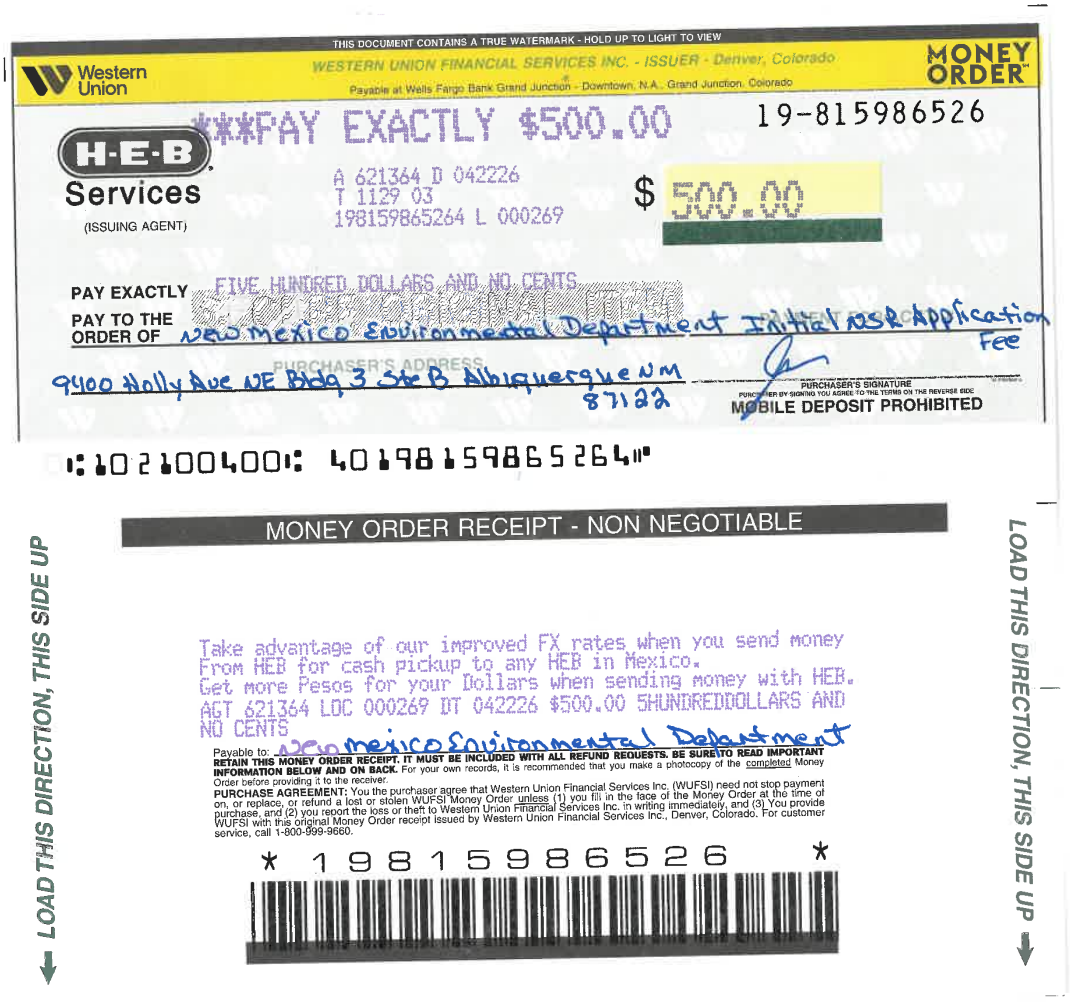
RE: Application for Initial NSR Permit
Yucca Growth Infrastructure, LLC – YGI Microgrid

Dear Permit Programs Manager:

On behalf of Yucca Growth Infrastructure, LLC ("Yucca"), Trinity Consultants is submitting this initial NSR application for the YGI Microgrid (YGI MG). The YGI MG consists of a Bloom Energy Server system, which will connect to adjacent electrical infrastructure and generate power for a nearby data center facility. The YGI MG will be located 3.6 miles south of Santa Teresa, New Mexico in Doña Ana County.

Please note that this application supersedes two applications submitted on November 17, 2025 by a Yucca affiliate, relating to the construction of Microgrids. The two prior applications are being withdrawn, and Yucca does not foresee submitting any additional construction permit applications. Furthermore, Yucca is not aware of any construction permit applications under consideration for the nearby data center. That is, this application covers all of the pollutant-emitting activities subject to permitting for the YGI Microgrid and the data center. The source covered by this application will be permitted to operate continuously (8,760 hours per year) and will be a minor source (i.e., the potential emission rate will be less than 250 tons/year regardless of permit limitations). Emissions of nitrogen oxides (ozone precursor) are less than 40 tons/year.



The format and contents of this application are consistent with the Bureau's current policy regarding NSR applications; it is a complete application package using the most current application forms. Enclosed is one hard copy and one working copy of the application, including the original certification page and application check. Yucca also intends to voluntarily provide a Spanish translation of this application as soon as practicable. Digital files (including the Spanish translation) will be sent once requested by the Bureau. Please feel free to contact me at (512) 961-4471 or by email at Jesse.Lovegren@trinityconsultants.com if you have any questions regarding this application.

Sincerely,

TRINITY CONSULTANTS

Jesse Lovegren

Section 1-I – Submittal Requirements

Each 20.2.73 NMAC (**NOI**), a 20.2.70 NMAC (**Title V**), a 20.2.72 NMAC (**NSR** minor source), or 20.2.74 NMAC (**PSD**) application package shall consist of the following:

Hard Copy Submittal Requirements:

1) One hard copy **original signed and notarized application package** **printed double sided** **'head-to-toe'** **2-hole punched** as we bind the document on top, not on the side; except Section 2 (landscape tables), which should be head-to-head. Please use **numbered tab separators** in the hard copy submittal(s) as this facilitates the review process. For NOI submittals only, hard copies of UA1, Tables 2A, 2D & 2F, Section 3 and the signed Certification Page are required. Please include a copy of the check on a separate page.

2) If the application is for a minor NSR, PSD, NNSR, or Title V application, include one working hard **copy** for Department use. This copy should be printed in book form, 3-hole punched, and **must be double sided**. Note that this is in addition to the head-to-to 2-hole punched copy required in 1) above. Minor NSR Technical Permit revisions (20.2.72.219.B NMAC) only need to fill out Sections 1-A, 1-B, 3, and should fill out those portions of other Section(s) relevant to the technical permit revision. TV Minor Modifications need only fill out Sections 1-A, 1-B, 1-H, 3, and those portions of other Section(s) relevant to the minor modification. NMED may require additional portions of the application to be submitted, as needed.

3) The entire NOI or Permit application package, including the full modeling study, should be submitted electronically. Electronic files for applications for NOIs, any type of General Construction Permit (GCP), or technical revisions to NSRs must be submitted with compact disk (CD) or digital versatile disc (DVD). For these permit application submittals, **two** CD copies are required (in sleeves, not crystal cases, please), with additional CD copies as specified below. NOI applications require only a single CD submittal. Electronic files for other New Source Review (construction) permits/permit modifications or Title V permits/permit modifications can be submitted on CD/DVD or sent through AQB's secure file transfer service.

Electronic files sent by (check one):

☐ CD/DVD attached to paper application

☑ secure electronic transfer.
Air Permit Contact Name: Trinity Albuquerque Office

a. If the file transfer service is chosen by the applicant, after receipt of the application, the Bureau will email the applicant with instructions for submitting the electronic files through a secure file transfer service. Submission of the electronic files through the file transfer service needs to be completed within 3 business days after the invitation is received, so the applicant should ensure that the files are ready when sending the hard copy of the application. The applicant will not need a password to complete the transfer. **Do not use the file transfer service for NOIs, any type of GCP, or technical revisions to NSR permits.**

4) Optionally, the applicant may submit the files with the application on compact disk (CD) or digital versatile disc (DVD) following the instructions above and the instructions in 5 for applications subject to PSD review.

5) If **air dispersion modeling** is required by the application type, include the **NMED Modeling Waiver** and/or electronic air dispersion modeling report, input, and output files. The dispersion modeling ***summary report only*** should be submitted as hard copy(ies) unless otherwise indicated by the Bureau.

6) If the applicant submits the electronic files on CD and the application is subject to PSD review under 20.2.74 NMAC (PSD) or NNSR under 20.2.79 NMC include,
   a. one additional CD copy for US EPA,

Administrative Record NSR 10833_000009

b. one additional CD copy for each federal land manager affected (NPS, USFS, FWS, USDI) and,
c. one additional CD copy for each affected regulatory agency other than the Air Quality Bureau.

If the application is submitted electronically through the secure file transfer service, these extra CDs do not need to be submitted.

Electronic Submittal Requirements [in addition to the required hard copy(ies)]:

1) All required electronic documents shall be submitted as 2 separate CDs or submitted through the AQB secure file transfer service. Submit a single PDF document of the entire application as submitted and the individual documents comprising the application.

2) The documents should also be submitted in Microsoft Office compatible file format (Word, Excel, etc.) allowing us to access the text and formulas in the documents (copy & paste). Any documents that cannot be submitted in a Microsoft Office compatible format shall be saved as a PDF file from within the electronic document that created the file. If you are unable to provide Microsoft office compatible electronic files or internally generated PDF files of files (items that were not created electronically: i.e. brochures, maps, graphics, etc,), submit these items in hard copy format. We must be able to review the formulas and inputs that calculated the emissions.

3) It is preferred that this application form be submitted as 4 electronic files (3 MSWord docs: Universal Application section 1 [UA1], Universal Application section 3-19 [UA3], and Universal Application 4, the modeling report [UA4]) and 1 Excel file of the tables (Universal Application section 2 [UA2]). Please include as many of the 3-19 Sections as practical in a single MS Word electronic document. Create separate electronic file(s) if a single file becomes too large or if portions must be saved in a file format other than MS Word.

4) The electronic file names shall be a maximum of 25 characters long (including spaces, if any). The format of the electronic Universal Application shall be in the format: "A-3423-FacilityName". The "A" distinguishes the file as an application submittal, as opposed to other documents the Department itself puts into the database. Thus, all electronic application submittals should begin with "A-". Modifications to existing facilities should use the core permit number (i.e. '3423') the Department assigned to the facility as the next 4 digits. Use 'XXXX' for new facility applications. The format of any separate electronic submittals (additional submittals such as non-Word attachments, re-submittals, application updates) and Section document shall be in the format: "A-3423-9-description", where "9" stands for the section # (in this case Section 9-Public Notice). Please refrain, as much as possible, from submitting any scanned documents as this file format is extremely large, which uses up too much storage capacity in our database. Please take the time to fill out the header information throughout all submittals as this will identify any loose pages, including the Application Date (date submitted) & Revision number (0 for original, 1, 2, etc.; which will help keep track of subsequent partial update(s) to the original submittal. Do not use special symbols (#, @, etc.) in file names. The footer information should not be modified by the applicant.

[1] Unit numbers must correspond to unit numbers in the previous permit unless a complete cross reference table of all units in both permits is provided.

[2] Specify dates required to determine regulatory applicability.

[3] To properly account for power conversion efficiencies, generator set rated capacity shall be reported as the rated capacity of the engine in horsepower, not the kilowatt capacity of the generator set. Gas turbine "manufacturer's rated capacity" is the advertised maximum power output at seal level based on public representations. The requested permitted capacity is the rated capacity of the unit at site conditions (not sea level) and does not reflect any deration.

Table 2-B: Insignificant Activities[1] (20.2.70 NMAC) OR Exempted Equipment (20.2.72 NMAC)

All 20.2.70 NMAC (Title V) applications must list all Insignificant Activities in this table. All 20.2.72 NMAC applications must list Exempted Equipment in this table. If equipment listed on this table is exempt under 20.2.72.202.B.5, include emissions calculations and emissions totals for 202.B.5 "similar functions" units, operations, and activities in Section 6, Calculations. Equipment and activities exempted under 20.2.72.202 NMAC may not necessarily be Insignificant under 20.2.70 NMAC (and vice versa). Unit & stack numbering must be consistent throughout the application package. Per Exemptions Policy 02-012.00 (see http://www.env.nm.gov/aqb/permit/aqb_pol.html), 20.2.72.202.B NMAC Exemptions do not apply, but 20.2.72.202.A NMAC exemptions do apply to NOI facilities under 20.2.73 NMAC. [1] Insignificant activities exempted due to size or production rate are defined in 20.2.70.300.D.6, 20.2.70.7.Q NMAC, and the NMED/AQB List of Insignificant Activities, dated September 15, 2008. Emissions from these insignificant activities do not need to be reported, unless specifically requested.

Table 2-C: Emissions Control Equipment

Unit and stack numbering must correspond throughout the application package. Only list control equipment for TAPs if the TAP's maximum uncontrolled emissions rate is over its respective threshold as listed in 20.2.72 NMAC, Subpart V, Tables A and B. In accordance with 20.2.72.203.A(3) and (8) NMAC, 20.2.70.300.D(5)(b) and (e) NMAC, and 20.2.73.200.B(7) NMAC, the permittee shall report all control devices and list each pollutant controlled by the control device regardless if the applicant takes credit for the reduction in emissions.

Control Equipment Unit No.	Control Equipment Description	Date Installed	Controlled Pollutant(s)	Controlling Emissions for Unit Number(s)[1]	Efficiency (% Control by Weight)	Method used to Estimate Efficiency
N/A - There is no emissions control equipment installed at this facility.						

[1] List each control device on a separate line. For each control device, list all emission units controlled by the control device.

Table 2-D: Maximum Emissions (under normal operating conditions)

X This Table was intentionally left blank because it would be identical to Table 2-E.

Maximum Emissions are the emissions at maximum capacity and prior to (in the absence of) pollution control, emission-reducing process equipment, or any other emission reduction. Calculate the hourly emissions using the worst case hourly emissions for each pollutant. For each pollutant, calculate the annual emissions as if the facility were operating at maximum plant capacity without pollution controls for 8760 hours per year, unless otherwise approved by the Department. List Hazardous Air Pollutants (HAP) & Toxic Air Pollutants (TAPs) in Table 2-I. Unit & stack numbering must be consistent throughout the application package. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41, 1.41, or 1.41E-4).

[1]**Condensable Particulate Matter:** Include condensable particulate matter emissions for PM10 and PM2.5 if the source is a combustion source. Do not include condensable particulate matter for PM unless PM is set equal to PM10 and PM2.5. Particulate matter (PM) is not subject to an ambient air quality standard, but PM is a regulated air pollutant under PSD (20.2.74 NMAC) and Title V (20.2.70 NMAC).

The Energy Server System equipment vendor maintains that there are zero PM emissions from its equipment. Extant reference method testing has been used by the applicant to conservatively estimate emissions, given test method limitations. Vendor indicates that extant testing may exhibit positive sampling method bias and reflects filterable particulate matter from intake air passed through the system. For that reason, the fuel cell system equipment vendor does not specify particulate emission factors.

Table 2-E: Requested Allowable Emissions

Unit & stack numbering must be consistent throughout the application package. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41, 1.41, or $1.41E^{-4}$).

Fuel cells are not a "combustion source" of PM2.5. Pursuant to 20.2.2.7, 20.2.74.7(AS)(6), and 20.2.72.203.A(3) NMAC, particulate emissions are a "regulated new source review pollutant" which include certain "gaseous emissions from a source or activity" and applicant must submit "all emissions information, calculations and computations" for computing "maximum" particulate matter emissions from the source. To be conservative, applicant uses an emission factor for condensable particulate matter based on available source test data.

Table 2-F: Additional Emissions during Startup, Shutdown, and Routine Maintenance (SSM)

☑ This table is intentionally left blank since all emissions at this facility due to routine or predictable startup, shutdown, or scehduled maintenance are no higher than those listed in Table 2-E and a malfunction emission limit is not already permitted or requested. If you are required to report GHG emissions as described in Section 6a, include any GHG emissions during Startup, Shutdown, and/or Scheduled Maintenance (SSM) in Table 2-P. Provide an explanations of SSM emissions in Section 6 and 6a.

All applications for facilities that have emissions during routine our predictable startup, shutdown or scheduled maintenance (SSM)[1], including NOI applications, must include in this table the Maximum Emissions during routine or predictable startup, shutdown and scheduled maintenance (20.2.7 NMAC, 20.2.72.203.A.3 NMAC, 20.2.73.200.D.2 NMAC). In Section 6 and 6a, provide emissions calculations for all SSM emissions reported in this table. Refer to "Guidance for Submittal of Startup, Shutdown, Maintenance Emissions in Permit Applications (https://www.env.nm.gov/aqb/permit/aqb_pol.html) for more detailed instructions. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41, 1.41, or 1.41E-4).

[1] **For instance**, if the short term steady-state Table 2-E emissions are 5 lb/hr and the SSM rate is 12 lb/hr, enter 7 lb/hr in this table. If the annual steady-state Table 2-E emissions are 21.9 TPY, and the number of scheduled SSM events result in annual emissions of 31.9 TPY, enter 10.0 TPY in the table below.

[2] **Condensable Particulate Matter:** Include condensable particulate matter emissions for PM10 and PM2.5 if the source is a combustion source. Do not include condensable particulate matter for PM unless PM is set equal to PM10 and PM2.5. Particulate matter (PM) is not subject to an ambient air quality standard, but it is a regulated air pollutant under PSD (20.2.74 NMAC) and Title V (20.2.70 NMAC).

Table 2-G: Stack Exit and Fugitive Emission Rates for Special Stacks

☐ I have elected to leave this table blank because this facility does not have any stacks/vents that split emissions from a single source or combine emissions from more than one source listed in table 2-A. Additionally, the emission rates of all stacks match the Requested allowable emission rates stated in Table 2-E.

Use this table to list stack emissions (requested allowable) from split and combined stacks. List Toxic Air Pollutants (TAPs) and Hazardous Air Pollutants (HAPs) in Table 2-I. List all fugitives that are associated with the normal, routine, and non-emergency operation of the facility. Unit and stack numbering must correspond throughout the application package. Refer to Table 2-E for instructions on use of the "-" symbol and on significant figures.

The Energy Server System equipment vendor maintains that there are zero PM emissions from its equipment. Extant reference method testing has been used by the applicant to conservatively estimate emissions, given test method limitations. Vendor indicates that extant testing may exhibit positive sampling method bias and reflects filterable particulate matter from intake air passed through the system. For that reason, the fuel cell system equipment vendor does not specify particulate emission factors.

Table 2-H: Stack Exit Conditions

Unit and stack numbering must correspond throughout the application package. Include the stack exit conditions for each unit that emits from a stack, including blowdown venting parameters and tank emissions. If the facility has multiple operating scenarios, complete a separate Table 2-H for each scenario and, for each, type scenario name here:

Table 2-I: Stack Exit and Fugitive Emission Rates for HAPs and TAPs

In the table below, report the Potential to Emit for each HAP from each regulated emission unit listed in Table 2-A, only if the entire facility emits the HAP at a rate greater than or equal to one (1) ton per year For each such emission unit, HAPs shall be reported to the nearest 0.1 tpy. Each facility-wide Individual HAP total and the facility-wide Total HAPs shall be the sum of all HAP sources calculated to the nearest 0.1 ton per year. Per 20.2.72.403.A.1 NMAC, facilities not exempt [see 20.2.72.402.C NMAC] from TAP permitting shall report each TAP that has an uncontrolled emission rate in excess of its pounds per hour screening level specified in 20.2.72.502 NMAC. TAPs shall be reported using one more significant figure than the number of significant figures shown in the pound per hour threshold corresponding to the substance. Use the HAP nomenclature as it appears in Section 112 (b) of the 1990 CAAA and the TAP nomenclature as it listed in 20.2.72.502 NMAC. Include tank-flashing emissions estimates of HAPs in this table. For each HAP or TAP listed, fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected or the pollutant is emitted in a quantity less than the threshold amounts described above.

Applications submitted under 20.2.70, 20.2.72, & 20.2.74 NMAC are required to complete this Table. Power plants, Title V major sources, and PSD major sources must report and calculate all GHG emissions for each unit. Applicants must report potential emission rates in short tons per year (see Section 6.a for assistance). Include GHG emissions during Startup, Shutdown, and Scheduled Maintenance in this table. For minor source facilities that are not power plants, are not Title V, or are not PSD, there are three options for reporting GHGs 1) report GHGs for each individual piece of equipment; 2) report all GHGs from a group of unit types, for example report all combustion source GHGs as a single unit and all venting GHG as a second separate unit; OR 3) check the following box ☐ By checking this box, the applicant acknowledges the total CO2e emissions are less than 75,000 tons per year.

All Calculations

Show all calculations used to determine both the hourly and annual controlled and uncontrolled emission rates. All calculations shall be performed keeping a minimum of three significant figures. Document the source of each emission factor used (if an emission rate is carried forward and not revised, then a statement to that effect is required). If identical units are being permitted and will be subject to the same operating conditions, submit calculations for only one unit and a note specifying what other units to which the calculations apply. All formulas and calculations used to calculate emissions must be submitted. The "Calculations" tab in the UA2 has been provided to allow calculations to be linked to the emissions tables. Add additional "Calc" tabs as needed. If the UA2 or other spread sheets are used, all calculation spread sheet(s) shall be submitted electronically in Microsoft Excel compatible format so that formulas and input values can be checked. Format all spread sheets and calculations such that the reviewer can follow the logic and verify the input values. Define all variables. If calculation spread sheets are not used, provide the original formulas with defined variables. Additionally, provide subsequent formulas showing the input values for each variable in the formula. All calculations, including those calculations are imbedded in the Calc tab of the UA2 portion of the application, the printed Calc tab(s), should be submitted under this section.

Tank Flashing Calculations: The information provided to the AQB shall include a discussion of the method used to estimate tank-flashing emissions, relative thresholds (i.e., NOI, permit, or major source (NSPS, PSD or Title V)), accuracy of the model, the input and output from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis. If Hysis is used, all relevant input parameters shall be reported, including separator pressure, gas throughput, and all other relevant parameters necessary for flashing calculation.

SSM Calculations: It is the applicant's responsibility to provide an estimate of SSM emissions or to provide justification for not doing so. In this Section, provide emissions calculations for Startup, Shutdown, and Routine Maintenance (SSM) emissions listed in the Section 2 SSM and/or Section 22 GHG Tables and the rational for why the others are reported as zero (or left blank in the SSM/GHG Tables). Refer to "Guidance for Submittal of Startup, Shutdown, Maintenance Emissions in Permit Applications (http://www.env.nm.gov/aqb/permit/app_form.html) for more detailed instructions on calculating SSM emissions. If SSM emissions are greater than those reported in the Section 2, Requested Allowables Table, modeling may be required to ensure compliance with the standards whether the application is NSR or Title V. Refer to the Modeling Section of this application for more guidance on modeling requirements.

Glycol Dehydrator Calculations: The information provided to the AQB shall include the manufacturer's maximum design recirculation rate for the glycol pump. If GRI-Glycalc is used, the full input summary report shall be included as well as a copy of the gas analysis that was used.

Road Calculations: Calculate fugitive particulate emissions and enter haul road fugitives in Tables 2-A, 2-D and 2-E for:

1. If you transport raw material, process material and/or product into or out of or within the facility and have PER emissions greater than 0.5 tpy.
2. If you transport raw material, process material and/or product into or out of the facility more frequently than one round trip per day.

Significant Figures:
A. All emissions standards are deemed to have at least two significant figures, but not more than three significant figures.
B. At least 5 significant figures shall be retained in all intermediate calculations.
C. In calculating emissions to determine compliance with an emission standard, the following rounding off procedures shall be used:

(1) If the first digit to be discarded is less than the number 5, the last digit retained shall not be changed;
(2) If the first digit discarded is greater than the number 5, or if it is the number 5 followed by at least one digit other than the number zero, the last figure retained shall be increased by one unit; **and**
(3) If the first digit discarded is exactly the number 5, followed only by zeros, the last digit retained shall be rounded upward if it is an odd number, but no adjustment shall be made if it is an even number.
(4) The final result of the calculation shall be expressed in the units of the standard.

Control Devices: In accordance with 20.2.72.203.A(3) and (8) NMAC, 20.2.70.300.D(5)(b) and (e) NMAC, and 20.2.73.200.B(7) NMAC, the permittee shall report all control devices and list each pollutant controlled by the control device regardless if the applicant takes credit for the reduction in emissions. The applicant can indicate in this section of the

Administrative Record NSR 10833_000144

application if they chose to not take credit for the reduction in emission rates. For notices of intent submitted under 20.2.73 NMAC, only uncontrolled emission rates can be considered to determine applicability unless the state or federal Acts require the control. This information is necessary to determine if federally enforceable conditions are necessary for the control device, and/or if the control device produces its own regulated pollutants or increases emission rates of other pollutants.

Emissions from the Bloom Energy Server System are provided by the manufacturer based on output-based emission factors (lb/MW-hr) determined through CARB certification or other stack testing for the particular unit. Each such emission factor is multiplied by the installed capacity of the Bloom Energy Server System to obtain an hourly emission rate. Annual emission rates are obtained by multiplying by the operating schedule (hr/yr) and converting to units of tons/yr. While Bloom Energy does not customarily recommend the use of safety factors for similar projects in other jurisdictions, a 15% safety factor was added to all hourly and annual emissions to account for potential variability in operating conditions and to ensure a conservative assessment of source impacts, consistent with local practice. For example, VOC emissions for a hypothetical 2,462.005 MW unit can be calculated as follows:

$ER = MW \times EF \times (1+15\%)$

$0.01 \text{ lb VOC/MW-hr} \times 2{,}462.005 \text{ MW} \times (1+15\%) = 28.31 \text{ lb/hr}$

The CO_2 emission factor indicated in the vendor data has been used. The vendor represents that the fuel cells do not emit detectable amounts of other GHGs.

Section 6.a

Green House Gas Emissions

(Submitting under 20.2.70, 20.2.72 20.2.74 NMAC)

Title V (20.2.70 NMAC), Minor NSR (20.2.72 NMAC), and PSD (20.2.74 NMAC) applicants must estimate and report greenhouse gas (GHG) emissions to verify the emission rates reported in the public notice, determine applicability to 40 CFR 60 Subparts, and to evaluate Prevention of Significant Deterioration (PSD) applicability. GHG emissions that are subject to air permit regulations consist of the sum of an aggregate group of these six greenhouse gases: carbon dioxide (CO_2), nitrous oxide (N_2O), methane (CH_4), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6).

Calculating GHG Emissions:

1. Calculate the ton per year (tpy) GHG mass emissions and GHG CO_2e emissions from your facility.
2. GHG mass emissions are the sum of the total annual tons of greenhouse gases without adjusting with the global warming potentials (GWPs). GHG CO_2e emissions are the sum of the mass emissions of each individual GHG multiplied by its GWP found in Table A-1 in 40 CFR 98 Mandatory Greenhouse Gas Reporting.
3. Emissions from routine or predictable start up, shut down, and maintenance must be included.
4. Report GHG mass and GHG CO_2e emissions in Table 2-P of this application. Emissions are reported in **short** tons per year and represent each emission unit's Potential to Emit (PTE).
5. All Title V major sources, PSD major sources, and all power plants, whether major or not, must calculate and report GHG mass and CO2e emissions for each unit in Table 2-P.
6. For minor source facilities that are not power plants, are not Title V, and are not PSD there are three options for reporting GHGs in Table 2-P: 1) report GHGs for each individual piece of equipment; 2) report all GHGs from a group of unit types, for example report all combustion source GHGs as a single unit and all venting GHGs as a second separate unit; 3) or check the following ☐ By checking this box, the applicant acknowledges the total CO2e emissions are less than 75,000 tons per year.

Global Warming Potentials (GWP):
Applicants must use the Global Warming Potentials codified in Table A-1 of the most recent version of 40 CFR 98 Mandatory Greenhouse Gas Reporting. The GWP for a particular GHG is the ratio of heat trapped by one unit mass of the GHG to that of one unit mass of CO_2 over a specified time period.

"Greenhouse gas" for the purpose of air permit regulations is defined as the aggregate group of the following six gases: carbon dioxide, nitrous oxide, methane, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. **(20.2.70.7 NMAC, 20.2.74.7 NMAC).** You may also find GHGs defined in 40 CFR 86.1818-12(a).

Metric to Short Ton Conversion:
Short tons for GHGs and other regulated pollutants are the standard unit of measure for PSD and title V permitting programs. 40 CFR 98 Mandatory Greenhouse Reporting requires metric tons.
1 metric ton = 1.10231 short tons (per Table A-2 to Subpart A of Part 98 – Units of Measure Conversions)

Greenhouse gases are calculated as described in Section 6.

1 Bloom Energy Server System (SOFC) uses no add-on controls for regulated pollutants. Uncontrolled equal controlled emissions.
The Energy Server System equipment vendor maintains that there are zero PM emissions from its equipment. Extant reference method testing has been used by the applicant to conservatively estimate emissions, given test method limitations. Vendor indicates that extant testing may exhibit positive sampling method bias and reflects filterable particulate matter from intake air passed through the system. For that reason, the fuel cell system equipment vendor does not specify particulate emission factors.
Fuel cells are not a "combustion source" of PM2.5. Pursuant to 20.2.2.7, 20.2.74.7(AS)(6), and 20.2.72.203.A(3) NMAC, particulate emissions are a "regulated new source review pollutant" which include certain "gaseous emissions from a source or activity" and applicant must submit "all emissions information, calculations and computations" for computing "maximum" particulate matter emissions from the source. To be conservative, applicant uses an emission factor for condensable particulate matter based on available source test data.

1.0 Introduction

1.1 Summary of Test Program

Bloom Energy contracted Montrose Air Quality Services, LLC (Montrose) to perform an engineering emissions test program on the Santa Cruz Unit located at their facility in Fremont, California. The tests were conducted to determine concentrations and mass emission rates of Total Particulate Matter (TPM) while the Unit was operating on pipeline natural gas for in-house engineering purposes.

The specific objectives were to:

- Measure the concentration and mass emission rate of TPM at the outlet of the Santa Cruz Unit
- Measure the concentration of TPM in the ambient air near the Unit's air intake
- Determine whether there was a difference that could be measured by the EPA reference methods between the TPM concentrations from the source and in the ambient air
- Conduct the test program with a focus on safety

Montrose performed the tests to measure the emission parameters listed in Table 1-1.

To simplify this report, a list of Units and Abbreviations is included in Appendix D.1. Throughout this report, chemical nomenclature, acronyms, and reporting units are not defined. Please refer to the list for specific details.

This report presents the test results and supporting data, descriptions of the testing procedures, descriptions of the facility and sampling locations, and a summary of the quality assurance procedures used by Montrose. The average emission test results are summarized in Table 1-2. Detailed results for individual test runs can be found in Section 4.0. All supporting data can be found in the appendices.

The testing was conducted by the Montrose personnel listed in Table 1-3. The tests were conducted according to a Montrose internal test plan. No test plan was submitted to any regulatory agency.

Notes: The "<" symbol is applied to results that are below the practical detection limit of the test method, or a result for which at least one sample fraction is below the detection limit. The detection limit values are used in calculation and presentation of the results.

There was no discernable difference in Total PM concentrations between the source and the ambient air. Each measured concentration was near the practical limit (0.0002 gr/dscf) for 240-minute test runs using Methods 5 and 202. See Section 4 for details. Actual concentrations were likely much lower than can be measured using EPA Reference Methods 5-202.

These test results support the supposition that the Bloom fuel cell unit generates no measurable PM emissions.

2.0 Plant and Sampling Location Descriptions

2.1 Process Description, Operation, and Control Equipment

The Bloom Energy facility is located at 44408 Pacific Commons Boulevard in Fremont, California. The facility includes a test-bed setup for emission testing of their fuel cell distributed energy generator units. The focus of the test program was Bloom's "Santa Cruz" fuel cell system as well as the facility's background (ambient) Total Particulate Matter concentrations.

The Solid Oxide Fuel Cell (SOFC) process is electrochemical, not combustion. That matters because the dominant mechanisms that create primary PM in stationary sources like turbines and engines are combustion-driven (soot, ash, incomplete combustion products, lubricating oil carryover, flame-generated nuclei). In an SOFC exhaust stream, those mechanisms do not exist.

Additionally, in combustion driven resources the inlet air and fuel sources must be mixed, whereas in the SOFC product fuel and atmospheric air follow separate and isolated paths within the process; the air on the cathode side and fuel on the anode. Through this process, the electrochemical reaction occurs by the natural attraction of the O_2 ions in atmospheric air present at the cathode passing through the cell wall and bonding with the free hydrogen on the anode side, releasing an electron in the process. Ambient air comes into the system, allows oxygen ions to enter the reaction, and bypasses the remaining ambient air. Any measured PM value from Bloom's system would simply be measuring the PM already existing in the ambient air.

Information regarding the Distributed Generation Unit is presented in Table 2-1.

Table 2-1
Distributed Generation Unit Information

Unit	Manufacturer	Model No.	Model Name	Rated Output (KW)	Fuels
Santa Cruz	Bloom Energy	ES-6.5	Santa Cruz	65	Natural Gas

2.2 Flue Gas Sampling Location

Exhaust gas from the cathode ordinarily vents to the atmosphere through a rectangular grating. For this test, the exhaust gas was redirected through a piece of transition ducting to a temporarily installed vertical, cylindrical stack extension.

Information regarding the sampling location is presented in Table 2-2.

Table 2-2
Sampling Location

Sampling Location	Stack Inside Diameter (in.)	Distance from Nearest Disturbance		Number of Traverse Points
		Downstream EPA "B" (in./dia.)	Upstream EPA "A" (in./dia.)	
Santa Cruz Unit stack extension	14	54.5 / 3.9	28 / 2	TPM: 24 (12/port)
Ambient Air	--	Sampling probe located near Unit air intake		TPM: Single location

The stack sampling location was verified in the field to conform to EPA Method 1. Acceptable cyclonic flow conditions were confirmed prior to testing using EPA Method 1, Section 11.4. See Appendix A.1 for more information, including a sketch of the configuration.

2.3 Operating Conditions and Process Data

Emission tests were performed while the Unit was operating on pipeline natural gas at normal conditions near the rated generation load capacity.

Plant personnel were responsible for establishing the test conditions and collecting all applicable unit-operating data. The process data that was provided is presented in Appendix B. Data collected includes the following parameters:

- Electrical AC power generated, KW
- Fuel flow rates
- Air flow rates

3.0 Sampling and Analytical Procedures

3.1 Test Methods

The test methods for this test program have been presented in Table 1-1. Additional information regarding specific applications or modifications to standard procedures is presented below.

3.1.1 EPA Method 1

Sample and Velocity Traverses for Stationary Source

EPA Method 1 is used to assure that representative measurements of volumetric flow rate are obtained by dividing the cross-section of the stack or duct into equal areas, and then locating a traverse point within each of the equal areas. Acceptable sample locations must be located at least two stack or duct equivalent diameters downstream from a flow disturbance and one-half equivalent diameter upstream from a flow disturbance.

Pertinent information regarding the performance of the method is presented below:

- The stack sampling location was checked for cyclonic flow according to Section 11.4 of Method 1.
- Method Exceptions:
  - Ambient air sampling was performed at a at a single point located near the air intake of the Santa Cruz unit.

The sample port and traverse point locations for the stack sampling are detailed in Appendix A.1.

3.1.2 EPA Method 2

Determination of Stack Gas Velocity and Volumetric Flow Rate (Type S Pitot Tube)

EPA Method 2 is used to measure the gas velocity using an S-type pitot tube connected to a pressure measurement device, and to measure the gas temperature using a calibrated thermocouple connected to a thermocouple indicator. Typically, Type S (Stausscheibe) pitot tubes conforming to the geometric specifications in the test method are used, along with an inclined manometer. The measurements are made at traverse points specified by EPA Method 1. The molecular weight of the gas stream is determined from independent measurements of O_2, CO_2 by EPA Method 3A, and moisture determined from EPA Method 4. The stack gas volumetric flow rate is calculated using the measured average velocity head, the area of the duct at the measurement plane, the measured average temperature, the measured duct static pressure, the molecular weight of the gas stream, and the measured moisture.

Pertinent information regarding the performance of the method is presented below:

- Method Options:
  - S-type pitot tube coefficient is 0.84
  - Shortridge multimeter is used to measure velocity less than 10 fps
- Method Exceptions:
  - Stack gas temperatures thermocouples are checked using EPA Alternate Method 011 (ALT-011). A single-point calibration is performed using a NIST-traceable thermometer.

3.1.3 EPA Method 3A

Determination of Oxygen and Carbon Dioxide in Emissions from Stationary Sources (Instrumental Analyzer Procedures)

Concentrations of O_2 and CO_2 are measured simultaneously using EPA Method 3A, which is an instrumental test method. Conditioned gas is sent to a series of analyzers to measure the gaseous emission concentrations. The performance requirements of the method must be met to validate the data.

Pertinent information regarding the performance of the method is presented below:

- Method Options:
  - No filter is used since low PM is expected
  - A dry extractive sampling system is used to report emissions on a dry basis
  - A paramagnetic analyzer is used to measure O_2
  - A nondispersive infrared analyzer is used to measure CO_2
- Method Exceptions:
  - No test method exceptions
- Target and/or Minimum Required Sample Duration: 240 minutes

3.1.4 EPA Method 4

Determination of Moisture Content in Stack Gas

EPA Method 4 is a manual, non-isokinetic method used to measure the moisture content of gas streams. Gas is sampled at a constant sampling rate through a probe and impinger train. Moisture is removed using a series of pre-weighed impingers containing methodology-specific liquids and silica gel immersed in an ice water bath. The impingers are weighed after each run to determine the percent moisture.

Pertinent information regarding the performance of the method is presented below:

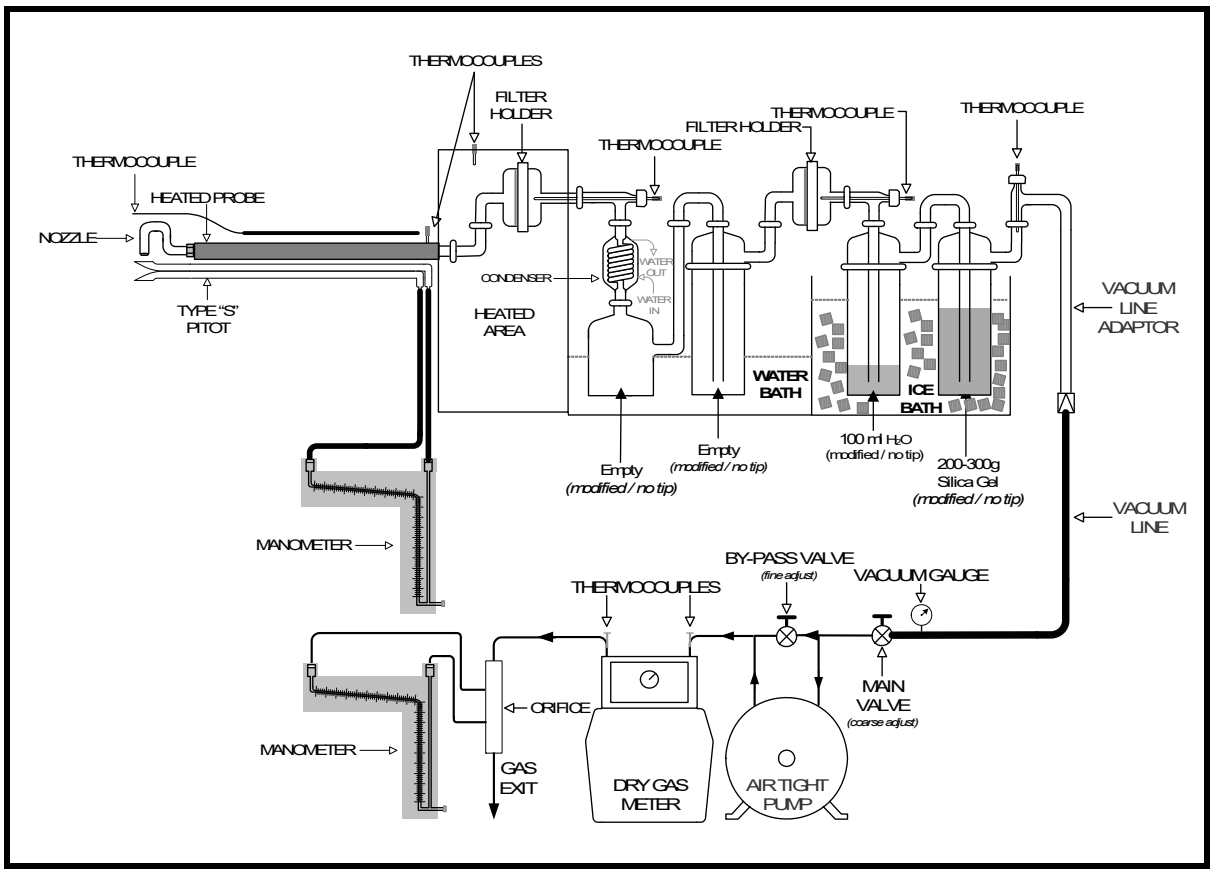
- Method Options:
  - Moisture sampling was performed as part of the pollutant sample trains
- Target and/or Minimum Required Sample Duration: 240 minutes

3.1.5 EPA Methods 5 and 202

Determination of Particulate Matter Emissions from Stationary Sources and Dry Impinger Method for Determining Condensable Particulate Emissions from Stationary Sources

EPA Methods 5 and 202 are manual, isokinetic methods used to measure filterable and condensable particulate matter (FPM and CPM) emissions. The methods are performed in conjunction with EPA Methods 1 through 4. FPM is withdrawn isokinetically from the source and collected on a glass fiber filter maintained at a temperature of 120 ± 14 °C (248 ± 25 °F) or such other temperature as specified by an applicable subpart of the standards or approved by the Administrator for a particular application. The FPM mass, which includes any material that condenses at or above the filtration temperature, is determined gravimetrically after the removal of uncombined water.

CPM is collected in dry impingers after filterable PM has been collected on a filter maintained as specified in Method 5. The organic and aqueous fractions of the impingers and an out-of-stack CPM filter are then taken to dryness and weighed. The total of the impinger fractions and the CPM filter represents the CPM.



Pertinent information regarding the performance of the method is presented below:

- Method Options:
  - Quartz glass sample nozzles and quartz glass probe liners are used
  - Condensed water is measured gravimetrically
  - Field train proof blanks were performed to demonstrate the cleanliness of the sampling train glassware
  - The post-test nitrogen purge is performed by passing nitrogen through the train under pressure
  - Test durations were increased to 240 minutes to maximize the amount of captured particulate matter
  - The Field Train Recovery Blank (FTRB) for the stack sampling train had a mass of 2.12 mg, exceeding the limit of 2.0 mg, and 2.0 mg was subtracted.
  - The Field Train Recovery Blank (FTRB) for the ambient air sampling train had a mass of 2.57 mg, exceeding the limit of 2.0 mg, and 2.0 mg was subtracted.
- Method Exceptions:
  - Ambient air sampling was performed at a at a single point located near the air intake of the Santa Cruz unit. Ambient air sampling was performed at a non-isokinetic sampling rate equal to the sampling rate of the stack sample train.

- Analytical Laboratory: MAQS, Antioch, CA
- Target and/or Minimum Required Sample Duration: 240 minutes

The typical sampling system is detailed in Figure 3-1.

Figure 3-1
EPA Method 5/202 Sampling Train

3.1.6 EPA Method ALT-009

Alternative Method 5 Post-Test Calibration

EPA Approved Alternative Method 009 (ALT-009) is used as an alternative to a two-point post-test meter box calibration. This procedure uses a calculation to check the meter box calibration factor rather than requiring a physical post-test meter box calibration using a standard dry gas meter. The average calculated meter box percent (%) error must result in a percent error within ±5% of Y. If not, a full calibration is performed, and the results are presented using the Y factor that yields the highest emissions.

3.1.7 EPA Method ALT-011

Alternative Method 2 Thermocouple Calibration

EPA Approved Alternative Method 011 (ALT-011) is used as an alternative to the EPA Method 2 two-point thermocouple calibration. This procedure involves a single-point in-field check using a reference thermometer to confirm that the thermocouple system is operating properly. The temperatures of the thermocouple and reference thermometers shall agree to within ±2 °F.

3.2 Process Test Methods

Pipeline quality natural gas was supplied to the unit during the testing, and no fuel gas samples were collected.

There were no process test methods other than digital data from calibrated fuel flow and temperature meters.

4.0 Test Discussion and Results

4.1 Field Test Deviations and Exceptions

Test lengths were increased to 240 minutes to maximize the mass of collected particulate matter and to provide detection at lower concentrations.

The Method 5 filters from the stack samplings included a pale yellow or beige discoloration. A fourth test run was conducted as a precaution in case there was some contamination or other unexpected effect on the samples. The discoloration apparently added no measurable mass to the filters. No evidence of contamination or other anomalies were observed in the laboratory results.

No other field deviations or exceptions from the test plan or test methods occurred during this test program.

4.2 Presentation of Results

The average results are presented and compared in Table 1-2. The results of individual test runs performed are presented in Tables 4-1 and 4-2. Emissions are reported in units consistent with those in the applicable regulations or requirements. The run averages shown in Tables 1-2, 4-1, 4-2, and in Appendix A.4 consist of average results of all four test runs. Additional information is included in the appendices as presented in the Table of Contents.

The results from the stack samplings and the ambient air samplings are the same within the uncertainty of the measurements. The Montrose Antioch office has decades of practice in measurement of PM emissions near or below the uncertainty limits of Methods 5 and 202. The results from both the Stack and Ambient Air test runs are at 0.0002 gr/dscf, which is the practical measurement limit for 240-minute test runs. The practical uncertainty of these results is approximately 0.0001 to 0.0002 gr/dscf. Therefore, there is no discernable difference between the Stack and the Ambient Air test results; the actual concentrations of the Stack Emissions and the Ambient Air are likely far below the measurement limits of these EPA Reference Methods.

These test results support the supposition that the Bloom fuel cell unit generates no measurable PM emissions.

The meter box and sampling train used during sampling performed within the requirements of their respective methods. All post-test leak checks, minimum metered volumes, and minimum sample durations met the applicable QA/QC criteria.

EPA Method 3A calibration audits were all within the measurement system performance specifications for the calibration drift checks, system calibration bias checks, and calibration error checks.

EPA Method 5 analytical QA/QC results are included in the laboratory report. The method QA/QC criteria were met. An EPA Method 5 reagent blank was analyzed. The maximum allowable amount that can be subtracted is 0.001% of the weight of the acetone used. The blank did not exceed the maximum residue allowed.

EPA Method 202 analytical QA/QC results are included in the laboratory report. The method QA/QC criteria were met. An EPA Method 202 Field Train Recovery Blank (FTRB) was performed for each source category. The maximum allowable amount that can be subtracted is 0.002 g (2.0 mg). For this project, the FTRB for the stack sampling train had a mass of 2.12 mg, and 2.0 mg was subtracted. The FTRB for the ambient sampling train had a mass of 2.57 mg, and 2.0 mg was subtracted.

5.2 QA/QC Discussion

The FTRBs exceeded the limit of 2.0 mg. All other QA/QC criteria were met during this test program.

5.3 Quality Statement

Montrose is qualified to conduct this test program and has established a quality management system that led to accreditation with ASTM Standard D7036-04 (Standard Practice for Competence of Air Emission Testing Bodies). Montrose participates in annual functional assessments for conformance with D7036-04 which are conducted by the American Association for Laboratory Accreditation (A2LA). All testing performed by Montrose is supervised on site by at least one Qualified Individual (QI) as defined in D7036-04 Section 8.3.2. Data quality objectives for estimating measurement uncertainty within the documented limits in the test methods are met by using approved test protocols for each project as defined in D7036-04 Sections 7.2.1 and 12.10. Additional quality assurance information is included in the report appendices. The content of this report is modeled after the EPA Emission Measurement Center Guideline Document (GD-043).

Measurement Uncertainty

Refer to the table(s) beginning on page 3. Reported uncertainties represent expanded uncertainties, expressed at approximately the 95% confidence level using a coverage factor of k = 2.

Decision Rule

This calibration uses a managed risk decision rule to achieve a PFA (probability of false accept) of 2% or lower, based on the Handbook for the Application of ANSI/NCSL Z540.3-2006. For double sided tolerances, Z540.3 Method 6 is used with the acceptance limit calculation based on test uncertainty ratio. For single sided tolerances, Z540.3 Method 5 is used where the acceptance limit is calculated by subtracting the expanded uncertainty from the tolerance limit.

Conformance With Requirements and Statement of Traceability

Trescal's calibration system complies with the requirements of ISO 17025:2017 and ANSI/NCSL Z540-1-1994.
This calibration was conducted using standards traceable to the International System of Units (SI) through NIST or an equivalent National Measurement Institute (NMI).

LABORATORY NARRATIVE
EPA METHOD 5/202
Client: Bloom Energy Stack and Ambient
Project: 066157

Custody

Four sets of samples for two units were received on April 10th, 2026. Each set consisted of a filter, probe/nozzle rinse, condensable particulate matter filter, impinger water and organic rinse. A set of field blanks, two sets of proof blanks, and a set of reagent blanks were also received. According to the chain-of-custody, these samples collected April 7th, 2026 to April 8th, 2026. Filters for the stack unit were torn outside collection area for runs one, two and four. The ambient unit had runs two and four torn outside of collection area. Sample bottles were marked with no evident sample loss.

Analysis

Samples were analyzed for particulate matter using the analytical procedures in EPA Methods 5 (Determination of Particulate Matter Emissions from Stationary Sources) and 202 (Determination of Condensable Particulate Matter Emissions from Stationary Sources. Samples were analyzed April 15th, 2026 to April 16th, 2026 after desiccating for at least 24 hours. The results were blank corrected according to the test methods.

Front-Half Analysis

The filters were white in color for the ambient unit and beige for the stack unit. Any results less than zero, in the detailed laboratory report, may be attributed to the mass collected during sampling being less than the normal mass is due to the loss of filter material during sampling, recovery, or sample handling. The probe/nozzle rinses appeared as white residues with light beige particulate.

Back-Half Analysis

The organic fractions appeared as white residues. The aqueous fractions appeared as white residues upon evaporation.

QC Notes

Prior to analysis, the accuracy of the balance was checked using 500 mg, 2 g, and 100 g ASTM E617-97 Class 1 Stainless Steel weights. Results below detection limits are reported as the detection limit. Two separate balances were used, SN # 1129323415 was used for the filters, SN # C036008161 was used for the samples evaporated in aluminum pans.

This certificate indicates Traceability to standards provided by (NIST) National Institute of Standards and Technology and/or a National Standards Laboratory.

A Test Uncertainty Ratio of at least 4:1 is maintained unless otherwise stated and is calculated using the expanded measurement uncertainty. Uncertainty evaluation includes the instrument under test and is calculated in accordance with the ISO "Guide to the Expression of Uncertainty in Measurement : (GUM). The uncertainty represents an expanded uncertainty using a coverage factor k=2 to approximate a 95% confidence level. Conformance based on Simple Acceptance as a Decision Rule, as defined in ILAC G8, with a measurement uncertainty value that will not exceed 50% of the tolerance unless otherwise stated by the customer. The results contained herein relate only to the item calibrated. This certificate shall not be reproduced except in full, without written approval of Control Company.

Note :

Maintaining Accuracy:

In our opinion once calibrated your Lollipop Thermometer should maintain its accuracy. There is no exact way to determine how long calibration will be maintained. Lollipop Thermometer change little, if any at all, but can be affected by aging, temperature, shock, and contamination.

Recalibration:

For factory calibration and re-certification traceable to National Institute of Standards and Technology contact Control Company.

Appendix D.5
Quality Assurance Program Summary and Equipment Calibration Schedule

QUALITY ASSURANCE PROGRAM SUMMARY AND CERTIFICATIONS

Montrose Air Quality Services, LLC (Montrose) ensures the quality and validity of its emission measurement and reporting procedures through a rigorous quality assurance (QA) program. The program is developed and administered by internal QA personnel and encompasses seven major areas:

1. Development and use of an internal QA manual
2. QA reviews of reports, laboratory work, and field testing
3. Equipment calibration and maintenance
4. Chain of custody
5. Continuous training
6. Knowledge of current test methods
7. Audit program

Each of these areas is discussed individually below.

Quality Assurance Manual. Montrose has prepared a QA Manual according to EPA guidelines and ASTM D-7036. The manual serves to document and formalize all of Montrose's QA efforts. The manual is constantly updated, and each employee involved in technical services for emission measurements is required to read, understand its contents, and sign a statement that all work they perform will conform to its practices. The manual includes details on the other seven QA areas discussed below.

QA Reviews. Montrose 's review procedure includes review of each source test report by the QA Manager or equivalent position including data input, calculations and averages, and report text. The laboratory manager or equivalent reviews all laboratory work, and the qualified individual on-site reviews all field work and data sheets.

The most important review is the one that takes place before a test program begins. The QA Manager works with testing personnel to prepare and review test protocols. Test protocol review includes selection of appropriate test procedures, evaluation of any interferences or other restrictions that might preclude use of standard test procedures, and evaluation and/or development of alternate procedures.

Equipment Calibration and Maintenance. The equipment used to conduct the emission measurements is maintained according to the manufacturer's instructions to ensure proper operation. In addition to the maintenance program, calibrations are carried out on each measurement device according to the schedule outlined below. The schedules for maintenance and calibrations are given in Tables A-1 and A-2.

Quality control checks are also conducted in the field for each test program. A partial list of checks made as part of each continuous analyzer system test series is included below as an example of the field QA procedures.

- Sample acquisition and conditioning system leak check
- 3-point analyzer calibrations (all analyzers)
- Complete system calibration check ("dynamic calibration" through entire sample system)

- Periodic analyzer calibration checks are conducted at the start and end of each test run. Any change between pre- and post-test readings are recorded.
- All calibrations are conducted using EPA Protocol gases certified by the manufacturer
- Calibration and continuous analyzer performance data are fully documented, and are included in each source test report

Chain of Custody. Montrose maintains full chain of custody documentation on all samples and data sheets. In addition to normal documentation of changes between field sample custodians, laboratory personnel, and field test personnel, Montrose documents every individual who handles any test component in the field (e.g., probe wash, impinger loading and recovery, filter loading and recovery, etc.).

Samples are stored in a locked area to which only laboratory personnel have access. Neither other Montrose employees nor cleaning crews have keys to this area.

Training. Personnel training is essential to ensure quality testing. Montrose has formal and informal training programs which may include some or all of the following:

1. Attendance at EPA-sponsored training courses
2. A requirement for all technicians to read, understand, and sign Montrose 's QA Manual
3. In-house training and Montrose meetings on a regular basis
4. Maintenance of training records
5. Administration of internal qualified individual (QI) tests for all methods performed
6. Participation in the Qualified Source Testing Individual (QSTI) program administered by the Source Evaluation Society (SES)

Knowledge of Current Test Methods. With the constant updating of standard test methods and the wide variety of emerging test methods, it is essential that any qualified source tester keep abreast of new developments. Montrose subscribes to services which provide updates on EPA reference methods, and on EPA and local agency rules and regulations. Additionally, source test personnel regularly attend and present papers at testing and emission-related seminars and conferences.

Audit Program. Montrose participates in the TNI Stationary Source Audit Sample (SSAS) audit program for all methods for which audit samples are available.

SECTION 2. SOURCE TEST PROGRAM

2.1. Overview

This source test was conducted to demonstrate that Bloom Energy's Energy Server 6.5 (Model ES6.5) fuel cell system is operating in compliance with the NO_X, CO and VOC emission limits and source test requirements stipulated in State of California Air Resources Board Executive Order DG-044.

The Distributed Generation Certification Regulation requires in Section 94203 (d} Compliance: "*DG Units must meet applicable emission standards for 15,000 hours of operation when operated and maintained according to the manufacturer's instructions.*" The CARB DG Certification application requests documentation that the technology meets emission standards for 15,000 hours of operation. While the required CARB test protocol does not require a 2-year test, Bloom Energy can project that Model ES6.5 will meet the emissions standards for at least 15,000 hours of operation. The emissions will remain within limits simply because Bloom Energy's fundamental solid oxide fuel cell (SOFC) technology and process architecture do not promote the release of these species.

Nitrogen (NO_X) is produced during the combustion process when nitrogen and oxygen are present at elevated temperatures. The two elements combine to form NO_X (NO and NO_2). NO_X emissions do not form in significant quantities until combustion temperatures reach 2800°F. Many combustion processes generate NO_X because of their high combustion temperatures. In contrast, Bloom's technology generates power using electrochemical oxidation of fuel rather than combustion - and operates at temperatures far below 2,800°F. Bloom does not anticipate NO_X emissions of Model ES-6.5 exceeding the CARB 2007 standard at or after 15,000 hours of operation.

Carbon monoxide (CO) is produced from the partial oxidation of carbon-containing compounds; it forms when there is not enough oxygen to produce carbon dioxide (CO_2), such as where combustion temperatures are too low or where there is insufficient mixing of fuel and air. Model ES-6.5's electrochemical operation means that, by design, Model ES-6.5 does not promote classical, combustion-based CO formation. Yet unlike other fuel cell technologies, SOFC stacks can actually consume CO as a fuel to generate electricity. So, if CO is created in the reformation process, the stacks will consume it, and oxidize it into CO_2. In addition, Bloom's technology utilizes components integral to the system's operation that have the added benefit of converting any residual CO into CO_2 prior to being exhausted. This latter process is tightly controlled throughout the product's lifetime. This means that if CO were to be generated in the system, it would be converted into CO_2 prior to being exhausted. Finally, because Bloom's technology is designed to operate for 10 years, and it requires the SOFC stacks to operate, and these SOFC stacks consume CO, Bloom does not anticipate the CO emissions of the ES-6.5 exceeding the CARB 2007 standard at or after 15,000 hours of operation.

The only possible source non-methane Volatile Organic Compounds (VOC) emissions from Model ES-6.5 are the traces of ethane, propane, etc. which are present in small quantities in pipeline natural gas - or trace organic gases that are products of incomplete combustion. When the natural gas fuel enters the Model ES-6.5, its components gases are fully catalyzed and/or consumed in the system. Accordingly, Bloom does not anticipate non-methane VOC emissions exceeding the CARB 2007 standard at or after 15,000 hours of operation.

2.2. Pollutants Tested

The following California Air Resources Board (CARB), South Coast Air Quality Management District (SCAQMD) and U.S. Environmental Protection Agency (EPA) sampling and analytical methods were used:

EPA Method 1	Stack Traverse Points
EPA Method 2	Stack Flow
EPA Method 4	Stack Moisture Determination
CARB Method 100	NO_X, CO, O_2 Emissions
EPA Method 7E	NO_2 to NO Conversion Efficiency
SCAQMD Method 25.3	VOC Emissions

2.3. Test Date

Testing was conducted on December 4-5, 2023.

2.4. Sampling and Observing Personnel

Sampling was performed by Finnegan Schall, Kyle Andersen, Frankie Sanfiorenzo and Vince Gigli of Blue Sky Environmental, Inc. Amanda Marruffo of Bloom Energy coordinated the testing program.

2.5. Source/Process Description

The Bloom Energy test facility is located at 543 Bailey Road, Mountain View California. The facility is used to test Bloom Energy's fuel cell systems called Energy Servers.

The focus of the test program was Bloom Energy's Energy Server 6.5 solid oxide fuel cell (SOFC). The unit may be fired on natural gas, blended hydrogen, biogas, and hydrogen. Exhaust gas from the cathode ordinarily vents to the atmosphere through a rectangular grating. For this test, the exhaust gas was redirected through a piece of transition ducting to a temporarily installed cylindrical stack extension. A copy of the specification sheet is provided in Appendix H.

2.6. Source Operating Conditions

Emissions testing was performed while the unit was operating at the conditions required by the Distributed Generation Certification Regulation. The unit was tested while operating at full power operating conditions under the following conditions:

- Runs 1-3 – 67.27 kW output power, fueled by natural gas.
- Runs 4-6 – 67.48 kW output power, fueled by natural gas.

SECTION 3. SAMPLING AND ANALYSIS PROCEDURES

3.1. Port Location

Sampling was conducted at the 6-inch diameter exhaust stack of the fuel cell through 2-inch diameter ports located in a temporarily installed stack extension. Ports were located approximately 10 feet (20 stack diameters) downstream from the nearest disturbance and 10 feet (20 stack diameters) upstream from the exhaust. This location met EPA Method 1 minimum criteria of two stack diameters downstream from the nearest disturbance and 0.5 stack diameters upstream from the nearest disturbance or exhaust.

3.2. Point Description/Labeling – Ports/Stack

Blue Sky Environmental conducted two perpendicular 4-point traverses of the stack to check for the presence of stratification. Stratification was less than 10%; therefore, subsequent CEM sampling was conducted using an average representative point.

3.3. Sample Train Description

Sampling system diagrams are provided in Appendix G. Additional descriptive information is included in the following section.

3.4. Sampling Procedure Description

Three consecutive 60-minute gaseous emissions tests were performed for oxides of nitrogen (NO_X), carbon monoxide (CO) and oxygen (O_2) at the fuel cell exhaust stack. The sampling system was checked for leaks before the start of the testing, by plugging the sample probe and observing the sample rotameter flow drop to zero. The temperature of the heated sample line between the probe and the sample conditioner/condenser, and the condenser exhaust temperatures were maintained within method limits during each test run. Instrument linearity and system bias were checked. The system response time for each analyzer was recorded. Analyzer external calibrations were performed before and after each run using EPA protocol certified gas standards. Any drift was corrected using CARB Method 100. A NO_X converter efficiency check was performed before the first test run and achieved an efficiency greater than 90%.

Blue Sky Environmental. Inc. collected an exhaust sample during each test run for analysis of VOCs. The samples were collected in 6-liter SUMMA canisters and analyzed by Atmospheric Analysis & Consulting (AAC) in Ventura, California.

Blue Sky Environmental, Inc. coordinated with site personnel and did not commence testing until the unit had reached stable operating conditions as indicated by Bloom Energy personnel on-site. Energy production rates were monitored using a Fluke 1736 power logger. For additional information, please refer to the calibration documentation provided in Appendix F

The sampling and analysis methods are summarized below:

EPA Method 1 – Sample and Velocity Traverses for Stationary Sources
This method is used to determine the duct or stack area and appropriate traverse points that represent equal areas of the duct for sampling and velocity measurements.

EPA Method 2 – Determination of Stack Gas Velocity and Volumetric Flow Rate (Type S Pitot Tube)

This method is used to determine stack gas velocity, volumetric flow rate and the presence or absence of cyclonic flow using a standard or S-type pitot tube and inclined manometer. Temperature is monitored using a K-type thermocouple and calibrated Omega temperature meter. QA/QC procedures include a system leak check before and after each traverse to validate the results. Thermometer calibrations are performed using an Omega Model CL-300 calibrator. Geometric calibrations of S-type pitot tubes are performed every six months or according to the guidelines outlined in California Air Resources Board (CARB) QA/QC Volume VI, Table 3.

EPA Method 4 – Determination of Moisture Content in Stack Gas

This method is used to determine the moisture content of stack gas. The sample is extracted and condensed in Greenburg-Smith impingers immersed in an ice bath and in a final impinger silica gel trap. The moisture is condensed in a solution of de-ionized water, or solutions of another type of sampling train if the moisture is being determined as part of another sampling method, such as EPA Method 5, SCAQMD Method 201.7 or BAAQMD ST-32. The moisture gain in the impinger solutions and silica gel is determined volumetrically and gravimetrically respectively.

QA/QC procedures require that a minimum of 21 cubic feet of sample is pulled using a leak tight pump. The sample volume is measured with a calibrated dry gas meter. The impingers are immersed in an ice bath to maintain a gas outlet temperature of less than 68°F. Pre-test leak checks are performed for each run using a minimum of 15 inches of mercury vacuum. Post-test leak checks are performed at the highest sample vacuum or greater. The leak test is acceptable if the leak rate is less than 0.02 cubic feet per minute or 4% of the average sampling rate, whichever is less. If the final leak check exceeds the criteria, either the volume is corrected based on the leak rate or the run is voided and repeated.

CARB Method 100 – Procedures for Continuous Gaseous Emission Stack Sampling

This continuous monitoring method is used to determine emissions of nitrogen oxides, carbon monoxide, carbon dioxide, total hydrocarbons, and oxygen from stationary source flowing gas streams in ducts, stacks, and flues. Sampling is performed by extracting exhaust flue gas from the stack, conditioning the sample to remove moisture and particulates, and analyzing it by continuous monitoring gas analyzers in a continuous emission monitoring (CEM) test van.

The sampling system consists of a stainless steel sample probe, heated Teflon sample line maintained at 248°F ± 25, a glass-fiber particulate filter, glass moisture-knockout condensers in ice, Teflon sample transfer tubing, a diaphragm pump, and a stainless steel/Teflon manifold and flow control/delivery system. A constant sample and calibration gas supply pressure of 5 psi is provided to each analyzer to avoid pressure variable response differences. The entire sampling system is leak checked prior to and at the end of the sampling program.

The sampling and analytical system is checked for linearity with zero, mid (40-60%) and high span (80-100%) calibrations and is checked for system bias at the beginning and end of each run. System bias is determined by introducing calibration gas to the probe and pulling it through the entire sampling system. All calibrations during testing are performed externally to incorporate any system bias that may exist. Sampling system bias, zero and calibration drift values are determined for each test. All calibration gases are EPA Protocol #1. The analyzer data recording system consists of a data acquisition system (DAS).

EPA Method 7E – Determination of Nitrogen Oxides Emissions from Stationary Sources (Instrumental Analyzer Procedure)

This method is used to measure nitrogen oxides in stationary source emissions using a continuous instrumental analyzer. A continuous representative gas sample is extracted from the sampling point and conditioned to remove water and particulate material. Nitric oxide is determined by passing the sample through a chemiluminescent analyzer. The chemiluminescent process is based on the light given off when nitric oxide and ozone react. Nitrogen dioxide (NO_2) concentrations are determined by passing the sample through a catalyst which reduces the NO_2 to NO. The total oxides of nitrogen concentration (NO_2 + NO) is then determined by chemiluminescence.

Section 16.2.2 of the method is used to determine the NO_X analyzer NO_2 to NO conversion efficiency.

SCAQMD Method 25.3 – Determination of Low Concentration Non-Methane Non-Ethane Organic Compound Emissions from Clean Fueled Combustion Sources

This method is used to measure low concentration volatile organic compounds (VOC) as non-methane non-ethane organic compounds in combustion products where methane and ethane are the only significant VOC exempt compounds.

Sampling equipment consists of an in-stack 1/8 inch Teflon or SS probe, SS filter, 4ml glass condensate trap filled with 2ml of ultra-pure water, vacuum gauge and SUMMA Canister. The ice water is kept above the level of the water in the trap, but below the rim of the vial lid. The SUMMA Canister flow is regulated by an orifice or regulator. The water is pre-chilled prior (>5mins) to sampling. The system in leak-checked before and after the test. The line is rinsed with 1 ml of ultra-pure water. A field blank "full assembly" is not required by the method but is often collected.
The emission sample is gradually drawn through a mini-impinger trap containing ultrapure de-ionized water and immersed in ice water and into a 6 Liter SUMMA Canister. The total organic carbon in the trap is analyzed by liquid injection into an infra-red total carbon analyzer, and the canisters are analyzed using the Method 25.1 approach using a GC column with foreflush and backflush followed by an oxidizer, methanizer and FID. The GC separates methane and ethane from the sample, the oxidizer converts these VOCs to CO_2, and the methanizer converts the resulting carbon dioxide to methane. The results are determined by FID as carbon.

3.5. Instrumentation and Analytical procedures

The following continuous emissions analyzers were used:

Instrumentation	Parameter	Principle
TECO Model 42C	$NO_X/NO/NO_2$	Chemiluminescence

3.6. System Performance Criteria

All calibration gases are EPA Protocol #1. The analyzer data recording system consists of a Honeywell DPR 3000 chart recorder, supported by a Data Acquisition System (DAS). The instrument response is recorded on strip charts and DAS. The averages are corrected for drift using CARB Method 100 and EPA Method 7E equations.

Instrument Linearity	≤ 2% Full Scale
Instrument Bias	≤ 5% Full Scale
System Response Time	≤± 2 minutes
NO_X Converter Efficiency *(EPA Method 7E)*	≥ 90%
Instrument Zero Drift	≤± 3% Full Scale
Instrument Span Drift	≤± 3% Full Scale

3.7. Comments: Limitations and Data Qualifications

This source test was performed in accordance with the quote submitted to Bloom Energy. A shutoff valve was used on the CEMS probe to prevent ambient contamination during port changes. There were no invalid test runs, time gaps, deviations or exceptions experienced during the test program.

Blue Sky Environmental, Inc. has reviewed this report for accuracy and concluded that the test procedures were followed using accepted standards of practices and are accurately described and documented. The review included the following items:

Review of the general text
Review of calculations

Method 25.3 Calculation Summary Sheet

TOC Calculations (Trap):

$$C_{Trap} = \frac{(C_{Toc} \times V_{Trap})}{(V_{Sample})} \times \frac{V_{id}}{MW_c}$$

Where:

C_{Trap} = Gaseous concentration of TOC in condensate trap water, ppmv (as Carbon)
C_{Toc} = TOC concentration in ug/ml of condensate trap water (*from Raw Data printout*)
V_{Trap} = Volume of condensate trap water in ml (*from Sample Receiving Data Sheet*)
V_{id} = Volume of ideal gas per mole at 25°C (24.4652 liters/mole)
MW_c = Atomic weight of carbon (12.01 g/mol)
V_{Sample} = Volume sampled in collection tank in Liters (V_{Tank} x ($P_r - P_i$)/ P_a)

Where:

VTank = Volume of the sampling tank in liters (*from Sample Receiving Data Sheet*)
Pr = Return canister pressure of the sampling tank (*from Sample Receiving Data Sheet*)
Pi = Initial canister pressure of the sampling tank (*from Sample Receiving Data Sheet*)
Pa = atmospheric pressure (760 mmHg)

TCA Calculations (Tank):

$$C_{Tank} = C_{TCA} \times DF_{Tank} \times 3.0$$

Where:

C_{Tank} = Gaseous concentration of tank, ppmv (as Carbon)
C_{TCA} = Average of analysis results from chromatograms, ppmv (as Propane)
DF_{Tank} = Dilution factor resulting from tank pressurization upon receipt (Pf/Pr)
3.0 = Conversion of result (as Propane) to (as Carbon)

Where:

Pf = Final canister pressure after pressurization for analysis (*from Sample Receiving Data Sheet*)
Pr = Return canister pressure upon sample receipt (*from Sample Receiving Data Sheet*)

Final Calculation (Tank and Trap):

$$\text{Total VOC (ppmC)} = (C_{Trap} + C_{Tank}) \times 1.086$$

Per method section 4.11, the final concentration includes a 1.086 bias correction factor.

Fixed Gases Calculations (Tank):

$$FG \text{ (i.e. } O_2) = C_{fg} \times DF_{Tank} / NF$$

Where:

C_{fg} = Average of analysis results from chromatograms, %
DF_{Tank} = Dilution factor resulting from tank pressurization upon receipt (Pf/Pr)
NF = Normalization Factor = sum of averages of all Fixed Gases x DF_{Tank} / 100%

METHOD 5 DRY GAS METER CALIBRATION USING CRITICAL ORIFICES

1) Select three critical orifices to calibrate the dry gas meter which bracket the expected operating range.
2) Record barometric pressure before and after calibration procedure.
3) Run at tested vacuum (from Orifice Calibration Report), for a period of time necessary to achieve a minimum total volume of 5 cubic feet.
4) Record readings in outlined boxes below, other columns are automatically calculated.

USING THE CRITICAL ORIFICES AS CALIBRATION STANDARDS:
The following equations are used to calculate the standard volumes of air passed through the DGM, V_m (std), and the critical orifice, V_{cr} (std), and the DGM calibration factor, Y. These equations are automatically calculated in the spreadsheet above.

AVERAGE DRY GAS METER CALIBRATION FACTOR, Y = 0.9707
PREVIOUS AVERAGE DRY GAS METER CALIBRATION FACTOR, Y = 0.9728 — 0.21 — PASS
AVERAGE $\Delta H_@$ = 1.7950

(1) $$Vm_{(std)} = K_1 * Vm * \frac{Pbar + (\Delta H / 13.6)}{Tm}$$

= Net volume of gas sample passed through DGM, corrected to standard conditions
K_1 = 17.64 °R/in. Hg (English), 0.3858 °K/mm Hg (Metric)
T_m = Absolute DGM avg. temperature (°R - English, °K - Metric)

(2) $$Vcr_{(std)} = K' * \frac{Pbar * \Theta}{\sqrt{Tamb}}$$

= Volume of gas sample passed through the critical orifice, corrected to standard conditions
T_{amb} = Absolute ambient temperature (°R - English, °K - Metric)
K' = Average K' factor from Critical Orifice Calibration

(3) $$Y = \frac{Vcr_{(std)}}{Vm_{(std)}}$$

= DGM calibration factor

$$\Delta H_@ = \left(\frac{0.75\,\theta}{V_{cr(std)}}\right)^2 \Delta H \left(\frac{V_{m(std)}}{V_m}\right)$$

Test Details

Site of Calibration	1065 Comstock Street, Santa Clara, CA
Ambient Environment	23.0 +/- 5.0 degrees C and 20 - 80 % relative humidity.
Measurement Results	Refer to the table(s) beginning on page 3.

Calibration Process

This calibration was performed using the manufacturer's procedure.

Measurement Uncertainty

Refer to the table(s) beginning on page 3. Reported uncertainties represent expanded uncertainties, expressed at approximately the 95% confidence level using a coverage factor of k = 2.

Decision Rule

This calibration uses a managed risk decision rule to achieve a PFA (probability of false accept) of 2% or lower, based on the Handbook for the Application of ANSI/NCSL Z540.3-2006. For double sided tolerances, Z540.3 Method 6 is used with the acceptance limit calculation based on test uncertainty ratio. For single sided tolerances, Z540.3 Method 5 is used where the acceptance limit is calculated by subtracting the expanded uncertainty from the tolerance limit.

Conformance With Requirements and Statement of Traceability

Trescal's calibration system complies with the requirements of ISO 17025:2017 and ANSI/NCSL Z540-1-1994.
This calibration was conducted using standards traceable to the International System of Units (SI) through NIST or an equivalent National Measurement Institute (NMI).

Bloomenergy®

Data Sheet

The Bloom Energy Server® 6.5

Bloom Energy's solid oxide fuel cell (SOFC) platform provides a non-combustion pathway to convert fuels directly to electricity. The Energy Server is fuel-flexible and can generate energy using natural gas, blended hydrogen, biogas, and hydrogen. A modular platform approach provides a pathway to upgrade existing systems to align with our customers' sustainability goals over time. With no water consumption during normal operation and a high operational efficiency, the Bloom Energy Server significantly reduces carbon emissions today, while providing a pathway to operate with cleaner fuels in the future.

The Bloom Energy Server provides reliable and resilient base power to facilities. It is designed in a modular concept ideal for on-site distributed power generation, operating 24x7, supporting the power demand in grid parallel or in a microgrid architecture. In addition, the heat from the flue gas can be captured from the Energy Server and integrated in a Combined Heat and Power (CHP) application.

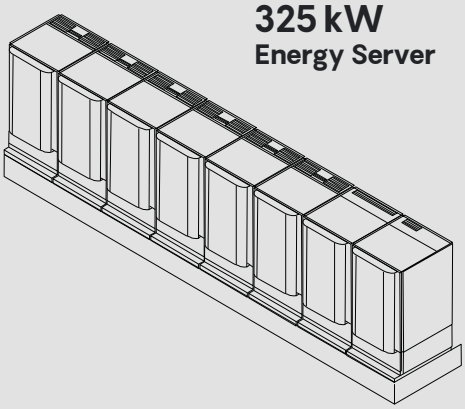
Bloom Energy has over 1 GW of power generation installations deployed globally across six countries. The Energy Server is suitable to address power needs in any industry and has multi-megawatt installations across industries such as retail, datacenters, hospitals, sporting arenas, manufacturing and warehousing.

Clean

Our systems reduce criteria pollutants (NOx, SOx, and particulate matter) to near zero and has far lower carbon emissions than legacy technologies.

Reliable

Bloom Energy Server is designed around a modular architecture of simple repeating elements. This enables us to generate power 24 x 7 x 365.



Resilient

Our system operates at very high availability due to its fault-tolerant design and its use of a robust natural gas pipeline system. The Bloom Energy Server has survived extreme weather events and other incidences and continues to provide power to our customers.

Simple Installation and Maintenance

The Energy Server is 'plug and play' and has been designed in compliance with a variety of safety standards. Bloom Energy manages all aspects of installation, operation and maintenance of the systems.

SECTION 2. SOURCE TEST PROGRAM

2.1. Overview

This source test was conducted to demonstrate that Bloom Energy's Energy Server 6.5 (Model ES6.5) solid oxide fuel cell system is operating in compliance with the HAPS emission limits and source test requirements stipulated in State of California Air Resources Board Executive Order DG-044.

2.2. Pollutants Tested

The following U.S. Environmental Protection Agency (EPA) sampling and analytical methods were used:

EPA Method 18	Collection of Gaseous Organic Compounds
EPA Method TO-12	Volatile Organic Compounds Analysis
EPA Method TO-15	Hazardous Air Pollutants Analysis

2.3. Test Date

Testing was conducted on December 5-6, 2023.

2.4. Sampling and Observing Personnel

Sampling was performed by Finnegan Schall of Blue Sky Environmental, Inc.
Amanda Marruffo of Bloom Energy coordinated the testing program.

2.5. Source/Process Description

The Bloom Energy test facility is located at 543 Bailey Road, Mountain View California. The facility is used to test Bloom Energy's fuel cell systems called Energy Servers.

The focus of the test program was Bloom Energy's Energy Server 6.5 solid oxide fuel cell (SOFC). The unit may be fired on natural gas or blended hydrogen, biogas, and hydrogen. Exhaust gas from the cathode ordinarily vents to the atmosphere through a rectangular grating. For this test, the exhaust gas was redirected through a piece of transition ducting to a temporarily installed cylindrical stack extension. A copy of the specification sheet is provided in Appendix F.

2.6. Source Operating Conditions

Emissions testing was performed while the unit and air pollution control device were operating at the conditions required by the permit. The unit was tested while operating on natural gas fuel at full power.

Administrative Record NSR 10833_000479

SECTION 3. SAMPLING AND ANALYSIS PROCEDURES

3.1. Port Location

Sampling was conducted at the 6-inch diameter exhaust stack of the fuel cell through 2-inch diameter ports located in a temporarily installed stack extension. Ports were located approximately 10 feet (20 stack diameters) downstream from the nearest disturbance and 10 feet (20 stack diameters) upstream from the exhaust. This location met EPA Method 1 minimum criteria of two stack diameters downstream from the nearest disturbance and 0.5 stack diameters upstream from the nearest disturbance or exhaust.

3.2. Sample Train Description

Sampling system diagrams are provided in Appendix E. Additional descriptive information is included in the following section.

3.3. Sampling Procedure Description

Three consecutive 60-minute gaseous emissions samples collected on December 5-6, 2023 for hazardous air pollutants (HAPS). The samples were collected in 6-liter SUMMA canisters using EPA Method 18 and analyzed by Atmospheric Analysis & Consulting (AAC) in Ventura, California.

Three consecutive 60-minute particulate emissions samples were collected concurrently with the HAPS samples at the fuel cell exhaust stack using EPA Methods 5/202. Stack gas volumetric flow rate was also measured. This data is presented in a separate report.

The sampling and analysis methods are summarized below:

EPA Method 18 – Measurement of Gaseous Organic Compound Emissions by Gas Chromatography

This method is used to determine emissions of volatile organics by gas chromatography (GC). Gases are collected in a pre-evacuated 6-Liter SUMMA canister with pre-set flow controller set to integrate over the desired test duration. The SUMMA® passivated canisters allow holding times up to 14 days for the target volatile organics. The sample gas is drawn by the canister vacuum through a micro-filter, pre-set orifice flow controller and on/off valve into the canister. The canister vacuum is monitored with a vacuum gauge to verify sample collection. The flow controller consists of capillary orifice tubing designed to sample for a pre-set duration of 0.5 hrs.

EPA Compendium Method TO-12 – Determination of Non-Methane Organic Compounds (NMOC) in Ambient Air using Cryogenic Preconcentration and Direct Flame Ionization Detection (PDFID)

This method is used to determine NMOC in air samples by FID gas chromatography following preconcentration using a cryogenic trap. The cryogenic trap simultaneously concentrates the NMOC while separating and removing the methane from the air samples. By convention, concentrations of NMOC are reported in units of parts per million carbon (ppmC), which, for a specific compound, is the concentration of volume (ppmV) multiplied by the number of carbon atoms in the compound.

Samples are collected in pre-evacuated 6-Liter SUMMA canisters with pre-set flow controllers set to integrate over the desired test duration. The SUMMA® passivated canisters allow holding times up to 14 days. The sample gas is drawn by the canister vacuum through a micro-filter, pre-set orifice flow controller and on/off valve into the canister. The canister vacuum is monitored with a vacuum

Administrative Record NSR 10833_000480

gauge to verify sample collection. The flow controller consisted of capillary orifice tubing designed to sample for a pre-set duration of 20 to 60 minutes.

To prevent moisture condensation, a condenser may be used before the canister and the condensate analyzed separately, or the canister can be partially pre-filled with a known quantity zero air or nitrogen, prior to collecting the gas sample, or the system can be heated and kept heated above the condensation point until analysis.

EPA Compendium Method TO-15 – Determination of Toxic Organic Compounds in Ambient Air

This method is used to measure volatile organic compounds that are included in the hazardous air pollutants (HAPs) listed in Title III of the Clean Air Act Amendments of 1990 by GC/MS (gas chromatography/mass spectroscopy). Samples are collected in pre-evacuated 6-Liter SUMMA canisters with pre-set flow controllers set to integrate over the desired test duration. The SUMMA® passivated canisters allow holding times up to 14 days for the TO-15 Method list of volatile organics. The sample gas is drawn by the canister vacuum through a micro-filter, pre-set orifice flow controller and on/off valve into the canister. The canister vacuum is monitored with a vacuum gauge to verify sample collection. The flow controller consisted of capillary orifice tubing designed to sample for a pre-set duration of 0.75hrs.

The analytical strategy for Compendium Method TO-15 involves using a high resolution gas chromatograph (GC) coupled to a mass spectrometer. Mass spectra for individual peaks in the total ion chromatogram are examined with respect to the fragmentation pattern of ions corresponding to various VOCs including the intensity of primary and secondary ions. The fragmentation pattern is compared with stored spectra taken under similar conditions to identify the compound. For any given compound, the intensity of the primary fragment is compared with the system response to the primary fragment for known amounts of the compound. This establishes the compound concentration that exists in the sample.

Data Sheet

The Bloom Energy Server® 6.5

Bloom Energy's solid oxide fuel cell (SOFC) platform provides a non-combustion pathway to convert fuels directly to electricity. The Energy Server is fuel-flexible and can generate energy using natural gas, blended hydrogen, biogas, and hydrogen. A modular platform approach provides a pathway to upgrade existing systems to align with our customers' sustainability goals over time. With no water consumption during normal operation and a high operational efficiency, the Bloom Energy Server significantly reduces carbon emissions today, while providing a pathway to operate with cleaner fuels in the future.

The Bloom Energy Server provides reliable and resilient base power to facilities. It is designed in a modular concept ideal for on-site distributed power generation, operating 24x7, supporting the power demand in grid parallel or in a microgrid architecture. In addition, the heat from the flue gas can be captured from the Energy Server and integrated in a Combined Heat and Power (CHP) application.

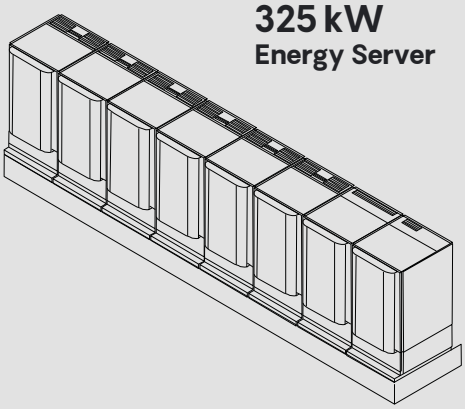
Bloom Energy has over 1 GW of power generation installations deployed globally across six countries. The Energy Server is suitable to address power needs in any industry and has multi-megawatt installations across industries such as retail, datacenters, hospitals, sporting arenas, manufacturing and warehousing.

Clean

Our systems reduce criteria pollutants (NOx, SOx, and particulate matter) to near zero and has far lower carbon emissions than legacy technologies.

Reliable

Bloom Energy Server is designed around a modular architecture of simple repeating elements. This enables us to generate power 24 x 7 x 365.



Resilient

Our system operates at very high availability due to its fault-tolerant design and its use of a robust natural gas pipeline system. The Bloom Energy Server has survived extreme weather events and other incidences and continues to provide power to our customers.

Simple Installation and Maintenance

The Energy Server is 'plug and play' and has been designed in compliance with a variety of safety standards. Bloom Energy manages all aspects of installation, operation and maintenance of the systems.

Latino vote

Continued from Page 1A

real or simply a function of fluctuating Latino Democratic turnout rates. In other words, are Latinos broadly changing their votes back to Democrats, or are Latinos who remained loyal to the Democrats now more angry and fired up?

Survey and election data suggest it's a bit of both. So what does this portend for the future of American politics?

The history of the Latino vote nationwide had for decades been one of long-term stability. Historically, Democrats enjoyed an approximate 65% to 35% advantage over Republicans.

That advantage shrank marginally after Republican President Ronald Reagan signed the Immigration Reform and Control Act in 1986, providing a path to citizenship for millions. But the more familiar two-thirds advantage for the Democratic Party returned following passage of Proposition 187, a 1994 anti-immigrant initiative in California that ultimately mobilized Latinos against Republicans.

Another effort at GOP outreach to Hispanic voters culminated in President George W. Bush taking approximately 40% of the Latino vote in 2004. That growth, however, soon eroded in the wake of anti-immigrant legislation passed by the Republican-controlled House in 2005 and 2006.

The successful campaigns of Democrat Barack Obama in 2008 and 2012, as well as Hillary Clinton's unsuccessful 2016 campaign against Trump, saw Democrats reaping a relatively high level of Latino support, peaking at a 3-to-1 advantage in 2012.

That made Trump's improvements among Latinos in 2020 and 2024 feel, for some, particularly unexpected. He lodged notable breakthroughs in parts of Florida, where he carried Miami-Dade County, and Texas, where he flipped the historically Democratic Rio Grande Valley.

It should not have been such a surprise. There has been a history of sizable shares of Latinos supporting Republican candidates. For instance, both former President George W. Bush and his brother, former Florida Gov. Jeb Bush, performed well with Latinos in Texas and Florida.

For two decades, Democrats have campaigned among Latinos on the promise of comprehensive immigration reform and an economic policy that would level the playing field, including raising the federal minimum wage, providing universal pre-K education and promoting affordable housing.

Many Latinos feel they are still waiting for these Democratic policies to be enacted, let alone improve their lives.

Democratic trifectas in 2009-10 and 2021-22 – when the party held both chambers of Congress, along with the presidency – failed to produce meaningful movement on immigration policy. Many Latinos felt their daily lives had not improved, as they faced high costs of living, expensive housing markets and rising health care costs. While House Democrats did pass numerous bills to address these topics, Senate moderates proved difficult to persuade.

Given these shortcomings, running on the message that "the GOP are bad guys" only gets Democrats so far. In 2024, surveys and focus groups of Hispanic voters made it clear that not everyone was convinced by this characterization. The frustrations of working-class families during the Biden administration were real, whereas fears of mass deportations and other social chaos that a second Trump term might portend were, at that point, conjecture.

The Trump campaign specifically promised widespread action against immigrants, but many of our Latino focus group participants felt this was bluster. They believed that Trump's actions would be targeted against blatant criminals and that his policies would not affect their families and friends.

They did not believe the worst-case scenarios presented by then-Vice President Kamala Harris and other Democrats during the campaign. Despite often not liking Trump, his economic promises felt good during the 2024 affordability crisis.

Many Latinos are now quite upset with Trump. The 2025 gubernatorial elections in New Jersey and Virginia point to dramatic 25-point changes in the Latino vote in the Democrats' direction, compared with Trump's 2024 performance.

In December 2025, the first Democrat was elected mayor of Miami since 1997, with Latino support. A Democrat won a heavily Republican state legislative district in Texas this February with an estimated 79% of the Latino vote. Most recently, Latino voter turnout surged to record levels in the March Democratic primary in Texas.

Majorities of Latino voters believe that their economic fortunes have declined since Trump returned to the White House. Moreover, they expect the situation to worsen over the next year. In March, The Economist reported that Trump's support among Latinos had fallen to 22%.

Evidence from general elections in 2025, as well as special elections in 2026, suggests some of the Latino voters who backed President Donald Trump are now swinging back to the Democrats. MARIO TAMA/GETTY IMAGES

Majorities of Latino voters believe that their economic fortunes have declined since Trump returned to the White House. Moreover, they expect the situation to worsen over the next year. In March, The Economist reported that Trump's support among Latinos had fallen to 22%.

In a bipartisan poll by UnidosUS released in November, only 14% of Latino voters said their lives were better after one year under Trump, while 39% said they had gotten worse. Looking ahead, 50% expected things to get worse still in 2026, while only 20% were optimistic about their economic future. Two-thirds of Latino voters felt that Trump and the Republicans were not focusing enough on improving the economy for people like them.

What's more, mass deportations have happened under the second Trump administration. The vast majority of those detained for deportation, including those who have died, had no criminal record.

Latinos are overwhelmingly opposed to federal troops in U.S. cities, according to our polling; 41% fear legal residents and U.S. citizens getting caught up in enforcement actions. The No. 1 immigration concern for Latino voters remains a path to citizenship for Dreamers – the undocumented immigrants brought to the U.S. as children – and for immigrants who have worked and paid taxes in the country for more than 20 years but lack formal status.

Among Latinos who actually voted for Trump, many would not do so again. Our poll suggests that 22% of Latinos who voted for Trump in 2024 would not vote for him again. By contrast, Democrats retain support from 93% of their 2024 Latino voters.

The long-term effects of the Trump presidency on the Latino electorate are difficult to predict, but for now party preferences have shifted firmly back toward the Democrats. Among voters in the UnidosUS poll, 55% said they felt the Democrats "care a great deal" about Latinos, compared with 29% saying they felt that way about the GOP. At the same time, 33% of Latino voters see the GOP as "hostile," compared with just 7% who believe this about the Democrats.

If the recent leftward shift is sustained, or the earlier shift to the right was illusory, the effects on the politics of 2026 could be large, potentially putting control of Congress in the hands of Latino voters. There are 46 House districts where the number of registered voters who are Latino exceeds the total margin of victory for those seats in 2024, with 23 currently held by Republicans and 23 currently held by Democrats.

Latino voters need to believe that politicians truly care about their concerns and will work to implement a plan to create equal opportunities for the nation's largest minority group to achieve the American dream. We believe the candidates able to make that pitch convincingly will be the most successful.

Written Description of the Routine Operations of the Facility

---

A written description of the routine operations of the facility. Include a description of how each piece of equipment will be operated, how controls will be used, and the fate of both the products and waste generated. For modifications and/or revisions, explain how the changes will affect the existing process. In a separate paragraph describe the major process bottlenecks that limit production. The purpose of this description is to provide sufficient information about plant operations for the permit writer to determine appropriate emission sources.

The facility utilizes a Bloom Energy Server System, which is a type of solid oxide fuel cell system (EUID: SOFC). The SOFC converts natural gas into electricity through an electrochemical reaction without combustion. Each individual fuel cell is composed of three layers: a solid ceramic electrolyte sandwiched between a cathode and an anode, where the anode and cathode are made from inks that coat the electrolyte. No precious metals, corrosive acids, or molten materials are required. Natural gas enters the anode side, where it mixes with steam to produce reformed fuel. As the reformed fuel crosses the anode, it attracts oxygen ions from the air on the cathode side. The oxygen ions combine with the reformed fuel to produce electricity, water, heat, and carbon dioxide. The water and heat are recycled to produce the steam needed to reform the fuel, enabling a highly efficient electrochemical reaction that requires no water other than during system startup. The electrochemical reaction occurs at 700–900 degrees Celsius. Individual cells are combined into stacks, then into power modules containing hundreds of individual fuel cells that produce direct current power. The modules are packaged into Energy Servers, which combine the power modules with a fuel processing module and an AC module containing DC-to-AC converters and transformers to produce 325 kW of net AC power. The proposed Bloom Energy Server System deploys co-functioning Energy Servers to create an integrated system capable of sustaining the target output represented for each applicable scenario. Depleted anode exhaust, which is approximately 95 percent carbon dioxide once dried is discharged to the atmosphere. The air emissions from the Energy Servers consist of depleted anode exhaust, which contains lower criteria air pollutants due to the absence of combustion, and use no water during steady-state operation. The Bloom Energy Server System is proposed to operate at its maximum rated load for 8,760 hours per year.

Section 11
Source Determination
Source submitting under 20.2.70, 20.2.72, 20.2.73, and 20.2.74 NMAC

Sources applying for a construction permit, PSD permit, or operating permit shall evaluate surrounding and/or associated sources (including those sources directly connected to this source for business reasons) and complete this section. Responses to the following questions shall be consistent with the Air Quality Bureau's permitting guidance, Single Source Determination Guidance, which may be found on the Applications Page in the Permitting Section of the Air Quality Bureau website.

Typically, buildings, structures, installations, or facilities that have the same SIC code, that are under common ownership or control, and that are contiguous or adjacent constitute a single stationary source for 20.2.70, 20.2.72, 20.2.73, and 20.2.74 NMAC applicability purposes. Submission of your analysis of these factors in support of the responses below is optional, unless requested by NMED.

A. Identify the emission sources evaluated in this section (list and describe)**: All sources listed in Table 2-A. The SOFC Unit includes a dedicated subsystem to supply backup power to the adjacent data center. Therefore, the data center, once constructed, will not require a permit and will have no regulated emission sources.**

B. Apply the 3 criteria for determining a single source:

SIC Code: Surrounding or associated sources belong to the same 2-digit industrial grouping (2-digit SIC code) as this facility, OR surrounding or associated sources that belong to different 2-digit SIC codes are support facilities for this source.

☑ **Yes** ☐ **No**

Common Ownership or Control: Surrounding or associated sources are under common ownership or control as this source.

☑ **Yes** ☐ **No**

Contiguous or Adjacent: Surrounding or associated sources are contiguous or adjacent with this source.

☑ **Yes** ☐ **No**

C. Make a determination:

☑ The source, as described in this application, constitutes the entire source for 20.2.70, 20.2.72, 20.2.73, or 20.2.74 NMAC applicability purposes. If in "A" above you evaluated only the source that is the subject of this application, all "**YES**" boxes should be checked. If in "A" above you evaluated other sources as well, you must check **AT LEAST ONE** of the boxes "**NO**" to conclude that the source, as described in the application, is the entire source for 20.2.70, 20.2.72, 20.2.73, and 20.2.74 NMAC applicability purposes.

☐ The source, as described in this application, **does not** constitute the entire source for 20.2.70, 20.2.72, 20.2.73, or 20.2.74 NMAC applicability purposes (A permit may be issued for a portion of a source). The entire source consists of the following facilities or emissions sources (list and describe):

Section 12

Section 12.A
PSD Applicability Determination for All Sources

(Submitting under 20.2.72, 20.2.74 NMAC)

A PSD applicability determination for all sources. For sources applying for a significant permit revision, apply the applicable requirements of 20.2.74.AG and 20.2.74.200 NMAC and to determine whether this facility is a major or minor PSD source, and whether this modification is a major or a minor PSD modification. It may be helpful to refer to the procedures for Determining the Net Emissions Change at a Source as specified by Table A-5 (Page A.45) of the EPA New Source Review Workshop Manual to determine if the revision is subject to PSD review.

A. This facility is:

- ☑ **a minor PSD source before and after this modification (if so, delete C and D below).**
- ☐ **a major PSD source before this modification. This modification will make this a PSD minor source.**
- ☐ **an existing PSD Major Source that has never had a major modification requiring a BACT analysis.**
- ☐ **an existing PSD Major Source that has had a major modification requiring a BACT analysis**
- ☐ **a new PSD Major Source after this modification.**

B. **This facility is not one of the listed 20.2.74.501 Table I – PSD Source Categories. The "project" emissions for this modification are not significant. The "project" emissions listed below do only result from changes described in this permit application, thus no emissions from other [revisions or modifications, past or future] to this facility. Also, specifically discuss whether this project results in "de-bottlenecking", or other associated emissions resulting in higher emissions. The project emissions (before netting) for this project are as follows [see Table 2 in 20.2.74.502 NMAC for a complete list of significance levels]:**

a.	**NOx:**	**37.20**	**TPY**
b.	**CO:**	**161.21**	**TPY**
c.	**VOC:**	**124.01**	**TPY**
d.	**SOx:**	**0.076**	**TPY**
e.	**PM:**	**75.40**	**TPY**
f.	**PM_{10}:**	**75.40**	**TPY**
g.	**$PM_{2.5}$:**	**75.40**	**TPY**
h.	**Flourides:**	**N/A**	**TPY**
i.	**Lead:**	**N/A**	**TPY**
j.	**Sulfur Compounds (listed in Table 2):**	**0.076**	**TPY**
k.	**GHG:**	**10,144,115**	**TPY**

** The Bloom Energy Server System equipment vendor maintains that there are zero PM emissions from its equipment. Extant reference method testing has been used by the applicant to conservatively estimate emissions, given test method limitations. Vendor indicates that extant testing may exhibit positive sampling method bias and reflects filterable particulate matter from intake air passed through the system. For that reason, the Bloom Energy Server System equipment vendor does not specify particulate emission factors.*

Section 13

Determination of State & Federal Air Quality Regulations

This section lists each state and federal air quality regulation that may apply to your facility and/or equipment that are stationary sources of regulated air pollutants.

Not all state and federal air quality regulations are included in this list. Go to the Code of Federal Regulations (CFR) or to the Air Quality Bureau's regulation page to see the full set of air quality regulations.

Required Information for Specific Equipment:
For regulations that apply to specific source types, in the 'Justification' column **provide any information needed to determine if the regulation does or does not apply**. **For example**, to determine if emissions standards at 40 CFR 60, Subpart IIII apply to your three identical stationary engines, we need to know the construction date as defined in that regulation; the manufacturer date; the date of reconstruction or modification, if any; if they are or are not fire pump engines; if they are or are not emergency engines as defined in that regulation; their site ratings; and the cylinder displacement.

Required Information for Regulations that Apply to the Entire Facility:
See instructions in the 'Justification' column for the information that is needed to determine if an 'Entire Facility' type of regulation applies (e.g. 20.2.70 or 20.2.73 NMAC).

Regulatory Citations for Regulations That Do Not, but Could Apply:
If there is a state or federal air quality regulation that does not apply, but you have a piece of equipment in a source category for which a regulation has been promulgated, you must **provide the low level regulatory citation showing why your piece of equipment is not subject to or exempt from the regulation. For example** if you have a stationary internal combustion engine that is not subject to 40 CFR 63, Subpart ZZZZ because it is an existing 2 stroke lean burn stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, your citation would be 40 CFR 63.6590(b)(3)(i). **We don't want a discussion of every non-applicable regulation, but if it is possible a regulation could apply, explain why it does not. For example,** if your facility is a power plant, you do not need to include a citation to show that 40 CFR 60, Subpart OOO does not apply to your non-existent rock crusher.

Regulatory Citations for Emission Standards:
For each unit that is subject to an emission standard in a source specific regulation, such as 40 CFR 60, Subpart OOO or 40 CFR 63, Subpart HH, include the low level regulatory citation of that emission standard. Emission standards can be numerical emission limits, work practice standards, or other requirements such as maintenance. **Here are examples:** a glycol dehydrator is subject to the general standards at 63.764C(1)(i) through (iii); an engine is subject to 63.6601, Tables 2a and 2b; a crusher is subject to 60.672(b), Table 3 and all transfer points are subject to 60.672(e)(1)

Federally Enforceable Conditions:
All federal regulations are federally enforceable. All Air Quality Bureau State regulations are federally enforceable except for the following: affirmative defense portions at 20.2.7.6.B, 20.2.7.110(B)(15), 20.2.7.11 through 20.2.7.113, 20.2.7.115, and 20.2.7.116; 20.2.37; 20.2.42; 20.2.43; 20.2.62; 20.2.63; 20.2.86; 20.2.89; and 20.2.90 NMAC. Federally enforceable means that EPA can enforce the regulation as well as the Air Quality Bureau and federally enforceable regulations can count toward determining a facility's potential to emit (PTE) for the Title V, PSD, and nonattainment permit regulations.

INCLUDE ANY OTHER INFORMATION NEEDED TO COMPLETE AN APPLICABILITY DETERMINATION OR THAT IS RELEVENT TO YOUR FACILITY'S NOTICE OF INTENT OR PERMIT.

Section 15

Alternative Operating Scenarios

(Submitting under 20.2.70, 20.2.72, 20.2.74 NMAC)

Alternative Operating Scenarios: Provide all information required by the department to define alternative operating scenarios. This includes process, material and product changes; facility emissions information; air pollution control equipment requirements; any applicable requirements; monitoring, recordkeeping, and reporting requirements; and compliance certification requirements. Please ensure applicable Tables in this application are clearly marked to show alternative operating scenario.

Construction Scenarios: When a permit is modified authorizing new construction to an existing facility, NMED includes a condition to clearly address which permit condition(s) (from the previous permit and the new permit) govern during the interval between the date of issuance of the modification permit and the completion of construction of the modification(s). There are many possible variables that need to be addressed such as: Is simultaneous operation of the old and new units permitted and, if so for example, for how long and under what restraints? In general, these types of requirements will be addressed in Section A100 of the permit, but additional requirements may be added elsewhere. Look in A100 of our NSR and/or TV permit template for sample language dealing with these requirements. Find these permit templates at: www.env.nm.gov/air-quality/permitting-section-procedures-and-guidance/. Compliance with standards must be maintained during construction, which should not usually be a problem unless simultaneous operation of old and new equipment is requested.

In this section, under the bolded title "Construction Scenarios", specify any information necessary to write these conditions, such as: conservative-realistic estimated time for completion of construction of the various units, whether simultaneous operation of old and new units is being requested (and, if so, modeled), whether the old units will be removed or decommissioned, any PSD ramifications, any temporary limits requested during phased construction, whether any increase in emissions is being requested as SSM emissions or will instead be handled as a separate Construction Scenario (with corresponding emission limits and conditions, etc.

N/A – There are no proposed alternative operating scenarios or construction scenarios proposed as part of this application.

Section 16

Air Dispersion Modeling

1) Minor Source Construction (20.2.72 NMAC) and Prevention of Significant Deterioration (PSD) (20.2.74 NMAC) ambient impact analysis (modeling): Provide an ambient impact analysis as required at 20.2.72.203.A(4) and/or 20.2.74.303 NMAC and as outlined in the Air Quality Bureau's Dispersion Modeling Guidelines found on the Planning Section's modeling website. If air dispersion modeling has been waived for one or more pollutants, attach the AQB Modeling Section modeling waiver approval documentation.
2) SSM Modeling: Applicants must conduct dispersion modeling for the total short term emissions during routine or predictable startup, shutdown, or maintenance (SSM) using realistic worst case scenarios following guidance from the Air Quality Bureau's dispersion modeling section. Refer to "Guidance for Submittal of Startup, Shutdown, Maintenance Emissions in Permit Applications (http://www.env.nm.gov/aqb/permit/app_form.html) for more detailed instructions on SSM emissions modeling requirements.
3) Title V (20.2.70 NMAC) ambient impact analysis: Title V applications must specify the construction permit and/or Title V Permit number(s) for which air quality dispersion modeling was last approved. Facilities that have only a Title V permit, such as landfills and air curtain incinerators, are subject to the same modeling required for preconstruction permits required by 20.2.72 and 20.2.74 NMAC.

Universal Application 4

Air Dispersion Modeling Report

Refer to and complete Section 16 of the Universal Application form (UA3) to assist your determination as to whether modeling is required. If, after filling out Section 16, you are still unsure if modeling is required, e-mail the completed Section 16 to the AQB Modeling Manager for assistance in making this determination. If modeling is required, a modeling protocol would be submitted and approved prior to an application submittal. The protocol should be emailed to the modeling manager. A protocol is recommended but optional for minor sources and is required for new PSD sources or PSD major modifications. Fill out and submit this portion of the Universal Application form (UA4), the "Air Dispersion Modeling Report", only if air dispersion modeling is required for this application submittal. This serves as your modeling report submittal and should contain all the information needed to describe the modeling. No other modeling report or modeling protocol should be submitted with this permit application.

16-I: Receptors and modeled property boundary

1	"Restricted Area" is an area to which public entry is effectively precluded. Effective barriers include continuous fencing, continuous walls, or other continuous barriers approved by the Department, such as rugged physical terrain with a steep grade that would require special equipment to traverse. If a large property is completely enclosed by fencing, a restricted area within the property may be identified with signage only. Public roads cannot be part of a Restricted Area. A Restricted Area is required in order to exclude receptors from the facility property. If the facility does not have a Restricted Area, then receptors shall be placed within the property boundaries of the facility. Describe the fence or other physical barrier at the facility that defines the restricted area.			
	The facility is enclosed by continuous fencing.

	There are no alternative modeling scenarios.		
2	Which scenario produces the highest concentrations? Why?		
	N/A – there are no alternative modeling scenarios.		
3	Were emission factor sets used to limit emission rates or hours of operation? (This question pertains to the "SEASON", "MONTH", "HROFDY" and related factor sets, not to the factors used for calculating the maximum emission rate.)	Yes☐	No☒
4	If so, describe factors for each group of sources. List the sources in each group before the factor table for that group. (Modify or duplicate table as necessary. It's ok to put the table below section 16-K if it makes formatting easier.) Sources:

16-L: Ozone Analysis

1	NMED has performed a generic analysis that demonstrates sources that are minor with respect to PSD do not cause or contribute to any violations of ozone NAAQS. The analysis follows. The basis of the ozone SIL is documented in *Guidance on Significant Impact Levels for Ozone and Fine Particles in the Prevention of Significant Deterioration Permitting Program*, EPA, April 17, 2018 and associated documents. NMED accepts this SIL basis and incorporates it into this permit record by reference. Complete documentation of the ozone concentration analysis using MERPS is included in the New Mexico Air Quality Bureau Air Dispersion Modeling Guidelines (Revised June 2024).		
2	The MERP values presented in Table 10 and Table 11 of the NM AQB Modeling Guidelines that produce the highest concentrations indicate that facilities emitting no more than 250 tons/year of NO_X and no more than 250 tons/year of VOCs will cause less formation of O_3 than the O_3 significance level. $$[O_3]_{8-hour} = \left(\frac{250 \frac{ton}{yr}}{340_{MERP_{NOX}}} + \frac{250 \frac{ton}{yr}}{4679_{MERP_{VOC}}} \right) \times 1.96\ \mu g/m^3$$ =1.546 µg/m³, which is below the significance level of 1.96 µg/m³. Sources that produce ozone concentrations below the ozone SIL do not cause or contribute to air contaminant levels exceeding the ozone NAAQS. Notwithstanding, permit applicants routinely perform hypothetical modeling calculations using the MERPs tool and the Dispersion Guidelines in order to demonstrate that the project will not cause or contribute to an ozone NAAQS. Such a project-specific calculation is presented in items 3–5, below, even though the facility will not emit more than 250 tons/year of NOx and 250 tons/year of VOC.		
3	Does the facility emit at least 250 tons per year of NO_X or at least 250 tons per year of VOCs? Sources that emit at least 250 tons per year of NO_X or at least 250 tons per year of VOCs are covered by the analysis above and require an individual analysis.	Yes☐	No☒

5	For new PSD Major Sources or PSD major modifications, if MERPs were used to account for ozone fill out the information below. If another method was used describe below. The facility is not a PSD Major source. It is a minor source and is providing MERPS information voluntarily in accordance with EPA's most recent MERP guidance.

	Secondary formation of ozone from the YGI Microgrid is estimated using Equation 2 from "Guidance on the Development of Modeled Emission Rates for Precursors (MERPs) as a Tier 1 Demonstration Tool for Ozone and $PM_{2.5}$ under the PSD Permitting Program" from EPA (MERPs guidance). Equation 2 is equivalent to the equation preceding Table 10 in the NM AQB Modeling Guidelines, understanding that the MERP (see below) is the inverse of the quotient in equation 2, and the ozone impact is the linear combination of the expressions for the NO_X and VOC-specific impacts, which result may be expressed in units of either ppb or $\mu g/m^3$. Equation 2 was computed for NO_X and VOC-specific impacts; the results were added; and a final result was compared to the EPA-recommended de minimis level of 1.0 ppb. The hypothetical source in Otero County, NM was selected based on the criteria provided in the MERPs guidance, which include proximity, terrain and land use, climate, regional sources of pollutants, and background pollutant concentrations. Otero County's proximity to the East Microgrid along with similarities in terrain were the primary reasons for selecting it as a hypothetical source. Under EPA's guidance, the modeled air quality impact from a hypothetical source of 500 tons/yr (the closest value to the project's annual emissions) is 1.209116 ppb for a 500 tpy NOX source and 0.0006089 ppb for a 500 tpy VOC source. Comparing these results with the project emission rates, the project impact for ozone would be 0.0915 ppb, which is below the significance threshold of 1.0 ppb. Eq. 2: $Project\ Impact = Project\ emission\ rate \times \frac{Modeled\ Air\ Quality\ Impact\ from\ Hypothetical\ Source}{Modeled\ emission\ rate\ from\ Hypothetical\ Source}$ The Modeled Air Quality Impact for NOx and VOC were provided by EPA's MERPs View Qlik tool. YGI is using MERP values from the hypothetical source in Otero County, NM. Based on the range of stack heights, the modeled impacts associated with a 10 m stack were used from this analysis. To calculate the MERP value listed above, YGI used the following equation: $$MERP = \frac{500\ tpy}{Modeled\ Air\ Quality\ Impact}$$

RE: Solicitud Inicial para el Permiso NSR
Yucca Growth Infrastructure, LLC – YGI Microgrid

Estimado Director del Programas de Permisos:

En nombre de Yucca Growth Infrastructure, LLC ("Yucca"), Trinity Consultants presenta esta solicitud inicial de permiso NSR para la microrred Microgrid YGI ("YGI MG"). YGI MG consiste de un sistema Bloom Energy Server que se conectará a la infraestructura eléctrica adyacente y generará energía para un centro de datos cercano. YGI MG estará situada a 3.6 millas al sur de Santa Teresa, Nuevo México, en el condado de Doña Ana.

Téngase en cuenta que esta solicitud sustituye dos solicitudes presentadas el 17 de noviembre de 2025 por una filial de Yucca, relacionada con la construcción de microrredes. Las dos solicitudes anteriores se retiran y Yucca no tiene previsto presentar ninguna otra solicitud de permiso de construcción. Además, Yucca no tiene conocimiento de ninguna solicitud de permiso de construcción que esté actualmente siendo considerada para el centro de datos cercano. Es decir, esta solicitud cubre todas las actividades emisoras de contaminantes sujetas a permiso para la microrred Microgrid YGI y el centro de datos. La fuente cubierta por esta solicitud tendrá permiso para funcionar de forma continua (8,760 horas al año) y será una fuente menor (es decir, la tasa de emisión potencial será inferior a 250 toneladas/año independientemente de las limitaciones del permiso). El solicitante no necesitará una contraseña para realizar la transferencia. **No utilice el servicio de transferencia de archivos para enviar Avisos de Intención (NOI), ningún tipo de Plan de Control General (GCP) ni revisiones técnicas a permisos NSR.**

4) Opcionalmente, el solicitante podrá presentar los archivos junto con la solicitud en un disco compacto (CD) o en un disco versátil digital (DVD), siguiendo las instrucciones anteriores y las instrucciones del punto 5 para las solicitudes sujetas a revisión de PSD.

5) Si el tipo de solicitud requiere modelización de la dispersión atmosférica, incluya la **Exención de Modelización de NMED** y/o el informe electrónico de modelización de la dispersión atmosférica, así como los archivos de entrada y salida. ***Únicamente el informe resumido*** de la modelización de la dispersión debe presentarse en formato impreso, a menos que la Oficina indique lo contrario.

6) Si el solicitante presenta los archivos electrónicos en CD y la solicitud está sujeta a revisión PSD según 20.2.74 NMAC (PSD) o NNSR según 20.2.79 NMC, incluya:
   a. Una copia adicional en CD para la Agencia de Protección Ambiental de EE. UU. (US EPA),

Administrative Record NSR 10833_000659

b. una copia adicional en CD para cada administrador de tierras federales afectado (NPS, USFS, FWS, USDI) y,
c. una copia adicional en CD para cada organismo regulador afectado, aparte de la Oficina de Calidad del Aire.

Si la solicitud se presenta electrónicamente a través del servicio seguro de transferencia de archivos, no es necesario presentar estos CDs adicionales.

Requisitos para el Envío Electrónico [además de la(s) copia(s) impresa(s) requerida(s)]:

1) Todos los documentos electrónicos requeridos deberán presentarse en dos CD separados o enviarse a través del servicio seguro de transferencia de archivos de AQB. Envíe un único documento en formato PDF que contenga la solicitud completa tal como fue presentada, así como los documentos individuales incluidos en la solicitud.

2) Los documentos también deben presentarse en un formato de archivo compatible con Microsoft Office (Word, Excel, etc.) que nos permita acceder al texto y a las fórmulas contenidos en ellos (mediante la función de copiar y pegar). Todo documento que no pueda presentarse en un formato compatible con Microsoft Office deberá guardarse como archivo PDF directamente desde el documento electrónico original con el que fue creado. Si no le es posible proporcionar archivos electrónicos compatibles con Microsoft Office, o bien archivos PDF generados internamente (en el caso de elementos que no fueron creados por medios electrónicos, por ejemplo: folletos, mapas, gráficos, etc.), deberá presentar dichos elementos en formato impreso. Es indispensable que podamos revisar las fórmulas y los datos de entrada utilizados para calcular las emisiones.

3) Se prefiere que este formulario de solicitud se envíe como 4 archivos electrónicos (3 documentos de MS Word: Solicitud Universal, sección 1 [UA1]; Solicitud Universal, secciones 3-19 [UA3]; y Solicitud Universal 4, el informe de modelado [UA4]) y 1 archivo de Excel con las tablas (Solicitud Universal, sección 2 [UA2]). Por favor, incluya tantas de las secciones 3 a 19 como resulte práctico en un único documento electrónico de MS Word. Cree archivos electrónicos separados si un solo archivo resulta demasiado grande o si algunas partes deben guardarse en un formato de archivo distinto al de MS Word.

4) Los nombres de los archivos electrónicos deberán tener una longitud máxima de 25 caracteres (incluyendo los espacios). El formato de la Solicitud Universal electrónica deberá ser el siguiente: “A-3423-Nombre de la Instalación”. La letra “A” distingue el archivo como una presentación de solicitud, a diferencia de otros documentos que el propio Departamento incorpora a la base de datos. Por lo tanto, todas las presentaciones de solicitudes electrónicas deben comenzar con “A-”. Las modificaciones a instalaciones existentes deben usar el número de permiso principal (es decir, ‘3423’) que el Departamento asignó a la instalación como los siguientes 4 dígitos. Utilice ‘XXXX’ para las solicitudes de nuevas instalaciones. El formato de cualquier presentación electrónica por separado (presentaciones adicionales, tales como archivos adjuntos que no sean de Word, nuevas presentaciones, actualizaciones de la solicitud) y de los documentos de las Secciones deberá ser el siguiente: “A-3423-9-descripción”, donde el “9” representa el número de la sección (en este caso, la Sección 9: Aviso Público). Por favor, absténgase en la medida de lo posible de enviar documentos escaneados, ya que este formato de archivo es extremadamente grande y consume demasiada capacidad de almacenamiento en nuestra base de datos. Por favor, tómese el tiempo para completar la información del encabezado en todas las presentaciones, ya que esto permitirá identificar cualquier página suelta; dicha información incluye la Fecha de la Solicitud (fecha de envío) y el Número de Revisión (0 para el original; 1, 2, etc.), lo cual ayudará a llevar un registro de las actualizaciones parciales posteriores a la presentación original. No utilice símbolos especiales (#, @, etc.) en los nombres de los archivos. La información del pie de página no debe ser modificada por el solicitante.

Todas las solicitudes 20.2.70 NMAC (Título V) deben enumerar todas las Actividades Insignificantes en esta tabla. Todas las solicitudes 20.2.72 NMAC deben enumerar el Equipo Exento en esta tabla. Si el equipo enumerado en esta tabla está exento bajo 20.2.72.202.B.5, incluya cálculos y totales de emisiones para unidades, operaciones y actividades de "funciones similares" 202.B.5 en la Sección 6, Cálculos. Los equipos y actividades exentos bajo 20.2.72.202 NMAC no necesariamente son Insignificantes bajo 20.2.70 NMAC (y viceversa). Tabla 2-C: Equipo de Control de Emisiones

La numeración de unidades y chimeneas debe corresponder en todo el paquete de solicitud. Solo enumere equipos de control para TAPs si la tasa máxima de emisiones no controladas del TAP supera su umbral respectivo enumerado en 20.2.72 NMAC, Subparte V, Tablas A y B. De acuerdo con 20.2.72.203.A(3) y (8) NMAC, 20.2.70.300.D(5)(b) y (e) NMAC, y 20.2.73.200.B(7) NMAC, el titular del permiso reportará todos los dispositivos de control y enumerará cada contaminante controlado por el dispositivo, independientemente de si el solicitante reclama crédito por la reducción de emisiones.

Tabla 2-D: Emisiones Máximas (bajo condiciones normales de operación)

X Esta Tabla se dejó intencionalmente en blanco porque sería idéntica a la Tabla 2-E.

Las Emisiones Máximas son las emisiones a capacidad máxima y previas a (en ausencia de) control de contaminación, equipos de proceso reductores de emisiones, o cualquier otra reducción de emisiones. Calcule las emisiones por hora usando las emisiones por hora del peor caso para cada contaminante. Para cada contaminante, calcule las emisiones anuales como si la instalación operara a capacidad máxima de planta sin controles de contaminación durante 8760 horas al año, salvo que el Departamento lo apruebe de otra manera. Enumere los Contaminantes Atmosféricos Peligrosos (HAP) y Contaminantes Atmosféricos Tóxicos (TAPs) en la Tabla 2-I. La numeración de unidades y chimeneas debe ser consistente en todo el paquete de solicitud. Llene todas las celdas de esta tabla con los números de emisiones o un símbolo "-". Un símbolo "-" indica que no se esperan emisiones de este contaminante. Los números se expresarán con al menos 2 decimales (p. ej., 0.41, 1.41, o 1.41E-4).

No incluya material particulado condensable para PM a menos que PM sea igual a PM10 y PM2.5. Particulate matter (PM) is not subject to an ambient air quality standard, but PM is a regulated air pollutant under PSD (20.2.74 NMAC) and Title V (20.2.70 NMAC).
El proveedor del equipo Energy Server System sostiene que no hay emisiones de PM de su equipo. El solicitante ha usado pruebas de método de referencia existentes para estimar las emisiones de manera conservadora, dadas las limitaciones del método de prueba. El proveedor indica que las pruebas existentes pueden mostrar un sesgo positivo del método de muestreo y reflejan material particulado filtrable del aire de admisión que pasa por el sistema. Por esa razón, el proveedor del equipo del sistema de celda de combustible no especifica factores de emisión de partículas.

Tabla 2-E: Emisiones Permitidas Solicitadas

La numeración de unidades y chimeneas debe ser consistente en todo el paquete de solicitud. Llene todas las celdas de esta tabla con los números de emisiones o un símbolo "-". Un símbolo "-" indica que no se esperan emisiones de este contaminante. Los números se expresarán con al menos 2 decimales (ej. 0.41, 1.41, or 1.41E^{-4}).

[1] **Material Particulado Condensable:** Incluya las emisiones de material particulado condensable para PM10 y PM2.5 si la fuente es una fuente de combustión. No incluya material particulado condensable para PM a menos que PM sea igual a PM10 y PM2.5. El material particulado (PM) no está sujeto a un estándar de calidad del aire ambiental, pero es un contaminante atmosférico regulado bajo PSD (20.2.74 NMAC) y Título V (20.2.70 NMAC).
El proveedor del equipo Energy Server System sostiene que no hay emisiones de PM de su equipo. El solicitante ha usado pruebas de método de referencia existentes para estimar las emisiones de manera conservadora, dadas las limitaciones del método de prueba. Por esa razón, el proveedor del equipo del sistema de celda de combustible no especifica factores de emisión de partículas.
Las celdas de combustible no son una "fuente de combustión" de PM2.5. Conforme a 20.2.2.7, 20.2.74.7(AS)(6), y 20.2.72.203.A(3) NMAC, las emisiones de partículas son un "contaminante regulado para revisión de nueva fuente" que incluye ciertas "emisiones gaseosas de una fuente o actividad" y el solicitante debe presentar "toda la información, cálculos y cómputos de emisiones" para calcular las emisiones "máximas" de material particulado de la fuente. Para ser conservador, el solicitante usa un factor de emisión para material particulado condensable basado en datos de prueba de fuente disponibles.

Tabla 2-F: Emisiones Adicionales durante Arranque, Parada y Mantenimiento de Rutina (SSM)

☑ Esta tabla se deja intencionalmente en blanco ya que todas las emisiones en esta instalación debidas a arranque, parada o mantenimiento programado rutinario o predecible no son superiores a las enumeradas en la Tabla 2-E y no se ha permitido ni solicitado un límite de emisión por malfunción. Si se le requiere reportar emisiones de GEI como se describe en la Sección 6a, incluya cualquier emisión de GEI durante Arranque, Parada y/o Mantenimiento Programado (SSM) en la Tabla 2-P. Proporcione una explicación de las emisiones SSM en las Secciones 6 y 6a.

Todas las solicitudes para instalaciones que tienen emisiones durante arranque, parada o mantenimiento programado rutinario o predecible (SSM)[1], incluidas las solicitudes NOI, deben incluir en esta tabla las Emisiones Máximas durante arranque, parada y mantenimiento programado rutinario o predecible (20.2.7 NMAC, 20.2.72.203.A.3 NMAC, 20.2.73.200.D.2 NMAC). En las Secciones 6 y 6a, proporcione los cálculos de emisiones para todas las emisiones SSM reportadas en esta tabla. Consulte la "Guía para la Presentación de Emisiones de Arranque, Parada y Mantenimiento en Solicitudes de Permiso (https://www.env.nm.gov/aqb/permit/aqb_pol.html) para instrucciones más detalladas. Los números se expresarán con al menos 2 decimales (p. ej., 0.41, 1.41, o 1.41E-4).

Si las emisiones anuales en estado estacionario de la Tabla 2-E son 21.9 TPY, y el número de eventos SSM programados resulta en emisiones anuales de 31.9 TPY, ingrese 10.0 TPY en la tabla a continuación.

Tabla 2-G: Tasas de Emisión de Salida de Chimenea y Fugitivas para Chimeneas Especiales

☐ He decidido dejar esta tabla en blanco porque esta instalación no tiene chimeneas/respiraderos que dividan las emisiones de una sola fuente o que combinen las emisiones de más de una fuente enumerada en la tabla 2-A. Además, las tasas de emisión de todas las chimeneas coinciden con las tasas de emisión permisibles solicitadas indicadas en la Tabla 2-E.

Use esta tabla para enumerar las emisiones de chimeneas (permisible solicitada) de chimeneas divididas y combinadas. Enumere los Contaminantes Tóxicos del Aire (TAPs) y los Contaminantes Peligrosos del Aire (HAPs) en la Tabla 2-I. Enumere todas las emisiones fugitivas asociadas con la operación normal, rutinaria y no de emergencia de la instalación. La numeración de unidades y chimeneas debe corresponder en todo el paquete de solicitud. Consulte la Tabla 2-E para obtener instrucciones sobre el uso del símbolo "-" y sobre las cifras significativas.

El proveedor del equipo del Energy Server System sostiene que las emisiones de PM (material particulado) de su equipo son cero. El solicitante ha utilizado pruebas con métodos de referencia existentes para estimar las emisiones de manera conservadora, considerando las limitaciones del método de prueba. El proveedor indica que las pruebas existentes pueden presentar un sesgo positivo del método de muestreo y reflejan material particulado filtrable proveniente del aire de admisión que pasa a través del sistema. Por esa razón, el proveedor del equipo del sistema de celdas de combustible no especifica factores de emisión de partículas.

Tabla 2-H: Condiciones de Salida de la Chimenea

La numeración de unidades y chimeneas debe corresponder en todo el paquete de solicitud. Incluya las condiciones de salida de la chimenea para cada unidad que emite desde una chimenea, incluyendo los parámetros de venteo de purga y las emisiones de tanques. Si la instalación tiene múltiples escenarios operativos, complete una Tabla 2-H separada para cada escenario y, para cada escenario, escriba el nombre del escenario aquí:

Tabla 2-I: Tasas de Emisión de Salida de Chimenea y Fugitivas para HAP y TAP

En la tabla a continuación, reporte el Potencial de Emisión para cada Contaminante Atmosférico Peligroso (HAP) de cada unidad de emisión regulada listada en la Tabla 2-A, solo si la instalación entera emite el HAP a una tasa mayor o igual a una (1) tonelada por año. Para cada una de dichas unidades de emisión, los HAP se reportarán al 0.1 tpy más cercano. Cada total individual de HAP a nivel de instalación y el total de HAP a nivel de instalación serán la suma de todas las fuentes de HAP calculadas al 0.1 ton por año más cercano. Conforme a 20.2.72.403.A.1 NMAC, las instalaciones no exentas [ver 20.2.72.402.C NMAC] del permiso de Contaminantes Atmosféricos Tóxicos (TAP) reportarán cada TAP que tenga una tasa de emisión no controlada superior a su nivel de detección en libras por hora especificado en 20.2.72.502 NMAC. Los TAP se reportarán usando una cifra significativa más que el número de cifras significativas mostradas en el umbral de libras por hora correspondiente a la sustancia. Use la nomenclatura HAP tal como aparece en la Sección 112(b) de la CAAA de 1990 y la nomenclatura TAP tal como se lista en 20.2.72.502 NMAC. Incluya estimaciones de emisiones de tank-flashing de HAP en esta tabla. Para cada HAP o TAP listado, llene todas las celdas de esta tabla con los números de emisión o el símbolo "-". El símbolo "-" indica que no se esperan emisiones de este contaminante o que el contaminante se emite en una cantidad menor que los umbrales descritos arriba.

Las solicitudes presentadas bajo 20.2.70, 20.2.72 y 20.2.74 NMAC deben completar esta Tabla. Las plantas de energía, las fuentes mayores Título V y las fuentes mayores PSD deben reportar y calcular todas las emisiones de Gases de Efecto Invernadero (GHG) para cada unidad. Todos los cálculos

Muestre todos los cálculos utilizados para determinar los índices de emisión controlados y no controlados, tanto por hora como anuales. Todos los cálculos se realizarán manteniendo un mínimo de tres cifras significativas. Documente la fuente de cada factor de emisión utilizado (si un índice de emisión se arrastra y no se revisa, se requiere una declaración a tal efecto). Si se autorizan unidades idénticas que estarán sujetas a las mismas condiciones de funcionamiento, presente los cálculos correspondientes a una sola unidad y una nota en la que se especifique a qué otras unidades se aplican los cálculos. Deben presentarse todas las fórmulas y los cálculos utilizados para calcular las emisiones. La pestaña "Cálculos" de la UA2 permite vincular los cálculos a las tablas de emisiones. Añada pestañas "Calc" adicionales según sea necesario. Si se utiliza la UA2 u otras hojas de cálculo, todas las hojas de cálculo se presentarán electrónicamente en formato compatible con Microsoft Excel para que puedan comprobarse las fórmulas y los valores introducidos. Formatee todas las hojas de cálculo y los cálculos de manera que el revisor pueda seguir la lógica y verificar los valores introducidos. Defina todas las variables. Si no se utilizan hojas de cálculo, facilite las fórmulas originales con las variables definidas. Además, proporcione fórmulas subsiguientes que muestren los valores de entrada para cada variable de la fórmula. Todos los cálculos, incluidos los de la pestaña Calc de la parte UA2 de la solicitud, la(s) pestaña(s) Calc impresa(s), deben presentarse en esta sección.

Cálculos de vaporización instantánea en tanques: La información facilitada a la AQB incluirá un análisis del método utilizado para estimar las emisiones de la vaporización instantánea en tanques, los umbrales relativos (es decir, NOI, permiso o fuente principal (NSPS, PSD o Título V)), la precisión del modelo, la entrada y salida de los modelos y programas informáticos de simulación, todos los cálculos, la documentación de cualquier suposición utilizada, las descripciones de los métodos y condiciones de muestreo, las copias de cualquier análisis de muestras de laboratorio. Si se utiliza Hysis, se deberán informar todos los parámetros de entrada pertinentes, incluida la presión del separador, el caudal de gas y todos los demás parámetros pertinentes necesarios para el cálculo de la vaporización.

Cálculos SSM: Es responsabilidad del solicitante facilitar una estimación de las emisiones de SSM o justificar por qué no lo hace. En esta sección, proporcione cálculos de emisiones para las emisiones de arranque, parada, y mantenimiento rutinario (SSM) enumeradas en las tablas de SSM de la Sección 2 y/o de GHG de la Sección 22, así como los motivos por los que las demás se declaran como cero (o se dejan en blanco en las tablas de SSM/GHG). Consulte la " Guía para la presentación de solicitudes de permiso para emisiones de arranque, parada y mantenimiento" (http://www.env.nm.gov/aqb/pennit/app_form.html) para obtener instrucciones más detalladas sobre el cálculo de emisiones de SSM. Si las emisiones de SSM son superiores a las indicadas en la Sección 2, Tabla de valores permitidos solicitados, puede ser necesaria la modelización para garantizar el cumplimiento de las normas, tanto si la solicitud es NSR como si lo es en virtud del Título V. Consulte la sección de modelización de esta solicitud para obtener más información sobre los requisitos de modelización.

Cálculos del deshidratador de glicol: La información facilitada a la AQB incluirá el caudal máximo de recirculación previsto por el fabricante para la bomba de glicol. Si se utiliza GRI-Glycalc, se incluirá el informe resumido de entrada completo, así como una copia del análisis de gases utilizado.

Cálculos de carreteras: Calcule las emisiones de partículas fugitivas e introduzca las fugitivas de los caminos de acarreo en los cuadros 2-A, 2-D y 2-E para:

1. Si transporta materia prima, procesar material y/o producto hacia o desde o dentro de la instalación y tiene emisiones PER superiores a 0.5 tpy.
2. Si transporta materia prima, procesar material y/o producto dentro o fuera de la instalación con más frecuencia que un viaje de ida y vuelta al día.

No se incluyen los cálculos de carreteras porque la instalación no utilizará materia prima, material de proceso ni productos que entren o salgan de la instalación por camión (el gas natural se recibirá por gasoducto y la electricidad se exportará por tendido eléctrico).

Cifras significativas:

A. Se considera que todas las normas sobre emisiones tienen al menos dos cifras significativas, pero no más de tres.

B. En todos los cálculos intermedios se conservarán al menos 5 cifras significativas.

C. Al calcular las emisiones para determinar el cumplimiento de una norma de emisiones, se utilizarán los siguientes procedimientos de redondeo:

(1) Si el primer dígito que se descarta es inferior al número 5, no se modificará el último dígito conservado;

(2) Si la primera cifra descartada es mayor que el número 5, o si es el número 5 seguido de al menos una cifra distinta del número cero, la última cifra conservada se incrementará en una unidad; **y**

(3) Si la primera cifra descartada es exactamente el número 5, seguido sólo de ceros, la última cifra conservada se redondeará al alza si es impar, pero no se efectuará ningún ajuste si es par.

Dispositivos de control: De conformidad con 20.2.72.203.A(3) y (8) NMAC, 20.2.70.300.D(5)(b) y (e) NMAC, y 20.2.73.200.B(7) NMAC, el titular del permiso deberá informar de todos los dispositivos de control y enumerar cada contaminante controlado por el dispositivo de control, independientemente de si el solicitante obtiene crédito por la reducción de emisiones. El solicitante puede indicar en esta sección de la solicitud si decide no obtener crédito por la reducción de las tasas de emisión. En el caso de los avisos de intención presentados con arreglo a 20.2.73 NMAC, solo se pueden considerar los índices de emisión no controlados para determinar la aplicabilidad, a menos que las leyes estatales o federales exijan el control. Esta información es necesaria para determinar si el dispositivo de control requiere condiciones de obligado cumplimiento a nivel federal y/o si el dispositivo de control produce sus propios contaminantes regulados o aumenta las tasas de emisión de otros contaminantes.

Las emisiones del sistema Bloom Energy Server son proporcionadas por el fabricante basándose en factores de emisión referidos a la potencia de salida (lb/MW-h), determinados mediante la certificación de CARB u otras pruebas de chimenea realizadas en la unidad específica. Cada uno de estos factores de emisión se multiplica por la capacidad instalada del sistema Bloom Energy Server para obtener una tasa de emisión por hora. Las tasas de emisión anuales se obtienen multiplicando por el programa de operación (h/año) y convirtiendo el resultado a unidades de toneladas/año. Si bien Bloom Energy no suele recomendar el uso de factores de seguridad para proyectos similares en otras jurisdicciones, se añadió un factor de seguridad del 15% a todas las emisiones horarias y anuales con el fin de tener en cuenta la posible variabilidad en las condiciones de operación y garantizar una evaluación conservadora de los impactos de la fuente, en consonancia con la práctica local. Por ejemplo, las emisiones de COV para una unidad hipotética de 2,462.005 MW pueden calcularse de la siguiente manera:

ER = MW × FE × (1 + 15 %)

0.01 lb COV/MW-h × 2,462.005 MW × (1 + 15 %) = 28.31 lb/h

Se ha utilizado el factor de emisión de CO_2 indicado en los datos del proveedor. El proveedor declara que las celdas de combustible no emiten cantidades detectables de otros GEI.

Sección 6.a

Emisiones de gases de efecto invernadero

(Presentación con arreglo a 20.2.70, 20.2.72, 20.2.74 NMAC)

Los solicitantes del Título V (20.2.70 NMAC), NSR menor (20.2.72 NMAC) y PSD (20.2.74 NMAC) deben estimar y notificar las emisiones de gases de efecto invernadero (GHG) para verificar los índices de emisión notificados en el aviso público, determinar la aplicabilidad de las subpartes de 40 CFR 60 y evaluar la aplicabilidad de la Prevención del Deterioro Significativo (PSD). Las emisiones de GHG sujetas a la normativa sobre permisos atmosféricos consisten en la suma de un grupo agregado de estos seis gases de efecto invernadero: dióxido de carbono (CO_2), óxido nitroso (N_2O), metano (CH_4), hidrofluorocarburos (HFC), perfluorocarburos (PFC) y hexafluoruro de azufre (SF_6).

Cálculo de las emisiones de GHG:

1. Calcule las emisiones másicas de GHG por tonelada al año (tpy) y las emisiones de GHG CO_2e de su instalación.
2. Las emisiones másicas de GHG son la suma de las toneladas anuales totales de gases de efecto invernadero sin ajustar con los potenciales de calentamiento global (GWP). Las emisiones de CO_2e de GHG son la suma de las emisiones másicas de cada GHG multiplicado por su GWP que se encuentra en la Tabla A-1 del 40 CFR 98 Informes obligatorios sobre gases de efecto invernadero.
3. Deben incluirse las emisiones procedentes de la puesta en marcha, el apagado y el mantenimiento rutinarios o previsibles.
4. Indique las emisiones de GHG en masa y de GHG CO_2e en la Tabla 2-P de esta solicitud. Las emisiones se indican en toneladas **cortas** anuales y representan el potencial de emisión (PTE) de cada unidad de emisión.
5. Todas las fuentes principales del Título V, las fuentes principales de PSD y todas las plantas eléctricas, ya sean principales o no, deben calcular y notificar las emisiones másicas de GHG y de CO_2e de cada unidad en la Tabla 2-P.
6. Para las instalaciones de fuentes menores que no son plantas eléctricas, no son Título V, y no son PSD hay tres opciones para informar de los GHG en la Tabla 2-P: 1) notificar los GHG de cada equipo individual; 2) notificar todos los GHG de un grupo de tipos de unidades, por ejemplo, notificar todos los GHG de fuentes de combustión como una única unidad y todos los GHG de ventilación como una segunda unidad independiente; 3) o marcar lo siguiente □ Al marcar esta casilla, el solicitante reconoce que las emisiones totales de CO_2e son inferiores a 75,000 toneladas anuales.

Fuentes para calcular las emisiones de GHG:

- Datos del fabricante
- Compilación AP-42 de factores de emisión de contaminantes atmosféricos en http://www.epa.gov/ttn/chief/ap42/index.html
- Base de datos de factores de emisión de la EPA en Internet WebFIRE en http://cfpub.epa.gov/webfire/
- 40 CFR 98 Obligación de informar sobre gases de efecto invernadero, salvo que las toneladas deben notificarse en toneladas cortas en lugar de métricas

toneladas a efectos de la aplicabilidad de la PSD.

- Compendio API de metodologías de emisiones de gases de efecto invernadero para la industria del petróleo y el gas natural. Agosto de 2009 o versión más reciente.
- Fuentes listadas en NSR Resources para estimación de emisiones GHG de en http://www.epa.gov/nsr/clean-air-act-permitting-greenhouse-gases:

Potenciales de Calentamiento Global (GWP, por sus siglas en inglés):
Los solicitantes deben utilizar los Potenciales de Calentamiento Global codificados en la Tabla A-1 de la versión más reciente del 40 CFR 98 Informes Obligatorios sobre Gases de Efecto Invernadero. El GWP de un determinado GHG es la relación entre el calor atrapado por una unidad de masa del GHG y el de una unidad de masa de CO_2 durante un periodo de tiempo determinado.

"Gas de efecto invernadero" a efectos de la normativa sobre permisos atmosféricos se define como el grupo agregado de los seis gases siguientes: dióxido de carbono, óxido nitroso, metano, hidrofluorocarburos, perfluorocarburos y hexafluoruro de azufre. **(20.2.70.7 NMAC, 20.2.74.7 NMAC).** También puede encontrar la definición de GHG en 40 CFR 86.1818-12(a).

Conversión de tonelada métrica a tonelada corta:
Las toneladas cortas para los GHG y otros contaminantes regulados son la unidad de medida estándar para los programas de permisos PSD y título V. 40 CFR 98 Obligación de informar sobre gases de efecto invernadero exige toneladas métricas.
1 tonelada métrica = 1.10231 toneladas cortas (según la Tabla A-2 de la Subparte A de la Parte 98 - Conversiones de unidades de medida) **Los gases de efecto invernadero se calculan como se describe en la Sección 6.**

1 El Bloom Energy Server System (SOFC) no utiliza controles adicionales para los contaminantes regulados. Las emisiones no controladas son iguales a las emisiones controladas.
El proveedor del equipo Energy Server System sostiene que no hay emisiones de PM (material particulado) provenientes de sus equipos. El solicitante ha utilizado las pruebas existentes según el método de referencia para estimar las emisiones de manera conservadora, dadas las limitaciones del método de prueba. El proveedor indica que las pruebas existentes pueden presentar un sesgo positivo del método de muestreo y reflejan material particulado filtrable proveniente del aire de admisión que pasa a través del sistema. Por esa razón, el proveedor del equipo de celdas de combustible no especifica factores de emisión de material particulado.

Las celdas de combustible no son una "fuente de combustión" de PM2.5. Conforme a 20.2.2.7, 20.2.74.7(AS)(6) y 20.2.72.203.A(3) NMAC, las emisiones de material particulado son un "contaminante regulado bajo revisión de nuevas fuentes" que incluye ciertas "emisiones gaseosas de una fuente o actividad" y el solicitante debe presentar "toda la información, cálculos y cómputos de emisiones" para calcular las emisiones "máximas" de material particulado de la fuente. Para ser conservador, el solicitante utiliza un factor de emisión para material particulado condensable basado en los datos de prueba de la fuente disponibles.

1. Factores de emisión de la certificación CARB y otras pruebas de métodos de referencia realizadas en diciembre de 2023 y abril de 2026

El proveedor de equipos del sistema de servidor de energía mantiene que sus equipos no emiten PM. El solicitante ha utilizado los ensayos de métodos de referencia existentes para estimar las emisiones de forma conservadora, dadas las limitaciones de los métodos de ensayo. El proveedor indica que las pruebas existentes pueden presentar un sesgo positivo en el método de muestreo y reflejar partículas filtrables procedentes del aire de admisión que pasa por el sistema. Por ese motivo, el proveedor de equipos de sistemas de pilas de combustible no especifica factores de emisión de partículas.

Las pilas de combustible no son una "fuente de combustión" de PM2.5. De conformidad con 20.2.2.7, 20.2.74.7(AS) (6), y 20.2.72.203.A(3) NMAC, las emisiones de partículas son un "contaminante regulado para la revisión de nuevas fuentes" que incluye ciertas "emisiones gaseosas de una fuente o actividad" y el solicitante debe presentar "toda la información sobre emisiones, cálculos y cómputos" para computar las emisiones "máximas" de partículas de la fuente. Para ser conservador, el solicitante utiliza un factor de emisión para las partículas condensables basado en los datos de prueba de la fuente disponibles.

1.0 Introducción

1.1 Resumen del Programa de Pruebas

Bloom Energy contrató a Montrose Air Quality Services, LLC (Montrose) para llevar a cabo un programa de pruebas de emisiones de ingeniería en la Unidad Santa Cruz ubicada en sus instalaciones de Fremont, California. Las pruebas se llevaron a cabo para determinar las concentraciones y los índices de emisión másica de materia particulada total (TPM) mientras la unidad funcionaba con gas natural de gasoducto para fines de ingeniería interna.

Los objetivos específicos eran

- Medir la concentración y la tasa de emisión másica de TPM a la salida de la Unidad de Santa Cruz
- Medir la concentración de TPM en el aire ambiente cerca de la entrada de aire de la Unidad
- Determinar si existía una diferencia que pudiera medirse con los métodos de referencia de la Agencia de Protección Ambiental de Estados Unidos entre las concentraciones de TPM en la fuente y en el aire ambiente
- Llevar a cabo el programa de pruebas centrándose en la seguridad

Montrose realizó las pruebas para medir los parámetros de emisión enumerados en la Tabla 1-1.

Para simplificar este informe, se incluye una lista de Unidades y Abreviaturas en el Apéndice D.1. A lo largo de este informe, la nomenclatura química, los acrónimos y las unidades de información no están definidos. Consulte la lista para obtener detalles específicos.

Este informe presenta los resultados de las pruebas y los datos de apoyo, descripciones de los procedimientos de prueba, descripciones de las instalaciones y ubicaciones de muestreo, y un resumen de los procedimientos de garantía de calidad utilizados por Montrose. Los resultados medios de las pruebas de emisiones se resumen en la Tabla 1-2. En la sección 4.0 figuran los resultados detallados de cada prueba. Todos los datos de apoyo se encuentran en los apéndices.

Las pruebas fueron realizadas por el personal de Montrose que se indica en la Tabla 1-3. Las pruebas se realizaron de acuerdo con un plan de pruebas interno de Montrose. No se presentó ningún plan de pruebas a ningún organismo regulador.

Notas: El símbolo "<" se aplica a los resultados que están por debajo del límite práctico de detección del método de ensayo, o a un resultado para el que al menos una fracción de muestra está por debajo del límite de detección. Los valores del límite de detección se utilizan en el cálculo y la presentación de los resultados.

No había ninguna diferencia perceptible en las concentraciones totales de PM entre la fuente y el aire ambiente. Cada concentración medida estuvo cerca del límite práctico (0.0002 gr/dscf) para las pruebas de 240 minutos utilizando los métodos 5 y 202. Véase la sección 4 para más detalles. Las concentraciones reales fueron probablemente mucho más bajas de lo que puede medirse utilizando los métodos de referencia 5-202 de la Agencia de Protección Ambiental de Estados Unidos.

Estos resultados de las pruebas apoyan la suposición de que la unidad de pila de combustible de Bloom no genera emisiones medibles de PM.

2.0 Descripciones de Planta y Ubicación de Muestreo

2.1 Descripción del Proceso, Operación y Equipo de Control

Las instalaciones de Bloom Energy están situadas en 44408 Pacific Commons Boulevard en Fremont, California. La instalación incluye una configuración de banco de pruebas para las pruebas de emisiones de sus unidades generadoras de energía distribuida de pila de combustible. El programa de pruebas se centró en el sistema de pilas de combustible "Santa Cruz" de Bloom, así como en las concentraciones de materia particulada total de fondo (ambiente) de las instalaciones.

El proceso de la pila de combustible de óxido sólido (SOFC) es electroquímico, no de combustión. Esto es importante porque los mecanismos dominantes que crean PM primarias en fuentes estacionarias como turbinas y motores son impulsados por la combustión (hollín, cenizas, productos de combustión incompletos, arrastre de aceite lubricante, núcleos generados por llamas). En una corriente de escape de una SOFC, esos mecanismos no existen.

Además, en los recursos impulsados por combustión, el aire de entrada y las fuentes de combustible deben mezclarse, mientras que en el producto de la SOFC el combustible y el aire atmosférico siguen caminos separados y aislados dentro del proceso; el aire en el lado del cátodo y el combustible en el ánodo. A través de este proceso, la reacción electroquímica se produce por la atracción natural de los iones de O2 del aire atmosférico presentes en el cátodo que atraviesan la pared de la célula y se enlazan con el hidrógeno libre del lado del ánodo, liberando un electrón en el proceso. El aire ambiente entra en el sistema, permite que los iones de oxígeno entren en la reacción y evita el aire ambiente restante. Cualquier valor de PM medido por el sistema de Bloom simplemente estaría midiendo la PM ya existente en el aire ambiente.

La información relativa a la Unidad de Generación Distribuida se presenta en la Tabla 2-1.

Tabla 2-1

2.2 Ubicación del muestreo de gases de combustión

Normalmente, los gases de escape del cátodo salen a la atmósfera a través de una rejilla rectangular. Para esta prueba, el gas de escape se redirigió a través de una pieza de conducto de transición a una extensión de chimenea cilíndrica vertical instalado temporalmente.

La información relativa a la ubicación del muestreo se presenta en la Tabla 2-2.

Tabla 2-2

Se verificó sobre el terreno que la ubicación de muestreo de la chimenea se ajustaba al método 1 de la Agencia de Protección Ambiental de Estados Unidos. Las condiciones de flujo ciclónico aceptables se confirmaron antes de la prueba utilizando el método 1 de la Agencia de Protección Ambiental de Estados Unidos, sección 11.4.
Véase el apéndice A.1 para más información, incluido un croquis de la configuración.

2.3 Condiciones de Funcionamiento y Datos del Proceso

Las pruebas de emisiones se realizaron mientras la Unidad funcionaba con gas natural de gasoducto en condiciones normales cercanas a la capacidad nominal de carga de generación.

El personal de la planta se encargó de establecer las condiciones de prueba y de recopilar todos los datos aplicables al funcionamiento de la unidad. Los datos de proceso que se facilitaron se presentan en el Apéndice
B. Los datos recogidos incluyen los siguientes parámetros:

- Potencia eléctrica de CA generada, KW
- Caudales de combustible
- Caudales de aire

3.0 Procedimientos de Muestreo y Análisis

3.1 Métodos de Ensayo

Los métodos de ensayo para este programa de pruebas se han presentado en la Tabla 1-1. A continuación, se presenta información adicional sobre aplicaciones específicas o modificaciones de los procedimientos estándar.

3.1.1 Método 1 de la Agencia de Protección Ambiental de Estados Unidos

Recorridos de Muestreo y Velocidad para Fuente Estacionaria

El método 1 de la Agencia de Protección Ambiental de Estados Unidos se utiliza para garantizar que se obtengan mediciones representativas del caudal volumétrico dividiendo la sección transversal de la chimenea o conducto en áreas iguales y, a continuación, localizando un punto transversal dentro de cada una de las áreas iguales. Los puntos de muestreo aceptables deberán estar situados como mínimo a dos diámetros equivalentes de la chimenea o conducto aguas abajo de una perturbación del flujo y a medio diámetro equivalente aguas arriba de una perturbación del flujo.

A continuación, se presenta información pertinente sobre el funcionamiento del método:

- Se comprobó que el lugar de muestreo de la chimenea presentaba flujo ciclónico de acuerdo con la sección 11.4 del método 1.
- Excepciones del método:
  - El muestreo del aire ambiente se realizó en un único punto situado cerca de la entrada de aire de la unidad de Santa Cruz.

Las ubicaciones del puerto de muestreo y del punto transversal para el muestreo de la chimenea se detallan en el Apéndice A.1.

3.1.2 Método 2 de la Agencia de Protección Ambiental de Estados Unidos

Determinación de la velocidad y el caudal volumétrico del gas de chimenea (tubo de Pitot tipo S)

El método 2 de la Agencia de Protección Ambiental de Estados Unidos se utiliza para medir la velocidad del gas mediante un tubo de Pitot de tipo S conectado a un dispositivo de medición de la presión, y para medir la temperatura del gas mediante un termopar calibrado conectado a un indicador de termopar. Normalmente, se utilizan tubos de Pitot de tipo S (Stausscheibe) conformes a las especificaciones geométricas del método de ensayo, junto con un manómetro inclinado. Las mediciones se realizan en puntos transversales especificados por el método 1 de la Agencia de Protección Ambiental de Estados Unidos. El peso molecular de la corriente de gas se determina a partir de mediciones independientes de O_2, CO_2 mediante el método 3A de la Agencia de Protección Ambiental de Estados Unidos, y la humedad se determina a partir del método 4 de la Agencia de Protección Ambiental de Estados Unidos. El caudal volumétrico de gas de chimenea se calcula

utilizando la cabeza de velocidad media medida, el área del conducto en el plano de medición, la temperatura media medida, la presión estática del conducto medida, el peso molecular de la corriente de gas y la humedad medida.

A continuación, se presenta información pertinente sobre el funcionamiento del método:

- Opciones del método:
  - El coeficiente del tubo de Pitot tipo S es de 0.84
  - Se utiliza un multímetro Shortridge para medir una velocidad inferior a 10 fps
- Excepciones del método:
  - Los termopares de temperatura del gas de chimenea se comprueban utilizando el método alternativo 011 (ALT-011) de la Agencia de Protección Ambiental de Estados Unidos. Se realiza una calibración de un solo punto utilizando un termómetro trazable al NIST.

3.1.3 Método 3A de la Agencia de Protección Ambiental de Estados Unidos

Determinación de Oxígeno y Dióxido de Carbono en Emisiones de Fuentes Estacionarias (Procedimientos de Analizadores Instrumentales)

Las concentraciones de O_2 y CO_2 se miden simultáneamente utilizando el método 3A de la Agencia de Protección Ambiental de Estados Unidos, que es un método de ensayo instrumental. El gas acondicionado se envía a una serie de analizadores para medir las concentraciones de emisiones gaseosas. Los requisitos de rendimiento del método deben cumplirse para validar los datos.

A continuación, se presenta información pertinente sobre el rendimiento del método:

- Opciones del método:
  - No se utiliza filtro ya que se espera un bajo nivel de PM
  - Se utiliza un sistema de muestreo extractivo en seco para registrar las emisiones en seco
  - Se utiliza un analizador paramagnético para medir el O_2
  - Se utiliza un analizador infrarrojo no dispersivo para medir el CO_2
- Excepciones del método:
  - No hay excepciones al método de ensayo
- Objetivo y/o duración mínima requerida de la muestra: 240 minutos

3.1.4 Método 4 de la Agencia de Protección Ambiental de Estados Unidos

Determinación del contenido de humedad en los gases de chimenea

El método 4 de la Agencia de Protección Ambiental de Estados Unidos es un método manual no isocinético utilizado para medir el contenido de humedad de las corrientes de gas. El gas se muestrea a una velocidad de muestreo constante a través de un tren de sonda e impulsor. La humedad se elimina utilizando una serie de impactadores previamente pesados que contienen líquidos específicos de la metodología y gel de sílice sumergidos en un baño de agua helada. Los impactadores se pesan después de cada medición para determinar el porcentaje de humedad.

A continuación, se presenta información pertinente sobre el funcionamiento del método:

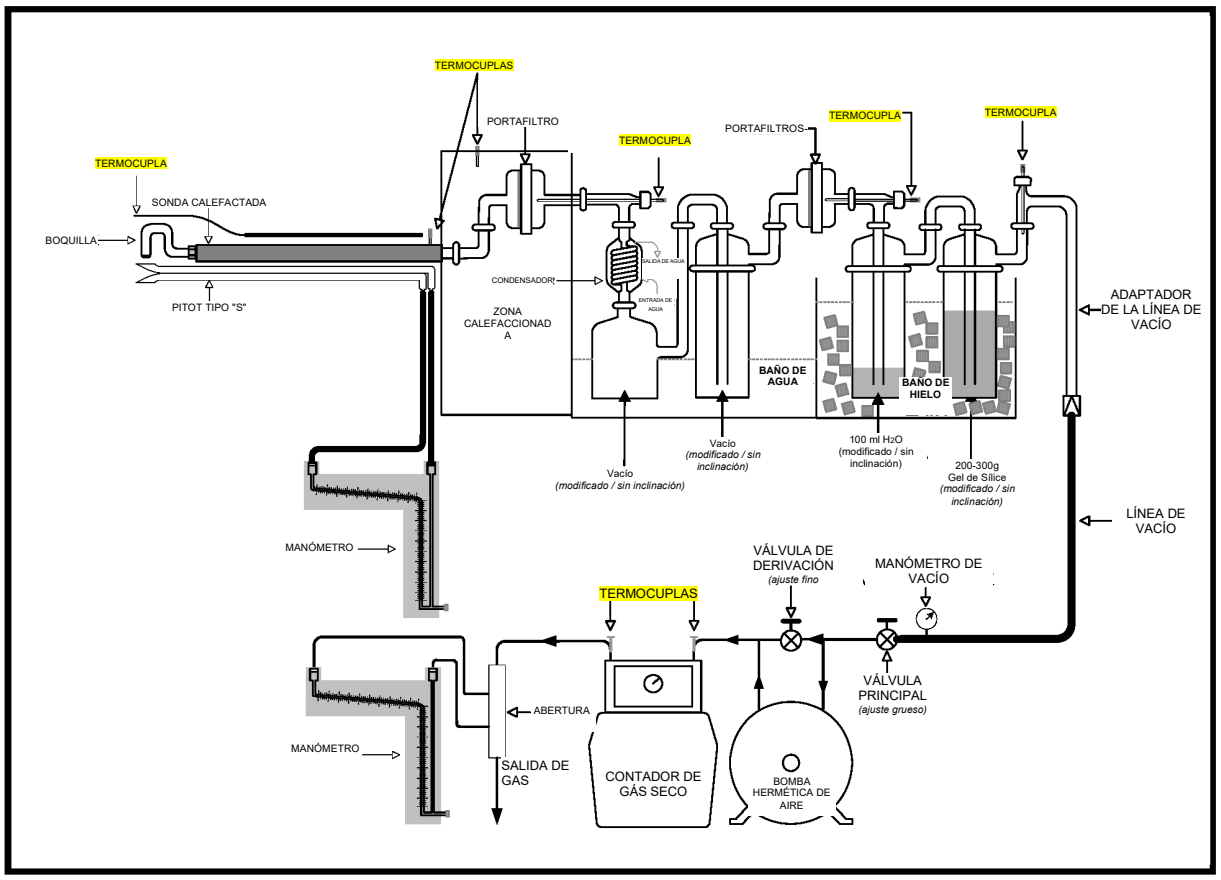
- Opciones del método:
  - El muestreo de humedad se realizó como parte de los trenes de muestreo de contaminantes
- Duración objetivo y/o mínima requerida de la muestra: 240 minutos

3.1.5 Métodos 5 y 202 de la Agencia de Protección Ambiental de Estados Unidos

Determinación de Emisiones de Partículas Procedentes de Fuentes Estacionarias y Método del Impactador Seco para Determinar Emisiones de Partículas Condensables Procedentes de Fuentes Estacionarias

Los métodos 5 y 202 de la Agencia de Protección Ambiental de Estados Unidos son métodos isocinéticos manuales utilizados para medir las emisiones de partículas filtrables y condensables (FPM y CPM). Los métodos se realizan conjuntamente con los métodos 1 a 4 de la Agencia de Protección Ambiental de Estados Unidos. Las FPM se extraen isocinéticamente de la fuente y se recogen en un filtro de fibra de vidrio mantenido a una temperatura de 120 ± 14 °C (248 ± 25°F) u otra temperatura especificada por una subparte aplicable de las normas o aprobada por el Administrador para una aplicación particular. La masa de FPM, que incluye cualquier material que se condense a la temperatura de filtración o por encima de ella, se determina gravimétricamente tras la eliminación del agua no combinada.

Las CMP se recogen en impactadores secos después de que las MP filtrables se hayan recogido en un filtro mantenido como se especifica en el método 5. Las fracciones orgánica y acuosa de los impactadores y de un filtro de CPM fuera de la pila se llevan a sequedad y se pesan. El total de las fracciones de los impactador y del filtro CPM representa el CPM.



A continuación, se presenta información pertinente sobre el funcionamiento del método:

- Opciones del método:
  - Se utilizan boquillas de muestreo de vidrio de cuarzo y revestimientos de sonda de vidrio de cuarzo
  - El agua condensada se mide gravimétricamente
  - Se realizaron blancos de prueba del tren de campo para demostrar la limpieza de la cristalería del tren de muestreo
  - La purga de nitrógeno posterior a la prueba se realiza haciendo pasar nitrógeno a presión a través del tren
  - La duración de las pruebas se aumentó a 240 minutos para maximizar la cantidad de partículas capturadas
  - El blanco de recuperación del tren de campo (FTRB) para el tren de muestreo de chimeneas tenía una masa de 2.12 mg, superando el límite de 2.0 mg, y se restaron 2.0 mg.
  - El blanco de recuperación del tren de campo (FTRB) para el tren de muestreo del aire ambiente tenía una masa de 2.57 mg, superando el límite de 2.0 mg, y se restaron 2.0 mg.
- Excepciones del método:
  - El muestreo de aire ambiente se realizó en un único punto situado cerca de la entrada de aire de la unidad de Santa Cruz. El muestreo del aire ambiente se realizó a una frecuencia no isocinética igual a la frecuencia de muestreo del tren de muestras de la chimenea.

- Laboratorio Analítico: MAQS, Antioch, CA
- Objetivo o Duración Mínima Requerida de la Muestra: 240 minutos

El sistema de muestreo típico se detalla en la Figura 3-1.

Figura 3-1
Método 5/202 de la EPA, Tren de Muestreo

3.1.6 Método ALT-009 de la EPA

Método Alternativo 5 Calibración Posterior a la Prueba

El método alternativo 009 aprobado por la EPA (ALT-009) se utiliza como alternativa a la calibración de la caja del medidor en dos puntos después de la prueba. Este procedimiento utiliza un cálculo para comprobar el factor de calibración de la caja del medidor en lugar de requerir una calibración física de la caja del medidor posterior a la prueba utilizando un medidor de gas seco estándar. El error porcentual (%) medio calculado de la caja del contador debe dar como resultado un error porcentual dentro del ±5% de Y. Si no es así, se realiza una calibración completa y los resultados se presentan utilizando el factor Y que arroje las emisiones más altas.

3.1.7 Método ALT-011 de la Agencia de Protección Ambiental de Estados Unidos

Método alternativo 2 de calibración de termopares

El método alternativo 011 aprobado por la Agencia de Protección Ambiental de Estados Unidos (ALT-011) se utiliza como alternativa a la calibración de termopares de dos puntos del método 2 de la Agencia de Protección Ambiental de Estados Unidos. Este procedimiento implica una comprobación en campo de un solo punto utilizando un termómetro de referencia para confirmar que el sistema de termopar funciona correctamente. Las temperaturas del termopar y de los termómetros de referencia deberán coincidir con una precisión de ±2 °F.

3.2 Métodos de Ensayo del Proceso

Durante las pruebas se suministró a la unidad gas natural de calidad de gasoducto y no se recogieron muestras de gas combustible.

No se utilizaron métodos de prueba de procesos distintos de los datos digitales de los medidores calibrados de flujo de combustible y temperatura.

4.0 Discusión y resultados de las pruebas

4.1 Desviaciones y excepciones de las pruebas de campo

La duración de las pruebas se aumentó a 240 minutos para maximizar la masa de partículas recogidas y proporcionar detección a concentraciones más bajas.

Los filtros del Método 5 de las muestras de chimenea presentaban una decoloración amarilla pálida o beige. Se realizó una cuarta prueba como precaución en caso de que hubiera alguna contaminación u otro efecto inesperado en las muestras. Aparentemente, la decoloración no añadió ninguna masa medible a los filtros. No se observaron indicios de contaminación ni otras anomalías en los resultados de laboratorio.

Durante este programa de pruebas no se produjeron otras desviaciones o excepciones sobre el terreno con respecto al plan o a los métodos de prueba.

4.2 Presentación de los resultados

Los resultados medios se presentan y comparan en el Cuadro 1-2. En los cuadros 4-1 y 4-2 se presentan los resultados de las pruebas individuales realizadas. Las emisiones se presentan en unidades coherentes con las de los reglamentos o requisitos aplicables. Los promedios de las series que se muestran en las tablas 1-2, 4-1, 4-2 y en el apéndice A.4 consisten en los resultados medios de las cuatro series de prueba. En los apéndices que figuran en el índice se incluye información adicional.

Los resultados de los muestreos de chimenea y los muestreos de aire ambiente son los mismos dentro de la incertidumbre de las mediciones. La oficina de Montrose Antioch tiene décadas de práctica en la medición de emisiones de PM cerca o por debajo de los límites de incertidumbre de los Métodos 5 y 202.
Los resultados de las pruebas en chimenea y en aire ambiente se sitúan en 0.0002 gr/dscf, que es el límite práctico de medición para las pruebas de 240 minutos. La incertidumbre práctica de estos resultados es de aproximadamente 0.0001 a 0.0002 gr/dscf. Por lo tanto, no hay ninguna diferencia perceptible entre los resultados de las pruebas de la chimenea y del aire ambiente; las concentraciones reales de las emisiones de la chimenea y del aire ambiente están probablemente muy por debajo de los límites de medición de estos métodos de referencia de la Agencia de Protección Ambiental de Estados Unidos.

Estos resultados de las pruebas apoyan la suposición de que la unidad de pila de combustible Bloom no genera emisiones medibles de PM.

5.0 Actividades de Control y Aseguramiento de la Calidad (QA/QC, por sus siglas en inglés) Internas

5.1 Auditorías de QA/QC

La caja del medidor y el tren de muestreo utilizados durante el muestreo cumplieron con los requisitos de sus respectivos métodos. Todas las comprobaciones de fugas posteriores a la prueba, los volúmenes mínimos medidos y las duraciones mínimas de muestreo cumplieron con los criterios de QA/QC aplicables.
Las auditorías de calibración del Método 3A de la EPA estuvieron todas dentro de las especificaciones de rendimiento del sistema de medición para las comprobaciones de deriva de calibración, las comprobaciones de sesgo de calibración del sistema y las comprobaciones de error de calibración.
Los resultados analíticos de QA/QC del Método 5 de la EPA se incluyen en el informe de laboratorio. Se cumplieron los criterios de QA/QC del método. Se analizó un blanco de reactivo del Método 5 de la EPA. La cantidad máxima permitida que se puede restar es el 0.001% del peso de la acetona utilizada. El blanco no excedió el residuo máximo permitido.
Los resultados analíticos de QA/QC del Método 202 de la EPA se incluyen en el informe de laboratorio. Se cumplieron los criterios de QA/QC del método. Se realizó un blanco de recuperación del tren de campo (FTRB, por sus siglas en inglés) del Método 202 de la EPA para cada categoría de fuente. La cantidad máxima permitida que se puede restar es 0.002 g (2.0 mg). Para este proyecto, el FTRB para el tren de muestreo de la chimenea tuvo una masa de 2.12 mg, y se restaron 2.0 mg. El FTRB para el tren de muestreo ambiental tuvo una masa de 2.57 mg, y se restaron 2.0 mg.

5.2 Discusión de QA/QC

Los FTRB excedieron el límite de 2.0 mg. Todos los demás criterios de QA/QC se cumplieron durante este programa de pruebas.

5.3 Declaración de Calidad

Montrose está calificado para llevar a cabo este programa de pruebas y ha establecido un sistema de gestión de calidad que condujo a la acreditación con la norma ASTM D7036-04 (Práctica Estándar para la Competencia de los Organismos de Prueba de Emisiones del Aire). Montrose participa en evaluaciones funcionales anuales para verificar la conformidad con la norma D7036-04, las cuales son realizadas por la Asociación Estadounidense para la Acreditación de Laboratorios (A2LA). Todas las pruebas realizadas por Montrose son supervisadas en el sitio por al menos una persona calificada (QI, por sus siglas en inglés) según se define en la sección 8.3.2 de la norma D7036-04. Los objetivos de calidad de los datos para estimar la incertidumbre de la medición dentro de los límites documentados en los métodos de prueba se cumplen mediante el uso de protocolos de prueba aprobados para cada proyecto, tal como se define en las secciones 7.2.1 y 12.10 de la norma D7036-04. Se incluye información adicional de aseguramiento de la calidad en los apéndices del informe. El contenido de este informe sigue el modelo del Documento de Directrices del Centro de Medición de Emisiones de la EPA (GD-043).

Observaciones de la Muestra

todos los filtros M5 [ilegibles] tenían la misma acumulación amarilla a pesar de los cambios en el día 2 de pruebas (R 3 y 4)

Se pensó que podría haber sido causado por adhesivo en las tapas de los puertos de la chimenea, pero esas se retiraron
