

Copper Flat Mine Discharge Permit DP-1840 Application

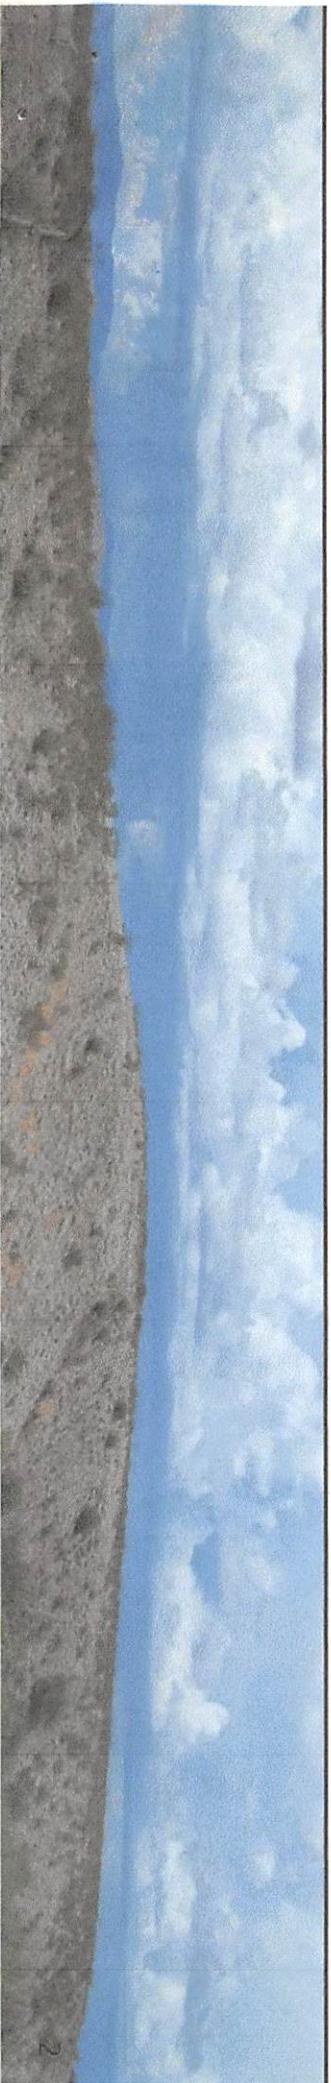

Steven T. Finch, Jr., CPG, PG
Principal Hydrogeologist-Geochemist
John Shomaker & Associates, Inc.
WATER-RESOURCE AND ENVIRONMENTAL CONSULTANTS

September 2018

Outline

1. Site Experience and Qualifications
2. Key References
3. Hydrogeologic Setting for DP-1840
4. Copper Flat Open Pit
5. Waste Rock Stockpiles 2&3
6. Tailings Impoundment
7. Summary

Expertise

Education

- ✓ B.S. Geology from Sul Ross State University, 1985
- ✓ M.S. Geology from Northern Arizona University, 1991

Professional Certifications and Registrations

- ✓ American Institute of Professional Geologists CPG-9590
- ✓ Texas Professional Geoscientist PG-5302

Relevant Experience

- ✓ 28+ years as Hydrogeologist-Geochemists at JSAI
- ✓ Copper Rule Technical Advisory Committee
- ✓ Experience with Copper Flat property – 1992 to current

Key References

Experience with Cobber Flat Property – 1995 to present

PROBABLE HYDROLOGIC
 CONSEQUENCES OF THE
 SIERRA FLAT PROJECT
 NEW MEXICO

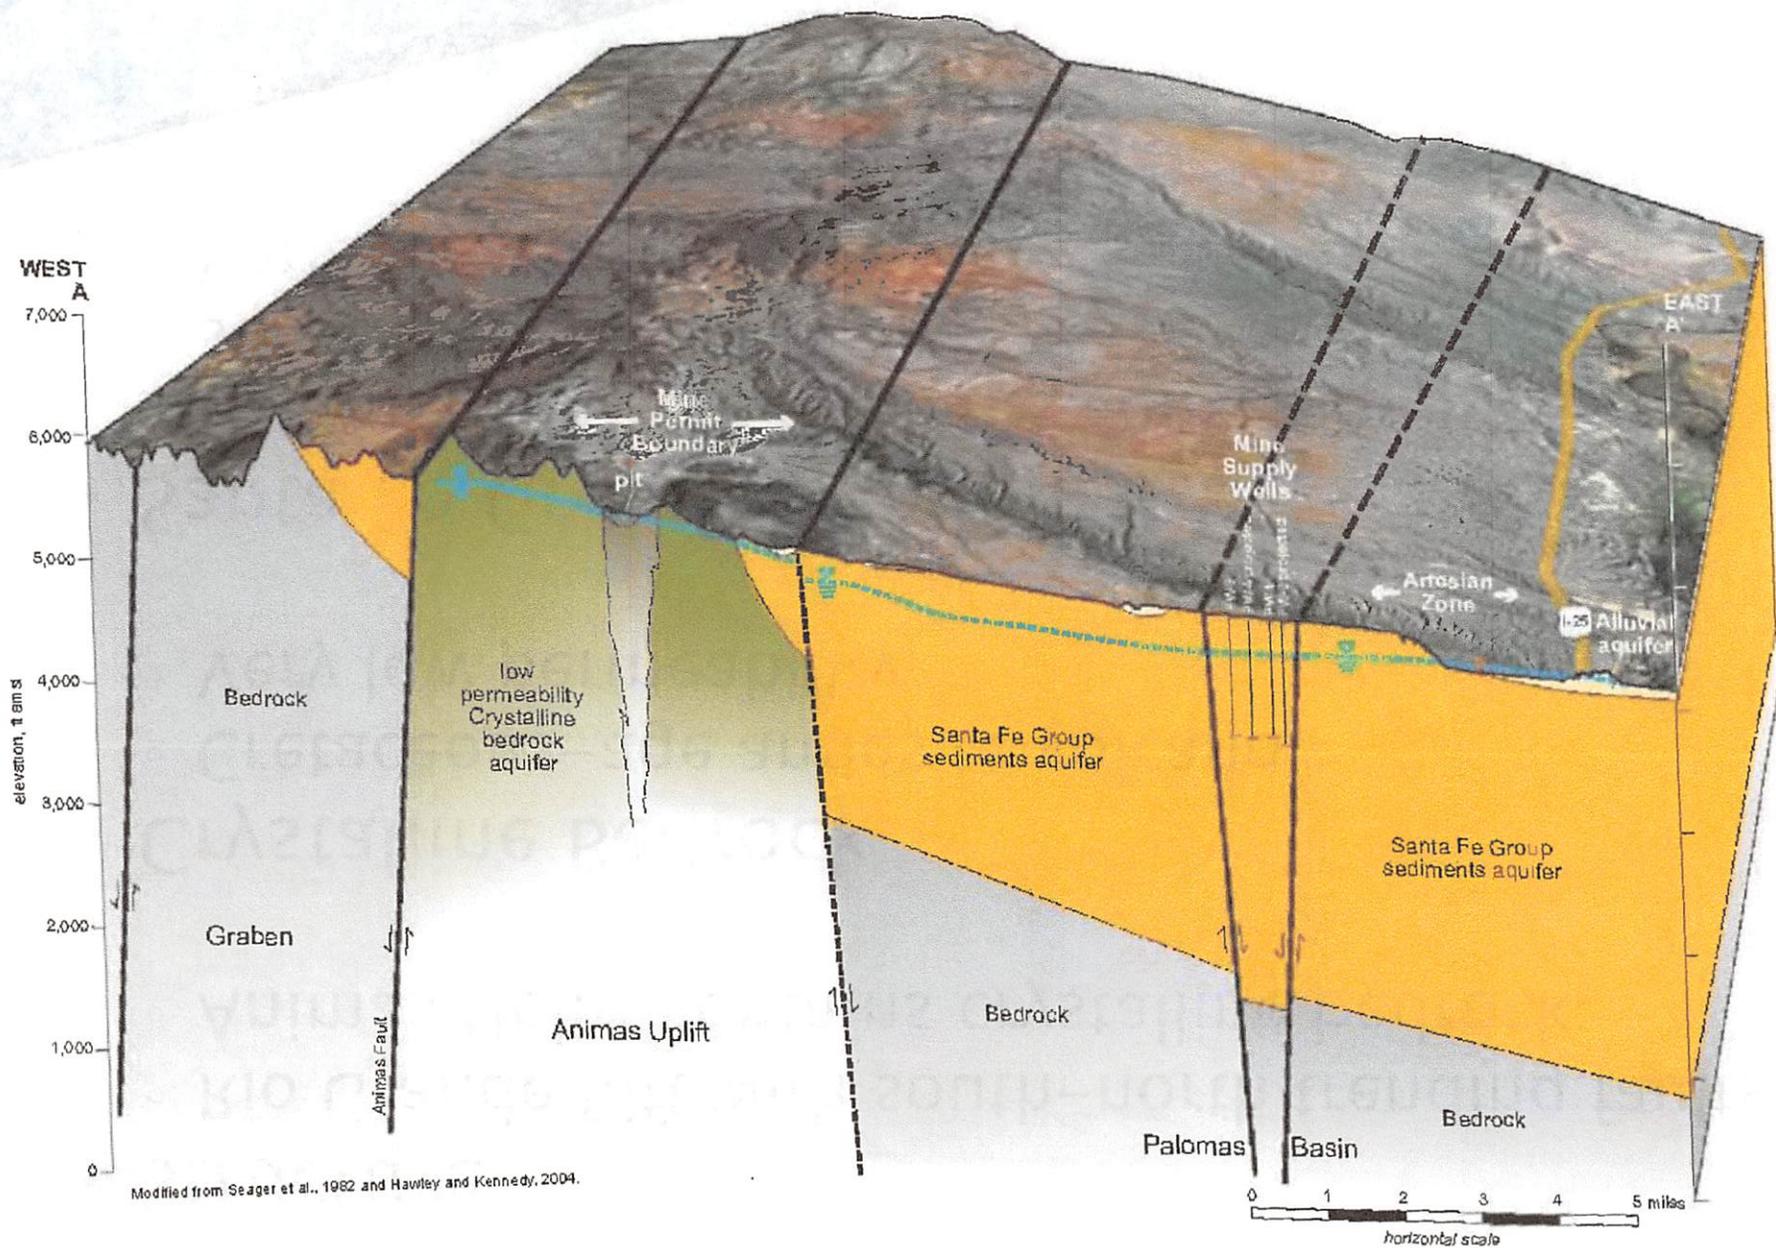

HYDROGEOLOGIC SETTING AND CONCEPTUAL MODEL

Regional Geologic Setting

20.6.7.11.P(2) NMAC

Regional Geologic Setting 20.6.7.11.P(2) NMAC

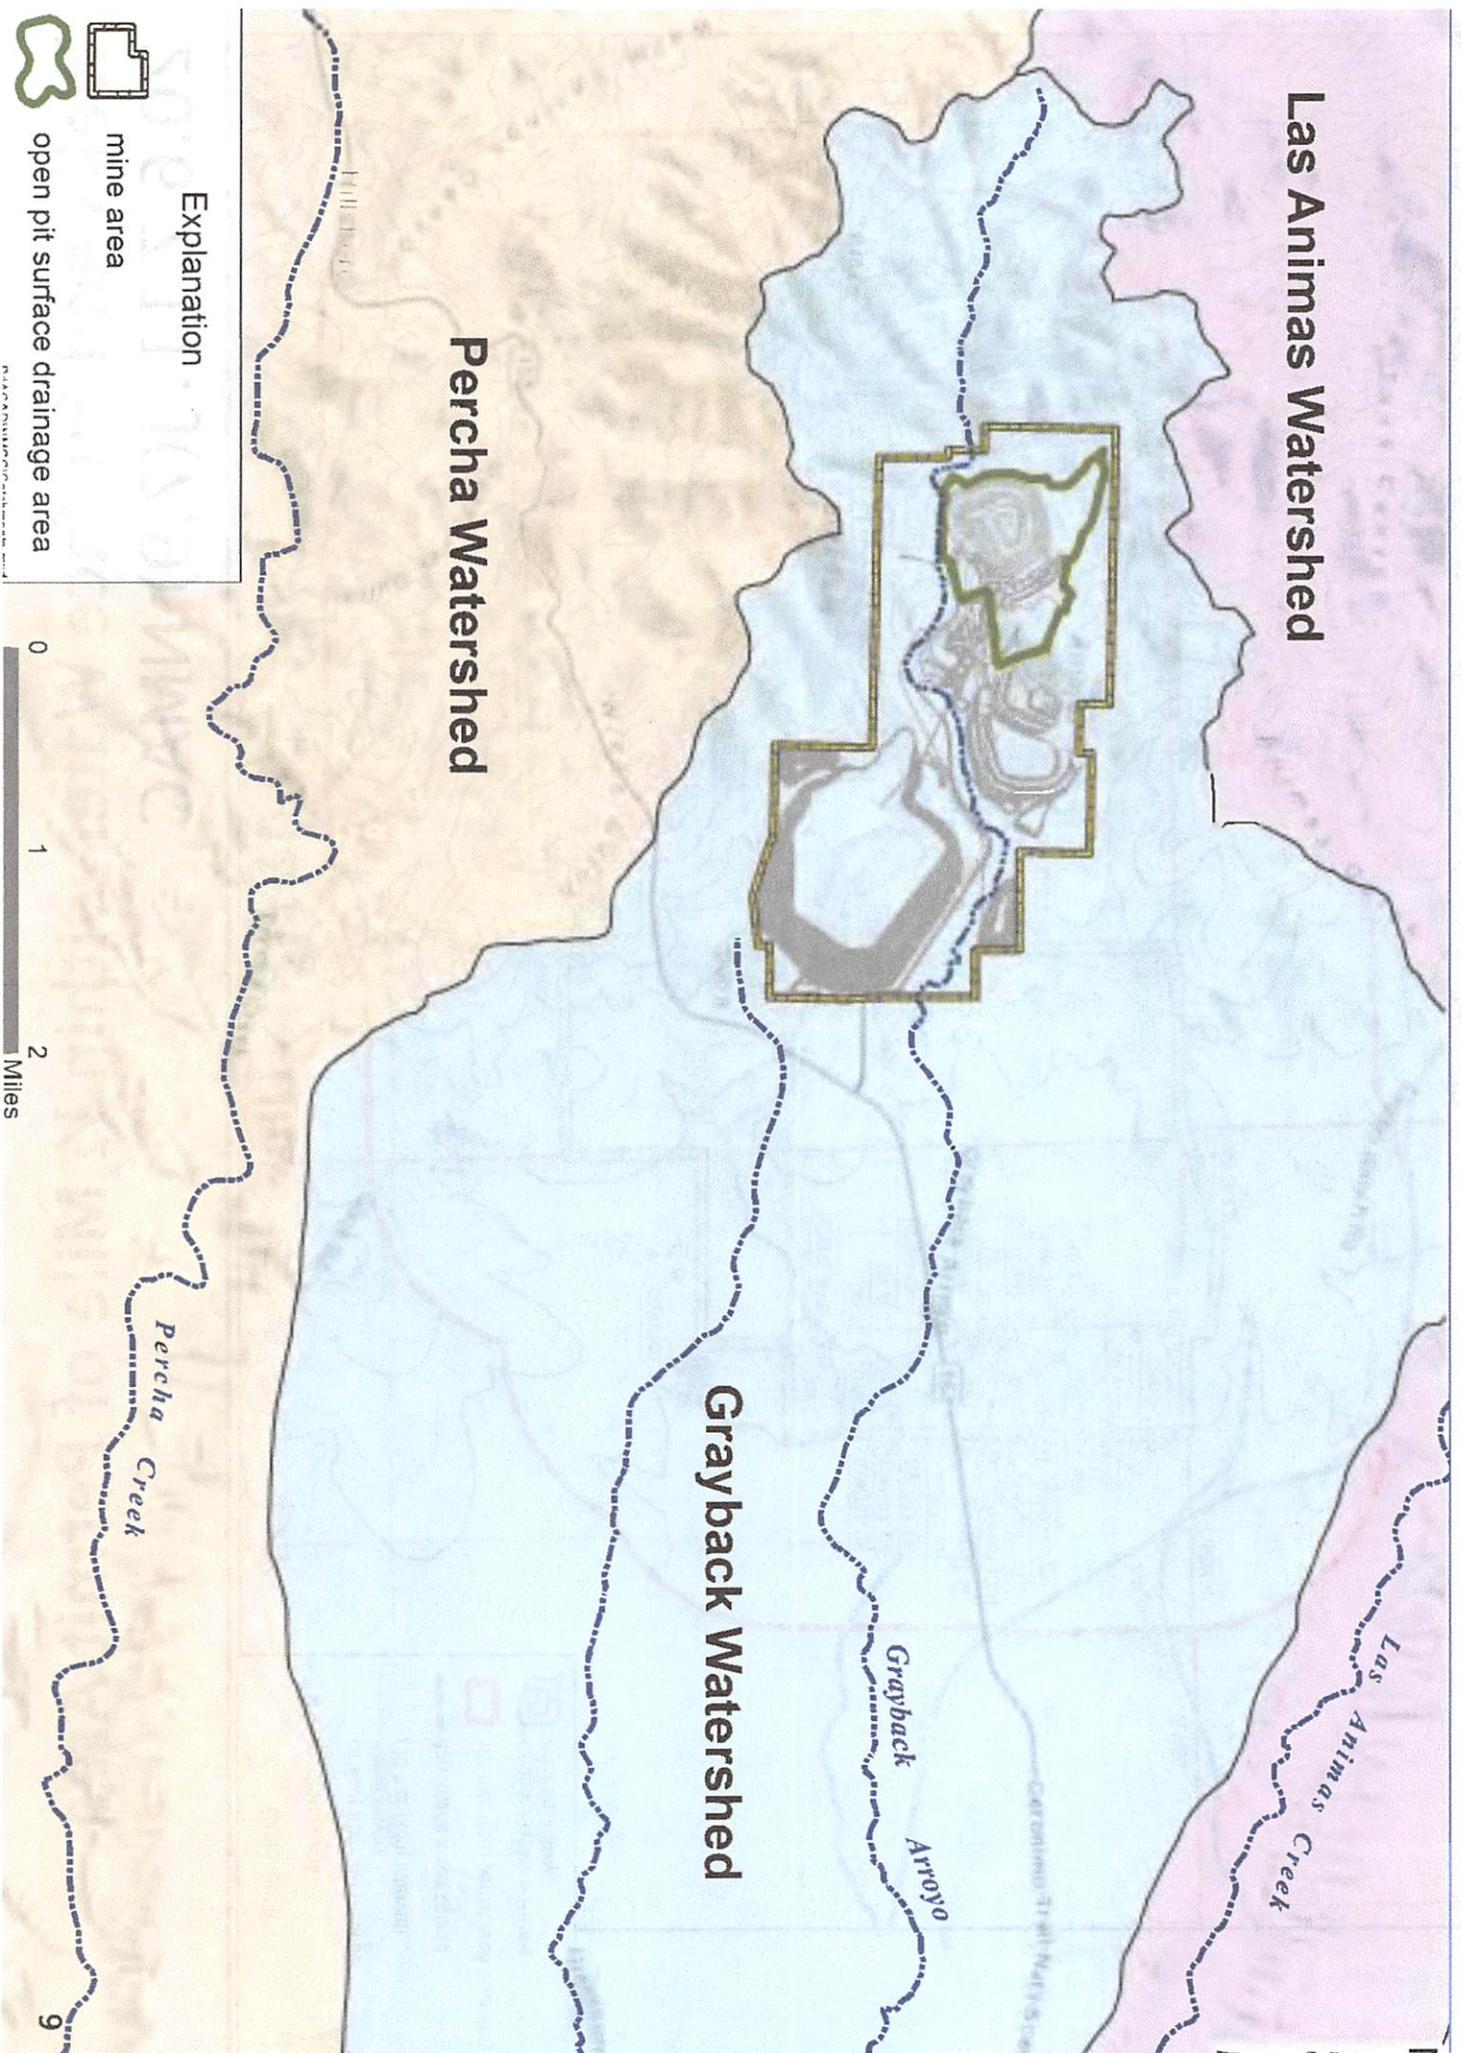

Regional Geology

- ▶ **Structure**
 - Rio Grande Rift with south–north trending faults
 - Animas Uplift contains crystalline bedrock

- ▶ **Crystalline Bedrock**
 - Cretaceous–age andesite volcano
 - Very low permeability

- ▶ **Santa Fe Group Sediments**
 - Unconsolidated sediments consisting of clay, silt, sand, and gravel
 - Variable permeability

Regional Hydrologic Setting 20.6.7.11.K&P NMAC

Wells and Surface Water within 1/2 Mile of Permit Area

Permit Area Hydrogeology

- ▶ **Geologic Model**
 - Detailed understanding of rock type distribution
 - Mapped faults and structures

- ▶ **Aquifer Characteristics**
 - Groundwater elevations and direction of flow
 - Permeability of rock units

- ▶ **Baseline Water Quality**
 - Over 40 years of water-quality data

Copper Flat Open Pit

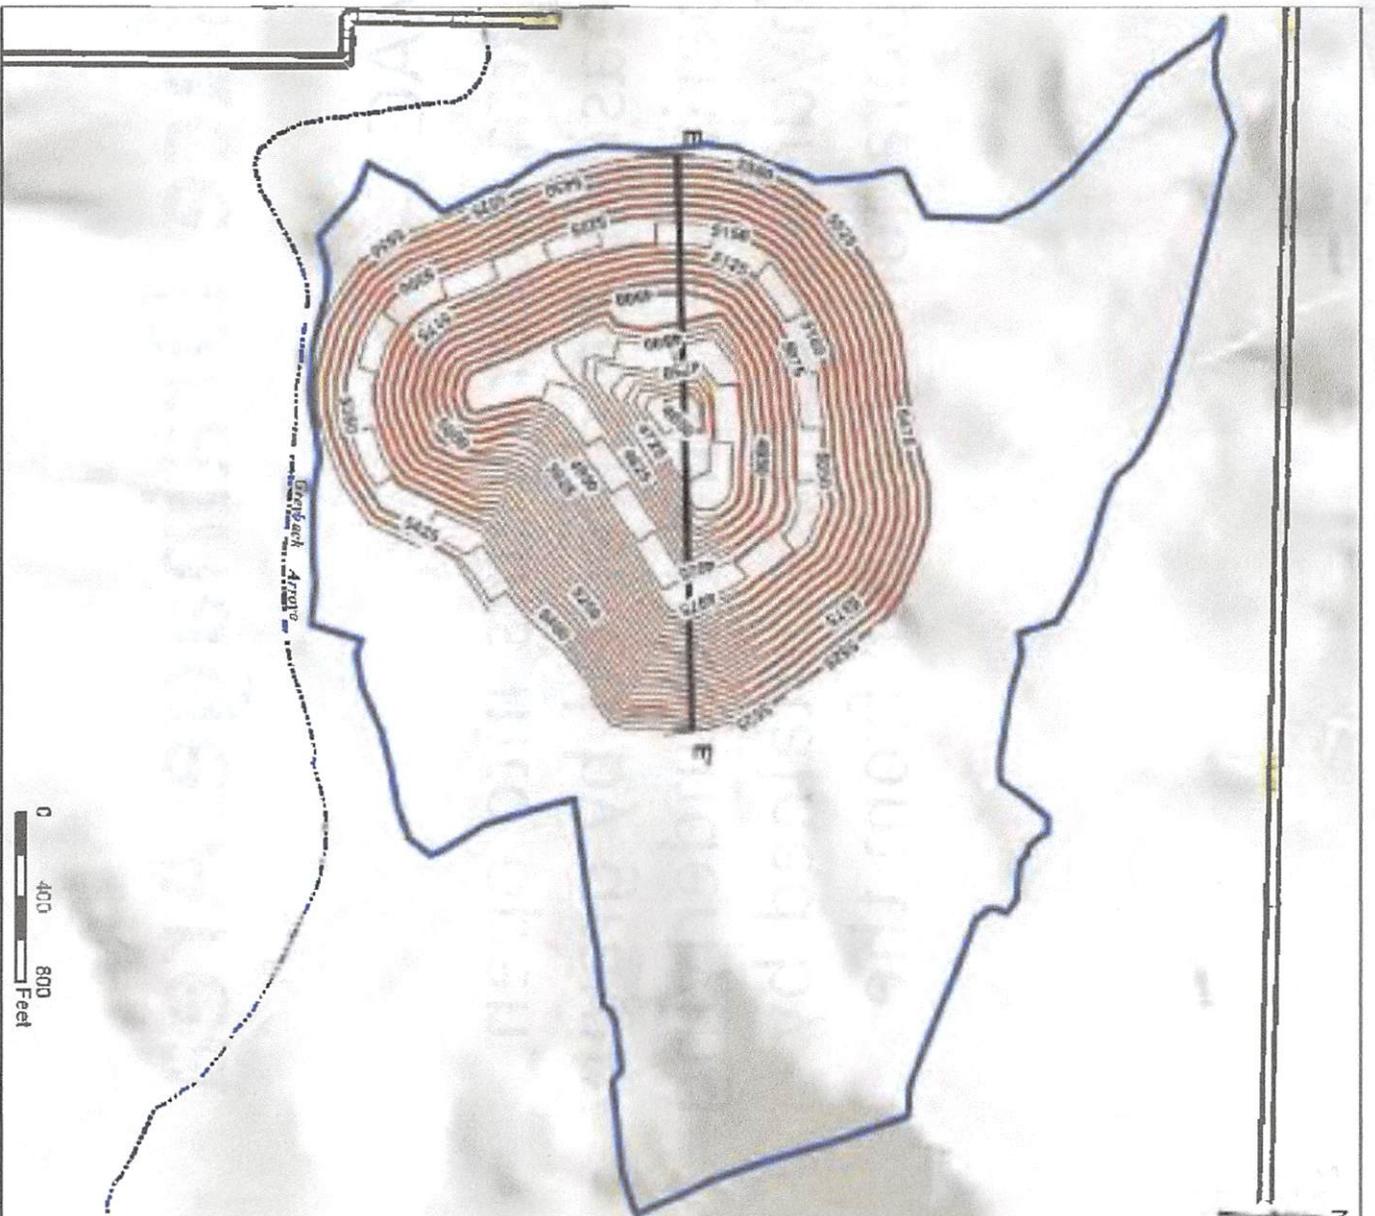

- » Monitoring 20.6.7.28 NMAC
- Closure 20.6.7.33 NMAC
- Post Closure 20.6.7.35 NMAC

Open Pit Surface Drainage Area

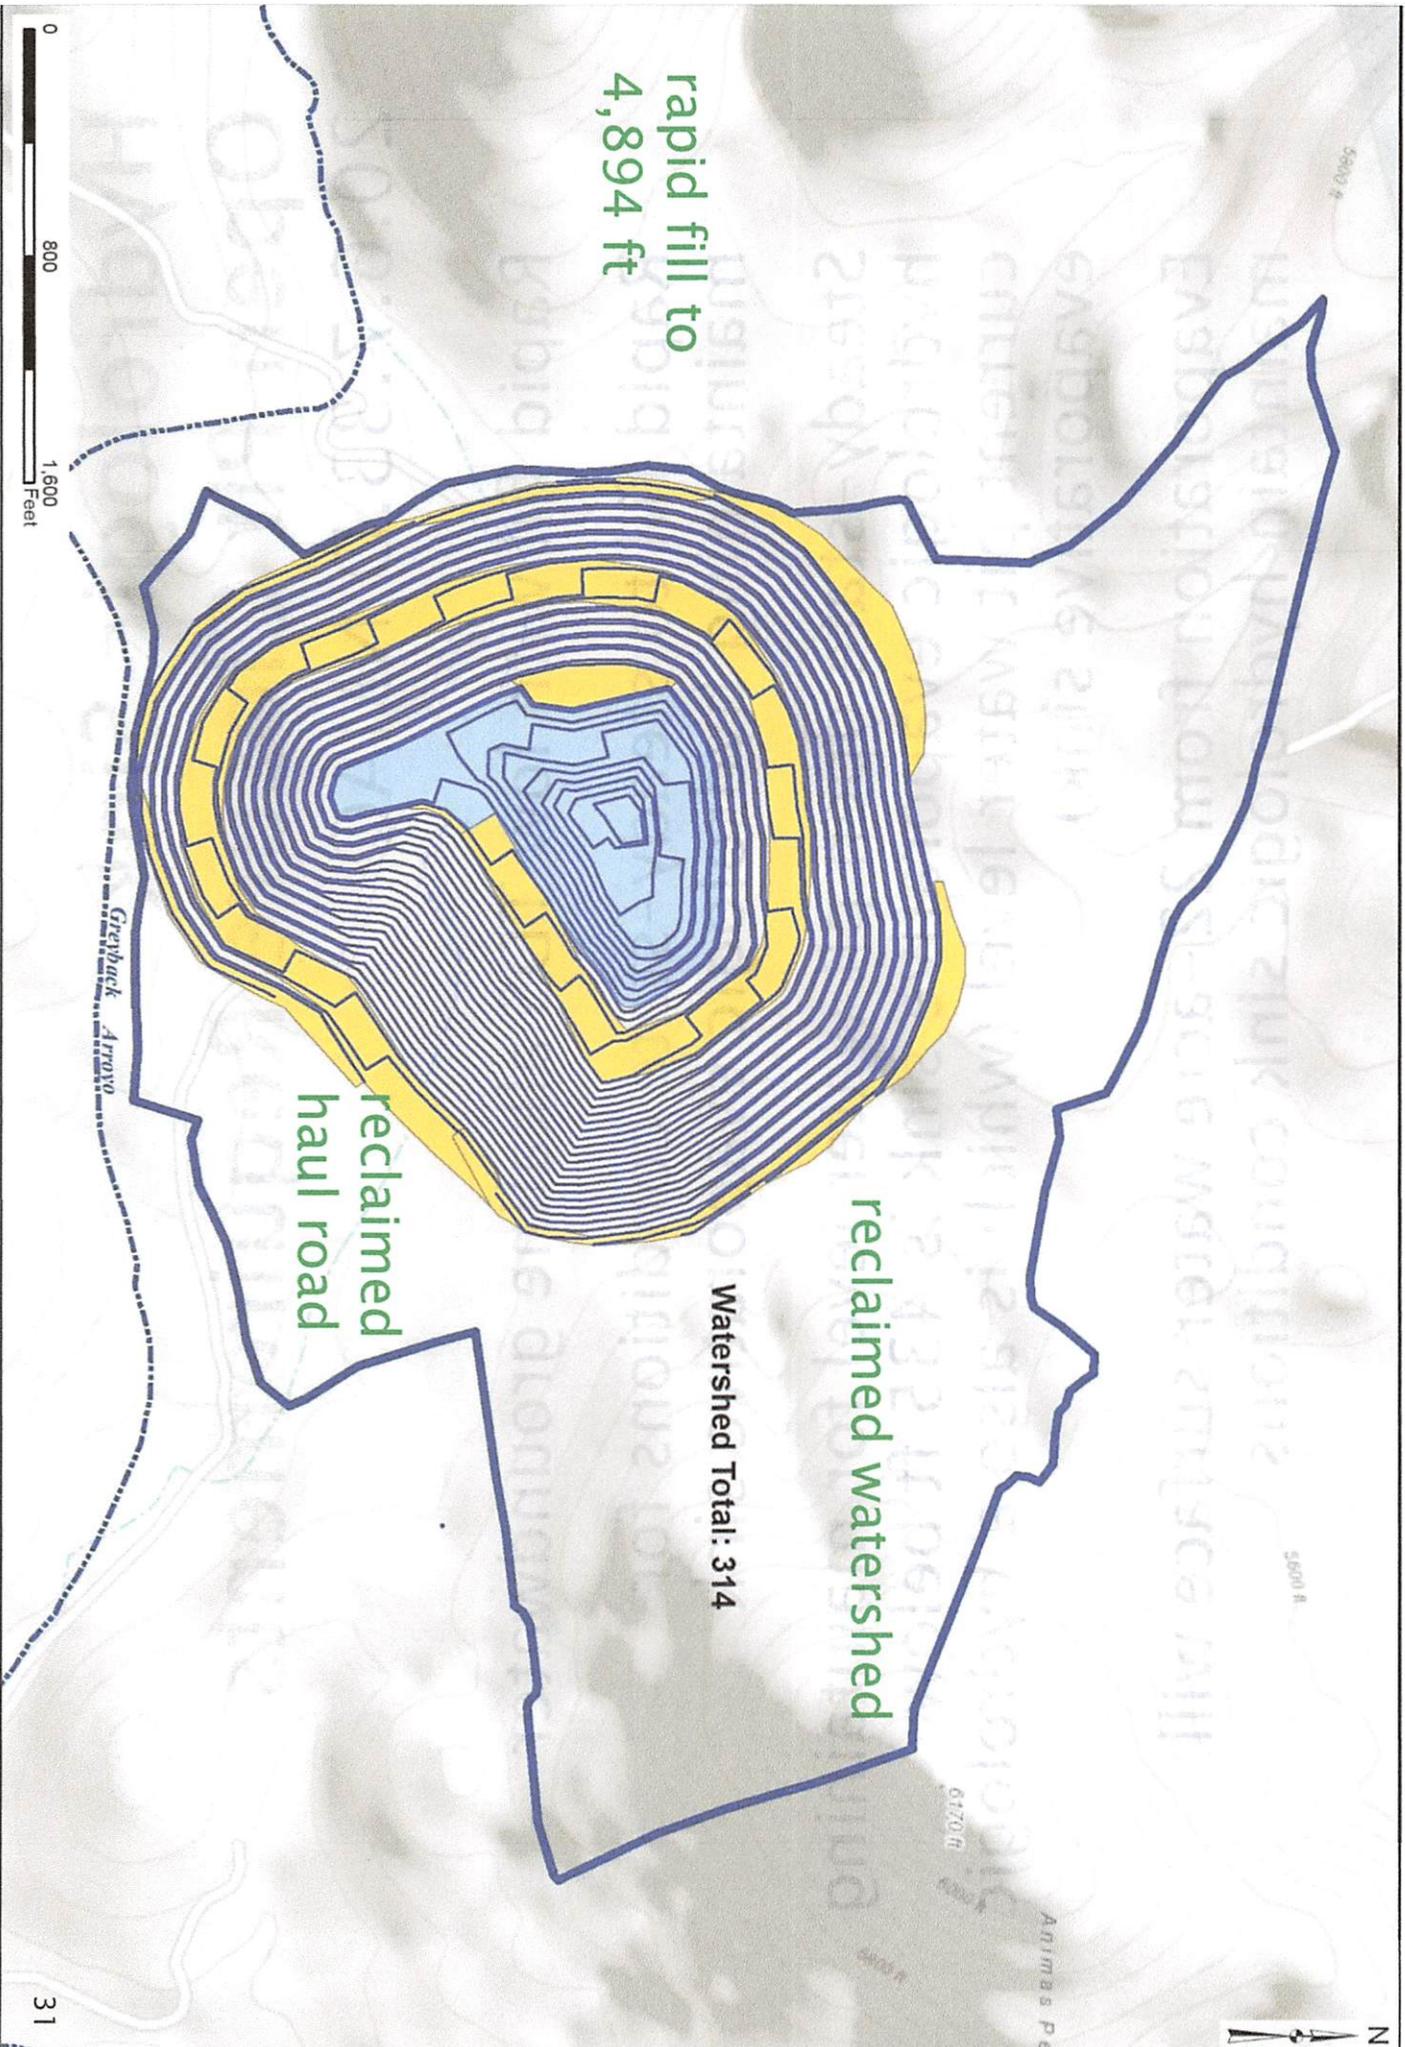

20.6.7.7.B(42) NMAC

- ▶ Area in which storm water drains into open pit and cannot feasibly be diverted by gravity outside the pit perimeter, and the underlying groundwater is hydrologically contained by pumping or evaporation of water from the open pit.

Copper Flat Open Pit Surface Drainage Area

Open Pit Rapid Fill Reclamation

rapid fill to
4,894 ft

reclaimed
haul road

reclaimed watershed

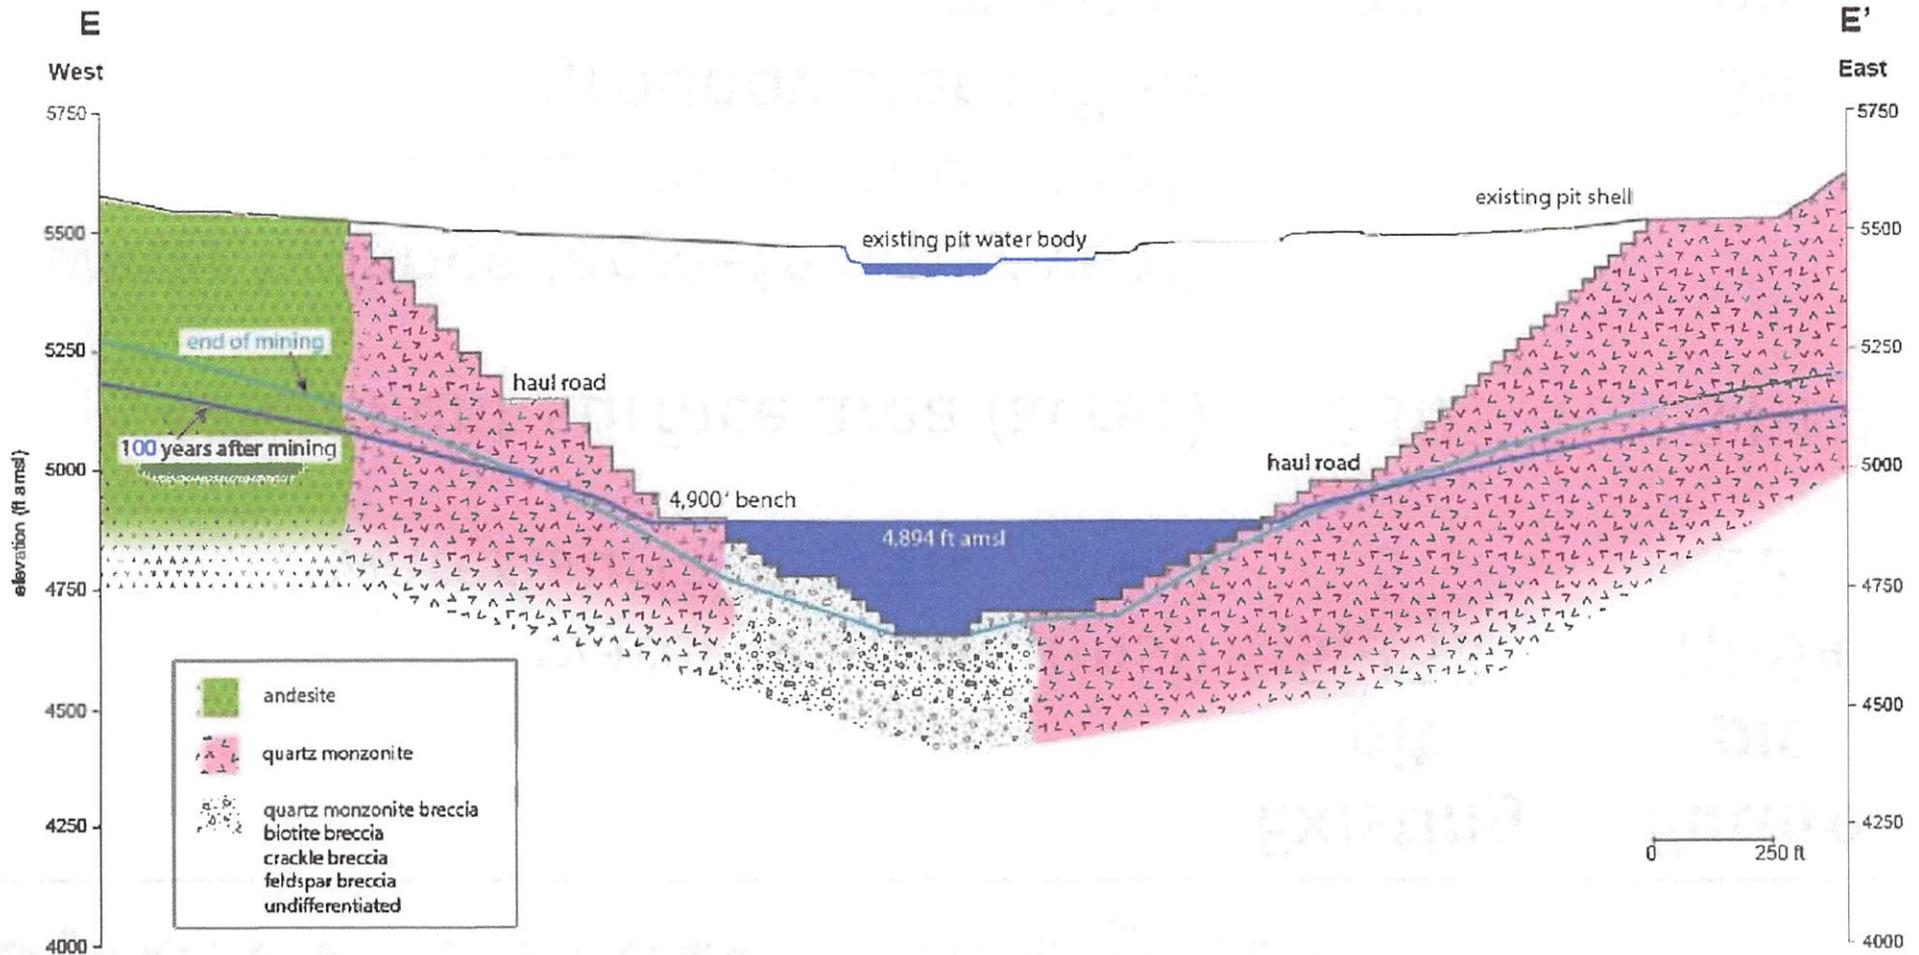

Watershed Total: 314

Hydrologic Sink Open Pit Closure Requirements

20.6.7.33.D NMAC

- Rapid fill with low TDS alkaline groundwater
- Rapid fill to steady-state conditions for maintaining hydrologic evaporative sink
- Steady-state open pit water level for maintaining hydrologic evaporative sink is 435 ft below current pit water level (which is also a hydrologic evaporative sink)
- Evaporation from 22-acre water surface will maintain hydrologic sink conditions

Open Pit Dewatering and Rapid Fill Reclamation

Open Pit Water Budgets

	Existing pit	Future pit
water level (ft amsl)	5,433	4,894
water surface area (acres)	5	22
catchment surface area (acres)	230	314
<u>water balance (acre-feet per year)</u>		
precipitation and runoff	18	57
groundwater inflow	7	36
Total In	25	93
Evaporation Out	25	93

WASTE ROCK STOCKPILES 2&3

SWQ₃

Photograph of WRSP 2&3 site

WRSP Operational Conceptual Model

Protection of Groundwater During Operations (20.6.7.21.D NMAC)

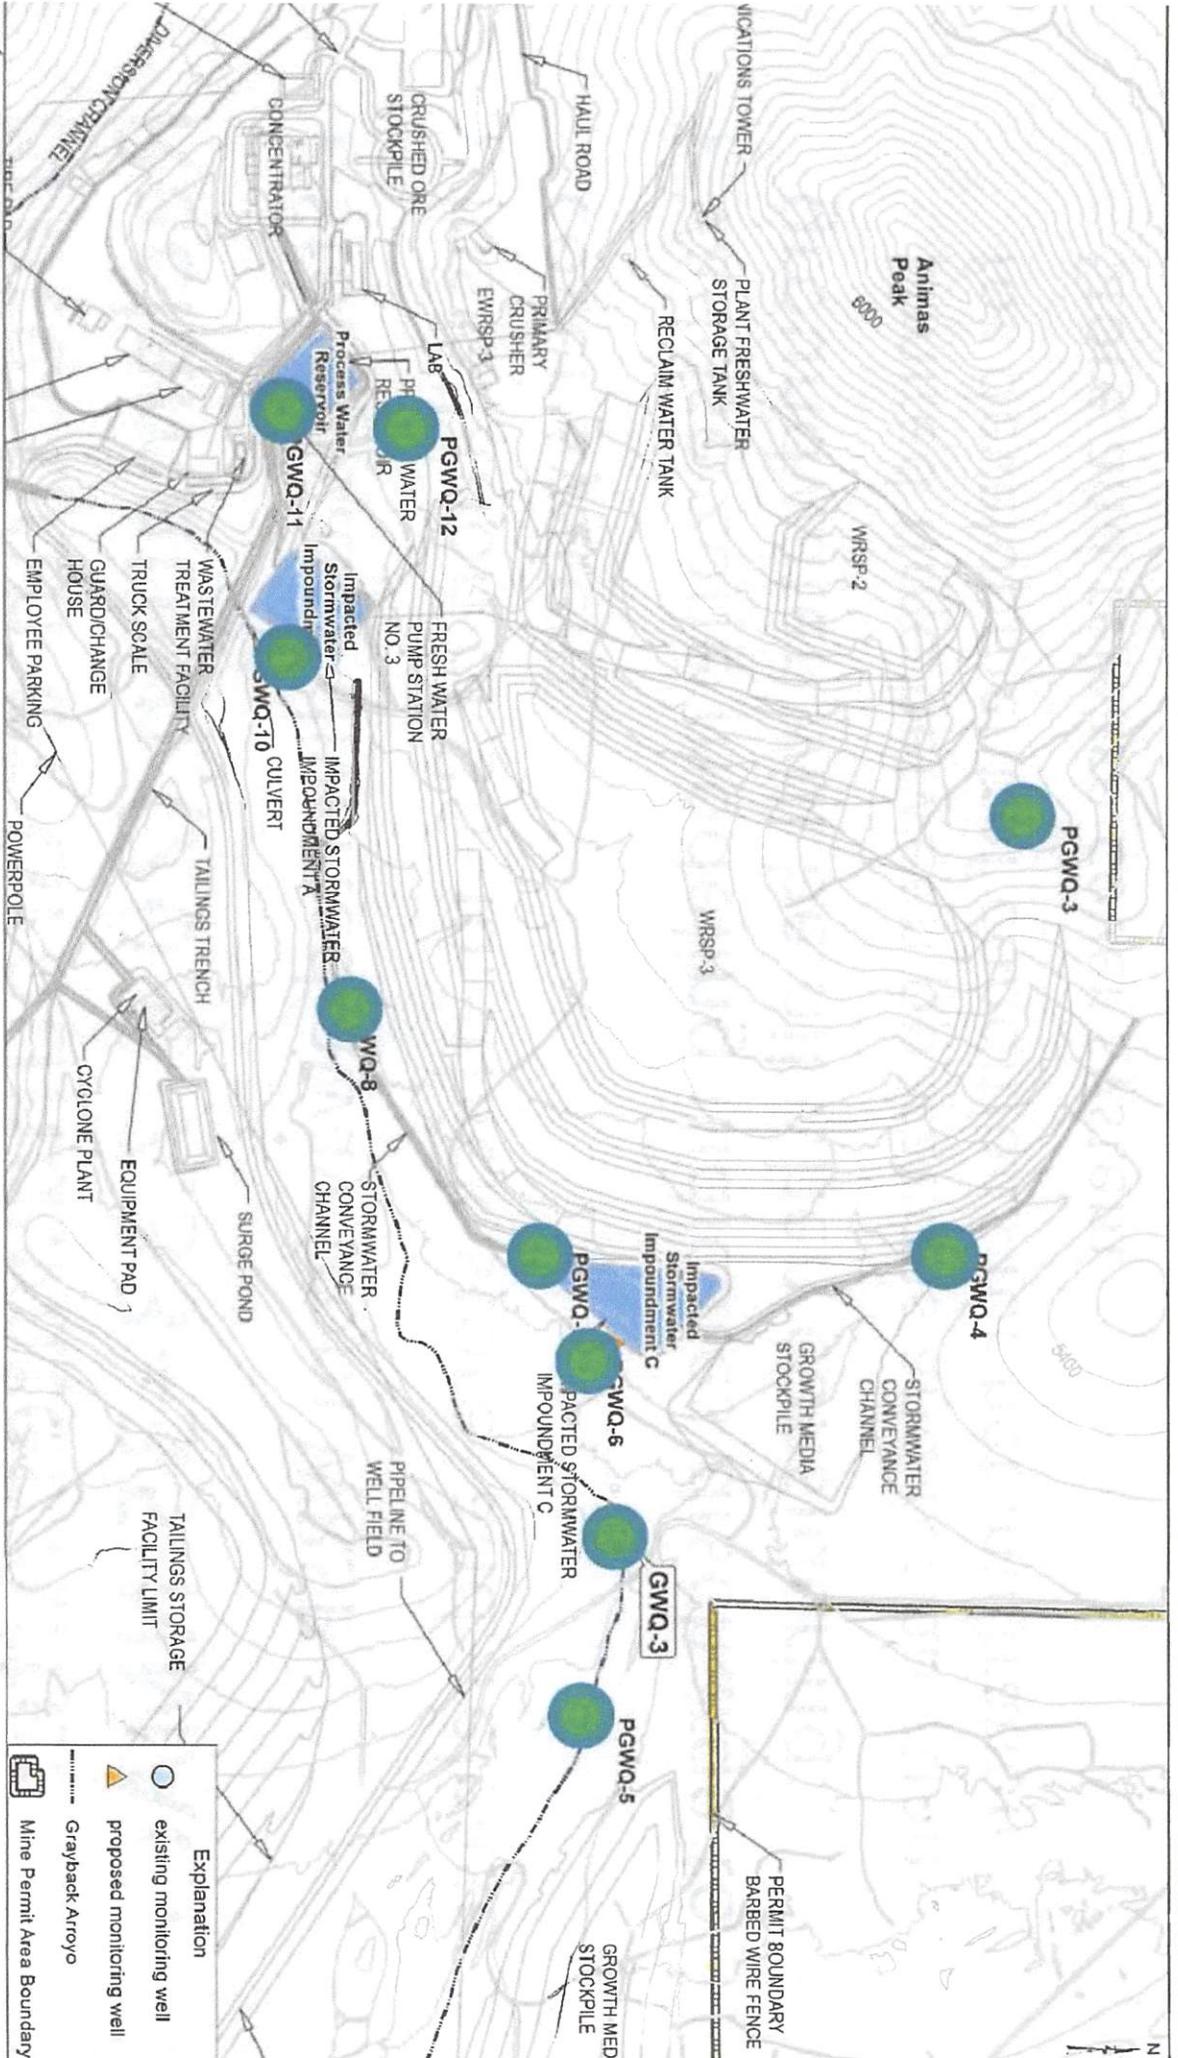

- ▶ Storm water diverted away from WRSP
- ▶ Low moisture content and high negative soil pore-water pressure of the coarse-grained waste rock prevents downward migration of surface infiltration
- ▶ Toe drain allows for capture of impacted storm water
- ▶ Andesite permeability is less than 1×10^{-6} cm/s
- ▶ Infiltration through WRSP is not expected during the operation period – consistent with 30 years of observations from existing WRSPs on-site

Protection of Groundwater After Reclamation (20.6.7.33–35 NMAC)

- ▶ Storm water diverted away from WRSP
- ▶ Installation of 36-in.-thick store-and-release cover system
- ▶ Vadose zone modeling indicates discharge to groundwater will be nil when considering:
 - Limited time between operations and reclamation for development of conditions for net infiltration
 - Store and release cover system
 - Low permeability of andesite

WRSP 2&3 Groundwater Monitoring

20.6.7.28.B NMAC

Tailings Storage Facility

20.6.7.22(4)(d)(vi) NMAC

20.6.7.28 NMAC

TSF aquifer evaluation considered potential liner leak, water quality of seepage, and groundwater mixing and transport calculations

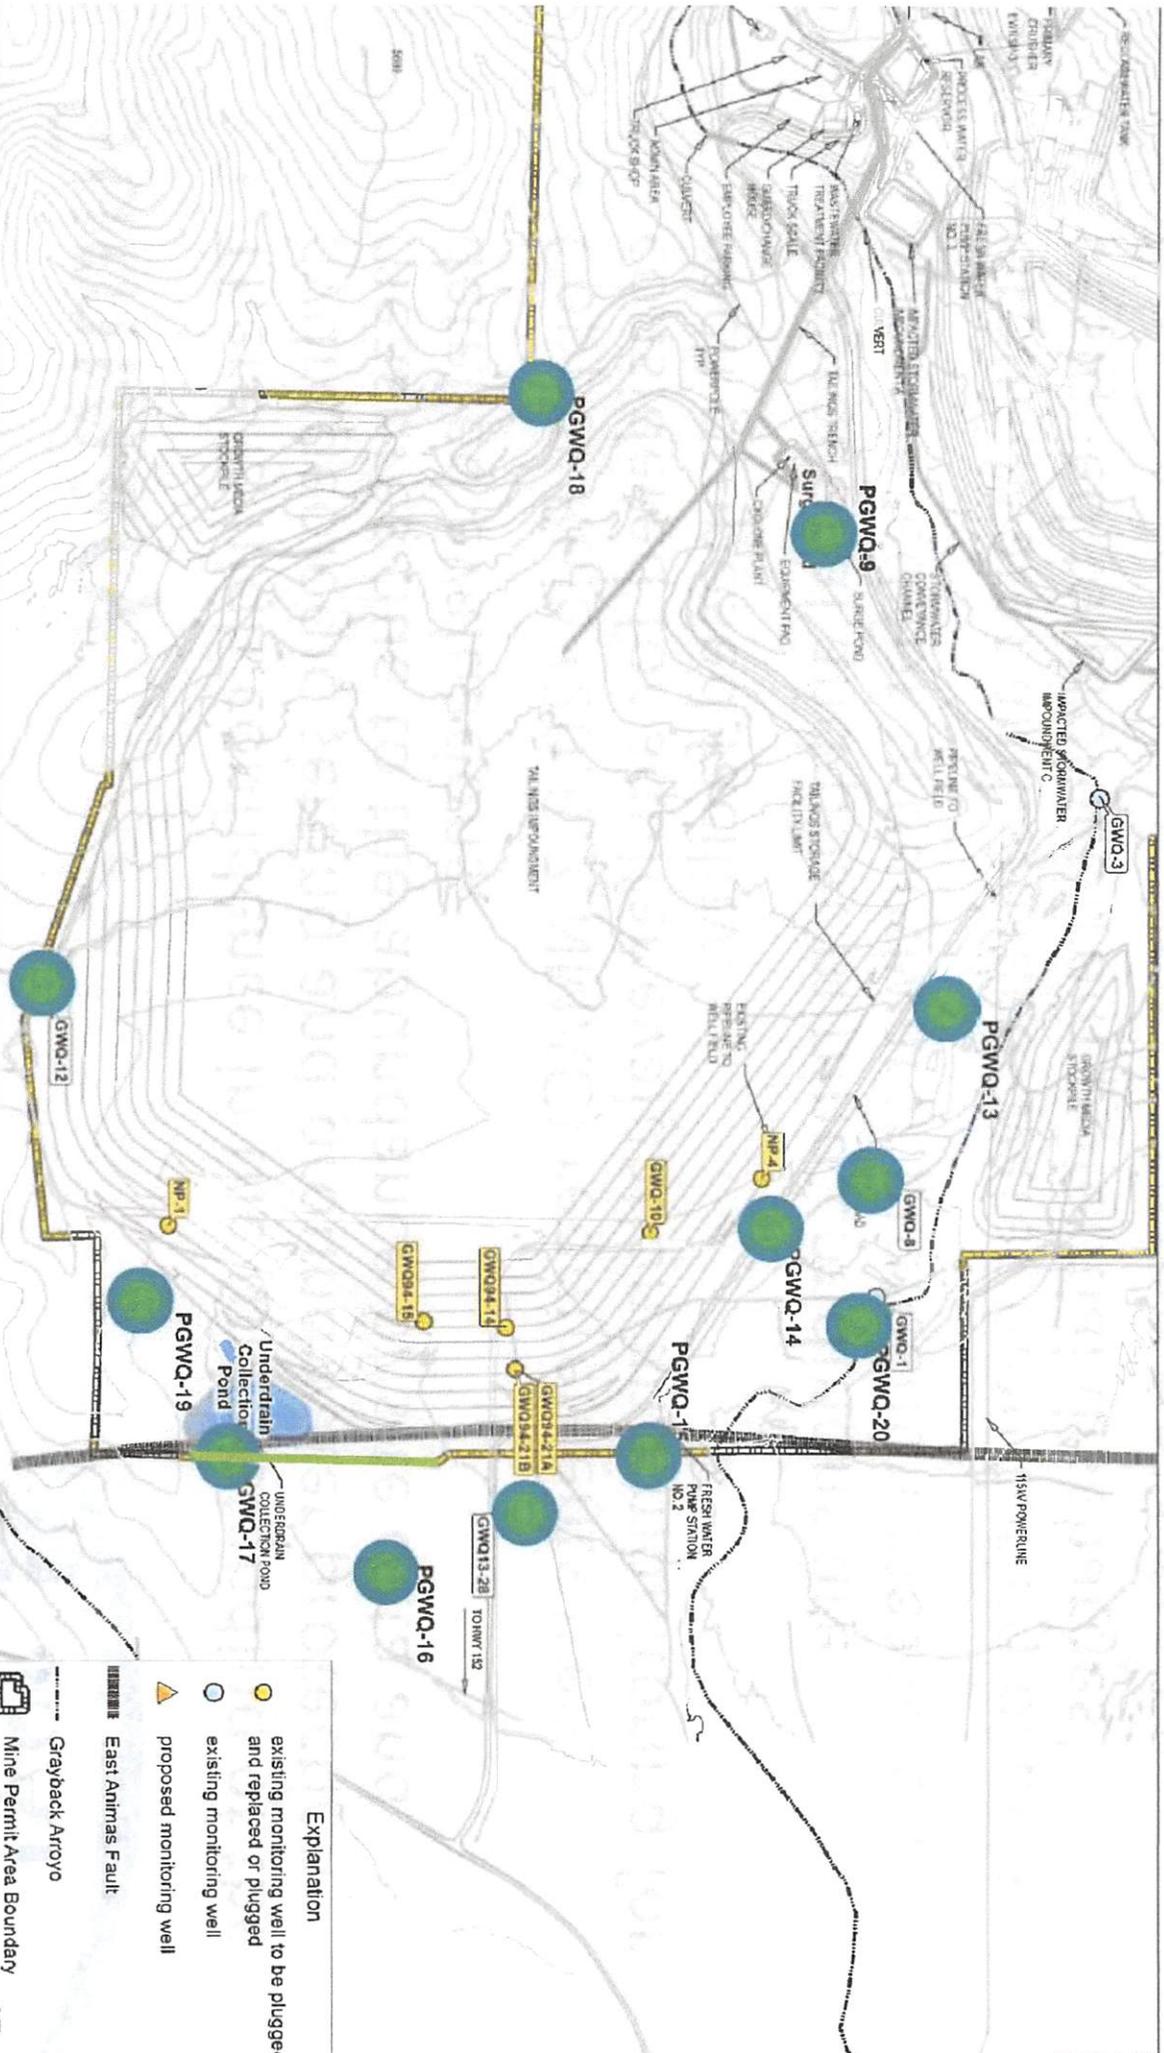

Table 3.6. Potential tailings liner leakage

B_c	0.21
h_w	1.5 ft
L_s	1 ft
a_d	1.0 cm ²
K_s	1x10 ⁻⁶ cm/s
q	0.0009 gpm/acre
total flow	0.5 gpm

TSF Aquifer Evaluation

- ▶ The projected rate of potential leakage from the liner is insignificant (0.5 gpm).
- ▶ The hydraulic gradient will be reduced as a result of the reduced recharge from the liner in the TSF footprint.
- ▶ Groundwater beneath the TSF will have a low travel velocity.
- ▶ Potential leakage, if percolates to groundwater, will blend or remain beneath the TSF for hundreds of years.

TSF Groundwater Monitoring

Summary

- ▶ There is high confidence in the understanding of the hydrogeologic setting and groundwater protection measures due to the abundance of site data and detailed evaluations.
- ▶ Copper Rule (20.6.7 NMAC) requirements were considered for aquifer evaluation and monitoring for each proposed facility.
- ▶ Operational and post mining conditions are considered for groundwater protection measures.
- ▶ Groundwater and surface-water monitoring plan is designed to protect from potential discharges.
- ▶ In my professional opinion, NMCC DP-1840 is compliant with the Copper Rule 20.6.7 NMAC.
