**List each reduction device and all sources they serve, e.g. FL-1: Oil tanks 1-4, loading, VRU downtime. FL-2: compressor and sales downtime. For NOIs, indicate the enforceability behind each device or clarify if it is voluntary and no credit is being claimed for the reduction, e.g., FL-1: Oil tanks 1-8 (OOOOa). FL-1: Loading (voluntary, no emissions reduction credit claimed.)**

Catalyst: ENG-1, ENG-2
Flare-1: Tank-1 thru Tank-3, Load, Dehy-1, VRU downtime
VRU: Dehy-1

## *Table 2-D: Maximum Emissions* (under normal operating conditions)

**This Table was intentionally left blank because it would be identical to Table 2-E.**

Maximum Emissions are the emissions at maximum capacity and prior to (in the absence of) pollution control, emission-reducing process equipment, or any other emission reduction. Calculate the hourly emissions using the worst case hourly emissions for each pollutant. For each pollutant, calculate the annual emissions as if the facility were operating at maximum plant capacity without pollution controls for 8760 hours per year, unless otherwise approved by the Department. List Hazardous Air Pollutants (HAP) & Toxic Air Pollutants (TAPs) in Table 2-I. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41).

## Table 2-E: Requested Allowable Emissions

Unit & stack numbering must be consistent throughout the application package. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41). Facility totals are a summation of all the emissions entered for equipment in this table plus total tpy SSM emissions from Table 2F.
**GCP-O&G:** Combustion emissions from malfunction events are not allowed under this permit.

**NOI:** Malfunction emissions are not allowed under a Notice of Intent.

## Table 2-F: Startup, Shutdown, and Routine Maintenance (SSM) Emissions

☐ **This table is intentionally left blank as all SSM emissions at this facility do not require an increase in Requested Allowables greater than those listed in Table 2-E.**

All applications for facilities that have emissions during routine our predictable startup, shutdown or scheduled maintenance (SSM)2, including NOI applications, must include in this table the Maximum Emissions during routine or predictable startup, shutdown and scheduled maintenance (20.2.7 NMAC, 20.2.72.203.A.3 NMAC, 20.2.73.200.D.2 NMAC). Provide emissions calculations for all SSM emissions reported in this table. Refer to the guidance "Startup, Shutdown, Maintenance Emissions in Permits" (www.env.nm.gov/air-quality/permitting-section-procedures-and-guidance/) for more detailed instructions. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41).

## Table 2-I: Stack Exit and Fugitive Emission Rates for HAPs and TAPs

☐ **By marking this table as intentionally left blank, you certify that the Total and individual HAPs for this facility are less than 1 ton per year.**

Data may not be provided for subject items (SIs) that are not complete. Please edit the SI in Table 2-A before providing information here.

**GCPs:** Report the potential emission rate for each HAP from each HAP emitting emission unit listed in Table 2A. For each emission unit, HAPs shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41). Emissions less than 0.0001 lb/hr or 0.0001 tpy and emission units that do not emit HAPs shall be omitted from the table. Each facility-wide Individual HAP total and the facility-wide Total HAPs is the sum of all HAP sources entered in the Table. Use the HAP nomenclature as it appears in Section 112 (b) of the 1990 CAA. Include tank-flashing emission estimates of HAP in this table.

**NOIs:** Report the individual and/or Total HAPs for each piece of equipment in Table 2A, only if the facility total for that pollutant is greater than or equal to 1 tpy.

| Edit | Unit No. | Total HAPs | | Acrolein HAP | | Acetaldehyde; (Ethyl aldehyde) HAP | | Formaldehyde HAP | | Benzene HAP | | Toluene; (Methyl benzene) HAP | | Ethylbenzene HAP | | Xylenes (total); (Xylol) HAP | | Hexane HAP | | | | | | | | | | Complete |

# GCP-Oil and Gas AQB ePermitting Portal Registration Form
# Section 1- (ePermitting Portal submittals)

**Portal submittals - delete all pages before this page.**
**Hardcopy submittals may delete this page.**

☒ I understand that I must submit the hard copy check with the required Payment Form for all AQB ePermitting Portal submittals. The 30-day review period will not begin until the check is received. (Does not apply if you are converting from a GCP-1 or GCP-4.) Form available: www.env.nm.gov/air-quality/aqb-epermitting-portal/

☒ I will upload this form to submit via the Portal. I understand that certain pages may be deleted by following instructions on this form, to avoid repeating information I entered directly into the Portal or uploaded separately.

☒ Attach only the electronic copy of the permit with the Department response, do not mail a paper copy. (If box is not checked, a paper copy of the permit will be sent with your response letter.)

**Facility Name or Facility Type Change for Modifications**
Fill out this section if requesting a change to the facility name or facility type that appears in the ePermitting Portal. These items cannot be updated through the Portal and will be corrected as part of the review of your permit. Check the appropriate box(es) and provide complete information in the table.

☒ **Not applicable**

☐ 1. Changing facility name. (Punctuation and special characters not allowed. Use “No123” instead of #123)

☐ 2. Changing facility type.

| | | | |
|---|---|---|---|
| **1a** | **Current Facility Nam** | **1b** | **New Facility Name:** |
| **2a** | **Current Facility Type:**<br>☐ Production Site<br>☐ Tank Battery<br>☐ Compressor Station<br>☐ Natural Gas Plant<br>☐ Reinjection facility<br>☐ Well head<br>☐ Misc Oil and Gas<br>☐ Amine Plant<br>☐ Energy Support Facility<br>☐ Other, please specify:_____ | **2b** | **New Facility Type:**<br>☐ Production Site<br>☐ Tank Battery<br>☐ Compressor Station<br>☐ Natural Gas Plant<br>☐ Reinjection facility<br>☐ Well head<br>☐ Misc Oil and Gas<br>☐ Amine Plant<br>☐ Energy Support Facility |

# Section 2- (ePermitting Portal submittals)

**Hardcopy submittals - delete this page as this table is in the required excel portion of the hardcopy forms.**

## Table 2-B: Exempted Equipment (20.2.72 NMAC)

All 20.2.72 NMAC applications must list Exempted Equipment in this table. If equipment listed on this table is exempt under 20.2.72.202.B.5, include emissions calculations and emissions totals for 202.B.5 "similar functions" units, operations, and activities in Section 5, Calculations. Unit & stack numbering must be consistent throughout the application package.

| Unit Number | Source Description | Manufacturer | Model No / Serial No | Max Capacity / Capacity Units | List Specific 20.2.72.202 NMAC Exemption (e.g. 20.2.72.202.B.5) | Date of Manufacture /Reconstruction1 / Date of Installation /Construction | For Each Piece of Equipment, Check One | |

# Section 3
## Registration Summary

**Hardcopy and Portal Submittals – complete this section**

**Registration Summary:** EOG Resources, Inc. (EOG) is submitting this application pursuant to 20.2.72.200.A NMAC for the changes to Boa Localized Gas Lift Station. This revision is to remove two Cat 3608 engines and add one Cat 3606. Everything else remains the same as currently permitted. This facility has been public noticed.

**Written description of the routine operations of the facility:** This facility will be localized gas lift station that compresses and dehydrates natural gas, which will later be injected into oil wells to stimulate oil production. The inlet gas stream will be separated into two phases (liquid and gas) as it passes through a slug catcher. The water and hydrocarbon liquids are sent to a 3-phase heated (HTR-1) separator where condensate and produced water are separated from gaseous hydrocarbons.

The condensate and produced water are sent to their respective storage tanks (TK-1 thru TK-3). Flash gas and working and breathing emissions from the tanks are routed to the flare (FL-1). Loading emissions (LOAD) from condensate and produced water tanks are routed to the flare (FL-1).

The gas from the 3-phase heated separator is sent to the VRU where it is compressed and routed back to the slug catcher as a recycle stream. In the event of VRU downtime, these gaseous emissions from the heated separator are routed to the flare.

The flare (FL-1) is a dual-tip flare with a high-pressure tip, a low-pressure tip, and one pilot. The low-pressure flare gas stream includes emission streams from the dehydration unit BTEX condenser, the tanks, and loading. The high-pressure tip controls emissions during the heated separator VRU downtime or emergencies.

The gas from the slug catcher is sent to the engines (ENG-1 thru ENG-5) for compression, and the compressed gas is then sent to a filter separator where gas is separated from the liquids. These liquids are routed back as a recycle stream to the initial stream entering the slug catcher. The gas from the filter separator (dehydrator inlet separator) is routed to the glycol contactor.

The TEG dehydrator (DEHY) removes water from the gas stream entering the glycol contactor. Dehydrated gas passes through a heat exchanger and is sent to oil wells and is used for fuel. Once lean TEG absorbs the water from the gas stream, it leaves as a rich stream from the bottom of the contactor which is then sent to a flash tank where the gaseous hydrocarbons are used for fuel. The TEG is then sent to the glycol regenerator (and associated reboiler RBL-1) where the TEG is reconcentrated by removal of the water. The water vapor is sent to a BTEX condenser and subsequent water knockout vessel. The BTEX vapors are routed to the flare (FL-1) and the separated water is routed to the produced water tank. The lean TEG leaving the regenerator passes through a heat exchanger where it is cooled and then recycled and reintroduced to the glycol contactor where the dehydration process begins again.

**Routine or predictable emissions during Startup, Shutdown and Maintenance (SSM):** Provide an overview of how SSM emissions are accounted for including a description of SSM activities routed to reduction device and check the applicable box(es).

☐ No SSM emissions are expected from routine operations.

☒ Applicant requests up to 10 tpy of VOC SSM emissions.

☐ No other activities (e.g. VRU downtime, stranded gas etc.) are considered SSM activities.

☐ Applicant requests site specific VOC SSM and those emission calculations are included in Section 5 and entered in Table 2F

Provide an overview:

☒ Applicant requests site specific combustion SSM and those emission calculations are included in Section 5 and entered in Table 2F.

Provide an overview: VRU downtime is requested. During VRU downtime, emissions are routed to FL-1.

**Malfunction Emissions (M):** Provide an overview of how malfunction emissions are accounted for in this Registration. The permit does not authorize combustion emissions for malfunctions. The permit does not authorize emissions from SSM and Malfunction to be combined as 10 TPY VOC. However, they may be permitted separately. In the allowable emissions table in Section 2, these two events are separate line items and must be kept separate.

Overview: EOG is requesting 10 tpy VOC emissions for malfunctions.

☐ No Malfunction emissions are requested for this permit.

**Allowable Operations:** Check the appropriate box below:

☒ Facility operates continuously (8760 hours per year)

☒ The following regulated equipment will operate less than 8760 hours per year. Add additional rows as necessary. These units are subject to Condition A108.C of the Permit.

**Table A – Equipment Operating Less Than 8760 hours per year**

☐ **Table is blank because I completed this information in the ePermitting Portal for each piece of equipment.**

| Unit # | Requested Annual Operating Hours |
|---|---|
| GEN-1 | 500 |
| | |
| | |

**Verification of Compliance with Stack Parameter Requirements:**

www.env.nm.gov/air-quality/air-quality-oil-and-gas-gcp-application-forms/

**Portal Submittals:** Applications submitted via the ePermitting Portal are required to use the Oil and Gas Stack Calculator.
**Hardcopy submittals** may voluntarily use the stack calculator.

Click "Print" in the stack calculator and attach the generated PDF results. If the stack calculator was completed and results attached, complete the information in this box and then go to Section 4. You may delete the items below this box until Section 4.

Check the box for each type of equipment at this facility & represented in the attached stack calculator results:
☒ Engine(s)
☐ Turbine(s)
☒ Flares(s)
☐ Enclosed Combustion Device (s)
☒ Heater(s)
☒ Reboiler(s)

☒ I attached the results from the current version of the Oil and Gas Stack Calculator from the AQB web page and the results indicate compliance with the stack parameters for all of my engines, turbines, flares, enclosed combustion devices, heaters or reboilers.

1. Does the flare gas contain 6% $H_2S$ or less by volume (pre-combustion)?

☒ Yes (done with section 3)
☐ No.

2. Explain in detail how assist gas will be added to reduce the gas composition to 6%$H_2S$ or less by volume:

# Section 5

## Emissions Calculation Forms

---

**Hardcopy and Portal Submittals – complete this section**

The Department has developed the Air Emissions Calculation Tool (AECT), which is required to be used in the GCP-Oil and Gas Registration. If the AECT, for a piece of equipment is under development, provide alternate calculations. The AECT must be submitted as a "live" interactive PDF. **Do not include alternative calculations unless there is an issue being resolved with the AECT. This will delay review of the application.** The AECT and this Registration Form may be updated as needed.

**Tank Emissions Calculations**: Provide the method used to estimate tank-flashing emissions, the input and output summary from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis. If Pro-Max or Hysis is used, all relevant input parameters shall be reported, including separator pressure, gas throughput, and all other relevant parameters necessary for flashing calculation. **The inputs must match the gas analyses information submitted. Inputs that don't match may be grounds for denial of the application submittal.**

**SSM Calculations**: In this Section, provide emissions calculations for Startup, Shutdown, and Routine Maintenance (SSM) emissions listed in the Table 2, and the rationale for why the others are reported as zero (or left blank).

**Control Devices:** Report all control devices and list each pollutant controlled by the control device. Indicate in this section if you chose to not take credit for the reduction in emission rates. Only uncontrolled emission rates can be considered to determine applicability unless the state or federal acts require the control. This information is necessary to determine if federally enforceable conditions are necessary for the control device, and if the control device produces its own regulated pollutants or increases emission rates of other pollutants.

**Calculation Details:** The AECT is required for all emission calculations. If the AECT is not functioning, alternative calculations may be submitted only for the portions of the AECT with issues being resolved. Utilize this section to explain in detail, on an equipment-by-equipment basis, why alternative calculations are necessary.

**Explain here:** Tanks, loading, dehydrator, and flare emissions were all calculated using a ProMax simulation. The AECT does not incorporate parameters that can be represented in ProMax. Engine emissions were calculated using Excel. The AECT has not been used to calculate emissions from the above-mentioned sources.

---

**Equipment Forms Submitted in this Section (add additional rows as necessary):**

| Equipment Type | Quantity | Check Box to Indicate Units that are Controlled | Enter Control Device Type and Pollutant Controlled |
|---|---|---|---|
| **Engine** | **5** | ☒ | *Catalyst (CO, VOC, HCHO)* |
| **Turbine** | | ☐ | |
| **Tanks** | **3** | ☒ | *FL-1 (VOC, HAP, H2S)* |
| **Generator** | **1** | ☐ | |
| **VRU** | **1** | ☒ | *FL-1 (downtime) (VOC, HAP, H2S)* |
| **VRT** | | ☐ | |
| **ULPS** | | ☐ | |
| **Glycol Dehydrator** | **1** | ☒ | *FL-1 (VOC, HAP, H2S)* |
| **Flare** | **1** | ☐ | *Tanks, Truck Loading, VRU, Dehydrator* |
| **Amine Unit** | | ☐ | |

| | | | |
|---|---|---|---|
| **Cryogenic Unit** | | ☐ | |
| **Fugitive Emissions** | **1** | ☐ | |
| **Heater** | **1** | ☐ | |
| **Truck Loading** | **1** | ☒ | *FL-1 (VOC, HAP, H2S)* |
| **Enclosed Combustion Device (ECD)** | | ☐ | *List all streams controlled by the ECD* |
| **Thermal Oxidizer (TO)** | | ☐ | *List all streams controlled by the TO* |
| **Reboiler** | **1** | ☐ | |
| **Other** | | ☐ | |

**For each scenario below, if there are more than one emissions unit, control device, or gas combustion scenario. Please copy and paste each applicable section and label the unit number(s) if the scenarios vary.**

**Vapor Recovery Tower, Ultra Low-Pressure Separator, or Flash Tower Located Upstream of Storage Vessels:** If the facility contains one of the following units located upstream of the storage vessels and is used to flash and capture flashing emissions, check the appropriate box.
Unit number: N/A
☐ Vapor Recovery Tower and VRU Compressor
☐ ULPS and VRU Compressor
☐ Flash Tower and VRU Compressor

**Vapor Recovery Unit (VRU) located upstream of Storage Vessels:** Check the box below if the facility is using a VRU to capture flashing emissions prior to any storage vessels to limit the PTE of the storage vessels to below applicability thresholds of NSPS OOOO or NSPS OOOOa. A process vs control determination should be prepared for this type of VRU application.
Unit number: N/A
☐ VRU capturing emissions prior to any storage vessel and routing directly to the sales pipeline

**Vapor Recovery Unit (VRU) attached to Storage Vessels:** Check the box below if this facility is using a VRU to reduce storage vessel emissions to limit the PTE to below NSPS OOOO or NSPS OOOOa applicability thresholds:
Unit number: FL-1
☐ VRU controlling Storage Vessel emissions and the facility is subject to the requirements under NSPS OOOO, 40 CFR 60.5411
☒ VRU controlling Storage Vessel emissions and the facility is subject to the requirements under NSPS OOOOa, 40 CFR 60.5411a

**Gas Combustion Scenarios:** Read through the scenarios below and check the boxes next to any appropriate facility operating scenarios. Flares shall assume a destruction efficiency of 95%, unless the facility is subject to requirements for flares under 40 CFR 60.18, or a higher destruction efficiency (up to 98%) is supported by a manufacturer specification sheet (MSS) for that unit. If so, include the MSS.

A flare, vapor combustion unit (VCU), enclosed combustion device (ECD), thermal oxidizer (TO):
Unit number: FL-1
☐ Controls storage vessels in accordance with 40 CFR 60, Subpart OOOO or OOOOa or OOOOb.
☒ Provides a federally enforceable control for the storage vessels to limit the PTE to below applicability thresholds of 40 CFR 60, Subpart OOOO or OOOOa or OOOOb.
☒ Controls the glycol dehydrator
☐ Controls the amine unit
☒ Controls truck loading
☐ Operates only during maintenance events, such as VRU downtime, check one below:
- ☐ The emissions during VRU downtime are represented as uncontrolled VOC emissions from the compressor
- ☒ The combustion emissions during VRU downtime are represented as controlled emissions from the combustion device

☐ Controls the facility during plant turnaround

**Amine Unit:** Provide the following information for each amine unit.

| | |
|---|---|
| Design Capacity in MMscf/day | |
| Rich Amine Flowrate in gal/min | |
| Lean Amine Flowrate in gal/min | |
| Mole Loading $H_2S$ | |
| Sour Gas Input in MMscf/day | |

**Glycol Dehydration Unit(s):** Provide the following information for each glycol dehydration unit:
Please include an extended gas analysis in Section 6 of this application.

| Unit # | Glycol Pump Circulation Rate |
|---|---|
| DEHY | 16 gpm |

**Voluntary Monitoring in Accordance with §40 CFR 60.5416(a):** Check the box(s) to implement a program that meets the requirements of 40 CFR 60.5416(a). This monitoring program will be conducted in lieu of the monitoring requirements established in the GCP-Oil and Gas for individual equipment. Ceasing to implement this alternative monitoring must be reported in an updated Registration Form to the Department.

☐ Condition A205.B Control Device Options, Requirements, and Inspections for Tanks
☐ Condition A206.B Truck Loading Control Device Inspection
☐ Condition A206.C Vapor Balancing During Truck Loading
☐ Condition A209.A Vapor Recovery Unit or Department-approved Equivalent
☐ Condition A210.B Amine Unit Control Device Inspection

**Fugitive $H_2S$ Screening Threshold and Monitoring in accordance with Condition A212:** Check the box that applies.

☒ Condition A212.A does not apply because the facility is below the fugitive $H_2S$ screening threshold in Condition A212, or

☐ Condition A212.A applies. Because the facility is above the fugitive $H_2S$ screening threshold in Condition A212, or the facility is voluntarily complying with Condition A212.A, and Condition A212.A applies

# Section 6

## Information Used to Determine Emissions

---

**Hardcopy and Portal Submittals – complete this section**

Check the box for each type of information submitted. This documentation is required, if applicable to the facility.

**Failure to include applicable supporting documentation may result in application denial.**

☒ Specifications for control equipment, including control efficiency specifications and sufficient engineering data for verification of control equipment operation, including design drawings, test reports, and design parameters that affect normal operation.

☒ Engine or Generator Manufacturer specifications

☒ Catalyst Manufacturer specifications (If a catalyst is being utilized to reduce emissions, the catalyst manufacturer emission factors must be used in all emission calculations. A 25% safety factor may be applied to each pollutant.

☐ NSPS JJJJ emission factors **may not** be utilized in lieu of catalyst manufacture specifications when a catalyst is installed, and the catalysts manufacturer achieves higher control efficiency.

☒ Flare Manufacturer specifications

☐ Oil/Liquid Analysis: This data is required to match the inputs in all applicable emission calculations. For facilities that have not been constructed and a representative analysis is used it cannot be older than 1 year. For existing facilities, the gas analyses required by Condition A201.A (must be 1 year old or less).

☒ Gas Analysis (four years old). This data is required to match the inputs in all applicable emission calculations.

☒ Extended Gas Analysis (four years old) This data is required to match the inputs in all applicable emission calculations.

☐ If requesting to use a representative gas sample, include a discussion of why the sample is representative for this facility and an explanation of how it is representative (e.g., same reservoir, same similar API gravity, similar composition).

☐ If test data are used, to support emissions calculations or to establish allowable emission limits, include a copy of the complete test report. If the test data are for an emissions unit other than the one being permitted, the emission units must be identical. Test data may not be used if any difference in operating conditions of the unit being permitted and the unit represented in the test report significantly effect emission rates.

☐ Fuel specifications sheet.

☒ If computer models are used to estimate emissions, include an input summary and a detailed report, and a disk containing the input file used to run the model.

☒ For tank-flashing emissions, include a discussion of the method used to estimate tank-flashing emissions, accuracy of the model, the **input and output** summary from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis.

---

**Representative Gas Analysis Justification:** The representative analysis is from a site that processes gas from the same producing reservoir/formation as the actual site stream; the gas being handled at the representative site and the actual site have very similar components and properties; and the representative analysis is taken from a site that processes the stream in a similar manner as the actual site.

# Section 8A

## Applicable State & Federal Regulations

---

**Hardcopy and Portal Submittals – complete this section**

**Provide a discussion demonstrating compliance with each applicable state & federal regulation**. All input cells should be filled in, even if the response is 'No' or 'N/A'.

In the "Justification" column, identify the criteria that are critical to the applicability determination, numbering each. For each unit listed in the "Applies to Unit No(s)" column, after each listed unit, include the lowest level citation of the applicable regulation. For each unit, list the information necessary to verify the applicability of the regulation, including date of manufacture, date of construction, size (hp), and combustion type. Doing so will provide the applicability criteria for each unit.

---

### Applicable State Regulations:

| State Regulation Citation | Title | Federally Enforceable | Overview of Regulation | Unit(s) or Facility | Applies? (Yes or No) | **Justification:** Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 $m^3$, 3. VOL) |
|---|---|---|---|---|---|---|
| 20.2.1 NMAC | General Provisions | Yes | General Provisions apply to Notice of Intent, Construction, and Title V permit applications. | Facility | Yes | EOG Resources, Inc. (EOG) will comply with the applicable requirements for the entire facility. |
| 20.2.3 NMAC | Ambient Air Quality Standards NMAAQS | Yes | 20.2.3 NMAC is a State Implementation Plan (SIP) approved regulation that limits the maximum allowable concentration of Sulfur Compounds, Carbon Monoxide, and Nitrogen Dioxide. | Facility | Yes | NAAQS is applicable. Per NMED guidance, documentation of compliance with GCP requirements constitutes documentation of compliance with NAAQS. |
| 20.2.7 NMAC | Excess Emissions | Yes | If your entire facility or individual pieces of equipment are subject to emissions limits in a permit or numerical emissions standards in a federal or state regulation, this applies. | Facility | Yes | EOG will comply with the applicable requirements for the entire facility. |
| 20.2.38 NMAC | Hydrocarbon Storage Facility | No | Use the regulation link then cut & paste applicable sections.<br>20.2.38 NMAC does **not** establish practically enforceable limits that can be used for PTE or PER calculations. | TK-1 thru TK-2 | Yes | EOG will comply with the applicable requirements by controlling the tanks with a VRU or a flare as stated in the application. |
| 20.2.50 NMAC | Oil and Gas Sector – Ozone Precursor Pollutants | No | This regulation establishes emission standards for volatile organic compounds (VOC) and oxides of nitrogen ($NO_x$) for oil and gas production, processing, compression, and transmission sources. | Check the box for the subparts that are applicable:<br>☒ 113 – Engines and Turbines<br>☐ 114 – Compressor Seals<br>☐ 115 – Control Devices and Closed Vent Systems<br>☒ 116 – Equipment Leaks and Fugitive Emissions<br>☐ 117 – Natural Gas Well Liquid Unloading<br>☒ 118 – Glycol Dehydrators<br>☐ 119 – Heaters<br>☒ 120 – Hydrocarbon Liquid Transfers<br>☐ 121 – Pig Launching and Receiving<br>☐ 122 – Pneumatic Controllers and Pumps | | 113-EOG will comply with applicable requirements.<br>114-Not Applicable.<br>115- Not Applicable.<br>116-EOG will comply with applicable requirements.<br>117-No Applicable.<br>118- EOG will comply with applicable requirements.<br>119-Not Applicable.<br>120- EOG will comply with applicable requirements.<br>121-Not Applicable.<br>122-Not Applicable.<br>123- Not Applicable. |

| State Regulation Citation | Title | Federally Enforceable | Overview of Regulation | Unit(s) or Facility | Applies? (Yes or No) | Justification: Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 $m^3$, 3. VOL) |
|---|---|---|---|---|---|---|
| | | | ☐ 123 – Storage Vessels<br>☐ 124 – Well Workovers<br>☐ 125 – Small Business Facilities<br>☐ 126 – Produced Water Management Unit<br>☐ 127 – Flowback Vessels and Preproduction Operations | | | 124-Not Applicable.<br>125-Not Applicable.<br>126-Not Applicable.<br>127-Not applicable. |
| 20.2.61.109 NMAC | Smoke & Visible Emissions | No | Engines and heaters are Stationary Combustion Equipment. Specify units subject to this regulation. | ENG-1 thru ENG-5, Heater-1, Reboiler-1, Flare-1 | Yes | EOG does not expect visible emissions from the gas fired heater or flare to equal or exceed 20% opacity. |
| 20.2.73 NMAC | NOI & Emissions Inventory Require-ments | Yes | NOI: 20.2.73.200 NMAC applies to all facilities emitting over 10 TPY of any regulated air contaminate. Thus, permitted facilities are also subject to this rule. This GCP-O&G registration also serves the purpose of meeting 20.2.73 NMAC notification requirements.<br><br>Emissions Inventory: 20.2.73.300. NMAC applies to facilities registering under the GCP. | *Facility* | *Yes – applies to all GCP-O&G registrants .* | *Under 20.2.73.300.B(4) NMAC, NMED will periodically request emissions inventory reporting from minor source (expected each third year starting in 2020.)*<br><br>*Under 20.2.73.300.B(1) NMAC, if fugitives result in PTE >100 tpy VOC, annual reporting is required.* |
| 20.2.77 NMAC | New Source Performanc e | Yes | This is a stationary source which is subject to the requirements of 40 CFR Part 60, as amended on the date of certification. | FUG, ENG-1 thru ENG-5 | Yes | EOG will comply with any applicable requirements in NSPS OOOOa for fugitive components and the compressors, and Subpart JJJJ for the engines.<br>The tanks are not an affected facility under NSPS OOOOa because controlled emissions are less than 6 tpy VOC, which is a federally enforceable limit. |
| 20.2.78 NMAC | Emission Standards for HAPS | Yes | This facility emits hazardous air pollutants which are subject to the requirements of 40 CFR Part 61, as amended on the date of certification. | N/A | No | Does not apply. There are no applicable NESHAP standards. |
| 20.2.82 NMAC | MACT Standards for source categories of HAPS | Yes | This regulation applies to all sources emitting hazardous air pollutants, which are subject to the requirements of 40 CFR Part 63, as amended on the date of certification. | ENG-1 thru ENG-5, DEHY | Yes | This facility has sources that are subject to 40 CFR 63. |

**Applicable Federal Regulations (This is not an exhaustive list; add applicable regulations such as NSPS GG and KKKK):**

| Federal Regulation Citation | Title | Overview of Regulation | Units(s) or Facility | Applies? (Yes or No) | **Justification:** Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 m3, 3. VOL) |
|---|---|---|---|---|---|
| 40 CFR 50 | National Primary and Secondary Ambient Air Quality Standards (NAAQS) | Applicable requirement per GCP-O&G Condition A103. Any national ambient air quality standard. | Facility | Yes | NAAQS is applicable. Per NMED guidance, documentation of compliance with GCP-Oil and Gas requirements constitutes documentation of compliance with NAAQS. |
| 40 CFR 60, Subpart A | General Provisions | Applies if any other NSPS subpart applies. | FUG, ENG-1 thru ENG-5 | Yes | EOG Resources, Inc. will comply with applicable requirements in NSPS OOOOa and JJJJ. |
| 40 CFR 60, Subpart OOOO | Standards of Performance for Crude Oil and Natural Gas Production, Transmission and Distribution for which Construction, Modification or Reconstruction Commenced After August 23, 2011, and on or before September 18, 2015 | If there is a standard or other requirement, then the facility is an "affected facility." Currently there are standards for: gas wells (60.5375); centrifugal compressors (60.5380); reciprocating compressors (60.5385): controllers (60.5390); storage vessels (60.5395); equipment leaks (60.5400); sweetening units (60.5405).<br><br>**If standards apply, list the unit number(s) and regulatory citation of the standard that applies to that unit (e.g. Centrifugal Compressors 1a-3a are subject to the standards at 60.5380(a)(1) and (2) since we use a control device to reduce emissions)** | N/A | No | Facility was constructed after September 18, 2015. It does not apply. |
| 40 CFR 60, Subpart OOOOa | Standards of Performance for Crude Oil and Natural Gas Facilities for which Construction, Modification or Reconstruction Commenced After September 18, 2015 | If there is a standard or other requirement, then the facility is an "affected facility." Currently there are standards for: gas wells (60.5375a); centrifugal compressors (60.5380a); reciprocating compressors (60.5385a): controllers (60.5390a); storage vessels (60.5395a); fugitive emissions at well sites and compressor stations (60.5397a); equipment leaks at gas plants (60.5400a); sweetening units (60.5405a). | FUG | Yes | EOG will comply with any applicable requirements in NSPS OOOOa for fugitive components.<br>The tanks are not an affected facility under NSPS OOOOa because controlled emissions are less than 6 tpy VOC, which is a federally enforceable limit. |
| 40 CFR 60, Subpart OOOOb | Standard of Performance for Crude Oil and Natural Gas Facilities for which Construction, Modification or Reconstruction Commenced After December 6, 2022 | If there is a standard or other requirement, then the facility is an "affected facility." Currently there are standards for: gas wells (60.5375b); centrifugal compressors (60.5380b); reciprocating compressors (60.5385b): controllers (60.5390b); storage vessels (60.5395b); fugitive emissions at well sites and compressor stations (60.5397b); equipment leaks at gas plants (60.5400b); sweetening units (60.5405b). | N/A | No | The modification does not trigger OOOOb. The addition of one compressor and removal of two compressors does not increase horsepower. |
| 40 CFR 60, Subpart IIII | Standards of performance for Stationary Compression Ignition | See 40 CFR 60.4200(a) 1 through 4 to determine applicable category and state engine size, fuel type, and date of manufacture. | N/A | No | Does not apply. |

| Federal Regulation Citation | Title | Overview of Regulation | Units(s) or Facility | Applies? (Yes or No) | **Justification:** Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 m3, 3. VOL) |
|---|---|---|---|---|---|
| | Internal Combustion Engines | | | | |
| 40 CFR 60, Subpart JJJJ | Standards of Performance for Stationary Spark Ignition Internal Combustion Engines | See 40 CFR 60.4230(a), 1 through 5 to determine applicable category and state engine size, fuel type, and date of manufacture. | ENG-1 thru ENG-5 | Yes | EOG will comply with applicable requirements under Subpart JJJJ for the engines. |
| 40 CFR 63, Subpart A | General Provisions | Applies if any other subpart applies. | ENG-1 thru ENG-5, DEHY | Yes | EOG will comply with the applicable requirements under Subparts ZZZZ and HH. |
| 40 CFR 63, Subpart HH | NESHAP for Glycol Dehydrators | See 40 CFR 63, Subpart HH | DEHY | Yes | This site is an area source of HAPs. Subpart HH applies to the dehydrator. However, because its Benzene emissions are less than 0.90 Mg/yr, the unit is exempt from multiple requirements. Records will be kept demonstrating that exemption criteria are met. |
| 40 CFR 63, Subpart ZZZZ | NESHAP for Stationary Reciprocating Internal Combustion Engines (**RICE MACT**) | Facilities are subject to this subpart if they own or operate a stationary RICE, except if the stationary RICE is being tested at a stationary RICE test cell/stand. | ENG-1 thru ENG-5 | Yes | EOG will comply with the applicable requirements under Subpart ZZZZ by complying with NSPS Subpart JJJJ. |

# Section 8B
# Compliance Test History and Disclosure Form

---

**Hardcopy and Portal Submittals – complete this section**

To evaluate the requirement for compliance tests, you must submit a compliance test history. The table below provides an example.

---

No compliance history to report.

Please note that EOG has an agreement with NMED that the attached letter can be submitted in lieu of the Compliance History Disclosure Form.

EOG Resources, Inc.
P.O. Box 2267
Midland, TX 79702

November 8, 2022

New Mexico Environment Department
Air Quality Bureau
525 Camino de los Marquez, Suite 1
Santa Fe, New Mexico 87505-1816

Dear Air Quality Bureau:

Per discussions with Secretary Kenney and other Department personnel, we are working with the Environment Department to prepare an entity-wide filing that will satisfy the requirements of the Compliance History Disclosure Form. Please do not hesitate to contact me at Doug_Lowrie@eogresources.com if you have any questions.

Sincerely,

Doug Lowrie

# Air Permit Application
# Compliance History Disclosure Form

Pursuant to Subsection 74-2-7(S) of the New Mexico Air Quality Control Act ("AQCA"), NMSA §§ 74-2-1 to -17, the New Mexico Environment Department ("Department") may deny any permit application or revoke any permit issued pursuant to the AQCA if, within ten years immediately preceding the date of submission of the permit application, the applicant met any one of the criteria outlined below. In order for the Department to deem an air permit application administratively complete or issue an air permit for those permits without an administrative completeness determination process, the applicant must complete this Compliance History Disclosure Form as specified in Subsection 74-2-7(P). An existing permit holder (permit issued prior to June 18, 2021) shall provide this Compliance History Disclosure Form to the Department upon request.

| **Permittee/Applicant Company Name** | | **Expected Application Submittal Date** |
|---|---|---|
| | | |
| **Permittee/Company Contact** | **Phone** | **Email** |
| | | |

| | **Within the 10 years preceding the expected date of submittal of the application, has the permittee or applicant:** | |
|---|---|---|
| 1 | Knowingly misrepresented a material fact in an application for a permit? | ☐ Yes ☐ No |
| 2 | Refused to disclose information required by the provisions of the New Mexico Air Quality Control Act? | ☐ Yes ☐ No |
| 3 | Been convicted of a felony related to environmental crime in any court of any state or the United States? | ☐ Yes ☐ No |
| 4 | Been convicted of a crime defined by state or federal statute as involving or being in restraint of trade, price fixing, bribery, or fraud in any court of any state or the United States? | ☐ Yes ☐ No |
| 5a | Constructed or operated any facility for which a permit was sought, including the current facility, without the required air quality permit(s) under 20.2.70 NMAC, 20.2.72 NMAC, 20.2.74 NMAC, 20.2.79 NMAC, or 20.2.84 NMAC? | ☐ Yes ☐ No |
| 5b | If "No" to question 5a, go to question 6.<br>If "Yes" to question 5a, state whether each facility that was constructed or operated without the required air quality permit met at least one of the following exceptions:<br><br>a. The unpermitted facility was discovered after acquisition during a timely environmental audit that was authorized by the Department; or<br><br>b. The operator of the facility estimated that the facility's emissions would not require an air permit, **and** the operator applied for an air permit within 30 calendar days of discovering that an air permit was required for the facility. | ☐ Yes ☐ No |
| 6 | Had any permit revoked or permanently suspended for cause under the environmental laws of any state or the United States? | ☐ Yes ☐ No |
| 7 | For each "yes" answer, please provide an explanation and documentation. | |

# Affidavit of Publication

STATE OF NEW MEXICO
COUNTY OF LEA

I, Daniel Russell, Publisher of the Hobbs News-Sun, a newspaper published at Hobbs, New Mexico, solemnly swear that the clipping attached hereto was published in the regular and entire issue of said newspaper, and not a supplement thereof for a period of 1 issue(s).

Beginning with the issue dated
July 25, 2025
and ending with the issue dated
July 25, 2025.

Publisher

Sworn and subscribed to before me this
25th day of July 2025.

Business Manager

My commission expires
January 29, 2027

(Seal) STATE OF NEW MEXICO
NOTARY PUBLIC
GUSSIE RUTH BLACK
COMMISSION # 1087526
COMMISSION EXPIRES 01/29/2027

This newspaper is duly qualified to publish legal notices or advertisements within the meaning of Section 3, Chapter 167, Laws of 1937 and payment of fees for said publication has been made.

**LEGAL NOTICE**
**July 25, 2025**

**NOTICE**

**EOG Resources, Inc.** announces its intent to apply to the New Mexico Environment Department for an air quality General Construction Permit, **GCP-Oil and Gas**. The expected date of the submittal of our registration form to the Air Quality Bureau is **August 25, 2025**. This notice is a requirement according to New Mexico air quality regulations.

The exact and approximate location of the facility will be:

**Boa Localized Gas Lift Station** – (32.190928°,-103.604355°) – 24.9 miles northwest of Jal in Lea County.
**Jefe BSJ Federal Com 1H** – (32.080565°, -103.695036°) – 23.8 miles southeast of Malaga in Lea County.

The standard operating schedule of this facility will be continuous.

Air emissions of any regulated air contaminant will be less than or equal to:

| | Tons per year (TPY) |
|---|---|
| 1. Nitrogen Oxides ($NO_x$) | 95 |
| 2. Carbon Monoxide (CO) | 95 |
| 3. Volatile Organic Compounds (VOC) (stack) | 95 |
| 4. Particulate Matter (PM10) | 25 |
| 5. Particulate Matter (PM2.5) | 25 |
| 6. Sulfur Dioxide ($SO_2$) | 95 |
| 7. Hydrogen Sulfide (H2S) | 25 |
| 8. Any one (1) Hazardous Air Pollutant (HAP) | <10 |
| 9. Sum of all Hazardous Air Pollutants (HAPs) | <25 |

The owner and/or operator of the facilities is:
**EOG Resources, Inc.**
**5509 Champions Drive**
**Midland, TX 79706**

If you have any questions or comments about construction or operation of above facility, and want your comments to be made as a part of the permit review process, you must submit your comments in writing to the address below:

New Mexico Environment Department
Air Quality Bureau Permit Section
525 Camino de los Marquez, Suite 1, Santa Fe, New Mexico, 87505
Phone (505) 476-4300

Other comments and questions may be submitted verbally.

**Please refer to the company name and site name in this notice or send a copy of this notice with your comments, since the Department may not have received the permit Registration at the time of this notice.**

**Atención**
Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono 505-629-3395.

**Notice of Non-Discrimination**
NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@env.nm.gov. You may also visit our website at www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

# APPENDIX P. RED HILLS UA4

# Universal Application 4

## Air Dispersion Modeling Report

Refer to and complete Section 16 of the Universal Application form (UA3) to assist your determination as to whether modeling is required. If, after filling out Section 16, you are still unsure if modeling is required, e-mail the completed Section 16 to the AQB Modeling Manager for assistance in making this determination. If modeling is required, a modeling protocol would be submitted and approved prior to an application submittal. The protocol should be emailed to the modeling manager. A protocol is recommended but optional for minor sources and is required for new PSD sources or PSD major modifications. Fill out and submit this portion of the Universal Application form (UA4), the "Air Dispersion Modeling Report", only if air dispersion modeling is required for this application submittal. This serves as your modeling report submittal and should contain all the information needed to describe the modeling. No other modeling report or modeling protocol should be submitted with this permit application.

### 16-A: Identification

| | | |
|---|---|---|
| 1 | Name of facility: | Red Hills Gas Processing Plant |
| 2 | Name of company: | Targa Northern Delaware, LLC |
| 3 | Current Permit number: | 4310M6R3 |
| 4 | Name of applicant's modeler: | John Ke (Class II), Jon Hill (Class II), Steve Ochs (Class I), Jeremias Szust (Class I) |
| 5 | Phone number of modeler: | (651) 275-9900 ext. 2406, (919) 462-9693, 480-262-9918, 786-252-8216 |
| 6 | E-mail of modeler: | JKe@trinityconsultants.com, JHill@trinityconsultants.com, SOchs@trinityconsultants.com, JSzust@trinityconsultants.com |

### 16-B: Brief

| | | | |
|---|---|---|---|
| 1 | Was a modeling protocol submitted and approved? A modeling protocol was submitted to NMED and FLMs on April 10, 2025. Modeling protocol approval was received on 01/27/2026. | Yes☒ | No☐ |
| 2 | Why is the modeling being done? PSD Significant Modification | Other (describe below) | |
| 3 | Describe the permit changes relevant to the modeling. | | |
| | This application is being submitted as a PSD Major Modification pursuant to 20.2.74.300.D NMAC. All sources at the site are being included as "new sources" in the PSD analysis. With regard to changes from the current permit, Targa is seeking to update calculation methodologies, representations, emission limits, and throughput capacities. Please refer to Section 3 of the application for details. | | |
| 4 | What geodetic datum was used in the modeling? | WGS84 | |
| 5 | How long will the facility be at this location? | More than 1 year. | |

| | | | |
|---|---|---|---|
| 6 | Is the facility a major source with respect to Prevention of Significant Deterioration (PSD)? | Yes☒ | No☐ |
| 7 | Identify the Air Quality Control Region (AQCR) in which the facility is located | 155 | |
| 8 | List the PSD baseline dates for this region (minor or major, as appropriate). | | |
| | NO2 | 3/16/1988 | |
| | SO2 | 7/28/1978 | |
| | PM10 | 2/20/1979 | |
| | PM2.5 | 11/13/2013 | |
| 9 | Provide the name and distance to Class I areas within 50 km of the facility (300 km for PSD permits). | | |
| | Carlsbad Caverns: 79.80 km<br>Guadalupe Mountains National Park: 116.00 km<br>Salt Creek Wilderness: 170.60 km<br>White Mountain Wilderness: 275 km<br>Big Bend National Park: 279.75 km | | |
| 10 | Is the facility located in a non-attainment area? If so describe below | Yes☐ | No☒ |
| | N/A | | |
| 11 | Describe any special modeling requirements, such as streamline permit requirements. | | |
| | CALPUFF was used to model deposition, visibility, regional haze, and to evaluate the Class I increment standards as all Class I areas are outside of AERMOD's 50km modeling range. Please see attached modeling report for details. | | |

## 16-C: Modeling History of Facility

Describe the modeling history of the facility, including the air permit numbers, the pollutants modeled, the National Ambient Air Quality Standards (NAAQS), New Mexico AAQS (NMAAQS), and PSD increments modeled. (Do not include modeling waivers).

1

| Pollutant | Latest permit and modification number that modeled the pollutant facility-wide. | Date of Permit | Comments |
|---|---|---|---|
| CO | 4310M5 | 12/30/2019 | SIL analysis was completed for 4310M6. |
| $NO_2$ | 4310M5 | 12/30/2019 | SIL analysis was completed for 4310M6. |
| $SO_2$ | 4310M5 | 12/30/2019 | SIL analysis was completed for 4310M6. |
| $H_2S$ | 4310M5 | 12/30/2019 | SIL analysis was completed for 4310M6. |
| PM2.5 | 4310M5 | 12/30/2019 | SIL analysis was completed for 4310M6. |
| PM10 | 4310M5 | 12/30/2019 | SIL analysis was completed for 4310M6. |
| Lead | N/A | N/A | |
| Ozone (PSD only) | N/A | N/A | |
| NM Toxic Air Pollutants (20.2.72.402 NMAC) | N/A | N/A | |

## 16-D: Modeling performed for this application

| | | | | | | |
|---|---|---|---|---|---|---|
| 1 | For each pollutant, indicate the modeling performed and submitted with this application.<br>Choose the most complicated modeling applicable for that pollutant, i.e., culpability analysis assumes ROI and cumulative analysis were also performed. | | | | | |
| | Pollutant | ROI | Cumulative analysis | Culpability analysis | Waiver approved | Pollutant not emitted or not changed. |
| | CO | ☐ | ☒ | ☐ | ☐ | ☐ |
| | $NO_2$ | ☐ | ☒ | ☐ | ☐ | ☐ |
| | $SO_2$ | ☐ | ☒ | ☐ | ☐ | ☐ |
| | $H_2S$ | ☐ | ☐ | ☒ | ☐ | ☐ |
| | PM2.5 | ☐ | ☐ | ☒ | ☐ | ☐ |
| | PM10 | ☐ | ☐ | ☒ | ☐ | ☐ |
| | Lead | ☐ | ☐ | ☐ | ☐ | ☒ |
| | Ozone | ☐ | ☐ | ☐ | ☐ | ☒ |
| | State air toxic(s) (20.2.72.402 NMAC) | ☐ | ☐ | ☐ | ☐ | ☒ |

## 16-E: New Mexico toxic air pollutants modeling

| | |
|---|---|
| 1 | List any New Mexico toxic air pollutants (NMTAPs) from Tables A and B in 20.2.72.502 NMAC that are modeled for this application.<br>N/A – The facility is not subject to toxic air pollutant modeling. See Section 20 of the application for the facility's screening analysis. |

2 List any NMTAPs that are emitted but not modeled because stack height correction factor. Add additional rows to the table below, if required.

| Pollutant | Emission Rate (pounds/hour) | Emission Rate Screening Level (pounds/hour) | Stack Height (meters) | Correction Factor | Emission Rate/ Correction Factor |
|---|---|---|---|---|---|
| | | | | | |
| | | | | | |

## 16-F: Modeling options

| | | | |
|---|---|---|---|
| 1 | Was the latest version of AERMOD used with regulatory default options? If not explain below. | Yes☒ | No☐ |
| | In addition to AERMOD, CALPUFF was used to model AQRVs and evaluate Class I PSD increment. | | |

## 16-G: Surrounding source modeling

| | | |
|---|---|---|
| 1 | Date of surrounding source retrieval | 01/26/2024 |

2 If the surrounding source inventory provided by the Air Quality Bureau was believed to be inaccurate, describe how the sources modeled differ from the inventory provided. If changes to the surrounding source inventory were made, use the table below to describe them. Add rows as needed.

| AQB Source ID | Description of Corrections |
|---|---|
| 29590E20 | NO2: Point source is in the wrong location (~93 km from facility). Source was removed. |

| | | |
|---|---|---|
| | 29590E21 | NO2: Point source is in the wrong location (~93 km from facility). Source was removed. |
| | 1775@1 | NO2, PM2.5, PM10, SO2: Point source is in the wrong location (~69 km from facility). Source was removed. |
| | 30051E7 | NO2, PM2.5, PM10, SO2: Point source is in the wrong location (~43 km from facility). Source was removed. |
| | 30051E8 | NO2, PM2.5, PM10, SO2: Point source is in the wrong location (~43 km from facility). Source was removed. |
| | 38058E18 | NO2, PM2.5, PM10, SO2: Point source is in the wrong location (~77 km from facility). Source was removed. |
| | 38058E19 | NO2, PM2.5, PM10, SO2: Point source is in the wrong location (~77 km from facility). Source was removed. |
| | 40063@1 | PM2.5, PM10: See Section 4.10 of the modeling report. |
| | 38504A1 | PM2.5: See Section 4.10 of the modeling report. |
| | 38504E3 | |
| | 38504E5 | |
| | 38504E6 | |
| | 38504E7 | |
| | 38504E36 | |
| | 38504E27 | |
| | 40140A1 | PM2.5: See Section 4.10 of the modeling report. |
| | 39913A1 | PM2.5: See Section 4.10 of the modeling report. |
| | 39913E2 | |
| | 39913E4 | |
| | 39575R2 | H2S: See Section 4.10 of the modeling report. |
| | 39575R3 | |
| | 39956R2 | H2S: See Section 4.10 of the modeling report. |
| | 39956R3 | |
| | 39664R2 | H2S: See Section 4.10 of the modeling report. |
| | 39664R3 | |
| | | |

## 16-H: Building and structure downwash

| | | | | |
|---|---|---|---|---|
| 1 | How many buildings are present at the facility? | 28 | | |
| 2 | How many above ground storage tanks are present at the facility? | 40 | | |
| 3 | Was building downwash modeled for all buildings and tanks? If not explain why below. | | Yes☒ | No☐ |
| | | | | |
| 4 | Building comments | | | |

## 16-I: Receptors and modeled property boundary

| | | | |
|---|---|---|---|
| 1 | "Restricted Area" is an area to which public entry is effectively precluded. Effective barriers include continuous fencing, continuous walls, or other continuous barriers approved by the Department, such as rugged physical terrain with a steep grade that would require special equipment to traverse. If a large property is completely enclosed by fencing, a restricted area within the property may be identified with signage only. Public roads cannot be part of a Restricted Area. A Restricted Area is required in order to exclude receptors from the facility property. If the facility does not have a Restricted Area, then receptors shall be placed within the property boundaries of the facility.<br><br>Describe the fence or other physical barrier at the facility that defines the restricted area. | | |
| | The facility is enclosed by continuous fencing. | | |
| 2 | Receptors must be placed along publicly accessible roads in the restricted area.<br>Are there public roads passing through the restricted area? There are no publicly accessible roads passing through the restricted area, but there are accessible easements within the facility. Receptors were placed over these easement areas. | Yes☐ | No☒ |
| 3 | Are restricted area boundary coordinates included in the modeling files? | Yes☒ | No☐ |

4 Describe the receptor grids and their spacing. The table below may be used, adding rows as needed.

| Grid Type | Shape | Spacing | Start distance from restricted area or center of facility | End distance from restricted area or center of facility | Comments |
|---|---|---|---|---|---|
| Cartesian | Square | 25 m | N/A | N/A | 25-m resolution at the two onsite easements. |
| Variable Density | Square | 100 m | 0 m | 500 m from ambient air boundary | |
| Variable Density | Square | 500 m | 500 m from ambient air boundary | 5,000 m from ambient air boundary | |
| Variable Density | Square | 1,000 m | 5,000 m from ambient air boundary | 20,000 m from ambient air boundary | |
| Variable Density | Square | 2,000 m | 20,000 m from ambient air boundary | 50,000 m from ambient air boundary | |
| | | | | | |
| | | | | | |

| | |
|---|---|
| 5 | Describe receptor spacing along the fence line.<br>25-m resolution along the ambient air boundary. |
| 6 | Describe the PSD Class I area receptors.<br>Class I modeling was completed in CALPUFF. The CALPUFF analysis included gridded meteorological data, as compiled and published by Tim Allen at USFWS. A 12 km grid spacing was used, across the entire domain covering the project site and all affected Class I areas. The Class I area receptors, available from the NPS website were included for each affected area. |

## 16-J: Modeling Scenarios

| | |
|---|---|
| | Identify, define, and describe all modeling scenarios. Examples of modeling scenarios include using different production rates, times of day, times of year, simultaneous or alternate operation of old and new equipment during transition periods, etc. Alternative operating scenarios should correspond to all parts of the Universal Application and should be fully described in Section 15 of the Universal Application (UA3). |
| 1 | For units with alternative operating scenarios occurring at the same emission point, such as the flares at the facility, the maximum scenario will be used for the modeling demonstration. The alternative operating scenarios will be detailed in Section 15 of the application package submittal.<br><br>For alternative operating scenarios that occur at different emission points, all scenarios will be modeled in the significant impact analysis and the scenario that results in the most significant impact will be used to demonstrate compliance through a cumulative analysis.<br><br>The most significant alternative operating scenario revolves around the flares that operate on the acid gas trains. Three scenarios exist: RHA-FL-5100 operating independently, RA2-FL-25100 operating independently, and RHA-FL-5100 and RA2-FL-25100 operating simultaneously. Details regarding the limitation of these scenarios and their associated emission rates will be provided in detail in the application and modeling report submitted to the NMED. |
| 2 | Which scenario produces the highest concentrations? Why?<br>CO: Scenario 1<br><br>H2S: Scenario 3<br><br>NO2 Annual: Scenario 2<br>NO2 1-hr: Scenario 3<br><br>PM2.5 Annual: Equivalent Scenarios (no difference in PM emissions between scenarios)<br>PM2.5 24-hr: Equivalent Scenarios (no difference in PM emissions between scenarios)<br><br>PM10 Annual: Equivalent Scenarios (no difference in PM emissions between scenarios)<br>PM10 24-hr: Equivalent Scenarios (no difference in PM emissions between scenarios)<br><br>SO2 Annual: Scenario 2<br>SO2 24-hr: Scenario 3<br>SO2 3-hr: Scenario 2<br>SO2 1-hr: Scenario 2 |
| | For Class I SIL and AQRVs modeling, all three operating scenarios were modeled. |
| 3 | Were emission factor sets used to limit emission rates or hours of operation?<br>(This question pertains to the "SEASON", "MONTH", "HROFDY" and related factor sets, not to the factors used for calculating the maximum emission rate.) — Yes☐ — No☒ |
| 4 | If so, describe factors for each group of sources. List the sources in each group before the factor table for that group. (Modify or duplicate table as necessary. It's ok to put the table below section 16-K if it makes formatting easier.)<br>Sources: N/A |

5

| Hour of Day | Factor | Hour of Day | Factor | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|

| | 12 | | 24 | | | | | | | | | |
| | If hourly, variable emission rates were used that were not described above, describe them below. | | | | | | | | | | | |
| | | | | | | | | | | | | |

| | | | |
|---|---|---|---|
| 6 | Were different emission rates used for short-term and annual modeling? If so describe below. | Yes☒ | No☐ |
| | Steady state emission rates for all averaging periods were modeled using the maximum short-term emission rate allowed in the Red Hills permit application. Startup, shutdown, and maintenance (SSM) emission rates were modeled using point sources and scenarios separate from steady state impacts to demonstrate compliance with standards. Short-term emissions for limited-hour sources (e.g., backup power generator engines) will be modeled at the maximum short-term emission rate for deterministic standards (PM10, CO) and at annualized emission rates based on the EPA guidance for probabilistic standards (1-hour NO2, 1-hour SO2). Although PM2.5 is a probabilistic standard, short-term emissions for limited-hour sources will be modeled at the maximum short-term emission rate. | | |

## 16-K: $NO_2$ Modeling

| | | |
|---|---|---|
| 1 | Which types of $NO_2$ modeling were used?<br>Check all that apply. | |
| | ☒ | ARM2 |
| | ☐ | 100% $NO_X$ to $NO_2$ conversion |
| | ☐ | PVMRM |
| | ☐ | OLM |

| 2 | Describe the $NO_2$ modeling. | |
| | The ARM2 Methodology was used with the default maximum and minimum ambient ratios. | |

| | | | |
|---|---|---|---|
| 3 | Were default $NO_2/NO_X$ ratios (0.5 minimum, 0.9 maximum or equilibrium) used? If not describe and justify the ratios used below. | Yes☒ | No☐ |
| | N/A | | |
| 4 | Describe the design value used for each averaging period modeled. | | |
| | 1-hour: High eighth high<br>Annual One Year Annual Average: | | |

## 16-L: Ozone Analysis

| | |
|---|---|
| 1 | NMED has performed a generic analysis that demonstrates sources that are minor with respect to PSD do not cause or contribute to any violations of ozone NAAQS. The analysis follows.<br>The basis of the ozone SIL is documented in *Guidance on Significant Impact Levels for Ozone and Fine Particles in the Prevention of Significant Deterioration Permitting Program*, EPA, April 17, 2018 and associated documents. NMED accepts this SIL basis and incorporates it into this permit record by reference. Complete documentation of the ozone concentration analysis using MERPS is included in the New Mexico Air Quality Bureau Air Dispersion Modeling Guidelines. |
| 2 | The MERP values presented in Table 10 and Table 11 of the NM AQB Modeling Guidelines that produce the highest concentrations indicate that facilities emitting no more than 250 tons/year of $NO_X$ and no more than 250 tons/year of VOCs will cause less formation of $O_3$ than the $O_3$ significance level.<br>$$[O_3]_{8-hour} = \left( \frac{250 \frac{ton}{yr}}{340_{MERP_{NOX}}} + \frac{250 \frac{ton}{yr}}{4679_{MERP_{VOC}}} \right) \times 1.96\ \mu g/m^3$$<br>=1.546 µg/m³, which is below the significance level of 1.96 µg/m³.<br>Sources that produce ozone concentrations below the ozone SIL do not cause or contribute to air contaminant levels exceeding the ozone NAAQS. |

| | | | |
|---|---|---|---|
| 3 | Does the facility emit at least 250 tons per year of $NO_X$ or at least 250 tons per year of VOCs? Sources that emit at least 250 tons per year of $NO_X$ or at least 250 tons per year of VOCs are covered by the analysis above and require an individual analysis. | Yes☒ | No☐ |

5 For new PSD Major Sources or PSD major modifications, if MERPs were used to account for ozone fill out the information below. If another method was used describe below.

| $NO_X$ (ton/yr) | $MERP_{NOX}$ | VOCs (ton/yr) | $MERP_{VOC}$ | $[O_3]_{8\text{-hour}}$ |
|---|---|---|---|---|
| 179.3 | 417 | 916.6 | 15,669 | 0.96 |

The calculated ozone MERP value of 1.42 µg/m³ which is below the significance threshold of 1.96 µg/m³.

## 16-M: Particulate Matter Modeling

1 Select the pollutants for which plume depletion modeling was used.

| | |
|---|---|
| ☐ | PM2.5 |
| ☐ | PM10 |
| ☒ | None |

2 Describe the particle size distributions used. Include the source of information.

N/A

| | | | |
|---|---|---|---|
| 3 | Does the facility emit at least 40 tons per year of $NO_X$ or at least 40 tons per year of $SO_2$? Sources that emit at least 40 tons per year of $NO_X$ or at least 40 tons per year of $SO_2$ are considered to emit significant amounts of precursors and must account for secondary formation of PM2.5. | Yes☒ | No☐ |
| 4 | Was secondary PM modeled for PM2.5? | Yes☐ | No☒ |

5 If MERPs were used to account for secondary PM2.5 fill out the information below. If another method was used describe below.

| Pollutant | $NO_X$ | $SO_2$ | | $[PM2.5]_{24\text{-hour}}$ |
|---|---|---|---|---|
| $MERP_{annual}$ | 26780 | 25,929 | | 0.2706 |

| | | | | | |
|---|---|---|---|---|---|
| | $MERP_{24\text{-hour}}$ | 7331 | 2,170 | | $[PM2.5]_{annual}$ |
| | Emission rate (ton/yr) | 179.3 | 436.3 | | 0.0047 |
| | | | | | |

## 16-N: Setback Distances

| | |
|---|---|
| | Portable sources or sources that need flexibility in their site configuration requires that setback distances be determined between the emission sources and the restricted area boundary (e.g. fence line) for both the initial location and future locations. Describe the setback distances for the initial location. |
| 1 | Generators can be located anywhere throughout the plant. Preliminary modeling which modeled generators along the generator zone boundaries as identified in Figure 4-1 of the modeling protocol located generators a minimum of 40 feet from the restricted area boundary. Targa used preliminary modeling to identify the worst-case locations for these generators and in their current modeled location, the generators are a minimum of 40 feet from the restricted area boundary. See Section 4.4 of the attached modeling report for more details. |
| 2 | Describe the requested, modeled, setback distances for future locations, if this permit is for a portable stationary source. Include a haul road in the relocation modeling. |
| | The facility requests to be able to locate the generators within the areas identified as the generator location zones in the modeling protocol. The worst-case locations within these areas were modeled. |

## 16-O: PSD Increment and Source IDs

| | | | |
|---|---|---|---|
| | The unit numbers in the Tables 2-A, 2-B, 2-C, 2-E, 2-F, and 2-I should match the ones in the modeling files. Do these match? If not, provide a cross-reference table between unit numbers if they do not match below. | Yes☐ | No☒ |

| | | | |
|---|---|---|---|
| | The emission rates in the Tables 2-E and 2-F should match the ones in the modeling files. Do these match? If not, explain why below. | Yes☐ | No☒ |

2

**Sweet Gas Flares**

Short-term emissions modeled for sweet gas flares, which include the 1-hr, 8-hr, and 24-hr averaging periods, reflect the sum of process emissions and the worst-case startup, shutdown and maintenance (SSM) emissions. Pilot, purge, and dehydrator still vent emissions are included in process emissions, where appropriate, meaning that they were assumed to be emitted continuously over a 24-hour period. For 24-hour standards, process emissions were assumed to occur for the entire period, while worst-case SSM emissions were assumed to only occur for the duration of the worst-case SSM event, which is 12 hours. The worst case SSM event would expend all of its proposed annual tons per year (TPY) emissions limit within a 12-hour period at that rate; therefore, it is presumed that this approach is conservative.

Annual emissions for sweet gas flares only account for process emissions, which include pilot, purge, and dehydrator still vent emissions, where appropriate. Per NMED Modeling Guidance Section 4.1.6, SSM does not have to demonstrate compliance with the annual standards or annual increment consumption.[1]

The table below summarizes the hourly, daily, and annual $NO_x$ and $SO_2$ emission rates modeled for each sweet gas flare. Modeling for CO and $H_2S$ utilized the highest hourly emission rate.

**Table 0-1. Sweet Gas Flares Emission Rates**

| Model Unit ID | Permit Unit ID | Hourly Emission Rate (lb/hr) | | Daily Emission Rate[a] (lb/hr) | | Annual Emission Rate[b] (lb/hr) | |
|---|---|---|---|---|---|---|---|
| | | $NO_x$ | $SO_2$ | $NO_x$ | $SO_2$ | $NO_x$ | $SO_2$ |
| 1-EP-2 | RH1-FL-29-1003 | 211.68 | 2.56 | 106.12 | 1.35 | 0.56 | 0.15 |
| 2-EP-2a | RH2-FL-5100 | 563.35 | 5.00 | 281.86 | 2.50 | 0.37 | 0.0017 |
| 3-EP-2a | RH3-FL-5100 | 563.35 | 5.00 | 281.86 | 2.50 | 0.37 | 0.0017 |
| 4-EP-2a | RH4-FL-45100 | 648.31 | 5.75 | 324.08 | 2.88 | 0.37 | 0.0017 |
| 5-EP-2 | RH5-FL-55100 | 648.18 | 5.75 | 324.47 | 2.88 | 0.76 | 0.0035 |

a. Daily emission rates assume process emissions are emitted continuously over a 24-hour period, while worst-case SSM emissions are assumed to occur for the duration of the worst-case SSM event, which is 12 hours.
b. Annual emission rates only account for process emissions.

**Acid Gas Flares**

Flare model unit IDs 2.5-EP-5 and 5.5-EP-1b (permit unit IDs RHA-FL-5100 and RA2-FL-25100) combust SSM and gaseous emissions from various process equipment at the facility. These flares also handle acid gas emissions from RHA-AMINE and RA2-AMINE when AGI-1 and AGI-2 are offline. There are three (3) operating scenarios for these flares are summarized in Table 0-2 below. Each flare unit will have hourly emission limits (represented by the three operating scenarios) based on whether the flares are operating simultaneously or exclusively, as represented in Table 0-3 below.

[1] NMED Modeling Guidance (July 2024). Section 4.1.6 Startup, Shutdown, Maintenance (SSM), and Other Short-term Emissions

**Table 0-2. Acid Gas Flare Scenarios**

| Model Unit ID | Permit Unit ID | AOS 1 Processes | AOS 2 Processes | AOS 3 Processes |
|---|---|---|---|---|
| **2.5-EP-5** | RHA-FL-5100 | Pilot<br>Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge |
| **5.5-EP-1b** | RA2-FL-25100 | Pilot<br>Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge | Pilot<br>Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions |

**Table 0-3. AGI Flaring Scenarios Hourly Emission Rates**

| Model Unit ID | Permit Unit ID | Scenario | $NO_x$ (lb/hr) | CO (lb/hr) | $SO_2$ (lb/hr) | $H_2S$ (lb/hr) |
|---|---|---|---|---|---|---|
| **2.5-EP-5** | RHA-FL-5100 | AOS 1 | 16.83 | 144.32 | 128.29 | 1.39 |
| | | AOS 2 | 16.87 | 144.65 | 259.57 | 2.85 |
| | | AOS 3 | 0.071 | 0.61 | 1.02E-03 | 2.86E-06 |
| **5.5-EP-1b** | RA2-FL-25100 | AOS 1 | 16.92 | 145.07 | 127.13 | 1.38 |
| | | AOS 2 | 0.17 | 1.47 | 1.83E-03 | 6.88E-06 |
| | | AOS 3 | 21.15 | 181.30 | 258.17 | 2.80 |

In addition to the flaring scenarios represented above, each flare is also going to take a daily emission rate limit to more appropriately represent impacts over a 24-hour period. The proposed daily emission rate limits for these units, in lb/day, are presented in Table 0-4 below.

**Table 0-4. AGI Flaring Scenarios Daily Emission Rates**

| Model Unit ID | Permit Unit ID | Scenario | $NO_x$ (lb/day) | CO (lb/day) | $SO_2$ (lb/day) | $H_2S$ (lb/day) |
|---|---|---|---|---|---|---|
| **2.5-EP-5** | RHA-FL-5100 | AOS 1 | 269.31 | 2,309.06 | 2,052.62 | 22.25 |
| | | AOS 2 | 269.93 | 2,314.44 | 4,153.05 | 45.55 |

## 16-Q: Volume and Related Sources

| | | | |
|---|---|---|---|
| 1 | Were the dimensions of volume sources different from standard dimensions in the Air Quality Bureau (AQB) Modeling Guidelines? | Yes☒ | No☐ |
| | | | |
| 2 | Describe the determination of sigma-Y and sigma-Z for fugitive sources. | | |
| | COMB123: Represents emissions from Trains 1-3, 2.5, 5.5 Venting SSM, RH-FUG-1, RHA-FUG, and RA2-FUG. Lateral dimension based on the area covering all these sources; using this lateral dimension to calculate the sigma-y would result in receptors located within the volume source exclusion zone, so sigma-y is conservatively lowered so that no receptors are within the volume source exclusion zone. Sigma z based on height of fugitive sources.<br>COMB-456: Similar to COMB123, although the source represents emissions from Trains 4-6 Venting SSM and RH-FUG-2.<br>RRGBOO01 – RRGOO077, O1O2078 - O1O2122, O1123 – O2140, R1R2141 – R1R2223, R1223 – R1127, GRN228-GRN242, BLUE243-BLUE273: Haul road volume source parameters were determined in accordance with the NMED AQB Modeling Guideline instructions for haul road sources.<br>REC1: Uses NMED AQB Modeling Guidelines standard dimensions.<br>REC2: Uses NMED AQB Modeling Guidelines standard dimensions.<br>REC3: Uses NMED AQB Modeling Guidelines standard dimensions.<br>REC4: Uses NMED AQB Modeling Guidelines standard dimensions.<br>REC5: Uses NMED AQB Modeling Guidelines standard dimensions.<br>REC8: Uses NMED AQB Modeling Guidelines standard dimensions.<br>REC9: Uses NMED AQB Modeling Guidelines standard dimensions. | | |

| 3 | Describe how the volume sources are related to unit numbers.<br>Or say they are the same. |
| | COMB123: Includes unit numbers 1-EP-1t, 2-EP-1t, 3-EP-1t, 2.5-EP-1t, 5.5-EP-1t, FUG, and FUG-AGI<br>COMB-456: Includes unit numbers 4-EP-1t, 5-EP-1t, 6-EP-1t, and FUG-1<br>RRGBOO01 – RRGOO077: Includes the overlap of all truck hauling routes.<br>O1O2078 - O1O2122: Includes overlap of both orange routes.<br>O1123 – O2140 : Includes each orange route's individual segments.<br>R1R2141 – R1R2223: Includes overlap of both red routes.<br>R1223 – R1127: Includes red route segments.<br>GRN228-GRN242: Includes green route segments.<br>BLUE243-BLUE273: Includes blue route segments.<br>REC1: Unit is the same.<br>REC2: Unit is the same.<br>REC3: Unit is the same.<br>REC4: Unit is the same.<br>REC5: Unit is the same.<br>REC8: Unit is the same.<br>REC9: Unit is the same.<br>LAU1: Unit is the same.<br>LAU2: Unit is the same.<br>LAU3: Unit is the same.<br>LAU4: Unit is the same.<br>LAU5: Unit is the same.<br>LAU6: Unit is the same.<br>2LOAD: Unit is the same.<br>4LOAD: Unit is the same. |
| 4 | Describe any open pits. |
| | N/A – There are no open pits. |
| 5 | Describe emission units included in each open pit. |
| | N/A – There are no open pits. |

## 16-R: Background Concentrations

| | | | |
|---|---|---|---|
| 1 | Were NMED provided background concentrations used? Identify the background station used below. If non-NMED provided background concentrations were used describe the data that was used. | Yes☐ | No☒ |
| | CO: El Paso Chamizal (481410044) | | |
| | $NO_2$: Hobbs-Jefferson (350250008) | | |
| | PM2.5: Hobbs-Jefferson (350450019) | | |
| | PM10: Choose an item. | | |

| | | | |
|---|---|---|---|
| | $SO_2$: N/A | | |
| | Other: PM10 background monitor – Douglas Red Cross (04-003-1005) | | |
| | Comments: PM10 background used Douglas Red Cross (04-003-1005). Please refer to the preconstruction monitoring waiver for background concentration development for all applicable pollutants. | | |
| 2 | Were background concentrations refined to monthly or hourly values? If so describe below. | Yes☐ | No☒ |
| | N/A – No refined monthly or hourly values were used. | | |

## 16-S: Meteorological Data

| | | | |
|---|---|---|---|
| 1 | Was NMED provided meteorological data used? If so select the station used.<br><br>Hobbs | Yes☒ | No☐ |
| 2 | If NMED provided meteorological data was not used describe the data set(s) used below. Discuss how missing data were handled, how stability class was determined, and how the data were processed. | | |
| | N/A – NMED provided meteorological data was used. | | |

## 16-T: Terrain

| | | | |
|---|---|---|---|
| 1 | Was complex terrain used in the modeling? If not, describe why below. | Yes☒ | No☐ |
| | N/A | | |
| 2 | What was the source of the terrain data? | | |
| | Terrain was incorporated into the modeling analysis through the use of AERMAP with the most recent 1/3 degree NED data currently available from https://apps.nationalmap.gov/downloader/#/ | | |

## 16-U: Modeling Files

Describe the modeling files:

Significant Impact Models

- File name format “RHGP _Poll AvgPer_SIL.ami”
- “Poll” = NO2… nitrogen oxides; CO…carbon monoxide; PM10…particulate matter, PM10; PM2.5…particulate matter, PM2.5; SO2… sulfur dioxide
- “AvgPer” = averaging period. 1hr = 1 hour, etc. annual = annual
- “SIL” SIL designator
- Files may contain SIL for short-term, annual, and increment averaging periods.

NM/NAAQS and Increment Models

- File name format “RHGP _Poll AvgPer_Standard.ami”
- “Poll” = NO2… nitrogen oxides; CO…carbon monoxide; PM10…particulate matter, PM10; PM25…particulate matter, PM2.5; SO2… sulfur dioxide
- “AvgPer” = averaging period. 1hr = 1 hour, etc. annual = annual
- “Standard”= air quality standard. PSD = PSD Increment Class II, NAAQS = NAAQS

PSD Class II Models

- File name format “RHGP_Poll AvgPer_Standard_SIL.ami” or “RHGP _Poll AvgPer_Standard.ami”
- “Poll” = NO2… nitrogen oxides; CO…carbon monoxide; PM10…particulate matter, PM10; PM2.5…particulate matter, PM2.5; SO2… sulfur dioxide
- “AvgPer” = averaging period. 1hr = 1 hour, etc. annual = annual
- “SIL” SIL designator

- "Standard"= air quality standard. Class I = PSD Increment Class I

Culpability

- File name format "RHGP_Poll AvgPer_Standard_CP.ami"
- "Poll" = NO2… nitrogen oxides; CO…carbon monoxide; PM10…particulate matter, PM10; PM25…particulate matter, PM2.5; SO2… sulfur dioxide
- "AvgPer" = averaging period. 1hr = 1 hour, etc. annual = annual
- "Standard"= air quality standard. PSD = PSD Increment Class II, NAAQS = NAAQS
- "CP" Culpability designator

| File name (or folder and file name) | Pollutant(s) | Purpose (ROI/SIA, cumulative, culpability analysis, other) |
|---|---|---|
| RHGP_Generators | All | Determine worst-case generator locations |
| RHGP_CO_SIL | CO | ROI/SIA |
| RHGP_H2S_SIL | H2S | ROI/SIA |
| RHGP_NO2 Ann_SIL | NO2 | ROI/SIA |
| RHGP_NO2 24hr_SIL | NO2 | ROI/SIA |
| RHGP_NO2 1hr_SIL | NO2 | ROI/SIA |
| RHGP_PM25 Ann_SIL | PM2.5 | ROI/SIA |
| RHGP_PM25 24hr_SIL | PM2.5 | ROI/SIA |
| RHGP_PM10 Ann_SIL | PM10 | ROI/SIA |
| RHGP_PM10 24hr_SIL | PM10 | ROI/SIA |
| RHGP_SO2 Ann_SIL | SO2 | ROI/SIA |
| RHGP_SO2 3hr_24hr_SIL | SO2 | ROI/SIA |
| RHGP_SO2 1hr_SIL | SO2 | ROI/SIA |
| RHGP_CO_CIA | CO | Cumulative – 8hr NAAQs |
| RHGP_H2S_CIA | H2S | Cumulative – 1/2hr NMAAQs |
| RHGP_NO2 Ann_PSD | NO2 | Cumulative – Annual PSD Inc. Class II |
| RHGP_NO2 Ann_CIA | NO2 | Cumulative – Annual NMAAQs |
| RHGP_NO2 1hr_CIA | NO2 | Cumulative – 1hr NAAQs |
| RHGP_PM25 Ann_PSD | PM2.5 | Cumulative – Annual PSD Inc. Class II |
| RHGP_PM25 Ann_CIA | PM2.5 | Cumulative – Annual NAAQs |
| RHGP_PM25 24hr_PSD | PM2.5 | Cumulative – 24hr PSD Inc. Class II |
| RHGP_PM25 24hr_CIA | PM2.5 | Cumulative – 24hr NAAQs |
| RHGP_PM10 Ann_PSD | PM10 | Cumulative – Annual PSD Inc. Class II |
| RHGP_PM10 24hr_PSD | PM10 | Cumulative – 24hr PSD Inc. Class II |
| RHGP_PM10 24hr_CIA | PM10 | Cumulative – 24hr NAAQs |
| RHGP_SO2 Ann_PSD | SO2 | Cumulative – Annual PSD Inc. Class II |
| RHGP_SO2 24hr_PSD | SO2 | Cumulative – 24hr PSD Inc. Class II |
| RHGP_SO2 3hr_PSD | SO2 | Cumulative – 3hr PSD Inc. Class II |
| RHGP_SO2 1hr_CIA | SO2 | Cumulative – 1hr NAAQs |
| RHGP_CC_Class I | Varies | ROI/SIA – Carlsbad PSD Inc. Class I |
| RHGP_GMNP_Class I | Varies | ROI/SIA – Guadalupe PSD Inc. Class I |
| RHGP_SCW_Class I | Varies | ROI/SIA – Salt Creek PSD Inc. Class I |
| RHGP_BBNP_Class I | Varies | ROI/SIA – Big Bend PSD Inc. Class I |
| RHGP_PM25 24hr_PSD_CP | PM2.5 | Culpability Analysis – PM2.5 24hr |
| RHGP_PM10 24hr_PSD_CP | PM10 | Culpability Analysis – PM10 24hr |
| RHGP_PM10 24hr_NAAQs_CP | PM10 | Culpability Analysis – PM10 24hr |
| RHGP_H2S 1hr_CIA_CP | H2S | Culpability Analysis – H2S 1hr |
| | | |

## 16-V: PSD New or Major Modification Applications

| | | | |
|---|---|---|---|
| 1 | A new PSD major source or a major modification to an existing PSD major source requires additional analysis.<br>Was preconstruction monitoring done (see 20.2.74.306 NMAC and PSD Preapplication Guidance on the AQB website)? | Yes☐ | No☒ |
| 2 | If not, did AQB approve an exemption from preconstruction monitoring? | Yes☒ | No☐ |
| 3 | Describe how preconstruction monitoring has been addressed or attach the approved preconstruction monitoring or monitoring exemption. | | |
| | The approved preconstruction monitoring waiver is included in the application, Section 12. Approval was received on 01/27/2026. | | |
| 4 | Describe the additional impacts analysis required at 20.2.74.304 NMAC. | | |
| | Growth Analysis:<br>A growth analysis consists of a projection of the associated industrial, commercial, and residential growth that is likely to occur in the area due to the facility, and an estimate of the emissions generated by that associated growth. Because the facility is an existing source, no new emission units will be constructed and no increase in workforce is planned; therefore, no future growth is anticipated.<br><br>Soils and Vegetation Analysis:<br>Pursuant to the requirements in 40 CFR 52.21(o), an analysis of the impact that could occur to soils and vegetation of significant commercial or recreational value as a result of operating the Red Hills Gas Plant is discussed below.<br><br>The EPA developed the secondary NAAQS in order to protect soil and vegetation air quality-related values that were not sufficiently protected by the primary NAAQS. The secondary NAAQS represent ambient air concentrations below which most types of soils and vegetation are unaffected by criteria pollutants. If predicted ambient air concentrations are found to be less than the secondary NAAQS, it is presumed that emissions from the Red Hills Gas Plant do not result in harmful effects to either soil or vegetation and no further soil or vegetation analysis will be performed.<br><br>Visibility Impairment Analysis:<br>Red Hills Identified the Lea County/Jal Airport-E26 as the nearest sensitive receptor. There are no other state parks or wilderness areas within 50 km. A Level 1 VISCREEN analysis was performed for the project emissions to estimate visual plume impacts at that airport location. The default ozone value (0.04 ppm) was updated to the most recent and most conservative nearby ozone design value in the area (0.08 ppm). Based on that analysis, it was determined that the proposed project will not cause any visible plume impact of concern at the airport. | | |
| 5 | If required, have ozone and secondary PM2.5 ambient impacts analyses been completed? If so describe below. | Yes☐ | No☒ |
| | | | |

## 16-W: Modeling Results

| | | | |
|---|---|---|---|
| 1 | If ambient standards are exceeded because of surrounding sources, a culpability analysis is required for the source to show that the contribution from this source is less than the significance levels for the specific pollutant. Was culpability analysis performed? If so describe below. | Yes☒ | No☐ |
| | A culpability analysis for the source was completed to demonstrate that the source is less than significance levels for PM10 24-hr NAAQs cumulative and PSD 24-hr Class II increment modeling, PM2.5 PSD 24-hr Class II increment modeling, and H2S 1-hr NMAAQs cumulative modeling. The analysis included all modeled receptors that showed NAAQS, NMAAQs or PSD Class II Increment exceedances in the CIA model and pulled postfiles for the total cumulative modeled impact and the Red Hills Gas Plant modeled impact. The culpability analysis showed that for each exceedance of the ambient standards, the Red Hills Gas Plant's contribution was below the $PM_{10,}$ $PM_{2.5}$, and $H_2S$ significance levels. Thus, the Red Hills Gas Plant does not cause or contribute to an exceedance of the NAAQS or PSD Class II Increment. An editable excel file is included with our modeling files as well as relevant postfiles. | | |
| 2 | Identify the maximum concentrations from the modeling analysis. Rows may be modified, added and removed from the table below as necessary. | | |

| Pollutant, Time Period and Standard | Modeled Facility Concentration (µg/m3) | Modeled Concentration with Surrounding Sources (µg/m3) | Secondary PM (µg/m3) | Background Concentration (µg/m3) | Cumulative Concentration (µg/m3) | Value of Standard (µg/m3) | Percent of Standard | Location | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | UTM E (m) | UTM N (m) | Elevation (ft) |

| 16-X: Summary/conclusions | |
|---|---|
| 1 | A statement that modeling requirements have been satisfied and that the permit can be issued. |
| | Targa has demonstrated that the proposed changes to NSR Permit 4310M6 would neither cause nor contribute to an exceedance of any applicable standards for CO, $H_2S$, $NO_2$, $PM_{2.5}$, $PM_{10}$, and $SO_2$. |

# APPENDIX Q. Q/D CALCULATIONS

| | RH-GEN-9 | DIESEL FIRED GENERATOR | Power Backup, Routine | 0.33 | <0.01 | 0.017 | 24 | 7.92 | 0.15 | 0.40 | 7.92 | 0.15 | 0.40 | |
| | RH-GEN-10 | DIESEL FIRED GENERATOR | Power Backup, Routine | 0.33 | <0.01 | 0.017 | 24 | 7.92 | 0.15 | 0.40 | 7.92 | 0.15 | 0.40 | |
| | RH-TRAILER | DIESEL FIRED HEATER TRAILER | Cold Weather Startup | 0.30 | 0.59 | 0.023 | 4 | 1.22 | 2.38 | 0.09 | 1.22 | 2.38 | 0.09 | Unit is used for cold weather startup, it was assumed 4 hrs of runtime a day. |
| | RH-GEN-WELL | DIESEL FIRED GENERATOR, WATER WELL | Monthy Well Testing | 0.63 | 0.081 | 0.087 | 2 | 1.26 | 0.16 | 0.17 | 1.26 | 0.16 | 0.17 | Unit is used once per month to run a pump for water well testing. It is assumed this activity lasts only 2 hours. |
| Thermal Oxidizers | RH2-TO-5500 | THERMAL OXIDIZER | Pilot/Fuel | 0.10 | 0.048 | 0.56 | 24 | 2.39 | 1.14 | 13.33 | 2.39 | 1.14 | 13.33 | Pilot / fuel is always operating in a steady state scenario. |
| | | | Process | 1.32 | 19.31 | 0.12 | 24 | 31.66 | 463.51 | 2.77 | 31.66 | 463.51 | 2.77 | Process emissions are always emitted in a steady state scenario. |
| | | | SSM | 1.71 | 1.54 | 0.09 | 4 | 6.82 | 6.18 | 0.37 | 6.82 | 6.18 | 0.37 | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Facility startup emissions were most significant and the event duration of 4 hours was conservatively assumed. |
| | RH4-TO-45500 | THERMAL OXIDIZER | Pilot/Fuel | 0.10 | 0.045 | 0.53 | 24 | 2.50 | 1.09 | 12.70 | 2.50 | 1.09 | 12.70 | Pilot / fuel is always operating in a steady state scenario. |
| | | | Process | 1.15 | 14.03 | 0.07 | 24 | 27.50 | 336.70 | 1.61 | 27.50 | 336.70 | 1.61 | Process emissions are always emitted in a steady state scenario. |
| | | | SSM | 0.16 | 1.55 | <0.011 | 4 | 0.62 | 6.21 | 0.034 | 0.62 | 6.21 | 0.034 | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Facility startup emissions were most significant and the event duration of 4 hours was conservatively assumed. |
| | RH5-TO-55500 | THERMAL OXIDIZER | Pilot/Fuel | 0.083 | 0.036 | 0.42 | 24 | 2.00 | 0.87 | 10.15 | 2.00 | 0.87 | 10.15 | Pilot / fuel is always operating in a steady state scenario. |
| | | | Process | 1.16 | 14.11 | 0.14 | 24 | 27.76 | 338.72 | 3.26 | 27.76 | 338.72 | 3.26 | Process emissions are always emitted in a steady state scenario. |
| | | | SSM | 0.16 | 1.59 | <0.011 | 4 | 0.64 | 6.36 | 0.034 | 0.64 | 6.36 | 0.034 | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Facility startup emissions were most significant and the event duration of 4 hours was conservatively assumed. |
| | RH1-FL-29-1003 | FLARE | Pilot | 0.04 | <0.01 | - | 24 | 1.01 | <0.01 | - | 1.01 | <0.01 | - | Pilot, purge, and dehy still vent gas are always operating in a steady state scenario. |
| | | | Purge | 0.29 | <0.01 | - | 24 | 6.91 | 0.03 | - | 6.91 | 0.03 | - | |
| | | | Dehy Still Vent Gas | 0.23 | 0.15 | - | 24 | 5.60 | 3.55 | - | 5.60 | 3.55 | - | |
| | | | SSM | 211.12 | 1.88 | - | 12 | 2533.42 | 22.50 | - | 2533.42 | 22.50 | - | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Residue Gas Flaring emissions were most significant and the event duration of 1 hour was conservatively assumed. There are 12 events permitted and it was assumed all events happen in a single day. |
| | | | AOS SSM | 0.64 | <0.01 | - | 24 | 15.42 | 0.19 | - | - | - | - | It was conservatively assumed that an AOS SSM event would last 24 hours. |
| | RH2-FL-5100 | FLARE | Pilot | <0.01 | <0.01 | - | 24 | 0.22 | <0.01 | - | 0.22 | <0.01 | - | Pilot and purge are always operating in a steady state scenario. |
| | | | Purge | 0.36 | <0.01 | - | 24 | 8.64 | 0.04 | - | 8.64 | 0.04 | - | |
| | | | SSM | 562.98 | 5.00 | - | 12 | 6755.77 | 60.00 | - | 6755.77 | 60.00 | - | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Residue Gas Flaring emissions were most significant. There are no durations or number of events permitted for residue gas flaring, but all permitted emissions would be depleted after 12 hours of operating at the maximum hourly rate. Therefore, 12 hours were conservatively assumed for this event. |
| | | | AOS SSM | 3.64 | 0.05 | - | 24 | 87.29 | 1.19 | - | - | - | - | It was conservatively assumed that AOS SSM and Dehy AOS SSM events would last 24 hours. SSM, AOS SSM, and Dehy AOS SSM are not flared simultaneiously. The maximum of each stream on a pollutant by pollutant basis was taken to derive the lb/day value as a conservative measure. The unit may operate in a way that allows for flaring of different streams during a given day, but this would not be quantifiable. Therefore, the maximum contributor was used. |
| | | | Dehy AOS SSM | 1.11 | - | - | 24 | 26.57 | - | - | - | - | - | |
| | | | Pilot | <0.01 | <0.01 | - | 24 | 0.22 | <0.01 | - | 0.22 | <0.01 | - | Pilot and purge are always operating in a steady state scenario. |
| | | | Purge | 0.36 | <0.01 | - | 24 | 8.64 | 0.04 | - | 8.64 | 0.04 | - | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Flares | RH3-FL-5100 | FLARE | SSM | 562.98 | 5.00 | - | 12 | 6755.77 | 60.00 | - | 6755.77 | 60.00 | - | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Residue Gas Flaring emissions were most significant. There are no durations or number of events permitted for residue gas flaring, but all permitted emissions would be depleted after 12 hours of operating at the maximum hourly rate. Therefore, 12 hours were conservatively assumed for this event. |
| | | | Dehy AOS SSM | - | - | - | 24 | - | - | - | - | - | - | It was conservatively assumed that Dehy AOS SSM events would last 24 hours. SSM and Dehy AOS SSM are not flared simultaneiously. The maximum of each stream on a pollutant by pollutant basis was taken to derive the lb/day value as a conservative measure. The unit may operate in a way that allows for flaring of different streams during a given day, but this would not be quantifiable. Therefore, the maximum contributor was used. |
| | RH4-FL-45100 | FLARE | Pilot | <0.01 | <0.01 | - | 24 | 0.22 | <0.01 | - | 0.22 | <0.01 | - | Pilot and purge are always operating in a steady state scenario. |
| | | | Purge | 0.36 | <0.01 | - | 24 | 8.64 | 0.04 | - | 8.64 | 0.04 | - | |
| | | | Pigging | 0.51 | <0.01 | - | 1 | 0.51 | <0.01 | - | 0.51 | <0.01 | - | It was conservatively assumed that one pigging event would happen per day at a duration of 1 hour. |
| | | | SSM | 647.43 | 5.75 | - | 12 | 7769.14 | 69.00 | - | 7769.14 | 69.00 | - | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Residue Gas Flaring emissions were most significant. There are no durations or number of events permitted for residue gas flaring, but all permitted emissions would be depleted after 12 hours of operating at the maximum hourly rate. Therefore, 12 hours were conservatively assumed for this event. |
| | | | AOS SSM | 3.52 | 0.09 | - | 24 | 84.40 | 2.26 | - | - | - | - | It was conservatively assumed that AOS SSM and Dehy AOS SSM events would last 24 hours. SSM, AOS SSM, and Dehy AOS SSM are not flared simultaneiously. The maximum of each stream on a pollutant by pollutant basis was taken to derive the lb/day value as a conservative measure. The unit may operate in a way that allows for flaring of different streams during a given day, but this would not be quantifiable. Therefore, the maximum contributor was used. |
| | | | Dehy AOS SSM | 0.42 | - | - | 24 | 10.02 | - | - | - | - | - | |
| | RH5-FL-55100 | FLARE | Pilot | 0.04 | <0.01 | - | 24 | 0.84 | <0.01 | - | 0.84 | <0.01 | - | Pilot and purge are always operating in a steady state scenario. |

| | RH-TRAILER | DIESEL FIRED HEATER TRAILER | Cold Weather Startup | 0.30 | 0.59 | 0.023 | 4 | 1.22 | 2.38 | 0.09 | 1.22 | 2.38 | 0.09 | Unit is used for cold weather startup, it was assumed 4 hrs of runtime a day. |
| | RH-GEN-WELL | DIESEL FIRED GENERATOR, WATER WELL | Monthy Well Testing | 0.63 | 0.081 | 0.087 | 2 | 1.26 | 0.16 | 0.17 | 1.26 | 0.16 | 0.17 | Unit is used once per month to run a pump for water well testing. It is assumed this activity lasts only 2 hours. |
| Thermal Oxidizers | RH2-TO-5500 | THERMAL OXIDIZER | Pilot/Fuel | 0.10 | 0.048 | 0.56 | 24 | 2.39 | 1.14 | 13.33 | 2.39 | 1.14 | 13.33 | Pilot / fuel is always operating in a steady state scenario. |
| | | | Process | 1.32 | 19.31 | 0.12 | 24 | 31.66 | 463.51 | 2.77 | 31.66 | 463.51 | 2.77 | Process emissions are always emitted in a steady state scenario. |
| | | | SSM | 1.71 | 1.54 | 0.09 | 4 | 6.82 | 6.18 | 0.37 | 6.82 | 6.18 | 0.37 | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Facility startup emissions were most significant and the event duration of 4 hours was conservatively assumed. |
| | RH4-TO-45500 | THERMAL OXIDIZER | Pilot/Fuel | 0.10 | 0.045 | 0.53 | 24 | 2.50 | 1.09 | 12.70 | 2.50 | 1.09 | 12.70 | Pilot / fuel is always operating in a steady state scenario. |
| | | | Process | 1.15 | 14.03 | 0.07 | 24 | 27.50 | 336.70 | 1.61 | 27.50 | 336.70 | 1.61 | Process emissions are always emitted in a steady state scenario. |
| | | | SSM | 0.16 | 1.55 | <0.011 | 4 | 0.62 | 6.21 | 0.034 | 0.62 | 6.21 | 0.034 | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Facility startup emissions were most significant and the event duration of 4 hours was conservatively assumed. |
| | RH5-TO-55500 | THERMAL OXIDIZER | Pilot/Fuel | 0.083 | 0.036 | 0.42 | 24 | 2.00 | 0.87 | 10.15 | 2.00 | 0.87 | 10.15 | Pilot / fuel is always operating in a steady state scenario. |
| | | | Process | 1.16 | 14.11 | 0.14 | 24 | 27.76 | 338.72 | 3.26 | 27.76 | 338.72 | 3.26 | Process emissions are always emitted in a steady state scenario. |
| | | | SSM | 0.16 | 1.59 | <0.011 | 4 | 0.64 | 6.36 | 0.034 | 0.64 | 6.36 | 0.034 | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Facility startup emissions were most significant and the event duration of 4 hours was conservatively assumed. |
| | RH1-FL-29-1003 | FLARE | Pilot | 0.04 | <0.01 | - | 24 | 1.01 | <0.01 | - | 1.01 | <0.01 | - | Pilot, purge, and dehy still vent gas are always operating in a steady state scenario. |
| | | | Purge | 0.29 | <0.01 | - | 24 | 6.91 | 0.03 | - | 6.91 | 0.03 | - | |
| | | | Dehy Still Vent Gas | 0.23 | 0.15 | - | 24 | 5.60 | 3.55 | - | 5.60 | 3.55 | - | |
| | | | SSM | 211.12 | 1.88 | - | 12 | 2533.42 | 22.50 | - | 2533.42 | 22.50 | - | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Residue Gas Flaring emissions were most significant. There are no durations or number of events permitted for residue gas flaring, but all permitted emissions would be depleted after 12 hours of operating at the maximum hourly rate. Therefore, 12 hours were conservatively assumed for this event. |
| | | | AOS SSM | 0.64 | <0.01 | - | 24 | 15.42 | 0.19 | - | - | - | - | It was conservatively assumed that an AOS SSM event would last 24 hours. |
| | RH2-FL-5100 | FLARE | Pilot | <0.01 | <0.01 | - | 24 | 0.22 | <0.01 | - | 0.22 | <0.01 | - | Pilot and purge are always operating in a steady state scenario. |
| | | | Purge | 0.36 | <0.01 | - | 24 | 8.64 | 0.04 | - | 8.64 | 0.04 | - | |
| | | | SSM | 562.98 | 5.00 | - | 12 | 6755.77 | 60.00 | - | 6755.77 | 60.00 | - | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Residue Gas Flaring emissions were most significant. There are no durations or number of events permitted for residue gas flaring, but all permitted emissions would be depleted after 12 hours of operating at the maximum hourly rate. Therefore, 12 hours were conservatively assumed for this event. |
| | | | AOS SSM | 3.64 | 0.05 | - | 24 | 87.29 | 1.19 | - | - | - | - | It was conservatively assumed that AOS SSM and Dehy AOS SSM events would last 24 hours. SSM, AOS SSM, and Dehy AOS SSM are not flared simultaneiously. The maximum of each stream on a pollutant by pollutant basis was taken to derive the lb/day value as a conservative measure. The unit may operate in a way that allows for flaring of different streams during a given day, but this would not be quantifiable. Therefore, the maximum contributor was used. |
| | | | Dehy AOS SSM | 1.11 | - | - | 24 | 26.57 | - | - | - | - | - | |

| | | | | | | | | | | | | | | | |

Since events cannot occur simultaneously, this was appropriate. Facility startup emissions were most significant and the event duration of 4 hours was conservatively assumed. |
| | RH5-TO-55500 | THERMAL OXIDIZER | Pilot/Fuel | 0.083 | 0.036 | 0.42 | 24 | 2.00 | 0.87 | 10.15 | 2.00 | 0.87 | 10.15 | Pilot / fuel is always operating in a steady state scenario. |
| | | | Process | 1.16 | 14.11 | 0.14 | 24 | 27.76 | 338.72 | 3.26 | 27.76 | 338.72 | 3.26 | Process emissions are always emitted in a steady state scenario. |
| | | | SSM | 0.16 | 1.59 | <0.011 | 4 | 0.64 | 6.36 | 0.034 | 0.64 | 6.36 | 0.034 | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Facility startup emissions were most significant and the event duration of 4 hours was conservatively assumed. |
| | RH1-FL-29-1003 | FLARE | Pilot | 0.04 | <0.01 | - | 24 | 1.01 | <0.01 | - | 1.01 | <0.01 | - | Pilot, purge, and dehy still vent gas are always operating in a steady state scenario. |
| | | | Purge | 0.29 | <0.01 | - | 24 | 6.91 | 0.03 | - | 6.91 | 0.03 | - | |
| | | | Dehy Still Vent Gas | 0.23 | 0.15 | - | 24 | 5.60 | 3.55 | - | 5.60 | 3.55 | - | |
| | | | SSM | 211.12 | 1.88 | - | 12 | 2533.42 | 22.50 | - | 2533.42 | 22.50 | - | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Residue Gas Flaring emissions were most significant. There are no durations or number of events permitted for residue gas flaring, but all permitted emissions would be depleted after 12 hours of operating at the maximum hourly rate. Therefore, 12 hours were conservatively assumed for this event. |
| | | | AOS SSM | 0.64 | <0.01 | - | 24 | 15.42 | 0.19 | - | - | - | - | It was conservatively assumed that an AOS SSM event would last 24 hours. |
| | RH2-FL-5100 | FLARE | Pilot | <0.01 | <0.01 | - | 24 | 0.22 | <0.01 | - | 0.22 | <0.01 | - | Pilot and purge are always operating in a steady state scenario. |
| | | | Purge | 0.36 | <0.01 | - | 24 | 8.64 | 0.04 | - | 8.64 | 0.04 | - | |
| | | | SSM | 562.98 | 5.00 | - | 12 | 6755.77 | 60.00 | - | 6755.77 | 60.00 | - | The largest contributing event was considered for the Q/D analysis. Since events cannot occur simultaneously, this was appropriate. Residue Gas Flaring emissions were most significant. There are no durations or number of events permitted for residue gas flaring, but all permitted emissions would be depleted after 12 hours of operating at the maximum hourly rate. Therefore, 12 hours were conservatively assumed for this event. |
| | | | AOS SSM | 3.64 | 0.05 | - | 24 | 87.29 | 1.19 | - | - | - | - | It was conservatively assumed that AOS SSM and Dehy AOS SSM events would last 24 hours. SSM, AOS SSM, and Dehy AOS SSM are not flared simultaneiously. The maximum of each stream on a pollutant by pollutant basis was taken to derive the lb/day value as a conservative measure. The unit may operate in a way that allows for flaring of different streams during a given day, but this would not be quantifiable. Therefore, the maximum contributor was used. |
| | | | Dehy AOS SSM | 1.11 | - | - | 24 | 26.57 | - | - | - | - | - | |

| | | | | | | | | | | | | | | | |

# Section 17

## Compliance Test History

(Submitting under 20.2.70, 20.2.72, 20.2.74 NMAC)

---

To show compliance with existing NSR permits conditions, you must submit a compliance test history. The table below provides an example.

---

Compliance test history is available upon request.

# Section 20

## Other Relevant Information

---

**Other relevant information**. Use this attachment to clarify any part in the application that you think needs explaining. Reference the section, table, column, and/or field. Include any additional text, tables, calculations or clarifying information.

Additionally, the applicant may propose specific permit language for AQB consideration. In the case of a revision to an existing permit, the applicant should provide the old language and the new language in track changes format to highlight the proposed changes. If proposing language for a new facility or language for a new unit, submit the proposed operating condition(s), along with the associated monitoring, recordkeeping, and reporting conditions. In either case, please limit the proposed language to the affected portion of the permit.

---

**Permit Conditions**

Targa Northern Delaware, LLC respectfully requests that AQB considers the following permit condition language changes:

Condition A107.D – Targa would like to request that an operator developed procedure be an option for compliance with the SSM Flare Gas Flow Monitoring and Gas Analysis condition. Please refer to the table in Section 3 of this application for unit ID cross-reference.

A. SSM Flare Gas Flow Monitoring and Gas Analysis (Units 1-EP-2, 2-EP-2a, 2.5-EP-5, 3-EP-2a, 4-EP-2a, 5-EP-2, 7-EP-2, 5.5-EP-1b)

**Requirement:** Compliance with the flare allowable emission limits in Table 107.A shall be demonstrated by completing the monitoring, recordkeeping, and reporting required by this condition and Condition A107.E. All flow meters and inline chemical composition analyzers shall be installed, calibrated, operated, and maintained in accordance with the requirements of Condition B108.H.

**Monitoring:**

(1) Gas Flow:

(a) One or more gas flowmeters equipped with a chart recorder or data logger (electronic storage) shall be installed to continuously monitor the flow (scf) of gas sent to the flare.

(b) Pilot, purge, and assist gas, if applicable, shall be monitored using a gas flowmeter under (a) or determined using manufacturer's specifications or engineering estimates.

(2) Gas Analysis:

(a) Once per calendar year, the permittee shall perform a gas analysis, including measurement of the $H_2S$ content, total sulfur content, VOC content, and heating value (BTU/scf) of gas sent to the flare for combustion. Gas analyses shall be separated by a minimum of six (6) months.

(b) Alternatively, for $H_2S$ only, in lieu of an annual analysis, $H_2S$ may be measured quarterly using a stain tube(s) of the appropriate size range or with an inline chemical composition analyzer.

(3) Calibration: In addition to the requirements of Condition B108.H, flow meters and inline chemical composition analyzers shall be operated, calibrated, and maintained as specified by the site-specific operations and maintenance plan, if applicable.

**Recordkeeping:** The following records shall be maintained in accordance with Condition B109.

(1) Gas Flow:

(a) Records of continuous flowmeter measurements and the hourly flow rate in scf/hr calculated

by averaging a minimum of four (4) equally spaced readings for each hour.

(b) Manufacturer's specifications or engineering estimates used for pilot, purge, and assist (if applicable) gas flow rates.

(2) Gas Analysis: All sample documentation received from the laboratory or testing service company, including $H_2S$ content, the total sulfur content, the VOC content, and the heating value (BTU/scf), analysis method utilized, and sample chain of custody. If stain tubes are used for measuring $H_2S$ content, records of the results, including size range of stain tubes used, the date of the test, and the name of the person conducting the test.

(3) Calibration: Records of all flowmeter and inline monitor certifications, calibrations, data capture calculations and documentation as specified by Condition B108.H, as well as any breakdowns, reasons for the breakdown, and corrective actions. The permittee shall also maintain a copy of the manufacturer specifications for operation and calibration or the site-specific operations and maintenance plan for flowmeters and inline monitors.

**Reporting:** The permittee shall report in accordance with Condition B110.

Condition A107.F – Targa would like to request the ability to sample a stream deemed representative of the gas vented during SSM/M activities, since sampling during a venting SSM/M event would be infeasible. Please refer to the table in Section 3 of this application for unit ID cross-reference.

B. Combined SSM/M (Malfunction) of VOC Emission Limit (Unit SSM/M, excludes venting from Cryogenic Trains and Unit EP-11 for ECD down time)

**Requirement:**

(1) **Compliance Method**

The permittee shall perform a gas analysis once every year based on a calendar year of a gas stream deemed representative of the gas vented during each SSM/M event.

On a monthly basis, the permittee shall complete the following monitoring and recordkeeping to demonstrate compliance with the allowable emission limits in Table 107.A for routine or predictable startup, shutdown, and maintenance (SSM); and/or malfunctions (M) herein referred to as SSM/M.

(2) **Emissions included in Permit Limit and/or Reported as Excess Emissions**

(a) All emissions due to routine or predictable startup, shutdown, and/or maintenance (SSM), other than venting from Cryogenic trains or EP-11, must be included under and shall not exceed the SSM/M emission limit in table 107.A in this permit. For emissions due to malfunctions, the permittee has the option to report these as excess emissions of the pound per hour limits in Table 106.A (or the pound per hour limits in condition B110F, if applicable), in accordance with 20.2.7 NMAC, or include the emissions under the limit in table 107.A.

(b) Once emissions from a malfunction event are submitted in the final report (due no later than ten days after the end of the excess emissions event) per 20.2.7.110.A(2) NMAC, the event is considered an excess emission and cannot be applied toward the SSM/M limit in table 107.A. in this permit.

(3) **Emissions Exceeding the Permit Limit**

If the monthly rolling 12-month total of SSM/M exceeds the emission limit in table 107.A, the permittee shall report the emissions as excess emissions in accordance with 20.2.7.110 NMAC.

(4) **Emissions Due to Preventable Events**

Emissions that are due entirely or in part to poor maintenance, careless operation, or any other preventable equipment breakdown shall not be included under the SSM/M emission limit in table

107.A. These emissions shall be reported as excess emissions of the pound per hour limits in Table 106.A (or the pound per hour limits in condition B110F, if applicable) in accordance with 20.2.7 NMAC.

**Monitoring:** The permittee shall monitor all SSM/M events.

**Recordkeeping:**

(1) **Compliance Method**

(a) Each month records shall be kept of the cumulative total of all VOC emissions related to SSM/M during the first 12 months and, thereafter of the monthly rolling 12-month total of SSM/M VOC emissions. Any malfunction emissions that have been reported in a final excess emissions report per 20.2.7.110.A(2) NMAC, shall be excluded from this total.

(b) Records shall also be kept of the inlet gas analysis, the weight percent VOC of the gas based on the most recent gas analysis, and of the volume of total gas vented in MMscf used to calculate the VOC emissions.

(c) The permittee shall identify the equipment or activity and shall describe the event that is the source of emissions.

(2) **Emissions included Under Permit Limit or Reported as Excess Emissions**

The permittee shall record whether emissions are included under the emission limit for SSM/M in table 107.A or if the event is included in a final excess emissions report per 20.2.7.110.A(2) NMAC.

(3) **Condition B109 Records**

The permittee shall keep records in accordance with Condition B109 of this permit except for the following:

(a) The requirement to record the start and end times of SSM/M events shall not apply to venting of known quantities of VOCs as long as the emissions do not exceed the SSM/M emission limit.

(b) The requirement to record a description of the cause of the event shall not apply to SSM/M events as long as the emissions do not exceed the SSM/M emission limit.

**Reporting:** The permittee shall report in accordance with Section B110.

Condition A202.B – Targa would like to request the ability to utilize Targa-specific procedures when manufacturer recommendations are not available. Please refer to the table in Section 3 of this application for unit ID cross-reference.

B. Control Requirements and Operation (Units 1-EP-3, 2a-EP-3, 3-EP-3, 4-EP-3, 5-EP-1e, and 6-EP-1e)

**Requirement:** The permittee shall meet the control requirements in Table 105 to demonstrate compliance with the allowable VOC emission limits in Table 106.A.

At all times dehydrator emissions shall be controlled as follows.

(1) Still vent emissions shall be routed to a condenser and then routed to a thermal oxidizer for combustion.

(2) Flash tank emissions shall be routed to a process point that allows the off-gas to be recycled and recompressed, and not vented to the atmosphere.

(3) At no time shall still vent or flash tank emissions be vented directly to the atmosphere except as allowed by Section 107.

**Monitoring:** The permittee shall inspect the glycol dehydrator and the control equipment semi-annually to ensure it is operating as initially designed and in accordance with the manufacturer's recommended

| |
|---|
| procedures or owner/operator procedures. The permittee shall also inspect that the reboiler is operating as initially designed and in accordance with the manufacturer's recommended procedures or the owner/operator procedures. |
| **Recordkeeping:** The permittee shall record the inspection and the results of all equipment and control device inspections chronologically, noting any maintenance or repairs needed to bring the dehydrator into compliance. The permittee shall maintain a copy of the manufacturer's maintenance recommendations or the owner/operator maintenance recommendations. |

Condition A208.E – Targa would like to request the ability to utilize Targa-specific procedures when manufacturer recommendations are not available. Please refer to the table in Section 3 of this application for unit ID cross-reference.

1) Control Requirement for Flares (EP-9 controlling units 2-T and2-Load, and EP-13 controlling units 4-T, and 4-Load)

| |
|---|
| **Requirement:**<br>The permittee shall ensure that all emissions from the Tanks and loadout are routed to a flare as required by Table 105.<br>At no time shall emissions be vented directly to the atmosphere except as authorized by Section A107. |
| **Monitoring:** The permittee shall inspect the tanks and the control equipment semi-annually to ensure they are operating in accordance with the manufacturer's recommended operating and maintenance procedures or owner/operator operating and maintenance procedure. The permittee shall inspect the control device during condensate stabilization system downtime to ensure that it is operating as designed. |
| **Recordkeeping:**<br>The permittee shall record the results of all equipment and control device inspections chronologically, noting any maintenance or repairs needed to bring the tanks into compliance. The permittee shall maintain a copy of the manufacturer's or owner/operator maintenance recommendations. |
| **Reporting:** The permittee shall report in accordance with Section B110. |

**Red Hills Gas Processing Plant Toxics Analysis**

According to 20.2.72.203.A(3), *"[…] all information, including all calculations and computations, to describe the specific chemical and physical nature and to estimate the maximum quantities of any regulated air contaminants the source will emit through routine operations after construction, modification or installation is completed, and estimate maximum potential emissions during malfunction, startup, shutdown"* must be included with an application. With respect to a toxic air pollutant as defined by Subsection H of 20.2.72.401 NMAC, this requirement only applies when the toxic air pollutant is emitted in such a manner that a permit is required under the provisions of 20.2.72.400 NMAC - 20.2.72.499 NMAC. Calculations and computations for toxic air pollutants are included in this section. No toxic air pollutant, as defined in 20.2.72.401 NMAC, is emitted in a quantity exceeding the screening threshold established in 20.2.72.502 Table A nor in Table B.

An analysis was completed for toxic air pollutants at the Red Hills. The following pollutants were evaluated: octane, nonane, cyclohexane, dichlorobenzene, barium, cadmium, chromium, cobalt, copper, manganese, molybdenum, nickel, selenium, vanadium, zinc, and antimony. Hexane was conservatively assumed to be cyclohexane throughout the analysis, if not present as an individually analyzed constituent.

Per 20.2.72.502 Table C, "*Sources may choose to use a correction factor for the release height of emissions for the purpose of determining whether a permit is necessary for the emission of a toxic air pollutant. To apply the correction go to the table below and find the minimum height of release for the toxic air pollutant and select the correction factor (CF) which corresponds to that figure. If the height of release is between two values, the lower number shall be selected; or in the event of multiple releases of the same substance from different release heights, the source may choose to use a weighted average CF, weighted by the emission rate at each. The emissions in pounds per hour is then multiplied by the CF (see below). If the emissions from your source exceed the resulting number, you must apply for a permit from the department. Remember, this must be done for each toxic air pollutant*."

This weighted correction factor was applied to octane, nonane, and cyclohexane and an adjusted Toxic Air Pollutant (TAPs) threshold for each pollutant was developed. Based on this adjustment, there are no toxic air pollutants in excess of the screening thresholds.

The weighted average correction factors were identified as follows: Octane = 11.05, Nonane = 3.09, and Cyclohexane =32.67.

Please see a sample calculation for cyclohexane's correction factor below:

Weighted Average Correction Factor = SUM [Correction Factor of each stack * cyclohexane emission rate] / SUM (Cyclohexane emission rate) = [(41*7.82 lb/hr)+(152*3.43 lb/hr)+(71*0.13 lb/hr)+(19*10.77 lb/hr)+(19*126.95 lb/hr)+(1*9.89E-04 lb/hr)+(5*0.94 lb/hr)+(1*0.32 lb/hr)+(1*0.53 lb/hr)+(1*6.52 lb/hr)+(1*0.90 lb/hr)+(1*0.70 lb/hr)] / 32.96 lb/hr = 32.67

TAPs Threshold (Cyclohexane) = 70 lb/hr * 32.67 = 2287.00 lb/hr.

# Section 22: Certification

Company Name: Targa Northern Delaware, LLC

I, Andrew Perdue, hereby certify that the information and data submitted in this application are true and as accurate as possible, to the best of my knowledge and professional expertise and experience.

Signed this 5th day of March, 2026, upon my oath or affirmation, before a notary of the State of Colorado.

*Signature

Date: 3/5/2026

Andrew Perdue
Printed Name

Vice President of Operations
Title

Scribed and sworn before me on this 5 day of March, 2026.

My authorization as a notary of the State of Colorado expires on the 21 day of July, 2029.

Notary's Signature

Date: 3/5/2026

Joshua Hulling
Notary's Printed Name

JOSHUA HULLING
Notary Public
State of Colorado
Notary ID: 20254027667
My Commission Expires July 21, 2029

*For Title V applications, the signature must be of the Responsible Official as defined in 20.2.70.7.AE NMAC.

# 1. EXECUTIVE SUMMARY

Targa Resources LLC, dba Targa Northern Delaware LLC, (Targa) operates the Red Hills Gas Processing Plant (Red Hills) at 1934 W NM Highway 128, Jal, 88252, Lea County, New Mexico under Construction Permit 4310-M6 and Title V Operating Permit P278-M1. This Modeling Protocol presents the regulatory framework and proposed model options and inputs that will be utilized for the Red Hills permitting project.

It is expected that Red Hills will be subject to Prevention of Significant Deterioration (PSD) review for ozone, nitrogen dioxide ($NO_2$), carbon monoxide (CO), sulfur dioxide ($SO_2$), particulate matter ($PM_{2.5/10}$), and hydrogen sulfide ($H_2S$). Since emissions at Red Hills are estimated to exceed the Significant Emission Rate (SER) for nitrogen oxides ($NO_X$) and $SO_2$, an assessment of secondary $PM_{2.5}$ formation will be performed. Targa will also perform state-level impact assessments for hydrogen sulfide ($H_2S$) and particulate matter ($PM_{2.5/10}$). Targa has prepared emission calculations that demonstrate that a 20.2.72 NMAC toxics modeling analysis is not required. This demonstration will be included with the narrative in the PSD application.

Targa has retained Trinity Consultants (Trinity) to perform the modeling analyses that will serve as the basis for the impact assessments. This modeling protocol defines the regulatory framework and technical methods that will be used for the following analyses:

- An air quality impact analysis (AQIA) that demonstrates that Red Hills emissions, in conjunction with background concentrations and neighboring sources as applicable[1], will not cause or contribute to a violation of applicable New Mexico and National Ambient Air Quality Standards (NMAAQS and NAAQS) or Class II PSD increments.[2]
- An Additional Impacts Analysis for growth, visibility impairment, and soils and vegetation analyses as required by the PSD regulations.
- A Class I impact assessment will be done in accordance with guidance and additional consultation from the applicable Federal Land Managers of Class I areas. This assessment will include initial screening significant impact analyses (SIL). For pollutants that may exceed a SIL, refined Class I increment analyses will be performed.
- A Q/D analysis for all Class I areas within 300 kilometers (km) of Red Hills and refined Air Quality Related Values analyses (see Section 7) for Q/D results that may exceed the threshold level determined by Federal Land Managers (FLM). The FLMs will be consulted to determine the requirements of additional analyses should a refined analysis be needed.

The AQIA will be conducted in accordance with guidance provided by the United States Environmental Protection Agency (EPA) and New Mexico Environmental Department (NMED) as prescribed in the following:

- Guideline on Air Quality Models (published as 40 CFR 51, Appendix W; hereafter referred to as the Modeling Guideline);[3]

[1] Code of Federal Regulations, Title 40 – Protection of Environment, Part 51, Appendix W, Section 8.3. January 17, 2017.

[2] If facility-only impacts from the Red Hills plant do not exceed the significant impact level (SIL) for a pollutant and averaging period, the facility will not cause or contribute to a NMAAQS, NAAQS, and PSD increment violation, as applicable to that pollutant and averaging period.

[3] Code of Federal Regulations, Title 40 – Protection of Environment, Part 51, Appendix W, January 17, 2017.

- Guidance on the Development of Modeled Emission Rates for Precursors (MERPs) as a Tier 1 Demonstration Tool for Ozone and $PM_{2.5}$ under the PSD permitting Program and Clarification on the Development of Modeled Emission Rates for Precursors (MERPs) as a Tier 1 Demonstration Tool for Ozone and $PM_{2.5}$ under the PSD Permitting Program;[4]
- NMED Air Dispersion Modeling Guidelines;[5]
- Federal Land Managers AQRV Workgroup (FLAG) Phase I Report (FLAG 2010);[6] and
- Interagency Work Group on Air Quality Modeling (IWAQM) Phase 2.[7]

Trinity will use the current dispersion models and methods described in the above-mentioned documents to perform the modeling analyses. Details regarding these methods are in this modeling protocol.

# 2. RED HILLS GAS PROCESSING PLANT OVERVIEW

## 2.1 Plant Description

Red Hills processes field natural gas in several trains. Each train includes an amine system to remove acid gas, glycol-based dehydrators to remove water, and further processing to remove C2+ hydrocarbons from the inlet gas stream.

Separators and slug catchers separate free hydrocarbon liquids and water present in the inlet pipeline gas stream. The resulting condensate is trucked out or sent to pipeline sales.

C2 to C5 hydrocarbons are removed by a propane refrigeration and compression system including an overhead stabilization system to increase the plant efficiency for natural has liquid (NGL) production from the treated inlet gas stream. NGL are stored in pressurized tanks before transport offsite via pipeline sales.

Plant startup, shutdown, maintenance, and upset conditions are either controlled by control devices on site or vented.

Red Hills operates various sources of regulated emissions. Tables with stack parameters, short-term emissions, and long-term emissions for point sources, volume sources, and area sources are presented in Appendix A of this protocol. The emission rates and stack parameters in these tables may be updated in the final permit application and modeling report.

## 2.2 Plant Location and Surrounding Area

Red Hills is located approximately 37 km west-northwest of Jal, Lea County, New Mexico at north latitude 32°12'38" and west longitude 103°31'26" and alternately, in Section 13, Range 33E and Township 24S, Universal Transverse Mercator (UTM) Zone 13 North American Datum 1983 (NAD83). An aerial image of the plant (Figure 2-1) and a wider view of the plant location (Figure 2-2) were obtained from Google Earth.

Lea County is designated by the EPA as "unclassifiable" and/or "attainment" for all criteria pollutants.[8]

The distance from the perimeter of the Area of operations at Red Hills to the nearest occupied residence or structure, or school is greater than 1.6 km (1 mile).

The Class I areas within 300 km of Red Hills are Carlsbad Caverns National Park (~80 km W-WSW), Guadalupe Mountains National Park (~115 km WSW), Salt Creek Wildlife Area (~170 km NNW), White Mountain Wilderness (~275 km WNW), and Big Bend National Park (~280 km SSE). The closest exterior boundary of the Bosque del Apache Wildlife Refuge is ~350 km from the Red Hills. The applicable Class I areas are shown in Figure 2-3. Except for Big Bend National Park, the exterior boundaries of the Class I areas are fully within the 300 km distance from the Red Hills. The portion of the exterior boundary of Big Bend National Park within 300 km distance of the Red Hills is shown in Figure 2-4.

# 3. SOURCE CHARACTERIZATION

The following sections provide details associated with characterizing the emission sources for purposes of air dispersion modeling. A list of sources and associated parameters are provided in Appendix A. Stack parameters that are revised in the final modeling report and permit application will be highlighted in those submittals.

## 3.1 Point Sources

Emissions that enter the atmosphere through a stack will be modeled as point sources. Stack parameters for point sources (height above grade, exhaust temperature and velocity, and inside stack diameter) can be found in Appendix A.

## 3.2 Flares

Emissions from flares will be modeled as point sources using the velocity, temperature, and effective stack diameter prescribed in the NMED Modeling Guidelines.[9]

To properly simulate flaring events, Trinity proposes to adjust the release height of flare emissions above the physical flare height to reflect the enhanced buoyancy generated by the combusted gas heat release rate. Equation (2) in Section 2.1.2 of EPA's AERSCREEN procedures will be used to calculate the effective release height.[10] Application of the effective release height is commonly used to simulate both flare pilot emissions and flared gas events at major stationary sources in other Western U.S. states[11,12,13,14] and conforms with EPA's AERSCREEN flare screening procedures. The modeled effective release height for the flares will not exceed the Good Engineering Practice (GEP) stack height discussed in Section 4.6.

## 3.3 Area Sources

Fugitive $H_2S$ emissions from components will be modeled as area sources. The area source type and dimensions will follow NMED Modeling Guidelines[15] and will be provided in the modeling report and can be found in 8.5Appendix A.

[15] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Section 5.3.4.

## 3.4 Volume Sources – Roads

Haul roads will be modeled as two lanes to allow for two-way traffic. The road segments will be characterized as volume sources following EPA's haul road guidance.[16] The road modeling will be performed using adjacent volume sources with inputs as shown below. The road and haul truck dimensions will be representative of vehicle traffic at the facility.

- Volume width = road width in meters (m) + 6 m
- Volume height = 1.7 x average vehicle height in meters
- Number of volume sources = road segment length / volume width
- Initial lateral dimension of the volume ($\sigma_{yo}$) = volume horizontal dimension / 2.15
- Initial vertical dimension of the volume ($\sigma_{zo}$) = volume height / 2.15
- Release height = volume height / 2
- Emission rate per volume source = total emission rate / number of volume sources

Haul roads sources may be separated into segments specific to the type of vehicular traffic. Emissions will be allocated to each road source segment based on the number of volume sources needed to represent a specific road segment and the total emissions for the traffic on the segments.

[16] EPA memorandum from T. Fox to Regional Office Modeling Contacts, *Haul Road Workgroup Final Report Submission to EPA-OAQPS*. March 2, 2012.

# 4. CLASS II MODELING PROCEDURES

## 4.1 Model Selection

Trinity will utilize the current version of the US EPAAERMOD modeling system to estimate off-site impacts. AERMOD is appropriate for use in modeling multi-source emissions, and accounts for plume downwash, stack tip downwash, and point, area, and volume sources.[17, 18]

Current versions of the AERMOD model and preprocessors[19] are:

- AERMAP Version 24142
- AERMOD Version 24142
- BPIPPRM Version 04274

All model input/output files and supporting data used in the modeling analysis will be provided electronically to NMED and represented in the modeling report. The latest version of these models will be utilized in the event of an update from EPA following submittal of this Protocol.

## 4.2 Model Input Options

Model input options will be set to EPA regulatory default values. Steady state emission rates for all averaging periods will be modeled using the maximum short-term emission rate allowed in the Red Hills permit application.[20] Startup, shutdown, and maintenance (SSM) emission rates will be modeled as shown in Appendix A, using point sources and scenarios separate from steady state impacts to demonstrate compliance with standards. Short-term emissions for limited-hour sources (e.g., backup power generator engines) will be modeled at the maximum short-term emission rate for deterministic standards ($PM_{10}$, CO) and at annualized emission rates based on the EPA guidance[21] for probabilistic standards ($NO_2$, $SO_2$). Although $PM_{2.5}$ is a probabilistic standard, short-term emissions for limited-hour sources will be modeled at the maximum short-term emission rate.

[17] User's Guide for the AMS/EPA Regulatory Model - AERMOD (EPA-454/B-23-008). Office of Air Quality Planning and Standards. October 2023.

[18] Code of Federal Regulations, Title 40 – Protection of Environment, Part 51, Appendix W, January 17, 2017.

[19] NMED provides pre-processed meteorological data [Resource Space (resourcespaceapp.azurewebsites.net)]. The data are available from NMED and were processed with AERMET Version 19191. Use of the current version of AERMET (Version 24142) is not expected to produce appreciably different dispersion meteorological conditions for this application. Therefore, the meteorological preprocessors AERSURFACE, AERMINUTE, and AERMET will not be used in this application. See Section 4.7 for a discussion of the proposed meteorological data.

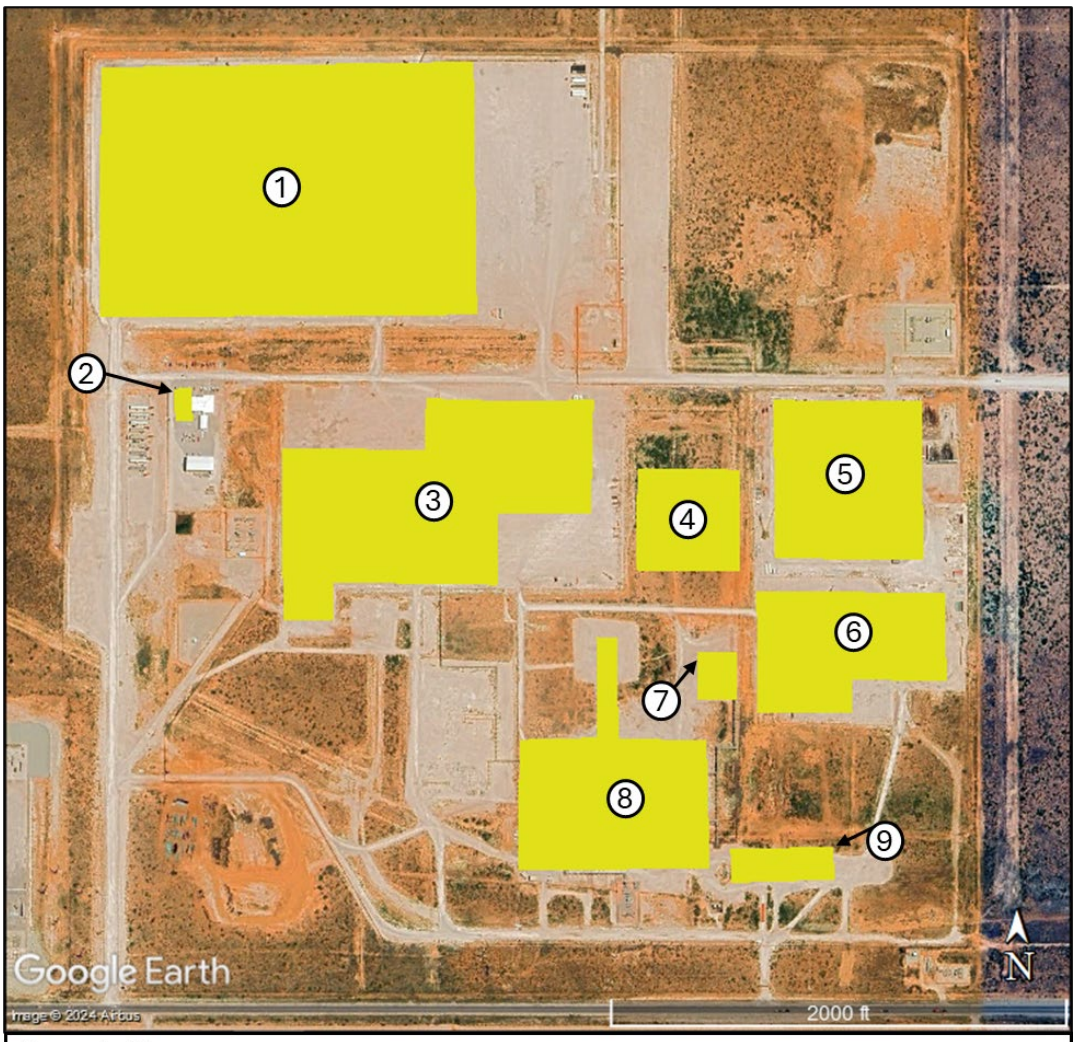
[20] See Appendix A, Table 2-E, excerpted from the Title V renewal application, June 2023.

[21] Additional Clarification Regarding Application of Appendix W Modeling Guidance for the 1 hour $NO_2$, National Ambient Air Quality Standard. Memorandum from Tyler Fox (Leader, Air Quality Modeling Group). March 1, 2011. (Note that this guidance also applies to the 1-hour $SO_2$ NAAQS).

## 4.3 Alternate Operating Scenarios

For units with alternative operating scenarios occurring at the same emission point, such as the flares at the facility, the maximum scenario will be used for the modeling demonstration. The alternative operating scenarios will be detailed Section 15 of the application package submittal.

For alternative operating scenarios that occur at different emission points, all scenarios will be modeled in the significant impact analysis and the scenario that results in the most significant impact will be used to demonstrate compliance through a cumulative analysis.



The most significant alternative operating scenario revolves around the flares that operate on the acid gas trains. Three scenarios exist: RHA-FL-5100 operating independently, RA2-FL-25100 operating independently, and RHA-FL-5100 and RA2-FL-25100 operating simultaneously. Details regarding the limitation of these scenarios and their associated emission rates will be provided in detail in the application and modeling report submitted to the NMED. Preliminary emissions associated with the scenarios are presented in Appendix A.

## 4.4 Portable Sources

Targa operates numerous portable diesel-fired generators and one heater trailer to support various activities throughout the facility that require additional power or heat. Targa seeks flexibility to relocate the generators and heater trailer within the Generator Zones, as outlined in Figure 4-1, with exact zone boundaries provided in Table 4-1. The generators and heater trailer will be modeled at various locations at the boundary of the operational areas at a spacing of 10 meters apart, closest to ambient air to determine the locations with a maximum impact. Since the same meteorological data will be used for the modeling of all pollutants for this facility, it is assumed that the location of worst impact will be identical for the generators. Therefore, it is assumed that the generator location modeling will appropriately determine the location of the worst-case impact for the units. These locations will be used for all significant impact and cumulative impact modeling. Portable and temporary sources will not be modeled for PSD Increment, according to the notes to Table 21 of the NMED Modeling Guidelines[22].

[22] [22] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Section 2.7.1, Table 21.

## 4.5 Land Use Classification

A qualitative Auer land-use analysis, as described in Section 7.2.1.1(b)(i) of the Modeling Guideline was performed to determine the appropriate dispersion coefficients used by the AERMOD model. The qualitative land use analysis was performed using aerial imagery from Google Earth.

Figure 4-2 presents an aerial image of the area around the Red Hills plant. The red circle shown represents a 3-km radius circle out from the site.

If more than 50% of the area within a 3 km radius of the Red Hills is classified as land use types I1, I2, C1, R2, or R3 [heavy industrial, light/moderate industrial, commercial, compact residential (single family), or compact residential (multi-family), respectively], the URBANOPT keyword in AERMOD with appropriate inputs will be used. As shown in the image, the large majority of the land use is undeveloped and as such, rural dispersion coefficients will be used in AERMOD.

**Figure 4-2 Area Surrounding the Red Hills Plant**

## 4.6 Plume Downwash

The Red Hills point emission sources will be evaluated for proximity to nearby structures to determine if the stack discharge might become caught in the structures' turbulent wakes. Wind blowing around a building creates zones of turbulence that are greater than if the building was absent. AERMOD incorporates the Plume Rise Model Enhancements (PRIME) algorithms for estimating enhanced plume growth and restricted plume rise for plumes affected by building wakes.

EPA has promulgated stack height regulations that restrict the use of stack heights in excess of GEP in air dispersion modeling analyses. Under these regulations, that portion of a stack in excess of the GEP height is generally not creditable when modeling to determine source impacts. This essentially prevents the use of excessively tall stacks to reduce the ground-level pollutant concentrations. Trinity will ensure that no stacks are represented as exceeding GEP height described in EPA's GEP Technical Support document.[23]

Direction-specific building dimensions and the dominant downwash structure parameters used as inputs to AERMOD bill be determined using the *BREEZE®* BPIP software, developed by Trinity, which incorporates the current version of EPA's Building Profile Input Program for PRIME (BPIPPRM) building downwash processor.

[23] Guideline for Determination of Good Engineering Practice Stack Height (Technical Support Document for the Stack Height Regulations). EPA-450/4-80-023R.

The BPIPPRM processor is designed to incorporate the concepts and procedures expressed in the GEP Technical Support document[24] and other related documents. The site elevation was determined from digital elevation data.

The output from the BPIPPRM downwash analysis lists the names and dimensions of the structures generating wake effects and the locations and heights of the affected point sources. In addition, the output contains a summary of the dominant structure for each emission unit (considering all wind directions) and the actual building height and projected widths for all wind directions. This information will be input to the AERMOD air dispersion model for each point source.

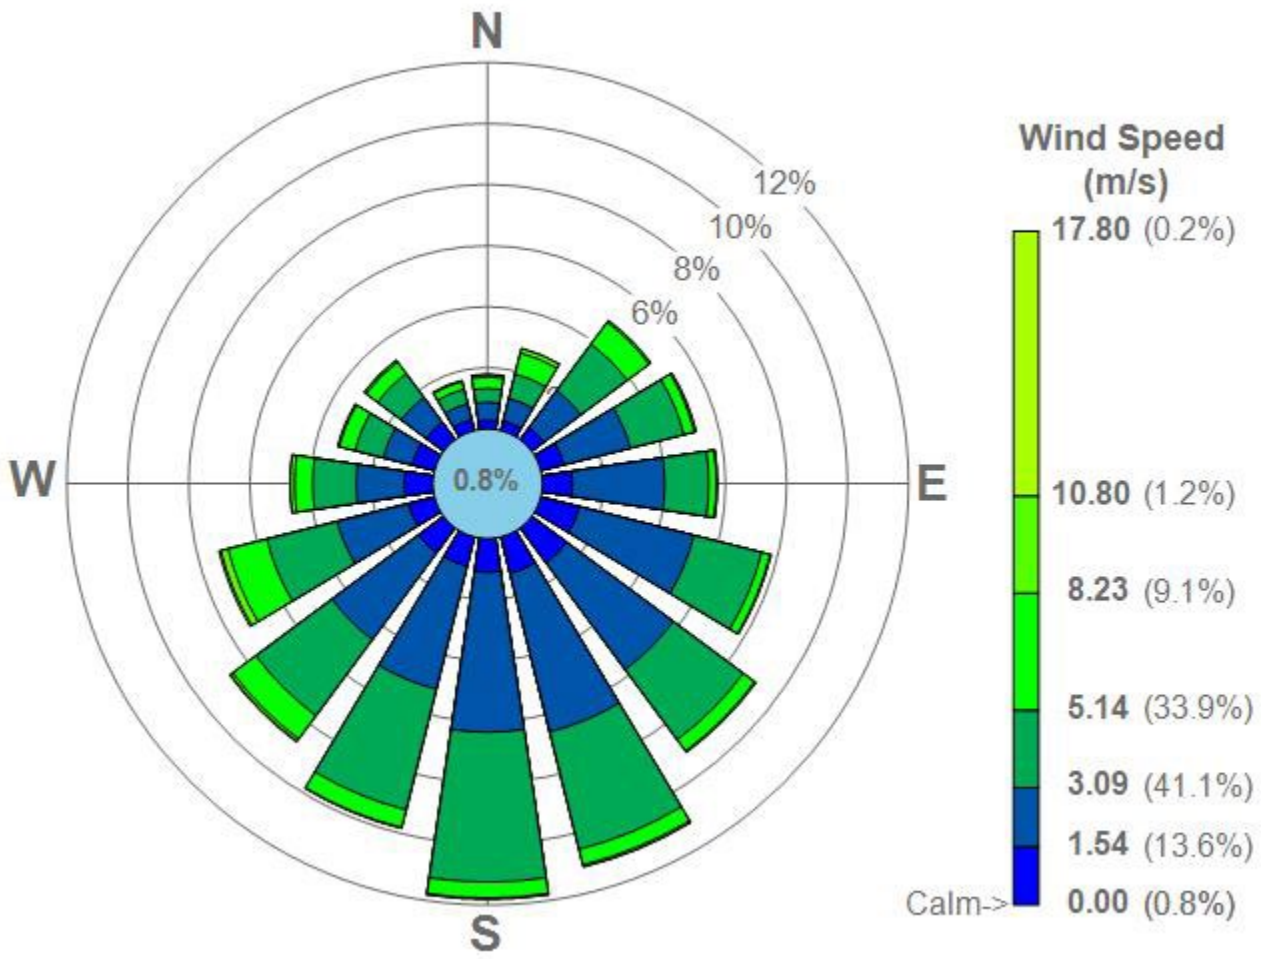
A simplified plot plan of the facility showing the locations of all proposed structures and emission units used in the plume downwash calculations, including structure dimensions and heights, will be provided in the modeling report. Structures with greater than 50% permeability will be excluded from the downwash analysis.

## 4.7 Meteorological Data

Hourly meteorological data used for air quality modeling must be spatially and climatologically representative of the area of interest. The Modeling Guideline requires at least one year of site-specific meteorological data or five years from the most recent, readily available data collected at a representative National Weather Service (NWS) station[25].

Site-specific meteorological data is not available for the immediate Red Hills area. The NMED provides processed meteorological data suitable for direct input to AERMOD.[26] Five years of AERMOD-ready meteorological data collected at Hobbs, New Mexico for the period 2017 through 2021 are proposed for this application. A composite 5-year wind rose is shown in Figure 4-3.

When updates to the Modeling Guideline were promulgated in 2017, EPA adopted the use of ADJ_U* as a regulatory option when using NWS airport meteorological data, site-specific meteorological data without turbulence parameters, or prognostic meteorological data. Utilizing ADJ_U* in data processing for meteorological data without turbulence parameters is recommended to address model overprediction issues during light wind, stable conditions. The NMED invoked the ADJ_U* option in the AERMET[27] processing of the Hobbs meteorological dataset. The surface station elevation is 1,108.2 m.



[24] Guideline for Determination of Good Engineering Practice Stack Height (Technical Support Document for the Stack Height Regulations). EPA-450/4-80-023R.

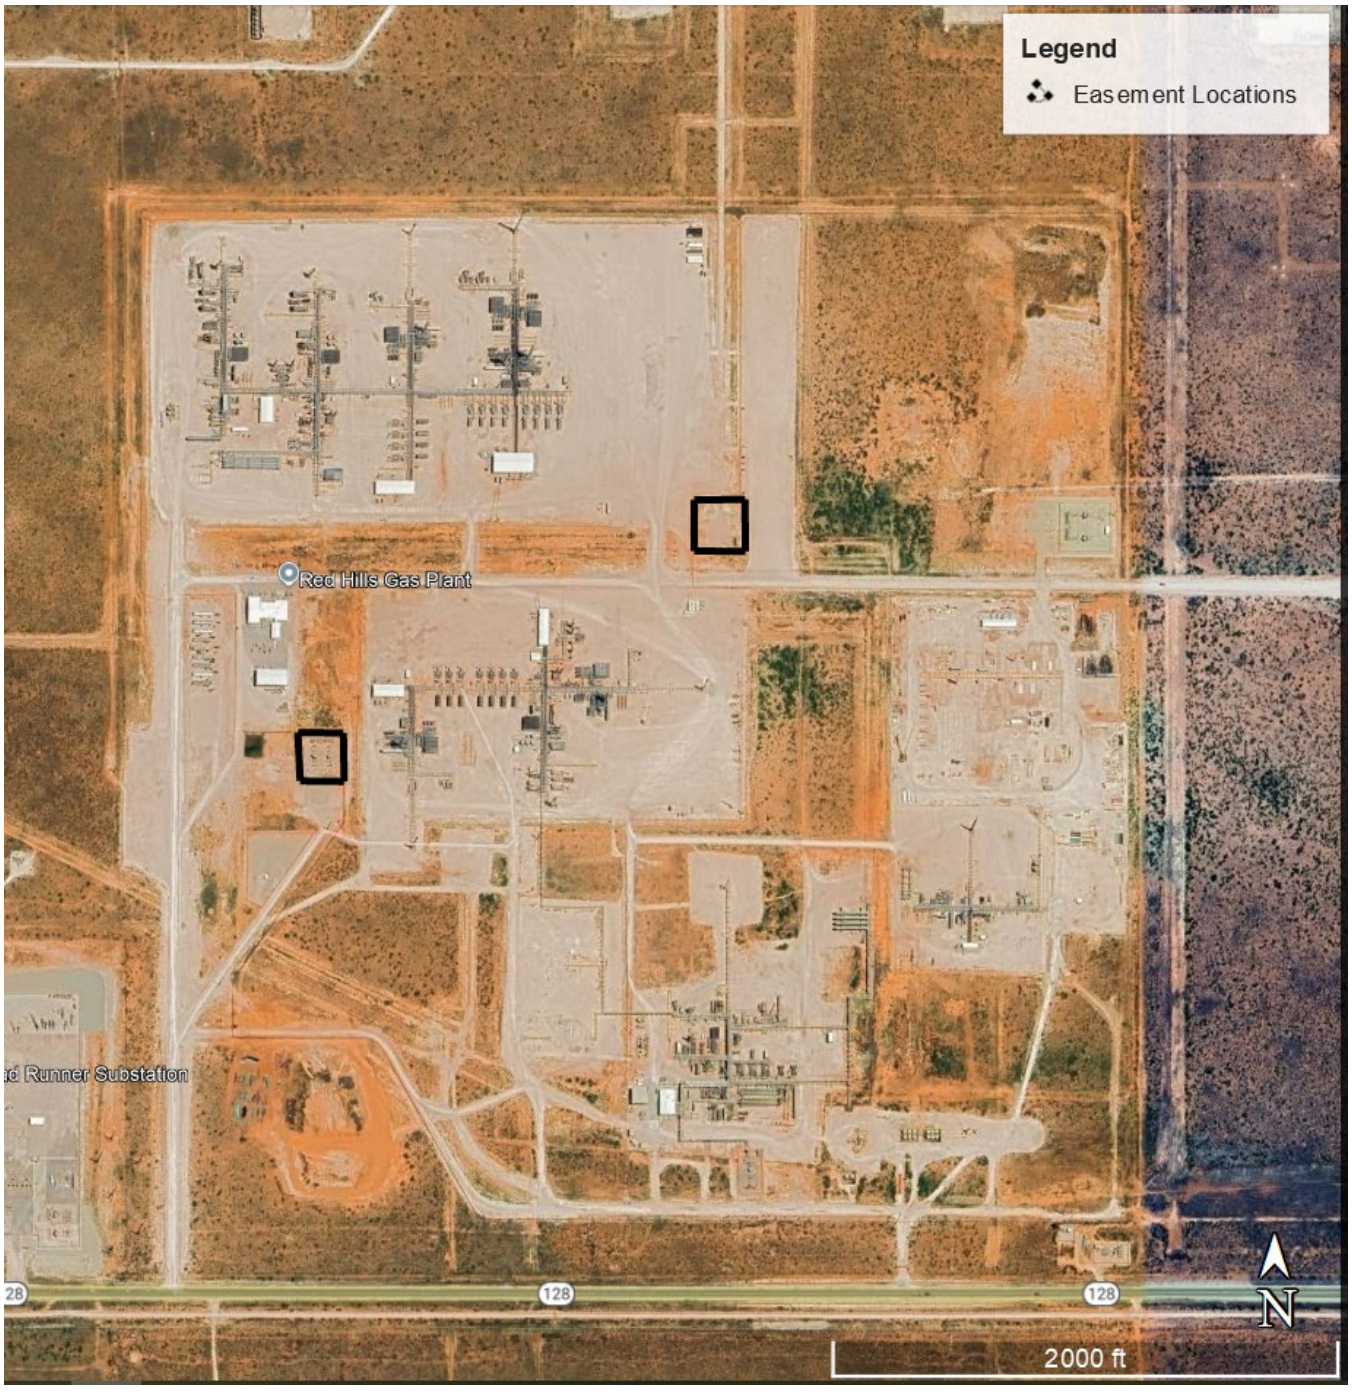
[25] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Section 4.3.1.

[26] Meteorological data available for download from Resource Space (resourcespaceapp.azurewebsites.net).

[27] The NMED processed the meteorological with AERMET Version 19191. Use of the current version of AERMET (Version 23132) is not expected to produce appreciably different dispersion meteorological conditions for this application.

**Figure 4-3 Hobbs, New Mexico Wind Rose**

## 4.8 Ambient Air Boundary



According to the NMED modeling guidelines, "ambient air" is defined as that portion of the atmosphere, external to buildings, to which the general public has access. The atmosphere over land owned or controlled by a facility may be excluded from ambient air where the facility employs measures, which may include physical barriers, that are effective in precluding access to the land by the general public. [28]

Within the facility boundaries of Red Hills, there are two separate areas that other companies have unrestricted access to. For this reason, onsite receptors are included within these two areas as denoted with yellow plus signs in Figure 4-4. The modeling report will include an image showing the land owned and controlled by Targa that constitutes the ambient air boundary used in the AQIA.

[28] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Section 4.6.2.

**Figure 4-4 Red Hills Gas Processing Plant Easement Locations**

Google Earth, image produced 04/08/2025

## 4.9 Receptor Network and Terrain Elevations

Cartesian receptor grids centered on the facility will be defined using UTM Zone 13 NAD83 coordinates. For purposes of air dispersion modeling, the NAD83 spatial reference system is equivalent to WGS84.[29] Several receptor grids of varying resolution will be defined for the Class II significant impact analysis following recommendations in NMED's modeling guidance.

The Class II significant impact analysis grids will consist of a set of nested receptors placed at:

- 25-m resolution at the two onsite easements.
- 25-m resolution along the ambient air boundary.
- 100-m resolution extending to approximately 500 m from the ambient air boundary
- 500-m resolution starting at 500 m and extending to approximately 5 km from the ambient air boundary.
- 1,000-m resolution starting at 5 km and extending to approximately 20 km from the ambient air boundary.
- 1,250-m resolution starting at 20 km and extending to approximately 50 km from the ambient air boundary.

For pollutants and averaging periods where modeled concentrations are greater than the applicable SIL and thus triggering cumulative impact analyses (see Section 5.2), only the receptors with modeled impacts greater than or equal to the SIL and will be modeled for the significant pollutant and averaging period.

If maximum cumulative impacts greater than or equal to 75 percent of the applicable standard are predicted at receptors located in the 100-m, 500-m or 1,000-m grids, supplemental receptors will be generated at 50-m spacing to identify the overall maximum impact. The refined grids will be large enough to include adjacent receptors in all directions (200 m square in the 100-m interval portion of the grid, 1,000 m square in the 500-meter interval portion of the grid, and 2,000 m square in the 1,000-meter interval portion of the grid). Figures showing the receptor grids will be included in the modeling report.

Receptor elevations will be obtained using the EPA's AERMAP terrain processor. The digital elevation dataset provided as input to AERMAP will be USGS National Elevation Data (NED) at 1/3 arc second resolution, which is equivalent to approximately 10 m.

In addition to receptor elevations, AERMAP will provide the hill height scale required for each receptor. The hill height scale supplies the computational algorithms with an indication of the relative relief within the modeling domain for the determination of the critical dividing streamline height for each hour of meteorological data. AERMOD computes the impact at a receptor as a weighted interpolation between horizontal and terrain-following conditions using a critical dividing streamline approach. This scheme assumes that part of the plume mass would have enough energy to ascend and traverse over a terrain feature and the remainder would impinge and traverse around a terrain feature under certain meteorological conditions. The hill height scale is computed by the AERMAP terrain preprocessor for each receptor as a measure of the one terrain feature in the modeling domain that would have the greatest effect on plume behavior at that receptor.

According to EPA guidance, the elevation array and domain boundary for AERMAP must include all terrain features that exceed a 10 percent elevation slope from any given receptor in order to properly calculate the hill height scale at each receptor. The domain for the hill height analysis will be set to at least the minimum required for proper handling of elevation slope.

[29] AERMAP User's Guide (EPA-454/B-18-004), Section 2.1.

## 4.10 Nearby Source Inventory

For pollutants and averaging periods that have impacts that exceed a SIL, cumulative modeling will be required to demonstrate compliance with the NMAAQS, NAAQS, and PSD increments, as applicable. In accordance with NMED's Modeling Guidance,[30] explicitly modeled nearby sources are required for $H_2S$, $PM_{10}$, $PM_{2.5}$, and $SO_2$. For CO, $NO_2$, and $SO_2$ (other than the 1-hour averaging period for NMAAQS, NAAQS, and increment, as applicable), an applicant may choose to explicitly model nearby sources within certain distances of the facility or add monitored background concentrations to facility-only modeled impacts for NMAAQS and NAAQS compliance demonstrations. For PSD increment analyses, while NMED provides the option to use monitored background concentrations, explicitly modeling nearby increment consumers and expanders may be preferred. Table 4-2 below summarizes the averaging periods to be modeled, NMED's guidance on the use of nearby sources and background, if nearby sources or background or both will be used for the facility's modeling, and the modeled concentration. Note that this may change during the course of the development of the application.

An inventory of all pollutants from surrounding sources will be obtained from NMED. Trinity will evaluate the inventory and will communicate with NMED on the choice of whether to explicitly model nearby sources or use monitored background concentrations for CO, $NO_2$, and $SO_2$ cumulative impact assessments. For pollutants that explicitly model nearby sources, the retention distance from the Red Hills Facility will follow Section 4.8.1.1 of NMED's Modeling Guidelines. The NMED-provided inventory will be used as applicable and any adjustments to source parameters will be documented in the modeling report and made per the guidance in Section 4.8.1.3 of NMED'S Modeling Guidelines.[31] Nearby source UTM coordinates will be preserved as provided by NMED unless errors are identified. If elevation data is provided, that data will be used in the model once verified. Per NMED Modeling Guidelines,[32] nearby sources for which elevation data is not provided, elevations will be calculated using AERMAP. Preliminary source inventories are included for $PM_{10}$ in Appendix B, for $PM_{2.5}$ in Appendix C, for $H_2S$ in Appendix D, and for $SO_2$ in Appendix E.

[30] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Table 20.

[31] NMED Air Dispersion Modeling Guidelines (Revised June 2024).

[32] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Section 4.5.2.

**Table 4-2 Nearby Sources and Background Determination**

| Averaging Period | NMED Guidance on Nearby Sources and Background | Nearby Sources or Background? | Modeled Concentration |
|---|---|---|---|
| CO 8-hour NMAAQs | Choose One (Both if near city) | Background | High 8 hour |
| CO 1-hour NMAAQs | Choose One (Both if near city) | Background | High 1 hour |
| $H_2S$ 1-hour or ½-hour NMAAQs | Model Nearby Sources | Nearby Sources | High 1 hour |
| $NO_2$ annual NMAAQs | Choose one (Both if near city) | Background | Annual average |
| $NO_2$ Annual PSD increment | Choose One | Background | Annual Average |
| $NO_2$ 1-hour NAAQs | Choose one (Both if near city) | Background | 98$^{th}$-percentile 1 hour |
| $PM_{2.5}$ annual NAAQs | Both | Nearby Sources and Background | Annual average |
| $PM_{2.5}$ annual PSD increment | Choose one | Nearby Sources | Annual average |
| $PM_{2.5}$ 24-hour NAAQS | Both | Nearby Sources and Background | 98$^{th}$-percentile 24 hour |
| $PM_{2.5}$ 24-hour PSD increment | Choose one | Nearby Sources | High second high 24 hour |
| $PM_{10}$ annual PSD increment | Choose one | Nearby Sources | Annual average |
| $PM_{10}$ 24-hour NAAQs | Both | Nearby Sources and Background | High second high 24 hour |
| $PM_{10}$ 24-hour PSD increment | Choose one | Nearby Sources | High second high 24 hour |
| $SO_2$ annual PSD increment | Choose one | Nearby Sources | Annual average |
| $SO_2$ 24-hour PSD increment | Choose one | Nearby Sources | High second high 24 hour |
| $SO_2$ 3-hour PSD increment | Choose one | Nearby Sources | High second high 3 hour |
| $SO_2$ 1-hour NAAQs | Choose one (Both if near city. Model nearby sources without adding background in Permian Basin) | Nearby Sources | 99$^{th}$ -percentile 1 hour |

The below sections detail adjustment to surrounding source parameters that have been identified as of the time of this protocol submittal. Additional refinements may be made during the course of the application development. If any additional changes are made, details will be included in the modeling report.

### 4.10.1 Surrounding Source AI # 40063

Surrounding source AI # 40063, with AQB source ID #40063@1, is the Roswell Ready Mix Company's Concrete Batch Plant which operates under GCP-5 #9285. $PM_{10}$ and $PM_{2.5}$ emission rates were based off 95 tpy (21.69 lb/hr) total suspended particulate (TSP) from the GCP-5 permit for Concrete Batch plants. No emission calculations were submitted with the last permitting action. Since TSP is larger than both $PM_{10}$ and $PM_{2.5}$, the 21.69 lb/hr emission rates were ratioed based on particle size multiplier constants taken from AP-42 Chapter 13.2.4 for Aggregate Handling and Storage Piles. The new values are: 10.26 lb/hr $PM_{10}$ and 1.55 lb/hr $PM_{2.5}$. Calculations are included in Appendix F for reference. The GCP-5 permit has been included for reference in Appendix G and the most recent publicly available permit application for GCP-5 #9285 is included for reference in Appendix H. AP-42 Chapter 13.2.4 is included for reference in Appendix I. Additionally, the facility's public notice notes that the facility operates during daylight hours only; therefore, the facility's emissions have been limited to 6am to 8pm. The facility public notice is included for reference in Appendix J.

### 4.10.2 Surrounding Source AI # 38504

Surrounding source AI #38504, with AQB source IDs 38504A1, 38504E3, 38504E5, 38504E6, 38504E7, 38504E36, and 38504E27, is Matador Production Company's Leo Thorsness Facility which operates under GCP-O&G #7899. Annual haul road emissions were adjusted based on the permitted tpy for $PM_{2.5}$. The tpy value was averaged over the course of the year to determine a long-term annualized emission rate in a lb/hr unit basis. Additionally, numerous unit emission rates for $PM_{2.5}$ were adjusted based on their actual operating hours per day and per year as provided in the surrounding source file, as retrieved from NMED's MergeMaster tool. Table 4-3 below summarizes the adjustments made. Permit GCP-O&G #7899 is included for reference in Appendix K and calculations are included in Appendix F.

**Table 4-3 AI # 38504 Adjusted Emission Rates**

| AQB Source ID | Unit ID | As Provided $PM_{2.5}$ Emission Rate | Daily Operating Hours | Annual Operating Hours | $PM_{2.5}$ Short-Term Emission Rate | $PM_{2.5}$ Long-Term Emission Rate |
|---|---|---|---|---|---|---|
| | | g/s | Hrs/day | Hrs/year | g/s | g/s |
| 38504A1[1] | HR-1 | 0.01386 | -- | 8760 | 0.01386 | 0.0023 |
| 38504E3 | ENG-5 | 0.00126 | -- | 8760 | 0.00126 | 0.00126 |
| 38504E5 | GEN-1 | 0.00504 | 3 | 1067 | 0.00063 | 0.000614 |
| 38504E6 | HT-1 | 0.00058 | -- | 8760 | 0.00058 | 0.00058 |
| 38504E7 | HT-2 | 0.00058 | 17 | 6192 | 0.00041 | 0.00041 |
| 38504E26[2] | ENG-2 | 0.00252 | 0 | 0 | 0.00252 | 0.00252 |
| 38504E27 | ENG-6 | 0.00252 | 11 | 3888 | 0.0012 | 0.0012 |

[1] Haul road emissions for unit HR-1 were adjusted for annualized rates based on the permitted tpy rate of 0.08 tpy for $PM_{2.5}$.

[2] Unit ENG-2 was conservatively assumed to operate 8760 hrs/yr instead of utilizing the provided hrs/yr in the surrounding source file.

### 4.10.3 Surrounding Source AI # 40140

Surrounding source AI #40140, with AQB source ID 40140A1, is Devon's Broadside 12 Facility 2, which operates under NOI #9357. The MergeMaster Source Retrieval tool provides only short-term emission rates. Annual haul road emissions were adjusted based on the tpy for $PM_{2.5}$ provided in the most recent NOI application. The tpy value was averaged over the course of the year to determine a long-term annualized emission rate in a lb/hr unit basis. Table 4-2 below summarizes the adjustments made. NOI #9357 is included for reference in Appendix L. Calculations are included in Appendix F.

**Table 4-4 AI # 40140 Adjusted Emission Rates**

| AQB Source ID | Unit ID | As Provided $PM_{2.5}$ Emission Rate | Daily Operating Hours | Annual Operating Hours | $PM_{2.5}$ Short-Term Emission Rate | $PM_{2.5}$ Long-Term Emission Rate |
|---|---|---|---|---|---|---|
| | | g/s | Hrs/day | Hrs/year | g/s | g/s |
| 40140A1[1] | ROAD-1 | 0.02772 | -- | 8760 | 0.02772 | 0.0011 |

[1] Haul road emissions for unit HR-1 were adjusted for annualized rates based on the NOI represented tpy rate of 0.038 tpy for $PM_{2.5}$.

### 4.10.4 Surrounding Source AI # 39913

Surrounding source AI #39913, with AQB source IDs 39913A1, 39913E2, and 39913E4, is Devon's Broadside 12 Facility 1, which operates under NOI #9134. The MergeMaster Source Retrieval tool provides only short-term emission rates. Annual haul road emissions were adjusted based on the tpy for $PM_{2.5}$ provided in the most recent NOI application. The tpy value was averaged over the course of the year to determine a long-term annualized emission rate in a lb/hr unit basis. The table below summarizes the adjustments made. NOI #9357 is included for reference in 0.

**Table 4-5 AI # 39913 Adjusted Emission Rates**

| AQB Source ID | Unit ID | As Provided $PM_{2.5}$ Emission Rate | Daily Operating Hours | Annual Operating Hours | $PM_{2.5}$ Short-Term Emission Rate | $PM_{2.5}$ Long-Term Emission Rate |
|---|---|---|---|---|---|---|
| | | g/s | Hrs/day | Hrs/year | g/s | g/s |
| 39913A1[1] | ROAD-1 | 0.02772 | -- | 8760 | 0.02772 | 0.0011 |

[1] Haul road emissions for unit HR-1 were adjusted for annualized rates based on the NOI represented tpy rate of 0.038 tpy for $PM_{2.5}$.

## 4.11 Background Concentrations

The portion of the background air quality that accounts for Other Sources as defined in Modeling Guideline, Section 8.3.1.(ii) [i.e., emission sources other than those that would be explicitly modeled under Section 8.3.1.(i) of the Modeling Guideline], must be characterized by ambient monitoring data. Other Sources are defined as the portion of the background attributable to natural sources, other unidentified sources in the vicinity of the Red Hills, and regional transport contributions from more distant sources (domestic and international). Table 4-6 provides the design values that will be used in the cumulative NMAAQS and NAAQS analyses for those pollutants and averaging periods that exceed the respective SIL. If refined background concentrations are used or if elimination of double-counting of emissions is performed, the methods provided in the NMED'S Modeling Guidelines will be employed.[33]

[33] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Section 4.4.1.4.

**Table 4-6 Proposed Background Air Quality Concentrations**

| Station/ AQS ID | Pollutant [a] | Averaging Period | Monitored Design Value ($\mu g/m^{3u}$) | NMAAQS/ NAAQS [b] ($\mu g/m^3$) |
|---|---|---|---|---|
| 5ZS Hobbs Jefferson/ 35-025-0008 | $NO_2$ | 1-Hour [c] | 58.3 | 188.03 |
| | | Annual [d] | 9.4 | 94.02 |
| El Paso Chamizal/ 48-141-0044 | CO | 1-Hour [e] | 4,577 | 14,997.5 |
| | | 8-Hour [e] | 3,433 | 9,960.1 |
| 5ZS Hobbs Jefferson/ 35-025-0008 | Ozone | 8-Hour [f] | 0.071 ppm | 0.070 ppm |
| Douglas Red Cross/ 04-003-1005 | $PM_{10}$ | 24-Hour [e] | 124 | 150 |
| 5ZS Hobbs Jefferson/ 35-025-0008 | $PM_{2.5}$ | 24-Hour [g] | 20 | 35 |
| | | Annual [h] | 6.6 | 9 |

a. Per NMED Air Dispersion Modeling Guidelines (Revised June 2024), Section 2.6.8.2, Red Hills and surrounding sources will be explicitly modeled and background $SO_2$ concentrations will not be added to the modeled impacts. Therefore, background $SO_2$ concentrations are not shown in this table. Both explicitly modeled nearby sources and background concentrations will be used in the $PM_{2.5}$ and $PM_{10}$ NMAAQS/NAAQS analyses. $NO_2$ and CO concentrations are provided for reference and cumulative NMAAQS/NAAQS analyses for these pollutants may only use explicitly modeled nearby sources.
b. The more stringent of the NMAAQS and NAAQS is shown in this table.
c. 98th percentile of 1-hour daily maximum concentrations, averaged over the 3-year period 2021-2023. Compliance with the 1-hour $NO_2$ NAAQS demonstrates compliance with the 24-hour NMAAQS.[34]
d. Maximum annual mean during the 3-year period 2021-2023.
e. 2nd highest concentration during the 3-year period 2021-2023.
f. 4th highest daily maximum 8-hour concentration, averaged over the 3-year period 2021-2023.
g. 98th percentile of the 24-hour average concentrations, averaged over the 3-year period 2021-2023.
h. Weighted annual mean concentration, averaged over the 3-year period 2021-2023.

## 4.12 Estimating $NO_2$ Impacts

Some forms of emitted $NO_X$ [i.e., nitrogen oxide (NO)] react with other atmospheric constituents (ozone) to form $NO_2$. These reactions are complex and depend on factors such as mixing of ambient air into the plume, individual reaction rates, and the concentration of specific reactants in the atmosphere. Regulatory dispersion models such as AERMOD are designed to model impacts of non-reactive pollutants, but there are various supplemental modeling techniques that can be used to estimate ambient $NO_2$ impacts.

The Modeling Guideline presents a three-tiered approach that may be applied to modeling $NO_2$ impacts. The three tiers are:

- Tier 1: assume full conversion of NO to $NO_2$ (i.e., assume that all $NO_X$ is emitted as $NO_2$).
- Tier 2: multiply the Tier 1 result by the Ambient Ratio Method 2 (ARM2), which provides estimates of representative equilibrium ratios of $NO_2/NO_X$ value based ambient levels of $NO_2$ and $NO_X$ derived from national data from the EPA's AQS.

[34] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Section 2.6.4.1.

- Tier 3: the ozone limiting method (OLM) or plume volume molar ratio method (PVMRM) as a detailed screening technique.

If Tier 3 methods are used, hourly and seasonal ozone and $NO_2$ background concentration data will be obtained from the NMED. In-stack ratios (ISR) of $NO_2/NO_X$ may be used for certain sources. The proposed ISRs may be obtained from the EPA's ISR database[35] or other data sources and will be provided to NMED for review and approval prior to use. At the time of submittal of this protocol, Tier 3 methods are not expected to be used for the modeling for this facility.

## 4.13 Secondary Pollutant Formation

Ozone and $PM_{2.5}$ are regulated pollutants under the Federal PSD program. Because the Red Hills site is a PSD source of the ozone precursors $NO_X$ and VOC and a source of direct $PM_{2.5}$ emissions and the $PM_{2.5}$ precursors $NO_X$ and $SO_2$, an air quality impact analysis is required for ozone and $PM_{2.5}$.

Secondary ozone and $PM_{2.5}$ formation resulting from facility emissions of $NO_X$ and VOC, and $NO_X$ and $SO_2$, respectively, will be evaluated using the methodology provided in EPA's Modeled Emission Rates for Precursors (MERPs) guidance[36] and guidance for ozone and fine particulate matter permit modeling.[37] Secondary formation of ozone and $PM_{2.5}$ from the Red Hills can be estimated using the following equation from the MERPs Guidance, Equation 2:

$$Facility\ Impact\ \left(\frac{\mu g}{m^3}\right) = Facility\ Emission\ Rate\ (tpy) \times \frac{Hypothetical\ Source\ Modeled\ Impact\ \left(\frac{\mu g}{m^3}\right)}{Hypothetical\ Source\ Emission\ Rate\ (tpy)}$$

The equivalent equation will be used to calculate secondary impacts resulting from each precursor and then summed for the total secondary contribution to ozone and $PM_{2.5}$ impacts. The modeled impacts from hypothetical sources can be obtained from the EPA MERPs View Qlik website.[38] The MERPs View Qlik website provides illustrative hypothetical single source modeled impacts for annual maximum daily 8-hour ozone, and daily maximum and annual average $PM_{2.5}$ for source locations across the United States based on various levels of precursor emissions (VOC, $NO_X$, and $SO_2$, as applicable) and stack heights.

Trinity reviewed the available hypothetical sources in the Qlik database and found that the nearest hypothetical source in New Mexico is in Otero County. MERP values are available for 500, 1,000, and 3,000 tons per year (tpy) of precursor emissions and 10 meter (m) and 90 m stack heights. Based on the preliminary Red Hills potential to emit, and range of stack heights, the modeled impacts associated with 500 tpy of precursor emissions from a 10 m stack will be used for this analysis. Table 4-7 provides the output from the MERPs View Qlik database for Otero County.

[35] Nitrogen Dioxide/Nitrogen Oxide In-Stack Ratio (ISR) Database | US EPA

[36] Guidance on the Development of Modeled Emission Rates for Precursors (MERPs) as a Tier 1 Demonstration Tool for Ozone and $PM_{2.5}$ under the PSD Permitting Program. Memorandum from Richard A. Weyland (Air Quality Assessment Division). April 30, 2019.

[37] EPA memorandum from C. Wayland and S. Mathias to EPA regional air division directors. July 29, 2022.

[38] https://www.epa.gov/scram/merps-view-qlik.

**Table 4-7 Closest Hypothetical MERP Source**

| Metric | Precursor | Emissions (tpy) | Stack Height (m) | Maximum Modeled Concentration ($\mu g/m^3$) |
|---|---|---|---|---|
| 24-Hour $PM_{2.5}$ | $NO_X$ | 500 | 10 | 0.006181 |
| 24-Hour $PM_{2.5}$ | $SO_2$ | 500 | 10 | 0.036081 |
| Annual $PM_{2.5}$ | $NO_X$ | 500 | 10 | 0.000284 |
| Annual $PM_{2.5}$ | $SO_2$ | 500 | 10 | 0.001754 |
| 8-Hour Ozone | $NO_X$ | 500 | 10 | 1.209116 |
| 8-Hour Ozone | VOC | 500 | 10 | 0.006089 |

The 2019 MERPs guidance states that the representativeness of a hypothetical source should be based on the chemical and physical environment (e.g., meteorology, background pollutant concentrations, and regional/local emissions and the following criteria:

- Proximity
- Terrain and Land Use
- Climate
- Regional Sources of Pollutants
- Background Pollutant Concentrations

If the predicted ozone formation from Red Hills precursor emissions is below the SIL value of 1 ppb, no further ozone analysis will conducted. If an ozone analysis is required, the proposed methods will be submitted as an addendum to this modeling protocol.

The predicted concentrations of secondarily formed $PM_{2.5}$ will be added to the AERMOD modeled impacts.

# 5. CLASS II MODELING ANALYSIS

## 5.1 Significant Impact Analysis

Significant impact analyses will be conducted to determine whether ambient air quality impacts on a pollutant-by-pollutant basis exceed the applicable Significant Impact Level (SIL) and require additional analysis. The significant impact analysis will include all facility emission units using the source characterizations discussed in Section 3, modeling methods in Section 4, the Cartesian receptor grids described in Section 4.9, and proposed emission rates presented in the permit application. The modeled significance impacts will be compared to the Class II SILs in Table 5-1.

**Table 5-1 Class II Significant Impact Levels for Air Quality Standards and PSD Increments**

| Pollutant | Averaging Period | SIL [a] ($\mu g/m^3$) |
|---|---|---|
| CO | 8-hour | 500 |
| | 1-hour | 2,000 |
| $NO_2$ [b] | Annual | 1.0 |
| | 24-hour | 5.0 |
| | 1-hour | 7.52 |
| Ozone [c] | 8-hour | 1.96 |
| $PM_{2.5}$ [d] | Annual | 0.13 |
| | 24-hour | 1.2 |
| $PM_{10}$ | Annual | 1.0 |
| | 24-hour | 5.0 |
| $SO_2$ | Annual | 1.0 |
| | 24-hour | 5.0 |
| | 3-hour | 25.0 |
| | 1-hour | 7.8 |

[a] All SIL analyses will compare the highest-first-high (H1H) modeled concentration to the applicable SIL.[39]

[b] The NMAAQS 24-hr averaging period compliance is demonstrated with compliance with the 1-hr averaging period.

[c] See Section 4.13.

[d] The annual $PM_{2.5}$ SIL was updated by EPA on 4/30/2024.[40] $PM_{2.5}$ modeled impacts will be the sum of direct secondarily formed $PM_{2.5}$ predicted by AERMOD for the 24-hour and annual averaging periods. Section 4.13 discusses the secondary $PM_{2.5}$ formation calculations.

[39] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Table 18

[40] Memo from R. Wayland (EPA Director of the Air Quality Assessment Division) to EPA Regional Air Division Directors titled: *Supplement to the Guidance on Significant Impact Levels for Ozone and Fine Particles in the Prevention of Significant Deterioration Permitting Program*. April 30, 2024.

Results will be reported for the maximum SIL impact for each pollutant and averaging period.

## 5.2 Cumulative Impact Analysis

### 5.2.1 New Mexico and National Ambient Air Quality Standards Analysis

A cumulative impact analysis will be performed for each pollutant and averaging period that exceeds the applicable SIL. Per modeling guidance, the cumulative impact modeling will be performed only for those receptors where the significant impact level is exceeded on a pollutant and averaging period basis. Compliance with the NMAAQS and NAAQS will be based on the total estimated air quality concentrations, which are the sum of the following:

- Red Hills emission sources;
- Modeled emissions from nearby sources described in Section 4.10; and
- Background pollutant concentrations described in Section 4.94.11.

The total estimated air quality concentrations will be compared to the NMAAQS and NAAQS shown in Table 5-2. Figures will be provided showing the maximum impact location for each pollutant and averaging period.

### 5.2.2 PSD Increment Analysis

A PSD increment is the maximum allowable increase in ambient concentrations allowed to occur above a baseline concentration for each applicable pollutant and averaging period. For PSD increment analyses, NMED allows two options: (1) Use monitored background concentrations or (2) model the facility and nearby increment consumers and expanders. If option 2 is used, the applicable Class II SIL is shown in Table 5-1. Class II PSD increment standards are shown in Table 5-2. All sources at Red Hills are considered increment consumers. The choice of option for each averaging period is outlined in Table 4-2. Surrounding source inventories are included in Appendix B, Appendix C, Appendix D, and Appendix E.

## Table 5-2 Air Quality Standards and Class II PSD Increments

| Pollutant | Averaging Period | NAAQS (µg/m³) | NMAAQS (µg/m³)[a] | Class II PSD Increment (µg/m³) | Design Value / Notes |
|---|---|---|---|---|---|
| $H_2S$ | ½-hour | -- | 139.3 | -- | Model the 1-hr averaging time. Include entire facility and nearby sources. No background concentration is added. |
| $SO_2$ | 1-hour | 196.4 | -- | -- | 3-year average of the 99th-percentile of the annual distribution of daily maximum 1-hour concentrations (H4H). Compliance with 1-hr average demonstrates compliance with all other NAAQS and NMAAQS averaging periods. |
| | 3-hour | -- | -- | 512 | Increment: H2H average |
| | 24-hour | -- | 261.9 | 91 | Increment: H2H average |
| | Annual | 26 | 52.4 | 20 | Annual average, averaged over 3 years |
| $PM_{2.5}$ [b] | 24-hour | 35 | -- | 9 | 98th percentile of the combined concentrations from all sources (H8H) |
| | Annual | 9 | -- | 4 | Annual average |
| $PM_{10}$ | 24-hour | 150 | -- | 30 | H2H and single year of representative met data or H4H with multi-year analysis. |
| | Annual | -- | -- | 17 | Annual average |
| $NO_x$ | 1-hour | 188.03 *(100 ppb)* | 188.03 *(100 ppb)* | -- | 3-year average of the 98th-percentile of the annual distribution of daily maximum 1-hour concentrations (H8H) |
| | Annual | 99.66 | 94.02 | 25 | Model entire facility and add annual background concentration or model entire facility and nearby sources. |
| CO | 1-hour | 40,069.6 | 14,997.5 | -- | NAAQS not to be exceeded more than once per year. NMAAQS not to be exceeded. Compliance with NMAAQS demonstrates compliance with NAAQS. |
| | 8-hour | 10,303.6 | 9,960.1 | -- | |
| Ozone | 8-hour | 137.3 (70 ppb) | -- | -- | Demonstrate compliance using MERPs method. |

# 6. ADDITIONAL IMPACTS

The PSD additional impacts analyses depend on existing air quality, the quantity of proposed emissions, and the sensitivity of local soils and vegetation in the Red Hills impact area. Additional impacts that will be reviewed for the pollutants subject to PSD review are:

- Growth analysis;
- Soils and vegetation analysis; and
- Visibility impairment analysis.

## 6.1 Growth Analysis

A growth analysis consists of a projection of the associated industrial, commercial, and residential growth that is likely to occur in the area due to the facility, and an estimate of the emissions generated by that associated growth. This analysis will be included in the modeling report.

## 6.2 Soil and Vegetation Analysis

Pursuant to the requirements in 40 CFR 52.21(o), an analysis of impacts to soils and vegetation of significant commercial or recreational value as a result of operating the Red Hills must be performed.

The EPA developed the secondary NAAQS in order to protect soil and vegetation air quality-related values that were not sufficiently protected by the primary NAAQS. The secondary NAAQS represent ambient air concentrations below which most types of soils and vegetation are unaffected by criteria pollutants. If predicted ambient air concentrations are found to be less than the secondary NAAQS, it is presumed that emissions from the Red Hills do not result in harmful effects to either soil or vegetation and no further soil or vegetation analysis will be performed.[41]

## 6.3 Visibility Impairment Analysis

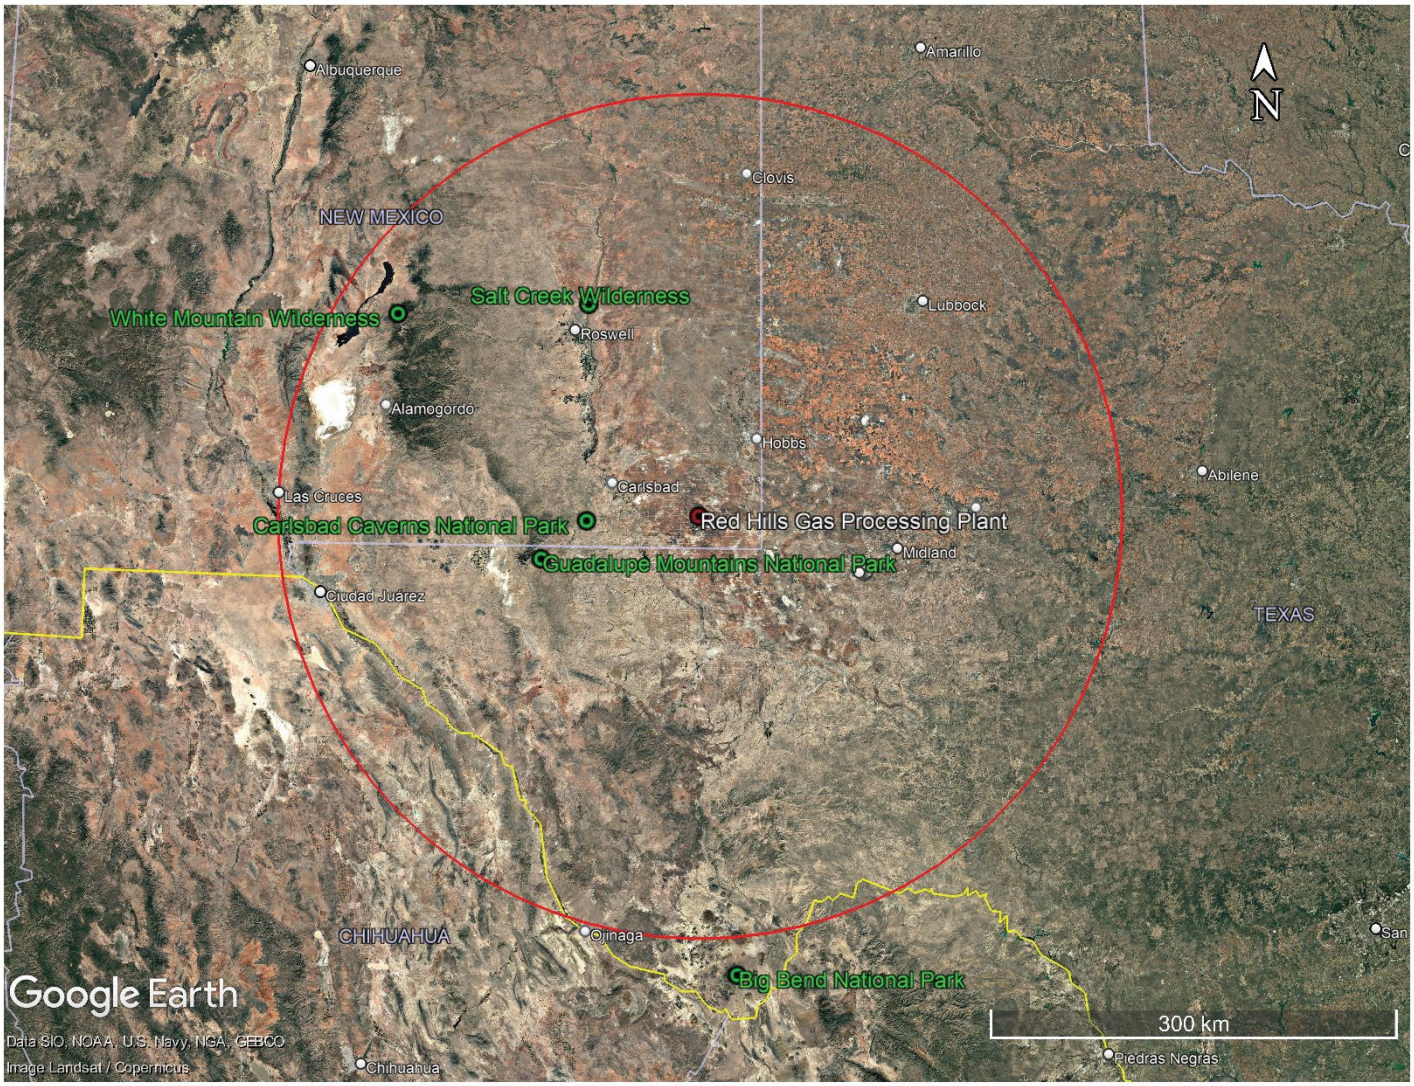
Per NMED guidance, a Class II visibility analysis is required to evaluate if facility emissions may have an impact on Class II area visibility. Trinity will utilize the EPA VISCREEN model following the guidelines published in the *Workbook for Plume Visual Impact Screening and Analysis* [42] to assess potential plume impairment of visibility. The VISCREEN model is designed to determine whether a plume from a facility may be visible from a given vantage point. To comply with the visibility requirements per Additional Impact Analysis (NMAC 20.2.74.304), Trinity will follow the guidance in the Modeling Guidelines Section 7.6.3.[43]

[41] EPA New Source Review Workshop Manual (Draft 1990) Section II.C.
[42] Environmental Protection Agency, Workbook for Plume Visual Impact Screening and Analysis (Revised), EPA-454/R-92-023, 1992.

[43] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Section 7.6.3.

# 7. PRELIMINARY CLASS I MODELING PROCEDURES AND ANALYSES

The NMED has requested that Targa demonstrate a passing Class II model prior to engaging with the appropriate Federal Land Manager (FLMs) to obtain their input on appropriate Air Quality Related Values (AQRVs). Therefore, this section of the Protocol is preliminary and will be revised and finalized once the FLMs have provided the AQRVs for those Class I Areas subject to further review.



There are no Class I areas within 50 km of Red Hills. The Class I areas within 300 km of Red Hills are Carlsbad Caverns National Park (~80 km W-WSW), Guadalupe Mountains National Park (~115 km WSW), Salt Creek Wildlife Area (~170 km NNW), White Mountain Wilderness (~275 km WNW), and Big Bend National Park (~280 km SSE). These Class I areas are shown in Figure 7-1. With the exception of Big Bend National Park, the exterior boundaries of the Class I areas are fully within the 300 km distance from the Red Hills.

## 7.1 Initial Screening Analyses

Trinity proposes to conduct initial screening analyses of the potential air quality impacts at Class I areas within 300 km of the Red Hills. The following sections present the initial screening analysis procedures and analyses that will be performed. If additional analysis is required, Targa will submit a specific Class I Area modeling protocol.

**Figure 7-1 PSD Class I Areas Within 300 km of Red Hills Gas Processing Plant**

Google Earth, image produced 12/05/2024

### 7.1.1 Significant Impact Analysis Screening

Initial screening for significant impacts will be conducted using EPA's initial screening procedures to address Class I increment impacts from the project.[44]

All model input/output files and supporting data used in the SIL screening analysis will be provided in the modeling report.

[44] Code of Federal Regulations, Title 40 – Protection of Environment, Part 51, Appendix W, Section 4.2(c)(i). January 17, 2017.

**Table 7-1 Class I Significant Impact Levels for Air Quality Standards and PSD Increments**

| Pollutant | Averaging Period | SIL [a] (µg/m³) | Form of SIL |
|---|---|---|---|
| $SO_2$ | 3-hour | 1.0 | H1H |
| | 24-hour | 0.2 | H1H |
| | Annual | 0.1 | H1H |
| $PM_{2.5}$ [b] | 24-hour | 0.27 | H1H [c] |
| | Annual | 0.03 | H1H [c] |
| $PM_{10}$ | 24-hour | 0.3 | H1H |
| | Annual | 0.2 | H1H |
| $NO_2$ | Annual | 0.1 | H1H |
| Ozone [d] | 8-hour | 1.96 | See Table Note d |

[a] The modeled facility-only impacts will be the H1H modeled concentrations for comparison to the SILs on an individual year basis unless otherwise noted.

[b] $PM_{2.5}$ modeled impacts will be the sum of direct $PM_{2.5}$ predicted by AERMOD and secondarily formed $PM_{2.5}$. See Section 4.13 for discussion of secondary $PM_{2.5}$ formation calculations.

[C] The annual $PM_{2.5}$ SIL was updated by EPA on 4/30/2024.[45] EPA guidance specifies that the highest of the multi-year averages of the maximum modeled 24 hour and annual $PM_{2.5}$ concentrations predicted each year at each receptor, based on 2 or more years and up to 5 complete years of available meteorological data, be used for the SIL analyses.[46]

[d] See Section 4.13.

## 7.2 Q/D ANALYSIS

A Q/D screening analysis was performed in a manner consistent with the proposed method as outlined in FLAG 2010.[47] This method compares the ratio of visibility-affecting pollutant (VAP, which includes $NO_X$, $SO_2$, and $PM_{10}$) emission rates associated with the project to the distance from the Class I area.

For the FLAG 2010 approach, "Q" is calculated as the sum of the worst-case 24-hour emissions due to the "project" converted to an annual basis. The "D'" term is defined as the distance, in kilometers (km), from the facility to the closest receptor in the corresponding Class I area. A Q/D screening threshold of ten (10) is provided in the FLAG 2010 guidance document.

---

[45] Memo from R. Wayland (EPA Director of the Air Quality Assessment Division) to EPA Regional Air Division Directors titled: *Supplement to the Guidance on Significant Impact Levels for Ozone and Fine Particles in the Prevention of Significant Deterioration Permitting Program*. April 30, 2024.

[46] EPA memorandum from C. Wayland and S. Mathias to EPA regional air division directors: Guidance for Ozone and Fine Particulate Matter Permit Modeling. July 29, 2022, Page 40.

[47] Federal Land Managers' Air Quality Related Values Work Group (FLAG), Phase I Report-Revised (2010), NSP,/NRPC/NRR, 2010

When considering the proposed emissions for facility, the total "Q" is roughly 35,213 tons per year (tpy). Table 3-1 shows the ratio of emissions to Class I distance (i.e., Q/D) for this project and as shown, the four (4) identified Class I areas have Q/D ratios more than 10.

**Table 7-2 Class I AQRV Screening Analysis Result**

| Class I Area | Distance (km) | Annualized Maximum Daily Emission Rate (tpy) | | | Q (tpy) | Q/D* | Additional Review? |
|---|---|---|---|---|---|---|---|
| | | SO2 | NOX | PM10 | | | (Yes/No) |
| Carlsbad Caverns National Park | 79.80 | 9,661 | 25,493 | 60 | 35,213 | 441.27 | Yes |
| Guadalupe Mountains National Park | 116.00 | | | | | 303.56 | Yes |
| Salt Creek Wilderness | 170.60 | | | | | 206.41 | Yes |
| Big Bend | 279.75 | | | | | 125.87 | Yes |

* Q/D values are based on preliminary emission estimates and are subject to change during the course of the application development.

## 7.3 Class I AQRV Analyses

The FLMs for Class I areas have the responsibility to protect air quality related values and to consider in consultation with the permitting authority whether a proposed major emitting facility will have an adverse impact on such values. Federal Land Managers' Air Quality Related Values Work Group (FLAG) 2010 Phase I Report defines the following:[48]

> *Air Quality Related Value* - A resource, as identified by the FLM for one or more Federal areas that may be adversely impacted by a change in air quality. The resource may include visibility or a specific scenic, cultural, physical, biological, ecological, or recreational resource identified by the FLM for a particular area.
>
> *Adverse Impact on Air Quality Related Values* - An unacceptable effect, as identified by an FLM, that results from current, or would result from predicted, deterioration of air quality in a Federal Class I or Class II area. A determination of unacceptable effect shall be made on a case-by-case basis for each area considering existing air quality conditions. It should be based on a demonstration that the current or predicted deterioration of air quality will cause or contribute to a diminishment of the area's national significance, impairment of the structure and functioning of the area's ecosystem, or impairment of the quality of the visitor experience in the area.

Red Hills will evaluate impacts to visibility, nitrogen, and sulfur deposition in order to address AQRVs at the four (4) Class I areas in Table 3-1. The following sections provide further details on the AQRVs that will be addressed for this project.

[48] https://www.fws.gov/guidance/sites/guidance/files/documents/FLAG Air Quality Phase 1 report.pdf

### 7.3.1 Deposition

In the deposition analysis, the project's contribution to the deposition of chemical species at the 4 Class I areas will be evaluated against the deposition analysis thresholds (DAT) for nitrate ($NO_3$) and sulfate ($SO_4$), which are set by the FLM. As the 4 Class I areas are located more than 50km from the facility, Targa will use CALPUFF to model deposition.[49]

As stated in *FLAG 2010* the DAT represents "the additional amount of nitrogen or sulfur deposition within a Class I area, below which estimated impacts from a proposed new or modified source are considered negligible." Moreover, according to *FLAG 2010* "if the new or modified source has a predicted nitrogen or sulfur deposition impact below the respective DAT, the NPS and FWS will consider that impact to be negligible, and no further analysis would be required of that pollutant." The recommended DAT is not necessarily an adverse impact threshold, rather it's used as a screening level value. The potentially-affected Class I areas are all in the Southwestern US, however since they are all west of the Mississippi river, the deposition impacts will be evaluated against appropriate sulfur and nitrogen DAT of 0.005 kg/ha/yr (each) for Class I areas in the Western United States.

Consistent with Interagency Workgroup On Air Quality Modeling (IWAQM) Phase 2 Summary Report *(IWAQM Phase 2)*, particulate-phase dry and wet deposition will be modeled for $SO_4$. For sulfur deposition, the sum of wet and dry deposition fluxes for $SO_4$ will be normalized by the molecular weight of sulfur and expressed as total S.

The contribution of the project to the deposition of sulfur and nitrogen species at each Class I area will be estimated and assessed against the DAT.

### 7.3.2 Visibility

Visibility can be affected by plume impairment (heterogeneous) or regional haze (homogeneous). Plume impairment results when there is a contrast or color difference between the plume and a viewed background (the sky or a terrain feature). Plume impairment is generally only of concern when the Class I area is near the proposed source (i.e., less than 50 km). Since the distances between the facility and the Class I areas are greater than 50 km, only regional haze will be considered.

### 7.3.3 Regional Haze

Regional haze occurs at distances where the plume has become evenly dispersed into the atmosphere such that there is no definable plume. The primary causes of regional haze are $SO_4$ and $NO_3$ (primarily as ammonium salts). Particulate emissions also contribute to regional haze but to a lesser extent since sulfates and nitrates are hygroscopic species that increasingly reduce visibility with increased relative humidity.

Regional haze is measured using the light extinction coefficient ($b_{ext}$). The Interagency Monitoring of Protected Visual Environments (IMPROVE) workgroup proposed a method informally known as "Method 8" to compute visibility impairments, which has been incorporated as the default method in *FLAG 2010*. This algorithm will be used to calculate the daily light extinction attributable to the project and light extinction attributable to a natural background.

To determine a change in regional haze, the percentage change of the light extinction coefficient ($\Delta b_{ext}$) will be evaluated using Equation 1:

[49] CALPUFF is required for Class I Areas greater than 50 KM from the source.

$$\Delta b_{ext} = (b_{ext(source+nat\ cond)} - b_{ext(nat\ cond)})/b_{ext(nat\ cond)}$$ (Equation 1)

The background extinction coefficient $b_{ext,(nat\ cond)}$ is affected by various chemical species and the Rayleigh scattering phenomenon and can be calculated as shown in Equation 2:

$$b_{ext} = 2.2 \times f_S(RH) \times [\text{Small Sulfate}] + 4.8 \times f_L(RH) \times [\text{Large Sulfate}] + 2.4 \times f_S(RH) \times [\text{Small Nitrate}] + 5.1 \times f_L(RH) \times [\text{Large Nitrate}] + 2.8 \times [\text{Small Organic Mass}] + 6.1 \times [\text{Large Organic Mass}] + 10 \times [\text{Elemental Carbon}] + 1 \times [\text{Fine Soil}] + 0.6 \times [\text{Coarse Mass}] + 1.7 \times f_{SS}(RH) \times [\text{Sea Salt}] + \text{Rayleigh Scattering (Site Specific)} + 0.33 \times [NO_2\ (\text{ppb})] \left\{\text{or as: } 0.1755 \times \left[NO_2\ \left(\frac{\mu g}{m^3}\right)\right]\right\}$$ *(Equation 2)*

Where:

[ ] indicates concentrations in µg/m$^3$

$f_S(RH)$ = Relative humidity adjustment factor for small sulfate and nitrate

$f_L(RH)$ = Relative humidity adjustment factor for large sulfate and nitrate

$f_{SS}(RH)$ = Relative humidity adjustment factor for sea salt

For Total Sulfate < 20 µg/m$^3$:

[Large Sulfate] = ([Total Sulfate] / 20 µg/m$^3$) x [Total Sulfate]

For Total Sulfate ≥ 20 µg/m$^3$:

[Large Sulfate] = [Total Sulfate]

And:

[Large Sulfate] = [Total Sulfate]-[Large Sulfate]

The natural background concentrations and Rayleigh scattering value at the Class I areas considered in this analysis are provided on an annual average basis in *FLAG 2010*. The values are shown in Table 7-3 and are representative of each of the four (4) Class I areas. The monthly relative humidity (f(RH)) values for each of the four (4) Class I areas were also obtained from *FLAG 2010* and are shown in 3-2 through 3-5.

The extinction coefficient $b_{ext(source)}$ due to emissions from the proposed project will be calculated. Pollutants that have the potential to affect visibility (particulate species) will be emitted from the proposed project. The extinction coefficient $b_{ext(source)}$ due to emissions of visibility affecting pollutants from a single project will be calculated using an air quality model (i.e., CALPUFF). The extinction due to the project will be calculated as shown in Equation 2 above and compared with natural conditions using Equation 1.

**Table 7-3 Annual Average Natural Conditions**

| Class I Area | Sulfate ($\mu g/m^3$) | Nitrate ($\mu g/m^3$) | OM ($\mu g/m^3$) | EC ($\mu g/m^3$) | Soil ($\mu g/m^3$) | CM ($\mu g/m^3$) | Sea Salt ($\mu g/m^3$) | Rayleigh $Mn^{-1}$ |
|---|---|---|---|---|---|---|---|---|
| White Mountain Wilderness | 0.12 | 0.10 | 0.60 | 0.02 | 0.50 | 3.00 | 0.03 | 9.00 |

### 7.3.4 Particulate Speciation

Equation 2 above for regional haze requires an estimate of the chemical composition and size distribution of the particulates emitted from the sources at the facility. Particulate extinction coefficients of a natural gas fuel burning source for use in the CALPOST program are based on best estimates for elemental carbon (EC), with the balance of filterable particulate divided between fine soil (PMF) and coarse mass (PMC). Condensable particulate matter will be assumed to be "Inorganic" Condensable $PM_{10}$ (CPM IOR) and secondary organic aerosol (SOA). A relative humidity adjustment factor of 3.0 * f (RH) is used to calculate the sulfate ($SO_4$) component of the light extinction coefficient, which accounts for the hygroscopic growth of sulfate aerosol in the presence of water vapor. Table 7-7 provides a summary of the particle speciation percentages based on the speciation profile from the EPA SPECIATE v5.3 database for a boiler burning natural gas [50].

**Table 7-7 Particle Speciation Percentages**

| Source | Coarse (PMC) | Fine Soil (PMF) | Fine EC | CPM IOR | SOA | Nitrate (NO3) |
|---|---|---|---|---|---|---|
| Heaters | 0.0 | 81.8 | 3.0 | 4.4 | 8.7 | 2.13 |
| Boilers | 0.0 | 81.8 | 3.0 | 4.4 | 8.7 | 2.13 |
| Thermal Oxidizer | 0.0 | 81.8 | 3.0 | 4.4 | 8.7 | 2.13 |

## 7.4 Class I PSD Increment Analyses

In general, all PSD permit applications are required to demonstrate through air quality modeling that the emissions from the proposed project will not cause or contribute to any violations of allowable increments within affected Class I areas, which are protected to a greater degree (i.e., the allowable increments are lower) than Class II areas. A significant contribution to Class I Increment consumption is defined as a modeled concentration in excess of the significant impact levels summarized in Table 3-7. These significant impact levels, which were originally developed as part of the 1996 NSR reform rulemaking, have been accepted by decision makers as an indication of whether a project is likely to cause or contribute to a Class I increment violation.

[50] https://www.epa.gov/air-emissions-modeling/speciate

**Table 7-8 Class I PSD Increments and Modeling Significance Levels**

| Pollutant | Averaging Period | SIL ($\mu g/m^3$) | Increment ($\mu g/m^3$) |
|---|---|---|---|
| $NO_2$ | Annual | 0.10 | 2.5 |
| $SO_2$ | 3-Hour | 1.00 | 25 |
| | 24-Hour | 0.20 | 5 |
| | Annual | 0.10 | 2 |
| $PM_{10}$ | 24-Hour | 0.30 | 8 |
| | Annual | 0.20 | 4 |
| $PM_{2.5}$ | 24-Hour | 0.27 | 2 |
| | Annual | 0.05 | 1 |

Because the facility PTE were used in the analysis, a Class I PSD Increment analysis will be completed for each pollutant listed in Table 7-8 at the Class I areas.

# 8. CLASS I AREA MODELING METHODS

The U.S. EPA established the CALPUFF modeling system as a screening tool for analyzing long-range pollutant transport (i.e., distances greater than 50 km) within the Guideline on Air Quality Models, Appendix W (*Guideline)*.[51] Ash Grove will use the EPA-approved version [Version 5.8.5 of CALPUFF (level 151214) and 6.221 of CALPOST (level 082724] of the CALPUFF modeling suite to determine the possible impacts of the proposed facility on Class I AQRVs at each of the five (5) Class I areas.

CALPUFF is a multi-layer, multi-species, non-steady-state Lagrangian puff model, which can simulate the effects of time- and space-varying meteorological conditions on pollutant transport, transformation, and removal. For this refined analysis, meteorological fields generated by CALMET will be used as inputs to the CALPUFF model to ensure that the effects of terrain and spatially varying surface characteristics on meteorology are considered.

In addition to meteorological data, the CALPUFF model uses several other input files to specify source and receptor parameters. The selection and control of CALPUFF options are determined by user-specific inputs contained in the control file. This file contains all of the necessary information to define a model run (e.g., starting date, run length, grid specifications, technical options, output options). The air quality modeling will be performed using CALPUFF default options unless otherwise noted, as specified in the federal *Guideline* and IWAQM documents. The following sections describe the modeling domain, meteorological data, background concentrations, and model implementation that will be used for the analysis of the Red Hills facility.

## 8.1 Modeling Domains

The location, terrain, and land use within the meteorological CALMET and computational CALPUFF domains will be based on the previously-developed datasets. Red Hills proposes to use the 2018-2020 WRF data recently compiled and distributed by Tim Allen at USFWS.[52] The CALPUFF computational domain will be set to encompass the entire CALMET domain selected and will use the same grid spacing (12 km). The horizontal domain is comprised of grid cells, each containing a central grid point at which meteorological and computational parameters are calculated at each time step. Red Hills is proposing to use a domain defined with Lambert Conformal Coordinate (LCC) shown in Table 8-1 and as shown in Figure 8-1. This domain is 612 km x 684 km which corresponds to a grid of 51 x 57 cells at a 12 km resolution. The grid center is offset from the facility to capture the Class I areas to the west and south.

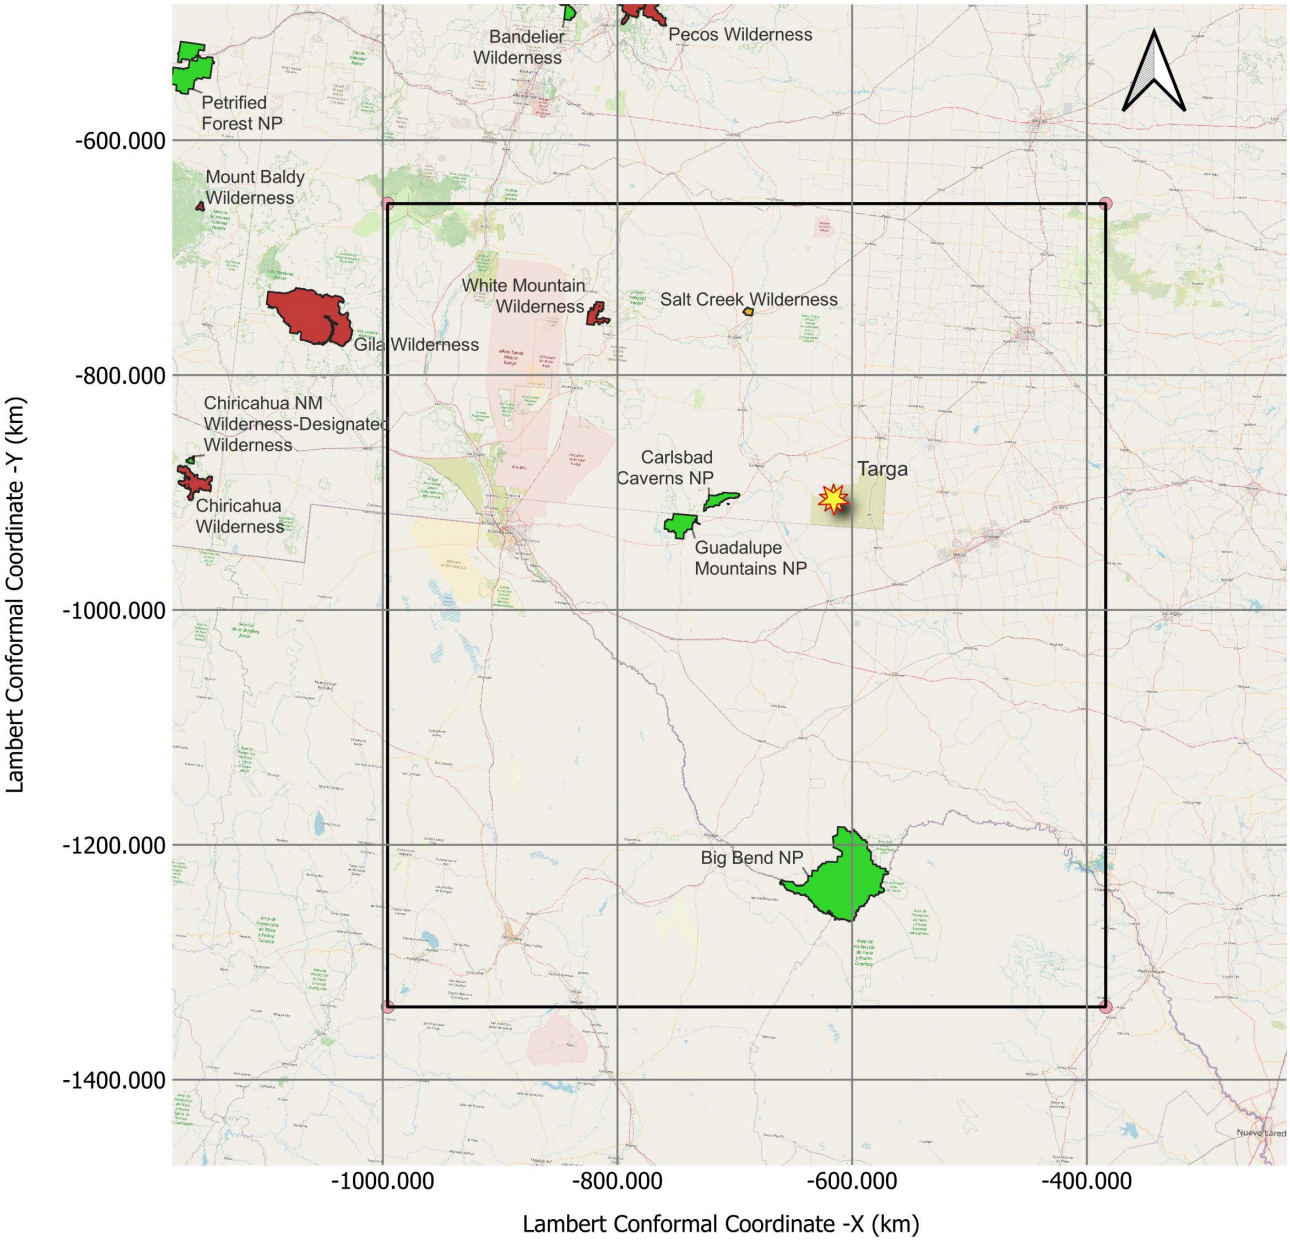

**Table 8-1 Model Domain Coordinates**

| Indices | Longitude | Latitude | LCC X (km) | LCC Y (km) |
|---|---|---|---|---|
| SW | -107.04637 | 28.04069 | -996.000 | -1338.000 |
| NE | -101.20709 | 34.58297 | -384.000 | -654.000 |

[51] https://www.epa.gov/scram/air-quality-dispersion-modeling-alternative-models

[52] WRF Data received via external harddrive shipped by Tim Allen (USFWS) on October 20, 2023

**Figure 8-1 Map Showing CALPUFF Modeling Domain**

Vertical grid structure is defined by the cell face height. The cell face height of each cell indicates its vertical extent. The vertical domain will be composed of terrain-following grid cells, the number and size of which are chosen so as to constrain the boundary layer where dispersion and chemical transformations take place. The highest cell face is proposed to be 4,000 meters to constrain the default maximum mixing height of 3,000 meters. CALMET and CALPUFF will use the same cell face heights. Table 8-2 summarizes the vertical grid structure proposed for both analyses.

**Table 8-2 Vertical Grid Structure**

| Vertical Grid Cell | Cell Face Height (meters) |
|---|---|
| 1 | 20 |
| 2 | 40 |
| 3 | 80 |
| 4 | 160 |
| 5 | 320 |
| 6 | 640 |
| 7 | 1,000 |
| 8 | 2,000 |
| 9 | 3,000 |
| 10 | 4,000 |

Ambient impacts are predicted at receptors specified by the FLMs to represent Class I Areas.[53] Receptor elevations were provided by NPS. Note that the coordinates used in this modeling simulation were Lambert Conformal Coordinates (LCC) based on the design of the CALMET meteorological domain. These coordinates have an origin of 40.574°N and 97°W with standard parallels of 33°N and 45°N. Receptor locations for the Class I areas will be converted to LCC using the Class I conversion tool provided by the NPS. The modeling domain may shift slightly to match the 12 km grid in the WRF data.

## 8.2 CALPUFF Meteorological Processing

Data from the 2018-2020 meteorological data set will be extracted in CALPUFF-ready format using the Mesoscale Model Interface (MMIF) tool provided by U.S. EPA. The data will be processed using the regulatory default settings in the MMIF guidance document.[54]

## 8.3 CALPUFF Model Processing

Using the data provided by MMIF, CALPUFF will be used to simulate the dispersion, deposition, and chemical transformation of discrete puffs of mass from emission sources. Each puff will contain emissions of each modeled species and will be advected throughout the domain while deposition and chemical transformation processes take place. CALPUFF is a Lagrangian puff model, the principal advantages of which are that pollutant plumes can evolve dynamically and chemically over time and can respond to complex winds caused by terrain effects, stagnation, or recirculation.

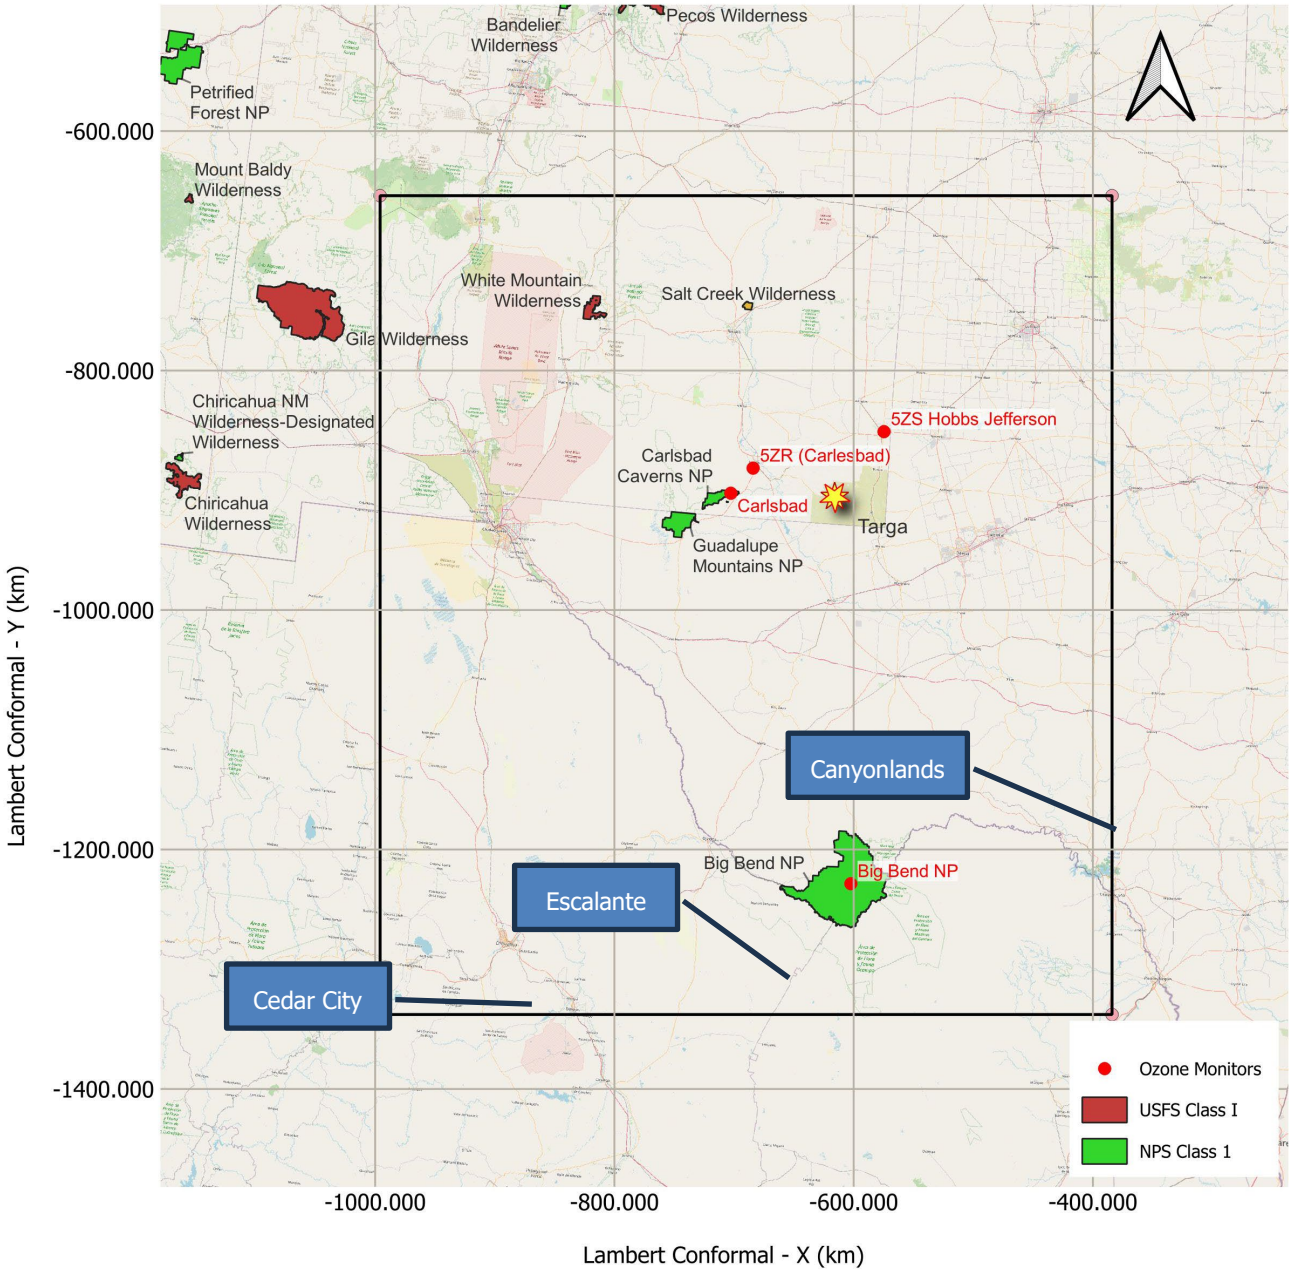
Emissions data for the Red Hills Plant will be entered into CALPUFF. The modeling analysis will only include the main combustion sources (i.e., heater, flares, etc) as this is the source that would be expected to contribute to long range transport. Fugitive PM emissions such as those from paved roadways will not be included due to their very localized nature. Emergency engines will also be excluded from the modeling given their infrequent operation and localized impacts.

[53] http://www.nature.nps.gov/air/maps/receptors/index.cfm

[54] https://www3.epa.gov/ttn/scram/models/relat/mmif/MMIF_Guidance.pdf

This analysis will be performed with the deposition and chemical transformation algorithms enabled. A full resistance model is provided in CALPUFF for the computation of dry deposition rates of gases and particulate matter as a function of geophysical parameters, meteorological conditions, and pollutant species. An empirical scavenging coefficient approach using default options will be enabled in CALPUFF to compute the depletion and wet deposition fluxes due to precipitation scavenging.

The CALPUFF model is capable of simulating linear chemical transformation effects by using pseudo-first-order chemical reaction mechanisms for the conversions of $SO_2$ to $SO_4$ and $NO_X$, which consists of NO and $NO_2$, to $NO_3$ and $HNO_3$. There are two user-selected input parameters that affect the MESOPUFF II chemical transformation, ammonia concentrations and ozone concentrations. The selection of each parameter is discussed separately.



### 8.3.1 Ozone

Ambient ozone concentrations can be input to the model as a background level or using hourly, spatially varying observations. For this analysis, monthly average ozone background values will be computed for each modeled year (2018, 2019 and 2020) from the CASTNET and AIRS data) The proposed sites for the ozone data are in Table 8-3 and their locations are demonstrated in Figure 8-2.

**Table 8-3 Proposed Ozone Background Monitors**

| Class I Area | Proposed Ozone Monitor Location | Proposed Ozone Monitor ID |
|---|---|---|
| White Mountain Wilderness | Carlsbad SZR | 35-015-1005 |
| Salt Creek Wilderness | Carlsbad SZR | 35-015-1005 |
| Guadalupe Mountains NP | Carlsbad and Carlsbad SZR | 35-015-1005 and 35-015-0010 |
| Carlsbad Caverns NP | Carlsbad and Carlsbad SZR | 35-015-1005 and 35-015-0010 |
| Big Bend NP | Big Bend | 48-043-0101 |

**Figure 8-2 Map Showing Ozone Monitor Locations**

## 8.3.2 Ammonia

*IWAQM Phase 2* recommends the use of spatially constant background ammonia concentrations to participate in the MESOPUFF-II chemical transformation mechanism. Ammonia background data may be available from the National Atmospheric Deposition Program (NADP), Ammonia Monitoring Network. However no nearby monitors were found within the modeling domain. Given the landuse across the domain is predominantly comprised of arid lands, the default ammonia background of 1.0 ppb will be applied for this analysis.

### 8.3.3 CALPUFF Processing Control

CALPUFF modeling will be conducted using the recommended regulatory default options specified in Appendix B of *IWAQM Phase 2*. The integrated puff representation will be used and puff splitting will be conservatively disabled. Any deviations from *IWAQM Phase 2* will be provided in the Class I modeling report. A summary of CALPUFF switches is in Appendix B.

## 8.4 POSTUTIL Processing

The first postprocessing step involves running POSTUTIL to calculate the concentrations of visibility-affecting and deposited species prior to running CALPOST. Specifically, POSTUTIL will be used to combine the appropriate wet and dry fluxes of sulfur-bearing species deposited as particles and gases.

The other step in the analysis which will be performed in POSTUTIL is to repartition the nitrogen mass between nitric acid and nitrate. This processing stage, referred to as the ammonia limiting method (ALM), will be accomplished by utilizing the default setting in POSTUTIL of MNITRATE = 1.

## 8.5 CALPOST Postprocessing Analysis

The CALPOST postprocessor will be used to compute the total deposition of nitrogen and sulfur within each of the five (5) Class I areas for assessment against the DAT as well as the 24-hour average visibility impairment. Section 3 generally described the technical approach for computing these values from the modeled concentrations of pollutant emissions. A summary of CALPOST program switches is included in Appendix B.

A change in light extinction attributable to a single facility of 5% or less on a 24-hour average basis is generally acceptable to the FLM. The FLAG 2010 guidance establishes a metric for assessing whether a single facility causes or contributes to visibility impairment. This guidance establishes a 5% extinction change threshold for contribution and a 10% extinction change threshold for causation of visibility impairment. These thresholds are applied to the 98th percentile model result for an analysis that considers multiple years of meteorological data. In other words, application of the 98th percentile standard formalizes the intensity, duration, and frequency aspects of modeled visibility impairment events by standardizing discretion left to the FLM on a case-by-case basis to exclude visibility impairment events that could be due to meteorological conditions or other naturally occurring phenomena that are not attributable to the emissions source.

# APPENDIX A. MODELED EMISSION RATES AND SOURCE PARAMETERS

The emission rates and stack parameters may change throughout the development of this application.
