7. Environmental Justice

The environmental justice dimension of Project Jupiter is among the most significant features distinguishing it from other hyperscale datacenter proposals.

Existing pollution burden

Santa Teresa and Sunland Park (the immediate host communities) have substantial documented pre-existing environmental burdens. The EPA, in its October 2024 Federal Register action approving the periodic emissions inventory for the Sunland Park nonattainment area, conducted an EJScreen analysis of the host community (population approximately 17,408 within 13.86 square miles). The EPA's published findings:

- **Eight of twelve EJScreen indicators exceed the 80th percentile** nationally
- **Seven of twelve EJScreen indicators exceed the 80th percentile** within the State of New Mexico
- **Five of twelve indicators exceed the 90th percentile** in both New Mexico and the United States, including indices for **particulate matter 2.5, ozone, air toxics cancer risk, air toxics respiratory hazard, and wastewater discharge**

Additional documented community characteristics:

- The **American Lung Association** has given Doña Ana County a **failing grade for ozone**, an air pollutant linked to asthma attacks, increased respiratory infection risk, and increased risk of premature death
- The Sunland Park Area has been designated by the EPA as a **2015 ozone National Ambient Air Quality Standards (NAAQS) nonattainment area** since 2018
- The area was incorporated into the expanded **El Paso-Las Cruces, Texas-New Mexico multi-state nonattainment area** effective December 2021
- Sunland Park's population is approximately **93.2% Hispanic or Latino**, with **86.3% of households Spanish-speaking** and **34.1% foreign-born**
- Approximately **42% of households** report median income below $25,000
- Adjacent to major industrial corridor along the border

Administrative Record NSR_001853

- Downwind of significant existing industrial and transportation pollution sources
- Documented historical pattern of polluting industry siting in border communities
- Lower-income communities with reduced capacity for individual mitigation

The cumulative-loading argument applied

The cumulative-loading framework applies to environmental justice analysis with particular force. A new industrial facility of Project Jupiter's scale is being proposed in an airshed and community that is already exceeding the capacity to absorb pollution without harm. The marginal regulatory framework asks whether this specific facility, with appropriate mitigation, can be approved within current standards. The cumulative framework asks whether any additional industrial loading is appropriate in a community already bearing more than its share of pollution.

Applicable regulatory framework

Several regulatory mechanisms apply specifically to environmental justice analysis:

- **Executive Order 12898** (Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations) requires federal agencies to consider EJ implications in their decisions
- **Executive Order 14096** (April 2023, Revitalizing Our Nation's Commitment to Environmental Justice for All) strengthens EJ requirements across federal agencies
- **EPA EJScreen** and similar tools allow specific characterization of cumulative environmental burden
- **New Mexico Environmental Justice policy** has been developed under several recent legislative initiatives

What this warrants

- Specific EJ analysis using EPA EJScreen and comparable tools for the affected community
- Cumulative pollution burden assessment that includes existing sources plus Project Jupiter
- Meaningful consultation with affected community members in language and format accessible to predominantly Spanish-speaking residents
- Health impact assessment addressing differential effects on already-burdened populations
- Documentation of how EJ considerations have been (or have not been) incorporated into the New Mexico Environment Department's permit review

8. Cumulative Loading on an Already-Stressed System

Drawing together the threads above, Project Jupiter would be introduced into a regional system that is already showing significant documented stress across multiple overlapping dimensions. Each of the following claims is anchored in specific verifiable sources, listed below:

- **Air quality:** The Sunland Park Area has been federally designated a nonattainment area for the 2015 ozone NAAQS since 2018, expanded to the El Paso-Las Cruces, Texas-New Mexico multi-state nonattainment area in December 2021. The American Lung Association has given Doña Ana County a failing grade for ozone. EPA's own EJScreen analysis (October 2024 Federal Register action) found five of twelve indicators above the 90th percentile, including PM2.5, ozone, and air toxics measures.
- **Water resources — groundwater:** The U.S. Geological Survey's long-term hydrologic monitoring of the Mesilla Basin documents declining groundwater elevations across the Rio Grande alluvium over the last two decades (2000–2020), accompanying reduced streamflow and irrigation deliveries. The New Mexico Bureau of Geology and Mineral Resources, in geostatistical analyses of groundwater monitoring data since the early 1900s, identifies the Mesilla Basin as one of New Mexico's larger groundwater storage decline regions. Increasing water demand and multi-year drought have resulted in diminished surface-water supplies and increased groundwater withdrawals throughout the basin.
- **Water resources — surface water:** The Rio Grande experienced its earliest recorded drying date in the past 30 years on 27 March 2026, with the Bureau of Reclamation noting "river drying may be some of the most extensive we've ever seen." Snow water equivalent in the Rio Grande headwaters was at 13% of median as of mid-April 2026. The US Fish and Wildlife Service observed a Rio Grande silvery minnow "population crash" in 2025.
- **Climate trajectory:** Project Jupiter's projected ~10 million tons CO_2-equivalent annual emissions (fuel cell version) represent approximately 1.5 times the combined annual emissions of Albuquerque and Las Cruces. Las Cruces environmental attorney David Baake has characterized the project's emissions as offsetting approximately 20 years of state-level decarbonization progress.
- **Environmental justice baseline:** EPA's EJScreen analysis of the Sunland Park nonattainment area (Federal Register, October 2024) found eight of twelve EJ indicators

above the 80th percentile nationally and five above the 90th percentile, including air toxics cancer risk and respiratory hazard. The host community is approximately 93% Hispanic/Latino with 86% Spanish-speaking households.

- **Drought conditions:** The southwestern United States is in a documented multi-decade megadrought. The NOAA National Integrated Drought Information System has identified the Rio Grande Basin among the regions most affected. The 2025 calendar year saw record-low snowpack across the Rio Grande headwaters, with rapid mid-March melt-out pushing southwestern basins from above-average snowpack to snow drought conditions within weeks. The 2026 Rio Grande Compact outlook, presented by New Mexico State Engineer Elizabeth Anderson, characterized the year ahead as "challenging" with "dire forecasts."
- **Energy supply vulnerability:** Winter Storm Uri (February 2021) caused catastrophic gas supply failures across the Texas-New Mexico region — frozen wellheads, pipeline failures, gas price spikes to thousands of dollars per MMBtu, and loss of residential heating service during life-threatening cold. The regional gas supply system has documented vulnerability under extreme weather events.
- **Cross-border ecological systems:** The Mesilla Basin aquifer is a recognized binational transboundary aquifer under the 2009 Cooperative Framework signed by the International Boundary and Water Commission (IBWC) and Comisión Internacional de Límites y Aguas (CILA). Shared groundwater systems, surface water, atmospheric pathways, and wildlife migration corridors extend across the US-Mexico border into Chihuahua state.

The framing question

The relevant question for the regulatory process is not "can this specific facility be permitted with appropriate mitigation?" but "what is the cumulative carrying capacity of this region, and how should remaining capacity be allocated?"

This question has not been asked in the regulatory process for Project Jupiter. The default framework — project-by-project review against existing standards — is structurally incapable of detecting or preventing cumulative collapse of stressed systems. Marginal addition of Project Jupiter to a system already showing stress across this many dimensions, simultaneously, warrants whole-system assessment rather than facility-by-facility review.

The legal team will know better than I do which specific regulatory hooks support raising this cumulative-loading argument in the actual proceedings. The substantive point — anchored in the sources listed above — is that the marginal regulatory framework is not the appropriate frame for evaluating this proposal.

9. Construction Proceeding Without Final Approvals

Construction at the Project Jupiter site has been moving forward despite final environmental permits not being in place. According to the developer's community engagement website (projectjupitertogether.com), **as of April 2026 the project had surpassed 1 million hours worked, employed more than 1,200 team members, and reached a new daily high of more than 1,600 onsite personnel**. Multiple independent sources have corroborated the pace and scale of construction activity:

- NM State Rep. Sarah Silva, in a 15 May 2026 op-ed in El Paso Matters, reported visiting the site and speaking to 1,200 workers there
- KRQE News (February 2026) reported construction underway with "hundreds of workers" on site
- The Albuquerque Journal (February 2026) reported construction "appears to be proceeding around the clock"
- Oracle has publicly stated only that "we have made great progress and expect to continue at a rapid pace"

This pattern creates several concerns:

- **Sunk-cost pressure on regulators.** As construction proceeds and capital is invested, regulatory decision-makers face increasing pressure to approve permits in order to avoid stranded investments
- **Premature site disturbance undermines required environmental review.** Significant site disturbance is occurring before the environmental review is complete
- **Procedural integrity.** The proper sequence is environmental review followed by construction, not concurrent construction and review
- **Community signal.** The pattern signals to the community that the regulatory process is a formality rather than a substantive review

The legal team should consider whether the construction-before-approval pattern itself supports procedural challenges or supports requests for project pause pending complete environmental review.

10. Procedural Concerns — A Whole-Systems Perspective

From a whole-systems perspective, procedural irregularities are not a separate category of concern from the substantive environmental issues documented above — they are part of the same pattern. The institutional architecture of review, public comment, and regulatory scrutiny is designed to provide the checks and feedback loops that allow consequential decisions to be informed by accurate information and corrected when problems emerge. When that architecture is short-circuited — through compressed timelines, materially incomplete disclosure to decision-makers, or filings structured to evade review — the system loses its capacity to detect and correct the very kinds of substantive failures documented above. The procedural concerns outlined below should therefore be understood as indicators that the decision system has been operating

outside its intended design parameters during the approvals that brought Project Jupiter to its current state.

The specific procedural issues I am aware of from publicly available reporting are listed below. I note these as a non-specialist; the legal team will know better how to characterize their significance and how to raise them in the appropriate proceedings. Several of these are matters of active litigation and active investigation by New Mexico state authorities.

Material information gap at IRB approval

When the Doña Ana County Commission voted on 19 September 2025 to approve up to $165 billion in industrial revenue bonds for Project Jupiter, the commissioners were reportedly informed that the on-site microgrid would initially produce 700–900 MW, eventually reaching up to about 1 GW. Subsequent air permit applications filed in late 2025 disclosed planned capacity of up to 2.8 GW for the gas turbine design; the current fuel cell pivot is sized for up to 2.45 GW.

The New Mexico Environmental Law Center's October 2025 lawsuit alleges that some of the applications before the Board of County Commissioners at the time of the vote were incomplete, and that some carried the word "draft" stamped across them. If accurate, this raises questions about whether commissioners made the IRB decision on materially complete information.

Water disclosure discrepancy

As discussed in Section 5, publicly available reporting documents a substantial gap between the water use figure communicated to the public at IRB approval (approximately 20,000 gallons per day, included in the official Doña Ana County materials) and the figure apparently verified by state engineers (up to approximately 1,000,000 gallons per day). The 50-fold gap was first reported by the Santa Fe New Mexican and subsequently picked up by other regional reporting. The Doña Ana County Commission has formally sought clarification from developers about the apparent discrepancy.

East/west microgrid permit structure

Project Jupiter's gas turbine air permit applications were filed as **two separate applications** — one for an "east microgrid" and one for a "west microgrid" — at the same site, operated by related entities. The applications were structured such that each fell just under New Mexico's state major-source classification threshold (250 tons per year of nitrogen oxides), avoiding the more comprehensive major-source review that would apply to the combined emissions of the integrated facility.

Environmental advocates have characterized this as an attempt to evade major-source review. Colin Cox, senior attorney at the Center for Biological Diversity's Climate Law Institute, told reporters: "They've split it into two separate plants that are 'minor sources' to avoid having to monitor their actual air quality impacts, which are going to be huge. They're coming up to 99.9% of the threshold." Maslyn Locke, NMELC senior attorney representing residents in active litigation, noted: "We've seen this with other air permit applications, where they're right under the limit. Ultimately that means everything has to go 100% perfectly as they operate to not violate that. I don't know if that's realistic."

Whether this structure also has implications under federal Title V (which has different thresholds and triggers than the New Mexico major-source classification) should be assessed by qualified Clean Air Act counsel.

Open Meetings Act violation alleged

The New Mexico Environmental Law Center has filed suit alleging that the Doña Ana County Commission violated New Mexico's Open Meetings Act during its 19 September 2025 meeting by "abruptly" pausing the heated public meeting on Project Jupiter and proceeding to meet behind closed doors before the vote. This lawsuit is currently pending.

Public records withholding alleged

Following IPRA (Inspection of Public Records Act) requests from NMELC for Project Jupiter-related emails, construction drawings, permits, and inspection reports, Doña Ana County reportedly withheld approximately 29 emails citing the Act's exemption for "tactical response plans...that could be used to facilitate the planning or execution of a terrorist attack." The New Mexico Foundation for Open Government (NMFOG) has filed a separate lawsuit on this matter. NMFOG legal director Amanda Lavin: "They're wrongfully relying on this exemption that's very narrow…they're using it to withhold emails that are obviously of great public concern."

Anonymous out-of-state advertising campaign

While the New Mexico Environment Department was reviewing the gas turbine air permit applications, an anonymous out-of-state group undertook a substantial advertising campaign in New Mexico promoting the project. The New Mexico State Ethics Commission is currently litigating the matter under the state's Lobbyist Regulation Act.

Coordinated promotional efforts

Source NM reported on 15 June 2026 that a firm previously engaged in a New Mexico Medicaid promotional campaign was recruiting influencers to promote Project Jupiter. The community-engagement landscape includes coordinated paid messaging.

Summary of active litigation

As of late June 2026, at least four active lawsuits regarding Project Jupiter are pending in New Mexico courts:

1. **NMELC suit #1 (October 2025)** — challenges IRB approval on grounds of incomplete applications, currently pending
2. **NMELC suit #2** — challenges alleged Open Meetings Act violation at the 19 September 2025 commission meeting, currently pending
3. **NM Foundation for Open Government** — challenges county's withholding of public records under IPRA exemptions

4. **Derrick Pacheco (individual resident)** — challenged IRB approval as procedurally improper; dismissed without prejudice on 23 June 2026 with permission to refile (second of three permitted attempts); Mr. Pacheco has been filing pro se with assistance from ChatGPT and is considering retaining counsel

A separate lawsuit by the New Mexico State Ethics Commission is pursuing the anonymous advertising group under the Lobbyist Regulation Act.

The legal team will know better than I do how to assess these proceedings and their interactions. The cumulative pattern — four separate active lawsuits from independent parties, plus a state ethics commission enforcement action, all arising from a single project's approval and permitting process — is itself a system-level indicator worth weighing.

Summary of Recommended Further Investigation

For the legal team, the following appear to warrant focused independent technical and procedural investigation:

Substantive environmental:

1. Three-dimensional atmospheric thermal modeling under realistic Doña Ana County meteorological conditions, including cross-border transport
2. Independent water use verification, reconciling developer-stated and state-engineering figures
3. Independent emissions modeling under realistic operational scenarios
4. Cross-border atmospheric, water, and ecological impact assessment
5. Environmental justice analysis using EPA EJScreen and comparable tools for affected populations
6. Cumulative loading assessment for the Mesilla Basin and southern Rio Grande corridor
7. Operational and lifecycle assessment of unprecedented-scale Bloom SOFC deployment
8. Acoustic and dust mobilization assessment specific to the site

Procedural:

9. Verification of IRB-time disclosure record vs. current proposal scale; documentation of materials available to commissioners on 19 September 2025
10. Major-source classification analysis under both New Mexico state regulations (250 tons/yr NOx threshold) and federal Title V (different thresholds), including assessment of the east/west microgrid permit structure

11. Open Meetings Act violation assessment (subject of pending NMELC litigation)
12. IPRA records-withholding assessment (subject of pending NMFOG litigation)
13. Status assessment of all four pending Project Jupiter lawsuits plus State Ethics Commission action
14. Cross-border consultation requirements under La Paz Agreement and related frameworks

Time-sensitive:

15. New Mexico Environment Department air permit decision is scheduled for **July 2026** (pushed back from earlier deadline after substantial public comment). Any analytical work intended to inform that decision must be in the relevant decision-makers' hands well before any specific decision date.

Caveat

This document is an assessment based on publicly available information as of late June 2026.

The intent of this document is to surface concerns warranting further investigation, particularly in the limited time before the July 2026 air permit decision, and to provide a whole-systems analytical frame for considering Project Jupiter's substantive and procedural dimensions together rather than separately.

CURRENT

ASSOCIATE PROFESSOR OF PROFESSIONAL PRACTICE

UTAH STATE UNIVERSITY DEP'T OF PHYSICS| 20017-PRESENT | Logan, Utah

Jointly sponsored by USU's College of Science, the Caine College of the Arts, and the USU Ecology Center, my focus is on synthesizing and communicating the science of complex systems as it applies to global change, sustainable human systems, and civilizational futures.

- *The Crossroads Project* — co-creator of two performance projects, a peformance science project weaving together science, imagery and music to better communicate the story of human un-sustainability. The project comprises to full-length performances, *Rising Tide* and *Emergence,* includes originally commissioned music and has seen nearly 70 performances across the United States.
- *Original Course Development* — Developed *Unveiling the Anthropocene*, a science course designed for Fine Arts and Humanities students, telling the story of humanity's impact on the planet, the human systems underlying this impact, and roadmaps for transformation.
- *Public-Interest Science Communication* — Conceptualized, prepared and delivered hundreds of public science lectures on climate change, human sustainability, and science communication.

ADJUNCT PROFESSOR

DEP'T OF PLANTS, SOILS & CLIMATE | UTAH STATE UNIV. | 2011-PRESENT | Logan, Utah

Adjunct facutly in USU's Climate Science Program. Efforts include:

- *Graduate student committee member*
- *Cooperative Extension Climate Change Initiative* — I am the Project Lead of an ongoing initiative to introduce climate change comprehensively throughout Utah's Cooperative Extension programs. The challenge is to first raise the knowledge base of Extension professionals, and then allow these professionals to introduce the topic into their communities and programs in a manner they themselves deem appropriate. My work has been conceptualizing, scripting and recording a sequence of approximately 20 short videos which, taken together, comprise a comprehensive overview of the science of climate change, including: the science of the climate system; the science of *impacts* to natural and human systems; the science of *adaptation*; the science of *mitigation*, and the science of *projections*.
