*RE: Application for PSD Major Modification to NSR Permit 4310-M6R1*
*Targa Northern Delaware, LLC – Red Hills Gas Processing Plant*

Permit Programs Manager:

On behalf of Targa Northern Delaware, LLC, Trinity Consultants is submitting a PSD Major Modification application for the Red Hills Gas Processing Plant, currently authorized to operate under NSR Permit No. 4310-M6R1.

With this application, Targa is seeking to update calculation methodologies, representations, emission limits, and throughput capacities throughout the facility. Targa is submitting this application to apply for a PSD major modification pursuant to 20.2.74.300.D NMAC. With this modification, the facility will undergo PSD review for $NO_x$, CO, VOC, $SO_2$, $PM_{10}$, $PM_{2.5}$, and $H_2S$ as the increases exceed the PSD major source thresholds or their respective significant emission rates. Per 20.2.74.7.AG NMAC, any major source that is major for nitrous oxides ($NO_x$) or volatile organic compounds (VOC) shall also be considered major for ozone. Targa has also determined that greenhouse gas emissions for the modification will exceed the major source threshold.

The format and content of this application are consistent with the Bureau's current policy regarding PSD applications; it is a complete application package using the most current application form. Enclosed are two hard copies of the application. Please feel free to contact Robert Andries, Senior Environmental Specialist for Targa Northern Delaware, LLC, at (713) 584-1360 or by email at randries@targaresources.com.

Sincerely,
Trinity Consultants

Cc: Rob Liles, rliles@trinityconsultants.com (Trinity Consultants)

**Air Permit Application**
**Compliance History Disclosure Form**

Pursuant to Subsection 74-2-7(S) of the New Mexico Air Quality Control Act ("AQCA"), NMSA §§ 74-2-1 to -17, the New Mexico Environment Department ("Department") may deny any permit application or revoke any permit issued pursuant to the AQCA if, within ten years immediately preceding the date of submission of the permit application, the applicant met any one of the criteria outlined below. In order for the Department to deem an air permit application administratively complete, or issue an air permit for those permits without an administrative completeness determination process, the applicant must complete this Compliance History Disclosure Form as specified in Subsection 74-2-7(P). An existing permit holder (permit issued prior to June 18, 2021) shall provide this Compliance History Disclosure Form to the Department upon request.

# Universal Air Quality Permit Application

**Use this application for NOI, NSR, or Title V sources.**

Use this application for: the initial application, modifications, technical revisions, and renewals. For technical revisions, complete Sections, 1-A, 1-B, 2-E, 3, 9 and any other sections that are relevant to the requested action; coordination with the Air Quality Bureau permit staff prior to submittal is encouraged to clarify submittal requirements and to determine if more or less than these sections of the application are needed. Use this application for streamline permits as well.

**This application is submitted as** (check all that apply): ☐ Request for a No Permit Required Determination (no fee)
☐ **Updating** an application currently under NMED review. Include this page and all pages that are being updated (no fee required).
**Construction Status:** ☐ Not Constructed ☒ Existing Permitted (or NOI) Facility ☐ Existing Non-permitted (or NOI) Facility
**Minor Source:** ☐ NOI 20.2.73 NMAC ☐ 20.2.72 NMAC application or revision ☐ 20.2.72.300 NMAC Streamline application
**Title V Source:** ☐ Title V (new) ☐ Title V renewal ☐ TV minor mod. ☐ TV significant mod. ☐ TV Acid Rain: ☐ New ☐ Renewal
**PSD Major Source:** ☐ PSD major source (new) ☐ Minor Modification to a PSD source ☒ a PSD major modification

**Acknowledgements:**

☒ I acknowledge that a pre-application meeting is available to me upon request. ☐ Title V Operating, Title IV Acid Rain, and NPR applications have no fees.

☒ $500 NSR application Filing Fee enclosed OR ☐ The full permit fee associated with 10 fee points (required w/ streamline applications).

☒ Check No.: **662835** in the amount of **$500**

☒ I acknowledge the required submittal format for the hard copy application is printed double sided 'head-to-toe', 2-hole punched (except the Sect. 2 landscape tables is printed 'head-to-head'), numbered tab separators. Incl. a copy of the check on a separate page.

☒ I acknowledge there is an annual fee for permits in addition to the permit review fee: www.env.nm.gov/air-quality/permit-fees-2/.

☐ This facility qualifies for the small business fee reduction per 20.2.75.11.C. NMAC. The full $500.00 filing fee is included with this application and I understand the fee reduction will be calculated in the balance due invoice. The Small Business Certification Form has been previously submitted or is included with this application. (Small Business Environmental Assistance Program Information: www.env.nm.gov/air-quality/small-biz-eap-2/.)

**Citation:** Please provide the **low level citation** under which this application is being submitted: **20.2.74.300.D NMAC**
(e.g. application for a new minor source would be 20.2.72.200.A NMAC, one example for a Technical Permit Revision is 20.2.72.219.B.1.b NMAC, a Title V acid rain application would be: 20.2.70.200.C NMAC)

## Section 1-B: Current Facility Status

| | | |
|---|---|---|
| 1.a | Has this facility already been constructed? ☒ Yes ☐ No | 1.b If yes to question 1.a, is it currently operating in New Mexico? ☒ Yes ☐ No |
| 2 | If yes to question 1.a, was the existing facility subject to a Notice of Intent (NOI) (20.2.73 NMAC) before submittal of this application? ☐ Yes ☒ No | If yes to question 1.a, was the existing facility subject to a construction permit (20.2.72 NMAC) before submittal of this application? ☒ Yes ☐ No |
| 3 | Is the facility currently shut down? ☐ Yes ☒ No | If yes, give month and year of shut down (MM/YY): N/A |
| 4 | Was this facility constructed before 8/31/1972 and continuously operated since 1972? ☐ Yes ☒ No | |
| 5 | If Yes to question 3, has this facility been modified (see 20.2.72.7.P NMAC) or the capacity increased since 8/31/1972? ☐ Yes ☐ No ☒ N/A | |
| 6 | Does this facility have a Title V operating permit (20.2.70 NMAC)? ☒ Yes ☐ No | If yes, the permit No. is: P-278M1 |
| 7 | Has this facility been issued a No Permit Required (NPR)? ☐ Yes ☒ No | If yes, the NPR No. is: N/A |
| 8 | Has this facility been issued a Notice of Intent (NOI)? ☐ Yes ☒ No | If yes, the NOI No. is: N/A |
| 9 | Does this facility have a construction permit (20.2.72/20.2.74 NMAC)? ☒ Yes ☐ No | If yes, the permit No. is: 4310M6R3 |
| 10 | Is this facility registered under a General permit (GCP-1, GCP-2, etc.)? ☐ Yes ☒ No | If yes, the register No. is: N/A |

## Section 1-C: Facility Input Capacity & Production Rate

| | | | | |
|---|---|---|---|---|
| 1 | What is the facility's maximum input capacity, specify units (reference here and list capacities in Section 20, if more room is required) | | | |
| a | Current | Hourly: 50.417 MMscfh | Daily: 1,210 MMscfd | Annually: 441,650 MMscfy |
| b | Proposed | Hourly: 65.625 MMscfh | Daily: 1,575 MMscfd | Annually: 574,875 MMscfy |
| 2 | What is the facility's maximum production rate, specify units (reference here and list capacities in Section 20, if more room is required) | | | |
| a | Current | Hourly: 50.417 MMscfh | Daily: 1,210 MMscfd | Annually: 441,650 MMscfy |

| | | | | |
|---|---|---|---|---|
| b | Proposed | Hourly: 65.625 MMscfh | Daily: 1,575 MMscfd | Annually: 574,875 MMscfy |

## Section 1-D: Facility Location Information

| | | | | |
|---|---|---|---|---|
| 1 | Latitude (decimal degrees): 32.21056 | Longitude (decimal degrees): -103.52389 | County: Lea | Elevation (ft): 3,582 |
| 2 | UTM Zone: ☐ 12 or ☒ 13 | Datum: ☐ NAD 83 ☒ WGS 84 | | |
| a | UTM E (in meters, to nearest 10 meters): 639,114 | UTM N (in meters, to nearest 10 meters): 3,564,730 | | |
| 3 | Name and zip code of nearest New Mexico town: Jal, NM 88252 | | | |
| 4 | Detailed Driving Instructions from nearest NM town (attach a road map if necessary): East of Carlsbad on Hwy 62/180 to State Road 31 south to Hwy 128. Go east for approximately 27 miles. Plant is on left just before MM 29. | | | |
| 5 | The facility is 20.7 miles NW of Jal, NM. | | | |
| 6 | Land Status of facility (check one): ☒ Private ☐ Indian/Pueblo ☐ Government ☐ BLM ☐ Forest Service ☐ Military | | | |
| 7 | List all municipalities, Indian tribes, and counties within a ten (10) mile radius (20.2.72.203.B.2 NMAC) of the property on which the facility is proposed to be constructed or operated: Lea County | | | |
| 8 | **20.2.72** NMAC applications **only**: Will the property on which the facility is proposed to be constructed or operated be closer than 50 km (31 miles) to other states, Bernalillo County, or a Class I area (see www.env.nm.gov/air-quality/modeling-publications/ )? ☒ Yes ☐ No (20.2.72.206.A.7 NMAC) If yes, list all with corresponding distances in kilometers: Texas, 43 km | | | |
| 9 | Name nearest Class I area: Carlsbad Caverns National Park | | | |
| 10 | Shortest distance (in km) from facility boundary to the boundary of the nearest Class I area (to the nearest 10 meters): 79.8 km | | | |
| 11 | Distance (meters) from the perimeter of the Area of Operations (AO is defined as the plant site inclusive of all disturbed lands, including mining overburden removal areas) to nearest residence, school or occupied structure: > 1600 m | | | |
| 12 | Method(s) used to delineate the Restricted Area: Continuous Fencing and signage<br><br>"**Restricted Area**" is an area to which public entry is effectively precluded. Effective barriers include continuous fencing, continuous walls, or other continuous barriers approved by the Department, such as rugged physical terrain with steep grade that would require special equipment to traverse. If a large property is completely enclosed by fencing, a restricted area within the property may be identified with signage only. Public roads cannot be part of a Restricted Area. | | | |
| 13 | Does the owner/operator intend to operate this source as a portable stationary source as defined in 20.2.72.7.X NMAC?<br>☐ Yes ☒ No<br>A portable stationary source is not a mobile source, such as an automobile, but a source that can be installed permanently at one location or that can be re-installed at various locations, such as a hot mix asphalt plant that is moved to different job sites. | | | |
| 14 | Will this facility operate in conjunction with other air regulated parties on the same property? ☒ No ☐ Yes<br>If yes, what is the name and permit number (if known) of the other facility? | | | |

## Section 1-E: Proposed Operating Schedule (The 1-E.1 & 1-E.2 operating schedules may become conditions in the permit.)

| | | | | | | |
|---|---|---|---|---|---|---|
| 1 | Facility **maximum** operating ($\frac{\text{hours}}{\text{day}}$): 24 | ($\frac{\text{days}}{\text{week}}$): 7 | ($\frac{\text{weeks}}{\text{year}}$): 52 | ($\frac{\text{hours}}{\text{year}}$): 8,760 | | |
| 2 | Facility's maximum daily operating schedule (if less than 24 $\frac{\text{hours}}{\text{day}}$)? Start: N/A | | ☐AM ☐PM | End: N/A | ☐AM ☐PM | |
| 3 | Month and year of anticipated start of construction: September 2026, or upon permit issuance | | | | | |
| 4 | Month and year of anticipated construction completion: September 2026, or upon permit issuance | | | | | |
| 5 | Month and year of anticipated startup of new or modified facility: September 2026, or upon permit issuance | | | | | |
| 6 | Will this facility operate at this site for more than one year? ☒ Yes ☐ No | | | | | |

## Section 1-F: Other Facility Information

| | | | |
|---|---|---|---|
| 1 | Are there any current Notice of Violations (NOV), compliance orders, or any other compliance or enforcement issues related to this facility? ☒ Yes ☐ No If yes, specify: LUC-29885-2201; Targa completed an audit and is presently resolving disclosed matters with NMED. This application is part of that action. | | |
| a | If yes, NOV date or description of issue: 12/05/2024 | | NOV Tracking No: LUC-29885-2201 |
| b | Is this application in response to any issue listed in 1-F, 1 or 1a above? ☒ Yes ☐ No<br>If Yes, provide the 1c & 1d info below: | | |
| c | Document Title: N/A | Date: N/A | Requirement # (or page # and paragraph #): N/A |
| d | Provide the required text to be inserted in this permit: Please refer to Section 20. | | |
| 2 | Is air quality dispersion modeling or modeling waiver being submitted with this application? ☒ Yes ☐ No | | |
| 3 | Does this facility require an "Air Toxics" permit under 20.2.72.400 NMAC & 20.2.72.502, Tables A and/or B? ☐ Yes ☒ No | | |
| 4 | Will this facility be a source of federal Hazardous Air Pollutants (HAP)? ☒ Yes ☐ No | | |
| a | If Yes, what type of source? ☒ **Major** (☒ ≥10 tpy of any single HAP **OR** ☒ ≥25 tpy of any combination of HAPS)<br>**OR** ☐ **Minor** (☐ <10 tpy of any single HAP **AND** ☐ <25 tpy of any combination of HAPS) | | |
| 5 | Is any unit exempt under 20.2.72.202.B.3 NMAC? ☐ Yes ☑ No | | |
| a | If yes, include the name of company providing commercial electric power to the facility: N/A<br><br>Commercial power is purchased from a commercial utility company, which specifically does not include power generated on site for the sole purpose of the user. | | |

## Section 1-G: Streamline Application (This section applies to 20.2.72.300 NMAC Streamline applications only)

| | | |
|---|---|---|
| 1 | ☐ I have filled out Section 18, "Addendum for Streamline Applications." | ☒ N/A (This is not a Streamline application.) |

## Section 1-H: Current Title V Information - Required for all applications from TV Sources

**(Title V-source required information for all applications submitted pursuant to 20.2.72 NMAC (Minor Construction Permits), or 20.2.74/20.2.79 NMAC (Major PSD/NNSR applications), and/or 20.2.70 NMAC (Title V))**

| | | |
|---|---|---|
| 1 | Responsible Official (R.O.) (20.2.70.300.D.2 NMAC): Andrew Perdue | Phone: (713) 584-1000 |
| a | R.O. Title: Vice President Operations | R.O. e-mail: APerdue@targaresources.com |
| b | R. O. Address: 1675 Broadway, Suite 2260, Denver, CO 80202 | |
| 2 | Alternate Responsible Official (20.2.70.300.D.2 NMAC): Jimmy Oxford | Phone: (940) 220-2493 |
| a | A. R.O. Title: Vice President Operations | A. R.O. e-mail: JOxford@targaresources.com |
| b | A. R. O. Address: 3100 McKinnon Street, Suite 800, Dallas, TX 75201 | |
| 3 | Company's Corporate or Partnership Relationship to any other Air Quality Permittee (List the names of any companies that have operating (20.2.70 NMAC) permits and with whom the applicant for this permit has a corporate or partnership relationship): Targa Resources, Inc. | |
| 4 | Name of Parent Company ("Parent Company" means the primary name of the organization that owns the company to be permitted wholly or in part.): Targa Resources, Inc. | |
| a | Address of Parent Company: 811 Louisiana Suite 2100, Houston, TX 77002-1400 | |
| 5 | Names of Subsidiary Companies ("Subsidiary Companies" means organizations, branches, divisions or subsidiaries, which are owned, wholly or in part, by the company to be permitted.): Targa Northern Delaware, LLC, Targa Midstream Services, LLC, Versado Gas Processors, LLC | |
| 6 | Telephone numbers & names of the owners' agents and site contacts familiar with plant operations: Jaylen Fuentes – (575) 810-6051 | |

| | |
|---|---|
| 7 | Affected Programs to include Other States, local air pollution control programs (i.e. Bernalillo) and Indian tribes:<br>Will the property on which the facility is proposed to be constructed or operated be closer than 80 km (50 miles) from other states, local pollution control programs, and Indian tribes and pueblos (20.2.70.402.A.2 and 20.2.70.7.B)? If yes, state which ones and provide the distances in kilometers: Texas 43 km. Local Pollution Control Programs: N/A. Indian Tribes and Pueblos: N/A |

# Section 1-I – Submittal Requirements

Each 20.2.73 NMAC (**NOI**), a 20.2.70 NMAC (**Title V**), a 20.2.72 NMAC (**NSR** minor source), or 20.2.74 NMAC (**PSD**) application package shall consist of the following:

## Hard Copy Submittal Requirements:

1) One hard copy **original signed and notarized application package** **printed double sided** **'head-to-toe'** **2-hole punched** as we bind the document on top, not on the side; except Section 2 (landscape tables), which should be head-to-head. Please use **numbered tab separators** in the hard copy submittal(s) as this facilitates the review process. For NOI submittals only, hard copies of UA1, Tables 2A, 2D & 2F, Section 3 and the signed Certification Page are required. Please include a copy of the check on a separate page.

2) If the application is for a minor NSR, PSD, NNSR, or Title V application, include one working hard **copy** for Department use. This copy should be printed in book form, 3-hole punched, and **must be double sided**. Note that this is in addition to the head-to-to 2-hole punched copy required in 1) above. Minor NSR Technical Permit revisions (20.2.72.219.B NMAC) only need to fill out Sections 1-A, 1-B, 3, and should fill out those portions of other Section(s) relevant to the technical permit revision. TV Minor Modifications need only fill out Sections 1-A, 1-B, 1-H, 3, and those portions of other Section(s) relevant to the minor modification. NMED may require additional portions of the application to be submitted, as needed.

3) The entire NOI or Permit application package, including the full modeling study, should be submitted electronically. Electronic files for applications for NOIs, any type of General Construction Permit (GCP), or technical revisions to NSRs must be submitted with compact disk (CD) or digital versatile disc (DVD). For these permit application submittals, **two** CD copies are required (in sleeves, not crystal cases, please), with additional CD copies as specified below. NOI applications require only a single CD submittal. Electronic files for other New Source Review (construction) permits/permit modifications or Title V permits/permit modifications can be submitted on CD/DVD or sent through AQB's secure file transfer service.

**Electronic files sent by (check one):**

☐ CD/DVD attached to paper application

☒ Secure electronic transfer.

Air Permit Contact Name: Jaimy Karacaoglu

Email: Jaimy.karacaoglu@trinityconsultants.com

Phone number: (410) 903-0750

a. If the file transfer service is chosen by the applicant, after receipt of the application, the Bureau will email the applicant with instructions for submitting the electronic files through a secure file transfer service. Submission of the electronic files through the file transfer service needs to be completed within 3 business days after the invitation is received, so the applicant should ensure that the files are ready when sending the hard copy of the application. The applicant will not need a password to complete the transfer. **Do not use the file transfer service for NOIs, any type of GCP, or technical revisions to NSR permits.**

4) Optionally, the applicant may submit the files with the application on compact disk (CD) or digital versatile disc (DVD) following the instructions above and the instructions in 5 for applications subject to PSD review.

5) If **air dispersion modeling** is required by the application type, include the **NMED Modeling Waiver** and/or electronic air dispersion modeling report, input, and output files. The dispersion modeling ***summary report only*** should be submitted as hard copy(ies) unless otherwise indicated by the Bureau.

6) If the applicant submits the electronic files on CD and the application is subject to PSD review under 20.2.74 NMAC (PSD) or NNSR under 20.2.79 NMC include,
   a. one additional CD copy for US EPA,
   b. one additional CD copy for each federal land manager affected (NPS, USFS, FWS, USDI) and,
   c. one additional CD copy for each affected regulatory agency other than the Air Quality Bureau.

   If the application is submitted electronically through the secure file transfer service, these extra CDs do not need to be submitted.

**Electronic Submittal Requirements** [in addition to the required hard copy(ies)]:

1) All required electronic documents shall be submitted as 2 separate CDs or submitted through the AQB secure file transfer service. Submit a single PDF document of the entire application as submitted and the individual documents comprising the application.

2) The documents should also be submitted in Microsoft Office compatible file format (Word, Excel, etc.) allowing us to access the text and formulas in the documents (copy & paste). Any documents that cannot be submitted in a Microsoft Office compatible format shall be saved as a PDF file from within the electronic document that created the file. If you are unable to provide Microsoft office compatible electronic files or internally generated PDF files of files (items that were not created electronically: i.e. brochures, maps, graphics, etc,), submit these items in hard copy format. We must be able to review the formulas and inputs that calculated the emissions.

3) It is preferred that this application form be submitted as 4 electronic files (3 MSWord docs: Universal Application section 1 [UA1], Universal Application section 3-19 [UA3], and Universal Application 4, the modeling report [UA4]) and 1 Excel file of the tables (Universal Application section 2 [UA2]). Please include as many of the 3-19 Sections as practical in a single MS Word electronic document. Create separate electronic file(s) if a single file becomes too large or if portions must be saved in a file format other than MS Word.

4) The electronic file names shall be a maximum of 25 characters long (including spaces, if any). The format of the electronic Universal Application shall be in the format: "A-3423-FacilityName". The "A" distinguishes the file as an application submittal, as opposed to other documents the Department itself puts into the database. Thus, all electronic application submittals should begin with "A-". Modifications to existing facilities should use the core permit number (i.e. '3423') the Department assigned to the facility as the next 4 digits. Use 'XXXX' for new facility applications. The format of any separate electronic submittals (additional submittals such as non-Word attachments, re-submittals, application updates) and Section document shall be in the format: "A-3423-9-description", where "9" stands for the section # (in this case Section 9-Public Notice). Please refrain, as much as possible, from submitting any scanned documents as this file format is extremely large, which uses up too much storage capacity in our database. Please take the time to fill out the header information throughout all submittals as this will identify any loose pages, including the Application Date (date submitted) & Revision number (0 for original, 1, 2, etc.; which will help keep track of subsequent partial update(s) to the original submittal. Do not use special symbols (#, @, etc.) in file names. The footer information should not be modified by the applicant.

## Table of Contents

**Section 1:** **General Facility Information**
**Section 2:** **Tables**
**Section 3:** **Application Summary**
**Section 4:** **Process Flow Sheet**
**Section 5:** **Plot Plan Drawn to Scale**
**Section 6:** **All Calculations**
**Section 7:** **Information Used to Determine Emissions**
**Section 8:** **Map(s)**
**Section 9:** **Proof of Public Notice**
**Section 10:** **Written Description of the Routine Operations of the Facility**
**Section 11:** **Source Determination**
**Section 12:** **PSD Applicability Determination for All Sources & Special Requirements for a PSD Application**
**Section 13:** **Discussion Demonstrating Compliance with Each Applicable State & Federal Regulation**
**Section 14:** **Operational Plan to Mitigate Emissions**
**Section 15:** **Alternative Operating Scenarios**
**Section 16:** **Air Dispersion Modeling**
**Section 17:** **Compliance Test History**
**Section 20:** **Other Relevant Information**
**Section 22:** **Certification Page**

# Table 2-A: Regulated Emission Sources

Unit and stack numbering must correspond throughout the application package. If applying for a NOI under 20.2.73 NMAC, equipment exemptions under 2.72.202 NMAC do not apply.

| Flare-M | Malfunction flaring associated with RH1-FL-29-1003, RH2-FL-5100, RH3-FL-5100, RH4-FL-45100, RH5-FL-55100, RHA-FL-5100, and RA2-FL-25100 | Callidus/Zeeco/Tulsa Combustion | RTA-20 Air-Assisted Tip/x/x | F-201113/30144/33985/37803/42009/170084-07/61585 | N/A[11] | N/A[11] | RH1-FL-29-1003 (2012) RH2-FL-5100 (2017) RH3-FL-5100 (2018) RH4-FL-45100 (2019) RH5-FL-55100 (2020) RHA-FL-5100 (2018) RA2-FL-25100 (2023)<br>RH1-FL-29-1003 (2012) RH2-FL-5100 (2017) RH3-FL-5100 (2018) RH4-FL-45100 (2019) RH5-FL-55100 (2020) RHA-FL-5100 (2018) RA2-FL-25100 (2023) | N/A<br>RH1-FL-29-1003, RH2-FL-5100, RH3-FL-5100, RH4-FL-45100, RH5-FL-55100, RHA-FL-5100, and RA2-FL-25100 | 31088811 | ☐ Existing (unchanged) ☐ To be Removed<br>☐ New/Additional ☐ Replacement Unit<br>☑ To Be Modified ☐ To be Replaced | N/A | N/A |

[1] Unit numbers must correspond to unit numbers in the previous permit unless a complete cross reference table of all units in both permits is provided. Cross reference tables have been included in Section 3 and 6 of this permit application.

[2] Specify dates required to determine regulatory applicability.

[3] To properly account for power conversion efficiencies, generator set rated capacity shall be reported as the rated capacity of the engine in horsepower, not the kilowatt capacity of the generator set.

[4] "4SLB" means four stroke lean burn engine, "4SRB" means four stroke rich burn engine, "2SLB" means two stroke lean burn engine, "CI" means compression ignition, and "SI" means spark ignition.

[5] The manufacturer of this unit does not provide make or model numbers.

[6] The manufacturer of this unit does not provide model numbers.

[7] As this unit is an activity and is not a physical piece of equipment, no manufactuer, model, or serial number is avaliable.

[8] As this unit consists of piping and is not a physical piece of equipment, no manufactuer, model, or serial number is avaliable.

[9] As this unit consists of haul roads and is not a physical piece of equipment, no manufactuer, model, or serial number is avaliable.

[10] As this unit consists of loading activites and is not a physical piece of equipment, no serial number is avaliable.

[11] As this unit is a fugitive, flared malfunction, or SSM activity and is not a physical piece of equipment, there is no manufacturer rated capacity or requested capacity.

## Table 2-B: Insignificant Activities[1] (20.2.70 NMAC) OR Exempted Equipment (20.2.72 NMAC)

All 20.2.70 NMAC (Title V) applications must list all Insignificant Activities in this table. All 20.2.72 NMAC applications must list Exempted Equipment in this table. If equipment listed on this table is exempt under 20.2.72.202.B.5, include emissions calculations and emissions totals for 202.B.5 "similar functions" units, operations, and activities in Section 6, Calculations. Equipment and activities exempted under 20.2.72.202 NMAC may not necessarily be Insignificant under 20.2.70 NMAC (and vice versa). Unit & stack numbering must be consistent throughout the application package. Per Exemptions Policy 02-012.00 (see http://www.env.nm.gov/aqb/permit/aqb_pol.html ), 20.2.72.202.B NMAC Exemptions do not apply, but 20.2.72.202.A NMAC exemptions do apply to NOI facilities under 20.2.73 NMAC. List 20.2.72.301.D.4 NMAC Auxiliary Equipment for Streamline applications in Table 2-A. The List of Insignificant Activities (for TV) can be found online at https://www.env.nm.gov/wp-content/uploads/sites/2/2017/10/InsignificantListTitleV.pdf. TV sources may elect to enter both TV Insignificant Activities and Part 72 Exemptions on this form.

## Table 2-B: Insignificant Activities[1] (20.2.70 NMAC) OR Exempted Equipment (20.2.72 NMAC)

All 20.2.70 NMAC (Title V) applications must list all Insignificant Activities in this table. All 20.2.72 NMAC applications must list Exempted Equipment in this table. If equipment listed on this table is exempt under 20.2.72.202.B.5, include emissions calculations and emissions totals for 202.B.5 "similar functions" units, operations, and activities in Section 6, Calculations. Equipment and activities exempted under 20.2.72.202 NMAC may not necessarily be Insignificant under 20.2.70 NMAC (and vice versa). Unit & stack numbering must be consistent throughout the application package. Per Exemptions Policy 02-012.00 (see http://www.env.nm.gov/aqb/permit/aqb_pol.html ), 20.2.72.202.B NMAC Exemptions do not apply, but 20.2.72.202.A NMAC exemptions do apply to NOI facilities under 20.2.73 NMAC. List 20.2.72.301.D.4 NMAC Auxiliary Equipment for Streamline applications in Table 2-A. The List of Insignificant Activities (for TV) can be found online at https://www.env.nm.gov/wp-content/uploads/sites/2/2017/10/InsignificantListTitleV.pdf. TV sources may elect to enter both TV Insignificant Activities and Part 72 Exemptions on this form.

| Unit Number | Source Description | Manufacturer | Model No. / Serial No. | Max Capacity / Capacity Units | List Specific 20.2.72.202 NMAC Exemption (e.g. 20.2.72.202.B.5) / Insignificant Activity citation (e.g. IA List Item #1.a) | Date of Manufacture /Reconstruction[2] / Date of Installation /Construction[2] | For Each Piece of Equipment, Check Onc |

[1] Insignificant activities exempted due to size or production rate are defined in 20.2.70.300.D.6, 20.2.70.7.Q NMAC, and the NMED/AQB List of Insignificant Activities, dated September 15, 2008. Emissions from these insignificant activities do not need to be reported, unless specifically requested.

[2] Specify date(s) required to determine regulatory applicability.

[3] Unit does not have a stamped capacity. Capacity is a function of the associated engine or driver.

## Table 2-C: Emissions Control Equipment (Tank Scenario 1)

Unit and stack numbering must correspond throughout the application package. Only list control equipment for TAPs if the TAP's maximum uncontrolled emissions rate is over its respective threshold as listed in 20.2.72 NMAC, Subpart V, Tables A and B. In accordance with 20.2.72.203.A(3) and (8) NMAC, 20.2.70.300.D(5)(b) and (e) NMAC, and 20.2.73.200.B(7) NMAC, the permittee shall report all control devices and list each pollutant controlled by the control device regardless if the applicant takes credit for the reduction in emissions.

| Control Equipment Unit No. | Control Equipment Description | Date Installed | Controlled Pollutant(s) | Controlling Emissions for Unit Number(s)[1] | Efficiency (% Control by Weight) | Method used to Estimate Efficiency |

[1] List each control device on a separate line. For each control device, list all emission units controlled by the control device.

# Table 2-D: Maximum Emissions (under normal operating conditions) (Tank Scenario 1)

☐ **This Table was intentionally left blank because it would be identical to Table 2-E.**

Maximum Emissions are the emissions at maximum capacity and prior to (in the absence of) pollution control, emission-reducing process equipment, or any other emission reduction. Calculate the hourly emissions using the worst case hourly emissions for each pollutant. For each pollutant, calculate the annual emissions as if the facility were operating at maximum plant capacity without pollution controls for 8760 hours per year, unless otherwise approved by the Department. List Hazardous Air Pollutants (HAP) & Toxic Air Pollutants (TAPs) in Table 2-I. Unit & stack numbering must be consistent throughout the application package. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41, 1.41, or 1.41E-4).

| Unit No. | NOx | | CO | | VOC | | SOx | | PM[1] | | PM10[1] | | PM2.5[1] | | $H_2S$ | | Lead | |

# Table 2-D: Maximum Emissions (under normal operating conditions) (Tank Scenario 1)

☐ **This Table was intentionally left blank because it would be identical to Table 2-E.**

Maximum Emissions are the emissions at maximum capacity and prior to (in the absence of) pollution control, emission-reducing process equipment, or any other emission reduction. Calculate the hourly emissions using the worst case hourly emissions for each pollutant. For each pollutant, calculate the annual emissions as if the facility were operating at maximum plant capacity without pollution controls for 8760 hours per year, unless otherwise approved by the Department. List Hazardous Air Pollutants (HAP) & Toxic Air Pollutants (TAPs) in Table 2-I. Unit & stack numbering must be consistent throughout the application package. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41, 1.41, or 1.41E-4).

☐ **This Table was intentionally left blank because it would be identical to Table 2-E.**

Maximum Emissions are the emissions at maximum capacity and prior to (in the absence of) pollution control, emission-reducing process equipment, or any other emission reduction. Calculate the hourly emissions using the worst case hourly emissions for each pollutant. For each pollutant, calculate the annual emissions as if the facility were operating at maximum plant capacity without pollution controls for 8760 hours per year, unless otherwise approved by the Department. List Hazardous Air Pollutants (HAP) & Toxic Air Pollutants (TAPs) in Table 2-I. Unit & stack numbering must be consistent throughout the application package. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41, 1.41, or 1.41E-4).

[1]**Condensable Particulate Matter:** Include condensable particulate matter emissions for PM10 and PM2.5 if the source is a combustion source. Do not include condensable particulate matter for PM unless PM is set equal to PM10 and PM2.5. Particulate matter (PM) is not subject to an ambient air quality standard, but PM is a regulated air pollutant under PSD (20.2.74 NMAC) and Title V (20.2.70 NMAC).

# Table 2-E: Requested Allowable Emissions (Tank Scenario 1)

Unit & stack numbering must be consistent throughout the application package. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41, 1.41, or 1.41E$^{-4}$).

[1] **Condensable Particulate Matter:** Include condensable particulate matter emissions for PM10 and PM2.5 if the source is a combustion source. Do not include condensable particulate matter for PM unless PM is set equal to PM10 and PM2.5. Particulate matter (PM) is not subject to an ambient air quality standard, but it is a regulated air pollutant under PSD (20.2.74 NMAC) and Title V (20.2.70 NMAC).

# Table 2-F: Additional Emissions during Startup, Shutdown, and Routine Maintenance (SSM) - AGI Flaring Scenario 1

☐ This table is intentionally left blank since all emissions at this facility due to routine or predictable startup, shutdown, or scehduled maintenance are no higher than those listed in Table 2-E and a malfunction emission limit is not already permitted or requested. If you are required to report GHG emissions as described in Section 6a, include any GHG emissions during Startup, Shutdown, and/or Scheduled Maintenance (SSM) in Table 2-P. Provide an explanations of SSM emissions in Section 6 and 6a.

All applications for facilities that have emissions during routine our predictable startup, shutdown or scheduled maintenance (SSM)[1], including NOI applications, must include in this table the Maximum Emissions during routine or predictable startup, shutdown and scheduled maintenance (20.2.7 NMAC, 20.2.72.203.A.3 NMAC, 20.2.73.200.D.2 NMAC). In Section 6 and 6a, provide emissions calculations for all SSM emissions reported in this table. Refer to "Guidance for Submittal of Startup, Shutdown, Maintenance Emissions in Permit Applications (https://www.env.nm.gov/aqb/permit/aqb_pol.html) for more detailed instructions. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41, 1.41, or 1.41E-4).

## Table 2-F: Additional Emissions during Startup, Shutdown, and Routine Maintenance (SSM) - AGI Flaring Scenario 1

☐ This table is intentionally left blank since all emissions at this facility due to routine or predictable startup, shutdown, or scehduled maintenance are no higher than those listed in Table 2-E and a malfunction emission limit is not already permitted or requested. If you are required to report GHG emissions as described in Section 6a, include any GHG emissions during Startup, Shutdown, and/or Scheduled Maintenance (SSM) in Table 2-P. Provide an explanations of SSM emissions in Section 6 and 6a.

All applications for facilities that have emissions during routine our predictable startup, shutdown or scheduled maintenance (SSM)[1], including NOI applications, must include in this table the Maximum Emissions during routine or predictable startup, shutdown and scheduled maintenance (20.2.7 NMAC, 20.2.72.203.A.3 NMAC, 20.2.73.200.D.2 NMAC). In Section 6 and 6a, provide emissions calculations for all SSM emissions reported in this table. Refer to "Guidance for Submittal of Startup, Shutdown, Maintenance Emissions in Permit Applications (https://www.env.nm.gov/aqb/permit/aqb_pol.html) for more detailed instructions. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41, 1.41, or 1.41E-4).

[1] **For instance**, if the short term steady-state Table 2-E emissions are 5 lb/hr and the SSM rate is 12 lb/hr, enter 7 lb/hr in this table. If the annual steady-state Table 2-E emissions are 21.9 TPY, and the number of scheduled SSM events result in annual emissions of 31.9 TPY, enter 10.0 TPY in the table below.

[2] **Condensable Particulate Matter:** Include condensable particulate matter emissions for PM10 and PM2.5 if the source is a combustion source. Do not include condensable particulate matter for PM unless PM is set equal to PM10 and PM2.5. Particulate matter (PM) is not subject to an ambient air quality standard, but it is a regulated air pollutant under PSD (20.2.74 NMAC) and Title V (20.2.70 NMAC).

# Table 2-G: Stack Exit and Fugitive Emission Rates for Special Stacks

☑ I have elected to leave this table blank because this facility does not have any stacks/vents that split emissions from a single source or combine emissions from more than one source listed in table 2-A. Additionally, the emission rates of all stacks match the Requested allowable emission rates stated in Table 2-E.

Use this table to list stack emissions (requested allowable) from split and combined stacks. List Toxic Air Pollutants (TAPs) and Hazardous Air Pollutants (HAPs) in Table 2-I. List all fugitives that are associated with the normal, routine, and non-emergency operation of the facility. Unit and stack numbering must correspond throughout the application package. Refer to Table 2-E for instructions on use of the "-" symbol and on significant figures.

| Stack No. | Serving Unit Number(s) from Table 2-A | NOx | | CO | | VOC | | SOx | | PM | | PM10 | | PM2.5 | | □ $H_2S$ or □ Lead | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | lb/hr | ton/yr | lb/hr | ton/yr | lb/hr | ton/yr | lb/hr | ton/yr | lb/hr | ton/yr | lb/hr | ton/yr | lb/hr | ton/yr | lb/hr | ton/yr |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | |

# Table 2-H: Stack Exit Conditions

Unit and stack numbering must correspond throughout the application package. Include the stack exit conditions for each unit that emits from a stack, including blowdown venting parameters and tank emissions. If the facility has multiple operating scenarios, complete a separate Table 2-H for each scenario and, for each, type scenario name here:

| Stack Number | Serving Unit Number(s) from Table 2-A | Orientation (H-Horizontal V=Vertical) | Rain Caps (Yes or No) | Height Above Ground (ft) | Temp. (F) | Flow Rate | | Moisture by Volume[1] (%) | Velocity (ft/sec) | Inside Diameter (ft) |

# Table 2-H: Stack Exit Conditions

Unit and stack numbering must correspond throughout the application package. Include the stack exit conditions for each unit that emits from a stack, including blowdown venting parameters and tank emissions. If the facility has multiple operating scenarios, complete a separate Table 2-H for each scenario and, for each, type scenario name here:

| Stack Number | Serving Unit Number(s) from Table 2-A | Orientation (H-Horizontal V=Vertical) | Rain Caps (Yes or No) | Height Above Ground (ft) | Temp. (F) | Flow Rate | | Moisture by Volume[1] (%) | Velocity (ft/sec) | Inside Diameter (ft) |

## Table 2-I: Stack Exit and Fugitive Emission Rates for HAPs and TAPs (Tank Scenario 1)

In the table below, report the Potential to Emit for each HAP from each regulated emission unit listed in Table 2-A, only if the entire facility emits the HAP at a rate greater than or equal to one (1) ton per year For each such emission unit, HAPs shall be reported to the nearest 0.1 tpy. Each facility-wide Individual HAP total and the facility-wide Total HAPs shall be the sum of all HAP sources calculated to the nearest 0.1 ton per year. Per 20.2.72.403.A.1 NMAC, facilities not exempt [see 20.2.72.402.C NMAC] from TAP permitting shall report each TAP that has an uncontrolled emission rate in excess of its pounds per hour screening level specified in 20.2.72.502 NMAC. TAPs shall be reported using one more significant figure than the number of significant figures shown in the pound per hour threshold corresponding to the substance. Use the HAP nomenclature as it appears in Section 112 (b) of the 1990 CAAA and the TAP nomenclature as it listed in 20.2.72.502 NMAC. Include tank-flashing emissions estimates of HAPs in this table. For each HAP or TAP listed, fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected or the pollutant is emitted in a quantity less than the threshold amounts described above.

| Stack No. | Unit No.(s) | Total HAPs | | Formaldehyde ☑ HAP or ☐ TAP | | Acetaldehyde ☑ HAP or ☐ TAP | | Acrolein ☑ HAP or ☐ TAP | | Benzene ☑ HAP or ☐ TAP | | n-Hexane ☑ HAP or ☐ TAP | | Toluene ☑ HAP or ☐ TAP | | Ethylbenzene ☑ HAP or ☐ TAP | | Xylenes ☑ HAP or ☐ TAP | |

# Table 2-I: Stack Exit and Fugitive Emission Rates for HAPs and TAPs (Tank Scenario 1)

In the table below, report the Potential to Emit for each HAP from each regulated emission unit listed in Table 2-A, only if the entire facility emits the HAP at a rate greater than or equal to one (1) ton per year For each such emission unit, HAPs shall be reported to the nearest 0.1 tpy. Each facility-wide Individual HAP total and the facility-wide Total HAPs shall be the sum of all HAP sources calculated to the nearest 0.1 ton per year. Per 20.2.72.403.A.1 NMAC, facilities not exempt [see 20.2.72.402.C NMAC] from TAP permitting shall report each TAP that has an uncontrolled emission rate in excess of its pounds per hour screening level specified in 20.2.72.502 NMAC. TAPs shall be reported using one more significant figure than the number of significant figures shown in the pound per hour threshold corresponding to the substance. Use the HAP nomenclature as it appears in Section 112 (b) of the 1990 CAAA and the TAP nomenclature as it listed in 20.2.72.502 NMAC. Include tank-flashing emissions estimates of HAPs in this table. For each HAP or TAP listed, fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected or the pollutant is emitted in a quantity less than the threshold amounts described above.

| Stack No. | Unit No.(s) | Total HAPs | | Formaldehyde ☑ HAP or ☐ TAP | | Acetaldehyde ☑ HAP or ☐ TAP | | Acrolein ☑ HAP or ☐ TAP | | Benzene ☑ HAP or ☐ TAP | | n-Hexane ☑ HAP or ☐ TAP | | Toluene ☑ HAP or ☐ TAP | | Ethylbenzene ☑ HAP or ☐ TAP | | Xylenes ☑ HAP or ☐ TAP | |

## Table 2-I: Stack Exit and Fugitive Emission Rates for HAPs and TAPs (Tank Scenario 1)

In the table below, report the Potential to Emit for each HAP from each regulated emission unit listed in Table 2-A, only if the entire facility emits the HAP at a rate greater than or equal to one (1) ton per year For each such emission unit, HAPs shall be reported to the nearest 0.1 tpy. Each facility-wide Individual HAP total and the facility-wide Total HAPs shall be the sum of all HAP sources calculated to the nearest 0.1 ton per year. Per 20.2.72.403.A.1 NMAC, facilities not exempt [see 20.2.72.402.C NMAC] from TAP permitting shall report each TAP that has an uncontrolled emission rate in excess of its pounds per hour screening level specified in 20.2.72.502 NMAC. TAPs shall be reported using one more significant figure than the number of significant figures shown in the pound per hour threshold corresponding to the substance. Use the HAP nomenclature as it appears in Section 112 (b) of the 1990 CAAA and the TAP nomenclature as it listed in 20.2.72.502 NMAC. Include tank-flashing emissions estimates of HAPs in this table. For each HAP or TAP listed, fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected or the pollutant is emitted in a quantity less than the threshold amounts described above.

| Stack No. | Unit No.(s) | Total HAPs | | Formaldehyde ☑ HAP or ☐ TAP | | Acetaldehyde ☑ HAP or ☐ TAP | | Acrolein ☑ HAP or ☐ TAP | | Benzene ☑ HAP or ☐ TAP | | n-Hexane ☑ HAP or ☐ TAP | | Toluene ☑ HAP or ☐ TAP | | Ethylbenzene ☑ HAP or ☐ TAP | | Xylenes ☑ HAP or ☐ TAP | |

# Table 2-I: Stack Exit and Fugitive Emission Rates for HAPs and TAPs (Tank Scenario 2)

In the table below, report the Potential to Emit for each HAP from each regulated emission unit listed in Table 2-A, only if the entire facility emits the HAP at a rate greater than or equal to one (1) ton per year For each such emission unit, HAPs shall be reported to the nearest 0.1 tpy. Each facility-wide Individual HAP total and the facility-wide Total HAPs shall be the sum of all HAP sources calculated to the nearest 0.1 ton per year. Per 20.2.72.403.A.1 NMAC, facilities not exempt [see 20.2.72.402.C NMAC] from TAP permitting shall report each TAP that has an uncontrolled emission rate in excess of its pounds per hour screening level specified in 20.2.72.502 NMAC. TAPs shall be reported using one more significant figure than the number of significant figures shown in the pound per hour threshold corresponding to the substance. Use the HAP nomenclature as it appears in Section 112 (b) of the 1990 CAAA and the TAP nomenclature as it listed in 20.2.72.502 NMAC. Include tank-flashing emissions estimates of HAPs in this table. For each HAP or TAP listed, fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected or the pollutant is emitted in a quantity less than the threshold amounts described above.

| Stack No. | Unit No.(s) | Total HAPs | | Formaldehyde ☑ HAP or ☐ TAP | | Acetaldehyde ☑ HAP or ☐ TAP | | Acrolein ☑ HAP or ☐ TAP | | Benzene ☑ HAP or ☐ TAP | | n-Hexane ☑ HAP or ☐ TAP | | Toluene ☑ HAP or ☐ TAP | | Ethylbenzene ☑ HAP or ☐ TAP | | Xylenes ☑ HAP or ☐ TAP | |

## Table 2-I: Stack Exit and Fugitive Emission Rates for HAPs and TAPs (Tank Scenario 2)

In the table below, report the Potential to Emit for each HAP from each regulated emission unit listed in Table 2-A, only if the entire facility emits the HAP at a rate greater than or equal to one (1) ton per year For each such emission unit, HAPs shall be reported to the nearest 0.1 tpy. Each facility-wide Individual HAP total and the facility-wide Total HAPs shall be the sum of all HAP sources calculated to the nearest 0.1 ton per year. Per 20.2.72.403.A.1 NMAC, facilities not exempt [see 20.2.72.402.C NMAC] from TAP permitting shall report each TAP that has an uncontrolled emission rate in excess of its pounds per hour screening level specified in 20.2.72.502 NMAC. TAPs shall be reported using one more significant figure than the number of significant figures shown in the pound per hour threshold corresponding to the substance. Use the HAP nomenclature as it appears in Section 112 (b) of the 1990 CAAA and the TAP nomenclature as it listed in 20.2.72.502 NMAC. Include tank-flashing emissions estimates of HAPs in this table. For each HAP or TAP listed, fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected or the pollutant is emitted in a quantity less than the threshold amounts described above.

| Stack No. | Unit No.(s) | Total HAPs | | Formaldehyde ☑ HAP or ☐ TAP | | Acetaldehyde ☑ HAP or ☐ TAP | | Acrolein ☑ HAP or ☐ TAP | | Benzene ☑ HAP or ☐ TAP | | n-Hexane ☑ HAP or ☐ TAP | | Toluene ☑ HAP or ☐ TAP | | Ethylbenzene ☑ HAP or ☐ TAP | | Xylenes ☑ HAP or ☐ TAP | |

# Table 2-K: Liquid Data for Tanks Listed in Table 2-L

For each tank, list the liquid(s) to be stored in each tank. If it is expected that a tank may store a variety of hydrocarbon liquids, enter "mixed hydrocarbons" in the Composition column for that tank and enter the corresponding data of the most volatile liquid to be stored in the tank. If tank is to be used for storage of different materials, list all the materials in the "All Calculations" attachment, run the newest version of TANKS on each, and use the material with the highest emission rate to determine maximum uncontrolled and requested allowable emissions rate. The permit will specify the most volatile category of liquids that may be stored in each tank. Include appropriate tank-flashing modeling input data. Use additional sheets if necessary. Unit and stack numbering must correspond throughout the application package.

| Tank No. | SCC Code | Material Name | Composition | Liquid Density (lb/gal) | Vapor Molecular Weight (lb/lb*mol) | Average Storage Conditions | | Max Storage Conditions | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | | Temperature (°F) | True Vapor Pressure (psia) | Temperature (°F) | True Vapor Pressure (psia) |
| TK-20101 | 40400311 | Condensate | Mixed Hydrocarbons | 4.93 | 69.08 | 109.40 | 13.13 | 109.40 | 13.13 |

* Methanol tanks have various sizes specified. Tank count is variable and numerous tanks are accounted for under each size categorization.

There are no seals on the tanks as tanks are fixed roof.

## Table 2-L2: Liquid Storage Tank Data Codes Reference Table

| Roof Type | Seal Type, Welded Tank Seal Type | | Seal Type, Riveted Tank Seal Type | | Roof, Shell Color | Paint Condition |
|---|---|---|---|---|---|---|

# Table 2-N: CEM Equipment

Enter Continuous Emissions Measurement (CEM) Data in this table. If CEM data will be used as part of a federally enforceable permit condition, or used to satisfy the requirements of a state or federal regulation, include a copy of the CEM's manufacturer specification sheet in the Information Used to Determine Emissions attachment. Unit and stack numbering must correspond throughout the application package. Use additional sheets if necessary.

| Stack No. | Pollutant(s) | Manufacturer | Model No. | Serial No. | Sample Frequency | Averaging Time | Range | Sensitivity | Accuracy |
|---|---|---|---|---|---|---|---|---|---|
| There is no CEM Equipment at this facility. | | | | | | | | | |

# Table 2-P: Greenhouse Gas Emissions (Tank Scenario 1)

Applications submitted under 20.2.70, 20.2.72, & 20.2.74 NMAC are required to complete this Table. Power plants, Title V major sources, and PSD major sources must report and calculate all GHG emissions for each unit. Applicants must report potential emission rates in short tons per year (see Section 6.a for assistance). Include GHG emissions during Startup, Shutdown, and Scheduled Maintenance in this table. For minor source facilities that are not power plants, are not Title V, or are not PSD, there are three options for reporting GHGs 1) report GHGs for each individual piece of equipment; 2) report all GHGs from a group of unit types, for example report all combustion source GHGs as a single unit and all venting GHG as a second separate unit; OR 3) check the following box ☐ By checking this box, the applicant acknowledges the total CO2e emissions are less than 75,000 tons per year.

| | | $CO_2$ ton/yr | $N_2O$ ton/yr | $CH_4$ ton/yr | $SF_6$ ton/yr | PFC/HFC ton/yr[2] | | | | | | | | | Total GHG Mass Basis ton/yr[4] | Total $CO_2e$ ton/yr[5] |

Power plants, Title V major sources, and PSD major sources must report and calculate all GHG emissions for each unit. Applicants must report potential emission rates in short tons per year (see Section 6.a for assistance). Include GHG emissions during Startup, Shutdown, and Scheduled Maintenance in this table. For minor source facilities that are not power plants, are not Title V, or are not PSD, there are three options for reporting GHGs 1) report GHGs for each individual piece of equipment; 2) report all GHGs from a group of unit types, for example report all combustion source GHGs as a single unit and all venting GHG as a second separate unit; OR 3) check the following box ☐ By checking this box, the applicant acknowledges the total CO2e emissions are less than 75,000 tons per year.

[1] **GWP** (Global Warming Potential): Applicants must use the most current GWPs codified in Table A-1 of 40 CFR part 98. GWPs are subject to change, therefore, applicants need to check 40 CFR 98 to confirm GWP values.

[2] For **HFCs** or **PFCs** describe the specific HFC or PFC compound and use a separate column for each individual compound.

[3] For each new compound, enter the appropriate GWP for each HFC or PFC compound from Table A-1 in 40 CFR 98.

[4] Green house gas emissions on a **mass basis** is the ton per year green house gas emission before adjustment with its GWP.

[5] **$CO_2e$** means Carbon Dioxide Equivalent and is calculated by multiplying the TPY mass emissions of the green house gas by its GWP.

# Table 2-P: Greenhouse Gas Emissions (Tank Scenario 2)

Applications submitted under 20.2.70, 20.2.72, & 20.2.74 NMAC are required to complete this Table. Power plants, Title V major sources, and PSD major sources must report and calculate all GHG emissions for each unit. Applicants must report potential emission rates in short tons per year (see Section 6.a for assistance). Include GHG emissions during Startup, Shutdown, and Scheduled Maintenance in this table. For minor source facilities that are not power plants, are not Title V, or are not PSD, there are three options for reporting GHGs 1) report GHGs for each individual piece of equipment; 2) report all GHGs from a group of unit types, for example report all combustion source GHGs as a single unit and all venting GHG as a second separate unit; OR 3) check the following box ☐ By checking this box, the applicant acknowledges the total CO2e emissions are less than 75,000 tons per year.

# Table 2-P: Greenhouse Gas Emissions (Tank Scenario 2)

Applications submitted under 20.2.70, 20.2.72, & 20.2.74 NMAC are required to complete this Table. Power plants, Title V major sources, and PSD major sources must report and calculate all GHG emissions for each unit. Applicants must report potential emission rates in short tons per year (see Section 6.a for assistance). Include GHG emissions during Startup, Shutdown, and Scheduled Maintenance in this table. For minor source facilities that are not power plants, are not Title V, or are not PSD, there are three options for reporting GHGs 1) report GHGs for each individual piece of equipment; 2) report all GHGs from a group of unit types, for example report all combustion source GHGs as a single unit and all venting GHG as a second separate unit; OR 3) check the following box ☐ By checking this box, the applicant acknowledges the total CO2e emissions are less than 75,000 tons per year.

| | | $CO_2$ ton/yr | $N_2O$ ton/yr | $CH_4$ ton/yr | $SF_6$ ton/yr | PFC/HFC ton/yr[2] | | | | | | | | | Total GHG Mass Basis ton/yr[4] | Total $CO_2e$ ton/yr[5] |

# Table 2-P: Greenhouse Gas Emissions (Tank Scenario 2)

Applications submitted under 20.2.70, 20.2.72, & 20.2.74 NMAC are required to complete this Table. Power plants, Title V major sources, and PSD major sources must report and calculate all GHG emissions for each unit. Applicants must report potential emission rates in short tons per year (see Section 6.a for assistance). Include GHG emissions during Startup, Shutdown, and Scheduled Maintenance in this table. For minor source facilities that are not power plants, are not Title V, or are not PSD, there are three options for reporting GHGs 1) report GHGs for each individual piece of equipment; 2) report all GHGs from a group of unit types, for example report all combustion source GHGs as a single unit and all venting GHG as a second separate unit; OR 3) check the following box ☐ By checking this box, the applicant acknowledges the total CO2e emissions are less than 75,000 tons per year.

| | | **$CO_2$** ton/yr | **$N_2O$** ton/yr | **$CH_4$** ton/yr | **$SF_6$** ton/yr | **PFC/HFC** ton/yr[2] | | | | | | | | | **Total GHG** Mass Basis ton/yr[4] | **Total $CO_2e$** ton/yr[5] |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **RH1-REC-PLANTVIEW** | **mass GHG** | 0.03 | - | 0.27 | | | | | | | | | | | 0.31 | |
| | **$CO_2e$** | 0.03 | - | 7.64 | | | | | | | | | | | | 7.67 |
| **RH1-REC-GUTLINE** | **mass GHG** | 0.22 | - | 1.82 | | | | | | | | | | | 2.04 | |
| | **$CO_2e$** | 0.22 | - | 51.02 | | | | | | | | | | | | 51.24 |
| **RH1-REC-ABU** | **mass GHG** | 0.08 | - | 0.71 | | | | | | | | | | | 0.79 | |

[1] **GWP** (Global Warming Potential): Applicants must use the most current GWPs codified in Table A-1 of 40 CFR part 98. GWPs are subject to change, therefore, applicants need to check 40 CFR 98 to confirm GWP values.

[2] For **HFCs** or **PFCs** describe the specific HFC or PFC compound and use a separate column for each individual compound.

[3] For each new compound, enter the appropriate GWP for each HFC or PFC compound from Table A-1 in 40 CFR 98.

[4] Green house gas emissions on a **mass basis** is the ton per year green house gas emission before adjustment with its GWP.

[5] **$CO_2e$** means Carbon Dioxide Equivalent and is calculated by multiplying the TPY mass emissions of the green house gas by its GWP.

# Section 3

# Application Summary

---

The **Application Summary** shall include a brief description of the facility and its process, the type of permit application, the applicable regulation (i.e. 20.2.72.200.A.X, or 20.2.73 NMAC) under which the application is being submitted, and any air quality permit numbers associated with this site. If this facility is to be collocated with another facility, provide details of the other facility including permit number(s). In case of a revision or modification to a facility, provide the lowest level regulatory citation (i.e. 20.2.72.219.B.1.d NMAC) under which the revision or modification is being requested. Also describe the proposed changes from the original permit, how the proposed modification will affect the facility's operations and emissions, de-bottlenecking impacts, and changes to the facility's major/minor status (both PSD & Title V).

The **Process Summary** shall include a brief description of the facility and its processes.

**Startup, Shutdown, and Maintenance (SSM) routine or predictable emissions:** Provide an overview of how SSM emissions are accounted for in this application. Refer to "Guidance for Submittal of Startup, Shutdown, Maintenance Emissions in Permit Applications (http://www.env.nm.gov/aqb/permit/app_form.html) for more detailed instructions on SSM emissions.

---

Targa Northern Delaware, LLC (Targa) owns and operates the Red Hills Gas Processing Plant (Red Hills) in Lea County, NM. Red Hills separates natural gas liquids and removes water, $H_2S$, $CO_2$, and other impurities from natural gas. Natural gas liquids and natural gas are transported offsite via sales pipelines. The facility currently operates under NSR Permit No. 4310-M6R3 and Title V Operating Permit No. P278-M2. This application is being submitted as a PSD Major Modification pursuant to 20.2.74.300.D NMAC. All sources at the site are being included as "new sources" in the PSD analysis. The heaters may require a physical modification with this permitting action in order to achieve the represented emission rates. With regard to changes from the current permit, Targa is seeking to (1) update calculation methodologies to the most recent New Mexico Environment Department (NMED) and AP-42 guidance; (2) update representations to more accurately reflect current operating scenarios; and (3) update emission limits based on changes to calculation methodologies, representations, and facility throughput. Changes to gas and liquid throughput changes are presented in the table below:

| Facility Throughputs | Gas Throughput (MMSCFD) | Condensate Throughput (bbl/y) | Sour Slop Water Throughput (bbl/y) | Slop Water Throughput (bbl/y) |
|---|---|---|---|---|
| **Current** | 1,210 | 2,341,900 | 31,950 | 88,944 |
| **Proposed** | 1,575 | 3,807,800 | 131,188 | 333,293 |

Methanol tanks (RH-TK-METHANOL) are being added to the permit as non-exempt units and will have a proposed throughput of 417,101 barrels per year.

With the proposed updates listed above, the following units will be modified. A high-level description of the changes made in this application are detailed below by train. Train 1 through Train 6 are sweet gas trains. FET-1 and FET-2 (front end treaters) are the sour gas trains.

**Train 1:**

| Unit ID | Application Changes |
|---|---|
| One (1) Hot Oil Heater (RH1-H-23-704) | Update heat duty to 42.50 MMBTU/hr and update emission factors. |
| One (1) Flare (RH1-FL-29-1003) | Update emissions based on equipment and activities routed to the flare. |
| One (1) TEG Regeneration System (RH1-TEG) | Increase gas throughput, update operating parameters, increase glycol recirculation rate. |
| One (1) Amine Regeneration System (RH1-AMINE) | Increase gas throughput, update operating parameters, increase amine recirculation rate. |

**Train 2:**

| Unit ID | Application Changes |
|---|---|
| One (1) Regeneration Gas Heater (RH2-H-741) | Update heat duty to 9.60 MMBTU/hr and update emission factors. |
| One (1) Cryo Hot Oil Heater (RH2-H-781) | Update heat duty to 13.20 MMBTU/hr and update emission factors. |
| One (1) TEG Reboiler (RH2-H-2301) | Update heat duty to 4 MMBTU/hr and update emission factors. |
| Two (2) Amine Hot Oil Heaters (RH2-H-0901 and RH2-H-1001) | Update heat duty to 75 MMBTU/hr and update emission factors. |
| One (1) Flare (RH2-FL-5100) | Update emissions based on equipment and activities routed to the flare. |
| One (1) TEG Regeneration System (RH2-TEG) | Update gas throughput, update operating parameters, update glycol recirculation rate. |
| One (1) Amine Regeneration System (RH2-AMINE) | Update gas throughput, update operating parameters, update amine recirculation rate. |
| One (1) Thermal Oxidizer (RH2-TO-5500) | Update emissions based on equipment and activities routed to the thermal oxidizer. |

**Train 3:**

| Unit ID | Application Changes |
|---|---|
| One (1) Regeneration Gas Heater (RH3-H-741) | Update heat duty to 9.20 MMBTU/hr and update emission factors. |
| One (1) Cryo Hot Oil Heater (RH3-H-781) | Update heat duty to 19.80 MMBTU/hr and update emission factors. |
| One (1) TEG Reboiler (RH3-H-6301) | Update heat duty to 4 MMBTU/hr and update emission factors. |
| One (1) Flare (RH3-FL-5100) | Update emissions based on equipment and activities routed to the flare. |
| One (1) TEG Regeneration System (RH3-TEG) | Increase gas throughput, update operating parameters, increase glycol recirculation rate. |

**Train 4:**

| Unit ID | Application Changes |
|---|---|
| One (1) Liquids In-Line Heater (RH4-H-41100) | Update heat duty to 13.16 MMBTU/hr and update emission factors. |
| One (1) Regeneration Gas Heater (RH4-H-741) | Update heat duty to 9.20 MMBTU/hr and update emission factors. |
| One (1) Cryo Hot Oil Heater (RH4-H-781) | Update heat duty to 22.30 MMBTU/hr and update emission factors. |
| Two (2) Amine Hot Oil Heaters (RH4-H-3901 and RH4-H-4001) | Update heat duty to 76.73 MMBTU/hr and update emission factors. |
| One (1) TEG Reboiler (RH4-H-5301) | Update heat duty to 4 MMBTU/hr and update emission factors. |
| One (1) Flare (RH4-FL-45100) | Update emissions based on equipment and activities routed to the flare. |
| One (1) TEG Regeneration System (RH4-TEG) | Update gas throughput, update operating parameters, update glycol recirculation rate. |
| One (1) Amine Regeneration System (RH4-AMINE) | Update gas throughput, update operating parameters, update amine recirculation rate. |
| One (1) Thermal Oxidizer (RH4-TO-45500) | Update emissions based on equipment and activities routed to the thermal oxidizer. |

**Train 5:**

| Unit ID | Application Changes |
|---|---|
| Two (2) Amine/TEG Hot Oil Heaters (RH5-H-50902 and RH5-H-50001 | Update heat duty to 89.94 MMBTU/hr and update emission factors. |
| One (1) Regeneration Gas Heater (RH5-H-50741) | Update heat duty to 9.08 MMBTU/hr and update emission factors. |
| One (1) Cryo Hot Oil Heater (RH5-H-50781) | Update heat duty to 33.99 MMBTU/hr and update emission factors. |
| One (1) Flare (RH5-FL-55100) | Update emissions based on equipment and activities routed to the flare. |
| One (1) TEG Regeneration System (RH5-TEG) | Update gas throughput, update operating parameters, update glycol recirculation rate. |
| One (1) Amine Regeneration System (RH5-AMINE) | Update gas throughput, update operating parameters, update amine recirculation rate. |
| One (1) Thermal Oxidizer (RH5-TO-55500) | Update emissions based on equipment and activities routed to the thermal oxidizer. |

**Train 6:**

| Unit ID | Application Changes |
|---|---|
| One (1) Stabilizer Hot Oil Heater (RH6-H-60001) | Update heat duty to 89.94 MMBTU/hr and update emission factors. |
| One (1) Regeneration Gas Heater (RH6-H-60741) | Update heat duty to 9.10 MMBTU/hr and update emission factors. |
| One (1) Cryo Hot Oil Heater (RH6-H-60781) | Update heat duty to 33.85 MMBTU/hr and update emission factors. |
| One (1) TEG Regeneration System (RH6-TEG) | Update gas throughput, update operating parameters, update glycol recirculation rate. |

**Inlet Liquids:**

| Unit ID | Application Changes |
|---|---|
| One (1) Stabilizer Hot Oil Heater (RH1-H-1101) | Update heat duty to 22.30 MMBTU/hr and update emission factors. |
| One (1) Condensate Storage Tanks Flare (RH1-FL-2850) | Update emissions based on equipment and activities routed to the flare. |

**FET-1:**

| Unit ID | Application Changes |
|---|---|
| One (1) Amine Regeneration System (RHA-AMINE) | Update gas throughput, update operating parameters, update amine recirculation rate. |
| One (1) Amine Hot Oil Heater (RHA-H-4901) | Update heat duty to 33.90 MMBTU/hr and update emission factors. |
| Two (2) Flares (RHA-FL-5100 and RHA-FL-5850) | Update emissions based on equipment and activities routed to the flare. |

**FET-2:**

| Unit ID | Application Changes |
|---|---|
| One (1) Amine Regeneration System (RA2-AMINE) | Update gas throughput, update operating parameters, update amine recirculation rate |
| One (1) Hot Oil Heater (RA2-H-20001) | Update heat duty to 89.24 MMBTU/hr and update emission factors. |
| Two (2) Flares (RA2-FL-25100 and RA2-FL-25850) | Update emissions based on equipment and activities routed to the flare. |

Emissions will also result from the following new or updated units: Startup, shutdown, and maintenance emissions (RH1-SSM, RH2-SSM, RH3-SSM, RH4-SSM, RH5-SSM, RH6-SSM, RHA-SSM, RA2-SSM, RH2-TO-5500-SSM, RH4-TO-45500-SSM, and RH5-TO-55500-SSM), RH4 slop water storage tanks flare (RH4-FL-46200), haul road emissions (RH-HAUL), methanol storage tanks (RH-TK-METHANOL), generators (RH-GEN-1 through RH-GEN-10), a heater trailer (RH-TRAILER)4 , a water well generator (RH-GEN-WELL), and fugitive emissions (RH-FUG-1, RH-FUG-2, RHA-FUG, and RA2-FUG).

Liquid throughput changes are also requested for the following tank batteries: RH1-TK-COND-EAST, RHA-TK-SLOP, RH1-TK-COND-WEST, RA2-TK-SLOP, RH4-TK-SLOP, RH2-TK-SLOP, and RH1-TK-SLOP and associated loading activities (RHA-TK-SLOP-LOAD, RH1-TK-COND-WEST-LOAD, RA2-TK-SLOP-LOAD, RH4-TK-SLOP-LOAD, RH2-TK-SLOP-LOAD, and RH1-TK-SLOP-LOAD).

There are two scenarios for the slop tank battery at Train 4, RH4-TK-SLOP, and the associated loading, RH4-TK-SLOP-LOAD. RH4-TK-SLOP may receive a combination of condensate, produced water, and slop water from various process streams at the facility. In Tank Scenario 1, up to 19,860 bbls/yr of condensate are routed to the tanks and the emissions from the tanks and associated loading are controlled by a new flare, RH4-FL-46200, with a 98% DRE. Note that the condensate contribution does not constitute the entire flowrate to this set of tanks, but rather a subset. In Tank Scenario 2, up to 120.7 bbls/yr of condensate are routed to the tanks as the condensate streams that were previously routed to this tank battery will be rerouted to another part of facility's process. The rerouting of these streams will require the installation of additional piping at the facility and associated fugitives. Note that the condensate contribution does not constitute the entire flowrate to this set of tanks, but rather a subset. In this scenario, RH4-TK-SLOP and associated loading RH4-TK-SLOP-LOAD remain uncontrolled. Additional details regarding these operating scenarios are detailed in Section 15. The UA2 tables have been represented with both Tank Scenario 1 and Tank Scenario 2 as appropriate.

In addition to the above, Targa will be completing two projects that will add fugitive only emissions. The first is to install a 16" jumper line between the 24" Red Hills South residue line and the 24" WWM/CGP interconnect and also involves the addition of 600 feet of buried pipeline. The second is to install 2 16" headers to separate the common treated gas header into separate cryogenic inlets and involves the construction of 1,200 feet of above ground pipeline.

In addition to the changes detailed above, Targa is seeking to update the emission unit IDs and equipment description for all units at this facility. A cross-reference table organized by unit type is included below:

| Heaters and Reboilers | | | |
|---|---|---|---|
| **Previous Unit Number** | **Previous Unit Description** | **New Unit Number** | **New Unit Description** |
| 1-EP-1 | RH1 HMO Heater | RH1-H-23-704 | HOT OIL HEATER |
| 1.5-EP-1g | RH1 Condensate Stabilization HMO Heater | RH1-H-1101 | STABILIZER HOT OIL HEATER |

## Plot Plan Drawn To Scale

---

A **plot plan drawn to scale** showing emissions points, roads, structures, tanks, and fences of property owned, leased, or under direct control of the applicant. This plot plan must clearly designate the restricted area as defined in UA1, Section 1-D.12. The unit numbering system should be consistent throughout this application.

---

A facility plot plan is attached.

# Section 6

## All Calculations

---

**Show all calculations** used to determine both the hourly and annual controlled and uncontrolled emission rates. All calculations shall be performed keeping a minimum of three significant figures. Document the source of each emission factor used (if an emission rate is carried forward and not revised, then a statement to that effect is required). If identical units are being permitted and will be subject to the same operating conditions, submit calculations for only one unit and a note specifying what other units to which the calculations apply. All formulas and calculations used to calculate emissions must be submitted. The "Calculations" tab in the UA2 has been provided to allow calculations to be linked to the emissions tables. Add additional "Calc" tabs as needed. If the UA2 or other spread sheets are used, all calculation spread sheet(s) shall be submitted electronically in Microsoft Excel compatible format so that formulas and input values can be checked. Format all spread sheets and calculations such that the reviewer can follow the logic and verify the input values. Define all variables. If calculation spread sheets are not used, provide the original formulas with defined variables. Additionally, provide subsequent formulas showing the input values for each variable in the formula. All calculations, including those calculations are imbedded in the Calc tab of the UA2 portion of the application, the printed Calc tab(s), should be submitted under this section.

**Tank Flashing Calculations**: The information provided to the AQB shall include a discussion of the method used to estimate tank-flashing emissions, relative thresholds (i.e., NOI, permit, or major source (NSPS, PSD or Title V)), accuracy of the model, the input and output from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis. If Hysis is used, all relevant input parameters shall be reported, including separator pressure, gas throughput, and all other relevant parameters necessary for flashing calculation.

**SSM Calculations**: It is the applicant's responsibility to provide an estimate of SSM emissions or to provide justification for not doing so. In this Section, provide emissions calculations for Startup, Shutdown, and Routine Maintenance (SSM) emissions listed in the Section 2 SSM and/or Section 22 GHG Tables and the rational for why the others are reported as zero (or left blank in the SSM/GHG Tables). Refer to "Guidance for Submittal of Startup, Shutdown, Maintenance Emissions in Permit Applications (http://www.env.nm.gov/aqb/permit/app_form.html) for more detailed instructions on calculating SSM emissions. If SSM emissions are greater than those reported in the Section 2, Requested Allowables Table, modeling may be required to ensure compliance with the standards whether the application is NSR or Title V. Refer to the Modeling Section of this application for more guidance on modeling requirements.

**Glycol Dehydrator Calculations**: The information provided to the AQB shall include the manufacturer's maximum design recirculation rate for the glycol pump. If GRI-Glycalc is used, the full input summary report shall be included as well as a copy of the gas analysis that was used.

**Road Calculations:** Calculate fugitive particulate emissions and enter haul road fugitives in Tables 2-A, 2-D and 2-E for:

1. If you transport raw material, process material and/or product into or out of or within the facility and have PER emissions greater than 0.5 tpy.
2. If you transport raw material, process material and/or product into or out of the facility more frequently than one round trip per day.

**Significant Figures:**

**A.** All emissions standards are deemed to have at least two significant figures, but not more than three significant figures.

**B.** At least 5 significant figures shall be retained in all intermediate calculations.

**C.** In calculating emissions to determine compliance with an emission standard, the following rounding off procedures shall be used:

**(1)** If the first digit to be discarded is less than the number 5, the last digit retained shall not be changed;

**(2)** If the first digit discarded is greater than the number 5, or if it is the number 5 followed by at least one digit other than the number zero, the last figure retained shall be increased by one unit; **and**

**(3)** If the first digit discarded is exactly the number 5, followed only by zeros, the last digit retained shall be rounded upward if it is an odd number, but no adjustment shall be made if it is an even number.

**(4)** The final result of the calculation shall be expressed in the units of the standard.

**Control Devices:** In accordance with 20.2.72.203.A(3) and (8) NMAC, 20.2.70.300.D(5)(b) and (e) NMAC, and 20.2.73.200.B(7) NMAC, the permittee shall report all control devices and list each pollutant controlled by the control device regardless if the applicant takes credit for the reduction in emissions. The applicant can indicate in this section of the

application if they chose to not take credit for the reduction in emission rates. For notices of intent submitted under 20.2.73 NMAC, only uncontrolled emission rates can be considered to determine applicability unless the state or federal Acts require the control. This information is necessary to determine if federally enforceable conditions are necessary for the control device, and/or if the control device produces its own regulated pollutants or increases emission rates of other pollutants.

---

# Amine Treating Units

## FET-1 and FET-2 Amine Treating (RHA-AMINE and RA2-AMINE)

Amine treating flash tank and regenerator stack emissions are calculated using a BR&E ProMax simulation. This simulation used a recent facility-specific gas analysis, dated November 16, 2022. Three different ProMax simulations are run for amine treating units RHA-AMINE and RA2-AMINE: High Inlet Gas Rate, $CO_2$ Slip, and High Inlet Acid Gas Content. The throughput and emissions for each amine treating unit are determined from the maximum values of the simulation results. The amine circulation rate remained constant for each amine treating unit between simulations. The worst-case scenario was used to determine emissions. Flash tank emissions are routed to the process with a capture efficiency of 100%. Regenerator stack emissions are routed to acid gas injection (AGI) wells using electric motor driven compressors. Regenerator stack emissions are routed to the corresponding flares (RHA-FL-5100 and RA2-FL-25100) with a DRE of 98% during startup, shutdown, or maintenance of the injection compressors or any operational conditions that would require the flaring of the regenerator stack emissions. The table below lists the specific throughput $CO_2$ and $H_2S$ content of the three simulations described above in addition to amine circulation rate, and control unit for amine treating units RHA-AMINE and RA2-AMINE.

| Amine Treating Unit | | RHA-AMINE | RA2-AMINE |
|---|---|---|---|
| High Inlet Gas Rate | Throughput (MMSCFD) | 70 | 175 |
| | Inlet mole fraction $CO_2$ | 5.5% | 8% |
| | Inlet mole fraction $H_2S$ | 0.3% | 0.5% |
| $CO_2$ Slip | Throughput (MMSCFD) | 40 | 105 |
| | Inlet mole fraction $CO_2$ | 8.4% | 8.3% |
| | Inlet mole fraction $H_2S$ | 0.5% | 1.1% |
| High Inlet Acid Gas Content | Throughput (MMSCFD) | 40 | 105 |
| | Inlet mole fraction $CO_2$ | 8.4% | 8.3% |
| | Inlet mole fraction $H_2S$ | 0.5% | 1.1% |
| Throughput (MMSCFD) (see details below regarding sliding scale throughput) | | 20 - 75 | 60 - 260 |
| Amine Circulation Rate (gpm) | | 415 | 1065 |
| Regenerator Stack Emission Control Unit | | Acid Gas Injection Well System, Flare (RHA-FL-5100) | Acid Gas Injection Well System, Flare (RA2-FL-25100) |

## Amine Treating (RH1-AMINE, RH2-AMINE, RH4-AMINE, and RH5-AMINE)

Amine treating flash tank and regenerator stack emissions are calculated using a BR&E ProMax simulation. The simulation uses a recent facility-specific gas analysis, dated November 16, 2022. Two different ProMax simulations are run for amine treating units RH1-AMINE, RH2-AMINE, RH4-AMINE, and RH5-AMINE: High Inlet Gas Rate and High Inlet $CO_2$. The throughput and emissions are determined from the maximum values of the simulation results. The amine circulation rate remained constant for each amine treating unit between simulations. Flash tank emissions are routed to the inlet with a capture efficiency of 100%. Regenerator stack emissions are routed to the corresponding thermal oxidizer (RH2-TO-5500 , RH4-TO-45500, and RH5-TO-55500) with a

DRE of 99%. Treated gas from the amine units is routed to glycol dehydration at Trains 1 to 6. Each unit operates with numerous regeneration towers, and dedicated still vents, flash tanks, and condensers. ProMax reports and process flow sheets are provided to demonstrate the overall routing for each unit. The table below lists the specific throughput and $CO_2$ content of the two simulations described above in addition to train connectivity, amine circulation rate, control unit, and control efficiency for each amine unit.

| **Amine Treating Unit** | | **RH1-AMINE** | **RH2-AMINE** | **RH4-AMINE** | **RH5-AMINE** |
|---|---|---|---|---|---|
| **High Inlet Gas Rate** | **Throughput (MMSCFD)** | 75 | 580 | 435 | 435 |
| | **Inlet mole fraction $CO_2$** | 4.5% | 2.8% | 3.6% | 3.6% |
| **High Inlet $CO_2$** | **Throughput (MMSCFD)** | 75 | 580 | 435 | 435 |
| | **Inlet mole fraction $CO_2$** | 5.6% | 5.5% | 5.6% | 5.6 % |
| **Train Dehydration** | | Train 1 | Trains 2 & 3 | Trains 4 & 6 | Trains 5 & 6 |
| **Amine Circulation Rate (gpm)** | | 420 | 1920 | 1920 | 2160 |
| **Regenerator Stack Emission Control Unit** | | Thermal Oxidizer (RH2-TO-5500) | Thermal Oxidizer (RH2-TO-5500) | Thermal Oxidizer (RH4-TO-45500) | Thermal Oxidizer (RH5-TO-55500) |
| **Control Unit DRE** | | 99% | 99% | 99% | 99% |

# Glycol Dehydration Units

**Glycol Dehydration (RH1-TEG, RH2-TEG, RH3-TEG, RH4-TEG, RH5-TEG, and RH6-TEG)**

Glycol dehydration regenerator and flash tank overhead emissions are calculated using a BR&E ProMax simulation. The simulation uses a recent facility-specific gas analysis, dated November 16, 2022. Three ProMax simulations are run: A maximum gas rate throughput, a minimum gas rate throughput, and a median gas rate throughput in order to capture the full profile of emissions at the various flowrates. The permitted throughput for each glycol dehydration unit is assumed to be the maximum gas rate throughput. The emissions are determined by taking the maximum emission rate of each pollutant between the three simulations. Each unit's TEG recirculation rate remained constant for all three simulations. Flash Tank overheads are recycled to the inlet with 100% capture efficiency and the non-condensable regenerator overheads are routed to either a flare or a thermal oxidizer with an assumed 100% capture efficiency. The table below lists the specific throughput, TEG recirculation rate, control unit, and control efficiency for each unit.

| Dehy Unit | RH1-TEG | RH2-TEG | RH3-TEG | RH4-TEG | RH5-TEG | RH6-TEG |
|---|---|---|---|---|---|---|
| Maximum Gas Rate Throughput (MMSCFD) | 75 | 300 | 300 | 300 | 300 | 300 |
| Median Gas Rate Throughput (MMSCFD) | 52.5 | 210 | 210 | 210 | 210 | 210 |
| Minimum Gas Rate Throughput (MMSCFD) | 30 | 120 | 120 | 120 | 120 | 120 |
| **TEG recirc rate (sgpm)** | 15.5 | 40 | 58 | 40 | 58 | 66.8 |
| **Regenerator overheads control device** | Train 1 Flare (RH1-FL-29-1003) | Thermal Oxidizer (RH2-TO-5500) | Thermal Oxidizer (RH2-TO-5500) | Thermal Oxidizer (RH4-TO-45500) | Thermal Oxidizer (RH5-TO-55500) | Thermal Oxidizer (RH5-TO-55500) |
| **Control Device DRE** | 98% | 99% | 99% | 99% | 99% | 99% |

# Heater and Reboiler Units

(RH2-H-741, RH2-H-2301, RHA-H-4901, RH3-H-6301, RH4-H-3901, RH4-H-5301, RH4-H-4001)
Except as noted in this paragraph, $NO_x$, VOC, and HAP emissions are calculated using AP-42 factors for external natural gas combustion sources in Tables 1.4-1, 1.4-2, 1.4-3, and 1.4-4. It is assumed that PM(Total) = $PM_{10}$ = $PM_{2.5}$. The 'Controlled – Low NOx burners' emission factors for small boilers (<100 MMBtu/hr) in Table 1.4-1 are used for Units RH4-H-3901 and RH4-H-4001. Greenhouse gas emissions are estimated using methodology from 40 CFR Part 98 and emission factors from Tables C-1 and C-2. Fuel gas is residue gas conservatively assumed to have a sulfur content of 0.25 gr S/100 scf based on site specification. Pipeline specification for residue gas is 4ppm (0.25 g S/100 scf). $SO_2$ emissions are based on 100% conversion of elemental sulfur to $SO_2$. CO and PM emission factors for RH2-H-741, RH2-H-2301, RH3-H-6301, and RH4-H-5301 are based on manufacturer guarantees. The NOx emission factor for RHA-H-4901, RH4-H-3901, and RH4-H-4001 is based on manufacturer specification of a concentration of 30 ppmv NOx @ 3% $O_2$..

| Heater Unit | Manufacturer Specifications | | | | AP-42 Emission Factors | |
|---|---|---|---|---|---|---|
| | NOx | CO | VOC* | PM | NOx | VOC* |
| | ppm @ 3% $O_2$ | lb/MMBtu | lb/MMBtu | lb/MMBtu | lb/MMscf | lb/MMscf |
| **RH2-H-741** | - | 0.037 | - | 0.0044 | 100 | 5.5 |
| **RH2-H-2301** | - | 0.037 | - | 0.0044 | 100 | 5.5 |
| **RHA-H-4901** | 30 | 0.037 | 0.0054 | 0.0044 | - | - |
| **RH3-H-6301** | - | 0.037 | - | 0.0044 | 100 | 5.5 |
| **RH4-H-3901** | 30 | 0.037 | 0.0054 | 0.0044 | - | - |
| **RH4-H-5301** | - | 0.037 | - | 0.0044 | 100 | 5.5 |
| **RH4-H-4001** | 30 | 0.037 | 0.0054 | 0.0044 | - | - |

* 5.5 lb/MMscf and 0.0054 lb/MMBtu emission factors are equal in value and are presented here as represented in the emission calculations.

(RH1-H-23-704, RH1-H-1101, RH2-H-781, RH3-H-741, RH3-H-781, RH4-H-41100, RH4-H-741, RH4-H-781, RH5-H-50902, RH5-H-50001, RH5-H-50741, RH5-H-50781, RA2-H-20001, RH6-H-60001, RH6-H-60741, RH6-H-60781)
$NO_x$, CO, VOC, and PM emissions are calculated using manufacturer guarantees. It is assumed that PM(Total) = $PM_{10}$ = $PM_{2.5}$. HAP emissions are calculated using AP-42 factors for external natural gas combustion sources in Tables 1.4-3 and 1.4-4. Greenhouse gas emissions are estimated using methodology from 40 CFR Part 98 and emission factors from Tables C-1 and C-2. Fuel gas is residue gas conservatively assumed to have a sulfur content of 0.25 gr S/100 scf. Pipeline specification for residue gas is 4ppm (0.25 g S/100 scf). $SO_2$ emissions are based on 100% conversion of elemental sulfur to $SO_2$.

# Storage Tanks

**Condensate Storage Tanks (RH1-TK-COND-EAST and RH1-TK-COND-WEST)**

Flashing, working, and breathing emissions are estimated using BR&E ProMax using a recent facility-specific condensate analysis, dated May 12, 2023. Each tank battery consists of six 500-bbl storage tanks, configured as three parallel sets of tanks, with each set containing two tanks that operate in series. Because the liquids from RH1-TK-COND-EAST and RH1-TK-COND-WEST are transported offsite via pipeline, the tanks operate as near constant-level tanks. However, RH1-TK-COND-WEST is also able to loadout via truck in the event of an issue with the outgoing pipeline system. When truck loading is required to transport liquids offsite, tank battery RH1-TK-COND-WEST operates as variable liquid height tanks.

Emissions from the condensate storage tanks are routed to the tank flare (RH1-FL-2850) with a 98% DRE. Controlled emissions are represented at RH1-FL-2850. RH1-TK-COND-EAST and RH1-TK-COND-WEST each have a total maximum throughput of 1,903,900 bbl/yr (79,963,800 gal/yr).

| Condensate Tank ID | RH1-TK-COND-EAST | RH1-TK-COND-WEST |
|---|---|---|
| Total Throughput (bbl/yr) | 1,903,900 | 1,903,900 |
| Number of Tanks | 6 | 6 |
| Unit(s) | TK-20101 through TK-20106 | TK-20107 through TK-20112 |
| Capacity of each Tank (bbl) | 500 | 500 |

**Sour Slop Water Storage Tanks (RHA-TK-SLOP and RA2-TK-SLOP)**

Flashing, working, and breathing emissions were estimated using the worst-case emission rates out of three different BR&E ProMax process simulations representing three different operating scenarios for the amine systems. Each set of tanks consists of two 500-bbl storage tanks. Emissions from the $H_2S$ sour slop storage tanks (RHA-TK-SLOP) are routed to the FET-1 sour slop tank flare (RHA-FL-5850) and emissions from the FET-2 sour slop tanks (RA2-TK-SLOP) are routed to the FET-2 sour slop tank flare (RA2-FL-25850), each with a 98% DRE. Controlled emissions are represented at RHA-FL-5850 and RA2-FL-25850. RHA-TK-SLOP and RA2-TK-SLOP have a maximum throughput of 235,550 bbl/yr (9,893,117 gal/yr) and 235,297 bbl/yr (9,882,486 gal/yr), respectively.

| Sour Slop Tank ID | RHA-TK-SLOP | RA2-TK-SLOP |
|---|---|---|
| Total Throughput (bbl/yr) | 235,550 | 235,297 |
| Number of Tanks | 2 | 2 |
| Unit(s) | TK-6100, TK-6200 | TK-26100, TK-26200 |
| Capacity of each Tank (bbl) | 500 | 500 |

**Slop Water Storage Tanks (RH4-TK-SLOP, RH2-TK-SLOP, and RH1-TK-SLOP)**

Flashing, working, and breathing emissions from the tanks are calculated using a BR&E ProMax simulation using a recent facility-specific slop water analysis, dated September 18, 2024. The slop water storage tanks RH2-TK-SLOP and RH1-TK-SLOP are not controlled. There are two scenarios for the slop tank battery at Train 4, RH4-TK-SLOP. In Tank Scenario 1, up to 19,860 bbls/yr of condensate are routed to the tanks and the emissions from the tanks are controlled by a new flare, RH4-FL-46200, with a 98% DRE. In Tank Scenario 2, up to 120.7 bbls/yr of condensate are routed to the tanks as the condensate streams that were previously routed to this tank battery will be rerouted to another part of facility's process. In Scenario 2, RH4-TK-SLOP remains uncontrolled. Additional details regarding these operating scenarios are detailed in Section 15. The table below lists the total throughput, number of tanks, and storage capacity for each set of slop water tanks.

| Slop Water Tanks ID | RH4-TK-SLOP | RH2-TK-SLOP | RH1-TK-SLOP |
|---|---|---|---|
| Total Throughput (bbl/yr) | 142,838 | 95,231 | 95,225 |
| Number of Tanks | 4 | 1 | 2 |
| Unit(s) | TK-46200-46230 | TK-6200 | TK-33-001, TK-33-002 |
| Capacity of each Tank (bbl) | 500 | 400 | 500 |

**Methanol Storage Tanks (RH-TK-METHANOL)**

The methanol tanks (unit RH-TK-METHANOL) at Red Hills include 41 tanks, ranging in size from 350 gallons to 2000 gallons, with a total site- wide storage capacity of 34,050 gallons and a maximum usage rate of 47,995 gallons per day. VOC and HAP emissions are determined using BR&E ProMax and an assumed 100% methanol content. The throughput for each tank is weighted based on the tanks' respective size. The methanol storage tanks are not controlled.

# Liquid Loading

**Condensate Loading (RH1-TK-COND-WEST-LOAD)**
Loading emissions are calculated using AP-42 Section 5.2 methodology. The maximum hourly throughput is based on the assumption that two trucks with a 180 bbl capacity can be loaded in an hour (15,120 gal/hr total). Loading is limited to the RH1-TK-COND-WEST tank battery. Emissions from loading activities are routed back to the RH1-TK-COND-WEST tank battery, which is controlled by flare (Unit RH1-FL-2850) with a 70% capture efficiency via vapor balance, per AP-42 Chapter 5.2 Section 5.2.2.1.1, and a 98% DRE. Controlled emissions are represented at RH1-FL-2850. The total loadout capacity for RH1-TK-COND-WEST-LOAD of truck loading is 3,067,105 gal/yr.

**Sour Slop Water Loading (RHA-TK-SLOP-LOAD and RA2-TK-SLOP-LOAD)**
Loading emissions are calculated using AP-42 Section 5.2 methodology. The maximum hourly throughput for RHA-TK-SLOP-LOAD is based on the assumption that one truck with a 180 bbl capacity can be loaded in an hour (7,560 gal/hr). The maximum hourly throughput for RA2-TK-SLOP-LOAD is based on the assumption that two trucks with a 180 bbl capacity each can be loaded in an hour (15,120 gal/hr total). Maximum annual throughput is equal to the entire throughput of the slop storage tanks (i.e., all slop storage tank throughput is loaded out). Sour slop loading emissions are sent to the sour gas flares (RHA-FL-5850 and RA2-FL-25850) with a 70% capture efficiency, per AP-42 Chapter 5.2 Section 5.2.2.1.1, and a 98% DRE. Controlled emissions are represented at units RHA-FL-5850 and RA2-FL-25850.

**Slop Water Loading (RH4-TK-SLOP-LOAD, RH2-TK-SLOP-LOAD, and RH1-TK-SLOP-LOAD)**
Loading emissions are calculated using AP-42 Section 5.2 methodology. The maximum hourly throughput is based on the assumption that two trucks with a 180 bbl capacity can be loaded in an hour (15,120 gal/hr total). The loading vapor pressures are determined from the BR&E ProMax simulation using a recent facility-specific wastewater analysis, dated September 18, 2024. The loading pressures for RH4-TK-SLOP-LOAD, RH2-TK-SLOP-LOAD and RH1-TK-SLOP-LOAD are assumed to be the same. The weight percentages of VOC, HAP, and $H_2S$ are obtained from the corresponding wastewater storage tanks in the BR&E ProMax Simulation. All throughput is assumed to be transported offsite via truck loading. Below is a table of annual loading throughput for each slop water truck loading unit. Loading activities for RH2-TK-SLOP-LOAD and RH1-TK-SLOP-LOAD are uncontrolled. There are two scenarios for RH4-TK-SLOP-LOAD. In Tank Scenario 1, the emissions from RH4-TK-SLOP-LOAD are controlled by a new flare, RH4-FL-46200, with a 98% DRE. In Tank Scenario 2, up to 120.7 bbls of condensate are routed to the tanks as the condensate streams that were previously routed to this tank battery will be rerouted to another part of facility's process. In Scenario 2, RH4-TK-SLOP-LOAD remains uncontrolled. Additional details regarding these operating scenarios are detailed in Section 15.

| Slop Water Truck Loading Unit | RH4-TK-SLOP-LOAD | RH2-TK-SLOP-LOAD | RH1-TK-SLOP-LOAD |
|---|---|---|---|
| Annual Loading Throughput (bbl/yr) | 142,838 | 95,231 | 95,231 |

# Thermal Oxidizers

**Thermal Oxidizers (RH2-TO-5500, RH4-TO-45500, and RH5-TO-55500)**

RH2-TO-5500 is a 90 MMBTU/hr thermal oxidizer controlling units RH2-TEG, RH1-AMINE, and RH2-AMINE. RH4-TO-45500 is an 80 MMBTU/hr thermal oxidizer controlling units RH3-TEG and RH4-AMINE. RH5-TO-55500 is a 75 MMBTU/hr thermal oxidizer controlling units RH5-TEG, RH6-TEG, and RH5-AMINE. NOx and CO emissions are calculated using manufacturer provided emission factors. PM emissions are calculated using AP-42 emission factors for external natural gas combustion sources in Tables 1.4-1 and 1.4-2. HAP and VOC emissions are calculated using streams from BR&E ProMax Simulations for the controlled sources. Greenhouse gas emissions are estimated using the methodology from 40 CFR Part 98 and emission factors from Tables C-1 and C-2 of Part 98. A 10% safety factor was incorporated on both the mass emissions of VOC, HAP, and $H_2S$ routed to the unit as well as the gas flow rate, which is used to determine the $NO_x$ and CO associated emissions. Pilot $SO_2$ emissions are calculated based on a standard assumed fuel sulfur content of 2 gr/100 scf, and an assumed 100% conversion of elemental sulfur to $SO_2$.

| Thermal Oxidizer Unit | Manufacturer Specifications | |
|---|---|---|
| | NOx | CO |
| | ppm | ppm |
| RH2-TO-5500 | 50 | 50 |
| RH4-TO-45500 | 50 | 50 |
| RH5-TO-55500 | 50 | 50 |

**Thermal Oxidizer Downtime (RH2-TO-5500-SSM, RH4-TO-45500-SSM, and RH5-TO-55500-SSM)**

The thermal oxidizers are used to control emissions from dehydrators and amine units during normal operations. For estimating thermal oxidizer downtime emissions, it was assumed that RH2-TO-5500 and RH4-TO-45500 each would be down for 109.5 hrs/yr, and RH5-TO-55500-SSM would be down for 175.2 hrs/yr. During this downtime the glycol dehydrator regenerator overheads will be routed to the flares RH2-FL-5100, RH4-FL-45100, and RH5-FL-55100 and the amine regenerator overheads will be vented. Emission calculation methodologies for the Glycol Dehydration and Amine Sweetening Units are described in their respective sections of Section 6.

# Flares

**Acid Gas Flares (RHA-FL-5100 and RA2-FL-25100)**

The acid gas injection (AGI) flares serve as control devices for the front end treaters if gas cannot be injected due to operational conditions or events that hinder the use of the wells. When injection into the AGI wells is not available, acid gas from the front end treater systems (units RHA-AMINE and RA2-AMINE) is routed to the flares for combustion. Additionally, the AGI flares will control various other events, including blowdowns of inlet acid gas for the sour trains, other SSM activities, and emissions from sour pig launching and receiving (units RHA-REC-WINKLER and RHA-REC-LIMESTONE-10INCH for RHA-FL-5100, and RHA-REC-LIMESTONE-8INCH, RA2-REC-GREYHOUND, and RHA-LAU-LIMESTONE-10INCH for RA2-FL-25100).

Emissions from the amine regenerator overhead are calculated using BR&E ProMax, with a 10% safety factor for emission rates and flow rates included to account for variability in the amine systems. Additionally, both flares will operate with a 5:1 assist gas ratio to aid in combustion. The pilot consumes 65 scf/hr of gas.

The flares control blowdowns of inlet gas, the various SSM activities, and pig launching. Hourly emissions for these units assume that SSM flaring does not occur at the same time as acid gas flaring or inlet gas flaring, but acid gas and inlet flaring can occur at the same time. Assist gas emissions are directly associated with acid gas flaring events. The maximum of both scenarios was used to determine the maximum hourly emission for each pollutant.

Pilot and process $NO_x$ and CO emissions are calculated using emission factors from the Texas Natural Resource Conservation Commission's Air Permit Technical Guidance for Chemical Sources: Flares and Vapor Oxidizers (TNRCC RG-109 dated October 2000). No pilot or process PM emissions occur as the flares are smokeless.

Pilot VOC emissions are calculated using emission factors from AP-42 Chapter 1.4 Table 1.4-1. Pilot $SO_2$ emissions are based on an assumed residue gas fuel sulfur content of 0.25 gr S/100 scf and an assumed 100% conversion of elemental sulfur to $SO_2$. Pipeline specification for residue gas is 4ppm (0.25 g S/100 scf). Additionally, assist gas $SO_2$ emissions are based on an assumed 1.5 ppm $H_2S$ content in the assist gas with a 100% conversion of combusted $H_2S$ to $SO_2$ and a 98% DRE. The $H_2S$ content of the assist gas is based on a residue analysis dated January 21, 2025. This is an additional conservative assumption for the assist gas used at these flares. Pilot and assist gas $H_2S$ emissions are based on the remaining 2% of uncombusted $H_2S$. Process VOC, HAP, and $H_2S$ emissions are based on emissions from the amine unit still vent with a 98% DRE. Process $SO_2$ emissions are based on an assumed 100% conversion of combusted $H_2S$ to $SO_2$.

Greenhouse gas emissions were calculated using 40 CFR 98 Subpart C Table C-1 and Table C-2 with the methodology outlined in 40 CFR 98.233(n).

**Process Flares (RH1-FL-29-1003, RH2-FL-5100, RH3-FL-5100, RH4-FL-45100, and RH5-FL-55100)**

The plant flares are used for flaring during facility startup, shutdown, maintenance and upset conditions. The only steady state conditions associated with these flares are from the pilot and purge gas streams. However, unit RH1-FL-29-1003 also controls the steady state regenerator overheads of the Train 1 dehydrator RH1-TEG. SSM emissions from the plant flares are due to various maintenance activities throughout the facility per maintenance schedules. These maintenance activities include but are not limited to equipment blowdowns for associated maintenance, instrumental calibrations, and process safety device maintenance.

The basis of the flaring calculations are the expected composition and maximum expected volumes of the gas. The $SO_2$ composition is based on a 100% molar conversion of $H_2S$ to $SO_2$. $NO_x$ and CO emissions for both scenarios are calculated using TNRCC RG-109. VOC emissions are calculated from the VOC volume fraction of the gas stream going to the flare, the specific volume of the VOC fraction of the gas stream, and a 98% destruction efficiency. Emissions of greenhouse gases are calculated using methodology from 40 CFR Subpart 98.233(n).

**Condensate Tank Flare (Unit RH1-FL-2850)**

The condensate tank flare controls flash, working, and breathing emissions from the condensate tank batteries (units RH1-TK-COND-EAST and RH1-TK-COND-WEST) as well as condensate loading emissions (unit RH1-TK-COND-WEST-LOAD). Tank and loading emissions are determined using BR&E ProMax and a 25% flow rate safety factor, and a 10% emission rate safety factor is included to account for variability in the tanks and loading.

Pilot and process $NO_x$ and CO emissions are calculated using emission factors from the Texas Natural Resource Conservation Commission's Air Permit Technical Guidance for Chemical Sources: Flares and Vapor Oxidizers (TNRCC RG-109 dated October 2000). No pilot or process PM emissions occur as the flares are smokeless.

Pilot VOC emissions are calculated using the VOC weight % and density of the fuel gas. Pilot $SO_2$ emissions are based on an assumed fuel sulfur content of 0.25 gr/100 scf and an assumed 100% conversion of elemental sulfur to $SO_2$. Process VOC, HAP, and $H_2S$ emissions are based on emissions from the tanks and loading with a 98% DRE. Process $SO_2$ emissions are based on an

assumed 100% conversion of combusted $H_2S$ to $SO_2$. Greenhouse gas emissions are calculated using 40 CFR 98 Subpart C Table C-1 and Table C-2 with the methodology outlined in 40 CFR 98.233(n).

**Slop Water Tank Flare (Unit RH4-FL-46200)**

The slop water tank flare controls flash, working, and breathing emissions from the slop water tank battery (unit RH4-TK-SLOP) as well as slop water loading emissions (unit RH4-TK-SLOP-LOAD). Tank and loading emissions are determined using BR&E ProMax and a 10% flow rate safety factor is included to account for variability in the tanks and loading.

Pilot and process $NO_x$ and CO emissions are calculated using emission factors from the Texas Natural Resource Conservation Commission's Air Permit Technical Guidance for Chemical Sources: Flares and Vapor Oxidizers (TNRCC RG-109 dated October 2000). No pilot or process PM emissions occur as the flares are smokeless.

Pilot VOC emissions are calculated using the VOC weight % and density of the fuel gas. Pilot $SO_2$ emissions are based on an assumed fuel sulfur content of 0.25 gr S/100 scf and an assumed 100% conversion of elemental sulfur to $SO_2$.

Greenhouse gas emissions are calculated using 40 CFR 98 Subpart C Table C-1 and Table C-2 with the methodology outlined in 40 CFR 98.233(n).

**Sour Slop Tank Flares (Units RHA-FL-5850 and RA2-FL-25850)**

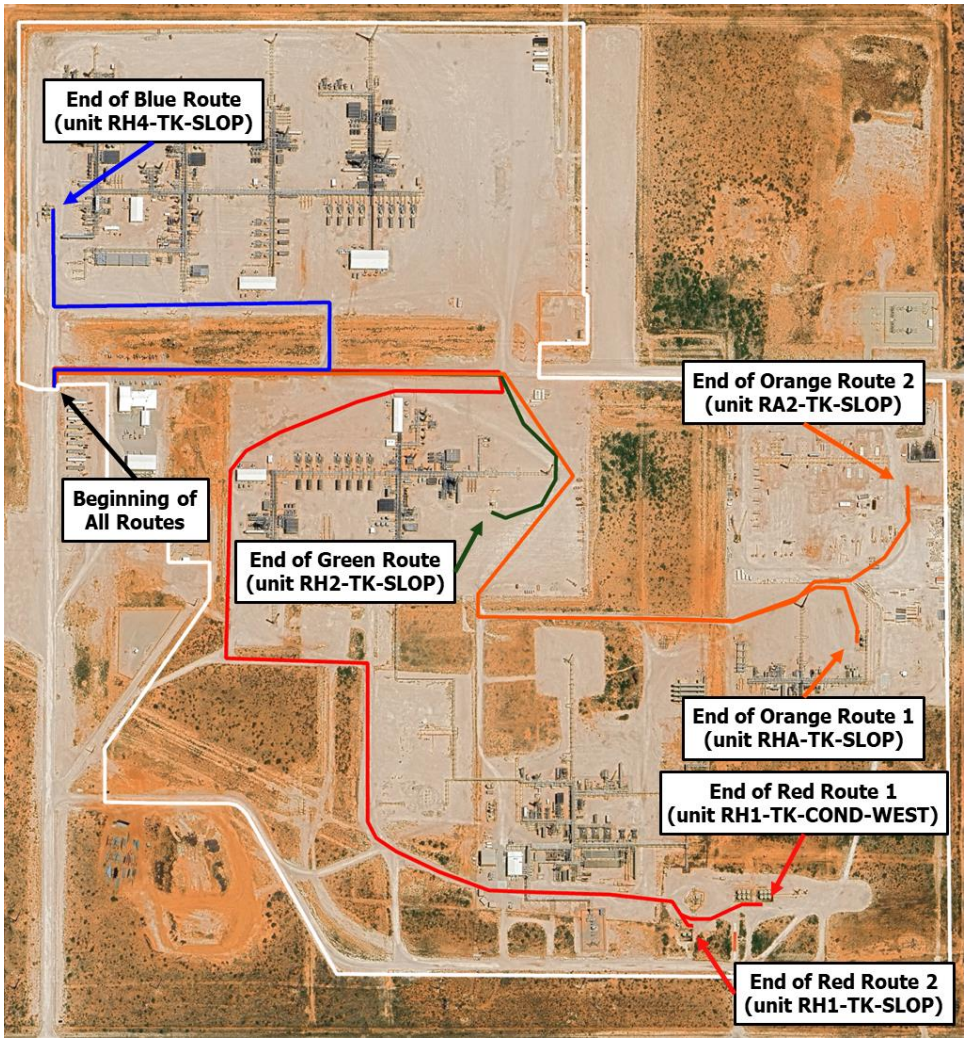
The sour slop tank flares controls flash, working, and breathing emissions from the sour slop tank batteries (units RHA-TK-SLOP and RA2-TK-SLOP) as well as sour slop loading emissions (units RHA-TK-SLOP-LOAD and RA2-TK-SLOP-LOAD). The flares control these units continuously (8,760 hr/yr). Tank and loading emissions are determined using BR&E ProMax and a 10% emission and flow rate safety factor is included to account for variability in the tanks and loading. It is assumed the pilot consumes 100 scf/hr of gas based on an engineering estimate.

Pilot and process $NO_x$ and CO emissions are calculated using emission factors from the Texas Natural Resource Conservation Commission's Air Permit Technical Guidance for Chemical Sources: Flares and Vapor Oxidizers (TNRCC RG- 109 dated October 2000). No pilot or process PM emissions occur as the flares are smokeless.

Pilot VOC emissions are calculated using emission factors from AP-42 Chapter 1.4 Table 1.4-1. Pilot $SO_2$ emissions are based on an assumed fuel sulfur content of 0.25 gr S/100 scf and an assumed 100% conversion of elemental sulfur to $SO_2$.

Process VOC, HAP, and $H_2S$ emissions are based on emissions from the tanks and loading with a 98% DRE. Process $SO_2$ emissions are based on an assumed 100% conversion of combusted $H_2S$ to $SO_2$.

Greenhouse gas emissions from are calculated using 40 CFR 98 Subpart C Table C-1 and Table C-2 with the methodology outlined in 40 CFR 98.233(n).



# Fugitives

**Fugitive Components (RH-FUG-1, RH-FUG-2, RHA-FUG, RA2-FUG)**

The emissions from fugitive components are calculated using emission factors from Table 2-4 of the EPA Protocol for Equipment Leak Emission estimates, November 1995. A safety factor is applied to the fugitive component count estimates. Heavy oil was conservatively assumed to be 100% VOC, 10% HAPs, and 1% $H_2S$. Methanol was assumed to be 100% VOC and 100% HAP. Fuel gas compositions are based on the maximum fuel gas VOC and HAPs content from available analyses. Additionally, VOC, HAP, and $H_2S$ weight percents are determined from compositions for each stream. Analyses used in the calculations are provided in Section 7. RHA-FUG and RA2-FUG conservatively assume an $H_2S$ concentration of 25,000 ppm to represent the annual average inlet acid gas concentration that is processed by FET-1 and FET-2. Additionally, RHA-FUG and RA2-FUG conservatively assume an $H_2S$ concentration of 250,000 ppm to represent the annual average acid gas concentration at the still vent outlet of FET-1 and FET-2.

**Haul Roads (RH-HAUL)**

The haul road inputs are based on projected production rates from the condensate, sour water, and slop water at the facility and estimated vehicle miles traveled to transport the material. The following image depicts all haul road routes at the Red Hills Gas Processing Plant facility, where they begin, where they end, and what units they are serving.

Haul road distances are estimated using Google Earth satellite images dated 7/2/2023. All haul road routes start at the west gate next to the facility check-in. From there, the routes split to head to their respective tank batteries as follows: Orange Route 1 is 0.94 miles long and transports sour water from the FET-1 Sour Slop Tanks (unit RHA-TK-SLOP); Red Route 1 is 1.33 miles long and transports condensate from the RH1 West Condensate Storage Tanks (unit RH1-TK-COND-WEST); Orange Route 2 is 0.99 miles long and transports sour water from the FET-2 Sour Slop Tanks (unit RA2-TK-SLOP); Blue Route is 0.58 miles long and transports slop water from the RH4 Slop Tanks (unit RH4-TK-SLOP); Green Route is 0.53 miles long and transports wastewater from the

RH2 Slop Tanks (unit TH2-TK-SLOP); and Red Route 2 is 1.28 miles long and transports slop water from the RH1 Slop Tanks (unit RH1-TK-SLOP).

Uncontrolled total suspended particulate matter (TSP), PM10, and PM2.5 emissions are calculated using Equations 1a and 2 from AP-42 Section 13.2.2 for unpaved haul road emissions. Surface silt content was taken from AP-42 Table 13.2.2-1.

Constants are taken from AP-42 Table 13.2.2-2. The number of days in a year with at least 0.01 inches of precipitation was taken from the NMED guidance document titled Guidance for Aggregate Handling, Storage Piles and Haul Road Emissions, published January 1, 2017. PM30 is assumed equivalent to (TSP) per AP-42 Table 13.2.2-2.
Controlled TSP, PM10, and PM2.5 emissions are calculated using an overall control efficiency of 78% based on the following control methods:

- Base course haul roads (60% reduction); Guidance for Aggregate Handling, Storage Piles and Haul Road Emissions, published January 1, 2017.
- 25 mph speed limit (44% reduction); Western Regional Air Partnership (WRAP) Fugitive Dust Handbook, published September 7, 2006.

# Engines and Generators

**Generators (RH-GEN-1 through RH-GEN-10)**

The diesel-fired generator emissions are calculated at 499 hp and 500 hrs/yr of runtime per engine. Since the generators are provided by a rental company and can have a range of horsepower, it is assumed that this is the maximum size of generator that is present on site. NSPS IIII Tier IV Final Emission Factors for Non- Road Engines for $NO_x$, CO, VOC, and PM are used. Emission factors for HAP and $SO_2$ emissions are obtained from AP- 42 Section 3.3, Gasoline and Diesel Industrial Engines (10/96) and are used to calculate potential emissions for the diesel generators. A typical diesel heating value of 0.137 MMBtu/gal is used. Greenhouse gas emissions are calculated using 40 CFR 98 Tables A-1, C-1, and C-2.

**Water Well Generator (RH-GEN-WELL)**

The diesel-fired generator emissions are calculated at 35 hp and 120 hrs/yr of runtime. EPA engine family certified levels are used for $NO_x$, CO, and VOC. Emission factors for $SO_2$, HCHO, and PM are obtained from AP-42 Section 3.3, Gasoline and Diesel Industrial Engines (10/96) and are used to calculate potential emissions for the diesel generator. A typical diesel heating value of 0.137 MMBtu/gal is used. Greenhouse gas emissions are calculated using 40 CFR 98 Tables A-1, C-1, and C-2.

**Heater Trailer (RH-TRAILER)**

The heater trailer is used to provide heat to units that require it during cold weather events in order to start up. The heater trailer consists of a diesel-fired 13.8 hp engine and a diesel-fired 1 MMBtu/hr heater. Heater trailer emissions are calculated as the sum of the engine emissions and heater emissions. Engine emissions are calculated based on NSPS IIII Tier IV Final Emission Factors. NSPS IIII Tier IV has a combined $NO_x$ and VOC emission factor of 5.6 g/hp- hr. For the combined non-methane hydrocarbon (NMHC) and $NO_x$ emission factor of 5.6 g/hp-hr, per CARB Emission Factors for CI Diesel Engines, a breakdown of 5% and 95%, respectively, is assumed. Engine emission factors for HAP and $SO_2$ emissions are obtained from AP- 42 Section 3.3, Gasoline and Diesel Industrial Engines (10/96). Heater $NO_x$, CO, VOC, $SO_2$, and PM emissions are calculated using emission factors obtained from AP-42 Section 1.3, Fuel Oil Combustion (05/10), for firing distillate oil containing less than 0.3 wt% sulfur. Per AP-42 Section 1.3, Fuel Oil Combustion (05/10), the emission factors in lb/1000 gal are converted to lb/MMBtu by dividing the emission factor by the heating value of Fuel Oil No. 2 (140 MMBtu/1000 gal). Greenhouse gas emissions are calculated using 40 CFR 98 Tables A-1, C-1, and C-2.

# Startup, Shutdown, Maintenance and Malfunction

**Pig Launching and Receiving (RHA-REC-WINKLER through RH4-REC-24INCH, RHA-REC-LIMESTONE-10INCH, RA2-REC-GREYHOUND, RHA-LAU-LIMESTONE-10INCH through RH2-LAU-GPX)**

Pig launching and receiving activities are determined using a mass balance approach based on the volume of gas vented with each pig launched or received and a representative gas analysis for each pig launcher or receiver. There are a total of eight pig receivers (RHA-REC-WINKLER through RH4-REC-24INCH, RHA-REC-LIMESTONE-10INCH, and RA2-REC-GREYHOUND), and six pig launchers (RHA-LAU-LIMESTONE-10INCH through RH2-LAU-GPX).

RHA-REC-WINKLER and RHA-REC-LIMESTONE-8INCH operate in sour gas service and blows down in three stages. The first stage is to a closed drain, the second stage is to a flare (RHA-FL-5100 and RA2-FL-25100 respectively), and the third stage releases to the atmosphere. Stages two and three are purged with residue gas prior to releasing to atmosphere.

RH1-REC-PLANTVIEW and RH1-REC-GUTLINE operate in sweet gas service and blows down in two stages. The first stage is to a closed drain, and the second state is released to the atmosphere.
RH1-REC-ABU operates in sweet gas service and RH1-LAU-NGPL and RH1-LAU-TW operate in residue gas service. These launchers and receivers are blown down to atmosphere.

RH4-REC-24INCH operates in sweet gas service and is blown down in three stages. The first stage is to a closed drain, the second stage is to flare RH4-FL-45100, and the third stage releases the remaining gas to the atmosphere.

RHA-REC-LIMESTONE-10INCH operates in sour gas service and is blown down in three stages. The first stage is to a closed drain, the second stage is to flare RHA-FL-5100, and the third stage is released to the atmosphere. Stages two and three are purged with residue gas prior to releasing to atmosphere.

RA2-REC-GREYHOUND and RHA-LAU-LIMESTONE-10INCH operate in sour gas service and are blown down in three stages. The first stage is to a closed drain, the second stage is to flare RA2-FL-25100, and the third stage is released to the atmosphere. Stages two and three are purged with residue gas prior to releasing to atmosphere.

RH2-LAU-GPX operates in sweet gas service and is blown down in three stages. The first stage is to a closed drain, the second stage is to flare RH2-FL-251000, and the third stage is released to the atmosphere.

RH1-LAU-ETC and RH1-LAU-ONEOK operate in Y-grade NGL service and are blown down in two stages. The first stage is to a closed drain, and the second stage is released to the atmosphere.

**Vented SSM (RH1-SSM, RH2-SSM, RH3-SSM, RH4-SSM, RH5-SSM, RH6-SSM, RHA-SSM, and RA2-SSM)**

This section provides the methodologies used for the various subsets of SSM events that occur at the Red Hills site. These example methodologies are not intended to be permit representations since individual activities in each subcategory vary by procedure and equipment configuration. Calculations are provided on a unit-by-unit basis for each train and each type of event.

Vented SSM has several components. Each type of SSM is described below:

*Vessel Blowdown and Startup*

Emissions from vessel maintenance blowdown activities are calculated using vessel volumes and the ideal gas law. The minimum flared blowdown pressure is assumed to be 20 psig. Conservatively, it is assumed that the full vessel volume is routed to the flare while also assumed that the vessel volume remaining from 20 psig to 0 psig is vented, if the blowdown is controlled. The $H_2S$ concentration for inlet sour gas was conservatively assumed to be 25,000 ppm which is representative of the annual average concentration FET-1 and FET-2 will process. Equipment blowdown volumes were calculated as follows:

$$[\text{Volume } (ft^3)] \times [\text{pressure (psia)}] * [459.67\ (°F) + 60\ (°F)] / [[14.696\ (\text{psia})] \times [\text{Temperature } (°F) + 459.67\ (°F)]]$$

Emissions from vessel maintenance startup activities are calculated using a three-step pressurization. The minimum of the vapor pressure or pressurization steps is used to determine the volume of gas or vapor vented to atmosphere or flare. The table below shows an example of a three-step pressurization.

| | | |
|---|---|---|
| 1st Step Pressure | 50 | psig |
| 2nd Step Pressure | 150 | psig |

| | | |
|---|---|---|
| 3rd Step Pressure | 300 | psig |

Equipment startup volumes were calculated as follows:

[Volume ($ft^3$)] x [1st step pressurization (psia) + 2nd step pressurization (psia) + 3rd step pressurization (psia)] / [14.696 (psia)]

*Tank Degassing (Non-forced)*

Emissions from Non-forced Tank Degassing are calculated based on a mass balance. The roof of the tank is not included in the clingage volume since no liquid reaches the roof. Clingage thickness is determined per TCEQ Maintenance, Startup and Shutdown (MSS) Guidance Document for Terminals and chemical plants. The presumed degassing event duration is 24 hours an event with 2 tank degassing events per year/per unit. The HAP content is conservatively assumed to be 25% of the vented liquid vapor analysis. The $H_2S$ concentration for inlet sour gas was conservatively assumed to be 25,000 ppm which is representative of the annual average FET-1 and FET-2 will process.

[Volume ($ft^3$)] x [pressure (psia)] * [459.67 (°F) + 60 (°F)] / [[14.696 (psia)] x [Temperature (°F) + 459.67 (°F)]]

*Meter Proving & Line Breaks*

Emissions to the atmosphere after opening lines are calculated using the Ideal Gas Law and conservatively use the maximum pressure for each service to determine blowdown volume. Piping is conservatively assumed to be one 10-foot length of 16" diameter pipe. Degassing occurs within one hour. The $H_2S$ concentration for inlet sour gas was conservatively assumed to be 25,000 ppm which is representative of the annual average FET-1 and FET-2 will process. Meter proving and line break volumes were calculated as follows:

[Volume ($ft^3$)] x [Maximum Pressure (psia) / [14.696 (psia)] / [1000 (scf/Mscf)]

*Filters*

The Filter SSM calculations utilize an ideal gas law equation to determine the mass of gas released. Weight percents are then applied to determine the uncontrolled emission rate. For controlled sources the control factor is applied. Degassing is assumed to occur in one hour. The $H_2S$ concentration for inlet sour gas was conservatively assumed to be 25,000 ppm which is representative of the annual average FET-1 and FET-2 will process. Filter blowdown volumes were calculated as follows:

[Volume ($ft^3$)] x [pressure (psia)] / [[Gas Constant R] x [Temperature (°F) + 459.67 (°F)]] x [Molecular Weight (lb/lb-mol)]

*Surface Coating*

PM, $PM_{10}$, and $PM_{2.5}$ emissions are calculated using solids content, usage rates, transfer efficiency, and fallout factors. Transfer efficiency and fallout factor are referenced from TCEQ's Painting Basics and Emissions Calculations for TCEQ Air Quality Permit Applications (November 5, 2012). The solids content is determined by the representative Safety Data Sheet (SDS). The usage rates are assumed to be 25 gallons/hr and 100 gallons/year. VOCs and HAPs are calculated using the density, VOC content, and HAP content on the representative Safety Data Sheet. Emissions associated with surface coating are represented as a total facility-wide hourly emission rate. It is presumed that surface coating will only occur at one train at a time.

*Full Plant Blowdown*

Emissions from vessel maintenance activities are calculated using the ideal gas law. The minimum flared blowdown pressure is assumed to be 20 psig. Full plant blowdown volumes were calculated by summing the volume of each piece of equipment. The $H_2S$ concentration for inlet sour gas was assumed to be no more than 2,000 ppm during a full plant turnaround for FET-1 and FET-2. As it is expected that only one event will occur per year, Targa will ensure that the $H_2S$ concentration of the gas within these treatment trains is adequately reduced prior to conducting a full plant turnaround. Equipment volumes were calculated as follows:

[Volume ($ft^3$)] x [pressure (psia)] * [459.67 (°F) + 60 (°F)] / [[14.696 (psia)] x [Temperature (°F) + 459.67 (°F)]]

*Full Plant Startup*

Emissions from vessel maintenance activities are calculated using a four-step pressurization, where vessels are blown down to check for leaks after pressurizing. The minimum of the vapor pressure or pressurization steps is used to determine the volume of gas or vapor vented to atmosphere or flare. The $H_2S$ concentration for inlet sour gas was assumed to be no more than 2,000 ppm during a full plant turnaround for FET-1 and FET-2. As it is expected that only one event will occur per year, Targa will ensure that the

$H_2S$ concentration of the gas within these treatment trains is adequately reduced prior to conducting a full plant turnaround. Full plant startup volumes for each step of pressurization were calculated as follows:

[Volume ($ft^3$)] x [step pressurization (psia) / [14.696 (psia)]

The table below shows an example of a four-step pressurization.

| | | |
|---|---|---|
| 1st Step Pressure | 25 | psig |
| 2nd Step Pressure | 50 | psig |
| 3rd Step Pressure | 100 | psig |
| 4th Step Pressure | 100 | psig |

For Trains 1 through 6, certain SSM events cannot occur simultaneously on a per train basis. Only one of the following can occur at each train at the same time:

- A full plant blowdown;
- A full plant startup; or,
- Individual vessel blowdowns, individual vessel startups, tank degassing, tank startup, meter proving and line breaks, and filter blowdowns.

If an individual vessel is blown down, only one vessel can be blown down in a single hour. Hourly emission rates within this application represent the highest emission individual vessel blowdown. Similarly, filter blowdowns assume only one filter is changed at a time per train.

For FET-1 and FET-2, SSM events cannot occur simultaneously at both trains. The same limitations as Trains 1 through 6 apply as well on an individual train basis.

# Section 6.a

## Green House Gas Emissions

(Submitting under 20.2.70, 20.2.72 20.2.74 NMAC)

---

**Title V (20.2.70 NMAC), Minor NSR (20.2.72 NMAC), and PSD (20.2.74 NMAC)** applicants must estimate and report greenhouse gas (GHG) emissions to verify the emission rates reported in the public notice, determine applicability to 40 CFR 60 Subparts, and to evaluate Prevention of Significant Deterioration (PSD) applicability. GHG emissions that are subject to air permit regulations consist of the sum of an aggregate group of these six greenhouse gases: carbon dioxide ($CO_2$), nitrous oxide ($N_2O$), methane ($CH_4$), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride ($SF_6$).

### Calculating GHG Emissions:

**1.** Calculate the ton per year (tpy) GHG mass emissions and GHG $CO_2e$ emissions from your facility.
**2.** GHG mass emissions are the sum of the total annual tons of greenhouse gases without adjusting with the global warming potentials (GWPs). GHG $CO_2e$ emissions are the sum of the mass emissions of each individual GHG multiplied by its GWP found in Table A-1 in 40 CFR 98 Mandatory Greenhouse Gas Reporting.
**3.** Emissions from routine or predictable start up, shut down, and maintenance must be included.
**4.** Report GHG mass and GHG $CO_2e$ emissions in Table 2-P of this application. Emissions are reported in **short** tons per year and represent each emission unit's Potential to Emit (PTE).
**5.** All Title V major sources, PSD major sources, and all power plants, whether major or not, must calculate and report GHG mass and CO2e emissions for each unit in Table 2-P.
**6.** For minor source facilities that are not power plants, are not Title V, and are not PSD there are three options for reporting GHGs in Table 2-P: 1) report GHGs for each individual piece of equipment; 2) report all GHGs from a group of unit types, for example report all combustion source GHGs as a single unit and all venting GHGs as a second separate unit; 3) or check the following ☐ By checking this box, the applicant acknowledges the total CO2e emissions are less than 75,000 tons per year.

**Sources for Calculating GHG Emissions:**

- Manufacturer's Data
- AP-42 Compilation of Air Pollutant Emission Factors at http://www.epa.gov/ttn/chief/ap42/index.html
- EPA's Internet emission factor database WebFIRE at http://cfpub.epa.gov/webfire/
- 40 CFR 98 Mandatory Green House Gas Reporting except that tons should be reported in short tons rather than in metric tons for the purpose of PSD applicability.
- API Compendium of Greenhouse Gas Emissions Methodologies for the Oil and Natural Gas Industry. August 2009 or most recent version.
- Sources listed on EPA's NSR Resources for Estimating GHG Emissions at http://www.epa.gov/nsr/clean-air-act-permitting-greenhouse-gases:

**Global Warming Potentials (GWP):**
Applicants must use the Global Warming Potentials codified in Table A-1 of the most recent version of 40 CFR 98 Mandatory Greenhouse Gas Reporting. The GWP for a particular GHG is the ratio of heat trapped by one unit mass of the GHG to that of one unit mass of $CO_2$ over a specified time period.

**"Greenhouse gas"** for the purpose of air permit regulations is defined as the aggregate group of the following six gases: carbon dioxide, nitrous oxide, methane, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. **(20.2.70.7 NMAC, 20.2.74.7 NMAC).** You may also find GHGs defined in 40 CFR 86.1818-12(a).

**Metric to Short Ton Conversion:**
Short tons for GHGs and other regulated pollutants are the standard unit of measure for PSD and title V permitting programs. 40 CFR 98 Mandatory Greenhouse Reporting requires metric tons.
1 metric ton = 1.10231 short tons (per Table A-2 to Subpart A of Part 98 – Units of Measure Conversions)

*NOTES:*

[1] RHA-FL-5100 has two hourly emission limits; one if it is operating simultaneously as RA2-FL-25100 and one if it is not.

[2] RA2-FL-25100 has two hourly emission limits; one if it is operating simultaneously as RHA-FL-5100 and one if it is not.

[3] There is no hourly SSM flaring at the same time as Flare-M Malfunction Flaring.

[4] There are no emissions from RH1-TEG in a controlled scenario. Flash tank overheads are routed back to process. Regenerator overheads are controlled by RH1-FL-29-1004 with 100% capture and 98% DRE.

[5] There are no emissions from RH2-TEG in a controlled scenario. Flash tank overheads are routed back to process. Regenerator overheads are controlled by RH2-TO-5500 with 100% capture and 99% DRE.

[6] There are no emissions from RH3-TEG in a controlled scenario. Flash tank overheads are routed back to process. Regenerator overheads are controlled by RH4-TO-45500 with 100% capture and 99% DRE.

[7] There are no emissions from RH4-TEG in a controlled scenario. Flash tank overheads are routed back to process. Regenerator overheads are controlled by RH4-TO-45500 with 100% capture and 99% DRE.

[8] There are no emissions from RH5-TEG in a controlled scenario. Flash tank overheads are routed back to process. Regenerator overheads are controlled by RH5-TO-55500 with 100% capture and 99% DRE.

[9] There are no emissions from RH6-TEG in a controlled scenario. Flash tank overheads are routed back to process. Regenerator overheads are controlled by RH5-TO-55500 with 100% capture and 99% DRE.

[10] There are no emissions from RH1-AMINE in a controlled scenario. Flash tank overheads are routed back to process. Still vent overheads are controlled by RH2-TO-5500 with 100% capture and 99% DRE.

[11] There are no emissions from RH2-AMINE in a controlled scenario. Flash tank overheads are routed back to process. Still vent overheads are controlled by RH2-TO-5500 with 100% capture and 99% DRE.

[12] There are no emissions from RHA-AMINE in a controlled scenario. All emissions are routed to AGI-1. During AGI-1 downtime, flash tank overheads are routed back to process and still vent overheads are controlled by RHA-FL-5100 with 100% capture and 98% DRE.

[13] There are no emissions from RH4-AMINE in a controlled scenario. Flash tank overheads are routed back to process. Still vent overheads are controlled by RH4-TO-45500 with 100% capture and 99% DRE.

[14] There are no emissions from RH5-AMINE in a controlled scenario. Flash tank overheads are routed back to process. Still vent overheads are controlled by RH5-TO-55500 with 100% capture and 99% DRE.

[15] There are no emissions from RA2-AMINE in a controlled scenario. All emissions are routed to AGI-2. During AGI-2 downtime, flash tank overheads are routed back to process and still vent overheads are controlled by RA2-FL-25100 with 100% capture and 98% DRE.

[16] There are no emissions from RH1-TK-COND-EAST in a controlled scenario. All emissions are routed to RH1-FL-2850 with 100% capture and 98% DRE. No loading is permitted from this tank battery.

[17] There are no emissions from RHA-TK-SLOP in a controlled scenario. All emissions are routed to RHA-FL-5850 with 100% capture and 98% DRE.

[18] There are no emissions from RH1-TK-COND-WEST in a controlled scenario. All emissions are routed to RH1-FL-2850 with 100% capture and 98% DRE.

[19] There are no emissions from RA2-TK-SLOP in a controlled scenario. All emissions are routed to RA2-FL-25850 with 100% capture and 98% DRE.

[20] Emissions from RHA-TK-SLOP-LOAD are routed to RHA-FL-5850 with a 70% capture and 98% DRE.

[21] Emissions from RH2-TK-COND-WEST-LOAD are routed to RH1-FL-2850 with a 70% capture and 98% DRE.

[22] Emissions from RA2-TK-SLOP-LOAD are routed to RA2-FL-25850 with a 70% capture and 98% DRE.

*NOTES:*

[1] RHA-FL-5100 has two hourly emission limits; one if it is operating simultaneously as RA2-FL-25100 and one if it is not.

[2] RA2-FL-25100 has two hourly emission limits; one if it is operating simultaneously as RHA-FL-5100 and one if it is not.

[3] There is no hourly SSM flaring at the same time as Flare-M Malfunction Flaring.

[4] There are no emissions from RH1-TEG in a controlled scenario. Flash tank overheads are routed back to process. Regenerator overheads are controlled by RH1-FL-29-1004 with 100% capture and 98% DRE.

[5] There are no emissions from RH2-TEG in a controlled scenario. Flash tank overheads are routed back to process. Regenerator overheads are controlled by RH2-TO-5500 with 100% capture and 99% DRE.

[6] There are no emissions from RH3-TEG in a controlled scenario. Flash tank overheads are routed back to process. Regenerator overheads are controlled by RH4-TO-45500 with 100% capture and 99% DRE.

[7] There are no emissions from RH4-TEG in a controlled scenario. Flash tank overheads are routed back to process. Regenerator overheads are controlled by RH4-TO-45500 with 100% capture and 99% DRE.

[8] There are no emissions from RH5-TEG in a controlled scenario. Flash tank overheads are routed back to process. Regenerator overheads are controlled by RH5-TO-55500 with 100% capture and 99% DRE.

[9] There are no emissions from RH6-TEG in a controlled scenario. Flash tank overheads are routed back to process. Regenerator overheads are controlled by RH5-TO-55500 with 100% capture and 99% DRE.

[10] There are no emissions from RH1-AMINE in a controlled scenario. Flash tank overheads are routed back to process. Still vent overheads are controlled by RH2-TO-5500 with 100% capture and 99% DRE.

[11] There are no emissions from RH2-AMINE in a controlled scenario. Flash tank overheads are routed back to process. Still vent overheads are controlled by RH2-TO-5500 with 100% capture and 99% DRE.

[12] There are no emissions from RHA-AMINE in a controlled scenario. All emissions are routed to AGI-1. During AGI-1 downtime, flash tank overheads are routed back to process and still vent overheads are controlled by RHA-FL-5100 with 100% capture and 98% DRE.

[13] There are no emissions from RH4-AMINE in a controlled scenario. Flash tank overheads are routed back to process. Still vent overheads are controlled by RH4-TO-45500 with 100% capture and 99% DRE.

[14] There are no emissions from RH5-AMINE in a controlled scenario. Flash tank overheads are routed back to process. Still vent overheads are controlled by RH5-TO-55500 with 100% capture and 99% DRE.

[15] There are no emissions from RA2-AMINE in a controlled scenario. All emissions are routed to AGI-2. During AGI-2 downtime, flash tank overheads are routed back to process and still vent overheads are controlled by RA2-FL-25100 with 100% capture and 98% DRE.

[16] There are no emissions from RH1-TK-COND-EAST in a controlled scenario. All emissions are routed to RH1-FL-2850 with 100% capture and 98% DRE. No loading is permitted from this tank battery.

[17] There are no emissions from RHA-TK-SLOP in a controlled scenario. All emissions are routed to RHA-FL-5850 with 100% capture and 98% DRE.

[18] There are no emissions from RH1-TK-COND-WEST in a controlled scenario. All emissions are routed to RH1-FL-2850 with 100% capture and 98% DRE.

[19] There are no emissions from RA2-TK-SLOP in a controlled scenario. All emissions are routed to RA2-FL-25850 with 100% capture and 98% DRE.

[20] Emissions from RHA-TK-SLOP-LOAD are routed to RHA-FL-5850 with a 70% capture and 98% DRE.

[21] Emissions from RH2-TK-COND-WEST-LOAD are routed to RH1-FL-2850 with a 70% capture and 98% DRE.

[22] Emissions from RA2-TK-SLOP-LOAD are routed to RA2-FL-25850 with a 70% capture and 98% DRE.

[1] Manufacturer Specification EF for heaters/boilers <20 MMBtu/hr.

[2] Assumes $PM_{10} = PM_{2.5}$

[3] $SO_2$ emissions based on fuel $H_2S$ (gr/100 scf). 100% conversion of $H_2S$ to $SO_2$ is assumed.

[4] BACT

[5] $SO_2$ and $H_2S$ lb/hr emissions are calculated using the following methods:
$SO_2$ (lb/hr) = $H_2S$ content (gr $H_2S$ / 100 scf) / (7000 g/lb) * Fuel Usage (scf/hr) * $SO_2$ to $H_2S$ Molar Ratio (64/32)
$H_2S$ (lb/hr) = $H_2S$ content (gr H2S / 100 scf) / (7000 g/lb) * Fuel Usage (scf/hr) * $SO_2$ to $H_2S$ Molar Ratio (64/32) * (1 - DRE %)

| Total HAP | - | 1.89 | 1.93 |

[1] Assumes $PM_{10} = PM_{2.5}$

[2] $SO_2$ emissions based on fuel $H_2S$ (gr/100 scf). 100% conversion of $H_2S$ to $SO_2$ is assumed.

[3] PV= nRT = n = PV/RT

P= 1.00 ATM

Gas Constant, R= 1.31 (atm*ft3)/(lb-mole*K)

[4] $SO_2$ and $H_2S$ lb/hr emissions are calculated using the following methods:

$SO_2$ (lb/hr) = $H_2S$ content (gr $H_2S$ / 100 scf) / (7000 g/lb) * Fuel Usage (scf/hr) * $SO_2$ to $H_2S$ Molar Ratio (64/32)

$H_2S$ (lb/hr) = $H_2S$ content (gr H2S / 100 scf) / (7000 g/lb) * Fuel Usage (scf/hr) * $SO_2$ to $H_2S$ Molar Ratio (64/32) * (1 - DRE %)

[1] BACT

[2] Assumes $PM_{10} = PM_{2.5}$

[3] $SO_2$ emissions based on fuel $H_2S$ (gr/100 scf). 100% conversion of $H_2S$ to $SO_2$ is assumed.

[4] PV= nRT = n = PV/RT

P= 1.00 ATM

Gas Constant, R= 1.31 (atm*ft3)/(lb-mole*K)

[5] $SO_2$ and $H_2S$ lb/hr emissions are calculated using the following methods:

$SO_2$ (lb/hr) = $H_2S$ content (gr $H_2S$ / 100 scf) / (7000 g/lb) * Fuel Usage (scf/hr) * $SO_2$ to $H_2S$ Molar Ratio (64/32)

$H_2S$ (lb/hr) = $H_2S$ content (gr H2S / 100 scf) / (7000 g/lb) * Fuel Usage (scf/hr) * $SO_2$ to $H_2S$ Molar Ratio (64/32) * (1 - DRE %)

| | 0.10 | tons/year[4] | lb/ MMscf * annual natural gas usage |

[1] $SO_2$ emissions based on fuel $H_2S$ (gr/100 scf). 100% conversion of $H_2S$ to $SO_2$ is assumed.
$SO_2$ and $H_2S$ lb/hr emissions are calculated using the following methods:
$SO_2$ (lb/hr) = $H_2S$ content (gr $H_2S$ / 100 scf) / (7000 g/lb) * Fuel Usage (scf/hr) * $SO_2$ to $H_2S$ Molar Ratio (64/32)
$H_2S$ (lb/hr) = $H_2S$ content (gr H2S / 100 scf) / (7000 g/lb) * Fuel Usage (scf/hr) * $SO_2$ to $H_2S$ Molar Ratio (64/32) * (1 - DRE %)

[2] Assumes $PM_{10}$ = $PM_{2.5}$

[3] lb/hr emissions calculated using the following methods:
Criteria and HAPs lb/hr = EF (lb/MMscf) * Rating (MMBtu/hr) / Heat value (Btu/scf)

[4] For all pollutant calculations, tons/year = lb/hr * Operating hours * 1ton/2000lb

[5] Total HAP emissions are the sum of all individual HAPs calculated.

[1] $SO_2$ emissions based on fuel $H_2S$ (gr/100 scf). 100% conversion of $H_2S$ to $SO_2$ is assumed.
$SO_2$ and $H_2S$ lb/hr emissions are calculated using the following methods:
$SO_2$ (lb/hr) = $H_2S$ content (gr $H_2S$ / 100 scf) / (7000 g/lb) * Fuel Usage (scf/hr) * $SO_2$ to $H_2S$ Molar Ratio (64/32)
$H_2S$ (lb/hr) = $H_2S$ content (gr H2S / 100 scf) / (7000 g/lb) * Fuel Usage (scf/hr) * $SO_2$ to $H_2S$ Molar Ratio (64/32) * (1 - DRE %)

[2] Assumes $PM_{10}$ = $PM_{2.5}$

[3] lb/hr emissions calculated using the following methods:
Criteria and HAPs lb/hr = EF (lb/MMscf) * Rating (MMBtu/hr) / Heat value (Btu/scf)

[4] For all pollutant calculations, tons/year = lb/hr * Operating hours * 1ton/2000lb

[5] Total HAP emissions are the sum of all individual HAPs calculated.

**HAP Emission Rates per Unit**

| | Total HAPs[5] | Units | Notes |
|---|---|---|---|
| Emission Factors | 1.89 | lb/MMscf | AP-42 Table 1.4-3 |
| | 1.93 | lb/MMscf | Adjusted EF, per footnote a in Table 1.4-3 |
| Emissions | 0.14 | lb/hr[3] | lb/ MMscf * hourly natural gas usage |
| | 0.61 | tons/year[4] | lb/ MMscf * annual natural gas usage |

[1] $SO_2$ emissions based on fuel $H_2S$ (gr/100 scf). 100% conversion of $H_2S$ to $SO_2$ is assumed.
$SO_2$ and $H_2S$ lb/hr emissions are calculated using the following methods:
$SO_2$ (lb/hr) = $H_2S$ content (gr $H_2S$ / 100 scf) / (7000 g/lb) * Fuel Usage (scf/hr) * $SO_2$ to $H_2S$ Molar Ratio (64/32)
$H_2S$ (lb/hr) = $H_2S$ content (gr H2S / 100 scf) / (7000 g/lb) * Fuel Usage (scf/hr) * $SO_2$ to $H_2S$ Molar Ratio (64/32) * (1 - DRE %)

[2] Assumes $PM_{10}$ = $PM_{2.5}$

[3] lb/hr emissions calculated using the following methods:
Criteria and HAPs lb/hr = EF (lb/MMscf) * Rating (MMBtu/hr) / Heat value (Btu/scf)

[4] For all pollutant calculations, tons/year = lb/hr * Operating hours * 1ton/2000lb

[5] Total HAP emissions are the sum of all individual HAPs calculated.

[6] PV= nRT = n = PV/RT

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| P= | 1.00 | ATM | | | | | |
| Gas Constant, | 1.31 | (atm*ft3)/(lb-mole*K) | | | | | |
| T= | 624.00 | °F = | 328.889 | °C = | 602.0389 | K | |

**Greenhouse Emissions**

# RH, METHANOL STORAGE TANKS

| | |
|---|---|
| Unit: | RH-TK-METHANOL |
| Source Description: | RH, METHANOL STORAGE TANKS |
| Annual Operating Hours: | 8760 |
| Number of Tanks: | 41 |
| Capacity of Tanks: | 350, 500, 1000, 1500, and 2000 gallons |
| Maximum Usage[1]: | 2,000 gal/hr |

| Methanol Storage Tank Emissions[2,3] | | |
|---|---|---|
| | **Total Hourly (lb/hr)** | **Average Annual Emissions (tpy)** |
| Methanol | 0.92 | 4.02 |
| **VOC** | **0.92** | **4.02** |
| **HAPs** | **0.92** | **4.02** |

[1] Maximum usage between all tank capacities.

[2] Emissions are the cumulative total from all methanol storage tanks.

[3] Emissions are calculated using BR&E ProMax.

## RHA, TK-6100-6200, SOUR SLOP WATER STORAGE TANKS, TRUCK LOADING

**Equation[1]:**

$$L_L = \frac{12.46 * SPM}{T}$$

**Variables[1]:**

$L_L$ - Loading Loss (lbs/1000 gal loaded)
S - Saturation Factor (From Table 5.2-1 of AP-42, Section 5.2)
P - True Vapor Pressure of Loaded Liquid (psia)
M - Molecular Weight of Vapor (lb/lb mol)
T- Temperature of Bulk Liquid ( °R = [°F + 460] )

[1] Loading loss equation and variables are from AP-42, Section 5.2, Transportation and Marketing of Petroleum Liquids.
[2] Material loaded is 100% sour slop.
[3] Sour slop loading emissions are sent to the sour gas flare (RHA-FL-5850) with a 70% capture effiency and a 98% DRE. Controlled emissions will be represented at that unit.
[4] Maximum temperature is 95° F and the average temperature is 67.97° F.
[5] The maximum hourly throughput is based on the assumption that one truck with a 180 bbl capacity can be loaded in an hour.
[6] The max TVP and MW are pulled from the sour tank alternative scenarios.
[7] Unit 2-Load is associated with tank battery 2-T.

## Flare GHG Emisssions

**§98.233(n) Flare stack GHG emissions.**

**Step 1. If necessary, convert volume of gas sent to flare from actual to standard conditions using Equation W-33**

$$E_{s,n} = \frac{E_{a,n} * (459.67 + T_s) * P_a}{(459.67 + T_a) * P_s * Z_a}$$ *(Equation W-33)*

where:

$E_{s,n}$ = Natural gas volumetric emissions at standard temperature and pressure (STP) conditions in cubic feet

$E_{a,n}$ = Natural gas volumetric emissions at actual conditions in cubic feet

| | | | |
|---|---|---|---|
| $T_s$ = Temperature at standard conditions (F) = | 60 | °F | |
| $T_a$ = Temperature at actual conditions (F) = | 75.8 | °F | (Based on Annual Avg Max Tempurature for Roswell, NM from AP-42 Chapter 7) |
| $P_s$ = Absolute pressure at standard conditions (psia) = | 14.7 | psia | |
| $P_a$ = Absolute pressure at actual conditions (psia) = | 12.88 | psia | (Based on Avg Atmospheric Pressure for Roswell, NM from AP-42 Chapter 7) |
| $Z_a$ = Compressibility factor at actual conditions for natural gas | 1 | (default value) | |

**Step 2. Calculate $CO_2$ and $CH_4$ Emissions from Flaring at standard conditions using Equations W-19 & W-20**

$E_{s,CH4} = V_s * X_{CH4} * [ (1 - \eta) * Z_L + Z_U ]$ (Equation W-19)

$E_{s,CO2} = V_s * X_{CO2} * \Sigma (\eta * V_s * Y_j * R_j * Z_L)$ (Equation W-20)

where:

$E_{s,CH4}$ = Annual $CH_4$ emissions from flare stack in cubic feet, at standard conditions

$E_{s,CO2}$ = Annual $CO_2$ emissions from flare stack in cubic feet, at standard conditions

$V_s$ = Volume of gas sent to flare in standard cubic feet

$\eta$ = Flare combustion efficiency, expressed as fraction of gas combusted by a burning flare 0.98 (default value)

$X_{CH4}$ = Mole fraction of $CH_4$ in the feed gas to the flare

| Pilot Gas | Purge Gas | Process Gas | AOS SSM |
|---|---|---|---|
| 0.8467 | 0.8467 | 0.084 | 0.628 |

$X_{CO2}$ = Mole fraction of $CO_2$ in the feed gas to the flare

| Pilot Gas | Purge Gas | Process Gas | AOS SSM |
|---|---|---|---|
| 0.0344 | 0.0344 | 0.143 | 0.201 |

$Z_U$ = Fraction of the feed gas sent to an un-lit flare determined by engineering estimate and process knowledge based on best available data and operating records

$Z_L$ = Fraction of the feed gas sent to a burning flare (equal to 1 − $Z_U$) 1 (assumes all gas is sent to burning flare)

$Y_j$ = Mole fraction of hydrocarbon constituents j in the feed gas to the flare

| | Pilot Gas | Purge Gas | Process Gas | AOS SSM |
|---|---|---|---|---|
| Constituent j, Methane = | 0.8467 | 0.8467 | 0.0837 | 0.6280 |
| Constituent j, Ethane = | 0.0896 | 0.0896 | 0.1264 | 0.1131 |
| Constituent j, Propane = | 0.0090 | 0.0090 | 0.1610 | 0.0426 |
| Constituent j, Butane = | 0.0003 | 0.0003 | 0.1402 | 0.0163 |
| Constituent j, Pentanes Plus = | 0.0002 | 0.0002 | 0.2246 | 0.0051 |

$R_j$ = Number of carbon atoms in the hydrocarbon constituent j in the feed gas to the flare

| | |
|---|---|
| Constituent j, Methane = | 1 |
| Constituent j, Ethane = | 2 |
| Constituent j, Propane = | 3 |
| Constituent j, Butane = | 4 |
| Constituent j, Pentanes Plus = | 5 |

**Step 3. Calculate $CO_2$ and $CH_4$ mass emissions using Equation W-36 (98.233(v))**

$Mass_i = E_{s,i} * \rho_i * 10^{-3}$ (Equation W-36)

where:

$Mass_i$ = $GHG_i$ (either $CH_4$ or $CO_2$) mass emissions in metric tons

$E_{s,i}$ = $GHG_i$ (either $CH_4$ or $CO_2$) volumetric emissions at standard conditions, in cubic feet.

$\rho_i$ = Density of $GHG_i$

| | | |
|---|---|---|
| $CO_2$ = | 0.0526 | $kg/ft^3$ |
| $CH_4$ = | 0.0192 | $kg/ft^3$ |

**Step 4. Calculate N2O mass emissions using Equation W-40 (98.233(z))**

$Mass_{N2O} = (1* 10^{-3}) * Fuel * HHV * EF$ *(Equation W-40)*

where:

$Mass_{N2O}$ = Annual $N_2O$ emissions from the combustion of a particular type of fuel (metric tons)

Fuel = Annual mass or volume of the fuel combusted (mass or volume per year, choose appropriately to be consistent with the units of HHV).

HHV = high heat value of the fuel

| Pilot Gas | Purge Gas | Process Gas | AOS SSM | |
|---|---|---|---|---|
| 0.0010 | 0.0010 | 0.0021 | 0.0010 | MMBtu/scf |

**Step 5. Calculate total annual emission from flare by summing Equations W-36 and W-40.**

| Gas Sent to Flare | Gas Sent to Flare (acf/yr) | Gas Sent to Flare (scf/yr) | Annual $CO_2$ Emissions (scf) | Annual $CH_4$ Emissions (scf) | Combusted $CO_2$ Mass Emissions (mtpy) | Uncombusted $CH_4$ Mass Emissions (mtpy) | $N_2O$ Mass Emissions (mtpy) | Combusted $CO_2$ Mass Emissions (tpy) | Uncombusted $CH_4$ Mass Emissions (tpy) | $N_2O$ Mass Emissions (tpy) | $CO_2e$ Mass Emissions (tpy) |
|---|---|---|---|---|---|---|---|---|---|---|---|

## Flare GHG Emisssions

**§98.233(n) Flare stack GHG emissions.**

**Step 1. If necessary, convert volume of gas sent to flare from actual to standard conditions using Equation W-33**

$$E_{s,n} = \frac{E_{a,n} * (459.67 + T_s) * P_a}{(459.67 + T_a) * P_s * Z_a}$$ *(Equation W-33)*

where:

$E_{s,n}$ = Natural gas volumetric emissions at standard temperature and pressure (STP) conditions in cubic feet

$E_{a,n}$ = Natural gas volumetric emissions at actual conditions in cubic feet

| | | | |
|---|---|---|---|
| $T_s$ = Temperature at standard conditions (F) = | 60 | °F | |
| $T_a$ = Temperature at actual conditions (F) = | 75.8 | °F | (Based on Annual Avg Max Tempurature for Roswell, NM from AP-42 Chapter 7) |
| $P_s$ = Absolute pressure at standard conditions (psia) = | 14.7 | psia | |
| $P_a$ = Absolute pressure at actual conditions (psia) = | 12.88 | psia | (Based on Avg Atmospheric Pressure for Roswell, NM from AP-42 Chapter 7) |
| $Z_a$ = Compressibility factor at actual conditions for natural gas | 1 | (default value) | |

**Step 2. Calculate $CO_2$ and $CH_4$ Emissions from Flaring at standard conditions using Equations W-19 & W-20**

$E_{s,CH4} = V_s * X_{CH4} * [ (1 - \eta) * Z_L + Z_U ]$ (Equation W-19)

$E_{s,CO2} = V_s * X_{CO2} * \Sigma (\eta * V_s * Y_i * R_i * Z_L)$ (Equation W-20)

where:

$E_{s,CH4}$ = Annual $CH_4$ emissions from flare stack in cubic feet, at standard conditions

$E_{s,CO2}$ = Annual $CO_2$ emissions from flare stack in cubic feet, at standard conditions

$V_s$ = Volume of gas sent to flare in standard cubic feet

$\eta$ = Flare combustion efficiency, expressed as fraction of gas combusted by a burning flare 0.98 (default value)

$X_{CH4}$ = Mole fraction of $CH_4$ in the feed gas to the flare

| Pilot Gas | Purge Gas | AOS SSM |
|---|---|---|
| 0.8467 | 0.8467 | 0.6860 |

$X_{CO2}$ = Mole fraction of $CO_2$ in the feed gas to the flare

| Pilot Gas | Purge Gas | AOS SSM |
|---|---|---|
| 0.0344 | 0.0344 | 0.2459 |

$Z_U$ = Fraction of the feed gas sent to an un-lit flare determined by engineering estimate and process knowledge based on best available data and operating records

$Z_L$ = Fraction of the feed gas sent to a burning flare (equal to $1 - Z_U$) 1 (assumes all gas is sent to burning flare)

$Y_i$ = Mole fraction of hydrocarbon constituents j in the feed gas to the flare

| | Pilot Gas | Purge Gas | AOS SSM |
|---|---|---|---|
| Constituent j, Methan | 0.8467 | 0.8467 | 0.6860 |
| Constituent j, Ethane | 0.0896 | 0.0896 | 0.1213 |
| Constituent j, Propane | 0.0090 | 0.0090 | 0.0427 |
| Constituent j, Butane | 0.0003 | 0.0003 | 0.0154 |
| Constituent j, Pentane | 0.0002 | 0.0002 | 0.0049 |

$R_j$ = Number of carbon atoms in the hydrocarbon constituent j in the feed gas to the flare

| | |
|---|---|
| Constituent j, Methan | 1 |
| Constituent j, Ethane | 2 |
| Constituent j, Propane | 3 |
| Constituent j, Butane | 4 |
| Constituent j, Pentane | 5 |

**Step 3. Calculate $CO_2$ and $CH_4$ mass emissions using Equation W-36 (98.233(v))**

$Mass_i = E_{s,i} * \rho_i * 10^{-3}$ (Equation W-36)

where:

$Mass_i$ = $GHG_i$ (either $CH_4$ or $CO_2$) mass emissions in metric tons

$E_{s,i}$ = $GHG_i$ (either $CH_4$ or $CO_2$) volumetric emissions at standard conditions, in cubic feet.

$\rho_i$ = Density of $GHG_i$

| | | |
|---|---|---|
| $CO_2$ = | 0.0526 | $kg/ft^3$ |
| $CH_4$ = | 0.0192 | $kg/ft^3$ |

**Step 4. Calculate N2O mass emissions using Equation W-40 (98.233(z))**

$Mass_{N2O} = (1* 10^{-3}) * Fuel * HHV * EF$ *(Equation W-40)*

where:

$Mass_{N2O}$ = Annual $N_2O$ emissions from the combustion of a particular type of fuel (metric tons)

Fuel = Annual mass or volume of the fuel combusted (mass or volume per year, choose appropriately to be consistent with the units of HHV).

$1 * 10^{-3}$ = Conversion factor from kilograms to metric tons.

**Step 5. Calculate total annual emission from flare by summing Equations W-36 and W-40.**

| Gas Sent to Flare | Gas Sent to Flare (acf/yr) | Gas Sent to Flare (scf/yr) | Annual $CO_2$ Emissions (scf) | Annual $CH_4$ Emissions (scf) | Combusted $CO_2$ Mass Emissions (mtpy) | Uncombusted $CH_4$ Mass Emissions (mtpy) | $N_2O$ Mass Emissions (mtpy) | Combusted $CO_2$ Mass Emissions (tpy) | Uncombusted $CH_4$ Mass Emissions (tpy) | $N_2O$ Mass Emissions (tpy) | $CO_2e$ Mass Emissions (tpy) |
|---|---|---|---|---|---|---|---|---|---|---|---|

## Flare GHG Emisssions

**§98.233(n) Flare stack GHG emissions.**

**Step 1. If necessary, convert volume of gas sent to flare from actual to standard conditions using Equation W-33**

$$E_{s,n} = \frac{E_{a,n} * (459.67 + T_s) * P_a}{(459.67 + T_a) * P_s * Z_a}$$ *(Equation W-33)*

where:

$E_{s,n}$ = Natural gas volumetric emissions at standard temperature and pressure (STP) conditions in cubic feet

$E_{a,n}$ = Natural gas volumetric emissions at actual conditions in cubic feet

| | | | |
|---|---|---|---|
| $T_s$ = Temperature at standard conditions (F) = | 60 | °F | |
| $T_a$ = Temperature at actual conditions (F) = | 75.8 | °F | (Based on Annual Avg Max Tempurature for Roswell, NM from AP-42 Chapter 7) |
| $P_s$ = Absolute pressure at standard conditions (psia) = | 14.7 | psia | |
| $P_a$ = Absolute pressure at actual conditions (psia) = | 12.88 | psia | (Based on Avg Atmospheric Pressure for Roswell, NM from AP-42 Chapter 7) |
| $Z_a$ = Compressibility factor at actual conditions for natural gas | 1 | (default value) | |

**Step 2. Calculate $CO_2$ and $CH_4$ Emissions from Flaring at standard conditions using Equations W-19 & W-20**

$E_{s,CH4} = V_s * X_{CH4} * [ (1 - \eta) * Z_L + Z_U ]$ (Equation W-19)

$E_{s,CO2} = V_s * X_{CO2} * \Sigma (\eta * V_s * Y_j * R_j * Z_L)$ (Equation W-20)

where:

$E_{s,CH4}$ = Annual $CH_4$ emissions from flare stack in cubic feet, at standard conditions

$E_{s,CO2}$ = Annual $CO_2$ emissions from flare stack in cubic feet, at standard conditions

$V_s$ = Volume of gas sent to flare in standard cubic feet

$\eta$ = Flare combustion efficiency, expressed as fraction of gas combusted by a burning flare 0.98 (default value)

$X_{CH4}$ = Mole fraction of $CH_4$ in the feed gas to the flare

| Pilot Gas | Purge Gas |
|---|---|
| 0.8467 | 0.8467 |

$X_{CO2}$ = Mole fraction of $CO_2$ in the feed gas to the flare

| Pilot Gas | Purge Gas |
|---|---|
| 0.0344 | 0.0344 |

$Z_U$ = Fraction of the feed gas sent to an un-lit flare determined by engineering estimate and process knowledge based on best available data and operating records

$Z_L$ = Fraction of the feed gas sent to a burning flare (equal to $1 - Z_U$) 1 (assumes all gas is sent to burning flare)

$Y_j$ = Mole fraction of hydrocarbon constituents j in the feed gas to the flare

| | Pilot Gas | Purge Gas |
|---|---|---|
| Constituent j, Methane = | 0.8467 | 0.8467 |
| Constituent j, Ethane = | 0.0896 | 0.0896 |
| Constituent j, Propane = | 0.0090 | 0.0090 |
| Constituent j, Butane = | 0.0003 | 0.0003 |
| Constituent j, Pentanes = | 0.0002 | 0.0002 |

$R_j$ = Number of carbon atoms in the hydrocarbon constituent j in the feed gas to the flare

| | |
|---|---|
| Constituent j, Methane = | 1 |
| Constituent j, Ethane = | 2 |
| Constituent j, Propane = | 3 |
| Constituent j, Butane = | 4 |
| Constituent j, Pentanes = | 5 |

**Step 3. Calculate $CO_2$ and $CH_4$ mass emissions using Equation W-36 (98.233(v))**

$Mass_i = E_{s,J} * \rho_i * 10^{-3}$ (Equation W-36)

where:

$Mass_i$ = $GHG_i$ (either $CH_4$ or $CO_2$) mass emissions in metric tons

$E_{s,J}$ = $GHG_i$ (either $CH_4$ or $CO_2$) volumetric emissions at standard conditions, in cubic feet.

$\rho_i$ = Density of $GHG_i$

| | | |
|---|---|---|
| $CO_2$ = | 0.0526 | $kg/ft^3$ |
| $CH_4$ = | 0.0192 | $kg/ft^3$ |

**Step 4. Calculate N2O mass emissions using Equation W-40 (98.233(z))**

$Mass_{N2O} = (1 * 10^{-3}) * Fuel * HHV * EF$ *(Equation W-40)*

Fuel = Annual mass or volume of the fuel combusted (mass or volume per year, choose appropriately to be consistent with the units of HHV).

HHV = high heat value of the fuel

| Pilot Gas | Purge Gas | |
|---|---|---|
| 0.0010 | 0.0010 | MMBtu/scf |

EF = Use $1.0 \times 10^{-4}$ kg $N_2O$/mmBtu.

$1 * 10^{-3}$ = Conversion factor from kilograms to metric tons.

**Step 5. Calculate total annual emission from flare by summing Equations W-36 and W-40.**

| Gas Sent to Flare | Gas Sent to Flare (acf/yr) | Gas Sent to Flare (scf/yr) | Annual $CO_2$ Emissions (scf) | Annual $CH_4$ Emissions (scf) | Combusted $CO_2$ Mass Emissions (mtpy) | Uncombusted $CH_4$ Mass Emissions (mtpy) | $N_2O$ Mass Emissions (mtpy) | Combusted $CO_2$ Mass Emissions (tpy) | Uncombusted $CH_4$ Mass Emissions (tpy) | $N_2O$ Mass Emissions (tpy) | $CO_2e$ Mass Emissions (tpy) |
|---|---|---|---|---|---|---|---|---|---|---|---|
| **Pilot Gas** | 669,616.94 | 569,400.00 | 608,449.867 | 9,641.889 | 32.00 | 0.19 | 5.94E-05 | 35.28 | 0.20 | 6.55E-05 | 41.01 |
| **Purge Gas** | 25,754,497.73 | 21,900,000.00 | 23,401,917.94 | 370,841.90 | 1,230.94 | 7.12 | 2.29E-03 | 1,356.88 | 7.85 | 2.52E-03 | 1,577.31 |
| | | | | | | | **Total** | **1,392.16** | **8.05** | **2.58E-03** | **1,618.32** |
| | | | | | | | GWP | 1 | 28 | 265 | |

## Flare GHG Emisssions

**§98.233(n) Flare stack GHG emissions.**

**Step 1. If necessary, convert volume of gas sent to flare from actual to standard conditions using Equation W-33**

$$E_{s,n} = \frac{E_{a,n} * (459.67 + T_s) * P_a}{(459.67 + T_a) * P_s * Z_a}$$ *(Equation W-33)*

where:

$E_{s,n}$ = Natural gas volumetric emissions at standard temperature and pressure (STP) conditions in cubic feet

$E_{a,n}$ = Natural gas volumetric emissions at actual conditions in cubic feet

| | | | |
|---|---|---|---|
| $T_s$ = Temperature at standard conditions (F) = | 60 | °F | |
| $T_a$ = Temperature at actual conditions (F) = | 75.8 | °F | (Based on Annual Avg Max Tempurature for Roswell, NM from AP-42 Chapter 7) |
| $P_s$ = Absolute pressure at standard conditions (psia) = | 14.7 | psia | |
| $P_a$ = Absolute pressure at actual conditions (psia) = | 12.88 | psia | (Based on Avg Atmospheric Pressure for Roswell, NM from AP-42 Chapter 7) |
| $Z_a$ = Compressibility factor at actual conditions for natural gas | 1 | (default value) | |

**Step 2. Calculate $CO_2$ and $CH_4$ Emissions from Flaring at standard conditions using Equations W-19 & W-20**

$E_{s,CH4} = V_s * X_{CH4} * [ (1 - \eta) * Z_L + Z_U ]$ (Equation W-19)

$E_{s,CO2} = V_s * X_{CO2} * \Sigma (\eta * V_s * Y_j * R_j * Z_L)$ (Equation W-20)

where:

$E_{s,CH4}$ = Annual $CH_4$ emissions from flare stack in cubic feet, at standard conditions

$E_{s,CO2}$ = Annual $CO_2$ emissions from flare stack in cubic feet, at standard conditions

$V_s$ = Volume of gas sent to flare in standard cubic feet

$\eta$ = Flare combustion efficiency, expressed as fraction of gas combusted by a burning flare 0.98 (default value)

$X_{CH4}$ = Mole fraction of $CH_4$ in the feed gas to the flare

| Pilot Gas | Purge Gas | Pigging | AOS SSM |
|---|---|---|---|
| 0.8467 | 0.8467 | 0.737 | 0.652 |

$X_{CO2}$ = Mole fraction of $CO_2$ in the feed gas to the flare

| Pilot Gas | Purge Gas | Pigging | AOS SSM |
|---|---|---|---|
| 0.0344 | 0.0344 | 0.032 | 0.204 |

$Z_U$ = Fraction of the feed gas sent to an un-lit flare determined by engineering estimate and process knowledge based on best available data and operating records

$Z_L$ = Fraction of the feed gas sent to a burning flare (equal to $1 - Z_U$) 1 (assumes all gas is sent to burning flare)

$Y_j$ = Mole fraction of hydrocarbon constituents j in the feed gas to the flare

| | Pilot Gas | Purge Gas | Pigging | AOS SSM |
|---|---|---|---|---|
| Constituent j, Methane | 0.8467 | 0.8467 | 0.7371 | 0.6522 |
| Constituent j, Ethane | 0.0896 | 0.0896 | 0.1102 | 0.1197 |
| Constituent j, Propane | 0.0090 | 0.0090 | 0.0582 | 0.0424 |
| Constituent j, Butane | 0.0003 | 0.0003 | 0.0275 | 0.0167 |
| Constituent j, Pentane | 0.0002 | 0.0002 | 0.0153 | 0.0305 |

$R_j$ = Number of carbon atoms in the hydrocarbon constituent j in the feed gas to the flare

| | |
|---|---|
| Constituent j, Methane | 1 |
| Constituent j, Ethane | 2 |
| Constituent j, Propane | 3 |
| Constituent j, Butane | 4 |
| Constituent j, Pentane | 5 |

**Step 3. Calculate $CO_2$ and $CH_4$ mass emissions using Equation W-36 (98.233(v))**

$Mass_i = E_{s,i} * \rho_i * 10^{-3}$ (Equation W-36)

where:

$Mass_i$ = $GHG_i$ (either $CH_4$ or $CO_2$) mass emissions in metric tons

$E_{s,i}$ = $GHG_i$ (either $CH_4$ or $CO_2$) volumetric emissions at standard conditions, in cubic feet.

$\rho_i$ = Density of $GHG_i$

| | | |
|---|---|---|
| $CO_2$ = | 0.0526 | $kg/ft^3$ |
| $CH_4$ = | 0.0192 | $kg/ft^3$ |

**Step 4. Calculate N2O mass emissions using Equation W-40 (98.233(z))**

$Mass_{N2O} = (1* 10^{-3}) * Fuel * HHV * EF$ *(Equation W-40)*

where:

$Mass_{N2O}$ = Annual $N_2O$ emissions from the combustion of a particular type of fuel (metric tons)

Fuel = Annual mass or volume of the fuel combusted (mass or volume per year, choose appropriately to be consistent with the units of HHV).

HHV = high heat value of the fuel

| Pilot Gas | Purge Gas | Pigging | AOS SSM | |
|---|---|---|---|---|
| 0.0010 | 0.0010 | 0.0012 | 0.0011 | MMBtu/scf |

EF = Use $1.0 \times 10^{-4}$ kg $N_2O$/mmBtu.

$1 * 10^{-3}$ = Conversion factor from kilograms to metric tons.

**Step 5. Calculate total annual emission from flare by summing Equations W-36 and W-40.**

| Gas Sent to Flare | Gas Sent to Flare (acf/yr) | Gas Sent to Flare (scf/yr) | Annual $CO_2$ Emissions (scf) | Annual $CH_4$ Emissions (scf) | Combusted $CO_2$ Mass Emissions (mtpy) | Uncombusted $CH_4$ Mass Emissions (mtpy) | $N_2O$ Mass Emissions (mtpy) | Combusted $CO_2$ Mass Emissions (tpy) | Uncombusted $CH_4$ Mass Emissions (tpy) | $N_2O$ Mass Emissions (tpy) | $CO_2e$ Mass Emissions (tpy) |
|---|---|---|---|---|---|---|---|---|---|---|---|
| **Pilot Gas** | 669,616.94 | 569,400.00 | 608,449.867 | 9,641.889 | 32.00 | 0.19 | 5.94E-05 | 35.28 | 0.20 | 6.55E-05 | 41.01 |

## Flare GHG Emisssions

**§98.233(n) Flare stack GHG emissions.**

**Step 1. If necessary, convert volume of gas sent to flare from actual to standard conditions using Equation W-33**

$$E_{s,n} = \frac{E_{a,n} * (459.67 + T_s) * P_a}{(459.67 + T_a) * P_s * Z_a}$$ *(Equation W-33)*

where:

$E_{s,n}$ = Natural gas volumetric emissions at standard temperature and pressure (STP) conditions in cubic feet

$E_{a,n}$ = Natural gas volumetric emissions at actual conditions in cubic feet

| | | | |
|---|---|---|---|
| $T_s$ = Temperature at standard conditions (F) = | 60 | °F | |
| $T_a$ = Temperature at actual conditions (F) = | 75.8 | °F | (Based on Annual Avg Max Tempurature for Roswell, NM from AP-42 Chapter 7) |
| $P_s$ = Absolute pressure at standard conditions (psia) = | 14.7 | psia | |
| $P_a$ = Absolute pressure at actual conditions (psia) = | 12.88 | psia | (Based on Avg Atmospheric Pressure for Roswell, NM from AP-42 Chapter 7) |
| $Z_a$ = Compressibility factor at actual conditions for natural gas | 1 | (default value) | |

**Step 2. Calculate $CO_2$ and $CH_4$ Emissions from Flaring at standard conditions using Equations W-19 & W-20**

$E_{s,CH4} = V_s * X_{CH4} * [ (1 - \eta) * Z_L + Z_U ]$ (Equation W-19)

$E_{s,CO2} = V_s * X_{CO2} * \Sigma (\eta * V_s * Y_i * R_i * Z_L)$ (Equation W-20)

where:

$E_{s,CH4}$ = Annual $CH_4$ emissions from flare stack in cubic feet, at standard conditions

$E_{s,CO2}$ = Annual $CO_2$ emissions from flare stack in cubic feet, at standard conditions

$V_s$ = Volume of gas sent to flare in standard cubic feet

$\eta$ = Flare combustion efficiency, expressed as fraction of gas combusted by a burning flare 0.98 (default value)

$X_{CH4}$ = Mole fraction of $CH_4$ in the feed gas to the flare

| Pilot Gas | Purge Gas |
|---|---|
| 0.8467 | 0.8467 |

$X_{CO2}$ = Mole fraction of $CO_2$ in the feed gas to the flare

| Pilot Gas | Purge Gas |
|---|---|
| 0.0344 | 0.0344 |

$Z_U$ = Fraction of the feed gas sent to an un-lit flare determined by engineering estimate and process knowledge based on best available data and operating records

$Z_L$ = Fraction of the feed gas sent to a burning flare (equal to 1 – $Z_U$) 1 (assumes all gas is sent to burning flare)

$Y_i$ = Mole fraction of hydrocarbon constituents j in the feed gas to the flare

| | Pilot Gas | Purge Gas |
|---|---|---|
| Constituent j, Methane = | 0.8467 | 0.8467 |
| Constituent j, Ethane = | 0.0896 | 0.0896 |
| Constituent j, Propane = | 0.0090 | 0.0090 |
| Constituent j, Butane = | 0.0003 | 0.0003 |
| Constituent j, Pentanes Pl | 0.0002 | 0.0002 |

$R_i$ = Number of carbon atoms in the hydrocarbon constituent j in the feed gas to the flare

| | |
|---|---|
| Constituent j, Methane = | 1 |
| Constituent j, Ethane = | 2 |
| Constituent j, Propane = | 3 |
| Constituent j, Butane = | 4 |
| Constituent j, Pentanes Pl | 5 |

**Step 3. Calculate $CO_2$ and $CH_4$ mass emissions using Equation W-36 (98.233(v))**

$Mass_i = E_{s,i} * \rho_i * 10^{-3}$ (Equation W-36)

where:

$Mass_i$ = $GHG_i$ (either $CH_4$ or $CO_2$) mass emissions in metric tons

$E_{s,i}$ = $GHG_i$ (either $CH_4$ or $CO_2$) volumetric emissions at standard conditions, in cubic feet.

$\rho_i$ = Density of $GHG_i$

| | | |
|---|---|---|
| $CO_2$ = | 0.0526 | $kg/ft^3$ |
| $CH_4$ = | 0.0192 | $kg/ft^3$ |

where:

$Mass_{N2O}$ = Annual $N_2O$ emissions from the combustion of a particular type of fuel (metric tons)

Fuel = Annual mass or volume of the fuel combusted (mass or volume per year, choose appropriately to be consistent with the units of HHV).

HHV = high heat value of the fuel

| Pilot Gas | Purge Gas | |
|---|---|---|
| 0.0010 | 0.0010 | MMBtu/scf |

EF = Use 1.0 × $10^{-4}$ kg $N_2O$/mmBtu.

1 * $10^{-3}$ = Conversion factor from kilograms to metric tons.

**Step 5. Calculate total annual emission from flare by summing Equations W-36 and W-40.**

| Gas Sent to Flare | Gas Sent to Flare (acf/yr) | Gas Sent to Flare (scf/yr) | Annual $CO_2$ Emissions (scf) | Annual $CH_4$ Emissions (scf) | Combusted $CO_2$ Mass Emissions (mtpy) | Uncombusted $CH_4$ Mass Emissions (mtpy) | $N_2O$ Mass Emissions (mtpy) | Combusted $CO_2$ Mass Emissions (tpy) | Uncombusted $CH_4$ Mass Emissions (tpy) | $N_2O$ Mass Emissions (tpy) | $CO_2e$ Mass Emissions (tpy) |
|---|---|---|---|---|---|---|---|---|---|---|---|
| **Pilot Gas** | 2,513,638.98 | 2,137,440.00 | 2,284,027.191 | 36,194.169 | 120.14 | 0.69 | 2.23E-04 | 132.43 | 0.77 | 2.46E-04 | 153.95 |
| **Purge Gas** | 51,508,995.47 | 43,800,000.00 | 46,803,835.89 | 741,683.80 | 2,461.88 | 14.24 | 4.57E-03 | 2,713.76 | 15.70 | 5.04E-03 | 3,154.62 |
| | | | | | | | **Total** | **2,846.19** | **16.46** | **5.28E-03** | **3,308.56** |
| | | | | | | | GWP | 1 | 28 | 265 | |

## RHA, FLARE

Emission Unit: RHA-FL-5100
Source Description: RHA, FLARE
Destruction Efficiency: 98%
Units being controlled: RHA-AMINE during AGI 1 downtime, Inlet Gas, SSM
Operating Hours: 8760 hrs/yr

The two AGI flares, RHA-FL-5100 and RA2-FL-25100, have three possible operating scenarios. In Scenario 1, both units operate at a reduced capacity. In Scenario 2, only RHA-FL-5100 is operating, and in Scenario 3, only RA2-FL-25100 is operating. Pilot and purge gas are combusted at both flares in all scenarios.

***VOC Heat Input and Flow Rate Calculation***

| Parameters | Scenario #1 | Scenario #2 | Unit | Notes |
|---|---|---|---|---|

[1] Flare $NO_X$ and CO emission factors: TNRCC RG-109 (high Btu; other).

[2] Fuel sulfur content is assumed to be 2 gr/100 Scf
Mass balance assuming 98% combustion of $H_2S$ and 100% conversion of combusted $H_2S$ to $SO_2$:

[3] Hourly emissions for this unit assume that SSM flaring does not occur at the same time as acid gas flaring or inlet gas flaring. Assist gas emissions are directly associated with acid gas flaring events. The maximum of both scenarios was used to determine the maximum hourly emissions for each pollutant.

"-" Indicates emissions of this pollutant are not expected

[4] The annual total emissions apply a 25% safety factor for NOx, CO, VOC, and HAP emissions to account for any fluctuations in composition throughout the year.

## Flare GHG Emisssions

**§98.233(n) Flare stack GHG emissions.**

**Step 1. If necessary, convert volume of gas sent to flare from actual to standard conditions using Equation W-33**

$$E_{s,n} = \frac{E_{a,n} * (459.67 + T_s) * P_a}{(459.67 + T_a) * P_s * Z_a}$$ *(Equation W-33)*

where:

$E_{s,n}$ = Natural gas volumetric emissions at standard temperature and pressure (STP) conditions in cubic feet

$E_{a,n}$ = Natural gas volumetric emissions at actual conditions in cubic feet

| | | | |
|---|---|---|---|
| $T_s$ = Temperature at standard conditions (F) = | 60 | °F | |
| $T_a$ = Temperature at actual conditions (F) = | 75.8 | °F | (Based on Annual Avg Max Tempurature for Roswell, NM from AP-42 Chapter 7) |
| $P_s$ = Absolute pressure at standard conditions (psia) = | 14.7 | psia | |
| $P_a$ = Absolute pressure at actual conditions (psia) = | 12.88 | psia | (Based on Avg Atmospheric Pressure for Roswell, NM from AP-42 Chapter 7) |
| $Z_a$ = Compressibility factor at actual conditions for natural gas | 1 | (default value) | |

**Step 2. Calculate $CO_2$ and $CH_4$ Emissions from Flaring at standard conditions using Equations W-19 & W-20**

$E_{s,CH4} = V_s * X_{CH4} * [ (1 - \eta) * Z_L + Z_U ]$ (Equation W-19)

$E_{s,CO2} = V_s * X_{CO2} * \Sigma (\eta * V_s * Y_j * R_j * Z_L)$ (Equation W-20)

where:

$V_s$ = Volume of gas sent to flare in standard cubic feet

$\eta$ = Flare combustion efficiency, expressed as fraction of gas combusted by a burning flare 0.98 (default value)

$X_{CH4}$ = Mole fraction of $CH_4$ in the feed gas to the flare

| Pilot Gas | Assist Gas | Acid Gas | Inlet Gas | Pigging |
|---|---|---|---|---|
| 0.8467 | 0.8467 | 0.004 | 0.749 | 0.749 |

$X_{CO2}$ = Mole fraction of $CO_2$ in the feed gas to the flare

| Pilot Gas | Assist Gas | Acid Gas | Inlet Gas | Pigging |
|---|---|---|---|---|
| 0.0344 | 0.0344 | 0.870 | 0.053 | 0.053 |

$Z_U$ = Fraction of the feed gas sent to an un-lit flare determined by engineering estimate and process knowledge based on best available data and operating records

$Z_L$ = Fraction of the feed gas sent to a burning flare (equal to 1 – $Z_U$) 1 (assumes all gas is sent to burning flare)

$Y_j$ = Mole fraction of hydrocarbon constituents j in the feed gas to the flare

| | Pilot Gas | Assist Gas | Acid Gas | Inlet Gas | Pigging |
|---|---|---|---|---|---|
| Constituent j, Methane = | 0.8467 | 0.8467 | 0.0038 | 0.7494 | 0.7494 |
| Constituent j, Ethane = | 0.0896 | 0.0896 | 0.0013 | 0.0949 | 0.0949 |
| Constituent j, Propane = | 0.0090 | 0.0090 | 0.0005 | 0.0457 | 0.0457 |
| Constituent j, Butane = | 0.0003 | 0.0003 | 0.0003 | 0.0229 | 0.0229 |
| Constituent j, Pentanes Plus = | 0.0002 | 0.0002 | 0.0001 | 0.0107 | 0.0106 |

$R_j$ = Number of carbon atoms in the hydrocarbon constituent j in the feed gas to the flare

| | |
|---|---|
| Constituent j, Methane = | 1 |
| Constituent j, Ethane = | 2 |
| Constituent j, Propane = | 3 |
| Constituent j, Butane = | 4 |
| Constituent j, Pentanes Plus = | 5 |

**Step 3. Calculate $CO_2$ and $CH_4$ mass emissions using Equation W-36 (98.233(v))**

$Mass_i = E_{s,i} * \rho_i * 10^{-3}$ (Equation W-36)

where:

$Mass_i$ = $GHG_i$ (either $CH_4$ or $CO_2$) mass emissions in metric tons

$E_{s,i}$ = $GHG_i$ (either $CH_4$ or $CO_2$) volumetric emissions at standard conditions, in cubic feet.

$\rho_i$ = Density of $GHG_i$

| | | |
|---|---|---|
| $CO_2$ = | 0.0526 | $kg/ft^3$ |
| $CH_4$ = | 0.0192 | $kg/ft^3$ |

**Step 4. Calculate N2O mass emissions using Equation W-40 (98.233(z))**

$Mass_{N2O} = (1* 10^{-3}) * Fuel * HHV * EF$ *(Equation W-40)*

where:

$Mass_{N2O}$ = Annual $N_2O$ emissions from the combustion of a particular type of fuel (metric tons)

Fuel = Annual mass or volume of the fuel combusted (mass or volume per year, choose appropriately to be consistent with the units of HHV).

HHV = high heat value of the fuel

| Pilot Gas | Assist Gas | Acid Gas | Inlet Gas | Pigging | |
|---|---|---|---|---|---|
| 0.0010 | 0.0010 | 0.000051 | 0.0012 | 0.0012 | MMBtu/scf |

EF = Use 1.0 × $10^{-4}$ kg $N_2O$/mmBtu.

1 * $10^{-3}$ = Conversion factor from kilograms to metric tons.

**Step 5. Calculate total annual emission from flare by summing Equations W-36 and W-40.**

| Gas Sent to Flare | Gas Sent to Flare (acf/yr) | Gas Sent to Flare (scf/yr) | Annual $CO_2$ Emissions (scf) | Annual $CH_4$ Emissions (scf) | Combusted $CO_2$ Mass Emissions (mtpy) | Uncombusted $CH_4$ Mass Emissions (mtpy) | $N_2O$ Mass Emissions (mtpy) | Combusted $CO_2$ Mass Emissions (tpy) | Uncombusted $CH_4$ Mass Emissions (tpy) | $N_2O$ Mass Emissions (tpy) | $CO_2e$ Mass Emissions (tpy) |
|---|---|---|---|---|---|---|---|---|---|---|---|
| **Pilot Gas** | 10,971,416.03 | 9,329,400.00 | 9,969,217.04 | 157,978.649 | 524.38 | 3.03 | 9.74E-04 | 578.03 | 3.34 | 1.07E-03 | 671.93 |

## RA2, FLARE

| | |
|---|---|
| Emission Unit: | RA2-FL-25100 |
| Source Description: | RA2, FLARE |
| Destruction Efficiency: | 98% |
| Units being controlled: | RA2-AMINE during AGI 2 downtime, Inlet Gas, SSM |
| Operating Hours: | 8760 hrs/yr |

The two AGI flares, RHA-FL-5100 and RA2-FL-25100, have three possible operating scenarios. In Scenario 1, both units operate at a reduced capacity. In Scenario 2, only RHA-FL-5100 is operating, and in Scenario 3, only RA2-FL-25100 is operating. Pilot and purge gas are combusted at both flares in all scenarios.

[1] Flare $NO_X$ and CO emission factors: TNRCC RG-109 (high Btu; other).

[2] Fuel sulfur content is assumed to be 0.25 gr/100 Scf

Mass balance assuming 98% combustion of $H_2S$ and 100% conversion of combusted $H_2S$ to $SO_2$:

Pilot Gas $SO_2$ Emissions (lb/hr) = (Pilot Gas Flow (Mscf/hr) * Fuel Gas Sulfur Content (lb S/Mscf)*(64 lb/lbmol $SO_2$ / 32 lb/lbmol S)) + (Pilot Gas Flow (Mscf/yr) * Fuel Gas $H_2S$ Content (lb $H_2S$/Mscf)*(64 lb/lbmol $SO_2$ /34 lb/lbmol $H_2S$)*(DRE))

Pilot Gas $H_2S$ Emissions (lb/hr) = Pilot Gas Flow Rate (Mscf/yr) * Fuel Gas $H_2S$ Content (lb $H_2S$/Mscf) * (1 - DRE)

Process $SO_2$ Emissions (lb/hr) = $H_2S$ Mass Flow Rate (lb/hr) * DRE * (64 lb/lbmol $SO_2$ / 34 lb/lbmol $H_2S$)

[3] Hourly emissions for this unit assume that SSM flaring does not occur at the same time as acid gas flaring or inlet gas flaring. Assist gas emissions are directly associated with acid gas flaring events. The maximum of both

[4] The annual total emissions apply a 25% safety factor for NOx, CO, VOC, and HAP emissions to account for any fluctuations in composition throughout the year.

"-" Indicates emissions of this pollutant are not expected

## Flare GHG Emisssions

**§98.233(n) Flare stack GHG emissions.**

**Step 1. If necessary, convert volume of gas sent to flare from actual to standard conditions using Equation W-33**

$$E_{s,n} = \frac{E_{a,n} * (459.67 + T_s) * P_a}{(459.67 + T_a) * P_s * Z_a}$$ *(Equation W-33)*

where:

$E_{s,n}$ = Natural gas volumetric emissions at standard temperature and pressure (STP) conditions in cubic feet

$E_{a,n}$ = Natural gas volumetric emissions at actual conditions in cubic feet

| | | | |
|---|---|---|---|
| $T_s$ = Temperature at standard conditions (F) = | 60 | °F | |
| $T_a$ = Temperature at actual conditions (F) = | 75.8 | °F | (Based on Annual Avg Max Tempurature for Roswell, NM from AP-42 Chapter 7) |
| $P_s$ = Absolute pressure at standard conditions (psia) = | 14.7 | psia | |
| $P_a$ = Absolute pressure at actual conditions (psia) = | 12.88 | psia | (Based on Avg Atmospheric Pressure for Roswell, NM from AP-42 Chapter 7) |
| $Z_a$ = Compressibility factor at actual conditions for natural gas | 1 | (default value) | |

**Step 2. Calculate $CO_2$ and $CH_4$ Emissions from Flaring at standard conditions using Equations W-19 & W-20**

$E_{s,CH4} = V_s * X_{CH4} * [ (1 - \eta) * Z_L + Z_U ]$ (Equation W-19)

$E_{s,CO2} = V_s * X_{CO2} * \sum (\eta * V_s * Y_j * R_j * Z_L)$ (Equation W-20)

where:

$E_{s,CH4}$ = Annual $CH_4$ emissions from flare stack in cubic feet, at standard conditions

$\eta$ = Flare combustion efficiency, expressed as fraction of gas combusted by a burning flare 0.98 (default value)

$X_{CH4}$ = Mole fraction of $CH_4$ in the feed gas to the flare

| Pilot Gas | Assist Gas | Process Gas | Inlet Gas | Pigging |
|---|---|---|---|---|
| 0.8467 | 0.8467 | 0.251 | 0.749 | 0.737 |

$X_{CO2}$ = Mole fraction of $CO_2$ in the feed gas to the flare

| Pilot Gas | Assist Gas | Process Gas | Inlet Gas | Pigging |
|---|---|---|---|---|
| 0.0344 | 0.0344 | 82.610 | 0.053 | 0.032 |

$Z_U$ = Fraction of the feed gas sent to an un-lit flare determined by engineering estimate and process knowledge based on best available data and operating records

$Z_L$ = Fraction of the feed gas sent to a burning flare (equal to 1 − $Z_U$) 1 (assumes all gas is sent to burning flare)

$Y_j$ = Mole fraction of hydrocarbon constituents j in the feed gas to the flare

| | Pilot Gas | Assist Gas | Process Gas | Inlet Gas | Pigging |
|---|---|---|---|---|---|
| Constituent j, Methane = | 0.8467 | 0.8467 | 0.2508 | 0.7494 | 0.7371 |
| Constituent j, Ethane = | 0.0896 | 0.0896 | 0.0822 | 0.0949 | 0.1102 |
| Constituent j, Propane = | 0.0090 | 0.0090 | 0.0298 | 0.0457 | 0.0582 |
| Constituent j, Butane = | 0.0003 | 0.0003 | 0.0153 | 0.0229 | 0.0275 |
| Constituent j, Pentanes Plus = | 0.0002 | 0.0002 | 0.0071 | 0.0107 | 0.0153 |

$R_j$ = Number of carbon atoms in the hydrocarbon constituent j in the feed gas to the flare

| | |
|---|---|
| Constituent j, Methane = | 1 |
| Constituent j, Ethane = | 2 |
| Constituent j, Propane = | 3 |
| Constituent j, Butane = | 4 |
| Constituent j, Pentanes Plus = | 5 |

**Step 3. Calculate $CO_2$ and $CH_4$ mass emissions using Equation W-36 (98.233(v))**

$Mass_i = E_{s,i} * \rho_i * 10^{-3}$ (Equation W-36)

where:

$Mass_i$ = $GHG_i$ (either $CH_4$ or $CO_2$) mass emissions in metric tons

$E_{s,i}$ = $GHG_i$ (either $CH_4$ or $CO_2$) volumetric emissions at standard conditions, in cubic feet.

$\rho_i$ = Density of $GHG_i$

| | | |
|---|---|---|
| $CO_2$ = | 0.0526 | $kg/ft^3$ |
| $CH_4$ = | 0.0192 | $kg/ft^3$ |

**Step 4. Calculate N2O mass emissions using Equation W-40 (98.233(z))**

$Mass_{N2O} = (1* 10^{-3}) * Fuel * HHV * EF$ *(Equation W-40)*

where:

$Mass_{N2O}$ = Annual $N_2O$ emissions from the combustion of a particular type of fuel (metric tons)

Fuel = Annual mass or volume of the fuel combusted (mass or volume per year, choose appropriately to be consistent with the units of HHV).

HHV = high heat value of the fuel

| Pilot Gas | Assist Gas | Process Gas | Inlet Gas | Pigging | |
|---|---|---|---|---|---|
| 0.0010 | 0.0010 | 0.000075 | 0.0012 | 0.0012 | MMBtu/scf |

EF = Use 1.0 × $10^{-4}$ kg $N_2O$/mmBtu.

1 * $10^{-3}$ = Conversion factor from kilograms to metric tons.

**Step 5. Calculate total annual emission from flare by summing Equations W-36 and W-40.**

## Flare GHG Emisssions

**§98.233(n) Flare stack GHG emissions.**

**Step 1. If necessary, convert volume of gas sent to flare from actual to standard conditions using Equation W-33**

$$E_{s,n} = \frac{E_{a,n} * (459.67 + T_s) * P_a}{(459.67 + T_a) * P_s * Z_a}$$ *(Equation W-33)*

where:

$E_{s,n}$ = Natural gas volumetric emissions at standard temperature and pressure (STP) conditions in cubic feet

$E_{a,n}$ = Natural gas volumetric emissions at actual conditions in cubic feet

| | | | |
|---|---|---|---|
| $T_s$ = Temperature at standard conditions (F) = | 60 | °F | |
| $T_a$ = Temperature at actual conditions (F) = | 75.8 | °F | (Based on Annual Avg Max Tempurature for Roswell, NM from AP-42 Chapter 7) |
| $P_s$ = Absolute pressure at standard conditions (psia) = | 14.7 | psia | |
| $P_a$ = Absolute pressure at actual conditions (psia) = | 12.88 | psia | (Based on Avg Atmospheric Pressure for Roswell, NM from AP-42 Chapter 7) |
| $Z_a$ = Compressibility factor at actual conditions for natural gas | 1 | (default value) | |

**Step 2. Calculate $CO_2$ and $CH_4$ Emissions from Flaring at standard conditions using Equations W-19 & W-20**

$E_{s,CH4} = V_s * X_{CH4} * [ (1 - \eta) * Z_L + Z_U ]$ (Equation W-19)

$E_{s,CO2} = V_s * X_{CO2} * \Sigma (\eta * V_s * Y_j * R_j * Z_L)$ (Equation W-20)

where:

$E_{s,CH4}$ = Annual $CH_4$ emissions from flare stack in cubic feet, at standard conditions

$E_{s,CO2}$ = Annual $CO_2$ emissions from flare stack in cubic feet, at standard conditions

$V_s$ = Volume of gas sent to flare in standard cubic feet

$\eta$ = Flare combustion efficiency, expressed as fraction of gas combusted by a burning flare: 0.98 (default value)

$X_{CH4}$ = Mole fraction of $CH_4$ in the feed gas to the flare

| Pilot Gas | Process Gas |
|---|---|
| 0.8467 | 0.00012 |

$X_{CO2}$ = Mole fraction of $CO_2$ in the feed gas to the flare

| Pilot Gas | Process Gas |
|---|---|
| 0.0344 | 0.739 |

$Z_U$ = Fraction of the feed gas sent to an un-lit flare determined by engineering estimate and process knowledge based on best available data and operating records

$Z_L$ = Fraction of the feed gas sent to a burning flare (equal to $1 - Z_U$): 1 (assumes all gas is sent to burning flare)

$Y_j$ = Mole fraction of hydrocarbon constituents j in the feed gas to the flare

| | Pilot Gas | Process Gas |
|---|---|---|
| Constituent j, Methar | 0.8467 | 0.000124 |
| Constituent j, Ethane | 0.0896 | 0.000047 |
| Constituent j, Propan | 0.0090 | 0.000013 |
| Constituent j, Butane | 0.0003 | 0.000006 |
| Constituent j, Pentan | 0.0002 | 0.000050 |

$R_j$ = Number of carbon atoms in the hydrocarbon constituent j in the feed gas to the flare

| |
|---|
| Constituent j, Methar 1 |
| Constituent j, Ethane 2 |
| Constituent j, Propan 3 |
| Constituent j, Butane 4 |
| Constituent j, Pentan 5 |

**Step 3. Calculate $CO_2$ and $CH_4$ mass emissions using Equation W-36 (98.233(v))**

$Mass_i = E_{s,i} * \rho_i * 10^{-3}$ (Equation W-36)

where:

$Mass_i$ = $GHG_i$ (either $CH_4$ or $CO_2$) mass emissions in metric tons

$E_{s,i}$ = $GHG_i$ (either $CH_4$ or $CO_2$) volumetric emissions at standard conditions, in cubic feet.

$\rho_i$ = Density of $GHG_i$

$CO_2$ = 0.0526 $kg/ft^3$

$Mass_{N2O} = (1* 10^{-3}) * Fuel * HHV * EF$ *(Equation W-40)*

where:

$Mass_{N2O}$ = Annual $N_2O$ emissions from the combustion of a particular type of fuel (metric tons)

Fuel = Annual mass or volume of the fuel combusted (mass or volume per year, choose appropriately to be consistent with the units of HHV).

HHV = high heat value of the fuel

| Pilot Gas | Process Gas | |
|---|---|---|
| 0.0010 | 0.00014 | MMBtu/scf |

EF = Use $1.0 \times 10^{-4}$ kg $N_2O$/mmBtu.

$1 * 10^{-3}$ = Conversion factor from kilograms to metric tons.

**Step 5. Calculate total annual emission from flare by summing Equations W-36 and W-40.**

| Gas Sent to Flare | Gas Sent to Flare (acf/yr) | Gas Sent to Flare (scf/yr) | Annual $CO_2$ Emissions (scf) | Annual $CH_4$ Emissions (scf) | Combusted $CO_2$ Mass Emissions (mtpy) | Uncombusted $CH_4$ Mass Emissions (mtpy) | $N_2O$ Mass Emissions (mtpy) | Combusted $CO_2$ Mass Emissions (tpy) | Uncombusted $CH_4$ Mass Emissions (tpy) | $N_2O$ Mass Emissions (tpy) | $CO_2e$ Mass Emissions (tpy) |
|---|---|---|---|---|---|---|---|---|---|---|---|
| **Pilot Gas** | 427,853.31 | 363,819.46 | 388,770.466 | 6,160.708 | 20.45 | 0.12 | 3.80E-05 | 22.54 | 0.13 | 4.18E-05 | 26.20 |
| **Process Gas** | 427,853.31 | 363,819.46 | 269,069.21 | 0.91 | 14.15 | 1.74E-05 | 5.21E-06 | 15.60 | 1.92E-05 | 5.74E-06 | 15.60 |
| | | | | | | | **Total** | **38.14** | **0.13** | **4.76E-05** | **41.81** |
| | | | | | | | GWP | 1 | 28 | 265 | |

## Flare GHG Emisssions

**§98.233(n) Flare stack GHG emissions.**

**Step 1. If necessary, convert volume of gas sent to flare from actual to standard conditions using Equation W-33**

$$E_{s,n} = \frac{E_{a,n} * (459.67 + T_s) * P_a}{(459.67 + T_a) * P_s * Z_a}$$ *(Equation W-33)*

where:

$E_{s,n}$ = Natural gas volumetric emissions at standard temperature and pressure (STP) conditions in cubic feet

$E_{a,n}$ = Natural gas volumetric emissions at actual conditions in cubic feet

| | | | |
|---|---|---|---|
| $T_s$ = Temperature at standard conditions (F) = | 60 | °F | |
| $T_a$ = Temperature at actual conditions (F) = | 75.8 | °F | (Based on Annual Avg Max Tempurature for Roswell, NM from AP-42 Chapter 7) |
| $P_s$ = Absolute pressure at standard conditions (psia) = | 14.7 | psia | |
| $P_a$ = Absolute pressure at actual conditions (psia) = | 12.88 | psia | (Based on Avg Atmospheric Pressure for Roswell, NM from AP-42 Chapter 7) |
| $Z_a$ = Compressibility factor at actual conditions for natural gas | 1 | (default value) | |

**Step 2. Calculate $CO_2$ and $CH_4$ Emissions from Flaring at standard conditions using Equations W-19 & W-20**

$E_{s,CH4} = V_s * X_{CH4} * [ (1 - \eta) * Z_L + Z_U ]$ (Equation W-19)

$E_{s,CO2} = V_s * X_{CO2} * \Sigma (\eta * V_s * Y_i * R_i * Z_L)$ (Equation W-20)

where:

$E_{s,CH4}$ = Annual $CH_4$ emissions from flare stack in cubic feet, at standard conditions

$E_{s,CO2}$ = Annual $CO_2$ emissions from flare stack in cubic feet, at standard conditions

$V_s$ = Volume of gas sent to flare in standard cubic feet

$\eta$ = Flare combustion efficiency, expressed as fraction of gas combusted by a burning flare 0.98 (default value)

$X_{CH4}$ = Mole fraction of $CH_4$ in the feed gas to the flare

| Pilot Gas | Process Gas |
|---|---|
| 0.8467 | 0.00019 |

$X_{CO2}$ = Mole fraction of $CO_2$ in the feed gas to the flare

| Pilot Gas | Process Gas |
|---|---|
| 0.0344 | 0.764 |

$Z_U$ = Fraction of the feed gas sent to an un-lit flare determined by engineering estimate and process knowledge based on best available data and operating records

$Z_L$ = Fraction of the feed gas sent to a burning flare (equal to 1 – $Z_U$) 1 (assumes all gas is sent to burning flare)

$Y_i$ = Mole fraction of hydrocarbon constituents j in the feed gas to the flare

| | Pilot Gas | Process Gas |
|---|---|---|
| Constituent j, Methane = | 0.8467 | 0.000192 |
| Constituent j, Ethane = | 0.0896 | 0.000070 |
| Constituent j, Propane = | 0.0090 | 0.000019 |
| Constituent j, Butane = | 0.0003 | 0.000009 |
| Constituent j, Pentanes P | 0.0002 | 0.000050 |

$R_j$ = Number of carbon atoms in the hydrocarbon constituent j in the feed gas to the flare

| | |
|---|---|
| Constituent j, Methane = | 1 |
| Constituent j, Ethane = | 2 |
| Constituent j, Propane = | 3 |
| Constituent j, Butane = | 4 |
| Constituent j, Pentanes P | 5 |

**Step 3. Calculate $CO_2$ and $CH_4$ mass emissions using Equation W-36 (98.233(v))**

$Mass_i = E_{s,i} * \rho_i * 10^{-3}$ (Equation W-36)

where:

$Mass_i$ = $GHG_i$ (either $CH_4$ or $CO_2$) mass emissions in metric tons

$E_{s,i}$ = $GHG_i$ (either $CH_4$ or $CO_2$) volumetric emissions at standard conditions, in cubic feet.

$\rho_i$ = Density of $GHG_i$

$CO_2$ = 0.0526 $kg/ft^3$

$Mass_{N2O} = (1* 10^{-3}) * Fuel * HHV * EF$ *(Equation W-40)*

where:

$Mass_{N2O}$ = Annual $N_2O$ emissions from the combustion of a particular type of fuel (metric tons)

Fuel = Annual mass or volume of the fuel combusted (mass or volume per year, choose appropriately to be consistent with the units of HHV).

HHV = high heat value of the fuel

| Pilot Gas | Process Gas | |
|---|---|---|
| 0.0010 | 0.0001 | MMBtu/scf |

EF = Use 1.0 × $10^{-4}$ kg $N_2O$/mmBtu.

1 * $10^{-3}$ = Conversion factor from kilograms to metric tons.

**Step 5. Calculate total annual emission from flare by summing Equations W-36 and W-40.**

| Gas Sent to Flare | Gas Sent to Flare (acf/yr) | Gas Sent to Flare (scf/yr) | Annual $CO_2$ Emissions (scf) | Annual $CH_4$ Emissions (scf) | Combusted $CO_2$ Mass Emissions (mtpy) | Uncombusted $CH_4$ Mass Emissions (mtpy) | $N_2O$ Mass Emissions (mtpy) | Combusted $CO_2$ Mass Emissions (tpy) | Uncombusted $CH_4$ Mass Emissions (tpy) | $N_2O$ Mass Emissions (tpy) | $CO_2e$ Mass Emissions (tpy) |

## Flare GHG Emisssions

**§98.233(n) Flare stack GHG emissions.**

**Step 1. If necessary, convert volume of gas sent to flare from actual to standard conditions using Equation W-33**

$$E_{s,n} = \frac{E_{a,n} * (459.67 + T_s) * P_a}{(459.67 + T_a) * P_s * Z_a}$$ *(Equation W-33)*

where:

$E_{s,n}$ = Natural gas volumetric emissions at standard temperature and pressure (STP) conditions in cubic feet

$E_{a,n}$ = Natural gas volumetric emissions at actual conditions in cubic feet

| | | | |
|---|---|---|---|
| $T_s$ = Temperature at standard conditions (F) = | 60 | °F | |
| $T_a$ = Temperature at actual conditions (F) = | 75.8 | °F | (Based on Annual Avg Max Tempurature for Roswell, NM from AP-42 Chapter 7) |
| $P_s$ = Absolute pressure at standard conditions (psia) = | 14.7 | psia | |
| $P_a$ = Absolute pressure at actual conditions (psia) = | 12.88 | psia | (Based on Avg Atmospheric Pressure for Roswell, NM from AP-42 Chapter 7) |
| $Z_a$ = Compressibility factor at actual conditions for natural gas | 1 | (default value) | |

**Step 2. Calculate $CO_2$ and $CH_4$ Emissions from Flaring at standard conditions using Equations W-19 & W-20**

$E_{s,CH4} = V_s * X_{CH4} * [ (1 - \eta) * Z_L + Z_U ]$ (Equation W-19)

$E_{s,CO2} = V_s * X_{CO2} * \Sigma (\eta * V_s * Y_j * R_j * Z_L)$ (Equation W-20)

where:

$E_{s,CH4}$ = Annual $CH_4$ emissions from flare stack in cubic feet, at standard conditions

$E_{s,CO2}$ = Annual $CO_2$ emissions from flare stack in cubic feet, at standard conditions

$V_s$ = Volume of gas sent to flare in standard cubic feet

$\eta$ = Flare combustion efficiency, expressed as fraction of gas combusted by a burning flare 0.98 (default value)

$X_{CH4}$ = Mole fraction of $CH_4$ in the feed gas to the flare

| Pilot Gas | Process Gas |
|---|---|
| 0.8467 | 0.000 |

$X_{CO2}$ = Mole fraction of $CO_2$ in the feed gas to the flare

| Pilot Gas | Process Gas |
|---|---|
| 0.0344 | 0.000 |

$Z_U$ = Fraction of the feed gas sent to an un-lit flare determined by engineering estimate and process knowledge based on best available data and operating records

$Z_L$ = Fraction of the feed gas sent to a burning flare (equal to $1 - Z_U$) 1 (assumes all gas is sent to burning flare)

$Y_j$ = Mole fraction of hydrocarbon constituents j in the feed gas to the flare

| | Pilot Gas | Process Gas |
|---|---|---|
| Constituent j, Methane = | 0.8467 | 0.0000 |
| Constituent j, Ethane = | 0.0896 | 0.0441 |
| Constituent j, Propane = | 0.0090 | 0.2199 |
| Constituent j, Butane = | 0.0003 | 0.3829 |
| Constituent j, Pentanes P | 0.0002 | 2.0654 |

$R_j$ = Number of carbon atoms in the hydrocarbon constituent j in the feed gas to the flare

Constituent j, Methane = 1

Constituent j, Ethane = 2

Constituent j, Propane = 3

**Step 3. Calculate $CO_2$ and $CH_4$ mass emissions using Equation W-36 (98.233(v))**

$Mass_i = E_{s,i} * \rho_i * 10^{-3}$ (Equation W-36)

where:

$Mass_i$ = $GHG_i$ (either $CH_4$ or $CO_2$) mass emissions in metric tons

$E_{s,i}$ = $GHG_i$ (either $CH_4$ or $CO_2$) volumetric emissions at standard conditions, in cubic feet.

$\rho_i$ = Density of $GHG_i$

| | | |
|---|---|---|
| $CO_2$ = | 0.0526 | $kg/ft^3$ |
| $CH_4$ = | 0.0192 | $kg/ft^3$ |

**Step 4. Calculate N2O mass emissions using Equation W-40 (98.233(z))**

$Mass_{N2O} = (1* 10^{-3}) * Fuel * HHV * EF$ *(Equation W-40)*

where:

$Mass_{N2O}$ = Annual $N_2O$ emissions from the combustion of a particular type of fuel (metric tons)

Fuel = Annual mass or volume of the fuel combusted (mass or volume per year, choose appropriately to be consistent with the units of HHV).

HHV = high heat value of the fuel

| Pilot Gas | Process Gas | |
|---|---|---|
| 0.0010 | 0.0034 | MMBtu/scf |

EF = Use $1.0 \times 10^{-4}$ kg $N_2O$/mmBtu.

$1 * 10^{-3}$ = Conversion factor from kilograms to metric tons.

**Step 5. Calculate total annual emission from flare by summing Equations W-36 and W-40.**

| Gas Sent to Flare | Gas Sent to Flare (acf/yr) | Gas Sent to Flare (scf/yr) | Annual $CO_2$ Emissions (scf) | Annual $CH_4$ Emissions (scf) | Combusted $CO_2$ Mass Emissions (mtpy) | Uncombusted $CH_4$ Mass Emissions (mtpy) | $N_2O$ Mass Emissions (mtpy) | Combusted $CO_2$ Mass Emissions (tpy) | Uncombusted $CH_4$ Mass Emissions (tpy) | $N_2O$ Mass Emissions (tpy) | $CO_2e$ Mass Emissions (tpy) |

| | |
|---|---|
| Constituent j, Methane = | 1 |
| Constituent j, Ethane = | 2 |
| Constituent j, Propane = | 3 |

**Step 3. Calculate $CO_2$ and $CH_4$ mass emissions using Equation W-36 (98.233(v))**

$Mass_i = E_{s,i} * \rho_i * 10^{-3}$ (Equation W-36)

where:

$Mass_i$ = $GHG_i$ (either $CH_4$ or $CO_2$) mass emissions in metric tons

$E_{s,i}$ = $GHG_i$ (either $CH_4$ or $CO_2$) volumetric emissions at standard conditions, in cubic feet.

$\rho_i$ = Density of $GHG_i$

| | | |
|---|---|---|
| $CO_2$ = | 0.0526 | $kg/ft^3$ |
| $CH_4$ = | 0.0192 | $kg/ft^3$ |

**Step 4. Calculate N2O mass emissions using Equation W-40 (98.233(z))**

$Mass_{N2O} = (1* 10^{-3}) * Fuel * HHV * EF$ *(Equation W-40)*

where:

$Mass_{N2O}$ = Annual $N_2O$ emissions from the combustion of a particular type of fuel (metric tons)

Fuel = Annual mass or volume of the fuel combusted (mass or volume per year, choose appropriately to be consistent with the units of HHV).

HHV = high heat value of the fuel

| Pilot Gas | Process Gas | |
|---|---|---|
| 0.0010 | 0.0030 | MMBtu/scf |

EF = Use $1.0 \times 10^{-4}$ kg $N_2O$/mmBtu.

$1 * 10^{-3}$ = Conversion factor from kilograms to metric tons.

**Step 5. Calculate total annual emission from flare by summing Equations W-36 and W-40.**

| Gas Sent to Flare | Gas Sent to Flare (acf/yr) | Gas Sent to Flare (scf/yr) | Annual $CO_2$ Emissions (scf) | Annual $CH_4$ Emissions (scf) | Combusted $CO_2$ Mass Emissions (mtpy) | Uncombusted $CH_4$ Mass Emissions (mtpy) | $N_2O$ Mass Emissions (mtpy) | Combusted $CO_2$ Mass Emissions (tpy) | Uncombusted $CH_4$ Mass Emissions (tpy) | $N_2O$ Mass Emissions (tpy) | $CO_2e$ Mass Emissions (tpy) |
|---|---|---|---|---|---|---|---|---|---|---|---|
| **Pilot Gas** | 1,030,179.91 | 876,000.00 | 936,076.718 | 14,833.676 | 49.24 | 0.28 | 9.14E-05 | 54.28 | 0.31 | 1.01E-04 | 63.09 |

Annual Emissions (tpy) = Annual Gas Volume (scf/yr) * Component Mol Wt (lb/lb-mol) * Component Mole% / 379.4 $ft^3$/lb mol / 2000 lb/ton
(4) Component BTU/hr = [ Component Hourly Emissions (pph) * Component Net Heating Value (BTU/scf) * 379.4 $ft^3$/lb-mol ] / Component Mol Wt (lb/lb-mol)
Component BTU/yr = [ Component Annual Emissions (tpy) * 2000 lb/ton * Component Net Heating Value (BTU/scf) * 379.4 $ft^3$/lb-mol ] / Component Mol Wt (lb/lb-mol)
Total Net BTU/event = Sum of all Individual Component BTU/event
(5) VOC, HAP and $H_2S$ emissions estimated based on event stream routed to flare and 98% efficiency.

**Gas Flaring Emissions Calculations**

| Unit ID | Pollutant | Emission Factors (lb/MMBTU)[1] | Emissions lb/hr |
|---|---|---|---|
| RH5-FL-55100 | $NO_X$ | 0.138 | 5.00 |
| | CO | 0.2755 | 9.98 |
| | VOC | Mass Balance [2] | 8.15 |
| | HAP | Mass Balance [2] | 0.14 |
| | $H_2S$ | Mass Balance [2] | <0.01 |
| | $SO_2$ | Stoichiometric[1] | <0.01 |

Flare Stream: 36.22 Max Net Hourly MMBTU Value (MMBTU/hr)

Notes:
(1) Flare $NO_X$ and CO emission factors: TNRCC RG-109 (high Btu; other). $SO_2$: Mass balance assuming 98% combustion of $H_2S$ and 100% conversion of combusted $H_2S$ to $SO_2$:
Pilot Gas $SO_2$ Emissions (lb/hr) = [(Pilot Gas Flow (Mscf/hr) * Fuel Gas Sulfur Content (lb S/Mscf)*(64 lb/lbmol $SO_2$ / 32 lb/lbmol S)) + ( Pilot Gas Flow (Mscf/yr) * Fuel Gas $H_2S$ Content (lb $H_2S$/Mscf)*(64 lb/lbmol $SO_2$
(2) VOC, HAP and $H_2S$ emissions estimated based on event stream routed to flare and 98% efficiency.

[1] Emission factors from Table 2-4 of EPA Protocol for Equipment Leak Emission Estimates, 1995.
[2] Weight percent of gas and liquid components from averaged site specific liquids and gas analyses of Trains I through III. Heavy oil is conservatively assumed to be 100% VOC, 10% HAPs, and 1% H2S
[3] Component counts are based on facility design. Assume Train VII has the same component counts as Train VI. Safety factor applied to component count.
[4] Hourly Emissions [lb/hr] = Emissions Factor [lb/hr/component] * Weight Content of Chemical Component [%] * Subcomponent Count.
[5] Annual Emissions [ton/yr] = Hourly Emissions [lb/hr] * Operating Hours [hr/yr] * 1/2000 [ton/lb].

[1] Emission factors from Table 2-4 of EPA Protocol for Equipment Leak Emission Estimates. 1995.
[2] Weight percent of gas and liquid components from Targa provided gas compositions for each stream. Heavy oil is conservatively assumed to be 100% VOC, 10% HAPs, and 1% $H_2S$. Methanol is assumed to be 100% VOC and 100% HAP.

[3] Component Counts provided by Targa. Safety factor applied to component count.

[4] Hourly Emissions [lb/hr] = Emissions Factor [lb/hr/component] * Weight Content of Chemical Component [%] * Subcomponent Count.
[5] Annual Emissions [ton/yr] = Hourly Emissions [lb/hr] * Operating Hours [hr/yr] * 1/2000 [ton/lb].
[6] Fuel gas compositions are based on the maximum fuel gas VOC and HAPs content from available analyses.
[7] $CO_2e$ emissions were calculated assuming gas streams to be 100 wt% methane + 10 wt% $CO_2$

TARGA

*Targa Northern Delaware LLC - Red Hills Gas Processing Plant*

## RA2, FUGITIVE EMISSIONS

Emission unit number(s): RA2-FUG
Source description: RA2. FUGITIVE EMISSIONS
Total Operating Hours: 8,760

[1] Emission factors from Table 2-4 of EPA Protocol for Equipment Leak Emission Estimates, 1995.

[2] Weight percent of gas and liquid components from Targa provided gas compositions for each stream. Heavy oil is conservatively assumed to be 100% VOC, 10% HAPs, and 1% $H_2S$. Methanol is assumed to be 100% VOC and 100% HAP.

0.34

[3] Component Counts provided by Targa. Safety factor applied to component count.
[4] Hourly Emissions [lb/hr] = Emissions Factor [lb/hr/component] * Weight Content of Chemical Component [%] * Subcomponent Count.
[5] Annual Emissions [ton/yr] = Hourly Emissions [lb/hr] * Operating Hours [hr/yr] * 1/2000 [ton/lb].
[6] Fuel gas compositions are based on the maximum fuel gas VOC and HAPs content from available analyses.
[7] $CO_2e$ emissions were calculated assuming gas streams to be 100 wt% methane + 10 wt% $CO_2$

# Sour Water Haul Roads (RHA-TK-SLOP) - Orange Haul Route

*Site-Wide*

| Description | Value | Unit |
|---|---|---|
| Annual Operating Hours: | 8,760 | hr |
| Daily Operating Hours: | 24 | hr |

*Unpaved Haul Road*

| Parameter | Value | Unit |
|---|---|---|
| Empty Vehicle Weight[1] | 16 | ton |
| Load Size[2] | 31.43 | ton |
| Loaded Vehicle Weight[3] | 47.43 | ton |
| Mean Vehicle Weight[4] | 31.72 | ton |
| Vehicles Per Day[5] | 24 | VPD |
| Vehicles Per Year | 265 | VPY |
| Segment Length | 0.94 | mile |
| Trips per Segment | 2 | - |
| Effective Segment Length[6] | 1.88 | mile |
| Trips per Hour[7] | 2 | - |
| Wet Days[8] | 70 | day |
| Surface Silt Content[9] | 4.8 | % |
| Control Efficiency | 78% | % |

[1] Empty vehicle weight includes driver and occupants and full fuel load.

[2] Include cargo, transported materials, etc. (~62.21 lb/ft$^3$ / 7.48052 gal/ft$^3$ *7560 gal truck/ 2000lb/ton)

[3] Loaded vehicle weight = Empty + Load Size

[4] Mean Vehicle weight = (Loaded Weight + Empty Weight) / 2

[5] Vehicles per day = Condensate and produced water throughput / 7560 gal truck

[6] Effective segment length = trips per segment * segment length

[7] Trips per hour = Vehicles per day * Segments per trip ÷ Hours of Operation per Day

[8] Wet days is the NM default allowed by NMED without additional justification

[9] Surface silt content based on AP-42 Section 13.2.2.2, Table 13.2.2-1

***Unpaved Road Emission Factors***

| | Calculation Parameters[1] | | | | | | | | | | | | Hourly Emission Factors | | | Annual Emission Factors | | |

[1] Surface silt = % of 75 micron diameter and smaller particles

[2] E = k x (s/12)^a x (W/3)^b (AP-42 page 13.2.2-4 Equation 1a, November 2006)

E= Size Specific Emission Factor (lb/VMT)

s = surface material silt content (%)

k, a, b = constants from AP-42 Table 13.2.2-2

W = Weighted Mean Vehicle Weight from Haul Road Inputs (tons)

[3] $PM_{30}$ emission factor in equation is assumed as a surrogate for TSP emissions

[4] VMT/yr = Vehicle Miles Travelled per year= Trips per year * Segment Length

[5] Wet Day Emission Factor = E * (365 - Wet Days)/365. Wet days value is the NM default allowed by NMED without additional justification.

[6] Controlled Emissions = Uncontrolled Emissions * (1 - Control Factor/100%)

Control Efficiency = 78%

$Control_{AB} = Control_A + (1-Control_A) \times Control_B$

$Control_{AB}$ = 60% for Base Course+ (1-60% for Base Course) x 44% for Speed Limit

$Control_{AB}$ = 78%

**Notes**

[1] NSPS IIII Tier IV has a combined $NO_x$ and VOC emission factor of 5.6 g/hp-hr. Per CARB Emission Factors for CI Diesel Engines, when the non-methane hydrocarbon (NMHC) and nitrogen oxide ($NO_x$) emission factor is combined, assume a breakdown of 5% and 95%, respectivley.

[2] $SO_2$ and total HAPs were calculated using AP-42 emissions factors for Diesel Industrial Engines (Table 3.3-1 & 3.3-2).

[3] $NO_x$, CO, PM Emission factors are from US EPA, AP-42, Section 1.3, Table 1.3, Firing configuration *Distillate oil fired.*

[4] VOC Emission factor is from US EPA, AP-42, Section 1.3, Table 1.3-3 Nonmethane Total Organic Compounds, Firing cofiguration Distillate oil fired.

[5] $SO_2$ Emission Factor is 142S from AP-42 Table 1.3-1 EF where S indicates that the weight % of sulfur in the oil should be multiplied by the value given. AP 42 Ch 1.3.1 states Distillate oils contain less that 0.3 percent sulfur by weight.

[6] Per AP-42 Section 1.3, page 1.3-13, in order to convert the emission factors from lb/1000 gal to lb/MMBtu of Fuel Oil No. 2, divide the emission factor by a heating value of: 140 MMBtu/ 1000 gal.

**Calculations / Equations used**

Calculation is based on Ideal gas law: P(V) = n(R)(T)

VOC result = (($$$Pressure of Gas Inside the Unit Before Venting) * (Actual Volume of the Vented Unit)) / (Frequency of events) * (Molecular Weight) * VOC wt%

(Ideal Gas Constant) * (Temperature of Gas Inside the Unit Before Venting)

$$$ Equation may slightly vary depending on whether or not the emissions are controlled. See notes under venting emission calculation for more explanation.

| High Pressure Periodic |

**Calculations / Equations used**

Calculation is based on Ideal gas law: P(V) = n(R)(T)

VOC result = (($$$Pressure of Gas Inside the Unit Before Venting) * (Actual Volume of the Vented Unit)) / (Frequency of events) * (Molecular Weight) * VOC wt%

(Ideal Gas Constant) * (Temperature of Gas Inside the Unit Before Venting)

$$$ Equation may slightly vary depending on whether or not the emissions are controlled. See notes under venting emission calculation for more explanation.

**Calculations / Equations used**

Calculation is based on Ideal gas law: P(V) = n(R)(T)

VOC result = (($$$Pressure of Gas Inside the Unit Before Venting) * (Actual Volume of the Vented Unit)) / (Frequency of events) * (Molecular Weight) * VOC wt%

---

(Ideal Gas Constant) * (Temperature of Gas Inside the Unit Before Venting)

$$$ Equation may slightly vary depending on whether or not the emissions are controlled. See notes under venting emission calculation for more explanation.

| **Emission Type:** (pick from list) |
| High Pressure Periodic |

**Calculations / Equations used**

Calculation is based on Ideal gas law: P(V) = n(R)(T)

VOC result = (($$$Pressure of Gas Inside the Unit Before Venting) * (Actual Volume of the Vented Unit)) / (Frequency of events) * (Molecular Weight) * VOC wt%

(Ideal Gas Constant) * (Temperature of Gas Inside the Unit Before Venting)

$$$ Equation may slightly vary depending on whether or not the emissions are controlled. See notes under venting emission calculation for more explanation.

**Venting Emission Calculation**

**Warning: This calculation should provide a conservatively high (potentially overestimated) result for emissions from venting when only gas is present in a unit. If liquids are present in the unit, this calculation could potentially significantly underestimate**

**If emissions from this source are uncontrolled:**

**The formula is set up to do one calculation, which assumes that the entire volume of gas inside the unit is vented from the unit. The calculation of the mass of vented gas is done based on the volume of the unit**

**If emissions from this source are controlled:**

**The formula is set up to do two calculations. To preface the explanation of the two calculations, it is understood that for a release from a pressurized vessel, initial venting due to depressurization could occur**
**In order to move the vapor present in the vessel at atmospheric conditions to a control device, a flare for example, some sort of extra operation is needed such as using air or nitrogen to move the vapor out, and if**
**If you do have a way to move the vapor present in the vessel at atmospheric conditions to a control device, do not use this calculation tab. Instead, use the calculation tab for "Other" and make sure to provide a**
**The first calculation of the mass of vented gas, which assumes that the entire volume of gas inside the unit is vented from the unit, is done based on the volume of the unit vented, which is assumed to be saturated**
**The second calculation is done the same as the first one except using the atmospheric pressure (instead of the pressure inside the unit before the venting occurs) and represents all of the mass vented from the**
**The final result is the first calculation plus the second calculation, with the control efficiency only applied to the first calculation (which uses the pressure inside the unit before venting and represents the entire**

*NOTES:*

[1] Vessel blowdowns assume only event occurs at one time at the specified train. Hourly emissions represent the highest emission vessel blowdown that can occur at the train. Annual emissions represent the sum of all vessel blowdowns at the train.

[2] Vessel startups assume all vessels are repressurized simultaneously, thereby assuming all events occur at the same time. Annual emissions represent the sum of all vessel startups at the train.

[3] Tank degassing and tank startups assume all tanks are blown down or repressurized simultaneously at the train.

[4] Meter proving and line breaks assume all events occur simultaneously. Annual emissions represent the sum of all meter proving and line break events at the train.

[5] Filter blowdowns assume only one filter is changed at a time per train. Annual Emissions represent the sum of all filter changes at the train.

[6] Surface coating and abrasive blasting are represented at each train; however, both events can only occur at one train at a time.

[7] The maximum of either Full Plant Blowdown, Full Plant Startup, or all other events was taken. The events cannot occur at the same time. The total hourly emissions for vented emissions from the train represent the maximum of these events.

*NOTES:*

[1] Vessel blowdowns assume only event occurs at one time at the specified train. Hourly emissions represent the highest emission vessel blowdown that can occur at the train. Annual emissions represent the sum of all vessel blowdowns at the train.

[2] Vessel startups assume all vessels are repressurized simultaneously, thereby assuming all events occur at the same time. Annual emissions represent the sum of all vessel startups at the train.

[3] Tank degassing and tank startups assume all tanks are blown down or repressurized simultaneously at the train.

[4] Meter proving and line breaks assume all events occur simultaneously. Annual emissions represent the sum of all meter proving and line break events at the train.

[5] Filter blowdowns assume only one filter is changed at a time per train. Annual Emissions rerpesent the sum of all filter changes at the train.

[5] Surface coating and abrasive blasting are represented at each train; however, both events can only occur at one train at a time.

[7] The maximum of either Full Plant Blowdown, Full Plant Startup, or all other events was taken. The events cannot occur at the same time. The total hourly emissions for vented emissions from the train represent the maximum of these events.

*NOTES:*

[1] All blowdown events routed to a control device conservatively assume that equipment is depressurized to 0psig, with all vapors within the equipment routed to the control device.

[2] Vessel blowdowns assume only event occurs at one time at the specified train. Hourly emissions represent the highest emission vessel blowdown that can occur at the train. Annual emissions represent the sum of all vessel blowdowns at the train.

[3] Vessel startups assume all vessels are repressurized simultaneously, thereby assuming all events occur at the same time. Annual emissions represent the sum of all vessel startups at the train.

[4] Tank degassing and tank startups assume all tanks are blown down or repressurized simultaneously at the train.

[5] Meter proving and line breaks assume all events occur simultaneously. Annual emissions represent the sum of all meter proving and line break events at the train.

[6] Hourly residue gas flaring is based on the maximum processing capacity of the train.

[7] Filter blowdowns assume only one filter is changed at a time per train. Annual Emissions rerpesent the sum of all filter changes at the train.

[8] Surface coating and abrasive blasting are represented at each train; however, both events can only occur at one train at a time.

[9] The maximum of either Full Plant Blowdown, Full Plant Startup, or all other events was taken. The events cannot occur at the same time. The total hourly emissions for vented emissions from the train represent the maximum of these events.

[10] For flares, $NO_x$ and CO emissions are based on the maximum TNRCC emission factor for either high or low BTU streams. For thermal oxidizers, $NO_x$ and CO emissions are based on 50 ppm.

*NOTES:*

[1] All blowdown events routed to a control device conservatively assume that equipment is depressurized to 0psig, with all vapors within the equipment routed to the control device.

[2] Vessel blowdowns assume only event occurs at one time at the specified train. Hourly emissions represent the highest emission vessel blowdown that can occur at the train. Annual emissions represent the sum of all vessel blowdowns at the train.

[3] Vessel startups assume all vessels are repressurized simultaneously, thereby assuming all events occur at the same time. Annual emissions represent the sum of all vessel startups at the train.

[4] Tank degassing and tank startups assume all tanks are blown down or repressurized simultaneously at the train.

[5] Meter proving and line breaks assume all events occur simultaneously. Annual emissions represent the sum of all meter proving and line break events at the train.

[6] Hourly residue gas flaring is based on the maximum processing capacity of the train.

[7] Filter blowdowns assume only one filter is changed at a time per train. Annual Emissions rerpesent the sum of all filter changes at the train.

[8] Surface coating and abrasive blasting are represented at each train; however, both events can only occur at one train at a time.

[9] The maximum of either Full Plant Blowdown, Full Plant Startup, or all other events was taken. The events cannot occur at the same time. The total hourly emissions for vented emissions from the train represent the maximum of these events.

[10] For flares, $NO_x$ and CO emissions are based on the maximum TNRCC emission factor for either high or low BTU streams. For thermal oxidizers, $NO_x$ and CO emissions are based on 50 ppm.

*NOTES:*

[1] All blowdown events routed to a control device conservatively assume that equipment is depressurized to 0psig, with all vapors within the equipment routed to the control device.

[2] Vessel blowdowns assume only event occurs at one time at the specified train. Hourly emissions represent the highest emission vessel blowdown that can occur at the train. Annual emissions represent the sum of all vessel blowdowns at the train.

[3] Vessel startups assume all vessels are repressurized simultaneously, thereby assuming all events occur at the same time. Annual emissions represent the sum of all vessel startups at the train.

[4] Tank degassing and tank startups assume all tanks are blown down or repressurized simultaneously at the train.

[5] Meter proving and line breaks assume all events occur simultaneously. Annual emissions represent the sum of all meter proving and line break events at the train.

[6] Filter blowdowns assume only one filter is changed at a time per train. Annual Emissions rerpesent the sum of all filter changes at the train.

[7] Surface coating and abrasive blasting are represented at each train; however, both events can only occur at one train at a time.

[8] The maximum of either Full Plant Blowdown, Full Plant Startup, or all other events was taken. The events cannot occur at the same time. The total hourly emissions for vented emissions from the train represent the maximum of these events.

[9] For flares, $NO_x$ and CO emissions are based on the maximum TNRCC emission factor for either high or low BTU streams. For thermal oxidizers, $NO_x$ and CO emissions are based on 50 ppm.

**Targa Northern Delaware, LLC**

**Calculation Basis:**
This calculation utilizes an ideal gas law equation to determine the mass of gas released. Weight percents then determine the uncontrolled emission rate and control factors are applied. Degassing is assumed to occur in one hour.
Alternatively, this calculation uses an operator-specified blowdown volume to determine VOC emissions from filter changeouts.

**Sample Calculations:**

VOC Emissions (lb/hr) = Volume (ft3) * Pressure (psia) * MW (lb/lb-mol) * VOC wt% / ( R (ft3 * psia / lb-mol * °R) * T (°R) )

VOC Emissions (tpy) = VOC Emissions (lb/hr) * Frequency (/year) / 2000 lb/ton

# Equipment Startup SSM Emissions

**Targa Northern Delaware, LLC**

**Calculation Basis:**

Emissions from vessel maintenance activities are calculated using a three step pressurization, where vessels are blown down to check for leaks after pressurizing. The minimum of the vapor pressure or pressurization steps is used to determine the volume of gas or vapor vented to atmosphere or flare.

**Train 1**

Atmospheric Pressure: 12.91 psia; 1st Step Pressurization: 50 psig; 2nd Step Pressurization: 150 psig; 3rd Step Pressurization: 300 psig

# Equipment Blowdown SSM Emissions

**Targa Northern Delaware, LLC**

Emissions from vessel maintenance activities are calculated using the ideal gas law.

| | | |
|---|---|---|
| **Minimum Flared Blowdown Pressure** | 15 | psig |
| **Atmospheric Pressure** | 12.91 | psia |

**Train 1**

| Equipment ID | Equipment Description | Service | Equipment Volume | Operating Pressure | Temp. | Mixture Vapor Pressure | Flared? | Control Device Type | Control Device | DRE (%) | Gas STD Volume at Operational Conditions | Volume to Atmosphere | Flared Volume | MW | Activity Duration | Annual Activities |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | $ft^3$ | psia | °F | psia | | | | | scf | scf | scf | lb/lb-mol | hours | activities/yr |

**Sample Calculations:**

Vo = V * Pmin1 * (519.67 °R) / (14.696 psia * To)

Va = V * Pmin2 * (519.67 °R) / (14.696 psia * To)

Vf = Vo - Va

Where:

Vo = Volume at Operating Conditions ($ft^3$)

V = Volume of Vessel ($ft^3$)

Pmin1 = Minimum of vapor and operating pressure (psia)

To = Operating temperature (°R)

Va = Volume released to atmosphere ($ft^3$)

Pmin2 = Minimum of vapor, flared blowdown, and operating pressure (psia)

Vf = Volume of gas sent to flare ($ft^3$)

Efh = Vf / (379 scf/lb-mol) * MW * VOC wt% / t * (1 - DRE)

Efy = Efh * t * a

Eah = Va / (379 scf/lb-mol) * MW * VOC wt% / t

Eay = Eah * t * a

Where:

Efh = hourly flared VOC emission rate (lb/hr)

MW = molecular weight (lb/lb-mol)

VOC wt% = weight percent of VOC (%)

t = activity duration (hr)

DRE = Destruction efficiency of flare (%)

Efy = yearly flared VOC emission rate (tpy)

a = activities per year

Eah = hourly vented VOC emission rate (lb/hr)

Eay = yearly vented VOC emission rate (tpy)

Eay = yearly vented VOC emission rate (tpy)

These example calculations are not intended to be representations under 106.6(b), but are an example of the emission calculation approach for a sub-category of MSS emissions activities. The basis of the example emission calculation (such as volume, concentration, pressure)

# Full Blowdown SSM Emissions

**Targa Northern Delaware, LLC**

**Calculation Basis:**

Emissions from vessel maintenance activities are calculated using the ideal gas law.

| | | |
|---|---|---|
| **Minimum Flared Blowdown Pressure** | 20 | psig |
| **Atmospheric Pressure** | 12.91 | psia |

**Train 1**

**Sample Calculations:**

Vo = V * Pmin1 * (519.67 °R) / (14.696 psia * To)

Va = V * Pmin2 * (519.67 °R) / (14.696 psia * To)

Vf = Vo - Va

Where:

Vo = Volume at Operating Conditions ($ft^3$)

V = Volume of Vessel ($ft^3$)

Pmin1 = Minimum of vapor and operating pressure (psia)

To = Operating temperature (°R)

Va = Volume released to atmosphere ($ft^3$)

Pmin2 = Minimum of vapor, flared blowdown, and operating pressure (psia)

Vf = Volume of gas sent to flare ($ft^3$)

Efh = Vf / (379 scf/lb-mol) * MW * VOC wt% / t * (1 - DRE)

Efy = Efh * t * a

Eah = Va / (379 scf/lb-mol) * MW * VOC wt% / t

Eay = Eah * t * a

Where:

Efh = hourly flared VOC emission rate (lb/hr)

MW = molecular weight (lb/lb-mol)

VOC wt% = weight percent of VOC (%)

t = activity duration (hr)

DRE = Destruction efficiency of flare (%)

Efy = yearly flared VOC emission rate (tpy)

a = activities per year

Eah = hourly vented VOC emission rate (lb/hr)

Eay = yearly vented VOC emission rate (tpy)

These example calculations are not intended to be representations under 116.116(b), but are an example of the emission calculation approach for a sub-category of MSS emissions activities. The basis of the example emission calculation (such as volume, concentration, pressure) are example conditions and should not be interpreted as representations of a specific plant or activity condition under 116.116(b). Individual activities in this MSS sub-category are performed which may have slight variations in procedure or equipment configuration.

# Full Startup SSM Emissions

**Targa Northern Delaware, LLC**

**Calculation Basis:**

Emissions from vessel maintenance activities are calculated using a four step pressurization, where vessels are blown down to check for leaks after pressurizing. The minimum of the vapor pressure or pressurization steps is used to determine the volume of gas or vapor vented to atmosphere or flare.

**Train 1**

Atmospheric Pressure: 12.91 psia; 1st Step Pressurization: 25 psig; 2nd Step Pressurization: 50 psig; 3rd Step Pressurization: 100 psig; 4th Step Pressurization: 100 psig
