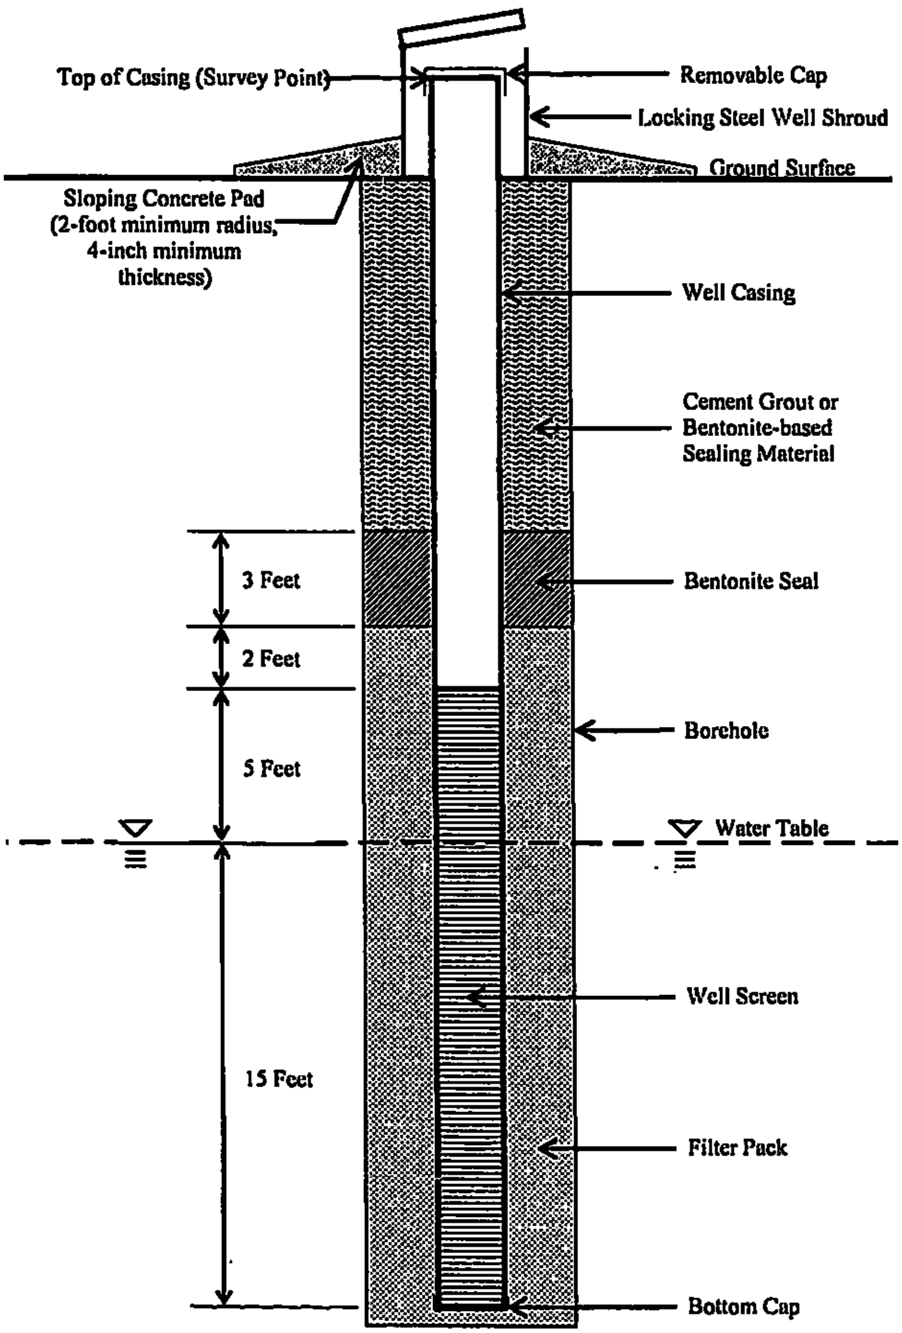
7. Casing and well screen must be centered in the borehole by placing centralizers near the top and bottom of the well screen.
8. A filter pack must be installed around the screen by filling the annular space from the bottom of the screen to 2 feet above the top of the screen with clean silica sand. The filter pack must be properly sized to prevent fine particles in the formation from entering the well; clean medium to coarse silica sand is generally adequate as filter pack material for 0.010-inch slotted well screen. For wells deeper than 30 feet, the sand must be emplaced by a tremmie pipe. The well should be surged or bailed to settle the filter pack and additional sand added, if necessary, before the bentonite seal is emplaced.
9. A bentonite seal must be constructed immediately above the filter pack by emplacing bentonite chips or pellets (3/8-inch in size or smaller) in a manner that prevents bridging of the chips/pellets in the annular space. The bentonite seal must be 3 feet in thickness and hydrated with clean water. Adequate time should be allowed for expansion of the bentonite seal before installation of the annular space seal.
10. The annular space above the bentonite seal must be sealed with cement grout or a bentonite-based sealing material acceptable to the State Engineer pursuant to 19.27.4 NMAC. A tremmie pipe must be used when placing sealing materials at depths greater than 20 feet below the ground surface. Annular space seals must extend from the top of the bentonite seal to the ground surface (for wells completed above grade) or to a level 3 to 6 inches below the top of casing (for wells completed below grade).
11. For monitoring wells finished above grade, a concrete pad (2-foot minimum radius, 4-inch minimum thickness) must be poured around the shroud and wellhead. The concrete and surrounding soil must be sloped to direct rainfall and runoff away from the wellhead. The installation of steel posts around the well shroud and wellhead is recommended for monitoring wells finished above grade to protect the wellhead from damage by vehicles or equipment. For monitoring wells finished below grade, a concrete pad (2-foot minimum radius, 4-inch minimum thickness) must be poured around the well vault and wellhead. The concrete and surrounding soil must be sloped to direct rainfall and runoff away from the well vault.

<u>**Abandonment**</u>:

12. Approval for abandonment of monitoring wells used for ground water monitoring in accordance with Discharge Permit and Abatement Plan requirements must be obtained from NMED prior to abandonment.
13. Well abandonment must be accomplished by removing the well casing and placing neat cement grout, bentonite-based plugging material, or other sealing material approved by the State Engineer for wells that encounter water pursuant to 19.27.4 NMAC from the bottom of the borehole to the ground surface using a tremmie pipe. If the casing cannot be removed, neat cement grout, bentonite-based plugging material, or other sealing material approved by the State Engineer must be placed in the well using a tremmie pipe from the bottom of the well to the ground surface.
14. After abandonment, written notification describing the well abandonment must be submitted to the NMED. Written notification of well abandonment must consist of a copy of the well plugging record submitted to the State Engineer in accordance with 19.27.4 NMAC, or alternate documentation containing the information to be provided in a well plugging record required by the State Engineer as specified in 19.27.4 NMAC.

Deviation from Monitoring Well Construction and Abandonment Requirements: Requests to construct water table monitoring wells or other types of monitoring wells for groundwater monitoring under groundwater Discharge Permits or Abatement Plans in a manner that deviates from the specified requirements must be submitted in writing to the GWQB. Each request must state the rationale for the proposed deviation from these requirements and provide detailed evidence supporting the request. The GWQB will approve or deny requests to deviate from these requirements in writing.

MONITORING WELL SCHEMATIC
(Not to Scale)



FACT SHEET
Groundwater Discharge Permit DP-831
September 2020

Facility Name:	Waste Isolation Pilot Plant
Facility Location:	Highway 128, 26 miles southeast of Carlsbad Carlsbad, NM Sections 20, 21, 28 and 29, Township 22S, Range 31E
County:	Eddy County
Applicant/Permittee:	Reinhard Knerr, Manager U.S. Department of Energy, Carlsbad Field Office P.O. Box 3090 Carlsbad, NM 88221
Proposed Permitting Action:	Discharge Permit Renewal and Modification
Regulatory Authority:	Water Quality Control Commission's Ground and Surface Water Protection Regulations, 20.6.2 NMAC
Issuing Agency:	Ground Water Quality Bureau of the New Mexico Environment Department
GWQB Contact:	Avery Young P.O. Box 5469, Santa Fe, NM 87502-5469 Phone: (505) 827-2909 Email: avery.young@state.nm.us

The New Mexico Environment Department (NMED) provides this Fact Sheet to inform the public regarding the Department's proposed permitting action at the Waste Isolation Pilot Plant (WIPP or Facility) to protect groundwater. Prior to issuing a permit, NMED is required by regulation to release a draft of the permit for public comment. NMED is also required to issue a Fact Sheet which serves two functions: 1) to facilitate public review of that draft permit; and 2) to provide a brief summary of the basis for draft permit conditions.

This Fact Sheet includes general information about WIPP, a description of the department's permitting process to protect groundwater, a description of the wastewater discharged from the Facility that could potentially impact groundwater, and a summary of the draft conditions in the groundwater discharge permit. NMED issues groundwater discharge permits in accordance with the State law, i.e., the New Mexico Water Quality Act, and State regulation, i.e., the Ground and Surface Water Protection Regulations.

Facility Background

The Facility is located near the Jal Highway (NM-128), 26 miles southeast of Carlsbad, in Sections 20, 21, 28, and 29, Township 22S, Range 31E, Eddy County. A map of the facility can be found in Attachment A.

The WIPP is a mined geologic repository for the disposal of U.S. Department of Energy (DOE or Permittee) mixed transuranic (MTRU) waste. MTRU waste is waste that has a hazardous component and radioactive elements heavier than uranium. DOE is obligated to manage MTRU waste in compliance with a Hazardous Waste Permit issued by NMED's Hazardous Waste Bureau (HWB) under the New Mexico Hazardous Waste Act and New Mexico's Hazardous Waste Regulations. New Mexico does not have the authority to regulate the radiological aspects of MTRU waste. The WIPP underground repository for MTRU waste is located 2,150 feet below land surface in the bedded salt of the Salado Formation. WIPP first began accepting MTRU waste in March 1999.

There are three basic structures associated with the Facility: surface structures, shafts and underground structures. The surface structures accommodate the personnel, equipment, and support services required for the receipt, preparation, and transfer of MTRU waste from the surface to the underground. Four vertical shafts connect the surface facility to the underground. The underground structures include the underground waste disposal areas, the shaft pillar area, interconnecting drifts, and other areas unrelated to waste management activities.

Regulatory Framework

The Ground and Surface Water Protection Regulations, 20.6.2 NMAC, establish the regulatory framework for controlling discharges onto or below the surface of the ground through the issuance of groundwater discharge permits. The purpose of the regulations pertaining to groundwater discharge permits, as stated in Section 20.6.2.3101 NMAC, is "to protect all ground water of the state of New Mexico which has an existing concentration of 10,000 mg/l or less of total dissolved solids, for present and potential future use as domestic and agricultural water supply, and to protect those segments of surface waters which are gaining because of ground water inflow, for uses designated" in the Standards for Interstate and Intrastate Surface Waters, 20.6.4 NMAC. (See the New Mexico Commission of Public Records website to view 20.6.2 and 20.6.4 NMAC: http://www.srca.nm.gov/chapter-6-water-quality/.) The regulations establish groundwater standards as identified in Section 20.6.2.3103 NMAC.

Persons proposing to discharge effluent or leachate in such a manner that it could move directly or indirectly into groundwater must obtain and comply with a discharge permit (20.6.2.3104

NMAC). In order to obtain a discharge permit, an applicant must submit an application (or "discharge plan" – 20.6.2.7 NMAC) proposing methods/techniques to be used or processes expected to naturally occur to ensure that the discharge of water contaminants does not result in the contamination of ground or surface water (20.6.2.3106 NMAC).

In reviewing and approving an application, NMED must ensure that the discharge plan will not result in a hazard to public health, undue risk to property, exceedance of the groundwater standards at any place of withdrawal of water for present or reasonably foreseeable future use, or violation of a stream standard (Subsections C and H of 20.6.3109 NMAC). "Hazard to public health" is defined in Section 20.6.2.7 NMAC and pertains to the exceedance of the groundwater standards in a drinking water supply.

Subsection B of 20.6.2.3109 NMAC directs the NMED Secretary to "approve, approve with conditions, or deny" a discharge permit application, after the administrative record is complete and all required information is available. This regulation authorizing permit approval "with conditions" provides the fundamental authority for including conditions in discharge permits.

Discharge Permit

NMED's Ground Water Quality Bureau (GWQB) is responsible for the issuance of the groundwater discharge permit (Discharge Permit of DP-831) to control discharges from the Facility for the protection of groundwater for present and potential future use as domestic and agricultural water supply. The draft Discharge Permit does not address the management of MTRU waste but instead addresses non-hazardous, non-radiological wastes generated primarily at the surface at WIPP in addition to mined salt disposed of at the surface.

Categories of wastes types addressed in the draft Discharge Permit include domestic waste, industrial wastewaters, salt brine, stormwater runoff, and salt. Domestic wastewater, i.e., human waste, is discharged to an impoundment system for treatment and disposal by evaporation. Industrial wastewater such as compressed air system generated waters, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous, non-radioactive wastewaters is discharged to an impoundment system for disposal by evaporation. Salt brine produced from stormwater runoff from salt storage piles and other Facility processes is discharged to an impoundment system for disposal by evaporation. Salt mined at the Facility is stored at the surface in four stockpiles or salt cells. A portion of these stockpiles are closed and covered. The salt stockpiles have lined stormwater collection and drainage systems which convey the water to impoundments or ponds for evaporation.

Discharge Permit History

The original WIPP groundwater Discharge Permit (DP-831) was issued by NMED on January 16, 1992, amended on August 28, 1995, renewed on July 3, 1997, amended on June 12, 1998 and on

January 24, 2000, renewed on April 29, 2003, modified on December 22, 2003 and on December 29, 2006, renewed and modified on July 23, 2008, and last renewed on July 29, 2014. The application (i.e., discharge plan) consists of the materials submitted by the Permittee dated December 3, 2018 and materials contained in the administrative record prior to issuance of this draft Discharge Permit and draft Fact Sheet.

The draft Discharge Permit addresses the renewal and modification of associated permit conditions. The permit modification consists of the addition of one new salt storage cell and four new liquid impoundments: Salt Cell 5, Salt Storage Pond 5, Brine Salt Storage Pone 4, Brine Retention Pond East, and Brine Retention Pond West. Additional changes made to the Discharge Permit issued on July 29, 2014 are described below.

Hydrogeology

The Facility is geologically situated in the southeast portion of New Mexico within the Delaware Basin, which is part of the larger Permian Basin. The geologic formations below the facility that are pertinent to this Discharge Permit, from deepest to shallowest, include: the Salado Formation (851 to 2,150 below ground surface [bgs]), the Rustler Formation (546 to 851 bgs), the Dewey Lake Formation (54 to 564 bgs), and, in the northeastern portion of the facility, the Santa Rosa Formation (34 to 54 bgs). The Salado Formation consists predominately of polyhalite, with some halite, carbonates, anhydrites, and clay seams. The Rustler Formation consists of carbonates, anhydrites, and halites. The Dewey Lake Formation consists almost entirely of mudstone, claystone, siltstone, and interbedded sandstone, and is frequently referred to as the Dewey Lake Redbeds Formation. The terms upper, middle, and lower Dewey Lake are used to describe the stratigraphic position in the formation and characteristics that related to the occurrence of saturated conditions. The upper Dewey Lake consists of a think, generally unsaturated section. The middle Dewey Lake occurs above a sulfate cementation change, which results in saturated conditions and a natural water table in limited areas. The lower Dewey Lake is below the sulfate cementation change and has low permeability. The Santa Rosa Formation consists of gray and red sandstone with lenses of shale and conglomerate.

The vadose zone, i.e., the area above the water table, consists of Quaternary dune sand (0 to 7.5 bgs), Mescalero caliche (7.5 to 17 bgs), and the Gatuña Formation (17 to 34 bgs). Recharge rates through the native soils are extremely low and there is little recharge through the vadose zone to the Santa Rosa Formation.

Groundwater below the Facility most likely to be affected by a discharge from the facility is at a depth of approximately 34 to 160 feet. The WIPP discovered a perched water zone in the lower Santa Rosa and upper Dewey Lake Formations in 1995 and determined that the probable sources of this shallow groundwater were the unlined impoundments constructed to capture stormwater runoff at the Facility and runoff from the above-ground salt piles. This shallow groundwater is contaminated with total dissolved solids, sulfate, and chloride. After the discovery of the human caused shallow groundwater, all impoundments at the facility were lined and a network of monitoring wells was installed. The shallow groundwater has a flow direction of north to south. Natural, non-human caused, groundwater occurs in the middle portion of the Dewey Lake Formation south of the WIPP facility at a depth of 160 feet. The Dewey Lake Formation has a relatively low hydraulic conductivity and the groundwater in the Formation has an average total dissolved solids concentration of approximately 3,400 milligrams per liter.

The first laterally continuous water-bearing zone below the Facility is within an approximately 30-foot-thick section of the Culebra Member of the Rustler Formation. Water in the Culebra Member is usually present in fractures and is confined by overlaying anhydrite and underlying clay and anhydrite beds. The Culebra Member is monitored through a network of monitoring wells.

Description of the Proposed Discharge

The activities that produce the discharge and the quantity, quality, and flow characteristics of the proposed discharges at the WIPP are briefly described as follows:

The source and disposition locations of proposed discharges at WIPP include the following: domestic wastewater to a facultative (treatment) lagoon system; industrial, non-hazardous, non-radioactive wastewater to evaporative impoundments; stormwater emanating generally from the Facility to evaporative impoundments, and stormwater emanating from the salt piles to evaporative impoundments.

Up to 23,000 gallons per day (gpd) of domestic wastewater may be discharged to seven synthetically lined impoundments (Facultative Lagoon System) comprised of Settling Lagoons 1 and 2, Polishing Lagoons 1 and 2, and Effluent Lagoons A, B, and C for disposal by evaporation and removal of precipitated domestic waste solids.

Non-domestic wastewater may be discharged at the Facility in the following ways:

- Up to 27,000 gpd of industrial wastewaters from the following sources: wastewater from compressed air systems, brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous, non-radioactive wastewaters. These industrial wastewaters are discharged to the Effluent Lagoons B and C of the Facultative Lagoon System for disposal by evaporation.

- Up to 50,000 gpd of industrial wastewaters from the following sources: brine, purge waters from sampling and developing Facility monitoring wells, condensate from the Exhaust Shaft fan ductwork on the surface, and water collected from the Waste Shaft Sump, Exhaust Shaft Interception Wells, and other observation boreholes in the underground. These industrial wastewaters are discharged to a separate synthetically lined impoundment for disposal by evaporation (Evaporation Pond H-19).

- Up to 2,210 gpd of brine produced from the operation of the to be constructed Salt Reduction System within the Safety Significant Confinement Ventilation System (SSCVS) will be discharged to two double synthetically lined impoundments, each with a leak detection system (Brine Retention Ponds East and West, collectively Brine Ponds). One brine retention pond will be in service while the other brine retention pond is closed for evaporation and removal of precipitated salt in order to maintain at least two feet of freeboard. Any remaining brine in the closed Brine Pond will be transferred to Brine Salt Storage Pond 4 for disposal by evaporation.

- Salt and other subsurface materials mined during construction of the Facility, as well as currently mined salt, are stored at the surface in four stockpiles. The stockpiles currently storing salt, or that will be used in the future as salt is mined from the Facility's underground panels, are referred to as Salt Cells 2, 3, and 5. Stormwater runoff in contact with Salt Cells 2 and 3 is collected in two double synthetically-lined stormwater impoundments, each with a leak detection system (Salt Storage Ponds 2 and 3). The total storage capacity of Salt Storage Ponds 2 and 3 is 21,737,254 gallons. Stormwater runoff in contact with Salt Cell 5 will be collected in a double synthetically-lined stormwater impoundment with a leak detection system (Salt Storage Pond 5). The storage capacity of Salt Storage Pond 5 will be 6,355,404 gallons. Salt Cell 1 no longer receives salt and is capped with synthetic material and an earthen cover. Stormwater runoff in contact with this stockpile is collected in synthetically-lined diversion ditches directed to a synthetically-lined impoundment (Salt Storage Pond 1). The storage capacity of Salt Storage Pond 1 is 3,301,634 gallons. The storage capacity of each salt storage pond is more than sufficient to contain a 24-hour, 100-year (5.84-inch rainfall) storm event.

- Stormwater runoff from the SSCVS area is collected in a double synthetically-lined stormwater impoundment with a leak detection system (Brine Salt Storage Pond 4). The storage capacity of Brine Salt Storage Pond 4 is 8,668,722 gallons. The capacity of the Brine Salt Storage Pond 4 is more than sufficient to contain a 24-hour, 100-year (5.84-inch rainfall) storm event.

- Additional stormwater runoff from the Facility's paved areas and roofs is collected in three synthetically-lined impoundments (Storm Water Ponds 1, 2, and 3). This runoff does not contact the salt stockpiles or other waste materials at the Facility and may be used by the permittee for dust control, soil compaction, and other construction activities.

Basis for Draft Permit Conditions

The conditions in this Draft Permit are organized into the following Sections: Operational Plan, Monitoring and Reporting, Additional Studies Required, Contingency, Closure, and General Requirements. The Draft Permit conditions conform to the requirements of the regulations and are generally consistent with similar conditions in other groundwater discharge permits issued by the Department.

1. Operational Plan Conditions (pages 6-14 in the Draft Permit)

Conditions in this Section require the permittee to properly operate and maintain the disposal systems, to restrict access to the systems via fencing so that unauthorized persons cannot damage a system or be exposed to unsafe conditions, and to post appropriate cautionary signs.

This Section contains operating conditions typically required for discharge systems composed of lined treatment impoundments for domestic wastewater and lined evaporative impoundments for industrial wastewater and stormwater. These conditions include requirements to appropriately maintain the synthetic impoundment liners, to maintain a specific freeboard within impoundments to prevent overtopping, to measure the thickness of settled solids within impoundments and to remove those solids in accordance with all local, state, and federal regulations if storage capacity is diminished to a specific limit. Proper operation and maintenance of the discharge system is critical for the Discharge Permit to achieve the performance criteria established in Subsection C of 20.6.2.3109 NMAC.

This Section requires the Permittee to monitor impoundment leak detection systems associated with specific salt storage ponds and the proposed impoundments. This requirement in-part addresses the requirement that a discharge plan include procedures for detecting a failure of the discharge system as specified in 20.6.2.3107 NMAC. The Permittee must construct, maintain, and operate impoundment leak detection, collection, and recovery systems (LDCRS) in a manner that will result in less than one foot of hydraulic head on the secondary liner. If this impoundment leakage limit cannot be maintained, the Permittee is obligated to submit a corrective action plan to NMED for approval.

This Section also requires the Permittee to conduct regular inspection of the earthen covers on Salt Cell 1 and the Site and Preliminary Design Validation (SPDV) Material Pile. The Permittee is required to inspect the earthen covers monthly and after storm events of 2 inches or greater in a 24-hour period to evaluate the covers, including erosional impact and vegetative success. Both piles consist of salt excavated during the construction of the Facility. Both piles are no longer active, i.e., they no longer receive mined salt; therefore, they have been covered in order to prevent stormwater infiltration and destabilization of the piles.

The Draft Permit does not contain discharge quality limitations because all discharges are contained in evaporative disposal systems.

2. Monitoring and Reporting Conditions (pages 15 – 27 in the Draft Permit)

Conditions in this Section require the Permittee to monitor and report on various aspects of the discharge system and groundwater to demonstrate that operations are compliant with the Discharge Permit and that the Discharge Permit is achieving the expected results. Monitoring and reporting requirements are authorized by Subsection A of 20.6.2.3107 NMAC. A discharge permit may not be approved without provisions for flow measurement and sampling, pursuant to Subsection H of 20.6.2.3109 NMAC.

The facility subsections require monitoring of the quantity and quality of the discharges, specifically, the discharge volumes to the impoundments, the chemical characterization of the impounded fluids, and the volume of liquid pumped from the leak detection systems.

This Section requires semi-annual sampling of Effluent Lagoon A of the Facultative Lagoon System for total Kjeldahl nitrogen, nitrate as nitrogen, total dissolved solids, chloride, and sulfate. If industrial wastewater is discharged into Effluent Lagoon B or C during a semi-annual period, the Permittee is required to sample the impoundments for total dissolved solids, chloride and sulfate. In addition, NMED may require comprehensive laboratory analysis of the industrial wastewater prior to it being discharged when NMED determines additional information is required.

This Section requires the Permittee once during the Discharge Permit term to evaluate the industrial wastewater in Evaporation Pond H-19 for constituent listed in 20.6.2.3103 NMAC. This comprehensive analysis pertains to the industrial waste discharges having varied origins, including brine, purge waters from sampling and developing monitoring wells, water collected from the Waste Shaft Sump, Exhaust Shaft Interception Wells, other observation boreholes in the underground, and condensate from the Exhaust Shaft fan ductwork on the surface. On an annual basis, the Permittee is required to sample Storm Water Ponds 1, 2, and 3 for sulfate, total dissolved solids, and chloride. The Permittee is required to sample the industrial wastewater in Brine Retention Ponds East and West quarterly and analyze the sample for every constituent listed in Subsection A of 20.6.2.3103 NMAC. After four consecutive quarterly sampling events, the Permittee may request to reduce the sampling frequency and/or the analyte list.

The Permittee is required to sample Salt Storage Ponds 1, 2, 3 and 5 on an annual basis and analyze the sample for sulfate, total dissolved solids, and chloride.

The Groundwater Monitoring and Reporting subsection requires monitoring groundwater downgradient of the following potential contaminant sources: impoundments containing stormwater runoff in contact with salt piles, the domestic wastewater impoundment system, capped salt piles, uncapped salt piles, and impoundments containing industrial discharges. This Section requires groundwater monitoring of two perched water zones, the shallow human caused groundwater measured at approximately 35 to 80 feet below ground surface in fifteen monitoring wells and the shallowest natural water-bearing zone in the Dewey Lake Formation measured at approximately 160 feet below ground surface in three monitoring wells. A map depicting monitoring well locations can be found in Attachment B.

The Permittee is required on a semi-annual basis to sample for total dissolved solids, chloride, and sulfate in eighteen groundwater monitoring wells designated to monitor salt piles, impoundments containing stormwater runoff in contact with salt piles, and the domestic wastewater system. The Permittee is required to sample on a semi-annual basis for nitrate as nitrogen and total Kjeldahl nitrogen in one groundwater monitoring well designated to monitor the domestic wastewater impoundment system. The Permittee is required to sample for uranium and combined radium-226 and radium-228 once within the first year of the permit term in eighteen groundwater monitoring wells designated to monitor all domestic and non-domestic discharge locations at the Facility. The sampling requirements for uranium and radium-226/radium-228 are included because these constituents are the only radioactive constituents for which New Mexico has groundwater protection standards. Historical analysis for 12 years at the Facility for other radioactive constituents showed results at concentrations at background levels or below counting limits. Radionuclides continue to be monitored in the Annual Site Environmental Report prepared by the WIPP.

Monitoring wells WQSP-6A, PZ-17, and PZ-19 are intended to monitor the shallowest natural water-bearing zone in the Dewey Lake Formation, which occurs in the subsurface at the southern end of the Facility. All other monitoring wells are intended to monitor the shallow human caused groundwater.

This subsection requires the installation of four new groundwater monitoring wells to monitor groundwater associated with newly authorized impoundments, to replace an improperly located well, and to monitor previously unmonitored locations. One monitoring well is required to be installed downgradient of the Facultative Lagoon System to replace an improperly located well. One monitoring well is required to be installed downgradient of Evaporation Pond H-19 because the impoundment is comprised of a single, 40-mil synthetic liner; therefore, a monitoring well is required downgradient to monitor the integrity of the liner. One monitoring well is required to be installed downgradient of the proposed Brine Salt Storage Pond 4 to monitor that impoundment system. One well is required to be installed downgradient of the proposed Salt Storage Pond 5 in order to monitor that impoundment system.

This Section requires the submittal of semi-annual monitoring reports that include the following: the chemical analytical results of domestic effluent and non-domestic wastewater; discharge volumes; record of solids (salt) removal and disposal; leak detection system measurements; the submittal of DOE's "Waste Isolation Pilot Plant Annual Site Environmental Report"; groundwater characterization data; groundwater depth measurements; and groundwater elevation contour maps.

3. Additional Studies Required (pages 27 - 28 in the Draft Permit)

This Section requires the Permittee to submit for NMED approval a workplan to investigate the shallow groundwater beneath the site, which contains concentrations of total dissolved solids, chloride, and sulfate above the standards of 20.6.2.3103 NMAC. Contingency Condition 26 of WIPP's previous Discharge Permit dated July 29, 2014 requires a response to exceedances to the standards of 20.6.2.3103 NAMC. Facility records identify the probable source of this groundwater as unlined stormwater impoundments from the time of initial construction of the Facility to the time the impoundments were lined in 2005. The purpose of the site investigation is to determine the efficacy of existing source controls, to determine the current lateral and vertical extent of this contaminated shallow groundwater, and to identify any potential impacts to the downgradient and naturally occurring downgradient groundwater in the Dewey Lake Formation. The site investigation may build upon the previous investigations completed by Daniel B. Stephens and Associates in 2003 and 2008.

This requirement is consistent with Section 20.6.2.3107 NMAC, which allows the Secretary to require a system of monitoring and reporting to verify that the permit is achieving the expected results and to require reporting of other information. The site investigation will provide additional information necessary to prevent further contamination and to determine whether to require corrective action or abatement.

4. Contingency Plan Conditions (pages 28 -31 in the Draft Permit)

This Section requires the Permittee implement specified actions, or to propose corrective actions for NMED's approval, in the case of failure of any aspect of the discharge system. The conditions, which reflect standard language used in other industrial discharge permits, address the exceedance of groundwater standards, damage to impoundment liners, lack of required freeboard in impoundments, and monitoring well deficiencies (e.g., improper construction, improper location for monitoring the intended source, insufficient water for sampling). If any of the conditions listed occur, the Permittee is required to submit a Corrective Action Plan resolving the issue to NMED for approval. Contingency plans are authorized by Subsection A(10) of 20.6.2.3107 NMAC. The Permittee is required to report and address unauthorized discharges in accordance with 20.6.2.1203 NMAC.

5. Closure Conditions (pages 32 – 35 in the Draft Permit)

This Section prescribes measures and timeframes for closing part, or all, of the Facility so that discharges can no longer occur and so that the exceedance of groundwater standards does not occur after the cessation of the operation. NMED understands that the Permittee does not plan to close the Facility during the term of this Discharge Permit, however general closure conditions are always included in discharge permits. Closure requirements are authorized by Subsection A(11) of 20.6.2.3107 NMAC, which also stipulates that closure requirements survive the termination or expiration of the Discharge Permit.

Groundwater monitoring is required after a discharge ceases and all means of transferring liquid to a discharge impoundment are sealed. This period after "closure" is commonly referred to as "post-closure" and generally continues until a minimum of eight consecutive quarters of groundwater sampling and analysis confirm no exceedance of standards. This two-year period allows for the potential movement of contaminants through the vadose zone and is consistent with the time period established in remediation programs for demonstrating that remediation is complete, e.g., 20.6.2.4103 NMAC (abatement plans) and 20.5.119.1929 NMAC (petroleum storage tank systems).

This Section includes a condition for properly closing the Facility in accordance with the WIPP Land Withdrawal Act, WIPP's Hazardous Waste Facility Permit (NM4890139088-TSDF), and the WIPP Land Management Plan's requirements for disposition of salt. In particular, the condition requires removal of all salt stockpiles from the land surface at the Facility so that the salt does not remain as a potential source of a contaminant discharge to groundwater.

6. General Terms and Conditions (pages 35 – 39 in the Draft Permit)

This Section's general terms and conditions are standard conditions in all discharge permits.

The Permittee is required to maintain certain records and provide them if requested to NMED, as authorized by Subsections A and D of 20.6.2.3107 NMAC. The Permittee is required to notify NMED of proposed changes to the volume, location, or character of the discharge, as this may require a "discharge permit modification" as defined in Subsection D of 20.6.2.7 NMAC and is consistent with the notification requirement in Subsection C of 20.6.2.3107 NMAC.

This Section identifies the Permittee's obligations, pursuant to the Ground and Surface Water Protection Regulations, regarding the transfer of the discharge permit, permit fees, and submittal of construction plans and specifications. The Section also cites New Mexico Water Quality Act provisions allowing for inspections, civil and criminal penalties, and the duty to comply with other laws.

Comment Period / Request for Hearing

NMED will allow at least thirty days during which time the public or the Facility may submit written comments and request a public hearing regarding the draft Discharge Permit. NMED will allow for these activities after publishing notice of the availability of this draft Permit and Fact Sheet. Requests for public hearing shall be in writing and shall set forth the reasons why a hearing should be held. A hearing will be held if the NMED Secretary determines that there is substantial public interest. To obtain a copy of the Draft Permit, to submit a comment, or to request a hearing on this matter, contact the GWQB Contact listed at the beginning of this Fact Sheet.

Also, if it's easy enough, can you send the original designs for H-19, Salt Storage Ponds 1, 2, 3, and Stormwater Ponds 1,2, 3? I think I have them in the office, but I'm not sure when I can go in to access them.

Thanks!

Avery,

We assumed that the impoundment was originally designed for 2 feet because "older" DP-831 Permits had us maintain 2 feet.
As the original drawing shows, 1 foot was the actual freeboard design.
At some point in the WIPP history, we changed it from 2 feet to 1 foot, which aligns with the original design criteria of the impoundment.

Hi Josh,

I did receive it. Sorry, I thought I'd responded.

I guess I'm just a little confused because during our call Stewart mentioned that it was designed for 2 feet of freeboard. If that is not the case, where did he get that from? Can you please clarify.

Thank you,

Avery,

As requested, we have attached the as-built Facultative Lagoon System Design drawing from 1987. The Section A cutaway in the bottom half of the drawing shows the 1 foot freeboard in the original design. The "Maximum Depth" is labeled at elevation 3384 and the "Top of Berm" is labeled at elevation 3385. The freeboard is consistent with Drawing number 25-C-004-W provided in the application. Let us know if you have any questions.

Re: Public Comments and Request for Public Hearing for the
Draft Discharge Permit DP-831, 3/2/2020 for WIPP

Dear Ms Young:

First, I am requesting that the comment period be postponed until the Corona Virus emergency has ended. When the state is still "peaking" and people throughout the state have lost their jobs, are scrambling to feed their families, find medical insurance, pay rent, **and are worried about their very lives,** it is impossible for the public—even directly-affected community members—to concentrate adequately on a discharge permit renewal.

If this is not enough to convince NMED to extend this process, perhaps more procedurally important, is that it has been impossible during this emergency, to study the Administrative Record for DP-831. A question about publication dates arose in my review of the public notice but there is no way to check that date, as the Record and even any Index of the Record are not online. Hardcopy can't be safely viewed at NMED's offices or anywhere else. In fact, the Record has been inaccessible to the public during two thirds of the comment period, since the Governor's March 23rd order.

In addition, hardcopy versions of the Draft Permit, the Fact Sheet and the PIP which were put in two public libraries and the local field office repositories were also inaccessible to the directly affected community because of closures during two thirds of the comment period. This included most of the information available for Low English Proficiency (LEP) Spanish speakers—the Fact Sheet. Though these documents are available online, NMED is well aware of the difficulties the local community in southeastern New Mexico has with online access because of lack of computer access, lack of proficiency going online and difficulties with connection in this area. This particularly affects the LEP community.

Also, were full translation and interpretation services available for LEP Spanish speakers during this same period? It doesn't appear so. Certainly, NMED still has no Spanish option on its phone service; even the non-discrimination coordinator's message is only in English and now has been abbreviated simply to "New Mexico Environment Department." If you go to the non-employee complaint page on NMED's website, the Spanish version is hidden. The English version fills the page and there is no link visible or indication to scroll down for Spanish. All of this combines to continue the difficulty LEP Spanish speakers have in participating and rises to the level of discriminatory action as these members of the public cannot access even the minimal materials translated for them, nor can they find out how to complain about this. No wonder NMED considers the potential for LEP contact with the permitting process to be only "occasional."

For these reasons alone, the comment period must be postponed or extended until the Record and hardcopy documents are safely available for review. At this point it is impossible to say when safe review of hardcopy documents either at NMED or near the facility will be available. Since many potentially affected people cannot access online documents, posting the documents online, as NMED has done, is unfortunately not sufficient. Posting the Administrative Record and the Index online might solve the problem of their inaccessibility, however, as anyone who would be researching on that level is probably able to use online resources. When critical and vital documents are not available for most of the comment period, the public participation process is defective and must be redone.

My comments will cover:

1. the DP-831 PIP
2. the latest PN-2
3, the Fact Sheet/Permit Summary

I am requesting:

1. a revision of Permit to eliminate the inclusion of Salt Cell 5 and Salt Storage Pond 5
2. a revision of the Fact Sheet whether or not the Draft Permit is revised
3. an extension or postponement of the comment period with an improved new PN-2 published after the Fact Sheet has been revised.
4. and even if none of these requests is approved, I request a public hearing. WIPP is an important and controversial facility in whose activities there is widespread interest throughout the state. Therefore, a hearing on this discharge permit must be held.

Public Involvement Plan (PIP) for DP-831
As with virtually all of NMED's PIPs, this PIP has certain glaring deficiencies—one of the largest being that PIPs are never translated into Spanish or any language other than English. I will describe the usual deficiencies at the end of this section as these deficiencies repeat in PIP after PIP with monotonous regularity. First I will describe problems that are unique to this particular PIP.

1. NMED relies too heavily and only on EJSCREEN as they do in all PIPs. What is particularly bad about this PIP is that NMED has arbitrarily chosen only a 30 mile radius for their EJSCREEN. We had hoped, after the URENCO discharge permit EJSCREEN radius was extended to 50 miles that other PIPs would follow. 50 miles is standard for EIS demographic investigations and was the radius used in the WIPP RCRA permit Volume Mod PIP. NMED has provided no justification for picking a 30 mile radius or for limiting the radius to 30 mile in one WIPP permit after using a 50 mile radius in another permit.

If NMED had extended to 50 miles they would have found that there was a majority of minority people in the area (55%). In addition, the people who speak a language other than English at home increases from 25 to 35%, and significantly, those who don't speak English well *doubles* from 5 to 10%. NMED said there were fewer linguistically isolated households than the state average within 30 miles, but that does not appear to be true if you go out to 50 miles.

NMED has no criteria on which to base choosing an EJSCREEN radius and should always pick the most conservative radius (in this case the largest and most commonly used). NMED needs to develop some kind of criteria as this decision should not be left to someone's best guess.

2. There are several other problems with the DP-1481 PIP starting with the lack of information for the general public on how to appeal or revise the PIP. In fact, there is no formal process at all to allow the public to respond when problems are found in the PIP. The public has no clear path to request corrections, make suggestions, or provide community-based, local input. Thus problems continue and the PIPs, including this one, having little or no public involvement of any kind in their creation, are of only limited use.

3. And, of course, the PIP is not translated into Spanish. How can members of the affected community who are LEP even have any idea what the PIP is about, let alone try to gauge its adequacy or make suggestions to improve it? Just finding the PIP online would be almost impossible if you are LEP, as the PIP website is also completely in English as are almost all Ground Water Quality Bureau (GWQB) pages and most of the rest of NMED's website. Nothing about accessing information at NMED is user-friendly if you are LEP.

The PIP acknowledges that the affected community has a significant percentage of persons with low English proficiency and thus allows for translation of some notices and announcements. It also requires all public notices to include information that interpretation is available and that translation can be arranged. However, the PIP limits the amount of language assistance that is provided to what is possible within the Bureau's "budget and time limitations." These limitations have resulted in a completely inadequate amount of translation so that it is impossible for LEP Spanish speakers to inform themselves enough to provide comments, make their needs known and to participate on a equal level with English speakers.

Interestingly, NMED never says they can only work with applicants or permittees as their "budget and time limitations allow." Instead, NMED provides thousands of dollars of their employees' work time and provides other resources to help applicants and Permittees. There are usually only pennies on the dollar left for NMED to assist the LEP public. The pitiful amount of translation of information recommended by this PIP is said to be all that NMED can afford. A note is made "[f]ees collected from the permittees...are not sufficient to cover [even] these costs." Yet NMED had a chance to raise those fees and chose not to. The public, and especially the LEP public, should not have to suffer without adequate information because of the Bureau's poor planning and poor budgeting.

NMED made a commitment in the Resolution Agreement to "ensure that all 'vital' information related to the ...permit process is accessible to LEP persons in a language they can understand." and that "...vital information...that is available to the public in English, whether in written form or orally, will, at a minimum, be available to the non-English speaking public through a qualified interpreter or through translation depending on the circumstances." Yet, again, NMED has not translated the permit, nor have they created and translated an adequate Fact Sheet containing a summary of all vital information in the draft permit and all other vital information. (More on the Fact Sheet is described below.) This is presumably because of NMED's time and budget constraints. However, the permitting process should not go forward until all vital information available to English speakers has been translated directly or adequately summarized and translated for LEP

Spanish speakers. Again, it is not okay to short circuit the public process while proceeding full speed ahead for the permittees.

3. The PIP overly relies on using only EJSCREEN and information in the ACS report to provide information on the affected community's needs, concerns, history, and demographics. This is despite the warnings in EPA's EJSCREEN Fact Sheet not to use EJSCREEN "as the sole basis for...decision-making or making a determination regarding the existence or absence of EJ concerns." It also says that EJSCREEN should be supplemented with "...additional information and local knowledge..." But NMED appears to have no interest in using local knowledge as they have made no effort to identify stakeholders in the affected community nor any effort to create partnerships with most private and public entities or to share information with affected communities, with environmental and environmental justice organizations, religious institutions, public administration, environmental, law and health departments at colleges and universities and relevant community service organizations.

What is critically important is that because of the lack of local knowledge, this PIP, like all NMED's PIPs, covers almost none of the community's concerns or needs or their history. The only concerns mentioned are language and disability needs—and even attention to those is minimal. All other concerns of the community are completely ignored though NMED has been told of them over and over again in comments, letters, during hearings, in complaints, in negotiations, etc. for years. NMED knows of the high cancer death rate and low life expectancies in southeastern New Mexico, the enormous level of pollution, the multiplicity of polluting facilities both permitted and unpermitted, the lack of access to medical care, the low income, high numbers of LEP persons, the rural nature of the area, and other social concerns of area residents. Yet again, NMED has chosen to ignore all of these, both in the PIP and in the formation of the draft permit. Not a word on any of this history or on any of these needs and concerns is anywhere in the PIP, public notice or permit. This is a significant deficiency.

Public Notice

This public notice has no publication date on it as with most of NMED's documents. It does state that the 45 day comment period ends on April 22, 2020 so counting back the publication date would be 3/8/20. This is also the online date given. However, downloading the Fact Sheet and the Public Notice from the website shows a date of 3/11/20 in the title of both documents. It's thus unclear when this public notice was actually published in the required newspapers or in other ways. It has been impossible for most of the comment period to check this date as the Record is inaccessible.

The **Discharge Locations** section of this notice is inadequate. Though the locations are described by type, they are not described by location in relation to the rest of the facility. In fact, it is even unclear if all these systems, cells and impoundments are above or below ground.

The **Activities that produce the discharge** section is also inadequate. It is unclear what "salt cells" are and too vague about what "other miscellaneous industrial non-hazardous wastewaters" are.

Potential Contaminants are listed only as nitrogen compounds, dissolved solids and chloride. It is not mentioned that any radioactive materials could be contaminants though they are monitored under this draft permit. Since the entire WIPP facility is devoted to radioactive waste, even if NMED can't regulate all the radioactive materials present, it should still tell the public what could be in the discharges. More could be present than NMED can monitor and that all should have been included here. In addition, the Fact Sheet refers to one-time monitoring of "a comprehensive list of chemical constituents," none of which are mentioned here. This section is deficient.

Accessing documents is confusing as one document is described as a "Fact Sheet" online but is described in the repositories in Eddy County as "the permit summary." NMED employees and this commenter have some experience to understand that this is only one document, but that isn't true of the general or LEP public. They have no idea whether these are two different documents or the same document so this is completely confusing for those with little knowledge of how to participate. And because LEP individuals have no access to the permit itself or to the administrative record, it is important to include extra information and clarifications that we just intuitively understand. It's difficult to imagine not knowing what we know, but it's necessary. NMED says they want to increase public participation but confusion like two different document names helps to lower public involvement.

The public notice tries to describe how the public can participate in a hearing and the procedures to be followed by the Secretary in making a final determination about the Draft Permit. However, the notice states that "members of the public may file *technical testimony* prior to the hearing and may provide verbal and written comments during the hearing itself." The statement about technical testimony is incorrect (though the second part of the statement is fine). Technical testimony can only be presented at the hearing itself though people can file a "statement of intent to present technical testimony" before the hearing. In the pre-hearing period, the public may "provide a general written statement concerning the Draft Permit, Application or Petition ..." [20.1.4.300B(2) NMAC] This is how it should have been described in the public notice—as general written statements, not technical testimony. Providing incorrect information on how to participate, again, only helps to lower public involvement and makes this section of the public notice deficient.

At the end of the paragraph the public notice also states that "NMED will approve, approve with conditions or disapprove the Permit based on the Administrative Record *and/or Final Order* from the NMED Cabinet secretary." Again, this is incorrect and confusing. The decision is not based in any way on the "Final Order from the ... secretary." The Final Order *is* the decision. A decision cannot be based on itself! The decision is made by the Secretary *based only on information in the Administrative Record*. NMED has stated this clearly in other documents and this should be cleared up in any future public notices. Wording this required statement in this way is confusing and incorrect and also makes this section of the notice deficient.

Finally, the public notice says that "Requested translation, interpretation services and accommodations or services for persons with disabilities will be arranged *to the extent possible.*" In fact, NMED must meet certain minimal translation, interpretation and accommodation requirements—period. Not to do so is discriminatory. If NMED cannot meet these minimum requirements so that the process is not discriminatory, NMED must stop the process until it can run a non-discriminatory public participation process.

Fact Sheet
Unfortunately, this Fact Sheet is deficient throughout and needs to be completely re-written. It is not an adequate summary of the Permit. I read it without reading the permit as an LEP Spanish speaker would do and I gained very little understanding of the draft permit, the geology and hydrology of the area and the demographics, history, needs and concerns of the potentially affected communities near WIPP. If the vital document of the permit is not translated in its entirety and this is all people have to explain the discharge permit, everything must be spelled out in much more detail. This Fact Sheet simply states that a certain section puts in the requirements for how something is to be done and leaves it at that. There is usually no description about how specifically those requirements have been met in the particular section.

Because NMED has allowed other permits to be approved with extensive deficiencies, it is critical that all members of the public can know exactly how regulatory requirements are to be met. This summary provides little detailed information. I recommend that NMED use the second URENCO fact sheet as a guide, supplemented by CCNS's comments. That is the best fact sheet prepared in many years, though even that needed to be tweaked so the LEP public had adequate information. Specific comments follow.

1. The first paragraph says the fact sheet is required by Subsection I of 20.6.2.3108 NMAC but this requirements does not appear to be part of that Subsection. Please clarify where NMED found this requirement and what the specific language of the requirement is.

2. **General Facility Information**
The description of the very complex geology and hydrology at WIPP is too thin, though the description of the human caused contaminated shallow groundwater is quite interesting. However, when writing for the general public, a description other than "anthropogenically created" should be used as that is very user un-friendly! It almost seems to hide the fact that WIPP created this contaminated water and is now a hazardous waste generator. This is important to understand since this contaminated water appears to be the result of the failure of a previous version of this discharge permit. This should lead people to look more closely to see if the provisions of this version of the permit are now adequate.

Also, a reference is made later to water percolating through the "vadose zone" but this zone is not described here, which it should be. The laterally continuous water-bearing zone in the Culebra has no depth described. Other geologic formations are described with thicknesses but require a calculation to figure where they start and end except for the Salado Formation. Calculations shouldn't be necessary here and this critically important section needs to be fleshed out much more.

3, **Description of the Proposed Discharge**
This section is again, deficient. Typos make it more confusing. Industrial wastewater is described as non-hazardous. Is it also non-radioactive? This needs to be clarified. Where evaporites go after treatment is also not described. It is totally insufficient to describe "*other miscellaneous* industrial non-hazardous wastewaters" and leave it at that. You must list every source for all waters. Stating the 100-year storm capacities for various impoundments etc. is a nice touch, however. Remember, LEP persons only know what is written in this Fact Sheet and the Public Notices.

4. **Operational Plan and Monitoring and Reporting conditions**
Both of these sections are so deficient that it is impossible to list everything. Again—get specific. It is totally unclear how many monitoring wells there are, (except for 4 that are very nicely described) or where they are, how deep each of them is, whether any are in the vadose zone, whether proper vadose zone monitoring is taking place, and mostly what contaminants are being monitored. The one-time monitoring states they are looking for a "comprehensive list of chemical constituents" but what are they? Certain NMED-regulated radioactive constituents are listed but could other radioactive constituents possibly be in the discharge as well? This needs to be clarified. The summary of the semi-annual monitoring reports is very well done.

5. **Additional Studies**
This is also well done and provides a good explanation of why a new workplan is required.

6. **Contingency Plan**
This is a critical part of the permit but basically says nothing. "Standard language" has been totally insufficient in previous permits so a detailed description here is necessary. It is impossible for the LEP public who have no access to the permit to know if the language here is adequate. In fact, I would say that this entire section should be copied and translated word for word from the permit. Anything else does not provide the same amount of vital information to LEP persons as is available to English speakers who can read the permit. Again, because of NMED's previous bad language in this section of another permit, they must go the distance to prove that this part of the permit is adequate.

7. **Closure Conditions.**
Again, there is not enough detailed information here. However, the statement that closure requirements survive the discharge permit is good to know. This is the first time the vadose zone is mentioned in the Fact Sheet and there should be more information on this. It is stated that there is a condition for properly closing the Facility in accordance with the WIPP Land Withdrawal Act and other rules and regulations, but the full condition needs to be described. It is unclear if the condition truly meets these laws' requirements. Particularly since the Land Withdrawal Act includes timelines and volume limitations, it is unclear if the permit truly is in compliance with the Act.

6. **General Terms and Conditions**
Again, more detail is required—though perhaps not as much detail as is needed in previous sections. In particular, the requirement to comply with other laws etc. should be quoted in its entirety.

Permit Problems
The modification including Salt Cell 5 and Salt Storage Pond 5 is premature. These items have not been approved yet and hopefully will never be approved. To permit discharge from these areas when they don't exist is not the correct way of doing things. If they are approved, then modify the permit. NMED appears to be trying to do an end run around the public by approving Salt Cell 5 here in a discharge permit when it should be part of a RCRA permit.

Conclusion
There are many problems with the PIP, Public Notice, Fact Sheet and the Draft Permit itself. These all need to be corrected and a new comment period and public notice, fact sheet etc. issued. Because of the virus and the current emergency, the lack of access to critical and vital documents, and combined with these multiple deficiencies, NMED should be in no hurry to push forward with this permit. This is the perfect time to correct all these problems so that when the emergency is lifted and the public can give their full attention to the permit process, NMED will be ready with excellent documents and information for the public process.

If NMED, however, chooses to go ahead with what would be a discriminatory process as well as a process that does not even meet the mimum requirements for the general public, I request that there be a public hearing on this version of the permit.

Sincerely,
Deborah Reade

Subject:	[EXT] CCNS Public Comments about draft DP-831 for WIPP
Date:	Wednesday, April 22, 2020 10:24:08 PM

April 22, 2020

By email to: Avery.Young@state.nm.us

Ms. Avery Young, Permit Contact
Ground Water Quality Bureau
New Mexico Environment Department
Santa Fe, NM

Re: Public Comments and Request for Public Hearing
Draft March 2, 2020 DP-831 for the Waste Isolation Pilot Plant (WIPP)
Opposition to Inclusion of Salt Cell 5 and Salt Storage Pond 5 in DP-831

Dear Ms. Young:

Concerned Citizens for Nuclear Safety (CCNS) is a Santa Fe-based non-governmental organization that formed in 1988 to address community concerns about the proposed transportation of radioactive and hazardous wastes from Los Alamos National Laboratory (LANL) to the unopened Waste Isolation Pilot Plant (WIPP) through Santa Fe on St. Francis Drive. Our mission is to *protect all living beings and the environment from the effects of radioactive and other hazardous materials now and in the future.*

CCNS opposes the inclusion of Salt Cell 5 and Salt Storage Pond 5 in the draft DP-831 for WIPP. Those two proposed facilities are essential for the new shaft and associated drifts, which are part of the "Forever WIPP" expansion, which CCNS strongly opposes. CCNS questions why they are included in the draft DP-831 when the New Mexico Environment Department (NMED) has not allowed construction of the proposed shaft and associated drifts. In fact, a temporary authorization request is pending decision before the NMED Hazardous Waste Bureau (HWB). Further, in both cases, such permitting can only happen after public comments, negotiations, and a public hearing, which have not occurred.

NMED must delete all reference to proposed Salt Cell 5 and proposed Salt Storage Pond 5 in the draft permit. It is unnecessary to include these facilities in draft DP-831. DOE is attempting a slight-of-hand to permit the proposed facilities without the HWB making a decision.

CCNS requests negotiations and a public hearing on the draft permit for the reasons detailed below about the draft Permit and Public Involvement Plan (PIP).

CCNS and many other non-governmental organizations and individuals oppose "Forever WIPP," and there is substantial public interest in the proposed WIPP expansion, including the new shaft, associated drifts, and the addition of proposed

Salt Cell 5 and Salt Storage Pond 5 that will receive industrial wastewater and stormwater. Please see the hundreds of 8 ½ by 5 ½ inch postcards submitted to the NMED HWB opposing the "WIPP Forever" Plans.

CCNS requests that NMED delete Salt Cell 5 and Salt Storage Pond 5 and its capacity of 1,292,499 gallons per day discharge volume from the draft permit.

Comments about the Public Involvement Plan (PIP), Template Version 2018-10-16, dated February 12, 2019.

1. *Inconsistent availability of documents.* Table of Public Involvement Activities on PIP page 3 does not include two of the document repository locations in Eddy County described in the Fact Sheet. They are the Eunice Public Library and Carlsbad Public Library.

Further, the Table of Mandated Public Involvement Activities on PIP page 8 does not list under Public Notice (PN-2) that the PIP will also be available, along with the draft permit and fact sheet.

2. *PIP does not include the NMED Spanish phone number: 1-800-327-1857 for Relay New Mexico found in the Fact Sheet and PN-2.* Under the PIP Non-English Language Speaker Assistance the Spanish phone number is not provided.

3. *NMED does not provide justification for using a 30-mile radius for the EJSCREEN analysis for this proposed permit.* NMED uses a 50-mile radius for the EJSCREEN for the its Hazardous Waste Permit for WIPP, which is up for renewal in 2020. What is NMED's justification for reducing the radius used?

4. *Occasional contact with LEP persons.* Following EJSCREEN analysis, NMED states, "[T]he Bureau considers the potential for Limited English Proficiency (LEP) contact with the permitting process to be 'occasional.'"

Conclusion. Given the reduced EJSCREEN radius, the omission of the Spanish phone number in the PIP, and the inconsistencies between the PIP and Fact Sheet about where the document repositories are located, of course, NMED would come to the conclusion that the potential for LEP contact is "occasional." CCNS urges NMED to correct these errors and re-issue the PIP, the PN-2, and Fact Sheet to fulfill its obligations under NMED's *Public Participation Policy 07-13.*

General Comments about the draft DP-831.

<!--[if !supportLists]-->1. <!--[endif]-->Delete all references to [proposed] Salt Cell 5 to [proposed] Salt Storage Pond 5 in the Table of Contents. P. 2.

<!--[if !supportLists]-->2. <!--[endif]-->Delete all references to [proposed] Salt Cell 5 and [proposed] Salt Storage Pond 5 in first bulleted paragraph and

last full paragraph at the bottom of p. 2 of 38.

<!--[if !supportLists]-->3. <!--[endif]-->Is the HDPE pipe proposed for installation "to collect and transmit by gravity the leachate and stormwater runoff from [proposed] Salt Cell 5 to [proposed] Salt Storage Pond 5" double-lined? P. 2 of 38.

<!--[if !supportLists]-->4. <!--[endif]-->Page 3 of 38: delete reference to proposed Salt Cell 5 and proposed Salt Storage Pond 5 in the first paragraph (bolded), as well as in bolded language on p. 6 of 38.

<!--[if !supportLists]-->5. <!--[endif]-->Add the following acronyms to the table on p. 4: LLDP, HDPE, and leak detection, collections, and recovery systems (LDCRS).

<!--[if !supportLists]-->6. <!--[endif]-->Section III. Authorization to Discharge includes reference to proposed Salt Cell 5 and proposed Salt Storage Pond 5, which must be deleted. P. 5 of 38.

<!--[if !supportLists]-->7. <!--[endif]-->The draft permit does not require calibration of monitoring equipment and flow measurement devices within a certain range of measurement, e.g., +/- 1%.

<!--[if !supportLists]-->8. <!--[endif]-->Add a Condition requiring DP-831 documents be posted to the WIPP Electronic Public Reading Room, such as the semi-annual monitoring reports (Condition 29) and groundwater monitoring data and reports (Condition 62).

Operational Plan Comments

<!--[if !supportLists]-->9. <!--[endif]-->Part A, # 3 must include requirements to meet the manufacturer's specifications for inspections and maintenance for the impoundment liners. p. 6 of 38.

<!--[if !supportLists]-->10. <!--[endif]-->Part A, # 4 – The *Groundwater Discharge Permit Guidance for Synthetically Lined Lagoons – Liner Material and Site Preparation* at No. 3, under Lagoon Design and Site Preparation Requirements, "Lagoon volume shall be designed to allow for a minimum of [two feet] 24 inches of freeboard." What is the justification for requiring one foot of freeboard throughout most of the permit? One foot of freeboard does not comply with NMED Guidance and Requirements.

<!--[if !supportLists]-->11. <!--[endif]-->Part B, # 5 – should the time period in the first sentence be revised from "three years" to "two years"? Three years conflict with the later requirement to submit the solids removal and

disposal plan to NMED for approval "within two years and two months following the effective date of this Discharge Permit…." Further, such as change would be consistent with Condition # 15. P. 10 of 38.

<!--[if !supportLists]-->12. <!--[endif]-->P. 11 of 38: Delete proposed Salt Storage Pond 5 and proposed Salt Cell 5 from the Part D title, as well as on p. 20 of 38, and p. 33 of 38.

<!--[if !supportLists]-->13. <!--[endif]-->Part D, # 19 – delete this Condition, which references the proposed Salt Storage Pond 5.

<!--[if !supportLists]-->14. <!--[endif]-->Part D, # 20 – delete this Condition, which references the proposed Salt Storage Pond 5 and proposed Salt Cell 5.

<!--[if !supportLists]-->15. <!--[endif]-->Part D, # 21 – delete this Condition, which references the proposed Salt Storage Pond 5 and proposed Salt Cell 5.

<!--[if !supportLists]-->16. <!--[endif]-->Part D, # 25 – delete reference to the proposed Salt Storage Pond 5.

Monitoring and Reporting Comments

<!--[if !supportLists]-->17. <!--[endif]-->Part D, # 46 – delete reference to proposed Salt Storage Pond 5.

<!--[if !supportLists]-->18. <!--[endif]-->Part D, # 47 – delete reference to proposed Salt Storage Pond 5.

<!--[if !supportLists]-->19. <!--[endif]-->Part D, # 49 – delete this Condition, which references Salt Storage Pond 5.

<!--[if !supportLists]-->20. <!--[endif]-->Part D, # 51 – delete reference to the proposed Salt Storage Pond 5.

Closure Plan Comments

<!--[if !supportLists]-->21. <!--[endif]-->Part D, # 75 – delete reference to proposed Salt Storage Pond 5.

Comments about Discharge Permit Summary.

The *Groundwater Discharge Permit Guidance for Synthetically Lined Lagoons – Liner Material and Site Preparation* requires at No. 3, under Liner Material Requirements, "Under no circumstance shall a synthetic liner material less than 40 mils in thickness be accepted."

Nevertheless, for the Domestic Wastewater description and comments, Effluent Lagoon A, B, and C are lined with 30-mil LLDP synthetic liner.

Under the Non-Domestic Wastewater description and comment, the Evaporation Pond H-19 uses a 36-mil Hypalon synthetic liner.

It is unclear why relaxed requirements are allowed.

The *Guidance* at No. 3, under Lagoon Design and Site Preparation Requirements, "Lagoon volume shall be designed to allow for a minimum of [two feet] 24 inches of freeboard."

Nevertheless, for the Domestic Wastewater description and comments, none of the impoundments are required to meet a minimum of two feet of freeboard. Each of the seven permitted lagoons only requires one foot of freeboard.

Under Storm Water Control heading, all three Storm Water Ponds require one foot of freeboard.

Under the Non-Domestic Wastewater heading, the Evaporation Pond H-19, Salt Storage Pond 1, and Salt Storage Pond 2/3, require one foot of freeboard. The Brine Salt Storage Pond 4 (to be constructed) requires one foot of freeboard.

It remains unclear why the relaxed requirements are allowed.

Thank you for your careful consideration of CCNS's comments. Please contact me with any questions or comments.

Sincerely,

Joni Arends, CCNS Co-founder and Executive Director

RE: Waste Isolation Pilot Plant Draft Groundwater Discharge Permit DP-831 Renewal and Modification

Dear Ms. Young:

Thank you for this opportunity to provide comments on the Waste Isolation Pilot Plant Draft Groundwater Discharge Permit DP-831 Renewal and Modification. Through comprehensive research, public education, and effective citizen action, Nuclear Watch New Mexico seeks to promote safety and environmental protection at regional nuclear facilities; mission diversification away from nuclear weapons programs; greater accountability and cleanup in the nation-wide nuclear weapons complex; and consistent U.S. leadership toward a world free of nuclear weapons.

Nuclear Watch New Mexico opposes the inclusion of Salt Cell 5 and Salt Storage Pond 5 in DP-831. Those facilities are essential for the new shaft and associated drifts, which are part of the "Forever WIPP" expansion, which our organization strongly opposes.

Further, we object to including facilities essential for the new shaft, when construction of the shaft has not been permitted by the NMED that can only happen after public comments, negotiations, and a hearing, which have not occurred.

Nuclear Watch New Mexico and many other groups oppose "Forever WIPP," and there is substantial public interest against WIPP expansion, including the new shaft and related drifts.

We request negotiations and a hearing on the draft permit.

Nuclear Watch New Mexico
903 W. Alameda #325, Santa Fe, NM 87501 • Voice and fax: 505.989.7342
info@nukewatch.org • www.nukewatch.org • http://www.nukewatch.org/watchblog/

Salt Cell 5 and Salt Storage Pond 5 and its discharge capacity of 1,292,499 gallons per day discharge volume should be deleted from the renewed permit as prejudicial actions biased towards an expansion of WIPP that have yet to be debated and approved.

If Salt Cell 5 and Salt Storage Pond 5 prematurely remain in the permit, the fact that the salt put in each of these is to be mined from an unapproved new shaft (Shaft 5) and unapproved new drifts must be included in this permit. And the fact that Shaft 5 may not be approved for construction must be included in this permit.

Nuclear Watch New Mexico strongly believes that there is not adequate NEPA analysis to support the construction and operation of the new shaft, Salt Cell 5, and Salt Storage Pond 5. We also believe that NMED should not permit facilities that do not have adequate, required NEPA documentation.

Again, thank you for this opportunity to comment.

Sincerely,

Jay Coghlan

RE: WIPP Draft Discharge Permit (DP)-831

Dear Ms. Young:

Southwest Research and Information Center (SRIC) is a non-profit organization based in Albuquerque, New Mexico that focuses on public education and involvement and public health and environmental justice. SRIC has been involved in Waste Isolation Pilot Plant (WIPP) Hazardous Waste Act (HWA) permitting activities for more than 20 years, as well as numerous other activities related to WIPP, public health, and the environment.

SRIC provides these comments on the Groundwater Discharge Permit, DP-831, Waste Isolation Pilot Plant, according to the Public Notice.

SRIC does not object to a renewal of the existing permit or for modifying the permit to add Brine Salt Storage Pond 4, Brine Retention Pond East, and Brine Retention Pond West. However, SRIC strongly opposes the inclusion in the permit of Salt Cell 5 and Salt Storage Pond 5, which are for a new shaft #5 and connecting drifts, which is an expansion of the WIPP facility that is strongly opposed by SRIC and many organizations and individuals, and has not been permitted to be constructed by NMED. Salt Cell 5 and Salt Storage Pond 5 and its 1,292,499 gpd discharge volume should not be included in the renewed and modified permit.

SRIC also requests negotiations and a public hearing regarding the draft permit.

Following are SRIC's more detailed comments.

1. <u>The new shaft has not been permitted for construction by NMED</u>.
On December 22, 2017, the Department of Energy (DOE) and co-permittee Nuclear Waste Partnership (NWP) submitted a Request for Determination of Class to the NMED Hazardous Waste Bureau (HWB) for a new shaft and connecting drifts.[1] SRIC and others submitted

[1]https://wipp.energy.gov/library/Information_Repository_A/Permit_Modification_Class_Determination_Requests_NMED_Responses/17-1091_Redacted_Enclosure.pdf

comments that the request must be considered as a Class 3 modification.[2] On August 15, 2019, DOE withdrew the 2017 request and submitted a Class 3 modification request for the new shaft and connecting drifts.[3] On January 16, 2020, DOE submitted a request for Temporary Authorization (TA) to begin construction of the new shaft.[4] As of this date, NMED has provided a Technical Incompleteness Determination on the Class 3 modification, but has not taken final action on either the TA or Class 3 request.

Thus, it is uncontested that construction of the new shaft cannot begin because there is no TA or approved modification. Consequently, there can be no discharge, and DOE cannot state that it intends to use Salt Cell 5 and Salt Storage Pond 5 when it does not have the required HWA permit to construct the new shaft and associated drifts. Additionally, NMED should not approve a discharge permit with facilities that are only needed for the new shaft and connecting drifts, while at the same time not permitting construction of the new shaft and connecting drifts.

2. <u>There is very significant public interest in the new shaft because it is part of the "Forever WIPP" expansion plans</u>.
There have been extensive comments from several organizations, including SRIC, and dozens (and perhaps more) of individuals opposing WIPP expansion and the new shaft and connecting drifts that have been submitted to Ricardo Maestas of the NMED HWB. The significant public interest is because the new shaft and connecting drifts are part of a DOE plan to substantially expand WIPP, including its physical facilities outside the long-established surface and underground footprint, its operating lifetime for waste disposal from 25 years to 80 years or longer, and the types and amounts of waste allowed.

Limits for WIPP were initially established by the Consultation and Cooperation (C&C) Agreement signed by the Governor of New Mexico and Secretary of Energy on July 1, 1981. The C&C Agreement has been modified, and it includes limits and requirements for WIPP. The WIPP Land Withdrawal Act (LWA, Public Law 102-579) also provides numerous limits and requirements for WIPP. The law also states that the C&C Agreement remains in full force and effect. Section 21. However, DOE has recently taken actions to exceed some of those limits and has released documents that describe some expansion plans. Among other documents, the DOE Carlsbad Field Office *Draft 2019-2024 Strategic Plan* declares the objective of operating WIPP through 2050 to emplace, not the up to 6.2 million cubic feet of defense transuranic (TRU) waste allowed by the C&C Agreement and LWA, but the entire "existing defense TRU waste inventory."[5] DOE's December 2019 *Final Supplement Analysis of the Complex Transformation Supplemental Programmatic Environmental Impact Statement* states that waste will be disposed at WIPP until sometime after 2080.[6] There is very significant public interest and opposition to those plans, including the new shaft and connecting drifts.

[6] https://www.energy.gov/sites/prod/files/2020/01/f70/final-supplement-analysis-eis-0236-s4-sa-02-complex-transformation-12-2019.pdf, at 65.

3. <u>The Public Notice, Fact Sheet, and draft Permit are deficient because they do not state that the Salt Cell 5 and Salt Storage Pond 5 are part of the facilities needed for the new shaft.</u>
Subsection F(3) of 20.6.2.3108 NMAC provides that the Public Notice shall include "a brief description of the activities that produce the discharge described in the application." Subsection I(1) of 20.6.2.3108 NMAC provides that the Fact Sheet and draft permit also shall provide that description.

The Public Notice includes no mention of the new shaft, even in the "Activities that Produce the Discharge," which only includes the "to be constructed Salt Reduction System," which does not include the new shaft. Thus, neither SRIC, nor any member of the public, would know from the notice that the renewed and modified permit relates to facilities required by the new shaft and connecting drifts. The Fact Sheet does not mention the new shaft. The Fact Sheet does mention the Salt Cell 5 and the Salt Storage Pond 5. Regarding "Description of the Proposed Discharge," the Fact Sheet states: "The stockpiles currently storing salt, or that will be used in the future as salt is mined from the Facility's underground panels, are referred to as Salt Cells 2, 3, and 5." Since there is current mining of Panel 8 and perhaps future mining of Panel 10, that description does not imply that the new shaft and connecting drifts are a source for the new Cell 5. Neither SRIC, nor any member of the public, would know from the Fact Sheet that the renewed and modified permit relates to facilities required by the new shaft and connecting drifts. The draft permit does not mention the new shaft and connecting drifts. The draft Permit does include the language about Salt Cells 2, 3, and 5 contained in the Fact Sheet and mentions the capacity of Salt Storage Pond 5. The draft permit does not even include a map that shows the locations of the new Salt Cell 5 and the Salt Storage Ponds 4 and 5 and the Brine Retention Ponds East and West, which would show that the new cell and Pond 5 are near the new shaft. Neither SRIC, nor any member of the public, would know from the draft permit that the renewed and modified permit relates to facilities required by the new shaft and connecting drifts.

Thus, the Public Notice, Fact Sheet, and draft Permit are all legally deficient in not adequately describing the activities that produce the discharge and that Salt Cell 5 and Storage Pond 5 are for the new shaft and connecting drifts. They also do not provide even location information and map from the application from which that required description could be determined.

4. <u>The Permit application clearly states that Salt Cell 5 and Salt Storage Pond 5 are for the new shaft and connecting drifts</u>.
The permit application states:

> "Salt Cell 5 adds a new salt storage location (Latitude: 32 22 21.02, Longitude: 103 48 7.44), which will receive overburden and salt from the construction of Shaft 5 and its associated underground connecting drifts.
> Salt Storage Pond 5 (Latitude: 32 22 20.25, Longitude: 103 48 13.22) will receive both the leachate and storm water in contact with mined salt located in Salt Cell 5. Salt Storage Pond 5 will increase the quantity of the current industrial wastewater maximum permitted discharge volume by 1,292,499 gallons per day (gpd), which is based on the total inflow from a 24-hour, 100-year rainfall event (5.84 inches)."
> at 3.

The permit application also states:

> "Industrial Wastewater - Salt Cell 5 and Salt Storage Pond 5 (Modification - New Shaft). Salt Cell 5 will be designed to contain 5,224,000 cubic feet of loose salt materials from the construction of Shaft 5 and the associated drifts." at 12.

The permit application also has similar information that Salt Cell 5 and Salt Storage Pond 5 are for the new shaft and connecting drifts on pages 21 and 26. So there is no question about their purpose, based on the application. Thus, not including the required description in the Public Notice, Fact Sheet, and draft Permit does not even adequately convey what is in the application.

The application also includes APPENDIX C - Shaft # 5 Pond Drawings. However, each of the drawings is titled for "WIPP Exhaust Shaft." However, the new shaft is <u>not</u> an exhaust shaft, so that is obsolete and inaccurate information.

5. <u>There is no adequate NEPA analysis for the Salt Cell 5 and Salt Storage Pond 5</u>
The DOE must comply with the National Environmental Policy Act (NEPA). The NEPA analysis of the new shaft is the *Supplement Analysis for the New Permanent Ventilation System* (DOE/EIS-0026-SA-11), November 2017.[7]

That document makes <u>no</u> mention of Salt Cell 5 or Salt Storage Pond 5. The document has two brief mentions of "construction and operation of lined evaporation ponds." (at 20). But the SA has no description of the size of the two facilities, no location description or map showing the facilities, and no analysis of the impacts. The document does mention DP-831, but does not state that the discharge permit would need to be modified to accommodate the new facilities.

Thus, SRIC strongly believes that there is no adequate NEPA analysis to support the construction and operation of the new shaft, Salt Cell 5, and Salt Storage Pond 5. SRIC also believes that NMED should not permit facilities that do not have adequate, required NEPA documentation.

6. <u>Correct typographical error</u>
Discharge Permit Summary, page 2 of 5 – Salt Storage Pond 1 – capacity is missing a comma and should be 3,301,634 gallons.

<u>Request for negotiations and hearing</u>
SRIC requests a hearing on the draft permit based on these comments. There is very significant public interest in the new shaft, both because it is a major expansion of the WIPP facility and because there are many organizations and individuals that have expressed interest regarding the new shaft and associated drifts. SRIC requests negotiations with NMED, DOE, and any other parties to resolve or narrow the issues before the hearing. Such negotiations might result in a withdrawal of the hearing request. In the event that Salt Cell 5 and Salt Storage Pond 5 are deleted from the permit, SRIC would withdraw its request for a hearing.

[7] https://wipp.energy.gov/library/seis/DOE-EIS-0026-SA-11_Nov_2017.pdf

On April 21, I discussed by phone with Mike Brown of DOE and Rick Chavez of NWP whether DOE would agree to delete Salt Cell 5 and Salt Storage Pond 5 from the current application. They said that it was discussed, but that they were unwilling to make that change at this time.

Thank you very much for your careful consideration of, and your response to, these comments.

Sincerely,

Don Hancock

Memorandum
April 21, 2020
New Mexico Environment Department
Mr. Avery Young
Groundwater Quality Bureau
Santa Fe, NM

Re: DP-831 Waste Isolation Pilot Plant (WIPP)
Sent by email to: Avery.Young@state.nm.us

Dear Mr. Young,

Citizen Action New Mexico (CANM) is a non-governmental organization (NGO) that participates in information gathering about radioactive and hazardous waste disposal and its permitting throughout the State of New Mexico. As an NGO, CANM has advocated for and pursued efforts to cleanup and monitor military and weapons facilities of the federal government in New Mexico. CANM has participated in numerous public hearings and matters regarding permitting at facilities such as WIPP, Sandia National Laboratories, Los Alamos, Los Alamos National Laboratory and Kirtland Air Force Base.

CANM requests that the NMED provide a public hearing and negotiations for DP-831 since the operation of WIPP is of concern to our organization and the public interest (both in-state and national) with respect to water and any expansion of existing operations that could result in accommodation of more nuclear weapons production and a concomitant greater disposal of radioactive and hazardous waste than allowed under the current permit.

CANM objects to the approval of DP-831 that would further the relationship of Salt Cell 5 and Salt Storage Pond 5 to the development of an additional shaft for nuclear weapons waste. CANM is strongly opposed to the continued production of nuclear weapons and the nuclear and toxic waste stream generated that would be facilitated by DP-831. DP-831 puts the cart before the horse in assisting a backdoor approval for a new shaft and facility to receive additional nuclear waste that has not yet been permitted for construction. The addition of a new shaft for more nuclear waste would result in WIPP operations well beyond the expiration of its current permit in 2024.

Any proposal for what would result in WIPP expansion or permitting of any further operations need to be reviewed in full perspective given public endangerment from WIPP's failed safety operations resulting in fire, explosion and worker exposures that caused a $2,000,000,000 cost to the taxpayer along with years of delay. While the discharge permit for storm water may seem disconnected to the poor operation of WIPP, CANM believes that the totality of the circumstances in relation to waste operations and expansion of nuclear weapons production must be considered before DP-831 is approved. There is also the matter of the upcoming expiration of the LANL RCRA hazardous waste permit.

Please delete Salt Cell 5 and Salt Storage Pond 5 and its discharge capacity of 1,292,499 gallons per day discharge volume from the permit.

Respectfully,

Dave McCoy, Executive Director
Citizen Action New Mexico
dave@radfreenm.org

RE: DP-831 (WIPP)

This organization opposes the inclusion of Salt Cell 5 and Salt Storage Pond 5 in DP-831. Those facilities are essential for the new shaft and associated drifts, which are part of the "Forever WIPP" expansion, which this organization strongly opposes. Further, we object to including facilities essential for the new shaft, when construction of the shaft has not been permitted by the NMED that can only happen after public comments, negotiations, and a hearing, which have not occurred.

This organization and many others oppose "Forever WIPP," and there is substantial public interest in WIPP expansion, including the new shaft and associated drifts.

This organization requests negotiations and a hearing on the draft permit.

Please delete Salt Cell 5 and Salt Storage Pond 5 and its discharge capacity of 1,292,499 gallons per day discharge volume from the permit.

Sincerely,

Janet Greenwald

Permittee Comments on Draft Discharge Permit Renewal and Modification, DP-831

Waste Isolation Pilot Plant

COMMENT 1 - Discharge Permit Summary, Non-Domestic Waste Water

The freeboard information for Salt Storage Pond 5 in the *Discharge Permit Summary, Non-Domestic Waste Water* table attached at the end of the draft permit is inconsistent with draft permit Condition #4 shown below.

> *The permittee shall preserve a minimum of one foot of freeboard between the liquid level in all the impoundments and the elevation of the top of the impoundment liner, except the Brine Retention Ponds East and West shall maintain two feet of freeboard. In the event that the permittee determines that the specified freeboard cannot be preserved in the impoundments, the permittee shall enact the contingency plan set forth in this Discharge Permit.*

The *Description and Comments* for the Salt Storage Pond 5 in the *Non-Domestic Wastewater* table states that this impoundment is "…permitted two feet of freeboard…" This is inconsistent with permit Condition 4 (shown above) which requires one foot of freeboard. Please revise the entry to make the Discharge Permit Summary table and permit Condition 4 consistent by changing "…permitted two feet of freeboard…" to "…permitted one foot of freeboard..." so that the description reads as shown in the redline strike out text below:

> *To be constructed, 60-mil HDPE liner, 200-mil geonet drainage layer, and a second 60-mil HDPE liner with a leak detection system; disposal by evaporation; permitted one foot ~~two feet~~ of freeboard; capacity of 6,355,404 gallons.*

COMMENT 2 – Draft Discharge Permit Condition #54: Recommend changing the word "measure" to "estimate" in reference to hydraulic conductivity in Condition #54 as shown in the redline strikeout text below. Aquifer parameters estimates are not obtained through measurement, but calculated based on hydraulic data obtained through the aquifer testing.

> *The permittee shall perform aquifer testing to determine the local hydraulic properties of the aquifer near the monitoring wells required by this Discharge Permit and that contain groundwater within 60 days of the complete installation of each new monitoring well. The purpose of the aquifer testing shall be to quantify the movement of groundwaters in the vicinity of each well or piezometer. Aquifer testing shall be performed in wells in both the shallow groundwater and in the natural groundwater in the Dewey Lake Formation where groundwater is present. Aquifer testing shall estimate ~~measure~~ hydraulic conductivity, transmissivity, and storage coefficient and shall be performed utilizing procedures previously utilized at the facility so as to produce comparable results.*
>
> *The estimated ~~measured~~ hydraulic properties for each monitoring well shall be submitted to NMED within 120 days of the installation of the monitoring wells in a cumulative well report.*

Subject: [EXT] Comments on the draft DP-831 permit dated March 2, 2020

This e-mail is for submitting my comments on the draft DP-831 permit dated March 2, 2020.

Permit conditions 6, 12, 13, 17, and 22 require that the permittee shall maintain and install fences to control access by the general public and animals. As stated, without specifics to the animal(s) that the fence is intended to control, it could then be perceived that any animal found in the controlled area would result in a permit violation. A large array of taxa is considered to belong to the animal kingdom.

Permit condition 16 has a typo for the acronym for leak detection, collection, and recovery systems; LDRCS rather than LDCRS.

PUBLIC NOTICE

Groundwater Discharge Permit
Proposed for Approval
DP-831, Waste Isolation Pilot Plant
Public Comment Period Open Until April 22, 2020

The New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) provides notice that the following Groundwater Discharge Permit has been proposed for approval: The U.S. Department of Energy's Waste Isolation Pilot Plant (WIPP) proposes to renew and modify the Discharge Permit (DP-831) for the discharge of up to 9,586,995 gallons per day of industrial wastewater and stormwater to an impoundment and disposal system and up to 23,000 gallons per day of domestic wastewater to a treatment and disposal system. The modification consists of the addition of one new salt cell and four new impoundments that will receive industrial wastewater and stormwater.

Applicant: U.S. Department of Energy's WIPP, Gregory Sosson, Acting Manager, Carlsbad Field Office, P.O. Box 3090, Carlsbad, NM 88221

Facility Description: The WIPP facility is a mined geologic repository for the disposal of transuranic (TRU) waste. The underground repository is located 2,150 feet below land surface in the bedded salt of the Salado Formation. Discharges addressed by this permit are not directly associated with the storage of TRU waste.

Discharge Locations: Discharge locations include an impoundment system for domestic wastewater, three active salt cells, four lined impoundments for stormwater in contact with salt cells, three lined impoundments for stormwater not in contact with salt cells, and four lined impoundments for non-hazardous, industrial wastewater.

Activities that Produce the Discharge: Discharges include stormwater collected from the facility grounds and from active and inactive salt cells which is discharged to synthetically lined impoundments. Additionally, industrial wastewater from various sources including brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous wastewaters, are discharged to synthetically lined impoundments. The facility's domestic wastewater is discharged to a synthetically lined impoundment system for treatment and disposal by evaporation. Brine produced from the operations of the to be constructed Salt Reduction System will be discharged to two synthetically lined impoundments.

Facility Location: The facility is located off Highway 128, approximately 26 miles southeast of Carlsbad, in Sections 20, 21, 28, and 29, Township 22S, Range 31E, Eddy County.

Potential Contaminants: Potential contaminants from this type of discharge include nitrogen compounds, dissolved solids, and chloride.

Groundwater Most Likely to be Affected by the Discharge: Groundwater most likely to be affected is at a depth of approximately 35 to 160 feet and had a pre-discharge total dissolved solids concentration of 3,400 milligrams per liter.

How to obtain more information: To learn more about this Discharge Permit and the permitting process or to obtain a copy of the draft permit, the Fact Sheet, or Public Involvement Plan, please contact the NMED Permit Contact, Ms. Avery Young by phone at (505) 827-2909 or email at Avery.Young@state.nm.us. NMED maintains a facility-specific mailing list for persons wishing to receive notices for permitting actions associated with this facility. Additionally, NMED maintains a facility specific Public Involvement Plan (PIP) for each permitting action to plan for providing public participation opportunities and information that may be needed for the community to participate in a permitting process.

> **Access documents online**: The draft permit, Fact Sheet, and PIP may be viewed online at https://www.env.nm.gov/gwqb/dp-831/. For a Spanish translation of the Fact Sheet, visit https://www.env.nm.gov/gwqb/dp-831-es/.
>
> **Access documents at a document repository in Eddy County**: A hard copy of the draft permit, the permit summary, and the PIP may be viewed at the following document repository locations: Eunice Public Library, 1003 Avenue N, Eunice, NM 88231; NMED Carlsbad Field Office, 406 N. Guadalupe, Carlsbad, NM 88220; and Carlsbad Public Library, 101 S. Halagueno St, Carlsbad, NM 88220.

How to submit a comment or request a hearing: NMED will allow 45 days after the date of publication of this notice for submittal of written comments and/or a request for a public hearing. Requests for a public hearing shall be in writing and shall set forth the reasons why a hearing should be held. Comments or a request for hearing regarding a draft permit should be addressed to the GWQB, PO Box 5469, Santa Fe, NM 87502-5469, or emailed to the NMED Permit contact, Avery Young, at Avery.Young@state.nm.us.

A hearing will be held if the NMED Cabinet Secretary determines that there is substantial public interest. If a hearing is held, a hearing officer will be appointed by the NMED Cabinet Secretary and will be held in the locally affected community. During the hearing process, members of the public may file technical testimony prior to the hearing and may provide verbal and written comments during the hearing itself. Once the hearing is complete, the hearing officer will provide the NMED Cabinet Secretary with a hearing report that includes a suggested determination. The NMED Cabinet Secretary will then issue a Final Order which will complete the Administrative Record for the permitting action. After the Administrative Record for a permitting action is complete and all required information is available, NMED will approve, approve with conditions, or disapprove the Permit based on the Administrative Record and/or Final Order from the NMED Cabinet Secretary.

7

How to request accommodations: If you are a non-English speaker, do not speak English well, or if you have a disability, you may contact Avery Young by phone at (505) 827-2909 or email at Avery.Young@state.nm.us to request assistance, translation services, an interpreter, or an accommodation in order to learn more about a Discharge Permit or the permitting process, or to participate in activities associated with the permitting process. Requested translation, interpretation services, and accommodations or services for persons with disabilities will be arranged to the extent possible. Telephone conversation assistance is available through Relay New Mexico at no charge for people who are deaf, hard of hearing, or have difficulty speaking on the phone, by calling 1-800-659-1779; TTY users: 1-800-659-8331; Spanish: 1-800-327-1857. Telephone interpretation assistance for persons that are a non-English speaker or do not speak English well is available at no charge when calling NMED.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non- discrimination programs, policies or procedures, you may contact: Kristine Yurdin, Non-Discrimination Coordinator, New Mexico Environment Department, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@state.nm.us. If you believe that you have been discriminated against with respect to a NMED program or activity, you may contact the Non-Discrimination Coordinator identified above or visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

AVISO PÚBLICO

Permiso de Descarga de Aguas Subterráneas propuesto para su aprobación DP-831, Planta Piloto de Aislamiento de Residuos Período de comentarios públicos abierto hasta el 22 de abril de 2020

La Oficina de Calidad de Aguas Subterráneas (GWQB, por sus siglas en inglés) del Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés) notifica que el siguiente Permiso de Descarga de Aguas Subterráneas ha sido propuesto para su aprobación: La Planta Piloto de Aislamiento de Residuos (WIPP, por sus siglas en inglés) del Departamento de Energía de los Estados Unidos propone renovar y modificar el Permiso de Descarga (DP-831) para la descarga de hasta 9,586,995 galones por día de aguas residuales industriales y aguas pluviales a un sistema de embalse y eliminación y hasta 23,000 galones por día de aguas residuales domésticas a un sistema de tratamiento y eliminación. La modificación consiste en la adición de una nueva celda de sal y cuatro nuevos embalses que recibirán aguas residuales industriales y aguas pluviales.

Solicitante: WIPP del Departamento de Energía de los Estados Unidos, Gregory Sosson, gerente en funciones, oficina local en Carlsbad, P.O. Box 3090, Carlsbad, NM 88221

Descripción de la instalación: La instalación WIPP es un depósito geológico minado para la eliminación de residuos transuránicos (TRU, por sus siglas en inglés). El depósito subterráneo está situado a 2,150 pies por debajo de la superficie del suelo en el lecho de sal de la Formación Salado. Los vertidos a los que se refiere este permiso no están directamente relacionados con el almacenamiento de los residuos TRU.

Ubicaciones de las descargas: Las ubicaciones de las descargas incluyen un sistema de embalses para aguas residuales domésticas, tres celdas de sal activas, cuatro embalses revestidos para aguas pluviales en contacto con celdas de sal, tres embalses revestidos para aguas pluviales que no están en contacto con celdas de sal y cuatro embalses revestidos para aguas residuales industriales no peligrosas.

Actividades que producen las descargas: Las descargas incluyen aguas pluviales recogidas en los terrenos de las instalaciones y de celdas de sal activas e inactivas que descargan en embalses revestidos sintéticamente. Además, las aguas residuales industriales de diversas fuentes, incluyendo salmuera, aguas de purga de muestreo y de pozos de monitoreo en vías de desarrollo de la Instalación y otras diversas aguas residuales industriales no peligrosas se descargan en embalses revestidos sintéticamente. Las aguas residuales domésticas de la instalación se descargan en un sistema de embalse revestido de material sintético para su tratamiento y eliminación por evaporación. La salmuera producida por las operaciones del sistema de reducción de sal que se construirá se descargará en dos embalses revestidos sintéticamente.

Ubicación de la instalación: La instalación se encuentra junto a la carretera 128, aproximadamente a 26 millas al sureste de Carlsbad, en las Secciones 20, 21, 28 y 29, Municipio 22S, Rango 31E, condado de Eddy.

Posibles contaminantes: Los posibles contaminantes de este tipo de descarga incluyen compuestos de nitrógeno, sólidos disueltos y cloruro.

Agua subterránea con más probabilidad de ser afectada por la descarga: El agua subterránea con más probabilidad de ser afectada se encuentra a una profundidad de 35 a 160 pies aproximadamente y tenía una concentración de sólidos disueltos totales antes del vertido de 3,400 miligramos por litro.

Cómo obtener más información: Para obtener más información sobre este Permiso de Descarga y el proceso de obtención de permisos o para obtener una copia del Borrador del Permiso, la Hoja de Datos, o el Plan de Participación Pública, comuníquese con la persona que sirve como contacto de permisos de NMED, La Sra. Avery Young, por teléfono llamando al (505) 827-2709 o por correo electrónico a Avery.Young@state.nm.us. NMED mantiene una lista de correo específica de la instalación para las personas que desean recibir avisos sobre las acciones de permisos asociados con esta instalación. Además, NMED mantiene un Plan de Participación Pública (PIP, por sus siglas en inglés) específico para cada instalación para cada acción de permiso para planear y proveer oportunidades de participación pública e información que puede ser necesaria para que la comunidad participe en el proceso de permisos.

> **Acceso a los documentos en línea**: El Borrador del Permiso, el PIP y la Hoja de Datos pueden verse en línea en https://www.env.nm.gov/gwqb/dp-831-es/. Para obtener una traducción en español de la Hoja de Datos visite https://www.env.nm.gov/gwqb/dp-831/.
>
> **Acceso a los documentos en el depósito de documentos en el condado de Eddy**: Una copia impresa del Borrador del Permiso, el resumen del Permiso y el PIP pueden ser vistos en las siguientes ubicaciones de depósito de documentos: Biblioteca Pública de Eunice, 1003 Avenue N, Eunice, NM 88231; Oficina local de NMED en Carlsbad, 406 N. Guadalupe, Carlsbad, NM 88220; y la Biblioteca Pública de Carlsbad, 101 S Halagueno St, Carlsbad, NM 88220.

Cómo presentar un comentario o solicitar una audiencia: NMED permitirá 45 días después de la fecha de la publicación de este aviso para la presentación de comentarios por escrito y/o una solicitud de audiencia pública. Las solicitudes de audiencia pública deberán hacerse por escrito y deberán exponer las razones por las que se debe llevar a cabo una audiencia. Los comentarios o la solicitud de audiencia con respecto al Borrador del Permiso deben dirigirse a GWQB, P.O. Box 5469, Santa Fe, NM 87502-5469, o por correo electrónico al contacto de permisos de NMED, Avery Young, a Avery.Young@state.nm.us.

Se llevará a cabo una audiencia si el secretario del gabinete de NMED determina que hay un considerable interés por parte del público. Si se lleva a cabo una audiencia, un funcionario de audiencias será designado por el secretario del gabinete de NMED y se llevará a cabo en la comunidad local afectada. Durante el proceso de audiencia, los miembros del público pueden presentar un testimonio técnico antes de la audiencia y pueden proporcionar comentarios verbales y por escritos durante la audiencia misma. Una vez terminada la audiencia el funcionario de audiencias proveerá al secretario del gabinete de NMED un informe de la audiencia que incluye una determinación sugerida. El secretario del gabinete de NMED entonces emitirá una Orden Final que completará el Registro Administrativo para la acción de permiso. Después de que el Registro Administrativo para la acción de permiso esté completo y toda la información requerida esté disponible, el NMED aprobará, aprobará con condiciones, o rechazará el Permiso basado en el Registro Administrativo y/o la Orden Final del secretario del gabinete de NMED.

Cómo solicitar acomodaciones: Si usted no habla inglés, no habla bien el inglés, o si tiene una discapacidad, puede comunicarse con Avery Young por teléfono llamando al (505) 827-2709 o por correo electrónico a Avery.Young@state.nm.us para solicitar asistencia, servicios de traducción, un intérprete, o acomodación para poder aprender más sobre un permiso de descarga o el proceso de permiso, o para participar en actividades asociadas con el proceso de permiso. Los servicios de traducción e interpretación solicitados y las acomodaciones o servicios para personas con discapacidades se organizarán en la medida de lo posible. Hay disponible asistencia para conversaciones telefónicas a través de Relay New Mexico de forma gratuita para las personas sordas, con problemas de audición o con dificultades para hablar por teléfono llamando al 1-800-659-1779; los usuarios de TTY: 1-800-659-8331; español: 1-800-327-1857. La asistencia telefónica de interpretación para personas que no hablan inglés o no hablan bien el inglés está disponible de forma gratuita llamando al NMED.

NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo exigido por las leyes y los reglamentos correspondientes. NMED es responsable de la coordinación de los esfuerzos de cumplimiento y la recepción de consultas relativas a los requisitos de no discriminación implementados por 40 C.F.R. Partes 5 y 7, incluido el Título VI de la Ley de Derechos Civiles de 1964, según enmendada; Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, Título IX de las Enmiendas de Educación de 1972 y la Sección 13 de las Enmiendas a la Ley Federal de Control de Contaminación del Agua de 1972. Si usted tiene preguntas sobre este aviso o sobre cualquier programa, política o procedimiento de no discriminación de NMED, usted puede comunicarse con la Coordinadora de No Discriminación: Kristine Yurdin, Non-Discrimination Coordinator, New Mexico Environment Department, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@state.nm.us. Si usted piensa que ha sido discriminado/a con respecto a un programa o actividad de NMED, usted puede comunicarse con la Coordinadora de No Discriminación antes indicada o visitar nuestro sitio web en https://www.env.nm.gov/non-employee-discrimination-complaint-page/ para aprender cómo y dónde presentar una queja de discriminación.

Groundwater Discharge Permit Proposed for Approval, DP-831, Waste Isolation Pilot Plant, Public Comment Period Open Until April 22, 2020

The New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) provides notice that the following Groundwater Discharge Permit has been proposed for approval: The U.S. Department of Energy's Waste Isolation Pilot Plant (WIPP) proposes to renew and modify the Discharge Permit (DP-831) for the discharge of up to 9,586,995 gallons per day of industrial wastewater and stormwater to an impoundment and disposal system and up to 23,000 gallons per day of domestic wastewater to a treatment and disposal system. The modification consists of the addition of one new salt cell and four new impoundments that will receive industrial wastewater and stormwater.

Applicant: U.S. Department of Energy's WIPP, Gregory Sosson, Acting Manager, Carlsbad Field Office, P.O. Box 3090, Carlsbad, NM 88221

Facility Description: The WIPP facility is a mined geologic repository for the disposal of transuranic (TRU) waste. The underground repository is located 2,150 feet below land surface in the bedded salt of the Salado Formation. Discharges addressed by this permit are not directly associated with the storage of TRU waste.

Discharge Locations: Discharge locations include an impoundment system for domestic wastewater, three active salt cells, four lined impoundments for stormwater in contact with salt cells, three lined impoundments for stormwater not in contact with salt cells, and four lined impoundments for non-hazardous, industrial wastewater.

Activities that Produce the Discharge: Discharges include stormwater collected from the facility grounds and from active and inactive salt cells which is discharged to synthetically lined impoundments. Additionally, industrial wastewater from various sources including brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous wastewaters, are discharged to synthetically lined impoundments. The facility's domestic wastewater is discharged to a synthetically lined impoundment system for treatment and disposal by evaporation. Brine produced from the operations of the to be constructed Salt Reduction System will be discharged to two synthetically lined impoundments.

Facility Location: The facility is located off Highway 128, approximately 26 miles southeast of Carlsbad, in Sections 20, 21, 28, and 29, Township 22S, Range 31E, Eddy County.

Potential Contaminants: Potential contaminants from this type of discharge include nitrogen compounds, dissolved solids, and chloride.

Groundwater Most Likely to be Affected by the Discharge: Groundwater most likely to be affected is at a depth of approximately 35 to 160 feet and had a pre-discharge total dissolved solids concentration of 3,400 milligrams per liter.

How to obtain more information: To learn more about this Discharge Permit and the permitting process or to obtain a copy of the draft permit, the Fact Sheet, or Public Involvement Plan, please contact the NMED Permit Contact, Ms. Avery Young by phone at (505) 827-2909 or email at Avery.Young@state.nm.us. NMED maintains a facility-specific mailing list for persons wishing to receive notices for permitting actions associated with this facility. Additionally, NMED maintains a facility specific Public Involvement Plan (PIP) for each permitting action to plan for providing public participation opportunities and information that may be needed for the community to participate in a permitting process.

Access documents online: The draft permit, Fact Sheet, and PIP may be viewed online at https://www.env.nm.gov/gwqb/dp-831/. For a Spanish translation of the Fact Sheet, visit https://www.env.nm.gov/gwqb/dp-831-es/.

Access documents at a document repository in Eddy County: A hard copy of the draft permit, the permit summary, and the PIP may be viewed at the following document repository locations: Eunice Public Library, 1003 Avenue N, Eunice, NM 88231; NMED Carlsbad Field Office, 406 N. Guadalupe, Carlsbad, NM 88220; and Carlsbad Public Library, 101 S. Halagueno St, Carlsbad, NM 88220.

How to submit a comment or request a hearing: NMED will allow 45 days after the date of publication of this notice for submittal of written comments and/or a request for a public hearing. Requests for a public hearing shall be in writing and shall set forth the reasons why a hearing should be held. Comments or a request for hearing regarding a draft permit should be addressed [illegible] GWQB, PO Box 5469, Santa Fe, NM 87502-5469, or emailed to the NMED Permit contact, Avery Young, at Avery.Young@state.nm.us.

A hearing will be held if the NMED Cabinet Secretary determines that there is substantial public interest. If a hearing is held, a hearing officer will be appointed by the NMED Cabinet Secretary and will be held in the locally affected community. During the hearing process, members of the public may file technical testimony prior to the hearing and may provide verbal and written comments during the hearing itself. Once the hearing is complete, the hearing officer will provide the NMED Cabinet Secretary with a hearing report that includes a suggested determination. The NMED Cabinet Secretary will then issue a Final Order which will complete the Administrative Record for the permitting action. After the Administrative Record for a permitting action is complete and all required information is available, NMED will approve, approve with conditions, or disapprove the Permit based on the Administrative Record and/or Final Order from the NMED Cabinet Secretary.

How to request accommodations: If you are a non-English speaker, do not speak English well, or if you have a disability, you may contact Avery Young by phone at (505) 827-2909 or email at Avery.Young@state.nm.us to request assistance, translation services, an interpreter, or an accommodation in order to learn more about a Discharge Permit or the permitting process, or to participate in activities associated with the permitting process. Requested translation, interpretation services, and accommodations or services for persons with disabilities will be arranged to the extent possible. Telephone conversation assistance is available through Relay New Mexico at no charge for people who are deaf, hard of hearing, or have difficulty speaking on the phone, by calling 1-800-659-1779; TTY users: 1-800-659-8331; Spanish: 1-800-327-1857. Telephone interpretation assistance for persons that are a non-English speaker or do not speak English well is available at no charge when calling NMED.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non- discrimination programs, policies or procedures, you may contact: Kristine Yurdin, Non-Discrimination Coordinator, New Mexico Environment Department, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@state.nm.us. If you believe that you have been discriminated against with respect to a NMED program or activity, you may contact the Non-Discrimination Coordinator identified above or visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

AVISO PI____)

Permiso de Descarga de Aguas Subterráneas propuesto para su aprobación, DP-831, Planta Piloto de Aislamiento de Residuos, Período de comentarios públicos abierto hasta el 22 de abril de 2020

La Oficina de Calidad de Aguas Subterráneas (GWQB, por sus siglas en inglés) del Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés) notifica que el siguiente Permiso de Descarga de Aguas Subterráneas ha sido propuesto para su aprobación: La Planta Piloto de Aislamiento de Residuos (WIPP, por sus siglas en inglés) del Departamento de Energía de los Estados Unidos propone renovar y modificar el Permiso de Descarga (DP-831) para la descarga de hasta 9,586,995 galones por día de aguas residuales industriales y aguas pluviales a un sistema de embalse y eliminación y hasta 23,000 galones por día de aguas residuales domésticas a un sistema de tratamiento y eliminación. La modificación consiste en la adición de una nueva celda de sal y cuatro nuevos embalses que recibirán aguas residuales industriales y aguas pluviales.

Solicitante: WIPP del Departamento de Energía de los Estados Unidos, Gregory Sosson, gerente en funciones, oficina local en Carlsbad, P.O. Box 3090, Carlsbad, NM 88221

Descripción de la instalación: La instalación WIPP es un depósito geológico minado para la eliminación de residuos transuránicos (TRU, por sus siglas en inglés). El depósito subterráneo está situado a 2,150 pies por debajo de la superficie del suelo en el lecho de sal de la Formación Salado. Los vertidos a los que se refiere este permiso no están directamente relacionados con el almacenamiento de los residuos TRU.

Ubicaciones de las descargas: Las ubicaciones de las descargas incluyen un sistema de embalses para aguas residuales domésticas, tres celdas de sal activas, cuatro embalses revestidos para aguas pluviales en contacto con celdas de sal, tres embalses revestidos para aguas pluviales que no están en contacto con celdas de sal y cuatro embalses revestidos para aguas residuales industriales no peligrosas.

Actividades que producen las descargas: Las descargas incluyen aguas pluviales recogidas en los terrenos de las instalaciones y de celdas de sal activas e inactivas que descargan en embalses revestidos sintéticamente. Además, las aguas residuales industriales de diversas fuentes, incluyendo salmuera, aguas de purga de muestreo y de pozos de monitoreo en vías de desarrollo de la instalación y otras diversas aguas residuales industriales no peligrosas se descargan en embalses revestidos sintéticamente. Las aguas residuales domésticas de la instalación se descargan en un sistema de embalse revestido de material sintético para su tratamiento y eliminación por evaporación. La salmuera producida por las operaciones del sistema de reducción de sal que se construirá se descargará en dos embalses revestidos sintéticamente.

Ubicación de la instalación: La instalación se encuentra junto a la carretera 128, aproximadamente a 26 millas al sureste de Carlsbad, en las Secciones 20, 21, 28 y 29, Municipio 22S, Rango 31E, condado de Eddy.

Posibles contaminantes: Los posibles contaminantes de este tipo de descarga incluyen compuestos de nitrógeno, sólidos disueltos y cloruro.

Agua subterránea con más probabilidad de ser afectada por la descarga: El agua subterránea con más probabilidad de ser afectada se encuentra a una profundidad de 35 a 160 pies aproximadamente y tenía una concentración de sólidos disueltos totales antes del vertido de 3,400 miligramos por litro.

Cómo obtener más información: Para obtener más información sobre este Permiso de Descarga y el proceso de obtención de permisos o para obtener una copia del Borrador del Permiso, la Hoja de Datos, o el Plan de Participación Pública, comuníquese con la persona que sirve como contacto de permisos de NMED, La Sra. Avery Young, por teléfono llamando al (505) 827-2709 o por correo electrónico a Avery.Young@state.nm.us. NMED mantiene una lista de correo específica de la instalación para las personas que desean recibir avisos sobre las acciones de permisos asociados con esta instalación. Además, NMED mantiene un Plan de Participación Pública (PIP, por sus siglas en inglés) específico para cada instalación para cada acción de permiso para planear y proveer oportunidades de participación pública e información que puede ser necesaria para que la comunidad participe en el proceso de permisos.

Acceso a los documentos en línea: El Borrador del Permiso, el PIP y la Hoja de Datos pueden verse en línea en https://www.env.nm.gov/gwqb/dp-831-es/. Para obtener una traducción en español de la H[illegible] datos visite https://ww w.env.nm.gov/gwqb/dp-831/.

Acceso a los documentos en el depósito de documentos en el condado de Eddy: Una copia impresa del Borrador del Permiso, el resumen del Permiso y el PIP pueden ser vistos en las siguientes ubicaciones de depósito de documentos: Biblioteca Pública de Eunice, 1003 Avenue N, Eunice, NM 88231; Oficina local de NMED en Carlsbad, 406 N. Guadalupe, Carlsbad, NM 88220; y la Biblioteca Pública de Carlsbad, 101 S Halagueno St, Carlsbad, NM 88220.

Cómo presentar un comentario o solicitar una audiencia: NMED permitirá 45 días después de la fecha de la publicación de este aviso para la presentación de comentarios por escrito y/o una solicitud de audiencia pública. Las solicitudes de audiencia pública deberán hacerse por escrito y deberán exponer las razones por las que se debe llevar a cabo una audiencia. Los comentarios o la solicitud de audiencia con respecto al Borrador del Permiso deben dirigirse a GWQB, P.O. Box 5469, Santa Fe, NM 87502-5469, o por correo electrónico al contacto de permisos de NMED, Avery Young, a Avery.Young@state.nm.us.

Se llevará a cabo una audiencia si el secretario del gabinete de NMED determina que hay un considerable interés por parte del público. Si se lleva a cabo una audiencia, un funcionario de audiencias será designado por el secretario del gabinete de NMED y se llevará a cabo en la comunidad local afectada. Durante el proceso de audiencia, los miembros del público pueden presentar un testimonio técnico antes de la audiencia y pueden proporcionar comentarios verbales y por escritos durante la audiencia misma. Una vez terminada la audiencia el funcionario de audiencias proveerá al secretario del gabinete de NMED un informe de la audiencia que incluye una determinación sugerida. El secretario del gabinete de NMED entonces emitirá una Orden Final que completará el Registro Administrativo para la acción de permiso. Después de que el Registro Administrativo para la acción de permiso esté completo y toda la información requerida esté disponible, el NMED aprobará, aprobará con condiciones, o rechazará el Permiso basado en el Registro Administrativo y/o la Orden Final del secretario del gabinete de NMED.

Cómo solicitar acomodaciones: Si usted no habla inglés, no habla bien el inglés, o si tiene una discapacidad, puede comunicarse con Avery Young por teléfono llamando al (505) 827-2709 o por correo electrónico a Avery.Young@stat e.nm.us para solicitar asistencia, servicios de traducción, un intérprete, o acomodación para poder aprender más sobre un permiso de descarga o el proceso de permiso, o para participar en actividades asociadas con el proceso de permiso. Los servicios de traducción e interpretación solicitados y las acomodaciones o servicios para personas con discapacidades se organizarán en la medida de lo posible. Hay disponible asistencia para conversaciones telefónicas a través de Relay New Mexico de forma gratuita para las personas sordas, con problemas de audición o con dificultades para hablar por teléfono llamando al 1-800-659-1779; los usuarios de TTY: 1-800-659-8331; español: 1-800-327-1857. La asistencia telefónica de interpretación para personas que no hablan inglés o no hablan bien el inglés está disponible de forma gratuita llamando al NMED.

NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo exigido por las leyes y los reglamentos correspondientes. NMED es responsable de la coordinación de los esfuerzos de cumplimiento y la recepción de consultas relativas a los requisitos de no discriminación implementados por 40 C.F.R. Partes 5 y 7, incluido el Título VI de la Ley de Derechos Civiles de 1964, según enmendada; Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, Título IX de las Enmiendas de Educación de 1972 y la Sección 13 de las Enmiendas a la Ley Federal de Control de Contaminación del Agua de 1972. Si usted tiene preguntas sobre este aviso o sobre cualquier programa, política o procedimiento de no discriminación de NMED, usted puede comunicarse con la Coordinadora de No Discriminación: Kristine Yurdin, Non-Discrimination Coordinator, New Mexico Environment Department, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@state.n m.us. Si usted piensa que ha sido discriminado/a con respecto a un programa o actividad de NMED, usted puede comunicarse con la Coordinadora de No Discriminación antes indicada o visitar nuestro sitio web en https://www.en v.nm.gov/non-employee-discrimination-complaint-page/ para aprender cómo y dónde presentar una queja de discriminación.

AVISO PÚBLICO

Permiso de Descarga de Aguas Subterráneas propuesto para su aprobación, DP-831, Planta Piloto de Aislamiento de Residuos, Período de comentarios públicos abierto hasta el 22 de abril de 2020

La Oficina de Calidad de Aguas Subterráneas (GWQB, por sus siglas en inglés) del Departamento de Medio Ambiente de Nuevo México (NMED, por sus siglas en inglés) notifica que el siguiente Permiso de Descarga de Aguas Subterráneas ha sido propuesto para su aprobación: La Planta Piloto de Aislamiento de Residuos (WIPP, por sus siglas en inglés) del Departamento de Energía de los Estados Unidos propone renovar y modificar el Permiso de Descarga (DP-831) para la descarga de hasta 9,566,995 galones por día de aguas residuales industriales y aguas pluviales a un sistema de embalse y eliminación y hasta 23,000 galones por día de aguas residuales domésticas a un sistema de tratamiento y eliminación. La modificación consiste en la adición de una nueva celda de sal y cuatro nuevos embalses que recibirán aguas residuales industriales y aguas pluviales.

Solicitante: WIPP del Departamento de Energía de los Estados Unidos, Gregor[illegible]sson, gerente en funciones, oficina local en Carlsbad, P.O. Box 3090, Carlsbad, NM 88221

Descripción de la instalación: La instalación WIPP es un depósito geológico minado para la eliminación de residuos transuránicos (TRU, por sus siglas en inglés). El depósito subterráneo está situado a 2,150 pies por debajo de la superficie del suelo en el lecho de sal de la Formación Salado. Los vertidos a los que se refiere este permiso no están directamente relacionados con el almacenamiento de los residuos TRU.

Ubicaciones de las descargas: Las ubicaciones de las descargas incluyen un sistema de embalses para aguas residuales domésticas, tres celdas de sal activas, cuatro embalses revestidos para aguas pluviales en contacto con celdas de sal, tres embalses revestidos para aguas pluviales que no están en contacto con celdas de sal y cuatro embalses revestidos para aguas residuales industriales no peligrosas.

Actividades que producen las descargas: Las descargas incluyen aguas pluviales recogidas en los terrenos de las instalaciones y de celdas de sal activas e inactivas que descargan en embalses revestidos sintéticamente. Además, las aguas residuales industriales de diversas fuentes, incluyendo salmuera, aguas de purga de muestreo y de pozos de monitoreo en vías de desarrollo de la instalación y otras diversas aguas residuales industriales no peligrosas se descargan en embalses revestidos sintéticamente. Las aguas residuales domésticas de la instalación se descargan en un sistema de embalse revestido de material sintético para su tratamiento y eliminación por evaporación. La salmuera producida por las operaciones del sistema de reducción de sal que se construirá se descargará en dos embalses revestidos sintéticamente.

Ubicación de la instalación: La instalación se encuentra junto a la carrete[illegible] 128, aproximadamente a 26 millas al sureste de Carlsbad, en las Secciones 20, 21, [illegible] 29, Municipio 22S, Rango 31E, condado de Eddy.

Posibles contaminantes: Los posibles contaminantes de este tipo de descarga incluyen compuestos de nitrógeno, sólidos disueltos y cloruro.

Agua subterránea con más probabilidad de ser afectada por la descarga: El agua subterránea con más probabilidad de ser afectada se encuentra a una profundidad de 35 a 160 pies aproximadamente y tenía una concentración de sólidos disueltos totales antes del vertido de 3,400 miligramos por litro.

Cómo obtener más información: Para obtener más información sobre este Permiso de Descarga y el proceso de obtención de permisos o para obtener una copia del Borrador del Permiso, la Hoja de Datos, o el Plan de Participación Pública, comuníquese con la persona que sirve como contacto de permisos de NMED, La Sra. Avery Young, por teléfono llamando al (505) 827-2709 o por correo electrónico a Avery.Young@state.nm.us. NMED mantiene una lista de correo específica de la instalación para las personas que desean recibir avisos sobre las acciones de permisos asociados con esta instalación. Además, NMED mantiene un Plan de Participación Pública (PIP, por sus siglas en inglés) específico para cada instalación para cada acción de permiso para planear y proveer oportunidades de participación pública e información que puede ser necesaria para que la comunidad participe en el proceso de permisos.

Acceso a los documentos en línea: El Borrador del Permiso, el PIP y la Hoja de Datos pueden verse en línea en https://www.env.nm.gov/gwqb/dp-831-es/. Para obtener una traducción en español de la Hoja de Datos visite https://www.env.nm.gov/gwqb/dp-831/ .

Acceso a los documentos en el depósito de documentos en el condado de Eddy: Una copia impresa del Borrador del Permiso, el resumen del Permiso y el PIP pueden ser vistos en las siguientes ubicaciones de depósito de documentos: Biblioteca Pública de Eunice, 1003 Avenue N, Eunice, NM 88231; Oficina local de NMED en Carlsbad, 406 N. Guadalupe, Carlsba[illegible]M 88220; y la Biblioteca Pública de Carlsbad, 101 S Halagueno St, Carlsbad, NM 88220.

Cómo presentar un comentario o solicitar una audiencia: NMED permitirá 45 días después de la fecha de la publicación de este aviso para la presentación de comentarios por escrito y/o una solicitud de audiencia pública. Las solicitudes de audiencia pública deberán hacerse por escrito y deberán exponer las razones por las que se debe llevar a cabo una audiencia. Los comentarios o la solicitud de audiencia con respecto al Borrador del Permiso deben dirigirse a GWQB, P. O. Box 5469, Santa Fe, NM 87502-5469, o por correo electrónico al contacto de permisos de NMED, Avery Young, a Avery.Young@state.nm.us .

Se llevará a cabo una audiencia si el secretario del gabinete de NMED determina que hay un considerable interés por parte del público. Si se lleva a cabo una audiencia, un funcionario de audiencias será designado por el secretario del gabinete de NMED y se llevará a cabo en la comunidad local afectada. Durante el proceso de audiencia, los miembros del público pueden presentar un testimonio técnico antes de la audiencia y pueden proporcionar comentarios verbales y por escritos durante la audiencia misma. Una vez terminada la audiencia el funcionario de audiencias proveerá al secretario del gabinete de NMED un informe de la audiencia que incluye una determinación sugerida. El secretario del gabinete de NMED entonces emitirá una Orden Final que completará el Registro Administrativo para la acción de permiso. Después do que el Registro Administrativo para la acción de permiso esté completo y toda la información requerida esté disponible, el NMED aprobará, aprobará con condiciones, o rechazará el Permiso basado en el Registro Administrativo y/o la Orden Final del secretario del gabinete de NMED.

Cómo solicitar acomodaciones: Si usted no habla inglés, no habla bien el inglés, o si tiene una discapacidad, puede comunicarse con Avery Young por teléfono llamando al (505) 827-2709 o por correo electrónico a **Avery.Young@state.nm.us** para solicitar asistencia, servicios de traducción, un intérprete, o acomodación para poder aprender más sobre un permiso de descarga o el proceso de permiso, o para participar en actividades asociadas con el proceso de permiso. Los servicios de traducción e interpretación solicitados y las acomodaciones o servicios para personas con discapacidades se organizarán en la medida de lo posible. Hay disponible asistencia para conversaciones telefónicas a través de Relay New Mexico de forma gratuita para las personas sordas, con problemas de audición o con dificultades para hablar por teléfono llamando al 1-800-659-1779; los usuarios de TTY: 1-800-659-8331; español: 1-800-327-1857. La asistencia telefónica de interpretación para personas que no hablan inglés o no hablan bien el inglés está disponible de forma gratuita llamando al NMED.

NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o [illegible] en la administración de sus programas o actividades, según lo exigido por las leyes y los reglamentos correspondientes. NMED es responsable de la coordinación de los esfuerzos de cumplimiento y la recepción de consultas relativas a los requisitos de no discriminación implementados por 40 C.F.R. Partes 5 y 7, incluido el Título VI de la Ley de Derechos Civiles de 1964, según enmendada; Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, Título IX de las Enmiendas de Educación de 1972 y la Sección 13 de las Enmiendas a la Ley Federal de Control de Contaminación del Agua de 1972. Si usted tiene preguntas sobre este aviso o sobre cualquier programa, política o procedimiento de no discriminación de NMED, usted puede comunicarse con la Coordinadora de No Discriminación: Kristine Yurdin, Non-Discrimination Coordinator, New Mexico Environment Department, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, **nd.coordinator@state.nm.us**. Si usted piensa que ha sido discriminado/a con respecto a un programa o actividad de NMED, usted puede comunicarse con la Coordinadora de No Discriminación antes indicada o visitar nuestro sitio web en https://www.env.nm.gov/non-employee-discrimination-complaint-page/ para aprender cómo y dónde presentar una queja de discriminación.

PUBLIC NOTICE

Groundwater Discharge Permit Proposed for Approval, DP-831, Waste Isolation Pilot Plant, Public Comment Period Open Until April 22, 2020

The New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) provides notice that the following Groundwater Discharge Permit has been proposed for approval: The U.S. Department of Energy's Waste Isolation Pilot Plant (WIPP) proposes to renew and modify the Discharge Permit (DP-831) for the discharge of up to 9,586,995 gallons per day of industrial wastewater and stormwater to an impoundment and disposal system and up to 23,000 gallons per day of domestic wastewater to a treatment and disposal system. The modification consists of the addition of one new salt cell and four new impoundments that will receive industrial wastewater and stormwater.

Applicant: U.S. Department of Energy's WIPP, Gregory Sosson, Acting Manager, Carlsbad Field Office, P.O. Box 3090, Carlsbad, NM 88221

Facility Description: The WIPP facility is a mined geologic repository for the disposal of transuranic (TRU) waste. The underground repository is located 2,150 feet below land surface in the bedded salt of the Salado Formation. Discharges addressed by this permit are not directly associated with the storage of TRU waste.

Discharge Locations: Discharge locations include an impoundment system for domestic wastewater, three active salt cells, four lined impoundments for stormwater in contact with salt cells, three lined impoundments for stormwater not in contact with salt cells, and four lined impoundments for non-hazardous, industrial wastewater.

Activities that Produce the Discharge: Discharges include stormwater collected from the facility grounds and from active and inactive salt cells which is discharged to synthetically lined impoundments. Additionally, industrial wastewater from various sources including brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous wastewaters, are discharged to synthetically lined impoundments. The facility's domestic wastewater is discharged to a synthetically lined impoundment system for treatment and disposal by evaporation. Brine produced from the operations of the to be constructed Salt Reduction System will be discharged to two synthetically lined impoundments.

Facility Location: The facility is located off Highway 128, approximately 26 miles southeast of Carlsbad, in Sections 20, 21, 28, and 29, Township 22S, Range 31E, Eddy County.

Potential Contaminants: Potential contaminants from this type of discharge include nitrogen compounds, dissolved solids, and chloride.

Groundwater Most Likely to be Affected by the Discharge: Groundwater most likely to be affected is at a depth of approximately 35 to 160 feet and had a pre discharge total dissolved solids concentration of 3,400 milligrams per liter.

How to obtain more information: To learn more about this Discharge Permit and the permitting process or to obtain a copy of the draft permit, the Fact Sheet, or Public Involvement Plan, please contact the NMED Permit Contact, Ms. Avery Young by phone at (505) 827-2909 or email at Avery.Young@state.nm.us. NMED maintains a facility-specific mailing list for persons wishing to receive notices for permitting actions associated with this facility. Additionally, NMED maintains a facility specific Public Involvement Plan (PIP) for each permitting action to plan for providing public participation opportunities and information that may be needed for the community to participate in a permitting process.

Access documents online: The draft permit, Fact Sheet, and PIP may be viewed online at https://www.env.nm.gov/gwqb/dp 831/ . For a Spanish translation of the Fact Sheet, visit https://www.env.nm.gov/gwqb/dp-831-es/ .

Access documents at a document repository in Eddy County: A hard copy of the draft permit, the permit summary, and the PIP may be viewed at the following document repository locations: Eunice Public Library, 1003 Avenue N, Eunice, NM 88231; NMED Carlsbad Field Office, 406 N. Guadalupe, Carlsbad, NM 88220; and Carlsbad Public Library, 101 S. Halagueno St, Carlsbad, NM 88220.

How to submit a comment or request a hearing: NMED will allow 45 days after the date of publication of this notice for submittal of written comments and/or a request for a public hearing. Requests for a public hearing shall be in writing and shall set forth the reasons why a hearing should be held. Comments or a request for hearing regarding a draft permit should be addressed to the GWQB, PO Box 5469, Santa Fe, NM 87502-5469, or emailed to the NMED Permit contact, Avery Young, at Avery.Young@state.nm.us .

A hearing will be held if the NMED Cabinet Secretary determines that there is substantial public interest. If a hearing is held, a hearing officer will be appointed by the NMED Cabinet Secretary and will be held in the locally affected community. During the hearing process, members of the public may file technical testimony prior to the hearing and may provide verbal and written comments during the hearing itself. Once the hearing is complete, the hearing officer will provide the NMED Cabinet Secretary with a hearing report that includes a suggested determination. The NMED Cabinet Secretary will then issue a Final Order which will complete the Administrative Record for the permitting action. After the Administrative Record for a permitting action is complete and all required information is available, NMED will approve, approve with conditions, or disapprove the Permit based on the Administrative Record and/or Final Order from the NMED Cabinet Secretary.

How to request accommodations: If you are a non-English speaker, do not speak English well, or if you have a disability, you may contact Avery Young by phone at (505) 827-2909 or email at Avery.Young@state.nm.us to request assistance, translation services, an interpreter, or an accommodation in order to learn more about a Discharge Permit or the permitting process, or to participate in activities associated with the permitting process. Requested translation, interpretation services, and accommodations or services for persons with disabilities will be arranged to the extent possible. Telephone conversation assistance is available through Relay New Mexico at no charge for people who are deaf, hard of hearing, or have difficulty speaking on the phone, by calling 1 800 659-1779; TTY users: 1-800-659-8331; Spanish: 1-800-327-1857. Telephone interpretation assistance for persons that are a non-English speaker or do not speak English well is available at no charge when calling NMED.

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Parts 5 and 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non- discrimination programs, policies or procedures, you may contact: Kristine Yurdin, Non-Discrimination Coordinator, New Mexico Environment Department, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@state.nm.us. If you believe that you have been discriminated against with respect to a NMED program or activity, you may contact the Non-Discrimination Coordinator identified above or visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

U.S. Department of Energy, Carlsbad Field Office
P.O. Box 3090
Carlsbad, NM 88221

RE: Draft Discharge Permit Renewal and Modification, DP-831, Waste Isolation Pilot Plant (WIPP)

Dear Mr. Sosson:

The New Mexico Environment Department (NMED) hereby gives notice to the U.S. Department of Energy of the proposed approval of Ground Water Discharge Permit Renewal and Modification, DP-831, (copy enclosed), pursuant to Subsection H of 20.6.2.3108 NMAC. NMED will publish notice of the availability of the draft Discharge Permit in the near future and will forward a copy of the notice to you.

Prior to making a final ruling on the proposed Discharge Permit, NMED will allow 30 days from the date the public notice is published in the newspaper for any interested party, including the Discharge Permit applicant, to submit written comments and/or a request a public hearing. A hearing request shall set forth the reasons why a hearing is requested. NMED will hold a hearing in response to a timely hearing request if the NMED Secretary determines there is substantial public interest in the proposed Discharge Permit.

Please review the enclosed draft Discharge Permit carefully. Please be aware that this Discharge Permit may contain conditions that require the permittee to implement operational, monitoring or closure actions by a specified deadline.

Please submit written comments or a request for hearing to my attention at the address above or via email to avery.young@state.nm.us. If NMED does not receive written comments or a request for hearing during the public comment period, the draft Discharge Permit will become final. Thank you for your cooperation during the review process. Feel free to contact me with any questions at (505) 827-2909.

Sincerely,

Avery Young
Environmental Scientist

GROUND WATER DISCHARGE PERMIT RENEWAL and MODIFICATION
Waste Isolation Pilot Plant (WIPP), DP-831

I. INTRODUCTION

The New Mexico Environment Department (NMED) issues this Discharge Permit Renewal and Modification (Discharge Permit), DP-831, to the U.S. Department of Energy (DOE or permittee) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978 §§74-6-1 through 74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Ground and Surface Water Protection Regulations, 20.6.2 NMAC.

NMED's purpose in issuing this Discharge Permit, and in imposing the requirements and conditions specified herein, is to control the discharge of water contaminants from the Waste Isolation Pilot Plant (WIPP or facility) into ground and surface water, so as to protect ground and surface water for present and potential future use as domestic and agricultural water supply and other uses, and to protect public health. In issuing this Discharge Permit, NMED has determined that the requirements of Subsection C of 20.6.2.3109 NMAC have been met. Pursuant to Section 20.6.2.3104 NMAC, it is the responsibility of the permittee to comply with the terms and conditions of this Discharge Permit; failure may result in an enforcement action(s) by NMED (20.6.2.1220 NMAC).

The activities that produce the discharge, the location of the discharge, and the quantity, quality and flow characteristics of the discharge are briefly described as follows:

Domestic wastewater is discharged to a synthetically lined impoundment system for treatment and disposal by evaporation at a rate of up to 23,000 gallons per day (gpd). The system consists of seven synthetically lined impoundments (Facultative Lagoon System) comprised of Settling Lagoons 1 and 2, Polishing Lagoons 1 and 2, and Effluent Lagoons A, B, and C.

Non-domestic wastewater may be discharged at the facility in the following ways:

- Up to 27,000 gpd of industrial wastewaters from the following sources: wastewater from compressed air systems, brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous wastewaters. These industrial wastewaters are discharged to Effluent Lagoons B and C of the Facultative Lagoon System for disposal by evaporation.

- Up to 50,000 gpd of industrial wastewaters from the following sources: brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous wastewaters. These industrial wastewaters are discharged to a separate synthetically lined impoundment for disposal by evaporation (Evaporation Pond H-19).

- Up to 2,210 gpd of brine produced from the operations of the, to be constructed, Salt Reduction System within the Safety Significant Confinement Ventilation System (SSCVS) will be discharged to two double synthetically lined impoundments, each with a leak detection system (Brine Retention Ponds East and West, collectively Brine Ponds). One brine retention pond will be in service while the other brine retention pond is closed for evaporation and removal of precipitated salt in order to maintain at least two feet of freeboard. Any remaining brine in the closed Brine Pond will be transferred to Brine Salt Storage Pond 4 for disposal by evaporation.

- Salt and other subsurface materials mined during construction of the Facility, as well as currently mined salt, are stored at the surface in four stockpiles. The stockpiles currently storing salt, or that will be used in the future as salt is mined from the Facility's underground panels, are referred to as Salt Cells 2, 3, and 5. Stormwater runoff in contact with Salt Cells 2 and 3 is collected in two double synthetically-lined stormwater impoundments, each with a leak detection system (Salt Storage Ponds 2 and 3). The total storage capacity of Salt Storage Ponds 2 and 3 is 21,737,254 gallons. Stormwater runoff in contact with Salt Cell 5 will be collected in a double synthetically-lined stormwater impoundment with a leak detection system (Salt Storage Pond 5). The storage capacity of Salt Storage Pond 5 will be 6,355,404 gallons. Salt Cell 1 no longer receives salt and is capped with synthetic material and an earthen cover. Stormwater runoff in contact with this stockpile is collected in synthetically-lined diversion ditches directed to a synthetically-lined impoundment (Salt Storage Pond 1). The storage capacity of Salt Storage Pond 1 is 3,301,634 gallons. The storage capacity of each salt storage pond is sufficient to contain a 24-hour, 100-year (5.84-inch rainfall) storm event.

- Stormwater runoff from the SSCVS area is collected in a double synthetically lined storm water impoundment with a leak detection system (Brine Salt Storage Pond 4). The storage capacity of Brine Salt Storage Pond 4 is 8,668,722 gallons. The capacity of the Brine Salt Storage Pond 4 is sufficient to contain a 24-hour, 100-year (5.84-inch rainfall) storm event.

- Additional stormwater runoff from the Facility's paved areas and roofs is collected in three synthetically-lined impoundments (Storm Water Ponds 1, 2, and 3). This runoff does not contact the salt stockpiles or other waste materials at the Facility and may be used by the permittee for dust control, soil compaction, and other construction activities.

Salt and other subsurface materials mined during construction of the facility, as well as currently mined salt, are stored on the surface in four stockpiles (Salt Cells 1, 2, 3, and 5). Salt Cell 1 is closed with a 60-mil HDPE synthetic liner cover and two feet of native soil, as well as a 60-mil HDPE synthetically lined drainage system for stormwater runoff collection. Salt Cells 2 and 3 were constructed with six inches of prepared subgrade, a 60-mil HDPE liner, a 200-mil Geonet drainage layer, an eight-ounce geotextile fabric, and the fabric is then covered with two feet of screened native soil. Each salt cell is sloped toward the center, which contains a collection trench and pipe for conveyance of water to Salt Storage Ponds 2 and 3. Salt Cell 5 will be constructed with a 60-mil HDPE liner on the bottom with a protective layer of native soil on top to protect the liner. A HDPE pipe will be installed to collect and transmit by gravity the leachate and stormwater runoff water from Salt Cell 5 to Salt Storage Pond 5.

The Site and Preliminary Design Validation (SPDV) material pile was constructed as the shafts were excavated when construction first began at the WIPP site. The SPDV material pile was closed in the year 2000 with a geosynthetic liner cover installed on 6 inches of bedding material and covered with a minimum of three feet of earthen material.

The modification consists of the addition of one new salt storage cell and four new impoundments: Salt Cell 5, Salt Storage Pond 5, Brine Salt Storage Pond 4, Brine Retention Pond East, and Brine Retention Pond West.

The discharge contains water contaminants that may be elevated above the standards of Section 20.6.2.3103 NMAC.

The facility is located near the Jal Highway (NM-128), 26 miles southeast of Carlsbad, in Sections 20, 21, 28, and 29, Township 22S, Range 31E, Eddy County.

The WIPP facility is a mined geologic repository for the disposal of transuranic (TRU) waste. The underground repository is located 2,150 feet below land surface in the bedded salt of the Salado Formation. The WIPP first began accepting waste in March 1999. In addition to this groundwater Discharge Permit, the WIPP is also regulated by the NMED Hazardous Waste Bureau under the New Mexico Hazardous Waste Act and New Mexico's Hazardous Waste Regulations.

The WIPP facility is geologically situated in the southeast portion of New Mexico within the Delaware Basin, which is part of the larger Permian Basin. The geologic formations below the facility that are pertinent to this Discharge Permit, from deepest to shallowest, include: the Salado Formation, the Rustler Formation, the Dewey Lake Formation, and, in the northeastern portion of the facility, the Santa Rosa Formation. The Salado Formation, which is first encountered at an approximate depth of 850 feet and is approximately 2,000 feet thick, consists predominately of polyhalite, with some halite, carbonates, anhydrites, and clay seams. The Rustler Formation ranges from 350 to 500 feet thick and consists of carbonates, anhydrites, and halites. The Dewey Lake Formation is approximately 500 feet thick and consists almost entirely of mudstone, claystone, siltstone, and interbedded sandstone, and is frequently referred to as the Dewey Lake Redbeds Formation.

Groundwater below the facility most likely to be affected by a discharge is at a depth of approximately 35 to 160 feet. Natural groundwater is located in the middle portion of the Dewey Lake Formation at a depth of approximately 160 feet and has an average total dissolved solids concentration of approximately 3,400 milligrams per liter. The WIPP discovered a perched water zone in the lower Santa Rosa and upper Dewey Lake Formations in 1995 and determined that the probable sources of this shallow groundwater were the unlined impoundments constructed to capture stormwater runoff at the facility and runoff from the above-ground salt piles. This shallow groundwater has been found to be contaminated with total dissolved solids, sulfate (SO_4), and chloride. After the discovery of the anthropogenically created shallow groundwater (referred to as shallow groundwater), all impoundments at the facility were lined and a network of monitoring wells was installed. The shallow groundwater has a flow direction of north to south. Natural, non-anthropogenic, groundwater occurs in the Dewey Lake Formation (referred to as natural groundwater in the Dewey Lake Formation) south of the WIPP facility at a depth of 160 feet. The Dewey Lake Formation has a relatively low hydraulic conductivity.

The first laterally continuous water-bearing zone below the facility is within an approximately 30-foot-thick section of the Culebra Member of the Rustler Formation. Water in the Culebra Member is usually present in fractures and is confined by overlaying anhydrite and underlying clay and anhydrite beds. The Culebra Member is monitored through a network of monitoring wells.

The original Discharge Permit was issued on January 16, 1992, amended on August 28, 1995, renewed on July 3, 1997, amended on June 12, 1998 and on January 24, 2000, renewed on April 29, 2003, modified on December 22, 2003 and on December 29, 2006, renewed and modified on July 23, 2008, and last renewed on July 29, 2014. The application (i.e., discharge plan) consists of the materials submitted by the permittee dated December 3, 2018 and materials contained in the administrative record prior to issuance of this Discharge Permit.

The discharge shall be managed in accordance with all conditions and requirements of this Discharge Permit.

Pursuant to Section 20.6.2.3109 NMAC, NMED reserves the right to require a Discharge Permit Modification in the event NMED determines that the requirements of 20.6.2 NMAC are being or may be violated or the standards of Section 20.6.2.3103 NMAC are being or may be violated. This may include a determination that structural controls and/or management practices approved under this Discharge Permit are not protective of groundwater quality, and that more stringent requirements to protect groundwater quality may be required by NMED. The permittee may be required to implement abatement of water pollution and remediate groundwater quality.

Issuance of this Discharge Permit does not relieve the permittee of the responsibility to comply with the WQA, WQCC Regulations, and any other applicable federal, state and/or local laws and regulations, such as zoning requirements and nuisance ordinances.

The following acronyms and abbreviations may be used in this Discharge Permit.

Abbreviation	Explanation
BOD_5	biochemical oxygen demand (5-day)
CFR	Code of Federal Regulations
CFU	Colony Forming Unit
Cl	chloride
EPA	United States Environmental Protection Agency
gpd	gallons per day
LAA	land application area
LADS	land application data sheet(s)
mg/L	milligrams per liter
mL	milliliters
MPN	Most Probable Number

Abbreviation	Explanation
NMED	New Mexico Environment Department
NMSA	New Mexico Statutes Annotated
NO_3-N	nitrate-nitrogen
NTU	nephelometric turbidity units
TDS	total dissolved solids
TKN	total Kjeldahl nitrogen
total nitrogen	= TKN + NO_3-N
TRC	total residual chlorine
TSS	total suspended solids
WQA	New Mexico Water Quality Act
WQCC	Water Quality Control Commission

Abbreviation	Explanation		Abbreviation	Explanation
NMAC	New Mexico Administrative Code		WWTF	Wastewater Treatment Facility

II. FINDINGS

In issuing this Discharge Permit, NMED finds the following.

1. The permittee is discharging effluent or leachate from the facility so that such effluent or leachate may move directly or indirectly into groundwater within the meaning of Section 20.6.2.3104 NMAC.

2. The permittee is discharging effluent or leachate from the facility so that such effluent or leachate may move into groundwater of the State of New Mexico that has an existing concentration of 10,000 mg/L or less of TDS within the meaning of Subsection A of 20.6.2.3101 NMAC.

3. The discharge from the facility is not subject to any of the exemptions of Section 20.6.2.3105 NMAC.

III. AUTHORIZATION TO DISCHARGE

Pursuant to 20.6.2.3104 NMAC, it is the responsibility of the permittee to ensure that discharges authorized by this Discharge Permit are consistent with the terms and conditions herein.

The permittee is authorized to discharge up to 23,000 gpd of domestic wastewater to a synthetically-lined facultative lagoon system for disposal by evaporation. The Facultative Lagoon System is authorized to accept up to 27,000 gpd of non-hazardous industrial wastewater from compressed air systems at the facility, brine, purge waters from sampling and developing wells, and miscellaneous industrial non-hazardous wastewater for disposal by evaporation. Up to 50,000 gpd of brine, purge waters, and miscellaneous non-hazardous process waters is authorized to be discharged into to Evaporation Pond H-19. Up to 2,210 gpd of brine is authorized to be discharged from a 3,000-gallon holding tank to Brine Retention Ponds East and West for disposal by evaporation. In order to maintain at least two feet of freeboard, the remaining brine in the Brine Ponds is authorized to be transferred to the Brine Salt Storage Pond 4.

The permittee is authorized to stockpile mined salt in four salt cells: Salt Pile 1 is closed with a cover; Salt Cells 2, 3 and 5 have authorized footprints of 6.2 acres, 5.2 acres, and 5.1 acres, respectively. The permittee is authorized to collect storm water runoff from these salt cells in three double synthetically lined impoundments with leak detection systems (Salt Storage Pond 2, Salt Storage Pond 3, and Salt Storage Pond 5) and one synthetically lined impoundment with a drainage system (Salt Storage Pond 1) for disposal by evaporation. The permittee is also authorized to collect storm water runoff from the facility's paved areas and roofs in Storm Water Ponds 1, 2, and 3, as well as Brine Salt Storage Pond 4. This runoff is not in contact with the salt stockpiles at the facility, and runoff from Storm Water Ponds 1, 2, and 3 may be used for dust control, soil compaction, and other construction activities.

This Discharge Permit sets forth requirements for the discharge and disposal of domestic and non-domestic wastewater. Conditions in the Operational Plan, the Monitoring and Reporting, and the Closure Plan sections are categorized as follows:

- **Part A. Generally Applicable to All Discharges;**
- **Part B. Applicable to the Facultative Lagoon System;**
- **Part C. Applicable to the Evaporation Pond H-19, Brine Retention Pond East, Brine Retention Pond West, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3;**
- **Part D. Applicable to the Impoundments Containing Storm Water Runoff in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, 3, and 5) and to Salt Stockpiles (Salt Cells 1, 2, 3, and 5);**
- **Part E. Applicable to Ground Water Monitoring.**

[20.6.2.3104 NMAC, Subsection C of 20.6.2.3106 NMAC, Subsection C of 20.6.2.3109 NMAC]

IV. CONDITIONS

NMED issues this Discharge Permit for the discharge of water contaminants subject to the following conditions.

OPERATIONAL PLAN

Part A. Generally Applicable to All Discharges

#	Operating Conditions Applicable to All Discharges
1.	The permittee shall implement the following operational plan to ensure compliance with Title 20, Chapter 6, Parts 2 and 4 NMAC. [Subsection C of 20.6.2.3109 NMAC]
2.	The permittee shall operate in a manner such that standards and requirements of Sections 20.6.2.3101 and 20.6.2.3103 NMAC are not violated. [20.6.2.3101 NMAC, 20.6.2.3103 NMAC, Subsection C of 20.6.2.3109 NMAC]
3.	The permittee shall maintain the impoundment liners in such a manner as to avoid conditions that could affect the liner or the structural integrity of the impoundments. Such conditions include or may be characterized by the following: • erosion damage; • animal burrows or other damage;

#	Operating Conditions Applicable to All Discharges
	• the presence of vegetation including aquatic plants, weeds, woody shrubs or trees growing within five feet of the top inside edge of a sub-grade impoundment, within five feet of the toe of the outside berm of an above-grade impoundment, or within the impoundment itself; • the presence of large debris or large quantities of debris in the impoundment; • evidence of seepage; or • evidence of berm subsidence. Vegetation growing around the impoundments shall be routinely controlled by mechanical removal in a manner that is protective of the impoundment liner. The permittee shall visually inspect the impoundments and surrounding berms on a monthly basis to ensure proper maintenance. In the event that inspection reveals any evidence of damage that threatens the structural integrity of an impoundment berm or liner, or that may result in an unauthorized discharge, the permittee shall enact the contingency plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
4.	The permittee shall preserve a minimum of one foot of freeboard between the liquid level in all the impoundments and the elevation of the top of the impoundment liner, except the Brine Retention Ponds East and West shall maintain two feet of freeboard. In the event that the permittee determines that the specified freeboard cannot be preserved in the impoundments, the permittee shall enact the contingency plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

Part B. Applicable to the Facultative Lagoon System

#	Facultative Lagoon System - Operational Actions with Implementation Deadlines
5.	Within three years following the effective date of this Discharge Permit (**by DATE**), the permittee shall measure the thickness of the settled solids in two impoundments (Settling Lagoon 1 and Settling Lagoon 2) that are part of the Facultative Lagoon System and report the results of the solids thickness measurements to NMED. The permittee shall measure the thickness of settled solids in each impoundment in accordance with the following procedure. a) The total surface area of the treatment impoundment shall be divided into nine equal sub-areas. b) A settled solids measurement device (core sampler) shall be utilized to obtain one measurement (to the nearest half-foot) per sub-area.

#	Facultative Lagoon System - Operational Actions with Implementation Deadlines
	c) The nine measurements shall be averaged. In the event the average solids accumulation exceeds one-third of the maximum allowable liquid depth in the impoundments, the permittee shall propose a plan for the removal and disposal of the solids. The solids removal and disposal plan shall be submitted to NMED for approval within two years and two months following the effective date of this Discharge Permit (**by DATE**) and shall include the following information: a) A method for removal of the solids to a depth of less than six inches throughout the treatment impoundment in a manner that is protective of the impoundment liner. b) A description of how the solids will be contained, transported, and disposed of in accordance with all local, state, and federal regulations, including 40 CFR Part 503. c) A schedule for completion of the solids removal and disposal project. The permittee shall initiate implementation of the plan following approval by NMED. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

#	Facultative Lagoon System - Operating Conditions
6.	The permittee shall maintain fences around the Facultative Lagoon System to control access by the general public and animals. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
7.	The permittee shall maintain signs indicating that the wastewater at the facility is not potable. Signs shall be posted at the Facultative Lagoon System's entrance and other areas where there is potential for public contact with wastewater. All signs shall be printed in English and Spanish remain visible and legible. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
8.	The permittee shall utilize operators, certified by the State of New Mexico at the appropriate level, to operate the domestic wastewater collection, treatment and disposal systems. The operations and maintenance of all or any part of the wastewater system shall be performed by, or under the direct supervision of, a certified operator. [Subsection C of 20.6.2.3109 NMAC, 20.7.4 NMAC]

Part C. Applicable to the Evaporation Pond H-19, Brine Retention Pond East, Brine Retention Pond West, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Operational Actions with Implementation Deadlines**
9.	Prior to discharging to the proposed Brine Retention Pond East, the Brine Retention Pond West, or the Brine Salt Storage Pond 4, the permittee shall submit written notification to NMED stating the date the discharge(s) is to commence. [Subsection C of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
10.	Prior to discharging to Brine Retention Pond East, Brine Retention Pond West, or Brine Salt Storage Pond 4, the permittee shall complete construction of the Ponds in accordance with the final construction plans and specifications submitted to NMED as part of the Discharge Permit application received on December 3, 2018. The permittee shall notify NMED prior to the commencement of construction to allow NMED personnel to be onsite for inspection during construction. [Subsections A and C of 20.6.2.1202 NMAC, Subsection C of 20.6.2.3109 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
11.	The permittee shall submit record drawings that bear the seal and signature of a licensed New Mexico professional engineer (pursuant to the New Mexico Engineering and Surveying Practice Act and the rules promulgated under that authority) for the constructed Brine Retention Pond East, Brine Retention Pond West, and Brine Salt Storage Pond 4 to NMED within 30 days of completion. [Subsections A and C of 20.6.2.1202 NMAC, Subsection C of 20.6.2.3109 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
12.	Within 180 days following the effective date of this Discharge Permit **(by DATE)**, the permittee shall install fences around Stormwater Ponds 1, 2 and 3 to control access by the general public and animals. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates and shall be maintained. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
13.	Prior to discharging to Brine Salt Storage Pond 4, the permittee shall install fences around said impoundment to control access by the general public and animals. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates and shall be maintained. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
14.	Prior to discharging to Brine Salt Storage Pond 4, the permittee shall post signs indicating that the wastewater in the impoundment is not potable. Signs shall be posted at the facility

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Operational Actions with Implementation Deadlines**
	entrance and other areas where there is potential for public contact with wastewater. All signs shall be printed in English and Spanish and shall remain visible and legible. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
15.	Within two years following the effective date of this Discharge Permit (by **DATE**), the permittee shall measure the thickness of the settled solids in Evaporation Pond H-19 and report the results of the solids thickness measurements to NMED. The permittee shall measure the thickness of settled solids in accordance with the following process. a) Measure the water level via the staff gauge located in the impoundment. b) Lower a sounding line to the top of the salt deposit and measure the length of the line from the top of the salt deposit to the water level. c) Subtract the depth to the salt deposit from the water level. In the event the average solids accumulation exceeds one-third of the maximum liquid depth in the impoundment, the permittee shall propose a plan for the removal and disposal of the solids. The solids removal and disposal plan shall be submitted to NMED for approval within two years and two months following the effective date of this Discharge Permit (by **DATE**) and shall include the following information. a) A method for removal of the solids to a depth of less than six inches throughout the treatment impoundment in a manner that is protective of the impoundment liner. b) A description of how the solids will be contained, transported, and disposed of in accordance with all local, state, and federal regulations. c) A schedule for completion of the solids removal and disposal project. The permittee shall initiate implementation of the plan following approval by NMED. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Operating Conditions**
16.	The permittee shall construct, maintain and operate the leak detection, collection, and recovery systems (LDCRS) for Brine Salt Storage Pond 4 and Brine Retention Ponds East and West in a manner that will result in less than one foot of hydraulic head on the secondary liners in the impoundments. In the event that the permittee cannot maintain less than one foot of hydraulic head on the secondary liners for Brine Salt Storage Pond 4 and Brine Retention Ponds East and West, the permittee shall notify NMED within 48 hours of discovery and shall submit a

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Operating Conditions**
	corrective action plan to NMED which evaluates the primary liner leakage rate, proposes options for reducing the leakage if optimal, or otherwise proposes a means to maintain less than one foot of hydraulic head on the secondary liner. The plan shall be submitted to NMED for approval within 60 days after the discovery that the hydraulic head on the secondary liner has surpassed one foot. In the event that it becomes necessary to modify a LDRCS for an impoundment, the permittee shall submit a report describing the proposed revised methodology for NMED approval. [20.6.2.3107 NMAC]
17.	The permittee shall maintain fences around Evaporation Pond H-19 to control access by the general public and animals. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
18.	The permittee shall maintain signs indicating that the wastewater in Evaporation Pond H-19 is not potable. Signs shall be posted at the impoundment entrance and other areas where there is potential for public contact with wastewater. All signs shall be printed in English and Spanish and shall remain visible and legible. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]

Part D. Applicable to the Impoundments Containing Storm Water Runoff in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, 3, and 5) and to Salt Stockpiles (Salt Cells 1, 2, 3, and 5)

#	**Salt Storage Ponds and Salt Stockpiles - Operational Actions with Implementation Deadlines**
19.	Prior to discharging to Salt Storage Pond 5, the permittee shall submit written notification to NMED stating the date the discharge is to commence. [Subsection C of 20.6.2.3107 NMAC]
20.	Prior to discharging to Salt Storage Pond 5 and prior to utilizing Salt Cell 5, the permittee shall complete construction in accordance with the final construction plans and specifications submitted to NMED as part of the Discharge Permit application received on December 3, 2018. The permittee shall notify NMED prior to construction to allow NMED personnel to be onsite for inspection during construction.

#	**Salt Storage Ponds and Salt Stockpiles - Operational Actions with Implementation Deadlines**
	[Subsections A and C of 20.6.2.1202 NMAC, Subsection C of 20.6.2.3109 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
21.	The permittee shall submit record final drawings that bear the seal and signature of a licensed New Mexico professional engineer (pursuant to the New Mexico Engineering and Surveying Practice Act and the rules promulgated under that authority) for the constructed Salt Storage Pond 5 and Salt Cell 5 to NMED within 30 days of completion. [Subsections A and C of 20.6.2.1202 NMAC, Subsection C of 20.6.2.3109 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
22.	Within 90 days following the effective date of this Discharge Permit (by **DATE**), the permittee shall install fences around Salt Storage Ponds 1, 2 and 3 to control access by the general public and animals. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
23.	Within 120 days following the effective date of this Discharge Permit (by **DATE**), the permittee shall post signs indicating that the wastewater in Salt Storage Ponds 1, 2 and 3 is not potable. Signs shall be posted at the facility entrance and other areas where there is potential for public contact with wastewater. All signs shall be printed in English and Spanish and shall remain visible and legible. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
24.	Within two years following the effective date of this Discharge Permit (**by DATE**), the permittee shall measure the thickness of the settled solids in Salt Storage Pond 1, 2, and 3 and report the results of the solids thickness measurements to NMED. The permittee shall measure the thickness of settled solids in each Salt Storage Pond in accordance with the following procedure. a) Measure the water level via the staff gauge located in the impoundment. b) Lower a sounding line to the top of the salt deposit and measure the length of the line from the top of the salt deposit to the water level c) Subtract the depth to the salt deposit from the water level. In the event the average solids accumulation exceeds one-third of the maximum liquid depth in the impoundments, the permittee shall propose a plan for the removal and disposal of the solids. The solids removal and disposal plan shall be submitted to NMED for approval within two years and two months following the effective date of this Discharge Permit (**by DATE**) and shall include the following information. a) A method for removal of the solids to a depth of less than six inches throughout the treatment impoundment in a manner that is protective of the impoundment liner.

#	**Salt Storage Ponds and Salt Stockpiles - Operational Actions with Implementation Deadlines**
	b) A description of how the solids will be contained, transported, and disposed of in accordance with all local, state, and federal regulations. c) A schedule for completion of the solids removal and disposal project. The permittee shall initiate implementation of the plan following approval by NMED. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

#	**Salt Storage Ponds and Salt Stockpiles - Operating Conditions**
25.	The permittee shall maintain and operate the leak detection, collection, and removal systems (LDCRS) for Salt Storage Ponds 2, 3 and 5 in a manner that will result in less than one foot of hydraulic head on the secondary liners in the ponds. In the event that the permittee cannot maintain less than one foot of hydraulic head on the secondary liners for Salt Storage Ponds 2, 3 and 5, the permittee shall notify NMED within 48 hours of the discovery and shall submit a corrective action plan to NMED which evaluates the primary liner leakage rate, proposes options for reducing the leakage if optimal, or otherwise proposes a means to maintain less than one foot of hydraulic head on the secondary liner. The plan shall be submitted to NMED for approval within 60 days after the discovery that the hydraulic head on the secondary liner has surpassed one foot. In the event that it becomes necessary to modify a LDCRS for a pond, the permittee shall submit a report describing the proposed revised methodology for NMED approval. [20.6.2.3107 NMAC]
26.	The permittee shall conduct regular inspection of the earthen cover on Salt Cell 1 and the SPDV material pile. Inspections shall be conducted monthly and after storm events of 2 inches or greater in a 24-hour period to evaluate the integrity of the covers, including erosional impact and vegetation success. General observations and minor cover repairs shall be reported to NMED in the subsequent semi-annual report. In the event of significant erosion, such as the formation of gullies, rills, or areas where ponding is occurring, vegetative failure, or impending liner damage, the permittee shall provide a plan and schedule for repair to NMED for approval within 90 days of discovery. [20.6.2.3107 NMAC]

MONITORING AND REPORTING

Part A. Generally Applicable to Monitoring

#	Monitoring and Reporting Conditions
27.	The permittee shall conduct monitoring, reporting, and the other requirements listed below in accordance with the monitoring requirements of this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
28.	METHODOLOGY – Unless otherwise specified by this Discharge Permit, or approved in writing by NMED, the permittee shall use sampling and analytical techniques that conform with the references listed in Subsection B of 20.6.2.3107 NMAC. [Subsection B of 20.6.2.3107 NMAC]
29.	Semi-annual monitoring shall be performed during the following periods and reports submitted to NMED as follows: • January 1st through June 30th – **due by August 1st; and** • July 1st through December 31st – **due by February 1st.** [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
30.	The permittee shall submit its "Waste Isolation Pilot Plant Annual Site Environmental Report" to NMED with the next semi-annual monitoring report following its publication. [Subsection A of 20.6.2.3107 NMAC]

Part B. Applicable to the Facultative Lagoon System

#	Facultative Lagoon System - Monitoring and Reporting Conditions
31.	The permittee shall estimate the monthly volume of domestic wastewater discharged to the Facultative Lagoon System by obtaining readings on a monthly basis from a totalizing flow meter that measures total domestic water usage. The permittee shall submit the monthly meter readings and calculated monthly and average daily water usage volumes to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
32.	The permittee shall measure the total monthly volume and record the origin of all industrial wastewater discharged to Effluent Lagoons B and C. Discharge volumes to Effluent Lagoons B and C shall be calculated by a time/volume method or volumetric measurement of the transport container(s). The monthly discharge volumes and other volumetric

#	**Facultative Lagoon System - Monitoring and Reporting Conditions**
	calculations each month shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
33.	The permittee shall collect a composite wastewater sample on a semi-annual basis (once every six months) from Effluent Lagoon A. The composite sample shall consist of a minimum of six equal aliquots collected at equal distances around the entire perimeter of the evaporative impoundment and thoroughly mixed. The composite sample shall be analyzed for: • TKN; • NO_3-N; • TDS; • Cl; and • SO_4. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
34.	In the event that the permittee discharges any industrial wastewater to Effluent Lagoon B or C within a monitoring reporting period, the permittee shall collect a composite wastewater sample from the impoundment(s) that received the industrial wastewater discharge. The composite sample(s) shall consist of a minimum of six equal aliquots collected at equal distances around the entire perimeter of the evaporative impoundment(s) and thoroughly mixed. The composite sample(s) shall be analyzed for: • TDS; • Cl; and • SO_4. Sample(s) shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. NMED may require comprehensive laboratory analyses of the industrial wastewater discharged to Effluent Lagoons B and C prior to discharge when NMED determines that additional information is needed. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]

Part C. Applicable to the Evaporation Pond H-19, Brine Retention Pond East, Brine Retention Pond West, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Monitoring and Reporting Conditions**
35.	The permittee shall measure the total monthly volume and record the origin of all wastewater discharged to Evaporation Pond H-19. Discharge volumes to Evaporation Pond H-19 shall be calculated by a time/volume method or volumetric measurement of the transport container(s). The monthly discharge volumes and other volumetric calculations each month shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
36.	The permittee shall measure the total monthly volume of brine received by Brine Retention Ponds East and West. Discharge volumes to Brine Retention Ponds East and West shall be calculated by a time/volume method or volumetric measurement of the transport container(s). NMED may require comprehensive laboratory analyses of such wastewater prior to discharge when NMED determines that additional information is needed. The monthly discharge volumes and other volumetric calculations each month shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
37.	The permittee shall measure the total weekly volume of liquid pumped from the leak detection sumps for Brine Salt Storage Pond 4 and Brine Retention Ponds East and West. The total volume of liquid pumped shall be calculated by a totalizing flow meter. The weekly volumes shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
38.	The permittee shall collect a composite wastewater sample annually after a storm event of two inches or greater in a 24-hour period from Storm Water Ponds 1, 2, and 3. The composite sample shall consist of a minimum of six equal aliquots collected at equal distances around the perimeter of the evaporative impoundments and thoroughly mixed. The composite sample shall be analyzed for: • SO_4; • TDS; and • Cl. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports.

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Monitoring and Reporting Conditions**
	[Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
39.	The permittee shall collect a composite wastewater sample on a semi-annual basis (once every six months) from Evaporation Pond H-19 and from Brine Salt Storage Pond 4, once it becomes operational. The composite sample shall consist of a minimum of six equal aliquots collected at equal distances around the perimeter of the evaporative impoundment and thoroughly mixed. The composite sample shall be analyzed for: • SO_4; • TDS; and • Cl. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. NMED may require comprehensive laboratory analyses of the industrial wastewater discharged to Evaporation Pond H-19 prior to discharge when NMED determines that additional information is needed. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
40.	During the first year following the effective date of the Discharge Permit (**by DATE**), the permittee shall collect a grab sample (except as noted for pH) of wastewater from Evaporation Pond H-19 and analyze the sample for the following inorganic contaminants (dissolved fraction, except as noted): • aluminum (CAS 7429-90-5) • antimony (CAS 7440-36-0) • arsenic (CAS 7440-38-2) • barium CAS 7440-39-3 • beryllium (CAS 7440-41-7) • boron (CAS 7440-42-8) • cadmium (CAS 7440-43-9) • chromium (CAS 7440-47-3) • cobalt (CAS 7440-48-4) • copper (CAS 7440-50-8) • cyanide CAS 57-12-5) • fluoride (CAS 16984-48-8) • iron (CAS 7439-89-6) • lead (CAS 7439-92-1) • manganese (CAS 7439-96-5) • molybdenum (CAS 7439-98-7) • total mercury (nonfiltered) (CAS 7439-97-6) • pH (instantaneous) • nickel (CAS 7440-02-0) • radioactivity: combined radium-226 & radium-228 (CAS 15262-20-1) • selenium (CAS 7782-49-2) • silver (CAS 7440-224) • sulfate (CAS 14808-79-8) • thallium (CAS 7440-28-0) • uranium (CAS 7440-61-1) • zinc (CAS 7440-66-6)

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Monitoring and Reporting Conditions**
	Samples shall be properly collected, prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Reporting limits shall be less than the corresponding numerical groundwater standards identified in 20.6.2.3103 NMAC. A summary of detected concentrations compared with the corresponding groundwater standards, and a copy of the laboratory report, including the analytical results and QA/QC summary report, shall be submitted to NMED in the next monitoring report. [Subsection A of 20.6.2.3107 NMAC, Subsections C and H of 20.6.2.3109 NMAC]
41.	During the first year following the effective date of the Discharge Permit **(by DATE)**, the permittee shall collect a grab sample of wastewater from Evaporation Pond H-19 and analyze the non-filtered sample for the following organic contaminants: • atrazine (CAS 1912-24-9) • benzene (CAS 71-43-2) • benzo-a-pyrene (CAS 50-32-8) • carbon tetrachloride (CAS 56-23-5) • chloroform (CAS 67-66-3) • 1,2-dichlorobenzene (CAS 95-50-1) • 1,4-dichlorobenzene (CAS 106-46-7) • 1,1-dichloroethane (CAS 75-34-3) • 1,2-dichloroethane (EDC, CAS 107-06-2) • 1,1-dichloroethene (1,1-DCE, CAS 75-35-4) • cis-1,2-dichloroethene (CAS 156-59-2) • trans-1,2-dichloroethene (CAS 156-60-5) • 1,2-dichloropropane (PDC, CAS 78-87-5) • ethylbenzene (CAS 100-41-4) • ethylene dibromide (EDB, CAS 106-93-4) • methylene chloride (CAS 75-09-2) • <u>PAHs</u>: total naphthalene (CAS 91-20-3) plus monomethylnaphthalenes • Phenols • polychlorinated biphenyls (PCBs, CAS 1336-36-3) • pentachlorophenol (CAS 87-86-5) • toluene (CAS 108-88-3) • styrene (CAS 100-42-5) • 1,1,2,2-tetrachloroethane (CAS 79-34-5) • tetrachloroethene (PCE, CAS 127-18-4) • 1,2,4-trichlorobenzene (CAS 120-82-1) • 1,1,1-trichloroethane (1,1,1-TCA, CAS 71-55-6) • 1,1,2-trichloroethane (CAS 79-00-5) • trichloroethene (TCE, CAS 79-01-6) • vinyl chloride (CAS 75-01-4) • total xylenes (CAS 1330-20-7) Samples shall be properly collected, prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Reporting limits shall

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Monitoring and Reporting Conditions**
	be less than the corresponding numerical groundwater standards identified in 20.6.2.3103 NMAC. A summary of detected concentrations compared with the corresponding groundwater standards, and a copy of the laboratory report, including the analytical results and QA/QC summary report, shall be submitted to NMED in the next monitoring report. [Subsection A of 20.6.2.3107 NMAC, Subsections C and H of 20.6.2.3109 NMAC]
42.	The permittee shall measure the water depth in Storm Water Ponds 1, 2, and 3 and Brine Salt Storage Pond 4 monthly to the nearest tenth of a foot (0.1 ft). The approximate monthly volume of water shall be calculated and submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC and Subsection H of 20.6.2.3109 NMAC]
43.	The permittee shall collect at least one sample quarterly rotating between Brine Retention Pond East and Brine Retention Pond West of the liquid present and analyze the sample for every constituent listed in Subsection A of 20.6.2.3103 NMAC. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. After four consecutive quarterly sampling events, the permittee may request to reduce the sampling frequency and analyte list set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
44.	The permittee shall submit any analytical results from Brine Retention Ponds East and West submitted to the NMED Hazardous Waste Bureau to the Ground Water Quality Bureau. [Subsection A of 20.6.2.3107 NMAC]
45.	The permittee shall submit a copy of all records of solids (salt) removal from the Brine Retention Basins East and West and the associated disposal documentation to NMED in the associated semi-annual monitoring report. [Subsection A of 20.6.2.3107 NMAC]

Part D. Applicable to the Impoundments Containing Storm Water Runoff in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, 3, and 5) and to Salt Stockpiles (Salt Cells 1, 2, 3, and 5)

#	Salt Storage Ponds and Salt Stockpiles - Monitoring and Reporting Conditions
46.	The permittee shall collect a composite wastewater sample annually after a storm event of 2 inches or greater in a 24-hour period from Salt Storage Ponds 1, 2, 3, and 5. The composite sample shall consist of a minimum of six equal aliquots collected at equal distances around the perimeter of the evaporative impoundments and thoroughly mixed. The composite sample shall be analyzed for: • SO_4; • TDS; and • Cl. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
47.	The permittee shall measure the water depth monthly to the nearest tenth of a foot (0.1 ft) in the Salt Storage Ponds 1, 2, 3, and 5. The approximate volume of water shall be calculated and submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
48.	The permittee shall measure the total volume of liquid pumped from the leak detection sumps for Salt Storage Ponds 2 and 3 during every pumping event. The total volume of liquid pumped shall be calculated by a volumetric measurement of the container(s) filled. The volumetric calculations for each pumping event shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
49.	The permittee shall measure the weekly volume of liquid pumped from the leak detection sump for Salt Storage Pond 5. The total volume of liquid pumped shall be calculated by a totalizing flow meter. The weekly volumes shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]

Part E. Groundwater Monitoring and Reporting

#	Groundwater Monitoring Actions with Implementation Deadlines
50.	Within 60 days following the effective date of this Discharge Permit (**by DATE**), the permittee shall install the following new monitoring wells in accordance to the Monitoring Well Proposal submitted to NMED on February 18, 2020 and approved by NMED on February 20, 2020. • One monitoring well (PZ-17) located 20 to 50 feet hydrologically downgradient of the Facultative Lagoon System in the natural groundwater of the Dewey Lake Formation and intended to monitor the Facultative Lagoon System. • One monitoring well (PZ-19) located 20 to 50 feet hydrologically downgradient of Evaporation Pond H-19 in the natural groundwater of the Dewey Lake Formation and intended to monitor Evaporation Pond H-19. The well shall be completed in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Guidelines*, Revision 1.1, March 2011 or alternative methods submitted for approval. Construction and lithologic logs shall be submitted to NMED within 120 days of well completion in a cumulative well report. [Subsection A of 20.6.2.3107 NMAC]
51.	Prior to discharging to Brine Salt Storage Pond 4, Salt Storage Pond 5, and Brine Retentions Ponds East and West, the permittee shall install the following new monitoring wells in accordance to the Monitoring Well Proposal submitted to NMED on February 18, 2020 and approved by NMED on February 20, 2020. • One monitoring well (PZ-16) located 20 to 50 feet hydrologically downgradient of Brine Salt Storage Pond 4 in the shallow groundwater. • One monitoring well (PZ-18) located 20 to 50 feet hydrologically downgradient of Salt Storage Pond 5 in the shallow groundwater. The wells shall be completed in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Guidelines*, Revision 1.1, March 2011 or alternative methods submitted for approval. Construction and lithologic logs shall be submitted to NMED within 120 days of well completion in a cumulative well report. [Subsection A of 20.6.2.3107 NMAC]
52.	Following the installation of the monitoring wells required by Condition 50 and 51 of this Discharge Permit, the permittee shall sample groundwater in the wells and analyze the samples for temperature, pH, specific conductance (field measured); and for SO_4, TDS, and Cl.

#	Groundwater Monitoring Actions with Implementation Deadlines
	Groundwater sample collection, preservation, transport and analysis shall be performed according to the following procedure: a) The pump intake shall be placed in the following manner: fully submerged, within the screened interval, and at least two feet above the base of the screen. b) The drawdown will be minimized such that it will maintain depression of the water level, but not exceed one liter per minute. c) Allow field-measured temperature, pH, and specific conductance to stabilize prior to sample collection. The system is considered stable when pH is within ± 0.5 pH units, temperature, and specific conductance are within ± 10% of the last three consecutive readings. d) Obtain samples from the well for analysis. e) Properly prepare, preserve and transport samples. f) Analyze samples in accordance with the methods authorized in this Discharge Permit. A well completion report including the Office of the State Engineer permit, depth-to-most-shallow groundwater measurements, groundwater analytical results (including the laboratory QA/QC summary report), and a facility layout map showing the location and number of each well, shall be submitted to NMED within 120 days of the installation of the monitoring wells in a cumulative well report. [Subsection A of 20.6.2.3107 NMAC]
53.	Within 120 days following the effective date of this Discharge Permit **(by DATE)**, the permittee shall survey all newly constructed monitoring wells in the natural groundwater of the Dewey Lake Formation and in the shallow groundwater to a U.S. Geological Survey (USGS) or other permanent benchmark. Survey data shall include northing, easting and elevation to the nearest hundredth of a foot and shall be in accordance with the "Minimum Standards for Surveying in New Mexico" (12.8.2 NMAC). A survey elevation shall be established at the top-of-casing, with a permanent marking indicating the point of survey. The survey shall bear the seal and signature of a licensed New Mexico professional surveyor (pursuant to the New Mexico Engineering and Surveying Practice Act and the rules promulgated under that authority). Depth-to-most-shallow groundwater shall be measured to the nearest hundredth of a foot in all surveyed wells and referenced to mean sea level, and the data shall be used to develop a groundwater elevation contour map showing the location of all monitoring wells and the direction and gradient of groundwater flow at the facility. The data and groundwater elevation contour map shall be submitted to NMED within 120 days of the installation of the monitoring wells in a cumulative well report. [Subsection A of 20.6.2.3107 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]

#	**Groundwater Monitoring Actions with Implementation Deadlines**
54.	The permittee shall perform aquifer testing to determine the local hydraulic properties of the aquifer near the monitoring wells required by this Discharge Permit and that contain groundwater within 60 days of the complete installation of each new monitoring well. The purpose of the aquifer testing shall be to quantify the movement of groundwaters in the vicinity of each well or piezometer. Aquifer testing shall be performed in wells in both the shallow groundwater and in the natural groundwater in the Dewey Lake Formation where groundwater is present. Aquifer testing shall measure hydraulic conductivity, transmissivity, and storage coefficient and shall be performed utilizing procedures previously utilized at the facility so as to produce comparable results. The measured hydraulic properties for each monitoring well shall be submitted to NMED within 120 days of the installation of the monitoring wells in a cumulative well report. [Subsection A of 20.6.2.3107 NMAC]

#	**Groundwater Monitoring Conditions**
55.	The permittee shall measure the depth to groundwater to the nearest hundredth of a foot (0.01 ft) quarterly in the following piezometers/monitoring wells: • PZ-1, PZ-2, PZ-3, PZ-4, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13, PZ-14, PZ-15, PZ-16, PZ-17, PZ-18, and PZ-19 • C-2505, C-2506, C-2507, C-2811, and WQSP-6A Depth-to-groundwater measurements shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
56.	Within the first year of the permit term, the permittee shall perform sampling in the following piezometers/monitoring wells and analyze the samples for temperature, pH, specific conductance (field measured); Uranium and combined Radium-226 and Radium-228: • PZ-1, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13, PZ-14, PZ-15, PZ-16, PZ-17, PZ-18, and PZ-19 • C-2507, C-2811, and WQSP-6A Monitoring wells WQSP-6A, PZ-17, and PZ-19 are intended to monitor the natural groundwater of the Dewey Lake Formation, which occurs in the subsurface at the southern end of the facility. All other monitoring wells are intended to monitor the shallow

#	**Groundwater Monitoring Conditions**
	groundwater. Groundwater sample collection, preservation, transport and analysis shall be performed according to the following low-flow sampling procedure: a) The pump intake shall be placed in the following manner: fully submerged, within the screened interval, and at least two feet above the base of the screen. b) The drawdown will be minimized such that it will maintain depression of the water level, but not exceed one liter per minute. c) Allow field-measured temperature, pH, and specific conductance to stabilize prior to sample collection. The system is considered stable when pH is within ± 0.5 pH units, temperature, and specific conductance are within ± 10% of the last three consecutive readings. d) Obtain samples from the well for analysis. e) Properly prepare, preserve and transport samples. f) Analyze samples in accordance with the methods authorized in this Discharge Permit. Analytical results, including the laboratory QA/QC summary report, and a facility layout map showing the location and number of each well shall be submitted to NMED in the next semi-annual monitoring report following sampling. [Subsection A of 20.6.2.3107 NMAC]
57.	The permittee shall perform semi-annual groundwater sampling in the following piezometers/monitoring wells and analyze the samples for temperature, pH, specific conductance (field measured); and for SO_4, TDS, and Cl: • PZ-1, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13, PZ-14, PZ-15, PZ-16, PZ-17, PZ-18, and PZ-19 • C-2507, C-2811, and WQSP-6A Monitoring wells WQSP-6A, PZ-17, and PZ-19 are intended to monitor the natural groundwater of the Dewey Lake Formation, which occurs in the subsurface at the southern end of the facility. All other monitoring wells are intended to monitor the shallow groundwater. Groundwater sample collection, preservation, transport and analysis shall be performed according to the following low-flow sampling procedure: a) The pump intake shall be placed in the following manner: fully submerged, within the screened interval, and at least two feet above the base of the screen. b) The drawdown will be minimized such that it will maintain depression of the water level, but not exceed one liter per minute.

#	**Groundwater Monitoring Conditions**
	c) Allow field-measured temperature, pH, and specific conductance to stabilize prior to sample collection. The system is considered stable when pH is within ± 0.5 pH units, temperature, and specific conductance are within ± 10% of the last three consecutive readings. d) Obtain samples from the well for analysis. e) Properly prepare, preserve and transport samples. f) Analyze samples in accordance with the methods authorized in this Discharge Permit. Analytical results, including the laboratory QA/QC summary report, and a facility layout map showing the location and number of each well shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
58.	The permittee shall perform semi-annual groundwater sampling in the following monitoring wells and analyze the samples for TKN and NO_3-N. • PZ-17, located south of the Facultative Lagoon System and intended to be located hydrologically downgradient of the Facultative Lagoon System in the natural groundwater of the Dewey Lake Formation. Groundwater sample collection, preservation, transport and analysis shall be performed according to the following procedure, or as otherwise approved by NMED. Groundwater sample collection, preservation, transport and analysis shall be performed according to the following low-flow sampling procedure: a) The pump intake shall be placed in the following manner: fully submerged, within the screened interval, and at least two feet above the base of the screen. b) The drawdown will be minimized such that it will maintain depression of the water level, but not exceed one liter per minute. c) Allow field-measured temperature, pH, and specific conductance to stabilize prior to sample collection. The system is considered stable when pH is within ± 0.5 pH units, temperature, and specific conductance are within ± 10% of the last three consecutive readings. d) Obtain samples from the well for analysis. e) Properly prepare, preserve and transport samples. f) Analyze samples in accordance with the methods authorized in this Discharge Permit. Analytical results, including the laboratory QA/QC summary report, and a facility layout map showing the location and number of each well shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]

#	Groundwater Monitoring Conditions
59.	The permittee shall develop a groundwater elevation contour map for the shallow groundwater and for the natural groundwater in the Dewey Lake Formation on a semi-annual basis. The permittee shall use the top of casing elevation data from the monitoring well surveys and quarterly depth-to-groundwater measurements, referenced to mean sea level, obtained from the groundwater monitoring wells required by this Discharge Permit. The groundwater elevation contour maps shall depict the groundwater flow direction based on the groundwater elevation contours. Groundwater elevations between monitoring well locations shall be estimated using common interpolation methods. A contour interval appropriate to the data shall be used, but the interval shall, in no case, be greater than two feet. Groundwater elevation contour maps shall depict the groundwater flow direction, using arrows, based on the orientation of the groundwater elevation contours, and the location and identification of each monitoring well and contaminant source, e.g., surface impoundment. The groundwater elevation contour maps shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
60.	A single table in a paper and electronic format (i.e., EXCEL spreadsheet) of water level measurements and water quality data with only those constituents analyzed and water levels measured during a single event shown in columns shall be submitted to NMED in the semi-annual monitoring reports. The table shall include the following tabulated field measurements: temperature, pH, and electrical conductivity corrected to 25 degrees Celsius. The monitoring sites shall be shown in rows on the table, and the second column shall contain the date of the sampling event. Values exceeding standards shall be bolded. Any constituent not analyzed for at a particular site shall be shown as "NA", any site not sampled shall be shown as "NS" with an associated reason, and any site not measured for water levels shall be shown as "NM" with an associated reason. [Subsection A of 20.6.2.3107 NMAC]
61.	A single table that includes all available groundwater data to date shall be submitted annually to NMED in the semi-annual monitoring reports due February 1st. For each monitoring well, the name of the well shall be entered in the far-left column in a row by itself. Sampling events, beginning with the earliest event first, shall be entered in subsequent rows with the sampling date in the second column and the corresponding analytical data in columns further to the right. Each new sampling event shall be added as an additional row to the existing spreadsheet with the corresponding date of the sampling event noted in the second column next to the monitoring well name. [Subsection A of 20.6.2.3107 NMAC]

ADDITIONAL STUDIES REQUIRED

#	Terms and Conditions
62.	The permittee's groundwater monitoring data and reports document that the shallow groundwater beneath the site is contaminated with TDS, chloride, and sulfate above the standards of 20.6.2.3103 NMAC. This information indicates that the contaminated groundwater is primarily anthropogenic, having resulted from the leaking of impoundments at the facility, and has spread laterally since the installation of impoundment liners. Within six months following the effective date of this Discharge Permit **(by DATE)**, the permittee shall submit for NMED approval a site investigation workplan and implementation schedule. The purpose of the site investigation shall be to evaluate the efficacy of existing source controls, to determine the current lateral and vertical extent of the shallow contaminated groundwater, and to identify any potential impacts to the downgradient and naturally occurring groundwater in the Dewey Lake Formation. The site investigation may build upon the previous investigations completed by Daniel B. Stephens and Associates in 2003 and 2008. The permittee shall implement the site investigation upon NMED approval of the workplan and shall submit a completion report no later than two years following the effective date of this Discharge Permit **(by DATE)**. NMED may require the permittee to take corrective actions pursuant to 20.6.2.1203 NMAC or to abate water pollution consistent with the requirements and provisions of Section 20.6.2.4101, Section 20.6.2.4103, Subsections C and E of 20.6.2.4106, Section 20.6.2.4107, Section 20.6.2.4108 and Section 20.6.2.4112 NMAC. [20.6.2.3107 NMAC, 20.6.2.4103 NMAC]

CONTINGENCY PLAN

#	Terms and Conditions
63.	In the event that groundwater monitoring indicates that a groundwater quality standard identified in Section 20.6.2.3103 NMAC is newly exceeded, the permittee shall collect a confirmatory sample from the monitoring well within 15 days of receipt of the initial sampling results to confirm the initial sampling results. Within 90 days of confirmation of groundwater contamination, the permittee shall submit to NMED a Corrective Action Plan that proposes, at a minimum, source control measures and an implementation schedule. The Plan shall be enacted as approved by NMED. Once invoked (whether during the term of this Discharge Permit, or after the term of this Discharge Permit and prior to the completion of the Discharge Permit closure plan requirements), this condition shall apply until the permittee has fulfilled the requirements

#	Terms and Conditions
	of this condition and groundwater monitoring confirms for a minimum of eight (8) consecutive quarterly samples that the standards of Section 20.6.2.3103 NMAC are not exceeded in groundwater. If the groundwater standard continues to be violated 180 days after the confirmation of groundwater contamination, the permittee may be required to abate water pollution consistent with the requirements and provisions of Section 20.6.2.4101, Section 20.6.2.4103, Subsections C and E of 20.6.2.4106, Section 20.6.2.4107, Section 20.6.2.4108 and Section 20.6.2.4112 NMAC. [Subsection A of 20.6.2.3107 NMAC, Subsection E of 20.6.2.3109 NMAC]
64.	In the event that information available to NMED indicates that a groundwater monitoring well or piezometer is not constructed in a manner consistent with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Guidelines*, Revision 1.1, March 2011; contains insufficient water to effectively monitor groundwater quality; or is not completed in a manner that is protective of groundwater quality, the permittee shall install a replacement well(s) within 120 days following notification from NMED. The permittee shall survey the replacement monitoring well(s)/piezometer(s) within 150 days following notification from NMED. Replacement well locations shall be approved by NMED prior to installation and completed in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011. The permittee shall submit construction and lithologic logs, survey data and a groundwater elevation contour map to NMED within 60 days following well completion. Upon completion of the replacement monitoring well, the monitoring well requiring replacement shall be properly plugged and abandoned. Well plugging, abandonment and documentation of the abandonment procedures shall be completed in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011, and all applicable local, state, and federal regulations. The well abandonment documentation shall be submitted to NMED within 60 days of completion of well plugging activities. [Subsection A of 20.6.2.3107 NMAC]
65.	In the event that groundwater flow information obtained pursuant to this Discharge Permit indicates that a monitoring well/piezometer is not located hydrologically downgradient of the discharge location it is intended to monitor, the permittee shall install a replacement well within 180 days following notification from NMED. The permittee shall survey the replacement monitoring well within 210 days following notification from NMED.

#	Terms and Conditions
	Replacement well locations shall be approved by NMED prior to installation and completed in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011. The permittee shall submit construction and lithologic logs, survey data and a groundwater elevation contour map within 30 days following well completion. [Subsection A of 20.6.2.3107 NMAC]
66.	In the event that the site investigation required by this Discharge Permit or an inspection reveals significant damage likely to affect the structural integrity of a lined impoundment or its ability to contain contaminants, the permittee shall propose to repair or the replacement of the impoundment liner by submitting a Corrective Action Plan to NMED for approval. The Plan shall be submitted to NMED within 30 days after discovery by the permittee or following notification from NMED that significant liner damage is evident. The Corrective Action Plan shall include a schedule for completion of corrective actions and the permittee shall initiate implementation of the Plan following approval by NMED. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
67.	In the event that the required freeboard cannot be preserved in an impoundment, the permittee shall take actions authorized by this Discharge Permit and all applicable local, state, and federal regulations to restore the required freeboard. In the event that the required freeboard cannot be restored within a period of 72 hours following discovery, the permittee shall propose actions to be immediately implemented to restore of the required freeboard by submitting a short-term Corrective Action Plan to NMED for approval. Examples of short-term corrective actions include the pumping and hauling of excess wastewater from the impoundment or reducing the volume of wastewater discharged to the impoundment. The Plan shall include a schedule for completion of corrective actions and shall be submitted within 15 days following the date when the freeboard deficiency was initially discovered. The permittee shall initiate implementation of the Plan following approval by NMED. In the event that the short-term corrective actions failed to restore the required freeboard, the permittee shall propose permanent corrective actions in a long-term Corrective Action Plan submitted to NMED within 90 days following failure of the short-term Corrective Action Plan. Examples include the installation of an additional storage impoundment, or a significant/permanent reduction in the volume of wastewater discharged to the impoundment. The Plan shall include a schedule for completion of corrective actions and implementation of the Plan shall be initiated following approval by NMED. [Subsection A of 20.6.2.3107 NMAC]

#	**Terms and Conditions**
68.	In the event that a release (commonly known as a "spill") occurs that is not authorized under this Discharge Permit, the permittee shall take measures to mitigate damage from the unauthorized discharge and initiate the notifications and corrective actions required in Section 20.6.2.1203 NMAC and summarized below. Within <u>24 hours</u> following discovery of the unauthorized discharge, the permittee shall verbally notify NMED and provide the following information. a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility. b) The name and address of the facility. c) The date, time, location, and duration of the unauthorized discharge. d) The source and cause of unauthorized discharge. e) A description of the unauthorized discharge, including its estimated chemical composition. f) The estimated volume of the unauthorized discharge. g) Any actions taken to mitigate immediate damage from the unauthorized discharge. Within <u>one week</u> following discovery of the unauthorized discharge, the permittee shall submit written notification to NMED with the information listed above and any pertinent updates. Within <u>15 days</u> following discovery of the unauthorized discharge, the permittee shall submit a corrective action report/plan to NMED describing any corrective actions taken and/or to be taken relative to the unauthorized discharge that includes the following information. a) A description of proposed actions to mitigate damage from the unauthorized discharge. b) A description of proposed actions to prevent future unauthorized discharges of this nature. c) A schedule for completion of proposed actions. In the event that the unauthorized discharge causes or may with reasonable probability cause water pollution in excess of the standards and requirements of Section 20.6.2.4103 NMAC, and the water pollution will not be abated within 180 days after notice is required to be given pursuant to Paragraph (1) of Subsection A of 20.6.2.1203 NMAC, the permittee may be required to abate water pollution pursuant to Sections 20.6.2.4000 through 20.6.2.4115 NMAC. Nothing in this condition shall be construed as relieving the permittee of the obligation to comply with all requirements of Section 20.6.2.1203 NMAC. [20.6.2.1203 NMAC]

#	Terms and Conditions
69.	In the event that NMED or the permittee identifies any failures of the discharge plan or this Discharge Permit not specifically noted herein, NMED may require the permittee to submit a Corrective Action Plan and a schedule for completion of corrective actions to address the failure(s). Additionally, NMED may require a Discharge Permit modification to achieve compliance with 20.6.2 NMAC. [Subsection A of 20.6.2.3107 NMAC, Subsection E of 20.6.2.3109 NMAC]

CLOSURE PLAN

Part A. Generally Applicable to All Discharges

#	Terms and Conditions
70.	The permittee shall close the facility covered under this Discharge Permit, either wholly or in part, in accordance with the closure plan in the March 10, 2005 Discharge Permit application. Where that closure plan references the closure plans in the WIPP Hazardous Waste Facility Permit and the WIPP Land Management Plan, the permittee shall use the most up-to-date version of the plans. [Subsection A of 20.6.2.3107 NMAC]
71.	For the purpose of post-closure monitoring, after closure of all authorized units is complete the permittee shall continue groundwater monitoring until the monitoring confirms for a minimum of eight (8) consecutive quarterly groundwater sampling events that the standards of Section 20.6.2.3103 NMAC are not exceeded. Total dissolved solids and chloride shall meet pre-discharge conditions. If during post-closure monitoring results show that a groundwater quality standard in Section 20.6.2.3103 NMAC is exceeded, the permittee shall implement the contingency plan required by this Discharge Permit. Following notification from NMED that post-closure monitoring may cease, the permittee shall plug and abandon all monitoring wells and piezometers in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Guidelines*, Revision 1.1, March 2011. [Subsection A of 20.6.2.3107 NMAC]

Part B. Applicable to the Facultative Lagoon System

#	**Terms and Conditions**
72.	In the event the Facultative Lagoon System is proposed to be permanently closed, the permittee shall perform the following closure measures: Within <u>60 days</u> of ceasing to discharge to the Facultative Lagoon System impoundments, the line leading to the impoundments shall be plugged so that a discharge can no longer occur. Within <u>60 days</u> of ceasing to discharge to the Facultative Lagoon System impoundments, wastewater shall be evaporated or removed from the impoundments and any other wastewater system components and it shall be disposed of in accordance with all local, state, and federal regulations. Within <u>90 days</u> of ceasing to discharge to the Facultative Lagoon System impoundments, the permittee shall submit a sludge removal and disposal plan to NMED for approval. The permittee shall initiate implementation of the plan within 30 days following approval by NMED. The sludge removal and disposal plan shall include the following: a) The estimated volume and dry weight of sludge to be removed and disposed, including measurements and calculations. b) Analytical results for samples of the sludge taken from the impoundment for TKN, NO_3-N, percent total solids, hazardous constituents, and any other parameters tested (reported in mg/kg, dry weight basis). c) The method(s) of sludge *removal* from the impoundments. d) The method(s) of *disposal* for all of the sludge removed from the impoundments. The method(s) shall comply with all local, state and federal regulations, including 40 CFR Part 503. *Note: A proposal that includes the surface disposal of sludge may be subject to Ground Water Discharge Permitting requirements pursuant to 20.6.2.3104 NMAC that are separate from the requirements of this Discharge Permit.* e) A schedule for completion of sludge removal and disposal not to exceed two years from the date discharge to the impoundments ceased. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: a) Remove all lines leading to and from the Facultative Lagoon System impoundments, or permanently plug and abandon them in place. b) Remove or demolish any other wastewater system components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liners. d) Fill the impoundments with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding.

#	Terms and Conditions
	[Subsection A of 20.6.2.3107 NMAC, 40 CFR Part 503]

Part C. Applicable to the Evaporation Pond H-19, Brine Retention Pond East, Brine Retention Pond West, Storm Water Ponds 1, 2, and 3, and Brine Salt Storage Pond 4

#	Terms and Conditions
73.	Upon cessation of operation, the permittee shall close Evaporation Pond H-19 and Storm Water Ponds 1, 2, and 3. Remaining liquids in Storm Water Ponds shall be removed and/or evaporated, and remaining liquids in Evaporation Pond H-19 shall be evaporated. All sludge shall be sampled to determine if it contains hazardous constituents and then managed and/or disposed of in accordance with applicable regulations. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: a) Remove or plug all piping and other ancillary components b) Remove or demolish any other components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liners. d) Fill the impoundments with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [Subsection A of 20.6.2.3107 NMAC]

Part D. Applicable to the Impoundments Containing Storm Water Runoff in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, 3, and 5) and to Salt Stockpiles (Salt Cells 1, 2, 3, and 5)

#	Terms and Conditions
74.	Upon cessation of operation, all mined salt at the facility shall be removed from the site. The permittee is permitted to use the mined salt as backfill in shafts and as interior fill material in berms and permanent markers after closure. All mined salt remaining after backfilling and after construction of surface structures shall be removed from the site. The permittee shall submit a plan and schedule for salt removal to NMED for approval within 120 days prior to the facility closure. The WIPP Land Management Plan reflects the Land Withdrawal Act's requirements for disposition of the salt. The WIPP's Hazardous Waste Facility Permit also addresses closure activities that include closure of the salt storage areas in accordance with the provisions of the WIPP Land Management Plan. The salt storage area shall be reclaimed in the manner described in these documents.

	[Subsection A of 20.6.2.3107 NMAC]
75.	Upon cessation of operation, the permittee shall close Salt Storage Ponds 1, 2, 3, and 5. Remaining liquids in each impoundment shall be evaporated. All sludge shall be sampled to determine if it contains hazardous constituents and then managed and/or disposed of in accordance with applicable regulations. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: a) Remove or plug all piping and other ancillary components. b) Remove or demolish any other components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liners. d) Fill the impoundments with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [Subsection A of 20.6.2.3107 NMAC]

GENERAL TERMS AND CONDITIONS

#	Terms and Conditions
76.	RECORD KEEPING - The permittee shall maintain a written record of: • information and data used to complete the application for this Discharge Permit; • any releases (commonly known as "spills") not authorized under this Discharge Permit and reports submitted pursuant to 20.6.2.1203 NMAC; • the operation, maintenance, and repair of all facilities/equipment used to treat, store or dispose of wastewater; • facility record drawings (plans and specifications) showing the actual construction of the facility and bear the seal and signature of a licensed New Mexico professional engineer; • copies of monitoring reports completed and/or submitted to NMED pursuant to this Discharge Permit; • the volume of wastewater or other wastes discharged pursuant to this Discharge Permit; • groundwater quality and wastewater quality data collected pursuant to this Discharge Permit; • copies of construction records (well log) for all groundwater monitoring wells required to be sampled pursuant to this Discharge Permit; • the maintenance, repair, replacement or calibration of any monitoring equipment or flow measurement devices required by this Discharge Permit; and • data and information related to field measurements, sampling, and analysis conducted pursuant to this Discharge Permit, including:

#	**Terms and Conditions**
	- the dates, location and times of sampling or field measurements; - the name and job title of the individuals who performed each sample collection or field measurement; - the sample analysis date of each sample - the name and address of the laboratory, and the name of the signatory authority for the laboratory analysis; - the analytical technique or method used to analyze each sample or collect each field measurement; - the results of each analysis or field measurement, including raw data; - the results of any split, spiked, duplicate or repeat sample; and - a copy of the laboratory analysis chain-of-custody as well as a description of the quality assurance and quality control procedures used. The written record shall be maintained by the permittee at a location accessible during a facility inspection by NMED for a period of at least five years from the date of application, report, collection or measurement and shall be made available to the department upon request. [Subsections A and D of 20.6.2.3107 NMAC]
77.	INSPECTION and ENTRY – The permittee shall allow inspection by NMED of the facility and its operations that are subject to this Discharge Permit and the WQCC regulations. NMED may upon presentation of proper credentials, enter at reasonable times upon or through any premises in which a water contaminant source is located or in which are located any records required to be maintained by regulations of the federal government or the WQCC. The permittee shall allow NMED to have access to and reproduce for their use any copy of the records, and to perform assessments, sampling or monitoring during an inspection for the purpose of evaluating compliance with this Discharge Permit and the WQCC regulations. Nothing in this Discharge Permit shall be construed as limiting in any way the inspection and entry authority of NMED under the WQA, the WQCC Regulations, or any other local, state or federal regulations. [Subsection D of 20.6.2.3107 NMAC, NMSA 1978, §§ 74-6-9.B and 74-6-9.E]
78.	DUTY to PROVIDE INFORMATION - The permittee shall, upon NMED's request, allow for NMED's inspection/duplication of records required by this Discharge Permit and/or furnish to NMED copies of such records. [Subsection D of 20.6.2.3107 NMAC]

#	**Terms and Conditions**
79.	MODIFICATIONS and/or AMENDMENTS – In the event the permittee proposes a change to the facility or the facility's discharge that would result in a change in the volume discharged; the location of the discharge; or in the amount or character of water contaminants received, treated or discharged by the facility, the permittee shall notify NMED prior to implementing such changes. The permittee shall obtain approval (which may require modification of this Discharge Permit) by NMED prior to implementing such changes. [Subsection C of 20.6.2.3107 NMAC, Subsections E and G of 20.6.2.3109 NMAC]
80.	PLANS and SPECIFICATIONS – In the event the permittee is proposing to construct a wastewater system or change a process unit of an existing system such that the quantity or quality of the discharge will change substantially from that authorized by this Discharge Permit, the permittee shall submit construction plans and specifications to NMED for the proposed system or process unit prior to the commencement of construction. In the event the permittee implements changes to the wastewater system authorized by this Discharge Permit that result in only a minor effect on the character of the discharge, the permittee shall report such changes (including the submission of record drawings, where applicable) as of January 1 and June 30 of each year to NMED. [Subsections A and C of 20.6.2.1202 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
81.	CIVIL PENALTIES - Any violation of the requirements and conditions of this Discharge Permit, including any failure to allow NMED staff to enter and inspect records or facilities, or any refusal or failure to provide NMED with records or information, may subject the permittee to a civil enforcement action. Pursuant to WQA 74-6-10(A) and (B), such action may include a compliance order requiring compliance immediately or in a specified time, assessing a civil penalty, modifying or terminating the Discharge Permit, or any combination of the foregoing; or an action in district court seeking injunctive relief, civil penalties, or both. Pursuant to WQA 74-6-10(C) and 74-6-10.1, civil penalties of up to $15,000 per day of noncompliance may be assessed for each violation of the WQA 74-6-5, the WQCC Regulations, or this Discharge Permit, and civil penalties of up to $10,000 per day of noncompliance may be assessed for each violation of any other provision of the WQA, or any regulation, standard, or order adopted pursuant to such other provision. In any action to enforce this Discharge Permit, the permittee waives any objection to the admissibility as evidence of any data generated pursuant to this Discharge Permit. [20.6.2.1220 NMAC, NMSA 1978, §§ 74-6-10 and 74-6-10.1]
82.	CRIMINAL PENALTIES – No person shall: • make any false material statement, representation, certification or omission of material fact in an application, record, report, plan or other document filed, submitted or required to be maintained under the WQA;

#	**Terms and Conditions**
	• falsify, tamper with or render inaccurate any monitoring device, method or record required to be maintained under the WQA; or • fail to monitor, sample or report as required by a permit issued pursuant to a state or federal law or regulation. Any person who knowingly violates or knowingly causes or allows another person to violate the requirements of this condition is guilty of a fourth-degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who is convicted of a second or subsequent violation of the requirements of this condition is guilty of a third-degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who knowingly violates the requirements of this condition or knowingly causes another person to violate the requirements of this condition and thereby causes a substantial adverse environmental impact is guilty of a third-degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who knowingly violates the requirements of this condition and knows at the time of the violation that he is creating a substantial danger of death or serious bodily injury to any other person is guilty of a second-degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. [20.6.2.1220 NMAC, NMSA 1978, §§ 74-6-10.2.A through 74-6-10.2.F]
83.	COMPLIANCE with OTHER LAWS - Nothing in this Discharge Permit shall be construed in any way as relieving the permittee of the obligation to comply with any other applicable federal, state, and/or local laws, regulations, zoning requirements, nuisance ordinances, permits or orders. [NMSA 1978, § 74-6-5.L]
84.	RIGHT to APPEAL - The permittee may file a petition for review before the WQCC on this Discharge Permit. Such petition shall be in writing to the WQCC within thirty days of the receipt of postal notice of this Discharge Permit and shall include a statement of the issues to be raised and the relief sought. Unless a timely petition for review is made, the decision of NMED shall be final and not subject to judicial review. [20.6.2.3112 NMAC, NMSA 1978, § 74-6-5.O]
85.	TRANSFER of DISCHARGE PERMIT - Prior to the transfer of any ownership, control, or possession of this facility or any portion thereof, the permittee shall: • notify the proposed transferee in writing of the existence of this Discharge Permit; • include a copy of this Discharge Permit with the notice; and • deliver or send by certified mail to NMED a copy of the notification and proof that such notification has been received by the proposed transferee.

#	Terms and Conditions
	Until both ownership and possession of the facility have been transferred to the transferee, the permittee shall continue to be responsible for any discharge from the facility. [20.6.2.3111 NMAC]
86.	PERMIT FEES - Payment of permit fees is due at the time of Discharge Permit approval. Permit fees shall be paid in a single payment or shall be paid in equal installments on a yearly basis over the term of the Discharge Permit. Single payments shall be remitted to NMED no later than 30 days following the effective date of the Discharge Permit. Initial installment payments shall be remitted to NMED no later than 30 days following the effective date of the Discharge Permit; subsequent installment payments shall be remitted to NMED no later than the anniversary of the effective date of the Discharge Permit. Permit fees are associated with issuance of this Discharge Permit. Nothing in this Discharge Permit shall be construed as relieving the permittee of the obligation to pay all permit fees assessed by NMED. A permittee that ceases discharging or does not commence discharging from the facility during the term of the Discharge Permit shall pay all permit fees assessed by NMED. An approved Discharge Permit shall be suspended or terminated if the facility fails to remit an installment payment by its due date. [Subsection F of 20.6.2.3114 NMAC, NMSA 1978, § 74-6-5.K]

New Mexico Environment Department Ground Water Quality Bureau
Discharge Permit Summary

Facility Information

Facility Name	Waste Isolation Pilot Plant (WIPP)
Discharge Permit Number	DP-831
Legally Responsible Party	Kirk D. Lachman, Acting Manager U.S. Department of Energy, Carlsbad Field Office P.O. Box 3090 Carlsbad, NM 88221 (575) 234-7300

Treatment, Disposal and Site Information

Primary Waste Type	Domestic and Industrial
Facility Type	Federal Agency - U.S. Department of Energy

Evaporative Impoundment Locations

Domestic Wastewater

Type	Designation	Description & Comments
Settling Impoundment	Settling Lagoon 1	Primary treatment; 60-mil HDPE synthetically lined; permitted one foot of freeboard; capacity of 963,214 gallons.
Settling Impoundment	Settling Lagoon 2	Primary treatment; 60-mil HDPE synthetically lined; permitted one foot of freeboard; capacity of 963,214 gallons.
Polishing Impoundment	Polishing Lagoon 1	Passive secondary treatment; 60-mil HDPE synthetically lined; permitted one foot of freeboard; capacity of 414,901 gallons.
Polishing Impoundment	Polishing Lagoon 2	Passive secondary treatment; 60-mil HDPE synthetically lined; permitted one foot of freeboard; capacity of 141,901 gallons.
Evaporation Impoundment	Effluent Lagoon A	Effluent storage; 30-mil LLDP synthetically lined; disposal by evaporation; permitted one foot of freeboard; capacity of 566,610 gallons.
Evaporation Impoundment	Effluent Lagoon B	Effluent storage; 30-mil LLDP synthetically lined; disposal by evaporation; permitted discharges are domestic waste, brine, purge waters, and miscellaneous industrial non-hazardous wastewater; permitted one foot of freeboard; capacity of 846,257 gallons.
Evaporation Impoundment	Effluent Lagoon C	Effluent Storage; 30-mil HDPE synthetically lined; disposal by evaporation; permitted discharges are domestic waste, brine, purge waters, and miscellaneous industrial non-hazardous wastewater; permitted one foot of freeboard; capacity of 846,257 gallons.

Storm Water Control

Type	Designation	Description & Comments
Storm Water Impoundment	Storm Water Pond 1	Constructed using a 60-mil HDPE synthetic liner; receives clean non-contact storm water from paved areas, roofs, air conditioner condensate, and water from domestic water lines; disposal by evaporation; permitted one foot of freeboard; capacity of 626,076 gallons.
Storm Water Impoundment	Storm Water Pond 2	Constructed using a 60-mil HDPE synthetic liner; receives clean non-contact storm after from the facilities paved areas, roofs, air conditioner condensate, and draining domestic water lines; disposal by evaporation; permitted one foot of freeboard; capacity of 2,268,330 gallons.
Storm Water Impoundment	Storm Water Pond 3	Constructed using a 60-mil HDPE synthetic liner; receives clean non-contact storm after from the facilities paved areas, roofs, air conditioner condensate, and draining domestic water lines; disposal by evaporation; permitted one foot of freeboard; capacity of 7,211,967 gallons.

Non-Domestic Wastewater

Type	Designation	Description & Comments
Evaporation Impoundment	Evaporation Pond H-19	Constructed using a 36-mil Hypalon synthetic liner; permitted discharges are brine, purge waters, and miscellaneous industrial non-hazardous wastewater; disposal by evaporation; permitted one foot of freeboard; capacity of 346,085 gallons.
Evaporation Impoundment	Salt Storage Pond 1	Constructed using a 60-mil HDPE synthetic liner; disposal by evaporation; permitted one foot of freeboard; capacity of 3,301634 gallons.
Evaporation Impoundment	Salt Storage Pond 2/3	Constructed using 60-mil HDPE liner, 200-mil geonet drainage layer, and a second 60-mil HDPE liner with a leak detection system; disposal by evaporation; permitted one foot of freeboard; capacity of 21,737,254 gallons
Evaporation Impoundment	Salt Storage Pond 5	To be constructed, 60-mil HDPE liner, 200-mil geonet drainage layer, and a second 60-mil HDPE liner with a leak detection system; disposal by evaporation; permitted two feet of freeboard; capacity of 6,355,404 gallons.

Evaporation Impoundment	Brine Salt Storage Pond 4	To be constructed, 60-mil HDPE geomembrane double liner with a leak detection system; permitted discharges are clean non-contact stormwater from the facilities paved areas, roofs, air conditioner condensate, draining domestic water lines, and brine from Brine Retention Ponds East and West; Disposal by evaporation; permitted one foot of freeboard; capacity of 8,668,722 gallons.
Retention Basin	Brine Retention Pond East	To be constructed, 60-mil HDPE geomembrane double liner with a leak detection system and an epoxy coated concrete bottom; disposal by evaporation; permitted two feet of freeboard; capacity of 46,094 gallons.
Retention Basin	Brine Retention Pond West	To be constructed, 60-mil HDPE geomembrane double liner with a leak detection system and an epoxy coated concrete bottom; disposal by evaporation; permitted two feet of freeboard; capacity of 46,094 gallons.
Holding tank	Brine Holding Tank	To be constructed, 3,000-gallon fiberglass reinforced plastic holding tank for brine prior to being discharged to either Brine Retention Pond East or West.

Salt Storage Locations

Type	Designation	Description & Comments
Salt Pile	Salt Cell 1	Inactive; approximately 18.8 acres; graded to 2% slope covered with sand and 60 mil HDPE liner and with two feet of native soil; seeded; run-off collects in Salt Storage Pond 1.
Salt Pile	Salt Cell 2	Active; 6.2 acres; run-off area of 326,350 sq. ft.; constructed using of six-inch prepared subgrade, 60-mil HDPE liner, 200-mil drainage layer, eight oz. geotextile fabric covered with two feet of native soil; runoff collects in Salt Storage Ponds 2 and/or 3.
Salt Pile	Salt Cell 3	Active; 5.2 acres; run-off area of 272,850 sq. ft.; constructed using of six-inch prepared subgrade, 60-mil HDPE liner, 200-mil drainage layer, eight oz. geotextile fabric covered with two feet of native soil; runoff collects in Salt Storage Ponds 2 and/or 3.
Salt Pile	Salt Cell 5	To be constructed; 5.09 acres; run-off area of 221,841 sq. ft.; 60-mil HDPE geomembrane liner with a protective native soil layer; runoff collects in Salt Storage Pond 5.
Salt Pile	Site and Preliminary Design Validation Pile	Closed in 2000; covered with a geosynthetic liner, six inches of bedding material, and three feet of soil; Seeded.

Flow Metering Locations

Type	Designation	Description & Comments
Totalizing Flow Meter	Ultrasonic Flow Meter	Located at the facility Pump House – water supply; estimates domestic wastewater discharged to the facultative sewage impoundment system.
Primary Measurement Device		To be installed. Measures brine discharged to Brine Retention Ponds East and West from the New Filter Building.
Totalizing Flow Meters		To be installed. Four separate meters to measure the brine pumped from the leak detection sumps for Brine Salt Storage Pond 4, Brine Retention Ponds East and West, and Salt Storage Pond 5.

Ground Water Monitoring Locations

Type	Designation	Description & Comments
Monitoring Wells	C-2505, C-2506, PZ-2, PZ-3, PZ-4	Quarterly depth to water measurement; all wells drilled in the shallow groundwater.
Monitoring Wells	C-2507, C-2811, PZ-1, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13, PZ-14, PZ-15, PZ-16, PZ-18	Quarterly depth to water measurement; semi-annual collection of field parameters for temperature, pH, and specific conductance; semi-annual monitoring for SO4, Cl, TDS, Uranium, and combined Radium-226 and Radium-228; all wells drilled in the shallow groundwater.
Monitoring Well	PZ-17	Quarterly depth to water measurement; semi-annual collection of field parameters for temperature, pH, and specific conductance; semi-annual monitoring for SO_4, Cl, TDS, TKN and NO_3-N; well drilled in the shallowest, water bearing zone of the Dewey Lake Formation and intended to monitor the Facultative Lagoon System.
Monitoring Wells	PZ-19 and WQSP-6A	Quarterly depth to water measurement; semi-annual collection of field parameters for temperature, pH, and specific conductance; semi-annual monitoring for SO4, Cl, and TDS; both wells drilled in the shallowest, water bearing zone of the Dewey Lake Formation and PZ-17 is intended to monitor Evaporation Pond H-19.

Depth-to-Ground Water	100 feet
Total Dissolved Solids (TDS)	3,400 mg/L

Permit Information

Original Permit Issued	January 16, 1992

Permit Amended	August 28, 1995
Permit Renewal	July 3, 1997
Permit Amended	June 12, 1998
Permit Amended	January 24, 2000
Permit Renewal	April 29, 2003
Permit Modification	December 22, 2003
Permit Modification	December 29, 2006
Permit Renewal and Modification	July 23, 2008
Permit Renewal	July 29, 2014
Current Action	**Permit Renewal and Modification**
Application Received	December 3, 2018
Public Notice Published	[not yet published]
Permit Issued (Effective Date)	[effective date]
Permitted Discharge Volume	Domestic – 23,000 gallons per day Non-Domestic – 9,586,995 gallons per day

DRAFT

Groundwater Discharge Permit Guidance for Synthetically Lined Lagoons – Liner Material and Site Preparation

This guidance document represent minimum liner material and site preparation requirements for wastewater treatment, storage and evaporation lagoons. These requirements do not apply to lagoons storing hazardous wastes or high strength waste. The Ground Water Quality Bureau may impose additional requirements (e.g., double-lined lagoons with leak detection) for facilities discharging hazardous or high strength waste to lagoons through the development of specific Discharge Permit conditions for such facilities.

Liner Material Requirements:

1. The liner shall be chemically compatible with any material that will contact the liner.
2. The liner material shall be resistant to deterioration by sunlight if any portion of the liner will be exposed.
3. Synthetic liner material shall be of sufficient thickness to have adequate tensile strength and tear and puncture resistance. Under no circumstances shall a synthetic liner material less than 40 mils in thickness be accepted. Any liner material shall be certified by a licensed New Mexico professional engineer and approved by the New Mexico Environment Department (NMED) prior to its installation.

Lagoon Design and Site Preparation Requirements:

1. The system shall be certified by a licensed New Mexico professional engineer and approved by NMED prior to installation.
2. Inside slopes shall be a maximum of 3 (horizontal): 1 (vertical), and a minimum of 4 (horizontal); 1 (vertical).
3. Lagoon volume shall be designed to allow for a minimum of 24 inches of freeboard.
4. The liner shall be installed with sufficient liner material to accommodate shrinkage due to temperature changes. Folds in the liner are not acceptable.
5. To a depth of at least six inches below the liner, the sub-grade shall be free of sharp rocks, vegetation and stubble. In addition, liners shall be placed on a sub-grade of sand or fine soil. The surface in contact with the liner shall be smooth to allow for good contact between liner and sub-grade. The surface shall be dry during liner installation.
6. Sub-grade shall be compacted to a minimum of 90% of standard proctor density.
7. The minimum dike width shall be eight feet to allow vehicle traffic for maintenance.
8. The base of the pond shall be as uniform as possible and shall not vary more than three inches from the average finished elevation.
9. Synthetic liners shall be anchored in an anchor trench in the top of the berm. The trench shall be a minimum of 12 inches wide, 12 inches deep and shall be set back at least 24 inches from the inside edge of the berm.
10. If the lagoon is installed over areas of decomposing organic materials or shallow groundwater, a liner vent system shall be installed.
11. Any opening in the liner through which a pipe or other fixture protrudes shall be properly sealed. Liner penetrations shall be detailed in the construction plans and record drawings.
12. A synthetic liner shall not be installed in temperatures below freezing.
13. The liner shall be installed or supervised by an individual that has the necessary training and experience as required by the liner manufacturer.
14. All manufacturer's installation and field seaming guidelines shall be followed.
15. All synthetic liner seams shall be field tested by the installer and verification of the adequacy of the seams shall be submitted to NMED along with the record drawings.
16. Concrete slabs installed on top of the synthetic liner for operational purposes shall be completed in accordance with manufacturer and installer recommendations to ensure liner integrity.

NEW MEXICO ENVIRONMENT DEPARTMENT
GROUND WATER QUALITY BUREAU
MONITORING WELL CONSTRUCTION AND ABANDONMENT GUIDELINES

Purpose: These guidelines identify minimum construction and abandonment details for installation of water table monitoring wells under groundwater Discharge Permits issued by the NMED's Ground Water Quality Bureau (GWQB) and Abatement Plans approved by the GWQB. Proposed locations of monitoring wells required under Discharge Permits and Abatement Plans and requests to use alternate installation and/or construction methods for water table monitoring wells or other types of monitoring wells (e.g., deep monitoring wells for delineation of vertical extent of contaminants) must be submitted to the GWQB for approval prior to drilling and construction.

General Drilling Specifications:

1. All well drilling activities must be performed by an individual with a current and valid well driller license issued by the State of New Mexico in accordance with 19.27.4 NMAC. Use of drillers with environmental well drilling experience and expertise is highly recommended.
2. Drilling methods that allow for accurate determinations of water table locations must be employed. All drill bits, drill rods, and down-hole tools must be thoroughly cleaned immediately prior to the start of drilling. The borehole diameter must be drilled a minimum of 4 inches larger than the casing diameter to allow for the emplacement of sand and sealant.
3. After completion, the well should be allowed to stabilize for a minimum of 12 hours before development is initiated.
4. The well must be developed so that formation water flows freely through the screen and is not turbid, and all sediment and drilling disturbances are removed from the well.

Well Specifications (see attached monitoring well schematic):

5. Schedule 40 (or heavier) polyvinyl chloride (PVC) pipe, stainless steel pipe, carbon steel pipe, or pipe of an alternate appropriate material that has been approved for use by NMED must be used as casing. The casing must have an inside diameter not less than 2 inches. The casing material selected for use must be compatible with the anticipated chemistry of the groundwater and appropriate for the contaminants of interest at the facility. The casing material and thickness selected for use must have sufficient collapse strength to withstand the pressure exerted by grouts used as annular seals and thermal properties sufficient to withstand the heat generated by the hydration of cement-based grouts. Casing sections may be joined using welded, threaded, or mechanically locking joints; the method selected must provide sufficient joint strength for the specific well installation. The casing must extend from the top of the screen to at least one foot above ground surface. The top of the casing must be fitted with a removable cap, and the exposed casing must be protected by a locking steel well shroud. The shroud must be large enough in diameter to allow easy access for removal of the cap. Alternatively, monitoring wells may be completed below grade. In this case, the casing must extend from the top of the screen to 6 to 12 inches below the ground surface; the monitoring wells must be sealed with locking, expandable well plugs; a flush-mount, watertight well vault that is rated to withstand traffic loads must be emplaced around the wellhead; and the cover must be secured with at least one bolt. The vault cover must indicate that the wellhead of a monitoring well is contained within the vault.
6. A 20-foot section (maximum) of continuous-slot, machine slotted, or other manufactured PVC or stainless steel well screen or well screen of an alternate appropriate material that has been approved for use by NMED must be installed across the water table. Screens created by cutting slots into solid casing with saws or other tools must not be used. The screen material selected for use must be compatible with the anticipated chemistry of the ground water and appropriate for the contaminants of interest at the facility. Screen sections may be joined using welded, threaded, or mechanically

locking joints; the method selected must provide sufficient joint strength for the specific well installation and must not introduce constituents that may reasonably be considered contaminants of interest at the facility. A cap must be attached to the bottom of the well screen; sumps (i.e., casing attached to the bottom of a well screen) should not be installed. The bottom of the screen must be installed no more than 15 feet below the water table; the top of the well screen must be positioned not less than 5 feet above the water table. The well screen slots must be appropriately sized for the formation materials and should be selected to retain 90 percent of the filter pack. A slot size of 0.010 inches is generally adequate for most installations.

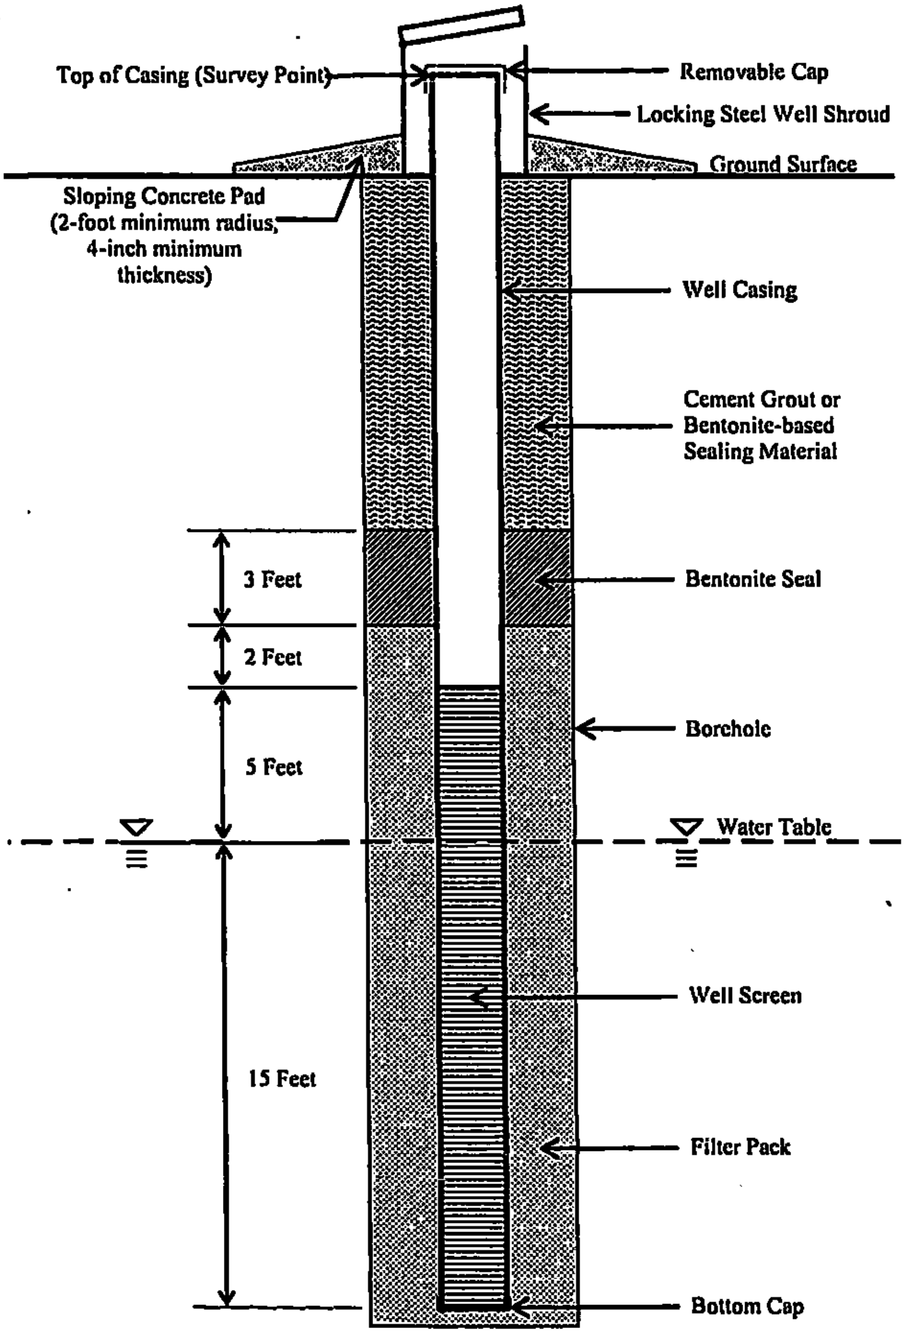
7. Casing and well screen must be centered in the borehole by placing centralizers near the top and bottom of the well screen.
8. A filter pack must be installed around the screen by filling the annular space from the bottom of the screen to 2 feet above the top of the screen with clean silica sand. The filter pack must be properly sized to prevent fine particles in the formation from entering the well; clean medium to coarse silica sand is generally adequate as filter pack material for 0.010-inch slotted well screen. For wells deeper than 30 feet, the sand must be emplaced by a tremmie pipe. The well should be surged or bailed to settle the filter pack and additional sand added, if necessary, before the bentonite seal is emplaced.
9. A bentonite seal must be constructed immediately above the filter pack by emplacing bentonite chips or pellets (3/8-inch in size or smaller) in a manner that prevents bridging of the chips/pellets in the annular space. The bentonite seal must be 3 feet in thickness and hydrated with clean water. Adequate time should be allowed for expansion of the bentonite seal before installation of the annular space seal.
10. The annular space above the bentonite seal must be sealed with cement grout or a bentonite-based sealing material acceptable to the State Engineer pursuant to 19.27.4 NMAC. A tremmie pipe must be used when placing sealing materials at depths greater than 20 feet below the ground surface. Annular space seals must extend from the top of the bentonite seal to the ground surface (for wells completed above grade) or to a level 3 to 6 inches below the top of casing (for wells completed below grade).
11. For monitoring wells finished above grade, a concrete pad (2-foot minimum radius, 4-inch minimum thickness) must be poured around the shroud and wellhead. The concrete and surrounding soil must be sloped to direct rainfall and runoff away from the wellhead. The installation of steel posts around the well shroud and wellhead is recommended for monitoring wells finished above grade to protect the wellhead from damage by vehicles or equipment. For monitoring wells finished below grade, a concrete pad (2-foot minimum radius, 4-inch minimum thickness) must be poured around the well vault and wellhead. The concrete and surrounding soil must be sloped to direct rainfall and runoff away from the well vault.

<u>**Abandonment**</u>:

12. Approval for abandonment of monitoring wells used for ground water monitoring in accordance with Discharge Permit and Abatement Plan requirements must be obtained from NMED prior to abandonment.
13. Well abandonment must be accomplished by removing the well casing and placing neat cement grout, bentonite-based plugging material, or other sealing material approved by the State Engineer for wells that encounter water pursuant to 19.27.4 NMAC from the bottom of the borehole to the ground surface using a tremmie pipe. If the casing cannot be removed, neat cement grout, bentonite-based plugging material, or other sealing material approved by the State Engineer must be placed in the well using a tremmie pipe from the bottom of the well to the ground surface.
14. After abandonment, written notification describing the well abandonment must be submitted to the NMED. Written notification of well abandonment must consist of a copy of the well plugging record submitted to the State Engineer in accordance with 19.27.4 NMAC, or alternate documentation containing the information to be provided in a well plugging record required by the State Engineer as specified in 19.27.4 NMAC.

Deviation from Monitoring Well Construction and Abandonment Requirements: Requests to construct water table monitoring wells or other types of monitoring wells for groundwater monitoring under groundwater Discharge Permits or Abatement Plans in a manner that deviates from the specified requirements must be submitted in writing to the GWQB. Each request must state the rationale for the proposed deviation from these requirements and provide detailed evidence supporting the request. The GWQB will approve or deny requests to deviate from these requirements in writing.

MONITORING WELL SCHEMATIC
(Not to Scale)



FACT SHEET
Groundwater Discharge Permit DP-831
March 2020

Facility Name:	Waste Isolation Pilot Plant (WIPP)
Facility Location:	Highway 128, 26 miles southeast of Carlsbad Carlsbad, NM Sections 20, 21, 28 and 29, Township 22S, Range 31E
County:	Eddy County
Applicant/Permittee:	Gregory Sosson, Acting Manager U.S. Department of Energy, Carlsbad Field Office P.O. Box 3090 Carlsbad, NM 88221
Proposed Permitting Action:	Discharge Permit Renewal and Modification
Regulatory Authority:	Water Quality Control Commission's Ground and Surface Water Protection Regulations, 20.6.2 NMAC
Issuing Agency:	Ground Water Quality Bureau (GWQB) of the New Mexico Environment Department (NMED)
GWQB Contact:	Avery Young P.O. Box 5469, Santa Fe, NM 87502-5469 Phone: (505) 827-2909 Email: avery.young@state.nm.us

The Ground Water Quality Bureau has prepared this Fact Sheet as required by Subsection I of 20.6.2.3108 NMAC because the proposed discharge is at a federal facility and is not comprised solely of domestic liquid waste.

The original Discharge Permit was issued on January 16, 1992, amended on August 28, 1995, renewed on July 3, 1997, amended on June 12, 1998 and on January 24, 2000, renewed on April 29, 2003, modified on December 22, 2003 and on December 29, 2006, renewed and modified on July 23, 2008, and last renewed on July 29, 2014. The application (i.e., discharge plan) consists of the materials submitted by the permittee dated December 3, 2018 and materials contained in the administrative record prior to issuance of this draft Discharge Permit and draft Fact Sheet.

The draft Discharge Permit that accompanies this draft Fact Sheet is for a renewal and modification. The modification consists of the addition of one new salt storage cell and four new impoundments: Salt Cell 5, Salt Storage Pond 5, Brine Salt Storage Pone 4, Brine Retention Pond East, and Brine Retention Pond West. Additional changes made to the Discharge Permit issued to the Waste Isolation Pilot Plant (WIPP or Facility) on July 29, 2014 are described below.

Comment Period / Request for Hearing

NMED will allow at least thirty days during which time written comments may be submitted and a public hearing may be requested. NMED will allow for these activities after publishing notice of the availability of this Draft Permit and Fact Sheet. Requests for public hearing shall be in writing and shall set forth the reasons why a hearing should be held. A hearing will be held if the NMED Secretary determines that there is substantial public interest. To obtain a copy of the Draft Permit, to submit a comment, or to request a hearing on this matter, contact the GWQB Contact listed at the beginning of this Fact Sheet.

Regulatory Framework

The Ground and Surface Water Protection Regulations, 20.6.2 NMAC, establish the regulatory framework for controlling discharges onto or below the surface of the ground through the issuance of groundwater discharge permits. The purpose of the regulations pertaining to groundwater discharge permits, as stated in Section 20.6.2.3101 NMAC, is "to protect all ground water of the state of New Mexico which has an existing concentration of 10,000 mg/l or less of total dissolved solids, for present and potential future use as domestic and agricultural water supply, and to protect those segments of surface waters which are gaining because of ground water inflow, for uses designated" in the Standards for Interstate and Intrastate Surface Waters, 20.6.4 NMAC. (See the New Mexico Commission of Public Records website to view 20.6.2 and 20.6.4 NMAC: http://www.srca.nm.gov/chapter-6-water-quality/.)

The regulations establish groundwater standards as identified in Section 20.6.2.3103 NMAC.

Persons proposing to discharge effluent or leachate in such a manner that it could move directly or indirectly into groundwater must obtain and comply with a discharge permit (20.6.2.3104 NMAC). In order to obtain a discharge permit, an applicant must submit an application (or "discharge plan" – 20.6.2.7 NMAC) proposing methods/techniques to be used or processes expected to naturally occur to ensure that the discharge of water contaminants does not result in the contamination of ground or surface water (20.6.2.3106 NMAC).

In reviewing and approving an application, NMED must ensure that the discharge plan will not result in a hazard to public health, undue risk to property, exceedance of the groundwater standards at any place of withdrawal of water for present or reasonably foreseeable future use, or violation of a stream standard (Subsections C and H of 20.6.3109 NMAC). "Hazard to public health" is defined in Section 20.6.2.7 NMAC and pertains to the exceedance of the groundwater standards in a drinking water supply.

Subsection B of 20.6.2.3109 NMAC directs the NMED Secretary to "approve, approve with conditions, or deny" a discharge permit application, after the administrative record is complete and all required information is available. This regulation authorizing permit approval "with conditions" provides the fundamental authority for including conditions in discharge permits.

General Facility Information

The WIPP is a mined geologic repository for the disposal of transuranic (TRU) waste. The underground repository is located 2,150 feet below land surface in the bedded salt of the Salado Formation. The WIPP first began accepting waste in March 1999. In addition to this groundwater Discharge Permit, the WIPP is also regulated by the NMED Hazardous Waste Bureau under the New Mexico Hazardous Waste Act and New Mexico's Hazardous Waste Regulations.

The WIPP facility is geologically situated in the southeast portion of New Mexico within the Delaware Basin, which is part of the larger Permian Basin. The geologic formations below the facility that are pertinent to this Discharge Permit, from deepest to shallowest, include: the Salado Formation, the Rustler Formation, the Dewey Lake Formation, and, in the northeastern portion of the facility, the Santa Rosa Formation. The Salado Formation, which is first encountered at an approximate depth of 850 feet and is approximately 2,000 feet thick, consists predominately of polyhalite, with some halite, carbonates, anhydrites, and clay seams. The Rustler Formation ranges from 350 to 500 feet thick and consists of carbonates, anhydrites, and halites. The Dewey Lake Formation is approximately 500 feet thick and consists almost entirely of mudstone, claystone, siltstone, and interbedded sandstone, and is frequently referred to as the Dewey Lake Redbeds Formation.

Groundwater below the facility most likely to be affected by this discharge is at a depth of approximately 35 to 160 feet. Natural groundwater is located in the middle portion of the Dewey Lake Formation, at a depth of approximately 160 feet, and has an average total dissolved solids concentration of approximately 3,400 milligrams per liter. The WIPP discovered a perched water zone in the lower Santa Rosa and upper Dewey Lake Formations in 1995 and determined that the probable sources of this shallow groundwater were the unlined impoundments constructed to capture stormwater runoff at the facility and runoff from the above-ground salt piles. This shallow groundwater has been found to be contaminated with total dissolved solids, sulfate, and chloride. After the discovery of the anthropogenically created shallow groundwater, all impoundments at the facility were lined and a network of monitoring wells was installed. The shallow groundwater has a flow direction of north to south. Natural, non-anthropogenic, groundwater occurs in the Dewey Lake Formation south of the WIPP facility at a depth of 160 feet. The Dewey Lake Formation has a relatively low hydraulic conductivity.

The first laterally continuous water-bearing zone below the facility is within an approximately 30-foot-thick section of the Culebra Member of the Rustler Formation. Water in the Culebra Member is usually present in fractures and is confined by overlaying anhydrite and underlying clay and anhydrite beds. The Culebra Member is monitored through a network of monitoring wells.

Description of the Proposed Discharge

The activities that produce the discharge and the quantity, quality, and flow characteristics of the proposed discharges at WIPP are briefly described as follows:

The source and disposition locations of proposed discharges at WIPP include the following: domestic wastewater to a facultative (treatment) lagoon system for; industrial, non-hazardous wastewater to evaporative impoundments; stormwater emanating generally from the Facility to evaporative impoundments, and stormwater emanating from the salt piles to evaporative impoundments.

Up to 23,000 gallons per day (gpd) of domestic wastewater may be discharged to seven synthetically lined impoundments (Facultative Lagoon System) comprised of Settling Lagoons 1 and 2, Polishing Lagoons 1 and 2, and Effluent Lagoons A, B, and C for disposal by evaporation and removal of precipitated domestic waste solids.

Non-domestic wastewater may be discharged at the Facility in the following ways:

- Up to 27,000 gpd of industrial wastewaters from the following sources: wastewater from compressed air systems, brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous wastewaters. These industrial wastewaters are discharged to the Effluent Lagoons B and C of the Facultative Lagoon System for disposal by evaporation.

- Up to 50,000 gpd of industrial wastewaters from the following sources: brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous wastewaters. These industrial wastewaters are discharged to a separate synthetically lined impoundment for disposal by evaporation (Evaporation Pond H-19).

- Up to 2,210 gpd of brine produced from the operation of the to be constructed Salt Reduction System within the Safety Significant Confinement Ventilation System (SSCVS) will be discharged to two double synthetically lined impoundments, each with a leak detection system (Brine Retention Ponds East and West, collectively Brine Ponds). One brine retention pond will be in service while the other brine retention pond is closed for evaporation and removal of precipitated salt in order to maintain at least two feet of freeboard. Any remaining brine in the closed Brine Pond will be transferred to Brine Salt Storage Pond 4 for disposal by evaporation.

- Salt and other subsurface materials mined during construction of the Facility, as well as currently mined salt, are stored at the surface in four stockpiles. The stockpiles currently storing salt, or that will be used in the future as salt is mined from the Facility's underground panels, are referred to as Salt Cells 2, 3, and 5. Stormwater runoff in contact with Salt Cells 2 and 3 is collected in two double synthetically-lined stormwater impoundments, each with a leak detection system (Salt Storage Ponds 2 and 3). The total storage capacity of Salt Storage Ponds 2 and 3 is 21,737,254 gallons. Stormwater runoff in contact with Salt Cell 5 will be collected in a double synthetically-lined stormwater impoundment with a leak detection system (Salt Storage Pond 5). The storage capacity of Salt Storage Pond 5 will be 6,355,404 gallons. Salt Cell 1 no longer receives salt and is capped with synthetic material and an earthen cover. Stormwater runoff in contact with this stockpile is collected in synthetically-lined diversion ditches directed to a synthetically-lined impoundment (Salt Storage Pond 1). The storage capacity of Salt Storage Pond 1 is 3,301,634 gallons. The storage capacity of each salt storage pond is more than sufficient to contain a 24-hour, 100-year (5.84-inch rainfall) storm event.

- Stormwater runoff from the SSCVS area is collected in a double synthetically-lined stormwater impoundment with a leak detection system (Brine Salt Storage Pond 4). The storage capacity of Brine Salt Storage Pond 4 is 8,668,722 gallons. The capacity of the Brine Salt Storage Pond 4 is more than sufficient to contain a 24-hour, 100-year (5.84-inch rainfall) storm event.

- Additional stormwater runoff from the Facility's paved areas and roofs is collected in three synthetically-lined impoundments (Storm Water Ponds 1, 2, and 3). This runoff does not contact the salt stockpiles or other waste materials at the Facility and may be used by the permittee for dust control, soil compaction, and other construction activities.

The modification consists of the addition of one new salt storage cell and four new impoundments: Salt Cell 5, Salt Storage Pond 5, Brine Salt Storage Pond 4, Brine Retention Pond East, and Brine Retention Pond West.

Basis for Draft Permit Conditions

The conditions in this Draft Permit are organized into the following Sections: Operational Plan, Monitoring and Reporting, Additional Studies Required, Contingency, Closure, and General Requirements. The Draft Permit conditions conform to the requirements of the regulations and are generally consistent with similar conditions in other groundwater discharge permits issued by the Department.

1. Operational Plan Conditions (pages 6-14 in the Draft Permit)

Conditions in this Section require the permittee to properly operate and maintain the disposal systems, to restrict access to the systems via fencing so that unauthorized persons cannot damage a system or be exposed to unsafe conditions, and to post appropriate cautionary signs.

This Section contains operating conditions typically required for discharge systems composed of lined treatment impoundments for domestic wastewater and lined evaporative impoundments for industrial wastewater and stormwater. These conditions include requirements to appropriately maintain the synthetic impoundment liners, to maintain a specific freeboard within impoundments to prevent overtopping, to measure the thickness of settled solids within impoundments and to remove those solids if storage capacity is diminished to a specific limit. Proper operation and maintenance of the discharge system is critical for the Discharge Permit to achieve the performance criteria established in Subsection C of 20.6.2.3109 NMAC.

This Section requires the Permittee to monitor impoundment leak detection systems associated with specific salt storage ponds and the proposed impoundments. This requirement in-part addresses the requirement that a discharge plan include procedures for detecting a failure of the discharge system as specified in 20.6.2.3107 NMAC. The Permittee must construct, maintain, and operate impoundment leak detection, collection, and recovery systems (LDCRS) in a manner that will result in less than one foot of hydraulic head on the secondary liner. If this impoundment leakage limit cannot be maintained, the Permittee is obligated to submit a corrective action plan to NMED for approval.

This Section also requires the Permittee to conduct regular inspection of the earthen covers on Salt Cell 1 and the Site and Preliminary Design Validation (SPDV) Material Pile. Both piles consist of salt excavated during the construction of the Facility. Both piles are no longer active, i.e., they no longer receive salt; therefore, they have been covered in order to prevent stormwater infiltration and destabilization of the piles.

The Draft Permit does not contain discharge quality limitations because all discharges are contained in evaporative disposal systems.

2. Monitoring and Reporting Conditions (pages 15 – 27 in the Draft Permit)

Conditions in this Section require the Permittee to monitor and report on various aspects of the discharge system and groundwater to demonstrate that operations are compliant with the Discharge Permit and that the Discharge Permit is achieving the expected results. Monitoring and reporting requirements are authorized by Subsection A of 20.6.2.3107 NMAC. A discharge permit may not be approved without provisions for flow measurement and sampling, pursuant to Subsection H of 20.6.2.3109 NMAC.

The facility subsections require monitoring of the quantity and quality of the discharges, specifically, the discharge volumes to the impoundments, the chemical characterization of the impounded fluids, and the volume of liquid pumped from the leak detection systems.

Once during the Discharge Permit term, the Permittee is required to evaluate industrial wastewater for a comprehensive list of chemical constituents pursuant to 20.6.2.3103 NMAC. This comprehensive analysis pertains to the industrial waste discharges having varied origins, including brine, purge waters from sampling and developing monitoring wells, and miscellaneous industrial non-hazardous wastewaters.

The Groundwater Monitoring and Reporting subsection requires monitoring groundwater downgradient of the following potential contaminant sources: impoundments containing stormwater runoff in contact with salt piles, the domestic wastewater impoundment system, capped salt piles, uncapped salt piles, and impoundments containing industrial discharges. This Section requires groundwater monitoring of two perched water zones, the shallow anthropogenic groundwater measured at approximately 35 to 80 feet below ground surface and the shallowest non-anthropogenic water-bearing zone in the Dewey Lake Formation measured at approximately 160 feet below ground surface.

The Permittee is required to sample for total dissolved solids, chloride, and sulfate in groundwater monitoring wells designated to monitor salt piles and impoundments containing stormwater runoff in contact with salt piles. The Permittee is required to sample for nitrate as nitrogen and total Kjeldahl nitrogen in the groundwater monitoring well designated to monitor the domestic wastewater impoundment system. The Permittee is required to sample for uranium and combined radium-226 and radium-228 in the groundwater monitoring wells designated to monitor all domestic and non-domestic discharge locations at the Facility. The sampling requirements for uranium and radium-226/radium-228 are included because these constituents are the only radioactive constituents for which New Mexico has groundwater protection standards.

Monitoring wells WQSP-6A, PZ-17, and PZ-19 are intended to monitor the shallowest non-anthropogenic water-bearing zone in the Dewey Lake Formation, which occurs in the subsurface at the southern end of the Facility. All other monitoring wells are intended to monitor the shallow anthropogenic groundwater.

This subsection requires the installation of four new groundwater monitoring wells to monitor groundwater associated with newly authorized impoundments, to replace an improperly located well, and to monitor previously unmonitored locations. One monitoring well is required to be installed downgradient of the Facultative Lagoon System to replace an improperly located well. One monitoring well is required to be installed downgradient of Evaporation Pond H-19 because the impoundment is comprised of a single, 40-mil synthetic liner; therefore, a monitoring well is required downgradient to monitor the integrity of the liner. One monitoring well is required to be installed downgradient of the proposed Brine Salt Storage Pond 4 to monitor that impoundment system. One well is required to be installed downgradient of the proposed Salt Storage Pond 5 in order to monitor that impoundment system.

This Section requires the submittal of semi-annual monitoring reports that include the following: the chemical analytical results of domestic effluent and non-domestic wastewater; discharge volumes; record of solids (salt) removal and disposal; leak detection system measurements; the submittal of DOE's "Waste Isolation Pilot Plant Annual Site Environmental Report"; groundwater characterization data; groundwater depth measurements; and groundwater elevation contour maps.

3. Additional Studies Required (pages 27 - 28 in the Draft Permit)

This Section requires the Permittee to submit for NMED approval a workplan to investigate the shallow groundwater beneath the site, which contains concentrations of total dissolved solids, chloride, and sulfate above the standards of 20.6.2.3103 NMAC. Contingency Condition 26 of WIPP's previous Discharge Permit dated July 29, 2014 requires a response to exceedances to the standards of 20.6.2.3103 NAMC. Facility records identify the probable source of this groundwater as unlined stormwater impoundments from the time of initial construction of the Facility to the time the impoundments were lined in 2005. The purpose of the site investigation is to determine the efficacy of existing source controls, to determine the current lateral and vertical extent of this contaminated shallow groundwater, and to identify any potential impacts to the downgradient and naturally occurring downgradient groundwater in the Dewey Lake Formation. The site investigation may build upon the previous investigations completed by Daniel B. Stephens and Associates in 2003 and 2008.

This requirement is consistent with Section 20.6.2.3107 NMAC, which allows the Secretary to require a system of monitoring and reporting to verify that the permit is achieving the expected results and to require reporting of other information. The site investigation will provide additional information necessary to prevent further contamination and to determine whether to require corrective action or abatement.

4. Contingency Plan Conditions (pages 28 -31 in the Draft Permit)

Conditions in this Section require the Permittee to implement specified actions, or to propose corrective actions for NMED's approval, in the case of failure of any aspect of the discharge system. The conditions, which reflect standard language used in other industrial discharge permits, address the exceedance of groundwater standards, damage to impoundment liners, lack of required freeboard in impoundments, and monitoring well deficiencies (e.g., improper construction, improper location for monitoring the intended source, insufficient water for sampling). Contingency plans are authorized by Subsection A(10) of 20.6.2.3107 NMAC. The Permittee is required to report and address unauthorized discharges in accordance with 20.6.2.1203 NMAC.

5. Closure Conditions (pages 32 – 35 in the Draft Permit)

Conditions in this Section prescribe measures and timeframes for closing part, or all, of the Facility so that discharges can no longer occur and so that the exceedance of groundwater standards does not occur after the cessation of the operation. NMED understands that the Permittee does not plan to close the Facility during the term of this Discharge Permit, however general closure conditions are always included in discharge permits. Closure requirements are authorized by Subsection A(11) of 20.6.2.3107 NMAC, which also stipulates that closure requirements survive the termination or expiration of the Discharge Permit.

Groundwater monitoring is required after a discharge ceases and all means of transferring liquid to a discharge impoundment are sealed. This period after "closure" is commonly referred to as "post-closure" and generally continues until a minimum of eight consecutive quarters of groundwater sampling and analysis confirm no exceedance of standards. This two-year period allows for the potential movement of contaminants through the vadose zone and is consistent with the time period established in remediation programs for demonstrating that remediation is complete, e.g., 20.6.2.4103 NMAC (abatement plans) and 20.5.119.1929 NMAC (petroleum storage tank systems).

This Section includes a condition for properly closing the Facility in accordance with the WIPP Land Withdrawal Act, WIPP's Hazardous Waste Facility Permit (NM4890139088-TSDF), and the WIPP Land Management Plan's requirements for disposition of salt. In particular, the condition requires removal of all salt stockpiles from the land surface at the Facility so that the salt does not remain as a potential source of a contaminant discharge to groundwater.

6. General Terms and Conditions (pages 35 – 39 in the Draft Permit)

This Section's general terms and conditions are standard conditions in all discharge permits.

The Permittee is required to maintain certain records and provide them if requested to NMED, as authorized by Subsections A and D of 20.6.2.3107 NMAC. The Permittee is required to notify NMED of proposed changes to the volume, location, or character of the discharge, as this may require a "discharge permit modification" as defined in Subsection D of 20.6.2.7 NMAC and is consistent with the notification requirement in Subsection C of 20.6.2.3107 NMAC.

This Section identifies the Permittee's obligations, pursuant to the Ground and Surface Water Protection Regulations, regarding the transfer of the discharge permit, permit fees, and submittal construction plans and specifications. The Section also cites New Mexico Water Quality Act provisions allowing for inspections, civil and criminal penalties, and the duty to comply with other laws.

Avery,

We have reviewed the proposed language regarding the LDCRS for the ponds and we have no comments. The language is ok as written. I am also including the pond volume calculations and pond calculation methodology as requested. Please understand that the annulus spacing value is an assumption based on design and as-built information. Let us know if you have any further questions.

Hello,

Please see the draft leak detection condition below for your comment:

The permittee shall maintain and operate the leak detection, collection, and removal systems (LDCRS) for Salt Storage Ponds 2, 3 and 5 in a manner that will result in less than one foot of hydraulic head on the secondary liners in the ponds.

In the event that the permittee cannot maintain less than one foot of hydraulic head on the secondary liners for Salt Storage Ponds 2, 3 and 5, the permittee shall notify NMED within 48 hours of the discovery and shall submit a corrective action plan to NMED which evaluates the primary liner leakage rate, proposes options for reducing the leakage if optimal, or otherwise proposes a means to maintain less than one foot of hydraulic head on the secondary liner. The plan shall be submitted for NMED approval within 60 days after the discovery that the hydraulic head on the secondary liner has surpassed one foot.

In the event that it becomes neces..., to modify a LDCRS for a pond, the permittee shall submit a report describing the proposed revised methodology for NMED approval.

This condition will be the same for Brine Salt Storage Pond 4 and Brine Retention Ponds East and West.

Thank you,

WIPP Pond Calculation Methodology

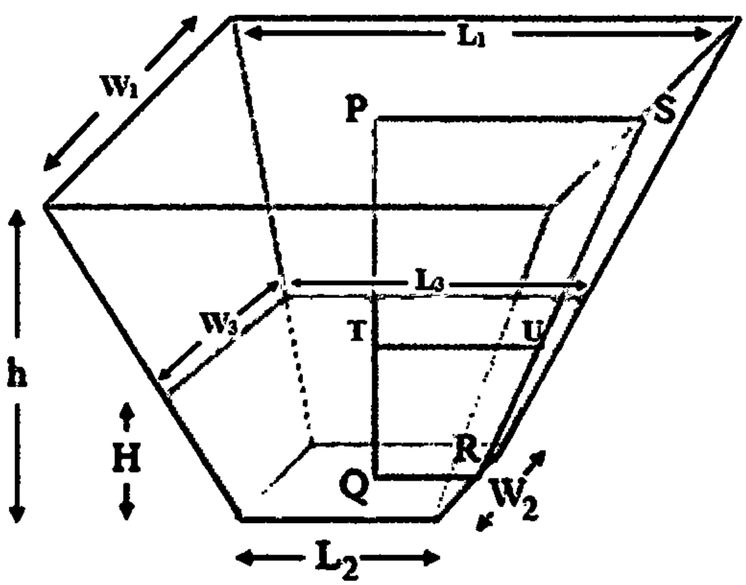
RECEIVED
FEB 24 2020
Ground Water Quality Bureau

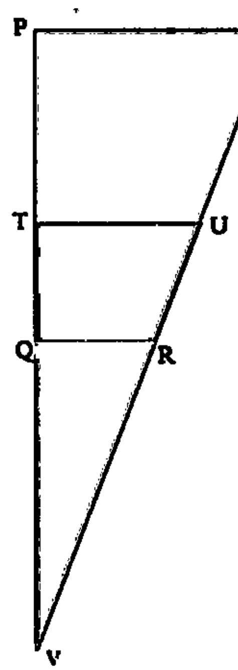
Volume of a pyramidal frustum:

$$V = \frac{1}{3}h(A_1 + A_2 + (A_1 A_2)^{0.5})$$

Where h is the height, A_1 is the top area and A_2 is the bottom area.

The rectangle at the base of the pond is L_2 units long by W_2 units wide; the rectangle at the top of the pond is L_1 units long by W_1 units wide; the pond is "h" units in height and the water in the pond is "H" units deep; "P" is the midpoint of the top rectangle; "Q" is the midpoint of the bottm rectangle and "R" and "S" are the midpoints of their respective sides. Let the rectangle formed by the surface of the water be L_3 units long and W_3 units wide.





Consider the two dimensional figure PQRS displayed at the right.

Extend the sides PQ and SR to meet at point V.

$|QR| = \frac{L_2}{2}$; $|TU| = \frac{L_3}{2}$; $|PS| = \frac{L_1}{2}$; $|PT| = h - H$; and $|TQ| = H$

Let the distance from Q to V be "x" feet.

The triangles QRV, TUV and PSV are similar; therefore

$$\frac{|PS|}{|PV|} = \frac{|TU|}{|TV|} = \frac{|QR|}{|QV|}$$

$$\frac{\frac{L_1}{2}}{(h+x)} = \frac{\frac{L_3}{2}}{(H+x)} = \frac{\frac{L_2}{2}}{x}$$

Solve the following expression for "x"

$$\frac{\frac{L_1}{2}}{(h+x)} = \frac{\frac{L_2}{2}}{x} \quad \dashrightarrow \quad x = \frac{hL_2}{(L_1 - L_2)}$$

Now substitute "x" into the following equation and simplify to get L_3.

$$\frac{\frac{L_1}{2}}{(h+x)} = \frac{\frac{L_3}{2}}{(H+x)}$$

$$\frac{\frac{L_1}{2}}{\left(h + \frac{hL_2}{(L_1 - L_2)}\right)} = \frac{\frac{L_3}{2}}{\left(H + \frac{hL_2}{(L_1 - L_2)}\right)}$$

$$L_3 = \frac{L_1\left(H + \frac{hL_2}{(L_1 - L_2)}\right)}{\left(h + \frac{hL_2}{(L_1 - L_2)}\right)} \quad \dashrightarrow \quad L_3 = \frac{HL_1 + (h - H)L_2}{h}$$

In a similar fashion, W_3 can be derived:

$$W_3 = \frac{HW_1 + (h - H)W_2}{h}$$

Now that we know the dimensions of the rectangle formed by the surface of the water, we can use the expression for the pyramidal frustum to calculate the volume at any desired water depth.

RE: Proposed Monitoring Well Location Approval, DP-831, Waste Isolation Pilot Plant

Dear Mr. Brown:

The New Mexico Environment Department (NMED) received on February 18, 2020 a Monitoring Well Decision Plan, which proposes locations for four monitoring wells to be installed at the facility referenced above. The proposed monitoring wells are to be located downgradient of two new impoundments and two existing impoundments. Based on the proposed location, proposed construction, and ground water flow direction information provided in the letter, NMED approves the proposed locations of the monitoring wells. Monitoring well installation shall be in accordance with the approved Monitoring Well Decision Plant. Also, construction and lithologic logs for the monitoring wells shall be submitted to NMED within 120 days of well completion. If you have any questions, feel free to call me at (505) 827-2909.

Sincerely,

Avery Young
Environmental Scientist

DP-831 Well Decision Plan
Wells for Pond 4, Pond 5, Facultative Lagoon, and H-19

Introduction

The Waste Isolation Plant is in the midst of several construction projects. The Safety Significant Confined Ventilation System (SSCVS) is one of these projects. Associated with the New Filter Building and the new shaft, there will be two lined evaporation ponds, and a lined salt storage cell. The salt storage cell will hold the cuttings/spoils from shaft sinking. One evaporation pond (Pond 4) will capture water runoff from the area of the filter building, and the other evaporation pond (Pond 5) will be used to capture water collected from the shaft spoils pile. The new ponds and shaft spoils pile cell were included as modifications in the recently submitted DP-831 renewal application to the New Mexico Environment Department (NMED) Groundwater Quality Bureau (GWQB), and is under review by the GWQB. During the DP-831 GWQB review, WQB, an additional monitoring wells have been requested. Wells were requested at Pond 4, Pond 5, the Facultative lagoon, and the H-19 evaporation pond.

This paper discusses the history of the anthropogenic shallow subsurface water (SSW), location of each well, and where the wells are to be located, and describe the pre-installed well construction based on known or predicted geology at each location.

Historical Discussion of the SSW

Shallow subsurface water was first discovered seeping into the Waste Handling Shaft at WIPP during an inspection in 1996. Investigation of the seeps began in 1996 with the installation of three wells around the waste shaft followed by 13 more wells at the site. Subsequent hydrologic modeling suggested that that the SSW was anthropogenic, generated by unlined ponds and salt storage cells.

The SSW is a perched water system, created by permeability difference between the Santa Rosa Formation (Santa Rosa) and the underlying Dewey Lake Formation (Dewey Lake). At approximately 180 feet deep into the Dewey Lake Formation the matrix cement changes from a carbonate to a sulfate (gypsum). This change in cement change creates an aquiclude, which causes the perching of natural Dewey Lake Formation water. Because the Dewey Lake permeability is much lower than the Santa Rosa, infiltrating water is impeded from further vertical migration. Water is retained on the upper surface of the Dewey Lake, as identified by wells throughout the WIPP site and documented in semi-annual reports for the DP-831 Permit. The cement change from carbonate to sulfate, however, is not spatially continuous. Well WQSP-6A was installed in an area where the change in cement, and therefore the aquiclude, exists. There are wells 3 miles south of WIPP, at the Mills Ranch, where natural water is perched on this cementation change in the deep Dewey Lake.

Drilling Scenarios

Although four wells have been requested, as many as six wells may be required to monitor different depths of the Dewey Lake Formation, if water is present. The nomenclature for the wells will be consistent with the current nomenclature. The well designations will be PZ-16 for Pond 4, PZ-17 for the sewage lagoon, PZ-18 for Pond 5, and PZ-19 for the H-19 pond. Additional wells (maximum of two), into the deeper Dewey Lake, may be required to determine if there water is present, and if so, for monitoring this horizon. Pre-drilling well construction was based on this premise.

There may or may not be water discovered in Wells PZ-17 and PZ-19 drilled into the lower Dewey Lake. The draft DP-831 Permit requires two deep wells to be drilled. The first borehole drilled will be a shallow borehole to the Santa Rosa and Dewey Lake geological contact and will be observed for evidence of SSW and a well installed. An additional corehole will be drilled at these locations, after the shallow well, and a well will be installed only if water is detected in the Dewey Lake Formation at the cementation change. Continuous geologic core and geophysical logs will be obtained and examined for evidence of water. An overnight pause in drilling will take place to see if water collects into the deep drill holes. The drilling scenarios and resulting actions are as follows:

1.) Water is determined in both the shallow and deep zone: Install two wells; one in the deep Dewey Lake to monitor the water at the change in cementation and one in the shallow zone to monitor water at the Dewey Lake and Santa Rosa geologic contact. The shallow well will be drilled and installed before the deep corehole is drilled.
2.) Water is not detected in the lower Dewey Lake Formation plug the drill hole up to the surface.
3.) No water is detected at either interval, deep or shallow: Install only a shallow well to monitor if a leak occurs in the liner of the sewage lagoon.
4.). Plugging of the deep drill hole, if needed, will be by tremmie pipe with Portland Type II cement.

Final well construction will be determined while drilling, observing cuttings, continuous core, and rig penetration rates. During discussions with the NMED GWQB, their preference was to install the monitoring wells as close to the central axis of each impoundment and presumed downgradient flow direction. Geophysical logs will be: gamma, 3-arm caliper, single point resistance, 16' normal resistivity, deep resistivity, medium resistivity, neutron, far density, and bulk density. Drilling will be by dry drilling using air rotary until such a point that returns are weak and a surfactant mist (Halliburton Quick-Foam™) will be used. Geologic core will be archived for future examination by project participants and the NMED.

All wells are planned to be installed as close as possible to the central axis of the impoundment to the south; the presumed downgradient flow direction.

Location and Design of PZ-16

PZ-16 is located 50 feet from Pond 4, close to the central axis of the impoundment. (Figure 1). Proposed construction is presented in Figure 2. Final construction and placement of the well screen will be determined in the field based on examination of continuous core and geophysics. Drilling will be by dry drilling using air rotary until such a point that returns are weak and a surfactant mist (Halliburton Quick-Foam™) will be used. Twenty feet of well screen will be used with two feet extending beyond the geologic contact. A 5 feet of sump will be constructed to allow space if any future testing should occur.

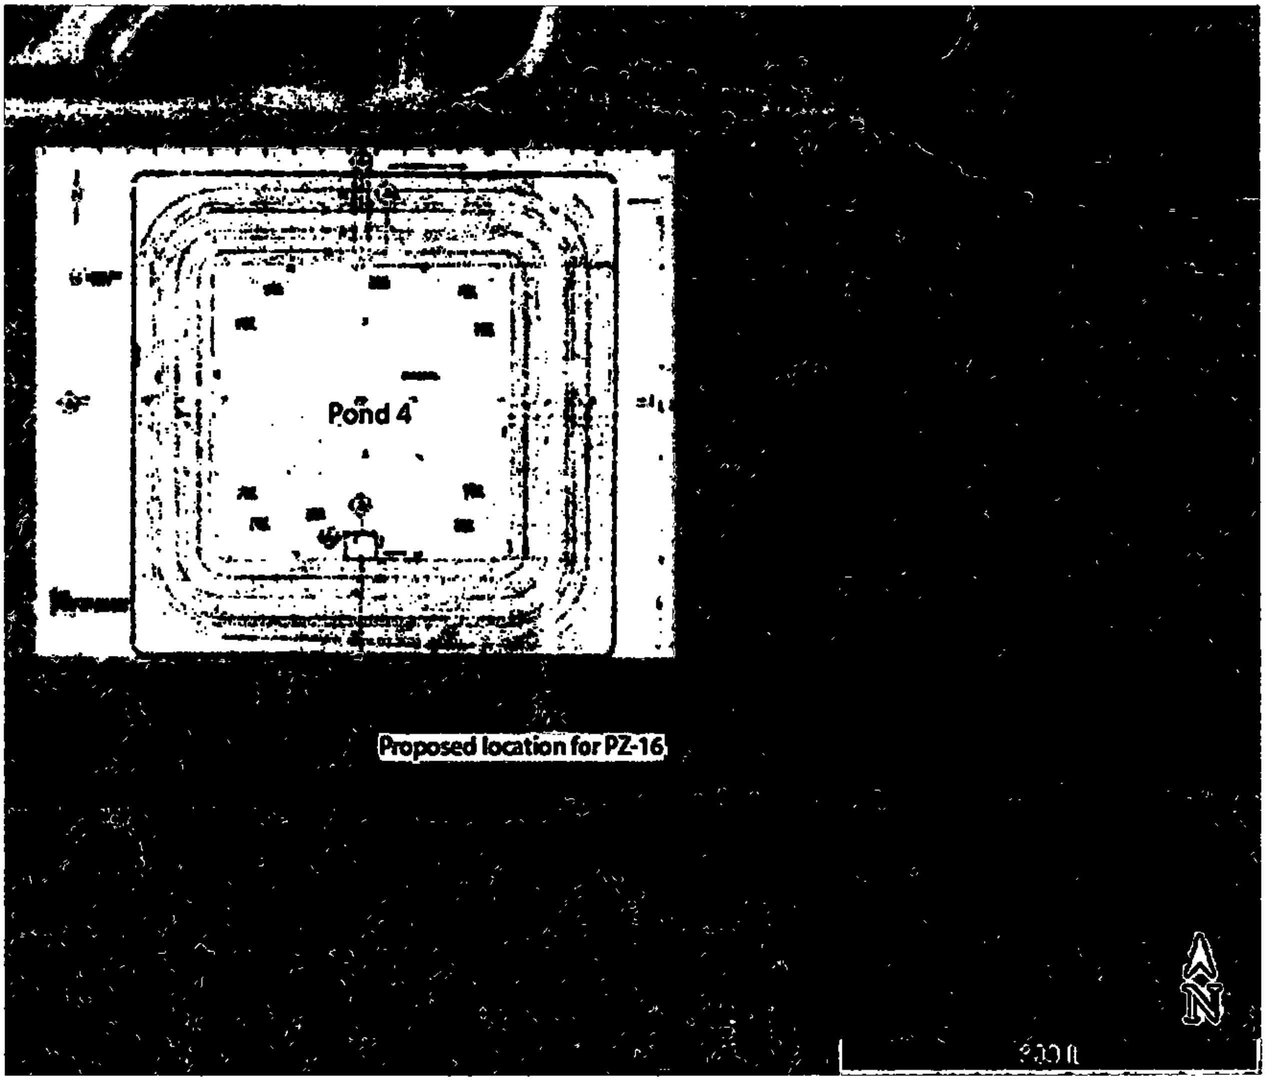

Figure 1: Proposed Location of PZ-16

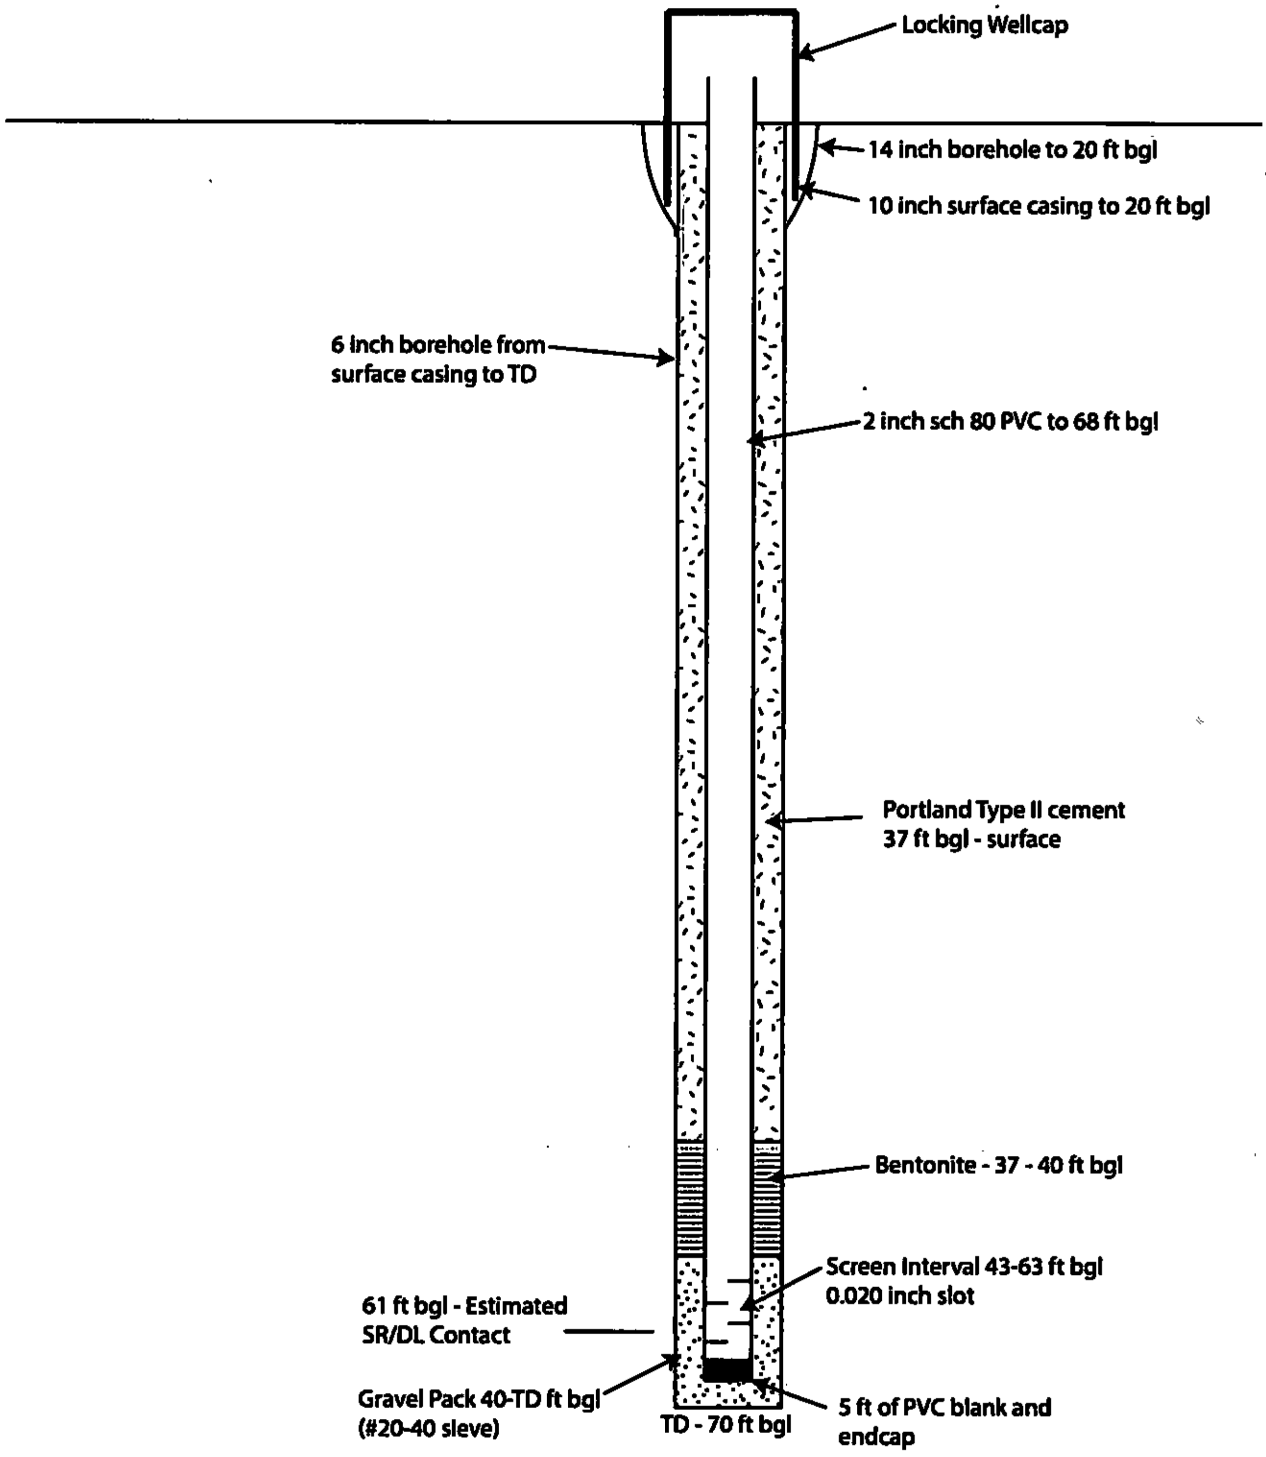
Figure 2 : PZ-16 Construction

Not To Scale



03264

Location and Design of PZ-17

PZ-17 is located 20 feet south of the Sewage Lagoon in line with the central axis (Figure 3). At this location there is a possibility of installing two monitoring wells. The decision to install one or two wells will be made in the field using the criteria described in the drilling scenarios above. Drilling will be by dry drilling using air rotary until such a point that returns are weak and a surfactant mist (Halliburton Quick-Foam™) will be used.

One corehole will be drilled and the core will be examined to total depth. The target depth for this hole will be in the lower Dewey Lake where the cementation changes from carbonate to sulfate (gypsum). The intent of this well is to determine if there is water at the cementation change. (Figure 4)

If there is no identified water at the cementation change and water is identified in the shallow interval of the Santa Rosa and Dewey Lake geological contact, then the corehole will be plugged up to the surface using tremmie pipe and Portland Type II cement.

A single shallow well will be installed and screened across the Santa Rosa and Dewey Lake geologic contact. This will be used to monitor potential future influx of water. (Figure 5).

Final construction and placement of the well screen will be determined in the field based on examination of continuous core and geophysics. Twenty feet of well screen will be used with two feet extending beyond the geologic contact. A 5 foot sump will be constructed to allow space if any future testing should occur. A twenty foot steel surface casing will also be installed after coring of 25 feet.

If while drilling the deeper borehole, there is a greater influx of water from the Santa Rosa/Dewey Lake geologic contact, a contingency for this will be to install and cement steel casing across the geologic contact.

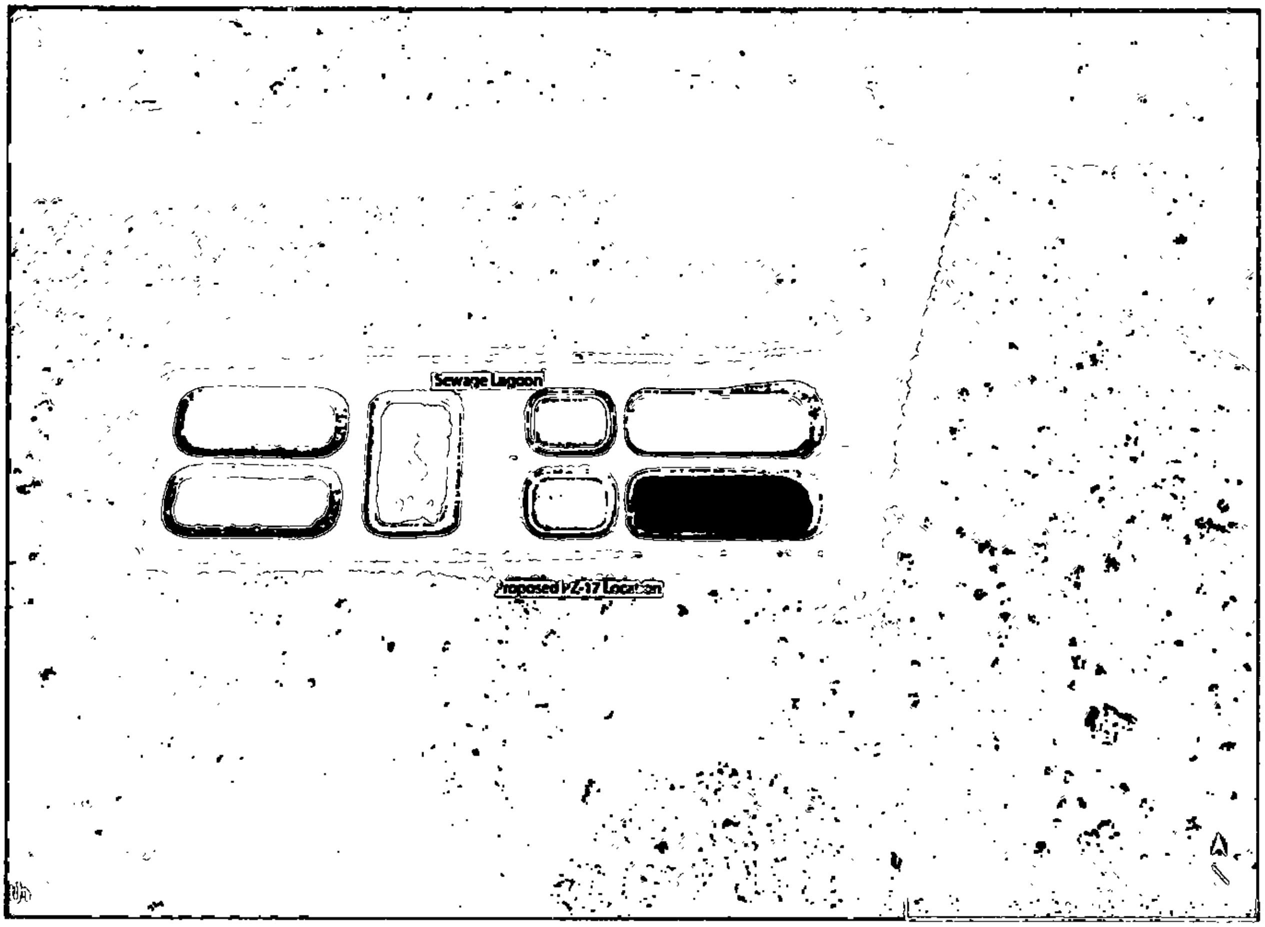


Figure 3: Proposed Location of PZ-17

03268

Location and Design of PZ-18

PZ-18 is located 50 feet from Pond 5, close to the central axis of the impoundment. (Figure 6). Proposed construction is presented in Figure 7. Drilling will be by dry drilling using air rotary until such a point that returns are weak and a surfactant mist (Halliburton Quick-Foam™) will be used. Final construction and placement of the well screen will be determined in the field based on examination of continuous core and geophysics. Twenty feet of well screen will be used with two feet extending beyond the geologic contact. A 5 foot sump will be constructed to allow space if any future testing should occur

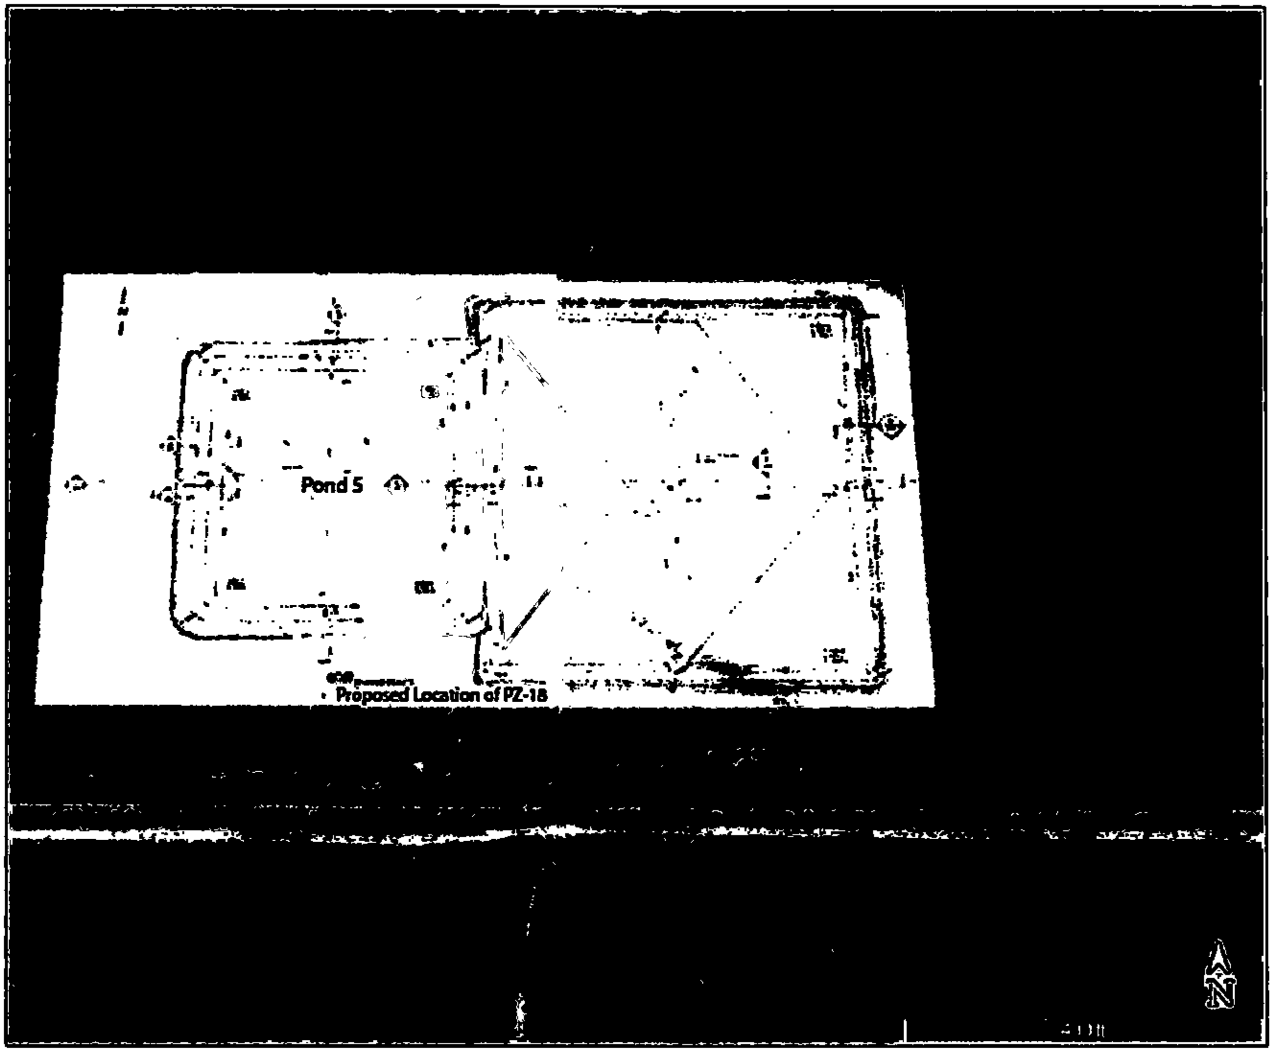

Figure 6: Proposed Location of PZ-18

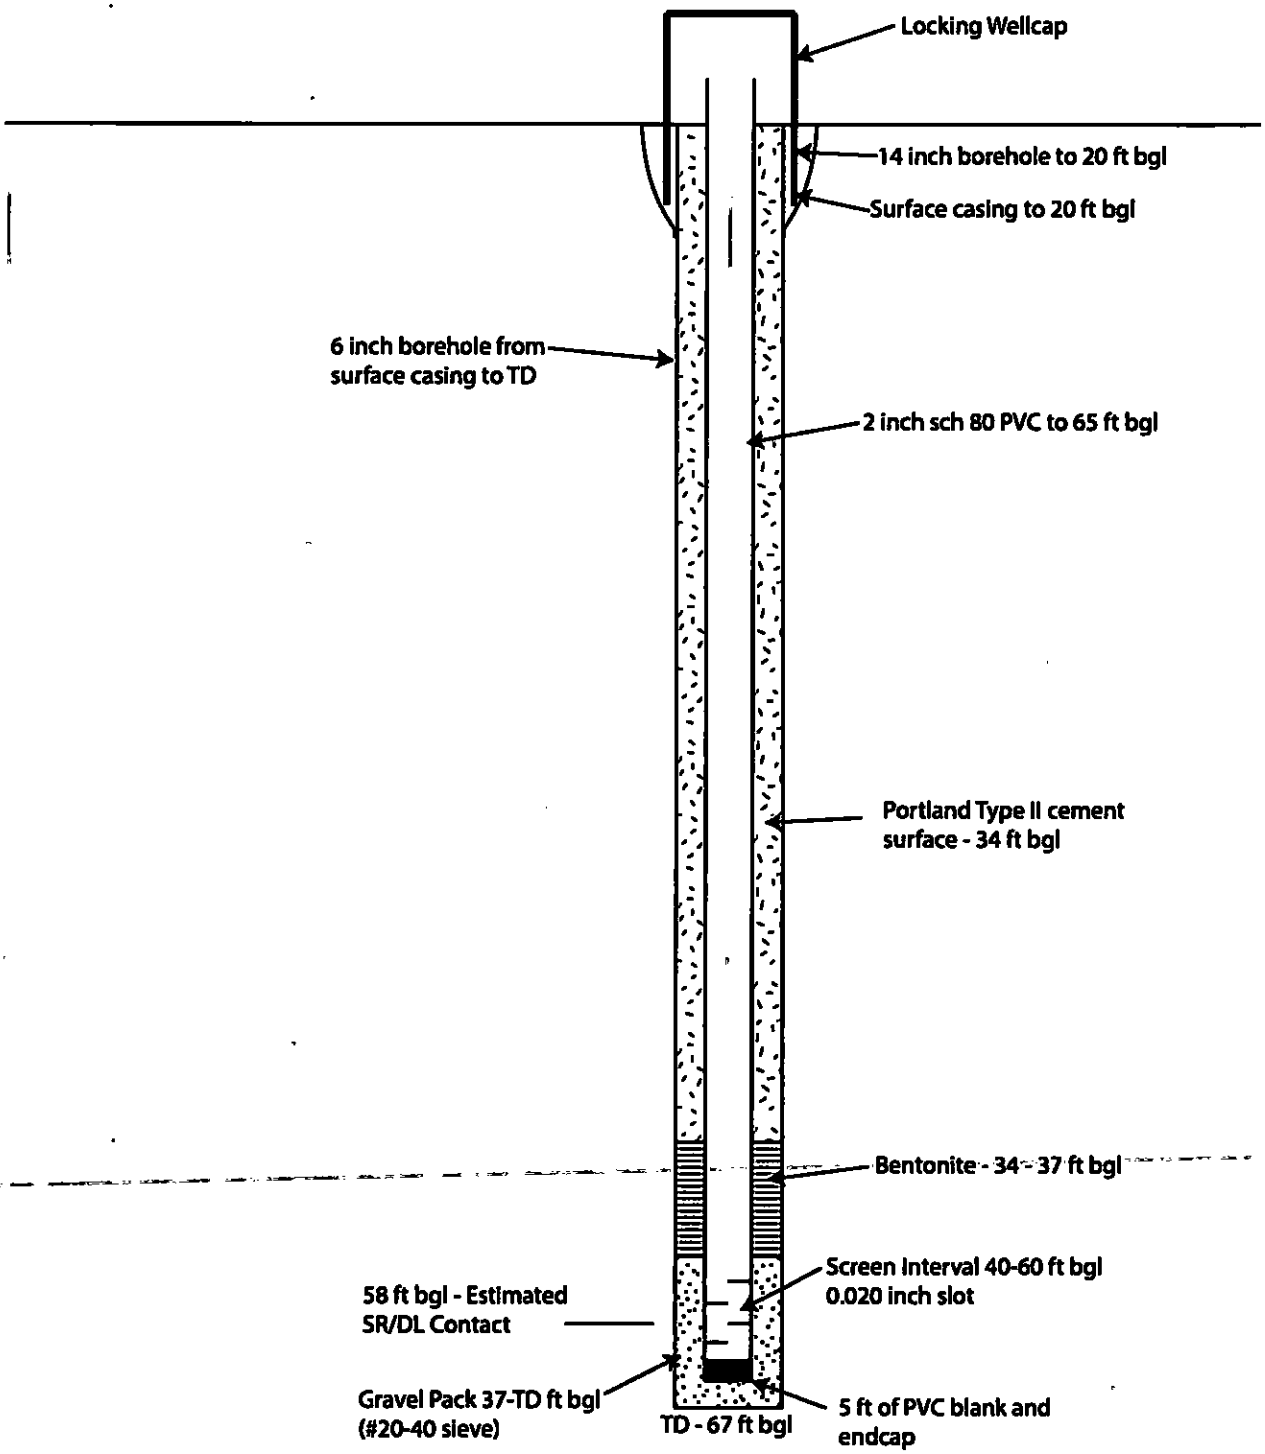
Figure 7 : PZ-18 Construction

Not To Scale



03270

Location and Design of PZ-19

PZ-19 is located 50 feet south of the H-19 evaporation pond in line with the central axis (Figure 8). At this location there is a possibility of installing two monitoring wells. The decision to install one or two wells will be made in the field using the criteria described in the drilling scenarios above. Drilling will be by dry drilling using air rotary until such a point that returns are weak and a surfactant mist (Halliburton Quick-Foam™) will be used.

One corehole will be drilled and the core will be examined to total depth. The target depth for this hole will be in the lower Dewey Lake where the cementation changes from carbonate to sulfate (gypsum). The intent of this well is to determine if there is water at the cementation change. (Figure 9)

If there is no identified water at the cementation change and water is identified in the shallow interval of the Santa Rosa and Dewey Lake geological contact, then the corehole will be plugged up to the surface using tremmie pipe and Portland Type II cement contact and a shallow well will be installed (Figure 10).

A single shallow well will be installed and screened across the Santa Rosa and Dewey Lake geologic contact. This will be used to monitor potential future influx of water. (Figure 10).

Final construction and placement of the well screen will be determined in the field based on examination of continuous core and geophysics. Twenty feet of well screen will be used with two feet extending beyond the geologic contact. A 5 foot sump will be constructed to allow space if any future testing should occur. A twenty foot steel surface casing will also be installed after coring of 25 feet

Final construction and placement of the well screen will be determined in the field based on examination of core and geophysics. If while drilling the deeper borehole, there is a greater influx of water from the Santa Rosa/Dewey Lake geologic contact, a contingency for this will be to install and cement steel casing across the geologic contact.

RE: NMED concerns regarding the DP-831 Well Decision Plan, DP-831, Waste Isolation Pilot Plant

Dear Mr. Brown,

The New Mexico Environment Department (NMED or Department) provides this response regarding a DP-831 proposed Well Decision Plan (Plan) submitted to the Department via email on January 27, 2020. The submittal requests an approval of the Plan. Before the Department can approve the Plan, the Department will need resolution of the following issues and associated commitments within the Plan.

The Plan provides drilling scenarios for PZ-17 and PZ-19, i.e. nested wells (one shallow and one deep), in a particular sequence. NMED believes it would be preferable to perform borehole drilling and well installation as follows.

a. The shallow borehole drilling and associated well installation (to the Santa Rosa/Dewey Lake contact, or shallow contact) should be performed first at each nested well location. NMED considers the original Plan's proposal to create an open borehole to the Lower Dewey Lake cementation change (deep contact) problematic due to the potential of aquifer cross-contamination. Should shallow water exist, it is anticipated that that water would inappropriately cascade down an open borehole to the deeper contact. NMED agrees that a shallow well will be installed at each location in each shallow borehole regardless of the presence of any groundwater.
b. The deep borehole drilling (and possible associated well installation) to the Lower Dewey Lake cementation change (or deep contact) at each nested well location should be performed second or after the shallow wells are installed and the presence of groundwater at the shallow contact is determined. Should water exist in the shallow well, it is preferable to install a surface casing that isolates the Santa Rosa Formation and any

shallow water in that formation while drilling the deeper portion. This borehole should be allowed to stand open overnight to ascertain the presence of deeper groundwater. Should groundwater accumulate at the bottom of the deep borehole, the Department concurs that a well should be installed in the hole. NMED agrees that a deep well will be installed at PZ-17 and PZ-19 only if groundwater is identified at the deep contact.

NMED considers it problematic that the original Plan proposes to first drill to the deep zone and, if no groundwater is encountered, to cement the borehole up to the shallow zone. It is difficult to emplace cement to a particular depth in a borehole without visual confirmation and it is possible that cement in the borehole in proximity to the shallow well screen will cause non-representative groundwater to exist in the shallow wells.

NMED anticipates that all boreholes, including both the shallow and deep boreholes, will be continuously cored and that core will be retained for future review by NMED. During our phone conversation on January 15, 2020, a WIPP representative committed to collecting continuous core, yet this commitment is not in the Plan.

NMED requests WIPP specify the types of geophysical logs proposed on the first paragraph of Page 2 of the Plan. Specific geophysical logging types will dictate numerous aspects of the borehole drilling and well construction.

NMED requests that, should the presence of groundwater in the bottom of each borehole not be readily obvious, that the borehole be allowed to stand open overnight to ascertain the existence of groundwater in the target zone.

NMED requests that WIPP identify the drilling method to be used. Clearly fluids associated with mud-rotary drilling would complicate the effort to identify saturated intervals in the boreholes.

NMED suggests that the Plan specify that monitoring wells will be located based on groundwater flow direction and the need for monitoring wells to be located downgradient of the monitored unit so as best to be able to detect a release from that unit. The Plan may state that without further information the wells will be located "close to the central axis of each impoundment."

NMED has the following comments on Figures 2, 4, 5, 7, 9, and 10.

a. NMED considers it advantageous to commit to utilizing 20 feet of surface casing in each borehole to maintain borehole stability from the ground surface to 20 feet below ground surface. The figures should reflect this.
b. NMED considers it preferable to utilize sch 80 PVC instead of sch 40 PVC to prevent casing deformation caused by heat created during cementation. The figures should reflect this.
c. NMED questions the reference to 15 feet of screened interval for each well. NMED suggests that the length of the screened interval be consistent with all other wells at the facility.

d. NMED suggests there be a commitment that all screened intervals will penetrate each monitored contact by precisely two feet.
e. NMED suggests that figures for the deeper boreholes detail the surface casing to be installed across the Santa Rosa Formation and how far that casing will penetrate the lower contact.
f. NMED would like an explanation of the purpose of the eight feet of PVC blank casing and end cap associated with each well. Eight feet is unusually long.

NMED would like a commitment to be sufficiently informed of when drilling will occur to allow NMED personnel to be onsite if available.

If you have any comments, questions, or concerns, please contact me at (505) 827-2909 or avery.young@state.nm.us.

Sincerely,

Avery Young

DP-831 Well Decision Plan
Wells for Pond 4, Pond 5, Facultative Lagoon, and H-19

Introduction

The Waste Isolation Plant is in the midst of several construction projects. The Safety Significant Confined Ventilation System (SSCVS) is one of these projects. Associated with the New Filter Building and the new shaft, there will be two lined evaporation ponds, and a lined salt storage cell. The salt storage cell will hold the cuttings/spoils from shaft sinking. One evaporation pond (Pond 4) will capture water runoff from the area of the filter building, and the other evaporation pond (Pond 5) will be used to capture water collected from the shaft spoils pile. The new ponds and shaft spoils pile cell were included as modifications in the recently submitted DP-831 renewal application to the New Mexico Environment Department (NMED) Groundwater Quality Bureau (GWQB), and is under review by the GWQB. During the DP-831 GWQB review, WQB, an additional monitoring wells have been requested. Wells were requested at Pond 4, Pond 5, the Facultative lagoon, and the H-19 evaporation pond.

This paper discusses the history of the anthropogenic shallow subsurface water (SSW), location of each well, and where the wells are to be located, and describe the pre-installed well construction based on known or predicted geology at each location.

Historical Discussion of the SSW

Shallow subsurface water was first discovered seeping into the Waste Handling Shaft at WIPP during an inspection in 1996. Investigation of the seeps began in 1996 with the installation of three wells around the waste shaft followed by 13 more wells at the site. Subsequent hydrologic modeling suggested that that the SSW was anthropogenic, generated by unlined ponds and salt storage cells.

The SSW is a perched water system, created by permeability difference between the Santa Rosa Formation (Santa Rosa) and the underlying Dewey Lake Formation (Dewey Lake). At approximately 180 feet deep into the Dewey Lake Formation the matrix cement changes from a carbonate to a sulfate (gypsum). This change in cement change creates an aquiclude, which causes the perching of natural Dewey Lake Formation water. Because the Dewey Lake permeability is much lower than the Santa Rosa, infiltrating water is impeded from further vertical migration. Water is retained on the upper surface of the Dewey Lake, as identified by wells throughout the WIPP site and documented in semi-annual reports for the DP-831 Permit. The cement change from carbonate to sulfate, however, is not spatially continuous. Well WQSP-6A was installed in an area where the change in cement, and therefore the aquiclude, exists. There are wells 3 miles south of WIPP, at the Mills Ranch, where natural water is perched on this cementation change in the deep Dewey Lake.

Drilling Scenarios

Although four wells have been requested, as many as six wells may be required to monitor different depths of the Dewey Lake Formation, if water is present. The nomenclature for the wells will be consistent with the current nomenclature. The well designations will be PZ-16 for Pond 4, PZ-17 for the sewage lagoon, PZ-18 for Pond 5, and PZ-19 for the H-19 pond. Additional wells (maximum of two), into the deeper Dewey Lake, may be required to determine if there water is present, and if so, for monitoring this horizon. Pre-drilling well construction was based on this premise.

There may or may not be water discovered in Wells PZ-17 and PZ-19 drilled into the lower Dewey Lake. The draft DP-831 Permit requires two deep wells to be drilled. While drilling, the Santa Rosa and Dewey Lake geological contact will be observed for evidence of SSW. Well drilling will continue into the deep Dewey Lake Formation to the cementation change. Geologic core and geophysical logs will be examined for evidence of water. A pause in drilling will take place to see if water collects into the drill hole at both depths. The drilling scenarios and resulting actions are as follows:

1.) Water is determined in both the shallow and deep zone: Install two wells; one in the deep Dewey Lake to monitor the water at the change in cementation and one in the shallow zone to monitor water at the Dewey Lake and Santa Rosa geologic contact.
2.) Water is not detected in the lower Dewey Lake Formation, but it is in the shallow zone of the Dewey Lake and Santa Rosa geologic contact: finish drilling and cement drill hole up to the shallow zone and install only the shallow well.
3.) No water is detected at either interval, deep or shallow: Install only a shallow well to monitor if a leak occurs in the liner of the sewage lagoon.

Final well construction will be determined while drilling, observing cuttings, core, and rig penetration rates. During discussions with the NMED GWQB, their preference was to install the monitoring wells as close to the central axis of each impoundment.

Location and Design of PZ-16

PZ-16 is located 50 feet from Pond 4, close to the central axis of the impoundment. (Figure 1). Proposed construction is presented in Figure 2. Final construction and placement of the well screen will be determined in the field based on examination of core and geophysics.

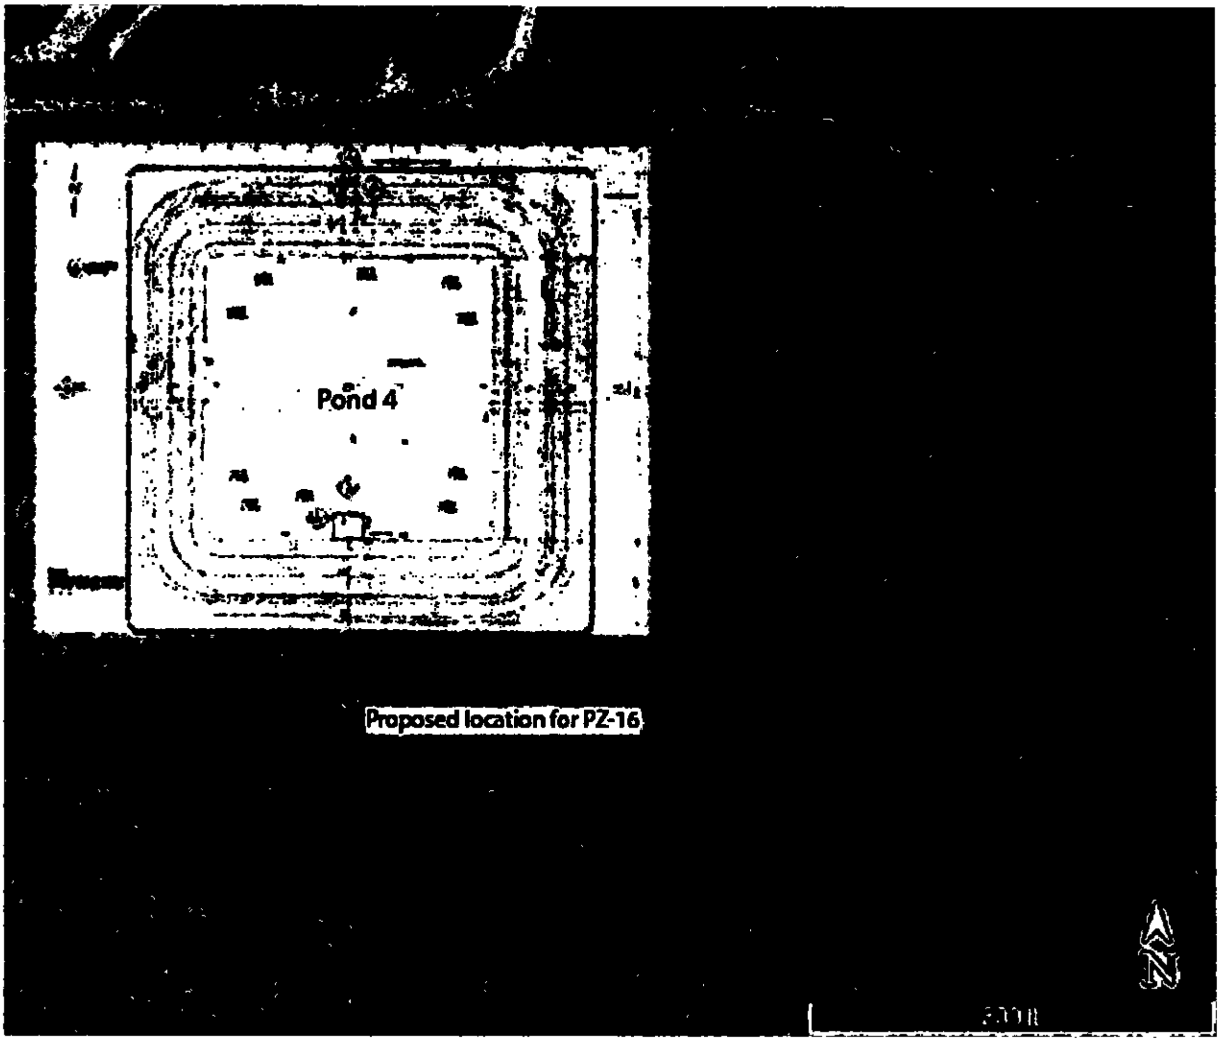

Figure 1: Proposed Location of PZ-16

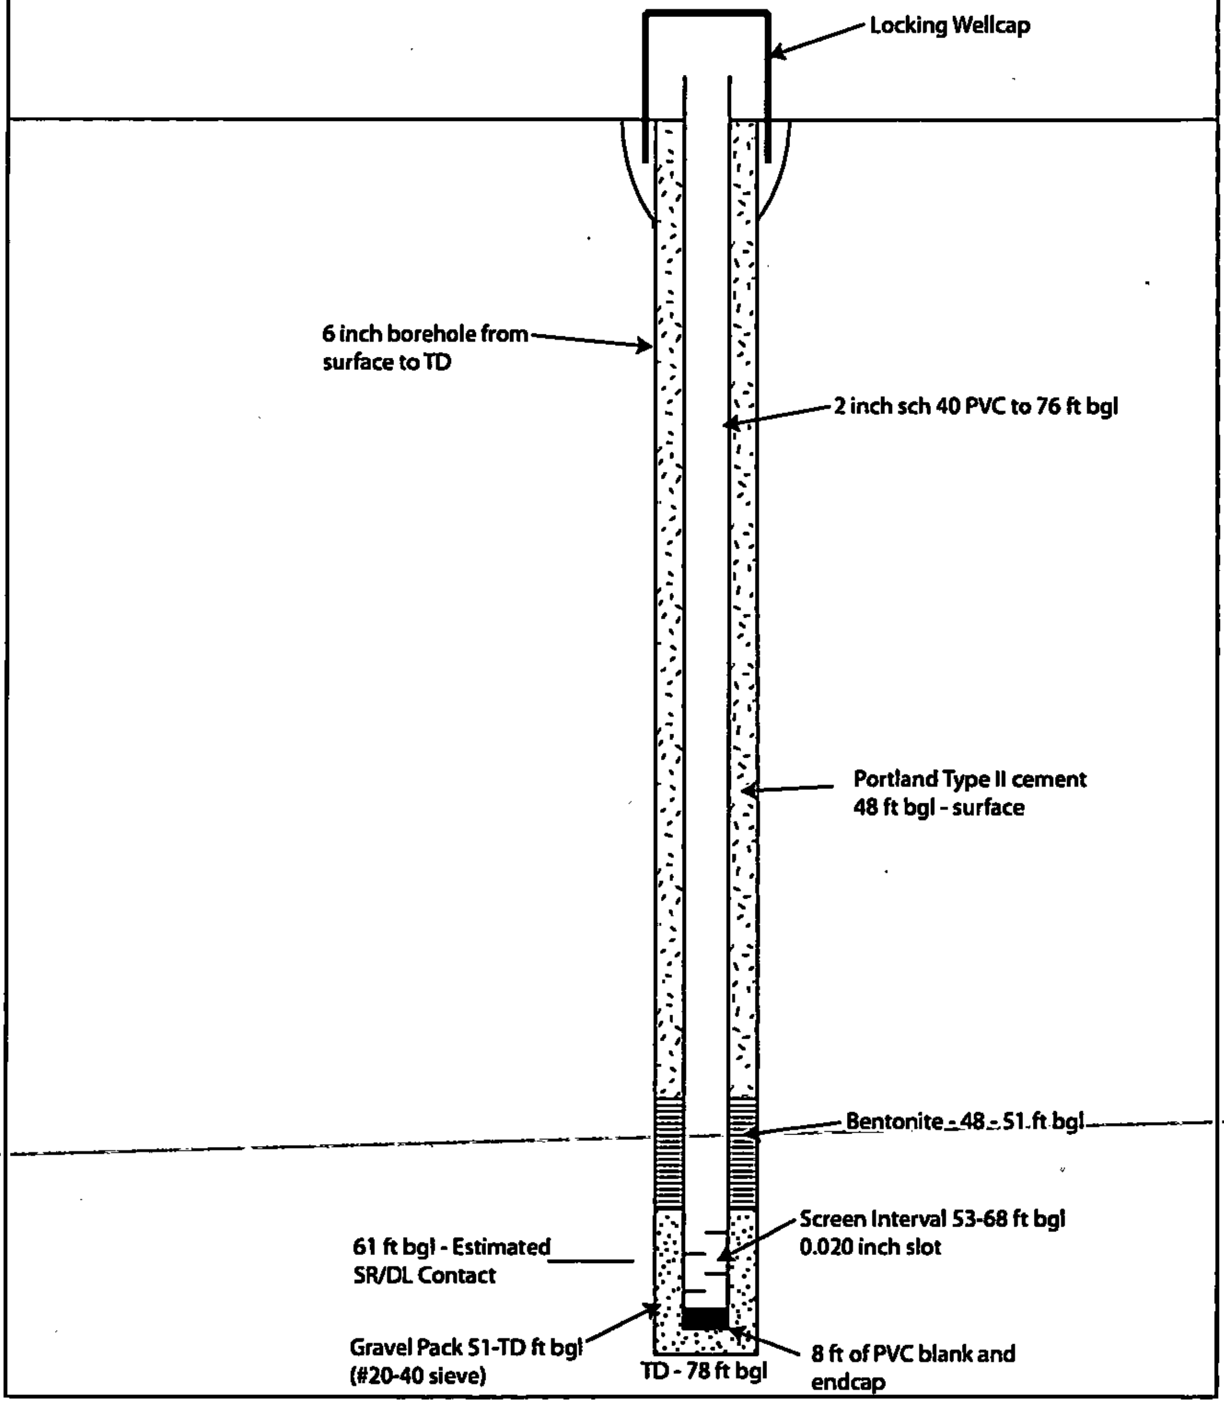
Figure 2 : PZ-16 Construction

Not To Scale



03282

Location and Design of PZ-17

PZ-17 is located 20 feet south of the Sewage Lagoon in line with the central axis (Figure 3). At this location there is a possibility of installing two monitoring wells. The decision to install one or two wells will be made in the field using the criteria described in the drilling scenarios above.

One corehole will be drilled and the core will be examined to total depth. The target depth for this hole will be in the lower Dewey Lake where the cementation changes from carbonate to sulfate (gypsum). The intent of this well is to determine if there is water at both the Santa Rosa and Dewey Lake geological contact and at the cementation change. If there is water at both target depths, then two wells will be installed to monitor the intervals. One will be a shallow screened well and the other a deep screened well (Figures 4 and 5)

The other scenario would be if there is no identified water at the cementation change and water is identified in the shallow interval of the Santa Rosa and Dewey Lake geological contact, then the corehole will be plugged up to the contact and a shallow well will be installed (Figure 4).

The third scenario is if there is no water in either interval, then a single shallow well will be installed screened across the Santa Rosa and Dewey Lake geologic contact. This will be used to monitor potential future influx of water in the future (Figure 4).

Final construction and placement of the well screen will be determined in the field based on examination of core and geophysics.

03286

Location and Design of PZ-18

PZ-18 is located 50 feet from Pond 5, close to the central axis of the impoundment. (Figure 6). Proposed construction is presented in Figure 7. Final construction and placement of the well screen will be determined in the field based on examination of core and geophysics.

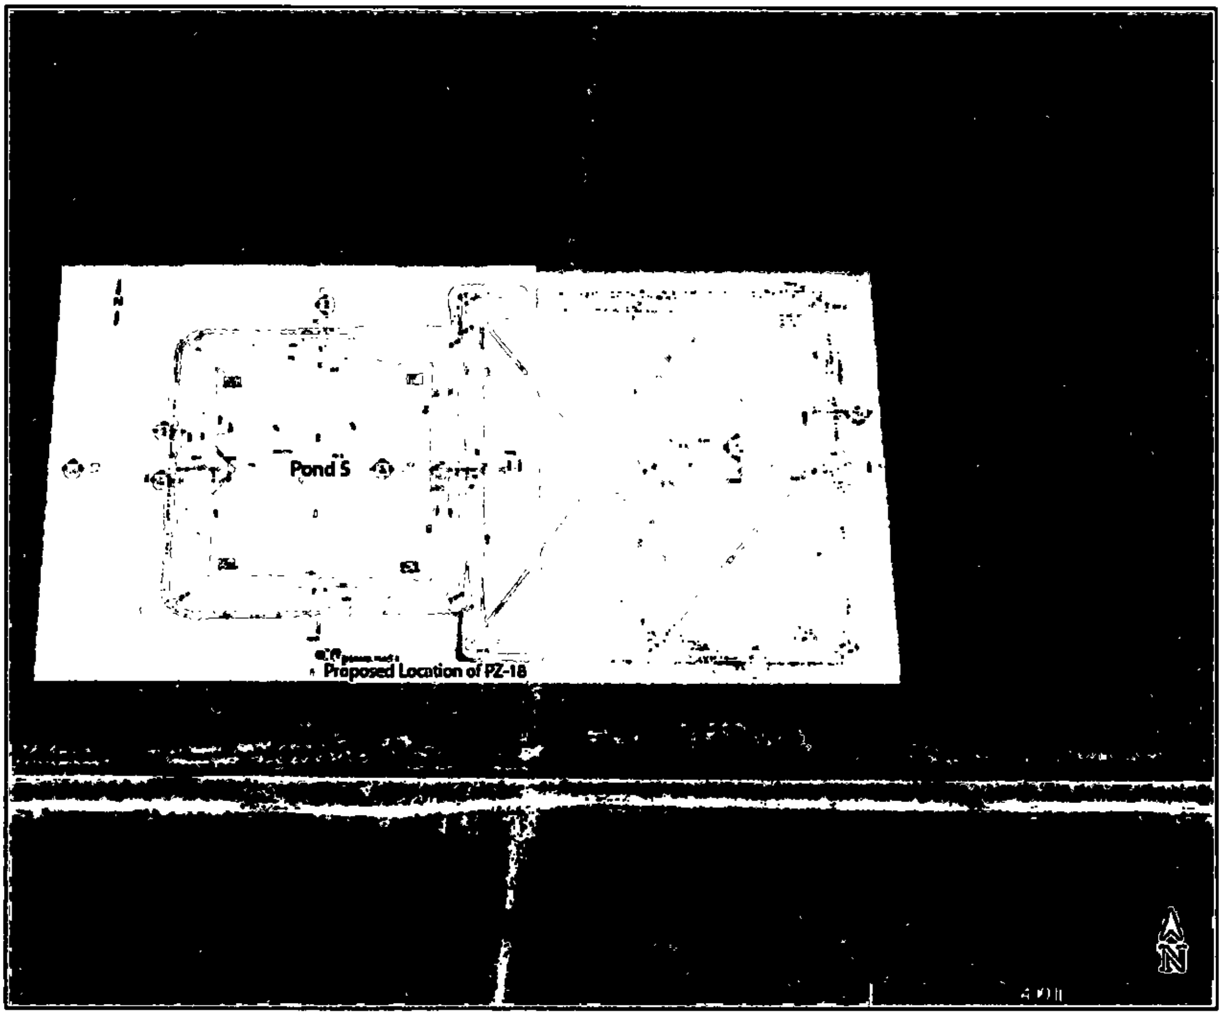

Figure 6: Proposed Location of PZ-18

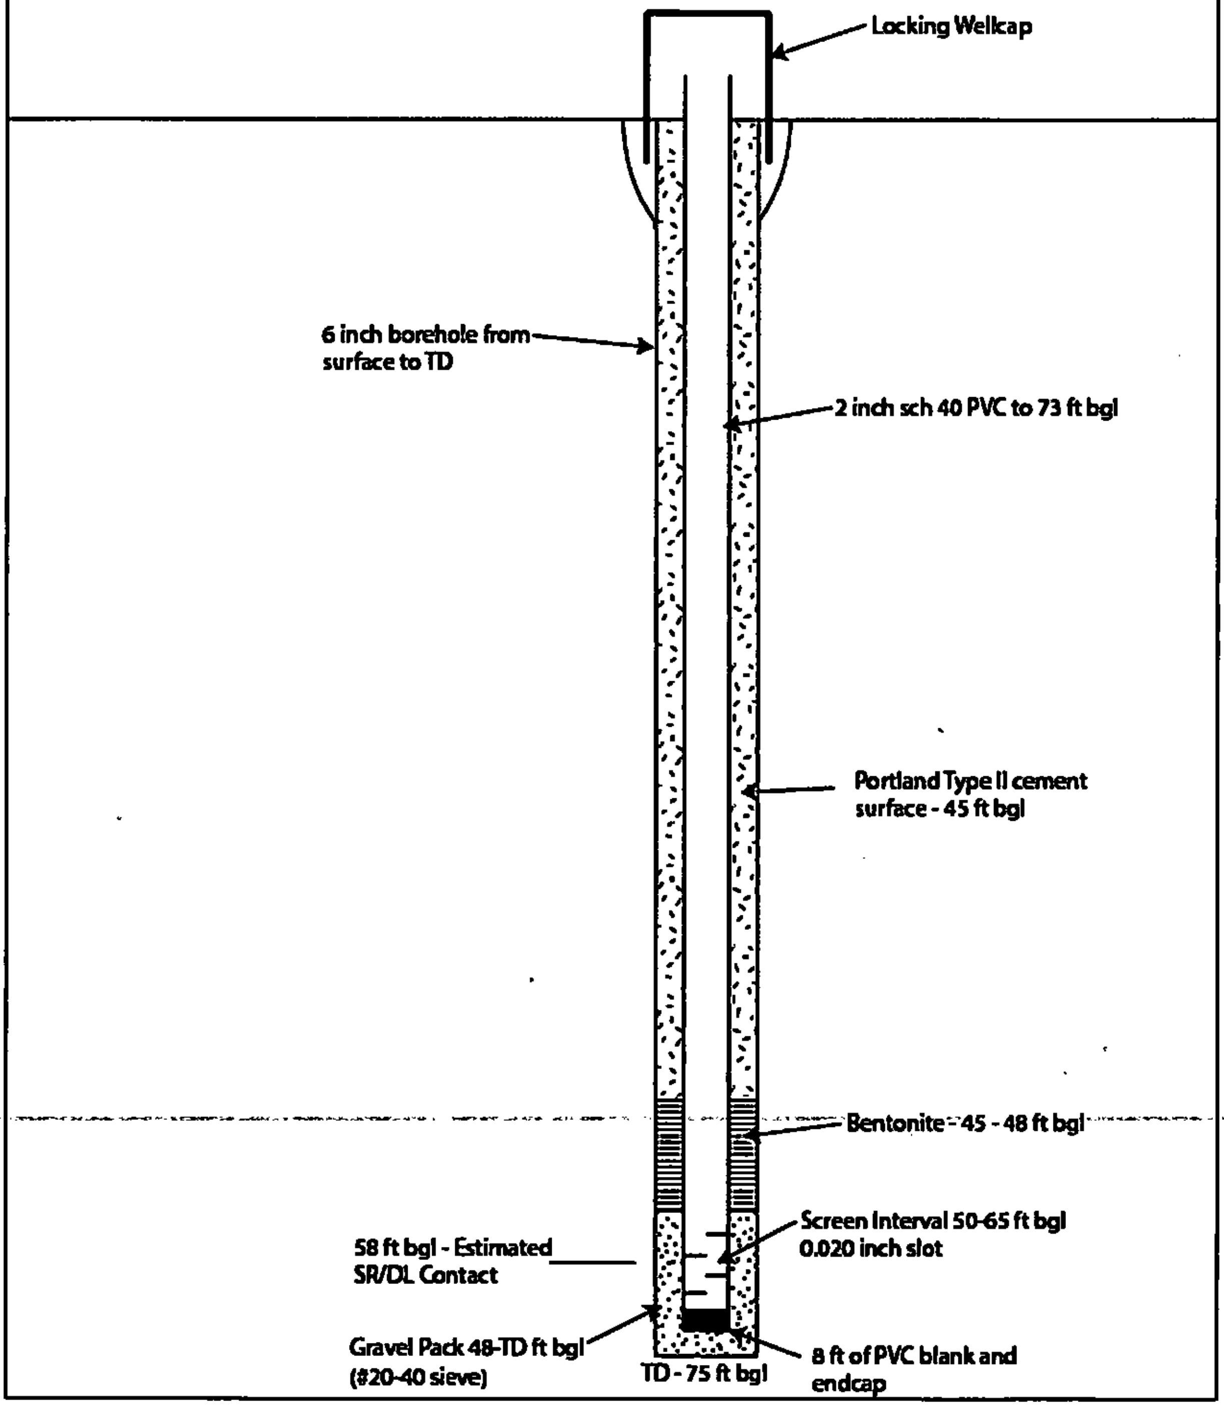
Figure 7 : PZ-18 Construction

Not To Scale



Location and Design of PZ-19

PZ-19 is located 50 feet south of the H-19 Evaporation Pond in line with the central axis (Figure 8). At this location there is a possibility of installing two monitoring wells. The decision to install one or two wells will be made in the field using the criteria described in the drilling scenarios above.

One corehole will be drilled and the core will be examined to total depth. The target depth for this hole will be in the lower Dewey Lake where the cementation changes from carbonate to sulfate (gypsum). The intent of this well is to determine if there is water at both the Santa Rosa and Dewey Lake geological contact and at the cementation change. If there is water at both target depths, then two wells will be installed to monitor the intervals. One will be a shallow screened well and the other a deep screened well (Figures 9 and 10)

The other scenario would be if there is no identified water at the cementation change and water is identified in the shallow interval of the Santa Rosa and Dewey Lake geological contact, then the corehole will be plugged up to the contact and a shallow well will be installed (Figure 9).

The third scenario is if there is no water in either interval, then a single shallow well will be installed screened across the Santa Rosa and Dewey Lake geologic contact. This will be used to monitor potential future influx of water in the future (Figure 10).

Final construction and placement of the well screen will be determined in the field based on examination of core and geophysics.

ACTION LEAKAGE RATES FOR LEAK DETECTION SYSTEMS

[Supplemental Background Document for
the Final Double Liners and Leak Detection Systems Rule for
Hazardous Waste Landfills, Waste Piles, and Surface Impoundments]

U. S. ENVIRONMENTAL PROTECTION AGENCY

ABSTRACT

This document supplements the background document [Ref. 4] for the May 29, 1987 proposed double liners and leak detection systems rule. This supplement explains the application of the formulas in the original background document to calculate an action leakage rate (called rapid and extremely large leak in the proposal), presents the results of action leakage rate calculations for facilities meeting the minimum design specifications in the final rule, and provides results from a more sophisticated 3-dimensional model. The action leakage rates, based on the minimum specifications in the final rule and a safety factor of two, are 100 gallons per acre per day (gpad) for landfills and waste piles, and 1,000 gpad for surface impoundments. The output from the 3-D model helps to visualize the shape of the flow for various design specifications and shows the relative impact of a number of factors on flow capacity.

This supplemental background document also presents additional data on flow rates actually achieved at a number of double-lined facilities. These numbers support the proposed and final rules by showing that facilities with good construction quality assurance (CQA) perform significantly better than those without. Further, only about 70% of the well designed facilities with good CQA meet 20 gpad which was proposed as the upper bound for a base action leakage rate, and sources of liquids other than top liner leakage can themselves result in flow rates from the leak detection system greater than 20 gpad, indicating that the proposed 20 gpad is too low for a practical action leakage rate.

Finally, this supplemental document also references a number of technical guidances the Agency has issued since the three proposals[1] that contain useful information relative to all of the design, performance, monitoring, and response action standards in the final rule.

1. INTRODUCTION

The purpose of this document is to supplement the original background documents supporting the 1986 and 1987 proposals for double liners and leachate collection and removal systems, and liners and leak detection system rules[2] for hazardous waste landfills, surface impoundments, and waste piles. A lot of information has been generated since the 1986 and 1987 proposals that further support this rulemaking. In particular, data on actual flow rates at double-lined landfills and surface impoundments and on top liner performance has been collected and evaluated, flow models have been applied to calculate action leakage rates, and a number of technical guidances have been published. This document discusses each of these.

2. ACTUAL FLOW RATES MEASURED IN THE FIELD

EPA acknowledged in the May 1987 preamble and background document that it had limited data on the performance capability of top liners in terms of flow rates and stated that the Agency is seeking additional data. Since the proposal, EPA has gathered information from a number of facilities, including some data submitted by commenters. This data is summarized here.

2.1 Data From Commenters

In response to EPA's request for more data, some commenters (facility operators) submitted actual flow data. One commenter claimed to achieve, after removal of construction water, a leakage rate of 2-3 gpad at six landfills and 0, 0, 18, and 75 gpad at four (non-regulated) surface impoundments. Commenters made a number of claims regarding other sources of liquids in leak detection systems: consolidation water (from clay in composite top liners) can be 10-50 gpad; construction water can be 10-50 gpad; vapor transmission through a top liner geomembrane can be 4 gpad; and ground water through a geomembrane in the bottom liner can be 20 gpad.

2.2 Data From Operating Units

Information on top liner performance can be obtained from an analysis of leachate detection, collection, and removal systems (LDCRS) flow rates. The results of field monitoring of LDCRS flows at double-lined landfills and surface impoundments have been presented by EPA [1987], Gross et al. [1990], and Bonaparte and Gross [1990]. The reference by Bonaparte and Gross includes the data from all the other references cited above, as well as a

significant body of otherwise unpublished information. The findings from Bonaparte and Gross are presented in Section 2.3.

2.3 Evaluation of Available Information

Bonaparte and Gross [1990] presented LDCRS flow rate data for 55 individually-monitored double-lined landfill cells and 14 individually-monitored double-lined surface impoundments. The units are located in different climatic regions across the United States; however, most of the units are located in relatively moist climatic regions with average annual rainfalls ranging from 35 to 43 in (900 to 1,100 mm). For each unit, they presented information on the design and operation of the unit, as well as the rate of flow from the LDCRS. Then they evaluated the probable sources of the flow from each unit. Potential sources of flow are illustrated in Figure 1 and include: (i) leakage through the top liner; (ii) water from precipitation that percolates into the LDCRS during construction ("construction water"); (iii) water squeezed out of the clay component of a composite top liner as a result of clay consolidation ("consolidation water"); and (iv) ground water that infiltrates the bottom liner and enters the LDCRS ("infiltration water").

Landfills with Geomembrane Top Liners

In their paper, Bonaparte and Gross evaluated flow rate data from 23 landfill cells that were constructed with geomembrane top liners (instead of composite top liners). A geomembrane top liner represents the minimum technology requirement for top liners at hazardous waste management units regulated under 40 CFR Parts 264 and 265. The authors determined that for 16 of the 23 landfills cells, there could be no consolidation water, and, based on design and operating considerations, construction water and infiltratin water were unlikely sources of LDCRS flow. As a result, the measured LDCRS flow could only be attributed to top liner leakage. Eleven of the 16 landfill cells had been constructed using construction quality assurance (CQA) procedures in substantial conformance with EPA [1986] guidance. The other five cells were constructed using less stringent CQA procedures or no CQA at all.

Table 1 presents a summary of the data for the 16 landfill cells constructed with geomembrane top liners. In Table 1, the LDCRS flow rates are reported in units of gallons per acre of lined area per day (gpad).

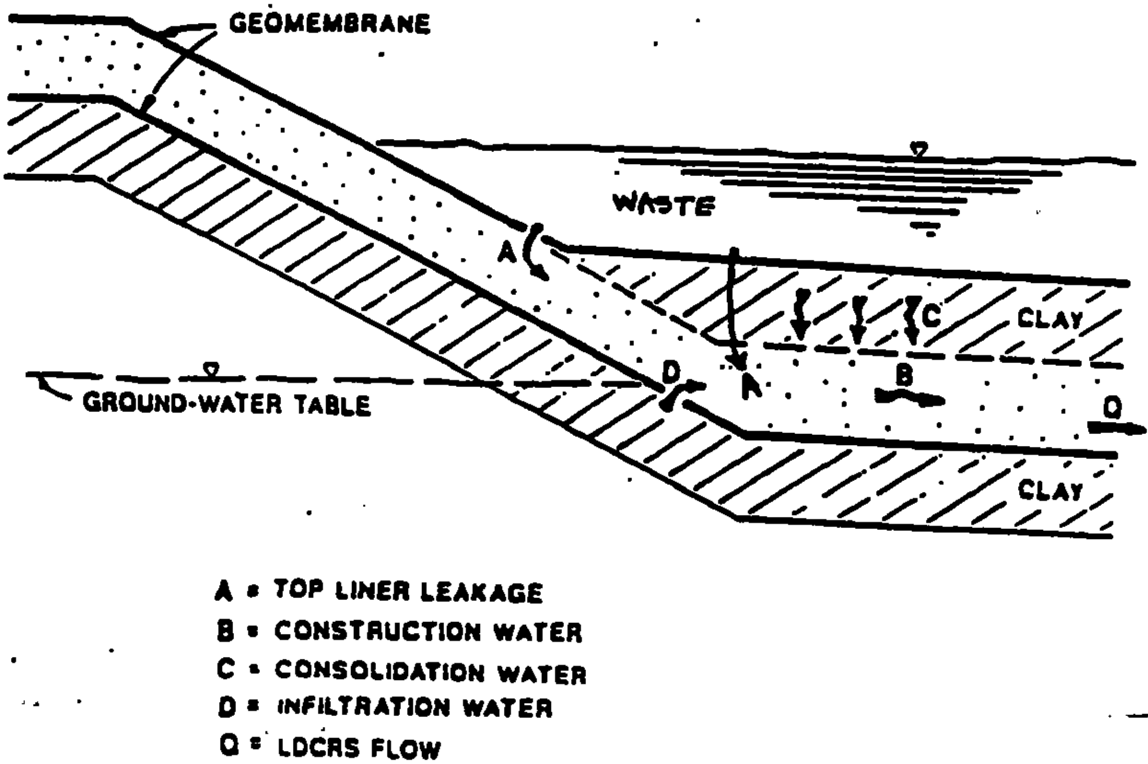

Figure 1. Sources of Flow in Leak Detection, Collection, and Removal Systems (LDCRSs).

03306

Table 1. Comparison of average LDCRS flow rates at 16 landfill cell with geomembrane top liners (from Bonaparte and Gross [1990]).

Leakage Detection Layer Flow Rate	No. of Cells	
	CQA	No CQA
Flow rate less than 5 gpad	4	-
Flow rate in range of 5 to 20 gpad	4	1
Flow rate in range of 20 to 50 gpad	3	-
Flow rate greater than 50 gpad	-	4

From Table 1, it can be seen that of the eleven landfill cells that were constructed using a CQA program, four cells had average flow rates less than 5 gpad (50 liters per hectare per day (lphd)), and a total of eight cells had average flow rates less than 20 gpad (200 lphd). The data in Table 1 show that a base leakage rate of 20 gpad (200 lphd), which is the top of the range for the base action leakage rate in the proposal, is too low (i.e., not "practicable") since only 73 percent (eight out of eleven) of the cells that had properly constructed geomembrane top liners using rigorous CQA procedures achieved a LDCRS flow rate of less than 20 gpad (200 lphd).

Table 1 also provides evidence of the benefit of a rigorous CQA program. All eleven units constructed using CQA procedures had LDCRS flow rates of less than 50 gpad (500 lphd), and eight of the eleven facilities had flow rates of less than 20 gpad (200 lphd). In contrast, four of the five units that were constructed with less rigorous CQA procedures or with no CQA at all had LDCRS flow rates in excess of 50 gpad (500 lphd), and two units had LDCRS flow rates in excess of 100 gpad (1,000 lphd). At these two units LDCRS flow rates were on the order of 300 gpad (1,000 lphd). In summary, the LDCRS flow rates from waste management units with rigourous CQA programs are significantly lower than the flow rates from units without rigorous programs.

Based on these data, it appears that flow rates from LDCRSs of landfills that are properly constructed using rigorous CQA programs should be well less than 100 gpad (1,000 lphd). On the other hand, if a unit is constructed using less rigorous CQA procedures, LDCRS flow rates greater than 100 gpad (1,000 lphd) may occur.

Surface Impoundments with Geomembrane Top Liners

Conclusions similar to those given above for landfills can also be drawn for surface impoundments. Bonaparte and Gross [1990] presented data on LDCRS flow rates from eight double-lined surface impoundments having geomembrane top liners. The authors determined that for six of these surface impoundments, top liner leakage was the likely source of any LDCRS flow. Five of the six surface impoundments were constructed with rigorous CQA programs, including either ponding tests or leak location surveys; it is not known if CQA was performed during the construction of the sixth surface impoundment. The authors reported that four of the six surface impoundments exhibited no LDCRS flow in the time period between the start of operation and the time the flow data was collected. The fifth surface impoundment exhibited no flow except during a short period between when a geomembrane defect developed and when it was repaired. The sixth surface impoundment exhibited a flow of about 0.2 gpad (2 lphd), except during a short period when the flow increased to about 40 gpad (400 lphd) due to a geomembrane defect. Thus, all six of the monitored surface impoundments with geomembrane top liners had LDCRS flow rates below 5 gpad (50 lphd) except during a short period between when a geomembrane defect developed and when it was repaired. This represents an extremely high level of performance; in fact it represents a higher level of top liner performance than was observed at landfills having geomembrane top liners. This high level of performance was obtained by using ponding tests and/or leak location surveys as part of the CQA program. These CQA techniques are typically better adapted to use at surface impoundments than landfills because surface impoundments are frequently smaller than landfill cells resulting in easier implementation of ponding tests or surveying techniques. In addition, geomembrane top liner defects that may develop after construction are generally easier to find and repair in a surface impoundment than in a landfill. The top liner in a surface impoundment is typically uncovered (or covered with only a thin veneer of soil), whereas the top liner in a landfill cell is covered with a drainage layer (leachate collection and removal system or LCRS) and then with a thick layer of waste which makes access to the liner difficult.

Based on the available data, it appears that flow rates from the LDCRSs of surface impoundments that are properly constructed using rigorous CQA programs (those that use leak location surveys or ponding tests) should be well less than 100 gpad (1,000 lphd). It should be anticipated, however, that if a unit is constructed using less rigorous CQA procedures, a flow rate greater than 100 gpad (1,000 lphd) could occur. It is interesting to note that leak location surveys and ponding tests represent two techniques that are frequently implemented as part of a response action plan at surface impoundments experiencing excessive flow from the LDCRS. The results described herein suggest that these techniques will be effective in reducing the LDCRS flow rate to below 100 gpad (1,000 lphd) at surface impoundments for which response actions are required.

Landfills with Composite Top Liners

The evaluations discussed above were for double-lined units having geomembrane top liners. It is also useful to consider units having composite top liners to assess the contribution of consolidation water from the clay component of the top liner toward potentially exceeding an action leakage rate. Although the action leakage rate in the final rule, as in the proposal, is based on total flow in the LDCRS, regardless of source, the response actions should consider sources other than leaks. For this reason, it is relevant to compare LDCRS flow rate data from units with composite top liners.

Bonaparte and Gross [1990] evaluated LDCRS flow rate data from 32 landfill units with a composite top liner. Because the top liner is a composite liner, the primary source of the flow can be attributed to construction water plus consolidation water if an analysis of the time required for leakage to flow through the top liner (i.e., leakage breakthrough time) was greater than the time since the end of construction of the landfill. For 18 of these units, the authors attributed the flow primarily to construction plus consolidation water from the clay component of the composite top liner. Data on these 18 units are provided in Table 2.

Thirteen of the waste management units used to generate the data in Table 2 were constructed using CQA programs in substantial accordance with EPA [1986] guidance; four were constructed without CQA programs; and it is not known if CQA was performed during construction of the remaining unit.

Table 2. Average LDCRS flow rates at 18 landfill cells with composite top liners (from Bonaparte and Gross [1990]).

Leak Detection Layer Flow Rate	No. of Cells
< 5 gpad	5
5 to 20 gpad	8
> 20 to 50 gpad	3
> 50 to 100 gpad	2
> 100 gpad	0

From Table 2, it can be seen that only five of 18 (28 percent) of the landfill cells constructed with composite top liners have LDCRS flow rates of less than 5 gpad (50 lphd), and 13 of 18 cells (72 percent) have LDCRS flow rates of less than 20 gpad (200 gpad). This data is similar to that for geomembrane only top liners, indicating that construction water is rather insignificant at these units (perhaps because overburden pressures have yet to squeeze out the consolidation water). This data also indicates that perhaps a significant source of the liquids at the geomembrane only units is construction water. At any rate, this data further supports the conclusion that an action leakage rate of 20 gpad (200 lphd) is inappropriate since it would mean most waste management units with composite top liners will also have LDCRS flow rates that exceed the action leakage rate under normal operating conditions.

All 18 units with composite top liners exhibited average LDCRS flows below 100 gpad (1,000 lphd). Thus, it appears that properly constructed waste management units with composite top

03309

liners are unlikely to exhibit LDCRS flows that exceed 100 gpad (1,000 lphd).

Surface Impoundments with Composite Top Liners

There is insufficient data to present observations on the performance of this category of facilities. However, it is anticipated that the performance of these facilities would be the same as the performance of landfills with composite top liners.

2.4. Theoretical Analysis of Top Liner Performance

A theoretical analysis of top liner performance was also performed. This analysis further supports the conclusion from the above data that 20 gpad is not a practical action leakage rate.

Available Information

In recent years, various investigators have developed analytical techniques for estimating leakage rates through liners. These investigations include: Bonaparte et al. [1989]; Brown et al. [1987]; EPA [1987]; Giroud and Bonaparte [1989a,b]; Giroud et al. [1991]; and Jayawickrama et al. [1987]. The reference presented by Bonaparte et al. [1989] presents equations to estimate leakage rates through both geomembrane liners and composite liners; these equations are used in the analysis below to estimate leakage rates through top liners.

To estimate the anticipated leakage rate through a top liner at a waste management unit, a frequency of defect and size of defect in the geomembrane component of the top liner must be assumed. Available information on the frequency and size of defects in properly-installed geomembrane liners had been reported by EPA [1987], Giroud and Bonaparte [1989a], Giroud and Fluent [1987], and Laine [1991]. This information is also used below to estimate leakage rates through top liners.

Results of Analysis

Frequency and Size of Geomembrane Defects. Giroud and Bonaparte [1989a] presented limited case study data, including CQA records, records of foresnic investigations, and LDCRS flow rate data, from which they drew "tentative" conclusions regarding the frequency and size of defects in geomembrane liners installed using rigorous CQA procedures. From their data, they recommended that for the purpose of estimating leakage rates through geomembranes, a geomembrane defect (hole) frequency of one to two per acre (two to five per hectare) be considered along with a defect size of 0.005 in^2 (3.2 mm^2). Recently Laine [1991] presented data from two leak location surveys in which geomembrane seam defects were identified at a frequency of two to five per acre (five to twelve per hectare). Thus, the frequency of defects found by Laine is twice as high as the frequency recommended by Giroud and Bonaparte for estimating leakage rates. However, the size of the defect found by Laine was typically very small, i.e., pinhole sized with areas on the order of 0.001 in^2 (0.6 mm^2) or less. The defect size is about five times smaller than the defect size recommended by Giroud and Bonaparte for estimating leakage rates. Since the calculated leakage rate for a given installed area of geomembrane is proportional to the product of the size of the defect and the frequency of defects, the findings of both of the above-described investigations lead to comparable top liner leakage rates when used.

For the analysis of top liner leakage rates presented below, a defect frequency of one per acre (two per hectare) and a defect size of 0.005 in^2 (3.2 mm^2) is assumed.

Analysis Results. The results of calculations using the equations from Bonaparte et al. [1989] for steady-state leakage through geomembrane holes are presented below. For the calculations, it was assumed that the top liner consists of a geomembrane alone, and the hydraulic conductivity of the material overlying the geomembrane is 1 x 10^{-2} cm/s (1 x 10^{-4} m/s) which is appropriate for a landfill with a granular leachate collection and removal system (LCRS). The calculated top liner leakage rates, given the above-described conditions, are presented in Table 3.

Table 3. Calculated leakage rates through a geomembrane top liner.

Liquid head on top liner (ft)	Steady-State leakage rate (gpad)
0.1	10
1.0	60
10.0	220

Calculated top liner leakage rates would be much lower than those given in Table 3 if the top liner was a composite liner rather than a geomembrane alone. Conversely, the calculated top liner leakage rate would be somewhat higher if the material above the top liner had a higher permeability, or if the liner was exposed (as might be the case for a surface impoundment).

The calculation results presented above must be interpreted separately with respect to landfills and surface impoundments. For landfills, the design maximum liquid head in the LCRS is 1 ft (0.3 m). However, the average liquid head under normal operating conditions should be only on the order of 0.1 ft (0.03 m); in many instances, the average head may be only on the order of 0.1 ft (0.03 m), or even less. In this case the calculated results support a conclusion that under normal operating conditions (i.e., when there is an average hydraulic head in the LCRS of 0.1 ft (0.03 m), or less), the leakage rate through a properly designed geomembrane top liner, constructed using proper procedures and rigorous CQA, will frequently be less than 20 gpad

(200 1 phd). During periods of maximum leachate flow (e.g, after major storm events), top liner leakage rates in landfills with geomembrane top liners could temporarily exceed 20 gpad (200 lphd) and approach 60 gpad (600 lphd), since the liquid head in the LCRS during this period could easily exceed 0.1 ft (0.03m).

The calculation results suggest that for surface impoundments constructed with geomembrane top liners (where the liquid head may be on the order of 10 ft (3 m)), top liner leakage rates could easily exceed 20 gpad (200 lphd) and approach 200 gpad (2,000 lphd) even if there is only one small geomembrane defect per acre (two defects per hectare) of liner. Thus, to keep top liner leakage rates below 20 gpad, or even 200 gpad, in surface impoundments with geomembrane top liners, geomembrane defects need to be virtually eliminated. In most cases, this will only be accomplished using ponding tests, leak location surveys, or other "extraordinary" CQA procedures. As shown by the monitoring data presented in Section 2.3 of this report, when these CQA procedures are used, top liner leakage can be largely eliminated, at least for some period of time.

2.5 Summary

As stated in the proposal, and restated by some of the commenters, the existing empirical data base at the time of the proposal regarding actual flow rates was quite limited. EPA has, however, accumulated empirical data since the proposal on the performance of different liner designs. This data help give meaning to different flow rates in terms of the ability of owner/operators and technology to achieve and in terms of leaks versus other sources of liquids. This additional leakage rate data are consistent with the data submitted by the commenters.

The actual flow rate data presented above are summarized in Table 4, for all 40 units.

Table 4. Actual Flow Rates at Double-Lined Individually-Monitored Landfill and Surface Impoundment Units.

LDS FLOW RATE (GPAD)	NO. of UNITS	% of UNITS
< 5	15	38
5-20	13	32
>20-50	6	15
>50	6	15

NOTES TO TABLE: These are units where other sources, except construction water, were determined not to be a factor. Thirty-one of the 40 units were constructed with rigorous CQA, 7 were not, and 2 are unknown. Of the six at >50 gpad, at least four had no rigorous CQA.

This data shows that only 70% of the 40 units meet 20 gpad; and only 85% of the 40 units, but at least 95% of the units with rigorous construction quality assurance (CQA), meet 50 gpad. This indicates that 20 gpad and even 50 gpad are not practicable action leakage rates for the general situation.

This data in conjunction with the previous EPA data show that over the past 10 years, and especially in more recent years, facility owners and operators have been building and operating liner systems that work better and better to minimize flow through the top liner. The major contributions to this improvement have been better installation practices and better CQA.

3. ACTION LEAKAGE RATE

In the final rule, as in the May 29, 1987 proposal, the owner or operator of units subject to the leak detection system requirements must propose and the Regional Administrator (or State Director in authorized States) must approve an action leakage rate. "Action leakage rate" is defined in the final rule as "the maximum design flow rate that the leak detection system (LDS) can remove without the fluid head on the bottom liner exceeding 1 foot. The action leakage rate must include an adequate safety margin to allow for uncertainties in the design (e.g., slope, hydraulic conductivity, thickness of drainage material), construction, operation, and location of the LDS, waste and leachate characteristics, likelihood and amounts of other sources of liquids in the LDS, and proposed response actions (e.g., the action leakage rate must consider decreases in the flow capacity of the system over time resulting from siltation and clogging, rib layover and creep of synthetic components of the system, overburden pressures, etc.)." In short, the "action leakage rate" is the maximum design flow rate, with a safety factor, that the leak detection system can remove without the head on the bottom liner exceeding one foot (called rapid and extremely large leak in the May 29, 1987 proposal). The objective is to minimize the head or pressure on the bottom liner and thereby decrease the potential for migration of hazardous constituents out of the unit should a leak in the bottom liner, as well as the top liner, occur. The proposal background document [Ref. 4] presented a number of mathematical models for making such a determination. All of these models are based on Darcy's Law for non-turbulent flow through saturated media.

3.1 Determining an Action Leakage Rate

The proposal background document gives the following formula for flow originating through a hole in the liner, the most likely leak scenario for a geomembrane liner (pages 2.6-12 and 2.10-10, Ref. 4):

$$Q = k \cdot h \cdot \tan \alpha \cdot B_{avg} \qquad \text{[Equation 1]}$$

where Q = flow rate in the leak detection system (drainage layer),
h = head on the bottom liner,
k = hydraulic conductivity of the drainage medium,
α = slope of the leak detection system,

(B_{avg}) = average width of the flow in the leak detection system, perpendicular to the flow.

Assumming that the gradient of flow through the hole, at the hole, is sin α and depth of flow at the hole for concentrated flow = the thickness of the drainage layer:

$$B_{avg} = D/\sin \alpha$$

where D = leak detection system thickness.

Then, with D = 1 ft and sin α = 0.01, B_{avg} = 100 ft
0.02, B_{avg} = 50 ft
0.03, B_{avg} = 33 ft.

Using these values for B_{avg} and Equation 1 with h $\approx$ D = 1 ft (h $\approx$ D for small values of α), Q in gpad =

k (cm/sec)	sin α	B_{avg} (ft) 33	50	100
1	.01 .02 .03	---- ---- 21,000	---- 21,000 ----	21,000 ---- ----
.1	.01 .02 .03	---- ---- 2,100	---- 2,100 ----	2,100 ---- ----
.01	.01 .02 .03	---- ---- 210	---- 210 ----	210 ---- ----

Thus, using the minimum specifications in today's rule: 1% slope, 12-in-thick drainage layer, and 1 X 10^{-1} cm/sec hydraulic conductivity for surface impoundments and 1 X 10^{-2} cm/sec hydraulic conductivity for landfills and waste piles, and assuming that the head is 1 ft and the average width of flow (B_{avg}) is as given above, the results show maximum flow rates of 2,100 gpad for surface impoundments and 210 gpad for landfills and waste piles. Using a safety factor of two, as suggested in the example given in the proposed rule preamble, yields about 1,000 gpad for surface impoundments and 100 gpad for landfills and waste piles as the Agency recommended action leakage rates, for units that are designed to the minimum specifications in today's rule. As listed in the rule and above, the safety factor helps account for uncertainties in the design, construction, operation, and location of the drainage layer and potential decreases in flow over time as a result of overburden compressive forces and clogging caused by fines and biological and chemical actions in any leachate that seeps through. Of course, all of the above mechanisms that could result in potential decreases in flow over time should also be considered when selecting the design, especially the hydraulic conductivity of the drainage layer, and in construction. Because this calculation used the minimum technical requirements and other design assumptions to maximize potential head on the bottom liner, and uses a safety factor, EPA believes that the units meeting the minimum technical requirements would not require action leakage rates below 100 gpad for landfills and waste piles and 1,000 gpad for surface impoundments.

Assuming the wetted area in the drainage layer beneath a small hole leak has approximately the shape of a cone from side view and a parabola from top view, the width of the parabola (B) is:

$$B = \frac{2\sqrt{Q/k}}{\sin\alpha}\sqrt{1+\frac{2x\sin\alpha}{\sqrt{Q/k}}}$$

where x = plan distance downslope from hole (i.e., B is a function of the distance x from the hole; most of B is at the hole with only slight increases downslope).

Assuming x = 0 (i.e., looking at B under the hole, $B = \frac{2\sqrt{Q/k}}{\sin\alpha}$) and substituting this value for B into Equation 1 modified for a triangular cross-section of flow (i.e., $Q = 1/2\ k \cdot h \cdot \tan\alpha \cdot B$) and solving for Q yields:

$$Q = k \cdot h^2 \qquad \text{[Equation 2]}$$

where h = head on the bottom liner and h < thickness of drainage layer.

This equation becomes the following if the condition is changed from "h < thickness of the drainage layer (D)" to "h ≥ D" (which is important for geonet calculations):

$$Q = k \cdot D\ (2h - D) \qquad \text{[Equation 3].}$$

Solving Equation 3 using the minimum design specifications in the final rule, Q =

for .1 cm/sec: 2100 gpad
.01 cm/sec: 210 gpad
geonet: 6800 gpad.

These numbers are the same as the results given above for Equation 1.

Results Using a 3-D Model

Tables 1-4 and Figures 1-10 in Appendix B were developed from a 3-D model to show the relative effects of various design parameters and assumptions on flow capacity, and to show the shapes of the flow in the drainage layer for various designs and assumptions, including hole size and head. Appendix C gives background information on the 3-D model. The tables show that slope, length of run, and hole size have some effect on flow rate (e.g., 4% increase in flow rate when slope is increased from 1% to 2% [Tables 1, 3-5]; 1% increase in flow rate at 1% slope when increasing length of run from 20 ft to 80 ft [Table 1; Figure 4 shows that length of run has negligible effect for slopes at or greater than the 1% minimum]; 43% increase when hole size is increased from .25 ft^2 to 1.0 ft^2 but a much less significant increase for holes > 3 ft^2 [Table 2; Figure 5 graphically shows the effect of leak size on flow rates]). However, the effect of these three variables is relatively insignificant compared to hydraulic conductivity, head, and drainage layer thickness (e.g., ten times increase (900%) when increased from .01 cm/sec to .1 cm/sec hydraulic conductivity [Tables 1, 3-5]; 382% increase when increased from no head to 2 ft head above the top liner, e.g., in a 2 ft deep surface impoundment [Table 3]; and 210% increase when geonet thickness is doubled from 5 mm to 10 mm [Table 5]).

Figures 2a-2d (side view) and 3a-b (top view) show the shape of the saturated zone for various designs, assuming no head above the top liner. These show only small portions of the bottom liner are actually exposed to the 1 ft head (as assumed in the simpler models discussed above). Figures 6-8b, however, show that as the head increases, so does the area of the bottom liner exposed to the greater heads. The graph for 8 ft head for surface impoundments is almost rectangular and therefore is not shown. Table 5 and Figure 10 show the results for geonets, which because of their high hydraulic conductivities have high flow rates.

Table 4 shows flow rates of 204 gpad and 2,040 gpad respectively for the landfill and surface impoundment specifications (i.e., 1% slope and hydraulic conductivity of 10^{-1} cm/sec for surface impoundments and 10^{-1} cm/sec for landfills, but with 1 ft of head above the top liner, 180 ft length of run, and a 1 ft^2 hole size). Comparing the results of the 3-D model to those of Equations 1 and 3, using the 1% slope and 10^{-1} cm/sec hydraulic conductivity for surface impoundments, shows that if the hole size is somewhat less than .25 ft^2, the flow rate with a 2 ft head would be about 2100 gpad [Table 3]. For 0 ft head above the top liner, the hole would be somewhat larger than 30 ft^2, or close to uniform flow [Figure 5].

3.2 Alternative Action Leakage Rates

While EPA recommends the above action leakage rates (100 and 1,000 gpad) for units that are built to the minimum design specifications, the Agency recognizes that a number of site-specific factors affect the maximum flow capacity of a leak detection system, and owners and operators may want to propose alternative action leakage rates. For example, the leak detection system design may be different than the minimums specified in the final rule. As indicated above, the hydraulic conductivity is a factor that significantly affects the flow capacity of the system. Since they are directly proportional, a ten times increase in hydraulic conductivity (i.e., from 10^{-2} to 10^{-1} cm/sec) increases the flow capacity ten times. Therefore, EPA believes that leak detection systems with greater hydraulic conductivities would have higher action leakage rates. In addition, owners or operators may have information to justify a different width of flow in the above calculation. Or the owners or operators may justify a higher action leakage rate by using a different formula or model. While the Agency recommends the use of the above model for defining the maximum flow capacity of the leak detection system and action leakage rate, EPA recognizes that there may be alternative models available now or in the future that may more accurately predict system flow capacity to justify higher action leakage rates. Therefore owners or operators may propose to use an alternative model that they believe more accurately predicts the maximum flow capacity of the leak detection system. Or, owners or operators may want to do a field flow (pump) test on the leak detection system to show actual flow capacity, which may justify a higher action leakage rate. Finally, owners or operators may have flow rate data on similarly designed units to use to justify a different level. As more and more units are built, the Agency as well as owners or operators will develop a better data base that may be used to justify other action leakage rates.

3.3 Action Leakage Rate Significance

Action leakage rates must not exceed the maximum flow rate capacity of the leak detection system in order to assure that a response action is triggered for significant leaks. That is, if the action leakage rate were greater than the flow capacity of the system, the trigger level or action leakage rate would never be reached and response actions implemented, no matter how large or massive the failure. Further, an action leakage rate that is based on a maximum of 1 ft head assures that significant pressures on the bottom liner will not be experienced, thereby decreasing the potential for migration of hazardous constituents into the bottom liner. Finally, EPA believes that flow rates in excess of the minimum action leakage rates often indicate a major localized or general failure of the top liner. Flow rates of 1,000 gpad or greater represent significant flow rates and potentially significant hole sizes that may be readily identified and repaired. Flow rates between 100 gpad and 1,000 gpad are large enough that the sources other than a leak will probably not account for all the flow (i.e., there is probably a leak situation that should be looked into). For these reasons, it is necessary to maintain leak detection flow rates below the action leakage rate and for the owner or operator to take response actions for leaks greater than the action leakage rate. *

The appropriate response action must be based on site-specific circumstances, including the magnitude of the actual flow rate (which is related to leak size), the ease of determining the source of leak and repairing it (e.g., often in a surface impoundment a hole can be observed from the surface, or a bulge in the top liner from underlying pressures may be observed from the surface indicating the possible leak location), and status of the unit (e.g., for a disposal unit about to close, it may be best to close the unit and get a sound cover on top rather than seek to find and repair a leak, especially for relatively low flow rates).

4. ADDITIONAL GUIDANCES AND REFERENCES

A number of technical guidance manuals have been published by EPA that discuss all the design features of the final rule. Some of these are listed in Appendix A. These cover: foundations and dikes; flexible membrane liners or geomembranes; soil/clay liners; composite liners; hydraulic conductivity and other properties of granular drainage layers, geonets, and clay/soil liners; leachate collection, and removal systems and leak detection systems designs; sumps and pumps; clogging; construction quality assurance and test fills; Darcy's Law and calculation of flow quantities, flow capacities, and time of travel or breakthrough times; response action plans; and covers.

5. CLOGGING

EPA sponsored studies [Bass et al., 1983; Bass, 1986; Ghassemi et al., 1986; Koerner et al., 1991] indicate that clogging of drainage layers of waste management units may potentially occur under some conditions. The results of the studies indicate that drainage layer clogging is caused primarily by sedimentation or biological growth. The results of the studies also suggest that the potential for clogging can be minimized by proper design and construction of the drainage layer. The potential for clogging of LDCRSs is generally lower than that for overlying leachate collection and removal systems (LCRSs) due to the relatively low volumes of flow in LDCRSs. Clogging of LDCRSs, however, could hinder the detection of leakage and the rapid removal of liquid from the LDCRS.

With this in mind, EPA is supporting the use of relatively permeable LDCRS materials in waste management units to minimize their potential for clogging. Fundamentally, a drainage material with large particles and, hence, large pore spaces, would have less potential for clogging than a material with smaller particles and, hence, smaller pore spaces. That is to say that materials such as coarse sands and fine gravels with a minimum hydraulic conductivity of 1 cm/s (1×10^{-2} m/s) would be less likely to clog than materials such as fine sand or silty sand with a minimum hydraulic conductivity of 1×10^{-2} cm/s (1×10^{-4} m/s).

Landfill Clogging[1]

Following is a summary of a research study looking at clogging.

Tested: * 2x10-2 cm/sec Ottawa sand (subrounded uniform size, 0.42mm--no. 40 sieve--avg particle size);
* 5x10-3 to 4.7x10-1 cm/sec filter fabrics (7 different geotextiles, including polypropylene (PP), polyethylene (PE), and polyester (PET)).

[Note: geotextiles use less space, are easier to transport, easier to place, and less expensive].

Tested using municipal waste leachate of different strengths.

Conclusions

* Flow rates always decreased (from 10-100%) over time: usually a sharp initial decrease followed by a continued linear, slightly linear, or sharply exponential decrease. In some cases flow decreased to levels that were not measurable by the experimental design.

* Sand (over geotextiles) clogged considerably more than those with geotextiles alone (23% flow retained for sand/geotextiles vs 34-45% flow retained with geotextiles alone).

* Type of polymer (PP, PE, & PET) appears to have no significance. Biological degradation of polymeric-based geotextiles did not occur.

* Stronger leachates (i.e., with higher BOD, COD, & TS) have greater clogging impacts. Particulate clogging appeared to be synergistic with the biological clogging.

* Both anaerobic and aerobic conditions promote clogging.

6. CONCLUSIONS

Facilities with good CQA perform significantly better than those without.

Facilities with good CQA appear to consistently achieve 50 gpad or less, taking into account other sources of liquids such as construction water and consolidation water. Whereas only about 70% of the facilities with good CQA achieve 20 gpad, which was the top of the range in the May 29, 1987 proposed rule. These results coupled with the magnitude of other sources of liquids indicates a practical action leakage rate is ≥ 100 gpad.

Calculations and models used to determine the action leakage rate show:

* Flow rates of 100 gpad for landfills and waste piles and 1,000 gpad for surface impoundments appear to be reasonable action leakage rates for the minimum specifications for slope and hydraulic conductivity in the final rule;
* Hydraulic conductivity is a significant factor (in all the models) since the flow rate is directly proportional to hydraulic conductivity: a change from 10^{-2} to 10^{-1} cm/sec increases the flow rate 10 times;
* Slope is relatively insignificant;
* Length of run is not a factor for slopes ≥ 1%;
* With no head above the top liner, the shape of flow is basically conical below the hole and rapidly tapers off, but with heads above the top liner more of the bottom liner is exposed to the higher heads;
* The size of leak is a factor that also influences whether the action leakage rate or flow capacity of the leak detection system will be exceeded. In the formula in the proposal background document, the size of leak is not considered since it is assumed that the hole is large enough to provide the maximum flow rate (Q) calculated. The 3-D model however confirms that the size of leak is indeed a limiting factor;
* Models that assume uniform leakage (which is an unrealistic assumption because the top liner is a geomembrane, not clay or other porous media) give higher flow capacities than models assuming one or more leaks through the top liner.

Clogging by fines or biological and chemical actions needs to be considered in the design (e.g., by the use of gradation or fabric filters and higher permeability drainage materials) and in the safety factor.

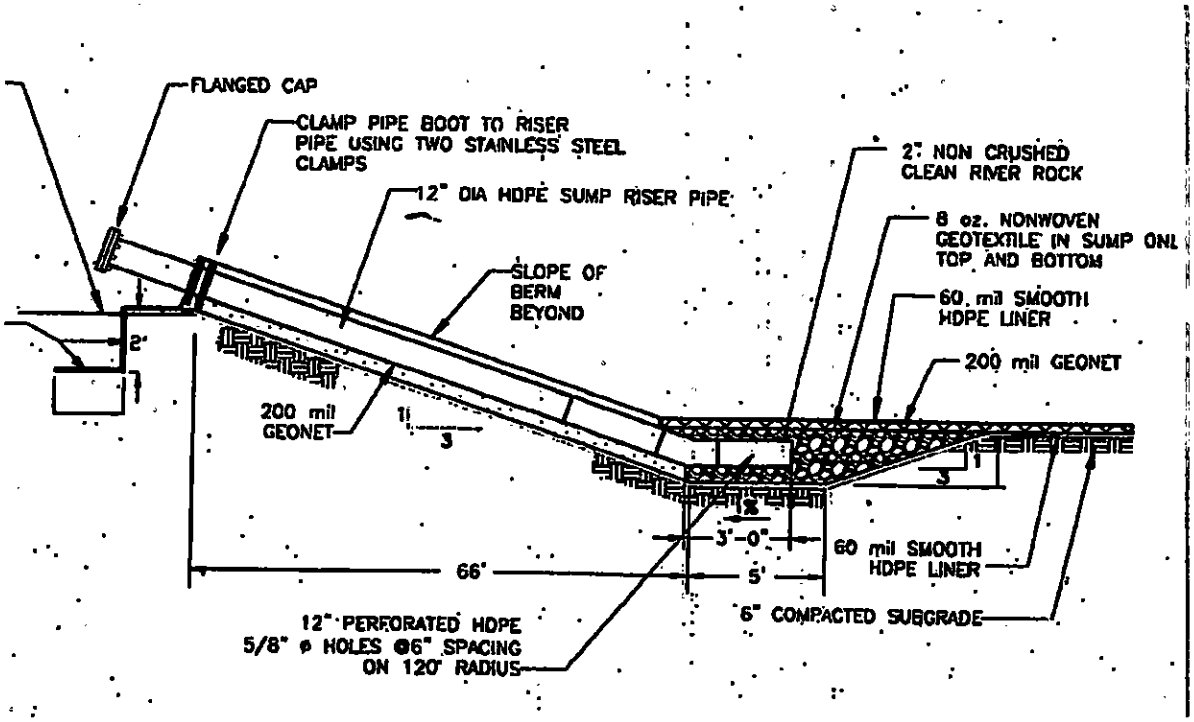
1.0 INTRODUCTION

Salt Storage Pond #5 will have a double liner and leak detection system that will be constructed with a CQA (Construction Quality Assurance) program. The leak detection, collection and removal system (LDCRS) will be monitored by checking the liquid level in the secondary liner in the pond's sump on a continuous basis.

This document provides a design criteria and descriptions, of the system for detection, collection and removal of leakage liquid in the sump between the top and bottom liner of the Salt Storage Pond #5.

2.0 DESIGN CRITERIA

The LDCRS will be designed to remove salt solution/leachate from the sump located between the primary and secondary liners of Salt Storage Pond #5. The sump will be located at the lowest elevation of the pond's bottom, and inside the berm's toe. The following is a proposed cross-sectional view of the Leachate Detection Collection and Removal System.



The leachate removal system will meet the following requirements:

1. Sized to fit through the existing 12 inch diameter HDPE riser pipe.
2. Operated automatically whenever the leachate is present in the sump.
3. Capable of removing the accumulated leachate at the earliest practicable time to minimize the leachate head on the liner.
4. The leachate (salt solution) depth in the sump will not exceed 12 inches.
5. Capable of recording the total volume of liquid in gallons, and the rate of leachate removed in Gallons per day.
6. Capable of conveying the leachate from the sump between the liners to the pond and overcome a minimum of 30 foot of pressure head.

3.0 LEACHATE REMOVAL SYSTEM COMPONENTS

There are four main components in the mechanics of the leachate removal system:

1. Submersible pump
2. PVC drain line
3. Flow meter and totalizer display
4. Power supply to the pump

– pressure transducer?,
– liquid level device

If there is no power grid within close proximity of the pond, it will be necessary to power the pump and the display with an off grid solar power system, which consists of:

1. Pure sine inverter charger
2. Battery temperature sensor
3. Solar panels
4. Solar charge controller
5. Deep cycle batteries

4.0 PUMP REQUIREMENTS

The pump will have the following characteristics:

1.0 Submersible type, (Grundfos SP series or approved equivalent) which eliminates the need for priming.

2.0 The motor will be:

- 2.1 Hermetically sealed and equipped with built in lightning protection.
- 2.2 Thermally protected to prevent overheating
- 2.3 Heavy duty and highly efficient

3.0 Tygon seal or similar for corrosion resistance in salt

4.0 Equipped with stainless steel housing or enclosure to eliminate corrosion

5.0 The pump can be inserted into the existing 12" diameter pipe riser

6.0 Capable to pump vertically to 50 feet or more

7.0 Equipped with thermoplastic impellers, diffusers, intake screen and check valve. (for corrosion resistance)

8.0 Flow (GPH) is a minimum of 300 at 60 ft. head

9.0 Maximum suction lifts 125 ft.

10.0 Maximum total head 120 ft.

An example of a pump which meets or exceeds the above requirements would be: Wayne 2 wire 4in. Submersible deep well pump, by Northern Tool & Equipment. Model No. T51S10-4, or equivalent.

5.0 FLOW METER AND TOTALIZER REQUIREMENTS

Flow meter and Totalizer are required to measure and monitor the amount of leakage rate in the double lined Salt Storage Pond #5. The flow meter requirements are as follows:

1.0 An insertion electromagnetic type, which would be easy to install, no maintenance and has no moving parts. It is highly accurate, insensitive to specific gravity, viscosity, pressure and temperature and non-corrosive.

2.0 Designed for use with conductive liquids in 1 to 6 inch diameter pipe.

3.0 Sensor body: PVC materials

4.0 Can be installed upstream

5.0 Designed for analog output and display of flow rate and total.

6.0 Non corrosive housing

7.0 Allow Rate and Totalizer to be mounted on the meter or remotely wall mounted.

8.0 Flow range 0 to 50 GPM (Maximum)

9.0 NRTL marked

The flow rate and total display will be:

1.0 Simple to set up

2.0 Looped powered

3.0 Rugged noncorrosive metal housing

4.0 Good for flow range of 0 to 50 GPM

5.0 Non-volatile memory

6.0 NEMA 4X (IP66) and NRTL marked

An example of an insertion electromagnetic flowmeter is FMG981P, or equivalent, with rate and total display, and complete with installation fittings and accessories when applicable, and if remotely mounted display is preferred.

6.0 SOLAR POWER REQUIREMENTS

The following equal or equivalent solar power kit is recommended:

1.0 Aims Power, 1440 watt, 24 Volt off grid solar kid with 2,000-Watt power inverter charger, model KITB-2K24120-C1. The panels are covered in tempered glass to protect hazardous weather. The PV wiring is protected against water, ozone, fluids, oil, salt and general weathering. Each system comes with a wiring diagram.

The kit includes the following parts:

- PICOGLF20W24V120V-2000 - watt pure sine inverter charger – 24 VOLT
- PICOGLFBATTS - qty 1- Battery temperature sensor
- PV240POLY- qty 6- 240-watt solar panels
- SCC60MPPT – 60-amp MPPT solar charge controller
- 6FM200H -qty 4 - 200AH deep cycle battery
- PVF100FT10AWG - 100-foot PV wire for solar panel (female)
- PVM100FT10AWG - 100-foot PV wire for solar panel (male)
- CBL08FT6AWGC - 8 ft. charge controller to battery cables
- CBL06FT6AWG - 6 ft. 6AWG cable (inverter cable)
- CBL02FT6AWG - 2 ft. 6AWG cable (battery cable)
- CBL01FT6AWGRED - qty 3- 1 ft. jumper for fuse kit and battery jumpers
- ANL100KIT – 100-amp inline fuse kit
- PVEXT15FT10AWG - qty 2 – 15 ft., PV extension wire
- PVMC4.A - 2F1M - MC4 Branch 2F to M
- PVMC4.A - 2M1F - MC4 Branch 2M to F

2.0 Apollo Solar Powered Piston Pump Model 102 or equivalent, with solar power set-up option consisting of solar panel, charge controller and batteries.

1.0 SCOPE

1.1 DESCRIPTION OF WORK

1.1.1 This specification discusses the requirements to perform installation of new 60 mil high density polyethylene (HDPE) geomembrane liner at NWP WIPP Salt Cell 5, Salt Storage Pond 5, Storm Water Pond 4 and Brine Evaporation Ponds West and East. This work consists of the following steps:

A. Submit all geosynthetic product information and testing results on each roll of the liner, geonets, geofabrics, HDPE pipes.

B. To provide liner panels, geonets, geofabrics and HDPE pipes lay out and installation plan

C. Placing liner panels on prepared subgrade

D. Double fusion welding of the liner panels, and extrusion welding for patching and repair.

E. QA/QC testing on all weld seams and liner patch welds

F. Installation of geonets, geofabrics and HDPE pipes

G. To provide records on as built drawings, testing results

1.1.2 The contractor shall furnish all labor, materials, equipment, and incidentals required to perform the work, as shown on the drawings, and as specified in these specifications.

1.2 DEFINITIONS

1.2.1 Geomembrane: High Density Poly Ethylene (HDPE) plastic liner, used for lining Salt Cell 5, Salt Storage Pond 5, Storm Water Pond 4 and Brine Evaporation Ponds West and East.

1.2.2 Sheet/Panel: Each separate piece of geomembrane sheeting that is seamed to other sheets at the project site

1.2.3 Fusion Welding: The Split Hot Wedge welder is a fully automated device comprising of a heated copper wedge, pressure rollers and electronic controls. The copper wedge shall be controlled and constantly monitored by a programmable controller with an audible off-temperature alarm and a variable speed drive unit. The copper wedge shall create two contact fusion areas of a minimum width of 10mm and a 2mm minimum wide void between each of the separate parallel zones. This void shall be created over the entire seam length to allow for field weld pressure testing

1.2.4 Extrusion Welding: A finishing technique where a bead of molten HDPE plastic is used to weld thermoplastic geomembrane (HDPE Liner) materials. Extrusion Welding Machine:

consists of a heated barrel with a plasticizing screw to deliver molten plastic to a specially shaped shoe. The shoe is shaped to make a bead of plastic suitable for the HDPE liner material type and thickness. A preheat blower is attached to the machine to ensure the weld area is dry and clean.

1.2.5 Cap strip/ Patch: Unwrinkled, new HDPE Geomembrane sheet, cut and shaped to cover a cut on the existing HDPE Geomembrane liner. The patch material shall be identical in texture and thickness with the existing liner to be repaired.

1.2.6 Replacement Strip: Geomembrane material placed over a gap in previously place geomembrane.

2.0 APPLICABLE DOCUMENTS

2.1 CODES, SPECIFICATIONS AND STANDARDS

The latest version of codes, specifications and standards referred to by title or number shall fom a part of this specifications where referenced herein. These publications are not furnished with contract documents.

Geosynthetic Research Institute (GRI):

GRI Test Method GM 13	Test Properties, Testing Frequency and Recommended Warranty for High Density Polyethylene (HDPE) Smooth and Textured Geomembranes.
GRI Test Method GM 19	Seam Strength and Related Properties of Thermally Bonded Polyolefin Geomembranes

National Sanitation Foundation (NSF)

NSF 54-1993	Standards for Flexible Membrane Liners

The following publications shall be used as applicable:

U.S. Environmental Protection Agency (EPA)

EPA/530-SW-86-031	Technical Guidance Document: Construction Quality Assurance for Hazardous Waste Land Disposal Facilities. October, 1986
EPA/530-SW-91/o51	Technical Guidance Document for the Fabrication of Geomembrane Field Seams. May, 1991
EPA/600/SR-93/182	Technical Guidance Document: Quality Assurance and Quality Control for waste Containment Facilities.

American Society for Testing and Materials (ASTM):

ASTM D 1505	Standard Test Method for Density of Plastics by the Density-Gradient Technique
ASTM D 1603	Standard Test Method for Carbon Black Content in Olefin Plastics
ASTM D 3786	Standard Test Method for Hydraulic Bursting Strength of Knitted Goods and Nonwoven Fabrics-Diaphragm Bursting Strength Tester Method
ASTM D4437	Standard Practice for Determining the Integrity of Field Seams Used in Joining Flexible Polymeric Sheet Geomembranes
ASTM D 4833	Standard Test Method for Index Puncture Resistance of Geotextiles, Geomembranes and Related Products

ASTM D 5035	Standard Test Method for Breaking Force and Elongation of Textiles Fabrics (Strip Method)
ASTM D 5199	Standard Test Method for Measuring Thickness of Textile Materials
ASTM D 5820	Standard practice for pressurized air channel Evaluation of Dual Seamed Geomembranes
ASTM D6365	Standard Practice for the Nondestructive Testing of Geomembrane Seams Using the Spark Test

2.2 RELATED WORK SPECIFIED ELSEWHERE

Specification E-Z-261	Specifications for Earthwork.

3.0 PRODUCTS PEROMANCE AND TESTING REQUIREMENTS

3.1 PRODUCTS

3.1.1 Geomembrane Liner

A. Geomembrane liner shall be HDPE liner, black, 60 mils thick, smooth, meeting the requirements in GRI Test Method GM-13.

Table 1 – Requirements for Smooth HDPE Liner

Property	Test Methods	60 Mil HDPE
Density g/cc	ASTM D 1505	0.094
Tensile Property	ASTM D638 (Type IV at 2 in/min)	
Yield lbs./in		126
Break Test lbs./in		228
Yield Elongation %		12
Break Elongation %		560
Tear Resistance	ASTM D 1004	42
Puncture Resistance, lb	ASTM D 4833	108
Carbon Black Content, %	ASTM D 1603	2-3
Carbon Black Dispersion	ASTM D5596	Cat 1-2
Seam Properties	ASTM D4437 (1-inch-wide at 2 in/min)	
Shear Strength, lb/in		120
Peel Strength, lb/in		78/FTB

B. The contractor shall furnish Manufacturer's certification that the geomembrane was manufactured and tested in accordance with GRI Test Method GM 13.

C. Provide a minimum 20 years manufacturer's warranty in writing, contractor shall warranty installation workmanship for one year, from completion of work.

D. Furnish the geomembrane in rolled, single ply continuous sheets with no factory seams.

E. Sheet width shall be minimum of 22 feet.

3.1.2 **The extrusion welding rod/wire**: shall have the same resin material characteristics as defined for geomembrane in GRI Test Method GM13

3.1.3 **Geonet**: Geonet shall consist of bi-planar 200 mil black HDPE drainage net thickness and provide transmissivity of 9.6 gallon/minute/foot

Property	Test Method	Frequency	Min. Avg. Roll Value
Thickness, Mil (mm)	ASTM D5199	50,000 sf	200 (5.1)
Peak Tensile Strength MD, lbs./in. (N/mm)	ASTM D5035/7179	50,000 sf	45 (7.9)
Density, g/cm3	ASTM D792, Method B	50,000 sf	0.94
Carbon Black Content (%)	ASTM D4218	50,000 sf	2 - 3
Transmissivity (2), m2/sec. (gal/min/ft)	ASTM D4716	500,000 sf	2 x 10-3 (9.6)

A. Geonet shall be free of visible defects, gels, undispersed ingredients, and any contamination or defects that may affect its serviceability. The geonet shall be free of cuts and tear.

B. The manufacturer shall provide certification that the material meets or exceeds the value listed above.

3.1.4 **Geotextile:** Geotextile shall be of 8 oz. per square yard polypropylene, staple fiber, needle punched nonwoven geotextile. The geotextile is resistant to ultraviolet degradation and to biological and chemical environments normally found in soils.

3.1.5 Meeting the following testing properties:

Property	Test Method	Frequency	Minimum Avg. Roll Value
Mass/Unit Area oz./sy (g/m2)	ASTM D-5261		8 (271)
Grab Tensile, lbs. (N)	ASTM-4632	100.000 SF	205 (910)
Elongation %	ASTM-4632	100,000 SF	50
CBR Puncture, lbs.(k N)	ASTM-6241	500.000 SF	500(2.2)
Trapezoidal Tear, lbs.(N)	ASTM-4533	100.000 SF	80 (359)
UV Resistance % strength retained after 500 hours	ASTM D-4365	Formulation	70
Apparent Opening Size, US Sieve (mm)	ASTM D-4751	500.000 SF	80 (0.180)
Permittivity, sec-1	ASTM D-4491	500.000 SF	1.1
Water Flow Rate, g/min/sf (l/min/m2)	ASTM D-4491	500.000 SF	90 (3675)

3.1.6 **HDPE Pipe:** The pipe shall be high density, high molecular weight, polyethylene pipe, shall conform to ASTM D3350 with a minimum cell classification value of 345464C. The pipe shall conform to the following physical property:

Property	Test Method	Value
Density	ASTMD1505	0.955 gms/ccm
Melt Index	ASTM D 1238	0.15 gms/10 min.
Flex Modulus	ASTM D790	110,000 to 160,000 psi
Tensile Strength @ yield	ASTM D638	3,200 to 3,500 psi
Slow Crack Growth Resistance	ASTM F1473	100 hours

Hydrostatic Design Basis	ASTM D2837	1,600 psi @ 23 Degree Celsius

3.2 DELIVERY STORAGE AND HANDLING OF ALL GEOSYNTHETIC MATERIALS

3.2.1 Materials shall be delivered onsite only after the NWP representative has approved all required submittals.

3.2.2 Care shall be taken to keep the materials clean and free from damage prior to installation.

3.3 EXTRUSION WELDING EQUIPMENT

3.3.1 Extrusion welding machines use a heated barrel with a plasticizing screw to deliver molten plastic to a specially shaped shoe. The shoe is shaped to make a bead of plastic suitable for the material type and thickness being welded. A hot air blower is attached to the extrusion welder to preheat the weld area. The welder uses its own weight to create the pressure required for welding and the operator steers the welder manually. Extrusion welders come in a number of sizes with different output rates. It is the contractor responsibility to choose the appropriate size for this work.

3.3.2 Hot Air Gun: use for temporary tacking the liner patch to cover the hole(s), before grinding and extrusion welding is applied.

3.3.3 Rotary Sander or grinder: use for removing oxidized liner surface prior to welding. It is a hand-held power tool, rotary grinder having a grinding disk of 4 inches in diameter and a sufficient quantity of #80 grit paper. Sand paper coarser than #80 is not acceptable.

3.3.4 Coupon Cutter: Use to perform easy productive cutting of weld sample specimens

3.3.5 Tensiometer: Use for destructive testing of a pre-weld trial seam. Contractor shall provide the current Calibration Certificate.

3.3.6 Vacuum Box tester: Use for non-destructive testing of a seam, to ensure no leakage on the seam. For more information see section 5.3 of this specification

3.3.7 Spark Tester: Use for non-destructive testing of a seam, to ensure no leakage on the seam. For more information, see Section 5.3 of this specifications.

3.3.8 Portable electric generator: Use for generating electricity to power the welding machine, hot air gun, rotary sander, and tensiometer. Provide generator with sufficient size to handle all power equipment and lighting when needed.

3.3.9 Extension cords with GFCI outlets to plug in all power equipment.

3.4 OTHER MATERIALS

3.4.1 Sand Bags used for hold-downs shall be tied and fastened with material that will not damage the liner. Metal wire shall not be used. The material makeup of the sandbags shall be sufficiently strong to withstand the forces that will be placed upon them during their use and shall be constructed to preclude spillage of sand contained therein. Leakage of sand onto liner shall not be permitted.

3.4.2 Sandbags shall be collected and remove from the work area and disposed of properly as directed by NWP representative, at the end project.

3.5 GASKETS, METAL BATTENS, CLAMPS, EMBEDDED CHANNELS, AND SEALANTS

3.5.1 Gasket material shall be neoprene, closed cell medium, 0.25-inch-thick, with adhesive on one side, or other gasket material as approved by the liner manufacturer.

3.5.2 Metal battens shall be 0.25-inch-thick by 2 inches wide stainless steel. Clamps shall be 0.5-inch-wide stainless steel.

3.5.3 Sealant shall be General Electric Silicone, RTV 103, or equivalent.

4.0 FIELD EXECUTION

4.1 PERFORMANCE REQUIREMENTS FOR LINER INSTALLATION

4.1.1 A liner installation plan and schedule shall be prepared detailing all aspects of geomembrane installation according to Contractor's approved schedule.

4.1.2 The liner shall be installed or supervised by an individual that has the necessary training and experience as required by the liner manufacturer. All manufacturer's installation and field seaming guidelines shall be followed. All synthetic liner seams shall be field tested by the installer and verification of the adequacy of the seams shall be submitted to NWP along with the record drawings and field testing records.

4.1.3 The contractor and NWP's QA representative shall visually inspect the subgrade where the liner shall be installed. The subgrade shall:

A. Have no sharp objects or rocks greater than ½"

B. Have smooth surface

C. Be even and no abrupt change in elevations

D. Be firm and unyielding.

E. Be dry, and no standing liquid or puddle.

The liner installation contractor shall prepare a certificate of "Subgrade Surface Acceptance" that documents the areas that the parties present (including the liner installer).

4.1.4 The contractor shall install the geomembrane HDPE liner as specified in this specification section 4.2 and have agreed that the criteria have been met for installation of geomembrane.

4.1.5 The contractor's seamer/welder shall perform pre-welding trial seam(s) as specified in section 5.1.

4.1.6 Only approved welder and welding machine team should apply extrusion weld to the seam uniformly and continuously, to cover the seam all around the patches.

4.1.7 Prior to the beginning of a seam, the extrusion welding machine shall be purged until all potentially heat degraded extruded material has been removed from the barrel

4.1.8 Installed liner shall not be backfilled or covered by sand or soil without prior approval and witness by NWP's QA representative

4.1.9 Driving construction equipment on any installed liners shall be prohibited unless the surface has been covered with at least 24 inches of protective soil to prevent damage by the equipment.

4.1.10 Installed liner shall be protected from any damage from placing protective sand or soil or backfill or any earth work. Any damages to the liner shall be reported to NWP representative and repaired immediately.

4.1.11 During the placement of any fill materials on top of the liner, NWP's QA representative shall be present to witness it.

4.1.12 Anchor trench backfilling shall be performed after the slack has been locked in and shall be in accordance with the Specifications EZ- 262 Earth Work

4.2 GEOMEMBRANE DEPLOYMENT

4.2.1 No geomembrane deployment shall be conducted during ice, snow or rain.

4.2.2 The contractor shall visually inspect each of the deployed liner panel for factory damage or imperfections. Each imperfection shall be marked and repaired.

4.2.3 The geomembrane shall be installed in accordance with the approved Liner Installation Plan, previously submitted by contractor and approved by NWP

4.2.4 Each deployed panel shall be identified by the manufacturer's roll number

4.2.5 The liner sheet shall be oriented in a manner that reduces stress on the seam. To this end, the liner shall be placed with seams oriented downslope where practicable. Horizontal seams shall be located at least 10 feet from the toe of the slope or areas of potential stress concentrations.

4.2.6 The panel layout shall minimize the number and length of field seams.

4.2.7 Only panels that are to be seamed together in one day shall be deployed. Some seams may be left open overnight to allow material to shrink before the seam is made.

4.2.8 Upon completion of installation, adequate anchorage and/or ballast shall be provided to prevent uplift by wind. The liner installer shall replace any liner material damaged by winds during installation.

4.2.9 Direct contact with the geomembrane shall be minimized. Scrub sheets shall be used under mechanical equipment and placed in high pedestrian traffic areas.

4.2.10 All tools and welding equipment shall be placed on a scrub sheet when not in use.

4.2.11 Cutting and patches shall be performed off the liner surface or on a scrub sheet.

4.2.12 The method of deployment of the geomembrane shall not cause scratches or crimps in the geomembrane and should not damage the subgrade. The method shall also follow the manufacturer's recommendations to minimize wrinkles, especially differential wrinkles between adjacent panels.

4.2.13 Once deployed each panel of geomembrane shall be inspected for indications of damage in the sheet continuity. Damaged areas shall be marked with water proof paint on the sheet. NWP shall be notified of ALL damaged areas and are to be patched or replaced.

4.2.14 Care shall be taken to ensure that the liner panels are positioned in a slacken condition so that they will:

A. Conform to the subgrade irregularities, with no "bridging" of the liner over depressions or corners in the underlying subgrade and

B. Not become taut when exposed to the temperature range expected in the area or when ponds are filled.

4.2.15 Slack shall be "locked in" in the liners on the side slopes and base and in the anchor trench. Hold down sandbags shall be placed along the bottom edge of the side slopes so that the open distance between sandbags shall not exceed 2 feet. The proper amount of slack for the side slopes shall be positioned above the stationary sandbags and distributed uniformly up to the slope.

4.2.16 With consideration of the actual liner temperature at the time that the slack is to be lock in, the contractor shall lock in adequate slack in each liner so that:

A. No major bridging or excessive tension shall occur at liner material temperature lower than 40-degree Fahrenheit. Major bridging is defined as the liner lifting 8-inches or more, off the subgrade at the toe of the slope and does not rest on the subgrade when the liner temperature exceeds 80-degree Fahrenheit

B. No permanent standing folds capable of folding over on themselves shall develop at temperatures higher than 90-degree Fahrenheit. If permanent standing fold occur, repair shall be made. Liner shall be cut to eliminate permanent standing folds higher than 12-inches.

4.3 GEOMEMBRANE SEAMING:

4.3.1 Field seams between panels shall be fusion welded by dual-hot-wedge welding method. Extrusion welded seams shall be used at panels corner intersection, pipe penetrations, at patches required after test samples are taken, and minor repairs where it is not practical to use hot-wedge seams. Hot-wedge and extrusion welding techniques, including surface and edge preparation, shall be as described in EPA/530-SW-91/051.

4.3.2 The Contractor shall provide certification that field seams meet the requirements of GRI Test Method GM 19.

4.3.3 Field seaming shall follow sheet placement as closely as possible, but with adequate time allowed for the adjacent sheets to equilibrate with respect to temperature.

4.3.4 The operator will keep constant visual contact with the temperature controls, as well as the completed seam being produced by the machine. Constant visual and "hands-on" inspection is also required.

4.3.5 The panels of geomembrane shall be overlapped by the minimum of the following dimensions:

- Three inches (73 mm) for extrusion welding
- Four inches (100 mm) for fusion welding

4.3.6 Clean the contact surfaces of the sheets to remove dirt and dust, moisture, debris, and foreign materials.

4.3.7 For extrusion welds, grinding/buffing shall be conducted to remove oxidized material at the seam locations. This shall be done in accordance with EPA/530-SW-91-051 and the following requirements:

A. The grinding shall not extend more than ¼ inch beyond the limit of the extrudate after seam completion.

B. Grinding shall be performed preferentially in perpendicular path across the seam.

C. The depth of grinding shall be less than 10% of the sheet thickness.

D. Grinding shall be performed just prior to extrusion welding.

E. The grinded area shall not be touched by hand or wiped with rag or paper. Excessive shavings shall be removed using the hot air gun, or Leister.

4.3.8 The area of a seam shall be trimmed in advance of seaming using the following procedure:

A. All trimming of seams shall be advanced and maintained at least 50 feet ahead of seaming operations when possible.

B. Trimming shall be accomplished using a shielded blade or hooked knife.

C. Whenever possible, the cutting of the geomembrane will be from the underside of the sheet in an upward motion.

4.3.9 Seam Samples and Trial Seams:

A. Preconstruction samples of field seams made using field construction techniques to be employed during seaming operation shall be prepared by the Contractor for testing and evaluation prior to the initiation of the liner installation. These pre-construction samples shall be welded at the site. Four weld test strips shall be produced, two by the extrusion welding method and two by the dual-hot-wedge welding method. Each weld test strip shall measure 6 feet long by 10 inches plus seam width wide and shall be made using the liner material delivered to the job site and approved under the Specification herein. At NWP discretion, the test strips may be tested by a third-party Quality Assurance laboratory.

B. Trial seams shall be made on scrap/fragment pieces of geomembrane to verify that the seaming conditions and equipment are adequate.

C. Trial seams shall be performed at the beginning of seaming period (start of the day, mid -day, and any time after equipment shutdown) for each seaming apparatus to be used following a substantial change in weather conditions, at any time the seaming procedure has changed, or upon request of NWP

D. Trial seams shall be perfomed under the same conditions under which the actual seaming will be conducted.

E. The sample size shall be 12 inches wide plus seam width and 30 inches long and with the seam centered lengthwise.

F. Six specimens, 1-inch wide each, shall be cut with a die by the seamer. Three specimens shall be tested in shear and three in peel using field tensiometer. The test specimens shall fail in the film-tearing bond. The passing criteria for a 60 mil HDPE liner extrusion weld, per GRI GM19, Minimum Shear Strength: 120 lbs. /in at 50% minimum elongation. Minimum Peel Strength of 78 lbs. /in, at maximum 25% peels on the weld width.

G. Interpretation of Results:

(1) If the destructive testing meets or exceeds the requirement above, the welding machine and the welder technician are approved for the work period.

(2) If the specimen fails the destructive evaluation, the entire process will be repeated.

(3) If the same welding machine and seamer fail the testing a second time, the welding machine and the seamer will not be accepted and cannot be used for seaming until the deficiencies are corrected and two consecutive successful trial seams are completed.

(4) The pre-weld testing shall be witness by NWP's QA representative, and the results shall be recorded by the person performing the tests and submitted to NWP.

4.3.10 HDPE Seaming:

A. Field seaming shall be conducted in dry conditions and in a manner that prevents dust, dirt, or other foreign material from being included in the seam.

B. All welding equipment shall be handled/operated in the manner that minimizes the potential for damage to the installed liner.

C. The extrusion welder shall be purged prior to beginning a seam until all potentially heat-degraded extruded material has been removed from the barrel.

D. Seams shall be extended to the end of the panels in the perimeter anchor trench.

E. Seaming of geomembrane within the anchor trench shall be accomplished by temporarily supporting the adjacent sheets so that horizontal seaming can be accomplished continuously to the end of the sheets.

F. All cross seams are to be patched with at least 12 inches-diameter patches where they intersect.

G. Each field seam shall be identified by writing the following information on the geomembrane near the seam with the waterproof paint:

- Date, starting time, and mark at starting point of weld
- Welder's name or identifying initials
- Completion time and mark at ending point of weld

4.4 GEOMEMBRANE PENETRATIONS

4.4.1 Panels around piping penetrations or other projections through the panel will be cut with rounded corners to prevent tear propagation and ballasted to prevent wind lift until the pipe boot can be installed.

4.4.2 Pipe boots shall be fabricated to a size that tightly fits the outside diameter of the penetrating pipe. The boot shall be made of the same type of geomembrane as that of the liner through which the penetration is being made

4.4.3 The skirt of the pipe boot that flare away from the pipe shall have at least 12 inches of geomembrane on all sides of the pipes. The skirt of the pipe boot shall be seamed to the base of geomembrane by extrusion welding. If the vacuum testing of the seam is impractical, a copper wire for a spark testing shall be inserted prior to welding. NWP's QA representative shall be notified and witness the placement of the copper wire.

4.4.4 Stainless steel pipe clamps shall be used to attach pipe boots to the penetrating pipes and shall be of an adequate size to allow for a cushion of compressive material to be placed between the inside surface of the clamp and that of the geomembrane portion of the boot.

4.5 GEOMEMBRANE REPAIR

4.5.1 Repair Areas

A. Repair areas shall be identified and marked with waterproof paint on the geomembrane by the contractor and recorded on the daily report prepared by the contractor.

B. Repair shall be identified by an identification number/code and shall be located on the as-built drawing.

4.5.2 Extent of Repair Area

A. Point Repairs

(1) A hole, tear, blister, scratch, undispersed raw material, or geomembrane contamination defines a point repair. This type of repair shall also be made after the removal of destructive test sample.

(2) The extent of the repair area is defined as the visible extent of damage or continuity of the liner plus minimum of 6 inches in all directions.

B. Seam Repairs

(1) Seam Repairs are defined as necessary repairs identified by visual, non-destructive, and/or destructive testing. occurring in a seam between the field panels. The extent of the repair is defined as the area between two passing destructive or non-destructive test locations.

(2) The following procedure shall apply whenever a sample failed a Quality Control or Quality Assurance test. The contractor has two options:

(a) The contractor can reconstruct the seam between the failed location and any adjacent passed test location in both directions from the failed sample location.

(b) The contractor can take additional samples from the failed seam at a 10-foot distance in both directions from the failed test location. If this additional tests pass, then the seam shall be reconstructed between the two passing locations. If the test fails, then this process can be repeated.

(3) In all cases, acceptable reconstructed seams shall be bounded by two-passed test locations.

4.5.3 Repair Procedure

A. Repair required areas with pieces of flat and unwrinkled geomembrane material free of defects and seams. The repair material shall be of the same type as the liner material.

B. All patches, cap strips, and replacement strips shall have comers rounded to a 3-inch minimum radius.

C. Each patch or cap strip shall be extrusion welded to the installed geomembrane around the entire perimeter of the patch or cap strip.

D. Each cap strip shall be centered over the weld or cut being repaired and extrusion welded to the existing geomembrane. In those instances where the weld area being capped contain patches, the geometry of the cap strip shall be varied as necessary to ensure that the cap strip extrusion weld is not less than 8 inches from any existing weld.

E. Each replacement strip shall be fusion welded by the dual-hot-wedge method. If the replacement strip is fusion welded, the selected width of the replacement strip shall ensure that the fusion weld is not less than 8 inches from existing weld.

4.6 GEOMEMBRANE LINER INSTALLATION ACCEPTANCE

4.6.1 The geomembrane liner installation shall be accepted when:

A. The installation is complete

B. All required Quality Control documentation has been received from the contractor.

C. All Quality Assurance testing is completed.

4.7 LEACHATE COLLECTION PIPING (PERFORATED PIPE)

4.7.1 Pipe supplied under this specification shall have IPS (Iron Pipe Size) OD unless otherwise specified.

4.7.2 The perforated piping shall have an OD of 6.625" and DR 17, unless otherwise specified on the plans. Hole size shall be 1/2". Three holes, at 120 degrees, on six-inch centers will be drilled in the pipe. To maintain accuracy and uniformity, the pipe is to be drilled by a machine designed for perforating HDPE pipe. No drilling by hand will be allowed.

4.7.3 The pipe shall be joined by butt fusion.

4.7.4 Pipe installation shall be according to the Project Drawings and manufacturer's best practice.

4.7.5 Cleanouts for leachate piping are shown in the Project Drawings.

4.8 LEACHATE TRANSPORT PIPING

4.8.1 Leachate transport piping shall be solid wall HDPE pipe. Pipe size shall be as specified on the plans. The DR rating shall be 17.

4.8.2 The pipe shall be joined by butt fusion.

4.9 LEACHATE DETECTION COLLECTION AND REMOVAL SYSTEM (LDCRS)

4.9.1 LDCRS shall be fabricated and installed as shown in contract drawing. 12" HDPE pipe SDR 17 shall be joined by butt fusion.

4.9.2 The incline part of the pipe is solid pipe, only the horizontal pipe in the sump shall be perforated, three 5/8" diameter holes at 120 degrees at 6" spacing.

4.10 MAN-HOLE IN SALT CELL 5 SUMP

4.10.1 Shall be fabricated and installed as shown in contract drawing. The 24" vertical perforated pipe, 12 and 6" horizontal stubs pipe shall be SDR 17 HDPE pipes, no leak proof testing required.

4.10.2 The 24" vertical pipe shall be perforated, six 5/8" diameter holes at 60 degrees at 9" spacing.

5.0 QUALITY ASSURANCE REQUIREMENTS

5.1 NWP QUALITY ASSURANCE NOTIFICATION

5.1.1 Field inspection notification to NWP is required a minimum of one (1) working day in advance for the following (NWP will attend the inspections at their discretion):

A. Inspection and acceptance of subgrade conditions. Refer to Specification EZ-262, Earth Work, and Sections 4.1.3 and 4.1.4 of this specification.

B. Inspection of seam welding and on-site non-destructive field seam testing. Refer to Sections 5.2, 5.3 ,5.4

5.2 CONFORMANCE TESTING

5.2.1 Geomembrane

A. The purpose of the manufacturer's in-pant Material Conformance Test Sampling is to verify that geomembrane material that is designated for NWP's project is confirmed as meeting the project specifications prior to shipment to the site, thus, barring a transportation accident, the geomembrane can be installed immediately once it arrives on site. Tests shall be done in accordance with GRI Test Method GM 13.

B. NWP will examine all results from conformance testing.

5.3 FIELD QUALITY CONTROL

5.3.1 The contractor shall visually inspect all field welds immediately following work.

5.3.2 All field welds shall be non-destructively tested over their full length for continuity for extrusion welds.

5.3.3 Vacuum Box testing shall not be performed when air temperature drops below 33-degree Fahrenheit or if there is frozen precipitation or ice on the geomembrane surface.

5.3.4 Non-destructive Testing

A. The Contractor shall nondestructively test all field seams over their full length using air pressure testing. Spark testing shall be used in localized areas of extrusion welds where vacuum box testing is impractical.

B. NWP shall be notified and witness all the nondestructive testing.

C. Testing shall be carried out as the seaming work progresses, not at the completion of all field seaming.

D. The Contractor shall record the location, date, time, test number, tester's name and the outcome of the test.

E. Vacuum Box Testing

(1) The equipment shall consist of the following:

(a) Vacuum box assembly consisting of a rigid housing, a transparent viewing window, a soft neoprene gasket attached to the bottom, port hole valve assembly, and a gauge to indicate chamber vacuum.

(b) A steel vacuum tank and pump assembly equipment with pressure control and pipe connections.

(c) A rubber pressure/vacuum hose with fittings and connections.

(d) A bucket and wide brush or spray assembly

(e) Soap

(2) Use the following procedure:

(a) Follow procedure described in ASTM D4437

(b) Energize the vacuum pump and reduce the tank pressure to about -5 psi.

(c) With the soap solution, wet a strip of weld seam that is 3 inches larger than the vacuum box assembly.

(d) Place the box over the wetted area

(e) Close the bleed valve and open the vacuum valve

(f) Make sure the leak tight seal is created

(g) For a period of 10 to 15 seconds, examine the seam through the viewing window for the presence of soap bubbles

(h) If bubbles are not present, close the vacuum valve and open the bleed valve, then move the box over the adjoining area with 3 inches minimum overlap and repeat the process.

(i) Any area where soap bubbles appear, indicates a leakage on the seam, and therefore must be marked and recorded, and must be repaired and retested

(j) Vacuum box testing log must be submitted at the end of the day.

F. Air-Pressure Testing

(1) The equipment shall consist of the following:

(a) An air pump equipped with pressure gauge capable of generating and sustaining a pressure of 30 psi.

(b) A rubber hose with fittings and connections.

(c) A sharp hollow needle or other approved pressure feed device.

(2) The following procedure shall be used:

(a) Seal both ends of the seam to be tested.

(b) Insert a needle or other approved pressure feed device that is connected to a pressure gauge into one end of the tunnel created by the double fusion weld.

(c) Energize the air pump to a minimum pressure of 30 psi, close valve, and sustain pressure for 5 minutes.

(d) At the end of 5 minutes, depressurize seam by placing a needle hole in the air space between the welds at the opposite end of the seam from the gauge. Observe the gauge.

(e) If the seam does not lose more than 3 psi during the 5-minute period and the pressure drops to 0 within 30 seconds of depressurization, seam is acceptable.

(f) If the pressure drops more than 3 psi during the test period, or does not drop to 0 during the 30 second depressurization period, repair the needle holes and retest seam by the same procedure or vacuum box test along the entire length of seam. If the seam does not loose more than 3 psi during the retest, seam is acceptable.

(g) If second air-pressure test fails, vacuum box test entire length of seam.

(i) If no bubbles appear in vacuum box, bottom or second seam will be considered defective, and upper seam is acceptable.

(ii) If bubbles appear in vacuum box, repair each defective area by extrusion welding and test again by vacuum box method.

(h) Mark, with waterproof paint, and repair needle holes.

G. Spark Testing:

(1) Provide equipment consisting of the following:

(a) A high voltage, low current source with the negative terminal for ground and a positive terminal for a voltage applicator. A voltage applicator may consist of a handle and a wire brush, conductive neoprene squeegee, or other suitable applicator.

(b) The range of high voltage source is typically 20,000 to 35,000 volts.

(c) The voltage required to cause a discharge (spark) between the positive electrode and the negative electrode wire is expressed by the formula $V= K\sqrt{D}$

Where:

V= Test Voltage K= Constant

D= Distance from the edge of extrusion bead on the lower panel to the conductive materials in millimeters

(d) If the voltage is not adequate due to under estimating D, a false positive test (a seam with a suspect area resulting in no spark and testing as a good seam) may result,

(e) The conductive material (fine copper wire) should be located 8 to 18 millimeters from the edge of extrusion Weld on the bottom HDPE liner to be a successful test.

(2) The following procedures shall be followed:

(a) ASTM D6365 Standard Practice for Nondestructive Testing of Geomembrane Seams Using the Spark Test

(b) Before or as the seam is welded, a fine copper wire is inserted in the lapped area of the patch 2 to 5 millimeters from the edge of the patch sheet

(c) Prior to testing, it is necessary to connect the copper wire installed in the field seam to the negative terminal of the voltage source or a separate ground

(d) Set the voltage source to a voltage needed for the expected distance. The technician should verify the test voltage is adequate using a trial seam with a simulated defect prior to testing and also verify that the test voltage will not damage the HDPE liner.

(e) Check that the seams and areas adjacent to the seams are dry prior to testing

(f) Place the voltage applicator connected to the positive terminal of the voltage source in contact with the HDPE liner at the seam.

(g) Move the voltage applicator along the seam at a uniform rate of 6 to 9 meter per minute. The voltage applicator must make intimate contact with the seam being inspected

(h) As the test progresses, the generation of a spark indicates a suspect area (leak) in the seam

(i) I. Mark the leaked area with waterproof paint and record it in the log. Repair the leak as soon as possible, and retest the area.

(j) j. Submit Spark Testing log at the end of the day to NWP representative.

5.3.5 Sampling Procedures for the Destructive Testing

A. The contractor shall cut a 12-inch wide by 36-inch-long sample with the seam centered lengthwise.

B. Two 1-inch-wide specimens shall be cut from each end of the sample and discarded

5.3.6 Destructive Testing.

A. Testing shall be carried out as the seaming work progress, not at the completion of all field seaming.

B. Random weld samples shall be cut from the installed welded geomembrane at a minimum frequency of one sample per 500 feet of weld per welding machine and a minimum of one test per machine per day.

C. All destructive testing samples shall be taken from non-critical areas (i.e. the berm above normal water levels or in the anchor trench) whenever possible.

D. Based upon visual observation and inspection, NWP shall determine additional sample times and locations.

E. The contractor shall indicate the location of all samples on the as-built drawing.

F. Holes in the geomembrane resulting from obtaining the seam samples shall be repaired in accordance with section 4.5 of the Specification.

G. The six specimens shall be tested for peel and shear strength.

(1) To be acceptable, all six specimens must pass.

(2) Any specimen that fails through the weld or by fusion at the weld/sheet interface is considered a failure.

(3) Results of the testing must meet the requirements of Section 4.3.9.F of this Specification.

H. If there is a sample failure, rerun the field seam test using new sample coupons from the same sample, if that test passes, NWP may assume that an error was made in the first test and accept the field seam. If the second test fails, the contractor may:

(1) Cap the seam between any two previously passing seam test location, or,

(2) Cut additional samples on each side of the failure location (10-foot minimum each way) and repeat sample procedure for each side. If both sides pass, cap the field seam between the two passing locations. If either fails, repeat the process of taking samples for testing. Each field seam shall be bounded by two passing test locations prior to acceptance.

5.3.7 Approvals

A. NWP or designated representative shall be notified to witness all non-destructive testing of field seams.

B. The contractor will sign a verification of field seam inspection.

C. At the completion of the liner installation, the contractor shall provide written verification that:

(1) Installation is complete.

(2) All field seams and repairs, and associated testing, as required by this specification, are adequate.

(3) All site requirements have been completed as specified.

5.3.8 Safety and Health

A. The Contractor shall have a documented and implemented safety and health program.

5.4 SUBMITTALS

5.4.1 Administrative submittals

A. Production dates for all geomembrane all geomembrane shall be manufactured of new, prime first-quality products designed and manufactures specifically to be chemically resistant to leachate.

B. Schedule of installation of the geomembrane. Revise and resubmit monthly.

C. A Liner Installation Plan that details the required procedures for proper installation of the geomembrane material. Following is the outline of the minimum required elements of the plan:

- Scaled drawing to show the liner panel layout at the corners, trenches, side slopes and bottom cell or pond.
- Transportation and off loading
- Inspection of delivered materials
- Storage of delivered materials
- On-site handling and deployment
- Subgrade acceptance
- Installation limit
- Seaming procedures
- Quality control testing
- General precaution to prevent damage

A. Safety and Health Program documentation.

5.4.2 Shop Drawings

A. Manufacturer's specifications and literature for the geomembrane and all products furnished and utilized to complete this project. Descriptions shall include name of manufacturer(s) and fabricator(s) and product trade name if any.

B. Product identification and supplier of polymer resin for geomembrane production.

C. The proposed panel layout, scaled drawing(s) for the geomembrane showing the installation layout, and seaming plan drawing(s) including the proposed size, number, position and sequence of sheet placement. Layouts shall be fully dimensioned. Seaming plan shall include the location of field seams and the approximate total length of fusion and extrusion welds.

D. Details of joining procedures, field testing, special construction details, anchoring details, temporary anchors, liner attachment to concrete structure, cap strips and replacement strips.

5.4.3 Geomembrane Samples

A. Product vendor material

B. Confirmation Test

C. Pre-construction field seam samples and results of associated tests

D. List of material properties and samples of geomembrane wit attached certified test results

5.4.4 Qualifications

Submit documented evidence of the ability and capacity of manufacturer, installer, and geomembrane testing agency to perform this work.

A. Manufacturer and Fabricator: Certification that the manufacturer has manufactured HDPE geomembranes for at least 5 years and has manufactured a minimum of 10 million square feet of similar HDPE geomembranes. Fabricators shall have at least 5 years of continuous documented experience in the fabrication of HDPE components for liner system applications.

B. Installer Certification of the following requirements shall be provided:

(1) Corporate Requirements: The contractor shall have successfully installed 2 million square feet of these types of geomembranes products specified in applications like this project.

(2) Field Staff Requirements: The Contractor shall provide the following persons to the project and submit resumes as verification of experience:

(a) Installation Supervisor: The installation Supervisor shall be onsite and be in responsible charge during all geomembrane installation (including site sub-grade acceptance, HDPE sheet layout, panel placement, seaming, testing, and repairs) and all other activities performed by the contractor. The Installation Supervisor shall have installed or supervised the installation of minimum of 5 million square feet of HDPE geomembrane.

(b) Master Seamer: All seaming shall be performed under the direction of Master Seamer. The Master Seamer may be the same person as the installation supervisor. The Master Seamer shall have welded a minimum of 2 million square feet of geomembrane using the same type of seaming apparatus as that proposed for this project.

(c) Seamer: All seamers shall have performed a minimum of 500,000 square feet of seaming HDPE geomembrane using the same type of seaming apparatus as that proposed for use on this project.

C. Independent Testing Agency: NWP and/or the contractor may choose to use an independent Quality Control Assurance (QCA) laboratory for geomembrane testing. The laboratory must provide records of equipment calibration, and documented standard procedures for performing specified testing. Test results shall be reviewed by a State of New Mexico Registered Professional Engineer.

Laboratory test equipment shall be certified and traceable to standards of National Institute of Standards and Traceability (NIST), or other recognized standard.

5.4.5 Quality Control Program Plan: Written description of the manufacturer's and installer's formal programs for quality control during manufacturing, fabricating, handling, storage, shipping, installation, seaming, testing, and repairing geomembrane.

5.4.6 Factory test results and manufacturer's certifications shall identify the lot number and roll number for each roll number for each roll delivered to the project site.

5.4.7 Certified destructive test results from an independent CQA testing laboratory, when applicable

5.4.8 Daily reports that include the following:

A. Record of deployment by type and panel number

B. Destructive testing by sample number, seam number, results (pass/fail), and location

C. Trial welds results.

5.4.9 Installer log and records

A. Production log

B. Seam and panel detail log

C. Geomembrane Seaming Log

D. Repair Log

E. Pressure Test Log

F. Vacuum Test Log

G. Spark Test Log

H. Trial Fusion Weld Log

I. Trial Extrusion Log

J. Destructive Test Log

K. Valid Calibration Records for tensiometer, pressure gages and thermometer

Information to be included in the logs, as appropriate, is to include:

1. Date
2. Panels deployed
3. Inspections
4. Seaming technicians
5. Ambient temperature
6. Weather condition
7. Field seams constructed
8. Any other site-specific conditions

5.4.10 As-Built Drawings: Submit reproducible drawings of record showing changes from approved installation drawings. These shall include the identity and location of each repair, cap strip, penetration, boot, and sample taken from the installed geomembrane for testing.

5.4.11 One copy of material and seam results.

5.4.12 Certification of "Subgrade Surface Acceptance" form for the liner sub-grade. See Attachment B

5.4.13 Certificate of warranty and Guarantee

A. Certificate of Warranty for the HDPE geomembrane material, seams, and installation. The geomembrane manufacturer shall warrant the HDPE material, on a prorated basis, against manufacturing defects and material degradation under outdoor exposure for a period of twenty years from the date of installation. The manufacturer shall furnish a written warranty covering the requirements of this paragraph.

B. The Contractor shall provide a written warranty covering the installation workmanship for a period of one year.

5.4.14 Documents shall be submitted in accordance with Attachment A, Document Submittal Requirements.

Specification Section	Description	Approval/Record	Due Prior To
1.1.1	Submit all geosynthetic product information and testing results on each roll of the liner, geonets, geofabrics, HDPE pipes.	A	S
3.1.1. B	Provide a minimum 20 years manufacturer's warranty in writing, contractor shall warranty installation workmanship for one year, from completion of work.		
3.1.1.C	Furnish Manufacturer's certification that the geomembrane was manufactured and tested in accordance with GRI Test Method GM 13

Subject:	WIPP Comments with NMED Responses
Attachments:	20200114 WIPP comments with NMED Responses.docx

Hello,

Attached is a table with NMED responses to comments that were not immediately accepted by NMED. The comments remaining on the table are what we would like to discuss or we will not be accepting but we are happy to discuss further.

Thank you,

Avery Young, Environmental Scientist
New Mexico Environment Department
Ground Water Quality Bureau

Comment Type	Page	Line/ Paragraph/ Condition	Comment / Recommended Changes	NMED Response
Water Usage/ Transport	I. Introduction 2 of 39 and III. Findings 6 of 39	Last bullet page 2 and paragraph 1 page 6	Recommend revising the last sentence in the last bullet of page 2 and the first paragraph on top of page 6 to read as follows: "This runoff does not contact the salt stockpiles or other waste materials at the Facility and may be used by the permittee for dust control, soil compaction, and other activities at the discretion of the Permittee." This will allow the Permittees to use the water for both construction and non-construction related activities.	No, we need to know what WIPP is using it for. Would you like to specify other uses that can be incorporated?
Editorial	Intro 3 of 39		Current language states the following "... covered with a minimum of three feet of earthen material." Recommend changing to "...covered with a minimum of two feet of earthen material." This is to be consistent with information in Attachment 3 of the Permit application submitted on December 3rd, 2018.	It says three feet in the application on page 12, and in the DBS&A 2008 report. Please clarify.
WIPP Geology	Intro 3 of 39		Recommend deleting the last paragraphs starting with "Groundwater below the facility most likely... " and the paragraph beginning with "The first Laterally..." Suggest a complete replacement to more accurately reflect the geology at the WIPP facility. Suggested new paragraphs/ wording is provided below and in the DRAFT DP-831 document as redline. "Natural groundwater occurs in the lower portion of the Dewey Lake Formation, south of the WIPP facility, at a depth of approximately 160 feet and might be affected by a discharge. This water is brackish with an average total dissolved solids concentration of 3,400 milligrams per liter. However, ground water in the lower Dewey Lake is not laterally continuous but tends to be perched, occurring only where the spatially variable cementation mineralogy changes from carbonate to sulfate (gypsum). Well WQSP-6A is the	We will correct what we have and possibly add some suggested language, but we want to keep it short.

			only location within the entire monitoring-well network where ground water was found in the lower Dewey Lake. A 1995 investigation of fluids seeping from the Exhaust Shaft sidewalls, approximately 50 to 80 feet below ground surface (bgs), led to the discovery of a perched water zone in the lower Santa Rosa and upper Dewey Lake Formations. This water was determined to be anthropogenic and in 1996, three monitoring wells (C-2505, C-2506, and C-2507) were drilled around the shaft to assess the hydraulic properties of the saturated stratigraphic horizons, including the identification of possible sources, and to determine water quality. The Dewey Lake Formation has a relatively low hydraulic conductivity. Total dissolved solid concentrations were all above 10,000 mg/L, classifying this water as saline and therefore non-potable. In 1997 twelve piezometers (PZ-1 through PZ-12) were installed around the WIPP facility to characterize the lateral extent of the perched water and flow direction. The shallow groundwater has a general flow direction of north to south. South of WIPP, there is the Mills ranch. Mills has wells producing natural water from the lower Dewey Lake. These wells were sampled by WIPP from 1986 through 1990 and also show the water to be saline and unfit for consumption. During the drilling of a Culebra monitoring well (C-2737) in February 2001, perched anthropogenic water was again encountered. Well C-2811 was subsequently installed in 2001 for further characterization. In 2007, three additional piezometers (PZ-13 through P-15) were installed for further characterization, as required by the 2006 modifications to the DP-831 conditions. During 2002, Daniel B. Stephens and Associates performed flow and transport modeling at the WIPP facility to identify sources of the perched water, to estimate the contributions from each source, and to calculate the water balance (Daniel B. Stephens, 2003). Unlined ponds and salt piles were determined to be the major contributors. The recommended abatement required lining of infiltration sources and in 2005, the ponds and salt piles were lined. In 2008, Daniel B Stephens and Associates performed another hydrologic assessment, this time to examine the effectiveness of the	

			liners in controlling infiltration. The installation of liners was determined to be effective in controlling the infiltration of rainfall, storm water, leachate from the ponds and salt piles (Daniel B. Stephens and Associates, 2008). The first laterally continuous water-bearing zone below the facility is within an approximately 30- foot-thick section of the Culebra Member of the Rustler Formation. Water in the Culebra Member is usually present in fractures and is confined by overlaying anhydrite and underlying clay and anhydrite beds. Water from the Culebra Member is not used as a water supply in the immediate WIPP facility vicinity; however, its nearest use is for livestock watering approximately seven miles southwest of the WIPP facility. The Culebra Member is monitored through a network of monitoring wells that are part of the facility's Water Quality Sampling Program."	
Sampling/ Sludge Measurement	IV 7 of 39	Condition 5	Measurement of the sludge thickness in Condition 5. The Permittee recommends using 1 sludge measurement location and sampling location versus 9 and 6 respectively pursuant to the existing Permit, which allows for utilization of the current site method to determine sludge thickness (i.e., the existing weir structure). Justification: We currently cannot safely perform the requested action as written in the draft Permit. The lagoons have only one point where personnel can walk out and sample the sludge without risking falling into the lagoon due to the slope of the berms. The 9 sample points or 6 sample locations are not reasonable from a safety/health standpoint. The Permittee has replaced liners in the past and visual data has shown that the sludge is evenly distributed on the liner.	No, GWQB does not accept this change for impoundments with domestic wastewater.
Sampling /Coring	IV 10 of 39 and 12 of 39	Condition 14 Condition 22	Coring has the potential to puncture the liner. The Permittee already has systems, process, or procedures in place that are protective of the liner and that include the appropriate precautions and safety limitations. Core sampling of salt is difficult and may cause puncturing of the liner. Salt is difficult to sample by coring especially underwater. The Permittee devised a method for measuring the salt in the Salt	What is the method?

			Storage Ponds that worked well in 2018 without using a coring device.	
Operation	IV 10 of 39	Condition 15 Condition 24 Condition 35	For Condition 15 consider changing "on a continuous basis" to "using an automated system." Recommend removing the words "average weekly" prior to leakage rate. The Permittee requests to establish the initial leakage rate after three removal events by the automated system. It is not known if this will occur within a one week time period.	We want to talk to you more about your leak detection systems and maybe using the average leakage rate for the existing leak detection system and the action leakage rate for the newly constructed systems.
Maintenance / Repair	IV 14 of 39	Condition 25	Consider revising the last sentence to read as follows to focus inspections on protection of the liners: "In the event of significant erosion that indicates liner damage or impending liner damage per the Permittee's inspection procedure, the permittee shall provide a plan and schedule for repair within 90 days of discovery."	What is the inspection procedure? NMED wants the soil cover maintained as well.
Reporting	IV 15 of 39	Condition 28	Consider changing the required report submittals as follows: • January 1st through June 30th – **due by August 31st** ; and • July 1st through December 31st **due by February 28th**. This change is requested to minimize impacts associated with the July 4th Holiday and the winter Holidays.	GWQB does not accept this change. We will discuss further during the phone conversation.
Sampling Analysis	IV 16 of 39	Condition 32	Since Effluent Lagoons A, B, and C are downstream of the Facultative Lagoon System, the Permittee proposes to only sample the influent to Settling Lagoon 1 & 2 (whichever is in operation) for TKN, NO3-N, TDS, Cl, and SO4 as our current Discharge Permit specifies. Sampling downstream Effluent Lagoons A, B, and C will not provide any additional information as this water has already been characterized by sampling Settling Lagoon 1 & 2.	The industrial input is into effluent lagoons B and C, so that is the sample point and it will be concentrated in those impoundments. How is the water managed between A, B, and C?

Sampling Analysis	IV 16 of 39	Condition 32	There is no listing of analytical methods in this Permit.	Condition 27 references analytical methods listed in our regulations.
Sampling Analysis	IV 18 of 39	Condition 38 Condition 39	Recommend deleting the 24-hour flow weighted composite and replacing with "a grab sample" (similar to other conditions). Recommend adding suggested language for analytes that have shown a natural background above the reporting limits and for existing conditions. Suggested language: "...unless the existing condition exceeds the standard or unless otherwise provided in Subsection E of Section 20.6.3.109 NMAC and unless natural background for the region shows values that exceed the standards."	Changed to grab, but no change with the additional sentence. It's about reporting limits, not about the standards.
Monitoring	IV 21 of 39	Condition 47	Recommend changing the word "calculated" to "measured". Recommend changing "weekly" to "three consecutive removal events."	Related to leak detection.
Reporting	IV 21 of 39 22 of 39	Condition 48 Condition 50	The Permittee requests to submit one cumulative report for all wells, which will include all pertinent reporting information as called out in this Permit condition. The Permittee requests an all-inclusive report rather than incrementally sending information.	Clarify the concern. there are two submittals: the proposal and the results. We can combine the results, well logs, and survey into one submittal, but the proposal is still separate. We would also like to discuss the submitted MW location proposal.
Sampling Locations / Monitoring	IV 25 of 39	Condition 55 Condition 56 Condition 57	It states that WQSP-6A is intended to monitor the shallowest water-bearing zone of the Dewey Lake Formation. This is incorrect. WQSP-6A monitors the natural Dewey Lake water, which is at the bottom of the Dewey Lake, approximately 160 feet below land surface. Naturally occurring groundwater is not always detected in the lower Dewey Lake. There is a water bearing zone due to a cementation change from a calcium carbonate to a sulfate (gypsum) cement. Water then perches on the sulfate cementation zone. This condition is not spatially consistent. That is why the Permittee only has one well in its network (WQSP-6A) with deep naturally occurring water. This well was added to the DP-831 sampling program in the last modification to determine if the anthropogenic water migrated both laterally and vertically into the deep natural Dewey Lake Formation water. PZ-16 (change to PZ-17) and PZ-17 (change to PZ-19) are not intended to monitor the Dewey Lake water, but any	Need to discuss during phone call.

			anthropogenic water perched on the Santa Rosa and Dewey Lake contact at the Facultative Lagoon and the Evaporation Pond H-19, respectively.	
Sampling Locations / Monitoring	IV 27 of 39	Condition 58	A potentiometric surface map cannot be developed for the naturally occurring Dewey Lake as identified in WQSP-6A. This is the only well with naturally occurring Dewey Lake water in the WIPP Monitoring Well network.	PZ-17 and PZ-19 are intended to be drilled in the Dewey Lake formation enabling WIPP to create a groundwater elevation contour map.
Investigation / Work Plan	IV 28 of 39	Condition 61	Please consider deleting this condition from the Fact Sheet and the Permit. Extensive investigations have already been conducted and as a result of those investigations, abatement efforts including lining of the site impoundments and extensive monitoring are being performed pursuant to DP-831. The Permittee is actively monitoring and has not observed any condition that indicates the remediation in place is not effective. Please see the 2003 and 2008 Daniel B Stevens reports. Furthermore, the WIPP Land Withdrawal Act restricts public access to the facility, which includes ground water usage for beneficial purposes. Further studies would provide no additional useful information.	This condition has not been deleted, but it has been revised. We will discuss further.
Sampling Locations / Monitoring	IV 28 of 39	Condition 62	The Permittee recommends adding text regarding the existing conditions and that address background for the region in regards to "newly exceeded". Please consider adding the following or similar text; "unless the existing condition exceeds the standard or unless otherwise provided in Subsection E of Section 20.6.3.109 NMAC and unless natural background for the region shows values that exceed the standards."	Why does this propose the two options (existing and natural background)? Discuss further.

Attachments: DP-831 Permit Comments & Recommendations.docx; DP-831 Prelim Draft DP_Permittee Redline_Strikeout Comments.docx; DP-831 Draft Fact Sheet_Permittee Redline_Strikeout Comments.docx

Avery,

Thank you for the opportunity to provide comments and recommendations on the DRAFT Permit. We appreciate all of your efforts in guiding us through this Permit renewal/modification process. We are providing you with three files:

- a comment summary table, in order by topic, with suggested edits and recommendations for the DRAFT Permit,
- a detailed redline/strikeout showing the exact recommendations for the DRAFT Permit, and
- a redline/strikeout of the Fact Sheet

If we can be of any further assistance, please don't hesitate to reach out. Thank you again for considering our comments and feedback.

Joshua Vajda

Waste Isolation Pilot Plant
(575) 234-3214

Comment Type	Page	Line/ Paragraph/ Condition	Comment / Recommended Changes
Editorial	Cover Page		Please change "Kirk D. Lachman" to "Gregory Sosson" because Greg Sosson recently replaced Kirk Lachman as the Acting CBFO Manager.
Editorial	Cover Page		The Facility Contact Phone Number is incorrectly listed as the fax number. Please change the number to the following: (575) 234-8143.
Editorial	Cover Page		Under Facility Location, recommend deleting the word "approximately".
Water Usage/ Transport	I. Introduction 2 of 39, bullet 3 and III. Para 2 5 of 39		Recommend replacing the words "every two weeks..." with "in order to maintain at least 2 feet of freeboard." This is consistent with the discussion in the application page 3 of 42 which states "When the brine retention ponds reach their allowed capacity, then accumulated brine will be transferred to Storm Water Pond 4."
Water Usage/ Transport	I. Introduction 2 of 39 and III. Findings 6 of 39	Last bullet page 2 and paragraph 1 page 6	Recommend revising the last sentence in the last bullet of page 2 and the first paragraph on top of page 6 to read as follows: "This runoff does not contact the salt stockpiles or other waste materials at the Facility and may be used by the permittee for dust control, soil compaction, and other activities at the discretion of the Permittee." This will allow the Permittees to use the water for both construction and non-construction related activities.
Editorial	Intro 3 of 39		Recommend adding an "&" sign between "Site" and "Preliminary". The revised sentence would read as follows: "Site & Preliminary Design Validation..."
Editorial	Intro 3 of 39		Current language states the following "... covered with a minimum of three feet of earthen material." Recommend changing to "...covered with a minimum of two feet of earthen material." This is to be consistent with information in Attachment 3 of the Permit application submitted on December 3rd, 2018.
Editorial	Intro 3 of 39		Recommend deleting the word "approximately" after (NM-128) and before the number 26.
Editorial	Intro 3 of 39		Recommend deleting the word "principally" in the following sentence: "The WIPP facility is principally..." Disposal is the only use for the WIPP facility.
Editorial	Intro 3 of 39		Recommend adding "polyhalite" to the list.
WIPP Geology	Intro 3 of 39		Recommend deleting the last paragraphs starting with "Groundwater below the facility most likely... " and the paragraph beginning with "The first Laterally..."

			Suggest a complete replacement to more accurately reflect the geology at the WIPP facility. Suggested new paragraphs/ wording is provided below and in the DRAFT DP-831 document as redline. "Natural groundwater occurs in the lower portion of the Dewey Lake Formation, south of the WIPP facility, at a depth of approximately 160 feet and might be affected by a discharge. This water is brackish with an average total dissolved solids concentration of 3,400 milligrams per liter. However, ground water in the lower Dewey Lake is not laterally continuous but tends to be perched, occurring only where the spatially variable cementation mineralogy changes from carbonate to sulfate (gypsum). Well WQSP-6A is the only location within the entire monitoring-well network where ground water was found in the lower Dewey Lake. A 1995 investigation of fluids seeping from the Exhaust Shaft sidewalls, approximately 50 to 80 feet below ground surface (bgs), led to the discovery of a perched water zone in the lower Santa Rosa and upper Dewey Lake Formations. This water was determined to be anthropogenic and in 1996, three monitoring wells (C-2505, C-2506, and C-2507) were drilled around the shaft to assess the hydraulic properties of the saturated stratigraphic horizons, including the identification of possible sources, and to determine water quality. The Dewey Lake Formation has a relatively low hydraulic conductivity. Total dissolved solid concentrations were all above 10,000 mg/L, classifying this water as saline and therefore non-potable. In 1997 twelve piezometers (PZ-1 through PZ-12) were installed around the WIPP facility to characterize the lateral extent of the perched water and flow direction. The shallow groundwater has a general flow direction of north to south. South of WIPP, there is the Mills ranch. Mills has wells producing natural water from the lower Dewey Lake. These wells were sampled by WIPP from 1986 through 1990 and also show the water to be saline and unfit for consumption. During the drilling of a Culebra monitoring well (C-2737) in February 2001, perched anthropogenic water was again encountered. Well C-2811 was subsequently installed in 2001 for further characterization. In 2007, three additional piezometers (PZ-13 through P-15) were installed for further characterization, as required by the 2006 modifications to the DP-831 conditions. During 2002, Daniel B. Stephens and Associates performed flow and transport modeling at the WIPP facility to identify sources of the perched water, to estimate the contributions from each source, and to calculate the water balance (Daniel B. Stephens, 2003). Unlined ponds and salt piles were determined to be the major contributors. The recommended abatement required lining of infiltration sources and in 2005, the ponds and salt piles were lined. In 2008, Daniel B Stephens and Associates performed another hydrologic assessment, this time to examine the effectiveness of the liners in controlling infiltration. The installation of liners was determined to be effective in controlling the infiltration of

			rainfall, storm water, leachate from the ponds and salt piles (Daniel B. Stephens and Associates, 2008). The first laterally continuous water-bearing zone below the facility is within an approximately 30- foot-thick section of the Culebra Member of the Rustler Formation. Water in the Culebra Member is usually present in fractures and is confined by overlaying anhydrite and underlying clay and anhydrite beds. Water from the Culebra Member is not used as a water supply in the immediate WIPP facility vicinity; however, its nearest use is for livestock watering approximately seven miles southwest of the WIPP facility. The Culebra Member is monitored through a network of monitoring wells that are part of the facility's Water Quality Sampling Program."
Sampling/ Sludge Measurement	IV 7 of 39	Condition 5	Measurement of the sludge thickness in Condition 5. The Permittee recommends using 1 sludge measurement location and sampling location versus 9 and 6 respectively pursuant to the existing Permit, which allows for utilization of the current site method to determine sludge thickness (i.e., the existing weir structure). Justification: We currently cannot safely perform the requested action as written in the draft Permit. The lagoons have only one point where personnel can walk out and sample the sludge without risking falling into the lagoon due to the slope of the berms. The 9 sample points or 6 sample locations are not reasonable from a safety/health standpoint. The Permittee has replaced liners in the past and visual data has shown that the sludge is evenly distributed on the liner.
Sampling /Coring	IV 10 of 39 and 12 of 39	Condition 14 Condition 22	Coring has the potential to puncture the liner. The Permittee already has systems, process, or procedures in place that are protective of the liner and that include the appropriate precautions and safety limitations. Core sampling of salt is difficult and may cause puncturing of the liner. Salt is difficult to sample by coring especially underwater. The Permittee devised a method for measuring the salt in the Salt Storage Ponds that worked well in 2018 without using a coring device.
Operation	IV 10 of 39	Condition 15 Condition 24 Condition 35	For Condition 15 consider changing "on a continuous basis" to "using an automated system." Recommend removing the words "average weekly" prior to leakage rate. The Permittee requests to establish the initial leakage rate after three removal events by the automated system. It is not known if this will occur within a one week time period.
Maintenance / Repair	IV 14 of 39	Condition 25	Consider revising the last sentence to read as follows to focus inspections on protection of the liners: "In the event of significant erosion that indicates liner damage or impending liner damage per the Permittee's inspection

			procedure, the permittee shall provide a plan and schedule for repair within 90 days of discovery."
Reporting	IV 15 of 39	Condition 28	Consider changing the required report submittals as follows: • January 1st through June 30th – **due by August 31st** ; and • July 1st through December 31st **due by February 28th**. This change is requested to minimize impacts associated with the July 4th Holiday and the winter Holidays.
Sampling Analysis	IV 16 of 39	Condition 32	Since Effluent Lagoons A, B, and C are downstream of the Facultative Lagoon System, the Permittee proposes to only sample the influent to Settling Lagoon 1 & 2 (whichever is in operation) for TKN, NO3-N, TDS, Cl, and SO4 as our current Discharge Permit specifies. Sampling downstream Effluent Lagoons A, B, and C will not provide any additional information as this water has already been characterized by sampling Settling Lagoon 1 & 2.
Sampling Analysis	IV 16 of 39	Condition 32	There is no listing of analytical methods in this Permit.
Sampling Analysis	IV 18 of 39	Condition 38 Condition 39	Recommend deleting the 24-hour flow weighted composite and replacing with "a grab sample" (similar to other conditions). Recommend adding suggested language for analytes that have shown a natural background above the reporting limits and for existing conditions. Suggested language: "...unless the existing condition exceeds the standard or unless otherwise provided in Subsection E of Section 20.6.3.109 NMAC and unless natural background for the region shows values that exceed the standards."
Monitoring	IV 21 of 39	Condition 47	Recommend changing the word "calculated" to "measured". Recommend changing "weekly" to "three consecutive removal events."
Reporting	IV 21 of 39 22 of 39	Condition 48 Condition 50	The Permittee requests to submit one cumulative report for all wells, which will include all pertinent reporting information as called out in this Permit condition. The Permittee requests an all-inclusive report rather than incrementally sending information.
Sampling Locations / Monitoring	IV. 22 of 39	Condition 49 Condition 51	Condition 49 provides the nomenclature for the new wells. Please change "PZ-16" to "PZ-17" and "PZ-17" to "PZ-19." This correlates with the well location plan that was created before the draft DP-831 was released. The numbers in our plan coincide with an east to west numbering system with PZ-19 named according to H-19 nomenclature. Condition 51 provides the nomenclature for the new wells. Please change "PZ-18" to "PZ-16" and "PZ-19" to "PZ-18." This correlates with the well location plan that was created before the draft DP-831 was released. The numbers in our plan coincide with an east to west numbering system with PZ-19 named according to H-19 nomenclature.

Sampling /Monitoring	IV 23 of 39	Condition 52 Condition 55 Condition 56 Condition 57	Recommend removing dissolved oxygen, turbidity, and oxidation-reduction potential (redox). Performing dissolved oxygen would be appropriate if making a determination if algae growth was in the well or water. These wells have been pumped and sampled for many years, the pump does not come in contact with potential silt in the well sump. Success has been established over the years by measuring temperature, specific conductance, and pH to establish that the samples are formation water and not water from the borehole annulus.
Reporting	IV 23 of 39	Condition 52	For Well Installation: The Permittee requests that the time frame for submittal of the groundwater analytical results (including the laboratory QA/QC summary report) be changed to 120 days instead of 45 days from the well completion date. Laboratory turnaround is typically 60 days. This will allow time for sample prep, sample analysis, data quality checks and data reporting.
Sampling Locations / Monitoring	IV 25 of 39 26 of 39	Condition 55 Condition 56 Condition 57	Recommend the following language to describe the drawdown: "The drawdown will be minimized such that it will maintain depression of the water level, but not exceed one liter per minute."
Sampling Locations / Monitoring	IV 25 of 39	Condition 55 Condition 56 Condition 57	It states that WQSP-6A is intended to monitor the shallowest water-bearing zone of the Dewey Lake Formation. This is incorrect. WQSP-6A monitors the natural Dewey Lake water, which is at the bottom of the Dewey Lake, approximately 160 feet below land surface. Naturally occurring groundwater is not always detected in the lower Dewey Lake. There is a water bearing zone due to a cementation change from a calcium carbonate to a sulfate (gypsum) cement. Water then perches on the sulfate cementation zone. This condition is not spatially consistent. That is why the Permittee only has one well in its network (WQSP-6A) with deep naturally occurring water. This well was added to the DP-831 sampling program in the last modification to determine if the anthropogenic water migrated both laterally and vertically into the deep natural Dewey Lake Formation water. PZ-16 (change to PZ-17) and PZ-17 (change to PZ-19) are not intended to monitor the Dewey Lake water, but any anthropogenic water perched on the Santa Rosa and Dewey Lake contact at the Facultative Lagoon and the Evaporation Pond H-19, respectively.
Sampling Locations / Monitoring	IV 27 of 39	Condition 58	A potentiometric surface map cannot be developed for the naturally occurring Dewey Lake as identified in WQSP-6A. This is the only well with naturally occurring Dewey Lake water in the WIPP Monitoring Well network.
Investigation / Work Plan	IV 28 of 39	Condition 61	Please consider deleting this condition from the Fact Sheet and the Permit. Extensive investigations have already been conducted and as a result of those investigations, abatement efforts including lining of the site impoundments and extensive monitoring are being performed pursuant to DP-831. The

			Permittee is actively monitoring and has not observed any condition that indicates the remediation in place is not effective. Please see the 2003 and 2008 Daniel B Stevens reports. Furthermore, the WIPP Land Withdrawal Act restricts public access to the facility, which includes ground water usage for beneficial purposes. Further studies would provide no additional useful information.
Sampling Locations / Monitoring	IV 28 of 39	Condition 62	The Permittee recommends adding text regarding the existing conditions and that address background for the region in regards to "newly exceeded". Please consider adding the following or similar text; "unless the existing condition exceeds the standard or unless otherwise provided in Subsection E of Section 20.6.3.109 NMAC and unless natural background for the region shows values that exceed the standards."

FACT SHEET
Ground Water Discharge Permit DP-831 (draft)
November 2019

Facility Name:	Waste Isolation Pilot Plant (WIPP)
Facility Location:	Highway 128, approximately 26 miles southeast of Carlsbad Carlsbad, NM Sections 20, 21, 28 and 29, Township 22S, Range 31E
County:	Eddy County
Applicant/Permittee:	Kirk D. Lachman, Acting Manager U.S. Department of Energy, Carlsbad Field Office P.O. Box 3090 Carlsbad, NM 88221
Proposed Permitting Action:	Discharge Permit Renewal and Modification
Regulatory Authority:	Water Quality Control Commission's Ground and Surface Water Protection Regulations, 20.6.2 NMAC
Issuing Agency:	Ground Water Quality Bureau (GWQB) of the New Mexico Environment Department (NMED)
GWQB Contact:	Avery Young PO Box 5469, Santa Fe, NM 87502-5469 Phone: (505) 827-2909 Email: avery.young@state.nm.us

The Ground Water Quality Bureau has prepared this Fact Sheet as required by Subsection I of 20.6.2.3108 NMAC because the proposed discharge is at a federal facility and is not comprised solely of domestic liquid waste.

The original Discharge Permit was issued on January 16, 1992, amended on August 28, 1995, renewed on July 3, 1997, amended on June 12, 1998 and on January 24, 2000, renewed on April 29, 2003, modified on December 22, 2003 and on December 29, 2006, renewed and modified on July 23, 2008, and last renewed on July 29, 2014. The application (i.e., discharge plan) consists of the materials submitted by the permittee dated December 3, 2018 and materials contained in the administrative record prior to issuance of this draft Discharge Permit and draft Fact Sheet.

The draft Discharge Permit that accompanies this draft Fact Sheet is for a renewal and modification. The modification consists of the addition of one new salt storage cell and four new impoundments: Salt Cell 5, Salt Storage Pond 5, Brine Salt Storage Pone 4, Brine Retention Pond East, and Brine Retention Pond West. Additional changes made to the Discharge Permit issued to the Waste Isolation Pilot Plant (WIPP or Facility) on July 29, 2014 are described below.

Comment Period / Request for Hearing

NMED will allow at least thirty days during which time written comments may be submitted and a public hearing may be requested. NMED will allow for these activities after publishing notice of the availability of this Draft Permit and Fact Sheet. Requests for public hearing shall be in writing and shall set forth the reasons why a hearing should be held. A hearing will be held if the NMED Secretary determines that there is substantial public interest. To obtain a copy of the Draft Permit, to submit a comment, or to request a hearing on this matter, contact the GWQB Contact listed at the beginning of this Fact Sheet.

Regulatory Framework

The Ground and Surface Water Protection Regulations, 20.6.2 NMAC, establish the regulatory framework for controlling discharges onto or below the surface of the ground through the issuance of groundwater discharge permits. The purpose of the regulations pertaining to groundwater discharge permits, as stated in Section 20.6.2.3101 NMAC, is "to protect all ground water of the state of New Mexico which has an existing concentration of 10,000 mg/l or less of total dissolved solids, for present and potential future use as domestic and agricultural water supply, and to protect those segments of surface waters which are gaining because of ground water inflow, for uses designated" in the Standards for Interstate and Intrastate Surface Waters, 20.6.4 NMAC. (See the New Mexico Commission of Public Records website to view 20.6.2 and 20.6.4 NMAC: http://www.srca.nm.gov/chapter-6-water-quality/.)

The regulations establish groundwater standards as identified in Section 20.6.2.3103 NMAC.

Persons proposing to discharge effluent or leachate in such a manner that it could move directly or indirectly into groundwater must obtain and comply with a discharge permit (20.6.2.3104 NMAC). In order to obtain a discharge permit, an applicant must submit an application (or "discharge plan" – 20.6.2.7 NMAC) proposing methods/techniques to be used or processes expected to naturally occur to ensure that the discharge of water contaminants does not result in the contamination of ground or surface water (20.6.2.3106 NMAC).

In reviewing and approving an application, NMED must ensure that the discharge plan will not result in a hazard to public health, undue risk to property, exceedance of the groundwater standards at any place of withdrawal of water for present or reasonably foreseeable future use, or violation of a stream standard (Subsections C and H of 20.6.3109 NMAC). "Hazard to public health" is defined in Section 20.6.2.7 NMAC and pertains to the exceedance of the groundwater standards in a drinking water supply.

Subsection B of 20.6.2.3109 NMAC directs the NMED Secretary to "approve, approve with conditions, or deny" a discharge permit application, after the administrative record is complete and all required information is available. This regulation authorizing permit approval "with conditions" provides the fundamental authority for including conditions in discharge permits.

General Facility Information

The WIPP is principally a mined geologic repository for the disposal of transuranic (TRU) waste. The underground repository is located 2,150 feet below land surface in the bedded salt of the Salado Formation. WIPP first began accepting waste in March 1999. In addition to this groundwater Discharge Permit, WIPP is also regulated by the NMED Hazardous Waste Bureau under the New Mexico Hazardous Waste Act and New Mexico's Hazardous Waste Regulations.

The WIPP facility is geologically situated in the southeast portion of New Mexico within the Delaware Basin, which is part of the larger Permian Basin. The geologic formations below the facility that are pertinent to this Discharge Permit, from deepest to shallowest, include: the Salado Formation, the Rustler Formation, the Dewey Lake Formation, and, in the northeastern portion of the facility, the Santa Rosa Formation. The Salado Formation, which is first encountered at a depth of 850 feet and is 2,000 feet thick, consists predominately of halite, with some carbonates, anhydrites, and clay seams. The Rustler Formation ranges from 350 to 500 feet thick and consists of carbonates, anhydrites, and halites. The Dewey Lake Formation is approximately 500 feet thick and consists almost entirely of mudstone, claystone, siltstone, and interbedded sandstone, and is frequently referred to as the Dewey Lake Redbeds Formation.

Groundwater below the facility most likely to be affected by this discharge is at a depth of approximately 30 to 160 feet, is located in the upper portion of the Dewey Lake Formation, and has an average total dissolved solids concentration of approximately 3,400 milligrams per liter. WIPP discovered the presence of shallow groundwater in March 2001 and determined that the probable sources of this shallow groundwater were the unlined impoundments constructed to capture stormwater runoff at the facility and runoff from the above-ground salt piles. This shallow groundwater has been found to be contaminated with total dissolved solids, sulfate, and chloride. After the discovery of the anthropogenically created shallow groundwater, all impoundments at the facility were lined and a network of monitoring wells was installed. The shallow groundwater has a flow direction of north to south. Natural, non-anthropogenic, groundwater occurs in the Dewey Lake Formation south of the WIPP facility at a depth of 160 feet. The Dewey Lake Formation has a relatively low hydraulic conductivity.

The first laterally continuous water-bearing zone below the facility is within an approximately 30-foot-thick section of the Culebra Member of the Rustler Formation. Water in the Culebra Member is usually present in fractures and is confined by overlaying gypsum or anhydrite and underlying clay and anhydrite beds. Water from the Culebra Member is not used as a water supply in the immediate WIPP facility vicinity; however, its nearest use is approximately seven miles southwest of the WIPP facility, where it is used for livestock watering. The Culebra Member is monitored through a series of monitoring wells that are part of the facility's Water Quality Sampling Program.

Description of the Proposed Discharge

The activities that produce the discharge and the quantity, quality, and flow characteristics of the proposed discharges at WIPP are briefly described as follows:

The source and disposition locations of proposed discharges at WIPP include the following: domestic wastewater to a facultative (treatment) lagoon system for; industrial, non-hazardous wastewater to evaporative impoundments; stormwater emanating generally from the Facility to evaporative impoundments, and stormwater emanating from the salt piles to evaporative impoundments.

Up to 23,000 gallons per day (gpd) of domestic wastewater may be discharged to seven synthetically lined impoundments (Facultative Lagoon System) comprised of Settling Lagoons 1 and 2, Polishing Lagoons 1 and 2, and Effluent Lagoons A, B, and C for disposal by evaporation and removal of precipitated domestic waste solids.

Non-domestic wastewater may be discharged at the Facility in the following ways:

- Up to 27,000 gpd of industrial wastewaters from the following sources: wastewater from two compressed air systems, brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous wastewaters. These industrial wastewaters are discharged to the Effluent Lagoons B and C of the Facultative Lagoon System for disposal by evaporation.

- Up to 50,000 gpd of industrial wastewaters from the following sources: brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous wastewaters. These industrial wastewaters are discharged to a separate synthetically lined impoundment for disposal by evaporation (Evaporation Pond H-19).

- Up to 2,210 gpd of brine produced from the operation of the to be constructed Salt Reduction System within the Safety Significant Confinement Ventilation System (SSCVS) will be discharged to two double synthetically lined impoundments, each with a leak detection system (Brine Retention Ponds East and West, collectively Brine Ponds). One brine retention pond will be in service while the other brine retention pond is closed for evaporation and removal of precipitated salt every two weeks. After two weeks, any remaining brine in the closed Brine Pond will be transferred to Brine Salt Storage Pond 4 for disposal by evaporation.

- Salt and other subsurface materials mined during construction of the Facility, as well as currently mined salt, are stored at the surface in four stockpiles. The stockpiles currently storing salt, or that will be used in the future as salt is mined from the Facility's underground panels, are referred to as Salt Cells 2, 3, and 5. Stormwater runoff in contact with Salt Cells 2 and 3 is collected in two double synthetically-lined stormwater impoundments, each with a leak detection system (Salt Storage Ponds 2 and 3). The total storage capacity of Salt Storage Ponds 2 and 3 is 21,737,254 gallons. Stormwater runoff in contact with Salt Cell 5 will be collected in a double synthetically-lined stormwater impoundment with a leak detection system (Salt Storage Pond 5). The storage capacity of Salt Storage Pond 5 will be 6,355,404 gallons. Salt Cell 1 no longer receives salt and is capped with synthetic material and an earthen cover. Stormwater runoff in contact with this stockpile is collected in synthetically-lined diversion ditches directed to a synthetically-lined impoundment (Salt Storage Pond 1). The storage capacity of Salt Storage Pond 1 is 3,301,634 gallons. The storage capacity of each salt storage pond is more than sufficient to contain a 24-hour, 100-year (5.84-inch rainfall) storm event.

- Stormwater runoff from the SSCVS area is collected in a double synthetically-lined stormwater impoundment with a leak detection system (Brine Salt Storage Pond 4). The storage capacity of Brine Salt Storage Pond 4 is 8,668,722 gallons. The capacity of the Brine Salt Storage Pond 4 is more than sufficient to contain a 24-hour, 100-year (5.84-inch rainfall) storm event.

- Additional stormwater runoff from the Facility's paved areas and roofs is collected in three synthetically-lined impoundments (Storm Water Ponds 1, 2, and 3). This runoff does not contact the salt stockpiles or other waste materials at the Facility and may be used by the permittee for dust control, soil compaction, and other construction activities.

The modification consists of the addition of one new salt storage cell and four new impoundments: Salt Cell 5, Salt Storage Pond 5, Brine Salt Storage Pond 4, Brine Retention Pond East, and Brine Retention Pond West.

Basis for Draft Permit Conditions

The conditions in this Draft Permit are organized into the following Sections: Operational Plan, Monitoring and Reporting, Additional Studies Required, Contingency, Closure, and General Requirements. The Draft Permit conditions conform to the requirements of the regulations and are generally consistent with similar conditions in other groundwater discharge permits issued by the Department.

1. Operational Plan Conditions (pages 6-15 in the Draft Permit)

Conditions in this Section require the permittee to properly operate and maintain the disposal systems, to restrict access to the systems via fencing so that unauthorized persons cannot damage a system or be exposed to unsafe conditions, and to post appropriate cautionary signs.

This Section contains operating conditions typically required for discharge systems composed of lined treatment impoundments for domestic wastewater and lined evaporative impoundments for industrial wastewater and stormwater. These conditions include requirements to appropriately maintain the synthetic impoundment liners, to maintain a specific freeboard within impoundments to prevent overtopping, to measure the thickness of settled solids within impoundments and to remove those solids if storage capacity is diminished to a specific limit. Proper operation and maintenance of the discharge system is critical for the Discharge Permit to achieve the performance criteria established in Subsection C of 20.6.2.3109 NMAC.

This Section requires the Permittee to monitor leak detection systems associated with specific salt storage ponds and impoundments that are proposed to be built during the term of the Discharge Permit. This requirement addresses the 20.6.2.3107 NMAC requirement that a discharge plan include procedures for detecting failure of the discharge system. To accomplish this, the Permittee must establish an average leakage rate for the primary liners and determine if there is a deviation of 20% above that leakage rate. If a deviation occurs, the Contingency Section specifies verification and remedial actions to be followed by the Permittee.

This Section also requires the Permittee to conduct regular maintenance of the earthen covers on Salt Cell 1 and the Site & Preliminary Design Validation (SPDV) Material Pile. Both piles consist of salt excavated during the construction of the Facility. Both piles are no longer active, i.e., they no longer receive salt; therefore, they have been covered in order to prevent stormwater infiltration and destabilization of the piles.

The Draft Permit does not contain discharge quality limitations because all discharges are contained in evaporative disposal systems.

2. Monitoring and Reporting Conditions (pages 15 – 28 in the Draft Permit)

Conditions in this Section require the Permittee to monitor and report on various aspects of the discharge system and groundwater to demonstrate that operations are compliant with the Discharge Permit limits and that the Discharge Permit is achieving the expected results. Monitoring and reporting requirements are authorized by Subsection A of 20.6.2.3107 NMAC. A discharge permit may not be approved without provisions for flow measurement and sampling, pursuant to Subsection H of 20.6.2.3109 NMAC.

The facility subsections require monitoring of the quantity and quality of the discharges, specifically, the discharge volumes to the impoundments, the chemical characterization of the impounded fluids, and the volume of liquid pumped from the leak detection systems.

Once during the Discharge Permit term, the Permittee is required to evaluate industrial wastewater for a comprehensive list of chemical constituents pursuant to 20.6.2.3103 NMAC. This comprehensive analysis pertains to the industrial waste discharges having varied origins, including brine, purge waters from sampling and developing monitoring wells, and miscellaneous industrial non-hazardous wastewaters.

The Groundwater Monitoring and Reporting subsection requires monitoring groundwater downgradient of the following potential contaminant sources: impoundments containing stormwater runoff in contact with salt piles, the domestic wastewater impoundment system, capped salt piles, uncapped salt piles, and impoundments containing industrial discharges. This Section requires groundwater monitoring of two saturated zones, the shallow anthropogenic groundwater measured at approximately 30 feet below ground surface and the shallowest non-anthropogenic water-bearing zone in the Dewey Lake Formation measured at approximately 160 feet below ground surface.

The Permittee is required to sample for total dissolved solids, chloride, and sulfate in groundwater monitoring wells designated to monitor salt piles and impoundments containing stormwater runoff in contact with salt piles. The Permittee is required to sample for nitrate as nitrogen and total Kjeldahl nitrogen in the groundwater monitoring well designated to monitor the domestic wastewater impoundment system. The Permittee is required to sample for uranium and combined radium-226 and radium-228 in the groundwater monitoring wells designated to monitor all domestic and non-domestic discharge locations at the Facility. The sampling requirements for uranium and radium-226/radium-228 are included because these constituents can be indicative of radioactive materials originating from the Facility and because these constituents are the only radioactive constituents for which New Mexico has groundwater protection standards.

Monitoring wells WQSP-6A, PZ-16, and PZ-17 are intended to monitor the shallowest non-anthropogenic water-bearing zone in the Dewey Lake Formation, which occurs in the subsurface at the southern end of the Facility. All other monitoring wells are intended to monitor the shallow anthropogenic groundwater.

This subsection requires the installation of four new groundwater monitoring wells to monitor groundwater associated with newly authorized impoundments, to replace an improperly located well, and to monitor previously unmonitored locations. One monitoring well is required to be installed downgradient of the Facultative Lagoon System to replace an improperly located well. One monitoring well is required to be installed downgradient of Evaporation Pond H-19 because the impoundment is comprised of a single, 40-mil synthetic liner; therefore, a monitoring well is required downgradient to monitor the integrity of the liner. One monitoring well is required to be installed downgradient of the proposed Brine Salt Storage Pond 4 to monitor that impoundment system. One well is required to be installed downgradient of the proposed Salt Storage Pond 5 in order to monitor that impoundment system.

This Section requires the submittal of semi-annual monitoring reports that include the following: the chemical analytical results of domestic effluent and non-domestic wastewater; discharge volumes; record of solids (salt) removal and disposal; leak detection system measurements; the submittal of DOE's "Waste Isolation Pilot Plant Annual Site Environmental Report"; groundwater characterization data; groundwater depth measurements; and groundwater elevation contour maps.

3. Additional Studies Required (page 28 in the Draft Permit)

This Section requires the Permittee to submit for NMED approval a workplan to investigate the shallow anthropogenic groundwater beneath the site, which contains concentrations of total dissolved solids, chloride, and sulfate above the standards of 20.6.2.3103 NMAC. Contingency Condition 26 of WIPP's previous Discharge Permit dated July 29, 2014 requires a response to exceedances to the standards of 20.6.2.3103 NAMC Facility records identify the probable source of this groundwater as unlined stormwater impoundments from the time of initial construction of the Facility to the time the impoundments were lined in 2005. The purpose of the site investigation is to determine the sources, composition, and extent of this contaminated shallow groundwater, and to evaluate possible impacts to naturally occurring downgradient groundwater in the Dewey Lake Formation.

This requirement is consistent with Section 20.6.2.3107 NMAC, which allows the Secretary to require a system of monitoring and reporting to verify that the permit is achieving the expected results and to require reporting of other information. The site investigation will provide additional information necessary to prevent further contamination and to determine whether to require corrective action.

4. Contingency Plan Conditions (pages 28 -32 in the Draft Permit)

Conditions in this Section require the Permittee to implement specified actions, or to propose corrective actions for NMED's approval, in the case of failure of any aspect of the discharge system. The conditions, which reflect standard language used in other industrial discharge permits, address the exceedance of groundwater standards, damage to impoundment liners, lack of required freeboard in impoundments, and monitoring well deficiencies (e.g., improper construction, improper location for monitoring the intended source, insufficient water for sampling). Contingency plans are authorized by Subsection A(10) of 20.6.2.3107 NMAC. The Permittee is required to report and address unauthorized discharges in accordance with 20.6.2.1203 NMAC.

5. Closure Conditions (pages 32 – 35 in the Draft Permit)

Conditions in this Section prescribe measures and timeframes for closing part, or all, of the Facility so that discharges can no longer occur and so that the exceedance of groundwater standards does not occur after the cessation of the operation. NMED understands that the Permittee does not plan to close the Facility during the term of this Discharge Permit, however general closure conditions are always included in discharge permits. Closure requirements are authorized by Subsection A(11) of 20.6.2.3107 NMAC, which also stipulates that closure requirements survive the termination or expiration of the Discharge Permit.

Groundwater monitoring is required after a discharge ceases and all means of transferring liquid to a discharge impoundment are sealed. This period after "closure" is commonly referred to as "post-closure" and generally continues until a minimum of eight consecutive quarters of groundwater sampling and analysis confirm no exceedance of standards. This two-year period allows for the potential movement of contaminants through the vadose zone and is consistent with the time period established in remediation programs for demonstrating that remediation is complete, e.g., 20.6.2.4103 NMAC (abatement plans) and 20.5.119.1929 NMAC (petroleum storage tank systems).

This Section includes a condition for properly closing the Facility in accordance with the WIPP Land Withdrawal Act, WIPP's Hazardous Waste Facility Permit (NM4890139088-TSDF), and the WIPP Land Management Plan's requirements for disposition of salt. In particular, the condition requires removal of all salt stockpiles from the land surface at the Facility so that the salt does not remain as a potential source of a contaminant discharge to groundwater.

6. General Terms and Conditions (pages 35 – 39 in the Draft Permit)

This Section's general terms and conditions are standard conditions in all discharge permits.

The Permittee is required to maintain certain records and provide them if requested to NMED, as authorized by Subsections A and D of 20.6.2.3107 NMAC. The Permittee is required to notify NMED of proposed changes to the volume, location, or character of the discharge, as this may require a "discharge permit modification" as defined in Subsection D of 20.6.2.7 NMAC and is consistent with the notification requirement in Subsection C of 20.6.2.3107 NMAC.

This Section identifies the Permittee's obligations, pursuant to the Ground and Surface Water Protection Regulations, regarding the transfer of the discharge permit, permit fees, and submittal construction plans and specifications. The Section also cites New Mexico Water Quality Act provisions allowing for inspections, civil and criminal penalties, and the duty to comply with other laws.

GENERAL TERMS AND CONDITIONS 35

DRAFT

GROUND WATER DISCHARGE PERMIT RENEWAL and MODIFICATION
Waste Isolation Pilot Plant (WIPP), DP-831

I. INTRODUCTION

The New Mexico Environment Department (NMED) issues this Discharge Permit Renewal and Modification (Discharge Permit), DP-831, to the U.S. Department of Energy (DOE) (permittee) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978 §§74-6-1 through 74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Ground and Surface Water Protection Regulations, 20.6.2 NMAC.

NMED's purpose in issuing this Discharge Permit, and in imposing the requirements and conditions specified herein, is to control the discharge of water contaminants from the Waste Isolation Pilot Plant (WIPP or facility) into ground and surface water, so as to protect ground and surface water for present and potential future use as domestic and agricultural water supply and other uses, and to protect public health. In issuing this Discharge Permit, NMED has determined that the requirements of Subsection C of 20.6.2.3109 NMAC have been met. Pursuant to Section 20.6.2.3104 NMAC, it is the responsibility of the permittee to comply with the terms and conditions of this Discharge Permit; failure may result in an enforcement action(s) by NMED (20.6.2.1220 NMAC).

The activities that produce the discharge, the location of the discharge, and the quantity, quality and flow characteristics of the discharge are briefly described as follows:

Domestic wastewater is discharged to a synthetically lined impoundment system for treatment and disposal by evaporation at a rate of up to 23,000 gallons per day (gpd). The system consists of seven synthetically lined impoundments (Facultative Lagoon System) comprised of Settling Lagoons 1 and 2, Polishing Lagoons 1 and 2, and Effluent Lagoons A, B, and C.

Non-domestic wastewater may be discharged at the facility in the following ways:

- Up to 27,000 gpd of industrial wastewaters from the following sources: wastewater from two compressed air systems, brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous wastewaters. These industrial wastewaters are discharged to the Effluent Lagoons B and C of the Facultative Lagoon System for disposal by evaporation.

- Up to 50,000 gpd of industrial wastewaters from the following sources: brine, purge waters from sampling and developing Facility monitoring wells, and other miscellaneous industrial non-hazardous wastewaters. These industrial wastewaters are discharged to a separate synthetically lined impoundment for disposal by evaporation (Evaporation Pond H-19).

- Up to 2,210 gpd of brine produced from the operations of the to be constructed Salt Reduction System within the Safety Significant Confinement Ventilation System (SSCVS) will be discharged to two double synthetically lined impoundments, each with a leak detection system (Brine Retention Ponds East and West, collectively Brine Ponds). One brine retention pond will be in service while the other brine retention pond is closed for evaporation and removal of precipitated salt every two weeks. After two weeks, any remaining brine in the closed Brine Pond will be transferred to Brine Salt Storage Pond 4 for disposal by evaporation.

- Salt and other subsurface materials mined during construction of the Facility, as well as currently mined salt, are stored at the surface in four stockpiles. The stockpiles currently storing salt, or that will be used in the future as salt is mined from the Facility's underground panels, are referred to as Salt Cells 2, 3, and 5. Stormwater runoff in contact with Salt Cells 2 and 3 is collected in two double synthetically-lined stormwater impoundments, each with a leak detection system (Salt Storage Ponds 2 and 3). The total storage capacity of Salt Storage Ponds 2 and 3 is 21,737,254 gallons. Stormwater runoff in contact with Salt Cell 5 will be collected in a double synthetically-lined stormwater impoundment with a leak detection system (Salt Storage Pond 5). The storage capacity of Salt Storage Pond 5 will be 6,355,404 gallons. Salt Cell 1 no longer receives salt and is capped with synthetic material and an earthen cover. Stormwater runoff in contact with this stockpile is collected in synthetically-lined diversion ditches directed to a synthetically-lined impoundment (Salt Storage Pond 1). The storage capacity of Salt Storage Pond 1 is 3,301,634 gallons. The storage capacity of each salt storage pond is more than sufficient to contain a 24-hour, 100-year (5.84-inch rainfall) storm event.

- Stormwater runoff from the SSCVS area is collected in a double synthetically lined storm water impoundment with a leak detection system (Brine Salt Storage Pond 4). The storage capacity of Brine Salt Storage Pond 4 is 8,668,722 gallons. The capacity of the Brine Salt Storage Pond 4 is more than sufficient to contain a 24-hour, 100-year (5.84-inch rainfall) storm event.

- Additional stormwater runoff from the Facility's paved areas and roofs is collected in three synthetically-lined impoundments (Storm Water Ponds 1, 2, and 3). This runoff does not contact the salt stockpiles or other waste materials at the Facility and may be used by the permittee for dust control, soil compaction, and other construction activities.

Salt and other subsurface materials mined during construction of the facility, as well as currently mined salt, are stored on the surface in four stockpiles (Salt Cells 1, 2, 3, and 5). Salt Cell 1 is closed with a 60-mil HDPE synthetic liner cover and two feet of native soil, as well as a 60-mil HDPE synthetically lined drainage system for stormwater runoff collection. Salt Cells 2 and 3 were constructed with six inches of prepared subgrade, a 60-mil HDPE liner, a 200-mil Geonet drainage layer, an eight-ounce geotextile fabric, and the fabric is then covered with two feet of screened native soil. Each salt cell is sloped toward the center, which contains a collection trench and pipe for conveyance of water to Salt Storage Ponds 2 and 3. Salt Cell 5 will be constructed with a 60-mil HDPE liner on the bottom with a protective layer of native soil on top to protect the liner. A HDPE pipe will be installed to collect and transmit by gravity the leachate and stormwater runoff water from Salt Cell 5 to Salt Storage Pond 5.

The Site Preliminary Design Validation (SPDV) material pile was constructed as the shafts were excavated when construction first began at the WIPP site. The SPDV material pile was closed in the year 2000 with a geosynthetic liner cover installed on 6 inches of bedding material and covered with a minimum of three feet of earthen material.

The modification consists of the addition of one new salt storage cell and four new impoundments: Salt Cell 5, Salt Storage Pond 5, Brine Salt Storage Pond 4, Brine Retention Pond East, and Brine Retention Pond West.

The discharge contains water contaminants that may be elevated above the standards of Section 20.6.2.3103 NMAC.

The facility is located near the Jal Highway (NM-128), approximately 26 miles southeast of Carlsbad, in Sections 20, 21, 28, and 29, Township 22S, Range 31E, Eddy County.

The WIPP facility is principally a mined geologic repository for the disposal of transuranic (TRU) waste. The underground repository is located 2,150 feet below land surface in the bedded salt of the Salado Formation. WIPP first began accepting waste in March 1999. In addition to this groundwater Discharge Permit, the WIPP is also regulated by the NMED Hazardous Waste Bureau under the New Mexico Hazardous Waste Act and New Mexico's Hazardous Waste Regulations.

The WIPP facility is geologically situated in the southeast portion of New Mexico within the Delaware Basin, which is part of the larger Permian Basin. The geologic formations below the facility that are pertinent to this Discharge Permit, from deepest to shallowest, include: the Salado Formation, the Rustler Formation, the Dewey Lake Formation, and, in the northeastern portion of the facility, the Santa Rosa Formation. The Salado Formation, which is first encountered at a depth of 850 feet and is 2,000 feet thick, consists predominately of halite, with some carbonates, anhydrites, and clay seams. The Rustler Formation ranges from 350 to 500 feet thick and consists of carbonates, anhydrites, and halites. The Dewey Lake Formation is approximately 500 feet thick and consists almost entirely of mudstone, claystone, siltstone, and interbedded sandstone, and is frequently referred to as the Dewey Lake Redbeds Formation.

Groundwater below the facility most likely to be affected by a discharge is at a depth of approximately 30 to 160 feet, is located in the upper portion of the Dewey Lake Formation and has an average total dissolved solids concentration of approximately 3,400 milligrams per liter. WIPP discovered the presence of shallow groundwater in March 2001 and determined that the probable sources of this shallow groundwater were the unlined impoundments constructed to capture stormwater runoff at the facility and runoff from the above-ground salt piles. This shallow groundwater has been found to be contaminated with total dissolved solids, sulfate, and chloride. After the discovery of the anthropogenically created shallow groundwater, all impoundments at the facility were lined and a network of monitoring wells was installed. The shallow groundwater has a flow direction of north to south. Natural, non-anthropogenic, groundwater occurs in the Dewey Lake Formation south of the WIPP facility at a depth of 160 feet. The Dewey Lake Formation has a relatively low hydraulic conductivity.

The first laterally continuous water-bearing zone below the facility is within an approximately 30-foot-thick section of the Culebra Member of the Rustler Formation. Water in the Culebra Member is usually present in fractures and is confined by overlaying gypsum or anhydrite and underlying clay and anhydrite beds. Water from the Culebra Member is not used as a water supply in the immediate WIPP facility vicinity; however, its nearest use is approximately seven miles southwest of the WIPP facility, where it is used for livestock watering. The Culebra Member is monitored through a series of monitoring wells that are part of the facility's Water Quality Sampling Program.

The original Discharge Permit was issued on January 16, 1992, amended on August 28, 1995, renewed on July 3, 1997, amended on June 12, 1998 and on January 24, 2000, renewed on April 29, 2003, modified on December 22, 2003 and on December 29, 2006, renewed and modified on July 23, 2008, and last renewed on July 29, 2014. The application (i.e., discharge plan) consists of the materials submitted by the permittee dated December 3, 2018 and materials contained in the administrative record prior to issuance of this Discharge Permit.

The discharge shall be managed in accordance with all conditions and requirements of this Discharge Permit.

Pursuant to Section 20.6.2.3109 NMAC, NMED reserves the right to require a Discharge Permit Modification in the event NMED determines that the requirements of 20.6.2 NMAC are being or may be violated or the standards of Section 20.6.2.3103 NMAC are being or may be violated. This may include a determination that structural controls and/or management practices approved under this Discharge Permit are not protective of groundwater quality, and that more stringent requirements to protect groundwater quality may be required by NMED. The permittee may be required to implement abatement of water pollution and remediate groundwater quality.

Issuance of this Discharge Permit does not relieve the permittee of the responsibility to comply with the WQA, WQCC Regulations, and any other applicable federal, state and/or local laws and regulations, such as zoning requirements and nuisance ordinances.

The following acronyms and abbreviations may be used in this Discharge Permit.

Abbreviation	Explanation	Abbreviation	Explanation
BOD_5	biochemical oxygen demand (5-day)	NMED	New Mexico Environment Department
CFR	Code of Federal Regulations	NMSA	New Mexico Statutes Annotated
CFU	Colony Forming Unit	NO_3-N	nitrate-nitrogen
Cl	chloride	NTU	nephelometric turbidity units
EPA	United States Environmental Protection Agency	TDS	total dissolved solids
gpd	gallons per day	TKN	total Kjeldahl nitrogen
LAA	land application area	total nitrogen	= TKN + NO_3-N
LADS	land application data sheet(s)	TRC	total residual chlorine
mg/L	milligrams per liter	TSS	total suspended solids

Abbreviation	Explanation		Abbreviation	Explanation
mL	milliliters		WQA	New Mexico Water Quality Act
MPN	Most Probable Number		WQCC	Water Quality Control Commission
NMAC	New Mexico Administrative Code		WWTF	Wastewater Treatment Facility

II. FINDINGS

Draft

In issuing this Discharge Permit, NMED finds the following.

1. The permittee is discharging effluent or leachate from the facility so that such effluent or leachate may move directly or indirectly into groundwater within the meaning of Section 20.6.2.3104 NMAC.

2. The permittee is discharging effluent or leachate from the facility so that such effluent or leachate may move into groundwater of the State of New Mexico that has an existing concentration of 10,000 mg/L or less of TDS within the meaning of Subsection A of 20.6.2.3101 NMAC.

3. The discharge from the facility is not subject to any of the exemptions of Section 20.6.2.3105 NMAC.

III. AUTHORIZATION TO DISCHARGE

Pursuant to 20.6.2.3104 NMAC, it is the responsibility of the permittee to ensure that discharges authorized by this Discharge Permit are consistent with the terms and conditions herein.

The permittee is authorized to discharge up to 23,000 gpd of domestic wastewater to a synthetically-lined facultative impoundment system for disposal by evaporation. The Facultative Lagoon System is authorized to accept up to 27,000 gpd of non-hazardous industrial wastewater from two compressed air systems at the facility, brine, purge waters from sampling and developing wells, and miscellaneous industrial non-hazardous wastewater for disposal by evaporation. Up to 50,000 gpd of brine, purge waters, and miscellaneous non-hazardous process waters is authorized to be discharged into to the Evaporation Pond H-19. Up to 2,210 gpd of brine is authorized to be discharged from a 3,000-gallon holding tank to Brine Retention Ponds East and West for disposal by evaporation, and every two weeks the remaining brine in the Brine Ponds is authorized to be transferred to the Brine Salt Storage Pond 4.

The permittee is authorized to stockpile mined salt in four salt cells: Salt Pile 1 is closed with a cover; Salt Cells 2, 3 and 5 have authorized footprints of 6.2 acres, 5.2 acres, and 5.1 acres, respectively. The permittee is authorized to collect storm water runoff from these salt cells in three double synthetically lined impoundments with leak detection systems (Salt Storage Pond 2, Salt Storage Pond 3, and Salt Storage Pond 5) and one synthetically lined impoundment with a drainage system (Salt Storage Pond 1) for disposal by evaporation. The permittee is also authorized to collect storm water runoff from the facility's paved areas and roofs in Storm Water Ponds 1, 2, and 3, as well as Brine Salt Storage Pond 4. This runoff is not in contact with the salt stockpiles at the facility, and runoff from Storm Water Ponds 1, 2, and 3 may be used for dust control, soil compaction, and other construction activities.

This Discharge Permit sets forth requirements for the discharge and disposal of domestic and non-domestic wastewater. Conditions in the Operational Plan, the Monitoring and Reporting, and the Closure Plan sections are categorized as follows:

- **Part A. Generally Applicable to All Discharges;**
- **Part B. Applicable to the Facultative Lagoon System;**
- **Part C. Applicable to the Evaporation Pond H-19, Brine Retention Pond East, Brine Retention Pond West, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3;**
- **Part D. Applicable to the Impoundments Containing Storm Water Runoff in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, 3, and 5) and to Salt Stockpiles (Salt Cells 1, 2, 3, and 5);**
- **Part E. Applicable to Ground Water Monitoring.**

[20.6.2.3104 NMAC, Subsection C of 20.6.2.3106 NMAC, Subsection C of 20.6.2.3109 NMAC]

IV. CONDITIONS

NMED issues this Discharge Permit for the discharge of water contaminants subject to the following conditions.

OPERATIONAL PLAN

Part A. Generally Applicable to All Discharges

#	**Operating Conditions Applicable to All Discharges**
1.	The permittee shall implement the following operational plan to ensure compliance with Title 20, Chapter 6, Parts 2 and 4 NMAC. [Subsection C of 20.6.2.3109 NMAC]
2.	The permittee shall operate in a manner such that standards and requirements of Sections 20.6.2.3101 and 20.6.2.3103 NMAC are not violated. [20.6.2.3101 NMAC, 20.6.2.3103 NMAC, Subsection C of 20.6.2.3109 NMAC]

#	Operating Conditions Applicable to All Discharges
3.	The permittee shall maintain the impoundment liners in such a manner as to avoid conditions that could affect the liner or the structural integrity of the impoundments. Such conditions include or may be characterized by the following: • erosion damage; • animal burrows or other damage; • the presence of vegetation including aquatic plants, weeds, woody shrubs or trees growing within five feet of the top inside edge of a sub-grade impoundment, within five feet of the toe of the outside berm of an above-grade impoundment, or within the impoundment itself; • the presence of large debris or large quantities of debris in the impoundment; • evidence of seepage; or • evidence of berm subsidence. Vegetation growing around the impoundments shall be routinely controlled by mechanical removal in a manner that is protective of the impoundment liner. The permittee shall visually inspect the impoundments and surrounding berms on a monthly basis to ensure proper maintenance. In the event that inspection reveals any evidence of damage that threatens the structural integrity of an impoundment berm or liner, or that may result in an unauthorized discharge, the permittee shall enact the contingency plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
4.	The permittee shall preserve a minimum of one foot of freeboard between the liquid level in all the impoundments and the elevation of the top of the impoundment liner, except the Brine Retention Ponds East and West shall maintain two feet of freeboard. In the event that the permittee determines that the specified freeboard cannot be preserved in the impoundments, the permittee shall enact the contingency plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

Part B. Applicable to the Facultative Lagoon System

#	Facultative Lagoon System - Operational Actions with Implementation Deadlines
5.	Within two years following the effective date of this Discharge Permit (**by DATE**), the permittee shall measure the thickness of the settled solids in the seven impoundments that are part of the Facultative Lagoon System and report the results of the solids thickness measurements to NMED. The permittee shall measure the thickness of settled solids in each impoundment in accordance with the following procedure.

#	**Facultative Lagoon System - Operational Actions with Implementation Deadlines**
	a) The total surface area of the treatment impoundment shall be divided into nine equal sub-areas. b) A settled solids measurement device (core sampler) shall be utilized to obtain one measurement (to the nearest half-foot) per sub-area. c) The nine measurements shall be averaged. In the event the average solids accumulation exceeds one-third of the maximum allowable liquid depth in the impoundments, the permittee shall propose a plan for the removal and disposal of the solids. The solids removal and disposal plan shall be submitted to NMED for approval within two years and two months following the effective date of this Discharge Permit (by **DATE**) and shall include the following information. a) A method for removal of the solids to a depth of less than six inches throughout the treatment impoundment in a manner that is protective of the impoundment liner. b) A description of how the solids will be contained, transported, and disposed of in accordance with all local, state, and federal regulations, including 40 CFR Part 503. c) A schedule for completion of the solids removal and disposal project. The permittee shall initiate implementation of the plan following approval by NMED. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

#	**Facultative Lagoon System - Operating Conditions**
6.	The permittee shall maintain fences around the Facultative Lagoon System to control access by the general public and animals. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
7.	The permittee shall maintain signs indicating that the wastewater at the facility is not potable. Signs shall be posted at the Facultative Lagoon System's entrance and other areas where there is potential for public contact with wastewater. All signs shall be printed in English and Spanish remain visible and legible. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
8.	The permittee shall utilize operators, certified by the State of New Mexico at the appropriate level, to operate the domestic wastewater collection, treatment and disposal systems. The operations and maintenance of all or any part of the wastewater system shall be performed by, or under the direct supervision of, a certified operator. [Subsection C of 20.6.2.3109 NMAC, 20.7.4 NMAC]

Part C. Applicable to the Evaporation Pond H-19, Brine Retention Pond East, Brine Retention Pond West, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Operational Actions with Implementation Deadlines**
9.	Prior to discharging to the proposed Brine Retention Pond East, the Brine Retention Pond West, or the Brine Salt Storage Pond 4, the permittee shall submit written notification to NMED stating the date the discharge(s) is to commence. [Subsection C of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
10.	Prior to discharging to Brine Retention Pond East, Brine Retention Pond West, or Brine Salt Storage Pond 4, the permittee shall complete construction of the Ponds in accordance with the final construction plans and specifications submitted to NMED as part of the Discharge Permit application received on December 3, 2018. The permittee shall notify NMED prior to the commencement of construction to allow NMED personnel to be onsite for inspection during construction. The permittee shall submit record drawings that bear the seal and signature of a licensed New Mexico professional engineer (pursuant to the New Mexico Engineering and Surveying Practice Act and the rules promulgated under that authority) for the constructed Brine Retention Pond East, Brine Retention Pond West, and Brine Salt Storage Pond 4 to NMED within 30 days of completion. [Subsections A and C of 20.6.2.1202 NMAC, Subsection C of 20.6.2.3109 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
11.	Within 90 days following the effective date of this Discharge Permit **(by DATE)**, the permittee shall install fences around Stormwater Ponds 1, 2 and 3 to control access by the general public and animals. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates and shall be maintained throughout the term of this Discharge Permit. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
12.	Prior to discharging to Brine Salt Storage Pond 4, the permittee shall install fences around said impoundment to control access by the general public and animals. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates and shall be maintained throughout the term of this Discharge Permit. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
13.	Prior to discharging to Brine Salt Storage Pond 4, the permittee shall post signs indicating that the wastewater in the impoundment is not potable. Signs shall be posted at the facility entrance and other areas where there is potential for public contact with wastewater. All signs shall be printed in English and Spanish and shall remain visible and legible for the term of this Discharge Permit.

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Operational Actions with Implementation Deadlines**
	[Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
14.	Within two years following the effective date of this Discharge Permit **(by DATE)**, the permittee shall measure the thickness of the settled solids in Evaporation Pond H-19 and report the results of the solids thickness measurements to NMED. The permittee shall measure the thickness of settled solids in accordance with the following procedure. a) The total surface area of the impoundment shall be divided into nine equal sub-areas. b) A settled solids measurement device (core sampler) shall be utilized to obtain one measurement (to the nearest half-foot) per sub-area. c) The nine measurements shall be averaged. In the event the average solids accumulation exceeds one-third of the maximum liquid depth in the impoundment, the permittee shall propose a plan for the removal and disposal of the solids. The solids removal and disposal plan shall be submitted to NMED for approval within two years and two months following the effective date of this Discharge Permit **(by DATE)** and shall include the following information. a) A method for removal of the solids to a depth of less than six inches throughout the treatment impoundment in a manner that is protective of the impoundment liner. b) A description of how the solids will be contained, transported, and disposed of in accordance with all local, state, and federal regulations. c) A schedule for completion of the solids removal and disposal project. The permittee shall initiate implementation of the plan following approval by NMED. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Operating Conditions**
15.	The permittee shall establish an average leakage rate for the primary liners installed in Brine Salt Storage Pond 4 and Brine Retention Ponds East and West. The average weekly leakage rate shall be determined by averaging the volume discharged from the leak detection sump(s) during the first two weeks following the initial date of discharge to the impoundment(s). The leak detection, collection and removal systems for Brine Salt Storage Pond 4 and Brine Retention Ponds East and West shall be monitored by checking the liquid level in the sump(s) for the impoundment's secondary liner on a continuous basis to determine if the rate of removal has deviated from the average leakage rate for the respective primary liner. If there is a deviation of 20% above the average leakage rate, the permittee shall

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Operating Conditions**
	sample the liquid in the sump(s) within 15 days and analyze the sample for TDS, Cl, SO_4, and pH. In the event that the analytical results of the liquid present in the leak detection sump(s) indicate that the composition of the liquid is consistent with the contents of the evaporative impoundment(s), the permittee shall submit a corrective action plan to NMED which evaluates the primary liner leakage rate and proposes options for reducing the leakage. The plan shall be submitted for NMED approval within 60 days of the receipt of the analytical results. If the composition of the liquid present in the leak detection sump(s) is not consistent with the contents of the evaporative impoundment(s), the permittee shall determine the source of the deviation and fix the issue. In the event that the leak detection system is modified or the method used to monitor the liquid level in the impoundment's sump(s) is modified, the permittee shall submit a revised methodology for NMED approval. [20.6.2.3107 NMAC]
16.	The permittee shall maintain fences around Evaporation Pond H-19 to control access by the general public and animals. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
17.	The permittee shall maintain signs indicating that the wastewater in Evaporation Pond H-19 is not potable. Signs shall be posted at the impoundment entrance and other areas where there is potential for public contact with wastewater. All signs shall be printed in English and Spanish and shall remain visible and legible. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]

Part D. Applicable to the Impoundments Containing Storm Water Runoff in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, 3, and 5) and to Salt Stockpiles (Salt Cells 1, 2, 3, and 5)

#	**Salt Storage Ponds and Salt Stockpiles - Operational Actions with Implementation Deadlines**
18.	Prior to discharging to Salt Storage Pond 5, the permittee shall submit written notification to NMED stating the date the discharge is to commence. [Subsection C of 20.6.2.3107 NMAC]

#	**Salt Storage Ponds and Salt Stockpiles - Operational Actions with Implementation Deadlines**
19.	Prior to discharging to Salt Storage Pond 5 and prior to utilizing Salt Cell 5, the permittee shall complete construction in accordance with the final construction plans and specifications submitted to NMED as part of the Discharge Permit application received on December 3, 2018. The permittee shall notify NMED prior to construction to allow NMED personnel to be onsite for inspection during construction. The permittee shall submit record final drawings that bear the seal and signature of a licensed New Mexico professional engineer (pursuant to the New Mexico Engineering and Surveying Practice Act and the rules promulgated under that authority) for the constructed Salt Storage Pond 5 and Salt Cell 5 to NMED within 30 days of completion. [Subsections A and C of 20.6.2.1202 NMAC, Subsection C of 20.6.2.3109 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
20.	Within 90 days following the effective date of this Discharge Permit **(by DATE)**, the permittee shall install fences around Salt Storage Ponds 1, 2 and 3 to control access by the general public and animals. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
21.	Within 120 days following the effective date of this Discharge Permit **(by DATE)**, the permittee shall post signs indicating that the wastewater in Salt Storage Ponds 1, 2 and 3 is not potable. Signs shall be posted at the facility entrance and other areas where there is potential for public contact with wastewater. All signs shall be printed in English and Spanish and shall remain visible and legible. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
22.	Within two years following the effective date of this Discharge Permit **(by DATE)**, the permittee shall measure the thickness of the settled solids in Salt Storage Pond 1, 2, and 3 and report the results of the solids thickness measurements to NMED. The permittee shall measure the thickness of settled solids in each Salt Storage Pond in accordance with the following procedure. a) The total surface area of the impoundment shall be divided into nine equal sub-areas. b) A settled solids measurement device (core sampler) shall be utilized to obtain one measurement (to the nearest half-foot) per sub-area. c) The nine measurements shall be averaged. In the event the average solids accumulation exceeds one-third of the maximum liquid depth in the impoundments, the permittee shall propose a plan for the removal and disposal of the solids. The solids removal and disposal plan shall be submitted to NMED for

#	**Salt Storage Ponds and Salt Stockpiles - Operational Actions with Implementation Deadlines**
	approval within two years and two months following the effective date of this Discharge Permit (**by DATE**) and shall include the following information. a) A method for removal of the solids to a depth of less than six inches throughout the treatment impoundment in a manner that is protective of the impoundment liner. b) A description of how the solids will be contained, transported, and disposed of in accordance with all local, state, and federal regulations. c) A schedule for completion of the solids removal and disposal project. The permittee shall initiate implementation of the plan following approval by NMED. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

#	**Salt Storage Ponds and Salt Stockpiles - Operating Conditions**
23.	The permittee shall establish an average leakage rate for the primary liners installed in Salt Storage Ponds 2 and 3. The average bi-monthly leakage rate shall be determined by averaging the volume removed from the leak detection sump(s) from three removal events. The permittee shall analyze the measured volumes of liquid removed from the leak detection system sump(s) for Salt Storage Ponds 2 and 3 on a bi-monthly basis (i.e., every other month) to determine if the rate of removal has deviated above the average leakage rate for the respective primary liner. If there is a deviation of 20% above the average leakage rate, the permittee shall sample the liquid in the sump(s) within 15 days and analyze the sample for TDS, Cl, SO_4, and pH. In the event that the analytical results of the liquid present in the leak detection sump(s) indicate that the composition of the liquid is consistent with the contents of the evaporative impoundment(s), the permittee shall submit a corrective action plan to NMED which evaluates the primary liner leakage rate and proposes options for reducing the leakage. The plan shall be submitted for NMED approval within 60 days of the receipt of the analytical results. If the composition of the liquid present in the leak detection sump(s) is not consistent with the contents of the evaporative impoundment(s), the permittee shall determine the source of the deviation and fix the issue. In the event that the leak detection system is modified or the method used to monitor the liquid level in the impoundment's sump(s) is modified, the permittee shall submit a revised methodology for NMED approval. [20.6.2.3107 NMAC]
24.	The permittee shall establish an average leakage rate for the primary liner installed in Salt Storage Pond 5. The average weekly leakage rate shall be determined by averaging the

#	Salt Storage Ponds and Salt Stockpiles - Operating Conditions
	volume discharged from the leak detection sump during the first two weeks following the initial date of discharge to the impoundment. The leak detection, collection and removal systems for Salt Storage Pond 5 shall be monitored by checking the liquid level in the sump for the impoundment's secondary liner on a continuous basis to determine if the rate of removal has deviated above the average leakage rate for the respective primary liner. If there is a deviation of 20% above the average leakage rate, the permittee shall sample the liquid in the sump within 15 days and analyze the sample for TDS, Cl, SO_4, and pH. In the event that the analytical results of the liquid present in the leak detection sump indicate that the liquid is consistent with the contents of the evaporative impoundment, the permittee shall submit a corrective action plan to NMED which evaluates the primary liner leakage rate and proposes options for reducing the leakage. The plan shall be submitted for NMED approval within 60 days of the receipt of the analytical results. If the liquid present in the leak detection sump is not consistent with the contents of the evaporative impoundment, the permittee shall determine the source of the deviation and fix the issue. In the event that the leak detection system is modified or the method used to monitor the liquid level in the impoundment's sump is modified, the permittee shall submit a revised methodology for NMED approval. [20.6.2.3107 NMAC]
25.	The permittee shall conduct regular maintenance of the earthen cover on the Salt Cell 1 and the SPDV material pile. Inspections shall be conducted monthly and after storm events of 2 inches or greater in a 24-hour period to evaluate the integrity of the cover, including erosional impact and vegetation success. General observations and minor cover repairs shall be reported to NMED in the subsequent semi-annual report. In the event of significant erosion, such as the formation of gullies, rills, or areas where ponding is occurring, or vegetative failure, the permittee shall provide a plan and schedule for repair within 90 days of discovery. [20.6.2.3107 NMAC]

MONITORING AND REPORTING

Part A. Generally Applicable to Monitoring

#	Monitoring and Reporting Conditions
26.	The permittee shall conduct monitoring, reporting, and the other requirements listed below in accordance with the monitoring requirements of this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
27.	METHODOLOGY – Unless otherwise specified by this Discharge Permit, or approved in writing by NMED, the permittee shall use sampling and analytical techniques that conform with the references listed in Subsection B of 20.6.2.3107 NMAC. [Subsection B of 20.6.2.3107 NMAC]
28.	Semi-annual monitoring shall be performed during the following periods and reports submitted to NMED as follows: • January 1st through June 30th – due by August 1st; and • July 1st through December 31st – due by February 1st. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
29.	The permittee shall submit its "Waste Isolation Pilot Plant Annual Site Environmental Report" to NMED with the next semi-annual monitoring report following its publication. [Subsection A of 20.6.2.3107 NMAC]

Part B. Applicable to the Facultative Lagoon System

#	Facultative Lagoon System - Monitoring and Reporting Conditions
30.	The permittee shall estimate the monthly volume of domestic wastewater discharged to the Facultative Lagoon System by obtaining readings on a monthly basis from a totalizing flow meter that measures total domestic water usage. The permittee shall submit the monthly meter readings and calculated monthly and average daily water usage volumes shall to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
31.	The permittee shall measure the total monthly volume and record the origin of all industrial wastewater discharged to Effluent Lagoons B and C. Discharge volumes to Effluent Lagoons B and C shall be calculated by a time/volume method or volumetric measurement of the transport container(s). The monthly discharge volumes and other volumetric

#	**Facultative Lagoon System - Monitoring and Reporting Conditions**
	calculations each month shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
32.	The permittee shall collect composite wastewater samples on a semi-annual basis (once every six months) from Effluent Lagoons A, B, and C. The composite samples shall consist of a minimum of six equal aliquots collected around the entire perimeter of the evaporative impoundment and thoroughly mixed. The composite samples shall be analyzed for: • TKN; • NO_3-N; • TDS; • Cl; and • SO_4. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. NMED may require comprehensive laboratory analyses of the industrial wastewater discharged to Effluent Lagoons B and C prior to discharge when NMED determines that additional information is needed. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]

draft

Part C. Applicable to the Evaporation Pond H-19, Brine Retention Pond East, Brine Retention Pond West, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Monitoring and Reporting Conditions**
33.	The permittee shall measure the total monthly volume and record the origin of all wastewater discharged to Evaporation Pond H-19. Discharge volumes to Evaporation Pond H-19 shall be calculated by a time/volume method or volumetric measurement of the transport container(s). The monthly discharge volumes and other volumetric calculations each month shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
34.	The permittee shall measure the total monthly volume of brine received by Brine Retention Ponds East and West. Discharge volumes to Brine Retention Ponds East and West shall be

#	Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Monitoring and Reporting Conditions
	calculated by a time/volume method or volumetric measurement of the transport container(s). NMED may require comprehensive laboratory analyses of such wastewater prior to discharge when NMED determines that additional information is needed. The monthly discharge volumes and other volumetric calculations each month shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
35.	The permittee shall measure the total weekly volume of liquid pumped from the leak detection sumps for Brine Storage Pond 4 and Brine Retention Ponds East and West. The total volume of liquid pumped shall be calculated by a totalizing flow meter. The weekly volumes shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
36.	The permittee shall collect a composite wastewater sample annually after storm events of two inches or greater in a 24-hour period from Storm Water Ponds 1, 2, and 3. The composite sample shall consist of a minimum of six equal aliquots collected at equal distances around the perimeter of the evaporative impoundment and thoroughly mixed. The composite sample shall be analyzed for: • SO_4; • TDS; and • Cl. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
37.	The permittee shall collect a composite wastewater sample on a semi-annual basis (once every six months) from Evaporation Pond H-19 and from Brine Salt Storage Pond 4, once it becomes operational. The composite sample shall consist of a minimum of six equal aliquots collected at equal distances around the perimeter of the evaporative impoundment and thoroughly mixed. The composite sample shall be analyzed for: • SO_4; • TDS; and • Cl. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results, including the

#	Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Monitoring and Reporting Conditions
	laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. NMED may require comprehensive laboratory analyses of such wastewater prior to discharge when NMED determines that additional information is needed. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
38.	During the first year following the effective date of the Discharge Permit, the permittee shall collect a 24-hour flow weighted composite sample (except as noted for pH) of wastewater from Evaporation Pond H-19 and analyze the sample for the following inorganic contaminants (dissolved fraction, except as noted): • aluminum (CAS 7429-90-5) • antimony (CAS 7440-36-0) • arsenic (CAS 7440-38-2) • barium CAS 7440-39-3 • beryllium (CAS 7440-41-7) • boron (CAS 7440-42-8) • cadmium (CAS 7440-43-9) • chromium (CAS 7440-47-3) • cobalt (CAS 7440-48-4) • copper (CAS 7440-50-8) • cyanide CAS 57-12-5) • fluoride (CAS 16984-48-8) • iron (CAS 7439-89-6) • lead (CAS 7439-92-1) • manganese (CAS 7439-96-5) • molybdenum (CAS 7439-98-7) • total mercury (nonfiltered) (CAS 7439-97-6) • pH (instantaneous) • nickel (CAS 7440-02-0) • radioactivity: combined radium-226 & radium-228 (CAS 15262-20-1) • selenium (CAS 7782-49-2) • silver (CAS 7440-224) • sulfate (CAS 14808-79-8) • thallium (CAS 7440-28-0) • uranium (CAS 7440-61-1) • zinc (CAS 7440-66-6) Samples shall be properly collected, prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Reporting limits shall be less than the corresponding numerical groundwater standards identified in 20.6.2.3103 NMAC. A summary of detected concentrations compared with the corresponding groundwater standards, and a copy of the laboratory report, including the analytical results and Quality Control/Quality Assurance information, shall be submitted to NMED in the next monitoring report. [Subsection A of 20.6.2.3107 NMAC, Subsections C and H of 20.6.2.3109 NMAC]

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Monitoring and Reporting Conditions**
39.	During the first year following the effective date of the Discharge Permit, the permittee shall collect a grab sample of wastewater from Evaporation Pond H-19 and analyze the non-filtered sample for the following organic contaminants: • atrazine (CAS 1912-24-9) • benzene (CAS 71-43-2) • benzo-a-pyrene (CAS 50-32-8) • carbon tetrachloride (CAS 56-23-5) • chloroform (CAS 67-66-3) • 1,2-dichlorobenzene (CAS 95-50-1) • 1,4-dichlorobenzene (CAS 106-46-7) • 1,1-dichloroethane (CAS 75-34-3) • 1,2-dichloroethane (EDC, CAS 107-06-2) • 1,1-dichloroethene (1,1-DCE, CAS 75-35-4) • cis-1,2-dichloroethene (CAS 156-59-2) • trans-1,2-dichloroethene (CAS 156-60-5) • 1,2-dichloropropane (PDC, CAS 78-87-5) • ethylbenzene (CAS 100-41-4) • ethylene dibromide (EDB, CAS 106-93-4) • methylene chloride (CAS 75-09-2) • <u>PAHs</u>: total naphthalene (CAS 91-20-3) plus monomethylnaphthalenes • Phenols • polychlorinated biphenyls (PCBs, CAS 1336-36-3) • pentachlorophenol (CAS 87-86-5) • toluene (CAS 108-88-3) • styrene (CAS 100-42-5) • 1,1,2,2-tetrachloroethane (CAS 79-34-5) • tetrachloroethene (PCE, CAS 127-18-4) • 1,2,4-trichlorobenzene (CAS 120-82-1) • 1,1,1-trichloroethane (1,1,1-TCA, CAS 71-55-6) • 1,1,2-trichloroethane (CAS 79-00-5) • trichloroethene (TCE, CAS 79-01-6) • vinyl chloride (CAS 75-01-4) • total xylenes (CAS 1330-20-7) Samples shall be properly collected, prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Reporting limits shall be less than the corresponding numerical groundwater standards identified in 20.6.2.3103 NMAC. The reporting limit for 1,4-dioxane shall be less than the Tap Water Screening Level for 1,4-dioxane identified in the *NMED Risk Assessment Guidance for Site Assessments and Investigations*, Table A-1 (available on the NMED Hazardous Waste Bureau's website under Guidance Documents). A summary of detected concentrations compared with the corresponding groundwater standards, and a copy of the laboratory report, including the analytical results and Quality Control/Quality Assurance information, shall be submitted to NMED in the next monitoring report.

#	**Evaporation Pond H-19, Brine Ponds, Brine Salt Storage Pond 4, and Storm Water Ponds 1, 2, and 3 - Monitoring and Reporting Conditions**
	[Subsection A of 20.6.2.3107 NMAC, Subsections C and H of 20.6.2.3109 NMAC]
40.	The permittee shall measure the water depth in Storm Water Ponds 1, 2, and 3 and Brine Salt Storage Pond 4 monthly to the nearest tenth of a foot (0.1 ft). The approximate monthly volume of water shall be calculated and submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC and Subsection H of 20.6.2.3109 NMAC]
41.	The permittee shall collect at least one sample quarterly rotating between Brine Retention Pond East and Brine Retention Pond West of the liquid present and analyze the sample for every constituent listed in Subsection A of 20.6.2.3103 NMAC. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. After four consecutive quarterly sampling events, the permittee may request to reduce the sampling frequency and analyte list set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
42.	The permittee shall submit any analytical results from Brine Retention Ponds East and West submitted to the Hazardous Waste Bureau. [Subsection A of 20.6.2.3107 NMAC]
43.	The permittee shall submit a copy of all records of solids (salt) removal from the Brine Retention Basins East and West and the associated disposal documentation to NMED in the associated semi-annual monitoring report. [Subsection A of 20.6.2.3107 NMAC]

Part D. Applicable to the Impoundments Containing Storm Water Runoff in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, 3, and 5) and to Salt Stockpiles (Salt Cells 1, 2, 3, and 5)

#	**Salt Storage Ponds and Salt Stockpiles - Monitoring and Reporting Conditions**
44.	The permittee shall collect a composite wastewater sample after a storm event of 2 inches or greater in a 24-hour period from Salt Storage Ponds 1, 2, 3, and 5. This sampling shall occur only once per year. The composite sample shall consist of a minimum of six equal aliquots collected at equal distances around the perimeter of the evaporative impoundment and thoroughly mixed. The composite sample shall be analyzed for:

	• SO_4; • TDS; and • Cl. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
45.	The permittee shall measure the water depth monthly to the nearest tenth of a foot (0.1 ft) in the Salt Storage Ponds 1, 2, 3, and 5. The approximate volume of water shall be calculated and submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
46.	The permittee shall measure the total bi-monthly volume of liquid pumped from the leak detection sumps for Salt Storage Ponds 2 and 3. The total volume of liquid pumped shall be calculated by a volumetric measurement of the container(s) filled. The bi-monthly volumetric calculations shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]
47.	The permittee shall measure the weekly volume of liquid pumped from the leak detection sumps for Salt Storage Pond 5. The total volume of liquid pumped shall be calculated by a totalizing flow meter. The weekly volumes shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsection H of 20.6.2.3109 NMAC]

Part E. Groundwater Monitoring and Reporting

#	Groundwater Monitoring Actions with Implementation Deadlines
48.	Within 30 days following the effective date of this Discharge Permit **(by DATE)**, the permittee shall submit a written monitoring well location proposal for review and approval by NMED. The proposal shall designate the locations of the monitoring wells required to be installed by Condition 49 of this Discharge Permit. The proposal shall include, at a minimum, the following information. a) A map showing the proposed locations of the monitoring wells from the boundary of the source the wells are intended to monitor. b) A detailed written description of the proposed locations for the monitoring wells including the distance (in feet) and direction of the monitoring wells from the edge of

#	**Groundwater Monitoring Actions with Implementation Deadlines**
	the source it is intended to monitor. Examples include: 35 feet north-northwest of the northern berm of the synthetically lined impoundment; 45 feet due south of the leachfield; 30 feet southeast of the re-use area 150 degrees from north. c) A statement describing the groundwater flow direction beneath the facility, and documentation and/or data supporting the determination. All monitoring well locations shall be approved by NMED prior to installation. [Subsection A of 20.6.2.3107 NMAC]
49.	Within 60 days following the effective date of this Discharge Permit (**by DATE**), the permittee shall install the following new monitoring wells: • One monitoring well (PZ-16) located 20 to 50 feet hydrologically downgradient of the Facultative Lagoon System in the shallowest water-bearing zone of the Dewey Lake Formation and intended to monitor the Facultative Lagoon System. • One monitoring well (PZ-17) located 20 to 50 feet hydrologically downgradient of Evaporation Pond H-19 in the shallowest water-bearing zone of the Dewey Lake Formation and intended to monitor Evaporation Pond H-19. The well shall be completed in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011 or alternative methods submitted for approval. Construction and lithologic logs shall be submitted to NMED within 30 days of well completion. [Subsection A of 20.6.2.3107 NMAC]
50.	Prior to discharging to Brine Salt Storage Pond 4 and Salt Storage Pond 5, the permittee shall submit a written monitoring well location proposal for review and approval by NMED. The proposal shall designate the locations of the monitoring wells required to be installed by Condition 51 of this Discharge Permit. The proposal shall include, at a minimum, the following information. a) A map showing the proposed location of each monitoring well from the boundary of the source it is intended to monitor. b) A written description of the specific location proposed for the monitoring wells including the distance (in feet) and direction of each monitoring well from the edge of the source it is intended to monitor. Examples include: 35 feet north-northwest of the northern berm of the synthetically lined impoundment; 45 feet due south of the leachfield; 30 feet southeast of the re-use area 150 degrees from north. c) A statement describing the groundwater flow direction beneath the facility, and documentation and/or data supporting the determination. All monitoring well locations shall be approved by NMED prior to installation. [Subsection A of 20.6.2.3107 NMAC]

#	Groundwater Monitoring Actions with Implementation Deadlines
51.	Prior to discharging to Brine Salt Storage Pond 4, Salt Storage Pond 5, and Brine Retentions Ponds East and West, the permittee shall install the following new monitoring wells. a) One monitoring well (PZ-18) located 20 to 50 feet hydrologically downgradient of Brine Salt Storage Pond 4 in the shallow groundwater. b) One monitoring well (PZ-19) located 20 to 50 feet hydrologically downgradient of Salt Storage Pond 5 in the shallow groundwater. The wells shall be completed in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011 or alternative methods submitted for approval. Construction and lithologic logs shall be submitted to NMED within 30 days of well completion. [Subsection A of 20.6.2.3107 NMAC]
52.	Following the installation of the monitoring wells required by Condition 51 of this Discharge Permit, the permittee shall sample groundwater in the wells and analyze the samples for temperature, pH, specific conductance (field measured); and for SO_4, TDS, and Cl. Groundwater sample collection, preservation, transport and analysis shall be performed according to the following procedure. a) Measure the depth to groundwater from the top of the well casing to the nearest hundredth of a foot. b) The pump intake shall be placed in the following manner: fully submerged, within the screened interval, and at least two feet above the base of the screen. c) The drawdown rate shall not exceed 0.3 feet on the startup and stabilize within the first few minutes. d) Allow field-measured dissolved oxygen, turbidity, Oxidation-Reduction Potential, temperature, pH, and specific conductance to stabilize prior to sample collection. The system is considered stable when pH is within ± 0.5 pH units, temperature, Oxidation-Reduction Potential, and specific conductance are within ± 10% of the last three consecutive readings, and turbidity is within ± 5 NTUs. e) Obtain samples from the well for analysis. f) Properly prepare, preserve and transport samples. g) Analyze samples in accordance with the methods authorized in this Discharge Permit. A well completion report including the Office of the State Engineer permit, depth-to-most-shallow groundwater measurements, groundwater analytical results (including the laboratory QA/QC summary report), and a facility layout map showing the location and number of each well, shall be submitted to NMED within 45 days of the installation of the monitoring wells.

#	Groundwater Monitoring Actions with Implementation Deadlines
	[Subsection A of 20.6.2.3107 NMAC]
53.	Within 120 days following the effective date of this Discharge Permit (**by DATE**), the permittee shall survey all newly constructed monitoring wells in the Dewey Lake water-bearing zone and in the shallow groundwater to a U.S. Geological Survey (USGS) or other permanent benchmark. Survey data shall include northing, easting and elevation to the nearest hundredth of a foot and shall be in accordance with the "Minimum Standards for Surveying in New Mexico" (12.8.2 NMAC). A survey elevation shall be established at the top-of-casing, with a permanent marking indicating the point of survey. The survey shall bear the seal and signature of a licensed New Mexico professional surveyor (pursuant to the New Mexico Engineering and Surveying Practice Act and the rules promulgated under that authority). Depth-to-most-shallow groundwater shall be measured to the nearest hundredth of a foot in all surveyed wells and referenced to mean sea level, and the data shall be used to develop a groundwater elevation contour map showing the location of all monitoring wells and the direction and gradient of groundwater flow at the facility. The data and groundwater elevation contour map shall be submitted to NMED within 30 days of survey completion. [Subsection A of 20.6.2.3107 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]

#	Groundwater Monitoring Conditions
54.	The permittee shall measure the depth to groundwater to the nearest hundredth of a foot (0.01 ft) quarterly in the following piezometers/monitoring wells: • PZ-1, PZ-2, PZ-3, PZ-4, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13, PZ-14, PZ-15, PZ-16, PZ-17, PZ-18, and PZ-19 • C-2505, C-2506, C-2507, C-2811, and WQSP-6A Depth-to-groundwater measurements shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
55.	Within the first year of the permit term, the permittee shall perform sampling in the following piezometers/monitoring wells and analyze the samples for temperature, pH, specific conductance (field measured); Uranium and combined Radium-226 and Radium-228: • PZ-1, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13, PZ-14, PZ-15, PZ-16, PZ-17, PZ-18, and PZ-19

#	Groundwater Monitoring Conditions
	• C-2507, C-2811, and WQSP-6A Monitoring wells WQSP-6A, PZ-16, and PZ-17 are intended to monitor the shallowest water-bearing zone of the Dewey Lake Formation, which occurs in the subsurface at the southern end of the facility. All other monitoring wells are intended to monitor the shallow groundwater. Groundwater sample collection, preservation, transport and analysis shall be performed according to the following low-flow sampling procedure: a) The pump intake shall be placed in the following manner: fully submerged, within the screened interval, and at least two feet above the base of the screen. b) The drawdown rate shall not exceed 0.3 feet on the startup and stabilize within the first few minutes. c) Allow field-measured dissolved oxygen, turbidity, Oxidation-Reduction Potential, temperature, pH, and specific conductance to stabilize prior to sample collection. The system is considered stable when pH is within ± 0.5 pH units, temperature, Oxidation-Reduction Potential, and specific conductance are within ± 10% of the last three consecutive readings, and turbidity is within ± 5 NTUs. d) Obtain samples from the well for analysis. e) Properly prepare, preserve and transport samples. f) Analyze samples in accordance with the methods authorized in this Discharge Permit. Analytical results, including the laboratory QA/QC summary report, and a facility layout map showing the location and number of each well shall be submitted to NMED in the next semi-annual monitoring report following sampling. [Subsection A of 20.6.2.3107 NMAC]
56.	The permittee shall perform semi-annual groundwater sampling in the following piezometers/monitoring wells and analyze the samples for temperature, pH, specific conductance (field measured); and for SO_4, TDS, and Cl: • PZ-1, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13, PZ-14, PZ-15, PZ-16, PZ-17, PZ-18, and PZ-19 , • C-2507, C-2811, and WQSP-6A Monitoring wells WQSP-6A, PZ-16, and PZ-17 are intended to monitor the shallowest water-bearing zone of the Dewey Lake Formation, which occurs in the subsurface at the southern end of the facility. All other monitoring wells are intended to monitor the shallow groundwater. Groundwater sample collection, preservation, transport and analysis shall be performed

#	Groundwater Monitoring Conditions
	according to the following low-flow sampling procedure: a) The pump intake shall be placed in the following manner: fully submerged, within the screened interval, and at least two feet above the base of the screen. b) The drawdown rate shall not exceed 0.3 feet on the startup and stabilize within the first few minutes. c) Allow field-measured dissolved oxygen, turbidity, Oxidation-Reduction Potential, temperature, pH, and specific conductance to stabilize prior to sample collection. The system is considered stable when pH is within ± 0.5 pH units, temperature, Oxidation-Reduction Potential, and specific conductance are within ± 10% of the last three consecutive readings, and turbidity is within ± 5 NTUs. d) Obtain samples from the well for analysis. e) Properly prepare, preserve and transport samples. f) Analyze samples in accordance with the methods authorized in this Discharge Permit. Analytical results, including the laboratory QA/QC summary report, and a facility layout map showing the location and number of each well shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
57.	The permittee shall perform semi-annual groundwater sampling in the following monitoring wells and analyze the samples for TKN and NO_3-N. • PZ-16, located south of the Facultative Lagoon System and intended to be located hydrologically downgradient of the Facultative Lagoon System in a water bearing zone of the Dewey Lake Formation. Groundwater sample collection, preservation, transport and analysis shall be performed according to the following procedure, or as otherwise approved by NMED. Groundwater sample collection, preservation, transport and analysis shall be performed according to the following low-flow sampling procedure: a) The pump intake shall be placed in the following manner: fully submerged, within the screened interval, and at least two feet above the base of the screen. b) The drawdown rate shall not exceed 0.3 feet on the startup and stabilize within the first few minutes. c) Allow field-measured dissolved oxygen, turbidity, Oxidation-Reduction Potential, temperature, pH, and specific conductance to stabilize prior to sample collection. The system is considered stable when pH is within ± 0.5 pH units, temperature, Oxidation-Reduction Potential, and specific conductance are within ± 10% of the last three consecutive readings, and turbidity is within ± 5 NTUs. d) Obtain samples from the well for analysis.

#	**Groundwater Monitoring Conditions**
	e) Properly prepare, preserve and transport samples. f) Analyze samples in accordance with the methods authorized in this Discharge Permit. Analytical results, including the laboratory QA/QC summary report, and a facility layout map showing the location and number of each well shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
58.	The permittee shall develop a groundwater elevation contour map for the shallow groundwater and for the Dewey Lake Formation water-bearing zone on a quarterly basis. The permittee shall use the top of casing elevation data from the monitoring well surveys and quarterly depth-to-groundwater measurements, referenced to mean sea level, obtained from the groundwater monitoring wells required by this Discharge Permit. The groundwater elevation contour maps shall depict the groundwater flow direction based on the groundwater elevation contours. Groundwater elevations between monitoring well locations shall be estimated using common interpolation methods. A contour interval appropriate to the data shall be used, but the interval shall, in no case, be greater than two feet. Groundwater elevation contour maps shall depict the groundwater flow direction, using arrows, based on the orientation of the groundwater elevation contours, and the location and identification of each monitoring well and contaminant source, e.g., surface impoundment. The groundwater elevation contour maps shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
59.	A single table in a paper and electronic format (i.e., EXCEL spreadsheet) of water level measurements and water quality data with only those constituents analyzed and water levels measured during a single event shown in columns shall be submitted to NMED in the semi-annual monitoring reports. The table shall include the following tabulated field measurements: temperature, pH, and electrical conductivity corrected to 25 degrees Celsius. The monitoring sites shall be shown in rows on the table, and the second column shall contain the date of the sampling event. Values exceeding standards shall be bolded. Any constituent not analyzed for at a particular site shall be shown as "NA", any site not sampled shall be shown as "NS" with an associated reason, and any site not measured for water levels shall be shown as "NM" with an associated reason. [Subsection A of 20.6.2.3107 NMAC]
60.	A single table that includes all available groundwater data to date shall be submitted annually to NMED in the semi-annual monitoring reports due February 1st. For each monitoring well, the name of the well shall be entered in the far-left column in a row by itself. Sampling events, beginning with the earliest event first, shall be entered in

#	Groundwater Monitoring Conditions
	subsequent rows with the sampling date in the second column and the corresponding analytical data in columns further to the right. Each new sampling event shall be added as an additional row to the existing spreadsheet with the corresponding date of the sampling event noted in the second column next to the monitoring well name. [Subsection A of 20.6.2.3107 NMAC]

ADDITIONAL STUDIES REQUIRED

#	Terms and Conditions
61.	The permittee's groundwater monitoring data and reports document that the shallow groundwater beneath the site is contaminated with TDS, chloride, and sulfate above the standards of 20.6.2.3103 NMAC. These data indicate that the contaminated groundwater is anthropogenic, having resulted from the leaking of impoundments at the facility. Within six months following the effective date of this Discharge Permit (by **DATE**), the permittee shall submit for NMED approval a site investigation workplan. The workplan shall include an implementation schedule to determine the existing groundwater contaminant sources, chemical composition, lateral and vertical extent of the shallow contaminated groundwater, and any potential impacts to the downgradient and naturally occurring groundwater in the Dewey Lake Formation. The site investigation shall be implemented upon NMED approval of the workplan and a report shall be submitted upon completion of the investigation. Based on the findings of the completed investigation report, applicable contingency plan conditions under this Discharge Permit may be enacted. [20.6.2.3107 NMAC, 20.6.2.4103 NMAC]

CONTINGENCY PLAN

#	Terms and Conditions
62.	In the event that groundwater monitoring indicates that a groundwater quality standard identified in Section 20.6.2.3103 NMAC is newly exceeded, the permittee shall collect a confirmatory sample from the monitoring well within 15 days of receipt of the initial sampling results to confirm the initial sampling results. Within 60 days of confirmation of groundwater contamination, the permittee shall submit to NMED a Corrective Action Plan that proposes, at a minimum, source control measures and an implementation schedule. The Plan shall be enacted as approved by NMED.

#	Terms and Conditions
	Once invoked (whether during the term of this Discharge Permit, or after the term of this Discharge Permit and prior to the completion of the Discharge Permit closure plan requirements), this condition shall apply until the permittee has fulfilled the requirements of this condition and groundwater monitoring confirms for a minimum of eight (8) consecutive quarterly samples that the standards of Section 20.6.2.3103 NMAC are not exceeded in groundwater. If the groundwater standard continues to be violated 180 days after the confirmation of groundwater contamination, the permittee may be required to abate water pollution consistent with the requirements and provisions of Section 20.6.2.4101, Section 20.6.2.4103, Subsections C and E of 20.6.2.4106, Section 20.6.2.4107, Section 20.6.2.4108 and Section 20.6.2.4112 NMAC. [Subsection A of 20.6.2.3107 NMAC, Subsection E of 20.6.2.3109 NMAC]
63.	In the event that information available to NMED indicates that a groundwater monitoring well or piezometer is not constructed in a manner consistent with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011; contains insufficient water to effectively monitor groundwater quality; or is not completed in a manner that is protective of groundwater quality, the permittee shall install a replacement well(s) within 120 days following notification from NMED. The permittee shall survey the replacement monitoring well(s)/piezometer(s) within 150 days following notification from NMED. Replacement well locations shall be approved by NMED prior to installation and completed in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011. The permittee shall submit construction and lithologic logs, survey data and a groundwater elevation contour map to NMED within 60 days following well completion. Upon completion of the replacement monitoring well, the monitoring well requiring replacement shall be properly plugged and abandoned. Well plugging, abandonment and documentation of the abandonment procedures shall be completed in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011, and all applicable local, state, and federal regulations. The well abandonment documentation shall be submitted to NMED within 60 days of completion of well plugging activities. [Subsection A of 20.6.2.3107 NMAC]
64.	In the event that groundwater flow information obtained pursuant to this Discharge Permit indicates that a monitoring well/piezometer is not located hydrologically downgradient of

#	Terms and Conditions
	the discharge location it is intended to monitor, the permittee shall install a replacement well within 120 days following notification from NMED. The permittee shall survey the replacement monitoring well within 150 days following notification from NMED. Replacement well locations shall be approved by NMED prior to installation and completed in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011. The permittee shall submit construction and lithologic logs, survey data and a groundwater elevation contour map within 30 days following well completion. [Subsection A of 20.6.2.3107 NMAC]
65.	In the event that an inspection reveals significant damage likely to affect the structural integrity of a lined impoundment or its ability to contain contaminants, the permittee shall propose the repair or replacement of the impoundment liner by submitting a Corrective Action Plan to NMED for approval. The Plan shall be submitted to NMED within 30 days after discovery by the permittee or following notification from NMED that significant liner damage is evident. The Corrective Action Plan shall include a schedule for completion of corrective actions and the permittee shall initiate implementation of the Plan following approval by NMED. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
66.	In the event that the analytical results of the liquid present in the leak detection sump(s) indicate that the liquid is consistent with the contents of the evaporative impoundment(s), the permittee shall submit a corrective action plan to NMED which evaluates the primary liner leakage rate and proposes options for stopping or reducing the leakage. The plan shall be submitted for NMED approval within 60 days of the receipt of the analytical results. [20.6.2.3107 NMAC, 20.6.2.3109 NMAC]
67.	In the event that the required freeboard cannot be preserved in an impoundment, the permittee shall take actions authorized by this Discharge Permit and all applicable local, state, and federal regulations to restore the required freeboard. In the event that the required freeboard cannot be restored within a period of 72 hours following discovery, the permittee shall propose actions to be immediately implemented to restore of the required freeboard by submitting a short-term Corrective Action Plan to NMED for approval. Examples of short-term corrective actions include the pumping and hauling of excess wastewater from the impoundment or reducing the volume of wastewater discharged to the impoundment. The Plan shall include a schedule for completion of corrective actions and shall be submitted within 15 days following the date

#	Terms and Conditions
	when the freeboard deficiency was initially discovered. The permittee shall initiate implementation of the Plan following approval by NMED. In the event that the short-term corrective actions failed to restore the required freeboard, the permittee shall propose permanent corrective actions in a long-term Corrective Action Plan submitted to NMED within 90 days following failure of the short-term Corrective Action Plan. Examples include the installation of an additional storage impoundment, or a significant/permanent reduction in the volume of wastewater discharged to the impoundment. The Plan shall include a schedule for completion of corrective actions and implementation of the Plan shall be initiated following approval by NMED. [Subsection A of 20.6.2.3107 NMAC]
68.	In the event that a release (commonly known as a "spill") occurs that is not authorized under this Discharge Permit, the permittee shall take measures to mitigate damage from the unauthorized discharge and initiate the notifications and corrective actions required in Section 20.6.2.1203 NMAC and summarized below. Within <u>24 hours</u> following discovery of the unauthorized discharge, the permittee shall verbally notify NMED and provide the following information. a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility. b) The name and address of the facility. c) The date, time, location, and duration of the unauthorized discharge. d) The source and cause of unauthorized discharge. e) A description of the unauthorized discharge, including its estimated chemical composition. f) The estimated volume of the unauthorized discharge. g) Any actions taken to mitigate immediate damage from the unauthorized discharge. Within <u>one week</u> following discovery of the unauthorized discharge, the permittee shall submit written notification to NMED with the information listed above and any pertinent updates. Within <u>15 days</u> following discovery of the unauthorized discharge, the permittee shall submit a corrective action report/plan to NMED describing any corrective actions taken and/or to be taken relative to the unauthorized discharge that includes the following information. a) A description of proposed actions to mitigate damage from the unauthorized discharge. b) A description of proposed actions to prevent future unauthorized discharges of this nature. c) A schedule for completion of proposed actions.

#	Terms and Conditions
	In the event that the unauthorized discharge causes or may with reasonable probability cause water pollution in excess of the standards and requirements of Section 20.6.2.4103 NMAC, and the water pollution will not be abated within 180 days after notice is required to be given pursuant to Paragraph (1) of Subsection A of 20.6.2.1203 NMAC, the permittee may be required to abate water pollution pursuant to Sections 20.6.2.4000 through 20.6.2.4115 NMAC. Nothing in this condition shall be construed as relieving the permittee of the obligation to comply with all requirements of Section 20.6.2.1203 NMAC. [20.6.2.1203 NMAC]
69.	In the event that NMED or the permittee identifies any failures of the discharge plan or this Discharge Permit not specifically noted herein, NMED may require the permittee to submit a Corrective Action Plan and a schedule for completion of corrective actions to address the failure(s). Additionally, NMED may require a Discharge Permit modification to achieve compliance with 20.6.2 NMAC. [Subsection A of 20.6.2.3107 NMAC, Subsection E of 20.6.2.3109 NMAC]

CLOSURE PLAN

Part A. Generally Applicable to All Discharges

#	Terms and Conditions
70.	The permittee shall close the facility covered under this Discharge Permit, either wholly or in part, in accordance with the closure plan in the March 10, 2005 Discharge Permit application. Where that closure plan references the closure plans in the WIPP Hazardous Waste Facility Permit and the WIPP Land Management Plan, the permittee shall use the most up-to-date version of the plans [Subsection A of 20.6.2.3107 NMAC]
71.	For the purpose of post-closure monitoring, after closure of all authorized units is complete the permittee shall continue groundwater monitoring until the monitoring confirms for a minimum of eight (8) consecutive quarterly groundwater sampling events that the standards of Section 20.6.2.3103 NMAC are not exceeded. Total dissolved solids and chloride shall meet pre-discharge conditions. If during post-closure monitoring results show that a groundwater quality standard in Section 20.6.2.3103 NMAC is exceeded, the permittee shall implement the contingency plan required by this Discharge Permit.

#	Terms and Conditions
	Following notification from NMED that post-closure monitoring may cease, the permittee shall plug and abandon all monitoring wells and piezometers in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011. [Subsection A of 20.6.2.3107 NMAC]

Part B. Applicable to the Facultative Lagoon System

#	Terms and Conditions
72.	In the event the Facultative Lagoon System is proposed to be permanently closed, the permittee shall perform the following closure measures: Within <u>60 days</u> of ceasing to discharge to the Facultative Lagoon System impoundments, the line leading to the impoundments shall be plugged so that a discharge can no longer occur. Within <u>60 days</u> of ceasing to discharge to the Facultative Lagoon System impoundments, wastewater shall be evaporated or removed from the impoundments and any other wastewater system components and it shall be disposed of in accordance with all local, state, and federal regulations. Within <u>90 days</u> of ceasing to discharge to the Facultative Lagoon System impoundments, the permittee shall submit a sludge removal and disposal plan to NMED for approval. The permittee shall initiate implementation of the plan within 30 days following approval by NMED. The sludge removal and disposal plan shall include the following: a) The estimated volume and dry weight of sludge to be removed and disposed, including measurements and calculations b) Analytical results for samples of the sludge taken from the impoundment for TKN, NO_3-N, percent total solids, hazardous constituents, and any other parameters tested (reported in mg/kg, dry weight basis). c) The method(s) of sludge *removal* from the impoundments. d) The method(s) of *disposal* for all of the sludge removed from the impoundments. The method(s) shall comply with all local, state and federal regulations, including 40 CFR Part 503. *Note: A proposal that includes the surface disposal of sludge may be subject to Ground Water Discharge Permitting requirements pursuant to 20.6.2.3104 NMAC that are separate from the requirements of this Discharge Permit.* e) A schedule for completion of sludge removal and disposal not to exceed two years from the date discharge to the impoundments ceased. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures:

#	Terms and Conditions
	a) Remove all lines leading to and from the Facultative Lagoon System impoundments, or permanently plug and abandon them in place. b) Remove or demolish any other wastewater system components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liners. d) Fill the impoundments with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [Subsection A of 20.6.2.3107 NMAC, 40 CFR Part 503]

Part C. Applicable to the Evaporation Pond H-19, Brine Retention Pond East, Brine Retention Pond West, Storm Water Ponds 1, 2, and 3, and Brine Salt Storage Pond 4

#	Terms and Conditions
73.	Upon cessation of operation, the permittee shall close Evaporation Pond H-19 and Storm Water Ponds 1, 2, and 3. Remaining liquids in Storm Water Ponds shall be removed and/or evaporated, and remaining liquids in Evaporation Pond H-19 shall be evaporated. All sludge shall be sampled to determine if it contains hazardous constituents and then managed and/or disposed of in accordance with applicable regulations. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: a) Remove or plug all piping and other ancillary components b) Remove or demolish any other components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liners. d) Fill the impoundments with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [Subsection A of 20.6.2.3107 NMAC]

Part D. Applicable to the Impoundments Containing Storm Water Runoff in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, 3, and 5) and to Salt Stockpiles (Salt Cells 1, 2, 3, and 5)

#	Terms and Conditions
74.	Upon cessation of operation, all mined salt at the facility shall be removed from the site. The permittee is permitted to use the mined salt as backfill in shafts and as interior fill

	material in berms and permanent markers after closure. All mined salt remaining after backfilling and after construction of surface structures shall be removed from the site. The permittee shall submit a plan and schedule for salt removal to NMED for approval within 120 days prior to the facility closure. The WIPP Land Management Plan reflects the Land Withdrawal Act's requirements for disposition of the salt. The WIPP's Hazardous Waste Facility Permit also addresses closure activities that include closure of the salt storage areas in accordance with the provisions of the WIPP Land Management Plan. The salt storage area shall be reclaimed in the manner described in these documents. [Subsection A of 20.6.2.3107 NMAC]
75.	Upon cessation of operation, the permittee shall close Salt Storage Ponds 1, 2, 3, and 5. Remaining liquids in each impoundment shall be evaporated. All sludge shall be sampled to determine if it contains hazardous constituents and then managed and/or disposed of in accordance with applicable regulations. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: a) Remove or plug all piping and other ancillary components. b) Remove or demolish any other components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liners. d) Fill the impoundments with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [Subsection A of 20.6.2.3107 NMAC]

GENERAL TERMS AND CONDITIONS

#	Terms and Conditions
76.	RECORD KEEPING - The permittee shall maintain a written record of: • information and data used to complete the application for this Discharge Permit; • any releases (commonly known as "spills") not authorized under this Discharge Permit and reports submitted pursuant to 20.6.2.1203 NMAC; • the operation, maintenance, and repair of all facilities/equipment used to treat, store or dispose of wastewater; • facility record drawings (plans and specifications) showing the actual construction of the facility and bear the seal and signature of a licensed New Mexico professional engineer; • copies of monitoring reports completed and/or submitted to NMED pursuant to this Discharge Permit;

#	**Terms and Conditions**

	• the volume of wastewater or other wastes discharged pursuant to this Discharge Permit;
	• groundwater quality and wastewater quality data collected pursuant to this Discharge Permit;
	• copies of construction records (well log) for all groundwater monitoring wells required to be sampled pursuant to this Discharge Permit;
	• the maintenance, repair, replacement or calibration of any monitoring equipment or flow measurement devices required by this Discharge Permit; and
	• data and information related to field measurements, sampling, and analysis conducted pursuant to this Discharge Permit, including:
	  o the dates, location and times of sampling or field measurements;
	  o the name and job title of the individuals who performed each sample collection or field measurement;
	  o the sample analysis date of each sample
	  o the name and address of the laboratory, and the name of the signatory authority for the laboratory analysis;
	  o the analytical technique or method used to analyze each sample or collect each field measurement;
	  o the results of each analysis or field measurement, including raw data;
	  o the results of any split, spiked, duplicate or repeat sample; and
	  o a copy of the laboratory analysis chain-of-custody as well as a description of the quality assurance and quality control procedures used.
	
	The written record shall be maintained by the permittee at a location accessible during a facility inspection by NMED for a period of at least five years from the date of application, report, collection or measurement and shall be made available to the department upon request.
	
	[Subsections A and D of 20.6.2.3107 NMAC]

77.	INSPECTION and ENTRY – The permittee shall allow inspection by NMED of the facility and its operations that are subject to this Discharge Permit and the WQCC regulations. NMED may upon presentation of proper credentials, enter at reasonable times upon or through any premises in which a water contaminant source is located or in which are located any records required to be maintained by regulations of the federal government or the WQCC. The permittee shall allow NMED to have access to and reproduce for their use any copy of the records, and to perform assessments, sampling or monitoring during an inspection for the purpose of evaluating compliance with this Discharge Permit and the WQCC regulations.

#	Terms and Conditions
	Nothing in this Discharge Permit shall be construed as limiting in any way the inspection and entry authority of NMED under the WQA, the WQCC Regulations, or any other local, state or federal regulations. [Subsection D of 20.6.2.3107 NMAC, NMSA 1978, §§ 74-6-9.B and 74-6-9.E]
78.	DUTY to PROVIDE INFORMATION - The permittee shall, upon NMED's request, allow for NMED's inspection/duplication of records required by this Discharge Permit and/or furnish to NMED copies of such records. [Subsection D of 20.6.2.3107 NMAC]
79.	MODIFICATIONS and/or AMENDMENTS – In the event the permittee proposes a change to the facility or the facility's discharge that would result in a change in the volume discharged; the location of the discharge; or in the amount or character of water contaminants received, treated or discharged by the facility, the permittee shall notify NMED prior to implementing such changes. The permittee shall obtain approval (which may require modification of this Discharge Permit) by NMED prior to implementing such changes. [Subsection C of 20.6.2.3107 NMAC, Subsections E and G of 20.6.2.3109 NMAC]
80.	PLANS and SPECIFICATIONS – In the event the permittee is proposing to construct a wastewater system or change a process unit of an existing system such that the quantity or quality of the discharge will change substantially from that authorized by this Discharge Permit, the permittee shall submit construction plans and specifications to NMED for the proposed system or process unit prior to the commencement of construction. In the event the permittee implements changes to the wastewater system authorized by this Discharge Permit that result in only a minor effect on the character of the discharge, the permittee shall report such changes (including the submission of record drawings, where applicable) as of January 1 and June 30 of each year to NMED. [Subsections A and C of 20.6.2.1202 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
81.	CIVIL PENALTIES - Any violation of the requirements and conditions of this Discharge Permit, including any failure to allow NMED staff to enter and inspect records or facilities, or any refusal or failure to provide NMED with records or information, may subject the permittee to a civil enforcement action. Pursuant to WQA 74-6-10(A) and (B), such action may include a compliance order requiring compliance immediately or in a specified time, assessing a civil penalty, modifying or terminating the Discharge Permit, or any combination of the foregoing; or an action in district court seeking injunctive relief, civil penalties, or both. Pursuant to WQA 74-6-10(C) and 74-6-10.1, civil penalties of up to $15,000 per day of noncompliance may be assessed for each violation of the WQA 74-6-5, the WQCC Regulations, or this Discharge Permit, and civil penalties of up to $10,000

#	**Terms and Conditions**
	per day of noncompliance may be assessed for each violation of any other provision of the WQA, or any regulation, standard, or order adopted pursuant to such other provision. In any action to enforce this Discharge Permit, the permittee waives any objection to the admissibility as evidence of any data generated pursuant to this Discharge Permit. [20.6.2.1220 NMAC, NMSA 1978, §§ 74-6-10 and 74-6-10.1]
82.	CRIMINAL PENALTIES – No person shall: • make any false material statement, representation, certification or omission of material fact in an application, record, report, plan or other document filed, submitted or required to be maintained under the WQA; • falsify, tamper with or render inaccurate any monitoring device, method or record required to be maintained under the WQA; or • fail to monitor, sample or report as required by a permit issued pursuant to a state or federal law or regulation. Any person who knowingly violates or knowingly causes or allows another person to violate the requirements of this condition is guilty of a fourth-degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who is convicted of a second or subsequent violation of the requirements of this condition is guilty of a third-degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who knowingly violates the requirements of this condition or knowingly causes another person to violate the requirements of this condition and thereby causes a substantial adverse environmental impact is guilty of a third-degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who knowingly violates the requirements of this condition and knows at the time of the violation that he is creating a substantial danger of death or serious bodily injury to any other person is guilty of a second-degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. [20.6.2.1220 NMAC, NMSA 1978, §§ 74-6-10.2.A through 74-6-10.2.F]
83.	COMPLIANCE with OTHER LAWS - Nothing in this Discharge Permit shall be construed in any way as relieving the permittee of the obligation to comply with any other applicable federal, state, and/or local laws, regulations, zoning requirements, nuisance ordinances, permits or orders. [NMSA 1978, § 74-6-5.L]
84.	RIGHT to APPEAL - The permittee may file a petition for review before the WQCC on this Discharge Permit. Such petition shall be in writing to the WQCC within thirty days of the receipt of postal notice of this Discharge Permit and shall include a statement of the issues to be raised and the relief sought. Unless a timely petition for review is made, the decision of NMED shall be final and not subject to judicial review.

#	Terms and Conditions
	[20.6.2.3112 NMAC, NMSA 1978, § 74-6-5.O]
85.	TRANSFER of DISCHARGE PERMIT - Prior to the transfer of any ownership, control, or possession of this facility or any portion thereof, the permittee shall: • notify the proposed transferee in writing of the existence of this Discharge Permit; • include a copy of this Discharge Permit with the notice; and • deliver or send by certified mail to NMED a copy of the notification and proof that such notification has been received by the proposed transferee. Until both ownership and possession of the facility have been transferred to the transferee, the permittee shall continue to be responsible for any discharge from the facility. [20.6.2.3111 NMAC]
86.	PERMIT FEES - Payment of permit fees is due at the time of Discharge Permit approval. Permit fees shall be paid in a single payment or shall be paid in equal installments on a yearly basis over the term of the Discharge Permit. Single payments shall be remitted to NMED no later than 30 days following the effective date of the Discharge Permit. Initial installment payments shall be remitted to NMED no later than 30 days following the effective date of the Discharge Permit; subsequent installment payments shall be remitted to NMED no later than the anniversary of the effective date of the Discharge Permit. Permit fees are associated with <u>issuance</u> of this Discharge Permit. Nothing in this Discharge Permit shall be construed as relieving the permittee of the obligation to pay all permit fees assessed by NMED. A permittee that ceases discharging or does not commence discharging from the facility during the term of the Discharge Permit shall pay all permit fees assessed by NMED. An approved Discharge Permit shall be suspended or terminated if the facility fails to remit an installment payment by its due date. [Subsection F of 20.6.2.3114 NMAC, NMSA 1978, § 74-6-5.K]

New Mexico Environment Department Ground Water Quality Bureau

Discharge Permit Summary

Facility Information

Facility Name	Waste Isolation Pilot Plant (WIPP)
Discharge Permit Number	DP-831
Legally Responsible Party	Kirk D. Lachman, Acting Manager U.S. Department of Energy, Carlsbad Field Office P.O. Box 3090 Carlsbad, NM 88221 (575) 234-7300

Treatment, Disposal and Site Information

Primary Waste Type	Domestic and Industrial
Facility Type	Federal Agency - U.S. Department of Energy

Evaporative Impoundment Locations

Domestic Wastewater

Type	Designation	Description & Comments
Settling Impoundment	Settling Lagoon 1	Primary treatment; 60-mil HDPE synthetically lined; permitted one foot of freeboard; capacity of 963,214 gallons.
Settling Impoundment	Settling Lagoon 2	Primary treatment; 60-mil HDPE synthetically lined; permitted one foot of freeboard; capacity of 963,214 gallons.
Polishing Impoundment	Polishing Lagoon 1	Passive secondary treatment; 60-mil HDPE synthetically lined; permitted one foot of freeboard; capacity of 414,901 gallons.
Polishing Impoundment	Polishing Lagoon 2	Passive secondary treatment; 60-mil HDPE synthetically lined; permitted one foot of freeboard; capacity of 141,901 gallons.
Evaporation Impoundment	Effluent Lagoon A	Effluent storage; 30-mil LLDP synthetically lined; disposal by evaporation; permitted one foot of freeboard; capacity of 566,610 gallons.
Evaporation Impoundment	Effluent Lagoon B	Effluent storage; 30-mil LLDP synthetically lined; disposal by evaporation; permitted discharges are domestic waste, brine, purge waters, and miscellaneous industrial non-hazardous wastewater; permitted one foot of freeboard; capacity of 846,257 gallons.
Evaporation Impoundment	Effluent Lagoon C	Effluent Storage; 30-mil HDPE synthetically lined; disposal by evaporation; permitted discharges are domestic waste, brine, purge waters, and miscellaneous industrial non-hazardous wastewater; permitted one foot of freeboard; capacity of 846,257 gallons.

Storm Water Control

Type	Designation	Description & Comments
Storm Water Impoundment	Storm Water Pond 1	Constructed using a 60-mil HDPE synthetic liner; receives clean non-contact storm water from paved areas, roofs, air conditioner condensate, and water from domestic water lines; disposal by evaporation; permitted one foot of freeboard; capacity of 626,076 gallons.
Storm Water Impoundment	Storm Water Pond 2	Constructed using a 60-mil HDPE synthetic liner; receives clean non-contact storm after from the facilities paved areas, roofs, air conditioner condensate, and draining domestic water lines; disposal by evaporation; permitted one foot of freeboard; capacity of 2,268,330 gallons.
Storm Water Impoundment	Storm Water Pond 3	Constructed using a 60-mil HDPE synthetic liner; receives clean non-contact storm after from the facilities paved areas, roofs, air conditioner condensate, and draining domestic water lines; disposal by evaporation; permitted one foot of freeboard; capacity of 7,211,967 gallons.

Non-Domestic Wastewater

Type	Designation	Description & Comments
Evaporation Impoundment	Evaporation Pond H-19	Constructed using a 36-mil Hypalon synthetic liner; permitted discharges are brine, purge waters, and miscellaneous industrial non-hazardous wastewater; disposal by evaporation; permitted one foot of freeboard; capacity of 346,085 gallons.
Evaporation Impoundment	Salt Storage Pond 1	Constructed using a 60-mil HDPE synthetic liner; disposal by evaporation; permitted one foot of freeboard; capacity of 3,301634 gallons.
Evaporation Impoundment	Salt Storage Pond 2/3	Constructed using 60-mil HDPE liner, 200-mil geonet drainage layer, and a second 60-mil HDPE liner with a leak detection system; disposal by evaporation;, permitted one foot of freeboard; capacity of 21,737,254 gallons
Evaporation Impoundment	Salt Storage Pond 5	To be constructed, 60-mil HDPE liner, 200-mil geonet drainage layer, and a second 60-mil HDPE liner with a leak detection system; disposal by evaporation; permitted two feet of freeboard; capacity of 6,355,404 gallons.
Evaporation Impoundment	Brine Salt Storage Pond 4	To be constructed, 60-mil HDPE geomembrane double liner with a leak detection system; permitted discharges are clean non-contact stormwater from the facilities paved areas, roofs, air conditioner condensate, draining domestic water lines, and brine from Brine Retention Ponds East and West; Disposal by evaporation; permitted one foot of freeboard; capacity of 8,668,722 gallons.

Retention Basin	Brine Retention Pond East	To be constructed, 60-mil HDPE geomembrane double liner with a leak detection system and an epoxy coated concrete bottom; disposal by evaporation; permitted two feet of freeboard; capacity of 46,094 gallons.
Retention Basin	Brine Retention Pond West	To be constructed, 60-mil HDPE geomembrane double liner with a leak detection system and an epoxy coated concrete bottom; disposal by evaporation; permitted two feet of freeboard; capacity of 46,094 gallons.
Holding tank	Brine Holding Tank	To be constructed, 3,000-gallon fiberglass reinforced plastic holding tank for brine prior to being discharged to either Brine Retention Pond East or West.

Salt Storage Locations

Type	Designation	Description & Comments
Salt Pile	Salt Cell 1	Inactive; approximately 18.8 acres; graded to 2% slope covered with sand and 60 mil HDPE liner and with 2 feet of native soil; seeded; run-off collects in Salt Storage Pond 1.
Salt Pile	Salt Cell 2	Active; 6.2 acres; run-off area of 326,350 sq. ft.; constructed using of six-inch prepared subgrade, 60-mil HDPE liner, 200-mil drainage layer, eight oz. geotextile fabric covered with 2 feet of native soil; runoff collects in Salt Storage Ponds 2 and/or 3.
Salt Pile	Salt Cell 3	Active; 5.2 acres; run-off area of 272,850 sq. ft.; constructed using of six-inch prepared subgrade, 60-mil HDPE liner, 200-mil drainage layer, eight oz. geotextile fabric covered with 2 feet of native soil; runoff collects in Salt Storage Ponds 2 and/or 3.
Salt Pile	Salt Cell 5	To be constructed; 5.09 acres; run-off area of 221,841 sq. ft.; 60-mil HDPE geomembrane liner with a protective native soil layer; runoff collects in Salt Storage Pond 5.
Salt Pile	Site Preliminary Design Validation Pile	Closed in 2000; covered with a geosynthetic liner, 6 inches of bedding material, and three feet of soil; Seeded.

Flow Metering Locations

Type	Designation	Description & Comments
Totalizing Flow Meter	Ultrasonic Flow Meter	Located at the facility Pump House – water supply; estimates domestic wastewater discharged to the facultative sewage impoundment system.

Primary Measurement Device		To be installed. Measures brine discharged to Brine Retention Ponds East and West from the New Filter Building.

Ground Water Monitoring Locations

Type	Designation	Description & Comments
Monitoring Wells	C-2505, C-2506, PZ-2, PZ-3, PZ-4	Quarterly depth to water measurement; all wells drilled in the Shallow Subsurface Water.
Monitoring Wells	C-2507, C-2811, PZ-1, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13, PZ-14, PZ-15, PZ-18, PZ-19	Quarterly depth to water measurement; semi-annual collection of field parameters for temperature, pH, and specific conductance; semi-annual monitoring for SO4, Cl, TDS, Uranium, and combined Radium-226 and Radium-228; all wells drilled in the Shallow Subsurface Water.
Monitoring Well	PZ-16	Quarterly depth to water measurement; semi-annual collection of field parameters for temperature, pH, and specific conductance; semi-annual monitoring for SO_4, Cl, TDS, TKN and NO_3-N; well drilled in the shallowest, water bearing zone of the Dewey Lake Formation and intended to monitor the Facultative Lagoon System.
Monitoring Wells	PZ-17 and WQSP-6A	Quarterly depth to water measurement; semi-annual collection of field parameters for temperature, pH, and specific conductance; semi-annual monitoring for SO4, Cl, and TDS; both wells drilled in the shallowest, water bearing zone of the Dewey Lake Formation and PZ-17 is intended to monitor Evaporation Pond H-19.

Depth-to-Ground Water 100 feet
Total Dissolved Solids (TDS) 3,400 mg/L

Permit Information

Original Permit Issued	January 16, 1992
Permit Amended	August 28, 1995
Permit Renewal	July 3, 1997
Permit Amended	June 12, 1998
Permit Amended	January 24, 2000
Permit Renewal	April 29, 2003
Permit Modification	December 22, 2003
Permit Modification	December 29, 2006
Permit Renewal and Modification	July 23, 2008
Permit Renewal	July 29, 2014

Current Action	**Permit Renewal and Modification**
Application Received	December 3, 2018

20.6.2.3103 STANDARDS FOR GROUND WATER

This table lists the numeric ground water standards in 20.6.2.3103 NMAC, effective as of December 21, 2018. It does not list the "toxic pollutants" for which Subsection A of 20.6.2.3103 NMAC establishes a narrative standard. The list of "toxic pollutants" can be found in Subsection T of 20.6.2.7 NMAC. The standards with an asterisk (*) take effect on July 1, 2020 for past and current water discharges occurring as of July 1, 2017. For full details, please refer to the Ground and Surface Water Protection Regulations, 20.6.2 NMAC.

Contaminant (Abbreviation) (CAS Number)	Standard
Numerical Standards (mg/l unless otherwise noted)	
Antimony (Sb) (CAS 7440-36-0)	0.006
Arsenic (As) (CAS 7440-38-2)	0.01*
Barium (Ba) (CAS 7440-39-3)	2.0
Beryllium (Be) (CAS 7440-41-7)	0.004
Cadmium (Cd) (CAS 7440-43-9)	0.005*
Chromium (Cr) (CAS 7440-47-3)	0.05
Cyanide (CN) (CAS 57-12-5)	0.2
Fluoride (F) (CAS 16984-48-8)	1.6
Lead (Pb) (CAS 7439-92-1)	0.015*
Total Mercury (Hg) (CAS 7439-97-6)	0.002
Nitrate (NO_3 as N) (CAS 14797-55-8)	10.0
Nitrite (NO_2 as N) (CAS 10102-44-0)	1.0
Selenium (Se) (CAS 7782-49-2)	0.05
Silver (Ag) (CAS 7440-224)	0.05
Thallium (Tl) (CAS 7440-28-0)	0.002
Uranium (U) (CAS 7440-61-1)	0.03
Radioactivity: Combined Radium-226 (CAS 13982-63-3) and Radium-228 (CAS 15262-20-1)	5 pCi/l*
Benzene (CAS 71-43-2)	0.005*
Polychlorinated biphenyls (PCB's) (CAS 1336-36-3)	0.0005*
Toluene (CAS 108-88-3)	1.0
Carbon Tetrachloride (CAS 56-23-5)	0.005*
1,2-dichloroethane (EDC) (CAS 107-06-2)	0.005*
1,1-dichloroethylene (1,1-DCE) (CAS 75-35-4)	0.007
tetrachloroethylene (PCE) (CAS 127-18-4)	0.005*
trichloroethylene (TCE) (CAS 79-01-6)	0.005*
ethylbenzene (CAS 100-41-4)	0.7*
total xylenes (CAS 1330-20-7)	0.62
methylene chloride (CAS 75-09-2)	0.005*
chloroform (CAS 67-66-3)	0.1
1,1-dichloroethane (CAS 75-34-3)	0.025
ethylene dibromide (EDB) (CAS 106-93-4)	0.00005*
1,1,1-trichloroethane (CAS 71-55-6)	0.2
1,1,2-trichloroethane (CAS 79-00-5)	0.005*
1,1,2,2-tetrachloroethane (CAS 79-34-5)	0.01
vinyl chloride (CAS 75-01-4)	0.002
PAHs: total naphthalene (CAS 91-20-3) plus monomethylnaphthalenes	0.03
benzo-a-pyrene (CAS 50-32-8)	0.0002*
cis-1,2-dichloroethene (CAS 156-59-2)	0.07
trans-1,2-dichloroethene (CAS 156-60-5)	0.1
1,2-dichloropropane (PDC) (CAS 78-87-5)	0.005

Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions

These conditions identify construction and abandonment requirements for installation of water table monitoring wells under ground water Discharge Permits issued by the NMED's Ground Water Quality Bureau (GWQB). Proposed locations of monitoring wells required under Discharge Permits and requests to use alternate installation and/or construction methods for water table monitoring wells shall be submitted to the GWQB for approval prior to drilling and construction.

General Drilling Specifications:

1. All well drilling activities shall be performed by an individual with a current and valid well driller license issued by the State of New Mexico in accordance with 19.27.4 NMAC.
2. Drilling methods that allow for accurate determinations of water table locations shall be employed. All drill bits, drill rods, and down-hole tools shall be thoroughly cleaned immediately prior to the start of drilling. The borehole diameter shall be drilled a minimum of 4 inches larger than the casing diameter to allow for the emplacement of sand and sealant.
3. After completion, the well shall be allowed to stabilize for a minimum of 12 hours before development is initiated.
4. The well shall be developed so that formation water flows freely through the screen and is not turbid, and all sediment and drilling disturbances are removed from the well.

Well Specifications (see attached monitoring well schematic):

5. Schedule 40 (or heavier) polyvinyl chloride (PVC) pipe, stainless steel pipe, carbon steel pipe, or pipe of an alternate appropriate material that has been approved for use by NMED shall be used as casing. The casing shall have an inside diameter not less than 2 inches. The casing material selected for use shall be compatible with the anticipated chemistry of the ground water and appropriate for the contaminants of interest at the facility. The casing material and thickness selected for use shall have sufficient collapse strength to withstand the pressure exerted by grouts used as annular seals and thermal properties sufficient to withstand the heat generated by the hydration of cement-based grouts. Casing sections shall be joined using welded, threaded, or mechanically locking joints; the method selected shall provide sufficient joint strength for the specific well installation. The casing shall extend from the top of the screen to at least one foot above ground surface. The top of the casing shall be fitted with a removable cap, and the exposed casing shall be protected by a locking steel well shroud. The shroud shall be large enough in diameter to allow easy access for removal of the cap. Alternatively, monitoring wells may be completed below grade. In this case, the casing shall extend from the top of the screen to 6 to 12 inches below the ground surface; the monitoring wells shall be sealed with locking, expandable well plugs; a flush-mount, watertight well vault that is rated to withstand traffic loads shall be emplaced around the wellhead; and the cover shall be secured with at least one bolt. The vault cover shall indicate that the wellhead of a monitoring well is contained within the vault.
6. A 20-foot section (maximum) of continuous-slot, machine slotted, or other manufactured PVC or stainless steel well screen or well screen of an alternate appropriate material that has been approved for use by NMED shall be installed across the water table. Screens created by cutting slots into solid casing with saws or other tools shall not be used. The screen material selected for use shall be compatible with the anticipated chemistry of the ground water and appropriate for the contaminants of interest at the facility. Screen sections shall be joined using welded, threaded, or mechanically locking joints; the method selected shall provide sufficient joint strength for the specific well installation and shall not introduce constituents that may reasonably be considered contaminants of interest at the facility. A cap shall be attached to the bottom of the well screen; sumps (i.e., casing attached to the bottom of a well screen) shall not be installed. The bottom of the screen shall be installed no more than 15 feet below the water table; the top of the well screen shall be positioned not

less than 5 feet above the water table. The well screen slots shall be appropriately sized for the formation materials and shall be selected to retain 90 percent of the filter pack.

7. Casing and well screen shall be centered in the borehole by placing centralizers near the top and bottom of the well screen.
8. A filter pack shall be installed around the screen by filling the annular space from the bottom of the screen to 2 feet above the top of the screen with clean silica sand. The filter pack shall be properly sized to prevent fine particles in the formation from entering the well. For wells deeper than 30 feet, the sand shall be emplaced by a tremmie pipe. The well shall be surged or bailed to settle the filter pack and additional sand added, if necessary, before the bentonite seal is emplaced.
9. A bentonite seal shall be constructed immediately above the filter pack by emplacing bentonite chips or pellets (3/8-inch in size or smaller) in a manner that prevents bridging of the chips/pellets in the annular space. The bentonite seal shall be 3 feet in thickness and hydrated with clean water. Adequate time shall be allowed for expansion of the bentonite seal before installation of the annular space seal.
10. The annular space above the bentonite seal shall be sealed with cement grout or a bentonite-based sealing material acceptable to the State Engineer pursuant to 19.27.4 NMAC. A tremmie pipe shall be used when placing sealing materials at depths greater than 20 feet below the ground surface. Annular space seals shall extend from the top of the bentonite seal to the ground surface (for wells completed above grade) or to a level 3 to 6 inches below the top of casing (for wells completed below grade).
11. A concrete pad (2-foot minimum radius, 4-inch minimum thickness) shall be poured around the shroud or well vault and wellhead. The concrete and surrounding soil shall be sloped to direct rainfall and runoff away from the wellhead.

Abandonment:

12. Approval for abandonment of monitoring wells used for ground water monitoring in accordance with Discharge Permit requirements shall be obtained from NMED prior to abandonment.
13. Well abandonment shall be accomplished by removing the well casing and placing neat cement grout, bentonite-based plugging material, or other sealing material approved by the State Engineer for wells that encounter water pursuant to 19.27.4 NMAC from the bottom of the borehole to the ground surface using a tremmie pipe. If the casing cannot be removed, neat cement grout, bentonite-based plugging material, or other sealing material approved by the State Engineer shall be placed in the well using a tremmie pipe from the bottom of the well to the ground surface.
14. After abandonment, written notification describing the well abandonment shall be submitted to the NMED. Written notification of well abandonment shall consist of a copy of the well plugging record submitted to the State Engineer in accordance with 19.27.4 NMAC, or alternate documentation containing the information to be provided in a well plugging record required by the State Engineer as specified in 19.27.4 NMAC.

Deviation from Monitoring Well Construction and Abandonment Requirements: Requests to construct water table monitoring wells or other types of monitoring wells for ground water monitoring under ground water Discharge Permits in a manner that deviates from these requirements shall be submitted in writing to the GWQB. Each request shall state the rationale for the proposed deviation from these requirements and provide detailed evidence supporting the request. The GWQB will approve or deny requests to deviate from these requirements in writing.

March 12, 2019

Dear Permittee,

The New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) wishes to notify you of recent amendments to the Ground and Surface Water Protection Regulations (20.6.2 NMAC). As a holder of a groundwater discharge permit, New Mexico's Water Quality Control Commission's amendments to the referenced regulations took effect on December 21, 2018, and these amendments may influence your current or future discharge permit.

Changes to the Ground Water Standards

The most significant changes for entities with discharge permits are the changes to the groundwater numerical standards at 20.6.2.3103 NMAC and the addition of several regulated contaminants. The numerical standards were revised to be consistent with the federal drinking water Maximum Contaminant Levels, resulting in both more and less stringent constituent specific standards. Please be aware that some of the revised standards will not take effect until July 1, 2020, as are identified in the regulations. Groundwater protection standards were adopted for 13 previously unregulated contaminants.

Furthermore, 13 additional contaminants were added to the list of "toxic pollutants" (See the definitions section at 20.6.2.7 NMAC). A minor change resulted in the toxic pollutants narrative standard being moved from the definitions section into the standards section at 20.6.2.3103 NMAC. A list showing the changes to the standards is enclosed for your reference.

Because of these changes to the standards, all general references in your current discharge permit to the standards of 20.6.2.3103 NMAC refer to the new standards, including the new contaminants. When your groundwater discharge permit is renewed or modified, it may contain specific requirements to sample for specific additional contaminants.

Other Changes to the Regulations

Other significant changes to the regulations include:

- NMED must prepare a fact sheet to accompany draft permits for federal facilities, unless the permit pertains to only domestic waste. (See 20.6.2.3108.I)
- NMED must issue a response to significant comments received on draft permits. (See 20.6.2.3109.B)
- Injection wells and surface impoundments constructed to recharge an aquifer are not exempt from the requirement to obtain a Discharge Permit. (See 20.6.2.5006)
- Revised requirements pertain to the content of petitions for a variance from the regulations, and to the duration and review of variances. (See 20.6.2.1210)

This letter does not attempt to identify or characterize all the changes to the regulations. You can find links to the amendments that were published in the New Mexico Register, to a clean version of the amended regulations, and to the Water Quality Control Commission's Order and Statement of Reasons for adopting the amendments at the GWQB's website at:

https://www.env.nm.gov/gwqb/gw-regulations/

Thank you for your ongoing cooperation. If you have any questions you may contact the reviewer assigned to your discharge permit and with whom you are accustomed to working, or you may contact me at 505-827-2962 or at steve.pullen@state.nm.us.

Sincerely,

Steve Pullen
Manager, Pollution Prevention Section

Encl: 20.6.2.3103 Revised Groundwater Standards

New Mexico Environment Department
Ground Water Quality Bureau
20.6.2.3103 STANDARDS FOR GROUND WATER

Revised groundwater standards adopted by the New Mexico Water Quality Control Commission became effective on December 21, 2018. Some standards were changed, and new standards were adopted for additional contaminants. Designations for each contaminant now include the Chemical Abstracts Service (CAS) number for clearer identification. The following table summarizes the additions and changes to the numeric standards in Section 20.6.2.3103 NMAC. Bold type highlights the standards that have changed and identifies the contaminants that are new to the numeric standards (previous standard listed as "none"). The second table lists contaminants that were added to the "toxic pollutants" identified in Subsection T of 20.6.2.7 NMAC. For full details, please refer to the Ground and Surface Water Protection Regulations, 20.6.2 NMAC.

Contaminant (Abbreviation) (CAS Number)	Previous Standard	Current Standard
Numerical Standards (mg/l unless otherwise noted)		
Antimony (Sb) (CAS 7440-36-0)	None	0.006
Arsenic (As) (CAS 7440-38-2)	0.1*	0.01*
Barium (Ba) (CAS 7440-39-3)	1.0	2.0
Beryllium (Be) (CAS 7440-41-7)	None	0.004
Cadmium (Cd) (CAS 7440-43-9)	0.01*	0.005*
Chromium (Cr) (CAS 7440-47-3)	0.05	0.05
Cyanide (CN) (CAS 57-12-5)	0.2	0.2
Fluoride (F) (CAS 16984-48-8)	1.6	1.6
Lead (Pb) (CAS 7439-92-1)	0.05*	0.015*
Total Mercury (Hg) (CAS 7439-97-6)	0.002	0.002
Nitrate (NO_3 as N) (CAS 14797-55-8)	10.0	10.0
Nitrite (NO_2 as N) (CAS 10102-44-0)	None	1.0
Selenium (Se) (CAS 7782-49-2)	0.05	0.05
Silver (Ag) (CAS 7440-224)	0.05	0.05
Thallium (Tl) (CAS 7440-28-0)	None	0.002
Uranium (U) (CAS 7440-61-1)	0.03	0.03
Radioactivity: Combined Radium-226 (CAS 13982-63-3) and Radium-228 (CAS 15262-20-1)	30 pCi/l*	5 pCi/l*
Benzene (CAS 71-43-2)	0.01*	0.005*
Polychlorinated biphenyls (PCB's) (CAS 1336-36-3)	0.001*	0.0005*
Toluene (CAS 108-88-3)	0.75	1.0
Carbon Tetrachloride (CAS 56-23-5)	0.01*	0.005*
1,2-dichloroethane (EDC) (CAS 107-06-2)	0.01*	0.005*
1,1-dichloroethylene (1,1-DCE) (CAS 75-35-4)	0.005	0.007
tetrachloroethylene (PCE) (CAS 127-18-4)	0.02*	0.005*
trichloroethylene (TCE) (CAS 79-01-6)	0.1*	0.005*
ethylbenzene (CAS 100-41-4)	0.75*	0.7*
total xylenes (CAS 1330-20-7)	0.62	0.62
methylene chloride (CAS 75-09-2)	0.1*	0.005*
chloroform (CAS 67-66-3)	0.1	0.1
1,1-dichloroethane (CAS 75-34-3)	0.025	0.025
ethylene dibromide (EDB) (CAS 106-93-4)	0.0001*	0.00005*
1,1,1-trichloroethane (CAS 71-55-6)	0.06	0.2
1,1,2-trichloroethane (CAS 79-00-5)	0.01*	0.005*
1,1,2,2-tetrachloroethane (CAS 79-34-5)	0.01	0.01
vinyl chloride (CAS 75-01-4)	0.001	0.002

PAHs: total naphthalene (CAS 91-20-3) plus monomethylnaphthalenes	0.03	0.03
benzo-a-pyrene (CAS 50-32-8)	0.0007*	0.0002*
cis-1,2-dichloroethene (CAS 156-59-2)	None	0.07
trans-1,2-dichloroethene (CAS 156-60-5)	None	0.1
1,2-dichloropropane (PDC) (CAS 78-87-5)	None	0.005
styrene (CAS 100-42-5)	None	0.1
1,2-dichlorobenzene (CAS 95-50-1)	None	0.6
1,4-dichlorobenzene (CAS 106-46-7)	None	0.075
1,2,4-trichlorobenzene (CAS 120-82-1)	None	0.07
pentachlorophenol (CAS 87-86-5)	None	0.001
atrazine (CAS 1912-24-9)	None	0.003
Other Standards for Domestic Water Supply		
Chloride (Cl) (CAS 16887-00-6)	250	250
Copper (Cu) (CAS 7440-50-80	1.0	1.0
Iron (Fe) (CAS 7439-89-6)	1.0	1.0
Manganese (Mn) (CAS 7439-96-5)	0.2	0.2
Phenols	0.005	0.005
Sulfate (SO_4) (CAS 14808-79-8)	600	600
Total Dissolved Solids (TDS) TDS	1000	1000
Zinc (Zn) (CAS 7440-66-6)	10	10
pH	6-9	6-9
Methyl tertiary-butyl ether (MTBE) (CAS 1634-04-4)	None	0.1
Standards for Irrigation Use		
Aluminum (Al) (CAS 7429-90-5)	5.0	5.0
Boron (B) (CAS 7440-42-8)	0.75	0.75
Cobalt (Co) (CAS 7440-48-4)	0.05	0.05
Molybdenum (Mo) (CAS 7439-98-7)	1.0	1.0
Nickel (Ni) (CAS 7440-02-0)	0.2	0.2

*For purposes of application of the amended numeric standards for arsenic, cadmium, lead, combined radium-226 & radium-228; benzene, PCBs, carbon tetrachloride, EDC, PCE, TCE, ethylbenzene, methylene chloride, EDB, 1,1,2-trichloroethane and benzo-a-pyrene, to past and current water discharges (as of July 1, 2017), the new standards will not become effective until July 1, 2020.

The following table lists contaminants that were added to the "toxic pollutants" identified in Subsection T of 20.6.2.7 NMAC. Narrative standards apply to the full list of toxic pollutants, as described in Subsection A of 20.6.2.3103 NMAC.

Toxic Pollutants Added as of December 21, 2018	
styrene (ethenylbenzene)	1,4-dioxane (1,4-D)
1,2-dichlorobenzene (ortho-dichlorobenzene)	sulfolane (thiolane 1,1-dioxide)
1,4-dichlorobenzene (para-dichlorobenzene)	perfluorohexane sulfonic acid (PFHxS)
1,2,4-trichlorobenzene	perfluorooctane sulfonate (PFOS)
pentachlorophenol (PCP)	perfluorooctanoic acid (PFOA)
1,2-dichloropropane (propylene dichloride, PDC)	atrazine
	prometon
