List of Acronyms

ARAR	Applicable or Relevant and Appropriate Requirements
BC	Biocurtain
BCE	Biocurtain Extraction
bgs	below ground surface
btoc	Below top of casing
bvcA	BAV1 reductase enzyme
cells/mL	cells (of micro-organisms) per milliliter of water
CGI	combustible gas indicator
CO	carbon monoxide
CO_2	carbon dioxide
COC	contaminant of concern
COPC	contaminant of potential concern
CSM	conceptual site model
cVOCs	chlorinated volatile organic compounds
D&D	Decommissioning and Demolition
DCE	dichloroethene
cDCE	cis-1,2 dichloroethene
tDCE	trans-1,2 dichloroethene
DHC	*Dehalococcoides spp.*
DNA	deoxyribonucleic acid
DNAPL	dense nonaqueous-phase liquid
EPA	U.S. Environmental Protection Agency
ERD	enhanced reductive dechlorination
ETS	enhanced treatment strategy
EVO	emulsified vegetable oil
FS	feasibility study
ft/ft	foot (feet) per foot
gpm	gallons per minute
GWQB	Ground Water Quality Bureau
H_2S	hydrogen sulfide
HSE	hotspot extraction well
HSI	hotspot injection well
lbs	pounds
LEL	Lower Explosive Limit
LTRA	Long Term Response Action
MCL	Maximum Contaminant Level
MDL	method detection limit
µg/m3	micrograms per cubic meter
µg/L	Microgram(s) per liter
mg/L	milligram(s) per liter
µmole/L	Micromole(s) per liter

NMED	New Mexico Environment Department
NMWQCC	New Mexico Water Quality Control Commission
NRAP	North Railroad Avenue Plume
O&F	operational and functional
O&M	Operations and Maintenance
PCE	tetrachloroethene, tetrachloroethylene, perchloroethene
PID	photoionization detector
ppm	parts per million
QA	Quality Assurance
QC	Quality Control
RA	remedial action
RAO	remedial action objectives
ROD	Record of Decision
RI	remedial investigation
RG	remedial goal
SA/HS	Source Area/Hotspot
SDWA	Safe Drinking Water Act
Site	North Railroad Avenue Plume Superfund site
SVE	soil vapor extraction
TCE	trichloroethene, trichloroethylene
tceA	TCE reduction enzyme
TOC	total organic carbon
VC	vinyl chloride
vcrA	vinyl chloride reduction enzyme
VOCs	volatile organic compounds

1 Introduction

This Operation and Maintenance (O&M) Report describes the O&M activities performed during annual groundwater treatment operations at the North Railroad Avenue Plume (NRAP) Superfund Site (the Site), located in Española, New Mexico.

The O&M report covers operational aspects of the enhanced reductive dechlorination (ERD) treatment and groundwater sampling activities for the period from January 2022 through December 2022. This report provides the results and analysis of groundwater sampling and field operations, and technical recommendations to consider for continued O&M. The U. S. Environmental Protection Agency (EPA) transferred financial responsibility to the New Mexico Environment Department (NMED) for future O&M activities following a 10-year, long-term response action (LTRA) for groundwater that ended on June 30, 2019.

The report consists of six sections. This section provides a brief introduction. Section 2.0 provides Site background information including a description of the Site, remedial action objectives and goals, and the remedial actions implemented at the Site. Section 3.0 describes the system operations and field sampling activities that occurred during the reporting period. Section 4.0 provides quality assurance information. Section 5.0 provides the results of sample analyses and an interpretation of those results. Section 6.0 provides conclusions and recommendations.

2 Site Description and Background

The Site is located in the downtown area of the City of Española, Rio Arriba County, New Mexico and was listed on the U.S. EPA's National Priorities List (#NMD986670156) in January 1999. The Remedial Investigation/Feasibility Study (RI/FS) was completed in January 2001, a Record of Decision (ROD) was issued in September 2001, and construction of the remedy began in July 2005 and was completed in June 2008.

The Site historically consisted of an approximately 58-acre, 260-foot-deep groundwater plume that extended approximately 0.75 miles south/southeast from the former Norge Town Dry Cleaners and Laundromat facility (Norge Town facility) located at 113 North Railroad Avenue. Site contaminated groundwater lies beneath the City of Española and Santa Clara Pueblo trust lands in the alluvial fill and Santa Fe Group aquifer, which is the sole-source drinking water aquifer for the City of Española, the Santa Clara Pueblo and nearby rural populations (Figure 1 and Figure 5).

Groundwater contamination was first discovered in 1989 when tetrachloroethene (PCE) and one of its degradation by-products, trichloroethene (TCE) were detected in two municipal drinking water supply wells for the City of Española. The wells were taken off-line and have been removed from the city's drinking water supply system since the discovery. A series of investigations conducted by the New Mexico Environment Department (NMED) Ground Water Quality Bureau (GWQB) between 1990 and 1998 concluded that the former Norge Town facility, which operated from 1970 to 2007, was the likely source of PCE and TCE contamination. The primary contaminants of concern associated with the Site are PCE and its degradation products: TCE, cis-1,2 dichloroethene (cDCE), trans-1,2 dichloroethene (tDCE), and vinyl chloride (VC).

2.1 Site Hydrogeology

The aquifer system is defined by shallow and deep aquifer units. The shallow aquifer comprises a high-permeability sand/gravel/cobble unit extending from near surface to approximately 20 feet below ground surface (bgs) and a five- to seven-foot-thick interbedded fine-grained sand and sandy clay layer from approximately 20 to 27 feet bgs. Beneath the shallow aquifer is a 20 to 40-foot-thick clay layer that is mostly contiguous across the Site which separates the shallow and deep aquifer units. The deep zone has been divided into four hydrostratigraphic units (HSUs; intermediate – I1 and I2, and deep – D1 and D2) based on the stratigraphy and contaminant occurrence. The intermediate zone contamination occurs in 10- to 20-foot-thick fine-grained sands between depths of approximately 50 to 70 feet bgs (I1 zone) and 80 to 100 feet bgs (I2 zone). The deep zone contamination occurs in 10- to 20-foot-thick fine-grained sands between depths of approximately 155 to 200 feet bgs (D1 zone) and 225 to 265 feet bgs (D2 zone). The vertical extent of contamination within the deep aquifer, identified as the D3 zone, is defined by a single non-contaminated well, R-09(D3), which is screened from 340 to 360 feet bgs. Site hydrogeology is explained in further detail in the most recent updated conceptual site model (CSM; INTERA, December 2021).

2.2 Remedial Action Objectives and Remedial Goals

The remedial action objectives (RAOs) and remedial goals (RGs) presented in the 2001 ROD were established after considering all Federal, State, and Tribal Applicable or Relevant and Appropriate Requirements (ARARs). As stated in the ROD, the RAOs include:

- Prevent human ingestion, inhalation, or dermal contact of groundwater containing Site-related Contaminants of Concern (COCs) at concentrations that exceed their corresponding non-zero Maximum Contaminant Level Goals (MCLGs) or Maximum Contaminant Levels (MCLs) where their corresponding MCLGs are zero as established under the Safe Drinking Water Act (SDWA).

- Restore the groundwater at the Site such that concentrations of COCs and Contaminants of Potential Concern (COPCs) are less than the MCLs.

- Prevent residual-phase PCE, dense non-aqueous phase liquid (DNAPL), from causing concentrations of COCs in groundwater to exceed their MCLs.

- Prevent the transport of COCs from groundwater to surface water at concentrations that may exceed the ARARs in the receiving surface water body.

- Prevent the degradation of surface water by ensuring that the concentrations of groundwater COCs and COPCs comply with applicable surface water standards.

The RGs for the COCs and COPCs in groundwater are based on the more restrictive of the EPA's MCLs or the New Mexico Water Quality Control Commission (NMWQCC) regulation standards for vinyl chloride (VC), 1,1-dichloroethene (1,1-DCE) and manganese.

The surface water RGs are based on the Water Quality Code of the Pueblo of Santa Clara as listed in the following table:

COC/COPC	Groundwater (µg/L)	Surface water (µg/L)
PCE	5.0	5.0
TCE	5.0	5.0
cDCE*	70	70
tDCE*	100	100
VC*	2.0	2.0
1,1-DCE*	7.0	7.0
manganese*	200	50

Note - * constituents not listed as COCs in the ROD
µg/L = micrograms per liter

2.3 Remedy Implementation

The remedy for the Site consists of four Remedial Action (RA) systems (Source Area, Hotspot, Biocurtain, and Deep Zone) for treatment of the residual adsorbed DNAPL at the Source Area and the shallow and deep zone dissolved phase groundwater plumes. Figure 1 shows the project location, site area, and locations of the treatment systems.

Each of the remediation systems are briefly described below:

- The Source Area treatment system is designed to address adsorbed DNAPL and dissolved-phase contamination in the approximately 1,600 square foot area at the dry cleaner release area. Pursuant to changes to the ROD (EPA, 2001) outlined in the Explanation of Significant Differences (EPA, 2008), the Source Area treatment system was converted from a surfactant enhanced recovery system (surfactant flush) to an enhanced in-situ bioremediation or ERD treatment system. The 2008 Source Area ERD system consisted of multiple injection, extraction, and monitoring wells. The system controls, amendment delivery system, piping manifold, and associated instrumentation for the Source Area were shared with the Hotspot system and located in a small building referred to as the Hotspot treatment building, located east of the Norge Town facility. Decommissioning and Demolition (D&D) of Source Area injection and extraction wells that were part of the 2008 ERD system and associated infrastructure was completed between November 2019 and November 2020. The Source Area treatment system currently consists of three injection wells (SAI-8, SAI-9, and SAI-10) that were installed in March 2020 and positioned to address residual Source Area contamination. These wells were installed with directional injection enhancements to better enable distribution of treatment amendments. Figure 2 depicts the locations of current and former Source Area injection, extraction, and monitoring wells.

- The Hotspot treatment system was an ERD recirculation system designed to address the dissolved-phase plume between the Source Area and Hunter Street and encompassed an area of approximately 56,000 square feet. Final substrate injections at the Hotspot area were completed in September 2017. Additional Hotspot remediation is not anticipated to be necessary and, as a result, D&D of all Hotspot injection wells, extraction wells and associated remediation infrastructure was completed between November 2019 and November 2020.

- The Biocurtain treatment system had an ERD recirculation system designed to address the dissolved-phase shallow aquifer plume near the former midpoint of the shallow plume approximately 1,500 feet southeast of the Source Area and Hotspot (SA/HS) systems. Final substrate injections at the Biocurtain were completed between December 2012 and April 2013. Additional Biocurtain injections are not anticipated to be necessary and, as a result, D&D of all Biocurtain injection wells, extraction wells, and associated remediation infrastructure was completed between November 2019 and November 2020. The remaining Biocurtain monitoring wells and historical injection/extraction well locations are depicted on Figure 3.

- The Deep Zone ERD injection wells are individual wells intended to address the contamination present in the deeper aquifer zones. The shallowest wells (I1 wells) have screen sections that span 45-75 feet bgs with the I2 zone wells screened between 80 to 100 feet bgs, whereas the deeper wells, D1 and D2, are screened between intervals from 155-200 feet and 225-265 feet bgs respectively. The Deep Zone remediation system consists of five 4-inch diameter, four 3-inch diameter, and six 2-inch diameter injection wells. The wells are mostly situated in or near the Plaza de Española with one to the south, two to the southeast, and one to the northeast. The Deep Zone does not have a constructed amendment delivery system (i.e., piping, controls, etc.). Substrate amendment delivery for the Deep Zone is performed at the individual wellhead using a water truck and portable metering pump and mixing equipment (Figure 4).

The Site has been undergoing ERD treatment since the field pilot test was conducted at the SA/HS treatment areas in June 2007. The field pilot test was conducted at four separate test cells using four different electron donor substrates – ethyl lactate, dairy whey, emulsified vegetable oil (EVO) and EVO plus hydrogen gas infusion. Based on the pilot test results, EVO plus a nutrient mixture was selected for full-scale operations. Full-scale operation of the four treatment systems (Source Area, Hotspot, Biocurtain, and Deep Zone) began in April 2008. To date, there have been six rounds of electron donor substrate injections completed in the Hotspot area, eight rounds at the Source Area, seven rounds at the Deep Zone, and nine rounds of injections completed at the Biocurtain.

ERD treatment to date in the Deep Zone has been limited to substrate injections at individual wells located at the Plaza de Española and R-15(D1) and R-09(D1) wells. Deep zone treatment began in April 2008 with EVO substrate injections to wells R-09(D1), R-15(D1), R-21(D2), DI-2(D1) and DI-2(D2) and intermediate wells DI-1(I1) and DI-2(I1). Additional injections were completed in October 2008 and August 2009. The October 2010 injection included the addition of wells DI-1(D1) and DI-1(D2) to the injection program and the elimination of the two intermediate wells. Substrate injections at the intermediate wells were terminated due to the low contaminant concentrations within this area. The last injection of EVO substrate in the Deep Zone occurred in November 2012.

In March 2020, alternative ERD/remediation amendments were injected in the Source Area and the Deep Zone as a pilot test of an enhanced treatment strategy (ETS) to address the Deep Zone and residual contamination in the Source Area. Continued ETS testing with alternative ERD/remediation amendments continued in February 2021 with injections in the Deep Zone at R-01(I1), R-09(D1), R-09(D2), and DI-2(D1). ETS activities are discussed further in Section 3.1. No amendments were injected in 2022.

3 Field Activities

This section provides a review of all O&M field activities that were conducted during the calendar year of 2022. The fourteen years include thirteen years of groundwater treatment operations and one year for the Operational and Functional (O&F) determination.

3.1 Treatment System Operations

In early 2020, NMED's contractor, INTERA Inc., started conducting pilot testing of an ETS to augment previous groundwater remedial actions and installed new monitoring wells to complete delineation of the Intermediate and Deep Zone plumes. The pilot test injections in the Source Area were designed to evaluate the effectiveness of directional injection enhancements (DIEs) in the three new injection wells to enable better distribution of treatment amendments within fine-grained lithologies. The Source Area and Deep Zone injections were also designed to evaluate alternative amendments supplied by REGENESIS Remediation Services (RRS): the amendments 3-D Microemulsion (3DME®), a patented molecular structure containing oleic acids bound to lactates/polylactates, and sulfidated micro-scale zero-valent iron (S-MicroZVI™) were selected for testing via DIEs in the Source Area, while 3DME® and Chemical Reducing Solution (CRS®), a solution of ferrous gluconate, were selected in 2020 for testing in four existing Deep Zone injection wells (DI-1 (D1), DI-2 (D1), DI-1 (D2) and DI-2 (D2)) located at the Plaza de Española. Between February 23 and February 26, 2021, alternative amendment injections of 3DME® and CRS were completed at wells R-09 (I1), R-09 (I2), R-09 (D1), R-09 (D2), and DI-2 (D1) on the Plaza de Española. No amendment injections took place in 2022.

Three wells (R-34 (I1, I2, and D2)) were drilled and installed along Calle Chavez in 2021 immediately downgradient of the R-09 well cluster to monitor the effects of the amendment injections at R-09 well cluster. R-34 (D2) was drilled between March 16 and 24, 2021, and wells R-34 (I1) and R-34 (I2) were drilled between December 6 and 11, 2021. In November 2022, two deep injection wells (R-35 (D1) and R-35 (D2)) were drilled to the northeast of the plaza and will receive amendment injections in 2023. For more information on the drilled 2022 deep injection wells (R-35 (D1) and R-35 (D2)) see *Fiscal Year 2023 Groundwater Treatment, Well Installations, Monitoring, and Maintenance North Railroad Avenue Plume Superfund Site Española, New Mexico* (Intera, May 2024).

The effects of the DIEs and alternative treatment amendments in the pilot test areas will be evaluated based on continued groundwater monitoring. Additional details of this work are provided in a separate report titled *Final Report for the Enhanced Treatment Strategy Pilot Test and Monitoring Well Installations at the North Railroad Avenue Plume Superfund Site* (INTERA, December 2020).

Biogenic Gas Monitoring and Soil Vapor Extraction (SVE) Operations

The action levels established for operation of the SVE system include a greater than 10% LEL measurement in the well vaults or greater than 20% methane measurement in the SVE drive points. However, because there were no exceedances of methane during the September 2016 monitoring

event and a limited exceedance at the one well vault (HSI-19) during the 2017 monitoring event, the SVE system has remained off since and was decommissioned in 2020.

NMED's contractor, INTERA, Inc., completed the biogenic gas monitoring for explosive vapors and methane in 2022 at ETS-related locations in the SA (five monitoring wells, SAI-9, and the SAI-4 drive point) and DZ (DI-1 (D1), DI-1 (D2), DI-2 (D2), M-20 (D2), R-09 Well Cluster, and R-35 Well Cluster). A larger monitoring effort was made for both health and safety reasons and to evaluate subsurface conditions developing in response to the ETS or at wells considered as future targets for treatment.

A photoionization detector (PID) equipped with a 10.6 eV lamp to detect VOCs and combustible gas indicator (CGI) instruments with multiple sensors which detect hydrogen sulfide (H_2S), carbon monoxide (CO), methane, and oxygen. The RKI Eagle 2 model CGI also had a carbon dioxide (CO_2) sensor useful for observing evidence of biodegradation of carbon substrate and accounting for displacement of oxygen.

Levels of biogenic gases (methane hydrogen sulfide, carbon monoxide, and carbon dioxide) observed in wells after groundwater treatment events pose potential toxic or physical risks to workers when affected wells are uncapped. Methane is commonly generated at wells treated with carbon substrates (EVO or 3DME®), hydrogen sulfide is sometimes present at treated wells, and carbon monoxide has been measured at some wells treated with carbon substrate plus S-MicroZVI™. The site geology and well caps appear to be effective in preventing risks to the public from biogenic gases, and risks to workers are expected to attenuate over time as treatment amendments are consumed. In the meantime, precautions such as securing wells to avoid disturbance by the public and screening for gases before work activities should continue. For further explanation and results of the 2023 biogenic gas monitoring see *Fiscal Year 2023 Groundwater Treatment, Well Installations, Monitoring, and Maintenance North Railroad Avenue Plume Superfund Site Española, New Mexico* (Intera, May 2024).

3.2 Air Sampling

NMED collected 8-hour indoor air samples at two buildings (the former El Centro Family Health Center Annex building and the former Norge Town Dry Cleaner building) and 24-hour indoor air samples at one building (the Las Cumbres Community Services (LCCS) building) around the SA/HS area in March 2022. One outdoor air sample was collected at the former Norge Town Dry Cleaner building and one outdoor air sample in the playground of the LCCS building was collected as well. In addition, one sub-slab soil vapor location in the LCCS building was collected. The air samples were collected in certified, pre-cleaned 6-liter Summa canisters equipped with 8-hour or 24-hour sample regulators and analyzed for target chlorinated Volatile Organic Compounds (cVOCs) by EPA Method TO-15 Low Level (LL). The sub-slab soil gas samples were collected in certified, pre-cleaned 1-liter Summa canisters equipped with 5-minute sample regulators. Analysis of the samples was performed by Eurofins TestAmerica in Knoxville, Tennessee. The air sampling results are discussed in Section 4.0.

3.3 Groundwater Monitoring

NMED performed one round of groundwater monitoring as part of the O&M monitoring program during this reporting period. The groundwater monitoring was completed in November 2022. The performance monitoring portion of the groundwater monitoring conducted by NMED's contractor, INTERA, was also completed in November 2022. The groundwater sampling was conducted in accordance with the *Sampling and Analysis Plan, Groundwater Sampling, North Railroad Avenue Plume* (NMED, November 2022), the NMED GWQB Superfund Oversight Section's *Quality Assurance Project Plan* (NMED, March 2022), and the NMED *Groundwater Sampling, Superfund Oversight Section, Standard Operating Procedure* (NMED, April 2022). The groundwater monitoring program was initiated in February 2006 as part of the site wide monitoring requirements outlined in the ROD. The analytical results are used to evaluate concentrations of cVOCs and dissolved metals and monitor remediation progress across the Site.

The November 2022 sampling event included water level measurements from all Site monitoring wells except for monitoring wells that were inaccessible or unsuitable for measurement during the water level measurement event, including BC-5, BC-6, BC-7S, BC-7D, RDP-01, RDP-02, RDP-03, RDP-04, DI-1(D1), DI-2(D2), DI-2(D1), DI-2(D2), EX-16, M-21, R-01(L2), R-05(S2), R-06(S1), R-06(S2), R-07(S2), R-09(I2), R-12(I2), R-14(S2), and R-16(S2). Groundwater samples were collected for laboratory analysis from a total of 74 remediation/monitoring wells and Flexible Liner Underground Technology (FLUTe) well sampling ports.

All wells were sampled and analyzed for the Site COCs. In addition, a subset of 18 wells were sampled and analyzed for dissolved metals, particularly arsenic, iron, and manganese to monitor geochemical changes that have occurred in association with the ERD treatment. An additional subset of 13 wells were sampled and analyzed for one or more of total organic carbon (TOC), dissolved gases and/or microbial analysis to measure ERD performance. Section 4 of this report evaluates the data collected and presents comparisons to the historical data collected during previous sampling events dating back to 1999. Figure 5 shows the monitoring well locations and historic plume boundaries as identified in the *Remedial Investigation Report, North Railroad Avenue Plume Superfund Site, Española, New Mexico* (RI Report) (DES, January 2001).

Field activities were completed by NMED and INTERA working in two or three-person teams. Field activities were conducted between November 1 - 16, 2022 as described in the following subsections. Table 1 provides well completion information, sampling methods, and the specific wells included in the LTRA monitoring program. Table 2 provides groundwater elevation data. Table 3 provides a summary of current and historical analytical results for PCE, TCE, cDCE, tDCE and VC from Site monitoring wells. Table 4 provides a summary of current and historical analytical results for wells monitored as part of the ERD treatment systems performance and includes wells within the four treatment areas that are not part of the Site-wide LTRA groundwater monitoring program. Table 5 provides a summary of current and historical analytical results for dissolved metals (specifically arsenic, manganese and iron). Appendix A contains the laboratory analytical results. The analytical results are arranged by the date samples were collected. Well purge and groundwater sampling forms are provided in Appendix B.

3.3.1 Groundwater Gauging and Elevation Data

NMED recorded water level measurements from a total of 69 shallow, intermediate, and deep screened monitoring wells located throughout the NRAP Site from October 31 to November 1, 2022; 37 wells were not measured for water levels. The water levels were used to develop potentiometric surface contour maps for each of the aquifer zones. Groundwater elevations are summarized in Table 2 and potentiometric surface contour maps for the various aquifers zones are provided in Figure 6 through Figure 10.

3.3.2 Groundwater Sampling Activities

Groundwater sampling activities were conducted between November 1 - 16, 2022 by NMED and/or NMED's site contractor, INTERA Inc. Samples were collected from 74 wells for analysis of volatile organic compounds (VOCs) by EPA Method 8260. Twenty (20) wells were sampled for dissolved metals by EPA Method 6020B. Selected wells were sampled for Total Organic Carbon (TOC) by EPA Method 9060, dissolved gases (ethane, ethene, methane) by EPA Method RSK 175, and microbial deoxyribonucleic acid (DNA) by DNA analysis (dehalococcoides (DHC) and functional genes). In addition, 26 field quality control (QC) samples were collected (i.e., field duplicates, field blanks, trip blanks, and equipment rinsate samples). Laboratory QC samples (i.e. matrix spike/matrix spike duplicate) for dissolved metals analysis and VOCs were performed by the laboratory. Samples for VOCs and dissolved metals were submitted to Eurofins TestAmerica, Knoxville, Tennessee for analysis. Additional VOC, dissolved metals, and TOC analyses were performed by Hall Environmental Analysis Laboratory in Albuquerque, New Mexico. Dissolved gases were analyzed by Pace Analytical in Mount Juliet, Tennessee and the microbial analysis and compound-specific isotope analysis was performed by Microbial Insights in Knoxville, Tennessee. Laboratory analytical results are provided in Appendix A.

At most wells, a passive sampling system, HYDRASleeve™, was used in the November 2022 groundwater sampling event to evaluate its effectiveness. At eight wells, a comparison sample was collected using low-flow purge/sampling methods. Since HydraSleeve samplers are a no-purge sampler, field parameters (pH, conductivity, temperature, Dissolved Oxyegn (DO), Oxidation-Reduction Potential (ORP)) were not recorded during sampling. HydraSleeves streamline the sampling process and minimize the need for contaminated purge-water treatment.

At locations were HydraSleeves were not used or where there was a comparison groundwater sample collected, several other sampling methods were used to collect the samples based on the depth of the well and volume of purge water required to obtain representative samples. In general, the 2-inch shallow wells with completions less than 30 feet bgs were sampled using peristaltic pumps with dedicated tubing or were hand bailed using new clean or well-dedicated disposable bailers (R-27(S2)) and remediation drive point wells (RDP-1, RDP-2, RDP-3)). Four-inch shallow wells were sampled using battery operated submersible pumps with dedicated tubing. The intermediate depth wells to depths of 100 feet bgs were sampled using either peristaltic or submersible pumps with dedicated tubing. Wells greater than 100 feet bgs were sampled using submersible pumps with either dedicated tubing or pump-equipped tubing (requiring decontamination). Each well was purged by removing three well casing/screen section volumes of water or until field parameters (pH, conductivity, and temperature) stabilized (+/- 0.10 for pH, +/- 3% for conductivity and +/- 1 °C for temperature) prior to sample collection. Well purge volumes

were calculated using one casing volume for the entire water column plus two casing volumes of the well's screened interval. Well purge volumes and collection methods are provided in Table 1 and individual well purge/sample collection information is provided in Appendix B. Low flow sampling methods were used on wells purged with the peristaltic pumps. For the deeper wells with high purge volumes, the flow rates were kept below 1.5 gallons per minute (gpm).
The VOC water samples were collected in 40 milliliter septum vials and preserved with hydrochloric acid to a pH of less than 2. The dissolved metals were field filtered using a 0.45-micron filter and collected in 250-milliliter polyethylene bottles preserved with nitric acid to a pH of less than 2.

The purge water from wells with low concentrations was discharged on the ground surface away from the wellhead. Purge water from wells with historical concentrations of site COCs greater than MCLs were run through a granulated activated carbon drum prior to discharge on the ground surface.

4 Quality Assurance (QA)

The following is a discussion of NMED's QA procedures implemented during the November 2022 sampling event. QA procedures implemented during Intera's November 2022 sampling event are described in Intera's summary report, *Fiscal Year 2023 Groundwater Treatment, Well Installations, Monitoring, and Maintenance North Railroad Avenue Plume Superfund Site Española, New Mexico* (Intera, May 2024).

NMED QA procedures included calibration of field water quality parameter meters in accordance with manufacture's recommendation and standard operating procedures (in accordance with the Site's 2022 Sampling and Analysis Plan), collection of duplicate samples, equipment rinsate samples, field blanks, and the inclusion of trip blanks and temperature blanks in coolers containing VOC samples. All QA samples were submitted for laboratory analysis by EPA Method 8260 for VOCs and by EPA Method 6020B for dissolved metals. Laboratory analysis was performed by Eurofins TestAmerica, Knoxville, Tennessee. Laboratory analytical results are provided in Appendix A.

A total of 78 groundwater samples were analyzed for VOCs and 21 samples were analyzed for dissolved metals (arsenic, iron, and manganese). VOC samples were received in good condition, within holding times, and within the acceptable temperature range of 4 ± 2°C for VOCs. However, the coolers' temperatures for the metal samples ranged from 16.4 – 17.2 °C, and all metal samples were received at the laboratory outside the required temperature criteria.

Field duplicate samples were collected to verify the laboratories' ability to replicate sample results. Eight VOC and three dissolved metals duplicate samples (approximately 10% of total samples) were collected during the November 2022 sampling event. VOC and dissolved metals duplicate sample locations and results are listed in Table 3, Table 4, and Table 5.

Comparison samples were collected at eight wells to evaluate the effectiveness and accuracy of the Hydrasleeve passive sampling system. The primary samples were collected using low-flow pumps while the duplicate samples were collected using Hydrasleeves. The samples collected with

HydraSleeves were called duplicate samples instead of comparison samples. Four sample pairs (R-29A(D1), M-09, R-34(D2), and SMW-3D) exceeded the acceptable range of ± 10% Relative Percent Difference (RPD) for VOCs. The four other sample pairs for VOCs (M-15, BC-6, R-25, and R-08) did not have site COC VOCs above the 10% RPD. Only the R-29A(D1) sample pair had iron and arsenic above the acceptable range of ± 10% RPD (See table below).

Low Flow and Hydrasleeve VOC and Metals Comparison Samples Near Injection Areas				
Well ID	Analyte	Low Flow Sample Result (µg/L)	Hydrasleeve Sample Result (µg/L)	Relative Percent Difference (%)
R-29A (D1)	PCE	110 E	7.2	87.71
	TCE	13	31	40.91
	cDCE	6.9	32	64.52
	tDCE	10	25	42.86
	VC	0.82	0.82	--
	Iron	1.3	0.1 J	85.71
	Arsenic	0.36 J	0.27 J	14.29
	Manganese	48	48	0.00
M-09	PCE	3.5	<0.48	27.27
	TCE	9.7	1.3 J	76.36
	cDCE	21	<0.62	82.61
	tDCE	1.9 J	1.2 J	22.58
	VC	2.8 J	<0.82	28.21
R-34(D2)	PCE	20	9.9	33.78
	TCE	6.8	3	38.78
	cDCE	<0.62	<0.62	--
	tDCE	<0.52	<0.52	--
	VC	<0.82	<0.82	--
SMW-3D	PCE	1200 D	0.62 J	99.90
	TCE	860 D	69	85.15
	cDCE	6300 D	1400 E	63.64
	tDCE	200 D	80	42.86
	VC	3700 *+	1400 D	45.10
Qualifiers: E – Results exceeded calibration range. J – Result is less than reporting limit but greater than or equal to the MDL and the concentration is an approximate value. D – Sample results are obtained from a dilution; the surrogate or matrix sike recoveries reported are calculated from diluted samples. *+ LCS and/or is outside acceptance limits, high biased.				

R-29A(D1), M-09, R-34 (D2), and SMW-3D are monitoring wells near injection wells while M-15, BC-6, R-25, and R-08 are farther away from injection wells. Low-flow VOC sample results are higher than Hydrasleeve sample results for most VOCs at most of the comparison wells. In the 2023 field sampling event, both comparison and field duplicate samples will be assessed to reevaluate the difference in VOC and metal concentrations between low-flow pumping and Hydrasleeves in selected monitoring wells near injection wells.

Four equipment rinsate samples were collected during this sampling event. The rinsate samples were collected from the non-dedicated sampling pumps after decontamination of the pumps to verify the effectiveness of the decontamination procedures. Site COCs were not detected in the four equipment rinsate samples. However, EB-01 and EB-02 had estimated concentrations of chloroform. EB-03 had estimated concentrations of dichlorobromomethane and iodomethane and chloroform detected at 4.0 µg/L. EB-04 had an estimated concentration of dichlorobromomethane and detections of chloroform (4.3 µg/L) and chlorodibromomethane (0.65 µg/L). These VOCs are not considered COCs for the site.

One field blank was collected during this sampling event for VOC analysis. Field blanks are used to determine if COCs or other method analytes are present in the sampling environment. Acetone was detected at 16 J µg/L in the field blank sample. However, this constituent is not considered a COCs for the site. Site COCs were not detected in the field blank.

All shipped coolers containing VOC samples contained a trip blank for VOC analysis. The trip blanks were provided by the analytical laboratory (Eurofins TestAmerica). A total of seven trip blanks were submitted for VOC analyses. Iodomethane was detected in TB-02, TB-04 TB-05, and TB-06 with the result less than the reporting limit (RL) but greater than or equal to the method detection limit (MDL). TB-04 had an estimated concentration of chloromethane (0.95 J µg/L) and TB-06 had an estimated concentration of acetone (10 J µg/L). Chloromethane, idomethane, and acetone are not considered Site COCs. No Site COCs were detected in the trip blanks.

SMW-3D for EPA method 8260B was diluted to bring the concentration of target analytes within the calibration range of laboratory equipment, and as such, elevated MDLs and RLs were provided for these sample results. The following samples were diluted to bring the concentration of manganese within the calibration range and elevated RLs were provided for BC-6, BC-5, EWMW-2, EX-13, R-04_S2, R-05, R-24, R-25, and R-925.

5 Evaluation of Results

5.1 Groundwater Flow and Elevation Data

The water level data collected in October 2022 were used to develop potentiometric contour maps and determine groundwater flow directions for the shallow, intermediate, and deep zone aquifers (Figure 6 through Figure 10). Depth to groundwater in the shallow aquifer ranged from 6.63 to 12.39 feet below top of casing (btoc), an average of 0.27 feet lower than the previous monitoring event. Depth to water in the intermediate zone ranged from 6.75 to 30.97 feet btoc, an average of 0.42 feet lower than the previous monitoring event.

Depth to water in the deep zone ranged from 28.98 to 41.61 feet btoc, an average of 3.09 feet lower than the previous monitoring event. The deep zone aquifer had a decreasing trend from May 2010 through August 2014, an overall increase from 2015 to 2019, and a decrease from 2019 to 2022. Consistent with previous groundwater measurements, groundwater elevations are lower in the

deeper screened wells indicating a vertical downward gradient between the shallow aquifer and deeper aquifer. Groundwater elevations are summarized in Table 2.

The groundwater flow direction within each aquifer zone has remained relatively unchanged from the May 2021 event. Water level data for specific wells that deviated from the normal elevations and trends were excluded in developing the potentiometric maps for each aquifer zone (as noted in the map/figure legends). Based on the most recent updated CSM completed by INTERA in 2021, deviations in groundwater elevations may be due to north-south staked sand boundaries (INTERA, 2021). These stacked sand boundaries are depicted on Figure 7 through Figure 9.

The groundwater flow direction in the shallow aquifer is to the south/southeast with a gradient of approximately 0.0016 feet per foot (ft/ft). The groundwater flow for the shallow aquifer developed for this report excludes the R-25 water level data. Water level data was not measured in the following wells - BC-6, R-03, R-05, R-06, R-14, R-16, RDP-01, RDP-02, RDP-03, and PASMW-01, PASMW-02, and PASMW-03.

The groundwater flow direction in the intermediate aquifer (I1 zone) is to the southeast at a gradient of approximately 0.0020 ft/ft. The groundwater flow for the I1 zone developed for this report excludes the R-10 and R-12 water level data; R-03 and R-29's water level was not measured.

The groundwater flow direction in the intermediate aquifer (I2 zone) is to the southeast at a gradient of approximately 0.0014 ft/ft. The groundwater flow for the I2 zone developed for this report excludes R-10. Water level data was not measured for R-01, R-03, R-29, and R-30.

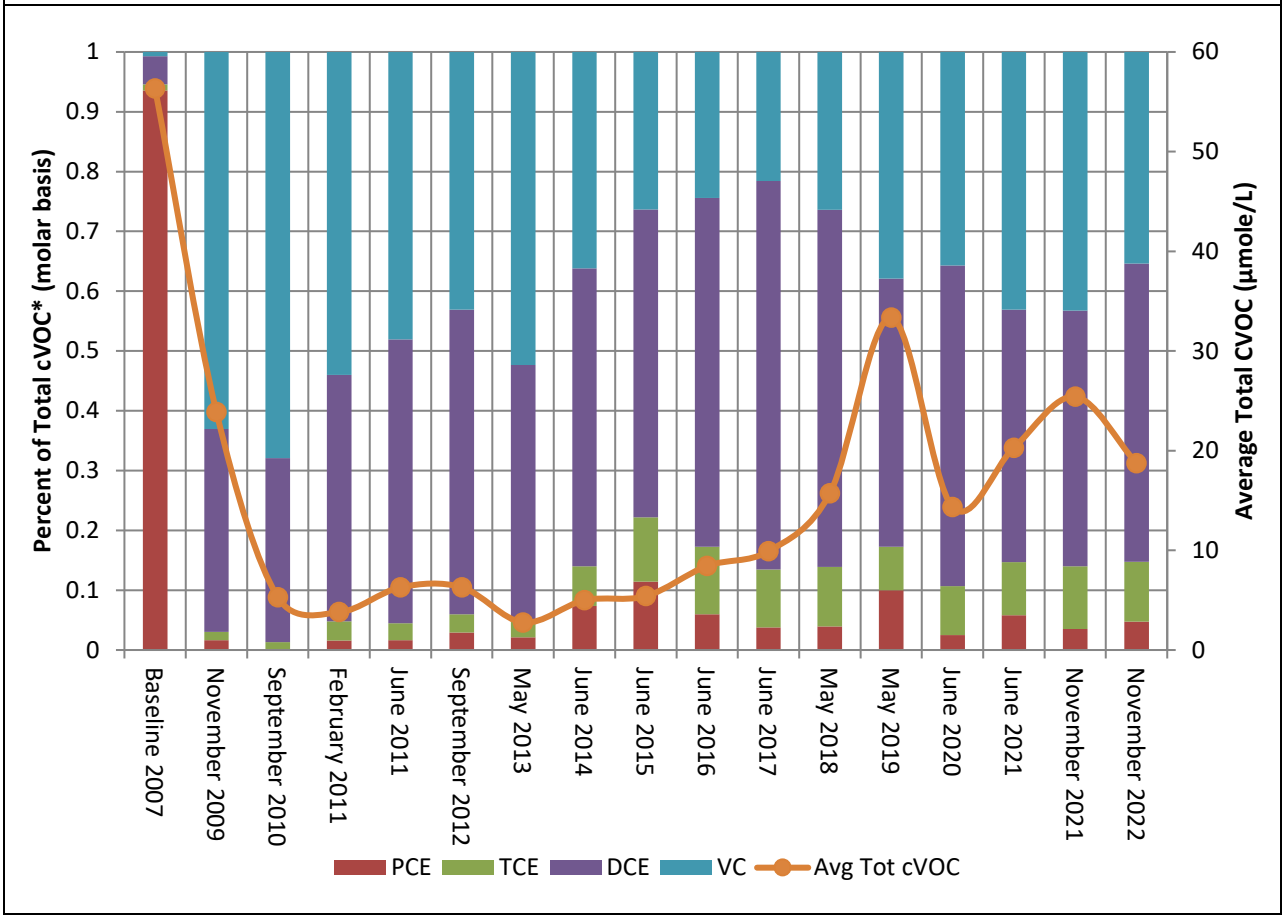
The groundwater flow direction in the D1 zone is to the south/southeast at a gradient of approximately 0.0031 ft/ft. The groundwater flow for the D1 zone developed for this report excludes the M-15, R-17, R-18 and R-19 water level data; R-30's was not measured.

The groundwater flow direction in the D2 zone is to the south/southeast at a gradient of approximately 0.0048 ft/ft. The groundwater flow for the D2 zone developed for this report excludes the R-10, , R-20, and R-32 water level data. Water level data was not measured in R-29 and R-30.

5.2 Groundwater Analytical Data

5.2.1 Shallow Aquifer (S1 and S2 wells)

Twenty-four shallow aquifer wells (S1 and S2 zones) were sampled in November 2022. Based on comparison of historical data (Figure 5) and the November 2022 results (Figure 11), the shallow aquifer plume is not expanding. Overall, the areal extent of the shallow plume has been reduced to an area of less than a half-acre at the Source Area. Reduction has occurred particularly in the northern third of the plume where concentrations within the shallow plume have decreased significantly since the ERD treatment began in April 2008. The shallow aquifer plume is undergoing active biodegradation through ERD within and downgradient of both the SA/HS and Biocurtain treatment systems. Shallow aquifer sampling and analysis is discussed in the following subsections.



5.2.1.1Source Area

Source Area monitoring for the 2022 monitoring event was performed at 13 monitoring wells completed within two stratigraphic units within the shallow aquifer. Two wells (SMW-3S and SMW-4S) are screened within a shallow gravel unit from approximately 8 to 18 feet bgs and eleven wells (SMW-1D, SMW-2D, SMW-3D, SMW-4D, SMW-5D, SMW-6D, SMW-7D, SMW-8D, SMW-9D, EWMW-2 and EWMW-4B) are screened within a fine-grained sand and clay unit from approximately 20 to 28 feet bgs.

Historically, PCE concentrations greater than 40,000 µg/L (40,000 µg/L in EWMW-4B (May 2002), 47,000 µg/L in SMW-3D and 65,000 µg/L in SAI-2D (January 2007)) were detected in the Source Area with the highest concentrations and mass occurring within the deeper, less permeable fine-grained unit that occurs from approximately 20 to 28 feet bgs. Prior to the start of remediation efforts in June 2007 (Field Pilot Test), the January 2007 baseline groundwater sampling results indicated the total cVOC mass from the 12 monitoring wells was 56.4 micro moles per liter (µmole/L). By February 2011, the contaminant mass had been reduced by 93% to 3.8 µmole/L. A trend reversal from decreasing to increasing contaminant mass was observed beginning in 2016 due primarily to a rebound in contaminant concentrations in monitoring wells SMW-2D, SMW-3D and SMW-8D. By May 2019, the source area contaminant mass had increased to approximately 48 µmole/L, which is believed to be due to "back diffusion" of adsorbed and dissolved phase PCE in the shallow aquifer of the Source Area from approximately 20 to 28 feet bgs.

Following the 2020 pilot test injections, contaminant mass in Source Area monitoring wells had decreased to approximately 17 µmole/L as of June 2020. Between June 2020 and June 2021, contaminant mass in Source Area monitoring wells increased to approximately 30 µmole/L. The composition of the contaminant constituents indicates that complete dechlorination is occurring. The results from the 2007 baseline sampling showed approximately 93% of the contamination was composed of PCE. By February 2011, approximately 95% of the mass was characterized as PCE daughter products DCE (41%) and VC (54%). During the November 2022 sampling event, the PCE mass was 4.7% and TCE mass was 10.0%. Approximately 85% of the mass remains as PCE daughter products created by the EDR treatment, DCE (49.9%) and VC (35.4%) (Graph 1).

Graph 1 – Source Area cVOC Mass by Constituent

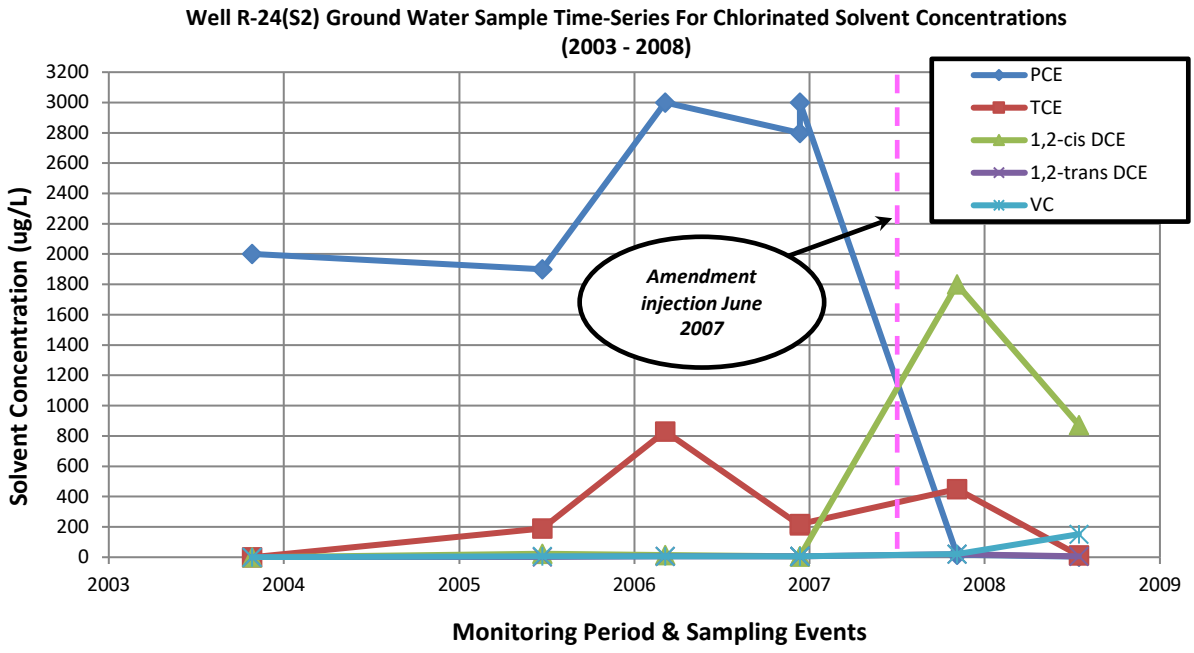
The highest cVOC concentrations within the Source Area occur in the less permeable lower unit of the shallow aquifer from approximately 20 to 28 feet bgs. During the baseline sampling in January 2007, PCE concentrations ranged from 2.0 to 65,000 µg/L and TCE ranged from less than 1.0 to 260 µg/L. cDCE concentrations were below 10 µg/L and tDCE and VC concentrations were below the laboratory detection limits (Table 4). By November 2009, PCE concentrations had decreased to 350 µg/L (SMW-6D) while the PCE daughter products, cDCE and VC, had increased to 5,600 µg/L (SMW-6D) and 11,000 µg/L (SMW-1D), respectively.

Analytical results from the November 2022 sampling event show that most of the contamination is concentrated in two wells (SMW-1D and SMW-3D) compared to three wells (SMW-1D, SMW-3D, and SMW-6D) in 2021. In SMW-1D, PCE decreased from 570 µg/L to 200 µg/L, TCE increased from 630 µg/L to 1,200 µg/L, cDCE increased from 460 µg/L to 1,000 µg/L, and VC increased from 76 µg/L to 91 µg/L. tDCE was not detected above an elevated laboratory reporting limit of 5 µg/L, respectively, due to sample dilution. In SMW-3D, PCE increased from 570 µg/L to 1,400 µg/L, TCE increased from 1,200 µg/L to 1,500 µg/L, cDCE increased from 4,200 µg/L to 7,000 µg/L, tDCE increased from 130 µg/L to 160 µg/L, and VC increased from 3,200 µg/L to 3,600 µg/L. PCE, TCE, cDCE, and VC were non-detect in SMW-6D; tDCE decreased from 7.6 µg/L to 1.6 J µg/L. Elevated daughter product concentrations were again observed in SMW-2D, with cDCE decreasing from 2,000 µg/L to 1,600 µg/L, tDCE decreasing from 66 µg/L to 47 µg/L, and VC decreasing from 1,400 µg/L to 770 µg/L. PCE and TCE were not detected in SMW-2D

above an elevated laboratory reporting limit of 5 µg/L due to sample dilution. All other SA/HS deep zone aquifer monitoring wells (SMW-4D, SMW-5D, SMW-7D, SMW-8D, and SMW-9D) are below the RGs for PCE, TCE, cDCE, and tDCE. VC is above the RG for all SA/HS deep zone wells except SMW-6D.

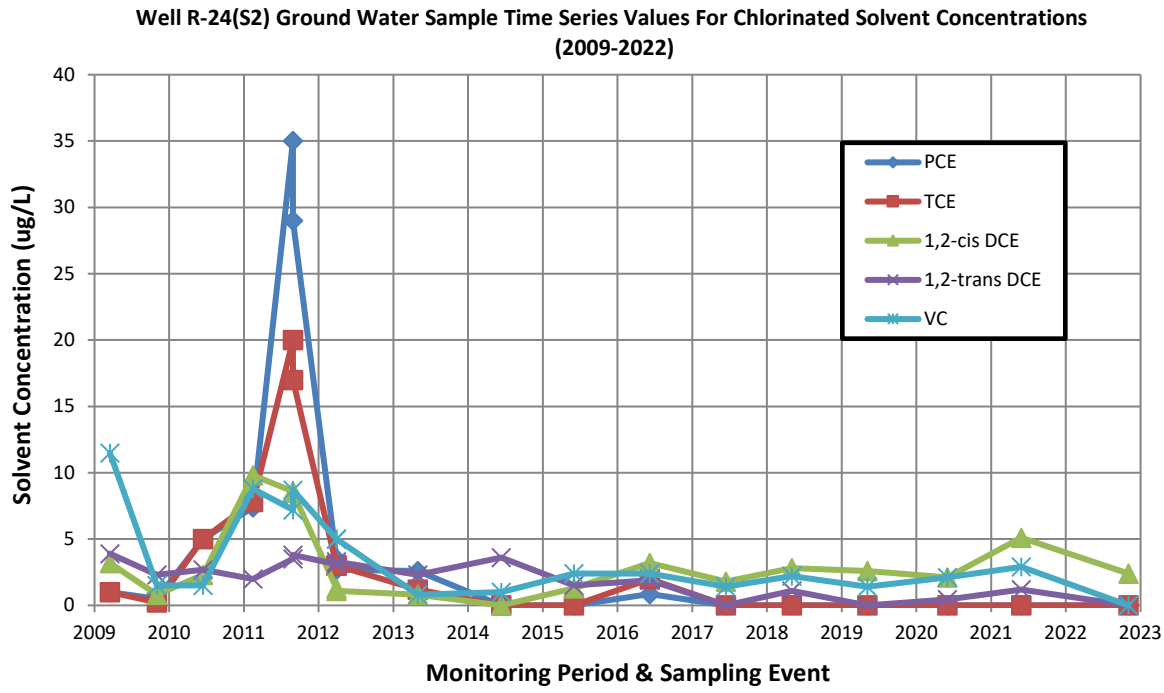
The current SA/HS shallow aquifer cVOC isoconcentration contour maps are shown on Figure 11a - 11c. Within the shallow aquifer, PCE, TCE, and cDCE were detected in samples from five of the six monitoring wells during the January 2007 baseline sampling. PCE concentrations ranged from 1.2 to 1,400 µg/L, TCE concentrations ranged from 1.8 to 280 µg/L and cDCE ranged from 4 to 2,200 µg/L. tDCE and VC concentrations were below the laboratory detection limits. Results from the six shallow zone wells over six sampling events beginning in November 2009 through May 2013 show that all cVOCs were below the Site RGs except VC. Consequently, beginning in June 2014, only two of the six shallow zone monitoring wells (SMW-3S and SMW-4S) have been sampled. As of November 2022, PCE was not detected above the RG and VC was detected at 13 µg/L in the sample from SMW-3S. All other cVOCs were below the Site RGs.

A significantly decreased contaminant mass was observed in June 2020 following Source Area pilot test amendment injections. In 2022, contaminant mass continues to remain lower than it was pre-injection in 2019. The continued presence of ethene indicates that complete dechlorination is sustained within the Source Area treatment zone.



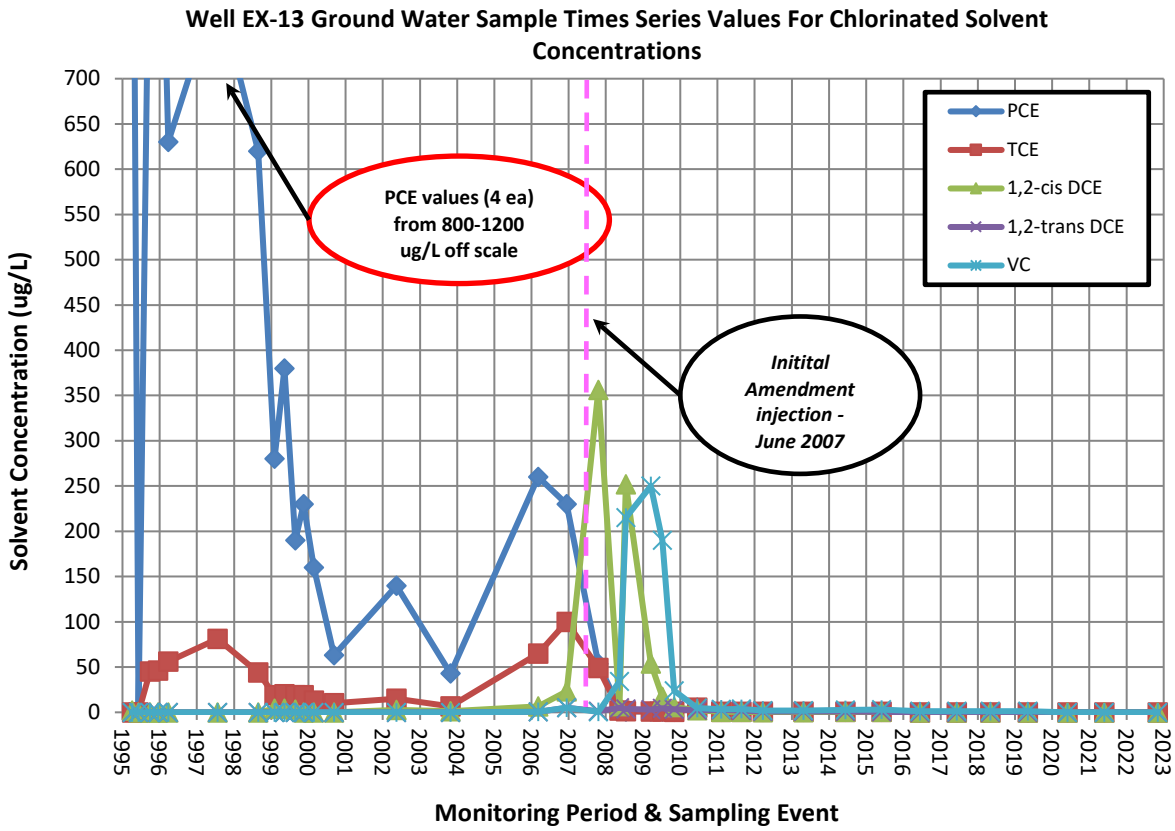
5.2.1.2 Hotspot

The primary objective of the former Hotspot monitoring program was to determine if rebound of cVOCs was occurring within this treatment area where the last substrate injection was performed in August 2009. The Hotspot monitoring program consisted of former treatment system wells that transected the middle of the Hotspot treatment area. These wells were plugged and abandoned in 2020 except for extraction wells HSE-7 and HSE-9, which were retained as water sources for future injection events.



In October 2009, a comprehensive round of sampling of 22 of the Hotspot extraction (HSE) and injection (HSI) wells showed that all cVOCs except VC were below the Site RGs. SMW-29D was installed immediately downgradient of the Hotspot treatment area in May 2017. VC is the only contaminant above the RG and had a detection of 4.4 µg/L at SMW-29D in the November 2022 sampling event.

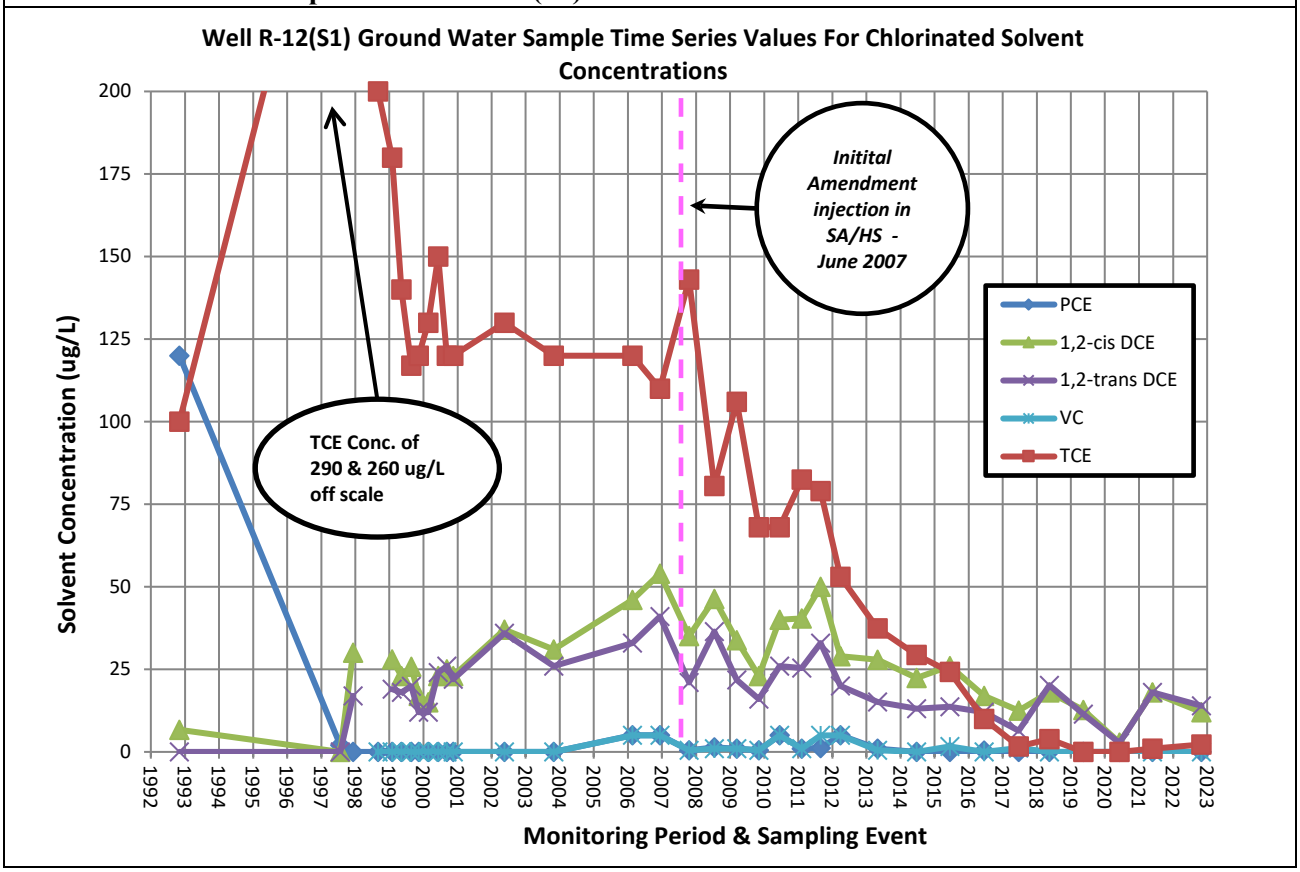
The effects from the ERD Hotspot treatment have been observed as far south as Paseo de Oñate approximately 400 feet downgradient from the Hotspot treatment area. Changes in concentrations and contaminant profiles in samples collected from four wells (R-24(S2), EX-16, R-25(S2), and EX-13) at increasing distances from the Hotspot treatment area have been observed (Table 3). Graph 2, Graph 3, and Graph 4 provide visual presentation of contaminant trends over time at R-24(S2) located just downgradient of the Hotspot treatment area and EX-13 located approximately 400 feet downgradient from the Hotspot.



Graph 2 – Well R-24(S2) Chlorinated Solvent Concentrations (2003-2008)

Graph 3 – Well R-24(S2) Chlorinated Solvent Concentrations (2009-2022)

Graph 4 – Well EX-13 Chlorinated Solvent Concentrations



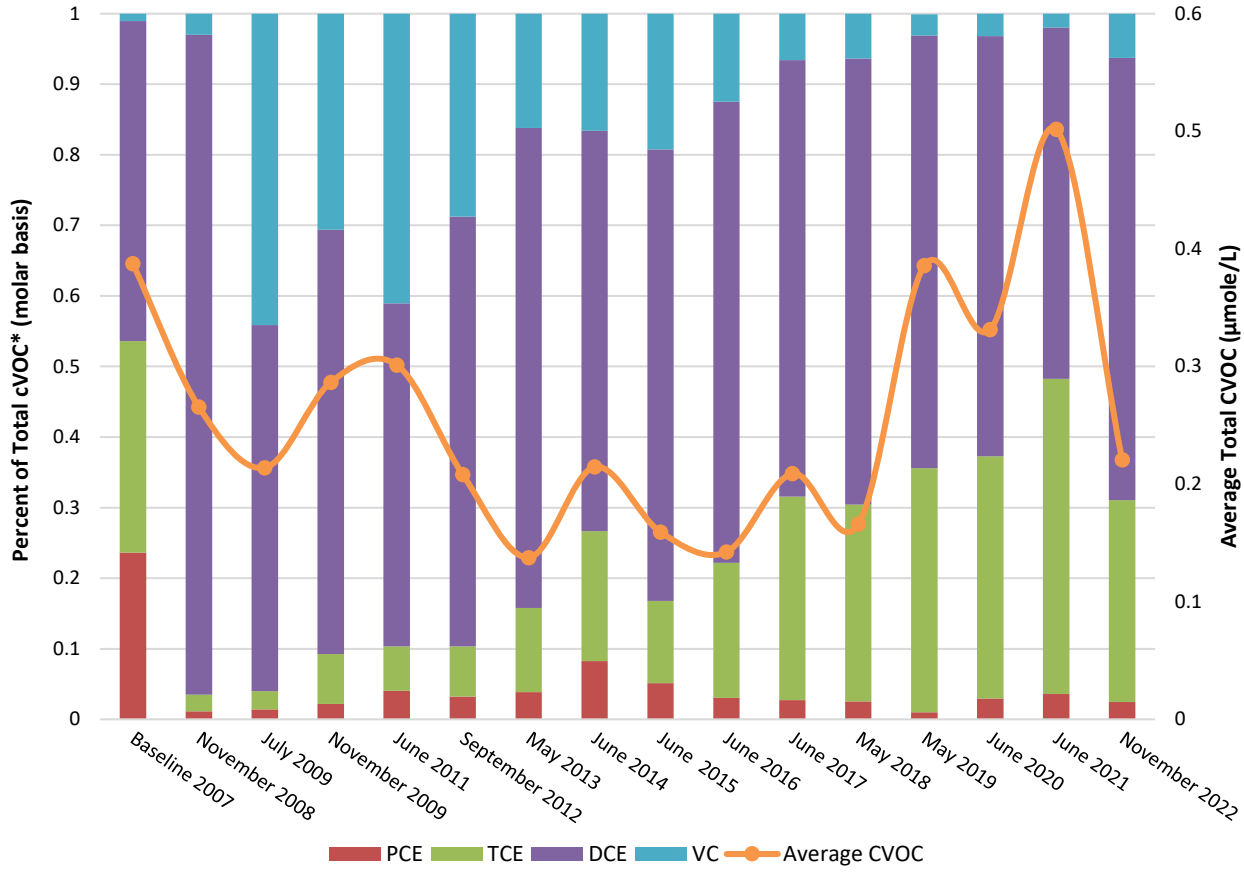
EX-16 was lost after 2018 due to regrading of a gravel lot; however, all cVOC concentrations were <1.0 µg/L since 2013. After the ERD substrate injections in May/June 2007, R-24(S2), EX-13, and EX-16 have PCE, TCE, and DCE below RGs. In the November 2022, there were estimated concentrations of VC detected above the MDL, but below the RL – R-24 (S2) at 1.9 µg/L J, EX-13 at 1.5 µg/L J, and EX-16 at 1.0 µg/L J. The presence of VC indicates complete ERD is occurring downgradient of the SA/HS treatment area.

5.2.1.3 Central Shallow Plume

Monitoring well R-12(S1) is the only well located in the middle portion of the shallow aquifer plume approximately 1,000 feet downgradient of the Source Area and 500 feet upgradient of the Biocurtain. Historically, PCE has completely degraded to TCE, cDCE, and tDCE daughter products at this well location. PCE concentration in the November 2022 groundwater sample was less than the 0.48 µg/L method detection limit. TCE concentrations from samples collected from this well decreased until June 2017 when the concentration level fell to 1.7 µg/L, which was the first time the TCE concentration fell below the RG of 5.0 µg/L. TCE levels have stayed below the RG since June 2017, and in November 2022, TCE concentration was 2.2 µg/L. The cDCE and

tDCE concentrations have fluctuated slightly, but they have stayed below their RGs. The concentrations of cDCE and tDCE in November 2022 were 12 µg/L and 14 µg/L, respectively. VC fell below 1.0 µg/L in May 2018, and it has remained below 1.0 µg/L since then. VC was below the method detection limit of 0.82 µg/L in November 2022 (Graph 5).

Graph 5 – Well R-12(S1) Chlorinated Solvent Concentrations

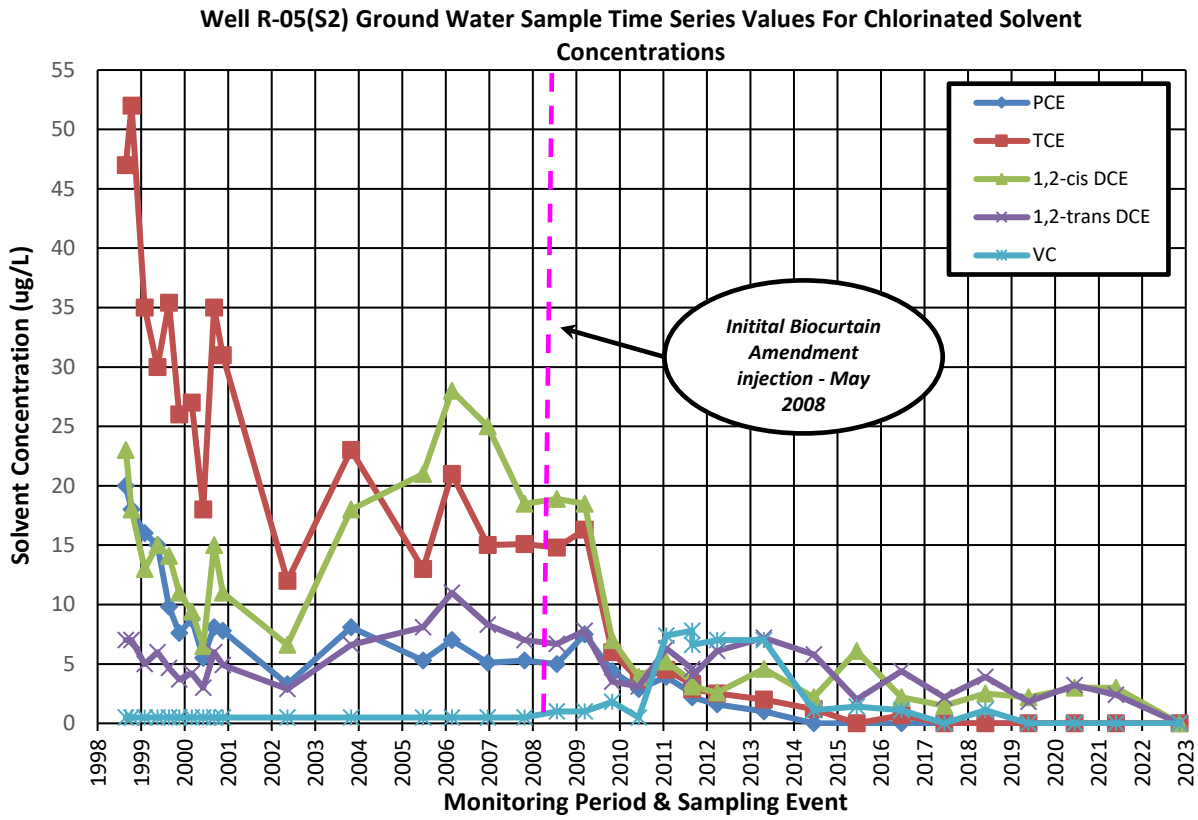


5.2.1.4 Biocurtain

Approximately 1,500 feet downgradient from the Source Area, active ERD is occurring in the Biocurtain treatment area. Six groundwater monitoring wells (BC-5, BC-6, BC-7S, BC-7D, R-04(S2) and R-27(S2)) are currently used to monitor shallow groundwater conditions in the Biocurtain area. Prior to the start of remediation in May 2008, the January 2007 baseline groundwater sampling results indicated the average total cVOC mass from the four former monitoring wells sampled (BC-2, BC-3, BC-4 and BC-5) was 0.39 µmole/L. The average cVOC mass from six wells (BC-5, BC-6, BC-7S, BC-7D, R-04(S2) and R-27(S2)) sampled in November 2022 was 0.22 µmole/L. An increase was first observed in May 2019 (0.39 µmole/L) and was attributed almost entirely to an increase in TCE, cDCE and tDCE concentrations in BC-6. cVOC concentrations in the remaining Biocurtain wells sampled in 2019 through 2021 remained relatively consistent. In November 2022, the average total cVOC mass was less than the 2007 average baseline sampling mass values due to a decrease in PCE, TCE, and DCE concentrations in BC-6. The results from the 2007 baseline sampling showed approximately 24% of the contamination as PCE, 30% as TCE, 45% as DCE and 1% VC. During the November 2022

sampling event, PCE represented 2.4% of the mass, TCE 28.6%, DCE 62.7%, and VC 6.3% (Graph 6).

Graph 6 – Biocurtain cVOC Mass by Constituent



PCE concentrations ranged between 3.2 µg/L to 30 µg/L and TCE concentrations were between 5.4 µg/L to 31 µg/L prior to the RA implementation. The PCE concentrations have decreased to less than 1.0 µg/L in samples collected from five of the six wells sampled in November 2022; PCE was detected in BC-6 at 2.1 µg/L. The TCE concentration was less than 2.0 µg/L in three of the six wells sampled in November 2022 and was detected at 2.9 µg/L in R-04 (S2), 6.3 µg/L in R-27(S2), and at 39 µg/L in BC-6. Five wells have cDCE and four wells have tDCE detections, but all wells remain below the remedial goals. VC was detected in one of the five wells sampled during the November 2022 event at 1.1 J µg/L (R-27(S2)).

The analytical results from one well (BC-6) have shown a significant increase in PCE and TCE since the 2012 sampling event. This well is situated at the eastern extent of the Biocurtain and cVOCs had not been detected prior to the September 2012 sampling event when TCE was detected at 6.6 µg/L. Since September 2012, PCE concentrations have ranged from a maximum of 20.0 µg/L in June 2014 to a minimum of 1.2 µg/L in May 2019. The November 2022 PCE concentration was 2.1 µg/L. TCE has ranged from 6.6 µg/L in September 2012 to 140 µg/L in June 2021. The November 2022 TCE concentration was 39 µg/L. Additional investigation around BC-6 was performed in August 2015 by NMED's contractor, CDM Smith Inc. During this investigation five boreholes were installed to the north and east of BC-6. A total of 11 groundwater grab samples

were collected from depths between 12 and 27 feet bgs and at least one sample from each boring exceeded of the Site RGs for both PCE and TCE. Three additional monitoring wells, PASMW-01, PASMW-02 and PASMW-03, were installed to the northeast of BC-6 in December 2018 and were sampled in January 2019. PCE, TCE and cDCE were detected at concentrations of up to 160 µg/L, 380 µg/L and 130 µg/L, respectively, in PASMW-01. Based on these results and the location of PASMW-01, the increase in cVOC concentrations observed in BC-6 since 2012 was determined to be the result of a release from a separate off-site source. NMED has designated the groundwater contamination from this other source to be the Calle Chavez Plume. Abatement actions are being conducted on the Calle Chavez Plume under the direct oversight of NMED. It is considered a separate plume not associated with the Superfund Site.

Historical PCE and TCE concentrations at well R-05(S2), approximately 2,300 feet downgradient of the Source Area and 700 feet downgradient of the Biocurtain, show a decreasing trend while VC increased following the RA implementation (Graph 7). PCE and TCE have been below the RGs since June 2010. VC was first detected (1.8 µg/L) in a sample collected from this well in October 2009 and was consistently detected at levels between 6.6 to 7.4 µg/L from 2011 to 2013. In 2014, VC decreased to 1.1 µg/L and was <0.82 µg/L during the November 2022 sampling event. VC was also detected at concentrations ranging from 1.7 to 15 µg/L in samples collected from R-14(S2), located approximately 300 feet east-southeast of R-05(S2), between 2010 and 2013 and has decreased to <1.0 µg/L since 2014. VC was also detected farther downgradient in samples collected from wells RDP-2 (2.6 µg/L) and RDP-4 (2.1 µg/L) in April 2013 and has since decreased to <1.0 µg/L since June 2015. The trend graph for R-05(S2) was used as it had the highest historical groundwater concentrations in this area of the plume.

Graph 7 – Well R-05(S2) Chlorinated Solvent Concentrations

The detection of VC in samples from these downgradient wells indicates that groundwater initially treated at the Biocurtain has migrated from 700 to 2,100 feet south of the Biocurtain treatment system. The VC detections at these downgradient wells also indicate that incomplete dechlorination was occurring within the Biocurtain system. The incomplete dechlorination is likely due in part to the high groundwater flow which reduces the residence time within the ERD treatment zone. This issue has been resolved since the 2013 substrate amendment injection when a higher substrate dose was applied at the Biocurtain; this injection resulted in the lower VC detections observed downgradient during the subsequent sampling events.

5.2.2 Intermediate Aquifer (I1 and I2 wells)

A total of 18 groundwater monitoring wells installed in the intermediate aquifer at the Site were sampled during the November 2022 event. Monitoring wells completed in the intermediate aquifer (I1 and I2 zone wells) are typically screened from approximately 50 to 70 feet bgs in the I1 zone and from 80 to 100 feet bgs in the I2 zone.

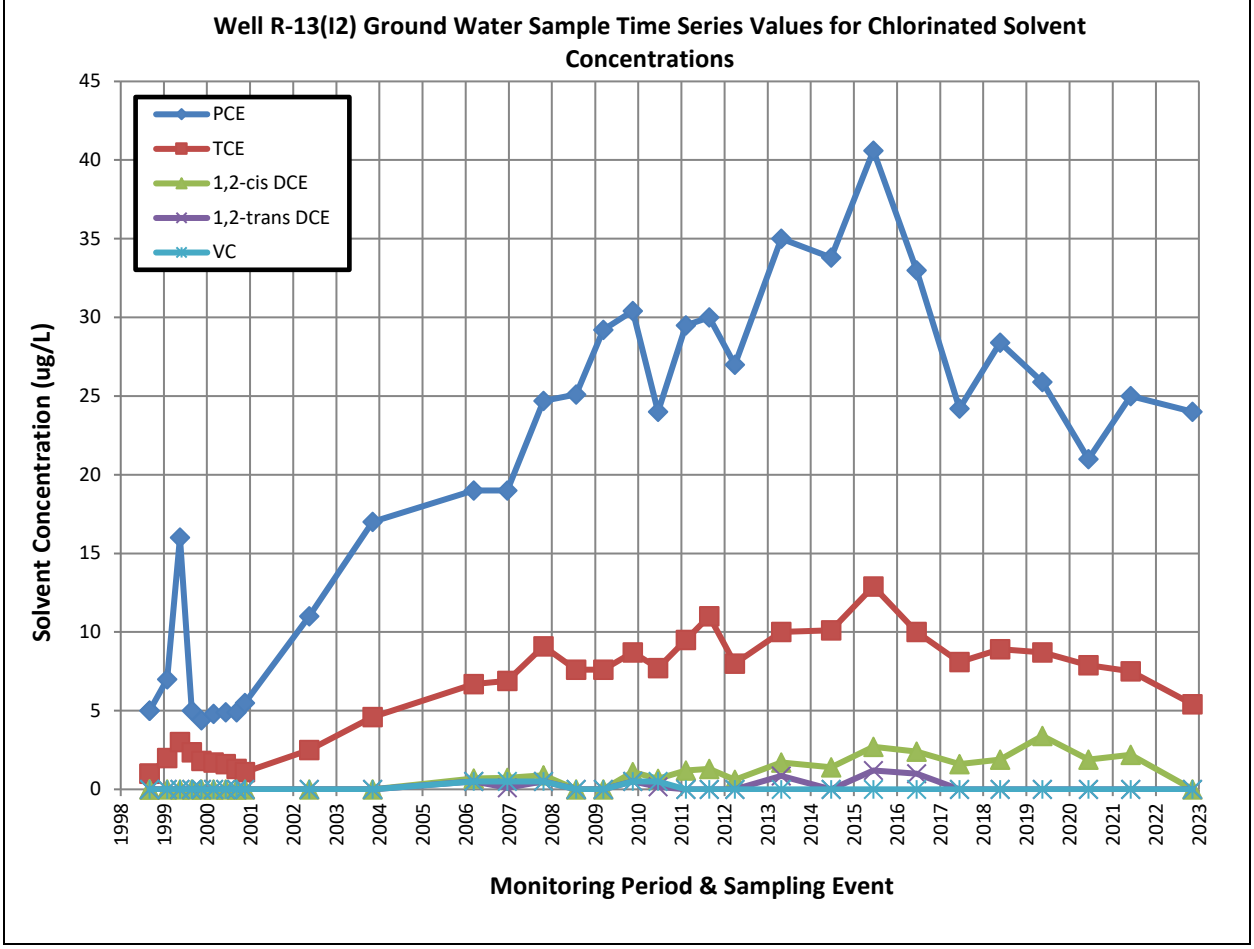
In general, both PCE and TCE concentrations in samples collected from wells completed within the contaminant plume boundaries of the intermediate aquifer have historically shown an increasing trend through June 2016, followed by a decreasing trend through November 2022. The exception to this observation is the downgradient monitoring well R-08(I2), which has consistently shown an increasing trend through 2021, but showed a decrease in November 2022. COCs have not been observed in the intermediate aquifer beneath or immediately downgradient of the Source Area as indicated by the historical results from samples collected from monitoring wells EWMW-

4A and R-23(I1). However, contaminants have reached the intermediate aquifer approximately 500 feet south/southwest of the Source Area near R-29A(I1) and are highest approximately 1,130 feet south/southwest of the Source Area at the R-34 well cluster located at the northeast corner of Calle Chavez and the Los Alamos Highway (Figure 5, Figure 12, Figure 13).

During the 2021 reporting period, wells in the R-09 well cluster were converted into injection wells. As a result, a new well cluster R-34 (R-34(I1) and R-34(I2)) was installed in December 2021 to replace the R-09 well cluster. PCE was detected above the Site RG of 5 ug/L in sample R-34(I2) at concentrations of 56 µg/L. PCE decreased in R-34(I1) from 12 ug/L to 4.1 ug/L from June 2021 to November 2022. TCE was also detected above the Site RG of 5 ug/L in samples collected from wells R-34(I1) and R-34(I2) at concentrations of 9.9 µg/L and 17.0 µg/L, respectively. The remaining COCs were below their respective RGs at these two wells.

The overall PCE trend has been decreasing from samples collected at R-13(I2) since 2015, the farthest southwest well completed in the intermediate aquifer. From June 2021 to November 2022, PCE concentrations stayed relatively stable from 25 µg/L to 24 µg/L (Graph 8). TCE was also detected above the Site RG of 5 µg/L in the sample collected from this well at a concentration of 5.4 µg/L while the remaining COCs are below their respective RGs.

Monitoring wells R-08(I2) and R-08A(I1) are located to the south of the R-09 well cluster along Highway 84/285 (Santa Clara Bridge Road). The PCE concentrations from R-08(I2), which historically measured less than 3.5 µg/L prior to 2012, increased consistently between 2012 and 2021. The PCE concentration has exceeded the Site RG at this well since June 2014 and was 25 µg/L during the November 2022 event, down from 43 µg/L in June 2021. TCE also exceeded the RG for the first time at 5.7 µg/L during the June 2015 sampling and was at 11.0 µg/L during the November 2022 event, which was down from 16 µg/L in June 2021. All other COCs remain below the RGs in samples collected from this well. R-08A(I1) was the only monitoring well in November 2022 in the I1 zone to have concentrations of PCE above the RG of 5 µg/L. PCE concentrations at R-08A(I1) decreased from 23 µg/L in June 2021 to 6.3 µg/L in November 2022, and TCE decreased from 15 µg/L to 7.5 µg/L. DCE and VC were not detected above the lab reporting limits.



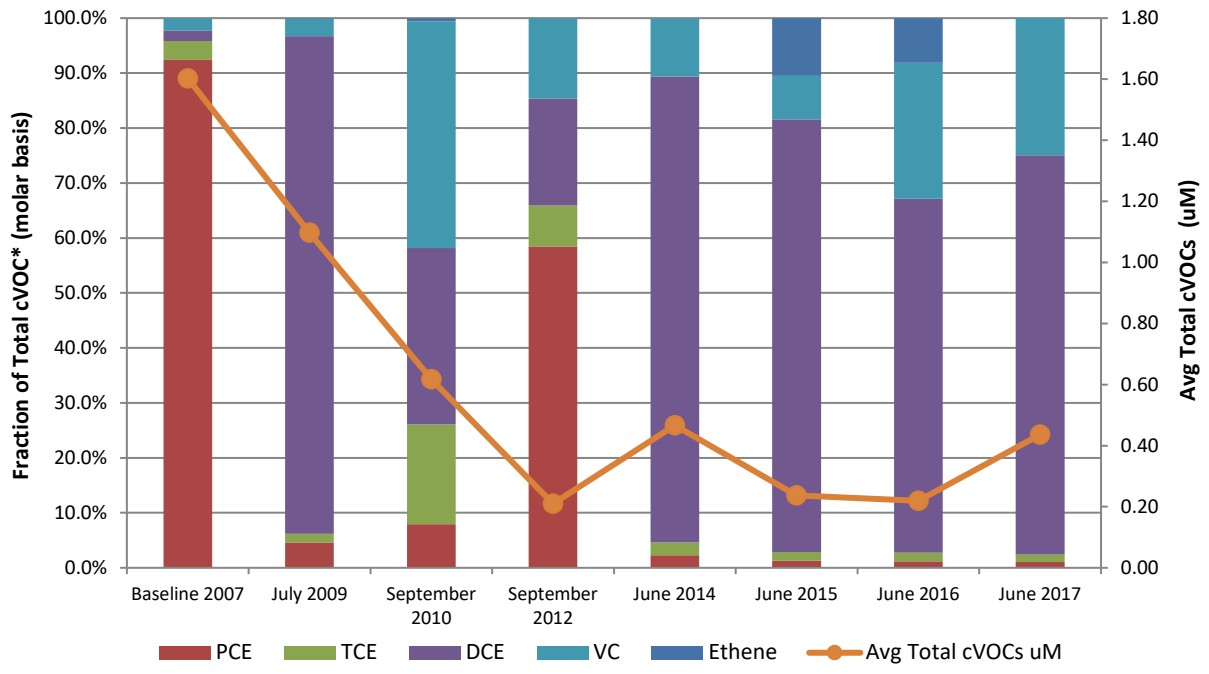
For the first time during this sampling event, PCE was below the Site RG of 5 µg/L in the sample collected from well R-29A(I1) at a concentration of 2.3 µg/L. All other COCs remain below the RGs in the sample collected from this well.

Nested monitoring well pairs R-31(I1&I2), R-32(I1&I2), and R-33(I1&I2) respectively define the western, southwestern, and southern limits of the intermediate zone contaminant plume. R-31(I1), R-32 (I2), and R-33 (I1) were not detected at the lab reporting limits for all cVOCs. In November 2022, PCE was below the Site RG of 5 µg/L in R-31(I2) at a concentration of 1.5 µg/L, and was not detected above the lab reporting limit (<0.48 µg/L) in R-32(I2) and R-33(I2). All other cVOC sampling results from these wells in November 2022 were non-detect.

Two ERD injection wells and two monitoring wells were installed in the intermediate aquifer at the Plaza de Española approximately 750 feet from the Source Area as part of the RA construction. Analytical results for samples collected from monitoring wells DM-1(I1) and DM-2(I1) have historically been lower than the R-09 well results with the highest PCE detected at 13.0 µg/L in

2007. DM-1(I1) was not sampled in November 2022. All cVOCs in DM-2 (I1) sampling results were not detected above the lab reporting limits.

Graph 8 – Well R-13(I2) Chlorinated Solvent Concentrations

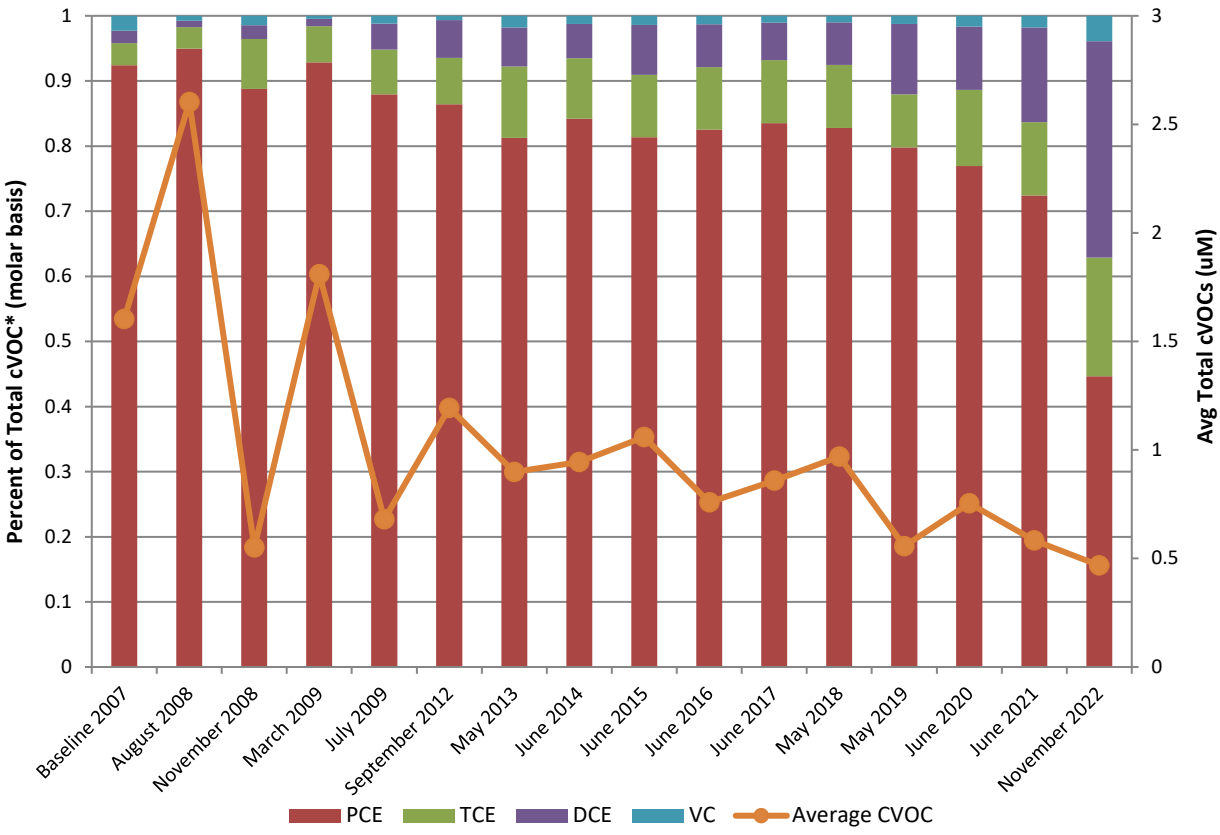


5.2.3 Deep Zone Aquifer (D1 and D2 wells)

A total of 20 monitoring wells including FLUTe well monitoring ports installed in the deep zone aquifer at the site were sampled during the November 2022 sampling event. The deep aquifer consists of two contaminated zones (D1 and D2) and one uncontaminated zone (D3). The D1 zone ranges in depths from approximately 155 to 200 feet bgs and the D2 zone ranges from between approximately 225 to 265 feet bgs. The uncontaminated D3 zone ranges from approximately 340 to 360 feet bgs. Results from the November 2022 sampling event continue to indicate that the highest cVOC concentrations in the deep aquifer occur around the R-29A (D1) and R-30 (D2U) (Figure 5, Figure 14, and Figure 15). Wells R-35 (D1) and R-35 (D2) were installed upgradient of R-29A(D1) and R-29(D2U) in November 2022.

Sample results from the injection wells show near complete degradation of PCE following the substrate injections that has sustained for years after the injections. PCE, which accounted for greater than 90% of the contaminant mass prior to the injections, was reduced to less than 10% through September 2010 (Graph 9). As expected during the ERD process, PCE daughter products initially increased from less than 5 µg/L to between 190 and 230 µg/L in the treatment wells with

TCE representing 18%, DCE 32%, and VC 41% of the contaminant mass by September 2010. All cVOCs except VC were below the Site RGs in the injection wells in 2017. In December 2021, one Deep Zone injection well, R-21, was sampled, and all COCs were reported at <1.0 µg/L. Deep Zone injection wells were not sampled during the 2022 sampling event.

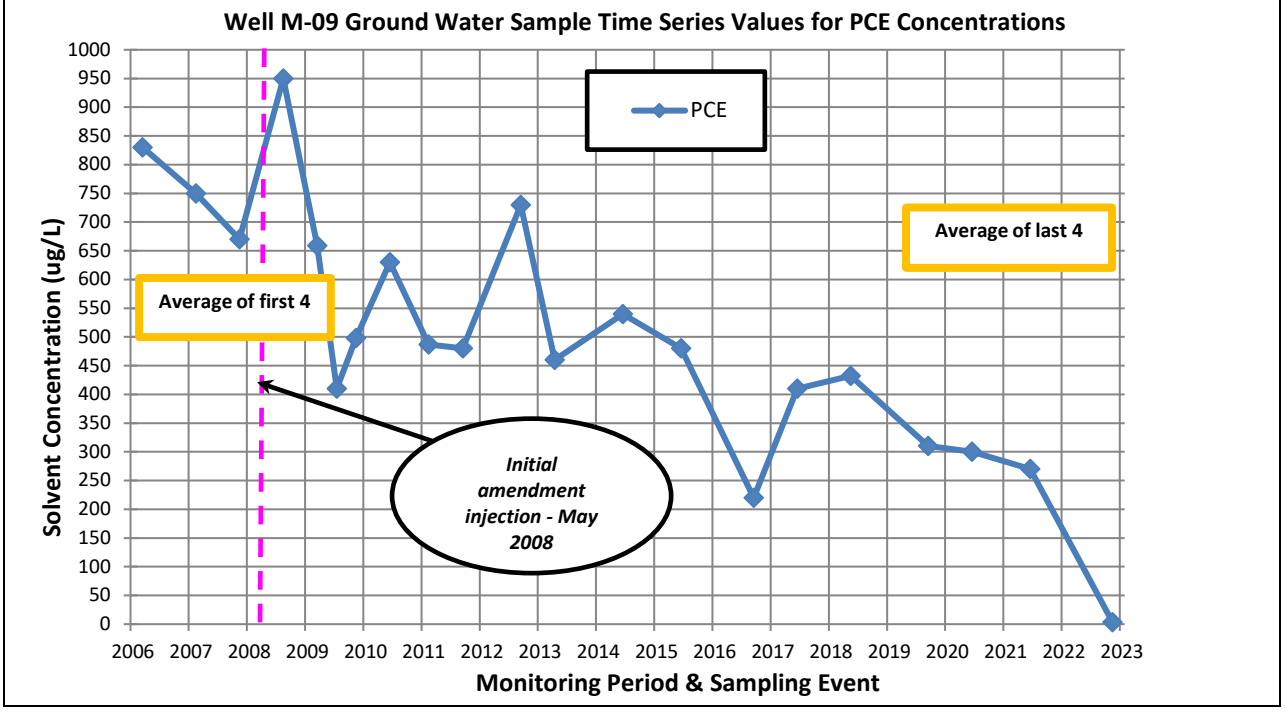


Graph 9 – Deep Zone Injection Well cVOC Trends

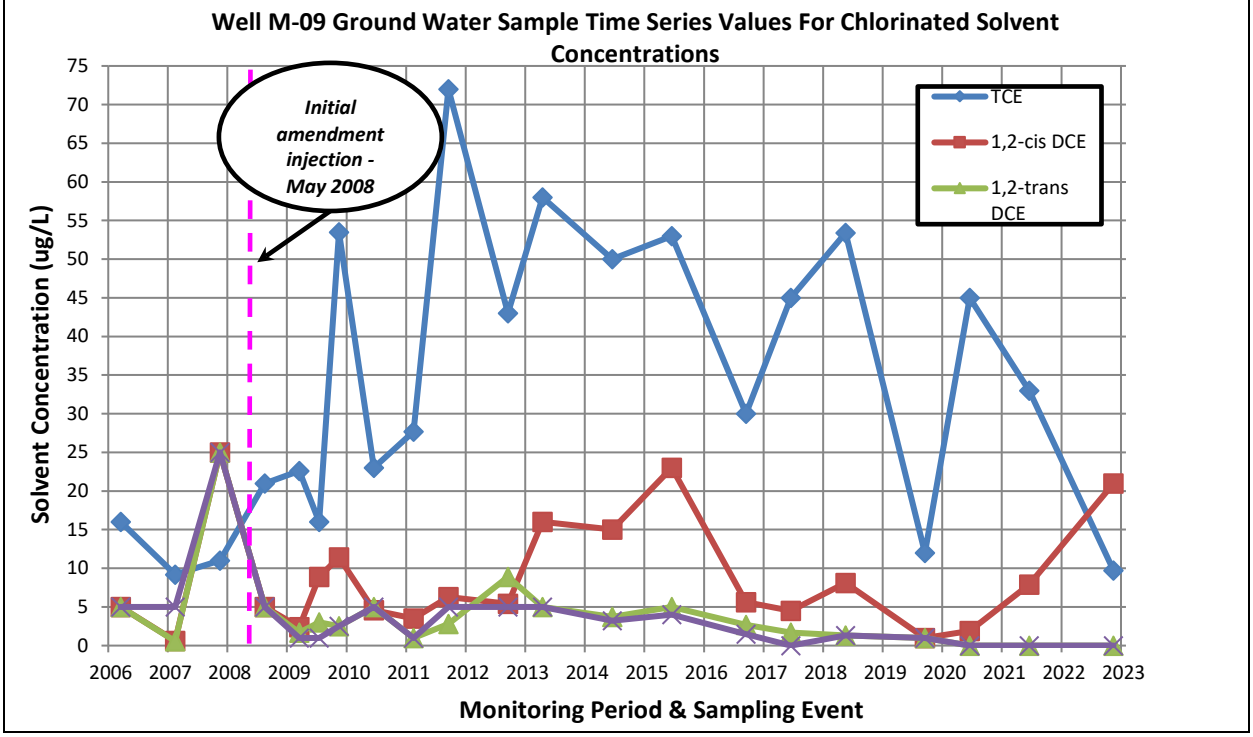
*Note: Fraction of Total cVOCs includes ethene. However, ethene was not analyzed in all wells in all events.

From June 2021 to November 2022, the overall cVOC mass has changed with a decrease in PCE and an increase in TCE, DCE, and VC in the deep zone monitoring wells which are located within approximately 40 feet of the injection wells. As of November 2022, PCE in the monitoring wells represents approximately 52% of the contaminant mass compared to 72% in June 2021 (Graph 10).

Graph 10 – Deep Zone Monitoring Well cVOC Trends



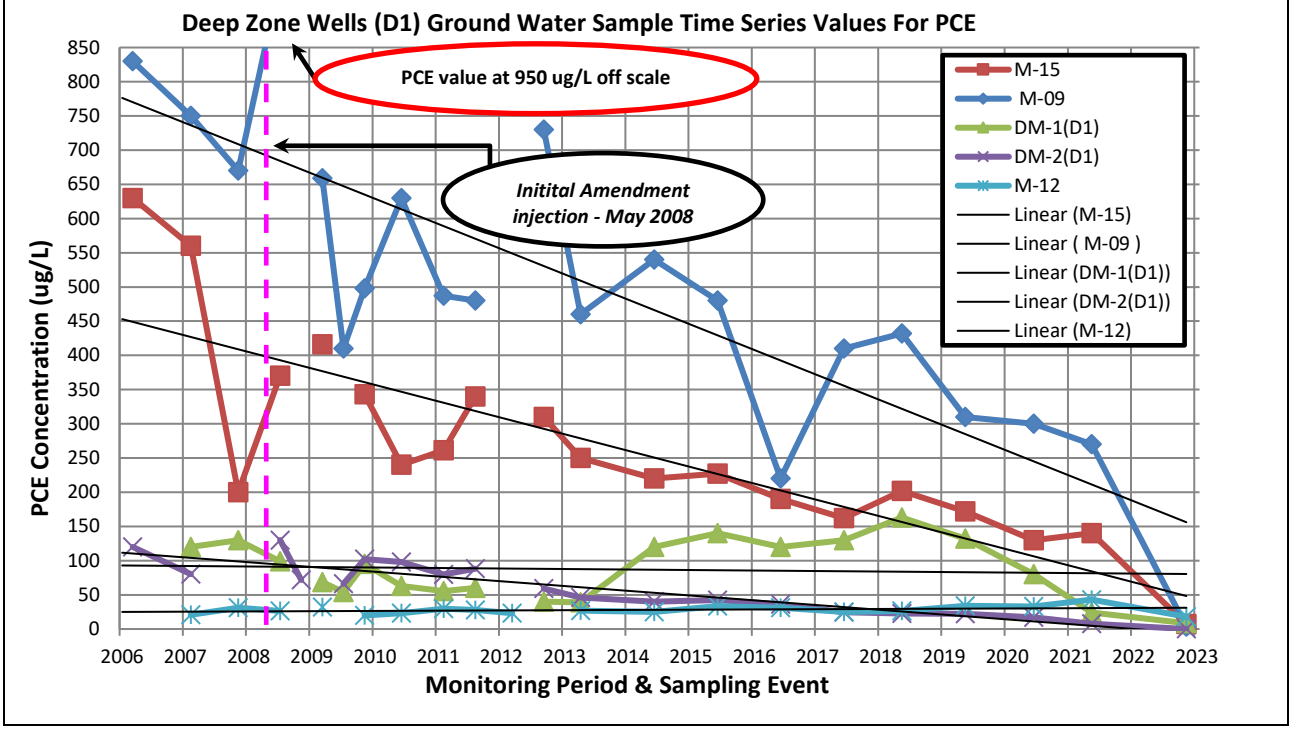
The November 2022 PCE concentrations in samples collected from the D1 Zone monitoring wells ranged from <1.8 µg/L in the samples from R-12(D1) to 110 E µg/L in R-29A(D1). The highest PCE concentrations within the D1 Zone were in samples from wells R-29A(D1) (110 E µg/L) and R-35(D1) (97 µg/L), located northwest of the plaza. PCE concentrations in samples from DM-1(D1) and DM-2(D1), located in the plaza, were 8.5 µg/L and 1.7 µg/L, respectively. TCE concentrations in samples collected from D1 zone monitoring wells ranged from 3.1 µg/L in the samples from DM-2(D1) to 28 µg/L in M-15. Compared to the 2021 analytical results, PCE concentrations decreased in M-09 (270 µg/L to 8.8 µg/L), M-15 (140 µg/L to 7.1 µg/L), R-29A(D1) (140 µg/L to 110 E µg/L), DM-1(D1) (24 µg/L to 8.5 µg/L), and DM-2 (D1) (7.7 µg/L to 1.7 µg/L). PCE concentrations in R-35(D1) were detected at 97 µg/L (Figure 14). From June 2021 to November 2022, M-09's PCE concentrations plummeted while cDCE increased (7.9 µg/L to 35 µg/L) (Graph 11 and Graph 12).



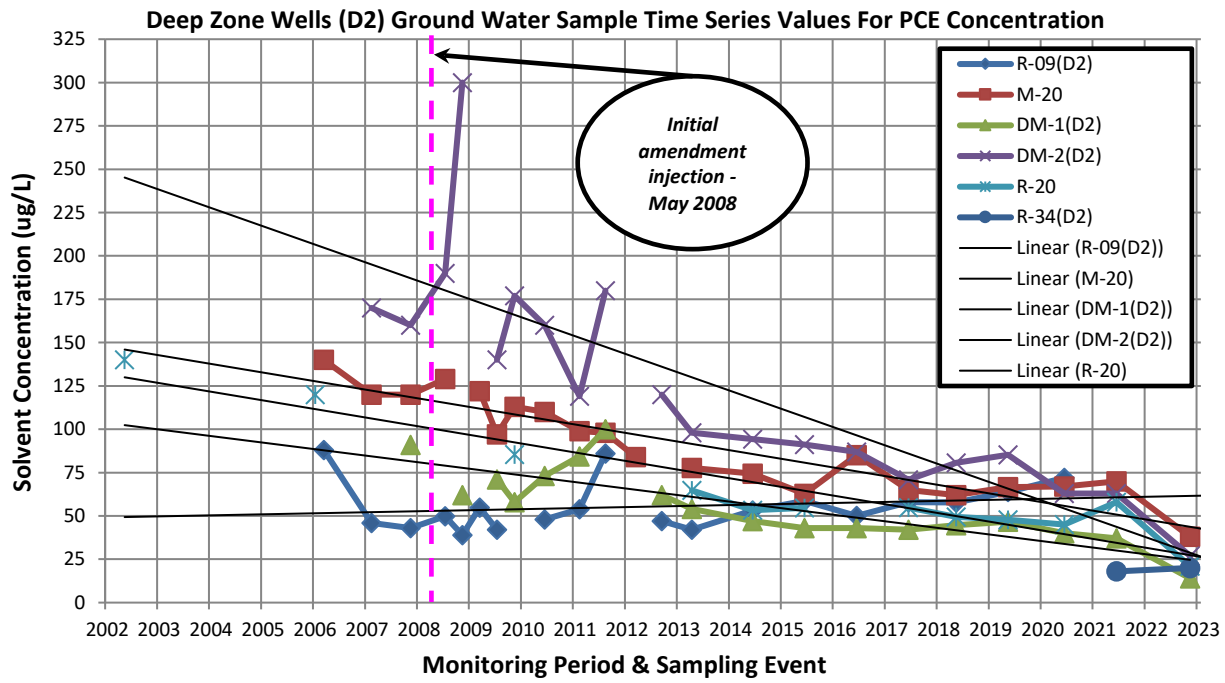
PCE concentrations in samples collected from the D2 zone wells (M-20, R-20, R-29 (D2U), R-30 (D2L), R-30 (D2U), R-32(D2), R-34(D2), R-35(D2), DM-1 (D2), and DM-2(D2)) in November 2022 ranged from <0.48 µg/L in R-32 (D2) to 120 µg/L in R-30(D2U) (Figure 15). Compared to the June 2021 analytical results, PCE concentrations have decreased in most samples collected from D2 zone. However, PCE increased from 44 µg/L to 120 µg/L in R-30(D2U). TCE concentrations were only above the RG in R-30(D2U) (7.8 µg/L) and R-34(D2) (6.8 µg/L). cDCE

and tDCE were detected in DM-1(D2) at concentrations of 6.9 µg/L and 1.8 J µg/L, respectively. cDCE and tDCE were not detected above 1 µg/L in samples collected from any other D2 wells. VC was not detected above the RGs in any of the samples collected from D2 wells.

Graph 11 – M-09(D1) Time Series Values for PCE



Graph 12 – Well M-09(D1) Time Series Values cVOCS



Analytical results for PCE from samples collected from the D1 and D2 aquifer wells show an overall decreasing trend since 2007 as shown in Graph 13 and Graph 14. The average PCE concentrations detected in samples from ten wells in 2007 was 217 µg/L. The average PCE concentration for samples from the same ten wells (excluding R-09 (D2) and M-12) was 15 µg/L in November 2022. This represents an approximate 93% decrease in the PCE concentrations since 2007.

Graph 13 – Deep Zone Wells (D1) Time Series Values for PCE

Graph 14 – Deep Zone Wells (D2) Time Series Values for PCE

5.2.4 Supply Wells

Santa Clara Pueblo's public supply well (SCTW-2), located approximately 1 mile downgradient from the plume, is no longer in use. Analytical results from previous samples collected from this well between 2006 and 2009 were non-detect for all COCs.

The Cook Estate private well located south of the plaza is used for irrigation purposes only. Historical results from the Cook well showed PCE and TCE concentrations ranging from 15 µg/L to 74 µg/L through the March 2009 sampling event. COCs in samples collected from this well have been below the Site RGs since the November 2009 sampling event. PCE was detected at a trace concentration of 0.30 J µg/L in June 2021. In November 2022, PCE was not detected. All other COCs (TCE, DCE, and VC) have been non-detect since the 2014 sampling event.

5.2.5 Dissolved Metals Analytical Results

The ERD treatment process can create secondary water quality concerns resulting from the reduced aquifer conditions within and downgradient of the treatment areas. These conditions result in the dissolution and mobilization of formerly insoluble forms of metals that occur naturally in the aquifer matrix. Three dissolved metals, arsenic, iron, and manganese, are used for comparison to the more restrictive of the Federal Primary Drinking Water MCL (arsenic) and NMWQCC standards (iron and manganese). Twenty (20) monitoring wells located upgradient, within, and downgradient from the treatment areas were sampled for dissolved metal analysis during the November 2022 sampling event. Table 5 provides historical results for the analysis of arsenic, iron, and manganese. Appendix A provides laboratory results for the metals analyzed. For further explanation of dissolved metals analytical results see *Fiscal Year 2023 Groundwater Treatment, Well Installations, Monitoring, and Maintenance North Railroad Avenue Plume Superfund Site Española, New Mexico* (Intera, May 2024).

Source area well SMW-8 (D) had the maximum dissolved iron (24,000 µg/L) in 2022. S-MicroZVI™ was injected into directional injection enhancements (DIEs) surrounding SMW-8 (D) in March 2020. In general, dissolved iron concentrations in the deep zone are below the NMWQCC Standard of 1.0 µg/L. However, R-29A (D1) using a low-flow sampling technique had a dissolved concentration of 1.3 µg/L.

All the Source Area and the Biocurtain wells have dissolved manganese above the ROD and NMWQCC of 200 µg/L. This is due to ERD which has created a reducing environment. Only R-29A (I1) had a detection above NMWQCC of 1,100 µg/L in the intermediate and deep zones.

Shallow zone EX-13 and R-25 (S2) are the only sampled wells above 10 µg/L. These elevated levels could be due to the Site plumes, petroleum hydrocarbon plumes from Underground Storage Tanks releases, or other contamination leading to reducing conditions that can dissolve aquifer minerals to which arsenic may be bound.

5.2.6 Total Organic Carbon (TOC) Analysis

TOC is a measure of the amount of substrate remaining for use as the electron donor during the ERD process. The TOC levels required for sustaining ERD are typically greater than 20 to 30 milligrams per liter (mg/L).

TOC concentrations remained elevated at SMW-8 (D) and SMW-9 (D), downgradient of the 2020 ETS treatment area. This indicates that the substrate has not been exhausted. For further explanation of TOC analysis see *Fiscal Year 2023 Groundwater Treatment, Well Installations, Monitoring, and Maintenance North Railroad Avenue Plume Superfund Site Española, New Mexico* (Intera, May 2024).

5.2.7 Microbial Activity Sampling and Analysis

Ten groundwater samples were collected during this reporting period for microbial deoxyribonucleic acid (DNA) analysis from selected wells in the Source Area, Itermediate Zone, and Deep Zone treatment areas. The samples were collected by INTERA, Inc. and submitted to Microbial Insights, Inc. of Knoxville, Tennessee for analysis. Laboratory results are provided in Appendix C.

The presence, abundance, and proliferation of specific microorganisms (*dehalococcoides spp.*, DHC) and functional genes (tceA, bvcA, and vcrA), are key components in assessing trends in biodegradation and effectiveness of the ERD treatment. According to Lu et al. (2006), a concentration of $1x10^4$ DHC cells (of micro-organisms) per milliliter of water (cells/mL) can be used as a screening criterion to identify sites where reductive dechlorination will yield useful biodegradation rates. Other functional RDase genes are useful in determining which compounds are degraded or whether the potential for incomplete degradation or stalling may occur. These specific RDase genes are described below.

- **tceA** – The tceA gene encodes the enzyme responsible for reductive dechlorination of TCE to cDCE in some strains of DHC. Absence of tceA does not preclude the potential for reductive dechlorination of TCE in the field since the tceA gene is not universally distributed among all DHC and is not present in other microorganisms capable of reductive dechlorination of TCE (for example, Dehalobacter). Detection of the tceA gene provides an additional line of evidence indicating the potential for dechlorination of TCE.
- **bvcA** – The bvcA gene encodes the vinyl chloride reductase enzyme responsible for reductive dechlorination of VC to ethene by DHC strain BAV1. Presence of bvcA gene indicates the potential for reductive dechlorination of VC to ethene. Absence of both bvcA and vcrA genes suggests VC may accumulate.
- **vcrA** – The vcrA gene encodes the vinyl chloride reductase enzyme responsible for reductive dechlorination of cDCE and VC by DHC strain VS. Presence of vcrA gene indicates the potential for reductive dechlorination of cDCE and/or VC to ethene. Absence of both bvcA and vcrA genes suggest VC may accumulate.

The microbial results indicate that DHC is present in the Source Area, Intermediate Zone, and Deep Zone treatment areas. Additionally, the presence of functional genes and reduction in COC concentrations, when compared to pre-injection levels in 2019, indicate that bioaugmentation is not warranted for the complete reductive dichlorination process to occur.

The populations of DHC and tceA and vinyl chloride reductase gene counts in Source Area wells appear healthy enough to support continued ERD. In the Deep Zone wells, there are lower counts of DHC populations and mostly non-detectable levels of functional genes. The Deep Zone wells could be targeted with amendment injections. For further explanation of Microbial Analysis see *Fiscal Year 2023 Groundwater Treatment, Well Installations, Monitoring, and Maintenance North Railroad Avenue Plume Superfund Site Española, New Mexico* (Intera, May 2024).

5.2.8 Air Sampling Results

NMED collected 8-hour air indoor air samples at two buildings (the former El Centro Family Health Center Annex building and the former Norge Town Dry Cleaner building) and 24-hour indoor air samples and sub-slab soil vapor samples at one building (the Las Cumbres Community Services building) around the SA/HS area in March 2022. In addition, outdoor air samples were collected at the former Norge Town Dry Cleaner and the Las Cumbres Community Services buildings.

The air and sub-slab soil vapor samples were collected in certified, pre-cleaned 6-liter Summa canisters equipped with 8-hour or 24-hour sample regulators and analyzed for target chlorinated Volatile Organic Compounds (cVOCs) by EPA Method TO-15 SIM (select ion monitoring). Analysis of the samples was performed by Eurofins TestAmerica in Knoxville, Tennessee. Indoor air and sub-slab soil vapor laboratory analytical results for the March 2022 sampling events are provided in Appendix D and summarized in Table 6.

PCE was detected in the indoor air sample from the former dry cleaner building at 7.6 micrograms per cubic meter ($\mu g/m^3$), which is below the indoor air PCE Vapor Intrusion Screening Level

(VISL) for commercial use (175 µg/m^3). At the former El Centro Family Health Center Annex building, an estimated concentration of PCE was detected above the MDL, but below the RL at 0.48 J µg/m^3. TCE, cDCE, and vinyl chloride were not detected above the MDLs.

At the Las Cumbres Community Services building, there were estimated concentrations of PCE detected above the MDL, but below the RL in the indoor air Classroom 1 sample (0.30 J µg/m^3), Classroom 2 (0.29 J µg/m^3), Classroom 3 (0.15 J µg/m^3), and the ambient air in the playground (0.10 J µg/m^3). All samples were below the PCE VISL for residential use (47 µg/m^3). TCE, cDCE, and vinyl chloride were not detected above the MDLs.

In April 2021, NMED installed a permanent sub-slab soil vapor monitoring point in Classroom 3 which monitors PCE concentrations beneath the building. PCE was detected (240 µg/m^3), but is below the target sub-slab soil vapor for residential use (360 µg/m^3). TCE had an estimated concentration (1.0 J µg/m^3) which is also below the target sub-slab soil vapor for residential use (16 µg/m^3). cDCE and vinyl chloride were not detected above the MDLs in the sub-slab soil vapor samples. The results of the March 2022 indoor air and sub-slab soil vapor sampling confirmed that PCE and TCE are not intruding into the building above residential VISLs; therefore, no further action is necessary to address sub-slab vapor at this time.

6 Conclusions and Recommendations

Based on evaluation of the groundwater monitoring data for this reporting period, the following conclusions are made for the North Railroad Avenue Plume (NRAP) Superfund Site:

- A passive sampling system, HYDRASleeve™, was used in the November 2022 groundwater sampling event to evaluate its effectiveness. A comparison sample was collected using low-flow purge/sampling methods at eight wells. The results of the comparison study showed that HydraSleeve samplers work well at most locations. However, low-flow volatile organic compounds (VOC) sample results are higher than Hydrasleeve sample results at monitoring wells located close to injection wells that have recently had groundwater treatment injections.

- The groundwater flow direction within the shallow, intermediate, and deep zones have remained relatively unchanged from previous events. Groundwater flows in the shallow and deep zone aquifers are to the south/southeast and southeast, respectively. Groundwater flows in the upper and lower intermediate zones are to the southeast.

- Based on historical water level measurements and groundwater analytical results, the lateral extent of shallow plume has been reduced and chlorinated solvent concentrations are decreasing throughout the shallow plume due to the Source Area pilot test amendment injections in early 2020. In November 2022, the contaminant mass decreased and remains lower than the 2019 pre-injection levels.

- The Enhanced Reductive Dechlorination (ERD) treatment has been effective at degrading tetrachloroethene (PCE) and its degradation by-products in the shallow aquifer downgradient of the Source Area/Hot Spot. The ERD treatment cycle is demonstrated by a sequential increase in the parent PCE daughter products (trichloroethene (TCE), cis-1,2-

dichloroethene (c-DCE), and vinyl chloride (VC)) followed by a sequential decrease in the same products. The ERD cycle of sequential increase-decrease of PCE daughter products indicates that biodegradation is occurring, and ERD treatment has reduced chlorinated volatile organic compounds (cVOCs) in the shallow aquifer. The continued presence of ethene indicates that complete dechlorination is sustained within the SA treatment zone. The presence of VC indicates complete ERD is occurring downgradient of the Source Area/Hot Spot treatment area.

- Biodegradation is occurring at the downgradient Biocurtain system and cVOCs are below the Site RGs south (downgradient) of the Santa Clara Bridge. However, due to a release from a separate off-site source to the east of the NRAP Site, PCE and TCE persist above the Site Remedial Goals (RGs) at the east side of the Biocurtain. The New Mexico Environment Department (NMED) has designated the groundwater contamination source to be the Calle Chavez Plume. Abatement actions are being conducted on the Calle Chavez Plume under the direct oversight of NMED. It is considered a separate plume not associated with the NRAP Superfund Site.

- In general, both PCE and TCE concentrations in groundwater samples collected from the intermediate wells have continued to decrease as of November 2022.

- In the Deep Zone, wells R-35 (D1) and R-35 (D2) were installed upgradient of R-29A (D1) and R-29 (D2U) in November 2022. From June 2021 to November 2022, the overall cVOC mass has changed with a decrease in PCE and an increase in TCE, DCE, and VC in the deep zone monitoring wells located approximately 40 feet of the injection wells. Results from the November 2022 sampling event continue to indicate that the highest cVOC concentrations in the deep aquifer occur around the R-29A (D1) and R-30 (D2U). Compared to the June 2021 analytical results, PCE concentrations have decreased in most samples collected from D2 zone. However, PCE increased from 44 µg/L to 120 µg/L in R-30 (D2U).

- Dissolved metals are monitored for comparison to EPA SDWA and NMWQCC standards. Sampling results within and down gradient of the treatment systems indicate an increase in both dissolved iron and manganese associated with the reduced (anaerobic) conditions created as the result of the ERD treatment process.

- Biogenic gas monitoring data indicates that observed wells after groundwater treatment events pose potential toxic or physical risks to workers when affected wells are uncapped. The site geology and well caps appear to be effective in preventing risks to the public from biogenic gases, and risks to workers are expected to attenuate over time as treatment amendments are consumed. In the meantime, precautions such as securing wells to avoid disturbance by the public and screening for gases before work activities should continue.

- All indoor air samples were below the PCE Vapor Intrusion Screening Level (VISL) for commercial use at the former El Centro Family Health Center Annex building and the former Norge Town Dry Cleaner building. PCE was below the VISL for residential use at the Las Cumbres Community Services building. TCE, cDCE, and VC were not detected in the indoor air samples.

- PCE was below the target sub-slab soil vapor for residential use at the Las Cumbres Community Services building. TCE had an estimated concentration but is below the target sub-slab soil vapor for residential use. The results of the March 2022 indoor air and sub-slab soil vapor sampling confirmed that PCE and TCE are not intruding into the building above residential VISLs. cDCE and VC were not detected.

Based on these findings, NMED recommends the following:

- Shallow Zone. Expand the treatment area by installing and injecting amendments into the Directional Injection Enhancements wells and continue monitoring to determine the effectiveness of treatments in further reducing contaminant concentrations within these aquifer zones.

- Intermediate and Deep Zones. Conduct additional Enhanced Treatment Strategy (ETS) injections at targeted locations in the Intermediate and Deep Zones and continue monitoring to determine the effectiveness of treatments in further reducing contaminant concentrations within these aquifer zones. An additional monitoring well southwest of R-30 (D2U) is likely necessary to delineate the plume and to help investigate the increasing trend for PCE at R-30 (D2U).

- Continue the comparison study between the passive sampling system, HYDRASleeve™ and low-flow purge/sampling methods at selected wells. It is recommended to determine which monitoring wells should be sampled using HydraSleeve or low-flow purge/sampling methods based on deviated VOC results at recently treated injection wells.

- Workers should secure wells to avoid disturbance by the public and screen for gases before continuing work activities. The site geology and well caps appear to be effective in preventing risks to the public from biogenic gases, and risks to workers are expected to attenuate over time as treatment amendments are consumed.

- Maintain current annual groundwater sampling schedule and monitoring well network. Ongoing evaluation of the monitoring well network will be conducted to eliminate redundancy of data and determine if wells continue to supply useful data for evaluating remedial progress.

- Maintain current air sampling schedule and locations. Ongoing air sampling is recommend because it is used to determine human exposure to harmful chemicals from site COCs, and is important in assessing human health risk.

SMW-3D	2	29	24 - 29	5.25	HydraSleeve /low flow	yes		x	x	monitors source area remediation progress
SMW-4S	2	16.5	6.5 - 16.5	5	HydraSleeve	yes				monitors source area remediation progress
SMW-4D	2	25	20 - 25	4.5	HydraSleeve	yes				monitors source area remediation progress
SMW-5S		18	8-18	5.5						not sampled
SMW-5D	2	25.5	20.5 - 25.5	4.75	HydraSleeve	yes	x	x		monitors source area remediation progress
SMW-6S	2	17	7- 17	5						not sampled
SMW-6D	2	26	21 - 26	5	HydraSleeve	yes				monitors source area remediation progress

Well ID	Well Diameter (inches)	Total Depth (ft. BTOC)	Screen Interval	Est. Purge volume (gal)	Purge Method	Exceeds MCLs	Dissolved Metals	TOC and/or dissolved gases*	Biological parameters (DNA/qprc)*	Data quality objective
SMW-7D	2	26	21 - 26	5	HydraSleeve	yes				monitors source area remediation progress
SMW-8D	2	33	23 - 33	5	peristaltic	yes	x	x		monitors source area remediation progress
SMW-9D	2	32.4	22 - 32	5	Peristaltic	yes	x	x		monitors source area remediation progress
EWMW-4B	4	28.5	18 - 28.0	35	HydraSleeve	no				monitors remediation progress at Source Area - Historic rapid changes observed
R-28	4	33	8 - 33	50	HydraSleeve	no				monitors plume boundary downgradient of Source Area treatment
Shallow Aquifer - Hotspot										
EWMW-2	4	28.0	17.5 - 28.0	41	HydraSleeve	no	x			monitors side gradient plume expansion associated w/ Hotspot treatment - increasing metals concentrations
EWMW-3	4	21.96	11.5 - 22.0	32	HydraSleeve	no				monitors side gradient plume associated w/ Hotspot treatment- historic COC variability
Shallow Aquifer - between Hotspot & Biocurtain										
SMW-29D	2	35	30 - 35	-	HydraSleeve	yes	x		x	monitors treatment area in southeastern portion of Source Area
EX-09	2	13.7	5 - 13.0	3	HydraSleeve	no				shallow aquifer boundary definition well
EX-13	2	13.3	5 - 13.2	3	HydraSleeve	no	x			monitors remediation progress downgradient of Hotspot treatment area; significant increase in daughter products since remediation began; increasing metals observed
EX-16	lost well	17.96		6		no				monitors remediation progress downgradient of Hotspot treatment

Well ID	Well Diameter (inches)	Total Depth (ft. BTOC)	Screen Interval	Est. Purge volume (gal)	Purge Method	Exceeds MCLs	Dissolved Metals	TOC and/or dissolved gases*	Biological parameters (DNA/qprc)*	Data quality objective
										area; monitoring residual daughter products since remediation began
EX-17	lost well	11.67		2		no				
R-24(S2)	2	24.7	9.8 - 24.4	10	HydraSleeve	no	x			monitors remediation progress and metals downgradient of Hotspot treatment area - fluctuating VOC and increasing metals conc. observed
R-25(S2)	2	25.2	10 - 25	10	HydraSleeve/peristaltic	no	x			monitors remediation progress downgradient of Hotspot treatment area; monitoring residual daughter products since remediation began; increasing metals conc. observed
R-03(S2)	2	24.67	14.0 - 23.9	9	HydraSleeve	no				shallow aquifer boundary definition well
R-09(S1)	2	16.77		5	HydraSleeve	no				shallow aquifer boundary definition well
R-12(S1)	2	19.9	9 - 19	6	HydraSleeve	no				monitors central portion of shallow plume upgradient of Biocurtain
Shallow Aquifer - Biocurtain										
BC-6	2	28.4	9.0 - 29.0	12	HydraSleeve	no				monitors remediation progress within Biocurtain - recent increase in concentrations
BC-7S	2	17	7 - 17	5	HydraSleeve	no				upgradient of Biocurtain system
BC-7D	2	25.5	20.5 - 25. 5	4.75	HydraSleeve	no				upgradient of Biocurtain system
R-04(S2)	2	27.94	18.0 - 28.0	10	peristaltic	no	x			monitors remediation within Biocurtain treatment area
R-08(S2)	2	22.92	13.0 - 23.0	6	HydraSleeve	no				monitors side gradient impacts from Biocurtain treatment area
R-08A(S2)	1.5	43.2	32.5 - 42.5	12	HydraSleeve	no				assess contaminant extent and concentrations within the shallow

Well ID	Well Diameter (inches)	Total Depth (ft. BTOC)	Screen Interval	Est. Purge volume (gal)	Purge Method	Exceeds MCLs	Dissolved Metals	TOC and/or dissolved gases*	Biological parameters (DNA/qprc)*	Data quality objective
										Tesuque formation in the southern portion of the plume
R-26(S2)	2	40	15 - 40	16	HydraSleeve	no				monitors remediation at edge Biocurtain treatment area
R-27(S2)	2	39.3	20 - 35 (5' sump)	16	HydraSleeve	no				monitors remediation within Biocurtain treatment area
Shallow Aquifer - Downgradient of Biocurtain										
R-05(S2)	2	28.07	18.0 - 28.0	8	HydraSleeve	no	x			monitors remediation progress and plume migration downgradient of Biocurtain - recent increase in VC & metals
R-06(S1)	lost well	?	5.0 - 15.0			no				
R-06(S2)	2	25.0	15.0 - 25.0	3	HydraSleeve	no				monitors downgradient plume boundary
R-07(S2)	Lost well	23.43	14.0 - 24.0	8		no				shallow aquifer boundary definition well
R-14(S2)	2	25.0	15 - 25	9	HydraSleeve	no				monitors remediation progress and plume migration downgradient of Biocurtain
R-16(S2)	2	30	20-30	9	HydraSleeve	no				monitors plume boundary along Rio Grande for potential surface water impacts
RDP-1	2"	12.4	?	0.4	bailer	no				monitors plume migration downgradient of Biocurtain
RDP-2	2"	8.9	?	0.3	bailer	no				monitors plume downgradient of Biocurtain
RDP-3	1.25"	9.1	?	0.5	bailer	no				monitors plume boundary and potential surface water impacts along Rio Grande
RDP-4	lost well	10.1	?	0.5	bailer	no				monitors plume boundary and potential surface water impacts along Rio Grande

Well ID	Well Diameter (inches)	Total Depth (ft. BTOC)	Screen Interval	Est. Purge volume (gal)	Purge Method	Exceeds MCLs	Dissolved Metals	TOC and/or dissolved gases*	Biological parameters (DNA/qprc)*	Data quality objective
Intermediate Zone Aquifer Wells										
EWMW-1	4	59.0	48.5 – 59.0	108	HydraSleeve	no				monitors potential migration/impacts to intermediate zone below Source Area
EWMW-4A	4	58.0	47.5 - 57.5	56	HydraSleeve	no	x			monitors potential migration/impacts to intermediate zone below Source Area
R-03(I1)	2	85.12	70.0 - 85.0	21	HydraSleeve	no				intermediate aquifer boundary definition well
R-03(I2)	2	108	93.0 - 108.0	25	HydraSleeve	no				intermediate aquifer boundary definition well
R-04(I2)	2	95.0	80.0 - 95.0	23	HydraSleeve	no	x			monitors potential migration/impacts on intermediate zone from Biocurtain treatment
R-08(I2)	2	95.0	80.0 - 95.0	23	HydraSleeve/Monsoon	yes				monitors southern portion of intermediate plume
R-08A(I1)	2	60.3	50 - 60	15	HydraSleeve	yes				assess contaminant extent and concentrations within the shallow Tesuque formation in the southern portion of the plume
R-09(I1)	2	70.17	54.5 - 69.5	19		yes				Injection well as of 2021 – not sampled
R-09(I2)	2	103.15	90-100 (5' sump)	24		yes				Injection well as of 2021 – not sampled
R-10(I1)	2	88	73.0 - 88.0	22	HydraSleeve	no				intermediate aquifer boundary definition well

DM-2(D1)	3	184	155.5 - 185.5	-	HydraSleeve	DI-2(D1)	x	x	x	monitors deep zone remediation progress at nearby monitor well
DM-2(D2)	3	258	230 - 260	-	HydraSleeve	DI-2(D2)	x			monitors deep zone remediation progress at nearby monitor well
Private / Public Supply Wells										
SCTW-2	2				Tap	no				well no longer in use, dropped from sampling program
Cook Estate					Outside Tap	no				well used for irrigation - fluctuating PCE/TCE concentrations observed

-- Wells sampled annually by NMED

-- Wells also sampled by NMED's contractor for additional ERD performance monitoring parameters

-- Wells sampled on a triennial schedule (next scheduled to be sampled in 2024)

Legend

BOLD values indicate exceedance of MCL

1,2-cis DCE-1,2-cis Dichloroethene

1,2-trans DCE-1,2-trans Dichloroethene

PCE- Tetrachloroethene

TCE - Trichloroethene

VC - Vinyl Chloride

NA - Not analyzed

NR - Not reported

NS - Not Sampled

ND - Not detected above laboratory quantitation limits

E - Result exceeded calibration range

J - Estimated value

LJ - Estimated value - Reported concentration below contract required quantitation limit value

C - Result biased low

* Well resampled due to mislabeling of original samples

Wells IDs switched during sampling

Table 4 – Source Area, Hotspot, Biocurtain, and Deep Zone Groundwater Sampling Analytical Results

Table 4a - Source Area Groundwater Sampling Analytical Results

Source Area Sampling Results				Laboratory Data								Field Data				
					Volatiles					TOC	YSI Readings

Legend

NMWQCC – New Mexico Water Quality Control Commission Standard
MCL – USEPA Maximum Contaminant Level
NA – Not Analyzed
NS – Not Sampled

Fe - Iron

Mn - Manganese

As - Arsenic

U – Not detected above the specified laboratory quantitation/reporting limits
L – Reported concentration is between the method detection limit and the contract required quantitation limit
J – Estimated result below the CRQL or due to outlying quality control parameters

Job Notes

This report is issued solely for the use of the person or company to whom it is addressed. Any use, copying or disclosure other than by the intended recipient is unauthorized. If you have received this report in error, please notify the sender and destroy this report immediately. This report shall not be reproduced except in full, without prior express written approval by the laboratory.

The data in the report relate to the field sample(s) as received by the laboratory and associated QC. All results have been reviewed and have been found to be compliant with laboratory and accreditation requirements, with the exception of the noted deviation(s). For questions, please contact the Project Manager.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
550-193084-1

Revision
This report was revised on 12/1/2022 to reprocess the VOC data under method 8260B_PREC. This final report replaces the report that was generated on 11/25/2022 at 5:20 PM.

Comments
No additional comments.

Receipt
The samples were received on 11/3/2022 10:00 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.6º C.

GC/MS VOA
Method 8260B: The continuing calibration verification (CCVIS) associated with batch 288515 recovered below project specific control limit for 1,2,4-Trichlorobenzene, but fell within laboratory control limits. The LCS/LCSD and MS/MSD had acceptable recoveries. The samples associated with this CCV were non-detects for the affected analyses; therefore, the data have been reported with flags.

DM-1_D2_11-2022 (550-193084-4), DM-2_D2_11-2022 (550-193084-5), R-12_D1_11-2022 (550-193084-6), R-27_I1_11-2022 (550-193084-7), R-12_S1_11-2022 (550-193084-8), DM-1_D1_11-2022 (550-193084-9), DM-2_I1_11-2022 (550-193084-10), R-29A_D1_11-2022 (550-193084-11), R-929A_D1_11-2022 (550-193084-12), TB-01_11-2022 (550-193084-13) and (CCVIS 550-288515/2)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Batch Notes	
Batch Comment	Prepped/loaded by DSJ

Basis	Basis Description
T	Total/NA

The pound sign (#) in the amount added field denotes that the reagent was used undiluted. All calculations are performed using the stated concentration for this reagent.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	False	Check done at department level as required.

Job Notes

This report is issued solely for the use of the person or company to whom it is addressed. Any use, copying or disclosure other than by the intended recipient is unauthorized. If you have received this report in error, please notify the sender and destroy this report immediately. This report shall not be reproduced except in full, without prior express written approval by the laboratory.

The data in the report relate to the field sample(s) as received by the laboratory and associated QC. All results have been reviewed and have been found to be compliant with laboratory and accreditation requirements, with the exception of the noted deviation(s). For questions, please contact the Project Manager.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
550-193178-1

Revision
This report was revised on 12/1/2022 to reprocess the VOC data under method 8260B_PREC. This final report replaces the report that was generated on 11/25/2022 at 5:37PM.

Comments
No additional comments.

Receipt
The samples were received on 11/4/2022 10:15 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 1.6º C.

GC/MS VOA
Method 8260B: The continuing calibration verification (CCV) associated with batch 550-288554 recovered above the upper control limit for Iodomethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: EWMW-4A_11-2022 (550-193178-1), SMW-6D_11-2022 (550-193178-2), R-04-S2_11-2022 (550-193178-3), SMW-4S_11-2022 (550-193178-4), R-08A_I1_11-2022 (550-193178-5), R-925_11-2022 (550-193178-6), R-08_D1-11-2022 (550-193178-7), TB_03_11-2022 (550-193178-8), EB-01_11-2022 (550-193178-9) and (CCVIS 550-288554/2).

Method 8260B: The continuing calibration verification (CCVIS) associated with batch 288554 recovered below project specific control limit for Bromoform, but fell within laboratory control limits. The LCS/LCSD and MS/MSD had acceptable recoveries. The samples associated with this CCV were non-detects for the affected analyses; therefore, the data have been reported.

EWMW-4A_11-2022 (550-193178-1), SMW-6D_11-2022 (550-193178-2), R-04-S2_11-2022 (550-193178-3), SMW-4S_11-2022 (550-193178-4), R-08A_I1_11-2022 (550-193178-5), R-925_11-2022 (550-193178-6), R-08_D1-11-2022 (550-193178-7), TB_03_11-2022 (550-193178-8), EB-01_11-2022 (550-193178-9) and (CCVIS 550-288554/2)

Method 8260B: The following sample(s) was collected in a properly preserved vial; however, the pH was outside the required criteria when verified by the laboratory. The sample was analyzed outside the 7-day holding time specified for unpreserved samples but within the 14-day holding time specified for preserved samples: SMW-6D_11-2022 (550-193178-2).

Method 8260B: The continuing calibration verification (CCVIS) associated with batch 288595 recovered below project specific control limit for Bromoform, but fell within laboratory control limits. The LCS/LCSD and MS/MSD had acceptable recoveries. The samples associated with this CCV were non-detects for the affected analyses; therefore, the data have been reported.

R-08_I2-11-2022 (550-193178-10), R-20_11-2022 (550-193178-11), M-20-11-2022 (550-193178-12) and (CCVIS 550-288595/2)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	False	Check done at department level as required.

Job Notes

This report is issued solely for the use of the person or company to whom it is addressed. Any use, copying or disclosure other than by the intended recipient is unauthorized. If you have received this report in error, please notify the sender and destroy this report immediately. This report shall not be reproduced except in full, without prior express written approval by the laboratory.

The data in the report relate to the field sample(s) as received by the laboratory and associated QC. All results have been reviewed and have been found to be compliant with laboratory and accreditation requirements, with the exception of the noted deviation(s). For questions, please contact the Project Manager.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

Definitions/Glossary

Client: New Mexico Environment Department
Job ID: 550-193180-1
Project/Site: NRAP

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
550-193180-1

Revision
This report was revised on 12/1/2022 to reprocess the VOC data under method 8260B_PREC. This final report replaces the report that was generated on 11/25/2022 at 5:43 PM.

Comments
No additional comments.

Receipt
The samples were received on 11/4/2022 10:15 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 1.1º C.

GC/MS VOA
Method 8260B: The continuing calibration verification (CCV) associated with batch 550-288554 recovered above the upper control limit for Iodomethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: R-04_I2_11-2022 (550-193180-1), TB-02_11-2022 (550-193180-4), R-33_I2_11-2022 (550-193180-9), R-33_I1_11-2022 (550-193180-10) and (CCVIS 550-288554/2).

Method 8260B: The continuing calibration verification (CCVIS) associated with batch 288554 recovered below project specific control limit for Bromoform, but fell within laboratory control limits. The LCS/LCSD and MS/MSD had acceptable recoveries. The samples associated with this CCV were non-detects for the affected analyses; therefore, the data have been reported.

R-04_I2_11-2022 (550-193180-1), TB-02_11-2022 (550-193180-4), R-33_I2_11-2022 (550-193180-9), R-33_I1_11-2022 (550-193180-10) and (CCVIS 550-288554/2)

Method 8260B: The continuing calibration verification (CCVIS) associated with batch 288595 recovered below project specific control limit for Bromoform, but fell within laboratory control limits. The LCS/LCSD and MS/MSD had acceptable recoveries. The samples associated with this CCV were non-detects for the affected analyses; therefore, the data have been reported.

Preservation Used: 1= Ice, 2= HCl; 3= H2SO4; 4=HNO3; 5=NaOH; 6= Other

Possible Hazard Identification:
Are any samples from a listed EPA Hazardous Waste? Please List any EPA Waste Codes for the sample in the Comments Section if the lab is to dispose of the sample.

☐ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)

☐ Return to Client ☑ Disposal by Lab ☐ Archive for_____ Months

Special Instructions/QC Requirements & Comments:

FED EX 1.1°C IR

Custody Seals Intact: ☐ Yes ☐ No	Custody Seal No.:	Cooler Temp. (°C): Obs'd:_____ Corr'd:_____	Therm ID No.:_____

Client: New Mexico Environment Department

Job Number: 550-193180-1

Login Number: 193180
List Number: 1
Creator: Maycock, Lisa

List Source: Eurofins Phoenix

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	False	Check done at department level as required.

Job Notes

This report is issued solely for the use of the person or company to whom it is addressed. Any use, copying or disclosure other than by the intended recipient is unauthorized. If you have received this report in error, please notify the sender and destroy this report immediately. This report shall not be reproduced except in full, without prior express written approval by the laboratory.

The data in the report relate to the field sample(s) as received by the laboratory and associated QC. All results have been reviewed and have been found to be compliant with laboratory and accreditation requirements, with the exception of the noted deviation(s). For questions, please contact the Project Manager.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southwest, LLC Project Manager.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
D	Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples.
E	Result exceeded calibration range.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
550-193293-1

Revision
This report was revised on 11/30/2022 to reprocess the VOC data under method 8260B_PREC. This final report replaces the report that was generated on 11/25/2022 at 5:48 PM.

Comments
No additional comments.

Receipt
The samples were received on 11/8/2022 10:10 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 1.4º C.

Receipt Exceptions
The container label for the following sample did not match the information listed on the Chain-of-Custody (COC): EB-04_11-2022 (550-193293-1). The container labels list EB-03_11-2022, while the COC lists EB-04_11-2022. The client was contacted, and the lab was instructed to log the sample in as EB-04_11-2022.

GC/MS VOA
Method 8260B: The continuing calibration verification (CCV) associated with batch 550-288554 recovered above the upper control limit for Iodomethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: TB-04_11-2022 (550-193293-11) and (CCVIS 550-288554/2).

Method 8260B: The continuing calibration verification (CCVIS) associated with batch 288554 recovered below project specific control limit for Bromoform, but fell within laboratory control limits. The LCS/LCSD and MS/MSD had acceptable recoveries. The samples associated with this CCV were non-detects for the affected analyses; therefore, the data have been reported.

TB-04_11-2022 (550-193293-11) and (CCVIS 550-288554/2)

Method 8260B: The continuing calibration verification (CCVIS) associated with batch 550-288639 recovered above the upper control limit for Vinyl chloride. The samples associated with this CCVIS were non-detects for the affected analyte; therefore, the data have been reported.

Method 8260B: The laboratory control sample (LCS) for analytical batch 550-288639 recovered outside control limits for the following analyte: Vinyl chloride. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Method 8260B: The continuing calibration verification (CCVIS) associated with batch 288639 recovered below project specific control limit for Bromoform, but fell within laboratory control limits. The LCS/LCSD and MS/MSD had acceptable recoveries. The samples associated with this CCV were non-detects for the affected analyses; therefore, the data have been reported.
R-34_D2_11-2022 (550-193293-2), R-934_D2_11-2022 (550-193293-3), R-23_11-2022 (550-193293-4), R-34_I1_11-2022 (550-193293-5) and (CCVIS 550-288639/2)

Method 8260B: The laboratory control sample duplicate (LCSD) for 550-288833 recovered outside control limits for the following analytes: Bromomethane and Vinyl chloride. These analytes were biased high in the LCSD and were not detected in the associated samples; therefore, the data have been reported.

Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for 550-288833 were outside control limits for 2-Butanone (MEK) and Trichloroethene. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8260B: The laboratory control sample duplicate (LCSD) associated with analytical batch 550-288833 was outside acceptance criteria for high: Vinyl chloride . The continuing calibration verification (CCVIS) and the laboratory control sample (LCS) in the batch were within acceptance limits and may be used to evaluate matrix performance. The sample will be flagged with L3 qualifier.

Method 8260B: The surrogate recovered outside project specific limits, high in the continuing calibration verification (CCV). The samples recovery for surrogates is within historical limits; therefore data have been reported.

(CCVIS 550-288949/3)

Method 8260B: Reanalysis of the following sample was performed outside of the analytical holding time due to cis-1,2-Dichloroethene requiring a dilution: SMW-93D_11-2022 (550-193293-6).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.
