E = tasa de emisión de masa, lb/MMBtu
EFF = eficacia de destrucción o eliminación del dispositivo de control de emisiones, % de eficacia
F_c = factor estequiométrico "F" del combustible basado en CO_2, dscf/MMBtu @ 100% CO_2
F_d = factor estequiométrico "F" del combustible basado en O_2, dscf/MMBtu @ 0% O_2
G = carga de partículas en grano, granos/dscf
G_{12} = carga de partículas en grano corregida, granos/dscf @ 12% CO_2
G_m = masa de las partículas recogidas, en mg
HHV = mayor poder calorífico, Btu/pie cúbico
I = tasa de muestreo isocinético, %.
J = potencia de frenado, CV
M_j = tasa de emisión másica de especies medidas (s), g/hp-hora
M = tasa de emisión de masa, lb/hr
MW_{dry} = peso molecular del gas de chimenea, base seca
MW_{wet} = peso molecular del gas de chimenea, base húmeda
MW_s = peso molecular de las especies gaseosas (s), lb/lb mol:

CO:	28.01	(puede utilizar 28)	NO_x como NO_2:	46.01	(puede utilizar 46)
SO_X Como SO_2:	64.06	(puede utilizar 64)	Hidrocarburos como C:	12.01	(puede utilizar 12)
Hidrocarburos como CH_4:	16.04	(puede utilizar 16)	Hidrocarburos como C_3H_8:	44.1	(se puede usar 44)
NH_3:	17.03	(puede utilizar 17)			

N_2 = contenido de nitrógeno del gas de chimenea, % volumen seco
P_{bar} = presión barométrica, en Hg
P_s = presión absoluta de la pila, pulg. Hg
P_{sg} = presión estática de la chimenea, pulgadas de agua, manómetro (iwg)
P = caudal de gas de chimenea húmeda en condiciones reales, acfm
Q_f = caudal de combustible, scfh o lb/hr (cuidado con las unidades)
Q_{ds} = caudal de gas seco de chimenea en condiciones estándar, dscfm
Q_{ws} = caudal de gas de chimenea húmeda en condiciones estándar, wscfm
SV = volumen molar específico de un gas ideal en condiciones estándar, ft^3/lb mol
T_m = temperatura del contador, °R
T_{std} = temperatura de referencia, °R
T_s = temperatura del gas de chimenea, °R
v_s = velocidad del gas de chimenea, ft/seg
V_{lc} = volumen de líquido recogido en los impingers, ml
V_m = volumen de contador seco no corregido, acf
$V_{m\ std}$ = volumen de contador seco corregido a condiciones estándar, dscf
$V_{w\ std}$ = volumen de vapor de agua en condiciones estándar, scf
Y = coeficiente de calibración del contador, adimensional
ΔH = diferencial de presión media a través del contador, pulgadas de agua
ΔP = cabeza de velocidad media del gas de chimenea, pulgadas de agua
Θ = tiempo de muestreo, minutos

Administrative Record NSR 10833_000887

Registrador/Monitor
Manual de calibración
Marzo de 2016 Rev. 2, 1/20

Incertidumbre de medición

Consulte la(s) tabla(s) que comienza(n) en la página 3. Las incertidumbres comunicadas representan incertidumbres expandidas, expresadas aproximadamente al nivel de confianza del 95% utilizando un factor de cobertura de k = 2.

Regla de decisión

Esta calibración utiliza una regla de decisión de riesgo gestionado para lograr una PFA (probabilidad de falsa aceptación) del 2% o inferior, basada en el Manual para la aplicación de ANSI/NCSL Z540.3-2006. Para las tolerancias de doble cara, se utiliza el método 6 de Z540.3 con el cálculo del límite de aceptación basado en la relación de incertidumbre del ensayo. Para tolerancias de una sola cara, se utiliza el método 5 de Z540.3, en el que el límite de aceptación se calcula restando la incertidumbre expandida del límite de tolerancia.

Conformidad con los requisitos y declaración de trazabilidad

El sistema de calibración de Trescal cumple los requisitos de la norma ISO 17025:2017 y ANSI/NCSL Z540-1-1994.
Esta calibración se realizó utilizando patrones trazables al Sistema Internacional de Unidades (SI) a través del NIST o de un Instituto Nacional de Medición (NMI) equivalente.

Todos los instrumentos utilizados en la realización de la calibración mostrada tienen trazabilidad al Instituto Nacional de Estándares y Tecnología (NIST). La relación de incertidumbre entre los patrones de calibración (DM. STD.) y la unidad bajo prueba (UUT) es de un mínimo de 4:1, a menos que se indique lo contrario. La calibración se ha realizado de acuerdo con el procedimiento indicado. Calibración realizada de acuerdo con ISO 10012:2003, ANSI/NCSL-Z-540 y/o MIL-STD-45662A; métodos de prueba como API2530-92 y/o ASME MFC-3M-1989.

Apéndice C
Datos de Análisis de Laboratorio

NARRATIVA DE LABORATORIO
MÉTODO DE LA AGENCIA DE PROTECCIÓN AMBIENTAL DE ESTADOS UNIDOS 5/202
Cliente: Bloom Energy Pila y Ambiente Proyecto: 066157

Custodia

El 10 de abril de 2026 se recibieron cuatro juegos de muestras para dos unidades. Cada juego consistió en un filtro, enjuague de sonda/boquilla, filtro de partículas condensables, agua de impulsor y enjuague orgánico. También se recibió un juego de blancos de campo, dos juegos de blancos de prueba y un juego de blancos de reactivo. Según la cadena de custodia, estas muestras se recogieron del 7 de abril de 2026 al 8 de abril de 2026. Los filtros de la unidad de chimenea se arrancaron fuera del área de recogida para las series uno, dos y cuatro. Los filtros de la unidad de ambiente tenían los tramos dos y cuatro rasgados fuera del área de recogida. Las botellas de muestras estaban marcadas y no se observó ninguna pérdida de muestras.

Análisis

Las muestras se analizaron en busca de partículas utilizando los procedimientos analíticos de los Métodos 5 (Determinación de Emisiones de Partículas Procedentes de Fuentes Estacionarias) y 202 (Determinación de Emisiones de Partículas Condensables Procedentes de Fuentes Estacionarias) de la Agencia de Protección Ambiental de Estados Unidos. Las muestras se analizaron del 15 de abril de 2026 al 16 de abril de 2026 tras desecarse durante al menos 24 horas. Los resultados se corrigieron en blanco de acuerdo con los métodos de ensayo.

Análisis frontal

Los filtros eran de color blanco para la unidad de ambiente y beige para la unidad de chimenea. Cualquier resultado inferior a cero, en el informe detallado del laboratorio, puede atribuirse a que la masa recogida durante el muestreo es inferior a la masa normal se debe a la pérdida de material filtrante durante el muestreo, la recuperación o la manipulación de la muestra. Los enjuagues de la sonda/boquilla aparecieron como residuos blancos con partículas de color beige claro.

Análisis del segundo semestre

Las fracciones orgánicas aparecieron como residuos blancos. Las fracciones acuosas aparecieron como residuos blancos tras la evaporación.

Notas de Control de Calidad

Antes del análisis, se comprobó la precisión de la balanza utilizando pesas de acero inoxidable ASTM E617-97 Clase 1 de 500 mg, 2 g y 100 g. Los resultados por debajo de los límites de detección se indican como límite de detección. Se utilizaron dos balanzas distintas, la SN # 1129323415 se utilizó para los filtros, la SN # C036008161 se utilizó para las muestras evaporadas en cacerolas de aluminio.

Captura Total de Material Particulado, mg netos			**2.22**		**2.13**		**2.42**		**1.84**

Notas: Las fracciones de acetona de la mitad frontal se corrigieron con el blanco de acuerdo con los métodos 5 / 17 de la EPA.
Las fracciones de la mitad posterior se corrigieron con el blanco de acuerdo con el Método 202 de la EPA.
Los valores de corrección con el blanco de las fracciones de la mitad posterior son (m_{ib} + m_{ob}) o 2.0 mg, lo que sea menor, de acuerdo con el Método 202 de la EPA

LISTA DE VERIFICACIÓN DE ACEPTACIÓN DE MUESTRAS

Sección 1 Cliente: [hw:] *Bloom Energy*		Método de prueba: [hw:] *Agencia de Protección Ambiental de Estados Unidos 51202*
Fecha de Recepción: [hw:] *04/10/26*	Proyecto: [hw:] *066157* Nombre del Muestreador Presente: ☑ Sí ☐ No	

Sección 2

Temperatura de la Muestra (°C): [hw:] *Ambiente*

Pruebas: ☐ Cumplimiento ☐ RATA ☐ Ingeniería ☐ No se Aplica

Sección 3	Sí	No	No se Aplica
¿Se incluyó una COC con las muestras?	-		
¿Están presentes los ID de muestra en la COC?	-		
¿Están presentes las fechas de muestreo en la COC?	-		
¿Está presente una firma de entrega?	-		
¿Están claramente indicados en la COC los métodos de prueba requeridos?	-		
¿Se mantuvieron frías las muestras durante el transporte?		-	
¿Se colocaron las muestras bajo refrigeración para su almacenamiento?		-	
¿Está marcado el nivel de líquido en la botella de muestra?	-		
Si las botellas de muestra están marcadas, ¿hubo una pérdida visible de muestra?			-
¿Están intactas las tapas/sellos?	-		
¿Coincidieron todas las etiquetas de las botellas con la COC? (ID de muestra, contenido)	-		
¿Incluyeron las etiquetas de las muestras el número de proyecto?	-		
¿Incluyeron las etiquetas de las muestras la fecha de recolección?	-		
¿Se recolectaron las muestras en los contenedores correctos para las pruebas requeridas?	-		
¿Están los recipientes etiquetados con los conservantes correctos?	-		
¿Se envió una cantidad suficiente de muestra para las pruebas solicitadas?	-		

Sección 4 Explicaciones/Comentarios

_____

_____

Sección 5

En caso de discrepancias, ¿Cómo se notificó al Gerente del Proyecto?

☐ Iniciales del GP (Verbal): _____ Fecha: _____

☐ Correo Electrónico (Enviado a/el): _____/_____

Respuesta del Gerente del Proyecto:

UNIDADES DE MEDIDA

Unidad	Descripción
@ X% O_2	corregido a X% de oxígeno (corregido para aire de dilución)
|CC|	valor absoluto del coeficiente de confianza
|d|	valor absoluto de las diferencias medias
ºC	grados Celsius
ºF	grados Fahrenheit
ºR	grados Rankine
" H_2O	pulgadas de columna de agua
13.6	gravedad específica del mercurio
ΔH	caída de presión a través del orificio medidor, pulgadas H_2O
ΔP	altura de velocidad del gas de chimenea, pulgadas H_2O
θ	tiempo total de muestreo, minutos
μ_g	microgramo
ρ_a	densidad de la acetona, mg/ml
ρ_w	densidad del agua, 0.9982 g/ml o 0.002201 lb/ml
% vd	porcentaje en volumen, base seca
% vw	porcentaje en volumen, base húmeda
acfm	pies cúbicos reales de gas por minuto en condiciones de chimenea
A_n	área de la sección transversal de la boquilla, ft²
A_s	área de la sección transversal de la chimenea, pies cuadrados (ft²)
Btu	Unidad térmica británica
Btu/ft³	Unidades térmicas británicas por pie cúbico
Btu/gal	Unidades térmicas británicas por galón
B_{ws}	proporción en volumen de vapor de agua en la corriente de gas
C_a	concentración de partículas en el gas de chimenea, gr/acf
C_{Avg}	concentración media de gas no ajustada, ppmv
C_{Dir}	concentración medida de gas de calibración, ppmv
cf o ft³	pies cúbicos
cfm	pies cúbicos por minuto
C_{Gas}	concentración media de gas ajustada al sesgo, ppmv
C_M	promedio de las respuestas inicial y final de la comprobación del sesgo del sistema a partir del gas de calibración ascendente, ppmv
cm o m³	metros cúbicos
C_{MA}	concentración real del gas de calibración ascendente, ppmv
C_O	media de las respuestas inicial y final de la comprobación del sesgo del sistema a partir del gas de calibración de bajo nivel, ppmv
C_p	coeficiente del tubo de Pitot
C_s	concentración de partículas en el gas de chimenea, gr/dscf
CS	span de calibración, % o ppmv
C_s	concentración medida de gas de calibración, ppmv
C_v	concentración certificada fabricada de gas de calibración, ppmv
D	evaluación de la deriva, % de la envergadura
dcf	pies cúbicos secos
dcm	metros cúbicos secos
D_n	diámetro de la boquilla, pulgadas
D_s	diámetro de la pila, pulgadas
dscf	pies cúbicos estándar secos
dscf/MMBtu	pie cúbico estándar seco por millón de unidades térmicas británicas
dscfm	pies cúbicos estándar secos por minuto
dscm	metros cúbicos estándar secos
F_d	Factor F, dscf/MMBtu de aporte térmico
fpm	pies por minuto
fps	pies por segundo
ft	pies
ft²	pies cuadrados
g	gramo
gal	galones

UNIDADES DE MEDIDA

Unidad	Descripción
gal/hr	galones por hora
gr	granos (7000 granos por libra)
gr/dscf	granos por pie cúbico estándar seco
GW	gigavatios
GWh	gigavatios-hora
hr	hora
I	porcentaje de muestreo isocinético
in	pulgada
k	kilo o mil (unidades métricas, multiplicar por 10^3)
K	kelvin (temperatura)
K_3	factor de conversión 0.0154 gr/mg
K_4	factor de conversión 0.002668 ((in. Hg)(ft^3))/((ml)(°R))
kg	kilogramo
K_p	constante del tubo pitot (85.49 pies/seg)
kwscfh	mil pies cúbicos estándar húmedos por hora
l o L	litros
lb/hr	libras por hora
lb/lb-mol	libras por libra mole
lb/MMBtu	libras por millón de Btu
lb/TBtu	libras por trillón de Btu
lpm	litros por minuto
m	metro o mili
M	mil (unidades inglesas) o mega (millón, unidades métricas)
m^3	metros cúbicos
m_a	masa del residuo de acetona tras la evaporación, en mg
M_d	peso molecular del gas de chimenea; base seca, lb/lb-mol
meq	miliequivalente
mg	miligramo
Mg	megagramo (10^6 gramos)
min	minuto
ml o mL	mililitro
mm	milímetro
MM	millones (unidades inglesas)
MMBtu	millones de unidades térmicas británicas
MMBtu/hr	millones de BTU por hora
m_n	cantidad total de partículas recogidas, en mg
mol	mol
mol. wt. o MW	peso molecular
M_s	peso molecular del gas de chimenea; base húmeda, lb/lb-mol
MW	peso molecular o megavatio
MWh	megavatio-hora
n	número de puntos de datos
ng	nanogramo
nm	nanómetro
Nm^3	metro cúbico normal
P_{bar}	presión barométrica, pulgadas Hg
pg	picogramo
P_g	presión estática de la chimenea, pulgadas H_2O
P_m	presión barométrica del contador de gas seco, pulgadas Hg
ppb	partes por billón
ppbv	partes por billón, en volumen
ppbvd	partes por billón en volumen, base seca
ppm	partes por millón
ppmv	partes por millón, en volumen

UNIDADES DE MEDIDA

Unidad	Descripción
ppmvd	partes por millón en volumen, base seca
ppmvw	partes por millón en volumen, base húmeda
P_s	presión absoluta del gas de chimenea, pulgadas Hg
psi	libras por pulgada cuadrada
psia	libras por pulgada cuadrada absolutas
psig	libras por pulgada cuadrada de calibre
P_{std}	presión absoluta estándar, 29.92 pulgadas Hg
Q_a	caudal volumétrico, condiciones reales, acfm
Q_s	caudal volumétrico, condiciones estándar, scfm
Q_{std}	caudal volumétrico, condiciones estándar en seco, dscfm
R	constante del gas ideal 21.85 ((in. Hg) (ft³))/((°R) (lbmole))
SB_{final}	comprobación del sesgo del sistema tras el funcionamiento, % del intervalo
SB_i	comprobación previa del sesgo del sistema, % del intervalo
scf	pies cúbicos estándar
scf/MMBtu	pie cúbico estándar por millón de unidades térmicas británicas
scfh	pies cúbicos estándar por hora
scfm	pies cúbicos estándar por minuto
scm	metros cúbicos estándar
scmh	metros cúbicos estándar por hora
sec	segundos
sf, sq. ft., o ft²	pies cuadrados
std	estándar
t	tonelada métrica (1000 kg)
$T_{0.975}$	valor t
T_a	temperatura ambiente media absoluta, ºR (+459.67 para el inglés)
T_m	temperatura media absoluta del contador de gas seco, ºR (+459.67 para el inglés)
ton o t	ton = 2000 libras
tph o tons/hr	toneladas por hora
tpy o tons/yr	toneladas por año
T_s	temperatura media absoluta del contador de gas de la chimenea, ºR (+459.67 para el inglés)
T_{std}	temperatura absoluta en condiciones estándar
V	voltios
V_a	volumen de blanco de acetona, ml
V_{aw}	volumen de acetona utilizada en el lavado, ml
V_{lc}	volumen total de H_2O recogido en impactadores y gel de sílice, gramos
V_m	volumen de gas muestreado a través del medidor de gas seco, pies³
$V_{m(std)}$	volumen de gas medido por el medidor de gas seco, corregido a condiciones estándar, dscf
V_{ma}	volumen de gas de chimenea muestreado, acf
V_n	volumen recogido en condiciones de chimenea a través de la tobera, acf
V_s	velocidad media del gas de chimenea, pies por segundo
$V_{wc(std)}$	volumen de vapor de agua condensado, corregido a condiciones estándar, scf
$V_{wi(std)}$	volumen de vapor de agua en el gas muestreado de los impactadores, scf
$V_{wsg(std)}$	volumen de vapor de agua en el gas muestreado del gel de sílice, scf
W	vatio
W_a	peso del residuo en el lavado con acetona, mg
W_{imp}	peso total de los impactadores, gramos
W_{sg}	peso total del gel de sílice, gramos
Y	factor de calibración del contador de gas seco, adimensional

ABREVIACIONES

Acrónimo	Descripción
ACE	error de calibración del analizador
AAS	espectroscopia de absorción atómica
ACDP	permiso de vertido de contaminantes atmosféricos
AD	diferencia absoluta
ADL	por encima del límite de detección
AETB	Organismo de ensayo de emisiones a la atmósfera
APCD	dispositivo de control de la contaminación atmosférica
APCS	sistema de control de la contaminación atmosférica
AS	norma aplicable (límite de emisión)
ASTM	Sociedad Americana de Pruebas y Materiales
BACT	mejor tecnología de control alcanzable
BDL	por debajo del límite de detección
BHP	potencia de frenado
BIF	caldera y horno industrial
BLS	sólidos de licor negro
CARB	Junta de Recursos del Aire de California
CC	coeficiente de confianza
CD	deriva de calibración
CE	eficiencia de captura o eficiencia de recogida
CEM	monitor continuo de emisiones
CEMS	sistema de monitorización continua de emisiones
CERMS	sistema de monitorización continua de la tasa de emisiones
CET	prueba de error de calibración
CFB	lecho fluidizado circulante
CFR	Código de Reglamentos Federales
CGA	auditoría de gases de botellas
CHNOS	análisis elemental para la determinación del contenido de C, H, N, O y S en los combustibles
CNCG	gas no condensable concentrado
CO	oxidante catalítico
COC	cadena de custodia
COMS	sistema de control continuo de la opacidad
CPM	materia particulada condensable
CPMS	sistema continuo de control de parámetros
CT	turbina de combustión
CTM	método de ensayo condicional
CTO	oxidador térmico catalítico
CTS	estándar de transferencia de calibración
CVAAS	espectroscopia de absorción atómica de vapor frío
CVAFS	espectrometría de fluorescencia atómica de vapor frío
D_e	diámetro equivalente
DE	eficiencia de destrucción
DGM	contador de gas seco
Dioxinas	dibenzo-p-dioxinas policloradas (PCDDs)
DLL	nivel de detección limitado
DNCG	gas diluido no condensable
EAF	horno de arco eléctrico
ECD	detector de captura de electrones
EGU	unidad generadora de vapor de la compañía eléctrica
EIT	Ingeniero en formación
ELCD	detector de conductividad electrolítica (detector hall)

ABREVIACIONES

Acrónimo	Descripción
EMPC	concentración máxima posible estimada
EPA	Agencia de Protección Ambiental de EE.UU.
EPRI	Instituto de Investigación de la Energía Eléctrica
ES	norma de emisión (límite aplicable)
ESP	precipitador electrostático
ERT	Herramienta de notificación electrónica
EU	unidad de emisión
FB	campo en blanco
FCCU	unidad de craqueo catalítico fluido
FGD	desulfuración de gases de combustión
FI	ionización de llama
FIA	analizador de ionización de llama
FID	detector de ionización de llama
FPD	detector fotométrico de llama
FPM	partículas filtrables
FTIR	Espectroscopia infrarroja con transformada de Fourier
FTPB	campo prueba de tren en blanco
FTRB	recuperación del tren de campo en blanco
Furanos	dibenzofuranos policlorados (PCDFs)
GC	cromatografía de gases
GC/MS	cromatografía de gases/espectroscopia de masas
GFAAS	espectroscopia de absorción atómica en horno de grafito
GFC	correlación de filtros de gas
GHG	gases de efecto invernadero
HAP	contaminante atmosférico peligroso
HC	hidrocarburos
HHV	mayor poder calorífico
HI	aporte de calor
HPLC	cromatografía líquida de alta resolución
HRGC/HRMS	cromatografía de gases de alta resolución/espectroscopia de masas de alta resolución
HRSG	generador de vapor con recuperación de calor
IC	cromatografía iónica
ICAP	espectroscopia de emisión de plasma de argón acoplada inductivamente
ICPCR	cromatografía iónica con reactor poscolumna
ICP-MS	espectroscopia de masas con plasma acoplado inductivamente
ICR	solicitud de recogida de información
IR	radiación infrarroja
ISDL	límite de detección en pila
ISE	electrodo iónico específico
ISO	Organización Internacional de Normalización
kW	kilovatios
LEE	EGU de bajas emisiones
LFG	gas de vertedero
LHV	menor poder calorífico
LPG	gas licuado de petróleo
LRGC/LRMS	cromatografía de gases de baja resolución/espectroscopia de masas de baja resolución
MACT	tecnología de control máximo alcanzable
MATS	Norma sobre mercurio y tóxicos atmosféricos
MDI	diisocianato de metilendifenilo
MDL	límite de detección del método

ABREVIACIONES

Acrónimo	Descripción
MNOC	condiciones máximas normales de funcionamiento
MRL	límite de notificación del método
MS	espectrometría de masas
MSW	residuos sólidos urbanos
MWC	cámara de combustión de residuos municipales
NA	no aplicable o no disponible
NCASI	Consejo Nacional para la Mejora del Aire y el Vapor
NCG	gases no condensables
ND	no detectado
NDIR	infrarrojo no dispersivo
NDO	apertura de tiro natural
NESHAP	Normas Nacionales de Emisión de Contaminantes Peligrosos del Aire
NG	gas natural
NIOSH	Instituto Nacional de Seguridad y Salud en el Trabajo
NIST	Instituto Nacional de Normalización y Tecnología
NMC	cortador sin metano
NMEOC	compuestos orgánicos no metánicos, no etánicos
NMOC	compuestos orgánicos no metánicos
NMVOC	compuestos orgánicos volátiles no metánicos
NPD	detector de nitrógeno y fósforo
NSPS	Normas de rendimiento de nuevas fuentes
OSHA	Occupational Safety And Health Administration
PAH	hidrocarburos aromáticos policíclicos
PCB	compuestos bifenílicos policlorados
PCWP	madera contrachapada y productos de madera compuestos
PE	Ingeniero profesional
PEMS	sistema predictivo de control de emisiones
PFAS	sustancias perfluoroalquiladas y polifluoroalquiladas
PI	fotoionización
PID	detector de fotoionización
PM	materia particulada
PM_{10}	partículas de menos de 10 micras de diámetro aerodinámico
$PM_{2.5}$	partículas de menos de 2.5 micras de diámetro aerodinámico
PMS	sistema de control paramétrico
PPE	equipo de protección individual
POM	materia orgánica policíclica
PS	especificación de rendimiento
PSD	distribución del tamaño de las partículas
PSEL	límites de emisión del emplazamiento de la planta
PST	ensayo de especificación del rendimiento
PTE	recinto total permanente
PTM	método de ensayo del funcionamiento
QA/QC	garantía de calidad y control de calidad
QI	Qualified Individual (individuo cualificado)
QSTI	Individuo cualificado para ensayos en la fuente
QSTO	Observador cualificado de ensayos en la fuente
RA	exactitud relativa
RAA	Auditoría de precisión relativa
RACT	tecnología de control razonablemente disponible
RATA	auditoría de ensayo de precisión relativa

ABREVIACIONES

Acrónimo	Descripción
RCA	auditoría de correlación de respuesta
RB	blanco de reactivo
RCTO	oxidador térmico concentrador rotativo
RE	eficiencia de eliminación o reducción
RICE	motor alternativo estacionario de combustión interna
RM	método de referencia
RRA	auditoría de respuesta relativa
RTO	oxidador térmico regenerativo
SAM	niebla de ácido sulfúrico
SCD	detector quimioluminiscente de azufre
SCR	sistema de reducción catalítica selectiva
SD	desviación estándar
Semi-VOST	tren de muestreo de compuestos orgánicos semivolátiles
SI ICE	motor de combustión interna de encendido por chispa
SLU	unidades de luz difusa
SNCR	reducción selectiva no catalítica
SRM	material de referencia estándar
SSI	incineración de lodos de depuradora
STMS	sistema de control de trampas sorbentes
TAP	contaminante tóxico del aire
TBD	por determinar
TCA	analizador de conductividad térmica
TCD	detector de conductividad térmica
TEF	factor de equivalencia tóxica
TEQ	cociente de equivalencia tóxica
TGNENM OC	compuestos orgánicos gaseosos totales no etánicos no metánicos
TGNMOC	compuestos orgánicos no metánicos gaseosos totales
TGOC	compuestos orgánicos gaseosos totales
THC	hidrocarburos totales
TIC	compuesto identificado provisionalmente
TO	oxidador térmico
TO	orgánicos tóxicos (como en el método TO-15 de la EPA)
TPM	partículas totales
TSP	partículas en suspensión totales
TTE	cerramiento total temporal
ULSD	gasóleo ultra bajo en azufre
US EPA	Agencia de Protección Ambiental de los Estados Unidos
UV	rango de radiación ultravioleta
VE	emisiones visibles
VOC	compuestos orgánicos volátiles
VOST	tren de muestras orgánicas volátiles
WC	columna de agua
WWTP	depuradora de aguas residuales

NOMENCLATURA QUÍMICA

Químico	Descripción
Ag	plata
As	arsénico
Ba	bario
Be	berilio
Br_2	bromo
C	carbono
Cd	cadmio
CdS	sulfuro de cadmio
CH_2O	formaldehído
CH_3CHO	acetaldehído
CH_3OH	metanol
CH_4	metano
C_2H_4O	óxido de etileno
C_2H_6	etano
C_3H_4O	acroleína
C_3H_6O	propionaldehído
C_3H_8	propano
C_6H_5OH	fenol
C_6H_{14}	hexano
Cl_2	cloro
ClO_2	dióxido de cloro
CO	monóxido de carbono
Co	cobalto
CO_2	dióxido de carbono
Cr	cromo
Cu	cobre
EtO	óxido de etileno
EtOH	alcohol etílico (etanol)
H_2	hidrógeno
H_2O	agua
H_2O_2	peróxido de hidrógeno
H_2S	sulfuro de hidrógeno
H_2SO_4	ácido sulfúrico
HBr	bromuro de hidrógeno
HCl	cloruro de hidrógeno
HF	fluoruro de hidrógeno
Hg	mercurio
IPA	alcohol isopropílico
MDI	diisocianato de metilendifenilo
$MeCl_2$	cloruro de metileno
MEK	metiletilcetona
MeOH	metanol

Químico	Descripción
Mn	manganeso
N_2	nitrógeno
NH_3	amoníaco
Ni	níquel
NO	óxido nítrico
NO_2	dióxido de nitrógeno
NOx	óxidos de nitrógeno
O_2	oxígeno
Mn	manganeso
N_2	nitrógeno
NH_3	amoníaco
Ni	níquel
NO	óxido nítrico
NO_2	dióxido de nitrógeno
NOx	óxidos de nitrógeno
O_2	oxígeno
P	fósforo
Pb	plomo
PCDD	dibenzo-p-dioxinas policloradas
PCDF	dibenzofuranos policlorados
Sb	antimonio
Se	selenio
SO_2	dióxido de azufre
SO_3	trióxido de azufre
SOx	óxidos de azufre
TCDD	tetraclorodibenzodioxina
TCDF	tetraclorodibenzofurano
TGOC	concentración orgánica gaseosa total
THC	hidrocarburos totales
Tl	talio
TRS	compuestos de azufre reducidos totales
Zn	zinc

Apéndice D.2

Todos los instrumentos utilizados en la realización de la calibración mostrada tienen trazabilidad con el Instituto Nacional de Estándares y Tecnología (NIST). A menos que el cliente indique lo contrario, **Dick Munns utiliza una regla de decisión de Aceptación Simple según lo definido en ILAC G8 con una TUR de 1:1 o mejor.** La calibración se ha realizado de acuerdo con el procedimiento mostrado. El uso del logotipo de IAS/ILAC indica que las calibraciones están de acuerdo con la norma ISO/IEC 17025:2017.

Dick Munns Company ▪ 11133 Winners Circle, Los Alamitos, CA 90720

Información del certificado:

Técnico: 420 Procedimiento: CAL-03 Fecha de Calibración: 29 Ene 2026 Fecha de Vencimiento de Calibración: 29 Ene 2028

Condiciones de Prueba: 30.91%HR 22.17°C 1027mBar

Datos de calibración: (Instrumento nuevo)

Unidad(es)	Nominal	Encontrado	En Tol.	Nominal	Dejado	En Tol.	Mínimo	Máximo	±U	TUR
°C	N.A.	N.A.		0.00	0.2	Y	-1	1	0.058	>4:1
°C	N.A.	N.A.		100.00	100.0	Y	99	101	0.058	>4:1

Este certificado indica la trazabilidad a los estándares proporcionados por el (NIST) Instituto Nacional de Estándares y Tecnología y/o un Laboratorio Nacional de Estándares.

Se mantiene una relación de incertidumbre de prueba de al menos 4:1 a menos que se indique lo contrario y se calcula utilizando la incertidumbre de medición expandida. La evaluación de la incertidumbre incluye el instrumento bajo prueba y se calcula de acuerdo con la "Guía para la expresión de la incertidumbre de medida" (GUM) de la ISO. La incertidumbre representa una incertidumbre expandida utilizando un factor de cobertura k=2 para aproximar un nivel de confianza del 95%. Conformidad basada en la Aceptación Simple como Regla de Decisión, según lo definido en ILAC G8, con un valor de incertidumbre de medición que no excederá el 50% de la tolerancia a menos que el cliente indique lo contrario. Los resultados aquí contenidos se refieren únicamente al artículo calibrado. Este certificado no debe reproducirse excepto en su totalidad, sin la aprobación por escrito de Control Company.

Nominal=Lectura del Estándar; Dejado=Lectura del Instrumento; En Tol.=En tolerancia; Mín/Máx=Rango de aceptación; ± U=Incertidumbre de medición expandida; TUR=Relación de incertidumbre de prueba; Precisión=±(Máximo-Mínimo)/2; Mínimo=Nominal dejado (redondeado) - Tolerancia; Máximo=Nominal dejado (redondeado) + Tolerancia;

[firma]
Nicol Rodriguez, Gerente de Calidad

Nota:

Mantenimiento de la precisión:

En nuestra opinión, una vez calibrado, su termómetro Lollipop debería mantener su precisión. No existe una forma exacta de determinar cuánto tiempo se mantendrá la calibración. Los termómetros Lollipop cambian poco, si es que cambian, pero pueden verse afectados por el envejecimiento, la temperatura, los golpes y la contaminación.

Recalibración:

Para la calibración de fábrica y la recertificación trazable al Instituto Nacional de Estándares y Tecnología, comuníquese con Control Company.

Fecha de emisión: 29 de enero de 2026

Notas:

Para obtener resultados de prueba válidos, el vacío real debe ser 25 mmHg mayor que el vacío crítico teórico.
[2] El coeficiente de orificio crítico, K', en unidades métricas, $(m^3 * K^{1/2}) / (mm\ Hg*min)$.
[3] El coeficiente de orificio crítico, K', en unidades inglesas, $(fr^3 * R^{1/2}) / (in\ Hg*min)$.

Técnico: Nathan Johnson Firma: [firma] Fecha: 31 de octubre de 2025

Certifico que el conjunto de orificios anterior fue calibrado de acuerdo con los métodos de la Agencia de Protección Ambiental de Estados Unidos [ilegible], CFR 40 Parte 60. Apéndice A, Método 5, Sección 16.2.

Los instrumentos enumerados y descritos en este certificado han sido calibrados con estándares trazables al Instituto Nacional de Estándares y Tecnología (N.I.S.T., por sus siglas en inglés).

Apex Instruments - Dirección: 204 Technology Park Ln., Fuquay-Varina, NC 27526 EE. UU. | Tel: (919) 557-7300 Web: www.apexinst.com

CERTIFICADO DE ANÁLISIS DE LOTE

Grado del producto: CEM-CAL ZERO

Número de pieza:	NI CZ15A	Número de referencia:	153-403259124-1
Cilindro analizado:	CC183670	Volumen del cilindro:	142.0 CF
Laboratorio:	124 - Tooele (SAP) - UT	Presión del cilindro:	2000 PSIG
Fecha de análisis:	30 de enero de 2025	Salida de la válvula:	580
Número de lote:	153-403259124-1		

Fecha de Caducidad: 22 de Enero de 2034

RESULTADOS ANALÍTICOS

Componente	Pureza Solicitada		Concentración Certificada
NITRÓGENO	99.9995 %		99.9995 %
NOx	0.1 PPM	<LDL	0.02 PPM
SO2	0.1 PPM	<LDL	0.1 PPM
THC	0.1 PPM	<LDL	0.05 PPM
MONÓXIDO DE CARBONO	0.5 PPM	<LDL	0.03 PPM
DIÓXIDO DE CARBONO	1.0 PPM	<LDL	0.03 PPM

Notas permanentes: Airgas certifica que el contenido de este cilindro cumple con los requisitos de 40 CFR 72.2

Cilindros en el lote:

AAL16511, ALM020727, C C1 9 3 8, CC122102, CC183670, CC190306, CC191313, CC201789, CC235294, CC278852, CC279563, CC320947, CC326512, CC411735, CC453431, CC46175, CC472868, CC476137, CC55253, CC733059, CC734811, EB0092303, EB0105116, EB0159648, SG9149074BAL, SG9199337BAL

Impurezas verificadas contra estándares analíticos trazables al NIST por peso y/o análisis.

CERTIFICADO DE ANÁLISIS DE LOTE

Grado del producto: CEM-CAL ZERO

Número de pieza:	NI CZ15A	Número de referencia:	153-403536514-1
Cilindro analizado:	ALM042836	Volumen del cilindro:	142.0 CF
Laboratorio:	124 - Tooele (SAP) - UT	Presión del cilindro:	2000 PSIG
Fecha de análisis:	14 de enero 2026	Salida de la válvula:	580
Número de lote:	153-403536514-1		

Fecha de Caducidad: 14 de Enero de 2034

RESULTADOS ANALÍTICOS

Componente	Pureza Solicitada		Concentración Certificada
NITRÓGENO	99.9995 %		99.9995 %
NOx	0.1 PPM	<LDL	0.02 PPM
SO2	0.1 PPM	<LDL	0.1 PPM
THC	0.1 PPM	<LDL	0.05 PPM
MONÓXIDO DE CARBONO	0.5 PPM	<LDL	0.03 PPM
DIÓXIDO DE CARBONO	1.0 PPM	<LDL	0.03 PPM

Notas permanentes: Airgas certifica que el contenido de este cilindro cumple con los requisitos de 40 CFR 72.2

Cilindros en el lote:

ALM-055730, ALM042836, ALM049516, CC190129, CC203667, CC23875, CC259666, CC279349, CC286839, CC351472, CC360853, CC42741, CC496849, CC505161, CC505331, CC708797, CC733233, EB0047465, EB0070223, EB0078344, EB0088997, EB0098556, EB0109084, EB0111881, EB0159751, SG9150708BAL, SG9168350BAL, XC002133B

Impurezas verificadas contra estándares analíticos trazables al NIST por peso y/o análisis.

CERTIFICADO DE ANÁLISIS

Grado del Producto: ESTÁNDAR DE PROTOCOLO DE LA EPA

Número de Pieza:	E03NI84E15A7419	Número de Referencia:	153-403295667-1
Número de Cilindro:	CC447111	Volumen del Cilindro:	147.0 CF
Laboratorio:	124 - Tooele (SAP) - UT	Presión del Cilindro:	2015 PSIG
Número de PGVP:	B72025	Salida de Válvula:	590
Código de Gas:	CO2,O2,BALN	Fecha de Certificación:	**24 de Mar de 2025**

Fecha de Vencimiento: 24 de Mar de 2025

Certificación realizada de acuerdo con el documento de la Agencia de Protección Ambiental de Estados Unidos "Protocolo de trazabilidad de la Agencia de Protección Ambiental de Estados Unidos para el ensayo y la certificación de estándares de calibración gaseosos (Mayo de 2012)" EPA 600/R-12/531, utilizando los procedimientos de ensayo enumerados. La metodología analítica no requiere corrección por interferencia analítica. Este cilindro tiene una incertidumbre analítica total como se indica a continuación con un nivel de confianza del 95%. No existen impurezas significativas que afecten el uso de esta mezcla de calibración. Todas las concentraciones se basan en mol/mol a menos que se indique lo contrario. Los resultados se refieren únicamente a los elementos probados. El informe no debe reproducirse excepto en su totalidad sin la aprobación del laboratorio. No utilice este cilindro por debajo de 100 psig, es decir, 0.7 megapascales.

PRUEBA DE RESPUESTA A LA INTERFERENCIA

Fecha de la prueba: 12/5/17 Nombre: Brett Sherwood
Analizador: Tipo / Modelo: O2/CO2 CAI 700 LX HE# 741
Número de serie: 1708026

Método de Referencia: Método 7E de la Agencia de Protección Ambiental de Estados Unidos

Resultados de O_2:

Gas de prueba	Concentración, ppmv o %	% Respuesta de salida del analizador	% Interferencia del Intervalo (21.42 %)
SO_2	490.2	0.01	0.04
CO_2	19.52	0.02	0.09
NO	475.5	-0.01	0.04
NO_2	50.08	0.13	0.61
H_2	40	0.21	0.98
CO	445.3	0.04	0.19

Se utilizó un Cilindro de Calibración que contenía 21.42% de oxígeno para ajustar el analizador (Span Analyzer)

Resultados de la Respuesta a la Interferencia:

Suma de Diferencias Absolutas	Porcentaje Máximo Permitido de Interferencia del Span (%)	Porcentaje Máximo Permitido de Interferencia del Span (%)
0.42	1.95	2.5

Resultados de CO_2:

Gas de prueba	% Respuesta de salida del analizador	% Respuesta de salida del analizador	% Interferencia del span (19.52 %)
SO_2	490.2	0.00	0.0
CO_2	4.945	0.00	0.0
NO	475.5	0.00	0.0
NO_2	50.08	0.00	0.0
H_2	40	0.00	0.0
CO	445.3	0.02	0.01

Se utilizó un Cilindro de Calibración que contenía 19.52% de dióxido de carbono para ajustar el analizador (Span Analyzer)

Resultados de la Respuesta a la Interferencia:

Suma de los Porcentajes de Interferencia de los Gases Individuales	Suma de los Porcentajes de Interferencia de los Gases Individuales	Porcentaje Máximo Permitido de Interferencia del Span (%)
0.02	0.01	2.5

Información sobre Acreditación/ Certificaciones

Estado de California
Junta de Recurso de la Calidad de Aire

Orden Ejecutiva I-24-008

Relacionada con la Aprobación de Contratistas Independientes Bajo el Código de Reglamentos de California, Título 17, Sección 91207 y siguiendo a Montrose Air Quality Services, LLC

Considerando que la Junta de Recursos de la Calidad del Aire de California (CARB, por sus siglas en inglés), de conformidad con el Código de Salud y Seguridad de California, sección 41512, ha establecido los procedimientos contenidos en el Código de Reglamentos de California, título 17, sección 91200 y siguientes, para permitir el uso de probadores independientes para las pruebas de conformidad exigidas por la CARB;

Considerando que se ha determinado que Montrose Air Quality Services, LLC cumple los requisitos de CARB para realizar los métodos de prueba CARB 1, 2, 3, 4, 5, 6, 8, 17, 20 y 100 (CO, CO_2, NO_x, O_2, SO_2, THC), la evaluación de emisiones visibles (VEE) y los métodos de prueba 201A, 202 y 205 de la Agencia de Protección Ambiental de Estados Unidos (U.S. EPA) de conformidad con el Cal. Code Regs., título 17, sección 91200 y siguientes, cuando se cumplan las siguientes condiciones:

1. Montrose Air Quality Services, LLC marca o graba permanentemente un número de identificación en el cuerpo de cada uno de sus tubos de Pitot de acuerdo con la sección 2.1 del Método de prueba 2 de CARB;
2. Montrose Air Quality Services, LLC calibra sus manómetros de presión diferencial después de cada serie de ensayos de conformidad con la sección 2.2 del método de ensayo CARB 2, y establece y mantiene un registro de las calibraciones;
3. Montrose Air Quality Services, LLC calibra sus medidores de temperatura de acuerdo con la sección 4.3 del método de prueba CARB 2, y establece y mantiene un registro de las calibraciones;
4. Montrose Air Quality Services, LLC calibra su sistema de medición de acuerdo con la sección 5.3 del método de prueba CARB 5, y establece y mantiene un registro de las calibraciones;
5. Montrose Air Quality Services, LLC adquiere y utiliza una bureta de 5 ml de acuerdo con la sección 2.3.3 del método de ensayo CARB 6 y la sección 4.2 del método de ensayo CARB 20;
6. Montrose Air Quality Services, LLC adquiere y utiliza vasos de precipitados de vidrio de 300 a 500 mL de acuerdo con la sección 6.2.2(c) del método de prueba 202 de la Agencia de Protección

Ambiental de Estados Unidos;

7. Montrose Air Quality Services, LLC utiliza desecante de acuerdo con la sección 3.3.2 de los métodos de prueba CARB 5 y 17, la sección 7.2.2 del método de prueba 201A de la Agencia de Protección Ambiental de Estados Unidos y la sección 7.2.4 del método de prueba 202 de la Agencia de Protección Ambiental de Estados Unidos;
8. La persona que realiza la VEE ha superado las pruebas MM104: Evaluación de emisiones visibles (en línea) y MM105: Evaluación de emisiones visibles (en clase), y está actualmente certificada para realizar VEE. Cualquier recertificación para VEE, tras la aprobación inicial de la FOE de CARB, debe ser de un organismo certificador reconocido por CARB en el momento en que se realice la VEE; y Considerando que, de conformidad con el artículo 39516 del Código de Salud y Seguridad de California, el Director Ejecutivo de la CARB dictó la Orden G-02-008, por la que delegaba en el Jefe de la División de Control y Laboratorio (MLD) de la CARB la autoridad para autorizar a los probadores independientes de conformidad con el Cal. Code Regs. 17, sección 91200 y siguientes.

Ahora, por lo tanto, yo, Walter Ham, jefe de la división de MLD, ordeno que se conceda a Montrose Air Quality Services, LLC la aprobación desde la fecha de ejecución de esta Orden Ejecutiva hasta el 30 de junio de 2026, para llevar a cabo los métodos de prueba identificados anteriormente sujetos al cumplimiento de Cal. Code Regs, tit. 17, sección 91200 y siguientes.

Se ordena además que, durante el período aprobado, el funcionario ejecutivo o su representante autorizado puedan auditar sobre el terreno una o más pruebas realizadas de conformidad con esta Orden Ejecutiva para cada método de prueba identificado anteriormente.

Se ordena además que la Orden Ejecutiva I-22-003 sea sustituida por la presente orden.

Ejecutado en Sacramento, California, este, 14 de Junio 2024

_____

Walter Ham, Ph.D.,

Jefe de la División de Control y Laboratorio

STACK TESTING ACCREDITATION COUNCIL

Asociación Americana para la Acreditación de Laboratorios

Organismo Acreditado para Ensayos de Emisiones a la Atmósfera

A2LA ha acreditado a

SERVICIOS DE CALIDAD DEL AIRE DE MONTROSE

En reconocimiento a la finalización con éxito del proceso de evaluación conjunto de A2LA y la Sociedad de Evaluación de Fuentes (SES), este laboratorio está acreditado para realizar actividades de ensayo de conformidad con ASTM D7036:2004 - Práctica Estándar para la Competencia de los Organismos de Ensayo de Emisiones a la Atmósfera.

Presentado este 23 de enero de 2026.

Apéndice D.5
Resumen del Programa de Garantía de Calidad y Calendario de Calibración de los Equipos

RESUMEN DEL PROGRAMA DE GARANTÍA DE CALIDAD Y CERTIFICACIONES

Montrose Air Quality Services, LLC (Montrose) garantiza la calidad y validez de sus procedimientos de medición y notificación de emisiones mediante un riguroso programa de garantía de calidad (GC). El programa es desarrollado y administrado por personal interno de QA y abarca siete áreas principales:

1. Elaboración y utilización de un manual interno de GC
2. Revisión de los informes, el trabajo de laboratorio y las pruebas sobre el terreno
3. Calibración y mantenimiento de equipos
4. Cadena de custodia
5. Formación continua
6. Conocimiento de los métodos de ensayo actuales
7. Programa de auditoría

A continuación, se analiza cada una de estas áreas por separado.

Manual de Garantía de Calidad. Montrose ha elaborado un Manual de garantía de calidad de acuerdo con las directrices de la EPA y la norma ASTM D-7036. El manual sirve para documentar y formalizar todos los esfuerzos de control de calidad de Montrose. El manual se actualiza constantemente y cada empleado que participa en los servicios técnicos de medición de emisiones debe leerlo, comprender su contenido y firmar una declaración en la que se compromete a que todo el trabajo que realice se ajustará a sus prácticas. El manual incluye detalles sobre las otras siete áreas de garantía de calidad que se tratan a continuación.

Revisiones de Control de Calidad. El procedimiento de revisión de Montrose incluye la revisión de cada informe de ensayo en origen por parte del responsable de control de calidad o puesto equivalente, incluyendo la introducción de datos, los cálculos y promedios, y el texto del informe. El director de laboratorio o equivalente revisa todo el trabajo de laboratorio, y la persona cualificada in situ revisa todo el trabajo de campo y las hojas de datos.

La revisión más importante es la que tiene lugar antes de que comience un programa de pruebas. El director de control de calidad trabaja con el personal de ensayos para preparar y revisar los protocolos de ensayo. La revisión de los protocolos de ensayo incluye la selección de los procedimientos de ensayo adecuados, la evaluación de cualquier interferencia u otras restricciones que pudieran impedir el uso de procedimientos de ensayo estándar, y la evaluación y/o el desarrollo de procedimientos alternativos.

Calibración y Mantenimiento del Equipo. El equipo utilizado para realizar las mediciones de emisiones se mantiene de acuerdo con las instrucciones del fabricante para garantizar su correcto funcionamiento. Además del programa de mantenimiento, se llevan a cabo calibraciones en cada dispositivo de medición de acuerdo con el calendario que se describe a continuación. Los calendarios de mantenimiento y calibración figuran en las tablas A-1 y A-2.

También se realizan comprobaciones de control de calidad sobre el terreno para cada programa de pruebas. A continuación, se incluye una lista parcial de las comprobaciones realizadas como parte de cada serie de pruebas del sistema de analizador continuo, como ejemplo de los procedimientos de control de calidad sobre el terreno.

- Comprobación de fugas del sistema de adquisición y acondicionamiento de muestras
- Calibración de 3 puntos del analizador (todos los analizadores)
- Comprobación completa de la calibración del sistema ("calibración dinámica" de todo el sistema de muestras)

- Se realizan comprobaciones periódicas de la calibración del analizador al inicio y al final de cada prueba. Se registra cualquier cambio entre las lecturas anteriores y posteriores a la prueba.
- Todas las calibraciones se realizan con gases del protocolo de la EPA certificados por el fabricante
- Los datos de calibración y de rendimiento continuo del analizador se documentan íntegramente y se incluyen en cada informe de prueba en la fuente

Cadena de Custodia. Montrose mantiene una documentación completa de la cadena de custodia en todas las muestras y hojas de datos. Además de la documentación normal de los cambios entre los custodios de las muestras de campo, el personal de laboratorio y el personal de pruebas de campo, Montrose documenta a cada persona que manipula cualquier componente de la prueba en el campo (por ejemplo, lavado de la sonda, carga y recuperación del impulsor, carga y recuperación del filtro, etc.).

Las muestras se almacenan en una zona cerrada a la que sólo tiene acceso el personal del laboratorio. Ni otros empleados de Montrose ni los equipos de limpieza tienen llaves de esta zona.

Formación. La formación del personal es esencial para garantizar la calidad de las pruebas. Montrose dispone de programas de formación formales e informales que pueden incluir algunos o todos los elementos siguientes:

1. Asistencia a cursos de formación patrocinados por la EPA
2. El requisito de que todos los técnicos lean, entiendan y firmen el manual de control de calidad de Montrose
3. Formación interna y reuniones periódicas de Montrose
4. Mantenimiento de registros de formación
5. Administración de pruebas internas de individuos cualificados (QI, por sus siglas en inglés) para todos los métodos realizados
6. Participación en el programa Qualified Source Testing Individual (QSTI) administrado por la Source Evaluation Society (SES).

Conocimiento de los Métodos de Ensayo Actuales. Con la actualización constante de los métodos de prueba estándar y la amplia variedad de métodos de prueba emergentes, es esencial que cualquier evaluador de fuentes cualificado se mantenga al corriente de los nuevos desarrollos. Montrose está suscrito a servicios que proporcionan actualizaciones sobre los métodos de referencia de la EPA y sobre las normas y reglamentos de la EPA y de las agencias locales. Además, el personal de pruebas en origen asiste con regularidad a seminarios y conferencias sobre pruebas y emisiones y presenta ponencias en ellos.

Programa de Auditoría. Montrose participa en el programa de auditoría de muestras de fuentes estacionarias (SSAS) del TNI para todos los métodos para los que se dispone de muestras de auditoría.

TABLA A-1
CALENDARIO DE CALIBRACIÓN DE
INSTRUMENTOS Y EQUIPOS DE MUESTREO

Tipo de Instrumento	Frecuencia de Calibración[1]	Norma de Comparación o Método de Calibración	Límites de aceptación
Medidor de Orificio (grande)	12 meses	Medidor de prueba en seco calibrado	± 2% del volumen medido
Medidor de Gas Seco	6 meses o al ser reparado	Medidor de prueba en seco calibrado	± 2% del volumen medido
Orificio Crítico	6 meses	Medidor de prueba en seco calibrado	± 0.5% del K' medio
Pitot Tipo S (para uso con tren de muestreo tipo de la Agencia de EPA)	6 meses	Método 2 de la EPA	Mediciones geométricas dentro de los márgenes especificados en el método
Medidores de Vacío	12 meses	Medidor Trazable a NIST Termómetro de Mercurio NBS	≤ 1.0 in Hg de diferencia
Medición de la Temperatura (termopares)	12 meses	RTD de Platino Calibrado NBS	±4 °F para <400 °F ± 1.5% para >400 °F
Dispositivos de Lectura de Temperatura	6 meses	Simulador de Termocupla	± 2% lectura a fondo de escala
Balanza Analítica	12 meses (comprobar antes de cada uso)	Pesas Trazables NIST	± 0.5 mg del peso declarado
Boquillas de Sonda	12 meses	Comprobación del Diámetro de la Boquilla	Alcance <± 0.10 mm para micrómetro de tres medidas
Analizadores Continuos	Cada día de campo, Depende del uso, la frecuencia y el rendimiento	Según lo especificado en los manuales de instrucciones de los fabricantes, los gases NBS de la EPA y/o los métodos de referencia.	Satisfacen todos los límites especificados en las especificaciones de funcionamiento

[1] Las frecuencias de calibración tabuladas son normas mínimas. En algunos casos, las calibraciones se realizan con mayor frecuencia.

TABLA A-2
PROGRAMA DE MANTENIMIENTO DEL EQUIPO
Basado en las especificaciones del fabricante y la experiencia de Montrose

Equipos	Requisitos de rendimiento	Intervalos de Mantenimiento[2]	Acción Correctiva
Bombas	1. Ausencia de fugas 2. Se requiere capacidad para dibujar al fabricante vacío y caudal	6 meses	1. Inspección visual 2. Limpiar 3. Sustituir las piezas desgastadas 4. Comprobación de fugas
Medidor de Caudal	1. Movimiento mecánico libre 2. Ausencia de averías	6 meses	1. Inspección Visual 2. Limpiar 3. Calibrar
Instrumentos de Muestreo	1. Ausencia de averías 2. Respuesta correcta a cero, gas patrón	Según los requisitos del fabricante	Según las recomendaciones del fabricante
Sistemas de Muestreo de Furgoneta Móvil	Ausencia de fugas	Depende de la naturaleza del uso	1. Cambiar los filtros 2. Comprobación de fugas 3. Comprobar si hay contaminación en el sistema
Líneas de Muestreo	Degradación de la muestra inferior al 2%.	Después de cada prueba o serie de pruebas	Blow filtered air through line until dry

[2] Los intervalos de mantenimiento tabulados son normas mínimas. En algunos casos, el mantenimiento se realiza con mayor frecuencia.

REVISIÓN Y CERTIFICACIÓN

Jefe de Equipo:

El trabajo aquí realizado se llevó a cabo bajo mi supervisión, y certifico que:

a) los detalles y resultados contenidos en este informe son, a mi leal saber y entender, una representación auténtica y exacta del programa de pruebas,
b) que los procedimientos de muestreo y análisis y los datos presentados en el informe son auténticos y exactos,
c) que todos los detalles y conclusiones de las pruebas son exactos y válidos, y
d) que la tasa de producción y/o la tasa de entrada de calor durante la prueba en la fuente se comunican con exactitud.

Si este informe se presenta a efectos de cumplimiento, sólo deberá reproducirse en su totalidad. Si tiene alguna pregunta sobre este informe, póngase en contacto con Jeramie Richardson en el (810) 923-3181 o conmigo mismo en el (913) 530-4713.

SECCIÓN 1. INTRODUCCIÓN

1.1. Resumen

Blue Sky Environmental, Inc. fue contratada por Bloom Energy para realizar una serie de pruebas de emisiones en sus instalaciones de Mountain View, California. Las pruebas se llevaron a cabo para determinar el cumplimiento de las Normas de Emisiones de Combustibles Fósiles de 2007 del Reglamento de Certificación de DG de CARB para ES-6.5.

Las pruebas fueron realizadas por Finnegan Schall, Kyle Andersen, Frankie Sanfiorenzo y Vince Gigli de Blue Sky Environmental, Inc. los días 4 y 5 de diciembre de 2023. Amanda Marruffo de Bloom Energy coordinó el programa de pruebas.

Los resultados del programa de pruebas se presentan en este informe. La información de las pruebas en la fuente se resume en la Tabla 1-1. Los resultados de las pruebas individuales se proporcionan en el Apéndice A. Todos los datos de apoyo se incluyen en los apéndices.

Tabla 1-1 Información sobre las pruebas en la fuente

Ubicación de la Prueba:	Bloom Energy 543 Bailey Road, Mountain View, CA 94043
Contacto de la Fuente:	Amanda Marruffo - Bloom Energy (214) 435-4587
Fuentes Probadas:	Energy Server 6.5 - pila de combustible de óxido sólido (SOFC)
Fecha de Prueba de la Fuente:	4-5 de diciembre de 2023
Objetivo de la Prueba:	Determinar el cumplimiento de los límites de emisión y los requisitos de prueba de fuentes de la Orden Ejecutiva DG-044 de la Junta de Recursos del Aire del Estado de California
Prueba Realizada Por:	Blue Sky Environmental, Inc. 2273 Lobert Street, Castro Valley, CA 94546 Finnegan Schall (913) 530-4713 fschall@blueskyenvironmental.com
Parámetros de la Prueba:	Sólo Gas Natural NO_X, CO, CO_2, O_2, COV, THC, CH_4, caudal volumétrico de chimenea y contenido de humedad

Administrative Record NSR 10833_000961

Tabla 1-2 Resumen de conformidad

Parámetro de Emisión	Resultados Medios Energía SC-13 (67.27 kW)	Límite Permitido
*ND= <2% del intervalo del analizador (<0,20) NOX, lb/MW-hora	*ND	0.07
CO, lb/MW-hora	0.013	0.1
COV, lb/MW-hora	0.00713	0.02

**ND = <2% del Rango del Analizador (<0.20)*

SECCIÓN 2. PROGRAMA DE PRUEBA EN LA FUENTE

2.1. Resumen

Esta prueba en la fuente se llevó a cabo para demostrar que el sistema de pila de combustible Energy Server 6.5 (Modelo ES6.5) de Bloom Energy funciona de conformidad con los límites de emisión de NOX, CO y COV y los requisitos de la prueba en la fuente estipulados en la Orden Ejecutiva DG-044 de la Junta de Recursos del Aire del Estado de California.

El Reglamento de Certificación de Generación Distribuida requiere en la Sección 94203 (d} Cumplimiento: "Las unidades de GD deben cumplir las normas de emisión aplicables durante 15.000 horas de funcionamiento cuando se operan y mantienen de acuerdo con las instrucciones del fabricante". La solicitud de Certificación CARB DG solicita documentación que demuestre que la tecnología cumple con las normas de emisión durante 15.000 horas de funcionamiento. Aunque el protocolo de pruebas CARB requerido no exige una prueba de 2 años, Bloom Energy puede proyectar que el modelo ES6.5 cumplirá las normas de emisiones durante al menos 15.000 horas de funcionamiento. Las emisiones permanecerán dentro de los límites simplemente porque la tecnología fundamental de la pila de combustible de óxido sólido (SOFC) de Bloom Energy y la arquitectura del proceso no promueven la liberación de estas especies.

El nitrógeno (NO_X) se produce durante el proceso de combustión cuando el nitrógeno y el oxígeno están presentes a temperaturas elevadas. Los dos elementos se combinan para formar NO_X (NO y NO_2). Las emisiones de NO_X no se forman en cantidades significativas hasta que las temperaturas de combustión alcanzan los 2800°F. Muchos procesos de combustión generan NO_X debido a sus altas temperaturas de combustión. En cambio, la tecnología de Bloom genera energía utilizando la oxidación electroquímica del combustible en lugar de la combustión, y funciona a temperaturas muy inferiores a 2.800 °F. Bloom no prevé que las emisiones de NO_X del modelo ES-6.5 superen la norma CARB 2007 en o después de 15.000 horas de funcionamiento.

El monóxido de carbono (CO) se produce a partir de la oxidación parcial de compuestos que contienen carbono; se forma cuando no hay suficiente oxígeno para producir dióxido de carbono (CO_2), como cuando las temperaturas de combustión son demasiado bajas o cuando no hay suficiente mezcla de combustible y aire. El funcionamiento electroquímico del modelo ES-6.5 significa que, por su diseño, el modelo ES-6.5 no promueve la formación clásica de CO basada en la combustión. Sin embargo, a diferencia de otras tecnologías de pilas de combustible, las pilas SOFC pueden realmente consumir CO como combustible para generar electricidad. Así, si se crea CO en el proceso de reformación, las pilas lo consumirán y lo oxidarán en. Además, la tecnología de Bloom utiliza componentes integrados en el funcionamiento del sistema que tienen el beneficio adicional de convertir cualquier residuo de CO en CO_2 antes de ser expulsado. Este último proceso se controla estrictamente durante toda la vida útil del producto. Esto significa que, si se generara CO en el sistema, se convertiría en CO_2 antes de ser agotado. Por último, dado que la tecnología de Bloom está diseñada para funcionar durante 10 años, y que requiere las pilas de SOFC para funcionar, y estas pilas de SOFC consumen CO, Bloom no prevé que las emisiones de CO de la ES-6.5 superen la norma CARB 2007 a las 15.000 horas de funcionamiento o después.

La única fuente posible de emisiones de compuestos orgánicos volátiles (COV) no metánicos del modelo ES-6.5 son las trazas de etano, propano, etc. que están presentes en pequeñas cantidades en el gas natural de gasoducto - o trazas de gases orgánicos que son productos de la combustión incompleta. Cuando el combustible de gas natural entra en el modelo ES-6.5, los gases que lo

componen son totalmente catalizados y/o consumidos en el sistema. Por consiguiente, Bloom no prevé que las emisiones de COV no metánicos superen la norma CARB 2007 a las 15.000 horas de funcionamiento o después.

2.2. Contaminantes analizados

Se utilizaron los siguientes métodos de muestreo y análisis de la Junta de Recursos Atmosféricos de California (CARB), el Distrito de Gestión de la Calidad del Aire de la Costa Sur (SCAQMD) y la Agencia de Protección Ambiental de los Estados Unidos (EPA):

Método 1 de la Agencia de la EPA	Puntos transversales de la pila
Método 2 de la EPA	Flujo de pilas
Método 4 de la Agencia de la EPA	Determinación de la humedad de las pilas
Método CARB 100	Emisiones de NO_X, CO, O_2
Método 7E de la EPA	Eficacia de conversión de NO_2 a NO
SCAQMD Método 25.3	Emisiones de COV

2.3. Fecha de la prueba

Las pruebas se realizaron los días 4 y 5 de diciembre de 2023.

2.4. Personal de muestreo y observación

El muestreo fue realizado por Finnegan Schall, Kyle Andersen, Frankie Sanfiorenzo y Vince Gigli de Blue Sky Environmental, Inc. Amanda Marruffo, de Bloom Energy, coordinó el programa de pruebas.

2.5. Fuente/Proceso Descripción

Las instalaciones de pruebas de Bloom Energy se encuentran en 543 Bailey Road, Mountain View California. Las instalaciones se utilizan para probar los sistemas de pilas de combustible de Bloom Energy, denominados Energy Servers.

El programa de pruebas se centró en la pila de combustible de óxido sólido (SOFC) Energy Server 6.5 de Bloom Energy. La unidad puede funcionar con gas natural, hidrógeno mezclado, biogás e hidrógeno. El gas de escape del cátodo se expulsa normalmente a la atmósfera a través de una rejilla rectangular. Para esta prueba, el gas de escape se redirigió a través de una pieza de conducto de transición a una extensión de chimenea cilíndrica instalada temporalmente. En el Apéndice H se incluye una copia de la hoja de especificaciones.

2.6. Condiciones de funcionamiento de la fuente

Las pruebas de emisiones se realizaron mientras la unidad funcionaba en las condiciones requeridas por el Reglamento de Certificación de Generación Distribuida. La unidad se probó mientras funcionaba a plena potencia en las siguientes condiciones:

- Etapas 1-3 - potencia de salida de 67.27 kW, alimentada con gas natural.
- Funcionamientos 4-6 - potencia de salida de 67.48 kW, alimentada con gas natural.

SECCIÓN 3 PROCEDIMIENTOS DE MUESTREO Y ANÁLISIS

3.1. Ubicación del puerto

El muestreo se realizó en la chimenea de escape de 6 pulgadas de diámetro de la pila de combustible a través de puertos de 2 pulgadas de diámetro situados en una extensión de chimenea instalada temporalmente. Los puertos se ubicaron aproximadamente a 10 pies (20 diámetros de chimenea) aguas abajo de la perturbación más cercana y a 10 pies (20 diámetros de chimenea) aguas arriba del escape. Esta ubicación cumplía los criterios mínimos del Método 1 de la EPA de dos diámetros de chimenea aguas abajo de la perturbación más cercana y 0.5 diámetros de chimenea aguas arriba de la perturbación o el escape más cercanos.

3.2. Punto Descripción/Etiquetado - Puertos/Pila

Blue Sky Environmental realizó dos recorridos perpendiculares de 4 puntos de la chimenea para comprobar la presencia de estratificación. La estratificación fue inferior al 10%; por lo tanto, el muestreo CEM subsiguiente se realizó utilizando un punto representativo medio.

3.3. Descripción del tren de muestreo

Los diagramas del sistema de muestreo figuran en el Apéndice G. En la sección siguiente se incluye información descriptiva adicional.

3.4. Descripción del procedimiento de muestreo

Se realizaron tres pruebas consecutivas de emisiones gaseosas de 60 minutos para óxidos de nitrógeno (NO_X), monóxido de carbono (CO) y oxígeno (O_2) en la chimenea de escape de la pila de combustible. Antes de comenzar las pruebas, se comprobó que el sistema de muestreo no presentaba fugas, taponando la sonda de muestreo y observando que el caudal del rotámetro de muestreo descendía a cero. La temperatura de la línea de muestra calentada entre la sonda y el acondicionador/condensador de muestra, y las temperaturas de escape del condensador se mantuvieron dentro de los límites del método durante cada prueba. Se comprobaron la linealidad del instrumento y el sesgo del sistema. Se registró el tiempo de respuesta del sistema para cada analizador. Se realizaron calibraciones externas del analizador antes y después de cada prueba utilizando estándares de gas certificados por el protocolo de la EPA. Cualquier desviación se corrigió utilizando el método CARB 100. Se realizó una comprobación de la eficiencia del convertidor de NO_X antes de la primera prueba y se alcanzó una eficiencia superior al 90%.

Blue Sky Environmental. Inc. recogió una muestra de gases de escape durante cada prueba para analizar los COV. Las muestras se recogieron en botes SUMMA de 6 litros y fueron analizadas por Atmospheric Analysis & Consulting (AAC) en Ventura, California.

Blue Sky Environmental, Inc. se coordinó con el personal del emplazamiento y no comenzó las pruebas hasta que la unidad hubo alcanzado unas condiciones de funcionamiento estables, según indicó el personal de Bloom Energy in situ. Las tasas de producción de energía se controlaron mediante un registrador de potencia Fluke 1736. Para más información, consulte la documentación de calibración incluida en el Apéndice F

Los métodos de muestreo y análisis se resumen a continuación:

Método 1 de la EPA - Muestreo y recorridos de velocidad para fuentes estacionarias

Este método se utiliza para determinar el área del conducto o chimenea y los puntos transversales apropiados que representan áreas iguales del conducto para las mediciones de muestreo y velocidad.

Método 2 de la EPA - Determinación de la velocidad y el caudal volumétrico de los gases de chimenea (tubo de Pitot tipo S)

Este método se utiliza para determinar la velocidad del gas de chimenea, el caudal volumétrico y la presencia o ausencia de flujo ciclónico utilizando un tubo de Pitot estándar o de tipo S y un manómetro inclinado. La temperatura se controla mediante un termopar de tipo K y un medidor de temperatura Omega calibrado. Los procedimientos de GC/CC incluyen una comprobación de fugas del sistema antes y después de cada travesía para validar los resultados. Las calibraciones de los termómetros se realizan con un calibrador Omega modelo CL-300. Las calibraciones geométricas de los tubos pitot tipo S se realizan cada seis meses o de acuerdo con las directrices descritas en el Volumen VI, Tabla 3, de QA/QC de la Junta de Recursos Atmosféricos de California (CARB).

Método 4 de la EPA - Determinación del contenido de humedad en los gases de chimenea

Este método se utiliza para determinar el contenido de humedad del gas de chimenea. La muestra se extrae y condensa en impactadores Greenburg-Smith sumergidos en un baño de hielo y en una trampa de gel de sílice de impactador final. La humedad se condensa en una solución de agua desionizada, o en soluciones de otro tipo de tren de muestreo si la humedad se está determinando como parte de otro método de muestreo, como el método 5 de la EPA, el método 201.7 del SCAQMD o el ST-32 del BAAQMD. La ganancia de humedad en las soluciones de impactador y gel de sílice se determina volumétrica y gravimétricamente, respectivamente.

Los procedimientos de GC/CC requieren que se extraiga un mínimo de 21 pies cúbicos de muestra utilizando una bomba estanca. El volumen de la muestra se mide con un medidor de gas seco calibrado. Los impulsores se sumergen en un baño de hielo para mantener una temperatura de salida del gas inferior a 68°F. Se realizan comprobaciones de fugas antes de cada prueba utilizando un vacío mínimo de 15 pulgadas de mercurio. Las comprobaciones de fugas posteriores a la prueba se realizan con el vacío de muestra más alto o superior. La prueba de fugas es aceptable si la tasa de fugas es inferior a 0.02 pies cúbicos por minuto o al 4% de la tasa media de muestreo, lo que sea menor. Si la comprobación final de fugas supera los criterios, o bien se corrige el volumen en función de la tasa de fugas o bien se anula la prueba y se repite.

Método CARB 100 - Procedimientos para el muestreo continuo de emisiones gaseosas en chimenea

Este método de monitoreo continuo se utiliza para determinar las emisiones de óxidos de nitrógeno, monóxido de carbono, dióxido de carbono, hidrocarburos totales y oxígeno de fuentes estacionarias que fluyen en corrientes de gas en ductos, chimeneas y conductos. El muestreo se realiza extrayendo los gases de combustión de la chimenea, acondicionando la muestra para eliminar la humedad y las partículas, y analizándola mediante analizadores de gases de monitorización continua en una furgoneta de pruebas de monitorización continua de emisiones (CEM).

El sistema de muestreo consta de una sonda de muestreo de acero inoxidable, un conducto de muestreo de teflón calentado que se mantiene a 248°F ± 25, un filtro de partículas de fibra de vidrio, condensadores de vidrio de eliminación de humedad en hielo, un tubo de transferencia de muestras de teflón, una bomba de diafragma y un colector de acero inoxidable/teflón y un sistema de control/entrega de flujo. Se suministra a cada analizador una presión constante de suministro de gas de muestreo y calibración de 5 psi para evitar diferencias de respuesta de la variable de presión. Se comprueba la estanqueidad de todo el sistema de muestreo antes y al final del programa de muestreo.

Se comprueba la linealidad del sistema analítico y de muestreo con calibraciones cero, media (40-60%) y de intervalo alto (80-100%) y se comprueba el sesgo del sistema al principio y al final de cada serie. El sesgo del sistema se determina introduciendo gas de calibración en la sonda y haciéndolo pasar por

todo el sistema de muestreo. Todas las calibraciones durante las pruebas se realizan externamente para incorporar cualquier sesgo del sistema que pueda existir. Los valores de sesgo del sistema de muestreo, cero y deriva de calibración se determinan para cada prueba. Todos los gases de calibración son del protocolo nº1 de la EPA. El sistema de registro de datos del analizador consiste en un sistema de adquisición de datos (DAS).

Método 7E de la EPA - Determinación de las emisiones de óxidos de nitrógeno procedentes de fuentes estacionarias (procedimiento del analizador instrumental)

Este método se utiliza para medir los óxidos de nitrógeno en emisiones de fuentes estacionarias utilizando un analizador instrumental continuo. Se extrae una muestra de gas representativa continua del punto de muestreo y se acondiciona para eliminar el agua y el material particulado. El óxido nítrico se determina haciendo pasar la muestra por un analizador quimioluminiscente. El proceso quimioluminiscente se basa en la luz que se desprende cuando reaccionan el óxido nítrico y el ozono. Las concentraciones de dióxido de nitrógeno (NO_2) se determinan haciendo pasar la muestra por un catalizador que reduce el NO_2 a NO. La concentración total de óxidos de nitrógeno (NO_2 + NO) se determina entonces por quimioluminiscencia.
La sección 16.2.2 del método se utiliza para determinar la eficiencia de conversión de NO_2 a NO del analizador de NO_X.

Método 25.3 del SCAQMD - Determinación de emisiones de compuestos orgánicos no metánicos no etánicos de baja concentración procedentes de fuentes de combustión limpias

Este método se utiliza para medir compuestos orgánicos volátiles (COV) de baja concentración como compuestos orgánicos no metánicos no etánicos en productos de combustión en los que el metano y el etano son los únicos compuestos significativos exentos de COV.
El equipo de muestreo consta de una sonda de teflón o acero inoxidable de 1/8 de pulgada, un filtro de acero inoxidable, un colector de condensados de vidrio de 4 ml lleno de 2 ml de agua ultrapura, un vacuómetro y un bote SUMMA. El agua helada se mantiene por encima del nivel del agua de la trampa, pero por debajo del borde de la tapa del vial. El caudal del SUMMA Canister se regula mediante un orificio o regulador. El agua se enfría previamente (>5 minutos) antes de la toma de muestras. El sistema se somete a una comprobación de fugas antes y después de la prueba. La línea se enjuaga con 1 ml de agua ultrapura. El método no exige un campo en blanco "montaje completo", pero a menudo se recoge.
La muestra de emisión se extrae gradualmente a través de una trampa mini-impactadora que contiene agua desionizada ultrapura y se sumerge en agua helada y en un SUMMA Canister de 6 litros. El carbono orgánico total de la trampa se analiza mediante inyección de líquido en un analizador de carbono total por infrarrojos, y los recipientes se analizan según el método 25.1 utilizando una columna GC con prelavado y retrolavado, seguida de un oxidante, un metanizador y un FID. El GC separa el metano y el etano de la muestra, el oxidante convierte estos COV en CO_2 y el metanizador convierte el dióxido de carbono resultante en metano. Los resultados se determinan por FID como carbono.

3.5. Instrumentación y procedimientos analíticos

Se utilizaron los siguientes analizadores de emisiones en continuo:

Instrumentación	Parámetro	Principio
TECO Modelo 42C	$NO_X/NO/NO_2$	Quimioluminiscencia
TECO Modelo 48C	CO	Correlación de filtros de gas/Infrarrojos
Servomex Modelo 1400	CO_2	Infrarrojos
Servomex Modelo 1400	O_2	Paramagnético

Administrative Record NSR 10833_000967

Se utilizaron los siguientes rangos de calibración y gases:

Analito	Analizador Rango	Calibración alta	Calibración media	Calibración baja
NO_x, ppmv	10	8.554	5.856	0
CO, ppmv	10	8.643	5.252	0
CO_2, EN %	20	18.00	9.39	0
O_2, %	25	20.35	10.50	0

3.6. Criterios de rendimiento del sistema

Todos los gases de calibración son del Protocolo nº1 de la EPA. El sistema de registro de datos del analizador consiste en un registrador gráfico Honeywell DPR 3000, apoyado por un Sistema de Adquisición de Datos (DAS). La respuesta del instrumento se registra en gráficos de tiras y en el DAS. Los promedios se corrigen por deriva utilizando las ecuaciones del Método CARB 100 y del Método 7E de la EPA.

Linealidad del Instrumento	≤ 2% escala completa
Sesgo del instrumento	≤ 5% escala completa
Tiempo de respuesta del sistema	≤ ± 2 minutos
Eficiencia del convertidor de Nox (*Método EPA 7E*)	≥ 90%
Deriva del cero del instrumento	≤ ± 3% de escala completa
Deriva del fondo de escala del instrumento	≤ ± 3% de escala completa

3.7. Observaciones: Limitaciones y Cualificación de los Datos

Esta prueba en la fuente se llevó a cabo de conformidad con la cotización presentada a Bloom Energy. Se utilizó una válvula de cierre en la sonda del CEMS para evitar la contaminación ambiental durante los cambios de puerto. No se registraron ejecuciones de prueba inválidas, lapsos de tiempo, desviaciones ni excepciones durante el programa de pruebas.

Blue Sky Environmental, Inc. ha revisado la exactitud de este informe y ha concluido que los procedimientos de prueba se siguieron utilizando estándares de práctica aceptados, y que los mismos han sido descritos y documentados con precisión. La revisión abarcó los siguientes elementos:

Revisión del texto general
Revisión de los cálculos
Revisión de los datos del CEMS
Revisión de la documentación de respaldo

	Otro:	MW =	0.00	0.00	0.00	0.00	0.00	0.00	%
	Nitrógeno (N_2)	MW = 28	82.31	82.48	82.64	78.39	78.40	78.32	%
Peso molecular del gas de chimenea (MWs)			28.16	28.20	28.28	28.91	28.87	28.85	g/g-mol
Dimensión de Chimenea	Diámetro/Ancho		6.0	6.0	6.0	6.0	6.0	6.0	in
	Largo		#N/A	#N/A	#N/A	#N/A	#N/A	#N/A	in
Área de Chimenea (As)			0.20	0.20	0.20	0.20	0.20	0.20	ft^2
Factor Tubo Pitot (Cp)			0.84	0.84	0.84	0.84	0.84	0.84	
Velocidad Gas Chimenea			32.51	32.25	31.85	28.51	28.97	27.19	ft/s
Caudal Real			382.9	380.0	375.2	335.9	341.3	320.3	ACFM
Caudal Estándar			176.9	175.3	171.0	156.5	158.0	147.8	DSCFM

DEFINICIONES:
Bws = % humedad / 100
MWs = peso molecular del gas de chimenea (base húmeda)
MWd = peso molecular del gas de chimenea (base seca)
ΔP = presión diferencial del tubo de Pitot

CÁLCULOS:
MWs = MWd · (1 - Bws) + 18 (Bws)
MWd = 0.44(% CO_2) + 0.32(% O_2) + 0.28(% CO + % N_2) + (% otro · MW/100)
Ps = (Pstatic / 13.6) + Pb
As = (diameter / 24)2 · P - para chimeneas circulares; length · width / 144 - para chimeneas rectangulares
Vs = 85.49 · Cp · √ ΔP · √((Ts + 460) / (Ps · MWs))
ACFM = 60 · Vs · As
DSCFM = 60 · (1 - Bwo) · Vs · As · (Tstd + 460)/(Ts + 460) · (Ps/29.92)

Administrative Record NSR 10833_000974

Determinación del Caudal de Gas de Chimenea - Recorrido con Tubo de Pitot
Método EPA 4

Instalación: Bloom Energy
Unidad: Energy Server 6.5
Condición: Carga Máxima Sostenible
Fecha: 4/12/23 - 5/12/23

Atmospheric Analysis & Consulting, Inc. .

CLIENT	: Blue Sky Environmental, Inc.
NOMBRE DEL PROYECTO	: Bloom
N.º DE PROYECTO DE AAC	: 232572
FECHA DEL INFORME	: 18/12/2023

El 8 de diciembre de 2023, Atmospheric Analysis & Consulting, Inc. recibió doce (12) contenedores Summa de seis litros y doce (12) viales de impacto para el análisis de TNMNEOC mediante SCAQMD 25.3 y el análisis de gases fijos mediante la Agencia de Protección Ambiental de Estados Unidos 3C/SCAQMD IO.I. Al recibirlas, a las muestras se les asignaron números de identificación de laboratorio únicos de la siguiente manera:

ID del Cliente	N.º de Laboratorio	Presión de Retorno (mmHg)	ID del Cliente	N.º de Laboratorio	Presión de Retorno (mmHg)
RIA-25.3	232572-52300	655.0	R5-25.3	232572-52306	586.0
RIB-25.3	232572-5230I	695.0	R6-25.3	232572-52307	619.5
R2-25.3	232572-52302	582.5	R7A-25.3	. 232572-52308	608.0
R3-25.3	232572-52303	599.5	R7B-25.3	232572-52309	546.0
R4A-25.3	232572-52304	673.5	R8-25.3	232572-52310	'522.0
R4B-25.3	232572-52305	647.0	R9-25.3	232572-52311	546.0

Este análisis se realiza de acuerdo con el Manual de Calidad de AAC. Los resultados de las pruebas se aplican a la(s) muestra(s) tal como se recibieron. Para obtener información detallada sobre acreditaciones específicas de la Agencia de Protección Ambiental de Estados Unidos (EPA), NCASI, ASTM y SCAQMD (Métodos y Analitos), visite nuestro sitio web en www.aaclab.com.

Certifico que estos datos son técnicamente precisos, completos y cumplen con los términos y condiciones del contrato. No se encontraron problemas durante la recepción, preparación y/o análisis de estas muestras. El Director Técnico o su designado, según lo verificado por la siguiente firma, ha autorizado la divulgación de los datos.

Si tiene alguna pregunta o requiere una explicación adicional de los resultados de los datos, comuníquese con el suscrito.

INFORME DE RECEPCIÓN / REGISTRO DE MUESTRAS

Nombre del Cliente: Blue Sky Environmental

Nombre del Proyecto: Bloom

N.º de Proyecto de AAC: 232572

Muestreado por: Cliente
Recibido por: G. Ruelas
Tiempo de entrega: 5 días
Fecha de entrega del laboratorio: 15/12/2023
Fecha de entrega final: 12/15/2023

Fecha y Hora de Recepción de la Muestra Hora	ID del Cliente	Fecha/Hora de Muestreo	N.º de Muestra	Matriz	Análisis Solicitado
08/12/2023 1141	R9-25.3	06/12/2023	52311	Frasco e Impactador	SCAQMD 25.3
08/12/2023 1141	R1-TO 15/12	05/12/2023	52312	Frasco Summa	PAMS TO15
08/12/2023 1141	R1-TO 15/12	05/12/2023	52313	Frasco Summa	PAMS TO15
08/12/2023 1141	R1-TO 15/12	05/12/2023	52314	Frasco Summa	PAMS TO15

OBSERVACIONES: Total de muestras: 15

El cliente devolvió 12 frascos (1 anulado) + 1 sonda. Faltan 6 colectores 25.3 + 5 sondas + 4 tapones.

Los gases fijos se han normalizado al 100% en base seca

Hoja de Resumen de Cálculos del Método 25.3

Cálculos del TOC (trampa):

$$C_{Trampa} = \frac{(C_{Toc} \times V_{Trampa}) \times V_{id}}{(V_{Muestra}) \quad MW_c}$$

Donde:

C_{Trampa} = Concentración gaseosa de TOC en el agua de la trampa de condensado, ppmv (como carbono)
C_{Toc} = Concentración de TOC en ug/ml del agua de la trampa de condensado *(del impreso de datos brutos)*
V_{Trampa} = Volumen del agua de la trampa de condensado en ml *(de la hoja de datos de recepción de muestras)*
V_{id} = Volumen de gas ideal por mol a 25°C (24.4652 litros/mol)
MW_c = Peso atómico del carbono (12.01 g/mol)
$V_{Muestra}$ = Volumen muestreado en el tanque de recogida en litros (V_{Tanque} x ($P_r - P_i$)/ P_a)

Donde:

VTanque = Volumen del tanque de muestreo en litros *(de la hoja de datos de recepción de muestras)*
Pr = Presión de retorno del canister del tanque de muestreo *(de la hoja de datos de recepción de muestras)*
Pi = Presión inicial del canister del tanque de muestreo *(de la hoja de datos de recepción de muestras)*
Pa = presión atmosférica (760 mmHg)

Cálculos del TCA (tanque):

$$C_{Tanque} = C_{TCA} \times DF_{Tanque} \times 3.0$$

Donde:

C_{Tanque} = Concentración gaseosa del tanque, ppmv (como carbono)
C_{TCA} = Promedio de los resultados del análisis de los cromatogramas, ppmv (como propano)
DF_{Tanque} = Factor de dilución resultante de la presurización del tanque a la recepción (Pf/Pr)
3.0 = Conversión del resultado (como propano) a (como carbono)

Donde:

Pf = Presión final del canister después de la presurización para el análisis *(de la hoja de datos de recepción de muestras)*
Pr = Presión de retorno del canister a la recepción de la muestra *(de la hoja de datos de recepción de muestras)*

Cálculo final (tanque y trampa):

$$\text{VOC total (ppmC)} = (C_{Trampa} + C_{Tanque}) \times 1.086$$

Según el apartado 4.11 del método, la concentración final incluye un factor de corrección de sesgo de 1.086.

Cálculos de gases fijos (tanque):

$$\text{FG (i.e. } O_2) = C_{fg} \times DF_{Tanque} / NF$$

Donde:

C_{fg} = Promedio de los resultados del análisis de los cromatogramas, %
DF_{Tanque} = Factor de dilución resultante de la presurización del tanque a la recepción (Pf/Pr)
NF = Factor de normalización = suma de los promedios de todos los gases fijos x DF_{Tanque} / 100%

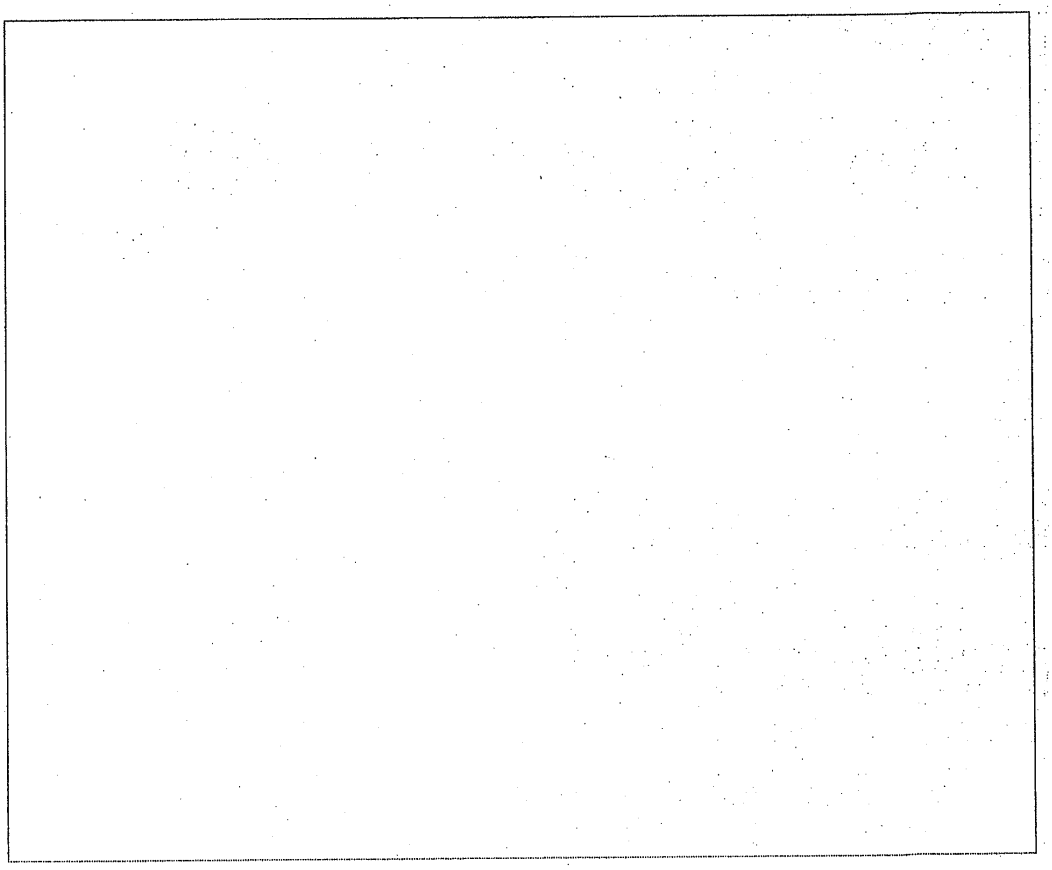
Resumen de Calibración

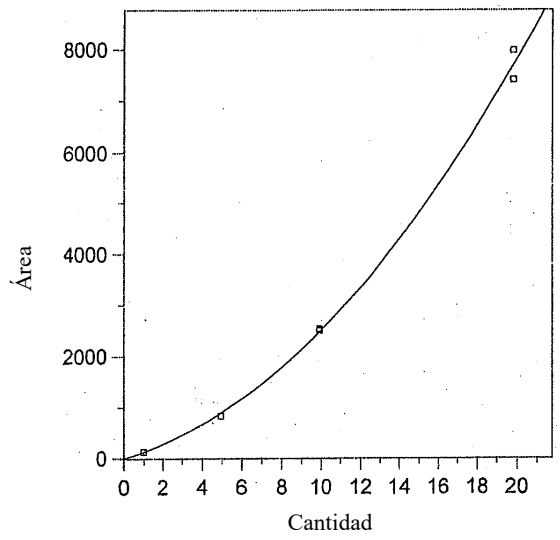
Administrative Record NSR 10833_001055



Nombre del Archivo: C:\Chromperfect 1\Cpmethods\Inst #01\2023\FG-092823 Standard.CAL
Versión: 371

Creador: CH
Description: Gases Fijos

Calibración de estándar interno
Sin corrección de volumen de inyección
Sin corrección de peso de muestra
Umbral de rechazo de área: 150
Umbral de rechazo de área de pico de referencia: 150
Unidades de cantidad: porcentaje
Sin componente predeterminado



Método de cálculo de promedios de puntos de datos: Peso igual para todas las actualizaciones
Sin informe de actualización de calibración

Todos los niveles son puntos de datos normales.

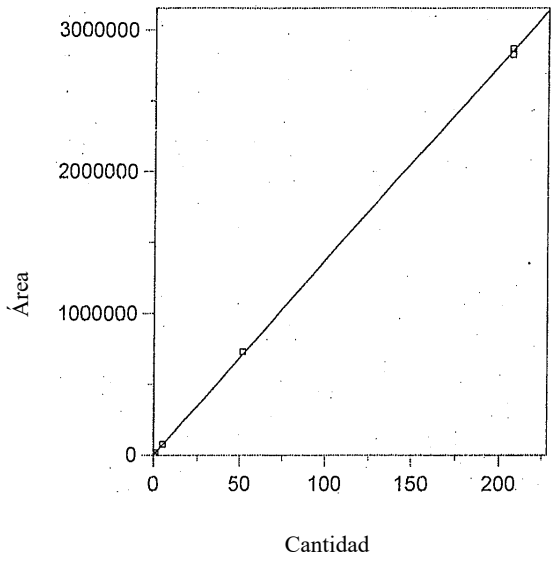
Nombre del Archivo: C:\Chromperfect 1\Cpmethods\Inst #04\2023\120123-25.1,3.CAL
Versión: 289

Creador: TT
Description: Metano, Ethane, Non-Metano and Non-Ethane con catalizadores



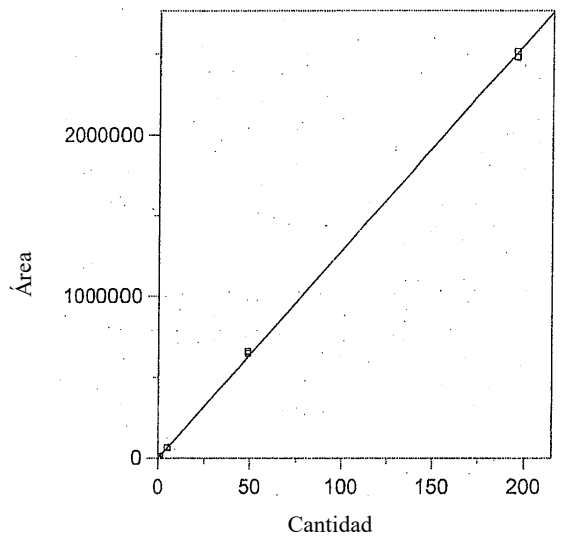
Calibración de estándar interno
Sin corrección de volumen de inyección
Sin corrección de peso de muestra
Área reject threshold: 500
Umbral de rechazo de área de pico de referencia: 500
Unidades de cantidad:
Sin componente predeterminado

Método de cálculo de promedios de puntos de datos: Peso igual para todas las actualizaciones
Sin informe de actualización de calibración

Todos los niveles son puntos de datos normales.

1 Monóxido de Carbono

Tiempo de retención esperado:	1.02 minutos
Ventana de búsqueda:	0.1 minutos
Sin componente de referencia de tiempo de retención	
Número de grupo:	0
Límite de alarma alto:	0
Límite de alarma bajo:	0
Constante de componente:	0



Cuantificación de pico único por área

Y = 13750.08 X + 0

Ajuste cuadrático con ponderación igual, forzado al origen	
Coeficiente de determinación:	0.9998549
Error promedio:	35.716%
GF promedio:	18635

CLIENTE : Blue Sky Environmental, Inc.
NOMBRE DEL PROYECTO : Bloom
N.º DE PROYECTO DE AAC : 232530
FECHA DEL INFORME : 15/12/2023

El 6 de Diciembre de 2023, Atmospheric Analysis & Consulting, Inc. recibió tres (3) bolsas Tedlar para el análisis ASTM D-1945. Al recibirlas, se asignaron a las muestras números de identificación de laboratorio únicos de la siguiente manera:

ID del Cliente	N.º de Laboratorio
Muestra de Combustible F1	232530-52134
Repuesto F2	232530-52135
Repuesto F3	232530-52136

Este análisis se realiza de acuerdo con el Manual de Calidad de AAC. Los resultados de la prueba se aplican a la(s) muestra(s) tal como se recibieron. Para obtener información detallada sobre acreditaciones específicas de la Agencia de Protección Ambiental de Estados Unidos (EPA), NCASI, ASTM y SCAQMD (Métodos y Analitos), visite nuestro sitio web en www.aaclab.com.

Certifico que estos datos son técnicamente precisos, completos y cumplen con los términos y condiciones del contrato. No se encontraron problemas durante la recepción, preparación y/o análisis de estas muestras. El Director Técnico o su designado, según lo verificado por la siguiente firma, ha autorizado la divulgación de los datos.

Si tiene alguna pregunta o requiere una explicación adicional de los resultados de los datos, comuníquese con el suscrito.

[firma]
Sucha Parman, Ph.D.
Director Técnico

Este informe consta de 5 páginas.

CERTIFICADO DE ANÁLISIS

Grado del producto: PROTOCOLO ESTÁNDAR DE LA AGENCIA DE PROTECCIÓN AMBIENTAL DE ESTADOS UNIDOS

Número de Pieza:	E03NI99E15A1702	Número de Referencia:	48-402684652-1
Número de Cilindro:	AAL072879	Volumen del Cilindro:	144.0 CF
Laboratorio:	124 - Los Ángeles (SAP) - CA	Presión del Cilindro:	2015 PSIG
Número PGVP:	B32023	Salida de la Válvula:	660
Código de Gas:	CO,NO,NOX,BALN	Fecha de Certificación:	14 de marzo de 2023

Fecha de caducidad: 14 de marzo de 2026

Certificación realizada de conformidad con el "Protocolo de trazabilidad de la Agencia de Protección Ambiental de Estados Unidos para el ensayo y la certificación de patrones de calibración gaseosos (mayo de 2012)", documento EPA 600/R-12/531, utilizando los procedimientos de ensayo indicados. La Metodología Analítica no requiere corrección por interferencias analíticas. Este cilindro tiene una analítica total incertidumbre que se indica a continuación con un nivel de confianza del 95%. No existen impurezas significativas que afecten al uso de esta mezcla de calibración. Todas las concentraciones se expresan en mol/ mol, salvo que se indique lo contrario. Los resultados se refieren únicamente a los elementos sometidos a prueba. El informe sólo podrá reproducirse íntegramente sin la aprobación del laboratorio. No utilice este cilindro por debajo de 100 psig, es decir, 0.7 megapascales.

RESULTADOS ANALÍTICOS

Componente	Concentración Solicitada	Concentración Actual	Método del Protocolo	Relativa Total Incertidumbre	Fechas de ensayo
NOX	8.500 PPM	8.554 PPM	G1	+/- 0.7% Trazable NIST	03/06/2023, 03/14/2023
MONÓXIDO DE CARBONO	8.500 PPM	8.643 PPM	G1	+/- 0.9% Trazable NIST	3/6/2023
ÓXIDO NÍTRICO	8.500 PPM	8.468 PPM	G1	+/- 1.1% Trazable NIST	03/06/2023, 03/14/2023
NITRÓGENO	Saldo				

ESTÁNDARES DE CALIBRACIÓN

CERTIFICADO DE ANÁLISIS

Grado del Producto: PROTOCOLO ESTÁNDAR DE LA AGENCIA DE PROTECCIÓN AMBIENTAL DE ESTADOS UNIDOS

Número de Pieza:	E03NI99E15W0021	Número de Referencia:	48-402348883-1
Número de Cilindro:	CC500698	Volumen del Cilindro:	144.4 CF
Laboratorio:	124 - Los Ángeles (SAP) - CA	Presión del Cilindro:	2015 PSIG
Número PGVP:	B32022	Salida de la Válvula:	660
Código de Gas:	NO2, O2, BALN	Fecha de Certificación:	17 de febrero de 2022

Fecha de caducidad: 17 de febrero de 2025

Certificación realizada de conformidad con el "Protocolo de trazabilidad de la Agencia de Protección Ambiental de Estados Unidos para el ensayo y la certificación de patrones de calibración gaseosos (mayo de 2012)", documento de la Agencia de Protección Ambiental de Estados Unidos 600/R-12/531, utilizando los procedimientos de ensayo indicados. La Metodología Analítica no requiere corrección por interferencias analíticas. Este cilindro tiene una analítica total incertidumbre que se indica a continuación con un nivel de confianza del 95%. No hay impurezas significativas que afecten al uso de esta mezcla de calibración. Todas las concentraciones se expresan en mol/ mol, a menos que se indique lo contrario. Los resultados se refieren únicamente a los elementos sometidos a prueba. El informe sólo podrá reproducirse íntegramente sin la aprobación del laboratorio. No utilice este cilindro por debajo de 100 psig, es decir, 0.7 megapascales.

MÉTODO 5 — CALIBRACIÓN DEL MEDIDOR DE GAS SECO USANDO ORIFICIOS CRÍTICOS

1) Seleccione tres orificios críticos para calibrar el medidor de gas seco que abarquen el rango de operación esperado.
2) Registre la presión barométrica antes y después del procedimiento de calibración.
3) Opere bajo el vacío de prueba (del Reporte de Calibración del Orificio), durante el tiempo necesario para alcanzar un volumen total mínimo de 5 pies cúbicos
4) Registre las lecturas en las casillas resaltadas; las demás columnas se calculan automáticamente.

USO DE LOS ORIFICIOS CRÍTICOS COMO ESTÁNDARES DE CALIBRACIÓN:

Las siguientes ecuaciones se usan para calcular los volúmenes estándar de aire que pasa a través del DGM, V_m(std), y del orificio crítico, V_cr(std), así como el factor de calibración del DGM, Y. Estas ecuaciones se calculan automáticamente en la hoja de cálculo anterior.

FACTOR PROMEDIO DE CALIBRACIÓN DEL MEDIDOR DE GAS SECO,, Y = 0.9707
FACTOR PROMEDIO ANTERIOR DE CALIBRACIÓN DEL MEDIDOR DE GAS SECO, Y = 0.9728
PROMEDIO $\Delta H_@$ = 1.7950

0.21 APROBADO

(1) $$Vm_{(std)} = K_1 * Vm * \frac{Pbar + (\Delta H / 13.6)}{Tm}$$

= Volumen neto de la muestra de gas que pasa por el DGM, corregido a condiciones estándar
K_1 = 17.64 °R/in. Hg (Inglés); 0.3858 °K/mm Hg (Métrico)
Tm = Temperatura promedio absoluta del DGM (°R — Inglés; °K — Métrico)

(2) $$Vcr_{(std)} = K' * \frac{Pbar * \Theta}{\sqrt{Tamb}}$$

= Volumen de la muestra de gas que pasa por el orificio crítico, corregido a condiciones estándar
= Temperatura ambiente absoluta (°R Inglés; °K Métrico)

(3) $$Y = \frac{Vcr_{(std)}}{Vm_{(std)}}$$

K' = Factor K' promedio de la calibración del orificio crítico
= Factor de calibración del DGM

$$\Delta H_@ = \left(\frac{0.75\,\theta}{V_{cr(std)}}\right)^2 \Delta H \left(\frac{V_{m(std)}}{V_m}\right)$$

Lugar de Calibración	1065 Comstock Street, Santa Clara, CA
Entorno Ambiental	23,0 +/- 5.0 grados C y 20 - 80 % de humedad relativa.
Resultados de las Mediciones	Consulte la(s) tabla(s) que comienza(n) en la página 3.

Proceso de Calibración

Esta calibración se realizó siguiendo el procedimiento del fabricante.

Incertidumbre de Medición

Consulte la(s) tabla(s) que comienza(n) en la página 3. Las incertidumbres comunicadas representan incertidumbres expandidas, expresadas aproximadamente al nivel de confianza del 95% utilizando un factor de cobertura de k = 2.

Regla de Decisión

Esta calibración utiliza una regla de decisión de riesgo gestionado para lograr una PFA (probabilidad de falsa aceptación) del 2% o inferior, basada en el Manual para la aplicación de ANSI/NCSL Z540.3-2006. Para las tolerancias de doble cara, se utiliza el método 6 de Z540.3 con el cálculo del límite de aceptación basado en la relación de incertidumbre del ensayo. Para tolerancias de una sola cara, se utiliza el método 5 de Z540.3, en el que el límite de aceptación se calcula restando la incertidumbre expandida del límite de tolerancia.

Conformidad con los Requisitos y Declaración de Trazabilidad

El sistema de calibración de Trescal cumple los requisitos de la norma ISO 17025:2017 y ANSI/NCSL Z540-1-1994. Esta calibración se realizó utilizando patrones trazables al Sistema Internacional de Unidades (SI) a través del NIST o de un Instituto Nacional de Medición (NMI) equivalente.

Bloomenergy®

Hoja de Datos

El Bloom Energy Server® 6.5

La plataforma de celdas de combustible de óxido sólido (SOFC) de Bloom Energy proporciona una vía sin combustión para convertir combustibles directamente en electricidad. El Energy Server es flexible en cuanto al combustible y puede generar energía utilizando gas natural, mezclas de hidrógeno, biogás e hidrógeno. Un enfoque de plataforma modular proporciona una vía para actualizar los sistemas existentes y alinearlos con los objetivos de sostenibilidad de nuestros clientes a lo largo del tiempo. Sin consumo de agua durante la operación normal y con una alta eficiencia operativa, el Bloom Energy Server reduce significativamente las emisiones de carbono hoy en día, al tiempo que proporciona una vía para operar con combustibles más limpios en el futuro.

El Bloom Energy Server proporciona energía base confiable y resiliente a las instalaciones. Está diseñado con un concepto modular ideal para la generación de energía distribuida en el sitio, operando 24x7, soportando la demanda de energía en paralelo a la red o en una arquitectura de microrred. Además, el calor de los gases de combustión puede capturarse del Energy Server e integrarse en una aplicación de Cogeneración (CHP).

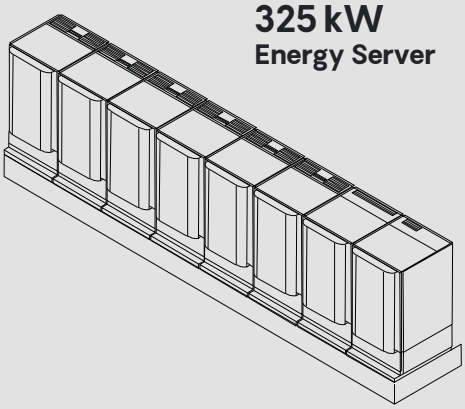
Bloom Energy tiene más de 1 GW de instalaciones de generación de energía desplegadas a nivel mundial en seis países. El Energy Server es adecuado para abordar las necesidades energéticas en cualquier industria y cuenta con instalaciones de varios megavatios en sectores como el comercio minorista, centros de datos, hospitales, estadios deportivos, manufactura y almacenamiento.

Limpio

Nuestros sistemas reducen los contaminantes criterio (NOx, SOx y material particulado) a casi cero y tienen emisiones de carbono mucho más bajas que las tecnologías heredadas.

Confiable

El Bloom Energy Server está diseñado en torno a una arquitectura modular de elementos simples repetitivos. Esto nos permite generar energía 24 x 7 x 365.



Resiliente

Nuestro sistema opera con una disponibilidad muy alta debido a su diseño tolerante a fallas y su uso de un sistema robusto de tuberías de gas natural. El Bloom Energy Server ha sobrevivido a eventos climáticos extremos y otros incidentes, y continúa proporcionando energía a nuestros clientes.

Instalación y Mantenimiento Sencillos

El Energy Server es 'plug and play' (conectar y usar) y ha sido diseñado en cumplimiento con una variedad de estándares de seguridad. Bloom Energy gestiona todos los aspectos de la instalación, operación y mantenimiento de los sistemas.

Interconexión a la red	IEEE 1547 2018, CA Rule 21, CEI 016, KEPCO, G99

Bloom Energy proporciona acceso a un sitio web seguro para monitorear el rendimiento del sistema y los beneficios ambientales. Los sistemas serán gestionados y monitoreados de forma remota por Bloom Energy. Capaz de realizar una parada de emergencia basada en la entrada desde el sitio.

Un Energy Server es un sistema de energía de celda de combustible estacionario. Está listado por UL Solutions (UL LLC) como un 'Sistema de energía de celda de combustible estacionario' según ANSI/CSA FC1-2014 bajo la categoría IRGZ de UL y el número de archivo MH45102 de UL.

REVISIÓN Y CERTIFICACIÓN

Jefe de Equipo:

El trabajo aquí realizado se llevó a cabo bajo mi supervisión, y certifico que:

a) los detalles y resultados contenidos en este informe son, a mi leal saber y entender, una representación auténtica y exacta del programa de pruebas,

b) que los procedimientos de muestreo y análisis y los datos presentados en el informe son auténticos y exactos,

c) que todos los detalles y conclusiones de las pruebas son exactos y válidos, y

d) que la tasa de producción y/o la tasa de entrada de calor durante la prueba en la fuente se comunican con exactitud.

Si este informe se presenta a efectos de cumplimiento, sólo deberá reproducirse en su totalidad. Si tiene alguna pregunta sobre este informe, póngase en contacto con Jeramie Richardson en el (810) 923-3181 o conmigo mismo en el (913) 530-4713.

SECCIÓN 1. INTRODUCCIÓN

1.1. Resumen

Blue Sky Environmental, Inc. fue contratada por Bloom Energy para realizar una serie de pruebas de emisiones en sus instalaciones de Mountain View, California. Las pruebas se llevaron a cabo para determinar el cumplimiento de los límites de emisión y los requisitos de prueba de fuentes de la Orden Ejecutiva DG-044 de la Junta de Recursos del Aire del Estado de California.

Las pruebas de contaminantes atmosféricos peligrosos (HAPS) fueron realizadas por Finnegan Schall, Kyle Andersen, Frankie Sanfiorenzo y Vince Gigli de Blue Sky Environmental, Inc. los días 5 y 6 de diciembre de 2023. Amanda Marruffo de Bloom Energy coordinó el programa de pruebas.

Los resultados del programa de pruebas se presentan en este informe. La información de las pruebas en la fuente se resume en la Tabla 1-1. Los resultados de las pruebas individuales se proporcionan en el Apéndice A. Todos los datos de apoyo se incluyen en los apéndices.

SECCIÓN 2. PROGRAMA DE PRUEBAS EN LA FUENTE

2.1. Resumen

Esta prueba en la fuente se realizó para demostrar que el sistema de pila de combustible de óxido sólido Energy Server 6.5 (Modelo ES6.5) de Bloom Energy funciona de conformidad con los límites de emisión de HAPS y los requisitos de prueba en la fuente estipulados en la Orden Ejecutiva DG-044 de la Junta de Recursos del Aire del Estado de California.

2.2. Contaminantes probados

Se utilizaron los siguientes métodos de muestreo y análisis de la Agencia de Protección Ambiental de los Estados Unidos (EPA, por sus siglas en inglés):

Método 18 de la Agencia de EPA	Recogida de Compuestos Orgánicos Gaseosos
Método TO-12 de la EPA	Análisis de compuestos orgánicos volátiles
Método TO-15 de la EPA	Análisis de contaminantes atmosféricos peligrosos

2.3. Fecha de la prueba

La prueba se realizó el 5 y 6 de diciembre de 2023.

2.4. Personal de muestreo y observación

El muestreo fue realizado por Finnegan Schall de Blue Sky Environmental, Inc. Amanda Marruffo de Bloom Energy coordinó el programa de pruebas.

2.5. Descripción de la fuente/proceso

Las instalaciones de pruebas de Bloom Energy están situadas en 543 Bailey Road, Mountain View California. La instalación se utiliza para probar los sistemas de pila de combustible de Bloom Energy llamados Energy Servers.

El programa de pruebas se centró en la pila de combustible de óxido sólido (SOFC) Energy Server 6.5 de Bloom Energy. La unidad puede funcionar con gas natural o con una mezcla de hidrógeno, biogás e hidrógeno. El gas de escape del cátodo se expulsa normalmente a la atmósfera a través de una rejilla rectangular. Para esta prueba, el gas de escape se redirigió a través de una pieza de conducto de transición a una extensión de chimenea cilíndrica instalada temporalmente. En el Apéndice F se incluye una copia de la hoja de especificaciones.

2.6. Condiciones de funcionamiento de la fuente

Las pruebas de emisiones se realizaron mientras la unidad y el dispositivo de control de la contaminación atmosférica funcionaban en las condiciones exigidas por el permiso. La unidad se probó funcionando con gas natural a plena potencia.

Administrative Record NSR 10833_001129

SECCIÓN 3. PROCEDIMIENTOS DE MUESTREO Y ANÁLISIS

3.1. Puerto Ubicación

El muestreo se realizó en la chimenea de escape de 6 pulgadas de diámetro de la pila de combustible a través de puertos de 2 pulgadas de diámetro situados en una extensión de chimenea instalada temporalmente. Los puertos estaban ubicados aproximadamente a 10 pies (20 diámetros de chimenea) aguas abajo de la perturbación más cercana y a 10 pies (20 diámetros de chimenea) aguas arriba del escape. Esta ubicación cumplía los criterios mínimos del Método 1 de la Agencia de Protección Ambiental de Estados Unidos de dos diámetros de chimenea aguas abajo de la perturbación más cercana y 0.5 diámetros de chimenea aguas arriba de la perturbación o escape más cercanos.

3.2. Descripción del tren de muestreo

Los diagramas del sistema de muestreo se incluyen en el Apéndice E. En la sección siguiente se incluye información descriptiva adicional.

3.3. Descripción del procedimiento de muestreo

Tres muestras consecutivas de emisiones gaseosas de 60 minutos recogidas los días 5 y 6 de diciembre de 2023 para contaminantes atmosféricos peligrosos (HAPS). Las muestras se recogieron en botes SUMMA de 6 litros utilizando el método 18 de la Agencia de Protección Ambiental de Estados Unidos y fueron analizadas por Atmospheric Analysis & Consulting (AAC) en Ventura, California.

Se recogieron tres muestras consecutivas de 60 minutos de emisiones de partículas simultáneamente con las muestras de HAPS en la chimenea de escape de la pila de combustible utilizando los métodos 5/202 de la Agencia de Protección Ambiental de Estados Unidos. También se midió el caudal volumétrico de gas de la chimenea. Estos datos se presentan en un informe aparte.
Los métodos de muestreo y análisis se resumen a continuación:

Método 18 de la EPA - Medición de Emisiones de Compuestos Orgánicos Gaseosos por Cromatografía de Gases
Este método se utiliza para determinar las emisiones de sustancias orgánicas volátiles mediante cromatografía de gases (GC). Los gases se recogen en un recipiente SUMMA pre evacuado de 6 litros con un controlador de flujo preajustado para integrarse durante la duración deseada de la prueba. Los recipientes pasivados SUMMA® permiten tiempos de retención de hasta 14 días para los compuestos orgánicos volátiles objetivo. El gas de muestra es aspirado por el vacío del recipiente a través de un microfiltro, un regulador de flujo de orificio preajustado y una válvula de encendido/apagado. El vacío del recipiente se controla con un vacuómetro para verificar la recogida de la muestra. El controlador de flujo consiste en un tubo de orificio capilar diseñado para muestrear durante una duración preestablecida de 0.5 horas.

Método del Compendio TO-12 de la EPA: Determinación de compuestos orgánicos no metánicos (NMOC) en el aire ambiental mediante preconcentración criogénica y detección directa por ionización de llama (PDFID)
Este método se utiliza para determinar CONM en muestras de aire mediante cromatografía de gases FID tras preconcentración utilizando una trampa criogénica. La trampa criogénica concentra simultáneamente los CONM al tiempo que separa y elimina el metano de las muestras de aire. Por convención, las concentraciones de CONM se notifican en unidades

Administrative Record NSR 10833_001130

de partes por millón de carbono (ppmC), que, para un compuesto específico, es la concentración de volumen (ppmV) multiplicada por el número de átomos de carbono del compuesto.

Las muestras se recogen en recipientes SUMMA pre evacuados de 6 litros con reguladores de caudal preajustados para integrarse a lo largo de la duración deseada de la prueba. Los recipientes pasivados SUMMA® permiten tiempos de retención de hasta 14 días. El gas de muestreo es aspirado por el vacío del recipiente a través de un microfiltro, un regulador de flujo de orificio preajustado y una válvula de encendido/apagado. El vacío del recipiente se controla con un vacuómetro para verificar la recogida de la muestra. El controlador de flujo consistía en un tubo de orificio capilar diseñado para tomar muestras durante una duración preestablecida de 20 a 60 minutos.

Para evitar la condensación de humedad, se puede utilizar un condensador antes del recipiente y analizar el condensado por separado, o bien pre llenar parcialmente el recipiente con una cantidad conocida cero de aire o nitrógeno, antes de recoger la muestra de gas, o bien calentar el sistema y mantenerlo caliente por encima del punto de condensación hasta el análisis.

Método TO-15 del Compendio de la EPA - Determinación de Compuestos Orgánicos Tóxicos en el Aire Ambiente

Este método se utiliza para medir compuestos orgánicos volátiles incluidos entre los contaminantes atmosféricos peligrosos (HAP) enumerados en el Título III de las Enmiendas a la Ley de Aire Limpio de 1990 mediante GC/MS (cromatografía de gases/espectroscopia de masas). Las muestras se recogen en recipientes SUMMA pre evacuados de 6 litros con reguladores de caudal preajustados para integrarse a lo largo de la duración deseada de la prueba. Los botes pasivados SUMMA® permiten tiempos de retención de hasta 14 días para la lista de orgánicos volátiles del método TO-15. El gas de muestra es aspirado por el vacío del recipiente a través de un microfiltro, un regulador de flujo de orificio preajustado y una válvula de encendido/apagado. El vacío del recipiente se controla con un vacuómetro para verificar la recogida de la muestra. El controlador de flujo consistía en un tubo de orificio capilar diseñado para muestrear durante una duración preestablecida de 0.75 horas.

La estrategia analítica del método TO-15 del Compendio consiste en utilizar un cromatógrafo de gases (GC) de alta resolución acoplado a un espectrómetro de masas. Los espectros de masas de los picos individuales en el cromatograma de iones totales se examinan con respecto al patrón de fragmentación de los iones correspondientes a diversos COV, incluida la intensidad de los iones primarios y secundarios. El patrón de fragmentación se compara con espectros almacenados tomados en condiciones similares para identificar el compuesto. Para cualquier compuesto dado, la intensidad del fragmento primario se compara con la respuesta del sistema al fragmento primario para cantidades conocidas del compuesto. Esto establece la concentración de compuesto que existe en la muestra.

3.4. Observaciones: Limitaciones y cualificación de los datos

Este ensayo en la fuente se realizó de acuerdo con el presupuesto presentado a Bloom Energy. No se observaron desviaciones del presupuesto ni otras anomalías durante la prueba.

Blue Sky Environmental, Inc. ha revisado la exactitud de este informe y ha concluido que los procedimientos de prueba se siguieron utilizando normas de prácticas aceptadas y están descritos y documentados con exactitud. La revisión incluyó los siguientes puntos:

Revisión del texto general
Revisión de los cálculos

Administrative Record NSR 10833_001131

Revisión de los datos del CEMS
Revisión de la documentación de apoyo

TABLA 1

Bloom Energy
Energy Server 6.5

Parámetro	Ejercicio 1	Ejercicio 2	Ejercicio 3	Resultados Promedio	Límites del Permiso
Fecha de la Prueba	5/12/23	5/12/23	6/12/23	--	
Hora de la Prueba	2036-2138	2242-2348	0036-0138	--	
Temperatura Estándar, °F	70	70	70	--	
Parámetros del Proceso:					
Tasa de Producción de Energía, kW CA	67.46	67.49	67.50	67.48	
Gas de Combustión:					
Tasa de Flujo de Escape, DSCFM *(Método 5 de la EPA)*	186.0	187.0	176.4	183.1	
Humedad (H_2O), % de volumen	4.70	4.57	5.02	4.76	
Oxígeno (O_2), % volumen seco	12.9	12.9	13.0	12.9	
Dióxido de Carbono (CO_2), % volumen seco	4.54	4.52	4.53	4.53	
Emisiones de Propeno (Propileno) ***Método TO-15 de la EPA***					
Propeno, ppb volumen seco	<0.76	4.25	<0.68	<1.89	
Propeno, lb/hr	<9.06E-07	5.13E-06	<7.68E-07	<2.27E-06	
Propeno, lb/MW-hr	<1.34E-05	7.60E-05	<1.14E-05	<3.36E-05	
Emisiones de Metanol (Alcohol Metílico) ***Método TO-15 de la EPA***					
Metanol, ppb volumen seco	<3.77	13.6	<3.38	<6.91	
Metanol, lb/hr	<3.44E-06	1.25E-05	<2.92E-06	<6.28E-06	
Metanol, lb/MW-hr	<5.10E-05	1.85E-04	<4.33E-05	<9.31E-05	
Emisiones de Tetrahidrofurano ***Método TO-15 de la EPA***					
Tetrahidrofurano, ppb volumen seco	<0.38	1.52	<0.34	<0.75	
Tetrahidrofurano, lb/hr	<7.71E-07	3.14E-06	<6.63E-07	<1.53E-06	
Tetrahidrofurano, lb/MW-hr	<1.14E-05	4.66E-05	<9.82E-06	<2.26E-05	
Emisiones de benceno ***Método TO-15 de la EPA***					
Benceno, ppb volumen seco	<0.38	0.77	<0.34	<0.50	
Benceno, lb/hr	<8.35E-07	1.72E-06	<7.18E-07	<1.09E-06	
Benceno, lb/MW-hr	<1.24E-05	2.55E-05	<1.06E-05	<1.62E-05	
Emisiones de m,p-xilenos ***Método TO-12 de la EPA***					
m,p-xilenos, ppb volumen seco	<0.095	0.18	<0.085	<0.12	
m,p-xilenos, lb/hr	<2.87E-07	5.48E-07	<2.44E-07	<3.60E-07	
m,p-xilenos, lb/MW-hr	<4.26E-06	8.12E-06	<3.61E-06	<5.33E-06	
Emisiones de 1,2,3-trimetilbenceno ***Método TO-12 de la EPA***					
1,2,3-trimetilbenceno, ppb volumen seco	0.38	0.65	<0.075	<0.37	
1,2,3-trimetilbenceno, lb/hr	1.30E-06	2.24E-06	<2.44E-07	<1.26E-06	
1,2,3-trimetilbenceno, lb/MW-hr	1.93E-05	3.32E-05	<3.61E-06	<1.87E-05	

DONDE:

MW = peso molecular

DSCFM = pies cúbicos estándar secos por minuto

CÁLCULOS:

ug/DSCM = ppbv · 0.0409 / MW

g/hr = ug/DSCM · (DSCFM · 60min-hr/35.3)/(1,000,000 g/ug)

lb/hr = (g/hr) / 453.6

lb/MW-hr = (lb/hr) / (tasa de producción de energía, kW · 1,000)

Totales de TO-15 y TO-12/PAMS	ug/m³	lb/hr
PAMS total (TO-12) como COV =	0.00	0.00E+00
POC total (TO-15+TO-12) como COV =	0.00	0.00E+00
NPOC total (POC-PAMS) como COV=	0.00	0.00E+00

ppb = partes por mil millones de concentración por volumen expresado sobre una base de gas seco
DSCFM = pies cúbicos estándar secos por minuto
POC = compuestos orgánicos precursores (TNMOC)
NPOC = compuestos orgánicos no precursores
PAMS = compuestos de la estación de monitoreo de evaluación fotoquímica

$ug/m^3 = ppbv \cdot 0.0409 \cdot PM$
$g/hr = ug/m^3 \cdot$ tasa de flujo de escape, DSCFM $\cdot$ 60 /35.3 /1,000,000
lb/hr = g/hr / 453.6
<SRL = menor que el límite de notificación de la muestra

Atmospheric Analysis & Consulting, Inc.

CLIENTE : Blue Sky Environmental
NOMBRE DEL PROYECTO : Bloom
N.º DE PROYECTO DE AAC : 232572
FECHA DEL INFORME : 12/15/2023

El 8 de diciembre de 2023, Atmospheric Analysis & Consulting, Inc. recibió tres (3) recipientes Summa de seis litros para el análisis de hidrocarburos (C_2-C_{12}) mediante el método TO-12M/Protocolo PAMS de la Agencia de Protección Ambiental de Estados Unidos por GC/MS/FID. Al recibirlas, a cada muestra se le asignó un número de identificación de laboratorio único de la siguiente manera:

ID del Cliente	N.º de Lab.	Presión de Recepción (mm Hg)
R1-TO 12/15	232572-52312	599.5
R2-TO 12/15	232572-52313	642.5
R3-TO 12/15	232572-52314	671.0

Este análisis se realiza de acuerdo con el Manual de Calidad de AAC. Los resultados de la prueba se aplican a la(s) muestra(s) tal como se recibió/recibieron. Para obtener información detallada sobre métodos y analitos específicos de la Agencia de Protección Ambiental de Estados Unidos, NCASI, ASTM y SCAQMD, visite nuestro sitio web en www.aaclab.com.

Certifico que estos datos son técnicamente precisos, completos y cumplen con los términos y condiciones del contrato. No se encontraron problemas durante la recepción, preparación y/o análisis de estas muestras.

El Director Técnico o su designado, según lo verificado por la siguiente firma, ha autorizado la divulgación de los datos contenidos en este informe impreso.

Si tiene alguna pregunta o requiere una explicación adicional de los resultados de los datos, comuníquese con el suscrito.

Administrative Record NSR 10833_001150

Atmospheric Analysis & Consulting, Inc.

CLIENT : Blue Sky Environmental
NOMBRE DEL PROYECTO : Bloom
N.º DE PROYECTO DE AAC : 232572
FECHA DEL INFORME : 12/14/2023

El 8 de diciembre de 2023, Atmospheric Analysis & Consulting, Inc. recibió tres (3) recipientes Silonite de 6.0 litros para el análisis de Compuestos Orgánicos Volátiles mediante el Método TO-15 de la Agencia de Protección Ambiental de Estados Unidos. Al recibirlas, a las muestras se les asignaron números de identificación de laboratorio únicos de la siguiente manera:

ID del Cliente	ID de Laboratorio	Presión de Retorno (mmHga)
R1-TO 12/15	232572-52312	599.5
R2-TO 12/15	232572-52313	642.5
R3-TO 12/15	232572-52314	671.0

Este análisis está acreditado bajo la acreditación ISO/IEC 17025:2017 del laboratorio, emitida por la Junta Nacional de Acreditación ANSI (ANSI National Accreditation Board). Consulte el certificado y el alcance de la acreditación AT-1908. Los resultados de las pruebas se aplican a la(s) muestra(s) tal como se recibió/recibieron. Para obtener información detallada sobre acreditaciones específicas de la Agencia de Protección Ambiental de Estados Unidos, NCASI, ASTM y SCAQMD (Métodos y Analitos), visite nuestro sitio web en www.aaclab.com.

Certifico que estos datos son técnicamente precisos, completos y cumplen con los términos y condiciones del contrato. No se encontraron problemas durante la recepción, preparación y/o análisis de estas muestras.

El Director Técnico o su designado, según lo verificado por la siguiente firma, ha autorizado la divulgación de los datos contenidos en este informe impreso.

Si tiene alguna pregunta o requiere una explicación adicional de los resultados de los datos, comuníquese con el suscrito.

1. El factor de dilución total es el producto del factor de dilución del canister y el factor de dilución del análisis.
2. La diferencia porcentual relativa (RPD) entre el análisis de la muestra y el análisis duplicado debe encontrarse dentro del rango aceptable de menos del 25 %.
SRL – Límite mínimo de informe de la muestra

Bloomenergy®

Hoja de Datos

El Bloom Energy Server® 6.5

La plataforma de celdas de combustible de óxido sólido (SOFC) de Bloom Energy proporciona una vía sin combustión para convertir combustibles directamente en electricidad. El Energy Server es flexible en cuanto al combustible y puede generar energía utilizando gas natural, mezclas de hidrógeno, biogás e hidrógeno. Un enfoque de plataforma modular proporciona una vía para actualizar los sistemas existentes y alinearlos con los objetivos de sostenibilidad de nuestros clientes a lo largo del tiempo. Sin consumo de agua durante la operación normal y con una alta eficiencia operativa, el Bloom Energy Server reduce significativamente las emisiones de carbono hoy en día, al tiempo que proporciona una vía para operar con combustibles más limpios en el futuro.

El Bloom Energy Server proporciona energía base confiable y resiliente a las instalaciones. Está diseñado con un concepto modular ideal para la generación de energía distribuida en el sitio, operando 24x7, soportando la demanda de energía en paralelo a la red o en una arquitectura de microrred. Además, el calor de los gases de combustión puede capturarse del Energy Server e integrarse en una aplicación de Cogeneración (CHP).

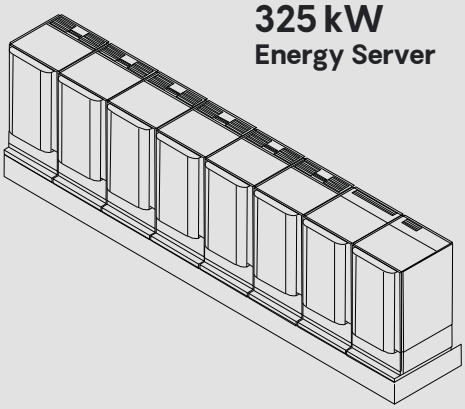
Bloom Energy tiene más de 1 GW de instalaciones de generación de energía desplegadas a nivel mundial en seis países. El Energy Server es adecuado para abordar las necesidades energéticas en cualquier industria y cuenta con instalaciones de varios megavatios en sectores como el comercio minorista, centros de datos, hospitales, estadios deportivos, manufactura y almacenamiento.

Limpio

Nuestros sistemas reducen los contaminantes criterio (NOx, SOx y material particulado) a casi cero y tienen emisiones de carbono mucho más bajas que las tecnologías heredadas.

Confiable

El Bloom Energy Server está diseñado en torno a una arquitectura modular de elementos simples repetitivos. Esto nos permite generar energía 24 x 7 x 365.



Resiliente

Nuestro sistema opera con una disponibilidad muy alta debido a su diseño tolerante a fallas y su uso de un sistema robusto de tuberías de gas natural. El Bloom Energy Server ha sobrevivido a eventos climáticos extremos y otros incidentes, y continúa proporcionando energía a nuestros clientes.

Instalación y Mantenimiento Sencillos

El Energy Server es 'plug and play' (conectar y usar) y ha sido diseñado en cumplimiento con una variedad de estándares de seguridad. Bloom Energy gestiona todos los aspectos de la instalación, operación y mantenimiento de los sistemas.

Administrative Record NSR 10833_001167

Especificaciones

Salidas

Potencia de Salida Nominal (CA neta)	325 kW
Salida de Carga (CA neta)	325 kW
Voltaje	380/400/415/480 V, 3-ph
Frecuencia	50/60 Hz

Entradas

Combustibles	Gas natural
Presión de entrada del combustible	12–18 psig (15 psig nominal)
Agua	Nada durante la operación normal

Eficacia

Eficiencia eléctrica acumulada	65–53% (LHV net AC)[1] 5,811–
Tasa de Calor (HHV)	7,127 Btu/kWh
Eficiencia térmica acumulada	35–40%
Eficiencia total	85-90%

1. Eficiencia LHV del 65% verificada por la prueba de rendimiento de sistemas de energía de celdas de combustible ASME PTC 50

Atributos Físicos y Entorno

Weight	14.8 toneladas (Energy Server)
	17.4 toneladas (Energy Server c/base)
Dimensiones	15'4" x 8'8" x 7'1" (espalda con espalda)
	29'3" x 4'4" x 7'1" (linear)
Dimensiones c/Base	33'6" x 4'4" x 8'3" (linear)
Rango de Temperatura	-20 °C to 45 °C
Humedad	0%–100%IBC
Vibración Sísmica	Clase de Sitio D de IBC
Ubicación	Exterior
Ruido	<65 dBA @ 10 ft

Código y Normas

Seguridad	FC1, UL 1741, UL 1741 SB, UL 1998, CE
EMC	EN 5501/KN11, EN 61000, KN32, KN35
Interconexión a la red	IEEE 1547 2018, CA Rule 21, CEI 016, KEPCO, G99

Bloom Energy proporciona acceso a un sitio web seguro para monitorear el rendimiento del sistema y los beneficios ambientales. Los sistemas serán gestionados y monitoreados de forma remota por Bloom Energy. Capaz de realizar una parada de emergencia basada en la entrada desde el sitio.

Un Energy Server es un sistema de energía de celda de combustible estacionario. Está listado por UL Solutions (UL LLC) como un 'Sistema de energía de celda de combustible estacionario' según ANSI/CSA FC1-2014 bajo la categoría IRGZ de UL y el número de archivo MH45102 de UL.

El número de modelo para Energy Server 6.5 sigue el formato:
ES6-XXXXXXXXXX-XXXXXX-X

Beneficios Adicionales

Acceso a un sitio web seguro para monitorear el rendimiento del sistema y los beneficios ambientales. Gestionado y monitoreado de forma remota por Bloom Energy. Capaz de realizar una parada de emergencia basada en la entrada del sitio.

1. Comuníquese con Bloom Energy para obtener información sobre el uso de biogás, hidrógeno mezclado e hidrógeno con el Energy Server.
2. Bloom Energy Server 6.5 está certificado por el Programa de Certificación de Generación Distribuida de la Junta de Recursos del Aire de California bajo la Orden Ejecutiva DG-058.
3. Se espera que las certificaciones estén disponibles a principios de 2026.

Sección 9

Prueba del Aviso público

(para las solicitudes NSR presentadas con arreglo a 20.2.72 o 20.2.74 NMAC)

(Esta prueba es exigida por: 20.2.72.203.A. 14 NMAC "Prueba documental del aviso público del solicitante")

☑ **He leído las "Directrices para la notificación pública de solicitudes de permisos de calidad del aire" de la AQB**
Este documento proporciona instrucciones detalladas sobre los requisitos de aviso público para diversas acciones de autorización. También proporciona ejemplos de aviso público y formularios de certificación. Los errores materiales en el aviso público requerirán un nuevo aviso antes de la expedición del permiso.

A menos que se permita lo contrario en otra parte de este documento, los siguientes elementos documentan la prueba de la Notificación Pública del solicitante. Incluya esta página en su prueba de presentación del aviso público con marcas de verificación que indiquen qué documentos se presentan con la solicitud.

Los avisos públicos de nuevos permisos y **Revisión significativa de permisos** deben incluir todos los puntos de esta lista.

Revisión técnica los avisos públicos sólo requieren los puntos 1, 5, 9 y 10.

Según el documento Directrices para la notificación pública mencionado anteriormente, incluya:

1. ☑ Una copia de los recibos de carta certificada con marcas postales (20.2.72.203.B NMAC)
2. ☑ Una lista de los lugares en los que se ha colocado el aviso público en al menos cuatro lugares accesibles al público y bien visibles, incluida la entrada de la instalación propuesta o existente, (por ejemplo: oficina de correos, biblioteca, tienda de comestibles, etc.)
3. ☑ Una copia del registro del impuesto sobre bienes inmuebles (20.2.72.203.B NMAC).
4. ☑ Una muestra de las cartas enviadas a los propietarios registrados.
5. ☑ Una muestra de las cartas enviadas a condados, municipios y tribus indígenas.
6. ☑ Una muestra del aviso público publicado y una verificación de los anuncios locales.
7. ☑ Una tabla de los ciudadanos, condados, municipios y tribus notificados y a quién se enviaron los avisos en cada grupo.
8. ☑ Una copia del PSA (por sus siglas en inglés, anuncio de servicio público) enviado a una emisora de radio local y una prueba documental de la presentación.
9. ☑ Una copia del anuncio clasificado o legal, incluido el encabezado de la página (fecha y título del periódico) o su declaración jurada de publicación en la que conste la fecha del anuncio, y una copia del anuncio. Cuando proceda, este anuncio se imprimirá tanto en inglés como en español.
10. ☑ Una copia del anuncio, incluido el encabezado de la página (fecha y título del periódico) o su declaración jurada de publicación en la que conste la fecha del anuncio, y una copia del anuncio. Cuando proceda, este anuncio se imprimirá tanto en inglés como en español.
11. ☑ Un mapa a escala gráfica que muestre los límites de la instalación y la zona circundante en la que se notificó por correo a los propietarios registrados. Esto es necesario para verificar que se ha utilizado el límite correcto de la instalación a la hora de determinar la distancia para notificar a los propietarios registrados.

9.4. Cartas Enviadas a los Propietarios Registrados

April 27, 2026

CERTIFIED MAIL 9589 0710 5270 4045 6426 28
RETURN RECEIPT REQUESTED *(certified mail is required, **return receipt is optional**)*

Dear **Scott Andrews,**
Yucca Growth Infrastructure, LLC announces its application to the New Mexico Environment Department for an air quality permit for the **construction** of its **microgrid** facility. The expected date of application submittal to the Air Quality Bureau is **April 27, 2026.**

The exact location for the proposed facility known as, **YGI Microgrid**, will be at latitude **31.818333** dec deg North and longitude **-106.679167** dec deg West. The approximate location of this facility is **3.6** miles **south** of **Santa Teresa** in **Doña Ana** county.

The proposed **construction** consists of the construction of a microgrid for power generation.

The estimated maximum quantities of any regulated air contaminant will be as follows in pound per hour (pph) and tons per year (tpy) and may change slightly during the course of the Department's review:

Pollutant:	Pounds per hour	Tons per year
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Sulfur Dioxide (SO_2)	0.02	0.08
Nitrogen Oxides (NO_x)	8.49	37.20
Carbon Monoxide (CO)	36.81	161.21
Volatile Organic Compounds (VOC)	28.31	124.01
Total sum of all Hazardous Air Pollutants (HAPs)	0.33	1.42
Green House Gas Emissions as Total CO_2e	n/a	10,144,115

The standard and maximum operating schedules of the facility will be 24 hours a day, 7 days a week and a maximum of 52 weeks per year.

The owner of the Facility is: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
The operator of the Facility is: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

If you have any comments about the construction or operation of this facility, and you want your comments to be made as part of the permit review process, you must submit your comments in writing to this address: Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Other comments and questions may be submitted verbally. (505) 476-4300; 1 800 224-7009.

Please refer to the company name and facility name, or send a copy of this notice along with your comments, since the Department may have not yet received the permit application. Please include a legible return mailing address with your comments. Once the Department has performed a preliminary review of the application and its air quality impacts, the Department's notice will be published in the legal section of a newspaper circulated near the facility location.

Attención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono 505-629-7748.

Sincerely,
Yucca Growth Infrastructure, LLC
600 Congress Ave, Suite 15041
Austin, TX 78701

Notice of Non-Discrimination
NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. You may also visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

27 de abril de 2026

CORREO CERTIFICADO 9589 0710 5270 4045 6426 28
SE SOLICITA ACUSE DE RECIBO *(el correo certificado es obligatorio;* ***el acuse de recibo es opcional****)*

Estimado(a) **Scott Andrews,**
Yucca Growth Infrastructure, LLC anuncia la presentación de su solicitud ante el Departamento de Medio Ambiente de Nuevo México para obtener un permiso de calidad del aire para la **construcción** de su instalación **de microrred**. La fecha prevista para la presentación de la solicitud ante la Oficina de Calidad del Aire es **el 27 de abril de 2026.**

La ubicación exacta de la instalación propuesta, conocida como **YGI Microgrid**, será a **31.818333** grados de latitud norte y **-106.679167** grados de longitud oeste. La ubicación aproximada de esta instalación es **3.6** millas **al sur** de **Santa Teresa** en el condado de **Doña Ana**.

La **construcción** propuesta consiste en la construcción de una microrred para la generación de energía.

Las cantidades máximas estimadas de cualquier contaminante atmosférico regulado serán las siguientes en libras por hora (pph, por sus siglas en inglés) y toneladas por año (tpy, por sus siglas en inglés) y podrían cambiar ligeramente durante el curso de la revisión del Departamento:

Contaminante:	Libras por hora	Toneladas por año
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Dióxido de Azufre (SO_2)	0.02	0.08
Óxidos de Nitrógeno (NO_x)	8.49	37.20
Monóxido de Carbono (CO)	36.81	161.21
Compuestos Orgánicos Volátiles (COV)	28.31	124.01
Suma Total de Todos los Contaminantes Atmosféricos Peligrosos (HAPs)	0.33	1.42
Emisiones de Gases de Efecto Invernadero como CO_2e Total	n/a	10,144,115

Los horarios de funcionamiento estándar y máximo de la instalación serán de 24 horas al día, 7 días a la semana y un máximo de 52 semanas al año.

El propietario de la instalación es: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
El operador de la instalación es: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

Si tiene algún comentario sobre la construcción o el funcionamiento de esta instalación, y desea que sus comentarios formen parte del proceso de revisión del permiso, debe enviarlos por escrito a esta dirección Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Otros comentarios y preguntas pueden presentarse verbalmente. (505) 476-4300; 1 800 224-7009.

Por favor, indique el nombre de la empresa y el nombre del sitio, o envíe una copia de este aviso junto con sus comentarios, ya que es posible que el Departamento aún no haya recibido la solicitud de permiso. Por favor, incluya una dirección postal de retorno legible con sus comentarios. Una vez que el Departamento haya realizado una revisión preliminar de la solicitud y de sus impactos en la calidad del aire, su aviso se publicará en la sección legal de un periódico que circule cerca de la ubicación de la instalación.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, sobre las emisiones generadas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con dicha oficina al teléfono 505-629-7748.

Atentamente,
Yucca Growth Infrastructure, LLC
600 Congress Ave, Suite 15041
Austin, TX 78701

Aviso de No Discriminación
NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, de conformidad con las leyes y regulaciones aplicables. NMED es responsable de coordinar los esfuerzos de cumplimiento y de recibir consultas relativas a los requisitos de no discriminación establecidos en 40 C.F.R. Parte 7, incluido el Título VI de la Ley de Derechos Civiles de 1964, en su versión enmendada; la Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, el Título IX de las Enmiendas de Educación de 1972, y la Sección 13 de las Enmiendas de la Ley Federal de Control de la Contaminación del Agua de 1972. Si tiene alguna pregunta sobre este aviso o cualquiera de los programas, políticas o procedimientos de no discriminación de NMED, o si considera que ha sido discriminado en relación con un programa o actividad de NMED, puede comunicarse con: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. April 27, 2026

CERTIFIED MAIL 9589 0710 5270 4045 6426 11
RETURN RECEIPT REQUESTED *(certified mail is required, **return receipt is optional**)*

Dear **Dionne Mack,**
Yucca Growth Infrastructure, LLC announces its application to the New Mexico Environment Department for an air quality permit for the **construction** of its **microgrid** facility. The expected date of application submittal to the Air Quality Bureau is **April 27, 2026.**

The exact location for the proposed facility known as, **YGI Microgrid**, will be at latitude **31.818333** dec deg North and longitude **-106.679167** dec deg West. The approximate location of this facility is **3.6** miles **south** of **Santa Teresa** in **Doña Ana** county.

The proposed **construction** consists of the construction of a microgrid for power generation.

The estimated maximum quantities of any regulated air contaminant will be as follows in pound per hour (pph) and tons per year (tpy) and may change slightly during the course of the Department's review:

Pollutant:	Pounds per hour	Tons per year
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Sulfur Dioxide (SO_2)	0.02	0.08
Nitrogen Oxides (NO_x)	8.49	37.20
Carbon Monoxide (CO)	36.81	161.21
Volatile Organic Compounds (VOC)	28.31	124.01
Total sum of all Hazardous Air Pollutants (HAPs)	0.33	1.42
Green House Gas Emissions as Total CO_2e	n/a	10,144,115

The standard and maximum operating schedules of the facility will be 24 hours a day, 7 days a week and a maximum of 52 weeks per year.

The owner of the Facility is: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
The operator of the Facility is: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

If you have any comments about the construction or operation of this facility, and you want your comments to be made as part of the permit review process, you must submit your comments in writing to this address: Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Other comments and questions may be submitted verbally. (505) 476-4300; 1 800 224-7009.

Please refer to the company name and facility name, or send a copy of this notice along with your comments, since the Department may have not yet received the permit application. Please include a legible return mailing address with your comments. Once the Department has performed a preliminary review of the application and its air quality impacts, the Department's notice will be published in the legal section of a newspaper circulated near the facility location.

Attención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono 505-629-7748.

Sincerely,
Yucca Growth Infrastructure, LLC
600 Congress Ave, Suite 15041
Austin, TX 78701

Notice of Non-Discrimination
NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. 27 de abril de 2026

CORREO CERTIFICADO 9589 0710 5270 4045 6426 11
SE SOLICITA ACUSE DE RECIBO *(el correo certificado es obligatorio;* ***el acuse de recibo es opcional****)*

Estimado(a) **Dionne Mack,**
Yucca Growth Infrastructure, LLC anuncia la presentación de su solicitud ante el Departamento de Medio Ambiente de Nuevo México para obtener un permiso de calidad del aire para la **construcción** de su instalación **de microrred**. La fecha prevista para la presentación de la solicitud ante la Oficina de Calidad del Aire es **el 27 de abril de 2026.**

La ubicación exacta de la instalación propuesta, conocida como **YGI Microgrid**, será a **31.818333** grados de latitud norte y **-106.679167** grados de longitud oeste. La ubicación aproximada de esta instalación es **3.6** millas **al sur** de **Santa Teresa** en el condado de **Doña Ana**.

La **construcción** propuesta consiste en la construcción de una microrred para la generación de energía.

Las cantidades máximas estimadas de cualquier contaminante atmosférico regulado serán las siguientes en libras por hora (pph, por sus siglas en inglés) y toneladas por año (tpy, por sus siglas en inglés) y podrían cambiar ligeramente durante el curso de la revisión del Departamento:

Contaminante:	Libras por hora	Toneladas por año
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Dióxido de Azufre (SO_2)	0.02	0.08
Óxidos de Nitrógeno (NO_x)	8.49	37.20
Monóxido de Carbono (CO)	36.81	161.21
Compuestos Orgánicos Volátiles (COV)	28.31	124.01
Suma Total de Todos los Contaminantes Atmosféricos Peligrosos (HAPs)	0.33	1.42
Emisiones de Gases de Efecto Invernadero como CO_2e Total	n/a	10,144,115

Los horarios de funcionamiento estándar y máximo de la instalación serán de 24 horas al día, 7 días a la semana y un máximo de 52 semanas al año.

El propietario de la instalación es: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
El operador de la instalación es: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

Si tiene algún comentario sobre la construcción o el funcionamiento de esta instalación, y desea que sus comentarios formen parte del proceso de revisión del permiso, debe enviarlos por escrito a esta dirección Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Otros comentarios y preguntas pueden presentarse verbalmente. (505) 476-4300; 1 800 224-7009.

Por favor, indique el nombre de la empresa y el nombre del sitio, o envíe una copia de este aviso junto con sus comentarios, ya que es posible que el Departamento aún no haya recibido la solicitud de permiso. Por favor, incluya una dirección postal de retorno legible con sus comentarios. Una vez que el Departamento haya realizado una revisión preliminar de la solicitud y de sus impactos en la calidad del aire, su aviso se publicará en la sección legal de un periódico que circule cerca de la ubicación de la instalación.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, sobre las emisiones generadas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con dicha oficina al teléfono 505-629-7748.

Atentamente,

Dear **City of Santa Teresa Limited Government,**
Yucca Growth Infrastructure, LLC announces its application to the New Mexico Environment Department for an air quality permit for the **construction** of its **microgrid** facility. The expected date of application submittal to the Air Quality Bureau is **April 27, 2026.**

The exact location for the proposed facility known as, **YGI Microgrid**, will be at latitude **31.818333** dec deg North and longitude **-106.679167** dec deg West. The approximate location of this facility is **3.6** miles **south** of **Santa Teresa** in **Doña Ana** county.

The proposed **construction** consists of the construction of a microgrid for power generation.

The estimated maximum quantities of any regulated air contaminant will be as follows in pound per hour (pph) and tons per year (tpy) and may change slightly during the course of the Department's review:

Pollutant:	Pounds per hour	Tons per year
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Sulfur Dioxide (SO_2)	0.02	0.08
Nitrogen Oxides (NO_x)	8.49	37.20
Carbon Monoxide (CO)	36.81	161.21
Volatile Organic Compounds (VOC)	28.31	124.01
Total sum of all Hazardous Air Pollutants (HAPs)	0.33	1.42
Green House Gas Emissions as Total CO_2e	n/a	10,144,115

The standard and maximum operating schedules of the facility will be 24 hours a day, 7 days a week and a maximum of 52 weeks per year.

The owner of the Facility is: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
The operator of the Facility is: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

If you have any comments about the construction or operation of this facility, and you want your comments to be made as part of the permit review process, you must submit your comments in writing to this address: Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Other comments and questions may be submitted verbally. (505) 476-4300; 1 800 224-7009.

Please refer to the company name and facility name, or send a copy of this notice along with your comments, since the Department may have not yet received the permit application. Please include a legible return mailing address with your comments. Once the Department has performed a preliminary review of the application and its air quality impacts, the Department's notice will be published in the legal section of a newspaper circulated near the facility location.

Attención

27 de abril de 2026

CORREO CERTIFICADO 9589 0710 5270 4045 6426 42
SE SOLICITA ACUSE DE RECIBO *(el correo certificado es obligatorio,* ***el acuse de recibo es opcional)***

Estimados **City of Santa Teresa Limited Government,**
Yucca Growth Infrastructure, LLC anuncia la presentación de su solicitud ante el Departamento de Medio Ambiente de Nuevo México para obtener un permiso de calidad del aire para la **construcción** de su instalación **de microrred**. La fecha prevista para la presentación de la solicitud ante la Oficina de Calidad del Aire es **el 27 de abril de 2026.**

La ubicación exacta de la instalación propuesta, conocida como **YGI Microgrid**, será a **31.818333** grados de latitud norte y **-106.679167** grados de longitud oeste. La ubicación aproximada de esta instalación es **3.6** millas **al sur** de **Santa Teresa** en el condado de **Doña Ana**.

La **construcción** propuesta consiste en la construcción de una microrred para la generación de energía.

Las cantidades máximas estimadas de cualquier contaminante atmosférico regulado serán las siguientes en libras por hora (pph, por sus siglas en inglés) y toneladas por año (tpy, por sus siglas en inglés) y podrían cambiar ligeramente durante el curso de la revisión del Departamento:

Contaminante:	Libras por hora	Toneladas por año
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Dióxido de Azufre (SO_2)	0.02	0.08
Óxidos de Nitrógeno (NO_x)	8.49	37.20
Monóxido de Carbono (CO)	36.81	161.21
Compuestos Orgánicos Volátiles (COV)	28.31	124.01
Suma Total de Todos los Contaminantes Atmosféricos Peligrosos (HAPs)	0.33	1.42
Emisiones de Gases de Efecto Invernadero como CO_2e Total	n/a	10,144,115

Los horarios de funcionamiento estándar y máximo de la instalación serán de 24 horas al día, 7 días a la semana y un máximo de 52 semanas al año.

El propietario de la instalación es: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
El operador de la instalación es: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

Si tiene algún comentario sobre la construcción o el funcionamiento de esta instalación, y desea que sus comentarios formen parte del proceso de revisión del permiso, debe enviarlos por escrito a esta dirección Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Otros comentarios y preguntas pueden presentarse verbalmente. (505) 476-4300; 1 800 224-7009.

Por favor, indique el nombre de la empresa y el nombre del sitio, o envíe una copia de este aviso junto con sus comentarios, ya que es posible que el Departamento aún no haya recibido la solicitud de permiso. Por favor, incluya una dirección postal de retorno legible con sus comentarios. Una vez que el Departamento haya realizado una revisión preliminar de la solicitud y de sus impactos en la calidad del aire, su aviso se publicará en la sección legal de un periódico que circule cerca de la ubicación de la instalación.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, sobre las emisiones generadas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con dicha oficina al teléfono 505-629-7748.

Atentamente,
Yucca Growth Infrastructure, LLC
600 Congress Ave, Suite 15041
Austin, TX 78701

Aviso de No Discriminación
NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, de conformidad con las leyes y regulaciones aplicables. NMED es responsable de coordinar los esfuerzos de cumplimiento y de recibir consultas relativas a los requisitos de no discriminación establecidos en 40 C.F.R. Parte 7, incluido el Título VI de la Ley de Derechos Civiles de 1964, en su versión enmendada; la Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, el Título IX de las Enmiendas de Educación de 1972, y la Sección 13 de las Enmiendas de la Ley Federal de Control de la Contaminación del Agua de 1972. Si tiene alguna pregunta sobre este aviso o cualquiera de los programas, políticas o procedimientos de no discriminación de NMED, o si considera que ha sido discriminado en relación con un programa o actividad de NMED, puede comunicarse con: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. Nitrogen Oxides (NO_x)	8.49	37.20
Carbon Monoxide (CO)	36.81	161.21
Volatile Organic Compounds (VOC)	28.31	124.01
Total sum of all Hazardous Air Pollutants (HAPs)	0.33	1.42
Green House Gas Emissions as Total CO_2e	n/a	10,144,115

The standard and maximum operating schedules of the facility will be 24 hours a day, 7 days a week and a maximum of 52 weeks per year.

The owner of the Facility is: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
The operator of the Facility is: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

If you have any comments about the construction or operation of this facility, and you want your comments to be made as part of the permit review process, you must submit your comments in writing to this address: Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Other comments and questions may be submitted verbally. (505) 476-4300; 1 800 224-7009.

Please refer to the company name and facility name, or send a copy of this notice along with your comments, since the Department may have not yet received the permit application. Please include a legible return mailing address with your comments. Once the Department has performed a preliminary review of the application and its air quality impacts, the Department's notice will be published in the legal section of a newspaper circulated near the facility location.

Attención

27 de abril de 2026

CORREO CERTIFICADO 9589 0710 5270 4045 6425 74
SE SOLICITA ACUSE DE RECIBO *(el correo certificado es obligatorio;* ***el acuse de recibo es opcional****)*

Estimados **Alta Mesa Estates LLC,**
Yucca Growth Infrastructure, LLC anuncia la presentación de su solicitud ante el Departamento de Medio Ambiente de Nuevo México para obtener un permiso de calidad del aire para la **construcción** de su instalación **de microrred**. La fecha prevista para la presentación de la solicitud ante la Oficina de Calidad del Aire es **el 27 de abril de 2026.**

La ubicación exacta de la instalación propuesta, conocida como **YGI Microgrid**, será a **31.818333** grados de latitud norte y **-106.679167** grados de longitud oeste. La ubicación aproximada de esta instalación es **3.6** millas **al sur** de **Santa Teresa** en el condado de **Doña Ana**.

La **construcción** propuesta consiste en la construcción de una microrred para la generación de energía.

Las cantidades máximas estimadas de cualquier contaminante atmosférico regulado serán las siguientes en libras por hora (pph, por sus siglas en inglés) y toneladas por año (tpy, por sus siglas en inglés) y podrían cambiar ligeramente durante el curso de la revisión del Departamento:

Contaminante:	Libras por hora	Toneladas por año
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Dióxido de Azufre (SO_2)	0.02	0.08
Óxidos de Nitrógeno (NO_x)	8.49	37.20
Monóxido de Carbono (CO)	36.81	161.21
Compuestos Orgánicos Volátiles (COV)	28.31	124.01
Suma Total de Todos los Contaminantes Atmosféricos Peligrosos (HAPs)	0.33	1.42
Emisiones de Gases de Efecto Invernadero como CO_2e Total	n/a	10,144,115

Los horarios de funcionamiento estándar y máximo de la instalación serán de 24 horas al día, 7 días a la semana y un máximo de 52 semanas al año.

El propietario de la instalación es: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
El operador de la instalación es: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

Si tiene algún comentario sobre la construcción o el funcionamiento de esta instalación, y desea que sus comentarios formen parte del proceso de revisión del permiso, debe enviarlos por escrito a esta dirección Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Otros comentarios y preguntas pueden presentarse verbalmente. (505) 476-4300; 1 800 224-7009.

Por favor, indique el nombre de la empresa y el nombre del sitio, o envíe una copia de este aviso junto con sus comentarios, ya que es posible que el Departamento aún no haya recibido la solicitud de permiso. Por favor, incluya una dirección postal de retorno legible con sus comentarios. Una vez que el Departamento haya realizado una revisión preliminar de la solicitud y de sus impactos en la calidad del aire, su aviso se publicará en la sección legal de un periódico que circule cerca de la ubicación de la instalación.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, sobre las emisiones generadas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con dicha oficina al teléfono 505-629-7748.

Atentamente,
Yucca Growth Infrastructure, LLC
600 Congress Ave, Suite 15041

If you have any comments about the construction or operation of this facility, and you want your comments to be made as part of the permit review process, you must submit your comments in writing to this address: Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Other comments and questions may be submitted verbally. (505) 476-4300; 1 800 224-7009.

Please refer to the company name and facility name, or send a copy of this notice along with your comments, since the Department may have not yet received the permit application. Please include a legible return mailing address with your comments. Once the Department has performed a preliminary review of the application and its air quality impacts, the Department's notice will be published in the legal section of a newspaper circulated near the facility location.

Notice of Non-Discrimination
NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. You may also visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

27 de abril de 2026

CORREO CERTIFICADO 9589 0710 5270 4045 6425 81
SE SOLICITA ACUSE DE RECIBO *(el correo certificado es obligatorio;* ***el acuse de recibo es opcional****)*

Estimados **Jobe Materials LP,**
Yucca Growth Infrastructure, LLC anuncia la presentación de su solicitud ante el Departamento de Medio Ambiente de Nuevo México para obtener un permiso de calidad del aire para la **construcción** de su instalación **de microrred**. La fecha prevista para la presentación de la solicitud ante la Oficina de Calidad del Aire es **el 27 de abril de 2026.**

La ubicación exacta de la instalación propuesta, conocida como **YGI Microgrid**, será a **31.818333** grados de latitud norte y **-106.679167** grados de longitud oeste. La ubicación aproximada de esta instalación es **3.6** millas **al sur** de **Santa Teresa** en el condado de **Doña Ana**.

La **construcción** propuesta consiste en la construcción de una microrred para la generación de energía.

Las cantidades máximas estimadas de cualquier contaminante atmosférico regulado serán las siguientes en libras por hora (pph, por sus siglas en inglés) y toneladas por año (tpy, por sus siglas en inglés) y podrían cambiar ligeramente durante el curso de la revisión del Departamento:

Contaminante:	Libras por hora	Toneladas por año
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Dióxido de Azufre (SO_2)	0.02	0.08
Óxidos de Nitrógeno (NO_x)	8.49	37.20
Monóxido de Carbono (CO)	36.81	161.21
Compuestos Orgánicos Volátiles (COV)	28.31	124.01
Suma Total de Todos los Contaminantes Atmosféricos Peligrosos (HAPs)	0.33	1.42
Emisiones de Gases de Efecto Invernadero como CO_2e Total	n/a	10,144,115

Los horarios de funcionamiento estándar y máximo de la instalación serán de 24 horas al día, 7 días a la semana y un máximo de 52 semanas al año.

El propietario de la instalación es: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
El operador de la instalación es: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

Si tiene algún comentario sobre la construcción o el funcionamiento de esta instalación, y desea que sus comentarios formen parte del proceso de revisión del permiso, debe enviarlos por escrito a esta dirección Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Otros comentarios y preguntas pueden presentarse verbalmente. (505) 476-4300; 1 800 224-7009.

Por favor, indique el nombre de la empresa y el nombre del sitio, o envíe una copia de este aviso junto con sus comentarios, ya que es posible que el Departamento aún no haya recibido la solicitud de permiso. Por favor, incluya una dirección postal de retorno legible con sus comentarios. Una vez que el Departamento haya realizado una revisión preliminar de la solicitud y de sus impactos en la calidad del aire, su aviso se publicará en la sección legal de un periódico que circule cerca de la ubicación de la instalación.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, sobre las emisiones generadas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con dicha oficina al teléfono 505-629-7748.

April 27, 2026

CERTIFIED MAIL 9589 0710 5270 4045 6421 78
RETURN RECEIPT REQUESTED *(certified mail is required, **return receipt is optional**)*

Dear **Paseo Del Norte LLC,**
Yucca Growth Infrastructure, LLC announces its application to the New Mexico Environment Department for an air quality permit for the **construction** of its **microgrid** facility. The expected date of application submittal to the Air Quality Bureau is **April 27, 2026.**

The exact location for the proposed facility known as, **YGI Microgrid**, will be at latitude **31.818333** dec deg North and longitude **-106.679167** dec deg West. The approximate location of this facility is **3.6** miles **south** of **Santa Teresa** in **Doña Ana** county.

The proposed **construction** consists of the construction of a microgrid for power generation.

The estimated maximum quantities of any regulated air contaminant will be as follows in pound per hour (pph) and tons per year (tpy) and may change slightly during the course of the Department's review:

Pollutant:	Pounds per hour	Tons per year
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Sulfur Dioxide (SO_2)	0.02	0.08
Nitrogen Oxides (NO_x)	8.49	37.20
Carbon Monoxide (CO)	36.81	161.21
Volatile Organic Compounds (VOC)	28.31	124.01
Total sum of all Hazardous Air Pollutants (HAPs)	0.33	1.42
Green House Gas Emissions as Total CO_2e	n/a	10,144,115

The standard and maximum operating schedules of the facility will be 24 hours a day, 7 days a week and a maximum of 52 weeks per year.

The owner of the Facility is: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
The operator of the Facility is: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

If you have any comments about the construction or operation of this facility, and you want your comments to be made as part of the permit review process, you must submit your comments in writing to this address: Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Notice of Non-Discrimination
NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. You may also visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

27 de abril de 2026

CORREO CERTIFICADO 9589 0710 5270 4045 6425 50
SE SOLICITA ACUSE DE RECIBO *(el correo certificado es obligatorio,* ***el acuse de recibo es opcional****)*

Estimados **Santa Teresa Land LLC,**
Yucca Growth Infrastructure, LLC anuncia la presentación de su solicitud ante el Departamento de Medio Ambiente de Nuevo México para obtener un permiso de calidad del aire para la **construcción** de su instalación **de microrred**. La fecha prevista para la presentación de la solicitud ante la Oficina de Calidad del Aire es **el 27 de abril de 2026.**

La ubicación exacta de la instalación propuesta, conocida como **YGI Microgrid**, será a **31.818333** grados de latitud norte y **-106.679167** grados de longitud oeste. La ubicación aproximada de esta instalación es **3.6** millas **al sur** de **Santa Teresa** en el condado de **Doña Ana**.

La **construcción** propuesta consiste en la construcción de una microrred para la generación de energía.

Las cantidades máximas estimadas de cualquier contaminante atmosférico regulado serán las siguientes en libras por hora (pph, por sus siglas en inglés) y toneladas por año (tpy, por sus siglas en inglés) y podrían cambiar ligeramente durante el curso de la revisión del Departamento:

Contaminante:	Libras por hora	Toneladas por año
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Dióxido de Azufre (SO_2)	0.02	0.08
Óxidos de Nitrógeno (NO_x)	8.49	37.20
Monóxido de Carbono (CO)	36.81	161.21
Compuestos Orgánicos Volátiles (COV)	28.31	124.01
Suma Total de Todos los Contaminantes Atmosféricos Peligrosos (HAPs)	0.33	1.42
Emisiones de Gases de Efecto Invernadero como CO_2e Total	n/a	10,144,115

Los horarios de funcionamiento estándar y máximo de la instalación serán de 24 horas al día, 7 días a la semana y un máximo de 52 semanas al año.

El propietario de la instalación es: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
El operador de la instalación es: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

Si tiene algún comentario sobre la construcción o el funcionamiento de esta instalación, y desea que sus comentarios formen parte del proceso de revisión del permiso, debe enviarlos por escrito a esta dirección Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Otros comentarios y preguntas pueden presentarse verbalmente. (505) 476-4300; 1 800 224-7009.

Por favor, indique el nombre de la empresa y el nombre del sitio, o envíe una copia de este aviso junto con sus comentarios, ya que es posible que el Departamento aún no haya recibido la solicitud de permiso. Por favor, incluya una dirección postal de retorno legible con sus comentarios. Una vez que el Departamento haya realizado una revisión preliminar de la solicitud y de sus impactos en la calidad del aire, su aviso se publicará en la sección legal de un periódico que circule cerca de la ubicación de la instalación.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, sobre las emisiones generadas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con dicha oficina al teléfono 505-629-7748.

Atentamente,
Yucca Growth Infrastructure, LLC
600 Congress Ave, Suite 15041
Austin, TX 78701

Aviso de No Discriminación
NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, de conformidad con las leyes y regulaciones aplicables. NMED es responsable de coordinar los esfuerzos de cumplimiento y de recibir consultas relativas a los requisitos de no discriminación establecidos en 40 C.F.R. Parte 7, incluido el Título VI de la Ley de Derechos Civiles de 1964, en su versión enmendada; la Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, el Título IX de las Enmiendas de Educación de 1972, y la Sección 13 de las Enmiendas de la Ley Federal de Control de la Contaminación del Agua de 1972. Si tiene alguna pregunta sobre este aviso o cualquiera de los programas, políticas o procedimientos de no discriminación de NMED, o si considera que ha sido discriminado en relación con un programa o actividad de NMED, puede comunicarse con: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. April 27, 2026

CERTIFIED MAIL 9589 0710 5270 4045 6421 61
RETURN RECEIPT REQUESTED *(certified mail is required, **return receipt is optional**)*

Dear **Southern Pacific Trans Corp,**
Yucca Growth Infrastructure, LLC announces its application to the New Mexico Environment Department for an air quality permit for the **construction** of its **microgrid** facility. The expected date of application submittal to the Air Quality Bureau is **April 27, 2026.**

The exact location for the proposed facility known as, **YGI Microgrid**, will be at latitude **31.818333** dec deg North and longitude **-106.679167** dec deg West. The approximate location of this facility is **3.6** miles **south** of **Santa Teresa** in **Doña Ana** county.

The proposed **construction** consists of the construction of a microgrid for power generation.

The estimated maximum quantities of any regulated air contaminant will be as follows in pound per hour (pph) and tons per year (tpy) and may change slightly during the course of the Department's review:

Pollutant:	Pounds per hour	Tons per year
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Sulfur Dioxide (SO_2)	0.02	0.08
Nitrogen Oxides (NO_x)	8.49	37.20
Carbon Monoxide (CO)	36.81	161.21
Volatile Organic Compounds (VOC)	28.31	124.01
Total sum of all Hazardous Air Pollutants (HAPs)	0.33	1.42
Green House Gas Emissions as Total CO_2e	n/a	10,144,115

The standard and maximum operating schedules of the facility will be 24 hours a day, 7 days a week and a maximum of 52 weeks per year.

The owner of the Facility is: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
The operator of the Facility is: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

If you have any comments about the construction or operation of this facility, and you want your comments to be made as part of the permit review process, you must submit your comments in writing to this address: Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Other comments and questions may be submitted verbally. (505) 476-4300; 1 800 224-7009.

Please refer to the company name and facility name, or send a copy of this notice along with your comments, since the Department may have not yet received the permit application. Please include a legible return mailing address with your comments. Once the Department has performed a preliminary review of the application and its air quality impacts, the Department's notice will be published in the legal section of a newspaper circulated near the facility location.

Yucca Growth Infrastructure, LLC anuncia la presentación de su solicitud ante el Departamento de Medio Ambiente de Nuevo México para obtener un permiso de calidad del aire para la **construcción** de su instalación **de microrred**. La fecha prevista para la presentación de la solicitud ante la Oficina de Calidad del Aire es **el 27 de abril de 2026.**

La ubicación exacta de la instalación propuesta, conocida como **YGI Microgrid**, será a **31.818333** grados de latitud norte y **-106.679167** grados de longitud oeste. La ubicación aproximada de esta instalación es **3.6** millas **al sur de Santa Teresa** en el condado de **Doña Ana**.

La **construcción** propuesta consiste en la construcción de una microrred para la generación de energía.

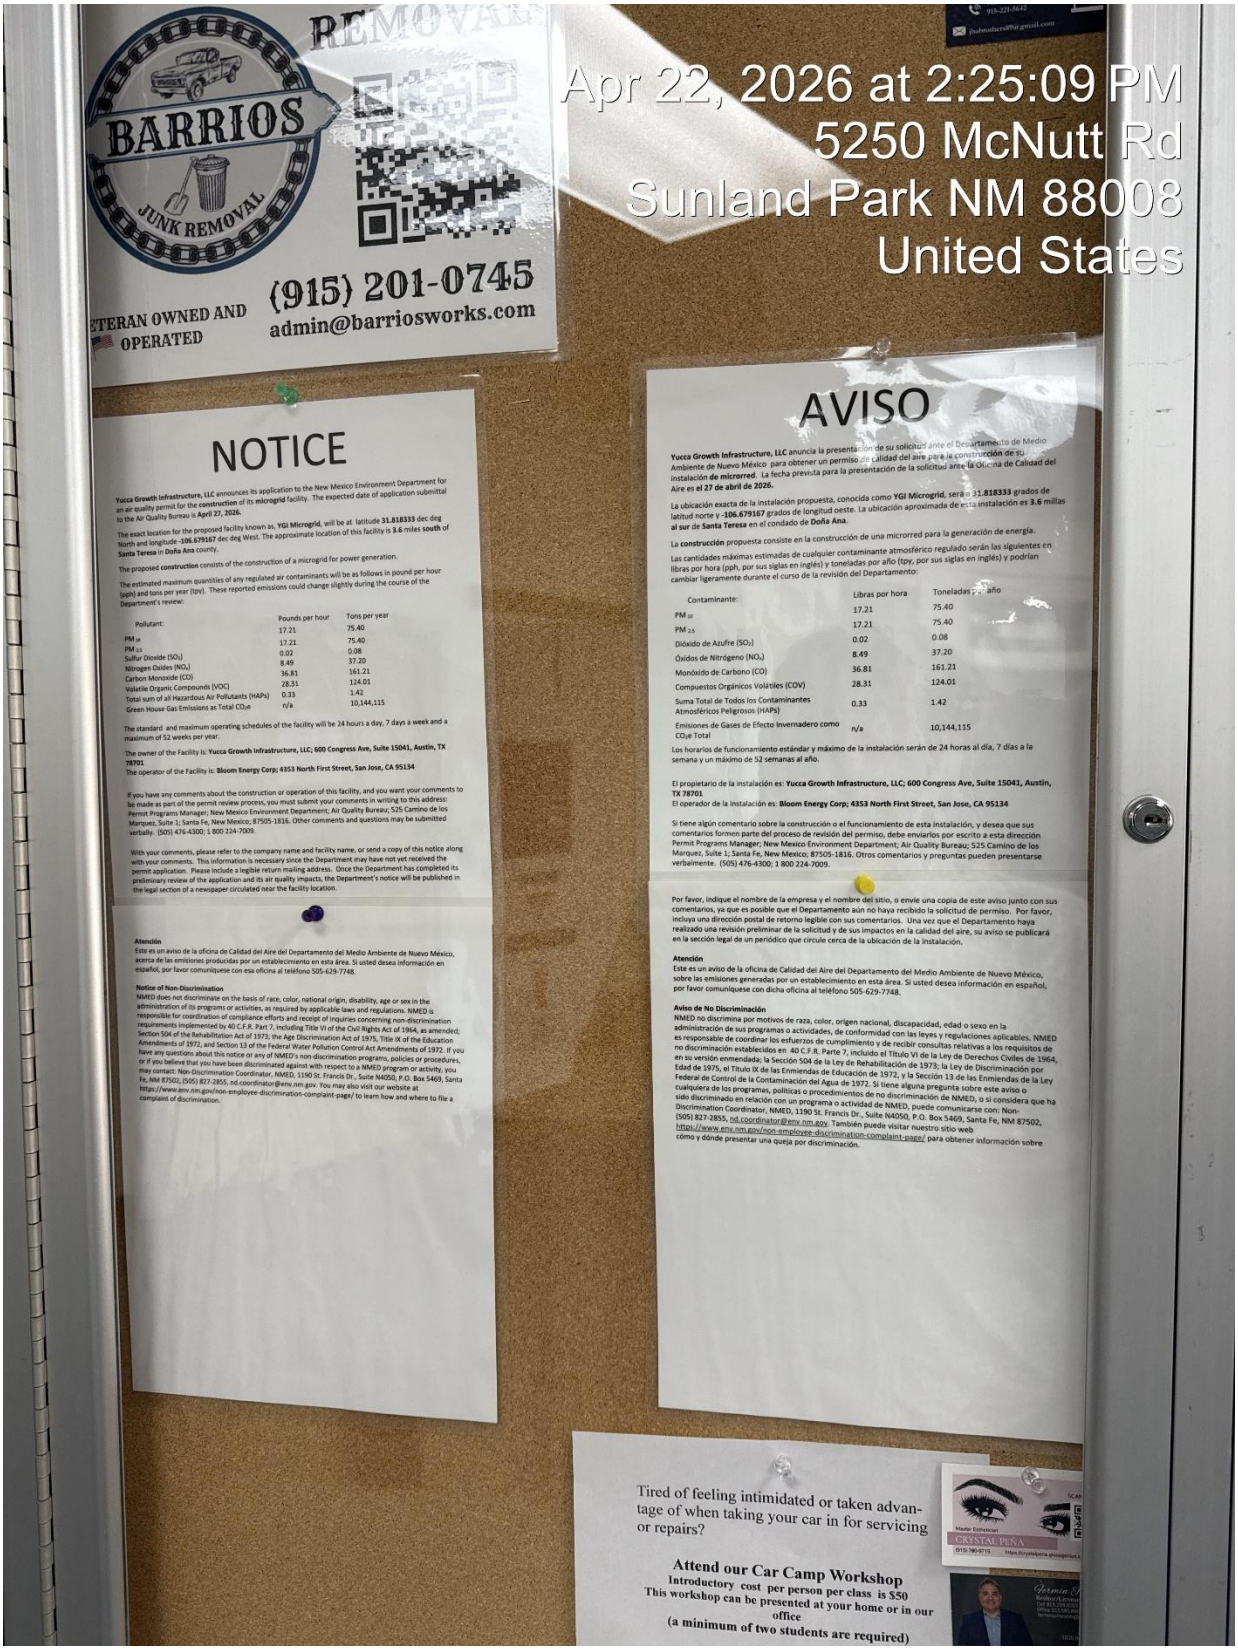
Las cantidades máximas estimadas de cualquier contaminante atmosférico regulado serán las siguientes en libras por hora (pph, por sus siglas en inglés) y toneladas por año (tpy, por sus siglas en inglés) y podrían cambiar ligeramente durante el curso de la revisión del Departamento:

Contaminante:	Libras por hora	Toneladas por año
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Dióxido de Azufre (SO_2)	0.02	0.08
Óxidos de Nitrógeno (NO_x)	8.49	37.20
Monóxido de Carbono (CO)	36.81	161.21
Compuestos Orgánicos Volátiles (COV)	28.31	124.01
Suma Total de Todos los Contaminantes Atmosféricos Peligrosos (HAPs)	0.33	1.42
Emisiones de Gases de Efecto Invernadero como CO_2e Total	n/a	10,144,115

Los horarios de funcionamiento estándar y máximo de la instalación serán de 24 horas al día, 7 días a la semana y un máximo de 52 semanas al año.

El propietario de la instalación es: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
El operador de la instalación es: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

Si tiene algún comentario sobre la construcción o el funcionamiento de esta instalación, y desea que sus comentarios formen parte del proceso de revisión del permiso, debe enviarlos por escrito a esta dirección Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1, Santa Fe, New Mexico, 87505-1816. Otros comentarios y preguntas pueden presentarse verbalmente. (505) 476-4300; 1 800 224-7009.



Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono 505-629-7748.

Notice of Non-Discrimination
NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. You may also visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

Por favor, indique el nombre de la empresa y el nombre del sitio, o envíe una copia de este aviso junto con sus comentarios, ya que es posible que el Departamento aún no haya recibido la solicitud de permiso. Por favor, incluya una dirección postal de retorno legible con sus comentarios. Una vez que el Departamento haya realizado una revisión preliminar de la solicitud y de sus impactos en la calidad del aire, su aviso se publicará en la sección legal de un periódico que circule cerca de la ubicación de la instalación.

NOTICE

Yucca Growth Infrastructure, LLC announces its application to the New Mexico Environment Department for an air quality permit for the **construction** of its **microgrid** facility. The expected date of application submittal to the Air Quality Bureau is **April 27, 2026.**

The exact location for the proposed facility known as, **YGI Microgrid**, will be at latitude **31.818333** dec deg North and longitude **-106.679167** dec deg West. The approximate location of this facility is **3.6** miles **south** of **Santa Teresa** in **Doña Ana** county.

The proposed **construction** consists of the construction of a microgrid for power generation.

The estimated maximum quantities of any regulated air contaminants will be as follows in pound per hour (pph) and tons per year (tpy). These reported emissions could change slightly during the course of the Department's review:

Pollutant:	Pounds per hour	Tons per year
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Sulfur Dioxide (SO_2)	0.02	0.08
Nitrogen Oxides (NO_x)	8.49	37.20
Carbon Monoxide (CO)	36.81	161.21
Volatile Organic Compounds (VOC)	28.31	124.01
Total sum of all Hazardous Air Pollutants (HAPs)	0.33	1.42
Green House Gas Emissions as Total CO_2e	n/a	10,144,115

The standard and maximum operating schedules of the facility will be 24 hours a day, 7 days a week and a maximum of 52 weeks per year.

The owner of the Facility is: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
The operator of the Facility is: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

If you have any comments about the construction or operation of this facility, and you want your comments to be made as part of the permit review process, you must submit your comments in writing to this address: Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Other comments and questions may be submitted verbally. (505) 476-4300; 1 800 224-7009.

With your comments, please refer to the company name and facility name, or send a copy of this notice along with your comments. This information is necessary since the Department may have not yet received the permit application. Please include a legible return mailing address. Once the Department has completed its preliminary review of the application and its air quality impacts, the Department's notice will be published in the legal section of a newspaper circulated near the facility location.

Asunto: Solicitud de Anuncio de Servicio Público en la Radio - 96.3 KHEY Country
Adjuntos: YGI Radio PSA.pdf

Buenos dias,
Según el Código Administrativo de Nuevo México 20.2.72.203.B NMAC y de acuerdo con la Guía para la Notificación Pública de Solicitudes de Permiso de Calidad del Aire - **(5) Notificaciones: Presentación de Anuncio de Servicio Público (PSA):** Un anuncio de servicio público requerido para permisos y revisiones significativas de permisos debe presentarse al menos a una emisora de radio o televisión que preste servicio al municipio o condado en el que esté o vaya a estar ubicada la instalación. **Por lo tanto, basado en lo anterior, le pedimos respetuosamente que emita el guión adjunto como Anuncio de Servicio Público.**

Antes de procesar el pago de los anuncios de servicio público, necesitaremos saber lo siguiente:

1. En qué **emisora de radio** se emitirán los anuncios; y
2. En qué **fecha** y **a qué hora** se emitirá cada uno de los anuncios.

Si tiene alguna pregunta, no dude en contactarme.

Saludos,

Beth Morley

This is a Public Service Announcement for an initial air quality permit application for a microgrid facility per the requirements of New Mexico Administrative Code 20.2.72.203.D. The name of the facility is the YGI Microgrid. The YGI Microgrid facility is located at the following coordinates: **31.818333** degrees North and **-106.679167** degrees West. The principal owner of YGI Microgrid is Yucca Growth Infrastructure, LLC. The principal operator of YGI Microgrid is Bloom Energy Corp. The permit is sought for the proposed construction of a microgrid for power generation.

Public notice has been posted near Santa Teresa, New Mexico at the following locations:

At the facility entrance of the YGI Microgrid, the United States Post Office in Santa Teresa located at 5250 McNutt Rd, in Santa Teresa, New Mexico, Zip Code 88008, at the Loves Travel Stop located at 2401 Airport Rd in Santa Teresa, New Mexico, Zip Code 88008, and at the Dollar General located at 5622 McNutt Rd in Sunland Park, New Mexico, Zip Code 88008.

Comments may be directed to the following address: Permits Program Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez; Suite 1, Santa Fe, New Mexico, 87505-1816. Comments may be directed to the following telephone numbers: (505) 476-4300 or 1(800) 224-7009.

Este es un Anuncio de Servicio Público relacionado con la solicitud inicial de un permiso de calidad del aire para una instalación de microrred propuesta, conforme a los requisitos del Código Administrativo de Nuevo México, regulación 20.2.72.302.D. El nombre de la instalación propuesta es YGI Microgrid. La ubicación de esta instalación está situada en las siguientes coordenadas: **31.818333** grados de latitud norte y **-106.679167** grados de longitud oeste. El propietario principal de YGI Microgrid es Yucca Growth Infrastructure, LLC. El operador principal de YGI Microgrid es Bloom Energy Corp. Se solicita el permiso para la instalación de una microrred (microgrid, en inglés) destinada a la generación eléctrica.

Se ha colocado un aviso público cerca de Santa Teresa, Nuevo México, en las siguientes ubicaciones:

En la entrada de la instalación de YGI Microgrid; en la Oficina Postal de Estados Unidos (United States Post Office, en inglés) ubicada en 5250 McNutt RD, en Santa Teresa, Nuevo México, Codigo Postal 88008; en la tienda Loves Travel Stop ubicada en 2401 Airport Rd en Santa Teresa, Nuevo México, código postal 88008; Dollar General ubicada en 5622 McNutt Rd en Sunland Park, Nuevo México, código postal 88008.

Se pueden dirigir comentarios a la siguiente dirección: Permits Program Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez; Suite 1, Santa Fe, New Mexico, 87505-1816. También puede presentar comentarios a través de los siguientes números telefónicos: (505) 476-4300; 1 800 224-7009.

Latino vote

Continued from Page 1A

real or simply a function of fluctuating Latino Democratic turnout rates. In other words, are Latinos broadly changing their votes back to Democrats, or are Latinos who remained loyal to the Democrats now more angry and fired up?

Survey and election data suggest it's a bit of both. So what does this portend for the future of American politics?

The history of the Latino vote nationwide had for decades been one of long-term stability. Historically, Democrats enjoyed an approximate 65% to 35% advantage over Republicans.

That advantage shrank marginally after Republican President Ronald Reagan signed the Immigration Reform and Control Act in 1986, providing a path to citizenship for millions. But the more familiar two-thirds advantage for the Democratic Party returned following passage of Proposition 187, a 1994 anti-immigrant initiative in California that ultimately mobilized Latinos against Republicans.

Another effort at GOP outreach to Hispanic voters culminated in President George W. Bush taking approximately 40% of the Latino vote in 2004. That growth, however, soon eroded in the wake of anti-immigrant legislation passed by the Republican-controlled House in 2005 and 2006.

The successful campaigns of Democrat Barack Obama in 2008 and 2012, as well as Hillary Clinton's unsuccessful 2016 campaign against Trump, saw Democrats reaping a relatively high level of Latino support, peaking at a 3-to-1 advantage in 2012.

That made Trump's improvements among Latinos in 2020 and 2024 feel, for some, particularly unexpected. He lodged notable breakthroughs in parts of Florida, where he carried Miami-Dade County, and Texas, where he flipped the historically Democratic Rio Grande Valley.

It should not have been such a surprise. There has been a history of sizable shares of Latinos supporting Republican candidates. For instance, both former President George W. Bush and his brother, former Florida Gov. Jeb Bush, performed well with Latinos in Texas and Florida.

For two decades, Democrats have campaigned among Latinos on the promise of comprehensive immigration reform and an economic policy that would level the playing field, including raising the federal minimum wage, providing universal pre-K education and promoting affordable housing.

Many Latinos feel they are still waiting for these Democratic policies to be enacted, let alone improve their lives.

Democratic trifectas in 2009-10 and 2021-22 – when the party held both chambers of Congress, along with the presidency – failed to produce meaningful movement on immigration policy. Many Latinos felt their daily lives had not improved, as they faced high costs of living, expensive housing markets and rising health care costs. While House Democrats did pass numerous bills to address these topics, Senate moderates proved difficult to persuade.

Given these shortcomings, running on the message that "the GOP are bad guys" only gets Democrats so far. In 2024, surveys and focus groups of Hispanic voters made it clear that not everyone was convinced by this characterization. The frustrations of working-class families during the Biden administration were real, whereas fears of mass deportations and other social chaos that a second Trump term might portend were, at that point, conjecture.

The Trump campaign specifically promised widespread action against immigrants, but many of our Latino focus group participants felt this was bluster. They believed that Trump's actions would be targeted against blatant criminals and that his policies would not affect their families and friends.

They did not believe the worst-case scenarios presented by then-Vice President Kamala Harris and other Democrats during the campaign. Despite often not liking Trump, his economic promises felt good during the 2024 affordability crisis.

Many Latinos are now quite upset with Trump. The 2025 gubernatorial elections in New Jersey and Virginia point to dramatic 25-point changes in the Latino vote in the Democrats' direction, compared with Trump's 2024 performance.

In December 2025, the first Democrat was elected mayor of Miami since 1997, with Latino support. A Democrat won a heavily Republican state legislative district in Texas this February with an estimated 79% of the Latino vote. Most recently, Latino voter turnout surged to record levels in the March Democratic primary in Texas.

Majorities of Latino voters believe that their economic fortunes have declined since Trump returned to the White House. Moreover, they expect the situation to worsen over the next year. In March, The Economist reported that Trump's support among Latinos had fallen to 22%.

Evidence from general elections in 2025, as well as special elections in 2026, suggests some of the Latino voters who backed President Donald Trump are now swinging back to the Democrats. MARIO TAMA/GETTY IMAGES

Majorities of Latino voters believe that their economic fortunes have declined since Trump returned to the White House. Moreover, they expect the situation to worsen over the next year. In March, The Economist reported that Trump's support among Latinos had fallen to 22%.

In a bipartisan poll by UnidosUS released in November, only 14% of Latino voters said their lives were better after one year under Trump, while 39% said they had gotten worse. Looking ahead, 50% expected things to get worse still in 2026, while only 20% were optimistic about their economic future. Two-thirds of Latino voters felt that Trump and the Republicans were not focusing enough on improving the economy for people like them.

What's more, mass deportations have happened under the second Trump administration. The vast majority of those detained for deportation, including those who have died, had no criminal record.

Latinos are overwhelmingly opposed to federal troops in U.S. cities, according to our polling; 41% fear legal residents and U.S. citizens getting caught up in enforcement actions. The No. 1 immigration concern for Latino voters remains a path to citizenship for Dreamers – the undocumented immigrants brought to the U.S. as children – and for immigrants who have worked and paid taxes in the country for more than 20 years but lack formal status.

Among Latinos who actually voted for Trump, many would not do so again. Our poll suggests that 22% of Latinos who voted for Trump in 2024 would not vote for him again. By contrast, Democrats retain support from 93% of their 2024 Latino voters.

The long-term effects of the Trump presidency on the Latino electorate are difficult to predict, but for now party preferences have shifted firmly back toward the Democrats. Among voters in the UnidosUS poll, 55% said they felt the Democrats "care a great deal" about Latinos, compared with 29% saying they felt that way about the GOP. At the same time, 33% of Latino voters see the GOP as "hostile," compared with just 7% who believe this about the Democrats.

If the recent leftward shift is sustained, or the earlier shift to the right was illusory, the effects on the politics of 2026 could be large, potentially putting control of Congress in the hands of Latino voters. There are 46 House districts where the number of registered voters who are Latino exceeds the total margin of victory for those seats in 2024, with 23 currently held by Republicans and 23 currently held by Democrats.

Latino voters need to believe that politicians truly care about their concerns and will work to implement a plan to create equal opportunities for the nation's largest minority group to achieve the American dream. We believe the candidates able to make that pitch convincingly will be the most successful.

Matt A. Barreto and Gary M. Segura are principals and co-founders of the polling firm BSP Research. BSP Research has conducted polling for non-profit and advocacy organizations, businesses, and candidates. Barreto has, in the past, directly consulted with Democratic candidates for House, Senate and the presidency. University of California, Los Angeles provides funding as a member of The Conversation US. The Conversation is an independent and nonprofit source of news, analysis and commentary from academic experts. The Conversation is wholly responsible for the content.

NOTICE OF AIR QUALITY PERMIT APPLICATION

Yucca Growth Infrastructure, LLC announces its application to the New Mexico Environment Department for an air quality permit for the **construction** of its **microgrid** facility. The expected date of application submittal to the Air Quality Bureau is **April 27, 2026.**

The exact location for the proposed facility known as, **YGI Microgrid**, will be at latitude **31.818333** dec deg North and longitude **-106.679167** dec deg West. The approximate location of this facility is **3.6** miles **south** of **Santa Teresa** in **Doña Ana** county.

The proposed **construction** consists of the construction of a microgrid for power generation.

The estimated maximum quantities of any regulated air contaminant will be as follows in pound per hour (pph) and tons per year (tpy) and could change slightly during the course of the Department's review:

Pollutant:	Pounds per hour	Tons per year
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Sulfur Dioxide (SO_2)	0.02	0.08
Nitrogen Oxides (NO_x)	8.49	37.20
Carbon Monoxide (CO)	36.81	161.21
Volatile Organic Compounds (VOC)	28.31	124.01
Total sum of all Hazardous Air Pollutants (HAPs)	0.33	1.42
Green House Gas Emissions as Total CO_2e	n/a	10,144,115

The standard and maximum operating schedules of the facility will be 24 hours a day, 7 days a week and a maximum of 52 weeks per year.

The owner of the Facility is: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
The operator of the Facility is: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

If you have any comments about the construction or operation of this facility, and you want your comments to be made as part of the permit review process, you must submit your comments in writing to this address: Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Other comments and questions may be submitted verbally. (505) 476-4300; 1 800 224-7009.

Please refer to the company name and site name, or send a copy of this notice along with your comments, since the Department may have not yet received the permit application. Please include a legible return mailing address with your comments. Once the Department has performed a preliminary review of the application and its air quality impacts, the Department's notice will be published in the legal section of a newspaper circulated near the facility location.

General information about air quality and the permitting process, and links to the regulations can be found at the Air Quality Bureau's website: www.env.nm.gov/air-quality/permitting-section-home-page/. The regulation dealing with public participation in the permit review process is 20.2.72.206 NMAC.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono 505-629-7748.

Notice of Non-Discrimination
NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. You may also visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

AVISO DE SOLICITUD DE PERMISO DE CALIDAD DEL AIRE

Yucca Growth Infrastructure, LLC anuncia la presentación de su solicitud ante el Departamento de Medio Ambiente de Nuevo México para obtener un permiso de calidad del aire para la **construcción** de su instalación **de microrred**. La fecha prevista para la presentación de la solicitud ante la Oficina de Calidad del Aire es **el 27 de abril de 2026.**

La ubicación exacta de la instalación propuesta, conocida como **YGI Microgrid**, será a **31.818333** grados de latitud norte y **-106.679167** grados de longitud oeste. La ubicación aproximada de esta instalación es **3.6** millas **al sur** de **Santa Teresa** en el condado de **Doña Ana**.

La **construcción** propuesta consiste en la construcción de una microrred para la generación de energía.

Las cantidades máximas estimadas de cualquier contaminante atmosférico regulado serán las siguientes en libras por hora (pph, por sus siglas en inglés) y toneladas por año (tpy, por sus siglas en inglés) y podrían cambiar ligeramente durante el curso de la revisión del Departamento:

Contaminante:	Libras por hora	Toneladas por año
PM_{10}	17.21	75.40
$PM_{2.5}$	17.21	75.40
Dióxido de Azufre (SO_2)	0.02	0.08
Óxidos de Nitrógeno (NO_x)	8.49	37.20
Monóxido de Carbono (CO)	36.81	161.21
Compuestos Orgánicos Volátiles (COV)	28.31	124.01
Suma Total de Todos los Contaminantes Atmosféricos Peligrosos (HAPs)	0.33	1.42
Emisiones de Gases de Efecto Invernadero como CO_2e Total	n/a	10,144,115

Los horarios de funcionamiento estándar y máximo de la instalación serán de 24 horas al día, 7 días a la semana y un máximo de 52 semanas al año.

El propietario de la instalación es: **Yucca Growth Infrastructure, LLC; 600 Congress Ave, Suite 15041, Austin, TX 78701**
El operador de la instalación es: **Bloom Energy Corp; 4353 North First Street, San Jose, CA 95134**

Si tiene algún comentario sobre la construcción o el funcionamiento de esta instalación, y desea que sus comentarios formen parte del proceso de revisión del permiso, debe enviarlos por escrito a esta dirección Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Otros comentarios y preguntas pueden presentarse verbalmente. (505) 476-4300; 1 800 224-7009.

Por favor, indique el nombre de la empresa y el nombre del sitio, o envíe una copia de este aviso junto con sus comentarios, ya que es posible que el Departamento aún no haya recibido la solicitud de permiso. Por favor, incluya una dirección postal de retorno legible con sus comentarios. Una vez que el Departamento haya realizado una revisión preliminar de la solicitud y de sus impactos en la calidad del aire, su aviso se publicará en la sección legal de un periódico que circule cerca de la ubicación de la instalación.

Puede encontrar información general sobre la calidad del aire y el proceso de concesión de permisos, así como enlaces a la normativa, en la página web de la Oficina de Calidad del Aire: www.env.nm.gov/air-quality/permitting-section-home-page/. La regulación que aborda la participación pública en el proceso de revisión de permisos es la 20.2.72.206 NMAC.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, sobre las emisiones generadas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con dicha oficina al teléfono 505-629-7748.

Aviso de No Discriminación
NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, de conformidad con las leyes y regulaciones aplicables. NMED es responsable de coordinar los esfuerzos de cumplimiento y de recibir consultas relativas a los requisitos de no discriminación establecidos en 40 C.F.R. Parte 7, incluido el Título VI de la Ley de Derechos Civiles de 1964, en su versión enmendada; la Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975, el Título IX de las Enmiendas de Educación de 1972, y la Sección 13 de las Enmiendas de la Ley Federal de Control de la Contaminación del Agua de 1972. Si tiene alguna pregunta sobre este aviso o cualquiera de los programas, políticas o procedimientos de no discriminación de NMED, o si considera que ha sido discriminado en relación con un programa o actividad de NMED, puede comunicarse con: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. También puede visitar nuestro sitio web https://www.env.nm.gov/non-employee-discrimination-complaint-page/ para obtener información sobre cómo y dónde presentar una queja por discriminación.

Govt Bids & Proposals

Govt Bids & Proposals

REQUEST FOR PROPOSALS: VETERANS TREATMENT COURT TREATMENT SERVICES.
RFP: 27-05

The Third Judicial District Court, Veterans Treatment Court Program, is seeking proposals from qualified providers of substance abuse treatment services. Services include, but are not limited to: counseling, group sessions such as Moral Reconation Therapy (MRT), operating costs, professional services and must be an approved, in-network provider with TRICARE/TRIWEST and all NM Turquoise Care (Medicaid) plans.
For a complete copy of the Request for Proposal please contact Carmen Florez-Lucero, Treatment Court Programs Manager, at (575) 528-8392. The Third Judicial District Court reserves the right to reject any and all proposals.
All proposals must be submitted in electronic format with the following subject line "RFP 27-05 Veterans Treatment Court Treatment Services". Proposals are due no later than 3:00 p.m. on Wednesday, June 03, 2026. Please ensure the complete Proposal packet is transmitted via email*

Please email proposals to:
Amanda Oliveri, Court Financial Manager
lcrdpurchasing@nmcourts.gov
Third Judicial District Court

CITY OF JAL, NEW MEXICO
REQUEST FOR PROPOSALS (RFP) NO. 2026-01
DESIGN-BUILD SERVICES
WASTEWATER TREATMENT FACILITY (WWTF)

The City of Jal, New Mexico is requesting qualifications and proposals from qualified Design-Build teams for the design, permitting, construction, and commissioning of a new wastewater treatment facility.
This procurement will be conducted using a two-phase selection process in accordance with the New Mexico Procurement Code.
The complete Request for Proposals (RFP), including all requirements, specifications, and submission instructions, will be available beginning April 20, 2026 through the Beacon Bid platform which can be located under the Treasurer/Finance department section of our website
www.cityofjal.us
Interested Offerors must register on Beacon Bid to download the RFP, submit proposals, and receive addenda and updates.
All proposals must be submitted electronically through the Beacon Bid platform.
Proposals are due no later than:
May 18, 2026 at 2:00 PM MT
Late submissions will not be accepted.
All questions regarding this solicitation must be submitted through the Beacon Bid platform in accordance with the RFP Schedule of Events.
#12268622 (8X) April 23, 24, 26-30; May 1, 2026

Sección 10

Descripción Escrita de las Operaciones Rutinarias de la Instalación

Una descripción escrita de las operaciones rutinarias de la instalación. Incluya una descripción de cómo funcionará cada equipo, cómo se utilizarán los controles y el destino tanto de los productos como de los residuos generados. Para las modificaciones y/o revisiones, explique cómo afectarán los cambios al proceso existente. En un párrafo aparte, describa los principales cuellos de botella del proceso de producción. El objetivo de esta descripción es proporcionar información suficiente sobre las operaciones de la planta para que el responsable de redactar el permiso de mareas pueda determinar las fuentes de emisión adecuadas.

La instalación utiliza un sistema Bloom Energy Server, que es un tipo de sistema de celdas de combustible de óxido sólido (EUID: SOFC). El sistema SOFC convierte el gas natural en electricidad mediante una reacción electroquímica sin combustión. Cada celda de combustible individual se compone de tres capas: un electrolito cerámico sólido intercalado entre un cátodo y un ánodo; tanto el ánodo como el cátodo están fabricados a partir de tintas que recubren el electrolito. No se requieren metales preciosos, ácidos corrosivos ni materiales fundidos. El gas natural ingresa por el lado del ánodo, donde se mezcla con vapor de agua para producir combustible reformado. A medida que el combustible reformado atraviesa el ánodo, atrae iones de oxígeno provenientes del aire situado en el lado del cátodo. Los iones de oxígeno se combinan con el combustible reformado para generar electricidad, agua, calor y dióxido de carbono. El agua y el calor se reciclan para producir el vapor necesario para reformar el combustible, lo que permite una reacción electroquímica de alta eficiencia que no requiere agua adicional, salvo durante el arranque del sistema. La reacción electroquímica tiene lugar a una temperatura de entre 700 y 900 grados Celsius. Las celdas individuales se agrupan en pilas y, posteriormente, en módulos de potencia que albergan cientos de celdas de combustible individuales capaces de generar corriente continua. Estos módulos se integran en unidades denominadas Energy Servers (Servidores de Energía), las cuales combinan los módulos de potencia con un módulo de procesamiento de combustible y un módulo de corriente alterna (CA) que contiene convertidores de CC a CA y transformadores, con el fin de producir una potencia neta de CA de 325 kW. El sistema Bloom Energy Server propuesto implementa varios servidores que operan de manera coordinada para conformar un sistema integrado, capaz de mantener la potencia de salida objetivo establecida para cada escenario aplicable. Los gases de escape del ánodo una vez agotados y secos , cuya composición es aproximadamente un 95 % dióxido de carbono, se descargan a la atmósfera. Las emisiones atmosféricas generadas por los Energy Servers consisten en dichos gases de escape del ánodo; debido a la ausencia de combustión, estos gases presentan niveles reducidos de contaminantes atmosféricos regulados y el sistema no consume agua durante su funcionamiento en régimen estable. Se ha propuesto que el sistema Bloom Energy Server opere a su carga nominal máxima durante 8.760 horas al año.

Sección 11
Determinación de la Fuente

Fuente de presentación en virtud de 20.2.70, 20.2.72, 20.2.73 y 20.2.74 NMAC

Las fuentes que soliciten un permiso de construcción, un permiso PSD o un permiso de operación deberán evaluar las fuentes circundantes y/o asociadas (incluyendo aquellas fuentes conectadas directamente a la presente fuente por razones comerciales) y completar esta sección. Las respuestas a las siguientes preguntas deberán ser congruentes con la guía de permisos de la Oficina de Calidad del Aire, titulada Single Source Determination Guidance (Guía para la Determinación de Fuente Única), la cual puede encontrarse en la Página de Solicitudes, dentro de la Sección de Permisos del sitio web de la Oficina de Calidad del Aire.

Por lo general, los edificios, estructuras, instalaciones o recintos que poseen el mismo código SIC, que se encuentran bajo propiedad o control común, y que son contiguos o adyacentes, constituyen una única fuente estacionaria para fines de aplicabilidad de las normas 20.2.70, 20.2.72, 20.2.73 y 20.2.74 del código NMAC. La presentación de su análisis sobre estos factores, como respaldo a las respuestas que figuran a continuación, es opcional, a menos que sea solicitada por el NMED.

A. Identifique las fuentes de emisión evaluadas en esta sección (enumere y describa): Todas las fuentes enumeradas en la Tabla 2-A. La Unidad SOFC incluye un subsistema dedicado para suministrar energía de respaldo al centro de datos adyacente. Por lo tanto, el centro de datos, una vez construido, no requerirá un permiso y no tendrá fuentes de emisión reguladas.

B. Aplique los 3 criterios para determinar una fuente única.

Código SIC: Las fuentes circundantes o asociadas pertenecen a la misma agrupación industrial de dos dígitos (código SIC de dos dígitos) que esta instalación, O bien, las fuentes circundantes o asociadas que pertenecen a códigos SIC de dos dígitos diferentes son instalaciones de apoyo para esta fuente.

☑ **Sí** ☐ **No**

Propiedad o Control Común: Las fuentes circundantes o asociadas se encuentran bajo la misma propiedad o control que esta fuente.

☑ **Sí** ☐ **No**

Contigua o adyacente: Las fuentes circundantes o asociadas son contiguas o adyacentes.

☑ **Sí** ☐ **No**

C. Haga una determinación:

☑ La fuente, tal como se describe en esta solicitud, constituye la totalidad de la fuente a efectos de la aplicabilidad de las normas 20.2.70, 20.2.72, 20.2.73 o 20.2.74 del NMAC. Si en el apartado "A" anterior evaluó únicamente la fuente que es objeto de esta solicitud, deberá marcar todas las casillas con la opción "SÍ". Si en el apartado "A" anterior evaluó también otras fuentes, deberá marcar AL MENOS UNA de las casillas con la opción "NO" para concluir que la fuente, tal como se describe en la solicitud, constituye la totalidad de la fuente a efectos de la aplicabilidad de las normas 20.2.70, 20.2.72, 20.2.73 y 20.2.74 del NMAC.

La fuente, tal como se describe en esta solicitud, **no** constituye la totalidad de la fuente para los fines de aplicabilidad de las secciones 20.2.70, 20.2.72, 20.2.73 o 20.2.74 del NMAC (se puede emitir un permiso para una parte de una fuente). La totalidad de la fuente consta de las siguientes instalaciones o fuentes de emisión (enumere y describa):

Sección 12

Sección 12.A
Determinación de la Aplicabilidad de la PSD para Todas las Fuentes

(Presentación conforme a las secciones 20.2.72 y 20.2.74 de las NMAC.)

Una determinación de la aplicabilidad de PSD para todas las fuentes. Para las fuentes que soliciten una revisión significativa de un permiso, aplique los requisitos pertinentes de las secciones 20.2.74.AG y 20.2.74.200 del NMAC para determinar si esta instalación constituye una fuente PSD mayor o menor, y si esta modificación constituye una modificación PSD mayor o menor. Puede resultar útil consultar los procedimientos para la «Determinación del cambio neto de emisiones en una fuente», tal como se especifica en la Tabla A-5 (página A.45) del *Manual del Taller de Revisión de Fuentes Nuevas (New Source Review Workshop Manual) de la EPA, a fin de determinar si la revisión está sujeta a la revisión de PSD.

A. Esta instalación es:

- ☑ **Una fuente PSD menor antes y después de esta modificación (de ser así, borre C y D a continuación).**
- ☐ **Una Fuente principal de PSD antes de esta modificación. Esta modificación convertirá esta instalación en una fuente menor de PSD.**
- ☐ **Una Fuente Mayor PSD existente que nunca ha tenido una modificación mayor que requiera un análisis de Mejor Tecnología de Control Disponible (BACT, por sus siglas en inglés).**
- ☐ **Una Fuente Mayor PSD existente que ha tenido una modificación mayor que requiere un análisis BACT.**
- ☐ **Una nueva fuente principal PSD después de esta modificación.**

B. **Esta instalación no figura entre las categorías de fuentes PSD enumeradas en la Tabla I de la sección 20.2.74.501. Las emisiones del "proyecto" correspondientes a esta modificación no son significativas. Las emisiones del "proyecto" que se enumeran a continuación derivan única y exclusivamente de los cambios descritos en esta solicitud de permiso; por consiguiente, no se incluyen emisiones provenientes de otras [revisiones o modificaciones, pasadas o futuras] realizadas en esta instalación. Asimismo, se debe indicar específicamente si este proyecto conlleva un "descuello" o genera otras emisiones asociadas que resulten en un incremento de las emisiones totales. Las emisiones del proyecto (antes del cálculo de compensación neta) para la presente iniciativa son las siguientes [vea la Tabla 2 de la norma 20.2.74.502 NMAC para consultar la lista completa de los niveles de significancia]:**

a.	**NOx:**	**37.20**	**TPY**
b.	**CO:**	**161.21**	**TPY**
c.	**VOC:**	**124.01**	**TPY**
d.	**SOx:**	**0.076**	**TPY**
e.	**PM:**	**75.40**	**TPY**
f.	**PM_{10}:**	**75.40**	**TPY**
g.	**$PM_{2.5}$:**	**75.40**	**TPY**
h.	**Flourides:**	**N/A**	**TPY**
i.	**Lead:**	**N/A**	**TPY**
j.	**Compuestos de azufre (en la Tabla 2):**	**0.076**	**TPY**
k.	**GHG:**	**10,144,115**	**TPY**

** El proveedor del equipo del sistema Bloom Energy Server sostiene que sus equipos no generan emisiones de material particulado (PM) en absoluto. El solicitante ha utilizado las pruebas existentes basadas en métodos de referencia para estimar las emisiones de manera conservadora, dadas las limitaciones de dichos métodos de prueba. El proveedor señala que las pruebas existentes podrían presentar un sesgo positivo en el método de muestreo y reflejar el material particulado filtrable proveniente del aire de admisión que atraviesa el sistema. Por esta razón, el proveedor del equipo del sistema Bloom Energy Server no especifica factores de emisión de material particulado.*

Sección 13

Determinación de la Normativa Estatal y Federal sobre la Calidad del Aire

---

En esta sección, se enumera cada normativa estatal y federal sobre calidad del aire que puede aplicarse a sus instalaciones y/o equipos que sean fuentes estacionarias de contaminantes atmosféricos regulados.

No todas las normativas estatales y federales sobre calidad del aire se incluyen en esta lista. Consulte el CFR (por sus siglas en inglés, Código de Reglamentos Federales) o la página de normativas de la Oficina de Calidad del Aire para ver el conjunto completo de normativas sobre calidad del aire.

Información requerida para equipos específicos:
En el caso de los reglamentos aplicables a tipos específicos de fuentes, en la columna "Justificación" **facilite toda la información necesaria para determinar si la normativa es o no aplicable. Por ejemplo,** para determinar si las normas sobre emisiones de 40 CFR 60, Subparte IIII, se aplican a sus tres motores estacionarios idénticos, necesitamos saber la fecha de construcción tal como se define en esa normativa, la fecha del fabricante, la fecha de reconstrucción o modificación (si corresponde), si son o no motores de bomba contra incendios, si son o no motores de emergencia tal como se define en esa norma, sus clasificaciones de sitio y el desplazamiento del cilindro.

Información obligatoria para los reglamentos que se aplican a toda la instalación:
Consulte las instrucciones de la columna "Justificación" para conocer la información necesaria para determinar si se aplica una normativa del tipo "Toda la instalación" (por ejemplo, 20.2.70 o 20.2.73 NMAC).

Citas reglamentarias de normativas que no se aplican, pero podrían aplicarse:
Si existe una normativa estatal o federal sobre calidad del aire que no se aplica, pero tiene un equipo en una categoría de fuentes para la que se ha promulgado una normativa, debe **proporcionar la cita reglamentaria de bajo nivel que demuestre por qué su equipo no está sujeto a la normativa o está exento de ella. Por ejemplo,** si tiene un motor de combustión interna estacionario que no está sujeto a 40 CFR 63, Subparte ZZZZ, porque se trata de un RICE (por sus siglas en inglés, motor alternativo de combustión interna) estacionario, de dos tiempos y de mezcla pobre, con una potencia nominal en el sitio mayor a 500 HP de freno, situado en una fuente importante de emisiones de HAP, su cita sería 40 CFR 63.6590(b)(3)(i). **No queremos que se discutan todas las normativas que no son aplicables, pero si es posible que una normativa sea aplicable, explique por qué no lo es. Por ejemplo,** si su instalación es una planta eléctrica, no necesita incluir una cita para demostrar que 40 CFR 60, Subparte OOO, no se aplica a su trituradora de rocas inexistente.

Citas reglamentarias para las normas de emisión:
Para cada unidad que esté sujeta a una norma de emisión en una normativa específica de la fuente, como 40 CFR 60, Subparte OOO, o 40 CFR 63, Subparte HH, incluya la cita reglamentaria de bajo nivel de esa norma de emisión. Las normas de emisión pueden ser límites numéricos de emisión, normas sobre prácticas de trabajo u otros requisitos como el mantenimiento. **Estos son algunos ejemplos:** un deshidratador de glicol está sujeto a las normas generales de 63.764C(l)(i) a (iii); un motor está sujeto a 63.6601, Tablas 2a y 2b; una trituradora está sujeta a 60.672(b), Tabla 3 y todos los puntos de transferencia están sujetos a 60.672(e)(1).

Condiciones exigibles a nivel federal:
Todos los reglamentos federales son exigibles a nivel federal. Todas las normativas estatales de la Oficina de Calidad del Aire son exigibles a nivel federal, excepto las siguientes: partes de defensa afirmativa en 20.2.7.6.B, 20.2.7.110(B)(15), 20.2.7.11 hasta 20.2.7.113, 20.2.7.115, and 20.2.7.116; 20.2.37; 20.2.42; 20.2.43; 20.2.62; 20.2.63; 20.2.86; 20.2.89 y 20.2.90 NMAC. Exigibles a nivel federal significa que la EPA (por sus siglas en inglés, Agencia de Protección Ambiental) puede hacer cumplir la normativa, así como la Oficina de Calidad del Aire, y que la normativa exigible a nivel federal puede contar a la hora de determinar el PTE (por sus siglas en inglés, potencial de emisión) de una instalación para las normativas del Título V, PSD y permisos de no cumplimiento.
INCLUYA CUALQUIER OTRA INFORMACIÓN NECESARIA PARA COMPLETAR UNA DETERMINACIÓN DE APLICABILIDAD O QUE
SEA PERTINENTE AL AVISO DE INTENCIÓN O PERMISO DE SU INSTALACIÓN.

Índice de determinación de aplicabilidad de la EPA para 40 CFR 60, 61, 63, etc.: http://cfpub.epa.gov/adi/

Administrative Record NSR 10833_001274

Tabla de Regulaciones Estatales:

Mención de Regulación Estatal	Título	¿Se Aplica? Ingrese Sí o No	Unidad(es) o Instalación	Justificación: (*Puede eliminar las instrucciones o declaraciones que no se apliquen en la columna de justificación para acortar el documento.*)
20.2.1 NMAC	Disposiciones Generales	Sí	Instalaciones	*Se aplica a todo el sitio. Yucca cumplirá con los requisitos de procedimiento indicados en 20.1.114 NMAC, 20.1.115 NMAC, 20.1.116 NMAC y 20.1.117 NMAC (relativos a audiencias de variación, información confidencial, dígitos significativos y presentación de informes electrónicos) en la medida que apliquen.*
20.2.3 NMAC	Normas de Calidad de Aire Ambiente NMAAQS	Sí	Instalaciones	*Se aplica a todo el sitio. Yucca entiende que las NMAAQS representan objetivos para preservar los recursos de aire del Estado y que las NMAAQS no son requisitos aplicables bajo la Parte 70. Véase 20.2.3.9 NMAC.*
20.2.7 NMAC	Emisiones Excesivas	Sí	Instalaciones	*Se aplica a todo el sitio. Yucca implementará un plan de mantenimiento según lo requerido bajo 20.2.7.14 NMAC, y cumplirá con los requisitos de notificación, defensa afirmativa y causa raíz de 20.2.7.108–114 NMAC.*
20.2.23 NMAC	Control de Polvo Fugitivo	Sí	Instalaciones	*Para las operaciones no sujetas a la exención en 20.2.23.108.B(3), el sitio desarrollará e implementará un plan de control de polvo de conformidad con 20.2.23.111–112 NMAC*
20.2.33 NMAC	Equipo de Combustión de Gas - Dióxido de	No	No Aplica	*No se instalará en esta instalación equipo de combustión de gas con una entrada de calor superior a 1,000,000 MMBTU.*
20.2.34 NMAC	Combustión de Petróleo Equipo: NO_2	No	No Aplica	*No se instalará equipo de combustión de petróleo. Véase 20.2.34.108 NMAC.*
20.2.35 NMAC	Planta de Procesamiento de Gas Natural – Azufre	No	No Aplica	*La instalación no es una planta de procesamiento de gas natural. Véase 20.2.109, 110 NMAC.*
20.2.37 y 20.2.36 NMAC	Instalaciones de Procesamiento de Petróleo y Refinerías de Petróleo	N/A	No Aplica	*Derogado.*
20.2.38 NMAC	Hidrocarburos Instalación de Almacenamiento	No	No Aplica	*Esta instalación no es una instalación de almacenamiento de hidrocarburos.*
20.2.39 NMAC	Planta de Recuperación de Azufre - Azufre	No	No Aplica	*Esta instalación no es una planta de recuperación de azufre.*
20.2.50 NMAC	Sector de petróleo y Gas – Contaminantes Precursores de	No	No Aplica	*Esta instalación no forma parte del sector de petróleo y gas.*
20.2.61.109 NMAC	Humo y Emisiones Visibles	No	No Aplica	*No hay fuentes sujetas al límite de opacidad del 20% en 20.2.61.109 NMAC. Yucca no operará locomotoras ni incineradores de cortina de aire en el sitio.*
20.2.70 NMAC	Permisos de Operación	Sí	Instalaciones	*Yucca presentará una solicitud de permiso de operación completa y oportuna según lo requerido en 20.2.70.200, 201, 300 NMAC.*
20.2.71 NMAC	Tarifas de Permisos de Operación	Sí	Instalaciones	*Yucca cumplirá con las disposiciones de tarifas de la Parte 71. El departamento proporcionará una factura por las tarifas adeudadas antes del 1 de abril de cada año según 20.2.71.113.A NMAC.*
20.2.72 NMAC	Permisos de Construcción	Sí	Instalaciones	*Esta solicitud de permiso se presenta para cumplir con los requisitos de la Parte 72.*
20.2.73 NMAC	Requisitos de NOI & inventario de emisiones	Sí	Instalaciones	*Debido a que se requiere un permiso, la acción final sobre el permiso satisfará los requisitos de 20.2.73.200.A(4) NMAC. Además, Yucca cumplirá con los requisitos de inventario de emisiones de 20.2.73.300 NMAC.*
20.2.74 NMAC	Permisos – Prevención de Deterioro Significativo (PSD)	No	Instalaciones	*El permiso PSD no aplica porque la nueva fuente estacionaria propuesta no es una fuente estacionaria principal. Específicamente, la fuente no está incluida en la tabla 1 (20.2.74.501 NMAC) y el potencial de emitir es menor de 250 toneladas por año para cada contaminante nuevo regulado sujeto a revisión.*
20.2.75 NMAC	Construcción Tarifas del permiso	Sí	Instalaciones	*Esta regulación aplica ya que esta solicitud se presenta conforme a 20.2.72 NMAC.*

Administrative Record NSR 10833_001275

Mención de Regulación Estatal	Título	¿Se Aplica? Ingrese Sí o No	Unidad(es) o Instalación	Justificación: (*Puede eliminar las instrucciones o declaraciones que no se apliquen en la columna de justificación para acortar el documento.*)
20.2.77 NMAC	Desempeño de Nuevas Fuentes	No	No Aplica	*La instalación no está sujeta a ningún estándar conforme a la Parte 60 del CFR Título 40.*
20.2.78 NMAC	Emisión Estándares para HAPS	No	No Aplica	*La instalación no está sujeta a ningún estándar conforme a la Parte 61 del CFR Título 40. Véase 20.2.78.9 NMAC.*
20.2.79 NMAC	Permisos – No Cumplimiento Áreas	No	No Aplica	*La instalación no está ubicada en un área de no cumplimiento. El área de no cumplimiento de Sunland Park incluye el "área delimitada por la línea estatal Nuevo México-Texas al este, la línea internacional Nuevo México-México al sur, la latitud N31°49'30" al norte y la longitud W106°36'36" al oeste." Véase 83 Fed. Reg. 25776, 25820 (4 de junio de 2018). La microrred YGI no está ubicada dentro de estos límites.* *Además, el sitio no causará ni contribuirá a ninguna violación existente de las NAAQS. Como se detalla más completamente en la Sección 16 (relacionada con modelación), las emisiones de NO_X y VOC son menores que los MERPs aplicables de O_3 de 8 horas (condado de Otero). Véase 20.2.79.109.A. Véase la*
20.2.80 NMAC	Alturas de Chimeneas	Sí	Todas las chimeneas	*Ninguna chimenea excederá la altura de chimenea de buena práctica de ingeniería. Véase 20.2.80.109.*
20.2.82 NMAC	Normas MACT para Categorías de Fuentes de HAP	No	No Aplica	*Esta regulación se aplica a todas las fuentes que emiten contaminantes peligrosos del aire, las cuales están sujetas a los requisitos de 40 CFR Parte 63. El sitio de la microrred YGI es una fuente de área bajo 40 CFR Parte 63.*

Tabla de Regulaciones Federales Aplicables:

Mención de Regulación Federal	Título	¿Aplica? Ingrese Sí o No	Unidad(es) o instalación	Justificación:
40 CFR 50	NAAQS	No	No Aplica	*El modelado y las condiciones desarrolladas a partir del modelado son los requisitos aplicables para demostrar el cumplimiento con las NAAQS.*
NSPS 40 CFR 60, Subparte A	Disposiciones Generales	No	No Aplica	*La instalación no está sujeta a ninguna norma bajo 40 CFR Parte 60.*
NSPS 40 CFR 60.330 Subparte GG	Turbinas de Gas Estacionarias	No	No Aplica	*No hay turbinas de gas estacionarias que se estén autorizando como parte de esta solicitud.*
NSPS 40 CFR Subparte IIII	Motores de Combustión Estacionario de Compresión e Ignición Interna	No	No Aplica	*No hay motores de combustión interna de ignición por compresión estacionarios que se estén autorizando como parte de esta solicitud.*
NSPS 40 CFR 60.330 Subparte KKKK	Turbinas de Gas Estacionarias	No	No Aplica	*No hay turbinas de gas estacionarias que se estén autorizando como parte de esta solicitud.*
NSPS 40 CFR 60.330 Subparte KKKKa	Turbinas de Gas Estacionarias	No	No Aplica	*No hay turbinas de gas estacionarias que se estén autorizando como parte de esta solicitud.*

Mención de Regulación Federal	Título	¿Aplica? Ingrese Sí o No	Unidad(es) o instalación	Justificación:
NSPS 40 CFR 60 Subparte TTTT	Normas de Desempeño para Emisiones de Gases de Efecto Invernadero para Unidades Generadoras de Electricidad	No	No Aplica	*No se están permitiendo Turbinas de Gas Estacionarias como parte de esta solicitud.*
NSPS 40 CFR 60 Subparte TTTTa	Normas de Desempeño para Emisiones de Gases de Efecto Invernadero para Unidades Generadoras de Electricidad	No	No Aplica	*No se están permitiendo Turbinas de Gas Estacionarias como parte de esta solicitud.*
NSPS 40 CFR 60 Subparte UUUU	Guía de Emisiones Para Emisiones de Gases de Efecto Invernadero y Tiempos de Cumplimiento para Unidades Generadoras de Servicios Eléctricos	No	No Aplica	*Derogado*
NSPS 40 CFR 60 Subparte UUUUb	Guía de Emisiones para Emisiones de Gases de Efecto Invernadero y Tiempos de Cumplimiento para Unidades Generadoras de Servicios Eléctricos	No	No Aplica	*La norma proporciona directrices para los planes estatales bajo el § 111(d) y no se aplica directamente a las instalaciones designadas. Véase 40 CFR § 60.5840b(a).*
NESHAP 40 CFR 61 Subparte A	Disposiciones Generales	No	No Aplica	*40 CFR Parte 61 no se aplica. La instalación no pertenece a ninguna categoría listada ni emite ningún contaminante listado que activaría la aplicabilidad.*
MACT 40 CFR 63, Subparte A	Disposiciones Generales	No	No Aplica	*La instalación no estará sujeta a ninguna norma de la Parte 63 que requiera el cumplimiento de la Subparte A.*
MACT 40 CFR 63 Subparte YYYY	Estándar de Emisiones Nacionales para Contaminantes Atmosféricos Peligrosos para Combustión Estacionaria Turbinas	No	No Aplica	*No se están permitiendo Turbinas de Gas Estacionarias como parte de esta solicitud.*
40 CFR 64	Monitoreo de Aseguramiento del Cumplimiento	No	No Aplica	*No hay fuentes sujetas al Monitoreo de Aseguramiento del Cumplimiento de conformidad con 40 CFR Parte 64.*
Título IV – Lluvia Ácida 40 CFR 72	Lluvia Ácida	No	No Aplica	*No existen fuentes que se estén permitiendo como parte de esta solicitud que estarían sujetas al 40 CFR Parte 72.*
Título IV – Lluvia Ácida 40 CFR 73	Asignación de Dióxido de Azufre Emisiones	No	No Aplica	*No existen fuentes que se estén permitiendo como parte de esta solicitud que estarían sujetas al 40 CFR Parte 72.*

Administrative Record NSR 10833_001277

Mención de Regulación Federal	Título	¿Aplica? Ingrese Sí o No	Unidad(es) o instalación	Justificación:
Título IV-Lluvia Ácida 40 CFR 75	Monitoreo Continuo de Emisiones	No	No Aplica	*No existen fuentes que se estén permitiendo como parte de esta solicitud que estarían sujetas al 40 CFR Parte 72.*
Título IV – Lluvia Ácida 40 CFR 76	**Lluvia Ácida** Óxidos de Nitrógeno **Programa de Reducción de Emisiones**	No	No Aplica	*La instalación no contiene unidades de servicios públicos alimentadas por carbón. Véase 40 CFR § 76.1.*
Título VI – 40 CFR 82	Protección del Ozono Estratosférico	No	No Aplica	*Si bien las sustancias que agotan la capa de ozono (SAO) no se fabricarán, importarán ni utilizarán como parte integral de las unidades de emisión, en la medida en que la instalación maneje o utilice incidentalmente cualquier SAO regulada como parte de las operaciones de la planta, cumplirá con todos los requisitos aplicables del Título VI.*

Administrative Record NSR 10833_001278

Sección 14
Plan Operativo para Mitigar las Emisiones

(Presentado según 20.2.70, 20.2.72, 20.2.74 NMAC)

☐ **Fuentes del Título V** (20.2.70 NMAC): Al marcar esta casilla y certificar esta solicitud, el titular del permiso certifica que ha elaborado un **Plan operativo para mitigar las emisiones durante los arranques, paradas y emergencias** en el que se definen las medidas que deben adoptarse para mitigar las emisiones de la fuente durante los arranques, paradas y emergencias, tal como se exige en 20.2.70.300.D.5 f) y g) de NMAC. Este plan se conservará in situ para ponerlo a disposición del Departamento cuando éste lo solicite. Este plan no debe presentarse con esta solicitud.

☑ **NSR** (20.2.72 NMAC), **PSD** (20.2.74 NMAC) y **No cumplimiento** (20.2.79 NMAC) **Fuentes:** Al marcar esta casilla y certificar esta solicitud, el titular del permiso certifica que ha elaborado un **Plan operativo para mitigar las emisiones de la fuente durante el mal funcionamiento, el arranque o la parada,** en el que se definen las medidas que se adoptarán para mitigar las emisiones de la fuente durante el mal funcionamiento, el arranque o la parada, tal como se exige en 20.2.72.203.A.5 NMAC. Este plan se conservará in situ para ponerlo a disposición del Departamento cuando éste lo solicite. Este plan no debe presentarse con esta solicitud.

☑ **Título V** (20.2.70 NMAC), **NSR** (20.2.72 NMAC), **PSD** (20.2.74 NMAC) y **No cumplimiento** (20.2.79 NMAC) **Fuentes:** Al marcar esta casilla y certificar esta solicitud, el titular del permiso certifica que ha establecido y aplicado un Plan para minimizar las emisiones durante las operaciones rutinarias o previsibles de arranque, parada y mantenimiento programado mediante normas de prácticas de trabajo y buenas prácticas de control de la contaminación atmosférica, tal como se exige en 20.2.7.14. A y B NMAC. Este plan se conservará en el sitio o en la oficina de campo más cercana para ponerlo a disposición del Departamento cuando este lo solicite. Este plan no debe presentarse con esta solicitud.

Administrative Record NSR 10833_001279

Sección 15
Escenarios de Funcionamiento Alternativos

(Presentado según 20.2.70, 20.2.72, 20.2.74 NMAC)

Escenarios operativos alternativos: Proporcione toda la información requerida por el departamento para definir escenarios operativos alternativos. Esto incluye cambios en los procesos, materiales y productos; información sobre las emisiones de las instalaciones; requisitos de los equipos de control de la contaminación atmosférica; cualquier requisito aplicable; requisitos de seguimiento, mantenimiento de registros y presentación de informes; y requisitos de certificación del cumplimiento. Asegúrese de que las tablas aplicables en esta solicitud estén marcadas con claridad para mostrar el escenario de funcionamiento alternativo.

Escenarios de construcción: Cuando se modifica un permiso que autoriza una nueva construcción en una instalación existente, NMED incluye una condición para indicar claramente qué condición(es) del permiso (del anterior y del nuevo) rigen durante el intervalo entre la fecha de expedición del permiso de modificación y la finalización de la construcción de la(s) modificación(es). Hay muchas variables posibles que deben abordarse, como las siguientes: ¿Está permitido el funcionamiento simultáneo de la unidad anterior y la nueva? Y en caso afirmativo, por ejemplo, ¿durante cuánto tiempo y bajo qué restricciones? En general, este tipo de requisitos se tratarán en la sección A100 del permiso, pero pueden añadirse requisitos adicionales en otro lugar. En el apartado A100 de nuestro modelo de contrato de NSR y/o Título V encontrará ejemplos de estos requisitos. Encontrará estas plantillas de permisos en: www.env.nm.gov/air-quality/permitting-section-procedures-and-guidance/. El cumplimiento de las normas debe mantenerse durante la construcción, lo que normalmente no debería ser un problema a menos que se solicite el funcionamiento simultáneo de equipos anteriores y nuevos.

En esta sección, bajo el título en negrita "Escenarios de construcción ", especifique cualquier información necesaria para redactar estas condiciones, tales como: tiempo estimado conservador/realista para la finalización de la construcción de las distintas unidades; si se solicita el funcionamiento simultáneo de las unidades anteriores y nuevas (y, en caso afirmativo, modelado); si las unidades antiguas serán retiradas o desmanteladas; cualquier ramificación de PSD; si se solicitan límites temporales durante las fases de construcción; si se solicita un aumento de las emisiones como emisiones de SSM o si, por el contrario, se tratará como un escenario de construcción independiente (con los correspondientes límites y condiciones de emisión, etc.).

No Aplica - No se proponen escenarios operativos ni de construcción alternativos como parte de esta solicitud.

Sección 16

Modelización de la Dispersión Atmosférica

1) Análisis del impacto ambiental (modelización) de Construcción de fuentes menores (20.2.72 NMAC) y Prevención del Deterioro Significativo (PSD) (20.2.74 NMAC): Presente un análisis del impacto ambiental, tal como se exige en 20.2.72.203, A(4) y/o 20.2.74.303 NMAC, y como se indica en las Directrices de modelización de la dispersión de la Oficina de Calidad del Aire que se encuentran en el sitio web de modelización de la Sección de Planificación. Si está exento de la modelización de la dispersión atmosférica para uno o más contaminantes, adjunte la documentación de aprobación de la exención de la modelización de la Sección de Modelización de la AQB (por sus siglas en inglés, Oficina de Calidad del Aire).
2) Modelización de SSM: Los solicitantes deben realizar modelización de dispersión para las emisiones totales a corto plazo durante SSM (por sus siglas en inglés, el arranque, la parada o el mantenimiento) rutinarios o predecibles utilizando escenarios realistas del peor de los casos siguiendo las orientaciones de la sección de modelización de dispersión de la Oficina de Calidad del Aire. Consulte la "Guía para la presentación de solicitudes de permiso para emisiones de arranque, parada y mantenimiento" (http://www.env.nm.gov/aqb/permit/appform.htm 1) para obtener instrucciones más detalladas sobre los requisitos de modelización de emisiones de SSM.
3) Análisis de impacto ambiental del Título V (20.2.70 NMAC): Las solicitudes del título V deben especificar el permiso de construcción y/o el(los) número(s) de permiso del título V para los que se aprobó por última vez la modelización de la dispersión de la calidad del aire. Las instalaciones que solo tienen un permiso del Título V, como los vertederos y las incineradoras de cortina de aire, están sujetas a la misma modelización exigida para los permisos previos a la construcción exigidos por 20.2.72 y 20.2.74 NMAC.

¿Cuál es la finalidad de esta solicitud?	Marque con una X cada finalidad que corresponda
Nueva fuente principal de PSD o modificación principal de PSD (20.2.74 NMAC). Véase el punto 1 anterior.	
Nueva fuente menor o revisión significativa del permiso con arreglo a 20.2.72 NMAC (20.2.72.219.D NMAC). Véase el punto 1 anterior. **Nota:** Para las emisiones de VOC no se requiere ni modelización ni exención de modelización.	X
Notificación de contaminantes existentes que no se habían notificado anteriormente.	
Notificación de contaminantes existentes cuando el impacto ambiental se aborda por primera vez.	
Solicitud del Título V (nueva, renovación, modificación significativa o menor. 20.2.70 NMAC). Véase el punto 3.	
Reubicación (20.2.72.202.B.4 o 72.202.D.3.c NMAC)	
Revisión del permiso técnico para fuentes menores 20.2.72.219.B. 1 .d.vi NMAC para sustituciones de unidades del mismo tipo.	
Otros: es decir, modelización de SSM. Véase el punto 2 anterior.	
Esta solicitud no requiere modelización, ya que se trata de una solicitud NPR (por sus siglas en inglés, no se requiere permiso).	
Esta solicitud no requiere modelización, ya que se trata de una solicitud NOI (por sus siglas en inglés, aviso de intención) (20.2.73 NMAC).	
Esta aplicación no requiere modelado según 20.2.70.7.E(l 1), 20.2.72.203. A(4), 20.2.74.303, 20.2.79.109.D NMAC y de conformidad con las directrices de modelización de la Oficina de Calidad del Aire.	

Marque cada casilla que corresponda:

☐ Véase adjunta la **exención** aprobada de la modelización para **todos** los contaminantes procedentes de la instalación.

☐ Véase adjunta la **exención** aprobada de la modelización para **algunos** contaminantes procedentes de la instalación.

☑ Se adjunta en el formulario de Solicitud Universal 4 (UA4) un **informe de modelización para todos** los contaminantes procedentes de la instalación.

☐ En el UA4 se adjunta un **informe de modelización** para **algunos** contaminantes de la instalación.

☐ No se requiere la modelización.

Administrative Record NSR 10833_001281

Solicitud Universal 4

Informe de Modelado de Dispersión Atmosférica

Consulte y complete la Sección 16 del formulario de Solicitud Universal (UA3) para ayudarle a determinar si se requiere modelado. Si, después de completar la Sección 16, aún no está seguro de si se requiere modelado, envíe por correo electrónico la Sección 16 completada al Gerente de Modelado de AQB para obtener ayuda para tomar esta determinación. Si se requiere modelado, se debe presentar y aprobar un protocolo de modelado antes de la presentación de la solicitud. El protocolo debe enviarse por correo electrónico al gerente de modelado. Se recomienda un protocolo, pero es opcional para fuentes menores y es obligatorio para nuevas fuentes PSD o modificaciones mayores de PSD. Complete y envíe esta parte del formulario de Solicitud Universal (UA4), el "Informe de modelado de dispersión atmosférica", solo si se requiere modelado de dispersión atmosférica para esta presentación de solicitud. Esto sirve como su presentación del informe de modelado y debe contener toda la información necesaria para describir el modelado. No se debe presentar ningún otro informe de modelado o protocolo de modelado con esta solicitud de permiso.

16-A: Identificación

1	Nombre de la instalación:	YGI Microgrid
2	Nombre de la empresa:	Yucca Growth Infrastructure, LLC (YGI)
3	Número de permiso actual:	Por Determinar
4	Nombre del modelador del solicitante:	John Ke, Trinity Consultants
5	Número de teléfono del modelador:	505-266-6611
6	Correo electrónico del modelador:	jke@trinityconsultants.com

16-B: Resumen

1	¿Se presentó y aprobó un protocolo de modelado? No se ha presentado un protocolo de modelado para esta solicitud de permiso.	Sí☐	No ☒
2	¿Por qué se está realizando el modelado?	Nueva instalación	
3	Describa los cambios en el permiso relevantes para el modelado.		
	Esta solicitud se presenta para una nueva instalación, bajo una solicitud 20.2.72 NMAC.		
4	¿Qué datum geodésico se utilizó en el modelado?	WGS84	
5	¿Cuánto tiempo estará la instalación en esta ubicación?	Más de 1 año	
6	¿Es la instalación una fuente principal con respecto a la Prevención del Deterioro Significativo (PSD)?	Sí ☐	No☒

Administrative Record NSR 10833_001282

7	Identifique la Región de Control de Calidad del Aire (AQCR) en la que se encuentra la instalación	153	
8	Enumere las fechas de referencia de PSD para esta región (menor o mayor, según corresponda).		
	NO2	2/8/1995	
	SO2	NO APLICA	
	PM10	16/6/2000	
	PM2.5	NO APLICA	
9	Proporcione el nombre y la distancia a las áreas de Clase I dentro de los 50 km de la instalación (300 km para permisos PSD).		
	NO APLICA – No hay áreas de Clase I dentro de los 50 km de la instalación.		
10	¿Se encuentra la instalación en un área de no cumplimiento? Si es así, describa a continuación	Sí☐	No ☒
	NO APLICA		
11	Describa cualquier requisito especial de modelado, como los requisitos de permisos simplificados.		
	NO APLICA		

16-C: Historial de Modelado de la Instalación

1

Describa el historial de modelado de la instalación, incluidos los números de permiso de aire, los contaminantes modelados, las Normas Nacionales de Calidad del Aire Ambiental (NAAQS, por sus siglas en inglés), las AAQS de Nuevo México (NMAAQS, por sus siglas en inglés) y los incrementos PSD modelados. (No incluya las exenciones de modelado).

16-E: Modelado de contaminantes tóxicos del aire de Nuevo México

1	Enumere cualquier contaminante tóxico del aire de Nuevo México (NMTAP, por sus siglas en inglés) de las Tablas A y B en 20.2.72.502 NMAC que se modele para esta solicitud. NO APLICA: no hay NMTAP en esta instalación.					
2	Enumere cualquier NMTAP que se emita pero que no se modele debido al factor de corrección de la altura de la chimenea. Agregue filas adicionales a la tabla a continuación, si es necesario. NO APLICA: no hay NMTAP en esta instalación.					
	Contaminante	Tasa de emisión (libras/hora)	Nivel de evaluación de la tasa de emisión	Altura de la chimenea	Factor de corrección	Tasa de emisión/ Factor de corrección

16-F: Opciones de modelado

1	¿Se utilizó la versión más reciente de AERMOD con las opciones predeterminadas reglamentarias? Si no, explique a continuación.	Sí☒	No☐

16-G: Modelado de fuentes circundantes

1	Fecha de obtención de las fuentes circundantes	17/9/25
2	Si consideró que el inventario de fuentes circundantes proporcionado por la Oficina de Calidad del Aire (Air Quality Bureau) era inexacto, describa en qué se diferencian las fuentes modeladas del inventario proporcionado. Si se realizaron cambios en el inventario de fuentes circundantes, utilice la siguiente tabla para describirlos. Agregue filas según sea necesario.	
	ID de fuente de la AQB	Descripción de las correcciones
	26582@1	$PM_{2.5}$, PM_{10}: Para la instalación Rinker Santa Teresa Pipe (AI# 26582), las tasas de emisión de PM_{10} y $PM_{2.5}$ se basaron en 95 tpy de partículas totales en suspensión del permiso GCP-5 #3602 para plantas de concreto premezclado. Las tasas de emisión de PM_{10} y $PM_{2.5}$ se calcularon proporcionalmente basándose en las constantes multiplicadoras de tamaño de partícula tomadas del Capítulo 13.2.4 de AP-42 para el manejo de agregados y pilas de almacenamiento. Los nuevos valores son 10.28 lb/hr de PM_{10} y 1.55 lb/hr
	38354@1	$PM_{2.5}$, PM_{10}: Para la instalación MiniConcrete Materials Concrete Batch Plant – No 7 (AI# 38354), las tasas de emisión de PM_{10} y $PM_{2.5}$ se basaron en 95 tpy de partículas totales en suspensión del permiso GCP-5 #7756 para plantas de concreto premezclado. Las tasas de emisión de PM_{10} y $PM_{2.5}$ se calcularon proporcionalmente basándose en las constantes multiplicadoras de tamaño de partícula tomadas del Capítulo 13.2.4 de AP-42 para el manejo de agregados y pilas de almacenamiento. Los nuevos valores son

Administrative Record NSR 10833_001284

16-H: Efecto de estela (downwash) de edificios y estructuras

1	¿Cuántos edificios hay en la instalación?	425		
2	¿Cuántos tanques de almacenamiento sobre el suelo hay en la instalación?	0		
3	¿Se modeló el efecto de estela (downwash) de edificios para todos los edificios y tanques? Si no, explique por qué a continuación.		Sí ☒	No☐
	NO APLICA: se modeló el efecto de estela (downwash) para todos los edificios.			
4	Comentarios sobre los edificios	Las estructuras de efecto de estela (downwash) representan los módulos que albergan el sistema Bloom Energy Server.		

16-I: Receptores y límite de propiedad modelado

1	El "Área restringida" es un área a la que se impide efectivamente el acceso público. Las barreras efectivas incluyen cercas continuas, muros continuos u otras barreras continuas aprobadas por el Departamento, como terreno físico accidentado con una pendiente pronunciada que requeriría equipo especial para atravesar. Si una propiedad grande está completamente cerrada por cercas, un área restringida dentro de la propiedad puede identificarse solo con señalización. Las vías públicas no pueden ser parte de un Área restringida. Se requiere un Área restringida para excluir a los receptores de la propiedad de la instalación. Si la instalación no tiene un Área restringida, los receptores deberán colocarse dentro de los límites de la propiedad de la instalación. Describa la cerca u otra barrera física en la instalación que define el área restringida.					
	La instalación está cerrada por una cerca continua.					
2	Los receptores deben colocarse a lo largo de las vías de acceso público en el área restringida. ¿Hay vías públicas que atraviesan el área restringida?				Sí☐	No☒
3	¿Se incluyen las coordenadas del límite del área restringida en los archivos de modelado?				Sí☒	No☐
4	Describa las cuadrículas de receptores y su espaciado. Se puede utilizar la siguiente tabla, agregando filas según sea necesario.					
	Tipo de cuadrícula	Forma	Espaciado	Distancia inicial desde el área restringida o el centro de la instalación	Distancia final desde el área restringida o el centro de la instalación	Observaciones
	Densidad variable	Cuadrada	100 m	0 m	500 m desde el límite de aire ambiente	Los receptores ubicados fuera de los Estados Unidos no se incluyen en este análisis.
	Densidad variable	Cuadrada	500 m	500 m desde el límite de aire ambiente	5,000 m desde el límite de aire ambiente	Los receptores ubicados fuera de los Estados Unidos no se incluyen en este análisis.
	Densidad variable	Cuadrada	1,000 m	5,000 m desde el límite de aire ambiente	20,000 m desde el límite de aire ambiente	Los receptores ubicados fuera de los Estados Unidos no se incluyen en este análisis.
	Densidad variable	Cuadrada	1,250 m	20,000 m desde el límite de aire ambiente	50,000 m desde el centro de la instalación	Los receptores ubicados fuera de los Estados Unidos no se incluyen en este análisis.
5	Describa el espaciado de los receptores a lo largo de la línea perimetral.					
	Resolución de 25 m a lo largo del límite de aire ambiente.					

Administrative Record NSR 10833_001285

6	Describa los receptores del área de Clase I de PSD.
	NO APLICA – No hay áreas de Clase I dentro de los 50 km de la instalación.

16-J: Escenarios de Modelado

1	Identifique, defina y describa todos los escenarios de modelado. Los ejemplos de escenarios de modelado incluyen el uso de diferentes tasas de producción, horas del día, épocas del año, operación simultánea o alternativa de equipos antiguos y nuevos durante los períodos de transición, etc. Los escenarios operativos alternativos deben corresponder a todas las partes de la Solicitud Universal y deben describirse completamente en la Sección 15 de la Solicitud Universal (UA3).		
	No existen escenarios de modelado alternativos.		
2	¿Qué escenario produce las concentraciones más altas? ¿Por qué?		
	NO APLICA – no existen escenarios de modelado alternativos.		
3	¿Se utilizaron conjuntos de factores de emisión para limitar las tasas de emisión u horas de operación? (Esta pregunta se refiere a los conjuntos de factores "SEASON", "MONTH", "HROFDY" y relacionados, no a los factores utilizados para calcular la tasa máxima de emisión.)	Sí☐	No ☐
4	Si es así, describa los factores para cada grupo de fuentes. Enumere las fuentes en cada grupo antes de la tabla de factores para ese grupo. (Modifique o duplique la tabla según sea necesario. Está bien colocar la tabla debajo de la sección 16-K si facilita el formato.) Fuentes:

	Se utilizó la metodología ARM2 con las proporciones ambientales máximas y mínimas predeterminadas.			
3	¿Se utilizaron las proporciones predeterminadas de NO_2/NO_X (0.5 mínimo, 0.9 máximo o equilibrio)? Si no es así, describa y justifique las proporciones utilizadas a continuación.		Sí ☒	No☐
4	Describa el valor de diseño utilizado para cada período de promedio modelado.			
	1 hora: Octavo valor alto más alto Promedio anual de un año:			

16-L: Análisis de Ozono

1	El NMED ha realizado un análisis genérico que demuestra que las fuentes que son menores con respecto al PSD no causan ni contribuyen a ninguna violación de los NAAQS de ozono. El análisis sigue a continuación. La base del SIL de ozono está documentada en *Guía sobre los niveles de impacto significativo para el ozono y las partículas finas en el Programa de permisos de prevención del deterioro significativo*, Agencia de Protección Ambiental de Estados Unidos, 17 de abril de 2018 y documentos asociados. El NMED acepta esta base del SIL y la incorpora a este registro de permiso por referencia. La documentación completa del análisis de concentración de ozono utilizando MERPS se incluye en las Pautas de modelado de dispersión atmosférica de la Oficina de Calidad del Aire de Nuevo México (Revisado en junio de 2024).		
2	Los valores MERP presentados en la Tabla 10 y la Tabla 11 de las Pautas de modelado de la NM AQB que producen las concentraciones más altas indican que las instalaciones que emiten no más de 250 toneladas/año de NO_X y no más de 250 toneladas/año de COV causarán menos formación de O_3 que el nivel de significancia de O_3. $$[O_3]_{8-hour} = \left(\frac{250 \frac{ton}{yr}}{340_{MERP_{NOX}}} + \frac{250 \frac{ton}{yr}}{4679_{MERP_{VOC}}} \right) \times 1.96\ \mu g/m^3$$ =1.546 µg/m³, que está por debajo del nivel de significancia de 1.96 µg/m³. Las fuentes que producen concentraciones de ozono por debajo del SIL de ozono no causan ni contribuyen a niveles de contaminantes atmosféricos que excedan las NAAQS de ozono. No obstante, los solicitantes de permisos realizan habitualmente cálculos de modelado hipotético utilizando la herramienta MERPs y las Pautas de dispersión para demostrar que el proyecto no causará ni contribuirá a una NAAQS de ozono. Dicho cálculo específico del proyecto se presenta en los puntos 3–5, a continuación, aunque la instalación no emitirá más de 250 toneladas/año de NOx y 250 toneladas/año de COV.		
3	¿La instalación emite al menos 250 toneladas por año de NO_X o al menos 250 toneladas por año de COV? Las fuentes que emiten al menos 250 toneladas por año de NO_X o al menos 250 toneladas por año de COV están cubiertas por el análisis anterior y requieren un análisis individual.	Sí☐	No☒

Administrative Record NSR 10833_001287

5

Para nuevas fuentes principales de PSD o modificaciones principales de PSD, si se utilizaron MERPs para contabilizar el ozono, complete la información a continuación. Si se utilizó otro método, descríbalo a continuación. La instalación no es una fuente principal de PSD. Es una fuente menor y proporciona información de MERPS voluntariamente de acuerdo con la guía de MERP más reciente de la Agencia de Protección Ambiental de Estados Unidos.

NO_X (ton/año)	$MERP_{NOX}$	COV (ton/año)	$MERP_{COV}$	$[O_3]_{8\ horas}$
37.20	413.5	124.01	82121	0.0915 ppb

La formación secundaria de ozono de la microrred YGI se estima utilizando la Ecuación 2 de la "Guía sobre el desarrollo de tasas de emisión modeladas para precursores (MERPs) como herramienta de demostración de Nivel 1 para ozono y $PM_{2.5}$ bajo el Programa de permisos PSD" de la Agencia de Protección Ambiental de Estados Unidos (guía de MERPs). La Ecuación 2 es equivalente a la ecuación que precede a la Tabla 10 en las Pautas de modelado de la NM AQB, entendiendo que el MERP (ver más abajo) es el inverso del cociente en la ecuación 2, y el impacto del ozono es la combinación lineal de las expresiones para los impactos específicos de NO_X y COV, cuyo resultado puede expresarse en unidades de ppb o $\mu g/m^3$. La Ecuación 2 se calculó para los impactos específicos de NO_X y COV; los resultados se sumaron; y un resultado final se comparó con el nivel de minimis recomendado por la Agencia de Protección Ambiental de Estados Unidos de 1.0 ppb. La fuente hipotética en el condado de Otero, NM, se seleccionó según los criterios proporcionados en la guía de MERPs, que incluyen proximidad, terreno y uso de la tierra, clima, fuentes regionales de contaminantes y concentraciones de contaminantes de fondo. La proximidad del condado de Otero a la microrred East junto con las similitudes en el terreno fueron las razones principales para seleccionarlo como fuente hipotética. Según la guía de la Agencia de Protección Ambiental de Estados Unidos, el impacto de la calidad del aire modelado de una fuente hipotética de 500 toneladas/año (el valor más cercano a las emisiones anuales del proyecto) es de 1.209116 ppb para una fuente de 500 tpa de NOX y 0.0006089 ppb para una fuente de 500 tpa de COV. Comparando estos resultados con las tasas de emisión del proyecto, el impacto del proyecto para el ozono sería de 0.0915 ppb, que está por debajo del umbral de significancia de 1.0 ppb.

$$\text{Eq. 2: } Project\ Impact = Project\ emission\ rate \times \frac{Modeled\ Air\ Quality\ Impact\ from\ Hypothetical\ Source}{Modeled\ emission\ rate\ from\ Hypothetical\ Source}$$

El impacto de la calidad del aire modelado para NOx y COV fue proporcionado por la herramienta MERPs View Qlik de la Agencia de Protección Ambiental de Estados Unidos. YGI está utilizando valores MERP de la fuente hipotética en el condado de Otero, NM. Según el rango de alturas de chimenea, se utilizaron los impactos modelados asociados con una chimenea de 10 m de este análisis. Para calcular el valor MERP enumerado anteriormente, YGI utilizó la siguiente ecuación:

$$MERP = \frac{500\ tpy}{Modeled\ Air\ Quality\ Impact}$$

16-M: Modelado de materia particulada

16-U: Archivos de Modelado

1

Describa los archivos de modelado:

Modelos de impacto significativo
- Formato del nombre del archivo de entrada “YGIMG_Poll AvgPer_SIL Input.inp”
- Formato del nombre del archivo de salida “YGIMG_Poll AvgPer_SIL Output.out”
- “Poll” = NO2 (óxidos de nitrógeno), CO (monóxido de carbono), PM10 (partículas en suspensión, PM_{10}), PM2.5 (partículas en suspensión, $PM_{2.5}$), SO2 (dióxido de azufre), NH3 (amoníaco)
- “AvgPer” = período de promedio. 1hr = 1 hora, etc. Ann = anual
- “SIL” – designador de SIL
- Los archivos pueden contener múltiples SIL para períodos de promedio a corto plazo, anuales y de incremento, así como múltiples escenarios.

Modelos de NM/NAAQS e incremento
- Formato del nombre del archivo de entrada “YGIMG_Poll AvgPer_Standard Input.inp”
- Formato del nombre del archivo de salida “YGIMG_Poll AvgPer_Standard Output.out”
- “Poll” = NO2 (óxidos de nitrógeno), CO (monóxido de carbono), PM10 (partículas en suspensión, PM_{10}), PM2.5 (partículas en suspensión, $PM_{2.5}$), SO2 (dióxido de azufre), NH3 (amoníaco)
- “AvgPer” = período de promedio. 1hr = 1 hora, etc. Ann = anual
- “Standard” = estándar de calidad del aire. PSD = Incremento PSD Clase II, NAAQS = NAAQS

Los archivos BPIP y AERMAP también se han incluido con esta presentación. Debido a limitaciones de tamaño, el archivo de modelado se dividió en tres secciones, Sector A, Sector B, Sector C y Sector D, para poder ejecutar AERMAP. YGI proporciona cuatro conjuntos de archivos AERMAP; todas las elevaciones para las fuentes, edificios y receptores en los archivos modelados se basan en estos conjuntos de archivos.

16-V: Solicitudes de PSD Nuevas o de Modificación Mayor – NO APLICA

1	Una nueva fuente principal de PSD o una modificación importante a una fuente principal de PSD existente requiere un análisis adicional. ¿Se realizó el monitoreo previo a la construcción (consulte 20.2.74.306 NMAC y la Guía de pre-aplicación de PSD en el sitio web de AQB)?	Sí☐	No☐
2	Si no, ¿aprobó AQB una exención del monitoreo previo a la construcción?	Sí☐	No☐
3	Describa cómo se ha abordado el monitoreo previo a la construcción o adjunte el monitoreo previo a la construcción aprobado o la exención de monitoreo.		
4	Describa el análisis de impactos adicionales requerido en 20.2.74.304 NMAC.		
5	Si es necesario, ¿se han completado los análisis de impactos ambientales de ozono y PM2.5 secundarios? Si es así, describa a continuación.	Sí☐	No☐

Administrative Record NSR 10833_001292

16-W: Resultados del Modelado

1	Si se exceden los estándares ambientales debido a fuentes circundantes, se requiere un análisis de culpabilidad para que la fuente demuestre que la contribución de esta fuente es menor que los niveles de significancia para el contaminante específico. ¿Se realizó un análisis de culpabilidad? Si es así, describa a continuación.	Sí☐ No ☐
	NO APLICA – no se realizaron análisis de culpabilidad para esta solicitud.	
2	Identifique las concentraciones máximas del análisis de modelado. Las filas pueden modificarse, agregarse y eliminarse de la tabla a continuación según sea necesario.	

Contaminante, Tiempo Período y estándar	Modelado Concentración de la instalación (µg/m3)	Concentración modelada con fuentes circundantes (µg/m3)	PM secundaria (µg/m3)	Concentración de fondo (µg/m3)	Concentración acumulativa (µg/m3)	Valor del estándar (µg/m3)	Porcentaje del estándar	Localización

16-X: Resumen/Conclusiones	
	Una declaración de que se han cumplido los requisitos de modelado y que se puede emitir el permiso.
1	YGI ha demostrado que la YGI Microgrid no causará ni contribuirá a que se exceda ninguna norma aplicable para CO, NO_2, $PM_{2.5}$, PM_{10} y SO_2.

Administrative Record NSR 10833_001295

Sección 17

Historial de las Pruebas de Conformidad

(Presentado según 20.2.70, 20.2.72, 20.2.74 NMAC)

Para demostrar el cumplimiento de las condiciones de los permisos NSR existentes, debe presentar un historial de pruebas de cumplimiento. La siguiente tabla ofrece un ejemplo.

No se han realizado pruebas de conformidad en esta instalación, ya que se trata de un sitio nuevo.

Administrative Record NSR 10833_001296

Sección 20

Otra Información Pertinente

Otra información Pertinente. Utilice este anexo para aclarar cualquier parte de la solicitud que considere que necesita explicación. Haga referencia a la sección, tabla, columna y/o campo. Incluya cualquier texto adicional, tablas, cálculos o información aclaratoria.

Además, el solicitante puede proponer una redacción específica del permiso para su consideración por parte de la AQB. En el caso de una revisión de un permiso existente, el solicitante debe facilitar la redacción antigua y la nueva en formato de seguimiento de cambios para resaltar los cambios propuestos. Si propone un texto para una instalación nueva o un texto para una unidad nueva, presente las condiciones de funcionamiento propuestas, junto con las condiciones de control, registro e información asociadas. En cualquier caso, limite la redacción propuesta a la parte afectada del permiso.

No aplica - No se proporciona información adicional como parte de esta solicitud.

Sección 22: Certificación

Nombre de la Empresa: Yucca Growth Infrastructure, LLC

Yo, [hw:] *Marisa Blackshire* , por la presente certifico que la información y los datos presentados en esta solicitud son verdaderos y lo más precisos posible, a mi leal saber y entender y según mi experiencia y conocimientos profesionales.

Firmado este día [hw:] *22* de [hw:] *abril, 2024,* bajo juramento o afirmación, ante un notario del Estado de

Yucca Growth Infrastructure, LLC
Air Quality Permit Application No. 10883
(Agency Interest No. 41351 - PRN20260001)
YGI Microgrid

General Application Questions

1. The cover letter of application states that "this application covers all of the pollutant-emitting activities subject to permitting for the YGI Microgrid and the data center." Based on available public information, it is expected that the data center referenced will be located adjacent to the location of the proposed microgrid.

    a. Please explain the relationship between the YGI Microgrid and the proposed data center, including ownership, operational control, and how the facilities will interact. Please include any supporting documentation regarding exclusivity agreements, long-term power purchase agreements, or operational dependencies between the microgrid and the data center.

    b. Please confirm if the data center will be dependent on the YGI Microgrid as its primary or sole power source. Section 11 of the application states that the SOFC Unit will be used to supply backup power to the adjacent data center (page 622/648). Please confirm whether the planned function for the SOFC Unit is to supply primary power or backup power to the data center, or a combination of those two modes of operation. If the SOFC Unit is solely being used to satisfy emergency backup power needs for the planned data center, what will the primary electrical power supply be for the data center?

    c. Please confirm whether the data center will include any on-site combustion equipment (turbines, generators), including emergency, temporary, portable, or non-road sources.

    d. Is the microgrid and/or the data center planning to add backup generators or other combustion units as exempt equipment after permit issuance?

2. Please confirm there are no additional process equipment such as heaters/burners for fuel conditioning, cooling towers, on-site storage, or maintenance activities such as coating operations at the YGI Microgrid that could be considered air emissions sources.

3. Additional concerns regarding the process:
    - It is not clear from the application how H2 is generated/extracted from natural gas. Please clarify. Will a reformer be utilized in the process?
    - How is steam generated? This process also may require the use of a reformer.

Administrative Record NSR 10833_001300

- Is water recycled into the system? Please describe the system. How is water quantified and/or stored? Please include tanks units, etc.

4. The cover letter states that YGI Microgrid will connect to "adjacent electrical infrastructure and generate power for a nearby data center facility". Please describe the ownership and function of the adjacent electrical infrastructure, including whether this refers to utility-owned distribution systems (i.e., primary electrical grid) or a privately owned infrastructure and provide any supporting documentation of this relationship. Does the adjacent electrical infrastructure serve multiple customers or is it dedicated to the data center?

5. Are there any plans to connect the planned campus to the primary electrical power grid, upon initial construction or in the future?

6. How will the fuel cell system meet the reliability requirements for the YGI Microgrid?

    a. Will any backup generation be required to ensure that the required up-time of the data center is met? If so, how will this backup power be supplied to the data center?

    b. What is the normal power demand of the data center? What is the maximum power demand?

    c. Are there plans to expand the electricity demand of the data center in the future? If so, how will the additional electricity demand be met, both for standard primary and backup power needs?

7. In Section 1-E of the application, Item No. 4 states that construction will be completed in November 2029. Item No. 5 states that the facility will start up in October 2026. Please provide additional details regarding the planned construction schedule, including information on key milestones that are planned to occur between initial startup in October 2026 and completion of construction in November 2029. Will the project be constructed in a phased manner, such that construction will continue after initial startup?

8. In Section 1-A, the owner is listed as Yucca Growth Infrastructure, LLC and the operator is listed as Bloom Energy Corp. The Responsible Official and Alternate Responsible Official in Section 1-H are from Bloom Energy Corp. In Section 22, the application is certified by Marisa Blackshire, the VP of Environmental Regulatory Law for Bloom Energy, but the Company Name is provided as Yucca Growth Infrastructure, LLC. Please explain the relationship between Yucca and Bloom.

9. Please clarify the use of the parcel of land previously planned for the West Microgrid:

    a. Will this land be used as part of the current project in any way?

    b. Does the permittee plan to, either as part of initial or phased future construction efforts, locate any regulated sources of air emissions on that nearby parcel of land?

10. Please update references to the East Microgrid that still exist in the application:

Administrative Record NSR 10833_001301

a. The map in Section 9.11 of the application still shows the "East Microgrid." Please provide an updated map that clearly indicates the location of the YGI Microgrid (page 620/648).

b. Section 5 of Part 16-L of the Air Dispersion Modeling Report references the East Microgrid. Please update to YGI Microgrid (page 638/648).

11. Section 3 Application Summary is incomplete. The "Application Summary", "Process Summary", and "SSM routine or predictable emissions" portions of this section should be included separately below the instructions. Currently, a brief description of the facility location, application type, and the emission unit source name is included, but this section requires more detailed information.

12. Although Table 2-E contains emissions that would be identical to Table 2-D, please fill in emissions values for Table 2-D. NMED's data system requires information for each relevant application table even if values are the same as other associated tables.

Fuel Cell Questions

13. No SSM emissions were provided in Table 2-F.

    a. Will venting of natural gas occur during operation of the SOFC Unit?

    b. Will venting of natural gas occur during maintenance of the SOFC Unit?

    c. Stack tests were conducted at normal / steady-state operation. Is there any available information which indicates that startup/shutdown emissions may be more significant than normal / stead-state operation? For startup operations, is it possible that more CO and/or VOC are exhausted from the fuel cells before the electrochemical reaction is fully functioning?

    d. Please clarify the expected frequency of SSM events.

    e. Please clarify whether degradation of the fuel cell performance over the operational life of the facility could affect fuel cell usage rates, emission rates, operational efficiency, or maintenance-related emissions.

    f. Please describe the longevity, catalyst use, maintenance, and replacement schedule for the ceramic electrolyte membranes associated with the fuel cells which can become thin and crack under frequent SSM events.

14. Please describe the nature of fugitive emissions (including criteria pollutants and HAPs) at YGI Microgrid and any quantification of fugitives (i.e., from valves, connectors, seals, interconnects) for this project. Additionally, please clarify:

    a. Whether the need for a Leak Detection and Repair (LDAR) program or equivalent monitoring was evaluated for this project. If hydrogen is present or generated within the

Administrative Record NSR 10833_001302

system, please discuss leak detection and safety considerations given hydrogen's low autoignition temperature of ~500°C.

b. How the unprecedented scale and generating capacity of this facility impacts LDAR considerations and enhanced fugitive emissions management? Specifically, please discuss how the facility scale, fuel throughput, component count (i.e., from valves, connectors, seals, interconnects), and overall operational configuration are considered in evaluating potential fugitive emissions and any LDAR program.

c. If breakthrough (such as physical cracks or pinholes to allow gas crossover, seal failures, or interconnect breaches) are being monitored, please describe how such conditions would be detected (i.e. voltage drops, performance degradation, or other operational indicators).

15. Malfunction emissions are not discussed within the application or calculations except within the checkbox in Table 2-F which indicates that malfunction emissions are not permitted or requested. Please clarify how combustion/venting malfunctions will be handled at the YGI Microgrid. Any procedures or reporting should be cited within the "SSM routine or predictable emissions" portion of in Section 3.

16. Table 2-O includes no parametric emissions monitoring equipment. How will continuous compliance with the emissions limitations be verified by the operator?

17. Carbon capture has been identified as a potential benefit of fuel cell electricity generation. Fuel cell systems can produce high-quality CO_2 streams for either industrial offtake or sequestration. Has this been considered for the project? Bloom Energy's website explains that the system is well-configured for carbon capture: "Bloom's approach not only removes carbon but also converts it into new sources of high-quality carbon for potential use in a variety of industries." https://www.bloomenergy.com/blog/carbon-capture-technology/.

18. Please confirm that only fuel will be natural gas. Will there be any storage tanks? If this is the case, provide number of tanks, specifications, and calculations.

19. Please provide the source of the natural gas to be used as fuel, including whether new pipeline infrastructure, expansions, or increased utility gas capacity would be required to support operations and identification of the supplying utility.
    a. Publicly available information indicates that the right-of-way was recently approved for Green Chile's pipeline. Please explain the relationship between the YGI Microgrid and the proposed pipeline, including ownership, operational control, and how the facilities will interact. Please include any supporting documentation regarding exclusivity agreements, long-term power purchase agreements, or operational dependencies between the microgrid and the datacenter.
    b. Please provide gas tariff.

20. Additionally, please clarify if the YGI Microgrid exerts any direct or indirect ownership, operational control, or dedicated supply arrangement over the natural gas wells supplying fuel

to the YGI Microgrid. Please provide any supporting documentation (for example gas supply agreements, infrastructure expansion plans, ownership or organizational structure documentation, joint venture agreements, or exclusivity agreements).

21. Please describe whether any upstream treatment is performed (e.g., to remove Sulfur compounds from the natural gas) prior to use in the fuel cells. If so, please provide details and discuss how sulfur in the fuel stream is managed to prevent catalyst poisoning and degradation of fuel cell performance. Please also describe how the facility plans to address additional catalyst concerns such as cathode degradation, nickel coarsening, and carbon deposition/coking.

22. Diamond State Electric Generation Partners, LLC's Delaware facility utilizes Bloom Energy fuel cells operating on natural gas. This facility operates desulfurization beds (filters) to remove sulfur from the fuel cells. The construction permit requires that the filters are operated and maintained according to manufacturer recommendations and good engineering practices to ensure that the rate of removal of sulfur from the fuel cells does not result in emissions in excess of the permitted emission rate. Bloom Energy's 2022 Sustainability Report also references Bloom's HW management program for managing the desulfurization materials and canisters, and the desulfurization recycling process.

    a. Will the fuel cells proposed for this facility require desulfurization beds?

        i. If yes, please provide documentation on how the beds will be operated, maintained, replaced, and disposed of.

        ii. If no, please confirm that sulfur in natural gas will not interfere with the fuel cell process.

    b. How much hazardous waste would be generated by managing the desulfurization materials at the site? Will disposal filters be subject to permit requirements?
    c. Desulfurization Filters – Without the filters will sulfur increase? If this is the case, are the filters considered a control device? What is the filter control efficiency of sulfur?

23. The PM stack test conducted in April states that the Bloom Energy ES-6.5 has a rated output of 65 kW (page 161/648), and the stack test was conducted when the unit was generating 70.68 kW of electricity (page 158/648). The fuel cells performance test report for NOx/CO/VOC, and HAP state that the unit was tested while operating at full power operating conditions, approximately 67 kW output power, fueled by natural gas (page 314/648). However, the output of the Energy Server is provided in the spec sheet as 325 kW. Please confirm whether the performance tests were conducted at 100% load and whether stack testing was conducted for the same units which are proposed to be installed at the facility.

24. Based on the description of the fuel cell operation in the stack test report (page 218/587) and in Section 10 (page 536/587), it appears that no NO_x should be formed, because combustion is not occurring and the electrochemical reaction occurs at 700-900C, which is less than the

Administrative Record NSR 10833_001304

temperature at which thermal NO_x forms (approx. 1,300C). The sources test results of 0.22 – 0.23 ppm NO_x indicate that some NO_x is formed (page 321/648). Please confirm:

a. How NO_x emissions are generated during the operation of the fuel cell.

b. How the facility will ensure that electrochemical reaction temperatures do not exceed the expected 700-900C, which could potentially promote additional NO_x formation.

c. Why there exists temperature differences between information provided in Section 10 and temperatures provided.

25. PM – Please provide additional information/clarification on the limitations of the Montrose Air Quality Services TPM testing when comparing exhaust gas to ambient air. Is the test industry standard? Please provide any additional testing history. Please provide information on how YGI will verify/confirm testing results on exhaust from facility's operations.
26. NO_x emissions are calculated using the vendor-guaranteed emissions factor of 0.003 lb/MW-hr. However, the stack test runs which were not "non-detect" show NO_x emissions higher than this guaranteed limit at 0.0043 and 0.0040 lb/MW-hr (page 321/648). Given these stack test results, please clarify why the lower NO_x emission factor was used in the calculations.

27. CO emissions are calculated using the vendor-guaranteed emissions factor of 0.013 lb/MW-hr. It is the average of the three results. Run 1 provided a result of 0.016 lb/MW-hr. (page 321/648). Given these stack test results, please clarify why the lower CO emission factor was used in the calculations.

Calculations – Emission Factors – <u>2026 EF show 50% reduction from 2023 EF</u>

Pollutants	EF - 2026	EF - 2023
	lb/MW-hr	lb/MW-hr
NOX	0.003	0.07
CO	0.013	0.1
VOC	0.01	0.02
SO2	0.00000613	
PM10	0.00608	
PM2.5	0.00608	
Methanol		0.0000931
Benzene		0.0000162
Xylenes		0.00000533

a) Please provide Fuel Cell 2026 Testing conditions.
b) Fuel 2023 Testing conditions – parameters provided differ from Table 2-H of application. Specifically Temperature and flow rates (dscfm). How does this impact performance?
c) Was the testing performed on the actual units that will be operated at the microgrid?

Administrative Record NSR 10833_001305

28. The stack test report indicates that *"...if CO is created in the reformation process, the stacks will consume it and oxidize it into CO_2. In addition, Bloom's technology utilizes components integral to the system's operation that have the added benefit of converting any residual CO into CO_2 prior to being exhausted. This latter process is tightly controlled throughout the product's lifetime*." (page 313/648).

    a. Please explain the components that convert residual CO into CO_2 prior to being exhausted.

    b. How is this process controlled through the product's lifetime?

    c. How are the units monitored to ensure that CO is being properly converted to CO_2?

29. For VOC emissions, the stack test report indicates that "*The only possible source non-methane Volatile Organic Compounds (VOC) emissions from Model ES-6.5 are the traces of ethane, propane, etc. which are present in small quantities in pipeline natural gas - or trace organic gases that are products of incomplete combustion*." (page 313/648).

    a. This statement appears to indicate that some natural gas may be emitted from the fuel cell. Is this correct? If so, please confirm how monitoring will be implemented to ensure that natural gas is not emitted.

    b. This statement appears to indicate that incomplete combustion may occur in the operation. Is this correct?

30. How was the SO_2 emission factor of 6.13E-06 lb/MW-hr determined? The calculation footnote states that emission factors are from CARB certification and other reference method testing performed in Dec. 2023 and Apr. 2026. However, the Dec. 2023 and Apr. 2026 stack test reports do not appear to include SO_2 testing.

31. How was the CO_2 emission factor of 818 lb/MW-hr determined? The calculation footnote states that emission factors are from CARB certification and other reference method testing performed in Dec. 2023 and Apr. 2026. The Dec, 2023 and Apr. 2026 stack test reports do show volume percents of CO_2 measured during the stack tests, but the derivation of the 818 lb/MW-hr factor is not provided. Using information included in the three stack test reports, NMED calculated three different CO_2 emission factors: 808 lb/MW-hr, 842 lb/MW-hr, and 992 lb/MW-hr. Based on this information, it is unclear how the CO2 factor used in the emission calculations is the worst-case. Please confirm. The HAP stack test report shows measurable quantities of methanol, benzene, and m,p-xylene emissions in some runs (page 485/648). The highest concentrations were recorded during the second test of the day (Run 2). Is there reason to believe that these pollutants will be emitted at higher quantities as the fuel cells are running continuously for long periods of time?

    a. It is not expected that methanol would participate in the electrochemical process within the fuel cell as methanol is not a constituent of natural gas and is typically produced during a stream reforming process. How much methanol is expected to be

Administrative Record NSR 10833_001306

produced in the reforming process? How will the operator ensure that the potential to emit for methanol is not exceeded?

32. Please describe how the fuel cells get to operating temperature of 700-900C as described in Section 10 of the application. Please identify any auxiliary equipment (e.g., heaters, burners) used for startup and temperature maintenance during normal operation and as the fuel is depressurized to the required 15 psig prior to entering the system. In addition, please clarify the temperature inconsistencies between Section 10 and Table 2-H of the application.

33. Based on the application, the facility has 7,576 325-kW fuel cell units divided into 2,275 stacks. Table 2-G indicates that each stack has the same emissions, but this does not translate to a whole number of fuel cell units. Please clarify how many units there are, how many stacks there are, and how many units are in each stack.

34. Section 4 of application:
    a) Please provide schematics and clarify module arrangement and emission points.
    b) Please provide addition information on facility design. Including if modules will be inside or outside of a building.

RE: Questions on Air Quality Permit Application No. 10883 Response (Agency Interest No. 41351 – PRN20260001) – YGI Microgrid

Ms. Kuhn:

In response to the questions issued by NMED Air Quality Bureau ("AQB") on May 12, 2026, Trinity Consultants has compiled information from the applicant, Yucca Growth Infrastructure, LLC ("YGI"), and operator, Bloom Energy, with whom YGI has contracted to operate the emitting units at the YGI Microgrid (collectively, the "Companies"). The Companies agree that Bloom will be responsible for the operations of all equipment that has the potential to emit at the YGI Microgrid, which is why the Responsible Official is a Bloom employee.

Trinity is providing responsive information to support continued review of the application on behalf of the Companies. Please find the responses below in bold, italic font. Each of the AQBs questions is repeated verbatim, with the response following.

As for certain of the responses, the Companies object to the questions to the extent they call for information not required under 20.2.72.203 NMAC (scope), to the extent they do not relate to compliance with any applicable regulation under the Air Quality Control Act (relevance), and/or to the extent the information makes no material difference to the compliance demonstrations attested to by other information already supplied in the application (extent).

Therefore, the Companies contend that many of the questions call for information unnecessary to support a completeness determination. Relatedly, review of unnecessary information should not delay AQB from timely determining the application complete. Responses below state, in a non-exhaustive fashion, specific places where we believe that the information is not necessary for a completeness determination. Through this response, Trinity Consultants has provided all information necessary for AQB to determine the application complete. Subject to and without waiving the above objections, the Companies are voluntarily providing information that they reasonably have access to. Where so captioned under each response, the Companies reserve the right to object to the inclusion of portions of its responses within the administrative record.

General Application Questions

1. The cover letter of application states that "this application covers all of the pollutant-emitting activities subject to permitting for the YGI Microgrid and the data center." Based on available public information, it is expected that the data center referenced will be located adjacent to the location of the proposed microgrid.
    a. Please explain the relationship between the YGI Microgrid and the proposed data center, including ownership, operational control, and how the facilities will interact. Please include any supporting

documentation regarding exclusivity agreements, long-term power purchase agreements, or operational dependencies between the microgrid and the data center.

The Companies maintain the position that this information is not relevant to the issuance of its air permit application under the New Mexico Air Quality Control Act. The YGI Microgrid will provide power to the proposed data center. To clarify the statement in the cover letter, the application does not specifically cover the data center. Rather, the power generation equipment necessary to provide both primary and backup power supply for the data center are the Energy Servers included in the application. So, both the primary and emergency backup power needs for the data center are reflected in the application. In other words, the Companies expect that no additional backup generation will be required for the data center and that instead, this air permit application would authorize sufficient power supply for the data center such that no separate, additional backup power that could not be served by connection to the electrical power grid would be needed at or for the data center. The Companies further expect that the data center will not operate any pollutant-emitting activities subject to permitting under the New Mexico Air Quality Control Act and implementing regulations.

b. Please confirm if the data center will be dependent on the YGI Microgrid as its primary or sole power source. Section 11 of the application states that the SOFC Unit will be used to supply backup power to the adjacent data center (page 622/648). Please confirm whether the planned function for the SOFC Unit is to supply primary power or backup power to the data center, or a combination of those two modes of operation. If the SOFC Unit is solely being used to satisfy emergency backup power needs for the planned data center, what will the primary electrical power supply be for the data center?

The Companies maintain the position that this information is not relevant to the issuance of its air permit application under the New Mexico Air Quality Control Act. The YGI Microgrid will be the primary power source for the data center and will also provide emergency backup power to the data center. The Companies expect that no additional onsite backup generation will be required for the data center and instead, this air permit application would authorize sufficient power supply for the data center such that no separate, additional backup power that could not be served by connection to the electrical power grid would be needed at or for the data center.

c. Please confirm whether the data center will include any on-site combustion equipment (turbines, generators), including emergency, temporary, portable, or non-road sources.

The Companies understand that this air permit application would authorize sufficient power supply for the data center such that no separate, additional backup power that could not be served by connection to the electrical power grid would be needed at or for the data center. The Companies do not anticipate that the data center operations will require pollutant-emitting activities subject to permitting under the Air Quality Control Act and its implementing regulations.

d. Is the microgrid and/or the data center planning to add backup generators or other combustion units as exempt equipment after permit issuance?

The Companies understand that this air permit application would authorize sufficient power supply for the data center such that no separate, additional backup power that could not be served by connection to the electrical power grid would be needed at or for the data center. Operations are not anticipated to require backup generators or other combustion units that constitute a pollutant-emitting activity subject to permitting under the Air Quality Control Act and its implementing

regulations. The Companies also do not anticipate that operations will require backup generators or other combustion units as exempt equipment under 20.2.72.202.

2. Please confirm there are no additional process equipment such as heaters/burners for fuel conditioning, cooling towers, on-site storage, or maintenance activities such as coating operations at the YGI Microgrid that could be considered air emissions sources.

The Companies do not anticipate that operations will require additional process equipment that constitutes a pollutant-emitting activity subject to permitting under the Air Quality Control Act and its implementing regulations.

3. Additional concerns regarding the process:
    a. It is not clear from the application how H2 is generated/extracted from natural gas. Please clarify. Will a reformer be utilized in the process?

The Companies object to any interpretation that a response to this Question 3.a is required in order to determine the application complete. Further, in order to preserve objections related to relevancy that may need to be asserted at hearings related to this permit application, the Companies maintain that information related to how hydrogen is generated is not relevant to the question of whether or not an air permit may be issued for these sources under the New Mexico Air Quality Control Act. Please refer to Section 10 of the application, which states that "Natural gas enters the anode side, where it mixes with steam to produce reformed fuel." That is, internal steam reformation is used to generate hydrogen.

Bloom Energy Servers have integrated natural gas reformation properties which convert the chemical energy within natural gas into electricity using a steam-methane reformation process. This process converts the methane in the natural gas input to hydrogen, which then reacts with oxygen in the fuel cell to produce electricity. The by-product of the fuel cell's production of electricity is heat and steam, some of which can be used in the steam-methane reformation process to convert more methane into hydrogen, which the fuel cells use, in combination with oxygen from the air, to produce electricity. For more information on how Bloom Energy's solid oxide fuel cells work please visit this link: https://youtu.be/wN4Z0iFifxc

Industrial gas manufacturers also produce hydrogen from natural gas using a steam-methane reformation process, but must produce their own steam, usually through combustion of some of the input natural gas. Because the buyers of the resulting hydrogen are usually remote from the industrial gas manufacturer, this hydrogen is either compressed or liquified to transport the hydrogen to the end user. Integrating the natural gas steam reformation process into a fuel cell system increases efficiency and avoids the energy loss of external reformation, and compression or liquefaction for surface transportation.

    b. How is steam generated? This process also may require the use of a reformer.

The Companies object to any interpretation that a response to this Question 3.b is required in order to determine the application complete. The Companies maintain that information related to how steam is generated is not relevant to the question of whether an air permit may be issued for these sources under the New Mexico Air Quality Control Act. Please refer to Section 10 of the application, which states that "The oxygen ions combine with the reformed fuel to produce electricity, water, heat, and carbon dioxide. The water and heat are recycled to produce the steam needed to reform the fuel." That is, steam is formed through a combination of hydrogen and oxygen in the fuel cell and

then internally recycled to the internal reforming module. The process also generates the heat required to keep the fuel cell warm and drive the reformation process. So long as fuel and air are added, the process continues.

Water is only added at the beginning of the process; the water is then converted to steam. As stated above, the by-product of the fuel cell's production of electricity is heat and steam, some of which can be used in the steam-methane reformation process to convert more methane into hydrogen, which the fuel cells use, in combination with oxygen from the air, to produce electricity. In sum, internally generated steam is used to reform fuel and no fossil fuels are fired to produce steam.

c. Is water recycled into the system? Please describe the system. How is water quantified and/or stored? Please include tanks units, etc.

The Companies object to any interpretation that a response to this Question 3.c is required in order to determine the application complete. The Companies maintain that information related to water recycling is not relevant to the question of whether or not an air permit may be issued for these sources under the New Mexico Air Quality Control Act. Water is recycled internally and not stored outside of the Energy Servers during operations. See above for how water is used and steam produced inside of an Energy Server.

4. The cover letter states that YGI Microgrid will connect to "adjacent electrical infrastructure and generate power for a nearby data center facility." Please describe the ownership and function of the adjacent electrical infrastructure, including whether this refers to utility-owned distribution systems (i.e., primary electrical grid) or a privately owned infrastructure and provide any supporting documentation of this relationship. Does the adjacent electrical infrastructure serve multiple customers or is it dedicated to the data center?

The Companies object to any interpretation that a response to this Question 4 is required in order to determine the application complete. The Companies maintain that information related to ownership of facilities like substations, transmission lines, and other non-emitting electrical equipment is not relevant to the issuance of its air permit application under the New Mexico Air Quality Control Act. Any electrical infrastructure will not generate emissions. YGI will own the electrical infrastructure that connects the Bloom Energy Server system to the data center's electrical infrastructure. Electrical infrastructure from the primary electrical grid likewise will not generate emissions that are subject to inclusion in YGI's permit application.

5. Are there any plans to connect the planned campus to the primary electrical power grid, upon initial construction or in the future?

The Companies object to any interpretation that a response to this Question 5 is required in order to determine the application complete. The Companies maintain the position that information related to the data center's connection to the electrical power grid operated by the public utility is not relevant to the issuance of its air permit application under the New Mexico Air Quality Control Act. The Companies understand that the data center will be connected to the primary electrical power grid in the future for a portion of auxiliary power. Please also note that none of the equipment included in the permit application meets the definition of "unit" under 40 C.F.R. § 72.2 (i.e., there are no fossil fuel-fired combustion devices).

6. How will the fuel cell system meet the reliability requirements for the YGI Microgrid?

The Companies object to any interpretation that a response to this Question 6 is required in order to determine the application complete. The Companies maintain that information related to the Energy Server system or microgrid reliability is not relevant to the question of whether or not an air permit may be issued for these sources under the New Mexico Air Quality Control Act. The Companies expect that this air permit application will authorize sufficient power supply for the data center such that no separate, additional backup power that could not be served by connection to the electrical power grid would be needed at or for the data center.

a. Will any backup generation be required to ensure that the required up-time of the data center is met? If so, how will this backup power be supplied to the data center?

The Companies object to any interpretation that a response to this Question 6 is required in order to determine the application complete. The Companies maintain that information related to the Energy Server system or microgrid reliability is not relevant to the question of whether or not an air permit may be issued for these sources under the New Mexico Air Quality Control Act. The Companies expect that no additional backup generation will be required for the data center and that instead, that this air permit application would authorize sufficient power supply for the data center such that no separate, additional backup power that could not be served by connection to the electrical power grid would be needed at or for the data center.

Bloom Energy Servers are reliable sources of power, and the YGI Microgrid has been designed to ensure reliability:

- ***Bloom Energy Servers contain modules. Each module and supporting equipment, internally, has embedded redundancy and in most cases the redundant components are hot-swappable. That means if a failure occurs, the replacement of one module doesn't need to shut down the entire Energy Server system, and the replacement can be done under full power operation. When designing an Energy Server system Bloom ensures that Bloom includes additional power modules and generation units so that Bloom ensures redundancy and high availability.***

Given the low probability of failure, separate back-up generators would not add any value to the Energy Server system, and it is not necessary.

Fuel cells have been commercially deployed for decades in the U.S. and around the world. Fuel cells were initially invented in 1839, with NASA developing the first practical applications for the Apollo program in the 1960s. Bloom Energy is the world's largest manufacturer of solid oxide fuel cell systems deployed at over 1600 locations in 9 countries worldwide. Customers using Bloom Energy Servers to power their facilities include:

- ***Hospitals: Kaiser Permanente, Sutter Health, Kings County Hospital NYC, Mass General Brigham, and the SUNY Downstate Medical Center.***
- ***Higher Education: Caltech, Fordham University, University of San Diego, University of California at Irvine, and University of Connecticut.***
- ***Retail: The Home Depot, Walmart, Target, Stop & Shop, and IKEA***
- ***Telecom: ATT, Verizon, Cox Communications, and Comcast***
- ***Manufacturers: Owens Corning, Medtronic, Coherent, and Ferrari***

- ***Data Centers: Equinix, Intel, AWS, Cologix, Coresite, QTS, Coreweave, and Oracle***
- ***Utilities: Exelon, American Electric Power, Long Island Power Authority, New Britain Utilities, and Southern California Gas.***

b. What is the normal power demand of the data center? What is the maximum power demand?

The Companies object to any interpretation that a response to this Question 6.b is required in order to determine the application complete. The Companies maintain the position that information related to power demand of the nearby data center is not relevant to the issuance of its air permit application under the New Mexico Air Quality Control Act. The maximum power output of the YGI Microgrid is stated in the application.

c. Are there plans to expand the electricity demand of the data center in the future? If so, how will the additional electricity demand be met, both for standard primary and backup power needs?

The Companies object to any interpretation that a response to this Question 6.c is required in order to determine the application complete. The Companies are not aware of any anticipated plans to expand the electricity demand of the data center in the future through the addition of pollutant-emitting units.

7. In Section 1-E of the application, Item No. 4 states that construction will be completed in November 2029. Item No. 5 states that the facility will start up in October 2026. Please provide additional details regarding the planned construction schedule, including information on key milestones that are planned to occur between initial startup in October 2026 and completion of construction in November 2029. Will the project be constructed in a phased manner, such that construction will continue after initial startup?

Yes, initial portions of the Energy Server system will have begun operation while other portions are still under construction. The current construction schedule contemplates a rate of 80-100 MW per month or ~250 MW per quarter. Construction will proceed in a continuous fashion to ensure that the data center end user's power needs are met at all times, and will be completed within a reasonable time.

8. In Section 1-A, the owner is listed as Yucca Growth Infrastructure, LLC and the operator is listed as Bloom Energy Corp. The Responsible Official and Alternate Responsible Official in Section 1-H are from Bloom Energy Corp. In Section 22, the application is certified by Marisa Blackshire, the VP of Environmental Regulatory Law for Bloom Energy, but the Company Name is provided as Yucca Growth Infrastructure, LLC. Please explain the relationship between Yucca and Bloom.

YGI and Bloom are the owner and operator, respectively, as indicated in the permit application. AQB's own template New Source Review permit contemplates that there may be both an owner and an operator at a facility stating for "Facility Owner/Operator: If different, list the one that is not the applicant here."

9. Please clarify the use of the parcel of land previously planned for the West Microgrid:

a. Will this land be used as part of the current project in any way?

The Companies object to any interpretation that a response to this Question 9.b is required in order to determine the application complete. The Companies maintain the position that information related to a parcel of land not associated with this permit application is not relevant to the issuance of its air permit application under the New Mexico Air Quality Control Act. Specifically, this question relates

to a different air permit application that has been withdrawn. The property described in the subject air permit application is the one proposed for development under this application and this property will contain all pollutant-emitting sources for the YGI Microgrid's operations regulated under the New Mexico Air Quality Control Act and its implementing regulations.

b. Does the permittee plan to, either as part of initial or phased future construction efforts, locate any regulated sources of air emissions on that nearby parcel of land?

The Companies object to any interpretation that a response to this Question 9.b is required in order to determine the application complete. Information about a parcel of land not covered by this permit application is not relevant to issuing an air permit under the New Mexico Air Quality Control Act. Subject to these objections, the Companies respond as follows: this question relates to a different air permit application that has been withdrawn. The property described in the current subject air permit application is the one proposed for development under this application, and it will contain all pollutant-emitting sources for the YGI Microgrid's operations regulated under the New Mexico Air Quality Control Act and its implementing regulations.

10. Please update references to the East Microgrid that still exist in the application:

a. The map in Section 9.11 of the application still shows the "East Microgrid." Please provide an updated map that clearly indicates the location of the YGI Microgrid (page 620/648).

A corrected map is enclosed.

b. Section 5 of Part 16-L of the Air Dispersion Modeling Report references the East Microgrid. Please update to YGI Microgrid (page 638/648).

A corrected Form UA-4 is enclosed.

11. Section 3 Application Summary is incomplete. The "Application Summary," "Process Summary," and "SSM routine or predictable emissions" portions of this section should be included separately below the instructions. Currently, a brief description of the facility location, application type, and the emission unit source name is included, but this section requires more detailed information.

An updated application page, Section 3, with the requested details, is enclosed.

12. Although Table 2-E contains emissions that would be identical to Table 2-D, please fill in emissions values for Table 2-D. NMED's data system requires information for each relevant application table even if values are the same as other associated tables.

The Companies checked the option provided in Table 2-D allowing for the table to be intentionally left blank. An additional version of Table 2-D with the emission rates filled in is enclosed.

Fuel Cell Questions

13. No SSM emissions were provided in Table 2-F.

a. Will venting of natural gas occur during operation of the SOFC Unit?

No.

b. Will venting of natural gas occur during maintenance of the SOFC Unit?

Certain maintenance activities will involve small amounts of natural gas venting. See the response to item 13.d, below.

c. Stack tests were conducted at normal / steady-state operation. Is there any available information which indicates that startup/shutdown emissions may be more significant than normal / steady-state operation? For startup operations, is it possible that more CO and/or VOC are exhausted from the fuel cells before the electrochemical reaction is fully functioning?

No.

During commissioning, the Energy Servers are ramping up to full power output. At a lower power output, emissions will be lower. Specifically, no natural gas is introduced until the heat is elevated to sufficient levels to allow the electrochemical process to begin. Thus, at the time of introduction of natural gas, the chemical process will be properly operating, and emissions will be lower during periods of less natural gas flow (i.e., prior to ramping up to full power output).

d. Please clarify the expected frequency of SSM events.

Maintenance activities include hot swap of power modules at a nominal frequency of approximately once per five years, replacement of desulfurization bed media at a nominal frequency of once per two years, as-needed individual component (e.g., blower) replacements. Air emissions (natural gas venting) will occur during desulfurization bed media replacements and during desulfurization unit initial start-ups. Associated emissions are less than 0.5 tpy of VOC. An updated application page electing the associated exemption and calculation sheet are enclosed.

e. Please clarify whether degradation of the fuel cell performance over the operational life of the facility could affect fuel cell usage rates, emission rates, operational efficiency, or maintenance-related emissions.

The represented emission rates reflect the maximum anticipated emission rate from the Energy Server system during all operations. Degradation would translate to lower power output, not higher. Lower power output dictates lower emissions potential, not higher. Further, as set forth above, module replacements occur periodically to ensure that the Energy Servers are operating optimally.

f. Please describe the longevity, catalyst use, maintenance, and replacement schedule for the ceramic electrolyte membranes associated with the fuel cells which can become thin and crack under frequent SSM events.

The Companies object to any interpretation that a response to this Question 13.f is required in order to determine the application complete. Nonetheless, the following information has been provided. As noted above, frequent SSM events are not anticipated. Further, air emissions from cracked ceramic electrolyte membranes are not anticipated (and therefore not described in the permit application). As set forth above, module replacements occur periodically to ensure that Energy Servers are operating optimally, and said replacements would translate to periods of lower, not higher, emissions.

14. Please describe the nature of fugitive emissions (including criteria pollutants and HAPs) at YGI Microgrid and any quantification of fugitives (i.e., from valves, connectors, seals, interconnects) for this project. Additionally, please clarify:

There will be no process piping in VOC or HAP service. Equipment leak fugitive emissions from natural gas supply piping downstream of the meter at power generation facilities (SIC 4911) are not customarily quantified in NSR applications. Any VOC emissions are negligible, not practicable to quantify in detail, and do not affect applicability of any regulation under the Air Quality Control Act.

See, for example, 20.2.74.7.AG(5) NMAC (stating that fugitive emissions are not considered when determining whether an unnamed source is a major stationary source).

Malfunctions are handled through immediate shutdown, stopping fuel flow and reducing emissions; therefore, such events are managed under the SSM framework. The Companies will comply with all requirements of the permit and 20.2.7 NMAC concerning malfunction planning for excess emissions.

a. Whether the need for a Leak Detection and Repair (LDAR) program or equivalent monitoring was evaluated for this project. If hydrogen is present or generated within the system, please discuss leak detection and safety considerations given hydrogen's low autoignition temperature of ~500°C.

The Companies considered AQB's VOC/HAP LDAR fugitives monitoring protocol (April 19, 2017) and have concluded that no monitoring will apply under the permit. Therefore, an LDAR program has not been evaluated. Process safety and occupational hazard measures will be employed but are not described in detail in the application. Operations and procedures that reduce potential malfunctions are addressed below.

b. How the unprecedented scale and generating capacity of this facility impacts LDAR considerations and enhanced fugitive emissions management? Specifically, please discuss how the facility scale, fuel throughput, component count (i.e., from valves, connectors, seals, interconnects), and overall operational configuration are considered in evaluating potential fugitive emissions and any LDAR program.

The generating capacity of the facility has not impacted LDAR considerations. As discussed above, the Companies considered applicable precedent in determining the scope of LDAR monitoring.

Fugitive emission programs are not typically mandated at electric generating stations and are not necessary here. The scale of the facility (increased fuel throughput, component count, and modular architecture) does not require an LDAR program. This is particularly true in light of the distributed monitoring and controls that are utilized on the Energy Servers. Specifically:

- ***Each module operates with independent sensing and shutdown capability***
- ***Any detected leak results in localized isolation (i.e. an automatic unit shutdown), limiting system-wide impact and potential emissions***

c. If breakthrough (such as physical cracks or pinholes to allow gas crossover, seal failures, or interconnect breaches) are being monitored, please describe how such conditions would be detected (i.e., voltage drops, performance degradation, or other operational indicators).

Potential breakthrough conditions (e.g., cracks, seal degradation, interconnect failures) are detected through continuous fuel pressure monitoring. Such pressure monitoring is conducted for process integrity and safety reasons, as a sudden loss of pressure due to unplanned atmospheric venting (similar to in any process vessel) would relate to a malfunction condition rather than an intended operating mode.

15. Malfunction emissions are not discussed within the application or calculations except within the checkbox in Table 2-F which indicates that malfunction emissions are not permitted or requested. Please clarify how combustion/venting malfunctions will be handled at the YGI Microgrid. Any procedures or reporting should be cited within the "SSM routine or predictable emissions" portion of Section 3.

If a malfunction occurs at the site, then any excess emissions will be subject to reporting under 20.2.7 NMAC as indicated in Section 13 of the application. The Companies are not requesting to permit malfunction emissions, as noted.

Bloom Energy Servers are remotely monitored 24/7 by its Remote Monitoring Control Center (RMCC). The RMCC monitors for the proper functioning and operation of the fuel cells and ensures timely identification and response to any circumstances that would alter fuel cell performance or output. Maintaining optimal performance of the fuel cells is critical to ensuring the functionality of the fuel cells and to achieve their primary function. The RMCC will support timely detection and minimization of any emissions occurring during malfunctions. The system is configured such that:

- ***Certain malfunction conditions (e.g., pressure increase or decrease, temperature increase) identified by the RMCC result in immediate and automatic shutdown of the affected Energy Server.***
- ***Shutdown includes cessation of fuel flow to the affected Energy Server and transition to a safe, non-operational state.***

As a result:

- ***Malfunctions inherently lead to reduced emissions, as fuel input is immediately stopped, and emissions associated with normal operations cease for the affected Energy Server.***

16. Table 2-O includes no parametric emissions monitoring equipment. How will continuous compliance with the emissions limitations be verified by the operator?

For purposes of air compliance purposes and for inclusion in a permit, the Companies propose that compliance with the emission limitations be verified through use of emission factors, and monitoring of energy output. Specifically, MWhrs generated by the Energy Server System can be tracked and reported.

The Bloom Energy Server Systems differs fundamentally from conventional combustion sources such as engines and turbines in that electricity is produced through an electrochemical process rather than flame-based combustion. As a result, emissions are inherently stable, low, and closely tied to system operating conditions rather than combustion variability. Accordingly, in addition to the proposed methodology for determining compliance with the emissions limits, Bloom notes that it monitors operational integrity through Remote Monitoring Control Center (RMCC) monitoring. Bloom's inherent operational program will ensure that Energy Servers are properly operating.

17. Carbon capture has been identified as a potential benefit of fuel cell electricity generation. Fuel cell systems can produce high-quality CO2 streams for either industrial offtake or sequestration. Has this been considered for the project? Bloom Energy's website explains that the system is well-configured for carbon capture: "Bloom's approach not only removes carbon but also converts it into new sources of high-quality carbon for potential use in a variety of industries." (https://www.bloomenergy.com/blog/carbon-capture-technology/)

The Companies object to any interpretation that a response to this Question 17 is required to determine the application complete. Information related to carbon capture is not relevant to the issuance of its air permit application under the New Mexico Air Quality Control Act. Currently the State of New Mexico does not have a carbon capture and sequestration regulatory program. The

Energy Minerals and Natural Resources Department filed its initial rulemaking application to create rules for a New Mexico carbon capture and sequestration program in late December 2025, and a Hearing Officer was appointed in the case on May 13, 2026. Parties have moved to dismiss the EMNRD application, and several parties are seeking to postpone the rulemaking. The timeline for promulgation of an effective carbon capture program is therefore unknown at this time. Additionally, the New Mexico State Land Commissioner has not been willing in recent years to issue easements for carbon capture and sequestration projects. And the area where the project is located lacks important pipeline infrastructure necessary for a sequestration project. This presents several regulatory and legal roadblocks to pursuing carbon sequestration within New Mexico that are beyond the Companies' and NMED's control.

18. Please confirm that the only fuel will be natural gas. Will there be any storage tanks? If this is the case, provide number of tanks, specifications, and calculations.

The only fuel currently planned for use in the Energy Servers is natural gas. There will be no fuel storage tanks.

19. Please provide the source of the natural gas to be used as fuel, including whether new pipeline infrastructure, expansions, or increased utility gas capacity would be required to support operations and identification of the supplying utility.

    a. Publicly available information indicates that the right-of-way was recently approved for Green Chile's pipeline. Please explain the relationship between the YGI Microgrid and the proposed pipeline, including ownership, operational control, and how the facilities will interact. Please include any supporting documentation regarding exclusivity agreements, long-term power purchase agreements, or operational dependencies between the microgrid and the data center.

The Companies object to any interpretation that a response to this Question 19 is required in order to determine the application complete. Information related to the microgrid's connection to the pipeline operated by a third party is not relevant to the issuance of its air permit application under the New Mexico Air Quality Control Act. Natural gas for use at the YGI Microgrid will be transported and purchased through unaffiliated, third parties.

    b. Please provide gas tariff.

A representative gas tariff is enclosed.

20. Additionally, please clarify if the YGI Microgrid exerts any direct or indirect ownership, operational control, or dedicated supply arrangement over the natural gas wells supplying fuel to the YGI Microgrid. Please provide any supporting documentation (for example gas supply agreements, infrastructure expansion plans, ownership or organizational structure documentation, joint venture agreements, or exclusivity agreements).

The Companies object to any interpretation that a response to this Question 20 is required in order to determine the application complete. Information related to natural gas wells that produce the natural gas provided to the YGI Microgrid by a third party is not relevant to the issuance of its air permit application under the New Mexico Air Quality Control Act. The Companies will not own or otherwise control any natural gas production wells. The natural gas for the YGI Microgrid will be transported and purchased from unaffiliated, third parties.

21. Please describe whether any upstream treatment is performed (e.g., to remove sulfur compounds from the natural gas) prior to use in the fuel cells. If so, please provide details and discuss how sulfur in the fuel stream is managed to prevent catalyst poisoning and degradation of fuel cell performance. Please also describe how the facility plans to address additional catalyst concerns such as cathode degradation, nickel coarsening, and carbon deposition/coking.

The Companies object to any interpretation that a response to this Question 21 is required in order to determine the application complete. Desulfurization units remove sulfur prior to reforming of the natural gas. Desulfurization occurs through an adsorbent-based sulfur removal process in which the incoming natural gas passes through a leading and lagging vessel of adsorbent material to capture and remove sulfur species. See below for additional discussion. Desulfurization unit internal media are periodically replaced at a nominal interval of once every two years. Replaced media will be transported and disposed of in accordance with hazardous waste laws that fall outside of the AQB's jurisdiction.

22. Diamond State Electric Generation Partners, LLC's Delaware facility utilizes Bloom Energy fuel cells operating on natural gas. This facility operates desulfurization beds (filters) to remove sulfur from the fuel cells. The construction permit requires that the filters are operated and maintained according to manufacturer recommendations and good engineering practices to ensure that the rate of removal of sulfur from the fuel cells does not result in emissions in excess of the permitted emission rate. Bloom Energy's 2022 Sustainability Report also references Bloom's HW management program for managing the desulfurization materials and canisters, and the desulfurization recycling process.

The Companies object to any interpretation that a response to this Question 22 is required in order to rule the application complete. Certain parts of Question 22, including those relating to hazardous waste, are outside of the AQB's jurisdiction.

a. Will the fuel cells proposed for this facility require desulfurization beds?

Yes.

i. If yes, please provide documentation on how the beds will be operated, maintained, replaced, and disposed of.

Approximately ninety-five central Desulfurization System (CDS) skids/blocks will be installed, each consisting of two vessels in a lead/lag configuration for desulfurization. Each vessel will contain 11,700 liters of desulfurization media, resulting in a total of 23,400 liters per CDS block.

Bloom expects to replace the media in one vessel (~11,700 liters) approximately every two years.

Upon removal, desulfurization material will be transported and disposed of in accordance with hazardous waste laws that fall outside of the scope of this air permit application.

ii. If no, please confirm that sulfur in natural gas will not interfere with the fuel cell process.

See above.

b. How much hazardous waste would be generated by managing the desulfurization materials at the site? Will disposal filters be subject to permit requirements?

Bloom will comply with any requirements applicable to generators of Hazardous Waste and has not determined its generator status or other applicable RCRA requirements at this time.

c. Desulfurization Filters – Without the filters, will sulfur increase? If this is the case, are the filters considered a control device? What is the filter control efficiency of sulfur?

Desulfurization units remove sulfur that is present in natural gas and are inherent process equipment that do not meet the definition of control device under 40 CFR Part 64. The desulfurization units are not utilized to reduce or avoid emissions of sulfur and thus are neither a control device nor appropriately considered to have a control efficiency. Rather, removal of sulfur must occur in order for the Energy Servers to properly operate.

23. The PM stack test conducted in April states that the Bloom Energy ES-6.5 has a rated output of 65 kW (page 161/648), and the stack test was conducted when the unit was generating 70.68 kW of electricity (page 158/648). The fuel cells performance test report for NOx/CO/VOC, and HAP state that the unit was tested while operating at full power operating conditions, approximately 67 kW output power, fueled by natural gas (page 314/648). However, the output of the Energy Server is provided in the spec sheet as 325 kW. Please confirm whether the performance tests were conducted at 100% load and whether stack testing was conducted for the same units which are proposed to be installed at the facility.

Each Energy Server consists of either four or five power modules each with a rated output of 65 kW.

The source "stack" tests were conducted on one-ES-6.5 power module. Five identical power modules make up a 325 kW Energy Server and four identical power modules make up a 260 kW Energy Server. While individual power modules can operate slightly higher on their own, Energy Servers are limited to 325 kW or 260 kW (depending on configuration) of generated power. Only ES-6.5 power modules make up the Energy Servers that will be installed at the YGI Microgrid.

Tests were performed on an ES-6.5 power module brought to the research and development facility for testing purposes. All ES-6.5 power modules are identical. The power modules to be used in Energy Servers at the YGI Microgrid site are ES-6.5 and rely upon the emission results from the tested module in determining emission factors.

24. Based on the description of the fuel cell operation in the stack test report (page 218/587) and in Section 10 (page 536/587), it appears that no NOx should be formed, because combustion is not occurring and the electrochemical reaction occurs at 700–900 °C, which is less than the temperature at which thermal NOx forms (approx. 1,300 °C). The source test results of 0.22–0.23 ppm NOx indicate that some NOx is formed (page 321/648). Please confirm:

    a. How NOx emissions are generated during the operation of the fuel cell.

As the source test executive summary notes, a NO_X value of 0.20 ppm is at 2% of the analyzer range and the average result is "ND." Thus, the test does not necessarily demonstrate the formation of NOx. While an "ND" result does not confirm that emissions are zero (half of the detection limit itself is conservatively used to estimate emissions), a reportable NO_X quantity from either a ND result or a result at the low range of the analyzer detection limit likewise does not indicate that NO_X is formed by the Energy Server units. In fact, for the reasons discussed below, there exists no expected path for formation of NOx. Nonetheless, Bloom conservatively estimates NOx from the fuel cells both through conservative test results and the addition of a 15 percent safety factor.

Any syngas (H2, CO, CO2, and water vapor) that has not reacted in the fuel cell flows to the anode tailgas oxidizer, a flameless catalytic oxidizer. The temperature in the anode tailgas oxidizer is controlled to approximately 900 C, well below expected combustion temperatures. In this reactor, the last traces of H2 and CO are mixed with ambient air and converted to inert CO2 and water vapor.

NOx generates in 3 ways: fuel NOx, thermal NOx, and prompt NOx. https://www.epa.gov/sites/default/files/2020-07/documents/cs4-2ch2.pdf.

Fuel NOx – If present, trace contaminants of organic nitrogen or ammonia in pipeline natural gas could slip by and be emitted as NOx. However, pipeline natural gas does not contain these forms of nitrogen, only a small amount of nitrogen gas. https://www.naesb.org/pdf2/wgq_bps100605w2.pdf

Thermal NOx -- There will be no thermal NOx formation, as the temperature is well below the 1300 C where nitrogen from air can react with oxygen to form NOx.
https://en.wikipedia.org/wiki/NOx#Thermal

Prompt NOx -- requires a fuel-rich flame front where hydrocarbon radicals directly attack N2. As the Bloom catalytic oxidizer runs in a fuel-lean mode, to scavenge the last traces of CO and H2, these conditions never materialize, and no prompt NOx is formed.

If NO_X is formed, it has been conservatively quantified.

b. How the facility will ensure that electrochemical reaction temperatures do not exceed the expected 700–900 °C, which could potentially promote additional NOx formation.

Non-detect results or results identified at the low end of the analyzers detection limit have been conservatively used to quantify NO_X emissions. NO_X emissions are not expected to exceed the reported values during operations.

The temperature of the catalytic oxidizer is limited to about 900 C by design. It is not designed to operate above this temperature. The RMCC will detect temperatures above 900 degree C, and shut down the Energy Server immediately. As discussed above, shutdowns would translate to a reduction in power output and would reduce total emissions during the period of the shutdown.

c. Why there exists temperature differences between information provided in Section 10 and temperatures provided.

The information in Section 10 is accurate and complete.

There is a difference between the internal temperature of the fuel cell stacks and the temperature of the exhaust. The temperature mentioned in Section 10 is referring to the internal temperature of the fuel cell stacks (700-900 deg C), the temperature referenced on Table 2-H is the exhaust stack temperature (350 deg F).

25. PM – Please provide additional information/clarification on the limitations of the Montrose Air Quality Services TPM testing when comparing exhaust gas to ambient air. Is the test industry standard? Please provide any additional testing history. Please provide information on how YGI will verify/confirm testing results on exhaust from the facility's operations.

Similar to NOx, it is appropriate to assume that PM is not being formed by the Energy Servers.

The Solid Oxide Fuel Cell (SOFC) process is electrochemical, not combustion. That matters because the dominant mechanisms that create primary PM in traditional stationary sources like turbines and engines are combustion-driven (soot, ash, incomplete combustion products, lubricating oil carryover, flame-generated nuclei). In an SOFC exhaust stream, those mechanisms do not exist.

Additionally, in combustion driven sources the inlet air and fuel sources must be mixed, whereas in the SOFC, product fuel and atmospheric air follow separate and isolated paths within the product. The air flows through the cathode side, and the fuel flows through the anode side. Through this process, the electrochemical reaction occurs by the natural attraction of the O_2 ions in atmospheric air present at the cathode passing through the cell wall and bonding with the free hydrogen on the anode side, releasing an electron in the process.

As discussed above, Bloom's bonding temperature is around 700 to 900 degree C, an environment not suited to create PM. Moreover, if any PM were created in the process, it would clog the cell surface and disable the passing on O_2 ions, stopping the creation of free electrons.

Notwithstanding the above and in the interest of conservatism, the application uses reference method test results from stack sampling.

The test method (EPA Method 5/202) used represents the only appropriate EPA approved test method for PM, PM10, PM2.5 for the modules. Due to its high detection limits relative to the anticipated emission rate of particulate matter (zero or near zero) use of this test method is expected to overstate PM emissions. The test was performed on an ES-6.5 power module brought to the research and development facility for testing purposes. All ES-6.5 power modules are identical, and the test power module is representative of all other ES-6.5 power modules. The Energy Servers to be used at the YGI Microgrid site are ES-6.5 and can appropriately rely on the test results from the ES-6.5 power module. In addition, a 15% safety factor was added to the emission rate for PM, PM10, and PM2.5 in this application.

26. NOx emissions are calculated using the vendor-guaranteed emissions factor of 0.003 lb/MW-hr. However, the stack test runs which were not "non-detect" show NOx emissions higher than this guaranteed limit at 0.0043 and 0.0040 lb/MW-hr (page 321/648). Given these stack test results, please clarify why the lower NOx emission factor was used in the calculations.

Stack test results are determined based on the average of three test runs. These test runs include non-detect runs which are considered valid test runs and result in an assumption of emissions (even if not present) of half of the detection limit. As such, the inclusion of runs that indicated non-detect in fact typically overstate emissions from a source. In any event, it is standard and appropriate to use average results to determine potential emission rates.

First, the Companies note that the NOx emission rate for all generations of Bloom equipment has been near or below the limit of detection. Notwithstanding the above, the average of three source test runs is used to calculate the emission rate; however, if the result from a run is below the limit of detection, then ½ the result is used to calculate the average. 0.0043 + <0.0037/2 + 0.004 = 0.003 lb/MWhr. In addition, a 15% safety factor was added to the emission rate for NOx in this application.

27. CO emissions are calculated using the vendor-guaranteed emissions factor of 0.013 lb/MW-hr. It is the average of the three results. Run 1 provided a result of 0.016 lb/MW-hr (page 321/648). Given these stack test results, please clarify why the lower CO emission factor was used in the calculations.

Stack test results are based on the average of three test runs.

As stated, the emission factor reported on the spec sheet reflects the average of three runs. 0.016+ 0.011 + 0.011 / 3 = 0.01267 lb/MWhr = rounded up to the nearest thousandths place gives you 0.013 lb/MWhr. In addition, a 15% safety factor was added to the emission rate for CO in the application.

28. Calculations – Emission Factors – 2026 EF show 50% reduction from 2023 EF:

The application contains a 2026 test report for particulate matter; a 2024 test report for NOX, CO, and VOC; and a 2024 HAP test report. The 2024 test reports relate to testing conducted in 2023. The Companies note that the highlighted, CARB-specific emissions rates are not source tested values as suggested by AQB; rather, those reflect the CARB's Distributed Generation Certification program limits, which do not correspond to the Energy Server's actual emissions. To qualify for certification under the CARB program, measured emission rates must be lower than those highlighted in the table. As indicated in the application and the actual source test reports, however, actual emission rates are much lower than those values (even with the 15% safety factor).

a. Please provide Fuel Cell 2026 testing conditions.

Please refer to the test report.

b. Fuel 2023 testing conditions – parameters provided differ from Table 2-H of application. Specifically temperature and flow rates (dscfm). How does this impact performance?

Please refer to the response in Question 28 above.

Table 2-H of the application is specific to the platform/stacked design of the Energy Servers. See site schematic provided. The source tests were performed following the requirements of the Test Methods as outlined in the reports.

c. Was the testing performed on the actual units that will be operated at the microgrid?

The actual Energy Servers to be operated at the YGI Microgrid are in manufacturing and have not been commissioned or tested. All ES-6.5 power modules are identical and the tested power module is representative of all other ES-6.5 power modules.

29. The stack test report indicates that "…if CO is created in the reformation process, the stacks will consume it and oxidize it into CO2. In addition, Bloom's technology utilizes components integral to the system's operation that have the added benefit of converting any residual CO into CO2 prior to being exhausted. This latter process is tightly controlled throughout the product's lifetime." (page 313/648).

The Companies acknowledge that the AQB has an interest in better understanding the fuel cell technology and looks forward to working with the AQB on that front. However, the Companies contend that information related to understanding the fuel cell technology does not relate to the completeness of the application and respectfully requests that AQB acknowledge that its completeness determination should not be withheld as AQB educates itself on the fuel cell process. Further, while Bloom remains excited to present its technology to the AQB , many of the questions relate to internal processes of the equipment that are beyond the scope of AQB's authority given the existence of stack tests and other materials that properly reflect maximum emissions from the units.

a. Please explain the components that convert residual CO into CO2 prior to being exhausted.

An internal anode tailgas oxidizer unit (flameless catalytic oxidizer) oxidizes residual CO to form CO_2.

b. How is this process controlled through the product's lifetime?

The anode tailgas oxidizer is a critical component of the Energy Server. It safely oxidizes unreacted fuel and byproducts that must be removed from the anode exhaust for the electrochemical reaction

to continue. If the anode tailgas oxidizer ceases to operate effectively, the power module will shut down requiring Energy Server maintenance.

c. How are the units monitored to ensure that CO is being properly converted to CO2?

The internal anode tailgas oxidizer is inherent process equipment not covered by the definition of "control device" under 40 CFR Part 64. Monitoring of internal conversion processes is not required or technically feasible. Moreover, as described above, it is a system component that is critical to Energy Server operations. Failure of the internal anode tailgas oxidizer would be identified by the RMCC, and thus, trigger action to ensure proper operation of the Energy Server.

30. For VOC emissions, the stack test report indicates that "The only possible source of non-methane Volatile Organic Compounds (VOC) emissions from Model ES-6.5 are the traces of ethane, propane, etc. which are present in small quantities in pipeline natural gas – or trace organic gases that are products of incomplete combustion." (page 313/648).

    a. This statement appears to indicate that some natural gas may be emitted from the fuel cell. Is this correct? If so, please confirm how monitoring will be implemented to ensure that natural gas is not emitted.

The statement appears to describe the logically possible sources of VOC emissions (combusted hydrocarbons or uncombusted hydrocarbons) that stack testers normally evaluate and does not imply that natural gas will be emitted from the fuel cell. As noted above, the reference to incomplete combustion appears to be an inaccurate statement by the test vendor.

    b. This statement appears to indicate that incomplete combustion may occur in the operation. Is this correct?

There is no combustion occurring in an Energy Server. As described above, electricity is generated via an electrochemical reaction, whereby hydrogen and oxygen exothermically react to produce free electrons. This is an incorrect use of the word "combustion" that can be attributed to the source test vendor, and does not reflect the process associated with the fuel cells or any statements by Bloom.

31. How was the SO2 emission factor of 6.13E-06 lb/MW-hr determined? The calculation footnote states that emission factors are from CARB certification and other reference method testing performed in Dec. 2023 and Apr. 2026. However, the Dec. 2023 and Apr. 2026 stack test reports do not appear to include SO2 testing.

Bloom conservatively assumes the SO2 emission rate based on the amount of sulfur that can pass through the fuel cell without poisoning the electrolyte, i.e., without shutting down an Energy Server and reducing overall power production.

This is a mass balance calculation based on a calculated fuel sulfur content of 5 ppbv for desulfurized natural gas as follows:

(Fuel consumption / rated power) / (359 ft^3 / lb mol NG) x (.005 lb mol S / 10^6 lb mol NG) x (64 lb SO_2 / lb mol S)

(2234 SCF NG / 0.325 MWhr) / (359 ft^3 / lb mol NG) x (< .005 lb mol S / 10^6 lb mol NG) x (64 lb SO_2 / lb mol S) = < 6.13E-06 lbs SO_2 / MWhr

Fuel Consumption (SCFH)	***2,234***
Energy Server size (MW)	***0.325***
Desulfurized NG sulfur concentration (ppbv)	***5***
Heat Rate (BTU/kWhr)	***7,127***
EIA Natural Gas HHV (BTU/SCF)	***1037***

Thus, the SO2 emission rate reflects the amount of sulfur that can be expected to pass through the desulfurization beds based on the calculations above. In addition, a 15% safety factor was added to the SO2 emission rate as a conservative assumption.

32. How was the CO2 emission factor of 818 lb/MW-hr determined? The calculation footnote states that emission factors are from CARB certification and other reference method testing performed in Dec. 2023 and Apr. 2026. The Dec. 2023 and Apr. 2026 stack test reports do show volume percents of CO2 measured during the stack tests, but the derivation of the 818 lb/MW-hr factor is not provided. Using information included in the three stack test reports, NMED calculated three different CO2 emission factors: 808 lb/MW-hr, 842 lb/MW-hr, and 992 lb/MW-hr. Based on this information, it is unclear how the CO2 factor used in the emission calculations is the worst-case. Please confirm. The HAP stack test report shows measurable quantities of methanol, benzene, and m,p-xylene emissions in some runs (page 485/648). The highest concentrations were recorded during the second test of the day (Run 2). Is there reason to believe that these pollutants will be emitted at higher quantities as the fuel cells are running continuously for long periods of time?

The emission factor is based on a vendor's data sheet. CO2 is not a regulated air contaminant for purposes of this permit application. The HAP emission factors reflect maximum expected emission rates during all anticipated operations.

The emission rate for the fuel cells operating at 54% efficiency is calculated using the following equation:

818-lb-CO2e/MWhr = 53.06 kg-CO2e/MMBTU * 2.20462 lbs/kg * 3412 BTU/kWhr * 1.1078 LHV/HHV * 1/54% LHV * MMBTU/10^6 BTU * 1000 kWhr/MWhr

In sum, the CO2 emission rate is based on the efficiency of the Energy Server, i.e., it is not measured via the same source testing methods as criteria pollutants. Further, Bloom notes that the RMCC monitoring and maintenance procedures ensure that the Energy Servers continue to function under relevant and necessary operational conditions that both ensure the necessary efficiency and output, but also ensure that CO2 emissions are minimized.

a. It is not expected that methanol would participate in the electrochemical process within the fuel cell as methanol is not a constituent of natural gas and is typically produced during a steam reforming process. How much methanol is expected to be produced in the reforming process? How will the operator ensure that the potential to emit for methanol is not exceeded?

An emission factor for methanol was provided in the permit application. This represents the maximum amount to be emitted. Methanol was reported as non-detect in two out of three test runs according to the test report. None of the electrochemical reactions create methanol and thus it is not expected to produce actual emissions of methanol.

The measured amount of methanol is near the limit of detection, i.e., the floor of what the method can measure. The results can be attributed to error or "noise" in the method. In addition, there was a 15% safety factor added to HAP emissions. There should be no dispute that the emission factor provided in the application represents a conservative approach and the maximum amount to be emitted.

33. Please describe how the fuel cells get to operating temperature of 700–900 °C as described in Section 10 of the application. Please identify any auxiliary equipment (e.g., heaters, burners) used for startup and temperature maintenance during normal operation and as the fuel is depressurized to the required 15 psig prior to entering the system. In addition, please clarify the temperature inconsistencies between Section 10 and Table 2-H of the application.

The Energy Servers utilize electricity at the outset of operation to reach the necessary operating temperature. For each module, once the initial electricity has been provided to the module, the fuel cells operate as a closed loop system to maintain the operating temperature. Once operational, the high temperature is produced from exothermic reactions: H2 + O -> H2O and CO + O -> CO2. The fuel cell process is exothermic—it generates heat without combustion—and provides sufficient heat for the endothermic internal reforming process.

The temperature mentioned in Section 10 is referring to the internal temperature of the fuel cell stacks (700-900 degree C), the temperature referenced on Table 2-H is the exhaust stack temperature.

34. Based on the application, the facility has 7,576 325-kW fuel cell units divided into 2,275 stacks. Table 2-G indicates that each stack has the same emissions, but this does not translate to a whole number of fuel cell units. Please clarify how many units there are, how many stacks there are, and how many units are in each stack.

There are 2,275 stacks. Most stacks consist of (4) Energy Servers, while a minority of stacks consist of (2) Energy Servers. The Energy Servers typically consist of 325 kW (which reflects five, 65 kW modules) with a small number of 260 kW models (which reflects four, 65 kW modules). The Companies are unable to locate a reference to 7,576 in the application tables. The division of emissions equally across the 2,275 stacks is a reasonable source characterization technique and more accurate than other potential characterizations (e.g., modeling as volume or area source). Section 10 of the application has been revised to indicate that a small number of 260 kW Energy Servers are included, though the majority are 325 kW units.

35. Section 4 of application:

a. Please provide schematics and clarify module arrangement and emission points.

A high resolution image showing the anticipated location of each stack based on the air dispersion modeling is enclosed. The discharge parameters modeled for each emission point is as shown in Table 2-G.

b. Please provide additional information on facility design. Including if modules will be inside or outside of a building.

Energy Servers will be outside of a building. However, they will be located on a platform structure that is open to the air.

Please feel free to contact me by email at Jesse.Lovegren@trinityconsultants.com if you have any questions regarding these responses.

Sincerely,

TRINITY CONSULTANTS

Subject:	RE: [EXTERNAL] RE: YGI Microgrid - requesting electronic files
Date:	Friday, May 22, 2026 4:10:12 PM
Attachments:	image001.png image002.png

Hi Jesse and Jaimy:

Thank you for providing the responses dated 5/19/26.

The Department still needs a few items of information or documentation to satisfy our due diligence in asserting that we have all of the necessary information to rule the YGI Microgrid application administratively complete. In order for the Department to make an affirmative administrative completeness determination by 5/27/26, please provide the following additional information/clarification (and updated application materials where relevant) by 12pm MT on 5/27/26. Note that these correspond to the questions in our letter dated 5/12/26.

- (Question 11) The updated process summary in Section 3 of the application states that depleted anode exhaust is approximately 95 percent carbon dioxide. **What compounds comprise the remaining 5% of the exhaust?**

- (Question 13.d) Please **provide the calculation of SSM emissions from hot swap of power modules**.

- (Question 14.a) Was leak detection of natural gas and/or hydrogen considered? Please **provide report(s) on leaks detected by the leak monitoring systems of operational Bloom systems**.

- (Question 23) We need to confirm that the conditions in the R&D facility are representative of the conditions in the field where the fuel cells will be operated. It appears that the testing was conducted on a 65-kW module, not the 325- or 260-kW units that will be installed at the facility.

  Representativeness of Testing Conditions
  Please describe the operating conditions at the research and development (R&D) facility where the 65-kW module was tested and explain how these conditions are representative of actual field operating conditions for the proposed units.

  Applicability of Module-Level Testing
  Based on the information provided, testing appears to have been

conducted on a single 65-kW module rather than on the full 260-kW or 325-kW systems proposed for installation. Please provide a detailed justification for why emissions data from a single module are representative of emissions from the fully integrated systems, which consist of four or five modules and additional components.

Impact of Additional System Components
The full system includes additional equipment such as a fuel processing module and an AC module. Please confirm whether these components generate emissions or affect system efficiency, and explain how their inclusion was accounted for in developing emission factors.

Scaling to System-Level Emission Rates
Please describe the methodology used to scale emissions from a 65-kW module to a system-level emission rate (e.g., lb/MW-hr). In your response, address whether efficiency losses or operational differences in the larger, integrated systems could result in higher emissions per unit of power output compared to a single module.

Field or Full-System Testing
Has any stack testing been conducted on a fully assembled 260-kW or 325-kW system under field conditions? If so, please provide those data. If not, please explain why module-level testing is sufficient to characterize emissions for the proposed units.

- (Question 24.a) The measured concentration of 0.20 ppm is two times the 1-hr NO2 standard of 100 ppb, so it does not appear that the NOx measured in the stack test is an ambient concentration. Based on the measured concentration, it appears that thermal NOx may be generated at low levels at the temperatures in the fuel cell. While these levels are very low, NMED needs to consider them due to the large scale of the proposed operation. **What is the source of the NOx measured in the source test, if not the Energy Server unit?**

- (Question 29.a) We need to understand more about the anode tailgas oxidizer. **Why is the anode tailgas oxidizer required? What is the control efficiency? How often does the catalyst need to be replaced?**

- (Question 32) Please **provide the referenced vendor's data sheet** that is used to generate the submitted emission factor.

- (Question 34) Based on the response to this question, the PTE for each stack shown

in Table 2-G of the application appears to be incorrect. The 5-module stacks will have higher emissions than what is shown, and the 4-module stacks will have lower emissions than what is shown and what was modeled. The actual stacks to be constructed will receive exhaust from an unknown combination of 2 or 4 Energy Servers with outputs of 325-kW or 260-kW. **Please confirm that this emission allocation is appropriate and conservative. To support this confirmation, please provide the number of 325-kW stacks and the number of 260-kW stacks to be installed, and identify the stacks on the facility plot plan and in Table 2-G.**

Please let me and Julie know if any questions - thank you!

Hi Abra and Julie,

Please find attached the response to AQB's questions and updated pages to the application.

The following items are attached:

1. YGI Letter Response
2. Updated Table 2-B
3. Updated Table 2-D
4. Updated Section 3
5. Updated Section 10
6. Updated Page 620
7. Updated Page 638
8. SSM Calculations
9. Fuel Tariff

Please let us know if you have any additional questions.

Thank you,

Jaimy Karacaoglu

Hi Jesse-

Please find attached a list of questions to support AQB's review of Yucca Growth Infrastructure, LLC's YGI Microgrid permit application.

In order to facilitate a timely determination of the permit application's administrative completeness, please revert with responses by a date that allows adequate time for AQB to evaluate the responses prior to the end of the 30-day application administrative review period (May 27).

Please let me and Julie know if you have any questions.

Thank you!

2026 Minor Source Emissions Inventory

Notice: The New Mexico Environment Department – Air Quality Bureau (Bureau) will conduct a Minor Source Emissions Inventory pursuant to 20.2.73.300 NMAC for calendar year 2026. This inventory applies to all facilities with air quality construction permits issued under 20.2.72 NMAC, including General Construction Permits (GCPs), as well as facilities registered under a Notice of Intent (NOI) pursuant to 20.2.73 NMAC. Owners, operators, and/or permittees are required to calculate and report actual tons per year of air pollutant emissions from individual equipment and from the facility as a whole. Facility-wide emissions for calendar year 2026 must be reported to the Bureau using the Bureau's online reporting tool during the submittal period of January 1 through April 1, 2027. Facilities are encouraged to sign up for Minor Source Emissions Inventory bulletins through the New Mexico Environment Department to receive updates and guidance regarding this requirement.

Julie,

We are pleased to report that the translation was timely completed. I've sent a fileshare link to

you in a separate email with the translated application.

Attached is the Albuquerque-based translator's certificate of accuracy.

Let us know if there's anything else you need.

Thanks!

We sent the final application to the translators at the same time as y'all got it and asked them to expedite the job.

We should have an ETA from them tomorrow if I don't get it tonight.

Subject: YGI Microgrid - requesting electronic files

Good afternoon, Jesse,

Can you please submit the electronic files for the YGI Microgrid application? Files should include pdf full application file, excel UA2 and calculations files, Word UA1, UA3, and UA4, modeling files, and other supporting documents.

NSR regulations 20.2.72.203.A(3) require that the computations are provided. See below:

(3) Provide all information, including all calculations and computations, to describe the specific chemical and physical nature and to estimate the maximum quantities of any regulated air contaminants the source will emit through routine operations after construction, modification or installation is completed, and estimate maximum potential emissions during malfunction, startup, shutdown. With respect to a toxic air pollutant as defined by Subsection H of 20.2.72.401 NMAC this requirement only applies when the toxic air pollutant is emitted in such a

manner that a permit is required under the provisions of 20.2.72.400 NMAC - 20.2.72.499 NMAC;

Also, would you please let us know when you will send us the Spanish translated application?

Thank you!

RE: Follow-up Questions on Air Quality Permit Application No. 10883 Response (Agency Interest No. 41351 – PRN20260001) – YGI Microgrid

Ms. Kuhn:

In response to the follow-up questions issued by the NMED Air Quality Bureau on May 22, 2026, which request additional information and clarification on Yucca Growth Infrastructure, LLC's ("YGI") and Bloom Energy ("Bloom")(collectively the Companies) responses to the Department's May 12, 2026 questions on the above-referenced application, the Companies provide the information below in support of an affirmative administrative completeness determination by May 27, 2026. Each of the Department's items is repeated verbatim, with the response following in bold, italic font. Item numbers correspond to the questions in the Department's May 12, 2026 letter.

Question 11. The updated process summary in Section 3 of the application states that depleted anode exhaust is approximately 95 percent carbon dioxide. What compounds comprise the remaining 5% of the exhaust?

Water vapor, unreacted molecular Oxygen, and trace species reported as air contaminant emissions.

Question 13.d. Please provide the calculation of SSM emissions from hot swap of power modules.

There are no air emissions from hot swap of power modules.

Question 14.a. Was leak detection of natural gas and/or hydrogen considered? Please provide report(s) on leaks detected by the leak monitoring systems of operational Bloom systems.

Bloom's RMCC monitoring system as described at length in the previous response (Item 15 and elsewhere) has the capacity to identify leaks within the system. As stated in that response, a drop in pressure (which results from a leak) is a monitored parameter that triggers an alarm and responsive action. As stated in the Companies' response to Items 14 and 15, an instrumental LDAR program using instrumentation such as an FID was not considered for the reasons given. Traditional LDAR programs are not employed at other Bloom installations and no associated reports are available.

Question 23. We need to confirm that the conditions in the R&D facility are representative of the conditions in the field where the fuel cells will be operated. It appears that the testing was conducted on a 65-kW module, not the 325- or 260-kW units that will be installed at the facility.

Representativeness of Testing Conditions. Please describe the operating conditions at the research and development (R&D) facility where the 65 kW module was tested and explain how these conditions are representative of actual field operating conditions for the proposed units.

The key relevant operating condition (electrical output) was disclosed in the submitted stack test report, was maximized during testing and will be representative of worst-case in-field operating electrical output.

Applicability of Module-Level Testing. Based on the information provided, testing appears to have been conducted on a single 65 kW module rather than on the full 260 kW or 325 kW systems proposed for installation. Please provide a detailed justification for why emissions data from a single module are representative of emissions from the fully integrated systems, which consist of four or five modules and additional components.

As stated in the prior response and elsewhere in this response, a 260 kW or a 325 kW consists of four or five identical 65 kW modules. A sample from a single module is representative of a sample taken from a separate, identical module.

Impact of Additional System Components. The full system includes additional equipment such as a fuel processing module and an AC module. Please confirm whether these components generate emissions or affect system efficiency, and explain how their inclusion was accounted for in developing emission factors.

These appurtenances do not generate any emissions not already reflected in the application.

Scaling to System-Level Emission Rates. Please describe the methodology used to scale emissions from a 65 kW module to a system-level emission rate (e.g., lb/MW-hr). In your response, address whether efficiency losses or operational differences in the larger, integrated systems could result in higher emissions per unit of power output compared to a single module.

The system consists of (6,925) identical 325 kW Energy Servers and (813) identical 260 kW Energy Servers. Each 325 kW Energy Servers consists of (5) identical 65 kW Power Modules, and each 260 kW Energy Server consists of (4) identical 65 kW Power Modules. The 65 kW Power Modules in each type of Energy Server are the same component. Each Power Module operates and generates air emissions in the same manner as it would in a total system of a different size. There are no relevant operational differences. Therefore, the selected scaling methodology (linear scale-up) is the only accurate way to estimate emissions.

The very concept of an emission factor, which is broadly accepted in the field of air pollution control, is based on the concept of emissions as an intensive property (i.e., linear and monotonic) of the pollutant-emitting equipment.

Field or Full-System Testing. Has any stack testing been conducted on a fully assembled 260 kW or 325 kW system under field conditions? If so, please provide those data. If not, please explain why module-level testing is sufficient to characterize emissions for the proposed units.

No. Field or Full-System testing are not expected to yield different results or call for a different methodology, as the testing at Bloom's facility was performed under representative (or worst case) operating conditions from the emitting unit.

Question 24.a. The measured concentration of 0.20 ppm is two times the 1-hr NO2 standard of 100 ppb, so it does not appear that the NOx measured in the stack test is an ambient concentration. Based on the measured concentration, it appears that thermal NOx may be generated at low levels at the temperatures in

the fuel cell. While these levels are very low, NMED needs to consider them due to the large scale of the proposed operation. What is the source of the NOx measured in the source test, if not the Energy Server unit?

The Companies agree that NMED needs to consider all NO_X emissions that could be emitted and have provided this information. The Companies also agree that 0.20 ppm is twice as large as 100 ppb. The application requests that NO_X emissions be regulated from the units and submit to an emission limit. The Air Quality Control Act does not require a source owner or operator to possess fundamental knowledge of the precise complex chemistry that occurs within the technology, only that emissions comply with all applicable Regulations and not result in unacceptable ambient impacts, in order to receive a permit. The Companies do not have any new insights on the mechanisms of NO_X formation beyond what was previously given. See the Companies' response to item 28.c.

Question 29.a. We need to understand more about the anode tailgas oxidizer. Why is the anode tailgas oxidizer required? What is the control efficiency? How often does the catalyst need to be replaced?

The anode tailgas oxidizer (ATO) oxidizes CO to CO_2, as stated in the Companies' prior response to this item. It has no specified control efficiency but results in the performance specified in the stack test and the vendor's emission factors. As a critical component of each power module, replacement is part of the maintenance activity that is hot swapping power modules approximately once every five years.

Question 32. Please provide the referenced vendor's data sheet that is used to generate the submitted emission factor.

The Companies include the vendor, Bloom Energy. The referenced vendor's data sheet was provided as an Appendix to the original application and is attached again here. That data sheet includes a CO2 emission factor of 679-833 lb/MW-hr. The supplied answer explains the calculation that gets to the value within the range and is based on ~54% efficiency (a conservative average). Keep in mind, the value provided in the application also includes a 15% safety factor, which would further account for any fluctuations in efficiency.

Question 34. Based on the response to this question, the PTE for each stack shown in Table 2-G of the application appears to be incorrect. The 5-module stacks will have higher emissions than what is shown, and the 4-module stacks will have lower emissions than what is shown and what was modeled. The actual stacks to be constructed will receive exhaust from an unknown combination of 2 or 4 Energy Servers with outputs of 325-kW or 260-kW. Please confirm that this emission allocation is appropriate and conservative. To support this confirmation, please provide the number of 325-kW stacks and the number of 260-kW stacks to be installed, and identify the stacks on the facility plot plan and in Table 2-G.

PTE applies to emission units and not to individual stacks. Table 2-G is used to designate emissions from single emission units that have multiple stacks. As stated in the response to item 16 and in the additional response to item 23 (above, in this letter), the Companies propose that compliance with the emission limitations be verified through the use of emission factors and monitoring of energy output; and that the emission stream from each Power Module will be representative of emissions from all Power Modules. Therefore, it is appropriate to use average values in Table 2-G, consistent with source characterization in the dispersion modeling analysis.

It is appropriate and conservative to average emissions from all units across the actual number of stacks (2,275), even if there will be slight differences in the number of Power Modules and Energy Servers contributing exhaust to each stack. Supporting justification is as follows:

The average stack corresponds to 1.0822 MW (2462.005 MW / 2,272 stacks), while the stack with the largest number of associated power modules (20) corresponds to 1.3 MW (325 kW per Bloom Energy Server × 4 Bloom Energy Servers per Stack) (a +20% difference). Each emission rate includes a safety factor of 15%, and the modeling results would be protective of the NAAQS even if each modeled facility concentration were increased by 20%. While a less refined source characterization would have been permissible under the State's Air Quality Modeling Guidelines, a more exact source characterization would have had no noticeable effect on the results, as the stacks are spaced closely together and have the same dispersion characteristics.

Please feel free to contact me by email at Jesse.Lovegren@trinityconsultants.com if you have any questions regarding these responses.

Sincerely,

Jesse Lovegren

Bloom energy

Data Sheet

The Bloom Energy Server® 6.5

Bloom Energy's solid oxide fuel cell (SOFC) platform provides a non-combustion pathway to convert fuels directly to electricity without combustion. The Energy Server is fuel-flexible and can generate energy using natural gas, blended hydrogen, biogas or hydrogen. A modular platform approach provides a pathway to upgrade existing systems to align with the sustainability goals of our customers over time. With no water consumption during normal operation and a high operational efficiency, the Bloom Energy Server significantly reduces greenhouse emissions today, while providing a pathway to operate with cleaner fuels in the future.

The Bloom Energy Server system provides reliable and resilient power to facilities. It is designed in a modular concept ideal for on-site distributed power generation, operating 24×7, supporting the power demand in grid parallel or in a microgrid architecture. In addition, the heat from the flue gas can be captured from the Energy Server system and integrated in a heat capture application.

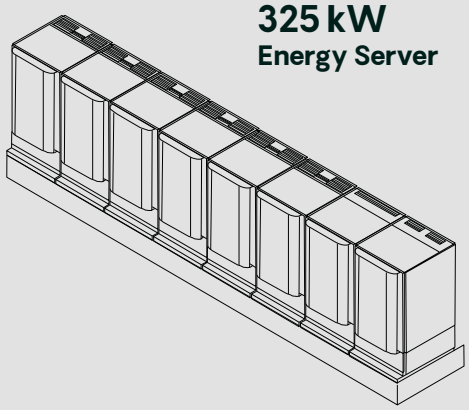
Bloom Energy has deployed over 1.5 GW across 1,200+ sites. The Energy Server system is suitable to address power needs, having installations across industries, such as retail, data centers, hospitals, sporting arenas, manufacturing, and warehousing.

Clean

Our systems reduce criteria pollutants (NO_x, SO_x, and particulate matter) to near zero and have far lower carbon emissions than legacy technologies.

Reliable

The Bloom Energy Server system is designed around a modular architecture of simple repeating elements. This enables us to generate power 24×7×365.



Resilient

Our system operates at very high availability due to its fault-tolerant design and its use of a robust natural gas pipeline system. The Bloom Energy Server system has survived extreme weather events and other incidents and continues to provide power to our customers.

Simple Installation and Maintenance

The Energy Server is 'plug and play' and has been designed in compliance with a variety of safety standards. Bloom Energy manages all aspects of installation, operation, and maintenance of the systems.

An Energy Server is a Stationary Fuel Cell Power System. It is Listed by UL Solutions (UL, LLC) as a 'Stationary Fuel Cell Power System' to ANSI/CSA FC1-2014 under UL Category IRGZ and UL File Number MH45102.

Model number for Energy Server 6.5 follows the format:
ES6-XXXXXXXXXXX-XXXXXX-X

Additional Benefits

Access to a secure website to monitor system performance and environmental benefits. Remotely managed and monitored by Bloom Energy. Capable of emergency stop based on input from the site.

1. Contact Bloom Energy for information on using biogas, blended hydrogen, and hydrogen with the Energy Server.
2. Bloom Energy Server 6.5 is certified by the California Air Resources Board Distributed Generation Certification Program under Executive Order DG-058.
3. Certifications expected to be available in early 2026.

VOC	**CH_4**	**Units**	**Notes**
447.72	21,938.08	lb/hr	Volume per event x NG Density x VOC wt%
0.22	10.97	tpy	

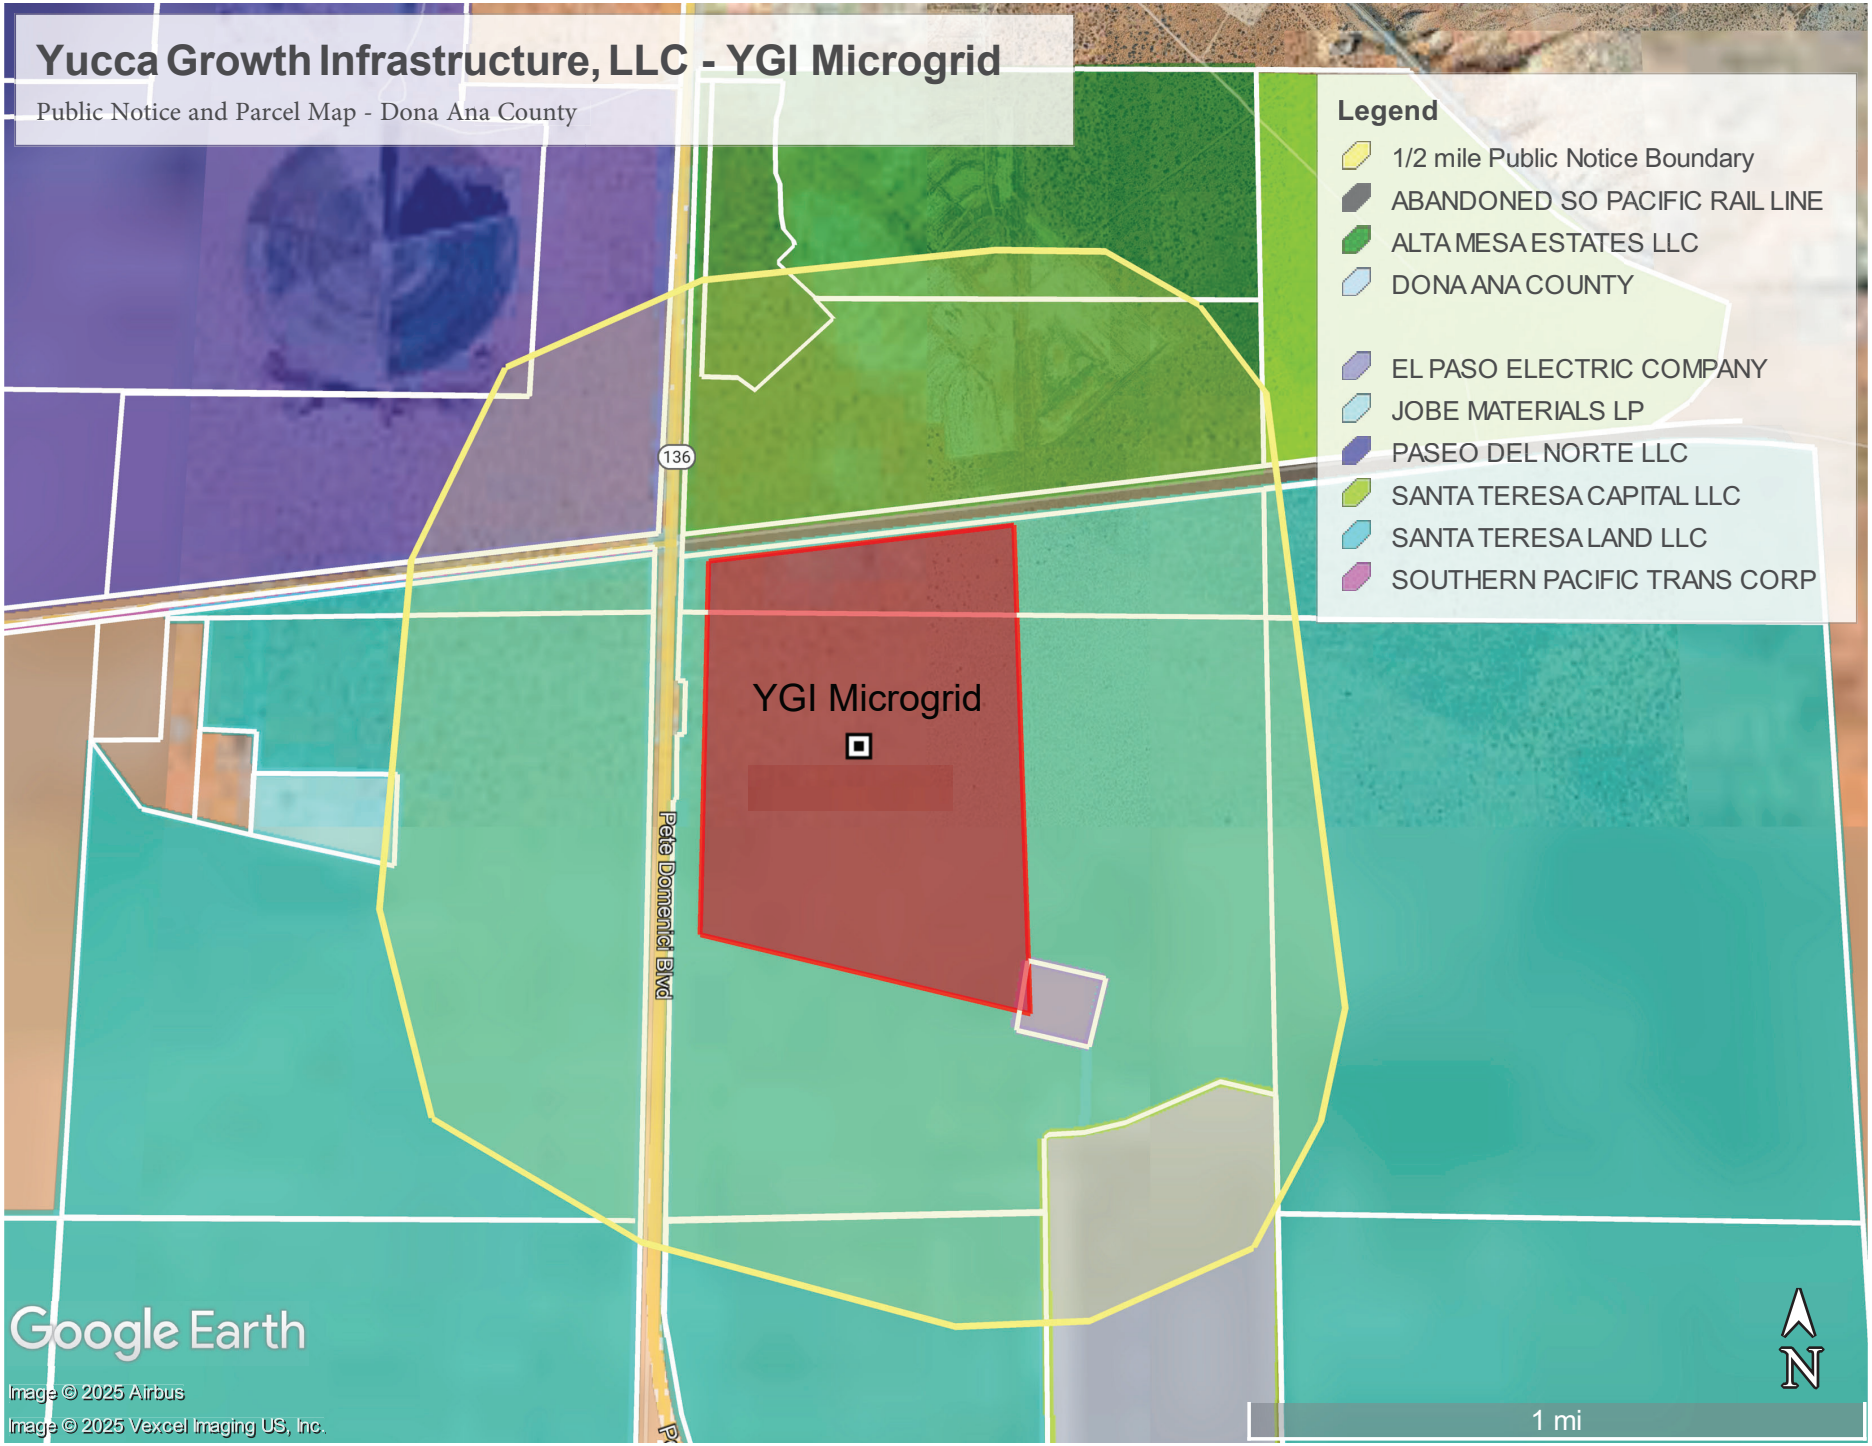
Total SSM Emissions[2]			
VOC	**CH_4**	**Units**	**Notes**
671.57	32,907.13	lb/hr	Startup and Maintenance cannot occur simulatenously or within the same year.
0.34	16.45	tpy	

[1] *Desulfurization is an adsorbent-based sulfur removal process in which the incoming natural gas is passed through vessel of adsorbent materials to capture and remove sulfur species. Approximately ninety-five central Desulfurization System (CDS) skids/blocks will be installed, consisting of two vessels in a lead/lag configuration for desulfurization. Each vessel has a volume of 1,370 standard cubic feet.*

[2] *The maximum of either startup or maintenance emissions was taken for total SSM emissions. The two events cannot occur within the same 12-month rolling period.*

Table 2-D: Maximum Emissions (under normal operating conditions)

☐ This Table was intentionally left blank because it would be identical to Table 2-E.



Maximum Emissions are the emissions at maximum capacity and prior to (in the absence of) pollution control, emission-reducing process equipment, or any other emission reduction. Calculate the hourly emissions using the worst case hourly emissions for each pollutant. For each pollutant, calculate the annual emissions as if the facility were operating at maximum plant capacity without pollution controls for 8760 hours per year, unless otherwise approved by the Department. List Hazardous Air Pollutants (HAP) & Toxic Air Pollutants (TAPs) in Table 2-I. Unit & stack numbering must be consistent throughout the application package. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41, 1.41, or 1.41E-4).

Unit No.	NOx		CO		VOC		SOx		PM[1]		PM10[1]		PM2.5[1]		H_2S		Lead

Totals	8.49	37.20	36.81	161.21	28.31	124.01	0.02	0.076	17.21	75.40	17.21	75.40	17.21	75.40	-	-	-	-

[1]**Condensable Particulate Matter:** Include condensable particulate matter emissions for PM10 and PM2.5 if the source is a combustion source. Do not include condensable particulate matter for PM unless PM is set equal to PM10 and PM2.5. Particulate matter (PM) is not subject to an ambient air quality standard, but PM is a regulated air pollutant under PSD (20.2.74 NMAC) and Title V (20.2.70 NMAC).

The Energy Server System equipment vendor maintains that there are zero PM emissions from its equipment. Extant reference method testing has been used by the applicant to conservatively estimate emissions, given test method limitations. Vendor indicates that extant testing may exhibit positive sampling method bias and reflects filterable particulate matter from intake air passed through the system. For that reason, the fuel cell system equipment vendor does not specify particulate emission factors.

Application Summary

The **Application Summary** shall include a brief description of the facility and its process, the type of permit application, the applicable regulation (i.e. 20.2.72.200.A.X, or 20.2.73 NMAC) under which the application is being submitted, and any air quality permit numbers associated with this site. If this facility is to be collocated with another facility, provide details of the other facility including permit number(s). In case of a revision or modification to a facility, provide the lowest level regulatory citation (i.e. 20.2.72.219.B.1.d NMAC) under which the revision or modification is being requested. Also describe the proposed changes from the original permit, how the proposed modification will affect the facility's operations and emissions, de-bottlenecking impacts, and changes to the facility's major/minor status (both PSD & Title V).

The **Process Summary** shall include a brief description of the facility and its processes.

Startup, Shutdown, and Maintenance (SSM) routine or predictable emissions: Provide an overview of how SSM emissions are accounted for in this application. Refer to "Guidance for Submittal of Startup, Shutdown, Maintenance Emissions in Permit Applications (http://www.env.nm.gov/aqb/permit/app_form.html) for more detailed instructions on SSM emissions.

Application Summary

Yucca Growth Infrastructure, LLC (Yucca) is proposing to construct a microgrid power generation facility (YGI Microgrid) in Dona Ana County, NM. Bloom Energy Corp (Bloom) will be the operator of the YGI Microgrid. The YGI Microgrid site will consist of a Bloom Energy Server System. This application is an initial NSR application being submitted under 20.2.72.200.A(1) NMAC. The site will be a major source for Title V (20.2.70 NMAC).

The proposed facility will consist of the following emission sources:

- A Bloom Energy Server System

Process Summary

The facility utilizes a Bloom Energy Server System, which is a type of solid oxide fuel cell system (EUID: SOFC). The SOFC converts natural gas into electricity through an electrochemical reaction without combustion. Each individual fuel cell is composed of three layers: a solid ceramic electrolyte sandwiched between a cathode and an anode, where the anode and cathode are made from inks that coat the electrolyte. No precious metals, corrosive acids, or molten materials are required. Natural gas enters the anode side, where it mixes with steam to produce reformed fuel. As the reformed fuel crosses the anode, it attracts oxygen ions from the air on the cathode side. The oxygen ions combine with the reformed fuel to produce electricity, water, heat, and carbon dioxide. The water and heat are recycled to produce the steam needed to reform the fuel, enabling a highly efficient electrochemical reaction that requires no water other than during system startup. The electrochemical reaction occurs at 700–900 degrees Celsius. Individual cells are combined into stacks, then into power modules containing hundreds of individual fuel cells that produce direct current power. The modules are packaged into Energy Servers, which combine the power modules with a fuel processing module and an AC module containing DC-to-AC converters and transformers to produce 325 kW of net AC power. A minority of units are smaller and produce 260 kW of net AC power. The proposed Bloom Energy Server System deploys co-functioning Energy Servers to create an integrated system capable of sustaining the target output represented for each applicable scenario. Depleted anode exhaust, which is approximately 95 percent carbon dioxide once dried is discharged to the atmosphere. The air emissions from the Energy Servers consist of depleted anode exhaust, which contains lower criteria air pollutants due to the absence of combustion, and use no water during steady-state operation. The Bloom Energy Server System is proposed to operate at its maximum rated load for 8,760 hours per year.

Startup, Shutdown, and Maintenance (SSM) routine or predictable emissions:

Minimal startup, shutdown, and maintenance emissions are expected. Maintenance activities include hot swap of power modules at a nominal frequency of approximately once per five years, replacement of desulfurization bed media at a nominal frequency of once per two years, as-needed individual component (e.g., blower) replacements. Air emissions (natural gas venting) will occur during desulfurization bed media replacements and during desulfurization unit initial start-ups. Approximately ninety-five central Desulfurization System (CDS) skids/blocks will be installed, consisting of two vessels in a lead/lag configuration for desulfurization. Each vessel has a volume of 1,370 standard cubic feet. This activity is exempt pursuant to 20.2.72.202.B(5) NMAC.

Administrative Record NSR 10833_001346

Section 10

Written Description of the Routine Operations of the Facility

---

A written description of the routine operations of the facility. Include a description of how each piece of equipment will be operated, how controls will be used, and the fate of both the products and waste generated. For modifications and/or revisions, explain how the changes will affect the existing process. In a separate paragraph describe the major process bottlenecks that limit production. The purpose of this description is to provide sufficient information about plant operations for the permit writer to determine appropriate emission sources.

The facility utilizes a Bloom Energy Server System, which is a type of solid oxide fuel cell system (EUID: SOFC). The SOFC converts natural gas into electricity through an electrochemical reaction without combustion. Each individual fuel cell is composed of three layers: a solid ceramic electrolyte sandwiched between a cathode and an anode, where the anode and cathode are made from inks that coat the electrolyte. No precious metals, corrosive acids, or molten materials are required. Natural gas enters the anode side, where it mixes with steam to produce reformed fuel. As the reformed fuel crosses the anode, it attracts oxygen ions from the air on the cathode side. The oxygen ions combine with the reformed fuel to produce electricity, water, heat, and carbon dioxide. The water and heat are recycled to produce the steam needed to reform the fuel, enabling a highly efficient electrochemical reaction that requires no water other than during system startup. The electrochemical reaction occurs at 700–900 degrees Celsius. Individual cells are combined into stacks, then into power modules containing hundreds of individual fuel cells that produce direct current power. The modules are packaged into Energy Servers, which combine the power modules with a fuel processing module and an AC module containing DC-to-AC converters and transformers to produce 325 kW of net AC power. A minority of units are smaller and produce 260 kW of net AC power. The proposed Bloom Energy Server System deploys co-functioning Energy Servers to create an integrated system capable of sustaining the target output represented for each applicable scenario. Depleted anode exhaust, which is approximately 95 percent carbon dioxide once dried is discharged to the atmosphere. The air emissions from the Energy Servers consist of depleted anode exhaust, which contains lower criteria air pollutants due to the absence of combustion, and use no water during steady-state operation. The Bloom Energy Server System is proposed to operate at its maximum rated load for 8,760 hours per year.

Administrative Record NSR 10833_001347

5

For new PSD Major Sources or PSD major modifications, if MERPs were used to account for ozone fill out the information below. If another method was used describe below. The facility is not a PSD Major source. It is a minor source and is providing MERPS information voluntarily in accordance with EPA's most recent MERP guidance.

NO_X (ton/yr)	$MERP_{NOX}$	VOCs (ton/yr)	$MERP_{VOC}$	$[O_3]_{8\text{-hour}}$
37.20	413.5	124.01	82121	0.0915 ppb

Secondary formation of ozone from the YGI Microgrid is estimated using Equation 2 from "Guidance on the Development of Modeled Emission Rates for Precursors (MERPs) as a Tier 1 Demonstration Tool for Ozone and $PM_{2.5}$ under the PSD Permitting Program" from EPA (MERPs guidance). Equation 2 is equivalent to the equation preceding Table 10 in the NM AQB Modeling Guidelines, understanding that the MERP (see below) is the inverse of the quotient in equation 2, and the ozone impact is the linear combination of the expressions for the NO_X and VOC-specific impacts, which result may be expressed in units of either ppb or µg/m^3. Equation 2 was computed for NO_X and VOC-specific impacts; the results were added; and a final result was compared to the EPA-recommended de minimis level of 1.0 ppb. The hypothetical source in Otero County, NM was selected based on the criteria provided in the MERPs guidance, which include proximity, terrain and land use, climate, regional sources of pollutants, and background pollutant concentrations. Otero County's proximity to the YGI Microgrid along with similarities in terrain were the primary reasons for selecting it as a hypothetical source. Under EPA's guidance, the modeled air quality impact from a hypothetical source of 500 tons/yr (the closest value to the project's annual emissions) is 1.209116 ppb for a 500 tpy NOX source and 0.0006089 ppb for a 500 tpy VOC source. Comparing these results with the project emission rates, the project impact for ozone would be 0.0915 ppb, which is below the significance threshold of 1.0 ppb.

Eq. 2: $Project\ Impact = Project\ emission\ rate \times \frac{Modeled\ Air\ Quality\ Impact\ from\ Hypothetical\ Source}{Modeled\ emission\ rate\ from\ Hypothetical\ Source}$

The Modeled Air Quality Impact for NOx and VOC were provided by EPA's MERPs View Qlik tool. YGI is using MERP values from the hypothetical source in Otero County, NM. Based on the range of stack heights, the modeled impacts associated with a 10 m stack were used from this analysis. To calculate the MERP value listed above, YGI used the following equation:

$$MERP = \frac{500\ tpy}{Modeled\ Air\ Quality\ Impact}$$

16-M: Particulate Matter Modeling

1 Select the pollutants for which plume depletion modeling was used.

☐	PM2.5
☐	PM10
☒	None

2 Describe the particle size distributions used. Include the source of information.

N/A

3	Does the facility emit at least 40 tons per year of NO_X or at least 40 tons per year of SO_2? Sources that emit at least 40 tons per year of NO_X or at least 40 tons per year of SO_2 are considered to emit significant amounts of precursors and must account for secondary formation of PM2.5.	Yes☐	No☒
4	Was secondary PM modeled for PM2.5?	Yes☐	No☒

5 If MERPs were used to account for secondary PM2.5 fill out the information below. If another method was used describe below. N/A – the source emits less than 40 tons per year of NOx and SO2.

Table 2-B: Insignificant Activities[1] (20.2.70 NMAC) OR Exempted Equipment (20.2.72 NMAC)

All 20.2.70 NMAC (Title V) applications must list all Insignificant Activities in this table. All 20.2.72 NMAC applications must list Exempted Equipment in this table. If equipment listed on this table is exempt under 20.2.72.202.B.5, include emissions calculations and emissions totals for 202.B.5 "similar functions" units, operations, and activities in Section 6, Calculations. Equipment and activities exempted under 20.2.72.202 NMAC may not necessarily be Insignificant under 20.2.70 NMAC (and vice versa). Unit & stack numbering must be consistent throughout the application package. Per Exemptions Policy 02-012.00 (see http://www.env.nm.gov/aqb/permit/aqb_pol.html), 20.2.72.202.B NMAC Exemptions do not apply, but 20.2.72.202.A NMAC exemptions do apply to NOI facilities under 20.2.73 NMAC. List 20.2.72.301.D.4 NMAC Auxiliary Equipment for Streamline applications in Table 2-A. The List of Insignificant Activities (for TV) can be found online at https://www.env.nm.gov/wp-content/uploads/sites/2/2017/10/InsignificantListTitleV.pdf. TV sources may elect to enter both TV Insignificant Activities and Part 72 Exemptions on this form.

[1] Insignificant activities exempted due to size or production rate are defined in 20.2.70.300.D.6, 20.2.70.7.Q NMAC, and the NMED/AQB List of Insignificant Activities, dated September 15, 2008. Emissions from these insignificant activities do not need to be reported, unless specifically requested.

[2] Specify date(s) required to determine regulatory applicability.

Administrative Record NSR 10833_001349

GENERAL TERMS AND CONDITIONS

2. QUALITY

2.1 The gas stream delivered into Transporter's pipeline system by Shipper or Shipper's designee at receipt points shall conform to each of the following quality specifications:

A. shall be commercially free from objectionable odors, solid matter, dust, gums, and gum forming constituents, or any other substance which interferes with the intended purpose or Merchantability of the gas, or causes interference with the proper and safe operation of the lines, meters, regulators, or other appliances through which it may flow;

B. shall contain not more than seven (7) pounds/MMcf of water at the temperature and pressure at which the gas is delivered into Transporter's pipeline system;

C. shall contain no hydrocarbons in liquid form at the temperature and pressure at which the gas is delivered into Transporter's pipeline system;

D. shall contain not more than 0.1% by volume of oxygen;

E. shall contain not more than 2.0% by volume of carbon dioxide;

F. shall contain not more than a combined total of 3.0% by volume of carbon dioxide plus nitrogen;

G. shall contain not more than one quarter (1/4) grain of hydrogen sulfide per one hundred (100) cubic feet of gas;

H. shall contain not more than 0.3 grains of mercaptan sulfur per one hundred (100) cubic feet of gas;

I. shall contain not more than 0.75 grains of total sulfur per one hundred (100) cubic feet of gas;

J. shall not contain any toxic or hazardous substance in concentrations which, in the normal use of the gas, may be hazardous to health, injurious to pipeline facilities, or be a limit to Merchantability or be contrary to applicable government standards;

K. shall have a minimum total heating value of not less than nine hundred seventy (970) Btu's per cubic foot, and shall have a maximum total heating value of not more than eleven hundred and ten (1110) Btu’s per cubic foot; and

Administrative Record NSR 10833_001350

L. shall have a temperature of not less than forty (40) degrees Fahrenheit, and not more than one hundred twenty (120) degrees Fahrenheit.

2.2 Transporter may not refuse to accept receipt of gas with a Hydrocarbon Dew point equal to or less than 15 degrees Fahrenheit provided that such gas satisfies all other applicable provisions of Transporter's Tariff. This standard shall be referred to as Transporter's Hydrocarbon Dew Point Safe Harbor.

A. Transporter may, from time to time, as operationally necessary, establish and post on its Internet Website a limit on Hydrocarbon Dew point for receipts on specified segments or other specified locations on its system to prevent hydrocarbon liquid fallout, or to ensure that gas will be accepted for delivery into interconnects with interstate pipelines, intrastate pipelines, end-users or directly connected local distribution companies; provided, however, Transporter may not make a posting that sets a Hydrocarbon Dew point limitation of less than 15 degrees Fahrenheit.

B. When Transporter determines there is an operational necessity to post a Hydrocarbon Dew point on a specific line segment or location, Transporter shall post on its Internet Website each blended Hydrocarbon Dew point Transporter calculates for a line segment or location within 24 hours of such calculation, and the method by which the Hydrocarbon Dew point value was calculated. Transporter will include in such posting the anticipated duration of the limitation as well as an explanation of the basis for the Hydrocarbon Dew point limitation.

C. Transporter will provide as much prior notice as reasonably practicable and will attempt to provide such notice at least two (2) days prior to the effective date of the limitation.

D. When Transporter posts a Hydrocarbon Dew point limit for a particular pipeline segment or location, all gas receipts into the affected area from interconnects or from any adjacent pipeline segments feeding gas directly into the affected pipeline segment must meet the posted Hydrocarbon Dew point limit for the affected pipeline segment.

E. Transporter shall post Hydrocarbon Dew point limitations for a given line segment or location only 1) to the extent necessary to prevent liquid fallout from occurring, 2) in order to manage and operate Transporter's system in a safe and reliable manner, and 3) as required to ensure that gas will be accepted for delivery at interconnects with interstate pipelines, intrastate pipelines, end-users or directly connected local distribution companies. Such posted Hydrocarbon Dew point limitations shall remain in effect no longer than necessary.

Administrative Record NSR 10833_001351

F. Transporter shall perform Receipt Point Hydrocarbon Dew point calculations for this Section 2.2 using the Peng-Robinson equation of state and C6+ assumptions consistent with industry practices. Upon a Shipper's request, Transporter shall conduct a C9+ analysis; provided that in no event shall Transporter be required to conduct such C9+ analysis at any one receipt point more frequently than once every twelve months. Transporter shall post on its Internet Website the chromatograph data available at not less than four (4) locations, including West of Thoreau, San Juan, Panhandle and West Texas mainlines, to monitor the gas quality of the blended gas stream existing in the mainline system. These gas quality monitoring locations shall be at points where the aggregated gas stream encompasses all or most of the gas from the West of Thoreau, San Juan, Panhandle and West Texas mainlines, respectively.

2.3 Transporter may refuse to accept any gas stream from Shipper or Shipper's designee which fails to conform with the gas quality specifications itemized in Sections 2.1 and 2.2. above; however Transporter, in its reasonable discretion exercised on a not unduly discriminatory basis, may accept any gas stream received into its pipeline system at receipt points, provided that such gas will not result in a blended gas stream which does not comply with the gas quality specifications listed in Sections 2.1 and 2.2 above (provided however, that the blended gas stream for deliveries in the East of Thoreau area may contain not more than 2.0% by volume of carbon dioxide and a combined total of up to 5.0% by volume of carbon dioxide plus nitrogen), or will not prevent delivery of the blended gas stream into a downstream pipeline and other points of delivery, and in the reasonable judgment of Transporter, will not adversely impact Transporter's facilities, pipeline integrity or operations. Transporter may, but is not obligated to, process or treat the gas stream on its system to assure that the gas stream meets Transporter's gas quality specifications.

Any Shipper on Transporter's system shall have the option of: (i) processing the volumes it owns or (ii) entering into contractual arrangements with third-party plant operators for such processing.

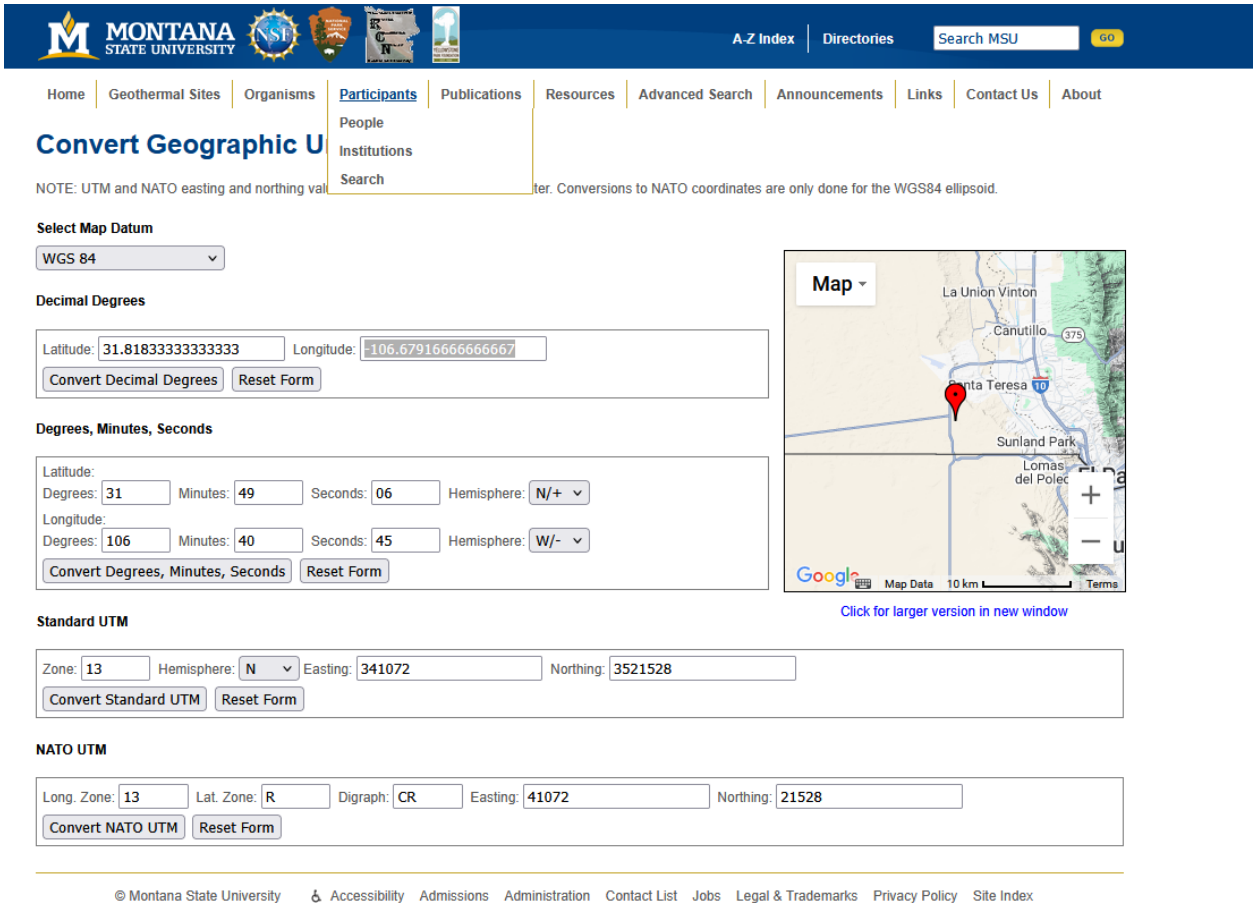
2.4 Except as provided in Section 2.5 below, the gas stream delivered to Shipper or Shipper's designee by Transporter at the delivery points shall conform to each of the gas quality specifications set forth in Sections 2.1, 2.2, and 2.3 above, except that delivery points that are located in the West of Thoreau Area shall not have a maximum heating value limitation as reflected in Section 2.1.K, subject to the presence of substances in Transporter's pipeline system as of January 1, 1990. If the gas delivered by Transporter to any downstream pipeline meets the quality specifications of Transporter but does not meet the downstream pipeline specifications, then Transporter shall use reasonable efforts to work with such downstream pipeline to resolve such differences to allow gas deliveries and the downstream pipeline shall have the continuing right to refuse to accept such gas deliveries.

Administrative Record NSR 10833_001352

2.5 If the gas stream delivered by Transporter to Shipper or Shipper's designee shall fail at any time to conform to any of the quality specifications set forth above, Shipper will notify Transporter of such deficiency and if Transporter fails to remedy such deficiency promptly, Shipper may, at its option, refuse to accept further delivery pending correction by Transporter.

2.6 If the gas offered for transportation hereunder shall fail at any time to conform to the quality provisions set forth in the Service Agreement between Transporter and Shipper, or if in Transporter's sole judgment such gas may cause harm to its facilities, then Transporter shall notify Shipper and Operator of such deficiency and may, at its option, refuse to accept receipt pending correction by Shipper or Operator.

2.7 With respect only to the maximum total heating value quality specification set forth in Section 2.1.K, Transporter and a point operator that operates multiple receipt points delivering gas into Transporter's pipeline system may agree that the volumes from designated receipt points will be considered in the aggregate for purposes of determining whether such volumes comply with the maximum total heating value quality specification. Any volumes to be aggregated shall be subject to the following conditions:



i. All such designated receipt points shall be in the same area of Transporter's system (i.e., either West Texas Lateral, Panhandle Lateral, or San Juan Lateral); and

ii. All volumes from such designated receipt points shall be adequately blended in Transporter's system, as determined by Transporter in its reasonable discretion exercised on a not unduly discriminatory basis, prior to delivery to any downstream delivery point affected by such volume.

When the aggregated heating value, calculated on a volume weighted average basis per day, is below the maximum total heating value set forth in Section 2.1.K, each of the designated receipt points therein shall be deemed to be in compliance with the maximum total heating value quality specification set forth in Section 2.1.K.

San Jose, CA 95134

Re: Air Quality Permit Application No. 10883 (Agency Interest No. 41351 - PRN20260001)

Dear Amanda Marrufo:

This letter is in response to your air quality permit application dated and received by the New Mexico Environment Department ("NMED" or "the Department") on April 27, 2026, to construct the "YGI Microgrid" near Santa Teresa, New Mexico in Doña Ana County. This letter addresses the Completeness Determination, Public Notice and Comment, and Invoice for Permit Fee and is intended for use by the applicant, interested individuals and groups, and the appropriate NMED Field Office.

Completeness Determination
A preliminary review has been completed and the information provided is sufficient to complete an evaluation of your permit application. Therefore, your application was ruled administratively complete on May 27, 2026. Under the requirements of 20.2.72 NMAC, the Department anticipates issuing or denying this permit on or before August 25, 2026.

Public Notice and Comment
The Department will publish a legal notice that will be sent to the NMED district or field office nearest the source (see enclosed). It describes the proposed facility, a summary of estimated emissions and ambient impact, the Department's preliminary intent to issue the permit, and the provisions for public comment.

The Department's analysis includes the Statement of Basis and is prepared as part of the technical review of the permit application. All interested persons have thirty (30) days from the date the public notice is published to notify the Department in writing of their interest in the permit application. The Department will notify all such persons of when and where the Department's analysis may be reviewed. Interested persons may review the Department's analysis for thirty (30) days after it becomes available at the NMED district or field office nearest the source. Written comments on the analysis or permit application and requests for a public hearing may be submitted to the Department during this second thirty (30) day period or any time before the permit is issued or denied.

The Department will hold a public hearing if the Secretary determines there is significant public interest in the permit application. The Department will also determine the time, date, and place of the hearing and shall notify the applicant and the public. At the hearing, all interested persons shall be given a reasonable chance to submit data, views or arguments orally or in writing, and to examine witnesses testifying at the hearing.

Administrative Record NSR 10833_001355

After the permit is issued or denied, the Department will mail written notice of the action taken on a permit application to all persons who submitted written comments or evidence on the application.

Invoice for Permit Fee
In accordance with 20.2.75 NMAC, this letter includes an invoice for the required permit fee in the amount of $16,170.00. The outstanding balance of $15,670.00 is due within thirty (30) days of the date ruled administratively complete. 20.2.75 NMAC states that the Department shall deny any permit application or request for permit revision if the required permit fee has not been paid. This fee is not refundable. An enforcement/compliance fee will also be assessed annually. All fees shall be remitted in the form of a corporate check, certified check, or money order made payable to the New Mexico Environment Department and shall be accompanied by the enclosed remittance slip. Fees shall be submitted to New Mexico Environment Department, Air Quality Bureau at the address shown on the invoice.

20.2.72.200.E NMAC states: "for all sources subject to this part, applications for permits shall be filed prior to the commencement of construction, modification, or installation. Regardless of the anticipated commencement date, no construction, modification, or installation shall begin prior to issuance of the permit."

The Department may make additional requests for information pursuant to 20.2.72.203(E) NMAC. Under Policy AQB 02-013, if the application changes substantially from the original application that was submitted during review, an extension may be requested and subsequently granted.

If you have any questions, please contact me in Santa Fe at 505-629-2893 or julia.kuhn@env.nm.gov.

Sincerely,

Julia Kuhn Digitally signed by Julia Kuhn

NMED District or Field Office Request – Attachment B

Legal Notice
and
Preliminary Determination for an Air Quality Permit for
Yucca Growth Infrastructure, LLC

Yucca Growth Infrastructure, LLC at 600 Congress Ave, Suite 15041, Austin, TX has submitted an air quality permit application to the Air Quality Bureau (AQB), New Mexico Environment Department (NMED) for an air quality permit to construct the "YGI Microgrid." The application file has been assigned Permit No. 10883 and TEMPO Agency Interest No. 41351. The exact location of the facility will be at latitude and longitude decimal degrees: 31.8183, -106.6792 Datum: WGS 84. To aid in locating this facility, the approximate location is 3.6 miles South of Santa Teresa in Doña Ana County, NM.

This application is for a microgrid power generation facility. This application is an initial NSR application being submitted under 20.2.72.200.A(1) NMAC. The proposed construction will consist of microgrid power generation facility consisting of a Bloom Energy Server System as emissions sources. This system is a type of solid oxide fuel cell system (SOFC) which converts natural gas into electricity. The site will be a major source for Title V (20.2.70 NMAC).

Total air pollutant emissions to the atmosphere are estimated to be approximately: Nitrogen Oxides (NOx) at 37.2 tons per year (tpy); Carbon Monoxide (CO) at 161.2 tpy; Volatile Organic Compounds (VOC) at 124.0 tpy; Sulfur Dioxide (SO_2) at 0.1 tpy; Particulate Matter 10 microns or less (PM10) at 75.4 tpy; and Particulate Matter 2.5 microns or less (PM2.5) at 75.4 tpy; total Hazardous Air Pollutants (HAPs) at 1.4 tpy; and greenhouse gas (CO_2e) >75,000 tpy. These emission estimates could change slightly during the course of the Department's review of the application.

The NMED has conducted a preliminary review of the information submitted with the permit application. The preliminary review and applicant's analysis of ambient air quality impacts indicates that the facility's air emissions will meet the air quality standards for NO_x, CO, SO_2, PM_{10}, and $PM_{2.5}$. VOCs are a pre-cursor to ozone and the NMED does not require an individual ozone ambient impact analysis for each application. To determine compliance with national ambient air quality standards for ozone, NMED uses air monitors to monitor ozone concentrations. A full review will evaluate the estimated emission rates for the pollutants listed in this public notice and determine compliance with ambient air quality requirements and standards.

Based on the applicant's analysis, a preliminary determination is that this facility will comply with the requirements of Title 20, New Mexico Administrative Code (NMAC), Chapter 2, Parts 1, 7, 23, 70, 72, 73, 75 and 80; and the New Mexico Air Quality Control Act. Therefore, the preliminary intent of NMED is to issue the air quality permit on or before August 25, 2026.

To ensure compliance with state and federal air regulations, the permit is expected to include conditions that limit the emissions, hours of operation, production rate, and conditions that will require record keeping and reporting to the Department.

The permit application is available for review on the AQB Public Notices of Permitting Actions website www.env.nm.gov/public-notices.

All interested persons have thirty (30) days from the date this notice is published, to notify the Department in writing of their interest in the permit application. The written comments should refer to the company name, facility name and Permit No. (or send a copy of this notice along with your comments). The written comments

shall state the nature of the issues raised and how it relates to the requirements of applicable state and federal air quality regulations and the Clean Air Act. The written comments should be mailed to New Mexico Environment Dept., Air Quality Bureau, Permit Section, 525 Camino de los Marquez Suite 1, Santa Fe, NM 87505-1816 or submitted electronically via the NMED public comment portal online at: https://nmed.commentinput.com/comment/search.

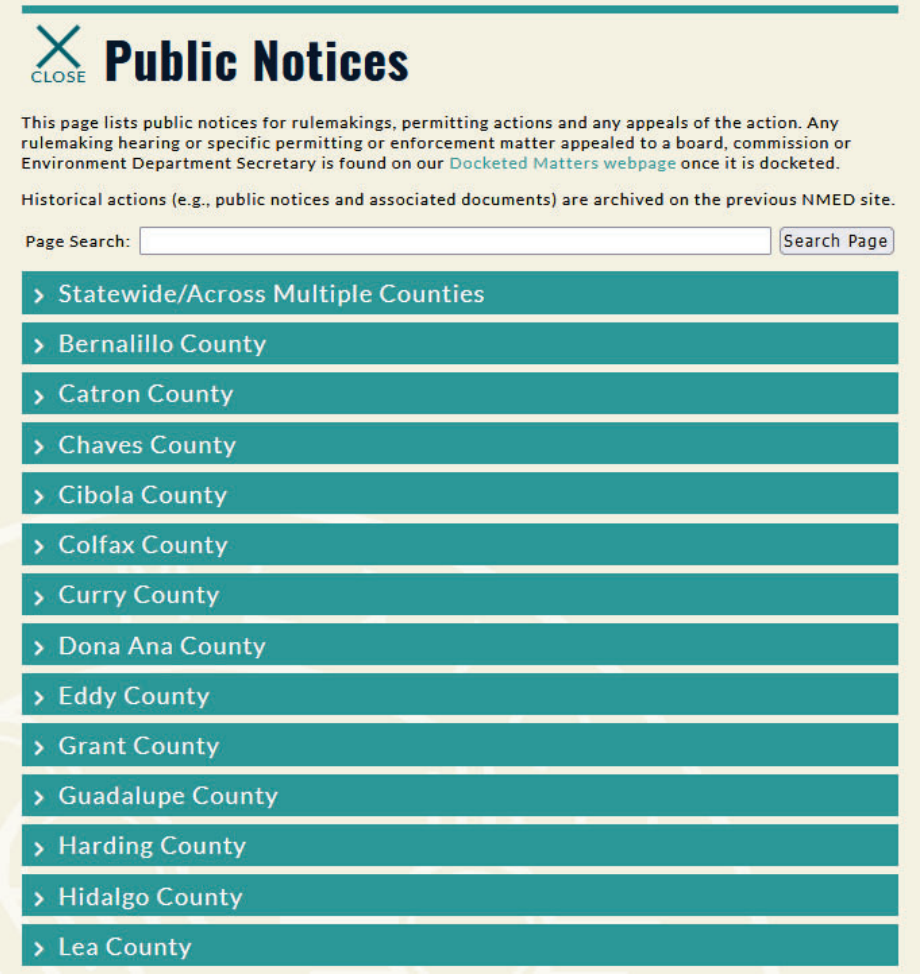
The Department will notify all persons who have provided written comments as to when and where the Department's analysis may be reviewed. Although all written comments will be made part of the public record, any person who does not express interest in writing before the end of this first thirty (30) day period will not receive such notification.

If the Department receives written public comment before the end of the Department's thirty (30) day public notice, the Department's analysis will be made available for review for thirty (30) days at the NMED district or field office nearest to the source before the permit will be issued. Written comments on the analysis or permit application may be submitted to the Department during this second thirty (30) day period or at any time before the permit is issued or denied.

General information about air quality and the permitting process can be found at the Air Quality Bureau's web site. The regulation dealing with public participation in the permit review process is 20.2.72.206 NMAC. This regulation can be found in the "Permits" section of this web site.

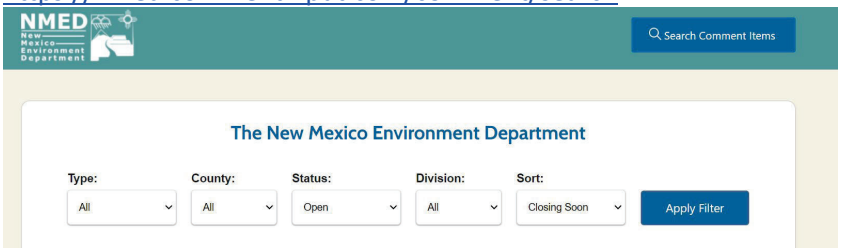
Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono (505) 629-7748.

Notice of Non-Discrimination
NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. You may also visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.



Attachment B – Field Office Request

District or Field Office Request



• The attached completeness letter and Legal Notice, which include website links, are being sent to your office in accordance with 20.2.72.206 NMAC - Public Notice and Participation, which states: "the Department shall make available for public inspection the permit application, the Department's analysis, and the Department's preliminary determination. This material shall be available both at the Department's central office and the district or field office nearest to the proposed source." The Legal Notice contains the Department's preliminary determination.

Asunto: Solicitud de Permiso de Calidad del Aire No. 10883 (Interés de la Agencia No. 41351 - PRN20260001)

Estimada Amanda Marrufo:

Esta carta es en respuesta a su solicitud de permiso de calidad del aire fechada y recibida por el Departamento de Medio Ambiente de Nuevo México ("NMED" o "el Departamento") el 27 de abril de 2026, para construir la "YGI Microgrid" cerca de Santa Teresa, Nuevo México en el Condado de Doña Ana. Esta carta aborda la Determinación de Integridad, el Aviso Público y Comentario, así como la Factura por la Tarifa del Permiso, y está destinada para el uso del solicitante, personas y grupos interesados, y la Oficina de Campo correspondiente del NMED.

Determinación de Integridad
Se ha completado una revisión preliminar y la información proporcionada es suficiente para completar una evaluación de su solicitud de permiso. Por lo tanto, su solicitud fue considerada administrativamente completa el 27 de mayo de 2026. Conforme a los requisitos de 20.2.72 NMAC, el Departamento prevé emitir o denegar este permiso a más tardar el 25 de agosto de 2026.

Aviso Público y Comentarios
El Departamento publicará un aviso legal que se enviará a la oficina de distrito o de campo del NMED más cercana a la fuente (ver adjunto). El mismo describe la instalación propuesta, un resumen de las emisiones estimadas y el impacto ambiental, la intención preliminar del Departamento de emitir el permiso, y las disposiciones para el comentario público.

El análisis del Departamento incluye la Declaración de Bases y se prepara como parte de la revisión técnica de la solicitud de permiso. Todas las personas interesadas disponen de treinta (30) días a partir de la fecha de publicación del aviso público para notificar por escrito al Departamento su interés en la solicitud de permiso. El Departamento notificará a todas esas personas sobre cuándo y dónde se puede revisar el análisis del Departamento. Las personas interesadas pueden revisar el análisis del Departamento durante treinta (30) días después de que esté disponible en la oficina de distrito o de campo del NMED más cercana a la fuente. Los comentarios por escrito sobre el análisis o la solicitud de permiso y las solicitudes de audiencia pública pueden presentarse al Departamento durante este segundo período de treinta (30) días o en cualquier momento antes de que se emita o deniegue el permiso.

El Departamento llevará a cabo una audiencia pública si el Secretario determina que existe un interés público significativo en la solicitud de permiso. El Departamento también determinará la hora, fecha y lugar de la audiencia y lo notificará al solicitante y al público. En la audiencia, todas las personas interesadas tendrán una oportunidad razonable de presentar datos, puntos de vista o argumentos de forma oral o por escrito, así como de interrogar a los testigos que testifiquen en la audiencia.

Administrative Record NSR 10833_001360

Una vez emitido o denegado el permiso, el Departamento enviará por correo una notificación por escrito de la acción tomada sobre una solicitud de permiso a todas las personas que presentaron comentarios o pruebas por escrito sobre la solicitud.

Factura por la Tarifa del Permiso

De conformidad con 20.2.75 NMAC, esta carta incluye una factura por la tarifa de permiso requerida por un monto de $16,170.00. El saldo pendiente de $15,670.00 debe pagarse dentro de un plazo de treinta (30) días a partir de la fecha en que se consideró administrativamente completa. 20.2.75 NMAC indica que el Departamento deberá denegar cualquier solicitud de permiso o solicitud de revisión de permiso si no se ha pagado la tarifa de permiso requerida. Esta tarifa no es reembolsable. También se impondrá anualmente una tarifa de cumplimiento/aplicación. Todas las tarifas deberán remitirse en forma de cheque corporativo, cheque certificado o giro postal, a nombre del Departamento de Ambiente de Nuevo México, y deberán ir acompañadas del talón de remisión adjunto. Las tarifas deberán enviarse al Departamento de Ambiente de Nuevo México, Oficina de Calidad del Aire, a la dirección que se muestra en la factura.

20.2.72.200.E NMAC establece: “para todas las fuentes sujetas a esta parte, las solicitudes de permisos se deberán presentar antes del inicio de la construcción, modificación o instalación. Independientemente de la fecha prevista de inicio, no podrá iniciar ninguna construcción, modificación o instalación antes de la emisión del permiso”.

El Departamento puede realizar solicitudes adicionales de información de conformidad con 20.2.72.203(E) NMAC. Bajo la Política AQB 02-013, si la solicitud cambia sustancialmente de la solicitud original que se presentó durante la revisión, se puede solicitar y posteriormente otorgar una extensión.

Si tiene alguna pregunta, por favor comuníquese conmigo en Santa Fe al 505-629-2893 o julia.kuhn@env.nm.gov.

Atentamente,

Julia Kuhn Firmado digitalmente por Julia Kuhn

Aviso Legal
y
Determinación Preliminar de un Permiso de Calidad del Aire para
Yucca Growth Infrastructure, LLC

Yucca Growth Infrastructure, LLC en 600 Congress Ave, Suite 15041, Austin, TX ha presentado una solicitud de permiso de calidad del aire a la Oficina de Calidad del Aire (AQB), Departamento de Ambiente de Nuevo México (NMED) para un permiso de calidad del aire para construir la "YGI Microgrid". Se ha asignado al expediente de solicitud el Permiso No. 10883 y el Número de Interés de Agencia TEMPO 41351. La ubicación exacta de la instalación será en la latitud y longitud grados decimales: 31.8183, -106.6792 Datum: WGS 84. Para ayudar a localizar esta instalación, la ubicación aproximada es 3.6 millas al Sur de Santa Teresa en el Condado de Doña Ana, NM.

Esta solicitud es para una instalación de generación de energía de microred. Esta solicitud es una solicitud inicial de NSR que se presenta bajo 20.2.72.200.A(1) NMAC. La construcción propuesta consistirá en una instalación de generación de energía de microred que consta de un Sistema de Servidor BloomEnergy como fuentes de emisiones. Este sistema es un tipo de sistema de celdas de combustible de óxido sólido (SOFC) que convierte el gas natural en electricidad. El sitio será una fuente mayor para el Título V (20.2.70 NMAC).

Las emisiones totales de contaminantes del aire a la atmósfera se estiman en aproximadamente: Óxidos de nitrógeno (NOx) en 37.2 toneladas por año(tpy); Monóxido de Carbono (CO) en 161.2 toneladas por año; Compuestos Orgánicos Volátiles (VOC) en 124.0 toneladas por año; Dióxido de Azufre (SO2) en 0.1 toneladas por año; Material particulado de 10 micras o menos (PM10) a 75.4 toneladas por año; y Material particulado de 2.5 micras o menos (PM2.5) a 75.4 toneladas por año; total de contaminantes peligrosos del aire (HAP) a 1.4 toneladas por año; y gases de efecto invernadero (CO2e) > 75,000 toneladas por año. Estas estimaciones de emisiones podrían cambiar ligeramente en el transcurso de la revisión de la solicitud por parte del Departamento.

El NMED ha llevado a cabo una revisión preliminar de la información presentada con la solicitud de permiso. La revisión preliminar y el análisis del solicitante sobre los impactos en la calidad del aire ambiente indican que las emisiones al aire de la instalación cumplirán las normas de calidad del aire para NO_x, CO, SO_2, PM_{10}, y $PM_{2.5}$. Los VOCs son precursores del ozono y el NMED no exige un análisis individual de impacto ambiental por ozono para cada solicitud. Para determinar el cumplimiento de las normas nacionales de calidad del aire ambiente en relación con el ozono, el NMED utiliza monitores de aire para monitorear las concentraciones de ozono. Una revisión completa evaluará los índices de emisión estimados para los contaminantes indicados en este aviso público y determinará el cumplimiento de los requisitos y normas de calidad del aire ambiente.

Basándose en el análisis del solicitante, una determinación preliminar es que esta instalación cumplirá con los requisitos del Título 20, Código Administrativo de Nuevo México (NMAC), Capítulo 2, Partes 1, 7, 23, 70, 72, 73, 75 y 80; y la Ley de Control de Calidad del Aire de Nuevo México. Por lo tanto, la intención preliminar del NMED es emitir el permiso de calidad del aire a más tardar el 25 de agosto de 2026.

Para garantizar el cumplimiento de los reglamentos estatales y federales sobre el aire, se espera que el permiso incluya condiciones que limiten las emisiones, las horas de operación, la tasa de producción, así como condiciones que exijan llevar registros y presentar informes al Departamento.

La solicitud de permiso está disponible para su revisión en el sitio web de Avisos Públicos de Acciones de Permiso de la AQB www.env.nm.gov/public-notices.

Todas las personas interesadas disponen de treinta (30) días a partir de la fecha de publicación de este aviso para notificar por escrito al Departamento su interés en la solicitud de permiso. Los comentarios escritos deberán hacer referencia al nombre de la empresa, el nombre de la instalación y el número de permiso (o enviar una

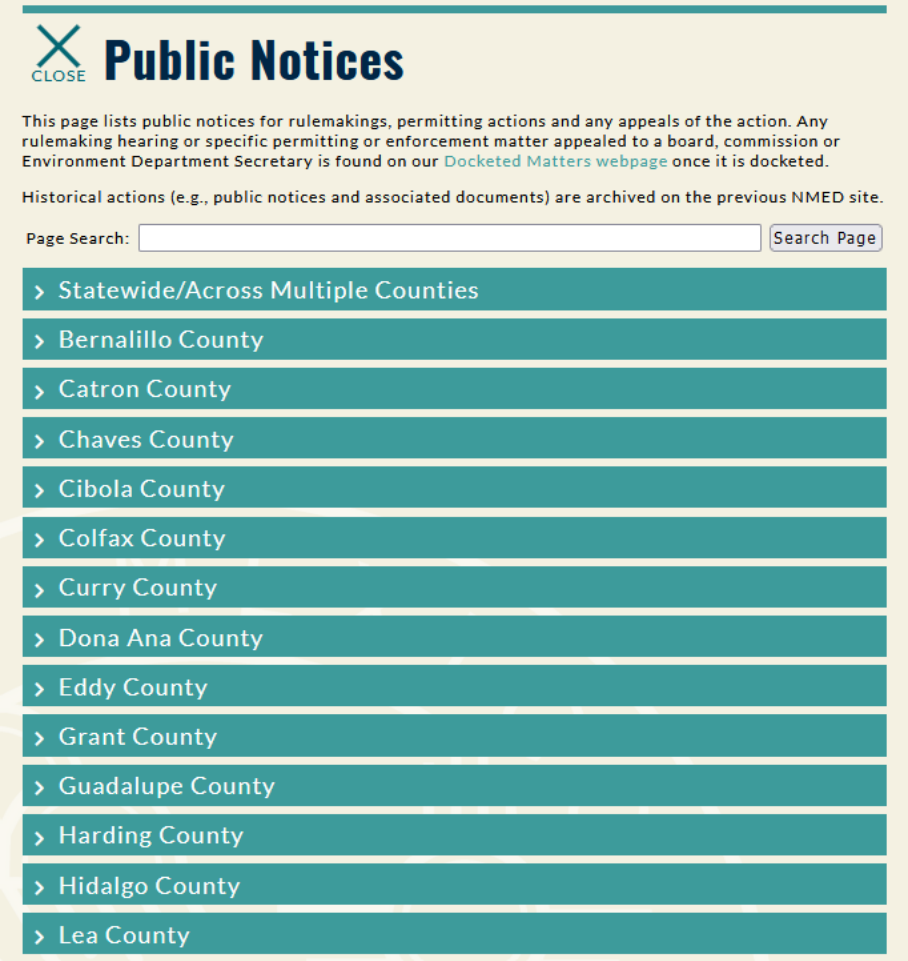
copia de este aviso junto con sus comentarios). Los comentarios escritos deberán indicar la naturaleza de los temas planteados y cómo se relacionan con los requisitos de los reglamentos estatales y federales aplicables en materia de calidad del aire y la Ley de Aire Limpio. Los comentarios por escrito deben enviarse por correo al Departamento de Ambiente de Nuevo México, Oficina de Calidad del Aire, Sección de Permisos, 525 Camino de los Márquez Suite 1, Santa Fe, NM 87505-1816, o presentarse electrónicamente a través del portal de comentarios públicos del NMED en línea en: https://nmed.commentinput.com/comment/search.

El Departamento notificará a todas las personas que hayan presentado comentarios por escrito cuándo y dónde pueden revisarse los análisis del Departamento. Aunque todos los comentarios escritos formarán parte del registro público, cualquier persona que no exprese su interés por escrito antes del final de este primer periodo de treinta (30) días no recibirá dicha notificación.

Si el Departamento recibe comentarios públicos por escrito antes del final del plazo de notificación pública de treinta (30) días del Departamento, el análisis del Departamento estará disponible para su revisión durante treinta (30) días en la oficina de distrito o de campo del NMED más cercana a la fuente antes de que se emita el permiso. Se podrán presentar al Departamento comentarios por escrito sobre el análisis o la solicitud de permiso durante este segundo período de treinta (30) días o en cualquier momento antes de que se emita o deniegue el permiso.

Se puede encontrar información general sobre la calidad del aire y el proceso de permisos en el sitio web de la Oficina de Calidad del Aire. El reglamento que aborda la participación pública en el proceso de revisión de permisos es el 20.2.72.206 NMAC. Este reglamento se puede encontrar en la sección “Permisos” de este sitio web.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono (505) 629-7748.



Aviso de No Discriminación
El NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo requieren las leyes y reglamentos aplicables. El NMED es responsable de coordinar los esfuerzos de cumplimiento y de recibir consultas relacionadas con los requisitos de no discriminación implementados por 40 C.F.R. Parte 7, incluyendo el Título VI de la Ley de Derechos Civiles de 1964, en su versión enmendada; la Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975; el Título IX de las Enmiendas de Educación de 1972; y la Sección 13 de las Enmiendas de 1972 a la Ley Federal de Control de la Contaminación del Agua. Si tiene alguna pregunta sobre este aviso o sobre cualquiera de los programas, políticas o procedimientos de no discriminación del NMED, o si considera que ha sido objeto de discriminación en relación con un programa o actividad del NMED, puede comunicarse con: Coordinador de No Discriminación, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM, 87502, (505) 827-2855, nd.coordinator@env.nm.gov. También puede visitar nuestro sitio web en https://www.env.nm.gov/non-employee-discrimination-complaint-page/ para conocer cómo y dónde presentar una queja por discriminación.

Anexo B – Solicitud a la Oficina de Campo

Solicitud a la Oficina de Distrito o de Campo

• La carta de integridad adjunta y el Aviso Legal, que incluyen enlaces a sitios web, se envían a su oficina de conformidad con 20.2.72.206 NMAC – Aviso Público y Participación, que establece: "el Departamento pondrá a disposición para inspección pública la solicitud de permiso, el análisis del Departamento y la determinación preliminar del Departamento. Este material estará disponible tanto en la oficina central del Departamento como en la oficina del distrito o de campo más cercana a la fuente propuesta". El Aviso Legal contiene la determinación preliminar del Departamento.

- El siguiente enlace del sitio web de Participación Pública del NMED muestra dónde el público puede acceder a los documentos relacionados con esta acción de permiso, tales como la solicitud, el permiso preliminar y el análisis del Departamento: https://www.env.nm.gov/public-notices/
  Para esta acción de permiso, baje hasta el Condado de Doña Ana para encontrar los documentos cargados en el sitio web y busque Yucca Growth Infrastructure, LLC-YGI Microgrid.

Legal Notice
and
Preliminary Determination for an Air Quality Permit for
Yucca Growth Infrastructure, LLC

Yucca Growth Infrastructure, LLC at 600 Congress Ave, Suite 15041, Austin, TX has submitted an air quality permit application to the Air Quality Bureau (AQB), New Mexico Environment Department (NMED) for an air quality permit to construct the "YGI Microgrid." The application file has been assigned Permit No. 10883 and TEMPO Agency Interest No. 41351. The exact location of the facility will be at latitude and longitude decimal degrees: 31.8183, -106.6792 Datum: WGS 84. To aid in locating this facility, the approximate location is 3.6 miles South of Santa Teresa in Doña Ana County, NM.

This application is for a microgrid power generation facility. This application is an initial NSR application being submitted under 20.2.72.200.A(1) NMAC. The proposed construction will consist of microgrid power generation facility consisting of a Bloom Energy Server System as emissions sources. This system is a type of solid oxide fuel cell system (SOFC) which converts natural gas into electricity. The site will be a major source for Title V (20.2.70 NMAC).

Total air pollutant emissions to the atmosphere are estimated to be approximately: Nitrogen Oxides (NOx) at 37.2 tons per year (tpy); Carbon Monoxide (CO) at 161.2 tpy; Volatile Organic Compounds (VOC) at 124.0 tpy; Sulfur Dioxide (SO_2) at 0.1 tpy; Particulate Matter 10 microns or less (PM10) at 75.4 tpy; and Particulate Matter 2.5 microns or less (PM2.5) at 75.4 tpy; total Hazardous Air Pollutants (HAPs) at 1.4 tpy; and greenhouse gas (CO_2e) >75,000 tpy. These emission estimates could change slightly during the course of the Department's review of the application.

The NMED has conducted a preliminary review of the information submitted with the permit application. The preliminary review and applicant's analysis of ambient air quality impacts indicates that the facility's air emissions will meet the air quality standards for NO_x, CO, SO_2, PM_{10}, and $PM_{2.5}$. VOCs are a pre-cursor to ozone and the NMED does not require an individual ozone ambient impact analysis for each application. To determine compliance with national ambient air quality standards for ozone, NMED uses air monitors to monitor ozone concentrations. A full review will evaluate the estimated emission rates for the pollutants listed in this public notice and determine compliance with ambient air quality requirements and standards.

Based on the applicant's analysis, a preliminary determination is that this facility will comply with the requirements of Title 20, New Mexico Administrative Code (NMAC), Chapter 2, Parts 1, 7, 23, 70, 72, 73, 75 and 80; and the New Mexico Air Quality Control Act. Therefore, the preliminary intent of NMED is to issue the air quality permit on or before August 25, 2026.

To ensure compliance with state and federal air regulations, the permit is expected to include conditions that limit the emissions, hours of operation, production rate, and conditions that will require record keeping and reporting to the Department.

The permit application is available for review on the AQB Public Notices of Permitting Actions website www.env.nm.gov/public-notices.

All interested persons have thirty (30) days from the date this notice is published, to notify the Department in writing of their interest in the permit application. The written comments should refer to the company name,

facility name and Permit No. (or send a copy of this notice along with your comments). The written comments shall state the nature of the issues raised and how it relates to the requirements of applicable state and federal air quality regulations and the Clean Air Act. The written comments should be mailed to New Mexico Environment Dept., Air Quality Bureau, Permit Section, 525 Camino de los Marquez Suite 1, Santa Fe, NM 87505-1816 or submitted electronically via the NMED public comment portal online at: https://nmed.commentinput.com/comment/search.

The Department will notify all persons who have provided written comments as to when and where the Department's analysis may be reviewed. Although all written comments will be made part of the public record, any person who does not express interest in writing before the end of this first thirty (30) day period will not receive such notification.

If the Department receives written public comment before the end of the Department's thirty (30) day public notice, the Department's analysis will be made available for review for thirty (30) days at the NMED district or field office nearest to the source before the permit will be issued. Written comments on the analysis or permit application may be submitted to the Department during this second thirty (30) day period or at any time before the permit is issued or denied.

General information about air quality and the permitting process can be found at the Air Quality Bureau's web site. The regulation dealing with public participation in the permit review process is 20.2.72.206 NMAC. This regulation can be found in the "Permits" section of this web site.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono (505) 629-7748.

Notice of Non-Discrimination
NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. You may also visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

Aviso Legal
y
Determinación Preliminar de un Permiso de Calidad del Aire para
Yucca Growth Infrastructure, LLC

Yucca Growth Infrastructure, LLC en 600 Congress Ave, Suite 15041, Austin, TX ha presentado una solicitud de permiso de calidad del aire a la Oficina de Calidad del Aire (AQB), Departamento de Ambiente de Nuevo México (NMED) para un permiso de calidad del aire para construir la "YGI Microgrid". Se ha asignado al expediente de solicitud el Permiso No. 10883 y el Número de Interés de Agencia TEMPO 41351. La ubicación exacta de la instalación será en la latitud y longitud grados decimales: 31.8183, -106.6792 Datum: WGS 84. Para ayudar a localizar esta instalación, la ubicación aproximada es 3.6 millas al Sur de Santa Teresa en el Condado de Doña Ana, NM.

Esta solicitud es para una instalación de generación de energía de microred. Esta solicitud es una solicitud inicial de NSR que se presenta bajo 20.2.72.200.A(1) NMAC. La construcción propuesta consistirá en una instalación de generación de energía de microred que consta de un Sistema de Servidor BloomEnergy como fuentes de emisiones. Este sistema es un tipo de sistema de celdas de combustible de óxido sólido (SOFC) que convierte el gas natural en electricidad. El sitio será una fuente mayor para el Título V (20.2.70 NMAC).

Las emisiones totales de contaminantes del aire a la atmósfera se estiman en aproximadamente: Óxidos de nitrógeno (NOx) en 37.2 toneladas por año(tpy); Monóxido de Carbono (CO) en 161.2 toneladas por año; Compuestos Orgánicos Volátiles (VOC) en 124.0 toneladas por año; Dióxido de Azufre (SO2) en 0.1 toneladas por año; Material particulado de 10 micras o menos (PM10) a 75.4 toneladas por año; y Material particulado de 2.5 micras o menos (PM2.5) a 75.4 toneladas por año; total de contaminantes peligrosos del aire (HAP) a 1.4 toneladas por año; y gases de efecto invernadero (CO2e) > 75,000 toneladas por año. Estas estimaciones de emisiones podrían cambiar ligeramente en el transcurso de la revisión de la solicitud por parte del Departamento.

El NMED ha llevado a cabo una revisión preliminar de la información presentada con la solicitud de permiso. La revisión preliminar y el análisis del solicitante sobre los impactos en la calidad del aire ambiente indican que las emisiones al aire de la instalación cumplirán las normas de calidad del aire para NO_x, CO, SO_2, PM_{10}, y $PM_{2.5}$. Los VOCs son precursores del ozono y el NMED no exige un análisis individual de impacto ambiental por ozono para cada solicitud. Para determinar el cumplimiento de las normas nacionales de calidad del aire ambiente en relación con el ozono, el NMED utiliza monitores de aire para monitorear las concentraciones de ozono. Una revisión completa evaluará los índices de emisión estimados para los contaminantes indicados en este aviso público y determinará el cumplimiento de los requisitos y normas de calidad del aire ambiente.

Basándose en el análisis del solicitante, una determinación preliminar es que esta instalación cumplirá con los requisitos del Título 20, Código Administrativo de Nuevo México (NMAC), Capítulo 2, Partes 1, 7, 23, 70, 72, 73, 75 y 80; y la Ley de Control de Calidad del Aire de Nuevo México. Por lo tanto, la intención preliminar del NMED es emitir el permiso de calidad del aire a más tardar el 25 de agosto de 2026.

Para garantizar el cumplimiento de los reglamentos estatales y federales sobre el aire, se espera que el permiso incluya condiciones que limiten las emisiones, las horas de operación, la tasa de producción, así como condiciones que exijan llevar registros y presentar informes al Departamento.

La solicitud de permiso está disponible para su revisión en el sitio web de Avisos Públicos de Acciones de Permiso de la AQB www.env.nm.gov/public-notices.

Todas las personas interesadas disponen de treinta (30) días a partir de la fecha de publicación de este aviso para notificar por escrito al Departamento su interés en la solicitud de permiso. Los comentarios escritos deberán

hacer referencia al nombre de la empresa, el nombre de la instalación y el número de permiso (o enviar una copia de este aviso junto con sus comentarios). Los comentarios escritos deberán indicar la naturaleza de los temas planteados y cómo se relacionan con los requisitos de los reglamentos estatales y federales aplicables en materia de calidad del aire y la Ley de Aire Limpio. Los comentarios por escrito deben enviarse por correo al Departamento de Ambiente de Nuevo México, Oficina de Calidad del Aire, Sección de Permisos, 525 Camino de los Márquez Suite 1, Santa Fe, NM 87505-1816, o presentarse electrónicamente a través del portal de comentarios públicos del NMED en línea en: https://nmed.commentinput.com/comment/search.

El Departamento notificará a todas las personas que hayan presentado comentarios por escrito cuándo y dónde pueden revisarse los análisis del Departamento. Aunque todos los comentarios escritos formarán parte del registro público, cualquier persona que no exprese su interés por escrito antes del final de este primer periodo de treinta (30) días no recibirá dicha notificación.

Si el Departamento recibe comentarios públicos por escrito antes del final del plazo de notificación pública de treinta (30) días del Departamento, el análisis del Departamento estará disponible para su revisión durante treinta (30) días en la oficina de distrito o de campo del NMED más cercana a la fuente antes de que se emita el permiso. Se podrán presentar al Departamento comentarios por escrito sobre el análisis o la solicitud de permiso durante este segundo período de treinta (30) días o en cualquier momento antes de que se emita o deniegue el permiso.

Se puede encontrar información general sobre la calidad del aire y el proceso de permisos en el sitio web de la Oficina de Calidad del Aire. El reglamento que aborda la participación pública en el proceso de revisión de permisos es el 20.2.72.206 NMAC. Este reglamento se puede encontrar en la sección “Permisos” de este sitio web.

To aid in locating this facility, the approximate location is 3.6 miles South of Santa Teresa in Doña Ana County, NM.

This application is for a microgrid power generation facility. This application is an initial NSR application being submitted under 20.2.72.200.A(1) NMAC. The proposed construction will consist of microgrid power generation facility consisting of a Bloom Energy Server System as emissions sources. This system is a type of solid oxide fuel cell system (SOFC) which converts natural gas into electricity. The site will be a major source for Title V (20.2.70 NMAC).

Total air pollutant emissions to the atmosphere are estimated to be approximately: Nitrogen Oxides (NOx) at 37.2 tons per year (tpy); Carbon Monoxide (CO) at 161.2 tpy; Volatile Organic Compounds (VOC) at 124.0 tpy; Sulfur Dioxide (SO_2) at 0.1 tpy; Particulate Matter 10 microns or less (PM10) at 75.4 tpy; and Particulate Matter 2.5 microns or less (PM2.5) at 75.4 tpy; total Hazardous Air Pollutants (HAPs) at 1.4 tpy; and greenhouse gas (CO_2e) >75,000 tpy. These emission estimates could change slightly during the course of the Department's review of the application.

The NMED has conducted a preliminary review of the information submitted with the permit application. The preliminary review and applicant's analysis of ambient air quality impacts indicates that the facility's air emissions will meet the air quality standards for NO_x, CO, SO_2, PM_{10}, and $PM_{2.5}$. VOCs are a pre-cursor to ozone and the NMED does not require an individual ozone ambient impact analysis for each application. To determine compliance with national ambient air quality standards for ozone, NMED uses air monitors to monitor ozone concentrations. A full review will evaluate the estimated emission rates for the pollutants listed in this public notice and determine compliance with ambient air quality requirements and standards.

Based on the applicant's analysis, a preliminary determination is that this facility will comply with the requirements of Title 20, New Mexico Administrative Code (NMAC), Chapter 2, Parts 1, 7, 23, 70, 72, 73, 75 and 80; and the New Mexico Air Quality Control Act. Therefore, the preliminary intent of NMED is to issue the air quality permit on or before August 25, 2026.

To ensure compliance with state and federal air regulations, the permit is expected to include conditions that limit the emissions, hours of operation, production rate, and conditions that will require record keeping and reporting to the Department.

The permit application is available for review on the AQB Public Notices of Permitting Actions website www.env.nm.gov/public-notices.

All interested persons have thirty (30) days from the date this notice is published, to notify the Department in writing of their interest in the permit application. The written comments should refer to the company name,

facility name and Permit No. (or send a copy of this notice along with your comments). The written comments shall state the nature of the issues raised and how it relates to the requirements of applicable state and federal air quality regulations and the Clean Air Act. The written comments should be mailed to New Mexico Environment Dept., Air Quality Bureau, Permit Section, 525 Camino de los Marquez Suite 1, Santa Fe, NM 87505-1816 or submitted electronically via the NMED public comment portal online at: https://nmed.commentinput.com/comment/search.

The Department will notify all persons who have provided written comments as to when and where the Department's analysis may be reviewed. Although all written comments will be made part of the public record, any person who does not express interest in writing before the end of this first thirty (30) day period will not receive such notification.

If the Department receives written public comment before the end of the Department's thirty (30) day public notice, the Department's analysis will be made available for review for thirty (30) days at the NMED district or field office nearest to the source before the permit will be issued. Written comments on the analysis or permit application may be submitted to the Department during this second thirty (30) day period or at any time before the permit is issued or denied.

General information about air quality and the permitting process can be found at the Air Quality Bureau's web site. The regulation dealing with public participation in the permit review process is 20.2.72.206 NMAC. This regulation can be found in the "Permits" section of this web site.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono (505) 629-7748.

Notice of Non-Discrimination
NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. You may also visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

Aviso Legal
y
Determinación Preliminar de un Permiso de Calidad del Aire para
Yucca Growth Infrastructure, LLC

Yucca Growth Infrastructure, LLC en 600 Congress Ave, Suite 15041, Austin, TX ha presentado una solicitud de permiso de calidad del aire a la Oficina de Calidad del Aire (AQB), Departamento de Ambiente de Nuevo México (NMED) para un permiso de calidad del aire para construir la "YGI Microgrid". Se ha asignado al expediente de solicitud el Permiso No. 10883 y el Número de Interés de Agencia TEMPO 41351. La ubicación exacta de la instalación será en la latitud y longitud grados decimales: 31.8183, -106.6792 Datum: WGS 84. Para ayudar a localizar esta instalación, la ubicación aproximada es 3.6 millas al Sur de Santa Teresa en el Condado de Doña Ana, NM.

Esta solicitud es para una instalación de generación de energía de microred. Esta solicitud es una solicitud inicial de NSR que se presenta bajo 20.2.72.200.A(1) NMAC. La construcción propuesta consistirá en una instalación de generación de energía de microred que consta de un Sistema de Servidor BloomEnergy como fuentes de emisiones. Este sistema es un tipo de sistema de celdas de combustible de óxido sólido (SOFC) que convierte el gas natural en electricidad. El sitio será una fuente mayor para el Título V (20.2.70 NMAC).

Las emisiones totales de contaminantes del aire a la atmósfera se estiman en aproximadamente: Óxidos de nitrógeno (NOx) en 37.2 toneladas por año(tpy); Monóxido de Carbono (CO) en 161.2 toneladas por año; Compuestos Orgánicos Volátiles (VOC) en 124.0 toneladas por año; Dióxido de Azufre (SO2) en 0.1 toneladas por año; Material particulado de 10 micras o menos (PM10) a 75.4 toneladas por año; y Material particulado de 2.5 micras o menos (PM2.5) a 75.4 toneladas por año; total de contaminantes peligrosos del aire (HAP) a 1.4 toneladas por año; y gases de efecto invernadero (CO2e) > 75,000 toneladas por año. Estas estimaciones de emisiones podrían cambiar ligeramente en el transcurso de la revisión de la solicitud por parte del Departamento.

El NMED ha llevado a cabo una revisión preliminar de la información presentada con la solicitud de permiso. La revisión preliminar y el análisis del solicitante sobre los impactos en la calidad del aire ambiente indican que las emisiones al aire de la instalación cumplirán las normas de calidad del aire para NO_x, CO, SO_2, PM_{10}, y $PM_{2.5}$. Los VOCs son precursores del ozono y el NMED no exige un análisis individual de impacto ambiental por ozono para cada solicitud. Para determinar el cumplimiento de las normas nacionales de calidad del aire ambiente en relación con el ozono, el NMED utiliza monitores de aire para monitorear las concentraciones de ozono. Una revisión completa evaluará los índices de emisión estimados para los contaminantes indicados en este aviso público y determinará el cumplimiento de los requisitos y normas de calidad del aire ambiente.

Basándose en el análisis del solicitante, una determinación preliminar es que esta instalación cumplirá con los requisitos del Título 20, Código Administrativo de Nuevo México (NMAC), Capítulo 2, Partes 1, 7, 23, 70, 72, 73, 75 y 80; y la Ley de Control de Calidad del Aire de Nuevo México. Por lo tanto, la intención preliminar del NMED es emitir el permiso de calidad del aire a más tardar el 25 de agosto de 2026.

Para garantizar el cumplimiento de los reglamentos estatales y federales sobre el aire, se espera que el permiso incluya condiciones que limiten las emisiones, las horas de operación, la tasa de producción, así como condiciones que exijan llevar registros y presentar informes al Departamento.

La solicitud de permiso está disponible para su revisión en el sitio web de Avisos Públicos de Acciones de Permiso de la AQB www.env.nm.gov/public-notices.

Todas las personas interesadas disponen de treinta (30) días a partir de la fecha de publicación de este aviso para notificar por escrito al Departamento su interés en la solicitud de permiso. Los comentarios escritos deberán

hacer referencia al nombre de la empresa, el nombre de la instalación y el número de permiso (o enviar una copia de este aviso junto con sus comentarios). Los comentarios escritos deberán indicar la naturaleza de los temas planteados y cómo se relacionan con los requisitos de los reglamentos estatales y federales aplicables en materia de calidad del aire y la Ley de Aire Limpio. Los comentarios por escrito deben enviarse por correo al Departamento de Ambiente de Nuevo México, Oficina de Calidad del Aire, Sección de Permisos, 525 Camino de los Márquez Suite 1, Santa Fe, NM 87505-1816, o presentarse electrónicamente a través del portal de comentarios públicos del NMED en línea en: https://nmed.commentinput.com/comment/search.

El Departamento notificará a todas las personas que hayan presentado comentarios por escrito cuándo y dónde pueden revisarse los análisis del Departamento. Aunque todos los comentarios escritos formarán parte del registro público, cualquier persona que no exprese su interés por escrito antes del final de este primer periodo de treinta (30) días no recibirá dicha notificación.

Si el Departamento recibe comentarios públicos por escrito antes del final del plazo de notificación pública de treinta (30) días del Departamento, el análisis del Departamento estará disponible para su revisión durante treinta (30) días en la oficina de distrito o de campo del NMED más cercana a la fuente antes de que se emita el permiso. Se podrán presentar al Departamento comentarios por escrito sobre el análisis o la solicitud de permiso durante este segundo período de treinta (30) días o en cualquier momento antes de que se emita o deniegue el permiso.

Se puede encontrar información general sobre la calidad del aire y el proceso de permisos en el sitio web de la Oficina de Calidad del Aire. El reglamento que aborda la participación pública en el proceso de revisión de permisos es el 20.2.72.206 NMAC. Este reglamento se puede encontrar en la sección “Permisos” de este sitio web.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono (505) 629-7748.

Aviso de No Discriminación
El NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo requieren las leyes y reglamentos aplicables. El NMED es responsable de coordinar los esfuerzos de cumplimiento y de recibir consultas relacionadas con los requisitos de no discriminación implementados por 40 C.F.R. Parte 7, incluyendo el Título VI de la Ley de Derechos Civiles de 1964, en su versión enmendada; la Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975; el Título IX de las Enmiendas de Educación de 1972; y la Sección 13 de las Enmiendas de 1972 a la Ley Federal de Control de la Contaminación del Agua. Si tiene alguna pregunta sobre este aviso o sobre cualquiera de los programas, políticas o procedimientos de no discriminación del NMED, o si considera que ha sido objeto de discriminación en relación con un programa o actividad del NMED, puede comunicarse con: Coordinador de No Discriminación, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM, 87502, (505) 827-2855, nd.coordinator@env.nm.gov. También puede visitar nuestro sitio web en https://www.env.nm.gov/non-employee-discrimination-complaint-page/ para conocer cómo y dónde presentar una queja por discriminación.

Legal Notice
and
Preliminary Determination for an Air Quality Permit for
Yucca Growth Infrastructure, LLC

Yucca Growth Infrastructure, LLC at 600 Congress Ave, Suite 15041, Austin, TX has submitted an air quality permit application to the Air Quality Bureau (AQB), New Mexico Environment Department (NMED) for an air quality permit to construct the "YGI Microgrid." The application file has been assigned Permit No. 10883 and TEMPO Agency Interest No. 41351. The exact location of the facility will be at latitude and longitude decimal degrees: 31.8183, -106.6792 Datum: WGS 84. To aid in locating this facility, the approximate location is 3.6 miles South of Santa Teresa in Doña Ana County, NM.

This application is for a microgrid power generation facility. This application is an initial NSR application being submitted under 20.2.72.200.A(1) NMAC. The proposed construction will consist of microgrid power generation facility consisting of a Bloom Energy Server System as emissions sources. This system is a type of solid oxide fuel cell system (SOFC) which converts natural gas into electricity. The site will be a major source for Title V (20.2.70 NMAC).

Total air pollutant emissions to the atmosphere are estimated to be approximately: Nitrogen Oxides (NOx) at 37.2 tons per year (tpy); Carbon Monoxide (CO) at 161.2 tpy; Volatile Organic Compounds (VOC) at 124.0 tpy; Sulfur Dioxide (SO2) at 0.1 tpy; Particulate Matter 10 microns or less (PM10) at 75.4 tpy; and Particulate Matter 2.5 microns or less (PM2.5) at 75.4 tpy; total Hazardous Air Pollutants (HAPs) at 1.4 tpy; and greenhouse gas (CO2e) >75,000 tpy. These emission estimates could change slightly during the course of the Department's review of the application.

The NMED has conducted a preliminary review of the information submitted with the permit application. The preliminary review and applicant's analysis of ambient air quality impacts indicates that the facility's air emissions will meet the air quality standards for NOx, CO, SO2, PM10, and PM2.5. VOCs are a pre-cursor to ozone and the NMED does not require an individual ozone ambient impact analysis for each application. To determine compliance with national ambient air quality standards for ozone, NMED uses air monitors to monitor ozone concentrations. A full review will evaluate the estimated emission rates for the pollutants listed in this public notice and determine compliance with ambient air quality requirements and standards.

Based on the applicant's analysis, a preliminary determination is that this facility will comply with the requirements of Title 20, New Mexico Administrative Code (NMAC), Chapter 2, Parts 1, 7, 23, 70, 72, 73, 75 and 80; and the New Mexico Air Quality Control Act. Therefore, the preliminary intent of NMED is to issue the air quality permit on or before August 25, 2026.

To ensure compliance with state and federal air regulations, the permit is expected to include conditions that limit the emissions, hours of operation, production rate, and conditions that will require record keeping and reporting to the Department.

The permit application is available for review on the AQB Public Notices of Permitting Actions website www.env.nm.gov/public-notices.

All interested persons have thirty (30) days from the date this notice is published, to notify the Department in writing of their interest in the permit application. The written comments should refer to the company name, facility name and Permit No. (or send a copy of this notice along with your comments). The written comments shall state the nature of the issues raised and how it relates to the requirements of applicable state and federal air quality regulations and the Clean Air Act. The written comments should be mailed to New Mexico Environment Dept., Air Quality Bureau, Permit Section, 525 Camino de los Marquez Suite 1, Santa Fe, NM 87505-1816 or submitted electronically via the NMED public comment portal online at: https://nmed.commentinput.com/comment/search.

The Department will notify all persons who have provided written comments as to when and where the Department's analysis may be reviewed. Although all written comments will be made part of the public record, any person who does not express interest in writing before the end of this first thirty (30) day period will not receive such notification.

If the Department receives written public comment before the end of the Department's thirty (30) day public notice, the Department's analysis will be made available for review for thirty (30) days at the NMED district or field office nearest to the source before the permit will be issued. Written comments on the analysis or permit application may be submitted to the Department during this second thirty (30) day period or at any time before the permit is issued or denied.

General information about air quality and the permitting process can be found at the Air Quality Bureau's web site. The regulation dealing with public participation in the permit review process is 20.2.72.206 NMAC. This regulation can be found in the "Permits" section of this web site.

Aviso Legal
y
Determinación Preliminar de un Permiso de Calidad del Aire para
Yucca Growth Infrastructure, LLC

Yucca Growth Infrastructure, LLC en 600 Congress Ave, Suite 15041, Austin, TX ha presentado una solicitud de permiso de calidad del aire a la Oficina de Calidad del Aire (AQB), Departamento de Ambiente de Nuevo México (NMED) para un permiso de calidad del aire para construir la "YGI Microgrid". Se ha asignado al expediente de solicitud el Permiso No. 10883 y el Número de Interés de Agencia TEMPO 41351. La ubicación exacta de la instalación será en la latitud y longitud grados decimales: 31.8183, -106.6792 Datum: WGS 84. Para ayudar a localizar esta instalación, la ubicación aproximada es 3.6 millas al Sur de Santa Teresa en el Condado de Doña Ana, NM.

Esta solicitud es para una instalación de generación de energía de microred. Esta solicitud es una solicitud inicial de NSR que se presenta bajo 20.2.72.200.A(1) NMAC. La construcción propuesta consistirá en una instalación de generación de energía de microred que consta de un Sistema de Servidor BloomEnergy como fuentes de emisiones. Este sistema es un tipo de sistema de celdas de combustible de óxido sólido (SOFC) que convierte el gas natural en electricidad. El sitio será una fuente mayor para el Título V (20.2.70 NMAC).

Las emisiones totales de contaminantes del aire a la atmósfera se estiman en aproximadamente: Óxidos de nitrógeno (NOx) en 37.2 toneladas por año(tpy); Monóxido de Carbono (CO) en 161.2 toneladas por año; Compuestos Orgánicos Volátiles (VOC) en 124.0 toneladas por año; Dióxido de Azufre (SO2) en 0.1 toneladas por año; Material particulado de 10 micras o menos (PM10) a 75.4 toneladas por año; y Material particulado de 2.5 micras o menos (PM2.5) a 75.4 toneladas por año; total de contaminantes peligrosos del aire (HAP) a 1.4 toneladas por año; y gases de efecto invernadero (CO2e) > 75,000 toneladas por año. Estas estimaciones de emisiones podrían cambiar ligeramente en el transcurso de la revisión de la solicitud por parte del Departamento.

El NMED ha llevado a cabo una revisión preliminar de la información presentada con la solicitud de permiso. La revisión preliminar y el análisis del solicitante sobre los impactos en la calidad del aire ambiente indican que las emisiones al aire de la instalación cumplirán las normas de calidad del aire para NOx, CO, SO2, PM10, y PM2.5. Los VOCs son precursores del ozono y el NMED no exige un análisis individual de impacto ambiental por ozono para cada solicitud. Para determinar el cumplimiento de las normas nacionales de calidad del aire ambiente en relación con el ozono, el NMED utiliza monitores de aire para monitorear las concentraciones de ozono. Una revisión completa evaluará los índices de emisión estimados para los contaminantes indicados en este aviso público y determinará el cumplimiento de los requisitos y normas de calidad del aire ambiente.

Basándose en el análisis del solicitante, una determinación preliminar es que esta instalación cumplirá con los requisitos del Título 20, Código Administrativo de Nuevo México (NMAC), Capítulo 2, Partes 1, 7, 23, 70, 72, 73, 75 y 80; y la Ley de Control de Calidad del Aire de Nuevo México. Por lo tanto, la intención preliminar del NMED es emitir el permiso de calidad del aire a más tardar el 25 de agosto de 2026.

Para garantizar el cumplimiento de los reglamentos estatales y federales sobre el aire, se espera que el permiso incluya condiciones que limiten las emisiones, las horas de operación, la tasa de producción, así como condiciones que exijan llevar registros y presentar informes al Departamento.

La solicitud de permiso está disponible para su revisión en el sitio web de Avisos Públicos de Acciones de Permiso de la AQB www.env.nm.gov/public-notices.

Todas las personas interesadas disponen de treinta (30) días a partir de la fecha de publicación de este aviso para notificar por escrito al Departamento su interés en la solicitud de permiso. Los comentarios escritos deberán hacer referencia al nombre de la empresa, el nombre de la instalación y el número de permiso (o enviar una copia de este aviso junto con sus comentarios). Los comentarios escritos deberán indicar la naturaleza de los temas planteados y cómo se relacionan con los requisitos de los reglamentos estatales y federales aplicables en materia de calidad del aire y la Ley de Aire Limpio. Los comentarios por escrito deben enviarse por correo al Departamento de Ambiente de Nuevo México, Oficina de Calidad del Aire, Sección de Permisos, 525 Camino de los Márquez Suite 1, Santa Fe, NM 87505-1816, o presentarse electrónicamente a través del portal de comentarios públicos del NMED en línea en: https://nmed.commentinput.com/comment/search.

El Departamento notificará a todas las personas que hayan presentado comentarios por escrito cuándo y dónde pueden revisarse los análisis del Departamento. Aunque todos los comentarios escritos formarán parte del registro público, cualquier persona que no exprese su interés por escrito antes del final de este primer periodo de treinta (30) días no recibirá dicha notificación.

Si el Departamento recibe comentarios públicos por escrito antes del final del plazo de notificación pública de treinta (30) días del Departamento, el análisis del Departamento estará disponible para su revisión durante treinta (30) días en la oficina de distrito o de campo del NMED más cercana a la fuente antes de que se emita el permiso. Se podrán presentar al Departamento comentarios por escrito sobre el análisis o la solicitud de permiso durante este segundo período de treinta (30) días o en cualquier momento antes de que se emita o deniegue el permiso.

Se puede encontrar información general sobre la calidad del aire y el proceso de permisos en el sitio web de la

Oficina de Calidad del Aire. El reglamento que aborda la participación pública en el proceso de revisión de permisos es el 20.2.72.206 NMAC. Este reglamento se puede encontrar en la sección "Permisos" de este sitio web.

Yucca Growth Infrastructure, LLC at 600 Congress Ave, Suite 15041, Austin, TX has submitted an air quality permit application to the Air Quality Bureau (AQB), New Mexico Environment Department (NMED) for an air quality permit to construct the "YGI Microgrid." The application file has been assigned Permit No. 10883 and TEMPO Agency Interest No. 41351. The exact location of the facility will be at latitude and longitude decimal degrees: 31.8183, -106.6792 Datum: WGS 84. To aid in locating this facility, the approximate location is 3.6 miles South of Santa Teresa in Doña Ana County, NM.

This application is for a microgrid power generation facility. This application is an initial NSR application being submitted under 20.2.72.200.A(1) NMAC. The proposed construction will consist of microgrid power generation facility consisting of a Bloom Energy Server System as emissions sources. This system is a type of solid oxide fuel cell system (SOFC) which converts natural gas into electricity. The site will be a major source for Title V (20.2.70 NMAC).

Total air pollutant emissions to the atmosphere are estimated to be approximately: Nitrogen Oxides (NOx) at 37.2 tons per year (tpy); Carbon Monoxide (CO) at 161.2 tpy; Volatile Organic Compounds (VOC) at 124.0 tpy; Sulfur Dioxide (SO2) at 0.1 tpy; Particulate Matter 10 microns or less (PM10) at 75.4 tpy; and Particulate Matter 2.5 microns or less (PM2.5) at 75.4 tpy; total Hazardous Air Pollutants (HAPs) at 1.4 tpy; and greenhouse gas (CO2e) >75,000 tpy. These emission estimates could change slightly during the course of the Department's review of the application.

The NMED has conducted a preliminary review of the information submitted with the permit application. The preliminary review and applicant's analysis of ambient air quality impacts indicates that the facility's air emissions will meet the air quality standards for NOx, CO, SO2, PM10, and PM2.5. VOCs are a pre-cursor to ozone and the NMED does not require an individual ozone ambient impact analysis for each application. To determine compliance with national ambient air quality standards for ozone, NMED uses air monitors to monitor ozone concentrations. A full review will evaluate the estimated emission rates for the pollutants listed in this public notice and determine compliance with ambient air quality requirements and standards.

Based on the applicant's analysis, a preliminary determination is that this facility will comply with the requirements of Title 20, New Mexico Administrative Code (NMAC), Chapter 2, Parts 1, 7, 23, 70, 72, 73, 75 and 80; and the New Mexico Air Quality Control Act. Therefore, the preliminary intent of NMED is to issue the air quality permit on or before August 25, 2026.

To ensure compliance with state and federal air regulations, the permit is expected to include conditions that limit the emissions, hours of operation, production rate, and conditions that will require record keeping and reporting to the Department.

The permit application is available for review on the AQB Public Notices of Permitting Actions website www.env.nm.gov/public-notices.

All interested persons have thirty (30) days from the date this notice is published, to notify the Department in writing of their interest in the permit application. The written comments should refer to the company name, facility name and Permit No. (or send a copy of this notice along with your comments). The written comments shall state the nature of the issues raised and how it relates to the requirements of applicable state and federal air quality regulations and the Clean Air Act. The written comments should be mailed to New Mexico Environment Dept., Air Quality Bureau, Permit Section, 525 Camino de los Marquez Suite 1, Santa Fe, NM 87505-1816 or submitted electronically via the NMED public comment portal online at: https://nmed.commentinput.com/comment/search.

The Department will notify all persons who have provided written comments as to when and where the Department's analysis may be reviewed. Although all written comments will be made part of the public record, any person who does not express interest in writing before the end of this first thirty (30) day period will not receive such notification.

If the Department receives written public comment before the end of the Department's thirty (30) day public notice, the Department's analysis will be made available for review for thirty (30) days at the NMED district or field office nearest to the source before the permit will be issued. Written comments on the analysis or permit application may be submitted to the Department during this second thirty (30) day period or at any time before the permit is issued or denied.

General information about air quality and the permitting process can be found at the Air Quality Bureau's web site. The regulation dealing with public participation in the permit review process is 20.2.72.206 NMAC. This regulation can be found in the "Permits" section of this web site.

Atencion
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo Mexico, acerca de las emisiones producidas por un establecimiento en esta area. Si usted desea informacion en espanol, por favor comuniquese con esa oficina al telefono (505) 629-7748.

Notice of Non-Discrimination
NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. You may also visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

Aviso Legal
y
Determinación Preliminar de un Permiso de Calidad del Aire
para
Yucca Growth Infrastructure, LLC

Yucca Growth Infrastructure, LLC en 600 Congress Ave, Suite 15041, Austin, TX ha presentado una solicitud de permiso de calidad del aire a la Oficina de Calidad del Aire (AQB), Departamento de Ambiente de Nuevo México (NMED) para un permiso de calidad del aire para construir la "YGI Microgrid". Se ha asignado al expediente de solicitud el Permiso No. 10883 y el Número de Interés de Agencia TEMPO 41351. La ubicación exacta de la instalación será en la latitud y longitud grados decimales: 31.8183, -106.6792 Datum: WGS 84. Para ayudar a localizar esta instalación, la ubicación aproximada es 3.6 millas al Sur de Santa Teresa en el Condado de Doña Ana, NM.

Esta solicitud es para una instalación de generación de energía de microred. Esta solicitud es una solicitud inicial de NSR que se presenta bajo 20.2.72.200.A(1) NMAC. La construcción propuesta consistirá en una instalación de generación de energía de microred que consta de un Sistema de Servidor BloomEnergy como fuentes de emisiones. Este sistema es un tipo de sistema de celdas de combustible de óxido sólido (SOFC) que convierte el gas natural en electricidad. El sitio será una fuente mayor para el Título V (20.2.70 NMAC).

Las emisiones totales de contaminantes del aire a la atmósfera se estiman en aproximadamente: Óxidos de nitrógeno (NOx) en 37.2 toneladas por año(tpy); Monóxido de Carbono (CO) en 161.2 toneladas por año; Compuestos Orgánicos Volátiles (VOC) en 124.0 toneladas por año; Dióxido de Azufre (SO2) en 0.1 toneladas por año; Material particulado de 10 micras o menos (PM10) a 75.4 toneladas por año; y Material particulado de 2.5 micras o menos (PM2.5) a 75.4 toneladas por año; total de contaminantes peligrosos del aire (HAP) a 1.4 toneladas por año; y gases de efecto invernadero (CO2e) > 75,000 toneladas por año. Estas estimaciones de emisiones podrían cambiar ligeramente en el transcurso de la revisión de la solicitud por parte del Departamento.

El NMED ha llevado a cabo una revisión preliminar de la información presentada con la solicitud de permiso. La revisión preliminar y el análisis del solicitante sobre los impactos en la calidad del aire ambiente indican que las emisiones al aire de la instalación cumplirán las normas de calidad del aire para NO x , CO, SO 2 , PM 10 , y PM 2.5 . Los VOCs son precursores del ozono y el NMED no exige un análisis individual de impacto ambiental por ozono para cada solicitud. Para determinar el cumplimiento de las normas nacionales de calidad del aire ambiente en relación con el ozono, el NMED utiliza monitores de aire para monitorear las concentraciones de ozono. Una revisión completa evaluará los índices de emisión estimados para los contaminantes indicados en este aviso público y determinará el cumplimiento de los requisitos y normas de calidad del aire ambiente.

Basándose en el análisis del solicitante, una determinación preliminar es que esta instalación cumplirá con los requisitos del Título 20, Código Administrativo de Nuevo México (NMAC), Capítulo 2, Partes 1, 7, 23, 70, 72, 73, 75 y 80; y la Ley de Control de Calidad del Aire de Nuevo México. Por lo tanto, la intención preliminar del NMED es emitir el permiso de calidad del aire a más tardar el 25 de agosto de 2026.

Para garantizar el cumplimiento de los reglamentos estatales y federales sobre el aire, se espera que el permiso incluya condiciones que limiten las emisiones, las horas de operación, la tasa de producción, así como condiciones que exijan llevar registros y presentar informes al Departamento.

La solicitud de permiso está disponible para su revisión en el sitio web de Avisos Públicos de Acciones de Permiso de la AQB www.env.nm.gov/public-notices.

Todas las personas interesadas disponen de treinta (30) días a partir de la fecha de publicación de este aviso para notificar por escrito al Departamento su interés en la solicitud de permiso. Los comentarios escritos deberán hacer referencia al nombre de la empresa, el nombre de la instalación y el número de permiso (o enviar una copia de este aviso junto con sus comentarios). Los comentarios escritos deberán indicar la naturaleza de los temas planteados y cómo se relacionan con los requisitos de los reglamentos estatales y federales aplicables en materia de calidad del aire y la Ley de Aire Limpio. Los comentarios por escrito deben enviarse por correo al Departamento de Ambiente de Nuevo México, Oficina de Calidad del Aire, Sección de Permisos, 525 Camino de los Márquez Suite 1, Santa Fe, NM 87505-1816, o presentarse electrónicamente a través del portal de comentarios públicos del NMED en línea en: https://nmed.commentinput.com/comment/search.

El Departamento notificará a todas las personas que hayan presentado comentarios por escrito cuándo y dónde pueden revisarse los análisis del Departamento. Aunque todos los comentarios escritos formarán parte del registro público, cualquier persona que no exprese su interés por escrito antes del final de este primer periodo de treinta (30) días no recibirá dicha notificación.

Si el Departamento recibe comentarios públicos por escrito antes del final del plazo de notificación pública de treinta (30) días del Departamento, el análisis del Departamento estará disponible para su revisión durante treinta (30) días en la oficina de distrito o de campo del NMED más cercana a la fuente antes de que se emita el permiso. Se podrán presentar al Departamento comentarios por escrito sobre el análisis o la solicitud de permiso durante este segundo período de treinta (30) días o en cualquier momento antes de que se emita o deniegue el permiso.

Se puede encontrar información general sobre la calidad del aire y el proceso de permisos en el sitio web de la Oficina de Calidad del Aire. El reglamento que aborda la participación pública en el proceso de revisión de permisos es el 20.2.72.206 NMAC. Este reglamento se puede encontrar en la sección "Permisos" de este sitio web.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono (505) 629-7748.

Aviso de No Discriminación
El NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo requieren las leyes y reglamentos aplicables. El NMED es responsable de coordinar los esfuerzos de cumplimiento y de recibir consultas relacionadas con los requisitos de no discriminación implementados por 40 C.F.R. Parte 7, incluyendo el Título VI de la Ley de Derechos Civiles de 1964, en su versión enmendada; la Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975; el Título IX de las Enmiendas de Educación de 1972; y la Sección 13 de las Enmiendas de 1972 a la Ley Federal de Control de la Contaminación del Agua. Si tiene alguna pregunta sobre este aviso o sobre cualquiera de los programas, políticas o procedimientos de no discriminación del NMED, o si considera que ha sido objeto de discriminación en relación con un programa o actividad del NMED, puede comunicarse con: Coordinador de No Discriminación, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM, 87502, (505) 827-2855, nd.coordinator@env.nm.gov. También puede visitar nuestro sitio web en https://www.env.nm.gov/non-employee-discrimination-complaint-page/ para conocer cómo y dónde presentar una queja por discriminación.

Subject: Notification to government entity
Air Quality New Source Review Permit Application No. 10883
Agency Interest No. 41351 - PRN20260001

Dear Andrea Carrillo:

The New Mexico Environment Department, Air Quality Bureau has received an NSR Construction Permit application from Yucca Growth Infrastructure, LLC for its YGI Microgrid on April 27, 2026.

This plant is located approximately 3.6 miles S of Santa Teresa in Dona Ana County at latitude and longitude decimal degrees 31.8183, -106.6792. Since this plant is within 50 km (31 miles) of your border, we are required to notify your organization per 20.2.72.206.A (7) NMAC.

In accordance with the New Mexico Administrative Code, Title 20, Chapter 2, Part 72 (20.2.72.206.A.7 NMAC), please find attached the Public Notice issued by the New Mexico Air Quality Bureau for the facility.

If you have any questions, please feel free to contact me at 505-629-2893.

Sincerely,

Julia Kuhn

NEW MEXICO
ENVIRONMENT DEPARTMENT

Legal Notice
and
Preliminary Determination for an Air Quality Permit for
Yucca Growth Infrastructure, LLC

Yucca Growth Infrastructure, LLC at 600 Congress Ave, Suite 15041, Austin, TX has submitted an air quality permit application to the Air Quality Bureau (AQB), New Mexico Environment Department (NMED) for an air quality permit to construct the "YGI Microgrid." The application file has been assigned Permit No. 10883 and TEMPO Agency Interest No. 41351. The exact location of the facility will be at latitude and longitude decimal degrees: 31.8183, -106.6792 Datum: WGS 84. To aid in locating this facility, the approximate location is 3.6 miles South of Santa Teresa in Doña Ana County, NM.

This application is for a microgrid power generation facility. This application is an initial NSR application being submitted under 20.2.72.200.A(1) NMAC. The proposed construction will consist of microgrid power generation facility consisting of a Bloom Energy Server System as emissions sources. This system is a type of solid oxide fuel cell system (SOFC) which converts natural gas into electricity. The site will be a major source for Title V (20.2.70 NMAC).

Total air pollutant emissions to the atmosphere are estimated to be approximately: Nitrogen Oxides (NOx) at 37.2 tons per year (tpy); Carbon Monoxide (CO) at 161.2 tpy; Volatile Organic Compounds (VOC) at 124.0 tpy; Sulfur Dioxide (SO_2) at 0.1 tpy; Particulate Matter 10 microns or less (PM10) at 75.4 tpy; and Particulate Matter 2.5 microns or less (PM2.5) at 75.4 tpy; total Hazardous Air Pollutants (HAPs) at 1.4 tpy; and greenhouse gas (CO_2e) >75,000 tpy. These emission estimates could change slightly during the course of the Department's review of the application.

The NMED has conducted a preliminary review of the information submitted with the permit application. The preliminary review and applicant's analysis of ambient air quality impacts indicates that the facility's air emissions will meet the air quality standards for NO_x, CO, SO_2, PM_{10}, and $PM_{2.5}$. VOCs are a pre-cursor to ozone and the NMED does not require an individual ozone ambient impact analysis for each application. To determine compliance with national ambient air quality standards for ozone, NMED uses air monitors to monitor ozone concentrations. A full review will evaluate the estimated emission rates for the pollutants listed in this public notice and determine compliance with ambient air quality requirements and standards.

Based on the applicant's analysis, a preliminary determination is that this facility will comply with the requirements of Title 20, New Mexico Administrative Code (NMAC), Chapter 2, Parts 1, 7, 23, 70, 72, 73, 75 and 80; and the New Mexico Air Quality Control Act. Therefore, the preliminary intent of NMED is to issue the air quality permit on or before August 25, 2026.

To ensure compliance with state and federal air regulations, the permit is expected to include conditions that limit the emissions, hours of operation, production rate, and conditions that will require record keeping and reporting to the Department.

The permit application is available for review on the AQB Public Notices of Permitting Actions website www.env.nm.gov/public-notices.

All interested persons have thirty (30) days from the date this notice is published, to notify the Department in writing of their interest in the permit application. The written comments should refer to the company name,

facility name and Permit No. (or send a copy of this notice along with your comments). The written comments shall state the nature of the issues raised and how it relates to the requirements of applicable state and federal air quality regulations and the Clean Air Act. The written comments should be mailed to New Mexico Environment Dept., Air Quality Bureau, Permit Section, 525 Camino de los Marquez Suite 1, Santa Fe, NM 87505-1816 or submitted electronically via the NMED public comment portal online at: https://nmed.commentinput.com/comment/search.

The Department will notify all persons who have provided written comments as to when and where the Department's analysis may be reviewed. Although all written comments will be made part of the public record, any person who does not express interest in writing before the end of this first thirty (30) day period will not receive such notification.

If the Department receives written public comment before the end of the Department's thirty (30) day public notice, the Department's analysis will be made available for review for thirty (30) days at the NMED district or field office nearest to the source before the permit will be issued. Written comments on the analysis or permit application may be submitted to the Department during this second thirty (30) day period or at any time before the permit is issued or denied.

General information about air quality and the permitting process can be found at the Air Quality Bureau's web site. The regulation dealing with public participation in the permit review process is 20.2.72.206 NMAC. This regulation can be found in the "Permits" section of this web site.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono (505) 629-7748.

Notice of Non-Discrimination
NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. You may also visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

Aviso Legal
y
Determinación Preliminar de un Permiso de Calidad del Aire para
Yucca Growth Infrastructure, LLC

Yucca Growth Infrastructure, LLC en 600 Congress Ave, Suite 15041, Austin, TX ha presentado una solicitud de permiso de calidad del aire a la Oficina de Calidad del Aire (AQB), Departamento de Ambiente de Nuevo México (NMED) para un permiso de calidad del aire para construir la "YGI Microgrid". Se ha asignado al expediente de solicitud el Permiso No. 10883 y el Número de Interés de Agencia TEMPO 41351. La ubicación exacta de la instalación será en la latitud y longitud grados decimales: 31.8183, -106.6792 Datum: WGS 84. Para ayudar a localizar esta instalación, la ubicación aproximada es 3.6 millas al Sur de Santa Teresa en el Condado de Doña Ana, NM.

Esta solicitud es para una instalación de generación de energía de microred. Esta solicitud es una solicitud inicial de NSR que se presenta bajo 20.2.72.200.A(1) NMAC. La construcción propuesta consistirá en una instalación de generación de energía de microred que consta de un Sistema de Servidor BloomEnergy como fuentes de emisiones. Este sistema es un tipo de sistema de celdas de combustible de óxido sólido (SOFC) que convierte el gas natural en electricidad. El sitio será una fuente mayor para el Título V (20.2.70 NMAC).

Las emisiones totales de contaminantes del aire a la atmósfera se estiman en aproximadamente: Óxidos de nitrógeno (NOx) en 37.2 toneladas por año(tpy); Monóxido de Carbono (CO) en 161.2 toneladas por año; Compuestos Orgánicos Volátiles (VOC) en 124.0 toneladas por año; Dióxido de Azufre (SO2) en 0.1 toneladas por año; Material particulado de 10 micras o menos (PM10) a 75.4 toneladas por año; y Material particulado de 2.5 micras o menos (PM2.5) a 75.4 toneladas por año; total de contaminantes peligrosos del aire (HAP) a 1.4 toneladas por año; y gases de efecto invernadero (CO2e) > 75,000 toneladas por año. Estas estimaciones de emisiones podrían cambiar ligeramente en el transcurso de la revisión de la solicitud por parte del Departamento.

El NMED ha llevado a cabo una revisión preliminar de la información presentada con la solicitud de permiso. La revisión preliminar y el análisis del solicitante sobre los impactos en la calidad del aire ambiente indican que las emisiones al aire de la instalación cumplirán las normas de calidad del aire para NO_x, CO, SO_2, PM_{10}, y $PM_{2.5}$. Los VOCs son precursores del ozono y el NMED no exige un análisis individual de impacto ambiental por ozono para cada solicitud. Para determinar el cumplimiento de las normas nacionales de calidad del aire ambiente en relación con el ozono, el NMED utiliza monitores de aire para monitorear las concentraciones de ozono. Una revisión completa evaluará los índices de emisión estimados para los contaminantes indicados en este aviso público y determinará el cumplimiento de los requisitos y normas de calidad del aire ambiente.

Basándose en el análisis del solicitante, una determinación preliminar es que esta instalación cumplirá con los requisitos del Título 20, Código Administrativo de Nuevo México (NMAC), Capítulo 2, Partes 1, 7, 23, 70, 72, 73, 75 y 80; y la Ley de Control de Calidad del Aire de Nuevo México. Por lo tanto, la intención preliminar del NMED es emitir el permiso de calidad del aire a más tardar el 25 de agosto de 2026.

Para garantizar el cumplimiento de los reglamentos estatales y federales sobre el aire, se espera que el permiso incluya condiciones que limiten las emisiones, las horas de operación, la tasa de producción, así como condiciones que exijan llevar registros y presentar informes al Departamento.

La solicitud de permiso está disponible para su revisión en el sitio web de Avisos Públicos de Acciones de Permiso de la AQB www.env.nm.gov/public-notices.

Todas las personas interesadas disponen de treinta (30) días a partir de la fecha de publicación de este aviso para notificar por escrito al Departamento su interés en la solicitud de permiso. Los comentarios escritos deberán

hacer referencia al nombre de la empresa, el nombre de la instalación y el número de permiso (o enviar una copia de este aviso junto con sus comentarios). Los comentarios escritos deberán indicar la naturaleza de los temas planteados y cómo se relacionan con los requisitos de los reglamentos estatales y federales aplicables en materia de calidad del aire y la Ley de Aire Limpio. Los comentarios por escrito deben enviarse por correo al Departamento de Ambiente de Nuevo México, Oficina de Calidad del Aire, Sección de Permisos, 525 Camino de los Márquez Suite 1, Santa Fe, NM 87505-1816, o presentarse electrónicamente a través del portal de comentarios públicos del NMED en línea en: https://nmed.commentinput.com/comment/search.

El Departamento notificará a todas las personas que hayan presentado comentarios por escrito cuándo y dónde pueden revisarse los análisis del Departamento. Aunque todos los comentarios escritos formarán parte del registro público, cualquier persona que no exprese su interés por escrito antes del final de este primer periodo de treinta (30) días no recibirá dicha notificación.

Si el Departamento recibe comentarios públicos por escrito antes del final del plazo de notificación pública de treinta (30) días del Departamento, el análisis del Departamento estará disponible para su revisión durante treinta (30) días en la oficina de distrito o de campo del NMED más cercana a la fuente antes de que se emita el permiso. Se podrán presentar al Departamento comentarios por escrito sobre el análisis o la solicitud de permiso durante este segundo período de treinta (30) días o en cualquier momento antes de que se emita o deniegue el permiso.

Se puede encontrar información general sobre la calidad del aire y el proceso de permisos en el sitio web de la Oficina de Calidad del Aire. El reglamento que aborda la participación pública en el proceso de revisión de permisos es el 20.2.72.206 NMAC. Este reglamento se puede encontrar en la sección “Permisos” de este sitio web.

Atención
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono (505) 629-7748.

Aviso de No Discriminación
El NMED no discrimina por motivos de raza, color, origen nacional, discapacidad, edad o sexo en la administración de sus programas o actividades, según lo requieren las leyes y reglamentos aplicables. El NMED es responsable de coordinar los esfuerzos de cumplimiento y de recibir consultas relacionadas con los requisitos de no discriminación implementados por 40 C.F.R. Parte 7, incluyendo el Título VI de la Ley de Derechos Civiles de 1964, en su versión enmendada; la Sección 504 de la Ley de Rehabilitación de 1973; la Ley de Discriminación por Edad de 1975; el Título IX de las Enmiendas de Educación de 1972; y la Sección 13 de las Enmiendas de 1972 a la Ley Federal de Control de la Contaminación del Agua. Si tiene alguna pregunta sobre este aviso o sobre cualquiera de los programas, políticas o procedimientos de no discriminación del NMED, o si considera que ha sido objeto de discriminación en relación con un programa o actividad del NMED, puede comunicarse con: Coordinador de No Discriminación, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM, 87502, (505) 827-2855, nd.coordinator@env.nm.gov. También puede visitar nuestro sitio web en https://www.env.nm.gov/non-employee-discrimination-complaint-page/ para conocer cómo y dónde presentar una queja por discriminación.

PUBLIC INVOLVEMENT PLAN (PIP)

Air Quality Bureau Air Permit Application

Version 08.14.25

Date: June 5, 2026
Applicant: Yucca Growth Infrastructure, LLC
Facility Name: YGI Microgrid
Air Quality Permit Application Number: 10883
Location: The facility is 3.6 miles south of Santa Teresa, in Doña Ana County, New Mexico
Latitude: 31.8183 Longitude: -106.6792

1. **Overview of Air Quality Bureau's plan of action for addressing the community's needs and concerns for processing Air Quality Permit Applications:**
   The New Mexico Environment Department (Department), Air Quality Bureau (AQB) developed this Public Involvement Plan (PIP) for the processing of air quality permit applications in accordance with the requirements at 20.2.72 NMAC for this facility. This air quality regulation does require public participation outreach throughout different stages of the permitting process. The AQB will meet the public participation requirements by following this PIP, which includes all applicable policy, regulatory, and statutory public participation requirements.

   In developing this PIP, the Department assessed community participation needs for this permitting action to ensure appropriate promotion of public outreach by identifying whether there is a combination of environmental and demographic factors (i.e., low-income community, minority community, Limited English Proficiency individuals, Linguistically Isolated Households, etc.) that may impact public participation. This assessment identifies community outreach needs and provides for public access opportunities above and beyond statutorily mandated requirements and underscores the provision of adequate public access to information about this permit application.

   As much as possible, the Department will hold public participation and informational activities related to this permit application within the regulatory timelines outlined below.

   a. AQB regulations at 20.2.72 NMAC require that the application must be ruled complete or incomplete no more than 30 days after receipt, and that the Department must publish a public notice for this application in a newspaper of general circulation where the facility is located. See Section 4.c below for more information.

   b. The public notice contains a paragraph in Spanish directing Spanish-speaking interested parties to call AQB at (505) 629-7748 to speak to Spanish-speaking staff for additional information regarding this permitting action.

   c. The AQB will provide a copy of the Completion Letter with Legal Notice on the Bureau website Public Notice page (https://www.env.nm.gov/public-notices/). Attachment B of the Completion Letter contains links and instructions to view the application and PIP on the Bureau website Public Notice page (https://www.env.nm.gov/public-notices/). The AQB will also provide a hard copy of the application and public notice in English/Spanish for public review at the following:

Docusign Envelope ID: E39ED836-CF41-8875-8101-F2D943FC0C15

NMED Field Office- Las Cruces
2301 Entrada Del Sol
Las Cruces, NM 88001
Phone (575)-288-2050
Fax (575)-526-6162

Sunland Park City Clerk's Office
1000 McNutt Rd, Suite A
Sunland Park, NM 88063

d. AQB regulations require that the Department send the public notice to interested parties maintained on a mailing list. See Section 4.b below for more information.

e. AQB regulations require that the Department send the public notice to "appropriate agencies" as defined at 20.2.72 NMAC. See Section 4.e below for more information.

f. In accordance with the evaluation of the site location and associated demographics, the Department has provided additional means for disseminating information, including translation of multiple documents to Spanish, including but not limited to the permit application and public notice, and posting of the public notice in English and Spanish in a state-circulating newspaper, a local newspaper, and at various physical locations. The Department will continue to evaluate information during the review process to consider other means for disseminating information to the public.

g. Public notice shall be followed by a 30-day public comment period that starts on the day that the notice is published in the newspaper. See Section 4.g below for details.

h. AQB regulations require that the permit must be issued, issued subject to conditions, or denied within ninety (90) days after the Department deems the application administratively complete. 20.2.72.207 NMAC does provide for extension of this timeline in certain circumstances.

2. Contact list of AQB staff with phone numbers and email addresses:

a. AQB contact for questions about this application or PIP (included in public notices and outreach materials):

Julia Kuhn
New Mexico Environment Department
Air Quality Bureau
525 Camino de los Marquez, Suite 1
Santa Fe, New Mexico 87505
505-629-2893
Julia.Kuhn@env.nm.gov

Electronic copies will be available at the following link, which will be included in public notices and outreach materials as appropriate: https://www.env.nm.gov/public-notices/. On that webpage, click on Doña Ana County and select Yucca Growth Infrastructure, LLC – YGI Microgrid.

b. Non-English language speaker assistance and accommodations

If the Department receives public comments in response to the public notice, the AQB may hold public meetings, open houses, stakeholder meetings, and/or a formal hearing depending on the

Docusign Envelope ID: E39ED836-CF41-8875-8101-F2D943FC0C15

interest in the application. Language assistance services may be arranged for translation of documents for meetings, for interpreters during meetings, and for obtaining services for persons with disabilities. A phone-based interpretation service may be available for languages other than English. The public notice provides contact information to request additional information in English and Spanish.

3. Description of the community/stakeholder groups:

To provide for adequate public participation opportunities and meaningful involvement of persons regarding this permit application, and to address potential or existing environmental justice areas, the Department must first identify affected communities, consider information about proposed environmental actions affecting the community, and invite the public to share their comments and concerns. The EJSCREEN tool developed by the U.S. Environmental Protection Agency (EPA) helps identify communities that are low income and minority populations that may benefit from a variety of approaches for notification and outreach communication.

Using a 10-mile radius from the facility, the results of the EJScreen V2.3 ACS Summary Report[1] (attached) are listed in the two tables below. [Archive EJ Screen | Population Demographics and Characteristics in NM]

Population and Income Data				
Total Population[2]:	150,047		Per capita income of community (2019-2023)[4]:	$36,669
People of Color Population, %[2]:	83		U.S. Per Capita Income[4]:	$43,289
Total number of households[3]:	54,858		Total Percent[3] of Limited English-Speaking Households:	20%

[1]The EJScreen tool was removed from the EPA website in February 2025. The data in this report is from an archived version hosted by Public Environmental Data Partners. Some data points are missing.

[2]Found in the EJScreen Community Report from EJScreen Version 2.3 (archived version)

[3] U.S. Census Bureau's American Community Survey (ACS) 2019-2023 5-year estimates for Limited English-Speaking Households

[4]U.S. Census Bureau's American Community Survey (ACS) 2019-2023 5-year estimates for Per Capita Income

Population by Race or Ethnicity, %			**Language in Limited English-Speaking Households as Indicated in Table Above - 20%**	
White	17		Speak Spanish	97
Black	1		Speak Other Indo-European Languages	1
American Indian	0		Speak Asian Pacific Island Languages	1
Asian	2		Speak Other Languages	0
Pacific Islander	0			
Some Other Race	0			
Two or More Races	1			
Hispanic (any race)	78			

In addition, the Department has identified the following community or stakeholder groups: New Mexico Environmental Law Center.

History of public involvement in air permitting: none, the YGI Microgrid is a new facility.

Docusign Envelope ID: E39ED836-CF41-8875-8101-F2D943FC0C15

Current public involvement in air permitting: high profile facility, high public interest. NMED - AQB will evaluate all comments concerning the YGI Microgrid application once the 30-day public notice comment period closes.

It is important for the AQB to incorporate the linguistic and communication needs of this community when conducting public outreach and participation activities. To help accomplish this, the AQB will provide information in Spanish and in English, in public comment notices, public meeting notices (if applicable), and other announcements (radio broadcasts, brochures, signs, postcards, etc., if applicable) and strive to make public participation efforts as inclusive as possible within AQB budget and time limitations. The Las Cruces NMED Field Office will serve as an access area for the AQB to leave hard copies of important documents and information about how to comment on this permit application. The Department will also make available for review hard copies of important documents at the Sunland Park City Clerk's Office.

4. Detailed actions and outreach activities the AQB Permitting Section will take to reach the affected public:

a. Overview

Based on the demographics report discussed in the PIP, the history of public involvement at the facility, and the facility background, basic information about public involvement opportunities will be made available in both English and Spanish. This information will include how to request materials in Spanish or to speak with AQB staff through an interpreter. Further details about public participation for this activity are outlined below.

The AQB maintains information regarding this air quality permit application at the following locations:

i. **On the Air Quality Bureau website, see Section 2.a above.**
ii. **At the District Field Office, see Section 1.c above.**
iii. **At the main office location:**
New Mexico Environment Department
Air Quality Bureau
525 Camino de los Marquez, Suite 1
Santa Fe, New Mexico 87505

b. Postal mailing or e-mailing of notices to persons on the facility-specific mailing list

AQB regulations require notification to persons who have expressed interest in applications. The AQB maintains a mailing list that includes individuals interested in permit applications from particular facilities or geographic areas. Notifications may be sent through physical mail and/or an email.

c. Notices in the state-circulating newspaper and local newspaper

The public notice for this permit application will be published in English and Spanish in the Legal Section of the Albuquerque Journal and Las Cruces Sun News.

Albuquerque Journal: http://www.abqjournal.com/

Las Cruces Sun News: http://www.lcsun-news.com/

Docusign Envelope ID: E39ED836-CF41-8875-8101-F2D943FC0C15

d. Mailing to Indian Tribes, Pueblos, or Nations

20.2.72 NMAC does not require AQB to provide public notice to Tribes, Pueblos, or Nations for air quality construction permitting actions under 20.2.72 NMAC. However, consistent with NMED's commitment to meaningful communication and engagement with Tribes, Pueblos, and Nations, and in accordance with the Department's Public Involvement Plan policy, the Department is providing public notice of this air quality construction permitting action to promote awareness and information-sharing regarding activities that may be of interest to the following communities:

Pueblo of Tortugas

President: Bill Acosta

e. Affected Local, State, or Federal Government agencies

Docusign Envelope ID: E39ED836-CF41-8875-8101-F2D943FC0C15

AQB regulations for air quality construction permitting actions under 20.2.72 NMAC require notification about this permit application to specific parties, including certain local, state, or federal government agencies. Accordingly, the following entities were notified:

US EPA Region VI
Elizabeth (Mary) Layton
r6airpermits@epa.gov & layton.mary@epa.gov

State of Texas
AIRPERM@tceq.texas.gov

The following entities within a 10-mile radius were also notified:

City of El Paso
Dionne Mack - El Paso City Manager
300 N Campbell St., El Paso, TX 79901

Village of Vinton
Andrea Carrillo - Village Administrator
acarrillo@vintontx.us
436 E. Vinton Rd., Vinton, TX 79821

Colonia of Sunland Park
Mario Juarez-Infante - Sunland Park City Manager
1000 McNutt Rd. Suite A, Sunland Park, NM 88063

f. Public meeting notices, public comment notices, and other notices

AQB may hold public meetings, open houses, stakeholder meetings, and/or a formal hearing depending on the interest in the application. Based on the results of the initial screening, there is no public meeting planned at this time for this permit application.

If the Department determines that expressed public interest warrants a public meeting, notice will be provided to the community as follows:

1) Via a newspaper of general circulation in the area closest to the location of the facility.
2) Locations commonly frequented by the general public, such as a nearby post office, public library, or city hall.
3) All persons and organizations that have expressed interest in the YGI Microgrid application and are on a list maintained by AQB.
4) The notices will be translated into Spanish.
5) The notices will include information for requesting accommodations for those with disabilities as listed in Section 2.b above.

AQB would locate an appropriate venue based on the availability to the community to access the meeting, and the specific needs of the affected community (e.g., size of community, community locations, impacts, etc.).

AQB may reschedule the meeting due to inclement weather. If rescheduled, AQB would provide as much advance notice as possible and reschedule for an appropriate time and date.

Meetings would be scheduled to make them as accessible and user-friendly as practical, considering work schedules, dinner hours, and other community commitments. To the extent possible, the

Docusign Envelope ID: E39ED836-CF41-8875-8101-F2D943FC0C15

meeting will be held at a location that is local and convenient, and meet Americans with Disabilities Act (ADA) standards. In addition, whenever practical and appropriate, interpreters for limited-English speaking communities and assistance for hearing-impaired individuals may be available. Information in public notices for a public meeting will adhere to AQB regulations, statutes, and policies.

g. Public comment periods

AQB regulations require that all interested persons have thirty (30) days from the date the public notice is published to express an interest in writing in the permit application. If AQB receives written public comment before the end of the thirty (30) day public comment period, the analysis of the application will be made available for review for thirty (30) days on the Air Quality Bureau Website and at the NMED District office (address listed in Section 1.b above). The public notice and the analysis of the application review periods are not concurrent.

The PIP has been reviewed and approved by the AQB Bureau Chief.

Limited English Proficiency (LEP) Services Evaluation

Air Quality Bureau Air Permit Application

Version P08.14.25

Date: June 5, 2026
Applicant: Yucca Growth Infrastructure, LLC
Facility Name: YGI Microgrid
Air Quality Permit Application Number: 10883
Location: The facility is 3.6 miles south of Santa Teresa, in Doña Ana County, New Mexico
Latitude: 31.8183 Longitude: -106.6792

Factor 1 – Number and Proportion of LEP Individuals in the Community:

A. Proportion of Limited English-Speaking Households[1]: 20%
B. Historical participation: The Bureau does not have records indicating any participation by LEP individuals or any member of the public regarding the YGI Microgrid facility.

[1]U.S. Census Bureau's American Community Survey (ACS) 2019-2023 5-year estimates for Limited English-Speaking Households

Factor 2 – Frequency with Which LEP Individuals Come in Contact with the Program (Frequent, Occasional, Not Frequent):
There is no record of frequent or any contact with LEP individuals regarding the YGI Microgrid facility.

Factor 3 – Nature and Importance of the Activity (Moderately Important, Important, Very Important):
Important. Permits cannot be issued in accordance with 20.2.72 NMAC unless they demonstrate compliance with all state and federal regulations, including health-based New Mexico and National Ambient Air Quality Standards. This requirement protects the health of the residents in the vicinity of this facility.

State regulations require that the Bureau take final action on this permit application no later than 90 days after the application has been ruled complete. 20.2.72.207 NMAC does provide for extension of this timeline in certain circumstances.

The Oil and Gas industry constitutes a significant source of revenue for the State. Permitting facilities that are demonstrated to be in compliance with state and federal regulations encourages responsible economic development for New Mexico.

Factor 4 – Resources Available to NMED and Associated Costs:

A. Costs associated with translation: $300
Costs associated with providing a translator: $1000-3000 depending on the length of the proceeding
Costs associated with hosting a public hearing: $1500-3000
Costs for a court reporter: $2000
B. The Department has contracts in place to include a Spanish translator; and the Department has call-in interpretation services available.

The Bureau has reviewed the above four factors. This Air Quality permitting action is for a construction NSR permit to authorize a power generation facility consisting of a Bloom Energy Server System as

Docusign Envelope ID: E39ED836-CF41-8875-8101-F2D943FC0C15

emissions sources and therefore, increasing criteria pollutants emission rates in the surrounding areas. The system is a type of solid oxide fuel cell system (SOFC) which converts natural gas into electricity without combustion. The criteria pollutants include NO_x, CO, VOC, SO_x $PM_{10/2.5}$, and Hazardous Air Pollutants (HAPs). Given the importance of this project, regardless of the limited involvement of LEP individuals or any member of the public regarding this facility in the past, the Bureau does plan to provide additional LEP services regarding this permitting action to include translation of multiple documents associated with this project in Spanish and additional posting of public notice in English and Spanish at the following locations: Sunland Park City Clerk's Office, Sunland Park Motor Vehicle Division, Sunland Park Public Health Office, Sunland Park Post Office, Sunland Park Library, Santa Teresa Post Office, Edgemont Park, Villa Valencia Park, San Gabriel Park, and Tuscan Ridge Park. Additional efforts will be made to post at Carlos Bakery, Sunland Park Grocery, Mercedes Grocery, and Carousel Convenience Store. Hard copies of the applications in English and Spanish are available for public inspection at the Las Cruces NMED Field Office and Sunland Park City Clerk's Office.

The LEP Services Evaluation has been reviewed and approved by the AQB Bureau Chief.

Julie,

To confirm, a modeling protocol was not submitted in advance, though the modeling follows the guidelines in all respects. We had a productive initial discussion with Sahil yesterday and look forward to continuing to work with your modelers during the review process.

Thanks!

Good morning, Jesse,

Have you submitted a modeling protocol?

Also, please reach out to Sahil (cc'd on this email). He may have some questions on the modeling files.

Thank you,

Julie

We sent the final application to the translators at the same time as y'all got it and asked them to expedite the job.

We should have an ETA from them tomorrow if I don't get it tonight.

Julie,

We'll get you the electronic files shortly, including the emission calculations and modeling files.

I'll check on the status of the Spanish translation and let you know shortly what the ETA is.

Subject: YGI Microgrid - requesting electronic files

Good afternoon, Jesse,

Can you please submit the electronic files for the YGI Microgrid application? Files should include pdf full application file, excel UA2 and calculations files, Word UA1, UA3, and UA4, modeling files, and other supporting documents.

NSR regulations 20.2.72.203.A(3) require that the computations are provided. See below:

(3) Provide all information, including all calculations and computations, to describe the specific chemical and physical nature and to estimate the maximum quantities of any regulated air contaminants the source will emit through routine operations after construction, modification or installation is completed, and estimate maximum potential emissions during malfunction, startup, shutdown. With respect to a toxic air pollutant as defined by Subsection H of 20.2.72.401 NMAC this requirement only applies when the toxic air pollutant is emitted in such a manner that a permit is required under the provisions of 20.2.72.400 NMAC - 20.2.72.499 NMAC;

Also, would you please let us know when you will send us the Spanish translated application?

Thank you!

Report Date: 6/16/2026

NMED/AQB Modeler: Sahil Kassanjee

Facility Identification:

Project: YGI Microgrid Company: Yucca Growth Infrastructure

Permit number: 10883 TEMPO ID: 41351

Location Information:

The facility is located 3.6 miles south of Santa Teresa, in Dona Ana County. The facility is located 6.0 miles west-northwest of Sunland Park. (Figure-1)

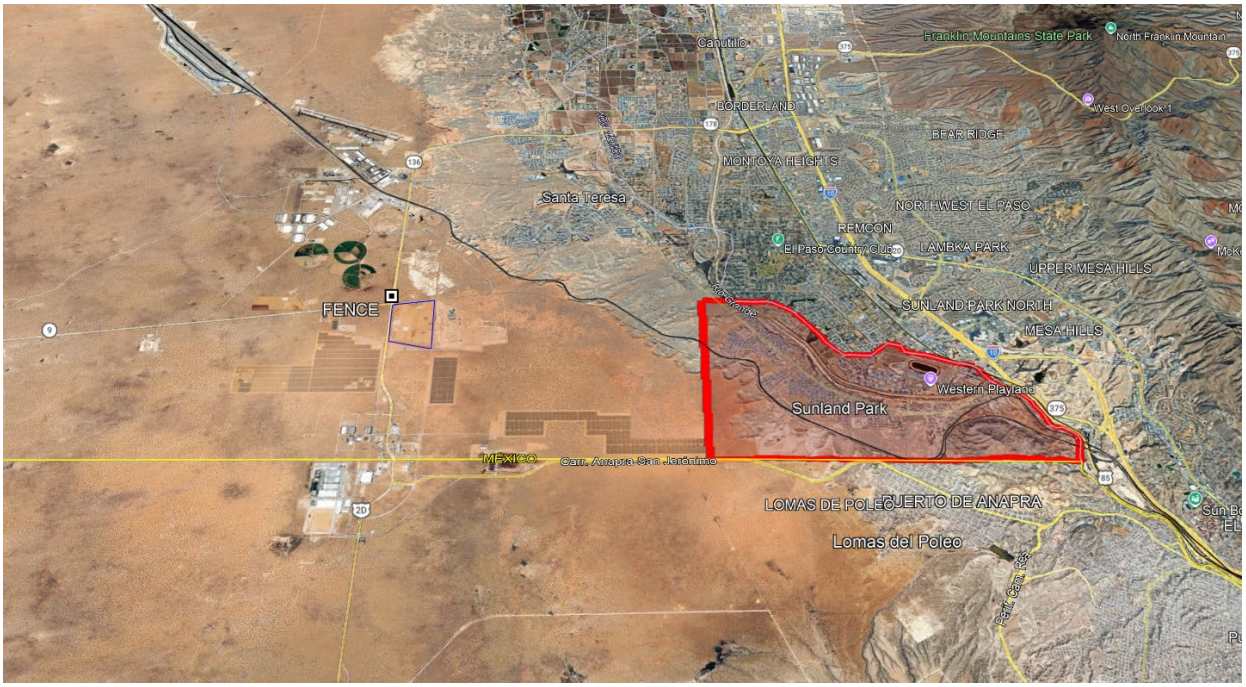

Figure 1. Location of the YGI Microgrid facility in Doña Ana County, New Mexico. The facility boundary is outlined in **purple**. The red shaded area represents the Sunland Park ozone nonattainment area, located approximately **6.0 miles east-southeast** of the facility.

UTM Coordinates: 341,072 m East, 3,521,528 m North, zone 13, Datum: NAD83

Elevation = 4124 feet

Air Quality Control Region (AQCR): 153

Airshed: Lrg

Administrative Record NSR_001422

Project Description:

Brief: Yucca Growth Infrastructure has applied to the New Mexico Air Quality Bureau for a New Source Review air quality permit for the construction of the YGI Microgrid facility (the facility). The facility is a power generation microgrid.

Yucca Growth Infrastructure, LLC (Yucca) is proposing to construct a microgrid power generation facility (YGI Microgrid) in Dona Ana County, NM. Bloom Energy Corp (Bloom) will be the operator of the YGI Microgrid. The YGI Microgrid site will consist of a Bloom Energy Server System. This application is an initial NSR application being submitted under 20.2.72.200.A(1) NMAC. The site will be a major source for Title V (20.2.70 NMAC).

The emission sources included in this project are Bloom Energy fuel cells. The emission units used in the modeling are described in the tables below.

For this permit, modeling was required for the following pollutants: Carbon Monoxide (CO), Nitrogen Dioxide (NO2), Particulate Matter 10 micrometers or less in aerodynamic diameter (PM10), Particulate Matter (2.5 microns or less) (PM2.5), and Sulfur Dioxide (SO2). Potential impacts from ozone, benzene, xylenes, and methanol were also evaluated.

The appendix provides the supporting location information used in the modeling analysis. Appendix A contains the facility fenceline coordinates, including the UTM eastings and northings for the northwest, northeast, southeast, and southwest corners of the controlled property boundary. Appendix B contains the fuel cell stack and housing location information for the 2,275 Bloom fuel cell stacks. The individual fuel cell stack coordinates are listed in Table B-1, and the fuel cell stacks and housing structures are shown visually in Figure B-1, where the fuel cell stacks are represented by red dots and the housing structures are represented by purple squares.

Table 1: Table of Total Facility Emissions

NO2 Rate (lbs/hr)	CO Rate (lbs/hr)	SO2 Rate (lbs/hr)	PM10 Rate (lbs/hr)	PM2.5 Rate (lbs/hr)
8.494	36.815	0.02	17.214	17.214

Table 2: Table of Point Sources

Stack Number	Description	Stack Height (ft)	Diameter (ft)	Velocity (ft/s)	Temperature (°F)	NO2 Rate (lbs/hr)	CO Rate (lbs/hr)	SO2 Rate (lbs/hr)	PM10 Rate (lbs/hr)	PM2.5 Rate (lbs/hr)
BL_1-BL_2275	Bloom Solid Oxide Fuel Cell System	30.0	8.2	16.4	350	0.004	0.016	0.000	0.008	0.008

Modeling Assumptions:

The facility operates continuously, 8,760 hours per year.

Permit Conditions:

The facility may operate 8,760 hours per year.

Administrative Record NSR_001423

Conclusion:

This modeling analysis demonstrates that operation of the facility described in this report neither causes nor contributes to any exceedances of applicable air quality standards. The standards relevant at this facility are NAAQS for CO, NO2, PM10, PM2.5, and SO2; NMAAQS for CO, NO2, and SO2; and Class II PSD increments for NO2 and PM10.

Action: The permit can be issued based on this modeling analysis.

The modeling report was submitted by Trinity Consultants and dated April 27, 2026.

The air quality analysis demonstrates compliance with applicable regulatory requirements.

Model(s) Used: AERMOD version 24142 was used to run the modeling analysis.

Note: Complete modeling input and output files can be made available and are located in the Modeling Archives in the folder, "10883_Yucca Growth Infrastructure_YGI Microgrid".

Description of model input files: NMED's AERMOD-ready meteorological data was used for this analysis. This data is available on AQB's website. GeoTIFF files were acquired through the USGS.

Modeling Parameters:

The AERMOD regulatory default parameters were included in assumptions made by the model.

Building downwash was modeled because the facility contains buildings that may cause significant building wake effects.

Table 3: Table of Buildings

Building Name	Height (m)	Diagonal Length (m)
SOFC Housing (Building 1 – Building 425)	7.6	32.4

Complex Terrain Data:

Elevations of receptors, facility sources, and surrounding sources were obtained from USGS GeoTIFF files using AERMAP.

Both simple and complex types of terrain were used to model the facility.

Receptor Grid: The following grids were used to determine the maximum concentration for each pollutant.

Table 4: Table of Receptors

Grid Type	Description	Shape	Spacing	Radius or Length
Cartesian	Rough	Square	2 kilometers	50 kilometers
Cartesian	Intermediate	Square	1 kilometers	20 kilometers
Cartesian	Intermediate	Square	500 meters	5 kilometers
Cartesian	Fine	Square	100 meters	500 meters
Cartesian	Fine	Square	50 meters	100 meters

Administrative Record NSR_001424

Cartesian	Very fine	Square	50 meters	Fenceline
Fence line	Very fine	Fence line	50 meters	Fence line

Receptors outside of the radii of impact were discarded for the surrounding source runs. Receptors that demonstrated compliance were then discarded, and further detailed analysis was performed on the remaining receptors.

Meteorological Data: AERMOD – Sunland Park (Desert View) 2018-2022.

Adjacent Sources:

The Division's Modeling Guidance was used to select 351 sources within 50 km of the facility.

The facility is 6.0 km from Stampede Meat, 6.0 km from Rinker Santa Teresa Pipe (GCP5-3602), 8.6 km from Camino Real Landfill, 12.5 km from Rio Grande Generating Station, 36.5 km from Afton Generating Station, and 36.8 km from Afton Compressor Station.

Modeling Procedures:

Hazardous air pollutant emissions from the SOFC unit include benzene, xylenes, and methanol. Total HAP emissions are estimated at 0.32 lb/hr and 1.42 tons/year. Methanol is the largest contributor, with emissions of 0.26 lb/hr and 1.15 tons/year, followed by benzene at 0.046 lb/hr and 0.20 tons/year, and xylenes at 0.015 lb/hr and 0.066 tons/year. Based on the values shown, total HAP emissions are below the federal major source thresholds of 10 tons/year for any individual HAP and 25 tons/year for combined HAPs.

The air dispersion modeling analysis evaluated facility impacts for carbon monoxide (CO), nitrogen dioxide (NO_2), particulate matter less than 10 microns (PM_{10}), particulate matter less than 2.5 microns ($PM_{2.5}$), and sulfur dioxide (SO_2). The pollutants and modeling demonstrations are summarized below.

Carbon Monoxide (CO)

Carbon monoxide emissions from the facility were modeled and compared to the applicable Significant Impact Levels (SILs) for the 1-hour and 8-hour averaging periods. The modeled impacts were evaluated to determine whether additional cumulative analysis was required.

Nitrogen Dioxide (NO_2)

Nitrogen dioxide impacts were modeled for the applicable averaging periods and compared to the applicable SILs. The NO_2 analysis was used to determine whether the facility's impacts were significant and whether further cumulative modeling was necessary.

Particulate Matter (PM_{10} and $PM_{2.5}$)

PM_{10} and $PM_{2.5}$ emissions from the facility were modeled and compared to the applicable Significant Impact Levels (SILs). A cumulative impact analysis (CIA) was evaluated where applicable to assess total particulate matter impacts from the facility, nearby sources, and representative background concentrations. Background concentrations were added to the modeled concentrations for comparison with the applicable ambient air quality standards. For $PM_{2.5}$, secondary formation from NOx and SO_2

Administrative Record NSR_001425

precursor emissions was also considered using the appropriate MERP-based screening approach for the facility location.

Sulfur Dioxide (SO_2)

Sulfur dioxide emissions from the facility were modeled and compared to the applicable SO_2 SILs. The results were used to determine whether the facility's SO_2 impacts were significant and whether additional cumulative modeling was required.

Overall, the modeling analysis was conducted to demonstrate whether the facility's emissions would cause or contribute to an exceedance of applicable ambient air quality standards or PSD increments.

PSD Increment Information:

The facility is a minor source (for PSD purposes) located in AQCR 153. The minor source baseline dates here are 8/2/1995 for NO2, not yet established for SO2, 6/16/2000 for PM10, and not yet established for PM2.5.

The facility is 156.5 km from the Class I area Guadalupe Mountains National Park. Class I area impacts are negligible for minor sources over 50 km from a Class I area. Modeling is not required.

CO Analysis:

The 1-hour CO concentration was below the significance level. No cumulative analysis is required.

The 8-hour CO concentration was below the significance level. No cumulative analysis is required.

NO2 Analysis:

ARM2 was used with default options (0.5 minimum ratio, 0.9 maximum ratio) to determine the conversion of NOX to NO2.

The 1-hour and annual NO2 concentrations were below the applicable significance levels. No cumulative analysis is required.

PM10 Analysis:

The maximum total 24-hour PM10 concentration was 78.081 µg/m3, which occurred 550 m west-southwest from the center of the facility. This was 52.1% of the NAAQS. A background concentration of 73.000 µg/m3 was added from the monitor 6ZM, at Sunland Park-Desert View Elementary School.

The maximum total 24-hour PM10 concentration was 5.652 µg/m3, which occurred 533 m west-southwest from the center of the facility. This was 18.8% of the PSD Class II increment.

The maximum total annual PM10 concentration was 1.015 µg/m3, which occurred 512 m west from the center of the facility. This was 6.0% of the PSD Class II increment.

PM2.5 Analysis:

The maximum total 24-hour PM2.5 concentration was 27.532 µg/m3, which occurred 507 m west from the center of the facility. This was 78.7% of the NAAQS. A background concentration of 24.300 µg/m3 was added from the monitor 6ZM, at Sunland Park-Desert View Elementary School.

Administrative Record NSR_001426

The maximum total annual PM2.5 concentration was 8.204 µg/m3, which occurred 512 m west from the 72center of the facility. This was 68.4% of the NAAQS. A background concentration of 7.300 µg/m3 was added from the monitor 6ZM, at Sunland Park-Desert View Elementary School.

SO2 Analysis:

The 1-hour SO2 concentration was below the significance level. No cumulative analysis is required.

O_3 Analysis

Although this facility will emit less than 250 tons per year of NOx and less than 250 tons per year of VOC, a project-specific MERPs screening calculation was also performed using the MERPs tool and the NM AQB Dispersion Modeling Guidelines. This additional calculation is provided below to further demonstrate that the project will not cause or contribute to an exceedance of the ozone NAAQS.

$$[O_3]_{8-hour} = \left(\frac{250 \frac{ton}{yr}}{340_{MERP_{NOX}}} + \frac{250 \frac{ton}{yr}}{4679_{MERP_{VOC}}} \right) \times 1.96 \ \mu g/m^3$$

The resulting 8-hour ozone concentration of 1.546 µg/m³ is below the ozone significance level of 1.96 µg/m³. Therefore, sources with ozone impacts below the ozone SIL are not expected to cause or contribute to ozone concentrations exceeding the ozone NAAQS.

Table 5: Table of Ambient Impact from Emissions

Pollutant	Period	Modeled Facility Concentration (µg/m3)	Modeled Concentration with Surrounding Sources (µg/m3)	Secondary Formation (µg/m3)	Background Concentration (µg/m3)	Cumulative Concentration (µg/m3)	Standard	Value of Standard (µg/m3)	Percent of Standard	UTM East (m)	UTM North (m)	Elevation (ft)

Appendix

Appendix A: Facility Fenceline coordinates

In air dispersion modeling, the fenceline represents the boundary of the facility property or controlled area. Receptors are typically placed along and outside the fenceline to evaluate where ambient air impacts may occur, while areas inside the fenceline are generally considered under facility control and are not treated as ambient air for public exposure purposes. The coordinates below represent the corners of the fenceline used for the modeling analysis.

Table A-1 Facility Fenceline Coordinates

Corner	Easting	Northing
Northwest (NW)	340560.3	3522076
Northeast (NE)	341510.2	3522199
Southeast (SE)	341537.7	3520739
Southwest (SW)	340570.8	3520974

Appendix B: Fuel Cell Stack Housing

A total of 2,275 fuel cell stacks will be located within housing structures. The locations of the fuel cell stacks and associated housing structures are listed in Tables B-1 and B-2 and shown in Figure B-1. In Figure B-1, the fuel cell stacks are represented by red dots, while the housing structures are represented by purple squares.

MEMORANDUM

Date: June 28, 2026

To: New Mexico Environmental Department (NMED) Air Quality Bureau (AQB)

From: Ralph Morris, Marco Rodriguez, Pradeepa Vennam and Jung Chien

Subject: Estimation of Ozone Impacts of a Proposed Microgrid Electricity Generating Facility in southern Doña Ana County

1 Introduction

In May 2026, the New Mexico Environment Department (NMED) Air Quality Bureau (AQB) received a permit application for the Yucca Growth Infrastructure, LLC Microgrid electricity generating facility (YGI Microgrid). The YGI Microgrid facility would be in southern Doña Ana County approximately 4 miles west of the New Mexico portion of the El Paso-Las Cruces ozone nonattainment area (NAA). Electricity would be generated at the proposed YGI Microgrid facility using natural gas fuel cells from 2,275 Clusters each consisting of multiple fuel cells. Multiple Clusters are combined in 425 Inverter Groups with common electrical appurtenances, and each Inverter Group has an emissions release point for emissions from the fuel cells in the Clusters. In total, the YGI Microgrid has a generation capacity of 2,462 MW of electricity. Given the proximity of the proposed YGI Microgrid facility to the ozone NAA, the NMED AQB requested that Ramboll conduct ozone modeling of the facility using the recently developed Comprehensive Air-quality Model with extensions (CAMx; Ramboll, 2024) 2022v2 12/4 km photochemical grid model (PGM) modeling platform (Ramboll, 2026a).

1.1 Overview of Approach

The NMED CAMx 2022v2 12/4 km modeling platform was used to simulate the ozone impacts due to emissions from the proposed YGI Microgrid facility. Emissions from the YGI Microgrid facility were processed and added to the CAMx 2022v2 12/4 km 2022 base case emissions scenario input file. The emissions from the YGI Microgrid facility were tagged for treatment by the CAMx ozone source apportionment tool. CAMx 2022v2 12/4 km was run for the May 1 through October 15 summer 2022 modeling period and the results were post-processed to obtain total Maximum Daily Average 8-hour (MDA8) ozone concentrations and the incremental contribution of the YGI Microgrid facility to the MDA8 ozone concentrations for each day of the modeling period. The total MDA8 ozone concentrations were compared with the 70 ppb 2015 ozone National Ambient Air Quality Standard (NAAQS) and the incremental MDA8 ozone concentrations due to emissions from the YGI Microgrid facility were compared to EPA's 1.0 ppb ozone Significant Impact Level (SIL).

Administrative Record NSR_001498

1.2 Summary of Results

The maximum MDA8 ozone impact due to the YGI Microgrid facility was 0.181 ppb and occurred near the facility outside of the NAA. The maximum MDA8 ozone impact due to emissions from the YGI Microgrid facility in the ozone NAA was 0.065 ppb. The maximum YGI Microgrid facility contribution to the fourth highest MDA8 ozone concentration, the relevant metric for the ozone Design Value that is compared against the NAAQS, was 0.049 ppb. These maximum YGI Microgrid facility MDA8 ozone concentrations are much less than EPA's 1.0 ozone SIL, therefore EPA SIL guidance would classify the YGI Microgrid facility ozone impacts as "de minimis" and they do not "cause or contribute" to a violation of the ozone NAAQS (EPA, 2018b).

1.3 Organization of Memorandum

Section 1 provides an overview of the approach for modeling the ozone impacts of the YGI Microgrid facility. The development of the NMED CAMx 2022v2 12/4 km modeling platform and ozone model evaluation are described in Section 2. Section 3 presents the YGI Microgrid facility emissions used in the modeling. Section 4 discusses the ozone impacts of the YGI Microgrid facility and their significance. References are provided in Section 5.

Administrative Record NSR_001499

2 Development of the NMED CAMx 2022v2 12/4 km PGM Modeling Platform

In 2025–2026, NMED contracted with Ramboll to conduct a Regional Ozone Source Apportionment Study. The study was conducted in two phases. Phase I was performed from April through June 2025 during Fiscal Year 2025 (FY2025) and included CAMx 2022v1 base case modeling with corresponding model performance evaluation (Ramboll, 2025b and 2025d), and 2026v1 ozone source apportionment modeling using EPA 2022v1 12 km PGM platform (Ramboll, 2025a and 2025b).

Under Phase II (FY2026) of the NMED study, Ramboll developed a Conceptual Model of ozone formation in New Mexico (Ramboll, 2026a) and a higher-resolution CAMx 2022v2 12/4 km modeling platform following EPA guidance (EPA, 2018a). The new CAMx 2022v2 12/4 km modeling platform was subjected to a comprehensive model performance evaluation using surface ozone, NO_X and VOC observations and satellite data (Ramboll, 2026b). Phase II also includes ozone source apportionment modeling for the 2022 and 2032 emission scenarios using the CAMx 2022v2 12/4 km modeling platform.

2.1 CAMx 2022v2 12/4 km Platform Development

A CAMx 2022v2 12/4 km modeling platform was developed for the summer 2022 (May to mid-October) modeling period (Ramboll, 2026b). The 12 km grid resolution domain covered the continental U.S. (CONUS; 12US2 domain) and the 4 km grid resolution domain included New Mexico and portions of adjacent states, including the Permian Basin in Texas (Figure 2-1). Meteorological inputs for the CAMx 2022v2 12/4 km platform were based on a 2022 simulation of the Weather Research and Forecasting (WRF) meteorological model (Ramboll, 2025c). Boundary conditions (BCs) for the lateral boundaries of the 12 km CONUS domain were based on output from a CAMx 2022v2 North American 36 km domain simulation, whose BCs were based on a 2022 simulation of the Hemispheric CMAQ global chemistry model. Emissions for the CAMx 2022v2 12/4 km platform were based on the National Emissions Collaborative (NEC) 2022v2 Emissions Modeling Platform (EMP) that is described in the 2022v2 EMP Emissions Technical Support Document (EPA, 2025b). EPA processed the 2022v2 emissions inventory to generate PGM model-ready emission inputs for the 12 km CONUS domain that were used directly in the NMED CAMx 2022v2 12/4 km modeling platform. Ramboll processed the 2022v2 emissions using the Sparse Matrix Operator Kernal Emissions (SMOKE) model to generate 2022 hourly gridded speciated CAMx emissions inputs for the 4 km New Mexico domain and the summer of 2022.

Administrative Record NSR_001500

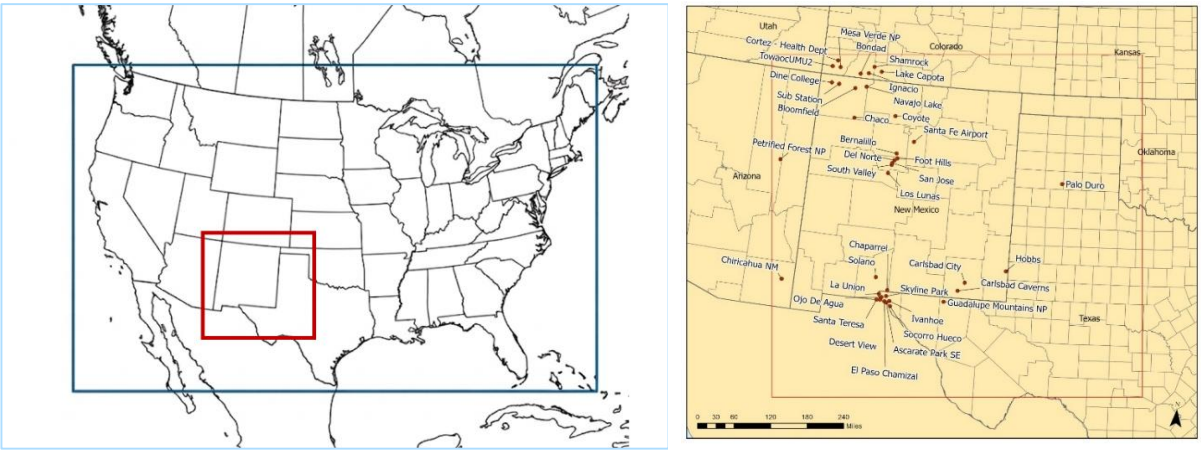

Figure 2-1. CAMx 2022v2 12/4 km modeling domains (left) and New Mexico 4 km modeling domain with locations of ozone monitoring sites (right).

2.2 CAMx 2022v2 12/4 km Model Evaluation

The CAMx 2022v2 12/4 km base case simulation was subjected to a comprehensive model performance evaluation across the New Mexico 4 km domain (Ramboll, 2026b). This section discusses the CAMx 2022v2 12/4 km base case ozone performance in southern Doña Ana County at monitoring sites closest to the YGI Microgrid facility and within the New Mexico portion of the El Paso-Las Cruces ozone NAA as shown in Figure 2-2. Additional details regarding the CAMx 2022v2 12/4 km base case model performance evaluation are provided in the model evaluation report (Ramboll, 2026b).

Administrative Record NSR_001501

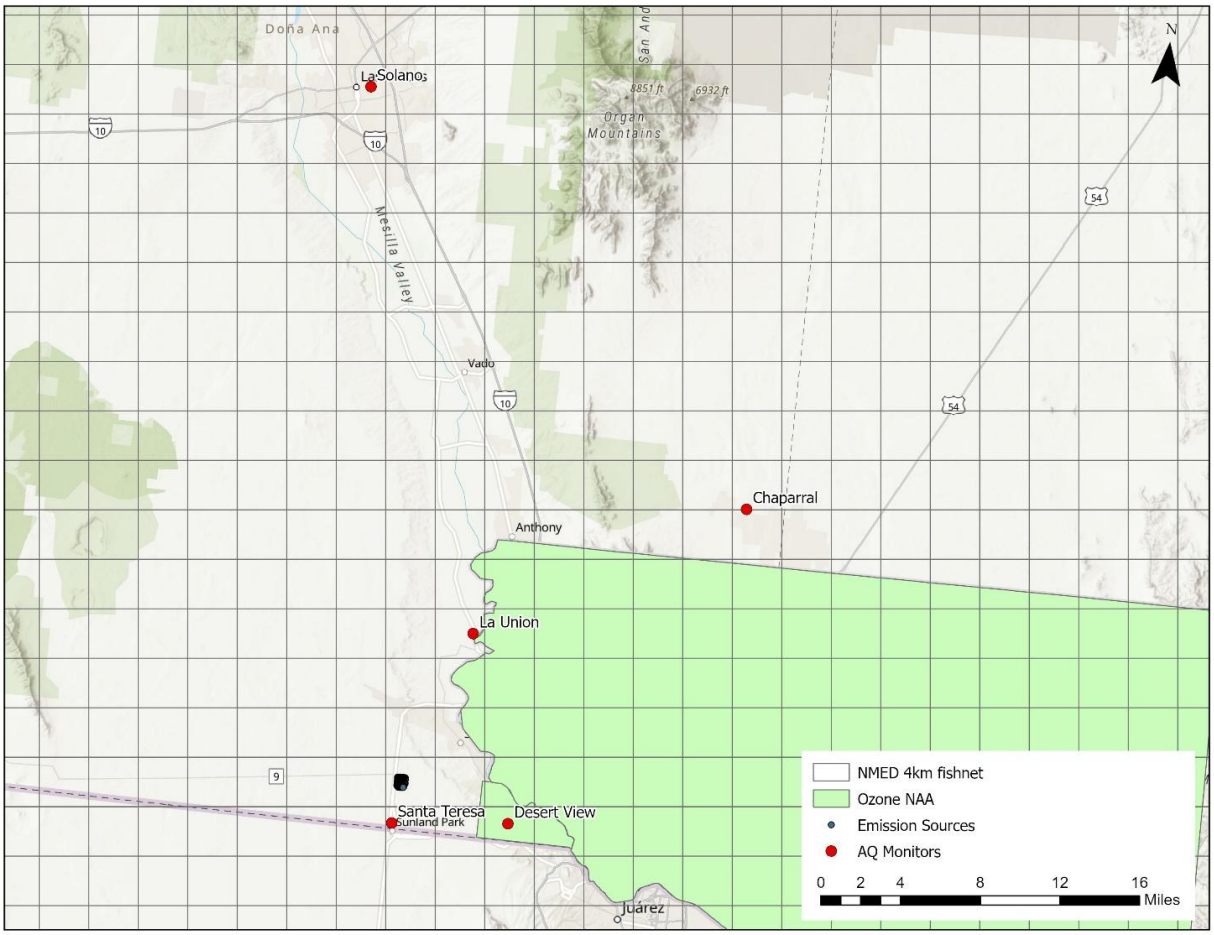

Figure 2-2. Five ozone monitoring sites in southern Doña Ana County within close proximity to the YGI Microgrid facility source locations (symbols north of Santa Teresa) and the El Paso Las Cruces ozone NAA (green) including the New Mexico portion of the NAA containing the Desert View monitoring site. The rectangular grid depicts the 4 km grid cells in the CAMx New Mexico 4 km modeling domain.

The CAMx 2022v2 ozone model performance evaluation included ozone model performance statistics and graphical displays of ozone performance, including time series and scatter plots of predicted and observed MDA8 and hourly ozone concentrations. The ozone model performance statistics included normalized mean bias and error (NMB and NME) and fractional bias and error (FB and FE), which are compared with commonly used bias and error Performance Goals and Criteria[1] to help put the ozone model performance into context (Emery et al., 2017):

	Bias	Error
Performance Goals	≤±5%	≤15%
Performance Criteria	≤±15%	≤25%

Table 2-1 displays the MDA8 ozone model performance statistics for MDA8 ozone for the CAMx 2022v2 12/4 km base case simulation at the five southern Doña Ana County monitoring sites that are color-coded green when they achieve the Performance Goal, yellow when they fall between the Performance Goal and Criteria, and red if they fail to achieve the Performance Criteria. Except for the Desert View FB bias statistic (-15.5%), which slightly fails to meet the bias Performance Criterion (≤±15%), all MDA8 ozone performance statistics achieve the Performance Criteria with over a third also achieving the Performance Goals. There is an ozone underestimation bias that is likely due in part to uncertainties associated with emissions from Mexico.

Table 2-1. Ozone model performance statistics at monitoring sites in southern Doña Ana County for the CAMx 2022v2 12/4 km base case simulation.

Local Name	SiteID	N	NMB	FB	NME	FE	COR
La Union	35-013-0008	192	-7.5	-7.6	12.4	12.7	0.655
Chaparrel	35-013-0020	196	-7.3	-7.3	12.3	12.5	0.652
Desert View	35-013-0021	196	-14.5	-15.5	16.3	17.5	0.652
Santa Teresa	35-013-0022	188	-10.8	-11.0	14.8	15.6	0.615
Solano	35-013-0023	194	3.8	4.0	11.4	11.3	0.649

Figure 2-3 displays scatter plots of predicted and observed MDA8 ozone concentrations at the four southernmost Doña Ana ozone monitoring sites, which are also the closest sites to the location of the proposed YGI Microgrid facility. The MDA8 ozone underestimation is readily apparent in the scatter plots with the 1:1 line of perfect agreement going through the scatter, but with more points under the line than over the line. If this underestimation bias is due to underrepresented ozone transport, as would occur if Mexico emissions are understated, it should not appreciably affect the incremental ozone impacts due to emissions from the YGI Microgrid facility.

[1] Performance Goals are what approximately a third of the photochemical modeling studies in the peer-reviewed literature could achieve and are viewed as the best performance a model could achieve, while Performance Criteria are what approximately two thirds of models could achieve and is viewed as typical acceptable model performance.

Scatter plots and performance statistics for MDA8 ozone concentrations and the CAMx 2022v2 12/4 base case simulation May 10 – October 15, 2022 period at the La Union (top left), Chaparral (top right), Desert View (bottom left) and Santa Teresa (bottom right) monitoring sites in southern Doña Ana County (Source: Ramboll, 2026b).

Administrative Record NSR_001504

3 YGI Microgrid Emissions

The NMED AQB provided Ramboll with a spreadsheet of emissions for the YGI Microgrid facility ("10883-YGI Microgrid-UA2 and Calcs.xlsx"). The spreadsheet included emissions for criteria pollutants, greenhouse gases (GHGs) and hazardous air pollutants (HAPs) from the proposed YGI Microgrid facility. Table 3-1 presents the total criteria pollutant emissions for the proposed YGI Microgrid facility reproduced from the provided spreadsheet. There were 8.49 pounds per hour (lb/hr; 37.20 tons per year [TPY]) of NO_X emissions and 28.31 lb/hr (124.01 TPY) of VOC emissions.

Table 3-1. Total criteria pollutant emissions from the proposed YGI Microgrid facility.

Controlled Emissions																	
Unit	Description	NO_x		CO		VOC		SO_2		PM_{10}		$PM_{2.5}$		Ammonia		Total HAPs	
		lb/hr	tpy	lb/hr	tpy	lb/hr	tpy	lb/hr	tpy	lb/hr	tpy	lb/hr	tpy	lb/hr	tpy	lb/hr	tpy
SOFC	Bloom Energy Server System[1]	8.49	37.20	36.81	161.21	28.31	124.01	0.017	0.076	17.21	75.40	17.21	75.40	-	-	0.32	1.42
Sum of Emissions		**8.49**	**37.20**	**36.81**	**161.21**	**28.31**	**124.01**	**0.017**	**0.076**	**17.21**	**75.40**	**17.21**	**75.40**	**-**	**-**	**0.32**	**1.42**

The proposed YGI Microgrid facility consists of 2,275 Clusters that consist of multiple fuel cells with multiple Clusters grouped into 425 Inverter Groups each with an emissions release point. The fuel cells were Bloom Energy Server 6.4 Solid Oxide Fuel System (SOFC) using natural gas. The YGI Microgrid facility 425 emission release points had identical stack parameters as shown in Table 3-2.

Table 3-2. Stack parameters for the proposed YGI Microgrid facility emission release points.

Stack Height (ft)	Stack Diameter (ft)	Exit Velocity (ft/s)	Temperature (F)
30	8.16	16.40	350

The locations of the YGI Microgrid facility emission release points were plotted on a map along with the CAMx 4 km grid cells (Figure 2-2) and we found that all emission release points were located within the same CAMx 4 km grid cell. Thus, the proposed YGI Microgrid facility emissions were represented by a single point source using the stack parameters in Table 3-2 emitting the total emissions from the proposed YGI Microgrid facility (Table 3-1).

The proposed YGI Microgrid facility NO_X (27.20 TPY), VOC (124.01 TPY), CO (161.21 TPY), SO_2 (0.076 TPY), and $PM_{2.5}$ (75.40 TPY) emissions were processed and added to the CAMx 2022v2 12/4 km 2022 4 km base case emissions. The proposed YGI Microgrid VOC and $PM_{2.5}$ emissions were speciated into the species used by CAMx chemical mechanism using the natural gas Source Classification Code (SCC) speciation profiles. Constant hourly emission rates were used 24 hours a day for the entire May through mid-October 2022 modeling period.

Administrative Record NSR_001505

4 Ozone Impacts of the Proposed YGI Microgrid Facility

The proposed YGI Microgrid facility emissions were tagged for treatment by the CAMx Anthropogenic Precursor Culpability Assessment (APCA) ozone source apportionment tool (see CAMx User's Guide for details on the ozone source apportionment tool; Ramboll, 2024). Three Source Groups were tracked in the CAMx ozone source apportionment simulation: (1) biogenic emissions; (2) proposed YGI Microgrid facility emissions; and (3) remaining emissions. CAMx v7.32 was run for the May 1 – October 15, 2022 modeling period using the NMED CAMx 2022v2 12/4 km modeling platform with the CAMx ozone source apportionment tool used to isolate the incremental ozone contribution of emissions from the proposed YGI Microgrid facility.

4.1 Ozone Modeling Results

The CAMx standard model results (i.e., total MDA8 ozone concentrations) and incremental ozone contribution of YGI Microgrid facility emissions to the daily MDA8 ozone from the ozone source apportionment results were processed for each day of the May 10 through October 15, 2022 period (May 1-9 was used as an initialization period). The highest MDA8 ozone impact due to emissions from the proposed YGI Microgrid facility anywhere in the domain was 0.181 ppb, which occurred on July 21, 2022. Figure 4-1 displays the spatial distribution of the MDA8 ozone impacts from the proposed YGI Microgrid facility on July 21 showing that the 0.181 ppb maximum MDA8 ozone impact occurred southwest of the YGI Microgrid facility location just west of Santa Teresa near the border with Mexico and approximately 5 miles west of the New Mexico portion of the El Paso-Las Cruces ozone NAA. Figure 4-2 displays the total MDA8 ozone and proposed YGI Microgrid ozone contribution on July 21, showing that when the YGI Microgrid has its maximum ozone contribution (0.181 ppb), the total MDA8 ozone is in the 55-60 ppb range, below the 70 ppb ozone NAAQS.

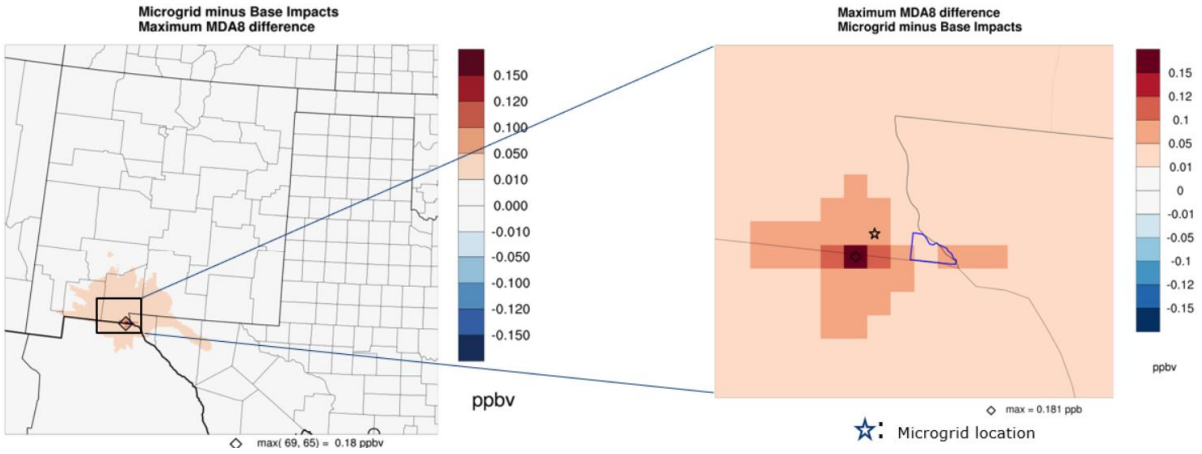

Figure 4-1. Maximum MDA8 ozone impact due to the proposed YGI Microgrid facility.

Administrative Record NSR_001506

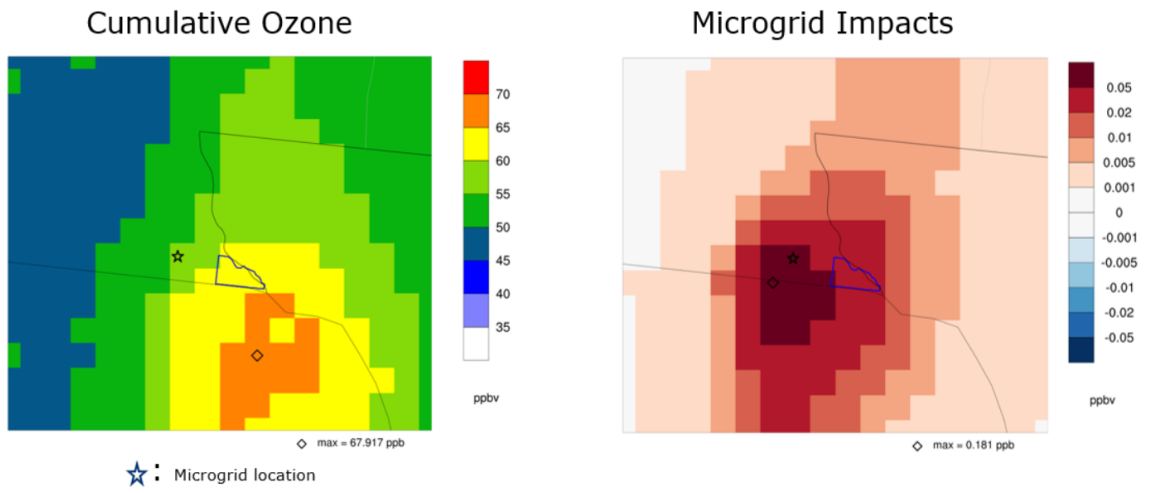

Figure 4-2. Total MDA8 ozone (left) and proposed YGI Microgrid facility incremental ozone contribution to the MDA8 ozone concentrations (right) on July 21, 2022, the day with the highest YGI Microgrid ozone impact.

Figure 4-3 displays the total MDA8 ozone and the contribution from the proposed YGI Microgrid facility on August 2, 2022, the day with the second highest MDA8 ozone impacts from the proposed YGI Microgrid facility. The second highest MDA8 ozone impact is 0.157 ppb and occurs to the southwest of the proposed YGI Microgrid facility location, west of the ozone NAA.

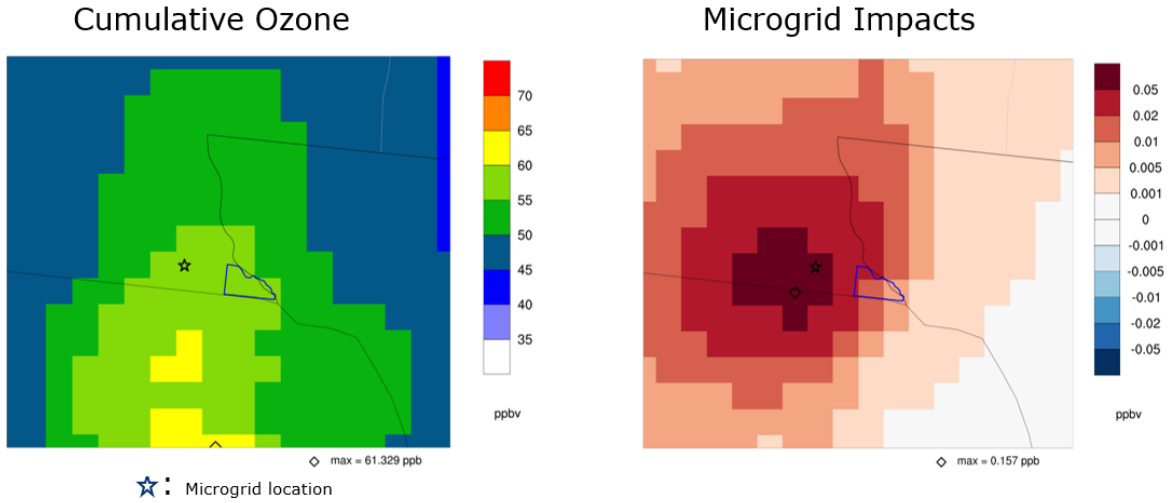

Figure 4-3. Total MDA8 ozone (left) and proposed YGI Microgrid facility incremental ozone contribution to the MDA8 ozone concentrations (right) on August 2, 2022, the day with the second highest YGI Microgrid ozone impact.

Administrative Record NSR_001507

The 2015 ozone NAAQS is 70 ppb with the relevant indicator being the ozone Design Value that is defined as the three-year average of the fourth highest MDA8 ozone concentration. Thus, the fourth highest MDA8 ozone concentration is a relevant metric related to attaining the 2015 ozone NAAQS. We ranked the daily MDA8 ozone contribution in each grid cell of the 4 km domain and calculated the 5 grid cell-days with the highest YGI Microgrid facility ozone contribution to the fourth highest MDA8 ozone concentrations, as shown in Table 4-1. The highest ozone contribution from the proposed YGI Microgrid facility to the fourth highest MDA8 ozone concentration in any grid cell-day is 0.049 ppb.

Table 4-1. Five highest proposed YGI Microgrid ozone contribution grid-cell-days to fourth highest MDA8 ozone concentrations during May 10 to October 15, 2022.

Date	ROW	COL	Ozone no Microgrid (ppb)	Ozone with Microgrid (ppb)	Microgrid Impacts (ppb)
6/30	67	68	66.19	66.24	0.049
7/21	63	71	64.14	64.19	0.042
8/13	66	66	66.55	66.59	0.041
8/13	66	67	65.71	65.75	0.040
8/13	67	66	65.22	65.26	0.040

The maximum MDA8 ozone impact due to emissions from the YGI Microgrid facility in the ozone NAA was 0.065 ppb and occurred on July 21, 2022 (Table 4-2). Figure 4-4 displays the spatial distribution of the YGI Microgrid facility contribution and total MDA8 ozone concentrations on this day. MDA8 ozone concentrations on July 21, 2022 are in the range of 60-65 ppb across the New Mexico portion of the ozone NAA when the YGI Microgrid facility has its maximum MDA8 ozone impact in the NAA.

Table 4-2. Maximum MDA8 ozone contribution from the proposed YGI Microgrid facility in the El Paso-Las Cruces ozone nonattainment area.

DATE	ROW	COL	MDA8 O3 Base Case (ppb)	MDA8 O3 YGI Microgrid (ppb)	Maximum YGI Microgrid Impact (ppb)
7/21/2022	65	71	60.503	60.567	0.065

Administrative Record NSR_001508

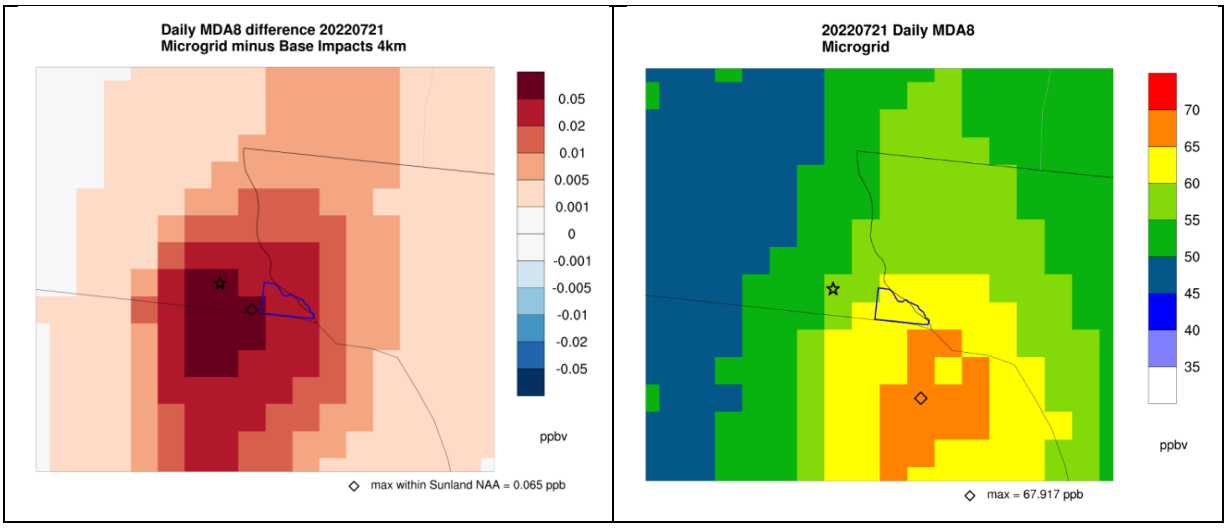

Figure 4-4. Proposed YGI Microgrid facility MDA8 ozone contributions on July 21, 2022 when the maximum YGI Microgrid ozone contribution in the ozone nonattainment area (0.065 ppb) occurs (left) and total MDA8 ozone concentrations on July 21 (right).

4.2 Interpretation of Proposed YGI Microgrid Ozone Impacts

In 2018, EPA established a definition of Significant Impact Level (SIL) for the 2015 ozone NAAQS *"to help determine whether a proposed PSD source causes or contributes to a violation of the corresponding NAAQS"* (EPA, 2018b). EPA conducted a detailed statistical analysis and found that two ozone Design Values that differed by less than 1.0 ppb were not statistically different from each other (EPA, 2018c). Consequently, EPA set the ozone SIL at 1.0 ppb and PSD sources whose ozone impacts are less than 1.0 ppb are determined to be *"de minimis"* and do not *"cause or contribute"* to a violation of the 2015 ozone NAAQS (EPA, 2018b). With the ozone SIL document (EPA, 2018b), EPA provided a legal justification for the SIL[2] and a peer-review that supported the 1.0 ppb ozone SIL (EPA, 2018d).

The maximum ozone contribution due to the proposed YGI Microgrid facility was 0.181 ppb, which is almost six times lower than the 1.0 ppb ozone SIL. Thus, according to EPA guidance (EPA, 2018b), the YGI Microgrid facility ozone impacts are de minimis and do not cause or contribute to a violation of the ozone NAAQS.

1.0 INTRODUCTION

1.1 Introductory Comments

Air pollution has been proven to have serious adverse impacts on human health and the environment. In response, governments have developed air quality standards designed to protect health and secondary impacts. The only way to predict compliance with these standards by a facility or modification that does not yet exist is to use models to simulate the impacts of the project. Regulatory models strike a balance between cost-effectiveness and accuracy, though the field of air quality prediction is not necessarily an inexpensive or a highly accurate field. The regulatory model design is an attempt to apply requirements in a standard way such that all sources are treated equally and equitably.

It is the duty of the NMED/Air Quality Bureau (the Bureau) to review modeling protocols and the resulting modeling analyses to ensure that air quality standards are protected and to ensure that regulations are applied consistently. This document is an attempt to document clear and consistent modeling procedures in order to achieve these goals. Occasionally, a situation will arise when it makes sense to deviate from the guidelines because of special site-specific conditions. Suggested deviations from the guidelines should be documented in a modeling protocol and submitted to the Bureau for approval prior to submission of modeling.

In general, the procedures in the latest version of the EPA document, Guideline on Air Quality Models[1] should be followed when conducting the modeling analysis. This EPA document provides complete guidance on appropriate model applications. The purpose of this document is to provide clarification, additional guidance, and to highlight differences between the EPA document and New Mexico State modeling requirements.

Please do not hesitate to call the Bureau modeling staff with any questions you have before you begin the analysis. We are here to help; however, we will not conduct modeling courses. There are many courses offered which teach the principles of dispersion modeling. These courses provide a much better forum for learning about modeling than the Bureau modeling staff can provide.

1.2 The Modeling Review Process

1.2.1 Modeling Protocol Review

A modeling protocol should be submitted and approved before submitting a permit application. The Bureau will make every attempt to approve, conditionally approve, or reject the protocol within two weeks. Details regarding the protocol are described in section 6.0, Modeling Protocols. Protocols will be archived in the modeling archives in the protocol section until they can be stored with the files for the application.

[1] Environmental Protection Agency, 40 CFR Part 51, Revision to the Guideline on Air Quality Models https://www.epa.gov/sites/production/files/2020-09/documents/appw_17.pdf

1.2.2 Permit Modeling Evaluation

When a permit application involving air dispersion modeling is received, modeling staff has 30 days to determine whether the modeling analysis is administratively complete. The modeling section staff will make a quick determination to see if the modeling analysis appears complete. This involves checking to see if modeling files are attached and readable and verifying that application forms and modeling report are present. If the analysis is incomplete, the staff will inform the applicant of the deficiencies as quickly as possible. This will halt the permitting process until sufficient information is submitted. Deficiencies not resolved prior to the completeness determination deadline may result in ruling the application incomplete.

After the application has been ruled complete, Bureau staff will perform a complete review of the modeling files. This analysis includes a review to make sure that information in the modeling files are consistent with the information in the permit application and may involve the emission rate of each emission point, the elevation of sources, receptors, and buildings, evaluation and modification of elevation data, property fence line, or other aspects of the modeling inputs. If the dispersion modeling analysis submitted with the permit application adequately demonstrates that ambient air concentrations will be below air quality standards and Prevention of Significant Deterioration (PSD) increments, the Bureau modeler will summarize the findings and provide the information to the permit writer. If dispersion modeling predicts that the construction or modification causes or significantly contributes to an exceedance of a New Mexico or National Ambient Air Quality Standard (NMAAQS or NAAQS) or PSD increment, the permit cannot be issued under the normal permit process. For nonattainment modeling, refer to 20.2.72.216 NMAC, 20.2.79 NMAC, or contact the Bureau for further information.

The application (including modeling) is expected to be complete and in good order at the time it is received. However, the Bureau will accept general modifications or revisions to the modeling before the modeling is reviewed provided that the changes do not conflict with good modeling practices. Once the modeling review begins, only changes to correct problems or deficiencies uncovered during the review of the modeling will normally be accepted, and the Bureau will provide a deadline by which changes need to be submitted to allow for them to be reviewed and for the permit to be issued. No changes to modeling will be allowed after the review has been completed.

2.0 MODELING REQUIREMENTS AND STANDARDS

2.1 Regulatory Requirement for Modeling

The requirements to perform air dispersion modeling are detailed in New Mexico Administrative Code (NMAC) **20.2.70.300.D.10 NMAC** (Operating Permits), **20.2.72.203.A.4 NMAC** (Construction Permits), and **20.2.74.305 NMAC** (Permits - Prevention of Significant Deterioration), and 20.2.79 NMAC (Nonattainment). The language from these sections is listed below for easy reference.

Basically, with a construction permit application, an analysis of air quality standards is required, which normally requires air dispersion modeling. In some cases, previous modeling may satisfy this requirement. In these cases, the applicant may seek a modeling waiver from the Bureau. In any case, it is the responsibility of the applicant to provide the modeling, or the justification for the modeling waiver, or the air quality analysis for nonattainment areas. Title V sources that have not demonstrated compliance with a standard or increment are required to come into compliance with this applicable requirement. This may be

accomplished by modeling to show the area is in attainment with this standard or increment. If they are not able to model compliance, then a compliance plan will be needed.

2.1.1 Title V Operating Permits

Federal air quality standards are applicable requirements for sources required to have an operating permit. Modeling is usually not required to issue a Title V operating permit. If a facility is not required to have a construction permit (e.g., some landfills and "Grandfathered" facilities) then it will need to model any new emissions or changes that could increase ambient pollutant concentrations.

Selected Title V regulatory language applying to modeling is copied below for easy reference.

> **20.2.70.7 NMAC DEFINITIONS:** In addition to the terms defined in 20.2.2 NMAC (definitions), as used in this part the following definitions shall apply.
>
> E. "Applicable requirement" means all of the following, as they apply to a Part 70 source or to an emissions unit at a Part 70 source (including requirements that have been promulgated or approved by the board or US EPA through rulemaking at the time of permit issuance but have future-effective compliance dates).
>
> (11) Any national ambient air quality standard.
>
> (12) Any increment or visibility requirement under Part C of Title I of the federal act, but only as it would apply to temporary sources permitted pursuant to Section 504(e) of the federal act.

Note: The PSD increment analysis is required for the development of general permits for temporary Title V sources but is not an applicable requirement for regular Title V permit modeling. PSD increment modeling is required for Title V sources that are satisfying their modeling requirements through 20.2.72 NMAC modeling.

> **20.2.70.201 NMAC REQUIREMENT FOR A PERMIT:**
>
> D, Requirement for permit under 20.2.72 NMAC.
>
> (1) Part 70 sources that have an operating permit and do not have a permit issued under 20.2.72 NMAC or 20.2.74 NMAC shall submit a complete application for a permit under 20.2.72 NMAC within 180 days of September 6, 2006. The department shall consider and may grant reasonable requests for extension of this deadline on a case-by-case basis.
>
> (2) Part 70 sources that do not have an operating permit or a permit under 20.2.72 NMAC upon the effective date of this subsection shall submit an application for a permit under 20.2.72 NMAC within 60 days after submittal of an application for an operating permit.
>
> (3) Paragraphs 1 and 2 of this subsection shall not apply to sources that have demonstrated compliance with both the national and state ambient air quality standards through dispersion modeling or other method approved by the department and that have requested incorporation of conditions in their operating permit to ensure compliance with these standards.
>
> **20.2.70.300.D.10 NMAC**
>
> (10) Provide certification of compliance, including all of the following.
>
> (a) A certification, by a responsible official consistent with Subsection E of 20.2.70.300 NMAC, of the source's compliance status for each applicable requirement. For national ambient air quality standards, certifications shall be based on the following.
>
> (i) For first time applications, this certification shall be based on modeling submitted with the application for a permit under 20.2.72 NMAC.

(ii) For permit renewal applications, this certification shall be based on compliance with the relevant terms and conditions of the current operating permit.

2.1.2 New Source Review (NSR) Permitting for Minor Sources

For new permits, a demonstration of compliance with air quality standards, PSD increments, and toxic air pollutants subject to 20.2.72.403.A(2) is required for all pollutants emitted by the facility. For significant revisions, a demonstration of compliance with air quality standards, PSD increments, and toxic air pollutants subject to 20.2.72.403.A(2) is required for all pollutants affected by the modification or permit revision. For technical revisions involving like kind replacement, as specified in 20.2.72.219B(1)(d), a demonstration that the replacement unit has stack parameters which are at least as effective in the dispersion of air pollutants is required (provided previous modeling determined the area to be in compliance with air quality standards). Permits for sources not in attainment with standards should refer to 20.2.72.216 NMAC, NONATTAINMENT AREA REQUIREMENTS.

If previous modeling has demonstrated compliance for each averaging period of each pollutant with a state or federal ambient air quality standard or toxic air pollutant, and that modeling used current modeling practices and is up-to-date for that area, then a modeling waiver may be used as the discussion demonstrating compliance. Otherwise, new modeling is required. For other minor source permitting actions, modeling is not part of the permitting process. Modeling waivers do not apply to nonattainment areas.

Selected NSR regulatory language applying to modeling is copied below for easy reference.
Definition of modification:

20.2.72.7 DEFINITIONS: In addition to the terms defined in 20.2.2 NMAC (Definitions) as used in this Part:

P. "Modification" means any physical change in, or change in the method of operation of, a stationary source which results in an increase in the potential emission rate of any regulated air contaminant emitted by the source or which results in the emission of any regulated air contaminant not previously emitted, but does not include:

(1) a change in ownership of the source;

(2) routine maintenance, repair or replacement;

(3) installation of air pollution control equipment, and all related process equipment and materials necessary for its operation, undertaken for the purpose of complying with regulations adopted by the board or pursuant to the Federal Act; or

(4) unless previously limited by enforceable permit conditions:

(a) an increase in the production rate, if such increase does not exceed the operating design capacity of the source;

(b) an increase in the hours of operation; or

(c) use of an alternative fuel or raw material if, prior to January 6, 1975, the source was capable of accommodating such fuel or raw material, or if use of an alternate fuel or raw material is caused by any natural gas curtailment or emergency allocation or any other lack of supply of natural gas.

Requirements for permit:

20.2.72.200 APPLICATION FOR CONSTRUCTION, MODIFICATION, NSPS, AND NESHAP - PERMITS AND REVISIONS:

A. Permits must be obtained from the Department by:

(1) Any person constructing a stationary source which has a potential emission rate greater than 10 pounds per hour or 25 tons per year of any regulated air contaminant for which there is a National or New Mexico Ambient Air Quality Standard. If the specified threshold in this subsection is exceeded for any one regulated air contaminant, all regulated air contaminants with National or New Mexico Ambient Air Quality Standards emitted are subject to permit review. Within this subsection, the potential emission rate for nitrogen dioxide shall be based on total oxides of nitrogen;

(2) Any person modifying a stationary source when all of the pollutant emitting activities at the entire facility, either prior to or following the modification, emit a regulated air contaminant for which there is a National or New Mexico Ambient Air Quality Standard with a potential emission rate greater than 10 pounds per hour or 25 tons per year and the regulated air contaminant is emitted as a result of the modification. If the specified threshold in this subsection is exceeded for any one regulated air contaminant, all regulated air contaminants with National or New Mexico Ambient Air Quality Standards emitted by the modification are subject to permit review. Within this subsection, the potential emission rate for nitrogen dioxide shall be based on total oxides of nitrogen;

Like-kind-replacement required modeling:

20.2.72.219 PERMIT REVISIONS:

B. Technical Permit Revisions:

(1) Technical permit revision procedures may be used only for:

(d) Modifications that replace an emissions unit for which the allowable emissions limits have been established in the permit, provided that the new emissions unit:

(i) Is equivalent to the replaced emissions unit, and serves the same function within the facility and process;

(ii) Has the same or lower capacity and potential emission rates;

(iii) Has the same or higher control efficiency, and stack parameters which are at least as effective in the dispersion of air pollutants;

(vi) Would not, when operated under applicable permit conditions, cause or contribute to a violation of any National or New Mexico Ambient Air Quality Standard; and

Modeling requirements for new permits or significant revisions:

20.2.72.203.A.4 NMAC

Contain a regulatory compliance discussion demonstrating compliance with each applicable air quality regulation, ambient air quality standard, prevention of significant deterioration increment, and provision of 20.2.72.400 NMAC - 20.2.72.499 NMAC. The discussion must include an analysis, which may require use of US EPA-approved air dispersion model(s), to (1) demonstrate that emissions from routine operations will not violate any New Mexico or National Ambient Air Quality Standard or prevention of significant deterioration increment, and (2) if required by 20.2.72.400 NMAC - 20.2.72.499 NMAC, estimate ambient concentrations of toxic air pollutants.

2.1.3 NSR Permitting for PSD Major Sources

PSD major sources and major modifications have additional modeling requirements beyond those of minor sources. PSD major source modeling authority is contained here:

> **20.2.74.305 NMAC AMBIENT AIR QUALITY MODELING:** All estimates of ambient concentrations required by this Part shall be based on applicable air quality models, data bases, and other requirements as specified in EPA's Guideline on Air Quality Models (EPA-450/2-78-027R, July, 1986), its revisions, or any superseding EPA document, and approved by the Department. Where an air quality impact model specified in the Guideline on Air Quality Models is inappropriate, the model may be modified or another model substituted. Any substitution or modification of a model must be approved by the Department. Notification shall be given by the Department of such a substitution or modification and the opportunity for public comment provided for in fulfilling the public notice requirements in subsection B of 20.2.74.400 NMAC. The Department will seek EPA approval of such substitutions or modifications.

2.2 Air pollutants

Emissions of Sulfur Dioxide (SO_2), Particulate matter with an aerodynamic diameter of less than or equal to 10 micrometers (PM_{10}), Particulate matter with an aerodynamic diameter of less than or equal to 2.5 micrometers ($PM_{2.5}$), Carbon Monoxide (CO), Nitrogen Dioxide (NO_2), Lead (Pb), Hydrogen sulfide (H_2S), and air toxics as listed in 20.2.72 NMAC are pollutants that may require modeling. Ozone and Volatile Organic Compound (VOC) emissions do not currently require a modeling analysis for a PSD minor source. If NO_X or VOCs are subject to PSD review, you should contact NMED and the EPA Regional Office to determine current ozone modeling requirements.

2.3 Modeling Exemptions and Reductions

2.3.1 Modeling waivers

In some cases, the demonstration that ambient air quality standards and PSD increments will not be violated can be satisfied with a discussion of previous modeling. If emissions have been modeled using current modeling procedures and air quality standards, and this modeling is still valid for the current standards, then the modeling waiver form may be submitted to request approval of a modeling waiver. The Bureau will determine on a case-by-case basis if the modeling waiver can be granted. The waiver discussion and written waiver approval should be included in the modeling section of the application.

The Bureau has performed generic modeling to demonstrate that the following small sources do not need modeling. The application must include a modeling waiver form to document the basis of the waiver. Permitting staff must approve the total emission rates during the permitting process for any waiver to be valid.

Table 1: Very small emission rate modeling waiver requirements

Pollutant	If all emissions come from stacks 20 feet or greater in height and there are no horizontal stacks or raincaps (lb/hr)	If not all emissions come from stacks 20 feet or greater in height, or there are horizontal stacks, raincaps, volume, or area sources (lb/hr)
CO	16.037	2.580
H_2S (Pecos-Permian Basin)	0.114	0.015
H_2S (Not in Pecos-Permian Basin)	0.022	0.0030
Lead	0.0050	0.0010
NO_2	0.189	0.024
PM2.5 – Point Sources	0.056	0.0090
PM2.5 – Volume Sources		0.0030
PM10 – Point Sources	0.255	0.039
PM10 – Volume Sources		0.015
SO_2	0.179	0.023
Reduced sulfur (Pecos-Permian Basin)	0.033	Waiver not available.
Reduced sulfur (Not in Pecos-Permian Basin)	Waiver not available.	Waiver not available.

2.3.2 General Construction Permits (GCPs)

General Construction Permits do not require modeling. General modeling was performed in the development of these permits.

2.3.3 Streamlined Compressor Station Modeling Requirements

Compressor stations may be eligible for streamlined permits under the authority of **20.2.72.300-399 NMAC**. Streamlined permits have reduced modeling analysis requirements.

2.3.3.1 Streamlined Compressor Station Location Requirements

Restrictions preventing use of streamlined permits in certain locations are listed in **20.2.72.301 NMAC**. Those restrictions dealing with location are described below.

According to **20.2.72.301.B.4 NMAC**, the facility cannot co-locate with petroleum refineries, chemical manufacturing plants, bulk gasoline terminals, natural gas processing plants, or at any facility containing sources in addition to IC engines and/or turbines for which an air quality permit is required through state or federal air quality regulations.

20.2.72.301.B.5 NMAC restricts the location of streamlined permit in areas predicted by air quality monitoring or modeling to have more than 80% of state or federal ambient air quality standards or PSD increments consumed. Table 2, below, is a list of these areas. This restriction means that any streamlined permit applicant wishing to locate in a nonattainment area or those areas listed in Table 2 must

demonstrate, using air dispersion modeling, that the entire facility will not produce any concentrations above significance levels.

Table 2: Areas Where Streamlined Permits Are Restricted

County	Latitude	Longitude	Radius (m)
San Juan	36.73120	-107.9608189	3000
San Juan	36.48296	-108.1200487	1000

Locations within 150 meters of a facility that emits 25 tons per year of NO_X are restricted areas for streamlined compressor station permits unless modeling is performed.

20.2.72.301.B.6 NMAC prohibits the location of streamline permit from use in areas if the nearest property boundary will be located less than:
(a) 1 kilometer (km) from a school, residence, office building, or occupied structure. Buildings and structures within the immediate industrial complex of the source are not included.
(b) 3 km from the property boundary of any state park, Class II wilderness area, Class II national wildlife refuge, national historic park, state recreation area, or community with a population of more than twenty thousand people.

Table 3: List of state parks, Class I areas, Class II wilderness areas, Class II national wildlife refuges, national historic parks, and state recreation areas

County	Name	Type	Min. Distance (km)
Bernalillo	Sandia Mountain Wilderness	State Wilderness	3
Catron	Gila Wilderness	Class I Area	30
Catron	Gila Cliff Dwelling	National Monuments	3
Catron	Datil Well	Recreation Sites	3
Chaves	Bottomless Lake	Class II State Parks	3
Chaves	Salt Creek Wilderness Area	Class I Area	30
Chaves	Bitter Lake National W.R.	Class II Wildlife Refuge	3

Torrance	Manzano Mountain Wilderness	State Wilderness	3
Union	Clayton Lake	Class II State Parks	3
Valencia	Sen. Willie Chavez	Class II State Parks	3
Valencia	Manzano Mountain Wilderness	State Wilderness	3

(c) 10 km from the boundary of any community with a population of more than forty-thousand people, or
(d) 30 km from the boundary of any Class I area;

20.2.72.301.B.7 NMAC prohibits the location of streamline permit in Bernalillo County or within 15 km of the Bernalillo County line.

2.3.3.2 Streamlined Compressor Station Modeling and Public Notice Requirements

Modeling and public notice requirements for streamlined compressor station permits depend on the amount of emissions from the facility. Refer to the table below, using the maximum of the Potential to Emit (PTE) of each regulated contaminant from all sources at the facility to determine applicability. The potential to emit for nitrogen dioxide shall be based on total oxides of nitrogen. The effects of building downwash shall be included in modeling if there are buildings at the site.

Table 4: Streamlined Permit Applicability Requirements for facilities with less than 200 tons/year PTE

Applicable Regulation	PTE (TPY)	Modeling Requirements (from 20.2.72.301 D NMAC)
20.2.72.301 D (1)	<40	• None
20.2.72.301 D (2)	<100	• The impact on ambient air from all sources at the facility shall be less than the ambient significance levels.
20.2.72.301 D (3)	<200	• Air quality impacts must be less than 50% of all applicable NAAQS, NMAAQS and PSD increments. • There shall be no adjacent sources emitting the same air contaminant(s) as the source within 2.5 km of the modeled NO_2 impact area. • The sum of all potential emissions for NO_X from all adjacent sources within 15 km of the NO_X ROI must be less than 740 tons/year. • The sum of all potential emissions for NO_X from all adjacent sources within 25 km of the NO_X ROI must be less than 1540 tons/year.

There are other criteria that must be met for streamlined permits for compressor stations. Please refer to **20.2.72.300-399 NMAC** for more information.

2.3.4 Minor NSR Exempt Equipment

Exempt equipment under 20.7.72.202 NMAC do not need to be included in modeling for 20.2.72 NMAC permits. The exemption does not exclude them from modeling requirements under other types of permits, such as 20.2.70 NMAC or 20.2.74 NMAC.

2.4 Levels of Protection

2.4.1 Air Quality Standards

Air quality standards are maximum allowable concentrations that are designed to protect public health and welfare from harm from airborne pollutants. The Environmental Protection Agency (EPA) develops National Ambient Air Quality Standards[2] (NAAQS) to keep the air quality throughout the country safe for the most sensitive individuals and periodically reviews the scientific basis of these standards to make sure they reflect the latest scientific evidence. New Mexico Ambient Air Quality Standards[3] (NMAAQS) are based on EPA's originally proposed NAAQS values. Unless otherwise noted, standards are not to be exceeded.

[2] EPA NAAQS table is at https://www.epa.gov/criteria-air-pollutants/naaqs-table.

[3] NMAAQS are defined in 20.2.3 NMAC (https://www.srca.nm.gov/parts/title20/20.002.0003.html)

2.4.2 Prevention of Significant Deterioration (PSD) Increments

To prevent relatively clean areas from degrading to levels just barely in compliance with the air quality standards, limits on the change have been established in the form of PSD increments. The PSD increment program establishes a Baseline Date after which changes in concentrations are evaluated. The total increase in concentration allowed at a location after the Baseline Date is the PSD increment. Compliance demonstrations for PSD increments demonstrate that the deterioration is less than the allowable increment.

2.4.3 Significance Levels

Modeling Significant Impact Levels (SILs) are significant ambient concentrations that are thresholds below which the source is not considered to contribute to any predicted exceedance of air quality standards or PSD increments. The definition of 'source' can apply to the whole facility or to the modifications at the facility. For a new facility or an unpermitted facility, NMED considers the entire facility to be the 'source'. For other cases, 'source' includes only the new equipment or new emissions increases described in the current application. Equipment that replaces other equipment is part of the new equipment. If the concentration (in ambient air) that is produced by a source is below the SIL at a location where total predicted concentrations are above air quality standards or allowable PSD increments, then addressing the small fraction produced by the source would not be an effective way to address the air quality standard or increment violation because that fraction of the total concentration is insignificant. The state can develop a State Implementation Plan (SIP) to pursue an effective way to address the high concentrations instead of preventing the issuance of a permit that has no significant influence over the total air concentrations.

Example of source to model for permitting:
The entire facility was modeled for annual NO_2 and 1-hour and 8-hour CO in 1999 but was never modeled for 1-hour NO_2. The facility applies to replace a widget. If this widget emits only NO_2 and CO, then modeling review is applicable for these pollutants. For CO and for NO_2, the applicant may model only the replacement widget. If the impacts from the widget alone are below significance levels, then modeling is done for that pollutant/averaging period. If the impacts from the widget alone are above significance levels, then the entire facility plus nearby sources must be modeled for comparison with air quality standards and PSD increments.

Significance levels are listed in **20.2.72.500 NMAC** and are repeated in the sections below. Always use the maximum predicted concentration from the source for radius of impact/significance level determination. Even if the form of the standard allows it to be exceeded several times per period, that fraction is based on cumulative concentration and cannot be related to partial concentrations. If multiple years of meteorological data are used, then the average of those concentrations is compared with the significance level.

Use of the $PM_{2.5}$ significant monitoring concentration for PSD major modifications or for new PSD major sources is not allowed.

2.5 Concentration Conversions

Many of the air quality standards are written in the form of parts per million (ppm) or parts per billion (ppb), but the models generally give output in units of micrograms per cubic meter (µg/m^3). EPA has verbally communicated to NMED that AERMOD output is expressed at Standard Temperature and Pressure (STP) conditions. Therefore, most air quality standards can be compared to modeled concentration without corrections for elevation (and associated low pressure). If a need for elevation correction arises, a method to adjust for elevation is listed below.

2.5.1 Gaseous Conversion Factor for Elevation and Temperature Correction

The following equation calculates the conversion from µg/m^3 to ppm, with corrections for temperature and pressure (elevation):

$$ppm = 4.553 \times 10^{-5} \times \frac{C \times T}{M_w} \times 10^{Z \times 1.598 \times 10^{-5}}$$

or, rearranged to calculate µg/m^3:

$$C = ppm \times M_W / (T \times (4.553\ E\ -5) \times (10^{Z \times 1.598\ E\ -5}))$$

where:

C = component concentration in µg/m^3.
T = average summer morning temperature in Rankin at site (typically 530 R).
M_w = molecular weight of component.
Z = site elevation, in feet.

2.5.2 Gaseous Conversion Factor at Standard Temperature and Pressure (STP) Conditions

Federal standards are expressed as mass per unit volume or ppm or ppb under standard temperature and pressure.

> "40 CFR 50.3 Reference conditions.
> All measurements of air quality that are expressed as mass per unit volume (e.g., micrograms per cubic meter) other than for particulate matter (PM2.5) standards contained in §§ 50.7 and 50.13 and lead standards contained in § 50.16 shall be corrected to a reference temperature of 25 (deg) C and a reference pressure of 760 millimeters of mercury (1,013.2 millibars)."

If a monitored or modeled concentration has been adjusted to STP, then the following equation calculates the conversion from ppm to µg/m^3 for NAAQS:

$$C = ppm \times M_w \times 40.8727$$

or, rearranged to calculate ppm:

$$ppm = C / (M_w \times 40.8727)$$

where:

C = component concentration in µg/m^3.
M_w = molecular weight of component.

$$p = p_0 \cdot \left(1 - \frac{L \cdot h}{T_0}\right)^{\frac{g \cdot M}{R \cdot L}} \approx p_0 \cdot \exp\left(-\frac{g \cdot M \cdot h}{R \cdot T_0}\right),$$

Parameter	Description	Value
p_0	sea level standard atmospheric pressure	101325 Pa
L	temperature lapse rate	0.0065 K/m
T_0	sea level standard temperature	288.15 K
g	Earth-surface gravitational acceleration	9.80665 m/s^2
M	molar mass of dry air	0.0289644 kg/mol
R	universal gas constant	8.31447 J/(mol•K)

$[PM10]_{STP} = [PM10]_{modeled} (P_{standard})(T_{measured})/((P_{calculated\ by\ elevation})(T_{standard}))$

2.6 Modeling the Standards and Increments

The general purpose of modeling is to compare the cumulative impacts of all sources impacting an area with the air quality standards or PSD increments that apply to that pollutant. This section describes the surrounding sources and background concentrations needed to produce an appropriate estimate of the total concentration. Sometimes background monitoring concentrations conservatively represent the surrounding sources and sometimes the surrounding sources will need to be explicitly modeled. The specific cases for each pollutant are described below.

One or more years of meteorological data are required for the analysis. See Section 4.3 for information about selecting meteorological data. For most air quality standards and PSD increments, when multiple years of meteorological are used, the concentrations predicted for each averaging period for each year are averaged together before comparing with the air quality standard or PSD increment. For Lead (Pb), the maximum monthly rolling 3-month average from the combined data is compared with the NAAQS. Background concentrations are averaged over three years unless otherwise specified.

2.6.1 Carbon Monoxide (CO) Standards

Table 5: Carbon Monoxide Air Quality Standards

Averaging Period	Significance Level[b] (µg/m³)	NAAQS[c] (ppm)	NAAQS (µg/m³)	NMAAQS[a] (ppm)	NMAAQS (µg/m³)
8-hour	500	9	10,303.6	8.7	9,960.1
1-hour	2,000	35	40,069.6	13.1	14,997.5

[a] 20.2.3.111 NMAC (https://www.srca.nm.gov/parts/title20/20.002.0003.html)
[b] 20.2.72.500 NMAC (https://www.srca.nm.gov/parts/title20/20.002.0072.html)
[c] EPA NAAQS Table (https://www.epa.gov/criteria-air-pollutants/naaqs-table)

2.6.1.1 Design value of CO standard.

CO NAAQS are not to be exceeded more than once per year. NMAAQS are not to be exceeded. Demonstration of compliance with CO NMAAQS automatically demonstrates compliance with NAAQS.

2.6.1.2 Modeling for the CO design value.

Tier 1, 1-hour NMAAQS: Model the entire facility to determine the high 1-hour concentration. Add the high 1-hour background concentration to the high 1-hour predicted concentration to determine the total design concentration for comparison to the 1-hour NMAAQS. Sources less than 20 km from the center of Albuquerque or El Paso shall also explicitly model surrounding sources within 10 km of the facility.

Tier 1, 8-hour NMAAQS: Model the entire facility to determine the high 8-hour concentration. Add the high 8-hour background concentration to the high 8-hour predicted concentration to determine the total design concentration for comparison to the 8-hour NMAAQS. Sources less than 20 km from the center of Albuquerque or El Paso shall also explicitly model surrounding sources within 10 km of the facility.

Optionally, all nearby sources may be modeled instead of adding a background concentration, if the facility is over 20 km from the center of Albuquerque and El Paso.

Tier 2: Hourly background concentrations may be added instead of the maximum concentrations for each averaging period.

2.6.2 Hydrogen sulfide (H_2S) Standards

Table 6: Hydrogen Sulfide Air Quality Standards

Averaging Period	Significance[b] Level (µg/m³)	NMAAQS[a] (ppm)	NMAAQS (µg/m³)	Notes
1-hour	1.0	0.010	13.9	For the state, except for the Pecos-Permian Basin Intrastate AQCR. Not to be exceeded more than once per year.
1/2-hour	5.0	0.10	139.3	For the Pecos-Permian Basin Intrastate AQCR
1/2-hour	5.0	0.030	41.8	for within 5-miles of the corporate limits of municipalities within the Pecos-Permian Basin AQCR

[a] 20.2.3.110 NMAC (https://www.srca.nm.gov/parts/title20/20.002.0003.html)
[b] 20.2.72.500 NMAC (https://www.srca.nm.gov/parts/title20/20.002.0072.html)

Design value of standard: For modeling ½-hour H_2S NMAAQS, use the 1-hour averaging time because the models cannot resolve less than one-hour increments.

Model the entire facility and any nearby sources and compare the high 1-hour concentration to the standard for that region. No background concentration is added.

2.6.3 Lead (Pb) Standards

Table 7: Lead Air Quality Standards

Averaging Period	Significance Level (µg/m³)	NAAQS[a] (µg/m³)
Quarterly	0.03	0.15

[a] 73 FR 66964 Nov 12, 2008 (https://www.govinfo.gov/content/pkg/FR-2008-11-12/pdf/E8-25654.pdf)

Design value of standard: For modeling quarterly lead averages, use the monthly averaging period as a conservative approach, unless the model being used has a quarterly averaging period or post-processing is desired to calculate quarterly values. Model the entire facility without surrounding sources and compare the high month concentration to the standard. No background concentration is added.

2.6.4 Nitrogen Dioxide (NO_2) Standards

Table 8: NO_2 Air Quality Standards

Averaging Period	Significance Level ($\mu g/m^3$)	NAAQS[e] (ppb)	NAAQS ($\mu g/m^3$)	NMAAQS[c] (ppb)	NMAAQS ($\mu g/m^3$)	Class II PSD Increment[f] ($\mu g/m^3$)	Class I PSD Significance Level ($\mu g/m^3$)	Class I PSD Increment ($\mu g/m^3$)
annual	1.0[d]	53	99.66	50	94.02	25	0.1[b]	2.5
24-hour	5.0[d]			100	188.03			
1-hour	7.52[a]	100	188.03					

[a] EPA recommended interim significance level of 4 ppb[4] corrected to a reference temperature of 25°C and a reference pressure of 760 millimeters of mercury.
[b] Class I Area Significant Impact Levels, John Calcagni, EPA, September 10, 1991 (https://www.epa.gov/sites/default/files/2015-07/documents/levels.pdf).

[d] 20.2.72.500 NMAC (https://www.srca.nm.gov/parts/title20/20.002.0072.html)
[e] EPA NAAQS Table (https://www.epa.gov/criteria-air-pollutants/naaqs-table)
[f] 40 CFR 52.21(c) (https://www.ecfr.gov/current/title-40/chapter-I/subchapter-C/part-52/subpart-A/section-52.21)

2.6.4.1 Design value of NO_2 standard

Demonstration of compliance with 1-hour standard is automatically a demonstration of compliance with the 24-hour NMAAQS. Otherwise, the 24-hour NO_2 standard is compared with the highest 24-hour average calculated by the model.

The annual NMAAQS design value is determined by modeling the entire facility and adding the annual background concentration. The total is compared to the standard. Sources less than 20 km from the center of Albuquerque or El Paso shall also explicitly model sources within 10 km of the facility. Optionally, to determine the total design value, the facility and all nearby sources may be modeled instead of adding a background concentration if the facility is over 20 km from the center of Albuquerque and El Paso.

The annual NO_2 PSD increment is compared with the annual average calculated by the model.

The 1-hour NO_2 standard is compared with the 3-year average of the 98th-percentile of the annual distribution of daily maximum 1-hour concentrations. If one year of on-site meteorological data is used, the 98th-percentile value associated with the 1-year period of meteorological data modeled is the design value. Each day of modeling, the maximum 1-hour concentration is determined for each

[4] Guidance Concerning the Implementation of the 1-hour NO_2 NAAQS for the Prevention of Significant Deterioration Program, Stephen D. Page, EPA, June 29, 2010 (https://www.epa.gov/sites/default/files/2015-07/documents/appwno2.pdf).
See also: Additional Clarification Regarding Application of Appendix W Modeling Guidance for the 1-hour NO_2 National Ambient Air Quality Standard, Tyler Fox, EPA, March 1, 2011 (https://www.epa.gov/sites/default/files/2015-07/documents/appwno2_2.pdf).

receptor. The high-eighth-high value at each receptor is calculated, and the maximum of these is compared with the standard. If multiple years are modeled, the maximum value is averaged over the span of years before comparing with standards. Sources less than 20 km from the center of Albuquerque or El Paso shall also explicitly model sources within 10 km of the facility.

2.6.4.2 NO_2 Reactivity

Combustion processes emit nitrogen oxides in the forms of nitrogen oxide (NO) and nitrogen dioxide (NO_2). Only the concentration of NO_2 is regulated by air quality standards; however, emissions of nitrogen oxides (NO_X = NO + NO_2) must be modeled to estimate total NO_2 concentrations because nitrogen oxides change form in the atmosphere.

Two key reactions are most important in determining the equilibrium (or quasi-equilibrium) ratio of NO_2 to NO.

$NO + O_3 \rightarrow NO_2 + O_2$

$NO_2 + h\nu$ (energy) $\rightarrow NO + O$

Many other reactions participate in the determination of the atmospheric concentration of NO_2. As the plume travels away from the stack, more and more ozone diffuses into the plume, enabling the relatively quick reaction to form NO_2.

2.6.4.3 Estimating NO_2 concentrations

The Bureau has approved techniques, described below, for estimating NO_2 concentrations from NO_X point sources. Note that NO_2 emissions reported by the emissions inventory are actually NO_X emissions.

Tier 1, Total Conversion Technique: 100% conversion

This technique assumes all the NO_X is converted to NO_2. This simple technique is suitable for small facilities where compliance with standards is not a problem.

Tier 2, Ambient Ratio Method 2 (ARM2) Technique

ARM2 method is included as an option in AERMOD. This method is approved without the need for EPA approval. 0.5 is the national default for minimum ambient NO_2/NO_X ratio for out of stack emissions. A minimum ambient ratio as low as 0.2 may be used by providing evidence that the in-stack ratio of the modeled emission units is equal to or lower than the minimum ambient ratio used. The default maximum ratio is 0.9. EPA maintains a database of in-stack NO_2/NO_X ratios that may provide additional information in cases where default values used in ARM2 or the methods listed below are not appropriate: https://www.epa.gov/scram/nitrogen-dioxidenitrogen-oxide-stack-ratio-isr-database.

Tier 3, Ozone Reaction Techniques

Two methods account for the ozone that mixes into the plumes and encourages NO_2 formation: Ozone Limiting Method (OLM) and Plume Volume Molar Ratio Method (PVMRM). Both these techniques are accepted and are built into AERMOD.

OLM assumes an NO_2 plume and an NO plume are each dispersing. The in-stack ratio of NO_2/NO_X is used to determine the amount of nitrogen dioxide initially in each plume. The concentration of NO at each receptor is assumed to react stoichiometrically with the background ozone concentration at that time to form NO_2. Contributions from both plumes are added to get the NO_2 concentration at that time.

PVMRM works similarly to OLM but uses the total volume of the plume by the time it reaches the receptor to calculate how much ozone is available for reaction. Both methods result in greater conversion with greater distance from the source but use different approximations for determining how much ozone has dispersed into the plume.

Both methods require additional information.
For the equilibrium NO_2/NO_X ratio, the value of 0.9 is approved.

For the in-stack NO_2/NO_X ratio, values lower than 0.5 must be justified with data. Combustion involving excess oxygen results in higher in-stack NO_2/NO_X ratios than do stoichiometric reactions. The facility may use an in-stack ratio of 0.5 without justification. Surrounding sources, if required, may be modeled with an in-stack ratio of 0.3 without justification.

Recent ozone data representative of the area should be used. See the section on background concentrations for more information.

Special techniques are required to model PSD increment with OLM or PVMRM if increment-expanding sources are being modeled. No negative emission rates can be used. See *User's Guide for the AMS/EPA Regulatory Model (AERMOD) (EPA-454/B-21-001, April 2021)*, Pg. 3-131, for more details on the PSDCREDIT option.
(https://gaftp.epa.gov/Air/aqmg/SCRAM/models/preferred/aermod/aermod_userguide.pdf**)**

Combined-Plume Option vs. Individual-Plume Option
AERMOD provides two options for calculating ozone-limited NO_2 concentrations, the "plume-by-plume" (INDVDL) calculation, and the combined plume (SRCGRP) calculation. The Bureau has accepted a general demonstration that if two plumes are impacting the same receptor at the same time, then the two plumes have merged. If the plumes do not impact the same receptor at the same time, then the plumes have not merged, but both options will calculate the same concentration for that hour. Therefore, the Bureau will accept either INDVL or SRCGP option without additional demonstrations.

2.6.4.4 Modeling for the 1-hour NO_2 design value

Model the entire facility and add the 98th percentile 1-hour background concentration to compare to the design value. Optionally, all nearby sources may be modeled instead of adding a background concentration if the facility is over 20 km from the center of Albuquerque and El Paso, Texas. Refined hourly background concentrations may be used instead of the maximum 1-hour concentration as described in the section on background concentrations.

Before attempting to calculate the design value, first locate the areas with highest overall concentrations. Place a few receptors in these areas and re-run the model in these areas. The maximums will occur in nearly the same places.

Maximum modeled concentration may also be used as a conservative approximation of the design value.

"The highest of the average 8th-highest (98th-percentile) concentrations across all receptors, based on the length of the meteorological data period, represents the modeled 1-hour NO_2 design value based on the form of the standard."

2.6.4.5 Modeling for the annual NO_2 NMAAQS design value

Model the entire facility and add the annual background concentration to compare to the design value. Optionally, all nearby sources may be modeled instead of adding a background concentration if the facility is over 20 km from the center of Albuquerque and El Paso, Texas. (Use of hourly background concentrations does not affect the result for an annual average).

2.6.4.6 Modeling for the annual NO_2 PSD increment design value

Model all increment-consuming parts of the facility and increment-consuming nearby sources of the facility (or nearby sources of the Class I area for Class I analysis). Compare the result to the design value. All sources (not just increment affecting sources) will need to be modeled in order to take credit for increment expanding sources using OLM or PVMRM. See the AERMOD User's Guide Addendum for more details. Optionally, a monitored background value may be substituted for the modeled surrounding sources as a conservative approach to the increment consumption.

2.6.5 Ozone (O_3) Standards

2.6.5.1 Design value of ozone standard

Ozone is normally only modeled for regional compliance demonstrations and does not need to be modeled for most air quality permits. NMED performs ozone modeling on a regional scale as need arises, rather than requiring permit applicants to quantify their contribution to a regional ozone concentration. Comprehensive ozone modeling is too resource intensive to attach this expense to a typical permit application, and screening modeling on an affordable scale currently cannot quantify a source's impacts to ambient ozone concentrations.

Regional ozone modeling for the Four Corners area was done in 2009.

Regional ozone modeling for the Doña Ana County area was done in 2016 (see https://www.wrapair2.org/SNMOS.aspx).

Regional ozone modeling was conducted for the state Ozone Attainment Initiative in 2021 (see https://www.env.nm.gov/air-quality/o3-initiative/ and https://www.wrapair2.org/NMOAI.aspx).

Table 9: O_3 Air Quality Standards

Averaging Period	Significance Level ($\mu g/m^3$)	NAAQS (ppm)	NAAQS ($\mu g/m^3$)
8-hour	1.96 [b]	0.07[a]	137.3

[a] To attain this standard, the 3-year average of the fourth-highest daily maximum 8-hour average ozone concentrations measured at each monitor within an area over each year must not exceed 0.07 ppm.
[b] 1.0 ppb converted to $\mu g/m^3$. This SIL is based on "Guidance on Significant Impact Levels for Ozone and Fine Particles in the Prevention of Significant Deterioration Permitting Program," EPA, April 17, 2018 (https://www.epa.gov/sites/production/files/2016-08/documents/pm2_5_sils_and_ozone_draft_guidance.pdf).

Permit applicants for PSD level sources that emit NO_X or VOCs should contact NMED. In most cases permit applicants required to demonstrate compliance with ozone standards may utilize Modeled Emission Rates for Precursors (MERPs) following EPA guidance[5]. EPA also has a tool that allows more region-specific evaluation and analysis based on the location of the facility and the distance the facility is from receptors of interest: https://www.epa.gov/scram/merps-view-qlik.

When necessary, O_3 secondary formation concentrations may be estimated using the following method derived from the MERP guidance. These MERP factors are location-specific and conservative. Other MERP values may be used in consultation with modeling staff and inclusion in a modeling protocol.

Below is the guiding equation to estimate 8-hour O_3 secondary formation concentration suggested by the Bureau. Choose the appropriate MERP value from Table 10 or Table 11 based on the AQCR in which the facility is located or the distance from the facility to receptors of interest.

$$[O_3]_{8-hour} = \left(\frac{NO_X\ emission\ rate(\frac{ton}{yr})}{MERP_{NOX}} + \frac{VOC\ emission\ rate(\frac{ton}{yr})}{MERP_{VOC}} \right) \times 1.96\ \mu g/m^3$$

Table 10: O3 MERPS[a]

AQCR	$MERP_{NOX}$	$MERP_{VOC}$
014	571	4679
155	340	9578
The rest of New Mexico	414	7331

[a] MERP values were determined using the most conservative value for each category from hypothetical single source modeling reported on the EPA website https://www.epa.gov/scram/merps-view-qlik. AQCR 014 values were from La Plata Co, Colorado. AQCR 155 were from Terry, Texas or Roosevelt County, NM. Values for other AQCRs were the worst case from McKinley County or Otero County.

In cases where the facility is over 20 km from the area to be analyzed (such as a Class I area), refined MERPS by distance may be used in the equation. These are listed in Table 11, below.

[5] Guidance on the Development of Modeled Emission Rates for Precursors (MERPS) as a Tier 1 Demonstration Tool for Ozone and $PM_{2.5}$ under the PSD Permitting Program, Richard A. Wayland, EPA, April 30, 2019. (https://www.epa.gov/sites/default/files/2019-05/documents/merps2019.pdf)

Table 11: O_3 MERPS by Distance[a]

Distance (km)	$MERP_{NOX}$	$MERP_{VOC}$
20	340	5907
40	590	7685
60	758	8982
80	910	8982
100	1421	13858
120	1821	19852
140	1877	23521
160	1973	23521
180	2108	26018
200	2372	29505
220	2637	42771
240	2807	44854
260	3116	52623
280	3794	53031
300	4269	54946

[a] MERP values were determined using the most conservative value for each category from hypothetical single source modeling reported on the EPA website https://www.epa.gov/scram/merps-view-qlik. Values were from La Plata Co, Colorado, Terry, Texas, McKinley County, NM, Otero County, NM, or Roosevelt County, NM.

2.6.5.2 Ozone compliance demonstration for PSD minor sources

Any source that emits over 250 tons/year of NOX or VOCs is classified as a major source in the PSD program. (Some categories have lower thresholds than this, but all above 250 are PSD major.) The MERP values presented in Table 10 and Table 11 that produce the highest concentrations indicate that facilities emitting no more than 250 tons/year of NO_X and no more than 250 tons/year of VOCs will cause less formation of O_3 than the O_3 significance level. The calculation follows.

$$[O_3]_{8-hour} = \left(\frac{250 \frac{ton}{yr}}{340_{MERP_{NOX}}} + \frac{250 \frac{ton}{yr}}{4679_{MERP_{VOC}}} \right) \times 1.96 \text{ µg/m}^3$$

=1.546 µg/m^3, which is below the significance level of 1.96 µg/m^3.

This calculation demonstrates that any source that may be categorized as minor with respect to PSD will produce concentrations below the ozone SIL documented above. (Some PSD major sources may also be below SILs.) Sources that produce concentrations below SILs do not cause or contribute to air contaminant levels in excess of any air quality standards or PSD increments.

2.6.6 Particulate matter less than 2.5 micrometers in aerodynamic diameter ($PM_{2.5}$) Standards

Table 12: PM2.5 Air Quality Standards[6]

Averaging Period	Significance Level [d] ($\mu g/m^3$)	NAAQS ($\mu g/m^3$)	Class II PSD Increment[c] ($\mu g/m^3$)	Class I PSD Significance Level[d] ($\mu g/m^3$)	Class I PSD Increment[c] ($\mu g/m^3$)
annual	0.13	9.0[a]	4	0.05	1
24-hour	1.2	35 [b]	9	0.27	2

[a] To attain this standard, the 3-year average of the annual arithmetic mean $PM_{2.5}$ concentrations from single or multiple community-oriented monitors must not exceed 9 ug/m^3.
[b] To attain this standard, the 3-year average of the 98th percentile of 24-hour concentrations at each population-oriented monitor within an area must not exceed 35 ug/m^3.
[c] For any period other than an annual period, the applicable maximum allowable increase may be exceeded during one such period per year at any one location. PSD increments are listed in 40 CFR 52.21(c) (https://www.ecfr.gov/current/title-40/chapter-I/subchapter-C/part-52/subpart-A/section-52.21).
[d] The SIL is based on *Guidance on Significant Impact Levels for Ozone and Fine Particles in the Prevention of Significant Deterioration Permitting Program*, EPA, April 17, 2018.
(https://www.epa.gov/sites/default/files/2018-04/documents/sils_policy_guidance_document_final_signed_4-17-18.pdf)
and Supplement to the Guidance on Significance Impact Levels for Ozone and Fine Particles in Prevention of Significant Deterioration Permitting Program
https://www.epa.gov/system/files/documents/2024-04/supplement-to-the-guidance-on-significant-impact-levels-for-ozone-and-fine-particles-in-the-psd-permitting-program-4-30-2024.pdf
[e] 40 CFR 52.21(c) (https://www.ecfr.gov/current/title-40/chapter-I/subchapter-C/part-52/subpart-A/section-52.21)

2.6.6.1 $PM_{2.5}$ design value

The 24-hour design value is the 98th percentile of the combined concentrations from all sources. The annual design value is the annual average.

2.6.6.2 Modeling for the 24-hour $PM_{2.5}$ design value

AERMOD and current emissions inventories currently do not account for secondary formation of $PM_{2.5}$ in the atmosphere. Sources that emit at least 40 tons per year of NO_X or at least 40 tons per year of SO_2 are considered to emit significant amounts of precursors. Sources (including minor sources) with significant

[6] Prevention of Significant Deterioration (PSD) for Particulate Matter Less Than 2.5 Micrometers ($PM_{2.5}$) – Increments, Significant Impact Levels (SILs) and Significant Monitoring Concentration (SMC), ENVIRONMENTAL PROTECTION AGENCY
40 CFR Parts 51 and 52, RIN 2060-AO24 http://www.epa.gov/nsr/documents/20100929finalrule.pdf

increases of $PM_{2.5}$ precursors must qualitatively and/or quantitatively account for secondary formation of $PM_{2.5}$.[7]

$PM_{2.5}$ secondary formation concentrations may be estimated using the following method derived from the MERP guidance[8]. These factors are location-specific and conservative. Other MERP values may be used in consultation with modeling staff and inclusion in a modeling protocol. EPA has a tool that includes many more sources than previously included in initial modeling, allowing more specific evaluation and analysis based on the distance of receptors from the facility being analyzed: https://www.epa.gov/scram/merps-view-qlik. All MERP values should be obtained from the MERP guidance and EPA's MERP website.

Below are the guiding equations to estimate 24-hour and annual $PM_{2.5}$ secondary formation concentration suggested by the Bureau. Choose the appropriate MERP values from the table below based on the AQCR in which the facility is located.

$$[PM2.5]_{annual} = \left(\frac{NO_X \ emission \ rate(\frac{ton}{yr})}{MERP_{NOXannual}} + \frac{SO_2 \ emission \ rate(\frac{ton}{yr})}{MERP_{SO2annual}} \right) \times 0.2 \ \mu g/m^3$$

$$[PM2.5]_{24-hour} = \left(\frac{NO_X \ emission \ rate(\frac{ton}{yr})}{MERP_{NOX\_24}} + \frac{SO_2 \ emission \ rate(\frac{ton}{yr})}{MERP_{SO2\_24}} \right) \times 1.2 \ \mu g/m^3$$

Secondary formation from the project should be added to the modeled concentration.

Table 13: $PM_{2.5}$ MERPS[a]

AQCR	$MERP_{NOXannual}$	$MERP_{SO2annual}$	$MERP_{NOX\_24}$	$MERP_{SO2\_24}$
014	43833	48057	33634	11410
155	26780	14978	7331	1981
The rest of New Mexico	130260	53898	42498	9753

[a] MERP values were determined using the most conservative value for each category from hypothetical single source modeling reported on the EPA website https://www.epa.gov/scram/merps-view-qlik. AQCR 014 values were from La Plata Co, Colorado. AQCR 155 were from Terry, Texas or Roosevelt County, NM. Values for other AQCRs were the worst case from McKinley County or Otero County.

In cases where the facility is over 20 km from the area to be analyzed (such as a Class I area), refined MERPS by distance may be used in the equation. These are listed in the table below.

[a] MERP values were determined using the most conservative value for each category from hypothetical single source modeling reported on the EPA website https://www.epa.gov/scram/merps-view-qlik. In cases where a smaller MERPs value occurs at a larger distance than the distance represented from the modeling results, the smaller value is used in place of the larger value. Values were from La Plata Co, Colorado, Terry, Texas, McKinley County, NM, Otero County, NM, or Roosevelt County, NM.

Two tiers of modeling are available for $PM_{2.5}$ modeling. Both tiers include modeling the facility and nearby sources and adding secondary formation and a background concentration to that. Particulate sources typically have impacts in the immediate vicinity of the source that are not represented in background monitors, so double-counting of background concentrations is expected to be limited. Add the design value of the modeled direct $PM_{2.5}$ to the design value of the secondary $PM_{2.5}$ (from MERP equation) and the design value of the background $PM_{2.5}$.

Tier 1: To the modeled concentration(s), add the secondary $PM_{2.5}$ and the 98th percentile 24-hour monitored background concentration.

Tier 2: Add the secondary $PM_{2.5}$ and the monthly or quarterly maximum background concentrations to daily modeled concentrations. Compare the high-eighth-high combined concentration with the 24-hour standard. If multiple years of meteorological data are used, then the high-eighth-high from each year is averaged and the combined concentration at each receptor is compared with the standard[9].

[9] Guidance for PM2.5 Permit Modeling, U.S. Environmental Protection Agency, Office of Air Quality Planning and Standards, Pg. 58. (https://www.epa.gov/sites/production/files/2020-09/documents/guidance_for_pm25_permit_modeling.pdf)

2.6.6.3 Modeling for the 24-hour $PM_{2.5}$ PSD increment design value

Model the high-second-high concentration of all increment-consuming sources at the facility and at nearby sources. Calculate secondary formation from NO_X and SO_2 increases after the appropriate baseline date and add that to the modeled concentration. Compare the total with the 24-hour PSD increment.

2.6.6.4 Modeling for the annual $PM_{2.5}$ PSD increment design value

Model all increment-consuming sources at the facility and at nearby sources. Calculate secondary formation from NO_X and SO_2 increases after the appropriate baseline date and add that to the modeled concentration. Compare the total predicted annual average concentration with the allowable increment.

2.6.7 Particulate matter less than 10 micrometers in aerodynamic diameter (PM_{10}) Standards

Table 15: PM_{10} Air Quality Standards

Averaging Period	Significance Level (µg/m³)	NAAQS (µg/m³)	PSD Increment[b] Class II (µg/m³)	PSD Class I Significance Level (µg/m³)	PSD Class I Increment[b] (µg/m³)
annual	1.0		17	0.2[a]	4
24-hour	5.0	150	30	0.3[a]	8

[a] EPA proposed significance level[10]

[b] For any period other than an annual period, the applicable maximum allowable increase may be exceeded during one such period per year at any one location. PSD increments are listed in 40 CFR 52.21(c) (https://www.ecfr.gov/current/title-40/chapter-I/subchapter-C/part-52/subpart-A/section-52.21).

2.6.7.1 Modeling for the 24-hour PM_{10} NAAQS design value

If PM2.5 emission rates are modeled as equal to PM10 emission rates, then the PM2.5 NAAQS demonstration will satisfy the requirement for demonstration of compliance with PM10 NAAQS. However, PM10 PSD increment demonstration is not necessarily satisfied by any PM2.5 modeling.

The 24-hour NAAQS is not to be exceeded more than once per year.
Use high second high and a single year of representative meteorological data. This is approximately equivalent to the high fourth high specified in the multi-year analysis.
"…[W]hen n years are modeled, the $(n+1)^{th}$ highest concentration over the n-year period is the design value, since this represents an average or expected exceedance rate of one per year."
(https://www.epa.gov/sites/production/files/2020-09/documents/appw_05.pdf)
Alternatively, use the high second high averaged across the multiple years.

Two tiers of modeling are available for PM_{10} NAAQS modeling. Both tiers include modeling the facility and nearby sources and adding a background concentration to that. Particulate sources typically have

[10] EPA proposed significance levels are lower than the particulate matter significance levels contained in *Class I Area Significant Impact Levels*, John Calcagni, EPA, September 10, 1991 (https://www.epa.gov/sites/default/files/2015-07/documents/levels.pdf).

impacts in the immediate vicinity of the source that are not represented in background monitors, so double-counting of background concentrations is expected to be limited.

Tier 1: Use high second high predicted concentration and a single year of representative meteorological data. To the modeled concentration, add the high second high 24-hour monitored background concentration[11].

Tier 2: Add monthly maximum background concentrations to daily modeled concentrations. The high-second-high combined concentration may be compared with the 24-hour standard.

2.6.7.2 Modeling for the 24-hour PM_{10} PSD increment design value

Model all increment-consuming sources at the facility and at nearby sources. Compare the high-second-high predicted concentration with the allowable increment.

2.6.7.3 Modeling for the annual PM_{10} PSD increment design value

Model all increment-consuming sources at the facility and at nearby sources. Compare the predicted annual average concentration with the allowable increment.

2.6.8 Sulfur Dioxide (SO_2) Standards

Table 16: SO_2 Air Quality Standards

Averaging Period	Significance Level (µg/m³)	NAAQS (ppb)	NAAQS (µg/m³)	NMAAQS (ppb)	NMAAQS (µg/m³)	PSD Class II Increment[c] (µg/m³)	PSD Class I Significance Level (µg/m³)	PSD Class I Increment[c] (µg/m³)
annual	1.0			20	52.4	20	0.1[b]	2
24-hour	5.0			100	261.9	91	0.2[b]	5
3-hour	25.0	500	1309.3			512	1.0[b]	25
1-hour	7.8[a]	75	196.4					

[a] EPA interim 1-hour significance level of 3 ppb[12] corrected to a reference temperature of 25°C and a reference pressure of 760 millimeters of mercury.

[b] EPA proposed significance level.[13]

[c] For any period other than an annual period, the applicable maximum allowable increase may be exceeded during one such period per year at any one location. PSD increments are listed in 40 CFR

[11] Guidance for PM2.5 Permit Modeling, U.S. Environmental Protection Agency, Office of Air Quality Planning and Standards, Pg. 58. (https://www.epa.gov/sites/production/files/2020-09/documents/guidance_for_pm25_permit_modeling.pdf)

[12] General Guidance for Implementing the 1-hour SO_2 National Ambient Air Quality Standard in Prevention of Significant Deterioration Permits, Including an Interim 1-hour SO_2 Significant Impact Level, Anna Marie Wood, EPA, August 23, 2010 (https://www.epa.gov/sites/default/files/2015-07/documents/appwso2.pdf)

[13] EPA proposed significance levels are less than or equal to the SO_2 significance levels contained in *Class I Area Significant Impact Levels*, John Calcagni, EPA, September 10, 1991 (https://www.epa.gov/sites/default/files/2015-07/documents/levels.pdf).

52.21(c) (https://www.ecfr.gov/current/title-40/chapter-I/subchapter-C/part-52/subpart-A/section-52.21).

2.6.8.1 SO_2 design value

In NMAC, the SO_2 NMAAQS standards for the area within 3.5 miles of the Chino Mines Company smelter furnace stack at Hurley are set equal to the federal standards. However, since this stack no longer exists, the distance is irrelevant. The NMAAQS listed in Table 16 apply for the entire state. Demonstration of compliance with 1-hour standard will also demonstrate compliance with the other standards, but not necessarily the PSD increments.

The form of the 1-hour SO_2 NAAQS is the 3-year average of the 99th percentile of the annual distribution of daily maximum 1-hour average concentrations.

2.6.8.2 Modeling for the 1-hour SO_2 NAAQS

The standard is calculated similarly to the NO_2 1-hour standard instructions in section 2.6.4.4, but the fourth highest is used in place of the eighth highest (and 99th percentile is substituted for 98th percentile). All sulfur oxides are assumed to be in the form of SO_2. If multiple years are modeled, the resulting high-fourth-high values at each receptor are averaged over the years modeled and the maximum average value is compared with the standard.

Tier 1: If the facility is less than 20 km from the center of Albuquerque and El Paso, add the 99th percentile 1-hour background concentration to 99th percentile modeling for the entire facility and neighboring sources within 10 km of the facility and compare the total with the 1-hour NAAQS. If the facility is in the Pecos-Permian Basin Intrastate AQCR (AQCR 155), model the facility and surrounding sources (because representative monitoring may not be available). Sources in other areas may add the 99th percentile 1-hour background concentration to 99th percentile modeling for the entire facility (without neighboring sources) and compare the total with the 1-hour NAAQS or model the facility and all nearby sources without adding a background concentration.

Tier 2: For the cases where monitored background concentrations are described in Tier 1, add the hourly 1-hour background concentrations (as described in the background concentration section) to each hour instead of the 99th percentile 1-hour background concentration. The combined modeling results are compared the 99th percentile of the totals with the 1-hour NAAQS.

2.6.8.3 Modeling for the 3-hour SO_2 PSD increment

Model the increment consuming emissions at the facility and at nearby sources and compare the high-second-high 3-hour average with the allowable PSD increment. Optionally, a monitored background value may be substituted for the modeled surrounding sources as a conservative approach to the increment consumption, if available.

2.6.8.4 Modeling for the 24-hour SO_2 PSD increment

Model the increment consuming emissions at the facility and at nearby sources and compare the high-second-high 24-hour average with the allowable PSD increment. Optionally, a monitored background value may be substituted for the modeled surrounding sources as a conservative approach to the increment consumption, if available.

2.6.8.5 Modeling for the annual SO_2 PSD increment

Model the increment consuming emissions at the facility and at nearby sources and compare the predicted annual average with the allowable PSD increment. Optionally, a monitored background value may be substituted for the modeled surrounding sources as a conservative approach to the increment consumption, if available.

2.6.9 Total Reduced Sulfur Except For Hydrogen Sulfide Standards

Table 17: Total Reduced Sulfur except for H_2S Air Quality Standards

Averaging Period	NMAAQS[a] (ppm)	Notes
1/2-hour	0.003	for the state, except for the Pecos-Permian Basin Intrastate AQCR
1/2-hour	0.010	for the Pecos-Permian Basin Intrastate AQCR
1/2-hour	0.003	For within corporate limits of municipalities within the Pecos-Permian Basin Intrastate Air Quality Control Region.
1/2-hour	0.003	For within five miles of the corporate limits of municipalities having a population of greater than twenty thousand and within the Pecos-Permian Basin Intrastate Air Quality Control Region

[a] 20.2.3.110.C NMAC (https://www.srca.nm.gov/parts/title20/20.002.0003.html)

2.6.9.1 Total Reduced Sulfur design value

EPA test methods suggest that reduced sulfur compounds in some cases consist primarily of carbon disulfide (CS_2), carbonyl sulfide (COS), and hydrogen sulfide (H_2S). To calculate the parts per million of reduced sulfur, use the average molecular weight in the sample. For example, 1-heptanethiol ($CH_3[CH_2]6SH$) has a molecular weight of 132.3.

For modeling ½-hour total reduced sulfur NMAAQS, use the 1-hour averaging time because the models cannot resolve less than one-hour increments.

2.6.9.2 Modeling the Total Reduced Sulfur ½-hour NMAAQS

Model the entire facility and compare the 1-hour predicted concentration with the ½-hour NMAAQS. Surrounding sources and background concentrations are not added.

Table 18: Air Quality Standard Summary (Without Notes)

Pollutant	Averaging Period	Significance Level (µg/m³)	Class I Significance Level (µg/m³)	NAAQS (µg/m³)	NMAAQS (µg/m³ unless noted)	PSD Increment Class I (µg/m³)	PSD Increment Class II (µg/m³)

Table 20: Modeling the Design Value Summary (Default Modeling)

Averaging Period	Model Nearby Sources or Add Background[a]?	Modeled Concentration
CO 8-hour NMAAQS	Choose one (Both if near city)	high 8 hour
CO 1-hour NMAAQS	Choose one (Both if near city)	high 1 hour
H_2S 1-hour or ½-hour NMAAQS	Model nearby sources	high 1 hour
Pb Quarterly NMAAQS	Model nearby sources, if available	high month
NO_2 annual NMAAQS	Choose one (Both if near city)	annual average
NO_2 annual PSD increment	Choose one[b]	annual average
NO_2 1-hour NAAQS	Choose one (Both if near city)	98th-percentile 1 hour
$PM_{2.5}$ annual NAAQS	Both	annual average
$PM_{2.5}$ annual PSD increment	Choose one[b]	annual average
$PM_{2.5}$ 24-hour NAAQS	Both	98th-percentile 24 hour
$PM_{2.5}$ 24-hour PSD increment	Choose one[b]	high second high 24 hour
PM_{10} annual PSD increment	Choose one[b]	annual average
PM_{10} 24-hour NAAQS	Both	high second high 24 hour
PM_{10} 24-hour PSD increment	Choose one[b]	high second high 24 hour
SO_2 annual PSD increment	Choose one[b]	annual average
SO_2 24-hour PSD increment	Choose one[b]	high second high 24 hour
SO_2 3-hour PSD increment	Choose one[b]	high second high 3 hour
SO_2 1-hour NAAQS	Choose one (Both if near city. Model nearby sources without adding background in Permian Basin)	99th-percentile 1 hour
Reduced S ½-hour NMAAQS	Model nearby sources, if available	high 1 hour

[a] Background concentrations added have the same form as the air quality standard. For example, if the standard is the 98th percentile then the 98th percentile modeled (high-eighth-high) concentration would be added to the 98th percentile monitored concentration. The pollutant-specific sections above provide additional details.

[b] Assuming that all monitored background concentration consumes PSD increment is thought to be conservative compared to modeling the subset of surrounding sources that consume increment. If the background concentration is available and low enough to demonstrate compliance with PSD increment when added to the modeled concentration from the facility, then this approach may be used instead of modeling the surrounding sources.

2.7 PSD Increment Modeling

2.7.1 Air Quality Control Regions and PSD Baseline Dates

Any facility that is required to provide an air dispersion modeling analysis with its construction permit application is required to submit a PSD increment consumption analysis unless none of its sources consume PSD increment. Table 21 serves as a tool to determine which sources to include in PSD increment modeling.

Table 21: PSD Increment Consumption and Expansion

Sources that do not consume PSD increment	• Temporary emissions (sources involved in a project that will be completed in a year or less). • Any facility or modification to a facility constructed before the PSD major source baseline date. • Any minor source constructed before the PSD minor source baseline date.
Sources that consume PSD increment	• Any new emissions or increase in emissions after the PSD Minor Source Baseline date (for that AQCR and pollutant). • Any new emissions or increase in emissions at a PSD Major source that occurs after the Major Source Baseline Date.
Sources that expand PSD increment	• A permanent reduction in actual emissions from a baseline source.

Notes:

- EPA memos written before the publication of the Draft NSR Workshop Manual indicate that PSD regulations were not intended to apply to temporary pilot projects. The memo clearly indicated that the pilot project did not need a PSD permit[14].
- If a minor source facility once existed but shut down before the minor source baseline date, then it would not be considered to be part of the baseline.
- Haul road emissions are treated the same way other sources of emissions are treated.
- An increase in emissions due to increased utilization of a facility, such as de-bottlenecking, are treated as any other increase in emissions.
- The Bureau interprets temporary emissions to mean emissions at the location that will occur for less than one year or emissions of standby or emergency equipment that operates less than 500 hours per year. For example, if a series of three gravel crushers operate at a mine for more than one year, PSD increment modeling should be performed because the mining operations at the location are not temporary in nature, even though none of the of individual crushers remained on-site for an entire year.

Table 22: Minor Source Baseline Dates by Air Quality Control Region

AQCR	NO_2 Date	SO_2 Date	PM_{10} Date	$PM_{2.5}$ Date
12	8/10/1995	8/10/1995	8/10/1995	Not established
14	6/6/1989	8/7/1978	8/7/1978	Not established
152	3/26/1997	5/14/1981	3/26/1997	2/11/2013
153	8/2/1995	Not established	6/16/2000	Not established
154	Not established	Not established	Not established	Not established
155	3/16/1988	7/28/1978	2/20/1979	11/13/2013
156	Not established	8/4/1978	8/4/1978	Not established
157	Not established	Not established	Not established	Not established

Table 23: Major Source Baseline Dates and Trigger Dates

Pollutant	Major Source Baseline Date	Trigger Date
PM	January 6, 1975	August 7, 1977
SO_2	January 6, 1975	August 7, 1977
NO_2	February 8, 1988	February 8, 1988
$PM_{2.5}$	October 20, 2010	October 20, 2011

2.7.2 PSD Class I Areas

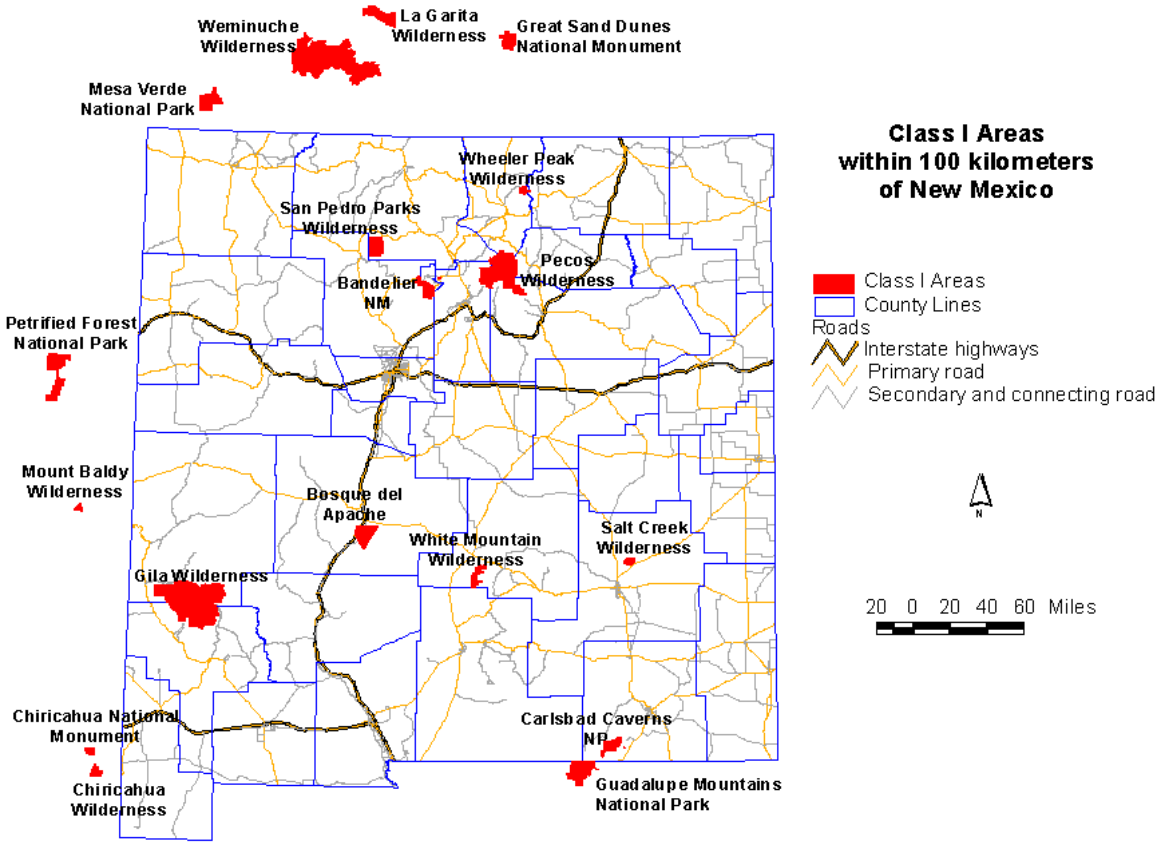

Figure 1: Class I areas

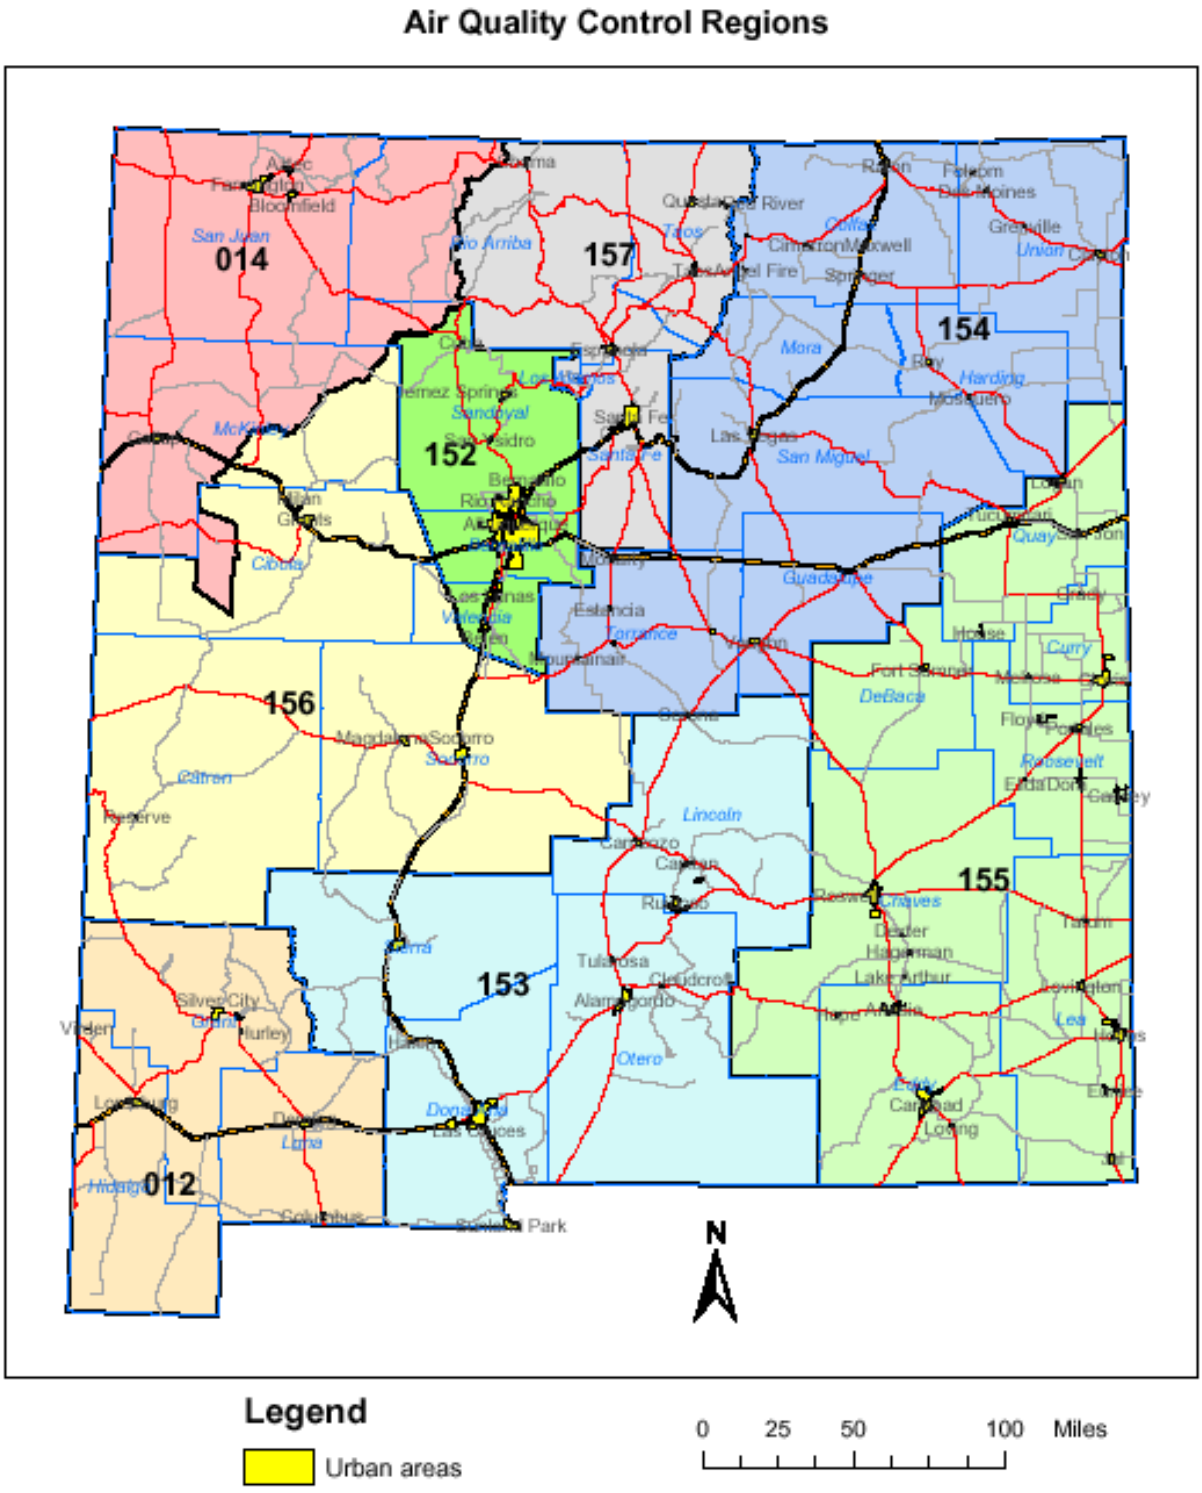

Figure 2: Air quality control regions (each AQCR has a different color)

2.8 New Mexico State Air Toxics Modeling

Modeling must be provided for any toxic air pollutant sources that may emit any toxic pollutant in excess of the emission levels specified in **20.2.72.502 NMAC** - Permits for Toxic Air Pollutants. Sources may use a correction factor based on release height for the purpose of determining whether modeling is required. Divide the emission rate for each release point by the correction factor for that release height on Table 25 and add the total values together to determine the total adjusted emission rate. If the total adjusted emission rate is higher than the emission rate in pounds per hour listed in **20.2.72.502 NMAC**, then modeling is required. The controlled emission rate (not the adjusted emission rate) of the toxic pollutant should be used for the dispersion modeling analysis.

Table 24: Stack Height Release Correction Factor (adapted from 20.2.72.502 NMAC)

Release Height in Meters	Correction Factor
0 to 9.9	1
10 to 19.9	5
20 to 29.9	19
30 to 39.9	41
40 to 49.9	71
50 to 59.9	108
60 to 69.9	152
70 to 79.9	202
80 to 89.9	255
90 to 99.9	317
100 to 109.9	378
110 to 119.9	451
120 to 129.9	533
130 to 139.9	617
140 to 149.9	690
150 to 159.9	781
160 to 169.9	837
170 to 179.9	902
180 to 189.9	1002
190 to 199.9	1066
200 or greater	1161

The table below lists a few of the commonly encountered State Air Toxics in New Mexico. This is not the complete list, which is too expansive to reprint here.

Table 25: A few common state air toxics and modeling thresholds (from 20.2.72.502 NMAC)

Pollutant	OEL (µg/m^3)	1% OEL (µg/m^3)	Emission Rate Screening Level (pounds/hour)
Ammonia	18	180	1.20
Asphalt (petroleum) fumes	5.00	50	0.333
Carbon black	3.50	35	0.233
Chromium metal	0.500	5.00	0.0333
Glutaraldehyde	0.700	7.0	0.0467
Nickel Metal	1.00	10.0	0.0667
Wood dust (certain hard woods as beech & oak)	1.00	10.0	0.0667
Wood dust (soft wood)	5.00	50.0	0.333

If modeling shows that the maximum eight-hour average concentration of each toxic pollutant is less than one one hundredth of its Occupational Exposure Level (OEL) listed in **20.2.72.502 NMAC**, then the analysis is finished. For a source of any known or suspected human carcinogens (per **20.2.72.502 NMAC**) which will cause an impact greater than one-one hundredth of the OEL, the source must demonstrate that best available control technology will be used to control the carcinogen. If modeling shows that the impact of a toxic which is not a known or suspected human carcinogen (per **20.2.72.502 NMAC**) is greater than one-one hundredth of the OEL, the application must contain a health assessment for the toxic pollutant that includes: source to potential receptor data and modeling, relevant environmental pathway and effects data, available health effects data, and an integrated assessment of the human health effects for projected exposures from the facility.

2.9 Hazardous Air Pollutants

Hazardous Air Pollutants (HAPs) do not require modeling, as they are regulated by means other than air quality standards. Sources should be aware of the Title V major source thresholds of 10 tons/year for any Hazardous Air Pollutants (HAP) and 25 tons/year for total HAPs, which will require an operating permit to be obtained from the department under **20.2.70 NMAC**- Operating Permits.

2.10 Nonattainment and Maintenance Areas

In nonattainment areas and for those sources outside of the nonattainment area that significantly contribute to concentrations in a nonattainment area, the modeling analysis required is a demonstration of an air quality benefit. Regular modeling is required in maintenance areas, however. Further information on nonattainment area modeling is in section 7.4, Nonattainment Area Requirements. Nonattainment areas are described at https://www.env.nm.gov/air-quality/nonattainment-areas/.

3.0 MODEL SELECTION

3.1 What dispersion models are available?

The Bureau accepts the use of EPA approved models for dispersion analysis. Commercial or parallel versions of these models are fine as long as they produce the same results. This section of the modeling guidelines is designed to describe the models that are available and provide some guidance on which situations are the most appropriate for which regulatory modeling situations.

Two types of models are currently in use for air dispersion modeling: probability density function (PDF) models, and puff models. Probability density function models apply a probability function from each emission release point to calculate the concentration at a receptor based on the location of the receptor, wind speed and direction, stability of the atmosphere, and other factors. The plume is assumed to extend all the way out to the most distant receptor, no matter how far that receptor is from the emission source. Because of this characteristic, PDF models suffer in accuracy when modeling distant concentrations or unstable conditions. SCREEN3, ISCST3, ISC_OLM, CTSCREEN, ISC-PRIME, and AERMOD are all PDF models. All but AERMOD use a Gaussian, or normal, distribution for their probability density function. AERMOD uses a PDF that varies depending on nearby terrain and other factors. Currently, AERMOD and CTSCREEN are EPA-approved models for near-field modeling. As of November 9, 2006, SCREEN3, ISCST3, and ISC_OLM are no longer considered EPA-approved models. The Federal Register notice detailing the promulgation of AERMOD is located at: https://www.epa.gov/sites/production/files/2020-09/documents/appw_05.pdf

CALPUFF is a puff model, meaning that it tracks puffs, or finite elements of pollution, after they are released from their source. This strategy makes the model ideal for tracking pollution over long distances or in conditions that are not stable, and also allows chemical reactions within the plume to be modeled. Unfortunately, puff models require large amounts of computing time. CALPUFF is an EPA-approved model for modeling long range transport and/or complex non-steady-state meteorological conditions.

3.2 EPA Modeling Conferences and Workshops

EPA Modeling Conference presented a wealth of information about recent regulatory modeling developments. The EPA web page with the details is https://www.epa.gov/scram/air-modeling-conferences-and-workshops.

3.3 Models Most Commonly Used in New Mexico

Most analyses reviewed by the Bureau will begin with an AERMOD analysis, and possibly CALPUFF for Class I analyses. For dispersion modeling within 50 kilometers of the source, AERMOD should be used. CALPUFF should be used only for PSD Class I area analyses, per the Interagency Workgroup Air Quality Modeling (IWAQM) Phase II report, but may be approved for use on a case-by-case basis for other analyses.

3.3.1 AERMOD

- AERMOD is intended to be the standard regulatory model. The PRIME building downwash algorithm is used by the model. Both the Ozone Limiting Method (OLM) and the Plume Volume Molar Ratio Method (PVMRM) algorithms for nitrogen conversion are built into the model.
- AERMOD has greater accuracy in complex terrain than CTSCREEN.
- AERMOD is suggested for extremely complex terrain.

See the section on nitrogen oxides for more information and options.

3.3.2 CALPUFF

- CALPUFF is a puff model designed to calculate concentrations at distances up to and beyond 50 kilometers. The model is significantly more difficult to run than the other models discussed in these guidelines. Use of CALPUFF for NAAQS, NMAAQS, or PSD increment modeling must be approved by the Bureau before submitting the modeling.
- CALPUFF is required for additional impact analyses when Federal Land Managers require additional impact analyses for Class I areas near PSD major sources. Typically, CALPUFF light is used for this modeling.

3.3.3 CTSCREEN

- CTSCREEN is applicable only for modeling receptors above stack height.
- CTSCREEN is a difficult model to run because of the difficulty in obtaining hill contour profiles.
- CTSCREEN uses screening meteorology.
- AERMOD produced greater accuracy than CTDMPLUS (the full implementation of CTSCREEN) when modeling the data that was used to develop CTSCREEN/CTDMPLUS.
- CTSCREEN is typically used to model the terrain on top of a hill that did not pass when using AERMOD.

The following list can be used to correct 1-hour CTSCREEN concentrations to 3-hour, 24-hour and annual concentrations by multiplying by the appropriate conversion factor for the averaging period.

Table 26: CTSCREEN Correction factors for 1-hour concentration

Averaging Period	Correction factor
3-hour	0.7
24-hour	0.15
Annual	0.03

3.3.4 AERSCREEN

- AERSCREEN is a screening version of AERMOD.

4.0 MODEL INPUTS AND ASSUMPTIONS

Models should be used with the technical options recommended in the Guideline on Air Quality Models (https://www.epa.gov/sites/production/files/2020-09/documents/appw_17.pdf) except as noted in this document or approved by the Bureau.

Unless otherwise noted, information and procedures in this section refer to all of the models listed above.

4.1 Operating Scenarios

4.1.1 Emission Rates

All averaging periods shall be modeled using the maximum short-term emission rate allowed in the permit. The preferred method of modeling all averaging periods is to use maximum short-term emission rates and to use the hours of operation model input option to limit the facility's emissions.

4.1.2 Hours of Operation

If the facility is limited to operating certain hours of the day or has other operating restrictions, limiting the operating hours in the model can normally reduce the concentration produced by the model. Hours of operation can only be modeled by models that use actual meteorology, but not by screening models. Use screening models only to model facilities as if the maximum operating rate were emitting continuously.

4.1.3 Time Scenarios

Sometimes a facility has unusual operating times, for example, if the facility is allowed to operate 12 hours per day, but the hours are not specified. The facility may model as if it operates continuously, but as an option, the facility can model different time periods at the amount of time allowed per day as different operating scenarios, making sure that the maximums are modeled. In the 12 hour example, the facility might model three scenarios: 7AM to 7PM. 7PM to 7AM. And 5PM to 5AM. This way, all the hours of the day were modeled, and the modeler can be fairly certain that the maximum was modeled because the worst-case scenarios would occur when the calm blocks of time were modeled together. All scenarios should be modeled at maximum hourly emission rates. Annualized or averaged emission rates of intermittent sources should not be used to evaluate short term standards.

4.1.4 Operating at Reduced Load

Some sources (like engines and boilers) can produce higher concentrations of pollution in ambient air when they are operating below maximum load than when they are at maximum load. The applicant shall analyze various feasible operating scenarios (100%, 75%, and 50% are typical) to determine the worst-case impacts, and then use that worst-case scenario for the entire modeling analysis. This requirement is in section 8.1 of Appendix W of EPA's Guideline.

4.1.5 Alternate Operating Scenario

If the permit application contains multiple operating scenarios (such as use of different fuels or different engines) then the applicant shall model each of the scenarios for the radius of impact analysis. Whichever scenario produces the greatest impacts for that pollutant on ambient air shall be used for the cumulative analysis, if any scenario produces significant concentrations. If it is unclear which operating scenario produces the greatest impacts, each scenario shall be modeled for cumulative impact analysis.

4.1.6 Startup, Shutdown, Maintenance (SSM), and Other Short-term Emissions

If startup, shutdown, maintenance, or other temporary events have the potential for producing short-term impacts greater than the normal operating scenarios, then the applicant shall model each of the scenarios to demonstrate compliance with the ambient air quality standard.

If it is probable that an adjacent facility will have emissions higher than normal operation during the time the applicant's facility has increased emissions, then those emissions should also be accounted for in the modeling. Otherwise, model surrounding sources at their normal operating rate. Because of the short nature of the SSM emissions, modeling does not have to demonstrate compliance with annual standards or annual increment consumption. Highest hourly SSM emission rate should be modeled for NAAQS, NMAAQS and for increment consumption modeling. Emergency equipment that operates less than 500 hours per year do not need to demonstrate compliance with PSD increment, but other SSM emissions do.

Whichever scenario produces the greatest impacts on ambient air shall be used for the cumulative analysis, if required. If it is unclear which operating scenario produces the greatest impacts, each scenario shall be modeled for cumulative impact analysis.

4.2 Plume Depletion and Deposition

Dry plume depletion may be used to reduce concentrations of particulate matter. Appropriate particle characteristics for the specific type of source being modeled should be used. Check the web page (https://www.env.nm.gov/air-quality/modeling-publications/) for sample particle size distributions. Because of the length of time required to run a model with plume depletion, the Bureau recommends only applying plume depletion to receptors that are modeled to be above standards when the model is run without plume depletion.

The wet deposition option should not be used for the modeling analysis unless data are available and the use of wet deposition has been previously approved.

Table 27: Plume Depletion Parameters for $PM_{2.5}$

Source Type	Mass Mean Particle Diameter (µm)	Mass Weighted Size Fraction	Density (g/cm^3)
Asphalt Baghouse[a]	0.63	0.72	1.50
	1.85	0.28	1.50

4.3 Meteorological Data

4.3.1 Selecting Meteorological Data

The meteorological data used in the modeling analysis should be representative of the meteorological conditions at the specific site of proposed construction or modification, or else use screening meteorological data, which contains worst-case data.

Representative, on-site data is obviously the best data to use; however, for many sources on-site data is not available. Bureau modeling staff can supply preferred meteorological data sets for various locations around the state. The National Weather Service (NWS) also collects data throughout the country. These data sets are available through the National Climatic Data Center. It is mandatory that Bureau modeling staff approve the chosen meteorological data before the analysis is submitted. At least one year of site-specific data, three years of prognostic meteorological data, or five years of NWS or comparable data must be used. Alternatively, one year of the data may be used with evidence that the year selected produces the highest concentrations for the type of facility and standard being modeled. Table 28, below, identifies cases where the Bureau has determined a single year can be used, based on the currently processed meteorological data. If an impact is more than 95% of a limit or standard, use 5 years of data.

PSD permits contain more rigorous requirements relating to the collection of representative, on-site meteorological data. Please contact the Bureau as soon as possible if you anticipate the need to collect on-site meteorological or ambient monitoring data for a PSD permit.

Table 29: Meteorological Data Year Producing Highest Concentrations

Met Station	Use for Haul Road, Fugitive Sources, or Short Stacks[a]	Use for Flares or Very Tall Stacks[b]	Years Processed	Latitude	Longitude	Elevation (m)

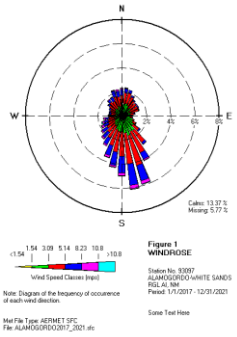
Sunland Park (Desert View)	Use 2020	Use 2018	2018-2022	31.796	-106.584	1176
Relocation modeling	Hobbs	Bernalillo				

[a] Analysis based on volume source with 3.4 m release height, 6.05 m initial horizontal dimension, and 3.16 m vertical dimension.

[b] Analysis based on stack with 30.48 m height, 1273.15 K temperature, 20 m/s exit velocity, and 15.298 m diameter.

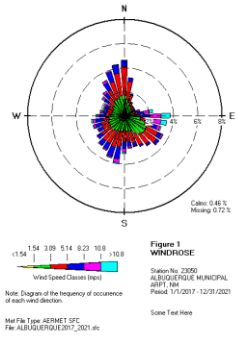
Select the site description that best matches the facility being modeled. For meteorological data, the similarity of the terrain (including canyon and valley directions) is more important than finding the closest monitor. Unless otherwise noted, AQB staff will need the exact location of the facility to select or approve a set of meteorological data representative of the location. Staff will compare wind roses with prominent terrain features that influence drainage patterns or otherwise influence wind directions.

Setback distance modeling for portable sources may require separate meteorological data than that used in the rest of the modeling analysis for that facility. The conclusions of the latest analysis are identified in the table above under the heading, "Relocation modeling". The selected meteorological data set is appropriate for locations throughout the State.



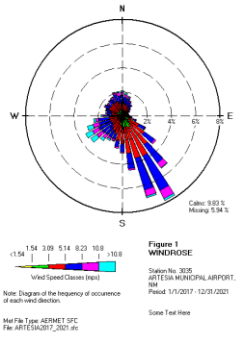
Processed meteorological data is available from the modeling web page: https://www.env.nm.gov/air-quality/modeling-publications/

The Bureau typically uses the following values for processing meteorological data. Contact Bureau staff with questions about how specific data sets were processed.



- Threshold wind speed = 0.5 m/s
- Arid and Dry conditions
- AERMINUTE data is used when available
- Adjust u_*
- Randomize NWS wind directions
- Adjust ASOS wind speeds
- 12 primary and secondary wind sectors

4.3.1 Wind Roses



Wind roses may be helpful for determining what data best matches the terrain features around the proposed facility or for other reasons. The wind roses of NMED processed data follow.

4.4 Background Concentrations

> "Background concentrations should be determined for each critical (concentration) averaging time." (68242 Federal Register / Vol. 70, No. 216 / Wednesday, November 9, 2005 / Rules and Regulations)

The background concentrations listed below were derived from information downloaded from https://aqs.epa.gov/aqsweb/airdata/download_files.html.

4.4.1 Uses of Background Concentrations

Background concentrations are added to the modeled concentrations or are used for stoichiometric modeling applications such as OLM or PVMRM. Normally, a background concentration associated with the averaging period being modeled is added after the model (with all facility and nearby sources) is completed. Sometimes this approach proves too conservative to demonstrate compliance with standards. If so, monthly, daily, or hourly concentration profiles can be developed using representative sets of monitoring data appropriate for the modeling domain. Adding refined background concentrations normally requires post-processing of hourly output files.

It is very important to use recent monitoring data, because concentration trends are likely to change over time (much more so than weather patterns). If hourly meteorological data does not match hourly monitoring data, then the following methods can be used to produce a concentration profile for the refined modeling exercise.

Choose the highest background for each period for the region that best describes the modeling domain, unless adequate justification can be made that a specific monitor is most representative. For rural areas that do not match the regional descriptions above, use a monitor from Eastern NM or Southwestern NM.

4.4.1.1 Refined background concentrations

Background concentrations may be refined to take into account patterns in daily and monthly fluctuations in concentration. Since background concentrations are added to the model after dispersion is complete, there is no point mathematically in determining refined background concentrations shorter than the averaging period of the air quality standard. 24-hour concentrations do not need 1-hour background concentrations (except for ozone limiting of NO_2 concentrations, which happens during dispersion).

4.4.1.2 Developing 24-hour refined background concentrations

Each of the 12 months is represented by the maximum 24-hour concentration occurring during that month. If three years of data are available, average the three values for each month and use the average for the background. If a given month has a low maximum concentration due to the small number of samples collected that month, then the concentration from that month is not used and the average of the maximums of the two other years will be used as the 24-hour background for that month.

4.4.1.3 Developing 1-hour refined background concentrations

From the geographically nearest full set of monitoring data to the facility to be modeled, determine the maximum one-hour concentration that occurs during each hour of the day for each month. The result will be twelve different 24-hour profiles that will be repeated for the entire month that each represents. This profile can be used for all averaging periods. If three years of data are available, average the three values for each month and use the average for the background.

Example: Determine the maximum concentration for hour 1 (midnight to 1AM) in January. Use this for hour 1 for each day in January. Determine the maximum concentration for hour 2 (1AM to 2AM) in January. Use this for hour 2 for each day in January. … Determine the maximum concentration for hour 24 (11PM to midnight) in December. Use this for hour 24 for each day in December. Complete the entire year in this manner, with hour and month-specific data.

4.4.1.4 Eliminating double-counting of emissions in background

In some cases the addition of a background concentration may result in double-counting of some of the emissions, if the reference monitor is very close to the modeling domain. This effect may be reduced by placing a receptor at the monitor location and modeling the sources in the model that existed at the time of the monitoring. The modeled concentration at the monitor may be subtracted from the background (with a minimum background of zero). The averaging period should be the same as the one used for the background calculation and must be temporally correlated if the maximum monitored concentration is not being used.

4.4.2 CO Background Concentration

Ambient CO monitors to represent New Mexico are very limited. Concentrations near Sunland Park are best represented by monitors in El Paso. Monitors operated by Albuquerque should be conservative for the rest of New Mexico.

Table 30: Carbon Monoxide Background Concentration

Region	ID	Location	1-hour (µg/m³)	8-hour (µg/m³)	Latitude	Longitude	Notes
The rest of New Mexico	350010023	Del Norte High School	2148	1265	35.1343	-106.585	4700a San Mateo NE, Albuquerque, NM
Albuquerque	350010029	South Valley	3297	1227	35.01708	-106.657	201 Prosperity SE, Albuquerque, NM
Sunland Park	481410044	El Paso Chamizal	4904	3335	31.76569	-106.455	800 S San Marcial Street, El Paso, TX

Concentrations are the average of the maximum concentrations for 2018-2020.

4.4.3 H_2S Background Concentration

NMED has no H_2S monitors. The standards are generally designed to protect against noticeable changes in concentration above the background concentration for the region, and no background concentration is added. Cumulative analysis should be conducted using surrounding source modeling.

4.4.4 Lead Background Concentration

Reformulation of gasoline and other control measures have virtually eliminated ambient lead concentrations. NMED has no lead monitors. Treat as zero background.

4.4.5 NO_2 Background Concentration

Note: No 24-hour averages were calculated. Compliance with 1-hour NAAQS automatically demonstrates compliance with 24-hour NMAAQS.

Table 31: NO_2 Background Concentration

Region	ID	Location	1-hour Background ($\mu g/m^3$)	1-hour 98th %ile ($\mu g/m^3$)	Annual Background ($\mu g/m^3$)	Latitude	Longitude	Address

Annual background is the average of three annual averages of monitoring data from 2018 to 2020. The maximum 1-hour NO_2 concentrations from each of three years were averaged to determine the 1-hour background concentration, using monitoring data from 2018 to 2020.
Refined 1-hour background profiles may be developed using the guidance described in "Refined Background Concentrations", above.
[a]Based on 2013 -2015 averages.

4.4.6 Total Reduced Sulfur Background Concentration

NMED has no total reduced sulfur monitors. The standards are generally designed to protect against noticeable changes in concentration above the background concentration for the region, and no background concentration is added.

4.4.7 Ozone Background Concentration

Ozone background concentrations are required for NO_2 modeling using PVMRM or OLM. The hourly maximum ozone concentration from the nearest ozone monitor may be used for ozone limiting. Refined 1-hour background profiles may be developed using the guidance described in "Refined Background Concentrations", above. Ozone files typically use the format, "(4I2,5X,F8.3)". Hourly concentrations use $\mu g/m^3$ to avoid elevation errors.

Table 32: Ozone Background Concentration

[a]Based on 2015-2017 averages.
[b]Based on 2013-2015 averages.

Concentrations are the average of three years of maximum data from 2018 to 2020. Some monitors may not represent background concentrations. Use the highest 98th percentile background concentration from the region in which the facility is located, unless another monitor is more representative of the local area. Refined 24-hour background profiles may be developed using the guidance described in "Refined Background Concentrations", above.

4.4.9 PM_{10} Background Concentration

[a]Average of 2019 and 2020.
[b]Based on 2015-2017 averages.
[c]Based on 2012-2014 averages.
[d]Based on 2013-2015 averages.

Concentrations are averaged from 2018 to 2020. Some monitors, such as 350010026 and 350010029, are located near industrial sources or in disturbed areas and do not represent ambient background concentrations.

Refined 24-hour background profiles may be developed using the guidance described in "Refined Background Concentrations", above.

Anomalously high values were eliminated before calculating aggregate concentrations.

4.4.10 SO_2 Background Concentration

Table 35: SO_2 Background Concentrations

Region	ID	Location	1-hour Background ($\mu g/m^3$)	1-hour Background 99th Percentile ($\mu g/m^3$)	Annual ($\mu g/m^3$)	Latitude	Longitude	Address
Albuquerque	350010023	Del Norte High School	33.1	10.1	1.3	35.1343	-106.585	4700A San Mateo NE

North-Eastern New Mexico	483751025	Amarillo, 24th Ave	40.3	23.1	0.8	35.2367	-101.787	4205 NE 24th Ave, Amarillo TX
Permian Basin	No representative background concentrations are currently available for the Pecos-Permian Basin region. Cumulative analysis must be conducted by modeling surrounding sources.							

[a]Based on 2013-2015 averages

Background concentrations are from 2018 to 2020

Refined 1-hour background profiles may be developed using the guidance described in "Refined Background Concentrations", above.

4.5 Location and Elevation

Important: Use the same UTM zone and datum for the entire facility. Facilities on the border between two UTM zones must convert all information into one zone or the other.

Make sure that the source location and parameters are the same as those listed in the application form. This is the most common mistake we see.

4.5.1 Terrain Use

Terrain classifications are defined as follows:

- **Flat terrain** – Terrain with all elevations equal to the base of the source
- **Simple terrain** – Terrain with elevations below stack height
- **Complex terrain** – Terrain with elevations above stack height

- **Intermediate (Complex) terrain** – Terrain with elevations between stack height and plume height (a subset of complex terrain).

Flat terrain should be used if the source base is higher than all the surrounding terrain or if the facility consists primarily of non-buoyant fugitive sources. Simple and complex terrain should be used for all other scenarios.

4.5.2 Obtaining Elevation

Elevation data for receptors, sources, and buildings should be calculated using AERMAP. Data are available from USGS at https://apps.nationalmap.gov/downloader/#/ in ArcGrid and GeoTIFF format. It is important to use the same source of data for all elevations. Surrounding sources are provided by the Bureau without elevations and AERMAP should be used to calculate the elevations.

4.6 Receptor Placement

4.6.1 Elevated Receptors on Buildings

Elevated receptors should be placed on nearby buildings at points of public access where elevated concentrations may be predicted. Use flagpole receptors in areas with multi-story buildings to model state and federal standards. In cases where nearby buildings have publicly accessible balconies, rooftops, or similar areas, the applicant should consult with the Bureau modeling staff to ensure proper receptor placement. PSD increment receptors are limited to locations at ground level.[15]

4.6.2 Ambient Air

Certain areas may be excluded from an analysis of concentrations for air quality standards and PSD increments. "Ambient air means that portion of the atmosphere, external to buildings, to which the general public has access.[16]" "The atmosphere over land owned or controlled by the stationary source may be excluded from ambient air where the source employs measures, which may include physical barriers, that are effective in precluding access to the land by the general public.[17]" Historically a continuous physical barrier, such as a fence or a wall, has been used for this purpose, but other measures may be approved on a case by case basis. In addition to physically restricting the public from the area, the source must have the legal authority to restrict the public from the area. For example, a steep cliff on public land would be considered ambient air but a similar cliff on property owned or leased by a source may be non-ambient air for that source.

---

[15] NSR Workshop Manual, page C.42 (https://www.epa.gov/sites/default/files/2015-07/documents/1990wman.pdf)
[16] 40 CFR 50.1 (e) (https://www.ecfr.gov/current/title-40/chapter-I/subchapter-C/part-50/section-50.1)
[17] Andrew R. Wheeler, *Revised policy on Exclusions from "Ambient Air",* EPA, December 2, 2019, pg. 1 (https://www.epa.gov/sites/default/files/2019-12/documents/revised_policy_on_exclusions_from_ambient_air.pdf)

If plant property is accessible to the public or if any residence is located within the restricted area, receptors should be located on-property.[18] Public access is interpreted to include housing, schools, hospitals, and similar areas that are frequented by family members of employees, but the remainder of the restricted area is excluded from public access if such family members do not have access to excluded areas. For example, receptors would not be placed by dormitories on military bases but would be placed in family housing areas.

Situations may arise where multiple sources locate close to each other. Each source may have its own ambient air and non-ambient air based on the area each physically and legally controls[19]. Contributions from each source may be subtracted from inside its own non-ambient air, but all other contributions in that area will be included for determinations of compliance with NAAQS, NMAAQS, and PSD increments[20]. See also https://www.epa.gov/nsr/ambient-air-definitioninterpretations for additional guidance.

4.6.3 Receptor Grids

"Receptor sites for refined modeling should be utilized in sufficient detail to estimate the highest concentrations and possible violations of a NAAQS or a PSD increment. In designing a receptor network, the emphasis should be placed on receptor resolution and location, not total number of receptors." (68238 Federal Register / Vol. 70, No. 216 / Wednesday, November 9, 2005 / Rules and Regulations)

The modeling domain can be defined using a Cartesian grid with 1000 meter spacing. Fine grids or fence line receptors with 50 to 100 meter spacing should fill any areas of the domain with potential to contain the highest concentration and/or any possible exceedances of NMAAQS, NAAQS, or PSD increment for the refined modeling. For the development of PRIME building downwash algorithms and for model comparison between AERMOD and other models, EPA used 50 meter spacing as the closest spacing[21]. 50 meter spacing is recommended for fence line receptors for most sources, but 100 meters is recommended for expansive sources like coal mines, copper mines, or large military bases. (Grids with 50 meter spacing and 2 km side width are recommended for medium or large neighboring point sources. 50 meter spacing and 1 km width grids are recommended for hilltops or small neighboring sources.) Once these areas of potential high concentrations have been refined, the remaining receptors may be discarded.

For sources with an ROI greater than 50 kilometers, the grid should not extend beyond 50 km, as is noted in the NSR Workshop Manual.

4.6.4 PSD Class I Area Receptors

---

[18] NSR Workshop Manual (Draft), EPA, October 1990, Page C.42
[19] Stephen D. Page, *Interpretation of "Ambient Air" In situations Involving Leased Land Under the Regulations for Prevention of Significant Deterioration (PSD)*, EPA OAQPS, June 22, 2007
[20] Robert D. Bauman, Ambient Air, EPA OAQPS, October 17, 1989 (https://www.epa.gov/sites/production/files/2015-07/documents/ambiet2.pdf)
[21] *Comparison of Regulatory Design Concentrations AERMOD vs ISCST3, CTDMPLUS, ISC-PRIME*, EPA, June 2003, pg. 18.

A modeling analysis of the PSD increment consumed at the nearest Class I areas must be performed by increment-consuming sources in AQCRs where the PSD minor source baseline date has been established, or in any AQCR where a new PSD-major source is to be installed. One receptor at the near boundary of the Class I area is normally sufficient for modeling to compare with Class I significance levels. 1000 meter spacing is recommended within the Class I areas for facilities with significant concentrations. If concentrations are above 75% of the PSD increment, then 50 to 100 meter spacing should be used near the hot spots. See Figure 1 for locations of Class I areas.

4.6.5 PSD Class II Area Receptors

Other than areas that are designated as PSD Class I areas, the entire state of New Mexico is a Class II area. The receptor grid for the PSD Class II increment analysis should be the same as the one for the cumulative run.

4.7 Building Downwash and Cavity Concentrations

Building downwash should be included in the analysis when stack height is less than good engineering practice (GEP) stack height and there are buildings, tanks, or other obstacles near the facility. All buildings and structures should be identified and analyzed for potential downwash effects. NMED requires the use of BPIP-Prime or equivalent for this analysis. GEP stack height should be determined as per 40 CFR 51.100.

As summarized from 40 CFR 51.100:
GEP stack height is the greater of:

1) 65 meters, measured from the ground-level elevation at the base of the stack
   or
2) H + 1.5L

Where

H = Height of nearby structure(s) measured from the ground-level elevation at the base of the stack.
L = The lesser of the height or the projected width (width seen by the stack) of nearby structures.

Nearby structures can be as far as 5 times the lesser of the width or height dimension of the structure, but not greater than 0.8 km.
Stacks taller than GEP stack height should be modeled as if they were GEP stack height.

4.8 Neighboring Sources/Emission Inventory Requirements

> "The number of nearby sources to be explicitly modeled in the air quality analysis is expected to be few except in unusual situations. In most cases, the few nearby sources will be located within the first 10 to 20 km from the source(s) under consideration." (Federal Register / Vol. 82, No. 10 / Tuesday, January 17, 2017 / Rules and Regulations)

4.8.1 Neighboring Sources Data

The Emissions Inventory of neighboring sources is used as input data in air quality models. This data will be provided by the Bureau within a few days of request. E-mail the UTM coordinates of the location(s) to be

modeled to the Bureau to request source data. Sources may also be downloaded directly with the MergeMaster program (requires MS Access).

4.8.1.1 Determining which sources to include

This section functions as a definition for "nearby sources" as used in this document. The definition varies based on context, as illustrated below.

The contributions of distant sources are included in the background concentration. If the background concentration is added and includes all neighboring sources or a conservative approximation of them, then surrounding source modeling is not required for modeling of NAAQS or NMAAQS. For particulate matter or cases where the background concentration does not include all neighboring sources, then include all sources within 10 km of the facility in the model, and discard sources beyond 10 km from the facility. PSD increment is modeled, not monitored. (A PSD increment analysis may optionally add a background concentration instead of modeling the more distant sources.) For cases where background concentrations are not added, retain all sources within 25 km of the facility, plus sources emitting over 1000 pounds per hour within 50 km of the facility. For PSD Class I increment analysis, retain all sources within 25 km of the Class I area, plus sources emitting over 1000 pounds per hour within 50 km of the Class I area.

Table 36: Surrounding Source Retention Example for a Source Near Bloomfield

Pollutant and averaging period	Neighboring source notes:
NO_2 1-hour NAAQS	Do not include surrounding sources. (Optionally, instead of adding background concentrations, include all sources within 25 km of the facility, plus sources emitting over 1000 pounds per hour within 50 km of the facility.)
$PM_{2.5}$ 24-hour NAAQS	Retain sources within 10 km of facility.
NO_2 annual Class II PSD increment	Retain sources within 25 km of the facility, plus sources emitting over 1000 pounds per hour within 50 km of the facility.
NO_2 annual Class I PSD increment	Retain sources within 25 km of Mesa Verde National Park, plus sources emitting over 1000 pounds per hour within 50 km of Mesa Verde.

4.8.1.2 Surrounding source format

The Bureau provides AERMOD input files with the surrounding sources (*.INP) and reference tables (*.XLS) to describe the sources in more detail. The AERMOD input files can be imported in GUI programs or edited manually.

The end of the "SO" pathway in the AERMOD input file contains source group information. Sources in the NAAQS group belong in the NAAQS/NMAAQS analysis. Sources in the PSD group belong in the PSD increment analysis. many sources are in both groups. Imported AERMOD input files should import that information if a GUI is used to manage modeling inputs. Source IDs provided can be used to identify the source in the Bureau's database.

Unless otherwise noted, units of measure used in the surrounding sources files are the metric units associated with model input format. Emissions designated as NO_2 are actually total oxides of nitrogen (NO_X).

4.8.1.3 Handling errors in surrounding source files

Please contact the Bureau if you see suspicious data in the inventory. We know that there are errors in our database and we would like to correct them.

If you find a piece of equipment that has unusual stack parameters, document the error and corrected values in your modeling report. Please also report the error to Fernando Romo (fernando.romo@env.nm.gov) as well for database correction. Include MASTER_AI_ID, SUBJECT_ITEM_CATEGORY_CODE, and SUBJECT_ITEM_ID in the documentation.
Please document the reason the error is suspected.

The following parameters may be substituted for missing or invalid data. Determine the type of source that best matches the types below. For example, engines use the "other" category. Find the smallest emission rate in the table that is greater than or equal to the emission rate of the emission unit. That column contains the parameters that may be used for the parameters that are missing. (These parameters are based on modeling for general construction permits or on existing source data for control devices.)

Table 37: Missing Stack Parameter Substitutions for Turbines

8	4.5	700	18	0.2
7	4.5	700	14	0.2
6	4.5	650	14	0.2
5	4.5	500	5	0.2
4	4	500	5	0.1
3	3.5	500	5	0.1
2	3	500	5	0.0762
1	2	500	5	0.0762

For GCP 2, 3, and 5 permits with 95 tons/year of $PM_{2.5}$ emissions, use the following values:

TSP emission rate = 95 TPY
PM_{10} emission rate = 71.25 TPY (TSP X 0.75)
$PM_{2.5}$ emission rate = 17.875 TPY (PM_{10} X 0.25) = (TSP X 0.1875)

For volume sources with missing parameters:

Maximum release height = 10 m
Minimum release height = 1 m
Missing release height = PM10 Rate x 20 m/(lb/hr)
Initial vertical dimension = release height x 0.93
No limit to the maximum lateral dimension.
Lateral dimension = PM10Rate x 10 m/(lb/hr)
Minimum Lateral Dimension = 0.47 m

Administrative Record NSR_001578

4.8.1.4 Refining Surrounding Sources

In some cases, it will be possible to use actual emissions to model surrounding sources instead of the maximum values allowed in the permit. If actual emission rates from the most recent two years is available, then the following optional technique may be used.

Annual averaging period: For the most recent two consecutive years of operation, if that period is representative of normal operation, the emission rate for each hour (in pounds per hour) is the total tons emitted for those two years divided by 8.76 (lb x year/ton x hour).

Other averaging periods: The unit is assumed to operate continuously unless there is a permit condition or physical limitation that prevents it from operating certain hours of the day or days of the year. If data is available for the most recent two years (Continuous Emissions Monitoring (CEM) data, for example) then a temporally representative level when operating may be used. For example, a generator that provides more power during peak hours could be modeled such that the maximum emission rate would be emitted during the peak hours of the day and the minimum operating emission rate would be emitted during the lowest-demand hours and the hours the unit would normally be off.[22]

4.8.2 Source Groups

It often saves considerable analysis time to set the model up to run with multiple source groups. The following groups are recommended.

- **Source alone group** – contains the sources at the facility that are used to compare with significance levels for the pollutant and averaging period being modeled. This group determines if the facility is above significance levels at the location and time.
- **Cumulative sources group** – contains all allowable emissions of the source and surrounding sources. This group is used to determine compliance with NAAQS and NMAAQS.
- **PSD sources group** – contains all sources that consume or expand PSD increment. This group is used to determine compliance with PSD increment regulations.

Impacts from different groups can be compared to determine if a source contributes significant concentrations if there is a problem complying with air quality standards.

4.8.3 Co-location with a GCP for aggregate processing facilities, asphalt plants, or concrete batch plants

At this time, General Construction Permits (GCPs) for aggregate processing facilities, asphalt plants, and concrete batch plants currently have the requirement that no visible emissions shall cross the fence line, which has been demonstrated to show compliance with all particulate matter air quality standards and PSD increments. NMED has allowed co-located facilities operating under a GCP to rely upon the GCP modeling demonstration for when co-located facilities operate at the same time, since all facilities at the location are required to have the same, no visible emissions, requirement at the fence line. However, if a source operating under a regular construction permit co-locates with a GCP source, it must show compliance with all particulate matter air quality standards through air dispersion modeling for times when the GCP opacity requirements may not apply. The modeling for the source operating under a regular construction permit

[22] **Federal Register,** Vol. 82, No. 10, pg. 5220 / Tuesday, January 17, 2017 / Rules and Regulations

shall include all sources other than the co-located GCP sources. Gaseous pollutant modeling shall include the co-located GCP(s).

5.0 EMISSIONS SOURCE INPUTS

This section describes appropriate modeling for many types of sources. Additional guidance can be found in the User's Guide for the AMS/EPA Regulatory Model - AERMOD (EPA, April 2021, https://gaftp.epa.gov/Air/aqmg/SCRAM/models/preferred/aermod/aermod_userguide.pdf).

5.1 Emission Sources

There are two general types of sources:

Sources that come from a stack or vent – stack sources, or point sources;
And sources that don't – fugitive sources.

5.2 Stack Emissions/Point Sources

All stacks should be modeled as point sources, as detailed below.

5.2.1 Vertical Stacks

Stacks that vent emissions vertically should be modeled as point sources with stack parameters that will simulate the manner in which emissions are released to the atmosphere:

Stack exit velocity, V_s = average upward velocity of emissions at the top of the stack;
Stack diameter, d_s = stack exit diameter;
Stack exit temperature, T_s = average temperature of emissions at the top of the stack;
Stack height, H_s = stack release height.

5.2.2 Stacks with Rain Caps and Horizontal Stacks

Stacks with capped stacks should be modeled in AERMOD using the POINTCAP source type.

Horizontal stacks should be modeled in AERMOD using the POINTHOR source type.

AERMOD will set the temperature to ambient temperature if the stack exit temperature is set to 0 K. If the model being used does not do this, then set the temperature to ambient temperature or to a close approximation thereof.

5.2.3 Flares

Both process and emergency flares should be modeled for comparisons with NAAQS and NMAAQS. If parts of the facility will be shut down when the flare operates then those emission units may be omitted from the flare modeling.

Flares should be treated as point sources with the following parameters:

Stack velocity = 20 m/s = 65.617 ft/s
Stack temperature = 1000°C = 1832°F
Stack height = height of the flare in meters

Effective stack diameter in meters= $D = \sqrt{10^{-6} q_n}$

where $q_n = q(1 - 0.048\sqrt{MW})$

and q is the gross heat release in cal/sec
MW is the weighted by volume average molecular weight of the mixture being burned.
(SCREEN3 Model User's Guide, 1995)

Flares in the surrounding sources inventory from the Bureau should already have an effective diameter calculated; so the parameters in the inventory can be entered directly into your model input "as is". There are other methods for analyzing impacts of flares; if you wish to use another method, check with the Bureau modeling staff first.

NOTE: The NAAQS cannot be violated, even during upset conditions. All emergency flares should be modeled to show compliance with the NAAQS short-term standards under upset conditions. Emergency flares should be modeled with surrounding sources, but not including neighboring emergency flares and other sources that operate less than 500 hours per year.

5.2.4 Cool Stacks

Filters, cooling towers, or other sources without raised temperature should be modeled at ambient temperature. AERMOD will set the temperature to ambient temperature if the stack exit temperature is set to 0 K. If the model being used does not do this, then set the temperature to ambient temperature or to a close approximation thereof.

5.3 Fugitive Sources

5.3.1 Aggregate Handling

Aggregate handling emissions consist of three separate activities, namely: loading material to and from piles, transportation of material between work areas, and wind erosion of storage piles.

Loading material to and from piles should be modeled as volume sources representative of the loading or unloading operation. Emissions for loading and unloading are calculated using AP-42 Section 13.2.4. The loading and unloading each involve dropping the material onto a receiving surface, whether being dropped by a dump truck, a front-end loader, or a conveyor. Each drop should be modeled as described in Fugitive Equipment Sources, below.

Transportation of material between work areas should be modeled according to haul road methodology if vehicles are used to transport the material, or using transfer point methodology if conveyors are used to transport the material, as described in Fugitive Equipment Sources, below.

Modeling of wind erosion of storage piles is optional, as it says in AP42 not to use the equations for wind erosion in a steady state model.

For the following example facility, aggregate is handled 6 times:

1- a pile in front of the mine face is created,
2- a pile in front of the mine face is loaded into trucks or conveyors,
3- a pile in front of the processing equipment (crusher or HMA) is created,
4- loading the equipment (crusher or HMA),
5- a pile after the equipment, and
6- loading the truck

1 and 2 would not apply if on-site mining does not occur.
5 may be considered a transfer point (conveyor) instead of aggregate handling if controls are applied.
5 and 6 may not apply for HMA plant, as material is bound in asphalt.
6 would not apply if the waste pile is left on site.

5.3.2 Fugitive Equipment Sources

Emissions coming from equipment such as crushers, screens, or material transfer points should be modeled as volume sources. Emission rates are normally calculated using AP42 factors.

The release height (H) is the distance from the center of the volume to the surface of the ground. The base of each volume source must be square. For elongated sources, use a series of volume sources with square bases. Determine the apparent size of a volume source by estimating how large the plume would look to an observer. Consider the movement of the plume source during the course of an hour when determining the apparent size. For example, if the source of emissions is from disturbances on a pile, and the entire pile is disturbed at some point in the hour, then use the size of the pile as the apparent size instead of the area of the pile that would be disturbed at any one instant. The reason for this is that the model operates in one-hour blocks of time, so using instantaneous sizes could inaccurately target nearby receptors with elevated emission concentrations.

For a single volume source, divide the apparent length by 4.3 to determine the initial lateral dimension (s_{Yo}) to input into the model[23]. For a line source represented by a series of volume sources, divide the distance between the centers of adjacent sources by 2.15 to determine s_{Yo}.

For a source on the ground, divide the vertical dimension of the source by 2.15 to determine the initial vertical dimension (s_{Zo}) to input into the model. For a source on or connected to a building, divide the height of the building by 2.15 to determine the s_{Zo}. For an isolated elevated source, divide the vertical dimension of the source by 4.3 to determine the s_{Zo}.

Example sources are described in the table below. Some sources will vary from the characteristics listed in the table.

[23] *User's Guide for the AMS/EPA Regulatory Model (AERMOD) (EPA-454/B-21-001, April 2021)*,pg. 3-105 (https://gaftp.epa.gov/Air/aqmg/SCRAM/models/preferred/aermod/aermod_userguide.pdf)

Table 41: Example Dimensions of Fugitive Sources

Source Type	Height of Volume (m)	s_{Zo} (m)	Release Height (m)	Width of Volume (m)	s_{Yo} (m)
Crusher	5	2.33	6	5	1.16
Screen	5	2.33	4	5	1.16
Transfer point	2	0.93	2	2	0.47
Elevated transfer point	4	0.93	4	2	0.47
High Elevated transfer point	4	0.93	8	2	0.47
Concrete truck loading	5	2.33	4	5	1.16

5.3.3 Haul Roads

Traffic carrying materials mined or processed at the facility must be modeled as part of the facility. Haul roads to be modeled include the portion of roads that are not publicly accessible. The Bureau recommends haul road modeling to be consistent with Regional/State/Local Haul Road Workgroup Recommendations[24], as described below. Haul road emissions should be modeled as a series of adjacent volume sources, except that area sources should be used for modeling haul roads where receptors located within source dimensions are important. A procedure to develop model input parameters follows. The applicant can use other procedures on a case-by-case basis but must demonstrate that those procedures would be appropriate.

Road Source Characterization: Follow the instructions described below.

Plume height:

The height of the volume (H) or plume height will be equal to 1.7 times the height of the vehicle generating the emissions. Use the same for top of plume height for area sources.
The initial vertical sigma (s_{Zo}) is determined by dividing the height of the plume by 2.15.
The release height is determined by dividing the height of the volume by two. This point is in the center of the volume.

Table 42: Example Haul Road Vertical Dimensions

Vehicle size	Truck Height	Height of Volume	s_{Zo}	Release Height
Large trucks	4 m (13.1 ft)	6.8 m (22.3 ft)	3.16 m (10.4 ft)	3.4 m (11.1 ft)
Small trucks	2 m (6.6 ft)	3.4 m (11.2 ft)	1.58 m (5.2 ft)	1.7 m (5.6 ft)

RH = H/2 = Release Height above the ground (m). It's the center of the volume source. Also use this for the source height of the area source, if using the area source alternative.
s_{Zo} = H/2.15 = initial vertical dimension of the volume (m)

[24] *Haul Road Workgroup Final Report*, U.S. Environmental Protection Agency, Office of Air Quality Planning and Standards, March 2, 2012 (https://www.epa.gov/sites/production/files/2020-10/documents/haul_road_workgroup-final_report_package-20120302.pdf)

Road width:

The adjusted width of the road (W) is the actual width of the road plus 6 meters. The additional width represents turbulence caused by the vehicle as it moves along the road. This width will represent a side of the base of the volume. Use W for the width of the area source, if using the area source alternative.

The initial horizontal sigma (s_{Yo}) for each volume is determined as follows:

- If the road is represented by a single volume, divide W by 4.3.
- If the road is represented by adjacent volumes, divide W by 2.15.
- If the road is represented by alternating volumes, divide the distance between the center point of one volume to the center point of the next volume by 2.15. $s_{Yo} =$ 2W/2.15 This representation is only recommended for very long roads.
- If using area sources, the aspect ratio (i.e., length/width) should be less than 100 to 1. Subdivide the sources if they are too long.
- If using area sources, model each road segment as a straight line. Do not create a road segment with a bend in the road – divide the road into different segments when bends occur.

Road length:

The sum of the length of all volume sources should be about equal to the actual road length, unless the road is very long and half the segments are skipped to save time. The volume sources should be evenly spaced along the road and should be of equal size for a given road. It is acceptable to artificially end the haul road up to 50 meters before the intersection with a public road. The reduced length of the road is due to the observation that vehicles normally slow down or stop before exiting the property. All emissions from haul roads must be modeled, however. Emissions from the reduced road length are added to other road segments.

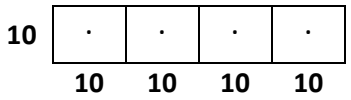
The two lateral dimensions (length and width) of a volume source should be equal. The number of volume sources, N, is determined by dividing the length of the road (optionally minus 50 meters) by W. The result is the maximum number of volume sources that could be used to represent the road. If N is very large, modeling time can be reduced by using alternating volume sources to reduce the number of sources.

Table 43: Example Haul Road Horizontal Dimensions

Vehicle size	Width of Volume	Length of Volume	s_{Yo}
Large trucks	13 m (42.65 ft)	13 m (42.65 ft)	W/2.15 = 6.05 m (19.85 ft)
Small trucks	10 m (32.8 ft)	10 m (32.8 ft)	W/2.15 = 4.65 m (15.26 ft)

Road location:

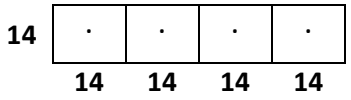
The UTM coordinates for the volume source are in the center of the base of the volume. This location must be at least one meter from the nearest receptor.



Emission Rate:

Divide the total emission rate equally among the individual volumes used to represent the road, unless there is a known spatial variation in emissions. Use the emissions calculated from the

entire road length, even if you artificially end the road volume sources early before exiting the facility.



Example sources:
Use of the following modeling parameters should result in acceptable haul road modeling. Different facilities have different sized trucks, roads, and other variables. It is acceptable to use facility-specific parameters

Example One-Way Road Source

(looking from above)
Width = W = 10 m (32.8 ft)
s_{Yo} = W/2.15 = 4.65 m (15.26 ft)
Figure 3: One-Way Road Source

Two-Way Road Source

(looking from above)
Width = W = 14 m (45.9 ft)
s_{Yo} = W/2.15 = 6.51 m (21.4 ft)
Figure 4: Two-Way Road Source

Additional guidance can be found in Volume II of the User's Guide for ISC3 model (EPA, 1995).

5.3.4 Area Sources

Sources that have little plume rise may be modeled as area sources. Examples are: storage pile emissions, waste lagoon emissions, or gaseous emissions from landfills. Area source types include rectangle, circle, and irregularly shaped polygon. The model uses only the portion of the area source that is upwind of the receptor for calculating emissions for the hour, so it is safe to put receptors inside the area source without overly magnifying concentrations. The AERMOD input file uses emissions per area, but front-end programs for developing input files may calculate this for you based on total emissions from the source. For additional information, see the *User's Guide for the AMS/EPA Regulatory Model (AERMOD) (EPA-454/B-21-001, April 2021)*.

Extremely long or odd-shaped (like a giant “L”) area sources should be broken up into smaller area sources or modeled as a series of volume sources, because they may misrepresent emissions. Area sources, such as AREACIRC sources, may require many times as long to run the model as do volume or point sources in AERMOD.

5.3.5 Open Pits

The open pit source type should only be used to model open pits (not elevated trash dumpsters or anything else that somewhat resembles an open pit). The elevation of the pit entered into the model is the elevation of the top of the pit, which should be ground level.

The model calculates the effective depth of the pit by dividing the pit volume by the length and width of the pit. Release height above the base of the pit must be smaller than this value. Emissions from the bottom of the pit are expressed with a release height of zero.

Pit length should be less than 10 times the pit width. However, a pit cannot be sub-divided because the model needs to calculate mixing done throughout the pit. If the pit is irregular in shape, use the actual area of the top of the pit to calculate a rectangular shape with the same area.

Do not place receptors inside a pit.

The model input file requires pit emission rates to be expressed in mass per time per area [i.e., $g/(s \cdot m^2)$]. Model input front-end programs may convert actual emission rate into area-based emission rates automatically, however.

5.3.6 Landfill Offgas

Decomposition of landfill material can result in the release of gasses such as H_2S. If these gases are not collected using a negative pressure system and flared, then the area of the landfill that is releasing gas can be modeled as an area or a circular area source. If gas is collected by a negative pressure collection system and flared, then model the flare the same way other flares are modeled. Place large area sources in areas that have little effect from the negative pressure collection system. In either case, elevation of the source should be equal to that of the surface, and release height should be zero because they are released from the ground and are not significantly affected by turbulence caused by vehicles traveling over the off-gasses.

6.0 MODELING PROTOCOLS

6.1 Submittal of Modeling Protocol

A modeling protocol should be submitted prior to the performance of a dispersion modeling analysis. For PSD applications, a modeling protocol is mandatory, and must be sent to NMED/AQB for review and comment. Consultation with Bureau modeling staff regarding appropriate model options, meteorological data, background concentrations, and neighboring sources is recommended for minor sources also, and can be accomplished in writing or by phone. The applicant should allow two weeks for the Bureau to review and respond to the written protocol. To avoid delays caused by misinterpretation or misunderstanding, we strongly recommend consultation with our staff on the following topics:

a.) Choice of models;
b.) Model input options;
c.) Terrain classification (flat or simple and complex);

d.) Receptor grids;
e.) Source inventory data;
f.) Minor source baseline dates for modeling increment consumption;
g.) Nearby Class I areas;
h.) Appropriate meteorological data;
i.) Background concentrations;
j.) Setback distance calculation if a proposed facility is a portable fugitive source;
k.) Any possible sources of disagreement;

Important: Modeling that substantially deviates from guidelines may be rejected if it is not accompanied by a written approved modeling protocol.

The input data to the models will be unique to the source. Data will usually consist of 1) emission rates and stack parameters for the proposed source at maximum load capacity and at reduced load capacity; 2) emission parameters of sources in the area; 3) model options; 4) suitable meteorological data; 5) definition of source operation which creates the greatest air quality impacts if other than maximum load conditions; and 6) terrain information, if applicable. Very important: **The emission parameters used in the modeling analysis of the proposed source are normally the same as those in the permit application. Any difference between the two should be clearly documented and explained.** Failure to adhere to this rule may result in an incomplete analysis.

6.2 Protocol ingredients

The shortest acceptable modeling protocol would be a statement that the modeling guidelines will be followed and a statement of what meteorological data and background concentration monitors will be used. Ask the modeling section or check the web page for the latest sample protocols.

6.3 How to submit the protocol

E-mail the modeling protocol to the modeling manager: Sufi.Mustafa@state.nm.us

7.0 DISPERSION MODELING PROCEDURE

Note: The basic steps for performing the modeling are presented in sequential format. Sometimes, it will make sense to perform some of the steps out of order. The sequential modeling steps are designed as an aid to modeling, not a mandatory requirement.

It is important to have an approved modeling protocol before proceeding. Modeling that substantially deviates from guidelines may be rejected if it is not accompanied by a written approved modeling protocol.

7.1 Step 1: Determining the Radius of Impact

A facility's significance area is defined as all locations outside of its fence line where the source produces concentrations that are above the significance levels listed in Table 6. The source is deemed culpable for concentrations that exceed air quality standards or PSD increments that occur at a receptor if the

source's contribution is above the significance level at the same time that the exceedance of air quality standards or PSD increments occurs.

The Bureau uses the Radius of Impact (ROI) to make sure the entire significance area is analyzed. The ROI is defined as the greatest distance from the center of the facility to the most distant receptor where concentrations are greater than significance levels.

An illustration of determining an ROI from modeling output is shown in Figure 5, below. Note that the entire ROI is completely contained within the receptor grid, as required.

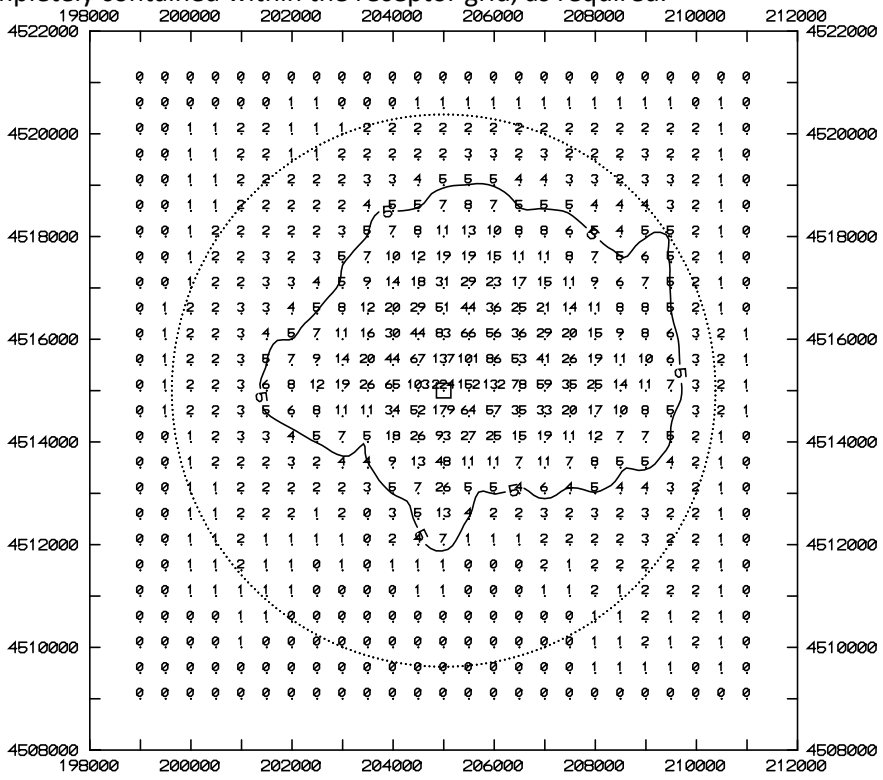


Figure 5. Plot of pollutant concentrations showing the 5 µg/m^3 significance level and the radius of impact (dashed line circle), determined from the greatest lineal extent of the significance level from the source.

7.1.1 Prepare the ROI analysis as follows:

I. Select the model that will be used for the analysis. It is usually quicker in the long run to use the same model for the radius of impact analysis as will be used for the refined analysis.
II. Model the entire source, as defined in section 2.4.1. Suggestion: Plot your sources to verify locations and identify typographical errors.
III. Set up the receptors as described above. Make sure the receptor grid extends far enough in every direction to capture the entire ROI, subject to the maximum radius of 50km.
IV. Optional step: Calculate the elevations of all sources, receptors, and buildings. This complex terrain analysis is optional for the ROI run, but it may save time to do it now.

V. Optional step: Add buildings and analyze them with BPIP or equivalent programs. This building downwash analysis is optional for the ROI run, but it may save time to do it now.
VI. Choose modeling options, as appropriate.
VII. Make sure that all sources and operating scenarios are modeled according to the guidelines in sections 4 and 5, above.
VIII. Run the model.

7.1.2 Analyze modeling results to determine ROI

I. Determine a radius of impact for each pollutant for each applicable averaging period. The largest ROI may be designated as the ROI for that pollutant, or each averaging period determined independently.
II. The ROI for NO_2 may be determined using Ambient Ratio Method 2 (ARM2).
III. Concentrations inside the facility's fence line can be ignored when determining the ROI.
IV. If no concentrations of a pollutant are above the significance levels for that pollutant, then the ROI for that pollutant is 0. Skip to Step 3 for that pollutant.
V. It is acceptable to scale impacts from one pollutant to determine impacts from another pollutant if several pollutants vent from the same stack and the ratios of emission rates and the averaging periods are the same.

Proceed to Step 2 for each pollutant with an ROI greater than zero.

7.2 Step 2: Refined Analysis

The entire area of significance must be included in the analyses for all averaging periods for each pollutant. If the ROI was determined using coarse grids, then add fine grid spacing to the potential areas of maximum concentration or concentrations above standards. If the ROI was determined using appropriate grid spacing, elevations, and building downwash (if applicable), then only the significant receptors need to be modeled for the refined analysis.

Once the ROI is determined for a specific source, neighboring sources need to be included and a cumulative impact analysis needs to be performed. As the ROI analysis is concerned with significance levels, the refined analysis is concerned with NAAQS, NMAAQS, and PSD Class I and Class II increments. The concentrations produced by the facility plus surrounding sources must be demonstrated to be below these levels in order to issue a permit under the regular permitting process.

7.2.1 Prepare the Refined Analysis as Follows:

I. If a screening model was used to determine ROI, the modeler may wish to use a refined model to reduce the area of significant impact. If so, return to *Step 1* and repeat the step with the new model.
II. Prepare a new modeling input file from the ROI file.
III. Fill the ROI with receptors with appropriate spacing (or discard receptors below significance levels if appropriate spacing was used for the ROI analysis).

IV. Add receptors near areas of high concentration if these areas are not contained within a fine grid. The modeling run must definitively demonstrate that the maximum impact has been identified. Concentrations should "fall off" from the center of the fine grid.
V. Add surrounding sources to the input file, if appropriate, as described in *Neighboring Sources/Emission Inventory Requirements*, above. Include $PM_{2.5}$ surrounding sources if particulate modeling is required. Suggestion: set up source groups so that impacts from the source alone, from the PSD increment consuming sources, and from all sources can be analyzed in a single run and compared with each other for determination of culpability.
VI. Building downwash analysis must be included in the refined analysis, if applicable.
VII. Terrain elevations must be included in the refined analysis, if applicable.

7.2.2 Analyze the Refined Modeling Results

I. Make sure the maximum impacts for each averaging period fall within a fine enough receptor grid to identify true maximums. Include fine grids near adjacent sources and in "hot spots".
II. Compare the highest short-term and annual impacts from all sources with NAAQS and NMAAQS.
III. Determine if there is an exceedance of PSD Class II increment within the area defined by the radius of impact by the group containing all PSD increment consuming sources.
IV. Determine if there is an exceedance of PSD Class I increment within any Class I area.
V. If the facility alone will violate any NAAQS, NMAAQS, or PSD increment, then the permit cannot be issued through the normal process. Please contact the Bureau for further information.
VI. If there are exceedances of the NMAAQS or NAAQS at any receptors within the ROI, the next step is to determine if the facility being modeled significantly contributes (see significance levels in Table 6) to the exceedance at those receptors during the same time period(s) that the exceedance occurs. If so, the permit cannot be issued through the normal process. See nonattainment area requirements, below.
VII. If no exceedances are found, or if the facility does not contribute amounts above significance levels to the exceedances, then the facility can be permitted per the modeling analysis.

7.2.3 NMAAQS and NAAQS

All sources are required to submit NMAAQS and NAAQS modeling. The total concentrations of all facilities and background sources are required to be below the NAAQS. The steps required for this analysis are outlined above.

7.2.4 PSD Class II increment

PSD Increment modeling applies to both minor and major sources. If the minor source baseline date has been established in the Air Quality Control Region (AQCR) in which the facility will be located, then PSD increment consumption modeling must be performed. If the minor source baseline date has not been established in that region, then only PSD major sources must perform this analysis.

Portable sources that are not located at a single location for more than one year are not required to model PSD increment consumption.

The steps required for this analysis are outlined above.

The same significance levels that apply to NAAQS and NMAAQS standards are assumed to apply to PSD Class II increment as well.

7.2.5 PSD Class I increment

If a PSD Class II increment analysis is required and the proposed construction of a minor source is within 50 km of a Class I area (see Figure 1), then PSD increment consumption at the Class I area(s) must be determined and compared with the Class I PSD increment. If the proposed construction of a PSD major source is within 100 km of a Class I area, then PSD increment consumption at the Class I area(s) must be determined and compared with the Class I PSD increment. The PSD permit process requires a more thorough Class I analysis, which is described in *Step 6*.

See *Receptor Placement*, above, for receptor instructions.

Proceed with the Class I area analysis similarly to the other analyses described above. Class I significance levels apply for determining whether or not a facility contributes significantly to an exceedance in a PSD Class I area and for determining the Class I ROI.

7.3 Step 3: Portable Source Fence Line Distance Requirements for Initial Location and Relocation

Skip this step if the facility is not a portable source.

Portable sources should model fence line distance requirements for relocation purposes and for setback distances within the initial property. If the facility wants to be able to move equipment around within the property, or move to a new location, permit conditions will be required to ensure the facility continues to demonstrate compliance with air quality standards as it moves. For this modeling, use meteorological data that the Bureau has approved for relocation modeling, which may be different from that used for the rest of the modeling for the facility. Model the facility with a haul road length at least as long as the setback distance and a number of truck trips equal in number to the count at the original location. Surrounding sources may be ignored, but include co-located facilities if the desire is to be able to co-locate with other facilities at the new locations. To determine setback distance, draw a line connecting the concentrations where they drop off to the point that are just under the ambient air standard or PSD increment. Make sure to add background concentration before determining the isopleths for ambient air standards. From each point on the isopleth line, determine the distance to the nearest source (excluding haul road sources). The setback distance is the largest of these distances. Setback distance is typically rounded up to the nearest meter that is above the calculated value. An example setback distance determination is pictured in Figure 6, below.

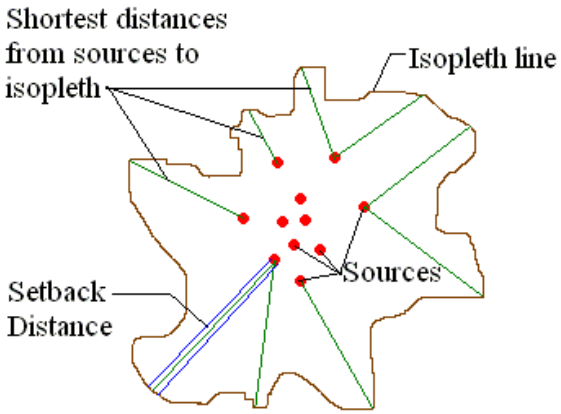

Figure 6: Setback Distance Calculation

Fine spacing is suggested within the property boundary for relocation requirement modeling.

If the applicant does not perform fence line distance modeling, relocation distance will be assumed to be the distance from the edge of a facility operations to the most distant point on the initial fence line. An irregular or elongated fence line shape can result in relocation requirements that require very large properties to be fenced off in order to relocate there without submitting modeling for each new location of the facility.

7.4 Step 4: Nonattainment Area Requirements

Skip this step if all modeled concentrations are below NAAQS, NMAAQS, and PSD Increments.

If the modeling analysis of a source predicts that the impact from any regulated air contaminant will exceed the significance level concentrations at any receptor which does not meet the NMAAQS or NAAQS, the source will be required to demonstrate a net air quality benefit and meet the requirements of 20.2.72.216 NMAC or 20.2.79 NMAC. The net air quality benefit is a reduction of at least 20% of the maximum modeled concentration from the facility or the emission sources being modified. The 20 percent reduction shall be calculated as the projected impact subtracted from the existing impact divided by the existing impact. The existing impact for the net air quality benefit must be based on the lowest enforceable emission rate, or the actual emission rate if a unit has no enforceable emission rate. The offsets used to meet the net air quality benefit must be quantifiable, enforceable, and permanent. For more information regarding nonattainment permit requirements, see **20.2.72.216 NMAC** and **20.2.79 NMAC** – Nonattainment Areas.

7.5 Step 5: Modeling for Toxic Air Pollutants

Skip this step if there are no toxics to model at this facility. See section 2, “New Mexico State Air Toxics Modeling”, to determine if modeling of toxics is required and for other details about toxics regulatory requirements.

I. Model the toxic air pollutants similar to the way the other pollutants were modeled, as described above in steps 1 and 2. Use an 8-hour averaging period, complex terrain, and building downwash.
II. No surrounding source inventory exists for the toxics, so model only your source.
III. Make sure a fine grid is used in the area of maximum concentration.
IV. If more than one toxic pollutant is being modeled and they use the same stacks at the same ratio of emission rates, it is allowable to scale the results of the first pollutants by the emission rate ratio to determine the concentration of the other toxics.

If modeling shows that the maximum eight-hour average concentration of all toxics is less than one percent of the Occupational Exposure Level (OEL) for that toxic, then the analysis of that toxic pollutant is finished. Report details about the maximum concentrations in the modeling report. Otherwise, perform BACT analysis or health assessments, as required. Contact the Bureau on how to proceed if the $1/100^{th}$ of the OEL is exceeded.

7.6 Step 6: PSD Permit Application Modeling

Skip this step if the facility is not a PSD major source.

PSD sources and requirements are defined in NMAC 20.2.74.303 to 305. New PSD major sources and major modifications to PSD major sources must submit the following modeling requirements in addition to the NSR minor source modeling requirements. Minor modifications to PSD major sources are only subject to NSR minor source modeling requirements listed above, as required under NMAC 20.2.72.

Due to a court ruling, the use of the $PM_{2.5}$ significant monitoring concentration for PSD major modifications or new PSD major sources is not allowed. The significant ambient concentration level may still be used for minor source and nonattainment permitting.

Sources subject to PSD requirements should consult with the Bureau to determine how to proceed in the application process. For PSD applications, a modeling protocol is required for review. Please refer to EPA's *New Source Review Workshop Manual.* The following items are required for PSD permit applications and supersede other modeling requirements in this document.

7.6.1 Meteorological Data

Applicants may need to collect one year of on-site meteorological and ambient data to satisfy PSD requirements. In some cases, it may be advantageous to begin collecting on-site meteorological and ambient data to ensure that it is available at a site that may become PSD in the future. A company considering a monitoring program is advised to consult with the Bureau as early as possible so that an acceptable data collection process, including instrument parameters, can be started. Generally, the following meteorological parameters will be measured: wind direction, wind speed, ambient air temperature, solar insolation, ΔT, and σ_θ. For further information on meteorological monitoring Refer to EPA's *Guideline on Air Quality Models* and *On-Site Meteorological Program Guidance for Regulatory Modeling Applications*. Refer to *Ambient Monitoring Guidelines for Prevention of Significant Deterioration (PSD)* for ambient monitoring guidance. In addition, a monitoring protocol and QA plan **must** be submitted and approved prior to beginning collection of data for a PSD application if these data are to be used for the analysis.

In the absence of actual on-site data, the Bureau may approve the use of off-site data that the Bureau believes mimics on-site data for that location or the Bureau may approve the use of data produced by the model MM5.

7.6.2 Ambient Air Quality Analysis

The ambient air quality analysis is the same as described above, with the exception of the following points.

- The PSD project is defined as the future potential emission rate minus the past actual emission rate.
- If the maximum ambient impact is less than significant ambient concentrations (see Table 6), then a full analysis is not required.
- Nearby sources must be considered. Discarding sources is discussed in the section on "neighboring sources data".
- A total air quality analysis must also be performed for each appropriate Class I area if the facility produces concentrations greater than the Class I significance levels in Table 6. All sources near the Class I area must be considered. The inventories for the analysis near the facility and the inventory for the analysis near Class I areas may be quite different because they are centered on different locations.
- If subject to 20.2.74.403 NMAC (Sources impacting Federal Class I Areas), an analysis of Air Quality Related Values must be included in the PSD application. If the facility will have no impact on the AQRV, then that must be stated in the application (NSR Workshop Manual, Chapter D).
- There may be additional analyses required by the Federal Land Managers (FLM) for Air Quality Related Values (AQRVs). See **F**ederal **L**and **M**anagers' **A**ir Quality Related Values Work **G**roup (FLAG) for more information at: https://irma.nps.gov/DataStore/Reference/Profile/2125044

7.6.3 Additional Impact Analysis (NMAC 20.2.74.304)

The owner or operator of the proposed major stationary source or major modification shall provide an analysis of the impact that would occur as a result of the source or modification and general commercial, residential, industrial, and other growth associated with the source or modification. This analysis is in addition to the Class I analysis, but may use some of the same techniques that were used in the Class I analysis. The analysis required for a National Environmental Policy Act (NEPA) review may work to satisfy some requirements of this section.

- Visibility Analysis: A Class II Visibility Analysis is required to determine impact the facility will have upon Class II areas. Analyze the change in visibility of a nearby peak or mountain for this analysis. In the absence of nearby mountains, analyze the visibility of clear sky from nearby state or local parks.
- Soils analysis: What changes will occur to soil pH, toxicity, susceptibility to erosion, or other soil characteristics as a result of the project and indirect growth related to the project?
- Vegetation analysis: What changes will occur to type, abundance, vulnerability to parasites, or other vegetation characteristics as a result of the project and indirect growth related to the project? The owner or operator need not provide an analysis of the impact on vegetation having no significant commercial or recreational value.

- Growth analysis: The owner or operator shall also provide an analysis of the air quality impact projected for the area as a result of general commercial, residential, industrial, and other growth associated with the source or modification.

7.6.4 Increment Analysis

- If the facility produces ambient concentrations greater than the significance levels in Table 6, then the Class II PSD increment analysis for the facility must use the inventory of all increment consuming sources near the facility. Sources in other states should be obtained from the agency in the surrounding state.
- If there is a Class I area within 100 km of the facility (or any distance, if requested by the FLM), then receptors must be located at the Class I area.
- If the facility produces ambient concentrations greater than the Class I significance levels in Table 6 in a Class I area, then the increment analysis for the Class I areas should use the inventory of all increment consuming sources near the Class I area, including those sources in other states. Sources in other states should be obtained from the agency in the surrounding state.

7.6.5 Emission Inventories

- The most current inventory of sources must be used. It should contain all sources currently under review by the Bureau that would be located within the appropriate inventory area. The applicant should check with the modeling staff to ensure that the inventory is up to date.

7.6.6 BACT analysis

- The analysis must follow current EPA procedures and guidelines.

7.7 Step 7: Write Modeling Report

A narrative report describing the modeling performed for the facility is required to be submitted with the permit application using Universal Application form 4 (UA4). This report should be written to provide the public and the Bureau with sufficient information to determine that the proposed construction does not cause or contribute to exceedances of air quality standards. The report needs to contain enough information to allow a reviewer to determine that modeling was done in a manner consistent and defensible with respect to available modeling guidance. Do not include raw modeling output in the report, only summaries and descriptions of the output or input.

This outline may be used as a checklist to determine if the analysis is complete.

I. Applicant and consultant information
   a. Name of facility and company.
   b. Permit numbers currently registered for the facility.
   c. Contact name, phone number, and e-mail address for the Bureau to call in case of modeling questions.

II. Facility and operations description
    a. A narrative summary of the purpose of the proposed construction, modification, or revision.
    b. Brief physical description of the location.
    c. Duration of time that the facility will be located at this location.
    d. A map showing UTM coordinates and the location of the proposed facility, on-site buildings, emission points, and property boundaries. Include UTM zone and datum.

III. Modeling requirements description
    a. List of pollutants at this facility requiring NAAQS and/or NMAAQS modeling.
    b. AQCR facility is located in and resulting list of pollutants requiring PSD increment (Class I and II) modeling. Include distances to Class I areas in discussion.
    c. List of State Air Toxic pollutants requiring modeling.
    d. PSD, NSPS, and NESHAP applicability and any additional modeling requirements that result if those regulations are applicable to the facility.
    e. State whether or not the facility is in a federal Nonattainment area, and any special modeling requirements or exemptions due to this status.
    f. Any special modeling requirements, such as streamline permit requirements.

IV. Modeling inputs
    a. General modeling approach
        i. The models used and the justification for using each model.
        ii. Model options used and why they were considered appropriate to the application.
        iii. Ozone limiting model options discussion, if used for NO_2 impacts.
        iv. Background concentrations.
    b. Meteorological data
        i. A discussion of the meteorological data, including identification of the source of the data.
        ii. Discussion of how missing data were handled, how stability class was determined, and how the data were processed, if the Bureau did not provide the data.
    c. Receptor and terrain discussion
        i. Description of the spacing of the receptor grids.
        ii. List fence line coordinates and describe receptor spacing along fence.
        iii. PSD Class I area receptor description.
        iv. Flat and complex terrain discussion, including source of elevation data.
    d. Emission sources
        i. Description of sources at the facility, including:
            1. A cross-reference from the model input source numbers/names to the sources listed in the permit application for the proposed facility.
            2. Determination of sigma-Y and sigma-Z for fugitive sources.
            3. Description and list of PSD increment consuming sources, baseline sources, and retired baseline sources.
            4. Describe treatment of operating hours
            5. Particle size characteristics, if plume depletion is used.
            6. If the modeled stack parameters are different from the stack parameters in the application, an explanation must be provided as to what special cases are being analyzed and why.

7. Partial operating loads analysis description.
8. Flare calculations used to determine effective stack parameters.
9. In-stack NO_2/NO_X ratio determination, if using OLM or PVMRM.

ii. Surrounding sources:

1. The date of the surrounding source retrieval.
2. Details of any changes or corrections that were made to the surrounding sources.
3. Description of adjacent sources eliminated from the inventory.

e. Building downwash

i. Dimensions of buildings

V. Modeling files description

a. A list of all the file names and description of these files.
b. Description of the scenarios represented by each file.

VI. Modeling results

a. A discussion of the radius of impact determination.
b. A summary of the modeling results including the maximum concentrations, location where the maximum concentration occurs, and comparison to the ambient standards.
c. Source, cumulative, and increment impacts.
d. Class I increment impact.
e. A table showing concentrations and standards corrected for elevation.
f. If ambient standards are exceeded because of surrounding sources, please include a culpability analysis for the source and show that the contribution from your source is less than the significance levels for the specific pollutant.
g. Toxics modeling results, if needed.

VII. Summary/conclusions

a. A statement that modeling requirements have been satisfied and that the permit can be issued.

Ask the modeling section or check the web page for a sample modeling reports. The modeling report documents details the standard format for the modeling report.

7.8 Step 8: Submit Modeling Analysis

Submit the following materials to the Bureau:

A CD containing the following:

I. An electronic copy (in MS Word format) of the modeling report.
II. Input and output files for all model runs. Include BEEST, ISC-View, or BREEZE files, if available.
III. Building downwash input and output files.
IV. Fence line coordinates.
V. Meteorological data, if not Bureau-supplied.
VI. A list of the surrounding sources at the time the facility was modeled.
VII. An electronic copy of the approved modeling protocol.

Do not include paper copies of modeling input and output files.

8.0 List of Abbreviations

Table 44: List of Abbreviations

ACRONYM	DESCRIPTION
AQB	Air Quality Bureau
AQCR	Air Quality Control Region
AQCR	Air Quality Control Regulation (CURRENTLY NOT USED)
AQRV	Air Quality Related Values
ARM2	Ambient Ratio Method 2
BACT	Best Available Control Technology
CO	Carbon monoxide
DEM	Digitized Elevation Model
EPA	Environmental Protection Agency
FLAG	**F**ederal **L**and **M**anagers' **A**ir Quality Related Values Work **G**roup
FEM	Federal Equivalent Method
FRM	Federal Reference Method
GEP	Good Engineering Practice
H_2S	Hydrogen sulfide
ISCST3	Industrial Source Complex Short Term Model version 3
NAAQS	National Ambient Air Quality Standards
NED	National Elevation Dataset
NO_2	Nitrogen dioxide
NO_X	Nitrogen oxides
NMAAQS	New Mexico Ambient Air Quality Standards
NMAC	New Mexico Administrative Code
O_3	Ozone
OEL	Occupational Exposure Level
OLM	Ozone limiting method
Pb	Lead
PDF	Probability density function
$PM_{2.5}$	Particulate matter equal to or under 2.5 mm in aerodynamic diameter
PM_{10}	Particulate matter equal to or under 10 mm in aerodynamic diameter
PPM	Parts per million (volume ratio)
PSD	Prevention of Significant Deterioration
PVMRM	Plume Volume Molar Ratio Method
ROI	Radius of Impact
SO_2	Sulfur dioxide
TSP	Total suspended particulates
UTM	Universal Trans Mercator
VOC	Volatile organic compounds

Appendix A: Recent changes to the NM Modeling Guidelines

Note of changes made in 2024:

Corrected order of cement handling depletion parameters in Table 28.
Updated PM2.5 annual standard to 9.0 µg/m^3.

Note of changes made in 2023:

Changed table notes from numbers to letters to distinguish from footnotes.
Removed *2.7.3 PSD Class I Area Proposed Significance Levels* because it contained only redundant information.
Updated *Very small emission rate modeling waiver requirements* based on recent modeling.
Added plume depletion parameters from separate NMED document.
Updated recommendations regarding using less than five years of meteorological data based on modeling the most recently processed meteorological data.
Added location, elevation, wind roses for available meteorological data.
Added additional information about ozone compliance demonstrations.
Added additional references to air quality standards sections.
Removed 24-hour refined background calculation example that was based on old data.

Note of changes made in 2022:

July 2022:
SO_2 modeling in the Permian Basin now requires surrounding sources.
If only one year of meteorological data is used, evidence is required that the year used produces the highest concentrations of the recent, available years.
Background concentrations were updated.
Obsolete references and links were updated.
Clarification of unclear language with updates to current EPA guidance.
Additional references were provided.

Note of changes made in 2020:

October 26, 2020:
Reference to old EPA Modeling Guideline was updated to 2017 version.
Clarification that PSD increment modeling is not normally an applicable requirement for Title V.
Sources within 20 km from the center of Albuquerque or El Paso should include both modeled sources and monitored concentrations (changed from 10 km because the cities are larger than 10 km in radius).
Option to use monitored background in lieu of surrounding sources for PSD increment presented.
Language was changed to reflect that capped and horizontal point sources are no longer beta options and do not need stack-tip downwash turned off.
Cool stack section added to explain the modeling of sources at ambient temperature.
Obsolete references and links were updated.

Note of changes made in 2019:

February 7, 2019: An error in summary Table 20 was corrected to make it match the full text in section 2.6.4.4.

Note of changes in 2017-2018:

Source definition was changed to better match EPA definitions.

Original:

> Modeling significance levels are thresholds below which the source is not considered to contribute to any predicted exceedance of air quality standards or PSD increments. The definition of 'source' can apply to the whole facility or to the modifications at the facility. In cases where a particular averaging period has not been modeled for a pollutant, or was modeled, but predicted concentrations were above 95% of air quality standards or PSD increments, then NMED considers the entire facility to be the 'source' for those pollutants and periods. For other cases, 'source' includes only the modification described in the current application plus all contemporaneous emissions increases in the past 5 years since the entire facility was last modeled.

New:

> Modeling significance levels are thresholds below which the source is not considered to contribute to any predicted exceedance of air quality standards or PSD increments. The definition of 'source' can apply to the whole facility or to the modifications at the facility. For a new facility or an unpermitted facility, NMED considers the entire facility to be the 'source'. For other cases, 'source' includes only the new equipment or new emissions increases described in the current application. Equipment that replaces other equipment is part of the new equipment.

Meteorological data recommendations have changed to reflect recent data. AQB has processed new meteorological data and has retired some old data that may be out of date. The processed data is available on the meteorological data webpage (https://cloud.env.nm.gov/air?c=3617&k=afa30dd21c see also https://www-archive.env.nm.gov/air-quality/meteorological-data/). At the time of this writing, Substation has replaced Bloomfield data for permitting sources to be located in unknown locations (portable source relocation modeling). This change was based on a comparison of modeling results for existing sets of meteorological data.

NO_2 conversion using Ambient Ratio Method (ARM) has been replaced with Ambient Ratio Method 2 (ARM2). EPA no longer mentions the use of ARM in Appendix W. Instead, that appendix described details about what ratios can be used for the ARM2 method, which is now built into AERMOD as a default option.

Title V sources that have not demonstrated compliance with NAAQS or PSD increments are required to model for these standards and increments or produce a compliance plan to come into compliance.

SO_2 background concentrations were added for the annual averaging period.

PM2.5 Class I significance levels were updated.

TSP standards were repealed November 30, 2018.

Background concentrations were updated to 2015-2017.

Areas Where Streamlined Permits Are Restricted were updated.

Secondary formation of ozone and PM2.5 were updated to reflect current Appendix W and MERP guidance.

Note of changes that were made in 2016:

1-hour NO_2 and SO_2 modeling is now required for all sizes of facilities with NO_2 or SO_2 emissions.

ARM2 method of NO_2 modeling has been added to the approved options.

AERMOD output is considered to be expressed at Standard Temperature and Pressure (STP), eliminating most of the need for concentration conversion.

Emission rates for the very small emission rate modeling waivers have changed.

The modeling report form, Universal Application 4 (UA4), is available.

Background concentrations have been updated to 2013-2015 monitoring results.

(Hobbs PM2.5 background concentration was corrected from the July 8, 2016 version).
(September 1, 2016: PM2.5 annual standard was corrected in Table 12)

Errors in summary Tables 6A and 6C that did not match the instructions in the pollutant-specific standards sections were corrected.

DRAFT AS OF August 11, 2026

Data Base Summary (Statement of Basis)
NSR Permit

Type of Permit Action: Regular-New

PSD or Not	Minor or Title V	Portable or Not
Minor (not PSD)	Major-Title V	**Stationary**

Facility:	YGI Microgrid
Company:	Yucca Growth Infrastructure, LLC
Facility Type:	ENRG-Power Plant
Permit No. (NSR)	10883
Operating Permit No. (TV)	N/A
Agency Interest No.	41351 - PRN20260001
AIRS ID No.	350134104
SIC CODE:	4911: Electric services
Permit Writer:	Julia Kuhn
Application Notarized Date:	April 22, 2026
Receive Date:	April 27, 2026
Timeliness of TV Application:	N/A
Ruled Incomplete:	N/A
Ruled Complete:	May 27, 2026
APP. sent to Field Office:	May 30, 2026
Public involvement Plan (PIP):	June 5, 2026
PSD APP. Sent to EPA:	N/A

*As required by 20.2.72.206.A.(7): Mail a copy of the public notice at the same time it is sent for publication to the appropriate agency in the following locations if the source will locate within 50 kilometers (31.1 miles) of the boundary of other states, Bernalillo County, or a Class I Area.

Part II – Facility Specifications

Table 102.A: Total Pollutant Emissions from Entire Facility:

Pollutant	**Emissions** (tons per year)	**Emission Type**	**Change in Emission since Permit N/A**
Carbon Monoxide	161.2	Allowable	N/A
Nitrogen Dioxide	37.2	Allowable	N/A
Particulate Matter (10 microns or less)	75.4	Allowable	N/A
Particulate Matter (2.5 microns or less)	75.4	Allowable	N/A
Particulate Matter (total suspended)	75.4	Allowable	N/A
Sulfur Dioxide	0.1	Allowable	N/A
Volatile Organic Compounds (VOC)	124.0	Allowable	N/A

Administrative Record NSR_001605

Note: Total Potential Pollutant Emissions in Table 102.A, may include fugitive emissions; routine or predictable, startup, shutdown, and maintenance emissions (SSM); and permitted malfunction allowances if these are a source of regulated air pollutants from this facility.

Table 102.B: Total Potential Hazardous Air Pollutants (HAPs)*

Pollutant	**Emissions** (tons per year)	**Emission Type**	**Change in Emission since Permit N/A**
Methanol	1.2	Potential	N/A
Total HAPs	1.4	Potential	N/A

* HAP emissions are included in the Table 102.A VOC emissions total.
** Total HAP emissions may not agree with the sum of individual HAPs because only individual HAPs emitted at a rate greater than 1.0 ton per year are listed in Table 102.B.

Administrative Record NSR_001606

Air Pollution Control Devices: None

Unit No.	Unit Type	Make	Model No.	Serial No.	Yr of Construction	Yr of Manufacture	Operating Rate/Capacity Max/Site	Subject Item Status	Subject Item Description
SOFC-1 to SOFC-2275	Cogeneration	Bloom	Energy Server 6.5	TBD	TBD	TBD	2,462 MW2	Active	Solid Oxide Fuel Cells - 260 kW and 325 kW
SSM	Startup, Shutdown, and Maintenance – Venting natural gas during Centralized Desulfurization System (CDS) Filter Replacement	N/A	N/A	N/A	TBD	N/A	N/A	Active	Natural gas venting during desulfurization bed media and desulfurization filter replacement for initial start-ups, maintenance and shutdown

1. A group of 260 kW and/or 325 kW Bloom Energy Server "units" that share a stack are referred to as an "cluster" for the purpose of this permit.
2. "MW" refers to megawatts of electricity.

Equipment Specifications (Inactive/Retired/Removed): None

Emissions: Pollutant **Permitted** (Allowable and SSM) Emissions per piece of equipment or Subject Item as represented by applicant.

1.0 Facility Process Description:

The facility will generate electricity using fuel cells. Fuel cells emit NOx, CO, VOC, SO_2, PM, PM_{10}, and $PM_{2.5}$ emissions as a byproduct of chemical and electrical (chemoelectrical) reactions. Other byproducts from power generation include heat and steam.

The facility will use a Bloom Energy Server System, which is a type of solid oxide fuel cell system (SOFC). The SOFC system converts natural gas into electricity through an electrochemical reaction. Each individual fuel cell is composed of three layers: a solid ceramic electrolyte sandwiched between a cathode and an anode, where the anode and cathode are made from inks that coat the electrolyte. No precious metals, corrosive acids, or molten materials are required. Natural gas enters the anode side, where it is mixed with steam to produce reformed fuel through Direct Internal Reforming (DIR). As the reformed fuel crosses the anode, it attracts oxygen ions from the air on the cathode side. The oxygen ions combine with the reformed fuel to produce electricity, water, heat, and carbon dioxide. The water and heat are recycled to produce the steam needed to reform the fuel, enabling a highly efficient electrochemical reaction occurring at 700–900 degrees Celsius.

Individual cells are combined into stacks, then into power modules containing hundreds of individual fuel cells that produce direct current power. The modules are packaged into Energy Servers, which combine the power modules with a fuel processing module and an AC module containing DC-to-AC converters and transformers to produce 325 kW of net AC power. A minority of smaller units produce 260 kW of net AC power.

Administrative Record NSR_001609

The fuel cells are organized/arranged as follows: *cell and stack -> power module -> energy server -> cluster -> inverter group/platform*. The proposed Bloom Energy Server System deploys co-functioning Energy Servers to create an integrated system capable of sustaining the target output represented for each applicable scenario (260 kW or 325 kW). Depleted anode exhaust, which is approximately 95 percent carbon dioxide once dried, is discharged to the atmosphere as greenhouse gas (GHG). The air emissions from the Energy Servers consist of depleted anode exhaust, which contains criteria air pollutants consisting of NOx, CO, VOC, SO_2, PM, PM_{10}, $PM_{2.5}$, and HAPs. The applicant seeks authorization to operate the Bloom Energy Server System at its maximum rated load for 8,760 hours per year.

Startup, Shutdown, and Maintenance (SSM) routine or predictable emissions: Maintenance activities include hot swap of power modules approximately once per five years, replacement of desulfurization bed media once per two years, and as-needed individual component (e.g., blower) replacements. Air emissions (natural gas venting) will occur during desulfurization bed media replacements and during desulfurization unit initial start-ups. Approximately ninety-five Central Desulfurization System (CDS) skids/blocks will be installed, consisting of two vessels in a lead/lag configuration for desulfurization. Each vessel has a volume of 1,370 standard cubic feet.

2.0 Description of this Modification:

This permit application is for a new source review (NSR) construction permit submitted pursuant to 20.2.72.200.A(1) NMAC for a microgrid power generation facility to generate power for a nearby (potentially adjacent) data center. The facility will generate power using fuel cells which are solid oxide fuel cell (SOCF) Bloom Energy Server System 260 kW and 325 kW. Energy Server "clusters" are routed to a total of 2,275 exhaust stacks as emission sources. The site will be a major source for Title V (20.2.70 NMAC).

3.0 Source Determination from Section 11 of the permit application:

1. The emission sources evaluated include the Units listed in Tables 2-A and 2-B of permit application corresponding to Permit # 10883. NMED has undertaken a preliminary analysis (below) of whether the data center and/or any nearby future facility (for which there is no submitted application(s)) may be aggregated.

2. Single Source Analysis (including preliminary analysis):

A. SIC Code: Do the facilities belong to the same industrial grouping (i.e., same two-digit SIC code grouping, or support activity)? N/A, if an aggregation analysis is conducted in the future, the microgrid and any future associated entities, such as the data center, may have different SIC Codes.

B. Common Control: Are the facilities under common ownership or control? N/A. Currently, the microgrid and data center are owned and operated by separate entities, and data center has no pollutant emitting activities. If an aggregation analysis is conducted in the future to include any associated nearby facility, NMED would need to evaluate the relationship between the microgrid and any future associated facility under relevant guidance and historical interpretations.

C. Contiguous or Adjacent: Are the facilities located on one or more contiguous or adjacent properties? N/A If an aggregation analysis is conducted in the future, the microgrid and the data center, or any future associated facility will need to be evaluated.

Administrative Record NSR_001610

3. Is the source, as described in the application, the entire source for 20.2.70, 20.2.72, 20.2.73, or 20.2.74 NMAC applicability purposes? Yes. At this time only the microgrid has applied for an air permit and it is not expected that the data center, or any other associated entity, will require an air permit in the future. As noted above, if an aggregation analysis is conducted in the future, NMED will determine whether the microgrid and data center, or any other associated entity requesting an air permit should be considered as a single source for the purpose of determining construction permit and Title V permit requirements. Even if the facilities are considered as a single source for purposes of air permitting, the facilities may be able to operate under separate construction and Title V permits; however, the total emissions of regulated air pollutants for all such pollutants will then be combined to determine permit requirements.

4.0 Prevention of Significant Deterioration (PSD) Applicability:

A. Emissions from the microgrid will be considered a single source unless a future aggregation analysis indicates that the data center (which currently has no air emissions) should be combined together as a single source. If the data center had pollutant emitting activities and the two locations were aggregated, the combined emissions from both facilities could potentially be a PSD **minor or major source** if this permit is issued.

The following is a statement from the applicant in response to AQB's request for information regarding the source determination for the two facilities.

"The Companies maintain the position that this information is not relevant to the issuance of its air permit application under the New Mexico Air Quality Control Act. The YGI Microgrid will provide power to the proposed data center. To clarify the statement in the cover letter, the application does not specifically cover the data center. Rather, the power generation equipment necessary to provide both primary and backup power supply for the data center are the Energy Servers included in the application. So, both the primary and emergency backup power needs for the data center are reflected in the application. In other words, the Companies expect that no additional backup generation will be required for the data center and that instead, this air permit application would authorize sufficient power supply for the data center such that no separate, additional backup power that could not be served by connection to the electrical power grid would be needed at or for the data center. The Companies further expect that the data center will not operate any pollutant-emitting activities subject to permitting under the New Mexico Air Quality Control Act and implementing regulations."

Administrative Record NSR_001611

5.0 **History (In descending chronological order, showing NSR and TV):** *The asterisk denotes the current active NSR and Title V permits that have not been superseded.

Permit Number	Issue Date	Action Type	Description of Action (Changes)
* 10883	TBD	NSR – New Permit	This permit application is for a new source review (NSR) construction permit submitted pursuant to 20.2.72.200.A(1) NMAC for a microgrid power generation facility to generate power for a nearby (potentially adjacent) data center. The facility will generate power using fuel cells which are solid oxide fuel cell (SOCF) Bloom Energy Server System 260 kW and 325 kW. Energy Server "clusters" are routed to a total of 2,275 exhaust stacks as emission sources. The site will be a major source for Title V (20.2.70 NMAC). NMED has undertaken a preliminary analysis of whether the data center and/or any nearby future facility may be aggregated.

6.0 **Public Response/Concerns:** As of 7/6/2026, the NMED Air Quality Bureau (AQB) has received approximately 22,500 public comments or concerns. The AQB notes that we have received reports of some comments being entered without the named commenter's knowledge and/or consent; this will be part of the administrative record.

7.0 **Compliance Testing History:** There is no compliance testing to report for this facility since this is a new source and has not yet been constructed.

8.0 **Startup and Shutdown from Section 14 of the Application:**

A. If applicable, did the applicant indicate that a startup, shutdown, and emergency operational plan was developed in accordance with 20.2.70.300.D(5)(g) NMAC? **No.** The facility does not currently have a Title V permit, and this section applies to facilities with Title V permits.
B. If applicable, did the applicant indicate that a malfunction, startup, or shutdown operational plan was developed in accordance with 20.2.72.203.A.5 NMAC? **Yes**
C. Did the applicant indicate that a startup, shutdown, and scheduled maintenance plan was developed and implemented in accordance with 20.2.7.14.A and B NMAC? **Yes**
D. Does the facility have emissions due to routine or predictable startup, shutdown, and maintenance? If so, have all emissions from startup, shutdown, and scheduled maintenance operations been permitted? **Yes,** due to the magnitude of the project in regard to the technology, NMED-AQB will require the applicant to comply to the conditions of the permit to determine if SSM emissions, based on actual operations, will be exempt per 20.2.72.202.B(5) NMAC since emissions from SSM activities are projected to be less than ½ tons per year.

9.0 **Compliance and Enforcement Status**: Per C&E email Verification of Compliance dated May 22, 2026 "We don't have any enforcement actions for them". In addition, the Compliance and Enforcement Division was unable to find any enforcement actions from AQB against the parent company BorderPlex Digital Assets LLC.

Additionally, on 7/29/2026 C&E verified compliance for the following associated companies:

Company	NMED Air permits (TEMPO)	NMED Air enforcement history
1. Forge Growth Infrastructure, LLC	no	None
2. Stack Infrastructure	no	None
3. El Paso Electric Company	AI# 122	2009 CD - $250k fine + order to tune up boilers. 2010 SASFCO & 2012 NOD - both matters for late reporting
4. Orion Digital Infrastructure, LLC	no	None
5. Santa Theresa Land LLC	no	None
6. STACK Infrastructure	duplicate	
7. BorderPlex Digital Assets	no	None
8. Oracle America, Inc. (OAI)	AI# 41338	None (application withdrawn 3/19/2026)
9. Yucca Growth Infrastructure, LLC	AI# 41351	None
10. Red Chiles A, LLC	no	None
11. Red Chiles B, LLC	no	None
12. Red Chiles C, LLC	no	None
13. Red Chiles D, LLC	no	None

10.0 Modeling:

Modeling Assumptions: The facility operates continuously, 8,760 hours per year.
Permit Conditions: The facility may operate 8,760 hours per year.
Conclusion:
This modeling analysis demonstrates that operation of the facility described in this report neither causes nor contributes to any exceedances of applicable air quality standards. The standards relevant at this facility are NAAQS for CO, NO2, PM10, PM2.5, and SO2; NMAAQS for CO, NO2, and SO2; and Class II PSD increments for NO2 and PM10.

Action: The permit can be issued based on this modeling analysis.

The modeling report was submitted by Trinity Consultants and dated April 27, 2026.
The air quality analysis demonstrates compliance with applicable regulatory requirements.
Model(s) Used: AERMOD version 24142 was used to run the modeling analysis.
Note: Complete modeling input and output files can be made available and are located in the Modeling Archives in the folder, "10883_Yucca Growth Infrastructure YGI Microgrid".
Description of model input files: NMED's AERMOD-ready meteorological data was used for this analysis. This data is available on AQB's website. GeoTIFF files were acquired through the USGS.

Administrative Record NSR_001613

11.0 State Regulatory Analysis (NMAC/AQCR):

Citation 20 NMAC	Title	Applies (Y/N)	Unit(s) or Facility	Justification:
2.1	General Provisions	Yes	Entire Facility	The facility is subject to Title 20 Environmental Protection Chapter 2 Air Quality of the New Mexico Administrative Code so is subject to Part 1 General Provisions, Update to Section 116 of regulation for Significant figures & rounding. Applicable with no permitting requirements. Applies sitewide. Yucca will comply with procedural requirements indicated in 20.1.114 NMAC, 20.1.115 NMAC, 20.1.116 NMAC, and 20.1.117 NMAC (concerning variance hearings, confidential information, significant digits, and electronic reporting) to the extent applicable
2.3	Ambient Air Quality Standards	No for both NSR and TV	N/A	**NSR:** 20.2.3 NMAC is a SIP approved regulation that establishes State standards. The NMAAQS themselves are not an "applicable requirement" with which a source must directly comply. The promulgation of a NMAAQS does not, in and of itself automatically result in actionable measures to a source. Instead, the specific measures contained in each individual issued permit, other state promulgated rules, and NM's EPA approved SIP are the relevant applicable requirements (such as NSPS and MACT). **Title V:** 20.2.3.9 NMAC, LIMITATION OF APPLICABILITY TO 20.2.70 NMAC. The requirements of NMAAQS are not applicable requirements under 20.2.70 NMAC, as defined by 20.2.3.9 NMAC, 20.2.3.9 NMAC does not limit the applicability of this part to sources required to obtain a permit under the minor NSR regulation, 20.2.72 NMAC, nor does it limit which terms and conditions of NSR permits issued pursuant to 20.2.72 NMAC are applicable requirements in a Title V permit.
2.7	Excess Emissions	Yes	Entire Facility	Applies to all facilities' sources. Federally enforceable except for Sections 6(b); 110(b)(15); 111; 112; 113; 115; and 116 that are State Enforceable Only. Applies sitewide. Yucca will implement a maintenance plan as required under 20.2.7.14 NMAC, and will comply with the notification, affirmative defense, and root cause requirements of 20.2.7.108–114 NMAC.
2.23	Fugitive Dust Control	Yes	Construction of Facility	The construction activities for the facility are subject to 20.2.23 NMAC.

Administrative Record NSR_001614

Citation 20 NMAC	Title	Applies (Y/N)	Unit(s) or Facility	Justification:
2.61	Smoke and Visible Emissions	Yes	SOFC-1 through SOFC--2275	This regulation limits from opacity to 20% from Stationary Combustion Equipment, such as engines, boilers, heaters, and flares. Each SOFC cluster is subject to this regulation because each cluster exhausts to a stack and meets the definition of "stationary combustion equipment" (subject to 20.2.80 NMAC). "Stationary combustion equipment" means any stationary device or system *used to oxidize solid, liquid, or gaseous materials,* including fuels or wastes, and includes but is *not limited to* incinerators, wood-fired boilers, air curtain destructors, and stationary oil burning equipment (20.2.61.7 NMAC). Facility is subject to the regulation.
2.70	Operating Permits	Yes	Entire Facility	The facility will be a Title V Major Source as defined at 20.2.70.7 NMAC. Yucca will submit a timely and complete operating permit application as required under 20.2.70.200, 201, 300 NMAC.
2.71	Operating Permit Fees	Yes	Entire Facility	Source will be subject to 20.2.70 NMAC annual fees as cited at 20.2.71.109 NMAC. The department will provide an invoice for fees owed by April 1 of each year per 20.2.71.113.A NMAC.
2.72	Construction Permits	Yes	Entire Facility	The current permit application was required by 20.2.72.200.A NMAC and so the facility is subject to this regulation.
2.73	NOI & Emissions Inventory Requirements	Yes, Always	Entire Facility	Applicable to all facilities that require a permit. Because a construction permit is required, the permit will satisfy requirements of 20.2.73.200.A(4) NMAC.
2.74	Permits-Prevention of Significant Deterioration	No	N/A	If subject, this would normally apply to the entire facility. PSD permitting does not apply because the proposed new facility is not a major PSD stationary source. Specifically, the facility is not listed in table 1 (20.2.74.501 NMAC) where the emissions threshold is 100 tpy and the potential to emit will be less than 250 tons per year for each regulated new source review pollutant
2.75	Construction Permit Fees	Yes	Entire Facility	This facility is subject to 20.2.72 NMAC. This regulation applies and the application was submitted pursuant to 20.2.72.200.A(1) NMAC.

Administrative Record NSR_001615

Citation 20 NMAC	Title	Applies (Y/N)	Unit(s) or Facility	Justification:
2.77	New Source Performance Standards	No	See Sources subject to 40 CFR 60	Applies to any stationary source constructing or modifying and which is subject to the requirements of 40 CFR Part 60. The facility is not subject to any standard under 40 CFR Part 60.
2.78	Emissions Standards for HAPs	No	See Sources subject to 40 CFR 61	This regulation applies to all sources emitting hazardous air pollutants, which are subject to the requirements of 40 CFR Part 61. The facility is not subject to any standard under 40 CFR Part 61. See 20.2.78.9 NMAC.
2.79	Permits Nonattainment Areas	No	N/A	This facility is adjacent to a nonattainment area. The facility is not located inside the nonattainment area. The Sunland Park nonattainment area includes the "area bounded on the New Mexico-Texas state line on the east, the New Mexico-Mexico international line on the south, latitude N31°49'30" on the north, and longitude W106°36'36" on the west." See 83 Fed. Reg. 25776, 25820 (Jun. 4, 2018). The YGI Microgrid is not located within these boundaries. A facility "affects" an adjacent nonattainment area if its radius of impact, that is determined from air dispersion modeling, overlaps an adjacent nonattainment area. The site will not cause or contribute to any existing NAAQS violation. As detailed more fully in Section 16 (relating to modeling), emissions of NOX and VOC are less than the applicable 8-hr O3 MERPs (Otero County). See 20.2.79.109.A. See sec. 2.6.5.2, Air Quality Modeling Guidelines. AQB modeling analysis states that although this facility will emit less than 250 tons per year of NOx and less than 250 tons per year of VOC, a project-specific MERPs screening calculation was also performed using the MERPs tool and the NM AQB Dispersion Modeling Guidelines to further demonstrate that the project will not cause or contribute to an exceedance of the ozone NAAQS. The ozone significance level (SIL) is 1.96 µg/m^3 and sources with ozone impacts below the ozone SIL are not expected to cause or contribute to ozone concentrations exceeding the ozone NAAQS. Based on the proposed allowable emission rates, the resulting concentration is 0.18 µg/m^3. Therefore,

Administrative Record NSR_001616

Citation 20 NMAC	Title	Applies (Y/N)	Unit(s) or Facility	Justification:
				the project will not cause or contribute to an exceedance of the ozone NAAQS.
2.80	Stack Heights	Yes	All SOFC-1 through SOFC—2275 stacks	The facility is subject to this regulation. No stack will exceed good engineering practice stack height. See 20.2.80.109.
2.82	MACT Standards for Source Categories of HAPs	No	N/A	This regulation applies to all sources emitting hazardous air pollutants, which are subject to the requirements of 40 CFR Part 63.

12.0 Federal Regulatory Analysis:

Federal Regulation	Title	Applies (Y/N)	Unit(s) or Facility	Comments
Air Programs Subchapter C (40 CFR 50)	National Primary and Secondary Ambient Air Quality Standards	No	N/A	The modeling and conditions developed from the modeling are the applicable requirements to demonstration compliance with the NAAQs.
NSPS Subpart A (40 CFR 60)	General Provisions	No	See sources subject to a Subpart in 40 CFR 60	Applies if any other subpart applies. The facility is not subject to any standard under 40 CFR Part 60.
40 CFR 60.330 Subpart GG	Stationary Gas Turbines	No	N/A	There are no Stationary Gas Turbines at this facility.
40 CFR Part 60 Subpart IIII (Quad-I)	Standards of Performance for Stationary Compression Ignition Internal Combustion Engines	No	N/A	There are no Stationary Compression Ignition Internal Combustion Engines (Diesel Engines) at this facility.
40 CFR Part 60 Subpart	Standards of Performance for	No	N/A	The provisions of this subpart are applicable to manufacturers, owners, and operators of stationary spark ignition (SI) internal

Administrative Record NSR_001617

Federal Regulation	Title	Applies (Y/N)	Unit(s) or Facility	Comments
JJJJ (Quad -J)	Stationary Spark. Ignition Internal Combustion Engines			combustion engines (ICE) as specified in paragraphs (a)(1) through (5) of section 60.4230. There are no stationary spark ignition (SI) internal combustion engines (ICE) (gas or propane engines) at this facility.
40 CFR Part 60 Subpart KKKK	Standards of Performance for Stationary Combustion Turbines after February 18, 2005 and on or before December 13, 2024	No	N/A	There are no Stationary Gas Combustion Turbines at this facility.
40 CFR 60 Subpart KKKKa	Standards of Performance for Stationary Combustion Turbines who commenced construction, modification, or reconstruction after December 13, 2024.	No	N/A	There are no Stationary Gas Combustion Turbines at this facility.
NSPS 40 CFR 60 Subpart TTTT	Standards of Performance for Greenhouse Gas Emissions for Electric Generating Units	No	N/A	There are no Stationary Gas Combustion Turbines at this facility.
NESHAP Subpart A (40 CFR 61)	General Provisions	No	See sources subject to a Subpart in 40 CFR 61	Applies if any other subpart applies. 40 CFR Part 61 does not apply. The facility does not belong to any listed category or emit any listed pollutants that would trigger applicability.
MACT Subpart A (40 CFR 63)	General Provisions	No	See sources subject to a Subpart in 40 CFR 63	Applies if any other subpart applies. The facility will not be subject to any Part 63 standard requiring compliance with Subpart A.

Federal Regulation	Title	Applies (Y/N)	Unit(s) or Facility	Comments
40 CFR 63 Subpart ZZZZ (Quad Z)	National Emissions Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines (RICE MACT)	No	N/A	A facility is subject to this subpart if they own or operate a stationary RICE at a major **OR** area source of HAP emissions, except if the stationary RICE is being tested at a stationary RICE test cell/stand. This regulation does not apply since there will be no engines authorized to operate at the facility.
MACT 40 CFR 63 Subpart YYYY	National Emissions Standards for Hazardous Air Pollutants for Stationary Combustion Turbines	No	N/A	There are no Stationary Gas Combustion Turbines at this facility.
40 CFR 64	Compliance Assurance Monitoring	No	N/A	There are no units equipped with a control device and uncontrolled emissions above the Title V major source thresholds. No sources at the facility are subject to Compliance Assurance Monitoring pursuant to 40 CFR Part 64.
40 CFR 68	Chemical Accident Prevention	No	N/A	According to the application, the permittee does not use or store regulated substances in amounts or at thresholds that would cause this regulation to apply. The CAA §112 (r)(1) General Duty Clause directs owners and operators of stationary sources to identify hazards that may result from accidental releases, to design and maintain a safe facility, and to minimize the consequences of releases when they occur. The General Duty Clause may only be enforced by the EPA under CAA section 113.
40 CFR 70	Title V- State Operating Permit Programs	No	N/A	Operating Permit Program – is not applicable – New Mexico State has full delegated authority, and Title V is administered under 20.2.70 NMAC.
CAA Title VI and 40 CFR 82	Protection of Stratospheric Ozone	No	N/A	According to the application, 40 CFR 82 does not apply.

Administrative Record NSR_001619

13.0 **Exempt and/or Insignificant Equipment**: The applicant reports SSM emissions as exempt activities per 20.2.72.202.B(5) NMAC, in table 2B of the application since emissions from SSM activities are less than ½ tons per year according to the theoretical number purges per events, and number of events provided in the calculations. Based on the technical analysis of the SSM calculations, the Department will require compliance with the SSM conditions in the permit. Additional information is provided in Section 14 of this document.

14.0 **New/Modified/Unique Conditions** (Format: Condition#: Explanation):

A. All conditions are new. This is a new NSR permit.
B. Section A107: Based on information provided in the permit application and additional submittals, the Department has determined that emissions during startup and maintenance need to be regulated by the permit. The applicant provided calculations showing that emissions from startup and maintenance activities are less than ½ ton per year per pollutant and would qualify as minor NSR exempt pursuant to 20.2.72.202.B(5) NMAC. However, the exemption applies to the potential emission rate (PER) and the AQB could not confirm that the PER of SSM activities are less than ½ tpy. There is nothing inherently limiting the number of maintenance activities nor the number of purges per event that may be required. AQB cannot verify the technical information regarding the maintenance or operational requirements of the units to verify the limits on SSM activities.

15.0 **For Title V action: Cross Reference Table between NSR Permit 10883 and TV Permit N/A. NSR permit conditions cross-referenced to the TV permit are federally enforceable conditions, and therefore brought forward into the TV permit:**

This section does not apply to this permit application.

NSR conditions identified as "NSR Unique" do not establish any applicable requirements or federally enforceable conditions that require adoption in the TV operating permits.

16.0 **Permit specialist's notes to other NSR or Title V permitting staff concerning changes and updates to permit conditions.**

A. Per 20.2.72.210(D) NMAC: Any term or condition imposed by the department on a permit or permit revision is enforceable to the same extent as a regulation of the board.
B. Fuel Cells Modules are the only equipment authorized at the facility to provide power, to energize external sources; and to provide all backup power during load spikes. Temporary and/or exempt equipment such as generators are not allowed per 20.2.72.202 B(3)(a) NMAC and cannot be authorized to operate at the facility and to deliver power.
C. Portable and/or stationary turbines, heaters, and/or other emission emitting equipment are not currently authorized and would be subject to 20.2.72 NMAC permitting.
D. A 15% safety factor has been removed from the applicant's GHG emission calculations. The requested GHG emissions reported in the application already reflect a significant value and AQB will not accept/allow the addition of a safety factor in the calculation to increase the GHG emissions by 1,323,145 tpy, from 8,820,970 tpy to 10,144,115 tpy. Additionally, the Department would expect the applicant to revise and recalculate GHG emissions yearly, based on future actual reporting emissions for purposes of requirements under the Department's Emissions Inventory pursuant 20.2.73.300 NMAC) rather than the theoretical calculations provided in the application.
E. Technical Feasibility: Solid Oxide Fuel Cell (SOFC) technology is proven and commercially

Administrative Record NSR_001620

operational. However, only one of the examples below has a capacity greater than 0.5 GW, while YGI's proposed electrical generation capacity is over 2.0 GW. The Department reserves the right to re-evaluate operation capabilities of the current permit application technology. Should the applicant modify the permit to include additional equipment such as turbines and engines, scaling up operations, emissions increase and/or excess emissions, the facility may be subject to a permit pursuant to 20.2.74.300 NMAC as if construction has not yet commenced. Additionally, the permittee is subject to conditions A117.B, and B113.A through C.

Facility	Permitting Authority	MFG	Fuel Cell Model	Capacity	Purpose (if available)	Source	Permitting Stage
Yucca Growth Infrastructure, LLC	**NMED**	**Bloom Energy**	**ES 6.5**	**2.4620 GW**	**Provides power to one data center**	**Application**	**Application Under Review**
Diamond State Generating Partners, LLC (Bloom Red Lion)	DNREC	Bloom Energy	ES5	0.0249 GW	Used with utility	Construction permit application	Issued, facility operating
Diamond State Generating Partners, LLC (Bloom Brookside)	DNREC	Bloom Energy	ES5	0.0026 GW	Used with utility	Construction permit	Issued, facility operating
Yellow BOX Partners, LLC	TCEQ	Bloom Energy	ES 6.5	0.5600 GW	Provides power to future, unidentified data centers	Standard EGU permit tech review	Permits approved, facility not built yet
Intel Santa Clara	BAAQMD (did not find a permit)	Bloom Energy	ES5	0.0200 GW[1]	Provides power to Intel's data centers	Fuel Cells as Energy Source for Data Centers	Permitted as distributed units rather than a single permit, facility operating
Amazon (AWS)	ODEQ	Bloom Energy	Server 5	0.0024 GW	Provides supplemental power to utility AWS Data Center	BAER Assessment	No, withdrawn
AEP Ohio	OEPA, PUCO	Bloom Energy	Unknown	0.007 GW	Supply power to 2 large data centers	Permit to Install & Operate	Permits approved, construction started in 2026

1. This is an estimate based on the values seen in the source (started at 1 MW, have multiple expansions including 1 5 MW that could be come 10 MW)

F. Solid Oxide Fuel Cells (SOFC) require natural gas to generate pure hydrogen through the Direct Internal Reforming (DIR) process integrated into the fuel cell. To ensure performance, hydrogen formation, and steam generation; system optimization and operating conditions

Administrative Record NSR_001621

include regulating temperatures, hydrogen mass flow, and humidity.

G. The high operating Temperatures of 700-900 degrees Celsius, and the volatile nature of hydrogen and syngas require strict thermal management and ventilation to prevent cracking/mechanical stress.
H. Gas handling and mass flow in the SOFC module requires precise delivery of fuels and air or oxygen for flow distribution and performance.
I. Fuel Cell Auxiliary Equipment and System Optimization and Management includes Electronic Loads; Cell Voltage Monitoring (CVM); Leak and Fluid Checks, and Air/Pressurization.
J. The comprehensive monitoring system (CMS) plan to be submitted by the applicant should not be limited to temperature and pressure readings (A601.A). NMED requires the applicant to expand the scope of a comprehensive monitoring to include at minimum continuous monitoring of the facility's CDS SSM events (A107.D and A107.E); gas flowrate (A108.B); electrical output measurements (MW) (A108.C); exiting sulfur concentration measurements (A110.A); temperature and pressure readings, (A601.A), and natural gas leaks flowrates at the SOFC Units (A601.H).
K. To prevent uncontrolled venting of hydrocarbons and sulfur gases into the atmosphere, the desulfurization canister replacement process system must be isolated and purged. The permittee must meet permitting requirements, if any, for Hazardous Waste Disposal.

PART B GENERAL CONDITIONS (Attached)

PART C MISCELLANEOUS: Supporting On-Line Documents; Definitions; Acronyms (Attached)

PART A FACILITY SPECIFIC REQUIREMENTS

A100 Introduction

A. This is a new permit.

A101 Permit Duration (expiration)

A. The term of this permit is permanent unless withdrawn or cancelled by the Department pursuant to Section B113 and/or NMSA 1978, Section 74-2-12.B.

B. Except for the equipment identified in Table 104.A, the construction, installation and/or operation of any stationary sources or portable stationary sources of regulated air pollutants is not authorized by this by permit and explicitly prohibited. This prohibition includes temporary, portable, and/or exempt sources pursuant to 20.2.72.202 NMAC.

A102 Facility: Description

A. The function of the facility is to generate power to operate a data center using Bloom Energy Server System fuel cells. This system is a type of solid oxide fuel cell system (SOFC) which electrochemically converts natural gas into electricity using an electrochemical reaction.

B. This facility is located approximately 3.6 miles South of Santa Teresa in New Mexico, Doña Ana County.

C. This permit application is for a New Source Review (NSR) construction permit issued pursuant to 20.2.72.200.A(1) NMAC. The facility will be a microgrid power generation facility that will consist of a maximum of 2,275 solid oxide fuel cell (SOFC) clusters with a total electric generating capacity of 2,462 MW. The electric generating capacity of each module is either 260 kW or 325 kW. Fuel cells are arranged in cell stack -> power module -> energy server -> cluster -> inverter group/platform. The description of this modification is for informational purposes only and is not enforceable.

D. Tables 102.A and Table 102.B show the total potential emission rates (PER) from this facility for information only. This is not an enforceable condition and excludes emissions from Minor NSR exempt activities per 20.2.72.202 NMAC.

Table 102.A: Total Potential Emission Rate (PER) from Entire Facility

Pollutant	Emissions (tons per year)
Nitrogen Oxides (NOx)	37.2

Table 102.A: Total Potential Emission Rate (PER) from Entire Facility

Pollutant	Emissions (tons per year)
Carbon Monoxide (CO)	161.21
Volatile Organic Compounds (VOC) [1]	124.0
Sulfur Dioxide (SO_2)	0.08
Particulate Matter (PM)[2]	75.4
Particulate Matter 10 microns or less (PM_{10})	75.4
Particulate Matter 2.5 microns or less ($PM_{2.5}$)	75.4
Greenhouse Gas (GHG) as CO_2e[3]	8,820,970

1. VOC includes emissions from Fugitives and SSM.
2. PM is a regulated new source review pollutant per 20.2.74 NMAC Prevention of Significant Deterioration. No ambient air quality standards apply to PM.
3. For reporting purposes only under 20.2.73.300 NMAC.

Table 102.B: Total Potential Emissions Rate (PER) for *Hazardous Air Pollutants (HAPs)

Pollutant	Emissions (tons per year)
Benzene	0.2
Methanol	1.2
Xylenes	0.7
Total HAPs**	1.4

* HAP emissions are already included in the VOC emission total.

** The total HAP emissions may not agree with the sum of individual HAPs because only individual HAPs greater than 1.0 tons per year are listed here.

A103 Facility: Applicable Regulations

A. The permittee shall comply with terms, conditions and requirements specified in this permit. A list of all applicable sections of the requirements presented in Table 103.A.

Table 103.A: Applicable Requirements

Applicable Requirements	Federally Enforceable	Unit No.
20.2.1 NMAC General Provisions	X	Entire Facility
20.2.7 NMAC Excess Emissions	X (Except for Sections 6(b); 110(b)(15); 111; 112; 113; 115; and 116 that are State Enforceable Only)	Entire Facility

Table 103.A: Applicable Requirements

Applicable Requirements	Federally Enforceable	Unit No.
20.2.23 NMAC Fugitive Dust Control	X	All Construction Activities at or for the Facility
20.2.61 NMAC Smoke and Visible Emissions	X	Entire Facility
20.2.70 NMAC Operating Permits	X	Entire Facility
20.2.71 NMAC Operating Permit Emission Fees	X	Entire Facility
20.2.72 NMAC Construction Permit	X	Entire Facility
20.2.73 NMAC Notice of Intent and Emissions Inventory Requirements	X	Entire Facility
20.2.75 NMAC Construction Permit Fees	X	Entire Facility
20.2.80 NMAC Stack Heights	State Only	All Stacks

A104 Facility: Regulated Sources

A. Table 104.A lists the emission units authorized for this facility.

Table 104.A: Regulated Sources List

Unit No.	Source Description	Make	Model	Serial No.	Construction Date	Manufacture Date	Manufacturer Rated Capacity /Permitted Capacity
SOFC-1 through SOFC-2275	[1]SOFC Clusters – 260 kW and 325 kW Units	Bloom	Energy Server 6.5	TBD	TBD	TBD	2,462 MW[2]
SSM	Startup, Shutdown, and Maintenance – Venting natural gas during Centralized Desulfurization System (CDS) Filter Replacement	N/A	N/A	N/A	TBD	N/A	N/A

1. A group of 260 kW and/or 325 kW Bloom Energy Server "units" that share a stack are referred to as an "cluster" for the purpose of this permit.
2. "MW" refers to megawatts of electricity.

A105 Facility: Control Equipment

A. There is no air pollution control equipment for this facility.

A106 Facility: Allowable Emissions

A. The following Section lists the emission units and their allowable emission limits. (20.2.72.210.A and B.1 NMAC).

Table 106.A: Allowable Emissions

Unit No.	NO_x[1] pph	NO_x[1] tpy	CO pph	CO tpy	VOC pph	VOC tpy	SO_2 pph	SO_2 tpy	PM / PM_{10} pph	PM / PM_{10} tpy	$PM_{2.5}$ pph	$PM_{2.5}$ tpy
SOFC-1 through SOFC-2275	8.5	37.2	36.8	161.2	28.3	124.0	0.02	0.1	17.2	75.4	17.2	75.4

1 Nitrogen dioxide emissions include all oxides of nitrogen expressed as NO_2

2 Excess emissions shall be reported in accordance with 20.2.7 NMAC and Conditions B107 and B109.C.

A107 Facility: Startup, Shutdown, & Maintenance (SSM) Requirements

A. The allowable startup, shutdown, or maintenance (SSM) activities and maximum allowable emission limits for those activities facility are listed in Section A107 and were relied upon by the Department to determine compliance with applicable regulations.

Table 107.A: Authorized SSM Units and Activities

Unit No.	Description	Make	Model	Serial No.	Construction/ Modification Date
SSM	Natural gas venting during desulfurization bed media and desulfurization filter replacement for initial start-ups, maintenance and shutdown	N/A	N/A	N/A	TBD

B. The permittee shall limit VOC emissions from all activities related to routine or predictable startup, shutdown, and scheduled maintenance (SSM) to no more than 0.34 tons per year.

C. The authorization of emission limits for routine or predictable startup, shutdown, or scheduled maintenance does not supersede the requirements to minimize emissions according to General Conditions B101.F and B107.A.

SSM condition option 1:

D. Method for Determining Compliance with the Startup, Shutdown and Maintenance Natural Gas Venting Emission Limit in Section 107.B – (Unit SSM)

Requirement: The permittee shall comply with the monitoring, recordkeeping, and reporting of this condition to demonstrate compliance with the limits from SSM emissions.

(1) The permittee shall calculate the emissions from each event using Equations 1 and 2, the maximum volume of natural gas (V_{max}) in cubic feet vented per activity, and the VOC emission factors for each activity. The permittee shall use the maximum volume of natural

gas (V_{max}) in this condition when determining emissions from SSM events, even if the actual volume of gas vented was less.

Note: The maximum volume of natural gas V_{max} is the maximum amount of natural gas that can be vented from the specific activity, for example venting during one desulfurization startup event based on its physical limitations. Furthermore, the V_{max} of natural gas applies per unit of that activity and is not the sum of all natural gas vented during the event.

Equation 1: ([Maximum standard cubic feet (scf)/startup] x [Startup/month]) + ([Maximum scf/maintenance event] x [Maintenance events/month]) x [VOC emission factor lb/scf] / [2,000 lb/ton] = VOC tons of emissions per month

Where:

Maximum scf/startup = 780,900 Vmax vented from one startup event at one CDS unit.

Maximum scf/ maintenance = 520,600 Vmax vented from one maintenance event at one CDS.

Startup/month = The number of total startup events that occur at all CDS units each month.

Maintenance events/month = The number of total maintenance events that occur at all CDS units each month.

VOC emission factor (lb/scf) = The sum of the emission factors for each VOC constituent in the current inlet analysis of the natural gas calculated using **Equation 2.**

Equation 2: [Mole Fraction of VOC Constituent] x [Molecular Weight of VOC Constituent (lb/lb-mol)] / [379.4 scf/lb-mol]

(2) Each month, the permittee shall calculate the monthly rolling 12-month tpy VOC emissions.

(3) **Emissions Due to Preventable Events:** Emission limits are 0.0 lb/hr and tons/yr for emissions due to preventable events. Emissions that are due entirely or in part to poor maintenance, careless operation, or any other preventable equipment breakdown shall be reported as excess emissions in accordance with 20.2.7 NMAC.

(4) **Emission Limits for Unpermitted Activities:** Emission limits are 0.0 lb/hr and tons/yr for emissions for venting from equipment that have no limits in Table 107.A. Emissions due to SSM other than those represented in Section 107.B shall be reported as excess emissions in accordance with 20.2.7 NMAC.

Monitoring:

(1) The permittee shall perform an extended gas analysis at the facility inlet at least once per year.

(2) The permittee shall monitor each venting event, the equipment that was vented, and the cause of the event.

(3) Each month, the permittee shall continuously monitor:
  (a) the number of venting events during the month,
  (b) the total calculated volume of vented gas during the month using V_{max} for the equipment that was vented as defined in the requirements of this condition,
  (c) the total tons of VOC emissions vented during the month, and
  (d) the monthly rolling 12-month total volume of gas and ton per year VOC emissions.

(4) The permittee shall monitor in accordance with Condition B108 of this permit.

Recordkeeping:

(1) For each natural gas venting event, the permittee shall keep records of:
  (a) the gas tariff sheet documenting the %VOC,
  (b) the total calculated volume of gas vented in scf or MMscf using the maximum volume capacity of the equipment that was vented, as defined in the requirements of this condition
  (c) the calculations used to determine emissions
  (d) the identification of all equipment that was vented during an event, and
  (e) the cause or causes of the event.

(2) Each month, the permittee shall record the tons per month VOC emissions, and the monthly rolling 12-month tons per year (tpy) VOC emissions from SSM events.

The permittee shall keep records in accordance with Condition B109 of this permit.

Reporting: The permittee shall report in accordance with Section B110

SSM condition option 2:

E. Method for Determining Compliance with the Startup, Shutdown and Maintenance Venting Emission Limit in Section 107.B – (Unit SSM)

Requirement: The permittee shall limit emissions from routine or predictable startup, shutdown, or maintenance to the limits in Condition A107.B.

(1) The permittee shall process only natural gas fuel required by Condition A110.A in the Central Desulfurization System (CDS).
(2) The permittee shall limit startup activities of all CDS units to no more than 570 vessel purges per year.
(3) The permittee shall limit shutdown and maintenance activities of the CDS units to no more than 380 vessel purges per year.
(4) **Emissions Due to Preventable Events:** Emission limits are 0.0 for emissions due to preventable events. Emissions that are due entirely or in part to poor maintenance, careless

operation, or any other preventable equipment breakdown shall be reported as excess emissions in accordance with 20.2.7 NMAC. (5) **Emission Limits for Unpermitted Activities:** Emission limits are 0.0 for emissions for venting from equipment that have no limits in Table 107.A. Emissions due to SSM other than those represented in Section107.B shall be reported as excess emissions in accordance with 20.2.7 NMAC.
Monitoring: (1) The permittee shall monitor each SSM event, the equipment that was the source of emissions, associated equipment that contributed to the SSM event, and the cause of the event. (2) Each month, the permittee shall continuously monitor: (a) the number of CDS startups and the number of CDS shutdowns and maintenance events (b) the number of purge cycles per startup or shutdown and maintenance venting event, and (c) the number of startup or shutdown and maintenance venting events,
Recordkeeping: (1) For each SSM event, the permittee shall keep records of: (a) the natural gas fuel records required by condition A110.A, (b) a unique identifier for the CDS at which the SSM event occurred (c) the cause of the SSM event (d) the equipment associated with the SSM event (e) the number of CDS startups and the number of CDS shutdowns and maintenance events, (f) the number of purge cycles per startup or shutdown and maintenance event, (g) and the monthly rolling 12-month total number of CDS startups and the number of CDS shutdowns and maintenance.
Reporting: The permittee shall report in accordance with Section B110

F. The permittee shall report excess emissions above the authorized emission limits in Table 106.A. For equipment without emission limits, report excess emissions pursuant to Condition B110.E.

1. Initial report: the owner or operator shall file an initial report, no later than the end of the next regular business day after the time of discovery of an excess emission that includes all available information for each item in Subsection B of 20.2.7.110 NMAC.

2. Final report: the owner or operator shall file a final report that contains specific and detailed information for each item in Subsection B of 20.2.7.110 NMAC, no later than ten (10) days after the end of the excess emission.

A108 Facility: Allowable Operations

A. This facility is authorized for continuous operation. Monitoring, recordkeeping, and reporting are not required to demonstrate compliance with continuous hours of operation.

B. Facility Throughput - Fuel Limitations

Requirement: The permittee shall limit the inlet fuel flowrate to the facility to 136,782 MMscf of natural gas per calendar year. Pursuant to 20.2.74.300.D NMAC, any increase of the 136,782 MMscf/y of natural gas limit resulting in an emissions increase that would cause the facility to operate as or have a potential to emit of a Prevention of Significant Deterioration (PSD) major source, will result in the units approved in construction permit 10883 to be unpermitted and subject to a permit pursuant to 20.2.74.300 NMAC as if construction has not yet commenced.
Monitoring: The permittee shall continuously monitor the inlet natural gas fuel flowrate to the facility in real time using a monitoring instrument that directly measures the inlet fuel flowrate with an accuracy of ± 2% or better as certified by the device manufacturer. The permittee shall maintain the device according to manufacturer specifications. The permittee shall meet the General Monitoring Requirements in Section B108.
Recordkeeping: The permittee shall keep records of the monthly rolling 12-month total inlet gas flowrate, records of monitoring instrument maintenance, and records of monitoring instrument calibration and according to Section B109.
Reporting: The permittee shall report according to Section B110.

C. Facility Output - MW limitations

Requirement: The permittee shall limit the annual power output generated from natural gas from the facility to 21,567,164 MW-hr per year. (1) The permittee shall generate electric power only by fuel cells arranged in modules Energy Servers of 260 kW and 325 kW. This permit does not authorize any other equipment at the facility to provide power; thus, only fuel cells/modules can generate and provide power. (2) Fuel Cells Modules shall provide all base load and all backup power. Pursuant to 20.2.74.300.D NMAC, any increase of the annual power output limit of 21,567,164 MW-hr per year limit resulting in an emissions increase that would cause the facility to operate as or have a potential to emit of a Prevention of Significant Deterioration (PSD) major source, will result in the units approved in construction permit 10883 to be unpermitted and subject to a permit pursuant to 20.2.74.300 NMAC as if construction has not yet commenced.
Monitoring: The Permittee shall continuously monitor and record the amount of electricity generated by the facility in units of kilowatt-hours (kWh) for the SOFC system. The permittee shall meet the General Monitoring Requirements in Section B108

Recordkeeping: The Permittee shall keep the following records of the amount of electricity generated by the SOFC systems a on monthly rolling 12-month total. Records shall be kept according to Condition B109.
Reporting: The permittee shall report according to Section B110.

A109 Facility: Reporting Schedules

A. The permittee shall report according to the Specific Conditions and General Conditions of this permit.

A110 Facility: Fuel and Fuel Sulfur Requirements

A. Fuel and Fuel Sulfur Requirements

Requirement: The permittee shall ensure that all fuel used by the SOFC 260 kW and 325 kW Units shall: (1) use only natural gas containing no more than 0.75 grains of total sulfur per 100 dry standard cubic, which meets the gas specifications required by the manufacturer, (2) process all-natural gas used by the SOFC units and clusters with the Central Desulfurization System (CDS).
Monitoring: The permittee shall continuously monitor the flowrate in real time using a monitoring instrument that directly measures the actual flowrate with an accuracy of ± 2% or better as certified by the device manufacturer: (1) the actual sulfur concentration in the natural gas exiting the Central Desulfurization System (CDS). Such measurements shall be made annually on at least 5% of installed CDS by obtaining an extended gas analysis on a representative grab sample, (2) the CDS shall be sampled on a rotating basis such that all CDS are sampled during each rotation prior to any CDS being re-sampled.
Recordkeeping: The permittee shall keep the following records: (1) a current purchase contract or tariff sheet listing the type of fuel and its quality specifications, (2) total measured sulfur content in the natural gas fuel exiting the CDS.
Reporting: The permittee shall report in accordance with Section B110.

A111 Facility: 20.2.61 NMAC Opacity

A. 20.2.61 NMAC Opacity Limit (SOFC 260 kW and 325 kW Units)

Requirement: Visible emissions from all Units SOFC-1 through SOFC-2275 shall not equal or exceed an opacity of 20 percent over any 10-minute period.
Monitoring: Use of natural gas fuel constitutes compliance with 20.2.61 NMAC unless opacity equals or exceeds 20% averaged over a 10-minute period. At such time as fuel other than natural gas, or when any visible emissions are observed during steady state operation, opacity shall be measured over a 10-minute period in accordance with the procedures at 40 CFR 60, Appendix A, Method 9 as required by 20.2.61.114 NMAC. Opacity measurements shall continue on a quarterly basis per calendar year for each affected unit until such time as natural gas are used.
Recordkeeping: The opacity measures and readings shall be recorded in accordance with Method 9 in 40 CFR 60, Appendix A.
Reporting: The permittee shall report in accordance with Section B110.

A112 Facility: Haul Roads – Not Required

A113 Facility: Location Requirements

A. The permittee shall construct the facility according to the representations in the permit application and air dispersion modeling pursuant to Section B101. The Universal Transverse Mercator (UTM) coordinates per Datum WGS84, listed in Table 113.A identify the boundaries in which the facility shall be constructed. Units SOFC-1 through SOFC-2275 must be within this area and as specified in Appendix B – Fuel Cell Stack Housing of the modeling report.

Table 113.A Facility Boundary Coordinates

Corner	Easting (m)	Northing (m)
Northwest (NW)	340,560.3	3,522,076
Northeast (NE)	341,510.2	3,522,199
Southeast (SE)	341,537.7	3,520,739
Southwest (SW)	340,570.8	3,520,974

A114 Facility: Relocation

A. This facility or any emissions sources at this facility shall not be relocated or repositioned without permit approval pursuant to Conditions B101.A, B, C, and D and 20.2.72.202.B(4) NMAC.

A115 Alternative Operating Scenario – Not Required

A116 Compliance Plan – Not Required

A117 Pursuant to this Permit:

A. Pursuant to Condition B110.A "Any term or condition imposed by the department on a permit or permit revision is enforceable to the same extent as a regulation of the board." 20.2.72.210.D NMAC The permittee shall comply with the terms and conditions of this permit, including all requirements monitoring, recordkeeping, and reporting. Failure to do so is a violation of this permit and applicable regulations.

B. If credible evidence or information obtained by the department or provided to the department by a third party indicates that a source is not in compliance with the provisions of this permit that evidence or information may be used by the department for purposes of establishing whether a person has violated or is in violation of this permit and applicable regulations.

A200 Oil and Gas Industry – Not Required

A300 Construction Industry – Aggregate – Not Required

A400 Construction Industry – Asphalt – Not Required

A500 Construction Industry – Concrete – Not Required

POWER GENERATION INDUSTRY

A600 Power Generation Industry

A. This section has common equipment related to most Electric Service Operations (SIC-4911).

A601 SOFC Clusters - 260 kW and 325 kW Units

A. SOFC Clusters – Remote Monitoring

Requirement: The permittee shall continuously monitor gas pressure and temperature within each SOFC Unit.

Each SOFC Unit shall be equipped with automated controls that initiate immediate shutdown and isolation of the affected unit following detection of out-of-range parameters. All excess emissions or emissions due to malfunction shall be calculated and reported in accordance with

20.2.7 NMAC.

Within 90 days of the issue date of permit 10883, the permittee shall submit to the Department Permit Program Manager for approval a comprehensive monitoring plan which will establish pressure and temperature ranges which indicate that atmospheric venting may be occurring. For purposes of determining compliance with the monitoring requirements of this Condition, prior to approval the permittee shall comply with the submitted monitoring plan (Condition A601.H).

The sensors shall be maintained in accordance with manufacturer specifications.

Monitoring: The permittee shall continuously monitor pressure and temperature within each SOFC Unit using sensors according to the approved monitoring plan. Any abnormal operational condition identified by the monitoring system shall be investigated by the permittee, reported and corrected in accordance with the General Reporting Requirements Section B100, and 20.2.72 NMAC Sections 210 and 212.

The permittee is subject to General Monitoring Requirements in Condition B108.

Recordkeeping: The permittee shall maintain output readings of the temperature and pressure from the sensors recorded at least once per hour.

For each out-of-range parameter, the permittee shall record:

(1) Dates and times of onset and resolution,

(2) Duration,

(3) Affected unit numbers,

(4) Cause of the temperature and/or pressure excursion,

(5) Corrective actions taken,

(6) Excess emissions estimated in accordance with the requirements in 20.2.7 NMAC.

The permittee shall also record the unit numbers that were shut down and shall make the monitoring plan available to Department personnel upon request.

The permittee shall maintain records in accordance with the applicable Sections in B109, B110, and B111.

Reporting: The permittee shall report in accordance with the applicable Sections B109, B110, and B111. All excess emissions or emissions due to malfunctions shall be reported in accordance with 20.2.7 NMAC.

B. 20.2.80 NMAC – Stack Heights (SOFC Cluster)

Requirement: The permittee shall ensure that each stack height of each SOFC cluster shall be at least 30 feet above ground.

Monitoring:
The permittee shall demonstrate compliance by measuring and verifying the height of each stack following installation.

The permittee shall meet the General Monitoring Requirements in Section B108

Recordkeeping: The permittee shall maintain records of the stack height measurements and in accordance with the applicable Sections in B109, B110, and B111.

Reporting: The permittee shall report in accordance with Section B110.

C. Maintenance and repair monitoring –SOFC Units and SOFC Clusters

Requirement: At all times, the permittee shall demonstrate compliance with the allowable emission limits in Table 106.A by operating and maintaining each SOFC Unit and SOFC cluster in a manner consistent with manufacturer guidelines and procedures to minimize emissions to the extent practicable.

Monitoring:

(1) The Permittee shall install, calibrate, operate and maintain a monitoring system that produces sufficient data to ensure that manufacturer guidelines and procedures are properly followed.

(2) At a minimum, the monitoring system shall determine when a SOFC Energy Server or SOFC cluster must be shut down for maintenance or repairs; and notify facility personnel that maintenance or repairs are needed.

The permittee shall meet the General Monitoring Requirements in Section B108

Recordkeeping:
The permittee shall maintain records in accordance with Section B109, including records of maintenance and repair activities and a copy of the manufacturer's or permittee's recommended maintenance schedule and in accordance with the applicable Sections in B109, B110, and B111.

Reporting:
The permittee shall report in accordance with Section B110.

D. Initial Compliance Testing SOFC Clusters

Requirement: The permittee shall demonstrate compliance with the allowable emission limits in Table 106.A by performing initial compliance tests for a representative number of SOFC clusters as specified under this Condition. The number of SOFC clusters subject to testing during a calendar quarter equals 1% of SOFC clusters meeting either of the following "initial stack test vesting" criteria:

(1) the SOFC clusters have achieved their maximum normal production date at least (60) days prior to the end of such calendar quarter; OR

(2) the SOFC clusters have started up at least (180) days prior to the end of such calendar quarter and are not part of the group of clusters that met initial stack test vesting criteria in a prior calendar quarter.

(3) If fewer than 600 clusters meet the stack test vesting criteria above, then at least 6, or the total number of clusters meeting such criteria (whichever is lesser) shall be tested.

Monitoring: The permittee shall perform an initial compliance test in accordance with the General Testing Requirements of Section B111. Emission testing is required for NOx, CO, VOC, PM_{10}, and

$PM_{2.5}$.

The permittee shall meet the General Monitoring Requirements in Section B108, except the monitoring exemptions in Condition B108.D do not apply to this condition.

Recordkeeping: The permittee shall include in each test notification and report submittal the total number of clusters satisfying the initial stack test vesting criteria of paragraph D of this Condition for that calendar quarter, and the total number of clusters to be tested during the calendar quarter, unit ID numbers, and the unit ID number and size (260 or 325 kW) of each cluster tested

The permittee shall maintain records in accordance with the applicable Sections in B109, B110, and B111.

Reporting: The permittee shall report in accordance with the applicable Sections B109, B110, and B111.

E. Periodic Testing SOFC Clusters

Requirement:

1) The permittee shall demonstrate compliance with the allowable emission limits in Table 106.A by completing periodic emissions tests for SOFC clusters. The permittee shall test 1% of the SOFC clusters that meet "initial stack test vesting" in each calendar year within each subsequent calendar year. The testing requirement for each “initial stack test vesting” year shall continue to apply in all subsequent years and shall not be superseded by the installation of additional clusters. The clusters that met “initial stack test vesting” year shall be tested on a rotating basis such that all clusters are sampled during each rotation prior to any cluster being retested.

   The permittee shall test the lowest performing (in terms of efficiency) clusters that have not yet been tested.

2) If all results of initial compliance tests and the first year of periodic testing are less than 75% of the values in Table A601.E(2), or below the relevant limit of detection for the reference test method, the permittee may reduce testing to a total of 2 SOFC clusters per stack test vesting year:

Table A601.E(2)

Pollutant	Value (lb/MW-hr)
NOx	3.00E-03
CO	1.30E-02
VOC	1.00E-02
PM10	6.08E-03
PM2.5	6.08E-03

3) The permittee shall resume periodic annual testing of 1% of all SOFC clusters per year if a test result exceeds the relevant limit of detection for the reference test method and exceeds the values in Table A601.E(3):

Table A601.E(3)

Pollutant	Value (lb/MW-hr)
NOx	3.00E-02
CO	1.30E-01
VOC	1.00E-01
PM10	6.08E-02
PM2.5	6.08E-02

Monitoring: The permittee shall test using EPA Reference Methods subject to the requirements and limitations of Section B108, General Monitoring Requirements. Emission testing is required for NOx, CO, VOC, PM_{10}, and $PM_{2.5}$ and shall be carried out as described below:

(1) The testing shall be conducted as follows:
(a) Testing frequency shall be at least once per year.
(b) The monitoring period is defined as a calendar year.

(2) The first periodic test shall occur for each initial stack test vesting year after completion of the last initial compliance test.

(3) All subsequent monitoring shall occur in each succeeding monitoring period. No two monitoring events shall occur closer together in time than 25% of a monitoring period.

(4) The permittee shall follow the General Testing Procedures of Section B111.

The permittee is subject to General Monitoring Requirements in Condition B108.

Recordkeeping: The permittee shall maintain records in accordance with the applicable Sections in B109, B110, and B111.

Reporting: The permittee shall report in accordance with the applicable Sections in B109, B110, and B111.

F. Operation and Emission Calculation

Requirement:
The permittee shall demonstrate compliance with the allowable emission limits in Table 106.A by performing the following monitoring, recordkeeping, and reporting for the facility.

Each Energy Server shall be equipped with a load meter, which shall continuously record the electrical output of each Energy Server.

Monitoring:
The Permittee shall continuously monitor the total hourly electrical output of each Energy Server.

The Permittee shall meet the General Monitoring Requirements in Condition B108.

Recordkeeping:

The Permittee shall keep records of the total hourly electrical output of each Energy Server and the total for the entire facility.

The Permittee shall use the records of the maximum electrical output per month and monthly hours of operation of each Energy Server and the emission rates from stack tests required by Conditions A601.D and E to calculate the monthly total ton per year NOx, CO, VOC, PM_{10}, and $PM_{2.5}$ emissions from the entire facility using the following equation:
E = (EF × H) / 2,000
Where:
E = Monthly NO_x (or CO, VOC, PM_{10}, and $PM_{2.5}$) emissions (tons/month)
EF = NOx (or CO, VOC, PM_{10}, and $PM_{2.5}$) emission factor (lb/MW-hr), based on the maximum results from the most recent stack tests.
H = total monthly electrical output (MWhr/mo)

The Permittee shall use the monthly records to calculate the monthly rolling 12-month total ton per year NO_x, CO, VOC, PM_{10}, and $PM_{2.5}$ emissions from the entire facility.

Compliance with SO2 emissions will be calculated based on the extended gas analysis results obtained annually using the following equations:

SO2 emission rate (lb/MWhr) = F / P / S * M_{SO2}/M_S * Y

F = fuel consumption in standard cubic feet per hour
P = electrical capacity in operation in MW
S = standard molar volume of natural gas in ft3/lb-mol natural gas, 359 ft3/lb-mol natural gas
M_{SO2} = molar mass of sulfur dioxide, 64 lb SO2/lb-mol SO2
M_S = molar mass of sulfur, 32 lb S/lb-mol S
Y = measured lb-mol S/lb-mol natural gas

SO2 emissions (tons) = SO2 emission rate (lb/MWhr) * H / 2000-lb/ton

H = total monthly electrical output (MWhr/mo)

The Permittee shall maintain records of all required calculations.

The permittee shall maintain records in accordance with the applicable Sections in B109, B110, and B111.

Reporting:
The permittee shall report in accordance with the applicable Sections in B109, B110, and B111.

G. Natural Gas Leaks

Requirement: The sum of the natural gas flow rates to all SOFC Units shall not be less than 98% of total natural gas at the inlet of the facility as measured in Condition A.108B.

Monitoring:

The permittee shall continuously monitor the sum of the natural gas flow rates to all SOFC Units using a monitoring instrument that directly measures the inlet flowrate with

an accuracy of ± 2% or better. The permittee shall calculate the difference between the sum of natural gas flow rates to all SOFC Units and the total natural gas at the inlet of the facility as measured in Condition A.108B. The difference between these values shall be the volume of natural gas vented. The permittee is subject to General Monitoring Requirements in Condition B108.
Recordkeeping: 1. The permittee shall keep the following records: The monthly 12-month rolling sum of flowrates to all SOFC Units. 2. The monthly 12-month rolling difference between the sum of natural gas flow rates to all SOFC Units and the total natural gas at the inlet of the facility as measured in Condition A.108B.
Reporting: The permittee shall report in accordance with Section B110.

H. Continuous Monitoring System (CMS)

Within 90 days of the issue date of permit 10883, the permittee is required to submit to the Department a comprehensive monitoring plan to include at minimum continuous monitoring of the facility's CDS SSM events (A107.D and A107.E); gas flowrate (A108.B); electrical output measurements (MW) (A108.C); exiting sulfur concentration measurements (A110.A); temperature and pressure readings, (A601.A), and natural gas leaks flowrates at the SOFC Units (A601.H).

For the purpose of this condition 40 CFR 63 defines a Continuous Monitoring System (CMS) as a comprehensive term that may include, but is not limited to, continuous emission monitoring systems, continuous opacity monitoring systems, continuous parameter monitoring systems, or other manual or automatic monitoring that is used for demonstrating compliance with an applicable regulation on a continuous basis as defined by the regulation.

PART B GENERAL CONDITIONS

B100 Introduction

A. The Department has reviewed the permit application for the proposed construction/modification/revision and determined that the proposed action will comply with the provisions of the Act and ambient air quality standards will be met. Conditions have been imposed in this permit to assure continued compliance. 20.2.72.210.D NMAC, states that any term or condition imposed by the Department on a permit is enforceable to the same extent as a regulation of the Environmental Improvement Board.

B101 Legal

A. The Department may incorporate portions of the permit application into the permit as enforceable terms and conditions. Unless modified by conditions of this permit, the permittee shall construct or modify and operate the Facility in accordance with all representations of the application and supplemental submittals that the Department relied upon to determine compliance with applicable regulations and ambient air quality standards. If the Department relied on air quality modeling to issue this permit, any subsequent change in the parameters used for this modeling shall be submitted to the Department for review. Upon the Department's request, the permittee shall submit additional modeling for review by the Department. Results of that review may require a permit modification. (20.2.72.210.A NMAC)

B. Any future physical changes, changes in the method of operation or changes in restricted area may constitute a modification as defined by 20.2.72 NMAC, Construction Permits. Unless the source or activity is exempt under 20.2.72.202 NMAC, no modification shall begin prior to issuance of a permit. (20.2.72 NMAC Sections 200.A.2 and E, and 210.B.4)

C. Changes in plans, specifications, and other representations stated in the application documents shall not be made if they cause a change in the method of control of emissions or in the character of emissions, will increase the discharge of emissions or affect modeling results. Any such proposed changes shall be submitted as a revision or modification. (20.2.72 NMAC Sections 200.A.2 and E, and 210.B.4)

D. The permittee shall establish and maintain the property's Restricted Area as identified in plot plan submitted with the application. (20.2.72 NMAC Sections 200.A.2 and E, and 210.B.4)

E. Applications for permit revisions and modifications shall be submitted to:

Program Manager, Permits Section

New Mexico Environment Department
Air Quality Bureau
525 Camino de los Marquez, Suite 1
Santa Fe, NM 87505

F. The owner or operator of a source having an excess emission shall, operate the source, including associated air pollution control equipment, in a manner consistent with good air pollutant control practices for minimizing emissions. (20.2.7.109 NMAC). The establishment of allowable malfunction emission limits does not supersede this requirement.

G. The issuance of a permit does not relieve any person from civil or criminal liability for failure to comply with the provisions of the Air Quality Control Act, the Federal Act, federal regulations thereunder, any applicable regulations of the board, and any other applicable law or regulation. (20.2.72.209 NMAC and the New Mexico Air Quality Control Act NMSA 1978, Chapter 74, Article 2)

B102 Authority

A. This permit is issued pursuant to the Air Quality Control Act (Act) and regulations adopted pursuant to the Act including Title 20, Chapter 2, Part 72 of the New Mexico Administrative Code (NMAC), (20.2.72 NMAC), Construction Permits and is enforceable pursuant to the Act and the air quality control regulations applicable to this source.

B. The Department is the Administrator for 40 CFR Parts 60, 61, and 63 pursuant to the delegation and exceptions of Section 10 of 20.2.77 NMAC (NSPS), 20.2.78 NMAC (NESHAP), and 20.2.82 NMAC (MACT).

B103 Annual Fee

A. The Department will assess an annual fee for this Facility. Sources that have been issued a construction permit under 20.2.72 NMAC shall be assessed an annual fee of $2,800. Sources that have filed a Notice of Intent under 20.2.73 NMAC and received a written determination that a permit is not required shall be assessed an annual fee of $700. Effective January 1, 2028, the fee shall be adjusted annually by the percentage increase, if any, in the Consumer Price Index (CPI). The current fee amount is available by contacting the Department or can be found on the Department's website. The Department will invoice the permittee for the applicable annual fee amount. Annual fee invoices are generally issued at the beginning of each calendar year. This fee does not apply to sources which are assessed an annual emissions fee in accordance with 20.2.71 NMAC. For sources that satisfy the definition of "small business" in 20.2.75.7.F NMAC, this annual fee will be divided by two. (20.2.75.11 NMAC)

B. All fees may be paid online via the Wells Fargo payment system linked on the NMED website here: Making Payments Online or by corporate check, certified check, or money order. An invoice for each facility's annual fee will be provided by email to the primary billing contact on file. For paper checks, make payable to the "NM Environment Department, AQB" mailed to the address shown on the invoice and shall be accompanied by the remittance slip attached to the invoice.

B104 Appeal Procedures

A. Any person who participated in a permitting action before the Department and who is adversely affected by such permitting action may file a petition for hearing before the Environmental Improvement Board. The petitioner shall submit the petition in writing to the Environmental Improvement Board within thirty (30) days from the date notice is given of the Department's action and shall specify the portions of the permitting action to which the petitioner objects, certify that a copy of the petition has been mailed or hand-delivered and attach a copy of the permitting action for which review is sought. Unless a timely request for hearing is made, the decision of the Department shall be final. The petition shall be copied simultaneously to the Department upon receipt of the appeal notice. If the petitioner is not the applicant or permittee, the petitioner shall mail or hand-deliver a copy of the petition to the applicant or permittee. The Department shall certify the administrative record to the board. Petitions for a hearing shall be sent to: (20.2.72.207.F NMAC)

For Mailing:
Administrator, New Mexico Environmental Improvement Board
P.O. Box 5469
Santa Fe, NM 87502-5469

For Hand Delivery:
Administrator, New Mexico Environmental Improvement Board
1190 St. Francis Drive, Harold Runnels Bldg.
Santa Fe, New Mexico 87505

B105 Submittal of Reports and Certifications

A. The permittee shall submit Stack Test Protocols and Stack Test Reports electronically to the Air Quality Bureau Compliance Reporting (AQBCR) system or as directed by the Department. (20.2.72.210 (E); 20.2.72.210 (C)(4)-(5); 20.2.72.213)

B. The permittee shall submit Excess Emission Reports as directed by the Department. (20.2.7.110 NMAC)

C. The permittee shall submit Routine reports to the mailing address below, or as directed by the Department:

Manager, Compliance and Enforcement Section

New Mexico Environment Department
Air Quality Bureau
525 Camino de los Marquez, Suite 1
Santa Fe, NM 87505

B106 NSPS and/or MACT Startup, Shutdown, and Malfunction Operations

A. If a facility is subject to an NSPS standard in 40 CFR 60, each owner or operator that installs and operates a continuous monitoring device required by a NSPS regulation shall comply with the excess emissions reporting requirements in accordance with 40 CFR 60.7(c), unless specifically exempted in the applicable subpart.

B. If a facility is subject to a NSPS standard in 40 CFR 60, then in accordance with 40 CFR 60.8(c), emissions in excess of the level of the applicable emission limit during periods of startup, shutdown, and malfunction shall not be considered a violation of the applicable emission limit unless otherwise specified in the applicable standard.

C. If a facility is subject to a MACT standard in 40 CFR 63, then the facility is subject to the requirement for a Startup, Shutdown and Malfunction Plan (SSM) under 40 CFR 63.6(e)(3), unless specifically exempted in the applicable subpart.

B107 Startup, Shutdown, and Maintenance Operations

A. The establishment of permitted startup, shutdown, and maintenance (SSM) emission limits does not supersede the requirements of 20.2.7.14.A NMAC. Except for operations or equipment subject to Condition B106, the permittee shall establish and implement a plan to minimize emissions during routine or predictable start up, shut down, and scheduled maintenance (SSM work practice plan) and shall operate in accordance with the procedures set forth in the plan. (SSM work practice plan) (20.2.7.14.A NMAC)

B108 General Monitoring Requirements

A. These requirements do not supersede or relax requirements of federal regulations.

B. The following monitoring requirements shall be used to determine compliance with applicable requirements and emission limits. Any sampling, whether by portable analyzer or EPA reference method, that measures an emission rate over the applicable averaging period greater than an emission limit in this permit constitutes noncompliance with this permit. The Department may require, at its discretion, additional tests pursuant to EPA Reference Methods at any time, including when sampling by portable analyzer measures an emission rate greater than an emission limit in this permit; but such requirement shall not be construed as a determination that the sampling by portable analyzer does not establish noncompliance with this permit and

shall not stay enforcement of such noncompliance based on the sampling by portable analyzer.

C. If the emission unit is shutdown at the time when periodic monitoring is due to be completed, the permittee is not required to restart the unit for the sole purpose of conducting the monitoring. Using electronic or written mail, the permittee shall notify the Department's Compliance and Enforcement Section of a delay in emission tests prior to the deadline for completing the tests. Upon recommencing operation, the permittee shall submit pre-test notification(s) to the Department's Compliance and Enforcement Section and shall complete the monitoring.

D. The requirement for monitoring during any monitoring period is based on the percentage of time that the unit has operated. However, to invoke the monitoring period exemption at B108.D(2), hours of operation shall be monitored and recorded.

(1) If the emission unit has operated for more than 25% of a monitoring period, then the permittee shall conduct monitoring during that period.

(2) If the emission unit has operated for 25% or less of a monitoring period then the monitoring is not required. After two successive periods without monitoring, the permittee shall conduct monitoring during the next period regardless of the time operated during that period, except that for any monitoring period in which a unit has operated for less than 10% of the monitoring period, the period will not be considered as one of the two successive periods.

(3) If invoking the monitoring **period** exemption in B108.D(2), the actual operating time of a unit shall not exceed the monitoring period required by this permit before the required monitoring is performed. For example, if the monitoring period is annual, the operating hours of the unit shall not exceed 8760 hours before monitoring is conducted. Regardless of the time that a unit actually operates, a minimum of one of each type of monitoring activity shall be conducted during any five-year period.

E. For all periodic monitoring events, except when a federal or state regulation is more stringent, three test runs shall be conducted at 90% or greater of the unit's capacity as stated in this permit, or in the permit application if not in the permit, and at additional loads when requested by the Department. If the 90% capacity cannot be achieved, the monitoring will be conducted at the maximum achievable load under prevailing operating conditions except when a federal or state regulation requires more restrictive test conditions. The load and the parameters used to calculate it shall be recorded to document operating conditions and shall be included with the monitoring report.

F. When requested by the Department, the permittee shall provide schedules of testing and monitoring activities. Compliance tests from previous NSR and Title V permits may be re-imposed if it is deemed necessary by the Department to determine whether the source is in compliance with applicable regulations or permit conditions.

G. If monitoring is new or is in addition to monitoring imposed by an existing applicable requirement, it shall become effective 120 days after the date of permit issuance. For emission units that have not commenced operation, the associated new or additional monitoring shall not apply until 120 days after the units commence operation. All pre-existing monitoring requirements incorporated in this permit shall continue to apply from the date of permit issuance.

H. Unless otherwise indicated by Specific Conditions or regulatory requirements, all instrumentation used for monitoring in accordance with applicable requirements including emission limits, to measure parameters including but not limited to flow, temperature, pressure and chemical composition, or used to continuously monitor emission rates and/or other process operating parameters, shall be subject to the following requirements:

(1) The owner or operator shall install, calibrate, operate and maintain monitoring instrumentation (monitor) according to the manufacturer's procedures and specifications and the following requirements.

(a) The monitor shall be located in a position that provides a representative measurement of the parameter that is being monitored.

(b) At a minimum, the monitor shall complete one cycle of operation (sampling, analyzing, and data recording) for each successive 15-minute period.

(c) At a minimum, the monitor shall be spanned to measure the normal range +/- 5% of the parameter that is being monitored.

(d) At least semi-annually, perform a visual inspection of all components of the monitor for physical and operational integrity and all electrical connections for oxidation and galvanic corrosion.

(e) Recalibrate the monitor in accordance with the manufacturer's procedures and specifications at the frequency specified by the manufacturer, or every two years, whichever is less.

(2) Except for malfunctions, associated repairs, and required quality assurance or control activities (including calibration checks and required zero and span adjustments), the permittee shall operate and maintain all monitoring equipment at all times that the emissions unit or the associated process is operating.

(3) The monitor shall measure data for a minimum of 90 percent of the time that the emissions unit or the associated process is in operation, based on a calendar monthly average.

(4) The owner or operator shall maintain records in accordance with Section B109 to demonstrate compliance with the requirements in B108H (1)-(3) above, as applicable.

B109 General Recordkeeping Requirements

A. The permittee shall maintain records to assure and verify compliance with the terms and conditions of this permit and any other applicable requirements that become effective after permit issuance. (20.2.72.210(E)) The minimum information to be included in these records is as follows:

(1) Records required for testing and sampling:

(a) equipment identification (include make, model and serial number for all tested equipment and emission controls)

(b) date(s) and time(s) of sampling or measurements

(c) date(s) analyses were performed

(d) the qualified entity that performed the analyses

(e) analytical or test methods used

(f) results of analyses or tests

(g) operating conditions existing at the time of sampling or measurement

(2) Records required for equipment inspections and/or maintenance required by this permit:

(a) equipment identification number (including make, model and serial number)

(b) date(s) and time(s) of inspection, maintenance, and/or repair

(c) date(s) any subsequent analyses were performed (if applicable)

(d) name of the person or qualified entity conducting the inspection, maintenance, and/or repair

(e) copy of the equipment manufacturer's or the owner or operator's maintenance or repair recommendations (if required to demonstrate compliance with a permit condition)

(f) description of maintenance or repair activities conducted

(g) all results of any required parameter readings

(h) a description of the physical condition of the equipment as found during any required inspection

(i) results of required equipment inspections including a description of any condition which required adjustment to bring the equipment back into compliance and a description of the required adjustments

B. Except as provided in the Specific Conditions, records shall be maintained on-site or at the permittee's local business office for a minimum of two (2) years from the time of recording and shall be made available to Department personnel upon request.

Sources subject to 20.2.70 NMAC "Operating Permits" shall maintain records on-site for a minimum of five (5) years from the time of recording. (20.2.70.302(D))

C. Unless otherwise indicated by Specific Conditions, the permittee shall keep the following records for malfunction emissions and routine or predictable emissions during startup, shutdown, and scheduled maintenance (SSM):

(1) The owner or operator of a source subject to a permit shall establish and implement a plan to minimize emissions during routine or predictable startup, shutdown, and scheduled maintenance through work practice standards and good air pollution control practices. This requirement shall not apply to any affected facility defined in and subject to an emissions standard and an equivalent plan under 40 CFR Part 60 (NSPS), 40 CFR Part 63 (MACT), or an equivalent plan under 20.2.72 NMAC - Construction Permits, 20.2.70 NMAC - Operating Permits, 20.2.74 NMAC - Permits - Prevention of Significant Deterioration (PSD), or 20.2.79 NMAC - Permits - Nonattainment Areas. The permittee shall keep records of all sources subject to the plan to minimize emissions during routine or predictable SSM and shall record if the source is subject to an alternative plan and therefore, not subject to the plan requirements under 20.2.7.14.A NMAC.

(2) If the facility has allowable SSM emission limits in this permit, the permittee shall record all SSM events, including the date, the start time, the end time, a description of the event, and a description of the cause of the event. This record also shall include a copy of the manufacturer's, or equivalent, documentation showing that any maintenance qualified as scheduled. Scheduled maintenance is an activity that occurs at an established frequency pursuant to a written protocol published by the manufacturer or other reliable source. The authorization of allowable SSM emissions does not supersede any applicable federal or state standard. The most stringent requirement applies.

(3) If the facility has allowable malfunction emission limits in this permit, the permittee shall record all malfunction events to be applied against these limits. The permittee shall also include the date, the start time, the end time, and a description of the event. **Malfunction means** any sudden and unavoidable failure of air pollution control equipment or process equipment beyond the control of the owner or operator, including malfunction during startup or shutdown. A failure that is caused entirely or in part by poor maintenance, careless operation, or any other preventable equipment breakdown shall not be considered a malfunction. (20.2.7.7.E NMAC) The authorization of allowable malfunction emissions does not supersede any applicable federal or state standard. The most stringent requirement applies. This authorization only allows the permittee to avoid submitting reports under 20.2.7 NMAC for total annual emissions that are below the authorized malfunction emission limit.

(4) The owner or operator of a source shall meet the operational plan defining the measures to be taken to mitigate source emissions during malfunction, startup or shutdown. (20.2.72.203.A(5) NMAC)

B110 General Reporting Requirements
(20.2.72 NMAC Sections 210 and 212)

A. Records and reports shall be maintained on-site or at the permittee's local business office unless specifically required to be submitted to the Department or EPA by another condition of this permit or by a state or federal regulation. Records for unmanned sites may be kept at the nearest business office.

B. The permittee shall notify the Department's Compliance Reporting Section using the current Submittal Form posted to NMED's Air Quality web site under Compliance and Enforcement/Submittal Forms in writing of or provide the Department with (20.2.72.212.A and B):

(1) the anticipated date of initial startup of each new or modified source not less than thirty (30) days prior to the date. Notification may occur prior to issuance of the permit, but actual startup shall not occur earlier than the permit issuance date;

(2) after receiving authority to construct, the equipment serial number as provided by the manufacturer or permanently affixed if shop-built and the actual date of initial startup of each new or modified source within fifteen (15) days after the startup date; and

(3) the date when each new or modified emission source reaches the maximum production rate at which it will operate within fifteen (15) days after that date.

C. The permittee shall notify the Department's Permitting Program Manager, in writing of, or provide the Department with (20.2.72.212.C and D):

(1) any change of operators or any equipment substitutions within fifteen (15) days of such change;

(2) any necessary update or correction no more than sixty (60) days after the operator knows or should have known of the condition necessitating the update or correction of the permit.

D. Results of emission tests and monitoring for each pollutant (except opacity) shall be reported in pounds per hour (unless otherwise specified) and tons per year. Opacity shall be reported in percent. The number of significant figures corresponding to the full accuracy inherent in the testing instrument or Method test used to obtain the data shall be used to calculate and report test results in accordance with 20.2.1.116.B and C NMAC. Upon request by the Department, CEMS and other tabular data shall be submitted in editable, MS Excel format.

E. The permittee shall submit reports of excess emissions in accordance with 20.2.7.110.A NMAC.

F. Allowable Emission Limits for Excess Emissions Reporting for Flares and Other Regulated Sources with No Pound per Hour (pph) and/or Ton per Year (tpy) Emission Limits.

(1) When a flare has no allowable pph and/or tpy emission limits in Sections A106 and/or A107, the authorized allowable emissions include only the combustion of pilot and/or purge gas. Compliance is demonstrated by limiting the gas stream to the flare to only pilot and/or purge gas.

(2) For excess emissions reporting as required by 20.2.7 NMAC, the allowable emission limits are 1.0 pph and 1.0 tpy for each regulated air pollutant (except for H2S) emitted by that source as follows:

(a) For flares, when there are no allowable emission limits in Sections A106 and/or A107.

(b) For regulated sources with emission limits in Sections A106 or A107 represented by the less than sign ("<").

(c) For regulated sources that normally would not emit any regulated air pollutants, including but not limited to vents, pressure relief devices, connectors, etc.

(3) For excess emissions reporting as required by 20.2.7 NMAC for H2S, the allowable limits are 0.1 pph and 0.44 tpy for each applicable scenario addressed in paragraph (2) above.

B111 General Testing Requirements

Unless otherwise indicated by Specific Conditions or regulatory requirements, the permittee shall conduct testing in accordance with the requirements in Sections B111A, B, C, D and E, as applicable.

A. Initial Compliance Tests

The permittee shall conduct initial compliance tests in accordance with the following requirements:

(1) Initial compliance test requirements from previous permits (if any) are still in effect, unless the tests have been satisfactorily completed. Compliance tests may be re-imposed if it is deemed necessary by the Department to determine whether the source is in compliance with applicable regulations or permit conditions. (20.2.72 NMAC Sections 210.C and 213)

(2) Initial compliance tests shall be conducted within sixty (60) days after the unit(s) achieve the maximum normal production rate. If the maximum normal production rate does not occur within one hundred twenty (120) days of source startup, then the tests must be conducted no later than one hundred eighty (180) days after initial startup of the source.

(3) The default time period for each test run shall be **at least** 60 minutes and each performance test shall consist of three separate runs using the applicable test method. For the purpose of determining compliance with an applicable emission limit, the arithmetic mean of results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances, beyond the owner or operator's control, compliance may, upon the Department approval, be determined using the arithmetic mean of the results of the two other runs.

(4) Testing of emissions shall be conducted with the emissions unit operating at 90 to 100 percent of the maximum operating rate allowed by the permit. If it is not possible to test at that rate, the source may test at a lower operating rate

(5) Testing performed at less than 90 percent of permitted capacity will limit emission unit operation to 110 percent of the tested capacity until a new test is conducted.

(6) If conditions change such that unit operation above 110 percent of tested capacity is possible, the source must submit a protocol to the Department within 30 days of such change to conduct a new emissions test.

B. EPA Reference Method Tests

The test methods in Section B111.B(1) shall be used for all initial compliance tests and all Relative Accuracy Test Audits (RATAs), and shall be used if a permittee chooses to use EPA test methods for periodic monitoring. Test methods that are not listed in Section B111.B(1) may be used in accordance with the requirements at Section B111.B(2).

(1) All compliance tests required by this permit shall be conducted in accordance with the requirements of CFR Title 40, Part 60, Subpart A, General Provisions, and the following EPA Reference Methods as specified by CFR Title 40, Part 60, Appendix A:

(a) Methods 1 through 4 for stack gas flowrate

(b) Method 5 for particulate matter (PM)

(c) Method 6C SO_2

(d) Method 7E for NO_X (test results shall be expressed as nitrogen dioxide (NO_2) using a molecular weight of 46 lb/lb-mol in all calculations (each ppm of NO/NO_2 is equivalent to 1.194 x 10-7 lb/SCF)

(e) Method 9 for visual determination of opacity

(f) Method 10 for CO

(g) Method 19 for particulate, sulfur dioxide and nitrogen oxides emission rates. In addition, Method 19 may be used in lieu of Methods 1-4 for stack gas flowrate. The permittee shall provide a contemporaneous fuel gas

analysis (preferably on the day of the test, but no earlier than three months prior to the test date) and a recent fuel flow meter calibration certificate (within the most recent quarter) with the final test report.

(h) Method 7E or 20 for Turbines per §60.335 or §60.4400

(i) Method 22 for visual determination of fugitive emissions from material sources and smoke emissions from flares

(j) Method 25A for VOC reduction efficiency

(k) Method 29 for Metals

(l) Method 30B for Mercury from Coal-Fired Combustion Sources Using Carbon Sorbent Traps

(m) Method 201A for filterable PM_{10} and $PM_{2.5}$

(n) Method 202 for condensable PM

(o) Method 320 for organic Hazardous Air Pollutants (HAPs)

(2) Permittees may propose test method(s) that are not listed in Section B111.B(1). These methods may be used if prior approval is received from the Department.

C. Periodic Monitoring and Portable Analyzer Requirements for the Determination of Nitrogen Oxides, Carbon Monoxide, and Oxygen Concentrations in Emissions from Reciprocating Engines, Combustion Turbines, Boilers, and Process Heaters

Periodic emissions tests (periodic monitoring) shall be conducted in accordance with the following requirements:

(1) Periodic emissions tests may be conducted in accordance with EPA Reference Methods or by utilizing a portable analyzer. Periodic monitoring utilizing a portable analyzer shall be conducted in accordance with the requirements of the current version of ASTM D 6522. However, if a facility has met a previously approved Department criterion for portable analyzers, the analyzer may be operated in accordance with that criterion until it is replaced.

(2) The default time period for each test run shall be **at least** 20 minutes.

Each performance test shall consist of three separate runs. The arithmetic mean of results of the three runs shall be used to determine compliance with the applicable emission limit.

(3) Testing of emissions shall be conducted in accordance with the requirements at Section B108.E.

(4) During emissions tests, pollutant and diluent concentration shall be monitored and recorded. Fuel flow rate shall be monitored and recorded if stack gas flow rate is determined utilizing Reference Method 19. This information shall be included with the test report furnished to the Department.

(5) Stack gas flow rate shall be calculated in accordance with Reference Method 19 utilizing fuel flow rate (scf) determined by a dedicated fuel flow meter and fuel heating value (Btu/scf). The permittee shall provide a contemporaneous fuel gas analysis (preferably on the day of the test, but no earlier than three months prior to the test date) and a recent fuel flow meter calibration certificate (within the most recent quarter) with the final test report. Alternatively, stack gas flow rate may be determined by using EPA Reference Methods 1-4.

(6) The permittee shall submit a notification and protocol for periodic emissions tests upon the request of the Department.

D. Initial Compliance Test and RATA Procedures

Permittees required to conduct initial compliance tests and/or RATAs shall comply with the following requirements:

(1) The permittee shall submit a notification and test protocol to the Department's Program Manager, Compliance and Enforcement Section, at least thirty (30) days before the test date and allow a representative of the Department to be present at the test. Proposals to use test method(s) that are not listed in Section B111.B(1) (if applicable) shall be included in this notification.

(2) Contents of test notifications, protocols and test reports shall conform to the format specified by the Department's Universal Test Notification, Protocol and Report Form and Instructions. Current forms and instructions are posted to NMED's Air Quality web site under Compliance and Enforcement Testing.

(3) The permittee shall provide (a) sampling ports adequate for the test methods applicable to the facility, (b) safe sampling platforms, (c) safe access to sampling platforms and (d) utilities for sampling and testing equipment.

(4) Where necessary to prevent cyclonic flow in the stack, flow straighteners shall be installed

E. General Compliance Test Procedures

The following requirements shall apply to all initial compliance and periodic emissions tests and all RATAs:

(1) Equipment shall be tested in the "as found" condition. Equipment may not be adjusted or tuned prior to any test for the purpose of lowering emissions, and then returned to previous settings or operating conditions after the test is complete.

(2) The stack shall be of sufficient height and diameter and the sample ports shall be located so that a representative test of the emissions can be performed in accordance with the requirements of EPA Reference Method 1 or the current version of ASTM D 6522, as applicable.

(3) Test reports shall be submitted to the Department no later than 30 days after completion of the test.

B112 Compliance

A. The Department shall be given the right to enter the facility at all reasonable times to verify the terms and conditions of this permit. Required records shall be organized by date and subject matter and shall at all times be readily available for inspection. The permittee, upon verbal or written request from an authorized representative of the Department who appears at the facility, shall immediately produce for inspection or copying any records required to be maintained at the facility. Upon written request at other times, the permittee shall deliver to the Department paper or electronic copies of any and all required records maintained on site or at an off-site location. Requested records shall be copied and delivered at the permittee's expense within three business days from receipt of request unless the Department allows additional time. Required records may include records required by permit and other information necessary to demonstrate compliance with terms and conditions of this permit. (NMSA 1978, Section 74-2-13)

B. A copy of the most recent permit(s) issued by the Department shall be kept at the permitted facility or (for unmanned sites) at the nearest company office and shall be made available to Department personnel for inspection upon request. (20.2.72.210.B.4 NMAC)

C. Emissions limits associated with the energy input of a Unit, i.e. lb/MMBtu, shall apply at all times unless stated otherwise in a Specific Condition of this permit. The averaging time for each emissions limit, including those based on energy input of a Unit (i.e. lb/MMBtu) is one (1) hour unless stated otherwise in a Specific Condition of this permit or in the applicable requirement that establishes the limit.

D. Permit Modifications and Enforcement of Prior Permit Conditions. Nothing in this permit, nor any administrative, technical, minor, or significant modification to this permit, shall be construed to limit, preclude or otherwise affect the authority of the Department to pursue enforcement for violations of permit conditions that occurred before the effective date of any permit modification, nor shall any such permit modification be interpreted as approval of past operations or emissions or as a determination of compliance for any prior period.

The Department retains full authority to investigate and enforce all violations based on the permit conditions in effect at the time the alleged violations occurred.

Any permit modification applies prospectively only and shall not constitute a defense to, or affect the determination of, liability for any past, current, or ongoing violations occurring prior to the effective date of the permit or modification.

B113 Permit Cancellation and Revocation

A. The Department may revoke this permit if, within ten years immediately preceding the date of submission of the permit application, the applicant or permitee has: (1) knowingly misrepresented a material fact in an application for a permit; (2) refused to disclose the information required by the provisions of the Air Quality Control Act; (3) been convicted in any court of any state or the United States of: (a) a felony related to an environmental crime, or (b) a crime defined by state or federal statute as involving or being in restraint of trade, price fixing, bribery or fraud; (4) constructed or operated a facility for which a permit is sought without a permit required by the Air Quality Control Act, except when such an unpermitted facility is discovered after acquisition in the course of a timely environmental audit authorized by department or local board policy and except if: (a) the operator of the facility using good engineering practices and established approved calculation methodologies estimated that the facility's emissions would not require a permit pursuant to the Air Quality Control Act; and (b) upon discovery of the discrepancy between the calculated pre-construction maximum facility emissions and the calculated post-construction maximum facility emissions, the operator of the facility applies for the appropriate permit within thirty calendar days; or (5) had any permit revoked or permanently suspended for cause under the environmental laws of any state of the United States. (1978 74-2-7 (P) NMSA. Revocation will be made in writing, and an administrative appeal may be taken to the Secretary of the Department within thirty (30) days.

B. The Department shall automatically cancel any permit for any source which ceases operation for five (5) years or more, or permanently. Reactivation of any source after the five (5) year period shall require a new permit. (20.2.72 NMAC)

C. The Department may cancel a permit if the construction or modification is not commenced within two (2) years from the date of issuance or if, during the construction or modification, work is suspended for a total of one (1) year. (20.2.72 NMAC)

B114 Notification to Subsequent Owners

A. The permit and conditions apply in the event of any change in control or ownership of the Facility. No permit modification is required in such case. However, in the event of any such change in control or ownership, the permittee shall notify the succeeding owner of the permit and conditions and shall notify the Department's Program Manager, Permits Section of the change in ownership within fifteen (15) days of that change. (20.2.72.212.C NMAC)

B. Any new owner or operator shall notify the Department's Program Manager, Permits Section, within thirty (30) days of assuming ownership, of the new owner's or operator's name and address. (20.2.73.200.E.3 NMAC)

B115 Asbestos Demolition

A. Before any asbestos demolition or renovation work, the permittee shall determine whether 40 CFR 61 Subpart M, National Emissions Standards for Asbestos applies. If required, the permittee shall notify the Department's Program Manager, Compliance and Enforcement Section using forms furnished by the Department.

B116 Short Term Engine Replacement

A. The following Alternative Operating Scenario (AOS) addresses engine breakdown or periodic maintenance and repair, which requires the use of a short term replacement engine. The following requirements do not apply to engines that are exempt per 20.2.72.202.B(3) NMAC. Changes to exempt engines must be reported in accordance with 20.2.72.202.B NMAC. A short term replacement engine may be substituted for any engine allowed by this permit for no more than 120 days in any rolling twelve month period per permitted engine. The compliance demonstrations required as part of this AOS are in addition to any other compliance demonstrations required by this permit.

(1) The permittee may temporarily replace an existing engine that is subject to the emission limits set forth in this permit with another engine regardless of manufacturer, model, and horsepower without modifying this permit. The permittee shall submit written notification to the Department within 15 days of the date of engine substitution according to condition B110.C(1).

(a) The potential emission rates of the replacement engine shall be determined using the replacement engine's manufacturer specifications and shall comply with the existing engine's permitted emission limits.

(b) The direction of the exhaust stack for the replacement engine shall be either vertical or the same direction as for the existing engine. The replacement engine's stack height and flow parameters shall be at least as effective in the dispersion of air pollutants as the modeled stack height and flow parameters for the existing permitted engine. The following equation may be used to show that the replacement engine disperses pollutants as well as the existing engine. The value calculated for the replacement engine on the right side of the equation shall be equal to or greater than the value for the existing engine on the left side of the equation. The permitting page of the Air Quality Bureau website contains a spreadsheet that performs this calculation.

EXISTING ENGINE REPLACMENT ENGINE

$$\frac{[(g) \times (h1)] + [(v1)^2/2] + [(c) \times (T1)]}{q1} <= \frac{[(g) \times (h2)] + [(v2)^2/2] + [(c) \times (T2)]}{q2}$$

Where
g = gravitational constant = 32.2 ft/sec^2
h1 = existing stack height, feet
v1 = exhaust velocity, existing engine, feet per second
c = specific heat of exhaust, 0.28 BTU/lb-degree F
T1 = absolute temperature of exhaust, existing engine = degree F + 460
q1 = permitted allowable emission rate, existing engine, lbs/hour
h2 = replacement stack height, feet
v2 = exhaust velocity, replacement engine, feet per second
T2 = absolute temperature of exhaust, replacement engine = degree F + 460
q2 = manufacturer's potential emission rate, replacement engine, lbs/hour

The permittee shall keep records showing that the replacement engine is at least as effective in the dispersion of air pollutants as the existing engine.

(c) Test measurement of NOx and CO emissions from the temporary replacement engine shall be performed in accordance with Section B111 with the exception of Condition B111A(2) and B111B for EPA Reference Methods Tests or Section B111C for portable analyzer test measurements. Compliance test(s) shall be conducted within fifteen (15) days after the unit begins operation, and records of the results shall be kept according to section B109.B. This test shall be performed even if the engine is removed prior to 15 days on site.

i. These compliance tests are not required for an engine certified under 40CFR60, subparts IIII, or JJJJ, or 40CFR63, subpart ZZZZ if the permittee demonstrates that one of these requirements causes such engine to comply with all emission limits of this permit. The permittee shall submit this demonstration to the Department within 48 hours of placing the new unit into operation. This submittal shall include documentation that the engine is certified, that the engine is within its useful life, as defined and specified in the applicable requirement, and shall include calculations showing that the applicable emissions standards result in compliance with the permit limits.

ii. These compliance tests are not required if a test was conducted by portable analyzer or by EPA Method test (including any required by 40CFR60, subparts IIII and JJJJ and 40CFR63, subpart ZZZZ) within the last 12 months. These previous tests are valid only if conducted at the same or lower elevation as the existing engine location prior to commencing operation as a temporary replacement. A copy of the test results shall be kept according to section B109.B.

(d) Compliance tests for NOx and CO shall be conducted if requested by the Department in writing to determine whether the replacement engine is in compliance with applicable regulations or permit conditions.

(e) Upon determining that emissions data developed according to B116.A.1(c) fail to indicate compliance with either the NOx or CO emission limits, the permittee shall notify the Department within 48 hours. Also within that time, the permittee shall implement one of the following corrective actions:

i. The engine shall be adjusted to reduce NOx and CO emissions and tested per B116.A.1(c) to demonstrate compliance with permit limits.

ii. The engine shall discontinue operation or be replaced with a different unit.

(2) Short term replacement engines, whether of the same manufacturer, model, and horsepower, or of a different manufacturer, model, or horsepower, are subject to all federal and state applicable requirements, regardless of whether they are set forth in this permit (including monitoring and recordkeeping), and shall be subject to any shield afforded by this permit.

(3) The permittee shall maintain a contemporaneous record documenting the unit number, manufacturer, model number, horsepower, emission factors, emission test results, and serial number of any existing engine that is replaced, and the replacement engine. Additionally, the record shall document the replacement duration in days, and the beginning and end dates of the short term engine replacement.

(4) The permittee shall maintain records of a regulatory applicability determination for each replacement engine (including 40CFR60, subparts IIII and JJJJ and 40CFR63, subpart ZZZZ) and shall comply with all associated regulatory requirements.

B. Additional requirements for replacement of engines at sources that are major as defined in regulation 20.2.74 NMAC, Permits – Prevention of Significant Deterioration, section 7.AG. For sources that are major under PSD, the total cumulative operating hours of the replacement engine shall be limited using the following procedure:

(1) Daily, the actual emissions from the replacement engine(s) of each pollutant regulated by this permit for the existing engine shall be calculated and recorded.

(2) The sum of the total actual emissions since the commencement of operation of the replacement engine(s) shall not equal or exceed the significant emission rates in Table 2 of 20.2.74 NMAC, section 502 for the time that the replacement engine is located at the facility.

C. All records required by this section shall be kept according to section B109.

PART C MISCELLANEOUS

C100 Supporting On-Line Documents

A. Copies of the following documents can be downloaded from NMED's web site under Compliance and Enforcement or requested from the Bureau.

(1) Excess Emission Form (for reporting deviations and emergencies)

(2) Universal Stack Test Notification, Protocol and Report Form and Instructions

C101 Definitions

A. **"Daylight"** is defined as the time period between sunrise and sunset, as defined by the Astronomical Applications Department of the U.S. Naval Observatory. (Data for one day or a table of sunrise/sunset for an entire year can be obtained at http://aa.usno.navy.mil/. Alternatively, these times can be obtained from a Farmer's Almanac or from http://www.almanac.com/rise/).

B. **"Decommission"** and **"Decommissioning"** applies to units left on site (not removed) and is defined as the complete disconnecting of equipment, emission sources or activities from the process by disconnecting all connections necessary for operation (i.e. piping, electrical, controls, ductwork, etc.).

C. **"Exempt Sources"** and **"Exempt Activities"** is defined as those sources or activities that are exempted in accordance with 20.2.72.202 NMAC. Note; exemptions are only valid for most 20.2.72 NMAC permitting actions.

D. **"Fugitive Emission"** means those emissions which could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening.

E. **"Insignificant Activities"** means those activities which have been listed by the department and approved by the administrator as insignificant on the basis of size, emissions or production rate. Note; insignificant activities are only valid for 20.2.70 NMAC permitting actions.

F. **"Malfunction"** for the requirements under 20.2.7 NMAC, means any sudden and unavoidable failure of air pollution control equipment or process equipment beyond the control of the owner or operator, including malfunction during startup or shutdown. A failure that is caused entirely or in part by poor maintenance, careless operation, or any other preventable equipment breakdown shall not be considered a malfunction. (20.2.7.7.E NMAC)

G. **"Natural Gas"** is defined as a naturally occurring fluid mixture of hydrocarbons that contains 20.0 grains or less of total sulfur per 100 standard cubic feet (SCF) and is either composed of at least 70% methane by volume or has a gross calorific value of between 950 and 1100 Btu per standard cubic foot. (40 CFR 60.631)

H. **"Natural Gas Liquids"** means the hydrocarbons, such as ethane, propane, butane, and pentane, that are extracted from field gas. (40 CFR 60.631)

I. **"National Ambient air Quality Standards"** means, unless otherwise modified, the primary (health-related) and secondary (welfare-based) federal ambient air quality standards promulgated by the US EPA pursuant to Section 109 of the Federal Act.

J. **"Night"** is the time period between sunset and sunrise, as defined by the Astronomical Applications Department of the U.S. Naval Observatory. (Data for one day or a table of sunrise/sunset for an entire year can be obtained at http://aa.usno.navy.mil/. Alternatively, these times can be obtained from a Farmer's Almanac or from http://www.almanac.com/rise/).

K. **"Night Operation** or **Operation at Night"** is operating a source of emissions at night.

L. **"NO2"** or "Nitrogen dioxide" means the chemical compound containing one atom of nitrogen and two atoms of oxygen, for the purposes of ambient determinations. The term **"nitrogen dioxide,"** for the purposes of stack emissions monitoring, shall include nitrogen dioxide (the chemical compound containing one atom of nitrogen and two atoms of oxygen), nitric oxide (the chemical compound containing one atom of nitrogen and one atom of oxygen), and other oxides of nitrogen which may test as nitrogen dioxide and is sometimes referred to as NOx or NO_2. (20.2.2 NMAC)

M. "**NOx**" see NO_2

N. "**Paved Road**" is a road with a permanent solid surface that can be swept essentially free of dust or other material to reduce air re-entrainment of particulate matter. To the extent these surfaces remain solid and contiguous they qualify as paved roads: concrete, asphalt, chip seal, recycled asphalt and other surfaces approved by the Department in writing.

O. **"Potential Emission Rate"** means the emission rate of a source at its maximum capacity to emit a regulated air contaminant under its physical and operational design, provided any physical or operational limitation on the capacity of the source to emit a regulated air contaminant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored or processed, shall be treated as part of its physical and operational design only if the limitation or the effect it would have on emissions is enforceable by the department pursuant to the Air Quality Control Act or the federal Act.

P. "**Restricted Area**" is an area to which public entry is effectively precluded. Effective barriers include continuous fencing, continuous walls, or other continuous barriers approved by the Department, such as rugged physical terrain with a steep grade that would require special equipment to traverse. If a large property is completely enclosed by fencing, a restricted area within the property may be identified with signage only. Public roads cannot be part of a Restricted Area.

Q. **"Shutdown"** for requirements under 20.2.72 NMAC, means the cessation of operation of any air pollution control equipment, process equipment or process for any purpose, except routine phasing out of batch process units.

R. **"SSM"** for requirements under 20.2.7 NMAC, means routine or predictable startup, shutdown, or scheduled maintenance.

(1) **"Shutdown"** for requirements under 20.2.7 NMAC, means the cessation of operation of any air pollution control equipment or process equipment.

(2) **"Startup"** for requirements under 20.2.7 NMAC, means the setting into operation of any air pollution control equipment or process equipment.

S. **"Startup"** for requirements under 20.2.72 NMAC, means the setting into operation of any air pollution control equipment, process equipment or process for any purpose, except routine phasing in of batch process units.

C102 Acronyms

2SLB ..... 2-stroke lean burn
4SLB ..... 4-stroke lean burn
4SRB ..... 4-stroke rich burn
acfm ..... actual cubic feet per minute
AFR ..... air-fuel ratio
AP-42 ..... EPA Air Pollutant Emission Factors
AQB ..... Air Quality Bureau
AQCR ..... Air Quality Control Region
ASTM ..... American Society for Testing and Materials
Btu ..... British thermal unit
CAA ..... Clean Air Act of 1970 and 1990 Amendments
CEM ..... continuous emissions monitoring
cfh ..... cubic feet per hour
cfm ..... cubic feet per minute
CFR ..... Code of Federal Regulations
CI ..... compression ignition
CO ..... carbon monoxides
COMS ..... continuous opacity monitoring system
EIB ..... Environmental Improvement Board
EPA ..... United States Environmental Protection Agency
gr/100 cf ..... grains per one hundred cubic feet
gr/dscf ..... grains per dry standard cubic foot
GRI ..... Gas Research Institute
HAP ..... hazardous air pollutant
hp ..... horsepower
H_2S ..... hydrogen sulfide
IC ..... internal combustion
KW/hr ..... kilowatts per hour

lb/hr.....pounds per hour
lb/MMBtu.....pounds per million British thermal unit
MACT.....Maximum Achievable Control Technology
MMcf/hr.....million cubic feet per hour
MMscf.....million standard cubic feet
N/A.....not applicable
NAAQS.....National Ambient Air Quality Standards
NESHAP.....National Emission Standards for Hazardous Air Pollutants
NG.....natural gas
NGL.....natural gas liquids
NMAAQS.....New Mexico Ambient Air Quality Standards

BOCETO AL 7/29/2026

Declaración de Fundamento - Narrativa
Permiso de NSR

Tipo de Acción de Permiso: Regular-Nueva
Instalaciones: YGI Microgrid
Compañía: Yucca Growth Infrastructure, LLC
Núm.(s) de Permiso: 10883
Núm. de ID Tempo/IDEA: 41351 - PRN20260001
Redactor del Permiso: Julia Kuhn

Seguimiento de tarifas (Tabla completa para NSR. No se requiere para el Título V)

Rastreo	**Registros de rastreo NSR completados:** [X] Sí [] No
	Página de rastreo NSR adjunta a la cubierta del folder del permiso: [X] Sí [] No
	Factura Pagada Adjunta: [X] Sí [] No
	Factura de Saldo Adeudado Adjunta: [] Sí [] No N/A
	Comentarios de la Factura: $16,170.00 pagados por completo

Revisión del Permiso	**Fecha de Ejecución:** 7/14/2026	**Fecha para la Réplica de la Ejecución:** 7/21/2026
	Fecha para el Solicitante: 7/13/2026	**Fecha para la Réplica del Solicitante:** 7/16/2026
	Fecha para la EPA: N/A	**Fecha para la Réplica de la EPA:** N/A
	Fecha para el Supervisor: 7/14/2026, 7/28/2026	

1.0 Descripción del Proceso de las Instalaciones:

Las instalaciones generarán electricidad mediante celdas de combustible. Las celdas de combustible emiten NOx, CO, VOC, SO_2, PM, PM_{10} y $PM_{2.5}$ como subproducto de reacciones químicas y eléctricas (quimioeléctricas). Otros subproductos de la generación de energía incluyen calor y vapor.

Las instalaciones utilizarán un sistema del Servidor Bloom Energy, que es un tipo de sistema de celda de combustible de óxido sólido (SOFC). El sistema SOFC convierte el gas natural en electricidad mediante una reacción electroquímica. Cada celda de combustible individual se compone de tres capas: un electrolito cerámico sólido colocado entre un cátodo y un ánodo, donde el ánodo y el cátodo están hechos de tintas que recubren el electrolito. No se requieren metales preciosos, ácidos corrosivos ni materiales fundidos. El gas natural ingresa por el lado del ánodo, donde se mezcla con vapor para producir un combustible reformado mediante Reformado Interno Directo (DIR). A medida que el combustible reformado cruza el ánodo, atrae iones de oxígeno del aire en el lado del cátodo. Los iones de oxígeno se combinan con el combustible reformado hasta producir electricidad, agua, calor y dióxido de carbono. El agua y el calor se reciclan hasta producir el vapor necesario para reformar el combustible, lo que permite una reacción electroquímica altamente eficiente que se produce entre los 700 y 900 grados Celsius.

Las celdas individuales se combinan en pilas y luego en módulos de energía que contienen cientos de celdas de combustible individuales que producen energía de corriente continua (CC).

Administrative Record NSR_001665

Los módulos están empacados en Servidores de Energía, que combinan los módulos de energía con un módulo de procesamiento de combustible y un módulo de corriente alterna (CA) que contiene convertidores y transformadores de CC a CA para producir 325 kW de energía de CA neta. Una minoría de unidades más pequeñas produce 260 kW de energía neta de CA.

Las celdas de combustible están organizadas/dispuestas de la siguiente manera: *celda y pila -> módulo de energía -> Servidor de Energía -> clúster -> grupo/plataforma de inversores*. El Sistema de Servidor de Energía Bloom propuesto implementa Servidores de Energía que funcionan conjuntamente para crear un sistema integrado capaz de sostener la producción objetivo representada para cada escenario aplicable (260 kW o 325 kW). La descarga del ánodo agotado, que contiene aproximadamente un 95 por ciento de dióxido de carbono una vez seco, se descarga a la atmósfera en forma de gases de efecto invernadero (GEI). Las emisiones al aire de los Servidores de Energía consisten en descargas de ánodos agotados, que contienen contaminantes atmosféricos de criterio que consisten en NOx, CO, VOC, SO_2, PM, PM_{10}, $PM_{2.5}$ y HAP. El solicitante requiere una autorización para operar el sistema del Servidor Bloom Energy a su carga nominal máxima durante 8,760 horas por año.

Rutina de Encendido, Apagado y Mantenimiento (SSM) o emisiones predecibles: las actividades de mantenimiento incluyen el intercambio en caliente de los módulos de energía aproximadamente una vez cada cinco años, el reemplazo de los medios del lecho de desulfuración una vez cada dos años y reemplazos de componentes individuales (p.ej., sopladores) según sea necesario. Se producirán emisiones al ambiente (ventilación de gas natural) durante los reemplazos de los medios del lecho de desulfuración y durante los arranques iniciales de la unidad de desulfuración. Se instalarán alrededor de noventa y cinco plataformas/bloques del Sistema Central de Desulfuración (CDS), los cuales constan de dos recipientes en una configuración de avance/retraso para la desulfuración. Cada recipiente tiene un volumen de 1,370 pies cúbicos estándar.

2.0 <u>Descripción de esta Modificación:</u>

Esta solicitud de permiso es para un permiso de construcción de una revisión de nueva fuente (NSR) presentado de conformidad con 20.2.72.200.A(1) NMAC correspondiente a unas instalaciones de generación de energía de microrred con el objetivo de generar energía para un centro de datos cercano (posiblemente adyacente). Las instalaciones generarán energía por medio de celdas de combustible las cuales son celdas de combustible de óxido sólido (SOCF) de un Sistema de Servidor de Bloom Energy de 260 kW y 325 kW. Los “grupos” del Servidor de Energía se dirigen a un total de 2,275 pilas de desecho como fuentes de emisión. El sitio será una fuente importante para el Título V (20.2.70 NMAC).

3.0 <u>Determinación de Fuentes de la Sección 11 de la solicitud de permiso:</u>

1. Las fuentes de emisión evaluadas incluyen las Unidades enumeradas en las Tablas 2-A y 2-B de la solicitud de permiso correspondiente al Permiso # 10883. El NMED ha realizado un análisis preliminar (a continuación) de si puede agregarse el centro de datos y/o cualesquiera instalaciones futuras cercanas (para las cuales no se han presentado solicitudes).

2. Análisis de Fuente Única (incluyendo el análisis preliminar):

A. <u>Código SIC:</u> ¿Las instalaciones pertenecen al mismo grupo industrial (es decir, mismo grupo de código SIC de dos dígitos o actividad de apoyo)? N/A, si se lleva a cabo un análisis

Administrative Record NSR_001666

de agregación en el futuro, la microrred y cualquier entidad asociada futura, como el centro de datos, pueden tener códigos SIC diferentes.

B. Control común: ¿Las instalaciones están bajo propiedad o control común? N / A. Actualmente, la microrred y el centro de datos pertenecen y son operados por entidades independientes, y el centro de datos no realiza actividades que emitan contaminantes. Si en el futuro se realiza un análisis de agregación que incluya cualesquiera instalaciones cercanas asociadas, el NMED necesitaría evaluar la relación entre la microrred y cualesquiera instalaciones futuras asociadas bajo una orientación relevante e interpretaciones históricas.

C. Contigua o Adyacente: ¿Las instalaciones están ubicadas en una o más propiedades contiguas o adyacentes? N/A Si se realiza un análisis de agregación en el futuro, será necesario evaluar la microrred y el centro de datos, o cualesquiera instalaciones futuras asociadas.

3. ¿La fuente, tal como se describe en la solicitud, es la fuente completa con fines de aplicabilidad NMAC 20.2.70, 20.2.72, 20.2.73 o 20.2.74? Si. En este momento, solo la microrred ha solicitado un permiso de aire y no se espera que el centro de datos, o cualquier otra entidad asociada, requiera un permiso de aire en el futuro. Como se señaló con anterioridad, si se realiza un análisis de agregación en el futuro, el NMED determinará si la microrred y el centro de datos, o cualquier otra entidad asociada que solicite un permiso de aire, deben considerarse como una fuente única para efectos de determinar los requisitos del permiso de construcción y del permiso del Título V. Incluso si las instalaciones se consideran una fuente única para efectos de los permisos de aire, las instalaciones pueden operar bajo permisos de construcción y del Título V separados; sin embargo, las emisiones totales de contaminantes atmosféricos regulados para todos esos contaminantes se combinarán a fin de determinar los requisitos del permiso.

4.0 Aplicabilidad de la Prevención de Deterioro Significativo (PSD, por sus siglas en inglés):

A. Las emisiones de la microrred se considerarán una fuente única a menos que un análisis de agregación futuro indique que el centro de datos (el cual actualmente no tiene emisiones al aire) debe combinarse como una sola fuente. Si el centro de datos tuviera actividades emisoras de contaminantes y las dos ubicaciones estuvieran agregadas, las emisiones combinadas de ambas instalaciones podrían ser potencialmente una **fuente mayor o menor** de PSD si se emite este permiso.

La siguiente es una declaración del solicitante en respuesta a la solicitud de información de AQB con respecto la determinación de la fuente para las dos instalaciones.

"Las Compañías mantienen la posición de que esta información no es relevante para la emisión de su solicitud de permiso aéreo bajo la Ley de Control de Calidad del Aire de Nuevo México. La microrred YGI proporcionará energía al centro de datos propuesto. Para aclarar la declaración de la carta de presentación, la solicitud no cubre específicamente el centro de datos. Más bien, el equipo de generación de energía necesario para brindar el suministro de energía tanto primario como de respaldo para el centro de datos son los Servidores de Energía incluidos en la solicitud. Así que, tanto las necesidades de energía primaria como las de respaldo de emergencia para el centro de datos se reflejan en la solicitud. En otras palabras, las Compañías esperan que no se requiera una generación de respaldo adicional para el centro de datos y que, en cambio, esta solicitud de permiso de aire autorizaría un suministro de energía suficiente para el centro de datos de modo que no se necesitaría energía de respaldo adicional separada que no pudiera

Administrative Record NSR_001667

ser suministrada mediante la conexión a la red eléctrica en o para el centro de datos. Las Compañías además esperan que el centro de datos no realice ninguna actividad que emita contaminantes sujeta a los permisos de conformidad con la Ley de Control de Calidad del Aire de Nuevo México y las normas de implementación".

5.0 **Historial (En orden cronológico descendente, mostrando NSR y TV):** * El asterisco indica los permisos NSR y Título V activos actuales que no han sido reemplazados.

Número de Permiso	Fecha de Expedición	Tipo de acción	Descripción de la Acción (Cambios)
* 10883	Por determinar	NSR – Permiso Nuevo	Esta solicitud de permiso es para un permiso de construcción de una revisión de fuente nueva (NSR) presentado de conformidad con 20.2.72.200.A(1) NMAC para unas instalaciones de generación de energía de microrred con el objetivo de generar energía para un centro de datos cercano (potencialmente adyacente). Las instalaciones generarán energía utilizando celdas de combustible que son celdas de combustible de óxido sólido (SOCF) del Sistema del Servidor de Bloom Energy de 260 kW y 325 kW. Los "grupos" del Servidor de Energía se dirigen a un total de 2275 pilas de desecho como fuentes de emisión. El sitio será una fuente importante para el Título V (20.2.70 NMAC). El NMED ha llevado a cabo un análisis preliminar para determinar si puede agregarse el centro de datos y/o cualesquiera instalaciones futuras cercanas.

6.0 **Respuestas/Dudas del Público:** Hasta el 6 de julio de 2026, la Oficina de Calidad del Aire (AQB) del NMED ha recibido aproximadamente 22,500 comentarios o inquietudes del público. La AQB señala que hemos recibido informes de algunos comentarios ingresados sin el conocimiento y/o consentimiento del comentarista nombrado; esto formará parte del expediente administrativo.

7.0 **Historial de las Pruebas de Cumplimiento:** No hay pruebas de cumplimiento que informar para estas instalaciones ya que se trata de una fuente nueva y aún no se ha construido.

8.0 **Inicio y Apagado de acuerdo con la Sección 14 de la Solicitud:**

A. Si corresponde, ¿el solicitante indicó que se desarrolló un plan operativo de inicio, apagado y emergencia de acuerdo con 20.2.70.300.D(5)(g) NMAC? **No**. Las instalaciones no cuentan actualmente con un permiso del Título V y esta sección se aplica a las instalaciones con permisos del Título V.
B. Si corresponde, ¿el solicitante indicó que se desarrolló un plan operativo de mal funcionamiento, inicio o apagado de acuerdo con 20.2.72.203.A.5 NMAC? **Sí**
C. ¿El solicitante indicó que se desarrolló e implementó un plan de inicio, apagado y mantenimiento programado de acuerdo con 20.2.7.14.A y B NMAC? **Sí**
D. ¿Las instalaciones tienen emisiones debido al inicio, apagado y mantenimiento rutinarios o predecibles? Si es así, ¿se han permitido todas las emisiones provenientes de las operaciones de inicio, apagado y mantenimiento programado? **Sí**, debido a la magnitud del proyecto con respecto a la tecnología, la AQB del NMED requerirá que el solicitante cumpla

Administrative Record NSR_001668

con las condiciones del permiso para determinar si las emisiones de SSM, con base en operaciones reales, estarán exentas según 20.2.72.202.B(5) NMAC, ya que se proyecta que las emisiones de las actividades de SSM sean menos de ½ tonelada al año.

9.0 **Estado de Cumplimiento y Ejecución**: Según el correo electrónico de C&E Verificación de Cumplimiento con fecha del 22 de mayo de 2026, "No tenemos ninguna medida de ejecución para ellos". Además, la División de Cumplimiento y Ejecución no pudo encontrar ninguna medida de ejecución por parte de la AQB contra la empresa matriz BorderPlex Digital Assets LLC. Además, el 7/29/2026 C&E verificó el cumplimiento de las siguientes empresas asociadas:

Compañía	Permisos de Aire del NMED (TEMPO)	Historial de ejecución de Aire del NMED
1. Forge Growth Infrastructure, LLC	no	Ninguna
2. Stack Infrastructure	no	Ninguna
3. El Paso Electric Company	AI# 122	2009 CD - multa de $250k + orden de ajustar las calderas. 2010 SASFCO & 2012 NOD - ambos asuntos para un informe posterior
4. Orion Digital Infrastructure, LLC	no	Ninguna
5. Santa Theresa Land LLC	no	Ninguna
6. STACK Infrastructure	duplicado	
7. BorderPlex Digital Assets	no	Ninguna
8. Oracle America, Inc. (OAI)	AI# 41338	Ninguna (solicitud retirada el 3/19/2026)
9. Yucca Growth Infrastructure, LLC	AI# 41351	Ninguna
10. Red Chiles A, LLC	no	Ninguna
11. Red Chiles B, LLC	no	Ninguna
12. Red Chiles C, LLC	no	Ninguna
13. Red Chiles D, LLC	no	Ninguna

10.0 **Modelado:**

Suposiciones del modelado: Las instalaciones funcionan de forma continua, 8,760 horas al año.
Condiciones del permiso: Las instalaciones pueden operar 8,760 horas al año.
Conclusión:
Este análisis de modelado demuestra que la operación de las instalaciones descritas en este informe no causa ni contribuye al rebasamiento de los estándares de calidad del aire aplicables. Los estándares relevantes en estas instalaciones son NAAQS para CO, NO2, PM10, PM2.5 y SO2; NMAAQS para CO, NO2 y SO2; e incrementos de PSD Clase II para NO2 y PM10.

Medida: Se puede expedir el permiso con base en este análisis de modelo.

Administrative Record NSR_001669

El informe del modelado fue presentado por Trinity Consultants y tiene fecha del 27 de abril de 2026.
El análisis de la calidad del aire demuestra el cumplimiento de los requisitos reglamentarios aplicables.
Modelo(s) utilizado(s): Se utilizó AERMOD versión 24142 para ejecutar el análisis del modelado.
Nota: Los archivos completos de entrada y salida de modelado pueden estar disponibles y se encuentran en los Archivos de modelado en la carpeta "10883_Yucca Growth Infrastructure YGI Microgrid".
Descripción de los archivos de entrada del modelo: para este análisis se utilizaron datos meteorológicos listos para AERMOD del NMED. Estos datos se encuentran disponibles en el sitio web de la AQB. Los archivos GeoTIFF se adquirieron a través del USGS.

11.0 Análisis Estatal Regulatorio (NMAC/AQCR):

Cita 20 NMAC	Título	Aplica (S/N)	Unidad(es) o Instalaciones	Justificación:
2.1	Disposiciones Generales	Sí	Instalaciones completas	Las instalaciones están sujetas al Título 20 Protección Ambiental Capítulo 2 Calidad del Aire del Código Administrativo de Nuevo México, por lo que están sujetas a la Parte 1 Disposiciones Generales, Actualización de la Sección 116 de la norma para Cifras Significativas y Redondeo. Aplicable sin requisitos de permisos. Se aplica en todo el sitio. Yucca cumplirá con los requisitos procesales indicados en 20.1.114 NMAC, 20.1.115 NMAC, 20.1.116 NMAC y 20.1.117 NMAC (relativos a audiencias de variación, información confidencial, dígitos significativos e informes electrónicos) en la medida aplicable.
2.3	Estándares de Calidad de Aire ambiental	No para NSR y TV	N/A	**NSR:** 20.2.3 NMAC es una norma aprobada por SIP que establece estándares estatales. Los NMAAQS en sí mismos no son un “requisito aplicable” que una fuente deba cumplir directamente. La promulgación de un NMAAQS no deriva automáticamente, en sí misma, en medidas procesables para una fuente. En cambio, las medidas específicas contenidas en cada permiso emitido de forma individual, otras reglas promulgadas por el estado y el SIP aprobado por la EPA de Nuevo México son los requisitos aplicables relevantes (como NSPS y MACT). **Title V:** 20.2.3.9 NMAC, LIMITACIÓN DE APLICABILIDAD A 20.2.70 NMAC. Los requisitos de NMAAQS no son requisitos aplicables según 20.2.70 NMAC, según lo definido por 20.2.3.9 NMAC, 20.2.3.9 NMAC no limita la aplicabilidad de esta parte a las fuentes requeridas para obtener un permiso según la norma menor NSR, 20.2.72 NMAC, ni limita qué términos y condiciones de los permisos NSR emitidos de conformidad con 20.2.72 NMAC son requisitos aplicables en un permiso del Título V.

Administrative Record NSR_001670

Cita 20 NMAC	Título	Aplica (S/N)	Unidad(es) o Instalaciones	Justificación:
2.7	Exceso de Emisiones	Sí	Instalaciones completas	Se aplica a todas las fuentes de las instalaciones. Aplicables a nivel federal, excepto las Secciones 6(b); 110(b)(15); 111; 112; 113; 115; y 116 que son aplicables únicamente por el estado. Se aplica en todo el sitio. Yucca implementará un plan de mantenimiento según lo requerido en 20.2.7.14 NMAC y cumplirá con los requisitos de notificación, defensa afirmativa y causa de raíz de 20.2.7.108–114 NMAC.
2.23	Control de Polvo Fugitivo	Sí	Construcción de las Instalaciones	Las actividades de construcción de las instalaciones están sujetas a 20.2.23 NMAC.
2.61	Humo y Emisiones Visibles	Sí	SOFC-1 hasta SOFC--2275	Esta regulación limita la opacidad al 20% de los Equipos de Combustión Estacionarios, como motores, calderas, calentadores y antorchas. Cada grupo de SOFC está sujeto a esta regulación porque cada grupo desemboca en una pila y cumple con la definición de "equipo de combustión estacionario" (sujeto a 20.2.80 NMAC). "Equipo de combustión estacionario" significa cualquier dispositivo o sistema estacionario *utilizado para oxidar materiales sólidos, líquidos o gaseosos*, incluyendo combustibles o desechos, e incluye, *entre otros*, incineradores, calderas alimentadas con leña, destructores de cortinas de aire y equipos estacionarios de combustión de petróleo (20.2.61.7 NMAC). Las instalaciones están sujetas a la norma.
2.70	Permisos de Operación	Sí	Instalaciones completas	Las instalaciones serán una Fuente Principal del Título V según lo definido en 20.2.70.7 NMAC. Yucca presentará una solicitud de permiso de operación completa y oportuna según lo exige 20.2.70.200, 201, 300 NMAC.
2.71	Tarifas de Permisos de Operación	Sí	Instalaciones completas	La fuente estará sujeta a las tarifas anuales de 20.2.70 NMAC según lo citado en 20.2.71.109 NMAC. El departamento proporcionará una factura por las tarifas adeudadas antes del 1 de abril de cada año según 20.2.71.113.A NMAC.
2.72	Permisos de Construcción	Sí	Instalaciones completas	La solicitud del permiso actual fue requerida por 20.2.72.200.A NMAC y, por lo tanto, las instalaciones están sujetas a esta norma.
2.73	Requisitos del NOI & Inventario de	Sí, Siempre	Instalaciones completas	Aplicable a todas las instalaciones que requieran permiso.

Administrative Record NSR_001671

Cita 20 NMAC	Título	Aplica (S/N)	Unidad(es) o Instalaciones	Justificación:
	Emisiones			Debido a que se requiere un permiso de construcción, el permiso cumplirá con los requisitos de 20.2.73.200.A(4) NMAC.
2.74	Permisos-Prevención del Deterioro Significativo	No	N/A	Si estuviera sujeto, esto normalmente se aplicaría a toda las instalaciones. Los permisos de PSD no se aplican porque las nuevas instalaciones propuestas no son una fuente estacionaria importante de PSD. Específicamente, las instalaciones no figuran en la tabla 1 (20.2.74.501 NMAC), donde el umbral de emisiones es de 100 tpa y el potencial de emisión será inferior a 250 toneladas por año con respecto a cada contaminante de revisión de nueva fuente regulada.
2.75	Tarifas del Permiso de Construcción	Sí	Instalaciones completas	Estas instalaciones están sujetas a 20.2.72 NMAC. Esta norma es aplicable y la solicitud se presentó de conformidad con 20.2.72.200.A(1) NMAC.
2.77	Estándares de Desempeño de Fuentes Nuevas	No	Ver las Fuentes sujetas a 40 CFR 60	Se aplica a cualquier fuente estacionaria que se esté construyendo o modificando y que esté sujeta a los requisitos del 40 CFR Parte 60. Las instalaciones no están sujetas a ninguna norma según 40 CFR Parte 60.
2.78	Estándares de Emisiones para HAPs	No	Ver las Fuentes sujetas a 40 CFR 61	Esta norma se aplica a todas las fuentes que emiten contaminantes peligrosos ambientales, que están sujetas a los requisitos del 40 CFR Parte 61. Las instalaciones no están sujetas a ninguna norma según 40 CFR Parte 61. Consulte 20.2.78.9 NMAC.
2.79	Áreas de Incumplimiento de Permisos	No	N/A	Estas instalaciones están adyacentes a un área de incumplimiento. Las instalaciones no están ubicadas dentro del área de incumplimiento. El área de incumplimiento de Sunland Park incluye el “área delimitada por la línea estatal de Nuevo México y Texas al este, la línea internacional Nuevo México-México al sur, la latitud N31°49’30” al norte y la longitud W106°36’36” al oeste”. Véase 83 Reserva Federal. Reg. 25776, 25820 (4 de junio de 2018). La microrred YGI no se encuentra dentro de estos límites. Las instalaciones “afectan” un área adyacente de incumplimiento si su radio de impacto, que se determina a partir del modelado de dispersión del aire, se superpone a un

Administrative Record NSR_001672

Cita 20 NMAC	Título	Aplica (S/N)	Unidad(es) o Instalaciones	Justificación:
				área adyacente de incumplimiento. El sitio no causará ni contribuirá a ninguna violación de NAAQS existente. Como se reporta más a detalle en la Sección 16 (relacionada con el modelado), las emisiones de NOX y VOC son menores que los MERP de O3 de 8 horas aplicables (Condado de Otero). Consulte 20.2.79.109.A. Ver sec. 2.6.5.2, Lineamientos para el Modelado de la Calidad del Aire. El análisis de modelado de AQB establece que, aunque estas instalaciones emitirán menos de 250 toneladas por año de NOx y menos de 250 toneladas por año de VOC, también se realizó un cálculo de detección de MERP específico del proyecto utilizando la herramienta MERP y los Lineamientos de Modelado de Dispersión de la AQB de NM con el fin de demostrar de forma subsecuente que el proyecto no causará ni contribuirá a un rebasamiento de los NAAQS de ozono. El nivel de importancia del ozono (SIL) es 1.96 µg/m³ y no se espera que las fuentes con impactos de ozono por debajo del SIL de ozono causen o contribuyan a las concentraciones de ozono que excedan los NAAQS de ozono. Según las tasas de emisión permitidas propuestas, la concentración resultante es de 0.18 µg/m^3. Por lo tanto, el proyecto no causará ni contribuirá a que se superen los NAAQS de ozono.
2.80	Alturas de las Pilas	Sí	Todas las pilas SOFC-1 hasta SOFC—2275	Las instalaciones están sujetas a esta norma. Ninguna pila excederá la altura de la pilas de las buenas prácticas de ingeniería. Véase 20.2.80.109.
2.82	Estándares MACT para las Categorías de Fuentes de HAPs	No	N/A	Este reglamento se aplica a todas las fuentes que emiten contaminantes peligrosos del aire, que están sujetas a los requisitos del 40 CFR Parte 63.

12.0 Análisis Federal Regulatorio:

Regulación Federal	Título	Aplica (S/N)	Unidad(es)o Instalaciones	Comentarios
Subcapítulo C de los Programas de Aire (40 CFR 50)	Estándares Nacionales Primarios y Secundarios de Calidad del Aire Ambiental	No	N/A	El modelado y las condiciones desarrolladas a partir del modelado son los requisitos aplicables para demostrar el cumplimiento de las NAAQ.
NSPS Subparte A	Disposiciones Generales	No	Ver las fuentes	Aplica si aplica cualquier otra subparte.

Administrative Record NSR_001673

Regulación Federal	Título	Aplica (S/N)	Unidad(es)o Instalaciones	Comentarios
(40 CFR 60)			sujetas a la Subparte 40 CFR 60	Las instalaciones no están sujetas a ninguna norma conforme a 40 CFR Parte 60.

40 CFR Parte 60 Subparte JJJJ (Cuad -J)	Estándares de Desempeño para la Chispa Estacionaria. Encendido Motores de Combustión Interna	No	N/A	Las disposiciones de esta subparte son aplicables a los fabricantes, propietarios y operadores de motores de combustión interna estacionarios (ICE) de encendido por chispa (SI) tal como se especifica en los párrafos (a)(1) a (5) de la sección 60.4230. No hay motores de combustión interna (ICE) estacionarios de encendido por chispa (SI) (motores de gas o propano) en estas instalaciones.
40 CFR Parte 60 Subparte KKKK	Estándares de Desempeño para Turbinas de Combustión Estacionarias después del 18 de febrero de 2005 y en o antes del 13 de diciembre de 2024	No	N/A	No hay Turbinas de Combustión de Gas Estacionarias en estas instalaciones.
40 CFR 60 Subparte KKKKa	Estándares de Desempeño para Turbinas de Combustión Estacionarias que iniciaron construcción, modificación o reconstrucción después del 13 de diciembre de 2024.	No	N/A	No hay Turbinas de Combustión de Gas Estacionarias en estas instalaciones.
NSPS 40 CFR 60 Subparte TTTT	Estándares de Desempeño para Emisiones de Gases de Efecto Invernadero para Unidades Generadoras de Electricidad	No	N/A	No hay Turbinas de Combustión de Gas Estacionarias en estas instalaciones.
NESHAP Subparte A (40 CFR 61)	Disposiciones Generales	No	Ver las fuentes sujetas a la Subparte 40 CFR 61	Aplica si aplica cualquier otra subparte. 40 CFR Parte 61 no aplica. Las instalaciones no pertenecen a ninguna categoría incluida en la lista ni emite ningún contaminante incluido que pudiera desencadenar su aplicabilidad.

Administrative Record NSR_001674

Regulación Federal	Título	Aplica (S/N)	Unidad(es)o Instalaciones	Comentarios
MACT Subparte A (40 CFR 63)	Disposiciones Generales	No	Ver las fuentes sujetas a la Subparte 40 CFR 63	Aplica si aplica cualquier otra subparte. Las instalaciones no estarán sujetas a ninguna norma de la Parte 63 que requiera el cumplimiento de la Subparte A.
40 CFR 63 Subparte ZZZZ (Cuad Z)	Estándares Nacionales de Emisiones de Contaminantes Atmosféricos Peligrosos para Motores de Combustión Interna Alternativos Estacionarios (RICE MACT)	No	N/A	Las instalaciones están sujetas a esta subparte si poseen u operan un RICE estacionario en una fuente importante **O** de área de emisiones de HAP, excepto si el RICE estacionario está siendo sometido a prueba en una celda/soporte de prueba RICE estacionario. Esta norma no aplica ya que no habrá motores autorizados para operar en las instalaciones.
MACT 40 CFR 63 Subparte YYYY	Estándares Nacionales de Emisiones de Contaminantes Atmosféricos Peligrosos para Turbinas de Combustión Estacionarias	No	N/A	No hay Turbinas de Combustión de Gas Estacionarias en estas instalaciones.
40 CFR 64	Monitoreo de Aseguramiento del Cumplimiento	No	N/A	No hay unidades equipadas con un dispositivo de control y emisiones no controladas por encima de los umbrales de fuentes principales del Título V. Ninguna fuente en las instalaciones está sujeta a Monitoreo de Aseguramiento del Cumplimiento de conformidad con 40 CFR Parte 64.
40 CFR 68	Prevención de Accidentes Químicos	No	N/A	De acuerdo con la solicitud, el titular del permiso no utiliza ni almacena sustancias reguladas en cantidades o en umbrales que harían que se aplicara esta regulación. La Cláusula de Obligación General de CAA §112 (r)(1) ordena a los propietarios y operadores de fuentes estacionarias identificar los peligros que pueden resultar de liberaciones accidentales, diseñar y mantener unas instalaciones seguras y minimizar las consecuencias de las liberaciones cuando ocurran. La Cláusula de Obligación General solo puede ser aplicada por la EPA conforme a la sección 113 de la CAA.
40 CFR 70	Título V- Programas Estatales de Permisos de Operación	No	N/A	Programa de Permiso de Operación – no aplicable – El Estado de Nuevo México tiene plena autoridad delegada y el Título V se aplica de conformidad con 20.2.70 NMAC.

Administrative Record NSR_001675

Regulación Federal	Título	Aplica (S/N)	Unidad(es)o Instalaciones	Comentarios
CAA Título VI y 40 CFR 82	Protección del Ozono Estratosférico	No	N/A	De acuerdo con la solicitud, no se aplica 40 CFR 82.

13.0 **Equipo Exento y/o Insignificante**: El solicitante informa las emisiones de SSM como actividades exentas de acuerdo con 20.2.72.202.B(5) NMAC, en la tabla 2B de la solicitud, ya que las emisiones de las actividades de SSM son menos de ½ tonelada por año según el número teórico de purgas por eventos y el número de eventos proporcionados en los cálculos. Con base en el análisis técnico de los cálculos del SSM, el Departamento exigirá el cumplimiento de las condiciones del SSM en el permiso. Se proporciona información adicional en la Sección 14 de este documento.

14.0 **Condiciones Nuevas/Modificadas/Únicas** (Formato: #Condición: Explicación):

A. Todas las condiciones son nuevas. Este es un nuevo permiso NSR.

B. Sección A107: Con base en la información proporcionada en la solicitud de permiso y presentaciones adicionales, el Departamento ha determinado que las emisiones durante el inicio y el mantenimiento deben estar reguladas por el permiso. El solicitante proporcionó cálculos que muestran que las emisiones de las actividades de inicio y mantenimiento son menos de ½ tonelada al año por contaminante y calificarían como exentas de NSR menor de conformidad con 20.2.72.202.B(5) NMAC. Sin embargo, la exención se aplica al índice de emisión potencial (PER) y la AQB no pudo confirmar que la PER de las actividades de SSM sea inferior a ½ tpa. No hay nada que limite de forma inherente la cantidad de actividades de mantenimiento ni la cantidad de purgas por evento que puedan ser necesarias. La AQB no puede verificar la información técnica acerca del mantenimiento o los requisitos operativos de las unidades para verificar los límites de las actividades de SSM.

15.0 **Para la acción del Título V: Tabla de Referencia Cruzada entre el Permiso NSR 10883 y el Permiso TV N/A. Las condiciones del permiso NSR con referencia cruzada al permiso de TV son condiciones aplicables a nivel federal y, por lo tanto, se incluyen en el permiso de TV:**

Esta sección no se aplica a esta solicitud de permiso.

Las condiciones NSR identificadas como "Sólo de NSR" no establecen ningún requisito o condiciones aplicables a nivel federal que requieran adopción en los permisos de operación de TV.

16.0 **Notas del especialista en permisos a otros NSR o al personal de permisos del Título V acerca de los cambios y actualizaciones de las condiciones del permiso.**

A. De acuerdo con 20.2.72.210(D) NMAC: Cualquier término o condición impuesta por el departamento a un permiso o revisión de un permiso es aplicable en la misma medida que una norma de la junta.

B. Los Módulos de Celdas de Combustible son los únicos equipos autorizados en las instalaciones para proporcionar energía, energizar fuentes externas; y para proporcionar toda la energía de respaldo durante picos de carga. Los equipos temporales y/o exentos, como generadores, no están permitidos según 20.2.72.202 B(3)(a) NMAC y no pueden estar

Administrative Record NSR_001676

autorizados para operar en las instalaciones y generar energía.

C. Las turbinas, calentadores y/u otros equipos emisores de emisiones portátiles y/o estacionarios no están autorizados actualmente y estarían sujetos a los permisos NMAC 20.2.72.

D. Se ha eliminado un factor de seguridad del 15 % de los cálculos de emisiones de GEI del solicitante. Las emisiones de GEI solicitadas reportadas en la solicitud ya reflejan un valor significativo y la AQB no aceptará/permitirá la adición de un factor de seguridad en el cálculo con el fin de aumentar las emisiones de GEI en 1,323,145 tpa, de 8,820,970 tpa a 10,144,115 tpa. Además, el Departamento esperaría que el solicitante revise y recalcule las emisiones de GEI de forma anual, basándose en futuras emisiones reales informadas para los fines de los requisitos del Inventario de Emisiones del Departamento de conformidad con 20.2.73.300 NMAC, en lugar de los cálculos teóricos proporcionados en la solicitud.

E. Viabilidad técnica: La tecnología de Celdas de Combustible de Óxido Sólido (SOFC) está probada y comercialmente operativa. Sin embargo, sólo uno de los ejemplos siguientes tiene una capacidad superior a 0.5 GW, mientras que la capacidad de generación eléctrica propuesta por YGI es superior a 2.0 GW. El Departamento se reserva el derecho de reevaluar las capacidades operativas de la tecnología actual de solicitud de permisos. Si el solicitante modifica el permiso para incluir equipos adicionales como turbinas y motores, operaciones de escalamiento, aumento de emisiones y/o exceso de emisiones, las instalaciones pueden estar sujetas a un permiso de conformidad con 20.2.74.300 NMAC como si la construcción aún no hubiera comenzado. Además, el titular del permiso está sujeto a las condiciones A117.B y B113.A a C.

Instalaciones	Autoridad Licenciataria	MFG	Modelo de Celda de Combustible	Capacidad	Objetivo (si está disponible)	Fuente	Etapa de Permiso
						los Centros de Datos	permiso único, instalaciones operativas
Amazon (AWS)	ODEQ	Bloom Energy	Server 5	0.0024 GW	Brinda energía complementaria al Centro de datos utility de AWS	Evaluación BAER	No, retirada
AEP Ohio	OEPA, PUCO	Bloom Energy	Desconocido	0.007 GW	Brinda energía a 2 centros de datos de gran tamaño	Permiso para Instalar & Operar	Permisos aprobados, la construcción comenzó en 2026

1. Esta es una estimación basada en las cifras que se ven en la fuente (que comenzaron en 1 MW, tiene múltiples expansiones, incluyendo 1 5 MW que podrían llegar a 10 MW)

F. Las Celdas de Combustible de Óxido Sólido (SOFC) requieren gas natural para generar hidrógeno puro mediante el proceso Reformado Interno Directo (DIR) integrado en la celda de combustible. A fin de garantizar el rendimiento, la formación de hidrógeno y la generación de vapor; la optimización del sistema y las condiciones del funcionamiento incluyen la regulación de temperaturas, el flujo de masa de hidrógeno y la humedad.

G. Las altas temperaturas de funcionamiento de 700 a 900 grados Celsius y la naturaleza volátil del hidrógeno y el gas de síntesis requieren una estricta gestión térmica y ventilación con el fin de evitar grietas o tensiones mecánicas.

H. El manejo de gas y el flujo de masa en el módulo SOFC requiere una entrega precisa de combustibles y aire u oxígeno para la distribución del flujo y el rendimiento.

I. El Equipo Auxiliar de la Celda de Combustible y la Optimización y Gestión del Sistema incluyen Cargas Electrónicas; Monitoreo del Voltaje de Celda (CVM); Verificaciones de Fugas y Fluidos, y Aire/Presurización.

J. El plan del sistema de monitoreo integral (CMS) que debe presentar el solicitante no debe limitarse a las lecturas de temperatura y presión (A601.A). El NMED requiere que el solicitante amplíe el alcance de un monitoreo integral a fin de incluir como mínimo un monitoreo continuo de los eventos CDS SSM de las instalaciones (A107.D y A107.E); el caudal de gas (A108.B); las mediciones de potencia eléctrica (MW) (A108.C); las mediciones de salida de las concentración de azufre (A110.A); las lecturas de temperatura y presión, (A601.A), y los caudales de fugas de gas natural en las Unidades SOFC (A601.H).

K. A fin de evitar la ventilación incontrolada de hidrocarburos y gases sulfúricos a la atmósfera, se debe aislar y purgar el sistema del proceso de reemplazo del recipiente de desulfuración. El titular del permiso debe cumplir con los requisitos del permiso, si los hubiera, para la Eliminación de Desechos Peligrosos.

PARTE B CONDICIONES GENERALES (Adjuntas)

PARTE C MISCELÁNEOS: Documentos de apoyo en línea; Definiciones; Acrónimos (Adjuntos)

PARTE A REQUISITOS ESPECÍFICOS DE LA INSTALACIÓN

A100 Introducción

A. Este es un permiso nuevo.

A101 Duración del permiso (vencimiento)

A. La vigencia de este permiso es permanente a menos que sea retirado o cancelado por el Departamento de conformidad con la Sección B113 y/o la NMSA 1978, Sección 74-2-12.B.

B. Excepto por el equipo identificado en la Tabla 104.A, la construcción, instalación y/u operación de cualquier fuente fija o fuente fija portátil de contaminantes regulados del aire no está autorizada por este permiso y queda explícitamente prohibida. Esta prohibición incluye fuentes temporales, portátiles y/o exentas de conformidad con el 20.2.72.202 NMAC.

A102 Instalación: Descripción

A. La función de la instalación es generar energía para operar un centro de datos utilizando celdas de combustible del sistema Bloom Energy Server. Este sistema es un tipo de sistema de celdas de combustible de óxido sólido (SOFC) que convierte electroquímicamente gas natural en electricidad mediante una reacción electroquímica.

B. Esta instalación se encuentra ubicada aproximadamente a 3.6 millas al sur de Santa Teresa en Nuevo México, condado de Doña Ana.

C. Esta solicitud de permiso es para un permiso de construcción de Revisión de Nuevas Fuentes (NSR) emitido de conformidad con 20.2.72.200.A(1) NMAC. La instalación será una instalación de generación de energía en microrred que constará de un máximo de 2,275 grupos de celdas de combustible de óxido sólido (SOFC) con una capacidad total de generación eléctrica de 2,462 MW. La capacidad de generación eléctrica de cada módulo es de 260 kW o de 325 kW. Las celdas de combustible están dispuestas en apilamiento de celdas -> módulo de potencia -> servidor de energía -> grupo -> grupo/plataforma de inversores. La descripción de esta modificación es solo para fines informativos y no es exigible.

D. Las Tablas 102.A y la Tabla 102.B muestran las tasas de emisiones potenciales (PER) totales de esta instalación solo a título informativo. Esta no es una condición exigible y excluye las emisiones de actividades exentas de NSR menor según 20.2.72.202 NMAC.

Tabla 102.A: Tasa de emisión potencial total (PER) de toda la instalación

Contaminante	Emisiones (toneladas por año)
Óxidos de Nitrógeno (NOx)	37.2

Tabla 102.A: Tasa de emisión potencial total (PER) de toda la instalación

Contaminante	Emisiones (toneladas por año)
Monóxido de Carbono (CO)	161.21
Compuestos orgánicos volátiles (VOC) [1]	124.0
Dióxido de Azufre (SO_2)	0.08
Material Particulado (PM)[2]	75.4
Material Particulado de 10 micras o menos (PM_{10})	75.4
Material Particulado de 2.5 micras o menos ($PM_{2.5}$)	75.4
Gases de Efecto Invernadero (GHG) como CO_2e[3]	8,820,970

1. Los VOC incluyen las emisiones de fugitivas y SSM.
2. El PM es un contaminante regulado de revisión de nuevas fuentes según 20.2.74 NMAC Prevención del deterioro significativo. No se aplican normas de calidad del aire ambiente al PM.
3. Solo para fines de presentación de informes según 20.2.73.300 NMAC.

Tabla 102.B: Tasa de emisiones potenciales (PER) totales para *contaminantes de aire peligrosos (HAPs)

Contaminante	Emisiones (toneladas por año)
Benceno	0.2
Metanol	1.2
Xilenos	0.7
HAPs totales**	1.4

* Las emisiones de HAP ya están incluidas en el total de emisiones de VOC.

** Es posible que el total de emisiones de HAP no coincida con la suma de los HAP individuales debido a que aquí solo se indican los HAP individuales superiores a 1.0 tonelada por año.

A103 Instalación: Normativas aplicables

A. El permisionario cumplirá con los términos, condiciones y requisitos especificados en este permiso. En la Tabla 103.A se presenta una lista de todas las secciones aplicables de los requisitos.

Tabla 103.A: Requisitos aplicables

Requisitos aplicables	Exigible a nivel federal	Número de unidad
20.2.1 NMAC Disposiciones generales	X	Toda la instalación

Tabla 103.A: Requisitos aplicables

Requisitos aplicables	Exigible a nivel federal	Número de unidad
20.2.7 NMAC Emisiones en Exceso	X (Excepto por las secciones 6(b); 110(b)(15); 111; 112; 113; 115; y 116 que son exigibles únicamente a nivel estatal)	Toda la Instalación
20.2.23 NMAC Control de Polvo Fugitivo	X	Todas las Actividades de Construcción en o para la Instalación
20.2.61 NMAC Humo y Emisiones Visibles	X	Toda la Instalación
20.2.70 NMAC Permisos de Operación	X	Toda la Instalación
20.2.71 NMAC Tarifas de Emisión de Permisos de Operación	X	Toda la Instalación
20.2.72 NMAC Permiso de Construcción	X	Toda la Instalación
20.2.73 NMAC Requisitos de Aviso de Intención e Inventario de Emisiones	X	Toda la Instalación
20.2.75 NMAC Tarifas de Permisos de Construcción	X	Toda la Instalación
20.2.80 NMAC Altura de chimeneas	Solo estatal	Todas las chimeneas

A104 Instalación: Fuentes reguladas

A. La Tabla 104.A indica las unidades de emisión autorizadas para esta instalación.

Tabla 104.A: Lista de fuentes reguladas

Número de unidad	Descripción de la fuente	Marca	Modelo	Número de serie	Fecha de construcción	Fecha de fabricación	Capacidad nominal del fabricante / Capacidad permitida
SOFC-1 a SOFC-2275	[1] Grupos de SOFC: unidades de 260 kW y 325 kW	Bloom	Energy Server 6.5	Por definir	Por definir	Por definir	2,462 MW[2]
SSM	Puesta en marcha, parada y mantenimiento: venteo de gas natural durante el reemplazo del filtro del sistema de desulfuración centralizado (CDS)	N/A	N/A	N/A	Por definir	N/A	N/A

1. Un grupo de "unidades" de Bloom Energy Server de 260 kW y/o 325 kW que comparten una chimenea se denomina "grupo" para efectos de este permiso.
2. "MW" se refiere a megavatios de electricidad.

A105 Equipos de control

A. No hay equipos de control de contaminación del aire para esta instalación.

A106 Instalación: Emisiones permisibles

A. La siguiente Sección indica las unidades de emisión y sus límites de emisión permisibles. (20.2.72.210.A y B.1 NMAC).

Tabla 106.A: Emisiones permisibles

Número de unidad	NO_x[1] lb/h	NO_x[1] t/año	CO lb/h	CO t/año	VOC lb/h	VOC t/año	SO_2 lb/h	SO_2 t/año	PM / PM_{10} lb/h	PM / PM_{10} t/año	$PM_{2.5}$ lb/h	$PM_{2.5}$ t/año
SOFC-1 a SOFC-2275	8.5	37.2	36.8	161.2	28.3	124.0	0.02	0.1	17.2	75.4	17.2	75.4

1 Las emisiones de dióxido de nitrógeno incluyen todos los óxidos de nitrógeno expresados como NO_2
2 Las emisiones en exceso se deberán reportar de conformidad con 20.2.7 NMAC y las Condiciones B107 y B109.C.

A107 Instalación: Requisitos de puesta en marcha, parada y mantenimiento (SSM)

A. Las actividades permisibles de puesta en marcha, parada o mantenimiento (SSM) y los límites máximos de emisión permisibles para dichas actividades en la instalación se indican en la Sección A107 y el Departamento se basó en ellos para determinar el cumplimiento con las normativas aplicables.

Tabla 107.A: Unidades y actividades de SSM autorizadas

Número de unidad	Descripción	Marca	Modelo	Número de serie	Fecha de construcción/ modificación
SSM	Venteo de gas natural durante el reemplazo del medio del lecho de desulfuración y del filtro de desulfuración para arranques iniciales, mantenimiento y parada	N/A	N/A	N/A	Por definir

B. El permisionario deberá limitar las emisiones de VOC provenientes de todas las actividades relacionadas con el arranque, parada y mantenimiento programado (SSM) de carácter rutinario o predecible a no más de 0,34 toneladas por año.

C. La autorización de los límites de emisión para el arranque, parada o mantenimiento programado de carácter rutinario o predecible no reemplaza los requisitos para minimizar las emisiones de acuerdo con las Condiciones Generales B101.F y B107.A.

Opción 1 de condición de SSM:

D. Método para determinar el cumplimiento con el límite de emisión por venteo de gas natural durante el arranque, parada y mantenimiento en la Sección 107.B – (Unidad SSM).

Requisito: El permisionario debe cumplir con los requisitos de monitoreo, registro de datos y presentación de informes de esta condición para demostrar el cumplimiento con los límites de emisiones de SSM.

(1) El permisionario calculará las emisiones de cada evento utilizando las Ecuaciones 1 y 2, el volumen máximo de gas natural (V_{max}) en pies cúbicos venteados por actividad, y los factores de emisión de VOC para cada actividad. El permisionario utilizará el volumen máximo de gas natural (V_{max}) de esta condición al determinar las emisiones de los eventos de SSM, incluso si el volumen real de gas venteado fue menor.

Nota: El volumen máximo de gas natural V_{max} es la cantidad máxima de gas natural que se puede ventear de la actividad específica, por ejemplo, el venteo durante un evento de puesta en marcha de desulfuración en función de sus limitaciones físicas. Además, el V_{max} de gas natural se aplica por unidad de esa actividad y no es la suma de todo el gas natural venteado durante el evento.

Ecuación 1: ([Pies cúbicos estándar (scf) máximos/puesta en marcha] x [Puestas en marcha/mes]) + ([scf máximo/evento de mantenimiento] x [Eventos de mantenimiento/mes]) x [Factor de emisión de VOC lb/scf] / [2,000 lb/ton] = Toneladas de emisiones de VOC por mes.

Donde:

Scf máximo/puesta en marcha = 780,900 Vmax venteados de un evento de puesta en marcha en una unidad CDS.

Scf máximo/ mantenimiento = 520,600 Vmax venteados de un evento de mantenimiento en una unidad CDS.

Puesta en marcha/mes = El número total de eventos de puesta en marcha que ocurren en todas las unidades CDS cada mes.

Eventos de mantenimiento/mes = El número total de eventos de mantenimiento que ocurren en todas las unidades CDS cada mes.

Factor de emisión de VOC (lb/scf) = La suma de los factores de emisión de cada componente de VOC en el análisis de entrada actual del gas natural, calculado mediante la **Ecuación 2.**

Ecuación 2: [Fracción molar del componente de VOC] x [Peso molecular del componente de VOC (lb/lb-mol)] / [379.4 scf/lb-mol]

(2) Cada mes, el permisionario deberá calcular las emisiones mensuales acumuladas de VOC de 12 meses en toneladas por año.

(3) **Emisiones debidas a eventos evitables:** Los límites de emisión son de 0.0 lb/h y toneladas/año para las emisiones debidas a eventos evitables. Las emisiones que se deban en su totalidad o en

parte a un mantenimiento deficiente, una operación descuidada o cualquier otra avería evitable del equipo se reportarán como exceso de emisiones de conformidad con 20.2.7 NMAC.

(4) **Límites de emisión para actividades no permitidas:** Los límites de emisión son de 0.0 lb/h y toneladas/año para las emisiones por venteo de equipos que no tengan límites en la Tabla 107.A. Las emisiones debidas a SSM distintas de las representadas en la Sección 107.B se reportarán como exceso de emisiones de conformidad con 20.2.7 NMAC.

Monitoreo:

(1) El permisionario deberá realizar un análisis extendido de gas en la entrada de la instalación al menos una vez al año.

(2) El permisionario deberá monitorear cada evento de venteo, el equipo que se venteó y la causa del evento.

(3) Cada mes, el permisionario deberá monitorear de manera continua:
(a) la cantidad de eventos de venteo durante el mes,
(b) el volumen total calculado de gas venteado durante el mes utilizando V_{max} para el equipo que se venteó según se define en los requisitos de esta condición,
(c) el total de toneladas de emisiones de VOC venteadas durante el mes, y
(d) el volumen total de gas acumulado mensual de 12 meses y las emisiones de VOC en toneladas por año.

(4) El permisionario deberá realizar el monitoreo conforme a la Condición B108 de este permiso.

Registro de datos:

(1) Para cada evento de venteo de gas natural, el permisionario deberá mantener registros de:
(a) la hoja de tarifa de gas que documente el % de VOC,
(b) el volumen total calculado de gas venteado en scf o MMscf utilizando la capacidad de volumen máximo del equipo que se venteó, según se define en los requisitos de esta condición
(c) los cálculos utilizados para determinar las emisiones
(d) la identificación de todo el equipo que se venteó durante el evento, y
(e) la causa o las causas del evento.

(2) Cada mes, el permisionario deberá registrar las emisiones de VOC en toneladas por mes, y las emisiones de VOC en toneladas por año acumuladas mensuales de 12 meses provenientes de eventos de SSM.

El permisionario deberá mantener registros de conformidad con la Condición B109 de este permiso.

Informes: El permisionario deberá informar de conformidad con la Sección B110

Opción 2 de condición de SSM:

E. Método para determinar el cumplimiento con el límite de emisiones por venteo en puesta en marcha, parada y mantenimiento de la Sección 107.B – (Unidad SSM)

Requisito: El permisionario deberá limitar las emisiones derivadas de la puesta en marcha, parada o mantenimiento rutinarios o predecibles a los límites en la Condición A107.B.

(1) El permisionario deberá procesar únicamente el combustible de gas natural requerido por la Condición A110.A en el Sistema Central de Desulfuración (CDS).

(2) El permisionario deberá limitar las actividades de puesta en marcha de todas las unidades CDS a no más de 570 purgas de recipientes por año.
(3) El permisionario deberá limitar las actividades de parada y mantenimiento de las unidades CDS a no más de 380 purgas de recipientes por año.
(4) **Emisiones debidas a eventos evitables:** Los límites de emisión son de 0.0 para las emisiones debidas a eventos evitables. Las emisiones que se deban en su totalidad o en parte a un mantenimiento deficiente, una operación descuidada o cualquier otra avería evitable del equipo se reportarán como exceso de emisiones de conformidad con la norma 20.2.7 del NMAC.
(5) **Límites de emisión para actividades no permitidas:** Los límites de emisión son de 0.0 para las emisiones por venteo de equipos que no tengan límites en la Tabla 107.A. Las emisiones debidas a SSM distintas de las representadas en la Sección 107.B se reportarán como exceso de emisiones de conformidad con 20.2.7 NMAC.

Monitoreo:
(1) El permisionario deberá monitorear cada evento de SSM, el equipo que fue la fuente de emisiones, el equipo asociado que contribuyó al evento de SSM y la causa del evento.

(2) Cada mes, el permisionario deberá monitorear de manera continua:
(a) la cantidad de puestas en marcha de CDS y la cantidad de eventos de parada y mantenimiento de CDS
(b) la cantidad de ciclos de purga por cada evento de puesta en marcha o parada y venteo por mantenimiento, y
(c) la cantidad de eventos de puesta en marcha o parada y venteo por mantenimiento,

Registro de datos:
(1) Para cada evento de SSM, el permisionario deberá mantener registros de:
(a) los registros de combustible de gas natural requeridos por la condición A110.A,
(b) un identificador único para el CDS en el que ocurrió el evento de SSM
(c) la causa del evento de SSM
(d) el equipo asociado con el evento de SSM
(e) la cantidad de puestas en marcha de CDS y la cantidad de eventos de parada y mantenimiento de CDS,
(f) la cantidad de ciclos de purga por evento de puesta en marcha o parada y mantenimiento,
(g) y la cantidad total acumulada mensual de 12 meses de puestas en marcha de CDS y la cantidad de paradas y mantenimientos de CDS.

Informes: El permisionario deberá informar de conformidad con la Sección B110

F. El permisionario deberá informar el exceso de emisiones por encima de los límites de emisión autorizados en la Tabla 106.A. Para los equipos sin límites de emisión, informará el exceso de emisiones de conformidad con la Condición B110.E.

1. Informe inicial: el propietario u operador presentará un informe inicial a más tardar al final del siguiente día hábil habitual posterior al momento del descubrimiento de un exceso de emisión que incluya toda la información disponible para cada elemento de la Subsección B 20.2.7.110 NMAC.

2. Informe final: el propietario u operador presentará un informe final que contenga información específica y detallada para cada elemento de la Subsección B de 20.2.7.110 NMAC, a más tardar diez (10) días después de finalizado el exceso de emisión.

A108 Instalación: Operaciones permitidas

A. Esta instalación está autorizada para operar de manera continua. No se requiere monitoreo, registro de datos ni presentación de informes para demostrar el cumplimiento con las horas de operación continua.

B. Capacidad de procesamiento de la instalación - Limitaciones de combustible

Requisito: El permisionario deberá limitar el caudal de combustible de entrada a la instalación a 136,782 MMscf de gas natural por año calendario. De conformidad 20.2.74.300.D NMAC, cualquier aumento en el límite de 136,782 MMscf/año de gas natural que resulte en un incremento de emisiones que provoque que la instalación opere como una fuente importante de Prevención del Deterioro Significativo (PSD) o que tenga el potencial de emitir como tal, dará lugar a que las unidades aprobadas en el permiso de construcción 10883 queden sin permiso y sujetas a un permiso de conformidad con 20.2.74.300 NMAC como si la construcción aún no hubiese comenzado.
Monitoreo: El permisionario deberá monitorear continuamente el caudal de combustible de gas natural de entrada a la instalación en tiempo real mediante un instrumento de monitoreo que mida directamente el caudal de combustible de entrada con una precisión de ± 2% o superior según lo certificado por el fabricante del dispositivo. El permisionario deberá dar mantenimiento al dispositivo de acuerdo con las especificaciones del fabricante. El permisionario deberá cumplir con los Requisitos generales de monitoreo de la Sección B108.
Registro de datos: El permisionario deberá mantener registros del caudal total de gas de entrada acumulado mensual de 12 meses, registros del mantenimiento del instrumento de monitoreo y registros de la calibración del instrumento de monitoreo y de conformidad con la Sección B109.
Informes: El permisionario deberá informar de conformidad con la Sección B110.

C. Producción de la instalación - Limitaciones de MW

Requisito: El permisionario deberá limitar la producción anual de energía generada a partir de gas natural en la instalación a 21,567,164 MW-h por año.

(1) El permisionario deberá generar energía eléctrica únicamente mediante celdas de combustible dispuestas en módulos Energy Servers de 260 kW y 325 kW. Este permiso no autoriza a ningún otro equipo en la instalación a suministrar energía; por lo tanto, solo las celdas/módulos de combustible pueden generar y suministrar energía.

(2) Los módulos de celdas de combustible deberán suministrar toda la carga base y toda la energía de respaldo.

De conformidad con 20.2.74.300.D NMAC, cualquier aumento del límite de producción anual de energía de 21,567,164 MW-h por año que resulte en un incremento de emisiones que cause que la instalación opere como una fuente importante de Prevención del Deterioro Significativo (PSD) o que tenga el potencial de emitir como tal, dará lugar a que las unidades autorizadas en el permiso de construcción 10883 queden sin permiso y estén sujetas a un permiso de conformidad con

20.2.74.300 NMAC como si la construcción aún no hubiese comenzado.
Monitoreo: El Permisionario deberá monitorear y registrar continuamente la cantidad de electricidad generada por la instalación en unidades de kilovatios-hora (kWh) para el sistema SOFC. El permisionario deberá cumplir con los Requisitos Generales de Monitoreo de la Sección B108
Registro de datos: El Permisionario deberá llevar los siguientes registros de la cantidad de electricidad generada por el sistema SOFC sobre una base mensual acumulada de 12 meses. Los registros se conservarán de acuerdo con la Condición B109.
Informes: El permisionario deberá presentar informes conforme a la Sección B110.

A109 Instalación: Cronogramas de presentación de informes

A. El permisionario deberá presentar informes de conformidad con las Condiciones Específicas y las Condiciones Generales de este permiso.

A110 Instalación: Requisitos de combustible y azufre en el combustible

A. Requisitos de combustible y azufre en el combustible

Requisito: El permisionario deberá garantizar que todo el combustible utilizado por las Unidades SOFC de 260 kW y 325 kW deberá: (1) utilizar únicamente gas natural que no contenga más de 0,75 granos de azufre total por cada 100 pies cúbicos estándar secos, el cual cumpla con las especificaciones de gas requeridas por el fabricante, (2) procesar todo el gas natural utilizado por las unidades y agrupaciones SOFC con el Sistema Central de Desulfuración (CDS).
Monitoreo: El permisionario deberá monitorear continuamente el caudal en tiempo real mediante un instrumento de monitoreo que mida directamente el caudal real con una precisión de ± 2% o superior, según lo certificado por el fabricante del dispositivo: (1) la concentración real de azufre en el gas natural que sale del Sistema Central de Desulfuración (CDS). Dichas mediciones se realizarán anualmente en al menos el 5% de los CDS instalados mediante la obtención de un análisis extendido de gas en una muestra puntual representativa, (2) el CDS se muestreará de forma rotatoria, de modo que todos los CDS sean muestreados durante cada rotación antes de que se vuelva a muestrear cualquier CDS.
Registro de datos: El permisionario deberá llevar los siguientes registros: (1) un contrato de compra u hoja de tarifas vigente que indique el tipo de combustible y sus especificaciones de calidad, (2) el contenido total de azufre medido en el combustible de gas natural que sale del CDS.

Informes: El permisionario deberá presentar informes conforme a la Sección B110.

A111 Instalación: Opacidad según 20.2.61 NMAC

A. Límite de opacidad según 20.2.61 NMAC (Unidades SOFC de 260 kW y 325 kW)

Requisito: Las emisiones visibles de todas las Unidades SOFC-1 a SOFC-2275 no deberán ser iguales ni superar una opacidad del 20 por ciento durante ningún período de 10 minutos.
Monitoreo: El uso de combustible de gas natural constituye cumplimiento con el 20.2.61 NMAC a menos que la opacidad sea igual o supere el 20% promediado durante un período de 10 minutos. En el momento en que se utilice un combustible distinto del gas natural, o cuando se observen emisiones visibles durante la operación en estado estacionario, la opacidad se medirá durante un período de 10 minutos de acuerdo con los procedimientos del 40 CFR 60, Apéndice A, Método 9, según lo requerido por 20.2.61.114 NMAC. Las mediciones de opacidad continuarán trimestralmente por año calendario para cada unidad afectada hasta el momento en que se utilice gas natural.
Registro de datos: Las mediciones y lecturas de opacidad se registrarán de acuerdo con el Método 9 del 40 CFR 60, Apéndice A.
Informes: El permisionario deberá presentar informes de conformidad con la Sección B110.

A112 Instalación: Caminos de transporte – No requerido

A113 Instalación: Requisitos de ubicación

A. El permisionario deberá construir la instalación de acuerdo con las representaciones contenidas en la solicitud de permiso y el modelado de dispersión atmosférica de conformidad con la Sección B101. Las coordenadas del Sistema Transversal de Mercator (UTM) según el Datum WGS84, indicadas en la Tabla 113.A, identifican los límites dentro de los cuales se construirá la instalación. Las Unidades SOFC-1 a SOFC-2275 deben estar dentro de esta área y según lo especificado en el Apéndice B – Alojamientos de Pilas de Celdas de Combustible del informe de modelado.

Tabla 113.A Coordenadas de los límites de la instalación

Esquina	Este (m)	Norte (m)
Noroeste (NW)	340,560.3	3,522,076
Noreste (NE)	341,510.2	3,522,199
Sureste (SE)	341,537.7	3,520,739
Suroeste (SW)	340,570.8	3,520,974

A114 Instalación: Reubicación

A. Esta instalación o cualquier fuente de emisiones en esta instalación no se reubicará ni se reposicionará sin la aprobación del permiso de conformidad con las Condiciones B101.A, B, C y D y 20.2.72.202.B(4) NMAC.

A115 Escenario operativo alternativo – No requerido

A116 Plan de cumplimiento – No requerido

A117 De conformidad con este permiso:

A. De conformidad con la Condición B110.A, "Cualquier término o condición impuesto por el departamento a un permiso o revisión de permiso es exigible en la misma medida que una regulación de la junta". 20.2.72.210.D NMAC El permisionario deberá cumplir con los términos y condiciones de este permiso, incluidos todos los requisitos de monitoreo, mantenimiento de registros y presentación de informes. El incumplimiento de esto constituye una violación de este permiso y de las regulaciones aplicables.

B. Si evidencia o información fehaciente obtenida por el departamento o proporcionada al departamento por un tercero indica que una fuente no cumple con las disposiciones de este permiso, dicha evidencia o información podrá ser utilizada por el departamento con el propósito de determinar si una persona ha violado o se encuentra en violación de este permiso y de las regulaciones aplicables.

A200 Industria del petróleo y gas – No requerido

A300 Industria de la construcción – Agregados – No requerido

A400 Industria de la construcción – Asfalto – No requerido

A500 Industria de la construcción – Concreto – No requerido

INDUSTRIA DE GENERACIÓN DE ENERGÍA

A600 Industria de generación de energía

A. Esta sección contiene equipos comunes relacionados con la mayoría de las Operaciones de Servicios Eléctricos (SIC-4911).

A601 Grupos de SOFC – Unidades de 260 kW y 325 kW

A. Grupos de SOFC – Monitoreo remoto

Requisito: El permisionario deberá monitorear continuamente la presión y la temperatura del gas dentro de cada Unidad SOFC.

Cada Unidad SOFC estará equipada con controles automatizados que inicien el apagado inmediato y el aislamiento de la unidad afectada tras la detección de parámetros fuera de rango. Todas las emisiones en exceso o emisiones debidas a un funcionamiento defectuoso se calcularán y notificarán de conformidad con 20.2.7 NMAC.

Dentro de los 90 días posteriores a la fecha de emisión del permiso 10883, el permisionario deberá presentar al Administrador del Programa de Permisos del Departamento, para su aprobación, un plan de monitoreo integral que establecerá los rangos de presión y temperatura que indiquen que podría estar ocurriendo ventilación a la atmósfera. A los efectos de determinar el cumplimiento de los requisitos de monitoreo de esta Condición, antes de la aprobación, el permisionario deberá cumplir con el plan de monitoreo presentado (Condición A601.H).

Los sensores se mantendrán de acuerdo con las especificaciones del fabricante.

Monitoreo: El permisionario deberá monitorear continuamente la presión y la temperatura dentro de cada Unidad SOFC mediante sensores de acuerdo con el plan de monitoreo aprobado. Cualquier condición operativa anormal identificada por el sistema de monitoreo deberá ser investigada por el permisionario, notificada y corregida de conformidad con los Requisitos Generales de Presentación de Informes de la Sección B100 y 20.2.72 NMAC Secciones 210 y 212.

El permisionario está sujeto a los Requisitos Generales de Monitoreo de la Condición B108.

Registro de datos: El permisionario deberá mantener las lecturas de salida de temperatura y presión registradas por los sensores al menos una vez por hora.

Para cada parámetro fuera de rango, el permisionario deberá registrar:

(1) Fechas y horas de inicio y resolución,

(2) Duración,

(3) Números de las unidades afectadas,

(4) Causa de la excursión de temperatura y/o presión,

(5) Acciones correctivas tomadas,

(6) Emisiones en exceso estimadas de acuerdo con los requisitos del 20.2.7 NMAC.

El permisionario también registrará los números de las unidades que fueron apagadas y mantendrá el plan de monitoreo a disposición del personal del Departamento cuando lo solicite.

El permisionario mantendrá los registros de conformidad con las Secciones aplicables en B109, B110 y B111.

Informes: El permisionario deberá presentar informes de conformidad con las Secciones aplicables

B109, B110 y B111. Todas las emisiones en exceso o emisiones debidas a funcionamientos defectuosos se notificarán de conformidad con 20.2.7 NMAC.

B. 20.2.80 NMAC – Alturas de chimeneas (grupo de SOFC)

Requisito: El permisionario se asegurará de que la altura de cada chimenea de cada grupo de SOFC sea de al menos 30 pies sobre el nivel del suelo.

Monitoreo:
El permisionario demostrará el cumplimiento midiendo y verificando la altura de cada chimenea tras la instalación.

El permisionario cumplirá con los Requisitos Generales de Monitoreo de la Sección B108

Registro de datos: El permisionario mantendrá registros de las mediciones de la altura de las chimeneas y de conformidad con las Secciones aplicables en B109, B110 y B111.

Informes: El permisionario presentará informes conforme a la Sección B110.

C. Monitoreo de mantenimiento y reparación – Unidades de SOFC y grupos de SOFC

Requisito: En todo momento, el permisionario demostrará el cumplimiento con los límites de emisiones permitidos en la Tabla 106.A mediante la operación y el mantenimiento de cada unidad de SOFC y grupo de SOFC de manera coherente con las directrices y procedimientos del fabricante para minimizar las emisiones en la medida de lo posible.

Monitoreo:

(1) El permisionario instalará, calibrará, operará y mantendrá un sistema de monitoreo que genere datos suficientes para garantizar que las directrices y los procedimientos del fabricante se cumplan adecuadamente.

(2) Como mínimo, el sistema de monitoreo determinará cuándo se debe apagar un Energy Server de SOFC o un grupo de SOFC para mantenimiento o reparaciones, y notificará al personal de las instalaciones que se requiere mantenimiento o reparaciones.

El permisionario cumplirá con los Requisitos Generales de Monitoreo de la Sección B108

Registro de datos:
El permisionario mantendrá registros de conformidad con la Sección B109, incluidos los registros de las actividades de mantenimiento y reparación y una copia del cronograma de mantenimiento recomendado por el fabricante o el permisionario, y de conformidad con las Secciones aplicables en B109, B110 y B111.

Informes:
El permisionario presentará informes de conformidad con la Sección B110.

D. Pruebas iniciales de cumplimiento para grupos de SOFC

Requisito: El permisionario demostrará el cumplimiento con los límites de emisiones permitidos en la Tabla 106.A mediante la realización de pruebas iniciales de cumplimiento para un número representativo de grupos de SOFC según lo especificado en esta Condición. El número de grupos de SOFC sujetos a pruebas durante un trimestre calendario equivale al 1% de los grupos de SOFC que cumplan con cualquiera de los siguientes criterios de "activación de la prueba inicial de chimenea":

(1) los grupos de SOFC hayan alcanzado su fecha máxima de producción normal al menos (60) días antes del final de dicho trimestre calendario; O

(2) los grupos de celdas de combustible SOFC hayan iniciado operaciones al menos ciento ochenta (180) días antes del final de dicho trimestre calendario y no formen parte de la agrupación de grupos que cumplió con los criterios de activación de la prueba inicial de chimenea en un trimestre calendario anterior.

(3) Si menos de 600 grupos cumplen con los criterios de activación de la prueba de chimenea indicados anteriormente, se deberán someter a prueba al menos 6 grupos, o el número total de grupos que cumplan con dichos criterios, lo que sea menor.

Monitoreo: El permisionario realizará una prueba inicial de cumplimiento de conformidad con los Requisitos Generales de Prueba de la Sección B111. Se requiere la prueba de emisiones para NOx, CO, VOC, PM_{10}, y $PM_{2.5}$.

El permisionario cumplirá con los Requisitos Generales de Monitoreo de la Sección B108, excepto que las exenciones de monitoreo de la Condición B108.D no se aplican a esta condición.

Registro de datos: El permisionario incluirá en cada notificación de prueba de emisiones y presentación de informe el número total de grupos que cumplan con los criterios de activación de la prueba inicial de chimenea del párrafo D de esta Condición para ese trimestre calendario, y el número total de grupos a los que se les realizarán pruebas durante el trimestre calendario, los números de identificación de las unidades, y el número de identificación de la unidad y la capacidad (260 o 325 kW) de cada grupo evaluado

El permisionario mantendrá registros de conformidad con las Secciones aplicables en B109, B110 y B111.

Informes: El permisionario presentará informes de conformidad con las Secciones aplicables en B109, B110 y B111.

E. Pruebas periódicas para grupos de SOFC

Requisito:

1) El permisionario deberá demostrar el cumplimiento de los límites de emisión permitidos establecidos en la Tabla 106.A mediante la realización de pruebas periódicas de emisiones a los grupos de celdas de combustible SOFC. El permisionario deberá someter a prueba el 1% de los grupos de celdas de combustible SOFC que cumplan con "la activación la prueba inicial de chimenea" en cada año calendario, dentro de cada año calendario posterior. El requisito de realizar pruebas correspondientes a cada año de "activación de la prueba inicial de chimenea" continuará aplicándose en todos los años posteriores y no será sustituido por la instalación de grupos adicionales. Los grupos que cumplieron con la "activación de la prueba inicial de chimenea" en un determinado año deberán someterse a pruebas de forma rotativa, de manera que todos los grupos sean incluidos en el muestreo durante cada rotación antes de que se vuelva a someter a prueba cualquier grupo.

   El permisionario evaluará los grupos de menor rendimiento (en términos de eficiencia) que aún no hayan sido evaluados.

2) Si todos los resultados de las pruebas iniciales de cumplimiento y el primer año de pruebas periódicas son inferiores al 75% de los valores de la Tabla A601.E(2), o inferiores al límite de

detección relevante para el método de prueba de referencia, el permisionario podrá reducir las pruebas a un total de 2 grupos de SOFC por cada año de activación de la prueba de chimenea:

Tabla A601.E(2)

Contaminante	Valor (lb/MW-hr)
NOx	3.00E-03
CO	1.30E-02
VOC	1.00E-02
PM10	6.08E-03
PM2.5	6.08E-03

3) El permisionario reanudará las pruebas periódicas anuales del 1% de todos los grupos de SOFC por año si el resultado de una prueba supera el límite de detección relevante para el método de prueba de referencia y supera los valores de la Tabla A601.E(3):

Tabla A601.E(3)

Contaminante	Valor (lb/MW-hr)
NOx	3.00E-02
CO	1.30E-01
VOC	1.00E-01
PM10	6.08E-02
PM2.5	6.08E-02

Monitoreo: El permisionario realizará las pruebas utilizando los Métodos de Referencia de la EPA sujetos a los requisitos y limitaciones de la Sección B108, Requisitos Generales de Monitoreo. Se requiere la prueba de emisiones para NOx, CO, VOC, PM_{10} y $PM_{2.5}$, y se llevará a cabo como se describe a continuación:

(1) Las pruebas se llevarán a cabo de la siguiente manera:
(a) La frecuencia de las pruebas será de al menos una vez al año.
(b) El período de monitoreo se define como un año calendario.

(2) La primera prueba periódica deberá realizarse para cada año de activación de la prueba inicial de chimenea después de completar la última prueba inicial de cumplimiento.

(3) Todo monitoreo subsiguiente se realizará en cada período de monitoreo subsiguiente. No habrá dos eventos de monitoreo con un intervalo de tiempo inferior al 25% de un período de monitoreo.

(4) El permisionario seguirá los Procedimientos Generales de Prueba de la Sección B111.

El permisionario está sujeto a los Requisitos Generales de Monitoreo de la Condición B108.

Registro de datos: El permisionario mantendrá registros de conformidad con las Secciones aplicables en B109, B110 y B111.

Informes: El permisionario presentará informes de conformidad con las Secciones aplicables en B109, B110 y B111.

F. Operación y cálculo de emisiones

Requisito:
El permisionario demostrará el cumplimiento con los límites de emisiones permitidos en la Tabla 106.A mediante la realización del siguiente monitoreo, registro de datos y presentación de informes para la instalación.

Cada Energy Server estará equipado con un medidor de carga, el cual registrará de forma continua la producción eléctrica de cada Energy Server.

Monitoreo:
El permisionario monitoreará de forma continua la producción eléctrica horaria total de cada Energy Server.

El permisionario cumplirá con los Requisitos Generales de Monitoreo de la Condición B108.

Registro de datos:
El permisionario mantendrá registros de la producción eléctrica horaria total de cada Energy Server y del total de toda la instalación.

El permisionario utilizará los registros de la producción eléctrica máxima por mes y las horas mensuales de operación de cada Energy Server, así como las tasas de emisión de las pruebas de chimenea requeridas por las Condiciones A601.D y E para calcular las emisiones mensuales totales en toneladas por año de NOx, CO, VOC, PM_{10}, y $PM_{2.5}$ de toda la instalación utilizando la siguiente ecuación:
$E = (EF \times H) / 2{,}000$
Donde:
E = Emisiones mensuales de NO_x (o CO, VOC, PM_{10}, y $PM_{2.5}$) (toneladas/mes)
EF = Factor de emisión de NOx (o CO, VOC, PM_{10}, y $PM_{2.5}$) (lb/MW-hr), basado en los resultados máximos de las pruebas de chimenea más recientes.
H = Producción eléctrica mensual total (MWhr/mes)

El permisionario utilizará los registros mensuales para calcular el total acumulado de 12 meses de emisiones en toneladas por año de NO_x, CO, VOC, PM_{10}, y $PM_{2.5}$ de toda la instalación.

El cumplimiento con las emisiones de SO2 se calculará con base en los resultados del análisis extendido de gas obtenidos anualmente utilizando las siguientes ecuaciones:

Tasa de emisión de SO2 (lb/MWhr) = $F / P / S * M_{SO2}/M_S * Y$

F = consumo de combustible en pies cúbicos estándar por hora
P = capacidad eléctrica en operación en MW
S = volumen molar estándar del gas natural en pie3/lb-mol de gas natural, 359 pie3/lb-mol de gas natural
M_{SO2} = masa molar del dióxido de azufre, 64 lb SO2/lb-mol SO2
M_S = masa molar del azufre, 32 lb S/lb-mol S
Y = lb-mol S/lb-mol de gas natural medido

Emisiones de SO2 (toneladas) = Tasa de emisión de SO2 (lb/MWhr) * H / 2000-lb/tonelada

H = producción eléctrica mensual total (MWhr/mes)

El permisionario mantendrá registros de todos los cálculos requeridos.

El permisionario mantendrá registros de conformidad con las Secciones aplicables en B109, B110 y B111.

Informes: El permisionario presentará informes de conformidad con las Secciones aplicables en B109, B110 y B111.

G. Fugas de gas natural

Requisito: La suma de los caudales de gas natural hacia todas las unidades de SOFC no será inferior al 98% del total de gas natural en la entrada de la instalación según lo medido en la Condición A.108B.

Monitoreo:

El permisionario monitoreará de forma continua la suma de los caudales de gas natural hacia todas las unidades de SOFC mediante un instrumento de monitoreo que mida directamente el caudal de entrada con una precisión de ± 2% o superior. El permisionario calculará la diferencia entre la suma de los caudales de gas natural hacia todas las unidades de SOFC y el gas natural total en la entrada de la instalación según lo medido en la Condición A.108B. La diferencia entre estos valores será el volumen de gas natural venteado.

El permisionario está sujeto a los Requisitos Generales de Monitoreo de la Condición B108.

Registro de datos:

1. El permisionario mantendrá los siguientes registros: La suma acumulada de 12 meses mensual de los caudales hacia todas las unidades de SOFC.
2. La diferencia móvil de 12 meses mensual entre la suma de los caudales de gas natural hacia todas las unidades de SOFC y el gas natural total en la entrada de la instalación según lo medido en la Condición A.108B.

Informes:
El permisionario presentará informes de conformidad con la Sección B110.

H. Sistema de Monitoreo Continuo (CMS)

Dentro de los 90 días posteriores a la fecha de emisión del permiso 10883, el permisionario debe presentar al Departamento un plan integral de monitoreo que incluya, como mínimo, el monitoreo continuo de los eventos de SSM del CDS de la instalación (A107.D y A107.E); el caudal de gas (A108.B); las mediciones de producción eléctrica (MW) (A108.C); las mediciones de concentración de azufre de salida (A110.A); las lecturas de temperatura y presión (A601.A), y los caudales de fugas de gas natural en las unidades de SOFC (A601.H).

A los efectos de esta condición, el 40 CFR 63 define un Sistema de Monitoreo Continuo (CMS) como un término amplio que puede incluir, entre otros, sistemas de monitoreo continuo de emisiones, sistemas de monitoreo continuo de opacidad, sistemas de monitoreo continuo de parámetros u otros monitoreos manuales o automáticos que se utilicen para

demostrar el cumplimiento con una regulación aplicable de forma continua, según lo definido por la regulación.

PARTE B CONDICIONES GENERALES

B100 Introducción

A. El Departamento ha revisado la solicitud de permiso para la construcción/ modificación/revisión propuesta y ha determinado que la acción propuesta cumplirá con las disposiciones de la Ley y que se cumplirán los estándares de calidad del aire ambiente. Se han impuesto condiciones en este permiso a fin de asegurar el cumplimiento continuo. 20.2.72.210.D NMAC establece que cualquier término o condición impuesto por el Departamento en un permiso es exigible en la misma medida que un reglamento de la Junta de Mejoras Ambientales.

B101 Asuntos Legales

A. El Departamento puede incorporar partes de la solicitud de permiso en el permiso como términos y condiciones exigibles. A menos que se modifique por las condiciones de este permiso, el titular del permiso deberá construir o modificar y operar la Instalación de conformidad con todas las representaciones de la solicitud y las presentaciones complementarias en las que el Departamento se basó para determinar el cumplimiento de los reglamentos aplicables y los estándares de calidad del aire ambiente. Si el Departamento se basó en los modelos de calidad del aire para emitir este permiso, cualquier cambio en los parámetros utilizados para estos modelos deberá presentarse al Departamento para su revisión. A solicitud del Departamento, el titular del permiso deberá presentar modelos adicionales para la revisión del Departamento. Los resultados de esa revisión pueden requerir una modificación del permiso. (20.2.72.210.A NMAC)

B. Cualquier cambio físico futuro, cambio en el método de operación o cambio en el área restringida puede constituir una modificación según lo definido por 20.2.72 NMAC, Permisos de Construcción. A menos que la fuente o actividad esté exenta bajo 20.2.72.202 NMAC, ninguna modificación deberá comenzar antes de la emisión de un permiso. (20.2.72 NMAC Secciones 200.A.2 y E, y 210.B.4)

C. No se realizarán cambios en los planos, especificaciones y otras representaciones declaradas en los documentos de la solicitud si causan un cambio en el método de control de emisiones o en el carácter de las emisiones, aumentan la descarga de emisiones o afectan los resultados de los modelos. Cualquier cambio propuesto de este tipo deberá presentarse como una revisión o modificación. (20.2.72 NMAC Secciones 200.A.2 y E, y 210.B.4)

D. El titular del permiso deberá establecer y mantener el Área Restringida de la propiedad tal como se identifica en el plano de distribución presentado con la solicitud. (20.2.72 NMAC Secciones 200.A.2 y E, y 210.B.4)

E. Las solicitudes de revisiones y modificaciones de permisos deberán enviarse a:

Gerente de Programa, Sección de Permisos

Departamento del Medio Ambiente de Nuevo México
Oficina de Calidad del Aire
525 Camino de los Marquez, Suite 1
Santa Fe, NM 87505

F. El propietario u operador de una fuente que tenga una emisión excesiva deberá, en la medida de lo posible, operar la fuente, incluyendo el equipo de control de contaminación del aire asociado, de forma consistente con las buenas prácticas de control de contaminantes del aire para minimizar las emisiones. (20.2.7.109 NMAC). El establecimiento de límites permisibles de emisión por fallas de funcionamiento no reemplaza este requisito.

G. La emisión de un permiso no exime a ninguna persona de la responsabilidad civil o penal por no cumplir las disposiciones de la Ley de Control de la Calidad del Aire, la Ley Federal, los reglamentos federales derivados de las mismas, cualquier reglamento aplicable de la junta y cualquier otra ley o reglamento aplicable. (20.2.72.209 NMAC y la Ley de Control de la Calidad del Aire de Nuevo México NMSA 1978, Capítulo 74, Artículo 2)

B102 Autoridad

A. Este permiso se emite de conformidad con la Ley de Control de la Calidad del Aire (Ley) y los reglamentos adoptados de conformidad con la Ley, incluyendo el Título 20, Capítulo 2, Parte 72 del Código Administrativo de Nuevo México (NMAC), (20.2.72 NMAC), Permisos de Construcción, y es exigible de conformidad con la Ley y los reglamentos de control de calidad del aire aplicables a esta fuente.

B. El Departamento es el Administrador para las Partes 60, 61 y 63 de 40 CFR de conformidad con la delegación y las excepciones de la Sección 10 de 20.2.77 NMAC (NSPS), 20.2.78 NMAC (NESHAP) y 20.2.82 NMAC (MACT).

B103 Tarifa Anual

A. El Departamento evaluará una tarifa anual para esta Instalación. Las fuentes a las que se les haya emitido un permiso de construcción bajo 20.2.72 NMAC pagarán una tarifa anual de $2,800. Las fuentes que hayan presentado un Aviso de Intención bajo 20.2.73 NMAC y hayan recibido una determinación por escrito de que no se requiere un permiso pagarán una tarifa anual de $700. A partir del 1 de enero de 2028, la tarifa se ajustará anualmente según el porcentaje de aumento, si lo hubiera, en el Índice de Precios al Consumidor (CPI). El monto actual de la tarifa está disponible comunicándose con el Departamento o en el sitio web del Departamento. El Departamento facturará al titular del permiso el monto de la tarifa anual correspondiente. Las facturas de las tarifas anuales se emiten generalmente al principio de cada año civil. Esta tarifa no se aplica a las fuentes a las que se les impone una tarifa anual por emisiones de conformidad con 20.2.71 NMAC. Para las fuentes que cumplan con la definición de “empresa pequeña” en 20.2.75.7.F NMAC, esta tarifa anual se dividirá entre dos. (20.2.75.11 NMAC)

B. Todas las tarifas deberán remitirse en forma de cheque corporativo, cheque certificado o giro postal a nombre de "NM Environment Department, AQB", enviarse por correo a la dirección mostrada en la factura y deberán ir acompañadas del talón de pago adjunto a la factura.

B104 Procedimientos de Apelación

A. Cualquier persona que haya participado en una acción de emisión de permisos ante el Departamento y que se vea afectada negativamente por dicha acción de emisión de permisos, puede presentar una petición de audiencia ante la Junta de Mejoras Ambientales. El peticionario deberá presentar la petición por escrito a la Junta de Mejoras Ambientales en un plazo de treinta (30) días a partir de la fecha en que se notifique la acción del Departamento y deberá especificar las partes de la acción de emisión de permisos a las que se opone el peticionario, certificar que se ha enviado por correo o entregado en persona una copia de la petición y adjuntar una copia de la acción de emisión de permisos para la cual se solicita la revisión. A menos que se haga una solicitud de audiencia a tiempo, la decisión del Departamento será definitiva. Se enviará una copia de la petición simultáneamente al Departamento tras la recepción de la notificación de apelación. Si el peticionario no es el solicitante o el titular del permiso, el peticionario deberá enviar por correo o entregar en persona una copia de la petición al solicitante o al titular del permiso. El Departamento certificará el expediente administrativo ante la junta. Las peticiones de audiencia deberán enviarse a: (20.2.72.207.F NMAC)

Para envío por correo:
Administrador, Junta de Mejoras Ambientales de Nuevo México
P.O. Box 5469
Santa Fe, NM 87502-5469

Para entrega en persona:
Administrador, Junta de Mejoras Ambientales de Nuevo México
1190 St. Francis Drive, Harold Runnels Bldg.
Santa Fe, New Mexico 87505

B105 Presentación de Informes y Certificaciones

A. El titular del permiso deberá presentar los Protocolos de Pruebas de Chimenea e Informes de Pruebas de Chimenea de forma electrónica al sistema de Informes de Cumplimiento de la Oficina de Calidad del Aire (AQBCR) o según lo instruya el Departamento. (20.2.72.210 (E); 20.2.72.210 (C)(4)-(5); 20.2.72.213)

B. El titular del permiso deberá presentar los Informes de Emisiones Excesivas según lo instruya el Departamento. (20.2.7.110 NMAC)

C. El titular del permiso deberá presentar los informes de Rutina a la siguiente dirección postal, o según lo instruya el Departamento:

Gerente, Sección de Cumplimiento y Aplicación de la Ley
Departamento del Medio Ambiente de Nuevo México
Oficina de Calidad del Aire

525 Camino de los Marquez, Suite 1
Santa Fe, NM 87505

B106 Operaciones de Arranque, Parada y Falla de Funcionamiento de NSPS y/o MACT

A. Si una instalación está sujeta a un estándar NSPS en 40 CFR 60, cada propietario u operador que instale y opere un dispositivo de monitoreo continuo requerido por un reglamento NSPS debe cumplir con los requisitos de informes de emisiones excesivas de acuerdo con 40 CFR 60.7(c), a menos que esté específicamente exento en la subparte aplicable.

B. Si una instalación está sujeta a un estándar NSPS en 40 CFR 60, entonces, de acuerdo con 40 CFR 60.8(c), las emisiones que excedan el nivel del límite de emisión aplicable durante los períodos de arranque, parada y falla de funcionamiento no se considerarán una violación del límite de emisión aplicable a menos que se especifique lo contrario en el estándar aplicable.

C. Si una instalación está sujeta a un estándar MACT en 40 CFR 63, entonces la instalación está sujeta al requisito de un Plan de Arranque, Parada y Falla de Funcionamiento (SSM) bajo 40 CFR 63.6(e)(3), a menos que esté específicamente exento en la subparte aplicable.

B107 Operaciones de Arranque, Parada y Mantenimiento

A. El establecimiento de límites de emisión permitidos para arranque, parada y mantenimiento (SSM) no reemplaza los requisitos del estándar 20.2.7.14.A NMAC. Excepto para las operaciones o equipos sujetos a la Condición B106, el titular del permiso deberá establecer e implementar un plan para minimizar las emisiones durante el arranque, la parada de rutina o predecible y el mantenimiento programado (plan de prácticas de trabajo de SSM) y deberá operar de acuerdo con los procedimientos establecidos en el plan. (plan de prácticas de trabajo de SSM) (20.2.7.14.A NMAC)

B108 Requisitos Generales de Monitoreo

A. Estos requisitos no reemplazan ni relajan los requisitos de los reglamentos federales.

B. Los siguientes requisitos de monitoreo se utilizarán para determinar el cumplimiento de los requisitos y límites de emisión aplicables. Cualquier muestreo, ya sea mediante analizador portátil o un método de referencia de la EPA, que mida una tasa de emisión durante el período de promedio aplicable mayor que un límite de emisión en este permiso constituye un incumplimiento de este permiso. El Departamento puede requerir, a su discreción, pruebas adicionales de conformidad con los Métodos de Referencia de la EPA en cualquier momento, incluyendo cuando el muestreo mediante analizador portátil mida una tasa de emisión mayor que un límite de emisión en este permiso; pero dicho requisito no se interpretará como una determinación de que el muestreo mediante el analizador portátil no establece un incumplimiento de este permiso y no suspenderá la aplicación de dicho incumplimiento basado en el muestreo mediante analizador portátil.

C. Si la unidad de emisión está parada en el momento en que se debe completar el monitoreo periódico, el titular del permiso no tiene la obligación de reiniciar la unidad con el único propósito de realizar el monitoreo. Mediante correo electrónico o escrito, el titular del permiso deberá notificar a la Sección de Cumplimiento y Aplicación de la Ley del Departamento sobre el retraso en las pruebas de emisión antes de la fecha límite para completar las mismas. Al reiniciar la operación, el titular del permiso deberá presentar notificación(es) previa(s) a la prueba a la Sección de Cumplimiento y Aplicación de la Ley del Departamento y deberá completar el monitoreo.

D. El requisito de monitoreo durante cualquier período de monitoreo se basa en el porcentaje de tiempo que la unidad ha operado. Sin embargo, para invocar la exención del período de monitoreo en B108.D(2), se deberán monitorear y registrar las horas de operación.

(1) Si la unidad de emisión ha operado durante más del 25% de un período de monitoreo, entonces el titular del permiso deberá realizar el monitoreo durante ese período.

(2) Si la unidad de emisión ha operado durante el 25% o menos de un período de monitoreo, entonces el monitoreo no es requerido. Luego de dos períodos sucesivos sin monitoreo, el titular del permiso deberá realizar el monitoreo durante el siguiente período independientemente del tiempo operado durante ese período, excepto que para cualquier período de monitoreo en el que una unidad haya operado durante menos del 10% del período de monitoreo, dicho período no se considerará como uno de los dos períodos sucesivos.

(3) Si se invoca la exención del **período** de monitoreo en B108.D(2), el tiempo de operación real de una unidad no deberá exceder el período de monitoreo requerido por este permiso antes de que se efectúe el monitoreo requerido. Por ejemplo, si el período de monitoreo es anual, las horas de operación de la unidad no deberán exceder las 8760 horas antes de que se efectúe el monitoreo. Independientemente del tiempo que una unidad opere realmente, se deberá realizar un mínimo de uno de cada tipo de actividad de monitoreo durante cualquier período de cinco años.

E. Para todos los eventos de monitoreo periódico, excepto cuando un reglamento federal o estatal sea más estricto, se deberán llevar a cabo tres corridas de prueba al 90% o más de la capacidad de la unidad según se establece en este permiso, o en la solicitud de permiso si no está en el permiso, y a cargas adicionales cuando lo solicite el Departamento. Si no se puede alcanzar el 90% de la capacidad, el monitoreo se realizará a la máxima carga alcanzable bajo las condiciones operativas prevalecientes, excepto cuando un reglamento federal o estatal requiera condiciones de prueba más restrictivas. La carga y los parámetros utilizados para calcularla deberán registrarse para documentar las condiciones operativas y deberán incluirse con el informe de monitoreo.

F. Cuando el Departamento lo solicite, el titular del permiso deberá proporcionar cronogramas de las actividades de prueba y monitoreo. Las pruebas de cumplimiento de permisos NSR y Título V previos pueden volver a imponerse si el Departamento lo considera necesario para determinar si la fuente cumple con los reglamentos aplicables o las condiciones del permiso.

G. Si el monitoreo es nuevo o se suma al monitoreo impuesto por un requisito aplicable existente, entrará en vigor 120 días luego de la fecha de emisión del permiso. Para las

unidades de emisión que no hayan comenzado a operar, el monitoreo nuevo o adicional asociado no se aplicará sino hasta 120 días luego de que las unidades comiencen la operación. Todos los requisitos de monitoreo preexistentes incorporados en este permiso continuarán aplicándose desde la fecha de emisión del permiso.

H. A menos que las Condiciones Específicas o los requisitos regulatorios indiquen lo contrario, toda la instrumentación utilizada para el monitoreo de conformidad con los requisitos aplicables, incluyendo los límites de emisión, para medir parámetros que incluyen, pero no se limitan a, el flujo, la temperatura, la presión y la composición química, o utilizada para monitorear continuamente los índices de emisión u otros parámetros operativos del proceso, estará sujeta a los siguientes requisitos:

(1) El propietario u operador deberá instalar, calibrar, operar y mantener la instrumentación de monitoreo (monitor) de conformidad con los procedimientos y especificaciones del fabricante y los siguientes requisitos.

(a) El monitor deberá ubicarse en una posición que proporcione una medición representativa del parámetro que se está monitoreando.

(b) Como mínimo, el monitor deberá completar un ciclo de operación (muestreo, análisis y registro de datos) por cada período sucesivo de 15 minutos.

(c) Como mínimo, el monitor deberá estar ajustado para abarcar el rango normal +/- 5% del parámetro que se está monitoreando.

(d) Al menos semestralmente, llevar una inspección visual de todos los componentes del monitor para verificar la integridad física y operativa, y de todas las conexiones eléctricas para verificar la presencia de oxidación y corrosión galvánica.

(e) Recalibrar el monitor de conformidad con los procedimientos y especificaciones del fabricante a la frecuencia especificada por el fabricante, o cada dos años, lo que sea menor.

(2) Excepto por fallas de funcionamiento, reparaciones asociadas y actividades requeridas de aseguramiento o control de calidad (incluyendo las verificaciones de calibración y los ajustes de cero y escala requeridos), el titular del permiso deberá operar y mantener todo el equipo de monitoreo en todo momento en que la unidad de emisiones o el proceso asociado esté operando.

(3) El monitor deberá medir datos durante un mínimo del 90 por ciento del tiempo que la unidad de emisiones o el proceso asociado esté en operación, basado en un promedio mensual calendario.

(4) El propietario u operador deberá mantener registros de conformidad con la Sección B109 para demostrar el cumplimiento de los requisitos en B108H (1)-(3) anteriores, según corresponda.

B109 Requisitos Generales de Mantenimiento de Registros

A. El titular del permiso deberá mantener registros para asegurar y verificar el cumplimiento de los términos y condiciones de este permiso y de cualquier otro requisito aplicable que

entre en vigor luego de la emisión del permiso. (20.2.72.210(E)) La información mínima que se debe incluir en estos registros es la siguiente:

(1) Registros requeridos para pruebas y muestreos:

(a) identificación del equipo (incluir marca, modelo y número de serie de todos los equipos probados y controles de emisión)

(b) fecha(s) y hora(s) del muestreo o de las mediciones

(c) fecha(s) en que se llevaron a cabo los análisis

(d) la entidad calificada que hizo los análisis

(e) métodos analíticos o de prueba utilizados

(f) resultados de los análisis o pruebas

(g) condiciones operativas existentes al momento del muestreo o de la medición

(2) Registros requeridos para las inspecciones y/o el mantenimiento de equipos requeridos por este permiso:

(a) número de identificación del equipo (incluyendo marca, modelo y número de serie)

(b) fecha(s) y hora(s) de la inspección, el mantenimiento y/o la reparación

(c) fecha(s) en que se llevó a cabo cualquier análisis posterior (si aplica)

(d) nombre de la persona o entidad calificada que realizó la inspección, el mantenimiento y/o la reparación

(e) copia de las recomendaciones de mantenimiento o reparación del fabricante del equipo o del propietario u operador (si se requiere para demostrar el cumplimiento de una condición del permiso)

(f) descripción de las actividades de mantenimiento o reparación realizadas

(g) todos los resultados de cualquier lectura de parámetros requerida

(h) una descripción de la condición física del equipo según se encontró durante cualquier inspección requerida

(i) resultados de las inspecciones de equipo requeridas, incluyendo una descripción de cualquier condición que haya requerido ajuste para que el equipo vuelva a estar en cumplimiento y una descripción de los ajustes requeridos

B. Excepto por lo dispuesto en las Condiciones Específicas, los registros deberán mantenerse en el sitio o en la oficina de negocios local del titular del permiso durante un mínimo de dos (2) años a partir del momento de su registro y deberán estar disponibles para el personal del Departamento bajo solicitud. Las fuentes sujetas a 20.2.70 NMAC “Permisos de Operación” deberán mantener los registros en el sitio durante un mínimo de cinco (5) años a partir del momento de su registro. (20.2.70.302(D))

C. A menos que las Condiciones Específicas indiquen lo contrario, el titular del permiso deberá llevar los siguientes registros para las emisiones por fallas de funcionamiento y las emisiones de rutina o predecibles durante el arranque, la parada y el mantenimiento programado (SSM):

(1) El propietario u operador de una fuente sujeta a un permiso deberá establecer e implementar un plan para minimizar las emisiones durante el arranque, la parada de rutina o predecible y el mantenimiento programado a través de estándares de prácticas de trabajo y buenas prácticas de control de la contaminación del aire. Este requisito no se aplicará a ninguna instalación afectada que esté definida en, y sujeta a, un estándar de emisiones y un plan equivalente bajo la Parte 60 de 40 CFR (NSPS), la Parte 63 de 40 CFR (MACT), o un plan equivalente bajo 20.2.72 NMAC - Permisos de Construcción, 20.2.70 NMAC - Permisos de Operación, 20.2.74 NMAC - Permisos - Prevención de Deterioro Significativo (PSD), o 20.2.79 NMAC - Permisos - Áreas de Incumplimiento. El titular del permiso deberá llevar registros de todas las fuentes sujetas al plan para minimizar las emisiones durante el SSM de rutina o predecible y deberá registrar si la fuente está sujeta a un plan alternativo y, por lo tanto, no está sujeta a los requisitos del plan bajo 20.2.7.14.A NMAC.

(2) Si la instalación tiene límites de emisión permisibles para SSM en este permiso, el titular del permiso deberá registrar todos los eventos de SSM, incluyendo la fecha, la hora de inicio, la hora de finalización, una descripción del evento y una descripción de la causa del evento. Este registro también deberá incluir una copia de la documentación del fabricante, o equivalente, que demuestre que cualquier mantenimiento calificó como programado. El mantenimiento programado es una actividad que ocurre a una frecuencia establecida de conformidad con un protocolo por escrito publicado por el fabricante u otra fuente confiable. La autorización de emisiones permisibles de SSM no reemplaza ningún estándar federal o estatal aplicable. Se aplica el requisito más estricto.

(3) Si la instalación tiene límites de emisión permisibles por fallas de funcionamiento en este permiso, el titular del permiso deberá registrar todos los eventos de fallas de funcionamiento que se aplicarán contra estos límites. El titular del permiso también debe incluir la fecha, la hora de inicio, la hora de finalización y una descripción del evento. **Falla de funcionamiento se refiere a** cualquier falla repentina e inevitable del equipo de control de contaminación del aire o del equipo del proceso que esté fuera del control del propietario u operador, incluyendo las fallas de funcionamiento durante el arranque o la parada. Una falla causada en su totalidad o en parte por mantenimiento deficiente, operación descuidada o cualquier otra avería prevenible del equipo no se considerará una falla de funcionamiento. (20.2.7.7.E NMAC) La autorización de emisiones permisibles por fallas de funcionamiento no reemplaza ningún estándar federal o estatal aplicable. Se aplica el requisito más estricto. Esta autorización solo permite al titular del permiso evitar la presentación de informes bajo 20.2.7 NMAC para las emisiones anuales totales que estén por debajo del límite de emisión autorizado por fallas de funcionamiento.

(4) El propietario u operador de una fuente deberá cumplir con el plan operativo que define las acciones que se tomarán para mitigar las emisiones de la fuente durante una falla de funcionamiento, arranque o parada. (20.2.72.203.A(5) NMAC)

B110 Requisitos Generales de Presentación de Informes
(20.2.72 NMAC Secciones 210 y 212)

A. Los registros e informes deberán mantenerse en el sitio o en la oficina de negocios local del titular del permiso, a menos que otra condición de este permiso o un reglamento estatal o federal requieran específicamente su presentación al Departamento o a la EPA. Los registros de los sitios sin personal pueden mantenerse en la oficina de negocios más cercana.

B. El titular del permiso deberá notificar por escrito a la Sección de Informes de Cumplimiento del Departamento, utilizando el Formulario de Presentación actual publicado en el sitio web de Calidad del Aire del NMED bajo Cumplimiento y Aplicación de la Ley/Formularios de Presentación, o proporcionar al Departamento lo siguiente (20.2.72.212.A y B):

(1) la fecha prevista para el arranque inicial de cada fuente nueva o modificada con no menos de treinta (30) días antes de la fecha. La notificación puede ocurrir antes de la emisión del permiso, pero el arranque real no deberá ocurrir antes de la fecha de emisión del permiso;

(2) luego de recibir la autorización para construir, el número de serie del equipo suministrado por el fabricante o fijado de manera permanente si fue construido en taller, y la fecha real del arranque inicial de cada fuente nueva o modificada dentro de los quince (15) días posteriores a la fecha de arranque; y

(3) la fecha en que cada fuente de emisión nueva o modificada alcance la tasa máxima de producción a la que operará dentro de quince (15) días posteriores a esa fecha.

C. El titular del permiso deberá notificar por escrito al Gerente del Programa de Permisos del Departamento, o proporcionar al Departamento lo siguiente (20.2.72.212.C y D):

(1) cualquier cambio de operadores o cualquier sustitución de equipos dentro de un plazo de quince (15) días posteriores a dicho cambio;

(2) cualquier actualización o corrección necesaria a más tardar sesenta (60) días luego de que el operador sepa o debiera haber sabido de la condición que requiere la actualización o corrección del permiso.

D. Los resultados de las pruebas de emisión y del monitoreo de cada contaminante (excepto la opacidad) deberán reportarse en libras por hora (a menos que se especifique lo contrario) y en toneladas por año. La opacidad deberá reportarse en porcentaje. El número de cifras significativas correspondiente a la precisión total inherente al instrumento de prueba o al Método de prueba utilizado a fin de obtener los datos deberá utilizarse para calcular y reportar los resultados de las pruebas de conformidad con 20.2.1.116.B y C NMAC. A solicitud del Departamento, los datos de CEMS y otros datos tabulares deberán presentarse en formato editable de MS Excel.

E. El titular del permiso deberá presentar informes de emisiones excesivas de conformidad con 20.2.7.110.A NMAC.

F. Límites de Emisión Permisibles para el Informe de Emisiones Excesivas para Antorchas y Otras Fuentes Reguladas sin Límites de Emisión en Libras Por Hora (pph) y/o Toneladas Por Año (tpy).

(1) Cuando una antorcha no tenga límites de emisión permisibles en pph y/o tpy en las Secciones A106 y/o A107, las emisiones permisibles autorizadas incluyen solo la combustión de gas piloto y/o de purga. El cumplimiento se demuestra limitando el flujo de gas hacia la antorcha a solo gas piloto y/o de purga.

(2) Para el informe de emisiones excesivas según lo requerido por 20.2.7 NMAC, los límites de emisión permisibles son 1.0 pph y 1.0 tpy para cada contaminante del aire regulado (excepto para el H2S) emitido por esa fuente de la siguiente manera:

(a) Para antorchas, cuando no existan límites de emisión permisibles en las Secciones A106 y/o A107.

(b) Para fuentes reguladas con límites de emisión en las Secciones A106 o A107 representados por el signo de menor que ("<").

(c) Para fuentes reguladas que normalmente no emitirían ningún contaminante del aire regulado, incluyendo, pero no limitado a, venteos, dispositivos de alivio de presión, conectores, etc.

(3) Para el informe de emisiones excesivas según lo requerido por 20.2.7 NMAC para H2S, los límites permisibles son 0.1 pph y 0.44 tpy para cada escenario aplicable abordado en el párrafo (2) anterior.

B111 Requisitos Generales de Prueba

A menos que las Condiciones Específicas o los requisitos reglamentarios indiquen lo contrario, el titular del permiso deberá realizar las pruebas de conformidad con los requisitos de las Secciones B111A, B, C, D y E, según corresponda.

A. Pruebas de cumplimiento inicial

El titular del permiso deberá realizar las pruebas de cumplimiento inicial de conformidad con los siguientes requisitos:

(1) Los requisitos de las pruebas de cumplimiento inicial de permisos anteriores (si los hay) siguen vigentes, a menos que las pruebas se hayan completado satisfactoriamente. Las pruebas de cumplimiento se pueden volver a imponer si el Departamento lo considera necesario para determinar si la fuente cumple con los reglamentos aplicables o las condiciones del permiso. (20.2.72 NMAC Secciones 210.C y 213)

(2) Las pruebas de cumplimiento inicial deberán realizarse dentro de un plazo de sesenta (60) días posteriores a que la(s) unidad(es) alcance(n) la tasa máxima de producción normal. Si la tasa máxima de producción normal no ocurre dentro de un plazo de ciento veinte (120) días posteriores al arranque de la fuente, entonces las pruebas deben llevarse a cabo a más tardar ciento ochenta (180) días luego del arranque inicial de la fuente.

(3) El período de tiempo predeterminado para cada corrida de prueba será de **al menos** 60 minutos y cada prueba de rendimiento constará de tres corridas separadas utilizando el método de prueba aplicable. Con el propósito de determinar el cumplimiento de un límite de emisión aplicable, se aplicará la media aritmética de los resultados de las tres corridas. En caso de que una muestra se pierda accidentalmente u ocurran condiciones en las que una de las tres corridas deba interrumpirse debido a una parada forzada, falla de una parte irremplazable del tren de muestras, condiciones meteorológicas extremas u otras circunstancias fuera del control del propietario u operador, el cumplimiento podrá, previa aprobación del Departamento, determinarse utilizando la media aritmética de los resultados de las otras dos corridas.

(4) Las pruebas de emisiones deberán realizarse con la unidad de emisiones operando del 90 al 100 por ciento de la tasa máxima de operación permitida por el permiso. Si no es posible hacer la prueba a esa tasa, la fuente puede realizar la prueba a una tasa de operación más baja.

(5) Las pruebas realizadas a menos del 90 por ciento de la capacidad permitida limitarán la operación de la unidad de emisión al 110 por ciento de la capacidad probada hasta que se lleve a cabo una nueva prueba.

(6) Si las condiciones cambian de tal forma que sea posible la operación de la unidad por encima del 110 por ciento de la capacidad probada, la fuente debe presentar un protocolo al Departamento dentro de un plazo de 30 días posteriores a dicho cambio para realizar una nueva prueba de emisiones.

B. Pruebas de Métodos de Referencia de la EPA

Los métodos de prueba en la Sección B111.B(1) se utilizarán para todas las pruebas de cumplimiento inicial y todas las Auditorías de Pruebas de Precisión Relativa (RATA), y se utilizarán si el titular del permiso opta por utilizar los métodos de prueba de la EPA para el monitoreo periódico. Los métodos de prueba que no se indiquen en la Sección B111.B(1) podrán utilizarse de acuerdo con los requisitos de la Sección B111.B(2).

(1) Todas las pruebas de cumplimiento requeridas por este permiso deberán realizarse de conformidad con los requisitos del Título 40 de CFR, Parte 60, Subparte A, Disposiciones Generales, y los siguientes Métodos de Referencia de la EPA según se especifica en el Apéndice A de la Parte 60 del Título 40 de CFR:

(a) Métodos 1 al 4 para la tasa de flujo de gas en chimenea

(b) Método 5 para material particulado (PM)

(c) Método 6C SO_2

(d) Método 7E para NO_X (los resultados de las pruebas deberán expresarse como dióxido de nitrógeno (NO_2) utilizando un peso molecular de 46 lb/lb-mol en todos los cálculos (cada ppm de NO/NO_2 es equivalente a 1.194 x 10-7 lb/SCF)

(e) Método 9 para la determinación visual de la opacidad

(f) Método 10 para CO

(g) Método 19 para tasas de emisión de material particulado, dióxido de azufre y óxidos de nitrógeno. Además, el Método 19 puede utilizarse en lugar de los

Métodos 1-4 para la tasa de flujo de gas en chimenea. El titular del permiso debe suministrar un análisis de gas combustible contemporáneo (preferiblemente el día de la prueba, pero no antes de tres meses previos a la fecha de la prueba) y un certificado de calibración reciente del medidor de flujo de combustible (dentro del trimestre más reciente) con el informe final de la prueba.

(h) Método 7E o 20 para turbinas de acuerdo con §60.335 o §60.4400.

(i) Método 22 para la determinación visual de emisiones fugitivas de fuentes de materiales y emisiones de humo de antorchas.

(j) Método 25A para la eficiencia de reducción de VOC.

(k) Método 29 para metales.

(l) Método 30B para mercurio proveniente de Fuentes de Combustión Alimentadas con Carbón Utilizando Trampas de Sorbente de Carbón.

(m) Método 201A para PM_{10} y $PM_{2.5}$ filtrables.

(n) Método 202 para PM condensable.

(o) Método 320 para Contaminantes del Aire Peligrosos (HAP) orgánicos.

(2) Los titulares de permisos pueden proponer métodos de prueba que no estén indicados en la Sección B111.B(1). Estos métodos podrán utilizarse si se recibe la aprobación previa del Departamento.

C. Requisitos de Monitoreo Periódico y de Analizadores Portátiles para la Determinación de Concentraciones de Óxidos de Nitrógeno, Monóxido de Carbono y Oxígeno en Emisiones de Motores Alternativos, Turbinas de Combustión, Calderas y Calentadores de Proceso

Las pruebas periódicas de emisiones (monitoreo periódico) se deberán llevar a cabo de conformidad con los siguientes requisitos:

(1) Las pruebas periódicas de emisiones pueden llevarse a cabo de conformidad con los Métodos de Referencia de la EPA o mediante el uso de un analizador portátil. El monitoreo periódico utilizando un analizador portátil se deberá llevar a cabo de conformidad con los requisitos de la versión vigente de ASTM D 6522. Sin embargo, si una instalación ha cumplido con un criterio del Departamento previamente aprobado para analizadores portátiles, el analizador puede operarse de conformidad con ese criterio hasta que sea reemplazado.

(2) El período de tiempo predeterminado para cada corrida de prueba será de **al menos** 20 minutos.

Cada prueba de rendimiento constará de tres corridas separadas. Se utilizará la media aritmética de los resultados de las tres corridas para determinar el cumplimiento del límite de emisión aplicable.

(3) Las pruebas de emisiones deberán realizarse de conformidad con los requisitos de la Sección B108.E.

(4) Durante las pruebas de emisiones, se deberá monitorear y registrar la concentración de contaminantes y diluyentes. Se deberá monitorear y registrar la tasa de flujo de combustible si la tasa de flujo de gas en chimenea se determina utilizando el Método de Referencia 19. Esta información deberá incluirse con el informe de la prueba suministrado al Departamento.

(5) La tasa de flujo de gas en chimenea deberá calcularse de conformidad con el Método de Referencia 19 utilizando la tasa de flujo de combustible (scf) determinada por un medidor de flujo de combustible dedicado y el poder calorífico del combustible (Btu/scf). El titular del permiso deberá proporcionar un análisis de gas combustible contemporáneo (preferiblemente el día de la prueba, pero no antes de tres meses previos a la fecha de la prueba) y un certificado de calibración reciente del medidor de flujo de combustible (dentro del trimestre más reciente) con el informe final de la prueba. Alternativamente, la tasa de flujo de gas en chimenea podrá determinarse utilizando los Métodos de Referencia 1-4 de la EPA.

(6) El titular del permiso deberá presentar una notificación y un protocolo para las pruebas periódicas de emisiones a solicitud del Departamento.

D. Procedimientos para pruebas de cumplimiento inicial y RATA

Los titulares de permisos obligados a realizar pruebas de cumplimiento inicial y/o RATAs deberán cumplir con los siguientes requisitos:

(1) El titular del permiso deberá presentar una notificación y un protocolo de prueba al Gerente del Programa del Departamento, Sección de Cumplimiento y Aplicación de la Ley del Departamento, al menos treinta (30) días antes de la fecha de la prueba, y permitir que un representante del Departamento esté presente en la prueba. Las propuestas para utilizar métodos de prueba que no estén indicados en la Sección B111.B(1) (si aplica) se deberán incluir en esta notificación.

(2) El contenido de las notificaciones, protocolos e informes de prueba deberá ajustarse al formato especificado por el Formulario e Instrucciones Universales de Notificación, Protocolo e Informe de Prueba del Departamento. Los formularios e instrucciones vigentes están publicados en el sitio web de Calidad del Aire del NMED bajo Pruebas de Cumplimiento y Aplicación de la Ley.

(3) El titular del permiso deberá proporcionar (a) puertos de muestreo adecuados para los métodos de prueba aplicables a la instalación, (b) plataformas de muestreo seguras, (c) acceso seguro a las plataformas de muestreo y (d) servicios públicos para el equipo de muestreo y prueba.

(4) Cuando sea necesario para evitar el flujo ciclónico en la chimenea, se deberán instalar enderezadores de flujo.

E. Procedimientos Generales para Pruebas de Cumplimiento

Los siguientes requisitos deberán aplicarse a todas las pruebas de cumplimiento inicial, pruebas periódicas de emisiones y todas las RATAs:

(1) El equipo se deberá probar en la condición “como se encuentre”. El equipo no puede ser ajustado ni afinado antes de cualquier prueba con el propósito de reducir las emisiones, para luego regresar a los ajustes o condiciones operativas anteriores luego de que se complete la prueba.

(2) La chimenea deberá tener la altura y el diámetro suficientes, y los puertos de muestra deberán estar ubicados de forma que se pueda realizar una prueba representativa de las emisiones de conformidad con los requisitos del Método de Referencia 1 de la EPA o la versión vigente de ASTM D 6522, según corresponda.

(3) Los informes de prueba deberán presentarse al Departamento a más tardar 30 días luego de la finalización de la prueba.

B112 Cumplimiento

A. Se le otorgará al Departamento el derecho de ingresar a las instalaciones en todo momento razonable a fin de verificar los términos y condiciones de este permiso. Los registros requeridos deberán estar organizados por fecha y tema, y deberán estar en todo momento disponibles para su inspección. El titular del permiso, bajo solicitud verbal o escrita de un representante autorizado del Departamento que se presente en las instalaciones, deberá mostrar de inmediato para su inspección o copiado cualquier registro que se requiera mantener en las instalaciones. Bajo solicitud por escrito en otros momentos, el titular del permiso deberá entregar al Departamento copias impresas o electrónicas de cualquiera y de todos los registros requeridos que se mantengan en el sitio o en una ubicación fuera del sitio. Los registros solicitados deberán ser copiados y entregados a expensas del titular del permiso dentro de un plazo de tres días hábiles siguientes a la recepción de la solicitud, a menos que el Departamento otorgue tiempo adicional. Los registros requeridos pueden incluir los exigidos por el permiso y otra información necesaria para demostrar el cumplimiento de los términos y condiciones de este permiso. (NMSA 1978, Sección 74-2-13)

B. Una copia del (de los) permiso(s) más reciente(s) emitido(s) por el Departamento deberá conservarse en las instalaciones autorizadas o (para sitios sin personal) en la oficina de la empresa más cercana, y deberá ponerse a disposición del personal del Departamento para su inspección cuando lo solicite. (20.2.72.210.B.4 NMAC)

C. Los límites de emisiones asociados con la entrada de energía de una Unidad, es decir, lb/MMBtu, se aplicarán en todo momento a menos que se indique lo contrario en una Condición Específica de este permiso. El tiempo de promedio para cada límite de emisiones, incluyendo aquellos basados en la entrada de energía de una Unidad (es decir, lb/MMBtu), es de una (1) hora a menos que se indique lo contrario en una Condición Específica de este permiso o en el requisito aplicable que establece el límite.

D. Modificaciones del Permiso y Aplicación de Condiciones de Permisos Anteriores. Nada en este permiso, ni ninguna modificación administrativa, técnica, menor o significativa a este permiso, deberá interpretarse en el sentido de limitar, rescindir o afectar de otro modo la autoridad del Departamento para procurar la aplicación de la ley por violaciones de las condiciones del permiso que hayan ocurrido antes de la fecha de entrada en vigencia de cualquier modificación del permiso, ni se interpretará dicha modificación del permiso como una aprobación de operaciones o emisiones pasadas o como una determinación de cumplimiento para cualquier período anterior.

El Departamento conserva plena autoridad para investigar y sancionar todas las violaciones con base en las condiciones del permiso vigentes al momento en que ocurrieron las presuntas violaciones.

Cualquier modificación del permiso se aplica solo de forma prospectiva y no constituirá una defensa ni afectará la determinación de responsabilidad por cualquier violación pasada, actual o continua que ocurra antes de la fecha de entrada en vigencia del permiso o de la modificación.

B113 Cancelación y Revocación del Permiso

A. El Departamento puede revocar este permiso si, dentro de los diez años inmediatamente anteriores a la fecha de presentación de la solicitud del permiso, el solicitante o titular del permiso ha: (1) declarado falsamente, de forma consciente, un hecho sustancial en una solicitud de permiso; (2) se ha negado a revelar la información requerida por lo dispuesto en la Ley de Control de la Calidad del Aire; (3) ha sido condenado en cualquier tribunal de cualquier estado o de los Estados Unidos por: (a) un delito grave relacionado con un delito ambiental, o (b) un delito definido por leyes estatales o federales que implique o constituya una restricción del comercio, fijación de precios, soborno o fraude; (4) ha construido u operado una instalación para la cual se busca un permiso sin el permiso requerido por la Ley de Control de la Calidad del Aire, salvo cuando dicha instalación sin permiso sea descubierta después de su adquisición en el curso de una auditoría ambiental oportuna autorizada por la política del departamento o de la junta local y salvo si: (a) el operador de la instalación, utilizando buenas prácticas de ingeniería y metodologías de cálculo aprobadas y establecidas, estimó que las emisiones de la instalación no requerirían un permiso de conformidad con la Ley de Control de la Calidad del Aire; y (b) al descubrir la discrepancia entre las emisiones máximas calculadas de la instalación antes de la construcción y las emisiones máximas calculadas de la instalación después de la construcción, el operador de la instalación solicita el permiso correspondiente dentro de un plazo de treinta días naturales; o (5) se le ha revocado o suspendido permanentemente algún permiso por causa justificada bajo las leyes ambientales de cualquier estado de los Estados Unidos. (1978 74-2-7 (P) NMSA. La revocación se hará por escrito, y se podrá interponer una apelación administrativa ante el Secretario del Departamento dentro de un plazo de treinta (30) días.

B. El Departamento cancelará automáticamente cualquier permiso para cualquier fuente que cese sus operaciones durante cinco (5) años o más, o de forma permanente. La reactivación de cualquier fuente luego del período de cinco (5) años requerirá un nuevo permiso. (20.2.72 NMAC)

C. El Departamento puede cancelar un permiso si la construcción o modificación no se inicia dentro de un periodo de dos (2) años a partir de la fecha de emisión o si, durante la construcción o modificación, el trabajo se suspende por un total de un (1) año. (20.2.72 NMAC)

B114 Notificación a Propietarios Posteriores

A. El permiso y las condiciones se aplican en caso de cualquier cambio en el control o la propiedad de las Instalaciones. No se requiere ninguna modificación del permiso en tal caso. Sin embargo, en caso de ocurrir dicho cambio en el control o la propiedad, el titular del permiso deberá notificar al propietario sucesor sobre el permiso y las condiciones, y deberá notificar al Gerente del Programa del Departamento, Sección de Permisos, sobre el cambio de propiedad dentro de un plazo de quince (15) días posteriores a dicho cambio. (20.2.72.212.C NMAC)

B. Cualquier nuevo propietario u operador deberá notificar al Gerente del Programa del Departamento, Sección de Permisos, dentro de un plazo de treinta (30) días posteriores a la

asunción de la propiedad, el nombre y la dirección del nuevo propietario u operador. (20.2.73.200.E.3 NMAC)

B115 Demolición de Asbesto

A. Antes de cualquier trabajo de demolición o renovación de asbesto, el titular del permiso deberá determinar si se aplica 40 CFR 61 Subparte M, Estándares Nacionales de Emisiones para el Asbesto. Si se requiere, el titular del permiso deberá notificar al Gerente del Programa del Departamento, Sección de Cumplimiento y Aplicación utilizando los formularios proporcionados por el Departamento.

B116 Sustitución de Motores a Corto Plazo

A. El siguiente Escenario de Operación Alternativo (AOS) aborda la avería de motores o el mantenimiento y reparación periódicos, lo cual requiere el uso de un motor de sustitución a corto plazo. Los siguientes requisitos no se aplican a los motores que están exentos según 20.2.72.202.B(3) NMAC. Los cambios en los motores exentos deben reportarse de conformidad con 20.2.72.202.B NMAC. Se puede sustituir un motor de reemplazo a corto plazo por cualquier motor permitido por este permiso durante un máximo de 120 días en cualquier período móvil de doce meses por cada motor permitido. Las demostraciones de cumplimiento requeridas como parte de este AOS son adicionales a cualquier otra demostración de cumplimiento requerida por este permiso.

(1) El titular del permiso puede sustituir temporalmente un motor existente que esté sujeto a los límites de emisiones establecidos en este permiso por otro motor, independientemente de su fabricante, modelo y potencia, sin modificar este permiso. El titular del permiso deberá enviar una notificación por escrito al Departamento dentro de un plazo de 15 días posteriores a la fecha de sustitución del motor, de acuerdo con la condición B110.C(1).

(a) Las tasas de emisiones potenciales del motor de reemplazo se determinarán utilizando las especificaciones del fabricante del motor de reemplazo y deberán cumplir con los límites de emisiones permitidos para el motor existente.

(b) La dirección de la chimenea de escape del motor de reemplazo deberá ser vertical o en la misma dirección que la del motor existente. La altura de la chimenea y los parámetros de flujo del motor de reemplazo deberán ser al menos tan efectivos en la dispersión de contaminantes del aire como la altura de la chimenea y los parámetros de flujo modelados para el motor permitido existente. Se puede utilizar la siguiente ecuación para mostrar que el motor de reemplazo dispersa los contaminantes tan bien como el motor existente. El valor calculado para el motor de reemplazo en el lado derecho de la ecuación deberá ser igual o mayor que el valor para el motor existente en el lado izquierdo de la ecuación. La página de permisos del sitio web de la Oficina de Calidad del Aire contiene una hoja de cálculo que realiza este cálculo.

MOTOR EXISTENTE MOTOR DE REEMPLAZO

$$\frac{[(g) \times (h1)] + [(v1)^2/2] + [(c) \times (T1)]}{q1} <= \frac{[(g) \times (h2)] + [(v2)^2/2] + [(c) \times (T2)]}{q2}$$

Donde
g = constante gravitacional = 32.2 pies/seg2
h1 = altura de la chimenea existente, pies
v1 = velocidad de escape, motor existente, pies por segundo
c = calor específico del escape, 0.28 BTU/lb-grado F
T1 = temperatura absoluta del escape, motor existente = grado F + 460
q1 = tasa de emisión permitida autorizada, motor existente, lbs/hora
h2 = altura de la chimenea de reemplazo, pies
v2 = velocidad de escape, motor de sustitución, pies por segundo
T2 = temperatura absoluta del escape, motor de reemplazo = grado F + 460
q2 = tasa de emisión potencial del fabricante, motor de reemplazo, lbs/hora

El titular del permiso deberá conservar registros que muestren que el motor de reemplazo es al menos tan eficaz en la dispersión de contaminantes del aire como el motor existente.

(c) Las pruebas de medición de emisiones de NOx y CO del motor de reemplazo temporal deberán realizarse de conformidad con la Sección B111, con la excepción de las Condiciones B111A(2) y B111B para las Pruebas de Métodos de Referencia de la EPA o la Sección B111C para las mediciones de prueba con analizador portátil. La(s) prueba(s) de cumplimiento deberá(n) realizarse dentro de un plazo de quince (15) días posteriores a que la unidad comience a operar, y los registros de los resultados deberán conservarse de conformidad con la sección B109.B. Esta prueba deberá realizarse incluso si el motor es retirado antes de cumplir los 15 días en el sitio.

i. Estas pruebas de cumplimiento no se requieren para un motor certificado bajo 40CFR60, subpartes IIII o JJJJ, o 40CFR63, subparte ZZZZ, si el titular del permiso demuestra que uno de estos requisitos hace que dicho motor cumpla con todos los límites de emisiones de este permiso. El titular del permiso deberá enviar esta demostración al Departamento dentro de un plazo de 48 horas posteriores a la puesta en operación de la nueva unidad. Este envío deberá incluir documentación que indique que el motor está certificado, que el motor se encuentra dentro de su vida útil, según se define y especifica en el requisito aplicable, y deberá incluir cálculos que demuestren que los estándares de emisiones aplicables dan como resultado el cumplimiento de los límites del permiso.

ii. Estas pruebas de cumplimiento no se requieren si se realizó una prueba mediante analizador portátil o prueba de Método de la EPA (incluyendo cualquiera requerida por 40CFR60, subpartes IIII y JJJJ, y 40CFR63, subparte ZZZZ) dentro de los últimos 12 meses. Estas pruebas anteriores son válidas solo si se realizaron a la misma elevación o a una elevación menor que la ubicación del motor existente antes de comenzar la operación como reemplazo temporal. Una copia de los

resultados de la prueba deberá conservarse de conformidad con la sección B109.B.

(d) Las pruebas de cumplimiento para NOx y CO deberán realizarse si el Departamento lo solicita por escrito para determinar si el motor de reemplazo cumple con los reglamentos aplicables o con las condiciones del permiso.

(e) Al determinar que los datos de emisiones obtenidos de conformidad con B116.A.1(c) no indican el cumplimiento de los límites de emisión de NOx o de CO, el titular del permiso deberá notificar al Departamento dentro de un plazo de 48 horas. Además, dentro de ese plazo, el titular del permiso deberá implementar una de las siguientes acciones correctivas:

i. El motor deberá ajustarse para reducir las emisiones de NOx y CO y probarse de acuerdo con B116.A.1(c) para demostrar el cumplimiento de los límites del permiso.

ii. El motor deberá dejar de operar o ser reemplazado por una unidad diferente.

(2) Los motores de reemplazo a corto plazo, ya sean del mismo fabricante, modelo y potencia, o de un fabricante, modelo o potencia diferentes, están sujetos a todos los requisitos federales y estatales aplicables, independientemente de si se establecen en este permiso (incluyendo el monitoreo y el mantenimiento de registros), y estarán sujetos a cualquier protección otorgada por este permiso.

(3) El titular del permiso deberá mantener un registro contemporáneo que documente el número de unidad, fabricante, número de modelo, potencia, factores de emisión, resultados de las pruebas de emisión y número de serie de cualquier motor existente que sea reemplazado, así como del motor de reemplazo. Adicionalmente, el registro deberá documentar la duración del reemplazo en días, y las fechas de inicio y finalización del reemplazo del motor a corto plazo.

(4) El titular del permiso deberá mantener registros de una determinación de aplicabilidad del reglamento para cada motor de reemplazo (incluyendo 40CFR60, subpartes IIII y JJJJ, y 40CFR63, subparte ZZZZ) y deberá cumplir con todos los requisitos reglamentarios asociados.

B. Requisitos adicionales para el reemplazo de motores en fuentes mayores según se define en el reglamento 20.2.74 NMAC, Permisos – Prevención del Deterioro Significativo, sección 7.AG. Para las fuentes mayores bajo la PSD, las horas de operación acumuladas totales del motor de reemplazo deberán limitarse mediante el siguiente procedimiento:

(1) Diariamente, se calcularán y registrarán las emisiones reales del (de los) motor(es) de reemplazo para cada contaminante regulado por este permiso para el motor existente.

(2) La suma de las emisiones reales totales desde el inicio de la operación del (de los) motor(es) de reemplazo no deberá ser igual ni exceder las tasas de emisión significativas indicadas en la Tabla 2 de 20.2.74 NMAC, sección 502, durante el tiempo que el motor de reemplazo se encuentre en las instalaciones.

C. Todos los registros requeridos por esta sección deberán conservarse de conformidad con la sección B109.

PARTE C MISCELÁNEOS

C100 Documentos de Respaldo en Línea

A. Las copias de los siguientes documentos se pueden descargar del sitio web del NMED bajo Cumplimiento y Aplicación o solicitarse a la Oficina.

(1) Formulario de Emisiones Excesivas (para reportar desviaciones y emergencias)

(2) Formulario e Instrucciones de Notificación, Protocolo e Informe Universal de Pruebas de Chimenea

C101 Definiciones

A. **"Luz de día"** se define como el período de tiempo comprendido entre el amanecer y el anochecer, según lo definido por el Departamento de Aplicaciones Astronómicas del Observatorio Naval de los Estados Unidos. (Los datos para un día o una tabla de amanecer/anochecer para un año entero se pueden obtener en http://aa.usno.navy.mil/. Alternativamente, estos horarios se pueden obtener de un Almanaque de Agricultor o de http://www.almanac.com/rise/).

B. **"Desmantelar"** y **"Desmantelamiento"** se aplica a las unidades que se dejan en el sitio (no retiradas) y se define como la desconexión completa de los equipos, fuentes de emisión o actividades del proceso mediante la desconexión de todas las conexiones necesarias para la operación (es decir, tuberías, electricidad, controles, ductos, etc.).

C. **"Fuentes Exentas"** y **"Actividades Exentas"** se definen como aquellas fuentes o actividades que están exentas de conformidad con 20.2.72 NMAC. Nota: las exenciones solo son válidas para la mayoría de las acciones de permisos bajo 20.2.72 NMAC.

D. **"Emisión Fugitiva"** significa aquellas emisiones que no podrían pasar razonablemente a través de una chimenea, conducto, ventilación u otra abertura funcionalmente equivalente.

E. **"Actividades Insignificantes"** se refiere a las actividades que han sido indicadas por el departamento y aprobadas por el administrador como insignificantes sobre la base de su tamaño, emisiones o tasa de producción. Nota: las actividades insignificantes solo son válidas para las acciones de permisos bajo 20.2.70 NMAC.

F. **"Falla de funcionamiento"** para los requisitos bajo 20.2.7 NMAC, significa cualquier falla repentina e inevitable del equipo de control de contaminación del aire o del equipo del proceso que esté fuera del control del propietario u operador, incluyendo la falla de funcionamiento durante el arranque o la parada. Una falla que sea causada en su totalidad o en parte por un mantenimiento deficiente, una operación descuidada o cualquier otra avería evitable del equipo no se considerará una falla de funcionamiento. (20.2.7.7.E NMAC)

G. **"Gas Natural"** se define como una mezcla fluida de hidrocarburos de origen natural que contiene 20.0 granos o menos de azufre total por cada 100 pies cúbicos estándar (SCF) y que está compuesta por al menos 70% de metano por volumen o tiene un poder calorífico bruto de entre 950 y 1100 Btu por pie cúbico estándar. (40 CFR 60.631)

H. **"Líquidos de Gas Natural"** se refiere a los hidrocarburos, tales como etano, propano, butano y pentano, que se extraen del gas de campo. (40 CFR 60.631)

I. **"Estándares Nacionales de Calidad del Aire Ambiental"** significa, a menos que se modifique de otro modo, los estándares federales primarios (relacionados con la salud) y secundarios (basados en el bienestar) de calidad del aire ambiental promulgados por la EPA de los Estados Unidos de conformidad con la Sección 109 de la Ley Federal.

J. **"Noche"** es el período de tiempo comprendido entre el anochecer y el amanecer, según lo definido por el Departamento de Aplicaciones Astronómicas del Observatorio Naval de los Estados Unidos. (Los datos para un día o una tabla de amanecer/anochecer para un año entero se pueden obtener en http://aa.usno.navy.mil/. Alternativamente, estos horarios se pueden obtener de un Almanaque de Agricultor o de http://www.almanac.com/rise/).

K. **"Operación Nocturna** u **Operación por la Noche"** es operar una fuente de emisiones por la noche.

L. **"NO2"** o "Dióxido de nitrógeno" se refiere al compuesto químico que contiene un átomo de nitrógeno y dos átomos de oxígeno, para efectos de determinaciones ambientales. El término **"dióxido de nitrógeno"**, para efectos del monitoreo de emisiones en chimeneas, incluirá el dióxido de nitrógeno (el compuesto químico que contiene un átomo de nitrógeno y dos átomos de oxígeno), el óxido nítrico (el compuesto químico que contiene un átomo de nitrógeno y un átomo de oxígeno) y otros óxidos de nitrógeno que puedan resultar en la prueba como dióxido de nitrógeno, y a veces se denominará NOx o NO_2. (20.2.2 NMAC)

M. "**NOx**" ver NO_2

N. "**Vía Pavimentada**" es una vía con una superficie sólida permanente que se puede barrer para dejarlo esencialmente libre de polvo u otro material a fin de reducir la resuspensión en el aire de material particulado. En la medida en que estas superficies se mantengan sólidas y contiguas, califican como vías pavimentadas: concreto, asfalto, sello de gravilla, asfalto reciclado y otras superficies aprobadas por el Departamento por escrito.

O. **"Tasa de Emisión Potencial"** significa la tasa de emisión de una fuente a su máxima capacidad para emitir un contaminante del aire regulado bajo su diseño físico y operativo, siempre que cualquier limitación física u operativa sobre la capacidad de la fuente para emitir un contaminante del aire regulado, incluyendo los equipos de control de contaminación del aire y las restricciones en las horas de operación o en el tipo o cantidad de material combustido, almacenado o procesado, se tratará como parte de su diseño físico y operativo solo si la limitación o el efecto que tendría en las emisiones sea exigible por el departamento de conformidad con la Ley de Control de la Calidad del Aire o la Ley federal.

P. "**Área Restringida**" es un área en la que se impide eficazmente el ingreso del público. Las barreras eficaces incluyen cercas continuas, muros continuos u otras barreras continuas aprobadas por el Departamento, tales como un terreno físico accidentado con una pendiente pronunciada que requiera equipo especial para ser atravesado. Si una propiedad de gran tamaño está completamente rodeada por cercas, un área restringida dentro de la propiedad podrá identificarse solo con señalización. Las vías públicas no pueden formar parte de un Área Restringida.

Q. **"Parada"** para los requisitos bajo 20.2.72 NMAC, se refiere al cese de operación de cualquier equipo de control de contaminación del aire, equipo de proceso o proceso para cualquier propósito, excepto la desincorporación rutinaria gradual de unidades de proceso por lotes.

R. **"SSM"** para los requisitos bajo 20.2.7 NMAC, se refiere al arranque, parada o mantenimiento programado de forma rutinaria o predecible.

(1) **"Parada"** para los requisitos bajo 20.2.7 NMAC, se refiere al cese de operación de cualquier equipo de control de contaminación del aire o equipo de proceso.

(2) **"Arranque"** para los requisitos bajo 20.2.7 NMAC, se refiere a la puesta en operación de cualquier equipo de control de contaminación del aire o equipo de proceso.

S. **"Arranque"** para los requisitos bajo 20.2.72 NMAC, se refiere a la puesta en operación de cualquier equipo de control de contaminación del aire, equipo de proceso o proceso para cualquier propósito, excepto la incorporación rutinaria gradual de unidades de proceso por lotes.

AQB ..... Oficina de Calidad del Aire
AQCR .....Región de Control de la Calidad del Aire
ASTM .....Sociedad Americana para Pruebas y Materiales
Btu .....Unidad térmica británica
CAA ..... Ley de Aire Limpio de 1970 y Enmiendas de 1990
CEM..... monitoreo continuo de emisiones
cfh ..... pies cúbicos por hora
cfm ..... pies cúbicos por minuto
CFR.....Código de Reglamentos Federales
CI ..... encendido por compresión
CO.....monóxido de carbono
COMS ..... sistema de monitoreo continuo de opacidad
EIB .....Junta de Mejoramiento Ambiental
EPA.....Agencia de Protección Ambiental de los Estados Unidos
gr/100 cf.....granos por cada cien pies cúbicos
gr/dscf .....granos por pie cúbico estándar seco
GRI.....Instituto de Investigación del Gas
HAP..... contaminante del aire peligroso
hp .....caballos de fuerza
H_2S ..... sulfuro de hidrógeno
IC .....combustión interna
KW/hr ..... kilovatios por hora

lb/hr ..... libras por hora
lb/MMBtu ..... libras por millón de unidades térmicas británicas
MACT ..... Tecnología de Control Máxima Alcanzable
MMcf/hr ..... millones de pies cúbicos por hora
MMscf ..... millones de pies cúbicos estándar
N/A ..... no aplica
NAAQS ..... Estándares Nacionales de Calidad del Aire Ambiental
NESHAP ... Estándares Nacionales de Emisiones para Contaminantes del Aire Peligrosos
NG ..... gas natural
NGL ..... líquidos de gas natural
NMAAQS ..... Estándares de Calidad del Aire Ambiental de Nuevo México
NMAC ..... Código Administrativo de Nuevo México
NMED ..... Departamento del Medio Ambiente de Nuevo México
NMSA ..... Estatutos Anotados de Nuevo México
NOx ..... óxidos de nitrógeno
NSCR ..... reducción catalítica no selectiva
NSPS ..... Estándar de Desempeño para Fuentes Nuevas
NSR ..... Revisión de Fuentes Nuevas
PEM ..... monitoreo paramétrico de emisiones
PM ..... material particulado (equivalente a TSP, partículas suspendidas totales)
PM_{10} ..... material particulado con un diámetro de 10 micras o menos
$PM_{2.5}$ ..... material particulado con un diámetro de 2.5 micras o menos
pph ..... libras por hora
ppmv ..... partes por millón en volumen
PSD ..... Prevención del Deterioro Significativo
RATA ..... Evaluación de la Prueba de Precisión Relativa
RICE ..... motor de combustión interna alternativo
rpm ..... revoluciones por minuto
scfm ..... pies cúbicos estándar por minuto
SI ..... encendido por chispa
SO_2 ..... dióxido de azufre
SSM ..... Arranque, Parada y Mantenimiento (ver definición de SSM)
TAP ..... Contaminante del Aire Tóxico
TBD ..... por determinar
THC ..... hidrocarburos totales
TSP ..... partículas suspendidas totales
tpy ..... toneladas por año
ULSD ..... diésel de ultra bajo azufre
USEPA ..... Agencia de Protección Ambiental de los Estados Unidos
UTM ..... Sistema de coordenadas Universal Transversa de Mercator
UTMH ..... Universal Transversa de Mercator Horizontal
UTMV ..... Universal Transversa de Mercator Vertical
VHAP ..... contaminante del aire peligroso volátil
VOC ..... compuestos orgánicos volátiles

RE: Greenhouse Gas Emissions from Project Jupiter

Amphibian populations are declining worldwide, and amphibians are experiencing high extinction rates due to habitat loss, chytrid fungus, pollutants, pesticides, invasive species, and climate change. Amphibians are the most threatened class of vertebrates. Greenhouse gas emissions from sources such as Project Jupiter will increase greenhouse gas emissions, which will affect New Mexico's climate with negative impacts on precipitation, snowfall, stream flows, communities, agriculture, native vegetation, and wildlife, including amphibians.

An article in the April 25, 2026, issue of the *Albuquerque Journal* presented the following concern with respect to the Project Jupiter artificial intelligence (AI) data center:

> "Project Jupiter's two natural gas microgrids will power a 1,700-acre data center used for training artificial intelligence. Those microgrids are expected to generate nearly twice as much greenhouse gas as both Albuquerque and Las Cruces combined, far exceeding original estimates given to the public."

New Mexico is already experiencing climate change impacts. The state is in a long-term drought. Snowpack is below average. Reservoirs have low water levels. Temperatures are rising as demonstrated by the March 2026 heat wave. Fires are becoming more frequent and damaging more acres. We cannot afford to bring Project Jupiter on-line since the project will have unacceptable levels of greenhouse gas emissions that contribute to climate change. Project Jupiter should use sustainable electric energy sources, such as solar panels and battery storage units, to power the microgrids instead of natural gas. I have had solar panels on my house since January 2017, and I installed a heat pump this past winter. If I can use solar panels for electric power, then Project Jupiter can, too.

Sincerely,

Eric R. Johnson

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Ms. Kuhn and Ms. Romero

The permit application should be rejected because the NOX and other pollutant data is based on a test of 65 kilowatt unit for a few hours. Bloom wants to build a power plant with 2,462,000 kilowatts and run it for twenty years. This is a power plant larger than the Hoover Dam ! They used fake data years ago in Dealware based on a sample size of 3 data points and where the standard deviation was greater than the mean and the California Air Resources Board and DNREC (both are corrupt) bought this nonsense. Now New Mexico must refuse to buy nonsense. 2,462,000 kilowatts is 37,877 times as large as 65 kilowatts.

Also the consultant was a little nervous using Bloom pollutant values and added 15% to the values Bloom gave them. For NOX the consultant used 0.00345 pounds per megawatt hour. Interestingly this is double the amount in the DE DNREC permit,

The consultant showed natural gas usage of 15.61 million scf per hour with 1,020 BTUs per scf

for 2,462 megawatts. This means a heat rate of 6.4672 million BTUs per mwh. The EPA uses 117 pounds of CO2 per million BTUs of gas. So multiply 6.4672 by 117 and we get 756.66 pounds of CO2 per mwh. But elsehwere in the submission the consultant revealed 818 pounds of CO2 per megawatt hour. The natural gas usage is TOO LOW and the whole application is not worth the paper it is written on.

Attached are screenshots I made from the pdf document that is the submission.

I am available anytime you wish to discuss this further.

Mr. Zeldin and Special Agent Rotell of the EPA CID. END THE BLOOMDOGGLE !

> I found the permit application Bloom's consultant submitted to you for the 2,462 megawatts of fuel cells at the proposed data center in your state. The application lists natural gas usage of 136,782.34 million scf per year with a sulfur content of 0.75 grains per 100 scf.
>
> All of sulfur excepting for a minuscule amount is filtered out of the natural gas before the gas enters the fuel cell stack. The sulfur together with benzene, chromium, arsenic and lead stays on the filtering media with the desulfurization canisters that Bloom uses. Doing the math we have 0.75 grains times 136,782,340,000 divide 100 we have 1,025,867,550 grains a year of sulfur. There are 7,000 grains in a pound so we have 146,552.5 pounds a year of sulfur. So we have 73 tons a year of sulfur that is trapped on the desiccant within the steel canisters. All of the desiccant is dangerous and the sealed steel canisters are shipped to

Shoremet in Indiana where the canisters are opened and the desiccant is pickled in hydrochloric acid to recover copper. I estimate that the sulfur is 10% of the total mass of the desiccant plus steel housing. Therefore 730 tons a year of dangerous material will be shipped out as solid waste from New Mexico to Indiana. This is 2 tons a day.

The corrupt EPA under Wheeler and Pruit decided the dangerous toxins can be shipped without manifest but that does not make the HAZMAT disappear.

The consultant also admits there will be 0.003 pounds of NOX per megawatt hour. Bloom LIED in Delaware that they emitted only 0.0017 pounds of NOX per megawatt hour and DNREC placed hourly and running 12 month limits on NOX that Bloom has far exceeded.

Bloom also LIED to DE DNREC that their natural gas only emits 112.9 pounds of CO2 per million BTUs. Weall know it emits 117 pounds of CO2 per million BTUs

In your permit application the Bloom consultant states that site will emit 10,144,115 tons per year of CO2. I assume these are short tons with 2,000 pounds,

The consultant stated that the natural gas in NM has 1,020 BTU per scf. Let's multiply 136,782.34 million scf by 1,020 and 117 pounds per million BTUs and divide by 2,000 pounds in a ton and we have 8,161,802.2 tons a year of CO2 This is less than the 10,144,115 tons of CO2 stated in the same permit application. Therefore there is a lot of natural gas missing from the permit application.

I believe the permit application must be rejected,

To the EPA CID

The NM permit application shows Bloom did testing on NOX in December 2023 and that is when they changed their claim of the 0.0017 pounds of NOX per megawatt hour to the 0.003 pounds per megawatt hour. You know that Bloom is submitting fraudulent invoices to Delmarva Power and fraudulent pollutant reports to DE DNREC. You have to end the BLOOMDOGGLE that I estimate has caused Delmarva ratepayers in Delaware to pay $150 million too much in subsidies since Bloom came to town in DE in 2012.

The BLOOMDOGGLE Bloom wants to pull in New Mexico is 89.5 times larger than Delaware. it is 2,462 megawatts versus 27.5 megawatts. I will be assisting Mr. Cox, Ms. Locke and Ms. Hovden to make sure that no environmental crimes happen in New Mexico.

Theranos was the Bloom of Blood and Bloom is the Theranos of Thermodynamics.

1 Bloom Energy Server System (SOFC) uses no add-on controls for regulated pollutants. Uncontrolled equal controlled emissions.
The Energy Server System equipment vendor maintains that there are zero PM emissions from its equipment. Extant reference method testing has been used by the applicant to conservatively estimate emissions, given test method limitations. Vendor indicates that extant testing may exhibit positive sampling method bias and reflects filterable particulate matter from intake air passed through the system. For that reason, the fuel cell system equipment vendor does not specify particulate emission factors.
Fuel cells are not a "combustion source" of PM2.5. Pursuant to 20.2.2.7, 20.2.74.7(AS)(6), and 20.2.72.203.A(3) NMAC, particulate emissions are a "regulated new source review pollutant" which include certain "gaseous emissions from a source or activity" and applicant must submit "all emissions information, calculations and computations" for computing "maximum" particulate matter emissions from the source. To be conservative, applicant uses an emission factor for condensable particulate matter based on available source test data.

Administrative Record NSR_001733

Table 2-P: Greenhouse Gas Emissions

Applications submitted under 20.2.70, 20.2.72, & 20.2.74 NMAC are required to complete this Table. Power plants, Title V major sources, and PSD major sources must report and calculate all GHG emissions for each unit. Applicants must report potential emission rates in short tons per year (see Section 6.a for assistance). Include GHG emissions during Startup, Shutdown, and Scheduled Maintenance in this table. For minor source facilities that are not power plants, are not Title V, or are not PSD, there are three options for reporting GHGs 1) report GHGs for each individual piece of equipment; 2) report all GHGs from a group of unit types, for example report all combustion source GHGs as a single unit and all venting GHG as a second separate unit; OR 3) check the following box ☐ By checking this box, the applicant acknowledges the total CO2e emissions are less than 75,000 tons per year.

You don't often get email from lleveen@gmail.com. Learn why this is important

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Ms. Kuhn and Ms. Romero

I am Lindsay Leveen of Sausalito, California. Tel 415 336 5508

I am an award winning chemical engineer and an award winning journalist and am considered by many to be an expert in Thermodynamics and fuel cells.

I am the informant to the US EPA on Bloom Energy mishandling HAZMAT and on Bloom Energy lying to Delaware DNREC regarding NOX and CO2 emissions.

I found the permit application Bloom's consultant submitted to you for the 2,462 megawatts of fuel cells at the proposed data center in your state. The application lists natural gas usage of 136,782.34 million scf per year with a sulfur content of 0.75 grains per 100 scf.

All of sulfur excepting for a minuscule amount is filtered out of the natural gas before the gas enters the fuel cell stack. The sulfur together with benzene, chromium, arsenic and lead stays on the filtering media with the desulfurization canisters that Bloom uses. Doing the math we have 0.75 grains times 136,782,340,000 divide 100 we have 1,025,867,550 grains a year of sulfur. There are 7,000 grains in a pound so we have 146,552.5 pounds a year of sulfur. So we have 73 tons a year of sulfur that is trapped on the desiccant within the steel canisters. All of the desiccant is dangerous and the sealed steel canisters are shipped to Shoremet in Indiana where the canisters are opened and the desiccant is pickled in hydrochloric acid to recover copper. I estimate that the sulfur is 10% of the total mass of the desiccant plus steel housing. Therefore 730 tons a year of dangerous material will be shipped out as solid waste from New Mexico to Indiana. This is 2 tons a day.

The corrupt EPA under Wheeler and Pruit decided the dangerous toxins can be shipped without manifest but that does not make the HAZMAT disappear.

The consultant also admits there will be 0.003 pounds of NOX per megawatt hour. Bloom LIED in Delaware that they emitted only 0.0017 pounds of NOX per megawatt hour and DNREC placed hourly and running 12 month limits on NOX that Bloom has far exceeded.

Bloom also LIED to DE DNREC that their natural gas only emits 112.9 pounds of CO2 per million BTUs. Weall know it emits 117 pounds of CO2 per million BTUs

In your permit application the Bloom consultant states that site will emit 10,144,115 tons per year of CO2. I assume these are short tons with 2,000 pounds,

The consultant stated that the natural gas in NM has 1,020 BTU per scf. Let's multiply 136,782.34 million scf by 1,020 and 117 pounds per million BTUs and divide by 2,000 pounds in a ton and we have 8,161,802.2 tons a year of CO2 This is less than the 10,144,115 tons of CO2 stated in the same permit application. Therefore there is a lot of natural gas missing from the permit application.

I believe the permit application must be rejected,

To the EPA CID

The NM permit application shows Bloom did testing on NOX in December 2023 and that is when they changed their claim of the 0.0017 pounds of NOX per megawatt hour to the 0.003 pounds per megawatt hour. You know that Bloom is submitting fraudulent invoices to Delmarva Power and fraudulent pollutant reports to DE DNREC. You have to end the BLOOMDOGGLE that I estimate has caused Delmarva ratepayers in Delaware to pay $150 million too much in subsidies since Bloom came to town in DE in 2012.

The BLOOMDOGGLE Bloom wants to pull in New Mexico is 89.5 times larger than Delaware. it is 2,462 megawatts versus 27.5 megawatts. I will be assisting Mr. Cox, Ms. Locke and Ms. Hovden to make sure that no environmental crimes happen in New Mexico. Theranos was the Bloom of Blood and Bloom is the Theranos of Thermodynamics.

Re: Yucca Growth Infrastructure, LLC Notice of Air Quality Permit Application – YGI Microgrid

Dear Ms. Romero, Ms. Kuhn, and Permitting Program Staff:

Please accept this initial comment and demand for public hearing, submitted by the New Mexico Environmental Law Center on behalf of José Saldaña Jr. and Vivian Fuller, (collectively, "community members"), regarding Yucca Growth Infrastructure, LLC,[1] (hereinafter "YGI"), formerly known as Acoma, LLC, and its latest attempt to apply for an air pollution permit to power Project Jupiter, the hyperscale data center campus proposed for Santa Teresa, New Mexico. Community members reserve the right to make additional comments on the YGI application as this process proceeds. As the Department is aware, YGI previously submitted two air pollution permit applications for two microgrid facilities – the East[2] and West[3] microgrids –

[1] *See* Danielle Prokop, *NM Project Jupiter data center developers rename company after Pueblo of Acoma criticism*, SourceNM (April 21, 2026), https://sourcenm.com/briefs/project-jupiter-developers-rename-company-after-pueblo-of-acoma-criticism/.

[2] *See* Acoma LLC's East Microgrid Withdrawn Application (Permit No. 10732 and TEMPO Agency Interest No. 41309) [accessible here: https://cloud.env.nm.gov/resources/_translator.php/YmQ3NWRjYmQ0YmY0OWI5NzgwYjk2N2VhZF8yMTU5Njg~.pdf].

[3] *See* Acoma LLC's West Microgrid Withdrawn Application (Permit No. 10734 and TEMPO Agency Interest No. 41311) [accessible here: https://cloud.env.nm.gov/resources/_translator.php/YTJlYjg5ZWQ2ZWYxOWFiODY0MDYyMzNkZl8yMTU5NTY~.pdf].

both of which were withdrawn on April 27, 2026, after the Department determined it would hold a public hearing on the applications due to significant public interest in and opposition to the project. Community members note that YGI's latest application appears to be nothing more than a thinly veiled attempt to address opposition to the heavily polluting microgrid and, more broadly, Project Jupiter, by disingenuously painting the new microgrid proposal as a green energy solution despite emitting 10 million tons per year of greenhouse gas emissions, 124.01 tons per year of VOCs, 161.21 tons per year of CO2[4] and generating unknown quantities of hazardous waste, while also attempting to exhaust community members and allies by requiring this additional effort to comment and demand a public hearing on a new permit application.

I. NMED must deny YGI's application because it is incomplete.

Pursuant to 20.2.72.203(A)(11) NMAC, YGI must include with its air pollution permit application all "such other specifically identified relevant information as the department may reasonably require." While applicable regulations do not specify what exactly may constitute such relevant information, the word "relevant," as defined by Webster's dictionary, means "relating in an appropriate way to something under consideration: having significant and demonstrable bearing on or relation to the matter at hand;" and "providing evidence tending to prove or disprove the matter at issue or under discussion."[5] Bloom Energy and its solid oxide fuel cell ("SOFC") system upon which YGI seeks to rely, has been the source of significant environmental concerns and challenges for years – concerns that YGI fails to mention in its application, despite relying on emissions testing from the Santa Clara Bloom Energy site – the

[4] Community members note this amount of emissions requires YGI to also obtain a Title V Operating Permit as the power plant qualifies as a major source. See 20.2.70.7(R) NMAC.
[5] "Relevant", Merriam-Webster Dictionary, https://www.merriam-webster.com/dictionary/relevant (last accessed May 12, 2026).

same site that is a chronic thorn in the side of the State of California.[6] This information is certainly relevant and must be meaningfully considered by the Department.

Bloom Energy and its solid oxide fuel cells do not provide clean energy – in fact, the city of Santa Clara, California, attempted to ban the use of these cells due to conflicts with the state of California's aggressive greenhouse gas reduction goals[7] – and the Department must recognize that and take this into consideration when reviewing YGI's Application. In addition to exorbitant greenhouse gas emissions, fuel cells generate NOX, CO, VOCS,[8] and hazardous solid waste.[9] When operating, waste generated sulfur compounds from natural gas combustion must be filtered out, and other toxins such as benzene, toluene, xylene, lead, chromium, and arsenic also become trapped.[10] The filtering material together with the trapped toxins becomes hazardous solid waste.[11] In July 2018, Bloom disclosed that the EPA was seeking to collect $1 million in

[7] *See Bloom Energy 1*, Respondent's Opposition Brief at 6 ("Fuel cells, once installed, generally operate for 15-20 years. Therefore, natural gas fuel cells that are installed in the City in the future will potentially emit GHGs and criteria air pollutants for decades to come. As these emissions are inconsistent with both the City's and State's GHG and green energy goals, the City adopted the Regulations, in part, to encourage development of biogas fuel cells instead of natural gas fuel cells in the City").

[8] As explained in community members' comments on the East and West Microgrid, included here as Attachments 1-A and 1-B, the area impacted by this proposed microgrid facility lands between the 80th and 100th percentile according to the U.S. Environmental Protection Agency's Ozone Environmental Justice Index – meaning residents in these areas are already at a greater risk of impacts from Ozone due to being minority, low-income residents. Archived EPA EJScreen, "Santa Teresa" and "Sunland Park," Environmental Justice Index: Ozone." Accessible at https://pedp-ejscreen.azurewebsites.net/ (last viewed February 23, 2026). As the Department is aware, VOCs are ozone precursors. In an area where residents are already at risk of increased negative health impacts from Ozone pollution, the last thing the Department should do is permit a major VOC source.

fines related to its disposal of benzene, the hazardous waste found in Bloom's desulfurization containers.[12] Benzene, as the Department is undoubtedly aware, is known to cause cancer, adverse gastrointestinal and nervous system effects, blood health impacts, fertility issues and pregnancy complications.[13] The servers upon which YGI now purports to rely upon for energy, over time, collect large quantities of this hazardous waste which, historically, Bloom has simply dumped into the nearest local landfill.[14] While community members understand that the regulation of such hazardous waste falls outside of the purview of the Air Quality Bureau, given the significant negative health and environmental impacts that will come from the use of the SOFCs, community members urge the Air Quality Bureau to coordinate with NMED's Hazardous Waste Bureau and ultimately demand that, prior to issuing any air pollution permit, YGI has obtained all requisite hazardous waste permits required to operate, should this project proceed.

Moreover, Bloom has aggressively lobbied for years for government subsidies to further its business interests, notwithstanding the environmental impacts associated with fuel cells operating using natural gas. Initially, Bloom's lobbying efforts were "tremendously successful, resulting in hundreds of millions of dollars in subsidies."[15] Specifically, Bloom has obtained over $400 million in rate-payer subsidies from the State of California's Self Generation Incentive Program (SGIP). In 2015, after the California State Legislature renewed the SGIP until 2021,

[15] *See Bloom Energy 1,* Respondent's Opposition Brief at 11.

State Assembly members sent a letter to the Public Utilities Commission criticizing the existing SGIP eligibility criteria, which "maintain[ed] eligibility for existing technologies operating on 100 percent conventional natural gas." The letter urged that such technologies are not "consistent with the state's long term climate and energy goals."[16] The letter also noted that these existing natural gas technologies would emit significantly less greenhouse gas emissions if they used renewable biogas.[17]

Importantly, while these fuel cells can operate on biogas, which would greatly reduce the environmental impacts of this proposed power plant, YGI clearly intends for this facility to rely on natural gas.[18] Notably, Bloom often overstates the efficiency of its natural gas fuel cells, especially due to the fact that these fuel cells become less efficient over time.[19] This information, all of which is relevant to YGI's application, is loud in its absence, and must be included for consideration by the Department.

II. NMED should deny YGI's application because the project is contrary to New Mexico's Climate Goals and will result in NMED's perpetuation of environmental racism.

As explained above, the fuel cells YGI purports to rely upon for its proposed power plant will certainly not provide clean energy to Project Jupiter and will cause incredible environmental and public health harm to the community members of Santa Teresa and neighboring Sunland Park. Furthermore, as the Department is aware, New Mexico has the goal of reducing statewide

greenhouse gas emissions by at least 45% by 2030 compared to 2005 levels.[20] It is impossible to fathom how permitting one source proposing to emit 10,144,115 tons of greenhouse gas ("GHG") emissions per year will achieve such a goal.[21] In the absence of state regulations controlling greenhouse gas emissions, and in light of EPA's recision of the endangerment finding,[22] now is the time for the Department to lead on climate change efforts – not to permit an enormous polluting facility for the sole purpose of servicing a data center complex that community members oppose.

Community members understand that the state currently lacks a regulatory scheme under which to regulate greenhouse gas emissions coming from the proposed microgrid. However, in light of Executive Order 2019-003, "Executive Order on Addressing Climate Change and Energy Waste Prevention;"[23] because the greenhouse gas emissions coming from the YGI Microgrid are substantial, because the Department is unequivocally required to "prevent and abate air pollution,"[24] and because greenhouse gases can hardly be considered anything other than a pollutant subject to regulation, the Department should deny YGI's permit application. In the event the Department decides to forego its responsibilities and its commitment to protecting the health and welfare of all New Mexicans and issue an air pollution permit to YGI, the Department must restrict the greenhouse gas emissions coming from the microgrid by requiring the source to

rely exclusively on biofuel or other clean energy sources such as solar, wind or geothermal, not natural gas. Community members further demand, in the event regulating such greenhouse gas emissions requires a rulemaking before the Environmental Improvement Board ("EIB"), the Department petition the EIB for a health protective greenhouse gas regulation prior to permitting any facility that will contribute so significantly to greenhouse gas emissions in New Mexico.

The YGI microgrid stands to emit over 10 million tons of GHG per year – including carbon dioxide (CO2), which is one of the most significant greenhouse gases. Traditionally, the solid oxide fuel cell system converts about 85% of the fuel (natural gas) into electricity, with unconverted fuel undergoing combustion, yielding water and CO2. CO2 exposure affects human health at many levels: short term exposure makes it difficult to breathe, leading to incapacitation, headaches, and, in some cases, vertigo and double vision. At higher concentrations and levels of exposure, the lungs cannot replace the CO2 quickly enough, increasing rate of respiration, metabolic stress, headaches, hypertension, blood and kidney issues, skin problems, muscle tremors, and hearing loss.[25] Importantly, community members in Sunland Park and Santa Teresa will feel these impacts to a significantly greater extent due to the fact that this is an environmental justice community that bears an already disproportionate burden of environmental and public health impacts.[26]

As explained in Community Members' comments on the East and West Microgrid, included here as Attachment 1-A and 1-B, when evaluating any permit application, the

Department must remember and exercise its obligation to consider and address environmental justice and civil rights, which cannot be uncoupled from its obligation to prevent and abate air pollution. The Department must consider information and evidence, in addition to what is required by its technical regulations, in order to ensure that "no group of people should bear a disproportionate share of the negative environmental consequences resulting from industrial, governmental and commercial operations or policies."[27] In addition, Title VI of the Civil Rights Act of 1964 continues to prohibit recipients of federal funds, like the Department, from operating its programs in such a way that results in discrimination in the form of disproportionate impacts of air pollution against any individual or community on the basis of race, color or national origin. 42 U.S.C. §§ 2000d. Finally, the New Mexico Air Quality Control Act, NMSA 1978 §§ 74-2-1 *et seq*., and the Department's implementing regulations require the Department to protect the public health and welfare of all members of the public, in recognition of the needs of the community impacted by the Department's decision. NMSA 1978 § 74-2-5.1(H) (requiring the Department to develop a plan for "the regulation, control, prevention or abatement of air pollution, recognizing the differences, needs, requirements and conditions in the different portions of the geographical area of the department's responsibility …") (emphasis added). Indeed, the Department should be well aware of this obligation to conduct its permitting program in such a way that the specific communities impacted by its decisions are adequately informed and protected.[28] Because any decision to issue an air pollution permit to YGI will impact the communities of Sunland Park and

Part 7, to ensure its permitting processes do not engage in discrimination on the basis of race or national origin).

Santa Teresa differently than it otherwise would if YGI was seeking the Department's permission to pollute a white, affluent community, the Department must consider the context and cumulative impacts a decision to issue any air pollution permit will have on this already overburdened community.

Furthermore, the National Ambient Air Quality Standards ("NAAQS"), and most ambient air quality standards, do not adequately protect the public health and welfare of residents in low-income communities and communities of color. All air pollution impacts, which the YGI Microgrid will significantly contribute to, fall disproportionately on these communities.[29] This is all the more important when considering the fact that the facility will be located in Santa Teresa, a community that is 84% Hispanic, with 23.9% of residents living below the federal poverty line,[30] and already dealing with the effects of being a nonattainment area for Ozone more broadly. In addition, this Borderland community has, for decades, dealt with the impacts of a contaminated drinking water supply,[31] lack of access to quality food and medical care,[32] and

[32] Food access and access to medical care are social determinants of health – non-medical factors that affect health outcomes. These factors combine with health effects of air pollution to exacerbate medical problems and health inequity. Centers for Disease Control, "Social Determinants of Health," (May 15, 2024). Accessible at:

ultimately, a refusal by the State of New Mexico to provide any meaningful assistance and support. Community Members understand that the Department's Air Quality Bureau is charged with making determinations on air quality permit applications, but urge the Department to recognize that any decision it makes on the YGI Permit Application will not occur in a vacuum. YGI's latest attempt to build a microgrid for Project Jupiter stands to emit, on its own, several hundred tons per year of harmful air pollutants with significant public health effects. These health effects will be in addition to the existing health effects already plaguing the Sunland Park and Santa Teresa Community.

Finally, Community Members reiterate that the state of New Mexico has recently reaffirmed its commitment to environmental justice, with Attorney General Raul Torres signing on to a declaration along with thirteen other states, affirming the continued legality and importance of environmental justice efforts by state agencies like the Department.[33] This affirmation is certainly based, at least in part, on the understanding that permitting decisions do not impact all people in the same way, and the Department's obligation to protect the public health and welfare does not mean the public health and welfare of only a few.

III. If the Department determines YGI's Application to be administratively complete, the Department must hold a public hearing in English and Spanish, in Santa Teresa, on the application.

The Air Quality Bureau received approximately 7,155 public comments during the comment period for the East and West Microgrid, most of which requested a public hearing on the permit applications, rising to the level of "significant public interest" required for the

[33] Multi-State Guidance Affirming the Importance and Legality of Environmental Justice Initiatives. Accessible at: https://nmelc.org/wp-content/uploads/2026/01/2025.01.16-EJ-Guidance-for-Publication.pdf (last viewed February 23, 2026).

Department to hold a public hearing on the air permit applications.[34] While the emissions from the proposed YGI microgrid are inconsequentially different, the impacts and opposition to the powerplant remain. As such, all comments submitted relating to the original East and West Microgrids should be considered and reflected in the record of any decision the Department makes on YGI's latest attempt at obtaining an air pollution permit. Community members note, however, that the consideration of earlier public comments does not impact the Department's responsibility to comply with all requirements in 20.2.72.206 NMAC, including ensuring that all public notices after administrative completeness is determined are posted in English and Spanish, all thirty (30) day deadlines are calculated from the date by which both an English and Spanish notice is posted and all application materials are provided to the public in English and Spanish, and the initial public comment period lasts at least thirty (30) days. Consistent with Community members' earlier requests, Community members urge the Department to allow for a public comment period of at least sixty (60) days to ensure members of the public are able to meaningfully participate in this process.

Additionally, community members again demand the Department hold a public hearing, in English and Spanish, in Santa Teresa with a hybrid online option available, as well as provide all permit information, including the application, in Spanish to the public, just as the Department did with the East and West Microgrid Applications, in order to ensure the Department does not fall victim to Bloom Energy's propaganda and allows New Mexico to become another in the list of states duped by the company's false promises.

Re: Community Members Initial Comments on Application for Initial NSR Permit Acoma, LLC – East Microgrid, Permit No. 10732 and TEMPO Agency Interest No. 41309

Dear Ms. Romero, Ms. Kuhn, and Permitting Program Staff:

Please accept this initial comment on Acoma, LLC's Application for Initial NSR Permit – East Microgrid Power Plant, Permit No. 10732 and TEMPO Agency Interest No. 41309 ("East Permit Application"), submitted on behalf of community members in Doña Ana County, José Saldaña, Jr., Vivian Fuller and Daisy Maldonado, collectively, "Community Members." Community Members reserve the right to make additional comments as this permitting process moves forward.

I. Public Access.

While Community Members appreciate the Department's efforts to comply with its own language access policies and provide the East Permit Application in Spanish and English, as well as posting notice of the East Permit Application in public spaces residents in Sunland Park and Santa Teresa, New Mexico, frequent, Community Members urge NMED to ensure residents have the most access to all information related to Acoma, LLC's East Microgrid natural gas power plant application. For this reason, Community Members demand NMED hold at least one public information session on the East Permit Application, prior to the public hearing, in a location of

the Community Members' choosing, in English and Spanish, because the impacts of this proposed major pollution source cannot be understated and must be understood by all residents in the area. This information session must include significant discussion of the Department's East Permit Application analysis, once it is released to the public. In addition, Community Members demand NMED hold a public hearing on the East Permit Application, no less than 90 (ninety) days after NMED's analysis is released, in Santa Teresa, New Mexico, and virtually, in both English and Spanish, in order to provide members of the public adequate opportunity to participate in the permitting process.[1]

II. Acoma, LLC's East Permit Application Must be Considered in Context.

When evaluating any permit application, NMED must remember that the Department's obligation to consider and address environmental justice and civil rights cannot be uncoupled from its obligation to prevent and abate air pollution. NMED must consider information and evidence, in addition to what is required by its technical regulations, in order to ensure that "no group of people should bear a disproportionate share of the negative environmental consequences resulting from industrial, governmental and commercial operations or policies."[2] Title VI of the Civil Rights Act of 1964, continues to prohibit recipients of federal funds, like the Department, from operating its programs in such a way that results in discrimination in the form of disproportionate impacts of air pollution against any individual or community on the basis of

[1] Community Members are concerned with the Department's current Public Involvement Plan, ("PIP"), which simultaneously admits that the public has demonstrated significant interest in the East Permit Application, while also failing to commit to holding either a public information session on the East Permit Application or a public hearing on the West Permit Application. Based on the significant interest in the East Permit Application, the Department must hold a hearing. 20.2.72.206(C) NMAC.

[2] New Mexico Environment Department, "Environmental Justice – Justicia Ambiental." Accessible at: https://www.env.nm.gov/general/environmental-justice-in-new-mexico/ (last viewed February 23, 2026).

race, color or national origin. 42 U.S.C. §§ 2000d. In addition, the New Mexico Air Quality Act, NMSA 1978 §§ 74-2-1 *et seq*., and the Department's implementing regulations require NMED to protect the public health and welfare of all members of the public, *in recognition of the needs of the community impacted by the Department's decision*. NMSA 1978 § 74-2-5.1(H) (requiring the Department to develop a plan for "the regulation, control, prevention or abatement of air pollution, recognizing the differences, needs, requirements and conditions in the different portions of the geographical area of the department's responsibility …") (emphasis added). Indeed, NMED should be well aware of this obligation to conduct its permitting program in such a way that the specific communities impacted by its decisions are adequately informed and protected.[3] Because any decision to issue an air pollution permit to Acoma, LLC will impact the communities of Sunland Park and Santa Teresa differently than it otherwise would if Acoma, LLC was seeking the Department's permission to pollute a white, affluent community, NMED must consider the context and cumulative impact a decision to grant the East Permit Application will have on an already overburdened community.

The National Ambient Air Quality Standards ("NAAQS"), and most ambient air quality standards, do not adequately protect public health and welfare – especially in low-income communities and communities of color. PM2.5 and Ozone impacts, which the East Microgrid will significantly contribute to, fall disproportionately on these communities.[4] This is all the

effects, including reduced lung function, increased asthma attacks, heart and lung harm, and increased risk of kidney and neurological harm.[8] NOx also contribute to the formation of Ozone, which is formed through reactions between precursor pollutants from emissions sources, including fossil fuel combustion sources like the East Microgrid. Ozone causes breathing difficulties, triggers asthma attacks, and leads to asthma development in children.[9] This is all the more important when considering that the entire area impacted by the East Microgrid lands between the 80th and 100th percentile on the U.S. Environmental Protection Agency's Ozone Environmental Justice Index – meaning residents in these areas are already at a greater risk of impacts from Ozone due to being minority, low-income residents.[10] Furthermore, though the area where the East Microgrid seeks to locate is not, from a technical standpoint, within the arbitrary boundaries of the neighboring Ozone "marginal" nonattainment area,[11] the impacts of any additional Ozone on residents in the area will almost certainly not be "marginal."

In addition, under configuration one, the East Microgrid has the potential to emit 600.53 tons of Carbon Monoxide ("CO") per year – a pollutant known to negatively affect the cardiovascular and respiratory systems, cause neurological impacts, and death.[12] Carbon Monoxide, like NOx, is an Ozone precursor, reacting in the presence of sunlight to produce

ground-level Ozone. Configuration two of the East Microgrid is similarly problematic, emitting up to 570.69 tons of CO per year. Notably, the neighboring area of Doña Ana County is currently out of attainment for both PM-10 and 8-Hour Ozone[13] – which the East Microgrid stands to contribute to significantly. For this reason alone, Acoma, LLC's East Permit Application should be denied by the Department, unless NMED wishes to contribute to the existing, and worsening, nonattainment problem.

Finally, the East Microgrid has the potential to emit several hundred tons of all sizes of particulate matter which, similarly, is detrimental to the health and welfare of the public, especially those individuals located in environmental justice and overburdened communities, like Sunland Park and Santa Teresa.

As the Department is undoubtedly aware, the state of New Mexico has recently reaffirmed its commitment to environmental justice, with Attorney General Raul Torres signing on to a publication along with thirteen states, affirming the continued legality and importance of environmental justice efforts.[14] This affirmation is certainly based, at least in part, on the understanding that permitting decisions do not impact all people in the same way, and NMED's obligation to protect the public health and welfare does not mean the public health and welfare of only a few. This, combined with NMED's own stated commitment to ensuring that "no group of people should bear a disproportionate share of the negative environmental consequences

resulting from industrial, governmental and commercial operations or policies,"[15] requires the Department to deny Acoma, LLC's East Permit Application.

III. The related Acoma, LLC West Microgrid must be considered as part of this source.

As the Department is aware, Acoma, LLC has submitted a second air pollution permit application for its West Microgrid Power Plant, similarly intended to exclusively power the data center complex, Project Jupiter, and located approximately two miles from the East Microgrid. Acoma LLC's inappropriate attempt to circumvent more stringent air pollution regulation by splitting its source in half seemingly to avoid Prevention of Significant Deterioration ("PSD") and Title V permitting cannot be ignored by the Department. When considered together, as the microgrid facilities must be, the facility is certainly a Major Source, emitting far more than 100 tons per year of Criteria Pollutants and more than ten tons per year of a single Hazardous Air Pollutant, ("HAP"), or 25 tons per year of a combination of HAPS. 20.2.70.7(R)(1)(a) NMAC. Acoma, LLC's audacious attempt to arbitrarily distinguish two halves of the same source is insulting to both the Department and Community Members, as it is so clearly an attempt to avoid air pollution control requirements: the West Microgrid seeks to emit 20.82 tons per year of HAPS under configuration one and 19.16 tons per year of HAPS under configuration two; the East Microgrid has the potential to emit 24.2 tons per year of HAPS under configuration one and 24.20 tons per year of HAPS under configuration two – thus both sources individually fall just under the 25 tons per year limit.

The East and West Microgrid must be considered to be a single, major source because both sources are adjacent to each other and under the common control of the same persons in

[15] New Mexico Environment Department, "Environmental Justice – Justicia Ambiental." Accessible at: https://www.env.nm.gov/general/environmental-justice-in-new-mexico/ (last viewed February 23, 2026).

which all of the pollutant emitting activities at such source belong to the same major group. 20.2.70.7(R) NMAC. The Department's single source determination on the basis that the East and West Microgrid are separated by a parcel of land not owned by the operator, Acoma, LLC, is preposterous. First, this determination ignores the fact that, the reason the two sources are separated by a parcel of land is because, sitting between the two sources, is the facility the microgrids intend to power. The fact that the sources are a mere two miles apart is insufficient to qualify the East and West Microgrid as separate sources, especially when that distance is because of, and a part of, the full data center campus the microgrid facility belongs to. This would be all the more obvious if Acoma, LLC had included with its East Permit Application a one line diagram of the facility, showing all the anticipated load calculations for the source. Community Members recommend the Department reject the East Permit Application in the absence of such a drawing, as it is needed to ensure NMED considers the project as what it is: a single major polluting source.

The United States Environmental Protection Agency is clear that, in order to be considered "adjacent," the facilities are not required to be on parcels of land that share a border.[16] The determination of whether a source is a single source due to the operations being adjacent to each other requires a case-specific inquiry that further depends on the nature of the industry involved and NMED has authority to make such a determination based on the facts before it.[17] Because the East and West Microgrid will essentially function as one natural gas power plant used for the sole purpose of supplying energy to Project Jupiter, the sources must be considered

[16] United States Environmental Protection Agency, Memorandum, "Interpreting 'Adjacent' for New Source Review and Title V Determinations in All Other Industries Other Than Oil and Gas," (11/28/2019). Administrative Record NSR_001763

as one plant. As such, the microgrid facility must be subject to Title V operating permit requirements, in addition to PSD permitting requirements.

IV. The East Microgrid, if permitted as a stand-alone facility, must be permitted as a Major Source subject to PSD permitting and Title V permitting.

Even if the Department arbitrarily determines it must review the East Permit Application as permitting a stand-alone source, the East Microgrid is, on its own, a Major Source subject to Title V and PSD permitting requirements, not minor source or synthetic minor source permitting requirements, as Acoma, LLC claims on the East Permit Application. For this reason, NMED must deny Acoma, LLC's East Permit Application.

A. The East Microgrid is likely a stand-alone PSD major source in the absence of consideration of the West Microgrid.

The East Microgrid is a source with the potential to emit more than 250 tons per year of any regulated new source review pollutant, such that it is a major source subject to PSD permitting, not NSR minor or synthetic minor source permitting. 20.2.74.7(AG) NMAC.

A major stationary source, if not listed in 20.2.74.501 NMAC, is one which emits or has the potential to emit two hundred fifty (250) tons per year or more of any regulated new source review pollutant. 20.2.74.7(AG)(2) NMAC. As it stands, Acoma, LLC's requested emissions limit would allow the East Microgrid to emit 245 tons per year of both NOx and CO – a mere five tons per year below the PSD limit. The ability of Acoma, LLC to meet these limitations successfully, however, is highly doubtful for two reasons. First, even if Acoma, LLC were to comply with its self-imposed limitation of operating only five of its seven turbines at 100% at one time, the total tons per year of NOx and CO would still exceed the limit of 250 TPY. For example, at Acoma, LLC's self-imposed limit under Configuration 1, operating only five of the seven turbines still puts the East Microgrid well-above the PSD limit, emitting 327.4 TPY of

NOx and 340.1 TPY of CO. This is all the more important when considering the high probability that Acoma, LLC is likely to operate over its self-imposed limitation, due to the enormous capacity the East Microgrid has to generate electricity.

The United States Environmental Protection Agency ("EPA") has raised concerns about the issue of "sham permitting," which occurs when a source improperly seeks a synthetic minor permit by constructing its facility subject to less stringent minor source permitting requirements that it intends to "free itself of shortly after completion of construction and commencement of operation."[18] EPA looks at objective indicia to identify whether a permit applicant is unlawfully circumventing major source permitting requirements, including "the economic realities surrounding a transaction; and projected levels of operation as portrayed to lending institutions and other records of projected demand output."[19] Most important, "where it appears obvious that a proposed source or modification, by its physical and operational design characteristics, could not economically run at minor source levels for an appreciable length of time, EPA will consider minor source limits taken by the source unrealistic and sham."[20] Acoma, LLC's East Permit Application is almost certainly a sham. In addition to unlawfully splitting the source into an East and West Microgrid, discussed above, the East Microgrid has an output potential less than what is required to operate Project Jupiter, such that it is inconceivable that the source plans to operate at minor levels, as proposed. Project Jupiter, which the East Microgrid will serve, will require at least 2700-2800 Megawatts of power.[21] Based on the East Permit Application, it is simply

[21] Peter Goodman, KRWG, "Big money moved Project Jupiter forward with lightning speed - at what cost?" (1/5/26). Accessible at:

inconceivable that Acoma, LLC intends to operate at any level less than full capacity in order to serve the data center.

Second, it is highly likely that the emissions from the East Microgrid will be even greater than anticipated, given that Acoma, LLC's emissions estimates are based on AP-42 emissions factors. Emissions factors are representative values, most commonly averages of all available data for emissions sources. Because these emissions factors represent an average of a range of emission rates, approximately half of the subject sources Acoma, LLC has estimated emissions of will have emissions rates greater than the emission factor. As such, a permit limit using an AP-42 emission factor would result in half of the sources being in noncompliance. This is all the more important because Acoma, LLC relies on emissions factors with ratings of "C," "D," and "E." These factors are developed from poorly rated data, with "D" and "E" rated emissions presenting a high likelihood that the facilities tested do not represent a random sample of the industry and are not reflective of emissions coming out of the source.

In November, 2020, EPA issued an Enforcement Alert, reminding all permitting agencies and regulated entities of these issues, and explicitly cautioning against the use of even highly rated factors of "A" and "B" and stating "Remember, AP-42 emissions factors should only be used as a last resort."[22] Rather than comply with this guidance, Acoma, LLC relies on these factors to estimate their enormous emissions. While Community Members understand that the Department often allows polluting industries to rely on these emissions factors for the purpose of administrative convenience, the significant risks of doing so in this case cannot be understated.

---

https://www.krwg.org/local-viewpoints/2026-01-05/big-money-moved-project-jupiter-forward-with-lightning-speed-at-what-cost (last viewed February 24, 2026).

[22] United States Environmental Protection Agency, Office of Enforcement and Compliance Assurance, "Enforcement Alert," Pub. No. EPA 325-N-20-001 (Nov. 2020). Accessible at: https://www.epa.gov/sites/default/files/2021-01/documents/ap42-enforcementalert.pdf (last viewed February 24, 2026).

Given how close the East Microgrid already is to being subject to PSD requirements, and when considering the nearby nonattainment area and environmental justice concerns in the community where the East Microgrid will locate, NMED must require Acoma, LLC to obtain and use the most representative emissions data, including source specific emissions data, in any permit application, in order to ensure the public is protected from the harmful impacts of emissions from this facility, and should deny the East Permit Application outright as Acoma, LLC has failed to seek a PSD Major Source permit.

B. Acoma, LLC must obtain Title V Operating Permit for the East Microgrid.

Finally, should NEMD issue an air pollution permit to Acoma, LLC, which it should not do on the basis of its existing East Permit Application, the Department must require Acoma, LLC to obtain a Title V operating permit. A Title V permit is required for sources that have a potential to emit more than 100 tons per year for criteria pollutants. The East Microgrid has the potential to emit far more than 100 tons per year of NOx, CO, and PM, all criteria pollutants, discussed above, as well as 35.84 tons per year of Hazardous Air Pollutants ("HAPs") – subjecting the source to Title V permitting requirements.

V. Permitting the East Microgrid is contrary to New Mexico's climate goals.

New Mexico has the goal of reducing statewide greenhouse gas emissions by at least 45% by 2030 compared to 2005 levels.[23] It is impossible to fathom how permitting one source proposing to emit 7,959,053.56 TPY of greenhouse gas emissions, let alone a combined nearly 14 million tons per year when including the West Microgrid's 5,116,498.57 TPY of greenhouse gas emissions, will achieve such a goal. In the absence of state regulations controlling

[23] New Mexico Interagency Climate Change Task Force, 2022-2024 New Mexico Climate Strategy, "Climate Progress Report," (October 2025). Accessible at: https://cloud.env.nm.gov/resources/_translator.php/MjI3NjdjZGQ2ZWQ4M2Q0YjlhZTY4ZDE5Ml8yMDg5MjU~.pdf (last viewed February 24, 2026).

greenhouse gas emissions, and in light of EPA's recision of the endangerment finding,[24] now is the time for the Department to lead on climate change mitigation – not to permit an enormous polluting facility for the sole purpose of servicing a data center.

Community Members understand that the state currently lacks a regulatory scheme under which to regulate greenhouse gas emissions coming from the East Microgrid. However, in light of Executive Order 2019-003, "Executive Order on Addressing Climate Change and Energy Waste Prevention,"[25] and because these emissions are substantial, because the Department is required to prevent and abate air pollution, and because greenhouse gases can hardly be considered anything other than a pollutant subject to regulation, NMED must restrict the greenhouse gas emissions coming from the East Microgrid by requiring strict emissions limitations in any final permit. In the event regulating such emissions requires a rulemaking before the Environmental Improvement Board ("EIB"), Community Members demand NMED petition the EIB for a health protective greenhouse gas regulation prior to permitting any facility that will contribute so significantly to greenhouse gas emissions in New Mexico.

VI. Permitting the East Microgrid will harm the public's health and welfare, along with the local and state economy.

Additionally, in light of Secretary Kenney's commitment to "environment and economy,"[26] the Department must deny Acoma, LLC's East Permit Application because issuing a

[24] 91 FR 7686; (Vol. 91, No. 32, (Feb. 18, 2026). Accessible at: https://www.govinfo.gov/content/pkg/FR-2026-02-18/pdf/2026-03157.pdf (last viewed February 24, 2026).

[26] See New Mexico Environment Department Secretary Kenney Statement on Repeal of EP Endangerment Finding (February 12, 2026). Accessible at: https://www.env.nm.gov/wp-content/uploads/2026/02/2026-02-12-COMMS-Sec.-Kenney-statement-on-repeal-of-EPA-endangerment-finding-Final.pdf (last viewed February 24, 2026).

permit will not only harm the environment and the public health and welfare, which the Department must protect, but will also harm the economy.[27] The high economic costs of air pollution have been well understood for decades. In 2014, premature mortality from PM2.5 alone cost the U.S. economy over $780 billion, and constituted over 4 percent of gross domestic product.[28] State-level studies have yielded similar conclusions. Research published in 2020 estimated the economic cost of air pollution in Utah to be $1.9 billion annually. The authors attributed 55 percent of these costs to PM2.5 and less than 10 percent to O3 and NOx.[29]

Moreover, a growing body of research demonstrates that air pollution reduces workforce participation and productivity. The Organisation for Economic Co-operation and Development, an international standard-setter for public welfare and policy, projects a marked decrease in global labor force productivity due to rising air pollution. Each year, an estimated 1.2 billion workdays are lost worldwide due to the health effects of air pollution. By 2060, this number is expected to more than triple, growing to 3.7 billion.[30] Air pollution decreases labor productivity by increasing absenteeism and 'presenteeism' the practice of working while sick.[31] Exposure to moderate levels of PM2.5, for example, has been shown to reduce the hours worked by adults,

---

[27] Community Members note that while the Department may consider the economic impacts of a proposed air pollution project, NMED's primary mission to prevent and abate air pollution and protect public health and welfare remains. For that reason, Community Members urge the Department to consider the economic costs of an unhealthy public due to polluted air in addition to any speculative economic benefit a polluting entity may provide – and weigh such factors accordingly.

likely due to the need for caregiving for susceptible dependents such as young children and elderly adults.[32] Indeed, parents of children with asthma have been shown to miss significantly more work days than parents of children without asthma.[33] Other studies have shown that mothers of children with asthma are less likely than other mothers to be employed with full-or part-time jobs.[34]

This stands in stark contrast to the claims being made by developers of Project Jupiter, who seek to construct the East Microgrid to service Project Jupiter – and who claim this project will bring jobs and economic gain to Doña Ana County and New Mexico. The Department has a responsibility to protect the health and welfare of New Mexico residents and should not contribute to airshed and economic problems already plaguing Doña Ana County by allowing a facility to locate in an already overburdened area.

VII. Conclusion

For the foregoing reasons, Community Members urge NMED to deny Acoma, LLC's East Permit Application. In addition, Community Members demand a public hearing on the East Permit Application, to be held in person and virtually, in English and Spanish, in Santa Teresa, no less than ninety days after the Department makes its analysis of the East Permit Application publicly available in English and Spanish. Community Members further request the Department hold at least one public information session about its East Permit Application analysis, both in

Re: Community Members Initial Comments on Application for Initial NSR Permit Acoma, LLC – West Microgrid, Permit No. 10734 and TEMPO Agency Interest No. 41311

Dear Ms. Romero, Ms. Kuhn, and Permitting Program Staff:

Please accept this initial comment on Acoma, LLC's Application for Initial NSR Permit – West Microgrid Power Plant, Permit No. 10734 and TEMPO Agency Interest No. 41311("West Permit Application"), submitted on behalf of community members in Doña Ana County, José Saldaña, Jr., Vivian Fuller and Daisy Maldonado, collectively, "Community Members." Community Members reserve the right to make additional comments as this permitting process moves forward.

I. Public Access.

While Community Members appreciate the Department's efforts to comply with its own language access policies and provide the West Permit Application in Spanish and English, as well as posting notice of the West Permit Application in public spaces residents in Sunland Park and Santa Teresa, New Mexico, frequent, Community Members urge NMED to ensure residents have the most access to all information related to Acoma, LLC's West Microgrid natural gas power plant. For this reason, Community Members demand NMED hold at least one public

information session on the West Permit Application, prior to the public hearing, in a location of the Community Members' choosing, in English and Spanish, because the impacts of this proposed major pollution source cannot be understated and must be understood by all residents in the area. This information session must include significant discussion of the Department's West Permit Application analysis, once it is released to the public. In addition, Community Members demand NMED hold a public hearing on the West Permit Application, no less than 90 (ninety) days after NMED's analysis is released, as required by 20.2.72.206(B) NMAC, in Santa Teresa, New Mexico, and virtually, in both English and Spanish, in order to provide members of the public adequate opportunity to participate in the permitting process.[1]

II. Acoma, LLC's West Permit Application Must be Considered in Context.

When evaluating any permit application, NMED must remember that the Department's obligation to consider and address environmental justice and civil rights cannot be uncoupled from its obligation to prevent and abate air pollution. NMED must consider information and evidence, in addition to what is required by its technical regulations, in order to ensure that "no group of people should bear a disproportionate share of the negative environmental consequences resulting from industrial, governmental and commercial operations or policies."[2] Title VI of the Civil Rights Act of 1964, continues to prohibit recipients of federal funds, like the Department, from operating its programs in such a way that results in discrimination in the form

[1] Community Members are concerned with the Department's current Public Involvement Plan, ("PIP"), which simultaneously admits that the public has demonstrated significant interest in the West Permit Application, while also failing to commit to holding either a public information session on the West Permit Application or a public hearing on the East Permit Application. Based on the significant interest in the West Permit Application, the Department must hold a hearing. 20.2.72.206(C) NMAC.

[2] New Mexico Environment Department, "Environmental Justice – Justicia Ambiental." Accessible at: https://www.env.nm.gov/general/environmental-justice-in-new-mexico/ (last viewed February 23, 2026).

of disproportionate impacts of air pollution against any individual or community on the basis of race, color or national origin. 42 U.S.C. §§ 2000d. In addition, the New Mexico Air Quality Act, NMSA 1978 §§ 74-2-1 *et seq*., and the Department's implementing regulations require NMED to protect the public health and welfare of all members of the public, *in recognition of the needs of the community impacted by the Department's decision*. NMSA 1978 § 74-2-5.1(H) (requiring the Department to develop a plan for "the regulation, control, prevention or abatement of air pollution, recognizing the differences, needs, requirements and conditions in the different portions of the geographical area of the department's responsibility …") (emphasis added). Indeed, NMED should be well aware of this obligation to conduct its permitting program in such a way that the specific communities impacted by its decisions are adequately informed and protected.[3] Because any decision to issue an air pollution permit to Acoma, LLC will impact the communities of Sunland Park and Santa Teresa differently than it otherwise would if Acoma, LLC was seeking the Department's permission to pollute a white, affluent community, NMED must consider the context and cumulative impact a decision to grant the West Permit Application will have on an already overburdened community.

The National Ambient Air Quality Standards ("NAAQS"), and most ambient air quality standards, do not adequately protect the public health and welfare of residents in low-income communities and communities of color. PM2.5 and Ozone impacts, which the West Microgrid will significantly contribute to, fall disproportionately on these communities.[4] This is all the

more important when considering the fact that the West Microgrid facility will be located in Santa Teresa, a community that is 84% Hispanic, with 23.9% of residents living below the federal poverty line,[5] and already dealing with the effects of being a nonattainment area for Ozone more broadly. In addition, this Borderland community has, for decades, dealt with the impacts of a contaminated drinking water supply,[6] lack of access to quality food and medical care,[7] and ultimately a refusal by the State of New Mexico to provide any meaningful assistance. Community Members understand that the Department's Air Bureau is charged with making determinations on air quality permit applications, but urge the Department to recognize that any decision it makes on the West Permit Application will not occur in a vacuum. The West Microgrid stands to emit, on its own, several hundred tons of harmful air pollutants with significant public health effects. These health effects will be in addition to the existing health effects already plaguing the Sunland Park and Santa Teresa Community.

[7] Food access and access to medical care are social determinants of health – non-medical factors that affect health outcomes. These factors combine with health effects of air pollution to exacerbate medical problems and health inequity. Centers for Disease Control, "Social Determinants of Health," (May 15, 2024). Accessible at: https://www.cdc.gov/public-health-gateway/php/about/social-determinants-of-health.html (last viewed March 2, 2026).

The West Microgrid, under configuration one,[8] has the potential to emit 3,775.25 tons of nitrogen oxides per year. Nitrogen oxides ("NOx") are known to cause a range of harmful health effects, including reduced lung function, increased asthma attacks, heart and lung harm, and increased risk of kidney and neurological harm.[9] NOx also contributes to the formation of Ozone, which is formed through reactions between precursor pollutants from emissions sources, including fossil fuel combustion sources like the West Microgrid. Ozone causes breathing difficulties, triggers asthma attacks, and leads to asthma development in children.[10] Again, this is all the more important when considering that the entire area impacted by the West Microgrid lands between the 80th and 100th percentile on the U.S. Environmental Protection Agency's Ozone Environmental Justice Index – meaning residents in these areas are already at a greater risk of impacts from Ozone due to being minority, low-income residents.[11] Furthermore, though the area where the West Microgrid seeks to locate is not, from a technical standpoint, within the arbitrary boundaries of the neighboring Ozone "marginal" nonattainment area,[12] the impacts of any additional Ozone on residents in the area will almost certainly not be "marginal."

In addition, under configuration one,[13] the West Microgrid has the potential to emit 2,298.3 tons of Carbon Monoxide ("CO") per year – a pollutant known to negatively affect the

[8] Similarly, under configuration two, the West Microgrid's maximum NOx emissions are 3,878.12 tons per year.
[9] American Lung Association, "Nitrogen Dioxide," https://www.lung.org/clean-air/outdoors/what-makes-air-unhealthy/nitrogen-dioxide (last viewed February 23, 2026).

[12] United States Environmental Protection Agency Greenbook, "Current Nonattainment Counties for All Criteria Pollutants." Accessible at: https://www3.epa.gov/airquality/greenbook/ancl.html (last viewed February 23, 2026).
[13] Under configuration two, the West Microgrid's potential CO emissions are 5,190.06 tons per year.

cardiovascular and respiratory systems, cause neurological impacts, and death.[14] Carbon Monoxide, like NOx, is an Ozone precursor, reacting in the presence of sunlight to produce ground-level Ozone. Notably, as mentioned above, a neighboring area of Doña Ana County is currently out of attainment for both PM-10 and 8-Hour Ozone[15] – which the West Microgrid stands to contribute to significantly. For this reason alone, Acoma, LLC's West Permit Application should be denied by the Department, unless NMED wishes to contribute to the existing, and worsening, nonattainment problem in the County.

Finally, the West Microgrid has the potential to emit several hundred tons of particulate matter of all sizes which, similar to the pollutants above, is detrimental to the health and welfare of the public, especially those individuals located in environmental justice and overburdened communities, like Sunland Park and Santa Teresa.

As the Department is undoubtedly aware, the state of New Mexico has recently reaffirmed its commitment to environmental justice, with Attorney General Raul Torres signing on to a publication along with 13 other states, affirming the continued legality and importance of environmental justice efforts by state agencies like NMED.[16] This affirmation is certainly based, at least in part, on the understanding that permitting decisions do not impact all people in the same way, and NMED's obligation to protect the public health and welfare does not mean the public health and welfare of only a few. This, combined with NMED's own stated commitment

to environmental justice and legal requirement to protect the public health and welfare for all members of the public, requires the Department to deny Acoma, LLC's West Permit Application.

III. The related Acoma, LLC East Microgrid must be considered as part of this source.

As the Department is aware, Acoma, LLC has submitted a second air pollution permit application for its East Microgrid Power Plant, similarly intended to exclusively power a data center complex, Project Jupiter, and located approximately two miles from the West Microgrid. Acoma, LLC's inappropriate attempt to circumvent more stringent air pollution regulation by splitting its source in half seemingly to avoid Prevention of Significant Deterioration ("PSD") and Title V permitting cannot be ignored by the Department. When considered together, as the microgrid facilities must be, the facility is certainly a Major Source, emitting far more than 100 tons per year of Criteria Pollutants and more than ten tons per year of a single Hazardous Air Pollutant, ("HAP"), or 25 tons per year of a combination of HAPS. 20.2.70.7(R)(1)(a) NMAC. Acoma, LLC's audacious attempt to arbitrarily distinguish two halves of the same source is insulting to both the Department and Community Members, as it is so clearly an attempt to avoid air pollution control requirements: the West Microgrid seeks to emit 20.82 tons per year of HAPS under configuration one and 19.16 tons per year of HAPS under configuration two; the East Microgrid has the potential to emit 24.2 tons per year of HAPS under configuration one and 24.20 tons per year of HAPS under configuration two – not coincidentally, both facilities fall just under the 25 tons per year HAPS limit.

The East and West Microgrid must be considered to be a single, major source because both sources are adjacent to each other and under the common control of the same persons in which all of the pollutant emitting activities at such source belong to the same major group. 20.2.70.7(R) NMAC. The Department's single source determination on the basis that the East

and West Microgrid are separated by a parcel of land not owned by the operator, Acoma, LLC, is nothing short of preposterous. First, this determination ignores the fact that the reason the two sources are separated by a parcel of land is because, sitting between the two sources, is the facility the microgrids intend to power. The fact that the sources are a mere two miles apart is insufficient to qualify the East and West Microgrid as separate sources, especially when that distance is because of, and a part of, the full data center campus the microgrid facility belongs to. This would be all the more obvious if Acoma, LLC had included with its West Permit Application a one line diagram of the facility, showing all the anticipated load calculations for the source. Community Members recommend the Department reject the West Permit Application in the absence of such a drawing, as it is needed to ensure NMED considers the project as what it is: a single major polluting source.

The United States Environmental Protection Agency ("EPA") is clear that "adjacent," does not require the facilities to be on parcels of land that share a border.[17] The determination of whether a source is a single source when two operations are adjacent to each other requires a case-specific inquiry that depends on the nature of the industry involved, and NMED has authority to make such a determination based on the facts before it.[18] Because the East and West Microgrid will essentially function as one natural gas power plant used for the sole purpose of supplying energy to Project Jupiter, the sources must be considered as one plant. As such, the microgrid facility must be subject to Title V operating permitting requirements, in addition to PSD permitting.

---

IV. The West Microgrid, if permitted as a stand-alone facility, must be permitted as a Major Source subject to PSD permitting and Title V permitting.

Even if the Department arbitrarily determines it must review the West Permit Application as permitting a stand-alone source, the West Microgrid is, on its own, a Major Source subject to Title V and PSD permitting requirements, not minor source or synthetic minor source permitting requirements, as Acoma, LLC claims on the West Permit Application. For this reason, NMED must deny Acoma, LLC's West Permit Application.

A. The West Microgrid is likely a stand-alone PSD major source in the absence of consideration of the East Microgrid.

The West Microgrid is a source with the potential to emit more than 250 tons per year of any regulated new source review pollutant, such that it is a major source subject to PSD permitting, not NSR minor or synthetic minor source permitting. 20.2.74.7(AG) NMAC.

A major stationary source, if not listed in 20.2.74.501 NMAC, is one which emits or has the potential to emit two hundred fifty (250) tons per year or more of any regulated new source review pollutant. 20.2.74.7(AG)(2) NMAC. As it stands, Acoma, LLC's requested emissions limit would allow the West Microgrid to emit 245 tons per year of NOx, PM, PM10, PM2.5 and CO – a mere five tons per year below the PSD limit for nearly every criteria pollutant. The ability of Acoma, LLC to meet these limitations successfully, however, is highly doubtful for two reasons. First, even if Acoma, LLC were to comply with its self-imposed annual emissions cap, Acoma, LLC is likely to operate over its self-imposed limitation, due to the enormous capacity the West Microgrid has to generate electricity and its potential to emit either 3,775.25 or 3,878.12 TPY of NOx, 2,298.30 or 5,190.06 TPY of CO, 259.49 TPY of VOCs, and 270.30 or 277.67 TPY of condensible PM, PM10 and PM2.5.

Administrative Record NSR_001780

The United States Environmental Protection Agency ("EPA") has raised concerns about the issue of "sham permitting," which occurs when a source improperly seeks a synthetic minor permit by constructing its facility subject to less stringent minor source permitting requirements that it intends to "free itself of shortly after completion of construction and commencement of operation."[19] EPA looks at objective indicia to identify whether a permit applicant is unlawfully circumventing major source permitting requirements, including "the economic realities surrounding a transaction; and projected levels of operation as portrayed to lending institutions and other records of projected demand output."[20] Most important, "where it appears obvious that a proposed source or modification, by its physical and operational design characteristics, could not economically run at minor source levels for an appreciable length of time, EPA will consider minor source limits taken by the source unrealistic and sham."[21] Acoma, LLC's West Permit Application is almost certainly a sham. In addition to unlawfully splitting the source into an East and West Microgrid, discussed above, the West Microgrid has an output potential much lower than what is required to operate Project Jupiter, such that it is inconceivable that the source plans to operate at minor levels, as proposed. Project Jupiter, which the West Microgrid will serve, will require at least 2700-2800 Megawatts of power.[22] Based on the West Permit Application, it is simply inconceivable that Acoma, LLC intends to operate at any level less than full capacity in order to successfully serve the data center.

[22] Peter Goodman, KRWG, "Big money moved Project Jupiter forward with lightning speed - at what cost?" (1/5/26). Accessible at: https://www.krwg.org/local-viewpoints/2026-01-05/big-money-moved-project-jupiter-forward-with-lightning-speed-at-what-cost (last viewed February 24, 2026).

Second, it is highly likely that the emissions from the West Microgrid will be even greater than anticipated, given that Acoma, LLC's emissions estimates are based on AP-42 emissions factors. Emissions factors are representative values, most commonly averages of all available data for emissions sources. Because these emissions factors represent an average of a range of emission rates, approximately half of the subject sources Acoma, LLC has estimated emissions of will have emissions rates greater than what is noted on the West Permit Application. As such, any permit limit based on the use of an AP-42 emission factor would result in half of the sources permitted being in noncompliance. This is all the more important because Acoma, LLC relies on emissions factors with ratings of "C," "D," and "E". These factors are developed from poorly rated data, with "D" and "E" rated emissions presenting a high likelihood that the facilities tested do not represent a random sample of the industry and are not reflective of emissions coming out of the source.

In November, 2020, the United States Environmental Protection Agency issued an Enforcement Alert, reminding all permitting agencies and regulated entities of these issues, and explicitly cautioning against the use of even highly rated factors of "A" and "B" and stating "Remember, AP-42 emissions factors should only be used as a last resort." (emphasis added)[23] Rather than comply with this guidance, Acoma, LLC relies on these factors to estimate their already enormous emissions. While Community Members understand that the Department often allows polluting industries to rely on these emissions factors for the purpose of administrative convenience, the significant risks of doing so in this case cannot be understated. Given how close the West Microgrid is to being subject to PSD requirements, and when considering the nearby

[23] United States Environmental Protection Agency, Office of Enforcement and Compliance Assurance, "Enforcement Alert," Pub. No. EPA 325-N-20-001 (Nov. 2020). Accessible at: https://www.epa.gov/sites/default/files/2021-01/documents/ap42-enforcementalert.pdf (last viewed February 24, 2026).

nonattainment area and environmental justice concerns in the community where the West Microgrid will locate, NMED must require Acoma, LLC to obtain and use the most representative emissions data, including source specific emissions data, in any permit application, in order to ensure the public is protected from the harmful impacts of emissions from this facility, and should deny the current West Permit Application outright as Acoma, LLC has failed to seek a PSD Major Source permit.

B. Acoma, LLC must obtain Title V Operating Permit for the West Microgrid.

Finally, should NEMD issue a construction permit to Acoma, LLC, which it should not do on the basis of its existing West Permit Application, the Department must require Acoma, LLC to obtain a Title V operating permit. A Title V permit is required for sources that have a potential to emit more than 100 tons per year for Criteria Pollutants. The West Microgrid has the potential to emit substantially more than 100 tons per year of NOx, CO, and PM, all of which are Criteria Pollutants, subjecting the source to Title V permitting requirements.

V. Permitting the West Microgrid is contrary to New Mexico's climate goals.

New Mexico has the goal of reducing statewide greenhouse gas emissions by at least 45% by 2030 compared to 2005 levels.[24] It is impossible to fathom how permitting one source proposing to emit 5,116,498.57 TPY of greenhouse gas emissions, let alone a combined nearly 14 million tons per year when including the East Microgrid's 7,959,053.56 TPY of greenhouse gas emissions, will achieve such a goal. In the absence of state regulations controlling

[24] New Mexico Interagency Climate Change Task Force, 2022-2024 New Mexico Climate Strategy, "Climate Progress Report," (October 2025). Accessible at: https://cloud.env.nm.gov/resources/_translator.php/MjI3NjdjZGQ2ZWQ4M2Q0YjlhZTY4ZDE5Ml8yMDg5MjU~.pdf (last viewed February 24, 2026).

greenhouse gas emissions, and in light of EPA's recision of the endangerment finding,[25] now is the time for the Department to lead on climate change efforts – not to permit an enormous polluting facility for the sole purpose of servicing a data center complex.

Community Members understand that the state currently lacks a regulatory scheme under which to regulate greenhouse gas emissions coming from the West Microgrid. However, in light of Executive Order 2019-003, "Executive Order on Addressing Climate Change and Energy Waste Prevention,"[26] and because the greenhouse gas emissions coming from the West Microgrid are substantial, because the Department is unequivocally required to "prevent and abate air pollution" and because greenhouse gases can hardly be considered anything other than a pollutant subject to regulation, in the event the Department decides to issue an air pollution permit to Acoma, LLC, NMED must restrict the greenhouse gas emissions coming from the West Microgrid by requiring strict emissions limitations in any final permit. In the event regulating such emissions requires a rulemaking before the Environmental Improvement Board ("EIB"), Community Members demand NMED petition the EIB for a health protective greenhouse gas regulation prior to permitting any facility that will contribute so significantly to greenhouse gas emissions in New Mexico.

VI. Permitting the West Microgrid will harm the public's health and welfare, along with the local and state economy.

[25] 91 FR 7686; (Vol. 91, No. 32, (Feb. 18, 2026). Accessible at: https://www.govinfo.gov/content/pkg/FR-2026-02-18/pdf/2026-03157.pdf (last viewed February 24, 2026).
[26] E.O. 2019-003, "Executive Order on Addressing Climate Change and Energy Waste Prevention," (January 29, 2019). Accessible at: https://www.governor.state.nm.us/wp-content/uploads/2019/01/EO_2019-003.pdf (last viewed February 24, 2026).

Additionally, in light of Secretary Kenney's commitment to "environment and economy,"[27] the Department must deny Acoma, LLC's West Permit Application because issuing a permit will not only harm the environment and the public health and welfare, discussed above, which the Department must protect, but will also harm the economy.[28] The high economic costs of air pollution have been well understood for decades. In 2014, premature mortality from PM2.5 alone cost the U.S. economy over $780 billion, and constituted over 4 percent of gross domestic product.[29] State-level studies have yielded similar conclusions. Research published in 2020 estimated the economic cost of air pollution in Utah to be $1.9 billion annually. The authors attributed 55 percent of these costs to PM2.5 and less than 10 percent to O3 and NOx.[30]

Moreover, a growing body of research demonstrates that air pollution reduces workforce participation and productivity. The Organisation for Economic Co-operation and Development, an international standard-setter for public welfare and policy, projects a marked decrease in global labor force productivity due to rising air pollution. Each year, an estimated 1.2 billion workdays are lost worldwide due to the health effects of air pollution. By 2060, this number is expected to more than triple, growing to 3.7 billion.[31] Air pollution decreases labor productivity

[27] See New Mexico Environment Department Secretary Kenney Statement on Repeal of EP Endangerment Finding (February 12, 2026). Accessible at: https://www.env.nm.gov/wp-content/uploads/2026/02/2026-02-12-COMMS-Sec.-Kenney-statement-on-repeal-of-EPA-endangerment-finding-Final.pdf (last viewed February 24, 2026).

[28] Community Members note that while the Department may consider the economic impacts of a proposed air pollution project, NMED's primary mission to prevent and abate air pollution and protect public health and welfare remains. For that reason, Community Members urge the Department to consider the economic costs of an unhealthy public due to polluted air in addition to any speculative economic benefit a polluting entity may provide – and weigh such factors accordingly.

[30] Errigo, I., et al., *Human Health and Economic Costs of Air Pollution in Utah: An Expert Assessment*. Atmosphere 2020, *11*, 1238. At 12 of 28. Retrieved from https://www.mdpi.com/2073-4433/11/11/1238.

[31] OECD (2016), The Economic Consequences of Outdoor Air Pollution, OECD Publishing, Paris.

by increasing absenteeism and 'presenteeism' – the practice of working while sick.[32] Exposure to moderate levels of PM2.5, for example, has been shown to reduce the hours worked by adults, likely due to the need for caregiving for susceptible dependents such as young children and elderly adults.[33] Indeed, parents of children with asthma have been shown to miss significantly more work days than parents of children without asthma.[34] Other studies have shown that mothers of children with asthma are less likely than other mothers to be employed with full-or part-time jobs.[35]

This stands in stark contrast to the claims being made by developers of Project Jupiter, who seek to construct the West Microgrid to service Project Jupiter – and who claim the project will bring jobs and economic gain to Doña Ana County and New Mexico. Because the Department has a responsibility to protect the health and welfare of New Mexico residents, it should not contribute to airshed and economic problems already plaguing Doña Ana County by allowing any microgrid facility to locate in this already overburdened area.

VII. Conclusion

For the foregoing reasons, Community Members urge NMED to deny Acoma, LLC's West Permit Application. In addition, Community Members demand a public hearing on the West Permit Application, to be held in person and virtually, in English and Spanish, in Santa

CONSENT AGREEMENT AND FINAL ORDER

CONSENT AGREEMENT

PRELIMINARY STATEMENT

1. This Consent Agreement is entered into by the Director of the Waste and Chemical Enforcement Divison, Office of Civil Enforcement, Office of Enforcement and Compliance Assurance ("Complainant") and Bloom Energy Corporation ("Respondent") (collectively the "Parties"), pursuant to Section 3008(a) and (g) of the Resource Conservation and Recovery Act ("RCRA" or the "Act"), as amended, 42 U.S.C. § 6928(a) and (g), and the Consolidated Rules of Practice Governing the Administrative Assessment of Civil Penalties and the Revocation, Termination or Suspension of Permits ("Consolidated Rules of Practice"), 40 C.F.R. Part 22.

2. Section 3008(a) of RCRA authorizes the Administrator of the U.S. Environmental Protection Agency ("EPA" or the "Agency") to assess penalties and undertake other actions required by this Consent Agreement. The Administrator has delegated this authority to the Complainant.

3. Section 3008(g) of RCRA, 42 U.S.C. § 6928(g), authorizes the assessment of a civil monetary penalty against any person who violates any requirement of RCRA Subtitle C, EPA's regulations thereunder, or any regulation of a state hazardous waste program which has been authorized by EPA.

4. This Consent Agreement and the attached Final Order resolve Complainant's civil penalty claims against Respondent under RCRA for the violations alleged herein.

5. In accordance with 40 C.F.R. §§ 22.13(b) and 22.18(b)(2) and (3) of the Consolidated Rules of Practice, Complainant hereby simultaneously commences and resolves this administrative proceeding.

JURISDICTION

6. The U.S. Environmental Protection Agency has jurisdiction over the above-captioned matter, as described in Paragraph 1, above.

7. Consolidated Rules of Practice govern this administrative adjudicatory proceeding pursuant to 40 C.F.R. § 22.1(a)(4).

8. The Commonwealth of Pennsylvania has received federal authorization to administer a Hazardous Waste Management Program (the "Pennsylvania Hazardous Waste Management Program") in lieu of the federal hazardous waste management program established under RCRA Subtitle C, 42 U.S.C. §§ 6921-6939g. Effective January 30, 1986, the Commonwealth of Pennsylvania Hazardous Waste Regulations were authorized by EPA pursuant to Section 3006(b) of RCRA, 42 U.S.C. § 6926(b), and 40 C.F.R. Part 271, Subpart A. The Commonwealth of Pennsylvania has revised, and EPA has re-authorized, the Commonwealth of Pennsylvania Hazardous Waste Regulations several times subsequent to this original authorization. The most recent authorized (revised) regulations became effective on June 29, 2009 (74 Fed. Reg. 19453). The provisions of the current authorized (revised) Commonwealth of Pennsylvania Hazardous Waste Regulations, codified at 25 Pa. Code Chapters 260a-266a, 266b, and 268a-270a ("PAHWR"), have thereby become requirements of RCRA Subtitle C and are enforceable by EPA pursuant to Section 3008(a) of RCRA, 42 U.S.C. § 6928(a).

9. On February 11, 1985, pursuant to Section 3006(b) of RCRA, 42 U.S.C. § 6926(b), and 40 C.F.R. Part 271, Subpart A, the State of Maryland was granted final authorization to administer its Hazardous Waste Management Regulations ("MDHWMR") set forth at the Code of Maryland Regulations ("COMAR"), Title 10, Subtitle 51 et seq., in lieu of the federal hazardous waste management program established under RCRA Subtitle C, 42 U.S.C. §§ 6921-6939e. Through this final authorization, the provisions of the MDHWMR became requirements of RCRA Subtitle C and are, accordingly, enforceable by EPA on and after that date pursuant to Section 3008(a) of RCRA, 42 U.S.C. § 6928(a). A revised Maryland hazardous waste management program set forth at COMAR, Title 26, Subtitle 13 was authorized and effective on July 31, 2001, September 24, 2004, and most recently on October 31, 2016. Accordingly, the provisions of the revised MDHWMR are enforceable by EPA on and after those dates pursuant to § 3008(a) of RCRA, 42 U.S.C. § 6928(a).

Administrative Record NSR_001790

10. This Consent Agreement addresses alleged violations by Respondent of Subtitle C of RCRA, 42 U.S.C. §§ 6921–6939g, certain federally-authorized PAHWMR and MDHWMR, as well as certain of the federal hazardous waste regulations, set forth at 40 C.F.R. Parts 260–268, for which the State of Maryland has not been granted authorization to administer in lieu of the federal hazardous waste management program under HSWA, in connection with Respondent's facilities, described below.

11. On January 8, 2018, EPA sent letters to the Commonwealth of Pennsylvania, through the Pennsylvania Department of Environmental Protection ("PADEP"), and the State of Maryland, through the Maryland Department of the Environment ("MDE"), giving prior notice of this enforcement action in accordance with Section 3008(a)(2) of RCRA, 42 U.S.C. § 6928(a)(2).

GENERAL PROVISIONS

12. For purposes of this proceeding only, Respondent admits the jurisdictional allegations set forth in this Consent Agreement and Final Order.

13. Except as provided in Paragraph 12, above, Respondent neither admits nor denies the specific factual allegations and conclusions of law set forth in this Consent Agreement.

14. Respondent agrees not to contest the jurisdiction of EPA with respect to the execution of this Consent Agreement, the issuance of the attached Final Order, or the enforcement of this Consent Agreement and Final Order.

15. For purposes of this proceeding only, Respondent hereby expressly waives its right to contest the allegations set forth in this Consent Agreement and waives its right to appeal the accompanying Final Order.

16. Respondent consents to the assessment of the civil penalty stated herein, to the issuance of any specified compliance order herein, and to any conditions specified herein.

17. Respondent shall bear its own costs and attorney's fees in connection with this proceeding.

FINDINGS OF FACT AND CONCLUSIONS OF LAW

18. In accordance with 40 C.F.R. §§ 22.13(b) and 22.18(b)(2) and (3) of the Consolidated Rules of Practice, Complainant alleges and adopts the Findings of Fact and Conclusions of Law set forth immediately below.

BLOOM OPERATIONS

19. Respondent Bloom is, and at all times relevant to the allegations set forth against it in this Consent Agreement was, a Delaware corporation.

Administrative Record NSR_001791

20. Respondent is, and at all times relevant to the allegations set forth against it in this Consent Agreement, was a "person," as defined in Section 1004(15) of RCRA, 42 U.S.C. § 6903(15), 25 Pa. Code § 260a.10 and COMAR 26.13.01.03(B)(61).

21. Respondent developed, sells and/or leases to its customers, and operates solid oxide fuel cell technology that converts natural gas into electricity without combustion. This technology is contained inside of equipment, known as "Bloom Energy Servers" or "Energy Servers".

22. Respondent has installed its Energy Servers at multiple customer facilities at locations in the United States.

23. Respondent installed Energy Servers at three customer facilities located in Pennsylvania and Maryland (respectively referred to as the "Pennsylvania Customer Facility," the "Maryland Customer 1 Facility" and the "Maryland Customer 2 Facility"). Collectively, these facilities will be referred to herein as the "Customer Facilities."

24. Respondent installed Energy Servers at the Pennsylvania Customer Facility, the Maryland Customer 1 Facility and the Maryland Customer 2 Facility, in 2012, 2014 and 2015, respectively.

25. Each Energy Server at the customer facilities utilizes natural gas. Each Energy Server contains (1) a group of fuel cell modules ("Fuel Cells"); (2) a fuel processing module; and (3) detachable canisters (referred to herein as "Desulf Canisters").

26. Inside each Fuel Cell, natural gas is converted into electricity through an electrochemical reaction.

27. The Desulf Canisters operate within an Energy Server and are located upstream of the Fuel Cells. The materials inside the Desulf Canisters remove sulfur compounds that were added as an odorant to the natural gas by the gas company, before the natural gas reaches the Fuel Cells.

28. Each Desulf Canister contains granular desulfurization material and carbon (collectively referred to as "media") which can adsorb a finite amount of sulfur compounds from the incoming natural gas.

29. At all times relevant to the allegations set forth against Respondent in this Consent Agreement, each Desulf Canister also incidentally adsorbed other compounds in the natural gas including, but not limited to, benzene. These contaminants were captured by the media within the Desulf Canisters.

30. The media in a Desulf Canister were only able to adsorb a finite amount of sulfur compounds, after which the media became exhausted and/or "spent."

31. When the adsorption capacity of the Desulf Canister degraded to a significant degree, the spent media in a Desulf Canister had to be replaced. Respondent made the determination as to when media became spent. Respondent replaced the spent Desulf Canister and its contents with a Desulf Canister containing fresh media. Respondent would then arrange for the disposal of the spent media.

32. Respondent detached the Desulf Canisters from the Energy Servers located at its customer facilities. Respondent then arranged to ship these Desulf Canisters offsite to receiving facilities so that the spent media could be removed and disposed. Respondent then replaced these Desulf Canisters containing spent media with other Desulf Canisters containing fresh media.

SHIPPING OF SPENT DESULF CANISTERS

33. From approximately June 2013 to the present, Respondent sent Desulf Canisters which were used at the Customer Facilities and contained spent media, from the Customer Facilities to receiving facilities.

34. Respondent sent Desulf Canisters containing spent media from the Customer Facilities to these receiving facilities, during the following timeframes:

    a. VLS Recovery Services LLC ("VLS"), located in Pasadena, Texas – March 2015 – February 2017;

    b. Advanced Chemical Treatment, Inc. ("ACT"), located in Albuquerque, New Mexico – October 2016 – June 2019.

    c. Ross Incineration Services, Inc. ("Ross"), located in Grafton, Ohio – October 2019 – the present.

    (Collectively referred to as the "Receiving Facilities.")

35. At the time that VLS received Respondent's spent media, this facility was a treatment, storage or disposal facility which was not permitted under RCRA Subtitle C, 40 C.F.R. Part 270, or Pa. Code § 270a.1 (which incorporates by reference 40 C.F.R. Part 270), or COMAR 26.13.07, or 30 TAC Chapter 335, to treat, store or dispose hazardous waste.

LEGAL CONCLUSIONS

36. At some point prior to the time that Respondent disconnected each Desulf Canister from a Fuel Cell and removed it from an Energy Server at a customer facility, and at all times thereafter relevant to the violations alleged herein, the spent media in the Desulf Canisters was a "solid waste" as this term is defined in 25 Pa. Code § 260a.1 (which

incorporates by reference 40 C.F.R. § 260.10, which further incorporates by reference 40 C.F.R. § 261.2), and COMAR 26.13.01.03(B)(73).

37. Pursuant to 25 Pa. Code § 260a.1 (which incorporates by reference 40 C.F.R. § 260.10), and COMAR 26.13.01.03(B)(31), and 25 Pa. Code § 261a.1 (which incorporates by reference 40 C.F.R. § 261.3), and COMAR 26.13.02, a solid waste is a hazardous waste if it is not excluded from regulation as a hazardous waste under 25 Pa. Code § 261a.1 (which incorporates by reference 40 C.F.R. § 261.4(b)), and COMAR 26.13.02.04 and, inter alia, it exhibits any of the characteristics of a hazardous waste set forth in 25 Pa. Code § 261a.1 (which incorporates by reference 40 C.F.R. Part 261, Subpart C), and COMAR 26.13.02.10 - .14.

38. Based upon the information above, EPA has determined that spent media generated at and shipped from the Maryland Customer 1 Facility and the Pennsylvania Customer Facility, at all times relevant to the allegations herein, was a "solid waste" as defined by 25 Pa. Code § 260a. (which incorporates by reference 40 C.F.R. § 260.10) and COMAR 26.13.01.03(B)(73).

39. Based upon the information above, EPA has determined that spent media generated at and shipped from the Maryland Customer 1 Facility and the Pennsylvania Customer Facility, at all times relevant to the allegations herein, was a "hazardous waste" as defined by 25 Pa. Code § 260a.1 (which incorporates by reference 40 C.F.R. § 260.10) and COMAR 26.13.01.03(B)(31), because it exhibits the characteristic of toxicity for benzene (EPA Waste Code D018), as described in 40 C.F.R. § 261.24.

40. EPA has determined that the spent media contained in the Desulf Canisters generated at the customer facilities was not "excluded from regulation as a hazardous waste" under 25 Pa. Code § 261a.1 (which incorporates by reference 40 C.F.R. § 261.4(b)), or COMAR 26.13.02.04.

41. 25 Pa. Code § 260a.1 (which incorporates by reference 40 C.F.R. § 260.10), defines "generator" as any person, by site, whose act or process produces hazardous waste identified or listed in 40 C.F.R. Part 261 or whose act first causes a hazardous waste to become subject to regulation.

42. COMAR 26.13.01.03(B)(29) defines "generator" as "any person, by site, whose act or process produces hazardous waste identified or listed in COMAR 26.13.02 or whose act first causes a hazardous waste to become subject to regulation."

43. Each of the customer facilities is a separate site.

44. At all times relevant to the allegations set forth in this Complaint, Respondent was a "generator" of hazardous waste generated in and "stored" within the Energy Servers at Respondent's Customer Facilities, as these terms are defined in 25 Pa. Code § 260a.1

(which incorporates by reference 40 C.F.R. § 260.10), and COMAR 26.13.01.03(B)(29) and (76).

COUNT I
(Failure to Prepare a Manifest for Offsite Shipment of Hazardous Waste)

45. The allegations of each of the preceding paragraphs are incorporated herein by reference as though fully set forth at length.

46. 25 Pa. Code § 262a.10 (which incorporates by reference 40 C.F.R. § 262.20(a)(1)), provides that "[a] generator who transports, or offers for transport a hazardous waste for offsite treatment, storage, or disposal, or a treatment, storage, and disposal facility who offers for transport a rejected hazardous waste load, must prepare a Manifest (OMB Control number 2050-0039) on EPA Form 8700-22, and, if necessary, EPA Form 8700-22A, according to the instructions included in the appendix to this part."

47. COMAR 26.13.03.04.A(1) similarly provides that "[a] generator who transports, or offers for transport a hazardous waste for off-site treatment, storage, or disposal, or a treatment, storage, and disposal facility who offers for transport a rejected hazardous waste load, shall prepare a manifest (OMB control number 2050-0039) on EPA Form 8700-22, and, if necessary, EPA Form 8700-22A, according to the instructions included in the appendix to 40 CFR Part 262 before the waste is transported off-site."

48. Respondent shipped Desulf Canisters storing spent media which contained benzene (EPA Hazardous Waste No. D018) from two Customer Facilities in Pennsylvania and Maryland, without first preparing a Hazardous Waste Manifest for each of these shipments, on at least the following dates:

    a. From the Pennsylvania Customer Facility: 2/11/16 (1 Desulf Canister, about 95 lbs of spent media), 11/23/16 (9 Desulf Canisters, about 855 lbs of spent media)

    b. From the Maryland Customer 1 Facility: 9/23/15 (32 Desulf Canisters, about 3,040 lbs of spent media), 10/7/16 (31 Desulf Canisters, about 2,945 lbs of spent media)

49. On at least four occasions, Respondent violated 25 Pa. Code § 262a.10 (which incorporates by reference 40 C.F.R. § 262.20(a)(1)) and COMAR 26.13.03.04.A(1), by offering for transport a hazardous waste (the spent media in the Desulf Canisters) for offsite treatment, storage, or disposal without first preparing a Manifest.

COUNT II
(Failure to Adequately Respond to Information Requests)

50. The allegations of each of the preceding paragraphs are incorporated herein by reference as though fully set forth at length.

Administrative Record NSR_001795

51. Section 3007(a) of RCRA, 42 U.S.C. § 6927(a), provides, in part: "Access Entry. For purposes of developing or assisting in the development of any regulation or enforcing the provisions of this chapter, any person who generates, stores, treats, transports, disposes of, or otherwise handles or has handled hazardous wastes shall, upon request of any officer, employee or representative of the Environmental Protection Agency, duly designated by the Administrator, or upon request of any duly designated officer, employee or representative of a State having an authorized hazardous waste program, furnish information relating to such wastes and permit such person at all reasonable times to have access to, and to copy all records relating to such wastes. . . ."

52. On or about December 31, 2015, Respondent installed a Bloom Energy Server which became operational at a Customer Facility in Maryland, known as the "Maryland Customer 2 Facility."

53. In an information request letter ("IRL") that EPA sent to Respondent, dated January 20, 2017 ("IRL #1), Question 1, EPA asked Respondent to: "Identify all facilities where a Bloom Energy Server has been installed within the States of Pennsylvania, Maryland, Virginia, West Virginia, and the District of Columbia."

54. In an information request letter that EPA sent to Respondent, dated September 1, 2017 ("IRL #2"), Question 9, EPA asked Respondent to update its response to the original IRL with any new information generated since January 1, 2017, up to the date of Respondent's receipt of the letter, and not already included in the previous submittal.

55. Respondent failed to provide any information related to the Maryland Customer 2 Facility in either its IRL Response #1, dated March 24, 2017, or its IRL Response #2, dated October 4, 2017.

56. On March 24, 2017 and October 4, 2017, Respondent violated the requirements of Section 3007(a) of RCRA, 42 U.S.C. § 6927(a), by failing to provide information about the Maryland Customer 2 Facility in response to an EPA information request that asked Respondent to identify all facilities where a Bloom Energy Server has been installed within the State of Maryland.

CIVIL PENALTY

57. In settlement of EPA's claims for civil penalties for the violations alleged in this Consent Agreement, Respondent consents to the assessment of a civil penalty in the amount of **TWO HUNDRED TEN THOUSAND DOLLARS ($210,000.00)**, which Respondent shall be liable to pay in accordance with the terms set forth below.

58. The civil penalty is based upon EPA's consideration of a number of factors, including the penalty criteria ("statutory factors") set forth in Section 3008(a)(3) of RCRA, 42 U.S.C. § 6928(a)(3)**,** including, the following: the seriousness of the violation and any good faith

Administrative Record NSR_001796

efforts to comply with the applicable requirements. These factors were applied to the particular facts and circumstances of this case with specific reference to EPA's October, 1990 RCRA Civil Penalty Policy, as revised in June, 2003 ("RCRA Penalty Policy"), which reflect the statutory penalty criteria and factors set forth at Section 3008(a)(3) and (g) of RCRA, 42 U.S.C. §§ 6928(a)(3) and (g), the appropriate Adjustment of Civil Monetary Penalties for Inflation, pursuant to 40 C.F.R. Part 19, and the applicable EPA memoranda addressing EPA's civil penalty policies to account for inflation.

59. Payment of the civil penalty amount, and any associated interest, administrative fees, and late payment penalties owed, shall be made by either cashier's check, certified check or electronic wire transfer, in the following manner:

a. All payments by Respondent shall include reference to Respondent's name and address, and the Docket Number of this action, *i.e.*, RCRA-HQ-2020-501;

b. All checks shall be made payable to the "United States Treasury";

c. All payments made by check and sent by regular mail shall be addressed and mailed to:

U.S. Environmental Protection Agency
Cincinnati Finance Center
P.O. Box 979077
St. Louis, MO 63197-9000

d. For additional information concerning other acceptable methods of payment of the civil penalty amount see:

https://www.epa.gov/financial/makepayment

e. A copy of Respondent's check or other documentation of payment of the penalty using the method selected by Respondent for payment shall be sent simultaneously to:

Natalie Katz
Senior Assistant Regional Counsel
U.S. EPA, Region III (3RC40)
1650 Arch Street
Philadelphia, PA 19103-2029
katz.natalie@epa.gov

60. Pursuant to 31 U.S.C. § 3717 and 40 C.F.R. § 13.11, EPA is entitled to assess interest and late payment penalties on outstanding debts owed to the United States and a charge to cover the costs of processing and handling a delinquent claim, as more fully described below. Accordingly, Respondent's failure to make timely payment of the penalty as

specified herein shall result in the assessment of late payment charges including interest, penalties and/or administrative costs of handling delinquent debts.

61. Payment of the civil penalty is due and payable immediately upon receipt by Respondent of a true and correct copy of the fully executed and filed Consent Agreement and Final Order. Receipt by Respondent or Respondent's legal counsel of such copy of the fully executed Consent Agreement and Final Order, with a date stamp indicating the date on which the Consent Agreement and Final Order was filed with the Clerk of the Environmental Appeals Board, shall constitute receipt of written initial notice that a debt is owed EPA by Respondent in accordance with 40 C.F.R. § 13.9(a).

62. INTEREST: In accordance with 40 C.F.R § 13.11(a)(1), interest on the civil penalty assessed in this Consent Agreement and Final Order will begin to accrue on the date that a copy of the fully executed and filed Consent Agreement and Final Order is mailed or hand-delivered to Respondent. However, EPA will not seek to recover interest on any amount of the civil penalties that is paid within thirty (30) calendar days after the date on which such interest begins to accrue. Interest will be assessed at the rate of the United States Treasury tax and loan rate in accordance with 40 C.F.R § 13.11(a).

63. ADMINISTRATIVE COSTS: The costs of the EPA's administrative handling of overdue debts will be charged and assessed monthly throughout the period a debt is overdue. 40 C.F.R. § 13.11(b). Pursuant to Appendix 2 of EPA's *Resources Management Directives – Case Management*, Chapter 9, EPA will assess a $15.00 administrative handling charge for administrative costs on unpaid penalties for the first thirty (30) day period after the payment is due and an additional $15.00 for each subsequent thirty (30) days the penalty remains unpaid.

64. LATE PAYMENT PENALTY: A late payment penalty of six percent per year will be assessed monthly on any portion of the civil penalty that remains delinquent more than ninety (90) calendar days. 40 C.F.R. § 13.11(c). Should assessment of the penalty charge on the debt be required, it shall accrue from the first day payment is delinquent. 31 C.F.R. § 901.9(d).

65. Respondent agrees not to deduct for federal tax purposes the civil penalty assessed in this Consent Agreement and Final Order.

SETTLEMENT CONDITION - COMPLIANCE AUDIT

66. As a condition of this settlement, Respondent agrees to conduct a Compliance Audit. Respondent shall retain an independent third party (the "Auditor") to perform the Compliance Audit, which shall consist of an audit of each of the records of Respondent's shipments of Desulf Canisters containing spent media from all of its customer facilities in the United States outside of Region III (DC, DE, MD, PA, VA, WV), for the time period beginning September 8, 2015 through December 31, 2019. (This Compliance Audit will not include records of shipments of Desulf Canisters containing spent media that

Administrative Record NSR_001798

Respondent sent to the Shoremet LLC facility in Valparaiso, Indiana.) Respondent agrees to undertake the following activities, described below, with regard to the performance of the Compliance Audit.

67. Within forty-five (45) days of the effective date of this Consent Agreement and Final Order, Respondent shall provide to EPA the following: the name and address of the Auditor that Respondent has selected to perform the Compliance Audit, and documentation that such Auditor satisfies the requirements described below in Paragraph 68 of this Consent Agreement and Final Order.

68. At a minimum, the Auditor selected by Respondent for performance of the Compliance Audit shall:

    a. have no less than 3 years of experience in performing RCRA compliance audits;

    b. have a trained and experienced staff for the performance of such audits;

    c. have no past or present relationship or affiliation with the Respondent nor anticipate any prospective relationship or affiliation with the Respondent as a result of performing the Compliance Audit.

69. Upon completion of a review by EPA of the materials described in Paragraph 68, relating to the name and qualifications of the proposed Auditor, EPA will, in its sole discretion (but subject to the Dispute Resolution provisions of Paragraphs 94 through 98), either: (1) notify Respondent in writing of EPA's approval of the selection of the proposed Auditor, or (2) notify Respondent in writing of EPA's rejection of the proposed Auditor. If EPA rejects Respondent's proposed Auditor, EPA will state the reasons for the rejection in writing and will allow Respondent thirty (30) days to make a new submittal.

70. Within thirty (30) days of receipt of notice of EPA's approval of the proposed Auditor, Respondent shall provide to EPA a proposed plan (the "Compliance Audit Plan") describing the procedures which satisfy the requirements set forth in Paragraphs 72 through 77, and Appendix A of this Consent Agreement and Final Order. The Audit Plan shall reflect the scope of the records audit provided herein and in Appendix A.

71. Upon completion of a review by EPA of the proposed Compliance Audit Plan, EPA will, in its sole discretion (but subject to the Dispute Resolution provisions of Paragraphs 94 through 98), either: (1) notify Respondent in writing of EPA's approval of the proposed Compliance Audit Plan, or (2) notify Respondent in writing of EPA's rejection of the proposed Compliance Audit Plan. EPA's decision regarding approval of the Compliance Audit Plan shall be consistent with the agreed scope of the Compliance Audit as reflected in Paragraph 66 and Appendix A. If EPA rejects any or all of Respondent's proposed Compliance Audit Plan, EPA will state the reasons for the rejection and will provide to Respondent in writing a reasonable timeframe to make a new submittal. The performance of the Compliance Audit shall commence only upon Respondent's receipt of

Administrative Record NSR_001799

approval by EPA of the Compliance Audit Plan. If Respondent fails to submit the name of the proposed Auditor or the Compliance Audit Plan within the deadline for submission or fails to revise and re-submit any of the items by EPA's deadline, EPA shall have the right to terminate this Consent Agreement and Final Order by providing written notice to Respondent, and EPA shall have the right to seek and collect the maximum penalty allowed by law for any and all violations of Subtitle C of RCRA at any of Respondent's customer facilities.

72. Respondent shall fully cooperate with requests made by the EPA-approved Auditor concerning performance of the Audit in accordance with the Compliance Audit Plan and preparation of the Final Audit Report.

73. Within ninety (90) days of receipt of EPA's approval of the proposed Auditor and Compliance Audit Plan, Respondent shall have the Compliance Audit completed, and submit to EPA a Final Audit Report.

74. The Final Audit Report shall contain the information set forth in Appendix A.

75. Respondent shall maintain for inspection by EPA the original records pertaining to the actual implementation and/or performance of the Compliance Audit for a period of three years from the date of approval of the Final Audit Report.

76. The Final Audit Report shall be certified by Respondent in the following manner:

> I certify that the information contained in or accompanying the Final Audit Report is true, accurate, and complete. As to [the/those] identified portions of the Final Audit Report for which I cannot personally verify [its/their] accuracy, I certify under penalty of law that the Final Audit Report and all attachments, including any and all supporting information, were prepared in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who participated in development of the Final Audit Report, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

> Title:

77. Upon completion of a review by EPA of the Final Audit Report, EPA shall, in its sole discretion (but subject to the Dispute Resolution provisions of Paragraphs 94 through 98),

Administrative Record NSR_001800

either: (1) notify Respondent in writing of its approval of the Final Audit Report, or (2) notify Respondent in writing of its rejection of all or any part of the Final Audit Report because of a failure to include information required in accordance with Appendix A. If EPA rejects all or any part of the proposed Final Audit Report, EPA will state the reasons for rejection and will provide to Respondent in writing a reasonable time to make a new submittal. In the event that Respondent fails to revise and re-submit any or all of the items addressed in EPA's notice of rejection for the Final Audit Report within the deadline provided by EPA in the notice, EPA shall have the right to investigate any and all of Respondent's shipments from customer facilities that are within the scope of the Compliance Audit as set forth in Paragraph 66, but that were not properly addressed in the Final Audit Report. In that case, pursuant to Section 3008(g) of RCRA, 42 U.S.C. § 6928(g), EPA also has the right to seek and collect the maximum civil penalty allowed by law for any and all violations of RCRA, at any such facility related to any such shipments.

78. Upon completion of a review by EPA of the Final Audit Report, EPA shall, in its sole discretion (but subject to the Dispute Resolution provisions of Paragraphs 94 through 98), determine whether facts reported by the Compliance Audit resulted in any violations of Subtitle C of RCRA, 42 U.S.C. § 6921 et seq., federal regulations promulgated thereunder, or state hazardous waste management requirements authorized by EPA pursuant to Section 3006 of RCRA, 42 U.S.C. § 6926. For purposes of determining whether the Audit findings resulted in any violations, the Parties stipulate that spent media generated at and/or shipped from the customer facilities listed in the Final Audit Report constituted a "hazardous waste" as defined by 40 C.F.R. § 260.10, and the applicable state hazardous waste management regulations.

79. Respondent shall immediately undertake any and all actions necessary to correct any ongoing violation of Subtitle C of RCRA, 42 U.S.C. § 6921 et seq., federal regulations promulgated thereunder, or state hazardous waste management requirements authorized by EPA pursuant to Section 3006 of RCRA, 42 U.S.C. § 6926, and remediate any harm caused or threatened by such violation discovered during the course of the performance of the Compliance Audit, and institute effective measures to ensure that any such violation does not reoccur in the future. Nothing in this Paragraph shall relieve Respondent of any obligation imposed by any applicable federal, state and/or local laws and requirements concerning compliance.

80. In the event EPA determines that there was a violation as described in Paragraph 85, below, Respondent agrees to pay penalties in accordance with the penalty schedule in Paragraphs 85 through 87 of this Consent Agreement and Final Order, for each violation. Each violation shall be resolved and settled by paying the assessed penalty in accordance with Paragraphs 59 through 65 of this Consent Agreement and Final Order. EPA reserves any rights and remedies available to it under RCRA, the regulations promulgated thereunder and any other federal law or regulation to resolve any violations identified through the Compliance Audit that are not listed in Paragraph 85.

Administrative Record NSR_001801

81. In the event EPA determines that there was a violation as described in Paragraph 85, below, Respondent will certify to EPA, upon personal investigation and to the best of its knowledge and belief, that it currently is in compliance with regard to the violations identified in the Compliance Audit. Respondent will submit this certification to EPA within 30 Days of receiving the EPA's written demand letter pursuant to Paragraph 82.

CIVIL PENALTIES FOR VIOLATIONS DISCOVERED THROUGH THE COMPLIANCE AUDIT

82. Following EPA's review of the approved Final Audit Report, EPA will furnish to Respondent a demand letter, which establishes the pre-agreed penalties to be paid for violations described in Paragraph 85, below, and identified through the Compliance Audit and Final Audit Report. Once paid, the penalty payment would resolve the claims for civil penalties EPA may have against Respondent for those violations identified through the Compliance Audit and Final Audit Report. A copy of the demand letter will also be sent to the EPA Cincinnati Finance Office.

83. No criminal violation or civil violation that results in serious actual harm or that may present an imminent and substantial endangerment to public health or the environment, shall qualify for the imposition of penalties under this Section and satisfaction under this Consent Agreement and Final Order, and EPA reserves the right to seek and obtain injunctive relief and the imposition of the maximum civil penalty or criminal sanction allowed by law for any such violation.

84. Subject to the provisions and terms of this Consent Agreement and Final Order, the period commencing May 31, 2018 and ending December 31, 2020 (the "Tolling Period"), inclusive, will not be included in computing the running of any statute of limitations applicable to any action brought by EPA or on behalf of EPA, pursuant to 3008(a) and (g) of RCRA, 42 U.S.C. § 6928(a) and (g), for civil penalties and/or other remedies provided by law in relation to any violation of the regulations identified through the Compliance Audit. Respondent shall not assert, plead or raise against EPA, or the U.S. Department of Justice on behalf of EPA, in any fashion, whether by answer, motion or otherwise, any defense or avoidance based on the running of any statute of limitations during any portion of the Tolling Period, and any statute of limitations shall be tolled during and for that period.

85. Respondent shall be liable and agrees to pay civil penalties, upon demand by EPA, for any violation discovered through the Compliance Audit and disclosed in the Final Audit Report, as set forth below:

    a. Violations of 40 C.F.R. § 262.20(a)(1), for offering for transport spent media in a Desulf Canister from a customer facility to a permitted TSD, without first preparing a manifest:

Administrative Record NSR_001802

$2,000 per shipment for violations occurring between September 8, 2015 and October 3, 2016.

$4,000 per shipment for violations occurring on or after October 4, 2016

b. Violations of 40 C.F.R. § 262.20(a)(1), for offering for transport spent media in a Desulf Canister from a customer facility to a non-permitted receiving facility, without first preparing a manifest:

$3,000 per shipment for violations occurring between September 8, 2015 and October 3, 2016.

$7,500 per shipment for violations occurring on or after October 4, 2016.

c. Violations of Section 3001(d)(5) of RCRA, 42 U.S.C. § 6921(d)(5), for ultimate disposal of spent media from a Desulf Canister at a facility not permitted for treatment, storage or disposal of hazardous waste

$10,000 per shipment for violations occuring on or after September 8, 2015.

86. Penalties shall be individually assessed for each separate shipment identified through the Compliance Audit.

87. Respondent shall pay any penalty within 30 Days of receiving the EPA's written demand for payment.

88. EPA may, in the unreviewable exercise of its discretion, reduce or waive penalties otherwise due it under this Consent Agreement and Final Order.

89. Respondent shall pay penalties owing to EPA in the manner set forth and with the confirmation notices required by Paragraph 59, except that Respondent's transmittal letter shall state that the payment is for penalties for violations discovered through the Compliance Audit, and it shall state for which violation(s) the penalties are being paid.

90. If Respondent fails to pay penalties for violations discovered through the Compliance Audit, according to the terms of this Consent Agreement and Final Order, Respondent shall be liable for interest on such penalties, as provided for in 28 U.S.C. § 1961, accruing as of the date payment became due. Nothing in this Paragraph shall be construed to limit EPA from seeking any remedy otherwise provided by law for Respondent's failure to pay any penalties.

91. Non-Exclusivity of Remedy. Penalties are not the EPA's exclusive remedy for violations discovered through the Compliance Audit. EPA expressly reserves the right to seek any other relief it deems appropriate for Respondent's violation of this Consent Agreement and Final Order or applicable law, including but not limited to an action against

Respondent for statutory penalties, additional injunctive relief, mitigation or offset measures, and/or contempt. However, the amount of any statutory penalty assessed for a violation shall be reduced by an amount equal to the amount of any penalty assessed and paid pursuant to this Consent Agreement and Final Order. EPA will not seek further penalties for violations addressed pursuant to Paragraph 85.

GENERAL SETTLEMENT CONDITIONS

92. By signing this Consent Agreement, Respondent acknowledges that this Consent Agreement and Final Order will be available to the public and represents that, to the best of Respondent's knowledge and belief, this Consent Agreement and Final Order does not contain any confidential business information or personally identifiable information from Respondent.

93. Respondent certifies that any information or representation it has supplied or made to EPA concerning this matter was, at the time of submission true, accurate, and complete and that there has been no material change regarding the truthfulness, accuracy or completeness of such information or representation. EPA shall have the right to institute further actions to recover appropriate relief if EPA obtains evidence that any information provided and/or representations made by Respondent to the EPA regarding matters relevant to this Consent Agreement and Final Order, including information about respondent's ability to pay a penalty, are false or, in any material respect, inaccurate. This right shall be in addition to all other rights and causes of action that EPA may have, civil or criminal, under law or equity in such event. Respondent and its officers, directors and agents are aware that the submission of false or misleading information to the United States government may subject a person to separate civil and/or criminal liability.

DISPUTE RESOLUTION

94. The dispute resolution procedures of this Section shall be the exclusive mechanism to resolve disputes arising under or with respect to this Consent Agreement and Final Order.

95. If Respondent disagrees, in whole or in part, with any decision by EPA under this Consent Agreement and Final Order, Respondent shall notify EPA through the Branch Chief of the Air, RCRA and Toxics Branch, EPA, Region III, and the parties shall use their best efforts to informally and in good faith resolve all disputes or differences of opinion relating to this Consent Agreement and Final Order.

96. In the event that the parties cannot resolve a dispute by informal negotiations under the preceding paragraphs, Respondent may pursue the matter by submitting its objection to the Branch Chief of the Air, RCRA and Toxics Branch, EPA, Region III, in writing. Respondent's written objections must set forth the specific points of the dispute, the basis for Respondent's position and any matters which it considers necessary for EPA's determination.

97. EPA and Respondent shall have thirty (30) days from receipt of Respondent's written objections to attempt to resolve the dispute through formal discussions.

98. If EPA and Respondent cannot resolve the dispute through formal discussions, EPA, through the Branch Chief of the Air, RCRA and Toxics Branch, EPA, Region III, will provide to Respondent in writing EPA's decision on the pending dispute, and that decision will be binding upon the Respondent.

NOTICE

99. Except as otherwise specified herein, whenever this Consent Agreement and Final Order requires notice or submission of reports, information, or documents, such notice or submission shall be provided to the following persons via certified mail, return receipt requested, first class mail, overnight mail (Express or priority), hand-delivery or any reliable commercial delivery service. Either party may substitute another person to receive notice on its behalf or change the address to which notices are to be sent by sending written notification of the substitution or change to the other party.

patrick.mccormick@bloomenergy.com

Michael Roesch
Bloom Energy Corporation
4353 North First Street
San Jose, CA 95134
michael.roesch@bloomenergy.com

CERTIFICATION OF COMPLIANCE

100. Respondent certifies to EPA, upon personal investigation and to the best of its knowledge and belief, that it currently is in compliance with regard to the violations alleged in this Consent Agreement.

OTHER APPLICABLE LAWS

101. Nothing in this Consent Agreement and Final Order shall relieve Respondent of its obligation to comply with all applicable federal, state, and local laws and regulations, nor shall it restrict EPA's authority to seek compliance with any applicable laws or regulations, nor shall it be construed to be a ruling on the validity of any federal, state or local permit. This Consent Agreement and Final Order does not constitute a waiver, suspension or modification of the requirements of RCRA, or any regulations promulgated thereunder.

RESERVATION OF RIGHTS

102. This Consent Agreement and Final Order resolves only EPA's claims for civil penalties for the specific violation[s] alleged against Respondent in this Consent Agreement and Final Order and for violations identified through the Compliance Audit. EPA reserves the right to commence action against any person, including Respondent, in response to any condition which EPA determines may present an imminent and substantial endangerment to the public health, public welfare, or the environment. This settlement is

subject to all limitations on the scope of resolution and to the reservation of rights set forth in Section 22.18(c) of the Consolidated Rules of Practice, 40 C.F.R. § 22.18(c). EPA reserves any rights and remedies available to it under RCRA, the regulations promulgated thereunder and any other federal law or regulation to enforce the terms of this Consent Agreement and Final Order after its effective date.

EXECUTION /PARTIES BOUND

103. This Consent Agreement and Final Order shall apply to and be binding upon EPA, the Respondent and the officers, directors, employees, contractors, successors, agents and assigns of Respondent. By his or her signature below, the person who signs this Consent Agreement on behalf of Respondent is acknowledging that he or she is fully authorized by the Respondent to execute this Consent Agreement and to legally bind Respondent to the terms and conditions of this Consent Agreement and Final Order.

EFFECTIVE DATE

104. The effective date of this Consent Agreement and Final Order is the date on which the Final Order, signed by the Environmental Appeals Board is filed along with the Consent Agreement with the Hearing Clerk for the Environmental Appeals Board pursuant to the Consolidated Rules of Practice.

ENTIRE AGREEMENT

105. This Consent Agreement and Final Order constitutes the entire agreement and understanding between the Parties regarding settlement of all claims for civil penalties pertaining to the specific violations alleged herein and there are no representations, warranties, covenants, terms, or conditions agreed upon between the Parties other than those expressed in this Consent Agreement and Final Order.

APPENDIX A

The purpose of the Compliance Audit shall be to audit each of the records of Respondent's shipments of Desulf Units containing spent catalysts from all of its customer facilities in the United States outside of Region III (DC, DE, MD, PA, VA, WV) for the time period beginning September 8, 2015 through December 31, 2019. The Final Audit Report, required by Paragraph 73 and 74 of this Consent Agreement and Final Order, shall include the following information:

1. Identification of all facilities where a Bloom Energy Server has been installed outside of Region III states (DC, DE, MD, PA, VA, WV). For each such facility, please provide the following:

    a. Name of customer, name of facility, address of facility, and EPA ID number of facility (if applicable)
    b. Date(s) of each Energy Server installation.
    c. Number and volume of all Desulf Canisters present at the facility.

2. For each of the facilities listed in response to question 1a. above, provide the date(s) and number of instances when any Desulf Canisters were removed from any installed Energy Server during the period of September 8, 2015 through December 1, 2019. For each such instance, provide the following:

    a. Date of removal
    b. Number of Desulf Canisters removed
    c. Date of off-site transport
    d. Name, address, and EPA ID number (if applicable) of transporter(s) utilized
    e. Copies of the following types of documents showing each shipment of the Desulf Canisters, including: bills of lading, manifests, hazardous waste manifests, shipping invoices, electronic records, LDR notices and certifications.

3. For each facility or location that received a Desulf Canister shipment ("Receiving Facility"), provide the following:

    a. Name, address, and EPA ID number (if applicable) of Receiving Facility
    b. Date of receipt for each Desulf Canister shipment
    c. For any and all material removed from a Desulf Canister ("Removed Material") at this location, provide the following:
        (1) Date of removal and volume removed
        (2) Whether Removed Material was shipped from the Receiving Facility to another location and the date and method of such shipment(s). If it has not been shipped from that location, state its current location and explain why it has not been shipped from the Receiving Facility.
        (3) If the Removed Material was shipped from the Receiving Facility, provide copies of the following types of documents reflecting each shipment, including: bills of lading, manifests, hazardous waste manifests, shipping

Administrative Record NSR_001809

invoices, electronic records, LDR notices and certifications that accompanied and/or refer to each off-site shipment of this material.

4. For each facility or location that received material removed from a Desulf Canister ("Final Destination"), please provide the following:

   a. Name, address, and EPA ID number (if applicable) of Final Destination
   b. Date of receipt for each shipment of Removed Material from a Desulf Canister
   c. Whether the Removed Material was ultimately disposed of. If so, provide:
      (1) date of disposal
      (2) volume disposed
      (3) disposal facility name, address and EPA ID number (if applicable)
      (4) method of disposal
      (5) copies of all documents related to the disposal.
   d. State whether the Removed Material was ultimately reclaimed or recycled. If so, provide:
      (1) whether the Removed Material was reclaimed or whether it was recycled
      (2) date of reclamation or recycling
      (3) name, address and EPA ID number (if applicable) of reclamation or recycling location
      (4) method of reclamation or recycling
      (5) copies of all documents related to the reclamation or recycling.

5. If Bloom is not in possession of documents (in any format) reflecting the information listed above, Bloom shall: i) specify which information and categories of documents it does not have; ii) formally request in writing and diligently pursue for the benefit of the auditor documents including such information from applicable transporters, receiving facilities, destination facilities, and any other entities likely to have such documents; and iii) inform EPA regarding the response of each entity to the request for documents.

6. A statement indicating any problems or difficulties, in performing the Compliance Audit, and the measures taken to address such problems or difficulties.

Thanks Cember and Pam. First and foremost, we want to confirm the emailed comments were received. In the first permit process the emailed comments were posted online. So that's the second, can they be. With the fraudulent comments, people are being asked to check and report if their names were misused. I just want to make sure that if people who commented through us, when they search for their comment they find it. Thanks! Camilla

aqb-yucca-microgrid@env.nm.gov

Re: Yucca Growth Infrastructure, LLC-YGI Microgrid Air Quality Construction Permit Application

To the New Mexico Environment Department:

We cannot allow data centers to take our precious natural resources.

I urge the Environment Department to hold a public hearing on the Project Jupiter air-quality permit application and to deny the current application.

NMED must hold a public hearing on the application:

NMED regulations require holding a public hearing on an air-pollution permit application if "there is significant public interest." Such a hearing is essential here, given that the proposed power plant would be the largest source of CO2 pollution in the state and could significantly impact everyone living in the borderlands.

NMED must enforce the state's climate goals:

New Mexico's Climate Action Plan states "New Mexicans recognize the threats posed by rising temperatures, prolonged and severe droughts, increasingly frequent wildfires, deadly flash flooding, and decreasing freshwater availability to the livelihoods and futures of all who call this place home." For this reason, Gov. Lujan Grisham set a target to reduce the state's greenhouse-gas emissions 45% by 2030 compared to 2005 emissions. If this application were approved in its current form, there is no way New Mexico would meet its climate targets. At a time when climate change continues to ravage the West, we cannot afford that kind of backsliding.

NMED must study whether the project's emissions of nitrogen oxides, VOCs, and waste heat will contribute to ozone violations:

Ozone forms in the atmosphere when NOx reacts with VOCs in the presence of sunlight. Ozone is a corrosive pollutant that irritates the lungs, constricts breathing, exacerbates asthma, and can cause serious respiratory and cardiovascular illnesses, even premature death. The Environmental Protection Agency has designated Sunland Park, NM, and El Paso, Texas, as nonattainment areas, meaning they experience unsafe levels of ozone.

NMED is required to deny an air-quality permit application if the project "will cause or contribute to air contaminant levels in excess of" the ozone standard. The application indicates that the project will release about 37 tons of nitrogen oxides and 125 tons of volatile organic compounds. The project will dump close to 5 GW of heat into the surrounding region whenever the power plant is operational -- more than the heat generated by 6 atomic bombs. That release will unquestionably increase ambient temperature in Santa Teresa, Sunland Park, and parts of El Paso.

The developer should be required to perform modeling to evaluate whether its emissions of NOx, VOCs and waste heat will contribute to excessive ozone pollution. If the modeling shows such an increase, the developer should be required to modify its proposal to eliminate the impact.

NMED must require developers to study mitigation strategies:

Bloom Energy, the company that makes the fuel cells Project Jupiter plans to use, claims that using waste heat to generate steam, hot water or chilled water could reduce emissions, yet the application includes no plans to implement this or any technique to mitigate the project's massive carbon emissions. As a 100% renewable option would be far superior for New Mexico, any fossil-fuel applicant must at least be required to study every possible method for mitigating its climate impact.

NMED must require the applicant to monitor and record emissions:

Air-pollution permit applications must include "a description of the equipment or methods proposed by the applicant to be used for emission measurement." The developer's estimates are based on inadequate data and include no real-world monitoring. NMED may require an applicant to install instruments to monitor and record emissions as a condition to granting permits. Particularly since the technology proposed is so new and there is so little data on how it functions, this project should be required to implement continuous emissions monitoring.

This project would be disastrous for New Mexicans, and this application should be rejected as deficient.

Addressing the Climate Challenge
With Bold Solutions

Public Comment on Air Quality Construction Permit Application 10883
Yucca Growth Infrastructure LLC Microgrid (YGI Microgrid)

Submitted to: New Mexico Environment Department on July 6th, 2026

We submit this comment in opposition to Air Quality Construction Permit Application 10883 proposed by Yucca Growth Infrastructure (YGI) in southern Doña Ana County. As described below, this application is based on technology that has never been deployed at the scale proposed, includes projected pollution totals based on inadequate emissions testing procedures that cannot be relied on for factual results, and proposes a design that does not provide avenues for verifiable and accurate emissions testing and enforcement.

Most importantly, approval of the applicant's permit to emit more than 10 million metric tons of CO_2 annually violates the New Mexico Environment Department (NMED)'s mission to "to protect and restore the environment and to foster a healthy and prosperous New Mexico for present and future generations." NMED is the department responsible for maintaining, developing, and enforcing New Mexico's air quality management regulations and if the NMED issues a New Source Review permit to YGI it will harm the health of all New Mexicans, particularly those living in proximity to the planned YGI Microgrid.

The New Mexico Environment Department (NMED) must reject this application and require the Applicant (YGI) to submit a permit based on reliable and robust independent testing results and a plant that allows for verifiable emissions testing and enforcement.

1. Bloom Solid Oxide Fuel Cells have never been deployed at the scale proposed and the company's track record and inadequate pollution testing protocol make all estimates provided in the application suspect. To grant a permit based on, essentially, wishful thinking, is grossly irresponsible.

Though several large projects have been announced with much fanfare, it appears the largest existing Bloom Energy Solid Oxide Fuel Cell (SOFC) installation actually in operation is a 40-megawatt (MW) deployment in South Korea.[1] That is sixty times smaller than what is being proposed for Project Jupiter. While SOFC's can demonstrate

[1] https://www.ajupress.com/view/20260422092470138

Administrative Record NSR_001829

notable chemical efficiency in controlled environments, translating this technology to mega-utility or industrial-scale applications remains an unproven prospect.

Bloom Energy's emissions estimates and public claims cannot be trusted, as evidenced by:

- In 2021 a Delaware judge ruled that Bloom stockholders had a "credible basis" to inspect the company's books over potentially misleading Bloom Energy server degradation and emissions claims.
- Also in 2021 the company was fined $1.16 million by the EPA for failure to properly dispose of hazardous waste from operation of its SOFC "Energy Servers."
- In 2020, Bloom admitted to a massive accounting error that forced them to restate nearly four years of earnings (2016–2019), reducing previously reported revenue by nearly 10%. In 2024 the company settled a related federal securities fraud case (*Roberts v. Bloom Energy Corp.*) for $3 million, in which it was alleged that Bloom made false and misleading statements regarding its financial health.
- In early June 2026, Bloom Energy's stock dropped by 10% after a 1.8GW data center contract in Wyoming fell through, with news sources reporting "investors have begun reassessing Bloom Energy's ability to fulfill its order backlog."
- Bloom Energy operates at approximately 1 GW of annual production capacity today. The company has committed $100 million to double that figure to 2 GW by the end of 2026. Utility Dive.[2]
- Bloom Energy's expansion to 2 GW annual capacity by the end of 2026 is insufficient given Project Jupiter's power needs.
- According to a June 2026, Rystad Energy report, "Bloom Energy's SOFC technology depends on scandium, a critical metal used in its electrolyte chemistry. At full utilization of its planned 2 GW manufacturing expansion, Bloom's theoretical scandium requirement would approach the size of the entire global market, currently estimated to be around 60 tonnes per year. This potential bottleneck is compounded by the fact that China heavily controls the global scandium supply chain."
- Bloom Energy's expansion is unlikely given its lack of experience with projects of this size, ability to scale production to meet Project Jupiter's electricity needs, and its ability to obtain the raw materials needed to produce the fuel cells.

[2] "Bloom Energy Says It's on Track for 2 GW Annual Production Capacity." Utility Dive, 2025. https://www.utilitydive.com/news/bloom-energy-says-its-on-track-for-2-gw-annual-production-capacity/804291/

- The Department shall deny any application for a permit if it appears that the construction of the new source will not be completed within a reasonable time. 20.2.7.208.G NMAC.

Construction must not be allowed to proceed on the basis of this unproven energy generation solution, the claims of this untrustworthy company, and the accompanying lack of rigorous empirical emissions testing data described below.

2. The proposed design - 2275 individual fuel cells, each with its own stack and no integrated controls for regulated pollutants - does not provide a realistic mechanism to verify compliance or facilitate enforcement of pollution standards.

On page 147 of the application YGI states "Bloom Energy Server System (SOFC) uses no add-on controls for regulated pollutants." (p 147 Emissions Summary) The estimated emissions, based on inadequate in-house testing, cannot be verified in any practical way, making enforcement impossible.

A permit issued under 20.2.72.210 NMAC must include monitoring, recordkeeping, and reporting requirements that ensure compliance and enable enforcement. Without continuous, long-term monitoring protocols capable of measuring localized particulate matter, volatile organic compounds (VOCs), and shifting CO_2 intensity per unit of energy under peak loads, any pollution mitigation claims represent theoretical best-case scenarios rather than dependable empirical projections.

It is unclear how appropriate monitoring can be conducted on 2275 individual units that do not include any control mechanisms. Without this information YGI's Application is incomplete on its face.

3. Air pollutant testing provided as part of the application was inadequate and cannot be relied upon for factual results.

The air pollutant estimates provided in Bloom Energy's applications are highly suspect due to a systemic lack of rigorous, real-world testing protocols for large-scale deployments. The estimated pollution from each Bloom Energy Server reported in the application are based on inadequate testing conducted on a single 65kw unit[3] in four tests of four hours each under ideal conditions. That unit generates 37,876 times less than the total capacity they are proposing. These estimates were further adjusted upward using a 15% "safety margin," an adjustment that would not be made if a company was

[3] Bloom Energy 'Santa Cruz' Model #ES-6.5 with rated output of 65kw. (Application page 161)

confident in their test results.[4] A single unit tested over a short time period and under ideal conditions does not offer credible, let alone conclusive, evidence of actual pollutant emissions.

With 2275 individual stacks, even small variations in performance could mean wildly variable actual emissions. This variability will be exacerbated when units are operated under real-world conditions, with variable feed-gas inputs, widely fluctuating temperatures that could exceed the maximum 113º F operating temperature, and rapid degradation as a result of continuous operation.

Without reliable emissions data, neither the Department nor the public can meaningfully evaluate whether the proposed facility will comply with applicable air quality standards or whether the permit will protect public health and the environment. **An application supported by emissions estimates derived from four-hour tests of a single 65-kW unit—extrapolated to a 2,275-stack, utility-scale facility nearly 38,000 times larger—does not constitute substantial evidence of actual emissions under real-world operating conditions, making any permit issued in response arbitrary and capricious.** See *Albuquerque CAB Co. v. N.M. Pub. Regulation Comm'n*, "An agency's action is arbitrary and capricious if it provides no rational connection between the facts found and the choices made, or entirely omits consideration of relevant factors or important aspects of the problem at hand."[5] In 2019 the NM Supreme Court wrote "In reviewing challenges to the factual findings of the Commission, we will affirm the Commission's order if it is "supported by substantial evidence," which is "evidence that is credible in light of the whole record and that is sufficient for a reasonable mind to accept as adequate to support the conclusion reached by the agency." (*N.M. Indus. Energy Consumers v. N.M. Pub. Regulation Comm'n*, 2019-NMSC-015, ¶ 8, 450 P. 3d 393). And in 2022 they found "We review the [air quality bureau's] determinations to decide whether they are arbitrary and capricious, not supported by substantial evidence, outside the scope of the agency's authority or otherwise inconsistent with law, with the burden on the appellant to make this showing." (*Citizens for Fair Rates and the Env't v. N.M. Pub. Regulation Comm'n,* 2022-NMSC-010, ¶12.)

The absence of representative testing, combined with the lack of any meaningful mechanism to verify emissions after construction, leaves critical gaps in the record that

[4] While Bloom Energy does not customarily recommend the use of safety factors for similar projects in other jurisdictions, a 15% safety factor was added to all hourly and annual emissions to account for potential variability in operating conditions and to ensure a conservative assessment of source impacts, consistent with local practice. (Application pg145)

[5] *Albuquerque CAB Co. v. N.M. Pub. Regulation Comm'n,* 2017-NMSC-028.

cannot be cured through speculation or assumptions. **Without accurate, representative emissions data demonstrating the project's actual pollution profile under reasonably foreseeable operating conditions, YGI's Application is incomplete on its face and should be denied unless and until that information is provided.**

4. Solid Oxide Fuel Cells emit hazardous air pollutants, extreme heat and hazardous waste streams that applicants fail to account for.

Applicants admit that pollutants of concern, including Carbon Monoxide (CO) at 161.2 tons per year and Volatile Organic Compounds (VOCs) at 124 tons per year will be emitted, constituting a major source of pollution under Title V and significantly impacting air quality and public health in a community that already experiences the cumulative impacts of nearby EPA non-attainment zones and significant deterioration of air quality related to oil and gas infrastructure.[6]

In addition to these regulated health hazards, the project will generate extreme heat, particularly for adjacent neighborhoods that could feel the "heat island" effect, increasing temperatures by up to 3.6º Fahrenheit downwind of Project Jupiter.[7] Data centers already generate significant waste heat as a result of their cooling mechanisms. **The Bloom Solid Oxide Fuel Cell plant will exacerbate that heat island effect. Bloom Solid Oxide Fuel Cells operate at extremely high temperatures - up to 800ºF - and emit waste heat at greater than 350ºF.[8]**

An analysis of the project prepared by Robert Davies, Ph.D from the Utah State University Department of Physics, attached and incorporated as Exhibit A, calculates that the YGI Microgrid will cause a thermal flux density of approximately: 4.1×10^9 W $\div 5.66 \times 10^6$ m² ≈ 725 W/m², explaining "This is a massive single-site thermal load — equivalent to something like 10,000 Walmart Supercenters. Roughly speaking, think of a rectangular footprint on the ground of 250 Supercenters stacked 50 deep." Exhibit B, attached and incorporated is Professor Davies' Curriculum Vitae.

---

[6] https://www.env.nm.gov/wp-content/uploads/sites/2/2024/02/Air-Quality-Issues-in-Dona-Ana-County_14Feb2024.pdf

[7] "While it should be emphasized that these are initial observations, the measured elevation of air temperature by as much as 2.2 °C at 100–500 m downwind is physically consistent with the extraordinary heat flux densities involved.." p.4. Data Center Waste Heat as an Emerging Urban Thermal Hazard: First Field Measurements of Neighborhood-Scale Air Temperature Impacts. ASME Journal of Engineering for Sustainable Buildings and Cities MAY 2026, Vol. 7.

[8] The Energy Server produces clean energy at one of the highest efficiencies in the market today. Its internal operating temperature is above 800 °C, and the resulting exhaust is available at above 350 °C. https://www.bloomenergy.com/wp-content/uploads/energy-server-with-heat-capture-brochure-2024.pdf

Extreme heat is one of the most deadly health hazards for infants, outdoor workers and vulnerable aging adults who cannot regulate their body temperatures.[9] Homes in these adjacent neighborhoods could also see their energy costs rise as they struggle to cool their homes in an already sweltering desert climate, a climate only growing hotter as a direct result of fossil fueled energy generation like the proposed plant. The plant could potentially generate a thermal plume powerful enough to create air turbulence and impact flight traffic above the facility.[10]

Finally, Bloom Energy Solid Oxide Fuel Cells generate a hazardous waste stream from sulfur and other contaminants filtered out of the methane feed-stock before its use. These contaminants accumulate, concentrating a toxic mix of aluminum oxide, copper oxide, manganese dioxide, benzene and others.[11] Though the permit application does not detail hazardous waste disposal, engineers verbally disclosed to community members that the proposed YGI microgrid would, for the first time, implement a collective cleaning mechanism for the feedstock, which will result in a significant concentration of hazardous waste with no clear plan for disposal. Bloom Energy's track record on hazardous waste handling is terrible. The company was fined $1.16 MM for improper hazardous waste disposal by the EPA, including for canisters containing benzene that ended up in New Mexico landfills.

5. Carbon dioxide overload is a significant and growing public health hazard. The addition of 10 million metric tons of CO_2 emissions annually will have significant health impacts for local communities and for all living things.

---

[9] "Temperatures above long-term averages during summer months and discrete heat extremes (eg, heatwaves) are associated with excess mortality. In high-income countries, heat is one of the largest weather-related causes of death. In addition to mortality, hot weather and heat extremes are associated with increased emergency room visits and hospital admittance, increased deaths from cardiorespiratory and other diseases, mental health issues, adverse pregnancy and birth outcomes, and increased health-care costs. Most heat-related morbidity and mortality should be preventable with improved preparedness and avoidance of exposure. Studies consistently show that adults older than 65 years, people with cardiopulmonary and other chronic diseases, and very young children are particularly vulnerable to the effects of heat, irrespective of income level or geographical region." Ebi K, Capon A, Berry P et al., *Hot weather and heat extremes: health risks*, The Lancet, 398, 698-708, https://www.thelancet.com/journals/lancet/article/PIIS0140-6736(21)01208-3/fulltext

[10] https://www.faa.gov/documentLibrary/media/Advisory_Circular/150_5190_4b_Land_Use_Compatibility.pdf

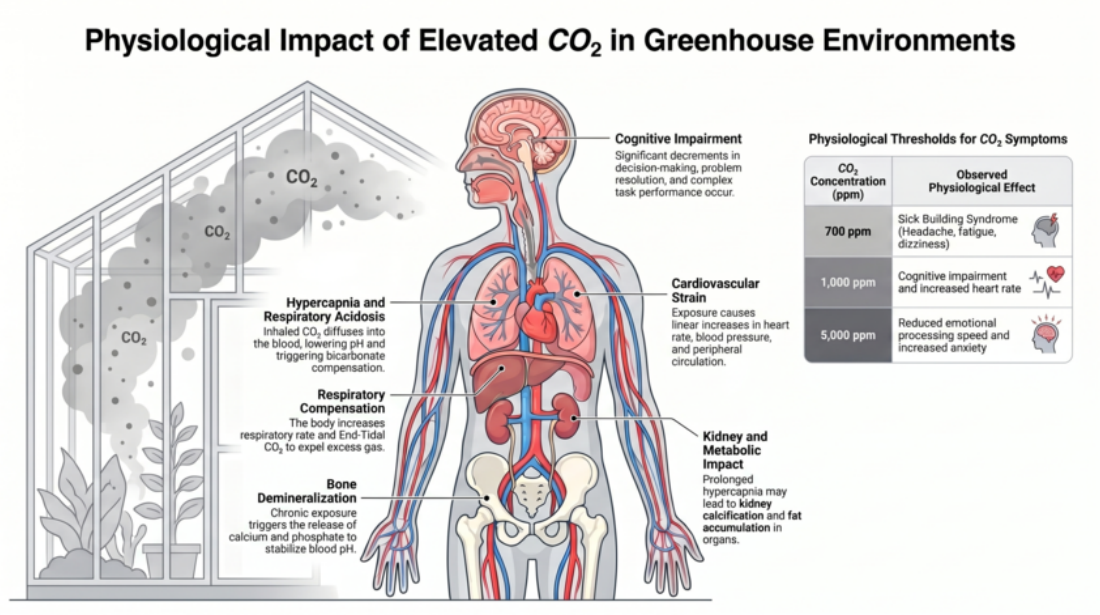
[11] https://www.bloomenergy.com/wp-content/uploads/bloom-energy-hazardous-materials-business-plan-may-2024.pdf

The YGI Microgrid application estimates that 2275 methane fueled Solid Oxide Fuel Cells will emit 10,144,115 metric tons of CO_2 annually, an amount that exceeds the annual emissions of Albuquerque, Santa Fe and Las Cruces combined; but this giga-size industrial project is concentrated in approximately 275 acres. **The extremely concentrated, continuous stream of CO_2 proposed will inevitably add to the steadily rising ambient CO_2 in the earth's atmosphere (currently 431ppm[12]), affecting neighboring communities in particular, a prospect with direct health implications that cannot be ignored.**

NMED's mission is to protect and restore the environment and to foster a healthy and prosperous New Mexico for present and future generations, and the mission of NMED's Air Quality Bureau is to protect the inhabitants and natural beauty of New Mexico by preventing the deterioration of air quality. **These mission critical objectives cannot be achieved without consideration of the growing body of research documenting the health impacts of increasing levels of carbon dioxide in the atmosphere.**

A study published in 2026 in Air Quality, Atmosphere & Health[13] reports that "As the atmospheric CO_2 levels rise, already at 431ppm, the increasing levels of bicarbonate, and decreasing levels of calcium and phosphorus in our blood represent permanent and growing changes in human blood chemistry." They report that elevated CO_2 can lead to significant health complications, including changes in heart rate, kidney calcification, neural damage, inflammation, and oxidative stress, which plays a major role in various clinical conditions including malignant diseases, diabetes, atherosclerosis, chronic inflammation and neurological disorders such as Parkinson's and Alzheimer's diseases. In particular, oxidative damage to cellular DNA can lead to the initiation and progression of cancer.

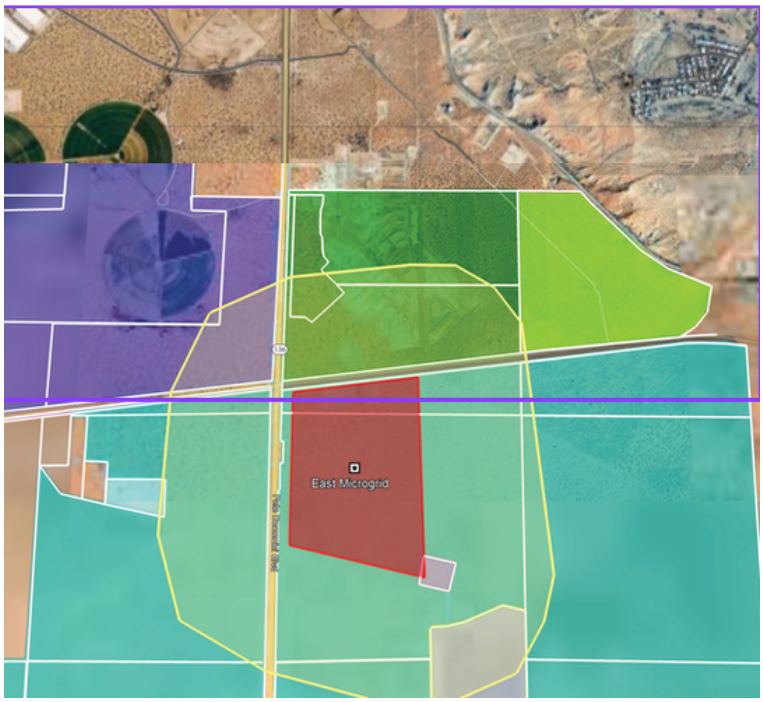
Another study published in 2025[14] reports that "Recent studies have shown that short-term exposures to values in the range of 1000–2000 ppm and even lower have measurable negative effects on human cognitive performance." Researchers have also found that increased exposure to CO_2 has the potential to detrimentally impact mental health in humans. It is known to cause anxiety and panic attacks, activating what is one of the most basic and general alarm/avoidance systems within the realm of biology. The authors write, "While panic and anxiety attacks generally occur at high levels of CO_2, the distribution of liability to CO_2 sensitivity is continuous and normally distributed in



[12] https://www.CO2.earth/daily-CO2

[13] https://www.researchgate.net/publication/401260507_Carbon_dioxide_overload_detected_in_human_blood_suggests_a_potentially_toxic_atmosphere_within_50_years

[14] https://pubs.rsc.org/en/content/articlelanding/2025/va/d5va00017c



humans and animals." **In other words, because CO_2 sensitivity exists on a spectrum, even minor increases in regular CO_2 exposure could disproportionately heighten anxiety or stress responses in vulnerable individuals.**

A pre-print examining the physiological impacts of elevated CO_2 in greenhouse environments[15] included this helpful illustration:

The proposed "microgrid," with CO2 emissions equivalent to the three largest cities in New Mexico compressed into about 275 acres, will have public health impacts in vulnerable local communities that cannot be ignored.

15 https://www.researchgate.net/publication/404391979_Physiological_and_health_effects_of_greenhouse_carbon_dioxide_exposure_a_review

The YGI Microgrid is adjacent to populated neighborhoods.

6. Solid Oxide Fuel Cells are fueled by methane and will further exacerbate the climate crisis. Renewable energy alternatives exist and are more cost effective.

Project Jupiter's proposed power plant will release up to 10 million tons – 20 billion pounds – of climate-warming greenhouse gasses every year. (10,144,115). The YGI proposal makes a mockery of New Mexico's emissions reduction goals and will erase most of the progress that has been made in the state in the last two decades. The YGI plant generation capacity, 2,462 MW, is nearly equivalent to the size of the 2900 MW grid of El Paso Electric and the 2,700 MW grid of PNM, but emits more CO_2 pollution than both electric utilities combined.[16]

It is imprudent to accept YGI's chosen resource generation without the consideration of alternatives; the failure to reasonably consider alternatives and present them is a fundamental flaw in YGI's decision-making process. In the analysis of feasible generation resources, YGI can and should be expected to factor in cost, time of deployment, externalized costs: water consumption, air, heat, noise pollution and health impacts. Environmental justice principles require NMED to analyze the total combined burden of multiple pollutants and social stressors (e.g., poverty, housing, water quality, heat and quantity) that will disproportionately affect the BIPOC and low-income

[16] El Paso Electric CO2 pollution: 3,119,379 tons (2025) (https://www.epelectric.com/el-paso-electric/uploads/2025-sustainability-report.pdf), PNM CO2 pollution: 5,276,705 tons (2022), https://www.txnmenergy.com/sustainability/environment/climate_change_report.aspx

communities living near Project Jupiter over time. NMED must evaluate these air permits beyond single-source pollution, requiring holistic assessments of health risks and socioeconomic vulnerabilities, and to prioritize the health and safety of New Mexicans.

According to the June 2025 Lazard Levelized Cost of Energy Report "renewables stand out as both the lowest-cost and quickest-to-deploy generation resource." (p. 4)[17] Construction time for utility-scale solar averages 15 months (p 34), and importantly, **a 100% renewable energy solution for data centers is not theoretical. Google is already deploying a 300MW/30GWh iron air battery system paired with 1.6 GW renewable energy generation to power a data center in Minnesota.[18] A new analysis from IRENA of solar-plus-battery configurations across multiple countries shows that firm renewable energy costs have fallen from above $100 per MWh in 2020 to around $54-82 per MWh by 2025 in high-irradiance solar regions and strong wind corridors.[19] A renewable energy solution is both possible and in the public interest.**

The YGI proposed Solid Oxide Fuel Cell powered "microgrid" attempts to greenwash Project Jupiter's extreme and dangerous impacts on air quality, public health and the environment. The proposed Solid Oxide Fuel Cell plant constitutes a major air pollutant source for both Carbon Monoxide and Volatile Organic Compounds and, importantly, is based on questionable estimates provided by a company with a less-than-stellar corporate history. Construction must not be allowed to proceed on the basis of this questionable energy generation solution and the accompanying lack of rigorous empirical emissions testing data.

The proposed YGI Microgrid will significantly impact the health and wellbeing of neighboring communities and vulnerable individuals and therefore the permit should be rejected outright. At the very least a hearing should be held to investigate the significant community impacts detailed above.

7. The Integrity of the Public Comment Record Has Been Compromised and Requires Investigation Before Any Permit Action.

Recent reports that New Mexico residents' names were used without permission to submit public comments in support of Project Jupiter raise serious questions about the integrity of the administrative record before NMED. Public participation in an air permitting process is not a public-relations contest; it is a legally significant component of agency decision-making. Where comments are submitted under false names, fake phone numbers, or without the consent of the

[17] https://www.lazard.com/media/eijnqja3/lazards-lcoeplus-june-2025.pdf
[18] https://pv-magazine-usa.com/2026/02/24/google-to-deploy-worlds-largest-iron-air-battery-for-minnesota-data-center/
[19] https://www.irena.org/Publications/2026/May/24-7-renewables-The-economics-of-firm-solar-and-wind

named speaker, the agency cannot treat the resulting record as reliable evidence of public support.

The experience of Darien Fernandez illustrates the gravity of the problem. Mr. Fernandez, a Taos Town Councilmember and Director of the Taos Land Trust, stated that he "did not talk with any canvassers," had "not seen any canvassers in Taos," and that the phone number used in the first pro-Project Jupiter comment submitted under his name was "fake." After receiving an email stating that a comment in favor of Project Jupiter had been registered to him, Mr. Fernandez contacted NMED and was instructed to submit a corrective comment explaining that the first comment was false and not submitted by him. He did so, registering his opposition to Project Jupiter, and also notified the State Auditor and submitted a complaint to the Ethics Commission.

Similarly, Albuquerque City Councilor Tammy Fiebelkorn publicly stated that comments submitted in support of Project Jupiter under her name were unauthorized and that she neither submitted nor approved them. She condemned the impersonation as an attack on the integrity of the public comment process and emphasized that she opposes Project Jupiter because she believes it threatens the environment, communities, and wildlife. Councilor Fiebelkorn further asserted that the company has misled the public about its plans and attempted to manufacture public support through deceptive advertising. She concluded that the unauthorized use of her name is reprehensible and that the public deserves an honest and transparent permitting process free from deception.

Accordingly, before NMED relies on any claimed public support for Project Jupiter, it must investigate whether comments submitted in favor of the project were authentic, knowingly authorized, and fairly obtained. At minimum, NMED should require disclosure of all contractors, canvassers, public-relations firms, consultants, scripts, databases, submission platforms, metadata, quality-control procedures, and communications used to solicit, prepare, transmit, or file public comments. Any comment shown to have been submitted without authorization must be removed from or separately identified in the record and given no evidentiary weight.

The agency should not proceed as though the public-comment record is intact when credible evidence suggests that New Mexicans' identities may have been misused to manufacture public support for a project with profound air-quality, climate, water, land-use, and community impacts. The integrity of the permitting process requires more than counting comments; it requires ensuring that the people whose names appear in the record actually spoke for themselves.

8. Significant Public Interest Warrants a Public Hearing.

The record leaves no doubt that this application has generated an extraordinary and unprecedented degree of public concern. Thousands of people have offered public comments, elected officials at every level of government have demanded greater scrutiny, construction has proceeded while critical environmental reviews remain incomplete, and substantial questions have been raised concerning the integrity of the public comment process itself. Under these

circumstances, the Secretary cannot reasonably conclude that the statutory threshold has not been met. Rather, the Secretary must find that there is a significant degree of public interest in this permit application and, consistent with the Department's obligation to ensure a full, fair, and transparent administrative process, must order a public hearing before any permit decision is issued. Anything less would deprive the public of its right to meaningfully participate in a permitting decision involving one of the largest and most consequential air pollution sources ever proposed in New Mexico.

WHEREFORE, for all of these reasons, NEE respectfully requests that the Department deny YGI's air permit application. The Application is not supported by substantial evidence, as required for permit approval, but instead rests on speculative emissions estimates derived from grossly inadequate testing that cannot reasonably be extrapolated to a facility consisting of 2,275 individual solid oxide fuel cells and stacks. The Applicants concede that the proposed design employs **no add-on controls for regulated pollutants**, yet fail to identify any practical means of monitoring, verifying, or enforcing compliance with applicable emission limits across thousands of independent emission points. Consequently, the Application fails to satisfy the monitoring, recordkeeping, and reporting requirements of **20.2.72.210 NMAC**, because it does not demonstrate how compliance can be measured or enforced throughout the life of the facility. Equally troubling, the Application fails to adequately characterize the full range of emissions and environmental impacts associated with the project, including hazardous air pollutants, significant carbon monoxide and VOC emissions, extreme waste heat, and hazardous waste streams generated by the proposed solid oxide fuel cells. In a community already burdened by existing industrial pollution and located near EPA nonattainment areas, the Department cannot lawfully rely on theoretical best-case assumptions in lieu of reliable empirical evidence. Because the record does not contain representative emissions testing, an enforceable compliance methodology, or substantial evidence demonstrating that the proposed facility will comply with the Air Quality Control Act and the Department's regulations, **YGI's Application is incomplete on its face and must be denied unless and until these fundamental deficiencies are remedied.**

Thank you for the opportunity to comment.

Respectfully,

Mariel Nanasi, Executive Director

Project Jupiter — Red-Flag Assessment

Prepared for New Energy Economy review
June 28, 2026

This document raises concerns and identifies areas for further independent investigation based on publicly available information about Project Jupiter as of late June 2026. It is intended to support, not replace, the work of qualified professionals (legal counsel, environmental engineers, atmospheric scientists, hydrologists, public health specialists, and others) engaged on this case. Specific numbers and claims herein should be verified against primary sources before being relied upon in formal proceedings.

Project Summary

Project Jupiter is a proposed AI-optimized datacenter campus in Doña Ana County, New Mexico, near Santa Teresa and the US-Mexico international port of entry. Key parameters:

- **Compute capacity:** Up to 2.45 GW across four datacenter buildings
- **Site footprint:** Approximately 1,400 acres
- **Power source:** On-site Bloom Energy solid oxide fuel cell (SOFC) microgrid at 2.45 GW installed capacity (revised from gas turbines and diesel generators in April 2026)
- **Cooling:** Closed-loop dry cooling
- **Anchor tenant:** Oracle, hosting AI infrastructure for OpenAI
- **Developer:** BorderPlex Digital Assets in partnership with STACK Infrastructure
- **Total claimed investment:** Up to $165 billion over 30-year project term; initial $50 billion within five years
- **Current status:** Construction underway despite final air permits not yet issued; New Mexico Environment Department air permit decision pushed to July 2026; at least four active lawsuits pending in New Mexico courts

The discussion below identifies several areas where publicly available information appears to understate likely impacts, where developer claims diverge from state-engineering verifications, and where the regulatory process appears to have proceeded on materially incomplete information. The report concludes with a section on procedural irregularities, framed within the whole-systems context.

1. Power Source: The Fuel Cell Pivot and What Did Not Change

The April 2026 announcement that Project Jupiter would replace gas turbines and diesel generators with Bloom Energy fuel cells has been framed publicly as a substantive environmental concession. The reality is more limited.

What changed

The pivot, announced 27 April 2026, was driven by regulatory friction rather than environmental conscience:

- In March 2026, the New Mexico State Land Office denied an application from Energy Transfer (Dallas-based pipeline owner via Transwestern Pipeline Company) for state-land right-of-way access for the "Green Chile Project" — a proposed 17-mile, $60 million pipeline that would have delivered 400,000 dekatherms per day of natural gas from El Paso to the Project Jupiter site
- Federal Energy Regulatory Commission staff protested the pipeline developer's filing as incomplete on historic preservation documentation
- Oracle and BorderPlex Digital Assets subsequently withdrew the two pending air permit applications tied to the gas turbine design and announced the fuel cell pivot

In the revised design, Bloom Energy will supply up to 2.45 GW of installed fuel cell capacity to power the datacenter. The development has been framed by the developer as part of a broader Oracle-Bloom partnership covering up to 2.8 GW of capacity across Oracle's US projects, of which 1.2 GW had been previously contracted at other sites.

Compared to the original gas turbine plan, the fuel cell design offers:

- Approximately 92% reduction in NO_x emissions
- Substantially lower water use at the generation facility itself
- Modest reduction in greenhouse gas emissions (approximately 30% lower than the gas turbine version)

What did not change

Several fundamentals are essentially unchanged by the pivot:

The datacenter load. The 2.45 GW of compute capacity becomes 2.45 GW of heat regardless of how the electricity is generated. This is a basic thermodynamic constraint.

The local thermal load on the basin. Approximately 4 GW (discussed in Section 2).

The natural gas dependency. Fuel cells consume natural gas through electrochemical reaction rather than combustion, but they still consume substantial quantities of methane. Discussed in Section 3.

The greenhouse gas emissions footprint. Even after the pivot, projected emissions of approximately 10 million tons CO_2-equivalent per year remain extraordinary for a single facility. Discussed in Section 4.

The scale relative to community-facing disclosure. The capacity disclosed to Doña Ana County commissioners at the time of the 19 September 2025 industrial revenue bond approval was 700–900 MW initially, reaching up to about 1 GW eventually. The current 2.45 GW capacity is roughly 2.5–3.5 times larger than that disclosure. This gap is addressed in Section 10.

Operational uncertainties at unprecedented scale

A 2.45 GW deployment of Bloom SOFC fuel cells at a single site is genuinely without precedent. As of August 2025, Bloom Energy's total deployed fleet across all customers globally was approximately 1.5 GW. Project Jupiter alone, at 2.45 GW, would be larger than Bloom's entire prior deployed installed base. This warrants caution about:

- Operational behavior at scale not previously demonstrated
- Reliability characteristics across thousands of units operating as a single microgrid
- Maintenance and replacement cycles for fuel cell stacks at this scale
- Long-term performance degradation patterns
- Acoustic profile (distributed across thousands of units rather than concentrated)
- End-of-life management for spent fuel cell stacks

What this warrants

- Independent technical assessment of the operational, reliability, and lifecycle characteristics of GW-scale SOFC deployment, not relying solely on developer or vendor representations
- Specific disclosure of unit count, expected replacement cycles, and lifecycle environmental footprint including stack manufacturing and disposal
- Verification that the revised microgrid design has undergone the same level of regulatory scrutiny that the original gas turbine plan was undergoing when it was withdrawn

2. Thermal Load

The local thermal injection into the Doña Ana County environment is determined by the datacenter electrical load plus the waste heat from on-site power generation.

Datacenter load:	2.45 GW electrical
Becomes heat at the facility:	2.45 GW (all electrical → heat)
Fuel cell efficiency:	~60% (Bloom SOFC, optimistic)
Primary gas energy required:	2.45 / 0.60 ≈ 4.08 GW thermal
Fuel cell waste heat:	4.08 – 2.45 ≈ 1.63 GW
Total local thermal load:	**~4.1 GW**

This is a massive single-site thermal load — equivalent to something like 10,000 Walmart Supercenters. Roughly speaking, think of a rectangular footprint on the ground of 250 Supercenters (say 25 Supercenters x 10 Supercenters) stacked 50 deep. Distributed across the 1,400-acre footprint (5.66×10^6 m²), this represents a thermal flux density of approximately:

$$4.1 \times 10^9 \text{ W} \div 5.66 \times 10^6 \text{ m}^2 \approx 725 \text{ W/m}^2$$

For context, the average solar irradiance in southern New Mexico (annualized, all hours) is approximately 230–250 W/m². The facility would therefore inject approximately **three times the local average solar energy budget** into the site, continuously, day and night.

Implications

A continuous 4 GW thermal injection into a single 1,400-acre site in the Chihuahuan Desert has several implications:

Local microclimate alteration. Persistent warming and altered convection patterns at the site, with effects on overnight cooling, soil temperature, evaporation rates, and local atmospheric stability.

Downwind atmospheric effects. Warm air plumes propagating downwind under typical wind regimes. In the southern Rio Grande corridor, prevailing winds carry effects toward El Paso and across the border into Ciudad Juárez.

Cumulative effects with regional thermal forcing. The Chihuahuan Desert is already experiencing climate-driven warming and aridification. A persistent 4 GW industrial heat injection adds to that trajectory in ways the regional environmental review process has not adequately characterized.

Dust mobilization. Industrial development on Chihuahuan Desert lands disrupts the biological soil crust that stabilizes soil against wind erosion. The footprint and operational thermal anomaly together can be expected to increase dust mobilization in a region already affected by significant dust events.

What this warrants

- Three-dimensional atmospheric boundary layer modeling under realistic Doña Ana County meteorological conditions, including typical wind regimes and downwind transport patterns, to determine temperature change implications — which are likely to be significant
- Specific assessment of cross-border atmospheric effects on Ciudad Juárez and surrounding Mexican territory
- Dust mobilization modeling specific to the site, including effects on regional air quality
- Cumulative thermal loading assessment that accounts for other industrial development in the Borderplex region

3. Gas Supply

Project Jupiter's full operation requires substantial natural gas volume to feed the Bloom fuel cell microgrid.

Plant primary energy input: ~4.08 GW thermal

At typical gas energy density (~1,000 Btu/cubic foot):

Annual gas consumption: ~0.35 Bcf/day at full build

The gas would be sourced from the Permian Basin via the El Paso Natural Gas Company mainline. The original gas turbine design required a new 17-mile pipeline ($60 million capital cost) to connect the site to existing infrastructure. With the fuel cell pivot, the status of that pipeline project requires verification — fuel cells still require gas supply, but the volumetric requirements are somewhat lower than the gas turbine design.

Energy Economics / Regional Supply Context

Several supply-side concerns are relevant and would likely have some impact on regional energy economics:

LNG export competition. Gulf Coast LNG export terminals are aggressively expanding. Multiple new export facilities are coming online over the next several years. The competition for available pipeline capacity between domestic industrial users like Jupiter and international LNG exports is more intense in this region than almost anywhere else in the United States.

Cross-border supply dynamics. El Paso Natural Gas serves substantial exports to Mexico. Mexican gas demand has been growing, driven by power generation and industrial demand. Jupiter would enter a tri-national supply competition (US domestic, Mexican imports, LNG exports) for the same regional pipeline capacity.

Price impact and ratepayer effects. A 0.35 Bcf/day industrial gas load is meaningful. For context, total residential and commercial gas consumption in New Mexico is approximately 0.3–0.4 Bcf/day. **Jupiter's industrial demand would be roughly equivalent to all of New Mexico's residential and commercial gas consumption combined.** The developer's "behind-the-meter" framing suggests Jupiter will not affect anyone else's rates, but the market dynamic is that a large new industrial load withdraws supply from the available regional pool, tightens supply-demand balance, and puts upward pressure on prices for everyone drawing from the same regional supply.

Curtailment risk. Under federal and state regulations, residential heating has legal priority over industrial gas customers during winter peak demand events. A datacenter designed for high uptime is structurally incompatible with being last in line during a cold weather event.

Administrative Record NSR_001846

Winter Storm Uri precedent. The Texas and New Mexico region experienced catastrophic gas supply failures during Winter Storm Uri in February 2021. Wellheads froze, pipelines failed, gas prices spiked, and residential heating customers lost service during life-threatening cold. The regional gas supply system has demonstrated documented vulnerability under extreme weather. Adding a multi-gigawatt continuous industrial load to that system makes the vulnerability worse, not better.

What this warrants

- Specific disclosure of pipeline capacity commitments and contractual structure for Project Jupiter's gas supply
- Assessment of cross-border supply implications, including Mexican demand competition
- Independent analysis of price impact on residential and commercial gas customers in southern New Mexico
- Curtailment risk analysis under historical extreme weather scenarios
- Resilience assessment under Winter Storm Uri-comparable conditions

4. Greenhouse Gas Emissions

The greenhouse gas emissions profile of Project Jupiter is among the most concerning aspects of the proposal, even after the fuel cell pivot.

The numbers

The original gas turbine design's air permit applications, filed in late 2025, projected emissions of more than 14 million tons CO_2-equivalent per year, from a planned 41 natural gas turbines across two co-located "east microgrid" and "west microgrid" facilities. The fuel cell redesign reduces projected emissions by approximately 30%, to approximately **10 million tons CO_2-equivalent per year**.

For context:

- The combined annual greenhouse gas emissions of Albuquerque and Las Cruces (New Mexico's two largest cities), per their respective climate action plans, are approximately **6.7 million metric tons** CO_2-equivalent

Administrative Record NSR_001847

- Project Jupiter's fuel-cell-version projected emissions (~10 million tons) are therefore **roughly 1.5 times** the combined emissions of the state's two largest cities, from a single facility
- The original gas-turbine-version emissions (14+ million tons) would have been **more than twice** the combined cities

The wipeout framing

Las Cruces environmental attorney David Baake has characterized the emissions impact as wiping out approximately 20 years of state-level climate progress. This characterization is broadly consistent with the arithmetic: at projected reductions in state-level emissions through the Energy Transition Act and other policy mechanisms, the cumulative reductions achieved over a multi-year period would be substantially offset by a single facility of this scale.

What this warrants

- Independent emissions modeling under realistic operational scenarios (load factor, duty cycle, maintenance schedules)
- Comparison against state Energy Transition Act trajectory and federal emissions reduction commitments
- Assessment of how the emissions framework integrates with state climate policy
- Consideration of cumulative emissions across the broader Oracle-Bloom 2.8 GW partnership

5. Water

This is one of the most significant areas of factual disagreement between developer-facing claims and apparent state-engineering verification, and warrants particularly careful attention.

The discrepancy

Publicly available reporting documents a substantial gap between the water use figures the developer has communicated to the public and the figures apparently verified by state engineers:

- **Developer-stated water use:** Approximately 20,000 gallons per day
- **State-engineering-verified figure (first application:** Up to approximately 1,000,000 gallons per day

This is a discrepancy of approximately **50-fold** between the public-facing claim and the apparent state verification. If the state-engineering figures are accurate, the developer's public communication of "two dairy cows per year" or equivalent low-impact framing substantially misrepresents the actual water demand of the project.

The legal team should verify the underlying documents (state engineer reports, water rights filings, infrastructure capacity assessments) and assess the implications for both the integrity of the public process and the substantive water impact analysis.

Why water use is consequential here

Doña Ana County sits in a multi-decade drought. The lower Rio Grande through the Mesilla Valley experiences zero-flow events during much of the year. Groundwater in the Mesilla Basin has been declining for decades due to over-allocation. Local farmers have been drilling wells deeper as the water table drops. Pecan orchards have been dying. The Camino Real Regional Utility Authority (CRRUA) provides public drinking water to the area and has its own infrastructure constraints.

Within this context:

- 20,000 gallons per day is roughly equivalent to a few residential customers — easily absorbed by existing infrastructure
- 1,000,000 gallons per day is equivalent to the water demand of approximately 3,000–5,000 residential customers — a substantial new water user that would compete directly with existing agricultural and municipal use

The arithmetic is straightforward, but the implications turn entirely on which figure is accurate.

I realize that the new application claims that Bloom Energy fuel cells will use no water during "normal operation" but I believe, especially given the conditions unique to this area, that there should be a third party independent assessment of this claim. I've included an additional section below discussing this point.

The cooling architecture

Like Stratos, Project Jupiter has committed to closed-loop dry cooling rather than evaporative cooling. The fuel cell facility itself uses relatively little water in normal operation. However:

- First-fill requirements for the closed-loop system at this scale are substantial
- Operational top-up losses through drift, treatment, and maintenance accumulate over time
- Ancillary water needs (cleaning, fire suppression, sanitation, fuel cell maintenance) add to the total

- Construction water requirements during the multi-year build-out are substantial

The 1,000,000 gallons per day state-engineering figure likely reflects the total operational water demand including these ancillary needs, while the 20,000 gallons per day developer figure likely reflects only the cooling tower top-up under steady-state operation.

If both figures are accurate within their narrow definitions, the public communications problem is that the developer has been disclosing only the smallest component of total water demand while the state has been verifying the full operational requirement. The 50-fold gap reflects the difference between these definitions, not a simple disagreement about the same number.

The Bloom SOFC "no water" claim — narrow scope, broader misapplication

The developer and Bloom Energy have publicly emphasized that Bloom's solid oxide fuel cells consume "no water during normal operation." This claim is technically accurate as stated, but its scope is much narrower than facility-wide framings may suggest.

What Bloom actually claims: From Bloom Energy's official product data sheet: "*With no water consumption during normal operation and a high operational efficiency, the Bloom Energy Server significantly reduces greenhouse emissions today.*" Bloom's technical explanation is that the steam required for the internal steam-reforming reaction (which converts natural gas to hydrogen for the electrochemical reaction) is generated by recycling the water produced as a byproduct of the $H_2 + O_2 \rightarrow H_2O$ reaction. Independent peer-reviewed literature confirms this mechanism: SOFCs require steam for reforming, and well-designed systems can recycle their own reaction water rather than requiring external supply.

What the claim does not cover: The "no water" characterization applies specifically to the fuel cell chemistry under steady-state operation. It does not cover:

- **Startup and shutdown — steam generation during initial startup requires external water**
- **Maintenance and cleaning** of the fuel cell stacks
- **Ancillary equipment cooling** — power electronics, inverters, controls, monitoring systems
- **Fire suppression infrastructure** — required for a fuel cell installation at this scale
- **Human sanitation for on-site workers**
- **Construction water demand** during the multi-year build-out
- **The *data center* (not powerplant) closed-loop cooling system** — an entirely separate water demand that exists regardless of the electricity source

For Project Jupiter specifically, the last item is decisive. The facility comprises 2.45 GW of fuel cells plus four data centre buildings totaling 2.45 GW of compute load. The data centre cooling infrastructure has its own substantial water demand — including a first-fill of approximately 10

million gallons over two years (per developer disclosure) plus ongoing top-up requirements — that is entirely separate from and independent of the fuel cell water accounting. Applying Bloom's "no water" characterization to the entire Project Jupiter facility conflates the fuel cell chemistry with the full facility water demand.

The Bloom claim is a real technical advantage over combustion power plants that require substantial cooling water. It does not, however, resolve the 50-fold gap between the 20,000 gallons per day figure communicated to the public and the up to 1,000,000 gallons per day figure verified by state engineers. That gap reflects the difference between the fuel cell chemistry alone and the total operational water demand of the integrated facility.

What this warrants

- Independent verification of state engineering documentation
- Specific disclosure by the developer of total operational water demand including all ancillary uses
- Assessment of cumulative water demand against Mesilla Basin sustainability
- Compliance review against the Camino Real Regional Utility Authority's capacity and any applicable water rights
- Assessment of cross-border water implications under the 1906 and 1944 US-Mexico water treaties

6. Cross-Border Ecological and Atmospheric Effects

Project Jupiter is sited approximately two miles from the US-Mexico border, with substantial implications for cross-border environmental analysis that domestic-only review may not adequately address.

Ecological pathways

The Chihuahuan Desert ecosystem does not end at the political border. It continues into northern Chihuahua state, with shared:

- Wildlife populations and migration corridors

- Vegetation communities and ecological processes
- Watershed connections via the Rio Grande
- Air pollution and dust transport patterns
- Light pollution from industrial development

Atmospheric pathways

Prevailing wind patterns in the southern Rio Grande corridor carry atmospheric pollutants and thermal effects across the border into Ciudad Juárez and surrounding Mexican territory. Project Jupiter's emissions and thermal anomaly will affect populations in Mexico who have had no meaningful opportunity to participate in the US permitting process.

Water pathways

The Mesilla Basin aquifer is hydrologically connected to the Rio Grande and to groundwater systems extending across the border. Water use in Doña Ana County has downstream implications for Mexican water users under the 1906 and 1944 US-Mexico water treaties.

Regulatory framework

The Espoo Convention and related international instruments establish principles for transboundary environmental impact assessment, though US-Mexico practice is governed primarily through bilateral mechanisms. The legal team should assess:

- Whether the US permitting process has adequately consulted Mexican authorities
- Whether the project triggers obligations under the La Paz Agreement (US-Mexico environmental cooperation framework)
- Whether the cumulative cross-border environmental footprint has been characterized

What this warrants

- Specific assessment of atmospheric pollution and thermal effects on Ciudad Juárez and surrounding Mexican populations
