Pond A	Eddy	22S	31E	SE 1/4 of the SW 1/4 of the SE 1/4 of section 20	N32°, 22 Minutes, 19.9 Seconds	W103°, 47 Minutes, 51.9 Seconds

(4) An estimate of the concentration of water contaminates in the discharge (based upon April 21, 2005, results):

Parameter	Pond A Results	Pond A Results (Duplicate)
pH	8.00	7.98
Specific Gravity @ 21° C	1.003	1.003
Specific Conductance @ 25° C	1,073	1082
Bicarbonate of Alkalinity HCO_3	112	110
Chloride (mg/l)	253	250
Divalent Cations mq/l	<1.0	<1.0
Fe (total)	0.01	0.01
Calcium (mg/l)	12.0	NA
Sulfide (mg/l)	23.0	NA
Potassium (mg/l)	2.5	NA

(5) The quantity of the discharge:

Approximately 130,000 gallons of storm water is to be discharged from SWIC Pond A to SWIC Ponds 1 and/or 2.

If you have any questions regarding this notification, please contact Mr. Jody Plum at (505) 234-7462.

Sincerely,

Ines R. Triay
Acting Manager

Subject: Notification of the Freeboard Levels in the Sewage Lagoons and the H-19 Evaporation Pond and Construction Progress Report for Storm Water Infiltration Control Pond A

Dear Mr. Marshall:

The purpose of this letter is to provide you the requested information as noted in your letter dated December 28, 2004, approving the corrective actions proposed by WIPP for the restoration of freeboard in the sewage lagoon system and the H-19 evaporation pond. Your December 28, 2004 letter requires us to notify you of the freeboard levels in each pond by the last day of each month. As requested, the freeboard levels for April 2005 are listed below.

Location	Remaining Freeboard on April 15, 2005
Settling Pond 1A	30 inches
Polishing Pond 1B	26 inches
Settling Pond 2A	29 inches
Settling Pond 2B	29 inches
Evaporation Pond A	14 inches
Evaporation Pond B	23 inches
Evaporation Pond C	23 inches
H-19 Evaporation Pond	30 inches

As discussed with you and documented in a letter dated March 4, 2005 the status of the activities for the construction of Storm Water Infiltration Control (SWIC) Pond A is as follows:

- An additional 0.38 inches of rain fell April 17, 2005 impacting efforts to install the liner.
- Earthwork has not been resumed pending scheduling of the liner contractor.

CBFO:AMO:HLP:GS:05-0267:UFC 5486.00

- Efforts are being taken to schedule the contractor to install the lienr at their first availability when Pond A dries out.

If you have any questions or require additional information, please contact Mr. H. L. Plum at (505) 234-7462.

Sincerely,

Inés Triay

Subject: Notice of Intent to Discharge

Dear Mr. Marshall:

The purpose of this letter is to document your verbal authorization on April 27, 2005, to discharge approximately 130,000 gallons of water from Storm Water Infiltration Control (SWIC) Pond A to SWIC Pond 1 and/or 2. A March 4, 2005, Notice of Intent (NOI) to discharge approximately 200,000 gallons from SWIC Pond A to SWIC Pond 1 and 2 or to the ground was approved without requiring a permit on March 7, 2005. Analytical results indicated the water discharged pursuant to the March 4, 2005, NOI conformed to the numerical standards outlined in 20.6.2.3103 NMAC and did not contain any toxic pollutants as defined in 20.6.2.1101.TT NMAC. Therefore, the discharge was exempt from requiring a permit pursuant to 20.6.2.3105.A. NMAC.

As the result of a storm event on April 17, 2005, additional water has accumulated in SWIC Pond A. In order to facilitate resuming earth work and the installation of the synthetic liner in SWIC Pond A, as required by the Discharge Permit Modification issued on December 22, 2003, the DOE requests authorization to discharge the water from SWIC Pond A to SWIC Pond 1 and/or 2. We estimate that there is less than 130,000 gallons of water in SWIC Pond A. The analytical results below indicate that the water that has collected in Pond A and sampled on April 21, 2005, exceeds the regulatory threshold of 250 mg/l of chloride listed in 20.6.2.3103 NMAC. The SWIC Ponds 1 and 2 are lined with a 60-mil high-density polyethylene liner so the discharge will not infiltrate to the subsurface or impact groundwater. The transfer of this water to SWIC Pond 1 and/or 2 will present no threat to human health or the environment.

The DOE is providing the information below to the New Mexico Environment Department as required pursuant to 20.6.2.1201 NMAC.

(1) Name of the person making the discharge;
Dr. Inés Triay, Acting Manager

CBFO:AMO:HLP:GS:05-0264:UFC 5487.00

(2) The address of the person making the discharge;

U.S. Department of Energy
Carlsbad Field Office
P.O. Box 3090
4021 National Parks Highway
Carlsbad, NM 88221
(505) 234-7303

(3) The location of the discharge;

Name	County	Township	Range	Section	Latitude	Longitude
Pond 1	Eddy	22S	31E	SW ¼ of the SE ¼ of the SE ¼ of Section 20	N32°, 22 Minutes, 13.6 Seconds	W103°, 47 Minutes, 39.4 Seconds
Pond 2	Eddy	22S	31E	SE ¼ of the SE ¼ of the SE ¼ of section 20	N32°, 22 Minutes, 13.7 Seconds	W103°, 47 Minutes, 34.3 Seconds
Pond A	Eddy	22S	31E	SE ¼ of the SW ¼ of the SE ¼ of section 20	N32°, 22 Minutes, 19.9 Seconds	W103°, 47 Minutes, 51.9 Seconds

(4) An estimate of the concentration of water contaminates in the discharge;

Parameter	Pond A Results	Pond A Results (Duplicate)
Ph	8.00	7.98
Specific Gravity @ 21o C	1.003	1.003
Specific Conductance @ 25o C	1,073	1082
Bicarbonate of Alkalinity HCO3	112	110
Chloride (mg/l)	253	250
Divalent Cations mq/l	<1.0	<1.0
Fe (total)	0.01	0.01
Calcium (mg/l)	12.0	NA
Sulfide (mg/l)	23.0	NA
Potassium (mg/l)	2.5	NA

(5) The quantity of the discharge.
Approximately 130,000 gallons of storm water may be discharged from SWIC Pond A to SWIC Ponds 1 and/or 2.

If you have any questions regarding this notification, please contact Mr. Jody Plum at (505) 234-7462.

Sincerely,

Ines Triay

RE: Administrative Completeness Determination and Applicant's Public Notice Requirements, DP-831, Waste Isolation Pilot Plant (REVISED).

Dear Discharge Permit Applicant:

The New Mexico Environment Department (NMED) received a Ground Water Discharge Permit Application from you on March 8, 2005. Pursuant to Section 20.6.2.3106 NMAC of the New Mexico Water Quality Control Commission Regulations (2016.2 NMAC), NMED determined on March 10, 2005 that your application is administratively complete.

Within 30 days of the submission of an administratively complete Discharge Permit Application, you must provide public notice using one of the 3 options listed in Section 20.6.2.3108 NMAC. You selected public notice option # 2. The instructions and materials needed to complete this option are enclosed.

If you have any questions, please call the Ground Water Quality Bureau at (505) 827-2900.

Sincerely,

Megan Nelson
for
William C. Olson, Chief
Ground Water Quality Bureau

Public Notice 1
DP-831

The U.S. Department of Energy's Waste Isolation Pilot Plant, Ines Triay, Acting Manager, proposes to modify the Discharge Permit (DP-831) for the discharge and treatment of up to 33,000 gallons per day of domestic and industrial wastewater and up to 3,231,360 gallons per day of storm water runoff from general facility grounds, parking lots, and synthetically lined and/or capped salt storage piles. This permit modification addresses additional potential contamination sources at the WIPP facility and incorporates all potential sources into a comprehensive closure plan. The sources addressed in the closure plan include three salt storage piles that are the result of constructing underground access drifts and rooms for the disposal of transuranic radioactive waste and transuranic radioactive mixed waste. Potential contaminants from these types of discharges include total dissolved solids, chloride and nitrogen compounds.

The facility is located 26 miles southeast of Carlsbad, in Sections 20, 21, 28 and 29, T22S, R31E, Eddy County, New Mexico. Ground water that could potentially be affected by the discharges ranges from the Culebra Member of the Rustler Formation at a depth of approximately 608 feet with a total dissolved solids concentration of approximately 234,000 mg/l to water in the Dewey Lake Formation south of the site at a depth of 225 feet with a total dissolved solids concentration of approximately 3,920 mg/l.

Information in this public notice was provided by the applicant and will be verified by the New Mexico Environment Department during the permit application process. NMED will accept comments and statements of interest regarding the application and will create a facility specific mailing list for persons who wish to receive future notices. Comments and statements of interest should be sent to Clint Marshall, DP-831, Ground Water Quality Bureau, PO Box 26110, Santa Fe, NM 87502. For additional information please call (505) 827-2900.

RE: Approval of Inspection Plan for Sewage Lagoon System, DP-831, Waste Isolation Pilot Plant

Dear Dr. Triay:

The Ground Water Quality Bureau of the New Mexico Environment Department (NMED) has received a plan to inspect the sewage lagoon system submitted by the U.S. Department of Energy Waste Isolation Pilot Plant (WIPP) dated March 10, 2005. The proposal was submitted based on a request from NMED personnel during a site inspection conducted on August 11, 2004. The purpose of the proposed plan is to evaluate the integrity of the existing synthetic liners in the sewage lagoon system and to determine if leaks exist below the waterline. NMED hereby approves the proposed inspection plan.

The proposed inspection plan and leak detection method is briefly described as follows:

A contractor will be employed by WIPP to provide professional engineering services using an electronic leak detection method to locate leaks in the existing synthetic liners. Electrodes will be placed in each lagoon and the adjacent ground and a voltage applied. The lagoon liner acts as an insulator, therefore leaks in the liner produce detectable localized anomalies of high current density. In addition to applying this technique, samples of the liner material will be collected from each of the lagoons above the waterline and subjected to laboratory testing to further determine the condition of the liners. A final report will be submitted to NMED within 90 days of the contractor's report.

If you have any questions regarding this approval, please call me at 505-827-0027.

Sincerely,

Clint Marshall

Subject: Notification of the Freeboard Levels in the Sewage Lagoons and the H-19 Evaporation Pond and Construction Progress Report for Storm Water Infiltration Control Pond A

Dear Mr. Marshall:

Your letter dated December 28, 2004, approving the corrective actions proposed by WIPP for the loss of freeboard in the sewage lagoons and the H-19 evaporation pond requires us to notify you of the freeboard levels in each pond by the last day of each month. As requested, the freeboard levels for March 2005 are listed below.

Location	Remaining Freeboard on March 15, 2005
Settling Pond 1A	20 inches
Polishing Pond 1B	18 inches
Settling Pond 2A	19 inches
Settling Pond 2B	18 inches
Evaporation Pond A	16 inches
Evaporation Pond B	18 inches
Evaporation Pond C	18 inches
H-19 Evaporation Pond	25 inches

Two feet of freeboard has been restored in the H-19 Evaporation Pond as required by DP-831.

As discussed with you and documented in a letter dated March 4, 2005, the following summarizes activities related to the construction of the Storm Water Infiltration Control (SWIC) Pond A.

- In order to provide additional capacity in the SWIC Pond 1, approximately 110,000 gallons of water was pumped to the SWIC Pond 2 for evaporation.

- Water was pumped from the SWIC Pond A to the environment until the pump would not keep suction. Small isolated areas of pond water remain on the west end of the SWIC Pond A.

- The culvert that directs storm water run-off from the parking lot to the SWIC Pond A was plugged to prevent run-off from the parking lot entering the SWIC Pond A. Much of the precipitation that may fall on the parking lot is diverted to the environment.

- A temporary dam has been constructed in the drainage ditch which conveys storm water run-off from the plant site to the SWIC Pond A. All run-off collected at this location is pumped to the SWIC Pond 1 as necessary.

Efforts to remove and prevent storm water accumulation are proving effective; however, the SWIC Pond A is still too wet for construction to resume at this time.

If you have any questions or require additional information, please contact Mr. H. L. Plum at (505) 234-7462.

Sincerely,

Ines R. Triay
Acting Manager

Public Notice 1
DP-831

DP-831, Waste Isolation Pilot Plant, Inez Triay, Acting Manager, proposes to modify the Discharge Permit for the discharge of up to 3,231,360 gallons per day of domestic and industrial wastewater, and storm water runoff from mine tailings from a federal nuclear waste storage facility to a treatment and disposal system. Potential contaminants from this type of discharge include dissolved solids, chloride and nitrogen compounds. The facility is located 26 miles southeast of Carlsbad, in Section 20, T22S, R31E, Eddy County. Ground water beneath the site is at a depth of approximately 608 feet and has a total dissolved solids concentration of approximately 3,920 milligrams per liter.

Information in this public notice was provided by the applicant and will be verified by the New Mexico Environment Department during the permit application review process. NMED will accept comments and statements of interest regarding the application and will create a facility specific mailing list for persons who wish to receive future notices. Comments and statements of interest should be sent to Clint Marshall, DP-831, Ground Water Quality Bureau, PO Box 26110, Santa Fe, NM 87502. For additional information, please call (505) 827-2900.

Subject: Stained Soils Found in the Parking Area During Excavation for the TRUPACT Sun Shade Structure

Dear Mr. Zappe:

The purpose of this letter is to provide follow-up information concerning the stained soils noted during construction of the TRUPACT Sun Shade Structure (Enclosure 1). On February 14, 2005, the Department of Energy (DOE) and Washington TRU Solutions (WTS) notified you that stained soil had been found in two of the 15 footing excavations. These excavations are located within the Parking Area Unit (PAU) as described in the Waste Isolation Pilot Plant (WIPP) Hazardous Waste Facility Permit (HWFP) that is paved over the area of Solid Waste Management Unit (SWMU) 005a (Enclosure 2). This SWMU was a concrete batch plant operated during the construction of several buildings at the WIPP facility. SWMU 005a is characterized in Revision 3 of the WIPP RCRA Permit Application as follows:

> "The only releases at these sites consist of spillage that occurred during filling of the trucks and stockpiling materials. The material released was water mixed with concrete, sand, and gravel and is considered non-hazardous. In addition, trace amounts of non-RCRA regulated motor oil, grease, and diesel may have leaked from trucks during handling."

During the notification call, it was stated that an investigation of the stained soil, including sampling, would be conducted to determine if there were constituents of concern present. The soil and a small amount of liquid were sampled on February 15, 2005. The excavations were deepened and a geologic soil description was made on February 18, 2005. The following enclosures provide details of the investigative activities:

Enclosure 1	Engineering Figure of the TRUPACT Sun Shade Shelter Noting the Location of the Structure and Footings
Enclosure 2	Aerial Photograph Noting the Location of Solid Waste Management Unit 005a
Enclosure 3	Analytical Results for the Investigation
Enclosure 4	Analytical Discussion
Enclosure 5	Summary Description of Additional Excavated Soil

The sample analyses have indicated the contaminant is diesel fuel (Enclosure 3). Excavations indicate only a small area was contaminated (see Enclosure 4). The levels of diesel fuel are slightly elevated (see Enclosure 4) above the clean soil levels described in the Solid Waste Regulations NMED 20.9.1.708. Data and observations indicate the stained soil is stable. The information developed during the investigation shows the stained soil is not migrating (Enclosure 5). The diesel found was bound to the soils and obvious signs of degradation indicate the microbes in the soil and oxidation of the fuels were taking place. The natural attenuation process is expected to continue to reduce the diesel levels in the soil. Inspection of the excavations on subsequent days after the excavations showed the stained soil to be dramatically lighter in color and no odor was present.

No impact is expected to human health or the environment, due to the depth of the contamination and the fact that it is covered with a minimum of 6 inches of concrete and 4 inches of asphalt under the concrete. The footings measuring approximately 4 feet wide by 4 feet long by 4 feet deep will be filled with compacted gravel and concrete. There is no apparent migration of the contaminants and no receptors under the concrete and asphalt.

The location has been identified using the Global Positioning Satellite System and SWMU 005a has been noted in the HWFP. Solid Waste Management Unit 005a will be thoroughly evaluated at the decommissioning of the WIPP facility and closed per the HWFP Attachment I. Since this is a previously identified SWMU with non hazardous constituents and no human health or environmental receptors, no further actions are planned until site closure.

Per DOE's phone conversation with you on March 4, 2005, construction of the TRUPACT sun shade structure will resume.

If you have any questions, please contact me at (505) 234-7300.

Sincerely,

Inés Triay

P.O.Box 2078
Carlsbad, NM 88221-2078

Report Date: February 24, 2005

Work Order: 5021614

Project Number: PO #402560

Enclosed are the Analytical Report and Quality Control Report for the following sample(s) submitted to TraceAnalysis, Inc.

Sample	Description	Matrix	Date Taken	Time Taken	Date Received

These results represent only the samples received in the laboratory. The Quality Control Report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

This report consists of a total of 37 pages and shall not be reproduced except in its entirety, without written approval of TraceAnalysis, Inc.

Analytical Report

Sample: 54725 - WST-05-008

Analysis:	Volatiles	Analytical Method:	S 8260B	Prep Method:	S 5030B

Enclosure 4

Analytical Discussion

Enclosure 4

Analytical Discussion

During excavation of the footings, brownish stains were encountered approximately four feet below the concrete and asphalt cover. Sampling of the soils and liquid occurred within 24 hours of discovery. No hazardous constituents were found in the soils. Samples were analyzed for Volatile Organic Chemicals (VOC), Gasoline Range Organics (GRO) and Diesel Range Organics (DRO). The GRO and DRO are both components of Total Petroleum Hydrocarbons (TPH). The sampling results are in Attachment 4.

All soil analytical results, except those at locations B and C (see Attachment 4 Figure), showed no detection of VOC, GRO, or DRO. Diesel was the only constituent found. In location B, a sample and duplicate were taken. These samples had DRO values of 1050 and 1130 mg/kg, respectively. Soils with TPH concentrations below 1000 mg/kg are considered clean. The analysis of the soil in location C showed the level of DRO constituents as 1710 mg/kg and GRO constituents were not detected. Location B GRO values were non-detect in one sample and a slight detection of 1.09 mg/Kg (detection limit is 1 mg/kg), in the duplicate. Therefore, the TPH concentration in locations B and C are slightly higher than the clean soil designation. It was noted during the excavations that the diesel was not migrating. No staining was found in the soils above or below the stained horizon. No stained soil or odor was found east, west or south of locations B & C. In addition the stained soils excavated were not stained after a short period of exposure to air and sunlight on the surface, and lost their odor within twenty-four hours.

Precipitation prior to sampling and during the additional excavation and soil description was believed to be the source of approximately 300 milliliters of water found in one excavation and sampled during the sampling event. The sampling results indicate that there are no hazardous constituents at levels of concern. With the exception of two samples from one location, Volatile Organic Compound (VOC) analyses were non-detect. The water sample and its duplicate contained acetone below levels of concern (0.02 and 0.018 ppm). This constituent and the associated levels are consistent with the use of acetone in the laboratory glass cleaning process. We are discussing possible sources of contamination in lab process due to the fact no known source of acetone is believed to be present. The analytical results for the water sample showed no detection of GRO and DRO.

Enclosure 5

Summary Description of Additional Excavated Soil

Enclosure 5
Summary Description of Additional Excavated Soil

The excavations were uncovered at 7:45 a.m. on February 18, 2005. Air quality testing by a Flame Ionization Detector (FID) was completed at each of the excavations. Three locations (B, C, and D) had FID detections. Location C had the highest reading at 1 ppm. Location B had a reading of 0.5 ppm, which is also the lower confidence limit for this analytical device in the prevailing conditions. Location D had a reading of 0.2 ppm. These readings were well below the human health risk levels. These locations are shown in the Attachment 4 Figure.

Soil logging, i.e., description of soils types utilizing geologic soil descriptions, commenced upon completion of the air quality tests. The observations began with further excavation (three feet deeper) in all of the locations. The locations were logged from least contaminated to most contaminated. Logging was completed at 9:40 a.m. All excavations were covered with plastic, plywood, and clean soil as logging was completed.

Location A was excavated and logged first. This location had a white caliche layer from 4 feet to 4 feet 4 inches. Then reddish-brown, medium-grained, drift sand occurred from 6 feet 4 inches to 6 feet 6 inches. Tan fine-grained sand was encountered from 6 feet 6 inches to the bottom of the hole at 7 feet. No stained soils or odor were found in location A.

Location G was excavated and logged second. White caliche was encountered from 4 feet 1 inch to 4 feet 4 inches. The brownish-red to reddish, medium-grained sand, as seen in location A, continued to 6 feet 8 inches into the hole. The final 4 inches to 6 inches were clean, tan, and fine-grained sand as seen in location A. No stained soils or odor were found in location G.

Location H was excavated and logged third. A thin caliche layer was found at the 4 foot level. The rest of the excavation found only the brownish-red, medium-grained sand to 7 feet. No stained soils or odor were found in location H.

Location D was excavated and logged fourth. A layer of caliche was found from 4 feet to 4 feet 6 inches. From 4 feet 6 inches to total depth at 7 feet, only the brownish-red, medium-grained sand was found. No stained soils or odor were found in location D.

Location C was excavated and logged fifth. Caliche was encountered between 4 feet 1 inch and 4 feet 8 inches. The caliche was mingled with reddish, medium-grained sand. From 4 feet 8 inches to 5 feet, the reddish sand began to show black staining and an odor was detected. The sand, at this depth, was dry. At 5 feet to 6 feet, the black stained sand, containing a medium strength odor, predominated. The sand remained dry through out the excavation. Between 6 feet and 6 feet 2 inches, the stained soil was mixed with unstained reddish sand. There was a slight odor at this level. From 6 feet 2 inches to a total depth of 7 feet, the reddish sand was not stained and graded to the tan fine-grained sand. This zone was unstained, dry and odor free.

CBFO:AMO:HLP:GS:05-0228:UFC 5486.00

The sixth excavation was location B. From 4 feet 1 inch to 4 feet 8 inches, caliche was encountered along with medium-grained, brown sand with a reddish tint. No stain was seen, but a faint odor was noted. From 4 feet 8 inches to 5 feet, a medium-grained, brown sand was encountered. There was no stain and only a faint petroleum odor. At this depth, the sand was dry. From 5 feet to 6 feet, a brown to gray-brown sand was encountered. It was medium-grained with possibly a slight stain which was not prominent and a faint odor. From 6 feet to 6 feet 6 inches, a light-brown to reddish-brown, medium to fine-grained sand was encountered. The sand at this depth was clean, dry, and had a faint odor. From 6 feet 6 inches to 6 feet 8 inches, the light-brown to reddish-brown sand persisted. It was medium-grained, dry, clean (no stain), and had no discernable odor. From 6 feet 8 inches to a total depth of 7 feet, tan fine-grained sand was encountered. This sand was dry, odor free, and not stained.

RE: NOTICE OF APPROVAL AND GENERAL RESPONSE TO COMMENTS; CLASS 3 MODIFICATION FOR NO FURTHER ACTION OF SOLID WASTE MANAGEMENT UNITS AND AREAS OF CONCERN
WIPP HAZARDOUS WASTE FACILITY PERMIT
EPA I.D. NUMBER NM4890139088

Dear Interested Person:

This letter is a notification of the final administrative action by the New Mexico Environment Department (**NMED**) to approve a Class 3 permit modification request (**PMR**) to the Waste Isolation Pilot Plant (**WIPP**) Hazardous Waste Facility Permit. The Department of Energy Carlsbad Field Office and Washington TRU Solutions LLC (**the Permittees**) submitted this PMR to the Hazardous Waste Bureau in the following document:

- Request for Class 3 Permit Modification (NFA), Letter Dated 8/27, Rec'd 9/4/07

In this PMR, the Permittees requested the following:

1. Modify the permit to reflect the determination by NMED that no further action is necessary to investigate fifteen Solid Waste Management Units (SWMUs) and eight Areas of Concern (AOCs) at WIPP.

This Class 3 PMR was evaluated and processed in accordance with the requirements specified in 20.4.1.900 NMAC (incorporating 40 CFR §270.42(c)). It was subject to a 60-day public comment period running from September 1 through October 30, 2007, during which NMED received written comments from one individual and one organization. NMED then issued a draft permit on March 7, 2008, accompanied by a fact sheet and public notice announcing a 60-day public comment period running from March 7 through May 6, 2008 and an opportunity for public hearing. By the conclusion of the public comment period on the draft permit, NMED had received no public comments on the draft permit and no request for a public hearing. NMED's general responses to the comments related to the submitted PMR are summarized in the attachment to this letter.

NMED is approving the draft permit without change to remove the fifteen SWMUs and eight AOCs from Module VII as requiring no further action. The modification will become effective 30 days after the approval of the modification, which makes the effective date of the permit modification November 22, 2008. Further information on this administrative action, including the modified permit and the Permittees' approval notification, may be found on the NMED WIPP Information Page at <http://www.nmenv.state.nm.us/wipp/>. Please contact Steve Zappe at (505) 476-6051 or via e-mail at <steve.zappe@state.nm.us> if you have further questions or need additional information.

Sincerely,

John E. Kieling

NMED General Response to Comments on Class 3 Permit Modification To WIPP Hazardous Waste Facility Permit (WIPP permit) Submitted August 27, 2007

Item 1. Modify the WIPP Permit to accurately reflect that No Further Action is required for Solid Waste Management Units and Areas of Concern at WIPP

Background: The PMR proposed to modify the WIPP Permit to reflect a determination by NMED on April 20, 2007, which had concluded that no further action was necessary to investigate fifteen Solid Waste Management Units (SWMUs) and eight Areas of Concern (AOCs) listed in several tables in Module VII of the WIPP Permit. NMED had issued this determination based upon evaluation of relevant sampling information for each site, which supported the conclusion that a more formal RCRA Facility Investigation (RFI) was unnecessary because either there had never been a release of hazardous constituents to the environment at a site or, if there had been a release, a release assessment indicated that the concentrations of hazardous constituents were at acceptably low levels to require no further action. Below is a summary of the changes proposed by the PMR:

- Delete Table 2 entitled "SWMUs Requiring an RFI"
- Delete Table 3 entitled "AOCs Included in the Permit"
- Add Table 4 entitled "SWMUs/AOCs Requiring No Further Action"

NMED received two comments during the public comment period for this PMR, which are addressed below. Based upon public comment and the administrative record, NMED issued a draft permit on March 7, 2008, accompanied by a fact sheet and public notice announcing a 60-day public comment period and opportunity for public hearing. By the conclusion of the public comment period on the draft permit, NMED had received no public comments and no request for a public hearing.

Comments: The first commenter submitted a redacted version of the Permittees' fact sheet for the PMR, suggesting that the Permittees had written the fact sheet intentionally to obscure the truth. The second commenter expressed no objection to the approval of the PMR, but noted that the proposed modification did not address a different minor modification to update another table in Module VII of the Permit. This commenter requested that the PMR not be approved until this specific table had been updated and finalized.

Response: The first comment did not provide any technical or regulatory suggestions relevant to the PMR, and no response is necessary.

Regarding the second comment, NMED incorporated the change to Table 2A, "SWMUs Not Requiring an RFI", which addressed the commenter's concern.

The only other changes from the original PMR that NMED incorporated in the draft permit consisted of not deleting Tables 2 and 3 in their entirety, but deleting all entries from each table and indicating that future entries in each table were "Reserved." This change was necessary because Permit Condition VII.J contains requirements associated with newly-identified SWMUs and potential AOCs, which would necessitate their listing on these tables that would otherwise have been deleted.

RE: Discharge Permit Renewal and Modification, DP-831, Waste Isolation Pilot Plant

Dear Mr. Moody:

The New Mexico Environment Department (NMED) issues the enclosed Discharge Permit Renewal and Modification, DP- 831 to the U.S. Department of Energy (DOE) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978§§74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Regulations, 20.6.2 NMAC.

The Discharge Permit Renewal and Modification contains terms and conditions that shall be complied with by the DOE and are enforceable by NMED pursuant to WQCC 20.6.2.3104, WQA, NMSA 1978 § 74-6-5 and §74-6-10. Issuance of this Discharge Permit Renewal and Modification does not relieve the DOE of its responsibility to comply with the WQA, WQCC Regulations, or any other applicable federal, state and/or local laws and regulations, such as zoning requirements and nuisance ordinances.

Pursuant to 20.6.2.3109.H.4 NMAC, this Discharge Permit Renewal and Modification shall expire on **September 9, 2013**. You must submit an application for renewal at least 120 days before the permit expiration date.

Sincerely,

William C. Olson, Chief
Ground Water Quality Bureau

WCO:clm

GROUND WATER DISCHARGE PERMIT RENEWAL AND MODIFICATION
U.S. DEPARTMENT OF ENERGY
WASTE ISOLATION PILOT PLANT, DP-831
September 9, 2008

I. INTRODUCTION

The New Mexico Environment Department (NMED) renews and modifies Discharge Permit, DP-831, to the U.S. Department of Energy's Waste Isolation Pilot Plant (WIPP) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978 §§ 74-6-1 through 74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Regulations, 20.6.2 NMAC.

NMED's purpose in issuing this Discharge Permit Renewal and Modification, and in imposing the requirements and conditions specified herein, is to control the discharge of water contaminants from the WIPP into ground water and surface water, so as to protect ground water and surface water for present and potential future use as domestic and agricultural water supply and other uses; to abate pollution of ground and surface water; and to protect public health. In issuing this Discharge Permit Renewal and Modification, NMED has determined that the requirements of 20.6.2.3109.C NMAC have been met.

Facility Description

The WIPP is a hazardous and radioactive waste disposal facility operated by the U.S. Department of Energy (DOE). The WIPP is constructed in a bedded salt formation 2,150 feet below ground surface. DP-831 covers the discharge of domestic effluent, storm water and miscellaneous process waters to various lined impoundments at the facility.

Domestic wastewater from the facility and industrial wastewaters from two compressed air systems are discharged to seven synthetically lined facultative sewage lagoons (Facultative Lagoon System) that include Evaporation Ponds A, B and C; Polishing Ponds 1B and 2B; and Settling Ponds 1A and 2A. Brine, purge waters and miscellaneous non-hazardous process waters are discharged to the H-19 Evaporation Pond and Evaporation Ponds B and C of the Facultative Lagoon System. Storm water runoff at the facility is collected in the synthetically lined Storm Water Infiltration Control (SWIC) Ponds A, 1 and 2.

Salt and other subsurface materials mined during construction as well as currently mined salt are stored on the surface in three stockpiles. The stockpiles include the Salt Storage Extension (SSE) Cells A and B that are being used to store salt currently, or in the future, as it is mined out from the underground panels at the WIPP. Storm water runoff from the SSE is collected in the synthetically lined Salt Storage Extension Basin (SSEB). The existing Salt Pile that was previously used has been capped with a synthetic and earthen cover. Storm water runoff from the Salt Pile is collected in synthetically lined diversion ditches and diverted to the synthetically lined Salt Pile Evaporation Pond (SPEP). The Site and Preliminary and Design Validation (SPDV) material pile was constructed as the shafts were excavated when construction first began at the WIPP site. The SPDV material pile was closed in the year 2000 with a cover consisting of a geosynthetic liner installed on 6 inches of bedding material and covered with a minimum of three feet of earthen material.

Location of Discharge

The WIPP facility is located approximately 26 miles east of Carlsbad, New Mexico in Sections 20, 21, 28 and 29, T22S, R31E, Eddy County.

Quantity, Quality, and Flow Characteristics of the Discharge

The permitted discharge consists of up to 23,000 gallons per day (gpd) of domestic effluent and industrial wastewaters; up to 150,000 gpd of brine, purge waters and non-hazardous process waters; a designed flow of 4,224,835 gpd of storm water runoff based on a 24-hour, 25-year storm event; and mined salt placed in Salt Storage Extension Cells A and B. The discharged waters contain contaminants or toxic pollutants that may exceed water quality standards set forth in WQCC Regulations 20.6.2.3103 NMAC for nitrate, chloride, sulfate and total dissolved solids. These discharged waters may move directly or indirectly into ground water.

Characteristics of Ground Water

Regional ground water beneath the site exists in the Culebra and Magenta Members of the Rustler Formation at approximate depths of 483 feet and 357 feet below ground level, respectively. Ground water also exists in the Dewey Lake Formation in the southwest portion of the WIPP site at well WQSP-6A, and as discontinuous lenses in the region beneath and surrounding the WIPP Site (16 Sections of the WIPP Land Withdrawal Area). Depth to ground water in the Dewey Lake Formation in well WQSP-6A is approximately 164 feet below ground surface and contains a total dissolved solids concentration of approximately 3,400 mg/L. A zone of shallow anthropogenic subsurface water (SSW) located underneath the WIPP facility at a depth of approximately 60-80 feet below ground surface has a TDS concentration ranging from approximately 1,500 to 165,000 mg/L.

General

The WIPP Discharge Plan Renewal and Modification consists of the materials in the Discharge Plan submitted by the DOE dated December 20, 2007. In addition, the discharge plan includes, in part, information and materials submitted as part of the original discharge plan approved on January 16, 1992, amended on August 28, 1995, renewed on July 3, 1997, amended on June 12, 1998, amended on January 24, 2000, renewed on April 29, 2003, modified on December 22, 2003, and modified again on December 29, 2006. The discharges at this site shall be managed in accordance with the Discharge Permit Renewal and Modification Application dated December 20, 2007 as conditioned by this Discharge Permit Renewal and Modification.

Changes as incorporated in this Discharge Permit Renewal and Modification include the following:

1. The minimum operating freeboard allowed for the Facultative Lagoon System and the H-19 Evaporation Pond is decreased from two feet to one foot.

2. The Facultative Lagoon System is permitted to accept non-hazardous industrial wastewater from two compressed air systems.

3. Up to 50,000 gpd of brine, purge waters, and miscellaneous non-hazardous process waters are permitted to be discharged into Evaporation Pond C of the Facultative Lagoon System up to the capacity of the pond with one foot of freeboard.

4. The maximum daily discharge rate to the H-19 Evaporation Pond is increased from 8,000 to 50,000 gpd up to the capacity of the pond with one foot of freeboard.

5. The maximum daily discharge rate to Evaporation Pond B is increased from 2,000 to 50,000 gpd up to the capacity of the pond with one foot of freeboard.

6. Quarterly monitoring for Pu^{238}, $Pu^{238/240}$, U^{234}, U^{235}, U^{238}, Am^{241} and Sr^{90} in the Facultative Lagoon System and the H-19 Evaporation Pond is no longer required.

7. Quarterly monitoring for selenium, chromium and nitrate in the SSW piezometers and wells, well WQSP-6A, and Storm Water Infiltration Control Ponds A, 1 and 2 is no longer required.

8. Semiannual monitoring for chloride has been added for Evaporation Ponds B and C of the Facultative Lagoon System and the H-19 Evaporation Pond. Semiannual monitoring for Total Kjeldahl Nitrogen (TKN) has been added for well WQSP-6A.

9. The accuracy of water level measurements in the Storm Water Infiltration Control Ponds is changed from a 100th of a foot to a 10th of a foot.

Pursuant to 20.6.2.3109.E NMAC, NMED reserves the right to modify permit requirements in the event NMED determines that the requirements of 20.6.2 NMAC are being, or may be, violated or standards of 20.6.2.3103 NMAC are being, or may be, violated. This may include a determination by NMED that operational practices approved under this Discharge Permit Renewal and Modification are not protective of ground and surface water quality, and that a modification is necessary to protect water quality or abate water pollution. Permit modification may include, but is not limited to, lining or relining impoundments, changing discharge locations, changing waste management practices, expanding monitoring requirements, and implementing abatement of water pollution.

Issuance of this Discharge Permit Renewal and Modification does not relieve the DOE of its responsibility to comply with all conditions or requirements of the WQA, WQCC Regulations, and any other applicable federal, state, and/or local laws and regulations such as zoning requirements and nuisance orders.

II. FINDINGS

In issuing this Discharge Permit Renewal and Modification, NMED finds:

1. The DOE is discharging effluent or impacted water at the WIPP Facility so that such effluent may move directly or indirectly into ground water within the meaning of 20.6.2.3104 NMAC.

2. Ground water (located at well WQSP 6A) in the Southwest portion of the WIPP Land Withdrawal Area has an existing concentration of 10,000 milligrams per liter or less of total dissolved solids within the meaning of 20.6.2.3101.A NMAC.

3. The discharges at the WIPP Facility are not subject to any of the exemptions of 20.6.2.3105 NMAC.

4. The WIPP Facility is located at a place of withdrawal of water for present or reasonable foreseeable future use within the meaning of 20.6.2.3101A NMAC.

III. CONDITIONS FOR APPROVAL

The following conditions shall be complied with by the DOE and are enforceable by NMED. The DOE is permitted to discharge water contaminants subject to the following conditions.

OPERATIONS

1. The DOE shall conduct the operational requirements set forth below, including investigations, in accordance with the WQCC Regulations at sections 20.6.2.3106.C and 3107 NMAC to ensure compliance with 20.6.1 and 20.6.2 NMAC.

Permitted Discharge Flow Rates

2. During the term of this Discharge Permit Renewal and Modification, the DOE shall manage discharges as follows. [20.6.2.3109 NMAC]

   a. The DOE is permitted to discharge no more than 23,000 gallons per day of domestic effluent and non-hazardous industrial wastewater from two compressed air systems to the Facultative Lagoon System (Evaporation Ponds A, B and C; Polishing Ponds 1B and 2B; and Settling Ponds 1A and 2A) for treatment and evaporation.

   b. The DOE is permitted to discharge no more than 50,000 gallons per day of brine, purge waters and miscellaneous non-hazardous wastewaters to the H-19 Evaporation Pond. The pond capacity is 346,085 gallons allowing for one foot of freeboard.

   c. The DOE is permitted to discharge no more than 50,000 gpd of brine, purge waters and miscellaneous non-hazardous wastewaters to Evaporation Pond B up to the capacity of the pond with one foot of freeboard. The pond capacity is 500,000 gallons allowing for two feet of freeboard.

d. The DOE is permitted to discharge no more than 50,000 gpd of brine, purge waters and miscellaneous non-hazardous wastewaters to Evaporation Pond C up to the capacity of the pond with one foot of freeboard. The pond capacity is 500,000 gallons allowing for two feet of freeboard.

e. The DOE is permitted to collect storm water runoff from the Salt Pile to the Salt Pile Evaporation Pond (SPEP) at a designed flow of 1,677,633 gallons per day based on a 25 year/24 hour storm event (3.90 inches). The pond capacity is 5,506,989 gallons not allowing for any freeboard.

f. The DOE is permitted to collect storm water runoff from the Salt Storage Extension to the Salt Storage Extension Basin (SSEB) at a designed flow of 2,547,202 gallons per day based on a 25 year/24 hour storm event (3.90 inches). The pond capacity is 4,170,732 gallons not allowing for any freeboard.

g. The DOE is permitted to place mined salt and associated minerals from the excavated panels, drifts and shafts in the nuclear waste repository into Salt Storage Extension Cells A and B.

Pond Maintenance and Inspections

3. The DOE shall properly operate and maintain all impoundments covered by this permit. The DOE shall maintain the capacity of the H-19 Evaporation Pond, the Facultative Lagoon System, SSEB and SPEP to store and evaporate the maximum daily discharge volume allowed by this discharge permit while maintaining one foot of freeboard at all times. In the event that a minimum of one foot of freeboard can not be maintained at all times, the DOE shall submit a corrective action plan to manage discharge volumes to the NMED for approval. [20.6.2.3109 NMAC]

4. The DOE shall measure the thickness of the sludge blanket in each pond of the Facultative Lagoon System every five years. When sludge accumulation exceeds 1/3 of the total depth of any pond, the DOE shall remove the sludge in a manner, which is protective of the pond liner. Removed sludge shall be contained, transported, and disposed of in accordance with all local, state, and federal (e.g., 40 CFR Part 503) regulations. [20.6.2.3109 NMAC]

5. The DOE shall perform visual inspection of the Facultative Lagoon System, H-19 Pond and surrounding berms on a monthly basis. The water surface of the ponds shall be kept free of floating plants and debris. Berms surrounding the ponds shall be kept free of all deep-rooted plants. Berms shall be inspected for signs of wind or water erosion and damage from burrowing animals. In the event berms show signs of damage, the DOE shall submit to the NMED for approval a plan for protection of the berms, which may include the emplacement of rip rap or other methods for armoring the berms. [20.6.2.3109 NMAC]

6. Within 180 days of the issuance of this Discharge Permit, the DOE shall submit, for NMED approval, a plan for controlling storm water and minimizing erosion of the earthen cover of the Salt Pile. The plan shall assess and potentially incorporate options including, but not limited to 1) rock armoring of the side slopes, 2) recontouring of the top surface, 3) the use of alternate borrow sources for cover material, and 4) revegetation of the top surface and side slopes. [20.6.2.3109 NMAC]

Cover Maintenance and Inspections

7. The DOE shall conduct regular maintenance of the earthen covers on the Salt Pile and the SPDV pile. Inspections shall be conducted monthly and after storm events of 2 inches or greater in a 24-hour period to evaluate potential erosion and vegetation success of the cover. In the event of significant erosion or failure of vegetative success, the DOE shall provide a plan and schedule for repair within 90 days of discovery. General observations and cover repairs shall be reported to NMED pursuant to Condition 14 below. [20.6.2.3109 NMAC]

MONITORING AND REPORTING

8. The DOE shall conduct the following monitoring, reporting, and other requirements listed below in accordance with the WQCC Regulations at 20.6.2.3107 NMAC and the monitoring plan submitted by the DOE dated December 20, 2007. A summary of monitoring requirements is attached to this permit as Table 1. A monitoring schedule is attached as Table 2. [20.6.2.3107 NMAC]

Sampling and Field Measurements

9. Discharge Volumes – The DOE shall measure discharge volumes to all impoundments covered under this discharge Permit Renewal and Modification as follows. [20.6.2.3107 NMAC]

    a. The volume of domestic effluent discharged to the Facultative Lagoon System shall be measured using a totalizing flow meter on the influent to the system or the totalizing meter that measures total domestic water usage. Volumes of other authorized discharges to the facultative lagoon system shall be calculated by a time/volume method or volumetric measurement of the transport container(s). NMED may require comprehensive laboratory analyses of such wastewater prior to discharge when NMED determines that additional information is needed. Monthly meter readings, the units of measurement, monthly discharge volumes and other volumetric calculations for the previous 6-month period shall be submitted to NMED semi-annually in the monitoring reports required in Condition 14 below.

    b. The volume and origin of all wastewater discharged to the H-19 Evaporation Pond that is derived from miscellaneous non-hazardous sources shall be measured and reported to NMED. Discharge volumes to the H-19 Evaporation Pond shall be calculated by a time/volume method or volumetric measurement of the transport container(s). NMED may require comprehensive laboratory analyses of such wastewater prior to discharge when NMED determines that additional information is needed. Monthly discharge volumes and other volumetric calculations for the previous 6-month period shall be submitted to NMED semi-annually in the monitoring reports required in Condition 14 below.

10. Surface Impoundments – The DOE shall measure water levels and analyze for water quality as follows.

    a. The water depth shall be measured monthly to the nearest tenth of a foot (0.1 ft) in the SSEB, SPEP, and SWIC Ponds A, 1 and 2. The approximate volume of storm water shall be calculated and a water quality sample collected in each of the five storm water collection ponds once per year after a selected significant storm event where a sufficient quantity of water has collected in the respective ponds. Water quality sampling shall be conducted as required in Condition 9b.

    b. Confirmation of one foot of freeboard shall be conducted monthly on the H-19 Evaporation Pond and each impoundment in the Facultative Lagoon System.

    c. Samples shall be collected from the influent to the Facultative Lagoon System semi-annually and analyzed for the parameters in Groups 2 and 3 listed in Condition 11 below and Table 1, Monitoring Summary. Samples shall be collected semi-annually from the H-19 Evaporation Pond and analyzed for the parameters in Group 2 listed in Condition 11 below and Table 1, Monitoring Summary. A single sample shall be collected annually after a selected significant storm event from each of the storm water ponds, SSEB, SPEP, and SWIC Ponds A, 1 and 2 and analyzed for the parameters in Group 2 listed in Condition 12 below and Table 1, Monitoring Summary.

Analytical results, water level measurements and freeboard confirmation for surface impoundments shall be reported to NMED as required in Condition 14 below. [20.6.2.3107 NMAC]

11. Ground Water Monitoring Wells – The DOE shall measure water depths and analyze for water quality as follows.

    a. Depth to the water table shall be measured to the nearest hundredth of a foot (0.01 ft) above msl, quarterly in piezometers/monitoring wells PZ-1, PZ-2, PZ-3, PZ-4, PZ-5, PZ-6, PZ-7, PZ-8, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13, PZ-14, PZ-15, C-2505, C-2506, C-2507, C-2811 and WQSP-6A.

    b. Samples shall be collected from piezometers/monitoring wells PZ-1, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13, C-2507, C-2811 and WQSP-6A semi-annually and analyzed for the parameters in Groups 1 and 2 listed in Condition 12 below.

    c. Samples shall be collected from monitoring well WQSP-6A semi-annually and analyzed for the parameters in Group 3 listed in Condition 12 below.

Analytical results and water level measurements for monitoring wells shall be reported to NMED as required in Condition 14. below. [20.6.2.3107 NMAC]

Analysis

12. The DOE shall analyze samples of ground water and water from surface impoundments for the specific parameters listed below and based on the schedule in the attached Table 1. Samples of ground water from monitoring wells shall be analyzed for the parameters listed in Groups 1, 2 and 3 as noted below. Samples collected from surface impoundments shall be analyzed for the parameters listed in Group 2.

    Group 1: Field parameters (analysis to be performed in the field): water level, temperature, pH and electrical conductivity.

    Group 2: General chemistry parameters: sulfate, chloride and total dissolved solids.

    Group 3: Nitrate-nitrogen and total Kjeldahl nitrogen.

    Copies of signed laboratory analysis sheets shall be maintained at the WIPP facility and made available to NMED staff upon request. [20.6.2.3107 NMAC]

Methodology

13. Unless otherwise approved in writing by NMED, the DOE shall conduct sampling and analysis in accordance with the most recent editions of the following documents. [20.6.2.3107 NMAC]

    a. American Public Health Association, *Standard Methods for Examination of Water and Wastewater.*

    b. U.S. Environmental Protection Agency, *Methods for Chemical Analysis of Water and Waste.*

    c. U.S. Geological Survey, *Techniques for Water Resource Investigations of the U.S. Geological Survey.*

    d. American Society for Testing and Materials, Annual Book of ASTM Standards, Part 31, Water.

    e. U.S. Geological Survey, et al., *National Handbook of Recommended Methods for Water Data Acquisition.*

    f. Surface water monitoring must also be conducted according to test procedures approved under Title 40 CFR Part 136.

g. New Mexico Environment Department, Hazardous Waste Bureau Position Paper, *Use of Low-Flow and Other Non-Traditional Sampling Techniques for RCRA Compliant Groundwater Monitoring.*

Reporting

14. The DOE shall submit to NMED semi-annual monitoring reports by the last day of January and July of each year. Reports shall include the following information. [20.6.2.3107 NMAC]

    a. A summary of all activities related to permitted discharges during the preceding 6 month period. Activities may include general operations, construction or demolition of structures, erosion features, maintenance and repairs to liners, pipelines, covers, berms and other facility components covered by this Discharge Permit Renewal and Modification, water management, water quality and ground water level trends, and precipitation patterns.

    b. A single table in a paper and electronic format (EXCEL spreadsheet) of water level measurements and water quality data with only those constituents analyzed and water levels measured during a single event shown in columns. Tabulated field measurements to include temperature, pH and electrical conductivity corrected to 25 degrees Celsius. Monitoring sites shall be shown in rows. The second column shall contain the date of the sampling event. Values exceeding standards shall be bolded. Any constituent not analyzed for a particular site shall be shown as "NA", any site not sampled shall be shown as "NS" with an associated reason, and any site not measured for water levels shall be shown as "NM" with an associated reason.

    c. A single table as described in Condition 13b above that includes all available ground water data to date shall be submitted annually. For each monitoring well, the name of the well shall be entered in the far left column in a row by itself. Sampling events, beginning with the earliest event first, shall be entered in subsequent rows with the sampling date in the second column and the corresponding analytical data in columns further to the right. Each new sampling event shall be added as an additional row to the existing spreadsheet with the corresponding date of the sampling event noted in the second column next to the monitoring well name.

    d. Discharge volumes, water depths, and calculated storm water volumes for all permitted impoundments at the facility.

    e. Copies of the signed laboratory analyses sheet shall be kept onsite and made available to NMED upon request.

    f. Hydrographs shall be submitted annually for all monitoring wells and piezometers covered under Condition 11a of this Discharge Permit Renewal and Modification. At a minimum, graphs shall include the previous five years of water level data, or for new wells, all data since the well was installed. Data for several wells may be included on one graph.

g. A potentiometric map for the WIPP facility area shall be submitted annually. The map shall incorporate the most recent water level data for all monitoring wells and piezometers installed in the shallow subsurface water (SSW).

CONTINGENCY MEASURES

15. In the event that monitoring indicates ground water standards as defined in Section 20.6.2.3103 NMAC are exceeded in ground water in wells that previously did not exceed ground water standards, or the extent or magnitude of any existing concentrations of water contaminants is significantly increasing, the DOE shall collect a confirmatory sample from the monitoring well(s) within 15 days to confirm the initial sampling results. Within 30 days of confirmation of ground water contamination, the DOE shall submit an abatement plan to NMED, which includes a site investigation to define the source, nature and extent of contamination; a proposed abatement option; and a schedule for its implementation. The site investigation and selection of an abatement option shall be consistent with the requirements and provisions of 20.6.2.4101, 4103, 4106.C & E, 4107, 4108 and 4112 NMAC. [20.6.2.3107A(10) NMAC]

16. In the event of a pipeline break, pump failure, pond overflow or other system failure at the WIPP Facility, discharged water shall be contained, pumped and transferred to areas of the facility that impose minimal impacts to ground water quality. Failed components shall be repaired or replaced as soon as possible and no later than 72 hours from the time of failure. For good cause shown, the DOE may request NMED approval of an extension of the schedule for the repair or replacement of a failed component. [20.6.2.3107A(10) NMAC]

17. In the event of a spill or release that is not authorized by this Discharge Permit Renewal and Modification, the DOE shall initiate the notification and corrective actions required in 20.6.2.1203 NMAC. The DOE shall take immediate corrective action to contain and remove or mitigate the damage caused by the discharge. Within 24 hours of discovery of the discharge, the DOE shall verbally notify the NMED and provide the information outlined in 20.6.2.1203.A.1 NMAC. Within seven days of discovering the discharge, the DOE shall submit a written report to NMED verifying the oral notification and providing any additional information or changes. The DOE shall submit a corrective action report within 15 days after the discovery of the discharge. [20.6.2.1203 NMAC]

CLOSURE

18. The DOE shall close the facilities covered under this Discharge Permit Renewal and Modification in accordance with the closure plan in the March 4, 2005 discharge permit application, the closure plan in the WIPP Hazardous Waste Facility Permit (HWFP) dated January 30, 2003, and the WIPP Land Management Plan as conditioned by this Discharge Permit Renewal and Modification. [20.6.2.3107A(11) NMAC]

Surface Impoundments

19. Upon cessation of operation, the DOE shall close all impoundments at the facility covered by this Discharge Permit. Remaining liquids in each impoundment shall be removed and/or evaporated. All sludge shall be sampled to determine if hazardous constituents exist and managed and/or disposed of in accordance with applicable regulations. All piping and other ancillary components shall be plugged or removed. Synthetic liners shall be removed or ripped in place. All impoundments shall be backfilled with clean fill materials and graded to create positive drainage. The final regraded surface shall be contoured to surrounding topography and shall be revegetated with natural grasses that include a seed mix approved by NMED. [20.6.2.3107A(11) NMAC]

Salt Piles and Salt Storage Area

20. Upon cessation of operation, all mined salt at the WIPP facility shall be removed from the site. The DOE is permitted to use the mined salt as backfill in shafts and as interior fill material in berms and permanent markers after closure. All mined salt remaining after backfilling and after construction of surface structures shall be removed from the site. The DOE shall submit a plan and schedule for salt tailings removal to NMED for approval within 120 days prior to the facility closure. The WIPP Land Management Plan reflects the Land Withdrawal Act's requirements for disposition of the salt. Section I-1d of the WIPP's Hazardous Waste Facility permit also addresses closure activities that include closure of the salt storage areas in accordance with the provisions of the WIPP Land Management Plan. The salt storage area will be reclaimed in the manner described in these documents. [20.6.2.3107A(11) NMAC]

Post-closure Monitoring

21. The DOE shall continue ground water monitoring in all wells covered under DP-831 as described in Condition 10 of this Permit Renewal and Modification for two years after the closure activities described in Conditions 18 and 19 are completed to confirm the absence of ground water contamination. If monitoring results show that the ground water standards in Section 20.6.2.3103 NMAC are being exceeded, the DOE shall implement the contingency plan described in Condition 15 of this Discharge Permit Renewal and Modification. Following notification from NMED that post-closure monitoring may cease, the DOE shall submit a plan to plug and abandon specified monitoring wells not needed for long-term monitoring. Upon NMED approval, the DOE shall plug and abandon the wells in accordance with *NMED Guidelines for Monitoring Well Construction and Abandonment* (copy enclosed) or alternative methods approved by NMED. When all post-closure requirements have been met, the DOE may request to terminate the discharge permit. [20.6.2.3107A(11) NMAC]

IV. GENERAL TERMS AND CONDITIONS

The DOE shall comply with the following general conditions, which shall be enforceable by NMED.

Record Keeping

22. The DOE shall maintain at its facility a written record (unalterable electronic images maintained electronically and available at the site constitutes a written record) of all data and information on monitoring of ground water, surface water, and seepage pursuant to this Discharge Permit Renewal and Modification including the following. [20.6.2.3107A NMAC]

    a. The date, exact time, and exact location of each sample collection or field measurement;

    b. The name of the person who performed each sample collection or field measurement;

    c. The date of the analysis of each sample;

    d. The name and address of the laboratory and the name of the authorized manager or his designee verifying that the laboratory report is complete and accurate.

    e. The analytical technique or method used to analyze each sample or take each field measurement;

    f. The results of each analysis or field measurement, including the raw data; and,

    g. A description of the quality assurance and quality control procedures used.

23. Such data and information as described in Condition 22, shall also be maintained on all split and duplicate samples, spike and blank samples, and repeat samples. [20.6.2.3107A NMAC]

24. The DOE shall maintain a written record of any spills, seeps, or leaks of effluent, leachate or process fluids not authorized by this Discharge Permit Renewal and Modification. [20.6.2.3107A NMAC]

25. The DOE shall maintain a written record of the operation, maintenance and repair of all facilities/equipment used to treat, store, or dispose of wastewater; to measure flow rates; to monitor water quality; or, to collect other data required by this Discharge Permit Renewal and Modification. This record shall include repair, replacement or calibration of any monitoring equipment and repair or replacement of any fixed equipment used in the conveyance of waters covered by this permit. [20.6.2.3107A NMAC]

26. Notwithstanding any company record retention policy to the contrary, until such time as NMED determines that all closure measures have been completed in accordance with the requirements of this Discharge Permit Renewal and Modification, the DOE shall retain copies of all data, records, reports, and other documents generated pursuant to this Discharge Permit. Such record retention period may be increased by the NMED at any time upon written notice to the DOE. [20.6.2.3107A NMAC]

27. All such data, records, reports, and other documents generated pursuant to this Discharge Permit Renewal and Modification, shall be provided to the NMED upon request. [20.6.2.3107A NMAC]

Inspection and Entry

28. The DOE shall allow the Secretary or an authorized representative of NMED, upon the presentation of credentials, to conduct the following actions. [20.6.2.3107D NMAC] [74-6-9.B & E WQA]

    a. Enter at reasonable times upon or through any property or premises owned or controlled by the DOE or at any other location where records are kept under the conditions of this Discharge or any Federal or WQCC regulation.

    b. Inspect and copy, at reasonable times, records required to be kept under the conditions of this Discharge Permit Renewal and Modification or pursuant to State or Federal water quality regulations.

    c. Inspect any facility, equipment (including monitoring and control equipment for treatment works), practices or operations regulated or required under this Discharge Permit Renewal and Modification or under any Federal or WQCC regulations.

    d. Sample or monitor at reasonable times for the purpose of assuring compliance with this Discharge Permit Renewal and Modification or as otherwise authorized by the New Mexico Water Quality Act, any effluent, water contaminant, or receiving water at any location before or after the discharge.

29. Nothing in this Discharge Permit Renewal and Modification shall be construed as limiting in any way the inspection and entry authority of the NMED under the WQA, the WQCC Regulations, or any other applicable law or regulation. [20.6.2.3107 NMAC]

Duty to Provide Information

30. Within a reasonable time after a request from the NMED, which time may be specified by the NMED, the DOE shall provide the NMED with any relevant information to determine whether cause exists for modifying, terminating, or renewing this Discharge Permit Renewal and Modification, or to determine whether the DOE is in compliance with this Discharge Permit Renewal and Modification. [20.6.2.3107D NMAC][74-6-9.B & E WQA]

31. Nothing in this Discharge Permit Renewal and Modification shall be construed as limiting in any way the information gathering authority of NMED under the WQA, the WQCC Regulations, or any other applicable law or regulation. [20.6.2.3107D NMAC][74-6-9.B & E WQA]

Spills, Leaks and Other Unauthorized Discharges

32. This Discharge Permit Renewal and Modification authorizes only those discharges specified herein. Any discharge not authorized by this Discharge Permit Renewal and Modification is a violation of the WQCC Regulations at 20.6.2.3104 NMAC. The DOE must report any such discharge to the NMED, and take corrective action to contain and remove or mitigate the damage caused by the discharge. [20.6.2.1203 NMAC]

Modifications and Amendments

33. The DOE shall notify the NMED of any changes to its wastewater collection or disposal system, including any changes in the wastewater flow rate or the volume of wastewater storage, or of any other changes to its mining operations or processes that would result in any significant change in the discharge of water contaminants. The DOE shall obtain the NMED approval, as a modification to this Discharge Permit Renewal and Modification pursuant to section 20.6.2.3109.E, F, or G NMAC, prior to any increase in the quantity of a discharge, or any increase in the concentration of water contaminants discharged, above those levels approved in this Discharge Permit Renewal and Modification. [20.6.2.3107C NMAC]

Enforcement

34. Any violation of the requirements and conditions of this Discharge Permit Renewal and Modification, including any failure or refusal to allow the NMED to enter and inspect records or facilities, or any refusal or failure to provide the NMED with records or information, may subject the DOE to an enforcement action. Pursuant to WQA § 74-6-10(A) and (B), such action may include a compliance order requiring compliance immediately or in a specified time, assessing a civil penalty, suspending or terminating the Discharge Permit Renewal and Modification, or any combination of the foregoing; or an action in district court seeking injunctive relief, civil penalties, or both. Pursuant to the WQA §§ 74-6-10(C) and 74-6-10.1, civil penalties of up to $15,000 per day of noncompliance may be assessed for each violation of the WQA § 74-6-5, the WQCC regulations, or this Discharge Permit Renewal and Modification, and civil penalties of up to $10,000 per day of noncompliance may be assessed for each violation of any other provision of the WQA, or any regulation standard, or order adopted pursuant to such other provision. For certain violations specified in the WQA § 74-6-10.2, criminal penalties may also apply. In any action to enforce this Discharge Permit Renewal and Modification, the DOE waives any objection to the admissibility as evidence of any data generated pursuant to this Discharge Permit Renewal and Modification. The DOE does not waive any argument as to the weight such evidence should be given. [74-6 WQA]

Compliance with Other Laws

35. Nothing in this Discharge Permit Renewal and Modification shall be construed in any way as relieving the DOE of its obligation to comply with all applicable Federal, State, and local laws, regulations, permits, or orders. The DOE does not waive any rights under such

applicable federal, state and local laws, regulations, permits, or orders except as expressly provided in this Discharge Permit Renewal and Modification. [20.6.2 NMAC]

Liability

36. The approval of this Discharge Permit Renewal and Modification does not relieve the DOE of liability should the operation result in actual pollution of surface or ground water which may be actionable under other laws and/or regulations. [20.6.2.3109 NMAC]

Right to Appeal

37. The DOE may file a petition for a hearing before the WQCC on this Discharge Permit Renewal and Modification. Such petition must be made in writing to the WQCC within thirty (30) days after the DOE receives this Discharge Permit Renewal and Modification. Unless a timely petition for a hearing is made, the decision of NMED shall be final. [74-6-5.N WQA]

Transfer

38. Prior to any transfer of ownership, control, or possession of the WIPP facility or any portion thereof, the DOE shall notify the proposed transferee in writing of the existence of this Discharge Permit Renewal and Modification and include a copy of this Permit Renewal and Modification with the notice. The DOE shall deliver or send by certified mail to the NMED a copy of the notification and proof that such notification has been received by the proposed transferee. [20.6.2.3111 NMAC]

Term

The effective date of this Discharge Permit Renewal and Modification is the date it is issued and signed by the Chief of the Ground Water Quality Bureau. The term of this Discharge Permit Renewal and Modification expires five (5) years from the date it was issued. To renew this Discharge Permit Renewal and Modification, the DOE must submit an application for renewal at least 120 days before the expiration date. [74-6-5.H WQA][20.6.2.3109.H NMAC]

Issued this 9th day of Sept, 2008

Subject: Environment Department Approves Renewal of WIPP Groundwater Discharge Permit

September 9, 2008 Contact: Marissa Stone, NMED Communications Director
For Immediate Release (505) 827-0314 or (505) 231-0475

Environment Department Approves Renewal of WIPP Groundwater Discharge Permit

(Santa Fe, NM) – The New Mexico Environment Department today approved a five-year groundwater discharge permit renewal and modification for the U.S. Department of Energy's Waste Isolation Pilot Plant east of Carlsbad.

The permit, which will be valid until 2013, allows for the discharge of sewage effluent, impacted storm water and nonhazardous wastewaters from the facility to synthetically lined impoundments.

"The permit renewal reflects the continuing efforts between us, DOE and WIPP to protect the environment," said New Mexico Environment Department Secretary Ron Curry. "We are confident this is a strong permit that will protect residents and the area's natural resources."

The department did not receive requests from citizens for a public hearing on the permit.

The permit will allow for the discharge of up to 23,000 gallons per day (gpd) of sewage effluent, up to 150,000 gpd of brine, purge waters and miscellaneous non-hazardous wastewaters. In addition, it will allow for a designed flow of 4,224,835 gpd of storm water runoff from salt storage areas based on a 24-hour, 25-year storm event. Modifications to the discharge permit primarily include changes in some of the monitoring requirements and increases in allowable discharge volumes to some of the synthetically lined impoundments. The depth to groundwater at the facility is about 164 feet and has a total dissolved solids concentration of approximately 3,400 milligrams per liter.

The Environment Department first approved a groundwater discharge permit for WIPP in January 16, 1992.

The permit imposes New Mexico Water Quality Act and Water Quality Control Commission Regulations to control the discharge of water contaminants from WIPP to protect groundwater and surface water.

WIPP, a hazardous and radioactive waste disposal facility operated by DOE, lies in a bedded salt formation 2,150 feet

Notice is hereby given pursuant to 20.6.2.3108.G NMAC, the following Ground Water Discharge Permit applications have been proposed for approval. To request additional information or to obtain a copy of a draft permit, contact the Ground Water Quality Bureau in Santa Fe at (505) 827-2900. Draft permits may also be viewed on-line at http://www.nmenv.state.nm.us/gwb/New_Pages/public_notice.htm

NOTE – If viewing by WEB - Click on facility name to review a copy of the draft permit.

1329	Bernalillo County Metropolitan Detention Center Douglas Dailey, Manager Water-Reclamation Division Albuquerque/Bernalillo County Water Utility Authority 4201 2nd St., SW Albuquerque, NM 87105	Albuquerque	Bernalillo	Bernalillo County Metropolitan Detention Center, Douglas Dailey, Water Reclamation Division Manager, proposes to renew the Discharge Permit for the discharge of up to 212,600 gallons per day of domestic wastewater from a correctional facility to an aerated lagoon system managed as a sequence batch reactor (SBR) system. Reclaimed wastewater from the SBR system is discharged to a 23 acre land application area, used for dust control and construction purposes at the Cerro Colorado Landfill, and applied by drip-irrigation to approximately 1 acre of landscaping. Potential contaminants associated with this type of discharge include nitrogen compounds. The facility is located at 5800 Shelly Rd SW, Albuquerque, in Sections 17 and 18, T09N, R01E, Bernalillo County. Ground water beneath the site is at a depth of approximately 855 feet and has a total dissolved solids concentration of approximately 850 milligrams per liter.	Naomi Davidson
759	Village of Hatch-Sludge Drying Beds Judd L. Nordyke Mayor Village of Willard P.O. Box 220 Hatch, NM 87937	Hatch	Dona Ana	Village of Hatch-Sludge Drying Beds, Honorable Judd L. Nordyke, Mayor, proposes to renew the Discharge Permit for the discharge of up to 1,000 gallons per day of sludge from the Village of Hatch Wastewater Treatment Facility. Sludge is removed from the wastewater treatment plant and discharged to 6 concrete-lined drying beds. Potential contaminants associated with this type of discharge include nitrogen compounds. The facility is located at 1101 East Herrera Road, in Hatch, in Section 10, T19S, R03W, Doña Ana County. Ground water beneath the site is at a depth of approximately 6 feet and has a total dissolved solids concentration of approximately 300 milligrams per liter.	Gerald Knutson
831	U.S. Department of	Carlsbad	Eddy	U.S. Department of Energy, Waste Isolation Pilot Plant,	Clint Marshall

	Energy, Waste Isolation Pilot Plant David C. Moody, Manager U.S. Dept. of Energy Carlsbad Field Office PO Box 3090 Carlsbad, NM 88221			Dave Moody, Manager, proposes to renew and modify the Discharge Permit, which presently allows for the discharge of up to 23,000 gallons per day (gpd) of sewage effluent, up to 150,000 gpd of brine, purge waters and miscellaneous non-hazardous wastewaters, and a designed flow of 4,224,835 gpd of storm water runoff from salt storage areas based on a 24-hour, 25-year storm event (3.90 inches). The facility is located approximately 26 miles east of Carlsbad, New Mexico, in Sections 20, 21, 28 and 29, T22S, R31E, Eddy County. Depth to ground water in the area of the facility is approximately 164 feet and has a total dissolved solids concentration of approximately 3,400 milligrams per liter.	
1056	Cobre Mining Company-Continental Mine James E. Humphrey Manager Cobre Mining Co. P.O. Box 7 Hurley, NM 88043	Hanover	Grant	Cobre Mining Company-Continental Mine, James E. Humphrey, Manager, proposes to renew and modify the discharge permit for the discharge of up to 17,280,000 gallons per day of leach solution to the Fierro and/or Humbolt Leach Stockpiles via a network of pipelines from the raffinate pond at the Continental SX/EW Plant or from the Chino Mine raffinate tank. Other facilities covered under this Discharge Permit include the Hanover Mountain Mine, No. 3 Shaft Stockpile, the North Overburden Stockpile, and pipelines to and from the Chino SX/EW Plant. Copper ore will be placed on synthetically-lined pads and leached with an acidic solution with an approximate pH of 2. The pregnant leach solution (PLS) will be collected at each stockpile in a synthetically double-lined pond with a leak detection system. Up to 12,000 gallons per minute of PLS may be pumped through pipelines to the Continental Mine SX/EW Plant or Chino Mine SX/EW Plant (DP-591). The copper will be removed from the leach solution at the SX/EW plant, and the barren leach solution will be discharged to a synthetically double-lined raffinate pond with a leak detection system. Sulfuric acid will be added to the barren leach solution in the raffinate pond, and the raffinate will be pumped through pipelines to the top of the leach stockpiles. The Fierro and Humbolt Leach Ore Stockpiles will receive ore from the Hanover Mountain Mine and/or the Continental Open Pit. The North Overburden Stockpile and the South Waste Rock Facility (permitted under DP-181) may receive waste rock from the Hanover	Kurt Vollbrecht

				Mountain Mine. The Continental Mine facility is located approximately 1/2 mile west of Fierro, 4 miles north of Hanover in Sections 3, 4, 5, 8, 9, 10, 15, 16, 17, 20, 21, 31, and 32, T17S, R12W in Grant County. The depth to ground water below the site ranges from approximately 1 to 200 feet and has a TDS concentration range of 350 to 1,400 milligrams per liter (mg/L).	
1612	City of Eunice-Wastewater Treatment Facility Johnnie M. White Mayor City of Eunice P.O. Box 147 Eunice, NM 88231	Eunice	Lea	City of Eunice-Wastewater Treatment Facility, Honorable Johnnie M. White, Mayor, proposes to discharge up to 400,000 gallons per day of municipal wastewater. Wastewater is presently treated by an Imhoff Tank and trickling filter. Wastewater will be treated in a newly constructed synthetically lined lagoon treatment system by 2010. Treated wastewater is stored and land applied to 80 acres and/or used for oil well drilling operations. Potential contaminants associated with this type of discharge include nitrogen compounds. The facility is located at approximately 0.7 miles east of the intersection of Highway 8 and Highway 207 in Eunice, in Section 27, T21S, R37E, Lea County. Ground water beneath the site is at a depth of approximately 76 feet and has a total dissolved solids concentration of approximately 1950 milligrams per liter.	Gerald Knutson
431	Sun Foundation Wastewater Treatment Plant Neal Pace, President City of the Sun Foundation PO Box 370 Columbus, NM 88029	Columbus	Luna	Sun Foundation Wastewater Treatment Plant, Neal Pace, President, proposes to renew and modify the Discharge Permit for the discharge of up to 6,000 gallons per day (gpd) of domestic wastewater from an unincorporated community to a clay lined evaporation lagoon. The modification consists of an increase in the discharge volume from 4,000 gpd to 6,000 gpd. Potential contaminants associated with this type of discharge include nitrogen compounds. The facility is located at Hwy 11 at Altura Street, just north of Columbus, in Section 27, T28S, R08W, Luna County. Ground water beneath the site is at a depth of approximately 200 feet and has a total dissolved solids concentration of approximately 300 milligrams per liter.	Naomi Davidson
615	Cyprus Pinos Altos Corporation-Deming Tailing Impoundment	Deming	Luna	Cyprus Pinos Altos Corporation-Deming Tailing Impoundment, James E. Humphrey, Manager, proposes to renew the discharge permit for closure and post-closure	Kurt Vollbrecht

	James E. Humphrey Cyprus Pinos Altos Corp. P.O. Box 7 Hurley, NM 88043			monitoring of the Deming Tailing Impoundment. There is currently no mining, milling or tailings discharge associated with present operation and no tailings discharge is authorized by this Discharge Permit. The Deming Tailing Impoundment is located in Deming in Sections 20 and 21, T23S, R9W, Luna County. The depth to ground water below the site is approximately 100 feet and has a total dissolved solids concentration of approximately 420 milligrams per liter.	
1234	Deming Jigging Plant, American Minerals, Inc., Paul V. Hall, Manager American Minerals, Inc. P.O. Box 37 Andersonville,GA. 31711	Deming	Luna	Deming Jigging Plant, American Minerals, Inc., Paul V. Hall, Manager, proposes to renew and modify the discharge permit for closure and post-closure monitoring and maintenance of the former AMI Deming Jigging Plant Site (AMI Site). The AMI Site was reclaimed in the fall of 2005. There is currently no mining, milling or tailings discharge associated with present operation and no tailings discharge is authorized by the Discharge Permit. The AMI Site is located east of Deming in Section 25, T23N, R9W in Luna County. Ground water below the site is at a depth of 74 feet and has a total dissolved solids concentration of 375 milligrams per liter.	Kurt Vollbrecht
1156	Christ Community Church Jack Brock, Pastor Christ Community Church P.O. Box 2975 Alamogordo, NM 88311	Alamogordo	Otero	Christ Community Church, Jack Brock, Pastor, proposes to renew the Discharge Permit for the discharge of up to 6,000 gallons per day of domestic wastewater. Wastewater from the church is discharged to 2 septic tank systems followed by a leachbed. Potential contaminants associated with this type of discharge include nitrogen compounds. The facility is located at 2960 North Scenic Drive in Alamogordo, in Section 5, T16S, R10E, Otero County. Ground water beneath the site is at a depth of approximately 270 feet and has a total dissolved solids concentration of approximately 1,750 milligrams per liter.	Gerald Knutson
1516	Stuckey's #112 Steve Kirkley, Director Store Operations Pecan Shoppe of Tucumcari, Inc. PO Box 4009	Tucumcari	Quay	Stuckey's #112, Steve Kirkley, Director of Store Operations, proposes to modify the Discharge Permit for the discharge of up to 2,150 gallons per day of wastewater from a restaurant and convenience store to an evaporative lagoon system that is preceded by a grease interceptor and two septic tanks in parallel. The modification consists of an increase in the discharge volume from 2,000 gpd to 2,150	Kathie Deal

	Eastman, GA 31023			gpd and the installation of a synthetically lined evaporative lagoon to replace the leachfields to address exceedance of ground water quality standards. Potential contaminants associated with this type of discharge include nitrogen compounds. The facility is located at Exit 321 off of Interstate 40, approximately 8 miles west of Tucumcari in Section 5, T10N, R29E, Quay County. Ground water beneath the site is at a depth of approximately 100 feet and has a total dissolved solids concentration of approximately 540 milligrams per liter	
1359	Rio Arriba Rural Events Center Phillip Morfin Administrator Grants & Contracts Rio Arriba County 1122 Industrial Park Espanola, NM 87532	Abiquiu	Rio Arriba	Rio Arriba Rural Events Center, Phillip Morfin, Grants and Contracts Administrator, Rio Arriba County, proposes to renew the Discharge Permit for the treatment of up to 6,000 gallons per day of wastewater in a treatment system consisting of two septic tanks in series, two BioMicrobics 3.0 Fixed Activated Sludge Treatment (FAST) systems in series, a holding tank and a final effluent tank. The treated wastewater is discharged to a 24,000 ft^2 subsurface irrigation system. Potential contaminants associated with this type of discharge include nitrogen compounds. The facility is located on SR 554 House 122A, approximately four miles east of Abiquiu, in the Lobato Land Grant, Section 18, Township 23N, Range 07E (projected), Rio Arriba County. Ground water beneath the site is at a depth of approximately 476 feet and has a total dissolved solids concentration of approximately 894 milligrams per liter.	Kathie Deal
419	Chaco Culture National Historical Park Barbara West Superintendent Chaco Culture National Historical Park P.O. Box 220 Nageezi, NM 87037	Chaco Canyon	San Juan	Chaco Culture National Historical Park, Department of Interior, National Park Service, proposes to renew and modify the Discharge Permit for the discharge of up to 19,500 gallons per day of domestic wastewater from various sites located throughout the park and reverse osmosis reject water. Domestic wastewater and reverse osmosis reject water is pumped through three lift stations and discharged to three synthetically lined lagoons, designed in series, for disposal by evaporation. The modifications consist of increasing the volume of wastewater discharged from 17,000 to 19,500 gallons per day, discontinuing the use of two leachfields and adding one additional lift station. Potential contaminants associated with this type of discharge include nitrogen	Melanie Sanchez

				compounds. The facility is located at 1808 West County Road 7950, Chaco Canyon, in Section 21, T21N, R10W, San Juan County. Ground water beneath the site is at a depth of approximately 81 feet and has a total dissolved solids concentration of approximately 1,410 milligrams per liter.	
494	City of Las Vegas-Sludge Disposal Facility John Avila, City Manager City of Las Vegas PO Box 160 Las Vegas, NM 87701	Las Vegas	San Miguel	City of Las Vegas-Sludge Disposal Facility, John Avila, City Manager, proposes to renew the Discharge Permit for the discharge of municipal biosolids (sludge). Up to 15,900 gallons per day of aerobically digested sludge from the City of Las Vegas Wastewater Treatment Facility (WWTF) is disposed to 400 acres of rangeland. Sludge is transported to the City of Las Vegas Sludge Disposal Facility by tanker truck and disposed of by subsurface injection in accordance with 40 CFR Part 503 to 400 acres of rangeland. Potential contaminants associated with this type of discharge include nitrogen compounds, metals and organic compounds. The facility is located approximately 10 miles northeast of Las Vegas, in Section 32, T17N, R17E, San Miguel County. Ground water most likely to be affected is at a depth of approximately 30 feet and has a total dissolved solids concentration of approximately 900 milligrams per liter.	Steven Pedro
399	Bowlin's Flying C Ranch Kit Johnson, Director Travel Center Operations Bowlin Travel Centers, Inc. 150 Louisiana Blvd., NE Albuquerque, NM 87108	Clines Corners	Torrance	Bowlin's Flying C Ranch, Kit Johnson, Director of Travel Center Operations, proposes to renew the Discharge Permit for the discharge of up to 5,000 gallons per day of domestic wastewater to three evaporative lagoons in series for disposal. Potential contaminants associated with this type of discharge include nitrogen compounds. The facility is located approximately 18 miles east of Clines Corners, in Section 20, T9N, R15E, Torrance County. Ground water beneath the site is at a depth of approximately 810 feet and has a total dissolved solids concentration of approximately 4000 milligrams per liter.	Sara Arthur

Prior to ruling on any proposed Discharge Permit or its modification, the New Mexico Environment Department (NMED) will allow thirty days after the date of publication of this notice to receive written comments and during which a public hearing may be requested by any interested person, including the applicant. Requests for public hearing shall be in writing and shall set forth the reasons why the hearing should be held. A hearing will be held if NMED determines that there is substantial public interest. Comments or requests for hearing should be submitted to the Ground Water Quality Bureau at PO Box 26110, Santa Fe, NM 87502.

Subject: Information Requested Concerning Areas Regulated Under the DP-831 Permit

Dear Mr. Bearzi:

The purpose of this letter is to transmit compact disk documents containing the reports discussed with Mr. Clint Marshall on June 12, 2008. Mr. Marshall requested the documents after inspecting the areas regulated under the Discharge Permit 831.

If you have any questions about these documents or require any additional information, please contact me at (575) 234-7462.

Sincerely,

H. L. "Jody" Plum
RCRA Program Manager

Inspection Report
Ground Water Quality Bureau

Start Date: 06/12/2008 08:30 AM **End Date:** 06/12/2008 12:00 PM

Facility Information
Facility Name: Waste Isolation Pilot Plant, DP-831
Contact: Jody Plum
Type of Operation: Federal Agency
Location: Carlsbad

Inspector(s): Clint Marshall, Kurt Vollbrecht

Inspection Summary
Purpose: Compliance

Activities
Samples Taken: No

Observations and Information Obtained
Surface impoundments and salt piles where inspected prior to the renewal of DP-831.

Storm Water Pond A – Pond is nearly empty. Plants growing in sediment on top of synthetic liner.

Salt Pile Evaporation Pond – Pond is dry, but full of sediment that has eroded from the earthen cover of the salt pile.

Salt Pile – There are numerous rills in the side slopes of the earthen cover. Vegetation is sparse. Wind blown sand has piled up on the east side of the pile. On top is is obvious that storm water runoff is not being properly controlled, causing the rilling and washouts on the side slopes.

Salt Storage Extension Cells A and B – Cell A is completely full. Cell B is partially full. There is a lot of drift sand in Cell B.

Salt Storage Extension Basin – The basin is full of salt water which is obviously evaporating fast enough. This leaves little capacity for additional storm water runoff which will likely occur during summer monsoon rains. There is evidence of wave action erosion of the edge of the salt pile in SSE Cell A.

Storm Water Ponds 1 and 2 – Both ponds appear in good condition with about one foot of water in each.

SPDV Pile – Vegetation is moderately robust with only minimal signs of erosion. The pile has rounded crown and rock armouring is present on the side slopes.

H-19 Pond – Salt crust in bottom. Liner appears to be in good condition.

Facultative (sewage) Lagoons – Settling and polishing ponds have new 60 mil HDPE liners. Evaporation Ponds A, B and C are being evaluated for repair or replacement this year. Only south train is being used at this time.

NMED staff also inspected a water line break on the south side of the facility. The leak occurred due to corrosion in a pipeline leading from the fire water tank to the main building. During the inspection, NMED staff also noticed another, apparently separate area of pooled water at a pipeline junction to the south of the location where the primary pipeline leak occurred. WIPP staff could not clearly account for the second area of pooled water, but assured NMED staff that they would investigate.

Action Required

A new grading plan is needed for the top of the salt pile to divert storm water more efficiently and with less erosion to the side slopes. A plan is needed for maintaining more freeboard in the Salt Storage Extension Basin. The staff gauge needs to be replaced due to salt encrustation.

Subject: Transmittal of Information Requested in a Letter Dated January 18, 2008 (Received January 22, 2008)

Dear Mr. Bearzi:

The purpose of this letter is to transmit to the Hazardous Waste Bureau the documentation requested in the subject letter relative to the discharge of approximately 150 gallons of brine water from the Exhaust Shaft Intercept Borehole Water collection system into the H-19 Evaporation Pond.

The Department of Energy (DOE) and Washington TRU Solutions LLC (WTS) appreciate this opportunity to provide the New Mexico Environment Department the documentation requested and allow your agency to review our in-depth critique of the actions that led to this incident. DOE and WTS promptly reported this issue and implemented corrective measures, including sampling the liquid and sediments from the H-19 Evaporation Pond. These actions were taken to correct brine water disposal operations and to ensure there was no negative impact to human health and the environment.

Compliance with waste management requirements is taken very seriously by DOE and WTS and every effort has and will continue to be expended to ensure the Waste Isolation Pilot Plant Facility remains in compliance in all areas. Extensive corrective measures have been identified and are being tracked through completion.

The attached documentation has been assembled to correspond to the eight sections of requested information, as noted in the request for information letter sent by your office.

If you have further questions or need additional information, please contact Mr. Jody Plum at (575) 234-7462.

Sincerely,

David C. Moody

Basic Data Report for Piezometers PZ-13, PZ-14, and PZ-15 and Shallow Subsurface Water

U.S. Department of Energy

Revision 1

April 2008

This document supersedes DOE/WIPP-08-3375.

This document has been submitted as required to:

Office of Scientific and Technical Information
P.O. Box 62
Oak Ridge, TN 37831
(865) 576-8401

Additional information about this document may be obtained by calling the WIPP Information Center at 1-800-336-9477. Copies may be obtained by contacting the National Technical Information Service, U.S. Department of Commerce, 5285 Port Royal Road, Springfield, VA 22101.

ABSTRACT

The Site and Preliminary Design Validation (SPDV) pile is located in the southwest corner of Section 21, Township 22 South, Range 31 East in Eddy County, New Mexico, adjacent to the Waste Isolation Pilot Plant (WIPP) operational area. During August 2007, piezometers (PZ)-13, PZ-14, and PZ-15 were drilled around the SPDV pile to determine if shallow subsurface water (SSW) existed around the SPDV pile and, if so, provide a means to monitor. These piezometers were drilled with a combination of hollow-stem auger and air-assisted hollow-stem auger drilling. Below the surficial dunes and Berino soil, piezometers PZ-13 and PZ-14 encountered in order, from shallowest to deepest, the Mescalero caliche, Gatuña Formation, Santa Rosa Formation, and Dewey Lake Formation. Piezometer PZ-15 was completed in the Gatuña Formation, having not encountered the lower formations by the time SSW was detected.

Water was encountered in all wells. Piezometers were constructed of 2-inch polyvinyl chloride casing and 15 feet of 0.020-inch slot screen. Water samples were obtained and analyzed for each well. Based on the results of the installation of the piezometers, analysis of water levels, and geological analysis, it is concluded that the water levels identified in PZ-13 and PZ-14 are the result of the SPDV pile runoff or infiltration prior to being lined. Water in PZ-15 is much shallower and chemically different that water in the other two wells, indicating another source, such as recharge and infiltration from the east of the SPDV pile.

1.0 INTRODUCTION

The Site and Preliminary Design Validation (SPDV) pile is located in the southwest corner of Section 21, Township 22 South, Range 31 East, Eddy County, New Mexico, adjacent to the Waste Isolation Pilot Plant (WIPP) operational area (Figure 1-1). Piezometers PZ-13, PZ-14, and PZ-15 are located around the SPDV pile as indicated in Figure 1-2. These piezometers were drilled to determine if shallow subsurface water (SSW) existed around the SPDV pile and, if so, to provide a means to monitor the water level and quality.

Most drillholes near WIPP have been described after completion to provide an account of the geology, hydrology, or other basic data acquired during drilling and immediate completion of the drillhole. This basic data report provides details and descriptions of the drilling procedures and activities utilized during the installation of PZ-13, PZ-14, and PZ-15 that may be helpful to later interpretations of data or for further work in the drillhole, such as test activities and plugging and abandonment.

1.1 Purpose of WIPP and the SPDV Pile

WIPP is a transuranic mixed waste disposal facility operated by the U.S. Department of Energy (DOE). WIPP waste is disposed in the Salado Formation, a bedded salt deposit, 2,150 feet below ground surface (bgs). Salt and other mined rock materials from the construction of WIPP and currently mined salt are stored on the surface in three stockpiles. The stockpiles include, from oldest to newest, the SPDV pile closed in 2000 with an engineered cover; the salt storage area (SSA), which was used previously for mined salt and materials, but recently covered with a synthetic and earthen liner, and the Salt Storage Extension (SSE) for currently mined salt. The focus of this investigation was the SPDV pile.

The SPDV pile was created during the WIPP design validation phase for placement of construction materials resulting from drilling of two 2,150-foot shafts and the underground excavation of connecting tunnels, exploratory tunnels, and four rooms. The materials in the SPDV pile include mined tailings interspersed with soil, rock, and debris from the construction of the shafts. The SPDV pile encompasses approximately 168,000 cubic yards, which includes an area beneath the pile where soil was excavated prior to tailings placement.

The SPDV pile was characterized in 1995 by Daniel B. Stephens and Associates to determine the chemical nature of wastes within the pile and to support selection of reclamation alternatives (Daniel B. Stephens and Associates, Inc., 1996). The investigation determined that no remedial measures were required according to New Mexico Environment Department (NMED) guidelines. As a result of the study, stabilization and reclamation were recommended in order to prevent off-site transport of salt and brine solutions into the surrounding environment, and to blend the salt pile into the surrounding environment. Based on the evaluation, the SPDV pile was formally closed in 2000 by covering it with geosynthetic clay liner installed on 6 inches of bedded material and covered with a minimum of 3 feet of earthen material. The entire SPDV pile was seeded with shallow rooted plants, which have successfully established.

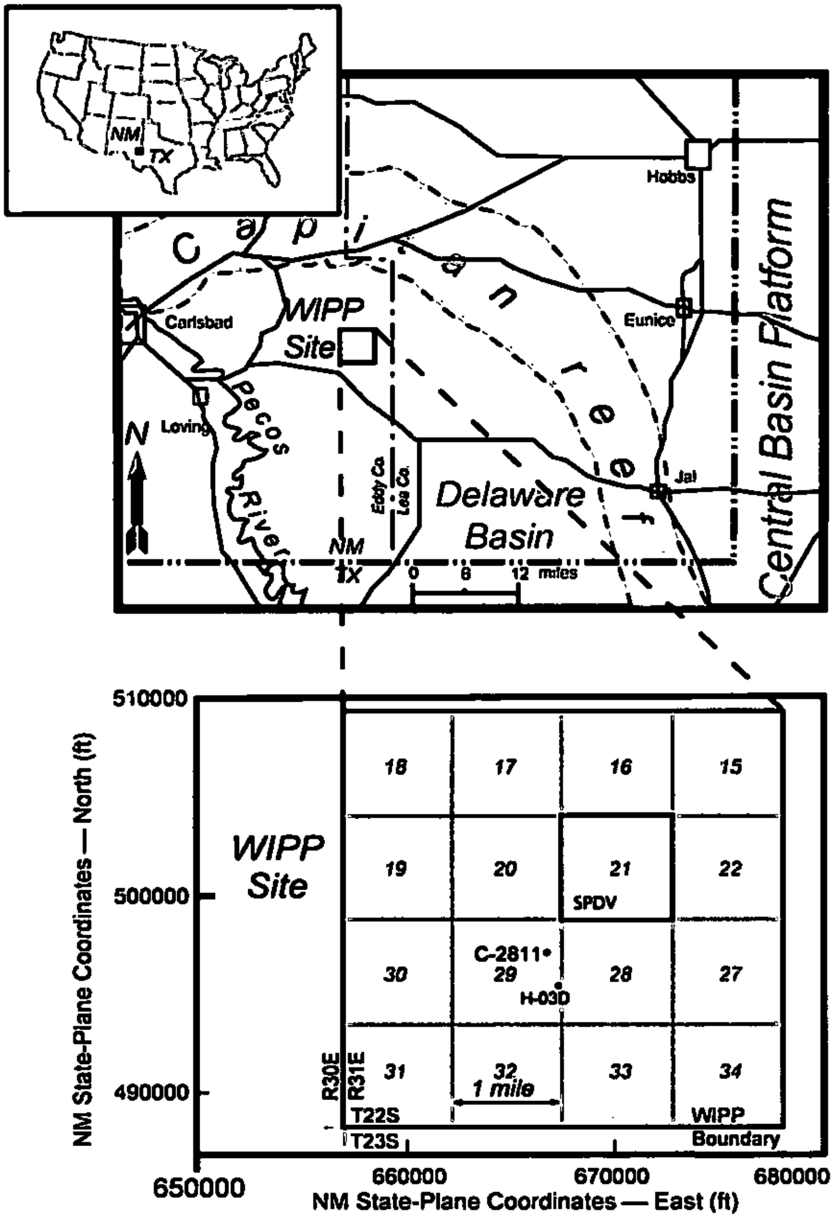

Figure 1-1 - Location Map

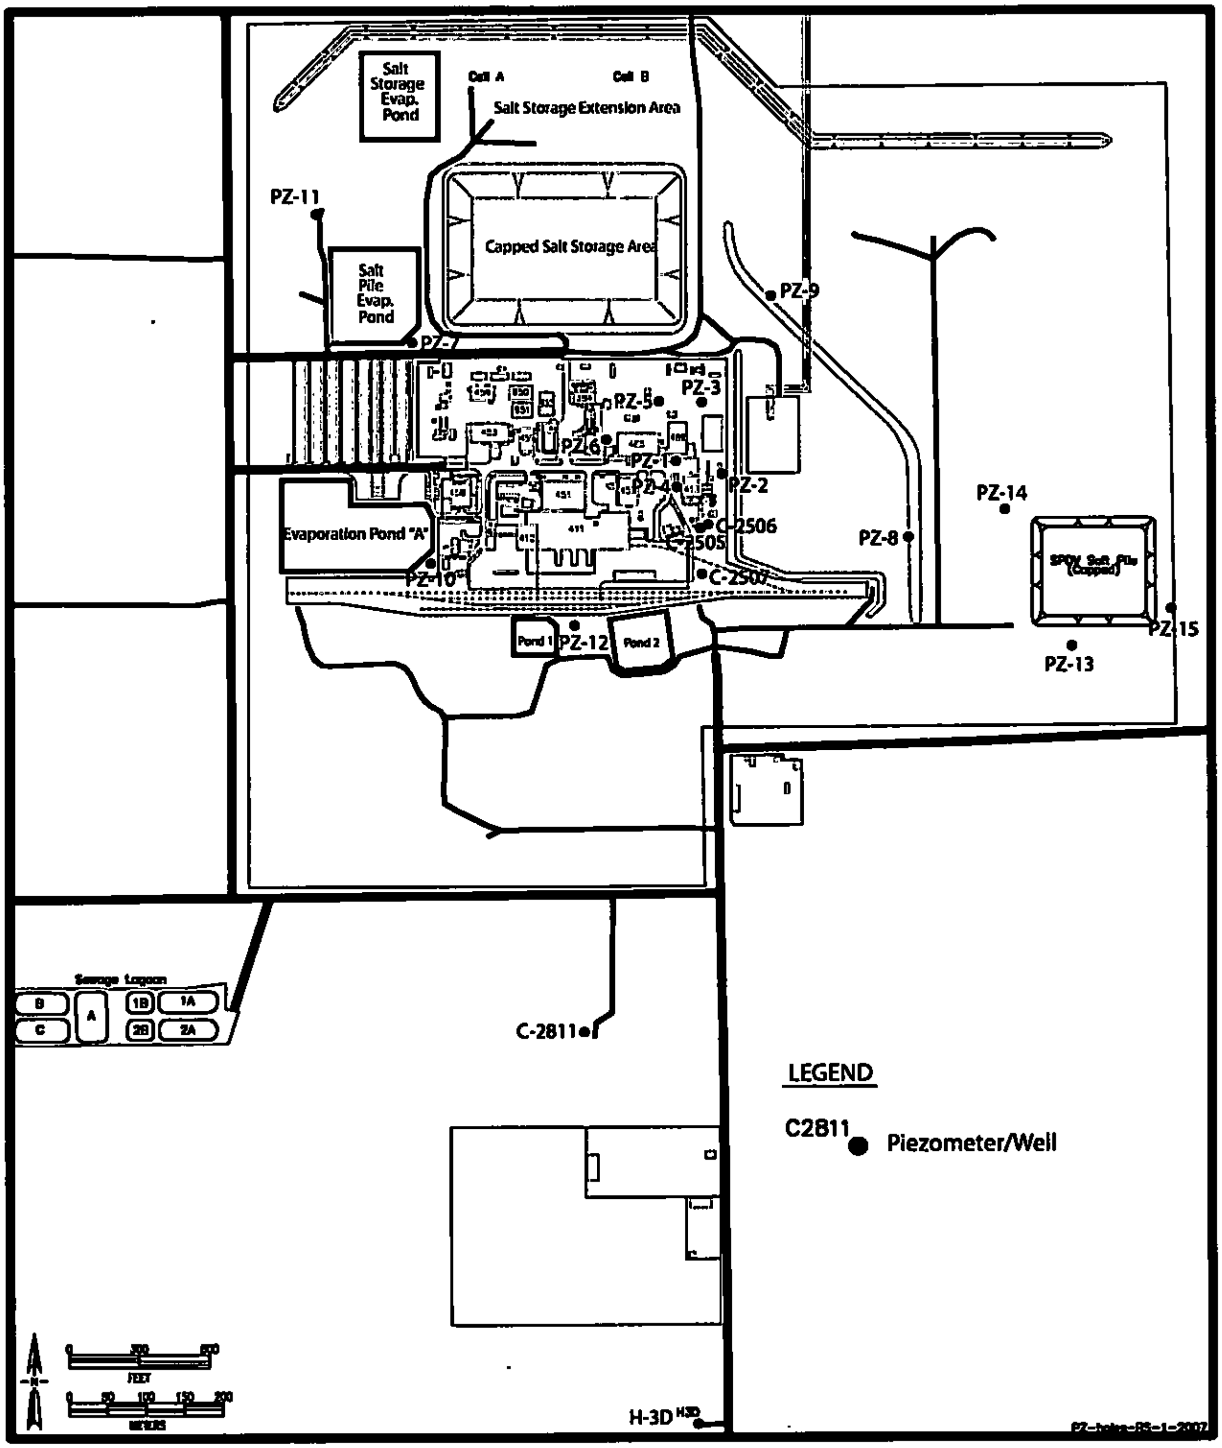

Figure 1-2 - Map of the WIPP Operational Area Showing the Location of Piezometers PZ-13, PZ-14, and PZ-15

01455

1.2 Purpose of PZ-13, PZ-14, and PZ-15

SSW was first detected in 1995 when a video inspection of the Exhaust Shaft detected seepage from about 50 to 80 feet bgs. After 1995, a series of hydrologic assessments were undertaken to identify the source and nature of the SSW at WIPP. Sixteen wells were installed (Figure 1-2) to assess the SSW. It is important to note that the area of interest to this assessment was the exhaust shaft and surface features such as the old salt pile, salt pile evaporation pond, and Ponds 1 and 2. The assessment excluded the SPDV pile. The SSW is a shallow perched water bearing zone that sits on a permeability change at the formational contact between the Santa Rosa Formation and the upper Dewey Lake Formation. The SSW is anthropogenic in nature, resulting from infiltration of precipitation that was captured by unlined ponds and stockpiles (see discharge permit DP-831 for details).

In December 2003, the NMED Ground Water Quality Bureau (GWQB) issued a modified DP-831 requiring that the unlined ponds and stockpiles be lined with a synthetic liner: SSA and Salt Pile Evaporation Pond (SPEP), Ponds 1 and 2, Pond A. Additionally, a new SSE was to be constructed with a synthetically lined base on which infiltration and surface runoff from this pile would be directed to a new evaporation basin. Also included in this modification was the implementation of a monitoring program of the SSW that included quarterly water level measurements from all the SSW wells and semiannual sampling of selected SSW wells for total dissolved solids (TDS), chloride, sulfate, nitrate, chromium, and selenium. This program was implemented in May 2004 and continues to date.

On December 29, 2006, the NMED GWQB issued another DP-831 modification with a condition that the SPDV pile be investigated as a possible source of shallow groundwater. The modification indicated that WIPP should install three monitoring wells adjacent to the SPDV pile. Piezometers PZ-13, PZ-14, and PZ-15 were drilled during August 2007 around the SPDV pile to investigate the possibility of SSW beneath the subsurface.

Prior to this investigation, the only other drilling in the area was by Daniel B. Stephens and Associates (1996) to characterize the content of the SPDV pile, and Sergent, Hauskins & Beckwith (1979), for geotechnical data collection and analysis. No water was detected in either of these investigations. Prior to drilling the SPDV pile piezometers, it was hypothesized that SSW, if present, would be perched on the contact between the Santa Rosa Formation and the Dewey Lake Formation, as it had at locations west of the SPDV pile. The best estimated depth for piezometers PZ-13, PZ-14, and PZ-15 was 60 feet bgs, based on PZ-8, which is located west of the SPDV pile.

This report summarizes the installation of the piezometers around the SPDV pile and correlates the data to the data for the other SSW piezometers around WIPP via interpretation of hydrology and chemistry.

2.0 GEOLOGICAL DATA

2.1 General Geological Background

The geology and hydrology of formations at the WIPP site and the surrounding area have been investigated since 1975, and the information and interpretations have been reported in numerous documents. The most thorough compilation is the Compliance Certification Application (CCA) submitted in 1996 by the DOE to the U.S. Environmental Agency (U.S. DOE, 1996). Some features of the broader geological history are relevant to understanding the geology and hydrology at the location of the SPDV pile and the piezometers associated with this report (Powers,1997).

The Delaware Basin (Figure 1-1) was a large structural feature that controlled deposition through much of the Paleozoic. By late Permian, the basin was restricted, and evaporite minerals dominated. The basin filled with sediments, and it no longer significantly affected sedimentation. Near the end of the Permian, circulation with the ocean improved, and some of the Rustler Formation was deposited in saline water rather than brine. As the Permian ended and Triassic began, continental environments prevailed and significant redbeds, the Dewey Lake Formation (Figure 2-1), were deposited. Although surrounding areas accumulated variable thicknesses of later Mesozoic and Cenozoic age sediments, the WIPP area appears to have mainly been subjected to erosion during an extended period from mid-Mesozoic to mid-Cenozoic (Figure 2-1). Some basin tilting around mid-Cenozoic exposed the evaporite beds to faster solution and erosion, and weathered material accumulated. The Pecos River drainage became integrated through the region during this period, and late Cenozoic deposits reflect this sedimentary environment and sediment sources outside the local area. Although the region is still subject to evaporite dissolution and erosion, large areas have remained geologically stable for about the last half-million years, resulting in the formation and preservation of pedogenic calcrete (Mescalero caliche) deposits (Powers 1997).

Three sources of information contribute to understanding the geology of PZ-13, PZ-14, and PZ-15: (1) the general near surface geology of this area (Powers 1997), (2) drilling and logging of shallow piezometers in the vicinity, and (3) core samples and cuttings collected during drilling. Formation color was determined using Munsell Soil Color Charts, year 2000 revised edition.

These piezometers were drilled by hollow-stem auger with split spoon sampling and air-assisted hollow-stem auger drilling, depending on the formation and consolidation. Contact depths to each formation were predicted prior to drilling based on those identified in piezometers PZ-8 and PZ-9 (Figure 1-2). Actual contact depths ranged from 11 feet deeper to 11 feet shallower than anticipated for any formation compared to these to piezometers (Table 2-1).

2.2 Geological Data From PZ-13

2.2.1 Permo-Triassic Dewey Lake Formation

The Dewey Lake was encountered in PZ-13 from 75 feet deep to total depth (TD) of the piezometer at 77 feet (Figure 2-2). The Dewey Lake in PZ-13 is dominated by dark reddish brown silty mudstone with mottling of red and gray-olive gray mudstone, with greenish gray reduction spots. The formation was platy, reflecting common thin bedding or laminae of the unit, contained some moisture at the Santa Rosa contact, but dried as the drilling proceeded deeper. This indicated that the upper portion of the Dewey Lake was acting as an aquitard, and drilling was stopped. A well was installed at this location and constructed as depicted in Figure 2-2.

The Dewey Lake at PZ-13 was encountered 11 feet deeper in elevation than it was in PZ-8, indicating possible erosion during deposition of the overlying Santa Rosa Formation during predominantly fluvial environments. The Dewey Lake was 3 feet deeper in elevation in PZ-13 than in PZ-9, another previously installed piezometer in the area. It was about 2 feet deeper in elevation than PZ-14 (Section 2.3).

Figure 2-2 - Core Log for PZ-13

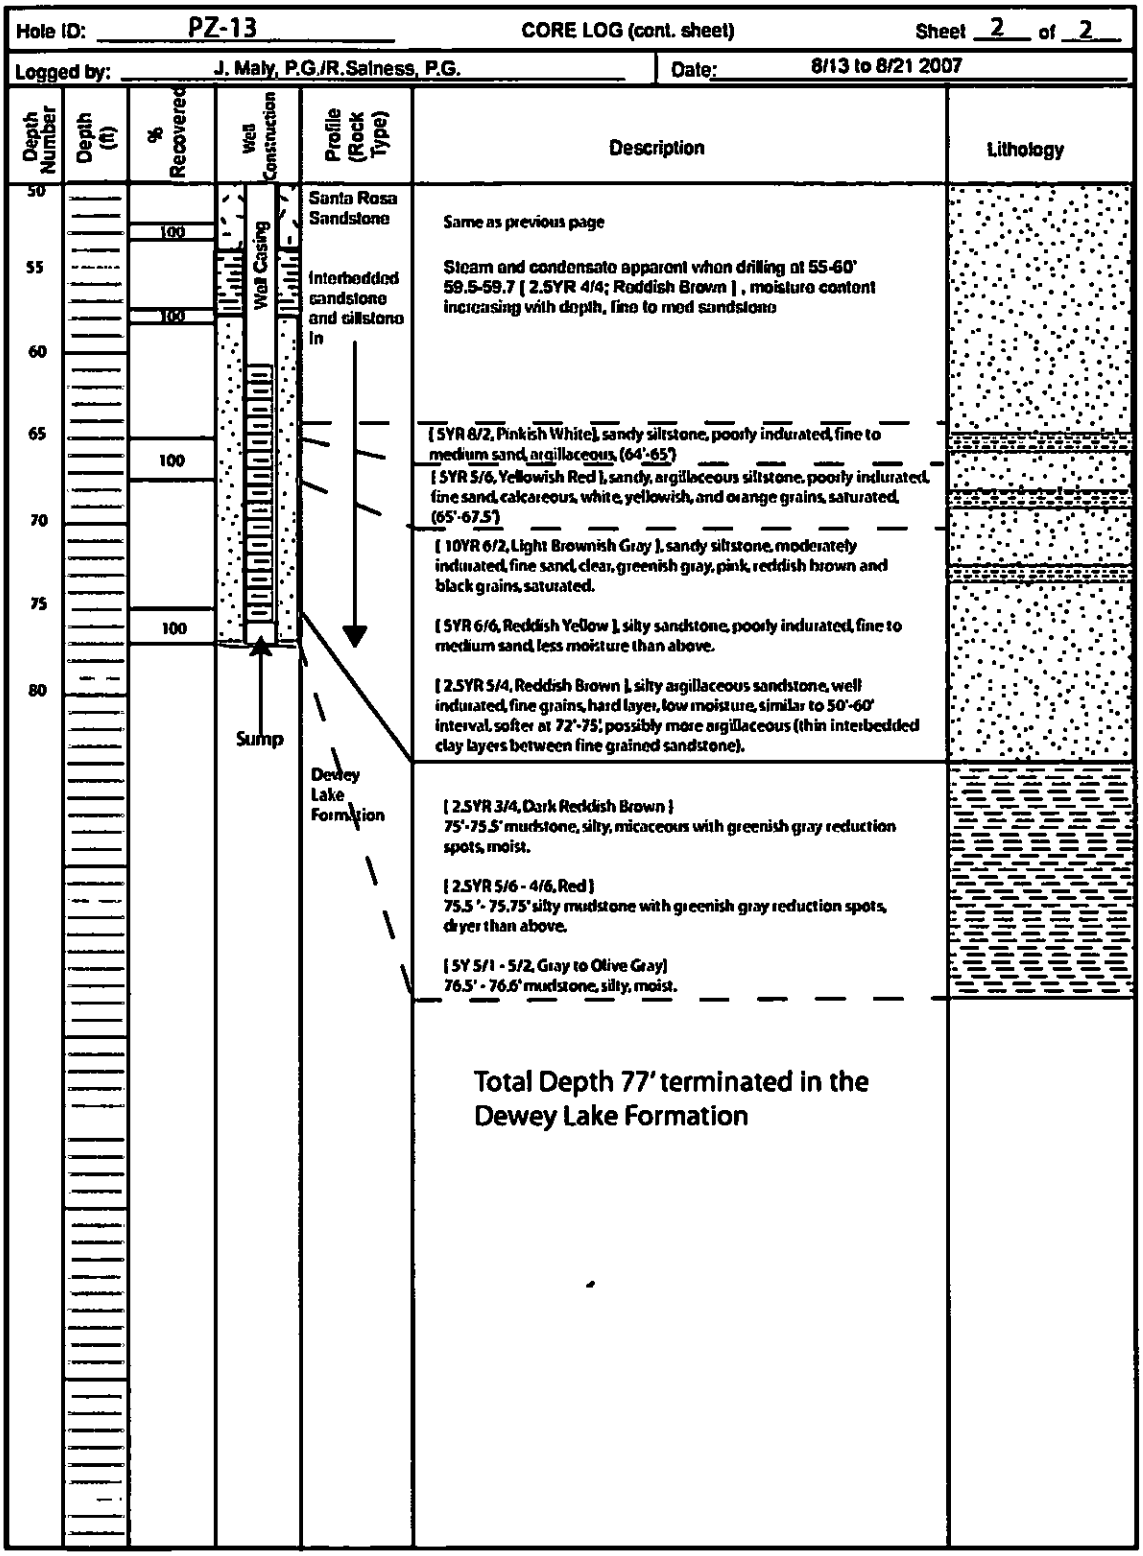

Figure 2-2 - Core Log for PZ-13 (Continued)

2.2.2 Triassic Santa Rosa Formation

The Santa Rosa is 40 feet thick at this location, from 35 feet bgs to 75 feet bgs. The Santa Rosa and Gatuña were differentiated in this drillhole by a mottled red and light gray sandstone with slickensides as opposed to the basal Gatuña Formation lacking these features and being predominantly a red sandstone at the contact. The Santa Rosa in this piezometer consists of interbedded sandstone of variable color, grain size, induration, cementation, and clay content (Figure 2-2). The formation was well indurated and required air assisted drilling from 47 feet to 64 feet, limiting samples to cuttings. It is presumed this may be due to cementation changes from a carbonate base to a silica base.

The interval from 65 feet to 67.5 feet is a sandy argillaceous siltstone that was saturated during drilling. The saturation in the Santa Rosa was identified during drilling to extend down into a harder siltstone of similar characteristic as the overlying lithology (Figure 2-2). The saturation diminished with depth, but showed increasing induration, and clay content. The underlying Dewey Lake was moist.

Comparatively, the Santa Rosa in PZ-13 is 11 feet thicker than in PZ-8 (29 feet) and PZ-9 (29 feet), indicating a thickening trend to the south, south-east of WIPP. This thickening is suggested by Jones (1978) as a consequence of eastward formational dip and eastward rise in surface topography. The Santa Rosa was deposited in dominantly fluvial environments and lies unconformably on the Dewey Lake.

The Santa Rosa was encountered at approximately the same elevation as in PZ-8, but approximately 2 feet shallower in elevation than PZ-9. Compared to PZ-14 and PZ-15, the Santa Rosa in PZ-13 was encountered 2 feet deeper in elevation than PZ-14 and 7 feet shallower in elevation than in PZ-15, indicating possible localized Permo-Triassic erosional features likely due to fluvial activities.

2.2.3 Miocene-Pleistocene Gatuña Formation

The Gatuña Formation is about 25 feet thick at this location. The Gatuña in PZ-13 is pink (Munsell 5YR 7/4) to red (2.5YR 5/8, 6/6, 4/8) sandstone, with generally fine to medium sand grains. The Gatuña contains bluish-black manganese oxide (MnO) stains throughout. The formation at PZ-13 is friable (very loose sand) to moderately well lithified and platy (Figure 2-2). It is very calcareous in the upper part due to overprint (penetration) of pedogenic processes during early stages of the development of overlying Mescalero caliche (Powers, 2003).

The Gatuña generally increases in thickness to the west in the WIPP area, and the depositional edge of the formation is in the same general area where the Santa Rosa pinches out because of erosion that preceded Gatuña deposition (Powers and Holt, 1993). Gatuña thicknesses in nearby piezometers reflect this trend of increasing thickness to the west. The Gatuña thickness in PZ-8, west of PZ-13, is approximately 30 feet. In PZ-9, northwest of PZ-13, the Gatuña is approximately 30 feet.

The Gatuña in PZ-13 was encountered 3 feet shallower in elevation than in PZ-8 and 2 feet shallower in elevation than in PZ-9. Compared to PZ-14 and PZ-15, the Gatuña in PZ-13 was encountered at the same elevation as in PZ-14, but approximately 4 feet shallower in elevation than in PZ-15, following a possible trend of infilling of an erosional feature.

2.2.4 Pleistocene Mescalero Caliche

The Mescalero caliche is 3.5 feet thick at this location; however, the pedogenic processes that developed the Mescalero have penetrated deeper into the Gatuña Formation as defined by the overprint in Section 2.2.3 and in Figure 2-2. The Mescalero in PZ-13 is pink (5YR 7/4) sandy limestone, or calcareous sandstone with pebbles and weak laminar structure. Basal Gatuña inclusions were encountered at this location from 9 to 10 feet (Figure 2-2). Because the Mescalero is a pedogenic process (soil forming), thicknesses will vary from location to location. In the area of PZ-13, compared to other wells, the thickness varies from 2.5 to 4 feet. The Mescalero is an informal soil stratigraphic unit defined by Bachman (1973). It is widespread in southeastern New Mexico, and it is a continuous stratigraphic unit at the WIPP site.

The Mescalero in PZ-13 is approximately 7 feet higher in elevation than in PZ-8 and 5 feet higher in elevation than in PZ-9. Compared to PZ-14 and PZ-15, the Mescalero in PZ-13 was encountered approximately 2 feet higher in elevation than PZ-14 and approximately 5 feet lower in elevation than in PZ-15. This variation is not surprising as the pedogenic process will vary from location to location and generally conforms to underlying topography.

2.2.5 Pleistocene Berino Soil and Surficial Sands

Based on the continuous split spoon sample taken at SNL-13, there is a 4-foot-thick layer of unlithified dune sand and basal argillaceous sand (commonly called the Berino soil, Powers, 2002). The sand is fine grained and calcareous. The Berino soil is not a geologic unit, but defined as a pedogenic unit by local soil scientists (Chugg el al., 1971). The surface sand around WIPP is eolian, with much of it fine to medium grain, moderately well sorted, and poorly indurated. Dunes at the WIPP site are partially stabilized by vegetation (Powers, 2003).

2.3 Geological Data From PZ-14

2.3.1 Permo-Triassic Dewey Lake Formation

The Dewey Lake was encountered in PZ-14 from 70.8 feet to TD at 73 feet (Figure 2-3). In this piezometer interval (70.8 to 73 feet), the Dewey Lake is characterized by a very hard, competent gray and red siltstone, platy, and dry; a red claystone that is unconsolidated with greenish gray reduction spots; and very hard platy red siltstone with greenish gray reduction spots (Figure 2-3). The Dewey Lake in this piezometer was dry at the contact, but damp below. Based on data obtained from the overlying Santa Rosa

Formation (see Section 2.3.2), the TD was based on this depth acting as an aquitard dampening vertical flow of SSW. A well was installed at this location and constructed as depicted in Figure 2-3. The sample obtained from this piezometer did indicate alternating lithologic variations of siltstone and claystone (Figure 2-3).

The Dewey Lake at PZ-14 was encountered 9 feet deeper in elevation than it was in PZ-8, indicating possible erosion during deposition of the overlying Santa Rosa Formation during predominantly fluvial environments. The Dewey Lake was only 0.5 feet shallower in elevation in PZ-14 than in PZ-9, another previously installed piezometer in the area.

2.3.2 Triassic Santa Rosa Formation

The Santa Rosa at this location is 20.8 feet thick, from 50 feet bgs to 70.8 feet bgs, but less than that identified in PZ-13. The Santa Rosa and Gatuña were differentiated in this drill hole, similarly as in PZ-13, by mottled reddish brown and light gray sandstone with slickensides as opposed to the basal Gatuña Formation lacking these features and being predominantly a red sandstone at the contact. Samples for this piezometer were not obtained continuously as the formation was very hard in places and alternative drilling techniques (air assisted) were used. Where samples were not obtained, the geology was assumed to be similar to that identified in PZ-13 where extraordinary effort was made for continuous sampling (Figures 2-2, 2-3).

From the samples obtained for 30 feet bgs to 50 feet bgs the Santa Rosa is identified as interbedded reddish and light gray sandstone to reddish brown very hard siltstone. The sandstone contained carbonate filled dessication cracks, slickensided surfaces, and was poorly to moderately indurated. At 50 feet bgs, the sample indicated a very hard competent siltstone (Figure 2-3). At 50 feet bgs to 70.8 ft bgs, the geology was assumed to be similar to PZ-13 (Figure 2-2).

From 70 to 70.8 feet in PZ-14, the formation was interbedded loose, silty sand and a layer of angular claystone and siltstone fragments. This interval was saturated throughout, but the claystone/siltstone fragments (70.5 to 70.8 feet bgs) appeared to be the primary saturation zone. As discussed in Section 2.3.1, the underlying Dewey Lake was dry, acting as an aquitard.

Comparatively, the Santa Rosa in PZ-14 is thinner than that in PZ-13, PZ-8, and PZ-9. This still correlates with thickening trend to the south-southeast of WIPP as suggested by Jones (1978) as a result of dipping and topography trends. The Santa Rosa in PZ-14 was encountered at approximately nine feet deeper in elevation than PZ-8, and approximately one foot deeper in elevation than PZ-9.

2.3.3 Miocene-Pleistocene Gatuña Formation

The Gatuña is about 23 feet thick at this location. The Gatuña in PZ-14 is pink (5YR 8/4) to red (2.5YR 4/8-5/8) with some light reddish brown (2.5YR 7/4-8/4) interbedded sandstone, with generally fine to medium grains. The Gatuña contains bluish-black MnO stains in the upper and basal portions. Some sections are well lithified and platy. It is very calcareous in the upper portion due to overprinting of the overlying Mescalero caliche. Silica cementation dominates in the basal portion.

Gatuña thickness in this well compared to other nearby piezometers reflects the trend of westward increasing thickness (Powers and Holt, 1993). The Gatuña in PZ-14 is thinner than in PZ-13, PZ-8, and PZ-9. The Gatuña in PZ-14 was encountered 3 feet shallower in elevation than in PZ-8, and 2 feet shallower in elevation than in PZ-9.

2.3.4 Pleistocene Mescalero Caliche

The Mescalero caliche is 4 feet at this location, although, as described in previous sections, the processes that developed the Mescalero have penetrated deeper into the underlying Gatuña Formation. The Mescalero in PZ-14 is pinkish-white to pink (5YR 8/2-8/3) sandy limestone, with low moisture content containing calcareous pebbles with weak laminar structure. At PZ-14 the Mescalero has a very hard surface cap. The Mescalero in PZ-14 is approximately 4 feet higher in elevation as it is in PZ-8 and 3 feet higher in elevation than it is in PZ-9.

2.3.5 Pleistocene Berino Soil and Surficial Sands

Continuous samples were not taken at PZ-14 until the top of the Mescalero caliche was encountered. Until the depth of 5 feet, center bit drilling with a wireline was used. The Berino soil and surficial sands were described based on auger cuttings, and the contact was estimated based on PZ-13 and PZ-15 sampling (Figure 2-3). The surficial dune sand at this location was the same as other, unlithified, calcareous light reddish brown (5YR 6/4) sand. The Berino soil was characterized as a red (2.5YR 5/8-4/8) loose, fine grained sand.

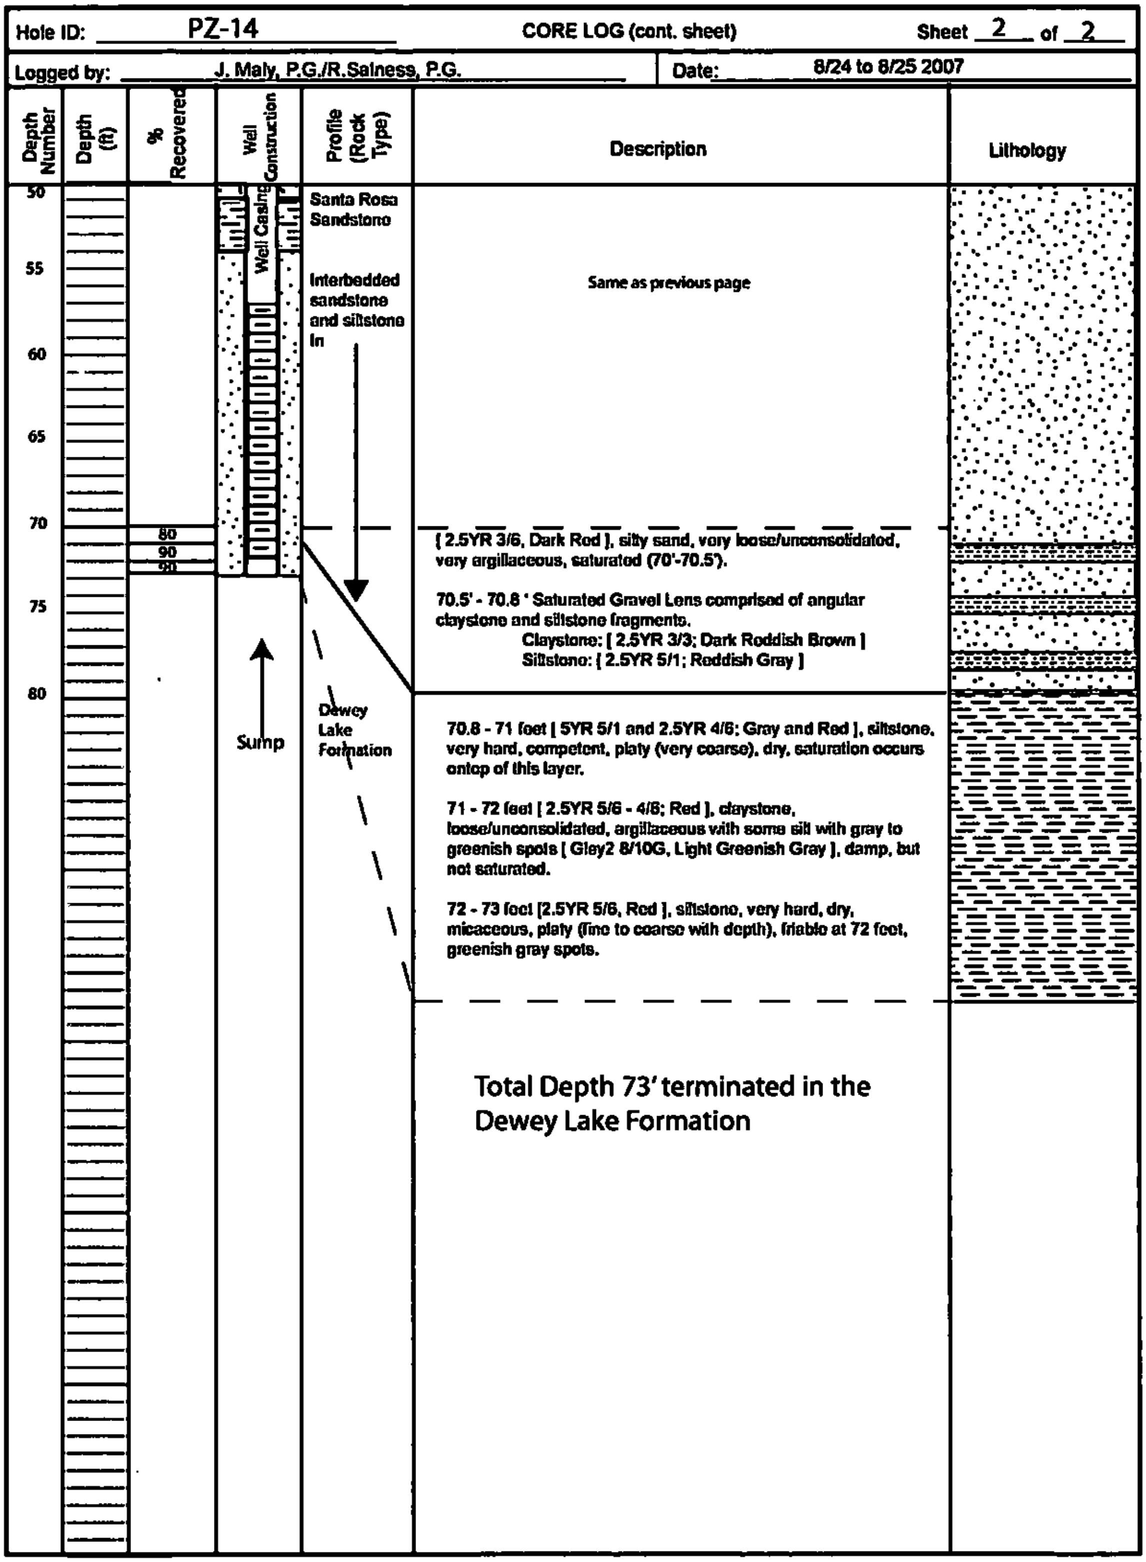

Figure 2-3 - Core Log for PZ-14 (Continued)

2.4 Geological Data from PZ-15

2.4.1 Triassic Santa Rosa Formation

PZ-15 was terminated in the Santa Rosa Formation where saturation was identified. As such, the Dewey Lake Formation was not encountered in this well.

The top of the Santa Rosa in the well was identified at 51 feet bgs. The entire thickness of this formation is unknown as it was not completely drilled through; however, it is assumed to be thinner than in PZ-13 and PZ-14 due to the thickening westward trend of this formation. The top of the Santa Rosa Formation was saturated.

Drilling was terminated at this point as it was apparent that just deeper, the Santa Rosa Formation dried and became very hard, acting as an aquitard. A piezometer was installed at this depth and constructed as depicted in Figure 2-4.

The 5 feet of Santa Rosa Formation penetrated in this well are characterized as two lithologic variations. The upper portion from 51 to 51.5 feet is described as red (2.5YR 4/8) to light gray (10YR 7/1) interbedded sandstone with dessication cracks that are carbonate filled (Figure 2-4) that becomes softer and sandier with depth. This upper portion was saturated at the top and became dry with depth at the lower very hard portion. The lower section sampled (51.5 to 56 feet) is described as a very hard consolidated dry reddish brown (2.5YR 4/4) sandstone.

The Santa Rosa in PZ-15 was encountered at approximately 7 feet deeper in elevation than PZ-8, and approximately 5 feet deeper in elevation than PZ-9.

2.4.2 Miocene-Pleistocene Gatuña Formation

The Gatuña Formation is about 39 feet thick at this location, indicating that it gets thicker to the east around the SPDV pile, which is non-typical of the area around the WIPP site. The Gatuña generally thickens to the west in the area of the WIPP site due to erosion of the Santa Rosa Formation, leading to thicker deposition of Gatuña (Powers and Holt, 1993).

The upper 4 feet of Gatuña at this location is pink (5YR 7/4) sandstone with overprint of pedogenic carbonate soil processes that developed the overlying Mescalero caliche. The upper 4 feet are dry to slightly moist, loose to very stiff, with clasts of caliche and altered MnO throughout (Figure 2-4). The lower portion of the Gatuña is predominantly red sandstone with chert pebbles throughout, MnO stained root casts, dominated by sand (less argillaceous) and increased bedding structure with depth (platy).

The Gatuña in PZ-15 was encountered 10 feet shallower in elevation than in PZ-8 and 2 feet shallower in elevation than in PZ-9.

Dune Sand	[5YR 6/4, LT Reddish Brown], sand, fine grained, loose, moist to dry, friable.
Berino Soil	[2.5YR 5/4; Reddish Brown], sandy, 7.8'-8' calcareous sand, indurated, low moisture, small roots, damp. [5YR 8/3 Pink] at 7.5'
Mescalero Caliche	[7.5YR 8/2-8/4; Pink], sandy limestone or calcareous sandstone, low moisture, stiff with chert pebbles and weak laminar structure (friable), moist in friable portions; pedogenic Gatuna interbedded identified by manganese oxide alterations.
Gatuna Sandstone	[5YR 7/4; Pink], Gatuna Sandstone with Mescalero Caliche overprint, dry to slightly moist, loose to very stiff clasts with caliche, altered manganese oxide throughout, less argillaceous/loose matrix, caliche clasts throughout.
	[2.5YR 4/6; Red at 16'] [2.5YR 5/8 at 16.6'], Gatuna Sandstone, chert pebbles throughout, root casts coated in manganes oxide, dry, carlcareous, less argillaceous matrix dominated by sand, increased bedding structure with depth, stiff, platy structures, dry, stiff, moderately indurated. 17.5-20' damp, loose, cabonaceous, more argillaceous 20-22.5' no bedding structure, inc. manganese oxide, damp 22.5' -27.5 platy bedding structure, bcame hard at 24' 26.1'-45' [2.5YR 4/6-4/8; Red], siliceous, friable, more argellacaous matrix interbedded with loose matrix. 45'-50.5' Saturated Gatuna Formation sitting on hard Santa Rosa Formation.
	[2.5YR 4/8, Red]. [10YR 7/1, LT Gray), interbedded Red and LT Gray sandstone, dessication cracks with carbonate fill, slickensided surfaces (subhorizontal), dry, moderately indurated, Wet/saturated at top and dries with depth/perched. 51.3-51.5 soft sandier zone 51.5 Very hard Santa Rosa Sandstone, very hard consolidated, well indurated sandstone, dry [2.5YR 4/4; Reddish Brown].
Santa Rosa Sandstone	Total Depth 55 feet terminated in the Santa Rosa Sandstone

Figure 2-4 - Core Log for PZ-15

2.4.3 Pleistocene Mescalero Caliche

The Mescalero caliche at this location is 4.5 feet thick at this location, although the processes that developed the Mescalero have penetrated deeper into the Gatuña as described in previous sections. The Mescalero in PZ-15 is pink (7.5YR 8/2-8/4) sandy limestone of low moisture content. It has weak laminar structure (friable) with chert pebbles throughout. Some pedogenic Gatuña is interbedded as defined by MnO alterations.

The Mescalero in PZ-14 is approximately 11 feet higher in elevation than it is in PZ-8 and 10 feet higher in elevation than it is in PZ-9.

2.4.4 Pleistocene Berino Soil and Surficial Sands

Based on continuous split spoon samples taken at PZ-15, there is 8 feet of unlithified dune sand and basal argillaceous sand (commonly called Berino soil, Powers, 2002). The sand is fine grained and calcareous. The Berino soil is fined grained, calcareous, and damp with small roots.

2.5 Geologic Significance, Discussion, and Correlation with Other Piezometers

The early SSW piezometers were drilled with air rotary and logged by examination of cuttings from the drill stem. The use of hollow stem augers in PZ-13, PZ-14, and PZ-15 allowed for close examination of the lithology and exactly where saturation occurred. Based on the information from the SPDV pile piezometers, it is clear that no one single lithologic zone can be isolated as being the predominant location for the SSW to reside or flow as the geology is vertically and spatially heterogeneous.

Figure 2-5 presents two cross-section across the site trending west to east (A-A') and northwest to southeast (B-B'). Cross-section A-A' presents a fairly consistent Gatuña thickness that undulates along the top of the Santa Rosa surface, dipping to the west. The Gatuña begins then to noticeably thicken at the point of PZ-15. The Santa Rosa Formation, on the other hand, is variable in thickness, thinning at the location of PZ-12 and thickening east and west of PZ-12, along the deepening Dewey Lake contact. The top of the Dewey Lake appears to have two structural divides; one at PZ-12 and the other at PZ-8, possibly erosional features. The surface dips sharply to the west and east from PZ-12. At Piezometer C-2507 the slope gradually increases approaching PZ-8, where the Dewey Lake surface dips off towards PZ-13, and presumably at the point of PZ-15; however, this well was completed in the Gatuña Formation. The structural divide at PZ-12 is higher in elevation than that in PZ-8, lending to a steeper slope to the east.

Cross-section B-B' also presents a fairly consistent Gatuña thickness that mimics the Santa Rosa depositional surface along this trend. The Gatuña gradually dips to the west and east of the PZ-8/PZ-14 area. The Santa Rosa Formation from roughly north to south is relatively consistent in thickness (± 5 feet), with the thicker portion to the south. Structurally, the Santa Rosa dips to the west and east from the PZ-8/PZ-14 area, similar to the Gatuña, and the thickening trends with the deepening Dewey Lake. The top of the Dewey Lake appears to have a structural divide around PZ-8 where the surface dips gently to the west and sharply to the east, possibly an erosional feature.

Figure 2-6 is a wireframe map showing the upper surface of the Dewey Lake Formation for all SSW piezometers that encountered the Dewey Lake contact. Superimposed on this map are the contours of this surface. This figure shows that the surface of the Dewey Lake in the area of interest is comprised of high areas, valleys, and bowls. Sitting on top of this surface is the Santa Rosa Formation. The Dewey Lake has a lower permeability than overlying formations such that vertical flow is impeded, creating a perched water zone at or near the contact.

These characteristics of the Dewey Lake surface (highs, valleys, ridges, bowls) play an important role in defining geological control of SSW accumulation and movement.

Figure 2-7 depicts the same contours of the Dewey Lake surface superimposed onto a shaded relief map of the Dewey Lake surface. This figure highlights the surficial features identified in previous figures and discussed in the above paragraphs. Low areas (depressions) on the Dewey Lake surface are associated with PZ-7, PZ-4, PZ-14, and C-2507. High points are associated with PZ-12, PZ-8, and C-2505/2506. Between these points are ridges, valleys, and plateaus.

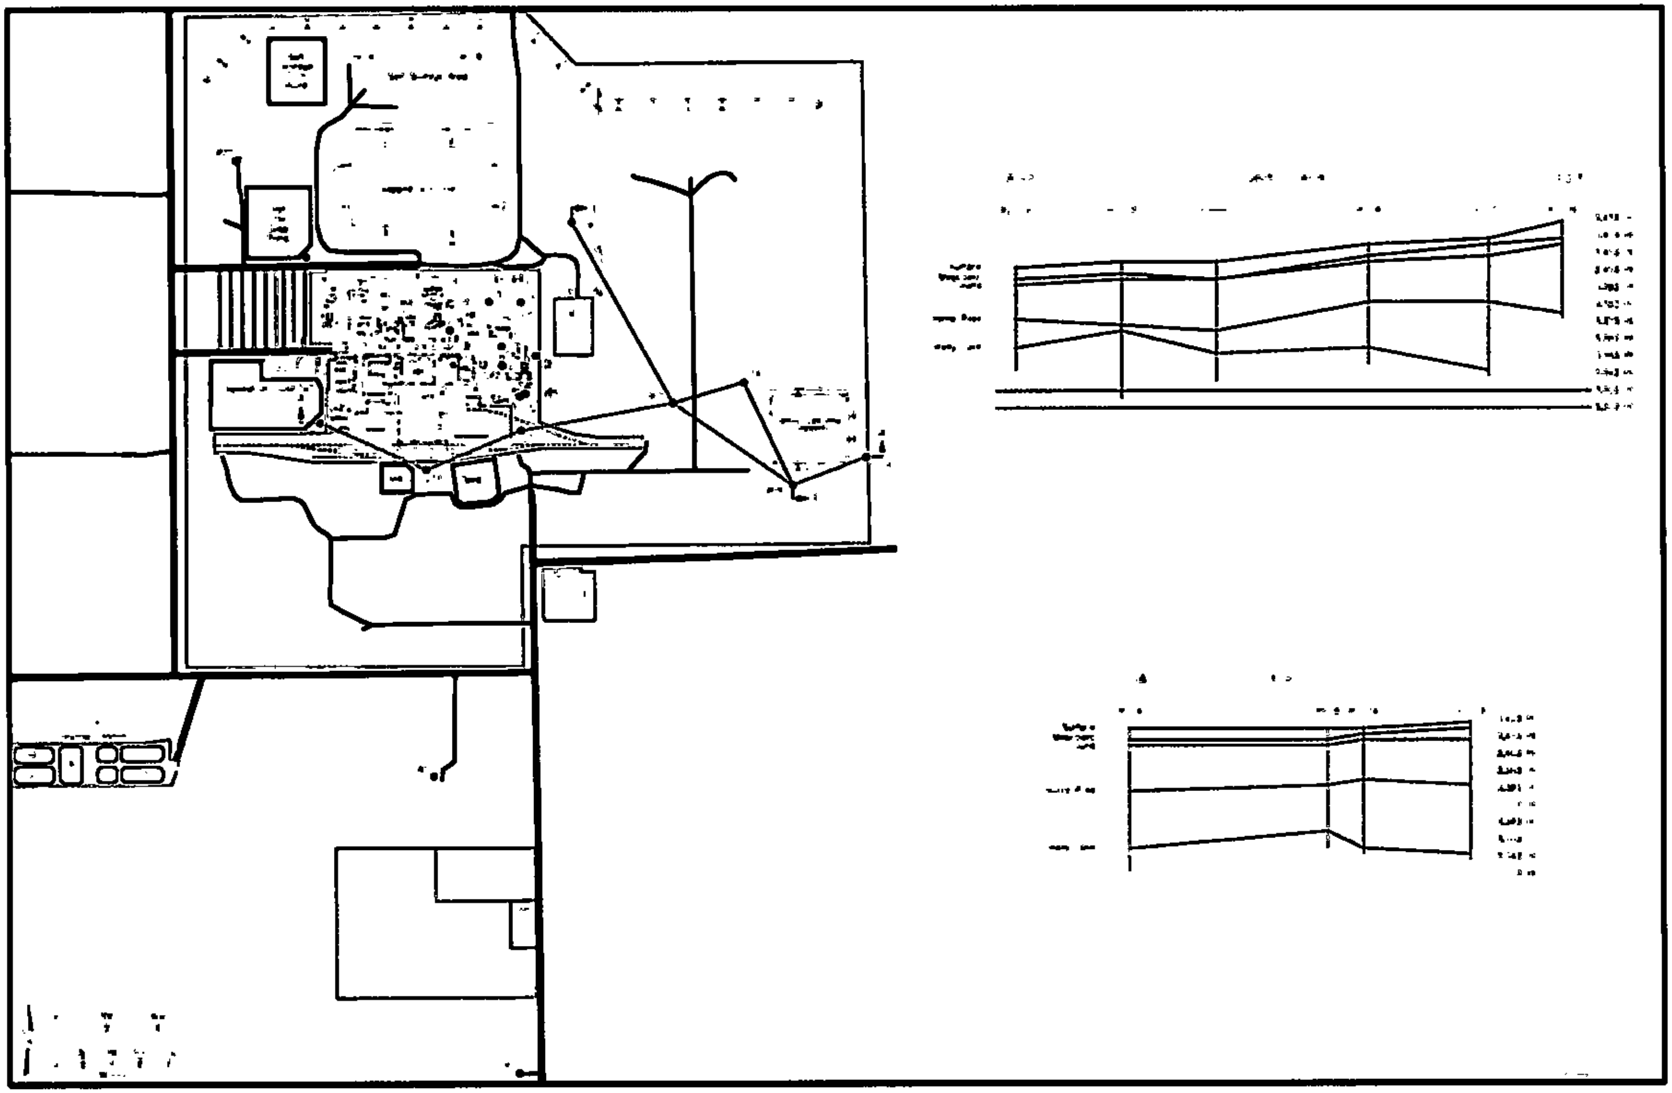

Figure 2-5 - Site Cross-Sections

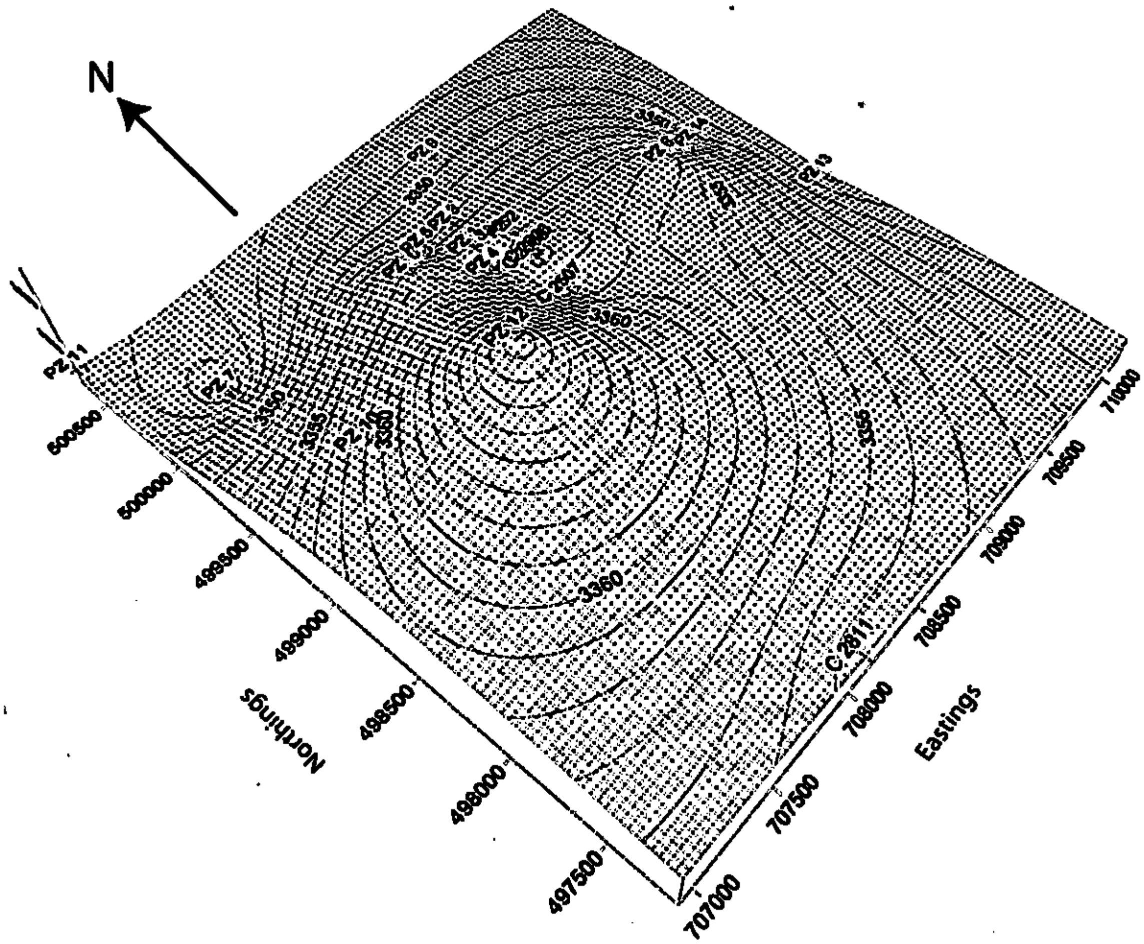

Figure 2-6 - Wireframe Structure Map of Dewey Lake Surface

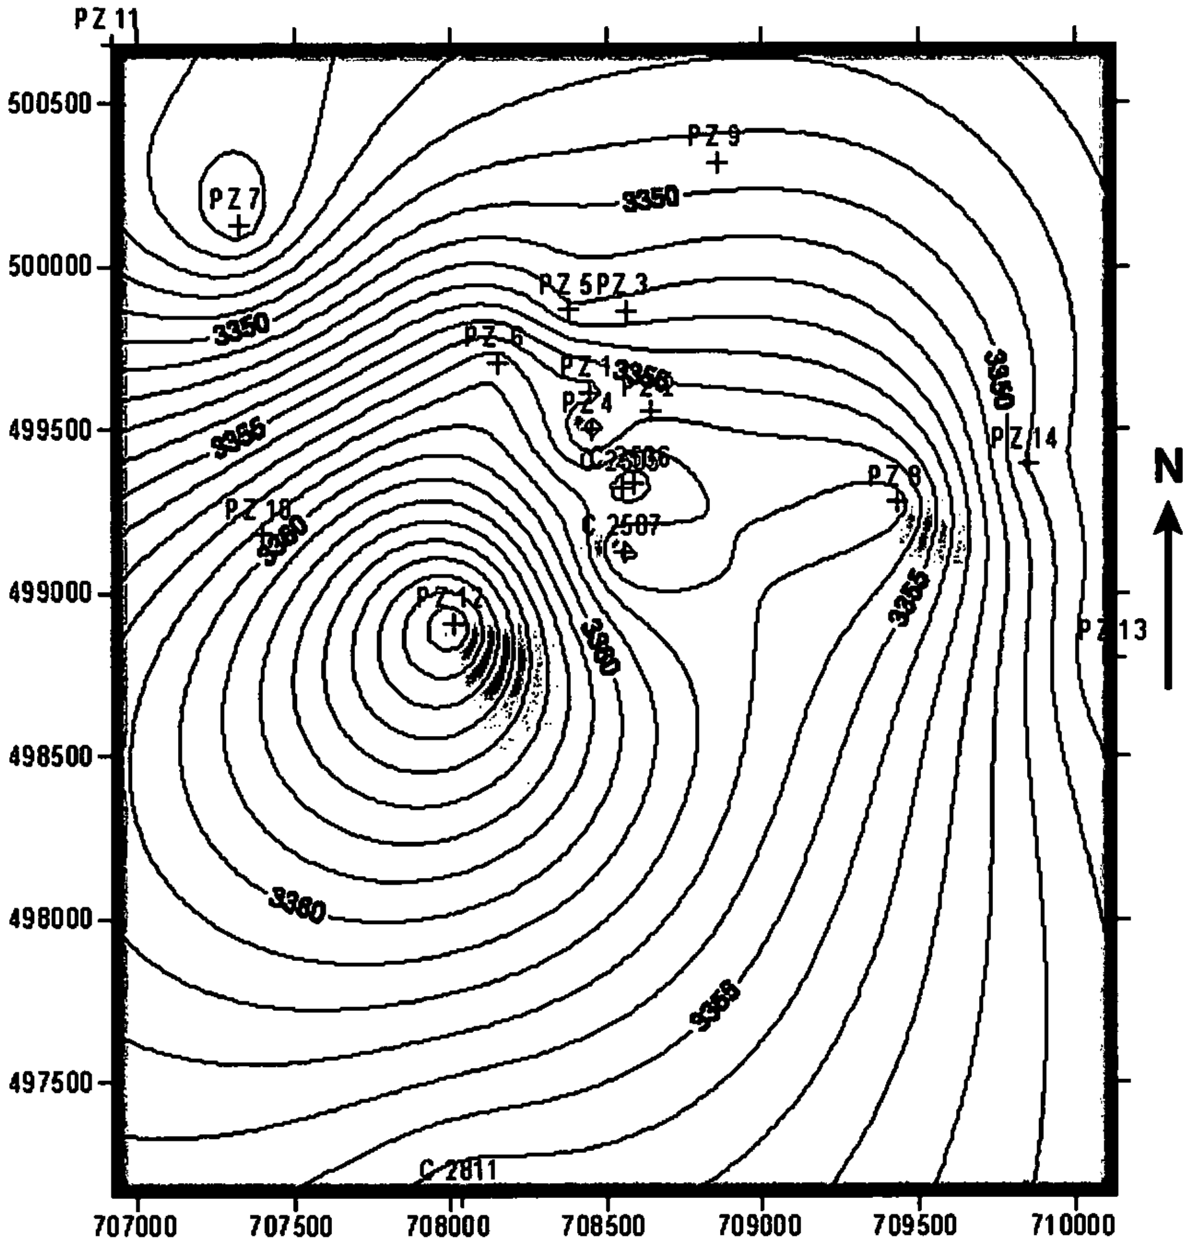

Figure 2-7 - Shaded Relief Structure Map of Dewey Lake Surface

Based of the geologic data obtained from the piezometers around the SPDV pile, there can be some conclusions made at this point:

- The SSW appears to be isolated in different and variable zones around the SPDV pile based on examination of split spoon samples obtained during drilling.
- Structural features of the Santa Rosa/Dewey Lake contact play an important role in accumulation and movement of SSW.
- The stratigraphy overlying the Santa Rosa/Dewey Lake contact is heterogeneous and tortuous.

3.0 HYDROLOGICAL DATA

3.1 Description of Shallow Subsurface Water in the Santa Rosa and Upper Dewey Lake Formations

Shallow Subsurface Water (SSW) was first detected in 1995 when a video inspection of the Exhaust Shaft detected seepage through the shaft liner from approximately 50 to 80 feet bgs. After 1995, a series of hydrologic assessments was undertaken to identify the source and nature of the SSW at WIPP. Sixteen wells were installed around the site to assess the SSW. The SSW was detected in all but one well, PZ-8, which was dry until March 2007. The SSW is a shallow-perched, water-bearing zone that sits on a permeability change at the formational contact between the Santa Rosa Formation and the upper Dewey Lake Formation. The SSW is believed to be entirely anthropogenic in nature, resulting in part from historical natural discharges from locations at WIPP.

In December 2003, the NMED GWQB issued a modified DP-831 indicating that the unlined ponds and stockpiles be lined with a synthetic liner: SSA and SPEP, Ponds 1 and 2, Pond A. Additionally, a new SSE was to be constructed with a synthetically lined base on which infiltration and surface runoff from this pile would be directed to a new evaporation basin. Also included in this modification was a monitoring program that included quarterly water level measurements from all the SSW wells and semiannual sampling of selected SSW wells for TDS, chloride, sulfate, nitrate, chromium, and selenium. This program was implemented in May 2004 and continues to date.

On December 29, 2006, the NMED GWQB issued another DP-831 modification with a condition that the SPDV pile be investigated as a possible source of shallow groundwater. The modification indicated that WIPP should install three monitoring wells adjacent to the SPDV pile. This report has documented the installation of these wells and the data obtained.

Isolated saturated sections were detected in all three piezometer boreholes installed around the SPDV pile, although at differing elevations and lithology. The following sections describe the water levels and chemistry in these wells and a discussion of each as it correlates to the SSW on the WIPP site and the other 16 piezometers.

3.2 Water Levels in Piezometers PZ-13, PZ-14, and PZ-15 and Comparison to WIPP Site Piezometers

In October 2007 a new survey of the piezometer top of casing and ground surface elevation was performed by a New Mexico licensed surveyor to NAD83/NAVD88 datum after the SPDV pile wells were installed. The prior survey performed in the late 1990s was surveyed to a NAD27/NAVD29 datum. All data reported herein are referenced to the 2007 survey. Water level elevations reported prior to this report were to the NAD27/NAVD29 survey.

Water was detected in all three piezometers around the SPDV pile at differing horizons and, in one case, a differing formation. Water saturation in PZ-13 was detected while drilling in the lower Santa Rosa at a depth of 65 feet bgs, an elevation of 3,356 feet above mean sea level (AMSL). Saturation in PZ-13 was confined to a 2.5-foot vertical section of the Santa Rosa characterized by interbedded sandy argillaceous siltstone and sandy siltstone. The water in this boring appeared to be perched upon much harder, consolidated Santa Rosa at the contact with the Dewey Lake Formation. The permeability change of the harder sandstone and underlying Dewey Lake mudstone act as an aquitard perching the water at this elevation. Lithologic intervals above the saturated interval were moist, but not saturated.

Water saturation in PZ-14 was detected while drilling in the lower Santa Rosa at a depth of 70 feet bgs, an elevation of 3,350 feet AMSL. Saturation in this borehole was confined to a thin lense (0.80 foot) of the Santa Rosa, characterized as loose argillaceous sand and a section of interbedded angular claystone and sandstone fragments/pebbles. The saturated lens was sitting upon the contact with the Dewey Lake Formation (mudstone). This permeability contrast allowed the perching of water at this depth as the Dewey Lake acted as an aquitard. Samples were not obtained above this interval as air assisted drilling was employed; however, steam or other indicators of moisture were not apparent.

Water saturation in PZ-15 was detected while drilling in the lower Gatuña Formation at a depth of 45 to 55.5 feet bgs, an elevation of 3,385 feet AMSL. Saturation was in the lower Gatuña, where it became more friable, sitting on the Santa Rosa contact. The upper Santa Rosa Formation in this borehole is very hard at 51.5 feet bgs (3,379 feet AMSL) acting as an aquitard and perching the water at this interval.

Geologically, the underlying formations are very heterogeneous between piezometers (spatially) as well as between formations and within formations (vertically). Heterogeneity in the horizontal and vertical directions is significant as characterized by careful and mostly continuous sampling while drilling. This heterogeneity leads to preferential and tortuous flow paths. The detected saturation, as discussed above, occurred in different horizons of variable thickness and lithologic structure, lending to preferential flow and tortuosity.

The heterogeneity and tortuous flow affects the ability for saturated lenses to develop or connect with one another. An attempt was made to sample piezometers PZ-8, PZ-13, PZ-14, and PZ-15 on October 10, 2007, by low-flow sampling methods using a small diameter submersible pump. Typical sustained flow rates during sampling for the SSW piezometers at WIPP range from 400 milliliters per minute (mpm) to 1,500 mpm while keeping water levels stable and drawdown to a minimum. This could only be achieved for PZ-13, which pumped at an average rate of 1,050 mpm, but was pumped dry as the sample was obtained. Piezometers PZ-8, PZ-14, and PZ-15 could not sustain enough flow to measure before pumping dry. These wells were later sampled using a Teflon™ hand bailer (see Section 2.3). This indicates not only low permeability in the formation but, due to the small saturated lenses, a low volume of SSW in storage around the SPDV pile.

Figure 3-1 is a potentiometric surface map of the SSW at the WIPP site inclusive of the wells at the SPDV pile based on the water levels presented in Table 3-1, and is superimposed on a shaded relief structure map of the Dewey Lake surface. Well H-3d (Figure 1-2) was converted to a shallow monitoring well during the *WIPP Fiscal Year 2005 Plugging, Abandonment, and Well Reconfiguration Program* (DOE/WIPP 05-3326) and is not included in this map. Water levels in Well H-3d are monitored quarterly and to date there has been no SSW impact at this location. Therefore, the southern extent of SSW at the WIPP likely lies between PZ-12 and H-3d. Figure 3-1 does not include PZ-15, as it was completed in the Gatuña Formation.

Based on Figure 3-1, it appears that the surface of the Dewey Lake has an influence on the potentiometric surface and flow system of the SSW. High points in the contact, such as at PC-7, appear to create a radial flow, when water from the SPEP was contributing to infiltration. A ridge aligned with PX-5 and south to C-2507 tends to direct water east and west. Low points in the surface structure are variable depending upon how much water has perched in these areas. The primary flow direction is south.

The water around the SPDV pile is defined by PZ-13, PZ-14, and PZ-15. Water levels for these wells were obtained approximately four months after they were installed. As discussed in previous sections, PZ-15 was completed in a different geologic horizon than PZ-13 and PZ-14, and is reflected in the differing water level elevations (Table 3-1). Hydrographs compiled for the WIPP site piezometers indicate an interconnection by having similar time series responses in water elevation fluctuation. Not enough data have been accumulated to determine connectivity between SPDV pile piezometers or between site piezometers and SPDV pile piezometers. However, based on the small lenses with water identified during drilling, lack of storage identified during sampling and low permeability, vertical and spatial heterogeneity, and tortuous media, the tentative conclusion at this point is that the water identified in PZ-13, PZ-14, and PZ-15 are all isolated from each other. Some of this can be seen with chemical differences (Section 3.3).

Table 3-1 - Measured Water Elevations
December 5, 2007

Well I.D.	Top of Casing Elevation	Water Level	Water Level Elevation
PZ-1	3,414.92	39.98	3,374.94
PZ-2	3,414.99	40.09	3,374.90

C-2811	3,400.47	51.34	3,349.13

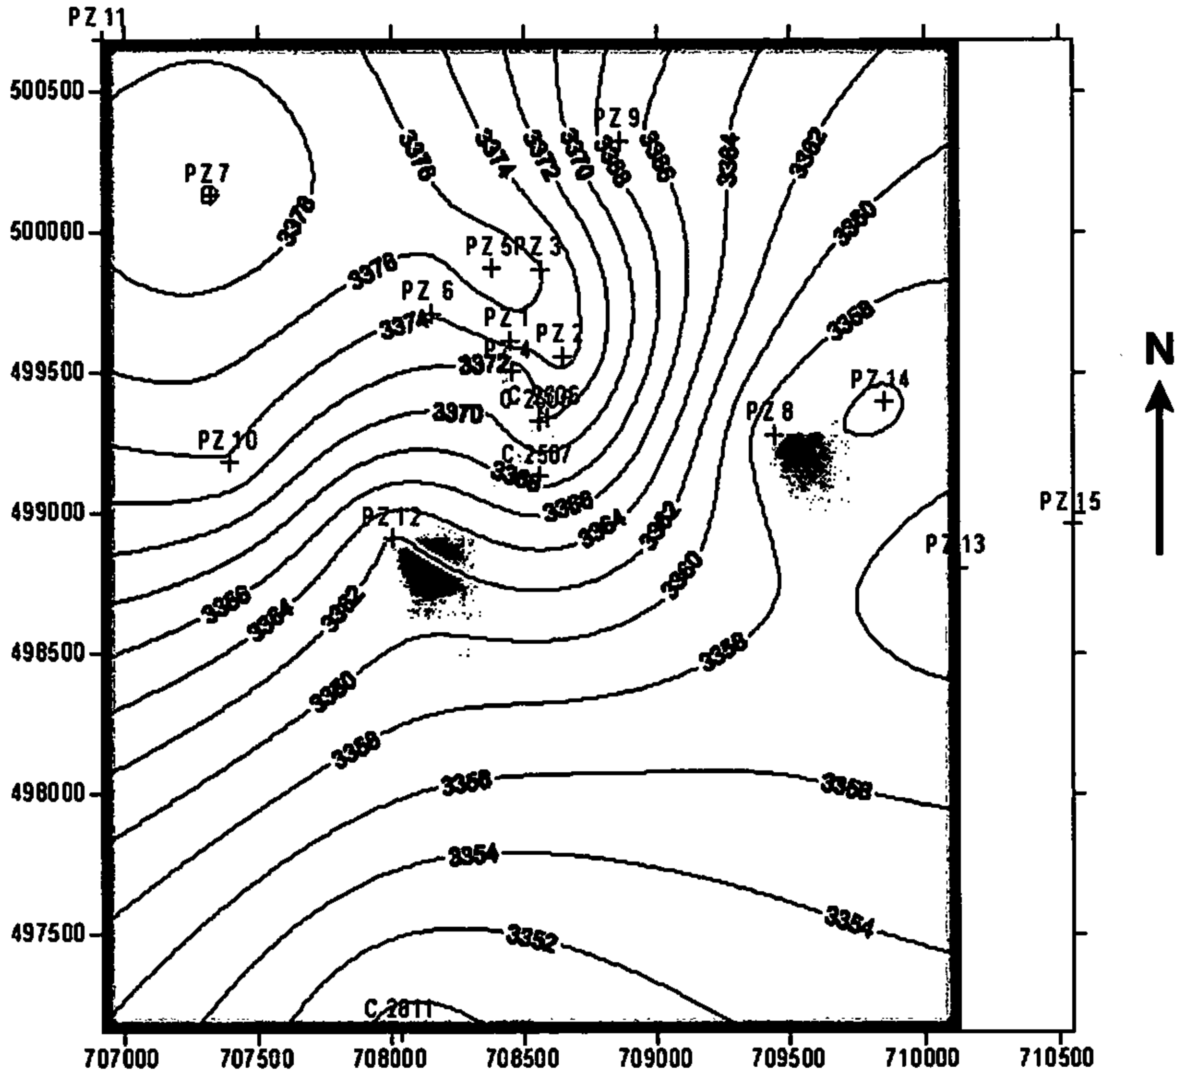

Figure 3-1 - Potentiometric Surface Map Superimposed on Dewey Lake Surface

Overall, the water levels in the WIPP piezometers are rising in all wells, although at differing rates. One well, PZ-9, has been decreasing in elevation since March of 2005. This decreasing water level may be the first sign that lining the salt pile is having an effect on the SSW elevation. The decreasing water levels at PZ-9 began shortly after the conveyance ditches around the Salt Storage Area were lined. This conclusion is preliminary, it is too soon to tell what impact the liner systems at the site have had on water levels in the piezometers.

3.3 Water Quality in Piezometers PZ-13, PZ-14, and PZ-15 and Comparison to WIPP Site Piezometers

SSW samples have been obtained semiannually from the site piezometers as part of DP-831 since 2004. The quarterly sampling event for DP-831 was performed in October 2007, and included the three new piezometers. Since the piezometers around the SPDV pile were new, parameters beyond those required by the permit were analyzed to characterize the water (Table 3-2).

Low-flow sampling techniques are typically employed to sample the piezometers at WIPP. This involves using a small diameter submersible pump with typical sustained flow rates during sampling of 400 mpm to 1500 mpm, while keeping water levels stable and drawdown to a minimum. The water is field analyzed for temperature, conductivity, and pH until these parameters stabilize, then a laboratory sample is obtained. This could only be achieved for PZ-13, which pumped at an average rate of 1,050 mpm, but was pumped dry as the sample was obtained. Piezometers PZ-8, PZ-14, and PZ-15 could not sustain enough flow to measure before pumping dry. Piezometers PZ-8, PZ-14, and PZ-15 were pumped dry on October 10, 2007, and allowed to recover until October 15, 2007, where they were sampled using a Teflon™ hand bailer. PZ-8 was installed in 1997 and remained dry until this year. This was the first time this well was sampled. Results for wells PZ-8, PZ-14, and PZ-15 are presented in Table 3-2. Table 3-3 presents results for the DP-831 required parameters for all the sampled WIPP SSW piezometers.

Table 3-2 presents three different geochemical zones:

1.0 PZ-15, carbonate-based alkalinity. PZ-15 is near is a topographic depression to the east. During heavy rainfall this depression holds water for a period of time; enough such that cattle congregate to drink. The alkalinity in PZ-15 is predominantly carbonate based while the others are bicarbonate based. This is due to the infiltration of rainwater through the upper Mescalero caliche and higher surficial calcium carbonate dissolution.

2.0 PZ-13 and PZ-14, bicarbonate-based alkalinity. These wells may be affected by recharge from the SPDV pile more than rainwater going through caliche at PZ-15. Alkalinity is likely due to the dissolution of sulfates (gypsum and anhydrite) in the SPDV pile. As discussed in Section 1.1, the SPDV pile was used to store mined tailings interspersed with soil, rock, and debris from the construction of the shafts. All formations to the depth of the shafts were mined; therefore, minerals such as gypsum ($CaSO_4 \cdot 2H_20$), anhydrite ($CaSO_4$), halite ($NaCl$), sylvite (KCl), carnallite ($KMgCl_3 \cdot 6H_20$), and soda niter ($NaNO_3$) associated with gypsum and halite were included in the SPDV pile cuttings and explain the chemical differentiation.

Dissolved potassium is significantly higher in PZ-13 and PZ-14 than the other two piezometers, which can likely be attributed to the dissolution of sylvite and carnallite (potash salts). Sulfate concentrations in PZ-13 and PZ-14 are significantly higher and can be attributed to dissolution of anhydrite and gypsum found in formations above the Salado Formation.

3.0 PZ-8, low TDS, low potassium and sulfate, intermediate sodium, and chloride. Dissolved sodium and chloride can be associated with the dissolution of halite, predominantly found in the Salado Formation. While halite is almost exclusive to the salt pile, the SPDV pile also contains halite. Thus, sodium and chloride concentrations are greater in PZ-13 and PZ-14 than in PZ-8, due to SPDV pile proximity. Lacking potassium and sulfate, it is difficult to conclude the source of water in PZ-8 based on a single sample.

To summarize, the document titled *Exhaust Shaft: Phase III Hydraulic Assessment Data Report October 1997 - October 1998* (DOE-WIPP Draft 2302) presents analytical data from piezometers PZ-1 through PZ-12, C-2505, C-2506, and C-2507 for these years. In it the concentration for sulfate range was 404 - 2910 mg/L, nitrate was 4.2 - 46.6 mg/L, sodium 183 - 50,900 mg/L, potassium 3.7 - 356 mg/L, and calcium 270 - 4580 mg/L. Table 3-2 fingerprints SPDV pile PZ-13 and PZ-14 by high potassium concentration, indicating a different source of groundwater than the wells within the operational area.

Table 3-2 - SPDV Piezometer Water Quality

Parameter	ID/Sample Date	PZ-8/ 10-15-07	PZ-13/ 10-10-07	PZ-14/ 10-15-07	PZ-15/ 10-15-07*

4.0 CONCLUSIONS

Piezometers PZ-13, PZ-14, and PZ-15 indicated saturated sections in all three locations at differing horizons and, in one case, a differing formation. Based on the geologic data obtained the SSW appears to be isolated in different and variable zones around the SPDV pile based on examination of split spoon samples obtained during drilling. Structural features of the Santa Rosa/Dewey Lake contact play an important role in accumulation and movement of SSW and the stratigraphy overlying the Santa Rosa/Dewey Lake contact is heterogeneous and tortuous. The heterogeneity and tortuosity leads to preferential flow and a vertical dampening affect. The heterogeneity, small saturated lenses, and tortuous flow affects the ability for flow to readily occur in the unsaturated zone around the SPDV pile.

Overall the water levels in the WIPP piezometers are rising, although at differing rates. One well, PZ-9, has been decreasing in elevation since March of 2005. The decreasing water levels at PZ-9 began shortly after the conveyance ditches around the Salt Storage Area were lined. It is too soon to consider this a cause and effect, or to tell other impacts of the liner systems at the site on water levels in the piezometers.

Three geochemical zones have been identified based on the data obtained from PZ-13, PZ-14, PZ-15, and PZ-8. One being associated with PZ-15, the second associated with PZ-13 and PZ-14, and the third associated with PZ-8. PZ-13 and PZ-14 are believed to be associated with the SPDV pile. The data are inconclusive with regard to PZ-8. Water detected in PZ-15 is believed to be associated with shallow infiltration from a topographic depression east of the SPDV pile.

Subject: Response to the Administrative Completeness Determination and Applicants' Public Notice Requirements for the Renewal and Modification of Discharge Plan 831

Dear Mr. Marshall:

The purpose of this letter is to provide proof of the completion of the public notice requirements for Discharge Permit 831 in accordance with your instructions dated January 23, 2008, received January 28, 2008. NMED's Public Notice Requirements requires that within 15 days of the completion of the public notice requirements, the Permittee must submit proof of notice to NMED containing:

1. Affidavit regarding the sign posting and mailing;
2. List of names and addresses to whom the public notice flyer was mailed;
3. List of name and addresses of owners of discharge sites;
4. Copy of the newspaper ad; and
5. Check number 017630 in the amount of $30.00 for invoice ID 49722, DP-831 Poster Fee.

Therefore, enclosed are the items requested by NMED to document the administrative completeness determination and public notice requirements.

If you have any questions or require additional information, please contact Mr. Jody Plum of my staff at (575) 234-7462.

Sincerely,

David C. Moody

The Affidavit

AFFIDAVIT OF PUBLIC NOTICE COMPLETION
New Permit or Permit Modification

DP-831

I certify, under penalty of law, that I have fulfilled the Ground Water Discharge Permit public notice requirements of Section 20.6.2.3108(B) NMAC.

✓ I posted a sign for 30 days displaying a synopsis of the public notice in English and in Spanish at or near the proposed facility in a conspicuous public location (or multiple locations) approved by NMED.

✓ I posted a public notice flyer at a conspicuous off-site location approved by NMED.

✓ I placed a synopsis of the public notice in English and in Spanish in a newspaper approved by NMED. A copy of the newspaper page containing the synopsis is enclosed.

✓ I sent the public notice flyer via 1st class mail to *(check box)*:

☑ owners of all properties within a 1/3 mile of the boundary of the property of the proposed discharge locations – mailing list is enclosed.

☐ owners of all adjacent property (if applicant owns all property within 1/3 mile) – mailing list is enclosed.

☐ owner of the property of the proposed discharge locations (if applicant is not the owner) – mailing address is enclosed.

I am aware that there are significant penalties for false certification including the possibility of fines.

PUBLIC NOTICE NO. 08-03

NEW MEXICO ENVIRONMENT DEPARTMENT
HAZARDOUS WASTE BUREAU
SANTA FE, NEW MEXICO
Issued February 28, 2008
Revised March 7, 2008

NOTICE OF PUBLIC COMMENT PERIOD AND INTENT TO APPROVE A MODIFICATION TO THE WASTE ISOLATION PILOT PLANT RCRA PERMIT

Under authority of the New Mexico Hazardous Waste Act (Section 74-4-1 et seq., NMSA 1978, as amended, 1992) and the New Mexico Hazardous Waste Management Regulations (20.4.1 NMAC), the New Mexico Environment Department (**NMED**) can approve or deny hazardous waste permits, closure plans, permit modifications, and amendments. Under this authority, NMED intends to approve, pending public input into this decision, an August 27, 2007 Class 3 permit modification request received from the U.S. Department of Energy and Washington TRU Solutions LLC (**the Permittees**) for the Waste Isolation Pilot Plant (**WIPP**), EPA ID# NM4890139088. NMED issued a Resource Conservation and Recovery Act (**RCRA**) permit, which incorporated corrective action requirements, to the Permittees on October 27, 1999.

WIPP is located in Eddy County in southeastern New Mexico, approximately 26 miles east of Carlsbad. The facility boundary corresponds to a 16-section Federal land area known as the WIPP Land Withdrawal Area, which was created when Congress approved the WIPP Land Withdrawal Act in October 1992. WIPP is an industrial facility that consists of 16 square miles of land surface, surface buildings and structures, an underground network of subsurface excavated openings, and vertical shafts that connect the surface and the subsurface areas. The Permittees have developed a 1,454 acre exclusive use area located in the center of the 16 square miles. Land uses within this area are limited to activities associated with the disposal of transuranic waste.

The Permittees' primary contact for this action is Mr. Jody Plum, US DOE/Carlsbad Field Office, 4021 National Parks Highway, Carlsbad, New Mexico, 88220.

If approved, the proposed modification would grant no further action (**NFA**) status for fifteen Solid Waste Management Units (**SWMUs**) and eight Areas of Concern (**AOCs**) (see list below).

Table 2 (SWMUs Requiring an RFI) and Table 3 (AOCs Included in the Permit) of Module VII of the WIPP Permit identify the SWMUs and AOCs at the facility that are proposed for NFA status. NMED has issued a draft permit to modify Module VII by moving the SWMUs and AOCs from Tables 2 and 3 to a new Table 4 (SWMUs/AOCs Requiring No Further Action).

NMED's approval of the SWMUs/AOCs proposed for NFA by the Permittees is on the basis that they have been characterized or remediated in accordance with current applicable state and/or federal regulations, and the available data indicate that contaminants pose an acceptable level of risk under current and projected future land use.

The following SWMUs and AOCs are the subject of this action:

1. SWMU 001g, H-14/P-1 Mud Pits
2. SWMU 001h, H-15/P-2 Mud Pits
3. SWMU 001j, P-3 Mud Pit
4. SWMU 001k, P-4 Mud Pit
5. SWMU 001L, WIPP-12/P-5 Mud Pits
6. SWMU 001m, P-6 Mud Pit
7. SWMU 001n, P-15 Mud Pit
8. SWMU 001o, Badger Unit Mud Pits
9. SWMU 001p, Cotton Baby Mud Pits
10. SWMU 001q, DOE-1 Mud Pits
11. SWMU 001s, ERDA-9 Mud Pit

PUBLIC REVIEW OF THE ADMINISTRATIVE RECORD

The Administrative Record for this proposed action consists of the WIPP No Further Action Petition, the Permittees' Class 3 Permit Modification Request, the Fact Sheet / Statement of Basis, this Public Notice, the Draft Permit consisting of revised Tables 2, 3, and new Table 4 of Permit Module VII, and the referenced supporting documentation for each site. The complete Administrative Record may be reviewed at the following location during the public comment period:

NMED – Hazardous Waste Bureau
2905 Rodeo Park Drive East, Building 1
Santa Fe, NM 87505-6303
Telephone: (505) 476-6000
Monday-Friday: 8:00 am – 5:00 pm

To obtain a copy of the Administrative Record or a portion thereof, please contact Ms. Pamela Allen at (505) 476-6000, or at the Santa Fe address given above. NMED will provide copies, or portions thereof, of the Administrative Record at a charge to the requestor.

A copy of the Fact Sheet/Statement of Basis, the Public Notice, and the Draft Permit consisting of revised Tables 2, 3, and new Table 4 of Permit Module VII are available electronically on the NMED WIPP Information Page at <www.nmenv.state.nm.us/wipp> or may be reviewed at the following location during the public comment period:

WIPP Information Center
Skeen-Whitlock Building
4021 National Park Highway
Carlsbad, NM 88220
Telephone: (575) 234-7502, (800) 336-9477
Monday-Friday: 7:00 am – 4:30 pm

Any person seeking additional information regarding this notice or the Draft Permit may also contact:

Steve Zappe, WIPP Project Leader
NMED – Hazardous Waste Bureau
2905 Rodeo Park Drive East, Bldg 1
Santa Fe, NM 87505-6303
Ref: WIPP No Further Action Petition
E-mail: steve.zappe@state.nm.us
Telephone: (505) 476-6000
Fax: (505) 476-6060

NMED issues this revised public notice on **March 7, 2008** to announce the beginning of a 60-day comment period that will now end at **5:00 pm MDT, May 6, 2008**. Any person who wishes to comment on this action or request a public hearing should submit written or electronic mail (e-mail) comment(s) with the commenter's name and address to Mr. Steve Zappe at the respective address above. Only comments and/or requests received on or before **5:00 pm MDT, May 6, 2008** will be considered.

Written comments must be based on the Administrative Record. Documents in the Administrative Record need not be re-submitted if referenced by the commenter. Requests for a public hearing shall provide: (1) a clear and concise factual statement of the nature and scope of the interest of the person requesting the hearing; (2) the name and address of all persons whom the requestor represents; (3) a statement of any objections to the proposed action, including specific references; and (4) a statement of the issues which such persons propose to raise for consideration at the hearing. Written comment and requests for Public Hearing must be filed with Mr. Steve Zappe on or before **5:00 pm MDT, May 6, 2008**. NMED will provide a thirty (30) day notice of a public hearing, if scheduled.

NMED must ensure that the approved final Permit will be consistent with the New Mexico Hazardous Waste Management Regulations. All written comments submitted on the draft Permit will become part of the administrative record, will be considered in formulating a final decision, and may cause the draft Permit to be modified. NMED will respond in writing to all significant public comment. The response will specify which provisions, if any, of the draft Permit have been changed in the final Permit decision, and the reasons for the change. This response will also be posted on the NMED website in addition to NMED notifying all persons providing written comments.

After consideration of all written public comments received, NMED will issue, or modify and issue, or disapprove the Permit modification. If NMED modifies the Permit, the Permittees shall be provided by mail a copy of the modified Permit and a detailed written statement of reasons for the modifications. The NMED Secretary will make the final Permit decision publicly available and shall notify the Permittees by certified mail. The Secretary's decision shall constitute a final agency decision and may be appealed as provided by the Hazardous Waste Act. All persons on the mailing list, or that provided written comments, or who requested notification in writing, will be notified of the final decision by mail.

The final decision will become effective thirty days after service of the decision to the Permittees, unless a later date is specified or review is requested under the New Mexico Hazardous Waste Management Regulations, 20.4.1 NMAC, Section 901.E, *Hearings*.

ARRANGEMENTS FOR PERSONS WITH DISABILITIES

Any person with a disability requiring assistance or auxiliary aid to participate in this process should contact Judy Bentley by 10 days prior to the end of the public comment period at the following address: New Mexico Environment Department, Room N-4030, P.O. Box 26110, 1190 St. Francis Drive, Santa Fe, New Mexico 87502-6110, (505) 827-9872. TDD or TDY users please access Ms. Bentley's number via the New Mexico Relay Network at 1-800-659-8331.

SUBJECT: NOTICE OF PUBLIC COMMENT PERIOD AND INTENT TO APPROVE A CLASS 3 PERMIT MODIFICATION TO THE WASTE ISOLATION PILOT PLANT RCRA PERMIT – CORRECTED

Dear Interested Person:

On February 28, 2008, the New Mexico Environment Department (**NMED**) sent you a letter announcing its intent to approve a Class 3 Permit modification to the Waste Isolation Pilot Plant (**WIPP**) Resource Conservation and Recovery Act (**RCRA**) Permit. However, NMED failed to enclose the Public Notice with the letter, and is therefore re-noticing this action and extending the public comment period.

The enclosed Public Notice provides locations where the administrative record, including the Class 3 permit modification request, Fact Sheet/Statement of Basis, and related documents for this action can be reviewed, and provides procedures for submitting comments and requesting a Public Hearing. Comments and requests for Public Hearing will now be received through **5:00 pm, May 6, 2008.**

Any person seeking additional information regarding this notice or the draft permit may contact:

Subject: Response to the Administrative Completeness Determination and Applicants' Public Notice Requirements for the Renewal and Modification of Discharge Plan 831

Dear Mr. Marshall:

The purpose of this letter is to provide proof of the completion of the public notice requirements for Discharge Permit 831 in accordance with your instructions dated January 23, 2008, received January 28, 2008. NMED's Public Notice Requirements requires that within 15 days of the completion of the public notice requirements, the Permittee must submit proof of notice to NMED containing:

1. Affidavit regarding the sign posting and mailing;
2. List of names and addresses to whom the public notice flyer was mailed;
3. List of name and addresses of owners of discharge sites;
4. Copy of the newspaper ad; and
5. Check number 017630 in the amount of $30.00 for invoice ID 49722, DP-831 Poster Fee.

Therefore, enclosed are the items requested by NMED to document the administrative completeness determination and public notice requirements.

If you have any questions or require additional information, please contact Mr. Jody Plum of my staff at (575) 234-7462.

Sincerely,

David C. Moody

The Affidavit

AFFIDAVIT OF PUBLIC NOTICE COMPLETION
New Permit or Permit Modification

DP-831

I certify, under penalty of law, that I have fulfilled the Ground Water Discharge Permit public notice requirements of Section 20.6.2.3108(B) NMAC.

- ✓ I posted a sign for 30 days displaying a synopsis of the public notice in English and in Spanish at or near the proposed facility in a conspicuous public location (or multiple locations) approved by NMED.
- ✓ I posted a public notice flyer at a conspicuous off-site location approved by NMED.
- ✓ I placed a synopsis of the public notice in English and in Spanish in a newspaper approved by NMED. A copy of the newspaper page containing the synopsis is enclosed.
- ✓ I sent the public notice flyer via 1st class mail to *(check box)*:
  - ☑ owners of all properties within a 1/3 mile of the boundary of the property of the proposed discharge locations – mailing list is enclosed.
  - ☐ owners of all adjacent property (if applicant owns all property within 1/3 mile) – mailing list is enclosed.
  - ☐ owner of the property of the proposed discharge locations (if applicant is not the owner) – mailing address is enclosed.

I am aware that there are significant penalties for false certification including the possibility of fines.

Santa Fe, NM 87505-6303

Subject: Transmittal of Information Requested in a Letter Dated January 18, 2008 (Received January 22, 2008)

Dear Mr. Bearzi:

The purpose of this letter is to transmit to the Hazardous Waste Bureau the documentation requested in the subject letter relative to the discharge of approximately 150 gallons of brine water from the Exhaust Shaft Intercept Borehole Water collection system into the H-19 Evaporation Pond.

The Department of Energy (DOE) and Washington TRU Solutions LLC (WTS) appreciate this opportunity to provide the New Mexico Environment Department the documentation requested and allow your agency to review our in-depth critique of the actions that led to this incident. DOE and WTS promptly reported this issue and implemented corrective measures, including sampling the liquid and sediments from the H-19 Evaporation Pond. These actions were taken to correct brine water disposal operations and to ensure there was no negative impact to human health and the environment.

Compliance with waste management requirements is taken very seriously by DOE and WTS and every effort has and will continue to be expended to ensure the Waste Isolation Pilot Plant Facility remains in compliance in all areas. Extensive corrective measures have been identified and are being tracked through completion.

The attached documentation has been assembled to correspond to the eight sections of requested information, as noted in the request for information letter sent by your office.

If you have further questions or need additional information, please contact Mr. Jody Plum at (575) 234-7462.

Sincerely,

David C. Moody

Potential contaminants from this type of discharge include nitrogen compounds. The facility is located at 100 Caja del Rio Road, Santa Fe, in Section 35, T17N, R08E, Santa Fe County. Ground water beneath the site is at a depth of approximately 283 feet and has a total dissolved solids concentration of approximately 140 milligrams per liter.	John Hall
1622	UNM Sevilleta Field Station Steve Chavez Project Manager Office of Capital Projects University of NM 1841 Lomas Blvd., NE (MSC 07 4210) Albuquerque, NM 87131	Socorro	Socorro	UNM Sevilleta Field Station, Steve Chavez, Project Manager, proposes to discharge up to 4,425 gallons per day of domestic wastewater from a research facility to a treatment and disposal system. Potential contaminants from this type of discharge include nitrogen compounds. The facility is located just west of exit 169 on I-25, approximately 19 miles north of Socorro, in the Sevilleta Land Grant, at latitude 34 degrees, 21 minutes, 12 seconds north and longitude 106 degrees, 53 minutes, 5 seconds west, Socorro County. Ground water most likely to be affected is at a depth of approximately 137 feet and has a total dissolved solids concentration of approximately 1,580 milligrams per liter.	John Rebar

Provided the applicant has met applicable requirements, the New Mexico Environment Department (NMED) will propose for approval a Discharge Permit containing limitations, monitoring requirements, and other conditions intended to protect ground water quality for present and potential future use. Information in this public notice was provided by the applicants and will be verified by NMED during the permit application review process. NMED will accept comments and statements of interest regarding applications and will create facility-specific mailing lists for persons who wish to receive future notices. Questions, comments or statements of interest should be directed to the NMED permit contact at (505) 827-2900 or at the following address: Ground Water Quality Bureau, PO Box 26110, Santa Fe, NM 87502.

RE: Administrative Completeness Determination and Applicant's Public Notice Requirements, DP-831, Waste Isolation Pilot Plant

Dear Mr. Moody:

The New Mexico Environment Department (NMED) received a Ground Water Discharge Permit Application for the above referenced facility on December 28, 2007. Pursuant to Section 20.6.2.3108 NMAC of the New Mexico Water Quality Control Commission Regulations (20.6.2 NMAC), NMED determined on January 18, 2008 that your application is administratively complete.

Within 30 days of the date your application was deemed administratively complete, you must provide public notice as required by Section 20.6.2.3108 NMAC. Instructions and materials needed to complete the public notice are enclosed.

A technical reviewer will contact you within the next few months if additional information is needed to process your application. If you have a deadline of concern in the interim or any questions, please call the Ground Water Quality Bureau at (505) 827-2900.

Sincerely,

Felicia Vort

INTRUCTIONS FOR COMPLETING PUBLIC NOTICE REQUIREMENTS

Discharge Permit DP- 531 ☐ New ☐ Modification ☒ Renewal & Modification

Within 30 days of the date NMED deemed your Discharge Permit application administratively complete, you must provide public notice as follows:

1. **Post sign(s) at the facility.**
   Enclosed is a sign 2 x 3 feet in size (or multiple signs if required) which must be posted **at or near the facility** in a conspicuous location approved by NMED. An invoice for the sign(s) is enclosed.
   NMED approves the following sign posting location(s): At North and South gate entrances.

2. **Post a public notice flyer off-site.**
   The enclosed public notice flyer which must be posted **off-site** at a location conspicuous to the public and approved by NMED. NMED approves the following flyer posting location: Carlsbad Post Office

3. **Mail a public notice flyer to property owners within 1/3 mile.**
   A copy of the enclosed public notice flyer must be sent by 1st class mail to the owners of record of all properties within 1/3 mile from the boundary of the property where the discharge site is located. If there are no properties within 1/3 mile other than properties owned by the applicant, then the flyer must be mailed to the owners of record of the nearest adjacent properties.

   The names and addresses of property owners can be obtained from the county tax assessor's office. The list of property owners' names and addresses must be submitted to NMED.

4. **Mail a public notice flyer to the owner of the discharge site.**
   A copy of the enclosed flyer must be sent via certified mail, return receipt requested, to the owner(s) of the discharge site(s), if the applicant is not the owner. The list of owners' names and addresses and the certified mail receipts must be submitted to NMED.

5. **Place a display ad in the newspaper.**
   A display ad 3 x 4 inches in size must be published for one day in a newspaper of general circulation in the location of the proposed discharge. The ad may **not** be placed in the classified or legal section. The text for the ad is enclosed. NMED approves publishing the ad in the following newspaper: Current Argus

PROOF OF NOTICE. Within 15 days of completing the above requirements, the applicant must submit the following items as proof of notice to NMED:

- ✓ Affidavit regarding the sign posting and mailing (form enclosed).
- ✓ List of names and addresses to whom the public notice flyer was mailed.
- ✓ List of names and addresses of owners of discharge sites.
- ✓ Certified mail receipts for mailing to discharge site owner(s), if required.
- ✓ Copy of newspaper ad.

Send to NMED Ground Water Quality Bureau, PO Box 26110, Santa Fe, NM 87502.

Reviewer's Initials and Date [signature] 1/9/08

PUBLIC NOTICE
Discharge Permit Application

Waste Isolation Pilot Plant, DP-831

DP-831, U.S Department of Energy Waste Isolation Pilot Plant, David Moody, Manager, proposes to renew and modify the Discharge Permit for the discharge of up to 1,368,000 gallons per day of domestic and process wastewater and up to 4,224,835 gallons per day of stormwater to a treatment and disposal system. Potential contaminants from this type of discharge include nitrogen compounds, chloride, sulfate, and total dissolved solids. The facility is located 32 miles east of Carlsbad on the Jal Highway, Carlsbad, in Sections 20, 28 and 29, T22S, R31E, Eddy County. Ground water beneath the site is at a depth of approximately 167 feet and has a total dissolved solids concentration of approximately 3,800 milligrams per liter.

The applicant is seeking a Discharge Permit for the proposed discharge. Provided the applicant has met applicable requirements, the New Mexico Environment Department (NMED) will propose a Discharge Permit containing limitations, monitoring requirements, and other conditions intended to protect ground water quality for present and potential future use. Information in this public notice was provided by the applicant and will be verified by the New Mexico Environment Department during the permit application review process. NMED will accept comments and statements of interest regarding the application and will create a facility specific mailing list for persons who wish to receive future notices.

You may send comments or statements of interest to:

Clint Marshall, DP-831
Ground Water Quality Bureau
PO Box 26110
Santa Fe, NM 87502.

Application in separate bound report

Subject: Discharge Permit 831 Renewal Application

Dear Ms. Menetrey:

Enclosed are three copies of the Discharge Permit 831 (DP-831) Renewal Application and Modification for the Waste Isolation Pilot Plant (WIPP) located in Eddy County, New Mexico and the $100.00 filing fee. Representatives of the Department of Energy (DOE) met with Mr. C. Marshall of your staff on August 23, 2007, to discuss these proposed changes. This application reflects the following modifications to the existing DP-831:

1. The April, 2003, Renewal of DP-831 contained a new requirement to maintain two feet of freeboard in the sewage treatment system ponds and at the H-19 Evaporation Pond. The sewage treatment system design is based on maintaining one foot of freeboard and was operated until 2003 with the design basis of one foot of freeboard with no releases due to wave action. The H-19 Evaporation Pond has four foot horizontal to one foot vertical side slopes. At one foot of freeboard, the water line is four feet from the perimeter of the pond and overflow from wave action is not a concern. For these reasons, we request that the discharge permit be modified to require only one foot of freeboard.

2. The current discharge permit has discharge limits based on average monthly discharge for volumes for the H-19 Evaporation Pond (8,000 gallons per day) and Evaporation Pond B (2,000 gallons per day) at the Sewage Treatment System. This application requests maximum discharge volumes based on the capacity of the evaporation ponds with the condition that one foot freeboard be maintained in the pond. This change will allow the capacity of the evaporation ponds to be utilized and minimize the need for the off-site disposal of water at commercial facilities when special projects (e.g. pump tests on ground water wells or during ground water well development) occur that generate larger than normal volumes of water.

3. The removal of the requirement to monitor for radionuclides (Pu^{238}, $Pu^{239/240}$, U^{234}, U^{235}, U^{238}, Am^{241} and Sr^{90}) in the sewage lagoons and the H-19 Evaporation Pond for the following reasons:

CBFO:AMO:HLP:KJB:07-2232:UFC5486

- The DOE has monitored these radionuclides in accordance with DP-831 for 12 years with concentrations at background levels or below counting limits.

- Annual environmental monitoring at WIPP, reported in the Annual Site Environmental Report, includes monitoring for these radionuclides in surface water, soil and biota.

4. Total and dissolved selenium and chromium in all the infiltration control ponds (Pond 1, 2 and A) have been non-detect since pond installation. Nitrate has typically been below detection limits also during that time. The DOE would like to remove the monitoring for nitrate, selenium and chromium in surface water from the infiltration control ponds.

5. Request to remove the requirement for monitoring infiltration control pond levels to 100th of a foot. The DOE recommends the nearest tenth of a foot, rough order of magnitude as measured with a graduated staff gauge.

If you have any questions regarding this transmittal, please contact Mr. Jody Plum at (505) 234-7462.

Sincerely,

David C. Moody

Subject: Discharge into the H-19 Evaporation Pond of Approximately 150 Gallons of Brine Containing Approximately 6.83 mg/L of Lead

Dear Sirs:

The purpose of this letter is to provide you with our written report, as required by 20.6.2.1203.A.(6) NMAC, concerning the subject occurrence. On November 20, 2007, Department of Energy (DOE) submitted our Notification of Discharge-Removal in accordance with 20.6.2.1203.A.(1) NMAC informing the Ground Water Quality Bureau (GWQB) of an unintended discharge into the H-19 Evaporation Pond. Such discharges are regulated by conditions found in Discharge Permit DP-831, issued to the DOE for operations at its Waste Isolation Pilot Plant (WIPP). This letter is intended to provide a description of events that caused this condition to occur and the corrective actions taken in response to this discharge as required by 20.6.2.1203.A.(6) NMAC. A sample of brine examined exhibited a lead concentration of approximately 6.83 milligrams per liter (mg/L), which exceeds the 20.4.1.200 NMAC (adopting 40 CFR 261.24) regulatory threshold limit of 5.0 mg/L for the characteristic of toxicity for lead.

On Friday, November 9, 2007, at approximately 10:00 a.m., 560 gallons of brine from the Exhaust Shaft Interception Borehole System was transported from a staging area near the WIPP Waste Handling Building to the H-19 Evaporation Pond. Approximately 150 gallons of brine was discharged by gravity feed into the H-19 Evaporation Pond. During the transfer of brine, an employee involved in this work questioned if the required paperwork had been completed and signatory approvals obtained, as required by WIPP Procedure WP 02-EM1016, *Request to Discharge to Evaporation Ponds*. The employee stopped work and evaluated the situation. It was then discovered that documentation (Request for Disposal, Attachment 1 of WP 02-EM1016 and the analytical results) authorizing the disposal of this brine in the H-19 Evaporation Pond was not complete. It was also discovered that the initial analytical results for the brine sample collected from the portable 1,000-gallon container from the Exhaust Shaft Interception Borehole System indicated that the sample contained greater than 5mg/L of lead.

The remaining 410 gallons of brine have been transferred to eight 55-gallon drums. These drums have been labeled, are being managed, and will be disposed of off-site.

Representative samples were collected of the sediment and brine in the H-19 Evaporation Pond on Tuesday, November 20, 2007. Four representative sediment samples were collected from each quadrant of the pond using a scoop, and were composited into one

CBFO:AMO:HP:LC:07-2228:UFC:5486

sample for analyses. One grab sample was also collected from the northwest corner of the pond near where the discharge occurred. A grab sample of brine was also collected from each quadrant of the pond. The analytical results are summarized in the following table.

Section of H-19 Sampled	Lead Concentration	
	Total	TCLP
Northwest Corner grab (Point of Discharge) Sediment	11.6 mg/kg	<0.100 mg/kg
Quadrant I Brine	<0.05 mg/l	<0.100 mg/l
Quadrant I Sediment	11.4 mg/kg	<0.100 mg/kg
Quadrant II Brine	<0.05 mg/l	<0.100 mg/l
Quadrant II Sediment	3.80 mg/kg	0.221 mg/kg
Quadrant III Brine	<0.05 mg/l	<0.100 mg/l
Quadrant III Sediment	3.32 mg/kg	0.221 mg/kg
Quadrant IV Brine	<0.05 mg/l	<0.100 mg/l
Quadrant IV Sediment	2.52 mg/kg	0.203 mg/kg

The average concentration of lead throughout the H-19 Evaporation Pond is 6.5 mg/kg (range of 2.52 mg/kg to 11.6 mg/kg) in the sediment. Lead concentrations suspended in the brine solution in the pond are below the detection limit. The WIPP *No Further Action Proposal for Solid Waste Management Units and Areas of Concern* (DOE/WIPP 02-3221, September 2002), established background lead concentrations in soil at 2.2 mg/kg (maximum of 5.4 mg/kg, minimum 1.2 mg/kg) using 55 data points. The New Mexico Environment Department's *Technical Background Document for Development of Soil Screening Levels*, Rev. 4.0 (June 2006) establishes a risk-based residential standard for lead in soil at 400 mg/kg. Therefore, the H-19 analytical results clearly indicate that no threat to human health, the environment, or property on or off-site has occurred.

Other corrective actions that have been taken to ensure that site procedures are followed include the following:

- WIPP Form WF08-011 was issued to ensure that a complete evaluation of the cause of the incident and corrective actions to prevent recurrence are put in place.

- A sign was placed on the gate at the H-19 Evaporation Pond to require approval from the Site Environmental Compliance Group prior to any disposal.

- A review of files for previous brine disposal was conducted to ensure no other unauthorized discharges had occurred. No other discharges unauthorized by DP-83 have occurred.

- Staff were directed to maintain in their possession copies of the completed waste water disposal packages (Request for Disposal, Attachment 1 of WP 02-EM1016, and the analytical results) when disposing of water.

- Staff performing any procedural functions associated with brine disposal in H-19 have been directed to have the procedure with them and to verify that all procedural steps are followed. If updates are needed to clarify or strengthen a procedure, corrections are to be noted to ensure timely revision of the procedure.

CBFO:AMO:HP:LC:07-2226:UFC:5486

- The analytical laboratory was immediately requested to rerun the analyses and review their laboratory processes to determine if there could have been an error in sample processing (e.g., dilution factors). Results were received on November 15th verifying that the concentration of lead was 6.83 mg/L.

A thorough review of waste water disposal procedures to determine any improvements to prevent the recurrence of this condition remains to be completed. If you have any questions or need additional information, please contact Mr. H.L. Plum at (505) 234-7462.

Sincerely,

David C. Moody

BUREAU

Subject: Notification of Discharge

The purpose of this letter is to confirm the U. S. Department of Energy's (DOE), Carlsbad Field Office (CBFO) verbal report to you at approximately 4:40 p.m., Friday, November 16, 2007. This report was made to Mr. C. Marshall by Mr. H. L. Plum, DOE/CBFO. This information is being provided to you in accordance with 20.6.2 NMAC, 20.6.2.1203 NOTIFICATION OF DISCHARGE-REMOVAL:

(a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility:

Persons in charge of the facility:	David C. Moody, Manager 4021 National Parks Highway Carlsbad, New Mexico, 88220 (505) 234-7300
Owner of the facility:	U. S. Department of Energy
Operator of the facility:	Washington TRU Solutions LLC

(b) Name and address of the facility:

U. S. Department of Energy
Waste Isolation Pilot Plant
30 miles east of Carlsbad, New Mexico off of State Highway 128
Carlsbad, NM 88220

(c) The date, time, location, and duration of the discharge:

Date: November 9, 2007
Time: 10:00 a.m.
Location: WIPP Site H-19 Evaporation Pond
Latitude: 32 21.532, Longitude 103 46.975
Duration: 15 minutes

CBFO:AMO:HLP:KJB:07-2224:UFC5486

(d) The source and cause of the discharge:

Source: Exhaust Shaft Intercept Borehole brine collection system.

Cause of discharge:

Approximately 560 gallons of brine from the Exhaust Shaft Intercept Borehole collection system was transported to the H-19 Evaporation Pond for disposal. During the brine disposal, the employee questioned if the procedurally required documentation for water disposal had been completed. The employee stopped work after transferring approximately 150 gallons of brine into the H-19 Evaporation Pond. Later, it was determined that documentation authorizing the disposal of this water into the H-19 Evaporation Pond was not complete.

(e) A description of the discharge, including chemical composition:

This brine was removed from the underground Exhaust Shaft Intercept Borehole collection system. It was sampled to determine its waste characteristics. This batch of water contained lead in the sample and sample duplicate with analytical results of 6.75 and 6.83 mg/L. The 150 gallons of brine were placed in the H-19 Evaporation Pond, which is a lined basin permitted for disposal under the existing Discharge Permit Number 831.

(f) The estimated volume of the discharge:

150 gallons

(g) Any actions taken to mitigate immediate damage from this discharge:

The following actions were taken:

- Upon noting that the brine had been transferred into H-19 without following the procedure, all brine disposal in H-19 was immediately stopped.
- A sign was placed on the gate at the H-19 Evaporation Pond to require additional approval prior to any disposal.
- Staff was directed to maintain, in their possession, a copy of the completed waste water disposal package (Request for Disposal, Attachment 1 of WP 02-EM1016, and the analytical results) when disposing of water.
- A WIPP Form WF08-011 (Corrective Action Report) was issued to tracking and completion of corrective measures.

Staff performing any procedural functions was directed to have the procedure with them and verify that applicable procedural steps are followed.

Notification of Discharge-Removal in 20.6.2.1203(6) NMAC requires the facility owner/operator to submit a report describing any corrective actions taken or to be taken relative to the discharge. As was requested in the November 16th telephone notification, water and sediment samples from the H-19 Evaporation Pond were collected. At the earliest, the analytical results will be available November 29, 2007. State statute 20.6.2.1203(6) NMAC requires that written corrective actions deemed necessary be submitted within 15 days after the discharger learns of the discharge. In order to accommodate the use of the data from the samples, the Permittees will make every effort to submit this report to the New Mexico Environment Department Ground Water Bureau by November 30, 2007.

At this time we believe the discharge poses no threat to human health, the environment or property. If you have any further questions regarding this matter or the proposed date to submit the follow-up report, please contact Mr. H. L. Plum at (505) 234-7462.

Sincerely,

David C. Moody

Subject: Transmittal of the Waste Isolation Pilot Plant Groundwater Level Measurements for September 2007

Dear Mr. Bearzi:

The purpose of this letter is to submit the Waste Isolation Pilot Plant groundwater level data for the month of September 2007, as required by Module V.J.2.b of the Hazardous Waste Facility Permit No. NM4890139088—TSDF.

We certify under penalty of law that this document and all enclosures were prepared under our direction or supervision according to a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on our inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of our knowledge and belief, true, accurate, and complete. We are aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Please feel free to contact Mr. Jody Plum at (505) 234-7462 if you have any questions regarding this data transmittal.

Sincerely,

David C. Moody, Manager
Carlsbad Field Office

M. R. Sharif, General Manager

SUMMARY COMMENTS FOR THE WATER LEVEL MEASUREMENTS FOR THE MONTH OF SEPTEMBER 2007

1. The WIPP Hazardous Waste Facility Permit (HWFP), Attachment L, Section L-4c (1) requires cumulative fluctuations noted in the Detection Monitoring Program wells of more than two feet in the course of one year which are not attributable to site tests and subsequent stabilization to be reported. Section 6.2.5 of the Calendar Year 2006 Annual Site Environmental Report, submitted to the New Mexico Environment Department in compliance with HWFP Module V.J.2.C, reports regional and DMP water level rises greater than two feet and offers possible causes.

2. Groundwater level measurements were not taken at wells SNL-14 and WIPP-25 due to Sandia National Laboratories (SNL) testing and instrumentation activities. Water level measurements will resume when the instrumentation is removed. These activities are expected to be completed by the end of 2007.

3. Water levels at H-15 do not reflect natural conditions. The packer was inflated with fresh water in December 2006 leaving residual water in the tubing, thus affecting the density. Equilibration will occur with time after mixing.

4. Groundwater levels in SNL-15 were affected during this round of measurements due to discrete water quality sampling performed at this location by SNL in April 2007.

5. The water density for SNL-6 has not been measured; therefore, the equivalent freshwater head has not been calculated. The fluid density for SNL-6 will be determined in the 2007-pressure density survey.

6. SNL-16 was repaired on 07/18/07. The top of casing (TOC) elevation is the pre-damaged elevation. This well will be resurveyed when new wells are drilled and surveyed. By the nature of the damage and repair, there was no significant change to the TOC elevation.

7. Adjusted freshwater heads are based on published fluid density data and pressure density surveys. Density values may be adjusted when a well experiences a significant event such as well maintenance, sampling, development, or pumping activities if the wellbore fluid density is altered.

Subject: Additional Salt to be put in Cell A

Discussion:

Jody and Stewart called as a follow-up to the June 27 letter stating the possible need to put additional salt in Cell A. The current capacity is 330,000 tons. They may have to add an additional 70,000 tons but will not know until September. They are having difficulty finding a contractor to build Cell B. I told them that even though the design is in their DP application, the permit only regulates the amount of runoff going to the collection ponds. Therefore, they do not need to amend or modify the permit.

Conclusions:

WIPP will send us notification if they have to put additional salt in Cell A.

Subject: Request for an Increase of Salt Storage Capacity in Cell A of the Salt Storage Extension, Discharge Permit 831

Dear Mr. Marshall:

The purpose of this letter is to notify the NMED of the need to increase the total capacity of Cell A of the Salt Storage Extension. Because the capacity of Cell A is listed in our Discharge Permit Application, your authorization is required before we can implement this increase. Specifically, in the *Waste Isolation Pilot Plant Conceptual Design For Infiltration Controls*, Attachment A, Table A.2 of the Discharge Permit Modification Application dated April 24, 2003, the capacity of Cell A of the Salt Storage Extension was noted as 330,000 tons and the capacity of Cell B was noted as 450,000 tons. The 330,000 ton capacity for Cell A was estimated at the convenience of the Permittees based on the height of the new salt storage extension area being slightly higher than the capped Salt Storage Area. The capacity of Cell A, as designated in the Discharge Permit Application, was not based on regulatory, safety or other technical requirements. Authorizing the Department of Energy to add additional salt in Cell A will have no impact on the maintenance and safe operation of the Salt Storage Extension or the volume of storm-water managed in the Salt Storage Extension Evaporation Pond.

The reason for this request to add additional salt to Cell A is due to difficulties in obtaining a contractor to complete the construction of Cell B. Contracting efforts began last February when the first request for proposals was issued. In May, a second request for proposal was sent out to a broader group of prospective bidders due to the lack of adequate response to the first solicitation. A proposal has been received and we intend to award a contract and mobilize the contractor; however, we need authorization to add an approximate 70,000 tons of additional salt to Cell A to support WIPP mining operations for approximately 20 weeks.

If you have any questions, concerns or would like to discuss this subject, please contact me at (505) 234-7462. Your concurrence in this matter would be appreciated.

Sincerely,

Harold Johnson for

RE: Approval of SPDV Pile Shallow Groundwater Investigation Work Plan, Waste Isolation Pilot Plant, DP-831,U.S. Department of Energy

Dear Mr. Plum:

The Ground Water Quality Bureau of theNew Mexico Environment Department (NMED) has reviewed the report titled, *SPDV Pile Shallow Groundwater Investigation Work Plan (Revision 2)*, submitted on May 7, 2007. The report includes a response to NMED comments provided to DOE dated March 28, 2007. NMED finds the response acceptable and hereby approves the revised work plan.

If you have any questions, please contact me at 505-827-0027.

Sincerely,

Clint Marshall

Subject: Transmittal of Work Plan for Installation of Three Piezometers around the Site and Preliminary Design Validation Salt Tailings Disposal Pile

Dear Mr. Marshall:

This letter transmits to you, our responses to your comments in a letter dated March 28, 2007. In addition, is the updated work plan and schedule for the investigation to detect shallow groundwater, if present, at the Waste Isolation Pilot Plant Salt and Preliminary Design Validation for your approval.

Please provide approval at your earliest convenience so we can begin the subcontractor procurement process.

If you have any questions, you may contact me at 505-234-7462.

Sincerely,

H. L. Plum

Response to NMED GWQB Comments
Dated March 28, 2007

1) **NMED GWQB Comment #1:** Upon reviewing potentiometric data for the shallow subsurface water (SSW) at the WIPP site, NMED requires that the location of the piezometers be adjusted. The latest monitoring data suggests that the piezometric surface for the SSW dips eastward or slightly southeastward. Therefore, the piezometer located on the west side of the SPDV Pile should be moved northward toward the northwest corner. The piezometer on the east side of the pile should be moved southward toward the southeast corner. This configuration will be better suited for upgradient and downgradient monitoring of the SSW with respect to the SPDV Pile.

   Answer: The piezometers were moved as previously discussed with Mr. Marshall on or about March 29, 2007. Figure 2 shows the revised locations.

2) **NMED GWQB Comment #2:** Please provide more detail of the screening of a wet zone if it is not found at the Santa Rosa/Dewey Lake (SR/DL) contact. Please provide additional discussion as to whether the well will be advanced to the contact if a wet zone is found above the contact.

   Answer: This comment suggests that SSW might be detected above the SR/DL. If so, a decision will have to be made as how to place well screen across this perched water. The text now shows three options for screening the well: (a) If a wet zone suspected of being SSW is detected and is not associated with the SR/DL contact, the well screen will be placed in this interval and the borehole (which will have been drilled to the SR/DL contact) will be backfilled with cement to the bottom of the PVC sump (b) If a moist or wet zone had been identified above the contact, the well screen length will be increased from the bottom up to intercept this water, to a maximum of 30 feet. (c) If a moist zone of shallow groundwater is not identified, the well screen will be placed across the sulfate cementation zone or SR/DL contact where shallow groundwater should be perched.

3) **NMED GWQB Comment #3:** An appropriate sand pack must be used to accommodate the larger screen slot size proposed in the well design.

   Answer: The 10/20 grade sand pack/filter is appropriately sized for the screen size and the formation. The Santa Rosa Formation and Dewey Lake are medium grained. Medium to coarse grained sand is about 0.02 to 0.04 inches. A 10/20 filter pack is gradational between sieve sizes 0.065" (#10), 0.046"(#14), 0.033"(#20). The goal is to have 70% of the fines retained by the filter pack and 90% of the filter pack retained by the screen (general rule). The filter pack should all be retained by the screen as the sieve sizes are all larger than the screen. Based on the Santa Rosa and Dewey Lake we should be able to retain 70% of the finer sediment, but this is qualitative as there are no available sieve analyses.

4) **NMED GWQB Comment #4:** Section 2.1.1 states the wells will be advanced five feet below the SR/DL contact. However, Section 2.1.2 and Figure 5 indicate a one-foot sump below the screen. Please provide clarification on this discrepancy.

   Answer: Whereas five feet of this contact layer will have been penetrated to verify it, a partial cement backfill of the perching layer with cement will protect its integrity. The one foot PVC sump will leave room for approximately four feet of cement.

5) **NMED GWQB Comment #5:** NMED is concerned that backfilling the sump with bentonite without interfering with the base of the screen will be difficult. Please provide additional information on how this will be accomplished.

   Answer: The work plan has been changed to use (pre-measured) cement placed by tremmie pipe.

6) **NMED GWQB Comment #6:** Section 2.1.4 states that piezometers that do not produce water within six months will be considered for plugging and abandonment. NMED requires that the piezometers stay open for a minimum of two years. The DOE must obtain NMED approval prior to well abandonment.

   Answer: The text has been revised to state: Each well in which water is found will then be incorporated into the quarterly water level monitoring program and semiannual sampling program as defined by DP-831. If water is not detected, the wells will be incorporated into the quarterly water-level monitoring program only. If no water is detected within two years after installation, discussions will be held with the NMED GWQB to determine if the well can be plugged and abandoned.

SPDV Pile Shallow Groundwater Investigation Work Plan

1.0 BACKGROUND

The Waste Isolation Pilot Plant (WIPP), located 26 miles east of Carlsbad, New Mexico (Figure 1), is a transuranic waste disposal facility operated by the U.S. Department of Energy (DOE). Transuranic waste is disposed in the Salado Formation, a bedded salt deposit, 2,150 feet below ground surface. Salt and other mined rock materials from the construction of WIPP and currently mined salt are stored on the surface in three stockpiles. The stockpiles include, from oldest to newest, the Site and Preliminary Design Validation (SPDV) pile closed in 2000 with an engineered cover, the Salt Storage Area (SSA), previously used for mined salt and materials, but recently covered with a synthetic and earthen liner, and the Salt Storage Extension (SSE) for currently mined salt. Storm water from these stockpiles discharges to five synthetically lined impoundments (Salt Pile Evaporation Pond [SPEP], Pond A, Salt Storage Extension Evaporation Basin, Pond 1, and Pond 2 [Figure 2]) are included in the Discharge Permit 831 (DP-831) as discharge locations.

Shallow Subsurface Water (SSW) was first detected in 1995 when a video inspection of the Exhaust Shaft detected seepage through the shaft liner from about 50 to 80 feet below ground surface (bgs). After 1995, a series of hydrologic assessments was undertaken to identify the source and nature of the SSW at WIPP. Sixteen wells were installed around the site (Figure 2) to assess the SSW. The SSW was detected in all but one well, PZ-8, which was dry until March 2007. The SSW is a shallow-perched, water-bearing zone that sits on a cementation change at the formational contact between the Santa Rosa Formation and the upper Dewey Lake Formation. The SSW is believed to be entirely anthropogenic in nature, resulting in part from historical natural discharges from locations identified in the above paragraph and DP-831.

In December 2003 the New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) issued a modified DP-831 indicating that the unlined ponds and stockpiles be lined with a synthetic liner: SSA and SPEP, Ponds 1 and 2, Pond A. Additionally, a new SSE was to be constructed with a synthetically lined base on which infiltration and surface run off from this pile would be directed to a new evaporation basin. Also included in this modification was to implement a monitoring program of the SSW that included quarterly water level measurements from all the SSW wells and semiannual sampling of selected SSW wells for total dissolved solids, chloride, sulfate, nitrate, chromium, and selenium. This program was implemented in May 2004 and continues to date.

On December 29, 2006, the NMED GWQB issued another DP-831 modification with a condition that the SPDV be investigated as a possible source of shallow groundwater. The modification indicated the WIPP should install three monitoring wells adjacent to the SPDV. These wells are then to be incorporated into the SSW monitoring and sampling program.

Site Map

2.0 SCOPE AND PURPOSE

The purpose of this Work Plan is to describe the proposed locations of three small-diameter monitoring wells, the logging of the boreholes, and the planned methodology of installing these wells. The SPDV (Figure 2) is a closed salt pile that stored the materials drilled from the site preliminary design activities at WIPP. The pile includes salt from the Salado Formation and substrata from overlying formations: Rustler Formation, Dewey Lake Formation, Santa Rosa Formation and Gatuna Formation.

The SPDV was closed in 2000 by covering it with geosynthetic liner installed on six inches of bedded material and covered with a minimum of three feet of earthen material. The plan is to install three 2-inch-diameter wells around the SPDV outside the liner footing as indicated in Figure 3 (PZ-13, PZ-14, PZ-15). The purpose is to identify the presence, if any, of shallow groundwater around the SPDV, and if present, the quality of the water. This work plan has some areas in which the installation of the piezometers deviate from the NMED guidance entitled *"NMED Guidelines for Monitoring Well Construction and Abandonment"*. Where there is a deviation it is called out in this plan requesting approval. By approving this work plan the NMED approves these deviations; therefore there will not be additional approval processes necessary.

2.1 Methodology

2.1.1 Drilling and Lithologic Sampling

Drilling the boreholes will be performed using dry drilling techniques in order to identify the cementation change and if there is a discernable "wet zone" consisting of shallow groundwater from the SPDV or other area. Hollow-stem auger drilling will be the preferred method to drill using continuous sampling of the formations. If auger refusal should occur, then air rotary drilling will be used. Under no circumstances will water, mist, or other drilling fluids be used while drilling these wells, as it is imperative that a wet zone be discernable if present. Continuous sample tubes will be used to obtain lithologic data on the formations. Where sample tubes cannot be used, drill cuttings will be used to define formations. Lithology will be described for each well borehole to assist in well design. A core log will be kept (Figure 4) at five-foot intervals or formation changes, whichever is more frequent, and the following will be recorded:

- Lithology, establishing mineralogy/composition of rock
- Texture: grain shape and roundness, sorting, fabric and color
- Structure, if any
- Moisture
- Consolidation

Each borehole will be drilled such that the outer diameter of the borehole is at least 6 inches in diameter (four inches larger than the well screen and casing). The depth is uncertain, but is expected to be no greater than 100 feet bgs. Each borehole will extend approximately 5 feet below the Santa Rosa/Dewey Lake contact where the sulfate cementation change occurs, to verify the contact, or to 100 feet, whichever is greater.

Based on other SSW wells and associated lithologic descriptions, the contact is expected to be between 65 and 70 feet bgs (Figure 5).

Figure 4 - Core Log

2.1.2 Well Construction

The wells will be constructed of two-inch, schedule 40 polyvinyl chloride (PVC) extending approximately two feet above ground surface. The span of the screened interval will be dependent upon the identification of the wet zone.

If a wet zone or SSW is identified that is not associated with a cementation change at the Santa Rosa/Dewey Lake contact, or if this contact has not been found within 100 feet of ground surface, the bottom of the screen will be placed at the base of the moist or wet zone with a one-foot PVC sump, 15 feet of screen above this location, and casing to the surface. This construction would include backfilling the borehole with cement to the bottom elevation of the sump.

If a moist or wet zone is identified above the Santa Rosa/Dewey Lake contact, the bottom of the screen will be placed at the base of the Santa Rosa/Dewey Lake contact and the screen length will be increased from the bottom up, to intercept that water, to a maximum of 30 feet. This will apply whether or not moisture was detected at the Santa Rosa/Dewey Lake contact.

If a moist zone of shallow groundwater is not identified, the base of the well screen will be placed across the sulfate cementation or Santa Rosa/Dewey Lake contact where shallow groundwater should be perched.

The well screen will be constructed of two-inch, schedule 40, slotted PVC to 0.020-inch. The well will be completed with sand annulus, bentonite pellets, and cement based on the screen placement. Figure 5 represents typical construction for the SPDV wells.

In all cases above, the bottom of the well screen will have a one-foot sump. If the Santa Rosa/Dewey Lake contact, or some other feature impeding downward flow, is the reason for perched water, it is important not to perforate this apparent barrier. Therefore, the bottom of the borehole will be cemented back with tremmie pipe to the bottom of the one-foot PVC sump. The cement interval will be minimal if the screen is at the Santa Rosa Dewey Lake contact, but will be greater if the SSW is not associated with the cementation change and the well screen is to be placed higher. With this type of completion, there will be one foot of sand below the bottom of the slotted liner as compared to two feet described in the NMED guideline. Also, the well screen for the piezometers will be slotted at 0.020-inch screen versus 0.010-inch as defined in the guidance. This is based on knowledge of the sediments being a medium-grained sand.

2.1.3 Well Development

Each well will be allowed to rest for at least 24 hours to allow shallow groundwater to accumulate if present. Following this period of recharge the wells will be evacuated using air lifting and surge block techniques. The wells will be developed until the existing water reaches equilibrium through measurement of field parameters (pH, temperature, conductivity) or the removal of three well volumes has occurred. If no water accumulates, development will not occur, but the well will remain for future water level monitoring.

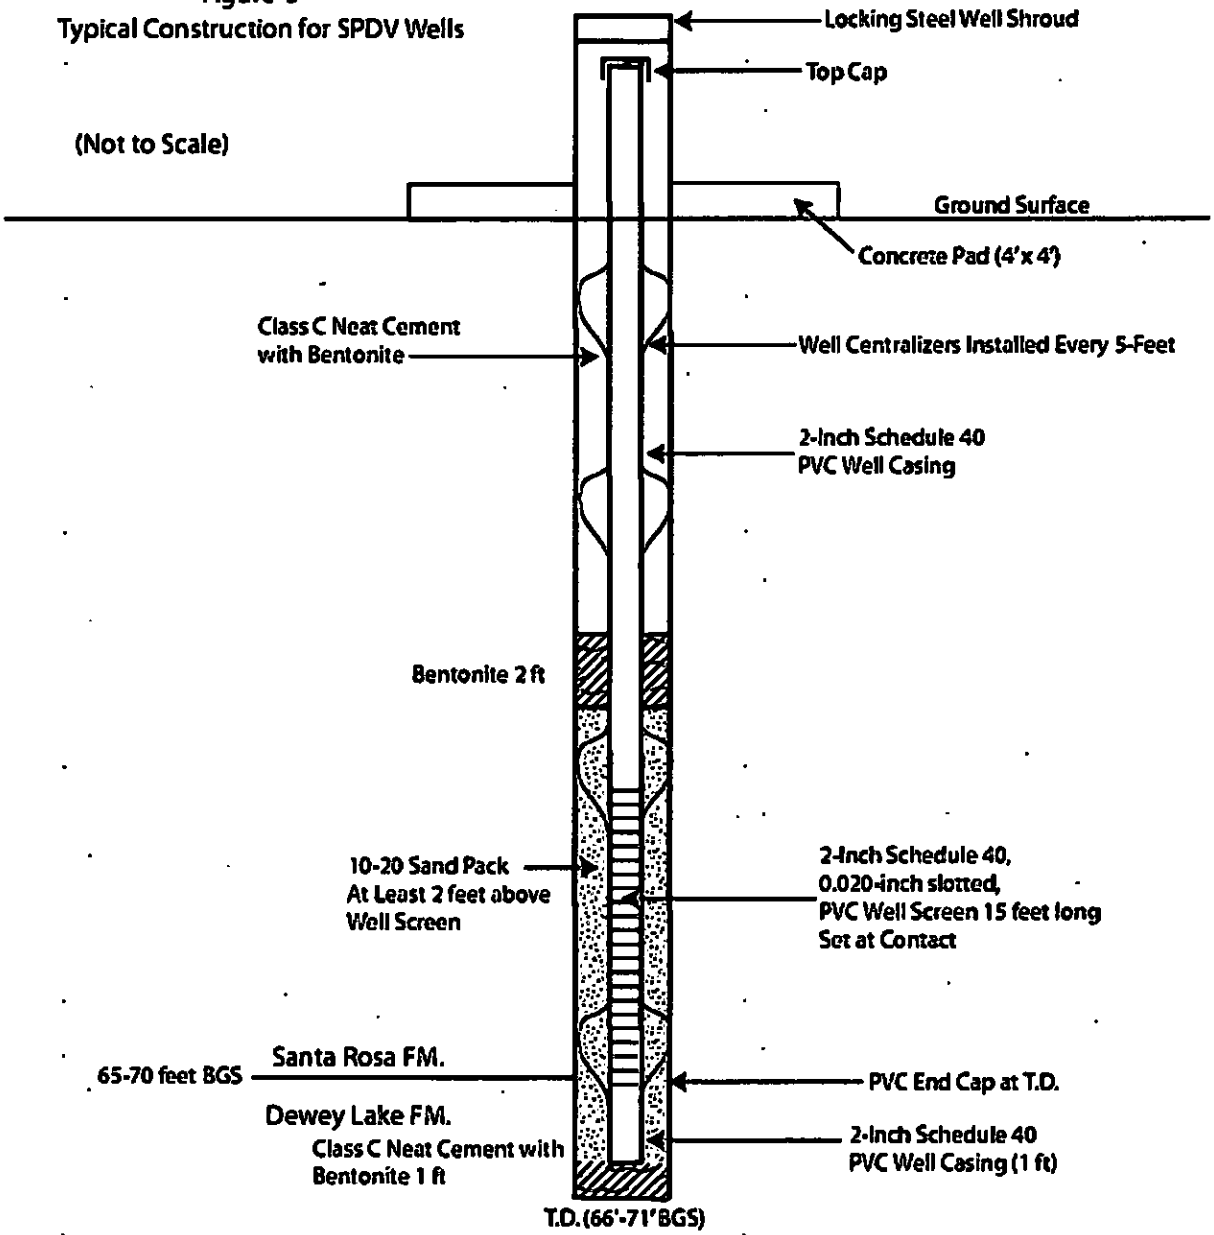
2.1.4 Well Sampling

If water is detected in the wells, sampling will occur following development. Low-flow sampling techniques will be used to purge the well. Continuous monitoring of purge water will occur using a flow through cell. Field parameters will consist of pH, temperature, and conductivity. A sample will be obtained after three consecutive readings for each parameter fall within the sampling criteria: ± 0.5 pH units, ± 10% temperature, and ± 10% conductivity. The samples will be laboratory analyzed for total dissolved solids, chloride, sulfate, nitrate, chromium, and selenium as defined in DP-831.

Each well in which water is found will then be incorporated into the quarterly water level monitoring program and semiannual sampling program as defined by DP-831. If water is not detected, the wells will be incorporated into the quarterly water-level monitoring program only. If no water is detected within two years after installation, discussions will be held with the NMED GWQB to determine a path forward.

Figure 5
Typical Construction for SPDV Wells

(Not to Scale)



3.0 REPORTING

A basic data report (BDR) will be developed for each well following the installation, receipt of any laboratory analyses, and survey of the well locations and top of casing elevations to a common benchmark. The BDR will summarize the geology, hydrology, well installations and construction. A discussion of encountered water in relation to SSW on-site, if any, will be included. Laboratory reports will be included in the BDR with a discussion of the relationship to SSW, if any. Well reports filed with the New Mexico Office of the State Engineer (NMOSE) will be included in the BDR as well as well construction diagrams and lithologic logs. An updated site map with the SPDV wells will be provided with an updated potentiometric surface map.

3.1 Reporting in Accordance with DP-831 Permit Condition IV.10

After the piezometers are installed they will be incorporated into the quarterly water level monitoring program and semiannual sampling program. The DOE will submit the information gathered in semiannual monitoring reports due by the last day of January and July of each year as required in Condition 10 of the December 29, 2006, Discharge Permit Modification.

4.0 SCHEDULE

The following schedule estimates the dates that the wells will be installed and provides the necessary steps in the process.

Activity	Date of Activity
WIPP Receives Permit	December 29, 2006
Submit Work Plan and Schedule to NMED GWQB	March 29, 2007
Submit Applications to drill to the NMOSE	March 1, 2007
Receive Approval to drill from NMOSE	April 1, 2007
Coordination with the U.S. Bureau of Land Management	April 1, 2007
Procurement of Drilling Contractor	February 1, 2007
Receive Approval of Plan from NMED GWQB	April 29, 2007
Drilling Contractor Mobilization	June 1, 2007
Drill and Develop Wells	June 2-15, 2007
Sample Wells	June 22, 2007
Survey Wells/Get Data (Top of Casing)	June 16, 2007
Develop BDR	June 15 - September 15, 2007
Submit BDR to NMED GWQB	September 15, 2007

RE: Comments on the SPDV Pile Shallow Groundwater Investigation Work Plan, DP-831, Waste Isolation Pilot Plant

Dear Mr. Plum:

The Ground Water Quality Bureau of the New Mexico Environment Department (NMED) has received the submittal titled, *SPDV Pile Shallow Groundwater Investigation Work Plan* (Work Plan) submitted March 28, 2007 from the U.S. Department of Energy (DOE). The Work Plan is required under Condition 4 of the December 29, 2006 Discharge Permit Modification, DP-831. NMED has reviewed the Work Plan and provides the following comments.

1. Upon reviewing potentiometric data for the shallow subsurface water (SSW) at the WIPP site, NMED requires that the location of the piezometers be adjusted. The latest monitoring data suggests that the piezometric surface for the SSW dips eastward or slightly southeastward. Therefore, the piezometer located on the west side of the SPDV Pile should be moved northward toward the northwest corner. The piezometer on the east side of the pile should be moved southward toward the southeast corner. This configuration will be better suited for upgradient and downgradient monitoring of the SSW with respect to the SPDV Pile.

2. Please provide more detail of the screening of a wet zone if it is not found at the Santa Rosa/Dewey Lake contact. Please provide additional discussion as to whether the well will be advanced to the contact if a wet zone is found above the contact.

3. An appropriate sand pack must be used to accommodate the larger screen slot size proposed

in the well design.

4. Section 2.1.1 states the wells will be advanced five feet below the Santa Rosa/Dewey Lake contact. However, Section 2.1.2 and Figure 5 indicate a one-foot sump below the screen. Please provide clarification on this discrepancy.

5. NMED is concerned that backfilling the sump with bentonite without interfering with the base of the screen will be difficult. Please provide additional information on how this will be accomplished.

6. Section 2.1.4 states that piezometers that do not produce water within six months will be considered for plugging and abandonment. NMED requires that the piezometers stay open for a minimum of two years. The DOE must obtain NMED approval prior to well abandonment.

Please respond to these comments within 30 days of receipt of this letter. If you have any questions regarding this approval, please call me at 505-827-0027.

Sincerely,

Clint Marshall

Subject: Transmittal of Work Plan for Installation of Three Piezometers around the Site and Preliminary Design Validation Salt Tailings Disposal Pile

Dear Mr. Marshall:

The purpose of this letter is to transmit a work plan, with schedule included, for an investigation to detect shallow groundwater, if present, at WIPP Site and Preliminary Design Validation Salt Tailings Disposal pile. According to DP-831, this plan requires your approval before we can proceed. This work plan has some areas in which the installation of the piezometers deviate from the NMED guidance entitled "*NMED Guidelines for Monitoring Well Construction and Abandonment*". Where there is a deviation it is called out in this plan requesting approval. Please provide any comments and/or your approval to me at your earliest convenience. We would like to initiate this work on May 2, 2007.

Please contact me at (505) 234-7462, if you have any questions or require additional information.

Sincerely,

H. L. Plum
RCRA Program Manager

1.0 BACKGROUND

The Waste Isolation Pilot Plant (WIPP), located 26 miles east of Carlsbad, New Mexico (Figure 1), is a transuranic waste disposal facility operated by the U.S. Department of Energy. Transuranic waste is disposed in the Salado Formation, a bedded salt deposit, 2,150 feet below ground surface. Salt and other mined rock materials from the construction of WIPP and currently mined salt are stored on the surface in three stockpiles. The stockpiles include, from oldest to newest, the Site and Preliminary Design Validation (SPDV) pile closed in 2000 with an engineered cover, the salt storage area (SSA), previously used for mined salt and materials, but recently covered with a synthetic and earthen liner, and the Salt Storage Extension (SSE) for currently mined salt. Storm water from these stockpiles discharges to five synthetically lined impoundments (Salt Pile Evaporation Pond [SPEP], Pond A, Salt Storage Extension Evaporation Basin, Pond 1, and Pond 2 [Figure 2]) are included in the Discharge Permit 831 (DP-831) as discharge locations.

Shallow Subsurface Water (SSW) was first detected in 1995 when a video inspection of the Exhaust Shaft detected seepage through the shaft liner from about 50 to 80 feet below ground surface (bgs). After 1995, a series of hydrologic assessments was undertaken to identify the source and nature of the SSW at WIPP. Sixteen wells were installed around the site (Figure 2) to assess the SSW. The SSW was detected in all but one well, PZ-8, which continues to be dry to date. The SSW is a shallow-perched, water-bearing zone that sits on a cementation change at the formational contact between the Santa Rosa Formation and the upper Dewey Lake Formation. The SSW is believed to be entirely anthropogenic in nature, resulting in part from historical natural discharges from locations identified in the above paragraph and DP-831.

In December 2003 the New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) issued a modified DP-831 indicating that the unlined ponds and stockpiles be lined with a synthetic liner: SSA and SPEP, Ponds 1 and 2, Pond A. Additionally, a new SSE was to be constructed with a synthetically lined base on which infiltration and surface run off from this pile would be directed to a new evaporation basin. Also included in this modification was to implement a monitoring program of the SSW that included quarterly water level measurements from all the SSW wells and semiannual sampling of selected SSW wells for total dissolved solids, chloride, sulfate, nitrate, chromium, and selenium. This program was implemented in May 2004 and continues to date.

On December 29, 2006, the NMED GWQB issued another DP-831 modification with a condition that the SPDV be investigated as a possible source of shallow groundwater. The modification indicated the WIPP should install three monitoring wells adjacent to the SPDV. These wells are then to be incorporated into the SSW monitoring and sampling program.

2.0 SCOPE AND PURPOSE

The purpose of this Work Plan is to describe the proposed locations of three small-diameter monitoring wells, the logging of the boreholes, and the planned methodology of installing these wells. The SPDV (Figure 2) is a closed salt pile that stored the materials drilled from the site preliminary design activities at WIPP. The pile includes salt from the Salado Formation and substrata from overlying formations: Rustler Formation, Dewey Lake Formation, Santa Rosa Formation and Gatuna Formation.

The SPDV was closed in 2000 by covering it with geosynthetic liner installed on six inches of bedded material and covered with a minimum of three feet of earthen material. The plan is to install three 2-inch-diameter wells around the SPDV outside the liner footing as indicated in Figure 3 (PZ-13, PZ-14, PZ-15). The purpose is to identify the presence, if any, of shallow groundwater around the SPDV, and if present, the quality of the water. This work plan has some areas in which the installation of the piezometers deviate from the NMED guidance entitled *"NMED Guidelines for Monitoring Well Construction and Abandonment"*. Where there is a deviation it is called out in this plan requesting approval. By approving this work plan the NMED approves these deviations; therefore there will not be additional approval processes necessary.

2.1 Methodology

2.1.1 Drilling and Lithologic Sampling

Drilling the boreholes will be performed using dry drilling techniques in order to identify the cementation change and if there is a discernable "wet zone" consisting of shallow groundwater from the SPDV or other area. Hollow-stem auger drilling will be the preferred method to drill using continuous sampling of the formations. If auger refusal should occur, then air rotary drilling will be used. Under no circumstances will water, mist, or other drilling fluids be used while drilling these wells, as it is imperative that a wet zone be discernable if present. Continuous sample tubes will be used to obtain lithologic data on the formations. Where sample tubes cannot be used, drill cuttings will be used to define formations. Lithology will be described for each well borehole to assist in well design. A core log will be kept (Figure 4) at five-foot intervals or formation changes, whichever is more frequent, and the following will be recorded:

- Lithology, establishing mineralogy/composition of rock
- Texture: grain shape and roundness, sorting, fabric and color
- Structure, if any
- Moisture
- Consolidation

Each borehole will be drilled such that the outer diameter of the borehole is at least 6-inches in diameter (four inches larger than the well screen and casing). The depth is uncertain, but is expected to be no greater than 100 feet bgs. Each borehole will extend approximately 5 feet below the Santa Rosa/Dewey Lake contact where the sulfate cementation change occurs to verify the contact and to serve as a sump to place the well casing. Based on other SSW wells and associated lithologic descriptions, the contact is expected to be between 65 and 70 feet bgs (Figure 5).

2.1.2 Well Construction

The wells will be constructed of two-inch, schedule 40 PVC extending approximately two feet above ground surface. The span of the screened interval will be dependent upon the identification of the wet zone. If a wet zone or SSW is identified, the screen will be placed at the location of the moist or wet zone with a one foot sump, 15 feet of screen above this location, and casing to the surface (Figure 5). If a moist zone of shallow groundwater is not identified, the well screen will be placed across the sulfate cementation zone where shallow groundwater should be perched. Well screen will be constructed of two-inch, schedule 40, slotted PVC to 0.020-inch. The well will be completed with sand annulus, bentonite pellets, and cement based on the screen placement. Figure 5 represents typical construction for the SPDV wells.

The well screen is planned to be placed at the contact of the cementation change at the Santa Rosa/Dewey Lake contact, with a one-foot sump. It is at this cementation change that shallow perched water resides at other on-site locations. The plan is to not drill much further beyond this change and plug back to the change with bentonite (Figure 5). With this type of completion there will not be 2 feet of sand below the bottom of the slotted liner as described in the NMED guideline. Also, the well screen for the piezometers will be slotted at 0.020-inch screen versus 0.010-inch as defined in the guidance. This is based on historical knowledge of the sediments and will assure adequate entrance velocity into the well from the formation and borehole.

2.1.3 Well Development

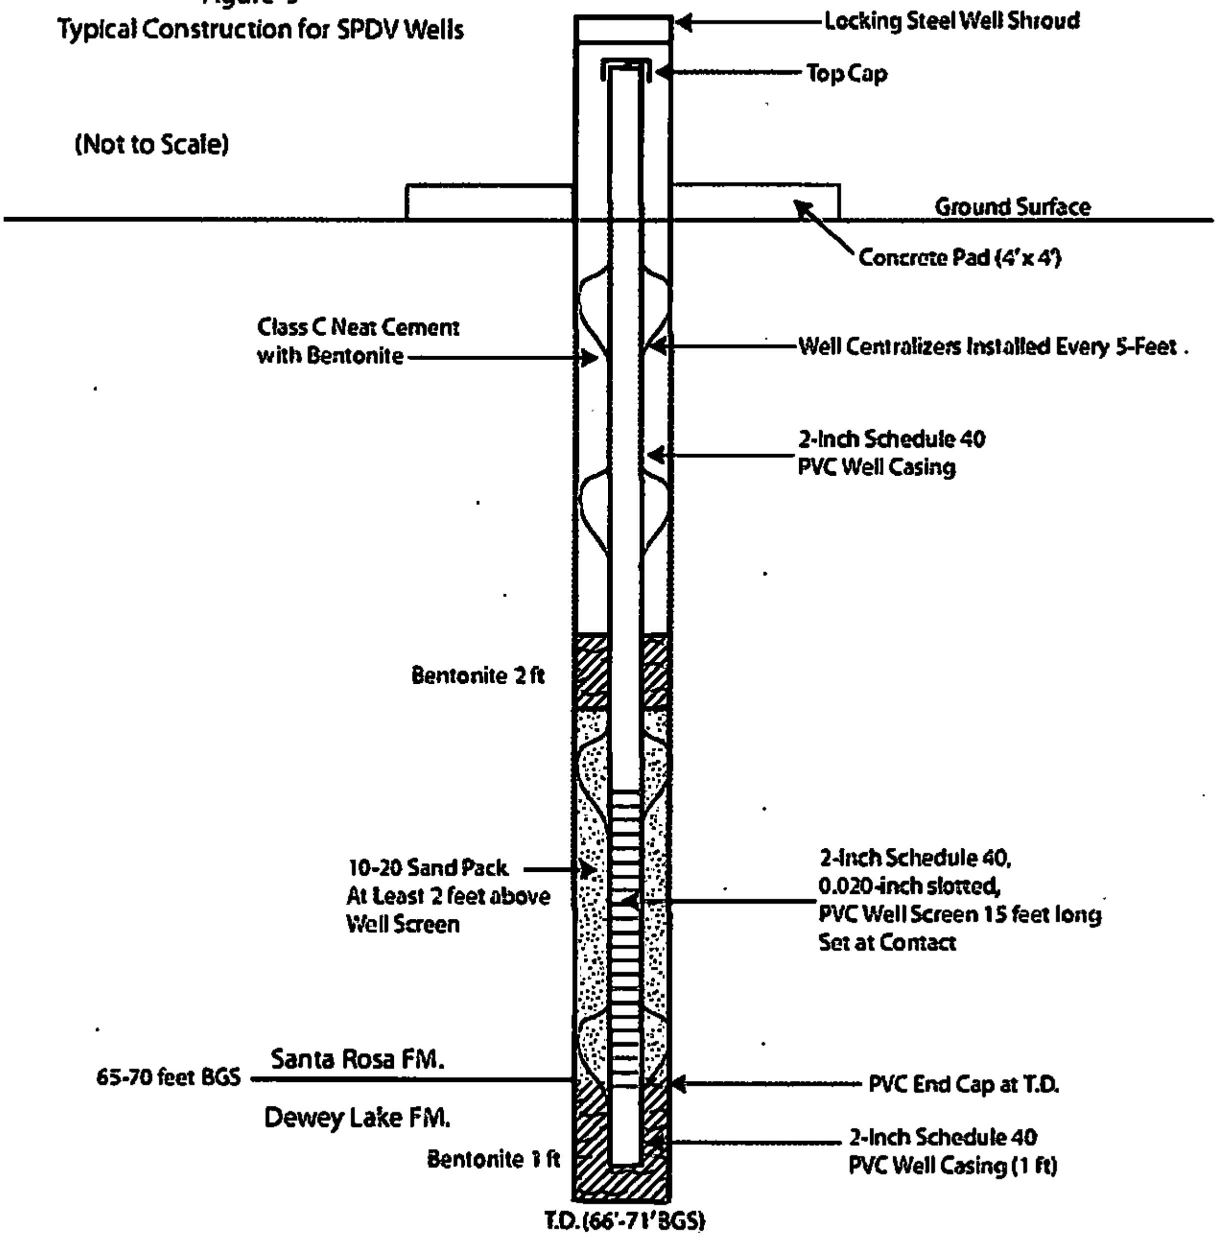
Each well will be allowed to rest for at least 24 hours to allow shallow groundwater to accumulate if present. Following this period of recharge the wells will be evacuated using air lifting and surge block techniques. The wells will be developed until the existing water reaches equilibrium through measurement of field parameters (pH, temperature, conductivity) or the removal of three well volumes has occurred. If no water accumulates, development will not occur, but the well will remain for future water level monitoring.

2.1.4 Well Sampling

If water is detected in the wells, sampling will occur following development. Low-flow sampling techniques will be used to purge the well. Continuous monitoring of purge water will occur using a flow through cell. Field parameters will consist of pH, temperature, and conductivity. A sample will be obtained after three consecutive readings for each parameter fall within the sampling criteria: $\pm$ 0.5 pH units, $\pm$ 10% temperature, and $\pm$ 10% conductivity. The samples will be laboratory analyzed for total dissolved solids, chloride, sulfate, nitrate, chromium, and selenium as defined in DP-831. Each well in which water is found will then be incorporated into the quarterly water level monitoring program and semiannual sampling program as defined by DP-831. If water is not detected, the wells will be incorporated into the quarterly water-level monitoring program. If no water is detected within six months of monitoring, these wells will be considered for plugging and abandonment.

Figure 5
Typical Construction for SPDV Wells

(Not to Scale)



01569

3.0 REPORTING

A basic data report (BDR) will be developed for each well following the installation, receipt of any laboratory analyses, and survey of the well locations and top of casing elevations to a common benchmark. The BDR will summarize the geology, hydrology, well installations and construction. A discussion of encountered water in relation to SSW on-site, if any, will be included. Laboratory reports will be included in the BDR with a discussion of the relationship to SSW, if any. Well reports filed with the New Mexico Office of the State Engineer (NMOSE) will be included in the BDR as well as well construction diagrams and lithologic logs. An updated site map with the SPDV wells will be provided with an updated potentiometric surface map.

3.1 Reporting in Accordance with DP-831 Permit Condition IV.10

After the piezometers are installed they will be incorporated into the quarterly water level monitoring program and semiannual sampling program. The DOE will submit the information gathered in semiannual monitoring reports due by the last day of January and July of each year as required in Condition 10 of the December 29, 2006, Discharge Permit Modification.

4.0 SCHEDULE

The following schedule estimates the dates that the wells will be installed and provides the necessary steps in the process.

Activity	Date of Activity
WIPP Receives Permit	December 29, 2006
Submit Work Plan and Schedule to NMED GWQB	March 29, 2007
Submit Applications to drill to the NMOSE	March 1, 2007
Receive Approval to drill from NMOSE	April 1, 2007
Coordination with the U.S. Bureau of Land Management	April 1, 2007
Procurement of Drilling Contractor	February 1, 2007
Receive Approval of Plan from NMED GWQB	April 29, 2007
Drilling Contractor Mobilization	May 1, 2007
Drill and Develop Wells	May 2-15, 2007
Sample Wells	May 22, 2007
Survey Wells/Get Data (Top of Casing)	May 16, 2007
Develop BDR	May 15 - August 15, 2007
Submit BDR to NMED GWQB	August 15, 2007

Subject: Use of Clean Stormwater to Assist in Establishment of Vegetation

Dear Mr. Marshall:

The purpose of this letter is to inform the New Mexico Environment Department Ground Quality Bureau of our intent to use the water collected in Stormwater Infiltration Control Ponds 1, 2 and A to irrigate the soil covered portion of the salt pile. The water in the Salt Pile Evaporation Pond will also be used under the condition that it is found to be suitable for agricultural purposes. The use of the water is to assist in establishing and maintaining vegetation.

As we enter into the 2007 growing season, the soil covered portion of the salt pile will be planted with native vegetation. Water will be needed to provide the best opportunity to establish and maintain vegetation on the site. Natural precipitation and the clean stormwater will become the source of this water. Water will be pumped from the pond(s) to an irrigation system. Application will be at a rate to enhance sprouting of seeds and growth of vegetation, but not in a manner that erosion will occur. Further application will be controlled such that during periods of natural precipitation, irrigation will not occur. Any run off from the covered portion of the salt pile will continue to be captured in the Salt Pile Evaporation Pond. Using the stormwater in this manner will allow the project to beneficially use the collected clean stormwater for establishing vegetation on this site, and subsequently reduce volume of water in these ponds. This will provide for future capacity of runoff from naturally occurring precipitation events. Irrigation will begin by the end of March 2007

If you have any questions or wish to discuss any of these comments, please feel free to contact me at (505) 234-7462.

Subject: Sixty Day Notice of the Plan for Construction of Salt Storage Area Extension Cell B

Dear Mr. Marshall:

The purpose of this letter is to provide you with sixty days notice that the U.S. Department of Energy Carlsbad Field Office intends to begin the construction of Cell B of the Salt Storage Extension Area.

This notice is in accordance with our September 12, 2005, request to defer construction of Cell B of the Salt Storage Extension Area and your October 20, 2005, letter approving the deferral contingent upon providing a 60 day notice prior to beginning construction. Our Management and Operating Contractor, Washington TRU Solutions, has established target dates of March 9, 2007, to issue the Request for Proposals and May 15, 2007, to begin the actual construction of Cell B.

Please contact me at (505) 234-7462, if you have any questions or require additional information.

Sincerely,

H.L. Plum
RCRA Program Manager

RE: Discharge Permit Modification, Waste Isolation Pilot Plant, DP-831, U.S. Department of Energy

Dear Mr. Moody:

The New Mexico Environment Department (NMED) issues the enclosed Discharge Permit Modification, DP-831 for the Waste Isolation Pilot Plant (WIPP) to the U.S. Department of Energy (DOE) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978§§74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Regulations, 20.6.2 NMAC.

The Discharge Permit Modification contains terms and conditions that shall be complied with by DOE and are enforceable by NMED pursuant to WQCC 20.6.2.3104, WQA, NMSA 1978 § 74-6-5 and §74-6-10. Issuance of this Discharge Permit Modification does not relieve the DOE of its responsibility to comply with the WQA, WQCC Regulations, or any other applicable federal, state and/or local laws and regulations, including zoning requirements and nuisance ordinances.

Pursuant to 20.6.2.3109.H.4 NMAC, this Discharge Permit Modification shall expire on **April 29, 2008**. You must submit an application for renewal at least 120 days before the permit expiration date.

Sincerely,

William C. Olson, Chief
Ground Water Quality Bureau

GROUND WATER DISCHARGE PERMIT MODIFICATION
Waste Isolation Pilot Plant, DP-831
December 29, 2006

I. INTRODUCTION

The New Mexico Environment Department (NMED) issues this Discharge Permit Modification, DP-831, to the U.S Department of Energy (DOE) Waste Isolation Pilot Plant (WIPP) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978 §§74-6-1 through 74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Regulations, 20.6.2 NMAC.

NMED's purpose in issuing this Discharge Permit Modification, and in imposing the requirements and conditions specified herein, is to control the discharge of water contaminants from the Site Preliminary Design Validation (SPDV) material pile into ground and surface water and to provide an updated closure plan, so as to protect ground and surface water for present and potential future use as domestic and agricultural water supply and other uses and protect public health. In issuing this Discharge Permit Modification, NMED has determined that the requirements of 20.6.2.3109.C NMAC have been met.

Facility Description

The WIPP is a hazardous and radioactive waste disposal facility operated by the U.S. Department of Energy. The WIPP is constructed in a bedded salt deposit 2150 feet below ground surface. Salt and other subsurface materials mined during construction as well as currently mined salt are stored on the surface in three stockpiles. The stockpiles include the Salt Storage Extension (SSE) that is being used to store salt currently mined at the WIPP. Storm water runoff from the SSE is collected in the synthetically lined Salt Storage Extension Basin (SSEB). The existing Salt Pile that was previously used has been capped with a synthetic and earthen cover. Storm water runoff from the Salt Pile is collected in the synthetically lined Salt Pile Evaporation Pond (SPEP). The Site Preliminary Design Validation (SPDV) material pile was constructed as the shafts were excavated when construction first began at the site. The SPDV material pile was closed in the year 2000 with a cover consisting of a geosynthetic liner installed on 6 inches of bedding material and covered with a minimum of three feet of earthen material. The earthen cover was seeded with shallow-rooted plants. Other discharges covered by DP-831 include domestic waste discharged to seven facultative lagoons, brine and high-TDS discharges to an evaporative lagoon, miscellaneous non-hazardous discharges to an evaporation pond and non-impacted storm water runoff to three synthetically lined impoundments.

Location of Discharge

The facility is located approximately 26 miles east of Carlsbad, New Mexico in Sections 28 and 29, T22S, R31E, Eddy County.

Quantity, Quality, and Flow Characteristics of the Discharge

The permitted discharge consists of up to 23,000 gallons per day (gpd) of sewage effluent, up to 2,000 gpd of non-hazardous high-TDS and brine water, up to 8,000 gpd of non-hazardous miscellaneous water, up to 100 gpd of neutralized acid waste, and a designed flow of 4,224,835 gpd of storm water runoff based on a 24-hour, 25-year storm event. The discharged waters contain contaminants or toxic pollutants that may exceed water quality standards set forth in WQCC Regulations 20.6.2.3103 NMAC for nitrate, chloride, sulfate and total dissolved solids. These discharged waters may move directly or indirectly into ground water.

Characteristics of Ground Water

Regional ground water below the site is at a depth of approximately 225 feet and has a total dissolved solids concentration of approximately 3,920 milligrams per liter. A zone of shallow subsurface water (SSW) below the site is at a depth of approximately 60 – 80 feet. The ground water flow direction for the regional aquifer is to the southeast and the flow direction of the SSW is to the south.

General

The WIPP Discharge Plan Modification consists of the materials submitted by the DOE dated March 5, 2005, September 12, 2005 and May 11, 2006. In addition, the discharge plan includes information and materials submitted as part of the original discharge plan approved on January 16, 1992, amended on August 28, 1995, renewed on July 3, 1997, amended on June 12, 1998, amended on January 24, 2000, renewed on April 29, 2003, and modified on December 22, 2003. The discharge shall be managed in accordance with the discharge plan as conditioned by the Discharge Permit issued April 29, 2003, modified on December 22, 2003, and this Discharge Permit Modification.

The components incorporated into the Discharge Permit through this modification include the following:

1. The inclusion of the Site Preliminary Design Validation (SPDV) material pile into DP-831.

2. The inclusion of a comprehensive closure plan that includes all salt stockpiles at the facility.

Pursuant to 20.6.2.3109.E NMAC, NMED reserves the right to modify permit requirements in the event that NMED determines that the requirements of 20.6.2 NMAC are being, or may be, violated or the standards of 20.6.2.3103 NMAC are being, or may be, violated. This may include a determination by NMED that operational practices approved under this Discharge Permit are not protective of ground and surface water quality, and that a modification is necessary to protect the water quality or abate water pollution. Permit modifications may include, but are not limited to, lining or relining impoundments, changing discharge locations, changing waste management practices, expanding monitoring requirements, and implementing abatement of water pollution.

Issuance of this Discharge Permit does not relieve the DOE of its responsibility to comply with all conditions or requirements of the WQA, WQCC Regulations, and any other applicable Federal, State and local laws and regulations including zoning requirements or nuisance orders.

II. FINDINGS

In issuing this Discharge Permit, NMED finds:

1. The DOE is discharging effluent or leachate from the WIPP facility so that such effluent or leachate may move directly or indirectly into ground water within the meaning of 20.6.2.3104 NMAC.

2. The ground water beneath the WIPP facility has an existing concentration of 10,000 milligrams per liter or less of total dissolved solids within the meaning of 20.6.2.3101.A NMAC.

3. The discharge from the WIPP facility is not subject to any of the exemptions of 20.6.2.3105 NMAC.

III. DEFINITIONS

Whenever any terms defined in the WQA or the WQCC Regulations are used in this Discharge Permit, including any documents incorporated herein by reference, those definitions shall apply. In addition, whenever the terms listed below are used in this Discharge Permit, including any documents incorporated herein by reference, the following definitions shall apply:

"Discharge" means any spilling, leaking, pumping, pouring, emitting, emptying, or dumping into water or in a location and manner where there is a reasonable probability that the discharged substance will directly or indirectly reach surface or subsurface water.

"Discharge Permit" or "DP-831" means, unless otherwise specified, this Discharge Permit DP-831 including any documents incorporated herein by reference.

"NMED" means the New Mexico Environment Department, a department of the executive branch and a constituent agency of the WQCC, and any successor agencies.

"WIPP" means the Waste Isolation Pilot Plant, a facility owned and operated by the U.S. Department of Energy and located in southeast New Mexico.

"WQA" means the New Mexico Water Quality Act, NMSA 1978 §§ 74-6-1 to 74-6-17, as amended.

"WQCC" means the New Mexico Water Quality Control Commission.

"WQCC Regulations" means Title 20, Chapter 6, Parts 2 and 4 NMAC, as amended.

IV. PERMIT CONDITIONS

The following conditions shall be complied with by the DOE and are enforceable by NMED. The DOE is permitted to discharge water contaminants subject to the following conditions.

OPERATIONS

1. The DOE shall conduct the operational requirements set forth below, including investigations, in accordance with the WQCC Regulations at sections 20.6.2.3106.C and 3107 NMAC to ensure compliance with 20.6.1 and 20.6.2 NMAC.

Storm Water Containment

2. The DOE is permitted to capture a designed flow of 4,224,835 gpd of storm water runoff from the existing Salt Pile and the SSE in the impoundments described in Conditions 2a and 2b below. The discharge volumes are based on storm water runoff estimates from a 24-hour, 25-year storm event (3.90 inches).

   a. Salt Pile Evaporation Pond. A designed flow of 1,677,633 gallons per day is permitted to be discharged to the impoundment. The pond capacity is 5,506,989 gallons not allowing for any freeboard.

   b. Salt Storage Extension Basin. A designed flow of 2,547,202 gallons per day is permitted to be discharged to the impoundment. The pond capacity is 4,170,732 gallons not allowing for any freeboard.

SPDV Material Pile

3. The DOE shall conduct regular maintenance of the earthen cover on the SPDV pile. Inspections shall be conducted monthly and after storm events of 2 inches or greater in a 24-hour period to evaluate potential erosion and vegetation success of the cover. In the event of significant erosion, the DOE shall provide a plan and schedule for repair within 90 days of discovery. General observations and cover repairs shall be reported to NMED pursuant to Condition 10 of this Discharge Permit Modification.

4. The DOE shall install three monitoring wells adjacent to the SPDV pile. Within 90 days of the date of this permit, the DOE shall submit for NMED approval a plan and schedule for well installation. The wells shall be installed at the locations indicated in Figure 2 of the September 12, 2005 supplemental information letter. The wells shall be screened in the upper 15 feet of ground water encountered within the Santa Rosa Formation or the Dewey Lake Formation. The wells shall be completed in accordance with NMED *Monitoring Well*

Construction and Abandonment Guidelines (enclosed) or other alternate methods approved by NMED.

MONITORING, REPORTING, AND OTHER REQUIREMENTS

5. In addition to the monitoring requirements in the April 29, 2003 Discharge Permit Renewal and the December 22, 2003 Discharge Permit Modification, the DOE shall conduct the monitoring, reporting, and other requirements listed below.

Sampling and Field Measurements

6. Ground Water Monitoring Wells – If sufficient water is present in any of the monitoring wells installed pursuant to Condition 4 of this permit, the DOE shall sample them as follows.

   a. The depth to the water table shall be measured to the nearest hundredth of a foot (0.01 ft) above mean sea level, quarterly.

   b. Samples shall be collected from each well semi-annually and analyzed for the water parameters listed in Conditions 8a, 8b and 8c below.

7. Seepage Volumes – The DOE shall propose a method to measure or estimate the volume of SSW that seeps into the exhaust shaft of the WIPP facility. The proposed method shall be submitted to NMED within 60 days of the date of this Permit. Upon NMED approval, the DOE shall measure seepage volumes and/or seepage flow rates of the SSW monthly and report the measurements as required in Condition 10 below.

Analysis

8. The DOE shall analyze samples of ground water for the parameters listed below. Samples of ground water from monitoring wells shall be analyzed for dissolved concentrations of the analytes listed below.

   a. Field parameters (analysis to be performed in the field): pH, temperature and specific conductance.

   b. General chemistry parameters: nitrate, sulfate, chloride, and total dissolved solids.

   c. Trace metals: selenium, chromium

   Analytical results and water level measurements shall be reported as required in Condition 10 below.

Methodology

9. Unless otherwise approved in writing by NMED, the DOE shall conduct sampling and analysis in accordance with the most recent edition of following documents:

a. American Public Health Association, *Standard Methods for the Examination of Water and Wastewater.*

b. U.S. Environmental Protection Agency, *Methods for Chemical Analysis of Water and Waste.*

c. U.S. Geological Survey, *Techniques for Water Resource Investigations of the U.S. Geological Survey.*

d. American Society for Testing and Materials, *Annual Book of ASTM Standards*, Part 31. Water.

e. U.S. Geological Survey, et al., *National Handbook of Recommended Methods for Water Data Acquisition.*

f. Surface water monitoring must also be conducted according to test procedures approved under Title 40 Code of Federal Regulations Part 136. [20.6.3107 NMAC]

g. New Mexico Environment Department, Hazardous Waste Bureau Position Paper, *Use of Low-Flow and Other Non-Traditional Sampling Techniques for RCRA Compliant Groundwater Monitoring.*

Reporting

10. The DOE shall submit the information required in Conditions 3, 6, 7 and 8 in the semi-annual monitoring reports due by the last day of January and July of each year as required in Condition 9 of the December 22, 2003 Discharge Permit Modification.

CONTINGENCY

11. In the event that monitoring indicates ground water standards as defined in Section 20.6.2.3103 NMAC are exceeded in ground water in wells that previously did not show exceedences of ground water standards, or the extent or magnitude of any existing concentrations of water contaminants is significantly increasing, the DOE shall collect a confirmatory sample from the monitoring well(s) within 15 days to confirm the initial sampling results. Within 30 days of confirmation of ground water contamination, the DOE shall submit an abatement plan to NMED, which includes a site investigation to define the source, nature and extent of contamination; a proposed abatement option; and a schedule for its implementation. The site investigation and selection of an abatement option shall be consistent with the requirements and provisions of 20.6.2.4101, 4103, 4106.C & E, 4107, 4108 and 4112 NMAC.

CLOSURE

12. The DOE shall close the facilities covered under this Discharge Permit in accordance with the closure plan in the March 4, 2005 discharge permit application, the closure plan in the WIPP Hazardous Waste Facility Permit (HWFP) dated January 30, 2003, and the WIPP Land Management Plan as conditioned by this Discharge Permit Modification.

Surface Impoundments

13. Upon cessation of operation, the DOE shall close all impoundments at the facility covered by this Discharge Permit. Remaining liquids in each impoundment shall be removed and/or evaporated. All sludge shall be sampled to determine if hazardous constituents exist and managed and/or disposed of in accordance with applicable regulations. All piping and other ancillary components shall be plugged or removed. Synthetic liners shall be removed or ripped in place. All impoundments shall be backfilled with clean fill materials and graded to create positive drainage. The final regarded surface shall be contoured to surrounding topography and shall be revegetated with natural grasses that include a seed mix approved by NMED.

Salt Piles and Salt Storage Area

14. Upon cessation of operation, all mined salt at the WIPP facility shall be removed from the site. The DOE is permitted to use the mined salt as backfill in shafts and as interior fill material in berms and permanent markers after closure. All mined salt remaining after backfilling and after construction of surface structures shall be removed from the site. The DOE shall submit a plan and schedule for salt tailings removal to NMED for approval within 120 days prior to the facility closure. The WIPP Land Management Plan reflects the Land Withdrawal Act's requirements for disposition of the salt. Section I-1d of the WIPP's Hazardous Waste Facility permit also addresses closure activities that include closure of the salt storage areas in accordance with the provisions of the WIPP Land Management Plan. The salt storage area will be reclaimed in the manner described in these documents.

Post-closure Monitoring

15. The DOE shall continue ground water monitoring in all wells covered under DP-831 as described in Condition 5 of this Permit Modification for two years after closure to confirm the absence of ground water contamination. If monitoring results show that the ground water standards in Section 20.6.2.3103 NMAC are being exceeded, the DOE shall implement the contingency plan described in Condition 11 of this Permit Modification. Following notification from NMED that post-closure monitoring may cease, the DOE shall submit a plan to plug and abandon specified monitoring wells not needed for long-term monitoring. Upon NMED approval, the DOE shall plug and abandon the wells in accordance with *NMED Guidelines for Monitoring Well Construction and Abandonment* (copy enclosed) or

alternative methods approved by NMED. When all post-closure requirements have been met, the DOE may request to terminate the discharge permit.

GENERAL TERMS AND CONDITIONS

The DOE shall comply with the following general conditions, which shall be enforceable by NMED.

Record Keeping

16. The DOE shall maintain at its facility a written record of all data and information on monitoring of ground water, surface water, and seepage pursuant to this Discharge Permit including the following:

    a. The date, exact time, and exact location of each sample collection or field measurement;

    b. The name of the person who performed each sample collection or field measurement;

    c. The date of the analysis of each sample;

    d. The name and address of the laboratory and the name of the name of the authorized manager or his designee verifying that the laboratory report is complete and accurate.

    e. The analytical technique or method used to analyze each sample or take each field measurement;

    f. The results of each analysis or field measurement, including the raw data; and,

    g. A description of the quality assurance and quality control procedures used.

17. Such data and information as described in Condition 16, shall also be maintained on all split and duplicate samples, spike and blank samples, and repeat samples.

18. The DOE shall maintain a written record of any spills, seeps, or leaks of effluent, leachate or process fluids not authorized by this Discharge Permit.

19. The DOE shall maintain a written record of the operation, maintenance and repair of all facilities/equipment used to treat, store, or dispose of wastewater; to measure flow rates; to monitor water quality; or, to collect other data required by this Discharge Permit. This record shall include repair, replacement or calibration of any monitoring equipment and repair or replacement of any fixed equipment used in the conveyance of waters covered by this permit.

20. Notwithstanding any company record retention policy to the contrary, until such time as NMED determines that all closure measures have been completed in accordance with the requirements of this Discharge Permit, the DOE shall retain copies of all data, records,

reports, and other documents generated pursuant to this Discharge Permit. Such record retention period may be increased by the NMED at any time upon written notice to the DOE.

21. All such data, records, reports, and other documents generated pursuant to this Discharge Permit, shall be provided to the NMED upon request.

Inspection and Entry

22. The DOE shall allow the Secretary or an authorized representative of NMED, upon the presentation of credentials, to:

    a. Enter at reasonable times upon or through any property or premises owned or controlled by the DOE or at any other location where records are kept under the conditions of this Discharge Permit or any Federal or WQCC regulation.

    b. Inspect and copy, at reasonable times, records required to be kept under the conditions of this Discharge Permit or pursuant to State or Federal water quality regulations.

    c. Inspect any facility, equipment (including monitoring and control equipment for treatment works), practices or operations regulated or required under this Discharge Permit or under any Federal or WQCC regulations.

    d. Sample or monitor at reasonable times for the purpose of assuring compliance with this Discharge Permit or as otherwise authorized by the New Mexico Water Quality Act, any effluent, water contaminant, or receiving water at any location before or after the discharge.

23. Nothing in this Discharge Permit shall be construed as limiting in any way the inspection and entry authority of the NMED under the WQA, the WQCC Regulations, or any other applicable law or regulation.

Duty to Provide Information

24. Within a reasonable time after a request from the NMED, which time may be specified by the NMED, the DOE shall provide the NMED with any relevant information to determine whether cause exists for modifying, terminating, or renewing this Discharge Permit, or to determine whether the DOE is in compliance with this Discharge Permit.

Spills, Leaks and Other Unauthorized Discharges

25. This Discharge Permit authorizes only those discharges specified herein. Any discharge not authorized by this Discharge Permit is a violation of the WQCC Regulations at 20.6.2.3104 NMAC. The DOE must report any such discharge to the NMED, and it must take corrective action to contain and remove or mitigate the damage caused by the discharge in accordance with section 20.6.2.1203 NMAC.

Modifications and Amendments

26. The DOE shall notify the NMED of any changes to its wastewater collection or disposal system, including any changes in the wastewater flow rate or the volume of wastewater storage, or of any other changes to its mining operations or processes that would result in any significant change in the discharge of water contaminants. The DOE shall obtain the NMED approval, as a modification to this Discharge Permit pursuant to section 20.6.2.3109.E, F, or G NMAC, prior to any increase in the quantity of a discharge, or any increase in the concentration of water contaminants discharged, above those levels approved in this Discharge Permit.

Enforcement

27. Any violation of the requirements and conditions of this Discharge Permit, including any failure or refusal to allow the NMED to enter and inspect records or facilities, or any refusal or failure to provide the NMED with records or information, may subject the DOE to an enforcement action. Pursuant to WQA § 74-6-10(A) and (B), such action may include a compliance order requiring compliance immediately or in a specified time, assessing a civil penalty, suspending or terminating the Discharge Permit, or any combination of the foregoing; or an action in district court seeking injunctive relief, civil penalties, or both. Pursuant to the WQA §§ 74-6-10(C) and 74-6-10.1, civil penalties of up to $15,000 per day of noncompliance may be assessed for each violation of the WQA § 74-6-5, the WQCC regulations, or this Discharge Permit, and civil penalties of up to $10,000 per day of noncompliance may be assessed for each violation of any other provision of the WQA, or any regulation standard, or order adopted pursuant to such other provision. For certain violations specified in the WQA § 74-6-10.2, criminal penalties may also apply. In any action to enforce this Discharge Permit, the DOE waives any objection to the admissibility as evidence of any data generated pursuant to this Discharge Permit. The DOE does not waive any argument as to the weight such evidence should be given.

Compliance with Other Laws

28. Nothing in this Discharge Permit shall be construed in any way as relieving the DOE of its obligation to comply with all applicable Federal, State, and local laws, regulations, permits, or orders.

Liability

29. The approval of this Discharge Permit does not relieve the DOE of liability should the operation result in actual pollution of surface or ground water which may be actionable under other laws and/or regulations.

Right to Appeal

30. The DOE may file a petition for a hearing before the WQCC on this Discharge Permit. Such petition must be made in writing to the WQCC within thirty (30) days after the DOE receives this Discharge Permit. Unless a timely petition for a hearing is made, the decision of NMED shall be final.

Transfer

31. Prior to any transfer of ownership, control, or possession of the WIPP facility or any portion thereof, the DOE shall notify the proposed transferee in writing of the existence of this Discharge Permit and include a copy of this Permit with the notice. The DOE shall deliver or send by certified mail to the NMED a copy of the notification and proof that such notification has been received by the proposed transferee.

Term

32. The effective date of this Discharge Permit Modification is the date it is issued and signed by the Chief of the Ground Water Quality Bureau. The term of this Discharge Permit Modification expires on **April 29, 2008** five (5) years from the date the original Discharge Permit Renewal was issued. To renew this Discharge Permit, the DOE must submit an application for renewal at least 120 days before that date.

Issued this 29th day of December 2006

William C. Olson, Chief
Ground Water Quality Bureau
New Mexico Environment Department

CERTIFIED MAIL – RETURN RECEIPT REQUESTED

December 28, 2006

Mr. David C. Moody, Manager
Waste Isolation Pilot Plant
U.S. Department of Energy
P.O. Box 3090
Carlsbad, New Mexico 88221-3090

RE: Response to Comments and Issuance of Discharge Permit Modification, DP-831, Waste Isolation Pilot Plant, U.S. Department of Energy

Dear Mr. Moody:

The Ground Water Quality Bureau of the New Mexico Environment Department (NMED) has reviewed the comments submitted by the U.S. Department of Energy (DOE) on September 15, 2006 for the Draft Discharge Permit Modification (DP-831) for the Waste Isolation Pilot Plant. The public notice for the Draft Discharge Permit Modification was published on August 16, 2006. The comments from the DOE were the only comments received by NMED concerning this discharge permit modification. NMED's responses to the comments are provided below. The Final Discharge Permit Modification incorporating relevant comments will be issued in a separate letter.

Response to General Comments

A. The conditions in the Discharge Permit Modification that address specific facility components such as the SPDV pile pertain only to those facility components. All general permit language that does not specifically address a specific facility component pertains to all facility components covered under DP-831 including those facilities addressed in the April 29, 2003 Discharge Permit Renewal and the December 22, 2003 Discharge Permit contingency language to more accurately reflect existing conditions at the WIPP site. The DOE is welcome to propose background ground water quality at the WIPP site and propose existing ground water quality conditions in certain monitoring wells.

9. In the last sentence of Condition 13, the word "regarded" has been changed to "regraded."

10. NMED does not agree with some of the changes proposed by DOE to the closure language in Condition 14. NMED has removed portions of the condition that the DOE states in the September 15, 2006 letter are not accurate. NMED retains the requirement that salt tailings be removed from the site as part of facility closure. Please refer to the attached Discharge Permit Modification for NMED's changes.

11. The reference to Condition 9 stated in Condition 15 has been changed to Condition 11.

12. The reference to meteorological data in Condition 16 has been removed.

13. The reference to Condition 15 stated in Condition 17 has been changed to Condition 16.

14. The language in the last sentence of Condition 19 has been changed from "any equipment used in the conveyance of process waters throughout this permit area" to "any fixed equipment used in the conveyance of waters covered by this permit."

15. NMED declines to modify this Condition 20. Retention or records beyond five years may be necessary to evaluate discharge permit compliance.

16. The reference to Condition 33 in Condition 25 has been removed.

If you have any questions, please contact Clint Marshall at 505-827-0027 or Mary Ann Menetrey at 505-827-2944.

Sincerely,

William C. Olson, Chief
Ground Water Quality Bureau

Santa Fe, NM 87502

Subject: Record of Communication Relative to Pumping Storm Water from Evaporation Ponds 1 and 2 into Pond A

Dear Mr. Marshall:

The purpose of this letter is to document the telephone conversation between you, Mr. Harold Johnson of the Department of Energy, (DOE) Carlsbad Field Office and Mr. Stewart Jones of Washington Regulatory and Environmental Services on October 24, 2006, regarding the pumping of storm water out of Evaporation Ponds 1 and 2 into Pond A. The reason for this action was to reduce the likelihood of overtopping of Ponds 1 and 2 if the major storm system predicted to impact southeastern New Mexico that week materialized. In the last month the Waste Isolation Pilot Plant (WIPP) has received approximately 1.3 inches of precipitation and Evaporation Ponds 1 and 2 had less than desirable capacity.

To prevent overtopping the ponds DOE suggested to you that storm water in Evaporation Ponds 1 and 2 be pumped into Pond A. It was noted that Ponds 1 and 2 had approximately eight to ten inches of freeboard and that Pond A had about 4 inches of freeboard. With the possibility of considerable precipitation at the WIPP, it was suggested that pumping water into Pond A from Evaporation Ponds 1 and 2 should preclude overtopping in these ponds.

As you know, Pond A has a designed spillway to eliminate erosion to the pond side slopes should it exceed its capacity. You concurred with this action and requested documentation of our telephone call. The DOE therefore pumped sufficient water into Pond A to obtain approximately two feet of free board in Ponds 1 and 2.

If you have any questions or wish to discuss any of these comments, please contact me at (505)234-8172 or (505)234-7452.

Sincerely,

Daryl Mercer
Physical Scientist

Santa Fe, NM 87502

Subject: Comments on the Draft WIPP Discharge Permit, DP-831

Dear Mr. Marshall:

The purpose of this letter is to provide comments on the draft WIPP Discharge Permit Modification (DP-831) placed on notice pursuant to 20.6.2.3108.G NMAC on or before August 16, 2006. We are submitting these comments to facilitate completion of the permit modification process. We are not requesting a public hearing.

General Comments:

A. Because this is a permit modification and not the entire permit, DOE requests clarification on which terms and conditions are specific to the elements of this modification; and which, if any, supersede the conditions of the April 29, 2003 Discharge Permit and the December 22, 2003 Discharge Permit Modification. Two conditions that require clarification are listed below:

   - The record keeping provisions in Item 20 requires all data, records, reports, and other documents generated pursuant to this discharge permit be retained until closure is completed while the April 29, 2003 Discharge Plan Renewal and December 22, 2003 Discharge Plan Modification requires this information be maintained for five years. Does this requirement pertain only to the recordkeeping for the SPDV Pile repairs and monitoring introduced in the permit modification or does it apply to all elements of DP-831 such as the sewage lagoons, other infiltration control features and monitoring of the existing wells and surface water? (This topic is discussed further in our specific comments below.)

   - The Contingency provisions in Item 11 differ from the Contingency requirements in the existing permit. Are these provisions applicable only to the monitoring wells installed at the SPDV Pile pursuant to this modification or all monitoring wells in DP-831? (This topic is discussed further in our specific comments below.)

B. In several locations throughout the permit WIPP is used as an entity to perform an action. In these cases, "WIPP" should be changed to "DOE".

CBFO:AMO:DM:KJB:06-0585:UFC5486

This occurs at Part II, Item 1; Part II, Item 2; Part IV, first sentence; Part IV, Item 1, Item 2, Item 3 (two occurrences), Item 4, Item 5, Item 7, Item 8, Item 9, Item 10, Item 11 (two occurrences), *Item 13, Item 14, Item 15 (three occurrences), General Terms and Conditions, introductory sentence: Item 16, Item 18, Item 19, Item 20, Item 22, Item 24 (two occurrences), Item 25, Item 26, Item 27 (three occurrences), Item 28, Item 29, Item 30, Item 31 (two occurrences), and Item 32.*

DOE's specific comments follow in the order that the text appears in the draft discharge permit modification:

1. Part I, Quantity, Quality, and Flow Characteristics of the Discharge
   The discharged waters contain contaminants or toxic pollutants that may exceed water quality standards set forth in WQCC Regulations 20.6.2.3103 NMAC for nitrate, chloride, sulfate, selenium, chromium and total dissolved solids.

   Please remove the reference to selenium and chromium as contaminants or pollutants in the DOE's discharges at the WIPP site. Selenium is only detected occasionally in trace quantities in naturally occurring ground water purged from ground water monitoring wells and discharged to the H-19 Evaporation Pond. Chromium is not present in detectable concentrations in any of the waters discharged. The other discharged waters (sewage effluent, salt contact storm water run-off and non contact storm water run-off) do not contain selenium or chromium in detectable concentrations.

2. Part IV. Item 3: *Inspections shall be conducted semi-annually and after storm events of one inch or greater to evaluate potential erosion and vegetation success of the cover.*

   DOE respectfully requests that the requirement to inspect the pile following a storm event of one inch or greater be removed and replaced with a requirement consistent with the existing discharge permit and current inspections of the infiltration control structures. The SPDV Pile is currently inspected monthly and following significant rainfall events. The term "significant rainfall event" has not been defined in the existing DP-831 but is defined in WIPP site procedures as greater than two inches in 12 hours.
   Monthly inspections are frequent enough to identify any significant erosion problems that are caused by lesser rainfalls and schedule repairs in a timely manner.

3. Part IV. Item 3: *General observations and cover repairs shall be reported to NMED pursuant to Condition 8 of this Discharge Permit Modification.*

   The reference to Condition 8, which is entitled, Analysis appears to be incorrect. The correct reference is believed to be Item 10, Reporting.

4. Part IV. Item 6.b.: Recommend that that the reference to Conditions 8A, 8B and 8C reference Conditions 8.a., 8.b. and 8.c. for consistency.

5. Part IV, Item 7: Seepage Volumes – *WIPP shall collect and measure the monthly volume of SSW that seeps into the exhaust shaft of the WIPP facility.*

CBFO:AMO:DM:KJB:06-0585:UFC5486

DOE requests that this requirement be removed from DP-831. The ground water level data collected in accordance with the December 22, 2003 Discharge Permit Modification provides the GWQB with information regarding the effectiveness of the infiltration controls. Most water that seeps into the Exhaust Shaft evaporates when the ventilation system is operating in normal mode (two Fans operating and airflow of approximately 425,000 cubic feet per minute). The water that is collected in the underground is derived from various natural sources (primarily humidity and condensation on the shaft walls) and the volume of subsurface anthropogenic shallow water that seeps into the Exhaust Shaft cannot be differentiated from other sources of water.

6. Part IV, Item 8: *Analytical results and water level measurements shall be reported as required in Condition 8 below.*

   The reference to Condition 8 appears to be incorrect. Condition 10 would be a more appropriate reference.

7. Part IV, Item 10: *WIPP shall submit the information required in Conditions 2, 5, 6 and 7 in the semi-annual monitoring reports due by the last day of January and July of each year as required in Condition 9 of the December 22, 2003 Discharge Permit Modification.*

   The reference to Conditions 2 and 5 appears to be incorrect. Conditions 3, 6, 7 and 8 appear to be the correct references.

8. Part IV, Item 11: *In the event that monitoring indicates ground water standards as defined in Section 20.6.2.3103 NMAC are exceeded in ground water, WIPP shall collect a confirmatory sample from the monitoring well(s) within 15 days to confirm the initial sampling results. Within 30 days of confirmation of ground water contamination, WIPP shall submit an abatement plan to NMED, which includes a site investigation to define the source, nature and extent of contamination; a proposed abatement option; and a schedule for its implementation.*

   Anthropogenic subsurface shallow ground water and naturally occurring Dewey Lake Formation water at the WIPP site already exceed some of the numerical standards of 20.6.2.3103 NMAC. Permit conditions and procedures, pursuant to the current DP-831 Permit and the WIPP Hazardous Waste Facility Permit (HWFP), Module V, are in place at WIPP recognizing current ground water characteristics and requiring use of sampling methods accepted by the U.S. EPA and NMED. To provide consistency in the application of NMED regulations and existing permits, DOE requests that the following paragraphs be added after the above permit condition:

   For ground water monitoring at WQSP 6a, "contamination" is to be determined pursuant to the conditions in the WIPP Hazardous Waste Facility Permit (HWFP), Module V, which defines "contamination" as a statistically significant increase in the concentration of the monitored parameters (which encompass the parameters established in the DP-

831 permit). Considering temporal and spatial variations in analytical data, "contamination" is indicated when the concentration of the analyte exceeds the 95th upper tolerance limit value for normal or log normal distributions of data or the 95th percentile for non-parametric data. The 15 and 30 day requirements above are inapplicable to ground water monitoring at WQSP6a and the DOE shall, in lieu of submitting an abatement plan, proceed with required actions under the WIPP HWFP.

For the anthropogenic subsurface shallow water, abatement controls have been imposed by NMED in the December 22, 2003 DP-831 Modification. Thus, the 15 and 30 day requirements above are not applicable to the subsurface shallow water. Reports of concentrations of analytes detected in subsurface shallow water wells must continue to be reported in the DOE's semi-annual monitoring reports to the NMED, as required in Condition 9 of the December 22, 2003 Discharge Permit Modification. Pursuant to 20.6.2.3109.E NMAC, NMED reserves the right to modify permit conditions if the infiltration controls approved under this Discharge Permit become ineffective to protect ground and surface water for present and potential future use.

9. Part IV. Condition 13: In the last sentence "regarded" should be changed to "regraded."

10. Part IV. Item 14: There are several subtle inaccuracies in the statements in this Condition. The berms or permanent markers are not specified to be constructed of concrete, there are no plans for backfilling the open drifts or panels in the underground and the Land Withdrawal Act directs the disposition of the salt in accordance with Sections 2 and 3 of the Materials Act of 1947. For simplicity, a mark-up of the condition that is more accurate is provided below:

    Upon cessation of operation, all ~~salt stockpiles~~ residual salt tailings at the WIPP facility shall be ~~removed~~ disposed of ~~from the site~~ as required by Section 4(b)(4) of the Waste Isolation Pilot Plant Land Withdrawal Act. WIPP ~~is permitted~~ has proposed to use stockpiled salt tailings as backfill in shafts~~, tunnels and panels,~~ and as interior fill material ~~on concrete perimeter~~ in berms~~,~~ and permanent markers after closure. ~~monuments and other surface closure structures.~~ All salt tailings remaining after backfilling and after construction of surface structures shall be ~~sold or otherwise~~ disposed of ~~offsite~~ in accordance with the provisions of the Materials Act of 1947. ~~WIPP~~ DOE shall submit a schedule for ~~salt removal~~ the disposition of residual salt tailings within 120 days prior to Facility Closure. ~~the facility ceasing operations.~~ The WIPP Land Management Plan reflects the Land Withdrawal Act's requirements for disposition the salt tailings. ~~and sets forth the plans to reclaim the salt storage area.~~ Section I-1d of the WIPP's Hazardous Waste Facility permit also addresses closure activities that include closure of the salt storage areas in accordance with the provisions of the WIPP Land Management Plan. The salt storage area will be reclaimed in the manner described in these documents.

11. Part IV. Condition 15: The condition references the contingency plan described in Condition 9. The correct reference appears to be Condition 11.

CBFO:AMO:DM:KJB:06-0585:UFC5486

12. Part IV, Item 16: *WIPP shall maintain at its facility a written record of all data and information on monitoring of ground water, surface water, seepage, and meteorological conditions pursuant to this Discharge Permit including the following:*

    No meteorological conditions are required to be monitored pursuant to DP-831. Please remove the reference to maintaining meteorological data.

13. Part IV. Condition 17: *Such data and information as described in Condition 15, shall also be maintained on all split and duplicate samples, spike and blank samples, and repeat samples.*

    It is not clear if the reference to Condition 15 is correct or if the reference should be to Condition 16.

14. Part IV, Item 19: The last sentence in this condition states, "*This record shall include repair, replacement or calibration of any monitoring equipment and repair or replacement of any equipment used in the conveyance of process waters.*"

    Please revise this statement to refer to "fixed equipment " used in the conveyance of waters covered by this permit." The current statement is overly broad such that it could be interpreted to apply to repairs on a truck, trailer or pump used to transfer water to H-19.

15. Part IV, Item 20: *Notwithstanding any company record retention policy to the contrary, until such time as NMED determines that all closure measures have been completed in accordance with the requirements of this Discharge Permit, WIPP shall retain copies of all data, records, reports, and other documents generated pursuant to this Discharge Permit. Such record retention period may be increased by the NMED at any time upon written notice to WIPP.*

    DOE requests that this condition be consistent with the Ground and Surface Water Protection Regulations and existing DP-831 conditions. The current permit (which is consistent with 20.6.2.3107.A.(7)) states under Retention of Records, "the discharger shall maintain all monitoring information, including all calibration and maintenance records, copies of all reports required by this discharge plan, and records of all data used to complete the application for this discharge plan, for a period of at least <u>five</u> years from the date of the sample collection, measurement, report or application."

16. Part IV, Item 25: There is a reference to "Condition 33 of this Discharge Permit." There is no Condition 33 in the draft discharge permit modification.

Thank you for your consideration of these comments. If you have any questions or wish to discuss any of these comments, contact Daryl Mercer at (505) 234-8172 or (505) 234-7452.

Sincerely,

David C. Moody

Subject: Required Actions Due to Precipitation at WIPP

Dear Mr. Marshall:

The purpose of this letter is to confirm yout telephone conversation with Waste Isolation Pilot Plant personnel on September 5, 2006. We agreed to provide written documentation regarding the impact of significant precipitation received at the WIPP site between September 1 and 4, 2006, and the planned corrective actions.

Between September 1 and September 4, 2006, the WIPP site received 4.38 inches of precipitation over four days. Run off from the Plant and the covered Salt Pile was collected in Evaporation Pond 1, Evaporation Pond 2, Evaporation Pond A, and the Salt Pile Evaporation Pond. These Ponds collect rainfall that does not contain salt. The Salt Storage Extension Evaporation Basin collects runoff that contains salt.

Accumulation of precipitation in Evaporation Pond 2 resulted in this pond exceeding its capacity and overflowing. The overflow from Evaporation Pond 2 occurred through an area approximately 15 feet wide on the west side of the pond. The discharge from this pond is not believed to have consisted of a significant volume of water because of the limited area that contained standing water. There was no erosion of the pond bank caused by the discharge.

On September 5, 2006, remaining evaporation ponds and basins at the WIPP site had the following approximate remaining freeboard:

- Evaporation Pond 1, eight inches
- Evaporation Pond 2, no additional capacity
- Evaporation Pond A, eight inches
- Salt Storage Extension Evaporation Basin, eight inches
- H-19 Evaporation Pond, four feet
- Sewage Lagoons, 40 inches
- Salt Pile Evaporation Pond, four inches

The freeboard for the Salt Pile Evaporation Pond is different from the three foot estimate we provided you on September 5, 2006. A re-evaluation has determined that the collection point where the run-off from the parking lot enters this pond, at the junction of the Salt Pile Run-off Ditch and the Salt Pile Evaporation Pond, is the area of the pond at the lowest elevation and that there is approximately four inches of freeboard at that point.

CBFO:AMO:DM:KJB:06-0583:UFC5486

Following consultation with you, DOE is implementing corrective measures to pump sufficient water out of Evaporation Ponds 1 and 2 into Evaporation Pond A, providing approximately two feet of freeboard in Evaporation Ponds 1 and 2. This will allow for the accumulation of precipitation in Ponds 1 and 2 in the event of additional rainfall. Additionally, if Evaporation Pond A should overflow, the discharge will be through the engineered overflow spillway of Pond A to the roadside drainage ditch adjacent to the WIPP access road that drains to the south. This roadside ditch is not hydrologically connected to any surface waters.

We believe the remaining freeboard available in the Salt Pile Evaporation Basin and Cell A of the salt storage pile is sufficient to accommodate additional rain, however, in the event that an overflow becomes imminent, we will notify your office to discuss options available to manage this water.

Additionally, we informed you that the berms we have constructed on the north and south side of the covered salt pile were effective in diverting water to the armored discharge chutes constructed to limit damage to the soil cover of the original Salt Pile. However, this rainfall event caused erosion in the form of rilling resulting in the deposition of sediment in the Salt Pile Run-off Ditch on the south and east sides of the salt pile. Sediments will be removed from the Salt Pile Run-off ditches and repairs will be made to the soil covering of the salt pile in a timely manner pending the soils drying out enough to allow work with heavy equipment.

If you have any questions pertaining to this matter, please call me at (505) 234-8172.

Sincerely,

Daryl Mercer

November 24, 2009

Mr. Marshall, this email is to follow-up on the discussion held via a telephone call on Friday, November 20, 2009.

A call was placed to your office, which you returned to, Stewart Jones of WRES, on this date. The purpose of the call was to inform you that WIPP procurement contracting actions were underway to accomplish the reclamation activities of the covered salt pile, as noted in your approval letter on October 15, 2009.

What we would like to bring to your attention is that after awarding a contract to complete the Salt Storage Evaporation Basin II (SSEB II), the WIPP requests to implement "lessons learned" from this project, into the contract for the covered salt pile. An example is that the bidders were provided 14 days to provide their SSEB II bids. We would like to lengthen this time to allow for more precise bids. Due to this bid preparation time, allowed for the SSEB II, there were required modifications and contract negotiations during construction of the pond. Had more time been provided to the contractors in developing their bids, in all likelihood, elimination of some contract modifications required during the project, could have been eliminated.

Also, as part of our procurement cycle, the anticipated timeframe of your office's approval (≈30 days) was to be applied to the procurement time to award the contract. When the timelines were developed to award the contact, WIPP did not account for a brief approval time by your office. The review time by your office was going to be applied to the contract preparation and award timeframe. Thus, adequate time is needed to complete contracting efforts.

The goal of the project remains unchanged, that is, to Control Storm Water and Minimize Erosion on the Covered Salt Pile before the seasonal rains of late summer. When the Semi-annual DP-831 Report is transmitted to your office by January 31, 2010, additional information related to this project will be provided.

If you have any questions please call Mr. Dan Ferguson at 575.234.8128.

Notice to the Waste Isolation Pilot Plant Facility Mailing List

On May 28, 2009, the Waste Isolation Pilot Plant Permittees, the U.S. Department of Energy Carlsbad Field Office and Washington TRU Solutions, submitted the Waste Isolation Pilot Plant Hazardous Waste Facility Permit Renewal Application (Renewal Application) to the New Mexico Environment Department (NMED). The Permittees received extensive comments related to the Renewal Application. To address important comments received on the Renewal Application and expedite the renewal application process, the Permittees requested an extension from NMED to submit an amended Renewal Application on August 19, 2009.

NMED granted the request and set a date of September 25, 2009, to submit an amended Renewal Application. The Permittees met that date and submitted their Amended Renewal Application on September 25, 2009.

The changes requested in the amended Renewal Application are limited to:

- Authorization to dispose of transuranic mixed-waste in Panel 8
- Inclusion of the WIPP Mine Ventilation Rate Monitoring Plan

Additionally, the Permittees provided new and or revised information required of all applications.

The Waste Isolation Pilot Plant Hazardous Waste Facility Permit Amended Renewal Application, September 2009, can be viewed on the Waste Isolation Pilot Plant webpage: http://www.wipp.energy.gov/library/rcrapermit/Final_Renewal_Application_9_09.htm.

RE: Approval of the Plan and Conceptual Design for Controlling Storm Water and Minimizing Erosion on the Covered Salt Pile, DP-831, DOE Waste Isolation Pilot Plant

Dear Mr. Moody:

The Ground Water Quality Bureau of the New Mexico Environment Department (NMED) has received the letter titled, *Conceptual Design for Controlling Storm Water and Minimizing Erosion on the Covered Salt Pile* (Letter) dated October 14, 2009. In the Letter, the U.S. Department of Energy (DOE) provides a design to construct additional controls to divert storm water off the Salt Pile, which has led to significant erosion of the cover in the past. The October 14, 2009 letter serves as a follow-up to the initial proposal titled, *Plan for Controlling Storm Water and Minimizing Erosion on the Covered Salt Pile* (Plan) submitted by the DOE on March 6, 2009. The Plan provided an evaluation of various alternatives for controlling storm water and minimizing erosion on the Salt Pile, and recommended a basic design for accomplishing the task. The submittal of these documents fulfills the requirements of Condition 6 of the Discharge Permit Renewal and Modification dated September 9, 2008. The WIPP facility is located 26 miles east of Carlsbad in Sections 20, 21, 28 and 29, T22S, R31E, Eddy County.

The proposed Plan and Letter for improvements of the Salt Pile includes 1) the construction of two new run-off chutes, 2) additional berms and top surface regrading to direct storm water to the chutes and off the top of the pile, and 3) the reestablishment of vegetation on the cover.

NMED hereby approves the Plan and Conceptual Design to control storm water and minimize erosion on the Salt Pile described in the letters dated March 6, 2009 and October 14, 2009. Upon completion of the work, the DOE must submit as-built plans of the improvements to NMED. If at any time in the future the DOE intends to make significant changes to the design, the DOE is required to notify NMED prior to implementing the changes.

If you have questions, please contact me at 505-827-0027 or by e-mail at clint.marshall@state.nm.us.

Sincerely,

Clint Marshall, Permit Lead

RE: Discharge Permit Amendment Approval, DP-831, Increase in Storage Capacity of the Salt Pile Evaporation Pond, DOE Waste Isolation Pilot Plant

Dear Mr. Moody:

The Ground Water Quality Bureau of the New Mexico Environment Department has received the letter titled, *Corrected DP-831 Amendment Request to Increase the Capacity of the Salt Pile Evaporation Pond* (Letter) dated September 30, 2009. In the Letter, the U.S. Department of Energy (DOE) requests the amendment of the Discharge Permit 831 (DP-831) to increase the capacity of the Salt Pile Evaporation Pond (SPEP) at the Waste Isolation Pilot Plant (WIPP) by redirecting storm water and raising the berm on the pond. The WIPP facility is located 26 miles east of Carlsbad in Sections 20, 21, 28 and 29, T22S, R31E, Eddy County.

The Amendment of DP-831 is described as follows.

The DOE proposes to increase the capacity of the SPEP to fully utilize the total volume of the pond allowing for one foot of freeboard. This will be accomplished by increasing the height the berm encompassing the pond by 2.5 feet. Rather than raise the entire berm elevation, the increase will be achieved by filling in a low area with fill material and covering it with a high density polyethylene (HDPE) liner. This will provide an additional 1.5 feet before reaching the required one foot freeboard level. The low area in the berm currently serves to catch storm water runoff from the west parking area located south of the SPEP.

Once the berm is raised, the ground surface south of the SPEP and north of the parking lot will be regraded to divert storm water runoff from approximately four acres of the parking lot in a westerly direction to an area of undisturbed land located west of the SPEP. The storm water to be diverted by these activities will be unaffected by salt storage activities.

Pursuant to the Water Quality Control Commission (WQCC) Regulations (20.6.2 NMAC) this request to amend DP-831 for the above referenced facility is hereby approved, subject to the conditions listed below. The renewal and modification of DP-831 was approved on September 9, 2008. In approving this Discharge Permit Amendment, NMED has determined that the requirements of 20.6.2.3109 NMAC have been met.

AMMENDED PERMIT CONDITIONS

Condition 2e of the current September 9, 2008 Discharge Permit Renewal and Modification, DP-831, shall be revised as follows.

Permitted Discharge Flow Rates

2. During the term of this Discharge Permit Renewal and Modification, the DOE shall manage discharges as follows. [20.6.2.3109 NMAC]

   e. The DOE is permitted to collect storm water runoff from the Salt Pile to the Salt Pile Evaporation Pond (SPEP) at a designed flow of 1,677,633 gallons per day based on a 25 year/24 hour storm event (3.90 inches). The pond capacity is 5,403,305 gallons not allowing for any freeboard.

ADDITIONAL PERMIT CONDITIONS

The following condition shall be added per this amendment to DP-831.

1. Within 90 days of completing the construction activities to increase the capacity of the SPEP and regrade the surrounding areas to divert storm water runoff, the DOE shall submit as-built plans to NMED. The plans shall show the improvements made the SPEP and the post-grade surface topography of the areas south and west of the SPEP where storm water will be diverted. [20.6.2.3109 NMAC]

OTHER REQUIREMENTS

The terms and conditions contained herein and those in the Discharge Permit that remain unchanged shall be complied with by the DOE and are enforceable by NMED pursuant to 20.6.2.3104 NMAC and NMSA 1978 74-6-5 and 75-6-10. Please be advised that this Discharge Permit Amendment does not relieve the DOE of liability should its operation result in actual pollution of surface or ground water which may be actionable under other laws and/or regulations.

PERIOD OF APPROVAL

Pursuant to 20.6.2.3109.H.4 NMAC, the term of this Discharge Permit Amendment for the DP-381 shall be the same as the remaining term of the Discharge Permit DP-831, which will expire on September 9, 2013. The DOE must submit an application for renewal at least 120 days before the permit expiration date. The timely submission of the renewal request keeps the permit and this amendment active until the renewal process is complete in accordance with 20.6.2.3106.F NMAC.

Approval of this Discharge Permit Amendment does not relieve the DOE of its responsibility to comply with the Water Quality Act (WQA), the WQCC Regulations, and any other applicable federal, state, and/or local laws and regulations.

If at any time in the future the DOE intends to change the disposition of any discharge relating to this amendment, the DOE is required to notify NMED prior to changing the discharge.

Please contact Clint Marshall of the Mining Environmental Compliance Section at 505-827-0027 with any questions.

Sincerely,

William Olson, Chief
Ground Water Quality Bureau

Subject: Conceptual Design for Controlling Storm Water and Minimizing Erosion of the Covered Salt Pile

Reference: DOE Memorandum CBFO:OPC:DF:MAG:09-0226:UFC:5486.00 from Dr. D. C. Moody to Mr. W. Olson, dated March 6, 2009, Subject: Plan for Controlling Storm Water and Minimizing Erosion of the Salt Pile

Dear Mr. Olson:

The purpose of this letter is to provide you with the conceptual design for controlling storm water and minimizing erosion on the covered salt pile in accordance with the commitment made in the March 6, 2009 letter referenced above. The enclosed figure illustrates the following improvements for controlling storm water and minimizing erosion:

- Installation of two new run-off chutes (one on the southwest corner and one on the southeast corner of the salt pile). The chutes will be similar in material and construction to the existing chutes.
- Additional berms will be constructed to aid in directing storm water flow to the four run-off chutes. The berms will be of similar construction to the existing berms.
- Grading will be performed to direct flows to the run-off chutes.
- Vegetation will be reestablished in the disturbed areas.

The conceptual design redefines the water shed of the salt pile and creates distinct flow paths for the run-off to the Salt Pile Evaporation Pond or Salt Storage Extension Basin. The enclosed figure contains arrows illustrating the post grading flows across the top of the salt pile. The conceptual design is expected to minimize erosion and control storm water runoff. Periodic maintenance will still be required on the salt pile cover due to erosion processes. During construction and following completion of the enhancements to the salt pile, the Permittee will continue efforts to identify efficiencies and improvements in controlling storm water and minimizing erosion and protecting groundwater.

Upon your approval of this plan, the design will be finalized and procurement of services to implement the design will be initiated.

If you have any concerns or need additional information regarding this matter, please contact Mr. Dan Ferguson at (575)234-8128.

Sincerely,

David C Moody

David C. Moody

Subject: Corrected DP-831 Amendment Request to Increase the Capacity of the Salt Pile Evaporation Pond

Dear Mr. Marshall:

This letter is intended to replace the August 21, 2009 request for an amendment to the Discharge Permit, DP-831, for the Department of Energy (DOE) Waste Isolation Pilot Plant (WIPP) facility located 26 miles east of Carlsbad, NM. The DOE requests to raise the berm on the south side of the Salt Pile Run-off Ditch to an elevation equivalent to the height of the south berm of the Salt Pile Evaporation Pond (SPEP). This will result in allowing the full capacity of the Salt Pile Evaporation Pond to be used. Currently, water would back up in the Salt Pile Run-off Ditch and overflow prior to the SPEP capacity being reached. The total capacity of the pond is approximately 722,400 cubic feet (5,403,350 gallons). The primary change in the discharge is the diversion of approximately 4 acres of the SPEP's drainage area to an area west of the SPEP.

This will be accomplished by increasing the berm height of the Salt Pile Run-off Ditch approximately two and a half feet at the lowest point. This will be accomplished by filling in a low area in the ditch with soil and covering the filled area with a High Density Poly Ethylene (HDPE) liner.

Once the berm is raised, we propose to regrade the soil area south of the SPEP and north of the parking lot to divert run-off from approximately four acres of the parking lot area west of the SPEP and then north into undisturbed terrain. The first page of the enclosure (Vicinity Map) shows the location to be graded relative to the covered salt pile and SPEP as the area enclosed with heavy dotted lines. The second page of the enclosure (SPEP Drainage Channel) shows the details as a conceptual post grading topographic survey with the arrows showing the direction of water flow. The water diverted in this manner will be storm water that is unaffected by the salt storage activities. If the final "as-built" elevation of the new berm or pond capacity differs from the proposed elevation and capacity, we will notify your office to revise this amendment request.

If you have any concerns or need additional information regarding this request for an amendment, please call me at 575-234-8128.

Sincerely,

Dan Ferguson
Site Regulatory Specialist

Subject: Schedule for the Installation of New Liners in Evaporation Ponds A and B at the WIPP Sewage Treatment Facility

Reference: D. C. Moody to William Olson, *Corrective Action Report for the WIPP Sewage Lagoon*, March 3, 2009

Dear Mr. Marshall:

The purpose of this letter is to notify you that the installation of the new liner in Evaporation Pond B will be completed on schedule by September 30, 2009. However, rain storms in September have resulted in a delay of the completion of liner installation in Evaporation Pond A, completion is now expected in early October 2009.

As noted in the referenced letter, we had proposed to complete the liner replacement in both ponds during fiscal year 2009. In the event the installation of the new liner in Evaporation Pond A cannot be completed by October 31, 2009, we will notify your office of any additional delay time.

If you have any concerns or need additional information regarding this matter, please call me at 575-234-8128.

Sincerely,

Dan Ferguson

Subject: Schedule for Construction of the New Salt Storage Extension Basin

Dear Mr. Marshall:

The purpose of this letter is to provide you with a construction schedule for the new Salt Storage Extension Basin (SSEB-II) in accordance with your letter dated July 15, 2009, and a summary of the work conducted to date. The construction contractor was mobilized on July 27, 2009. The SSEB-II location was surveyed and staked between July 30 and August 3, 2009. Excavation began on August 6, 2009. Approximately 150,000 cubic yards of soil will be removed to excavate the pond. Excavation is anticipated to be completed about October 28, 2009.

The primary 60 mil High Density Polyethylene (HDPE) liner, the 200 mil geonet drainage layer, and then the secondary 60 mil HDPE liner will be installed. As much of the liner system that can be installed will be installed; however, it is necessary to leave enough unlined area to allow room to excavate and install two 12-inch culverts to connect the existing SSEB with the SSEB-II.

If the Discharge Permit Modification for the SSEB-II has not been approved by the time it is necessary to connect the two ponds, the Department of Energy will request a temporary authorization to discharge for up to 120 days in accordance with 20.6.2.3106.B. NMAC. This will authorize the transfer of water from the SSEB to the SSEB-II to facilitate completion of the culvert installation. Following installation of the culverts and back filling the berm, the liner installation in the SSEB-II will be completed. Assuming no issues with the weather or contractor resources, the construction of the new pond is projected to be completed by February 28, 2010.

If you have any questions or need additional information regarding the above projects, please contact me at (575) 234-8128.

Sincerely,

Daniel J. Ferguson
Site Regulatory Specialist

State Capitol, Room 400
Santa Fe, NM 87501

Mr. Doug Burger, District Manager
United States Department of Interior
Bureau of Land Management
Pecos District Office
2909 W. Second Street
Roswell, NM 88201-2019

Subject: Consultation Regarding the Viable Sale of Salt Tailings at the Waste Isolation Pilot Plant

Dear Governor Richardson and Mr. Burger:

This letter is to notify you that the U.S. Department of Energy (DOE) Carlsbad Field Office (CBFO) through the managing and operating contractor for the Waste Isolation Pilot Plant (WIPP) site, Washington TRU Solutions (WTS), intends to sell excess salt tailings generated by mining activities at the WIPP to Magnum Blue Ribbon Feeds, Inc. (Magnum), a Texas-based cattle feed company. This letter is being written pursuant to Section 4 of the WIPP Land Withdrawal Act (LWA) that requires that the Secretary of Energy consult the Secretary of the Interior and the State of New Mexico in discharging its responsibilities pursuant to managing the LWA.

Section 4 (b)(4) of the WIPP LWA provides that the Secretary of Energy shall dispose of salt tailings extracted from the withdrawal that the Secretary of Energy determines are not needed for backfill at WIPP and that the disposal of such tailings shall be made under §§2 and 3 of the Act of July 31, 1947 (30 U.S.C. §§602, 603; commonly referred to as the "Materials Act of 1947"). Under the Materials Act, DOE is required to dispose of excess salt tailings to the highest responsible qualified bidder after formal advertising unless the tailings can be used for a federal, state and local government works program for which a public exigency precludes formal advertising or it is otherwise impracticable to obtain competition for them. WTS formally issued an expression of interest letter to four prospective buyers. Magnum was the only qualified bidder to respond to the expression of interest.

Mining activities at the WIPP facility result in approximately 2,000 tons per week of salt tailings being excavated when mining operations are in progress. These tailings are brought to the surface and stored in a high density polyethylene lined, uncovered area (Cell B). The staging area for buyer pickup of the excess salt tailings would be located at the existing active salt tailings storage area (Cell B). Truck/trailers belonging to the buyer would be provided access to the staging area via existing roads. The buyer would be responsible for constructing a ramp over an existing berm to gain access to the salt storage area. This constructed ramp would allow the buyer separate access to the staging area without interacting with the site traffic (e.g., trucks hauling salt tailings from the salt skip to Cell B), impinging upon the WIPP Property Protection Area, or otherwise impacting existing site infrastructure or operations. The buyer would be responsible for loading the salt tailings into their trucks and then transporting the material offsite. No processing of the salt tailings would be allowed within the WIPP Land Withdrawal Area. Other than the new ramp, no new facilities would be constructed in conjunction with the

CBFO:ORC:SEM:SES:09-0295:UFC 1000.00

sale of the salt. A review of the potential environmental impacts of the sale of the salt tailings was conducted and a summary of that review is provided in an enclosure to this letter. Also enclosed is a site map showing the locations of Cell B and the proposed access ramp.

The sale of excess salt tailings from mining at WIPP to commercial interests will result in significant cost savings to the DOE. It will reduce the level of DOE resources presently required to manage excess salt tailings and, ultimately, will reduce costs to remediate the salt tailings storage area at the time of WIPP closure. The sale of excess salt tailings will help to minimize the potential for brine discharge to the subsurface thereby reducing the risk of future shallow subsurface water degradation.

WTS, on behalf of the CBFO, will begin the process of releasing salt tailings to Magnum as soon as practicable given the need to complete contracting agreements and the construction requirements previously mentioned.

If you have any comments or questions regarding this sale, please contact Ms. Susan McCauslin at (575) 234-7349.

Sincerely,

for David C. Moody
Manager

Summary of Environmental Review – Salt Tailings Sale

Review of Existing NEPA Documentation

A review of the environmental impacts associated with the construction and operation of the WIPP facility can be found in the Waste Isolation Pilot Plant Final Environmental Statement (FEIS) (DOE/EIS-0026) and the Waste Isolation Pilot Plant Disposal Phase Supplemental Environmental Impact Statement (SEIS-II) (DOE/EIS-0026-S-2). The management and disposition of excavated salt tailings at the WIPP facility is addressed in the SEIS-II. Review of the subject document finds that one of the disposition pathways considered for unneeded salt tailings is to sell it in accordance with the Materials Act (see pp. 3-10, 3-15, 4-6, 5-6 of the SEIS-II).

Environmental Impacts

Construction-Related Activities: Implementation of the proposed action would require the construction of a ramp over an existing berm to the active salt tailings storage area (Cell B). The purpose of this ramp would be to provide buyer access to the salt tailings storage area without impinging upon the WIPP Property Protection Area or impacting existing site infrastructure or operations. Review of available data finds that there are no environmentally sensitive resources (e.g., threatened and endangered species, critical habitat, and archaeological/ cultural resources) in the area of the proposed ramp. Assuming implementation of appropriate best management practices (BMP's) (e.g., soil erosion control and spill prevention control), construction of the ramp would not significantly impact human health or the environment.

Truck Traffic: The proposed action would allow buyer truck/trailers separate access to the salt tailings storage area without interacting with onsite traffic involved with the receipt of TRU waste or hauling mined salt tailings from the skip to Cell B. Assuming that salt tailings dumping and pickup operations occurred in separate locations within the salt tailings storage area, the potential for interaction or accidents between the respective traffic streams would be negligible.

The North Access Road, which connects the WIPP facility to U.S. Highway 62/180, was constructed to provide access for employees and heavy transports bringing TRU waste to the facility. The traffic on this road presently averages approximately 800 vehicles per day. Only two percent of this traffic volume involves heavy haul trucks. It is estimated that up to 96 trucks per week may be required to transport excess salt tailings offsite. This new traffic stream would not interact with onsite traffic and would easily be accommodated by the existing area road system (e.g., North Access Road, U.S. Highway 62/180 or the South Access Road, Highway 128). The environmental impacts of increased truck traffic associated with the proposed action would be negligible.

Air Quality: Air emissions associated with the proposed action (e.g., fugitive dust, airborne particulates and engine exhaust) would result from ramp construction activities and the loading/transport of salt tailings by the buyer. Construction-related activities would result in fugitive dust and engine exhaust emissions. The environmental impacts of these air emissions would be transient and limited to the project area. If required, these impacts could be partially mitigated by the application of appropriate Best Management Practices (e.g., wetting the road surface during construction). The proposed loading and transport of excess salt tailings by the buyer would result in the generation of airborne particulates and engine exhaust emissions. The environmental impacts of these air emissions would be limited to the project area and would not pose an unacceptable and adverse impact on air quality. Engine exhaust emissions associated with the loading and subsequent transport of salt tailings would have a negligible impact on area air quality.

Water Quality: Implementation of the proposed action reduces the quantity of salt tailings stored on site and will not adversely impact surface or ground water quality. The proposed action may in fact minimize the potential future contribution of brine discharge to the subsurface thereby reducing the risk of future shallow subsurface water degradation.

Other Impacts: The sale of excess salt tailings to commercial interests would reduce the level of DOE resources required to manage excess salt tailings and, ultimately, to remediate the salt tailings storage area at the time of WIPP closure.

Conclusion and Recommendation: Although implementation of the proposed action would result in airborne emissions resulting from ramp construction and the loading/transport of excess salt tailings, the incremental and cumulative impacts of these activities on the human environment are negligible. Additionally, reduction in the amount of salt tailings in storage as the result of the sale of excess salt tailings may result in significant cost savings to the DOE and will partially mitigate potential degradation of subsurface water from brine discharges. Accordingly, the proposed action will be tiered back to DOE/EIS-0026-S-2. No further NEPA review is required.

Subject: DP-831 Amendment Request to Increase the Capacity of the Salt Pile Evaporation Pond

Dear Mr. Marshall:

The purpose of this letter is to request an amendment to the Discharge Permit, DP-831, for the Department of Energy (DOE) Waste Isolation Pilot Plant facility located 26 miles east of Carlsbad, New Mexico. The DOE requests to modify the Salt Pile Evaporation Pond (SPEP) to increase the available water storage capacity from approximately 200,000 cubic feet with one foot of freeboard to approximately 494,000 cubic feet with one foot of freeboard. This will be accomplished by increasing the berm height approximately two and a half feet by filling in a low area with soil and covering the filled area with a High Density Polyethylene liner, thereby providing an additional 1.5 feet of capacity before reaching the one foot freeboard level.

Once the berm is raised, we propose to regrade the soil area south of the SPEP and north of the parking lot to divert run-off from approximately four acres of the parking lot area west of the SPEP and then north into undisturbed terrain. The first page of the enclosure (Vicinity Map) shows the location to be graded relative to the covered salt pile and SPEP as the area enclosed with heavy dotted lines. The second page of the enclosure (SPEP Drainage Channel) shows the details as a conceptual post grading topographic survey with the arrows showing the direction of water flow. The water diverted in this manner will be storm water that is unaffected by the salt storage activities. If the final "as built" elevation of the new berm or pond capacity differs from the proposed elevation and capacity, we will notify your office to revise this amendment request.

If you have any concerns or need additional information regarding this request for an amendment, please call me at 575-234-8128.

Sincerely,

total

CARLSBAD FIELD OFFICE
SURVEILLANCE PLAN

Surveillance Number:	S-09-28	
Organization to be: Surveilled	Washington TRU Solutions LLC (WTS)	
Date and Location of Surveillance:	September 8 – 10, 2009 Waste Isolation Pilot Plant (WIPP) Site Offices	
Surveillance Team:	M. Lea Chism	Carlsbad Field Office (CBFO) Management Representative
	Paul C. Gomez	Surveillance Team Leader, CBFO Technical Assistance Contractor (CTAC)
	Nick Wade	Team Member, CTAC

Surveillance Scope:

The surveillance will verify the adequacy and implementation of the WTS Quality Assurance Program with respect to DP-831 procurement activities in accordance with CBFO documents. The surveillance will also evaluate and verify the implementation and effectiveness of WTS procurement services and engineering implementing processes.

Activities to be Surveilled:

- Procurement
- Control of the Discharge Permit

Governing Documents/Requirements:

The overall adequacy of WTS documents will be assessed based on DOE/CBFO-94-1012, Rev. 10, *Quality Assurance Program Document*. The Discharge Permit, DP-831, will be used as a reference.

Checklists or annotated procedures based on the active revision of WTS implementing Procedure 02-EC.07, *WIPP Affirmative Procurement Plan*, will be used for the surveillance.

In addition, the following selected support functions will be evaluated and verified:

- Quality Assurance Oversight (specific questions in each checklist)
- Management Oversight and Control (specific questions in each checklist)
- 02-EM3001, *Administrative Processes for Environmental Monitoring and Hydrology Programs* (only environmental monitoring program)

Schedule of Surveillance Activities:

A presurveillance meeting is scheduled at 8:30 a.m. Tuesday, September 8, 2009 in the Support Building LCR at the WIPP site.

Management briefings will be held at 9:00 a.m. Wednesday and Thursday, September 9 and 10, 2009, in the Safety Building Mine Rescue Room at the WIPP site.

Daily surveillance team caucus meetings will be held at 3:00 p.m. Tuesday and Wednesday, September 8 and 9, 2009, in the Safety Building Mine Rescue Room at the WIPP site, and at 1:00 p.m. Thursday September 10, 2009, to evaluate surveillance progress, concerns, and logistics.

A postsurveillance meeting will be held at 2:00 p.m., Thursday, September 10, 2009, in the Support Building LCR at the WIPP site.

Marshall, Clint, NMENV

To: Ferguson, Daniel - DOE
Subject: RE: Berm Located Next to Salt Pile Evaporation Pond

Dan,

NMED approves your request to begin construction activities associated with raising the berm on the Salt Pile Evaporation Pond (SPEP) as described in your July 23, 2009 e-mail below. This approval is contingent on the forthcoming letter requesting an amendment to DP-831 allowing this project to be completed and put into operation. Please contact me if the situation changes or if you have questions.

Clint Marshall
Mining Environmental Compliance Section
Ground Water Quality Bureau
New Mexico Environment Department
505-827-0027

From: Ferguson, Daniel - DOE [mailto:daniel.ferguson@wipp.ws]
Sent: Thursday, July 23, 2009 8:50 AM
To: Marshall, Clint, NMENV
Cc: Jones, Stewart; Roush, Parrish
Subject: Berm Located Next to Salt Pile Evaporation Pond

Clint,

This e-mail is being sent to document the portion of our phone conversation on July 21, 2009 relevant to raising the berm on the Salt Pile Evaporation Pond to increase the pond capacity. The pond was designed with a low area in the south east corner where the Salt Pile Run-off Ditch enters the pond. The low area was an engineered feature for the collection of storm water run-off from approximately 4 acres of the north portion of the site parking lot. The bottom of the pond is at an elevation of 3408 feet. The overflow point in the low area is at an elevation of approximately 3410.5 feet placing the one foot freeboard elevation at approximately 3409.5 feet.

Increasing the berm height to approximately 3412 feet by filling in the low area with soil and covering it with HDPE will provide an additional 1.5 feet before reaching the one foot freeboard level. The soil area south of the SPEP berm and north of the parking lot will be graded to divert run-off from approximately 4 acres of the parking lot west of the SPEP and then north into undisturbed terrain..

During the phone conversation on July 21, 2009, you stated that your office had determined that this modification could be made by requesting an amendment to the permit rather following the permit modification process. The DOE will follow up with a letter requesting the amendment in the near future. In the interim we appreciate your verbal approval to conduct the work if contractor availability should be available to support this project.

Between relining the sewage lagoons, constructing the SSEB-II, and raising the SPEP berm we appreciate having the flexibility to be able to begin this project should contractor availability become available prior to the amendment request being officially approved by your office.

Thanks for your assistance in this matter,

Dan Ferguson, CBFO

RE: Approval of Engineering Drawings for the New Salt Storage Evaporation Basin and Extension Approval to Submit Updated Construction Schedule and Project Completion Date, DP-831, Waste Isolation Pilot Plant

The Ground Water Quality Bureau of the New Mexico Environment Department (NMED) has reviewed the letter titled, *Proposed Engineering Modifications and Schedule for Corrective Actions for Salt Contact Run-off into the Salt Storage Evaporation Basin*, submitted by the U.S. Department of Energy (DOE) on May 28, 2009. The letter requests approval of engineering design drawings and an amended construction schedule for a new evaporation pond to increase the storage capacity and evaporative surface area of the Salt Storage Extension Basin (SSEB). The pond will be constructed at the DOE's Waste Isolation Pilot Plant (WIPP) facility located approximately 26 miles east of Carlsbad, New Mexico in Sections 20, 21, 28 and 29, T22S, R31E, Eddy County.

In a letter dated December 24, 2008, the DOE committed to present NMED with proposed engineering modifications to minimize the likelihood of the loss of freeboard or overflow of the SSEB and a preliminary schedule of construction activities by May 15, 2009. The DOE met this requirement at a meeting with NMED on May 12, 2009. In addition to the information presented to NMED at the meeting, the DOE committed to submit updated design drawings for the new evaporation basin (SSEB-II) for NMED approval, which were enclosed with the May 28, 2009 letter. DOE's December 24, 2008 letter also indicated that the SSEB-II would likely be completed by the end of August 2009, and a schedule for completion of the project would be submitted to NMED by June 12, 2009. NMED issued a Notice of Violation (NOV) to the DOE on March 3, 2009, requiring the DOE to complete the corrective actions proposed in the December 24, 2008 letter by August 31, 2009.

The SSEB-II that is proposed to be constructed is a double synthetically lined 4-acre evaporation pond with a leak detection system designed to expand the storage and evaporation capacity of the existing SSEB. The combined storage capacity of both ponds together will be 1,300,000 cubic feet equaling approximately 3.5 times the 25-year, 24 hour storm event. The pond was sized estimating the evaporation rate of the saturated brines to be 70% of the evaporation rate of fresh water.

Based on the information presented at the May 12, 2009 meeting, and the information enclosed in the May 28, 2009 letter, the scope and magnitude of the corrective actions has increased significantly since the initial December 24, 2008 letter was submitted to NMED. Therefore, the DOE is seeking NMED approval for the following requests.

1. Approval is requested for Engineering Design Drawings 23-2-014-W1, 23-2-014-W2, 23-2-014-W3 for the SSEB-II. This will allow the DOE to begin construction on the evaporation ponds prior to receiving a discharge permit modification.

2. Relief is requested from the June 12, 2009 submittal date for an updated construction schedule as initially proposed in DOE's December 24, 2008 letter. The DOE proposes to submit a revised construction schedule once a successful bid is received for the project and in no case later than August 31, 2009.

3. Relief is requested from the August 31, 2009 deadline to complete pond construction as set forth in the NOV dated March 3, 2009. A new project completion date will be proposed in the revised construction schedule described in Item 2 above.

Pursuant to 20.6.2.1203A(7), NMED hereby approves the requests for the corrective action modifications described above. If additional information becomes available indicating these corrective actions are inadequate, then additional actions may be required. Approval of these corrective action modifications does not relieve you of your responsibility to comply with any other applicable federal, state and/or local laws and regulations.

If you have any questions, please contact Clint Marshall of the NMED Mining Environmental Compliance Section at 505- 827-0027.

Sincerely,

Clint Marshall, Hydrogeologist

Subject: Proposed Engineering Modifications and Schedule for Corrective Actions for Salt Contact Run-off into the Salt Storage Evaporation Basin

Reference: DOE Letter CBFO:AMO:HLP:KJB:08-1426:UFC5486 from Dr. D. C. Moody to Mr. C. Marshall dated December 24, 2008, Subject: *Schedule for Permanent Corrective Actions for Salt Contact Run-off into the Salt Storage Extension Evaporation Basin*

NMED Letter dated March 3, 2009 from William C. Olson to David C. Moody RE: *Notice of Violation, DP-831, U.S. Department of Energy Waste Isolation Pilot Plant*

Dear Mr. Olson:

The purpose of this letter is to provide the Ground Water Quality Bureau (GWQB) with the following:

a) updated drawings and engineering calculations for the proposed construction of a new evaporation pond,
b) provide justification for an extension to the August 31, 2009 completion date for the construction of a new pond noted in the March 3, 2009 NOV, and,
c) notify the GWQB that an updated schedule for construction will be provided promptly following the receipt of a schedule from the contractor which is not likely to occur by the June 12, 2009 date committed to in the December 24, 2008 letter.

In the December 24, 2008 letter, *Schedule for Permanent Corrective Actions for Salt Contact Run-off into the Salt Storage Extension Evaporation Basin*, the Department of Energy (DOE) committed to present the GWQB the proposed engineering modifications to minimize the likelihood of the loss of freeboard or overflow of the Salt Storage Evaporation Basin (SSEB) and a preliminary schedule of activities by May 15, 2009. In order to meet this commitment, the DOE met with Mr. C. Marshall of the GWQB on May 12, 2009. The proposed

CBFO:ORC:DF:SES:09-0257:UFC5486

modification to construct an additional pond for the collection and evaporation of salt contact storm water run-off from the Salt Storage Extension Area was presented. In addition, DOE provided the GWQB with preliminary copies of drawings, a water balance, preliminary schedule of activities, and provided a general explanation of various aspects of the new design for the additional evaporation pond.

At the May 12, 2009 meeting, the agreement was reached that DOE would provide the GWQB with a letter and updated drawings for approval. The letter was to note that a permit modification would follow the GWQB's approval and provide a justification for an extension to the August 31, 2009 completion date for the corrective actions noted in the March 3, 2009 Notice of Violation.

Enclosed are drawings (23-2-014-W1, 23-2-014-W2, and 23-2-014-W3) and the design calculations for determining the size of the proposed evaporation pond. The new pond provides approximately four acres of additional evaporative surface area. The new pond, in conjunction with the existing evaporation pond, will provide the storage capacity for 1,300,000 cubic feet of water (approximately 3.5 times the 25-year, 24 hour storm event). The new pond was sized based on a water balance evaluating three years of monthly average rainfall and estimating the evaporation rate of the saturated brines to be 70 percent of the evaporation rate of fresh water. One 25 year/24 hour rainfall event of 3.9 inches results in the accumulation of 368,000 cubic feet of water.

DOE stated in the December 24, 2008 letter that efforts would be directed to complete this project by the end of August 2009 and proposed to provide the GWQB a schedule for completion of the project by June 12, 2009. However, the GWQB issued a Notice of Violation dated March 3, 2009 requiring these corrective actions be completed by August 31, 2009. During the design development it became apparent that the new double lined pond with leak detection would require a large surface area and storage capacity due to the slower evaporation rate for salt water. The increased size and corresponding higher cost has resulted in estimated schedules that will most likely extend into late fall.

A schedule has been estimated by DOE based on previous work of a similar nature; however, this involves making certain assumptions about the successful bidder's resources and time required for mobilization. This schedule assumes that a qualified successful bid is received and no weather interruptions occur during the project. For these reasons, DOE requests relief from the August 31, 2009 date for completion of this project set forth in the Notice of Violation dated March 3, 2009.

CBFO:ORC:DF:SES:09-0257:UFC5486

Once the successful offeror is selected and their schedule is reviewed, DOE will provide the completion schedule to the GWQB. The DOE committed to provide a schedule for completion by June 12, 2009 in the December 24, 2008 letter, this date will be difficult to meet. The DOE will provide the contractor's schedule to the GWQB promptly upon receipt; this new schedule is expected to indicate the project completion date well into the fall of 2009.

DOE has completed the interim corrective measures for the loss of freeboard in the SSEB by raising the berm between the SSEB and the Salt Storage Extension by approximately two feet and installing a high density polyethylene liner over the previously unlined berm. The DOE believes that the increased capacity of the SSEB will be sufficient to prevent overflow of the SSEB and no negative impacts to human health or the environment are likely to occur from extending the schedule to complete the construction of the new pond later into the fall of 2009.

Please advise us if you approve of the proposed corrective measures or if you have any concerns or comments regarding this matter. Additionally, please notify the DOE if the GWQB is amenable to an extension to the August 31, 2009 date for completion of the construction of the new evaporation pond to a date that DOE would prefer to propose upon contract issuance.

Thank you for your assistance and feel free contact Mr. Dan Ferguson of my staff at 575-234-8128 if you have any questions or need additional information.

Sincerely,

David C. Moody
Manager

Subject: May 12, 2009 meeting to Present the Proposed Engineering Modifications and Schedule for Corrective Actions for Salt Contact Run-off into the Salt Storage Extension

RE:

DOE Letter CBFO:AMO:HLP:KJB:08-1426:UFC5486 from Dr. D. C. Moody to Mr. C. Marshall dated December 24, 2008, Subject: *Schedule for Permanent Corrective Actions for Salt Contact Run-off into the Salt Storage Extension Evaporation Basin*

NMED Letter dated March 3, 2009 William C. Olson to David C. Moody, RE: *Notice of Violation, DP-831, U.S. Department of Energy Waste Isolation Pilot Plant*

Dear Mr. Marshall:

The purpose of this letter is to document this meeting which was conducted to meet the May 15, 2009, commitment established in the December 24, 2008 letter. Thank you for providing the Department of Energy (DOE) with the opportunity to present the proposed engineering modifications and preliminary schedule of activities set forth in the

December 24, 2008 Schedule for Permanent Corrective Actions for Salt Contact Run-off into the Salt Storage Extension Evaporation Basin.

During the meeting, the proposed corrective actions were discussed that involved the construction of a new Salt Storage Extension Evaporation Pond. This pond will have an evaporative surface area of approximately four acres, and in conjunction with the existing Salt Storage Extension Evaporation Basin, will contain the average annual precipitation and approximately three, 25 year/ 24-hour storm events prior to backing water up into the Salt Storage Extension. You noted that the proposed pond and sizing calculations (water balance values) seemed to be reasonable. In addition, it was also noted that the berm between the salt pile (Cell A) and the salt pile evaporation pond has been raised and liner has been placed over the berm to prevent salt water infiltration to the environment and increased water holding capacity until the new pond is completed.

During the meeting you were provided with the latest estimated schedule that was based on experience with similar projects at WIPP. We explained that upon evaluating design criteria, noting the size of the pond, incorporating federal procurement requirements, and the corresponding high cost, the initial date of completion by August 31, 2009 was not practical. We further explained that a firm schedule is not possible until the contract is awarded and the successful bidder provides the DOE with a schedule based on their resources, procurement of materials, subcontractor availability, and mobilization time.

It was noted that you will be provided with an approved construction design drawing package and justification for an extension of the August 31, 2009 date for completion of the corrective actions for overtopping the Salt Storage Extension Evaporation Pond for approval on or about May 26, 2009.

Thank you again for meeting with us on this subject and if you have any questions or need additional information please call me at 575.234.8128.

Sincerely,

Dan Ferguson,

Site Regulatory Specialist

STATE OF NEW MEXICO
ENVIRONMENT DEPARTMENT

MAY 2009
DOCKETED BY THE HEARING CLERK BEFORE THE SECRETARY OF ENVIRONMENT

NEW MEXICO ENVIRONMENT DEPARTMENT, Complainant,	)	No. HWB 08-46 (NOV) (H-19)
v.	)	
UNITED STATES DEPARTMENT OF ENERGY, and WASHINGTON TRU SOLUTIONS LLC, Respondents.	)	

STIPULATED FINAL ORDER

The New Mexico Environment Department ("Department") and Respondents the United States Department of Energy ("DOE") and Washington TRU Solutions LLC ("WTS"), pursuant to 20.1.5.600B(2) NMAC, stipulate to resolve the Notice of Violation issued to Respondents on November 14, 2008 on the terms and conditions specified in this Stipulated Final Order.

I. BACKGROUND

1. The Department is authorized to administer and enforce the New Mexico Hazardous Waste Act, ("HWA") NMSA 1978, §§74-4-14, the Hazardous Waste Management Regulations ("HWMR"), 20.4.1 NMAC, the Water Quality Act, ("WQA") NMSA 1978 §74-6-10 and the New Mexico Water Quality Control Regulations, 20.6.2 NMAC ("WQCC Regulations") including assessing civil penalties for violations thereof.

2. Respondents are DOE, who is a department of the United States government and the owner and operator of the Waste Isolation Pilot Plant ("WIPP") and WTS, who is a co-operator of WIPP, a mixed waste storage and disposal facility, located 26 miles east of Carlsbad in Eddy County, New Mexico for which a permit is required under the HWMR, 20.4.1.900 NMAC, incorporating 40 CFR §270.1(a), and a discharge permit is required under WQCC Regulations, 20.6.2.3104 NMAC.

3. On October 27, 1999, the Department issued a hazardous waste facility permit, No. NM4890139088-TSDF (the "Facility Permit"), for the storage and disposal of mixed transuranic waste at WIPP, pursuant to section 74-4-4.2(C) of the HWA.

4. On January 16, 1992, the Department issued Discharge Permit DP-831 to the DOE that included the conditions for the discharge of effluent to the H-19 Evaporation Pond at WIPP. DP-831 has been renewed and subsequent issuances modified as appropriate.

5. On November 9, 2007, the Respondents discharged approximately 150 gallons of brine from the Exhaust Shaft Intercept Borehole collection system into the H-19 Evaporation Pond at WIPP that exceeded the regulatory limit of 5 mg/L for lead. The Department was orally notified of the discharge on November 16, 2007, received an initial written notification of the discharge dated November 20, 2007, and received a written report on the incident dated November 30, 2007.

6. On January 18, 2008, NMED requested information and supporting documentation associated with the discharge from DOE and WTS. The response to this request was transmitted to NMED by the Respondents on February 21, 2008, and received on February 25, 2008.

II. ALLEGED VIOLATIONS

7. On November 14, 2008, the Department issued a Notice of Violation ("Notice of Violation") to the Respondents alleging the following violations:

A. The Respondents disposed of approximately 150 gallons of characteristic hazardous waste (D008) in the H-19 Evaporation Pond, an unpermitted disposal unit, in violation of 20.4.1.900 NMAC (incorporating 40 CFR 270.1(c)).

B. The Respondents disposed of approximately 150 gallons of characteristic hazardous waste (D008) in the H-19 Evaporation Pond without treating the waste to meet appropriate treatment standards specified in 20.4.1.800 NMAC (incorporating 40 CFR part 268, subpart D) in violation of 20.4.1.800 (incorporating 40 CFR 268.34).

C. Respondent DOE disposed of approximately 150 gallons of characteristic hazardous waste D008 in the H-19 Evaporation Pond, in violation of Ground Water Discharge Permit Renewal (DP-831) Condition 3.

III. COMPROMISE AND SETTLEMENT

8. The parties enter into this Stipulated Final Order to settle and completely resolve the violations alleged in the Notice of Violation, and to avoid further litigation and expense.

9. The Respondents admit the jurisdictional allegations of the Notice of Violation, and consent to the relief specified in this Stipulated Final Order including the civil penalty. This Stipulated Final Order shall not be construed as an admission by Respondents of the violations alleged in the Notice of Violation.

10. In compromise and settlement of the violations alleged in the Notice of Violation, the parties agree that the Respondents shall pay a civil penalty as follows:

A. Respondents agree to pay a civil penalty of $4,368.00 to resolve violations of the Hazardous Waste Act alleged in the Notice of Violation. Respondents shall pay the civil penalty to the State of New Mexico within 30 days after the effective date of this Stipulated Final Order. Payment shall by certified check or other guaranteed negotiable instrument, payable to the *State of New Mexico*, and shall be sent to the Department at the following address:

James P. Bearzi
Chief, Hazardous Waste Bureau
New Mexico Environment Department
2905 Rodeo Park Drive East, Building 1
Santa Fe, New Mexico 87505-6303

B. Respondent DOE agrees to pay a civil penalty of $7,875.00 to resolve violations of the Water Quality Act alleged in the Notice of Violation. Respondent DOE shall pay the civil penalty to the State of New Mexico within 30 days after the effective date of this Stipulated Final Order. Payment shall by certified check or other guaranteed negotiable instrument, payable to the *State of New Mexico*, and shall be sent to the Department at the following address:

William C. Olson, Bureau Chief
Ground Water Quality Bureau
New Mexico Environment Department
1190 St. Francis Dr., Suite N-2250
Santa Fe, NM 87502

C. Respondents shall provide written notification of the payments to the following address:

Charles F. Noble, Assistant General Counsel
Office of General Counsel
New Mexico Environment Department
1190 St. Francis Drive
Santa Fe, New Mexico 87502
Facsimile: (505) 827-1628

D. If Respondents fail to make timely and complete payment, Respondents shall pay interest on the outstanding balance at the rate established for judgments and decrees under NMSA 1978, §56-8-4.

IV. OTHER TERMS AND CONDITIONS

A. ENFORCEMENT

NMED retains the right to pursue any relief authorized by the HWA, the HWMR, the WQA and the WQCC Regulations for any violation not raised in the Notice of Violation.

B. COVENANTS NOT TO SUE

i. The Department covenants not to sue or take any administrate or civil action against Respondents for the violations of the HWA, HWMR, WQA or WQCC Regulations and the facility permits alleged in the Notice of Violation.

ii. Respondents covenant not to sue the State of New Mexico for any claims arising from the Notice of Violation.

C. EFFECTIVE DATE

This Stipulated Final Order shall become effective on the date it is approved and signed by the Department Secretary.

D. INTEGRATION

This Stipulated Final Order merges all prior written and oral communications between NMED and the Respondents concerning the subject matter of this Stipulated Final Order and contains the entire agreement between NMED and the Respondents.

E. BINDING EFFECT

This Stipulated Final Order shall be binding upon NMED and its successor agencies and shall be binding upon the Respondents and any employees, agents, subsidiaries, successors, assigns, trustees, heirs, or receivers of the Respondents.

F. AUTHORITY OF SIGNATORIES

The persons executing this Stipulated Final Order represent that they have the requisite authority to bind either NMED or the Respondents, as appropriate, to this Stipulated Final Order, and that their representation shall be legally sufficient evidence of actual or apparent authority to bind NMED or the Respondents to this Stipulated Final Order.

Subject: Proposed engineering designs for an additional salt storage extension basin (SSEB)

Discussion:

DOE and WTS presented preliminary plans and specifications for a new evaporation basin to be constructed adjacent to the existing Salt Storage Extension Basin (SSEB). The group went over plans and specifications for the proposed 5-acre synthetically lined impoundment including precipitation and evaporation calculations that were used in the sizing of the pond. This presentation meets the commitment by DOE's December 24, 2008 letter to present NMED with proposed engineering modifications and a preliminary schedule of activities. DOE will deliver a final set of drawings and a request for approval by approximately May 26, 2009. Upon NMED approval of the final design DOE may choose to break ground on the project. The new evaporation basin will be incorporated into the DP-831 through a permit modification and the application will be submitted after the plans are approved. The May 26 submittal date for the design package will not allow NMED approval by May 22, 2009, the date suggested in DOE's December 24 letter.

DOE also presented the agency with a proposal to eliminate a spillway on the SE corner of the Salt Pile Evaporation Pond (SPEP). The spillway drains storm water off the north end of the parking lot (approximately 3.8 acres) into the SPEP. This design change will significantly will significantly increase the capacity of the SPEP. The DOE will contact NMED with a proposed timeline for accomplishing this task.

Conclusions:

NMED awaiting design plans for evaporation pond.

Distribution:

Initialed CM

May 12, 2009, meeting to disuss proposed engineering modifications addressing a new salt water evaporation pond associated with the WPD DP-831 permit.

Proposed Schedule of Activities for Construction of the New Salt Storage Extension Evaporation Pond

Following the overtopping of the Salt Storage Extension Evaporation Pond in October 2008 the following accomplishments have been made:

- Pumped water to Ponds B and C at the Sewage Lagoons to restore freeboard.
- The berm between the Salt Storage Extension Area and the Salt Storage Extension Evaporation Pond has been raised approximately 2 feet and installed a liner, welding the liner of the Salt Storage Extension to the Salt Storage Extension Basin.
- An engineering firm was contracted to evaluate options for both Control of Storm Water and Erosion Control on the Salt Pile and the options for managing storm water run-off from the Salt Storage Extension.
- A second engineer was contracted who has evaluated the existing Salt Storage Extension, Precipitation Patterns in the region and developed a Conceptual Design for the construction of a second Pond.
- An independent engineering firm has conducted an independent review of the design and all calculations used in sizing the new pond.
- Engineering and Procurement have begun developing the Request for Proposals.

In accordance with the December 24, 2008 letter, *Schedule for Permanent Corrective Actions for Salt Contact Run-Off into the Salt Storage Extension Evaporation Basin*, this schedule of activities is being provided to the Ground Water Quality Bureau. This schedule of activities is based on experience with similar projects at WIPP and requires making certain assumptions about the selected contractor's resources, their ability to mobilize people and equipment, and the availability of qualified liner contractors. This schedule assumes that there are no grievances based on the contract award and no weather delays are encountered.

Scheduled activities include:

Generate Request for Proposal	5/12/09
Evaluate and Award Subcontract	6/10/09
Provide NMED with final Schedule	6/12/09 **(This needs to be based on Contractors' Schedule)**
Procure Liner Materials	7/8/09 (Pending Contractors Schedule)
Excavate Pond	8/6/09 (Pending Contractors Schedule)

Complete 80-90% liner and leak detections system	9/3/09 (Pending Contractors Schedule)
Pump SSEB water to new Pond	9/10/09 (Pending Contractors Schedule)
Excavate and install 12" Culvert	9/17/09 (Pending Contractors Schedule)
Complete Liner Installation	10/12/09 (Pending Contractors Schedule)
Inspection and Turnover	10/20/09 (Pending Contractors Schedule)

RE: Corrective Action Approval, DP-831, February 16, 2009 Discharge of Domestic Effluent from Sewage Settling Pond 1A, Waste Isolation Pilot Plant

The Ground Water Quality Bureau of the New Mexico Environment Department (NMED) received oral notification from the U.S. Department of Energy (DOE) of a discharge of domestic wastewater at the Waste Isolation Pilot Plant (WIPP) on February 17, 2009. The discharge was discovered at Settling Pond 1A of the Sewage Lagoon System at approximately 5:00 p.m. on February 16, 2009. The DOE submitted written notification containing interim corrective actions on February 23, 2009, and a corrective action report on March 3, 2009. The WIPP facility is located approximately 26 miles east of Carlsbad, New Mexico in Sections 20, 21, 28 and 29, T22S, R31E, Eddy County.

<u>Spill Description and Investigation</u>

At 5:00 p.m. on February 16, 2009, WIPP facility personnel while conducting the daily inspection of the lagoon system noticed erosion and ground settlement on the west side of Settling Pond 1A. Excavation in the area of settlement yielded water pooled underneath the liner and a sample of the water was collected for laboratory analysis. WIPP personnel believed at the time of discovery that an estimated 300 gallons of domestic wastewater had leaked beneath the liner. After the lagoon was emptied and the liner inspected, it was determined that there was no apparent liner leak, seam separation or other visible damage that would have caused a discharge. WIPP personnel then concluded that the pooled water was storm water rather than effluent.

Corrective Actions

Upon discovery of the leak all further discharged sewage was diverted to Settling Pond 2A and the equalization valve between Settling Ponds 1A and 2A was closed. All sewage in Settling Pond 1A was pumped to Evaporation Pond A. Necessary actions to bring Settling Pond 1A back into service include removing the liner from the affected area, filling and compacting the underlying material to 90 percent proctor, and performing repairs to the synthetic liner if needed. The repairs are scheduled to be complete within the summer timeframe. If liner damage is discovered, NMED will be notified.

Evaporation Pond A had been previously removed from service in early 2008 to facilitate replacement of the liner in accordance with a November 3, 2005 corrective action. Pursuant to 20.6.2.1203A(6), NMED hereby confirms the following actions, authorized by NMED in a telephone conversation on February 24, 2009, to facilitate the corrective actions described above.

1. DOE is permitted to temporarily transfer domestic effluent to Evaporation Pond A while repairs are made to Settling Pond 1A.

2. DOE is granted an extension to reline Evaporation Ponds A and B until the end of fiscal year 2009.

Pursuant to 20.6.2.1203A(7), NMED hereby approves the Corrective Action Report. If additional information becomes available indicating these corrective actions are inadequate, then additional actions may be required. Approval of this corrective action report does not relieve you of your responsibility to comply with any other applicable federal, state and/or local laws and regulations.

If you have any questions, please contact Clint Marshall of the Mining Environmental Compliance Section at 505- 827-0027 or clint.marshall@state.nm.us.

Sincerely,

Mary Ann Menetrey, Program Manager

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLE, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR SEPTEMBER 2006

Dear Mr. Mercer:

The purpose of this letter is to provide you with the September 2006 volumetrics of Exhaust Shaft intercept borehole water, Waste Shaft sump water, 700-fan condensate, and precipitation data. There were 2,105 gallons of water collected from the 700 fans and 2,120 gallons of water collected from the Exhaust Shaft intercept boreholes in September 2006.

Attachments 1 and 2 are the monthly volumetrics of water removed from the underground and exhaust ductwork by month and by date, respectively. Attachment 3 is the precipitation data collected monthly from January through September 2006.

If you have any questions, please call me at Extension 7545.

Sincerely,

D. T. Bignell, Manager

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT CATCH BASIN, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR JANUARY 2006

Dear Mr. Plum:

The purpose of this letter is to provide you with the January 2006 volumetrics of exhaust shaft catch basin water, waste shaft sump water, 700-fan condensate, and precipitation data. There was no water generated at any of these locations in January 2006. Additionally there was no recordable precipitation in January 2006.

As there are no volumetrics or precipitation data to report for the current calendar year, no attachments are included with this transmittal.

If you have any questions, please call me at Extension 7545.

Sincerely,

D. T. Bignell

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT BOREHOLE INTERCEPT, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR APRIL 2006

Dear Mr. Plum:

The purpose of this letter is to provide you with the April 2006 volumetrics of exhaust shaft borehole intercept water, waste shaft sump water, 700-fan condensate, and precipitation data. There were 890 gallons of water collected from the 700 fans and 500 gallons of water collected from the exhaust shaft borehole intercept in April 2006. April precipitation data have not been validated and will be updated in the May 2006 report.

Attachments 1 and 2 are the monthly volumetrics of water removed from the underground and exhaust ductwork by month and by date, respectively. Attachment 3 is the precipitation data collected monthly from January through March 2006.

If you have any questions, please call me at Extension 7545.

Sincerely,

Steve C. Kouba

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLE, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR OCTOBER 2006

Dear Mr. Mercer:

The purpose of this letter is to provide you with the October 2006 volumetrics of Exhaust Shaft intercept borehole water, Waste Shaft sump water, 700-fan condensate, and precipitation data. There were 900 gallons of water collected from the 700 fans. There was no water collected from the Exhaust Shaft intercept boreholes or the Waste Shaft sump in October 2006.

Attachment 1 is the monthly volumetrics of water removed from the underground and exhaust ductwork by month, respectively. Attachment 2 is the precipitation data collected monthly from January through October 2006.

If you have any questions, please call me at Extension 7545.

Sincerely,

Steve C. Kouba

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLE, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR NOVEMBER 2006

Dear Mr. Mercer:

The purpose of this letter is to provide you with the November 2006 volumetrics of Exhaust Shaft intercept borehole water, Waste Shaft sump water, 700-fan condensate, and precipitation data. There were 550 gallons of water collected from the Exhaust Shaft intercept boreholes and 1,375 gallons of water collected from the Waste Shaft sump. There was no water collected from the 700 fans in November 2006.

Attachment 1 is the monthly volumetrics of water removed from the underground and exhaust ductwork by month, respectively. Attachment 2 is the precipitation data collected monthly from January through November 2006.

If you have any questions, please call me at Extension 7545.

Sincerely,

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLE, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR DECEMBER 2006

Dear Mr. Johnson:

The purpose of this letter is to provide you with the December 2006 volumetrics of Exhaust Shaft Intercept borehole water, Waste Shaft sump water, 700-fan condensate, and precipitation data. There were 200 gallons of water collected from the 700 fans. There was no water collected from the Exhaust Shaft Intercept boreholes or the Waste Shaft sump in December 2006.

Attachment 1 is the monthly volumetrics of water removed from the underground and exhaust ductwork by month, respectively. Attachment 2 is the precipitation data collected monthly from January through December 2006.

If you have any questions, please call me at Extension 7545.

Sincerely,

W. M. Wierzbicki, Manager
Regulatory Compliance

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLE, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR JUNE 2007

Dear Mr. Johnson:

The purpose of this letter is to provide you with the June 2007 volumetrics of Exhaust Shaft intercept borehole water, Waste Shaft sump water, 700-fan condensate, and precipitation data. There were 200 gallons of water collected from the Exhaust Shaft intercept boreholes; 4,800 gallons of water collected from the 700 fan ductwork; no water was collected from the Waste Shaft sump; and June had a total precipitation accumulation of 0.90 inches.

Attachment 1 is the monthly volumetrics of water removed from the exhaust fan ductwork, exhaust shaft boreholes, and waste shaft sump. Attachment 2 is the calendar year 2007 precipitation data noted by month.

If you have any questions, please call me at Extension 7545.

Sincerely,

Steve C. Kouba

for W. M. Wierzbicki, Manager
Regulatory Compliance

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLE, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR JULY 2007

Dear Mr. Johnson:

The purpose of this letter is to provide you with the July 2007 volumetrics of Exhaust Shaft intercept borehole water, Waste Shaft sump water, 700-fan condensate, and precipitation data. There were 1,640 gallons of water collected from the Exhaust Shaft intercept boreholes, 12,400 gallons of water collected from the 700 fan ductwork, no water was collected from the Waste Shaft sump, and July had a total accumulation of 3.96 inches of precipitation.

Attachment 1 is the monthly volumetrics of water removed from the exhaust fan ductwork, exhaust shaft boreholes, and waste shaft sump. Attachment 2 is the calendar year 2007 precipitation data noted by month.

If you have any questions, please call me at Extension 7545.

Subject: MONTHLY SUMMARY OF ENVIRONMENTAL REGULATIONS AND FEDERAL REGISTER NOTICES REVIEWED FOR IMPACT TO WIPP

Dear Mr. Johnson:

Washington Regulatory and Environmental Services has completed review of environmental regulations and Federal Register (FR) notices for impact to the WIPP Program for September 2007. This review is part of the scope found in the Activity Based Cost estimate for the Site Environmental Compliance Program, Activity #1250106.

This review focused on the evaluation of environmental compliance related publications such as those provided in the FR by the DOE, the U.S. Environmental Protection Agency (EPA), the U.S. Department of Interior's Bureau of Land Management and Fish and Wildlife Service, as well as revisions to the State of New Mexico environmental regulations. The monthly regulatory review spans FR, Volume 72, Numbers 170 through 188.

The following items; one EPA proposed rule, one EPA notice, one EPA Final Rule, one EPA final action, one Nuclear Regulatory Commission (NRC) Guidance notice, two DOE Memorandums, and one New Mexico Environment Improvement Board update were noted with the potential to impact the WIPP during this review period.

OCT 0 9 2007

H. Johnson
CBFO Mgmt

<u>NRC Guidance for Activities Related to U.S. Department of Energy Waste Determinations</u>

On September 4, 2007, the NRC published a notice of NUREG-1854 providing guidance to the NRC staff in evaluating non-high-level waste determinations developed by the DOE for the Savannah River Site, Idaho National Laboratory, Hanford, and West Valley for certain wastes that are a result of the reprocessing of spent nuclear fuel. NUREG-1854 does not set forth regulatory requirements for NRC or for the DOE, and compliance with NUREG-1854 is not required.

Impact Assessment

This notice provides assistance to Savannah River Site, Idaho National Laboratory, Hanford, and West Valley for wastes that result from reprocessing spent nuclear fuel. The Ronald Reagan Defense Authorization Act for Fiscal Year 2005 authorizes NRC to consult with the DOE on its waste determinations and to monitor the DOE disposal actions to assess compliance with the performance objectives in 10 CFR part 61, subpart C. If any of the waste that this process applies to was formerly managed as high level waste or was managed in the tanks listed in the WIPP hazardous waste facility permit, then the process of determining that the waste is TRU waste will have to be included in a Class 3

P.O. Box 2078 • Carlsbad, New Mexico USA 88221-2078
Phone: (575) 234-7200 • Fax: (575) 234-7083

permit modification request to authorize management and disposal of the waste. Consequently, the WIPP staff should become familiar with this guidance to assure it is applied to the waste in a manner that satisfies the permitting requirements.

Approval and Promulgation of Air Quality Implementation Plans; New Mexico

On September 5, 2007, the EPA published a final action to approve the State Implementation Plan (SIP) revisions that the Governor of New Mexico submitted on December 29, 2005. This submittal consists of revisions to two regulations that are already part of the New Mexico SIP. The affected regulations are 20.2.74 New Mexico Administrative Code (NMAC) (Permits-Prevention of Significant Deterioration (PSD)) and 20.2.79 NMAC (Permits-Non-attainment Areas). The revisions will update New Mexico's PSD and New Source Review (NSR) regulations to make them consistent with changes to the Federal NSR regulations published on December 31, 2002 (67 FR 80186) and November 7, 2003 (68 FR 63021).

Impact Assessment

The WIPP facility is not located in a non-attainment area. Currently, the WIPP facility does not have projects planned to install equipment that would increase the emissions from the facility. The revisions in the New Mexico SIP involve non-attainment areas and new emission sources. Therefore, this does not affect the WIPP facility at this time. In the event that new emission sources are added to the facility, this change will affect the facility.

New Mexico Environmental Improvement Board Issues Solid Waste Rules Updates

On September 6, 2007, the New Mexico Environmental Improvement Board announced updates to the solid waste rules. This part applies to the transportation, storage, transfer, processing, transformation, recycling, composting, nuisance abatement and disposal of solid waste. The objective of these updates is to establish regulations in the general requirements, requirements of public entities, prohibited acts and exceptions, entry by the department, and procedures for exemptions, specific approvals, waivers for small municipal landfills and variances.

Impact Assessment

The updates submitted by the New Mexico Environmental Improvement Board apply to the transportation, storage, transfer, processing, transformation, recycling, composting, nuisance abatement and disposal of solid waste. The WIPP facility only transports recyclable waste off-site and disposes of demolition and construction debris on-site. These regulations deal with the transporters and disposal side of solid waste and not the generator. The WIPP operates the on-site industrial landfill according to regulations to eliminate nuisance and vector problems. At this time, these new regulations will not impact the WIPP facility.

DOE Memorandum on Protection of Stratospheric Ozone

On September 6, 2007, the DOE issued a memorandum urging DOE facilities to seek safe alternative chemicals to replace Ozone Depleting Substances (ODS) used as cleaning solvents. On May 30, 2007, the EPA issued a final rule on phasing out ODS used as cleaning solvents and in adhesives and listed some substitutes to replace the ODS. This DOE memorandum establishes guidance in seeking replacements for those ODS used at DOE sites.

Impact Assessment

The WIPP facility uses a high flash point Stoddard Solvent made up of petroleum distillates and not ODS to clean oily or greasy parts. No ODS are used on the WIPP property as a solvent or in an adhesive. Chemicals used on the WIPP site are screened as to the chemical content. Procurement and Site Environmental Compliance will review new products to prevent ODS from being used on the WIPP property as a solvent or in adhesives.

<u>DOE Memorandum on Options for the Expression of Daily Loads in Total Maximum Daily Loads</u>

On September 6, 2007, the DOE issued a memorandum addressing the June 22, 2007, EPA draft technical document, "Options for the Expression of Daily Loads in TMDLs". A TMDL (total maximum daily load) is a calculation of the maximum amount of a pollutant that a waterbody can receive and still meet water quality standards. The document provides options for expressing daily pollutant loads where TMDLs are calculated using greater than daily allocation time frames (e.g., annually, monthly, seasonally). National Pollutant Discharge Elimination System (NPDES) rules regulate the TMDLs. The EPA is soliciting feedback on the application of the recommended technical approaches in the draft document.

Impact Assessment

The WIPP facility does not discharge into any body of water or any waters of the U.S. Because of this, WIPP does not have a NPDES permit. This memorandum does not pertain to the WIPP facility.

<u>EPA Give Inspection Credentials to State Environment Department</u>

On September 11, 2007, the EPA issued credentials to the NMED to perform inspections on its behalf. The credentials are for inspections done under the NPDES program. The credentials allow NMED to work directly with local governments, residents and other entities to ensure water quality is protected. The NMED staff will have the authority to assess federal provisions not covered by state law.

Impact Assessment

Since the WIPP does not have a NPDES permit and does not discharge to a water of the U.S., this does not affect the WIPP.

<u>EPA Proposes to Revise Regulations for State and Federal Operating Permit Programs</u>

On September 12, 2007, the EPA issued a proposed rule revising the regulations governing State and Federal operating permit programs required by title V of the Clean Air Act (CAA) and the New Source Review (NSR) programs required by parts C and D of title I. The proposed revisions clarify how permitting flexibility can often be done in the existing regulatory framework of the operating permit programs. The proposed revisions also add major NSR requirements for Green Groups, which allow future changes to occur within a group of emissions activities, provided that they are ducted to a common air pollution control device which is determined to meet "best available control technology" or "lowest achievable emission rate" as applicable and that they are determined to comply with all relevant ambient requirements.

P.O. Box 2078 • Carlsbad, New Mexico USA 88221-2078 •
Phone: (575) 234-7200 • Fax: (575) 234-7083

Impact Assessment

Entities potentially affected by these proposed actions are facilities currently required to obtain title V permits under State, local, tribal or Federal operating permits programs, and State, local and tribal governments that are authorized by the EPA to issue such operating permits. Other entities potentially affected by this proposed action are facilities required to obtain major NSR permits under State, local, tribal or Federal major NSR programs, and State, local and tribal governments that issue such permits pursuant to approved part 51 major NSR programs. Since the WIPP facility does not have a Title V permit or a NSR permit, this proposed rule will not affect the WIPP facility.

Comprehensive Procurement Guideline V for Procurement of Products Containing Recovered Materials

On September 14, 2007, the EPA issued a final rule amending the Comprehensive Procurement Guideline (CPG) for recovered content products. Specifically, EPA is revising the list of items designated in the category of landscaping products. First, EPA is changing the description of "compost" by consolidating all compost designations under one item designation: "compost made from recovered organic materials." At the same time, the Agency is amending the definition of compost. The effect of the two changes will be to include compost from bio-solids and manure, and not limit the designation to specific types of organic materials. Second, EPA has added "fertilizer made from recovered materials" as a designated landscaping item and added a definition for "fertilizer made from recovered organic materials."

Impact Assessment

This action may potentially affect procuring agencies that purchase compost made from recovered organic materials and fertilizers made from recovered organic materials. Section 6002 defines procuring agencies to include the following: (1) any federal agency; (2) any state or local agency using appropriated federal funds for procurement; or (3) any contractors of these agencies who are procuring these items for work they perform under the contract (see Resource Conservation and Recovery Act section 1004(17)). The requirements of section 6002 apply to these procuring agencies only when the agencies procure designated items whose price exceeds $10,000 or when the quantity of the item purchased in the previous year exceeded $10,000. This rule will go into effect on September 15, 2008. The WIPP facility will need to begin the procurement of recovered organic materials and fertilizers for the landscaping performed at the site.

If you have any questions regarding this report, please contact me at Extension 7545.

Sincerely,

William M. Wierzbicki

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLES, WASTE SHAFT SUMP, 700-FAN CONDENSATE, AND PRECIPITATION DATA FOR JANUARY 2007

Dear Mr. Johnson:

The purpose of this letter is to provide you with the January 2007 volumetrics of Exhaust Shaft intercept borehole water, Waste Shaft sump water, 700-fan condensate, and precipitation data. There were 310 gallons of water collected from the Exhaust Shaft intercept boreholes and 110 gallons of water collected from the 700 fans. There was no water collected from the Waste Shaft sump in January 2007.

Attachment 1 is the monthly volumetrics of water removed from the underground and exhaust ductwork by month, respectively. Attachment 2 is the January precipitation data and the calendar year 2007 running total.

If you have any questions, please call me at Extension 7545.

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLE, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR MARCH 2007

Dear Mr. Johnson:

The purpose of this letter is to provide you with the March 2007 volumetrics of Exhaust Shaft intercept borehole water, Waste Shaft sump water, 700-fan condensate, and precipitation data. There were 610 gallons of water collected from the 700 Fans. No water was collected from the Exhaust Shaft intercept boreholes or Waste Shaft sump in March 2007.

Attachment 1 is the monthly volumetrics of water removed from the underground and exhaust ductwork by month, respectively. Attachment 2 is the precipitation data collected monthly from January through December 2007.

If you have any questions, please call me at Extension 7545.

Sincerely,

W. M. Wierzbicki

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLE, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR APRIL 2007

Dear Mr. Johnson:

The purpose of this letter is to provide you with the April 2007 volumetrics of Exhaust Shaft intercept borehole water, Waste Shaft sump water, 700-fan condensate, and precipitation data. There were 1400 gallons of water collected from the 700 fans. No water was collected from the Exhaust Shaft intercept boreholes or the Waste Shaft sump in April 2007.

Attachment 1 is the monthly volumetrics of water removed from the underground and exhaust ductwork by month, respectively. Attachment 2 is the precipitation data collected monthly from January through December 2007.

If you have any questions, please call me at Extension 7545.

Sincerely,

W. M. Wierzbicki, Manager
Regulatory Compliance

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLE, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR MAY 2007

Dear Mr. Johnson:

The purpose of this letter is to provide you with the May 2007 volumetrics of Exhaust Shaft Intercept borehole water, Waste Shaft sump water, 700-fan condensate, and precipitation data. There were 75 gallons of water collected from the Exhaust Shaft intercept boreholes; 2,900 gallons of water collected from the 700 fan ductwork; no water was collected from the Waste Shaft sump; and there was a total accumulation of 3.32 inches of precipitation during the month of May.

Attachment 1 is the monthly volumetrics of water removed from the exhaust fan ductwork, exhaust shaft boreholes, and waste shaft sump. Attachment 2 is the calendar year 2007 precipitation data noted by month.

If you have any questions, please call me at Extension 7545.

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLE, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR AUGUST 2007

Dear Mr. Johnson:

The purpose of this letter is to provide you with the August 2007 volumetrics of Exhaust Shaft intercept borehole water, Waste Shaft sump water, 700-fan condensate, and precipitation data. There were 2,230 gallons of water collected from the Exhaust Shaft intercept boreholes; 3,200 gallons collected from the Waste Shaft sump; 13,400 gallons of water collected from the 700 fan ductwork; and August had a total accumulation of 0.46 inches of precipitation.

Attachment 1 is the monthly volumetrics of water removed from the exhaust fan ductwork, exhaust shaft boreholes, and waste shaft sump. Attachment 2 is the calendar year 2007 precipitation data noted by month.

If you have any questions, please call me at Extension 7545.

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLES, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR OCTOBER 2007

Dear Mr. Johnson:

The purpose of this letter is to provide you with the October 2007 volumetrics of the Exhaust Shaft intercept borehole water, 700-fan condensate, Waste Shaft sump water, and precipitation data. There were 1,400 gallons of water collected from the 700 fan ductwork. No water was collected from the Exhaust Shaft intercept boreholes or Waste Shaft sump, and there was zero precipitation recorded for the month of October.

Attachment 1 is the monthly volumetrics of water removed from the exhaust fan ductwork, exhaust shaft boreholes, and waste shaft sump. Attachment 2 is the calendar year 2007 precipitation data noted by month.

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLES, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR NOVEMBER 2007

Dear Mr. Johnson:

The purpose of this letter is to provide you with the November 2007 volumetrics of Exhaust Shaft intercept borehole water, 700-fan condensate, Waste Shaft sump water and precipitation data. There were 150 gallons of water collected from the Exhaust Shaft intercept boreholes. No water was collected from the 700 fan ductwork or the Waste Shaft sump, and November had a total accumulation of 0.66 inches of precipitation.

Attachment 1 is the monthly volumetrics of water removed from the exhaust fan ductwork, exhaust shaft boreholes, and waste shaft sump. Attachment 2 is the calendar year 2007 precipitation data noted by month.

If you have any questions, please contact me at Extension 7545.

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLE, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR DECEMBER 2007

Dear Mr. Patterson:

The purpose of this letter is to provide you with the December 2007 volumetrics of Exhaust Shaft intercept borehole water, 700-fan condensate, Waste Shaft sump water and precipitation data. There were 410 gallons of water collected from the Exhaust Shaft intercept boreholes and 1,200 gallons of water collected from the Waste Shaft sump. No water was collected from the 700 fan ductwork and December had a total accumulation of 0.57 inches of precipitation.

Attachment 1 is the monthly volumetrics of water removed from the exhaust fan ductwork, exhaust shaft boreholes, and waste shaft sump. Attachment 2 is the calendar year 2007 precipitation data noted by month.

If you have any questions, please call me at Extension 7545.

Sincerely,

W. M. Wierzbicki

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLE, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR APRIL 2008

Dear Ms. McCauslin:

The purpose of this letter is to provide you with the April 2008 volumetrics of Exhaust Shaft intercept borehole water, 700-fan condensate, Waste Shaft sump water, and precipitation data. There were 2,000 gallons of water collected from the Waste Shaft sump and no water was collected from the Exhaust Shaft intercept boreholes or the 700-fan ductwork. There was no precipitation for the month of April.

Attachment 1 is the monthly volumetrics of water removed from the exhaust fan ductwork, exhaust shaft boreholes, and waste shaft sump. Attachment 2 is the 2008 calendar year of precipitation data noted by month.

If you have any questions, please call me at Extension 7545.

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE EXHAUST SHAFT INTERCEPT BOREHOLES, WASTE SHAFT SUMP, 700-FAN CONDENSATE AND PRECIPITATION DATA FOR AUGUST 2008

Dear Ms. McCauslin:

The purpose of this letter is to provide you with the August 2008 volumetrics of 700-fan condensate, Exhaust Shaft intercept borehole water, Waste Shaft sump water, and precipitation data. There were 800 gallons of water collected from the 700 fan ductwork; 50 gallons of water collected from the Exhaust Shaft intercept boreholes and 2,000 gallons of water collected from the Waste Shaft sump. There was a total of 1.83 inches of precipitation in August.

Attachment 1 is the monthly volumetrics of water removed from the underground and exhaust ductwork by month. Attachment 2 is the precipitation data collected monthly from January through August 2008.

If you have any questions, please call me at Extension 7545.

Sincerely,

William M. Wierzbicki

W. M. Wierzbicki
Manager of Regulatory Compliance

Subject: VOLUMETRICS FOR WATER REMOVED FROM THE 700-FAN CONDENSATE, EXHAUST SHAFT INTERCEPT BOREHOLES, WASTE SHAFT SUMP, AND PRECIPITATION DATA FOR SEPTEMBER 2008

Dear Ms. McCauslin:

The purpose of this letter is to provide you with the September 2008 volumetrics of 700-fan condensate, Exhaust Shaft intercept borehole water, Waste Shaft sump water, and precipitation data. There were 3,600 gallons of water collected from the 700 fan ductwork, 115 gallons of water collected from the Exhaust Shaft intercept boreholes and 1,500 gallons of water collected from the Waste Shaft sump. There was a total of 2.03 inches of precipitation in September.

Attachment 1 is the monthly volumetrics of water removed from the underground and exhaust ductwork by month, respectively. Attachment 2 is the precipitation data collected monthly from January through September 2008.

If you have any questions, please call me at Extension 7545.

Dear Ms. McCauslin:

The purpose of this letter is to provide you with the October 2008 volumetrics of 700-fan condensate, Exhaust Shaft intercept borehole water, Waste Shaft sump water, and precipitation data. There were 2,000 gallons of water collected from the 700 fan ductwork. There was no water collected from the Exhaust Shaft intercept boreholes or the Waste Shaft sump. There was a total of 4.18 inches of precipitation in October.

Attachment 1 is the monthly volumetrics of water removed from the underground and exhaust ductwork by month, respectively. Attachment 2 is the precipitation data collected monthly from January through October 2008.

If you have any questions, please call me at Extension 7545.

Pre-Application Meetings

Waste Isolation Pilot Plant

May 5, 2009	May 7, 2009
5 to 7 p.m.	2 to 4 p.m.
WIPP Information Center	6 to 8 p.m.
Skeen-Whitlock Building	Courtyard by Marriott
4021 National Parks Highway	3347 Cerrillos Road
Carlsbad, New Mexico	Santa Fe, New Mexico

The U.S. Department of Energy Carlsbad Field Office and Washington TRU Solutions (co-permittees) are hosting pre-application meetings regarding the Hazardous Waste Facility Permit (HWFP) renewal application for the Waste Isolation Pilot Plant (WIPP).

This notice is to inform the public of the pre-application meeting for the WIPP HWFP Renewal Application, as required by the New Mexico Hazardous Waste Management Regulations. The purpose of the pre-application meetings for the WIPP HWFP Renewal Application is to inform stakeholders of the proposed hazardous waste management activities and to solicit questions. The radioactive components of WIPP waste are regulated separately by the U.S. Environmental Protection Agency.

The effective term for the WIPP HWFP is ten years. At least 180-days before the expiration of the current permit (November 26, 2009), the Permittees must reapply for a permit. The Renewal Application must be submitted to NMED no later than May 30, 2009.

The WIPP facility, located 30 miles east of Carlsbad, New Mexico, is designed for permanent disposal of defense-generated transuranic waste, the byproduct of nuclear weapons research and production. WIPP is permitted to dispose only this type of waste. Project facilities include disposal rooms excavated 2,150 feet underground in a stable salt formation.

To obtain information regarding the reapplication or about WIPP operations, contact Mr. Bobby St. John at 1-800-336-9477. The draft renewal application submittal may also be viewed on the WIPP web site, http://www.wipp.energy.gov, and at the WIPP Information Center, Skeen-Whitlock Building, 4021 National Parks Highway, Carlsbad, New Mexico.

Persons requiring special assistance to participate in these meetings may also contact Mr. St. John at the telephone number noted above at least 72 hours prior to the meeting.

~NOTICE~

Waste Isolation Pilot Plant
Class 1 Permit Modification Notification

The U.S. Department of Energy and Washington TRU Solutions LLC hereby inform you of the following Class 1 Permit Modifications to the Waste Isolation Pilot Plant (WIPP) Hazardous Waste Facility Permit (HWFP), Permit Number: NM4890139088-TSDF.

The New Mexico Environment Department (NMED) was notified of the following Class 1 permit modifications on the date indicated below. Summary of the change follows.

January 30, 2009

- Revise Panel Figures to include Panel 5
- Revise Firewater Distribution System Figures

February 27, 2009

- Revise Table I-1 to include actual dates that waste emplacement was started, completed, closure began and partial closure ended in Panels 1, 2, 3 and 4.

- Revise Attachment B6 checklist to include quality assurance objectives for visual examination. These were previously inadvertently omitted from the previous B6 checklist.

- Revise the permit to make the following changes regarding the Facility transfer Vehicle:
    1. Add an additional FTV inspection procedure to table D-1
    2. Allow facility pallets to be stored on either the floor of the Waste handling Building or on the facility pallet stands
    3. Revise the FTV description
    4. Increase the capacity of the FTVs from 26,000 pounds to 30,000 pounds

Subject: WIPP the new Yucca?

Some suggest NM area could replace Yucca Mountain

The Associated Press

Thu, Mar 26, 2009 (1:06 p.m.)

Longtime Carlsbad Mayor Bob Forrest recalls the days when no one wanted to take the federal government's radioactive waste except his southern New Mexico community.

Ten years after it opened, the Waste Isolation Pilot Plant, commonly known as WIPP, remains the government's only radioactive waste dump.

But now, Forrest says, the climate for all things nuclear has changed, and communities across the nation are fighting for projects.

Forrest himself believes the vast, 250 million-year-old salt beds that house WIPP east of his community of about 25,000 could store high-level nuclear waste such as that once destined for the Yucca Mountain project the Obama administration is apparently abandoning.

Such a repository would be separate from WIPP, he said.

WIPP, excavated 2,150 feet below the surface of the desert, is designed for so-called transuranic waste generated by the nation's defense work _ such things as plutonium-contaminated rags, tools or clothing. Although it takes some defense waste that's so radioactive it's handled by robotic machines, high-level and commercial nuclear waste are prohibited.

Some worry that could change as the nation looks for a place to put nearly 60,000 tons of highly radioactive fuel rods generated by the nuclear power industry.

For two decades, Yucca Mountain in the Nevada desert northwest of Las Vegas was the focus of government plans for such waste. But earlier this month, Energy Secretary Steven Chu said Yucca Mountain no longer is viewed as an option.

Instead, Chu said the administration believes used reactor fuel can remain at power plants while a comprehensive plan for disposal is developed. He hopes to have a recommendation from a special panel on alternatives to Yucca Mountain and long-term disposal before the end of the year.

Forrest said Monday he has high hopes of making the Carlsbad area "the next Yucca Mountain" and will lobby for such a project. It would be separate from WIPP in another part of the salt beds.

"The community's ready, the timing couldn't be better. ... I think the stage is right to move forward," Forrest said.

He believes Carlsbad would be behind the idea _ unlike Nevada was with Yucca Mountain.

Polls conducted by Nevada newspapers consistently showed most Nevadans opposed the project, and Senate Majority Leader Harry Reid, D-Nev., vowed to starve it of funds.

"If you don't have the community support you can't get to first base," Forrest said. "That's the key to our success (with WIPP) but it didn't happen overnight."

State Environment Secretary Ron Curry said there will always be some who want to expand WIPP's mission, but noted Gov. Bill Richardson ordered the state Environment Department to modify WIPP's permit to ensure high-level reactor waste isn't stored at the site.

Curry does not favor a Yucca Mountain-type facility, even if it's not part of WIPP.

"The federal government must abide by the promise it made to New Mexicans more than a decade ago and focus on WIPP's original purpose to dispose of only transuranic waste," he said. "We will vigorously oppose any attempt to expand or alter the mission of WIPP to allow high-level waste."

Don Hancock of the Southwest Research and Information Center in Albuquerque, a longtime WIPP watchdog, said the idea of burying high-level defense waste or nuclear fuel at WIPP keeps coming up _ despite being prohibited by the land withdrawal act that authorized the permanent repository.

He said the administration's recent actions over Yucca Mountain have raised concerns, but he believes New Mexicans would fight any attempt to put such a repository in the state.

Waste that would go into a Yucca Mountain-type dump "is orders of magnitude different (from WIPP) in terms of the order of radioactivity, in terms of the physical heat generated," he said. Hancock also said scientific studies that came up during hearings over WIPP demonstrated salt was unsuitable for such waste.

Roger Nelson, chief scientist for the DOE's Carlsbad field office, said if Yucca Mountain is to be replaced, the nation should consider disposal in salt.

Nelson said that doesn't mean WIPP.

"WIPP has a mission. It's been designed and legislated and authorized," he said. "If Congress or any other agency wanted to change WIPP, it would jeopardize this mission that is working so well."

There are other places _ the formation where WIPP lies covers thousands of square miles that are virtually contiguous into central Kansas, "so there's a lot of real estate for a salt repository in the U.S.," he said.

From the beginning of the nuclear age in the 1940s, scientists studied what to do with radioactive waste that remains dangerous for tens of thousands of years. Early ideas included sending it on a rock to the sun or burying it in deep sea subduction zones.

Eventually, they turned to salt beds.

"The safest way to isolate something that you don't want for a very, very long time is find an ancient salt formation and put your waste in the middle," Nelson said. "Salt is still there for a very good reason, it has not been eroded away. It's indicator of hydrological stability. The same hydrological barriers that protect the salt will protect the waste."

Still, some critics have argued for years the WIPP site is the wrong place.

Concerns over water leaching into the salt were raised in numerous hearings on the repository over the years; the DOE eventually dismissed them. But Citizens for Alternatives to Radioactive Dumping scheduled a news conference in Albuquerque on \. .. ?'s 10th anniversary Thursday to relea hydrological report that argues the conceptual groundwater model used to assess the WIPP site was fatally flawed.

Forrest has proposed advertising in major newspapers that Carlsbad has a solution for nuclear power waste. In recent years, Carlsbad has competed for, but lost, projects to make fuel for commercial nuclear power plants.

"It's been a lifesaver for us, and there's a lot of potential for more projects," the mayor said. "As long as we keep safety as the No. 1 issue, I think the sky's the limit."

Ground Water Quality Bureau
New Mexico Environment Department
P.O. Box 26110
Santa Fe, NM 87502

Subject: PLAN FOR CONTROLLING STORM WATER AND MINIMIZING EROSION OF THE SALT PILE

Dear Mr. Olson:

The U.S. Department of Energy's (DOE) Waste Isolation Pilot Plant (WIPP) Discharge Permit Renewal and Modification (DP-831) issued on September 9, 2008 contains a requirement, (Condition 6), that states:

> *Within 180 days of issuance of this Discharge Permit, the DOE shall submit, for NMED approval, a plan for controlling storm water and minimizing erosion of the earthen cover of the Salt Pile. The plan shall assess and potentially incorporate options including, but not limited to 1) rock armoring of the side slopes, 2) recontouring of the top surface, 3) the use of alternate borrow sources for cover material, and 4) revegetation of the top surface and side slopes.*

An engineering evaluation of erosion of the earthen cover of the Salt Pile was conducted by a contracted engineering firm in accordance with the September 9, 2008 Discharge Permit requirement in order to develop a plan for controlling storm water and minimizing erosion. This engineering evaluation drew upon a complementary study conducted in 2005. Observations by both engineering evaluations resulted in the same conclusion.

The primary concern that needs to be addressed is the erosion of the side slopes due to concentrated run-off at several locations on the Salt Pile top surface. This issue can be best addressed by grading of the top surface of the Salt Pile and facilitating the flow of water from the top surface of the Salt Pile down the side slopes to the perimeter ditches.

The following options, as well as others, were evaluated:

1. Rock armoring of the side slopes or the construction of chutes with rip rap or gabions. The liner contractor strongly recommends against the use of rock armoring due to the likelihood of damage to the liner. The 2009 contractor agreed that this was a potential concern. This recommendation and the good performance of the high density polyethylene (HDPE) liner discharge chutes installed following the 2005 engineering evaluation resulted in the decision to install additional HDPE lined discharge chutes to promote drainage from the top surface of the Salt Pile to the perimeter ditches.

2. Recontouring of the top surface has been evaluated and is important to promote the drainage of water from the top surface of the Salt Pile to engineered discharge chutes and the perimeter ditches. Recontouring of the top surface of the Salt Pile to engineered discharge chutes is central to the concept of promoting the safe, fast and efficient removal of precipitation from the top surface of the Salt Pile to the perimeter discharge ditches.

   As a result of the 2005 Engineering Evaluation, two storm water diversion berms were constructed. One on the south side of the pile to divert water to a discharge chute located in the center of the south side of the Salt Pile. The second storm water diversion berm was constructed on the north side of the Salt Pile to divert water to a discharge chute on the northeast corner of the Salt Pile. These berms were constructed with soil and turf reinforcement mats and seeded with native vegetation. The 2009 engineering evaluation confirmed that the chutes are adequately sized to accommodate the volume and velocity of the run-off from the Salt Pile top surface in the event of the 24-hour, 25-year storm event. The principle problem is that the grading of the top surface of the Salt Pile is not steep enough to accommodate the efficient run-off from the top surface of the Salt Pile to the two discharge chutes.

3. The use of alternate cover material and revegetation of the side slopes was extensively evaluated considering the blending of rock or caliche with native soils, the use of turf reinforcement mats, rolled erosion control products, live turf installation with sprig and sod strips, deploying cellular containment systems and various combinations of the aforementioned options. Options that require anchors that penetrate the liner (cellular containment systems) have been dismissed. Blending the native soil with rock or caliche are the most viable options.

4. Revegetation of the top surface and side slopes has been integral to all concepts of maintaining the Salt Pile top surface and side slope erosion. The use of non-native vegetation is not currently an option without consultation with the Bureau of Land Management (BLM). Continued efforts will be made to improve the existing vegetation, including reseeding and irrigation with storm water. Additionally, the plan discussed below attempts to minimize damage to the existing vegetation by minimizing grading and providing additional chutes to facilitate the removal of storm water from the Salt Pile top surface.

5. Other options evaluated and dismissed included adding detention to the Salt Pile top surface and the construction of a berm on the Salt Pile rim. The potential for overflow of any water detained on the top surface of the Salt Pile could result in considerably worse erosion than has been experienced to date. The construction of berms could result in the undesirable detention of water in low areas and promote new erosion around the berms.

Following consultation with the contractor utilized in the 2009 engineering evaluation, input from past liner contractors, and our observations of the effects of on the Salt Pile cover, the conceptual plan for controlling storm water run-off and minimizing erosion includes:

- The construction of HDPE run-off chutes at the locations where the concentrated run-off causes the greatest erosion. Based on current observations, as many as five chutes may be necessary depending on volumes of fill material and the extent of grading required to direct water to chutes.
- Re-grading the Salt Pile top surface to facilitate flow to the HDPE lined run-off chutes.
- Soils used to conduct repairs on the Salt Pile side slopes will be blended with caliche to provide better resistance to the forces creating the erosion.
- As the conceptual design is developed, the evaluation of alternative erosion control products will be evaluated based on flow calculations.

The schedule for the design is outlined in the table below which contains the time frame anticipated to complete the main phases of the project design and will have a start date pending approval of this plan by the Ground Water Quality Bureau. Until the conceptual design is finalized, a realistic construction schedule is not possible. The following time frames (in work days) are derived from previous experience in conducting similar Salt Pile projects.

Experience indicates that each discharge chute requires at least 35 days to construct due to hand digging, styrofoam block placement and liner installation. Currently, there appears to be five areas that could be candidates for HDPE chutes. Based on the final design, the number of chutes may be minimized by grading and directing to less than five drainage chutes. Limitations on contract labor availability and the limited number of qualified liner installation companies makes the construction of more than one drainage chute at a time unlikely. Therefore, the drainage chutes will probably have to be installed one at a time (up to 25 weeks for five).

Procure Engineering Support	45 days
Develop Final Design • Perform a topographical survey	90 days
Obtain NMED approve for Final Design	30 days
Award Construction Contract	45 days
Field Work • Regrade salt pile surface areas as needed • Install drainage Chute #1 • Install drainage Chute #2-X • Side slope erosion repairs	To be determined based on the number of chutes and extent of required grading and quantity of fill material needed.

DOE and its contractors (Washington TRU Solutions, LLC [WTS] and independent consultants) have evaluated the Salt Pile erosion issues and believe that the proposed plan is the best approach for controlling storm water and minimizing erosion. However, this plan, nor any options evaluated, would result in a Salt Pile cover that would not require ongoing routine maintenance.

If you have any further questions regarding this matter or need additional information, please contact Mr. Dan Ferguson of my staff at (575) 234-8128.

RE: Notice of Violation, DP-831, U.S. Department of Energy Waste Isolation Pilot Plant

The New Mexico Environment Department (NMED, the Department) has determined that the U.S. Department of Energy (DOE) has violated the Water Quality Act, the Water Quality Control Commission (WQCC) Regulations, and Discharge Permit 831 (DP-831) due to unauthorized discharges at the Waste Isolation Pilot Plant (WIPP). The violations resulted from the unauthorized discharge of brine from an unlined portion of the spillway between the Salt Storage Extension (SSE) Cell A and the Salt Storage Extension Basin (SSEB). The spillway was required to be synthetically lined in accordance with Condition 2 of the December 22, 2003 Discharge Permit Modification as incorporated into the current Discharge Permit Renewal and Modification dated September 9, 2008.

Background

NMED received oral notification followed by a written corrective action report dated October 31, 2008 of a discharge of brine water from the SSE and the SSEB at the DOE Waste Isolation Pilot Plant (WIPP). A follow-up letter detailing corrective action activities was submitted to NMED on November 14, 2008, and a Modified Corrective Action Plan was submitted on December 5, 2008. The report, letter and plan were submitted in accordance with Condition 3 of the September 9, 2008 Discharge Permit Renewal and Modification (DP-831) and approved by NMED on December 5, 2008.
According to the Report, the WIPP site received 2.96 inches of rain over a 15-hour period beginning October 13, 2008. The rainfall caused the water level in the SSEB to rise above the

one foot of freeboard required in DP-831. On October 22, 2008, as water levels continued to rise, it was discovered that the water had covered the spillway between the SSE and the SSEB. It was also discovered that the center of the spillway was not covered with a synthetic liner, which is in violation of the construction design requirements in Condition 2 of the December 22, 2003 Discharge Permit Modification. The rise in salt-contaminated water over the unprotected spillway berm resulted in a discharge to the ground.

Enforcement Authority

Pursuant to section 74-6-5 of the Water Quality Act, the Department has the authority to terminate or modify the WIPP discharge permit, DP-831, prior to its date of expiration for any of the following causes:

1) violation of any condition of the permit;
2) obtaining the permit by misrepresentation or failure to disclose fully all relevant facts;
3) violation of any provisions of the Water Quality Act, or any applicable regulations, standard of performance or water quality standards;
4) violation of any applicable state or federal effluent regulations or limitations; or
5) change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge.

Additionally, the Department may issue a compliance order that assesses a civil penalty pursuant to section 74-6-10 of the Water Quality Act. Penalties may be assessed for up to $15,000 per day for discharge permit violations and violations of section 74-6-5 of the Water Quality Act, and up to $10,000 per day for violations of other sections of the Water Quality Act and regulations adopted pursuant to those sections.

As an alternative to the remedies described above, the Department may commence an action in district court for appropriate relief, including injunctive relief.

Nature of Violation

Section 20.6.2.3104 NMAC provides that "...no person shall cause or allow effluent or leachate to discharge so that it may move directly or indirectly into ground water." That section further provides, "When a permit has been issued, discharges must be consistent with the terms and conditions of the permit." Condition 2 of the December 22, 2003 Discharge Permit Modification as incorporated into the current Discharge Permit Renewal and Modification dated September 9, 2008 states, "The installation of the storm water control structures shall be in accordance with the application for discharge permit modification dated April 24, 2003, or in accordance with subsequent design and specification amendments subject to approval by NMED."

The DOE violated Section 20.6.2.3104 NMAC and Condition 2 of DP-831 (December 22, 2003) by failing to construct the liner between the SSE and the SSEB according to the plans submitted as part of the application for discharge plan modification April 24, 2003. The approved plans called for a synthetic liner to fully cover the spillway between the SSE and the SSEB. While implementing corrective actions to address rising water in the SSEB, the DOE informed NMED in a letter dated October 31, 2008, that the spillway was not protected with a synthetic liner.

Remedial Action Required

The DOE must take the following remedial actions to correct its violations.

1. The DOE shall continue with the interim corrective actions described in the letter titled, *Modified Corrective Action Plan for Loss of Freeboard in the Salt Storage Extension Basin,* submitted on December 5, 2008 and approved by NMED by letter on the same day.

2. The DOE shall implement the permanent corrective actions described in the letter titled, *Schedule for Permanent Corrective Actions for Salt Contact Run-Off into the Salt Storage Extension Evaporation Basin* submitted to NMED on December 24, 2008. The permanent corrective actions must be completed by **August 31, 2009.**

Failure to comply with these remedial actions and associated deadlines may subject the DOE to enforcement actions as described above, including termination or modification of its discharge permit, issuance of a compliance order, assessment of penalties, or filing of a district court action. In any event, the Department reserves the right to seek civil penalties for the violations described above.

If you have any questions, please contact Mary Ann Menetrey, Program Manager of the Mining Environmental Compliance Section at 505- 827-2944, or Clint Marshall of the Mining Environmental Compliance Section at 505-827-0027.

Sincerely,

William C. Olson, Chief

Subject: Corrective Action Report for the WIPP Sewage Lagoon

Dear Mr. Olson:

The purpose of this letter is to provide the Corrective Action Plan for the erosion that occurred under the liner of Settling Pond 1A at the U. S. Department of Energy (DOE) Waste Isolation Pilot Plant (WIPP) sewage treatment facility. It was verbally reported to your office on the afternoon of February 17, 2009, and confirmed in writing in a letter dated February 23, 2009, that erosion was observed and that water existed outside the liner. At the time, it was believed that the water was the result of a discharge from the Pond, possibly due to a liner tear, seam separation, or separation from the weir. Corrective Actions included diverting sewage influent into Settling Pond 2A and isolating Settling Pond 1A from the sewage treatment system. Water was also pumped from Settling Pond 1A to Evaporation Pond A. These actions were performed to prevent any further discharge from Settling Pond 1A.

We have inspected the liner in Settling Pond 1A and have determined that there is no apparent liner tear, seam separation, or other visible damage to the liner that would lead to a discharge. We now believe the water observed is storm water runoff that created the erosion and became trapped under the liner after the erosion event. If, during repair of the erosion and reestablishment of the pond integrity, there is liner damage noted, your office will be informed of any additional corrective actions that were necessary.

This notwithstanding, repairs to the pond are necessary prior to bringing it back into service to avoid liner damage in the future. The time and repairs required to return Settling Pond 1A to service are anticipated to require removing the liner from the affected area, filling in the eroded area, compacting the secondary liner (compacted caliche to 90 percent proctor), and performing repairs to the synthetic liner, if needed. Our goal is to complete the repairs in the summer timeframe.

As discussed in a telephone call to you on February 24, 2009, it was necessary to pump water from Settling Pond 1A into Evaporation Pond A in order to investigate the condition of Pond 1A. Prior to this, Evaporation Pond A had been removed from service in early

2008 to facilitate replacement of the liner in accordance with a November 3, 2005, Corrective Action Plan. The February 24, 2009, phone conversation authorized the use of Evaporation Pond A and provided DOE relief from the liner replacement schedule for Evaporation Pond A. DOE proposes to complete the liner replacement in Evaporation Pond A and B during fiscal year 2009 provided precipitation and evaporation rates accommodate emptying the ponds.

The corrective actions described in this report are intended to meet all the reporting requirements of 20.6.2.1203 NMAC and DP-831 as renewed on September 9, 2008.

If you have any further questions regarding this matter or need additional information please contact Mr. Dan Ferguson at (575) 234-8128.

Sincerely,

David C Moody

Subject: Notification of Discharge

Dear Mr. Olson:

The purpose of this letter is to confirm the U. S. Department of Energy's (DOE), Carlsbad Field Office (CBFO) verbal report to your office on the afternoon of February 17, 2009. This report was made by Dan Ferguson, DOE/CBFO. This information is being provided to you in accordance with the WIPP Discharge Permit (DP-831) which references 20.6.2.1203 NMAC, NOTIFICATION OF DISCHARGE-REMOVAL:

(a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility:

Persons in charge of the facility:	David C. Moody, Manager 4021 National Parks Highway Carlsbad, New Mexico, 88220 (575) 234-7300
Owner of the facility:	U. S. Department of Energy
Operator of the facility:	Washington TRU Solutions LLC

(b) Name and address of the facility:

U. S. Department of Energy
Waste Isolation Pilot Plant
30 miles east of Carlsbad, New Mexico off of State Highway 128
Carlsbad, NM 88220

CBFO:ORC:DJF:KLJB:09-0224:UFC5486

(c) The date, time, location, and duration of the discharge:

Date: February 16 through the present (February 23, 2009)
Time: 5:00 p.m. (approximately)
Location: WIPP Site, Sewage Lagoon 1A
Latitude: 32 22.215, Longitude 103 47.641
Duration: seven days and currently; assuming that water under the liner started collecting at the time the ground settling was noted on February 16, 2009.

(d) The source and cause of the discharge:

Source: Sewage water in Sewage Lagoon 1A

Cause of discharge:

At 5:00 p.m. on Monday February 16, 2009, WIPP Facility Operations performed the daily inspection of the sewage lagoons. The inspector noticed erosion that resulted in ground settling on the west end of Lagoon 1A. As the inspector further investigated the site, he noticed a bulge in the liner which looked as if the soil had sloughed off the side of the lagoon and collected underneath the liner below the water level. Water, approximately one gallon, was also observed in the bottom of the area where the soil settled.

On Tuesday February 17, 2009, plans and documentation were completed to excavate the area in order to determine the source of the water. Disinfectant was applied prior to excavation activities. The area where the water was located was excavated to an approximate four foot depth and the soil was dry below ground level. Water was discovered under the liner after the edge of the liner was lifted. With hand tools the area under the liner was partially excavated, and at that time water ran from under the liner and partially filled the previously excavated area. At this time sand bags were used to dam off the water and keep it isolated to the area adjacent to the weir structure under the edge of the liner. The liner was not rolled back at this time due to excessive winds. There were no visible leaks or separation in the seams of the liner. The liner in this lagoon was replaced in March 2008.

(e) A description of the discharge, including chemical composition:

The discharged water is sewage water from the WIPP facility. Analyses for the Sewage Lagoon 1A Sludge was performed on September 5, 2007. Toxicity Characteristic Leachate Procedure analyses including heavy metals, volatile and semi-volatile organic compounds, and pesticides were performed on the sludge. None of the constituents were found above the regulatory threshold values. The WIPP Sample Team has collected a sample of the water and a full analysis of heavy metals, volatile and semi-volatile organic compounds, pesticides, and nitrate will be performed on the water to verify its non-hazardous status.

(f) The estimated volume of the discharge:

The ground settling extended underneath the upper edge of the liner for approximately ten feet. The width of the settling, underneath the liner, is approximately eight feet wide. The water has apparently pooled underneath the liner allowing an estimated 300 gallons, given a six inch depth available for discharge. With the sand bagging of the area after the excavation, the intent was to confine the area where the water is located outside of the liner to decrease the potential for infiltration.

(g) Any actions taken to mitigate immediate damage from this discharge:

- Upon identifying the source of the subsidence on February 17, 2009, a corrective action plan was being prepared for submittal to the NMED as required by DP-831.
- No sewage is being introduced into the pond. All sewage from the WIPP facility was rerouted into Pond 2A.
- In addition, the equalization valve connecting Pond 1A and Pond 2A was closed on February 17, 2009 to prevent water from flowing into Pond 1A from Pond 2A.

We believe this discharge poses minimal threat to the environment and to human health. The influent controls implemented to Pond 1A will minimize discharge from the pond. Work packages are being developed to clean up the effects of the discharged sewage

CBFO:ORC:DJF:KLJB:09-0224:UFC5486

water, repair the leaking liner, and place the pond back into service. The corrective actions described in this report are intended to meet the seven day reporting requirements of 20.6.2.1203 NMAC and DP-831 as renewed on September 9, 2008. If you have any further questions regarding this matter or need additional information please contact me at (575) 234-7300.

Sincerely,

David C. Moody

Subject: Schedule for Permanent Corrective Actions for Salt Contact Run-Off into the Salt Storage Extension Evaporation Basin

RE: (1) DOE Letter CBFO:AMO:HLP:KJB:08-1426:UFC5486 from Dr. D. C. Moody to Mr. C. Marshall dated November 14, 2008, Subject: Interim Corrective Actions

(2) DOE Letter CBFO:AMO:HLP:KJB:08-1438:UFC:5486 from Dr. D. C. Moody to Mr. C. Marshall dated December 5, 2008, Subject: Modified Corrective Action Plan for Loss of Freeboard in the Salt Storage Extension Evaporation Basin

The purpose of this letter is to provide the New Mexico Environment Department - Ground Water Pollution Prevention Section a schedule of activities to implement permanent corrective actions for the management of salt contact run-off water into the Salt Storage Extension Evaporation Basin (SSEB) as noted in the referenced letter sent to your office on November 14, 2008. The following table notes the schedule of required actions:

Schedule for Corrective Actions to Improve SSEB Capacity

DATE	ACTIVITY
January 30, 2009	Develop the statement of work for the service subcontract to procure the engineering services to review drawings, calculations, current field applications / construction, and provide a report detailing recommendations with a path forward.
February 27, 2009	Procure engineering services.
April 30, 2009	Complete an evaluation of documentation and field review from subcontractor with suggested corrective modifications to the existing salt pile run-off area and evaporation pond.
May 15, 2009	Present to the Ground Water Quality Bureau the proposed engineering modifications for review and preliminary schedule of activities.
May 22, 2009	Receive from the Ground Water Quality Bureau approval to proceed with the engineering modifications.
June 12, 2009	Provide the Groundwater Quality Bureau a schedule for completion of this project.

01786

CBFO:AMO:HLP:MAG:08-1441:UFC:5486.00

These dates are approximate. An estimated completion date will be determined upon the contract award. Efforts will be directed to complete this project by the end of August, 2009.

In previous discussions and correspondence with your office (December 5, 2008), we informed you that water in the SSEB would be pumped to Evaporation Ponds B and C at the sewage treatment facility. This effort begán December 5, 2008 and has continued since that date. On December 12, 2008, water was below the top of the liner of the SSEB. Pumping efforts through December 16, 2008 have created additional freeboard.

Contracting efforts were initiated December 10, 2008 to address the need for brine water containment enhancements associated with the WIPP DP-831 permit.

Engineering actions are on schedule to raise the elevation of the east berm of the SSEB separating it from the Salt Storage Extension - Cell-A providing increased freeboard capacity. Details of this action will be provided to your office in the DP-831 semi-annual report due to your office on January 31, 2009.

If you have any questions regarding this matter, please call H. L. (Jody) Plum at (575)234-7462.

Sincerely,

David C. Moody,
Manager

Executive Summary

The hydrologic assessment presented in this report examines the shallow subsurface water (SSW) conditions at the Waste Isolation Pilot Plant (WIPP) site near Carlsbad, New Mexico. The hydrologic assessment was conducted on behalf of the U.S. Department of Energy (DOE) by Daniel B. Stephens & Associates, Inc. (DBS&A), under contract to Washington TRU Solutions LLC (WTS). The assessment provides an update to previous SSW investigations and examines the effects of infiltration controls that have been implemented to halt recharge to the SSW.

The goal of the SSW hydrologic assessment was to evaluate data collected since the installation of the infiltration controls for the purpose of updating the conceptual model of the important hydrologic processes controlling the SSW hydrologic system. The hydrologic assessment uses the complete monitoring record from 1996 to 2008 to examine the effects of infiltration controls installed in 2004 and 2005. The assessment considers the observed hydrologic responses that are evident from the monitoring to determine whether the infiltration controls are producing positive results. A comprehensive database was assembled to bring together all of the relevant monitoring data to analyze trends in SSW flow and water quality before and after infiltration control systems were put in place. The liners and covers that have been put in place will halt the primary SSW recharge; however, the infiltration controls will not eliminate the existing SSW lens, which will persist in the Santa Rosa sandstone and potentially migrate laterally or downward into the Dewey Lake redbeds.

The infiltration control systems require continued operation and maintenance in order to effectively manage on-site stormwater. The lined stormwater ponds that receive stormwater with elevated salinity (Salt Storage Extension and Salt Pile Evaporation Ponds) are designed for full retention through an inflow/evaporation water balance. The lined stormwater ponds that receive relatively fresh stormwater runoff (Detention Basin A, Pond 1, and Pond 2) are designed with evaporation capacities that are supplemented by using stormwater for irrigation of vegetation on the Salt Storage Area final cover.

A time-series analysis completed to examine SSW water level trends shows that the water table has risen since the first monitor wells were installed in 1996. Recharge causing a rising water table is correlated with precipitation rates. Water level rises occur 3 to 9 months after periods of heavy precipitation. The June 2008 measurements indicated a decline in water levels in most wells, potentially the first sign of a response to the infiltration controls; however, it is too early to reach a conclusion regarding a possible trend toward water level declines without a longer monitoring record. Monitor wells that appear to be at the fringes of the SSW saturated lens show rising water levels and increasing saturated thickness. In March 2007, saturation was detected for the first time in monitor well PZ-08, which had previously been dry. Water levels at the three new monitor wells installed in 2007 around the Site and Preliminary Design Validation (SPDV) pile suggest that the saturation found in this area is not directly hydrologically connected to the main SSW saturated lens.

The SSW water quality is dominated by highly saline brine that is representative of halite (NaCl) dissolution. Total dissolved solids (TDS) concentrations range from less than 10,000 milligrams per liter (mg/L) to as high as 245,000 mg/L. The highest TDS concentration is in monitor well PZ-13, installed in 2007 near the SPDV pile. Within the 15 monitor wells in the main SSW lens underlying the WIPP facilities area, higher TDS concentrations are found in the northern half of the site near the Salt Storage Area and Salt Pile Evaporation Pond. TDS concentrations are much lower in the southern half of the site, where low-TDS water recharged the SSW from stormwater retention ponds prior to installation of liners to prevent recharge. Sufficient time has not yet elapsed since installation of the liners to observe water quality changes that can be attributed to reduced SSW recharge.

Due to the implementation of the infiltration controls, the initially high moisture content of the vadose zone materials will gradually drain to lower moisture content. Calculations of moisture redistribution in the vadose zone beneath former recharge sources estimate the duration and magnitude of transient drainage providing continued moisture input to the SSW. Moisture redistribution calculations were completed for a 5-year duration for a range of vadose zone hydrologic properties. Based on likely hydrologic parameters that are representative of field conditions, a total of approximately 120 acre-feet of transient drainage is estimated to occur.

During the 3 years since the infiltration controls were completed in 2005, most of the rapid transient drainage should have occurred. Under all cases tested for variable hydrologic properties, transient drainage reaches slow (but continuing) rates beyond 3 years. The transient drainage volume is estimated to add approximately 12 to 33 percent additional water to the SSW and cause an estimated water table rise of between 8 feet over the immediate area around the former recharge sources and 2 feet over the entire SSW lens.

- not reflected in 2018 monitoring Report. 7

The primary benefit of implementing the infiltration controls is prevention of continued recharge that was predicted to continue increasing the SSW saturated volume. Due to the effect of transient drainage, water level field data do not yet show the expected positive effect of the infiltration controls to gradually reduce water levels.

1. Introduction

The hydrologic assessment presented in this report examines the shallow subsurface water (SSW) conditions at the Waste Isolation Pilot Plant (WIPP) site near Carlsbad, New Mexico. The assessment provides an update to previous SSW investigations and examines the effects of infiltration controls that have been implemented to halt recharge to the SSW. The hydrologic assessment was conducted on behalf of the U.S. Department of Energy (DOE) by Daniel B. Stephens & Associates, Inc. (DBS&A), under contract to Washington TRU Solutions LLC (WTS).

The hydrologic assessment focuses on updating the SSW conceptual model that was developed during previous investigations. Much of the investigation field work was completed in 1996 and 1997. In 2003, DBS&A completed a water budget analysis to quantify the recharge sources and characteristics of the SSW. Infiltration control systems were constructed in 2004 and 2005. The hydrologic assessment considers new monitoring data collected since the 2003 water budget analysis to determine the effects of infiltration controls on the SSW hydrology and water quality. The hydrologic assessment provides a comprehensive review of all SSW monitoring data from before and after implementation of infiltration controls to improve understanding of the effectiveness of the surface infiltration controls that have been implemented at WIPP.

The goal of the SSW hydrologic assessment is to update the conceptual model of the important hydrologic processes controlling the SSW hydrologic system. The assessment evaluates how the infiltration controls may be affecting SSW water levels, water chemistry, and the rate and direction of flow.

The overall purpose of the SSW hydrologic assessment is to support DOE efforts to ensure regulatory compliance at the WIPP and to provide information that will assist DOE decision makers in determining the efficacy of actions to control and monitor the SSW.

2. Hydrologic Assessment Methodology

The hydrologic assessment uses the complete monitoring record from 1996 to 2008 to examine the SSW conditions and the effects of the infiltration control systems since 2005. The hydrologic assessment considers the highly variable SSW water quality measured at monitor wells to evaluate the sources of recharge water quality and mixing of various waters that could lead to the SSW geochemistry observed. To examine the effects of infiltration controls, the assessment considers the observed hydrologic responses that are evident in the monitor well network to determine whether the infiltration controls are producing positive results.

The SSW hydrologic assessment includes the following components:

- A comprehensive database was assembled to bring together all of the relevant SSW monitoring data, including water level measurements, water quality monitoring, well construction details, geologic information, and climate data.

- A time-series analysis was completed using hydrographs that show the water level, total dissolved solids (TDS) concentration, and precipitation at each monitor well for the complete monitoring record.

- Maps showing water level elevation contours for the SSW monitor wells were prepared to show water level and flow direction changes at approximately annual time steps over the complete monitoring record.

- Maps showing TDS contours for the SSW monitor wells were prepared to show water quality changes at approximately annual time steps over the complete monitoring record.

- SSW geochemistry was evaluated based on water quality within the SSW monitor wells:
  - Charge balance was calculated to determine water chemistry data quality.
  - Saturation indices were calculated for the water quality at each monitor well to classify the water quality and mineral dissolution from recharge sources.

- Durov plots were prepared to display water quality characteristics of major cations and anions, TDS, and pH.

- Moisture redistribution calculations were completed to estimate the rate of draindown of residual moisture beneath the infiltration controls in order to understand the rate and impact of moisture movement below the former recharge sources.

Each component of the hydrologic assessment is described in this report, followed by a discussion of the results.

3. Hydrologic Setting

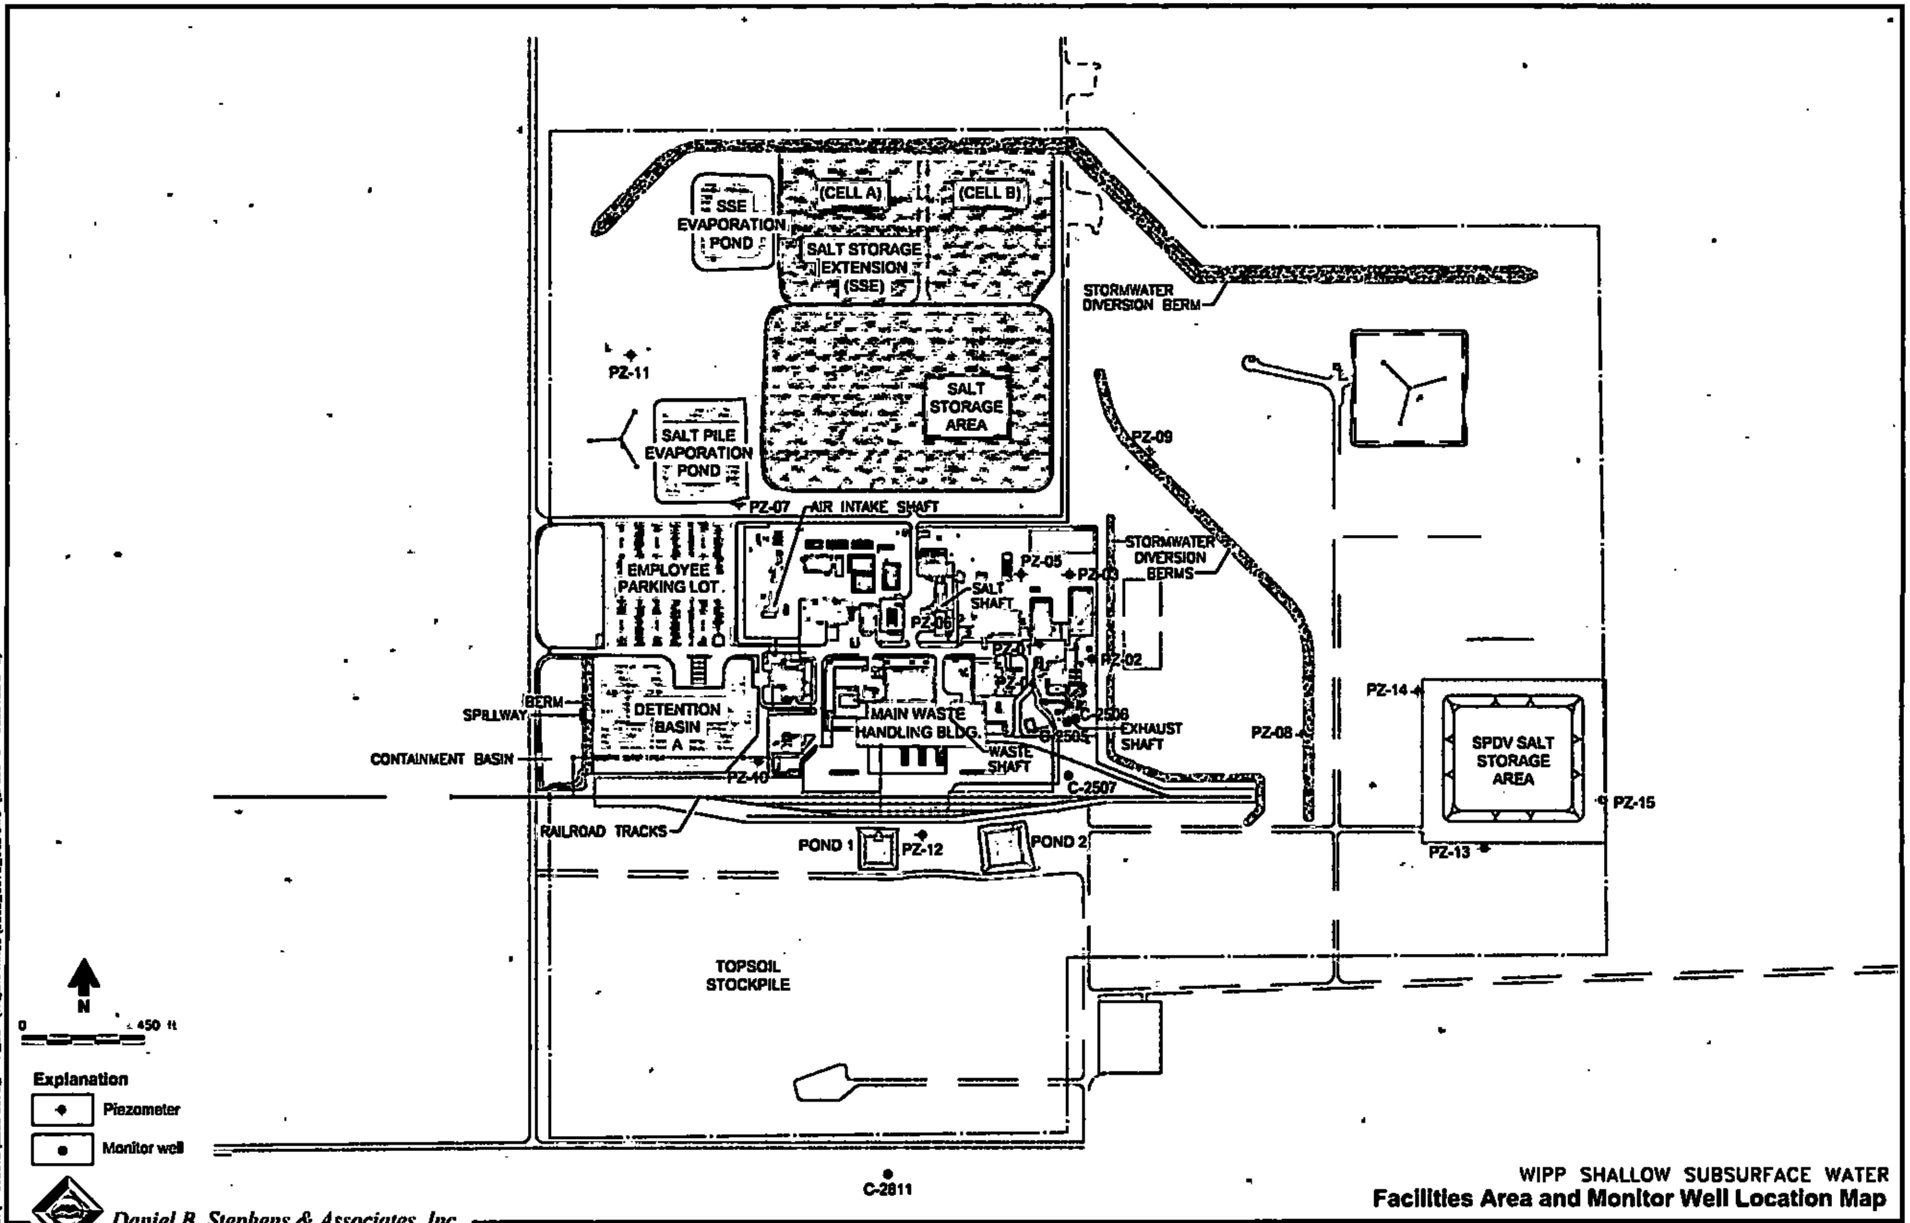
The WIPP site is located in eastern Eddy County, New Mexico, in a remote area 26 miles east of Carlsbad, New Mexico. The entire land withdrawal area for the WIPP site is 16 square miles, and the surface facilities area covers roughly 150 acres. A detailed site plan of the WIPP surface facilities is provided in Figure 1. An aerial photograph of the WIPP surface facilities area from 2005 is provided in Figure 2.

3.1 Climate and Physiography

The WIPP site is located in a semiarid region of the U.S. desert southwest. The average annual precipitation for Carlsbad, New Mexico is 12.22 inches per year (in/yr) based on records beginning in 1949 for the Carlsbad Federal Aviation Administration (FAA) Airport. Records of precipitation from the on-site WIPP weather station for 1986 to 2007 show an average annual precipitation of 13.48 in/yr. Annual evaporation from surface water for the Carlsbad area exceeds 98 in/yr (Mercer, 1983). Native vegetation consists of mesquite, scrub oak, and other plants typical of the northern Chihuahuan Desert (Mercer, 1983). Surficial soils at the WIPP site are characterized by sand and dune sand deposits (Campbell et al., 1996).

Climate data used in the hydrologic evaluation were obtained from the Carlsbad FAA Airport weather station and an on-site weather station (Table 1). The detailed climate data required for some analyses are available only for more recent years; therefore, data from various time frames were used in the water budget analysis (Table 1). The primary precipitation data used for the hydrologic evaluation are monthly precipitation totals from the WIPP weather station from 1995 to 2008.

The long-term record of precipitation data from the Carlsbad FAA Airport and the WIPP weather station is illustrated in Figure 3. As shown in this figure, precipitation was below normal until around 1970 and above normal from 1984 (the year that construction of the main WIPP facilities began) to 1992. Above-average precipitation has also been experienced at WIPP each year from 2004 to 2007.



WIPP SHALLOW SUBSURFACE WATER

Annual Precipitation and Cumulative Departure from Mean

Daniel B. Stephens & Associates, Inc.

9-2-08

JN ES08.0072

Based on the long-term precipitation records available from the Carlsbad FAA Airport, the average annual precipitation has been 13.65 in/yr over the years from the initial development of the WIPP facilities in 1984 through 2007. This precipitation rate is approximately 12 percent above the long-term average (Table 1).

3.2 Hydrogeologic Regime

The regional hydrogeologic regime in the area of the WIPP has been described by several investigators. Comprehensive reports by Hendrickson and Jones (1952) and Bachman (1984) describe the regional geologic setting. A more detailed description of the local hydrogeologic regime at the WIPP site is provided by Mercer (1983).

At the WIPP site, Powers (1995) reports the following stratigraphic column from geologic mapping of the WIPP Exhaust Shaft:

0 to 7.5 feet below ground surface (bgs)	Quaternary dune sand
7.5 to 17 feet bgs	Mescalero caliche
17 to 34 feet bgs	Gatuña Formation
34 to 54 feet bgs	Santa Rosa Sandstone Formation
54 to 546 feet bgs	Dewey Lake Redbeds Formation
546 to 851 feet bgs	Rustler Formation
851 to 2,150(+) feet bgs	Salado Formation

The SSW hydrologic assessment focuses on unsaturated flow processes in the vadose zone and saturated flow in the SSW perched lens in the upper formations within 100 feet of the ground surface. This section describes the geologic units in these shallower formations, including the Dewey Lake Redbeds Formation (hereafter referred to as Dewey Lake) and the overlying geologic units.

3.2.1 Dewey Lake Redbeds Formation

The Dewey Lake, which consists of alternating thin beds of siltstone and fine-grained sandstone, is the deepest formation examined in the hydrologic assessment. This formation is absent in some areas due to erosion since Triassic time, but is as thick as 560 feet in eastern Eddy County and western Lea County (Bachman, 1984) near the WIPP site. Drilling within the WIPP facilities area shows that the Dewey Lake is approximately 500 feet thick (Powers, 1995). The Dewey Lake dips gently eastward and also increases in thickness to the east (Mercer, 1983).

The Dewey Lake is at the base of the SSW, with saturated conditions found in an overlying perched zone. A siliceous layer in the upper Dewey Lake at the Santa Rosa/Dewey Lake contact (Intera, 1997a; Powers, 2003b) and a sulfate (gypsum) cementation zone in the lower Dewey Lake (Powers, 2003a) form zones of reduced permeability in the otherwise more permeable sandstone. During hydrogeologic investigations undertaken during the development of the WIPP, minor thin, discontinuous saturated zones were identified in the Dewey Lake (Mercer, 1983).

In this report, the terms upper, middle, and lower Dewey Lake are used to describe the stratigraphic position in the formation along with certain characteristics of the formation that relate to the occurrence of saturated conditions. Although these horizons are not strictly defined and their thicknesses vary, the terms upper, middle, and lower are useful to describe the hydrologic conditions.

- The upper Dewey Lake consists of a thick, generally unsaturated section.

*

- The middle Dewey Lake is the interval immediately abov... ...ite cementation change, where saturated c... ...en identified in limited areas.

Sulfate cementation

Within the WIPP site, monitor well \ ... southwest of the surface facilities area, intersects ... is screened across an interval from 189 to 214 fe... ...proximately 165 feet bgs (Stensrud, 1995). At thi... ...pth of 35 to 410 feet bgs (U.S. DOE, 1996), which ... e portion of the formation.

The Dewey Lake generally does not yield a water supply to wells; however, in a localized area at the Mills Ranch (formerly James Ranch, located about 1 mile south of the WIPP site boundary in T23S, R31E, Sections 6 and 7), domestic and stock supply wells produce water from the middle Dewey Lake at depths of 94 to 212 feet bgs (Mercer, 1983).

3.2.2 Santa Rosa Sandstone Formation

The Santa Rosa Sandstone Formation (hereafter referred to as Santa Rosa), of Triassic age, unconformably overlies the Dewey Lake. The Santa Rosa consists of gray and red sandstone with lenses of shale and conglomerate (Hendrickson and Jones, 1952). The Santa Rosa encountered in potash exploration holes immediately east of the WIPP site boundary is 200 to 300 feet thick; however, due to erosion, its thickness is much reduced in the central part of the WIPP site and is zero west and southwest of the site (U.S. DOE, 2004). Drilling within the WIPP facilities area (Intera, 1997a) shows that the Santa Rosa ranges in thickness from 16 to 39 feet in the area of the SSW.

Shallow water in the Santa Rosa is the focus of the water budget. Earlier hydrogeologic investigations show that the Santa Rosa was generally not water-bearing at the WIPP site.

Saturation was detected in the lower part of the Santa Rosa in two test holes drilled approximately 3 miles northeast of the WIPP surface facilities (Mercer, 1983).

At the WIPP facilities area, water in the Santa Rosa is perched on the relatively impermeable underlying Dewey Lake. Small amounts of water may discharge downward into the Dewey Lake through fractures and along bedding planes, although drilling performed to investigate the Santa Rosa perched water found the Dewey Lake to be dry below the Santa Rosa (U.S. DOE, 2000).

3.2.3 Gatuña Formation

The Gatuña Formation (hereafter referred to as the Gatuña), of Pleistocene age, unconformably overlies the Santa Rosa at the WIPP site. This formation consists of silt, sand, and clay, and is discontinuous, with deposits in localized depressions (Hendrickson and Jones, 1952). Boring logs from on-site drilling by Sergent, Hauskins & Beckwith (1979) describe the Gatuña as predominantly sandstone with interbedded siltstone that is highly weathered, fractured, and moderately hard. Drilling within the WIPP facilities area shows that the Gatuña ranges in thickness from 19 to 31 feet (Intera, 1997a).

The Gatuña is water-bearing in some areas, with saturation occurring in discontinuous perched zones. However, because of its erratic distribution, the Gatuña has no known continuous saturated zone (Mercer, 1983). Drilling at the WIPP site, including 30 exploration borings drilled between 1978 and 1979 in the surface facilities area, did not identify any saturated zones in the Gatuña.

3.2.4 Mescalero Caliche

The Mescalero Caliche is an informal stratigraphic unit consisting of well-lithified deposits of finely crystalline limestone (caliche) that developed below the surficial soils and in the upper portion of the Gatuña (Mercer, 1983). Powers (2002) indicates that the caliche is generally well developed in the vicinity of the WIPP. The Mescalero Caliche is described in detail by Phillips (1987), who indicates that although the caliche is continuous and well-lithified in some areas, it is often dissected by holes, fractures, and other discontinuities. The Mescalero Caliche is typically between 2 and 10 feet thick, with the upper contact of the caliche between 5 and 10 feet bgs (Sergent, Hauskins & Beckwith, 1979).

3.2.5 Soils

Berino series soils make up the sandy, surficial soils at the WIPP site (Bachman, 1980). These soils are developed in reddish, noncalcareous, wind-worked deposits, generally about 3 feet in thickness. The Berino soils are classified as loamy fine sands with a sandy clay loam subsoil and are very susceptible to wind and water erosion, often forming hummocks or dunes.

3.2.6 Recharge in Native Soils

Under natural conditions, recharge rates through the native soils are extremely low, and little recharge to the Santa Rosa SSW zone is likely to occur in the vicinity of the WIPP site. Most precipitation falls on rangeland and is returned to the atmosphere through evapotranspiration. Hunter (1985) estimated an evapotranspiration rate of 96 percent for a broad water balance study area encompassing 2,000 square miles in Eddy and Lea Counties. A preliminary water balance estimate for a 400-square-mile area surrounding the WIPP site determined recharge rates of 0.5 to 2 percent of precipitation, or less than 0.25 in/yr (Hunter, 1985). A study by Campbell et al. (1996) determined recharge rates for the WIPP site based on stable isotopes in soil waters and chloride mass balance analysis. These investigators estimated recharge rates in surficial soils of only 0.06 to 0.6 percent of precipitation, or less than 0.08 in/yr.

The extremely low recharge rates that occur in native soils covered with desert vegetation indicate that natural recharge around the WIPP facilities area is likely an insignificant component of recharge to the SSW. However, site development at the WIPP has altered the recharge conditions by focusing stormwater in retention ponds and removing vegetation over large areas, thereby decreasing evapotranspiration and increasing recharge in comparison to natural conditions.

3.3 Previous SSW Investigation

Early exploratory drilling at the WIPP site (Sergent, Hauskins & Beckwith, 1979; Mercer, 1983) and geologic mapping of the Exhaust Shaft in 1984 and 1985 (Powers, 1995) did not detect saturated conditions in the Santa Rosa at the WIPP site prior to site development. Seepage into the Exhaust Shaft was first detected in 1995 (U.S. DOE, 2002), and subsurface investigations of the source of this seepage determined that a saturated zone had developed in the Santa Rosa underlying the WIPP surface facilities.

3.3.1 Site Investigation Activities

While many hydrogeologic investigations have been conducted at the WIPP site, this section describes only the investigations that focus on the SSW. SSW investigations were initiated following the May 1995 detection of fluid seeping through cracks in the Exhaust Shaft concrete liner at depths of 50 to 80 feet bgs (Intera, 1996). This section describes a series of investigations and ongoing monitoring to characterize the SSW and meet regulatory requirements.

3.3.1.1 1996 to 1997 Initial Investigation

A series of SSW investigation activities was conducted by Intera in 1996 and 1997 (Intera, 1996, 1997a, and 1997b), including the following:

- Geophysical survey to identify saturated zones in the subsurface
- Drilling of 3 monitor wells (C-2505, C-2506, and C-2507 [4-inch-diameter])
- Drilling of 12 piezometers (PZ-01 through PZ-12 [2-inch-diameter])
- Pumping and slug tests to determine hydrologic properties of the saturated zone
- Sampling of the SSW for water quality analysis

Hereafter, this report refers to the 3 C-series monitor wells and the 12 PZ-series piezometers collectively as monitor wells. The locations of monitor wells installed to investigate the SSW and shaft seepage are shown in Figure 1. Copies of well logs (Intera, 1996 and 1997a) are provided in Appendix A.

During the initial investigation, a saturated zone ranging in thickness from 12 to 32 feet was encountered in the Santa Rosa in wells completed at depths ranging from 54 to 75 feet bgs. The well screens are predominantly in the saturated interval in the lower portion of the Santa Rosa, and the wells typically penetrate approximately 5 to 10 feet into the Dewey Lake. The Dewey Lake was found to be dry in the interval penetrated, although one borehole (C-2507) was reported to have saturation within the upper 5 feet of the Dewey Lake (Intera, 1996). The dry Dewey Lake horizon below the saturated Santa Rosa indicates that the saturated lens in the Santa Rosa is perched and downward infiltration into the Dewey Lake occurs very slowly in the low-permeability redbeds. Piezometer PZ-08, the easternmost piezometer at the time of the initial investigation, located approximately 0.25 mile east of the facilities area, did not intersect the SSW, indicating a limit on the saturated zone in this area.

Water quality analysis of samples from the monitor wells and piezometers indicated TDS concentrations ranging from 3,700 to 155,000 milligrams per liter (mg/L) (Intera, 1997a). Pumping and slug tests showed saturated hydraulic conductivity (K_{sat}) values for the Santa Rosa of 2.64×10^{-8} to 5.48×10^{-5} meters per second (m/s) (Intera, 1996 and 1997a).

The monitor well and piezometer installations showed that the lower portion of the Santa Rosa contains a substantial saturated zone, the areal extent of which includes the entire WIPP surface facilities area. Based on a typical porosity range of 5 to 30 percent for sandstone, Intera (1997a) estimated a total volume of SSW between 20 to 120 million gallons. Intera (1997b) concluded that the increase in water level and gradient observed between October 1996 and March 1997 indicated a significant recharge source north of the Exhaust Shaft.

3.3.1.2 2001 Investigation

Water encountered in the upper Dewey Lake at monitor well C-2811 may be interconnected with the SSW in the Santa Rosa, although the interconnection is uncertain (Powers, 2002). Shallow monitor well C-2811, drilled in March 2001 approximately 1,300 feet south of the nearest SSW monitoring location, PZ-12 (Figure 4), was completed in the upper Dewey Lake and intersected water at a depth of approximately 60 feet bgs (Powers, 2002). According to Powers (2002), the Dewey Lake encountered at C-2811 was not saturated during drilling of earlier wells nearby. The thin zone of Santa Rosa, encountered from 35 to 45 feet bgs at the

Figure 4

C-2811 location, was not water-bearing. The water quality from C-2811 is consistent with that of the SSW wells, with similar molar ratios (Powers, 2002). The TDS concentration in C-2811 was 2,630 mg/L, which is lower than TDS concentrations in the SSW wells but follows the trend of decreasing TDS concentration toward the south.

Figures 4 through 7 show geologic cross sections through the SSW perched zone that are based on drilling logs from previous investigations (Appendix A). Cross section B-B′ (Figure 6) shows the relationship of the Santa Rosa, where the SSW is known to occur, and the shallow saturated zone encountered at well C-2811 in the predominantly unsaturated upper Dewey Lake. The saturated zone in the Dewey Lake at C-2811 is stratigraphically lower than the SSW occurring in the Santa Rosa to the north.

The location of monitor well WQSP-6A in relation to the WIPP facilities area and SSW monitor wells is shown in Figure 8. Geologic cross section D-D' (Figure 9) shows the SSW perched lens in the Santa Rosa in relation to the deeper water table encountered at WQSP-6A in the middle Dewey Lake. The saturated zone at C-2811 in the upper Dewey Lake is both vertically and laterally distinct from the water at monitor well WQSP-6A, located about 1 mile southwest, where saturation occurs in the middle Dewey Lake.

3.3.1.3 2007 Investigation

Recent investigations in 2007 included installation of 3 new SSW monitor wells near the Site and Preliminary Design Validation (SPDV) salt and mine rock pile (U.S. DOE, 2008). As shown in Figure 1, the SPDV pile is located east of the WIPP facilities area and the other SSW monitor wells. The SPDV pile covers approximately 10 acres and ranges in height from approximately 7 to 20 feet above ground surface. The approximate pile volume, including an estimate of 10 percent below grade, is 168,000 cubic yards (DBS&A, 1996). The pile is about 95 percent mined salt interspersed with various types of construction debris and fine-grained sediments generated during drilling of shafts and underground excavation. A final cover was constructed over the SPDV pile in 2000, consisting of a geosynthetic clay liner covered by 3 feet of soil cover with a revegetated surface (U.S. DOE, 2008).

Complete details of the 2007 well installations are provided in an October 2008 report by DOE (U.S. DOE, 2008). The SPDV monitor wells, PZ-13, -14, and -15, encountered water in thin saturated zones in formation horizons that differ from the other SSW monitor wells in the previously studied SSW saturated lens. Only PZ-14 encountered saturation in the lower Santa Rosa, perched on the Dewey Lake contact, consistent with other SSW monitor wells. A thin saturated layer 0.8 foot thick was identified in PZ-14, overlying dry Dewey Lake claystone/siltstone. At PZ-13, a saturated interval 2.5 feet thick was encountered in a sandy siltstone layer in the middle Santa Rosa. This saturated interval is perched above a hard sandstone layer in the lower Santa Rosa, approximately 10 feet higher than the Dewey Lake contact. At PZ-15, saturation was encountered in the lower Gatuña, above the Santa Rosa, where a dry and very hard sandstone was encountered. The water quality in the SPDV pile monitor wells is highly variable. The TDS is reported to be 2,060 mg/L in PZ-15, 106,000 mg/L in PZ-14, and 245,500 mg/L in PZ-13. Based on the variability in the formation intervals where saturation occurs and water quality, the water encountered in the SPDV pile wells is not clearly linked to the main SSW saturated lens and may be a result of infiltration through the SPDV pile prior to final cover construction or recharge from other sources.

3.3.1.4 Ongoing Monitoring

The current understanding of the SSW conditions is based on the culmination of the investigation activities from 1996 through 2008 and ongoing monitoring and interpretation of the SSW monitor wells (well logs in Appendix A). Monitoring activities have been carried out by DOE since 1996 to meet the regulatory requirements of groundwater discharge permit DP-831, administered by the New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB). The groundwater discharge plan regulates the SSW, as well as WIPP wastewater facilities that are not addressed by this hydrologic assessment. Continued water quality monitoring and water level measurements have been carried out by WIPP personnel from 1996 to present. During some monitoring intervals, DOE has tested for water quality parameters that exceed the discharge plan requirements. The complete monitoring record has been used in this hydrologic assessment.

The current groundwater discharge permit was approved on September 9, 2008 (NMED, 2008). It includes sampling of PZ-01, PZ-05, PZ-06, PZ-07, PZ-09, PZ-10, PZ-11, PZ-12, PZ-13, C-2507, C-2811, and WQSP-6A. The required water quality parameters include the following:

- Field parameters: pH, temperature, specific conductance
- General chemistry: sulfate, chloride, TDS
- Nitrate-nitrogen and total Kjeldahl nitrogen in WQSP-6A only

Water level measurements are required in all 20 monitor wells, including the additional PZ-series and C-series wells that are not included in water quality sampling. Monitoring is performed on a semiannual basis.

The complete set of water quality data collected for the SSW monitor wells is provided in Appendix B. Over the complete monitoring record, water quality testing has included variable parameters during sampling intervals, with some monitoring events testing for a more extensive list of chemical parameters. The monitoring frequency has varied during the period of record, ranging from monthly to annually. The monitoring data used in this hydrologic assessment include the complete monitoring record for all 20 wells used for SSW monitoring.

3.3.2 Water Budget Analysis

A water budget analysis was completed in 2003 to quantify the SSW sources and consider the potential for migration and the effectiveness of planned infiltration controls (DBS&A, 2003). The water budget refined the conceptual model of the SSW by quantifying the important hydrologic processes controlling the SSW system, providing the following:

- An estimate of the volume of water contained within the perched zone
- Quantification of seepage inputs to the SSW from past and current practices
- A model of SSW accumulation, flow conditions, and potential long-term migration
- Determination of the effects of engineered seepage reduction measures that could be implemented at existing seepage sources

The water budget analysis focused on the sources of water introduced to the subsurface as a result of site development at the WIPP. Because site investigation found the Santa Rosa to be unsaturated prior to site development, the SSW is considered to be anthropogenic, the result of a variety of water discharges and changes in site drainage that have occurred since on-site development of the WIPP began. Increases in recharge from the site have contributed to the saturated, perched zone at depths of 40 to 60 feet bgs within the Santa Rosa.

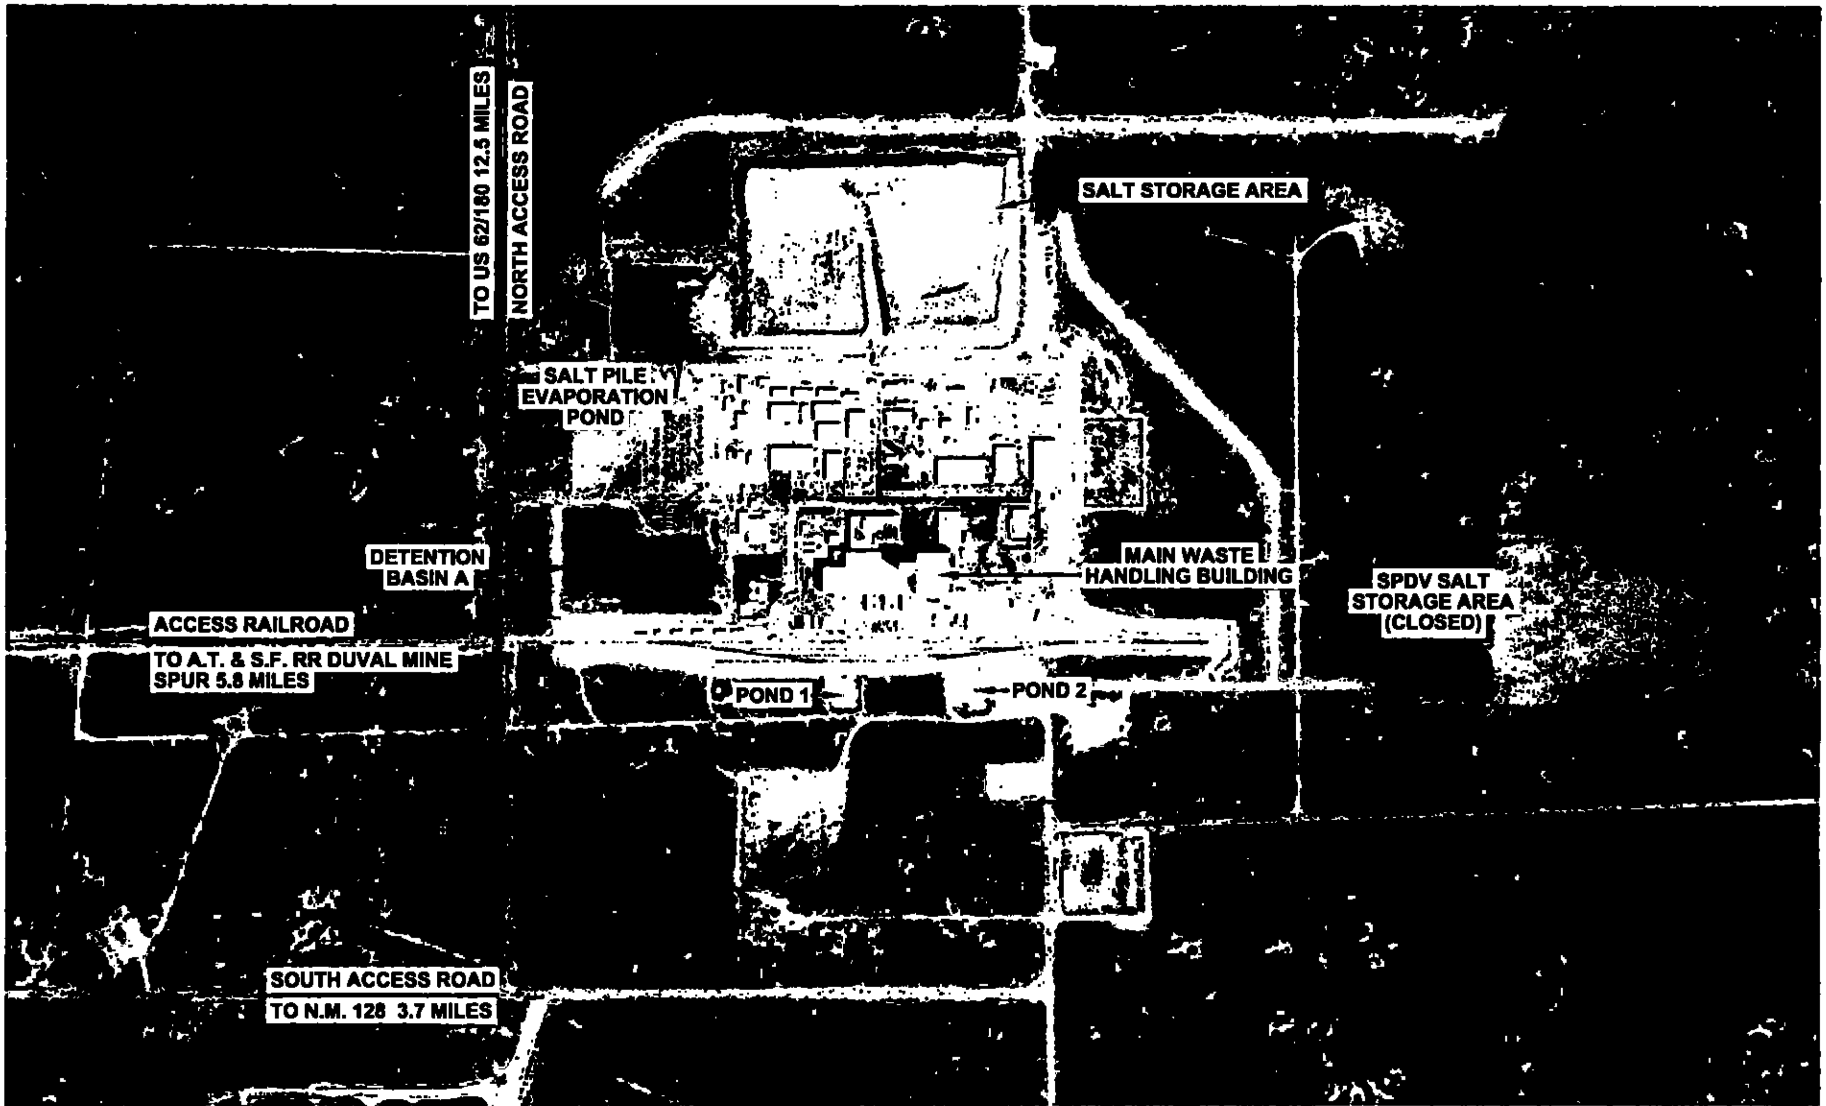
The water budget analyses included seepage estimates from five principal SSW recharge sources within the WIPP surface facilities area: (1) the Salt Storage Area, (2) the Salt Pile Evaporation Pond, (3) Detention Basin A, (4) stormwater retention pond 1, and (5) stormwater retention pond 2. An aerial photograph from 2000 (Figure 10) shows the condition of these recharge sources before liners and covers were constructed to control infiltration. Since 1984, when the WIPP surface facilities were constructed, recharge of precipitation to the subsurface has increased because runoff from impervious surfaces is routed into retention ponds. Recharge from the Salt Storage Area occurs when precipitation falling on the salt pile infiltrates through the highly fractured surface.

The water budget included the following analyses:

- *Compilation of recorded discharges:* Records of past discharges were compiled to quantify the extent of discharges from activities such as drilling, shaft dewatering, water line purging, water line leakage, and sewage treatment.

- *Site drainage summary:* Stormwater runoff calculations were completed to determine the volume of on-site stormwater that drains to the four stormwater retention ponds, where seepage may contribute to the SSW.

- *Surface infiltration modeling:* Infiltration rates were modeled for the four stormwater retention ponds and the Salt Storage Area. The model calculated evaporation and plant transpiration losses and the amount of recharge to the SSW.



Daniel B. Stephens & Associates, Inc.
09-03-08 JN ES08.0072

WIPP SHALLOW SUBSURFACE WATER
Aerial Photograph of WIPP Facilities Area, 2000

Figure 10

- *Saturated flow modeling:* Saturated flow modeling was conducted to quantify recharge from the stormwater retention ponds and Salt Storage Area and to determine whether such recharge accounts for observed conditions in the SSW.

- *Long-term migration modeling:* The long-term SSW migration was modeled for a 100-year time frame to evaluate whether the SSW has the potential to migrate to known groundwater resources. The potential for migration was examined both with and without the engineered infiltration controls to prevent recharge and reduce SSW migration.

The water budget results indicated that seepage from the five primary sources provides sufficient recharge to account for the observed SSW saturated lens and that the lens is expected to spread. The water budget results quantified the following components of the SSW hydrologic system:

- The SSW saturated zone covers approximately 150 to 520 acres to a maximum saturated thickness exceeding 30 feet, and contains a total estimated volume of water in the range of 108 to 315 million gallons.

- Average annual precipitation on the 85-acre watershed surrounding the WIPP facilities area amounts to approximately 29.2 million gallons per year, and average annual stormwater flow to the retention ponds and precipitation falling on the Salt Storage Area amounts to approximately 25.0 million gallons per year.

- Modeling by three independent methods produces seepage estimates in the range of 5.4 to 16.9 million gallons per year from the five primary seepage sources, which is equivalent to 18 to 58 percent of on-site precipitation.

- Records of discrete discharges from drilling and construction activities during the 1980s indicate that these discharges total approximately 6 million gallons, with evaporative losses further reducing the volume that these discharges may have contributed to the SSW.

- The estimated leakage from water lines providing input to the SSW is 0.22 million gallons per year, totaling approximately 4 million gallons of water line leakage since the WIPP facilities opened in 1984.

- Seepage into the Exhaust Shaft, which is a loss from the SSW, amounts to approximately 4 million gallons since seepage was detected in 1995.

The quantified water budget components show that seepage from on-site precipitation is the most significant recharge source providing input to the SSW saturated lens. To develop a valid conceptual model of the SSW, considering the uncertainties of the models and calculations, multiple analysis methods were used to obtain a range of independent results, enhancing the reliability of the overall analysis.

The potential extent of long-term SSW migration was examined by expanding the saturated flow model domain to include the 16–square-mile WIPP land withdrawal area. A two-layer model was established. The upper model layer includes the SSW perched lens in the Santa Rosa and the Gatuña. The lower model layer includes the Dewey Lake, which is the shallowest groundwater depth interval used for water supply near the WIPP boundary. If SSW migration toward the regional groundwater were to occur, the potential migration of SSW would involve downward flow from the Santa Rosa moving vertically through the unsaturated upper Dewey Lake and laterally to areas where a natural water table exists in the middle Dewey Lake. The two-layer model is conservative in that it simulates all of the Dewey Lake recharge accumulating in a saturated lens, whereas a complex system of discontinuous saturated pathways in the predominantly unsaturated upper Dewey Lake may disperse the flow and lead to less migration. The rate of downward flow from the Santa Rosa to the Dewey Lake, controlled by the vertical hydraulic conductivity, was established by a model calibration phase that matched observed SSW water levels for the 1996 to 2002 record. The calibrated model was then run for 100-year predictive simulations of SSW migration with seepage ending in either 2035 when the facility closes or in 2006 after the implementation of engineered infiltration controls.

The long-term migration model simulations indicated that the engineered seepage controls that were subsequently implemented by DOE in 2004 and 2005 would substantially reduce the extent of migration. The simulations predicted that without seepage controls, the SSW has the potential to migrate as far as the northern WIPP boundary and to the Dewey Lake saturated zone in the southwestern corner of the WIPP site near monitor well WQSP-6A over a 100-year time frame. The predictive modeling results showed that engineered infiltration controls would prevent the existing SSW saturated volume from otherwise doubling over the next 20 years if recharge were allowed to continue. The long-term migration model predicted that the infiltration controls prevent SSW migration from reaching the facility boundary within 100 years.

4. Infiltration Controls

In order to reduce or eliminate recharge to the SSW, engineered infiltration control systems were constructed over the primary recharge sources in 2004 and 2005. The infiltration controls consist of liners installed in each of the stormwater retention ponds, an impermeable cover over the Salt Storage Area, and new lined areas for salt storage and stormwater containment.

4.1.1 Stormwater Retention Ponds

Prior to construction of the infiltration controls, surface water drainage at the WIPP site consisted of four watershed areas that drain to four on-site stormwater retention ponds. The four ponds include the following:

- Salt Pile Evaporation Pond
- Detention Basin A
- Stormwater retention pond 1
- Stormwater retention pond 2

The areas of the ponds and watersheds, including the pervious and impervious areas, are summarized in Table 2. The surface conditions of the watersheds range from relatively permeable bare ground to impermeable pavement and rooftops. Three of the ponds receive relatively clean stormwater from the surface facilities, while the Salt Pile Evaporation Pond received runoff containing dissolved salt from the outer slopes of the Salt Storage Area prior to cover construction. Stormwater runoff calculations by DBS&A (2003) found that the average annual stormwater runoff for a 5-year period of record from 1997 to 2001 was 19.8 million gallons. The total runoff is divided among the four ponds as follows:

- Detention Basin A: 55.5 percent
- Salt Pile Evaporation Pond: 26.5 percent
- Pond 1: 5.0 percent
- Pond 2: 13.0 percent

Table 2. Summary of Watershed and Pond Areas

Pond	Pervious [a] Watershed Area		Impervious [b] Watershed Area		Entire Pond Area		Total Watershed Area [c]	
	ft^2	acres	ft^2	acres	ft^2	acres	ft^2	acres
Salt Pile Evaporation Pond	724,393	16.6	0	0	158,024	3.63	882,417	20.3
Detention Basin A	502,172	11.5	890,778	20.4	249,956	5.74	1,642,906	37.7
Stormwater retention pond 1	119,793	2.75	16,615	0.38	21,818	0.50	158,226	3.63
Stormwater retention pond 2	98,643	2.26	222,328	5.10	32,416	0.74	353,387	8.11
Totals	1,445,001	33.1	1,129,721	25.9	462,214	10.61	3,036,936	69.7

[a] Pervious surfaces represent bare ground, gravel, and vegetated ground conditions.
[b] Impervious surfaces represent asphalt and concrete surfaces, and rooftops.
[c] Areas adjacent to the railroad tracks are excluded from the watersheds. Little runoff is expected from these gravel surfaces, which are level or in swales without an apparent discharge point.

Past observations of the stormwater retention ponds found that water collected to a significant depth (up to a depth of 8 feet) following storm events. Water levels in the basins decrease in response to combined losses of infiltration and evaporation, but ponded water may remain for days. Eventually, the ponded water completely infiltrates and/or evaporates.

Records regarding the design and construction of WIPP facilities indicate that the ponds were constructed between 1981 and 1984. The total capacity of the ponds is designed to handle the runoff from either a 100-year/24-hour storm event (U.S. DOE, 1993) or two consecutive 10-year/24-hour storms (Westinghouse, 1992). During 1993 to 1994, design improvements were completed on Detention Basin A and Ponds 1 and 2 to provide total stormwater retention (Westinghouse, 1992). Constructed berms to the north and east of the site prevent surface water from running onto the operations area at the WIPP site (hereafter referred to as on-site) (Figure 1). Therefore, all of the stormwater collected in the retention ponds is from on-site runoff.

4.1.2 Salt Storage Area

The Salt Storage Area used in the past to receive salt mined from the WIPP underground mine workings covers an area of 18.8 acres. When placement of salt in the Salt Storage Area ended in 2004, the average height of the salt pile was approximately 30 feet. The top deck of the Salt Storage Area was sloped to drain internally with perimeter berms to contain stormwater on top of the salt pile and prevent runoff of stormwater contacting the salt. The Salt Storage Area had steep side slopes to shed stormwater to a perimeter drainage channel that routed stormwater to the Salt Pile Evaporation Pond.

Precipitation that falls on the Salt Storage Area infiltrates below the salt pile surface through extensive fractures and dissolution channels (i.e., macropores) observed on the salt pile surface (DBS&A, 2003). The halite (NaCl) contained in the Salt Storage Area is susceptible to dissolution by precipitation leaching through the salt. Based on a halite solubility constant of 38.1944 (log K_{sp} = 1.528) (Parkhurst, 1995), water saturated with respect to halite contains 133,000 mg/L sodium and 205,000 mg/L chloride, and has an approximate TDS concentration of 338,000 mg/L, depending on the exact composition of the crushed rock salt. Seepage that is near saturation with respect to dissolved halite would have a TDS concentration approximately twice as high as the highest TDS concentration measured in the main SSW lens. Seepage through the Salt Storage Area may be near halite saturation, while stormwater runoff from the side slopes would be expected to be at a fraction of halite saturation concentration.

4.1.3 Infiltration Control Systems

Infiltration control systems have been constructed to prevent recharge to the SSW due to seepage beneath the stormwater retention ponds and Salt Storage Area. Details of the infiltration control systems engineering design are shown on design drawings prepared by WTS (2005). A new lined Salt Storage Extension (SSE) has been constructed for the placement of mined salt over a lined area to prevent seepage of halite-impacted water that leaches through the salt. A new lined SSE Evaporation Pond has also been constructed to contain and prevent infiltration of stormwater runoff from the SSE. These infiltration control systems were proposed by DOE and incorporated into the groundwater discharge permit DP-831 that was approved by the NMED GWQB. In addition to the infiltration controls constructed in 2004 and 2005, a final cover was constructed over the SPDV pile in 2000. The location of these infiltration control systems is shown on Figure 1.

Table 3 provides the capacity of the lined ponds and runoff quantities and areas draining to the ponds based on information provided in the WTS request for proposals for this project. Table 4 lists infiltration controls constructed in the study area. The infiltration controls listed in Table 4 are described in further detail below.

- *SPDV Pile.* A final cover has been constructed over the SPDV pile consisting of a geosynthetic clay liner (GCL) covered by a 3-foot-thick soil layer, which serves as a soil rooting medium to support vegetative growth on the cover. The final cover is designed with slopes to shed stormwater. Efforts to revegetate the final cover with shallow-rooted plants have been successful in establishing a well-vegetated surface.

- *Detention Basin A, Pond 1, and Pond 2.* These stormwater retention ponds receive relatively fresh stormwater from on-site. Each pond has had a 60-mil high-density polyethylene (HDPE) liner installed within nearly the same pond configuration as the previously unlined pond. Detention Basin A has a spillway on the west side of the pond to allow excess water to overflow to a secondary containment basin, which is unlined.

- *Salt Storage Area.*—A final cover has been constructed over the Salt Storage Area consisting of 60-mil HDPE covered by a 3-foot-thick soil layer, which serves as a soil rooting medium to support vegetative growth on the cover. The final cover is designed to shed stormwater with a minimum 2 percent slope on the top deck and 3:1 (3 horizontal to 1 vertical) side slopes. Vegetation is nearly absent on the cover and rill erosion is evident on the side slopes. The runoff conveyance ditches around the perimeter of the Salt Storage Area have also had 60-mil HDPE liners installed, with runoff directed to the Salt Storage Evaporation Pond.

- *Salt Pile Evaporation Pond.* The Salt Pile Evaporation Pond previously received runoff from the uncovered Salt Storage Area, but now receives relatively fresh stormwater after

Table 3. Infiltration Control Ponds and Runoff Volumes

Evaporation Pond	Drainage Area (ft^2)	Runoff Volume for Design Storm [a] (gallons)	Pond Capacity [b] (gallons)
Salt Pile Evaporation Pond	690,100	1,677,633	5,506,989
Salt Storage Extension Evaporation Basin	1,047,800 [c]	2,547,202 [c]	4,170,732
Pond A	1,642,199	3,992,186	6,670,940
Pond 1	178,595	434,163	813,925
Pond 2	387,681	942,452	2,447,692

[a] Runoff volumes are calculated for a 25-year/24-hour design storm event of 3.90 inches assuming 100% runoff and including the volume that falls onto the surface area of the pond.
[b] Capacity is the maximum capacity without any freeboard.
[c] Current configuration with only Cell A has a drainage area of 538,000 square feet (ft^2), runoff volumes for the 3.90-inch rainfall event is 1,307,878 gallons.

Table 4. Infiltration Controls

Infiltration Control	Completion Date [a]	Liner/Cover
SPDV pile final cover	2000	GCL cover with 3-foot soil rooting medium
SSE evaporation pond liner	January 2004	HDPE geomembrane liner
SSE liner	February 2004	HDPE geomembrane liner
Salt Storage Evaporation Pond liner	July 2004	HDPE double geomembrane liner with leak detection system
Salt Storage Area cover	July 2004	HDPE geomembrane cover with 3-foot soil rooting medium
Salt Storage Area runoff ditches	January 2005	HDPE geomembrane liner
Pond 1 liner	January 2005	HDPE geomembrane liner
Pond 2 liner	January 2005	HDPE geomembrane liner
Detention Basin A liner	July 2005	HDPE geomembrane liner

[a] Completion dates from U.S. DOE (2008) and Roush (2008)
SPDV = Site and Preliminary Design Validation
GCL = Geosynthetic clay liner
SSE = Salt Storage Extension
HDPE = High-density polyethylene

the Salt Storage Area has been covered. The Salt Pile Evaporation pond has had a 60-mil HDPE liner installed within nearly the same pond configuration as the previously unlined pond.

- *Salt Storage Extension.* The SSE has been constructed with a 60-mil HDPE liner covered by a 200-mil geonet and a 2-foot protective soil layer. The liner is constructed on a 2 percent slope and the geonet conveys any fluid on the liner to a sump that discharges to the SSE Evaporation Pond. The SSE includes Cell A, which has been constructed, and Cell B, which will be added in the future. The SSE liner is seamed directly to the Salt Storage Area cover along the north side slope of the cover.

- *Salt Storage Extension Evaporation Pond.* The SSE Evaporation Pond receives stormwater runoff from the SSE and water that is conveyed to the SSE liner sump. The water managed in the pond is highly saline, and has contacted halite in the SSE. The SSE Evaporation Pond has a double liner consisting of two layers of 60-mil HDPE with a 200-mil geonet between the liners to convey any leakage through the primary liner to a sump on the secondary liner. The liner is constructed on a 2 percent slope to convey water to the sump. Primary liner leakage in the sump is pumped back to the pond when detected.

The infiltration controls that have been constructed have eliminated the major sources of recharge to the SSW. The infiltration controls have now been in place for three years, preventing continued input to the SSW saturated lens that would have occurred had the controls not been put in place.

4.1.4 Design, Operation, and Maintenance

The infiltration control systems were designed in a manner that requires ongoing operation to manage stormwater. Based on the groundwater discharge plan (DP-831), the stormwater ponds were designed to meet the following design capacity requirements (U.S. DOE, 2003):

- Salt Pile Evaporation Pond and SSE Evaporation Pond

- Designed to contain a 25-year, 24-hour design storm event
- Designed for full retention of stormwater by an inflow/evaporation water balance based on average annual precipitation

- Detention Basin A, Pond 1, and Pond 2
  - Original unlined ponds designed with capacity to store two 10-year, 24-hour storm events
  - Lined ponds appear to have been designed to contain 25-year, 24-hour storm
  - Calculations of an inflow/evaporation water balance not provided in the discharge plan

Detention Basin A, Pond 1, and Pond 2 each have liners that were constructed within nearly the same footprint area as the original unlined ponds. The capacity and surface area of these ponds do not provide for complete evaporation of the stormwater. Monthly pond inspection records indicate that the ponds have been near capacity during the recent years of above-average precipitation (U.S. DOE, 2004-2008).

Stormwater is managed in Detention Basin A, Pond 1, and Pond 2 by pumping between the ponds using temporary water lines and portable pumps. Water is removed from the ponds and pumped to irrigate the surface of the final cover on the Salt Storage Area. Irrigation is used both to manage stormwater and to aid efforts to revegetate the final cover.

Vegetation is nearly absent on the Salt Storage Area final cover. As a result, erosion repair on the cover has been an ongoing maintenance need. The absence of vegetation also reduces the amount of stormwater that can be applied to the cover through irrigation. Without vegetation, water applied to the soil surface is lost through evaporation only. Much more water is removed from the system with plant growth on the cover because the plants remove water from the cover soil and release it to the atmosphere through transpiration.

Due to the high precipitation rates since 2005 and limits on capacity to manage stormwater in Detention Basin A, Pond 1, and Pond 2, overflows have been experienced at the spillway from

Detention Basin A (Roush, 2008). These overflows discharge to the small secondary containment basin west of Detention Basin A; this secondary containment basin is unlined, allowing for a limited amount of stormwater infiltration and recharge to the SSW.

5. Hydrologic Assessment Methods and Results

This section describes the hydrologic assessment methods and results, providing details for each of the project components identified in Section 2, including the following:

- Database compilation
- Time-series analysis using hydrographs
- Water level contour maps
- Water quality contour maps
- Geochemical analysis
- Moisture redistribution calculations

5.1 Database Compilation

A comprehensive database was organized to evaluate and present data on the SSW. DBS&A obtained a series of Microsoft Excel spreadsheets from WTS containing data potentially relevant to evaluation of the SSW. The data were organized in a central Microsoft SQL database following standard procedures developed by DBS&A to enable efficient evaluation and presentation of environmental data. Site documents obtained from WTS and from DBS&A's files from prior work were used to supplement and spot check the data for any potential problems or omissions due to the fact that the spreadsheets may not have all been originally intended for construction of a database. The types of data provided included the following:

- Water chemistry
- Water level measurements
- Geology
- Precipitation
- Survey coordinates

The water chemistry data provided in WTS spreadsheets were supplemented with details provided in available reports, including measurements of field parameters, sampling techniques that could potentially affect laboratory results, and laboratory qualifiers. The spreadsheets provided list laboratory qualifiers for most analytes, but not for TDS, chloride, sulfate, total inorganic carbon, or silicon. Water quality reports from 1998 and 1999 indicate that some of these data had been previously rejected according to criteria established by Westinghouse. These data were retained in the database and flagged with an R qualifier. The set of qualifiers reported with data from Wastren laboratory are not uncommon, but also are not universally recognized; that is, the B, E, and N qualifiers are defined differently by many other laboratories. Therefore, each qualifier was translated to a corresponding qualifier used by the U.S. Environmental Protection Agency (EPA) or to a custom qualifier with a definition provided in a separate table.

Compiling the water level elevation data in a central database provided a continuous time-series of data from multiple files and reconciled vertical elevation data that had historically been referenced to more than one datum. The majority of water level measurements were reported as elevations referenced to an early survey using the NGVD 29 datum. Therefore, more recent water level and geology data referenced to an October 2007 survey using the NAVD 88 datum were adjusted according to WTS protocol to be consistent with older data on the NGVD 29 datum. Data for horizontal coordinates were not adjusted for smaller differences on the order of one-tenth of a foot between the different surveys.

Geologic data were included in the database primarily to assist in calculation of hydraulic head above perching horizons; the data were therefore limited to elevations of these horizons relevant to the SSW assessment. Depths in the geology table were checked against boring logs.

Precipitation data in the database included monthly totals for the WIPP meteorological station; higher-resolution site data and monthly data from the Carlsbad FAA Airport station were considered but not included in the database. Precipitation data were compared to records for the WIPP station posted online by the Desert Research Institute (WRCC, 2008). The online precipitation data included a longer historical record with additional details; specifically, it listed any days missing from the record in a given month. In cases where the online data differed from data provided by WTS (apparently due to WTS having a more complete record in recent years), the data provided by WTS were assumed to be more reliable.

Complete water quality data for the full period of record since 1996 are presented in Appendix B. Water level data are presented in the hydrographs provided in Appendix C. The geologic contact elevations, based on well logs for the SSW monitor wells, are also provided on the hydrographs in Appendix C. Precipitation summary results are presented in Figure 3, and a more complete data set of monthly and annual precipitation totals is provided on the hydrographs in Appendix C.

5.2 Time-Series Analysis

A time-series analysis was completed to examine water level trends for each of the SSW monitor wells. Water level hydrographs were plotted showing the record of water level fluctuations based on regular water level measurements that have been performed on all monitor wells since their installation. Also plotted on the hydrographs are additional data including the following:

- Monthly precipitation totals from the WIPP weather station
- TDS concentration
- Elevation of the Santa Rosa/Dewey Lake contact and top of Santa Rosa
- Monitor well screened interval

The data plotted on the hydrographs allow the water level elevation to be seen in relation to the saturated thickness above the Santa Rosa/Dewey Lake contact. In some cases, the water level elevation rises into the Gatuña. The hydrographs include data needed to evaluate changes in water levels in comparison to precipitation rates and fluctuations in TDS concentration.

Hydrographs for each of the SSW monitor wells are included in Appendix C. Select hydrographs are provided in Figures 11 through 16. The SSW water levels appear to correlate with precipitation rates over the 12-year period of record.

Water levels were observed to rise significantly in the SSW monitor wells during the first years of record, from 1996 to 1998. The first 15 SSW monitor wells were installed in 1996 and 1997. In 1997, when the total annual precipitation (23.91 in/yr) was nearly twice the average annual precipitation (13.24 in/yr at the WIPP weather station), SSW water levels increased sharply. In contrast, during the ensuing years from 1999 to 2004, when the total annual precipitation was below the WIPP station average (Figure 3), water levels remained fairly constant in most monitor wells. From 1999 to 2004, some wells show gradual rising or falling trends. In 2005, a strong water level rise was observed in many of the wells, after which water levels again leveled out in 2006 and 2007. The water level rise in 2005 follows a year of heavy precipitation in 2004, when the annual precipitation was 23.78 inches. Early 2005 also had heavy precipitation (6.78 inches from January through May 2005) at the time of year when precipitation rates are typically low. The most recent monitoring event included in the database, the June 2008 event, indicated a decline in water levels in most wells.

The hydrograph for monitor well C-2505 (Figure 11) is a typical example that illustrates the general trends observed in most monitor wells. Water levels were rising quickly in 1996 and 1997, shortly after the first monitor wells were installed. The water level declines gradually from 1999 to 2004, followed by a sharp water level rise in 2005. The plot of TDS concentrations shows that the SSW salinity tends to be highly variable. The TDS concentration varies from approximately 3,000 to 13,000 mg/L, with an apparent correlation between low TDS concentrations during times of increasing water levels and higher TDS concentrations when water levels are constant.

The rise in water levels observed in 2005 occurs in the same time frame during which the infiltration control systems were being constructed to stop recharge from the four original stormwater ponds and the Salt Storage Area. The infiltration controls for these areas were completed from July 2004 to July 2005. The infiltration controls presumably prevented some recharge from occurring as a result of the heavy precipitation period in 2004 and early 2005. However, the largest recharge source, Detention Basin A, was the last area to be lined in July 2005. The response to recharge occurring in 2004 and 2005 is evident in the hydrograph trends. The strongest water level increase in 2005 is observed in monitor wells PZ-10 (Figure 12) and PZ-12, located near the stormwater retention ponds that remained unlined during 2004. The 2005 water level rise is moderate in most monitor wells in the main SSW lens and is least pronounced in the northernmost wells, PZ-09 (Figure 13) and PZ-11.

Other notable features of the hydrographs include the following:

- *C-2811* (Figure 14): A steady water level rise has been observed in monitor well C-2811 since its installation. This trend suggests that the saturation observed in this well may be connected to the SSW. The rising water level is consistent with the conceptual model of the SSW lens gradually spreading out, increasing the saturated thickness at C-2811 approximately 1,300 feet south of the nearest SSW monitoring location, PZ-12 (Figure 4). Monitor well C-2811 was drilled in March 2001. Saturation was encountered in the upper Dewey Lake at a depth of approximately 60 feet bgs (Powers, 2002). According to Powers (2002), the Dewey Lake encountered at C-2811 was not saturated during drilling of earlier wells nearby. The water level in C-2811 has risen 12 feet since its installation.

- *PZ-08* (Figure 15): In March 2007, saturation was detected at monitor well PZ-08 for the first time since monitoring began in 1996. By March 2008, the water level in this monitor well had risen 4 feet. Like at monitor well C-2811, the detection of saturation and rising water level in PZ-08 is consistent with the conceptual model of the SSW lens gradually spreading out, increasing the saturated thickness at PZ-08.

- *PZ-15* (Figure 16): The water level elevation at monitor well PZ-15 is higher than at any of the other SSW monitor wells. This saturated zone exists in the Gatuña, perched above the Santa Rosa. The water level at PZ-15 suggests that this saturated zone is not directly connected to the main SSW lens encountered by the first 12 PZ-series wells and the 3 C-series wells.

5.3 Water Level–Precipitation Cross Correlation Analysis

Cross correlation analysis was used to quantitatively examine the relationship between monitor well water levels and precipitation. Cross correlation is a statistical measure of the degree of correlation between two series. Given two time-series, each consisting of a sequence of observations of some variable measured at successive, uniform intervals, an intuitive measure of their correlation is given by multiplying the series point-by-point and summing the results. If the series are well correlated, the result will be large and positive. If they are well correlated but opposite in sign (i.e., negatively correlated), the result will be large and negative. If they are uncorrelated, the agreement and disagreement of the signs will be random and the resulting sum will be small in magnitude. The magnitude of the result can be scaled by the product of the standard deviation of the two series in order to facilitate interpretation of the result. Normalized this way, a resulting sum of 1 means that the series are perfectly correlated and a resulting sum of zero means that the series are completely uncorrelated. This operation can be performed for simultaneous observations from the two series, providing the "instantaneous" correlation between the observables. It can also be performed for measurements offset by one or more sampling intervals, providing the correlation between observables lagged in time. Each time the series are shifted, the number of overlapping data points is reduced by one, making it impracticable to evaluate the cross correlation at lags comparable to the total length of the series.

To perform the cross correlation operation, the time-series must have certain characteristics. The observations from each series must be simultaneous and separated by constant intervals of time. The series must be stationary—the descriptive statistics of the series (mean, variance and higher order moments) should not depend on when the measurement was made. In effect, this means that there should be no trend in the series; if there is, the trend should be removed. Series were tested for stationarity by examining their autocorrelation functions. Just as two series may be compared by their cross correlation, a series may be compared to itself using the autocorrelation. Operationally, autocorrelation is identical to cross correlation. The autocorrelation provides a means of assessing the similarity measurements of some observable to subsequent measurements. For a stationary series, the measurement of an observable at any given time should not correlate with previous measurements. This can be seen in the autocorrelation as a steep drop at lags greater than zero.

Four wells were included in this analysis, PZ-07 (adjacent to the Salt Pile Evaporation Pond), PZ-09 (immediately outside the east stormwater diversion berm), PZ-10 (adjacent to Detention

Basin A) and PZ-12 (between Pond 1 and Pond 2). Water levels measurements in these wells have been made on varying schedules since their installation. Quarterly measurements are available from September 1997 to March 2008, with the exception of December 1997, December 1998, September 1999, March 2002, June 2002, and September 2005. For these quarters, the water level was estimated by a linear interpolation of the previous and subsequent measurements. For quarters in which more than one measurement of water level was made, the average monthly water level was used. Quarterly cumulative precipitation was obtained from the WIPP meteorological station. Stationarity for both types of data was achieved by subtracting the fitted linear trend from each series. This approach was confirmed by analysis of the autocorrelation function, which showed the expected pattern (Appendix D).

Two scenarios were analyzed: (1) the unlined scenario (before construction of infiltration controls) and (2) the lined scenario (after construction of infiltration controls). The unlined scenario was defined to apply from September 1997 to June 2005. The lined scenario was defined to apply from October 2005 to March 2008. Cross correlation plots of the unlined scenario for PZ-07 and PZ-09 showed a similar pattern of the cross correlation of a negative correlation at zero lag rising to a positive sill at a lag of 3 (9 months). Cross correlation for PZ-10 was similar, though it rose to a sill value at a lag of 2 (6 months). The cross correlation of PZ-12 was positive at lag zero and rose to a sill at a lag of 1 (3 months) before falling off thereafter. The results for PZ-07, PZ-09 and PZ-10 are consistent with infiltration times of between 6 and 9 months. The cross correlation for PZ-12 shows a stronger correlation at lag zero and at 3 months, suggesting a shorter infiltration time. Analysis of the lined scenario did not provide useful results due to the short period of record and very limited dataset when evaluating cross correlation at lag times.

5.4 Water Level Contour Maps

Water level contour maps for the SSW were prepared to show water level and flow direction changes over the complete monitoring record. A series of water level maps is provided in Appendix E, illustrating approximately annual time steps. This section discusses the water level contour map preparation methods and results.

5.4.1 Water Level Density Correction

The high TDS concentrations in the SSW at many locations result in a measurable difference in the density of the SSW relative to freshwater. Given the differences in TDS across the site, the potential for a density gradient to contribute to the hydraulic gradient must be considered. Because of contrasting TDS concentrations observed in the SSW, corrections were made to the measured water levels to account for water density differences.

The concept of equivalent freshwater head was employed to account for density differences across the SSW. Equivalent freshwater head is the height of a column of freshwater with the same potential energy as the measured height of a column of brackish to briny water. The equivalent freshwater head represents the potentiometric surface that controls the flow rate and direction within a hydrologic regime with variable salinity.

To adjust the measured water level, a calculated specific gravity was multiplied by the height of the water column, yielding an equivalent freshwater head water elevation. The base of the column in each well was defined as the elevation of the surface on which the SSW is perched. In most of the wells, the surface used was the Dewey Lake/Santa Rosa contact. In the new wells PZ-13 and PZ-15, water is perched on hard layers within the Santa Rosa. Equivalent freshwater head was obtained in this case by multiplying the measured height of the column of SSW in a well by its specific gravity. The corresponding water level elevation was obtained by adding the resulting equivalent freshwater head to the elevation of the surface above which it was measured.

Specific gravity measurements were available over much of the period of record for most of the wells; however, the laboratory-measured specific gravity values were not reported for any wells after 2002, and they were not of high precision. Therefore, it was necessary to estimate specific gravity from the available data using a consistent procedure. It was assumed that specific gravity could be predicted from solute concentration alone, neglecting any variations in pressure and temperature across the site on a given date (Guo and Langevin, 2002).

Of the data available for the whole period of record, only TDS and chloride were considered predictive of specific gravity. Because most of the TDS in the SSW is attributable to halite dissolution, the concentrations of TDS, sodium, and chloride are typically dependent variables, although TDS is a more general measure of the total solute load. Sodium was generally not measured after 2002.

A site-specific relationship between specific gravity and TDS was preferred because relationships for saline water of differing quality do not reflect the exact composition and specific gravity of the SSW. High-precision measurements of specific gravity made with hydrometers are available for samples that were also analyzed for TDS and chloride in December 2001. Using the specific gravity data, plots were prepared of specific gravity versus TDS and specific gravity versus chloride. Despite temperature variation of a few degrees Celsius between the samples, the measured specific gravities were highly correlated to both TDS and chloride concentrations and produced simple linear relationships. One measured specific gravity value deviated significantly from the relationship and was rejected as anomalous and possibly a typographic error (an original data report could not be located, but rearrangement of the last two digits would have placed the value along the same line as the others). To avoid reliance on insignificant digits, and for easier comparison to literature values, the intercepts of the fitted lines were prescribed values of unity (Figure 17). The resulting equation relating specific gravity to TDS concentration was as follows:

$$SG = 1 + TDS \cdot 6.6 \times 10^{-7} \tag{1}$$

where SG = specific gravity

TDS = TDS concentration (mg/L)

The equation relating specific gravity to chloride concentration was as follows:

$$SG = 1 + Cl \cdot 1.2 \times 10^{-6} \tag{2}$$

where Cl = chloride concentration (mg/L)

WIPP SHALLOW SUBSURFACE WATER

Specific Gravity–TDS Relationship

Figure 17

Daniel B. Stephens & Associates, Inc.

9/3/08

The relationship between specific gravity and TDS concentration was retained to predict specific gravities used in calculations of equivalent freshwater head. The relationship between specific gravity and chloride concentration was useful for validation purposes because a U.S. Geological Survey (USGS) study of halite brine near Syracuse, New York (Yager et al., 2007) reported a corresponding relationship intended for use with an updated version of the variable-density flow model, SEAWAT (Guo and Langevin, 2002), that was identical to the SSW relationship within the accuracy of the results. The report did not tabulate all the data used and did not state the equation of the line, but by digitizing a plot of the line, the equation was determined to be as follows:

$$SG = 1.000001 + Cl \cdot 1.19 \times 10^{-6} \qquad (3)$$

The authors reported a coefficient of determination (R^2) of 0.988 for chloride concentrations between 0 and roughly 125,000 mg/L (Yager et al., 2007).

Upon verifying the relationship between chloride concentration and measured specific gravity for the WIPP halite-dominated water, the corollary relationship between TDS concentration and measured specific gravity was used to compute the equivalent freshwater head for each water level measurement used in preparing water level contour maps for the SSW.

5.4.2 Water Level Contour Maps

Water level contour maps were prepared using the equivalent freshwater head elevations as the basis for the potentiometric surface contours. The contour maps were generated using Surfer software to interpolate the data, without any additional interpretation or revisions. A series of 12 water level contour maps is provided in Appendix E. These maps show a time-series of water level changes at approximately 1-year time steps over the monitoring record. The frequency of water level measurements has varied over the monitoring record. Most of the contour maps reflect water level measurements collected in October or another fall month each year. Fall data were selected because this sampling time follows the period of heaviest precipitation during the summer monsoon season. During some years, data were not available for a consistent time horizon; therefore, data from other seasons are used in some of the water level contour maps. The series of maps also includes the most recent water level measurements included in the database (the June 2008 measurements).

Figures 18 and 19 show the water level contours for the first (October 1997) and last (June 2008) monitoring periods selected. The time-series of maps consistently uses the set of SSW monitor wells installed in 1996 and 1997, including C-2505, -2506, and -2507 and PZ-01 through -12, but excluding PZ-08, which was dry until 2007. The contour maps exclude monitor well PZ-08, which was dry until 2007, and monitor wells PZ-13, PZ-14, and C-2811, which are not conclusively linked by a direct hydrologic connection with the main SSW lens.

5.4.3 Direction and Rate of Flow

The series of water level contour maps shows that the potentiometric surface has remained relatively consistent from 1997 to 2008 with respect to SSW flow direction and gradient. Each of the contour maps shows a similar pattern of contours. However, water levels have consistently risen in the monitor wells by approximately 2 to 4 feet.

The water level contour maps indicate that a water table mound exists near the Salt Pile Evaporation Pond and Salt Storage Area. The SSW flow pattern suggests radial flow outward from the high point at PZ-07, with a predominantly eastward flow toward PZ-03, -05, and -09 and a predominantly southward flow toward PZ-10 and -12. In the WIPP facilities area, where most SSW monitor wells are located, the SSW flows south and east from the apex of the water table mound. Monitor well PZ-11, located approximately 200 feet northwest of the Salt Pile Evaporation Pond, suggests a gradient to the north; however, the existing monitor well locations do not provide sufficient data to clearly demonstrate the gradient and extent of the SSW to the north and west of the water table mound. The SPDV monitor wells PZ-13, -14, and -15 appear to monitor SSW that is distinct from the main SSW lens. The SPDV monitor wells do not show a radial flow pattern that is consistent with the other SSW monitor wells. Water level elevations in the SPDV monitor wells are higher than the water level at PZ-08, which is located between the SPDV wells and the main SSW lens.

JN ES08.0072

The potentiometric surface is influenced by the areas of recharge and geologic controls on flow. Previous recharge estimates found that the Salt Storage Area, Salt Pile Evaporation Pond, and Detention Basin A are the most significant recharge sources (DBS&A, 2003). SSW water table mounding would be expected in these high recharge areas. The potentiometric surface is also affected by geologic controls that include the following:

- Configuration of the irregular Santa Rosa/Dewey Lake contact that forms the perching horizon
- Other perching horizons, such as the Gatuña/Santa Rosa contact at PZ-15 and middle Santa Rosa at PZ-13
- Hydraulic conductivity of the formations where SSW occurs

The Santa Rosa/Dewey Lake contact is an erosional unconformity with an irregular surface. A contour map of the contact elevation based on contact elevations from the well logs is provided in Figure 20. The contact surface exhibits a higher ridge area between monitor wells C-2505 and PZ-10 and a lower trough area near PZ-07. The contact surface drops steeply to the south toward PZ-12. The SSW flow regime interacts with the contact surface at the top of the low-permeability Dewey Lake.

The hydraulic conductivity of the formations involved with SSW flow also influences the potentiometric surface. Pumping and slug tests performed in 1996 and 1997 indicated a lower Santa Rosa hydraulic conductivity zone in the area around PZ-01, -02, and -05 (Intera, 1996, 1997a, and 1997b). The low hydraulic conductivity in this area may play a role in the slow migration of SSW to eventually reach PZ-08 in 2007. This zone may also limit the rate of flow between the SSW and new monitor wells PZ-13 and -14 near the SPDV pile. The rate of flow to C-2811, if this well is in hydraulic connection with the SSW, is also affected by the contrasting hydraulic conductivity in the Dewey Lake potentially limiting downward flow to a saturated horizon in the upper Dewey Lake, approximately 10 feet below the Santa Rosa/Dewey Lake contact.

The water level contour map from June 2008 (Figure 19) shows that the hydraulic gradient and flow direction are variable. This variation leads to variable flow rates, with the flow rate

dependent on hydraulic gradient and hydraulic conductivity of the formation. Using the June 2008 contours, the typical hydraulic gradient is approximately 0.012 foot per foot (ft/ft) toward the southeast. A typical SSW seepage velocity can then be calculated using an effective porosity of 10 percent (DBS&A, 2003) and the geometric mean hydraulic conductivity (Intera, 1997a) of 1.5 feet per day (ft/d) for wells PZ-06, -07, -10, and -12 (located in the central portion of the site where a relatively uniform southeasterly gradient is observed). The resulting seepage velocity is 0.18 ft/d, which represents a typical SSW flow velocity for current conditions.

5.5 Water Quality Contour Maps

Water quality contour maps for the SSW were prepared to evaluate trends in water quality over the complete monitoring record. The water quality maps use TDS concentration as the indicator of SSW salinity because elevated salinity is the most significant water quality indicator for the SSW. The contour maps were generated using Surfer software to interpolate the data, with no additional interpretation or revisions. A series of water quality contour maps is provided in Appendix F illustrating approximately annual time steps, the same time steps illustrated in water level contour maps. This section discusses the water quality contour map preparation methods and results.

Figures 21 through 23 show the water quality contours for October 1997, June 2004, and June 2008 monitoring periods. These monitoring periods represent the start and end of the monitoring record, as well as the time in June 2004 when salinity reached peak concentrations. The time-series of maps uses the set of SSW monitor wells installed in 1996 and 1997, including C-2505, C-2506, C-2507, and PZ-01 through -12, but excluding PZ-08, which was dry until 2007, and excluding monitor wells PZ-13, PZ-14, and C-2811, which are not conclusively linked by a direct hydrologic connection with the main SSW lens. During early years of monitoring, from 1997 to 2002, all 14 of the monitor wells were monitored for TDS. Beginning in 2003, the number of wells monitored on a regular basis was reduced to 9; these wells were used in water quality contour maps from 2004 to 2008.

Figure 23

5.5.1 Salinity Distribution

The series of water quality contour maps shows that salinity levels are highly variable in the SSW monitor wells. TDS concentrations range from less than 10,000 mg/L to more than 200,000 mg/L. All of the SSW is characterized by high salinity, ranging from water considered brackish (TDS concentration of approximately 3,000 mg/L) to water classified as brine (TDS concentration greater than the salinity of seawater, or approximately 35,000 mg/L [National Academy of Sciences, 2008]). The highest TDS concentrations are found throughout the northern half of the WIPP facilities area and near the SPDV pile, where much of the water contains TDS concentrations exceeding 50,000 mg/L. Wells near the Salt Storage Area, Salt Pile Evaporation Pond, and SPDV pile have the highest salinity. TDS concentrations are much lower in the southern part of the WIPP facilities area, where low TDS water recharges the SSW from stormwater retention ponds. Wells near Detention Basin A, Pond 1, and Pond 2 have the lowest salinity (TDS concentrations less than 10,000 mg/L).

Salinity levels were lowest during the earliest years of monitoring from 1997 to 1998 (Figure 21). Salinity levels then increased to the highest concentrations by 2004 (Figure 22). By 2008, salinity levels declined slightly from the peak (Figure 23). Over the monitoring record, higher salinity levels in the northern part of the site gradually shift southward, in the general direction of SSW flow. The observed water table mound, centered near the Salt Pile Evaporation Pond and Salt Storage Area, causes an outward radial flow from the mound's apex, with the high-salinity plume spreading radially and increasing the TDS concentrations in wells at the periphery.

Additional water quality details can be reviewed in the monitoring data tables included in Appendix B. The data include all monitoring events. The monitoring data show that high TDS concentrations exceeding 100,000 mg/L have been measured in monitor wells PZ-03, -07, -09, and -11. The highest TDS concentration within the main SSW lens was 185,000 mg/L, measured in PZ-03 in 1999. Currently, the highest TDS concentration within the main SSW lens is 150,000 mg/L in PZ-09. The highest TDS concentration in any monitor well was 245,500 mg/L, measured in PZ-13 in 2007, although this water near the SPDV pile appears to be hydrologically separated from the main SSW lens. The lowest TDS concentrations have been measured in monitor well PZ-10, in the range of 1,000 to 3,000 mg/L. The TDS concentration in monitor well PZ-08, which was sampled for the first time in October 2007, is 15,000 mg/L. As shown in the water quality data in Appendix B and hydrographs in Appendix C, the TDS concentration in individual wells fluctuates significantly over time in many of the monitor wells.

5.5.2 Salinity Sources

The SSW water quality has the signature of halite brine, containing high concentrations of sodium (Na) and chloride (Cl). U.S. DOE (2002) indicates that the composition of the Santa Rosa and overlying sediments does not provide a mechanism to produce naturally occurring water with the high salinities observed; therefore, the SSW is likely derived, at least in part, from anthropogenic saline sources. Two potential sources of SSW salinity are the Salt Storage Area and Salt Pile Evaporation Pond, which are close to the monitor wells with the highest TDS concentrations. Monitor wells PZ-13 and -14, near the SPDV pile, also exhibit high salinity. In contrast, monitor wells near the stormwater retention ponds, which are sources of freshwater recharge, exhibit the lowest TDS concentrations. Other salinity sources associated with WIPP drilling and construction activities in the 1980s could also contribute to the SSW salinity, although the quantity of water discharges at that time were a small fraction of the SSW volume (DBS&A, 2003).

The halite (NaCl) contained in the Salt Storage Area is susceptible to dissolution by precipitation leaching through the salt. Dissolution is dependent on the rate of infiltration and the area of exposed mineral surfaces. Based on a halite solubility constant from Parkhurst (1995), water saturated with halite contains 133,000 mg/L sodium and 205,000 mg/L chloride and has an approximate TDS concentration of 338,000 mg/L, depending on the exact composition of the crushed rock salt. Seepage that is near saturation with dissolved halite would have a TDS concentration approximately twice as high as the highest TDS concentration measured in the main SSW lens. Thus, seepage from the Salt Storage Area provides a potential mechanism to generate the TDS concentrations observed in the monitor wells.

The SPDV pile received mined tailings and construction debris from the drilling of two 2,150-foot shafts and the excavation of tunnels and rooms during the WIPP design validation phase (U.S.

DOE, 2008). Based on available information, the composition of the pile is expected to be predominantly halite, with small amounts of other minerals. Other minerals possibly present include dolomite, calcite, gypsum, anhydrite, sylvite, carnallite, soda niter, and other evaporites such as polyhalite that may be present as impurities in the primary materials. The mined salt extends to approximately 5 feet bgs, where the underlying caliche is undisturbed (DBS&A, 1996). Test borings in the SPDV pile encountered multiple layers of recrystallized salt (DBS&A, 1996), implying some amount of historical infiltration.

5.5.3 SPDV Monitor Wells

Water quality in new SPDV monitor wells (PZ-13, -14, and -15) is addressed in detail in the Basic Data Report for these wells (U.S. DOE, 2008). This report also provides water quality data for monitor well PZ-08, located between the main SSW lens and the SPDV pile, which was sampled for the first time in 2007.

The SPDV wells have highly variable water quality. Monitor well PZ-13 has a TDS concentration of 245,500 mg/L, higher than any previously tested monitor well. Monitor well PZ-14 also has a high TDS concentration of 106,000 mg/L. In contrast, monitor well PZ-15, which is screened in a saturated zone in the lower Gatuña, has a low TDS concentration of 2,060 mg/L.

U.S. DOE (2008) has evaluated the water quality in the SPDV monitor wells and concluded that the water encountered in PZ-13 and -14 has a geochemical association with minerals in the SPDV pile. It appears that this water is the result of infiltration through the SPDV pile and is not associated with the main SSW saturated lens. The water encountered in PZ-15 has a much lower TDS concentration and is associated with recharge that has not been significantly affected by mineral dissolution.

5.6 Water Chemistry and Monitoring

The SSW water chemistry was evaluated to determine the distinguishing characteristics of the water and to examine relationships between the monitor wells and potential salinity sources. Using Geochemist's Workbench software, the following analyses were completed:

- The cation/anion charge balance was calculated for individual samples.
- Saturation indices were calculated for major minerals.
- Durov plots were prepared to display water chemistry characteristics and variability.

5.6.1 Charge Balance

Water chemistry calculations of charge balance accounting, using the major cations and anions to examine the balance between positive and negative charges, produced results generally similar to calculations provided by WTS. The SSW monitor well water quality data produce charge balances reasonably near to neutrality; greater than 95 percent of the SSW data had deviations less than 5 percent, and all of the SSW data had deviations less than 10 percent, with the exception of a single sample from PZ-02, which was previously rejected. Monitor well WQSP-6A had multiple samples in which measured ion concentrations had large deviations from neutrality. WTS had previously employed criteria requiring charge balance within 5 percent of neutrality for screening the data; however, none of the data were rejected from consideration in the interpretations that follow.

The Geochemist's Workbench software was used to calculate a TDS concentration based on the concentrations of the individual dissolved constituents. The method adjusts the ion values to achieve charge balance before calculating the TDS concentration. Comparison of the calculated TDS values with measured TDS values showed that, on average, the measured TDS values were significantly higher, which could reflect suspended sediment in the samples. Samples collected prior to the initiation of low-flow sampling techniques around 2000 may be more susceptible to the effects of suspended sediment.

5.6.2 Saturation Indices

Saturation indices were calculated for the water quality at each monitor well to classify the water quality and mineral dissolution from recharge sources. Geochemist's Workbench was used to calculate saturation indices for major minerals by determining activity coefficients for each major ion in solution.

The highest TDS concentrations in the SSW are associated with high sodium and chloride concentrations indicative of halite dissolution. SSW is undersaturated with respect to halite in all of the wells. Typical halite saturation indices are 1 to 5 orders of magnitude below saturation (saturation indices –1 to –5), except in PZ-13, which is still below saturation (saturation index -0.6).

In parts of the SSW where TDS concentrations transition to lower values, the contribution of halite to the water quality becomes somewhat less dominant, and the concentrations of calcium, magnesium, and sulfate account for an increasing share of the solute load. Gypsum and anhydrite are close to saturation in places but generally undersaturated in the SSW. Calcite and dolomite are close to saturation or supersaturated in some samples.

5.6.3 Durov Plots

Durov plots were prepared to display water quality characteristics of major cations and anions, TDS, and pH. These water chemistry trends are illustrated by the Durov plots in Figures 24 and 25. Figure 24 presents all of the historical data for events where complete sets of cation and anion measurements are reported. Most of the carbonate species were reported as total inorganic carbon. Figure 25 presents "representative" data for each well for ease of comparison. The representative samples are defined as those with sulfate and chloride concentrations near the median values for each well, as these analytes capture most of the historical variability for each well. Dates are variable for the representative samples because complete datasets are available for only periodic samples.

WIPP SHALLOW SUBSURFACE WATER

Durov Plot of Representative Water Chemistry

Figure 25

Daniel B. Stephens & Associates, Inc.
8-25-08 JN ES08.0072

The data in Figures 24 and 25 plot along straight lines in the triangular cation and anion spaces. The anion data fall along the axis between chloride and sulfate, showing little relative contribution from the carbonate species (even though the SSW is saturated with respect to carbonate minerals). The cation data show varying contributions of sodium plus potassium and of a roughly 1:1 mixture of calcium and magnesium.

Monitor well WQSP-6A, a distant well screened in the middle Dewey Lake, is a notable exception to the general water quality trends. At this well, water is perched above the sulfate cementation zone in the middle Dewey Lake. The relatively high proportions of calcium and sulfate in the samples indicate that the water may have dissolved secondary sulfate minerals in the Dewey Lake, or that it may have followed a distinct pathway through a zone containing gypsum or anhydrite. The finding that WQSP-6A is distinguished by higher proportions of calcium and sulfate, as well as relatively low TDS concentrations, demonstrates the potential ability of cation and anion measurements to distinguish SSW from other sources of water or to predict characteristics of hypothetical mixtures of SSW and other waters.

On the other hand, the ion data do not distinguish monitor well C-2811 from nearby SSW wells. C-2811 is screened in the upper Dewey Lake, and it remains uncertain whether it is in direct hydrologic connection with the SSW. The consistency of C-2811 water quality with that of other SSW monitor wells suggests that the water may be connected. The TDS concentration in C-2811 does not exhibit any obvious relationship to the well hydrograph, which has been continuously rising over the period of record (Figure 14).

The central square space in the Durov plots in Figures 24 and 25 shows a trend across the site of halite-dominated water mixing with water containing a higher proportion of calcium, magnesium, and sulfate. The rectangular TDS space shows a trend across the site in the overall solute load corresponding to the compositional trend in the central space. The only exception is the sample from PZ-15, which is dominated by halite dissolution, but has relatively low TDS concentration. PZ-15 is the only well that is screened in the Gatuña; therefore, the water quality in PZ-15 is not determined by water quality elsewhere in the SSW. The PZ-15 sample also had a distinct, possibly anomalous pH that appears to have been measured in the laboratory. Degassing of carbon dioxide from a water sample during handling and holding may result in a rise in pH of roughly one-half standard unit, but PZ-15 would still have a relatively high pH after adjusting for such a shift. The sample's carbonate alkalinity was reported to be twice that of its total alkalinity, indicating unusually high uncertainty in the data. This new well will be subject to additional monitoring to confirm the water quality data.

5.7 Moisture Redistribution Calculations

It is expected that there will be some time before the construction of infiltration control systems at the former SSW recharge sources causes noticeable changes to the SSW conditions. The surficial sediment and formations that make up the vadose zone beneath the recharge sources will initially have a high moisture content that will gradually drain to lower moisture content after the source of recharge from the surface is removed. This moisture redistribution is also referred to as draindown or transient drainage. The moisture redistribution rate was calculated in order to estimate the duration and magnitude of continued moisture input to the SSW even after the infiltration controls were constructed in 2004 and 2005.

In the WIPP water budget analysis presented by DBS&A (2003), hydrologic modeling was performed to examine the effects of implementing seepage controls. This modeling assumed that moisture redistribution or transient drainage would continue for at least one year after implementing infiltration controls. Predictive modeling simulations found that implementing infiltration controls would lead to a gradual response in declining SSW water levels. The primary benefit of implementing the infiltration controls is prevention of continued recharge, which was predicted to more than double the SSW saturated volume over the WIPP operating period to 2035.

This section presents the methods used to calculate moisture redistribution in the vadose zone beneath the stormwater retention ponds and in the Salt Storage Area and underlying vadose zone following construction of infiltration controls. The calculation method presents a range of results to better understand the processes and likely duration of moisture redistribution. However, uncertainties regarding untested unsaturated flow properties of the vadose zone and salt pile materials prevent definitive quantification of results. Within the range of results, reasonable values were selected for hydraulic parameters to develop a likely best estimate for vadose zone moisture redistribution rates based on available information.

5.7.1 Calculation Method

The moisture redistribution calculation method follows the method presented by Stephens (1996) based on Mualem's equation for unsaturated flow. The calculation assumes that there is one-dimensional downward flow under a gravitational unit gradient for a uniform moisture content across the depth profile. A spreadsheet calculation was set up to calculate residual drainage at daily or hourly time steps over a 5-year duration. Details of the calculation spreadsheet and results are provided in Appendix G.

The rate of water flow in unsaturated porous media is governed by a form of Darcy's equation for unsaturated flow, as follows:

$$Q = -K_\theta \, A \, (dh/dz) \, C \tag{4}$$

where Q = volumetric discharge (gallons per minute [gal/min])

K_θ = unsaturated hydraulic conductivity (cm/s)

A = area across which flow occurs (i.e., seepage area) (acres)

dh/dz = drainage gradient, assumed equal to –1 under gravity flow (dimensionless)

C = constant for unit conversions

The results of this calculation, included in Appendix G, provide the flow rate of transient drainage, expressed in terms of gallons per minute, and the total quantity of drainage over a 5-year duration, expressed in terms of acre-feet.

In soil or rock materials, the unsaturated hydraulic conductivity (K_θ) is less than the saturated hydraulic conductivity. In the calculation spreadsheets, K_θ is recalculated at daily or hourly time steps as the moisture content decreases.

Mualem's equation calculates unsaturated hydraulic conductivity based on the change in hydraulic conductivity that occurs with changing moisture content. In this equation, the unsaturated hydraulic conductivity is expressed relative to the pressure potential of the pore water, as follows:

$$K_r(\psi) = \frac{\left\{1 - |\alpha_v \psi|^{N-1}\left[1 + |\alpha_v \psi|^N\right]^{-m}\right\}^2}{\left[1 + |\alpha_v \psi|^N\right]^{m/2}} \tag{5}$$

where K_r = relative hydraulic conductivity (cm/s)

Ψ = calculated pressure potential, negative in unsaturated zone (cm)

α_v = van Genuchten fitting parameter (cm^{-1})

N = van Genuchten fitting parameter (dimensionless)

m = 1-1/N (dimensionless)

The fitting parameters in this equation (α_v and N) are derived from moisture retention (θ–Ψ) curves from laboratory test results. Based on theoretical models of the porous medium, van Genuchten (1978 and 1980) developed a solution for calculating conductivity based on the following equation that must be fitted to the measured moisture retention curve:

$$S_e = \left[1 + |\alpha_v \psi|^N\right]^{-m} \tag{6}$$

where S_e = effective saturation (dimensionless)

The effective saturation is expressed as follows:

$$S_e = \frac{\theta - \theta_r}{\theta_s - \theta_r} \tag{7}$$

where θ = volumetric moisture content (dimensionless)

θ_r = residual moisture content, from laboratory results (dimensionless)

θ_s = saturated moisture content, from laboratory results (dimensionless)

The moisture redistribution calculation uses hydrologic parameters that are representative of the vadose zone and salt pile characteristics where unsaturated residual drainage occurs. In order to consider the sensitivity of input parameters and examine a range of possible moisture redistribution results, hydrologic parameters were selected for cases outside the expected range of most likely material properties. Hydrologic parameters for unsaturated materials were selected from standard values reported in Carsel and Parrish (1988). This reference includes a compilation of soil unsaturated flow hydrologic parameters from test results on numerous soil samples exhibiting a broad spectrum of material properties, from fine-grained to coarse-grained soils.

The moisture redistribution calculation uses van Genuchten parameters that were initially selected based on the parameters used to represent vadose zone materials in the 2003 water budget analysis (DBS&A, 2003). The vadose zone is comprised primarily of Gatuña sediments, which consists of silt, sand, and clay that is moderately hard, forming sandstone and interbedded siltstone layers. The hydrologic parameters selected as the best fit for the Gatuña are based on a sandy clay loam soil. Other materials selected for sensitivity analysis calculations include silt, clay loam, clay, and sand. These materials represent finer- and coarser-grained characteristics than the representative sandy clay loam. Table 5 provides the unsaturated flow parameters selected for each material type.

Table 5. Unsaturated Flow Parameters Used in Moisture Redistribution Calculations

Unit Parameters	Gatuña Formation	Additional Material Types			
Material Type	*Sandy clay loam*	*Silt*	*Clay loam*	*Clay*	*Sand*
K_{sat} (cm/s)	3.63×10^{-4}	6.94×10^{-5}	7.22×10^{-5}	5.56×10^{-5}	8.25×10^{-3}
α	0.059	0.016	0.019	0.008	0.145
N	1.48	1.37	1.31	1.09	2.68
θ_s (v/v)	0.39	0.46	0.41	0.38	0.43
θ_r (v/v)	0.100	0.034	0.095	0.068	0.045

K_{sat} = Saturated hydraulic conductivity
cm/s = Centimeters per second
α = Fitting parameter
N = Fitting parameter
θ_s = Saturated moisture content
v/v = Volume per volume
θ_r = Residual moisture content

The calculation spreadsheets in Appendix G were set up to account for the physical properties of moisture redistribution conditions in the vadose zone at WIPP beneath the former recharge sources after infiltration controls were implemented. The total area of the stormwater recharge ponds is approximately 10.6 acres, with the vadose zone thickness approximately 30 feet between the pond bottom and the SSW water table. The Salt Storage Area covers approximately 18.8 acres, where the salt pile is approximately 30 feet thick and the vadose zone below is approximately 35 feet thick above the SSW water table. The moisture redistribution calculation determines the residual drainage from these profiles and calculates the total drainage quantity and the quantity of water that remains in the profile after 5 years.

The initial moisture content of the vadose zone profile is a variable that has not been tested. Beneath the stormwater retention ponds, recharge rates of 1 to 30 feet per year (ft/yr) are estimated to occur (DBS&A, 2003). Therefore, a relatively wet vadose zone profile is expected. The initial moisture content beneath the ponds was set at 90 percent of saturation in the calculation. Within and beneath the Salt Storage Area, relatively high recharge rates of approximately 0.5 to 1 foot of water per year have been estimated (DBS&A, 2003). Therefore, the initial moisture content in the salt and underlying vadose zone was set at 80 percent of saturation. Residual drainage brings the moisture content toward a residual moisture content, below which moisture is retained in the porous medium and moisture movement becomes very slow. The residual moisture content is based on values published by Carsel and Parrish (1988) as shown in Table 5. As a check on the calculation sensitivity to the initial moisture condition, calculations were also performed for initial moisture contents set at 60 percent and 30 percent of saturation.

5.7.2 Calculation Results

The moisture redistribution calculation spreadsheets provided in Appendix G include the following information:

- Input parameters
- Initial water storage volume in the profile (acre-feet [ac-ft])
- Total water drainage after 5 years (ac-ft)

- Residual water storage after 5 years (ac-ft)
- Initial and final moisture content (percent)

The full spreadsheets include thousands of calculations at daily or hourly time steps. The spreadsheets in Appendix G show only the initial five time steps and the final time step. The results sum up the total outflow from the profile at the end of 5 years.

The results of the moisture redistribution calculations are summarized in Table 6, which shows all of the residual drainage results for each case of initial moisture content at 30, 60, 80, and 90 percent.

The results show a wide range of drainage responses depending on the material type and initial moisture. Many of the cases tested show significant drainage over a period of months to years. The material type controls the drainage behavior, with sand rapidly draining large quantities of water while very little drains from the clay profile. The other soil types produce intermediate results. For each case tested, Appendix G includes a graph of changes in moisture content and discharge flow rate over time. These graphs show that drainage generally begins rapidly and then slows to a low rate of drainage after a period of time. The coarser-grained materials drain rapidly, while the fine-grained materials drain very little in 5 years.

Table 6. Moisture Redistribution Calculation Results

Initial Moisture Content (%)	5-Year Residual Drainage (acre-feet)				
	Sandy Clay Loam	Silt	Clay Loam	Clay	Sand
Redistribution Beneath Stormwater Ponds					
30	1.31×10^{-5}	0.004	8.84×10^{-8}	5.93×10^{-20}	21.2
60	6.98	3.02	0.316	1.44×10^{-6}	62.2
80	29.4	20.4	9.44	2.20×10^{-2}	89.6
90	41.7	33.8	20.68	0.913	103.3
Redistribution Within and Beneath the Salt Storage Area					
30	1.31×10^{-5}	0.004	8.84×10^{-8}	5.93×10^{-20}	68.0
60	10.6	3.41	0.316	1.44×10^{-6}	225.1
80	78.7	37.3	14.8	2.20×10^{-2}	330.1
90	124.5	78.3	45.9	1.01	382.7

The following sets of conditions are likely to be representative of actual field conditions:

- Vadose zone below stormwater retention ponds
  - Sandy clay loam
  - Initial moisture 90 percent of saturation

  The initial moisture content is 0.35, which drains to a moisture content of 0.22 after 5 years. The moisture content changes very slowly after 5 years, although the moisture content is still well above the residual moisture content of 0.10 set in the equation (Carsel and Parrish, 1988). Of the initial 79.9 ac-ft of moisture available for drainage in the profile, 41.7 ac-ft drains out of the profile in 5 years.

- Salt Storage Area and underlying vadose zone
  - Sandy clay loam
  - Initial moisture 80 percent of saturation

  The initial moisture content is 0.31, which drains to a moisture content of 0.25 after 5 years. Of the initial 259 ac-ft of moisture available for drainage in the profile, 78.8 ac-ft drains out of the profile in 5 years.

Because the Salt Storage Area covers a larger area and has a thicker vadose zone profile than the stormwater ponds, the overall drainage is 2 to 3 times greater. The moisture in the profile within and below the Salt Storage Area is likely to be near saturation with respect to halite dissolution as it leaches downward through the salt. Therefore, a substantial additional input of sodium and chloride to the SSW may be expected for a period of time after the final cover was constructed over the Salt Storage Area. The amount of highly saline drainage is expected to exceed the amount of relatively fresh drainage beneath the stormwater ponds.

Although significant uncertainties exist with the moisture redistribution conditions because laboratory testing of unsaturated hydrologic properties and initial moisture content are unavailable, the calculation results frame the conditions that may be expected. Drainage is expected to occur over a period of months to years. The total drainage quantity is expected to be on the order of tens of ac-ft to more than 100 ac-ft. Based on likely parameters that are representative of field conditions, a total of approximately 120 ac-ft of drainage occurs. It has been 3 years since the infiltration controls were completed (in 2005). Under all cases tested, most of the rapid transient drainage should have occurred by this time, with drainage reaching slow rates (but continuing) beyond three years.

5.7.3 Transient Drainage Impact on SSW

The transient drainage that redistributes downward from the vadose zone beneath the infiltration controls provides a significant water addition to the SSW. The effect on the SSW was estimated based on the most likely case for drainage calculated to represent field conditions.

When water drains from beneath the former recharge areas, the water reaches the water table of the SSW, causing the water table to rise and saturating a greater volume of the previously unsaturated Santa Rosa. The amount of water level rise depends on the amount of drainage, as well as the formation hydrologic properties, including the following:

- Porosity
- Initial moisture content
- Hydraulic conductivity

DBS&A (2003) reported that few data are available on porosity and moisture content of the Santa Rosa. Porosity of the Santa Rosa in the vicinity of the WIPP site is reported from a pumping test of a supply well in the Santa Rosa (Nicholson and Clebsch, 1961), which indicated an average porosity of 13 percent. No test data are available on the Santa Rosa initial moisture content at the WIPP. Assuming this average 13 percent porosity and a residual moisture content of 3 percent (23 percent saturation), saturation in the SSW zone would be achieved when the remaining porosity of 10 percent is filled by additional water. Despite uncertainties, filling 10 percent porosity to bring the unsaturated sandstone to saturation is a reasonable assumption, regardless of the absolute value of porosity.

An estimate was calculated for the SSW water table rise based on the likely case of 120 ac-ft of water addition. The SSW volume has been previously estimated at between 108 and 315 million gallons (331 to 966 ac-ft), covering 150 to 520 acres. Thus, the transient drainage adds approximately 12 to 33 percent additional water to the SSW. The transient drainage can be expected to first affect the central portion of the SSW saturated lens, before spreading radially toward the perimeter of the lens. The estimated water table rise from 120 ac-ft of transient drainage is as follows:

- 8 feet of water table rise over the 150-acre immediate area
- 2 feet of water table rise over the 520-acre SSW lens

These estimates contain significant uncertainties, but show that based on reasonable assumptions, a significant water table rise can be expected following construction of the infiltration controls. The water table rise may take place over a period of 3 to 5 years before the transient drainage slows to low rates. Even after the transient drainage slows, water levels may continue to rise in monitor wells some distance from the former recharge sources as the water table rise in the SSW saturated lens propagates radially outward.

6. Summary and Conclusions

This hydrologic assessment of SSW at WIPP provides an update to previous SSW investigations, including recent monitoring data, and examines the effects of infiltration controls that have been implemented to halt recharge to the SSW. The purpose of the SSW hydrologic assessment is to support WIPP regulatory compliance efforts and provide a basis to understand the efficacy of actions to control and monitor the SSW.

Through an analysis of the SSW hydrology and geochemical conditions, the hydrologic assessment refines the conceptual model of the SSW hydrologic system. The hydrologic assessment considered the complete monitoring record from before and after implementation of infiltration controls to evaluate the impact of the infiltration controls with regard to SSW water quality and quantity. A comprehensive database was assembled for the hydrologic assessment to bring together all of the relevant SSW monitoring data from 1996 to 2008. The database was used to analyze trends in water quality over time and compare conditions before and after infiltration control systems were put in place in 2004 and 2005.

6.1 Infiltration Control Systems

In order to reduce or eliminate recharge to the SSW, engineered infiltration control systems have been constructed for all WIPP stormwater retention ponds and salt storage areas. The infiltration controls include the following:

- Salt Pile Evaporation Pond liner
- Detention Basin A liner
- Stormwater retention pond 1 liner
- Stormwater retention pond 2 liner
- SPDV pile cover
- Salt Storage Area cover
- SSE liner
- SSE Evaporation Pond liner

These liners and covers should be effective at halting the SSW recharge that has occurred in the past from these sources. In particular, infiltration of saline water that has contacted salt through leaching or runoff will be virtually eliminated. Past modeling of infiltration controls has shown that the infiltration controls will prevent the SSW saturated volume from more than doubling over the upcoming years of WIPP operation. However, the infiltration controls will not eliminate the existing SSW lens, which will persist in the Santa Rosa and potentially migrate laterally or downward into the Dewey Lake. The hydrologic assessment examined SSW monitoring data to consider the effects of the infiltration controls.

6.2 Time-Series Analysis of Water Level Trends

The time-series analysis completed to examine SSW water level trends shows that the water table has risen since the first monitor wells were installed in 1996. Recharge causing a rising water table is correlated with precipitation rates. Water level rises occur 6 to 9 months after periods of heavy precipitation. SSW water levels increased sharply in 1996 to 1998, during above-average precipitation years. During the ensuing years from 1999 to 2004, total annual precipitation was below average and water levels remained relatively constant in most monitor wells. Following a heavy precipitation year in 2004, when precipitation was nearly twice the annual average, a sharp water level rise was observed in many of the wells in 2005. Infiltration control systems were constructed in 2004 and 2005 to limit SSW recharge. Water levels fluctuated, but remained relatively constant in 2006 and 2007. In the most recent monitoring event in June 2008, water levels declined in most wells. This recent water level decline may indicate the first sign of a response to the infiltration controls, following a 3-year period of transient drainage beneath the former recharge sources; however, it is too early to reach a conclusion.

Monitor wells that appear to be at the fringes of the SSW saturated lens show rising water levels and increasing saturated thickness. Monitor well C-2811 has exhibited a water table rise of 12 feet since the well was installed in 2001. This trend is consistent with the conceptual model of a saturated lens spreading laterally over time. Monitor well PZ-08 may be at the fringe of the SSW saturated lens east of the WIPP facilities area. Saturation was detected for the first time in PZ-08 in March 2007, and the water level rose 4 feet during the next year. Like monitor well

C-2811, the rising water level in PZ-08 is consistent with the conceptual model of the SSW lens gradually spreading and increasing the saturated thickness at the perimeter, a phenomenon that will continue until the water table mound diminishes.

Water levels at the three new monitor wells installed in 2007 around the SPDV pile suggest that the saturation found in this area is not directly hydrologically connected to the main SSW saturated lens. The saturated zone at monitor well PZ-15 exists in the Gatuña at an elevation higher than at any of the other SSW monitor wells. The two other SPDV monitor wells, PZ-13 and -14, are distinguished from the other SSW monitor wells based on water levels, apparent gradient, and geochemistry.

6.3 Water Level Contour Maps

Water level contour maps for the SSW, prepared for approximately annual time steps, show that the SSW flow direction and gradient have remained consistent over the complete monitoring record since 1997. Each of the contour maps shows a similar pattern of contours, although water levels have consistently risen by approximately 2 to 4 feet. The water level contour maps were prepared using equivalent freshwater head elevations that were calculated based on the salinity and water density at each monitor well.

6.3.1 Water Table Conditions

The water level contour maps indicate that a water table mound exists near the Salt Pile Evaporation Pond and Salt Storage Area, with a generally radial pattern of flow outward from the high point near PZ-07. In the area where most SSW monitor wells are located, the SSW flows south and east from the apex of the water table mound. The SSW conditions are influenced by geologic controls including the irregular surface of the Santa Rosa/Dewey Lake contact and the hydraulic conductivity of the formations where SSW occurs.

Away from the central portion of the SSW saturated lens where most monitor wells are located, the hydrologic connection to monitor wells PZ-08, -13, and -14 and C-2811 remains uncertain. The increasing water level in C-2811 and detection of saturation in PZ-08 for the first time in

2007 appear consistent with a radially spreading SSW lens. In contrast, monitor wells PZ-13 and -14 exhibit higher water levels than those at PZ-08 to the west, suggesting that local recharge at the SPDV pile has resulted in a minor water level mound (although this mound may be dissipating since the SPDV pile was capped in 2000). Based on differences in water levels and water quality, the water encountered at PZ-08 appears distinct from the water at PZ-13 and -14, although between these wells, it is uncertain whether unsaturated conditions exist or whether there is a saturated zone of commingled water.

6.4 Water Quality Contour Maps

Water quality contour maps for the SSW prepared for approximately annual time steps show that the SSW water quality has become generally more saline over the monitoring record since 1997. Overall salinity reached a maximum in 2004 and has declined slightly by 2008..

The SSW water quality is dominated by highly saline brine that is representative of halite (NaCl) dissolution. In the main SSW lens, TDS concentrations range from less than 10,000 mg/L to more than 150,000 mg/L. Higher TDS concentrations are found in the northern half of the WIPP facilities area, near the Salt Storage Area and Salt Pile Evaporation Pond. Currently, the highest TDS concentration within the main SSW lens is 150,000 mg/L in PZ-09, a decline from the highest previous TDS concentration measured within the main SSW lens (185,000 mg/L in PZ-03). TDS concentrations are much lower in the southern half of the site, where low-TDS water recharged the SSW from stormwater retention ponds prior to lining the ponds and subsequent transient drainage. Relatively low TDS concentrations of 1,000 to 3,000 mg/L have been measured in monitor well PZ-10, adjacent to Detention Basin A.

New monitor wells around the SPDV pile have water quality that is chemically distinct from the SSW. SPDV monitor well PZ-13 has the highest salinity level measured thus far, with a TDS concentration of 245,500 mg/L. In contrast, SPDV monitor well PZ-15 has a low TDS concentration of 2,060 mg/L in a saturated zone in the lower Gatuña.

6.5 Moisture Redistribution Calculations

Calculations of moisture redistribution were completed to estimate the duration and magnitude of transient drainage that provides continued moisture input to the SSW even after the infiltration controls were constructed in 2004 and 2005. The initially high moisture content of the vadose zone materials beneath the recharge sources will gradually drain to lower moisture content after the source of recharge from the surface is removed. Because test results for unsaturated hydrologic properties of the vadose zone and salt pile materials are not available, moisture redistribution calculations were completed for a range of vadose zone hydrologic properties and initial moisture conditions to estimate a range of transient drainage results. Within the range of hydrologic properties used in the calculations, hydrologic parameters were selected as the likely best fit for the Gatuña and salt pile to produce a reasonable estimate of the transient drainage quantity and duration.

The hydrologic parameters selected as the best fit for the Gatuña and salt pile are based on published values for sandy clay loam soil. A broad range of additional hydrologic properties were selected for sensitivity analysis calculations, including silt, clay loam, clay, and sand. These materials represent finer- and coarser-grained characteristics than the representative sandy clay loam. Moisture redistribution calculations were completed for each material type for initial moisture conditions set at 30, 60, 80, and 90 percent saturation. The likely best fit calculations used an initial moisture content of 90 percent saturation below the stormwater retention ponds and 80 percent saturation within and beneath the salt pile.

6.5.1 Transient Drainage Results

The moisture redistribution results show a wide range of transient drainage responses depending on the material type and initial moisture. The test cases were analyzed for a period of 5 years, and the results show significant transient drainage over a period of months to years. The material type controls the drainage behavior; the sand profile rapidly drains large quantities of water within days, while very little drains from the clay profile over 5 years.

For the set of likely hydrologic parameters that is representative of actual field conditions, the calculations produce reasonable results in terms of the drainage quantity, duration, and amount of residual moisture remaining in the profile after 5 years. The results for each of the two profiles are as follows:

- Vadose zone below stormwater retention ponds
  - 41.7 ac-ft transient drainage in 5 years
  - Most of the drainage within 1 year
  - Initial moisture content of 0.35 (90 percent of saturation), drains to a moisture content of 0.22
- Salt Storage Area and underlying vadose zone
  - 78.8 ac-ft transient drainage in 5 years
  - Most of the drainage within 2 years
  - Initial moisture content of 0.31 (80 percent of saturation), drains to a moisture content of 0.25

The moisture content changes very slowly after 1 to 3 years until the end of the 5-year calculation, although the moisture content remains well above the residual moisture content of 0.10 set in the equation. Over a longer duration, additional water is available to drain from the vadose zone profile, although the rates become slow as the unsaturated hydraulic conductivity declines with decreasing moisture content.

Because the Salt Storage Area covers a larger area and has a thicker vadose zone profile than the stormwater ponds, the overall drainage is 2 to 3 times greater that the total drainage below all four stormwater retention ponds. The residual drainage below the Salt Storage Area is expected to provide substantial additional input of sodium and chloride to the SSW, exceeding the amount of relatively fresh drainage beneath the stormwater ponds.

Although the moisture redistribution calculations contain significant uncertainties, the results frame a range of conditions that can be expected. Transient drainage quantities on the order of tens of ac-ft to more than 100 ac-ft are expected over a period of months to years. Based on likely hydrologic parameters that are representative of field conditions, a total of approximately 120 ac-ft of transient drainage occurs. During the 3 years since the infiltration controls were completed in 2005, most of the rapid transient drainage should have occurred. Under all cases tested for variable hydrologic properties, transient drainage reaches slow (but continuing) rates beyond three years.

6.5.2 Transient Drainage Impact on SSW

Based on the estimated transient drainage quantities, a significant water addition to the SSW is expected following completion of the infiltration controls. The transient drainage volume of 120 ac-ft for the most likely conditions will add approximately 12 to 33 percent additional water to the SSW (based on previous SSW volume estimates of 330 to 970 ac-ft [108 and 315 million gallons], covering 150 to 520 acres).

The amount of water table rise depends on the amount of drainage, as well as the Santa Rosa sandstone hydrologic properties. Considering that the porosity within the Santa Rosa sandstone is partially filled with water when it is unsaturated, only about 10 percent moisture addition (per sandstone unit volume) is needed to reach saturation. The SSW water table rise is estimated to be between 8 feet over the 150-acre immediate area around the former recharge sources and 2 feet of water table rise over the 520-acre SSW lens.

These estimates contain significant uncertainties, but show that based on reasonable assumptions, a significant water table rise can be expected following construction of the infiltration controls. The water table rise may take place over a period of 3 to 5 years before the transient drainage slows to low rates. The water table rise can be expected to first affect the central portion of the SSW saturated lens before spreading radially toward the perimeter of the lens. Water levels may continue to rise over a longer duration in monitor wells some distance from the former recharge sources as the water table rise in the SSW saturated lens propagates radially outward.

The primary benefit of implementing the infiltration controls is prevention of continued recharge that was predicted to continue increasing the SSW saturated volume. However, the moisture redistribution process involves a period of transient drainage when SSW water levels continue to rise. The declining water levels measured in 2008 may represent the first indication that a gradual response toward declining SSW water levels is beginning; however, any conclusions regarding a trend toward water level declines will require a longer monitoring record.

30		100				
		100		Santa Rosa Sandstone	(2.5YR 7/4-8/4, Pink to Light Reddish Brown), (Gley 1 8/1; Light Greenish Gray), interbedded Reddish and LT Gray sanstone, desication cracks with carbonate fill, slickensided surfaces (subhorizontal), dry, poorly to moderately indurated. Hard at 35.5'-drilled with center bit only to 40 feet; no recovery at 40 feet; drilled with center bit only to 50 feet. (5YR 5/4-4/6; Reddish Brown), Very hard, silt sandstone, argillaceous. (50'-50.5'), pulverized by sample barrel Used center bit drilling only instead of wireline to 56 feet. Hit hard, competent Santa Rosa at 56 feet then switched to air rotary until softer Dewey Lake FM. encountered at depth. Center bit at 56 feet is dry. Assume similar geology to that seen in PZ-13

Well Construction: Well Casing

Profile (Rock Type)	Description
Dune Sand	[5YR 6/4, LT Reddish Brown], sand, fine grained, loose, moist to dry, friable.
Berino Soil	[2.5YR 5/4; Reddish Brown], sandy, 7.8'-8' calcareous sand, indurated, low moisture, small roots, damp. [5YR 8/3 Pink] at 7.5'
Mescalero Caliche	[7.5YR 8/2-8/4; Pink], sandy limestone or calcareous sandstone, low moisture, stiff with chert pebbles and weak laminar structure (friable), moist in friable portions; pedogenic Gatuna interbedded identified by manganese oxide alterations
Gatuna Sandstone	[5YR 7/4; Pink], Gatuna Sandstone with Mescalero Caliche overprint, dry to slightly moist, loose to very stiff clasts with caliche, altered manganese oxide throughout, less argillaceous/loose matrix, caliche clasts throughout.
	[2.5YR 4/6; Red at 16'] [2.5YR 5/8 at 16.6'], Gatuna Sandstone, chert pebbles throughout, root casts coated in manganes oxide, dry, carcareous, less argillaceous matrix dominated by sand, increased bedding structure with depth, stiff, platy structures, dry, stiff, moderately indurated. 17.5-20' damp, loose, cabonaceous, more argillaceous 20-22.5' no bedding structure, inc. manganese oxide, damp 22.5' -27.5 platy bedding structure, bcame hard at 24' 26.1'-45' [2.5YR 4/6-4/8; Red], siliceous, friable, more argellacaous matrix interbedded with loose matrix. 45'-50.5' Saturated Gatuna Formation sitting on hard Santa Rosa Formation.
	[2.5YR 4/8, Red], [10YR 7/1, LT Gray], interbedded Red and LT Gray sandstone, dessication cracks with carbonate fill, slickensided surfaces (subhorizontal), dry, moderately indurated, Wet/saturated at top and dries with depth/perched. 51.3-51.5 soft sandier zone 51.5 Very hard Santa Rosa Sandstone, very hard consolidated, well indurated sandstone, dry [2.5YR 4/4; Reddish Brown].

Appendix B. Water Quality Monitoring Data

Notes

[a] pH measured in standard units

[b] Specific conductance measured in microSiemens per centimeter (uS/cm) at 25 degrees Celsius

[c] Temperature measured in degrees Celsius

NE = Normal environmental sample
DUP = Duplicate sample
DD = Discrete depth sample
LF = Low flow sample
BLR = Bailer sample

Qualifier Definitions

<	Actual value is known to be less than the value shown.
INT	Estimated value due to interference.
J	The result is an estimated quantity (due either to the quality of the data, or the concentration of the anlayte was below the quantitation limit).
MS	Matrix spike/matrix spike duplicate sample recovery not within acceptance limits.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present.
REP	Duplicate analysis not within limits.
U	The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

Calculation Sheet - Time Series Analysis

Location: Piezometer PZ-07
Time Range: 09/1997 - 06/2004 (UnLined)

Objective

Perform correlation analyses to qualitatively assess the response of water levels in wells to precipitation.

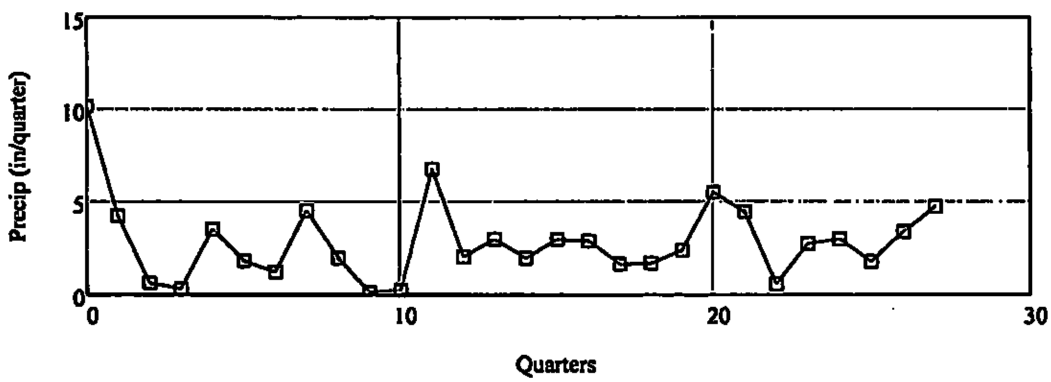
Methods

Auto-Correlation: Qualitatively shows the dependence of water-level or precipitation on time. Data series where this is no relation between measurements will show a sharply peaked graph of autocorrelation over lag (common for precipitation). Data series that are dependent to some degree on the previous measurement will have a more gradual (exponential) slope (common for water-level).

Cross-Correlation: Qualitatively shows the inter-dependence of water-level and precipitation. The lag distance from 0 to the peak is the approximate delay between precipitation and water-level response. The height of the peak qualitatively indicates the degree of "connection" between precipitation and water-level response.

Input Data

Total precipitation per quarter (in/quarter).



Quarterly average water level elevation (ft, AMSL).

 PZ07_UnLined_edit1.xmcd

01975

Summary Statistics

Precipitation (in/quarter)

Mean: $\mu_x := \text{mean}(x)$ $\mu_x = 2.86$

Variance: $\sigma 2_x := \text{var}(x)$ $\sigma 2_x = 4.565$

Count: $N = 28$

Maximum: $\max(x) = 10.15$

Minimum: $\min(x) = 0.14$

Quarterly Average Water Elevation (ft, AMSL)

Mean: $\mu_y := \text{mean}(y)$ $\mu_y = 3376.87$

Variance: $\sigma 2_y := \text{var}(y)$ $\sigma 2_y = 0.313$

Count: $N = 28$

Maximum: $\max(y) = 3377.78$

Minimum: $\min(y) = 3374.92$

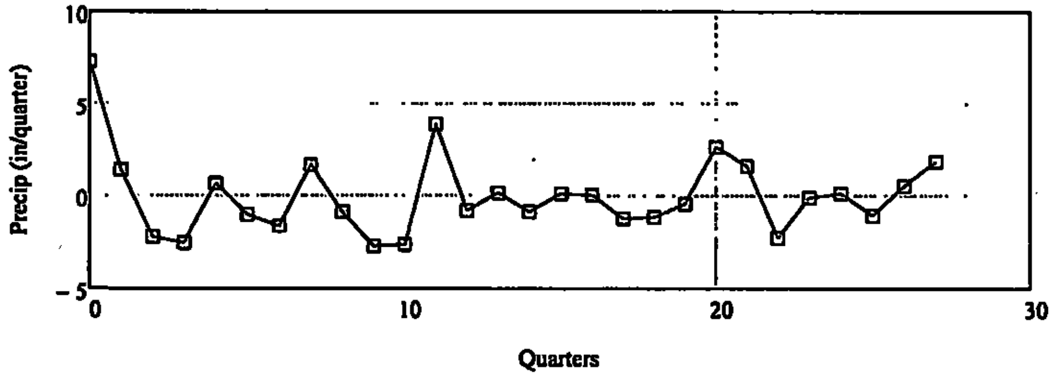
Zero-Mean Perturbation

Remove mean from data to obtain zero-mean perturbation for calculations.

Precipitation

Remove mean: $x0_i := x_i - \mu_x$

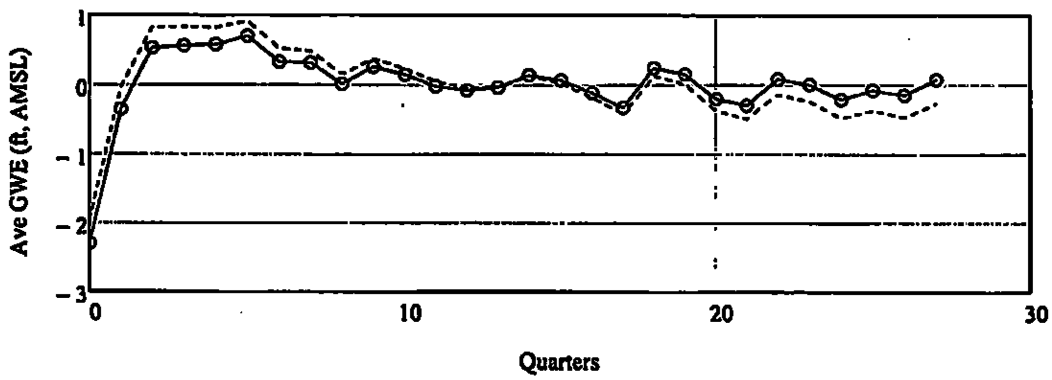
Zero-mean perturbation of total precipitation per quarter (in/quarter).



Quarterly Average Water Elevation

Remove mean: $y1_i := y_i - \mu_y$ Remove trend: $I_i := i \cdot 1$ $y0_i := y1_i - (\text{slope}(I, y1) \cdot i + \text{intercept}(I, y1))$

Zero-mean perturbation of quarterly average water level elevation (ft, AMSL).



Global Correlation Parameters

Count: $N = 28$

Maximum Lag: $MaxLag := 5$

Autocorrelation

Fast Fourier Transform Method for Discrete Covariance Estimate (Press et al., 1992)

<u>Autocorrelation of Precipitation</u>

Calculate the Complex Fast Fourier Transform (doesn't require zero padding)

$\Xi := CFFT(x0)$

Calculate the product of the transform with its complex conjugate

$j := 0 .. rows(\Xi) - 1 \qquad Z_j := \Xi_j \cdot \overline{\Xi_j}$

The inverse gives the Autocovariance. Correlation = covariance / variance

$Corr := ICFFT(Z) \qquad r := 0 .. MaxLag \qquad Rx_{est_r} := Corr_r$

<u>Autocorrelation of Average Quarterly Water Level</u>

Calculate the Complex Fast Fourier Transform (doesn't require zero padding)

$\Psi := CFFT(y0)$

Calculate the product of the transform with its complex conjugate

$j := 0 .. rows(\Psi) - 1 \qquad Z_j := \Psi_j \cdot \overline{\Psi_j}$

The inverse gives the Autocovariance

$Corr := ICFFT(Z) \qquad MaxLag = 5 \qquad r := 0 .. MaxLag \qquad Ry_{est_r} := Corr_r$

 PZ07_UnLined_edit1.xmcd

Cross-Correlation

Use Complex Fast Fourier Transforms from above. Calculate the product of the x transform with the complex conjugate of the y transform (x leads y)

$j := 0 .. \mathrm{rows}(\Xi) - 1 \qquad Z_j := \Psi_j \cdot \overline{\Xi_j}$

The inverse gives the Cross-covariance (Not necessarily symmetrical so index r must be adjusted to show negative lags. CrossCorr array contains positive lag results from 0 to N/2 and negative lag results from N to N/2 [in reverse]. CrossCorr results are then mapped into the Rxy array from 0 to N-1)

$\mathrm{CrossCorr} := \mathrm{ICFFT}(Z) \qquad r := 0 .. \frac{N}{2} - 1 \qquad Rxy_{est_r} := \mathrm{CrossCorr}_{\frac{N}{2}+r}$

$r := \frac{N}{2} .. N - 1 \qquad Rxy_{est_r} := \mathrm{CrossCorr}_{r-\frac{N}{2}}$

Cross-Correlation

Use Complex Fast Fourier Transforms from above. Calculate the product of the x transform with the complex conjugate of the y transform (x leads y)

$j := 0..\mathrm{rows}(\Xi) - 1 \qquad Z_j := \Psi_j \cdot \overline{\Xi_j}$

The inverse gives the Cross-covariance (Not necessarily symmetrical so index r must be adjusted to show negative lags. CrossCorr array contains positive lag results from 0 to N/2 and negative lag results from N to N/2 [in reverse]. CrossCorr results are then mapped into the Rxy array from 0 to N-1)

$\mathrm{CrossCorr} := \mathrm{ICFFT}(Z) \qquad r := 0..\frac{N}{2} - 1 \qquad \mathrm{Rxy_{est}}_r := \mathrm{CrossCorr}_{\frac{N}{2}+r}$

$r := \frac{N}{2}..N - 1 \qquad \mathrm{Rxy_{est}}_r := \mathrm{CrossCorr}_{r-\frac{N}{2}}$

Calculation Sheet - Time Series Analysis

Location: Piezometer PZ-10
Time Range: 09/1997 - 06/2004 (UnLined)

Objective

Perform correlation analyses to qualitatively assess the response of water levels in wells to precipitation.

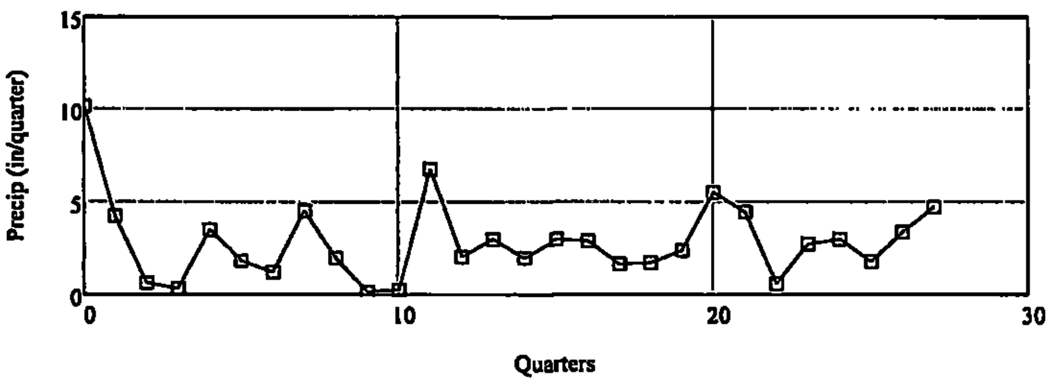
Methods

Auto-Correlation: Qualitatively shows the dependence of water-level or precipitation on time. Data series where this is no relation between measurements will show a sharply peaked graph of autocorrelation over lag (common for precipitation). Data series that are dependent to some degree on the previous measurement will have a more gradual (exponential) slope (common for water-level).

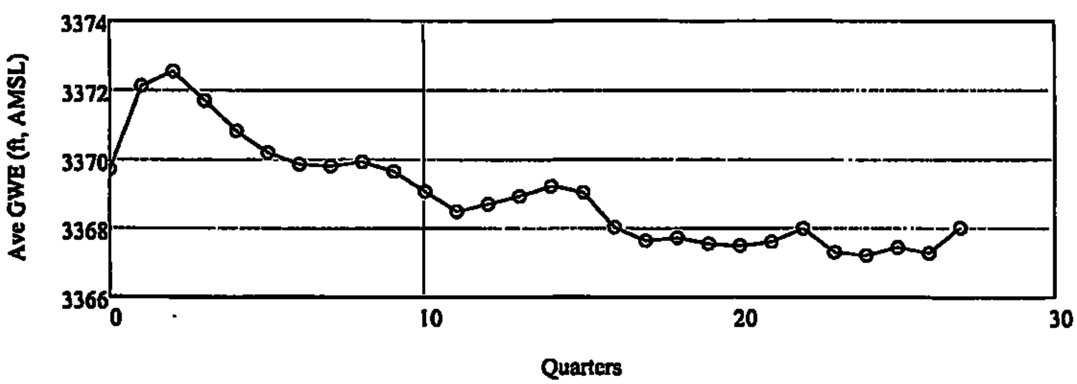
Cross-Correlation: Qualitatively shows the inter-dependence of water-level and precipitation. The lag distance from 0 to the peak is the approximate delay between precipitation and water-level response. The height of the peak qualitatively indicates the degree of "connection" between precipitation and water-level response.

Input Data

Total precipitation per quarter (in/quarter).



Quarterly average water level elevation (ft, AMSL).



Summary Statistics

Precipitation (in/quarter)

Mean: $\mu_x := \text{mean}(x)$ $\mu_x = 2.86$

Variance: $\sigma2_x := \text{var}(x)$ $\sigma2_x = 4.565$

Count: $N = 28$

Maximum: $\max(x) = 10.15$

Minimum: $\min(x) = 0.14$

Quarterly Average Water Elevation (ft, AMSL)

Mean: $\mu_y := \text{mean}(y)$ $\mu_y = 3368.97$

Variance: $\sigma2_y := \text{var}(y)$ $\sigma2_y = 2.22$

Count: $N = 28$

Maximum: $\max(y) = 3372.54$

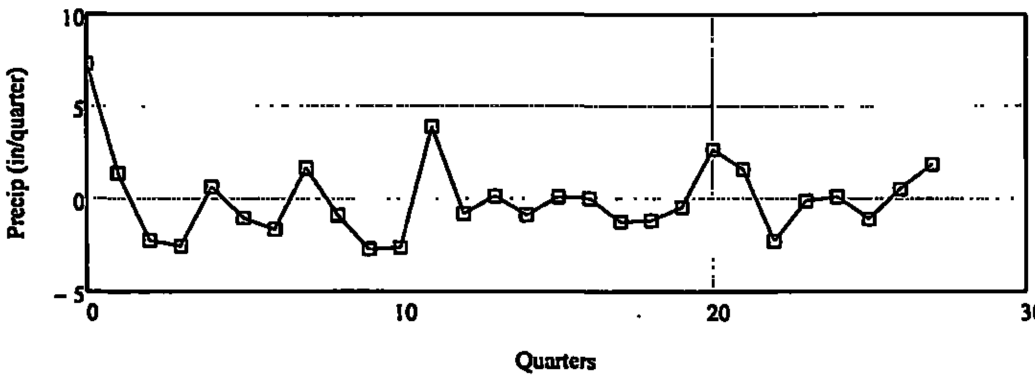
Minimum: $\min(y) = 3367.22$

Zero-Mean Perturbation
Remove mean from data to obtain zero-mean perturbation for calculations.

Precipitation

Remove mean: $x0_i := x_i - \mu_x$

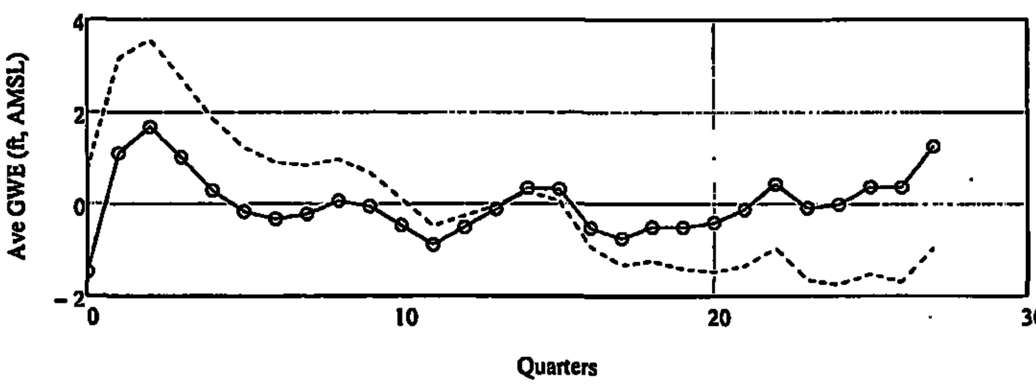
Zero-mean perturbation of total precipitation per quarter (in/quarter).



Quarterly Average Water Elevation

Remove mean: $y1_i := y_i - \mu_y$ Remove trend: $I_i := i \cdot 1$ $y0_i := y1_i - (\text{slope}(I, y1) \cdot i + \text{intercept}(I, y1))$

Zero-mean perturbation of quarterly average water level elevation (ft, AMSL).



Global Correlation Parameters

Count: $N = 28$

Maximum Lag: $MaxLag := 5$

Autocorrelation

Fast Fourier Transform Method for Discrete Covariance Estimate (Press et al., 1992)

Autocorrelation of Precipitation

Calculate the Complex Fast Fourier Transform (doesn't require zero padding)

$\Xi := CFFT(x0)$

Calculate the product of the transform with its complex conjugate

$j := 0..rows(\Xi) - 1$ $\quad Z_j := \Xi_j \cdot \overline{\Xi_j}$

The inverse gives the Autocovariance. Correlation = covariance / variance

$Corr := ICFFT(Z)$ $\quad r := 0..MaxLag$ $\quad Rx_{est_r} := Corr_r$

Autocorrelation of Average Quarterly Water Level

Calculate the Complex Fast Fourier Transform (doesn't require zero padding)

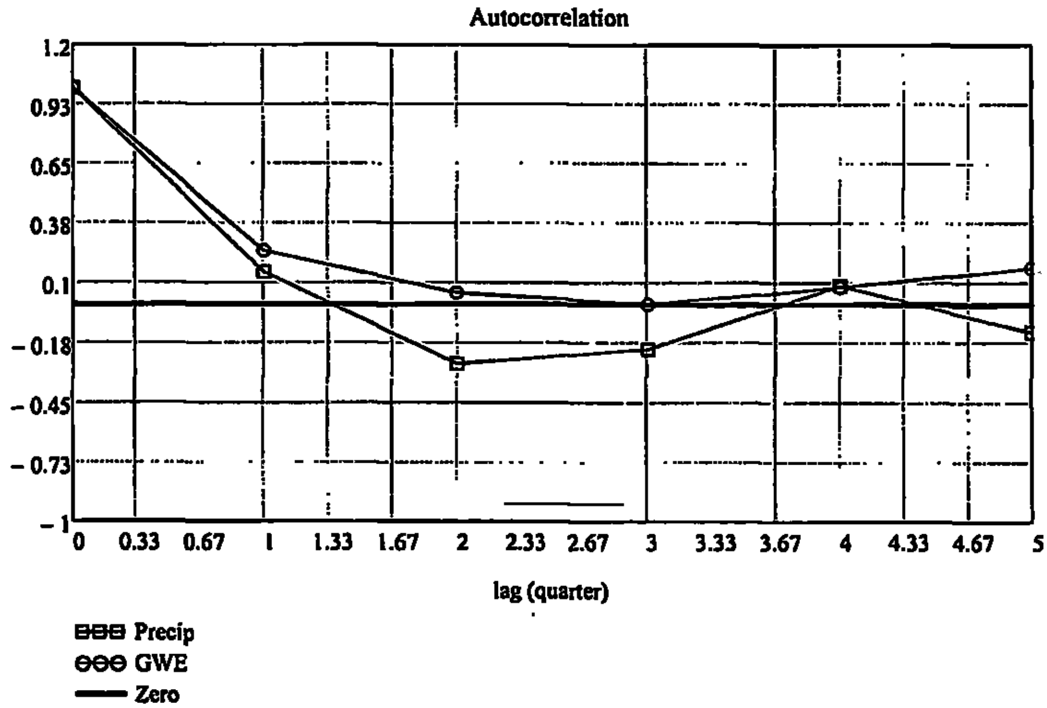
$\Psi := CFFT(y0)$

Calculate the product of the transform with its complex conjugate

$j := 0..rows(\Psi) - 1$ $\quad Z_j := \Psi_j \cdot \overline{\Psi_j}$

The inverse gives the Autocovariance

$Corr := ICFFT(Z)$ $\quad MaxLag = 5$ $\quad r := 0..MaxLag$ $\quad Ry_{est_r} := Corr_r$



Cross-Correlation

Use Complex Fast Fourier Transforms from above. Calculate the product of the x transform with the complex conjugate of the y transform (x leads y)

$j := 0 .. \mathrm{rows}(\Xi) - 1 \qquad Z_j := \Psi_j \cdot \overline{\Xi_j}$

The inverse gives the Cross-covariance (Not necessarily symmetrical so index r must be adjusted to show negative lags. CrossCorr array contains positive lag results from 0 to N/2 and negative lag results from N to N/2 [in reverse]. CrossCorr results are then mapped into the Rxy array from 0 to N-1)

$\mathrm{CrossCorr} := \mathrm{ICFFT}(Z) \qquad r := 0 .. \frac{N}{2} - 1 \qquad Rxy_{est_r} := \mathrm{CrossCorr}_{\frac{N}{2}+r}$

$r := \frac{N}{2} .. N - 1 \qquad Rxy_{est_r} := \mathrm{CrossCorr}_{r-\frac{N}{2}}$

Subject: Information Requested in Notice of Violation, dated November 14, 2008

Dear Messrs. Vollmer and Marshall:

The purpose of this letter is to respond to your letter of November 14, 2008, *Reference: Notice of Violation*. The Permittees were required to "submit to NMED within fifteen (15) days of receipt of [the] letter evidence that all corrective actions associated with the two findings identified in the Audit I08-03, *Hydrology and Water Management*, have been completed and that all corrective actions recommended in the *WIPP Discharge Evaporation Pond H-19 Root Cause Analysis Report*" have been implemented. NMED also requests a written description of any actions that the Permittees have taken since the Response [submitted to you on November 20, 2007, November 30, 2007, and January 25, 2008,] to address the violations described above, and a schedule for implementation for any actions not yet completed." In response to these requests, the Permittees are providing you the following information:

- Documentation that the corrective actions for two findings identified in Audit I08-03, *Hydrology and Water Management* have been completed.

- Documentation for the corrective actions recommended in the *Waste Isolation Pilot Plant (WIPP) Discharge to Evaporation Pond H-19 Root Cause Analysis Report*.

- A written description of any actions the Permittees have taken since the *Response to NMED Hazardous Waste Bureau Letter, dated January 18, 2008, received January 23, 2008* to address the alleged violations in the November 14, 2008 Letter, *Notice of Violation*.

I. Corrective Actions for Findings identified in Audit I08-03, *Hydrology and Water Management*.

Audit I08-03, *Hydrology and Water Management*, resulted in two findings related to procedural non-compliance.

Finding I08-03-F-01 related to instances where procedural compliance was not adequately completed in all instances. Attachment 1 (2-pages) contains the Corrective Action Plan for Finding I08-03-F-01.

Corrective/Preventative Actions for I08-03-F-01 were:

a. Consolidate WIPP Procedure (WP) 02-EM1016 Revision 2, *Request to Discharge to Evaporations Ponds* and WP 02-RC3108 Revision 6, *Request for Disposal* into one procedure. This was completed on June 30, 2008 and Attachment 1.a. (21-pages) contains WP 02-RC3108 Revision 7, *Request for Disposal*. .
b. Re-train Environmental Monitoring and Hydrology and Site Environmental Compliance Staff to the WP 02-EM1016 Revision 2, *Request to Discharge to Evaporations Ponds* and WP 02-RC3108 Revision 6, *Request for Disposal* procedures. Attachment 1.b. (1-page) contains the training documentation completed on February 29, 2008.
c. Environmental Monitoring and Hydrology and Site Environmental Compliance staff received Conduct of Operations[1] training. Attachment 1.c. (1-page) contains the training documentation completed on February 27, 2008.

Finding I08-03-F-02 related to instances of procedural non-compliance Attachment 2 (2-pages) contains the Corrective Action Plan for Finding I08-03-F-02. Corrective/Preventative Actions for I08-03-F-02 were:

a. Consolidate WP 02-EM1016 Revision 2, *Request to Discharge to Evaporations Ponds* and WP 02-RC3108 Revision 6, *Request for Disposal* procedures into one procedure. This was completed on June 30, 2008 and Attachment 1.a. contains WP 02-RC3108 Revision 7, *Request for Disposal*, as previously discussed in Finding I08-03-F-01.
b. Reinstate the offsite non-hazardous waste disposal vendor on the Quality Supplier List (QSL). The vendor was reinstated on the QSL on March 11, 2008. Attachment 2.a. (1 page) contains the QSL database printout of information reflecting reinstatement of the vendor.
c. WP 02-EC.06, Revision 6, Table 2 lists "Required Analysis" for site effluents, which includes analyses that are not necessary for characterizing all waste streams. The procedure was revised to reflect "common" analyses and "potential" analyses to clarify that all parameters do not necessarily have to be analyzed for each waste stream. This allows procedural flexibility to run only necessary parameters instead of procedurally requiring all analytes. Attachment 2.b. (5-pages) contains the cover page of WP 02-RC3108, Revision 7 and the revised pages including Table 2 of WP 02-EC.06,

[1] Conduct of Operations is a set of standards which establishes an overall philosophy for achieving excellence in the operation of DOE facilities. This is achieved through effective implementation and control of operations activities recognizing that environment, safety, and productivity are compatible goals. Conduct of Operations Field Handbook, Rev 1, 9/1/93

Revision 7. Attachment 2.b. also contains training documentation on the revised procedure for members of the Sampling Team.

II. Corrective Action Recommendations described in the *WIPP Discharge to Evaporation Pond H-19 Root Cause Analysis Report.*

Attachment 3 (14 pages) contains a copy of the *WIPP Discharge to Evaporation Pond H-19 Root Cause Analysis Report*. Each recommended corrective action is itemized below (1-7) with a description of corrective actions implemented.

1. Improved Management Assessments

Attachment 4 (24 pages) contains a management assessment conducted to determine readiness to resume the disposal of non-hazardous water in the H-19 Evaporation Pond or offsite disposal facility. Several criteria were established and documented as complete before water disposal activities were allowed to resume by management. The criteria that were satisfied included:

- Manpower is identified and in place.
- Equipment is ready.
- Tools and supplies are in place.
- Plans and procedures are approved and ready to use.
- Personal Protective Equipment is identified and ready.
- Notification (for disposal) has been given.
- Methods of communication are in place.
- Corrective Actions are complete.

The Readiness Review was completed in May of 2008. This review was conducted to WP 02-RC3108, Revision 6 prior to the issuance of Revision 7.

2. Clarification of Procedures, including:
   - Ownership and responsibilities in procedures (WP 02-EM1016, WP 02-RC3108).
   - Enforce attention to detail (implement independent verification forms for accuracy/completion prior to discharge of materials).
   - Enforce sequential completion of forms/approvals.
   - Sequential step(s) completion.

Prior to June 30, 2008, two procedures existed that controlled the disposal of water and other solid wastes generated at the WIPP site, 02-RC3108, *Request for Disposal* and 02-EM1016, *Authorization to Discharge Nonhazardous Effluent into the WIPP Sewage Treatment Facility.* As discussed in the Corrective Action Plans contained in Attachments 1 and 2, 02-EM1016 was merged into 02-

RC3108 to reduce redundant steps, improve efficiencies, and clarify language to ensure steps can be completed in sequence. The Request for Disposal form was simplified and instructions were clarified to ensure that the processes of waste characterization, storage and disposal are appropriately completed and clearly documented.

Attention to detail, sequential completion of forms/approvals and procedural steps has been addressed by the renewed emphasis on Conduct of Operations referenced in multiple attachments and corrective actions discussed in this letter.

3. Improve communication (process and equipment), including:
   - Implementation of pre-job briefings.
   - Information turnover process.

Pre-job briefings have been implemented as a matter of policy. See, Attachment 4, *Readiness Review Criteria for the On-Site Disposal of Non-Hazardous Water and Shipment of Water for Off-Site Disposal*, Section 1.7. Attachment 5 (20 pages), *02-EC1001, Characterization Sampling, Shipping, and Documentation*, Section 1.0, Pre-sampling Activities addresses pre-job briefings for non-routine sampling events. In addition, the procedures being used to accomplish field work are being revised during their periodic review cycle to incorporate pre-job and post-job briefings as deemed appropriate. This enhancement aligns field program activities with a formal Conduct of Operations approach to conducting work. Employees conducting disposal operations were also provided upgraded cell phones for improved communications in the remote area of the WIPP site.

4. Improve Identification of containers (enhance the clarity and visibility of identification):

This was emphasized during the Management Assessment for the readiness review for the disposal of Water enclosed in Attachment 4, see *Readiness Review Criteria for the On-Site Disposal of Non-Hazardous Water and Shipment of Water for Off-Site Disposal*, Section 1.8.2.2. Container identification was a specific topic discussed during the Management Assessment. The goal was to ensure that sufficient information is always noted on container labels to prevent any confusion for personnel handling waste.

5. Improve scheduling (management attention to scheduling of activities requiring the same personnel):

Management has established weekly staff meetings. An action discussed in the meetings is the schedule of activities to ensure appropriate staffs are available to complete tasks.

6. Consider establishment of a locking process for trailers:

The recommended corrective action for locking trailers was reviewed and the decision was made to not implement this recommendation. This is based on the fact that trailers used to manage water pending characterization are located in secure facilities. The implementation of the corrective actions addressed in Item 4 above related to improved visibility and clarity of labels will also prevent confusion about the contents of containers containing waste pending characterization or disposal.

7. Reinforce employee authority/accountability:

This recommended corrective action has been addressed through the site-wide emphasis on Conduct of Operations affirming the importance of following procedures. Attachment 6 (2 pages) contains training documentation relative to this recommended corrective action.

III. Written description of other actions taken subsequent to the Response to NMED Hazardous Waste Bureau Letter, Dated January 18, 2008 to address the alleged violations in the November 14, 2008 Letter, Notice of Violation.

The Permittees routinely conduct management assessments and evaluations of operations. Routine quality assurance assessments and procedure reviews that are included in the Environmental Compliance Assessment Program are among the tools used to continually monitor and improve programs. Washington TRU Solutions has implemented a Conduct of Operations Council (Council) to enhance the over-arching philosophy of Conduct of Operations for all WIPP programs. The environmental programs in place at WIPP are within this Council's purview and are being reviewed and improved, as deemed appropriate, throughout the entire evaluation process.

We certify under penalty of law that this document and all enclosures were prepared under our direction or supervision according to a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on our inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of our knowledge and belief, true, accurate, and complete. We are aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

If you have any questions or need additional information please contact Mr. H. L. (Jody) Plum at 575-234-7462.

Sincerely,

David C. Moody

Corrective Action Plan for Finding I08-03-F-01

Corrective Action Plan for WIPP Form 08-024, CTS item 30971

Issue Being Addressed
Finding I08-03-F-01 relates to instances where procedural compliance was not adequately completed in all instances. Issues were:

- Ensure all forms are completed in sequence and that the forms are completed with yes / no, dates, signatures, and with N/A in blank spaces where information is needed to complete a document.
- As per WP-02-EM-1016 rev. 2, *Request to Discharge to Evaporation Ponds*, notification to Central Monitoring Room of the individual entering and leaving the area, date and time of entry and departure, and the amount of material being disposed of in the H-19 Evaporation Pond or Evaporation Pond B was not routinely performed.

Cause of the Issue
Inattention to detail and a lack of understanding by staff of the importance to thoroughly follow procedural sequences to operate in accordance with Conduct of Operations requirements.

Extent and Impact Cause
There was extensive evidence of the 2006 and 2007 disposal records for the H-19 Evaporation Pond that the sequences of procedures were not followed. None of the disposals reviewed during the audit I08-03 related to improper disposal of hazardous waste into the H-19 Evaporation Pond, therefore outside of WTS procedure compliance requirements and expected Conduct of Operations, there were no additional compliance impacts as all disposals were of non-hazardous waste.

Corrective / Preventive Actions Planned
Consolidate WP 02-EM1016 rev. 2, *Request to Discharge to Evaporation Ponds*, and WP 02-RC3108 rev. 6 *Request for Disposal* procedures into one procedure.
Due date: July 31, 2008

Re-train Environmental Monitoring and Hydrology and Site Environmental Compliance staff to the WP 02-EM-1016 rev. 2, *Request to Discharge to Evaporation Ponds*, and WP 02-RC3108 rev. 6, *Request for Disposal* procedures.
Due date: March 10, 2008—Completed

Environmental Monitoring and Hydrology and Site Environmental Compliance staff receive Conduct of Operations Training.
Due date March 10, ~~2009~~ 8—Completed

Attachment 3 - Waste Flow Chart 21

INTRODUCTION [1, 2]

This procedure provides instruction for the disposition, characterization, and tracking of site-generated wastes at the Waste Isolation Pilot Plant (WIPP), from the point of generation through final disposal. With the exception of sanitary waste, lead-acid batteries, nonhazardous scrap metal and other waste types that are approved by Site Environmental Compliance (SEC), this procedure addresses all other wastes, including hazardous waste, nonhazardous waste, universal waste, low-level waste, mixed low-level waste, special waste and construction debris. This procedure also applies to waste water that may be discharged into the evaporation ponds (EP), sewage treatment system or site manholes. Mined salt is managed in accordance with WP 04-GC.01.

This procedure applies to the WIPP contractors, unless contractual requirements specify otherwise.

This procedure generates the following Quality Assurance (QA) records:

- Attachment 1, Request for Disposal (RFD)
- Attachment 2, Materials Listing and Disposition Record (MLDR)

EQUIPMENT

- Radio, telephone (communications should always be available)

PRECAUTIONS AND LIMITATIONS

- The transportation of hazardous material or hazardous waste in privately owned vehicles is prohibited.
- Only personnel with a completed RFD may discharge directly into the WIPP evaporation ponds, sewage lagoons or site manholes.
- The Sewage Lagoon and H-19 perimeter fence gate shall remain locked during all times when the area is unoccupied.
- Operations within the Sewage Lagoon fence area should be conducted during daylight hours whenever possible.
- All cuts, abrasions, and similar injuries must be promptly cleaned and treated by the site Health Services personnel or Emergency Services Technicians.
- Eating, drinking, smoking, and chewing are prohibited within the Sewage Lagoon fenced perimeter.
- Life jackets must be worn around the ponds in accordance with WP 12-IS.01-5, Section 3.9, Work Over or Around Water.

PERFORMANCE

NOTE

Sampling for the purpose of this procedure may occur prior to initiation of the RFD.

NOTE

Attachment 3, Waste Flow Chart is an example of the possible instruction for disposition, characterization, and tracking of site-generated wastes at the WIPP from the point of generation through final disposal.

1.0 DISPOSAL OF WASTE

1.1 Requestor, perform the following:

1.1.1 **IF** a material is no longer needed and can still be used for its intended purpose,
THEN exit this procedure and go to WP 15-PM3509.

1.1.2 Requestor/Generator, when a waste requires disposal, complete Section I of the RFD with the following information:

- The commercial or generic name of the material that requires disposal (e.g., hydraulic oil, condensate water)

- The physical form of the waste (solid, liquid, gas), check all that apply
- The location where the waste was generated and the process generating the waste (e.g., mine dewatering, demolition, spill cleanup)
- Material Safety Data Sheet (MSDS) information included (if applicable)
- The type of container in which the waste is located
- The number of containers to be disposed
- The size of the containers in weight or volume. If the final quantity will not be known until disposed, record the estimated volume or weight and note as estimated.
- Printed name, signature, and phone number of the person requesting the disposal and the date of the request

NOTE

If waste is known or suspected to be hazardous, it must be placed in the Hazardous Waste Staging Area (Area 474) or other 90 day hazardous waste area and properly labeled.

1.1.3 Attach supporting documentation, such as any applicable MSDS or evidence of process knowledge, to the RFD.

1.1.4 If the waste is generated from a Satellite Accumulation Area (SAA) and the container becomes full, write the accumulation start date on the container and ensure the container is transferred to the Hazardous Waste Staging Area (Area 474) or other 90-day hazardous waste area within 3 days.

1.1.5 **IF** the waste is a result of a spill cleanup activity,
THEN complete an RFD and attach a copy of Attachment 1, WIPP Hazardous Materials Incident Log, from WP 12-ER4902.

1.1.6 **IF** the waste is a rechargeable battery,
THEN refer to WP 02-RC3503 or contact SEC for disposal.

1.1.7 **IF** the waste to be disposed of is not specifically addressed by this procedure,
THEN contact SEC for appropriate guidance.

NOTE

The RFD and supporting documentation must never be left unattended (e.g., on top of unattended desk or file cabinet).

1.1.8 Deliver the RFD and supporting documentation to an SEC representative, (e.g., do not leave the RFD on an unattended desk).

1.1.9 For materials where volumes or weights are estimated in Section I of the RFD, provide the contractor's disposal ticket(s) and/or other available documentation for weight or volume of that waste stream to SEC when all materials have been disposed.

1.2 SEC, perform the following:

1.2.1 Record the date and time that the RFD was received in Section II of the RFD.

1.2.2 Review the information provided in Section I of the RFD and supporting documentation.

1.2.3 Based on the information provided in the RFD and supporting documentation, determine staging area requirements and record the staging area location in Section II of the RFD.

1.2.4 **IF** the waste is a low-level waste (LLW) or mixed low-level waste (MLLW),
THEN GO TO WP 02 RC3110.

NOTE

Steps in Sections 1.2.6, 1.2.7 and 1.2.8 may be performed in any order or may be performed concurrently.

NOTE

RFD and container numbers are of the following format: the two digit year followed by a dash and the next three digit sequential number. The first RFD and container number for the calendar year will be designated as XX-001.

1.2.5 Obtain the next sequential RFD from column 1 of the Materials Listing and Disposition Record (MLDR) and record the RFD number on the RFD and in column 1 of the MLDR.

1.2.6 SEC, perform the following:

[A] Obtain the next sequential container number(s) from column 2 of the MLDR and record the corresponding container number(s) on the RFD and in column 2 of the MLDR.

NOTE

The RFD number may be the same for several different container numbers (e.g., one RFD for 10 drums of the same type of waste).

[B] Label the container(s) with the container number, accumulation start date, and commercial or generic name of the waste on each container or provide a label to the requestor.

[C] Arrange for the waste to be transported to the following areas as described in the RFD, Section II.

- Nonhazardous waste (antifreeze, used oil, etc.) may be placed in the Nonhazardous Waste Staging Area (NWSA) (located southeast of Area 474).
- All hazardous waste, or waste that is being managed as hazardous pending analysis, will be placed in the designated location in the Hazardous Waste Staging Area 474 or other 90 day staging area, and labeled appropriately.
- All New Mexico Special Waste will be placed in Hazardous Waste Staging Area 474, or other area designated by SEC.
- All Universal Waste will be placed in a Universal Waste Staging Area (Area 474 A[c], the surface and underground tool cribs, Skeen-Whitlock Building, 401 N. Canal or other area designated by SEC).
- LLW and MLLW will be placed in Area 474 B[a] or other area designated by SEC.

[D] Prior to transporting the waste container to the appropriate staging area, inspect it for the following:

- The closure device is secure.
- The drum ring is installed correctly, if applicable.
- The bung caps are in place and tightened, if applicable.
- The lid is installed correctly, if applicable.
- The container is in good condition (e.g., metal drums do not show signs of compromised integrity due to rust or corrosion; fiber containers are not ripped or torn) and will provide containment and protection until waste is disposed.

[E] Deliver the waste to the specified staging area.

[F] Allow a minimum of two feet of space between spill pallets when placing waste at Area 474 or the NWSA.

[G] Provide the requestor with a replacement container, as necessary.

[H] Record the following information on the MLDR, columns 3 through 7. Record N/A when not applicable.

- Quantity - Amount of waste by weight or volume
- Waste Code - Applicable EPA waste codes
- Commercial or generic name of the waste material
- Staging Location - Location where the waste will be staged while awaiting disposal
- Accumulation Start Date - Date when waste accumulation began

1.2.7 SEC, perform the following:

[A] Request an evaluation of the materials/wastes from Radiological Technology for proper release requirements if the material is:

- A metal which is in or has been in the CH Bay, RH complex, or Radiation, Contamination, or Airborne Radioactivity Areas in the underground.
- Water which collects in the Waste Handling Building sumps.
- HEPA filters which are associated with Waste Handling Building or underground exhaust systems.
- Materials which could potentially or are suspected to be radiologically contaminated.

[B] **IF** a Radiological Technology review is not required, **THEN** check the appropriate box in Section II of the RFD, and sign and date the corresponding line, and **GO TO** Step 1.2.8.

[C] Rad Technology, review materials from Section I of the RFD.

[D] Rad Technology, check the appropriate box in Section III of the RFD and sign and date to acknowledge review of materials has been completed.

1.2.8 SEC, perform the following:

[A] Based on the information provided in Section I of the RFD, determine if sampling will be required to characterize the waste.

NOTE

SEC may determine when waste characterization sampling is required.

NOTE

Waste stream profile data must be up-to-date. Routine, active waste streams that have been previously characterized by sampling must be sampled and analyzed when analytical data is more than five years old to ensure that there have been no changes to the waste stream.

[B] Sampling may be required when an MSDS or process knowledge is unavailable and:

- Hazards of a waste stream are unknown
- Waste is from a new, uncharacterized waste stream with unknown hazards
- Waste stream profile data for a routine, active waste stream is more than five years old
- A process generating a routine waste stream has changed
- A non-routine waste stream with unknown hazards

[C] **IF** sampling is **NOT** required,
THEN GO TO Step 1.2.9.

NOTE

If the waste requires sampling and analysis to determine if it is hazardous, the waste must be managed as a hazardous waste pending analysis. All hazardous waste management requirements apply to the waste until analytical data indicates the waste is nonhazardous.

[D] **IF** sampling is required,
THEN contact a SEC sampling team member to perform the sampling event.

[E] Record the date the samples were collected and the sample ID numbers in the appropriate lines on the RFD.

[F] After sampling analytical data is received obtain a copy of the completed data validation and verification (V&V) form(s) from the sampling team.

1.2.9 Make a final waste determination based on the analytical results, process knowledge, V&V or MSDS and mark the appropriate box for the type of waste in Section II of the RFD and record the basis used to make the determination.

NOTE

Nonhazardous waste which does not require shipment off-site for disposal may be disposed of on-site in the construction landfill or in the evaporation ponds.

1.2.10 SEC, once waste determination has been made, record on the RFD the U.S. Environmental Protection Agency (EPA) Hazard Code(s) that apply to the waste or record N/A if not applicable.

1.2.11 Provide information on the RFD about how the waste is to be handled and any incompatibilities or precautions to be considered.

1.2.12 **IF** nonhazardous waste is to be disposed of on-site at the construction landfill or in the evaporation ponds,
GO TO Step 1.3 for guidance on construction debris disposal or Step 1.4 for guidance on waste water disposal and record disposal location on the RFD.

1.2.13 If waste is to be sent off-site for disposal, determine the desired waste disposal vendor and record the vendor name on the RFD.

1.2.14 For hazardous waste shipments, check that the vendor is currently on the WIPP Qualified Suppliers List (QSL).

NOTE

RFD must be signed by an SEC representative before waste is disposed. The SEC representative who signs must be different than the Requestor.

1.2.15 Print, sign and date the RFD when Section II of the RFD has been completed and analytical data has been reviewed, validated, and verified or process knowledge has been reviewed.

1.2.16 File the RFD and supporting documentation.

NOTE

If additional information or changes are added to the RFD after it has been signed, then the changes must be marked by initials and the date the changes were made.

1.3 SEC, for waste to be disposed in the construction landfill, **GO TO** WP 02-EC1108.

1.3.1 When disposal at the construction landfill is complete, record the waste disposition information corresponding to the RFD number on the MLDR, as follows:

- Record "CL" in Column 6.
- Record disposition date in Column 8.
- Record "N/A" in Columns 9, 11, 12, and 13.
- Record "WIPP" in Column 10.

1.3.2 Retain the RFD and Attachment 1, Construction Debris Disposal Sheet as a record.

NOTE

DP-831 allows for the discharge of up to 2,000 gallons per day (GPD) of nonhazardous brine waters to Evaporation Pond B of the WIPP sewage system, and up to 8,000 gallons per day of nonhazardous brine to the H-19 Evaporation Pond. These permitted effluents typically result from the pumping of groundwater observation wells around WIPP, mine dewatering activities, air compressor condensate and other nonhazardous sources.

NOTE

DP-831 requires that all waters being discharged be nonhazardous. Additionally, waste waters shall not be discharged into the sewer or evaporation ponds if they are of sufficient quantity or toxicity that they may interfere with the facultative functions of the lagoons. Wastes that are incompatible with the synthetic liners at the lagoons are not suitable discharge to the lagoon system or evaporation ponds.

1.4 SEC, perform the following for waste waters to be disposed in the evaporation ponds and site manholes:

1.4.1 Verify that documentation package is complete and includes the following:

- The completed and signed RFD

- A copy of analytical results or evidence of process knowledge

- The appropriate V&V forms

1.4.2 Check the MLDR to verify that the gallons to be disposed does not exceed the daily amount permitted as specified in DP-831.

1.4.3 After disposal of waste water in one of the evaporation ponds is complete, record the waste disposition information corresponding to the RFD number on the MLDR, as follows:

- Record "EP" and the number of the pond in Column 6.

- Record disposition date in Column 8.

- Record "N/A" in Columns 9, 11, 12, and 13.

- Record "WIPP" in Column 10.

1.4.4 Retain the RFD and associated documentation as a record, in accordance with the SEC Records Inventory and Disposition Schedule.

1.4.5 Personnel performing waste water discharge, perform the following:

[A] Carry a copy of WP 02-RC3108 and refer to it while performing this procedure.

[B] Carry a copy of the documentation package, which includes:

- The completed and signed RFD

- The analytical results or evidence of process knowledge

- The appropriate V&V forms

[C] Obtain key from Facility Operations to enter Sewage Lagoon fenced area and/or from Washington Regulatory and Environmental Services to enter the H-19 fenced area.

[D] Before disposing of water, verify that the label on the container coincides with the container number listed on the RFD.

[E] After disposal of waste water, ensure the gates are locked upon leaving the area and return the key to the appropriate organization.

2.0 SHIPPING OF WASTE

2.1 SEC, take a copy of the RFD to Transportation Operations.

2.2 Transportation Operations, **GO TO** WP 08-NT3103.

2.3 SEC, complete columns 8 through 12 , if applicable, of the MLDR after the waste has been shipped off-site with the following information:

- Disposition Date - date that waste was shipped off-site or disposed of on-site in the construction landfill or evaporation ponds
- Shipment Number - shipment number obtained from the Transportation shipping documents
- Carrier - the vendor that took the waste (can also be WIPP)
- Shipping Weight - total shipping weight of the waste
- Manifest Number - number obtained from shipping manifests provided by the vendor

3.0 RETURN OF HAZARDOUS WASTE MANIFESTS

3.1 SEC, record the date the returned manifest is received in column 13 of the MLDR.

3.2 SEC, if the manifest is not received within 35 calendar days of the waste shipment, perform the following:

3.2.1 Call the waste disposal vendor or transporter to determine the status of the hazardous waste shipment. Create a telephone log of the conversation and file it with the waste shipment paperwork.

3.2.2 If the vendor or transporter does not commit to providing the signed copy of the manifest within 10 days, notify the SEC manager and, if necessary, the U.S. Department of Energy Carlsbad Field Office (DOE/CBFO) of the status of the manifest and the vendor's explanation.

3.3 SEC, if the manifest is not received within 45 calendar days of the waste shipment, perform the following:

3.3.1 Prepare an exception report in accordance with the requirements of Title 40 CFR 262.42(2).

3.3.2 Notify the SEC manager and the DOE/CBFO of the status of the manifest.

3.3.3 Transmit the Exception Report to DOE/CBFO for submission to the EPA and to the New Mexico Environment Department.

3.3.4 File copies of the Exception Report and any supporting documentation with the waste shipment paperwork.

4.0 DEFINITIONS

- Accumulation Start Date - The date that waste accumulation starts. For an SAA container this is the date that the container becomes full. For containers not from an SAA, this is the date that waste is first put into the container.

- Construction and Demolition Debris - Nonhazardous, non-water soluble materials generated from construction or demolition of structures or from land clearing activities.

    - Includes, but is not limited to, steel, glass, brick, concrete, asphalt roofing materials, pipe, gypsum wallboard and lumber, rocks, soil, tree remains, and other vegetative matter

    - Does not include asbestos-containing materials, liquids, waste paints, solvents, sealers, adhesives, or potentially hazardous materials

- Hazardous waste - Waste is considered hazardous if it is listed in 40 CFR 261, Subpart D or is ignitable, corrosive, reactive, or toxic.

- Low-level waste - Radioactive waste that is not high-level radioactive waste, spent nuclear fuel, transuranic waste, byproduct material, or Naturally Occurring Radioactive Material.

- Mixed low-level waste - LLW that also contains at least one hazardous component subject to the RCRA.

- New Mexico special waste - The following types of solid wastes (as defined in 20.9.2 NMAC) that have unique handling, transportation, or disposal requirements to assure protection of the environment and the public health and safety:

    - Treated formerly characteristic hazardous waste (TFCH)

    - Asbestos waste

    - Infectious waste

- Sludge
- Industrial solid waste
- Spill of a chemical substance or commercial product
- Dry chemicals, which, when wetted, become characteristically hazardous
- Petroleum contaminated soils

* WIPP Contractors - The WIPP Managing and Operating Contractor and affiliated organizations.
* Sanitary waste - Nonhazardous, non-liquid waste generated at the site which is appropriate to be disposed of at the municipal landfill.
* Universal waste - any of the following hazardous waste that are subject to the universal waste requirements of 40 CFR Part 273 which includes batteries, pesticides, thermostats, lamps.

Attachment 1 - Request for Disposal

RFD # ____________
(SEC USE ONLY)

This form must accompany waste to be disposed of by the WIPP site. Fill out completely.

SECTION I
(FOR REQUESTOR USE ONLY)

For large volumes of waste where difficulties exist for quantity estimation (i.e., well development, roll-offs) see Steps 1.1.9 and 1.2.3.

Commercial or generic name of waste: ____________

Waste Form: ☐ Solid ☐ Liquid ☐ Gas

Location of and process generating the waste: (e.g., SAA, maintenance) ____________

MSDS attached? ☐ Yes ☐ No If no, explain ____________

____

Container type: ☐ Metal drum ☐ Plastic container ☐ Box ☐ Can ☐ Other (specify): ____________

Number of container(s):____________ Size of container(s): (weight or volume) ____________

Requestor: ____________

Printed name | Signature | Date | Phone

SECTION II
(FOR SEC USE ONLY)

RFD received by SEC personnel: Date: ____________ Time: ____________

Staging location: ____________ Container(s) #: ____________

Sampling required? ☐ No
☐ Yes If yes, date samples collected:____________ Sample ID # ____________

Rad review required? ☐ Yes ☐ No ____________

SEC Signature | Date

Basis of determination: (i.e., analytical data, process knowledge, MSDS, etc.) ____________

EPA Hazard code(s): ____________

Handling Instructions: ____________

____

Vendor or Disposal Location: ____________

SEC Representative: ____________ ____________ ____________

Printed name | Signature | Date

Attachment 1 - Request for Disposal

SECTION III (FOR RADIOLOGICAL TECHNOLOGY USE ONLY)		
☐ Material may be released without radiological controls.		
☐ Material may be released for reuse or disposal but not for metal recycle.		
☐ Material may not be released as non-radioactive materials.		
Rad Tech Representative:

Corrective Action Plan for Finding I08-03-F-02

Corrective Action Plan for WIPP Form 08-025, CTS item 30964

Revision one

Issue Being Addressed

Finding I08-03-F-02 relates to instances of procedural non-compliance.

(1) Procedure WP 02-RC3108 *Request for Disposal* indicates that if material is to be sent offsite for disposal, the vendor is to be listed on the QSL. Brine waters were sent to Sundance, a non-hazardous waste disposal vendor, that had been graded QL 0, resulting in the removal of Sundance from the QSL.

(2) Procedure WP 02-EC.06, Table 2 notes a list of analysis that are "required" for site effluents. The entire list of analyses was not conducted for all site effluents.

(3) Procedure WP 02-EM1016 states that air compressor condensates require an Authorization to Discharge (ATD) before they are discharged to the sewage system. ATD's are not being generated for these effluents, and at this time no exemptions are described.

Cause of the Issue

(1) Personnel did not check the QSL vendor list to assure that Sundance was still on the list prior to sending non-hazardous brine water off-site for disposal.

(2) Complete analysis of Site Effluent specified in WP 02-EC.06 Table 2 was not performed prior to disposal; a subset of the analyses list was used for characterization which did not include some listed analysis. The table heading with "required" leads a reviewer to expect that all analyses listed in the table are required for each characterization; this was not the intent.

(3) ATD's have not routinely been generated for the disposal of non-hazardous air compressor condensate, as required in WP 02-EM1016.

All three of the issues being addressed have a common cause, which is failure to follow all of the procedural requirements.

Extent and Impact Cause

Although no hazardous wastes have been disposed of inappropriately and the three disposal topics listed have not contributed to improper disposal, the extent of the problem warrants immediate attention, even though other disposals were in compliance with NMED regulations. A continuation of these practices could have significant impact to the facility and needs to be corrected.

Corrective / Preventive Actions Planned

Site Environmental Compliance and Environmental Monitoring and Hydrology have reviewed the listed procedures, regulatory requirements, and best management practices to determine the retraining requirements that will ensure

WF08-025

REVISION ONE

personnel follow the procedural requirements. The procedures will be modified to more clearly define the requirements.

- Combine procedures (WP 02-EM1016 and WP 02-RC3108) into one procedure and train personnel to follow the specific requirements in the revised procedures. The procedures will be combined and personnel will be trained.
  Due Date July 31, 2008
- The offsite non-hazardous waste disposal vendor has been reinstated on the QSL (March 26, 2008). Completed March 26.2008
- WP 02-EC.06 Table 2 lists "Required Analysis" for site effluents, which includes analyses that are not necessary for characterizing all waste streams. This procedure has been revised.
  Completed March 1, 2008
- ~~WP 02-EM1016 indicates that condensates from air compressors require an ATD before they are discharged into the sewage system. WP 02-EM1016 condensate discharge requirements will be followed.~~
  ~~Due date June 31, 2008~~

WIPP Site Effluent and Hazardous Materials Sampling Plan

Cognizant Section: Site Environmental Compliance

Approved By: Stewart Jones

material give the sampler an idea of what the composition might be, making it easier to determine the analyses needed to be conducted by the analytical laboratory.

5.1.1 pH Measurement

In most cases, the pH will be measured by the contract laboratory. For purposes of shipping, pH may be measured in the field using pH strips. As required, the pH of a substance may be measured per WP 02-EM1005, Groundwater Serial Sample Analysis, or applicable instrument instructions. The pH can be measured only if the sample media is aqueous or multiphase with the aqueous part of the sample media being at least 20 percent of the total volume.

5.1.2 Temperature Measurement

When it is necessary to determine the temperature of a substance, it will be measured per WP 02-EM1005 or the applicable instrument instructions.

5.1.3 Conductivity Analysis

When it is necessary to determine the conductivity of a solution, it will be measured per WP 02-EM1005 or the applicable instrument instructions.

5.2 Qualitative and Quantitative Analyses

Sample analyses must be specified on the Request for Analysis (RFA) form sent to the contract laboratory with the samples. Common analyses are listed in Table 2. The contract laboratory will be responsible for providing the results to the qualitative and quantitative analyses according to their contract. SW-846 methods, when available, are suggested for analyses of all parameters. The contract laboratory may deviate from SW-846 if the laboratory method is at least as accurate as the suggested SW-846 method. The contract laboratory shall present the deviations from SW-846 for approval at the time of contract placement.

6.0 TRANSPORTATION [6,7]

6.1 Shipment of Samples for Laboratory Analysis

Samples being transported to a laboratory for the purpose of testing to determine their characteristics or composition are exempted from RCRA regulations under 40 CFR §261.4(d), "Exclusions." However, sample shipment shall be coordinated with Transportation Operations to ensure that the applicable U.S. Department of Transportation (DOT) regulations for packaging and shipping have been met. Shipments of samples that are hazardous materials as defined by the DOT will be completed in accordance with WP 08-NT3101, Shipment of Nonradioactive Hazardous Materials, or WP 08-NT3110, Shipment of Radioactive Materials. Verification of this process shall be indicated by a signature from a designated Transportation Operations representative on the Shipping Authorization form in accordance with WP 15-PM3525.

Table 2 - Common Analytical Parameters

Program	Potential Analyses
Hazardous Waste Characterization	- pH - Ignitability - TCLP metals, semivolatiles, and volatiles - TSS - TOC
Soil Samples	- Na - Mg - Cl - Ca - K - Metals, if applicable - Oil and Grease, if applicable
Site Effluent	- Metals - pH - Conductance - TOC - Volatiles - Semivolatiles
TRU-Mixed Waste Samples	- pH - Ignitability - TCLP metals and organics - TSS - TOC - Gross alpha and gross beta/gamma - PCBs

WIPP Discharge to Evaporation Pond H-19 Root Cause Analysis Report

Washington
TRU Solutions LLC

QA:08:00036
UFC:2300.00

INTER-OFFICE CORRESPONDENCE

DATE: February 15, 2008

FROM: C. E. Nesser — LOCATION: Assurance Programs

TO: W. M. Wierzbicki ED — LOCATION: Washington Regulatory Environmental Services (WRES)

SUBJECT: WIPP DISCHARGE TO EVAPORATION POND H-19 ROOT CAUSE ANALYSIS REPORT

This correspondence transmits the final Root Cause Analysis Report on the WIPP Discharge to Evaporation Pond H-19. This Report is the result of an investigation conducted by an appointed Root Cause Analysis Team (RCAT) and each member on the RCAT has concurred with the content of the Report.

The root cause was identified by the RCAT as failure to follow procedures.

Eight recommended corrective actions were identified by the RCAT to prevent recurrence.

If you have any questions or comments regarding this Root Cause Analysis Report, please contact me at Extension 8376.

ROOT CAUSE ANALYSIS REPORT

WIPP Discharge to Evaporation Pond H-19

Washington TRU Solutions LLC
February 14, 2008

1. Executive Summary

This Root Cause Analysis addresses issues surrounding and leading to the November 9, 2007 disposal of approximately 150 gallons of water into the H-19 Evaporation Pond (EP) without following a requirement defined in Technical Procedure WP 02-EM1016, *Request to Discharge to Evaporation Ponds.*

Technical Procedure WP 02-EM1016, requires that prior to discharge into H-19, Washington Regulatory and Environmental Services (WRES) Environmental Monitoring and Hydrology (EM&H) and Site Environmental Compliance (SEC) authorize the discharge and document the authorization on Attachment 1 to the procedure. These authorizations were not obtained.

The unauthorized disposal of 150 gallons of leaded brine water in EP H-19 was documented through the WIPP Form process (WP 04-IM1000, *Issues Management Processing of WIPP Forms* [WF]), on WF08-011. WIPP Form 08-011 was evaluated by Quality Assurance (QA) Management, and determined not to be a Significant Condition Adverse to Quality (SCAQ).

WRES SEC, the organization cognizant over the evaporation ponds, requested a QA audit of the Hydrology and Water Management program. Audit I08-03, *Hydrology and Water Management*, was completed on December 20, 2007. This audit was performed to evaluate the implementation effectiveness of established programs, procedures, processes, and practices for compliance with WIPP Procedure (WP) 13-1, *WTS Quality Assurance Program Description*, Revision 26, and requirements from other applicable regulations and procedures.

The results of audit I08-03 indicate that although portions of the system for collection, characterization, sampling, analysis, and disposal of site-generated effluent waters are effectively implemented, some weaknesses exist in the procedural guidance and implementation of the system.

This audit resulted in the identification of two findings, related to recording of information taken during the water sampling process, one condition corrected during the audit (CDA), and one observation. The two findings were documented on WIPP Forms WF 08-024 and WF 08-025, both issues were determined to be Significant Conditions Adverse to Quality (SCAQs), according to the following criteria, as defined in WP 13-1, *WTS Quality Assurance Program Description*, Section 1.3.4.2, Revision 26, *Significant Conditions Adverse to Quality*:

- If uncorrected, could lead to a serious effect on safety/operability, the ability to isolate waste, TRU waste site certification, regulatory compliance demonstration, or effective implementation of the QA program (WF08-024); or
- Constitutes an adverse trend or inclination, as determined by formal performance evaluation and trend analysis (WF08-024 and WF08-025).

Per WP 04-IM1000, Attachment 2 - *Response to SCAQ WIPP Forms*, Section 1, "SCAQ WIPP Forms require the initiation of a CAP and completion of an evaluation, which includes the documentation of a formal root cause analysis in accordance with WP 13-QA3016."

The Root Cause Analysis Team (RCAT) identified several significant contributing factors that led to the inappropriate disposal of leaded brine water into EP H-19. However, the root cause was determined to be a failure to strictly adhere to procedure.

1.1 Introduction

This root cause evaluation was chartered by the WRES management team to review the circumstances regarding the release of water taken from the Exhaust Shaft Intercept Borehole Collection System that was discharged into EP H-19, November 9, 2007, without utilization of available analyses, and prior to completion of required documentation.

Prior to the initiation of this root cause evaluation, an audit was performed by the WTS Quality Assurance group. This audit concentrated on the evaluation of the collection, sampling, analysis, and disposal of site-generated effluent waters. The findings and observations noted in this audit are currently being tracked on WTS corrective action documents and will be referenced in this report but the actions will not be duplicated as open actions.

Interviews were conducted with WRES management personnel that had direct responsibility for the environmental program, as well as with personnel responsible for the technical basis aspects daily program operations, and maintenance of the program. An understanding was gained as to such aspects as knowledge base of assigned personnel, clarity of procedural guidance, personnel interaction related to the sampling, tracking, testing, release and documentation of the site effluent water.

2.0 Similarity with Other Events or Incidents

During Internal Audit I08-03, *Hydrology and Water Management*, 127 data packages were reviewed to verify that documents were completed in accordance with procedure requirements. A pattern of instances between January 2006 and October 2007 were identified, in which omissions to documents associated with the sequence of identifying specific effluent waters, discharge requests, authorizations, and annotations of disposal and failure to follow relative procedure(s) were identified. The identified issues can be generally categorized as:

- Failure to follow process sequence as defined by procedure;
- Incomplete documentation of discharge events; and
- Omission of a required document in (reviewed) data packages.

Although instances of failure to follow procedural requirements were identified, during interviews, it was noted that no other discharges of unallowable materials into EP H-19 have occurred.

3.0 Facts

Procedures used to perform sampling and disposal functions are:

WP 02-RC3108, Revision 6, November 21, 2006, *Request for Disposal*
WP 02-RC3108, Revision 7, Draft, *Request for Disposal*
WP 02-EM1016, Revision 2, June 29, 2004, *Request to Discharge to Evaporation Ponds*
WP 02-EC1001, Revision 6, February 28, 2006, *Characterization Sampling, Shipping, and Documentation*
WP 02-EC.05, Revision 4, April 12, 2006, *Quality Assurance Project Plan for WIPP Site Effluent and Hazardous Materials Sampling*
WP 02-EC.06, Revision 6, April 5, 2006, *WIPP Site Effluent and Hazardous Materials Sampling Plan*
WP 02-EM.02, Revision 2, December 12, 2005, *Integrated Sample Control Plan*

The groups involved with the incident include members of WRES SEC, WRES EM&H, WTS Engineering/Geotechnical Engineering, and WTS Radiological Services/Emergency Management (Environmental Safety and Health Technician). The Environmental Safety and Health Technician performs most water hauling/discharge duties for the site. This team configuration is typical for performance of water sampling and discharge activities.

Training records for primary personnel in this event were reviewed during Internal Audit I08-03. Qualification for specific individuals to STC-01, *Sampling Team Coordinator*; and ST-01, *Sampling Team Member*, were found to be current.

Events, as understood via personnel interviews occurred in the following sequence:

Date/Sequence	Event
June 29, 2004	WP 02-EM1016, Revision 2 effective
September 23, 2005	DOE Letter to NMED regarding sampling analysis, and disposition of brine water
November 21, 2006	WP 02-RC3108, Revision 6 effective
October 29, 2007	RFD #07-146, Section 1 of Attachment 1 completed, Section 2 signed (by SEC), although analytical results of test were not known
October 30, 2007	Samples were collected and transferred to the contract analytical laboratory
November 8, 2007	(The form) *Authorization to Discharge Nonhazardous Effluent into the WIPP Sewage Treatment Facility* (WP 02-EM1016, Attachment 1 / authorized by SEC (Section 3 not signed, no EM&H authorization to release).
November 9, 2007	Received Trace Analysis' "Analytical and Quality Control Report" Work Order #7110117 / Sample #141417 Results of brine analysis received, and Section 2 of Attachment 1 completed (first analysis)
November 9, 2007	150 gallons of the 560 gallons of brine discharged into EP H-19
November 14, 2007	Received Trace Analysis' "Analytical and Quality Control Report" Work Order #7110117 / Re-run values
November 14, 2007	RFD #07-146 date revised to show date of second analytical receipt
November 28, 2007	Remaining brine drummed, RFD #07-163 initiated to ship material off-site to Veolia Environmental

Interviews with cognizant individuals indicated that the discharge into EP H-19 involved Exhaust Shaft Intercept Borehole water. Water accumulation for this area is checked on a weekly basis by cognizant individuals (WRES SEC, or WTS Geotechnical Engineering). Water is sampled after it has collected for 45 days (accumulation start date is determined by instrumentation, and entered into Attachment 1 of WP 02-RC3108). Toxic Characteristic Leaching Procedure results are typically returned from the contract analytical laboratory within two weeks.

During an interview, as part of the RCA process, the Technician indicated that he was working under heavier than normal schedule pressure, and had a large quantity of 700 fan collection water along with

Sandia National Lab (SNL) water to discharge. Discharge of SNL well water is a typical activity, which is coordinated by WRES.

On November 9, 2007 the individual (SEC) that performs the majority of RFD data package development and release was away from the office, but stated that the data package had been left in the Environmental Safety and Health Technician's chair. An email from the analytical lab (Trace Analysis) was received by SEC on November 9, 2007, and indicated that the analyzed sample tested slightly high in lead content. This information was not immediately relayed to the Technician, because it was presumed that he was discharging 700 fan and SNL water first, and there would be sufficient time to contact him later in the day.

It was observed by interviewees, that the containers used to haul the water for discharge are not clearly identified as to origin (700 fans, SNL, exhaust shaft borehole, etc.). Only one container was available at the time of the incident, and the Technician was not aware that the water was from the Exhaust Shaft Intercept Borehole, but assumed that he was discharging water collected from the 700 fan(s). Although pumping of the container had begun, the Technician noticed that the quantity of water to be discharged was different than that normally discharged from 700 fan accumulation. At that point, the Technician attempted to get analysis information and direction from alternate SEC personnel, via cell phone communication.

SEC was able to relay to the Technician that the water had high lead content, and the Technician had already stopped pumping. It was reported by all interviewees that cell phone communications were poor.

In the proper sequence of events, the Technician acknowledged that the last form he completes for a discharge event is the *Authorization to Discharge Nonhazardous Effluent into the WIPP Sewage Treatment Facility* (WP 02-EM1016, Attachment 1). Although the data package relative to this incident was not carried with the container to the discharge site, the Technician stated that he now recognizes that all required forms (or copies) should be carried with the container for discharge.

The personnel involved with this event were qualified and experienced in the task(s) being performed. However, the RCA Team found that the approvals required for discharge in this incident, and previous discharges (as discussed in Internal Audit I08-03), were non-sequential. Documentation of approvals and dates was not accurate (also addressed in I08-03).

Interviewees noted that human performance issues also contributed to the incident. The Technician indicated that he was distracted by the significant, unanticipated illness of an immediate family member, and experienced additional stress due to perceived schedule pressure (SNL and 700 fan water discharge).

The cognizant SEC representative and the Technician stated that the incident was immediately reported to SEC management.

4.0 Analysis Tools

WP 13-QA3016 directs that one or a combination of methods be used depending on the circumstances. A combination of analysis tools was used to ensure that all relevant areas were appropriately evaluated. The analysis tools used were the TapRoot Analysis, Phoenix Analysis, and Barrier Analysis processes.

The TapRoot Analysis system is based on laws, rules, and theories of human and equipment performance and the application of these rules to performance improvement. The Phoenix Analysis process looks from a broad perspective, allowing the use of the best available information to ensure that significance is adequately analyzed. The Barrier Analysis method focuses on the barriers (physical, administrative, and procedural controls) that should have prevented the nonconformances from occurring.

THE TAPROOT ANALYSIS

The TapRoot Causal Tree Analysis method is generally advantageous for obtaining insights into factors influencing the performance of activities, e.g., work environment and management interaction. It offers clear traceability for human performance, work direction, management systems, training, and components that were particularly applicable to this event.

Factors	Conclusion
Procedures (failure to follow procedure was determined to be the root cause of this incident.) Quality Control (contributing factor)	• WP 02-RC3108, R/6, §1.1.10, requires that the RFD and required documentation, be hand-carried to SEC, and not left at an unattended desk (issue: forms left in Technician's chair). • WP 02-EM1016, R/2, §1.3.3, requires that the requestor (Technician) verify the documentation package is complete, and states that the requestor is not to proceed until the package is complete (issue: forms not completed in sequence / analysis information not in package at the time of the incident. Non-sequential approval dates in data packages has been a recurring issue). Procedures used in this process are generally well developed, and have been in continuous use for several years. There are, however, areas in which procedures steps were not followed, or in which the process could be strengthened: • The RCA Team observed that a final hold point is not yet procedurally required. However, an independent review of data packages prior to discharge would help ensure that the packages are complete and accurate. • The RCA Team observed that additional, random independent review of data packages prior to discharge would provide additional assurance.
Training (contributing factor) Communications (contributing factor)	• All personnel directly involved in the inappropriate discharge into EP H-19, are trained and qualified for the activity. Most of the involved personnel have performed data package preparation and water discharge functions as a regular part of the job function. One individual is trained and qualified, as required, but serves as an alternate to the cognizant individual, and has had few opportunities to perform the required SEC function(s). • Although the process is proceduralized, per interview with SEC personnel, performance of the job was taught with "tribal knowledge." • SEC personnel and the Technician are provided with cell phones. However, this specific geographical area has poor cell phone reception, and communications

Factors	Conclusion
	during this event were hampered, thereby impacting relay of significant information.
Management System (contributing factor) Work Direction (contributing factor)	• During interview, the Technician indicated that he experienced stress due to perceived schedule pressure to discharge SNL, 700 fan, and borehole water. • It was observed (as noted in I08-03) that incomplete and/or non-sequentially completed/signed authorization documents are part of data packages dating back to 2006, indicating that there has been insufficient independent or management oversight of the data package preparation. • Via interview, the RCA Team determined that team communications and turnover of responsibilities are insufficient. • During interview, the Technician indicated that he was distracted/stressed due to the significant, unanticipated illness of an immediate family member.
Human Engineering (contributing factor)	• Per interview, containers used to store/transport water for discharge are not thoroughly identified as to location of source. • Per interview, placement of the water trailers with non-hazardous water is a concern, and it is proposed that all trailers be parked in a designated area.

THE PHOENIX ANALYSIS

Eight Question Analysis	
Impact	
Consequences (Tangible and intangible adverse effects)	Potential: • Diminished stakeholder confidence • Increased oversight by Customer/Stakeholder • Increase in equipment costs due to water holding requirements
Significance (What does this mean for the future of the facility?)	Potential: • Diminished stakeholder confidence • Increased oversight by Customer/Stakeholder • Increase in equipment costs due to water holding requirements
Influences on Consequences	
Vulnerability (What set us up for this event?)	• Inadequate procedures / failure to comply with procedures • Complacency • No independent verification • Distraction • Inadequate information turnover • Perceived schedule pressure

	• Poor communication
Trigger (What put the ball in motion?)	• Procedure not followed • Perceived schedule pressure • Primary SEC personnel unavailable • Complacency
Exacerbation (What made the consequences as bad as they were?)	• Analytical report showing high level of lead available, but not utilized prior to discharge • Poor communication
Mitigation (What kept the consequences from being a lot worse?)	• Technician recognition of adverse condition • Self-reported
Close Out	

Lessons to be Learned (What skills, rules, and knowledge should be added or reinforced?)	• Improved Management Assessments
	• Management walkdown of processes
	• Implement pre-job briefings / SEC and EM&H Plan of the Day
	• Attention to detail
	• Completion of forms
	• Clarifying responsibilities in procedures (WP 02-EM1016, WP 02-RC3108)
	  o Procedural ownership
	  o taking documentation to worksite
	  o sequential step(s) completion
	• Information turnover process

Corrective Actions (What conditions and behaviors should be changed?)	• Improve identification of containers (include RFD number, etc.) • Improve scheduling • Consider establishment of a locking process for trailers to verify accuracy and completion of discharge documentation • Reinforce employee authority/accountability • Improve communication (process and equipment) • Clarification of sampling requirements for all materials • Independent Verification • Implement SEC and EM&H Plan of the Day • Consolidation of records • Add field for RFD number to WP 02-EM1016, Attachment 1 • Clarify the date to be disposed by on WP 02-EM1016; Attachment 1 (vs. signature date) • Other corrective actions are being addressed as a result of WTS Internal Audit I08-03.

The Phoenix Analysis reflected the following causal factors:

1. Failure of barriers – procedures, communication, etc.
2. Changed process – primary assigned SEC off-site
3. Lack of pre-job briefings
4. Failure to adhere to procedural requirements
5. Complacency

THE BARRIER ANALYSIS

Barriers are controls that should have prevented the nonconformance from occurring. Barriers generally fall in the following categories: equipment, design, administrative (procedures and work processes), supervisory/management, warning devices, knowledge and skills, and physical. The principle benefits of barrier analysis are that it identifies safety system elements that failed, and the results can be succinctly presented.

Barrier	Conclusion
Barrier 1 – Standards, Policies, Procedures/ Administrative Controls	Barrier failed – Cognizance for elements of collection, sampling, and discharge of materials into the evaporation ponds falls under four distinct and organizationally separate groups: WRES Site Environmental Compliance, WRES Environmental Monitoring and Hydrology, WTS Site Operations and Disposal/Environmental Monitoring Support, and WTS Engineering/Geotechnical Engineering. Communication among to the organizations appears to be sufficient. • There has been inadequate management supervision of the water sampling and discharge process, as evidenced by the recurring instances of failure to follow the sequential order of applicable procedures. • There has been inadequate management attention to the scheduling of water discharge events. The Technician in this incident perceived pressure to expedite discharge of SNL water. • There is inadequate opportunity for independent verification that forms are complete and appropriate authorization attained prior to discharge of materials (procedure). • The containers to be discharged were identified, but not clearly or distinctively). • The Technician did not verify the information about the water, and did not carry the data package to the discharge point. There is no procedural requirement for the Technician to carry the documentation to the discharge point.
Barrier 2 – Communications	Barrier failed – • An assumption was made by a SEC representative that there was no urgent need to provide the Technician with lab analysis information. • Cell phone communications were poor due to reception quality.
Barrier 3 – Turnover of Information	Barrier failed – • Although the procedure requires hand delivery of the data package/forms, the data package for the leaded brine water was left at the Technician's (unattended) desk. • Although trained/qualified, the alternate SEC

Barrier	Conclusion
	representative has had little experience in preparing data packages for discharge events. • An assumption was made by a SEC representative that there was no urgent need to provide the Technician with lab analysis information.
Barrier 4 – Attention to Detail	Barrier failed – • As evidenced in I08-03, inattention to detail has been an issue for the past 18 months (forms not completed in sequential order, all required documentation not attached to RFD, etc.). • There is no procedural requirement for independent verification of completion and accuracy of data packages prior to discharge of materials.

4.1 Summary of Causes and Recommendations

The three methods of analysis used resulted in identification of the following causes:

Procedures (failure to follow procedures/inadequate procedures)
Quality Control (no independent verification/hold points)
Communications (equipment/timeliness)
Management System (schedule pressure, inadequate oversight of process)
Work Direction (Inadequate information turnover)
Human Engineering (complacency, distraction)

4.1.1 Contributing Causes

- Management System
- Work Direction
- Communications
- Human Engineering

4.1.2 Root Cause

- Failure to follow procedures

5.0 Conclusions

This analysis included the use of multiple analysis tools and identified similar causes. The RCA Team determined that the root and contributing causes have been adequately identified (as noted above). If the contributing causes are effectively addressed, the Site Environmental Compliance and Environmental Management and Hydrology program(s) can be greatly improved. However, the recommended actions will require significant management focus to ensure effective implementation.

6.0 Corrective Actions

Corrective Action recommendations include:

- Improved Management Assessments
- Clarification of procedures
  - ownership and responsibilities in procedures (WP 02-EM1016, WP 02-RC3108)
  - enforce attention to detail (implement independent verification of forms for accuracy/completion prior to discharge of materials)
  - Enforce sequential completion of forms/approvals
  - taking documentation to worksite
  - sequential step(s) completion
- Improve communication (process and equipment)
  - Implementation of pre-job briefings (procedure revision)
  - Information turnover process (Procedurally, RFDs are to be hand-delivered, and not left at an unattended desk.)
- Improve identification of containers (enhance the clarity and visibility of identification)
- Improve scheduling (management attention to scheduling of activities requiring the same personnel)
- Consider establishment of locking process for trailers
- Reinforce employee authority/accountability
- Other corrective actions are being addressed as a result of WTS Internal Audit I08-03.

Washington Regulatory and Environmental Services Management Assessment Report May 2008, WRES MA SEC-08-008

Washington

Regulatory and Environmental Services
(an affiliate of Washington TRU Solutions LLC)

WRES:08:551
UFC:2300.00

INTER-OFFICE CORRESPONDENCE

DATE: July 17, 2008

FROM: S. B. Jones, Manager S B Jones LOCATION: Site Environmental Compliance

TO: W. M. Wierzbicki, Manager LOCATION: Washington Regulatory and Environmental Services

SUBJECT: Washington Regulatory and Environmental Services Management Assessment Report May 2008, WRES MA SEC-08-008

The purpose of this correspondence is to transmit the management assessment report for Washington Regulatory Environmental Services Site Environmental Compliance (SEC) MA SEC-08-008. This assessment was to determine readiness to initiate disposal of non-hazardous water in the H-19 evaporation pond or offsite at a commercial disposal facility.

The final report is comprised of this communication and the supporting Attachments. It summarizes the process used for conducting the assessment and resulting conclusions. This assessment was performed in alignment with WP 15-GM1000, Management Assessment and assessment guidance available on the WIPP intranet. It also utilized a graded approach in completing the appropriate level of readiness review for these two processes.

Assessment Process

The management assessment was performed from May 1 through May 31, 2008 under the direction of the readiness review administrator, Gene Valett. The assessment completed an in-depth review of the state of readiness for disposal of non-hazardous water prior to re-initiating disposal operations. This assessment was completed in two phases, the first phase focused on onsite disposal while the second phase focused on offsite disposal. Each phase focused on confirming the following eight criteria:

- Manpower identified and in place
- Equipment readiness
- Tools and Supplies in place
- Plans and Procedures ready to use
- Personal Protective Equipment is identified and ready
- Notifications have been given
- Methods of communication are in place
- Corrective actions are completed (onsite disposal only)

The detailed list of the readiness review criteria is included as Attachment A. These criteria corresponded to multiple items from WIPP's MA Guidance documents 001, 002, 005, 006, 007, 009, and 010.

The full range of assessment methods were utilized including visual inspection, interviews, and review of documents and records. WRES and WTS personnel participating in the disposal processes were identified and involved in completing the assessment. Personnel involved are listed in the following table. A WRES staff member, independent of the waste disposal processes, verified the results of the review on May 14, 2008 and May 29, 2008.

Personnel Participating in Review

Name	Process Role
Gene Valett	Readiness Review Administrator
Stewart Jones	Manager, Site Environmental Compliance
Joel Siegel	Manager, Environmental Monitoring and Hydrology
Miriam Whatley	Independent Verifier
On-Site Disposal of Non-Hazardous Water Process	
Rick Whiteley	Owner
Bill Jaco	Owner Backup
Danny Contreras	Bargaining Unit Operator
Parrish Roush	Participant
Jimmy Neatherlin	Participant
Steve Travis	Participant
Kristine Nelson	Participant
Judy McLemore	Participant
Mel Balderrama	Participant
Richard Jimenez	Participant
Rick Salness	Participant
James Maly	Participant
Off-Site Disposal of Non-Hazardous Water Process	
Rick Salness	Owner
Rick Whiteley	Owner Backup
Aurelio Rivas	Bargaining Unit Operator
Jimmy Neatherlin	Participant
Steve Travis	Participant
Greg Jungclaus	Participant
Mel Balderrama	Participant

Assessment Results

Site readiness for disposal of non-hazardous water was demonstrated with objective evidence consolidated and documented and retained in the MA file. There were three items that had not been closed at the completion of the assessment. Each of these items was determined to not be critical to complete prior to initiating disposal. Copies of the readiness review summaries are included as Attachment B.

Results for onsite disposal and for offsite disposal were reviewed by the Readiness Review Administrator with WRES Managers for SEC and Environmental Monitoring & Hydrology on May 14, 2008 and May 29, 2008 respectively.

Please call me at extension 8293 should you have any questions.

SHIPMENT OF WATER FOR OFF-SITE DISPOSAL

READINESS REVIEW CRITERIA FOR
ON-SITE DISPOSAL OF NON-HAZARDOUS WATER
AND
SHIPMENT OF WATER FOR OFF-SITE DISPOSAL

1.0 <u>On-Site Disposal of Non-Hazardous Water at H-19 is Ready</u>

1.1 Manpower is identified and in place.
- 1.1.1 Process owner is identified
- 1.1.2 Support staff is identified
- 1.1.3 Bargaining Unit operator is identified

1.2 Equipment is ready.
- 1.2.1 Collection containers ready to use
  - 1.2.1.1 Containers inspected
  - 1.2.1.2 Containers on-site
- 1.2.2 Trailers
  - 1.2.2.1 Trailers inspected
  - 1.2.2.2 Trailers on-site
- 1.2.3 Truck with hitch
  - 1.2.3.1 Truck with hitch inspected
  - 1.2.3.2 Truck with hitch on-site

1.3 Tools and supplies are in place.
- 1.3.1 Pumps ready to use
  - 1.3.1.1 Pumps inspected
  - 1.3.1.2 MSDSs identified and in place
  - 1.3.1.3 Fuel for pumps properly contained
  - 1.3.1.4 Pumps on-site
- 1.3.2 Hoses
  - 1.3.2.1 Hoses inspected
  - 1.3.2.2 Hoses on-site

1.4 Plans and Procedures are approved and ready to use.
- 1.4.1 02 EM 1016 (Request to Discharge to Evaporation Ponds; Rev. 2)
  - 1.4.1.1 Document package completeness verified
  - 1.4.1.2 Assemble document package
    - 1.4.1.2.1 Request for Disposal form
    - 1.4.1.2.2 Analytical results or evidence of process knowledge
    - 1.4.1.2.3 Completed and signed Attachment 1 "Authorization to Discharge Non Hazardous Effluent in the Sewage Treatment Facility"
  - 1.4.1.3 Owner training complete
  - 1.4.1.4 Participants training complete

1.4.1.4.1 Support staff training complete
1.4.1.4.2 Bargaining Unit operator training complete
1.4.1.4.3 Bargaining Unit qualifications in place
1.4.1.5 Approved procedure in place

1.4.2 02 RC 3108 (Request for Disposal; Rev. 6)
1.4.2.1 Attachment 2 of 02 RC 3108 complete
1.4.2.2 RFD and attachments hand delivered to SEC
1.4.2.3 RFD complete with attachments
1.4.2.3.1 Current analytical data
1.4.2.3.2 Applicable MSDSs for any additives
1.4.2.3.3 Attachment 1 from 02 EM 1016
1.4.2.4 Owner training complete
1.4.2.5 Participants training complete
1.4.2.5.1 Support staff training complete
1.4.2.5.2 Bargaining Unit operator training complete
1.4.2.5.3 Bargaining Unit qualifications in place
1.4.2.6 Approved procedure in place
1.4.3 Approved JHA ready to use
1.4.3.1 JHA reviewed by owner
1.4.3.2 JHA reviewed by support staff
1.4.3.3 JHA reviewed by Bargaining Unit operator
1.4.3.4 Approved JHA in place

1.5 PPE is identified and ready
1.5.1 Workers have gloves, eye protection, and cell communications per JHA

1.6 Notifications have been given
1.6.1 CMR notified
1.6.1.1 CMR notified upon leaving H-19
1.6.1.2 CMR notified upon entering H-19
1.6.2 Owner approves

1.7 Methods of communication are in place
1.7.1 Pre-job briefing complete
1.7.2 Bargaining Unit labor has contact cards
1.7.3 Cell communications are operable

1.8 Corrective Actions are complete
1.8.1 WIPP Form actions complete
1.8.1.1 Operator has a copy of the document package (CTS 31235)
1.8.1.2 CONOPS training is complete (CTS 31227)
1.8.1.3 Retrain staff to 02 EM 1016; Rev 2 and 02 RC 3108; Rev 6
1.8.2 Root Cause Analysis
1.8.2.1 Independent review of data packages prior to discharge

1.8.2.2 Containers thoroughly identified as to water source
1.8.2.3 All trailers parked in a designated area
1.8.2.4 Implement pre-job briefings
1.8.2.5 Operator to take verified documentation to the work site
1.8.2.6 Consider locking process for trailers

1.8.3 Eight DOE Actions for Approval to use H-19
1.8.3.1 Actions implemented or in process

1.8.4 Participants complete Root Cause Analysis review

2.0 Shipment of Water for Off-Site Disposal is Ready

2.1 Manpower is identified and in place.
- 2.1.1 Process owner is identified
- 2.1.2 Support staff is identified
- 2.1.3 Bargaining Unit operator is identified

2.2 Equipment is ready.
- 2.2.1 Collection containers ready to use
  - 2.2.1.1 Containers pass inspection
    - 2.2.1.1.1 Complete Attachment 5 "Frac Tank Inspection" from 02-EM 1024
    - 2.2.1.1.2 Flashlight for container inspection
  - 2.2.1.2 Containers on-site
  - 2.2.1.3 Container contract in place

2.3 Tools and supplies are in place.
- 2.3.1 Pumps
  - 2.3.1.1 Pumps inspected
  - 2.3.1.2 Fuel for pumps properly contained
  - 2.3.1.3 Pumps on-site
  - 2.3.1.4 MSDSs identified and in place
- 2.3.2 Hoses
  - 2.3.2.1 Hoses inspected
  - 2.3.2.2 Hoses on-site

2.4 Plans/Procedures are approved and ready to use.
- 2.4.1 02 EM 1016 (Request to Discharge to Evaporation Ponds; Rev. 2)
  - 2.4.1.1 Document package completeness verified
  - 2.4.1.2 Assemble document package
    - 2.4.1.2.1 Request for Disposal form
    - 2.4.1.2.2 Analytical results or evidence of process knowledge
    - 2.4.1.2.3 Completed and signed Attachment 1 "Authorization to Discharge Non Hazardous Effluent in the Sewage Treatment Facility"
  - 2.4.1.3 Owner training complete
  - 2.4.1.4 Participants training complete
    - 2.4.1.4.1 Support staff training complete
    - 2.4.1.4.2 Bargaining Unit operator training complete
    - 2.4.1.4.3 Bargaining Unit qualifications in place
    - 2.4.1.5 Approved procedure in place
- 2.4.2 WP 02 RC 3108 (Request for Disposal; Rev. 6)
  - 2.4.2.1 Attachment 2 of 02 RC3108 complete
  - 2.4:2.2 RFD and attachments hand delivered to SEC
  - 2.4.2.3 RFD complete with attachments

- 2.4.2.3.1 Current analytical data
- 2.4.2.3.2 Applicable MSDSs for any additives
- 2.4.2.3.3 Attachment 1 from 02 EM 1016

2.4.2.4 Owner training complete

2.4.2.5 Participants training complete

- 2.4.2.5.1 Support staff training complete
- 2.4.2.5.2 Bargaining Unit operator training complete
- 2.4.2.5.3 Bargaining Unit qualifications in place

2.4.3 Approved JHA ready to use

- 2.4.3.1 JHA reviewed by owner
- 2.4.3.2 JHA reviewed by support staff
- 2.4.3.3 JHA reviewed by Bargaining Unit operator
- 2.4.3.4 Approved JHA in place

2.4.4 QSL vendors in place

- 2.4.4.1 Off-site location under contract
- 2.4.4.2 Container supplier under contract

2.5 PPE is identified and ready

- 2.5.1 Steel toe safety shoes, safety glasses, hard hat, leather gloves

2.6 Notifications have been given

- 2.6.1 Owner approves

2.7 Methods of communication are in place

- 2.7.1 Pre-job briefing complete
- 2.7.2 Bargaining Unit labor has contact cards
- 2.7.3 Cell communications are operable

Readiness Review
On-Site Disposal of Non-Hazardous Water
And
Shipment of Water for Off-Site Disposal

Readiness Status:

Unconditional

Conditional X (1.0 only)

Not Ready X (2.0 only)

Remarks:

1. 1.8.1.2 – CONOPS training complete. (CTS 31227). P. Roush training not documented.
2. 1.8.1 – WIPP Form actions complete. See 1.8.1.2.
3. 1.8 – Corrective Actions are complete. See 1.8.1.
4. 1.6.1.1 – CMR notified upon leaving H-19. This notification can only be given after disposal.
5. 1.6.1 – CMR notified. See 1.6.1.1.
6. 1.6 – Notifications have been given. See 1.6.1.
7. 1.4.2.1 – Attachment 2 of 02 RC 3108 complete. This form can only be completed after disposal.
8. 1.4.2 – 02 RC 3108 (Request for Disposal; Rev. 6). See 1.4.2.1.
9. 1.4 – Plans and procedures are approved and ready to use.

Attachment 1 - Verification and Validation of Waste Characterization Analytical Data 19

INTRODUCTION [1]

This procedure provides instructions for characterization sampling, documentation, and off-site shipment of samples of site-generated, nonhazardous, hazardous, transuranic (TRU) waste, PCB (polychlorinated biphenyl)-containing TRU waste, and TRU-mixed waste. Throughout the rest of this procedure, "TRU waste," "PCB-containing TRU waste" and, "TRU-mixed waste" will be referred to as "TRU waste."

Industrial Hygiene sampling procedures are addressed within the WP 12-IH series of documents and are not within the scope of this document.

Performance of this procedure generates the following records:

- Entries in Sample Field Logbook
- Entries in Sample Tracking Logbook
- Verification and Validation of Waste Characterization Analytical Data
- Sampling documentation file (includes Analytical and Quality Control report, Request for Analysis [RFA] form, Chain-of-Custody [COC] form, Shipping Authorization form, and any other information pertinent to the sampling event that is not already contained in a logbook)

EQUIPMENT

- pH litmus paper or litmus paper
- Sampling kit (sample containers, sampling equipment, decontamination swipes, etc.)

PRECAUTIONS AND LIMITATIONS

- Logbooks are quality records. Only photocopies of the logbooks may be taken off-site unless the field logbook is being used during a sampling activity.
- Only personnel qualified in accordance with SAF-630, Respiratory Protection, may wear a respirator.
- Only personnel qualified in accordance with the Waste Isolation Pilot Plant (WIPP) Sampling Team Qualification Card ST-01, or the Sampling Team Assistant Qualification Card STA-01, may collect samples.

- Qualified Sampling Team Assistants (STA-01) may collect samples only if a qualified Sampling Team Member (ST-01) is present.

- Only personnel qualified in accordance with RAD 201, Radworker II; and either the WIPP Sampling Team Qualification Card ST-01, or the Sampling Team Assistant Qualification Card STA-01 may collect TRU waste samples in radiological areas.

- The appropriate personal protective equipment (PPE), as described in WP 02-EC.06 or in the Radiological Work Permit (RWP), whichever is applicable, shall be used when sampling.

- The integrity of all PPE shall be verified before donning by checking for rips, cracks, pinholes, etc. PPE shall be periodically inspected during use for damage or contamination. If damage or contamination occurs, sampling activities shall be stopped and new PPE donned.

- If there is a possibility of toxic gaseous emissions during a sampling event, Industrial Safety and Hygiene (IS&H) must be contacted for proper respiratory protection.

- Because of possible contamination from the outside of sample containers, personnel engaged in sampling activities must remain in PPE until sample containers are sealed.

- Inhaling of vapors from containers should be avoided.

- Personnel **MUST NOT** attempt to identify any material by odor.

- Personnel **MUST** hold sample containers away from the body to avoid spilling or splashing the sample material on the body.

- Personnel **MUST NOT** add sample preservative to unknown material.

- For safety reasons, at least two people will be involved in any sampling activity.

- Disposable sampling equipment such as coliwasas, funnels, scoops, etc. should be placed in the original packaging, then into a plastic trash bag for disposal.

- Used paper towels should be placed into plastic trash bags after use for disposal.

- PPE should be placed into plastic bags or appropriate containers for disposal after removal.

PREREQUISITE ACTIONS

- Use WP 02-EC.06, Table 1, Containers, Preservatives, and Holding Times, to identify the sample containers required for each sampling activity.
- If necessary, obtain sample containers, with preservatives added, from the contracted analytical laboratory. If sample containers with preservatives are not available, samples can be preserved by the Sampling Team Coordinator (STC) or a trained technician in a WIPP laboratory. If necessary, consult the contract laboratory for guidance.
- Inspect all sampling equipment for integrity before starting field sampling activities.

PERFORMANCE

1.0 PRESAMPLING ACTIVITIES

1.1 Samplers, hold pre-job briefings for all nonroutine sampling activities, and discuss the following:

- Number of samples to be taken
- Level of PPE required to perform sampling activities and inspection of PPE prior to donning
- Types of material (liquid, solid, sludge, or heterogeneous) to be sampled
- RWP, if radioactive material is suspected
- Safety hazards associated with the sampling activity
- Sample location

1.2 Contact IS&H regarding appropriate PPE requirements for sampling involving unknowns or non-routine hazards.

NOTE

The pre-job briefing, if necessary, should be signed by all personnel participating in the sampling event. The pre-job briefing should be retained in the sampling documentation file.

1.3 If necessary, review Chapter 9 of EPA SW-846 or RCRA Waste Sampling Draft Technical Guidance to perform the following:

1.3.1 Determine appropriate sampling protocols.

1.3.2 Document the review.

1.3.3 Summarize the protocols in the field logbook.

1.4 Obtain the first available sequential sample number for each sample to be collected from the field logbook.

NOTE

The format for sample numbers is WST-YY-XXX, where YY is the last two digits of the current calendar year and XXX is the next sequential number. The first sample collected in each calendar year is designated as sample number WST-YY-001.

1.5 Obtain sample kit **AND** materials.

1.6 **IF** liquids are being sampled,
GO TO Section 2.0.

1.7 **IF** solids are being sampled,
GO TO Section 3.0.

1.8 **IF** contaminated areas from a TRU waste spill are being sampled,
GO TO Section 4.0.

2.0 CHARACTERIZATION SAMPLING OF LIQUIDS

2.1 Don the appropriate PPE after inspecting for holes and tears that would compromise the integrity of the PPE .

2.2 Perform one of the following:

2.2.1 **IF** sample media is containerized,
GO TO Step 2.3.

2.2.2 **IF** a liquid sample is collected from anything other than a container, such as a lagoon, retention basin, well, or drainage ditch,
GO TO Step 2.6.

2.3 Visually inspect container of materials to be sampled.

2.4 **IF** crystallization that cannot be verified as salt is present on the containers, the contents of the container are unknown, **OR** the containers are bulging,
THEN perform the following:

2.4.1 **DO NOT** open or move containers.

2.4.2 Move away from the immediate area.

2.4.3 Prevent access to the area by others.

2.4.4 Call the Central Monitoring Room (CMR).

2.4.5 Stop work until the integrity of the container has been determined.

2.5 **IF** the container appears to be in good condition,
GO TO Step 2.6.

2.6 If applicable, obtain a pH measurement of the sample material by dipping litmus paper into the liquid.

2.7 Record pH measurements in the sample field logbook.

2.8 Collect representative samples by using a coliwasa, bailer, or dipper as follows:

- Ensure all phases of a multiphased material are represented in a sample.
- If a single representative sample cannot be obtained, collect a sample of each phase present.
- If solid material is at the bottom of a container, ensure some solid material is included in the sample.

2.9 Perform the following when obtaining samples for semi-volatile or volatile organics analysis:

2.9.1 Fill the sample containers to the top.

2.9.2 Secure the lid on the sample container and invert.

2.9.3 If air bubbles are observed in the sample, remove the lid and add more of the sample material.

2.9.4 Repeat Steps 2.9.2 and 2.9.3 until no air bubbles are observed when the sample container is inverted.

2.10 Secure the lid on the sample container.

2.11 If drips or splashes occur when sampling, perform the following:

2.11.1 Decontaminate the outside of the sample container by rinsing it with deionized water or wiping it with decontamination swipes or paper towels.

2.11.2 If hazardous material has splashed on PPE, and compromised the integrity of the PPE, change PPE before continuing sampling activities to prevent accidental contact with hazardous material.

2.12 **GO TO** Section 5.0 for Sampling Event Documentation.

3.0 CHARACTERIZATION SAMPLING OF SOLIDS, SLUDGES, OR HETEROGENEOUS MATERIALS

3.1 Don the appropriate PPE.

3.2 If the materials to be sampled are containerized, visually inspect the containers.

3.3 If the container is breeched or bulging, perform the following:

3.3.1 **DO NOT** open or move the containers.

3.3.2 Move away from the immediate area.

3.3.3 Prevent access to the area by others.

3.3.4 Stop work and call the CMR.

3.4 **IF** the container appears to be in good condition,
GO TO Step 3.5.

3.5 Collect representative samples as follows:

- Ensure all phases of a multiphased material are represented in a sample.
- If a single representative sample cannot be obtained, collect a sample of each phase present.

3.6 Secure the lid on the sample container.

3.7 If the material being sampled gets on the outside of the sample container, decontaminate the outside of the sample container by rinsing it with deionized water and wiping it with decontamination swipes or paper towels.

3.8 Change PPE before sampling another waste source to prevent cross-contamination of subsequent samples.

3.9 **GO TO** Section 5.0 for Sampling Event Documentation.

4.0 CHARACTERIZATION SAMPLING OF SURFACE AREAS CONTAMINATED FROM TRU WASTE

NOTE

In the event of a TRU waste spill the sampling team will collect clean-up verification samples only after radiological clean-up is complete. Occupational Health Physics will notify Site Environmental Compliance (SEC) when the removable radioactivity contamination survey is below 20 dpm/100 cm^2 alpha and 200 dpm/100 cm^2 beta/gamma.

Process knowledge, which may include review of applicable waste stream profiles, should be used to determine the analyses to be performed. Analyses may include, but are not limited to, the following:

- Total metals
- Total semivolatiles
- Total volatiles
- PCBs

4.1 Collect swipe samples for PCB analysis in accordance with the directions provided with the PCB test kit, if applicable.

4.2 Collect solid or liquid samples for PCB analysis in accordance with directions provided by the contract laboratory.

4.3 Collect total or Toxicity Characteristic Leachate Procedure (TCLP) analysis samples as specified in Sections 2.0 and 3.0, as applicable.

5.0 SAMPLING EVENT DOCUMENTATION

5.1 Record the following information in the sample field logbook:

- Sample number
- Location of sampling point
- Type of material (e.g., water, sludge)
- Number and volume of containers of samples taken
- Purpose of sampling (e.g., hazardous waste characterization)
- Date and time of collection
- Analytical parameters

- Notation if the sample is a blank, duplicate, or equipment rinseate
- Preservative used, if applicable
- Field observations, if applicable
- Field measurements, if applicable (e.g., pH, conductivity)
- Detailed description of how the sample is collected, including the in situ orientation of the sample, if applicable
- Notation that PPE was inspected prior to donning
- Any other information that may be pertinent to the sampling event, if applicable (e.g., photographs, maps, drawings, or descriptions that delineate the sample area)

5.2 At least two people involved in the sampling event, sign the last page of the sample field logbook entries for the day of sampling.

6.0 SEALING SAMPLE CONTAINERS

6.1 Complete a container label with the following information for each sample container:

- Sample number
- Date and time of sample collection
- Location of sample collection
- Known sample hazards
- A team member's signature

6.2 Place the container label around the mid-section of the container.

6.3 Complete a custody seal with the following minimum information for each sample container lid:

- Date
- A team member's signature

6.4 Ensure the sample container lid is securely tightened.

6.5 Seal the lid to the sample container by wrapping seal tape or electrical tape around the lid and the neck of the sample container.

6.6 Place a custody label over the tape around the sample container lid.

6.7 Place clear tape over the container label to hold it in place and to prevent moisture damage.

7.0 DISPOSAL OF PPE AND SAMPLING EQUIPMENT

7.1 **IF** process knowledge indicates the sampled materials or the PPE **AND** disposable equipment are nonhazardous,
THEN discard the PPE and disposable equipment in the plant trash.

7.2 **IF** the sampled materials are suspected to be hazardous
AND process knowledge indicates the PPE and disposable equipment are hazardous,
THEN complete a Request for Disposal for the PPE and disposable equipment in accordance with WP 02-RC3108.

7.3 If the sampled materials are TRU waste, discard the PPE and disposable equipment as site-derived waste in accordance with WP 05-WH1036.

8.0 SAMPLING SHIPPING DOCUMENTATION

NOTE

Information required to complete a COC form can be obtained from the sample field logbook.

A sample of a COC form is maintained as an attachment to procedure WP 02-EM3001. This is an example only. There is not a required format for a COC form if the form being used contains the required information.

8.1 Complete a COC form, as follows:

8.1.1 Record the following required information in the appropriate blanks:

- Unique COC number (preprinted on the corresponding RFA Form)
- Sample number(s)
- Sample location and description
- Date and time of sample collection
- Sample type (e.g., liquid, solid, soil)
- Container type
- Sampling program (e.g., WIPP Sampling Team)

- Names of sampling team members involved in the sampling event
- Name of the laboratory being used for sample analysis

8.1.2 Record any special instructions or sample hazards in the appropriate blanks.[2]

NOTE

Information required to complete an RFA form can be obtained from the sample field logbook.

An example of an RFA form is maintained as an attachment to procedure WP 02-EM3001. This is an example only. There is not a required format for an RFA form if the form being used contains the required information.

8.2 Complete an RFA form, as follows:

8.2.1 Record the following required information in the appropriate blanks:

- Sample number(s)
- Sample type
- Sample quantity
- Preservative, if applicable
- Required testing program
- Special instructions, if applicable
- Sampling Program (e.g., WIPP Sampling Team)
- Purchase order number
- Date of shipment
- Name of laboratory being used for analysis
- Name of laboratory contact
- Address to send report to
- Date report is due

- Name of project contact
- Project contact telephone number

8.2.2 Record any special instructions or sample hazards in the appropriate blanks.

8.2.3 Use the following address for laboratory report:

WIPP Site/Jal Highway
370 Louis Whitlock Road
Carlsbad, NM 88220

NOTE

EA15PM3525-1-0, including the instructions for use, is available in the electronic document processing system.

8.3 Complete the Shipping Authorization, EA15PM3525-1-0, using WP 15-PM3525, as follows:

8.3.1 Check "Material Being Shipped Covered by a Purchase Order/Blanket Purchase Order" in Section 1, and enter the purchase order number.

8.3.2 Enter the receiving address in Section 2.

8.3.3 Check "Prepaid-WIPP Cost" in Section 3 **AND** enter the appropriate cost account number.

8.3.4 Check "FEDEX" in Section 4.

8.3.5 Check "WIPP Warehouse" in Section 5.

8.3.6 **IF** the samples are preserved,
THEN check "Yes" in Section 6 if shipment method will cost more than normal rate.

8.3.7 Enter special instructions in Section 7, such as, but not limited to: Must meet sample holding time, turnaround time, Rush Analysis, etc.

NOTE

If two or more samples of one material are included in a shipment, the amount listed is the total quantity of each material. For example, two 6-oz. samples of material "A" should be listed as 12 oz. of material "A."

8.3.8 In Section 8.0, insert a line item number for each item starting with the number 1 (one).

8.3.9 List quantities of materials, see above note.

8.3.10 Insert description of material being shipped.

8.3.11 Include the following language for preserved samples, as appropriate:

[A] For samples preserved with Nitric Acid specify "Preserved to pH<2 with HNO_3 in water concentration of 0.15% by weight or less."

[B] For samples preserved with Hydrochloric Acid specify "Preserved to pH<2 with HCl in water concentrations of 0.04% by weight or less."

[C] For samples preserved with Sulfuric Acid specify "Preserved to pH<2 with H_2SO_4 in water concentrations of 0.35% by weight or less."

[D] For sample preserved with Sodium Hydroxide specify "Preserved to pH>12.5 with NaOH in water concentrations of 0.08% by weight or less."

8.3.12 Enter name, phone extension, mail stop, and date in Section 9.

8.4 In Section 10.0, obtain the signature of the SEC Manager or designee.

NOTE

For shipment of samples, Sections 11 and 12 should be stamped with "Soil/Water." Property and Procurement signatures are not required for shipment of samples.

8.5 Carry the Shipping Authorization and any documents that are to accompany the shipment to Transportation Operations.

8.6 Transportation Operations, perform one of the following:

8.6.1 **IF** material is considered a U.S. Department of Transportation (DOT) hazardous materials shipment,
THEN GO TO WP 08-NT3101, or WP 08-NT3110, as applicable, and advise SEC of the proper DOT shipping container.

8.6.2 **IF** material is shipped by air,
THEN GO TO WP 08-NT3102, as applicable.

8.6.3 If material is considered a DOT nonhazardous materials shipment, stamp Section 13 of the Shipping Authorization "Approved for Shipment" and sign the appropriate line.

9.0 SAMPLE CONTAINER PACKAGING [3]

9.1 Wrap all glass sample containers with several layers of plastic bubble wrap. Tape the bubble wrap securely in place.

9.2 Place each sample container in a sealable plastic bag, remove as much air as possible, and seal the bag.

9.3 For liquid samples, place each bagged sample container into a second sealable plastic bag and fill each outside bag approximately half full with absorbent material, remove as much air as possible, and seal the bag.

9.4 Place the bagged sample containers into the cooler or shipping container.

9.5 If the samples need to be cooled, place blue ice packs around the plastic bags.

9.6 If necessary, label the outside of the cooler or shipping container with the words "Samples Chilled at 4° (or Degrees) C."

9.7 Add bubble wrap or other packing material to the cooler or shipping container to prevent the sample containers from moving or contacting each other during shipping.

10.0 SAMPLE SHIPMENT

10.1 Transport the cooler and shipping documents to the WIPP warehouse.

10.2 Warehouse personnel, complete Sections 14 and 15 of the Shipping Authorization.

10.3 Photocopy the Shipping Authorization for SEC records after the completion of Section 14.

10.4 Leave the original copy of the Shipping Authorization with WIPP warehouse personnel.

10.5 Complete the first available "Relinquished by" line on the COC form, with a signature, company name, date, and time of relinquishment.

10.6 Warehouse personnel, complete the first available "Received by" line with a signature, company name, date, and time of receipt.

10.7 Place the original copies of the RFA and COC forms into a sheet protector.

10.8 Place the sheet protector containing the RFA and COC forms inside the cooler or shipping container.[2]

10.9 Tape the cooler lid closed using shipping tape.

11.0 SAMPLE DOCUMENTATION FILE

11.1 Place the remaining copies of the RFA and COC forms and the photocopy of the Shipping Authorization in a file folder.

11.2 Mark or label the file folder with the following:

- The words "Environmental Analysis"
- Sample numbers
- COC number
- Sample Delivery Group (SDG) number (provided by the laboratory with the analytical data package)

11.3 Place any other sample documentation (e.g., pre-job safety briefs, sampling plans, etc.) in the file folder.

12.0 SAMPLE TRACKING LOGBOOK

12.1 STC, ensure the following information from the sample documentation packet is entered into the sample tracking logbook:

- Sample number
- Date of sample collection
- COC form number
- Location of sampling
- Description of sampled material
- Analyses requested
- Initials of the person logging the information

13.0 ANALYTICAL AND QUALITY CONTROL REPORT REVIEW[1]

13.1 Upon receipt of the Analytical and Quality Control Report (AQCR) from the contract laboratory, the STC, a contractor, or the STC's designee will review the AQCR using Attachment 1, Verification and Validation of Waste Characterization Analytical Data. The person filling out Attachment 1 will be the Reviewer.

13.1.1 The Reviewer will complete every section of Attachment 1 by looking for the information on the AQCR. The Reviewer will sign and date Attachment 1 upon completion of the form.

The STC, or other SEC personnel, other than the Reviewer will verify the Reviewer's calculations and sign the section where the calculations were involved. This person will also review the completion of Attachment 1 and sign and date the bottom of the Attachment.

13.1.2 If necessary, request the AQCR be reviewed by additional SEC, Environmental Monitoring and Hydrology, or Quality Assurance personnel.

13.1.3 Document all reviews on Attachment 1, and place it in the sample documentation file folder.

13.2 Place the AQCR and Attachment 1 in an accordion folder.

13.3 Label the accordion folder with the Sample Number, Chain of Custody, and Lab's SDG Number.

Attachment 1 - Verification and Validation of Waste Characterization Analytical Data

RE: Corrective Action Approval, DP-831, Interim Actions to Control High Water Levels in the Salt Storage Extension and Salt Storage Extension Basin, Waste Isolation Pilot Plant

The Ground Water Quality Bureau of the New Mexico Environment Department (NMED) received oral notification followed by a written corrective action report dated October 31, 2008 (Report) of a discharge of brine water from the Salt Storage Extension Facility (SSE) and the Salt Storage Extension Basin (SSEB) at the U.S. Department of Energy's (DOE) Waste Isolation Pilot Plant (WIPP). A follow-up letter (Letter) detailing corrective action activities was submitted to NMED on November 14, 2008, and a Modified Corrective Action Plan was submitted on December 5, 2008 (Plan). The Report, Letter and Plan were submitted in accordance with Condition 3 of the September 9, 2008 Discharge Permit Renewal and Modification (DP-831). The interim corrective actions described in these submittals are hereby approved by NMED.

According to the Report, the WIPP site received 2.96 inches of rain over a 15-hour period beginning October 13, 2008. The rainfall caused the water level in the SSEB to rise above the one foot of freeboard required in DP-831. On October 22, 2008, as water levels continued to rise, it was discovered that the water had covered the spillway between the SSE and the SSEB. It was also discovered that the center of the spillway was not covered with a synthetic liner, which is not in accordance with the construction designs required in Condition 2 of the December 22, 2003 Discharge Permit Modification. The rise in salt contaminated water over the unprotected spillway berm resulted in a discharge to the ground.

As an initial corrective action, sandbags and liner material were emplaced to halt the discharge. After discovering that water levels were still rising, sandbagging was abandoned and an alternative corrective action implemented. The alternative plan consisted of constructing an unlined holding pond in the top of the active salt pile in Cell A of the SSE and pumping water from the SSEB to the pond for evaporation. The intention was to lower the water level below the spillway at which time synthetic liner material would be attached over the spillway and adjacent berm thereby eliminating discharges to the ground. Construction of the holding pond was completed on November 10, 2008. It was soon discovered that pumping water to the pond was ineffective in lowering water levels in the SSEB.

In the Modified Corrective Action Plan proposed by teleconference on December 3, 2008, and submitted in writing on December 5, 2008, the DOE proposes to pump water from the SSE and SSEB to Evaporation Ponds B and C, and H-19. These actions are intended to lower the water levels in the SSE and SSEB while providing additional evaporation capacity to reduce the overall volume of water. Once water levels are lowered the spillway and berm will be synthetically lined. As part of the corrective action, NMED hereby temporarily waives the requirement in Conditions 2a, 2b and 2c of DP-831, which limits daily discharges to Evaporation Ponds B and C, and Pond H-19 to 50,000 gallons per day provided one foot of freeboard is maintained at all times.

The DOE is evaluating permanent long term corrective actions to permanently control water levels in the SSEB. These proposals will be submitted to NMED at a future date.

If additional information becomes available indicating these corrective actions are inadequate, then additional actions may be required. Approval of this corrective action report does not relieve you of your responsibility to comply with any other applicable federal, state and/or local laws and regulations.

If you have any questions, please contact Clint Marshall of the Mining Environmental Compliance Section at 505-827-0027 or clint.marshall@state.nm.us.

Sincerely,

Mary Ann Menetrey, Program Manager

Subject: Modified Corrective Action Plan for Loss of Freeboard in the Salt Storage Extension Evaporation Basin

References: (1) CBFO Letter from Dr. David Moody to Mr. Clint Marshall dated October 31, 2008, Subject: Notification of Discharge

(2) CBFO Letter from Dr. David Moody to Mr. Clint Marshall dated November 14, 2008, Subject: Interim Corrective Actions

Dear Mr. Marshall:

The purpose of this letter is to provide the Ground Water Quality Bureau with a modified Corrective Action Plan in accordance with Section III, Condition 3 of the Waste Isolation Pilot Plan (WIPP) Discharge Permit issued on September 9, 2008. This Corrective Action Plan addresses the loss of one foot of freeboard in the Salt Storage Extension Basin (SSEB) and water levels rising above the elevation of the berm and engineered spillway between the SSEB and the Salt Storage Extension (SSE). This modified Corrective Action Plan was discussed with you during a phone conversation on December 3, 2008, and the Department of Energy (DOE) has begun implementation based on your verbal approval.

This modified Corrective Action Plan also serves as a follow-up to the initial corrective actions described in the October 31, 2008, and November 14, 2008, Notification of Discharge letters. The first plan proposed in the October 31, 2008, Notification of Discharge has, so far, proven ineffective for lowering the water level sufficiently to permit work on the berm. Water infiltrates the salt pile and drains back to the SSE and SSEB too rapidly.

The DOE has modified the October 31, 2008, corrective action plan based on your verbal approval of December 3, 2008. We will continue to pump water to the top of the salt pile in the Salt Storage Extension Area. In addition, we have begun pumping brine water to Evaporation Ponds B and C at the sewage treatment facility and potentially the H-19 Evaporation Pond. These ponds are currently permitted for the disposal of up to 50,000 gallons per day for Evaporation Pond B and C, and H-19, of miscellaneous non-hazardous waste water provided one foot of freeboard is maintained. Evaporation

CBFO:AMO:HLP:KJB:08-1438:UFC5486

Ponds B and C provide for a combined capacity of approximately 1 million gallons and the H-19 Evaporation Pond provides an additional 350,000 gallons of capacity if needed.

We have requested, and you verbally approved, a waiver from the 50,000 gallon per day limit to quickly lower the elevation of water in the SSEB below the elevation of the berm between the SSE and SSEB. This will allow DOE an opportunity to raise the elevation of the east berm of the SSE from 3,420 feet (3419 feet at the engineered spillway) above mean sea level to an elevation more consistent with the top of the south, north and west edges at 3,424 feet above mean sea level. If additional capacity is needed to accomplish the modifications, we will seek a temporary authorization to pump salt water from the SSEB to the Salt Pile Evaporation Pond which is not currently permitted for the disposal of salt water.

The DOE committed to reline Evaporation Pond B by September 30, 2009, in a November 3, 2005, letter, *Sewage Lagoon Electrical Leak Testing Results, Liner Integrity Evaluations and Corrective Action Plan*. DOE still intends to meet this commitment; however, an extension could be necessary if evaporation rates do not dry Evaporation Pond B and/or precipitation limits the capacity to transfer water to other locations.

During our phone conversation on December 3, 2008, we also discussed permanent corrective measures to provide additional water management capacity for the SSE. Initial engineering evaluations are favoring construction of an additional evaporation pond. The construction of this pond may be on top of the Salt Pile in Cell A of the Salt Storage Extension. We will provide an update on our engineering evaluations by December 31, 2008, as we proposed in our October 31, 2008, Notification of Discharge letter.

If you have any questions about this report or require any additional information or actions, please contact H.L. (Jody) Plum at (575) 234-7462.

Sincerely,

David C Moody

RE: NOTICE OF VIOLATION
WASTE ISOLATION PILOT PLANT, EPA I.D. # NM4890139088

Dear Dr. Moody and Mr. Sharif:

On November 16, 2007, the New Mexico Environment Department (NMED) Groundwater Quality Bureau and Hazardous Waste Bureau received verbal reports from Mr. Jody Plum of the Department of Energy's Carlsbad Field Office (CBFO) regarding a discharge on November 9, 2007 of approximately 150 gallons of brine from the Exhaust Shaft Intercept Borehole collection system into the H-19 Evaporation Pond at the Waste Isolation Pilot Plant (WIPP) that exceeded the regulatory limit of 5 mg/L for lead. NMED subsequently received a written notification of discharge dated November 20, 2007 and a written report on the incident dated November 30, 2007. On January 18, 2008, NMED requested information and supporting documentation associated with this discharge from CBFO and Washington TRU Solutions LLC (jointly, the Permittees). The response to this request (the Response) was received by NMED on February 25, 2008.

Upon review of the Response, NMED has determined that the Permittees have violated the New Mexico Hazardous Waste Management Regulations (20.4.1 NMAC), as well as the New Mexico Ground and Surface Water Protection Regulations (20.6.2 NMAC) and Condition 3 of the WIPP Ground Water Discharge Permit Renewal, dated April 29, 2003, as specified below:

1. 20.4.1.900 NMAC (incorporating 40 CFR 270.1(c)) states: "RCRA requires a permit for the 'treatment,' 'storage,' and 'disposal' of any 'hazardous waste' as identified or listed in 40 CFR part 261. The terms 'treatment,' 'storage,' 'disposal," and 'hazardous waste' are defined in §270.2. Owners and operators of hazardous waste management units must have permits during the active life (including the closure period) of the unit."

   20.4.1.900 NMAC (incorporating 40 CFR 270.10(a)) states: "Any person who is required to have a permit... shall complete, sign, and submit an application to the Director as described in this section and §§270.70 through 270.73."

   The Permittees disposed of approximately 150 gallons of characteristic hazardous waste (D008) in the H-19 Evaporation Pond, an unpermitted disposal unit in violation of 20.4.1.900 NMAC (incorporating 40 CFR 270.1(c)).

2. 20.4.1.800 NMAC (incorporating 40 CFR 268.34(a)) states: "Effective August 24, 1998, the following wastes are prohibited from land disposal: the wastes specified in 40 CFR Part 261 as EPA Hazardous Waste numbers D004–D011 that are newly identified (i.e. wastes, soil, or debris identified as hazardous by the Toxic Characteristic Leaching Procedure but not the Extraction Procedure)..."

   20.4.1.800 NMAC (incorporating 40 CFR 268.34(f)) states, "...If the waste contains constituents (including underlying hazardous constituents in characteristic waste) in excess of the applicable Universal Treatment Standard levels of §268.48 of this part, the waste is prohibited from land disposal, and all requirements of part 268 are applicable..."

   The Permittees disposed of approximately 150 gallons of characteristic hazardous waste (D008) in the H-19 Evaporation Pond without treating the waste to meet appropriate treatment standards specified in 20.4.1.800 NMAC (incorporating 40 CFR part 268, subpart D) in violation of 20.4.1.800 NMAC (incorporating 40 CFR 268.34).

3. 20.6.2.3104 NMAC states: "Unless otherwise provided by this Part, no person shall cause or allow effluent or leachate to discharge so that it may move directly or indirectly into ground water unless he is discharging pursuant to a discharge permit issued by the secretary. When a discharge permit is issued, discharges must be consistent with the terms and conditions of the permit."

   Condition 3 of the Ground Water Discharge Permit Renewal (DP-831), dated April 29, 2003 states: "The permittee is authorized to discharge up to 8,000 gallons per day of non-hazardous brine water generated from mine dewatering activities, pumping of ground water wells, and from other non-hazardous sources to the synthetically lined H-19 evaporation pond."

> The Permittees disposed of approximately 150 gallons of characteristic hazardous waste D008 in the H-19 Evaporation Pond in violation of Ground Water Discharge Permit Renewal (DP-831) Condition 3.

In accordance with 74-4-10 NMSA 1978, NMED may: (1) issue a Compliance Order requiring compliance immediately or within a specified time period, or assess a civil penalty for any past or current violations of up to $10,000 per day of non-compliance with each violation, or both; or (2) commence a civil action in District Court for appropriate relief, including a temporary or permanent injunction. Any such order may include a suspension or revocation of any permit issued by NMED.

In accordance with 74-6-10 NMSA 1978, NMED may: (1) issue a Compliance Order requiring compliance immediately or within a specified time period, or assess a civil penalty for any past or current violations of up to $15,000 per day of non-compliance with each violation, or both; or (2) commence a civil action in District Court for appropriate relief, including a temporary or permanent injunction. Any such order may include a suspension or revocation of any permit issued by NMED.

Due to the nature and extent of the violations listed above, NMED will propose a civil penalty for these violations in its settlement offer, which we are sending you by separate letter.

NMED requires that the Permittees submit to NMED within fifteen (15) days of receipt of this letter evidence that all corrective actions associated with the two findings identified in Audit I08-03, *Hydrology and Water Management,* have been completed, and that all corrective actions recommended in the *WIPP Discharge to Evaporation Pond H-19 Root Cause Analysis Report* have been implemented. NMED also requests a written description of any actions that the Permittees have taken since the Response to address the violations described above, and a schedule for implementation for any actions not yet completed.

Any action taken in response to this letter does not relieve the Permittees of their obligation to comply with any other applicable laws and regulations.

If you have any questions regarding this letter, please contact Art Vollmer of at (505) 476-6004 regarding hazardous waste regulation violations, and Clint Marshall at (505) 827-0027 regarding the Ground Water Discharge Permit violation. Please address any written response to the attention of Art Vollmer and Clint Marshall at the addresses on the letterhead.

Sincerely,

James P. Bearzi

Subject: Interim Corrective Actions

RE: October 31, 2008, Notification of Discharge

Dear Mr. Marshall:

The purpose of this letter is to provide your office with the outline of corrective action activities that DOE committed to providing you by November 14, 2008. In the letter to you dated October 31, 2008, *Notification of Discharge,* related to the loss of freeboard and overtopping of the Salt Storage Extension Basin (SSEB), the DOE proposed to provide your office an outline of activities by November 14, 2008, and a detailed schedule of activities to implement permanent corrective actions for the management of salt contact run-off in the Salt Storage Extension Evaporation Basin by December 31, 2008. The following outline the activities being conducted to permanently correct this matter:

- Develop a Statement of Work for Service Subcontract;
- Obtain a qualified Contractor;
- Contractor will evaluate run-off volume(s) and pond capacities and provide corrective action recommendations;
- Evaluate the engineered corrective measure options and select the preferred recommendation for implementation;
- Prepare a Work Package to implement the proposed corrective actions.

In addition, in our October 31, 2008, letter, *Notification of Discharge,* we stated that water would be pumped out of SSEB into an impoundment area in the Salt Storage Area to lower the water level in the SSEB. The development of the holding pond on the top of the salt pile was completed the week of November 10, 2008. Pumping of water from the SSEB was initiated on completion of the holding pond to lower the water level in the SSEB. This will allow the interim corrective actions to be accomplished.

If you have any questions on this subject, please call Jody Plum at 575-234-7462.

Sincerely,

Roger A Nelson for

David C. Moody
Manager

Subject: Notification of Discharge

The purpose of this letter is to confirm the U. S. Department of Energy's (DOE), Carlsbad Field Office (CBFO) verbal report to you on the morning of October 23, 2008, following an initial phone message left on October 22, 2008. This report was made by Mr. H. L. (Jody) Plum, DOE/CBFO. On October 28, Mr. Plum again contacted you to seek an extension of time to provide this written response. You verbally granted his request, allowing for submittal of this Notification before close of business day October 31, 2008.

This information is being provided to you in accordance with the WIPP Discharge Permit (DP-831) which references 20.6.2.1203 NMAC, NOTIFICATION OF DISCHARGE-REMOVAL:

(a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility:

Person in charge of the facility:	David C. Moody, Manager 4021 National Parks Highway Carlsbad, New Mexico, 88220 (575) 234-7300
Owner of the facility:	U. S. Department of Energy
Operator of the facility:	Washington TRU Solutions LLC

(b) Name and address of the facility:

U. S. Department of Energy
Waste Isolation Pilot Plant
30 miles East of Carlsbad, New Mexico off of State Highway 128
Carlsbad, NM 88220

CBFO:AMO:HLP:KJB:08-1421:UFC5486

(c) The date, time, location, and duration of the discharge:

Date: October 16 through the present
Time: Approximately 8:00 a.m.
Location: WIPP Site, Salt Storage Extension Basin (SSEB)
Latitude: 32 22.589, Longitude 103 47.746

Duration: 17 days to date, assuming that the water level in the SSEB rose above the elevation of the spillway between the SSEB and the Salt Storage Extension (SSE) on October 15, 2008. The duration could be as long as an additional 15 days as described in the corrective actions under Item (g) of this letter.

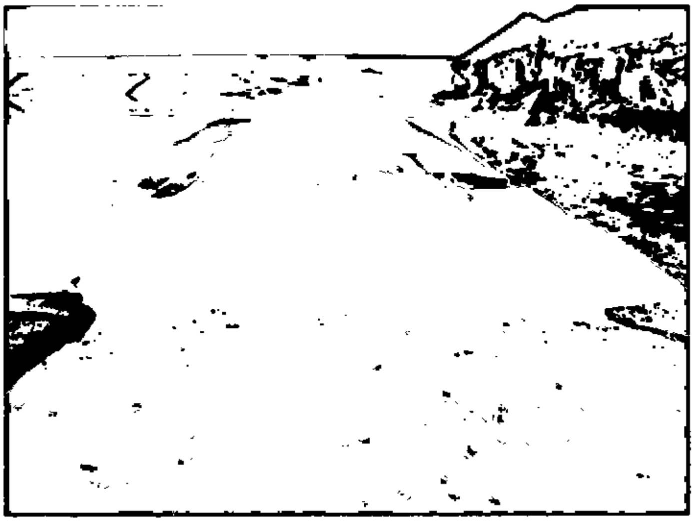
(d) The source and cause of the discharge:

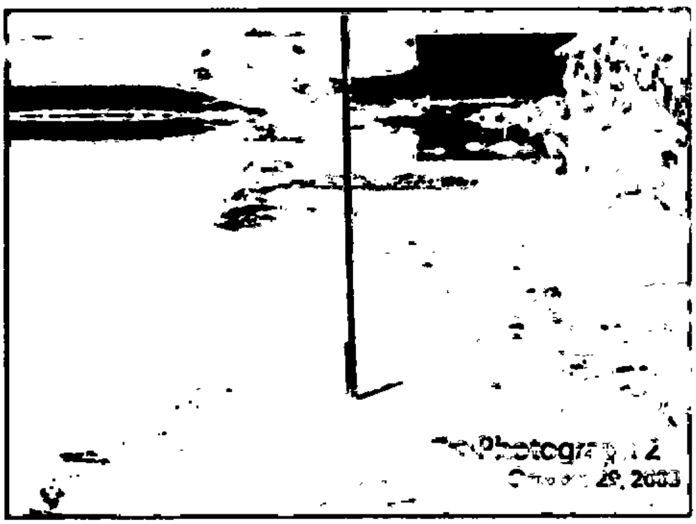
Source: 2.96 inch rainfall

Cause of discharge:

Between 5:00 p.m. Monday October 13, 2008, and 8:00 a.m. Tuesday October 14, 2008, the WIPP site received a 2.96 inch rainfall. Prior to this rainfall event, the SSEB had approximately two to two and half feet of freeboard. The 2.96 inch rain event over the 1,048,000 square foot SSE drainage area resulted in approximately 1,933,000 gallons of water entering the SSE and SSEB. By October 15, 2008, sufficient water had drained from the SSE to fill the SSEB above the one foot of freeboard required by DP-831.

In accordance with DP-831, Section III, Condition 3, a corrective action plan was being prepared for submittal to the GWQB; however, on October 22, 2008, it was discovered that further drainage caused the water level to rise above the elevation of the spillway between the SSE and the SSEB. The spillway in the center of the berm between the SSE and the SSEB is not protected from infiltration with a liner. Photograph 1 illustrates the discharge area as observed on October 16, 2008. On October 29, 2008, while preparing to protect the spillway from infiltration using high density polyethylene and sandbags it was discovered that the water level had slightly risen, enlarging the area of the berm subject to the infiltration of salt contaminated water. Photograph 2 illustrates the discharge area as observed on October 29, 2008.





(e) A description of the discharge, including chemical composition:

The discharged water is storm water that has been in contact with salt and is high in total dissolved solids and chlorides. The last discharge monitoring report for this water reported a total dissolved solids concentration of 339,500 mg/l, chlorides at 260,000 mg/l, and sulfate at 16,900 mg/l.

(f) The estimated volume of the discharge:

The unlined spillway is approximately one foot deep, 10 feet wide and 10 feet long. The discharge area initially encompassed approximately 25 feet by ten feet. The deepest water would be one foot deep over the 100 square foot spillway. The volume of water in the spillway would be approximately 800 gallons subject to infiltration for the duration of the discharge. Additional square footage along the 290 foot berm has been exposed to less than an inch of water for the duration of the discharge as illustrated in Photos 1 and 2. Upon saturation of the soil, infiltration would be minimal. All other water is contained in the SSE or SSEB and is contained by high density polyethylene liners.

(g) Any actions taken to mitigate immediate damage from this discharge:

- Upon identifying the loss of one foot of freeboard on October 15, 2008, a corrective action plan was being prepared for submittal to the NMED as required by DP-831.
- Upon discovery that the elevation of water had risen above the spillway between the SSEB and the SSE on October 22, 2008, a corrective action plan was being formulated whereby sandbags and liner material would have been emplaced to halt the discharge.
- On October 29, 2008, when it was discovered that the water level had slightly risen, it was determined that sandbagging the spillway was not going to be a practical option. Revised interim corrective actions now include; modifying the salt pile in the SSE by shoring up the existing three foot berm forming a holding pond on top of the salt pile. Water will be pumped from the SSEB into the holding pond on the salt pile. Since the water is saturated with the salt, the holding pond constructed of salt should hold the water until it evaporates. When sufficient water has been removed from the SSEB, a HDPE liner will be welded to join the liner in the SSE to the liner in the east side of the SSEB to protect the berm from infiltration in the event of any future overflow. Every effort will be made to implement this interim corrective action by November 14, 2008.
- DOE proposes to conduct an engineering evaluation to determine what permanent corrective actions can be taken to prevent the loss of freeboard in the SSEB in the future and provide adequate volume for collection of precipitation caused runoff from Cells A & B. Options available for evaluation may include, but are not limited to, construction of a new pond, enlarging the existing pond or increasing evaporation rates by pumping water into a lined or unlined holding pond constructed on the salt pile. We propose to provide to you an outline of activities by November 14, 2008, and then on or about December 31, 2008, provide a detailed schedule of activities to implement the permanent corrective actions to the Groundwater Quality Bureau.

We believe this discharge poses minimal threat to groundwater. The infiltration controls installed by the DOE at the WIPP site have greatly minimized the infiltration of salt contact storm water run-off into the subsurface. The corrective actions described in this report are intended to meet all the reporting requirements of 20.6.2.1203 NMAC and DP-831 as renewed on September 9, 2008. If you have any further questions regarding this matter or need additional information please contact H. L. Plum at (575) 234-7462.

Sincerely,

Dave Moody

Additional information about this document may be obtained by calling the WIPP Information Center at 1-800-336-9477. Copies may be obtained by contacting the National Technical Information Service, U.S. Department of Commerce, 5285 Port Royal Road, Springfield, VA 22101.

ABSTRACT

The Site and Preliminary Design Validation (SPDV) pile is located in the southwest corner of Section 21, Township 22 South, Range 31 East in Eddy County, New Mexico, adjacent to the Waste Isolation Pilot Plant (WIPP) operational area. During August 2007, piezometers (PZ)-13, PZ-14, and PZ-15 were drilled around the SPDV pile to determine if shallow subsurface water (SSW) existed around the SPDV pile and, if so, provide a means to monitor. These piezometers were drilled with a combination of hollow-stem auger and air-assisted hollow-stem auger drilling. Below the surficial dunes and Berino soil, piezometers PZ-13 and PZ-14 encountered in order, from shallowest to deepest, the Mescalero caliche, Gatuña Formation, Santa Rosa Formation, and Dewey Lake Formation. Piezometer PZ-15 was completed in the Gatuña Formation, having not encountered the lower formations by the time SSW was detected.

Water was encountered in all wells. Piezometers were constructed of 2-inch polyvinyl chloride casing and 15 feet of 0.020-inch slot screen. Water samples were obtained and analyzed for each well. Based on the results of the installation of the piezometers, analysis of water levels, and geological analysis, it is concluded that the water levels identified in PZ-13 and PZ-14 are the result of the SPDV pile runoff or infiltration prior to being lined. Water in PZ-15 is much shallower and chemically different that water in the other two wells, indicating another source, such as recharge and infiltration from the east of the SPDV pile.

1.0 INTRODUCTION

The Site and Preliminary Design Validation (SPDV) pile is located in the southwest corner of Section 21, Township 22 South, Range 31 East, Eddy County, New Mexico, adjacent to the Waste Isolation Pilot Plant (WIPP) operational area (Figure 1-1). Piezometers PZ-13, PZ-14, and PZ-15 are located around the SPDV pile as indicated in Figure 1-2. These piezometers were drilled to determine if shallow subsurface water (SSW) existed around the SPDV pile and, if so, to provide a means to monitor the water level and quality.

Most drillholes near WIPP have been described after completion to provide an account of the geology, hydrology, or other basic data acquired during drilling and immediate completion of the drillhole. This basic data report provides details and descriptions of the drilling procedures and activities utilized during the installation of PZ-13, PZ-14, and PZ-15 that may be helpful to later interpretations of data or for further work in the drillhole, such as test activities and plugging and abandonment.

1.1 Purpose of WIPP and the SPDV Pile

WIPP is a transuranic mixed waste disposal facility operated by the U.S. Department of Energy (DOE). WIPP waste is disposed in the Salado Formation, a bedded salt deposit, 2,150 feet below ground surface (bgs). Salt and other mined rock materials from the construction of WIPP and currently mined salt are stored on the surface in three stockpiles. The stockpiles include, from oldest to newest, the SPDV pile closed in 2000 with an engineered cover; the salt storage area (SSA), which was used previously for mined salt and materials, but recently covered with a synthetic and earthen liner, and the Salt Storage Extension (SSE) for currently mined salt. The focus of this investigation was the SPDV pile.

The SPDV pile was created during the WIPP design validation phase for placement of construction materials resulting from drilling of two 2,150-foot shafts and the underground excavation of connecting tunnels, exploratory tunnels, and four rooms. The materials in the SPDV pile include mined tailings interspersed with soil, rock, and debris from the construction of the shafts. The SPDV pile encompasses approximately 168,000 cubic yards, which includes an area beneath the pile where soil was excavated prior to tailings placement.

The SPDV pile was characterized in 1995 by Daniel B. Stephens and Associates to determine the chemical nature of wastes within the pile and to support selection of reclamation alternatives (Daniel B. Stephens and Associates, Inc., 1996). The investigation determined that no remedial measures were required according to New Mexico Environment Department (NMED) guidelines. As a result of the study, stabilization and reclamation were recommended in order to prevent off-site transport of salt and brine solutions into the surrounding environment, and to blend the salt pile into the surrounding environment. Based on the evaluation, the SPDV pile was formally closed in 2000 by covering it with geosynthetic clay liner installed on 6 inches of bedded material and covered with a minimum of 3 feet of earthen material. The entire SPDV pile was seeded with shallow rooted plants, which have successfully established.

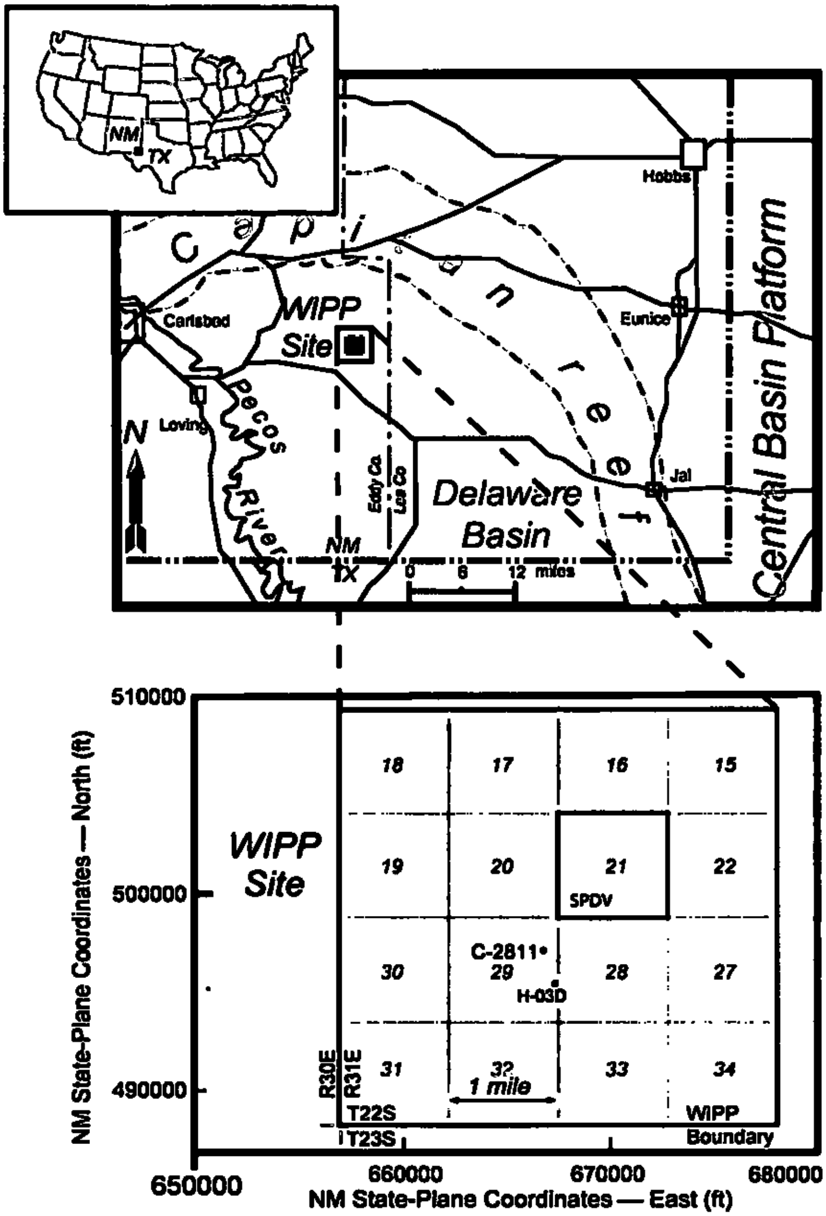

Figure 1-1 - Location Map

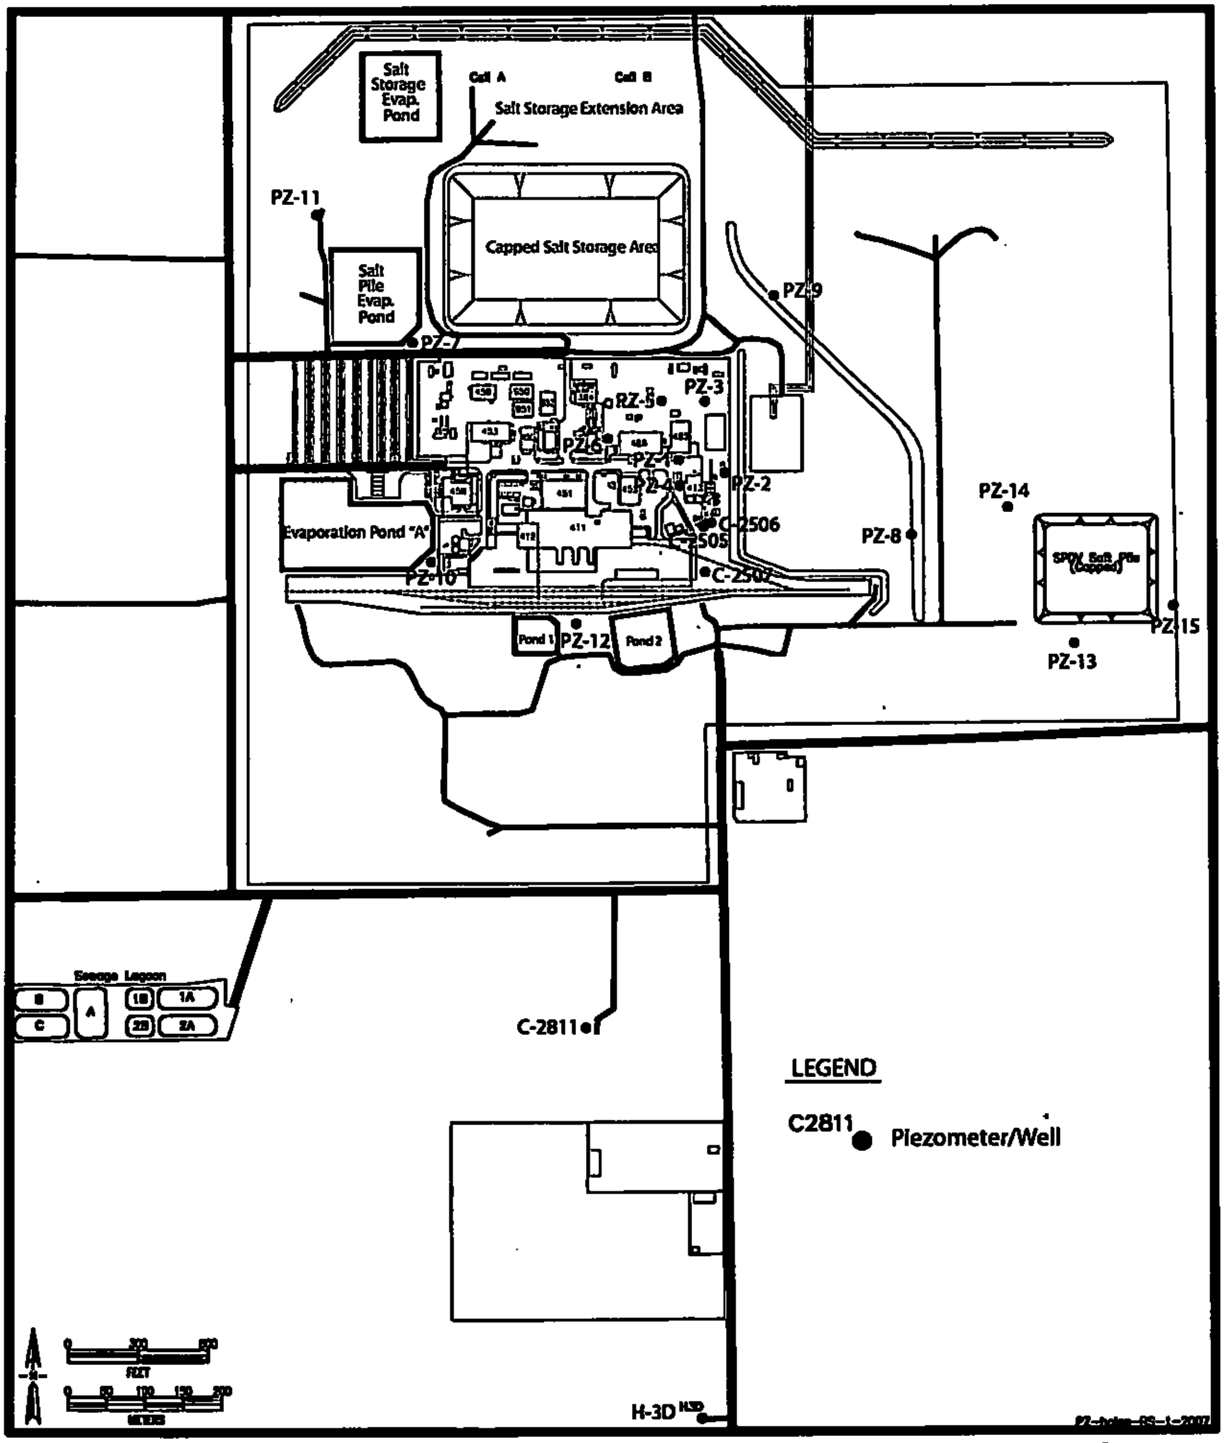

Figure 1-2 - Map of the WIPP Operational Area Showing the Location of Piezometers PZ-13, PZ-14, and PZ-15

02276

1.2 Purpose of PZ-13, PZ-14, and PZ-15

SSW was first detected in 1995 when a video inspection of the Exhaust Shaft detected seepage from about 50 to 80 feet bgs. After 1995, a series of hydrologic assessments were undertaken to identify the source and nature of the SSW at WIPP. Sixteen wells were installed (Figure 1-2) to assess the SSW. It is important to note that the area of interest to this assessment was the exhaust shaft and surface features such as the old salt pile, salt pile evaporation pond, and Ponds 1 and 2. The assessment excluded the SPDV pile. The SSW is a shallow perched water bearing zone that sits on a permeability change at the formational contact between the Santa Rosa Formation and the upper Dewey Lake Formation. The SSW is anthropogenic in nature, resulting from infiltration of precipitation that was captured by unlined ponds and stockpiles (see Discharge Permit (DP)-831 for details).

In December 2003, the NMED Ground Water Quality Bureau (GWQB) issued a modified DP-831 requiring that the unlined ponds and stockpiles be lined with a synthetic liner: SSA and Salt Pile Evaporation Pond (SPEP), Ponds 1 and 2, Pond A. Additionally, a new SSE was to be constructed with a synthetically lined base on which infiltration and surface runoff from this pile would be directed to a new evaporation basin. Also included in this modification was the implementation of a monitoring program of the SSW that included quarterly water level measurements from all the SSW wells and semiannual sampling of selected SSW wells for total dissolved solids (TDS), chloride, sulfate, nitrate, chromium, and selenium. This program was implemented in May 2004 and continues to date.

On December 29, 2006, the NMED GWQB issued another DP-831 modification with a condition that the SPDV pile be investigated as a possible source of shallow groundwater. The modification indicated that WIPP should install three monitoring wells adjacent to the SPDV pile. Piezometers PZ-13, PZ-14, and PZ-15 were drilled during August 2007 around the SPDV pile to investigate the possibility of SSW beneath the subsurface.

Prior to this investigation, the only other drilling in the area was by Daniel B. Stephens and Associates (1996) to characterize the content of the SPDV pile, and Sergent, Hauskins & Beckwith (1979), for geotechnical data collection and analysis. No water was detected in either of these investigations. Prior to drilling the SPDV pile piezometers, it was hypothesized that SSW, if present, would be perched on the contact between the Santa Rosa Formation and the Dewey Lake Formation, as it had at locations west of the SPDV pile. The best estimated depth for piezometers PZ-13, PZ-14, and PZ-15 was 60 feet bgs, based on PZ-8, which is located west of the SPDV pile.

This report summarizes the installation of the piezometers around the SPDV pile and correlates the data to the data for the other SSW piezometers around WIPP via interpretation of hydrology and chemistry.

2.0 GEOLOGICAL DATA

2.1 General Geological Background

The geology and hydrology of formations at the WIPP site and the surrounding area have been investigated since 1975, and the information and interpretations have been reported in numerous documents. The most thorough compilation is the Compliance Certification Application (CCA) submitted in 1996 by the DOE to the U.S. Environmental Protection Agency (U.S. DOE, 1996). Some features of the broader geological history are relevant to understanding the geology and hydrology at the location of the SPDV pile and the piezometers associated with this report (Powers,1997).

The Delaware Basin (Figure 1-1) was a large structural feature that controlled deposition through much of the Paleozoic. By late Permian, the basin was restricted, and evaporite minerals dominated. The basin filled with sediments, and it no longer significantly affected sedimentation. Near the end of the Permian, circulation with the ocean improved, and some of the Rustler Formation was deposited in saline water rather than brine. As the Permian ended and Triassic began, continental environments prevailed and significant redbeds, the Dewey Lake Formation (Figure 2-1), were deposited. Although surrounding areas accumulated variable thicknesses of later Mesozoic and Cenozoic age sediments, the WIPP area appears to have mainly been subjected to erosion during an extended period from mid-Mesozoic to mid-Cenozoic (Figure 2-1). Some basin tilting around mid-Cenozoic exposed the evaporite beds to faster solution and erosion, and weathered material accumulated. The Pecos River drainage became integrated through the region during this period, and late Cenozoic deposits reflect this sedimentary environment and sediment sources outside the local area. Although the region is still subject to evaporite dissolution and erosion, large areas have remained geologically stable for about the last half-million years, resulting in the formation and preservation of pedogenic calcrete (Mescalero caliche) deposits (Powers, 1997).

Three sources of information contribute to understanding the geology of PZ-13, PZ-14, and PZ-15: (1) the general near surface geology of this area (Powers, 1997), (2) drilling and logging of shallow piezometers in the vicinity, and (3) core samples and cuttings collected during drilling. Formation color was determined using Munsell Soil Color Charts, year 2000 revised edition.

These piezometers were drilled by hollow-stem auger with split spoon sampling and air-assisted hollow-stem auger drilling, depending on the formation and consolidation. Contact depths to each formation were predicted prior to drilling based on those identified in piezometers PZ-8 and PZ-9 (Figure 1-2).

2.2 Geological Data From PZ-13

2.2.1 Permo-Triassic Dewey Lake Formation

The Dewey Lake was encountered in PZ-13 from 75 feet deep to total depth (TD) of the piezometer at 77 feet (Figure 2-2). The Dewey Lake in PZ-13 is dominated by dark reddish brown silty mudstone with mottling of red and gray-olive gray mudstone, with greenish gray reduction spots. The formation was platy, reflecting common thin bedding or laminae of the unit, contained some moisture at the Santa Rosa contact, but dried as the drilling proceeded deeper. This indicated that the upper portion of the Dewey Lake was acting as an aquitard, and drilling was stopped. A well was installed at this location and constructed as depicted in Figure 2-2.

The Dewey Lake at PZ-13 was encountered 11 feet deeper in elevation than it was in PZ-8, indicating possible erosion during deposition of the overlying Santa Rosa Formation during predominantly fluvial environments. The Dewey Lake was deeper in elevation in PZ-13 than in PZ-9, another previously installed piezometer in the area. It was about 2 feet deeper in elevation than PZ-14 (Section 2.3).

Total Depth 77' terminated in the Dewey Lake Formation

Figure 2-2 - Core Log for PZ-13 (Continued)

2.2.2 Triassic Santa Rosa Formation

The Santa Rosa is 40 feet thick at this location, from 35 feet bgs to 75 feet bgs. The Santa Rosa and Gatuña were differentiated in this drillhole by a mottled red and light gray sandstone with slickensides as opposed to the basal Gatuña Formation lacking these features and being predominantly a red sandstone at the contact. The Santa Rosa in this piezometer consists of interbedded sandstone of variable color, grain size, induration, cementation, and clay content (Figure 2-2). The formation was well indurated and required air assisted drilling from 47 feet to 64 feet, limiting samples to cuttings. It is presumed this may be due to cementation changes from a carbonate base to a silica base.

The interval from 65 feet to 67.5 feet is a sandy argillaceous siltstone that was saturated during drilling. The saturation in the Santa Rosa was identified during drilling to extend down into a harder siltstone of similar characteristic as the overlying lithology (Figure 2-2). The saturation diminished with depth, but showed increasing induration, and clay content. The underlying Dewey Lake was moist.

Comparatively, the Santa Rosa in PZ-13 is 11 feet thicker than in PZ-8 (29 feet) and five feet thicker than in PZ-9 (35 feet), indicating a thickening trend to the south, south-east of WIPP. This thickening is suggested by Jones (1978) as a consequence of eastward formational dip and eastward rise in surface topography. The Santa Rosa was deposited in dominantly fluvial environments and lies unconformably on the Dewey Lake.

The Santa Rosa was encountered at approximately the same elevation as in PZ-8, but approximately 2 feet shallower in elevation than PZ-9. Compared to PZ-14 and PZ-15, the Santa Rosa in PZ-13 was encountered 2 feet deeper in elevation than PZ-14 and 7 feet shallower in elevation than in PZ-15, indicating possible localized Permo-Triassic erosional features likely due to fluvial activities.

2.2.3 Miocene-Pleistocene Gatuña Formation

The Gatuña Formation is about 25 feet thick at this location. The Gatuña in PZ-13 is pink (Munsell 5YR 7/4) to red (2.5YR 5/8, 6/6, 4/8) sandstone, with generally fine to medium sand grains. The Gatuña contains bluish-black manganese oxide (MnO) stains throughout. The formation at PZ-13 is friable (very loose sand) to moderately well lithified and platy (Figure 2-2). It is very calcareous in the upper part due to overprint (penetration) of pedogenic processes during early stages of the development of overlying Mescalero caliche (Powers, 2003).

The Gatuña generally increases in thickness to the west in the WIPP area, and the depositional edge of the formation is in the same general area where the Santa Rosa pinches out because of erosion that preceded Gatuña deposition (Powers and Holt, 1993). Gatuña thicknesses in nearby piezometers reflect this trend of increasing thickness to the west. The Gatuña thickness in PZ-8, west of PZ-13, is approximately 22 feet. In PZ-9, northwest of PZ-13, the Gatuña is approximately 25 feet.

The Gatuña in PZ-13 was encountered 3 feet shallower in elevation than in PZ-8 and 2 feet shallower in elevation than in PZ-9. Compared to PZ-14 and PZ-15, the Gatuña in PZ-13 was encountered at the same elevation as in PZ-14, but approximately 6 feet shallower in elevation than in PZ-15, following a possible trend of infilling of an erosional feature.

2.2.4 Pleistocene Mescalero Caliche

The Mescalero caliche is 3.5 feet thick at this location; however, the pedogenic processes that developed the Mescalero have penetrated deeper into the Gatuña Formation as defined by the overprint in Section 2.2.3 and in Figure 2-2. The Mescalero in PZ-13 is pink (5YR 7/4) sandy limestone, or calcareous sandstone with pebbles and weak laminar structure. Basal Gatuña inclusions were encountered at this location from 9 to 10 feet (Figure 2-2). Because the Mescalero is a pedogenic process (soil forming), thicknesses will vary from location to location. In the area of PZ-13, compared to other wells, the thickness varies from 2.5 to 4 feet. The Mescalero is an informal soil stratigraphic unit defined by Bachman (1973). It is widespread in southeastern New Mexico, and it is a continuous stratigraphic unit at the WIPP site.

The Mescalero in PZ-13 is approximately 7 feet higher in elevation than in PZ-8 and 5 feet higher in elevation than in PZ-9. Compared to PZ-14 and PZ-15, the Mescalero in PZ-13 was encountered approximately 2 feet higher in elevation than PZ-14 and approximately 5 feet lower in elevation than in PZ-15. This variation is not surprising as the pedogenic process will vary from location to location and generally conforms to underlying topography.

2.2.5 Pleistocene Berino Soil and Surficial Sands

Based on the continuous split spoon sample taken at SNL-13, there is a 4-foot-thick layer of unlithified dune sand and basal argillaceous sand (commonly called the Berino soil, Powers, 2002). The sand is fine grained and calcareous. The Berino soil is not a geologic unit, but defined as a pedogenic unit by local soil scientists (Chugg et al., 1971). The surface sand around WIPP is eolian, with much of it fine to medium grain, moderately well sorted, and poorly indurated. Dunes at the WIPP site are partially stabilized by vegetation (Powers, 2003).

2.3 Geological Data From PZ-14

2.3.1 Permo-Triassic Dewey Lake Formation

The Dewey Lake was encountered in PZ-14 from 70.8 feet to TD at 73 feet (Figure 2-3). In this piezometer interval (70.8 to 73 feet), the Dewey Lake is characterized by a very hard, competent gray and red siltstone, platy, and dry; a red claystone that is unconsolidated with greenish gray reduction spots; and very hard platy red siltstone with greenish gray reduction spots (Figure 2-3). The Dewey Lake in this piezometer was dry at the contact, but damp below. Based on data obtained from the overlying Santa Rosa Formation (see Section 2.3.2), the TD was based on this depth acting as an aquitard dampening vertical flow of SSW. A well was installed at this location and constructed as depicted in Figure 2-3. The sample obtained from this piezometer did indicate alternating lithologic variations of siltstone and claystone (Figure 2-3).

The Dewey Lake at PZ-14 was encountered 9 feet deeper in elevation than it was in PZ-8, indicating possible erosion during deposition of the overlying Santa Rosa Formation during predominantly fluvial environments. The Dewey Lake was only 0.5 feet deeper in elevation in PZ-14 than in PZ-9, another previously installed piezometer in the area.

2.3.2 Triassic Santa Rosa Formation

The Santa Rosa at this location is 20.8 feet thick, from 50 feet bgs to 70.8 feet bgs, but less than that identified in PZ-13. The Santa Rosa and Gatuña were differentiated in this drill hole, similarly as in PZ-13, by mottled reddish brown and light gray sandstone with slickensides as opposed to the basal Gatuña Formation lacking these features and being predominantly a red sandstone at the contact. Samples for this piezometer were not obtained continuously as the formation was very hard in places and alternative drilling techniques (air assisted) were used. Where samples were not obtained, the geology was assumed to be similar to that identified in PZ-13 where extraordinary effort was made for continuous sampling (Figures 2-2, 2-3).

From the samples obtained for 30 feet bgs to 50 feet bgs the Santa Rosa is identified as interbedded reddish and light gray sandstone to reddish brown very hard siltstone. The sandstone contained carbonate filled dessication cracks, slickensided surfaces, and was poorly to moderately indurated. At 50 feet bgs, the sample indicated a very hard competent siltstone (Figure 2-3). At 50 feet bgs to 70.8 ft bgs, the geology was assumed to be similar to PZ-13 (Figure 2-2).

From 70 to 70.8 feet in PZ-14, the formation was interbedded loose, silty sand and a layer of angular claystone and siltstone fragments. This interval was saturated throughout, but the claystone/siltstone fragments (70.5 to 70.8 feet bgs) appeared to be the primary saturation zone. As discussed in Section 2.3.1, the underlying Dewey Lake was dry, acting as an aquitard.

Comparatively, the Santa Rosa in PZ-14 is thinner than that in PZ-13, PZ-8, and PZ-9. This still correlates with thickening trend to the south-southeast of WIPP as suggested by Jones (1978) as a result of dipping and topography trends. The Santa Rosa in PZ-14 was encountered at approximately 9 feet shallower in elevation than PZ-8, and approximately 4 feet shallower in elevation than PZ-9.

2.3.3 Miocene-Pleistocene Gatuña Formation

The Gatuña is about 23 feet thick at this location. The Gatuña in PZ-14 is pink (5YR 8/4) to red (2.5YR 4/8-5/8) with some light reddish brown (2.5YR 7/4-8/4) interbedded sandstone, with generally fine to medium grains. The Gatuña contains bluish-black MnO stains in the upper and basal portions. Some sections are well lithified and platy. It is very calcareous in the upper portion due to overprinting of the overlying Mescalero caliche. Silica cementation dominates in the basal portion.

Gatuña thickness in this well compared to other nearby piezometers reflects the trend of westward increasing thickness (Powers and Holt, 1993). The Gatuña in PZ-14 is thinner than in PZ-13, PZ-8, and PZ-9. The Gatuña in PZ-14 was encountered 3 feet shallower in elevation than in PZ-8, and 2 feet shallower in elevation than in PZ-9.

2.3.4 Pleistocene Mescalero Caliche

The Mescalero caliche is 4 feet at this location, although, as described in previous sections, the processes that developed the Mescalero have penetrated deeper into the underlying Gatuña Formation. The Mescalero in PZ-14 is pinkish-white to pink (5YR 8/2-8/3) sandy limestone, with low moisture content containing calcareous pebbles with weak laminar structure. At PZ-14 the Mescalero has a very hard surface cap. The Mescalero in PZ-14 is approximately 4 feet higher in elevation as it is in PZ-8 and 3 feet higher in elevation than it is in PZ-9.

2.3.5 Pleistocene Berino Soil and Surficial Sands

Continuous samples were not taken at PZ-14 until the top of the Mescalero caliche was encountered. Until the depth of 5 feet, center bit drilling with a wireline was used. The Berino soil and surficial sands were described based on auger cuttings, and the contact was estimated based on PZ-13 and PZ-15 sampling (Figure 2-3). The surficial dune sand at this location was the same as other, unlithified, calcareous light reddish brown (5YR 6/4) sand. The Berino soil was characterized as a red (2.5YR 5/8-4/8) loose, fine grained sand.

Total Depth 73' terminated in the Dewey Lake Formation

Figure 2-3 - Core Log for PZ-14 (Continued)

2.4 Geological Data from PZ-15

2.4.1 Triassic Santa Rosa Formation

PZ-15 was terminated in the Santa Rosa Formation where saturation was identified. As such, the Dewey Lake Formation was not encountered in this well.

The top of the Santa Rosa in the well was identified at 51 feet bgs. The entire thickness of this formation is unknown as it was not completely drilled through; however, it is assumed to be thinner than in PZ-13 and PZ-14 due to the thickening westward trend of this formation. The top of the Santa Rosa Formation was saturated.

Drilling was terminated at this point as it was apparent that just deeper, the Santa Rosa Formation dried and became very hard, acting as an aquitard. A piezometer was installed at this depth and constructed as depicted in Figure 2-4.

The 5 feet of Santa Rosa Formation penetrated in this well are characterized as two lithologic variations. The upper portion from 51 to 51.5 feet is described as red (2.5YR 4/8) to light gray (10YR 7/1) interbedded sandstone with dessication cracks that are carbonate filled (Figure 2-4) that becomes softer and sandier with depth. This upper portion was saturated at the top and became dry with depth at the lower very hard portion. The lower section sampled (51.5 to 56 feet) is described as a very hard consolidated dry reddish brown (2.5YR 4/4) sandstone.

The Santa Rosa in PZ-15 was encountered at approximately 7 feet deeper in elevation than PZ-8, and approximately 5 feet deeper in elevation than PZ-9.

2.4.2 Miocene-Pleistocene Gatuña Formation

The Gatuña Formation is about 39 feet thick at this location, indicating that it gets thicker to the east around the SPDV pile, which is non-typical of the area around the WIPP site. The Gatuña generally thickens to the west in the area of the WIPP site due to erosion of the Santa Rosa Formation, leading to thicker deposition of Gatuña (Powers and Holt, 1993).

The upper 4 feet of Gatuña at this location is pink (5YR 7/4) sandstone with overprint of pedogenic carbonate soil processes that developed the overlying Mescalero caliche. The upper 4 feet are dry to slightly moist, loose to very stiff, with clasts of caliche and altered MnO throughout (Figure 2-4). The lower portion of the Gatuña is predominantly red sandstone with chert pebbles throughout, MnO stained root casts, dominated by sand (less argillaceous) and increased bedding structure with depth (platy).

The Gatuña in PZ-15 was encountered 10 feet shallower in elevation than in PZ-8 and 9 feet shallower in elevation than in PZ-9.

Figure 2-4 - Core Log for PZ-15

2.4.3 Pleistocene Mescalero Caliche

The Mescalero caliche at this location is 4.5 feet thick at this location, although the processes that developed the Mescalero have penetrated deeper into the Gatuña as described in previous sections. The Mescalero in PZ-15 is pink (7.5YR 8/2-8/4) sandy limestone of low moisture content. It has weak laminar structure (friable) with chert pebbles throughout. Some pedogenic Gatuña is interbedded as defined by MnO alterations.

The Mescalero in PZ-15 is approximately 11 feet higher in elevation than it is in PZ-8 and 10 feet higher in elevation than it is in PZ-9.

2.4.4 Pleistocene Berino Soil and Surficial Sands

Based on continuous split spoon samples taken at PZ-15, there is 8 feet of unlithified dune sand and basal argillaceous sand (commonly called Berino soil, Powers, 2002). The sand is fine grained and calcareous. The Berino soil is fined grained, calcareous, and damp with small roots.

2.5 Geologic Significance, Discussion, and Correlation with Other Piezometers

The early SSW piezometers were drilled with air rotary and logged by examination of cuttings from the drill stem. The use of hollow stem augers in PZ-13, PZ-14, and PZ-15 allowed for close examination of the lithology and exactly where saturation occurred. Based on the information from the SPDV pile piezometers, it is clear that no one single lithologic zone can be isolated as being the predominant location for the SSW to reside or flow as the geology is vertically and spatially heterogeneous.

Figure 2-5 presents two cross-section across the site trending west to east (A-A') and northwest to southeast (B-B'). Cross-section A-A' presents a fairly consistent Gatuña thickness that undulates along the top of the Santa Rosa surface, dipping to the west. The Gatuña begins then to noticeably thicken at the point of PZ-15. The Santa Rosa Formation, on the other hand, is variable in thickness, thinning at the location of C-2507 and thickening east C-2507, along the deepening Dewey Lake contact.

Cross-section B-B' also presents a fairly consistent Gatuña thickness that mimics the Santa Rosa depositional surface along this trend. The Santa Rosa Formation from roughly north to south is relatively consistent in thickness (± 5 feet), with the thicker portion to the south. Structurally, the Santa Rosa dips to the west and east from the PZ-8/PZ-14 area, similar to the Gatuña, and the thickening trends with the deepening Dewey Lake. The top of the Dewey Lake appears to have a structural divide around PZ-8 where the surface dips gently to the west and sharply to the east, possibly an erosional feature.

Figure 2-6 is a wireframe map showing the upper surface of the Dewey Lake Formation for all SSW piezometers that encountered the Dewey Lake contact. Superimposed on this map are the contours of this surface. This figure shows that the surface of the Dewey Lake in the area of interest is comprised of high areas, valleys, and bowls. Sitting on top of this surface is the Santa Rosa Formation. The Dewey Lake has a lower permeability than overlying formations such that vertical flow is impeded, creating a perched water zone at or near the contact.

These characteristics of the Dewey Lake surface (highs, valleys, ridges, bowls) play an important role in defining geological control of SSW accumulation and movement.

Figure 2-7 depicts the same contours of the Dewey Lake surface superimposed onto a shaded relief map of the Dewey Lake surface. This figure highlights the surficial features identified in previous figures and discussed in the above paragraphs. Low areas (depressions) on the Dewey Lake surface are associated with PZ-4, PZ-5, PZ-7, PZ-12, PZ-14, and C-2507. High points are associated with PZ-6, PZ-8, PZ-10, and C-2505/2506. Between these points are ridges, valleys, and plateaus.

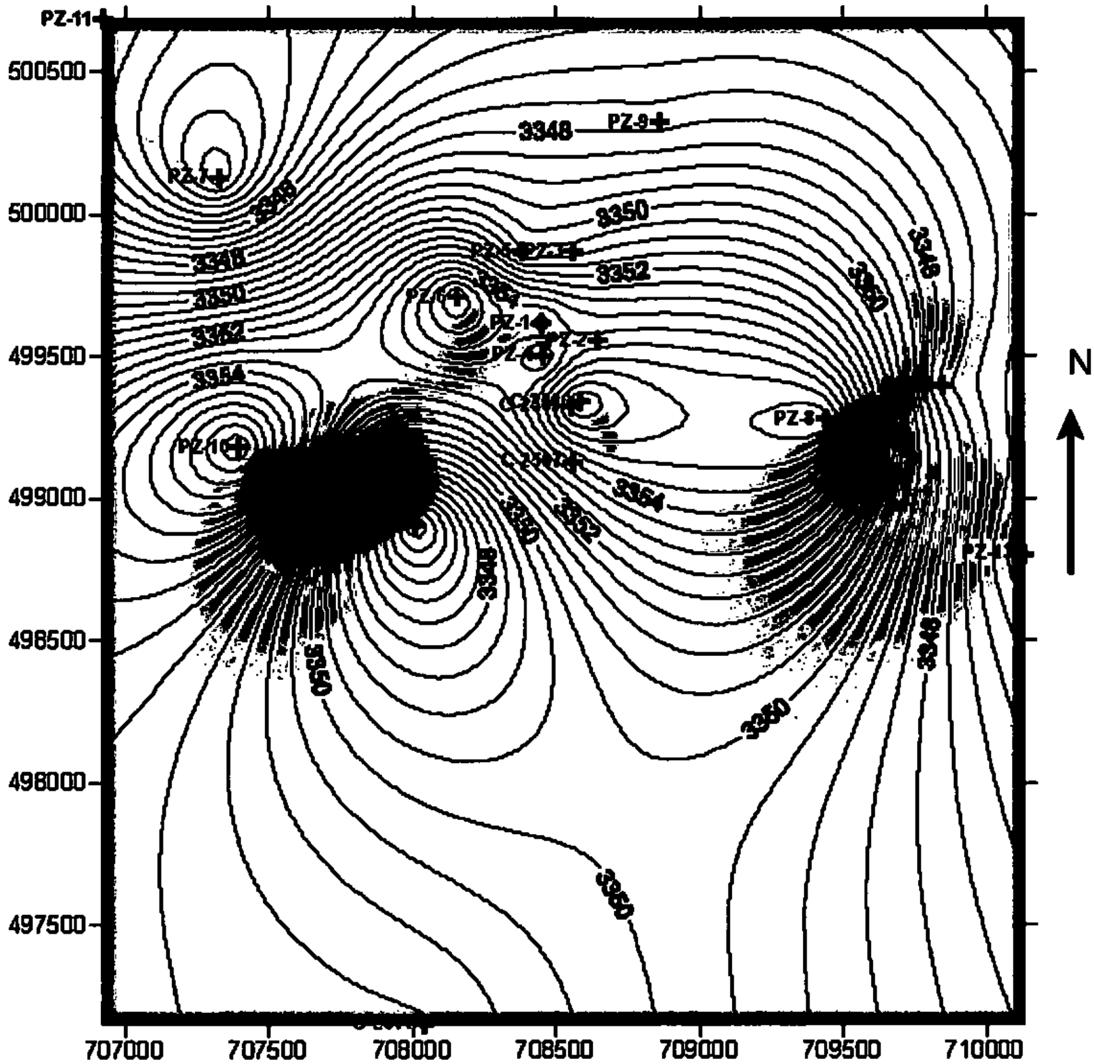

Figure 2-7 - Shaded Relief Structure Map of Dewey Lake Surface

02295

Based of the geologic data obtained from the piezometers around the SPDV pile, there can be some conclusions made at this point:

- The SSW appears to be isolated in different and variable zones around the SPDV pile based on examination of split spoon samples obtained during drilling.
- Structural features of the Santa Rosa/Dewey Lake contact play an important role in accumulation and movement of SSW.
- The stratigraphy overlying the Santa Rosa/Dewey Lake contact is heterogeneous and tortuous.

3.0 HYDROLOGICAL DATA

3.1 Description of Shallow Subsurface Water in the Santa Rosa and Upper Dewey Lake Formations

SSW was first detected in 1995 when a video inspection of the Exhaust Shaft detected seepage through the shaft liner from approximately 50 to 80 feet bgs. After 1995, a series of hydrologic assessments was undertaken to identify the source and nature of the SSW at WIPP. Sixteen wells were installed around the site to assess the SSW. The SSW was detected in all but one well, PZ-8, which was dry until March 2007. The SSW is a shallow-perched, water-bearing zone that sits on a permeability change at the formational contact between the Santa Rosa Formation and the upper Dewey Lake Formation. The SSW is believed to be entirely anthropogenic in nature, resulting in part from historical natural discharges from locations at WIPP.

In December 2003, the NMED GWQB issued a modified DP-831 indicating that the unlined ponds and stockpiles be lined with a synthetic liner: SSA and SPEP, Ponds 1 and 2, Pond A. Additionally, a new SSE was to be constructed with a synthetically lined base on which infiltration and surface runoff from this pile would be directed to a new evaporation basin. Also included in this modification was a monitoring program that included quarterly water level measurements from all the SSW wells and semiannual sampling of selected SSW wells for TDS, chloride, sulfate, nitrate, chromium, and selenium. This program was implemented in May 2004 and continues to date.

On December 29, 2006, the NMED GWQB issued another DP-831 modification with a condition that the SPDV pile be investigated as a possible source of shallow groundwater. The modification indicated that WIPP should install three monitoring wells adjacent to the SPDV pile. This report has documented the installation of these wells and the data obtained.

Isolated saturated sections were detected in all three piezometer boreholes installed around the SPDV pile, although at differing elevations and lithology. The following sections describe the water levels and chemistry in these wells and a discussion of each as it correlates to the SSW on the WIPP site and the other 16 piezometers.

3.2 Water Levels in Piezometers PZ-13, PZ-14, and PZ-15 and Comparison to WIPP Site Piezometers

In October 2007 a survey of the piezometer top of casing and ground surface elevation was performed by a New Mexico licensed surveyor. All data reported herein are referenced to coordinate systems NAD27/NAVD29 survey.

Water was detected in all three piezometers around the SPDV pile at differing horizons and, in one case, a differing formation. Water saturation in PZ-13 was detected while drilling in the lower Santa Rosa at a depth of 65 feet bgs, an elevation of 3,355 feet above mean sea level (AMSL). Saturation in PZ-13 was confined to a 2.5-foot vertical section of the Santa Rosa characterized by interbedded sandy argillaceous siltstone and sandy siltstone. The water in this boring appeared to be perched upon much harder, consolidated Santa Rosa at the contact with the Dewey Lake Formation. The permeability change of the harder sandstone and underlying Dewey Lake mudstone act as an aquitard perching the water at this elevation. Lithologic intervals above the saturated interval were moist, but not saturated.

Water saturation in PZ-14 was detected while drilling in the lower Santa Rosa at a depth of 70 feet bgs, an elevation of 3,348 feet AMSL. Saturation in this borehole was confined to a thin lense (0.80 foot) of the Santa Rosa, characterized as loose argillaceous sand and a section of interbedded angular claystone and sandstone fragments/pebbles. The saturated lens was sitting upon the contact with the Dewey Lake Formation (mudstone). This permeability contrast allowed the perching of water at this depth as the Dewey Lake acted as an aquitard. Samples were not obtained above this interval as air assisted drilling was employed; however, steam or other indicators of moisture were not apparent.

Water saturation in PZ-15 was detected while drilling in the lower Gatuña Formation at a depth of 45 to 55.5 feet bgs, an elevation of 3,384 feet AMSL. Saturation was in the lower Gatuña, where it became more friable, sitting on the Santa Rosa contact. The upper Santa Rosa Formation in this borehole is very hard at 51.5 feet bgs (3,377 feet AMSL) acting as an aquitard and perching the water at this interval.

Geologically, the underlying formations are very heterogeneous between piezometers (spatially) as well as between formations and within formations (vertically). Heterogeneity in the horizontal and vertical directions is significant as characterized by careful and mostly continuous sampling while drilling. This heterogeneity leads to preferential and tortuous flow paths. The detected saturation, as discussed above, occurred in different horizons of variable thickness and lithologic structure, lending to preferential flow and tortuosity.

The heterogeneity and tortuous flow affects the ability for saturated lenses to develop or connect with one another. An attempt was made to sample piezometers PZ-8, PZ-13, PZ-14, and PZ-15 on October 10, 2007, by low-flow sampling methods using a small diameter submersible pump. Typical sustained flow rates during sampling for the SSW piezometers at WIPP range from 400 milliliters per minute (mpm) to 1,500 mpm while keeping water levels stable and drawdown to a minimum. This could only be achieved for PZ-13, which pumped at an average rate of 1,050 mpm, but was pumped dry as the sample was obtained. Piezometers PZ-8, PZ-14, and PZ-15 could not sustain enough flow to measure before pumping dry. These wells were later sampled using a Teflon™ hand bailer (see Section 2.3). This indicates not only low permeability in the formation but, due to the small saturated lenses, a low volume of SSW in storage around the SPDV pile.

Figure 3-1 is a potentiometric surface map of the SSW at the WIPP site inclusive of the wells at the SPDV pile based on the water levels presented in Table 3-1, and is superimposed on a shaded relief structure map of the Dewey Lake surface. Well H-3d (Figure 1-2) was converted to a shallow monitoring well during the *WIPP Fiscal Year 2005 Plugging, Abandonment, and Well Reconfiguration Program* (DOE/WIPP 05-3326) and is not included in this map. Water levels in Well H-3d are monitored quarterly and to date there has been no SSW impact at this location. Therefore, the southern extent of SSW at the WIPP likely lies between PZ-12 and H-3d. Figure 3-1 does not include PZ-15, as it was completed in the Gatuña Formation.

Based on Figure 3-1, it appears that the surface of the Dewey Lake has an influence on the potentiometric surface and flow system of the SSW. Low points in the contact, such as at PZ-7, appear to create a radial flow, when water from the SPEP was contributing to infiltration. A ridge aligned with PZ-5 and south to C-2507 tends to direct water east and west. Low points in the surface structure are variable depending upon how much water has perched in these areas. The primary flow direction is south.

The water around the SPDV pile is defined by PZ-13, PZ-14, and PZ-15. Water levels for these wells were obtained approximately four months after they were installed. As discussed in previous sections, PZ-15 was completed in a different geologic horizon than PZ-13 and PZ-14, and is reflected in the differing water level elevations (Table 3-1). Hydrographs compiled for the WIPP site piezometers indicate an interconnection by having similar time series responses in water elevation fluctuation. Not enough data have been accumulated to determine connectivity between SPDV pile piezometers or between site piezometers and SPDV pile piezometers. However, based on the small lenses with water identified during drilling, lack of storage identified during sampling and low permeability, vertical and spatial heterogeneity, and tortuous media, the tentative conclusion at this point is that the water identified in PZ-13, PZ-14, and PZ-15 are all isolated from each other. Some of this can be seen with chemical differences (Section 3.3).

Table 3-1 - Measured Water Elevations
December 5, 2007

Well I.D.	Top of Casing Elevation	Water Level	Water Level Elevation
PZ-1	3,413.28	39.98	3,373.30

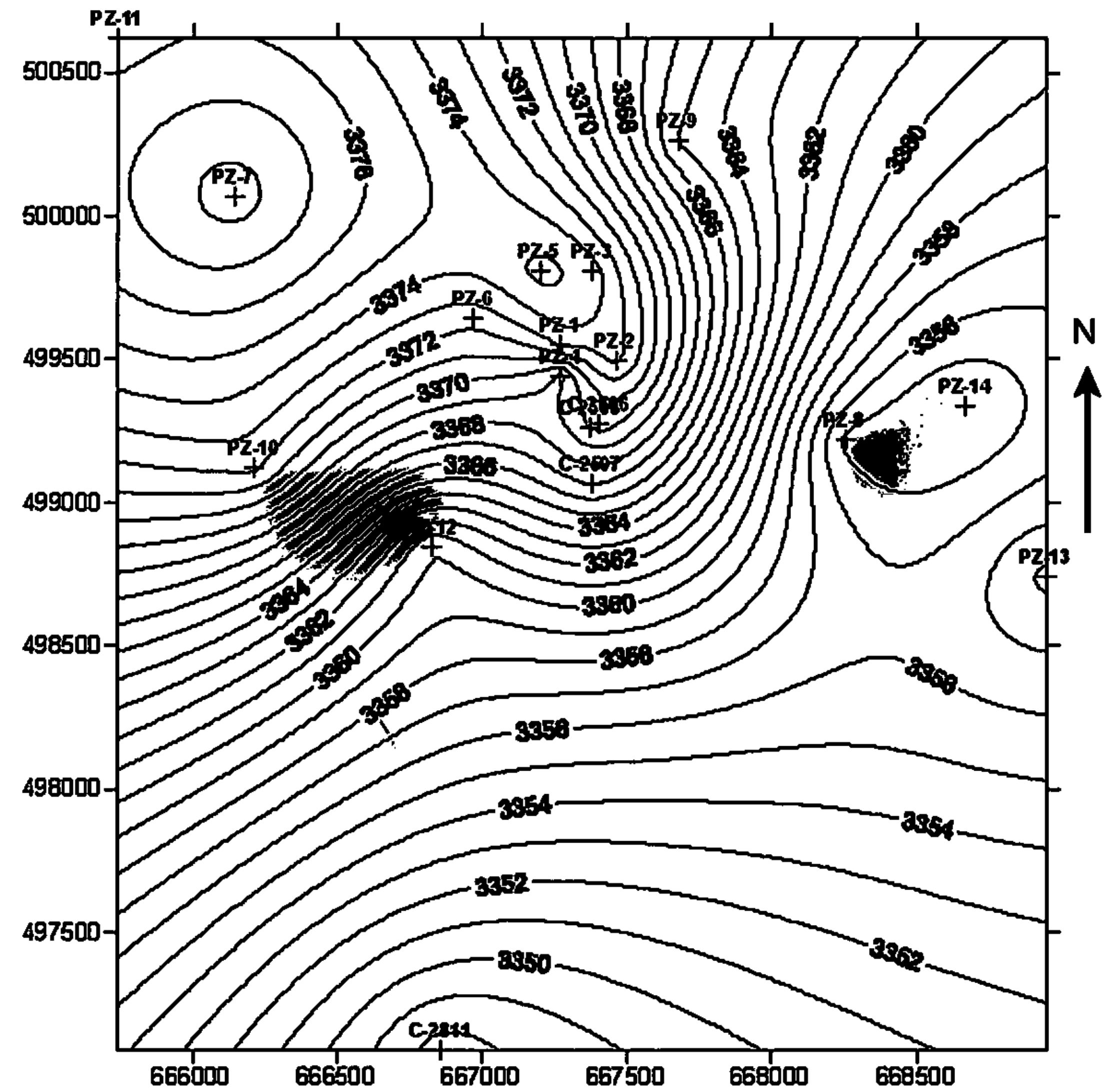

Figure 3-1 - Potentiometric Surface Map Superimposed on Dewey Lake Surface

02300

Overall, the water levels in the WIPP piezometers have been rising in all wells through December 2007, although at differing rates. One well, PZ-9, has been decreasing in elevation since March of 2005. This decreasing water level may be the first sign that lining the salt pile is having an effect on the SSW elevation. The decreasing water levels at PZ-9 began shortly after the conveyance ditches around the Salt Storage Area were lined. This conclusion is preliminary, it is too soon to tell what impact the liner systems at the site have had on water levels in the piezometers.

3.3 Water Quality in Piezometers PZ-13, PZ-14, and PZ-15 and Comparison to WIPP Site Piezometers

SSW samples have been obtained semiannually from the site piezometers as part of DP-831 since 2004. The quarterly sampling event for DP-831 was performed in October 2007, and included the three new piezometers. Since the piezometers around the SPDV pile were new, parameters beyond those required by the permit were analyzed to characterize the water (Table 3-2).

Low-flow sampling techniques are typically employed to sample the piezometers at WIPP. This involves using a small diameter submersible pump with typical sustained flow rates during sampling of 400 mpm to 1500 mpm, while keeping water levels stable and drawdown to a minimum. The water is field analyzed for temperature, conductivity, and pH until these parameters stabilize, then a laboratory sample is obtained. This could only be achieved for PZ-13, which pumped at an average rate of 1,050 mpm, but was pumped dry as the sample was obtained. Piezometers PZ-8, PZ-14, and PZ-15 could not sustain enough flow to measure before pumping dry. Piezometers PZ-8, PZ-14, and PZ-15 were pumped dry on October 10, 2007, and allowed to recover until October 15, 2007, where they were sampled using a Teflon™ hand bailer. PZ-8 was installed in 1997 and remained dry until this 2007. This was the first time PZ-8 was sampled. Results for wells PZ-8, PZ-14, and PZ-15 are presented in Table 3-2. Table 3-3 presents results for the DP-831 required parameters for all the sampled WIPP SSW piezometers.

Table 3-2 presents three different geochemical zones:

1.0 PZ-15, carbonate-based alkalinity. PZ-15 is near is a topographic depression to the east. During heavy rainfall this depression holds water for a period of time; enough such that cattle congregate to drink. The alkalinity in PZ-15 is predominantly carbonate based while the others are bicarbonate based. This is due to the infiltration of rainwater through the upper Mescalero caliche and higher surficial calcium carbonate dissolution.

2.0 PZ-13 and PZ-14, bicarbonate-based alkalinity. These wells may be affected by recharge from the SPDV pile more than rainwater going through caliche at PZ-15. Alkalinity is likely due to the dissolution of sulfates (gypsum and anhydrite) in the SPDV pile. As discussed in Section 1.1, the SPDV pile was used to store mined tailings interspersed with soil, rock, and debris from the construction of the shafts. All formations to the depth of the shafts were mined; therefore, minerals such as gypsum ($CaSO_4 \cdot 2H_20$), anhydrite ($CaSO_4$), halite ($NaCl$), sylvite (KCl), carnallite ($KMgCl_3 \cdot 6H_20$), and soda niter ($NaNO_3$) associated with gypsum and halite were included in the SPDV pile cuttings and explain the chemical differentiation.

Dissolved potassium is significantly higher in PZ-13 and PZ-14 than the other two piezometers, which can likely be attributed to the dissolution of sylvite and carnallite (potash salts). Sulfate concentrations in PZ-13 and PZ-14 are significantly higher and can be attributed to dissolution of anhydrite and gypsum found in formations above the Salado Formation.

3.0 PZ-8, low TDS, low potassium and sulfate, intermediate sodium, and chloride. Dissolved sodium and chloride can be associated with the dissolution of halite, predominantly found in the Salado Formation. While halite is almost exclusive to the salt pile, the SPDV pile also contains halite. Thus, sodium and chloride concentrations are greater in PZ-13 and PZ-14 than in PZ-8, due to SPDV pile proximity. Lacking potassium and sulfate, it is difficult to conclude the source of water in PZ-8 based on a single sample.

To summarize, the document titled *Exhaust Shaft: Phase III Hydraulic Assessment Data Report October 1997 - October 1998* (DOE-WIPP Draft 2302) presents analytical data from piezometers PZ-1 through PZ-12, C-2505, C-2506, and C-2507 for these years. In it the concentration for sulfate range was 404 - 2910 mg/L, nitrate was 4.2 - 46.6 mg/L, sodium 183 - 50,900 mg/L, potassium 3.7 - 356 mg/L, and calcium 270 - 4580 mg/L. Table 3-2 fingerprints SPDV pile PZ-13 and PZ-14 by high potassium concentration, indicating a different source of groundwater than the wells within the operational area.

4.0 CONCLUSIONS

Piezometers PZ-13, PZ-14, and PZ-15 indicated saturated sections in all three locations at differing horizons and, in one case, a differing formation. Based on the geologic data obtained the SSW appears to be isolated in different and variable zones around the SPDV pile based on examination of split spoon samples obtained during drilling. Structural features of the Santa Rosa/Dewey Lake contact play an important role in accumulation and movement of SSW and the stratigraphy overlying the Santa Rosa/Dewey Lake contact is heterogeneous and tortuous. The heterogeneity and tortuosity leads to preferential flow and a vertical dampening affect. The heterogeneity, small saturated lenses, and tortuous flow affects the ability for flow to readily occur in the unsaturated zone around the SPDV pile.

It is believed that the water detected around the SPDV pile is limited in volume and spatial distribution based on the ability to bail the wells dry and slow recovery. Hence, there will be no realized benefit of further areal characterization of the SPDV pile, and no risk of not detecting a continuous, flowing, saturated zone.

Overall the water levels in the WIPP piezometers are rising, although at differing rates. One well, PZ-9, has been decreasing in elevation since March of 2005. The decreasing water levels at PZ-9 began shortly after the conveyance ditches around the Salt Storage Area were lined. It is too soon to consider this a cause and effect, or to tell other impacts of the liner systems at the site on water levels in the piezometers.

Three geochemical zones have been identified based on the data obtained from PZ-13, PZ-14, PZ-15, and PZ-8. One being associated with PZ-15, the second associated with PZ-13 and PZ-14, and the third associated with PZ-8. PZ-13 and PZ-14 are believed to be associated with the SPDV pile. The data are inconclusive with regard to PZ-8. Water detected in PZ-15 is believed to be associated with shallow infiltration from a topographic depression east of the SPDV pile.

It is recommended that the additional wells (PZ-13, PZ-14, and PZ-15) be included in the semiannual sampling and quarterly monitoring program as defined by the WIPP DP-831 permit.

RE: Response to Notice of Intent to Discharge; Discharge Permit Required for Proposed Discharge of Water from Pump Test at Well SNL-16, Waste Isolation Pilot Plant, DP-831

Dear Mr. Franco:

The Ground Water Quality Bureau of the New Mexico Environment Department (NMED) received a Notice of Intent from you on February 27, 2013. The notice describes your intent to discharge approximately 978,000 gallons of water generated from a pump test from Well SNL-16 (OSE File # C-3220). The notice satisfies the requirements of Subsection A of 20.6.2.1201 NMAC of the New Mexico Water Quality Control Commission (WQCC) Regulations (20.6.2 NMAC). The proposed discharge is located in Section 33, Township 22S, Range 30E, Eddy County.

NMED has reviewed the information provided in accordance with Subsection D of 20.6.2.1201 NMAC. **You are hereby notified that a Discharge Permit is required for the proposed discharge.**

To apply for a Discharge Permit, you must complete and submit three copies of the enclosed Discharge Permit application, along with the $100 filing fee. Please be advised that any discharge from this facility without prior written approval from NMED would be a violation of the WQCC Regulations.

Any appeal of this determination that a Discharge Permit is required must be made to the New Mexico WQCC within 30 days of receipt of this letter, in accordance with Subsection B of 20.6.2.3112 NMAC. A copy of the WQCC Regulations, 20.6.2 NMAC, is available at http://www.nmcpr.state.nm.us/nmac/_title20/T20C006.htm.

If you have any questions, please contact Clint Marshall, Program Manager of the Mining Environmental Section, at (505) 827-0027.

Sincerely,

Clint Marshall

Subject: Notice of Intent for the Proposed Surface Discharge of Water from the Pump Test at Well SNL-16

Dear Mr. Marshall:

The purpose of this letter is to provide the Notice of Intent Form including supporting information for the proposed one-time surface discharge of water from a pumping test at Well SNL-16 (OSE File # C-3220) for your review. It is our intent to obtain authorization to discharge and be exempt from the discharge permit application process for testing purposes. The test will be conducted by Sandia National Laboratories to study the hydrogeologic characteristics in the Culebra Member of the Rustler Formation in Nash Draw to the southwest of the WIPP site boundary. The total water pumped would be approximately 978,000 gallons (3 acre feet) over a 3-4 week time frame to test the double-porosity and unconfined responses of the Culebra at this location. The water will be dispersed from a temporary holding tank at a controlled rate to prevent erosion. The test is to be conducted during the current federal fiscal year.

Primary reasons for this request for a variance are the cost associated with storage and disposal of the generated water and risks associated with increased heavy traffic around the well and between the well and the disposal site. The cost would be approximately $800,000 to store, haul, and dispose of the water, while a one-time surface discharge would cost approximately $10,000. The increased traffic accident risk is associated with an estimated 180 round-trips to haul the water to an approved discharge site such as the H-19 evaporation pond near the WIPP facility.

The water quality in this well was sampled in 2006 following well completion activities and the main constituents are: Chloride: 8,600 mg/L, Sulfate: 2,500 mg/L, TDS: 18,000 mg/L. The water quality of the pumped water is expected to be similar to these values. The complete water quality data from SNL-16, photographs, and maps showing the surrounding area where the water would be discharged are part of the Notice of Intent.

CBFO:OESH:GTB:ANC:13-0717:UFC 5486.00

If you have any questions about this report or require any additional information, please contact Mr. George T. Basabilvazo at (575) 234-7488.

Sincerely,

George T. Basabilvazo for
Jose R. Franco, Manager
Carlsbad Field Office

Enclosure

CBFO:OESH:GTB:ANC:13-0717:UFC 5486.00

1. Name and mailing address of person proposing to discharge:

Jose Franco – Manager

U.S. Dept. of Energy – Carlsbad Field Office

P.O. Box 3090

Carlsbad, NM 88220

Work Phone: (575) 234-7300

Cell/Home Phone: NA

Fax: (575) 234-7027

Email: Jose.Franco@wipp.ws

2. Name of facility:

Waste Isolation Pilot Plant (WIPP), Monitoring Well SNL-16 (OSE# C-3220)

3. Physical location of discharge (if applicable, give street address, township, range, section, distance from closest town or landmark, directions to facility, location map):

SNL-16 is located in the Southeast quarter of Sec. 33, Twp. 22S, Rge. 30E. New Mexico State Plane (NAD27) coordinates are: 489396.00 North, 639328.28 East. UTM coordinates (NAD27, Zone 13): 605191.79 East, 3578999.71 North. See attached maps.

4. Type of operation generating the discharge (e.g., truck wash, food processing plant, restaurant, etc.):

Aquifer pumping test of the Culebra Member of the Rustler Formation.

5. Source(s) of the discharge. Describe how the wastewater, sludge, or other discharges processed and/or disposed at your facility are generated. Identify all sources. Attach additional pages if needed:

One-time discharge of water from the Culebra Member of the Rustler Formation derived from a pumping test in 2013, additional information attached.

6. Expected contaminants in the discharge (e.g., nitrate-nitrogen, metals, organic compounds, salts, etc.) Include estimated concentration if known, and copies of results of laboratory analyses, if available:

Main constituents of the discharge water would be Chloride: 8600 mg/L, Sulfate: 2500 mg/L, Calcium: 1400 mg/L, Sodium: 4400 mg/L, TDS: 18,000 mg/L. See additional information attached.

7. Describe all components of wastewater processing, treatment, storage, and disposal system (e.g., grease interceptor, lagoon, septic tank/leachfield, etc.) Include sizes, site layout map, plans and specifications, etc. if available:

A submersible pump will be placed in the well to bring the water to the surface where it will be held in a storage container, then discharged 350 feet to the west of the well pad through a pipe. The ground will be protected with rip-rap to prevent surface erosion. See additional details and photos below.

8. Estimated maximum daily discharge volume in gallons per day (or other units):

20-30 day test generating 3 acre feet (977,553 gallons), daily discharge estimated at 30,000-40,000 gallons per day

9. Estimated depth to ground water (ft): 193 ft below ground level (Culebra)

Fax: 505-827-2965

Additional Information

A variance is being sought from obtaining a discharge permit to allow a one-time discharge to the surface surrounding WIPP monitoring well SNL-16 (OSE# C-3220). Sandia National Laboratories (SNL) would like to perform a large scale pumping test to study the Culebra Member of the Rustler Formation at this location. The well is located in the southeastern area of Nash Draw; approximately 3 miles west of the WIPP Site boundary (see Figure 1 below).

This test will focus on investigating the double-porosity and unconfined response in the Culebra at SNL-16. The double-porosity response typically occurs quickly (a few hours), while the unconfined response would likely occur over longer time scales (a few days). SNL is also hoping to collect geophysical data during the test (gravity and streaming potential), to maximize the value of this test. All these data together will help understand the nature of the Rustler and Culebra in Nash Draw, where there are many different processes going on. Understanding these processes will help answer questions about how connected the Culebra is to recharge in Nash Draw, which is a perennial WIPP stakeholder question.

The primary reason for the variance request is based on the cost of storage and disposal of generated water from this test. The current increase in oil and gas activity in southeast New Mexico has driven up the cost of the frac tanks used for holding the water and the trucking and disposal rates to dispose of water. The estimated cost to store and dispose of the 3 acre-feet of water is approximately $800,000 based on pricing from subcontractors. Being able to perform the surface discharge would cost approximately $10,000.

WIPP maintains a high level of safety standards for all projects and this test will be no exception. The primary safety concerns related to this test would be hauling and disposing of the water from the pad to a disposal location. Increased traffic and associated risk resulting from transporting water for disposition, estimated at 180 round-trips, could be eliminated with surface discharge authorization.

SNL-16 was rotary drilled and cored to a depth of 299.3 ft below ground level (bgl) to investigate the geology of this area. SNL-16 was completed in the Culebra Member with the screened interval at 193-217 feet bgl, Figure 2 below. Culebra transmissivity is expected to be relatively high due to the many fractures and vugular porosity that occur in this area. SNL-16 is in an area where the halite units in the Tamarisk and Forty-niner members have been dissolved and the mudflat facies remain. The Magenta Dolomite displays normal bedding and laminae, but the typically porous water bearing zone was not identifiable. No water was observed in the Magenta. The upper parts of the Rustler, Dewey Lake and Santa Rosa formations have been eroded in this location, see Table 1.

General chemistry samples were collected for this well by SNL on June 9, 2006 during development activities following well completion. The analytical results are summarized in Table 2 below and the complete data package is attached. The produced water from this test is expected to be of the same quality.

Table 1 – Geology at SNL-16

System/ Period/Epoch		Formation or unit	Member *Informal units*	Depth below surface (ft)[1] *log depths*	*core marks*

Table 2 – SNL-16 Water Quality

Parameter	Concentration	Parameter	Concentration
Chloride	8,600 mg/L	Magnesium	430 mg/L
Fluoride	2.5 mg/L	Potassium	290 mg/L
Sulfate	2,500 mg/L	Sodium	440 mg/L
Calcium	1,400 mg/L	pH	7.19
Iron	0.024 mg/L	Total Dissolved Solids	18,000 mg/L

The planned test will be 20-30 days of pumping generating no more than 3 acre-feet (977,553 gallons) of water. The Culebra at this location is expected to support a continuous pumping rate of 20-30 gallons per minute, although previous testing indicates the potential to pump at a higher rate during shorter periods. The pumping strategy may be adjusted to a series of high rate, short time events instead of one long term steady pump rate event. Water will be held on the surface for a short time then discharged to the surrounding area through a series of pipes to prevent erosion to the surface. This method of discharge was used during a similar large scale pump test in 2012 and the water flowed for approximately 200 feet with no erosion to the surface.

An assessment of the area surrounding the well pad revealed a natural drainage channel about 50 feet north of the pad that would provide a route to place the discharge pipe, Figure 3. This drainage feature extends about 400 yards to the west of the well, eventually running into a culvert at the railroad tracks to the southwest, Figure 4. A drainage line will be placed from the storage tank on the north end of the pad, through a culvert under Nash Draw Road (Figure 4), and out to a discharge point 350 feet west of the pad. Rip-rap will be used to prevent surface erosion at the discharge location.

RE: WIPP

Order No.: 0606131

Dear Rick Beauheim:

Hall Environmental Analysis Laboratory, Inc. received 1 sample(s) on 6/13/2006 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman, Business Manager
Nancy McDuffie, Laboratory Manager

New Mexico Environment Department
Ground Water Quality Bureau

Ground Water Quality Bureau – Pollution Prevention Section Notice of Intent

1. Name and mailing address of person proposing to discharge:

Jose Franco – Manager

U.S. Dept. of Energy – Carlsbad Field Office

P.O. Box 3090

Carlsbad, NM 88220

Work Phone: (575) 234-7300

Cell/Home Phone: NA

Fax: (575) 234-7027

Email: Jose.Franco@wipp.ws

2. Name of facility:

Waste Isolation Pilot Plant (WIPP), Monitoring Well SNL-16 (OSE# C-3220)

3. Physical location of discharge (if applicable, give street address, township, range, section, distance from closest town or landmark, directions to facility, location map):

SNL-16 is located in the Southeast quarter of Sec. 33, Twp. 22S, Rge. 30E. New Mexico State Plane (NAD27) coordinates are: 489396.00 North, 639328.28 East. UTM coordinates (NAD27, Zone 13): 605191.79 East, 3578999.71 North. See attached maps.

4. Type of operation generating the discharge (e.g., truck wash, food processing plant, restaurant, etc.):

Aquifer pumping test of the Culebra Member of the Rustler Formation.

5. Source(s) of the discharge. Describe how the wastewater, sludge, or other discharges processed and/or disposed at your facility are generated. Identify all sources. Attach additional pages if needed:

One-time discharge of water from the Culebra Member of the Rustler Formation derived from a pumping test in 2013, additional information attached.

6. Expected contaminants in the discharge (e.g., nitrate-nitrogen, metals, organic compounds, salts, etc.) Include estimated concentration if known, and copies of results of laboratory analyses, if available:

Main constituents of the discharge water would be Chloride: 8600 mg/L, Sulfate: 2500 mg/L, Calcium: 1400 mg/L, Sodium: 4400 mg/L, TDS: 18,000 mg/L. See additional information attached.

7. Describe all components of wastewater processing, treatment, storage, and disposal system (e.g., grease interceptor, lagoon, septic tank/leachfield, etc.) Include sizes, site layout map, plans and specifications, etc. if available:

A submersible pump will be placed in the well to bring the water to the surface where it will be held in a storage container, then discharged 350 feet to the west of the well pad through a pipe. The ground will be protected with rip-rap to prevent surface erosion. See additional details and photos below.

8. Estimated maximum daily discharge volume in gallons per day (or other units):

20-30 day test generating 3 acre feet (977,553 gallons), daily discharge estimated at 30,000-40,000 gallons per day

9. Estimated depth to ground water (ft): 193 ft below ground level (Culebra)

Additional Information

A variance is being sought from obtaining a discharge permit to allow a one-time discharge to the surface surrounding WIPP monitoring well SNL-16 (OSE# C-3220). Sandia National Laboratories (SNL) would like to perform a large scale pumping test to study the Culebra Member of the Rustler Formation at this location. The well is located in the southeastern area of Nash Draw; approximately 3 miles west of the WIPP Site boundary (see Figure 1 below).

This test will focus on investigating the double-porosity and unconfined response in the Culebra at SNL-16. The double-porosity response typically occurs quickly (a few hours), while the unconfined response would likely occur over longer time scales (a few days). SNL is also hoping to collect geophysical data during the test (gravity and streaming potential), to maximize the value of this test. All these data together will help understand the nature of the Rustler and Culebra in Nash Draw, where there are many different processes going on. Understanding these processes will help answer questions about how connected the Culebra is to recharge in Nash Draw, which is a perennial WIPP stakeholder question.

The primary reason for the variance request is based on the cost of storage and disposal of generated water from this test. The current increase in oil and gas activity in southeast New Mexico has driven up the cost of the frac tanks used for holding the water and the trucking and disposal rates to dispose of water. The estimated cost to store and dispose of the 3 acre-feet of water is approximately $800,000 based on pricing from subcontractors. Being able to perform the surface discharge would cost approximately $10,000.

WIPP maintains a high level of safety standards for all projects and this test will be no exception. The primary safety concerns related to this test would be hauling and disposing of the water from the pad to a disposal location. Increased traffic and associated risk resulting from transporting water for disposition, estimated at 180 round-trips, could be eliminated with surface discharge authorization.

SNL-16 was rotary drilled and cored to a depth of 299.3 ft below ground level (bgl) to investigate the geology of this area. SNL-16 was completed in the Culebra Member with the screened interval at 193-217 feet bgl, Figure 2 below. Culebra transmissivity is expected to be relatively high due to the many fractures and vugular porosity that occur in this area. SNL-16 is in an area where the halite units in the Tamarisk and Forty-niner members have been dissolved and the mudflat facies remain. The Magenta Dolomite displays normal bedding and laminae, but the typically porous water bearing zone was not identifiable. No water was observed in the Magenta. The upper parts of the Rustler, Dewey Lake and Santa Rosa formations have been eroded in this location, see Table 1.

General chemistry samples were collected for this well by SNL on June 9, 2006 during development activities following well completion. The analytical results are summarized in Table 2 below and the complete data package is attached. The produced water from this test is expected to be of the same quality.

Table 1 – Geology at SNL-16

System/ Period/Epoch		Formation or unit	Member *Informal units*	Depth below surface (ft)[1] *log depths*	*core marks*
Cenozoic	Holocene	surface dune sand and pad fill		0 - 6 ft	
	Pleistocene	Mescalero caliche		6 ft - 10 ft

			Culebra Dolomite	193 ft - 217 ft	190.6 ft - 215.3 ft
			Los Medaños[4] *M-2/H-2* *A-1* *M-1/H-1*	217 ft - 299.3 ft *217 ft - 228 ft* *228 ft - 240 ft*	215.3 ft - 299.3 ft *215.3 ft - 226.2 ft* *226.2 ft - 239 ft* *239 ft - 299.3 ft* [5]

Table 2 – SNL-16 Water Quality

Parameter	Concentration	Parameter	Concentration
Chloride	8,600 mg/L	Magnesium	430 mg/L
Fluoride	2.5 mg/L	Potassium	290 mg/L
Sulfate	2,500 mg/L	Sodium	440 mg/L
Calcium	1,400 mg/L	pH	7.19
Iron	0.024 mg/L	Total Dissolved Solids	18,000 mg/L

The planned test will be 20-30 days of pumping generating no more than 3 acre-feet (977,553 gallons) of water. The Culebra at this location is expected to support a continuous pumping rate of 20-30 gallons per minute, although previous testing indicates the potential to pump at a higher rate during shorter periods. The pumping strategy may be adjusted to a series of high rate, short time events instead of one long term steady pump rate event. Water will be held on the surface for a short time then discharged to the surrounding area through a series of pipes to prevent erosion to the surface. This method of discharge was used during a similar large scale pump test in 2012 and the water flowed for approximately 200 feet with no erosion to the surface.

An assessment of the area surrounding the well pad revealed a natural drainage channel about 50 feet north of the pad that would provide a route to place the discharge pipe, Figure 3. This drainage feature extends about 400 yards to the west of the well, eventually running into a culvert at the railroad tracks to the southwest, Figure 4. A drainage line will be placed from the storage tank on the north end of the pad, through a culvert under Nash Draw Road (Figure 4), and out to a discharge point 350 feet west of the pad. Rip-rap will be used to prevent surface erosion at the discharge location.

Figure 1 – SNL-16 General Location

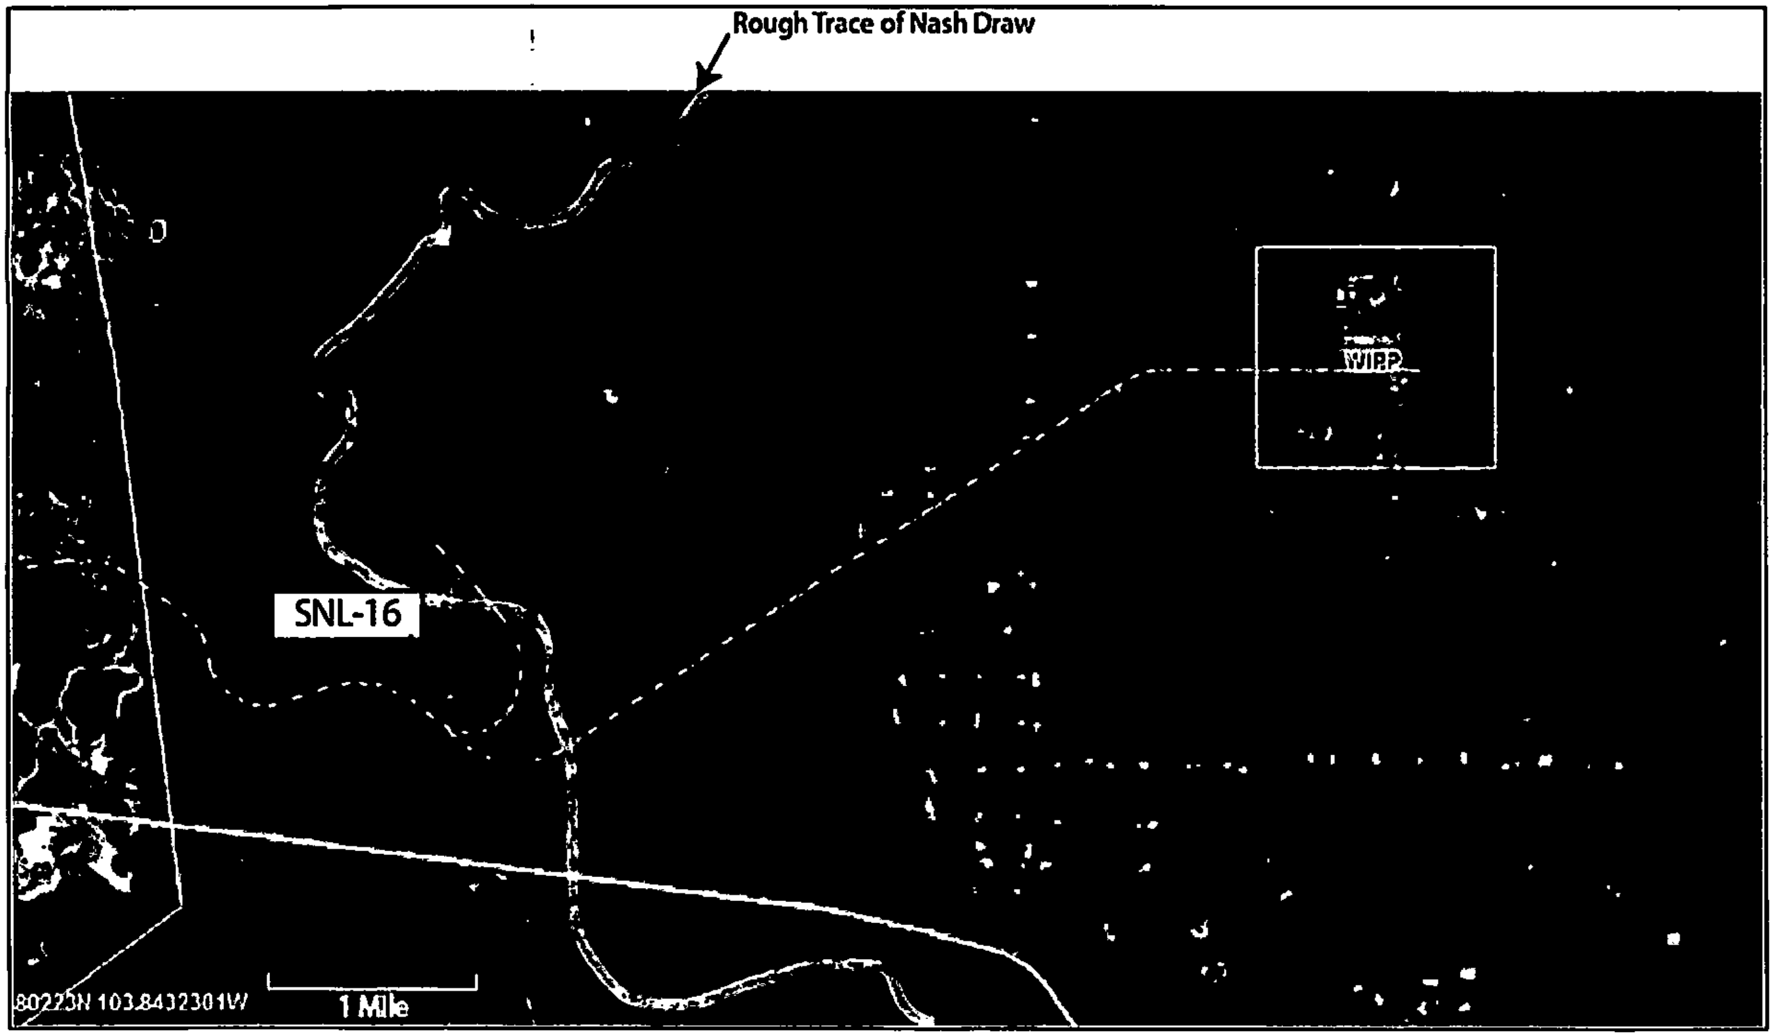

Figure 2 – SNL-16 As-Built Diagram

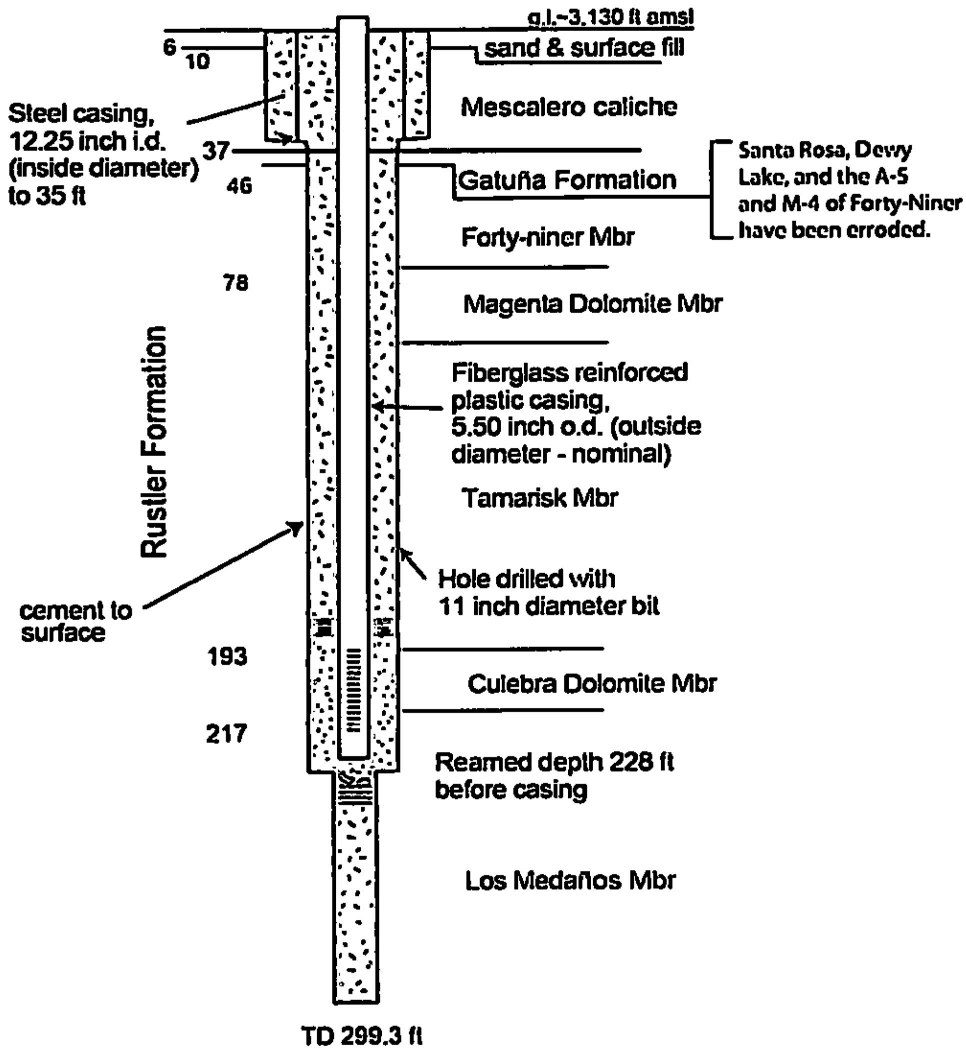

Note: Depths for drilling, geophysical logs, and completion are referenced to the top of the steel connector on the surface conductor casing, which is at the surface of the drilling pad at SNL-16 and is taken as 3,130 ft amsl.

RE: WIPP

Order No.: 0606131

Dear Rick Beauheim:

Hall Environmental Analysis Laboratory, Inc. received 1 sample(s) on 6/13/2006 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman, Business Manager
Nancy McDuffie, Laboratory Manager

PUBLIC INFORM...ION MEETINGS

GROUND WATER

APR 15 2013

BUREAU

On Requested Modification to the Hazardous Waste Facility Permit for the Waste Isolation Pilot Plant

WHO: U.S. Department of Energy (DOE) Carlsbad Field Office and Nuclear Waste Partnership LLC (NWP)

WHAT: DOE and NWP will conduct public meetings to provide information on the following permit modification request to the WIPP Hazardous Waste Facility Permit (Permit).

WHEN:
Tuesday, May 14, 2013
3 – 5 p.m.

WHERE:
Courtyard by Marriott
3347 Cerrillos Road
Santa Fe, New Mexico

WHEN:
Thursday, May 16, 2013
5 – 6 p.m.

WHERE:
Skeen-Whitlock Building
4021 National Parks Highway
Carlsbad, New Mexico

WHY: On April 8, 2013, DOE submitted a Class 2 permit modification request to the New Mexico Environment Department (NMED). The permit modification requests the following change and proposes to:

Revise the WIPP permit to modify the prohibition with respect to "excluded waste." Excluded waste is transuranic (TRU) waste that has been managed as high-level waste and waste from specific tanks identified in the Permit. In some instances, TRU waste tanks were located in the same tank farm that stored high-level waste and were managed with the same radioactive waste management practices. The radioactive characteristics, including the radioactive classification, of the wastes are not regulated by the Resource Conservation and Recovery Act (RCRA) hazardous waste regulations that govern the Permit. The prohibition for disposal of high-level waste at the WIPP facility is stipulated in the WIPP Land Withdrawal Act. Therefore, the excluded waste prohibition in the Permit is inappropriate and unnecessary because it is outside of the RCRA hazardous waste regulations. The Permit already requires the Permittees to verify that all waste disposed of at the WIPP facility meets the WIPP Waste Acceptance Criteria prior to being shipped to the WIPP facility.

HOW: To obtain additional information about this permit modification request, contact Mr. Bobby St. John, NWP, at 1-800-336-9477. The permit modification request is also available on the WIPP web site at http://www.wipp.energy.gov and at the WIPP Information Center, Skeen-Whitlock Building, 4021 National Parks Highway, Carlsbad, N.M. A copy of the permit modification request may also be obtained from NMED at the address listed below.

COMMENTS: Written comments for the record must be sent to the NMED contact person at the address below and received no later than 5 p.m. on June 10, 2013:

Ms. Trais Kliphuis
New Mexico Environment Department
2905 Rodeo Park Drive East, Building 1
Santa Fe, N.M. 87505
Phone: 505-476-6051
Fax: 505-476-6060
E-mail: trais.kliphuis@state.nm.us

The Permittees' compliance history during the life of the permit being modified is available from Ms.Kliphuis at the New Mexico Environment Department.

QUESTIONS: Any questions or comments to the Permittees regarding this permit modification may be sent to Mr. Bobby St. John, P.O. Box 2078, Carlsbad, N.M. 88221, no later than May 28, 2013.

Waste Isolation Pilot Plant

July 12, 2012

Fact Sheet

DOE Proposes Modification To Hazardous Waste Facility Permit

Changes to the WIPP Hazardous Waste Facility Permit

Background

The U.S. Department of Energy Carlsbad Field Office (DOE) and Washington TRU Solutions LLC (WTS) submitted a Class 2 permit modification request to the New Mexico Environment Department (NMED) to change the Waste Isolation Pilot Plant (WIPP) Hazardous Waste Facility Permit (Permit). The NMED issued the Permit (Permit Number: NM4890139088-TSDF) in November 2010.

What is Proposed?

The proposed modification submitted to NMED on July 5, 2012 is:

Addition of a Shielded Container

The generator/storage sites are proposing to package a portion of the remote-handled (RH) transuranic (TRU) mixed waste inventory in shielded containers for disposal at the WIPP facility. The use of the shielded containers will enable the WIPP facility to have an approved container to manage, store, and dispose RH TRU mixed waste as CH TRU mixed waste. Shielded containers will be transported to the WIPP in 3-pack assemblies in the HalfPACT transportation package and comply with the U.S. Department of Transportation requirements for a Type 7A container. The RH TRU mixed waste that will be packaged in these containers is the same type of waste that is currently being disposed at the WIPP. This waste will continue to count against the total RH TRU waste volume allowed for disposal at the WIPP facility, as specified in the Permit.

The shielded containers are similar to a 55-gallon drum, however, they consist of approximately one-inch of lead shielding that is located between a three-inch inner and outer steel wall. A shipment will consist of a three-shielded container assembly. Once they arrive at the WIPP facility, employees will unload and process the shipment in the using existing CH-TRU mixed waste shipment equipment and procedures.

Comments

Comments for the record must be sent to Ms. Trais Kliphaus, New Mexico Environment Department, 2905 Rodeo Park Drive, Building 1, Santa Fe, NM 87505. They also may be e-mailed: trais.kliphuis@state.nm.us or faxed to 505-476-6060. Only written comments will be accepted and must be received no later than 5 p.m. (MDT) on

September 10, 2012. A copy of the permit modification may be viewed or copied at the NMED offices of Ms. Kliphuis. To be placed on the WIPP mailing list, contact Ms. Kliphuis at the address above.

For more Information

For more information about transuranic waste shipments and procedures, call the WIPP Information Center at 1-800-336-WIPP (9477). This permit modification request is available for review in the Information Repository located on the WIPP home page at www.wipp.energy.gov. Comments to the Permittees regarding this permit modification may be sent to Mr. Bobby St. John, Washington TRU Solutions LLC, P.O. Box 2078, Carlsbad, NM 88221.

PUBLIC INFORMATION MEETINGS

On a Requested Modification to the Hazardous Waste Facility Permit for the Waste Isolation Pilot Plant

WHO: U.S. Department of Energy (DOE) Carlsbad Field Office and Washington TRU Solutions LLC (WTS)

WHAT: DOE and WTS will conduct public meetings to provide information on the following permit modification request to the WIPP Hazardous Waste Facility Permit.

WHEN:	Tuesday, August 14, 2012 5 – 6 p.m.	Thursday, August 16, 2012 2 – 4 p.m. & 6 – 8 p.m.
WHERE:	Skeen-Whitlock Building 4021 National Parks Highway Carlsbad, New Mexico	Courtyard by Marriott 3347 Cerrillos Road Santa Fe, New Mexico

WHY: On July 5, 2012, DOE submitted a Class 2 permit modification request to the New Mexico Environment Department (NMED). The permit modification request proposes to:

Add a shielded container for use at WIPP

This request is to add an additional container to the list of approved containers for disposal at WIPP. The container will allow the Permittees to handle waste that is packaged in a shielded container.

HOW: To obtain additional information about this permit modification request, contact Mr. Bobby St. John, WTS, at 1-800-336-9477. The permit modification is also available on the WIPP web site at http://www.wipp.energy.gov and at the WIPP Information Center, Skeen-Whitlock Building, 4021 National Parks Highway, Carlsbad, N.M. A copy of the requested permit modification also may be obtained from NMED at the address listed below.

COMMENTS: Written comments for the record must be sent to the NMED contact person at the address below and received no later than 5 p.m. on September 10, 2012:

Ms. Trais Kliphuis
New Mexico Environment Department
2905 Rodeo Park Drive East, Building 1
Santa Fe, N.M. 87505
Phone: 505-476-6051
Fax: . 505-476-6060
E-mail: trais.kliphuis@state.nm.us

The Permittees' compliance history during the life of the permit being modified is available from Ms. Kliphuis at the New Mexico Environment Department.

QUESTIONS: Any questions or comments to the Permitees regarding this permit modification may be sent to Mr. Bobby St. John, P.O. Box 2078, Carlsbad, N.M. 88221, no later than August 27, 2012.

<u>WIPP Permit Community Relations Plan</u>

U.S. Department of Energy
Waste Isolation Pilot Plant
Hazardous Waste Facility Permit-Related Community Relations Plan

GROUND WATER
MAY 31 2012
BUREAU

PURPOSE: The U.S. Department of Energy and Washington TRU Solutions LLC (the Permittees) are seeking public comments and suggestions to improve the Waste Isolation Pilot Plant Hazardous Waste Facility Permit Community Relations Plan as part of the WIPP Hazardous Waste Facility Permit (Permit Number: NM4890139088-TSDF) issued by the New Mexico Environment Department.

The Community Relations Plan is designed to inform communities and interested members of the public about WIPP Hazardous Waste Facility Permit activities and opportunities for public participation in those activities. Permit-related activities include waste management, closure, post-closure and corrective actions, as specified in 20.4.1.900 New Mexico Administrative Code (NMAC) (incorporating 40 Code of Federal Regulations (CFR)§270.32(b)(2)).

WHERE: The Permittees have updated the Plan which will be mailed to individuals on the WIPP Facility Mailing List on May 24, 2012, for comment. Community Relations Plan updates will also be available online:http://www.wipp.energy.gov/WIPPCommunityRelations/index.html.

New Mexico residents, organizations, special interest groups, federal, state and local government entities, tribal governments and tribal members are encouraged to provide comments or suggestions to the Permittees to enhance the Plan so that it continues to meet public needs for permit-related information.

PLAN ELEMENTS: Part 1, Section 1.15.2 of the WIPP Hazardous Waste Facility Permit identifies six key elements of the Permittees' Community Relations Plan:

1. Establish working relationships with communities and interested members of the public.
2. Establish productive government to government relations between the U.S. Department of Energy and affected tribes and pueblos.
3. Inform communities and interested parties of permit activities.
4. Minimize disputes and resolve differences with communities and interested members of the public.
5. Provide timely responses to individual requests for information.
6. Establish mechanisms for communities and interested members of the public to provide feedback and input to the Permittees.

HOW YOU CAN PARTICIPATE:

Contact the Permittees by e-mail, telephone or by mail to receive a copy of the updated WIPP Hazardous Waste Facility Permit Community Relations Plan and comment/suggestion form. Comments and suggestions can be made online by accessing the Plan at: http://www.wipp.energy.gov/WIPPCommunityRelations/index.html and clicking on "Comments."

- E-mail: communityrelations@wipp.ws
- Toll free telephone number: 1-800-234-7280 – available during normal business hours, Monday through Friday, 7:30 a.m.-4:30 p.m. MST
- Mailing address: Bobby St. John, P.O. Box 2078, Carlsbad, NM 88221

Waste Isolation Pilot Plant Hazardous Waste Facility Permit
Community Relations Plan Updates

The Waste Isolation Pilot Plant (WIPP) Permittees (U. S. Department of Energy and Washington TRU Solutions LLC) are seeking comments from members of the public to improve the WIPP Hazardous Waste Facility Permit Community Relations Plan, as well as comments to Plan updates proposed by the Permittees. Based on public comments, text changes to the Plan will become effective June 25, 2012.

Updates proposed by the Permittees include:

- Change to New Mexico Environment Department WIPP staff manager contact information
- Language to clarify that the Plan is specific to the WIPP Hazardous Waste Facility Permit and does not address non permit- related WIPP project programs or activities (See Comment form attachment)
- Consistency in capitalization

The updates are identified with red text and a double underline for new text and a strikeout font for deleted information.

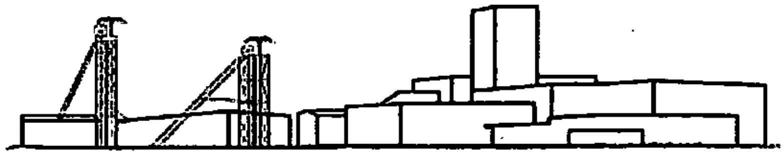
As part of the WIPP Hazardous Waste Facility Permit Community Relations Plan, the Permittees are required to document and publish permit-related comments, consultations, communications, agreements and disagreements between the Permittees and members of the public regarding the Community Relations Plan on the Community Relations Plan Web page. The Permittees do not publish individual communications or correspondence without the consent of the contributor.

Published comments can be found by accessing the Community Relations Plan Web page at: http://www.wipp.energy.gov/WIPPCommunityRelations/index.html. Click on the "Comments" tab and view the "Community Comments."

The one-page comment and consent form can be completed on the Community Relations Plan Web page or requested by mail from Bobby St. John at P.O. Box 2078, Carlsbad, NM 88221, or by calling toll-free (1-866-271-9640) and requesting the comment form. Copies of published public comments are also available by request.

Thank you for your interest in the WIPP Hazardous Waste Facility Permit
Community Relations Plan.

Welcome to the
Waste Isolation Pilot Plant (WIPP) Hazardous Waste Facility Permit
Community Relations Plan



Welcome to the Waste Isolation Pilot Plant (WIPP) Hazardous Waste Facility Permit Community Relations Plan Web page. We trust that the information provided here will be of value to you. The New Mexico Environment Department renewed the WIPP Hazardous Waste Facility Permit with the U.S. Department of Energy and Washington TRU Solutions LLC in November 2010 for a ten year period.

As part of the ~~renewed~~ permit, we are committed to providing you background information about the Permit, offering updated information on permit actions, and keeping you informed about public opportunities to participate in the permit process.

Our commitment to you goes well beyond this Community Relations Plan Web page. Our pledge is to operate WIPP in a safe, compliant manner that protects workers, the public and the environment.

Waste Isolation Pilot Plant Draft Community Relations Plan
Comment/Suggestion Form

The WIPP Hazardous Waste Facility Permit Community Relations Plan specifically addresses Permit-related activities and information. Non Hazardous Waste Facility Permit comments, suggestions or questions may be directed to the WIPP Information toll-free telephone number at 1-800-336-9477

*First Name | *Last Name

*required

Phone Number, E-mail Address, or New Mexico Mailing Address

If you would like a response to your comments, be sure to include your contact information.

Write your comments here

If you choose to have your comments and suggestions posted to the WIPP Community Plan Web Page, you can provide your written consent by checking the "Yes" box and include your contact information. If you do not want your comments posted, check "no." If you don't check any box, we will assume you do not want your comments posted.

5.0 Resources

6.0 Records Management

1.0 Introduction

1.1 Plan Required by Renewed Permit

This Community Relations Plan is a requirement of the Hazardous Waste Facility Permit for the U.S. Department of Energy's Waste Isolation Pilot Plant (WIPP) facility. The New Mexico Environment Department (NMED) re-issued the ten year permit to the U.S. Department of Energy and Washington TRU Solutions LLC (the Permittees) in November

2010.

1.2 Participants

The intended participants to this Community Relations Plan are interested members of the public who reside within the state of New Mexico, and include individuals, organizations, special interest groups, federal, state and local government entities, tribal governments and tribal members.

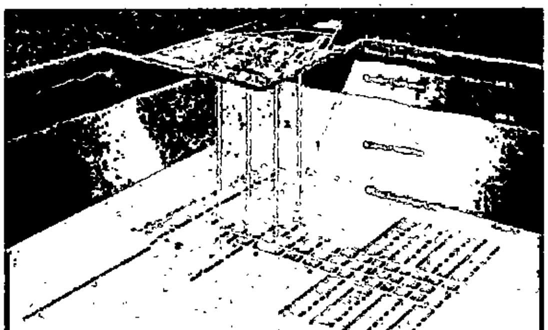
1.3 Purpose

The purpose of the WIPP Hazardous Waste Facility Permit Community Relations Plan (the Plan) is to provide permit-related information to communities and interested members of the public and to alert the public to opportunities for participation in the permit process. Permit-related activities include waste disposal operations, facility closure, post-closure and permit-driven corrective actions.

The U.S. Department of Energy (DOE) operates the WIPP facility in a transparent manner. The DOE has conducted WIPP outreach programs in New Mexico for more than two decades to establish open working relationships with communities, tribal governments and residents statewide. The Permittees view this Plan as an opportunity to expand public participation and dialogue in the WIPP facility permit process.

The Plan is web-based to reach a broad spectrum of New Mexico residents and tribal governments. Alternate methods to disseminate permit-related information to members of the public who may not have computer access are included in this Plan. These avenues of communication are further discussed in Section 3.0 How to Use this Plan.

2.0 Overview of the Waste Isolation Pilot Plant



WIPP Surface and Underground Facilities

So that members of the public may better understand the WIPP mission and hazardous waste facility permit, this Plan begins with an overview of the WIPP facility.

The WIPP facility is owned and operated by the DOE through its Carlsbad Field Office (CBFO). Washington TRU Solutions LLC (WTS) is the co-operator of the WIPP facility and performs day-to-day plant operation. The DOE and WTS are co-Permittees to the Permit.

2.1 Location and Facility

The WIPP facility is located 26 miles southeast of Carlsbad, New Mexico. It is designed and operated for the safe disposal of transuranic, or TRU, radioactive waste resulting from U.S. nuclear defense programs.

In 1992, Congress withdrew 16 sections of land from the public domain to be used by the DOE for the WIPP facility. The WIPP facility consists of surface facilities to receive and prepare waste for disposal and an underground repository that includes disposal rooms excavated from a geologically stable salt formation nearly one-half mile underground.

2.2 TRU Waste

TRU waste is solid material such as protective clothing, rags, tools, soils and residues contaminated with radioactive elements-mostly plutonium. The majority of this waste resulted from government research and the production of nuclear weapons. TRU waste will also be generated as

some DOE sites are decommissioned.

Some TRU waste contains non-radioactive chemicals such as solvents which are classified as hazardous waste under federal and state law. A hazardous waste facility permit is required to manage and dispose of these TRU and hazardous "mixed" wastes.

The NMED regulates the management and disposal of the hazardous waste contained in TRU mixed waste. In 1999, NMED issued the initial WIPP hazardous waste facility permit that allowed the DOE to receive its first waste shipment from Los Alamos National Laboratory in northern New Mexico for disposal at the WIPP facility. The hazardous waste facility permit was renewed for a ten year period in 2010.

The project life cycle and the amount of waste to be disposed at the WIPP facility is detailed in the permit as follows: "During the disposal phase of the facility, which is expected to last 25 years, the total amount of waste received from off-site generators (**see map**) and any derived waste will be limited to 175,600 cubic meters of TRU waste, of which up to 7080 cubic meters may be remote-handled TRU (RH-TRU) mixed waste. For purposes of the WIPP Permit, all TRU waste is managed as though it were mixed."

2.3 Regulatory Background and the Hazardous Waste Facility Permit

In 1976, the U.S. Congress passed the Resource Conservation and Recovery Act (RCRA) to regulate "cradle to grave" management of hazardous waste. In accordance with RCRA, the U.S. Environmental Protection Agency (EPA) can authorize states to implement their own hazardous waste regulatory programs in lieu of the federal program. The State of New Mexico is authorized to implement and enforce its own hazardous waste management program which includes regulating the hazardous components in TRU mixed waste that are disposed at the WIPP facility.

The EPA certifies DOE compliance with environmental standards for the disposal of radioactive materials such as the TRU waste disposed 2,150 feet underground. At five year intervals, the DOE must demonstrate to EPA through a recertification process that the WIPP underground repository will continue to safely contain radionuclides for 10,000 years.

This Plan is specific to the New Mexico Hazardous Waste Management Program.

3.0 How to use this Plan

3.1 Elements of the WIPP Community Relations Plan

The Permit identifies six objectives that this Plan is to address:

- Establish working relationships with communities and interested members of the public.
- Establish productive government to government relations between the U.S. Department of Energy and affected tribes and pueblos.
- Inform communities and interested parties of permit activities.
- Minimize disputes and resolve differences with communities and interested members of the public.
- Provide timely responses to individual requests for information.
- Establish mechanisms for communities and interested members of the public to provide feedback and input to

the Permittees.

3.2 A Broad Approach to Communicating Permit Activities

The Permittees determined that the most effective way to meet Permit objectives is a universal approach to communications with individuals, organizations, special interest groups, federal, state and local government entities, tribal governments and tribal members in New Mexico. The Plan makes Permit-related information available to interested New Mexicans through various points of access.

Tribal governments and tribal members will be provided information about WIPP permit-related actions in the same manner as that outlined in this Plan for communities, the general public and interested parties.

3.3 Community Relations Plan Web page

This Web page provides information on current permit activities and public meeting schedules, and includes a link to the *WIPP Permit Information Repository* where members of the public can access specific documents related to the current permit and other permit resources.

To assure public access, the Web page includes instructions for software required to view documents in the WIPP Permit Information Repository and provides free downloads to public reviewers, as needed.
Documents available in the WIPP Information Repository include: (link)

- WIPP Hazardous Waste Facility Permit renewal application, Parts A and B
- A complete copy of the Permit, as it may be modified
- Permit modification notifications and requests associated with the Permit and any associated responses from the NMED
- Waste Minimization Report submitted per Permit Part 2, Section 2.4
- Extensions of time submitted per Permit Part 1, Section 1.10.3
- Corrective action documents submitted per Permit Part 8
- Written reports, such as notifications of planned changes, submitted per the Permit Part 1, Sections 1.7.11 and 1.7.13
- Notices of Deficiency or disapproval, responses, final approval letters and directives from the NMED associated with renewal permit applications, permit modifications and corrective action documents
- Notices of Violation or administrative compliance orders, and responses to such required by the NMED and directives from the NMED associated with the Permit
- Biennial Reports submitted per Permit Section Part 2, Section 2.14.2

3.4 Notifications in major newspapers

Notifications regarding substantive (Class 2 and 3) requests by the Permittees to modify the Permit are published in major local newspapers. Included in the notification is a description of the proposed permit change, dates for a public comment period, contact information at NMED and the WIPP project, and the time, dates and locations for public meetings.

3.5 Facility mailing list

The facility mailing list consists of individuals, organizations, special interest groups, federal, state and local government entities, tribal governments and tribal members who have expressed interest in being notified by mail of WIPP permit-related actions. By regulation, the NMED maintains the WIPP facility mailing list; the Permittees are responsible for mail-outs to subscribers.

The facility mailing list benefits infrequent users of the Community Relations Web page and members of the public who do not have computer access. There are a number of opportunities to subscribe to the facility mailing list below. Please include your name, mailing address, phone number and organization, if any, when you subscribe to the list.

- Subscribe on this Community Relations Plan Web page http://www.nmenv.state.nm.us/wipp/index.html#list
- Email communityrelations@wipp.ws and request to be added to the list
- The New Mexico Environment Department WIPP Web page at ~~timothy.hall@state.nm.us~~ trais.kliphuis@state.nm.us
- Call 1-866-271-9640 and request Bobby St. John, Washington TRU Solutions, to add your name to the list
- Mail a request to subscribe:

Bobby St. John
Washington TRU Solutions
P.O. Box 2078
Carlsbad, N.M. 88221

OR

~~Timothy Hall~~ Trais Kliphuis
New Mexico Environment Department
2905 Rodeo Park Drive East
Building 1
Santa Fe, N.M. 87505

- Sign up at WIPP public meetings

3.6 Email Notification Service

The Permittees also maintain an email notification service. Subscribers to this service are assured timely email notification for a specific set of permit actions. Adding your name to the email notification service is quick and easy.

Just click here http://www.wipp.energy.gov/Stakeholders/Notice.aspx and follow the directions for sign up.

3.7 Public meetings

Federal and state regulations require hazardous waste facilities to schedule public meetings for proposed Class 2 and 3 permit modification requests. These public meetings provide the Permittees a forum to explain the purpose of the permit modification request and for members of the public to ask questions and express their views. The general public is notified of public meeting schedules in major local newspapers.

Interested members of the public are encouraged to monitor the Community Relations Web page, subscribe to the WIPP facility mailing list and email notification system for public meeting schedules related to Permit modification requests.

3.8 Community Relations Plan email address

A dedicated Community Relations Plan email address provides the public direct communication to Permittee staff for inquiries related to the permit. The email account is monitored by staff members during normal business hours, Monday through Friday, 7:30 a.m. to 4:30 p.m. The Permittees will respond to requests as quickly as possible, within the constraints of applicable regulations such as those involving dissemination of security or personal information.

That email address is communityrelations@wipp.ws.

3.9 Toll-free telephone number

A Community Relations Plan toll free telephone number is a convenient way to contact Permittee staff for permit-related information or questions. The toll free number will be staffed during normal business hours, Monday through Friday from 7:30 a.m.to 4:30 p.m.

The toll-free number is 1-866-271-9640.

3.10 Public outreach products

To increase public awareness of the Plan, the Community Relations Plan Web page address, toll-free telephone number and dedicated e-mail address will be printed on WIPP information products and permit-related public notifications in major local newspapers.

4.0 Community Relations Plan Goals

4.1 Changes to the Plan

The goal of this Plan is to provide timely information to members of the public about Permit actions and opportunities for participation in the Permit process so that they can make informed decisions about Permit actions.

The Plan is intended to be useful and responsive to public information needs related to the Permit. It is a "living" document which is expected to change throughout the 10 year Permit period to accommodate public and Permittee input, ~~and~~ as well as new communication technologies.

In May of each year of the current Permit period, the Permittees will solicit comments and suggestions regarding the Community Relations Plan from interested stakeholders. Periodic changes may be made to the Plan to enhance functionality and content. Members of the public are encouraged to send comments or suggestions to improve the Plan at any time. Comments may be sent by email (see **Comments** on the Web page menu), or by mail to:
Bobby St. John, Washington TRU Solutions, P.O. Box, 2078, Carlsbad, N.M., 88221

4.2 Resolving Differences Between the Public and Permittees Regarding the Community Relations Plan

The Permittees will give careful consideration to public comments and suggestions, and work in consultation with communities and with interested members of the public to avoid disputes and to resolve differences regarding the Community Relations Plan.

The Permittees will address comments that require a response and provide the response to the community or individual who originated it. Responses specific to this Plan will be posted to the Community Relations Plan Web page, with the consent of the parties involved.

5.0 Resources

The Permittees will provide the resources necessary to maintain the Plan for as long as the Plan is a requirement of the Permit.

6.0 Records Management

Consistent with Permit requirements, the Permittees will document all Permit-related consultations, communications, agreements and disagreements between the Permittees and members of the public related to the development and administration of the Plan.

These communications and responses will become part of the WIPP facility operating record and will be posted annually to the Plan Web page, with the express consent of the commenting individual or group.

Thank you for your interest in the WIPP Hazardous Waste Facility Permit.

RE: Response to Notice of Intent to Discharge; Discharge Permit Not Required for Pumping Test on Well H-9bR, U.S. Department of Energy Waste Isolation Pilot Plant, AI: 318

Dear Mr. Franco:

The New Mexico Environment Department (NMED) received a Notice of Intent on May 11, 2012 to discharge approximately 977,533 gallons of produced ground water associated with a pumping test on Well H-9bR located south of the Waste Isolation Pilot Plant (WIPP). The notice satisfies the requirements of Subsection A of 20.6.2.1201 NMAC of the New Mexico Water Quality Control Commission (WQCC) Regulations (20.6.2 NMAC). The proposed discharge is located approximately 8 miles south of the WIPP facility in Section 4, Township 24S, Range 31E, Eddy County.

Based on the information provided in your Notice of Intent, NMED has determined that a Discharge Permit is not required as long as the discharge is as described. A Discharge Permit is not required at this time because the information and data provided indicates it is unlikely that the discharge will adversely affect ground water quality.

The proposed discharge is briefly described as follows:

Sandia National Laboratories proposes to conduct an aquifer pumping test on Well H-9bR (OSE File # C-2783-POD2) to study the hydrogeologic characteristics in the Culebra Member of the Rustler Formation. Approximately 978,000 gallons of water will be pumped over a 3 to 4 week timeframe to test responses in nearby wells. The water will be dispersed by a series of fanned piping or from a temporary holding tank at a controlled rate to prevent erosion.

Although a Discharge Permit is not being required for this discharge at this time, you are not relieved of liability should your operation result in actual pollution of surface or ground waters. Further, this decision by NMED does not relieve you of your responsibility to comply with any other applicable federal, state, and/or local laws and regulations, such as zoning requirements, plumbing codes and nuisance ordinances.

If at some time in the future you intend to change the amount, character or location of your discharge, or if observation or monitoring shows that the discharge is not as described in your Notice of Intent, you must file a revised Notice of Intent with the Ground Water Quality Bureau.

If you have any questions, please contact Clint Marshall, Program Manager of the Ground Water Pollution Prevention Section, at (505) 827-0027.

Sincerely,

Jerry Schoeppner, Chief
Ground Water Quality Bureau

Subject: Notice of Intent for the Proposed Surface Discharge

Dear Mr. Marshall:

The purpose of this letter is to provide the Notice of Intent Form and supporting information (totaling 20 pages) for the proposed one-time surface discharge of water from a pumping test at Well H-9bR (OSE File # C-2783-POD2) for your review. It is our intent to obtain authorization to discharge and be exempt from the discharge permit application process for testing purposes. The test will be conducted by Sandia National Laboratories to study the hydrogeologic characteristics in the Culebra Member of the Rustler Formation to the south of the WIPP site boundary. The total water pumped would be approximately 978,000 gallons (3 acre feet) over a 3-4 week timeframe to test the responses in nearby wells. The water will be dispersed from the wellhead by a series of fanned piping or from a temporary holding tank at a controlled rate to prevent erosion.

The water quality in the original Culebra well (H-9b-OSE File # C-2783) at this location was: Chloride: 160-320 mg/L Sulfate: 1600-2220 mg/L, TDS: 2800-3590 mg/L. Samples collected from the water generated while performing water quality testing of the new well had Chlorides: 170 mg/L, Sulfate: 2000 mg/L, and TDS: 3330 mg/L. The water quality of the pumped water is expected to be similar to these values.

The complete historical water quality data from H-9b, analytical data of the water quality testing of H-9bR, a photograph, and a topographical map showing the surrounding area where the water would be discharged are part of the Notice of Intent.

If you have any questions about this report or require any additional information, please contact Mr. Dan Ferguson at (575) 234-7018.

Sincerely,

Jose R. Franco, Manager
Carlsbad Field Office

Enclosure

1. **Name and mailing address of person proposing to discharge:**

Jose Franco – Manager Carlsbad Field Office, Waste Isolation Pilot Plant **Work Phone:** (575) 234-7300

U.S. Department of Energy – Carlsbad Field Office **Cell/Home Phone:** NA

Fax: (575) 234-7027
Email: Jose.Franco@wipp.ws

2. **Name of facility:**

Waste Isolation Pilot Plant (WIPP) Monitoring Well H-9bR

3. **Physical location of discharge (if applicable, give street address, township, range, section, distance from closest town or landmark, directions to facility, location map):**

WIPP monitoring well H-9bR (C-2783-POD2) located at T24S, R31E, S4; NAD27 State Plane Coordinates:

eastings 667,850.39, northings 454,083.79) Latitude: 32 deg. 14 min. 49.4 sec. North Longitude: 103 deg. 47 min. 26.9 sec. West, (See attached figure); 8 miles south of the WIPP facility

4. **Type of operation generating the discharge (e.g., truck wash, food processing plant, restaurant, etc.):**

Aquifer pumping test of the Culebra Member of the Rustler Formation

5. **Source(s) of the discharge. Describe how the wastewater, sludge, or other discharges processed and/or disposed at your facility are generated. Identify all sources. Attach additional pages if needed:**
One-time discharge of water from the Culebra Member of the Rustler Formation derived from pumping test

6. **Expected contaminants in the discharge (e.g., nitrate-nitrogen, metals, organic compounds, salts, etc.) Include estimated concentration if known, and copies of results of laboratory analyses, if available:**

The water quality in the original Culebra well, H-9b, at this location was: Chloride: 160-320 mg/L, Sulfate: 1600-2220 mg/L, TDS: 2800-3590 mg/L. Samples collected from the new well for water quality testing showed Chlorides: 170 mg/L, Sulfate: 2000 mg/L and TDS: 3330 mg/L. The water quality of the pumped water is expected to be similar to these values. No hazardous constituents are expected. Lab results are attached that show the most recent water quality sampling results.

7. **Describe all components of wastewater processing, treatment, storage, and disposal system (e.g., grease interceptor, lagoon, septic tank/leachfield, etc.) Include sizes, site layout map, plans and specifications, etc. if available:**

Water derived from pumping test will be removed from the well by a submersible pump to the surface.

Discharge will be plumbed to a series of PVC pipes to disperse the flow to prevent erosion.

8. **Estimated maximum daily discharge volume in gallons per day (or other units):**

23-day test generating 977,533 gallons. Test will produce 42, 501 gallons per day.

9. **Estimated depth to ground water (ft):** See attached summary Culebra (644) Magenta (527)

Signature: Jose Franco **Date:** 5/8/2012

ATTACHED ADDITIONAL INFORMATION

The discharge from this well is a one-time only operation to test aquifer parameters. An exemption is sought from a Discharge Permit Application for this test. The well identified for aquifer testing, H-9bR (C-2783-POD2), is located in Township 24 South, Range 31 East, Section 4 in Eddy County, New Mexico. It is located about 8 miles south of the Waste Isolation Pilot Plant (WIPP) (Figure 1). The well is completed (screened) in the Culebra Member (Culebra) of the Rustler Formation (Rustler) (Figure 2).

Water bearing zones in this area are identified in the Magenta and Culebra Members of the Rustler Formation (Figure 2). The first water bearing zone beneath the discharge point is the Magenta, between 527-558 feet below ground surface.

The pumping test is planned to be performed for 23 continuous days at a flow rate of 29-30 gallons per minute. Flow will be dispersed through a series of fanned piping from the wellhead or a temporary holding tank, to reduce any surface erosion. The point of discharge is identified in Figure 3 in relation to the well pad.

Sandia National Laboratories (SNL) performed historical sampling of a well that was plugged and replaced by H-9bR on the same pad. Results from this testing indicated concentrations below those identified in 20.6.2.3103 NMAC, for the parameters analyzed. The table of results is attached as Appendix A showing all historical testing of this well.

Following well completion and development, the new well was tested for water quality by SNL with results similar to the historical data collected from the Culebra at this location. These results are included as an attachment to this document.

HALL ENVIRONMENTAL ANALYSIS LABORATORY

COVER LETTER

Friday, July 15, 2011

Michael Schuhen
Sandia National Lab
4100 National Parks Hwy.
MS1395
Carlsbad, NM 88220

TEL: (505) 234-0006
FAX (505) 234-0061

RE: WIPP/H-9bR (C)

Order No.: 1106C12

Dear Michael Schuhen:

Hall Environmental Analysis Laboratory, Inc. received 1 sample(s) on 6/30/2011 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. Below is a list of our accreditations. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. All samples are reported as received unless otherwise indicated.

Please do not hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman, Laboratory Manager

RE: Corrective Action Plan Approval, Waste Isolation Pilot Plant, DP-831

Dear Mr. Ferguson:

On April 11, 2012, the Ground Water Quality Bureau of the New Mexico Environment Department (NMED) received oral notification of an unauthorized discharge at the Waste Isolation Pilot Plant (WIPP). Written notification of the discharge and a Corrective Action Plan were received on April 19, 2012. The information submitted satisfies the reporting requirements of Subsection A of 20.6.2.1203 NMAC of the Water Quality Control Commission Regulations (20.6.2 NMAC).

According to the information submitted, the unauthorized discharge and the corrective actions taken are described as follows:

A rubber coupling on a sewer line at a portable building on the site is believed to have been damaged during cleanout by a cleaning subcontractor. Black and gray water leaked on to the ground under the building whenever the facilities were used from March 13, 2012 to April 10, 2012. The leak was discovered when water was discovered running out from under the building. The volume of the discharge taken from meter readings is conservatively estimated to be 3,350 gallons assuming all water used in the building during the suspected period went to the ground.

As a corrective action, water to the building was shut off immediately upon discovery of the leak. The skirting to the building was removed and on April 12, 2012, the sewer line was repaired with a compression fitting. Impacted soil in the area of the pipe disconnection was disposed of and the area sanitized.

The corrective actions taken are acceptable to NMED, and the Corrective Action Plan is satisfactory.

Additional corrective actions may be required if additional information becomes available indicating that the corrective actions taken are inadequate and/or ground water contamination occurs as a result of the described discharge. The DOE may be required to abate water pollution pursuant to Sections 20.6.2.4000 through 20.6.2.4115 NMAC, if the corrective action plan will not result in compliance with the standards and requirements set forth in Section 20.6.2.4103 NMAC within 180 days of confirmation of ground water contamination.

If you have any questions regarding these issues, please contact Clint Marshall, Program Manager of the Pollution Prevention Section, at (505) 827-0027.

Sincerely,

Jerry Schoeppner, Chief
Ground Water Quality Bureau

Subject: Notification of Discharge / Corrective Action Report

The purpose of this letter is: 1) to document the U. S. Department of Energy, Carlsbad Field Office call to you (via subcontractor) on the morning of April 11, 2012 and to provide your office a Notification of Discharge within seven days; and 2) to describe the corrective actions relative to the notification within 15 days. This information is being provided to you per your direction.

1. Notification

(a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility:

Person in charge of the facility:	Jose R. Franco, Manager 4021 National Parks Highway Carlsbad, New Mexico, 88220 (575) 234-7300
Owner of the facility:	U. S. Department of Energy
Operator of the facility:	URS Washington TRU Solutions, LLC

(b) Name and address of the facility:

U. S. Department of Energy
Waste Isolation Pilot Plant
30 miles east of Carlsbad, New Mexico off of State Highway 128
Carlsbad, NM 88220

(c) The date, time, location, and duration of the discharge:

Date:	March 13, 2012 to April 10, 2012
Time:	N/A
Location:	WIPP Site, Building 953

CBFO:OESH:DJF:ANC:12-0731:UFC 5486.00

- Once it was noted that the sewer line connection fitting was damaged, work orders were placed on a high priority level to reconnect the building sewer drain pipe.

2. Corrective Action Report - 20.6.2.1203.A. (3) & (6)

On April 12, 2012 a subcontractor completed the reconnection of the sewer line with a compression fitting. Work orders are being finalized with a contractor to remove residue left from the water accumulation under the building. Replacement of the connector fitting was completed in approximately 48 hours after detection of the discharge. Stained soil in the area of the pipe disconnection will be properly disposed of and the area will be sanitized.

In the future when drain cleaning is conducted the plumbing line will be evaluated confirming that there was no damage during the cleaning process. If any additional actions are needed, that are not described in the correspondence, they will be provided to your office in the next semi-annual DP – 831 report that is due to your office by July 31, 2012.

Upon review of this matter it is believed that this loss of sewage containment did not pose a threat to human health and environment. The corrective actions described are intended to meet all notification requirements of 20.6.2.1203 NMAC and DP-831.

If you have any further questions regarding this matter or need additional information, please contact me at (575) 234-8128.

Sincerely,

Mr. Daniel J. Ferguson,
Carlsbad Field Office

**RE: WIPP HAZARDOUS WASTE FACILITY PERMIT
REVISED NOVEMBER 2, 2011
EPA I.D. NUMBER NM4890139088**

Dear Messrs. Ziemianski and Sharif:

On November 2, 2011, the New Mexico Environment Department (NMED) revised the WIPP Hazardous Waste Facility Permit, incorporating the following specific submittal:

- Notification of Class 1 Pemit Modification (Revise Table 4.1.1 and Table G-1), Letter Dated 8/8/11, Rec'd 8/9/11

NMED made the following corrections to the Permittees' submittal:

- Table 4.1.1:
  - NMED rounded the cubic feet (ft^3) final volume for contact-handled (CH) waste in Panel 5 to the nearest 100 ft^3 to maintain consistency with the volumes reported in Panels 1 through 4.
  - NMED changed the final volume for remote-handled (RH) waste in Panel 5 to 8,300 ft^3 (235 m^3) to maintain consistency with the calculations used to report the RH volume for Panel 4. In their submittal, the Permittees reported the RH volume based on the volume of the containers within the RH canisters emplaced in Panel 5. The corrected RH volume is based on the volume of the RH canisters (264 canisters * 0.89 m^3 per canister = 235 m^3).

- NMED rounded the cubic feet (ft^3) final volume for RH waste in Panel 5 to the nearest 100 ft^3 to maintain consistency with the volumes reported in Panel 4.

- Table G-1:
  - NMED added asterisks (*) to the Panel 5 "Operations End" and "Closure Start" dates, and to the Panel 6 "Operations Start" date to indicate actual dates.

Attached is an electronic copy of the revised Permit Part 4 and Attachment G that contains the corrected tables. Because NMED made corrections to the PMR, NMED encourages the Permittees to notify the facility mailing list of the corrections and post this letter and the revised Permit Part 4 and Attachment G on its website.

If you have any questions regarding this matter, please contact me at (505) 476-6035 or Tim Hall at (505) 476-6049.

Sincerely,

~NOTICE~

Waste Isolation Pilot Plant
Class 1 Permit Modification Notifications

The U.S. Department of Energy and Washington TRU Solutions LLC hereby inform you of the following Class 1 Permit Modification Notifications to the Waste Isolation Pilot Plant (WIPP) Hazardous Waste Facility Permit (Permit), Permit Number: NM4890139088-TSDF.

The New Mexico Environment Department (NMED) was notified of the following Class 1 permit modifications on the dates indicated below. Summary of the changes follows.

June 2, 2011

- Update Emergency Coordinator List

Two individuals are being added as primary emergency coordinators and one person is being removed from the list. Table D-2 is being updated to indicate that change.

July 5, 2011

- Update Emergency Coordinator List

One person is being deleted as the primary emergency coordinator from the list. Table D-2 is being updated to indicate that change.

July 11, 2011

- Editorial Corrections

Make various editorial corrections/changes to clarify specific items in the current WIPP Permit.

August 8, 2011

- Revise Table 4.1.1

Revise Table 4.1.1 to indicate final waste volume in Panel 5.

- Revise Table G-1

Revise Table G-1 to reflect the actual operations end and closure start and estimated closure end dates for Panel 5. Revise the actual operations start date of Panel 6.

~NOTICE~

Waste Isolation Pilot Plant
Class 1 Permit Modifications Notification

The U.S. Department of Energy and Washington TRU Solutions LLC hereby inform you of the following Class 1 Permit Modifications to the Waste Isolation Pilot Plant (WIPP) Hazardous Waste Facility Permit (HWFP), Permit Number: NM4890139088-TSDF.

The New Mexico Environment Department (NMED) was notified of the following Class 1 permit modifications on the dates indicated below. Summary of the changes follows.

March 17, 2011

- Add South Access Road for Transportation of TRU Mixed Waste

The South Access Road was reconstructed to be equivalent in construction to the North Access Road, thereby allowing it to be used for the transport of trucks carrying transuranic mixed waste. The Class 1 Permit Modification Notification removed language that indicated that only the North Access Road could be used for waste and updated other information.

May 24, 2011

- Revise TRUPACT-III Management Language

Language in the Permit was revised to provide the option to remove TRUPACT III bolts either using the Bolting Robot or manually if needed.

- Revise Procedure Reference for the Bolting Station in Table E-1

A procedure number was updated in the inspection schedule because one procedure, instead of two, will be used for inspecting both the Bolting Station and the Bolting Robot.

Notice of Information Repository

Background

The U.S. Department of Energy's Waste Isolation Pilot Plant (WIPP) received its Hazardous Waste Facility Permit (Permit) renewal from the New Mexico Environment Department on November 30, 2010. The Permit effective date is December 30, 2010.

Information Repository

Beginning December 30, 2010, the new permit requires the Permittees to establish and maintain an electronic Information Repository on the WIPP Homepage. The Information Repository will be located at: http://www.wipp.energy.gov/library/information_repository. The Information Repository will include the following information:

- The Part A and Part B permit applications associated with the Permit
- A complete copy of the Permit, including any modifications
- Permit modification notifications and requests associated with the Permit
- The Annual Waste Minimization Report
- Any requests for time extensions associated with Permit Section 1.10.3
- Corrective action documents associated with Permit Part 8
- Reports required by Permit Sections 1.7.11 and 1.7.13 that must be submitted in writing
- Notices of deficiency or disapproval, associated responses, final approval letters and directives from the Secretary associated with specific documents
- Notices of violation, administrative compliance orders, responses to these documents required by the Secretary and any directives from the Secretary associated with the Permit
- Biennial Report submitted to NMED pursuant to Section 2.14.2

The Information Repository will contain an index of the documents included in the repository.

Questions regarding the Information Repository should be directed to Mr. Bobby St. John at:

RE: FINAL PERMIT DECISION AND RESPONSE TO COMMENTS, CLASS 2 MODIFICATION REQUEST
WIPP HAZARDOUS WASTE FACILITY PERMIT
EPA I.D. NUMBER NM4890139088

Dear Interested Person:

On April 15, 2011, the New Mexico Environment Department (**NMED**) took final administrative action on a Class 2 permit modification request (**PMR**) to the Waste Isolation Pilot Plant (**WIPP**) Hazardous Waste Facility Permit. The Department of Energy Carlsbad Field Office and Washington TRU Solutions LLC (**the Permittees**) submitted this PMR to the Hazardous Waste Bureau on January 11, 2011, seeking to add the TRUPACT-III as a shipping package and the Standard Large Box 2 (**SLB2**) as a storage and disposal container, to add Room 108 and Airlock 107 as part of the Contact-Handled Bay in the Waste Handling Building Storage Unit, and to add equipment to the facility to allow for the handling of the TRUPACT-III and SLB2.

NMED approved this PMR with changes for the reasons specified in the response to comments. This Class 2 PMR was subject to a 60-day public comment period running from January 17, 2011 through March 17, 2011, during which NMED received written specific comments from a total of four individuals and organizations.

Further information on this administrative action, including the response to comments, may be found on the NMED WIPP Information Page at <http://www.nmenv.state.nm.us/wipp/>. Please contact Steve Zappe at (505) 476-6051 or via e-mail at <steve.zappe@state.nm.us> if you have further questions or need additional information.

Sincerely,

John E. Kieling

PUBLIC INFORMATION MEETINGS

On a Requested Modification to the Hazardous Waste Facility Permit for the Waste Isolation Pilot Plant

GROUND WATER

JAN 21 2011

BUREAU

WHO: U.S. Department of Energy (DOE) Carlsbad Field Office and Washington TRU Solutions LLC (WTS)

WHAT: DOE and WTS will conduct public meetings to provide information on the following permit modification request to the WIPP Hazardous Waste Facility Permit. There will be a 60-day public comment period beginning on January 17, 2011.

WHEN:	Tuesday, February 8, 2011 5 – 6 p.m.	Thursday, February 10, 2011 2 – 4 p.m. & 6 – 8 p.m.
WHERE:	Skeen-Whitlock Building 4021 National Parks Highway Carlsbad, New Mexico	Courtyard by Marriott 3347 Cerrillos Road Santa Fe, New Mexico

WHY: On January 10, 2011, DOE submitted a Class 2 permit modification request to the New Mexico Environment Department (NMED). The proposed modification is requesting that the items listed below be added to the WIPP Permit for use at the site.

- Allow for the receipt of the TRUPACT-III shipping package at the WIPP facility. This package is a Nuclear Regulatory Commission certified Type B package as required for transporting transuranic (TRU) waste to the WIPP facility. It is designed to transport TRU waste in a large container known as the Standard Large Box 2 (SLB2).
- Add the SLB2 as an approved storage and disposal container at the WIPP facility. This container is necessary to accommodate items that exceed the volume capacity of existing approved TRU waste containers.
- Add Airlock 107 and Room 108 as part of the Contact-Handled Bay. These additional areas are necessary to manage TRUPACT-III and will increase the size of the CH Bay by 6,156 square feet. This increase in size does not include an increase in the amount of storage capacity for TRU waste in the CH Bay.
- Add equipment for handling TRUPACT-III and the SLB2. The equipment will consist of an automated yard transfer vehicle, payload transfer station, bolting robot and vent hood. The yard transfer vehicle will be used to move the TRUPACT-III from the parking area unit into Room 108 inside the CH Bay. Additionally, a payload transfer station, bolting robot and vent hood will be added to the permit to facilitate the removal of the SLB2 from the TRUPACT-III.

HOW: Additional information about this permit modification request can be obtained from Mr. Bobby St. John, WTS, at 1-800-336-9477. The permit modification is also available in the Information Repository located on the WIPP web site at www.wipp.energy.gov and at the WIPP Information Center, Skeen-Whitlock Building, 4021 National Parks Highway, Carlsbad, N.M. A copy of the requested permit modification also may be obtained from NMED at the address listed below.

COMMENTS: Written comments for the record must be sent to the NMED contact person at the address below and received no later than 5 p.m. on March 17, 2011:

Mr. Steve Zappe
New Mexico Environment Department
2905 Rodeo Park Drive East, Building 1
Santa Fe, N.M. 87505
Phone: 505-476-6051
Fax: 505-476-6060
E-mail: steve.zappe@state.nm.us

The Permittees' compliance history during the life of the permit being modified is available from Mr. Steve Zappe at the New Mexico Environment Department.

QUESTIONS: Any questions or comments to the Permitees regarding this permit modification may be sent to Mr. Bobby St. John, P.O. Box 2078, Carlsbad, N.M. 88221, no later than March 10, 2011.

Waste Isolation Pilot Plant

January 16, 2011

Fact Sheet

DOE Proposes Modification To Hazardous Waste Facility Permit

Changes to WIPP Hazardous Waste Facility Permit

Background

The U.S. Department of Energy Carlsbad Field Office (DOE) and Washington TRU Solutions LLC (WTS) submitted a Class 2 permit modification request to the New Mexico Environment Department (NMED) to change the Waste Isolation Pilot Plant (WIPP) Hazardous Waste Facility Permit (Permit). NMED issued the Permit (Permit Number: NM4890139088-TSDF) in November 2010.

What is Proposed?

The proposed modification submitted to NMED on January 10, 2011, is requesting specific items be added to the Permit for use at the site. The modification is requesting the addition of:

1. TRUPACT-III as a shipping package
2. Standard Large Box 2 as a storage and disposal container
3. Room 108 and Airlock 107 as part of the contact-handled (CH) bay
4. Equipment to the facility to allow for the handling of TRUPACT-III and Standard Large Box 2

The shipping package, container and handling equipment will be used to manage CH transuranic (TRU) mixed waste that is approved for shipment and disposal at the WIPP facility.

TRUPACT-III

The first request would allow for the receipt of the TRUPACT-III shipping package at the WIPP facility. This package is a Nuclear Regulatory Commission certified Type B package as required for transporting TRU waste to the WIPP facility. The TRUPACT-III is designed to transport TRU waste in a large container known as the Standard Large Box 2. When loaded with TRU waste, TRUPACT-III will consist of a single Standard Large Box 2. Shipments made in TRUPACT-III will meet applicable Department of Transportation requirements.

Standard Large Box 2
This container is necessary to accommodate items that exceed the volume capacity of existing TRU waste containers approved for management at the WIPP facility. These large boxes will not fit inside either the TRUPACT-II or the HalfPACT, which are currently the only two CH waste shipping containers approved for use at the WIPP facility.

Room 108 and Airlock 107
Additional areas are necessary to manage TRUPACT-III in the CH Bay. These areas are designated as Airlock 107 and Room 108. These areas will increase the total area of the CH Bay by 6,156 square feet. This increase in size does not include an increase in the amount of storage capacity for TRU waste.

Additional Equipment for Handling TRUPACT-III and Standard Large Box 2

- Facility Transfer Vehicle and Yard Transfer Vehicle
  The Facility Transfer Vehicle is currently described in the Permit in Table A1-2. The Yard Transfer Vehicle is an automated guided vehicle that will transport the TRUPACT-III shipping container from parking area unit into Room 108. It will travel on a pre-programmed path and will communicate with the computer guidance system via wireless transmission. There are numerous safety features on the Yard Transfer Vehicle to ensure the vehicle will not bump something or deviate from the pre-determined path.

- Bolting Robot
  The Bolting Robot is used to remove and/or install the TRUPACT-III overpack cover and closure lid bolts. The Bolting Robot is an electro-mechanical system with an end-of-arm tool used to de-tension, remove, install and re-tension the TRUPACT-III overpack cover and closure lid bolts.

- Vent Hood
  The Bolting Station has an exhaust system that consists of a vent system. The system is similar to the one used for the TRUPACT-II and HalfPACT. The system will tie into the existing exhaust system in the Waste Handling Building. The vent hood operation routes air through a high efficiency particulate air filter prior to discharging it to the atmosphere.

- Payload Transfer Station
  The Payload Transfer Station consists of a payload lifter, transfer table or Facility Transfer Vehicle with roller table and a control system. This location allows for the removal of the Standard Large Box 2 from the TRUPACT-III. The Standard Large

Box 2 sits on a pallet inside the TRUPACT-III and the pallet slides out. The SLB2 is placed on a Facility Pallet for movement to the underground.

- Drum Age Criteria (DAC)
  Since a new container is being added to the Permit, it is necessary to identify appropriate DAC values for the Standard Large Box 2. The Permittees have determined these DAC values for the Standard Large Box 2 and are proposing to put them into the Permit.

- Waste Emplacement
  The Standard Large Box 2 will be emplaced in the same manner as other TRU mixed waste containers. The SLB2 does not use slipsheets as described for smaller containers. Instead, the SLB2 is handled in the underground using a standard fork lift.

Comments

Comments for the record must be sent to Mr. Steve Zappe, New Mexico Environment Department, 2905 Rodeo Park Drive, Building 1, Santa Fe, NM 87505. They also may be e-mailed: steve.zappe@state.nm.us or faxed to 505-476-6060. Only written comments will be accepted and must be received no later than 5 p.m. (MDT) on March 17, 2011. A copy of the permit modification may be viewed or copied at the NMED offices of Mr. Zappe. To be placed on the WIPP mailing list, contact Mr. Zappe at the address above

For more Information

For more information about transuranic waste shipments and procedures, call the WIPP Information Center at 1-800-336-WIPP (9477). This permit modification request is available for review in the Information Repository located on the WIPP home page at www.wipp.energy.gov. Comments to the Permittees regarding this permit modification may be sent to Mr. Bobby St. John, Washington TRU Solutions LLC, P.O. Box 2078, Carlsbad, NM 88221.

Subject: Attendance list for 113th Quarterly Meeting, action items

Attachments: Attendance 113th.pdf; AMWTP Incident 10_28_10.pdf

All -

As promised, here is the attendance list from last week's WIPP quarterly meeting.

Here are the action items we discussed at the end of the meeting:

1. NMED HWB - provide Joni with a copy of the WSPF for LANL waste stream LA-MHD01.001
2. CBFO - provide all a copy of the 1/20/11 response letter to DNFSB regarding work planning and control deficiencies.
3. CBFO - address presentation of shipments and emplacements by fiscal year (instead of ,or in addition to, calendar year) at future quarterly meetings
4. CBFO - address Goals 3 and 4 in DOE EM's "Roadmap: Journey to Excellence" at the next quarterly meeting
5. NMED - provide all a copy of the AMWTP incident in suggested agenda topic #4
6. CBFO - identify to all the appropriate venue to talk about suggested agenda topics #12 and 13 (WTS award fees under the WIPP contract)
7. CBFO - defer suggested agenda topics #6 (ARRA) and #14 (amount of waste not meeting WAC by year) until after Casey Gadbury has had a chance to address, defer topic #15 (sodium- and potassium-bearing waste) for a future meeting

Scott Kovac provided me with a link to the response to DNFSB, so action item #2 is complete by the link below:
http://www.hss.energy.gov/deprep/
January 20, 2011, Department letter transmitting the response to the Board's October 22, 2010 report regarding work planning and control at the Waste Isolation Pilot Plant. [PDF]

Also attached is a copy of the letter from AMWTP notifying Idaho Department of Environmental Quality of the incident in October, so action item #5 is also complete.

Finally, at some point CBFO will set the date of the next quarterly meeting, tentatively set for Thursday, April 28, 2011.\

Steve

Subject: 15-Day Written Incident Report for the Advanced Mixed Waste Treatment Project's Mixed Waste Incident in the Supercompactor Glovebox at the Advanced Mixed Waste Treatment Facility on October 28, 2010 – LSS-20-10

Dear Mr. Monson:

This letter provides the 15-day written report required by the Idaho Administrative Procedures Act (IDAPA) 58.01.05.008 [Title 40 of the Code of Federal Regulations (CFR) Part 264.56(j)] and Section G-8 of Attachment 7 of the Advanced Mixed Waste Treatment Project (AMWTP) Hazardous Waste Management Act (HWMA)/Resource Conservation Recovery Act (RCRA) Permit (EPA ID Number ID4890008952) for the response to a pressure event that occurred on October 28, 2010, in the Supercompactor Glovebox. This incident was originally reported by telephone on October 28, 2010, to Natalie Clough of the Idaho Department of Environmental Quality (IDEQ) at approximately 2:30 p.m.

  Transuranic Storage Area
  Scoville, ID 83415
  (208) 557-6456

- *Date, time, and type of incident:*
  On October 28, 2010, at approximately 1111 hours, the Supercompactor Glovebox in WMF-676 experienced alarms for low-inflow flow and low depression, followed by a trip of the light curtain that shut down compactor operation. This condition was created by a release of pressure from a drum undergoing supercompaction at the time.

- *Location and cause of the incident:*
  The incident occurred in the Supercompactor Glovebox located in WMF-676. Cause has been determined as a sudden release of pressure from a pressurized fire extinguisher in the drum being compacted.

- *Name and quantity of material(s) involved:*
  One confirmed and probably two other fire extinguishers (approximately 30-pound units) were in the silver drum being compressed. The waste stream in the silver drum was from Box 10010056, which was an IDC 480 box (miscellaneous metals) from Rocky Flats.

- *Extent of Injuries, if any:*
  No personnel were injured.

- *Assessment of any actual or potential hazards to human health or the environment:*
  The event was contained in the Supercompactor Glovebox, with an indication of minor potential release to the ventilation-controlled area/room which contains the glovebox. Four personnel were present in the room at the time the Continuous Air Monitors (CAMs) alarmed (approximately 1130 hours). All personnel were screened out of the room by Radiation Control Technicians, with no contamination found on them. The rooms were subsequently characterized with swipes and air samples. Over 300 swipes were performed, and three were determined to show contamination above 20 dpm (all below 100 dpm and none were repeatable). One swipe was from a known, controlled Contamination Area. Air samples were also pulled and analyzed. The maximum potential airborne exposure to any individual was determined as 13.2 DAC (Derived Air Concentration) hours. This potential exposure is below all health and regulatory thresholds (i.e., a potential exposure of 40 DAC hours requires bioassay monitoring for an actual exposure determination). The four individuals involved will be bioassayed. Upgraded characterization was also conducted with11.7 electrovolt Photoionization Detectors for detection of potential chemical vapors, and none were detected. The room was determined cleared and released back to normal operations.

The glovebox was evaluated by engineering for integrity, and no abnormal conditions or breaches were discovered. All installed gloves were inspected, and two gloves were determined to have minor contamination and one glove had a pinhole (outside the knot). These gloves were replaced. This is not an unusual result for a quarterly glove inspection. The Supercompactor Glovebox also received a complete criticality/incompatible clean-out. No liquids were in the collection sump at the time of the clean-out.

Based on the data from the event, the upgraded characterization activities, and subsequent inspections of the systems, there are no determined hazards to human health or the environment.

- *Estimated quantity and disposition of material recovered from the incident:*
  No additional waste was generated from this incident.

- *General Description of the Incident:*
  At 1111 hours on Thursday, October 28, 2010, the Supercompactor Glovebox in WMF-676 experienced alarms for low-inflow flow and low depression, followed by a trip of the light curtain that shut down compactor operation. Operations personnel went to the supercompactor to determine the issue and reset the light curtain in accordance with established procedures. This was accomplished and compaction completed on the drum in the supercompactor when a CAM on the third level of the room alarmed, followed by a CAM on the first level. This was at 1130 hours. Operations were secured and Radiation Control technicians contacted to perform full-body screens on the four personnel to exit the room. These screens found no contamination on any of the personnel.

  Upgraded characterization, with Radiation Control personnel and Safety personnel, was initiated to identify any contamination and hazard within the room. Plant Shift Manager and Emergency Action Manager, Mike Loftus, along with the Acting Plant Manager, Ted Griffith, initiated a review of the tapes of the glovebox and determined that there had been an unexpected pressure release from the drum during the compaction cycle that had resulted in the identified alarms and tripped light curtain. They issued a Step Back/Stop Work for the supercompactor and boxline operations. Notifications were made to the Nuclear Facility Manager, David Griggs, and the Department of Energy representative of the incident status. Emergency actions required were reviewed with the Emergency Manager, and no Emergency Action Limits were exceeded. The upgraded characterization found three swipes with detectable concentrations of contamination out of over 300 swipes performed. None of the swipes were repeatable (any contamination present was removed by the swipe). One swipe was from the third level at 33 dpm. A second swipe was from the first level at 90 dpm. The third swipe was from an area between the second and third level in a posted Contamination Area at 55 dpm. Air monitoring was also conducted for both organic vapors and radiological contamination and was negative. Initial readings of the filters from the CAMs indicated some Radon present. A long-term count of the filters ultimately showed a small amount of contamination present for a maximum potential exposure to the four individuals of 13.2 DAC hours. This potential exposure is below all health and regulatory thresholds (i.e., a potential exposure of 40 DAC hours requires bioassay monitoring for an actual exposure determination).

Based on upgraded characterization, the room was returned to general access. At this time engineering performed a glovebox integrity inspection and determined no breach of integrity. A complete inspection of the inserted gloves was also conducted. This found two gloves with some minor contamination and one glove with a pinhole to the outside of the knot (all were replaced). This is a normal result for a quarterly glove inspection. In addition, a close inspection of the suspect compacted puck was completed; and no scorching, burns, or other indication of any deflagration was observed on the puck or in the glovebox.

A review of the boxline tapes was initiated for the drum involved in the incident. This review ultimately confirmed that one fire extinguisher and two other packages that probably contained fire extinguishers were placed in the drum being compacted.

Immediate actions as a result of this incident included a Stop Work for boxline operations and supercompactor operations until corrective actions could be determined. In addition, a complete review by Visual Examination Experts (VEE) of all the silver drums filled that shift by the Operators/Visual Exam (VE) technicians involved in loading the drum with the fire extinguishers was completed. This was a total of 18 silver drums. Of these 18 drums, eight had been compacted, including the drum involved in the incident, and ten remained uncompacted. This resulted in the identification of six compacted drums (including the one involved in the incident) that contained fire extinguishers. Of the ten uncompacted drums, one drum was identified with a potential for issues due to the placement of an unopened bag in the container. These drums were all placed on Nonconformance Reports for remediation and resolution prior to disposition.

As a result of the determination of inadequate/improper job performance by these two operators, a larger review was conducted of all uncompacted silver drums currently in the facility with available recordings. This involved 48 additional silver drums for which boxline recordings were reviewed by the VEEs. As a result of these reviews (which included the drums packaged by the majority of the other operators/VE technicians for the boxline), there were two more silver drums that were placed on Nonconformance Reports for further investigation of items (a bag and a pipe) that the VEEs were unable to determine the status from the limited view of the recording.

As a result of this larger review and two recent surveillances of this operation (one in July and one in October by Quality Assurance personnel) with no findings or issues, it was determined that there was not a programmatic issue but that clearly the two operators involved had not performed in accordance with training and procedural requirements. This has resulted in additional corrective actions that include a minor change in procedure to further reinforce the requirement for intrusive investigation (e.g., opening all bags) and an additional briefing (two hours) to all the affected crews on the procedural requirements and review of this incident to reinforce why these requirements are in place. In addition, an Operator Proficiency Program for VE operators is being developed, and there is an emphasis on additional surveillance and oversight of the VE operators by the VEEs. The VE qualifications for the two operators involved have been removed, and an additional action is under consideration. Finally, Corrective Action Report (CAR) 56646 has been opened on this incident to track all short- and long-term corrective actions, and it will require a formal root-cause analysis.

Based on these corrective actions, the boxline and supercompactor operations were restarted on November 5, 2010, with additional Senior Supervisory oversight for at least the first 30 days of operation.

The Contingency Plan has been evaluated to be adequate for this response, and no updates or changes to the Contingency Plan are required.

The AMWTP appreciates your attention and efforts. Please contact either me at (208) 557-6320 or Mr. Neil Brill at (208) 557-7316 with any questions and comments.

Sincerely,

Leonard Sygitowicz

Start Date: 11/17/2010 03:30 PM **End Date:** 11/17/2010 05:00 PM

Facility Information
Facility Name: Waste Isolation Pilot Plant, DP-831 Type of Operation: Federal Agency
Contact: Dan Ferguson (DOE), Parrish Rousch (WRES), Rick Salness (WRES), Stuart Jones (WRES) Location: Carlsbad

Inspector(s): Clint Marshall

Inspection Summary
Purpose: Facility Inspection (GWB)

Activities
Samples Taken: No

Observations and Information Obtained
Inspected stormwater ponds, sewage lagoons, salt basins and salt pile.

Salt Storage Extension Basin (SSEB) I has been mucked out and is now operational. Construction of the SSEB II is finished and it is also operational. NMED did not receive the as-builts for SSEB II so DOE is resending them.

The low spot on the southeast corner of the Salt Pile Evaporation Pond (SPEP) has been completed raising the maximum operating level of the pond by 12 inches. The Salt Pile cover has been refurbished. New chutes have been installed on the west and south slopes. Mesh has been installed on the cover after amendment with cow manure, and then reseeded. Vegetation is being established quite successfully for the first time since the cover was installed.

Stormwater Pond A is still holding stormwater from last summer. WIPP has permission to transfer some of the water to Pond 2 where a transfer station exists to truck water offsite for road construction. Pond 1 has about a foot of water in the bottom.

We did not enter the fenced area to look at the sewage lagoons. We looked through the fence from the north side. Pond C has just been relined and was the last of the ponds to be relined.

H-19 pond is not receiving much liquid. There is quite a bit of wind blown sand in the bottom. A leak detection survey was conducted in 2005 and only one leak found.

Action Required

Have DOE resend as-builts for SSEB II.

Water Quality Inspection & Sampling Checklist

Reference: Regulation No. HED 86 – 14 (NMED)

Entry Conference:

☐ Was facility representative informed of NMED's right of entry and authority: (To access records, inspect monitoring equipment or methods and sample effluents under Sections 74-6-9.E of the New Mexico Water Quality Act NMSA 1978)?

☐ Was NMED identification presented?

☐ Were other potential or suspected violations which prompted inspections listed?

☐ During the inspection, was the facility representative immediately advised or addition potential violations?

Exit Conference:

☐ Were the preliminary inspection results summarized?

☐ Was the facility representative advised if violations discussed during the entry conference remain under investigation?

☐ Were other potential violations discovered during the inspection discussed?

☐ Was a date provided as to when NMED expects to complete consideration of potential violation?

Water Quality Sampling:

☐ Was the facility representative offered a reasonable opportunity to obtain split/replicate samples, perform simultaneous tests, measurements or photographs?

☐ Were copies of NMED's results (sampling, testing, photos) requested? If yes, copies must be provided within ten working days after such results are in NMED's possession.

RE: Approval to Transfer Brine from Pond B to the Salt Storage Extension Basin II, DP-831, U.S. Department of Energy Waste Isolation Pilot Plant

Dear Mr. Moody:

The New Mexico Environment Department has reviewed the request, dated January 14, 2010, from the U.S. Department of Energy (DOE) for approval to transfer approximately 150,000 gallons of brine from Pond B at the Sewage Treatment Facility to the Salt Storage Extension Basin II (SSEB-II) at the Waste Isolation Pilot Plant (WIPP). The purpose of the transfer is to minimize salt build-up and extend the life of the newly lined Pond B. The WIPP facility is located approximately 26 miles east of Carlsbad, New Mexico in Sections 20, 21, 28 and 29, T22S, R31E, Eddy County.

The SSEB-II and Pond B are both synthetically lined and permitted to hold brine under the Discharge Permit Renewal and Modification dated September 9, 2008, and the Discharge Permit Modification dated February 15, 2010. DOE's request to transfer brine from Pond B to the SSEB-II is hereby approved.

This approval does not relieve you of your responsibility to comply with any other applicable federal, state, and/or local laws and regulations, such as zoning requirements and nuisance ordinances. Also, this approval does not relieve you of liability should your operation result in actual pollution of surface or ground waters.

If you have any questions, please contact Clint Marshall of the Mining Environmental Compliance Section at 505-827-0027.

Sincerely,

Mary Ann Menetrey

Subject: Request to Transfer Brine from Pond B at the Sewage Treatment Facility to the Salt Storage Extension Basin-II

Dear Mr. Marshall:

The purpose of this letter is to request authorization to transfer approximately 150,000 gallons of brine from Pond B at the Sewage Treatment Facility to the Salt Storage Extension Basin (SSEB)-II. Brine was transferred from the SSEB-I to Ponds B and C at the Sewage Treatment Facility as authorized in the Ground Water Quality Bureau Corrective Action Approval dated December 05, 2008 to mitigate the overflowing of the berm in the SSEB-I following significant precipitation events. The salt water in Pond C at the Sewage Treatment Facility was transferred to Pond B in order to prepare Pond C for liner replacement in 2010. Fresh water has been added to Pond B to keep the salt in solution and to provide a less concentrated salt solution for transfer to the SSEB-II. The purpose of this request is to minimize the build-up of salt in the newly lined pond and extend the life of Pond B in the Sewage Treatment Facility.

At your request, we have had the water from the Sewage Treatment Facility Pond B analyzed for Nitrate (As N)+Nitrite (As N) and total Kjeldahl nitrogen (TKN). The nitrate and nitrite concentrations were below the method detection limit and the TKN concentration was 45 mg/l.

Thank you for your consideration of this request. If you have any questions regarding this request to transfer brine, please call me at (575) 234-8128.

Sincerely,

Daniel J. Ferguson
Site Regulatory Specialist

Subject: RE: Use of Storm Water

Dan,

As stated by phone on August 6, 2010, NMED approves the use of storm water from Ponds A, 1 and 2 for use on road construction activities on the WIPP South Access Road. I a phone conversation with Stuart Jones this morning, it is now NMED's understanding that the storage pond that was previously mentioned for temporary storage of the storm water will not be constructed. The storm water will be pumped directly from Ponds A, 1 and 2 into tanker trucks for use on road construction. If additional questions arise, feel free to contact me.

Subject: Use of Storm Water

Clint,

The purpose of this email is to comply with your request via phone message on August 6, 2010, to inform you when the storm water from Ponds A, 1 and 2 would be used for the road construction activities associated with the WIPP South Access Road. It is anticipated that the construction contractor will be begin removing the storm water on or about September 28, 2010.

Prior to the release of this storm water, a full hazardous waste characterization was conducted on the water. The storm water did not exhibit any characteristic of hazardous waste. As previously discussed with you, this analytical suite confirmed a chloride range from 140 to 630 mg/l varying among the three ponds.

Please respond if you concur that the Ground Water Quality Bureau has no additional requirements or restrictions for the use of this storm water for the road construction project.

If you have any questions, please call me at (575) 234-8128.

Thank you,

Dan Ferguson

WIPP salt headed to feed cattle in West Texas

From the Current-Argus
Posted: 08/02/2010 09:14:36 PM MDT

From the Current-Argus

CARLSBAD — Having spent the past 250 million years or so half a mile underground, salt excavated at the Waste Isolation Pilot Plant is now on its way to help feed cattle in Texas.

The U.S. Department of Energy's Carlsbad Field Office has worked out an agreement to transfer 300,000 tons of run-of-mine salt from WIPP to Magnum Blue Ribbon Feeds over a five-year period. On July 26, the first truckload of stored salt left the WIPP facility for Hereford, Texas, which is located southwest of Amarillo.

"This is an excellent arrangement for all government parties, for Magnum Blue Ribbon Feeds, and for the taxpayer," said Stewart Jones, environmental manager.

Salt tailings have accumulated on the surface of the WIPP site since mining began in the 1980s. In 2008, Magnum successfully responded to a request for interest in the salt tailings with a business plan to remove up to 10 truckloads of salt a day from the site.

As part of the agreement, the Carlsbad Soil and Water Conservation District is administering the agreement, allowing proceeds provided by Magnum to remain in southeast New Mexico for educational and range improvement projects within the district. The Bureau of Land Management was instrumental in coordinating the multi-agency agreement. Magnum has provided all of the infrastructure improvements for the project, and the salt removal process has no adverse impact on WIPP's mission as a waste repository.

Magnum specializes in providing

Advertisement

---

minerals and feed for the livestock industry. The WIPP salt will mostly be used to add a mineral supplement to cattle feed.

The salt excavated from the 250 million-year-old salt beds 2,150 feet below the surface is currently placed in piles adjacent to the WIPP site, but the DOE will eventually have to dispose of the salt, as required by the WIPP Land Withdrawal Act. Magnum is taking its salt from a pile to the north of the WIPP facility, referred to as cells A and B. Cells A and B are not covered, but storm water from the cells is managed by collection and evaporation in lined ponds

"If Magnum Blue Ribbon Feeds removes all the salt that is allowable under this agreement, about one-third of that uncovered salt will be taken," Jones said.

A second, older salt pile also adjacent to the site has been covered with a poly-liner and a layer of top soil.

The Carlsbad Field Office has estimated that it would cost $15 per ton to haul the salt to a municipal landfill, meaning the agreement with Magnum could be saving the taxpayer about $4.5 million in disposal costs. It is estimated that it will take Magnum five years to haul the 300,000 tons of salt.

RE: FINAL PERMIT DECISION AND RESPONSE TO COMMENTS, CLASS 2 MODIFICATION REQUEST
WIPP HAZARDOUS WASTE FACILITY PERMIT
EPA I.D. NUMBER NM4890139088

Dear Interested Person:

On July 2, 2010, the New Mexico Environment Department (**NMED**) took final administrative action on a Class 2 permit modification request (**PMR**) to the Waste Isolation Pilot Plant (**WIPP**) Hazardous Waste Facility Permit. The Department of Energy Carlsbad Field Office and Washington TRU Solutions LLC (**the Permittees**) submitted this PMR to the Hazardous Waste Bureau on April 14, 2010, seeking to revise volatile organic compound concentrations of concern and update these values using current EPA IRIS data.

NMED approved this PMR with changes for the reasons specified in the response to comments. This Class 2 PMR was subject to a 60-day public comment period running from April 19, 2010 through June 18, 2010, during which NMED received written specific comments from a total of six individuals and organizations.

Further information on this administrative action, including the response to comments, may be found on the NMED WIPP Information Page at <http://www.nmenv.state.nm.us/wipp/>. Please contact Steve Zappe at (505) 476-6051 or via e-mail at <steve.zappe@state.nm.us> if you have further questions or need additional information.

SUBJECT: PUBLIC HEARING NOTICE ON A DRAFT HAZARDOUS WASTE PERMIT FOR WASTE ISOLATION PILOT PLANT

Dear Interested Person:

The New Mexico Environment Department **(Department)** is providing the attached Notice on a public hearing, and the opportunity for the public to comment on, a pending action before the Department for the Waste Isolation Pilot Plant **(WIPP)**. Specifically, the Department intends to issue a hazardous waste permit to WIPP to manage, store, and dispose hazardous waste, and to close hazardous waste disposal units, in accordance with the New Mexico Hazardous Waste Act and its implementing regulations. The proposed activity is more fully described in the attached notice.

The Notice provides information on how to submit public comment and the public hearing process. Public comment will be received through the end of the public hearing. The public hearing on the draft Permit will begin **Monday, August 9, 2010** at **9:00 AM MDT** and continue as necessary through **Friday, August 20, 2010**. The public hearing will be held at the Santa Fe Community College located at 6401 S. Richards Avenue, Santa Fe, NM 87508, in the Board Room (Room 223), with one day for non-technical oral public comment in Carlsbad, NM on **Monday, August 16, 2010** at **2:00 PM to 4:00 PM and 6:00 PM to 8:00 PM** at the Best Western Stevens Inn located at 1829 S. Canal Street, Carlsbad, NM 88220.

PUBLIC NOTICE No. 10-03

NEW MEXICO ENVIRONMENT DEPARTMENT
HAZARDOUS WASTE BUREAU
SANTA FE, NEW MEXICO
June 4, 2010

NOTICE OF PUBLIC COMMENT AND A PUBLIC HEARING ON THE DRAFT HAZARDOUS WASTE PERMIT FOR THE WASTE ISOLATION PILOT PLANT EPA ID NUMBER: NM4890139088

The New Mexico Environment Department (**Department**) is providing this public notice on a public hearing, and the opportunity for the public to comment on, a pending action before the Department for the Waste Isolation Pilot Plant (**WIPP**, or the **Facility**). Specifically, the Department intends to issue a hazardous waste permit (**Permit**) to WIPP to manage, store, and dispose hazardous waste, and to close hazardous waste disposal units, in accordance with the New Mexico Hazardous Waste Act (**HWA**) and its implementing regulations. The Department is charged with issuing a permit that will ensure that WIPP's hazardous waste operations are managed in a manner protective of human health and the environment.

WIPP is a hazardous waste facility currently operating under a Permit issued by the Department on October 27, 1999, which authorizes the management, storage, and disposal of transuranic (**TRU**) mixed waste at the Facility. Mixed waste is radioactive waste that is also a hazardous waste as defined by the HWA, and is thus subject to regulation by the Department. The U.S. Department of Energy Carlsbad Field Office (**DOE**) owns and operates the Facility, and Washington TRU Solutions LLC (**WTS**) co-operates the Facility. These entities are collectively referred to as "Applicants" in this public notice.

WIPP manages wastes that are regulated under the federal Resource Conservation and Recovery Act (**RCRA**), the HWA (Chapter 74, Article 4 NMSA 1978), and their implementing regulations.

WIPP is located north of Jal Highway (State Highway 128) in Eddy County, New Mexico, approximately 26 miles east of Carlsbad. The Applicants are located at the following mailing addresses: DOE Carlsbad Field Office, P.O. Box 3090, Carlsbad, New Mexico 88221-3090; and Washington TRU Solutions LLC, P.O. Box 2078, Carlsbad, New Mexico 88221-5608. The Permittees' primary contact for this permitting action is: George Basabilvazo, Regulatory Compliance Director, DOE Carlsbad Field Office, P.O. Box 3090, Carlsbad, New Mexico 88221-3090.

I. NOTICE OF HEARING AND OPPORTUNITY TO COMMENT ON THE DRAFT PERMIT

On September 25, 2009, the Applicants submitted to the Department a permit renewal application to manage, store, and dispose of TRU mixed wastes at WIPP under the HWA. The Department issued a draft Permit for WIPP for public comment on April 27, 2010, which it is proposing to approve.

The draft Permit, when finalized, would allow WIPP to continue hazardous waste management operations in much the same manner as those authorized by the existing Permit, such as: requiring generator/storage sites to implement applicable waste characterization requirements prior to the receipt of TRU mixed waste at WIPP; conducting waste characterization audits at generator storage sites to ensure their implementation of and compliance with applicable requirements; safely managing, storing, and disposing contact-handled and remote-handled TRU mixed waste upon receipt at WIPP; performing required environmental monitoring of air and groundwater at WIPP to ensure protection of human health and the environment; closing all permitted storage and disposal units following final receipt of waste; conducting required post-closure care activities after final closure of WIPP; and complying with corrective action requirements related to any release of hazardous waste or hazardous constituents from the Facility.

Through this notice the Department announces a public hearing to accept additional public comment and provide persons a reasonable opportunity to present data, views, and arguments, as well as to examine witnesses on the draft Permit prior to issuance of a final Permit. See *II. Public Hearing*, below, which addresses the public hearing and submission of public comment on this action.

II. PUBLIC HEARING

The public hearing on the draft Permit will begin **Monday, August 9, 2010** at **9:00 AM MDT** and continue as necessary through **Friday, August 20, 2010**. The public hearing will provide interested persons a reasonable opportunity to present data, views, and arguments, as well as to examine witnesses. The hearing will afford an opportunity for all persons to present comment. Except for one day as noted below, the public hearing will be held at the Santa Fe Community College (SFCC) located at 6401 S. Richards Avenue, Santa Fe, NM 87508, in the Board Room (Room 223). The hearing will convene for one day for non-technical oral public comment in Carlsbad, NM on **Monday, August 16, 2010** at **2:00 PM to 4:00 PM and 6:00 PM to 8:00 PM** at the Best Western Stevens Inn located at 1829 S. Canal Street, Carlsbad, NM 88220. The hearing will then return to Santa Fe the following day at the SFCC location noted above. The hearing will be conducted in accordance with the Hazardous Waste Management Regulations, 20.4.1.901.F NMAC, the Environment Department Permit Procedures, 20.1.4 NMAC, and any scheduling and procedural orders as may be entered by the Hearing Officer.

Any person, including the Applicants, wishing to submit written public comment or present oral public comment at the public hearing for Department's consideration, shall do so according to the procedures set forth below. The public comment period continues through the close of the public hearing.

A. WRITTEN PUBLIC COMMENT

The Department will accept written public comment on the draft Permit. Written comments shall be based on all reasonably available information and include, to the extent practicable, all referenced factual materials. Documents in the Administrative Record need not be re-submitted if expressly referenced by the commenter. Written comment must be filed with the Hearing Clerk on or before the close of the public hearing at the New Mexico Environment Department, Room N-2153, 1190 S. St. Francis Drive, PO Box 5469, Santa Fe, NM, 87502-5469. Written public comments may also be submitted at the public hearing.

B. TECHNICAL TESTIMONY AND ORAL PUBLIC COMMENTS

At the public hearing, the Department will accept technical testimony and non-technical oral comments. The Hearing Officer may set reasonable limits upon the time allowed for technical testimony and oral comments. Technical testimony and oral comments on the draft Permit shall be accepted at the public hearing, in accordance with Department regulations, as set forth below:

1. Technical Written Statements and Oral Testimony: Any person who intends to provide a technical written statement or oral testimony concerning a Draft Permit, Application or Petition shall file a Statement of Intent to Present Technical Testimony on or before **July 16, 2010** with Hearing Clerk at the address provided above.

(a) Content of Statement of Intent: The Statement of Intent to Present Technical Testimony shall:

(i) identify the person filing the statement;

(ii) state whether the person filing the statement supports or opposes the Draft Permit, Application, or Petition, or in the case of the Division, the Division's recommended decision to approve, deny, or approve with conditions the Draft Permit, Application, or Petition;

(iii) identify each witness, including name, address, affiliation(s), and educational and work background;

(iv) estimate the length of the direct testimony of each witness;

(v) identify all exhibits which are part of the Record Proper and, for exhibits not part of the Record Proper, attach a copy;

(vi) list or make available all technical materials relied upon by each witness in making statement of technical of fact or opinion contained in his or her direct testimony; and

(vii) attach a summary of the testimony of each witness, stating any opinion(s) to be offered by such witness, and an explanation of the basis for such opinion(s).

2. Effect of Failure to File: Failure to file a timely Statement of Intent to Present Technical Testimony meeting the requirements above, pursuant to 20.1.4.300.B NMAC, shall preclude a person from presenting technical testimony, and if the person has not filed a timely Entry of Appearance, pursuant to 20.1.4.300.A NMAC, from being a party in the proceeding, but shall not preclude a person from presenting a general written or oral statement or non-technical testimony in the proceeding.

3. General Written and Oral Statements; Non-Technical Testimony: Any person may provide a general written statement concerning the draft Permit at or before the hearing. Any person may provide a general oral statement or non-technical testimony concerning the draft Permit at the hearing.

PROCEDURE FOR ISSUANCE OF FINAL PERMIT DECISION

The Department must ensure that the approved final Permit is consistent with the New Mexico Hazardous Waste Management Regulations (20.4.1 NMAC). All written comments submitted on the draft Permit will be considered in formulating a decision on issuance of a final Permit, and may cause the draft Permit to be modified.

The Department will respond in writing to all public comments. This response will specify which provisions, if any, of the draft Permit have been changed in the final Permit, the reasons for the changes, and briefly describe and respond to all public comments on the draft Permit raised during the public comment period. All persons presenting written comments or who requested notification in writing will be notified of the Department's decision by mail. These responses will also be posted on the Department's website.

After consideration of all the written public comments received, the Department will issue, modify and issue, or not issue a final Permit. If the Department modifies and issues the Permit, the Applicants shall be provided by mail a copy of the modified documents and a detailed written statement of reasons for the modifications.

The Secretary of the Department or his designee will make the final decision on this draft Permit be publicly available, and will notify the Applicants by certified mail. The Secretary's decision shall constitute a final agency decision and may be appealed as provided by the HWA.

ARRANGEMENTS FOR PERSONS WITH DISABILITIES

Persons having a disability and requiring assistance or auxiliary aid to participate in this process should contact Judy Bentley at the New Mexico Environment Department, Human Resources Bureau, P.O. Box 5469, 1190 St. Francis Drive, Santa Fe, New Mexico, 87502, telephone number: (505) 827-9872. TDY users please access her number via the New Mexico Relay Network at 1-800-659-8331.

ADDITIONAL INFORMATION

Any person seeking additional information regarding this action, or who would like to arrange for review of the draft Permit, Fact Sheet, or the Administrative Record, may contact Mr. Steve Zappe at the Hazardous Waste Bureau, 2905 Rodeo Park Drive East, Building 1, Santa Fe, New Mexico 87505, (505) 476-6000. A copy of the draft Permit, Fact Sheet, the index to the Administrative Record, and this Public Notice are also available on the Department website at: www.nmenv.state.nm.us/wipp/index.html. The Department will provide copies, or portions thereof, of the Administrative Record at a cost to the requestor.

Waste Isolation Pilot Plant
Class 1 Permit Modification Notification

The U.S. Department of Energy and Washington TRU Solutions LLC hereby inform you of the following Class 1 Permit Modifications to the Waste Isolation Pilot Plant (WIPP) Hazardous Waste Facility Permit (HWFP), Permit Number: NM4890139088-TSDF.

The New Mexico Environment Department (NMED) was notified of the following Class 1 permit modifications on the dates indicated below. Summary of the changes follow.

March 17, 2010

- Modify Waste Isolation Pilot Plant South Access Road Information and Update Active Environmental Permits
- Modify the Fire Suppression System Description

June 7, 2010

- Revise Laboratory Accuracy Standards

WIPP PERMIT RENEWAL APPLICATION
INFORMATION AVAILABILITY

In order for the public to easily access information regarding the Waste Isolation Pilot Plant (WIPP) Hazardous Waste Facility Permit Renewal Application, the Department of Energy, Carlsbad Field Office and Washington TRU Solutions LLC, collectively referred to as the Applicants have made the following documents available:

- Applicants Permit Renewal Application
- Draft WIPP Permit Issued by the New Mexico Environment Department (NMED)
- Draft Permit Public Notices
- Draft Permit Fact Sheets
- Comments Submitted or Received on the Draft Permit
- Class 1 Modifications Submitted Since Renewal Application Submittal
- Class 2 Modifications Submitted Since Renewal Application Submittal
- Approval of Any Class 1 or 2 Modifications
- Information Sent to the Facility Mailing List Regarding the Draft Permit
- Link to the NMED WIPP Web Page
- Link to Request Documents

This information can be accessed through the following link:
http://www.wipp.energy.gov/library/rcrapermit/WIPP_Permit_Renewal.htm
For those that do not have computer access most public libraries offer free computer usage. There is generally no charge to use these computers. If you require hard copies of large documents there is a link which will allow you to request the documents you desire from the Applicants.

If you have questions or concern please contact Mr. Bobby St. John at (575) 234-7348.

Santa Fe, NM 87502

Subject: Record of Communication for March 26, 2010, Telephone Conversation

Dear Mr. Marshall:

The purpose of this letter is to document the content of a March 26, 2010 telephone conversation between you and members of the Waste Isolation Pilot Plant (WIPP) Project Staff. During this call, the WIPP Project Staff described the planned routine maintenance activities for the Salt Storage Extension Basin (SSEB)-I. This includes removing approximately three of the four feet of salt that has accumulated in the pond using heavy equipment and soil ramps constructed for access to the pond. The salt that is removed will be loaded into a dump truck and transported to the Salt Storage Extension Area where salt from current mining operations is disposed. Plans are to leave sufficient salt in the bottom of the SSEB-I to protect the liner from the heavy equipment. In the event that any damage to the liner occurs, the Department of Energy will implement the appropriate corrective actions in accordance with the discharge permit, DP-831.

Additionally, I wish to inform you that construction of the connection between the SSEB-I and SSEB-II was completed on April 1, 2010 and the pond was released for standard operations on April 5, 2010. This completes the construction of the SSEB-II and closes the corrective actions committed to in the document submitted to your office on May 28, 2009 entitled "Proposed Engineering Corrective Actions for Salt Contact Run-Off into the Salt Storage Extension."

If you have any questions or wish to discuss these activities, please feel free to contact me at (575) 234-8128.

Sincerely,

Daniel J. Ferguson

RE: Discharge Permit Modification, Waste Isolation Pilot Plant, DP-831, U.S. Department of Energy

Dear Mr. Moody:

The New Mexico Environment Department (NMED) issues the enclosed Discharge Permit Modification, DP-831 for the Waste Isolation Pilot Plant (WIPP) to the U.S. Department of Energy (DOE) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978§§74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Regulations, 20.6.2 NMAC.

The Discharge Permit Modification contains terms and conditions that shall be complied with by DOE and are enforceable by NMED pursuant to WQCC 20.6.2.3104, WQA, NMSA 1978 § 74-6-5 and §74-6-10. Issuance of this Discharge Permit Modification does not relieve the DOE of its responsibility to comply with the WQA, WQCC Regulations, or any other applicable federal, state and/or local laws and regulations, including zoning requirements and nuisance ordinances.

Pursuant to 20.6.2.3109.H.4 NMAC, this Discharge Permit Renewal and Modification shall expire on **September 9, 2013**, the same date as the current Discharge Permit Renewal and Modification. You must submit an application for renewal at least 120 days before the permit expiration date.

Sincerely,

William C. Olson, Chief
Ground Water Quality Bureau

GROUND WATER DISCHARGE PERMIT MODIFICATION
U.S. DEPARTMENT OF ENERGY, DP-831
WASTE ISOLATION PILOT PLANT
April 5, 2010

I. INTRODUCTION

The New Mexico Environment Department (NMED) issues this Discharge Permit Modification, DP-831, to the U.S. Department of Energy (DOE) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978 §§ 74-6-1 through 74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Regulations, 20.6.2 NMAC.

The NMED's purpose in issuing this Discharge Permit Modification, and in imposing the requirements and conditions specified herein, is to control the discharge of water contaminants from the Waste Isolation Pilot Plant (WIPP) that may move directly or indirectly into ground and surface water, so as to protect ground and surface water for present and potential future use as domestic and agricultural water supply and other uses; to abate pollution of ground and surface water; and to protect public health. In issuing this Discharge Permit, NMED has determined that the requirements of 20.6.2.3109.C NMAC have been met.

Facility Description

The WIPP is a hazardous and radioactive waste disposal facility operated by the U.S. Department of Energy (DOE). The WIPP is constructed in a bedded salt formation 2,150 feet below ground surface. DP-831 covers the discharge of domestic effluent, storm water and miscellaneous process waters to various lined impoundments at the facility.

Domestic wastewater from the facility and industrial wastewaters from two compressed air systems are discharged to seven synthetically lined facultative sewage lagoons (Facultative Lagoon System) that include Evaporation Ponds A, B and C; Polishing Ponds 1B and 2B; and Settling Ponds 1A and 2A. Brine, purge waters and miscellaneous non-hazardous process waters are discharged to the H-19 Evaporation Pond and Evaporation Ponds B and C of the Facultative Lagoon System. Storm water runoff at the facility is collected in the synthetically lined Storm Water Infiltration Control (SWIC) Ponds A, 1 and 2.

Salt and other subsurface materials mined during construction as well as currently mined salt are stored on the surface in three stockpiles. The stockpiles include the Salt Storage Extension (SSE) Cells A and B that are being used to store salt currently, or in the future, as it is mined out from the underground panels at the WIPP. Storm water runoff from the SSE is collected in the synthetically lined Salt Storage Extension Basin (SSEB) and will hereby be referred to in the future as Salt Storage Extension Basin I (SSEB-I). The existing Salt Pile that was previously used has been capped with a synthetic liner and earthen cover. Storm water runoff from the Salt Pile is collected in synthetically lined diversion ditches and diverted to the synthetically lined Salt Pile Evaporation Pond (SPEP). The Site and Preliminary and Design Validation (SPDV) material pile was constructed as the shafts were excavated when construction first began at the WIPP site. The SPDV material pile was closed in the year 2000 with a cover consisting of a geosynthetic liner installed on 6 inches of bedding material and covered with a minimum of two feet of earthen material.

Description of Permit Modification

The permit modification to DP-831 includes the expansion of the storm water runoff storage capacity from the SSE by constructing an additional storm water storage basin immediately west of SSEB-I, referred to as Salt Storage Extension Basin II (SSEB-II). The SSEB-II is synthetically double-lined with 60 mil high density polyethylene (HDPE) and a 200 mil geonet leak detection layer. The SSEB-II is connected by two overflow pipes from the SSEB-I, approximately two feet above the SSEB-I basin floor. The maximum operating capacity of the new basin with one foot of freeboard is 17,489,456 gallons (2,338,000 cubic feet).

Location of Discharge

The newly constructed SSEB-II is located approximately 26 miles east of Carlsbad in Section 20, T22S, R31E, Eddy County.

Quantity, Quality, and Flow Characteristics of the Discharge

The designed discharge rate of storm water runoff to the interconnected SSEB-I and SSEB-II is 2,752,831 gallons per day (368,000 cubic feet per day) based on a 25 year/24 hour storm event (3.90 inches). The intended maximum operating elevation for both basins is approximately 3414 feet above mean sea level (msl) providing an operating capacity of 9,851,845 gallons (1,317,000 cubic feet). The basins have a drainage area of approximately 26 acres which includes the surface area of the SSE Cells A and B, and the north section of the covered Salt Pile. The storm water comes in contact with mined salt stored in the cells resulting in a discharge with contaminant concentrations that may exceed water quality standards set forth in WQCC Regulations 20.6.2.3103 NMAC for chloride, sulfate and total dissolved solids.

Characteristics of Ground Water

Regional ground water beneath the WIPP site exists in the Culebra and Magenta Members of the Rustler Formation at approximate depths of 374 feet and 257 feet below ground level, respectively. Ground water also exists in the Dewey Lake Formation in the southwest portion of the WIPP site at well WQSP-6A, and as discontinuous lenses in the region beneath and surrounding the WIPP Site (16 Sections of the WIPP Land Withdrawal Area). Depth to ground water in the Dewey Lake Formation in well WQSP-6A is approximately 164 feet below ground surface and contains a total dissolved solids concentration of approximately 3,400 mg/L. A zone of shallow anthropogenic subsurface water (SSW) located underneath the WIPP facility at a depth of approximately 60-70 feet below ground surface has a TDS concentration ranging from approximately 1,500 to 255,000 mg/L.

General

The DOE's Discharge Plan consists of letters and documents submitted by WIPP to NMED dated November 19, 2009 and May 28, 2009. In addition, the discharge plan includes, in part, information and materials submitted as part of the original discharge plan approved on January 16, 1992, amended on August 28, 1995, renewed on July 3, 1997, amended on June 12, 1998, amended on January 24, 2000, renewed on April 29, 2003, modified on December 22, 2003, modified on December 29, 2006, and renewed and modified on September 9, 2008. The discharges at this facility approved in this Discharge Permit Modification shall be managed in accordance with the Discharge Permit Modification Application dated November 19, 2009 as conditioned by this Discharge Permit Modification.

Pursuant to 20.6.2.3109.E NMAC, NMED reserves the right to modify permit requirements in the event NMED determines that the requirements of 20.6.2 NMAC are being, or may be, violated or standards of 20.6.2.3103 NMAC are being, or may be, violated. This may include a determination by NMED that operational practices approved under this Discharge Plan are not protective of ground and surface water quality, and that a modification is necessary to protect water quality or abate water pollution. Permit modifications may include but are not limited to lining or relining impoundments, changing discharge locations, changing waste management practices, expanding monitoring requirements and/or implementing abatement of water pollution.

Issuance of this Discharge Permit Modification does not relieve the DOE of its responsibility to comply with all conditions or requirements of the WQA, WQCC Regulations, and any other applicable federal, state, and/or local laws and regulations such as zoning requirements and nuisance orders.

II. FINDINGS

In issuing this Discharge Permit Modification, NMED finds:

1. The DOE is discharging effluent or impacted water at the WIPP Facility so that such effluent may move directly or indirectly into ground water within the meaning of 20.6.2.3104 NMAC.

2. Ground water (located at well WQSP 6A) in the Southwest portion of the WIPP Land Withdrawal Area has an existing concentration of 10,000 milligrams per liter or less of total dissolved solids within the meaning of 20.6.2.3101.A NMAC.

3. The discharges at the WIPP Facility are not subject to any of the exemptions of 20.6.2.3105 NMAC.

4. The WIPP Facility is located at a place of withdrawal of water for present or reasonably foreseeable future use within the meaning of 20.6.2.3101A NMAC.

III. PERMIT CONDITIONS

In addition to the conditions specified in the September 9, 2008 Discharge Permit Renewal and Modification, the DOE shall comply with the following conditions, which shall be added to DP-831 and are enforceable by NMED.

Permitted Discharge Flow Rate

1. The DOE is permitted to collect storm water runoff from the Salt Storage Extension to the Salt Storage Extension Basin II (SSEB II) at a designed flow of 2,752,831 gallons per day based on a 25 year/24 hour storm event (3.90 inches). The basin capacity is 17,489,456 gallons (2,338,000 cubic feet) allowing for one foot of freeboard. The combined capacities of the SSEB I and SSEB II are 22,254,547 gallons (2,975,000 cubic feet) allowing for one foot of freeboard. [20.6.2.3109 NMAC]

Operation and Maintenance

2. The DOE shall properly operate and maintain the hydraulically connected SSEB I and SSEB II to store and evaporate the maximum daily discharge volume allowed by this Discharge Permit Modification while maintaining a minimum of one foot of freeboard at all times. In the event that a minimum of one foot of freeboard can not be maintained at all times, the DOE shall submit a corrective action plan to manage discharge volumes to the NMED for approval. [20.6.2.3109 NMAC]

Monitoring and Reporting

3. The DOE shall measure the water depth monthly to the nearest tenth of a foot (0.1 ft) in the SSEB II. The approximate volume of storm water shall be calculated annually consistent with Condition 10.a of the September 9, 2008 Discharge Permit Renewal and Modification. The water levels and volume calculations shall be reported to NMED as required in Condition 14 of the September 9, 2008 Discharge Permit Renewal and Modification. [20.6.2.3107 NMAC]

IV. GENERAL TERMS AND CONDITIONS

In addition to any other requirements provided by law, approval of this Discharge Permit Modification is subject to the General Requirements as specified in the Discharge Permit Renewal and Modification approved on September 9, 2008. Refer to the Discharge Permit, DP-831, for specific information on the following General Requirements

Monitoring and Reporting
Record Keeping
Inspection and Entry
Duty to Provide Information
Spills, Leaks and Other Unauthorized Discharges
Retention of Records
Enforcement
Modification and/or Amendments

Compliance with Other Laws

4. Nothing in this Discharge Permit shall be construed in any way as relieving the DOE of its obligation to comply with all applicable Federal, State, and local laws, regulations, permits, or orders. [74-5-5.K WQA]

Liability

5. The approval of this Discharge Permit does not relieve the DOE of liability should the operation result in actual pollution of surface or ground water which may be actionable under other laws and/or regulations. [20.6.2.1220 NMAC]

Right to Appeal

6. The DOE may file a petition for a hearing before the WQCC on this Discharge Permit. Such petition must be made in writing to the WQCC within thirty (30) days after the DOE receives this Discharge Permit. Unless a timely petition for a hearing is made, the decision of NMED shall be final. [74-6-5.N WQA]

Transfer

7. Prior to any transfer of ownership, control, or possession of the permitted facility or any portion thereof, The DOE shall notify the proposed transferee in writing of the existence of this Discharge Permit and include a copy of this Permit with the notice. The DOE shall deliver or send by certified mail to the NMED a copy of the notification and proof that such notification has been received by the proposed transferee. [20.6.2.3111 NMAC]

Term

8. The effective date of this Discharge Permit Modification is the date it is issued and signed by the Chief of the Ground Water Quality Bureau. The term of this Discharge Permit Modification is the same as the September 9, 2008 Discharge Permit Renewal and Modification and will automatically expire on September 9, 2013. To renew this Discharge Permit, the DOE must submit an application for renewal at least 120 days before that date. [74-6-5.H and 20.6.2.3109.H NMAC]

Subject: Response to the Administrative Completeness Determination and Applicants Public Notice Requirements for the Renewal and Modification of Discharge Plan 831

Dear Mr. Marshall:

The purpose of this letter is to provide proof of the completion of the public notice requirements for Discharge Permit 831 in accordance with your instructions dated December 31, 2009, and received January 7, 2010. The New Mexico Environmental Department (NMED) Public Notice Requirements require that within 15 days of the completion of the public notice requirements, the Permittee must submit proof of notice to NMED containing:

1. Affidavit regarding the sign posting and mailing
2. List of names and addresses to whom the public notice flyer was mailed
3. List of name and addresses of owners of discharge sites
4. Copy of the *Carlsbad Current Argus* newspaper ad
5. Public notice documentation

Therefore, enclosed are the items requested by NMED to document the public notice requirements.

If you have any questions or require additional information, please contact Daniel J. Ferguson at (575) 234-7018.

Sincerely,

David C. Moody

AFFIDAVIT OF PUBLIC NOTICE COMPLETION
New Permit or Permit Modification

DP-831

I certify, under penalty of law, that I have completed the actions below for the Ground Water Discharge Permit public notice.

I posted a sign for 30 days displaying a synopsis of the public notice in English and in Spanish at or near the proposed facility in a conspicuous public location (or multiple locations) approved by NMED.

I posted a public notice flyer at a conspicuous off-site location approved by NMED.

I placed a synopsis of the public notice in English and in Spanish in a newspaper approved by NMED. A copy of the newspaper page containing the synopsis is enclosed.

I sent the public notice flyer via 1st class mail to (*check box*):

- ✓ owners of all properties within a 1/3 mile of the boundary of the property of the proposed discharge locations-mailing list is enclosed.
- ☐ owners of all adjacent property (if applicant owns all property within 1/3 mile)-mailing list is enclosed.
- ☐ owner of the property of the proposed discharge locations (if applicant is not the owner)-mailing address is enclosed.

I am aware that there are significant penalties for false certification including the possibility of fines.

Subject: FW: SSEB-II Construction Schedule Status

Clint,

We wanted to keep you fully informed as to the construction of the new evaporation pond here at WIPP. All we lack is to install the culvert (pipe) between the new pond and the old pond and the project will be complete. As Parrish says in his email, the high winds here have been hindering the construction work. As soon as the wind dies down we should be able to finish everything up.

Because it doesn't look as though we will be finished by March 15, 2010, would it be allowable for us to keep working at this and notify you immediately as soon as the work is completed?

Sincerely,
Dan Ferguson, CBFO

Sent: Wednesday, March 10, 2010 1:02 PM
To: Ferguson, Daniel - DOE
Cc: Jones, Stewart
Subject: FW: SSEB-II Construction Schedule Status

Dan,

In accordance with our e-mail commitment in the February 18, 2010 e-mail below we need to advise Clint Marshall that it is quite unlikely that we will be able to complete installing the culvert to connect the SSEB-II to the SSEB-I by March 15, 2010. We plugged the drain pipe from the Salt Storage Extension Area to prevent water from the Salt Storage Extension Area entering the SSEB-I. However, water continues to drain from the salt accumulated in the SSEB-I into the area where the excavation will take place to install the culvert. High winds last week and this week have also slowed progress, since we do not want to disturb the liner in the SSEB-I when there is a potential for wind to get under the liner and create additional damage during the excavation and installation of the culvert.

We have several pumps in place to transfer water from the SSEB-I to the SSEB-II in the event of additional precipitation. The new pond is in place and functional. If Clint is in agreement, we propose to notify Clint when the Culvert is installed completing this project rather than continuing to project optimistic completion dates during the windy season.

Thanks

Parrish

To: Ferguson, Daniel - DOE
Subject: SSEB-II Construction Schedule Status

Clint,

The U.S. DOE submitted a schedule for the construction of the new Salt Storage Extension Basin II (SSEB-II) in a letter dated August 28, 2009. The schedule estimated completion by February 28, 2010, assuming no issues with the weather or contractor resources. Snow and rain events totaling 1.54 inches in late January resulted in a considerable delay completing the installation of the second liner. Water had to be removed from the SSEB-II and leak detection sump to complete the installation of the last section of top liner. Currently water is being pumped from the Salt Storage Extension Basin I (SSEB-I) with less than a foot of water remaining. We are planning to excavate and complete the culvert installation the week of February 22, 2010 and hope to be complete by February 28, 2010. However, water

The U.S. Department of Energy (DOE) Carlsbad Field Office and Washington TRU Solutions LLC hereby provide you with the following notice concerning the Waste Isolation Pilot Plant Hazardous Waste Facility Permit, Permit Number: NM4890139088-TSDF.

December 15, 2009 (Class 1)

This modification allows for

- Revision to clarify which fire-water tank is used first during a fire and revised the unit of pressure for the fire-water tank's rating from kilograms per square inch to kiloPascal.
- Revision of several procedure numbers.
- Updates the pre-fire survey figures.
- Removal of trailer 965 and the addition of new trailer 953.
- Updates and consolidates the on-site assembly areas to improve personnel accountability and new areas were delineated to ensure personnel are away from substantially affected areas.
- Revision of the title of the WWIS User's manual in Section B-4a(6), B-5a(1), B-9, B3-12b(4) and B3-16.
- Change in specific area codes to reflect the change from (505) to (575) for certain areas in the State of New Mexico and update a phone number for the Hobbs Fire Department.
- Updated emergency coordinator list in Table F-2.

December 23, 2009 (Class 1)

- This modification allows the installation of a bulkhead in a filled room for additional ventilation control, if required.

February 19, 2010 (Notice)

Mine Operations plans to begin mining of Panel 7 on or about April 5, 2010. The reason for starting mining at this time is based on a need date for Panel 7 of February 2012.

Mining will take approximately 14 months followed by outfitting and certification (6.5 months) and drilling remote-handled transuranic waste emplacement holes in Room 7 (2 months). Based on this anticipated schedule, mining, outfitting and certification of Panel 7 will be completed before the anticipated first waste emplacement date in the panel. Initial preparatory operations, scheduled to begin on or about March 29, 2010, may include ramp building, setting ventilation and probe hole drilling.

RE: Administrative Completeness Determination and Applicant's Public Notice Requirements, DP-831, Waste Isolation Pilot Plant

Dear Mr. Moody:

The New Mexico Environment Department (NMED) received a Ground Water Discharge Permit Application for the above referenced facility on November 24, 2009. Pursuant to Section 20.6.2.3108 NMAC of the New Mexico Water Quality Control Commission Regulations (20.6.2 NMAC), NMED determined on December 9, 2009 that your application is administratively complete.

Within 30 days of the date your application was deemed administratively complete, you must provide public notice as required by Section 20.6.2.3108 NMAC. Instructions and materials needed to complete the public notice are enclosed.

A technical reviewer will contact you within the next few months if additional information is needed to process your application. If you have a deadline of concern in the interim or any questions, please call the Ground Water Quality Bureau at (505) 827-2900.

Sincerely,

for William C. Olson, Chief
Ground Water Quality Bureau

enc: Instructions for Completing Public Notice Requirements
Affidavit
Public Notice Flyer
Text for Newspaper Display Ad
Public Notice Sign
Invoice ($15 fee for sign) if not attached, the invoice will be mailed separately

INSTRUCTIONS FOR COMPLETING PUBLIC NOTICE REQUIREMENTS

Discharge Permit DP- 831 ☐ New ☒ Modification ☐ Renewal & Modification

Within 30 days of the date NMED deemed your Discharge Permit application administratively complete, you must provide public notice as follows:

1. **Post sign(s) at the facility.**
   Enclosed is a sign 2 x 3 feet in size (or multiple signs if required) which must be posted **at or near the facility** in a conspicuous location approved by NMED. An invoice for the sign(s) is enclosed. NMED approves the following sign posting location(s):
   Facility entrance

2. **Post a public notice flyer off-site.**
   The enclosed public notice flyer which must be posted **off-site** at a location conspicuous to the public and approved by NMED. NMED approves the following flyer posting location:
   Carlsbad Public Library

3. **Mail a public notice flyer to property owners within 1/3 mile.**
   A copy of the enclosed public notice flyer must be sent by 1st class mail to the owners of record of all properties within 1/3 mile from the boundary of the property where the discharge site is located. If there are no properties within 1/3 mile other than properties owned by the applicant, then the flyer must be mailed to the owners of record of the nearest adjacent properties.

   The names and addresses of property owners can be obtained from the county tax assessor's office. The list of property owners' names and addresses must be submitted to NMED.

4. **Mail a public notice flyer to the owner of the discharge site.**
   A copy of the enclosed flyer must be sent via certified mail, return receipt requested, to the owner(s) of the discharge site(s), if the applicant is not the owner. The list of owners' names and addresses and the certified mail receipts must be submitted to NMED.

5. **Place a display ad in the newspaper.**
   A display ad 3 x 4 inches in size must be published for one day in a newspaper of general circulation in the location of the proposed discharge. The ad may **not** be placed in the classified or legal section. The text for the ad is enclosed. NMED approves publishing the ad in the following newspaper:
   Carlsbad Current Argus

PROOF OF NOTICE. Within 15 days of completing the above requirements, the applicant must submit the following items as proof of notice to NMED:

Affidavit regarding the sign posting and mailing (form enclosed).
List of names and addresses to whom the public notice flyer was mailed.
List of names and addresses of owners of discharge sites.
Certified mail receipts for mailing to discharge site owner(s), if required.
Copy of newspaper ad.

Send to NMED Ground Water Quality Bureau, PO Box 5469, Santa Fe, NM 87502.

PUBLIC NOTICE

Discharge Permit Application

Waste Isolation Pilot Plant, DP-831

DP-831, Waste Isolation Pilot Plant, David Moody, Manager, proposes to modify the Discharge Permit for the discharge of up to 2,752,831 gallons per day of salt contaminated storm water to a synthetically lined impoundment. Potential contaminants from this type of discharge include total dissolved solids, chloride and sulfate. The facility is located approximately 33 miles East/Southeast of Carlsbad, in Sections 20, 21, 28, and 29, T22S, R31E, Eddy County. Ground water beneath the site is at a depth of approximately 164 feet and has a total dissolved solids concentration of approximately 3,400 milligrams per liter.

The applicant is seeking a Discharge Permit for the proposed discharge. Provided the applicant has met applicable requirements, the New Mexico Environment Department (NMED) will propose a Discharge Permit containing limitations, monitoring requirements, and other conditions intended to protect ground water quality for present and potential future use. Information in this public notice was provided by the applicant and will be verified by the New Mexico Environment Department during the permit application review process. NMED will accept comments and statements of interest regarding the application and will create a facility specific mailing list for persons who wish to receive future notices.

You may send comments or statements of interest to:

Clint Marshall, DP-831
Ground Water Quality Bureau
PO Box 5469

RE: Temporary Permission to Discharge Impacted Storm Water to the Salt Storage Extension Basin II, DP-831, U.S. Department of Energy Waste Isolation Pilot Plant

Dear Mr. Moody:

The New Mexico Environment Department has reviewed the request, dated January 14, 2010, from the U.S. Department of Energy (DOE) for temporary permission to discharge up to 2,752,831 gallons per day of impacted storm water to the newly constructed Salt Storage Extension Basin II (SSEB-II) at the Waste Isolation Pilot Plant (WIPP). NMED is currently processing an application for a discharge permit modification dated November 19, 2009, which will incorporate the new pond into DP-831. The newly constructed SSEB-II is located approximately 26 miles east of Carlsbad in Section 20, T22S, R31E, Eddy County.

The purpose of constructing the SSEB-II is to expand the storm water runoff storage capacity from the Salt Storage Extension (SSE), a synthetically lined repository for mined salt brought up from the subsurface. The SSEB-II will add additional storage capacity currently provided by the previously constructed SSEB-I. The SSEB-II is synthetically double-lined with 60 mil high density polyethylene (HDPE) and a 200 mil geonet leak detection layer. The SSEB-II is connected by two overflow pipes from the SSEB-I, approximately two feet above the SSEB-I basin floor. Temporary Permission is being requested in order to transfer water currently in SSEB-I to SSEB-II so that the piping between the two ponds can be completed.

Temporary permission to discharge is hereby granted for 120 days from the date discharge commences, pursuant to Section 20.6.2.3106.B NMAC of the New Mexico Water Quality Control Commission (WQCC) Regulations. This approval is contingent on your discharging and reporting as described in your request.

Please be advised that this temporary permission to discharge is for 120 days from the date discharge commences. You will not be authorized to discharge after this temporary permission expires without an approved permit.

This approval does not relieve you of your responsibility to comply with any other applicable federal, state, and/or local laws and regulations, such as zoning requirements and nuisance ordinances. Also, this approval does not relieve you of liability should your operation result in actual pollution of surface or ground waters.

If you have any questions, please contact Clint Marshall of the Mining Environmental Compliance Section at 505-827-0027.

Sincerely,

for:

William C. Olson, Chief
Ground Water Quality Bureau

Fact Sheet

January 12, 2010

DOE Proposes Modification To Hazardous Waste Facility Permit

Changes to WIPP Hazardous Waste Facility Permit

Background The U.S. Department of Energy Carlsbad Field Office (DOE) and Washington TRU Solutions LLC (WTS) submitted three proposed Class 2 permit modification requests to the New Mexico Environment Department (NMED) to change the Waste Isolation Pilot Plant (WIPP) Hazardous Waste Facility Permit (Permit). NMED issued WIPP's Permit (Permit Number: NM4890139088-TSDF) in October 1999.

What is Proposed? The purpose of the proposed modifications, submitted to NMED on January 7, 2010, is to clarify language in the permit. Modification is requested for the following items:

1. Clarify language regarding the liquid prohibition in the Permit.
2. Clarify language regarding the use of the visual examination method to characterize waste
3. Clarify the requirements regarding nonconformance reports.

The first modification request clarifies Permit language related to the amount of liquids acceptable in containers for disposal at the WIPP facility. Specifically, the modification proposes four items:

1. Change the liquid prohibition and clarify the associated language.
   a. Retain an overall one percent liquid limit for each waste container.
   b. Define the acceptable amount of liquid for small internal containers.
   c. Prohibit overpacking and redistribution of untreated liquid as a means to comply with the liquid limit.

2. Define or clarify the following terms that are associated with the implementation of the liquid prohibition:
   a. Observable liquid
   b. Internal container
   c. Payload container
   d. Inner container

PUBLIC INFORMATION MEETINGS

On Three Proposed Modifications to the Hazardous Waste Facility Permit for the Waste Isolation Pilot Plant

WHO: U.S. Department of Energy (DOE) Carlsbad Field Office and Washington TRU Solutions LLC (WTS).

WHAT: DOE and WTS will conduct public meetings to provide information on the following requested permit modifications to the WIPP Hazardous Waste Facility Permit (Permit). There will be a 60-day public comment period beginning on January 13, 2010.

WHEN:	Tuesday, February 23, 2010 5 – 6 p.m.	Thursday, February 25, 2010 2 – 4 p.m. & 6 – 8 p.m.
WHERE:	Skeen-Whitlock Building 4021 National Parks Highway Carlsbad, New Mexico	Courtyard by Marriott 3347 Cerrillos Road Santa Fe, New Mexico

WHY: On January 7, 2010, DOE submitted three Class 2 permit modification requests to the New Mexico Environment Department (NMED).

1. The first proposed modification request is to clarify language regarding the liquid prohibition in the Permit.
2. The second proposed modification request is to clarify the use of the visual examination method to characterize waste.
3. The third proposed modification request is to clarify requirements regarding nonconformance reports.

HOW: To obtain additional information about this permit modification request, contact Mr. Bobby St. John, WTS, at 1-800-336-9477. The permit modification is also available on the WIPP web site at http://www.wipp.energy.gov and at the WIPP Information Center, Skeen-Whitlock Building, 4021 National Parks Highway, Carlsbad, N.M. A copy of the requested permit modification also may be obtained from NMED at the address listed below.

COMMENTS: Written comments for the record must be sent to the NMED contact person at the address below and received no later than 5 p.m. on March 15, 2010:

Mr. Steve Zappe
New Mexico Environment Department
2905 Rodeo Park Drive East, Building 1
Santa Fe, N.M. 87505
Phone: 505-476-6051
Fax: 505-476-6060
E-mail: steve.zappe@state.nm.us

The Permittees' compliance history during the life of the permit being modified is available from Mr. Steve Zappe at the New Mexico Environment Department.

QUESTIONS: Any questions or comments to the Permitees regarding this permit modification may be sent to Mr. Bobby St. John, P.O. Box 2078, Carlsbad, N.M. 88221, no later than March 1, 2010.

Santa Fe, NM 87502

Subject: Request for Temporary Authorization to Discharge to the New Salt Storage Extension Evaporation Basin II

Dear Mr. Marshall:

The purpose of this letter is to request a temporary authorization to discharge to the new Salt Storage Extension Basin II (SSEB-II) for up to 120-days in accordance with 20.6.2.3106.B. NMAC. A discharge permit modification application was submitted to the Ground Water Quality Bureau on November 19, 2009 for the construction of the SSEB-II immediately west of the existing SSEB-I, to receive evaporate run-off from the Salt Storage Extension Area.

It is necessary to pump water from the existing SSEB-I to the SSEB-II in order to complete the piping installation that connects the two ponds. As discussed in the May 28, 2009 proposed engineering specifications for the new pond approved by the GWQB in a letter dated July 15, 2009, the two ponds will be hydraulically connected, and the discharge from the SSEB-I to the SSEB-II will be based on gravity flow.

The current construction schedule targets January 18, 2010 to begin transfer of water from the SSEB-I to SSEB-II, and to initiate the piping connection between the two ponds. Therefore, this is the requested date to begin the 120-day Temporary Authorization.

If you have any questions or wish to discuss this request for a Temporary Authorization, please contact me at 575-234-8128.

Sincerely,

Daniel J. Ferguson

BY:

Subject: Transmittal of Discharge Permit 831 Modification Application

Dear Mr. Olson:

Enclosed are three copies of the Discharge Permit 831 (DP-831) Modification for the construction of a new evaporation pond to receive run-off from the Salt Storage Extension Area at the Waste Isolation Pilot Plant located in Eddy County, New Mexico and the $100 filing fee. The design and specifications for the new evaporation pond were submitted to the Ground Water Quality Bureau (GWQB) in correspondence dated May 28, 2009, and approved by the GWQB in a letter dated July 15, 2009. Accordingly, this modification references that document for plans and specifications.

If the Discharge Permit Modification is not able to be issued by the time the construction of the new evaporation pond is complete, DOE will request a temporary authorization to discharge to the new pond for up to 120 days in accordance with 20.6.2.3106.B. NMAC. When completed, the new pond will be hydrologically connected to the existing Salt Storage Extension Basin permitted under DOE's existing Discharge Permit, DP-831. For this reason, DOE would appreciate the public notice process utilizing the option in 20.6.2.3108.J., combining the public notice procedures of Subsections E and H of 20.6.2.3108 NMAC.

If you have any questions or wish to discuss this application, please contact Mr. Dan Ferguson, Site Regulatory Specialist, at (575) 234-8128.

Sincerely,

David C. Moody

PART A: ADMINISTRATIVE COMPLETENESS
All Facilities

A-1. Facility Information. See Supplemental Instructions to determine what constitutes the "facility." The physical location of the facility must be provided. If the facility does not have an address, the location can be described by road intersections, mile posts, or landmarks, as appropriate.

Facility Name: Waste Isolation Pilot Plant (WIPP)

Former Names (if any):

Physical address/location (*mandatory*): Driving distance is 33 miles east-southeast of Carlsbad, NM. Driving east from Carlsbad on U.S. Highway 62/180 turn onto the WIPP access road (Louis Whitlock Rd.) just east of mile marker 64, proceed 12.5 miles to the facility.

County: Eddy

Mailing address: P.O. Box 3090
Carlsbad, NM 88221-3090

Contact person: Mr. Dan Ferguson

Title: Site Regulatory Specialist

Telephone number(s): 575-234-8128

Fax number: 575-234-7061 E-mail address: dan.ferguson@wipp.ws

A-2. Type of Discharge and Type of Facility. See Supplemental Instructions.

Type of discharge: ☐ Domestic ☐ Agricultural X Industrial ☐ Mining

Type of facility: The facility's primary mission is the disposal of defense generated transuranic (TRU) waste in a geologic repository constructed using conventional mining techniques. Domestic wastewater is treated in the sewage treatment system. Wastewater from industrial related activities is treated by evaporation in synthetically lined ponds. Stormwater run-off from one active Salt Pile and one HDPE capped Salt Pile is collected in evaporation ponds for evaporation. An older inactive salt pile, the Site and Preliminary Design Validation (SPDV) material pile was closed by grading and lining the pile with a geosynthetic liner and covering it with 2 feet of soil blended with rock and establishing native vegetation.

The purpose of this modification is to add an additional evaporation pond to increase the treatment capacity for storm water run-off from the Salt Storage Extension Area for evaporation.

A-3. Applicant Information. The applicant is the person or entity (e.g., corporation, partnership, organization, municipality, etc.) legally responsible for the discharge and for complying with the terms of the Discharge Permit. If the applicant is an entity, then the name and title of a contact person must be provided. This application must be signed by the applicant or contact person named here.

Applicant Name: U.S. Department of Energy, Carlsbad Field Office

Mailing address: P.O. Box 3090

	Carlsbad, New Mexico 88221-3090
Contact person	Mr. David C. Moody
Title	Manager
Telephone number(s)	575-234-7300
Fax number	575-234-7027 E-mail address dave.moody@wipp.ws

A-4. Consultant Information (if applicable). If the consultant is a company or organization, then the name and title of a contact person must be provided.

Consultant/Firm Name	NA
Mailing address	
Contact person	
Title	
Telephone number(s)	
Fax number	E-mail address

A-5. Permit Contact Information (if applicable). If someone other the applicant listed in Item A-3 or a consultant listed in Item A-4 is a primary contact for this application and/or facility, list here.

Permit Contact Name	Mr. Dan Ferguson
Title	Site Regulatory Specialist
Mailing address	P. O. Box 3090
	Carlsbad, NM 88221-3090
Telephone number(s)	575-234-8128
Fax number	575-234-7061 E-mail address dan.ferguson@wipp.ws

A-6. Ownership.

The applicant owns (check as appropriate): X the facility ☐ some discharge sites X all discharge sites

If other parties own the facility or any of the discharge sites, attach their names and contact information.

Not Applicable

A-7. Discharge Quantity.

Your Discharge Permit will specify a maximum discharge volume, which is typically expressed as the maximum number of gallons per day that may be treated and/or disposed of. Please indicate below the maximum discharge volume for your facility. You must show how it was determined in Part B of your application. For further explanation, see Supplemental Instructions for Part B.

Infiltration Control Ponds and Run-Off Volumes			
	Drainage Area	Run-off Volumes for Design basis 25-year/24 hour storm event (3.90 inches)	Pond Capacity
Salt Storage Extension and Salt Storage Extension Basins (SSEB-I and SSEB-II)	26 acres	368,000 cubic feet	1,317,000 cubic feet[1]

[1] The existing pond (SSEB-I) and the new pond (SSEB-II) are hydraulically connected and this capacity is the combined capacity of both ponds.

A-8. Processing, Treatment, Storage and Disposal System. Briefly describe how wastewater, sludge, etc. is processed, treated, stored, and/or disposed of at your facility. See Supplemental Instructions for examples of system components.

The Salt Storage Extension Area and Salt Storage Extension Evaporation Basins

The Salt Storage Extension (SSE) is used to stockpile rock (primarily evaporites) excavated during the construction and maintenance of the underground geologic repository. The SSE was constructed with six inches of prepared subgrade, a 60-mil high density polyethylene (HDPE) liner, a 200-mil geonet drainage layer, an eight ounce geotextile fabric and covered with two feet of screened native soil. Each Cell slopes two percent toward the center which contains a collection trench and pipe for the conveyance of storm water run-off west to the SSEB-I. The SSEB-I is constructed with a prepared subgrade, a 60-mil HDPE liner, a 200-mil geonet cushion/drainage system, and a second 60-mil HDPE liner. The geonet leak detection layer drains to a sump with an inclined riser to allow for inspection and monitoring.

This modification is to add an additional pond to be constructed due west of the existing Salt Storage Extension Evaporation Basin (SSEB-I), and will be referred to as SSEB-II. When the level of water in the SSEB-I rises over approximately 2 feet deep, the water will flow into the SSEB-II for evaporation. The SSEB-II will be constructed with a prepared subgrade, a 60-mil HDPE liner, a 200-mil geonet cushion/drainage system, a second 60-mil HDPE liner, and a leak detection sump.

Sediment removed from the SSEB-I or SSEB-II is returned to the original SSE Area stockpile and will ultimately be dispositioned in accordance with the Closure Plan, Part B-18 of the December 20, 2007 Discharge Permit Renewal and Modification Application.

A-9. Discharge Locations. List the locations of your facility and of all components of your processing, treatment, storage and/or disposal system. Examples of components include septic tanks, lagoons, leachfields, irrigation sites, mine stockpiles, etc. Additional examples are listed in the Supplemental Instructions. Latitude and longitude are optional unless township, range and section are not available. .

Components	Township	Range	Section(s)	Latitude	Longitude
New Salt Storage Extension Basin (SSEB-II)	22S	31E	SE, NW, SE-20		

A-10. Discharge Quality.

Indicate the expected quality of the discharge -- wastewater, leachate, sludge, etc. -- generated, stored, treated, processed and/or discharged at your facility. List the contaminants of concern and the expected concentrations. *Not all facilities need to characterize influent quality.* See Supplemental Instructions for typical contaminants and additional guidance.

Expected or Known Contaminants	Expected or Known Contaminants Indicate units: mg/L, CFU/100 ml	
	Incoming (Influent)[1]	Final (Effluent)
Total Dissolved Solids (TDS)	250,000 mg/l	NA[2]
chlorides	223,00 mg/l	NA[2]
sulfate	11,000 mg/l	NA[2]

[1]Evaporation Ponds are a no discharge system
[2]High value from 2004 through 2006 Discharge Monitoring Reports

For new septic tank systems, you may either fill out the chart above or simply check one of the following options:

- ☐ typical domestic wastewater
- ☐ low-strength domestic wastewater (large gray water component; e.g., laundromat, spa, etc.)
- ☐ high-strength domestic wastewater (low water use; e.g., RV park, low-flow toilets at campground, etc.)

A-11. Ground Water Conditions.

All applicants must provide the depth to and pre-discharge TDS concentration of the ground water that could be affected by the discharge. Refer to Supplemental Instructions for details on how to obtain these values.

See the December 20, 2007 Discharge Permit Renewal and Modification Application

A-12. Public Notice. See Supplemental Instructions.

a) The public notice packet including instructions and materials should be sent to:

X Applicant ☐ Consultant ☐ Other: Dan Ferguson, P. O. Box 3090
Carlsbad, NM 88221-3090

b) Copies of the public notice packet (excluding sign) should be sent to:

X Applicant ☐ Consultant ☐ Other: Dan Ferguson, P. O. Box 3090
Carlsbad, NM 88221-3090

c) The applicant is required to provide public notice of this application by placing a display ad in a newspaper of general circulation near the location of the proposed discharge. Indicate newspaper you intend to place the ad in:

Newspaper: Carlsbad Current Argus

d) *For new or modification applications only:* The applicant must post a sign for 30 days in a conspicuous location at or near the facility, as approved by NMED. One sign must be posted for each 640 contiguous acres or less of the discharge site. An additional notice must be posted at an off-site location conspicuous to the public. Describe the locations below where you intend to post the notices. You may also attach sketches or photographs.

At or near facility: On the WIPP access road near the WIPP Site parking lot entrance
2 by 3 feet in size

Off-site location: Intersection of WIPP South Access Road and New Mexico Highway 128
flyer size Intersection of WIPP North Access Road and U.S. Highway 62/180

GROUND WATER DISCHARGE PERMIT APPLICATION
PART B: OPERATIONAL, MONITORING, CONTINGENCY AND CLOSURE PLANS
GENERAL FORM (VARIOUS FACILITY TYPES)

Operational Plan *[Section 20.6.2.3106.C, 3109.C NMAC]*

B-1. Source(s) of the Discharge. Describe what generates the wastewater, sludge or other discharges processed and/or disposed of at your facility. Identify all sources. Attach additional pages, if needed. See Supplemental Instructions.

See the December 20, 2007 Discharge Permit Renewal and Modification. The source of the discharge to the SSEB-II is precipitation that has been in contact with salt stored in the Salt Storage Extension.

B-2. Discharge Quantity. Describe the methods/calculations used to determine the maximum discharge volume listed in Item A-7 in Part A of your application. Attach additional pages, if needed. See Supplemental Instructions.

The discharge quantified in Part A, Section A-7 is a direct result of the quantity of precipitation received at the WIPP site. The SSEB-I was designed to contain and evaporate the average annual rainfall plus the 24 hour/25-25 year/24 hour storm event. Experience has indicated that one foot freeboard requirement can be exceeded in the SSEB-I by successive rainfall events over multiple days or weeks. The new pond provides approximately four acres of additional evaporative surface area at the design basis elevation of 3414 feet above sea level. The new pond in conjunction with the existing evaporation pond will provide the storage capacity for 1,317,000 cubic feet of water (approximately 3.5 times the 25-year/24 hour storm event). The new pond was sized based on a water balance evaluating three years of monthly average rainfall and estimating the evaporation rate of the saturated brines to be 70 percent of the evaporation rate of fresh water. One 25 year/24 hour rainfall event of 3.9 inches results in the accumulation of 368,000 cubic feet of water. Calculations are shown in the *Proposed Engineering Modifications and Schedule for Corrective Actions for Salt Contact Run-Off into the Salt Storage Extension* submitted May 28, 2009 and approved by the Ground Water Quality Bureau in a letter dated July 15, 2009.

B-3. Site Map. Attach a site map showing the components of your proposed system and relevant surrounding features, clearly labeled, such as:

- treatment units
- lagoons
- tanks
- sumps
- manure separators
- land application fields
- domestic wastewater reuse areas
- pits
- stockpiles
- leachfields
- sludge drying beds
- roads
- buildings
- supply wells
- monitoring wells
- extraction/injection wells
- arroyos
- nearby water bodies such as ponds or canals
- property boundaries
- other permitted discharges
- required setbacks
- north arrow

If map is not to scale, mark distances on the map.

X Site map is included in the *Proposed Engineering Modifications and Schedule for Corrective Actions for Salt Contact Run-Off into the Salt Storage Extension* submitted May 28, 2009. Attachment I is drawing 23-Z-014-W1, Salt Pile Infiltration Controls New SSE Evaporation Pond Site Plan. This drawing illustrates the Salt Storage Extension, SSEB-I and SSEB-II. See the December 20, 2007 Discharge Permit Renewal and Modification for other existing discharge facilities covered under the September 9, 2008 Discharge Permit DP-831 for the WIPP Site.

B-4. Flood Protection. Describe the methods used to prevent flooding and run-off at the facility (tank protection, berms, diversion channels, etc.)

The WIPP Site is within the Pecos River Basin. There are no perennial streams at the WIPP site. At its nearest point, the Pecos River is about 12 miles southwest of the WIPP site boundary. The maximum recorded flood on the Pecos River occurred on August 23, 1966 at an elevation of about 2,938 feet above mean sea level. The Surface elevation at WIPP is over 500 feet above the river bed and approximately 470 feet above the elevation of this maximum historical flood elevation. The potential for flash flooding is considered minimal because of the high percolation rate of the surrounding sand dunes and protection from flash floods by probable maximum precipitation events is provided by a system of peripheral interceptor berms and dikes.[1] The Salt Storage Area and Salt Storage Extension Area are within these peripheral berms.

1 Final No-Migration Variance Petition, June 14, 1996, DOE/CAO-96-2160

B-5. Plans and Specifications. For new facilities and for new components of existing systems, attach plans and specifications certified by a New Mexico registered professional engineer. *[Section 20.6.2.1202 NMAC]*

☐ Not applicable because no new facilities are proposed.

☐ Plans and specifications are attached.

X Plans and specifications were previously submitted. Submittal date(s): May 28, 2009

B-6. Description of Components. Provide descriptive details of all components of your processing, treatment, storage and/or disposal system. Include all components listed under Item A-8 in Part A.

Component	Construction Material	Volumetric Capacity/Area
Salt Storage Area Cell A and Cell B	60 mil HDPE 200-mil Geonet drainage layer 2-feet of native soil cover	Cell A: 6.2 acres Cell B: 5.2 acres Total:11.4 acres
Salt Storage Extension Basin (SSEB-I)	Double lined with 60-mil HDPE with a 200 mil geonet leak detection layer and sump	637,000 cubic feet
Salt Storage Extension Basin II (SSEB-II)	Double lined with 60-mil HDPE with a 200 mil geonet leak detection layer and sump	2,338,000 cubic feet

B-7. Operational Plan. Attach a detailed description of how you operate your processing, treatment, storage and/or disposal system.

Animal feeding operations: include stormwater management, nutrient management plans, method for mixing irrigation and wastewater.

Domestic wastewater treatment facilities: include pre-treatment, solids management, vegetation management for land application.

Facilities using reclaimed domestic wastewater above ground: include proposed water quality classification(s), effluent monitoring, setbacks, irrigation schedules, etc. that will result in protection of public health and the environment. Please refer to *NMED Ground Water Quality Bureau Guidance: Above-Ground Use of Reclaimed*

Domestic Wastewater for further information. A copy of the guidance document is available on the NMED website www.nmenv.state.nm.us under "Ground Water Quality".

X Operational plan is attached, see below.

☐ Operational plan was previously submitted. Submittal date(s): ____________________

The Salt Storage Extension consists of Cells A and B. Each cell was constructed with 6-inches of soil, a 60-mil HDPE liner, 200-mil geonet, and covered with two feet of screened native soil. Each Cell slopes two percent toward the center which contains a six inch perforated pipe for the collection of storm water which is diverted west by down gradient flow to the Salt Storage Extension Evaporation Basin. The Salt Storage Extension Evaporation Basin is constructed with a 60-mil HDPE liner, a 200-mil geonet, and a second HDPE liner. The geonet leak detection layer drains to a sump with an inclined riser for leak detection.

When water in the SSEB-I reaches an elevation of 3414 feet above sea level, it enters a pair of twelve inch diameter pipes which drains into the SSEB-II. The SSEB-II has a sloped bottom from 3409 feet above sea level on the east to 3404 feet above sea level on the west. See Attachment IV of the *Proposed Engineering Modifications and Schedule for Corrective Actions for Salt Contact Run-Off into the Salt Storage Extension* submitted on May 28, 2009 for design calculations, a description of drainage areas, evaporation surface areas, SSEB-II storage capacities at various elevations, and a water mass balance demonstrating that the pond is sized to store and evaporate the annual average precipitation of 12.8 inches plus a 25-year 24-hour rain event of 3.9 inches.

Inspections are conducted at least monthly for damage or erosion and appropriate repairs are made. It may be necessary to install a pipe connecting the SSE to the SSEB-II, bypassing the SSEB-I if sediment should build up in the pond excessively.

B-8. System Maintenance. Attach a description of the operations and maintenance procedures which ensure that your processing, treatment and disposal system functions properly; e.g., inspections, pumping schedules, equipment maintenance, etc.

X O & M procedures are attached, See Below.

☐ O & M procedures were previously submitted. Submittal date(s): ____________________

The Salt Storage Area and associated evaporation ponds are designed as gravity flow systems. Inspection and maintenance of the liners are the primary operational controls. The Salt Storage Area, SSEB-I and SSEB-II are inspected monthly and following rainstorms (two inches or greater during a 24 hour period) for signs of erosion, damage to the liners, signs of burrowing animals, deep rooted plants that could damage the anchor trenches or other items that may need remediation. In the event of an unsatisfactory condition, appropriate corrective actions are initiated.

The system is designed such that, when necessary, the pipe that conveys water to the SSEB-I can be connected directly to the pipe that drains the SSEB-I into the SSEB-II. This would facilitate evaporating liquids from the SSEB-I and the removal of accumulated sediment from the SSEB-I. Similarly, the pipes that drain the SSEB-I into the SSEB-II could be capped to facilitate drying and cleaning out the SSEB-II if necessary.

B-9. Backflow Prevention. If wastewater is used for land application or irrigation, describe methods used to protect wells from contamination by wastewater backflow. For new facilities or new systems at an existing facility, only air gap or reduced pressure valve assemblies are acceptable methods.

a) Clearly describe and/or sketch the location of air gaps or devices and attach specifications.

NA

b) Describe how devices are maintained.

NA

B-10. Water Rights. Animal feeding operations which land apply wastewater must attach documentation of irrigation water rights for the proposed land application fields, sufficient to sustain the intended crop rotation.

☐ Water right documentation is attached.

X Not applicable.

B-11. Past Ground Water Monitoring Results. *This item applies only to existing facilities seeking renewal and/or modification of a Discharge Permit that required ground water monitoring.*

a) Attach a graph or a table showing all analytical results from ground water sampling at your facility. If preparing graphs, a separate graph should be developed for each constituent, except that nitrate and TKN may be shown on the same graph. Multiple wells may be shown on the same graph. See Supplemental Instructions for sample table and graph.

b) If the monitoring results indicate that ground water standards have been violated or that there is an upward trend approaching standards, attach a description of what actions you have taken or will take to address the elevated concentrations. Ground water standards are listed in Section 20.6.2.3103 NMAC. See the Supplemental Instructions for frequently referenced standards.

See Section B-11 of the December 20, 2007 Discharge Permit Renewal and Modification for ground water monitoring results and a description of actions taken to address elevated concentrations of constituents outlined in 20.6.2.3103 NMAC.

Monitoring Plan *[Section 20.6.2.3107.A NMAC]*

B-12. Discharge Volumes. Describe how and where the monthly discharge volume at your facility will be. For all measuring devices, provide type, location, and units of measure including multipliers (e.g., gallons, gallons x 100, acre-ft, etc.) See Supplemental Instructions. Attach additional pages, if necessary.

Discharge volumes are a direct function of the precipitation events, the surface area of the Salt Storage Extension drainage area and surface area of SSEB-I and SSEB-II. See Attachment IV of the *Proposed Engineering Modifications and Schedule for Corrective Actions for Salt Contact Run-Off into the Salt Storage Extension* for the Evaporation Pond Design Calculations and Water Mass Balance for sizing the ponds.

B-13. Discharge Quality Monitoring. Discharge Permits typically require that the discharge (treated wastewater, sludge, septage, etc.) be sampled on a regular basis. The frequency of sampling varies by type of facility, as do the contaminants of concern. Domestic and agricultural Discharge Permits typically require sampling for total Kjeldahl nitrogen (TKN), nitrate-nitrogen (NO_3-N), total dissolved solids (TDS) and chloride on a quarterly or semi-annual basis. *(continued on next page)*

If reclaimed domestic wastewater will be discharged for above ground uses, testing of the discharge for additional parameters is appropriate. Please refer to the *NMED Ground Water Quality Bureau Guidance: Above-Ground Use of Reclaimed Domestic Wastewater* for further information.

In the space below, provide a description or sketch of the sampling point(s) to be used for sampling the discharge at your facility.

A grab sample of the homogenous saturated salt solution is collected from the SSEB-I or the SSEB-II depending on water levels and the safest most accessible location on one of the ponds using a sampling boom.

Optional: In the space below (or as an attachment), you may propose revisions or additions to the standard discharge quality monitoring requirements. If you do, provide the rationale for your proposal.

No additional discharge quality monitoring is proposed. The SSEB-I is sampled annually for TDS, chlorides and sulfates. The SSEB-II receives the same water that is discharged to the SSEB-I. One sample will be collected annually from either the SSEB-I or the SSEB-II and analyzed for TDS, chlorides and sulfates. The results will be presented in the semi-annual discharge monitoring report.

B-14. Ground Water Quality Monitoring. Discharge Permits typically require that ground water samples be collected quarterly from properly constructed monitoring wells located downgradient from discharge locations. The samples must be analyzed for contaminants of concern. For most domestic and agricultural Discharge Permits, the typical contaminants of concern are total Kjeldahl nitrogen (TKN), nitrate-nitrogen (NO_3-N), total dissolved solids (TDS) and chloride.

Optional: In the space below (or as an attachment), you may propose revisions or additions to the standard ground water monitoring requirements. If you do, provide the rationale for your proposal.

See the December 20, 2007 Discharge Permit Renewal and Modification.

For existing facilities:

Indicate number of existing monitoring wells: ________

Attach copies of monitoring well logs.

☐ Well logs attached. ☐ Well logs cannot be located.

☐ Well logs previously submitted. Submittal date(s): ________________

Attach copy of monitoring well survey (typically not applicable if fewer than 3 monitoring wells).

☐ Survey attached. ☐ No survey has been conducted.

☐ Survey previously submitted. Submittal date(s): ________________

B-15. Other Monitoring. In addition to discharge volumes, discharge quality monitoring and ground water sampling, Discharge Permits typically require the following monitoring, depending on the type of facility:

- inspection and pumping of septic tanks, grease tanks, lift stations
- inspection of leachfields
- inspection of lagoons
- process testing for treatment plants
- land application data sheets (LADS)
- tracking of chemical fertilizer applications to land application areas
- soil sampling (agricultural and selected other facilities land applying wastewater)
- harvested plant material testing (agricultural facilities)

Optional: In the space below (or as an attachment), you may propose revisions or additions to the other standard monitoring requirements for your type of facility. If you do, provide the rationale for your proposal.

See the December 20, 2007 Discharge Permit Renewal and Modification.

Contingency Plan *[Section 20.6.2.3107.A.10 NMAC]*

B-16. System Failure. Describe your contingency plan in the event there is a failure of your wastewater or discharge system (e.g., wastewater back-up, pump failure, pipe breaks, tank overflow, leachfield failure, saturated fields etc.)

See the December 20, 2007 Discharge Permit Renewal and Modification.

B-17. Contingency Leachfield Location. *This item applies only if your disposal system includes a leachfield.* Identify a location on your site map (Item B-3) for a contingency leachfield in the event that your leachfield must be replaced. If no land is available for a contingency leachfield at an existing facility, describe how you will address a failed leachfield. New facilities must provide for a contingency leachfield location.

NA

B-18. Other Contingencies. Discharge Permits typically contain standard contingencies to address:

- exceeding wastewater quality limits
- violation of ground water or surface water standards
- spills or illegal releases of wastewater
- migration of soil nitrogen
- loading nitrogen above limit

Propose additional contingency plans, if appropriate:

See the December 20, 2007 Discharge Permit Renewal and Modification.

__Closure Plan__ [Section 20.6.2.3107(A)11 NMAC]

B-18. Facility Closure and Post-Closure Monitoring. Discharge Permits contain standard requirements to address the closure of part or all of your discharge system, as follows:

- cap or plug lines to prevent the flow of wastewater to treatment or disposal system
- empty and remove or backfill tanks
- empty lagoons, perforate or remove liners, re-grade to surface topography
- appropriately dispose of solids
- regrade and cover stockpiles at mine facilities
- continue ground water monitoring for at least two years, longer as appropriate
- enact contingency plans if ground water standards are violated
- financial assurance may be required.

Propose additional closure plans in the space below or as an attachment, if appropriate:

See the December 20, 2007 Discharge Permit Renewal and Modification. Closure of the SSEB-II will be consistent with the other evaporation ponds covered by DP-831. The plan includes the pumping or evaporation of the wastewater in the ponds, removal of solids, and recontouring and revegetation of the site. In addition, basin liners will be removed or perforated upon closure of the site. This will be performed to comply with Section 20.6.2.3107.A.11 NMAC.

	☐ teleconference	
	☐ other:	

Subject: Exceedance of Freeboard in Impoundment Due to Rainfall Event

Discussion:

Stewart Jones left a message saying that one impoundment exceeded its one foot freeboard limit and that they will be transferring wastewater to an adjacent impoundment that has enough excess volume to receive it.

John Hall called and left Stewart Jones a message saying that if they have problems restoring the freeboard within 72 hours, they will need to submit a short term corrective action plan and that he should call me if necessary.

Conclusions:

No further actions.

Subject: TRANSMITTAL OF THE WASTE ISOLATION PILOT PLANT GROUND WATER DISCHARGE PERMIT 831 FEE

Dear Ms. Pruitt:

The purpose of this letter is to transmit check number 43198 for the amount of $12,650.00. This is for invoice identification number 123475 dated July 31, 2014, for the Ground Water Quality Bureau (GWQB) Discharge Permit 831.

This check is being submitted on behalf of the U.S. Department of Energy, Waste Isolation Pilot Plant, and is due to the GWQB by August 30, 2014. In addition to the check, a copy of the invoice is enclosed.

If you have any questions regarding this transmittal, please contact Mr. Bill Jaco at (575) 234-8177.

Sincerely,

R. R. Chavez, Manager
Regulatory Environmental Services

RE: Discharge Permit Renewal, DP-831, Waste Isolation Pilot Plant (WIPP)

Dear Mr. Franco:

The New Mexico Environment Department (NMED) issues the enclosed Discharge Permit Renewal, DP-831, to the Department of Energy (permittee) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978 §§74-6-1 through 74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Regulations, 20.6.2 NMAC.

The Discharge Permit contains terms and conditions that shall be complied with by the permittee and are enforceable by NMED pursuant to Section 20.6.2.3104 NMAC, WQA, NMSA 1978 §74-6-5 and §74-6-10. Please be aware that this Discharge Permit may contain conditions that require the permittee to implement operational, monitoring or closure actions by a specified deadline. Such conditions are listed at the beginning of the operational, monitoring and closure plans of this Discharge Permit.

Issuance of this Discharge Permit does not relieve the permittee of the responsibility to comply with the WQA, WQCC Regulations, and any other applicable federal, state and/or local laws and regulations, such as zoning requirements and nuisance ordinances.

Pursuant to Paragraph (4) of Subsection H of 20.6.2.3109 NMAC, the term of the Discharge Permit shall be five years from the effective date. The term of this Discharge Permit will end on July 29, 2019.

NMED requests that the permittee submit an application for renewal (or renewal and modification) at least 180 days prior to the date the Discharge Permit term ends.

An invoice for the Discharge Permit Fee of $12,650.00 is being sent under separate cover. Payment of the Discharge Permit Fee must be received by NMED within 30 days of the date the Discharge Permit is issued.

If you have any questions, please contact John Hall at (505) 827-1049. Thank you for your cooperation during this Discharge Permit review.

Sincerely,

Jerry Schoeppner, Chief
Ground Water Quality Bureau

GROUND WATER DISCHARGE PERMIT RENEWAL
Waste Isolation Pilot Plant (WIPP), DP-831

I. INTRODUCTION

The New Mexico Environment Department (NMED) issues this Discharge Permit Renewal (Discharge Permit), DP-831, to the U.S. Department of Energy (permittee) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978 §§74-6-1 through 74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Regulations, 20.6.2 NMAC.

NMED's purpose in issuing this Discharge Permit, and in imposing the requirements and conditions specified herein, is to control the discharge of water contaminants from the Waste Isolation Pilot Plant (WIPP) (facility) into ground and surface water, so as to protect ground and surface water for present and potential future use as domestic and agricultural water supply and other uses and protect public health. In issuing this Discharge Permit, NMED has determined that the requirements of Subsection C of 20.6.2.3109 NMAC have been or will be met. Pursuant to Section 20.6.2.3104 NMAC, it is the responsibility of the permittee to comply with the terms and conditions of this Discharge Permit; failure may result in an enforcement action(s) by NMED (20.6.2.1220 NMAC).

The activities which produce the discharge, the location of the discharge, and the quantity, quality and flow characteristics of the discharge are briefly described as follows:

Up to 23,000 gallons per day (gpd) of domestic wastewater is discharged to a synthetically lined impoundment system for disposal by evaporation. The system consists of seven synthetically-lined facultative sewage lagoons (Facultative Lagoon System) that include Settling Lagoons 1 and 2, Polishing Lagoons 1 and 2, and Effluent Lagoons A, B, and C. Industrial wastewater from two compressed air systems at the facility is also discharged to the Facultative Lagoon System. Brine, purge waters, and miscellaneous industrial non-hazardous wastewater are discharged to the Effluent Lagoons B and C of the Facultative Lagoon System. In addition, brine, purge waters, and miscellaneous industrial non-hazardous wastewater are discharged to a separate synthetically-lined impoundment for disposal by evaporation (Evaporation Pond H-19).

Salt and other subsurface materials mined during construction of the facility, as well as currently mined salt, are stored on the surface in three stockpiles. The stockpiles that are being used to store salt currently, or in the future, as it is mined out from the underground panels at the facility are Salt Cells 2 and 3. Up to 2,547,202 gpd of storm water runoff in contact with these salt stockpiles (based on a 24-hour, 25-year storm event - 3.9 inches) is collected in two double synthetically-lined storm water impoundments, each with a leak detection system (Salt Storage Ponds 2 and 3). The third salt stockpile (Salt Cell 1) is capped with a synthetic liner and earthen cover. Up to 1,677,633 gpd of storm water runoff in contact with this stockpile is collected in synthetically-lined diversion ditches and is diverted to a synthetically-lined impoundment (Salt Storage Pond 1).

Additional storm water runoff from the facility's paved areas and roofs is collected in three synthetically-lined impoundments (Storm Water Ponds 1, 2, and 3). This runoff is not in contact with the salt stockpiles at the facility.

The Site and Preliminary and Design Validation (SPDV) material pile was constructed as the shafts were excavated when construction first began at the WIPP site. The SPDV material pile was closed in the year 2000 with a cover consisting of a geosynthetic liner installed on 6 inches of bedding material and covered with a minimum of three feet of earthen material.

The discharge contains water contaminants which may be elevated above the standards of Section 20.6.2.3103 NMAC and/or the presence of toxic pollutants as defined in Subsection WW of 20.6.2.7 NMAC. The facility is located off of the Jal Highway, approximately 26 miles southeast of Carlsbad, in Sections 20, 28, and 29, Township 22 South, Range 31 East, Eddy County. Ground water most likely to be affected is at a depth of approximately 164 feet and has a total dissolved solids concentration of approximately 3,400 milligrams per liter.

The Discharge Permit sets forth separate requirements for the Facultative Lagoon System, the storage of storm water runoff in contact with salt stockpiles, and storm water runoff from the facility's paved and impermeable areas.

- Part A. Applicable to All Parts
- Part B. Applicable to the Facultative Lagoon System
- Part C. Applicable to the Evaporation Pond H-19 and Storm Water Impoundments Not in Contact with Salt Stockpiles (Storm Water Ponds 1, 2, and 3)
- Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2, and 3)

The original Discharge Permit was issued on January 16, 1992, amended on August 28, 1995, renewed on July 3, 1997, amended on June 12, 1998, amended on January 24, 2000, renewed on April 29, 2003, modified on December 22, 2003, modified again on December 29, 2006, and renewed and modified on July 23, 2008. The application (i.e., discharge plan) consists of the materials submitted by the permittee dated May 10, 2013 and materials contained in the administrative record prior to issuance of this Discharge Permit. The discharge shall be managed in accordance with all conditions and requirements of this Discharge Permit.

Pursuant to Section 20.6.2.3109 NMAC, NMED reserves the right to require a Discharge Permit Modification in the event NMED determines that the requirements of 20.6.2 NMAC are being or may be violated or the standards of Section 20.6.2.3103 NMAC are being or may be violated. This may include a determination that structural controls and/or management practices approved under this Discharge Permit are not protective of ground water quality, and that more stringent requirements to protect ground water quality may be required by NMED. The permittee may be required to implement abatement of water pollution and remediate ground water quality.

Issuance of this Discharge Permit does not relieve the permittee of the responsibility to comply with the WQA, WQCC Regulations, and any other applicable federal, state and/or local laws and regulations, such as zoning requirements and nuisance ordinances.

The following acronyms and abbreviations may be used in this Discharge Permit:

Abbreviation	Explanation
CFR	Code of Federal Regulations
Cl	Chloride
EPA	United States Environmental Protection Agency
gpd	gallons per day
mg/L	milligrams per liter
mL	Milliliters
NMAC	New Mexico Administrative Code
NMED	New Mexico Environment Department
NMSA	New Mexico Statutes Annotated
NO_3-N	nitrate-nitrogen
TDS	total dissolved solids
TKN	total Kjeldahl nitrogen
total nitrogen	= TKN + NO_3-N
SO_4	Sulfate
UPC	Uniform Plumbing Code
WQA	New Mexico Water Quality Act
WQCC	Water Quality Control Commission
WWTF	Wastewater Treatment Facility

II. FINDINGS

In issuing this Discharge Permit, NMED finds:

1. The permittee is discharging effluent or leachate from the facility so that such effluent or leachate may move directly or indirectly into ground water within the meaning of Section 20.6.2.3104 NMAC.

2. The permittee is discharging effluent or leachate from the facility so that such effluent or leachate may move into ground water of the State of New Mexico which has an existing concentration of 10,000 mg/L or less of TDS within the meaning of Subsection A of 20.6.2.3101 NMAC.

3. The discharge from the facility is not subject to any of the exemptions of Section 20.6.2.3105 NMAC.

III. AUTHORIZATION TO DISCHARGE

Pursuant to 20.6.2.3104 NMAC, it is the responsibility of the permittee to ensure that discharges authorized by this Discharge Permit are consistent with the terms and conditions herein.

The permittee is authorized to discharge up to 23,000 gpd of domestic wastewater to a synthetically-lined facultative impoundment system for disposal by evaporation. The permittee is also authorized to discharge up to 4,224,835 gpd of runoff in contact with salt stockpiles to three synthetically-lined impoundments for disposal by evaporation. The Facultative Lagoon System is permitted to accept non-hazardous industrial wastewater from two compressed air systems at the facility. Up to 50,000 gpd of brine, purge waters, and miscellaneous non-hazardous process waters are permitted to be discharged into Evaporation Ponds B and C of the Facultative Lagoon System, up to the capacity of the ponds with one foot of freeboard. Up to 50,000 gpd of brine, purge waters, and miscellaneous non-hazardous process waters are permitted to be discharged into to the Evaporation Pond H-19, up to the capacity of the pond with one foot of freeboard. The permittee is also authorized to collect storm water runoff from the facility's paved areas and

roofs in Storm Water Ponds 1, 2, and 3. This runoff is not in contact with the salt stockpiles at the facility.

[20.6.2.3104 NMAC, Subsection C of 20.6.2.3106 NMAC, Subsection C of 20.6.2.3109 NMAC]

IV. CONDITIONS

NMED issues this Discharge Permit for the discharge of water contaminants subject to the following conditions:

OPERATIONAL PLAN

Part A. Applicable to All Parts

#	Terms and Conditions
1.	The permittee shall implement the following operational plan to ensure compliance with Title 20, Chapter 6, Parts 1 and 2 NMAC. [Subsection C of 20.6.2.3109 NMAC]
2.	The permittee shall operate in a manner such that standards and requirements of Sections 20.6.2.3101 and 20.6.2.3103 NMAC are not violated. [20.6.2.3101 NMAC, 20.6.2.3103 NMAC, Subsection C of 20.6.2.3109 NMAC]
3.	The permittee shall maintain the impoundment liner(s) in such a manner as to avoid conditions which could affect the structural integrity of the impoundment(s) and/or impoundment liner(s). Such conditions include or may be characterized by the following: • erosion damage; • animal burrows or other damage; • the presence of vegetation including aquatic plants, weeds, woody shrubs or trees growing within five feet of the top inside edge of a sub-grade impoundment, within five feet of the toe of the outside berm of an above-grade impoundment, or within the impoundment itself; • the presence of large debris or large quantities of debris in the impoundment; • evidence of seepage; and • evidence of berm subsidence. Vegetation growing around the impoundment shall be routinely controlled by mechanical removal in a manner that is protective of the impoundment liner. The permittee shall visually inspect the impoundment(s) and surrounding berms on a monthly basis to ensure proper maintenance. In the event that inspection reveals any evidence of damage that threatens the structural integrity of an impoundment berm or liner, or that may result in an unauthorized discharge, the permittee shall enact the

#	Terms and Conditions
	contingency plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
4.	The permittee shall preserve a minimum of one foot of freeboard between the liquid level in the all impoundments and the elevation of the top of the impoundment liners. In the event that the permittee determines that one foot of freeboard cannot be preserved in any impoundment, the permittee shall enact the contingency plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

Part B. Applicable to the Facultative Lagoon System

#	Terms and Conditions
5.	The permittee shall maintain fences around the Facultative Lagoon System to control access by the general public and animals. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. Fences shall be maintained throughout the term of this Discharge Permit. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
6.	The permittee shall maintain signs indicating that the wastewater at the facility is not potable. Signs shall be posted at the Facultative Lagoon System's entrance and other areas where there is potential for public contact with wastewater. All signs shall be printed in English and Spanish remain visible and legible for the term of this Discharge Permit. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
7.	The permittee shall utilize operators, certified by the State of New Mexico at the appropriate level, to operate the wastewater collection, treatment and disposal systems. The operations and maintenance of all or any part of the wastewater system shall be performed by, or under the direct supervision of, a certified operator. [Subsection C of 20.6.2.3109 NMAC, 20.7.4 NMAC]
8.	The permittee shall measure the thickness of the sludge blanket in each pond of the Facultative Lagoon System ***once within the effective term*** of this Discharge Permit, but before the end of 2018. When sludge accumulation exceeds 1/3 of the total depth of any pond, the permittee shall remove the sludge in a manner, which is protective of the pond liner. Removed solids shall be contained, transported, and disposed of in accordance with all local, state, and federal regulations. The permittee shall maintain solids blanket measurements and solids disposal manifests for solids transported from the facility for

#	**Terms and Conditions**
	off-site disposal. The permittee shall submit all measurements and manifests to NMED in the semi-annual monitoring report immediately following the solids thickness measurement. [20.6.2.3109 NMAC, 20.6.2.3107 NMAC]

Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2 and 3)

#	**Terms and Conditions**
9.	The permittee shall measure the thickness of the solids blanket in each impoundment ***once within the effective term*** of this Discharge Permit, but before the end of 2018. Removed solids shall be contained, transported, and disposed of in accordance with all local, state, and federal regulations. The permittee shall maintain solids blanket measurements and solids disposal manifests for solids transported from the facility for off-site disposal. The permittee shall submit all measurements and manifests to NMED in the semi-annual monitoring report immediately following the solids thickness measurement. [20.6.2.3109 NMAC, 20.6.2.3107 NMAC]
10.	The permittee shall inspect the leak detection systems for Salt Storage Ponds 2 and 3 on a monthly basis for the presence of liquid. The permittee shall keep a log of the inspection findings and repairs made. The inspection log, including a statement whether or not liquids were observed in the leak detection systems, shall be submitted to NMED in the semi-annual monitoring reports. [20.6.2.3107 NMAC]
11.	The permittee shall conduct regular maintenance of the earthen cover on the Salt Cell 1 and the SPDV material pile. Inspections shall be conducted monthly and after storm events of 2 inches or greater in a 24-hour period to evaluate potential erosion and vegetation success of the cover. In the event of significant erosion or failure of vegetative success, the permittee shall provide a plan and schedule for repair within 90 days of discovery. General observations and cover repairs shall be reported to NMED. [20.6.2.3109 NMAC]

MONITORING AND REPORTING

Part A. Applicable to All Parts

#	**Terms and Conditions**
12.	The permittee shall conduct the following monitoring, reporting, and other requirements listed below in accordance with the monitoring requirements of this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
13.	METHODOLOGY – Unless otherwise approved in writing by NMED, the permittee shall conduct sampling and analysis in accordance with the most recent edition of the following documents: a) American Public Health Association, Standard Methods for the Examination of Water and Wastewater (18th, 19th or current) b) U.S. Environmental Protection Agency, Methods for Chemical Analysis of Water and Waste c) U.S. Geological Survey, Techniques for Water Resources Investigations of the U.S. Geological Survey d) American Society for Testing and Materials, Annual Book of ASTM Standards, Part 31. Water e) U.S. Geological Survey, et al., National Handbook of Recommended Methods for Water Data Acquisition f) Federal Register, latest methods published for monitoring pursuant to Resource Conservation and Recovery Act regulations g) Methods of Soil Analysis: Part 1. Physical and Mineralogical Methods; Part 2. Microbiological and Biochemical Properties; Part 3. Chemical Methods, American Society of Agronomy h) New Mexico Environment Department, Hazardous Waste Bureau Position Paper, *Use of Low-Flow and Other Non-Traditional Sampling Techniques for RCRA Compliant Groundwater Monitoring.* [Subsection B of 20.6.2.3107 NMAC]
14.	The permittee shall submit semi-annual monitoring reports to NMED for the most recently completed semi-annual period by the 1st of February and August each year. Semi-annual monitoring shall be performed during the following periods and submitted as follows: • January 1st through June 30th (first half) – **due by August 1st** • July 1st through December 31st (second half) – **due by February 1st** [Subsection A of 20.6.2.3107 NMAC]

Part B. Applicable to the Facultative Sewage Lagoon System

#	Terms and Conditions
15.	The volume of domestic influent discharged to the Facultative Lagoon System shall be measured ***monthly*** using a totalizing flow meter on the influent line to the system or the totalizing meter that measures total domestic water usage. Volumes of other authorized discharges to the Facultative Lagoon System shall be calculated by a time/volume method or volumetric measurement of the transport container(s). NMED may require comprehensive laboratory analyses of such wastewater prior to discharge when NMED determines that additional information is needed. Monthly meter readings, the units of measurement, monthly discharge volumes and other volumetric calculations for the previous 6-month period shall be submitted to NMED semi-annually in the monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
16.	The permittee shall collect a wastewater sample on a ***semi-annual*** basis (once every six months) from the influent to the Facultative Lagoon System. The grab sample shall be analyzed for TKN, NO_3-N, SO_4, TDS and Cl. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsections C and H of 20.6.2.3109 NMAC]

Part C. Applicable to the Evaporation Pond H-19 and Storm Water Impoundments Not in Contact with Salt Stockpiles (Storm Water Ponds 1, 2, and 3)

#	Terms and Conditions
17.	The volume and origin of all wastewater discharged to the Evaporation Pond H-19 that is derived from miscellaneous non-hazardous sources shall be measured ***monthly*** and reported to NMED. Discharge volumes to the Evaporation Pond H-19 shall be calculated by a time/volume method or volumetric measurement of the transport container(s). NMED may require comprehensive laboratory analyses of such wastewater prior to discharge when NMED determines that additional information is needed. Monthly discharge volumes and other volumetric calculations for the previous 6-month period shall be submitted to NMED semi-annually in the monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
18.	A sample shall be collected ***semi-annually*** from the Evaporation Pond H-19 and analyzed for SO_4, Cl, and TDS. Samples shall be collected ***annually*** after a significant storm event from each of the storm water ponds, Storm Water Ponds 1, 2, and 3 and analyzed for SO_4, Cl, and TDS. Samples shall be properly prepared, preserved, transported and

#	Terms and Conditions
	analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
19.	The water depth shall be measured ***monthly*** to the nearest tenth of a foot (0.1 ft) in the Storm Water Ponds 1, 2, and 3. The approximate volume of storm water shall be calculated and submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]

Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2 and 3)

#	Terms and Conditions
20.	A sample shall be collected ***annually*** after a significant storm event from each of the Salt Storage Cells 1, 2, and 3 and analyzed for SO_4, Cl, and TDS. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
21.	The water depth shall be measured monthly to the nearest tenth of a foot (0.1 ft) in the Salt Storage Ponds 1, 2, and 3. The approximate volume of storm water shall be calculated and submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]

GROUND WATER MONTIROING AND REPORTS

#	Terms and Conditions
22.	Depth to the water table shall be measured to the nearest hundredth of a foot (0.01 ft) ***quarterly*** in piezometers/monitoring wells: • PZ-1, PZ-2, PZ-3, PZ-4, PZ-5, PZ-6, PZ-7, PZ-8, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13,

#	Terms and Conditions
	PZ-14, and PZ-15 • C-2505, C-2506, C-2507, C-2811, and WQSP-6A [Subsection A of 20.6.2.3107 NMAC]
23.	The permittee shall perform ***semi-annual*** ground water sampling in the following piezometers/monitoring wells and analyze the samples for temperature, pH, specific conductance, SO_4, TDS, and Cl: • Piezometers: PZ-1, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, and PZ-13 • Monitoring Wells: C-2507, C-2811, and WQSP-6A Ground water sample collection, preservation, transport and analysis shall be performed according to the following procedure: a) Measure the depth-to-most-shallow ground water from the top of the well casing to the nearest hundredth of a foot. b) Purge three well volumes of water from the well prior to sample collection. c) Obtain samples from the well for analysis. d) Properly prepare, preserve and transport samples. e) Analyze samples in accordance with the methods authorized in this Discharge Permit. Depth-to-most-shallow ground water measurements, analytical results, including the laboratory QA/QC summary report, and a facility layout map showing the location and number of each well shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
24.	The permittee shall perform ***semi-annual*** ground water sampling from monitoring well WQSP-6A and analyzed for TKN and NO_3. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
25.	Hydrographs shall be submitted ***annually*** for all monitoring wells and piezometers covered under Condition 22 of this Discharge Permit. At a minimum, graphs shall include the previous five years of water level data, or for recently installed wells, all data since the well was installed. Data for several wells may be included on one graph.

#	Terms and Conditions
	[Subsection A of 20.6.2.3107 NMAC]
26.	A potentiometric map for facility area shall be submitted ***annually***. The map shall incorporate the most recent water level data for all monitoring wells and piezometers installed in the shallow subsurface water (SSW). [Subsection A of 20.6.2.3107 NMAC]
27.	A single table in a paper and electronic format (EXCEL spreadsheet) of water level measurements and water quality data with only those constituents analyzed and water levels measured during a single event shown in columns. Tabulated field measurements to include temperature, pH, and electrical conductivity corrected to 25 degrees Celsius. Monitoring sites shall be shown in rows. The second column shall contain the date of the sampling event. Values exceeding standards shall be bolded. Any constituent not analyzed for a particular site shall be shown as "NA", any site not sampled shall be shown as "NS" with an associated reason, and any site not measured for water levels shall be shown as "NM" with an associated reason. [Subsection A of 20.6.2.3107 NMAC]
28.	A single table that includes all available ground water data to date shall be submitted annually. For each monitoring well, the name of the well shall be entered in the far left column in a row by itself. Sampling events, beginning with the earliest event first, shall be entered in subsequent rows with the sampling date in the second column and the corresponding analytical data in columns further to the right. Each new sampling event shall be added as an additional row to the existing spreadsheet with the corresponding date of the sampling event noted in the second column next to the monitoring well name. [Subsection A of 20.6.2.3107 NMAC]

CONTINGENCY PLAN

#	Terms and Conditions
29.	In the event that ground water monitoring indicates that a ground water quality standard identified in Section 20.6.2.3103 NMAC is exceeded; the total nitrogen concentration in ground water is greater than 10 mg/L; or a toxic pollutant (defined in Subsection WW of 20.6.2.7 NMAC) is present in a ground water sample and in any subsequent ground water sample collected from a monitoring well required by this Discharge Permit, the permittee shall enact the following contingency plan: Within 60 days of the subsequent sample analysis date, the permittee shall propose measures to ensure that the exceedance of the standard or the presence of a toxic pollutant will be mitigated by submitting a corrective action plan to NMED for approval.

#	Terms and Conditions
	The corrective action plan shall include a description of the proposed actions to control the source and an associated completion schedule. The plan shall be enacted as approved by NMED. Once invoked (whether during the term of this Discharge Permit; or after the term of this Discharge Permit and prior to the completion of the Discharge Permit closure plan requirements), this condition shall apply until the permittee has fulfilled the requirements of this condition and ground water monitoring confirms for a minimum of two years of consecutive ground water sampling events that the standards of Section 20.6.2.3103 NMAC are not exceeded and toxic pollutants are not present in ground water. The permittee may be required to abate water pollution pursuant to Sections 20.6.2.4000 through 20.6.2.4115 NMAC, should the corrective action plan not result in compliance with the standards and requirements set forth in Section 20.6.2.4103 NMAC within 180 days of confirmed ground water contamination. [Subsection A of 20.6.2.3107 NMAC, Subsection E of 20.6.2.3109 NMAC]
30.	In the event that inspection findings reveal significant damage likely to affect the structural integrity of the lined impoundment(s) or its ability to contain contaminants, the permittee shall propose the repair or replacement of the impoundment liner(s) by submitting a corrective action plan to NMED for approval. The plan shall be submitted to NMED within 30 days after discovery by the permittee or following notification from NMED that significant liner damage is evident. The corrective action plan shall include a schedule for completion of corrective actions and the permittee shall initiate implementation of the plan following approval by NMED. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
31.	In the event that a minimum of one foot of freeboard cannot be preserved in the impoundment(s), the permittee shall take actions authorized by this Discharge Permit and all applicable local, state, and federal regulations to restore the required freeboard. In the event that one foot of freeboard cannot be restored within a period of 72 hours following discovery, the permittee shall propose actions to be immediately implemented to restore one foot of freeboard by submitting a short-term corrective action plan to NMED for approval. Examples of short-term corrective actions include: removing excess wastewater from the impoundment through pumping and hauling; or reducing the volume of liquid/wastewater discharged to the impoundment. The plan shall include a schedule for completion of corrective actions and shall be submitted within 15 days following the date when the one foot of freeboard limit was initially discovered. The permittee shall initiate implementation of the plan following approval by NMED. In the event that the short-term corrective actions failed to restore one foot of freeboard,

#	Terms and Conditions
	the permittee shall propose permanent corrective actions in a long-term corrective action plan submitted to NMED within 90 days following failure of the short-term corrective action plan. Examples include: the installation of an additional storage impoundment, or a significant/permanent reduction in the volume of liquid/wastewater discharged to the impoundment. The plan shall include a schedule for completion of corrective actions and implementation of the plan shall be initiated following approval by NMED. [Subsection A of 20.6.2.3107 NMAC]
32.	In the event that a release (commonly known as a "spill") occurs that is not authorized under this Discharge Permit, the permittee shall take measures to mitigate damage from the unauthorized discharge and initiate the notifications and corrective actions required in Section 20.6.2.1203 NMAC and summarized below. Within <u>24 hours</u> following discovery of the unauthorized discharge, the permittee shall verbally notify NMED and provide the following information: a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility. b) The name and address of the facility. c) The date, time, location, and duration of the unauthorized discharge. d) The source and cause of unauthorized discharge. e) A description of the unauthorized discharge, including its estimated chemical composition. f) The estimated volume of the unauthorized discharge. g) Any actions taken to mitigate immediate damage from the unauthorized discharge. Within <u>one week</u> following discovery of the unauthorized discharge, the permittee shall submit written notification to NMED with the information listed above and any pertinent updates. Within <u>15 days</u> following discovery of the unauthorized discharge, the permittee shall submit a corrective action report/plan to NMED describing any corrective actions taken and/or to be taken relative to the unauthorized discharge that includes the following: a) A description of proposed actions to mitigate damage from the unauthorized discharge. b) A description of proposed actions to prevent future unauthorized discharges of this nature. c) A schedule for completion of proposed actions. In the event that the unauthorized discharge causes or may with reasonable probability cause water pollution in excess of the standards and requirements of Section 20.6.2.4103 NMAC, and the water pollution will not be abated within 180 days after notice is required to be given pursuant to Paragraph (1) of Subsection A of 20.6.2.1203 NMAC, the permittee may be required to abate water pollution pursuant to Sections 20.6.2.4000

#	Terms and Conditions
	through 20.6.2.4115 NMAC. Nothing in this condition shall be construed as relieving the permittee of the obligation to comply with all requirements of Section 20.6.2.1203 NMAC. [20.6.2.1203 NMAC]
33.	In the event that NMED or the permittee identifies any failures of the discharge plan or this Discharge Permit not specifically noted herein, NMED may require the permittee to submit a corrective action plan and a schedule for completion of corrective actions to address the failure(s). Additionally, NMED may require a Discharge Permit modification to achieve compliance with 20.6.2 NMAC. [Subsection A of 20.6.2.3107 NMAC, Subsection E of 20.6.2.3109 NMAC]
34.	In the event of a pipeline break, pump failure, pond overflow or other system failure at the facility, discharged water shall be contained, pumped and transferred to area of the facility that impose minimal impacts to ground water quality. Failed components shall be repaired or replaced as soon as possible and no later than 72 hours from the time of failure. For good cause demonstrated, the permittee may request NMED approval of an extension of the schedule for the repair or replacement of a failed component. [20.6.2.3107A NMAC]

CLOSURE PLAN

Part A. Applicable to All Parts

#	Terms and Conditions
35.	The permittee shall close the facilities covered under this Discharge Permit in accordance with the closure plan in the March 4, 2005 discharge permit application, the closure plan in the WIPP Hazardous Waste Facility Permit (HWFP) dated November 1, 2012, and the WIPP Land Management Plan. [Subsection A of 20.6.2.3107 NMAC]
36.	The permittee shall continue ground water monitoring until the requirements of this condition have been met and ground water monitoring confirms for a minimum of two years of consecutive ground water sampling events that the standards of Section 20.6.2.3103 NMAC are not exceeded and toxic pollutants are not present in ground water. If monitoring results show that a ground water quality standard in Section 20.6.2.3103 NMAC is exceeded; the total nitrogen concentration in ground water is greater than 10

#	Terms and Conditions
	mg/L; or a toxic pollutant (defined in Subsection WW of 20.6.2.7 NMAC) is present in ground water, the permittee shall implement the contingency plan required by this Discharge Permit. Following notification from NMED that post-closure monitoring may cease, the permittee shall plug and abandon the monitoring well(s) in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011. [Subsection A of 20.6.2.3107 NMAC]

Part B. Applicable to the Facultative Sewage Lagoon System

#	Terms and Conditions
37.	In the event the Facultative Lagoon System is proposed to be permanently closed, upon ceasing discharging, the permittee shall perform the following closure measures: Within <u>60 days</u> of ceasing discharging to the Facultative Lagoon System impoundments(s), the line leading to the impoundment shall be plugged so that a discharge can no longer occur. Within <u>60 days</u> of ceasing discharging to the Facultative Lagoon System (impoundments), wastewater shall be drained or evaporated from the impoundment and any other wastewater system components and it shall be disposed of in accordance with all local, state, and federal regulations. Within <u>90 days</u> of ceasing discharging to the Facultative Lagoon System impoundment(s), the permittee shall submit a sludge removal and disposal plan to NMED for approval. The permittee shall initiate implementation of the plan within 30 days following approval by NMED. The sludge removal and disposal plan shall include the following: a) The estimated volume and dry weight of sludge to be removed and disposed, including measurements and calculations. b) Analytical results for samples of the sludge taken from the impoundment for TKN, NO_3-N, percent total solids, hazardous constituents, and any other parameters tested (reported in mg/kg, dry weight basis). c) The method(s) of sludge *removal* from the impoundment(s). d) The method(s) of *disposal* for all of the sludge (and its contents) removed from the impoundment(s). The method(s) shall comply with all local, state and federal regulations, including 40 CFR Part 503. *Note: A proposal that includes the surface disposal of sludge may be subject to Ground Water Discharge Permitting requirements pursuant to 20.6.2.3104 NMAC that are separate from the*

#	Terms and Conditions
	requirements of this Discharge Permit. e) A schedule for completion of sludge removal and disposal not to exceed two years from the date discharge to the impoundment(s) ceased. Within one year following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: a) Remove all lines leading to and from the Facultative Lagoon System impoundment(s), or permanently plug and abandon them in place. b) Remove or demolish any other wastewater system components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liner(s). d) Fill the impoundment(s) with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [Subsection A of 20.6.2.3107 NMAC, 40 CFR Part 503]

Part C. Applicable to the Evaporation Pond H-19 and Storm Water Impoundments Not in Contact with Salt Stockpiles (Storm Water Ponds 1, 2, and 3)

#	Terms and Conditions
38.	Upon cessation of operation, the permittee shall close the Evaporation Pond H-19 and Storm Water Ponds 1, 2, and 3. Remaining liquids in each impoundment shall be removed and/or evaporated. All sludge shall be sampled to determine if hazardous constituents exist and managed and/or disposed of in accordance with applicable regulations. Within one year following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: a) Remove or plug all piping and other ancillary components b) Remove or demolish any other components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liner(s). d) Fill the impoundment(s) with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [20.6.2.3107A(11) NMAC]

Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2 and 3)

#	Terms and Conditions
39.	Upon cessation of operation, all mined salt at the facility shall be removed from the site. The permittee is permitted to use the mined salt as backfill in shafts and as interior fill material in berms and permanent markers after closure. All mined salt remaining after backfilling and after construction of surface structures shall be removed from the site. The permittee shall submit a plan and schedule for salt tailings removal to NMED for approval within 120 days prior to the facility closure. The WIPP Land Management Plan reflects the Land Withdrawal Act's requirements for disposition of the salt. The WIPP's Hazardous Waste Facility Permit also addresses closure activities that include closure of the salt storage areas in accordance with the provisions of the WIPP Land Management Plan. The salt storage area will be reclaimed in the manner described in these documents. [20.6.2.3107A(11) NMAC]
40.	Upon cessation of operation, the permittee shall close Salt Storage Ponds 1, 2, and 3. Remaining liquids in each impoundment shall be removed and/or evaporated. All sludge shall be sampled to determine if hazardous constituents exist and managed and/or disposed of in accordance with applicable regulations. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: f) Remove or plug all piping and other ancillary components g) Remove or demolish any other components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. h) Perforate or remove the impoundment liner(s). i) Fill the impoundment(s) with suitable fill. j) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [20.6.2.3107A(11) NMAC]

E. GENERAL TERMS AND CONDITIONS

#	Terms and Conditions
41.	RECORD KEEPING - The permittee shall maintain a written record of the following information: a) Information and data used to complete the application for this Discharge Permit. b) Records of any releases (commonly known as "spills") not authorized under this Discharge Permit and reports submitted pursuant to 20.6.2.1203 NMAC.

#	Terms and Conditions
	c) Records of the operation, maintenance, and repair of all facilities/equipment used to treat, store or dispose of wastewater. d) Facility record drawings (plans and specifications) showing the actual construction of the facility and bear the seal and signature of a licensed New Mexico professional engineer. e) Copies of monitoring reports completed and/or submitted to NMED pursuant to this Discharge Permit. f) The volume of wastewater or other wastes discharged pursuant to this Discharge Permit. g) Ground water quality and wastewater quality data collected pursuant to this Discharge Permit. h) Copies of construction records (well log) for all ground water monitoring wells required to be sampled pursuant to this Discharge Permit. i) Records of the maintenance, repair, replacement or calibration of any monitoring equipment or flow measurement devices required by this Discharge Permit. j) Data and information related to field measurements, sampling, and analysis conducted pursuant to this Discharge Permit. The following information shall be recorded and shall be made available to NMED upon request: i) The dates, location and times of sampling or field measurements; ii) The name and job title of the individuals who performed each sample collection or field measurement; iii) The sample analysis date of each sample; iv) The name and address of the laboratory, and the name of the signatory authority for the laboratory analysis; v) The analytical technique or method used to analyze each sample or collect each field measurement; vi) The results of each analysis or field measurement, including raw data; vii) The results of any split, spiked, duplicate or repeat sample; and viii) A copy of the laboratory analysis chain-of-custody as well as a description of the quality assurance and quality control procedures used. The written record shall be maintained by the permittee at a location accessible during a facility inspection by NMED for a period of at least five years from the date of application, report, collection or measurement and shall be made available to the department upon request. [Subsections A and D of 20.6.2.3107 NMAC]
42.	INSPECTION and ENTRY – The permittee shall allow inspection by NMED of the facility and its operations which are subject to this Discharge Permit and the WQCC regulations. NMED may upon presentation of proper credentials, enter at reasonable times upon or through any premises in which a water contaminant source is located or in which are located any records required to be maintained by regulations of the federal government or the WQCC.

#	Terms and Conditions
	The permittee shall allow NMED to have access to and reproduce for their use any copy of the records, and to perform assessments, sampling or monitoring during an inspection for the purpose of evaluating compliance with this Discharge Permit and the WQCC regulations. Nothing in this Discharge Permit shall be construed as limiting in any way the inspection and entry authority of NMED under the WQA, the WQCC Regulations, or any other local, state or federal regulations. [Subsection D of 20.6.2.3107 NMAC, NMSA 1978, §§ 74-6-9.B and 74-6-9.E]
43.	DUTY to PROVIDE INFORMATION - The permittee shall, upon NMED's request, allow for NMED's inspection/duplication of records required by this Discharge Permit and/or furnish to NMED copies of such records. [Subsection D of 20.6.2.3107 NMAC]
44.	MODIFICATIONS and/or AMENDMENTS – In the event the permittee proposes a change to the facility or the facility's discharge that would result in a change in the volume discharged; the location of the discharge; or in the amount or character of water contaminants received, treated or discharged by the facility, the permittee shall notify NMED prior to implementing such changes. The permittee shall obtain approval (which may require modification of this Discharge Permit) by NMED prior to implementing such changes. [Subsection C of 20.6.2.3107 NMAC, Subsections E and G of 20.6.2.3109 NMAC]
45.	PLANS and SPECIFICATIONS – In the event the permittee is proposing to construct a wastewater system or change a process unit of an existing system such that the quantity or quality of the discharge will change substantially from that authorized by this Discharge Permit, the permittee shall submit construction plans and specifications to NMED for the proposed system or process unit prior to the commencement of construction. In the event the permittee implements changes to the wastewater system authorized by this Discharge Permit which result in only a minor effect on the character of the discharge, the permittee shall report such changes (including the submission of record drawings, where applicable) as of January 1 and June 30 of each year to NMED. [Subsections A and C of 20.6.2.1202 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
46.	CIVIL PENALTIES - Any violation of the requirements and conditions of this Discharge Permit, including any failure to allow NMED staff to enter and inspect records or facilities, or any refusal or failure to provide NMED with records or information, may

#	Terms and Conditions
	subject the permittee to a civil enforcement action. Pursuant to WQA 74-6-10(A) and (B), such action may include a compliance order requiring compliance immediately or in a specified time, assessing a civil penalty, modifying or terminating the Discharge Permit, or any combination of the foregoing; or an action in district court seeking injunctive relief, civil penalties, or both. Pursuant to WQA 74-6-10(C) and 74-6-10.1, civil penalties of up to $15,000 per day of noncompliance may be assessed for each violation of the WQA 74-6-5, the WQCC Regulations, or this Discharge Permit, and civil penalties of up to $10,000 per day of noncompliance may be assessed for each violation of any other provision of the WQA, or any regulation, standard, or order adopted pursuant to such other provision. In any action to enforce this Discharge Permit, the permittee waives any objection to the admissibility as evidence of any data generated pursuant to this Discharge Permit. [20.6.2.1220 NMAC, NMSA 1978, §§ 74-6-10 and 74-6-10.1]
47.	CRIMINAL PENALTIES – No person shall: 1) make any false material statement, representation, certification or omission of material fact in an application, record, report, plan or other document filed, submitted or required to be maintained under the WQA; 2) falsify, tamper with or render inaccurate any monitoring device, method or record required to be maintained under the WQA; or 3) fail to monitor, sample or report as required by a permit issued pursuant to a state or federal law or regulation. Any person who knowingly violates or knowingly causes or allows another person to violate the requirements of this condition is guilty of a fourth degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who is convicted of a second or subsequent violation of the requirements of this condition is guilty of a third degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who knowingly violates the requirements of this condition or knowingly causes another person to violate the requirements of this condition and thereby causes a substantial adverse environmental impact is guilty of a third degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who knowingly violates the requirements of this condition and knows at the time of the violation that he is creating a substantial danger of death or serious bodily injury to any other person is guilty of a second degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. [20.6.2.1220 NMAC, NMSA 1978, §§ 74-6-10.2.A through 74-6-10.2.F]
48.	COMPLIANCE with OTHER LAWS - Nothing in this Discharge Permit shall be construed in any way as relieving the permittee of the obligation to comply with all applicable federal, state, and local laws, regulations, permits or orders.

#	Terms and Conditions
	[NMSA 1978, § 74-6-5.L]
49.	RIGHT to APPEAL - The permittee may file a petition for review before the WQCC on this Discharge Permit. Such petition shall be in writing to the WQCC within thirty days of the receipt of postal notice of this Discharge Permit and shall include a statement of the issues to be raised and the relief sought. Unless a timely petition for review is made, the decision of NMED shall be final and not subject to judicial review. [20.6.2.3112 NMAC, NMSA 1978, § 74-6-5.O]
50.	TRANSFER of DISCHARGE PERMIT - Prior to the transfer of any ownership, control, or possession of this facility or any portion thereof, the permittee shall: 1) notify the proposed transferee in writing of the existence of this Discharge Permit; 2) include a copy of this Discharge Permit with the notice; and 3) deliver or send by certified mail to NMED a copy of the notification and proof that such notification has been received by the proposed transferee. Until both ownership and possession of the facility have been transferred to the transferee, the permittee shall continue to be responsible for any discharge from the facility. [20.6.2.3111 NMAC]
51.	PERMIT FEES - Payment of permit fees is due at the time of Discharge Permit approval. Permit fees shall be paid in a single payment or shall be paid in equal installments on a yearly basis over the term of the Discharge Permit. Single payments shall be remitted to NMED no later than 30 days after the Discharge Permit effective date. Initial installment payments shall be remitted to NMED no later than 30 days after the Discharge Permit effective date; subsequent installment payments shall be remitted to NMED no later than the anniversary of the Discharge Permit effective date. Permit fees are associated with <u>issuance</u> of this Discharge Permit. Nothing in this Discharge Permit shall be construed as relieving the permittee of the obligation to pay all permit fees assessed by NMED. A permittee that ceases discharging or does not commence discharging from the facility during the term of the Discharge Permit shall pay all permit fees assessed by NMED. An approved Discharge Permit shall be suspended or terminated if the facility fails to remit an installment payment by its due date. [Subsection F of 20.6.2.3114 NMAC, NMSA 1978, § 74-6-5.K]

V. PERMIT TERM & SIGNATURE

EFFECTIVE DATE: July 29, 2014
TERM ENDS: July 29, 2019

[Subsection H of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.I]

JERRY SCHOEPPNER
Chief, Ground Water Quality Bureau
New Mexico Environment Department

New Mexico Environment Department Ground Water Quality Bureau
Discharge Permit Summary

Facility Information

Facility Name	Waste Isolation Pilot Plant (WIPP)
Discharge Permit Number	DP-831
Legally Responsible Party	Jose Franco, Manager U.S. Department of Energy P.O. Box 3090 Carlsbad, NM 88221 (575) 234-7300

Treatment, Disposal and Site Information

Primary Waste Type	Domestic and Industrial
Facility Type	Federal Agency - U.S. Department of Energy

Evaporative Impoundment Locations

Domestic Wastewater

Type	Designation	Description & Comments
Settling Impoundment	Settling Lagoon 1	Formerly known as "Settling Pond 1A"; Primary treatment; Permitted 1 foot of freeboard.
Settling Impoundment	Settling Lagoon 2	Formerly known as "Settling Pond 2A"; Primary treatment; Permitted 1 foot of freeboard.
Polishing Impoundment	Polishing Lagoon 1	Formerly known as "Polishing Pond 1B"; Passive secondary treatment; Permitted 1 foot of freeboard.
Polishing Impoundment	Polishing Lagoon 2	Formerly known as "Polishing Pond 2B"; Passive secondary treatment; Permitted 1 foot of freeboard.
Evaporation Impoundment	Effluent Lagoon A	Formerly known as "Evaporation Pond A"; Effluent storage; Disposal by evaporation; Permitted 1 foot of freeboard.
Evaporation Impoundment	Effluent Lagoon B	Formerly known as "Evaporation Pond B"; Effluent storage; Disposal by evaporation; Permitted discharges are domestic waste, brine, purge waters, and miscellaneous industrial non-hazardous wastewater; Permitted 1 foot of freeboard.
Evaporation Impoundment	Effluent Lagoon C	Formerly known as "Evaporation Pond C"; Effluent Storage; Disposal by evaporation; Permitted discharges are domestic waste, brine, purge waters, and miscellaneous industrial non-hazardous wastewater; Permitted 1 foot of freeboard.

Storm Water Control

Type	Designation	Description & Comments
Storm Water Impoundment	Storm Water Pond 1	Formerly known as "Storm Water Intrusion Pond 1"; Receives clean non-contact storm water from paved areas, roofs, air conditioner condensate, and water from domestic water lines; Disposal by evaporation.

Storm Water Impoundment	Storm Water Pond 2	Formerly known as "Storm Water Intrusion Pond 2"; Receives clean non-contact storm after from the facilities paved areas, roofs, air conditioner condensate, and draining domestic water lines; Disposal by evaporation.
Storm Water Impoundment	Storm Water Pond 3	Formerly known as "Storm Water Intrusion Pond A"; Receives clean non-contact storm after from the facilities paved areas, roofs, air conditioner condensate, and draining domestic water lines; Disposal by evaporation.

Industrial Wastewater

Type	Designation	Description & Comments
Evaporation Impoundment	Evaporation Pond H-19	Permitted discharges are brine, purge waters, and miscellaneous industrial non-hazardous wastewater; 346, 085 gallons (with one foot of freeboard); Disposal by evaporation.
Evaporation Impoundment	Salt Storage Pond 1	Formerly known as "Salt Pile Evaporation Pond"; 1,677,633 gallons (with one foot freeboard); Disposal by evaporation
Evaporation Impoundment	Salt Storage Pond 2	Formerly known as "Salt Storage Extension Basin I"; Constructed using 60-mil HDPE liner, 200-mil geonet drainage layer, and a second 60-mil HDPE liner with a leak detection system;1,273,601 gallons (with one foot of freeboard); Disposal by evaporation.
Evaporation Impoundment	Salt Storage Pond 3	Formerly known as "Salt Storage Extension Basin II"; Constructed using 60-mil HDPE liner, 200-mil geonet drainage layer, and a second 60-mil HDPE liner with a leak detection system; 1,273,601 gallons (with one foot of freeboard); Disposal by evaporation.

Salt Storage Locations

Type	Designation	Description & Comments
Salt Pile	Salt Cell 1	Formerly known as "Salt Pile"; Inactive; Approximately 18.8 acres; graded to 2% slope covered with sand and 60 mil HDPE liner and with 2 ft. of native soil; Seeded; Run-off collects in to Salt Storage Pond 1.
Salt Pile	Salt Cell 2	Formerly known as "Salt Extension Cell A"; Active; 6.2 acres; Run-off area of 326,350 sq. ft.; Constructed using of six inch prepared subgrade, 60-mil HDPE liner, 200-mil drainage layer, eight oz. geotextile fabric covered with 2 ft. of native soil; Runoff collects in Storage Pond(s) 2 and/or 3.

Salt Pile	Salt Cell 3	Formerly known as "Salt Extension Cell B"; Active; 5.2 acres; run-off area of 272,850 sq. ft.; Constructed using of six inch prepared subgrade, 60-mil HDPE liner, 200-mil drainage layer, eight oz. geotextile fabric covered with 2 ft. of native soil; Runoff collects in Storage Pond(s) 2 and/or 3.
Salt Pile	Site Preliminary Design Validation Pile	Closed in 2000; Covered with a geosynthetic liner, 6 inches of bedding material, and three feet of soil; Seeded.

Flow Metering Locations

Type	Designation	Description & Comments
Totalizing Flow Meter	Ultrasonic Flow Meter	Located at the facility Pump House – water supply; Estimates domestic wastewater discharged to the facultative sewage impoundment system.
Primary Measurement Device	Time Recorder	Estimates miscellaneous wastewater discharged to Evaporation Pond H-19 and Facultative Lagoon System.

Ground Water Monitoring Locations

Type	Designation	Description & Comments
Monitoring Well	C-2505	Quarterly depth to water measurement.
Monitoring Well	C-2506	Quarterly depth to water measurement.
Monitoring Well	C-2507	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Monitoring Well	C-2811	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Monitoring Well	WQSP-6A	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO_4, Cl, TDS, TKN and NO_3.
Piezometer	PZ-4	Quarterly depth to water measurement.
Piezometer	PZ-5	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.

Piezometer	PZ-6	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-7	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-8	Quarterly depth to water measurement.
Piezometer	PZ-9	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.

Piezometer	PZ-13	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-14	Quarterly depth to water measurement.
Piezometer	PZ-15	Quarterly depth to water measurement.

Depth-to-Ground Water 164 feet
Total Dissolved Solids (TDS) 3,400 mg/L

Permit Information

Application Received May 10, 2013
Public Notice Published May 31, 2014
Discharge Permit Issued July 29, 2014
Discharge Permit Term Ends July 29, 2019
Permitted Discharge Volume Domestic – 23,000 gallons per day
Industrial – 4,224,835 gallons per day

Subject: Comments on the Waste Isolation Pilot Plant Discharge Permit 831

Reference: Letter from Diana D Sandoval, Ground Water Pollution Prevention Section to Mr. Jose Franco, Manager, US Department of Energy, dated May 31, 2014

Dear Ms. Sandoval:

The purpose of this letter is to transmit comments on the Waste Isolation Pilot Plant Discharge Permit 831, as noted in the referenced letter to Mr. Franco. Our comments are as follows:

1. Page 6, Section IV, Conditions/Operational Plan/Part D: #11, delete "and after storm events of 2" or greater in a 24 hour period" since inspections are performed monthly.
2. Page 6, Section IV, Conditions/Operational Plan/Part D: #11, "The first sentence should read "...Salt Cell 1 and..." instead of "...Salt Cell 1and".
3. Page 7, Section IV, Condition/Monitoring and Reporting/Part A: #13 – Add the words "as applicable to analysis conducted for WIPP" at the end of the first sentence. This allows the laboratory to use older versions of the documents when the actual methods are not changed in the updates.
4. Page 9, Section IV, Conditions/Monitoring and Reporting/Part D: #20 – The first sentence should read "... Salt Storage Ponds 1, 2, and 3..." not "... Salt Storage Cells 1, 2, 3, and 3..."

If you have any questions, please contact Mr. George T. Basabilvazo at (505) 234-7488.

Sincerely,

George T. Basabilvazo

GROUND WATER DISCHARGE PERMIT RENEWAL
Waste Isolation Pilot Plant (WIPP), DP-831

I. INTRODUCTION

The New Mexico Environment Department (NMED) issues this Discharge Permit Renewal (Discharge Permit), DP-831, to the U.S. Department of Energy (permittee) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978 §§74-6-1 through 74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Regulations, 20.6.2 NMAC.

NMED's purpose in issuing this Discharge Permit, and in imposing the requirements and conditions specified herein, is to control the discharge of water contaminants from the Waste Isolation Pilot Plant (WIPP) (facility) into ground and surface water, so as to protect ground and surface water for present and potential future use as domestic and agricultural water supply and other uses and protect public health. In issuing this Discharge Permit, NMED has determined that the requirements of Subsection C of 20.6.2.3109 NMAC have been or will be met. Pursuant to Section 20.6.2.3104 NMAC, it is the responsibility of the permittee to comply with the terms and conditions of this Discharge Permit; failure may result in an enforcement action(s) by NMED (20.6.2.1220 NMAC).

The activities which produce the discharge, the location of the discharge, and the quantity, quality and flow characteristics of the discharge are briefly described as follows:

Up to 23,000 gallons per day (gpd) of domestic wastewater is discharged to a synthetically lined impoundment system for disposal by evaporation. The system consists of seven synthetically-lined facultative sewage lagoons (Facultative Lagoon System) that include Settling Lagoons 1 and 2, Polishing Lagoons 1 and 2, and Effluent Lagoons A, B, and C. Industrial wastewater from two compressed air systems at the facility is also discharged to the Facultative Lagoon System. Brine, purge waters, and miscellaneous industrial non-hazardous wastewater are discharged to the Effluent Lagoons B and C of the Facultative Lagoon System. In addition, brine, purge waters, and miscellaneous industrial non-hazardous wastewater are discharged to a separate synthetically-lined impoundment for disposal by evaporation (Evaporation Pond H-19).

Salt and other subsurface materials mined during construction of the facility, as well as currently mined salt, are stored on the surface in three stockpiles. The stockpiles that are being used to store salt currently, or in the future, as it is mined out from the underground panels at the facility are Salt Cells 2 and 3. Up to 2,547,202 gpd of storm water runoff in contact with these salt stockpiles (based on a 24-hour, 25-year storm event - 3.9 inches) is collected in two double synthetically-lined storm water impoundments, each with a leak detection system (Salt Storage Ponds 2 and 3). The third salt stockpile (Salt Cell 1) is capped with a synthetic liner and earthen cover. Up to 1,677,633 gpd of storm water runoff in contact with this stockpile is collected in synthetically-lined diversion ditches and is diverted to a synthetically-lined impoundment (Salt Storage Pond 1).

Additional storm water runoff from the facility's paved areas and roofs is collected in three synthetically-lined impoundments (Storm Water Ponds 1, 2, and 3). This runoff is not in contact with the salt stockpiles at the facility.

The Site and Preliminary and Design Validation (SPDV) material pile was constructed as the shafts were excavated when construction first began at the WIPP site. The SPDV material pile was closed in the year 2000 with a cover consisting of a geosynthetic liner installed on 6 inches of bedding material and covered with a minimum of three feet of earthen material.

The discharge contains water contaminants which may be elevated above the standards of Section 20.6.2.3103 NMAC and/or the presence of toxic pollutants as defined in Subsection WW of 20.6.2.7 NMAC. The facility is located off of the Jal Highway, approximately 26 miles southeast of Carlsbad, in Sections 20, 28, and 29, Township 22 South, Range 31 East, Eddy County. Ground water most likely to be affected is at a depth of approximately 164 feet and has a total dissolved solids concentration of approximately 3,400 milligrams per liter.

The Discharge Permit sets forth separate requirements for the Facultative Lagoon System, the storage of storm water runoff in contact with salt stockpiles, and storm water runoff from the facility's paved and impermeable areas.

- Part A. Applicable to All Parts
- Part B. Applicable to the Facultative Lagoon System
- Part C. Applicable to the Evaporation Pond H-19 and Storm Water Impoundments Not in Contact with Salt Stockpiles (Storm Water Ponds 1, 2, and 3)
- Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2, and 3)

The original Discharge Permit was issued on January 16, 1992, amended on August 28, 1995, renewed on July 3, 1997, amended on June 12, 1998, amended on January 24, 2000, renewed on April 29, 2003, modified on December 22, 2003, modified again on December 29, 2006, and renewed and modified on July 23, 2008. The application (i.e., discharge plan) consists of the materials submitted by the permittee dated May 10, 2013 and materials contained in the administrative record prior to issuance of this Discharge Permit. The discharge shall be managed in accordance with all conditions and requirements of this Discharge Permit.

Pursuant to Section 20.6.2.3109 NMAC, NMED reserves the right to require a Discharge Permit Modification in the event NMED determines that the requirements of 20.6.2 NMAC are being or may be violated or the standards of Section 20.6.2.3103 NMAC are being or may be violated. This may include a determination that structural controls and/or management practices approved under this Discharge Permit are not protective of ground water quality, and that more stringent requirements to protect ground water quality may be required by NMED. The permittee may be required to implement abatement of water pollution and remediate ground water quality.

Issuance of this Discharge Permit does not relieve the permittee of the responsibility to comply with the WQA, WQCC Regulations, and any other applicable federal, state and/or local laws and regulations, such as zoning requirements and nuisance ordinances.

The following acronyms and abbreviations may be used in this Discharge Permit:

Abbreviation	Explanation	Abbreviation	Explanation
CFR	Code of Federal Regulations	NO_3-N	nitrate-nitrogen
Cl	Chloride	TDS	total dissolved solids
EPA	United States Environmental Protection Agency	TKN	total Kjeldahl nitrogen
gpd	gallons per day	total nitrogen	= TKN + NO_3-N
mg/L	milligrams per liter	SO_4	Sulfate
mL	Milliliters	UPC	Uniform Plumbing Code
NMAC	New Mexico Administrative Code	WQA	New Mexico Water Quality Act
NMED	New Mexico Environment Department	WQCC	Water Quality Control Commission
NMSA	New Mexico Statutes Annotated	WWTF	Wastewater Treatment Facility

II. FINDINGS

In issuing this Discharge Permit, NMED finds:

1. The permittee is discharging effluent or leachate from the facility so that such effluent or leachate may move directly or indirectly into ground water within the meaning of Section 20.6.2.3104 NMAC.

2. The permittee is discharging effluent or leachate from the facility so that such effluent or leachate may move into ground water of the State of New Mexico which has an existing concentration of 10,000 mg/L or less of TDS within the meaning of Subsection A of 20.6.2.3101 NMAC.

3. The discharge from the facility is not subject to any of the exemptions of Section 20.6.2.3105 NMAC.

III. AUTHORIZATION TO DISCHARGE

Pursuant to 20.6.2.3104 NMAC, it is the responsibility of the permittee to ensure that discharges authorized by this Discharge Permit are consistent with the terms and conditions herein.

The permittee is authorized to discharge up to 23,000 gpd of domestic wastewater to a synthetically-lined facultative impoundment system for disposal by evaporation. The permittee is also authorized to discharge up to 4,224,835 gpd of runoff in contact with salt stockpiles to three synthetically-lined impoundments for disposal by evaporation. The Facultative Lagoon System is permitted to accept non-hazardous industrial wastewater from two compressed air systems at the facility. Up to 50,000 gpd of brine, purge waters, and miscellaneous non-hazardous process waters are permitted to be discharged into Evaporation Ponds B and C of the Facultative Lagoon System, up to the capacity of the ponds with one foot of freeboard. Up to 50,000 gpd of brine, purge waters, and miscellaneous non-hazardous process waters are permitted to be discharged into to the Evaporation Pond H-19, up to the capacity of the pond with one foot of freeboard. The permittee is also authorized to collect storm water runoff from the facility's paved areas and

roofs in Storm Water Ponds 1, 2, and 3. This runoff is not in contact with the salt stockpiles at the facility.

[20.6.2.3104 NMAC, Subsection C of 20.6.2.3106 NMAC, Subsection C of 20.6.2.3109 NMAC]

IV. CONDITIONS

NMED issues this Discharge Permit for the discharge of water contaminants subject to the following conditions:

OPERATIONAL PLAN

Part A. Applicable to All Parts

#	Terms and Conditions
1.	The permittee shall implement the following operational plan to ensure compliance with Title 20, Chapter 6, Parts 1 and 2 NMAC. [Subsection C of 20.6.2.3109 NMAC]
2.	The permittee shall operate in a manner such that standards and requirements of Sections 20.6.2.3101 and 20.6.2.3103 NMAC are not violated. [20.6.2.3101 NMAC, 20.6.2.3103 NMAC, Subsection C of 20.6.2.3109 NMAC]
3.	The permittee shall maintain the impoundment liner(s) in such a manner as to avoid conditions which could affect the structural integrity of the impoundment(s) and/or impoundment liner(s). Such conditions include or may be characterized by the following: • erosion damage; • animal burrows or other damage; • the presence of vegetation including aquatic plants, weeds, woody shrubs or trees growing within five feet of the top inside edge of a sub-grade impoundment, within five feet of the toe of the outside berm of an above-grade impoundment, or within the impoundment itself; • the presence of large debris or large quantities of debris in the impoundment; • evidence of seepage; and • evidence of berm subsidence. Vegetation growing around the impoundment shall be routinely controlled by mechanical removal in a manner that is protective of the impoundment liner. The permittee shall visually inspect the impoundment(s) and surrounding berms on a monthly basis to ensure proper maintenance. In the event that inspection reveals any evidence of damage that threatens the structural integrity of an impoundment berm or liner, or that may result in an unauthorized discharge, the permittee shall enact the

#	Terms and Conditions
	contingency plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
4.	The permittee shall preserve a minimum of one foot of freeboard between the liquid level in the all impoundments and the elevation of the top of the impoundment liners. In the event that the permittee determines that one foot of freeboard cannot be preserved in any impoundment, the permittee shall enact the contingency plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

Part B. Applicable to the Facultative Lagoon System

#	Terms and Conditions
5.	The permittee shall maintain fences around the Facultative Lagoon System to control access by the general public and animals. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. Fences shall be maintained throughout the term of this Discharge Permit. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
6.	The permittee shall maintain signs indicating that the wastewater at the facility is not potable. Signs shall be posted at the Facultative Lagoon System's entrance and other areas where there is potential for public contact with wastewater. All signs shall be printed in English and Spanish remain visible and legible for the term of this Discharge Permit. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
7.	The permittee shall utilize operators, certified by the State of New Mexico at the appropriate level, to operate the wastewater collection, treatment and disposal systems. The operations and maintenance of all or any part of the wastewater system shall be performed by, or under the direct supervision of, a certified operator. [Subsection C of 20.6.2.3109 NMAC, 20.7.4 NMAC]
8.	The permittee shall measure the thickness of the sludge blanket in each pond of the Facultative Lagoon System ***once within the effective term*** of this Discharge Permit, but before the end of 2018. When sludge accumulation exceeds 1/3 of the total depth of any pond, the permittee shall remove the sludge in a manner, which is protective of the pond liner. Removed solids shall be contained, transported, and disposed of in accordance with all local, state, and federal regulations. The permittee shall maintain solids blanket measurements and solids disposal manifests for solids transported from the facility for

#	Terms and Conditions
	off-site disposal. The permittee shall submit all measurements and manifests to NMED in the semi-annual monitoring report immediately following the solids thickness measurement. [20.6.2.3109 NMAC, 20.6.2.3107 NMAC]

Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2 and 3)

#	Terms and Conditions
9.	The permittee shall measure the thickness of the solids blanket in each impoundment ***once within the effective term*** of this Discharge Permit, but before the end of 2018. Removed solids shall be contained, transported, and disposed of in accordance with all local, state, and federal regulations. The permittee shall maintain solids blanket measurements and solids disposal manifests for solids transported from the facility for off-site disposal. The permittee shall submit all measurements and manifests to NMED in the semi-annual monitoring report immediately following the solids thickness measurement. [20.6.2.3109 NMAC, 20.6.2.3107 NMAC]
10.	The permittee shall inspect the leak detection systems for Salt Storage Ponds 2 and 3 on a monthly basis for the presence of liquid. The permittee shall keep a log of the inspection findings and repairs made. The inspection log, including a statement whether or not liquids were observed in the leak detection systems, shall be submitted to NMED in the semi-annual monitoring reports. [20.6.2.3107 NMAC]
11.	The permittee shall conduct regular maintenance of the earthen cover on the Salt Cell 1 and the SPDV material pile. Inspections shall be conducted monthly to evaluate potential erosion and vegetation success of the cover. In the event of significant erosion or failure of vegetative success, the permittee shall provide a plan and schedule for repair within 90 days of discovery. General observations and cover repairs shall be reported to NMED. [20.6.2.3109 NMAC]

MONITORING AND REPORTING

Part A. Applicable to All Parts

#	Terms and Conditions
12.	The permittee shall conduct the following monitoring, reporting, and other requirements listed below in accordance with the monitoring requirements of this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
13.	METHODOLOGY – Unless otherwise approved in writing by NMED, the permittee shall conduct sampling and analysis in accordance with the most recent edition of the following documents as applicable to analysis conducted for WIPP: a) American Public Health Association, Standard Methods for the Examination of Water and Wastewater (18th, 19th or current) b) U.S. Environmental Protection Agency, Methods for Chemical Analysis of Water and Waste c) U.S. Geological Survey, Techniques for Water Resources Investigations of the U.S. Geological Survey d) American Society for Testing and Materials, Annual Book of ASTM Standards, Part 31. Water e) U.S. Geological Survey, et al., National Handbook of Recommended Methods for Water Data Acquisition f) Federal Register, latest methods published for monitoring pursuant to Resource Conservation and Recovery Act regulations g) Methods of Soil Analysis: Part 1. Physical and Mineralogical Methods; Part 2. Microbiological and Biochemical Properties; Part 3. Chemical Methods, American Society of Agronomy h) New Mexico Environment Department, Hazardous Waste Bureau Position Paper, *Use of Low-Flow and Other Non-Traditional Sampling Techniques for RCRA Compliant Groundwater Monitoring.* [Subsection B of 20.6.2.3107 NMAC]
14.	The permittee shall submit semi-annual monitoring reports to NMED for the most recently completed semi-annual period by the 1st of February and August each year. Semi-annual monitoring shall be performed during the following periods and submitted as follows: • January 1st through June 30th (first half) – **due by August 1st** • July 1st through December 31st (second half) – **due by February 1st** [Subsection A of 20.6.2.3107 NMAC]

Part B. Applicable to the Facultative Sewage Lagoon System

#	Terms and Conditions
15.	The volume of domestic influent discharged to the Facultative Lagoon System shall be measured ***monthly*** using a totalizing flow meter on the influent line to the system or the totalizing meter that measures total domestic water usage. Volumes of other authorized discharges to the Facultative Lagoon System shall be calculated by a time/volume method or volumetric measurement of the transport container(s). NMED may require comprehensive laboratory analyses of such wastewater prior to discharge when NMED determines that additional information is needed. Monthly meter readings, the units of measurement, monthly discharge volumes and other volumetric calculations for the previous 6-month period shall be submitted to NMED semi-annually in the monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
16.	The permittee shall collect a wastewater sample on a ***semi-annual*** basis (once every six months) from the influent to the Facultative Lagoon System. The grab sample shall be analyzed for TKN, NO_3-N, SO_4, TDS and Cl. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsections C and H of 20.6.2.3109 NMAC]

Part C. Applicable to the Evaporation Pond H-19 and Storm Water Impoundments Not in Contact with Salt Stockpiles (Storm Water Ponds 1, 2, and 3)

#	Terms and Conditions
17.	The volume and origin of all wastewater discharged to the Evaporation Pond H-19 that is derived from miscellaneous non-hazardous sources shall be measured ***monthly*** and reported to NMED. Discharge volumes to the Evaporation Pond H-19 shall be calculated by a time/volume method or volumetric measurement of the transport container(s). NMED may require comprehensive laboratory analyses of such wastewater prior to discharge when NMED determines that additional information is needed. Monthly discharge volumes and other volumetric calculations for the previous 6-month period shall be submitted to NMED semi-annually in the monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
18.	A sample shall be collected ***semi-annually*** from the Evaporation Pond H-19 and analyzed for SO_4, Cl, and TDS. Samples shall be collected ***annually*** after a significant storm event from each of the storm water ponds, Storm Water Ponds 1, 2, and 3 and analyzed for SO_4, Cl, and TDS. Samples shall be properly prepared, preserved, transported and

#	Terms and Conditions
	analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
19.	The water depth shall be measured ***monthly*** to the nearest tenth of a foot (0.1 ft) in the Storm Water Ponds 1, 2, and 3. The approximate volume of storm water shall be calculated and submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]

Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2 and 3)

#	Terms and Conditions
20.	A sample shall be collected ***annually*** after a significant storm event from each of the Salt Storage Ponds 1, 2 and 3, and analyzed for SO_4, Cl, and TDS. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
21.	The water depth shall be measured monthly to the nearest tenth of a foot (0.1 ft) in the Salt Storage Ponds 1, 2, and 3. The approximate volume of storm water shall be calculated and submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]

GROUND WATER MONTIROING AND REPORTS

#	Terms and Conditions
22.	Depth to the water table shall be measured to the nearest hundredth of a foot (0.01 ft) ***quarterly*** in piezometers/monitoring wells: • PZ-1, PZ-2, PZ-3, PZ-4, PZ-5, PZ-6, PZ-7, PZ-8, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13,

#	Terms and Conditions
	PZ-14, and PZ-15 • C-2505, C-2506, C-2507, C-2811, and WQSP-6A [Subsection A of 20.6.2.3107 NMAC]
23.	The permittee shall perform ***semi-annual*** ground water sampling in the following piezometers/monitoring wells and analyze the samples for temperature, pH, specific conductance, SO_4, TDS, and Cl: • Piezometers: PZ-1, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, and PZ-13 • Monitoring Wells: C-2507, C-2811, and WQSP-6A Ground water sample collection, preservation, transport and analysis shall be performed according to the following procedure: a) Measure the depth-to-most-shallow ground water from the top of the well casing to the nearest hundredth of a foot. b) Purge three well volumes of water from the well prior to sample collection. c) Obtain samples from the well for analysis. d) Properly prepare, preserve and transport samples. e) Analyze samples in accordance with the methods authorized in this Discharge Permit. Depth-to-most-shallow ground water measurements, analytical results, including the laboratory QA/QC summary report, and a facility layout map showing the location and number of each well shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
24.	The permittee shall perform ***semi-annual*** ground water sampling from monitoring well WQSP-6A and analyzed for TKN and NO_3. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
25.	Hydrographs shall be submitted ***annually*** for all monitoring wells and piezometers covered under Condition 22 of this Discharge Permit. At a minimum, graphs shall include the previous five years of water level data, or for recently installed wells, all data since the well was installed. Data for several wells may be included on one graph.

#	Terms and Conditions
	[Subsection A of 20.6.2.3107 NMAC]
26.	A potentiometric map for facility area shall be submitted ***annually***. The map shall incorporate the most recent water level data for all monitoring wells and piezometers installed in the shallow subsurface water (SSW). [Subsection A of 20.6.2.3107 NMAC]
27.	A single table in a paper and electronic format (EXCEL spreadsheet) of water level measurements and water quality data with only those constituents analyzed and water levels measured during a single event shown in columns. Tabulated field measurements to include temperature, pH, and electrical conductivity corrected to 25 degrees Celsius. Monitoring sites shall be shown in rows. The second column shall contain the date of the sampling event. Values exceeding standards shall be bolded. Any constituent not analyzed for a particular site shall be shown as "NA", any site not sampled shall be shown as "NS" with an associated reason, and any site not measured for water levels shall be shown as "NM" with an associated reason. [Subsection A of 20.6.2.3107 NMAC]
28.	A single table that includes all available ground water data to date shall be submitted annually. For each monitoring well, the name of the well shall be entered in the far left column in a row by itself. Sampling events, beginning with the earliest event first, shall be entered in subsequent rows with the sampling date in the second column and the corresponding analytical data in columns further to the right. Each new sampling event shall be added as an additional row to the existing spreadsheet with the corresponding date of the sampling event noted in the second column next to the monitoring well name. [Subsection A of 20.6.2.3107 NMAC]

CONTINGENCY PLAN

#	Terms and Conditions
29.	In the event that ground water monitoring indicates that a ground water quality standard identified in Section 20.6.2.3103 NMAC is exceeded; the total nitrogen concentration in ground water is greater than 10 mg/L; or a toxic pollutant (defined in Subsection WW of 20.6.2.7 NMAC) is present in a ground water sample and in any subsequent ground water sample collected from a monitoring well required by this Discharge Permit, the permittee shall enact the following contingency plan: Within 60 days of the subsequent sample analysis date, the permittee shall propose measures to ensure that the exceedance of the standard or the presence of a toxic pollutant will be mitigated by submitting a corrective action plan to NMED for approval.

#	Terms and Conditions
	The corrective action plan shall include a description of the proposed actions to control the source and an associated completion schedule. The plan shall be enacted as approved by NMED. Once invoked (whether during the term of this Discharge Permit; or after the term of this Discharge Permit and prior to the completion of the Discharge Permit closure plan requirements), this condition shall apply until the permittee has fulfilled the requirements of this condition and ground water monitoring confirms for a minimum of two years of consecutive ground water sampling events that the standards of Section 20.6.2.3103 NMAC are not exceeded and toxic pollutants are not present in ground water. The permittee may be required to abate water pollution pursuant to Sections 20.6.2.4000 through 20.6.2.4115 NMAC, should the corrective action plan not result in compliance with the standards and requirements set forth in Section 20.6.2.4103 NMAC within 180 days of confirmed ground water contamination. [Subsection A of 20.6.2.3107 NMAC, Subsection E of 20.6.2.3109 NMAC]
30.	In the event that inspection findings reveal significant damage likely to affect the structural integrity of the lined impoundment(s) or its ability to contain contaminants, the permittee shall propose the repair or replacement of the impoundment liner(s) by submitting a corrective action plan to NMED for approval. The plan shall be submitted to NMED within 30 days after discovery by the permittee or following notification from NMED that significant liner damage is evident. The corrective action plan shall include a schedule for completion of corrective actions and the permittee shall initiate implementation of the plan following approval by NMED. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
31.	In the event that a minimum of one foot of freeboard cannot be preserved in the impoundment(s), the permittee shall take actions authorized by this Discharge Permit and all applicable local, state, and federal regulations to restore the required freeboard. In the event that one foot of freeboard cannot be restored within a period of 72 hours following discovery, the permittee shall propose actions to be immediately implemented to restore one foot of freeboard by submitting a short-term corrective action plan to NMED for approval. Examples of short-term corrective actions include: removing excess wastewater from the impoundment through pumping and hauling; or reducing the volume of liquid/wastewater discharged to the impoundment. The plan shall include a schedule for completion of corrective actions and shall be submitted within 15 days following the date when the one foot of freeboard limit was initially discovered. The permittee shall initiate implementation of the plan following approval by NMED. In the event that the short-term corrective actions failed to restore one foot of freeboard,

#	Terms and Conditions
	the permittee shall propose permanent corrective actions in a long-term corrective action plan submitted to NMED within 90 days following failure of the short-term corrective action plan. Examples include: the installation of an additional storage impoundment, or a significant/permanent reduction in the volume of liquid/wastewater discharged to the impoundment. The plan shall include a schedule for completion of corrective actions and implementation of the plan shall be initiated following approval by NMED. [Subsection A of 20.6.2.3107 NMAC]
32.	In the event that a release (commonly known as a "spill") occurs that is not authorized under this Discharge Permit, the permittee shall take measures to mitigate damage from the unauthorized discharge and initiate the notifications and corrective actions required in Section 20.6.2.1203 NMAC and summarized below. Within <u>24 hours</u> following discovery of the unauthorized discharge, the permittee shall verbally notify NMED and provide the following information: a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility. b) The name and address of the facility. c) The date, time, location, and duration of the unauthorized discharge. d) The source and cause of unauthorized discharge. e) A description of the unauthorized discharge, including its estimated chemical composition. f) The estimated volume of the unauthorized discharge. g) Any actions taken to mitigate immediate damage from the unauthorized discharge. Within <u>one week</u> following discovery of the unauthorized discharge, the permittee shall submit written notification to NMED with the information listed above and any pertinent updates. Within <u>15 days</u> following discovery of the unauthorized discharge, the permittee shall submit a corrective action report/plan to NMED describing any corrective actions taken and/or to be taken relative to the unauthorized discharge that includes the following: a) A description of proposed actions to mitigate damage from the unauthorized discharge. b) A description of proposed actions to prevent future unauthorized discharges of this nature. c) A schedule for completion of proposed actions. In the event that the unauthorized discharge causes or may with reasonable probability cause water pollution in excess of the standards and requirements of Section 20.6.2.4103 NMAC, and the water pollution will not be abated within 180 days after notice is required to be given pursuant to Paragraph (1) of Subsection A of 20.6.2.1203 NMAC, the permittee may be required to abate water pollution pursuant to Sections 20.6.2.4000

#	Terms and Conditions
	through 20.6.2.4115 NMAC. Nothing in this condition shall be construed as relieving the permittee of the obligation to comply with all requirements of Section 20.6.2.1203 NMAC. [20.6.2.1203 NMAC]
33.	In the event that NMED or the permittee identifies any failures of the discharge plan or this Discharge Permit not specifically noted herein, NMED may require the permittee to submit a corrective action plan and a schedule for completion of corrective actions to address the failure(s). Additionally, NMED may require a Discharge Permit modification to achieve compliance with 20.6.2 NMAC. [Subsection A of 20.6.2.3107 NMAC, Subsection E of 20.6.2.3109 NMAC]
34.	In the event of a pipeline break, pump failure, pond overflow or other system failure at the facility, discharged water shall be contained, pumped and transferred to area of the facility that impose minimal impacts to ground water quality. Failed components shall be repaired or replaced as soon as possible and no later than 72 hours from the time of failure. For good cause demonstrated, the permittee may request NMED approval of an extension of the schedule for the repair or replacement of a failed component. [20.6.2.3107A NMAC]

CLOSURE PLAN

Part A. Applicable to All Parts

#	Terms and Conditions
35.	The permittee shall close the facilities covered under this Discharge Permit in accordance with the closure plan in the March 4, 2005 discharge permit application, the closure plan in the WIPP Hazardous Waste Facility Permit (HWFP) dated November 1, 2012, and the WIPP Land Management Plan. [Subsection A of 20.6.2.3107 NMAC]
36.	The permittee shall continue ground water monitoring until the requirements of this condition have been met and ground water monitoring confirms for a minimum of two years of consecutive ground water sampling events that the standards of Section 20.6.2.3103 NMAC are not exceeded and toxic pollutants are not present in ground water. If monitoring results show that a ground water quality standard in Section 20.6.2.3103 NMAC is exceeded; the total nitrogen concentration in ground water is greater than 10

#	Terms and Conditions
	mg/L; or a toxic pollutant (defined in Subsection WW of 20.6.2.7 NMAC) is present in ground water, the permittee shall implement the contingency plan required by this Discharge Permit. Following notification from NMED that post-closure monitoring may cease, the permittee shall plug and abandon the monitoring well(s) in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011. [Subsection A of 20.6.2.3107 NMAC]

Part B. Applicable to the Facultative Sewage Lagoon System

#	Terms and Conditions
37.	In the event the Facultative Lagoon System is proposed to be permanently closed, upon ceasing discharging, the permittee shall perform the following closure measures: Within 60 days of ceasing discharging to the Facultative Lagoon System impoundments(s), the line leading to the impoundment shall be plugged so that a discharge can no longer occur. Within 60 days of ceasing discharging to the Facultative Lagoon System (impoundments), wastewater shall be drained or evaporated from the impoundment and any other wastewater system components and it shall be disposed of in accordance with all local, state, and federal regulations. Within 90 days of ceasing discharging to the Facultative Lagoon System impoundment(s), the permittee shall submit a sludge removal and disposal plan to NMED for approval. The permittee shall initiate implementation of the plan within 30 days following approval by NMED. The sludge removal and disposal plan shall include the following: a) The estimated volume and dry weight of sludge to be removed and disposed, including measurements and calculations. b) Analytical results for samples of the sludge taken from the impoundment for TKN, NO_3-N, percent total solids, hazardous constituents, and any other parameters tested (reported in mg/kg, dry weight basis). c) The method(s) of sludge *removal* from the impoundment(s). d) The method(s) of *disposal* for all of the sludge (and its contents) removed from the impoundment(s). The method(s) shall comply with all local, state and federal regulations, including 40 CFR Part 503. *Note: A proposal that includes the surface disposal of sludge may be subject to Ground Water Discharge Permitting requirements pursuant to 20.6.2.3104 NMAC that are separate from the*

#	Terms and Conditions
	requirements of this Discharge Permit. e) A schedule for completion of sludge removal and disposal not to exceed two years from the date discharge to the impoundment(s) ceased. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: a) Remove all lines leading to and from the Facultative Lagoon System impoundment(s), or permanently plug and abandon them in place. b) Remove or demolish any other wastewater system components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liner(s). d) Fill the impoundment(s) with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [Subsection A of 20.6.2.3107 NMAC, 40 CFR Part 503]

Part C. Applicable to the Evaporation Pond H-19 and Storm Water Impoundments Not in Contact with Salt Stockpiles (Storm Water Ponds 1, 2, and 3)

#	Terms and Conditions
38.	Upon cessation of operation, the permittee shall close the Evaporation Pond H-19 and Storm Water Ponds 1, 2, and 3. Remaining liquids in each impoundment shall be removed and/or evaporated. All sludge shall be sampled to determine if hazardous constituents exist and managed and/or disposed of in accordance with applicable regulations. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: a) Remove or plug all piping and other ancillary components b) Remove or demolish any other components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liner(s). d) Fill the impoundment(s) with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [20.6.2.3107A(11) NMAC]

Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2 and 3)

#	Terms and Conditions
39.	Upon cessation of operation, all mined salt at the facility shall be removed from the site. The permittee is permitted to use the mined salt as backfill in shafts and as interior fill material in berms and permanent markers after closure. All mined salt remaining after backfilling and after construction of surface structures shall be removed from the site. The permittee shall submit a plan and schedule for salt tailings removal to NMED for approval within 120 days prior to the facility closure. The WIPP Land Management Plan reflects the Land Withdrawal Act's requirements for disposition of the salt. The WIPP's Hazardous Waste Facility Permit also addresses closure activities that include closure of the salt storage areas in accordance with the provisions of the WIPP Land Management Plan. The salt storage area will be reclaimed in the manner described in these documents. [20.6.2.3107A(11) NMAC]
40.	Upon cessation of operation, the permittee shall close Salt Storage Ponds 1, 2, and 3. Remaining liquids in each impoundment shall be removed and/or evaporated. All sludge shall be sampled to determine if hazardous constituents exist and managed and/or disposed of in accordance with applicable regulations. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: f) Remove or plug all piping and other ancillary components g) Remove or demolish any other components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. h) Perforate or remove the impoundment liner(s). i) Fill the impoundment(s) with suitable fill. j) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [20.6.2.3107A(11) NMAC]

E. GENERAL TERMS AND CONDITIONS

#	Terms and Conditions
41.	RECORD KEEPING - The permittee shall maintain a written record of the following information: a) Information and data used to complete the application for this Discharge Permit. b) Records of any releases (commonly known as "spills") not authorized under this Discharge Permit and reports submitted pursuant to 20.6.2.1203 NMAC.

#	**Terms and Conditions**
	c) Records of the operation, maintenance, and repair of all facilities/equipment used to treat, store or dispose of wastewater. d) Facility record drawings (plans and specifications) showing the actual construction of the facility and bear the seal and signature of a licensed New Mexico professional engineer. e) Copies of monitoring reports completed and/or submitted to NMED pursuant to this Discharge Permit. f) The volume of wastewater or other wastes discharged pursuant to this Discharge Permit. g) Ground water quality and wastewater quality data collected pursuant to this Discharge Permit. h) Copies of construction records (well log) for all ground water monitoring wells required to be sampled pursuant to this Discharge Permit. i) Records of the maintenance, repair, replacement or calibration of any monitoring equipment or flow measurement devices required by this Discharge Permit. j) Data and information related to field measurements, sampling, and analysis conducted pursuant to this Discharge Permit. The following information shall be recorded and shall be made available to NMED upon request: i) The dates, location and times of sampling or field measurements; ii) The name and job title of the individuals who performed each sample collection or field measurement; iii) The sample analysis date of each sample; iv) The name and address of the laboratory, and the name of the signatory authority for the laboratory analysis; v) The analytical technique or method used to analyze each sample or collect each field measurement; vi) The results of each analysis or field measurement, including raw data; vii) The results of any split, spiked, duplicate or repeat sample; and viii) A copy of the laboratory analysis chain-of-custody as well as a description of the quality assurance and quality control procedures used. The written record shall be maintained by the permittee at a location accessible during a facility inspection by NMED for a period of at least five years from the date of application, report, collection or measurement and shall be made available to the department upon request. [Subsections A and D of 20.6.2.3107 NMAC]
42.	INSPECTION and ENTRY – The permittee shall allow inspection by NMED of the facility and its operations which are subject to this Discharge Permit and the WQCC regulations. NMED may upon presentation of proper credentials, enter at reasonable times upon or through any premises in which a water contaminant source is located or in which are located any records required to be maintained by regulations of the federal government or the WQCC.

#	**Terms and Conditions**
	The permittee shall allow NMED to have access to and reproduce for their use any copy of the records, and to perform assessments, sampling or monitoring during an inspection for the purpose of evaluating compliance with this Discharge Permit and the WQCC regulations. Nothing in this Discharge Permit shall be construed as limiting in any way the inspection and entry authority of NMED under the WQA, the WQCC Regulations, or any other local, state or federal regulations. [Subsection D of 20.6.2.3107 NMAC, NMSA 1978, §§ 74-6-9.B and 74-6-9.E]
43.	DUTY to PROVIDE INFORMATION - The permittee shall, upon NMED's request, allow for NMED's inspection/duplication of records required by this Discharge Permit and/or furnish to NMED copies of such records. [Subsection D of 20.6.2.3107 NMAC]
44.	MODIFICATIONS and/or AMENDMENTS – In the event the permittee proposes a change to the facility or the facility's discharge that would result in a change in the volume discharged; the location of the discharge; or in the amount or character of water contaminants received, treated or discharged by the facility, the permittee shall notify NMED prior to implementing such changes. The permittee shall obtain approval (which may require modification of this Discharge Permit) by NMED prior to implementing such changes. [Subsection C of 20.6.2.3107 NMAC, Subsections E and G of 20.6.2.3109 NMAC]
45.	PLANS and SPECIFICATIONS – In the event the permittee is proposing to construct a wastewater system or change a process unit of an existing system such that the quantity or quality of the discharge will change substantially from that authorized by this Discharge Permit, the permittee shall submit construction plans and specifications to NMED for the proposed system or process unit prior to the commencement of construction. In the event the permittee implements changes to the wastewater system authorized by this Discharge Permit which result in only a minor effect on the character of the discharge, the permittee shall report such changes (including the submission of record drawings, where applicable) as of January 1 and June 30 of each year to NMED. [Subsections A and C of 20.6.2.1202 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
46.	CIVIL PENALTIES - Any violation of the requirements and conditions of this Discharge Permit, including any failure to allow NMED staff to enter and inspect records or facilities, or any refusal or failure to provide NMED with records or information, may

#	Terms and Conditions
	subject the permittee to a civil enforcement action. Pursuant to WQA 74-6-10(A) and (B), such action may include a compliance order requiring compliance immediately or in a specified time, assessing a civil penalty, modifying or terminating the Discharge Permit, or any combination of the foregoing; or an action in district court seeking injunctive relief, civil penalties, or both. Pursuant to WQA 74-6-10(C) and 74-6-10.1, civil penalties of up to $15,000 per day of noncompliance may be assessed for each violation of the WQA 74-6-5, the WQCC Regulations, or this Discharge Permit, and civil penalties of up to $10,000 per day of noncompliance may be assessed for each violation of any other provision of the WQA, or any regulation, standard, or order adopted pursuant to such other provision. In any action to enforce this Discharge Permit, the permittee waives any objection to the admissibility as evidence of any data generated pursuant to this Discharge Permit. [20.6.2.1220 NMAC, NMSA 1978, §§ 74-6-10 and 74-6-10.1]
47.	CRIMINAL PENALTIES – No person shall: 1) make any false material statement, representation, certification or omission of material fact in an application, record, report, plan or other document filed, submitted or required to be maintained under the WQA; 2) falsify, tamper with or render inaccurate any monitoring device, method or record required to be maintained under the WQA; or 3) fail to monitor, sample or report as required by a permit issued pursuant to a state or federal law or regulation. Any person who knowingly violates or knowingly causes or allows another person to violate the requirements of this condition is guilty of a fourth degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who is convicted of a second or subsequent violation of the requirements of this condition is guilty of a third degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who knowingly violates the requirements of this condition or knowingly causes another person to violate the requirements of this condition and thereby causes a substantial adverse environmental impact is guilty of a third degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who knowingly violates the requirements of this condition and knows at the time of the violation that he is creating a substantial danger of death or serious bodily injury to any other person is guilty of a second degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. [20.6.2.1220 NMAC, NMSA 1978, §§ 74-6-10.2.A through 74-6-10.2.F]
48.	COMPLIANCE with OTHER LAWS - Nothing in this Discharge Permit shall be construed in any way as relieving the permittee of the obligation to comply with all applicable federal, state, and local laws, regulations, permits or orders.

#	Terms and Conditions
	[NMSA 1978, § 74-6-5.L]
49.	RIGHT to APPEAL - The permittee may file a petition for review before the WQCC on this Discharge Permit. Such petition shall be in writing to the WQCC within thirty days of the receipt of postal notice of this Discharge Permit and shall include a statement of the issues to be raised and the relief sought. Unless a timely petition for review is made, the decision of NMED shall be final and not subject to judicial review. [20.6.2.3112 NMAC, NMSA 1978, § 74-6-5.O]
50.	TRANSFER of DISCHARGE PERMIT - Prior to the transfer of any ownership, control, or possession of this facility or any portion thereof, the permittee shall: 1) notify the proposed transferee in writing of the existence of this Discharge Permit; 2) include a copy of this Discharge Permit with the notice; and 3) deliver or send by certified mail to NMED a copy of the notification and proof that such notification has been received by the proposed transferee. Until both ownership and possession of the facility have been transferred to the transferee, the permittee shall continue to be responsible for any discharge from the facility. [20.6.2.3111 NMAC]
51.	PERMIT FEES - Payment of permit fees is due at the time of Discharge Permit approval. Permit fees shall be paid in a single payment or shall be paid in equal installments on a yearly basis over the term of the Discharge Permit. Single payments shall be remitted to NMED no later than 30 days after the Discharge Permit effective date. Initial installment payments shall be remitted to NMED no later than 30 days after the Discharge Permit effective date; subsequent installment payments shall be remitted to NMED no later than the anniversary of the Discharge Permit effective date. Permit fees are associated with <u>issuance</u> of this Discharge Permit. Nothing in this Discharge Permit shall be construed as relieving the permittee of the obligation to pay all permit fees assessed by NMED. A permittee that ceases discharging or does not commence discharging from the facility during the term of the Discharge Permit shall pay all permit fees assessed by NMED. An approved Discharge Permit shall be suspended or terminated if the facility fails to remit an installment payment by its due date. [Subsection F of 20.6.2.3114 NMAC, NMSA 1978, § 74-6-5.K]

V. PERMIT TERM & SIGNATURE

CLA-22-A (R-1/93)

ACCOUNT NUMBER 1007595

New Mexico Environment Department
Ground Water Quality Bureau

Notice is hereby given pursuant to 20.6.2.3108.G NMAC, the following Ground Water Discharge Permit applications have been proposed for approval. To request additional information or to obtain a copy of a draft permit, contact the Ground Water Quality Bureau in Santa Fe at (505) 827-2900. Draft permits may also be viewed on-line at http://www.nmenv.state.nm.us/gwb/NMED-GWQB-PublicNotice.htm

DP-1810, Young Guns, Inc., Christopher Franzoy, Owner, P.O. Box 959, Hatch, NM 87937, proposes to discharge up to 68,000 gallons per day (gpd) to two surface disposal fields that are under cultivation via flood irrigation. Solids generated by chile processing are stored at the facility prior to disposal offsite in accordance with all local, state, and federal regulations. Potential contaminants associated with this type of discharge include nitrogen compounds. The facility is located at 1230 BB Romig Road approximately 2.5 miles northwest of Hatch, in Section 1, Township 19 South, Range 04 West, Doña Ana County. Ground water beneath the site is at a depth of approximately 17 feet and has a total dissolved solids concentration of approximately 1,650 milligrams per liter. NMED permit contact: Nancy McDuffie at (505) 222-9523 or nancy.mcduffie@state.nm.us

DP-831, Waste Isolation Pilot Plant, Jose Franco, Manager, U.S. Dept. of Energy, P.O. Box 3090, Carlsbad, NM 88221, proposes to renew the Discharge Permit for the discharge of up to 23,000 gallons per day (gpd) of domestic wastewater to a synthetically lined impoundment system consisting of seven synthetically-lined impoundments for disposal by evaporation. Industrial wastewater from two compressed air systems, brine, purge waters, and miscellaneous industrial non-hazardous wastewater is also discharged to the domestic wastewater impoundment system. In addition, brine, purge waters, and miscellaneous industrial non-hazardous wastewater are discharged to a separate synthetically-lined impoundment for disposal by evaporation. Up to 2,547,202 gpd of storm water runoff in contact with salt and other subsurface material stockpiles (based on a 24-hour, 25-year storm event - 3.9 inches) is collected in two double synthetically-lined storm water impoundments, each with a leak detection system. A third salt stockpile is capped with a synthetic liner and earthen cover that discharges up to 1,677,633 gpd of storm water runoff to a synthetically-lined impoundment. Potential contaminants associated with this type of discharge include nitrogen compounds, chloride, sulfate, and total dissolved solids. The facility is located off of the Jal Highway approximately 26 miles southeast of Carlsbad, in Sections 20, 28, and 29, Township 22 South, Range 31 East, Eddy County. Ground water most likely to be affected is at a depth of approximately 164 feet and has a total dissolved solids concentration of approximately 3,400 milligrams per liter. NMED permit contact: John Hall at (505) 827-1049 or

DP-1042, National Solar Observatory, Rex Hunter, Administrative Manager, P.O. Box 62, Sunspot, NM 88349, proposes to renew the Discharge Permit for the discharge of up to 10,000 gallons per day of domestic wastewater from the National Solar Observatory and employee housing to a wastewater treatment and disposal system. Wastewater collects in a lift station, which pumps wastewater to a mechanical treatment plant. Treated wastewater is then pumped to approximately four acres of land application area for disposal. The Discharge Plan includes a reduction in the permitted discharge volume from 17,000 to 10,000 gallons per day. Potential contaminants associated with this type of discharge include nitrogen compounds. The facility is located at New Mexico Scenic Byway 6553, Sunspot, in Sections 33 and 34, T17S, R11E, Otero County. Ground water most likely to be affected is at a depth of approximately 400 feet and has a total dissolved solids concentration of approximately 424 milligrams per liter. NMED permit contact: Melanie Sanchez at (505) 222-9574 or melanie.sanchez@state.nm.us

Prior to ruling on any proposed Discharge Permit or its modification, the New Mexico Environment Department (NMED) will allow thirty days after the date of publication of this notice to receive written comments and during which a public hearing may be requested by any interested person, including the applicant. Requests for public hearing shall be in writing and shall set forth the reasons why the hearing should be held. A hearing will be held if NMED determines that there is substantial public interest. Comments for requests for hearing should be submitted to the Ground Water Quality Bureau at PO Box 5469, Santa Fe, NM 87502-5469.

DP-1132, Los Alamos National Laboratory's Radioactive Liquid Waste Treatment Facility, Robert Beers, Point of Contact, Los Alamos National Laboratory, Environmental Protection Division, Water Quality & RCRA Group, P.O. Box 1663, Mail Stop K490, Los Alamos, NM 87545. As a result of comments received during the public comment period for DP-1132, the New Mexico Environment Department is hereby withdrawing the draft permit noticed (PN-2) on or around September 13, 2013 in order to further evaluate the comments received and amend the draft permit, as necessary. The New Mexico Environment Department will re-issue for public notice (PN-2) any subsequent draft permit in compliance with 20.6.2.3108.H NMAC. Los Alamos National Security, LLC (LANS) and the United States Department of Energy (DOE) have proposed to treat up to 40,000 gallons per day of low-level radioactive wastewater at Los Alamos National Laboratory's Radioactive Liquid Waste Treatment Facility, and to discharge treated effluent to a mechanical evaporation system, solar evaporation system or to an outfall (Outfall 051 also regulated under a National Pollutant Discharge Elimination System (NPDES) permit issued by the United States Environmental Protection Agency (EPA) pursuant to the federal Clean Water Act section 402, 33 U.S.C. § 1342). Potential contaminants associated with this type of waste stream include nitrogen compounds, metals, organic compounds, and low-level radioactive materials. The Facility is located within Los Alamos National Laboratory, approximately 1.5 miles south of Los Alamos, New Mexico, in Sections 16, 17, 20, 21 and 22, Township 19N, Range 06E, Los Alamos County. Ground water most likely to be affected ranges from depths of approximately one foot to 1,306 feet and has a total dissolved solids concentration ranging from approximately 162 to 255 milligrams per liter. NMED permit contact:

DP-831, Waste Isolation Pilot Plant, Jose Franco, Manager, U.S. Dept. of Energy, P.O. Box 3090, Carlsbad, NM 88221, proposes to renew the Discharge Permit for the discharge of up to 23,000 gallons per day (gpd) of domestic wastewater to a synthetically lined impoundment system consisting of seven synthetically-lined impoundments for disposal by evaporation. Industrial wastewater from two compressed air systems, brine, purge waters, and miscellaneous industrial non-hazardous wastewater is also discharged to the domestic wastewater impoundment system. In addition, brine, purge waters, and miscellaneous industrial non-hazardous wastewater are discharged to a separate synthetically-lined impoundment for disposal by evaporation. Up to 2,547,202 gpd of storm water runoff in contact with salt and other subsurface material stockpiles (based on a 24-hour, 25-year storm event - 3.9 inches) is collected in two double synthetically-lined storm water impoundments, each with a leak detection system. A third salt stockpile is capped with a synthetic liner and earthen cover that discharges up to 1,677,633 gpd of storm water runoff to a synthetically-lined impoundment. Potential contaminants associated with this type of discharge include nitrogen compounds, chloride, sulfate, and total dissolved solids. The facility is located off of the Jal Highway, approximately 26 miles southeast of Carlsbad, in Sections 20, 28, and 29, Township 22 South, Range 31 East, Eddy County. Ground water most likely to be affected is at a depth of approximately 164 feet and has a total dissolved solids concentration of approximately 3,400 milligrams per liter. NMED permit contact: John Hall at (505) 827-1049 or john.hall@state.nm.us

Prior to ruling on any proposed Discharge Permit or its modification, the New Mexico Environment Department, (NMED) will allow thirty days after the date of publication of this notice to receive written comments and during which a public hearing may be requested by any interested person, including the applicant. Requests for public hearing shall be in writing and shall set forth the reasons why the hearing should be held. A hearing will be held if NMED determines that there is substantial public interest. Comments for requests for hearing should be submitted to the Ground Water Quality Bureau at PO Box 5469, Santa Fe, NM 87502-5469.

RE: Draft Discharge Permit Renewal, DP-831, Waste Isolation Pilot Plant (WIPP)

Dear Mr. Franco:

Notice is hereby given pursuant to Subsection H of 20.6.2.3108 NMAC that Ground Water Discharge Permit, DP-831, Waste Isolation Pilot Plant, has been proposed for approval (copy enclosed). The New Mexico Environment Department (NMED) will publish notice of the availability of the draft Discharge Permit in the near future and will forward a copy of the notice to you.

Prior to making a final ruling on the proposed Discharge Permit, NMED will allow 30 days from the date the public notice is published during which time written comments can be submitted and/or a public hearing requested. Comments and/or hearing requests may be submitted by any interested person, including the Discharge Permit applicant. Written comments and/or hearing requests must be submitted to the Ground Water Quality Bureau at the address above and shall set forth the reasons why a hearing is requested. A hearing will be held only if hearing requests are received from the public and/or the Discharge Permit applicant during the 30-day comment period and NMED determines there is substantial public interest in the proposed Discharge Permit. Hearings are presided over by the NMED Secretary or a hearing officer appointed by the Secretary.

Please review the enclosed draft Discharge Permit carefully for accuracy and completeness, and to make sure you understand what it requires. Please be aware that this Discharge Permit may contain conditions that require the permittee to implement operational, monitoring or closure actions by a specified deadline

A copy of the Water Quality Control Commission (WQCC) Regulations, 20.6.2 NMAC, is available at http://www.nmcpr.state.nm.us/nmac/_title20/T20C006.htm.

If you have any comments, questions, or concerns, please contact me at (505) 827-1046. If written comments and/or a written request for hearing are not received during the public comment period, the draft Discharge Permit will become final. Thank you for your cooperation during the review process.

Sincerely,

JERRY SCHOEPPNER
Chief, Ground Water Quality Bureau
New Mexico Environment Department

GROUND WATER DISCHARGE PERMIT RENEWAL
Waste Isolation Pilot Plant (WIPP), DP-831

I. INTRODUCTION

The New Mexico Environment Department (NMED) issues this Discharge Permit Renewal (Discharge Permit), DP-831, to the U.S. Department of Energy (permittee) pursuant to the New Mexico Water Quality Act (WQA), NMSA 1978 §§74-6-1 through 74-6-17, and the New Mexico Water Quality Control Commission (WQCC) Regulations, 20.6.2 NMAC.

NMED's purpose in issuing this Discharge Permit, and in imposing the requirements and conditions specified herein, is to control the discharge of water contaminants from the Waste Isolation Pilot Plant (WIPP) (facility) into ground and surface water, so as to protect ground and surface water for present and potential future use as domestic and agricultural water supply and other uses and protect public health. In issuing this Discharge Permit, NMED has determined that the requirements of Subsection C of 20.6.2.3109 NMAC have been or will be met. Pursuant to Section 20.6.2.3104 NMAC, it is the responsibility of the permittee to comply with the terms and conditions of this Discharge Permit; failure may result in an enforcement action(s) by NMED (20.6.2.1220 NMAC).

The activities which produce the discharge, the location of the discharge, and the quantity, quality and flow characteristics of the discharge are briefly described as follows:

Up to 23,000 gallons per day (gpd) of domestic wastewater is discharged to a synthetically lined impoundment system for disposal by evaporation. The system consists of seven synthetically-lined facultative sewage lagoons (Facultative Lagoon System) that include Settling Lagoons 1 and 2, Polishing Lagoons 1 and 2, and Effluent Lagoons A, B, and C. Industrial wastewater from two compressed air systems at the facility is also discharged to the Facultative Lagoon System. Brine, purge waters, and miscellaneous industrial non-hazardous wastewater are discharged to the Effluent Lagoons B and C of the Facultative Lagoon System. In addition, brine, purge waters, and miscellaneous industrial non-hazardous wastewater are discharged to a separate synthetically-lined impoundment for disposal by evaporation (Evaporation Pond H-19).

Salt and other subsurface materials mined during construction of the facility, as well as currently mined salt, are stored on the surface in three stockpiles. The stockpiles that are being used to store salt currently, or in the future, as it is mined out from the underground panels at the facility are Salt Cells 2 and 3. Up to 2,547,202 gpd of storm water runoff in contact with these salt stockpiles (based on a 24-hour, 25-year storm event - 3.9 inches) is collected in two double synthetically-lined storm water impoundments, each with a leak detection system (Salt Storage Ponds 2 and 3). The third salt stockpile (Salt Cell 1) is capped with a synthetic liner and earthen cover. Up to 1,677,633 gpd of storm water runoff in contact with this stockpile is collected in synthetically-lined diversion ditches and is diverted to a synthetically-lined impoundment (Salt Storage Pond 1).

Additional storm water runoff from the facility's paved areas and roofs is collected in three synthetically-lined impoundments (Storm Water Ponds 1, 2, and 3). This runoff is not in contact with the salt stockpiles at the facility.

The Site and Preliminary and Design Validation (SPDV) material pile was constructed as the shafts were excavated when construction first began at the WIPP site. The SPDV material pile was closed in the year 2000 with a cover consisting of a geosynthetic liner installed on 6 inches of bedding material and covered with a minimum of three feet of earthen material.

The discharge contains water contaminants which may be elevated above the standards of Section 20.6.2.3103 NMAC and/or the presence of toxic pollutants as defined in Subsection WW of 20.6.2.7 NMAC. The facility is located off of the Jal Highway, approximately 26 miles southeast of Carlsbad, in Sections 20, 28, and 29, Township 22 South, Range 31 East, Eddy County. Ground water most likely to be affected is at a depth of approximately 164 feet and has a total dissolved solids concentration of approximately 3,400 milligrams per liter.

The Discharge Permit sets forth separate requirements for the Facultative Lagoon System, the storage of storm water runoff in contact with salt stockpiles, and storm water runoff from the facility's paved and impermeable areas.

- Part A. Applicable to All Parts
- Part B. Applicable to the Facultative Lagoon System
- Part C. Applicable to the Evaporation Pond H-19 and Storm Water Impoundments Not in Contact with Salt Stockpiles (Storm Water Ponds 1, 2, and 3)
- Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2, and 3)

The original Discharge Permit was issued on January 16, 1992, amended on August 28, 1995, renewed on July 3, 1997, amended on June 12, 1998, amended on January 24, 2000, renewed on April 29, 2003, modified on December 22, 2003, modified again on December 29, 2006, and renewed and modified on July 23, 2008. The application (i.e., discharge plan) consists of the materials submitted by the permittee dated May 10, 2013 and materials contained in the administrative record prior to issuance of this Discharge Permit. The discharge shall be managed in accordance with all conditions and requirements of this Discharge Permit.

Pursuant to Section 20.6.2.3109 NMAC, NMED reserves the right to require a Discharge Permit Modification in the event NMED determines that the requirements of 20.6.2 NMAC are being or may be violated or the standards of Section 20.6.2.3103 NMAC are being or may be violated. This may include a determination that structural controls and/or management practices approved under this Discharge Permit are not protective of ground water quality, and that more stringent requirements to protect ground water quality may be required by NMED. The permittee may be required to implement abatement of water pollution and remediate ground water quality.

Issuance of this Discharge Permit does not relieve the permittee of the responsibility to comply with the WQA, WQCC Regulations, and any other applicable federal, state and/or local laws and regulations, such as zoning requirements and nuisance ordinances.

The following acronyms and abbreviations may be used in this Discharge Permit:

Abbreviation	Explanation	Abbreviation	Explanation
CFR	Code of Federal Regulations	NO_3-N	nitrate-nitrogen
Cl	Chloride	TDS	total dissolved solids
EPA	United States Environmental Protection Agency	TKN	total Kjeldahl nitrogen
gpd	gallons per day	total nitrogen	= TKN + NO_3-N
mg/L	milligrams per liter	SO_4	Sulfate
mL	Milliliters	UPC	Uniform Plumbing Code
NMAC	New Mexico Administrative Code	WQA	New Mexico Water Quality Act
NMED	New Mexico Environment Department	WQCC	Water Quality Control Commission
NMSA	New Mexico Statutes Annotated	WWTF	Wastewater Treatment Facility

II. FINDINGS

In issuing this Discharge Permit, NMED finds:

1. The permittee is discharging effluent or leachate from the facility so that such effluent or leachate may move directly or indirectly into ground water within the meaning of Section 20.6.2.3104 NMAC.

2. The permittee is discharging effluent or leachate from the facility so that such effluent or leachate may move into ground water of the State of New Mexico which has an existing concentration of 10,000 mg/L or less of TDS within the meaning of Subsection A of 20.6.2.3101 NMAC.

3. The discharge from the facility is not subject to any of the exemptions of Section 20.6.2.3105 NMAC.

III. AUTHORIZATION TO DISCHARGE

Pursuant to 20.6.2.3104 NMAC, it is the responsibility of the permittee to ensure that discharges authorized by this Discharge Permit are consistent with the terms and conditions herein.

The permittee is authorized to discharge up to 23,000 gpd of domestic wastewater to a synthetically-lined facultative impoundment system for disposal by evaporation. The permittee is also authorized to discharge up to 4,224,835 gpd of runoff in contact with salt stockpiles to three synthetically-lined impoundments for disposal by evaporation. The Facultative Lagoon System is permitted to accept non-hazardous industrial wastewater from two compressed air systems at the facility. Up to 50,000 gpd of brine, purge waters, and miscellaneous non-hazardous process waters are permitted to be discharged into Evaporation Ponds B and C of the Facultative Lagoon System, up to the capacity of the ponds with one foot of freeboard. Up to 50,000 gpd of brine, purge waters, and miscellaneous non-hazardous process waters are permitted to be discharged into to the Evaporation Pond H-19, up to the capacity of the pond with one foot of freeboard. The permittee is also authorized to collect storm water runoff from the facility's paved areas and

draft

roofs in Storm Water Ponds 1, 2, and 3. This runoff is not in contact with the salt stockpiles at the facility.

[20.6.2.3104 NMAC, Subsection C of 20.6.2.3106 NMAC, Subsection C of 20.6.2.3109 NMAC]

IV. CONDITIONS

NMED issues this Discharge Permit for the discharge of water contaminants subject to the following conditions:

OPERATIONAL PLAN

Part A. Applicable to All Parts

#	Terms and Conditions
1.	The permittee shall implement the following operational plan to ensure compliance with Title 20, Chapter 6, Parts 1 and 2 NMAC. [Subsection C of 20.6.2.3109 NMAC]
2.	The permittee shall operate in a manner such that standards and requirements of Sections 20.6.2.3101 and 20.6.2.3103 NMAC are not violated. [20.6.2.3101 NMAC, 20.6.2.3103 NMAC, Subsection C of 20.6.2.3109 NMAC]
3.	The permittee shall maintain the impoundment liner(s) in such a manner as to avoid conditions which could affect the structural integrity of the impoundment(s) and/or impoundment liner(s). Such conditions include or may be characterized by the following: • erosion damage; • animal burrows or other damage; • the presence of vegetation including aquatic plants, weeds, woody shrubs or trees growing within five feet of the top inside edge of a sub-grade impoundment, within five feet of the toe of the outside berm of an above-grade impoundment, or within the impoundment itself; • the presence of large debris or large quantities of debris in the impoundment; • evidence of seepage; and • evidence of berm subsidence. Vegetation growing around the impoundment shall be routinely controlled by mechanical removal in a manner that is protective of the impoundment liner. The permittee shall visually inspect the impoundment(s) and surrounding berms on a monthly basis to ensure proper maintenance. In the event that inspection reveals any evidence of damage that threatens the structural integrity of an impoundment berm or liner, or that may result in an unauthorized discharge, the permittee shall enact the

#	Terms and Conditions
	contingency plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
4.	The permittee shall preserve a minimum of one foot of freeboard between the liquid level in the all impoundments and the elevation of the top of the impoundment liners. In the event that the permittee determines that one foot of freeboard cannot be preserved in any impoundment, the permittee shall enact the contingency plan set forth in this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]

Part B. Applicable to the Facultative Lagoon System

#	Terms and Conditions
5.	The permittee shall maintain fences around the Facultative Lagoon System to control access by the general public and animals. The fences shall consist of a minimum of six-foot chain link or field fencing and locking gates. Fences shall be maintained throughout the term of this Discharge Permit. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
6.	The permittee shall maintain signs indicating that the wastewater at the facility is not potable. Signs shall be posted at the Facultative Lagoon System's entrance and other areas where there is potential for public contact with wastewater. All signs shall be printed in English and Spanish remain visible and legible for the term of this Discharge Permit. [Subsections B and C of 20.6.2.3109 NMAC, NMSA 1978, § 74-6-5.D]
7.	The permittee shall utilize operators, certified by the State of New Mexico at the appropriate level, to operate the wastewater collection, treatment and disposal systems. The operations and maintenance of all or any part of the wastewater system shall be performed by, or under the direct supervision of, a certified operator. [Subsection C of 20.6.2.3109 NMAC, 20.7.4 NMAC]
8.	The permittee shall measure the thickness of the sludge blanket in each pond of the Facultative Lagoon System ***once within the effective term*** of this Discharge Permit, but before the end of 2018. When sludge accumulation exceeds 1/3 of the total depth of any pond, the permittee shall remove the sludge in a manner, which is protective of the pond liner. Removed solids shall be contained, transported, and disposed of in accordance with all local, state, and federal regulations. The permittee shall maintain solids blanket measurements and solids disposal manifests for solids transported from the facility for

#	Terms and Conditions
	off-site disposal. The permittee shall submit all measurements and manifests to NMED in the semi-annual monitoring report immediately following the solids thickness measurement. [20.6.2.3109 NMAC, 20.6.2.3107 NMAC]

Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2 and 3)

#	Terms and Conditions
9.	The permittee shall measure the thickness of the solids blanket in each impoundment ***once within the effective term*** of this Discharge Permit, but before the end of 2018. Removed solids shall be contained, transported, and disposed of in accordance with all local, state, and federal regulations. The permittee shall maintain solids blanket measurements and solids disposal manifests for solids transported from the facility for off-site disposal. The permittee shall submit all measurements and manifests to NMED in the semi-annual monitoring report immediately following the solids thickness measurement. [20.6.2.3109 NMAC, 20.6.2.3107 NMAC]
10.	The permittee shall inspect the leak detection systems for Salt Storage Ponds 2 and 3 on a monthly basis for the presence of liquid. The permittee shall keep a log of the inspection findings and repairs made. The inspection log, including a statement whether or not liquids were observed in the leak detection systems, shall be submitted to NMED in the semi-annual monitoring reports. [20.6.2.3107 NMAC]
11.	The permittee shall conduct regular maintenance of the earthen cover on the Salt Cell 1and the SPDV material pile. Inspections shall be conducted monthly and after storm events of 2 inches or greater in a 24-hour period to evaluate potential erosion and vegetation success of the cover. In the event of significant erosion or failure of vegetative success, the permittee shall provide a plan and schedule for repair within 90 days of discovery. General observations and cover repairs shall be reported to NMED. [20.6.2.3109 NMAC]

MONITORING AND REPORTING

Part A. Applicable to All Parts

#	Terms and Conditions
12.	The permittee shall conduct the following monitoring, reporting, and other requirements listed below in accordance with the monitoring requirements of this Discharge Permit. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
13.	METHODOLOGY – Unless otherwise approved in writing by NMED, the permittee shall conduct sampling and analysis in accordance with the most recent edition of the following documents: a) American Public Health Association, Standard Methods for the Examination of Water and Wastewater (18th, 19th or current) b) U.S. Environmental Protection Agency, Methods for Chemical Analysis of Water and Waste c) U.S. Geological Survey, Techniques for Water Resources Investigations of the U.S. Geological Survey d) American Society for Testing and Materials, Annual Book of ASTM Standards, Part 31. Water e) U.S. Geological Survey, et al., National Handbook of Recommended Methods for Water Data Acquisition f) Federal Register, latest methods published for monitoring pursuant to Resource Conservation and Recovery Act regulations g) Methods of Soil Analysis: Part 1. Physical and Mineralogical Methods; Part 2. Microbiological and Biochemical Properties; Part 3. Chemical Methods, American Society of Agronomy h) New Mexico Environment Department, Hazardous Waste Bureau Position Paper, *Use of Low-Flow and Other Non-Traditional Sampling Techniques for RCRA Compliant Groundwater Monitoring.* [Subsection B of 20.6.2.3107 NMAC]
14.	The permittee shall submit semi-annual monitoring reports to NMED for the most recently completed semi-annual period by the 1st of February and August each year. Semi-annual monitoring shall be performed during the following periods and submitted as follows: • January 1st through June 30th (first half) – **due by August 1st** • July 1st through December 31st (second half) – **due by February 1st** [Subsection A of 20.6.2.3107 NMAC]

Part B. Applicable to the Facultative Sewage Lagoon System

#	Terms and Conditions
15.	The volume of domestic influent discharged to the Facultative Lagoon System shall be measured ***monthly*** using a totalizing flow meter on the influent line to the system or the totalizing meter that measures total domestic water usage. Volumes of other authorized discharges to the Facultative Lagoon System shall be calculated by a time/volume method or volumetric measurement of the transport container(s). NMED may require comprehensive laboratory analyses of such wastewater prior to discharge when NMED determines that additional information is needed. Monthly meter readings, the units of measurement, monthly discharge volumes and other volumetric calculations for the previous 6-month period shall be submitted to NMED semi-annually in the monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
16.	The permittee shall collect a wastewater sample on a ***semi-annual*** basis (once every six months) from the influent to the Facultative Lagoon System. The grab sample shall be analyzed for TKN, NO_3-N, SO_4, TDS and Cl. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC, Subsections C and H of 20.6.2.3109 NMAC]

Part C. Applicable to the Evaporation Pond H-19 and Storm Water Impoundments Not in Contact with Salt Stockpiles (Storm Water Ponds 1, 2, and 3)

#	Terms and Conditions
17.	The volume and origin of all wastewater discharged to the Evaporation Pond H-19 that is derived from miscellaneous non-hazardous sources shall be measured ***monthly*** and reported to NMED. Discharge volumes to the Evaporation Pond H-19 shall be calculated by a time/volume method or volumetric measurement of the transport container(s). NMED may require comprehensive laboratory analyses of such wastewater prior to discharge when NMED determines that additional information is needed. Monthly discharge volumes and other volumetric calculations for the previous 6-month period shall be submitted to NMED semi-annually in the monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
18.	A sample shall be collected ***semi-annually*** from the Evaporation Pond H-19 and analyzed for SO_4, Cl, and TDS. Samples shall be collected ***annually*** after a significant storm event from each of the storm water ponds, Storm Water Ponds 1, 2, and 3 and analyzed for SO_4, Cl, and TDS. Samples shall be properly prepared, preserved, transported and

#	Terms and Conditions
	analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
19.	The water depth shall be measured ***monthly*** to the nearest tenth of a foot (0.1 ft) in the Storm Water Ponds 1, 2, and 3. The approximate volume of storm water shall be calculated and submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]

Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2 and 3)

#	Terms and Conditions
20.	A sample shall be collected ***annually*** after a significant storm event from each of the Salt Storage Cells 1, 2 and 3and 3 and analyzed for SO_4, Cl, and TDS. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
21.	The water depth shall be measured monthly to the nearest tenth of a foot (0.1 ft) in the Salt Storage Ponds 1, 2, and 3. The approximate volume of storm water shall be calculated and submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]

GROUND WATER MONTIROING AND REPORTS

#	Terms and Conditions
22.	Depth to the water table shall be measured to the nearest hundredth of a foot (0.01 ft) ***quarterly*** in piezometers/monitoring wells: • PZ-1, PZ-2, PZ-3, PZ-4, PZ-5, PZ-6, PZ-7, PZ-8, PZ-9, PZ-10, PZ-11, PZ-12, PZ-13,

#	Terms and Conditions
	PZ-14, and PZ-15 • C-2505, C-2506, C-2507, C-2811, and WQSP-6A [Subsection A of 20.6.2.3107 NMAC]
23.	The permittee shall perform ***semi-annual*** ground water sampling in the following piezometers/monitoring wells and analyze the samples for temperature, pH, specific conductance, SO_4, TDS, and Cl: • Piezometers: PZ-1, PZ-5, PZ-6, PZ-7, PZ-9, PZ-10, PZ-11, PZ-12, and PZ-13 • Monitoring Wells: C-2507, C-2811, and WQSP-6A Ground water sample collection, preservation, transport and analysis shall be performed according to the following procedure: a) Measure the depth-to-most-shallow ground water from the top of the well casing to the nearest hundredth of a foot. b) Purge three well volumes of water from the well prior to sample collection. c) Obtain samples from the well for analysis. d) Properly prepare, preserve and transport samples. e) Analyze samples in accordance with the methods authorized in this Discharge Permit. Depth-to-most-shallow ground water measurements, analytical results, including the laboratory QA/QC summary report, and a facility layout map showing the location and number of each well shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
24.	The permittee shall perform ***semi-annual*** ground water sampling from monitoring well WQSP-6A and analyzed for TKN and NO_3. Samples shall be properly prepared, preserved, transported and analyzed in accordance with the methods authorized in this Discharge Permit. Analytical results shall be submitted to NMED in the semi-annual monitoring reports. Analytical results, including the laboratory QA/QC summary report, shall be submitted to NMED in the semi-annual monitoring reports. [Subsection A of 20.6.2.3107 NMAC]
25.	Hydrographs shall be submitted ***annually*** for all monitoring wells and piezometers covered under Condition 22 of this Discharge Permit. At a minimum, graphs shall include the previous five years of water level data, or for recently installed wells, all data since the well was installed. Data for several wells may be included on one graph.

draft

#	Terms and Conditions
	[Subsection A of 20.6.2.3107 NMAC]
26.	A potentiometric map for facility area shall be submitted ***annually***. The map shall incorporate the most recent water level data for all monitoring wells and piezometers installed in the shallow subsurface water (SSW). [Subsection A of 20.6.2.3107 NMAC]
27.	A single table in a paper and electronic format (EXCEL spreadsheet) of water level measurements and water quality data with only those constituents analyzed and water levels measured during a single event shown in columns. Tabulated field measurements to include temperature, pH, and electrical conductivity corrected to 25 degrees Celsius. Monitoring sites shall be shown in rows. The second column shall contain the date of the sampling event. Values exceeding standards shall be bolded. Any constituent not analyzed for a particular site shall be shown as "NA", any site not sampled shall be shown as "NS" with an associated reason, and any site not measured for water levels shall be shown as "NM" with an associated reason. [Subsection A of 20.6.2.3107 NMAC]
28.	A single table that includes all available ground water data to date shall be submitted annually. For each monitoring well, the name of the well shall be entered in the far left column in a row by itself. Sampling events, beginning with the earliest event first, shall be entered in subsequent rows with the sampling date in the second column and the corresponding analytical data in columns further to the right. Each new sampling event shall be added as an additional row to the existing spreadsheet with the corresponding date of the sampling event noted in the second column next to the monitoring well name. [Subsection A of 20.6.2.3107 NMAC]

#	Terms and Conditions
29.	In the event that ground water monitoring indicates that a ground water quality standard identified in Section 20.6.2.3103 NMAC is exceeded; the total nitrogen concentration in ground water is greater than 10 mg/L; or a toxic pollutant (defined in Subsection WW of 20.6.2.7 NMAC) is present in a ground water sample and in any subsequent ground water sample collected from a monitoring well required by this Discharge Permit, the permittee shall enact the following contingency plan: Within 60 days of the subsequent sample analysis date, the permittee shall propose measures to ensure that the exceedance of the standard or the presence of a toxic pollutant will be mitigated by submitting a corrective action plan to NMED for approval.

#	Terms and Conditions
	The corrective action plan shall include a description of the proposed actions to control the source and an associated completion schedule. The plan shall be enacted as approved by NMED. Once invoked (whether during the term of this Discharge Permit; or after the term of this Discharge Permit and prior to the completion of the Discharge Permit closure plan requirements), this condition shall apply until the permittee has fulfilled the requirements of this condition and ground water monitoring confirms for a minimum of two years of consecutive ground water sampling events that the standards of Section 20.6.2.3103 NMAC are not exceeded and toxic pollutants are not present in ground water. The permittee may be required to abate water pollution pursuant to Sections 20.6.2.4000 through 20.6.2.4115 NMAC, should the corrective action plan not result in compliance with the standards and requirements set forth in Section 20.6.2.4103 NMAC within 180 days of confirmed ground water contamination. [Subsection A of 20.6.2.3107 NMAC, Subsection E of 20.6.2.3109 NMAC]
30.	In the event that inspection findings reveal significant damage likely to affect the structural integrity of the lined impoundment(s) or its ability to contain contaminants, the permittee shall propose the repair or replacement of the impoundment liner(s) by submitting a corrective action plan to NMED for approval. The plan shall be submitted to NMED within 30 days after discovery by the permittee or following notification from NMED that significant liner damage is evident. The corrective action plan shall include a schedule for completion of corrective actions and the permittee shall initiate implementation of the plan following approval by NMED. [Subsection A of 20.6.2.3107 NMAC, Subsection C of 20.6.2.3109 NMAC]
31.	In the event that a minimum of one foot of freeboard cannot be preserved in the impoundment(s), the permittee shall take actions authorized by this Discharge Permit and all applicable local, state, and federal regulations to restore the required freeboard. In the event that one foot of freeboard cannot be restored within a period of 72 hours following discovery, the permittee shall propose actions to be immediately implemented to restore one foot of freeboard by submitting a short-term corrective action plan to NMED for approval. Examples of short-term corrective actions include: removing excess wastewater from the impoundment through pumping and hauling; or reducing the volume of liquid/wastewater discharged to the impoundment. The plan shall include a schedule for completion of corrective actions and shall be submitted within 15 days following the date when the one foot of freeboard limit was initially discovered. The permittee shall initiate implementation of the plan following approval by NMED. In the event that the short-term corrective actions failed to restore one foot of freeboard,

#	Terms and Conditions
	the permittee shall propose permanent corrective actions in a long-term corrective action plan submitted to NMED within 90 days following failure of the short-term corrective action plan. Examples include: the installation of an additional storage impoundment, or a significant/permanent reduction in the volume of liquid/wastewater discharged to the impoundment. The plan shall include a schedule for completion of corrective actions and implementation of the plan shall be initiated following approval by NMED. [Subsection A of 20.6.2.3107 NMAC]
32.	In the event that a release (commonly known as a "spill") occurs that is not authorized under this Discharge Permit, the permittee shall take measures to mitigate damage from the unauthorized discharge and initiate the notifications and corrective actions required in Section 20.6.2.1203 NMAC and summarized below. Within 24 hours following discovery of the unauthorized discharge, the permittee shall verbally notify NMED and provide the following information: a) The name, address, and telephone number of the person or persons in charge of the facility, as well as of the owner and/or operator of the facility. b) The name and address of the facility. c) The date, time, location, and duration of the unauthorized discharge. d) The source and cause of unauthorized discharge. e) A description of the unauthorized discharge, including its estimated chemical composition. f) The estimated volume of the unauthorized discharge. g) Any actions taken to mitigate immediate damage from the unauthorized discharge. Within one week following discovery of the unauthorized discharge, the permittee shall submit written notification to NMED with the information listed above and any pertinent updates. Within 15 days following discovery of the unauthorized discharge, the permittee shall submit a corrective action report/plan to NMED describing any corrective actions taken and/or to be taken relative to the unauthorized discharge that includes the following: a) A description of proposed actions to mitigate damage from the unauthorized discharge. b) A description of proposed actions to prevent future unauthorized discharges of this nature. c) A schedule for completion of proposed actions. In the event that the unauthorized discharge causes or may with reasonable probability cause water pollution in excess of the standards and requirements of Section 20.6.2.4103 NMAC, and the water pollution will not be abated within 180 days after notice is required to be given pursuant to Paragraph (1) of Subsection A of 20.6.2.1203 NMAC, the permittee may be required to abate water pollution pursuant to Sections 20.6.2.4000

#	Terms and Conditions
	through 20.6.2.4115 NMAC. Nothing in this condition shall be construed as relieving the permittee of the obligation to comply with all requirements of Section 20.6.2.1203 NMAC. [20.6.2.1203 NMAC]
33.	In the event that NMED or the permittee identifies any failures of the discharge plan or this Discharge Permit not specifically noted herein, NMED may require the permittee to submit a corrective action plan and a schedule for completion of corrective actions to address the failure(s). Additionally, NMED may require a Discharge Permit modification to achieve compliance with 20.6.2 NMAC. [Subsection A of 20.6.2.3107 NMAC, Subsection E of 20.6.2.3109 NMAC]
34.	In the event of a pipeline break, pump failure, pond overflow or other system failure at the facility, discharged water shall be contained, pumped and transferred to area of the facility that impose minimal impacts to ground water quality. Failed components shall be repaired or replaced as soon as possible and no later than 72 hours from the time of failure. For good cause demonstrated, the permittee may request NMED approval of an extension of the schedule for the repair or replacement of a failed component. [20.6.2.3107A NMAC]

CLOSURE PLAN

Part A. Applicable to All Parts

#	Terms and Conditions
35.	The permittee shall close the facilities covered under this Discharge Permit in accordance with the closure plan in the March 4, 2005 discharge permit application, the closure plan in the WIPP Hazardous Waste Facility Permit (HWFP) dated November 1, 2012, and the WIPP Land Management Plan. [Subsection A of 20.6.2.3107 NMAC]
36.	The permittee shall continue ground water monitoring until the requirements of this condition have been met and ground water monitoring confirms for a minimum of two years of consecutive ground water sampling events that the standards of Section 20.6.2.3103 NMAC are not exceeded and toxic pollutants are not present in ground water. If monitoring results show that a ground water quality standard in Section 20.6.2.3103 NMAC is exceeded; the total nitrogen concentration in ground water is greater than 10

#	Terms and Conditions
	mg/L; or a toxic pollutant (defined in Subsection WW of 20.6.2.7 NMAC) is present in ground water, the permittee shall implement the contingency plan required by this Discharge Permit. Following notification from NMED that post-closure monitoring may cease, the permittee shall plug and abandon the monitoring well(s) in accordance with the attachment titled *Ground Water Discharge Permit Monitoring Well Construction and Abandonment Conditions*, Revision 1.1, March 2011. [Subsection A of 20.6.2.3107 NMAC]

Part B. Applicable to the Facultative Sewage Lagoon System

#	Terms and Conditions
37.	In the event the Facultative Lagoon System is proposed to be permanently closed, upon ceasing discharging, the permittee shall perform the following closure measures: Within <u>60 days</u> of ceasing discharging to the Facultative Lagoon System impoundments(s), the line leading to the impoundment shall be plugged so that a discharge can no longer occur. Within <u>60 days</u> of ceasing discharging to the Facultative Lagoon System (impoundments), wastewater shall be drained or evaporated from the impoundment and any other wastewater system components and it shall be disposed of in accordance with all local, state, and federal regulations. Within <u>90 days</u> of ceasing discharging to the Facultative Lagoon System impoundment(s), the permittee shall submit a sludge removal and disposal plan to NMED for approval. The permittee shall initiate implementation of the plan within 30 days following approval by NMED. The sludge removal and disposal plan shall include the following: a) The estimated volume and dry weight of sludge to be removed and disposed, including measurements and calculations. b) Analytical results for samples of the sludge taken from the impoundment for TKN, NO_3-N, percent total solids, hazardous constituents, and any other parameters tested (reported in mg/kg, dry weight basis). c) The method(s) of sludge *removal* from the impoundment(s). d) The method(s) of *disposal* for all of the sludge (and its contents) removed from the impoundment(s). The method(s) shall comply with all local, state and federal regulations, including 40 CFR Part 503. *Note: A proposal that includes the surface disposal of sludge may be subject to Ground Water Discharge Permitting requirements pursuant to 20.6.2.3104 NMAC that are separate from the*

#	Terms and Conditions
	requirements of this Discharge Permit. e) A schedule for completion of sludge removal and disposal not to exceed two years from the date discharge to the impoundment(s) ceased. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: a) Remove all lines leading to and from the Facultative Lagoon System impoundment(s), or permanently plug and abandon them in place. b) Remove or demolish any other wastewater system components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liner(s). d) Fill the impoundment(s) with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [Subsection A of 20.6.2.3107 NMAC, 40 CFR Part 503]

Part C. Applicable to the Evaporation Pond H-19 and Storm Water Impoundments Not in Contact with Salt Stockpiles (Storm Water Ponds 1, 2, and 3)

#	Terms and Conditions
38.	Upon cessation of operation, the permittee shall close the Evaporation Pond H-19 and Storm Water Ponds 1, 2 and 3. Remaining liquids in each impoundment shall be removed and/or evaporated. All sludge shall be sampled to determine if hazardous constituents exist and managed and/or disposed of in accordance with applicable regulations. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: a) Remove or plug all piping and other ancillary components b) Remove or demolish any other components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. c) Perforate or remove the impoundment liner(s). d) Fill the impoundment(s) with suitable fill. e) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [20.6.2.3107A(11) NMAC]

Part D. Applicable to the Storm Water Runoff Impoundments in Contact with Salt Stockpiles (Salt Storage Ponds 1, 2, and 3) and Salt Stockpiles (Salt Cells 1, 2 and 3)

#	Terms and Conditions
39.	Upon cessation of operation, all mined salt at the facility shall be removed from the site. The permittee is permitted to use the mined salt as backfill in shafts and as interior fill material in berms and permanent markers after closure. All mined salt remaining after backfilling and after construction of surface structures shall be removed from the site. The permittee shall submit a plan and schedule for salt tailings removal to NMED for approval within 120 days prior to the facility closure. The WIPP Land Management Plan reflects the Land Withdrawal Act's requirements for disposition of the salt. The WIPP's Hazardous Waste Facility Permit also addresses closure activities that include closure of the salt storage areas in accordance with the provisions of the WIPP Land Management Plan. The salt storage area will be reclaimed in the manner described in these documents. [20.6.2.3107A(11) NMAC]
40.	Upon cessation of operation, the permittee shall close Salt Storage Ponds 1, 2, and 3. Remaining liquids in each impoundment shall be removed and/or evaporated. All sludge shall be sampled to determine if hazardous constituents exist and managed and/or disposed of in accordance with applicable regulations. Within <u>one year</u> following completion of the sludge removal and disposal, the permittee shall complete the following closure measures: f) Remove or plug all piping and other ancillary components g) Remove or demolish any other components and re-grade area with suitable fill to blend with surface topography, promote positive drainage and prevent ponding. h) Perforate or remove the impoundment liner(s). i) Fill the impoundment(s) with suitable fill. j) Re-grade the impoundment site to blend with surface topography, promote positive drainage and prevent ponding. [20.6.2.3107A(11) NMAC]

E. GENERAL TERMS AND CONDITIONS

#	Terms and Conditions
41.	RECORD KEEPING - The permittee shall maintain a written record of the following information: a) Information and data used to complete the application for this Discharge Permit. b) Records of any releases (commonly known as "spills") not authorized under this Discharge Permit and reports submitted pursuant to 20.6.2.1203 NMAC.

#	Terms and Conditions
	c) Records of the operation, maintenance, and repair of all facilities/equipment used to treat, store or dispose of wastewater. d) Facility record drawings (plans and specifications) showing the actual construction of the facility and bear the seal and signature of a licensed New Mexico professional engineer. e) Copies of monitoring reports completed and/or submitted to NMED pursuant to this Discharge Permit. f) The volume of wastewater or other wastes discharged pursuant to this Discharge Permit. g) Ground water quality and wastewater quality data collected pursuant to this Discharge Permit. h) Copies of construction records (well log) for all ground water monitoring wells required to be sampled pursuant to this Discharge Permit. i) Records of the maintenance, repair, replacement or calibration of any monitoring equipment or flow measurement devices required by this Discharge Permit. j) Data and information related to field measurements, sampling, and analysis conducted pursuant to this Discharge Permit. The following information shall be recorded and shall be made available to NMED upon request: i) The dates, location and times of sampling or field measurements; ii) The name and job title of the individuals who performed each sample collection or field measurement; iii) The sample analysis date of each sample; iv) The name and address of the laboratory, and the name of the signatory authority for the laboratory analysis; v) The analytical technique or method used to analyze each sample or collect each field measurement; vi) The results of each analysis or field measurement, including raw data; vii) The results of any split, spiked, duplicate or repeat sample; and viii) A copy of the laboratory analysis chain-of-custody as well as a description of the quality assurance and quality control procedures used. The written record shall be maintained by the permittee at a location accessible during a facility inspection by NMED for a period of at least five years from the date of application, report, collection or measurement and shall be made available to the department upon request. [Subsections A and D of 20.6.2.3107 NMAC]
42.	INSPECTION and ENTRY – The permittee shall allow inspection by NMED of the facility and its operations which are subject to this Discharge Permit and the WQCC regulations. NMED may upon presentation of proper credentials, enter at reasonable times upon or through any premises in which a water contaminant source is located or in which are located any records required to be maintained by regulations of the federal government or the WQCC.

#	Terms and Conditions
	The permittee shall allow NMED to have access to and reproduce for their use any copy of the records, and to perform assessments, sampling or monitoring during an inspection for the purpose of evaluating compliance with this Discharge Permit and the WQCC regulations. Nothing in this Discharge Permit shall be construed as limiting in any way the inspection and entry authority of NMED under the WQA, the WQCC Regulations, or any other local, state or federal regulations. [Subsection D of 20.6.2.3107 NMAC, NMSA 1978, §§ 74-6-9.B and 74-6-9.E]
43.	DUTY to PROVIDE INFORMATION - The permittee shall, upon NMED's request, allow for NMED's inspection/duplication of records required by this Discharge Permit and/or furnish to NMED copies of such records. [Subsection D of 20.6.2.3107 NMAC]
44.	MODIFICATIONS and/or AMENDMENTS – In the event the permittee proposes a change to the facility or the facility's discharge that would result in a change in the volume discharged; the location of the discharge; or in the amount or character of water contaminants received, treated or discharged by the facility, the permittee shall notify NMED prior to implementing such changes. The permittee shall obtain approval (which may require modification of this Discharge Permit) by NMED prior to implementing such changes. [Subsection C of 20.6.2.3107 NMAC, Subsections E and G of 20.6.2.3109 NMAC]
45.	PLANS and SPECIFICATIONS – In the event the permittee is proposing to construct a wastewater system or change a process unit of an existing system such that the quantity or quality of the discharge will change substantially from that authorized by this Discharge Permit, the permittee shall submit construction plans and specifications to NMED for the proposed system or process unit prior to the commencement of construction. In the event the permittee implements changes to the wastewater system authorized by this Discharge Permit which result in only a minor effect on the character of the discharge, the permittee shall report such changes (including the submission of record drawings, where applicable) as of January 1 and June 30 of each year to NMED. [Subsections A and C of 20.6.2.1202 NMAC, NMSA 1978, §§ 61-23-1 through 61-23-32]
46.	CIVIL PENALTIES - Any violation of the requirements and conditions of this Discharge Permit, including any failure to allow NMED staff to enter and inspect records or facilities, or any refusal or failure to provide NMED with records or information, may

#	Terms and Conditions
	subject the permittee to a civil enforcement action. Pursuant to WQA 74-6-10(A) and (B), such action may include a compliance order requiring compliance immediately or in a specified time, assessing a civil penalty, modifying or terminating the Discharge Permit, or any combination of the foregoing; or an action in district court seeking injunctive relief, civil penalties, or both. Pursuant to WQA 74-6-10(C) and 74-6-10.1, civil penalties of up to $15,000 per day of noncompliance may be assessed for each violation of the WQA 74-6-5, the WQCC Regulations, or this Discharge Permit, and civil penalties of up to $10,000 per day of noncompliance may be assessed for each violation of any other provision of the WQA, or any regulation, standard, or order adopted pursuant to such other provision. In any action to enforce this Discharge Permit, the permittee waives any objection to the admissibility as evidence of any data generated pursuant to this Discharge Permit. [20.6.2.1220 NMAC, NMSA 1978, §§ 74-6-10 and 74-6-10.1]
47.	CRIMINAL PENALTIES – No person shall: 1) make any false material statement, representation, certification or omission of material fact in an application, record, report, plan or other document filed, submitted or required to be maintained under the WQA; 2) falsify, tamper with or render inaccurate any monitoring device, method or record required to be maintained under the WQA; or 3) fail to monitor, sample or report as required by a permit issued pursuant to a state or federal law or regulation. Any person who knowingly violates or knowingly causes or allows another person to violate the requirements of this condition is guilty of a fourth degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who is convicted of a second or subsequent violation of the requirements of this condition is guilty of a third degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who knowingly violates the requirements of this condition or knowingly causes another person to violate the requirements of this condition and thereby causes a substantial adverse environmental impact is guilty of a third degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. Any person who knowingly violates the requirements of this condition and knows at the time of the violation that he is creating a substantial danger of death or serious bodily injury to any other person is guilty of a second degree felony and shall be sentenced in accordance with the provisions of NMSA 1978, § 31-18-15. [20.6.2.1220 NMAC, NMSA 1978, §§ 74-6-10.2.A through 74-6-10.2.F]
48.	COMPLIANCE with OTHER LAWS - Nothing in this Discharge Permit shall be construed in any way as relieving the permittee of the obligation to comply with all applicable federal, state, and local laws, regulations, permits or orders.

#	**Terms and Conditions**
	[NMSA 1978, § 74-6-5.L]
49.	RIGHT to APPEAL - The permittee may file a petition for review before the WQCC on this Discharge Permit. Such petition shall be in writing to the WQCC within thirty days of the receipt of postal notice of this Discharge Permit and shall include a statement of the issues to be raised and the relief sought. Unless a timely petition for review is made, the decision of NMED shall be final and not subject to judicial review. [20.6.2.3112 NMAC, NMSA 1978, § 74-6-5.O]
50.	TRANSFER of DISCHARGE PERMIT - Prior to the transfer of any ownership, control, or possession of this facility or any portion thereof, the permittee shall: 1) notify the proposed transferee in writing of the existence of this Discharge Permit; 2) include a copy of this Discharge Permit with the notice; and 3) deliver or send by certified mail to NMED a copy of the notification and proof that such notification has been received by the proposed transferee. Until both ownership and possession of the facility have been transferred to the transferee, the permittee shall continue to be responsible for any discharge from the facility. [20.6.2.3111 NMAC]
51.	PERMIT FEES - Payment of permit fees is due at the time of Discharge Permit approval. Permit fees shall be paid in a single payment or shall be paid in equal installments on a yearly basis over the term of the Discharge Permit. Single payments shall be remitted to NMED no later than 30 days after the Discharge Permit effective date. Initial installment payments shall be remitted to NMED no later than 30 days after the Discharge Permit effective date; subsequent installment payments shall be remitted to NMED no later than the anniversary of the Discharge Permit effective date. Permit fees are associated with <u>issuance</u> of this Discharge Permit. Nothing in this Discharge Permit shall be construed as relieving the permittee of the obligation to pay all permit fees assessed by NMED. A permittee that ceases discharging or does not commence discharging from the facility during the term of the Discharge Permit shall pay all permit fees assessed by NMED. An approved Discharge Permit shall be suspended or terminated if the facility fails to remit an installment payment by its due date. [Subsection F of 20.6.2.3114 NMAC, NMSA 1978, § 74-6-5.K]

V. PERMIT TERM & SIGNATURE

EFFECTIVE DATE: [effective date]
TERM ENDS: [expiration date]

draft

New Mexico Environment Department Ground Water Quality Bureau
Discharge Permit Summary

Facility Information

Facility Name — Waste Isolation Pilot Plant (WIPP)
Discharge Permit Number — DP-831

Legally Responsible Party
Jose Franco, Manager
U.S. Department of Energy
P.O. Box 3090
Carlsbad, NM 88221
(575) 234-7300

Treatment, Disposal and Site Information

Primary Waste Type — Domestic and Industrial
Facility Type — Federal Agency - U.S. Department of Energy

Evaporative Impoundment Locations

Domestic Wastewater

Type	Designation	Description & Comments
Settling Impoundment	Settling Lagoon 1	Formerly known as "Settling Pond 1A"; Primary treatment; Permitted 1 foot of freeboard.
Settling Impoundment	Settling Lagoon 2	Formerly known as "Settling Pond 2A"; Primary treatment; Permitted 1 foot of freeboard.
Polishing Impoundment	Polishing Lagoon 1	Formerly known as "Polishing Pond 1B"; Passive secondary treatment; Permitted 1 foot of freeboard.
Polishing Impoundment	Polishing Lagoon 2	Formerly known as "Polishing Pond 2B"; Passive secondary treatment; Permitted 1 foot of freeboard.
Evaporation Impoundment	Effluent Lagoon A	Formerly known as "Evaporation Pond A"; Effluent storage; Disposal by evaporation; Permitted 1 foot of freeboard.
Evaporation Impoundment	Effluent Lagoon B	Formerly known as "Evaporation Pond B"; Effluent storage; Disposal by evaporation; Permitted discharges are domestic waste, brine, purge waters, and miscellaneous industrial non-hazardous wastewater; Permitted 1 foot of freeboard.
Evaporation Impoundment	Effluent Lagoon C	Formerly known as "Evaporation Pond C"; Effluent Storage; Disposal by evaporation; Permitted discharges are domestic waste, brine, purge waters, and miscellaneous industrial non-hazardous wastewater; Permitted 1 foot of freeboard.

Storm Water Control

Type	Designation	Description & Comments
Storm Water Impoundment	Storm Water Pond 1	Formerly known as "Storm Water Intrusion Pond 1"; Receives clean non-contact storm water from paved areas, roofs, air conditioner condensate, and water from domestic water lines; Disposal by evaporation.

Storm Water Impoundment	Storm Water Pond 2	Formerly known as "Storm Water Intrusion Pond 2"; Receives clean non-contact storm after from the facilities paved areas, roofs, air conditioner condensate, and draining domestic water lines; Disposal by evaporation.
Storm Water Impoundment	Storm Water Pond 3	Formerly known as "Storm Water Intrusion Pond A"; Receives clean non-contact storm after from the facilities paved areas, roofs, air conditioner condensate, and draining domestic water lines; Disposal by evaporation.

Industrial Wastewater

Type	Designation	Description & Comments
Evaporation Impoundment	Evaporation Pond H-19	Permitted discharges are brine, purge waters, and miscellaneous industrial non-hazardous wastewater; 346, 085 gallons (with one foot of freeboard); Disposal by evaporation.
Evaporation Impoundment	Salt Storage Pond 1	Formerly known as "Salt Pile Evaporation Pond"; 1,677,633 gallons (with one foot freeboard); Disposal by evaporation
Evaporation Impoundment	Salt Storage Pond 2	Formerly known as "Salt Storage Extension Basin I"; Constructed using 60-mil HDPE liner, 200-mil geonet drainage layer, and a second 60-mil HDPE liner with a leak detection system;1,273,601 gallons (with one foot of freeboard); Disposal by evaporation.
Evaporation Impoundment	Salt Storage Pond 3	Formerly known as "Salt Storage Extension Basin II"; Constructed using 60-mil HDPE liner, 200-mil geonet drainage layer, and a second 60-mil HDPE liner with a leak detection system; 1,273,601 gallons (with one foot of freeboard); Disposal by evaporation.

Salt Storage Locations

Type	Designation	Description & Comments
Salt Pile	Salt Cell 1	Formerly known as "Salt Pile"; Inactive; Approximately 18.8 acres; graded to 2% slope covered with sand and 60 mil HDPE liner and with 2 ft. of native soil; Seeded; Run-off collects in to Salt Storage Pond 1.
Salt Pile	Salt Cell 2	Formerly known as "Salt Extension Cell A"; Active; 6.2 acres; Run-off area of 326,350 sq. ft.; Constructed using of six inch prepared subgrade, 60-mil HDPE liner, 200-mil drainage layer, eight oz. geotextile fabric covered with 2 ft. of native soil; Runoff collects in Storage Pond(s) 2 and/or 3.

Salt Pile	Salt Cell 3	Formerly known as "Salt Extension Cell B"; Active; 5.2 acres; run-off area of 272,850 sq. ft.; Constructed using of six inch prepared subgrade, 60-mil HDPE liner, 200-mil drainage layer, eight oz. geotextile fabric covered with 2 ft. of native soil; Runoff collects in Storage Pond(s) 2 and/or 3.
Salt Pile	Site Preliminary Design Validation Pile	Closed in 2000; Covered with a geosynthetic liner, 6 inches of bedding material, and three feet of soil; Seeded.

Flow Metering Locations

Type	Designation	Description & Comments
Totalizing Flow Meter	Ultrasonic Flow Meter	Located at the facility Pump House – water supply; Estimates domestic wastewater discharged to the facultative sewage impoundment system.
Primary Measurement Device	Time Recorder	Estimates miscellaneous wastewater discharged to Evaporation Pond H-19 and Facultative Lagoon System.

Ground Water Monitoring Locations

Type	Designation	Description & Comments
Monitoring Well	C-2505	Quarterly depth to water measurement.
Monitoring Well	C-2506	Quarterly depth to water measurement.
Monitoring Well	C-2507	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Monitoring Well	C-2811	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Monitoring Well	WQSP-6A	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO_4, Cl, TDS, TKN and NO_3.
Piezometer	PZ-4	Quarterly depth to water measurement.
Piezometer	PZ-5	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.

Piezometer	PZ-6	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-7	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-8	Quarterly depth to water measurement.
Piezometer	PZ-9	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-10	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-11	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-12	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-13	Quarterly depth to water measurement; Semi-annual collection of field parameters for temperature, pH, and specific conductance; Semi-annual monitoring for SO4, Cl, and TDS.
Piezometer	PZ-14	Quarterly depth to water measurement.
Piezometer	PZ-15	Quarterly depth to water measurement.

Depth-to-Ground Water 164 feet
Total Dissolved Solids (TDS) 3,400 mg/L

Permit Information

Application Received May 10, 2013
Public Notice Published [not yet published]
Discharge Permit Issued [effective date]
Discharge Permit Term Ends [term end date]
Permitted Discharge Volume Domestic – 23,000 gallons per day
Industrial – 4,224,835 gallons per day

Inspection Report

Inspection Date: 1/14/2014 **DP #:** 831
Facility Name: Waste Isolation Pilot Plant (WIPP)

Facility Contact Information – Scheduling Inspection

☑ **Scheduled Inspection - provide contact information** ☐ **Unannounced Inspection**

Person Contacted: George Basabilvazo

Phone Number: 575-234-7488

Facility Description

Waste Type: Dom - WW Impoundments, Mining - Salt Tailing Impoundments, Storm Water - Impoundments

Directions to Facility: From Carlsbad, take Hwy. 285 to 31. Go East on 31 for approximately 8 miles, and drive past the salt lake. Take 128 East for approximately 10 miles. Turn left on to WIPP Rd. and drive for approximately 5 miles. Facility map is attached.

Inspection Information

Start Time: 1:30 **End Time:** 5:00

NMED Inspector(s): Melissa Halick, Russell Isaac

Verify that NMED identification was presented: ☑ Yes ☐ No

Facility Representative(s) present during the Inspection/Discussion: George Basabilvazo, and two environmental contractors for WIPP

Reason for Inspection: permit pre-approval

If "other", describe reason for inspection:

Discussion, Observations and Information Obtained

Initial discussion included a brief overview of the site. The facility is on 34 acres with one disposal and three storm water control impoundments, three impoundments that collect runoff from three salt tailing piles, and an evaporative lagoon system (7 impoundments). The facility has four shafts that have been excavated to approximately 2,000 below surface – one air-intake shaft, one salt shaft, one exhaust shaft, and one disposal shaft that contains TRU waste (active disposal).

Storm Water Impoundments

Evaporation Pond A – will be renamed Storm Water Pond #3 in renewal permit. Some cattails in lagoon (non-root forming) - will not damage 60 mil HDPE liner. Can see that minor repairs have been made near the top of the impoundment. Collects storm water from the west 1/3 of facility (approximately 12 acres) – fresh water. Liner is in good condition, was installed ~2006.

Pond #1 – will be renamed Storm Water Pond #1 in the renewal permit. Liner is in good condition.

Pond #2 – will be renamed Storm Water Pond #2 in the renewal permit. Liner is in good condition.

H-19 – approximately 1 foot of sediment in the corners of impoundment. Accepts purge water and non-hazardous water from exhaust shaft (after analyzed). Impoundment is in decent condition with no visible damage. Very low liquid level. Permittee stated that they may look into reclamation and closure if they chose not to replace the pond liner in the future. Not essential for facility operations.

Salt Piles and Salt Pile Impoundments

SPEP (Impoundment) – will be renamed Salt Storage Pond #1 in renewal permit. Collects runoff from geosynthetic covered Salt Pile. Lined ditch that is south of the Capped Salt Pile drains into the SPEP. Liner is intact and clear of brush. Liquid level was low.

SSEB #1 (Impoundment) – will be renamed Salt Storage Pond #2 in renewal permit. Double lined impoundment with leak detection system. Drains to an additional storage pond to the west (SSEB #2) if permitted freeboard cannot be maintained. Liquid level was not approaching freeboard. A large volume of salt deposits was present. Liner is in good condition.

SSEB #2 (Impoundment) – will be renamed Salt Storage Pond #3 in renewal permit. Double lined impoundment with leak detection system. Liquid level was very low with minimal salt deposits. Site personnel mentioned that the sump pumps are checked every quarter and that the liquid collected between the liners is pumped back into the impoundments. Impoundment was constructed to collect overflow from SSEB #1.

Capped Salt Pile – will be renamed Salt Cell #1 in renewal permit. Area has been reseeded and berms on top of pile are in good condition. The topographic low area at the top of the pile drains to a lined conveyance that discharges to the SPEP. Pile was reconfigured to minimize erosion and runoff. During inspection erosion was minimal.

SEP A (Salt Pile) – will be renamed Salt Cell #2 in the renewal permit. Salt pile is no longer active. Lined ditch north of the salt pile drains to SSEB #1. Not reseeded or capped with geosynthetic liner.

SEP B (Salt Pile) – will be renamed Salt Cell #3 in the renewal permit. Active salt pile – salt tailings transferred to this location as excavation activities continue. Currently, an unrelated company (Texas) is hauling away salt from active pile for free.

Domestic Wastewater Impoundments

2 Primary Lagoons (1A and 1B) – low volume of accumulated sludge. Liquid levels were low – approximately 5 feet of freeboard. Site personnel mentioned that the ponds are inspected daily as part of the facility wastewater operations. They also estimate wastewater discharge using the water supply for the facility – no irrigation at the facility. Liners are in good condition.

2 Polishing Lagoons (2A and 2B) – liners are in good condition. Clear of brush.

3 Evaporation Lagoons (3A, 3B, and 3C) – Evaporation Pond A is permitted to take additional water from other resources – storm water, purge water, processing water, etc. Documented in DP-file. Evaporation Ponds 3B and 3C are not permitted to accept additional liquid generated at the facility. Liquid levels in all evaporation lagoons were very low. Some deposits within the evaporation lagoons appear to be salt deposits (most likely from the high TDS water supply). Sand bags were placed at the bottom of Evaporation Pond 3C to hold down the liner (not enough volume).

The wastewater treatment area was surrounded by locked fences with signs displayed in English and Spanish approximately every 10 feet.

Photographic Documentation

Photos Taken? ☑ Yes - see attached ☐ No

Sample Information

Samples Collected? ☐ Yes ☑ No

Samples Collected by: Choose an item.

Sample Id #s and locations:

Were samples split between permittee and NMED? ☐ Yes ☐ No ☑ N/A

<<Carlsbad-WIPP Map>>

Attached is a map for your use. There are two ways to access the WIPP site. The dark blue highlight on the map is for the southern access and is used by most WIPP workers the drive in from Carlsbad. I recommend you initially try the northern access route it is four lane to the WIPP turn off. The northern access is via 62/180 to Hobbs and the WIPP turn off is about 30 miles east of Carlsbad. Once your turn south on the WIPP access road the WIPP Facility is located about 12.5 miles south of the turn off. I look forward to meeting you and showing you the surface areas around WIPP. The traffic around southeast New Mexico (e.g., Carlsbad and WIPP) is very heavy with oil and gas traffic so please use extra caution and I recommend driving with your headlights on.

If you have any question please call.

Best regards,

George

Subject: RE: WIPP GW Permit

Hi Trais,

I don't know if you are aware of this but Intrepid Potash has applied to modify their DP-1681 to increase their brine injection rate from 2000 gpm to 3000 gpm. They intend to install three new brine production wells to generate this brine and the production wells will be screened across both the Culebra and the Magenta dolomites. I've attached their permit application that includes a map of where they intend to install these wells (IP-WS 5,6&7 on Figure PM-06). Their new brine mixture will then be sourced from the 1) production wells 1-4, 2)tailings brine recovery water (TBR) discharges from their tailings pile, and 3) production wells IP-WS-5,6&7. I wanted to give you a heads up on this and ask that you let me know if any concerns arise.

Also, I have been toying with the idea of incorporating WIPP's monitoring wells and water quality data into a common GIS database with Intrepid and Mosaic's monitoring wells. This would be a common GIS database that Melissa and HWB and others could access. I recognize from my reading of the WIPP compliance certification documents that WIPP or Sandia Labs is using Arc Info (at least they budgeted to purchase the software) and I am wondering whether WIPP or one of their contractors has actually created a GIS database with well locations and other topology? If they have, I would like to ask if you could put me in contact with the persons who would be able to give me access to their GIS files. If their data management system has not evolved to that stage yet, I 'd like to suggest that this might be one of the problems that our various agencies could work on collaboratively. Perhaps in the later part of January we could get together and talk about this and it would be good to include Melissa and someone from the SEO and the ISC as well.

Thanks,

Larry

Subject: Panel 6 Closure and Final Waste Emplacement Notifications

Dear Mr. Kieling:

The purpose of this letter is to notify the New Mexico Environment Department (NMED) that the Permittees intend to commence closure of Hazardous Waste Disposal Unit Panel 6 at the Waste Isolation Pilot Plant (WIPP) facility. This notification fulfills the requirements of the WIPP Hazardous Waste Facility Permit (Permit), NM48900139088-TSDF, Permit Part 6, Section 6.4 and Permit Attachment G, Section G-1b, *Requirements*, to notify NMED 60 days prior to the date on which closure activities are scheduled to begin, and Attachment G, Section G-1d(1), *Schedule for Panel Closure*, to notify the NMED 30 days prior to placing the final waste in a panel.

Final waste emplacement in Panel 6 is expected on or about January 29, 2014. Closure activities are expected to begin on or about January 29, 2014. The actual date is dependent on the availability of waste and may change.

We certify under penalty of law that this document and all attachments were prepared under our direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Re: *Administrative Completeness Determination and Applicant's Public Notice Requirements, DP-831, Waste Isolation Pilot Plant*; letter from Jerry Schoeppner, Chief Ground Water Quality Bureau to Mr. Jose Franco, Manager, Waste Isolation Pilot Plant, received on June 3, 2013

Dear Mr. Marshall:

The purpose of this letter is to provide you documentation that the Public Notice for the Waste Isolation Pilot Plant Discharge Permit 831 renewal application was published in the Carlsbad Current-Argus on June 13, 2013, and the signed Affidavit of Public Notice Completion. This submission to you satisfies the requirements noted in the *Administrative Completeness Determination and Applicant's Public Notice Requirements, DP-831, Waste Isolation Pilot Plant* received on June 3, 2013, and the public notice of permit renewal as specified in 20.6.2.3108.D NMAC.

If you have any questions regarding this transmittal, please contact me at (575) 234-7488.

Sincerely,

George T. Basabilvazo

The Waste Isolation Pilot Plant Hazardous Waste Facility Permit Community Relations Plan is Currently Being Updated

The U.S. Department of Energy Carlsbad Field Office and Nuclear Waste Partnership LLC (the Permittees) are seeking public comments to improve the Waste Isolation Pilot Plant (WIPP) Hazardous Waste Facility Permit Community Relations Plan (the Plan).

The Permittees also have proposed changes to the Plan that include:

- Co-Permittee name change from Washington TRU Solutions LLC to Nuclear Waste Partnership LLC, the current WIPP Project management and operating contractor
- Clarification to Section 3.5 of Plan that describes how members of the public may be added to Facility Mailing List
- Clarification to Section 3.7 to describe how public viewpoints can be documented for the record
- Changes to standardize capitalization and hyphenation

The Permittees' proposed changes to the Plan are identified by red text with a double underline for new text and a strikeout font for deleted information. See "Read the Plan."

We encourage members of the public to submit comments or suggestions. Your ideas will help us to provide a plan that continues to meet the public need for permit-related information. Comments may be submitted by:

- E-mail to Communityrelations@wipp.ws
- Access http://www.wipp.energy.gov/WIPPCommunityRelations/index.html online. Click on the "Comments" tab, type in your comments and submit them.
- Call the toll-free number at 1-866-271-9640 to speak directly to WIPP Project staff

Based on timely resolution of comments, text changes to the Plan will become effective on June 24, 2013.

The Permittees are required to post comments, consultations, communications, agreements and disagreements between the Permittees and members of the public on the Community Relations Plan Web page. Comments and suggestions will only be posted with the express consent of the contributor.

1.0 Introduction

1.1 Plan Required by Permit

This Community Relations Plan is a requirement of the Hazardous Waste Facility Permit (Permit) for the U.S. Department of Energy's Waste Isolation Pilot Plant (WIPP) facility. The New Mexico Environment Department (NMED) re-issued the ten year Permit to the U.S. Department of Energy and Nuclear Waste Partnership LLC (NWP) ~~Washington TRU Solutions LLC~~ (the Permittees) in November 2010.

1.2 Participants

The intended participants to this Community Relations Plan are interested members of the public who reside within the state of New Mexico, and include individuals, organizations, special interest groups, federal, state and local government entities, tribal governments and tribal members.

1.3 Purpose

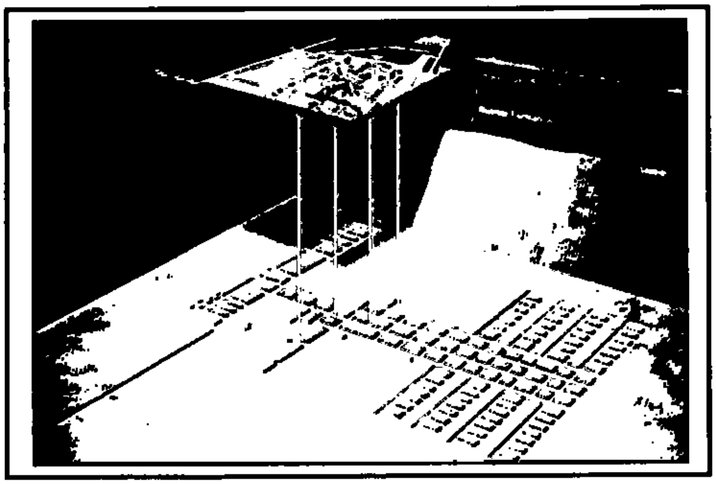
The purpose of the WIPP Hazardous Waste Facility Permit Community Relations Plan (the Plan) is to provide Permit-related information to communities and interested members of the public and to alert the public to opportunities for participation in the permit process. Permit-related activities include waste disposal operations, facility closure, post-closure and Permit-driven corrective actions.

The U.S. Department of Energy (DOE) operates the WIPP facility in a transparent manner. The DOE has conducted WIPP Project outreach programs in New Mexico for more than two decades to establish open working relationships with communities, tribal governments and residents statewide. The Permittees view this Plan as an opportunity to expand public participation and dialogue in the WIPP facility Permit process.

The Plan is web-based to reach a broad spectrum of New Mexico residents and tribal governments. Alternate methods to disseminate permit-related information to members of the public who may not have computer access are included in this Plan. These avenues of communication are further discussed in Section 3.0 How to Use this Plan.

2.0 Overview of the Waste Isolation Pilot Plant

So that members of the public may better understand the WIPP mission and Permit, this Plan begins with an overview of the WIPP facility.



The WIPP facility is owned and operated by the DOE through its Carlsbad Field Office (CBFO). Nuclear Waste Partnership LLC (NWP) ~~Washington TRU Solutions LLC (WTS~~ is the co-operator of the WIPP facility and performs day-to-day plant operation. The DOE and NWP ~~WTS~~ are co-Permittees to the Permit.

2.1 Location and Facility

The WIPP facility is located 26 miles southeast of Carlsbad, New Mexico. It is designed and operated for the safe disposal of transuranic, or TRU, radioactive waste resulting from U.S. nuclear defense programs.

In 1992, Congress withdrew 16 sections of land from the public domain to be used by the DOE for the WIPP facility. The WIPP facility consists of surface facilities to receive and prepare waste for disposal and an underground repository that includes disposal rooms excavated from a geologically stable salt formation nearly one-half mile underground.

2.2 TRU Waste

TRU waste is solid material such as protective clothing, rags, tools, soils and residues contaminated with radioactive elements–mostly plutonium. The majority of this waste resulted from government research and the production of nuclear weapons. TRU waste will also be generated as some DOE sites are decommissioned.

Some TRU waste contains non-radioactive chemicals such as solvents which are classified as hazardous waste under federal and state law. The WIPP Permit is required to manage and dispose of these TRU and hazardous "mixed" wastes.

The NMED regulates the management and disposal of the hazardous waste contained in TRU mixed waste. In 1999, NMED issued the initial WIPP Permit that allowed the DOE to receive its first waste shipment from Los Alamos National Laboratory in northern New Mexico for disposal at the WIPP facility. The Permit was renewed for a ten year period in 2010.

The project life cycle and the amount of waste to be disposed at the WIPP facility is detailed in the Permit as follows: "During the disposal phase of the facility, which is expected to last 25 years, the total amount of waste received from off-site generators and any derived waste will be limited to 175,600 cubic meters of TRU waste, of which up to 7080 cubic meters may be remote-handled TRU (RH-TRU) mixed waste. For purposes of the WIPP Permit, all TRU waste is managed as though it were mixed."

2.3 Regulatory Background and the Hazardous Waste Facility Permit

In 1976, the U.S. Congress passed the Resource Conservation and Recovery Act (RCRA) to regulate "cradle to grave" management of hazardous waste. In accordance with RCRA, the U.S. Environmental Protection Agency (EPA) can authorize states to implement their own hazardous waste regulatory programs in lieu of the federal program. The State of New Mexico is authorized to implement and enforce its own hazardous waste management program which includes regulating the hazardous components in TRU mixed waste that are disposed at the WIPP facility.

The EPA certifies DOE compliance with environmental standards for the disposal of radioactive materials such as the TRU waste disposed 2,150 feet underground. At five year intervals, the DOE must demonstrate to EPA through a recertification process that the WIPP underground repository will continue to safely contain radionuclides for 10,000 years.

This Plan is specific to the New Mexico Hazardous Waste Management Program.

3.0 How to use this Plan

3.1 Elements of the WIPP Community Relations Plan

The Permit identifies six objectives that this Plan is to address:

1. Establish working relationships with communities and interested members of the public.
2. Establish productive government to government relations between the U.S. Department of Energy and affected tribes and pueblos.
3. Inform communities and interested parties of permit activities.
4. Minimize disputes and resolve differences with communities and interested members of the public.
5. Provide timely responses to individual requests for information.
6. Establish mechanisms for communities and interested members of the public to provide feedback and input to the Permittees.

3.2 A Broad Approach to Communicating Permit Activities

The Permittees determined that the most effective way to meet Permit objectives is a universal approach to communications with individuals, organizations, special interest groups, federal, state and local government entities, tribal governments and tribal members in New Mexico. The Plan makes Permit-related information available to interested New Mexicans through various points of access.

Tribal governments and tribal members will be provided information about WIPP Permit-related actions in the same manner as that outlined in this Plan for communities, the general public and interested parties.

3.3 Community Relations Plan Web page

This Web page provides information on current permit activities and public meeting schedules, and includes a link to the *WIPP Permit Information Repository* where members of the public can access specific documents related to the current Permit and other Permit resources.

To assure public access, the Web page includes instructions for software required to view documents in the WIPP Permit Information Repository and provides free downloads to public reviewers, as needed.

Documents available in the WIPP Information Repository include:

- WIPP Hazardous Waste Facility Permit renewal application, Parts A and B
- A complete copy of the Permit, as it may be modified
- Permit modification notifications and requests associated with the Permit and any associated responses from the NMED
- Waste Minimization Report submitted per Permit Part 2, Section 2.4
- Extensions of time submitted per Permit Part 1, Section 1.10.3
- Corrective action documents submitted per Permit Part 8

- Written reports, such as notifications of planned changes, submitted per the Permit Part 1, Sections 1.7.11 and 1.7.13
- Notices of Deficiency or disapproval, responses, final approval letters and directives from the NMED associated with renewal permit applications, permit modifications and corrective action documents
- Notices of Violation or administrative compliance orders, and responses to such required by the NMED and directives from the NMED associated with the Permit
- Biennial Reports submitted per Permit Section Part 2, Section 2.14.2

3.4 Notifications in major newspapers

Notifications regarding substantive (Class 2 and 3) requests by the Permittees to modify the Permit are published in major local newspapers. Included in the notification is a description of the proposed permit change, dates for a public comment period, contact information at NMED and the WIPP Project , and the time, dates and locations for public meetings.

3.5 Facility mailing list

The facility mailing list consists of individuals, organizations, special interest groups, federal, state and local government entities, tribal governments and tribal members who have expressed interest in being notified by mail of WIPP permit-related actions. By regulation, the NMED maintains the WIPP facility mailing list; the Permittees are responsible for certain mail-outs to subscribers.

The facility mailing list benefits infrequent users of the Community Relations Web page and members of the public who do not have computer access. There are a number of opportunities to subscribe to the facility mailing list below. Please include your name, mailing address, phone number and organization, if any, when you subscribe to the list.

-

- Email the request to communityrelations@wipp.ws and request to be added to the list

- Email the request directly to the New Mexico Environment Department WIPP Web page at trais.kliphuis@state.nm.us

- Call 1-866-271-9640 and request Bobby St. John, Nuclear Waste Partnership ~~Washington TRU Solutions~~, to ~~add~~ forward your name to NMED for inclusion on the list

- Mail a request to subscribe:

Trais Kliphuis New Mexico Environment Department 2905 Rodeo Park Drive East Building 1 Santa Fe. N.M. 87505	OR	Bobby St. John Nuclear Waste Partnership ~~Washington TRU Solutions~~ P.O. Box 2078

- Sign up at WIPP Hazardous Waste Facility Permit public meetings

3.6 Email Notification Service

The Permittees also maintain a Permit-related email notification service. Subscribers to this service are assured timely email notification for a specific set of permit actions. Adding your name to the email notification service is quick and easy.

Just click here http://www.wipp.energy.gov/Stakeholders/Notice.aspx and follow the directions for sign up.

3.7 Public meetings

Federal and state regulations require hazardous waste facilities to schedule public meetings for proposed Class 2 and 3 permit modification requests. These public meetings provide the Permittees a forum to explain the purpose of the Permit modification request and for members of the public to ask questions and express their views by submitting written comments. The general public is notified of public meeting schedules in major local newspapers.

Interested members of the public are encouraged to monitor the Community Relations Web page, subscribe to the WIPP facility mailing list and email notification system for public meeting schedules related to Permit modification requests.

3.8 Community Relations Plan email address

A dedicated Community Relations Plan email address provides the public direct communication to Permittee staff for inquiries related to the permit. The email account is monitored by staff members during normal business hours, Monday through Friday, 7:30 a.m. to 4:30 p.m. The Permittees will respond to requests as quickly as possible, within the constraints of applicable regulations such as those involving dissemination of security or personal information.

That email address is communityrelations@wipp.ws.

3.9 Toll-free telephone number

A Community Relations Plan toll free telephone number is a convenient way to contact Permittee staff for permit-related information or questions. The toll free number will be staffed during normal business hours, Monday through Friday from 7:30 a.m.to 4:30 p.m.

The toll-free number is 1-866-271-9640.

3.10 Public outreach products

To increase public awareness of the Plan, the Community Relations Plan Web page address, toll-free telephone number and dedicated email address will be printed on WIPP Project information products and Permit- related public notifications in major local newspapers.

.0 Community Relations Plan Goals

4.1 Changes to the Plan

The goal of this Plan is to provide timely information to members of the public about Permit actions and opportunities for participation in the Permit process so that they can make informed decisions about Permit actions.

The Plan is intended to be useful and responsive to public information needs related to the Permit. It is a "living" document which is expected to change throughout the 10 year Permit period to accommodate public and Permittee input as well as new communication technologies.

In May of each year of the current Permit period, the Permittees will solicit comments and suggestions from interested stakeholders through major local newspapers, the facility mailing list and the Web-based Community Relations Plan. Periodic changes may be made to the Plan to enhance functionality and content. Members of the public are encouraged to send comments or suggestions to improve the Plan at any time. Comments may be sent by email (see **Comments** on the Web Page menu), or by mail to:

Bobby St. John, Nuclear Waste Partnership ~~Washington TRU Solutions~~, P.O. Box, 2078, Carlsbad, N.M., 88221

4.2 Resolving Differences between the Public and Permittees Regarding the Community Relations Plan

The Permittees will give careful consideration to public comments and suggestions, and work in consultation with communities and with interested members of the public to avoid disputes and to resolve differences regarding the Community Relations Plan.

The Permittees will address comments that require a response and provide the response to the community or individual who originated it. Responses specific to this Plan will be posted to the Community Relations Plan Web page, with the consent of the parties involved.

5.0 Resources

The Permittees will provide the resources necessary to maintain the Plan for as long as the Plan is a requirement of the Permit.

6.0 Records Management

Consistent with Permit requirements, the Permittees will document all Permit-related consultations, communications, agreements and disagreements between the Permittees and members of the public related to the development and administration of the Plan.

These communications and responses will become part of the WIPP facility operating record and will be posted annually to the Plan Web page, with the express consent of the commenting individual or group.

PUBLIC COMMENT
U.S. Department of Energy
Waste Isolation Pilot Plant Hazardous Waste Facility Permit
Community Relations Plan

WHO: The U.S. Department of Energy and Nuclear Waste Partnership LLC (the Permittees) are seeking public comments and suggestions to improve the Waste Isolation Pilot Plant Hazardous Waste Facility Permit Community Relations Plan as part of the WIPP Hazardous Waste Facility Permit (Permit Number: NM4890139088-TSDF) issued by the New Mexico Environment Department.

New Mexico residents, organizations, interest groups, federal, state and local government entities, tribal governments and tribal members are encouraged to provide comments or suggestions to the Permittees to enhance the Plan.

WHAT: The Community Relations Plan is designed to inform communities and interested members of the public about WIPP Hazardous Waste Facility Permit activities and opportunities for public participation in those activities.

PLAN ELEMENTS:

Part 1, Section 1.15.2 of the WIPP Hazardous Waste Facility Permit identifies six key elements of the Plan:

1. Establish working relationships with communities and interested members of the public.
2. Establish productive government to government relations between the U.S. Department of Energy and affected tribes and pueblos.
3. Inform communities and interested parties of permit activities.
4. Minimize disputes and resolve differences with communities and interested members of the public.
5. Provide timely responses to individual requests for information.
6. Establish mechanisms for communities and interested members of the public to provide feedback and input to the Permittees.

WHEN: The Permittees have proposed updates to the Plan which will be mailed to individuals on the WIPP Facility Mailing List by May 23, 2013, for comment. Proposed updates are available online at: http://www.wipp.energy.gov/WIPPCommunityRelations/index.html. Based on timely resolution of comments, changes to the Plan will become effective June 24, 2013.

HOW TO PROVIDE COMMENTS:

Contact the Permittees by e-mail, telephone or by mail to receive a copy of the updated WIPP Hazardous Waste Facility Permit Community Relations Plan and a comment form.

Comments and suggestions can be made online by accessing the Plan at: http://www.wipp.energy.gov/WIPPCommunityRelations/index.html and clicking on "Comments."

E-mail: communityrelations@wipp.ws

Toll free telephone number: 1-800-234-7280 – available during normal business hours, Monday through Friday, 7:30 a.m.-4:30 p.m. MST

Mailing address: Bobby St. John, Nuclear Waste Partnership, P.O. Box 2078, Carlsbad, NM 88221

RE: Administrative Completeness Determination and Applicant's Public Notice Requirements, DP-831, Waste Isolation Pilot Plant

Dear Mr. Franco:

The New Mexico Environment Department (NMED) received a Ground Water Discharge Permit Application for the above referenced facility on May 10, 2013. Pursuant to Section 20.6.2.3108 NMAC of the New Mexico Water Quality Control Commission Regulations (20.6.2 NMAC), NMED determined on May 15, 2013 that your application is administratively complete.

Within 30 days of the date when the US Postal Service first makes notice to you of its possession of this letter, you must provide public notice. Instructions and materials needed to complete the public notice are enclosed.

After NMED receives the completed proof of public notice, a technical reviewer will contact you if additional information is needed to process your application. If you have a deadline of concern in the interim or any questions, please call the Ground Water Quality Bureau at (505) 827-2900.

Sincerely,

Naomi David

for Jerry Schoeppner, Chief
Ground Water Quality Bureau

enc: Instructions for Completing Public Notice Requirements
Affidavit
Public Notice Flyer
Text for Newspaper Display Ad

INSTRUCTIONS FOR COMPLETING PUBLIC NOTICE REQUIREMENTS

Discharge Permit Renewal DP-831

Within 30 days of the date NMED deemed your Discharge Permit application administratively complete, you must provide public notice as follows:

1. **Mail a public notice flyer to the owner of the discharge site.**
   A copy of the enclosed public notice flyer must be sent via certified mail, return receipt requested, to the owner(s) of the discharge site(s), if the applicant is not the owner. The list of owners' names and addresses and the certified mail receipts must be submitted to NMED.

2. **Place a display ad in the newspaper.**
   A display ad 2 x 3 inches in size must be published for one day in a newspaper of general circulation in the location of the proposed discharge. The ad may not be placed in the classified or legal section. The text for the ad is enclosed. NMED approves publishing the ad in the following newspaper:

   Carlsbad Current-Argus

PROOF OF NOTICE. Within 15 days of completing the above requirements, the applicant must submit the following items as proof of notice to NMED:

- ✓ List of names and addresses of owners of discharge sites.
- ✓ Certified mail receipts for mailing to discharge site owner(s), if required.
- ✓ Copy of newspaper ad.

Send to NMED Ground Water Quality Bureau, PO Box 5469, Santa Fe, NM 87502.

PUBLIC NOTICE

Discharge Permit Application

Waste Isolation Pilot Plant, DP-831

DP-831, Waste Isolation Pilot Plant, Jose Franco, Manager, proposes to renew the Discharge Permit for the discharge of up to 23,000 gallons per day of domestic wastewater and 2,752,831 gallons per day of storm water to a treatment and disposal system. Potential contaminants from this type of discharge include nitrogen compounds, sulfate, chloride, and total dissolved solids. The facility is located on the Jal Highway, approximately 26 miles southeast of Carlsbad, in Section 20, 28, and 29, T22S, R31E, Eddy County. Ground water beneath the site is at a depth of approximately 164 feet and has a total dissolved solids concentration of approximately 3,400 milligrams per liter.

The applicant is seeking a Discharge Permit for the proposed discharge. Provided the applicant has met applicable requirements, the New Mexico Environment Department (NMED) will propose a Discharge Permit containing limitations, monitoring requirements, and other conditions intended to protect ground water quality for present and potential future use. Information in this public notice was provided by the applicant and will be verified by the New Mexico Environment Department during the permit application review process. NMED will accept comments and statements of interest regarding the application and will create a facility specific mailing list for persons who wish to receive future notices.

You may send comments or statements of interest to:

Clint Marshall, DP-831
Ground Water Quality Bureau
PO Box 5469
Santa Fe, NM 87502.

Subject: Waste Isolation Pilot Plant Discharge Permit 831 Renewal Application

Dear Mr. Marshall:

Enclosed are three copies of the Discharge Permit 831 (DP-831) Renewal Application for the Waste Isolation Pilot Plant (WIPP) located in Eddy County, New Mexico and the $100.00 filing fee.

Please contact George T. Basabilvazo at (575) 234-7488, if you have any questions regarding this transmittal.

Sincerely,

José R. Franco, Manager
Carlsbad Field Office

Type of Application. Check appropriate box.

☐ Application for new Discharge Permit -- new facility

☐ Application for new Discharge Permit -- existing (unpermitted) facility

☐ Application for Discharge Permit Renewal

☐ Application for Discharge Permit Modification
"Modification" is defined as a change to the permit requirements that result from a change in the location of the discharge, a significant increase in the quantity of the discharge, or a significant change in the quality of the discharge.

X Application for Discharge Permit Renewal and Modification

For an existing Discharge Permit, please indicate: DP Number 831 Expiration date 09/09/2013

Checklist of Application Components.

X Part A: Administrative Completeness.	*Instructions for completing the application are included on the form itself and on Supplemental Instructions for Parts A and B.* *You may fill out the application manually, or a Microsoft Word version may be downloaded from www.nmenv.state.nm.us (Ground Water Quality) and filled out electronically.*
X Part B: Operational, Monitoring, Contingency and Closure Plans, with required attachments. *Choose appropriate option*: ☐ Septic Tank System **X** General – Various Facility Types	
X Part C: Site Information, with required attachments.	
X $100 Filing Fee, payable to the New Mexico Environment Department. *Required from all applicants.* An additional fee will be assessed prior to permit issuance. Permit fees are listed in Section 20.6.2.3114 NMAC.	

Certification. Signature must be that of the person named in Item A-3 of Part A of the application.

I certify under penalty of law that I am knowledgeable about the information contained in this application. The information is, to the best of my knowledge and belief, true, accurate and complete.

Signature: Jose R Franco Date: 5/9/13

Printed Name: Jose R. Franco

Title: Manager

Send three complete copies of this application and the filing fee to:
Program Manager
Ground Water Pollution Prevention Section
New Mexico Environment Department
PO Box 5469
Santa Fe, NM 87502

Supplemental Information:

This Application reflects name changes of ponds, basins, and cells that better reflect the function of the structures as well as enhancing the order of the structures for their purpose. The new names are found throughout the application, however, drawings and maps reflect the previous names of the structures. When the Permit renewal is granted by the NMED-GWQB, initiation of the changes on the drawings will follow. The proposed name changes are listed below:

Sewage Treatment Facility Lagoons

BUREAU

GROUND WATER DISCHARGE PERMIT APPLICATION
PART A: ADMINISTRATIVE COMPLETENESS
All Facilities

A-1. Facility Information. See Supplemental Instructions to determine what constitutes the "facility." The physical location of the facility must be provided. If the facility does not have an address, the location can be described by road intersections, mile posts, or landmarks, as appropriate.

Facility Name: Waste Isolation Pilot Plant (WIPP)

Former Names (if any):

Physical address/location (mandatory): 26 miles east-southeast of Carlsbad, NM. Driving east from Carlsbad on U.S. Highway 62/180 turn onto the WIPP access road just east of mile marker 64, proceed 12.5 miles to the facility.

County: Eddy

Mailing address: P.O. Box 3090
Carlsbad, NM 88221-3090

Contact person: Mr. George Basabilvazo

Title: Director, Office of Environmental, Safety, and Health

Telephone number(s): 575-234-7488

Fax number: 575-234-7061 E-mail address: george.basabilvazo@wipp.ws

A-2. Type of Discharge and Type of Facility. See Supplemental Instructions.

Type of discharge: X Domestic ☐ Agricultural X Industrial ☐ Mining

Type of facility: The facility's primary mission is the disposal of defense generated transuranic (TRU) and TRU mixed waste in a geologic repository constructed using conventional mining techniques. Domestic wastewater is treated in the sewage treatment facility. Wastewater from industrial related activities is evaporated in synthetically lined ponds/lagoons. Stockpiles of excavated rock (primarily halite) are stored on site and associated storm water run-off is collected and evaporated in synthetically lined ponds.

A-3. Applicant Information. The applicant is the person or entity (e.g., corporation, partnership, organization, municipality, etc.) legally responsible for the discharge and for complying with the terms of the Discharge Permit. If the applicant is an entity, then the name and title of a contact person must be provided. This application must be signed by the applicant or contact person named here.

Applicant Name: U.S. Department of Energy, Carlsbad Field Office

Mailing address: P.O. Box 3090
Carlsbad, NM 88221-3090

Contact person: Mr. Jose R. Franco

Title: Manager

Telephone number(s) 575-234-7300

Fax number 575-234-7027 E-mail address jose.franco@wipp.ws

A-4. Consultant Information (if applicable). If the consultant is a company or organization, then the name and title of a contact person must be provided.

Consultant/Firm Name NA

Mailing address

Contact person

Title

Telephone number(s)

Fax number E-mail address

A-5. Permit Contact Information (if applicable). If someone other the applicant listed in Item A-3 or a consultant listed in Item A-4 is a primary contact for this application and/or facility, list here.

Permit Contact Name Mr. George Basabilvazo

Title Director, Office of Environmental, Safety, and Health

Mailing address P.O. Box 3090

Carlsbad, NM 88221-3090

Telephone number(s) 575-234-7488

Fax number 575-234-7061 E-mail address george.basabilvazo@wipp.ws

A-6. Ownership.

The applicant owns (check as appropriate): X the facility ☐ some discharge sites X all discharge sites

If other parties own the facility or any of the discharge sites, attach their names and contact information.

A-7. Discharge Quantity.

Your Discharge Permit will specify a maximum discharge volume, which is typically expressed as the maximum number of gallons per day that may be treated and/or disposed of. Please indicate below the maximum discharge volume for your facility. You must show how it was determined in Part B of your application. For further explanation, see Supplemental Instructions for Part B.

Sewage Treatment Facility (Settling Lagoons 1 & 2 and Polishing Lagoons 1 & 2):

Domestic effluent and non-hazardous industrial waste water from compressed air systems are discharged into the sewage system.

Maximum discharge volume: 23,000 gallons per day

Sewage Treatment Facility Effluent Lagoon A:

Maximum Discharge Volume: 50,000 gallons per day

Sewage Treatment Facility Effluent Lagoon B:

Maximum Discharge Volume: 50,000 gallons per day

Sewage Treatment Facility Effluent Lagoon C:

Maximum Discharge Volume: 50,000 gallons per day

Evaporation Pond H-19:

Maximum Discharge Volume: 50,000 gallons per day

Infiltration Control Ponds:

Salt Storage Pond 1:

Maintain 1 foot freeboard

Salt Storage Pond 2 interconnected with Salt Storage Pond 3:

Maintain 1 foot freeboard

Storm Water Pond 1, Storm Water Pond 2, and Storm Water Pond 3:

Maintain 1 foot freeboard.

A-8. Processing, Treatment, Storage and Disposal System. Briefly describe how wastewater, sludge, etc. is processed, treated, stored, and/or disposed of at your facility. See Supplemental Instructions for examples of system components.

A. Sewage Treatment Facility

The WIPP sewage treatment facility is a facultative system designed to meet the American Society of Civil Engineers and the Water Pollution Control Federation design criteria. The system contains parallel trains each consisting of an equally sized primary settling lagoons (Settling Lagoon 1 and Settling Lagoon 2) and polishing lagoons (Polishing Lagoon 1 and Polishing Lagoon 2) utilizing a passive biological treatment process. Incoming sewage enters the Settling Lagoon 1 or 2 where solids settle to the bottom of the lagoon and undergo bacterial digestion. The water then enters the Polishing Lagoon 1 or 2 where any small particles that did not settle in the Settling Lagoons will settle. All effluent water from the Polishing Lagoons is discharged into a synthetically lined pond (Effluent Lagoon A) for evaporation. The water in the Effluent Lagoon A either evaporates or flows into one of two additional Effluent Lagoons (Effluent Lagoons B and/or C) as needed to control freeboard in Effluent Lagoon A. In the event that any sludge is removed from the system, the sludge will be disposed of in accordance with 40 CFR Part 503 and 20.9.1.709 NMAC.

B. Wastewater Evaporation Ponds

Wastewaters from several sources at the facility described in Parts A-10 and B-1 of this application are evaporated in synthetically lined evaporation ponds. These ponds include the Evaporation Pond H-19 and Effluent Lagoons A, B, or C at the Sewage Treatment Facility. In the event that sediment accumulates to the point that the ponds are no longer suitable for the treatment of wastewater by evaporation, the sediment will be characterized to determine the appropriate disposition in accordance with all applicable federal and state regulations.

C. Salt Cell 2, Salt Cell 3, Salt Storage Pond 2, and Salt Storage Pond 3

The salt storage system consists of Salt Cell 2 with a run-off area of 326,350 sq. ft. and Salt Cell 3 with a run-off area of 272,850 sq. ft. which are used to stockpile salt (primarily halite) excavated during the construction and maintenance of the underground geologic repository. Each cell was constructed with six inches of prepared subgrade, a 60-mil high density polyethylene (HDPE) liner, a 200-mil Geonet drainage layer, an eight ounce geotextile fabric and covered with two feet of screened native soil. Each Cell is sloped toward the center which contains a collection trench and pipe for the conveyance of water west to the Salt Storage Pond 2 and Salt Storage Pond 3. Salt Storage Pond 2 and Salt Storage Pond 3 are constructed with a prepared subgrade, a 60-mil HDPE liner, a 200-mil Geonet cushion/drainage system, and a second 60-mil HDPE liner. In each of the ponds, the Geonet leak detection layer drains to a sump with an inclined riser to allow for water removal. Salt Storage Pond 2 and Salt Storage Pond 3 are connected by two 12 inch polyethylene pipes to prevent overflow of Salt Storage Pond 2. A one foot freeboard is maintained in both of these ponds. Non-hazardous brine water from well testing and mine related water accumulation may be disposed in Salt Storage Ponds 2 and 3.

D. Salt Cell 1 and Salt Storage Pond 1

Salt Cell 1 covers approximately 18.8 acres and was used for the storage of salt from the construction of the TRU Waste Repository using conventional mining techniques. To cover the now unused pile, the Salt Cell 1 crown was graded to a minimum two percent slope, covered with screened sand and a 60-mil HDPE line. The liner was covered with approximately 24 inches of native soils and seeded with Bureau of Land Management approved grass mix. The Salt Cell 1 has 3:1 side slopes and a two percent crown slope from the center north and west diverting storm water run-off to the salt cell runoff ditch with conveys run-off west to the three acre HDPE lined Salt Storage Pond 1.

E. Storm Water Ponds

Storm Water Ponds 1, 2, and 3 receive clean non-contact storm water from the WIPP facilities paved areas, roofs, air conditioner condensate, and domestic water from testing fire hydrants and hoses and draining domestic and fire water lines. Water from these ponds is retained for evaporation or used for industrial purposes as a recycle measure to preclude the use of fresh water. Water in Ponds 1, 2, and 3 may be transferred within the system to alleviate freeboard concerns and to provide an ease in removal as needed basis.

F. Site and Preliminary Design Validation (SPDV) Material Pile

The SPDV Material Pile is located immediately east of the WIPP facilities infrastructure. The SPDV pile was created during the design validation phase of the WIPP for the placement of construction materials resulting from the drilling of two 2,150 foot shafts and the underground excavation of connecting tunnels, exploratory tunnels, and four rooms. The materials in the SPDV pile include mined tailings interspersed with soil, rock and debris from the construction of the shafts. The SPDV pile encompasses approximately 10 acres and ranges in height from 7 to 20 feet above ground. The pile was closed by grading the contours and covering the pile with a geosynthetic liner, 2 feet of soil blended with rock and establishing native vegetation. Three shallow sub-surface monitoring wells are placed in the vicinity of this material pile to determine if any discharges have occurred from the pile.

A-9. Discharge Locations. List the locations of your facility and of all components of your processing, treatment, storage and/or disposal system. Examples of components include septic tanks, lagoons, leachfields, irrigation sites, mine stockpiles, etc. Additional examples are listed in the Supplemental Instructions. Latitude and longitude are optional unless township, range and section are not available. .

Components	Township	Range	Section(s)	Latitude	Longitude
Evaporation Pond H-19	22S	31E	NE, SE, NW-28	32 21.532	103 46.975
Effluent Lagoon A	22S	31E	NE, SE, NW-29	32 21.950	103 48.000
Effluent Lagoon B	22S	31E	NE, SE, NW-29	32 21.959	103 48.056
Effluent Lagoon C	22S	31E	NE, SE, NW-29	32 21.940	103 48.057
Settling Lagoons 1 and 2	22S	31E	NE, NW, NE-29	32 22.33	103 46.58
Polishing Lagoons 1 and 2	22S	31E	NE, SW, NW-29	32 21.939	103 47.973
Salt Cell 1	22S	31E	SW, NE, SE-20	32 22.495	103 47.620
Salt Storage Pond 1	22S	31E	NE, NW, SE-20	32 22.455	103 47.754
Salt Cells 2 and 3	22S	31E	NW, NE, SE-20	32 22.588	103 47.619
Salt Storage Pond 2	22S	31E	SE, NW, SE-20	32 22.589	103 47.746
Salt Storage Pond 3	22S	31E	SE, NW, SE-20	32 22.593	103 47.788
Storm Water Pond 1	22S	31E	SE, NW, SE-20	32 22.215	103 47.641
Storm Water Pond 2	22S	31E	SW, SE, SE-20	32 22.214	103 47.550
Storm Water Pond 3	22S	31E	SE, SE, SE-20	32 22.291	103 47.775
SPDV Material Pile	22S	31E	SW, SE, SW	32 22.268	103 47.176

A-10. Discharge Quality.

Indicate the expected quality of the discharge -- wastewater, leachate, sludge, etc. -- generated, stored, treated, processed and/or discharged at your facility. List the contaminants of concern and the expected concentrations. *Not all facilities need to characterize influent quality.* See Supplemental Instructions for typical contaminants and additional guidance.

Sewage Treatment Facility Influent (sewage)

Expected or Known Contaminants	Expected or Known Contaminants Indicate units: mg/L, CFU/100 ml, etc.	
	Incoming (Influent)	Final (Effluent)
Total Dissolved Solids (TDS)	200-5,000 mg/L	NA
Nitrate	0-7.0 mg/L	NA
Total Kjeldahl Nitrogen	4-130 mg/L	NA

*Values are calculated using data from Discharge Monitoring Reports April 2004 through July 2012.

Typical Contaminants in Wastewater Discharged to the Evaporation Pond H-19 or Sewage Treatment Facility Effluent Lagoons A, B or C (non-hazardous industrial wastewater)

Expected or Known Contaminants	Expected or Known Contaminants Indicate units: mg/L, CFU/100 ml, etc.	
	Incoming (Influent)	Final (Effluent)
Total Dissolved Solids (TDS)	0-400,000 mg/L	NA
Sulfate	0-8,500 mg/L	NA
Chloride	149,000 mg/L	NA
Lead	<5.0 mg/L Toxicity Characteristic Leachate Procedure	NA

Each value represents the range of waters described in Part B, Section B-1.B which can vary from minor TDS concentrations to totally saturated brine. Sulfate and chloride concentrations represent the 95th percentile upper tolerance limit for water from Water Quality Sampling Program Well 3 (WQSP-3) reported in the Waste Isolation Pilot Plant Annual Site Environmental Report for 2012 (DOE/WIPP-07-2225).

Salt Storage Pond 2 and 3 (storm water run-off and industrial non-hazardous wastewater)

Expected or Known Contaminants	Expected or Known Contaminants Indicate units: mg/L, CFU/100 ml, etc.	
	Incoming (Influent)*	Final (Effluent)
Total Dissolved Solids (TDS)	250,000 mg/L	NA
Chloride	223,000 mg/L	NA
Sulfate	11,000 mg/L	NA

Note: Current concentration of retained storm water, not an influent sample
*Values are the maximum value reported in Discharge Monitoring Reports from 2004 through 2012.

Salt Storage Pond 1 (storm water run-off)

Expected or Known Contaminants	Expected or Known Contaminants Indicate units: mg/L, CFU/100 ml, etc.	
	Incoming (Influent)*	Final (Effluent)
Total Dissolved Solids (TDS)	67,000 mg/L	NA
Chloride	50,500 mg/L	NA
Sulfate	478 mg/L	NA

*Values are the maximum value reported in Discharge Monitoring Reports from 2004 through 2012.

A-11. Ground Water Conditions.

All applicants must provide the depth to and pre-discharge TDS concentration of the ground water that could be affected by the discharge. Refer to Supplemental Instructions for details on how to obtain these values.

Indicate the depth to the most shallow ground water beneath the discharge site. If there are multiple discharge sites, indicate the range of depths.	Indicate pre-discharge total dissolved solids (TDS) concentration of most shallow ground water beneath the discharge site. Attach copies of analyses.
Depth to water (feet): 100 Reference: ☐ Measurement, nearby monitoring well ☐ Measurement, nearby supply well ☐ Well log from nearby well (attach copy) ☐ Office of the State Engineer http://www.ose.state.nm.us/ X Report or study (give citation here and attach relevant portion): Daniel B. Stephens & Associates (September 30, 2003) Water Budget Analysis of Shallow Subsurface Water at the Waste Isolation pilot Plant. ☐ Other (describe):	TDS (mg/L): 100,000 Reference: ☐ Analysis from upgradient monitoring well ☐ Analysis from on-site supply well ☐ Analysis from shallow nearby supply well X Concentration provided in previous Discharge Permit application ☐ Report or study (give citation here and attach relevant portion): ☐ Other (describe):

A-12. Public Notice. See Supplemental Instructions.

a) The public notice packet including instructions and materials should be sent to:

X Applicant ☐ Consultant ☐ Other: ______________________

b) Copies of the public notice packet (excluding sign) should be sent to:

X Applicant ☐ Consultant ☐ Other: ______________________

c) The applicant is required to provide public notice of this application by placing a display ad in a newspaper of general circulation near the location of the proposed discharge. Indicate newspaper you intend to place the ad in:

Newspaper: Carlsbad Current-Argus

d) *For new or modification applications only:* The applicant must post a sign for 30 days in a conspicuous location at or near the facility, as approved by NMED. One sign must be posted for each 640 contiguous acres or less of the discharge site. An additional notice must be posted at an off-site location conspicuous to the public. Describe the locations below where you intend to post the notices. You may also attach sketches or photographs.

At or near facility: N/A
2 by 3 feet in size

Off-site location: N/A
flyer size

Part B

GROUND WATER DISCHARGE PERMIT APPLICATION
PART B: OPERATIONAL, MONITORING, CONTINGENCY AND CLOSURE PLANS
GENERAL FORM (VARIOUS FACILITY TYPES)

Operational Plan *[Section 20.6.2.3106.C, 3109.C NMAC]*

B-1. Source(s) of the Discharge. Describe what generates the wastewater, sludge or other discharges processed and/or disposed of at your facility. Identify all sources. Attach additional pages, if needed. See Supplemental Instructions.

A. Sewage Treatment Facility influent typically includes:

1. Domestic wastewater from the facilities showers, restrooms, sinks and other plumbing features.
2. Industrial wastewaters from two compressed air systems at the facility are discharged to the sewage system by pumping the water from containers into manholes/drains at the site.

B. Wastewater evaporated in Effluent Lagoon A

Water from the Polishing Lagoons 1 and 2 flows into Effluent Lagoon A for evaporation. To maintain 1' freeboard, water will flow into Effluent Lagoons B and/or C as needed.

C. Wastewaters evaporated in effluent lagoons and evaporation ponds:

The following non-hazardous wastewaters are evaporated in the Evaporation Pond H-19 and/or Effluent Lagoon A, B, or C at the Sewage Treatment Facility:

1. Water from purging groundwater monitoring wells for sampling or occasionally developing groundwater monitoring wells. Water from the Culebra water bearing formation around the WIPP site is the predominant source of groundwater disposed of in evaporation ponds. Water from the Santa Rosa/Dewey Lake contact and the Dewey Lake Formation are also disposed of in these lagoons and ponds.
2. Water collected from the Waste Shaft Sump, Exhaust Shaft Interception Wells and other observation boreholes in the underground
3. Condensate from the Exhaust Shaft fan ductwork on the surface.
4. Miscellaneous non-hazardous wastewaters may occasionally be discharged to the sewage treatment facility or one of the effluent lagoons. Typically, these could include neutralized acids or bases and miscellaneous water from routine cleaning.

D. The Salt Storage Ponds 2 and 3

The Salt Storage Pond 2 receives salt contact storm water run-off containing high TDS and chlorides from storm water that has been in contact with mined salt tailings excavated from the WIPP underground facilities and placed in Salt Cells 2 and 3. Two 12 inch polyethylene pipes connect Salt Storage Pond 2 with Salt Storage Pond 3. This allows excess water in Pond 2 to flow into Pond 3 to avoid overflowing Pond 2.

The following wastewaters may be evaporated in the Salt Storage Pond 2 and 3:

1. Water from purging groundwater monitoring wells for sampling or occasionally developing groundwater monitoring wells. Water from the Culebra water bearing formation around the WIPP site is the predominant source of groundwater disposed of in evaporation ponds. Water from the Santa Rosa/Dewey Lake contact and the Dewey Lake Formation are also disposed of in these ponds.
2. Water collected from the Waste Shaft Sump, Exhaust Shaft Interception Wells and other observation boreholes in the underground
3. Condensate from the Exhaust Shaft fan ductwork on the surface.

E. **Salt Storage Pond 1**

This pond currently receives non-contact storm water run-off from the covered Salt Storage Pile.

F. **Storm Water Ponds 1, 2, and 3**

Storm Water Ponds 1, 2, and 3 receive clean non-contact storm water from the WIPP facility's paved areas, roofs, and air conditioner condensate, and occasionally clean domestic water from testing and repairing water lines, fire hydrants, and hoses. The water in these ponds is allowed to evaporate, or is used to irrigate vegetation established on the Salt Storage Pile.

B-2. Discharge Quantity. Describe the methods/calculations used to determine the maximum discharge volume listed in Item A-7 in Part A of your application. Attach additional pages, if needed. See Supplemental Instructions.

Sewage Treatment Facility:

The maximum design flow rate for the Sewage Treatment Facility is 23,000 gallons per day. The flow rate is of the Settling Lagoons 1 and 2 and Polishing Lagoons 1 and 2 is determined at their operating maximum depth of 6 feet and maintaining 1 foot of freeboard (Note: The drawings referenced in Part B, Section B-7 and included in Attachment I were revised to reflect the 2 feet of freeboard required by the April 29, 2003 discharge permit application).

Settling Lagoon Calculations:

At a water depth of 6 ft, the surface area of Settling Lagoons 1 and 2 is:

252 ft. x 92 ft. x 2 = 46,368 ft^2 = 1.065 acres

At a BOD_5 loading of 40 lbs/day/acre and the available area of 1.064 acres, the BOD_5 mass loading is:

40 lbs/day/acre x 1.064 acres = 42.58 lbs/day BOD_5

The average daily flow rate (Q) to produce a BOD_5 mass loading of 42.58 lbs/day is:

Q = 42.58 lbs/day / (8.38 lbs/Mgal/mg/l x 220 mg/l) = 0.02321 Mgal/day

Q = 23,000 gal/day

Settling Lagoons 1 and 2 can process 23,000 gal/day at an operating depth of 6 feet.

Using the flow rate of 23,000 gal/day in the calculations, the average hydraulic detention time (DT) for the primary treatment cells yields the following results:

At 3 ft., DT = 20 days

At 4 ft., DT = 28 days

At 6 ft., DT = 47 days

Polishing Lagoon Calculations:

At a BOD_5 loading of 40 lbs/day/acre and the average daily flow rate of 23,000 gal/day, the BOD_5 mass loading is:

0.023 Mgal/D x 8.34 lb/Mgal/mg/l x 100 mg/l = 19.18 lbs/day BOD_5

The required surface area to process 19.18 lbs/day BOD_5 is:

19.18 lbs/day / 40 lbs/day/acre = 0.48 acres = 20,909 ft^2

The available surface area of Polishing Lagoons 1 and 2 at a depth of 6 ft. is:

116 ft. x 92 ft. x 2 = 21,344 ft^2

Therefore, the two Polishing Lagoons are large enough to process the 23,000 gal/day average daily flow without exceeding a depth of 6 ft.

Using the flow rate of 23,000 gal/day in the calculation of average hydraulic detention time (DT) for the Polishing

Polishing Lagoons yields the following results:

At 3 ft., DT = 7.2 days

At 4 ft., DT = 9.6 days

At 6 ft., DT = 17.7 days

Effluent Lagoons B and C

The volume of 637,000 gallons per Effluent Lagoon B and C is based on the volume of each pond with one feet of freeboard. Conservatively, two feet of freeboard has been used in the calculations establishing the maximum discharge limit of 500,000 gallons. However, the proposed maximum discharge is that one foot of freeboard is maintained. Effluent Lagoons B and C have the same dimensions (224 feet in length, 92 feet wide and 6 feet deep with 3 foot horizontal to 1 foot vertical slopes). The volume of each pond with 2 feet of freeboard is shown on drawing 25-C-004-W in Attachment I. as 68,032 cubic feet (508,879 gallons).

Top Area = 92 ft. x 224 ft. = 20,608 sq. ft.

Middle Area = 80 ft. x 212 ft. = 16,960 sq. ft.

Bottom Area = 68 ft. x 200 ft. = 13,600 sq. ft.

Length of side = $[(4^2 + (4 \times 3)^2]^{1/2} = [16 + 144]^{0.5}$ = 12.65 ft.

Area of liner = [(92 ft + 68 ft) / 2) x 12.65 ft. x 2] + [(224 + 200 / 2) x 12.65) + 13,600]

= [80 x 12.65 x 2] + [212 x 12.65 x 2] + 13,600

= 2,024 + 5,363.6 + 13,600

= 20,987.6

Volume = 4 x [20,608 + (4 x 16,960 + 13,600)] / 6

= 4 x [20,608 + 67,840 + 13,600] / 6

= 4 x [102,048] / 6

= 68,032 cubic feet

= 68,032 ft^3 x 7.48 gal/ft^3 = 508,879 gallons

Effluent Lagoon A

Effluent Lagoon A is slightly smaller than Effluent Lagoons B and C, and is used mainly to received water from the Polishing Lagoons that has a low BOD load. Some non-hazardous wastewater from well testing may be introduced in Effluent Lagoon A. The total volume of Effluent Lagoon A is 566,610 gallons without any freeboard. Conservatively, two feet of freeboard has been used in the calculations establishing the maximum discharge limit of 302,536 gallons as seen on drawing 25-C-004-W in Attachment I. However, the proposed maximum discharge is that one foot of freeboard is maintained.

Evaporation Pond H-19

The volume of Evaporation Pond H-19 with one foot of freeboard is 46,268 cubic feet (346,085 gallons). Attachment I. contains drawing 23-C-012-W1of the Evaporation Pond H-19.

Salt Storage Ponds

1. Salt Storage Pond 1:

   Drainage Area = 690,100 sq. ft.

   Design Basis Storm Event = 3.9 inches

   Run-off from design basis storm event =

   690,100 ft^2 x 3.9 inches / 12 inches/ft. x 7.48 ft^3/gal = 1,677,633 gallons

2. Salt Storage Ponds 2 and 3:

2. Salt Storage Ponds 2 and 3:

Drainage Area = 1,047,800 sq. ft.

Design Basis Storm Event = 3.9 inches

Run-off from design basis storm event =

1,047,800 ft^2 x 3.9 inches / 12 inches/ft. x 7.48 ft^3/gal = 2,547,202 gallons

Storm Water Infiltration Control Ponds

Storm water Ponds 1, 2, and 3 and Salt Storage Ponds 1, 2, and 3 collect run-off storm water from the plant site and salt storage cells respectively. These ponds are designed to contain water from a 25 year 24 hour storm event and maintain a one foot freeboard. The table in Section B7 identifies the area and volume of run-off collected for each individual pond. Attachments II, III, IV, and V contain drawings showing design and locations of these ponds.

B-3. **Site Map.** Attach a site map showing the components of your proposed system and relevant surrounding features, clearly labeled, such as:

- treatment units
- lagoons
- tanks
- sumps
- manure separators
- land application fields
- domestic wastewater reuse areas
- pits
- stockpiles
- leachfields
- sludge drying beds
- roads
- buildings
- supply wells
- monitoring wells
- extraction/injection wells
- arroyos
- nearby water bodies such as ponds or canals
- property boundaries
- other permitted discharges
- required setbacks
- north arrow

If map is not to scale, mark distances on the map.

X Site maps is attached. Attachment VI contains two aerial photos and two topography maps show the location of the site. Attachment V contains one site map showing the locations of the shallow subsurface water monitoring wells and other regulated units of this permit, and another site map of the WIPP Water Quality Sampling Program Wells (WQSP 1-6 and 6A). The WQSP Wells 1-6 and 6A are monitored as part of the detection monitoring program for the Hazardous Waste Facility Permit. WQSP 6A monitors naturally occurring water in the middle Dewey Lake Formation and is designated as the monitor well for the Sewage Treatment Facility.

B-4. **Flood Protection**. Describe the methods used to prevent flooding and run-off at the facility (tank protection, berms, diversion channels, etc.)

The WIPP facility is within the Pecos River Basin. There are no perennial streams at the WIPP facility. At its nearest point, the Pecos River is about 12 miles southwest of the WIPP facility boundary. The maximum recorded flood on the Pecos River occurred near the town of Malaga, New Mexico on August 23, 1966, with a discharge of 120,000 cubic feet per second and a stage elevation of about 2,938 feet above mean sea level. The Surface elevation at the WIPP site is over 500 feet above the river bed and approximately 470 feet above the elevation of this maximum historical flood elevation. The potential for flash flooding is considered minimal because of the high percolation rate of the surrounding sand dunes and protection from flash floods from probable maximum precipitation events is provided by a system of peripheral interceptor berms and dikes. The Salt Cell area is within these peripheral berms. The sewage lagoons are graded to promote run-off, and berms have been constructed to minimize run-on in the events of a significant rainfall event. The Evaporation Pond H-19 is also graded to minimize run-on during precipitation events.

B-5. Plans and Specifications. For new facilities and for new components of existing systems, attach plans and specifications certified by a New Mexico registered professional engineer. *[Section 20.6.2.1202 NMAC]*

X Not applicable because no new facilities are proposed.

Plans and specifications are attached.

☐ Plans and specifications were previously submitted. Submittal date(s): ____________

B-6. Description of Components. Provide descriptive details of all components of your processing, treatment, storage and/or disposal system. Include all components listed under Item A-8 in Part A.

Component	Description (construction material, liner type, irrigation method, capacity, dimensions, area, etc.)
Settling Lagoon 1	60-mil HDPE, 128,772 ft^3 (796.499 gallons)*
Polishing Lagoon 1	60-mil HDPE, 55,466 ft^3 (314,871 gallons)*
Settling Lagoon 2	60-mil HDPE, 128,772 ft^3 (796,871 gallons)*
Polishing Lagoon 2	60-mil HDPE, 55,466 ft^3 (314,871 gallons)*
Effluent Lagoon A	30-mil linear low density polyethylene (LLDP), 75,750 ft^3 (483,252 gallons)*
Effluent Lagoon B	30-mil LLDP, 113,138 ft^3 (762,899 gallons)*
Effluent Lagoon C	30-mil HDPE, 113,138ft^3 (762,899 gallons)*
Evaporation Pond H-19	36-mil Hypalon®, 80,457 ft^3 (601,818 gallons)*
Salt Cell 2 and Salt Cell 3	60-mil HDPE, 200-mil Geonet Drainage layer, 2-feet of native soil cover, Cell A: 6.2 acres, Cell B: 5.2 acres, Total: 11.4 acres
Salt Storage Pond 2	Two 60-mil HDPE, 200-mil Geonet leak detection layer, 4,844,935 gallons*
Salt Storage Pond 3	Two 60-mil HDPE, 200-mil Geonet leak detection layer, 17,4849,456 gallons*
Salt Cell 1 (Run-off Ditches)	60-mil HDPE, 2 feet of native soil, 18.8 acres, 1.0 Acres
Salt Storage Pond 1	60-mil HDPE, 5,506,989 gallons*
Storm Water Pond 1	60-mil HDPE, 813,925 gallons*
Storm Water Pond 2	60-mil HDPE, 2,447,692 gallons*
Storm Water Pond 3	60-mil HDPE, 6,670,940 gallons*
Site and Preliminary Design Validation Material Pile	Geosynthetic liner, 2 feet of native soil blended with rock, 10 acres

*Total Cell Volume without freeboard

Attachments I, II, III, and IV contain drawings of each of the pond, lagoons, and salt storage cells mentioned in the table above.

B-7. Operational Plan. Attach a detailed description of how you operate your processing, treatment, storage and/or disposal system.

Animal feeding operations: include storm water management, nutrient management plans, method for mixing irrigation and wastewater.

Domestic wastewater treatment facilities: include pre-treatment, solids management, vegetation management for land application.

Facilities using reclaimed domestic wastewater above ground: include proposed water quality classification(s), effluent monitoring, setbacks, irrigation schedules, etc. that will result in protection of public health and the environment. Please refer to *NMED Ground Water Quality Bureau Guidance: Above-Ground Use of Reclaimed Domestic Wastewater* for further information. A copy of the guidance document is available on the NMED website **www.nmenv.state.nm.us** under "Ground Water Quality".

X Operational plan is attached. (See Attachment VII)

☐ Operational plan was previously submitted. Submittal date(s): ____________________

Sewage Treatment System:

Wastewaters are conveyed from WIPP facilities to the sewage treatment facility through a buried gravity flow system constructed of vitrified clay piping with approximately 80 feet of PVC piping. The wastewater totalizing flow meter is subject to erratic readings due to the buildup of solids on the weir and the low flows of effluent from the WIPP site facilities. Therefore, wastewater discharge is assumed to be equal to the volume of total domestic water use which is measured using a totalizing flow meter.

The Sewage Treatment Facility is a facultative lagoon system consisting of two parallel trains of one settling lagoon and one polishing lagoon. Both polishing lagoons discharge into one common evaporation lagoon (Effluent Lagoon A). Effluent Lagoon A discharges into Effluent Lagoon B and/or Effluent lagoon C. Each train of the facultative lagoon system is designed to accommodate the discharge of up to 23,000 gallons per day of domestic and industrial wastewater. Attachment I contains engineering drawing 25-C-004-W, Stabilization Lagoon and Evaporation Pond illustrating the construction of the WIPP sewage treatment facility.

When not in domestic sewage service, one settling lagoon, one polishing lagoon and Effluent Lagoons B and C are available to accept other miscellaneous non-hazardous wastewater. Primarily the Effluent Lagoons B and C are available for use as evaporation ponds to receive water generated from developing or purging groundwater-monitoring wells. Effluent Lagoon A may accept miscellaneous non-hazardous wastewater as long as 1 foot freeboard is maintained. Occasional groundwater pump tests are conducted on wells and can generate large volumes of water depending on the length of the test.

Evaporation Pond H-19

Wastewater is transferred to the Evaporation Pond H-19 in portable containers and transferred into the pond. The volumes of waste discharged to the evaporation pond are estimated using the time/volume method (e.g. two 55-gallon drums/day = 110 gallons/day). Wastewaters placed in Evaporation Pond H-19 are evaporated only, with no discharge or disposal to another facility. When sediments build up on the pond so that the pond does not operate properly, the sediments will be characterized and shipped off-site for proper disposal in accordance with applicable state and federal laws and regulations.

Infiltration Controls

A portion of the subsurface water contains elevated total dissolved solids and chlorides which are theorized to be elevated as the result of storm water infiltrating the salt cells north of the facility. The GWQB determined that WIPP needed a discharge permit for discharges to the subsurface from the salt cells. The DOE developed a conceptual design for nfiltration controls to minimize the migration of the subsurface shallow water and reduce the potential for impacts to the ıaturally occurring Dewey Lake water. A new salt storage area was constructed on a HDPE lined area that would divert salt contact storm water to a double lined pond with a leak collection sump. In addition to the controls proposed in the original NOI, the DOE proposed to line three storm water retention ponds to prevent the infiltration of clean storm water to the subsurface to further minimize the potential for the migration of the subsurface shallow water. The infiltration control evaporation and storm water infiltration control ponds are sized with a design basis using a 25-year, 24 hour storm event of 3.9 inches. The table below identifies the area and volume of run-off collected for each individual pond.

Evaporation Pond	Drainage Area (ft^2)	Run-off Volumes for Design basis 25-year/24 hour storm event (3.90 inches)[1]	Pond Capacity[2]
Salt Storage Pond 1	690,100	1,677,633 gallons	5,506,989 gallons
Salt Storage Pond 2	1,047,800[3]	2,547,202 gallons	4,170,732 gallons
Salt Storage Pond 3	2,752,700[3]	2,547,202 gallons	9,724,000 gallons
Storm Water Pond 3	1,642,199	3,992,186 gallons	6,670,940 gallons
Storm Water Pond 1	178,595	434,163 gallons	813,824 gallons
Storm Water Pond 2	387,681	942,452 gallons	2,447,692 gallons

[1] Run-off volumes assume 100% run-off since infiltration coefficients are unknown and can only be estimated. This also included the volume that falls onto the surface area of the pond.
[2] Capacity is the maximum capacity without assuming any freeboard.
[3] Current configuration with only Salt Cell A has a drainage area of 538,000 ft^2, run-off volumes for the 3.90 inch rainfall event is 1,307,878 gallons.

Salt Cell 1 and Salt Storage Pond 1
The Salt Cell 1 covers approximately 18.8 acres and was used for the storage of salt from the construction of the TRU waste repository using conventional mining techniques. The Salt Cell 1 crown was graded to a minimum two percent slope with screened sand and covered with a 60-mil HDPE liner. The liner was covered with approximately 24 inches of native soils and seeded with Bureau of Land Management approved native grasses. Salt Cell 1 has 3:1 side slopes and a two percent crown slope from the center north and west diverting storm water run-off west to the three acre Salt Storage Pond 1. Attachment IV contains engineering drawings for Salt Cell 1, and Attachment III contains engineering drawings for Salt Storage Pond 1.

Salt Cell 2, Salt Cell 3, Salt Storage Pond 2, and Salt Storage Pond 3
The salt storage extension consists of Salt Cells 2 and 3. Each cell was constructed with 6-inches of soil, a 60-mil HDPE liner, 200-mil Geonet, and covered with 24 inches of screened native soil. Each cell slopes two percent toward the center which contains a pipe for the collection of water which is diverted west to the Salt Storage Pond 1. The Salt Storage Pond 2 is constructed with a 60-mil HDPE liner, a 200-mil Geonet, and a second HDPE liner. The Geonet leak detection layer drains to a sump with an inclined riser for leak detection. The Salt Storage Pond 2 is connected via two 12 inch polyethylene pipe to the Salt Storage Pond 3. The Salt Storage Pond 3 is 560' long and 450' wide and is 22 feet in depth at the deepest point. It is constructed with a 60 mil HDPE liner over a 200 mil Geonet layer and a second HDPE 60 mil liner. The Salt Storage Pond 3 receives overflow water from Salt Storage Pond 2 to maintain 1 foot freeboard in Salt Storage Pond 2. Attachment IV contains engineering drawings for Salt Cell 2 and Salt Cell 3, and Attachment III contains engineering drawings for Salt Storage Pond 2 and Salt Storage Pond 3.

Non-Contact Storm Water Ponds
Storm Water Pond 1, Storm Water Pond 2, and Storm Water Pond 3 are each lined with 60-mil HDPE. The water collected in these ponds is clean non-contact storm water which meets the criteria described in 20.6.2.3105 NMAC, *Exemption from Discharge Permit Requirement.* The storm water collected in these ponds is run-off from the WIPP Site and/or clean domestic water from testing of the fire fighting system and from broken/repaired domestic water system distribution piping. This water is retained for evaporation or used for irrigation of the Salt Cell 1 cover. Attachment II contains engineering drawings for Storm Water Pond 1, 2, and 3.

Site and Preliminary Design Validation Material Pile
The SPDV pile was created during the design validation phase of the WIPP facility for placement of construction materials resulting from the drilling of two 2,150 foot shafts and the underground excavation of connecting tunnels, exploratory tunnels, and four rooms. The materials in the SPDV pile include mined tailings interspersed with soil, rock, and debris from the construction of the shafts. The SPDV Pile encompasses approximately 10 acres and ranges in height from 7 to ?0 feet above ground. The volume is approximately 168,000 cubic yards, which includes an area beneath the pile where soil was excavated prior to tailing placement.

In 1995, the SPDV pile was characterized to determine the chemical nature of wastes within the pile and to support selection of reclamation alternatives. ("Characterization of the Site Preliminary Design Validation Salt Pile," Daniel B. Stephens & Associates, Inc., January 5, 1996). The investigation determined that no remedial measures were required according to NMED guidelines. As a result of the study, stabilization and reclamation were recommended in order to prevent offsite transport of salt and brine solutions into the surrounding environment, and to blend the salt into the surrounding environment.

The reclaimed SPDV pile is unlikely to discharge to the groundwater due to the capping installed during reclamation and the fact that no brine liquid was added to the pile. However, as set forth in DP-831, additional shallow sub-surface monitoring wells were installed around the SPDV pile.

B-8. **System Maintenance**. Attach a description of the operations and maintenance procedures which ensure that your processing, treatment and disposal system functions properly; e.g., inspections, pumping schedules, equipment maintenance, etc.

X O & M procedures are attached. (See Attachment VII)

☐ O & M procedures were previously submitted. Submittal date(s): ____________

The sewage treatment facility is a facultative, no discharge system, requiring maintenance only in the event a broken valve or obvious damage to the liners or peripheral berm and fencing. The sewage treatment facility, associated effluent ponds and the Evaporation Pond H-19 are inspected weekly for adequate freeboard, signs of damage to the liners, septic conditions, erosion, intrusion of animals, or damage to the fences or berms.

The infiltration controls (storm water ponds, salt storage ponds, the SPDV pile, Salt Cells 1, 2, and 3) are inspected monthly for signs of erosion, damage to the liners, signs of burrowing animals, deep rooted plants that could penetrate the liner or other issues that need to be addressed. In the event of an unsatisfactory condition, corrective actions are initiated as appropriate.

Maintenance of the soil cover on the Salt Cell 1 and SPDV Pile is an on-going activity which can be impacted by severe storm events. In the event of significant erosion that cannot be repaired within three months of occurrence, the New Mexico Ground Water Quality Bureau (GWQB) will be notified and a corrective action plan submitted within 30 days of the time that it is apparent the repairs cannot be completed timely. Significant erosion for the SPDV pile is considered the point at which the liner is exposed or greater than four square feet of the liner is about to be exposed. Significant erosion for the Salt Cell 1 soil cover is considered to be the exposure of liner to the point that the liner could be subject to damage due to uplifting by the wind.

B-9. **Backflow Prevention.** If wastewater is used for land application or irrigation, describe methods used to protect wells from contamination by wastewater backflow. For new facilities or new systems at an existing facility, only air gap or reduced pressure valve assemblies are acceptable methods.

a) Clearly describe and/or sketch the location of air gaps or devices and attach specifications.

NA

b) Describe how devices are maintained.

NA

B-10. Water Rights. Animal feeding operations which land apply wastewater must attach documentation of irrigation water rights for the proposed land application fields, sufficient to sustain the intended crop rotation.

☐ Water right documentation is attached.

X Not applicable.

B-11. Past Ground Water Monitoring Results. *This item applies only to existing facilities seeking renewal and/or modification of a Discharge Permit that required ground water monitoring.*

a) Attach a graph or a table showing all analytical results from ground water sampling at your facility. If preparing graphs, a separate graph should be developed for each constituent, except that nitrate and TKN may be shown on the same graph. Multiple wells may be shown on the same graph. See Supplemental Instructions for sample table and graph.

b) If the monitoring results indicate that ground water standards have been violated or that there is an upward trend approaching standards, attach a description of what actions you have taken or will take to address the elevated concentrations. Ground water standards are listed in Section 20.6.2.3103 NMAC. See the Supplemental Instructions for frequently referenced standards.

Response to Parts a) and b) of Section B-11:

a) Attachment V contains a table with the groundwater monitoring results for each well that Discharge Permit, DP-831, requires monitoring for the shallow subsurface water at the Dewey Lake/Santa Rosa contact and WQSP 6A south of the discharge site in the middle Dewey Lake.
b) The analytical trend in the monitor wells shows a slight decrease in chloride concentration and in TDS since 2006.

Monitoring Plan *[Section 20.6.2.3107.A NMAC]*

B-12. Discharge Volumes. Describe how and where the monthly discharge volume at your facility will be. For all measuring devices, provide type, location, and units of measure including multipliers (e.g., gallons, gallons x 100, acre-ft, etc.) See Supplemental Instructions. Attach additional pages, if necessary.

The influent to the Sewage Treatment Facility is measured using an ultrasonic flow meter which reads the level (height) of water flowing over a weir in inches which is converted to gallons per minute. The meter display is located in the WIPP facility domestic water pump house. The ultrasonic monitoring device is located in manhole number 11 west of the pump house. The meter is subject to erratic readings due to low flows from the facility and material build-up on the weirs. For this reason the total domestic water use, which is also monitored with an ultrasonic continuous flow meter located at the domestic water pump house, may be used to determine the volumes discharged to the Sewage Treatment Facility.

Miscellaneous wastewater discharged to Evaporation Pond H-19, Effluent Lagoons A, B, and C, and Salt Storage Ponds 2 and 3 is recorded using the time volume method. (i.e., two 1,000 gallon containers per day = 2,000 gallons/day). Records of the date and volume discharged and the physical/chemical characteristics of the water are maintained.

B-13. Discharge Quality Monitoring. Discharge Permits typically require that the discharge (treated wastewater, sludge, septage, etc.) be sampled on a regular basis. The frequency of sampling varies by type of facility, as do the contaminants of concern. Domestic and agricultural Discharge Permits typically require sampling for total Kjeldahl nitrogen (TKN), nitrate-nitrogen (NO_3-N), total dissolved solids (TDS) and chloride on a quarterly or semi-annual basis.

If reclaimed domestic wastewater will be discharged for above ground uses, testing of the discharge for additional parameters is appropriate. Please refer to the *NMED Ground Water Quality Bureau Guidance: Above-Ground Use of Reclaimed Domestic Wastewater* for further information.

In the space below, provide a description or sketch of the sampling point(s) to be used for sampling the discharge at your facility.

Discharge Unit	Frequency	Sample Location	Parameters
Active Settling Lagoon 1 or Settling Lagoon 2	Semiannually	Grab sample from influent mixing zone	TDS, NO_3-N, TKN
Effluent Lagoon B	Semiannually	Grab sample from pond*	TDS
Effluent Lagoon C	Semiannually	Grab sample from pond*	TDS
Evaporation Pond H-19	Semiannually	Grab sample from pond*	TDS
Salt Storage Pond 1	Annually	Grab sample from pond*	TDS, Cl, SO_4
Salt Storage Pond 2	Annually	Grab sample from pond*	TDS
Salt Storage Pond 3	Annually	Grab sample from pond*	TDS
Storm Water Pond 1	Annually	Grab sample from pond*	TDS, Cl, SO_4
Storm Water Pond 2	Annually	Grab sample from pond*	TDS, Cl, SO_4
Storm Water Pond 3	Annually	Grab sample from pond*	TDS, Cl, SO_4

*Provided sufficient water is available in the pond for sampling.

Optional: In the space below (or as an attachment), you may propose revisions or additions to the standard discharge quality monitoring requirements. If you do, provide the rationale for your proposal.

No changes are proposed to the current DP-831 discharge quality monitoring requirements.

B-14. Ground Water Quality Monitoring. Discharge Permits typically require that ground water samples be collected quarterly from properly constructed monitoring wells located down gradient from discharge locations. The samples must be analyzed for contaminants of concern. For most domestic and agricultural Discharge Permits, the typical contaminants of concern are total Kjeldahl nitrogen (TKN), nitrate-nitrogen (NO_3-N), total dissolved solids (TDS) and chloride.

Optional: In the space below (or as an attachment), you may propose revisions or additions to the standard ground water monitoring requirements. If you do, provide the rationale for your proposal.

No changes are proposed to the current DP-831 ground water monitoring.

For existing facilities:

Indicate number of existing monitoring wells: 19

Attach copies of monitoring well logs.

X Well logs attached. ☐ Well logs cannot be located.

Well logs previously submitted. Submittal date(s): ____________

Attach copy of monitoring well survey (typically not applicable if fewer than 3 monitoring wells).

Survey attached. ☐ No survey has been conducted.

X Survey previously submitted. Submittal date(s): 12/20/2007

B-15. Other Monitoring. In addition to discharge volumes, discharge quality monitoring and ground water sampling, Discharge Permits typically require the following monitoring, depending on the type of facility:

- inspection and pumping of septic tanks, grease tanks, lift stations
- inspection of leachfields
- inspection of lagoons
- process testing for treatment plants
- land application data sheets (LADS)
- tracking of chemical fertilizer applications to land application areas
- soil sampling (agricultural and selected other facilities land applying wastewater)
- harvested plant material testing (agricultural facilities)

Optional: In the space below (or as an attachment), you may propose revisions or additions to the other standard monitoring requirements for your type of facility. If you do, provide the rationale for your proposal.

No other monitoring is proposed for the purpose of monitoring discharges covered by this permit application.

__Contingency Plan__ [Section 20.6.2.3107.A.10 NMAC]

B-16. System Failure. Describe your contingency plan in the event there is a failure of your wastewater or discharge system (e.g., wastewater back-up, pump failure, pipe breaks, tank overflow, leachfield failure, saturated fields etc.)

WIPP emergency response, maintenance, safety and environmental personnel are available to attempt to isolate or contain any discharge and conduct necessary repairs. An assessment of any release that should occur will be conducted to determine the extent of the release and appropriate decontamination or remedial actions. Samples will be taken to determine the extent and severity of contamination as deemed necessary. A corrective action plan will be developed based on communications with the NMED Ground Water Bureau. Reporting will be consistent with the requirements of 20.6.2.1203 NMAC.

B-17. Contingency Leachfield Location. *This item applies only if your disposal system includes a leachfield.* Identify a location on your site map (Item B-3) for a contingency leachfield in the event that your leachfield must be replaced. If no land is available for a contingency leachfield at an __existing__ facility, describe how you will address a failed leachfield. __New__ facilities must provide for a contingency leachfield location.

NA

B-18. Other Contingencies. Discharge Permits typically contain standard contingencies to address:

- exceeding wastewater quality limits
- violation of ground water or surface water standards
- spills or illegal releases of wastewater
- migration of soil nitrogen
- loading nitrogen above limit

Propose additional contingency plans, if appropriate:

NA

Closure Plan [Section 20.6.2.3107(A)11 NMAC]

B-18. Facility Closure and Post-Closure Monitoring. Discharge Permits contain standard requirements to address the closure of part or all of your discharge system, as follows:

- cap or plug lines to prevent the flow of wastewater to treatment or disposal system
- empty and remove or backfill tanks
- empty lagoons, perforate or remove liners, re-grade to surface topography
- appropriately dispose of solids
- regrade and cover stockpiles at mine facilities
- continue ground water monitoring for at least two years, longer as appropriate
- enact contingency plans if ground water standards are violated
- financial assurance may be required.

Propose additional closure plans in the space below or as an attachment, if appropriate:

Closure Plan

The closure plan will be based on existing decontamination and decommissioning plans and closure plans developed pursuant to the Hazardous Waste Facility Permit (HWFP), applicable federal regulations and requirements. The final Compliance Recertification Application (CRA), will be prepared during the final three years of the project, as WIPP operations approach completion.

The HWFP contain closure plan requirements and is available at **http://www.nmenv.state.nm.us/wipp/index.html**.

The detailed closure plan to be developed as part of the final CRA will include design engineering, construction and decommissioning details, borrow source locations, cut and fill plans, final drainage plans, sampling and remediation plans, confirmation and verification plans, and closure monitoring plans.

As required by the HWFP, once operations at the WIPP facility are completed, the entire facility will undergo decontamination and decommissioning prior to final closure. The objective of decontamination and decommissioning activities at the WIPP facility is to return the surface to as close to the pre-construction condition as reasonably possible, while protecting the health and safety of the public and the environment."

Part C

GROUND WATER DISCHARGE PERMIT APPLICATION
PART C: SITE INFORMATION
All Facilities

C-1. **Area Map.** Attach a current area map showing roads and clearly mark the location of your facility.

An Area Map is enclosed as Attachment VI.

C-2. **Directions to Site.** Provide driving directions to the site from the nearest town or, if located in a town, from an easily identifiable location.

From Carlsbad, NM take Highway 62/180 east toward Hobbs, NM. After entering Lea County turn south on the WIPP access road just east of mile marker 64. Continue south 12.5 miles to the WIPP facility parking lot on the east side of the road.

C-3. **Topographic Map.** Attach a copy of the appropriate US Geological Survey topographic map. You may provide just the relevant portion. USGS maps are available at many outdoor equipment stores or bookstores, from the USGS at www.usgs.gov or 1-888-ASKUSGS, and from commercial websites.

On the map clearly indicate the location of your facility. Also identify the approximate locations of all wells within 1,000 feet of your discharge locations. The Office of the State Engineer has a searchable database of supply wells on its website at www.ose.state.nm.us.

X USGS map attached with facility location and neighboring wells marked.

C-4. **Flood Potential.** Attach a copy of the latest Federal Emergency Management Agency (FEMA) flood map with your facility's location clearly marked, to the best of your ability. Information about how to obtain this map, formally known as a Flood Insurance Rate Map (FIRM) is available at www.fema.gov, insurance agencies or county government offices. A site specific analysis may be substituted.

FEMA map or site-specific analysis attached.

☐ Previously submitted and still up-to-date. Submittal date(s): __________

A FEMA flood map is not available for the WIPP facility. Part B-4 of this application contains a narrative discussion of the flood potential for the WIPP facility.

C-5. **Soils.** Attach either:

a) A copy of the appropriate Natural Resource Conservation Service (NRCS) soil survey map, with your site clearly identified to the best of your ability. Include the descriptive information for soils associated with the discharge locations. To obtain the map, contact your local NRCS office – there is one in every county.

b) A site-specific assessment showing the soils classifications. This is preferred over the more generalized NRCS surveys.

X NRCS soil survey or site-specific assessment attached. See Attachment VI

☐ Previously submitted. Submittal date(s): __________

C-6. **Geology.** Provide information on the geology beneath the site by attaching relevant portions of geologic reports, well logs for on-site or nearby wells, or site specific assessments. A variety of geology publications and resources are available from the New Mexico Bureau of Geology and Mineral Resources at http://geoinfo.nmt.edu or 505-835-5420 (Socorro). Well logs are available from the New Mexico State Engineer's Office at http://www.ose.state.nm.us/.

☐ Geologic report attached. X Well log(s) attached.

☐ Geologic information previously submitted. Submittal date(s): __________

Geological Formations as Measured at WQSP 4

Unit Description	Thickness (feet)	Water Bearing (Y/N)
Superficial Deposits/Santa Rosa Formation	78	No
Dewey Lake Redbeds Formation	510	Yes
Forty-Niner Member of the Rustler Formation	64	No
Magenta Member of the Rustler Formation	20	Yes
Tamarisk Member of the Rustler Formation	2	No
Culebra Member of the Rustler Formation	20	Yes
Los Medanos Member of the Rustler Formation	12	Partial

Source for Information: *Basic data Report for Water Quality Sampling Well 4* (DOE/WIPP-95-92154) which is near the Evaporation Pond H-19. For geological information relevant to the subsurface shallow water see the well logs in Attachment V.

C-7. Ground Water Hydrology. Ground water hydrology refers to the occurrence, distribution, movement and chemistry of ground water. The ground water hydrology at your site will determine in large part whether your discharge will adversely affect ground water quality. You may need to present detailed information in order to "demonstrate that the Discharge Permit will not result in concentrations in excess of the standards of Section 20.6.2.3103 NMAC or the presence of any toxic pollutant." (20.2.3106.C.7 NMAC)

At a minimum, provide information below on the direction of ground water flow. Ground water may not flow in the same direction as water on the surface of the ground. A monitoring well survey is one of the best methods to determine the direction of ground water flow at a particular site. Such surveys are routinely required for many Discharge Permit locations.

If a survey is not available, check with well drillers, the city water department, staff at the Office of the State Engineer, environmental consultants or other knowledgeable persons in your area. In addition, relevant reports have been published for some areas. See the OSE website at www.ose.state.nm.us or the NMBGMR website at http://geoinfo.nmt.edu.

Direction of ground water flow: See Description Below

If ground water flow shifts seasonally, describe here: NA

Reference:

X On-site well survey attached. ☐ Previously submitted. Submittal date(s): ________

☐ Nearby well survey attached. ☐ Previously submitted. Submittal date(s): ________

☐ Other. Specify: ________

☐ Relevant portion attached.

☐ Previously submitted. Submittal date(s): ________

Attach any additional information available about ground water hydrology at the site.

Shallow Subsurface Water

Daniel B. Stephens & Associates (September 30, 2003) Water Budget Analysis of Shallow Subsurface Water at the Waste Isolation Pilot Plant determined the following hydrological conditions for the subsurface shallow water at the WIPP Site:

Water level data indicates that a Water table mound exists near the Salt Storage Pond with a radial flow outward. A lens of shallow subsurface water occurs beneath a portion of the WIPP site at a depth of less than 100 ft below grade surface at the contact between the Santa Rosa Formation and the Upper Dewey Lake Redbeds Formation. The predominant flow of subsurface shallow water in the northern portion is eastward while the predominant flow in the southern portion is to the south. The hydraulic gradient beneath the WIPP administrative area is approximately 0.016 ft/ft toward the south. The seepage velocity has been calculated to be 0.24 feet per day using an effective porosity of 10 percent and the geometric mean hydraulic conductivity of 1.5 ft per day for wells PZ-06, PZ-07, PZ-10, and PZ-12. The formations containing shallow water yield generally less than one gallon per minute in monitoring wells and piezometers. Average TDS concentrations range from approximately 2,400 mg/l at PZ-10 to greater than 100,000 mg/l at PZ-09. The Santa Rosa Formation in this area was unsaturated at the WIPP during early pre-construction hydrological investigations indicating that the shallow subsurface water has occurred since that time. The origin of this water is believed to be primarily from anthropogenic causes.

A perched lens of water at the Santa Rosa/Dewey Lake contact that is believed to be anthropogenic has developed less than 100 feet below the surface. This water was not present at the time the WIPP shafts were constructed. The subsurface shallow water is believed to have originated due to WIPP related activities such as diverting storm water run-off from paved and unpaved areas to previously unlined retention basins.

Dewey Lake Redbeds Formation Water

In the vicinity of the WIPP facility surface structures, no water bearing zones are known to exist in the Dewey lake Redbeds Formation. Natural shallow groundwater occurs in the middle part of the Dewey Lake Redbeds Formation at the southern portion of the WIPP facility and to the south of the WIPP facility. Well WQSP-6A located 1.25 miles southwest of the Salt Storage Area contains natural Dewey Lake Ground Water at a depth of approximately 167 feet below ground surface. TDS values measured in WQSP-6A is approximately 3,800 mg/l.

Magenta Member of the Rustler Formation

In the vicinity of the WIPP facility, another water bearing geologic unit that exists beneath the Shallow Subsurface Water is the Magenta Member of the Rustler Formation at approximately 608 feet below ground surface. Due to pressure in the formation, water levels measured in wells completed in the Magenta rise to the potentiometric surface, approximately 315 feet below grade surface. The hydraulic gradient was generated from depth to water measurements from wells completed in the Magenta Member. Underneath the Salt Storage Area, the potentiometric surface is interpolated to be approximately 315 feet below ground surface. The TDS concentrations for Magenta wells were reported in the Title 40 CFR 191 Compliance Certification Application for the Waste Isolation Pilot Plant as ranging from 4,600 mg/l to 24,600 mg/l.

Culebra member of the Rustler Formation

The quality of the Culebra water sampled near WIPP is naturally poor and not suitable for human consumption or for agricultural purposes, because the TDS concentrations are generally above 10,000 mg/l. In 2011, TDS concentrations in the Culebra varied from a low of 14,950 mg/l to a high of 223,500 mg/l as reported in the Waste Isolation Pilot Plant Annual Site Environmental Report for 2010 (DOE/WIPP-11-2225). The groundwater of the Culebra is considered to be Class III water by EPA guidelines. Groundwater elevation measurements in the Culebra indicate that the flow of groundwater is north to south at the center of the WIPP facility. Regionally, the flow is from the north to the southwest. The discharge velocity across the WIPP Land Withdrawal Area ranged from the high of 1.30E-04 m/d (4.27E-04 ft/d) to a low of 1.34E-05 m/d (1.42E-04 ft/d). The average discharge velocity across the WIPP Land Withdrawal Area was calculated to be 1.06E-04 m/d (3.48E-04 ft/d). Typical segment gradients ranged from 0.002 to 0.006, hydraulic conductivity was set to 0.022 m/d (0.071 ft/d).

C-8. Other Permitted Discharge Locations. If applicable, list other locations of wastewater or stormwater discharges on your site that are not described in this application and indicate what permits apply to them. Examples include discharges from small septic systems (covered by Liquid Waste Permits, discharges to surface waters under a NPDES permit, a discharge covered by a separate Discharge Permit, etc. Be sure these other discharge locations are identified on the site map required in Item B-3.

Discharge Type	Permit Identification
NA	N/A
NA	N/A
NA	N/A
NA	N/A

C-9. Other Information. Describe below or attach any additional information to demonstrate that your proposed discharge plan will be protective of ground water quality, public health and property.

In general, ground water quality in vicinity of the WIPP facility is poor and is not present in sufficient quantity or quality to be suitable for the public drinking water supply. Naturally occurring Dewey lake water south of the facility could be used for livestock watering. Significant efforts have been taken in covering the existing Salt Cell 1, constructing a new salt storage area and containing run-off in a lined pond for evaporation. Additionally, other significant sources of recharge to the subsurface shallow water are also contained in lined ponds for evaporation. These efforts in addition to the natural hydrological and geological features present at the WIPP site make it unlikely that WIPP related activities will impact ground water that could be used for present or future use as a domestic or agricultural water supply.

CHANGE HISTORY SUMMARY

REVISION NUMBER	DATE ISSUED	DESCRIPTION OF CHANGES
6	05/05/11	Added WP 02-2 to Baseline Documents Reworded last bullet in Prerequisite Actions Changed all references to Facultative Lagoon system to Sewage Treatment Facility Added Notes above Step 1.1 and Step 1.1.1 Added wording to Step 3.3.1 on what to do in case of significant erosion. Replaced Attachment 3 with updated map Deleted Attachment 4
7	01/22/13	• Editorial revision in accordance with MD 1.1.
8	04/18/13	• Deleted "Satisfactory Plant Growth" column in attachment 2. • Replaced attachment 3 with updated figure.

INTRODUCTION

This procedure provides instructions for inspecting the infiltration control areas. The term "infiltration control areas" refers to lined evaporation ponds and covered salt piles which are intended to minimize the infiltration of water that could contribute to the recharge of the shallow subsurface water beneath the Waste Isolation Pilot Plant (WIPP) site.

Performance of this procedure generates the following record(s), as applicable. Any records generated are handled in accordance with departmental Records Inventory and Disposition Schedules (RIDS).

- Attachment 1, Site Discharge Area Evaporation Pond Inspections
- Attachment 2, Salt Storage Area Inspections

04-AD3008, *Shift Operating Logs and Round Sheets*		✓	

PRECAUTIONS AND LIMITATIONS

- Inspections shall be conducted during daylight hours.
- Inspections shall be performed monthly, at a minimum, and also following severe rainstorm events greater than or equal to 2 inches in 24 hours.
- Caution must be used when walking around ponds and ditches; the liner surfaces may be slippery, which could result in slips or falls.
- Performer must beware of snakes, spiders, and any other threatening wildlife.
- Performer must watch for rapidly changing or severe weather conditions.

- Requirements for personal protective equipment (PPE) include reflective vest, hard hat, steel-toed boots, and safety glasses, when an active construction zone is implemented in the area.

- This procedure may be performed by more than one individual, and may be completed over multiple days.

- Only exposed portions of the liners (i.e., portion not submerged under water or covered with soil) are required to be inspected.

- "Minor Erosion" is erosion that is leading to "Major Erosion."

- "Major Erosion" on the salt storage area (SSA) (covered salt pile) is characterized as sufficient soil erosion indicating that the liner integrity could be damaged by wind lifting up the liner. Major erosion for the Site and Preliminary Design Validation (SPDV) Pile is defined as when the liner is, exposed and wind action cause the liner to agitate in the wind. Major erosion around lined ponds and the Salt Storage Extension Area (SSE) is when the integrity of the anchor trench is threatened.

EQUIPMENT

- Binoculars

PREREQUISITE ACTIONS

- Outstanding deficiencies shall be noted on the current inspection form.

- Refer to Attachment 3, Inspection Area Locations, to verify the location of each inspection area.

If required inspection goes delinquent, go to 04-IM1000 and determine if a WIPP Form should be written.

PERFORMANCE

1.0 EVAPORATION POND INSPECTIONS

NOTE

The criteria for inspection of each pond listed below are listed in section 1.1. The results of each criterion are to be recorded on Attachment 1, Table 1, Site Discharge Area Evaporation Pond Inspections. A notation of "Sat" means satisfactory, and "Unsat" means unsatisfactory. Any necessary comments are to be recorded in the comments section. A comment section with no text entered, means no comments were recorded.

- Salt Storage Extension Basin I (SSEB-I)
- Salt Storage Extension Basin II (SSEB-II)
- Salt Pile Evaporation Pond (SPEP)
- Evaporation Basin A (EBA)
- Evaporation Pond 1 (PD1)
- Evaporation Pond 2 (PD2)

NOTE

The Sewage Treatment Facility and H-19 Evaporation Pond are inspected by Facility Site Operations Infrastructure under procedure 04-AD3008.

1.1 Inspect each Evaporation Pond for the following criteria:

NOTE

Not being able to record an elevation reading due to salt build up is not an unsatisfactory condition. The water level is unsatisfactory if 1 ft of freeboard is not maintained. In the SSEB I, note in the comment section if the water level is below, at, or above the effluent pipe to the SSEB-II, which is at an elevation of approximately 3413.8.

1.1.1 Pond Level: Record the level of water in each pond by reading the level indicated on the staff gauge to the nearest 10th of a foot. If staff gauge is encrusted with salt or there is wave action, make best possible estimate.

1.1.2 Freeboard: Verify one foot of freeboard is maintained in the SSEB-I, SSEB-II, and SPEP. The south east corner of the SPEP has a one foot freeboard mark on top of it (top of painted line) and SSEB-I has a one foot freeboard mark (top of painted line on berm between the SSEB-I and the Salt Storage Extension Area. Due to construction design, the freeboard for the SSEB-II is the same elevation as freeboard on the SSEB-I, the one foot freeboard on the east berm of the SSEB-I.

1.1.3 Verify ponds are relatively free of floating plants and debris.

NOTE

Berms and liner condition may be satisfactory with small plants. However, preventive measures may need to be taken if woody plants are revealed (e.g., spraying).

1.1.4 Verify that the berms and lined pond and are non-impactive of burrowing animals or deep rooted vegetation (i.e., salt cedar, mesquite, desert willow, etc.) that could damage the liner.

NOTE

Liner integrity may be satisfactory; however tears above the water line or near anchor trenches may need to be addressed for long term maintenance.

1.1.5 Liner integrity: Inspect the liner to verify the absence of holes, cuts, signs of abrasion. Verify that berms are not damaged by wind or water erosion.

NOTE

Some sediment is generally present in the ditches and removal should be done before the sediment becomes an obstruction to the flow of water to the respective basin/pond or results in the ditch overflowing during storm events.

1.1.6 Culverts/ditches and pond berms: Verify that influent culverts/ditches are free of debris that could impede flow into the pond.

1.2 Initial and date: Initial for the line item inspected and note the date in the appropriate column.

2.0 INSPECTION OF SALT STORAGE AREAS

NOTE

Each location listed below shall be inspected for the criteria listed in section 2.1. The results of each criterion should be recorded on Attachment 2, Table 2, Salt Storage Area Inspections. A notation of "Sat" means satisfactory, and "Unsat" means unsatisfactory. Any necessary comments should be recorded in the comments section.

- Salt Pile
- Salt Storage Extension (SSE)
- Site and Preliminary Design Validation (SPDV) Pile

2.1 Visually inspect each SSA listed above and perform the following:

2.1.1 Verify that no major wind or water erosion has occurred to the SSA or SPDV pile soil covers and that the integrity of the SSE anchor liner has not been impacted by erosion.

NOTE

Condition may be satisfactory with small plants. However, preventive measures may need to be taken (e.g., spraying).

2.1.2 Verify that deep rooted plants, (i.e., salt cedar, mesquite, desert willow, etc.) are not growing such that the roots could damage the liner on the SSA and SPDV Pile covers nor in the vicinity of the SSE anchor trench.

2.1.3 Verify that no evidence of burrowing animals are present in such a manner that could damage liner integrity.

2.1.4 Verify that liner integrity is in good condition.

2.1.5 Verify that stormwater run-off is not causing channelized erosion escaping containment systems that could damage liner.

2.1.6 Provide the inspector's initials and enter the date of inspection.

3.0 INSPECTION RESULT REPORTING

3.1 Inspectors, sign and date completed inspection form.

3.2 If an unsatisfactory condition is observed:

3.2.1 Correct the condition if possible and note corrective actions in the comments section (add additional pages if necessary).

3.2.2 Provide a description of any unsatisfactory conditions for which SEC needs to evaluate and coordinate corrective actions.

3.3 SEC, review inspection documentation and sign acknowledging the inspection results.

3.3.1 SEC, coordinate with EM&H and/or Operations and Maintenance to initiate corrective actions or note that no actions are necessary.

3.3.2 In the event of significant erosion or failure of vegetative success, a plan and schedule will be developed for repair by SEC within 90 days of discovery.

3.3.3 SEC, attach documentation (e.g., e-mail, memorandum, action request) to the inspection form and notify the inspector of actions taken.

3.3.4 SEC, file inspection documentation in accordance with SEC's RIDS.

DESIGN CRITERIA

* A. RMC-IIA, AUGUST 1982 (PAGE 1-21):

1. SITE POPULATION – 285 (DOE, OPERATING CONTRACTOR AND GUARD PERSONNEL)
19 (SUB-CONTRACTOR PERSONNEL)
TOTAL = 304 PERSONS *

2. NO. OF SHIFT OPERATION = 2 SHIFTS *

3. FLOW RATE CAPACITY = 50 GALLONS PER DAY PER PERSON OF RAW SEWAGE

4. TYPE OF RAW SEWAGE = MEDIUM STRENGTH WITH A FIVE DAY BIOCHEMICAL OXYGEN DEMAND (BOD_5) OF 220 MG/L.

5. TYPE OF SANITARY SEWAGE TREATMENT FACILITY = TWO PARALLEL STABILIZATION LAGOON PAIRS.

6. TYPE OF SEWAGE COLLECTION PIPING SYSTEM USED – GRAVITY TYPE

* B. NEW MEXICO WATER QUALITY CONTROL COMMISSION REGULATIONS AS AMENDED THROUGH JULY 2, 1981 (PAGE, 13):

LABORATORY ANALYSIS FOR THE QUALITY OF THE SEWAGE PLANT

1. BIO-CHEMICAL OXYGEN DEMAND (BOD) – LESS THAN 30 MG/L
2. CHEMICAL OXYGEN DEMAND (COD) – LESS THAN 125 MG/L
3. SETTLEABLE SOLIDS – LESS THAN 0.5 MG/L
4. FECAL COLIFORM BACTERIA – LESS THAN 500 ORGANISMS/100 ML
5. PH – BETWEEN 6.6 AND 8.6

* C. DOE ORDER 6430 (DRAFT) – GENERAL DESIGN CRITERIA, CHAPTER XII:

1. DESIGN CAPACITY OF TREATMENT FACILITY SHOULD NOT EXCEED KNOWN ... BY MORE THAN 30% OF THE AVERAGE DAILY

NUCLEAR FUEL OPERATIONS

NOTE: REFER TO WASTEWATER ENGINEERING - METCALF & EDDY, INC. PAGE 243:

Biochemical oxidation is a slow process and theoretically takes an infinite time to go to completion. Within a 20-day period, the oxidation is about 95 to 99 percent complete, and in the 5-day period used for the BOD test, oxidation is from 60 to 70 percent complete. The 20°C temperature used is an average value for slow-moving streams in temperate climates and is easily duplicated in an incubator. Different results would be obtained at different temperatures because biochemical reaction rates are temperature-dependent.

POLISHING CELLS

Estimate the effluent quality using the data from Table 12-9:

$$(SS)_e = 0.20(BOD_5)_i + 0.20(BOD_5)_i + 0.1(SS)_i$$

$$= 0.20(220) + 0.20(220) + 0.1(220)$$

$$= 44 + 44 + 22 = 110 \text{ mg/l} \approx \text{USE } 100 \text{ MG/L}$$

$$(BOD_5)_e = 0.02(BOD_5)_i + 0.30(BOD_5)_i$$

$$= 0.02 \times 220 + 0.30 \times 220$$

$$= 4.4 + 66 = 70.4 \text{ mg/l} \approx \text{USE } 100 \text{ MG/L}$$

THEREFORE, EFFLUENT QUALITY IN THE POLISHING CELLS SHALL BE:

$$BOD_5 = 100 \text{ MG/L}$$

$$TSS = 100 \text{ MG/L}$$

NUCLEAR FUEL OPERATIONS

CALCULATION SHEET

CHLORINE CONTACT CHAMBER / STORAGE CELL

SIZING CRITERIA :

1. PROVIDE 30 MINUTES MINIMUM DETENTION TIME FOR DISINFECTION OF 18,500 GAL/DAY FLOW.

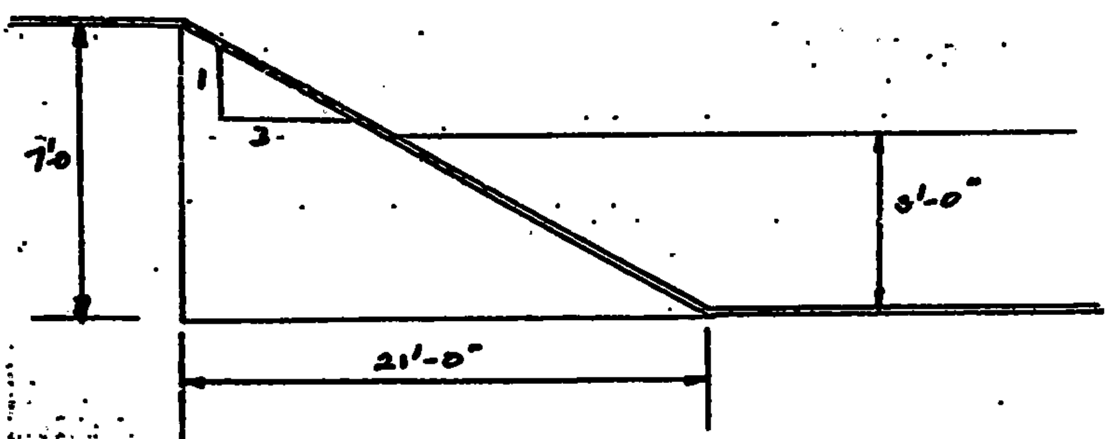
2. PROVIDE 80 TO 90 % OF THE WASTEWATER TO BE RETAINED FOR THE SPECIFIED CONTACT TIME (REF. PAGE 477, WASTEWATER ENGINEERING, METCALF & EDDY INC.)

VOLUME OF CONTACT CHAMBER/STORAGE CELL = $\frac{0.90 \times 18{,}500 \text{ GAL/DAY}}{7.48 \text{ GAL}/FT^3}$

$= 2,226 \ FT^3$ *

WASTEWATER 3 FEET IN STORAGE DEPTH.

CONFIGURATIONS : 3:1 BERM SLOPE AND SQUARE CONFIGURATION



[illegible] FLOOR AREA = 18'x18' @ TOP OF BERM

[illegible] BERM = (18 + 2x21) x (18+2x21) = 60' x 60'

NUCLEAR FUEL OPERATIONS

CALCULATION SHEET

* VOLUME OF CONTACT CHAMBER / STORAGE CELL AT 3 FEET DEPTH:

$$V = \frac{1}{3}\left[A_1 + A_2 + \sqrt{A_1 \times A_2}\right] \times h$$

WHERE:

$$A_1 = (18 + 2\times3\times3) \times (18 + 2\times3\times3) = 36 \times 36 = 1296\ FT^2$$

$$A_2 = 18 \times 18 = 324\ FT^2$$

$$h = 3\ FT$$

$$V = \frac{1}{3}\left[1,296 + 324 + \sqrt{1,296 \times 324}\right] \times 3$$

$$= \frac{1}{3}\left[1,620 + \sqrt{419,904}\right] \times 3 = \frac{1}{3}\left[1620 + 648\right] \times 3$$

$$= \frac{1}{3}\left[2,268\right] \times 3 = 2,268\ FT^3$$

$$V = 2,268\ FT^3 \times 7.48\ GALS/FT^3 = 16,965\ GALS$$

$$\frac{16,965\ GALS}{18,500\ GALS} = 0.92 \approx 92\%$$ OF WASTEWATER TO BE RETAINED FOR STORAGE

CHLORINE FEED RATE CAPACITY (LB/HR) = [MAX. DOSAGE (PPM)] [MAX. FLOW (MGD)] × 8.34 LB/MIL GALLONS/PPM

REF. TABLE 1. PAGE 158 AND FIG 3 PAGE 165 OF WATER TREATMENT PLANT DESIGN, 1969 – ASCE, AWWA, CSSE

MAX. DOSAGE = 2 ppm *

CHLORINE FEED RATE CAPACITY = 2 × 0.0185 × 8.34 = 0.31 LB/DAY hr.

TABLE 1

Representative Chlorine Dosage Required for Various Treatment Objectives and Other Uses

Treatment Objective	Chlorine Dosage ppm	Contact Time min	pH Range	Chlorine Residual Recommended		Alkalinity Consumed as $CaCO_3$
				Type	ppm	
Disinfection						
* Combined available chlorine residual	1.0-5.0	•		•	•	1.38 per ppm Cl_2
Free available chlorine residual	1.0-10.0				•	1.38 per ppm Cl_2
Breakpoint reaction	10 x NH_3 (as N) content	20+	6.5-8.5 (7.5 optimum)	•	•	1.38 per ppm Cl_2
Ammonia Removal						
Monochloramine formation	5 x NH_3 (as N) content	20+	>8.5	free	0.1	1.38 per ppm Cl_2
Dichloramine formation	10 x NH_3 (as N) content	20+	4.4-5.0	free	0.1	
Taste and Odor Control	10 x NH_3 (as N) content plus 1-5 ppm	20+		free	1.0	1.38 per ppm Cl_2
Phenol destruction (up to 200 ppm)	6-20 x phenol content	1.5-5 hr (stepwise)	7.0	free	variable	
Hydrogen Sulfide Removal						
Oxidation to sulfur	2.2 x H_2S content	instantaneous	6.0-8.8 (8 optimum)	free or combined	0.1	2.6 per ppm H_2S
Oxidation to sulfate	8.5 x H_2S content	instantaneous	6.5-9.0 (9 optimum)	free or combined		10 per ppm H_2S
Manganese Removal						
Oxidation to [illegible] form	1.3 x Mn content	up to 3 hr (variable)	7.0-10.0 (10 optimum)	free	0.5	3.4 per ppm Mn oxidized

EFFLUENT DISINFECTION

SINCE THERE'S A WIDE VARIATION IN LAGOON EFFLUENT FLOW RATES, CONVENTIONAL CHLORINATION USING GASEOUS CL_2 MAY PROVE DIFFICULT TO CONTROL OR MANAGE

AN ALTERNATE IS THE HYPOCHLORITE FEEDING USING DRY-FEED METHOD, IN WHICH THE MATERIAL IS RECEIVED, MEASURED AND DISPENSED IN DRY FORM (GRANULAR, POWDERED; OR TABLET FORMS OF HIGH TEST CALCIUM HYPOCHLORITE). SIMILAR TO DIAMOND SHAMROCK "SANURIL".

COSTS:

FROM LITERATURE - CHEMICAL REQUIREMENTS IN #/0.1000 GALLONS IS EQUAL TO $\frac{1}{100}$ OF DESIRED RESIDUAL IN PPM.

USING:

FOR 2 ppm RESIDUAL:

$$\frac{0.02}{1000\,GAL} \times (16,965\ GAL/DAY) = 0.34\#/DAY \ *$$

$$\frac{0.34\#/DAY \times \$2.70/\#}{16,965\ GAL/DAY} = \text{NEGLIGIBLE}$$

COST OF UNIT = \$300.00

REFERENCE: SEE CALCULATION SHEET NO. 12 OF W.L. SHIPMAN DATED 7/6/81.

* USE: 10 ppm.

$$\left(\frac{18,500\ GPD}{10^6}\right)(10\ ppm)(8.34) = 1.5\#/D$$

@ \$2.70/#

$$(\$2.\text{--})(1.5\#/D) = \$3.40/DAY \text{ CHEM. COSTS (YR. 1981)}$$

YR 3 ≈ \$4.--/DAY
