# 1. EXECUTIVE SUMMARY (SUPPLEMENT)

Targa Resources LLC, dba Targa Northern Delaware LLC, (Targa) operates the Red Hills Gas Processing Plant (Red Hills) at 1934 W NM Highway 128, Jal, 88252, Lea County, New Mexico under Construction Permit 4310-M6 and Title V Operating Permit P278-M1.

The initial modeling protocol was submitted on April 10, 2025. After initial discussions, minor revisions and additional modeling methodologies were determined to be necessary. This addendum is being submitted as a supplement to the initial modeling protocol to address the following additional items:

- Daily flaring emission rates.
- Clarification on alternative operating scenarios.
- Updated Class I Q/D Analyses for all relevant operating scenarios.
- Additional flaring information for Class I AQRV Analyses and Class I PSD Increment Analyses.

In addition to the above, refined modeled emission rates are provided for all model scenarios in Appendix A to this supplement. The sections of this addendum parallel the original sections of the submitted modeling protocol for ease of integration. The emission rates presented herein are subject to change throughout the further development of the associated application.

The table below provides a cross reference between the unit IDs utilized throughout the application for the facility and the Model IDs presented herein.

**Table 1-1. Unit ID Cross Reference**

| Application Unit ID | Model ID |
|---|---|
| RH1-FL-29-1003 | 1-EP-2 |
| RH2-FL-5100 | 2-EP-2a |
| RH3-FL-5100 | 3-EP-2a |
| RH4-FL-45100 | 4-EP-2a |
| RH5-FL-55100 | 5-EP-2 |
| RHA-FL-5100 | 2.5-EP-5 |
| RA2-FL-25100 | 5.5-EP-1b |

# 2. RED HILLS GAS PROCESSING PLANT OVERVIEW

## 2.1 Plant Description

This section is unchanged from the previously submitted protocol.

## 2.2 Plant Location and Surrounding Area

This section is unchanged from the previously submitted protocol.

# 3. SOURCE CHARACTERIZATION (SUPPLEMENT)

## 3.1 Point Sources

This section is unchanged from the previously submitted protocol.

## 3.2 Flares (Supplement)

This section presents the way the flares and their corresponding emission rates will be represented in the AERMOD and CALPUFF models.

### 3.2.1 Sweet Gas Flares (Supplement)

Short-term emissions for sweet gas flares, which include the 1-hr, 8-hr, and 24-hr averaging periods reflect the sum of process emissions and the worst-case startup, shutdown and maintenance (SSM) emissions. Short-term emissions modeled for sweet gas flares, which include the 1-hr, 8-hr, and 24-hr averaging periods, reflect the sum of process emissions and the worst-case startup, shutdown and maintenance (SSM) emissions. Pilot, purge, and dehydrator still vent emissions are all included in process emissions, where appropriate, meaning that they are assumed to be emitted continuously over a 24-hour period. For 24-hour standards, process emissions are assumed to occur for the entire period, while worst-case SSM emissions are assumed to only occur for the duration of the worst-case SSM event, which is 12 hours. The worst case SSM event would expend all of its proposed annual tons per year (TPY) emissions limit within a 12-hour period at that rate; therefore, it is assumed that this approach is conservative.

Annual emissions for sweet gas flares only account for process emissions, which include pilot, purge, and dehydrator still vent emissions, where appropriate. Per NMED Modeling Guidance Section 4.1.6, SSM does not have to demonstrate compliance with the annual standards or annual increment consumption.[1]

The table below summarizes the hourly, daily, and annual $NO_x$ and $SO_2$ emission rates proposed to be modeled for each sweet gas flare. Due to the short averaging periods for CO (1-hour and 8-hour) and $H_2S$ ($^1/_2$ hour), emissions are not reported here. Modeling for both pollutants will utilize the highest hourly emission rate, as reported in Appendix A.

**Table 3-1. Sweet Gas Flares Emission Rates**

| Unit ID | Hourly Emission Rate (lb/hr) | | Daily Emission Rate[a] (lb/hr) | | Annual Emission Rate[b] (lb/hr) | |
|---|---|---|---|---|---|---|
| | $NO_x$ | $SO_2$ | $NO_x$ | $SO_2$ | $NO_x$ | $SO_2$ |
| 1-EP-2 | 211.68 | 2.56 | 106.12 | 1.35 | 0.56 | 0.15 |
| 2-EP-2a | 563.35 | 5.00 | 281.86 | 2.50 | 0.37 | 0.0017 |
| 3-EP-2a | 563.35 | 5.00 | 281.86 | 2.50 | 0.37 | 0.0017 |
| 4-EP-2a | 648.31 | 5.75 | 324.08 | 2.88 | 0.37 | 0.0017 |
| 5-EP-2 | 648.18 | 5.75 | 324.47 | 2.88 | 0.76 | 0.0035 |

a. Daily emission rates assume process emissions are emitted continuously over a 24-hour period, while worst-case SSM emissions are assumed to only occur for the duration of the worst-case SSM event, which is 12 hours.
b. Annual emission rates only account for process emissions.

[1] NMED Modeling Guidance (July 2024). Section 4.1.6 Startup, Shutdown, Maintenance (SSM), and Other Short-term Emissions

### 3.2.2 Acid Gas Flares (Supplement)

Flare units 2.5-EP-5 and 5.5-EP-1b are designed to combust SSM and gaseous emissions from various process equipment at the facility. These flares also handle acid gas emissions from RHA-AMINE and RA2-AMINE when AGI-1 and AGI-2 are offline. There are three (3) operating scenarios for these flares summarized in Table 3-2 below. Each flare unit will have hourly emission limits (represented by the three operating scenarios) based on whether the flares are operating simultaneously or exclusively, as represented in Table 3-3 below.

**Table 3-2. Acid Gas Flare Scenarios**

| Unit ID | AOS 1 Processes | AOS 2 Processes | AOS 3 Processes |
|---|---|---|---|
| **2.5-EP-5** | Pilot<br>Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge |
| **5.5-EP-1b** | Pilot<br>Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge | Pilot<br>Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions |

**Table 3-3. AGI Flaring Scenarios Hourly Emission Rates**

| Unit ID | Scenario | NOx (lb/hr) | CO (lb/hr) | $SO_2$ (lb/hr) | $H_2S$ (lb/hr) |
|---|---|---|---|---|---|
| **2.5-EP-5** | AOS 1 | 16.83 | 144.32 | 128.29 | 1.39 |
| | AOS 2 | 19.65 | 168.45 | 274.83 | 3.01 |
| | AOS 3 | 0.071 | 0.61 | 1.02E-03 | 2.86E-06 |
| **5.5-EP-1b** | AOS 1 | 16.92 | 145.07 | 127.13 | 1.38 |
| | AOS 2 | 0.17 | 1.47 | 1.83E-03 | 6.88E-06 |
| | AOS 3 | 53.99 | 215.79 | 258.17 | 2.80 |

In addition to the flaring scenarios represented above, each flare is also going to take a daily emission rate limit to more appropriately represent impacts over a 24-hour period. The proposed daily emission rate limits for these units, in lb/day, are presented in Table 3-4 below.

**Table 3-4. AGI Flaring Scenarios Daily Emission Rates**

| Unit ID | Scenario | NOx (lb/day) | CO (lb/day) | $SO_2$ (lb/day) | $H_2S$ (lb/day) |
|---|---|---|---|---|---|
| **2.5-EP-5** | AOS 1 | 269.31 | 2309.06 | 2052.62 | 22.25 |
| | AOS 2 | 314.34 | 2695.23 | 4397.29 | 48.20 |
| | AOS 3 | 1.71 | 14.66 | 0.025 | 6.86E-05 |
| **5.5-EP-1b** | AOS 1 | 270.72 | 2321.19 | 2034.08 | 22.05 |
| | AOS 2 | 2.75 | 23.54 | 0.029 | 1.10E-04 |
| | AOS 3 | 971.74 | 384.23 | 4646.98 | 50.38 |

## 3.3 Area Sources

This section is unchanged from the previously submitted protocol.

## 3.4 Volume Sources - Roads

This section is unchanged from the previously submitted protocol.

# 4. CLASS II MODELING PROCEDURES (SUPPLEMENT)

## 4.1 Model Selection

This section is unchanged from the previously submitted protocol.

## 4.2 Model Inputs Options

This section is unchanged from the previously submitted protocol.

## 4.3 Alternate Operating Scenarios (Supplement)

For units with alternative operating scenarios occurring at the same emission point, such as the flares at the facility, the scenario with the maximum modeled impact will be used for the modeling demonstration. The alternative operating scenarios, which have lesser impact, will be detailed Section 15 of the PSD permit application package submittal.

For alternative operating scenarios that occur at different emission points, all scenarios will be modeled in the significant impact analysis. The scenario that results in the most significant impact will be used to demonstrate compliance through a cumulative analysis.

The most significant alternative operating scenario revolves around the flares that operate on the acid gas trains. Three scenarios exist: RHA-FL-5100 operating independently (Scenario #1), RA2-FL-25100 operating independently (Scenario #2), and RHA-FL-5100 and RA2-FL-25100 operating simultaneously (Scenario #3). Details regarding the limitation of these scenarios and their associated emission rates will be provided in detail in the application and modeling report submitted to the NMED. Preliminary emissions associated with the scenarios are presented in Section 3.2. and Appendix A.

## 4.4 Portable Sources

This section is unchanged from the previously submitted protocol.

## 4.5 Land Use Classification

This section is unchanged from the previously submitted protocol.

## 4.6 Plume Downwash

This section is unchanged from the previously submitted protocol.

## 4.7 Meteorological Data

This section is unchanged from the previously submitted protocol.

## 4.8 Ambient Air Boundary

This section is unchanged from the previously submitted protocol.

## 4.9 Receptor Network and Terrain Elevations

This section is unchanged from the previously submitted protocol.

## 4.10 Nearby Source Inventory

This section is unchanged from the previously submitted protocol.

## 4.11 Background Concentrations

This section is unchanged from the previously submitted protocol.

## 4.12 Estimating $NO_2$ Impacts

This section is unchanged from the previously submitted protocol.

## 4.13 Secondary Pollutant Formation

This section is unchanged from the previously submitted protocol.

# 5. CLASS II MODELING ANALYSIS

## 5.1 Significant Impact Analysis

This section is unchanged from the previously submitted protocol.

## 5.2 Cumulative Impact Analysis

This section is unchanged from the previously submitted protocol.

# 6. ADDITIONAL IMPACTS

## 6.1 Growth Analysis

This section is unchanged from the previously submitted protocol.

## 6.2 Soil and Vegetation Analysis

This section is unchanged from the previously submitted protocol.

## 6.3 Visibility Impairment Analysis

This section is unchanged from the previously submitted protocol.

# 7. CLASS I MODELING PROCEDURES AND ANALYSES (SUPPLEMENT)

## 7.1 Initial Screening Analysis

This section is unchanged from the previously submitted protocol.

## 7.2 Q/D Analysis (Supplement)

A Q/D screening analysis was performed in a manner consistent with the proposed method as outlined in FLAG 2010.[2] This method compares the ratio of visibility-affecting pollutants (VAP, which includes $NO_X$, $SO_2$, $PM_{10}$ and $H_2SO_4$) emission rates associated with the project to the distance from the Class I area. There are no direct $H_2SO_4$ emissions, so the screening analysis only considers $NO_X$, $SO_2$, and $PM_{10}$ emissions.

For the FLAG 2010 approach, "Q" is calculated as the sum of the worst-case 24-hour emissions due to the "project", converted to an annual basis. The "D"' term is defined as the distance, in kilometers (km), from the facility to the closest receptor in the corresponding Class I area. A Q/D screening threshold of ten (10) is provided in the FLAG 2010 guidance document.

When considering the proposed emissions for facility, the total "Q" is roughly 7,100 tons per year (tpy). Table 7-1 through 7-3 show the project's Q/D for the three operating scenarios detailed in Section 3.2.2.

**Table 7-1. Class I AQRV Screening Analysis Result – Scenario 1**

| Class I Area | Distance (km) | Annualized Maximum Daily Emission Rate (tpy) | | | Q (tpy) | Q/D* | Additional Review? |
|---|---|---|---|---|---|---|---|
| | | $SO_2$ | $NO_X$ | $PM_{10}$ | | | (Yes/No) |
| Carlsbad Caverns National Park | 79.80 | 1,123 | 6,022 | 36.87 | 7,182 | 90.00 | Yes |
| Guadalupe Mountains National Park | 116.00 | | | | | 61.91 | Yes |
| Salt Creek Wilderness | 170.60 | | | | | 42.10 | Yes |
| Big Bend | 279.75 | | | | | 25.67 | Yes |

[2] Federal Land Managers' Air Quality Related Values Work Group (FLAG), Phase I Report-Revised (2010), NSP,/NRPC/NRR, 2010

**Table 7-2. Class I AQRV Screening Analysis Result – Scenario 2**

| Class I Area | Distance (km) | Annualized Maximum Daily Emission Rate (tpy) | | | Q (tpy) | Q/D* | Additional Review? |
|---|---|---|---|---|---|---|---|
| | | $SO_2$ | $NO_X$ | $PM_{10}$ | | | (Yes/No) |
| Carlsbad Caverns National Park | 79.80 | 1,136 | 5,673 | 36.87 | 7,146 | 89.55 | Yes |
| Guadalupe Mountains National Park | 116.00 | | | | | 61.60 | Yes |
| Salt Creek Wilderness | 170.60 | | | | | 41.89 | Yes |
| Big Bend | 279.75 | | | | | 25.54 | Yes |

**Table 7-3. Class I AQRV Screening Analysis Result – Scenario 3**

| Class I Area | Distance (km) | Annualized Maximum Daily Emission Rate (tpy) | | | Q (tpy) | Q/D* | Additional Review? |
|---|---|---|---|---|---|---|---|
| | | $SO_2$ | $NO_X$ | $PM_{10}$ | | | (Yes/No) |
| Carlsbad Caverns National Park | 79.80 | 1,132 | 5,981 | 36.87 | 7,150 | 89.59 | Yes |
| Guadalupe Mountains National Park | 116.00 | | | | | 61.64 | Yes |
| Salt Creek Wilderness | 170.60 | | | | | 41.91 | Yes |
| Big Bend | 279.75 | | | | | 25.56 | Yes |

* Q/D values are based on preliminary emission estimates and are subject to change during the course of the application development.

## 7.3 Class I AQRV

This section is unchanged from the previously submitted protocol.

## 7.4 Class I PSD Increment Analyses

This section is unchanged from the previously submitted protocol.

# APPENDIX. MODELED EMISSION RATES AND SOURCE PARAMETERS

The emission rates and stack parameters may change throughout the development of this application.

TARGA

# 1. BACT DEFINITION

This report discusses the regulatory basis and approach used in completing the Best Available Control Technology (BACT) analysis for pollutants triggering this requirement for the Targa Northern Delaware, LLC (Targa) Red Hills Gas Processing Plant (Red Hills). In addition, this report also documents the emission units for which the BACT analyses were performed.

The requirement to conduct a BACT analysis is set forth in the PSD regulations in 40 CFR §52.21(j)(2):

> *(j) Control Technology Review.*
>
> *(2) A new major stationary source shall apply best available control technology for each regulated NSR pollutant that it would have the potential to emit in significant amounts.*

BACT is defined in the PSD regulations 40 CFR §52.21(b)(12)(emphasis added) in relevant part as:

> *…an emissions limitation (including a visible emission standard) based on the maximum degree of reduction for each pollutant subject to regulation under Act which would be emitted from any proposed major stationary source or major modification which the Administrator, on a case-by-case basis taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such a source or modification through application of production processes or available methods, systems, and techniques, including fuel cleaning or treatment or innovative fuel combustion techniques for control of such pollutant. In no event shall application of best available control technology result in emissions of any pollutant which would exceed the emissions allowed by any applicable standard under 40 CFR parts 60 and 61.*

Although this definition was not changed by the Tailoring Rule, differences in the characteristics of criteria pollutants and GHG emissions from large industrial sources present several GHG-specific considerations under the BACT definition, which warrants further discussion. Those underlined terms in the BACT definition are addressed further below.

## 1.1 Emission Limitation

BACT is "an emission limitation," not an emission reduction rate or a specific technology. While BACT is prefaced upon the application of technologies reflecting the maximum reduction rate achievable, the final result of BACT is an emission limit. Typically, when quantifiable and measurable[1], this limit would be expressed as an emission rate limit of a pollutant (e.g., lb/MMBtu, ppm, or lb/hr).[2] Furthermore, EPA's guidance on GHG BACT has indicated that GHG BACT limitations should be averaged over long-term timeframes such as a 30- or 365-day rolling average.[3]

[1] The definition of BACT allows use of a work practice where emissions are not easiily measured or enforceable. 40 CFR §52.21(b)(12).

[2] Emission limits can be broadly differentiated as "rate-based' or "mass-based." For a turbine, a rate-basedlimit would typically be in units of lb/MMBtu (mass emissions per heat input. In contrast, a typical mass-based limit would be in units of lb/hr (mass emissions per time).

[3] PSD and Title V Permitting Guidance for Greenhouse Gases. March 2011, page 46.

## 1.2 Each Pollutant

Since BACT applies to "each pollutant subject to regulation under the Act," the BACT evaluation process is typically conducted for each regulated NSR pollutant individually and not for a combination of pollutants.[4] For PSD applicability assessments involving GHGs, the regulated NSR pollutant subject to regulation under the Clean Air Act (CAA) is the sum of six greenhouse gases and not a single pollutant.[5] In the final Tailoring Rule preamble, EPA went beyond applying this combined pollutant approach for GHGs to PSD applicability and made the following recommendations that suggest applicants should conduct a single GHG BACT evaluation on a $CO_2e$ basis for emission sources that emit more than one GHG:

> *However, we disagree with the commenter's ultimate conclusion that BACT will be required for each constituent gas rather than for the regulated pollutant, which is defined as the combination of the six well-mixed GHGs. To the contrary, we believe that, in combination with the sum-of-six gases approach described above, the use of the $CO_2e$ metric will enable the implementation of flexible approaches to design and implement mitigation and control strategies that look across all six of the constituent gases comprising the air pollutant (e.g., flexibility to account for the benefits of certain $CH_4$ control options, even though those options may increase $CO_2$). Moreover, we believe that the $CO_2e$ metric is the best way to achieve this goal because it allows for tradeoffs among the constituent gases to be evaluated using a common currency.*[6]

For this project, the GHG emissions are driven primarily by $CO_2$. $CO_2$ emissions represent more than 99% of the total $CO_2e$ for the project as a whole. As such, the top-down GHG BACT analysis in the relevant sections should and will focus on $CO_2$.

## 1.3 BACT Applies to the Source

BACT applies to the type of source proposed by the applicant. BACT does not redefine the source. The applicant defines the source (i.e., its goals, aims, and objectives). Although BACT is based on the type of source as proposed by the applicant, the scope of the applicant's ability to define the source is not absolute. A key task for the reviewing agency is to determine which parts of the proposed process are inherent to the applicant's purpose and which parts may be changed without changing that purpose. The project is discussed in Form UA3, Section 3 and a process description has been included in Form UA3, Section 10 of this application to guide the technical reviewers in the areas of need and scope of this project and how BACT should be reviewed in light of this detailed information.

## 1.4 Case-By-Case Basis

The PSD program's BACT evaluation is case-by-case. BACT permit limits are not simply the requirement for a control technology because of its application elsewhere or the direct transference of the lowest emission rate found in other permits for similar sources, applied to the proposed source. EPA has explained how the top-down BACT analysis process works on a case-by-case basis. To assist applicants and regulators with the case-by-case process, in 1990 EPA issued a Draft Manual on New Source Review permitting which included a "top-down" BACT analysis.

---

[4] 40 CFR §52.21(b)(12).

[5] 40 CFR §52.21(b)(49)(i).

[6] 75 FR 31,531, Prevention of Significant Deterioration and Title V Greenhouse Gas Tailoring Rule; Final Rule, June 3, 2010.

*In brief, the top-down process provides that all available control technologies be ranked in descending order of control effectiveness. The PSD applicant first examines the most stringent--or "top"--alternative. That alternative is established as BACT unless the applicant demonstrates, and the permitting authority in its informed judgment agrees, that technical considerations, or energy, environmental, or economic impacts justify a conclusion that the most stringent technology is not "achievable" in that case. If the most stringent technology is eliminated in this fashion, then the next most stringent alternative is considered, and so on.*[7]

The five steps in a top-down BACT evaluation can be summarized as follows:

- Step 1. Identify all available control technologies;
- Step 2. Eliminate technically infeasible options;
- Step 3. Rank the technically feasible control technologies by control effectiveness;
- Step 4. Evaluate the most effective controls; and
- Step 5. Select BACT.

Additionally, it is important to note that the top-down process is conducted on a unit-by-unit, pollutant-by-pollutant basis and only considers the portions of the facility that are considered "emission units" as defined under the PSD regulations.[8]

## 1.5 Achievable

BACT is to be set at the lowest value that is "achievable." However, there is an important distinction between emission rates achieved at a specific time on a specific unit and an emission limitation that a unit must be able to meet continuously over its operating life. As discussed by the DC Circuit Court of Appeals:

*In National Lime Ass'n v. EPA, 627 F.2d 416, 431 n.46 (D.C. Cir. 1980), we said that where a statute requires that a standard be "achievable," it must be achievable" under most adverse circumstances which can reasonably be expected to recur."*[9]

EPA has reached similar conclusions in prior determinations for PSD permits.

*Agency guidance and our prior decisions recognize a distinction between, on the one hand, measured 'emissions rates,' which are necessarily data obtained from a particular facility at a specific time, and on the other hand, the 'emissions limitation' determined to be BACT and set forth in the permit, which the facility is required to continuously meet throughout the facility's life. Stated simply, if there is uncontrollable fluctuation or variability in the measured emission rate, then the lowest measured emission rate will necessarily be more stringent than the "emissions limitation" that is "achievable" for that pollution control method over the life of the facility. Accordingly, because the "emissions limitation" is applicable for the facility's life, it is wholly appropriate for the permit issuer to consider, as part of the*

[7] Draft NSR Manual at B-2. "The NSR Manual has been used as a guidance document in conjunction with new source review worshops and training, and as a smiple guide for state and federal permitting officials with respect to PSD requirements and policy. Although it is not binding Agency regulation, the NSR Manual has been looked to be this Board as a statement of the Agency's thinking on certain PSD issues. E.g., *In re RockGen Energy Ctr.*, 8 E.A.D. 536, 542 n. 10 (EAB 1999), *In re Knauf Fiber Glass, GmbH*, 8 E.A.D. 121, 129 n. 13 (EAB 1999)." *In re Prairie State Generating Company* 13 E.A.D. 1, 13 n 2 (2006).

[8] Pursuant to 40 CFR §52.21(a)(7), emission unit means any part of a stationary source that emits or would have the potential to emit any regulated NSR pollutant.

[9] As quated in Sierra Club v. U.S. EPA (97-1686).

*BACT analysis, the extent to which the available data demonstrate whether the emissions rate at issue has been achieved by other facilities over a long term.*[10]

Thus, BACT must be set at the lowest feasible emission rate recognizing that the facility must be in compliance with that limit for the lifetime of the facility on a continuous basis. While viewing individual unit performance can be instructive in evaluating what BACT might be, any actual performance data must be viewed carefully, as rarely will the data be adequate to truly assess the performance that a unit will achieve during its entire operating life.

To assist in meeting the BACT limit, the source must consider production processes or available methods, systems, or techniques, as long as those considerations do not redefine the source.

## 1.6 Production Process

The definition of BACT lists both production processes and control technologies as possible means for reducing emissions.

## 1.7 Available

The term "available" is the definition of BACT implemented through a feasibility analysis – a determination that the technology being evaluated is demonstrated or available and applicable.

## 1.8 Floor

For Criteria pollutants, the least stringent emission rate allowable for BACT is any applicable limit under either New Source Performance Standards (NSPS – Part 60) or National Emission Standards for Hazardous Air Pollutants (NESHAP – Parts 61). Since no GHG limits have been incorporated into any existing NSPS or Part 61 NESHAPs, no floor for a GHG BACT analysis is available for consideration.

[10] U.S. EPA Environmental Appeals Board decisison, *In re: Newmont Nevada Energy Investment L.L. C.* PSD Appeal No. 05-04, decided December 21, 2005. Environmental Administrative Decisions, Volume 12, Page 442.

# 2. PROJECT DEFINITION

Targa Northern Delaware, LLC (Targa) owns and operates the Red Hills Gas Processing Plant (Red Hills) in Lea County, NM. The facility is currently authorized to operate under NSR Permit No. 4310-M6 and Title V Operating Permit No. P278-M1. The Red Hills Gas Processing Plant dehydrates and removes $CO_2$, $H_2S$, and natural gas liquids from field gas for transportation via a sales pipeline.

For the purposes of this BACT Review, all permitted equipment at the facility is included, as detailed below:

- Two (2) Hot Oil Heaters (Units RH1-H-23-704 and RA2-H-20001)
- Two (2) Stabilizer Hot Oil Heaters (Units RH1-H-1101 and RH6-H-60001)
- One (1) Liquids In-Line Heater (Unit RH4-H-41100)
- Five (5) Regen Gas Heaters (Units RH2-H-741, RH3-H-741, RH4-H-741, RH5-H-50741, and RH6-H-60741)
- Five (5) Cryo Hot Oil Heaters (Units RH2-H-781, RH3-H-781, RH4-H-781, RH5-H-50781, and RH6-H-60781)
- Five (5) Amine Hot Oil Heaters (Units RH2-H-0901, RH2-H-1001, RHA-H-4901, RH4-H-3901, and RH4-H-4001)
- Two (2) Amine/TEG Hot Oil Heaters (Units RH5-H-50902 and RH5-H-50001)
- Three (3) TEG Reboilers (Units RH2-H-2301, RH3-H-6301, and RH4-H-5301)
- Six (6) Glycol Dehydrators (Units RH1-TEG, RH2-TEG, RH3-TEG, RH4-TEG, RH5-TEG, and RH6-TEG)
- Six (6) Amine Units (Units RH1-AMINE, RH2-AMINE, RHA-AMINE, RH4-AMINE, RH5-AMINE, and RA2-AMINE)
- Eleven (11) Flares (Units RH1-FL-29-1003, RH2-FL-5100, RH3-FL-5100, RH4-FL-45100, RH5-FL-55100, RHA-FL-5100, RA2-FL-25100, RHA-FL-5850, RA2-FL-25850, RH1-FL-2850, and RH4-FL-46200)
- Twelve (12) Condensate Storage Tanks (Units RH1-TK-COND-EAST and RH1-TK-COND-WEST)
- Four (4) Sour Slop Water Storage Tanks (Units RHA-TK-SLOP and RA2-TK-SLOP)
- Seven (7) Slop Water Storage Tanks (Units RH4-TK-SLOP, RH2-TK-SLOP, and RH1-TK-SLOP)
- Three (3) Thermal Oxidizers (Units RH2-TO-5500, RH4-TO-45500, and RH5-TO-55500)
- One (1) Methanol Tank (RH-TK-METHANOL)

# 3. BACT ASSESSMENT METHODOLOGY

BACT for the project has been evaluated via a "top-down" approach which includes the steps outlined in the following subsections.

Additionally, EPA's March 2011 GHG Permitting Guidance generally directed that a BACT review for GHGs should be done in the same manner as it is done for any other regulated pollutant.[11] It should be noted that the scope of a BACT review was clarified in two ways with respect to GHGs:

- EPA stressed that applicants should clearly define the scope of the project being reviewed.[12] Targa has provided this information in Section 2 and the BACT Evaluation section for each source type.
- EPA clarified that the scope of the BACT should focus on the project's largest contributors to $CO_2e$ and that applicants may subject less significant contributors for $CO_2e$ to less stringent BACT review.[13]

## 3.1 Step 1 – Identify All Available Control Technologies

Available control technologies with the practical potential for application to the emission unit and regulated air pollutant in question are identified. Available control options include the application of alternate production processes and control methods, systems, and techniques including fuel cleaning and innovative fuel combustion, when applicable and consistent with the project. The application of demonstrated control technologies in other similar source categories to the emission unit in question must also be considered. While identified technologies may be eliminated in subsequent steps in the analysis based on technical and economic infeasibility or environmental, energy, economic, or other impacts, control technologies with potential application to the emission unit under review are identified in this step.

Under Step 1 of a criteria pollutant BACT analysis, the following resources are typically consulted when identifying potential technologies:

1. EPA's Reasonably Available Control Technology (RACT)/Best Available Control Technology (BACT)/Lowest Achievable Emission Reduction (LAER) Clearinghouse (RBLC) database;
2. Determinations of BACT by regulatory agencies for other similar sources or air permits and permit files from federal or state agencies;
3. Engineering experience with similar control applications;
4. Information provided by air pollution control equipment vendors with significant market share in the industry; and/or
5. Review of literature from industrial technical or trade organizations.

EPA's "top-down" BACT analysis procedure also recommends the consideration of inherently lower-emitting processes as available control options under Step 1.[14]

[11] *PSD and Title V Permitting Guidance for Greenhouse Gases*. March 2011, page 17.

[12] Ibid, pages 22-23.

[13] Ibid, page 31.

[14] Ibid, page 24.

For GHG BACT analyses, low-carbon intensity fuel selection is the primary control option that can be considered a lower-emitting process. Additionally, EPA's GHG BACT guidance suggests that carbon capture and sequestration (CCS) be evaluated as an available control for substantial, large projects such as steel mills, refineries, and cement plants where $CO_2e$ emission levels are in the order of 1,000,000 tpy, or for industrial facilities with high-purity $CO_2$ streams.[15] However, EPA explained that "this does not necessarily mean CCS should be selected as BACT for such sources."

## 3.2 Step 2 – Eliminate Technically Infeasible Options

After the available control technologies have been identified, each technology is evaluated with respect to its technical feasibility in controlling individual pollutant emissions from the source in question. The first question in determining whether a technology is feasible is whether it is demonstrated. Whether or not a control technology is demonstrated is a relatively straightforward determination, although a source may cite specific site-specific differences to eliminate a technology from consideration.

> Demonstrated "means that it has been installed and operated successfully elsewhere on a similar facility." *Prairie State*, slip op. at 45. "This step should be straightforward for control technologies that are demonstrated--if the control technology has been installed and operated successfully on the type of source under review, it is demonstrated, and it is technically feasible."[16]

A technology "not demonstrated" is only technically feasible if it is "available" and "applicable." A control technology or process is only considered available if it has reached the licensing and commercial sales phase of development and is "commercially available".[17] Control technologies in the R&D and pilot scale phases are not considered available. Based on EPA guidance, an available control technology is presumed to be applicable if it has been permitted or implemented by a similar source. Decisions about technical feasibility of a control option consider the physical or chemical properties of the emissions stream in comparison to emissions streams from similar sources successfully implementing the control alternative. The NSR Manual explains the concept of applicability as follows: "An available technology is "applicable" if it can reasonably be installed and operated on the source type under consideration."[18] Applicability of a technology is determined by technical judgment and consideration of the use of the technology on similar sources as described in the NSR Manual.

## 3.3 Step 3 – Rank Remaining Control Technologies by Control Effectiveness

All remaining technically feasible control options are ranked based on their overall control effectiveness for the pollutant under review. For GHGs, this ranking may be based on energy efficiency and/or emission rate. The analysis conducted in step 3 should also document the energy impacts, secondary environmental impacts, and cost-effectiveness of each control option.

---

[15] *PSD and Title V Permitting Guidance for Greenhouse Gases*. March 2011, pages 32-33.

[16] NSR Workshop Manual (Draft), Prevention of Significant Deterioriation (PSD) and Nonattainment New Source Review (NNSR) Permitting, page B.17.

[17] Ibid, page B.18.

[18] Ibid, page B.18.

## 3.4 Step 4 – Evaluate Most Effective Controls and Document Results

After identifying and ranking available and technically feasible control technologies, the economic, environmental, and energy impacts are evaluated to select the best control option. If adverse collateral impacts do not disqualify the top-ranked option from consideration it is selected as the basis for the BACT limit. Alternatively, in the judgment of the permitting agency, if unreasonable adverse economic, environmental, or energy impacts are associated with the top control option, the next most stringent option is evaluated. This process continues until a control technology is identified.

The energy, environment, and economic impacts analysis under Step 4 of a GHG BACT assessment presents a unique challenge with respect to the evaluation of $CO_2$ and $CH_4$ emissions. The technologies that are most frequently used to control emissions of $CH_4$ in hydrocarbon-rich streams (e.g., flares, combustors, and thermal oxidizers) convert $CH_4$ emissions to $CO_2$ emissions. Consequently, the reduction of one GHG (i.e., $CH_4$) results in a proportional increase in emissions of another GHG (i.e., $CO_2$). However, since the GWP of $CH_4$ is 25 times higher than $CO_2$, the conversion of $CH_4$ emissions to $CO_2$ results in a net reduction of $CO_2e$ emissions.

Permitting authorities have historically considered the effects of multiple pollutants in the application of BACT as part of the PSD review process, including the environmental impacts of collateral emissions resulting from the implementation of emission control technologies. To clarify the permitting agency's expectations with respect to the BACT evaluation process, states have sometimes prioritized the reduction of one pollutant above another. For example, technologies historically used to control $NO_X$ emissions frequently caused increases in CO emissions. Accordingly, several states prioritized the reduction of $NO_X$ emissions above the reduction of CO emissions, approving low $NO_X$ control strategies as BACT that result in higher CO emissions relative to the uncontrolled emissions scenario.

## 3.5 Step 5 – Select BACT

In the final step, the BACT emission limit is determined for each emission unit under review based on evaluations from the previous step.

Although the first four steps of the top-down BACT process involve technical and economic evaluations of potential control options (i.e., defining the appropriate technology), the selection of BACT in the fifth step involves an evaluation of emission rates achievable with the selected control technology. BACT is an emission limit unless technological or economic limitations of the measurement methodology would make the imposition of an emissions standard infeasible, in which case a work practice or operating standard can be imposed.

Establishing an appropriate averaging period for the BACT limit is a key consideration under Step 5 of the BACT process. Localized GHG emissions are not known to cause adverse public health or environmental impacts. Rather, EPA has determined that GHG emissions are anticipated to contribute to long-term environmental consequences on a global scale. Accordingly, EPA's Climate Change Workgroup has characterized the category of regulated GHGs as a "global pollutant." Given the global nature of impacts from GHG emissions, NAAQS are not established for GHGs and a dispersion modeling analysis for GHG emissions is not a required element of a PSD permit application for GHGs. Since localized short-term health and environmental effects from GHG emissions are not recognized, Targa proposes only an annual average GHG BACT limit as noted in the multiple sections that contain GHG BACT selections.

# 4. BACT REQUIREMENT

For the Red Hills Gas Processing Plant, the BACT requirement applies to each emission unit from which there are emissions increases of pollutants subject to PSD review. The facility is subject to PSD permitting for $NO_x$, CO, VOC, $SO_2$, TSP, $PM_{10}$, $PM_{2.5}$, $H_2S$, and $CO_2e$. Therefore, the project is subject to BACT analysis for these pollutants.

Table 4-1 identifies the pollutants considered in the PSD BACT analysis for each emission unit.

**Table 4.1 Pollutants Evaluated in the BACT Analysis for Each Emission Unit**

| Equipment | $NO_x$ | CO | VOC | $SO_2$ | TSP/$PM_{10}$ /$PM_{2.5}$ | $H_2S$ | $CO_2e$ |
|---|---|---|---|---|---|---|---|
| Heaters ≤ 20 MMBtu/hr | X | X | X | X | X | -- | X |
| 20 MMBtu/hr < Heaters ≤ 50 MMBtu/hr | | | | | | | |
| 50 MMBtu/hr < Heaters ≤ 100 MMBtu/hr | | | | | | | |
| Glycol Dehydrators | -- | -- | X | -- | -- | X | -- |
| Amine Still Vents | -- | -- | X | -- | -- | X | X |
| Thermal Oxidizers | X | X | X | X | X | -- | X |
| Flares | X | X | X | X | -- | X | X |
| Fixed Roof Tanks | -- | -- | X | -- | -- | X | -- |
| Truck Loading and Unloading | -- | -- | X | -- | -- | X | -- |
| Fugitives | -- | -- | X | -- | -- | X | X |
| Haul Roads | -- | -- | -- | -- | X | -- | -- |

The following sections provide details on the BACT assessment methodology utilized in preparing the BACT analysis for the Red Hills facility. The minimum control efficiency to be considered in a BACT assessment must result in an emission rate less than or equal to any applicable NSPS or NESHAP emission rate for the source.

## 4.1 Identification of Potential Control Technologies

Potentially applicable emission control technologies were identified by researching the U.S. EPA control technology database RACT/BACT/LAER Clearinghouse (RBLC), The Texas Commission on Environmental Quality's (TCEQ) BACT Guidelines, the California Air Resources Board's (CARB) Interim BACT Clearinghouse, technical literature, control equipment vendor information, state permitting authority files, and by using process knowledge and engineering experience. The RBLC, a database made available to the public through the U.S. EPA's Office of Air Quality Planning and Standards (OAQPS) Technology Transfer Network (TTN), lists technologies and corresponding emission limits that regulatory agencies have approved in major source permit actions. These technologies are grouped into industry categories and can be referenced in determining what emissions levels were proposed for similar types of emissions units.
An RBLC database search was performed in September 2023, April 2024, and February 2025 to identify the emission control technologies and emission levels that were determined by permitting authorities as BACT

within the past ten years for sources comparable to those at Red Hills. The following categories were searched:

- Heaters & Reboilers < 100 MMBtu/hr (RBLC Code 13.310, process contains "heater" or "reboiler");
- Amine Units (process name contains "amine");
- Unpaved Haul Roads (RBLC Code 99.150);
- Fugitives (RBLC Codes 50.007 and 99.999 or process name contains "fugitive");
- Truck Loading and Unloading (process name contains "loading");
- Fixed Roof and Internal Floating Roof Storage Tanks (RBLC Codes 42.005 and 42.006);
- Flares (RBLC Codes 13.330, 19.390, or process name contains "flare");
- Thermal Oxidizers (RBLC Codes 19.20, 50.002, process name contains "thermal oxidizer");
- Glycol Dehydrators (RBLC Codes 50.002 or process contains "dehydrator"); and
- SSM Activities (RBLC Codes 42.006 and 99.999)

Appendix A includes the RBLC search results.

Additionally, the following guidance documents were utilized as resources in completing the GHG BACT evaluation for the project:

- TCEQ Current Tier I BACT for Combustion Sources
- TCEQ Current Tier I BACT for Chemical Sources

## 4.2 Proposed Primary BACT Limits Summary

Based on the BACT assessment, Targa proposes the BACT limits shown in Table 4-2. A detailed discussion of the determination for each emission source is provided in the following Sections of this report.

**Table 4.2 Proposed Primary BACT Limits Summary**

| Unit | Pollutant | Limit | Proposed BACT |
|---|---|---|---|
| Heaters <50 MMBtu/hr | $NO_X$ (<20 MMBtu/hr) | 0.1 lb/MMBtu | Good combustion practices, pipeline quality natural gas |
| | $NO_X$ (>20 & <50 MMBtu/hr) | 30 ppm @ 3% $O_2$ | Ultra-low $NO_X$ burners, good combustion practices, and/or pipeline-quality natural gas to meet 20.2.50.119 NMAC |
| | CO | 0.037 lb/MMBtu | Good combustion practices and pipeline-quality natural gas |
| | VOC | 0.0054 lb/MMBtu | Good combustion practices and pipeline-quality natural gas |
| | $SO_2$ | 2 gr/100 scf | Good combustion practices and pipeline quality natural gas/low sulfur fuel |
| | TSP/$PM_{10}$/$PM_{2.5}$ | 0.007 lb/MMBtu | Good combustion practices and pipeline-quality natural gas |
| | $CO_2e$ | 117 lb/MMBtu | Good Combustion, Operating & Maintenance Practices, Use of Low Carbon Fuel (Natural Gas) |
| Heaters >50 & <100 MMBtu/hr | $NO_x$ | 30 ppm @ 3% $O_2$ | Ultra-low $NO_x$ burners, good combustion practices, and/or pipeline-quality natural gas to meet 20.2.50.119 NMAC |
| | CO | 0.037 lb/MMBtu | Good combustion practices and pipeline-quality natural gas |
| | VOC | 0.0054 lb/MMBtu | Good combustion practices and pipeline-quality natural gas |
| | $SO_2$ | 2 gr/100 scf | Good combustion practices and pipeline quality natural gas/low sulfur fuel |

## Table 4.2 Proposed Primary BACT Limits Summary (cont)

| Unit | Pollutant | Limit | Proposed BACT |
|---|---|---|---|
| Heaters >50 & <100 MMBtu/hr | $TSP/PM_{10}/PM_{2.5}$ | 0.007 lb/MMBtu | Good combustion practices and pipeline-quality natural gas |
| | $CO_2e$ | 117 lb/MMBtu | Good Combustion, Operating & Maintenance Practices, Use of Low Carbon Fuel (Natural Gas) |
| Dehydrator | VOC<br>$H_2S$ | 98% DRE | Flash tank and still vent condenser, flash gas recovery, thermal incineration, manufacturer recommended operation and maintenance. |
| Amine | VOC<br>$H_2S$ | 99% DRE for thermal incineration<br>100% via AGI[19] | All Amine Units: Flash gas recovery, manufacturer-recommended operation and maintenance.<br>Secondary Amine Units: Thermal Incineration<br>Inlet Amine Units: Acid Gas Injection |
| | $CO_2e$ | 99% DRE methane for thermal incineration<br>100% via AGI[20] | All Amine Units: Proper design, manufacturer-recommended operation and maintenance.<br>Secondary Amine Units: Thermal Incineration<br>Inlet Amine Units: Acid Gas Injection |
| Thermal Oxidizers | $NO_x$ | 0.06 lb/MMBtu | Low $NO_x$ Burners |
| | CO | 0.06 lb/MMBtu | Good Combustion Practices & Manufacturer Recommended Operation/Maintenance |
| | VOC | 0.0054 lb/MMBtu | Manufacturer-recommended operation/maintenance and good combustion practices |
| | $TSP/PM_{10}/PM_{2.5}$ | 0.0075 lb/MMBtu | Manufacturer-recommended operation/maintenance and good combustion practices |
| | $SO_2$ | 2 gr/100 scf | Manufacturer-recommended operation/maintenance and good combustion practices<br>Pipeline Natural Gas<br>Process streams $H_2S$ BACT is covered under respective sources (dehy and amine vents) |
| | $CO_2e$ | 117 lb/MMBtu | Manufacturer-recommended operation/maintenance and good combustion practices |
| Flares | $NO_x$ | Emission rates as determined in calculations | Pipeline quality natural gas for pilot, good combustion, operating and maintenance practices with a 98% DRE, meet 60.18. |
| | CO | | |
| | VOC | | |
| | $SO_2$ | | |
| | $H_2S$ | | |
| | $CO_2e$ | | |
| Fixed Roof Tanks | VOC | 98% DRE | Submerged Fill, Closed Vent System to Combustion Device |
| | $H_2S$ | 98% DRE | Closed Vent System to Combustion Device |
| Loading and Unloading | VOC | 100%<br>98% control | Submerged fill and vapor balancing with return vapors to Combustion Device for loading of condensate and sour slop, and submerged fill for loading of contact water |
| | $H_2S$ | 98% DRE | Closed Vent System to Combustion Device for loading of sour slop |

[19] Excluding downtime and maintenance

[20] Excluding downtime and maintenance

| Unit | Pollutant | Limit | Proposed BACT |
|---|---|---|---|
| Fugitives | VOC | N/A | AVO and OGI monitoring under 20.2.50 NMAC. |
| | $H_2S$ | N/A | AVO and OGI monitoring under 20.2.50 NMAC. |
| Haul Roads | TSP/$PM_{10}$/$PM_{2.5}$ | 78% Reduction | Limit Speed, Use of Aggregate Base Course, 78% Reduction |
| SSM | $NO_x$ | Emission rates as determined in calculations | Good combustion, operating, and maintenance practices. |
| | CO | | |
| | $SO_2$ | | |
| | TSP/$PM_{10}$/$PM_{2.5}$ | | |
| | VOC | 100% capture efficiency and 98% DRE[21] | Good operating and maintenance practices, vent SSM emissions to control device |
| | $H_2S$ | | |

## 4.3 Overall Project Efficiency Considerations

While the five-step top-down BACT analysis is the EPA's preferred methodology with respect to the selection of control technologies, EPA has also indicated that an overarching evaluation of energy efficiency should take place, as increases in energy efficiency will inherently reduce the total amount of GHG emissions produced by the source. As such, overall energy efficiency was a basic criterion in the selection of technologies and processing alternatives for the Red Hills Gas Processing Plant.

The Red Hills Gas Processing Plant is designed and constructed using new or updated energy-efficient equipment. The plant is designed with heat and process integration in mind for increased energy efficiency. Where feasible, the facility utilizes available process streams to transfer heat which reduces combustion heating requirements in the process. Equipment (vessels), piping, and components in hot service are designed to prevent heat loss to the atmosphere from equipment containing hot streams as appropriate.

The facility recycles the flash gas from the amine and dehydrator units, which are sent back to the fuel gas system or to the process instead of sending these overheads to a control device, except during cold-weather events where this is not feasible. The recycling of this material reduces the amount of natural gas required to fuel the facility's combustion sources and avoids the formation of additional GHG from combusting this material in a control device.

Process control instrumentation and pneumatic components are operated using compressed air rather than fuel gas or off-gas; therefore, no GHG emissions will be emitted to the atmosphere from these components. Targa operating and maintenance policies maintains all equipment according to manufacturer specifications or industry standards in order to keep all equipment operating efficiently.

[21] Excluding low-emitting activities, activities not routable to a control device, and fugitive SSM emissions.

# 5. BACT EVALUATION FOR HEATERS & REBOILERS

The BACT evaluation for combustion emissions from the heaters for $NO_X$, CO, VOC, $SO_2$, TSP/$PM_{10}$/$PM_{2.5}$, and GHG (as $CO_2e$) are provided in Sections 5.1 through 5.6. Appendix A provides a summary of RBLC and permit search results. The following provides a detailed list of the heaters and reboilers with rated capacity that are covered in this BACT evaluation.

**Table 5.1 List of Heaters and Reboilers with Rated Capacities**

| Equipment Type | Unit ID | Equipment Description | Rated Capacity | Units |
|---|---|---|---|---|
| Hot Oil Heaters | RH1-H-23-704 | Hot Oil Heater | 42.5 | MMBTU/HR |
| | RA2-H-20001 | Hot Oil Heater | 89.24 | MMBTU/HR |
| Stabilizer Hot Oil Heaters | RH1-H-1101 | Stabilizer Hot Oil Heater | 22.3 | MMBTU/HR |
| | RH6-H-60001 | Stabilizer Hot Oil Heater | 89.94 | MMBTU/HR |
| Regen Gas Heaters | RH2-H-741 | Regen Gas Heater | 9.6 | MMBTU/HR |
| | RH3-H-741 | Regen Gas Heater | 9.2 | MMBTU/HR |
| | RH4-H-741 | Regen Gas Heater | 9.2 | MMBTU/HR |
| | RH5-H-50741 | Regen Gas Heater | 9.08 | MMBTU/HR |
| | RH6-H-60741 | Regen Gas Heater | 9.1 | MMBTU/HR |
| Cryo Hot Oil Heaters | RH2-H-781 | Cryo Hot Oil Heater | 13.2 | MMBTU/HR |
| | RH3-H-781 | Cryo Hot Oil Heater | 19.8 | MMBTU/HR |
| | RH4-H-781 | Cryo Hot Oil Heater | 22.3 | MMBTU/HR |
| | RH5-H-50781 | Cryo Hot Oil Heater | 33.99 | MMBTU/HR |
| | RH6-H-60781 | Cryo Hot Oil Heater | 33.85 | MMBTU/HR |
| Amine Hot Oil Heaters | RH2-H-0901 | Amine Hot Oil Heater | 75 | MMBTU/HR |
| | RH2-H-1001 | Amine Hot Oil Heater | 75 | MMBTU/HR |
| | RHA-H-4901 | Amine Hot Oil Heater | 33.9 | MMBTU/HR |
| | RH4-H-3901 | Amine Hot Oil Heater | 76.73 | MMBTU/HR |
| | RH4-H-4001 | Amine Hot Oil Heater | 76.73 | MMBTU/HR |
| Amine/TEG Hot Oil Heaters | RH5-H-50902 | Amine/TEG Hot Oil Heater | 89.94 | MMBTU/HR |
| | RH5-H-50001 | Amine/TEG Hot Oil Heater | 89.94 | MMBTU/HR |
| TEG Reboilers | RH2-H-2301 | TEG Reboiler | 4.0 | MMBTU/HR |
| | RH3-H-6301 | TEG Reboiler | 4.0 | MMBTU/HR |
| | RH4-H-5301 | TEG Reboiler | 4.0 | MMBTU/HR |
| Liquids In-Line Heaters | RH4-H-41100 | RH4, Liquids In-Line Heater | 13.16 | MMBTU/HR |

## 5.1 $NO_X$ BACT

### 5.1.1 Background on Pollutant Formation

In combustion processes, $NO_X$ is formed by two fundamentally different mechanisms known as "fuel $NO_X$" and "thermal $NO_X$". $NO_X$ formation from natural gas combustion is primarily thermal $NO_X$.

"Fuel $NO_X$" forms when fuels containing nitrogen are burned. When these fuels are burned, the nitrogen bonds break and some of the resulting free nitrogen oxidizes to form $NO_X$. With excess air, the degree of fuel $NO_X$ formation is primarily a function of the nitrogen content of the fuel. Therefore, since natural gas contains little or no fuel-bound nitrogen, fuel $NO_X$ is an insignificant contributor to $NO_X$ emissions from natural gas-fired heaters.[22]

Thermal $NO_X$ is formed by a series of chemical reactions in which oxygen and nitrogen present in the combustion air dissociate and react to form $NO_X$. Prompt $NO_X$, a form of thermal $NO_X$, is formed in the proximity of the flame front as intermediate combustion products (e.g., HCN, N, and NH) are oxidized to form $NO_X$. Prompt $NO_X$ is usually negligible when compared to thermal $NO_X$ but can become significant with ultra-low-$NO_X$-burners.[23]

### 5.1.2 Identify All Available Control Technologies

Using the RBLC search and permit review results, potentially applicable $NO_X$ control technologies for heaters and reboilers rated <100 MMBtu/hr were identified.

The heaters and reboilers have a heat release duty ranging from 3.9 MMBtu/hr up to 89.94 MMBtu/hr and RBLC searches were performed for these sources rated <100 MMBtu/hr. Differences were found for heaters based on their respective heat release duty. Therefore, the heater and reboiler units were categorized into three groups based on heat release duty ranges of less than 20 MMBtu/hr, greater than 20 MMBtu/hr and less than 50 MMBtu/hr, and greater than 50 MMBtu/hr but less than 100 MMBtu/hr.

Tables 5.1-1, 5.1-2 and 5.1-3 outline the top-down BACT analysis for $NO_X$ emissions from the heaters and reboilers.

### 5.1.3 Selection of BACT for $NO_X$

Based on the review of the RBLC search and other permit review results, the selected BACT is included in Tables 5.1-1, 5.1-2 and 5.1-3.

Targa has determined that $NO_X$ BACT for heaters/reboilers <20 MMBtu/hr is utilizing good combustion practices and pipeline-quality natural gas, which is typically able to achieve an emissions rate of 0.1 lb/MMBtu. Installation of ultra-low or low-$NO_X$ burners is not economically reasonable as shown in Table 5-4.

[22] AP-42, Fifth Edition, Chapter 1.4 Natural Gas Combustion, Section 1.4.3. https://www.epa.gov/sites/default/files/2020-09/documents/1.4_natural_gas_combustion.pdf

[23] AP-42, Fifth Edition, Chapter 1.4 Natural Gas Combustion, Section 1.4.3. https://www.epa.gov/sites/default/files/2020-09/documents/1.4_natural_gas_combustion.pdf

For heaters/reboilers 20 MMBtu/hr to 50 MMBtu/hr, Targa has determined that $NO_X$ BACT consists of the use of ultra-low or low $NO_X$ burners, good combustion practices, and pipeline-quality natural gas. Regarding the emissions rates, the effectiveness of low $NO_X$ burners can vary based on the physical layout of the combustion unit, among other factors. Flame lengths from low $NO_X$ burners are longer because air and fuel stage mechanisms introduce a delay in fuel/air mixing as compared to conventional burners. Flame diameters are also greater, and burners must meet any space constraints for the heater/reboiler(s) under consideration. $NO_X$ emission reductions can vary for low $NO_X$ burners and can be from 40 to 85% relative to uncontrolled emission levels.[24]

Per the established requirements in 20.2.50.119 NMAC, natural gas-fired heaters with a rated capacity equal to or greater than 20 MMBtu/hr must meet the 30 ppm $NO_x$ emission limit.[25] Therefore, this limit is proposed as BACT.

For heaters/reboilers greater than 50 MMBtu/hr, an additional control technology was evaluated for $NO_X$ BACT. Selective Catalytic Reduction (SCR) is included in the RBLC for the control of $NO_X$ emissions. The overall control effectiveness ranges from 70% to 90%, higher than that of low or ultra-low $NO_X$ burners, but capital costs are higher than that of other $NO_X$ control technologies primarily due to catalyst and installation costs.

To evaluate the cost for the Targa heaters and reboilers, the study-level total annual cost of SCR controls was calculated following the EPA OAQPS Air Pollution Control Cost Manual (APCCM), which provides guidelines to estimate costs based on the capacity of the heater among other factors. Targa believes the estimated costs derived from the APCCM are conservatively low and that actual bids for the cost of installing and operating SCR controls would be higher.

To estimate the total capital investment (TCI) of SCR controls the nearest benchmark was used, and the average capital cost was multiplied by the maximum firing rate. The TCI was scaled up by the Consumer Price Index to translate costs to 2024 dollars. Relevant direct annual costs for SCR include maintenance costs, electricity costs, reagent costs, and catalyst replacement costs. These were calculated using the relevant equations of APCCM Chapter 2 as described in more detail in the notes of the calculations in Table 5-5. The $NO_X$ emission reduction was based on the difference between the existing emissions rate and a rate of 0.015 lb/MMBtu for SCR $NO_X$ control. SCR cost-effectiveness for the heaters ranges from $20,000 to $255,000 per ton of $NO_X$ removed, which is not economically reasonable.

Additionally, the operation of SCR would result in ammonia slip emissions, typically at the 2-10 ppm range, from the 10 heaters over 50 MMBtu/hr. Ammonia is a precursor that contributes to the formation of fine particulate ($PM_{2.5}$) that can cause haze and reduced visibility. Red Hills Gas Plant is near two designated Class I areas which are Carlsbad Caverns National Park (80 km away) and Guadalupe Mountains National Park (116 km away).

Therefore, due to the economically unreasonable costs and the secondary adverse environmental impact near Class I areas, SCR is eliminated as a BACT option. Targa proposes ultra-low $NO_X$ burners, good combustion practices, or pipeline-quality natural gas to achieve an emission rate of 30 ppm $NO_x$ for heaters and reboilers above 50 MMBtu/hr and below 100 MMBtu/hr.

[24] AP-42, Fifth Edition, Chapter 1.4 Natural Gas Combustion, Section 1.4.4. https://www.epa.gov/sites/default/files/2020-09/documents/1.4_natural_gas_combustion.pdf

[25] 20.2.50.119 NMAC – Emission standards for natural gas-fired heaters with a rated heat input equal to or greater than 20 MMBtu/hr.

**Table 5.1-1 BACT Analysis for Natural Gas-Fired Heaters (<20 MMBtu/hr) – $NO_x$**

https://www.epa.gov/sites/default/files/2017-12/documents/scrcostmanualchapter7thedition_2016revisions2017.pdf

**Notes:**

1. Total Capital Investment (TCI) based on Maximum capacity and EPA OAQPS Air Pollution Control Cost Manual. ("APCCM") benchmark values, scaled by Consumer Price Index values Federal Reserve Bank of Minneapolis for 2024 and 1999. (314.4/166.6)
2. Retrofit factor of 40% applied to calculated TCI values for existing equipment.
3. Annual maintenance costs figured as 0.5% of Total Capital Investment.
4. Electricity costs assuming 5.57 ¢/kW-h
5. Reagent costs conservatively assuming use of anhydrous ammonia obtained at $800/t (higher costs apply for aqueous ammonia). Also use SRF=1.05.
6. Catalyst replacement costs assuming $400/ft$^3$ catalyst cost and η=90%.
7. Cost effectiveness is Total Annual Costs divided by Tons per year removed with SCR control, rounded down to the nearest thousands of dollars.

## 5.2 CO BACT

### 5.2.1 Background on Pollutant Formation

CO from combustion sources is a by-product of incomplete combustion. Conditions leading to incomplete combustion include the following: insufficient oxygen availability, poor fuel/air mixing, reduced combustion temperature, reduced combustion gas residence time, and load reduction.

### 5.2.2 Identify All Available Control Technologies

Using the RBLC search potentially applicable CO control technologies for heaters were identified. Additionally, Table 5.2-1 outlines the top-down BACT analysis for CO emissions from the heaters.

### 5.2.3 Selection of BACT for CO

Based on the review of the RBLC search and other permit review results, Targa has determined that CO BACT is good combustion practices and use of pipeline-quality natural gas. The proposed emissions rate for CO is 0.037 lb/MMBtu.

**Table 5.2-1 BACT Analysis for Natural Gas-Fired Heaters (<100 MMBtu/hr) – CO**

## 5.3 VOC BACT

### 5.3.1 Background on Pollutant Formation

The formation of VOC is the result of incomplete combustion from natural gas. VOC results when there is insufficient residence time at high temperatures to complete the final step in hydrocarbon oxidation.

### 5.3.2 Identify All Available Control Technologies

Using the RBLC search potentially applicable VOC control technologies for heaters were identified.

Table 5.3-1 outlines the top-down BACT analysis for VOC emissions from the heaters.

### 5.3.3 Selection of BACT for VOC

Based on the review of the RBLC search and other permit review results, Targa has determined that BACT is good combustion practices and use of pipeline quality natural gas. The proposed emission rate of VOC is 0.0054 lb/MMBtu.

**Table 5.3-1 BACT Analysis for Natural Gas-Fired Heaters (<100 MMBtu/hr) – VOC**

## 5.4 $SO_2$ BACT

### 5.4.1 Background on Pollutant Formation

$SO_2$ emissions result from the oxidation of fuel-bound sulfur. Emissions of $SO_2$ from heaters is dependent on the amount of sulfur-containing compounds in the fuel.

### 5.4.2 Identify All Available Control Technologies

Using the RBLC search potentially applicable $SO_2$ control technologies for heaters were identified.

Table 5.4-1 outlines the top-down BACT analysis for $SO_2$ emissions from the heaters.

### 5.4.3 Selection of BACT for $SO_2$

Based on the review of the RBLC search, Targa has determined that $SO_2$ BACT is the use of pipeline-quality natural gas as fuel with a proposed limit of 2 grains sulfur/100 scf in the fuel gas.

**Table 5.4-1 BACT Analysis for Natural Gas-Fired Heaters (<100 MMBtu/hr) – $SO_2$**

## 5.5 TSP/$PM_{10}$/$PM_{2.5}$ BACT

### 5.5.1 Background on Pollutant Formation

Particulate matter emissions from natural gas combustion are typically low and consists of both filterable and condensable fractions. Filterable PM emissions from combustion are formed by ash and sulfur in the fuel. Combustion of natural gas generates low filterable PM emissions in comparison to other fuels due to its low ash and sulfur content. Particulate matter emissions from natural gas combustion can result from higher molecular weight hydrocarbons that are not fully combusted due to poor air/fuel mixing or maintenance issues.

### 5.5.2 Identify All Available Control Technologies

Using the RBLC search potentially applicable TSP/$PM_{10}$/$PM_{2.5}$ control technologies for heaters were identified.

Table 5.5-1 outlines the top-down BACT analysis for filterable and condensable TSP/$PM_{10}$/$PM_{2.5}$ emissions from the heaters.

### 5.5.3 Selection of BACT for TSP/$PM_{10}$/$PM_{2.5}$

Based on the review of the RBLC search and other literature, Targa has determined that TSP/$PM_{10}$/$PM_{2.5}$ BACT is good combustion practices and use of pipeline quality natural gas, with a proposed emission rate of 0.007 lb/MMBtu.

**Table 5.5-1 BACT Analysis for Natural Gas-Fired Heaters (<100 MMBtu/hr) – TSP/$PM_{10}$/$PM_{2.5}$**

| Table 5-5.1 BACT Analysis for Natural Gas-Fired Heaters (<100 MMBtu/hr) - TSP, $PM_{10}$, and $PM_{2.5}$ | | | |

| *Units Subject to Selected BACT* | | | **RH1-H-23-704, RA2-H-20001, RH1-H-1101, RH6-H-60001, RH2-H-741, RH3-H-741, RH4-H-741, RH5-H-50741, RH6-H-60741, RH2-H-781, RH3-H-781, RH4-H-781, RH5-H-50781, RH6-H-60781, RH2-H-0901, RH2-H-1001, RHA-H-4901, RH4-H-3901, RH4-H-4001, RH5-H-50902,RH5-H-50001, RH2-H-2301, RH3-H-6301, RH4-H-5301, RH4-H-41100** |

Notes:

1. Other filterable particulate matter control technologies include baghouse/fabric filer, electrostatic precipitator (ESP), and cyclone; however, these technologies are technically infeasible for use on natural gas-fired heaters of these sizes, nor are included in the RBLC for control of PM for heaters < 100 MMBtu/hr.
2. Other condensable particulate matter control technologies possibly include catalytic oxidation and thermal incineration; however, these technologies are technically infeasible, are not proven to reduce condensable particulate matter, are not implemented on any heaters of this size, nor are in the RBLC for control of PM for heaters <100 MMBtu/hr.

## 5.6 $CO_2e$ BACT

### 5.6.1 Background on Pollutant Formation

GHG emissions from the heaters include $CO_2$, $CH_4$, and $N_2O$ which result from the combustion of natural gas. The majority of carbon combusted in the fuel stream is converted to $CO_2$ since each carbon atom results in nearly one molecule of $CO_2$ emissions. $CH_4$ and $N_2O$ form as the result of incomplete combustion and are emitted in much lower quantities. Even when scaling $CH_4$ and $N_2O$ by their relative global warming potentials (GWPs), these constituents combined contribute approximately one percent of the total GHG emissions (on $CO_2e$ basis) resulting from the combustion of natural gas. Therefore, BACT assessment for the heaters is focused on $CO_2$. In addition, using $CO_2$ as a surrogate for a $CO_2e$ BACT analysis is consistent with federal regulations.[26]

### 5.6.2 Identify All Available Control Technologies

Using the RBLC search potentially applicable $CO_2e$ control technologies for heaters were identified.

Low-carbon intensity fuel selection is the primary control option that can be considered a lower-emitting process. Table C-1 of 40 CFR Part 98 shows $CO_2$ emissions per unit heat input (MMBtu) for a wide variety of industrial fuel types. Only biogas (captured methane) and coke oven gas result in lower $CO_2$ emissions per unit heat input than natural gas, but these fuel types are not readily available for this project.

Table 5.6-1 outlines the top-down BACT analysis for $CO_2e$ emissions from the heaters.

### 5.6.3 Selection of BACT for $CO_2e$

Based on the review of the RBLC search and other literature, Targa has determined that $CO_2e$ BACT is good combustion practices and use of pipeline quality natural gas.

[26] 40 CFR § 52.21(b)(49)(i)

# 6. BACT EVALUATION FOR GLYCOL DEHYDRATORS

The BACT evaluation for the glycol dehydrators (Unit IDs RH1-TEG, RH2-TEG, RH3-TEG, RH4-TEG, RH5-TEG, RH6-TEG) for VOC and $H_2S$ are provided in this Section. Appendix A provides a summary of RBLC and permit search results.

**Table 6.1 List of Glycol Dehydrators with Rated Capacities**

| Equipment Type | Unit ID | Equipment Description | Rated Capacity | Units |
|---|---|---|---|---|
| Glycol Dehydrators | RH1-TEG | RH1, TEG Regeneration System | 75 | MMSCF/D |
| | RH2-TEG | RH2, TEG Regeneration System | 300 | MMSCF/D |
| | RH3-TEG | RH3, TEG Regeneration System | 300 | MMSCF/D |
| | RH4-TEG | RH4, TEG Regeneration System | 300 | MMSCF/D |
| | RH5-TEG | RH5, TEG Regeneration System | 300 | MMSCF/D |
| | RH6-TEG | RH6, TEG Regeneration System | 300 | MMSCF/D |

## 6.1 VOC and $H_2S$ BACT

### 6.1.1 Background on Pollutant Formation

VOC emissions are a result of water and volatiles being removed from the wet gas stream during the glycol recovery process. Triethylene glycol (TEG) is used to absorb water from the wet gas with VOC HAP, and $H_2S$ also being absorbed. The TEG is regenerated by heating in a reboiler where the absorbed water, VOC, and HAP create a vapor stream (i.e., regenerator vent or still column vent).

### 6.1.2 Identify All Available Control Technologies

Using the RBLC search potentially applicable VOC and $H_2S$ control technologies were identified based on the principles of control technology and engineering experience for TEG dehydration units.

Table 6.1-1 outlines the top-down BACT analysis for VOC and $H_2S$ emissions from glycol dehydration units.

### 6.1.3 Selection of BACT for VOC and $H_2S$

Based on the review of the RBLC search and other permit review results, Targa has determined that VOC and $H_2S$ BACT is flash gas recovery with the gas being recycled back to the process, and utilizing a condenser and a vapor combustion device with 98% efficiency for the dehydrator still vent.

**Table 6.1-2 BACT Analysis for Glycol Dehydrators – VOC & $H_2S$**

# 7. BACT EVALUATION FOR AMINE STILL VENTS

The BACT evaluation for control of emissions from the amine still vents (Units RH1-AMINE, RH2-AMINE, RHA-AMINE, RH4-AMINE, RH5-AMINE, and RA2-AMINE) for VOC and $H_2S$ are provided in Sections 7.1, for $SO_2$ in Section 7.2, and for $CO_2e$ in Section 7.3.

**Table 7.1.1 List of Amine Still Vents with Rated Capacities**

| Equipment Type | Unit ID | Equipment Description | Rated Capacity | Units |
|---|---|---|---|---|
| Amine Still Vents | RH1-AMINE | RH1, Amine Regeneration System | 75 | MMSCF/D |
| | RH2-AMINE | RH2, Amine Regeneration System | 290 | MMSCF/D |
| | RHA-AMINE | RHA, Amine Regeneration System | 20-75 | MMSCF/D |
| | RH4-AMINE | RH4, Amine Regeneration System | 290 | MMSCF/D |
| | RH5-AMINE | RH5, Amine Regeneration System | 290 | MMSCF/D |
| | RA2-AMINE | RA2, Amine Regeneration System | 60-260 | MMSCF/D |

## 7.1 VOC and $H_2S$ BACT for Amine Units

### 7.1.1 Background on Pollutant Formation

VOC and $H_2S$ emissions are a result of removal of acidic contaminants from natural gas. The amine units are used to remove $CO_2$ and $H_2S$ in order to produce pipeline quality natural gas for transportation to end use customers. Amine absorbs the $CO_2$ and $H_2S$ from the gas, and the rich amine is regenerated in an amine regenerator. The regenerator overhead vapor stream contains $CO_2$ and $H_2S$, and some residual VOC. If the stream is combusted, the $H_2S$ is converted to $SO_2$ emissions.

### 7.1.2 Identify All Available Control Technologies

Using the RBLC search potentially applicable VOC and $H_2S$ control technologies were identified based on the principles of control technology and engineering experience for amine still vents. Table 7.1-2 outlines the top-down BACT analysis for VOC and $H_2S$ from amine still vents. One control technology is to use a high temperature control device for control of the acid gas streams from the amine units, such as a thermal oxidizer. $H_2S$ removed from the sour gas is converted to $SO_2$ when burned. Alternatives include a sulfur recovery unit with or without a tailgas treating unit (TGTU) and acid gas injection. A sulfur recovery unit converts sulfur from $H_2S$ in the regen gas into elemental sulfur which is recovered in a sulfur recovery unit. Only residual sulfur is converted to $SO_2$ using thermal incineration such as a thermal oxidizer. In acid gas injection, the gas stream is captured and sequestered in a Class II or VI injection well.

### 7.1.3 Selection of BACT

The sulfur removal capacity of the amine units vary. The inlet amine units remove a large percentage of the $H_2S$ in the inlet sour gas to the plant, while the secondary units remove residual $H_2S$ in the sweetened sour gas as well as any $H_2S$ from sweet gas entering the plant. Therefore, the selection of BACT will vary between the amine units. The sulfur removal capacities of the amine units are as follows.

**Table 7.1.2 Sulfur Removal Capacities of Amine Still Vents**

| Amine Unit | Description in Process | Sulfur Removal Capacity (long tons / day) |
|---|---|---|
| RHA-AMINE | Inlet Amine Unit | 7.71 |
| RA2-AMINE | Inlet Amine Unit | 50.72 |
| RH1-AMINE | Secondary Amine Unit | 0.011 |
| RH2-AMINE | Secondary Amine Unit | 0.044 |
| RH4-AMINE | Secondary Amine Unit | 0.028 |
| RH5-AMINE | Secondary Amine Unit | 0.044 |

Based on the review of the RBLC search and other permit review results, Targa has determined that VOC and $H_2S$ BACT is flash tank with off gas recovery, proper design and operation, and thermal incineration at 99% DRE for the amine units treating sweet gas and acid gas injection for amine units treating sour gas. The selection of BACT is outlined in Table 7.1-1.

**Table 7.1-2 BACT Analysis for Amine Still Vents – VOC & $H_2S$**

Notes:
1. Excluding downtime and maintenance

## 7.2 $CO_2e$ BACT

### 7.2.1 Background on Pollutant Formation

The amine units are designed to remove $CO_2$ and $H_2S$ to meet pipeline specifications for transportation of natural gas. Since the primary purpose of the amine units is to remove $CO_2$ and $H_2S$ from the inlet gas stream, the generation of $CO_2$ is inherent to the process, and any reduction of the $CO_2$ emissions by process changes would reduce process efficiency. This could result in off-specification product, which is required to be flared or higher $CO_2$ concentrations in the end product which would likely be combusted by the end user.

### 7.2.2 Identify All Available Control Technologies

Table 7.2.-1 outlines the top-down BACT analysis for $CO_2e$ from amine still vents. Using the RBLC search, and a review of the Acid Gas Injection well authorization to inject permits within a 25-mile radius, potentially applicable $CO_2e$ controls were identified based on the principles of control technology and engineering experience for amine units. This review identified Acid Gas Injection (AGI) wells, a type of Class II Underground Injection Control (UIC) well, as well as thermal incineration with proper design and operational practices as feasible control technologies for controlling $CO_2e$ emissions. Red Hills currently operates two Class II AGI injection wells: the Red Hills AGI #001 and the Red Hills AGI #003. It is important to note that the primary intent of Class II AGI wells is the disposal of oil and gas waste, in this case, the safe disposal of $H_2S$ from the atmosphere in a manner that protects the health of the employees and communities. Both Targa and the NMOCD will always prioritize the capacity of the AGI wells for $H_2S$ disposal versus $CO_2$ disposal. This allows the processing plant to remain viable to treat sour gas in the area and do so safely.

### 7.2.3 Selection of BACT

Based on the review of the RBLC search and permit review results, Targa has determined that $CO_2e$ BACT will require a multi-faceted approach. Targa will utilize thermal incineration to control methane emissions as follows.

**Table 7.2 Amine Still Vent Thermal Incineration Methane Destruction Efficiency**

| Amine Unit | Description in Process | Thermal Incineration Unit | Methane DRE |
|---|---|---|---|
| RHA-AMINE | Inlet Amine Unit | RHA-FL-5100 | 98% |
| RA2-AMINE | Inlet Amine Unit | RA2-FL-5100 | 98% |
| RH1-AMINE | Secondary Amine Unit | RH2-TO-5500 | 99% |
| RH2-AMINE | Secondary Amine Unit | RH2-TO-5500 | 99% |
| RH4-AMINE | Secondary Amine Unit | RH4-TO-45500 | 99% |
| RH5-AMINE | Secondary Amine Unit | RH5-TO-55500 | 99% |

Due to the variability associated with the life cycle of an injection well, Targa is at this time unable to definitively quantify the remaining capacity of the existing AGI wells. While assumptions can be made based on the original design of the well, factors such as injectate interaction with the reservoir, injection formation pressure increases, and third-party activity surrounding the injection reservoir may significantly impact the facility's ability to realize the estimated, or any, additional injection capacity. All these factors are out of Targa's control. The primary goal of the existing AGI wells is to inject acid gas that has a significant $H_2S$ concentration; losing the ability to do so or being required to reserve capacity for $CO_2$ injection from the

secondary amine units would present significant ambient air impacts, possible violations of the NAAQs/NMAAQs, and extremely unsafe conditions for the operators working at the facility. It is due to this that it was determined that underground injection is not a feasible or quantifiable control technology for the secondary amine units for the purposes of BACT. Targa will continue to utilize the two existing AGI wells (Red hills AGI #1 and Red Hills AGI#3) located onsite to control the $H_2S$ and $CO_2$ emissions from Amine Units RHA-AMINE, and RA2-AMINE. In addition to controlling emissions from the inlet amine units, Targa also plans to incorporate an alternative operating scenario (AOS) to potentially route amine overheads (RH1-AMINE, RH2-AMINE, RH4-AMINE, and RH5-AMINE) to the two existing or any future AGI Class II wells. This is an operational decision for which the facility will not be taking control credit or quantifying a methane DRE. The selection of BACT is outlined in Table 7.2-1.

Notes:

1. Excluding downtime and maintenance
2. CO2 injected from remaining Amine Units will be dependent on realized well capacity and has the potential to be limited in order to comply with existing surface injection pressure restrictions.

# 8. BACT EVALUATION FOR FLARES

The BACT evaluation for combustion emissions from the flares (Units RH1-FL-29-1003, RH2-FL-5100, RH3-FL-5100, RH4-FL-45100, RH5-FL-55100, RHA-FL-5100, RA2-FL-25100, RHA-FL-5850, RA2-FL-25850, and RH1-FL-2850) for $NO_X$, CO, VOC, $SO_2$, and GHG (as $CO_2e$) are provided in Section 8.1. Appendix A provides a summary of RBLC and permit search results.

**Table 8.1 List of Flares with Rated Capacities**

| Equipment Type | Unit ID | Equipment Description |
|---|---|---|
| Flares | RH1-FL-29-1003 | RH1, Flare |

## 8.1 $NO_x$, CO, VOC, $SO_2$, $H_2S$ and $CO_2e$ BACT

### 8.1.1 Background on Pollutant Formation

Emissions result from the destruction of gases/vapors from the Red Hills processes. Process vapors, including VOC and $H_2S$, are combusted to reduce emissions to the atmosphere; however, products of combustion including $NO_x$, CO, and $SO_2$ are formed in the process. Smokeless flares are not expected to generate measurable amounts of particulate matter (PM) emissions, so PM has not been calculated for the Red Hills flares. Flares are an example of a control device in which the control of certain pollutants causes the formation of collateral GHG emissions. Specifically, the control of methane in the process gas at the flare results in the creation of additional $CO_2$ emissions. However, given the relative GWPs of $CO_2$ and methane and the destruction of VOC, it is appropriate to apply combustion controls to methane emissions even though it will form additional $CO_2$ emissions.

### 8.1.2 Identify All Available Control Technologies

Using the RBLC search and permit review results, as well as a review of technical literature, potentially applicable control technologies were identified based on the principles of control technology and engineering experience for the Red Hills flares.

Table 8.1-1 outlines the top-down BACT analysis for $NO_X$, CO, VOC, $SO_2$, $H_2S$, and $CO_2e$ emissions from flares.

### 8.1.3 Selection of BACT

The flares will meet the minimum requirements set out in 40 CFR §60.18 (General control device and work practice requirements) with the following control efficiency requirements:

- Destruction efficiency of 98% for VOCs, methane, and $H_2S$;
- No flaring of halogenated compounds allowed.

Based on the review of the RBLC search and other permit review results, Targa has determined that the BACT for flares is good flare design, good combustion, operating and maintenance practices, and use of pipeline-quality natural gas as pilot fuel.

**Table 8.1-2 BACT Analysis for Flares – $NO_x$, CO, VOC, $SO_2$, and $CO_2e$**

**Table 8.1-1 BACT Analysis for Flares - $NO_x$, CO, VOC, $SO_2$, H2S, CO2e**

# 9. BACT EVALUATION FOR THERMAL OXIDIZERS

This section contains the BACT evaluation for combustion emissions from the thermal oxidizers (Units RH2-TO-5500, RH4-TO-45500, and RH5-TO-55500) for $NO_X$, CO, VOC, $SO_2$, TSP/$PM_{10}$/$PM_{2.5}$, and GHG (as $CO_2e$). Appendix A provides a summary of RBLC results.

**Table 9.1 List of Thermal Oxidizers with Rated Capacities**

| Equipment Type | Unit ID | Equipment Description |
|---|---|---|
| Thermal Oxidizers | RH2-TO-5500 | RH2, Thermal Oxidizer |
| | RH4-TO-45500 | RH4, Thermal Oxidizer |
| | RH5-TO-55500 | RH5, Thermal Oxidizer |

## 9.1 $NO_x$ BACT

### 9.1.1 Background on Pollutant Formation

Vapors from the glycol dehydrators and amine units will be routed to thermal oxidizers for control, and some SSM control. Product of combustion emissions, including $NO_x$, will be generated by the combustion of natural gas as well as the combustion of the vapors sent to the oxidizers. Thermal $NO_x$ is the dominant mechanism. Please refer to Section 5.1.1 for a detailed description of $NO_x$ formation.

### 9.1.2 Identify All Available Control Technologies

Using the RBLC search and based on the principles of control technology and engineering experience for the Red Hills thermal oxidizers, potentially applicable control technologies were identified.

### 9.1.3 Selection of BACT

Based on the review of the RBLC search, the selected BACT is included in Table 9.1-1. SCR controls are eliminated as a BACT option due to concerns with feasibility, economically unreasonable costs, and the secondary adverse environmental impact near Class I areas. Targa has determined that $NO_X$ BACT for thermal oxidizers utilize low-$NO_X$ burners; implementing good combustion, operating, and maintenance practices; and use of natural gas as fuel with a limit for $NO_x$ of 0.06 lb/MMBtu.

**Table 9.1-1 BACT Analysis for Thermal Oxidizers – $NO_x$**

**Table 9.1-1 BACT Analysis for Thermal Oxidizer – $NO_x$**

| | | | | | |
|---|---|---|---|---|---|
| *Step 1.* | **IDENTIFY AIR POLLUTION CONTROL TECHNOLOGIES** | **Control Technology** | **Low $NO_X$ Burners [1,2,3]** | **Selective Catalytic Reduction[1,4]** | **Good Combustion Practices** |
| | | **Control Technology Description** | Reduce $NO_X$ by accomplishing the combustion process in stages. Staging delays the combustion process resulting in a cooler flame which suppresses $NO_X$ formation. | A nitrogen-based reagent (e.g., ammonia, urea) is injected into the exhaust stream downstream of the combustion unit. The reagent reacts selectively with $NO_X$ to produce molecular $N_2$ and water in a reactor vessel containing a metallic or ceramic catalyst. | Operate and maintain the equipment in accordance with good air pollution control practices and with good combustion practices. |
| | | **Typical Operating Temperature** | 1100 - 1400 °F | 480 - 800°F<br>(variations of ± 200°F) | N/A |
| | | **Typical Waste Stream Inlet Flow Rate** | N/A | N/A | N/A |
| | | **Typical Waste Stream Inlet Pollutant Concentration** | N/A | Efficiency improves with increased concentrations up to 150 ppm | N/A |
| | | **Other Considerations** | N/A | Ammonia emissions from an SCR is a precursor that contributes to the formation of fine particulate (PM2.5), and can cause haze and reduced visibility. Red Hills Gas Plant is near two designated Class I areas (Carlsbad Caverns National Park and Guadalupe Mountains National Park). | Oxidizer will be fueled by natural gas, which is a clean fuel that minimizes emissions. |
| *Step 2.* | **ELIMINATE TECHNICALLY INFEASIBLE OPTIONS** | **RBLC Database Information** | Included in RBLC for the control of $NO_X$ emissions from TOs. | Included in RBLC for the control of $NO_X$ emissions from TOs. | Included in RBLC for the control of $NO_X$ emissions from TOs. |
| | | **Feasibility Discussion** | Feasible | The Thermal Oxidizers have a high operating temperature, above the typical operating temperature of an SCR. Incremental waste heat recovery section(s) might be required. | Feasible |
| *Step 3.* | **RANK REMAINING CONTROL TECHNOLOGIES** | **Overall Control Efficiency** | 80%[1] | 94%[1] | Base Case |
| *Step 4.* | **EVALUATE AND DOCUMENT MOST EFFECTIVE CONTROLS** | **Cost Effectiveness ($/ton)** | | ≥$18,000/ton<br>Expected to be no lower than cost for heaters between 50-100 MMBtu/hr | |
| *Step 5.* | **SELECT BACT** | | **Yes, 0.06 lb/MMBtu** | Eliminated due to feasibility concerns, collateral ammonia emissions which will lead to adverse environmental impact to Class I areas, and not economically reasonable. | **Yes** |
| *Units Subject to Selected BACT* | | | **RH2-TO-5500, RH4-TO-45500, RH5-TO-55500** | | |

## 9.2 CO and VOC BACT

### 9.2.1 Background on Pollutant Formation

Vapors from the glycol dehydrators and amine units, including VOC, will be routed to thermal oxidizers for control. Product of combustion emissions, including CO, will be generated by the combustion of natural gas as well as the combustion of the vapors sent to the oxidizers.

### 9.2.2 Identify All Available Control Technologies

Using the RBLC search and permit review results, as well as a review of technical literature, potentially applicable control technologies were identified based on the principles of control technology and engineering experience for the Red Hills thermal oxidizers.

Table 9.2-1 and Table 9.2-2 outline the top-down BACT analysis for CO and VOC emissions from thermal oxidizers. Note that BACT for the control of VOC from the glycol dehydrators and the amine units is addressed in their respective Sections 6 and 7.

### 9.2.3 Selection of BACT

Based on the review of the RBLC search and other permit review results, Targa has determined that the BACT for thermal oxidizers is the implementation of good combustion, operating, and maintenance practices and the use of natural gas as fuel. For CO the proposed emission limit is 0.06 lb/MMBtu and for VOC the emissions will be the permitted emission rates, which consist of Good Combustion Practices & Manufacturer Recommended Operation/Maintenance and 98% DRE for process streams.

## 9.3 $SO_2$ BACT

### 9.3.1 Background on Pollutant Formation

Vapors from the glycol dehydrators and amine units, including $H_2S$, will be routed to thermal oxidizers for control. Emissions of $SO_2$ are generated by the combustion of sulfur-containing compounds in the natural gas and process vapors sent to the oxidizers.

### 9.3.2 Identify All Available Control Technologies

Using the RBLC search and permit review results, as well as a review of technical literature, potentially applicable control technologies were identified based on the principles of control technology and engineering experience for the Red Hills thermal oxidizers. Table 9.3-1 outlines the top-down BACT analysis for $SO_2$ emissions from thermal oxidizers. Note that BACT for the $H_2S/SO_2$ emissions from the glycol dehydrators and BACT for $H_2S/SO_2$ emissions from the amine units are covered in Sections 6 and 7, respectively; whereas, this section is focused on the fuel-based emissions from the thermal oxidizer.

### 9.3.3 Selection of BACT

Based on the review of the RBLC search and other permit review results, Targa has determined that the BACT for thermal oxidizers uses low-sulfur fuel and implements good combustion, operating, and maintenance practices.

**Table 9.3-1 BACT Analysis for Thermal Oxidizers – $SO_2$**

## 9.4 TSP/$PM_{10}$/$PM_{2.5}$ and $CO_2e$ BACT

### 9.4.1 Background on Pollutant Formation

Vapors from the glycol dehydrators and amine units will be routed to thermal oxidizers for control. Product of combustion emissions, including particulate matter and $CO_2$, will be generated by the combustion of natural gas as well as the combustion of the vapors sent to the oxidizers. Thermal oxidizers are an example of a control device in which the control of certain pollutants causes the formation of collateral GHG emissions. Specifically, the control of $CH_4$ in the combusted process gas results in the creation of additional $CO_2$ emissions. However, given the relative GWPs of $CO_2$ and $CH_4$ and the destruction of VOC, it is appropriate to apply combustion controls to $CH_4$ emissions even though it will form additional $CO_2$ emissions.

### 9.4.2 Identify All Available Control Technologies

Using the RBLC search and permit review results, as well as a review of technical literature, potentially applicable control technologies were identified based on the principles of control technology and engineering experience for the Red Hills thermal oxidizers.

Table 9.4-1 outlines the top-down BACT analysis for PM and $CO_2e$ emissions from thermal oxidizers.

### 9.4.3 Selection of BACT

Based on the review of the RBLC search and other permit review results, Targa has determined that the BACT for thermal oxidizers is the implementation of good combustion, operating, and maintenance practices and the use of natural gas as fuel.

**Table 9.4-1 BACT Analysis for Thermal Oxidizers – PM & $CO_2e$**

**Table 9.4-1 BACT Analysis for Thermal Oxidizer – PM & $CO_2e$**

# 10. BACT EVALUATION FOR FIXED ROOF TANKS

This section contains the BACT evaluation for VOC and $H_2S$ emissions from the fixed roof tanks summarized in the table below. The pollutant(s) applicable to each set of tanks are identified in the table below.

**Table 10.1 List of Fixed Roof Tanks with Applicable Pollutants**

| Material Stored | Unit IDs | VOC | $H_2S$ |
|---|---|---|---|
| Condensate | RH1-TK-COND-EAST (TK-20101, TK-20102, TK-20103, TK-20104, TK-20105, TK-20106)<br>RH1-TK-COND-WEST (TK-20107, TK-20108, TK-20109, TK-20110, TK-20111, TK-20112) | YES | NO |
| Sour Slop | RHA-TK-SLOP (TK-6100, TK-6200)<br>RA2-TK-SLOP (TK-26100, TK-26200) | YES | YES |
| Methanol | RH-TK-METHANOL | YES | NO |
| Contact Water | RH4-TK-SLOP (TK-46200, TK-46210, TK-46220, TK-46230)<br>RH2-TK-SLOP (TK-6200)<br>RH1-TK-SLOP (TK-33-001, TK-33-002) | YES | NO |

Details are provided in Sections 10.1 through 10.2. RBLC and permit search results are not included for tanks because the control method strategies for storage tanks are so well established. Furthermore, many RBLC results do not indicate the tank service or liquid vapor pressure; therefore, it is not possible to determine which entries are comparable to the Red Hills tanks.

## 10.1 VOC BACT

### 10.1.1 Background on Pollutant Formation

Emissions are formed as a result of working and breathing losses of the tank contents. Transfer to atmospheric storage of pressurized liquid streams containing entrained gases may generate flashing losses. The condensate is processed through a stabilization process before entering the storage tanks. Stabilized condensate has no flashing losses. Only the stored sour slop material is expected to generate flashing losses.

### 10.1.2 Identify All Available Control Technologies

Potentially applicable control technologies were identified based on the principles of control technology and engineering experience for the Red Hills tanks. Table 10.2-1 outlines the top-down BACT analysis for VOC emissions from storage tanks. Note that only two control methods are presented. The use of a combustion device was determined to be the best feasible control method and per the EPA's guidance[27] "If no better control technology is available for an emission point, then such finding should be stated and supported, and no further analysis is required".

[27] U. S. Environmental Protection Agency. *Guidelines for Determining Best Available Control Technology (BACT)*. Office Of Air, Noise, and Radiation, Office of Air Quality Planning and Standards, 1978.

### 10.1.3 Selection of BACT

The proposed BACT control method for facility tanks, except for methanol tanks and contact water tanks, is the use of fixed roof storage tanks vented to combustion controls. Specifically, use of flare or enclosed combustion device controls capable of achieving a minimum 98% destruction efficiency. Based on the small capacity and low emission level for the methanol tanks and contact water tanks, fixed roof design with submerged fill is proposed as BACT. Emissions and flow rates from the methanol and contact water tanks are at such low levels that assist gas would be needed to combust the vapors from the tanks, leading to collateral emission increases, further supporting the proposed BACT for these tanks.

**Table 10.2-1 BACT Analysis for Fixed Roof Tanks – VOC**

**Table 10.1-1 BACT Analysis for Fixed Roof Tanks - VOC**

## 10.2 $H_2S$ BACT

### 10.2.1 Background on Pollutant Formation

Like VOC, $H_2S$ emissions are formed as a result of working, and breathing losses of the tank contents. Transfer to atmospheric storage of pressurized liquid streams containing entrained gases may generate flashing losses. The only material stored at Red Hills expected to emit $H_2S$ is sour slop. The stored sour slop material is expected to generate flashing losses.

### 10.2.2 Identify All Available Control Technologies

Potentially applicable control technologies were identified based on the principles of control technology and engineering experience for the Red Hills tanks. Table 10.2-1 outlines the top-down BACT analysis for $H_2S$ emissions from storage tanks. Note that only one control method is presented following the EPA's instruction[28] that "If no better control technology is available for an emission point, then such finding should be stated and supported, and no further analysis is required".

### 10.2.3 Selection of BACT

The proposed BACT control method for facility sour slop storage tanks is the use of fixed roof storage tanks vented to combustion controls. Specifically, use of flare or combustor controls capable of achieving a minimum 98% destruction efficiency.

[28] U. S. Environmental Protection Agency. *Guidelines for Determining Best Available Control Technology (BACT)*. Office Of Air, Noise, and Radiation, Office of Air Quality Planning and Standards, 1978.

* As use of combustion device controls is the most protective option, other options are not considered.

# 11. BACT EVALUATION FOR LOADING

This section contains the BACT evaluation for VOC and $H_2S$ emissions from the loading categories summarized in the table below. The pollutant(s) applicable to each type of loading activity are identified.

**Table 11.1 List of Materials Loaded and Associated Pollutants**

| Material Loaded | Unit IDs | VOC | $H_2S$ |
|---|---|---|---|
| Condensate | RH1-TK-COND-WEST-LOAD | YES | NO |
| Sour Slop | RHA-TK-SLOP-LOAD, RA2-TK-SLOP-LOAD | YES | YES |
| Contact Water | RH4-TK-SLOP-LOAD, RH2-TK-SLOP-LOAD, RH1-TK-SLOP-LOAD | YES | NO |

Details are provided in Sections 11.1 through 11.2. Appendix A provides a summary of RBLC search results.

## 11.1 VOC BACT

### 11.1.1 Background on Pollutant Formation

Emissions can be generated due to loading losses that occur as condensate product is transferred from the facility tanks to tank trucks.

### 11.1.2 Identify All Available Control Technologies

Using the RBLC search, potentially applicable control technologies were identified based on the principles of control technology and engineering experience for the Red Hills tanks and truck loading. Table 11.1-1 outlines the top-down BACT analysis for VOC emissions from truck loading for VOC.

### 11.1.3 Selection of BACT

The proposed BACT control method for loading condensate and sour slop is submerged fill and vapor balancing service, with return vapors routed to combustion controls, such as a flare or enclosed combustion device controls capable of achieving a minimum 98% destruction efficiency.

For the truck loading of contact water, the proposed BACT control method is submerged fill. The vapor stream generated from loading water consists of mostly water vapor and has a low heating value such that it is not efficient or cost-effective to combust the loading vapors from loading contact water.

**Table 11.1-1 BACT Analysis for Loading Condensate/Slop – VOC**

**Table 11.1-1. BACT Analysis for Loading Condensate/Slop/Contact Water - VOC**

| | | | | | |
|---|---|---|---|---|---|
| *Step 1.* | **IDENTIFY AIR POLLUTION CONTROL TECHNOLOGIES** | **Control Technology** | **Combustion Device / Vapor Balance to Combustion Device (e.g., Flare[1] or Thermal Oxidizer[2])** | **Pipeline Transfer** | **Submerged loading** |
| | | **Control Technology Description** | A control device that uses thermal combustion to reduce emissions of captured waste gas streams. For loading, this consists of loading via vapor balance back to the tank for any loading vapors to be controlled with a combustion device. | Material is transferred from the facility via pipeline thereby avoiding generation of loading emissions. | Submerged loading involves use of a fill pipe that extends almost to the bottom of the cargo tank so liquid splashing is minimized during filling. |
| | | **Typical Operating Temperature** | Flare: 1,000 - 2,000 °F<br>Oxidizer: 1,100 - 1,200 °F | N/A | N/A |
| | | **Typical Waste Stream Inlet Flow Rate** | Flare: 100,000 lb/hr - 2 MM lb/hr<br>Oxidizer: 500 - 50,000 scfm | N/A | N/A |
| | | **Typical Waste Stream Inlet Pollutant Concentration** | Flare: minimum 300 Btu/scf<br>Oxidizer: 1,500 - 3,000 ppmv | N/A | N/A |
| | | **Other Considerations** | Flare & Oxidizer: Typically not utilized for low-concentration, high-flow organic vapor streams. | N/A | N/A |
| *Step 2.* | **ELIMINATE TECHNICALLY INFEASIBLE OPTIONS** | **RBLC Database Information** | Included in RBLC | Not included in RBLC | Included in RBLC for control of emissions from truck loading |
| | | **Feasibility Discussion** | **Feasible** | **Infeasible, pipeline transfer requires a modification to the facility process.** | **Feasible** |
| *Step 3.* | **RANK REMAINING CONTROL TECHNOLOGIES** | **Overall Control Efficiency** | 98%+ | 100% | 40%-60% |
| *Step 4.* | **EVALUATE AND DOCUMENT MOST EFFECTIVE CONTROLS** | **Cost Effectiveness ($/ton)** | | Pipeline transfer is only a viable option for certain materials. The cost to install a LACT and pipeline addition would be approximately $4 million for transfer of sour slop. For control of VOC, the cost would exceed $2.5 million/ton of VOC controlled, since VOC emissions from sour slop loading are less than the H2S emissions (see Table 11.2-1). Therefore, at this time removal of sour slop through a pipeline is considered economically infeasible. | |
| *Step 5.* | **SELECT BACT*** | | **Yes, for condensate loading and sour slop** | | **Yes, for contact water loading, condensate loading, and sour slop loading** |
| *Units Subject to Selected BACT* | | | **RH-1TK-COND-WEST-LOAD, RHA-TK-SLOP-LOAD, RA2-TK-SLOP-LOAD, RH4-TK-SLOP-LOAD, RH2-TK-SLOP-LOAD, RH1-TK-SLOP-LOAD** | | |

[1] U.S. EPA, Office of Air Quality Planning and Standards, "Air Pollution control Technology Fact Sheet (Flare)," EPA-452/F-03-019

[2] U.S. EPA, Office of Air Quality Planning and Standards, "Air Pollution control Technology Fact Sheet (Thermal Incineration)," EPA-452/F-03-022

* As use of combustion device controls is the most protective feasible option, other options are not considered.

[3] Except for minimal timeframes when the pipeline is unavailable.

## 11.2 $H_2S$ BACT

### 11.2.1 Background on Pollutant Formation

Emissions are generated due to loading losses that occur as the product is transferred from the facility tanks to tank trucks. The only loaded material at Red Hills expected to emit $H_2S$ is sour slop.

### 11.2.2 Identify All Available Control Technologies

Using the RBLC search potentially applicable control technologies were identified based on the principles of control technology and engineering experience for the Red Hills tanks and truck loading. Table 11.2-1 outlines the top-down BACT analysis for $H_2S$ emissions from truck loading. The best control method identified, though not feasible, is included for completeness.

### 11.2.3 Selection of BACT

The proposed BACT control method for truck loading is submerged fill and vapor balancing service, with return vapors routed to combustion controls. Specifically, use of flare or enclosed combustion device controls capable of achieving a minimum 98% destruction efficiency.

**Table 11.2-1. BACT Analysis for Loading Sour Slop – $H_2S$**

**Table 11.2-1 BACT Analysis for Loading Sour Slop - $H_2S$**

| | | | | | |
|---|---|---|---|---|---|
| *Step 1.* | **IDENTIFY AIR POLLUTION CONTROL TECHNOLOGIES** | **Control Technology** | **Combustion Device / Vapor Balance to Combustion Device (e.g., Flare[1] or Thermal Oxidizer[2])** | **Pipeline Transfer** | **Submerged loading** |
| | | **Control Technology Description** | A control device that uses thermal combustion to reduce emissions of captured waste gas streams. For loading, this consists of loading via vapor balance back to the tank for any loading vapors to be controlled with a combustion device. | Material is transferred from the facility via pipeline thereby avoiding generation of loading emissions. | Submerged loading involves use of a fill pipe that extends almost to the bottom of the cargo tank so liquid splashing is minimized during filling. |
| | | **Typical Operating Temperature** | Flare: 1,000 - 2,000 °F<br>Oxidizer: 1,100 - 1,200 °F | N/A | N/A |
| | | **Typical Waste Stream Inlet Flow Rate** | Flare: 100,000 lb/hr - 2 MM lb/hr<br>Oxidizer: 500 - 50,000 scfm | N/A | N/A |
| | | **Typical Waste Stream Inlet Pollutant Concentration** | Flare: minimum 300 Btu/scf<br>Oxidizer: 1,500 - 3,000 ppmv | N/A | N/A |
| | | **Other Considerations** | Typically not utilized for low-concentration, high-flow organic vapor streams. | N/A | N/A |
| *Step 2.* | **ELIMINATE TECHNICALLY INFEASIBLE OPTIONS** | **RBLC Database Information** | Included in RBLC | Not included in RBLC | Included in RBLC for control of emissions from truck loading |

* As use of combustion device controls is the most protective feasible option, other options are not considered.

# 12. BACT EVALUATION FOR FUGITIVES

This section contains the BACT evaluation for VOC, $H_2S$, and $CO_2e$ emissions from the facility-wide fugitive components (Units RH-FUG-1, RH-FUG-2, RHA-FUG, and RA2-FUG). Details are provided in Sections 12.1 through 12.2. Appendix A provides a summary of RBLC and permit search results.

**Table 12.1 List of Fugitives**

| Equipment Type | Unit ID | Equipment Description |
|---|---|---|
| Fugitives | RH-FUG-1 | RH1, Fugitive Emissions |
| | RH-FUG-2 | RH, Fugitive Emissions |
| | RHA-FUG | RHA, Fugitive Emissions |
| | RA2-FUG | RA2, Fugitive Emissions |

## 12.1 VOC and $CO_2e$ BACT

### 12.1.1 Background on Pollutant Formation

Emissions are generated due to leaks from piping components and associated equipment such as valves, connectors, or compressor seals.

### 12.1.2 Identify All Available Control Technologies

Using the RBLC search and permit review results, as well as a review of technical literature, potentially applicable control technologies were identified based on the principles of control technology and engineering experience for the Red Hills equipment fugitives.

Table 12.1-1 outlines the top-down BACT analysis for VOC and $CO_2e$ emissions from fugitives.

### 12.1.3 Selection of BACT for VOC

Monitoring will be conducted at the facility following the requirements established in 20.2.50 NMAC.[29] Any leaks discovered will be repaired in accordance with 20.2.50 NMAC.29 The selected BACT for the fugitives was compared to the RBLC results. Several facilities proposed implementation of LDAR as BACT for fugitive emissions. 20.2.50 NMAC implements technologies that exist within LDAR and are more stringent.29 20.2.50 NMAC requires monthly optical gas imaging (OGI) and weekly audio, visual, and olfactory (AVO) monitoring, while 40 CFR Part 60 Subpart OOOOb only requires bi-monthly LDAR monitoring.29

Since Targa is implementing the most effective control options available, additional analysis is not necessary. In addition, because fugitive VOC and $CO_2e$ emissions are estimations only, Targa proposes no numerical BACT limit, but rather proposes to comply with the AVO, EPA Method 21, and OGI provisions detailed in 20.2.50 NMAC.29

[29] 20.2.50 NMAC – To establish emission standards for VOC and NOx for oil and gas production, processing, compression, and transmissions sources.

**Table 12.1-1 BACT Analysis for Fugitives – VOC & $CO_2e$**

**Table 12.1-1 BACT Analysis for Fugitives - VOC & $CO_2e$**

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| *Step 1.* | **IDENTIFY AIR POLLUTION CONTROL TECHNOLOGIES** | **Control Technology** | **Monitoring and Repair Program under 20.2.50 NMAC** | **Installation of Leakless Equipment** | **Alternative Monitoring Program - Infrared Technologies** | **Audio/Visual/Olfactory (AVO) Monitoring Program** | **Use High Quality Components and Materials of Construction Compatible with Process** |
| | | **Control Technology Description** | Leaking fugitive components can be identified through the use of AVO, EPA Method 21, and optical gas imaging (OGI) technology. The facility is required to comply with the monitoring and repair requirements per 20.2.50 NMAC. | Leakless technology valves are available and currently in use, primarily where highly toxic or otherwise hazardous materials are used. | Alternate monitoring programs have been proven effective in leak detection and repair. The use of sensitive infrared camera technology has become widely accepted as a cost effective means for identifying leaks of hydrocarbons. | Leaking fugitive components can be identified through audio, visual, or olfactory (AVO) methods. | The use of high quality equipment that is designed for the specific service in which it is employed results in effective control of fugitive emissions |
| *Step 2.* | **ELIMINATE TECHNICALLY INFEASIBLE OPTIONS** | **RBLC Database Information** | Included in RBLC | Included in RBLC | Included in RBLC | Included in RBLC | Included in RBLC |
| | | **Feasibility Discussion** | Technically feasible. | Technically Infeasible. Used for highly toxic or otherwise hazardous material; not implemented or included in RBLC for VOC streams at gas plants. | Technically feasible. | Technically feasible for particularly odorous materials and detection of larger leaks. | Technically feasible. |
| *Step 3.* | **RANK REMAINING CONTROL TECHNOLOGIES** | **Overall Control Efficiency** | Varies with 20.2.50 NMAC and type of facility. | | Included in the chosen control technology; therefore, no further evaluation required. | Included in the chosen control technology; therefore, no further evaluation required. AVO is conducted weekly. | Choosing a higher ranked control technology; therefore, no further evaluation required. |
| *Step 4.* | **EVALUATE AND DOCUMENT MOST EFFECTIVE CONTROLS** | **Cost Effectiveness ($/ton)** | | | | | |
| *Step 5.* | **SELECT BACT** | | **Comply with 20.2.50.116 NMAC by completing monthly optical gas imaging (OGI).** | | | | |
| *Units Subject to Selected BACT* | | | **RH-FUG-1, RH-FUG-2, RHA-FUG, RA2-FUG** | | | | |

## 12.2 $H_2S$ BACT

### 12.2.1 Background on Pollutant Formation

Emissions are generated due to leaks from piping components and associated equipment such as valves, connectors, or compressor seals.

### 12.2.2 Identify All Available Control Technologies

Using the RBLC search and permit review results, as well as a review of technical literature, potentially applicable control technologies were identified based on the principles of control technology and engineering experience for the Red Hills equipment fugitives. Table 12.2-1 outlines the top-down BACT analysis for $H_2S$ emissions from fugitives.

### 12.2.3 Selection of BACT for $H_2S$

Monitoring will be conducted at the facility following the protocol established in 20.2.50 NMAC.[30] While 20.2.50 NMAC requirements are focused on VOC emission reduction, the same monitoring and actions taken for VOC will also result in minimizing $H_2S$ emissions. Any leaks discovered will be repaired as required in 20.2.50 NMAC.[29] The selected BACT for the fugitives was compared to the RBLC results. All RBLC results for $H_2S$ proposed implementation of LDAR as BACT for fugitive emissions. 20.2.50 NMAC implements technologies that exist within LDAR and are more stringent.[30] 20.2.50 NMAC requires monthly optical gas imaging (OGI) and weekly audio, visual, and olfactory (AVO) monitoring, while 40 CFR Part 60 Subpart OOOOb only requires bi-monthly LDAR monitoring.[29]

Since Targa is implementing the most effective control options available, additional analysis is not necessary. In addition, because fugitive $H_2S$ emissions are estimations only, Targa proposes no numerical BACT limit; but rather proposes to comply with the AVO, EPA Method 21, and OGI provisions detailed in 20.2.50 NMAC.[29]

[30] 20.2.50 NMAC – To establish emission standards for VOC and NOx for oil and gas production, processing, compression, and transmissions sources.

# 13. BACT EVALUATION FOR HAUL ROADS

The BACT evaluation for total suspended particles (TSP) and particulate matter (PM) emissions, including particulate matter less than 10 microns ($PM_{10}$) and particulate matter less than 2.5 microns ($PM_{2.5}$), from the haul road (Unit RH-HAUL) for TSP/$PM_{10}$/$PM_{2.5}$ are provided in Section 13.1. Appendix A provides a summary of RBLC and permit search results.

**Table 13.1 List of Haul Roads**

| Equipment Type | Unit ID | Equipment Description |
|---|---|---|
| Haul Road | RH-HAUL | RH, Haul Road Emissions |

## 13.1 TSP/$PM_{10}$/$PM_{2.5}$ BACT

### 13.1.1 Background on Pollutant Formation

Haul roads have the potential to generate dust particles as vehicles traveling on the roads cause particles on the surface of the roads to become suspended in the atmosphere. The particle loading of the road surfaces is an indicator of the potential for vehicles traveling on the roads to generate these suspended dust particles. Unpaved haul roads have a higher potential for particle loading than paved haul roads, as vehicles traveling on unpaved roads can cause pulverization of the unpaved road surface, and the pulverized material contributes to the particle loading of the road.

The dust particles that are generated as vehicles travel on haul roads are filterable particulate matter ($PM_{10}$/$PM_{2.5}$). Therefore, the BACT evaluation for the haul roads addresses filterable particulate matter.

### 13.1.2 Identify All Available Control Technologies

Using the RBLC search and permit review results, as well as a review of technical literature, potentially applicable control technologies were identified based on the principles of control technology and engineering experience for the haul roads.

Table 13.1-1 outlines the top-down BACT analysis for TSP/$PM_{10}$/$PM_{2.5}$ emissions from haul roads.

### 13.1.3 Selection of BACT for TSP/$PM_{10}$/$PM_{2.5}$

Targa proposes to limit the speed of haul trucks to 25 mph by posting speed limit signs at regular intervals along the haul road. Targa will also apply an aggregate base course. This will result in a 44% and 60% control of the particulate matter emissions respectively. An overall control of 78% has been applied to the estimated emissions.

**Table 13.1-1 BACT Analysis for Haul Roads – TSP/$PM_{10}$/$PM_{2.5}$**

**Table 13.1-1 BACT Analysis for Haul Roads - TSP, $PM_{10}$, and $PM_{2.5}$**

| | | | | | |
|---|---|---|---|---|---|
| *Step 1.* | **IDENTIFY AIR POLLUTION CONTROL TECHNOLOGIES** | **Control Technology** | **Base Course** | **Water Application** | **Paved Roads** |
| | | **Control Technology Description** | A limit on the speed of the vehicular traffic and use of aggregate base course prevents disturbance of particulate matter from the surface of the road. | Spraying water and/or dust suppressants on the roads has been found to reduce fugitive emissions from unpaved haul roads. | A durable surface material like asphalt or concrete is laid out on the road, to sustain vehicular traffic. |
| | | **Typical Operating Temperature** | N/A | N/A | N/A |
| | | **Typical Waste Stream Inlet Flow Rate** | N/A | N/A | N/A |
| | | **Typical Waste Stream Inlet Pollutant Concentration** | N/A | N/A | N/A |
| | | **Other Considerations** | N/A | N/A | N/A |
| *Step 2.* | **ELIMINATE TECHNICALLY INFEASIBLE OPTIONS** | **RBLC Database Information** | Included in RBLC | Included in RBLC | Included in RBLC |
| | | **Feasibility Discussion** | Feasible | Technically infeasible based on the very limited availability of water in the facility's proposed location as well as meteorological and climatological conditions at facility. | Technically infeasible for industrial roads which are subject to very heavy vehicles and pavement breakage. Paving is not common for O&G facilities in the area. |
| *Step 3.* | **RANK REMAINING CONTROL TECHNOLOGIES** | **Overall Control Efficiency** | Since the emissions from this source are minor, limiting the speed to 25 mph at the facility provides a 44% control, and base course provides a 60% control. These controls provide a cost effective method of reducing emissions. | | |
| *Step 4.* | **EVALUATE AND DOCUMENT MOST EFFECTIVE CONTROLS** | **Cost Effectiveness ($/ton)** | | | |
| *Step 5.* | **SELECT BACT** | | **Limit Speed, Use of Aggregate Base Course, 78% Reduction** | | |
| *Units Subject to Selected BACT* | | | **RH-HAUL** | | |

# 14. BACT EVALUATION FOR SSM

The BACT evaluation for the SSM activities for VOC and $H_2S$, as well as $NO_X$, CO, $SO_2$, TSP/$PM_{10}$/$PM_{2.5}$ is provided in Section 14.1. Appendix A provides a summary of RBLC and permit search results. No GHG BACT is evaluated for the SSM activities.

**Table 14.1 List of SSM Activities**

| Equipment Type | Unit ID | Equipment Description |
|---|---|---|
| Startup, Shutdown, and Maintenance Activities | RH1-SSM | RH1, SSM |
| | RH2-SSM | RH2, SSM |
| | RH3-SSM | RH3, SSM |
| | RH4-SSM | RH4, SSM |
| | RH5-SSM | RH5, SSM |
| | RH6-SSM | RH6, SSM |
| | RHA-SSM | RHA, SSM |
| | RA2-SSM | RA2, SSM |
| | RH2-TO-5500-SSM | RH2, Thermal Oxidizer, SSM |
| | RH4-TO-45500-SSM | RH4, Thermal Oxidizer, SSM |
| | RH5-TO-55500-SSM | RH5, Thermal Oxidizer, SSM |

## 14.1 BACT for SSM

### 14.1.1 Background on Pollutant Formation

VOC and $H_2S$ emissions are emitted as a result of startup, shutdown, and maintenance activities such as during plant turnarounds, pigging, purging, and other maintenance. Products of combustion including $NO_X$, CO, and $SO_2$ will be generated by the combustion of vapors sent to the flare or combustion unit for control.

### 14.1.2 Identify All Available Control Technologies

Using the RBLC search and permit review results, as well as a review of technical literature, potentially applicable control technologies were identified based on the principles of control technology and engineering experience for SSM activities. Table 14.1-1 outlines the top-down BACT analysis for VOC and $H_2S$. Table 14.1-2 outlines the top-down BACT analysis for $NO_X$, CO, $SO_2$, and TSP/$PM_{10}$/$PM_{2.5}$.

### 14.1.3 Selection of BACT for SSM

The most stringent RBLC and permit entries for SSM control are provided in Appendix A. Red Hills has chosen to send SSM emissions to a flare for VOC and $H_2S$ BACT with a 98% DRE during plant turnarounds and routine plant maintenance for activities that can reasonably be routed to the flare. Certain activities are limited by the presence of high differential pressure, insufficient flow or volume, temperature issues, chemical composition suitability, and physical constraints relative to the flare. For startup, shutdown, and

maintenance activities, BACT for $NO_x$, CO, $SO_2$, and TSP/$PM_{10}$/$PM_{2.5}$ is good combustion, operating, and maintenance practices. For vapors that will be controlled with a flare, such as during equipment deinventory and purging, refer to the flare section for details.

**Table 14.1-1 BACT Analysis for SSM – VOC, $H_2S$**

**Table 14.1-1 BACT Analysis for Startup, Shutdown, and Maintenance Emissions - VOC, $H_2S$**

| | | | | |
|---|---|---|---|---|
| *Step 1.* | **IDENTIFY AIR POLLUTION CONTROL TECHNOLOGIES** | **Control Technology** | **Vent SSM Emissions to Control Device** | **Operating and Maintenance Practices** |
| | | **Control Technology Description** | A high temperature control device used for disposing of waste gas streams. | Operate and maintain the equipment in accordance with good air pollution control practices and with good combustion practices. |
| | | **Other Considerations** | SSM activities that will be controlled are limited by the presence of high differential pressure relative to the control device, insufficient flow or volume, temperature issues, chemical composition suitability, and physical constraints. | N/A |
| *Step 2.* | **ELIMINATE TECHNICALLY INFEASIBLE OPTIONS** | **RBLC Database Information** | Included in RBLC. | Included in RBLC. |
| | | **Feasibility Discussion** | Low-emitting activities, non-routable activities, and fugitive SSM emissions will be excluded from BACT. Non-routable emissions encompass streams with high differential pressure relative to the control device, insufficient flow or volume, temperature issues, chemical composition suitability, and physical constraints. | Feasible |
| *Step 3.* | **RANK REMAINING CONTROL TECHNOLOGIES** | **Overall Control Efficiency** | Flare: 98% | Base Case |
| *Step 4.* | **EVALUATE AND DOCUMENT MOST EFFECTIVE CONTROLS** | **Cost Effectiveness ($/ton)** | | |
| *Step 5.* | **SELECT BACT** | | **100% capture efficiency and 98% DRE where feasible.** | |
| *Units Subject to Selected BACT* | | | **RH1-SSM, RH2-SSM, RH3-SSM, RH4-SSM, RH5-SSM, RH6-SSM, RHA-SSM, RA2-SSM, RH2-TO-5500-SSM, RH4-TO-45500-SSM, RH5-TO-55500-SSM** | |

**Table 14.1-2 BACT Analysis for SSM – $NO_x$, CO, $SO_2$, TSP/$PM_{10}$/$PM_{2.5}$**

**Table 14.1-2 BACT Analysis for Startup, Shutdown, and Maintenance Emissions - $NO_x$, CO, $SO_2$, TSP/$PM_{10}$/$PM_{2.5}$**

| | | | | |
|---|---|---|---|---|
| *Step 1.* | **IDENTIFY AIR POLLUTION CONTROL TECHNOLOGIES** | **Control Technology** | **Good Combustion & Fuel Selection** | **Good Operating and Maintenance Practices** |
| | | **Control Technology Description** | Operation at the appropriate oxygen range and temperature to promote complete combustion and minimize pollutant formation. Select clean natural gas fuel that is primarily methane and ethane and of low sulfur to reduce emissions. | Operate and maintain the equipment in accordance with good air pollution control practices and with good combustion practices. |
| | | **Other Considerations** | Flare is used to control gaseous streams. | N/A |
| *Step 2.* | **ELIMINATE TECHNICALLY INFEASIBLE OPTIONS** | **RBLC Database Information** | Included in RBLC for the control of NOx, CO, SO2, TSP/PM10/PM2.5 | Included in RBLC. |
| | | **Feasibility Discussion** | Feasible | Feasible |
| *Step 3.* | **RANK REMAINING CONTROL TECHNOLOGIES** | **Overall Control Efficiency** | Base Case | Base Case |
| *Step 4.* | **EVALUATE AND DOCUMENT MOST EFFECTIVE CONTROLS** | **Cost Effectiveness ($/ton)** | | |
| *Step 5.* | **SELECT BACT** | | **Good combustion, operating, and maintenance practices. Emission rates as determined in calculations** | |
| *Units Subject to Selected BACT* | | | **RH1-SSM, RH2-SSM, RH3-SSM, RH4-SSM, RH5-SSM, RH6-SSM, RHA-SSM, RA2-SSM, RH2-TO-5500-SSM, RH4-TO-45500-SSM, RH5-TO-55500-SSM** | |

## RBLC Results for Loading

**Search Criteria**

Permit Date Between 01/01/2014 And 04/17/2024
And Process Contains 'loading'
*results filtered to exclude marine loading, railcar loading, pressurized loading, and loading of dissimilar products such as asphalt, waxes, petroleum coke, and other solids*

| RBLCID | FACILITY NAME | PERMIT ISSUANCE DATE | PROCESS NAME | POLLUTANT | CONTROL METHOD DESCRIPTION | EMISSION LIMIT | EMISSION LIMIT UNIT |
|---|---|---|---|---|---|---|---|
| TX-0955 | INEOS OLIGOMERS CHOCOLATE BAYOU | 3/14/2023 | PAO Truck & Rail Loading | Volatile Organic Compounds (VOC) | Truck and railcar loading of Poly Alpha Olefin products is not required to be controlled since the vapor pressures of these materials are less than 0.002 psia. No loading through defective lines or components, loading must stop if liquid leaks are detected. All loading shall be submerged or bottom loading.<br>Truck and railcar loading of Linear Alpha Olefin products with vapor pressures over 0.1 psia are captured and directed to thermal oxidizer control and products with vapor pressures under 0.1 psia (actually less than 0.01 psia) are not required to be directed to add on control.<br>Products with a VOC vapor pressure over 0.1 psia (lower than tier 1 BACT of 0.5psia), are directed to the thermal oxidizer for control. Tanks trucks handling liquids with a VOC vapor pressure over 0.10 psia must pass vapor tightness testing every 12 months using the methods described in Title 40 Code of Federal Regulations Part 63 (40 CFR 63), Subpart R, assumed to achieve a 99.2% capture. Railcar tankers handling liquids with a VOC vapor pressure over 0.10 psia must have a current certification in accordance with U.S. Department of Transportation (DOT) pressure test requirements of 49 CFR Â§173.31, assumed to achieve 100% capture. All loading lines and connectors must be visually inspected for defects before loading and not used if damaged and loading must be stopped if a leak is detected. The thermal oxidizer has a 99.9% destruction efficiency. All loading shall be submerged or bottom loading. | 0 | |
| TX-0933 | NACERO PENWELL FACILITY | 11/17/2021 | Rail and Truck Loading | Volatile Organic Compounds (VOC) | Vapor-tightness testing of trucks and railcars, hard-piped and flanged connections, route vapors to VCU | 0 | |
| TX-0931 | ROEHM AMERICA BAY CITY SITE | 12/16/2021 | Truck and Rail Loading | Volatile Organic Compounds (VOC) | Transport vehicles limited to DOT pressure-rated railcars and trucks meeting NSPS XX vapor-tightness specifications. Capture and route loading vapors to VCU if VOC VP > 0.5 psia. Inspection of closed vent system in same manner as other piping components in VOC service. | 0 | |
| TX-0904 | MOTIVA POLYETHYLENE MANUFACTURING COMPLEX | 9/9/2020 | TRUCK AND RAILCAR LOADING | Volatile Organic Compounds (VOC) | Vapor-tightness testing of trucks and railcars, hard-piped and flanged connections, route vapors to thermal oxidizer if VP>0.5psi | 0 | |
| TX-0876 | PORT ARTHUR ETHANE CRACKER UNIT | 2/6/2020 | Truck and railcar loading operations | Volatile Organic Compounds (VOC) | Vapor-tightness testing of trucks and railcars, hard-piped and flanged connections, route vapors to thermal oxidizer | 0 | |
| TX-0858 | GULF COAST GROWTH VENTURES PROJECT | 6/12/2019 | Truck and Railcar Liquid Loading/Unloading Operations | Volatile Organic Compounds (VOC) | Low vapor pressure (< 0.50 psia) organic liquids<br>For organic liquids with a low volatility the permit requires that loading be conducted using bottom or submerged fill. Add-on control is not required.<br>High vapor pressure (> 0.50 psia) organic liquids<br>For high volatility organic liquids (pyrolysis gasoline), the permit requires that the truck or railcar being loaded be certified as vapor tight (following NSPS XX vapor tightness specifications), and that a closed vent system be used to direct all displaced loading emissions to a properly-operated control device. For loading into railcars, vapor tightness can also be demonstrated through a valid DOT certification for pressure-rated vessels. | 0 | |

# Section 13

## Determination of State & Federal Air Quality Regulations

**This section lists each state and federal air quality regulation that may apply to your facility and/or equipment that are stationary sources of regulated air pollutants.**

Not all state and federal air quality regulations are included in this list. Go to the Code of Federal Regulations (CFR) or to the Air Quality Bureau's regulation page to see the full set of air quality regulations.

**Required Information for Specific Equipment:**
For regulations that apply to specific source types, in the 'Justification' column **provide any information needed to determine if the regulation does or does not apply**. **For example**, to determine if emissions standards at 40 CFR 60, Subpart IIII apply to your three identical stationary engines, we need to know the construction date as defined in that regulation; the manufacturer date; the date of reconstruction or modification, if any; if they are or are not fire pump engines; if they are or are not emergency engines as defined in that regulation; their site ratings; and the cylinder displacement.

**Required Information for Regulations that Apply to the Entire Facility:**
See instructions in the 'Justification' column for the information that is needed to determine if an 'Entire Facility' type of regulation applies (e.g. 20.2.70 or 20.2.73 NMAC).

**Regulatory Citations for Regulations That Do Not, but Could Apply:**
If there is a state or federal air quality regulation that does not apply, but you have a piece of equipment in a source category for which a regulation has been promulgated, you must **provide the low level regulatory citation showing why your piece of equipment is not subject to or exempt from the regulation. For example** if you have a stationary internal combustion engine that is not subject to 40 CFR 63, Subpart ZZZZ because it is an existing 2 stroke lean burn stationary RICE with a site rating of more than 500 brake HP located at a major source of HAP emissions, your citation would be 40 CFR 63.6590(b)(3)(i). **We don't want a discussion of every non-applicable regulation, but if it is possible a regulation could apply, explain why it does not. For example,** if your facility is a power plant, you do not need to include a citation to show that 40 CFR 60, Subpart OOO does not apply to your non-existent rock crusher.

**Regulatory Citations for Emission Standards:**
**For each unit that is subject to an emission standard in a source specific regulation, such as 40 CFR 60, Subpart OOO or 40 CFR 63, Subpart HH, include the low level regulatory citation of that emission standard.** Emission standards can be numerical emission limits, work practice standards, or other requirements such as maintenance. **Here are examples:** a glycol dehydrator is subject to the general standards at 63.764C(1)(i) through (iii); an engine is subject to 63.6601, Tables 2a and 2b; a crusher is subject to 60.672(b), Table 3 and all transfer points are subject to 60.672(e)(1)

**Federally Enforceable Conditions:**
All federal regulations are federally enforceable. All Air Quality Bureau State regulations are federally enforceable except for the following: affirmative defense portions at 20.2.7.6.B, 20.2.7.110(B)(15), 20.2.7.11 through 20.2.7.113, 20.2.7.115, and 20.2.7.116; 20.2.37; 20.2.42; 20.2.43; 20.2.62; 20.2.63; 20.2.86; 20.2.89; and 20.2.90 NMAC. Federally enforceable means that EPA can enforce the regulation as well as the Air Quality Bureau and federally enforceable regulations can count toward determining a facility's potential to emit (PTE) for the Title V, PSD, and nonattainment permit regulations.

INCLUDE ANY OTHER INFORMATION NEEDED TO COMPLETE AN APPLICABILITY DETERMINATION OR THAT IS RELEVENT TO YOUR FACILITY'S NOTICE OF INTENT OR PERMIT.

**EPA Applicability Determination Index for 40 CFR 60, 61, 63, etc**: http://cfpub.epa.gov/adi/

## Table for State Regulations:

| State Regulation Citation | Title | Applies? Enter Yes or No | Unit(s) or Facility | Justification: (You may delete instructions or statements that do not apply in the justification column to shorten the document.) |
|---|---|---|---|---|
| 20.2.1 NMAC | General Provisions | Yes | Facility | General Provisions apply to Notice of Intent, Construction, and Title V permit applications. |
| 20.2.3 NMAC | Ambient Air Quality Standards NMAAQS | Yes | Facility | If subject, this would normally apply to the entire facility.<br>20.2.3 NMAC is a State Implementation Plan (SIP) approved regulation that limits the maximum allowable concentration of, Sulfur Compounds, Carbon Monoxide and Nitrogen Dioxide.<br>Title V applications, see exemption at 20.2.3.9 NMAC<br>The TSP NM ambient air quality standard was repealed by the EIB effective November 30, 2018. |
| 20.2.7 NMAC | Excess Emissions | Yes | Facility | This regulation establishes requirements for the facilityf if operation results in any excess emission, the extent practicable, including associated air pollution control equipment, in a manner consistent with good air pollution control practices for minimizing emissions. The facility will also notify NMED of any excess emissions per 20.2.7.110 NMAC. |
| 20.2.23 NMAC | Fugitive Dust Control | No | Facility | This regulation may apply if this is an application for a notice of intent (NOI) per 20.2.73 NMAC, if the activity or facility is a fugitive dust source listed at 20.2.23.108.A NMAC, **and** if the activity or facility is located in an area subject to a mitigation plan pursuant to 40 CFR 51.930.<br><br>As of January 2019, the only areas of the State subject to a mitigation plan per 40 CFR 51.930 are in Doña Ana and Luna Counties.<br><br>As this site is a permitted facility in Lea County, NM, this regulation does not apply. |
| 20.2.33 NMAC | Gas Burning Equipment - Nitrogen Dioxide | No | N/A | This facility does not have gas burning equipment with a heat input greater than 1,000,000 MMBtu. |
| 20.2.34 NMAC | Oil Burning Equipment: $NO_2$ | No | N/A | This facility does not have oil burning equipment **(external combustion emission sources, such as oil-fired boilers and heaters)** having a heat input of greater than 1,000,000 million British Thermal Units per year per unit. |
| 20.2.35 NMAC | Natural Gas Processing Plant – Sulfur | No | N/A | This regulation establishes sulfur emission standards for natural gas processing plants. The proposed facility meets the definition of a new natural gas processing plant under this regulation (20.2.35.7.B NMAC), but does not utilize a sulfur recovery unit, therefore, this regulation does not apply. NMED memorandum *Guidance and Clarification Regarding Applicability of 20.2.35 NMAC*, dated March 4, 2016. |
| 20.2.37 and 20.2.36 NMAC | Petroleum Processing Facilities and Petroleum Refineries | N/A | N/A | These regulations were repealed by the Environmental Improvement Board. If you had equipment subject to 20.2.37 NMAC before the repeal, your combustion emission sources are now subject to 20.2.61 NMAC. |
| 20.2.38 NMAC | Hydrocarbon Storage Facility | Yes | N/A | This regulation establishes hydrogen sulfide emission standards for hydrocarbon storage facilities. The proposed facility meets the definition of a new hydrocarbon storage facility under this regulation and is subject to the requirements of this regulation [20.2.38.109 NMAC]. The facility will comply with all requirements under 20.2.38 NMAC as applicable. |
| 20.2.39 NMAC | Sulfur Recovery Plant - Sulfur | No | N/A | This regulation could apply to sulfur recovery plants that are not part of petroleum or natural gas processing facilities. As this site is a natural gas processing facility, this regulation does not apply. |
| 20.2.50 NMAC | Oil and Gas Sector – Ozone Precursor Pollutants | Yes | Applicable units are identified for each subpart. | 113- This facility does not have any portable or stationary natural gas-fired spark ignition engines, compression ignition engines, or natural gas-fired combustion turbines that meet the applicability criteria. Thus, this facility is not subject to this rule. |

| State Regulation Citation | Title | Applies? Enter Yes or No | Unit(s) or Facility | Justification: (You may delete instructions or statements that do not apply in the justification column to shorten the document.) |
|---|---|---|---|---|
| | | | | 114 – This facility has electric engines with reciprocating and centrifugal compressors. Thus, this rule applies to the facility.<br>The following existing reciprocating compressors are applicable to 20.2.50.114 per 20.2.50.114(A)(2) NMAC: RHA-C-5530, RHA-C-5540, RA2-C-25530, RA2-C-25540, RA2-C-29300, RA2-C-29400, RH1-C-42-601A, RH1-C-42-601B, RH1-C-42-601C, RH1-C-42-15-U205, RH1-C-42-15-U206, RH1-C-42-108A, RH1-C-42-108B, RH2-C-1300, RH2-C-1350, RH2-C-1400, RH2-C-1450, RH2-C-0101, RH3-C-1475, RH3-C-1500, RH3-C-1550, RH4-C-41300, RH4-C-41350, RH4-C-41400, RH4-C-41450, RH4-C-3101, RH5-C-51300, RH5-C-51350, RH5-C-51400, RH5-C-51450, RH6-C-61300, RH6-C-61350, RH6-C-61400, RH6-C-61450, RH6-C-69300, RH6-C-69400, and C-2000. The reciprocating compressors will comply with the requirements of 20.2.50.114.B(2) and 20.2.50.114.B(4) NMAC.<br><br>The following existing centrifugal compressors are applicable to 20.2.50.114 per 20.2.50.114(A)(1) NMAC: RH1-C-42-406, RH2-C-141, RH3-C-141, RH4-C-141, RH5-C-50141, RH6-C-60141. The centrifugal compressors will comply with the requirements of 20.2.50.114.B(1) and 20.2.50.114.B(3) NMAC as applicable.<br><br>115 – The control devices and closed vent systems at this facility are used to comply with the requirements of this rule; therefore, they are subject to the requirements of 20.2.50.115 NMAC.<br>The following existing control devices are subject to this rule RH2-TO-5500, RH4-TO-45500, RH5-TO-55500, RH1-FL-29-1003, RH1-FL-2850, RHA-FL-5100, RH2-FL-5100, 3EP-2a, RH4-FL-45100, RHA-FL-5850, RA2-FL-25100, RH5-FL-55100, RA2-FL-25850.<br>The following new control devices are subject to this rule: RA2-FL-25100 and RA2-FL-25850. The Thermal Oxidizers will comply with the requirements stated in 20.2.50.115.D NMAC. The Flares will comply with the requirements stated in 20.2.50.115.C NMAC<br><br>116 – This facility will have equipment leaks and fugitive emissions. Thus, it will comply with the requirements of 20.2.50.116 NMAC. The following existing units are subject to this regulation: RH-FUG-1, RH-FUG-2, and RHA-FUG<br>The following new units are subject to this regulation: RA2-FUG.<br>This facility will comply with the emission standards of subpart as stated in 20.2.50.116.B NMAC.<br><br>117 – This facility is a natural gas processing plant. Thus, it is not subject to this rule.<br><br>118 – The TEG dehydrator units at this facility have a PTE VOC emissions greater than 2 tpy VOC; therefore, they are subject to the requirements of 20.2.50.118 NMAC. The following existing dehydrators are subject to this rule: RH1-TEG, RH2-TEG, RH3-TEG, RH4-TEG, RH5-TEG, and RH6-TEG. The dehydrators at this facility will comply with the emission standards in 20.2.50.118.B.(1) NMAC and 20.2.50.118.B.(3) to (5) NMAC.<br><br>119 – This facility has heater and reboiler units with a capacity greater than 20 MMBtu/hr. Therefore, this rule is applicable to this facility.<br>The following existing heaters and reboilers are subject to the requirements of 20.2.50.119.B(1) and (2) NMAC: RH1-H-23-704, RH1-H-1101, RH2-H-0901, RH2-H-1001, RHA-H-4901, RH4-H-781, RH4-H-3901, RH4-H-4001, RH5-H-50902, RH5-H-50001, RH5-H-50781, RH6-H-60001, and RH6-H-60781.<br>The following new heaters and reboilers are subject to the requirements of 20.2.50.119.B(1) and (3) NMAC: RA2-H-20001. |

| State Regulation Citation | Title | Applies? Enter Yes or No | Unit(s) or Facility | Justification: (You may delete instructions or statements that do not apply in the justification column to shorten the document.) |
|---|---|---|---|---|
| | | | | 120 – This facility is connected to a pipeline for hydrocarbon liquid transfers. Thus, this rule does not apply to the facility per 20.2.50.120.A(1) NMAC. Non-hydrocarbon liquid transfers (slop water / produced water) at the facility are not subject to the requirements of this subpart.<br><br>121 – Pig launching and receiving activities have the potential to emit more than 1 tpy; therefore, this regulation applies. The following pig launching and receiving activities are subject to the requirements of 20.2.50.121 NMAC: RH4-REC-24INCH. This activity will comply with the emission standards in 20.2.50.121.B NMAC.<br><br>122 – All pneumatic controllers and pumps are air driven. Thus, the facility is not subject to this rule.<br><br>123 – This facility has less than 3 tpy maximum allowable VOC emissions for existing hydrocarbon storage tanks. Thus, it is not subject to this subpart.<br><br>124 – The facility does not have any applicable activities. Therefore, this regulation does not apply.<br><br>125 – The facility does not qualify for a small business. Thus, this regulation is not applicable.<br><br>126 – The facility does not have any applicable activities. Therefore, this regulation does not apply.<br><br>127 – The facility does not have any applicable activities. Therefore, this regulation does not apply. |
| 20.2.61.109 NMAC | Smoke & Visible Emissions | Yes | **Generators:** RH-GEN-1 to RH-GEN-10, RH-GEN-WELL, RH-TRAILER,<br><br>**Heaters:** RH1-H-23-704, RH1-H-1101, RH4-H-41100, RH2-H-741, RH2-H-781, RH2-H-2301, RH2-H-0901, RH2-H-1001, RHA-H-4901, RH3-H-741, RH3-H-781, RH3-H-6301, RH4-H-741, RH4-H-781, RH4-H-3901, RH4-H-5301, | This regulation that limits opacity to 20% applies to Stationary Combustion Equipment, such as engines, boilers, heaters, thermal oxidizers, and flares unless your equipment is subject to another state regulation that limits particulate matter such as 20.2.19 NMAC (see 20.2.61.109 NMAC). **If equipment at your facility was subject to the repealed regulation 20.2.37 NMAC it is now subject to 20.2.61 NMAC.** |

| | | | | facility is exempt from annual fees under this part (20.2.75.11.E NMAC) as it is subject to fees pursuant to 20.2.71 NMAC. |
| 20.2.77 NMAC | New Source Performance | Yes | Units subject to 40 CFR 60 | The following equipment at this facility are subject to the requirements of 40 CFR Part 60:<br>• 40 CFR 60, Subpart Dc: Heaters and Reboilers (Unit IDs: RH1-H-23-704, RH1-H-1101, RH4-H-41100, RH2-H-741, RH2-H-781, RH2-H-2301, RH2-H-0901, RH2-H-1001, RHA-H-4901, RH3-H-741, RH3-H-781, RH3-H-6301, RH4-H-741, RH4-H-781, RH4-H-3901, RH4-H-5301, RH4-H-4001, RH5-H-50902, RH5-H-50001, RH5-H-50741, RH5-H-50781, RH6-H-60001, RH6-H-60741, RH6-H-60781, RA2-H-20001).<br>• 40 CFR 60, Subpart Kb: Tanks at this facility (Unit IDs: TK-20101, TK-20102, TK-20103, TK-20104, TK-20105, TK-20106, TK-20107, TK-20108, TK-20109, TK-20110, TK-20111, TK-20112).<br>• 40 CFR 60, Subpart OOOO: Amine sweeting, Fugitives and Compressors (Unit IDs: RH1-AMINE, RH-FUG-2, reciprocating compressors).<br>• 40 CFR 60, Subpart OOOOa: Amine sweeting and Fugitives (Unit IDs: RH2-AMINE, RHA-AMINE, RH5-AMINE, RH-FUG-1, RH-FUG-2, RHA-FUG).<br>• 40 CFR 60, Subpart OOOOb: Amine sweetening, control devices and Fugitives (Unit IDs:RA2-AMINE, RA2-FL-25100, and RA2-FUG). |
| 20.2.78 NMAC | Emission Standards for HAPS | No | N/A | This facility emits hazardous air pollutants but none of which are subject to the requirements of 40 CFR Part 61. |
| 20.2.79 NMAC | Permits – Nonattainment Areas | No | N/A | This facility is not located in a non-attainment area and therefore it is not subject to this regulation. |
| 20.2.80 NMAC | Stack Heights | No | N/A | This regulation establishes requirements for the evaluation of stack heights and other dispersion techniques. This regulation does not apply as all stacks at the facility follow good engineering practice. |
| 20.2.82 NMAC | MACT Standards for source categories of HAPS | Yes | Units Subject to 40 CFR 63 | This regulation applies to all sources emitting hazardous air pollutants, which are subject to the requirements of 40 CFR Part 63:<br>• 40 CFR 63.760, Subpart HH: Dehydrators and Fugitives (Unit IDs: RH1-TEG, RH2-TEG, RH3-TEG, RH4-TEG, RH5-TEG, RH6-TEG, RH-FUG-1, RH-FUG-2, RHA-FUG, RA2-FUG).<br>• 40 CFR 63 Subpart DDDDD: Boilers and Process Heaters (Unit IDs: RH1-H-23-704, RH1-H-1101, RH4-H-41100, RH2-H-741, RH2-H-781, RH2-H-2301, RH2-H-0901, RH2-H-1001, RHA-H-4901, RH3-H-741, RH3-H-781, RH3-H-6301, RH4-H-741, RH4-H-781, RH4-H-3901, RH4-H-5301, RH4-H-4001, RH5-H-50902, RH5-H-50001, RH5-H-50741, RH5-H-50781, RA2-H-20001, RH6-H-60001, RH6-H-60741, RH6-H-60781) |

## Table for Applicable Federal Regulations:

| Federal Regulation Citation | Title | Applies? Enter Yes or No | Unit(s) or Facility | Justification: |
|---|---|---|---|---|
| 40 CFR 50 | NAAQS | No | N/A | The modeling and conditions developed from the modeling are the applicable requirements to demonstrate compliance with the NAAQs. |
| NSPS 40 CFR 60, Subpart A | General Provisions | Yes | Units subject to 40 CFR 60 | Applies if any other Subpart in 40 CFR 60 applies. |
| NSPS 40 CFR60.40a, Subpart Da | Subpart Da, Performance Standards for **Electric Utility Steam Generating Units** | No | N/A | This regulation establishes standards of performance for electric utility steam generating units. This regulation does not apply because the facility does not operate any electric utility steam generating units. |
| NSPS 40 CFR60.40b Subpart Db | **Electric Utility Steam Generating Units** | No | N/A | This regulation does not apply because the facility does not operate any electric utility steam generating units. |
| 40 CFR 60.40c, Subpart Dc | Standards of Performance for Small Industrial-Commercial-Institutional Steam Generating Units | Yes | RH1-H-23-704, RH1-H-1101, RH4-H-41100, RH2-H-741, RH2-H-781, RH2-H-2301, RH2-H-0901, RH2-H-1001, RHA-H-4901, RH3-H-741, RH3-H-781, RH3-H-6301, RH4-H-741, RH4-H-781, RH4-H-3901, RH4-H-5301, RH4-H-4001, RH5-H-50902, RH5-H-50001, RH5-H-50741, RH5-H-50781, | The listed units are steam generating units for which construction, modification or reconstruction is commenced after June 9, 1989 and that have a maximum design heat input capacity of 29 MW (100 MMBtu/hr) or less, but greater than or equal to 2.9 MW (10 MMBtu/hr). The heaters at this facility are exempt from the SO2 [§60.42c(a) through (j)] emission standards and the PM [§60.43c(a) through (e)] emission standards, as the units only use natural gas. The heaters are subject to the recordkeeping and reporting requirements outlined in § 60.48c(a) and § 60.48c(g)(2). |

| Federal Regulation Citation | Title | Applies? Enter Yes or No | Unit(s) or Facility | Justification: |
|---|---|---|---|---|
| | | | RH6-H-60001, RH6-H-60741, RH6-H-60781, RA2-H-20001 | |
| NSPS 40 CFR 60, Subpart Ka | Standards of Performance for **Storage Vessels for Petroleum Liquids** for which Construction, Reconstruction, or Modification Commenced After May 18, 1978, and **Prior** to July 23, 1984 | No | N/A | Except as provided in paragraph (b) of this section, the affected facility to which this subpart applies is each storage vessel with a storage capacity greater than 151,416 liters (40,000 gallons) that is used to store petroleum liquids for which construction is commenced after May 18, 1978 and prior to July 23, 1984. The condensate tanks at this facility were constructed after July 23, 1984, therefore, this subpart does not apply. |
| NSPS 40 CFR 60, Subpart Kb | Standards of Performance for **Volatile Organic Liquid Storage Vessels** (Including Petroleum Liquid Storage Vessels) for Which Construction, Reconstruction, or Modification Commenced **After** July 23, 1984 | Yes | TK-20101, TK-20102, TK-20103, TK-20104, TK-20105, TK-20106, TK-20107, TK-20108, TK-20109, TK-20110, TK-20111, TK-20112 | Except as provided in paragraph (b) of this section, the affected facility to which this subpart applies is each storage vessel with a capacity greater than or equal to 75 cubic meters ($m^3$) that is used to store volatile organic liquids (VOL) for which construction, reconstruction, or modification is commenced after July 23, 1984. The tanks at this facility have a design capacity greater than or equal to 75 $m^3$ but less than 151 $m^3$ storing a liquid with a maximum true vapor pressure more than 15.0 kPa. The storage vessels listed are applicable to NSPS 40 CFR 60, Subpart Kb and will comply with the standards for VOCs outlined in §60.112b(b). |
| NSPS 40 CFR 60.330 Subpart GG | **Stationary Gas Turbines** | No | N/A | There are no turbines onsite; therefore, this regulation does not apply. |
| NSPS 40 CFR 60, Subpart KKK | Leaks of VOC from **Onshore Gas Plants** | No | N/A | Affected Facility with Leaks of VOC from Onshore Gas Plants. Any affected facility under paragraph (a) of this section that commences construction, reconstruction, or modification after January 20, 1984 and on or before August 23, 2011, is subject to the requirements of this subpart. As this site was constructed after August 23, 2011, Subpart KKK is not applicable. |
| NSPS 40 CFR Part 60 Subpart LLL | Standards of Performance for **Onshore Natural Gas Processing**: $SO_2$ Emissions | No | N/A | This regulation applies to onshore natural gas processing facilities which commence construction, reconstruction, or modification after January 20, 1984 and on or before August 23, 2011. As this site was constructed after August 23, 2011, Subpart LLL does not apply. |
| NSPS 40 CFR Part 60 Subpart OOOO | Standards of Performance for Crude Oil and Natural Gas Production, Transmission, and Distribution for which construction, modification or reconstruction commenced after | Yes | Amine: RH1-AMINE<br><br>Fugitives: RH-FUG-2 (Train 1)<br><br>Reciprocating Compressors: RHA-C-5530, RHA-C-5540, | This regulation establishes emission standards and compliance schedule for the control of volatile organic compounds (VOC) emissions from affected facilities that commence construction, modification, or reconstruction after August 23, 2011 and before September 18, 2015. Since the facility has equipment that was constructed or modified after August 23, 2011 and before September 18, 2015, pneumatic devices and equipment leaks are subject to this regulation. Amine Units, reciprocating compressors, and fugitive equipment leaks constructed between August 24, 2011 and September 18, 2015 are subject to this regulation. The owner will comply with any applicable requirements under this subpart. |

| Federal Regulation Citation | Title | Applies? Enter Yes or No | Unit(s) or Facility | Justification: |
|---|---|---|---|---|
| | August 23, 2011 and before September 18, 2015 | | RA2-C-25530, RA2-C-25540, RA2-C-29300, RA2-C-29400, RH1-C-42-601A, RH1-C-42-601B, RH1-C-42-601C, RH1-C-42-15-U205, RH1-C-42-15-U206, RH1-C-42-108A, RH1-C-42-108B, RH2-C-1300, RH2-C-1350, RH2-C-1400, RH2-C-1450, RH2-C-0101, RH3-C-1475, RH3-C-1500, RH3-C-1550, RH4-C-41300, RH4-C-41350, RH4-C-41400, RH4-C-41450, RH4-C-3101, RH5-C-51300, RH5-C-51350, RH5-C-51400, RH5-C-51450, RH6-C-61300, RH6-C-61350, RH6-C-61400, RH6-C-61450, RH6-C-69300, RH6-C-69400, and C-2000 | Some of the condensate tanks at the facility are pressurized and do not meet the definition of a storage vessel in this regulation. All atmospheric condensate storage tanks are exempt from this regulation as they have less than 6 tpy VOC per affected unit. [40 CFR 60.5395].<br><br>Sweetening units located at onshore natural gas processing plants are an affected unit [40 CFR 60.5365(g)(1)]. RH1-AMINE has a design capacity less than 2 long tons per day (LT/D) of hydrogen sulfide (H2S) in the acid gas (expressed as sulfur) and is required to comply with recordkeeping and reporting requirements specified in § 60.5423(c) but are not required to comply with §§ 60.5405 through 60.5407 and §§ 60.5410(g) and 60.5415(g). Leak standards will apply to FUG-2 (Train 1) as per [40 CFR 60.5400(a) through (f)].<br><br>The pneumatic devices located at the facility will not be continuous gas bleed and therefore will not have applicable requirements under this regulation [40 CFR 60.5365(d)(3)]. This facility uses pneumatic air devices.<br><br>The reciprocating compressors at this facility are subject to the standards outlined in §60.5385(a) through (d).<br><br>The centrifugal compressors at this facility do not use wet seals and are therefore not subject to this subpart per §60.5365(b). |
| NSPS 40 CFR Part 60 Subpart OOOOa | Standards of Performance for Crude Oil and Natural Gas Facilities for which Construction, Modification or Reconstruction Commenced **After** September 18, 2015 | Yes | Amine:<br>RH2-AMINE, RHA-AMINE, RH4-AMINE, RH5-AMINE<br>Fugitives:<br>RHA-FUG, RH-FUG-1 | This regulation applies to amine units and fugitive equipment leaks which commenced construction after September 18, 2015.<br><br>Sweetening units located at onshore natural gas processing plants are an affected unit [40 CFR 60.5365a(g)(1)]. RHA-AMINE will comply with the standards outlined in §60.5405a(a) and (b).<br><br>RH2-AMINE, RH4-AMINE, and RH5-AMINE have a design capacity less than 2 long tons per day (LT/D) of hydrogen sulfide (H2S) in the acid gas (expressed as sulfur) and is required to comply with recordkeeping and reporting requirements specified in § 60.5423a(c) but are not required to |

|---|---|---|---|---|
| | | | (Train 2-4), RH-FUG-2 | comply with §§ 60.5405a through 60.5407a and §§ 60.5410a(g) and 60.5415a(g).<br><br>Leak standards will apply to RHA-FUG, RH-FUG-1 (Train 2-4), and RH-FUG-2 as per [40 CFR 60.5400a(a) through (f)].<br><br>Pressurized tanks at the facility do not meet the definition of a storage vessel in this regulation. All atmospheric condensate storage tanks are exempt from this regulation as they have less than 6 tpy VOC per affected unit. [40 CFR 60.5365a]. |
| NSPS 40 CFR Part 60 Subpart OOOOb | Standards of Performance for Crude Oil and Natural Gas Facilities for which Construction Commenced After November 15, 2021 | Yes | Fugitives: RA2-FUG<br><br>Amine: RA2-AMINE<br><br>Control Devices: RA2-FL-25100 | This regulation applies to amine units and fugitive equipment leaks which commenced construction after December 6, 2022.<br><br>Leak standards will apply to RA2-FUG as per [40 CFR 60.5397b].<br><br>Sweetening units located at onshore natural gas processing plants are an affected unit. [40 CFR 60.5365b(g)(1)]. RA2-AMINE will comply with the standards outlined in §60.5405b through 60.5407b, 60.5410b(i), 60.5415b(k), and 60.5423b.<br><br>The flare (RA2-FL-25100) is subject to the requirements of §60.5412b. |
| NSPS 40 CFR 60 Subpart IIII | Standards of performance for Stationary Compression Ignition Internal Combustion Engines | Yes | Generators: RH-GEN-WELL, RH-GEN-1 to RH-GEN-10, RH-TRAILER | This regulation establishes standards of performance for stationary compression ignition internal combustion engines. This rule applies to IC engines (diesel engines) that commenced construction after July 11, 2005. [40 CFR 60.4200(a)(1)].<br><br>RH-GEN-WELL is a diesel-fired stationary compression ignition engine and will commence operation after June 12, 2006 and is manufactured on or after July 1, 2007; therefore, the unit is subject to this subpart. The unit will comply with the emission standards outlined in § 60.4205(b). This unit will comply with § 60.4202(a)(i).<br><br>RH-GEN-1 to RH-GEN-10 are diesel-fired compression ignition engines; however, these engines will not be stationary for more than 12 months; therefore, this regulation does not apply. [40 CFR 60.4200(e)].<br><br>RH-TRAILER is a diesel fired compression ignition engine; however, RH-TRAILER will not be stationary for more than 12 months; therefore, this regulation does not apply. [40 CFR 60.4200(e)]. |
| NSPS 40 CFR Part 60 Subpart JJJJ | Standards of Performance for Stationary Spark Ignition Internal Combustion Engines | No | N/A | This regulation establishes standards of performance for stationary compression ignition combustion engines. There are no stationary compression ignition internal combustion engines at this facility. This regulation does not apply. |
| NSPS 40 CFR 60 Subpart TTTT | Standards of Performance for Greenhouse Gas Emissions for Electric Generating Units | No | N/A | The facility does not operate an affected source under this subpart. |
| NSPS 40 CFR 60 Subpart UUUU | Emissions Guidelines for Greenhouse Gas Emissions and Compliance Times | No | N/A | The facility does not operate an affected source under this subpart. |

| Federal Regulation Citation | Title | Applies? Enter Yes or No | Unit(s) or Facility | Justification: |
|---|---|---|---|---|
| | for Electric Utility Generating Units | | | |
| NSPS 40 CFR 60, Subparts WWW, XXX, Cc, and Cf | Standards of performance for Municipal Solid Waste (MSW) Landfills | No | N/A | This facility is not an MSW landfill. |
| NESHAP 40 CFR 61 Subpart A | General Provisions | No | N/A | NSPS 40 CFR 61 does not apply to the facility because the facility does not emit or have the triggering substances on site and/or the facility is not involved in the triggering activity. The facility is not subject to this regulation. None of the subparts of Part 61 apply to the facility. |
| NESHAP 40 CFR 61 Subpart E | National Emission Standards for **Mercury** | No | N/A | The provisions of this subpart are applicable to those stationary sources which process mercury ore to recover mercury, use mercury chlor-alkali cells to produce chlorine gas and alkali metal hydroxide, and incinerate or dry wastewater treatment plant sludge. This facility is not involved in these activities. This regulation does not apply. |
| NESHAP 40 CFR 61 Subpart V | National Emission Standards for **Equipment Leaks** (Fugitive Emission Sources) | No | N/A | This regulation establishes national emission standards for equipment leaks (fugitive emission sources). The facility does not have equipment that operates in volatile hazardous air pollutant (VHAP) service [40 CFR Part 61.240]. The regulated activities subject to this regulation do not take place at this facility. The facility is not subject to this regulation. |
| MACT 40 CFR 63, Subpart A | General Provisions | Yes | Units Subject to 40 CFR 63 | Applies if any other Subpart in 40 CFR 63 applies. |
| MACT 40 CFR 63.760 Subpart HH | **Oil and Natural Gas Production Facilities** | Yes | <u>Dehydration:</u> RH1-TEG, RH2-TEG, RH3-TEG, RH4-TEG, RH5-TEG, RH6-TEG<br><br><u>Fugitives:</u> RH-FUG-1, RH-FUG-2, RHA-FUG, RA2-FUG | This regulation establishes national emission standards for hazardous air pollutants from oil and natural gas production facilities. The facility is a major source of HAPs [§63.760(a)(1)] and meets the definition of a natural gas processing plant. The dehydrators will have a natural gas flow rate equal to or greater than 85 thousand standard cubic feet. The dehydrators that comply with the 1 tpy control option under 63.765(b)(1)(ii) are considered large dehydrators under MACT HH. The units will comply with applicable closed vent and control requirements outlined in §63.771(c)(1) through (3) and §63.771(d)(1) through (5), along with monitoring, recordkeeping, and reporting requirements, as applicable.<br><br>Fugitive components must comply with requirements under NSPS Subpart OOOO and OOOOa but there are still some reporting requirements that may apply under MACT Subpart HH. The owner will comply with any applicable requirements under Subpart HH for this site. [§63.769].<br><br>Fugitive emissions components associated with RA2-FUG are considered ancillary equipment and will comply with §63.769 (c)(1) through (c)(6).<br><br>Compressors at this facility have less than 10% by weight VHAP, therefore these units do not operate in VHAP service and are not an affected source. [40 CFR 63.760(b)(1)(iv)].<br><br>Storage tanks TK-20101, TK-20102, TK-20103, TK-20104, TK-20105, TK-20106, TK-20107, TK-20108, TK-20109, TK-20110, TK-20111, and TK-20112 are subject to subpart Kb and are therefore not subject to HH. [40 CFR 63.766(d)].<br><br>The other storage tanks at this facility (TK-6100, TK-6200, TK-26100, TK-26200, TK-46200, TK-46210, TK-46220, TK-46230, TK-6200 (2), TK-33-001, and TK-33-002) have an annual average hydrocarbon liquid throughput of less than 79,500 liters per day, and are therefore not subject to MACT HH. . |

| Federal Regulation Citation | Title | Applies? Enter Yes or No | Unit(s) or Facility | Justification: |
|---|---|---|---|---|
| MACT 40 CFR 63 Subpart HHH | National Emissions Standards for Hazardous Air Pollutants from Natural Gas Transmission and Storage facilities | No | N/A | This subpart applies to owners and operators of natural gas transmission and storage facilities that transport or store natural gas prior to entering the pipeline to a local distribution company or to a final end user (if there is no local distribution company), and that are major sources of hazardous air pollutants (HAP) emissions as defined in §63.1271. This regulation does not apply because this facility is not a natural gas transmission or storage facility as defined in this regulation [40 CFR Part 63.1270(a)]. |
| MACT 40 CFR 63 Subpart DDDDD | National Emission Standards for Hazardous Air Pollutants for Major Industrial, Commercial, and Institutional Boilers & Process Heaters | Yes | RH1-H-23-704, RH1-H-1101, RH4-H-41100, RH2-H-741, RH2-H-781, RH2-H-2301, RH2-H-0901, RH2-H-1001, RHA-H-4901, RH3-H-741, RH3-H-781, RH3-H-6301, RH4-H-741, RH4-H-781, RH4-H-3901, RH4-H-5301, RH4-H-4001, RH5-H-50902, RH5-H-50001, RH5-H-50741, RH5-H-50781, RA2-H-20001, RH6-H-60001, RH6-H-60741, RH6-H-60781, | The facility is a major source of HAPs as defined in §63.7485. The units listed will be subject to MACT 40 CFR 63 Subpart DDDDD as they will be constructed after the June 4, 2010 applicability date. [§63.7490(2)(b]. The boilers and process heaters will be combusting natural gas. The owner will comply with all applicable MACT DDDDD requirements [§63.7500(a)(1) through (f)]. |
| MACT 40 CFR 63 Subpart UUUUU | National Emission Standards for Hazardous Air Pollutants Coal & Oil Fire Electric Utility Steam Generating Unit | No | N/A | See 63.9980 (known as the MATs rule) |
| MACT 40 CFR 63 Subpart ZZZZ | National Emissions Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines (**RICE MACT**) | No | RH-GEN-WELL, RH-GEN-1 through RH-GEN-10 | The diesel fired generators (RH-GEN-1 through RH-GEN-10) and the heater trailer (RH-TRAILER) will not be stationary for more than 12 months; therefore, this regulation does not apply.<br><br>The generator engine (RH-GEN-WELL) is a stationary unit and will be stationary for longer than 12 months; therefore, this regulation applies. [§63.6590(c)]. This unit has a site rating of 35 hp and therefore meets the requirement of this part by meeting the requirements of 40 CFR Part 60 subpart IIII per §63.6590(c)(7). |

| Federal Regulation Citation | Title | Applies? Enter Yes or No | Unit(s) or Facility | Justification: |
|---|---|---|---|---|
| 40 CFR 64 | **Compliance Assurance Monitoring** | Yes | Amine: RH2-AMINE, RH4-AMINE, RH5-AMINE, RHA-AMINE<br>Dehydration: RH1-TEG, RH2-TEG, RH3-TEG, RH4-TEG, RH5-TEG, RH6-TEG | This regulation defines compliance assurance monitoring (CAM). As defined in § 64.2(a)(3), applies to the listed amine units and glycol dehydration units because the units have potential pre-control device emissions that are equal to or greater than 100 percent of the amount, in tons per year, required for a source to be classified as a major source.<br><br>The owner will comply with all applicable requirements under 40 CFR Part 64. |
| 40 CFR 68 | **Chemical Accident Prevention** | Yes | Facility | The facility is an affected facility, as it will use flammable process chemicals such as propane at quantities greater than the thresholds. The facility will develop and maintain an RMP for these chemicals per the requirements of § 68.150. |
| Title IV – Acid Rain 40 CFR 72 | **Acid Rain** | No | N/A | This regulation does not apply as this facility does not generate commercial electric power or electric power for sale. |
| Title IV – Acid Rain 40 CFR 73 | **Sulfur Dioxide** Allowance Emissions | No | N/A | This regulation does not apply as this facility does not generate commercial electric power or electric power for sale. |
| Title IV-Acid Rain 40 CFR 75 | **Continuous Emissions Monitoring** | No | N/A | This regulation does not apply as this facility does not generate commercial electric power or electric power for sale. |
| Title IV – Acid Rain 40 CFR 76 | **Acid Rain** Nitrogen Oxides **Emission Reduction Program** | No | N/A | This regulation does not apply as this facility does not generate commercial electric power or electric power for sale. |
| Title VI – 40 CFR 82 | Protection of **Stratospheric Ozone** | No | N/A | Not applicable as this facility does not meet any of the following:<br><br>(40 CFR 82.1 and 82.100) produce, transform, destroy, import, or export a controlled substance or import or export a controlled product;<br><br>(40 CFR 82.30) if you perform service on a motor vehicle for consideration when this service involves the refrigerant in the motor vehicle air conditioner;<br><br>(40 CFR 82.80) if you are a department, agency, and instrumentality of the United States subject to Federal procurement requirements;<br><br>(40 CFR 82.150) if you service, maintain, or repair appliances, dispose of appliances, refrigerant reclaimers, if you are an owner or operator of an appliance, if you are a manufacturer of appliances or of recycling and recovery equipment, if you are an approved recycling and recovery equipment testing organization, and/or if you sell or offer for sell or purchase class I or class I refrigerants. |

# Section 14

## Operational Plan to Mitigate Emissions

(Submitting under 20.2.70, 20.2.72, 20.2.74 NMAC)

---

☐ **Title V Sources** (20.2.70 NMAC)**:** By checking this box and certifying this application the permittee certifies that it has developed an **Operational Plan to Mitigate Emissions During Startups, Shutdowns, and Emergencies** defining the measures to be taken to mitigate source emissions during startups, shutdowns, and emergencies as required by 20.2.70.300.D.5(f) and (g) NMAC. This plan shall be kept on site to be made available to the Department upon request. This plan should not be submitted with this application.

☑ **NSR** (20.2.72 NMAC)**, PSD** (20.2.74 NMAC) **& Nonattainment** (20.2.79 NMAC) **Sources:** By checking this box and certifying this application the permittee certifies that it has developed an **Operational Plan to Mitigate Source Emissions During Malfunction, Startup, or Shutdown** defining the measures to be taken to mitigate source emissions during malfunction, startup, or shutdown as required by 20.2.72.203.A.5 NMAC. This plan shall be kept on site to be made available to the Department upon request. This plan should not be submitted with this application.

☑ **Title V** (20.2.70 NMAC)**, NSR** (20.2.72 NMAC)**, PSD** (20.2.74 NMAC) **& Nonattainment** (20.2.79 NMAC) **Sources:** By checking this box and certifying this application the permittee certifies that it has established and implemented a Plan to Minimize Emissions During Routine or Predictable Startup, Shutdown, and Scheduled Maintenance through work practice standards and good air pollution control practices as required by 20.2.7.14.A and B NMAC. This plan shall be kept on site or at the nearest field office to be made available to the Department upon request. This plan should not be submitted with this application.

---

- To the maximum extent practicable, the air pollution control equipment, process equipment, and processes will be maintained and operated in a manner consistent with good practice for minimizing emissions;
- Repairs will be made in an expeditious fashion when the operator becomes aware that applicable emission limitations are being exceeded;
- Repairs will be made in an expeditious fashion when the operator becomes aware of a malfunction that may cause emission limitations to be exceeded;
- Repairs will be made in an expeditious fashion when the operator becomes aware of a malfunction;
- Off-shift labor and overtime will be utilized, to the extent practicable, to ensure that such repairs were made as expeditiously as practicable;
- The amount and duration of the excess emissions (including any during bypass) periods will be minimized to the maximum extent practicable;
- All possible steps will be taken to minimize the impact of the excess emission on ambient air quality; and,
- The facility will monitor operations to ensure that excess emissions are not part of a recurring pattern indicative of inadequate design, operation, or maintenance.

# Section 15

## Alternative Operating Scenarios

(Submitting under 20.2.70, 20.2.72, 20.2.74 NMAC)

---

**Alternative Operating Scenarios:** Provide all information required by the department to define alternative operating scenarios. This includes process, material and product changes; facility emissions information; air pollution control equipment requirements; any applicable requirements; monitoring, recordkeeping, and reporting requirements; and compliance certification requirements. Please ensure applicable Tables in this application are clearly marked to show alternative operating scenario.

**Construction Scenarios**: When a permit is modified authorizing new construction to an existing facility, NMED includes a condition to clearly address which permit condition(s) (from the previous permit and the new permit) govern during the interval between the date of issuance of the modification permit and the completion of construction of the modification(s). There are many possible variables that need to be addressed such as: Is simultaneous operation of the old and new units permitted and, if so for example, for how long and under what restraints? In general, these types of requirements will be addressed in Section A100 of the permit, but additional requirements may be added elsewhere. Look in A100 of our NSR and/or TV permit template for sample language dealing with these requirements. Find these permit templates at: www.env.nm.gov/air-quality/permitting-section-procedures-and-guidance/. Compliance with standards must be maintained during construction, which should not usually be a problem unless simultaneous operation of old and new equipment is requested.

In this section, under the bolded title "Construction Scenarios", specify any information necessary to write these conditions, such as: conservative-realistic estimated time for completion of construction of the various units, whether simultaneous operation of old and new units is being requested (and, if so, modeled), whether the old units will be removed or decommissioned, any PSD ramifications, any temporary limits requested during phased construction, whether any increase in emissions is being requested as SSM emissions or will instead be handled as a separate Construction Scenario (with corresponding emission limits and conditions, etc.

---

**Alternate Operating Scenarios:**

**AGI Flaring Scenarios (RHA-FL-5100 and RA2-FL-25100)**

Flare units RHA-FL-5100 and RA2-FL-25100 are designed to combust startup, shutdown, and maintenance (SSM) and gas emissions from various process equipment at the facility. These flares also handle acid gas emissions from RHA-AMINE and RA2-AMINE when the AGI well system is offline. There are three (3) operating scenarios for these flares summarized in Table 15-1 below. Each flare unit will have two hourly emission limits depending on the flaring scenario. RHA-FL-5100 has one emission limit for if it is operating simultaneously as RA2-FL-25100 and one if it is not. Likewise, RA2-FL-25100 has one emission limit for if it is operation simultaneously as RHA-FL-5100 and one if it is not. The hourly emission limits for each flare during the three operating scenarios are summarized in Table 15-2 below.

**Table 15-1 AGI Flaring Scenarios**

| Unit ID | Nominal Processes | AOS 1 Processes | AOS 2 Processes | AOS 3 Processes |
|---|---|---|---|---|

**Table 15-2 AGI Flaring Scenarios Hourly Emission Rates (lb/hr)**

| Unit ID | Scenario | NOx | CO | VOC | $SO_2$ | $H_2S$ | HAPs |
|---|---|---|---|---|---|---|---|
| RHA-FL-5100 | AOS 1 | 16.83 | 144.32 | 33.66 | 128.29 | 1.39 | 0.40 |
| | AOS 2 | 16.87 | 144.65 | 6.76 | 259.57 | 2.85 | 0.62 |
| | AOS 3 | - | - | - | - | - | - |
| RA2-FL-25100 | AOS 1 | 16.92 | 145.07 | 39.16 | 127.13 | 1.38 | 0.47 |
| | AOS 2 | - | - | - | - | - | - |
| | AOS 3 | 21.15 | 181.30 | 77.28 | 258.17 | 2.80 | 0.92 |

**Flaring Scenarios (RH1-FL-29-1003, RH2-FL-5100, RH3- FL-5100, RH4-FL-45100, and RH5-FL-55100)**

Flare units RH1-FL-29-1003, RH2-FL-5100, RH3- FL-5100, RH4-FL-45100, and RH5-FL-55100 are designed to combust startup, shutdown, and maintenance (SSM) emissions from various process equipment at the facility. These flares may also handle flash gas emissions from amine units RH1-AMINE, RH2-AMINE, RH4-AMINE, and RH5-AMINE during cold weather events. Additionally, these flare may also handle regenerator overheads from glycol dehydrator units RH2-DEHY, RH3-DEHY, RH4-DEHY, RH5-DEHY, and RH6-DEHY during thermal oxidizer downtime. It is important to note that facility SSM emissions and amine flash gas emissions will not be combusted simultaneously. All other nominal events can still occur within any given hour. This is summarized in Table 15-3 below.

**Table 15-3 Flaring Scenarios**

| Unit ID | Nominal Processes | AOS Processes |
|---|---|---|
| RH1-FL-29-1003 | Pilot<br>Purge<br>RH1-TEG (dehy) Still Vent<br>SSM Emissions | Pilot<br>Purge<br>RH1-TEG (dehydrator) Still Vent<br>RH1-AMINE (amine) Flash Gas |
| RH2-FL-5100 | Pilot<br>Purge<br>SSM Emissions | Pilot<br>Purge<br>RH2-AMINE (amine) Flash Gas<br>RH2-TEG and RH3-TEG (dehydrator) Regenerator Overheads |
| RH3-FL-5100 | Pilot<br>Purge<br>SSM Emissions | Pilot<br>Purge |
| RH4-FL-45100 | Pilot<br>Purge<br>SSM<br>Pigging Emissions | Pilot<br>Purge<br>RH4-AMINE (amine) Flash Gas<br>RH5-AMINE (amine) Flash Gas<br>RH4-TEG (dehydrator) Regenerator Overheads<br>Pigging Emissions |
| RH5-FL-55100 | Pilot<br>Purge<br>SSM Emissions | Pilot<br>Purge<br>RH5-TEG (dehydrator) Regenerator Overheads<br>RH6-TEG (dehydrator) Regenerator Overheads |

**Thermal Oxidizer Downtime (RH2-TO-5500, RH4-TO-45500, RH5-TO-55500)**

Thermal Oxidizers RH2-TO-5500, RH4-TO-45500, and RH5-TO-55500 are designed to combust regenerator overheads for glycol dehydrator units RH2-TEG, RH3- TEG, RH4- TEG RH5- TEG, and RH6- TEG and amine units RH1-AMINE, RH2-AMINE, RH4-AMINE, and RH5-AMINE. Thermal oxidizer downtime will occur during scheduled maintenance events (2 weeks/yr). During this downtime the glycol dehydrator regenerator overheads will be routed to the flares RH2-FL-5100, RH4-FL-45100, and RH5-FL-55100 and the amine regenerator overheads will be vented.

**Carbon-Capture and Sequestration for Sweet Amine Units (RH1-AMINE, RH2-AMINE, RH4-AMINE, RH5-AMINE)**

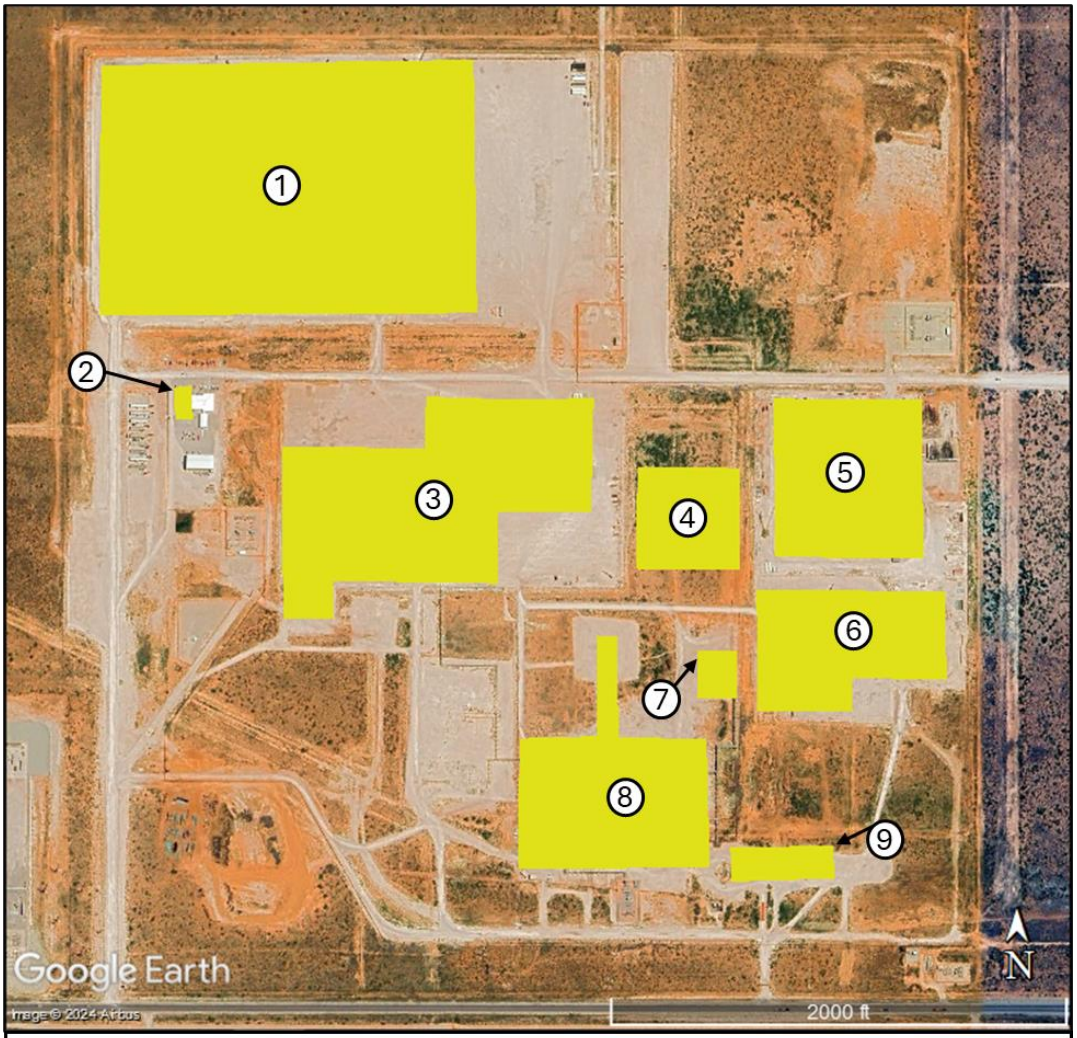
The AGI wells can be utilized to control $CO_2e$ emissions up to the permitted maximum surface injection pressure and if achievable, maximum injection capacity of 13 MMSCFD. Injection activities during normal operations will result in the injection formation continuing to pressure up, causing the achievable daily injection rate to decrease.

**Portable Generator and Heater Trailer**

Red Hills operates ten (10) portable emergency generators (units RH-GEN-1 through RH-GEN-10) and one (1) portable diesel-fired heater trailer (unit RH-TRAILER). The generators supply power for various activities during SSM events across the facility,

while the heater trailer is utilized exclusively in the winter months for cold-starting equipment. Targa seeks the flexibility to relocate these units within the designated Generator Zones, as outlined in Figure 15-1, with exact zone boundaries provided in Table 15-2. To ensure compliance with the National and New Mexico Ambient Air Quality Standards (NAAQS & NMAAQS), the units were modeled at various locations around the perimeter of each zone.

**Train 4 Slop Tank Scenarios**



There are two scenarios for the slop tank battery at Train 4, RH4-TK-SLOP, and the associated loading, RH4-TK-SLOP-LOAD. RH4-TK-SLOP may receive a combination of condensate, produced water, and slop water from various process streams at the facility. The UA2 tables 2-C, 2-D, 2-E, 2-I, and 2-P have been represented with both Tank Scenario 1 and Tank Scenario 2 as appropriate.

In Tank Scenario 1, up to 19,860 bbls/yr of condensate are routed to the tanks and the emissions from the tanks and associated loading are controlled by a new flare, RH4-FL-46200, with a 98% DRE. Note that the condensate contribution does not constitute the entire flowrate to this set of tanks, but rather a subset.

In Tank Scenario 2, up to 120.7 bbls/yr of condensate are routed to the tanks as the condensate streams that were previously routed to this tank battery will be rerouted to another part of facility's process. The rerouting of these streams will require the installation of additional piping at the facility and associated fugitives, which are covered under the fugitive emissions represented in this application. Note that the condensate contribution does not constitute the entire flowrate to this set of tanks, but rather a subset. In this scenario, RH4-TK-SLOP and associated loading RH4-TK-SLOP-LOAD remain uncontrolled.

**Table 15-4 RH4-TK-SLOP Tank Scenarios**

| Scenario | Lube Oil (%) | Condensate (bbl/yr) | Produced and Slop Water (bbl/yr) | Total Throughput (bbl/yr) |
|---|---|---|---|---|
| 1 | 15% | 19,860 | 142,860 | 149,860 |
| 2 | 15% | 120.7 | 145,880 | 142,885 |

# Section 16

## Air Dispersion Modeling

1) Minor Source Construction (20.2.72 NMAC) and Prevention of Significant Deterioration (PSD) (20.2.74 NMAC) ambient impact analysis (modeling): Provide an ambient impact analysis as required at 20.2.72.203.A(4) and/or 20.2.74.303 NMAC and as outlined in the Air Quality Bureau's Dispersion Modeling Guidelines found on the Planning Section's modeling website. If air dispersion modeling has been waived for one or more pollutants, attach the AQB Modeling Section modeling waiver approval documentation.
2) SSM Modeling: Applicants must conduct dispersion modeling for the total short term emissions during routine or predictable startup, shutdown, or maintenance (SSM) using realistic worst case scenarios following guidance from the Air Quality Bureau's dispersion modeling section. Refer to "Guidance for Submittal of Startup, Shutdown, Maintenance Emissions in Permit Applications (http://www.env.nm.gov/aqb/permit/app_form.html) for more detailed instructions on SSM emissions modeling requirements.
3) Title V (20.2.70 NMAC) ambient impact analysis: Title V applications must specify the construction permit and/or Title V Permit number(s) for which air quality dispersion modeling was last approved. Facilities that have only a Title V permit, such as landfills and air curtain incinerators, are subject to the same modeling required for preconstruction permits required by 20.2.72 and 20.2.74 NMAC.

| **What is the purpose of this application?** | Enter an X for each purpose that applies |
|---|---|
| New PSD major source or PSD major modification (20.2.74 NMAC). See #1 above. | X |
| New Minor Source or significant permit revision under 20.2.72 NMAC (20.2.72.219.D NMAC). See #1 above. **Note:** Neither modeling nor a modeling waiver is required for VOC emissions. | |
| Reporting existing pollutants that were not previously reported. | |
| Reporting existing pollutants where the ambient impact is being addressed for the first time. | |
| Title V application (new, renewal, significant, or minor modification. 20.2.70 NMAC). See #3 above. | |
| Relocation (20.2.72.202.B.4 or 72.202.D.3.c NMAC) | |
| Minor Source Technical Permit Revision 20.2.72.219.B.1.d.vi NMAC for like-kind unit replacements. | |
| Other: i.e. SSM modeling. See #2 above. | |
| This application does not require modeling since this is a No Permit Required (NPR) application. | |
| This application does not require modeling since this is a Notice of Intent (NOI) application (20.2.73 NMAC). | |
| This application does not require modeling according to 20.2.70.7.E(11), 20.2.72.203.A(4), 20.2.74.303, 20.2.79.109.D NMAC and in accordance with the Air Quality Bureau's Modeling Guidelines. | |

**Check each box that applies:**

☐ See attached, approved modeling **waiver for all** pollutants from the facility.
☐ See attached, approved modeling **waiver for some** pollutants from the facility.
☑ Attached in Universal Application Form 4 (UA4) is a **modeling report for all** pollutants from the facility.
☐ Attached in UA4 is a **modeling report for some** pollutants from the facility.
☐ No modeling is required.

# 1. EXECUTIVE SUMMARY

Targa Resources LLC, dba Targa Northern Delaware LLC, (Targa) operates the Red Hills Gas Processing Plant (Red Hills) at 1934 W NM Highway 128, Jal, 88252, Lea County, New Mexico under Construction Permit 4310-M6R3 and Title V Operating Permit P278-M1.

Red Hills is subject to Prevention of Significant Deterioration (PSD) review for ozone, nitrogen dioxide ($NO_2$), carbon monoxide (CO), sulfur dioxide ($SO_2$), particulate matter ($PM_{2.5/10}$), and hydrogen sulfide ($H_2S$). Since emissions at Red Hills exceed the Significant Emission Rate (SER) for nitrogen oxides ($NO_X$) and $SO_2$, an assessment of secondary $PM_{2.5}$ formation was performed. Targa also performed state-level impact assessments for hydrogen sulfide ($H_2S$) and particulate matter ($PM_{2.5/10}$). Targa has prepared emission calculations that demonstrate that a 20.2.72 NMAC toxics modeling analysis is not required; this demonstration is included in Section 20 of the application package.

Targa retained Trinity Consultants (Trinity) to perform the modeling analyses that served as the basis for the impact assessments. A modeling protocol presenting the regulatory framework and proposed model options was submitted to the New Mexico Environmental Department (NMED) on April 10th, 2025, and an additional Modeling Addendum was submitted on May 22, 2025. The protocol and addendum were approved by NMED and EPA on January 27, 2026. Approval documentation is included in 10.4Appendix A. This modeling report includes the results of the completed air dispersion modeling. This modeling report defines the regulatory framework and technical methods that were used for the following analyses:

- An air quality impact analysis (AQIA) that demonstrates that Red Hills emissions, in conjunction with background concentrations and neighboring sources as applicable,[1] do not cause or contribute to a violation of applicable New Mexico and National Ambient Air Quality Standards (NMAAQS and NAAQS) or Class II PSD increments.[2]
- An Additional Impacts Analysis for growth, visibility impairment, water consumption, endangered species and soils and vegetation analyses as required by the PSD regulations.
- A Class I Area impact assessment performed in accordance with guidance and additional consultation from the applicable Federal Land Managers of Class I areas. This assessment includes an initial screening significant impact analyses (SIL).
- A Q/D analysis for all Class I areas within 300 kilometers (km) of Red Hills (see Section 8.2) and refined Air Quality Related Values analyses (see Section 8.3) for Q/D results that may exceed the threshold level determined by Federal Land Managers (FLM). The FLMs were consulted to determine the requirements of additional analyses. Documentation of this consultation is included in 10.4Appendix B.

[1] Code of Federal Regulations, Title 40 – Protection of Environment, Part 51, Appendix W, Section 8.3. January 17, 2017.

[2] If facility-only impacts from the Red Hills plant do not exceed the significant impact level (SIL) for a pollutant and averaging period, the facility will not cause or contribute to a NMAAQS, NAAQS, and PSD increment violation, as applicable to that pollutant and averaging period.

The AQIA was conducted in accordance with guidance provided by the United States Environmental Protection Agency (EPA) and NMED as prescribed in the following:

- Guideline on Air Quality Models (published as 40 CFR 51, Appendix W; hereafter referred to as the Modeling Guideline);[3]
- Guidance on the Development of Modeled Emission Rates for Precursors (MERPs) as a Tier 1 Demonstration Tool for Ozone and $PM_{2.5}$ under the PSD permitting Program and Clarification on the Development of Modeled Emission Rates for Precursors (MERPs) as a Tier 1 Demonstration Tool for Ozone and $PM_{2.5}$ under the PSD Permitting Program;[4]
- NMED Air Dispersion Modeling Guidelines;[5]
- Federal Land Managers AQRV Workgroup (FLAG) Phase I Report (FLAG 2010);[6] and
- Interagency Work Group on Air Quality Modeling (IWAQM) Phase 2.[7]

Trinity used the current dispersion models and methods described in the above-mentioned documents to perform the modeling analyses in addition to the approved modeling protocol. Details regarding these methods and the results of the AIQA are included in this modeling report.

During application development, the unit numbers for all sources were modified. As the new unit numbers would exceed the character limit for AERMOD data entry, the old unit numbers were retained for modeling purposes. A cross-reference table for unit number identification is provided below.

# 2. RED HILLS GAS PROCESSING PLANT OVERVIEW

## 2.1 Plant Description

The Red Hills Gas Processing Plant (Red Hills) is an existing natural gas processing plant located in Lea County. The primary function of the plant is to remove $CO_2$, water, and other impurities from raw field gas to ensure the processed gas meets pipeline quality specifications. The plant has been designated a primary Standard Industrial Classification (SIC) Code of 1311.

The gas will be treated to remove acid gases ($H_2S$ and $CO_2$) dehydrated to remove water and processed to remove C2+ hydrocarbons from the gas stream. Several plant systems will be involved to perform these functions.

**Slug Catcher / Separator**
Several slug catchers have been installed to catch and separate any free hydrocarbon liquids and water present in the inlet pipeline gas stream prior to undergoing gas treating and processing. The slug catchers are capable of handling large volumes of liquid brought into the plant from pipeline pigging operations. This equipment acts as a three-phase separator to separate the free hydrocarbons, gas to be processed, and free water. Separate inlet systems consisting of a series of separators and slug catchers will be associated with various trains. The south inlet system handles Trains 1 through 3 and the north inlet system handles Trains 4 through 6. Front end treaters RHA-AMINE and RA2-AMINE each have their own inlet systems.

**Condensate Stabilizer / Compressor**
The condensate stabilization system is in place to lower the Reid Vapor Pressure (RVP) of the pipeline liquids / condensate to meet required specifications. Condensate stabilization is accomplished by using a distillation process that uses heat to separate lighter hydrocarbon compounds in vapor phase from heavier hydrocarbon compounds in liquid phase to decrease the condensate RVP to a nominal RVP 9 product. The condensate from various filters/separators and the slug catcher are combined, stabilized, and sent to the tank farms for truck or pipeline sales. Any vapors that are created/removed during the stabilization process are recycled back to the plant inlet via compression.

**Amine Treating**
The amine units are designed to remove $CO_2$ and $H_2S$ from the natural gas stream to meet pipeline specifications. Amine treating is an exothermic chemical reaction process. The treating solution is a mixture of reverse osmosis (RO) water and MDEA (Methyldiethanolamine). This aqueous mixture is regenerated and reused. Lean amine/water solution is pumped to the top of the contactor and allowed to flow downward. Inlet gas is fed into the bottom of the contactor and flows upward. As the lean amine/water solution flows down through the contactor, it contacts the gas. The $CO_2$ and $H_2S$ react with the amine to form amine carbonate. The reacted amine, known as "sour" or "rich" amine, flows to the regeneration system and the processed ("sweet") gas continues to the glycol dehydration system. Sour gas is first treated in the front end treaters RHA-AMINE or RA2-AMINE to remove the majority of $H_2S$ present in the stream. Emissions from amine units RHA-AMINE and RA2-AMINE are controlled by a redundant Acid Gas Injection well system . During events such as AGI compressor downtime, startup, shutdown, or maintenance events on any associated equipment, or any other operational conditions that would prevent injection into the wells, the emissions are controlled by AGI Flares, units RHA-FL-5100 and RA2-FL-25100, respectively. Sweet gas from inlet pipelines, RHA-AMINE, and RH2-AMINE is then treated in the sweet amine units including RH1-AMINE, RH2-AMINE, RH4-AMINE, and RH5-AMINE. The emissions from these units are routed to various thermal oxidizers, including units RH2-TO-5500, RH4-TO-45500, and RH5-TO-55500, at the facility.

**Hot Oil System**
The hot oil system at the plant is used to provide heat to multiple processes within the facility. The system utilizes pumps to circulate hot oil through natural gas fired heaters to increase the oil temperature and then delivers it to various heat exchangers. Hot oil heaters within the hot oil system include RH1-H-23-704, RH1-H-1101, RH4-H-41100, RH2-H-781, RH2-H-0901, RH2-H-1001, RHA-H-4901, RH3-H-781, RH4-H-781, RH4-H-3901, RH4-H-4001, RH5-H-50902, RH5-H-50001, RH5-H-50781, RH6-H-60001, RH6-H-60781, and RA2-H-20001.

In addition to the hot oil system, the facility utilizes heaters for the regenerator gas, including units RH2-H-741, RH3-H-741, RH4-H-741, RH5-H-50741, and RH6-H-60741 and TEG reboilers, including units RH2-H-2301, RH3-H-6301, and RH4-H-5301.

**Glycol Dehydration**
Triethylene glycol (TEG) dehydration is used to remove water from the natural gas stream by reducing the inlet water dew point (temperature at which vapor begins to condense into a liquid) to the outlet dew point temperature which contains a specified amount of water. The water saturated inlet gas is brought into contact with "lean" TEG in a countercurrent contactor tower. Water vapor is absorbed in the TEG and consequently, the natural gas dew point is reduced. Wet inlet gas passing through the contactor tower is dehydrated, then flows to the molecular sieve beds. The water saturated (or "rich") glycol then flows from the absorber to a regeneration system in which it is partially decompressed, then heated to remove water vapor, resulting in "lean" glycol that is reintroduced to the contactor tower. Emissions from glycol dehydrator units, RH1-TEG, RH2-TEG, RH3-TEG, RH4-TEG, RH5-TEG, and RH6-TEG are controlled by various flares and thermal oxidizers at the facility, including units RH1-FL-29-1003, RH2-TO-5500, RH4-TO-45500, and RH5-TO-55500.

**Molecular Sieve Dehydration**
Molecular sieve dehydration is used upstream of the cryogenic units to achieve a gas stream dew point of -150°F. The process consists of three molecular sieve vessels cycling through one vessel in regeneration mode and two vessels in moisture adsorption mode. During the regeneration mode, hot, dry gas (regen gas) is passed up through the vessel to drive off the adsorbed moisture from the molecular sieve. The gas comes from a slipstream at the outlet of the molecular sieve dehy beds, and it is passed through a heater to achieve a temperature of approximately 500°F. After the gas passes through the molecular sieve vessels, it is cooled in an air-cooled exchanger. The water in the gas condenses and is separated from the gas stream in a separator. This process operates in a closed vent system.

**Cryogenic Unit**
The cryogenic unit is designed to liquefy natural gas components from the sweet, dehydrated inlet gas by removing work (heat) from the gas primarily by means of the propane refrigeration system and turbo expander. The cryogenic unit recovers natural gas liquids (NGL) by cooling the gas stream to extremely cold temperatures (-150°F and lower) and condensing components such as ethane, propane, butanes and heavier components into a liquid phase. The gas is cooled by a series of heat exchangers and by rapidly lowering the pressure of the gas from around 760 PSIG to approximately 190 PSIG. This process operates in a closed vent system under pressure. Once the gas has passed through the system of exchangers and expander, it is re-compressed using the energy obtained from expanding the gas. The gas is sent to residue compressors and pipelined out of the facility. The NGL's are pumped into a pipeline from the NGL Surge Tanks. In case the compressors are shut in, the gas may be temporarily sent to flares, including units RH1-FL-29-1003, RH2-FL-5100, RH3-FL-5100, RH4-FL-45100, and RH5-FL-55100.

**Propane Refrigeration**
The propane refrigeration system works to remove heavier hydrocarbons in the gas stream to increase cryogenic efficiencies later in the process. Typically, the gas stream is refrigerated to just below minus 20°F and C4+ components are dropped out of the process gas in varying efficiencies so the cryogenic equipment can concentrate on the lighter C2 and C3 components. This process operates in a closed vent system.

**Storage and Loading Operations**
The unstabilized liquids will be stored in up to four pressurized 90,000-gallon tanks, also called bullet tanks. These tanks are not a source of regulated pollutants and are considered process vessels. The tank loading will take place via a pressurized, closed loop system. Atmospheric tanks batteries include RH1-TK-COND-EAST (condensate), RHA-TK-SLOP (sour slop), RH1-TK-COND-WEST (condensate), and RA2-TK-SLOP (sour slop) are controlled by flares RHA-FL-5850, RA2-FL-25850, and RH1-FL-2850. RH2-TK-SLOP, and RH1-TK-SLOP contain slop water and are uncontrolled. Loading operations are quantified as units RHA-TK-SLOP-LOAD, RH1-TK-COND-WEST-LOAD, RA2-TK-SLOP-LOAD, RH2-TK-SLOP-LOAD, and RH1-TK-SLOP-LOAD. Haul road emissions associated with loading activities are quantified as RH-HAUL.

There are two scenarios for the slop tank battery at Train 4, RH4-TK-SLOP, and the associated loading, RH4-TK-SLOP-LOAD. RH4-TK-SLOP may receive a combination of condensate, produced water, and slop water from various process streams at the facility. In Tank Scenario 1, up to 19,860 bbls of condensate are routed to the tanks and the emissions from the tanks and associated loading are controlled by a new flare, RH4-FL-46200, with a 98% DRE. Note that the condensate contribution does not constitute the entire flowrate to this set of tanks, but rather a subset. In Tank Scenario 2, up to 120.7 bbls of condensate are routed to the tanks as the condensate streams that were previously routed to this tank battery will be rerouted to another part of facility's process. The rerouting of these streams will require the installation of additional piping at the facility and associated fugitives. Note that the condensate contribution does not constitute the entire flowrate to this set of tanks, but rather a subset. In this scenario, RH4-TK-SLOP and associated loading RH4-TK-SLOP-LOAD remain uncontrolled. Additional details regarding these operating scenarios are detailed in Section 15. The UA2 tables have been represented with both Tank Scenario 1 and Tank Scenario 2 as appropriate.

**Flares**
The plant flares are used during startup, shutdown, maintenance and upset conditions as well as some AOS SSM situations, as described in Section 15. In most cases, the only steady state operations associated with this flare are from the pilot and purge gas streams. RH1-FL-29-1003 also controls steady state emissions associated with RH1-TEG. SSM emissions from the plant flare result from maintenance activities per manufacturer-recommended or other preventative maintenance schedules. These maintenance activities include, but are not limited to, equipment blowdowns for associated maintenance, instrument calibrations, and process safety device maintenance. The inclusion of flare malfunction emissions captures any emissions that occur during process equipment malfunctions and are routed to any of the included flares (RH1-FL-29-1003, RH2-FL-5100, RH3-FL-5100, RH4-FL-45100, RH5-FL-55100).

**AGI Flare**
During events such as AGI compressor downtime, startup, shutdown, or maintenance events on any associated equipment, or any other operational conditions that would prevent injection into the wells, acid gas will be flared for limited periods at the respective acid gas flares until the facility can safely be brought offline. Under startup, shutdown, maintenance, and upset conditions the AGI wells could be offline. The AGI Flare units, RHA-FL-5100 and RA2-FL-25100, will also control non-condensable and flash tank emissions from the amine vent units, RHA-AMINE and RA2-AMINE during such events.

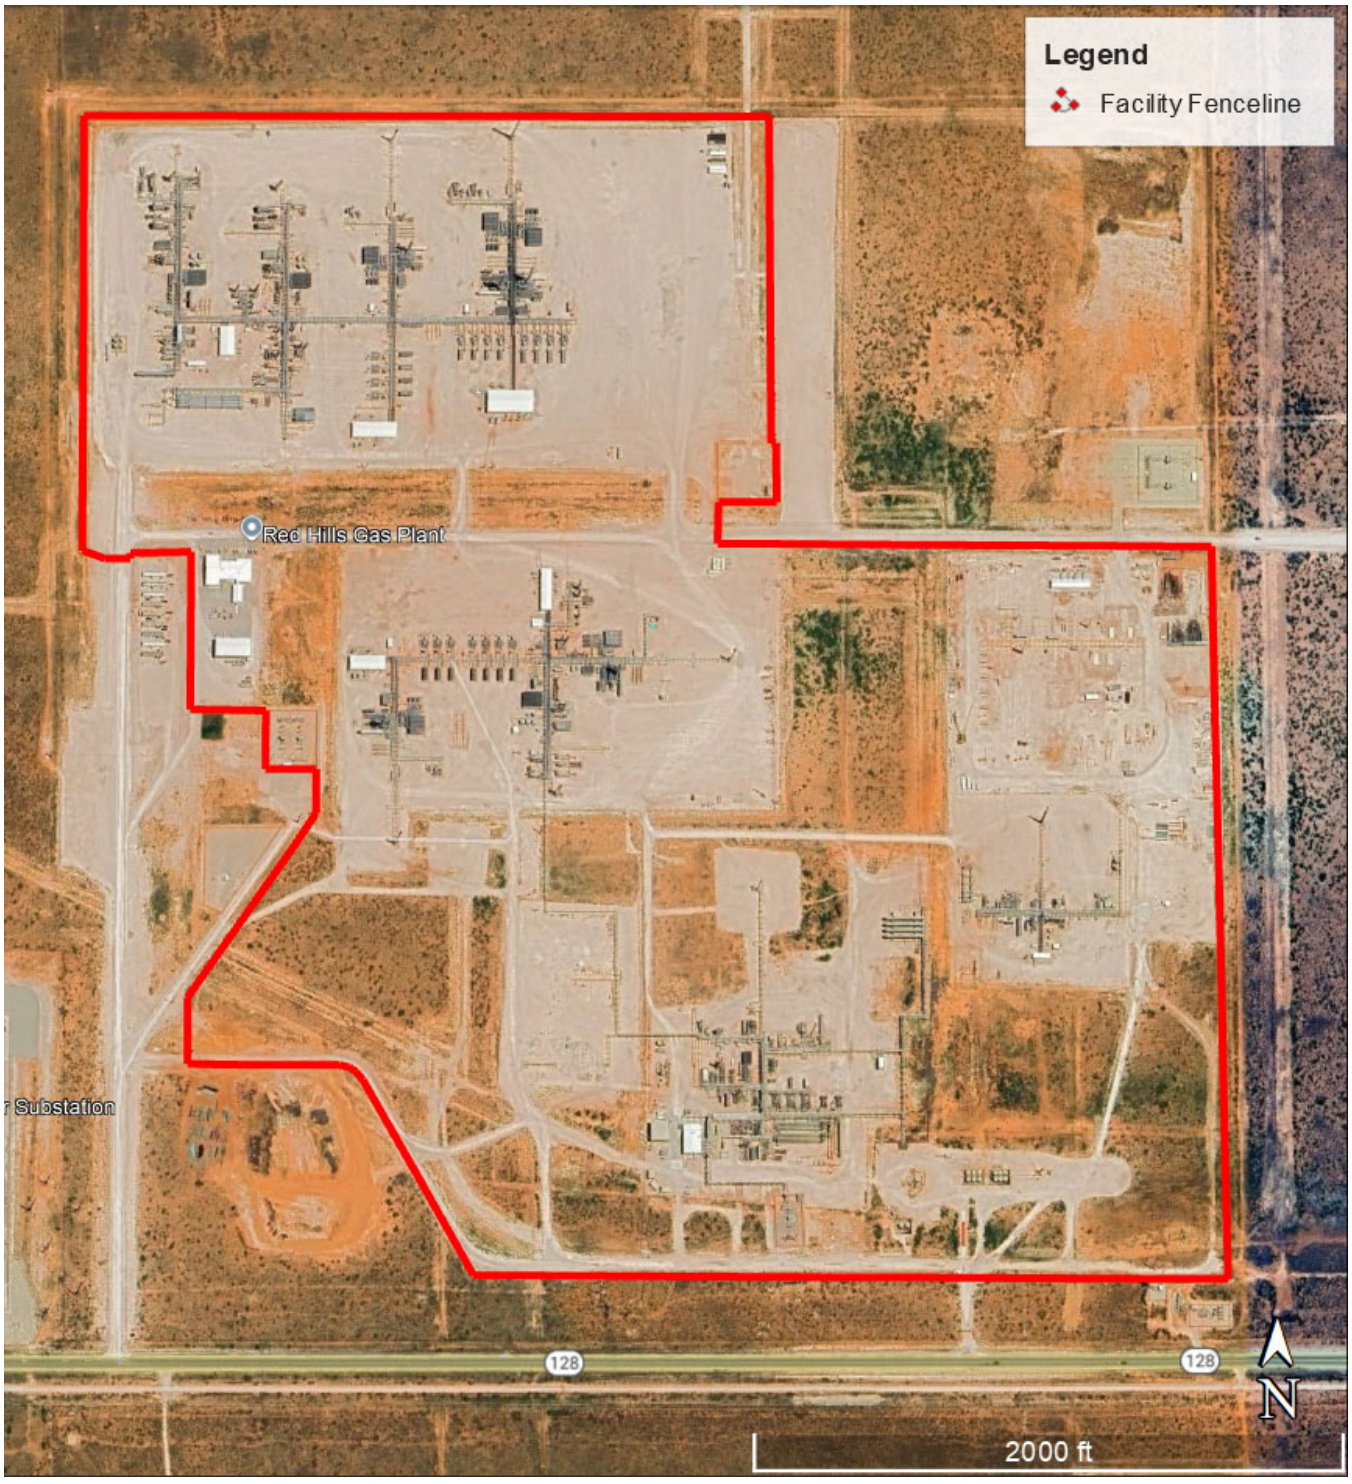
**Pigging Operations**
Pipeline inspection gauges (PIG) are used in the pipelines to purge, clean, and inspect pipelines to maintain operations and flow assurance of materials. This includes the removal of any accumulated materials or liquids. PIG receivers are used to receive the PIG device as well as to isolate other portions of the pipeline for the pigging process. PIG launchers are used to "launch" the PIG device through the pipeline. Pig Launchers and receivers at the site include RHA-REC-WINKLER, RHA-REC-LIMESTONE-8INCH, RH1-REC-PLANTVIEW, RH1-REC-GUTLINE, RH1-REC-ABU, RH4-REC-24INCH, RHA-REC-LIMESTONE-10INCH, RA2-REC-GREYHOUND, RHA-LAU-LIMESTONE-10INCH, RH1-LAU-NGPL, RH1-LAU-TW, RH1-LAU-ETC, RH1-LAU-ONEOK, and RH2-LAU-GPX.

**Major Process Bottlenecks**
The production at the Red Hills facility is limited at various processes. Inlet separation is constrained by the maximum liquid handling capacity, which limits the ability to manage large slugs or high liquid-to-gas ratios. Amine treating is limited by amine recirculation rates, contactor surface area, and heat duty supplied by the reboilers and hot oil system, which restricts the amount of $CO_2$ and $H_2S$ that can be removed. Glycol dehydration is limited by reboiler capacity. Residue gas compression is constrained by the compression capacity and discharge temperature limits, which restrict the maximum gas throughput and the pressure that can be delivered to the pipeline. NGL production is limited by the heater duty and downstream pumping capacity which restricts how much stabilized product can be processed and exported. Liquid storage is limited by tank volume and export rates, restricting how long the plant can operate at full capacity without offloading. Heaters and the hot oil system are capped by the total installed heat duty, fluid temperature limits, and flow distribution constraints, which together cap how much thermal energy can be supplied to various processes.

## 2.2 Plant Location and Surrounding Area

Red Hills is located approximately 37 km west-northwest of Jal, Lea County, New Mexico at north latitude 32°12'38" and west longitude 103°31'26" and alternately, in Section 13, Range 33E and Township 24S, Universal Transverse Mercator (UTM) Zone 13 North American Datum 1983 (NAD83). An aerial image of the plant (Figure 2-1) and a wider view of the plant location (Figure 2-2) were obtained from Google Earth.

Lea County is designated by the EPA as "unclassifiable" and/or "attainment" for all criteria pollutants.[8]



The distance from the perimeter of the Area of Operations at Red Hills to the nearest occupied residence or structure, or school is greater than 1.6 km (1 mile).

The Class I areas within 300 km of Red Hills are Carlsbad Caverns National Park (~80 km W-WSW), Guadalupe Mountains National Park (~115 km WSW), Salt Creek Wildlife Area (~170 km NNW), White Mountain Wilderness (~275 km WNW), and Big Bend National Park (~280 km SSE). The closest exterior boundary of the Bosque del Apache Wildlife Refuge is ~350 km from Red Hills. The applicable Class I areas are shown in Figure 2-3. Except for Big Bend National Park, the exterior boundaries of the Class I areas are fully within the 300 km distance from the Red Hills. The portion of the exterior boundary of Big Bend National Park within 300 km distance of the Red Hills is shown in Figure 2-4.

# 3. SOURCE CHARACTERIZATION

The following sections provide details associated with characterizing the emission sources for purposes of air dispersion modeling. A list of sources and associated parameters are provided in 10.4Appendix C.

## 3.1 Point Sources

Emissions that enter the atmosphere through a stack were modeled as point sources. Stack parameters for point sources (height above grade, exhaust temperature and velocity, and inside stack diameter) can be found in 10.4Appendix C.

## 3.2 Flares

Emissions from flares were modeled as point sources using the velocity, temperature, and effective stack diameter prescribed in the NMED Modeling Guidelines.[9] To properly simulate flaring events, Trinity adjusted the release height of flare emissions above the physical flare height to reflect the enhanced buoyancy generated by the combusted gas heat release rate, as described in Section 3.2.1.

### 3.2.1 Effective Flare Height

The regulatory default model, AERMOD, does not have a specific source type for flares. Rather, analysts must use the point source type to model emissions from flares in AERMOD. For a standard point source, AERMOD determines an effective height of the source, which is the height of the centerline of the plume above ground. AERMOD calculates the effective height by adding the physical height of the stack (supplied as a direct input) with the final plume rise, which is a function of buoyancy (exit temperature in relation to ambient air) and momentum (stack exhaust velocity). Flare source inputs are unique and difficult to quantify since "combustion occurs at or beyond the flare tip, appropriate values for stack exit temperature and exit velocity cannot be accurately determined."[10] Thus, flare temperature and exit velocity are modeled using default parameters, which means that AERMOD does not account for flare-specific characteristics, such as buoyancy flux due to the flare's heat release rate or the actual release height of pollutants. Appendix W to Title 40 Code of Federal Regulations Part 51 (40 CFR 51), the Guideline of Air Quality Models, also states that no "explicit provisions in [AERMOD] are made for…the handling of such special plumes as flares."[11]

For flare stack height, the height of the flame can exceed the original height of the flare itself, such that modeling the release of emissions at the base height of the flare would underestimate the actual release height.

The EPA's recommended screening model, AERSCREEN, does include a flare source option. For that source type, AERSCREEN requests users to input the emission rate, stack height, total heat release rate, and radiative heat loss fraction and then calculates effective stack diameter and stack height using this data. AERSCREEN then inputs into AERMOD the calculated effective stack height and diameter, along with default parameters of 20 m/s and 1,273 K, as the stack parameters for a point source. AERMOD does not natively have a flare

[9] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Section 5.2.3.

[10] New Source Review Emission Calculations, APD-ID 6v1. TCEQ, Revised 3/21.

[11] 40 CFR Part 51, Appendix W, 7.2.2.2

source type, so unlike AERSCREEN, this calculation of effective stack height and diameter is not done automatically.

To account for the characteristics of the flare emission source when directly entered in AERMOD, Targa calculated effective stack heights and diameters for each flare by scaling the flare stack's exit diameter based on the total flared gas heat release rate using Equation 1 (below)[12] and finding the sum of the expected height of the flame, also based on the total flared gas heat release rate, and the actual height of the flare to model the correct release height using Equation 2.[13] AERMOD can then calculate plume rise and model the emissions release reflecting the operational flare data while using the standard point source algorithm.

$$D = \sqrt{10^{-6} q_n} \qquad \text{Eq. 1}$$

Where:

- D – diameter
- $q_n$ – net heat release

$$H_{eff} = H_s + 4.56 \times 10^{-3} \times HR^{0.478} \qquad \text{Eq. 2}$$

Where:

- $H_{eff}$ – effective stack height
- $H_s$ – physical stack height
- HR – total heat release rate

The modeled effective release height for the flares does not exceed the Good Engineering Practice (GEP) stack height discussed in Section 4.6.

### 3.2.2 Sweet Gas Flares

Short-term emissions modeled for sweet gas flares, which include the 1-hr, 8-hr, and 24-hr averaging periods, reflect the sum of process emissions and the worst-case startup, shutdown and maintenance (SSM) emissions. Pilot, purge, and dehydrator still vent emissions are included in process emissions, where appropriate, meaning that they were assumed to be emitted continuously over a 24-hour period. For 24-hour standards, process emissions were assumed to occur for the entire period, while worst-case SSM emissions were assumed to only occur for the duration of the worst-case SSM event, which is 12 hours. The worst case SSM event would expend all of its proposed annual tons per year (TPY) emissions limit within a 12-hour period at that rate; therefore, it is presumed that this approach is conservative.

Annual emissions for sweet gas flares only account for process emissions, which include pilot, purge, and dehydrator still vent emissions, where appropriate. Per NMED Modeling Guidance Section 4.1.6, SSM does not have to demonstrate compliance with the annual standards or annual increment consumption.[14]

The table below summarizes the hourly, daily, and annual $NO_x$ and $SO_2$ emission rates modeled for each sweet gas flare. Modeling for CO and $H_2S$ utilized the highest hourly emission rate, as reported in 10.4Appendix C.

[12] Air Dispersion Modeling Guidelines. New Mexico Air Quality Bureau, June 2024.

[13] Engineering Guide #69: Air Dispersion Modeling Guidance. Ohio Environmental Protection Agency, November 14, 2018.

[14] NMED Modeling Guidance (July 2024). Section 4.1.6 Startup, Shutdown, Maintenance (SSM), and Other Short-term Emissions

**Table 3-1. Sweet Gas Flares Emission Rates**

| Model Unit ID | Permit Unit ID | Hourly Emission Rate (lb/hr) | | Daily Emission Rate[a] (lb/hr) | | Annual Emission Rate[b] (lb/hr) | |
|---|---|---|---|---|---|---|---|
| | | $NO_x$ | $SO_2$ | $NO_x$ | $SO_2$ | $NO_x$ | $SO_2$ |
| 1-EP-2 | RH1-FL-29-1003 | 211.68 | 2.56 | 106.12 | 1.35 | 0.56 | 0.15 |
| 2-EP-2a | RH2-FL-5100 | 563.35 | 5.00 | 281.86 | 2.50 | 0.37 | 0.0017 |
| 3-EP-2a | RH3-FL-5100 | 563.35 | 5.00 | 281.86 | 2.50 | 0.37 | 0.0017 |
| 4-EP-2a | RH4-FL-45100 | 648.31 | 5.75 | 324.08 | 2.88 | 0.37 | 0.0017 |
| 5-EP-2 | RH5-FL-55100 | 648.18 | 5.75 | 324.47 | 2.88 | 0.76 | 0.0035 |

a. Daily emission rates assume process emissions are emitted continuously over a 24-hour period, while worst-case SSM emissions are assumed to occur for the duration of the worst-case SSM event, which is 12 hours.
b. Annual emission rates only account for process emissions.

### 3.2.3 Acid Gas Flares

Flare model unit IDs 2.5-EP-5 and 5.5-EP-1b (permit unit IDs RHA-FL-5100 and RA2-FL-25100) combust SSM and gaseous emissions from various process equipment at the facility. These flares also handle acid gas emissions from RHA-AMINE and RA2-AMINE when AGI-1 and AGI-2 are offline. There are three (3) operating scenarios for these flares are summarized in Table 3-2 below. Each flare unit will have hourly emission limits (represented by the three operating scenarios) based on whether the flares are operating simultaneously or exclusively, as represented in Table 3-3 below.

**Table 3-2. Acid Gas Flare Scenarios**

| Model Unit ID | Permit Unit ID | AOS 1 Processes | AOS 2 Processes | AOS 3 Processes |
|---|---|---|---|---|
| **2.5-EP-5** | RHA-FL-5100 | Pilot<br>Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge |
| **5.5-EP-1b** | RA2-FL-25100 | Pilot<br>Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge | Pilot<br>Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions |

**Table 3-3. AGI Flaring Scenarios Hourly Emission Rates**

| Model Unit ID | Permit Unit ID | Scenario | $NO_x$ (lb/hr) | CO (lb/hr) | $SO_2$ (lb/hr) | $H_2S$ (lb/hr) |
|---|---|---|---|---|---|---|
| **2.5-EP-5** | RHA-FL-5100 | AOS 1 | 16.83 | 144.32 | 128.29 | 1.39 |
| | | AOS 2 | 16.87 | 144.65 | 259.57 | 2.85 |
| | | AOS 3 | 0.071 | 0.61 | 1.02E-03 | 2.86E-06 |
| **5.5-EP-1b** | RA2-FL-25100 | AOS 1 | 16.92 | 145.07 | 127.13 | 1.38 |
| | | AOS 2 | 0.17 | 1.47 | 1.83E-03 | 6.88E-06 |
| | | AOS 3 | 21.15 | 181.30 | 258.17 | 2.80 |

In addition to the flaring scenarios represented above, each flare is also going to take a daily emission rate limit to more appropriately represent impacts over a 24-hour period. The proposed daily emission rate limits for these units, in lb/day, are presented in Table 3-4 below.

**Table 3-4. AGI Flaring Scenarios Daily Emission Rates**

| Model Unit ID | Permit Unit ID | Scenario | $NO_x$ (lb/day) | CO (lb/day) | $SO_2$ (lb/day) | $H_2S$ (lb/day) |
|---|---|---|---|---|---|---|
| **2.5-EP-5** | RHA-FL-5100 | AOS 1 | 269.31 | 2,309.06 | 2,052.62 | 22.25 |
| | | AOS 2 | 269.93 | 2,314.44 | 4,153.05 | 45.55 |
| | | AOS 3 | 1.71 | 14.66 | 0.025 | 6.86E-05 |
| **5.5-EP-1b** | RA2-FL-25100 | AOS 1 | 270.72 | 2,321.19 | 2,034.08 | 22.05 |
| | | AOS 2 | 2.75 | 23.54 | 0.029 | 1.10E-04 |
| | | AOS 3 | 338.32 | 2,900.81 | 4,130.65 | 44.78 |

## 3.3 Volume Sources – Roads

Haul roads were modeled as two lanes to allow for two-way traffic. The road segments were characterized as volume sources following EPA's haul road guidance.[15] The road modeling was performed using adjacent volume sources with inputs as shown below. The road and haul truck dimensions are representative of vehicle traffic at the facility.

- Volume width = road width in meters (m) + 6 m
- Volume height = 1.7 x average vehicle height in meters
- Number of volume sources = road segment length / volume width
- Initial lateral dimension of the volume ($\sigma_{yo}$) = volume horizontal dimension / 2.15
- Initial vertical dimension of the volume ($\sigma_{zo}$) = volume height / 2.15
- Release height = volume height / 2
- Emission rate per volume source = total emission rate / number of volume sources
- Haul roads sources may be separated into segments specific to the type of vehicular traffic. Emissions were allocated to each road source segment based on the number of volume sources needed to represent a specific road segment and the total emissions for the traffic on the segments.

## 3.4 Volume Sources – Process Emissions

Pig receivers and launchers, train venting emissions during startup, shutdown, and maintenance, and sour water truck loading were modeled as volume sources. The volume source type and dimensions followed NMED Modeling Guidelines and can be found in Appendix C.

There are two volume sources at the facility that represent combined emissions from the emissions sources listed above. COMB123 represents emissions from Trains 1-3, 2.5, and 5.5 during startup, shutdown, and maintenance (RH-1SSM, RH2-SSM, RH3-SSM), fugitive $H_2S$ emissions (RH-FUG-1), and fugitive $H_2S$ emissions from sour water truck loading (RA2-TK-SLOP-LOAD and RH4-TK-SLOP-LOAD). COMB56 represents emissions from Trains 4-6 during startup, shutdown, and maintenance (RH4-SSM, RH5-SSM, RH6-SSM) and fugitive H2S emissions (RH-FUG-2). For both COMB sources, the location is based on the center of all the represented

[15] EPA memorandum from T. Fox to Regional Office Modeling Contacts, *Haul Road Workgroup Final Report Submission to EPA-OAQPS*. March 2, 2012.

sources. The initial lateral dimension is based on the area covering all these sources. However, to avoid receptors located in the volume source exclusion zone, Trinity conservatively calculated an initial lateral dimension such that no receptors are located within the volume source exclusion zone. The release height and initial vertical dimension are based on the height of fugitive sources.

# 4. CLASS II MODELING PROCEDURES

## 4.1 Model Selection

Trinity utilized the current version of the US EPA AERMOD modeling system to estimate off-site impacts. AERMOD is appropriate for use in modeling multi-source emissions, and accounts for plume downwash, stack tip downwash, and point, area, and volume sources.[16, 17]

Current versions of the AERMOD model and preprocessors[18] are:

- AERMAP Version 24142
- AERMOD Version 24142
- BPIPPRM Version 04274

All model input/output files and supporting data used in the modeling analysis were provided electronically to NMED concurrently with this modeling report.

## 4.2 Model Input Options

Model input options were set to EPA regulatory default values. Steady state emission rates for all averaging periods were modeled using the maximum short-term emission rate requested in the Red Hills permit application.[19] Startup, shutdown, and maintenance (SSM) emission rates were modeled as shown in Appendix C, using point sources and scenarios separate from steady state impacts to demonstrate compliance with standards. Short-term emissions for limited-hour sources (e.g., backup power generator engines) were modeled at the maximum short-term emission rate for deterministic standards ($PM_{10}$, CO) and at annualized emission rates based on the EPA guidance[20] for probabilistic standards ($NO_2$, $SO_2$). Although $PM_{2.5}$ is a probabilistic standard, short-term emissions for limited-hour sources were modeled at the maximum short-term emission rate.

[16] User's Guide for the AMS/EPA Regulatory Model - AERMOD (EPA-454/B-23-008). Office of Air Quality Planning and Standards. October 2023.

[17] Code of Federal Regulations, Title 40 – Protection of Environment, Part 51, Appendix W, January 17, 2017.

[18] NMED provides pre-processed meteorological data that has been processed using AERMET Version 19191. Use of the current version of AERMET (Version 24142) is not expected to produce appreciably different dispersion meteorological conditions for this application. Therefore, the meteorological preprocessors AERSURFACE, AERMINUTE, and AERMET were not used in this application. See Section 4.7 for a discussion of the proposed meteorological data.

[19] See application for permit 4310M7, Table 2-E.

[20] Additional Clarification Regarding Application of Appendix W Modeling Guidance for the 1 hour $NO_2$, National Ambient Air Quality Standard. Memorandum from Tyler Fox (Leader, Air Quality Modeling Group). March 1, 2011. (Note that this guidance also applies to the 1-hour $SO_2$ NAAQS).

## 4.3 Alternate Operating Scenarios

For units with alternate operating scenarios occurring at the same emission point, such as the flares at the facility, the maximum emission scenario was used for the modeling demonstration. The alternate operating scenarios are detailed in Section 15 of the application package submittal.[21]

For alternate operating scenarios that occur at different emission points, all scenarios were modeled in the significant impact analysis. The scenario that resulted in the most significant impact was used to demonstrate compliance through a cumulative analysis.

The most significant alternate operating scenario revolves around the flares that operate on the acid gas trains. Three scenarios exist: RHA-FL-5100 and RA2-FL-25100 operating simultaneously (Scenario 1), RHA-FL-5100 operating independently (Scenario 2), and RA2-FL-25100 operating independently (Scenario 3). Table 4-1 lists the emission rates for each scenario, Table 4-2 lists the changes in stack parameters for the two stacks based on changes in heat content of the controlled stream, and Table 4-3 identifies the scenarios with the maximum modeled impact for each pollutant and averaging period. For all annual scenarios, the emission rates are identical across all three scenarios. If modeled impacts were identical for all scenarios, such as for PM modeling where emissions are identical for all scenarios, Scenario 1 was used.

**Table 4-1. Scenario Emission Rates**

| Pollutant | Averaging Period | Scenario | RHA-FL-5100 Emission Rate (lb/hr) | RA2-FL-25100 Emission Rate (lb/hr) |
|---|---|---|---|---|
| CO | 1-hr/8-hr | 1 | 144.32 | 145.08 |
| | | 2 | 144.65 | 1.47 |
| | | 3 | 0.61 | 181.30 |
| $NO_2$ | 1-hr/24-hr | 1 | 16.83 | 16.92 |
| | | 2 | 16.87 | 0.17 |
| | | 3 | 0.071 | 21.15 |
| $SO_2$ | 1-hr/3-hr/24-hr | 1 | 128.29 | 127.13 |
| | | 2 | 259.57 | $1.83 \times 10^{-3}$ |
| | | 3 | $1.02 \times 10^{-3}$ | 258.17 |
| $H_2S$ | 1-hr | 1 | 1.39 | 1.38 |
| | | 2 | 2.85 | $6.89 \times 10^{-6}$ |
| | | 3 | $2.86 \times 10^{-6}$ | 2.80 |

[21] See application for permit 4310M7, Section 15.

**Table 4-2. Scenario Stack Parameters**

| Scenario | Stack ID | Stack Height* (m) | Stack Temperature (K) | Stack Velocity (m/s) | Stack Diameter* (m) |
|---|---|---|---|---|---|
| 1 | RHA-FL-5100 | 62.06 | 1273 | 20 | 4.70 |
| | RA2-FL-25100 | 61.32 | 1273 | 20 | 4.84 |
| 2 | RHA-FL-5100 | 64.71 | 1273 | 20 | 5.48 |
| | RA2-FL-25100 | 45.71 | 1273 | 20 | 0.38 |

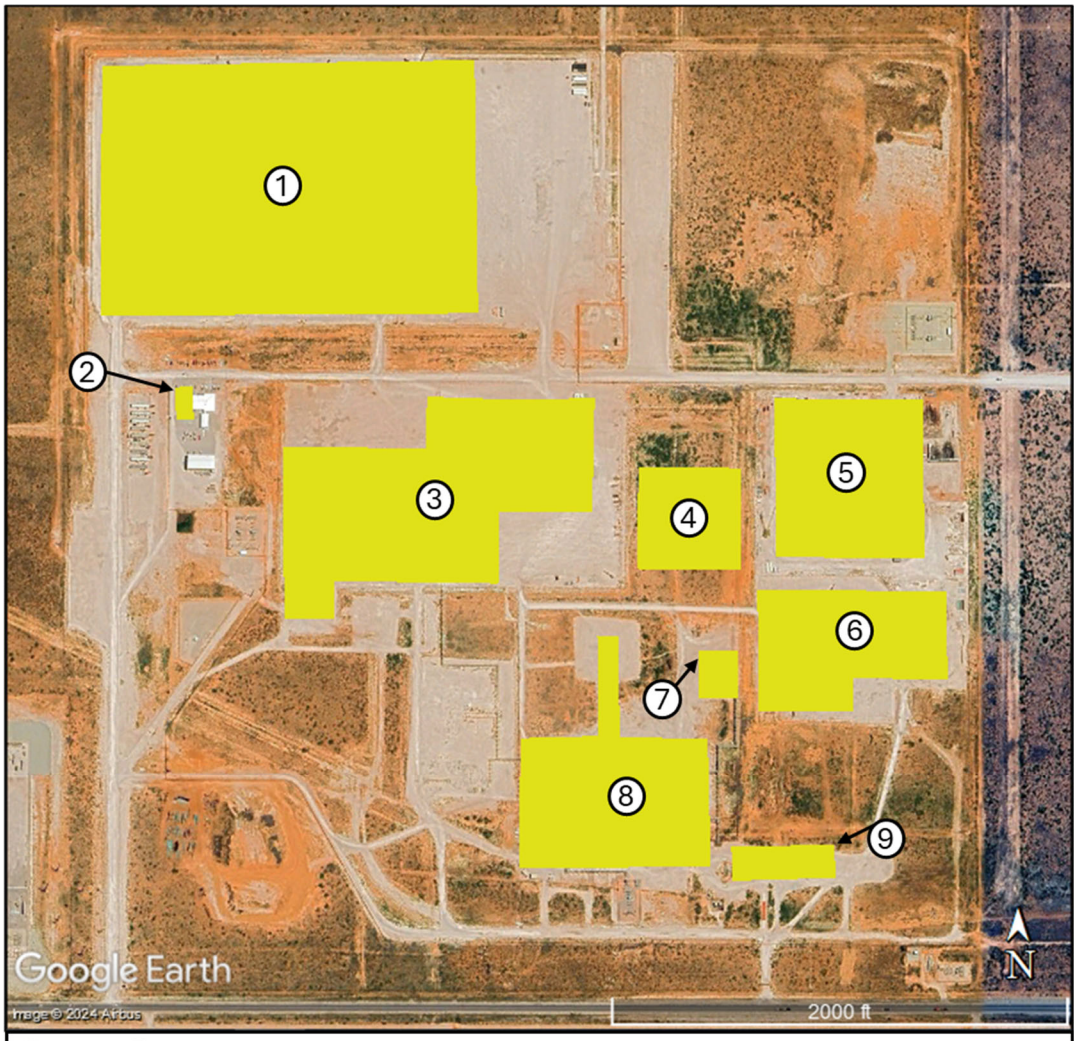
| | 3-hr | 2 |
| | 24-hr | 3 |
| | Annual | 2 |



## 4.4 Portable Sources

Targa operates numerous portable diesel-fired generators and one heater trailer to support various activities that require additional power or heat. Targa seeks flexibility to relocate the generators and heater trailer within the Generator Zones, as outlined in Figure 4-1, with zone boundaries provided in Table 4-4. The generators and heater trailer were modeled at the boundary of the operational areas at a spacing of 10 meters apart in order to determine the locations that result in maximum impact. These locations were used for all significant impact and cumulative impact modeling. Portable and temporary sources were not modeled for PSD Increment, according to the notes to Table 21 of the NMED Modeling Guidelines.[22]

[22] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Section 2.7.1, Table 21.

This demonstration was set up to model for the 24-hr $PM_{10}$ standard. The model includes 762 sources, each modeled with the same parameters as the generators presently on site. Trinity identified the 10 generator locations that result in the highest modeled impact; these locations are used for significant impact and cumulative impact modeling for these units. General proximity of these locations can be seen in Figure 4-2, a more granular location map can be seen in Figure 4-3, and coordinates of locations can be found in Table 4-5. It is assumed that the location of worst impact will be identical for each pollutant. The locations were all in Generator Zone 2 and are identified in Figure 4-2.

## 4.5 Land Use Classification

A qualitative Auer land-use analysis, as described in Section 7.2.1.1(b)(i) of the Modeling Guideline was performed to determine the appropriate dispersion coefficients used by the AERMOD model. The qualitative land use analysis was performed using aerial imagery from Google Earth.

Figure 4-4 presents an aerial image of the area around Red Hills. The red circle shown represents a 3-km radius circle from the site. Less than 50% of the area within the 3-km radius is classified as land use types I1, I2, C1, R2, or R3 [heavy industrial, light/moderate industrial, commercial, compact residential (single family), or compact residential (multi-family), respectively], so the URBANOPT keyword in AERMOD with appropriate inputs was not used. As shown in the image, the majority of the land use is undeveloped; as such, rural dispersion coefficients were used in AERMOD.

**Figure 4-4. Area Surrounding the Red Hills Gas Processing Plant**

## 4.6 Building Downwash

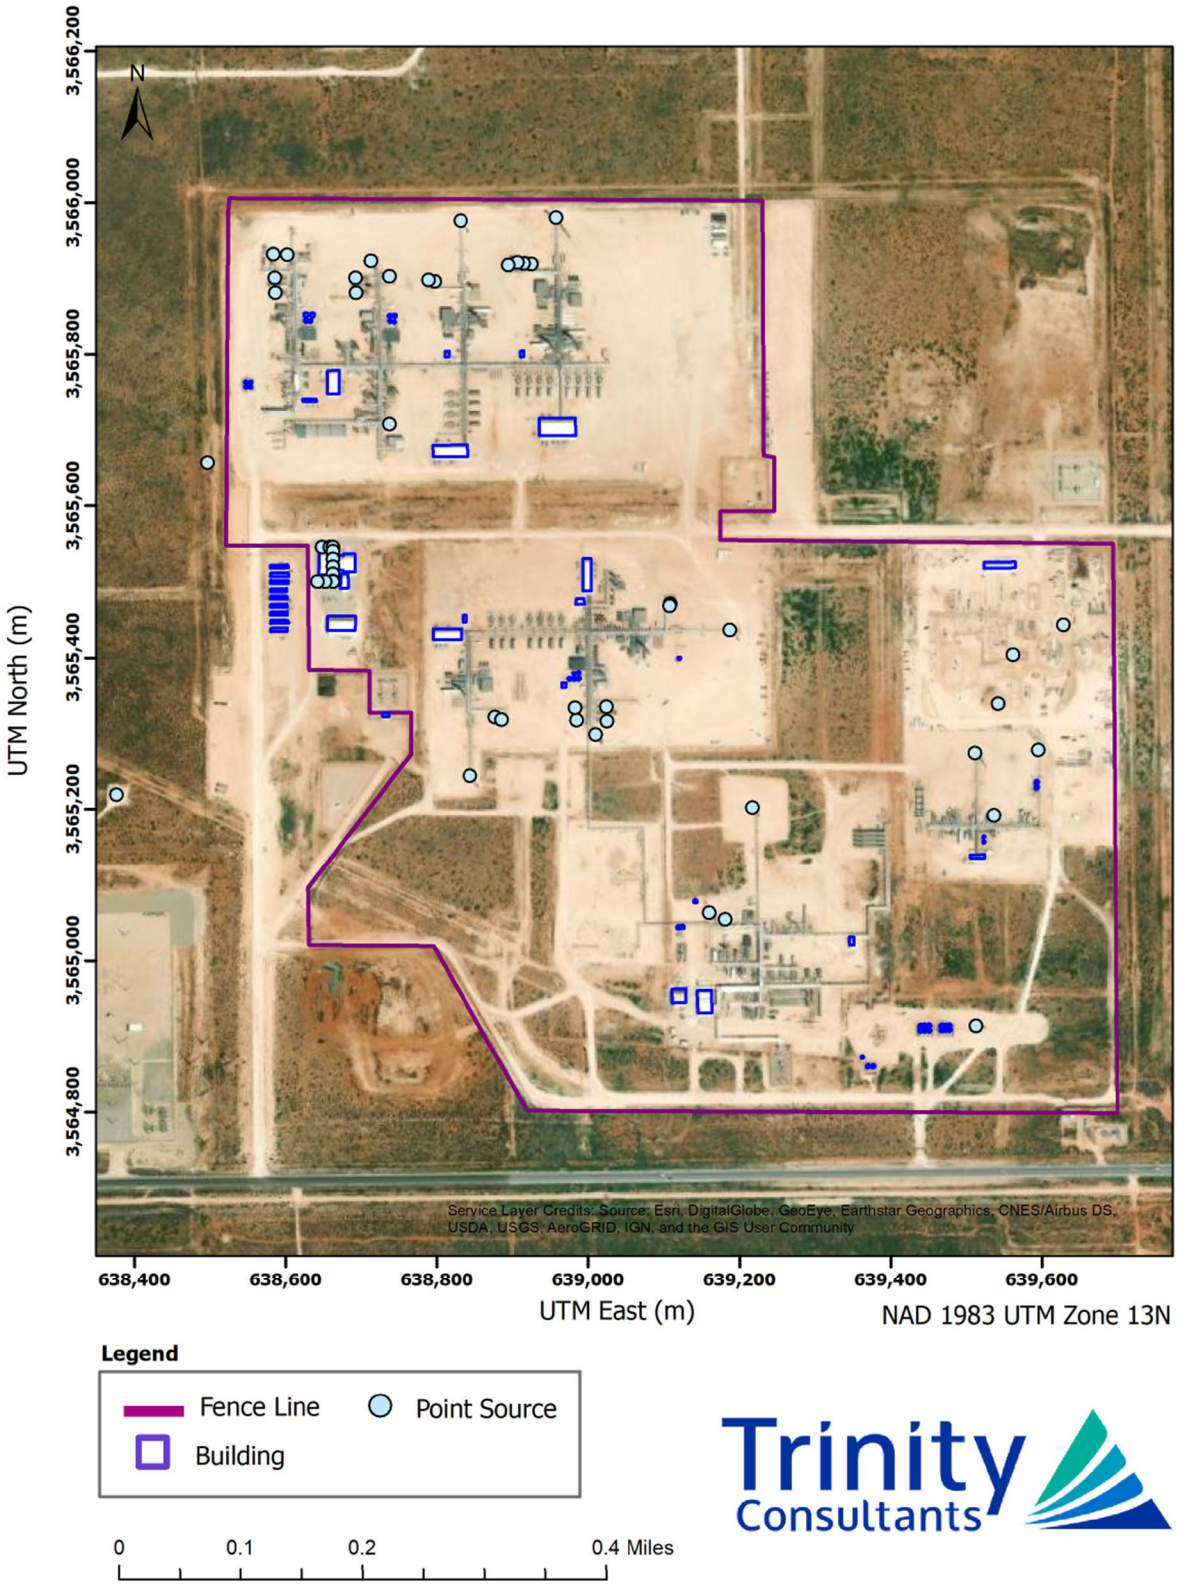
The Red Hills point sources were evaluated for proximity to nearby structures to determine if the stack discharge might become caught in the structures' turbulent wakes. Wind blowing over a building creates zones of turbulence that are greater than if the building was absent. AERMOD incorporates the Plume Rise Model Enhancements (PRIME) algorithms for estimating enhanced plume growth and restricted plume rise for plumes affected by building wakes.

EPA has promulgated stack height regulations that restrict the use of stack heights in excess of GEP in air dispersion modeling analyses. Under these regulations, that portion of a stack in excess of the GEP height is

generally not creditable when modeling to determine source impacts. This essentially prevents the use of excessively tall stacks to reduce the ground-level pollutant concentrations. Trinity has ensured that no stacks are represented as exceeding GEP height as described in EPA's GEP Technical Support document.[23]

Direction-specific building dimensions and the dominant downwash structure parameters used as inputs to AERMOD were determined using the *BREEZE®* BPIP software, developed by Trinity, which incorporates the current version of EPA's Building Profile Input Program for PRIME (BPIPPRM) building downwash processor.

The BPIPPRM processor is designed to incorporate the concepts and procedures expressed in the GEP Technical Support document[24] and other related documents. The site elevation was determined from digital elevation data.



The output from the BPIPPRM downwash analysis lists the names and dimensions of the structures generating wake effects and the locations and heights of the affected point sources. In addition, the output contains a summary of the dominant structure for each emission unit (considering all wind directions) and the actual building height and projected widths for all wind directions. This information was input into the AERMOD air dispersion model for each point source.

A simplified plot plan of the facility showing the locations of analyzed structures and point sources is provided in Figure 4-5. Structures with greater than 50% permeability were excluded from the downwash analysis.

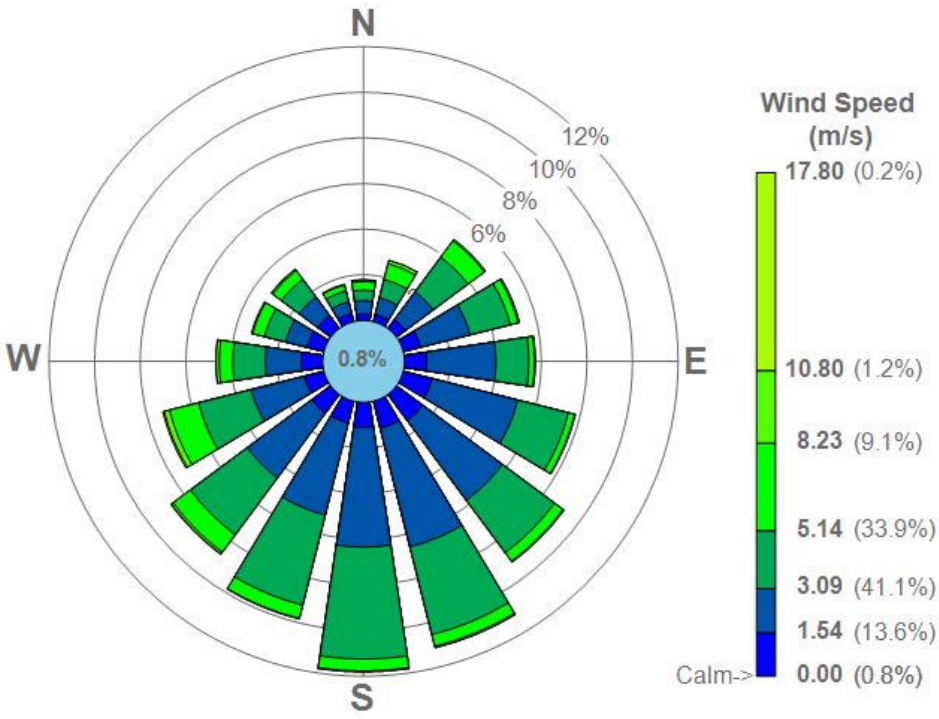
[24] Guideline for Determination of Good Engineering Practice Stack Height (Technical Support Document for the Stack Height Regulations). EPA-450/4-80-023R.

**Figure 4-5. Plot Plan: Buildings and Structures**



## 4.7 Meteorological Data

Hourly meteorological data used for air quality modeling must be spatially and climatologically representative of the area of interest. The EPA Modeling Guideline requires at least one year of site-specific meteorological data or five years from the most recent, readily available data collected at a representative National Weather Service (NWS) station.[25]

Site-specific meteorological data is not available for the immediate Red Hills area. The NMED provides processed meteorological data suitable for direct input to AERMOD.[26] Five years of AERMOD-ready meteorological data collected at Hobbs, New Mexico for the period 2017 through 2021 was used for this application. A composite 5-year wind rose is shown in Figure 4-6.

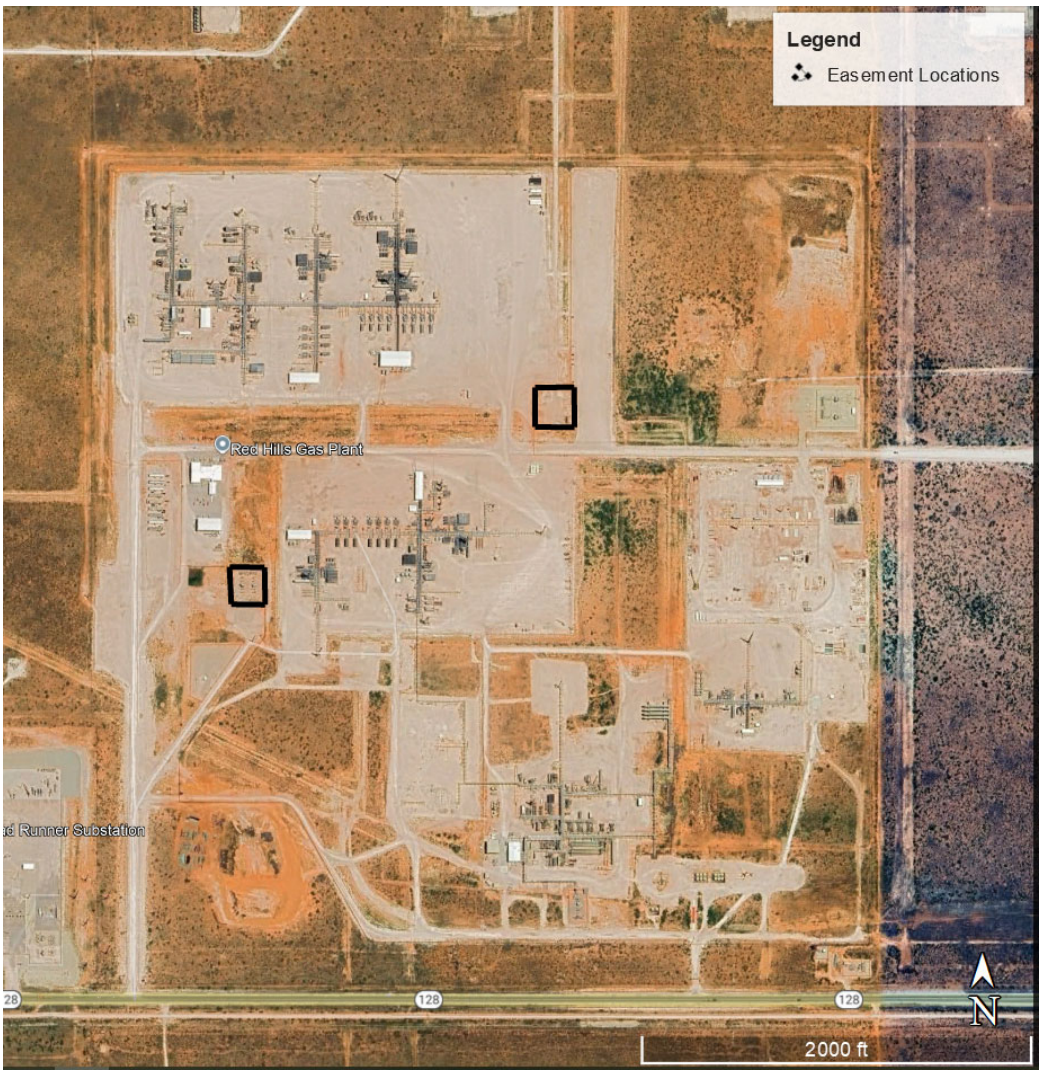
When updates to the EPA Modeling Guideline were promulgated in 2017, EPA adopted the use of ADJ_U* as a regulatory option when using NWS airport meteorological data, site-specific meteorological data without turbulence parameters, or prognostic meteorological data. Utilizing ADJ_U* in data processing for meteorological data without turbulence parameters is recommended to address model overprediction issues during light wind, stable conditions. The NMED invoked the ADJ_U* option in the AERMET[27] processing of the Hobbs meteorological dataset. The surface station elevation is 1,108.2 m.

**Figure 4-6. Hobbs, New Mexico Wind Rose (2017-2021)**

[25] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Section 4.3.1.

[26] Meteorological data available for download from Resource Space (resourcespaceapp.azurewebsites.net).

[27] The NMED processed the meteorological with AERMET Version 19191. Use of the current version of AERMET (Version 23132) is not expected to produce appreciably different dispersion meteorological conditions for this application.



## 4.8 Ambient Air Boundary

According to the NMED modeling guidelines, "ambient air" is defined as that portion of the atmosphere, external to buildings, to which the general public has access. The atmosphere over land owned or controlled by a facility may be excluded from ambient air where the facility employs measures, such as physical barriers, that are effective in precluding access to the land by the general public. [28]

Within the facility boundaries of Red Hills, there are two separate areas to which other companies have unrestricted access. For this reason, onsite receptors are included within these two areas as denoted in Figure 4-7. Figure 2-1 shows the land owned and controlled by Targa that constitutes the ambient air boundary used in the AQIA.

**Figure 4-7. Red Hills Gas Processing Plant Easement Locations**

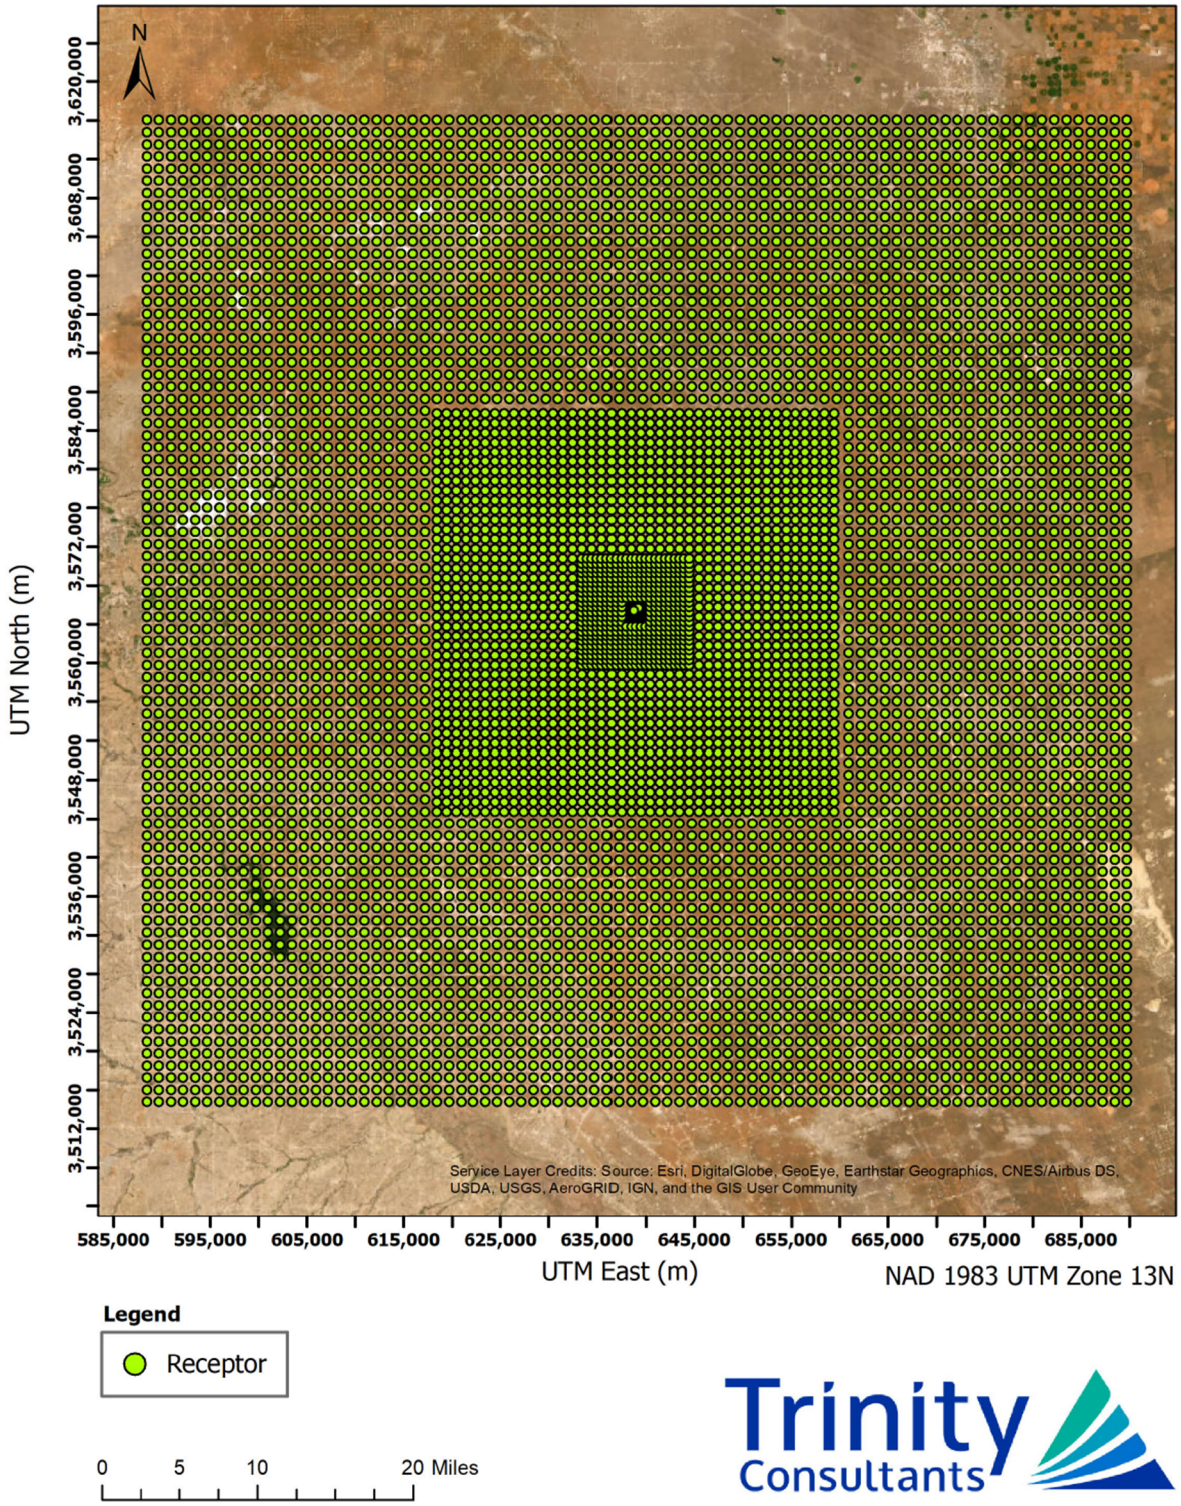
Google Earth, image produced 04/08/2025

[28] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Section 4.6.2.

## 4.9 Receptor Network and Terrain Elevations

Cartesian receptor grids centered on the facility were defined using UTM Zone 13 NAD83 coordinates. For purposes of air dispersion modeling, the NAD83 spatial reference system is equivalent to WGS84.[29]

Several receptor grids of varying resolution were defined for the Class II significant impact analysis following recommendations in NMED's modeling guidance. The Class II significant impact analysis grids consisted of a set of nested receptors placed at:



- 25-m resolution at the two onsite easements.
- 25-m resolution along the ambient air boundary.
- 100-m resolution extending to approximately 500 m from the ambient air boundary.
- 500-m resolution starting at 500 m and extending to approximately 5 km from the ambient air boundary.
- 1,000-m resolution starting at 5 km and extending to approximately 20 km from the ambient air boundary.
- 1,250-m resolution starting at 20 km and extending to approximately 50 km from the ambient air boundary.

For pollutants and averaging periods where modeled concentrations are greater than the applicable SIL and thus triggering cumulative impact analyses (see Section 5.2), only the receptors with modeled impacts greater than or equal to the SIL were modeled for the significant pollutant and averaging period.

If maximum cumulative impacts greater than or equal to 75 percent of the applicable standard are predicted at receptors located in the 100-m, 500-m or 1,000-m grids, supplemental receptors were generated at 50-m spacing to identify the overall maximum impact. The refined grids were large enough to include adjacent receptors in all directions (200 m square in the 100-m interval portion of the grid, 1,000 m square in the 500-meter interval portion of the grid, and 2,000 m square in the 1,000-meter interval portion of the grid). The receptor grid is shown in Figure 4-8 below.

[29] AERMAP User's Guide (EPA-454/B-18-004), Section 2.1.

**Figure 4-8. Receptor Grid**

Receptor elevations were obtained using the EPA's AERMAP terrain processor. The digital elevation dataset provided as input to AERMAP was USGS National Elevation Data (NED) at 1/3 arc second resolution, which is equivalent to approximately 10 m.

In addition to receptor elevations, AERMAP provided the hill height scale required for each receptor. The hill height scale supplies the computational algorithms with an indication of the relative relief within the modeling domain for the determination of the critical dividing streamline height for each hour of meteorological data. AERMOD computes the impact at a receptor as a weighted interpolation between horizontal and terrain-following conditions using a critical dividing streamline approach. This scheme assumes that part of the plume mass would have enough energy to ascend and traverse over a terrain feature and the remainder would impinge and traverse around a terrain feature under certain meteorological conditions. The hill height scale is computed by the AERMAP terrain preprocessor for each receptor as a measure of the one terrain feature in the modeling domain that would have the greatest effect on plume behavior at that receptor.

## 4.10 Nearby Source Inventory

For pollutants and averaging periods that have impacts that exceed a SIL, cumulative modeling is required to demonstrate compliance with the NMAAQS, NAAQS, and PSD increments, as applicable. In accordance with NMED's Modeling Guidance,[30] modeled nearby sources are required for $H_2S$, $PM_{10}$, $PM_{2.5}$, and $SO_2$. For CO, $NO_2$, and $SO_2$ (other than the 1-hour averaging period for NMAAQS, NAAQS, and increment, as applicable), an applicant may choose to explicitly model nearby sources within certain distances of the facility or add monitored background concentrations to facility-only modeled impacts for NMAAQS and NAAQS compliance demonstrations. Red Hills does not meet the definition of being near a city, which NMED has stated as being within 20 km of Albuquerque, NM or El Paso, TX. For PSD increment analyses, while NMED provides the option to use monitored background concentrations, explicitly modeling nearby increment consumers and expanders may be preferred. Table 4-6 summarizes the averaging periods that were modeled, NMED's guidance on the use of nearby sources and background, if nearby sources or background or both were used for the facility's modeling, and the modeled concentration.

An inventory of all pollutants from surrounding sources was obtained from NMED. For pollutants that explicitly model nearby sources, the retention distance from the Red Hills Facility follows Section 4.8.1.1 of NMED's Modeling Guidelines. The NMED-provided inventory was used as applicable and any adjustments to source parameters is documented in in Section 4.10.1 through 4.10.8 below and made per the guidance in Section 4.8.1.3 of NMED'S Modeling Guidelines.[31] Nearby source UTM coordinates were preserved as provided by NMED unless errors were identified. If elevation data is provided, that data was used in the model once verified. Per NMED Modeling Guidelines,[32] nearby sources for which elevation data is not provided, elevations were calculated using AERMAP. Copies of source inventories are included for $PM_{10}$, $PM_{2.5}$, $H_2S$, and for $SO_2$ with the submitted and approved modeling protocol. A secondary copy is not included herein as a copy is included as part of the submitted application.

[30] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Table 20.

[31] NMED Air Dispersion Modeling Guidelines (Revised June 2024).

[32] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Section 4.5.2.

**Table 4-6. Nearby Sources and Background Determination**

| Averaging Period | NMED Guidance on Nearby Sources and Background | Nearby Sources or Background? | Modeled Concentration |
|---|---|---|---|
| CO 8-hour NMAAQs | Choose One (Both if near city) | Background | High 8 hour |
| CO 1-hour NMAAQs | Choose One (Both if near city) | Background | High 1 hour |
| $H_2S$ 1-hour or ½-hour NMAAQs | Model Nearby Sources | Nearby Sources | High 1 hour |
| $NO_2$ annual NMAAQs | Choose one (Both if near city) | Background | Annual average |
| $NO_2$ Annual PSD increment | Choose One | Background | Annual Average |
| $NO_2$ 1-hour NAAQs | Choose one (Both if near city) | Background | 98$^{th}$-percentile 1 hour |
| $PM_{2.5}$ annual NAAQs | Both | Nearby Sources and Background | Annual average |
| $PM_{2.5}$ annual PSD increment | Choose one | Nearby Sources | Annual average |
| $PM_{2.5}$ 24-hour NAAQS | Both | Nearby Sources and Background | 98$^{th}$-percentile 24 hour |
| $PM_{2.5}$ 24-hour PSD increment | Choose one | Nearby Sources | High second high 24 hour |
| $PM_{10}$ annual PSD increment | Choose one | Nearby Sources | Annual average |
| $PM_{10}$ 24-hour NAAQs | Both | Nearby Sources and Background | High second high 24 hour |
| $PM_{10}$ 24-hour PSD increment | Choose one | Nearby Sources | High second high 24 hour |
| $SO_2$ annual PSD increment | Choose one | Nearby Sources | Annual average |
| $SO_2$ 24-hour PSD increment | Choose one | Nearby Sources | High second high 24 hour |
| $SO_2$ 3-hour PSD increment | Choose one | Nearby Sources | High second high 3 hour |
| $SO_2$ 1-hour NAAQs | Choose one (Both if near city. Model nearby sources without adding background in Permian Basin) | Nearby Sources* | 99$^{th}$ -percentile 1 hour |

*Per comments received from Sufi Mustafa, Manager Air Dispersion Modeling and Emission Inventory Section on January 6, 2026 regarding the modeling protocol, Background concentrations for 1-hour SO2 was included in addition to surrounding sources. The background concentration (2024 design value) from Del Norte High School (AQS ID: 35-001-0023) was used.

Surrounding sources were obtained from the NMED MergeMaster Database on January 27, 2024. The below sections detail adjustment to surrounding source parameters that have been identified.

### 4.10.1 Adjusted Sources based on Distance

Upon reviewing the surrounding source files, several sources were identified as being located more than 25 km from the facility, which exceeds the inclusion limit for surrounding sources. Table 4-7 below lists these sources, the pollutants they were associated with, and the proposed corrections to the surrounding source file.

**Table 4-7. Surrounding Source Corrections**

| AQB Source ID | Description of Corrections |
|---|---|
| 29590E20 | NO2: Point source is in the wrong location (~93 km from facility). Source was removed. |
| 29590E21 | NO2: Point source is in the wrong location (~93 km from facility). Source was removed. |
| 1775@1 | NO2, PM2.5, PM10, SO2: Point source is in the wrong location (~69 km from facility). Source was removed. |
| 30051E7 | NO2, PM2.5, PM10, SO2: Point source is in the wrong location (~43 km from facility). Source was removed. |
| 30051E8 | NO2, PM2.5, PM10, SO2: Point source is in the wrong location (~43 km from facility). Source was removed. |
| 38058E18 | NO2, PM2.5, PM10, SO2: Point source is in the wrong location (~77 km from facility). Source was removed. |
| 38058E19 | NO2, PM2.5, PM10, SO2: Point source is in the wrong location (~77 km from facility). Source was removed. |

### 4.10.2 Surrounding Source AI # 40063

Surrounding source AI # 40063, with AQB source ID #40063@1, is the Roswell Ready Mix Company's Concrete Batch Plant which operates under GCP-5 #9285. $PM_{10}$ and $PM_{2.5}$ emission rates were based off 95 tpy (21.69 lb/hr) total suspended particulate (TSP) from the GCP-5 permit for Concrete Batch plants. No emission calculations were submitted with the last permitting action. Since TSP is larger than both $PM_{10}$ and $PM_{2.5}$, the 21.69 lb/hr emission rates were ratioed based on particle size multiplier constants taken from AP-42 Chapter 13.2.4 for Aggregate Handling and Storage Piles. The new values are: 10.26 lb/hr $PM_{10}$ and 1.55 lb/hr $PM_{2.5}$. Calculations are included in Appendix D for reference. The GCP-5 permit has been included for reference in Appendix E and the most recent publicly available permit application for GCP-5 #9285 is included for reference in Appendix F. AP-42 Chapter 13.2.4 is included for reference in Appendix G. Additionally, the facility's public notice notes that the facility operates during daylight hours only; therefore, the facility's emissions have been limited to 6am to 8pm. The facility public notice is included for reference in10.4Appendix H.

### 4.10.3 Surrounding Source AI # 38504

Surrounding source AI #38504, with AQB source IDs 38504A1, 38504E3, 38504E5, 38504E6, 38504E7, 38504E36, and 38504E27, is Matador Production Company's Leo Thorsness Facility which operates under GCP-O&G #7899. Annual haul road emissions were adjusted based on the permitted tpy for $PM_{2.5}$. The tpy value was averaged over the course of the year to determine a long-term annualized emission rate in a lb/hr unit basis. Additionally, numerous unit emission rates for $PM_{2.5}$ were adjusted based on their actual operating hours per day and per year as provided in the surrounding source file, as retrieved from NMED's MergeMaster tool. Table 4-8 below summarizes the adjustments made. Permit GCP-O&G #7899 is included for reference in 10.4Appendix I and calculations are included in Appendix D.

**Table 4-8. AI # 38504 Adjusted Emission Rates**

| AQB Source ID | Unit ID | As Provided $PM_{2.5}$ Emission Rate | Daily Operating Hours | Annual Operating Hours | $PM_{2.5}$ Short-Term Emission Rate | $PM_{2.5}$ Long-Term Emission Rate |
|---|---|---|---|---|---|---|
| | | g/s | Hrs/day | Hrs/year | g/s | g/s |
| 38504A1[1] | HR-1 | 0.01386 | -- | 8760 | 0.01386 | 0.0023 |
| 38504E3 | ENG-5 | 0.00126 | -- | 8760 | 0.00126 | 0.00126 |
| 38504E5 | GEN-1 | 0.00504 | 3 | 1067 | 0.00063 | 0.000614 |
| 38504E6 | HT-1 | 0.00058 | -- | 8760 | 0.00058 | 0.00058 |
| 38504E7 | HT-2 | 0.00058 | 17 | 6192 | 0.00041 | 0.00041 |
| 38504E26[2] | ENG-2 | 0.00252 | 0 | 0 | 0.00252 | 0.00252 |
| 38504E27 | ENG-6 | 0.00252 | 11 | 3888 | 0.0012 | 0.0012 |

[1] Haul road emissions for unit HR-1 were adjusted for annualized rates based on the permitted tpy rate of 0.08 tpy for $PM_{2.5}$.

[2] Unit ENG-2 was conservatively assumed to operate 8760 hrs/yr instead of utilizing the provided hrs/yr in the surrounding source file.

### 4.10.4 Surrounding Source AI # 40140

Surrounding source AI #40140, with AQB source ID 40140A1, is Devon's Broadside 12 Facility 2, which operates under NOI #9357. The MergeMaster Source Retrieval tool provides only short-term emission rates. Annual haul road emissions were adjusted based on the tpy for $PM_{2.5}$ provided in the most recent NOI application. The tpy value was averaged over the course of the year to determine a long-term annualized

emission rate in a lb/hr unit basis. Table 4-9 below summarizes the adjustments made. NOI #9357 is included for reference in Appendix J. Calculations are included in Appendix D.

**Table 4-9. AI # 40140 Adjusted Emission Rates**

| AQB Source ID | Unit ID | As Provided $PM_{2.5}$ Emission Rate | Daily Operating Hours | Annual Operating Hours | $PM_{2.5}$ Short-Term Emission Rate | $PM_{2.5}$ Long-Term Emission Rate |
|---|---|---|---|---|---|---|
| | | g/s | Hrs/day | Hrs/year | g/s | g/s |
| 40140A1[1] | ROAD-1 | 0.02772 | -- | 8760 | 0.02772 | 0.0011 |

[1] Haul road emissions for unit HR-1 were adjusted for annualized rates based on the NOI represented tpy rate of 0.038 tpy for $PM_{2.5}$.

### 4.10.5 Surrounding Source AI # 39913

Surrounding source AI #39913, with AQB source IDs 39913A1, 39913E2, and 39913E4, is Devon's Broadside 12 Facility 1, which operates under NOI #9134. The MergeMaster Source Retrieval tool provides only short-term emission rates. Annual haul road emissions were adjusted based on the tpy for $PM_{2.5}$ provided in the most recent NOI application. The tpy value was averaged over the course of the year to determine a long-term annualized emission rate in a lb/hr unit basis. Table 4-10 summarizes the adjustments made. NOI #9134 is included for reference in 10.4Appendix K K. Calculations are included in Appendix D.

**Table 4-10. AI # 39913 Adjusted Emission Rates**

| AQB Source ID | Unit ID | As Provided $PM_{2.5}$ Emission Rate | Daily Operating Hours | Annual Operating Hours | $PM_{2.5}$ Short-Term Emission Rate | $PM_{2.5}$ Long-Term Emission Rate |
|---|---|---|---|---|---|---|
| | | g/s | Hrs/day | Hrs/year | g/s | g/s |
| 39913A1[1] | ROAD-1 | 0.02772 | -- | 8760 | 0.02772 | 0.0011 |

1 Haul road emissions for unit HR-1 were adjusted for annualized rates based on the NOI represented tpy rate of 0.038 tpy for $PM_{2.5}$.

### 4.10.6 Surrounding Source AI # 39575

Surrounding source AI #39575, with AQB source IDs 39575R2 and 39575R3 is EOG Resources Inc. Midland Division's Bandit Compressor Station, which operates under GCP-O&G #8851M1. The MergeMaster Source Retrieval tool provides $H_2S$ emission rates for both unit IDs. Upon review of the most recent publicly available permit application, which is included in Appendix M for reference, it was found that the $H_2S$ emissions were associated with vented SSM and malfunction emissions (permit IDs SSM and MALF). Per Condition A107.C, the GCP-O&G, which is included in Appendix L for reference, only VOC emissions are authorized for SSM and malfunction events. Therefore, the $H_2S$ sources from this facility were removed from the surrounding source file.

### 4.10.7 Surrounding Source AI # 39956

Surrounding source AI #39956, with AQB source IDs 39956R2 and 39956R3 is EOG Resources Inc – Midland Division's Bald Eagle LGL Station, which operates under GCP-O&G #9177. The MergeMaster Source Retrieval tool provides $H_2S$ emission rates for both unit IDs. Upon review of the most recent publicly available permit application, which is included in Appendix N for reference, it was found that the $H_2S$ emissions were associated

with vented SSM and malfunction emissions (permit IDs SSM and MALF). Per Condition A107.C, the GCP-O&G, which is included in Appendix L for reference, only VOC emissions are authorized for SSM and malfunction events. Therefore, the $H_2S$ sources from this facility were removed from the surrounding source file.

### 4.10.8 Surrounding Source AI # 39664

Surrounding source AI 39664, with AQB source IDs 39664R2 and 39664R3 is EOG Resources Inc – Midland Division's Boa Localized Gas Lift Station, which operates under GCP-O&G #8932. The MergeMaster Source Retrieval tool provides $H_2S$ emission rates for both unit IDs. Upon review of the most recent publicly available permit application, which is included in Appendix O for reference, it was found that the $H_2S$ emissions were associated with vented SSM and malfunction emissions (permit IDs SSM and MALF). Per Condition A107.C, the GCP-O&G, which is included in 10.4Appendix L for reference, only VOC emissions are authorized for SSM and malfunction events. Therefore, the $H_2S$ sources from this facility were removed from the surrounding source file.

## 4.11 Background Concentrations

The portion of the background air quality that accounts for Other Sources as defined in Modeling Guideline, Section 8.3.1.(ii) [i.e., emission sources other than those that would be explicitly modeled under Section 8.3.1.(i) of the Modeling Guideline], must be characterized by ambient monitoring data. Other Sources are defined as the portion of the background attributable to natural sources, other unidentified sources in the vicinity of the Red Hills, and regional transport contributions from more distant sources (domestic and international). Table 4-10 provides the design values that were used in the cumulative NMAAQS and NAAQS analyses for those pollutants and averaging periods that exceed the respective SIL.

**Table 4-11. Background Air Quality Concentrations**

| Station/ AQS ID | Pollutant [a] | Averaging Period | Monitored Design Value ($\mu g/m^{3u}$) | NMAAQS/ NAAQS [b] ($\mu g/m^3$) |
|---|---|---|---|---|
| 5ZS Hobbs Jefferson/ 35-025-0008 | $NO_2$ | 1-Hour [c] | 58.3 | 188.03 |
| | | Annual [d] | 9.4 | 94.02 |
| El Paso Chamizal/ 48-141-0044 | CO | 1-Hour [e] | 4,577 | 14,997.5 |
| | | 8-Hour [e] | 3,433 | 9,960.1 |
| 5ZS Hobbs Jefferson/ 35-025-0008 | Ozone | 8-Hour [f] | 0.071 ppm | 0.070 ppm |
| Douglas Red Cross/ 04-003-1005 | $PM_{10}$ | 24-Hour [e] | 124 | 150 |
| 5ZS Hobbs Jefferson/ 35-025-0008 | $PM_{2.5}$ | 24-Hour [g] | 20 | 35 |
| | | Annual [h] | 6.6 | 9 |
| Albuquerque/35-001-0023 | $SO_2$ | 1-Hour [i] | 5.2 | 196.4 |

a. Per NMED Air Dispersion Modeling Guidelines (Revised June 2024), Section 2.6.8.2, Red Hills and surrounding sources were explicitly modeled and background $SO_2$ concentrations will not be added to the modeled impacts. Therefore, background $SO_2$ concentrations are not shown in this table. Both explicitly modeled nearby sources and background concentrations were used in the $PM_{2.5}$ and $PM_{10}$ NMAAQS/NAAQS analyses. $NO_2$ and CO concentrations are provided for reference and cumulative NMAAQS/NAAQS analyses for these pollutants may only use explicitly modeled nearby sources.
b. The more stringent of the NMAAQS and NAAQS is shown in this table.
c. 98th percentile of 1-hour daily maximum concentrations, averaged over the 3-year period 2021-2023. Compliance with the 1-hour $NO_2$ NAAQS demonstrates compliance with the 24-hour NMAAQS.[33]
d. Maximum annual mean during the 3-year period 2021-2023.
e. 2nd highest concentration during the 3-year period 2021-2023.
f. 4th highest daily maximum 8-hour concentration, averaged over the 3-year period 2021-2023.
g. 98th percentile of the 24-hour average concentrations, averaged over the 3-year period 2021-2023.
h. Weighted annual mean concentration, averaged over the 3-year period 2021-2023.
i. In discussion with NMED, the background data from the Albuquerque monitor will be used in the $SO_2$ NAAQS modeling in addition to modeling surrounding sources.

## 4.12 Estimating $NO_2$ Impacts

Some forms of emitted $NO_X$ [i.e., nitrogen oxide (NO)] react with other atmospheric constituents (ozone) to form $NO_2$. These reactions are complex and depend on factors such as mixing of ambient air into the plume, individual reaction rates, and the concentration of specific reactants in the atmosphere. Regulatory dispersion models such as AERMOD are designed to model impacts of non-reactive pollutants, but there are various supplemental modeling techniques that can be used to estimate ambient $NO_2$ impacts.

The Modeling Guideline presents a three-tiered approach that may be applied to modeling $NO_2$ impacts. The three tiers are:

- Tier 1: Assume full conversion of NO to $NO_2$ (i.e., assume that all $NO_X$ is emitted as $NO_2$).

[33] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Section 2.6.4.1.

- Tier 2: Multiply the Tier 1 result by the Ambient Ratio Method 2 (ARM2), which provides estimates of representative equilibrium ratios of $NO_2/NO_X$ value based ambient levels of $NO_2$ and $NO_X$ derived from national data from the EPA's AQS.
- Tier 3: The ozone limiting method (OLM) or plume volume molar ratio method (PVMRM) as a detailed screening technique.

Trinity used Tier 2 screening techniques in this analysis.

## 4.13 Secondary Pollutant Formation

Ozone and $PM_{2.5}$ are regulated pollutants under the Federal PSD program. Because the Red Hills site is a PSD source of the ozone precursors $NO_X$ and VOC and a source of direct $PM_{2.5}$ emissions and the $PM_{2.5}$ precursors $NO_X$ and $SO_2$, an air quality impact analysis is required for ozone and $PM_{2.5}$.

Secondary ozone and $PM_{2.5}$ formation resulting from facility emissions of $NO_X$ and VOC, and $NO_X$ and $SO_2$, respectively, were evaluated using the methodology provided in EPA's Modeled Emission Rates for Precursors (MERPs) guidance[34] and guidance for ozone and fine particulate matter permit modeling.[35] Secondary formation of ozone and $PM_{2.5}$ from the Red Hills can be estimated using the following equation from the MERPs Guidance, Equation 2:

$$Facility\ Impact\ \left(\frac{\mu g}{m^3}\right) = Facility\ Emission\ Rate\ (tpy) \times \frac{Hypothetical\ Source\ Modeled\ Impact\ \left(\frac{\mu g}{m^3}\right)}{Hypothetical\ Source\ Emission\ Rate\ (tpy)}$$

Thise equation was used to calculate secondary impacts resulting from each precursor and then summed for the total secondary contribution to ozone and $PM_{2.5}$ impacts. The modeled impacts from hypothetical sources can be obtained from the EPA MERPs View Qlik website.[36] The MERPs View Qlik website provides illustrative hypothetical single source modeled impacts for annual maximum daily 8-hour ozone, and daily maximum and annual average $PM_{2.5}$ for source locations across the United States based on various levels of precursor emissions (VOC, $NO_X$, and $SO_2$, as applicable) and stack heights.

Trinity reviewed the available hypothetical sources in the View Qlik database and found that the nearest hypothetical source in New Mexico is in Otero County. MERP values are available for 500, 1,000, and 3,000 tons per year (tpy) of precursor emissions and 10 meter (m) and 90 m stack heights. Based on the preliminary Red Hills potential to emit, and range of stack heights, the modeled impacts associated with 500 tpy of precursor emissions from a 10 m stack were used for this analysis. Table 4-12 provides the output from the MERPs View Qlik database for Otero County.

[34] Guidance on the Development of Modeled Emission Rates for Precursors (MERPs) as a Tier 1 Demonstration Tool for Ozone and $PM_{2.5}$ under the PSD Permitting Program. Memorandum from Richard A. Weyland (Air Quality Assessment Division). April 30, 2019.

[35] EPA memorandum from C. Wayland and S. Mathias to EPA regional air division directors. July 29, 2022.

[36] https://www.epa.gov/scram/merps-view-qlik.

**Table 4-12. Closest Hypothetical MERP Source**

| Metric | Precursor | Emissions (tpy) | Stack Height (m) | Maximum Modeled Concentration (mg/m3) |
|---|---|---|---|---|
| 24-Hour $PM_{2.5}$ | $NO_X$ | 500 | 10 | 0.006181 |
| 24-Hour $PM_{2.5}$ | $SO_2$ | 500 | 10 | 0.036081 |
| Annual $PM_{2.5}$ | $NO_X$ | 500 | 10 | 0.000284 |
| Annual $PM_{2.5}$ | $SO_2$ | 500 | 10 | 0.001754 |
| 8-Hour Ozone | $NO_X$ | 500 | 10 | 1.209116 |
| 8-Hour Ozone | VOC | 500 | 10 | 0.006089 |

The 2019 MERPs guidance states that the representativeness of a hypothetical source should be based on the chemical and physical environment, for example, meteorology, background pollutant concentrations, and regional/local emissions and the following criteria:

- Proximity
- Terrain and Land Use
- Climate
- Regional Sources of Pollutants
- Background Pollutant Concentrations

The contributions of secondarily formed ozone and $PM_{2.5}$ are calculated using the equations provided by the NMED modeling guidelines and are presented below. The secondary formation due to each precursor (i.e., $NO_X$ and VOC for ozone, and $NO_X$ and $SO_2$ for $PM_{2.5}$) are summed in the calculations below.

8-hour ozone:

$$[O_3]_{8-hour} = \frac{NOx\ emission\ rate\ (\frac{ton}{yr})}{MERP_{NOx}} + \frac{VOC\ emission\ rate\ (\frac{ton}{yr})}{MERP_{VOC}} x\ 1.96\ \mu g/m^3$$

$$[O_3]_{8-hour} = \frac{188.76\ (\frac{ton}{yr})}{340} + \frac{909.63\ (\frac{ton}{yr})}{9578} x\ 1.96\ \mu g/m^3 = 1.27\ \mu g/m^3$$

As shown, predicted ozone formation from the project emissions are less than the SIL value of 1 ppb (1.96 µg/m$^3$) and as such, no further ozone analysis was conducted for this project.

24-hour $PM_{2.5}$:

$$[PM_{2.5}]_{24-hour} = \frac{NOx\ emission\ rate\ (\frac{ton}{yr})}{MERP_{NOx-24\ hour}} + \frac{SO_2\ emission\ rate\ (\frac{ton}{yr})}{MERP_{SO_{2-24\ hour}}} x\ 1.2\ \mu g/m^3$$

$$[PM_{2.5}]_{24-hour} = \frac{188.76\ (\frac{ton}{yr})}{7331} + \frac{436.30\ (\frac{ton}{yr})}{1981} x\ 1.2\ \mu g/m^3 = 0.295\ \mu g/m^3$$

Annual $PM_{2.5}$:

$$[PM_{2.5}]_{annual} = \frac{NOx\ emission\ rate\ (\frac{ton}{yr})}{MERP_{NOx-annual}} + \frac{SO_2\ emission\ rate\ (\frac{ton}{yr})}{MERP_{SO_{2}-annual}}\ x\ 0.2\ \mu g/m^3$$

$$[PM_{2.5}]_{annual} = \frac{188.76\ (\frac{ton}{yr})}{26780} + \frac{436.30\ (\frac{ton}{yr})}{14978}\ x\ 0.2\ \mu g/m^3 = 0.00724\ \mu g/m^3$$

The predicted concentrations of secondarily formed $PM_{2.5}$ were added to the AERMOD modeled impacts presented in Section 6 if this modeling report.

# 5. CLASS II MODELING ANALYSIS

## 5.1 Significant Impact Analysis

Significant impact analyses were conducted to determine whether ambient air quality impacts on a pollutant-by-pollutant basis exceed the applicable Significant Impact Level (SIL) and require additional analysis. The significant impact analysis included all facility emission units using the source characterizations discussed in Section 3, modeling methods in Section 4, the Cartesian receptor grids described in Section 4.9, and proposed emission rates presented in the corresponding permit application. The modeled significance impacts are compared to the Class II SILs listed in Table 5-1.

**Table 5-1. Class II Significant Impact Levels for Air Quality Standards and PSD Increment**

| Pollutant | Averaging Period | SIL [a] ($\mu g/m^3$) |
|---|---|---|
| CO | 8-hour | 500 |
| | 1-hour | 2,000 |
| $NO_2$ [b] | Annual | 1.0 |
| | 24-hour | 5.0 |
| | 1-hour | 7.52 |
| Ozone [c] | 8-hour | 1.96 |
| $PM_{2.5}$ [d] | Annual | 0.13 |
| | 24-hour | 1.2 |
| $PM_{10}$ | Annual | 1.0 |
| | 24-hour | 5.0 |
| $SO_2$ | Annual | 1.0 |
| | 24-hour | 5.0 |
| | 3-hour | 25.0 |
| | 1-hour | 7.8 |

[a] All SIL analyses compared the highest-first-high (H1H) modeled concentration to the applicable SIL.[37]

[b] The NMAAQS 24-hr averaging period compliance is demonstrated with compliance with the 1-hr averaging period.

[c] See Section 4.13.

[d] The annual $PM_{2.5}$ SIL was updated by EPA on 4/30/2024.[38] $PM_{2.5}$ modeled impacts were the sum of direct secondarily formed $PM_{2.5}$ predicted by AERMOD for the 24-hour and annual averaging periods. Section 4.13 discusses the secondary $PM_{2.5}$ formation calculations.

[37] NMED Air Dispersion Modeling Guidelines (Revised June 2024) Table 18

[38] Memo from R. Wayland (EPA Director of the Air Quality Assessment Division) to EPA Regional Air Division Directors titled: *Supplement to the Guidance on Significant Impact Levels for Ozone and Fine Particles in the Prevention of Significant Deterioration Permitting Program*. April 30, 2024.

## 5.2 Cumulative Impact Analysis

### 5.2.1 New Mexico and National Ambient Air Quality Standard Analysis

A cumulative impact analysis was performed for each pollutant and averaging period that exceeds the applicable SIL. Per modeling guidance, the cumulative impact modeling was performed only for those receptors where the significant impact level is exceeded on a pollutant and averaging period basis. Compliance with the NMAAQS and NAAQS was based on the total estimated air quality concentrations, which are the sum of the following:

- Red Hills emission sources;
- Modeled emissions from nearby sources described in Section 4.10; and
- Background pollutant concentrations described in Section 4.11.

### 5.2.2 PSD Increment Analysis

PSD increment is the maximum allowable increase in ambient concentrations allowed to occur above a baseline concentration for each applicable pollutant and averaging period. Red Hills is located in Air Quality Control Region (AQCR) 155. Per Table 22 of the NMED Modeling Guidelines, the minor source baseline dates are as follows:

- $NO_2$ – March 16, 1988
- $SO_2$ – July 28, 1978
- $PM_{10}$ – February 20, 1979
- $PM_{2.5}$ – November 13, 2013

For PSD increment analysis, only the emissions increases (and decreases) from the facility after the minor source baseline date are considered. Modeled emissions from nearby sources described in Section 4.10 are included in the PSD increment analysis. If ozone or PM2.5 is modeled, the applicable Class II PSD increments listed in Table 5 of the NMED Modeling Guidelines are used. The applicable Class II PSD increments are listed in Table 5-1.

Table 5-3. All sources at Red Hills are considered increment consumers as they were constructed after the minor source baseline dates previously stated for AQCR 155, except for SSM emission sources and generators that operate less than 500 hours per year. Table 5-2 below indicates which pollutant each source is an increment consumer of. The choice of option for each averaging period is outlined in Table 4-6. Surrounding source inventories are included with the modeling protocol. Refer to Section 16 of the application.

**Table 5-2. Red Hills Increment Consuming Sources**

| Model Unit ID | Permit Unit ID | NO2 | SO2 | PM10 | PM2.5 |
|---|---|---|---|---|---|
| 1EP1 | RH1-H-23-704 | X | X | X | X |

| EP8 | RH4-TO-45500 | X | X | X | X |

| Model Unit ID | Permit Unit ID | NO2 | SO2 | PM10 | PM2.5 |
|---|---|---|---|---|---|
| EP10 | RH5-TO-55500 | X | X | X | X |
| HAUL-1 | RH-HAUL | * | * | X | X |

X indicates the source ID consumes increment for the indicated pollutant.

* indicates the source ID is not an emitter of the indicated pollutant.

## Table 5-3. Air Quality Standards and Class II PSD Increments

| Pollutant | Averaging Period | NAAQS (µg/m³) | NMAAQS (µg/m³)[a] | Class II PSD Increment (µg/m³) | Design Value / Notes |
|---|---|---|---|---|---|
| $H_2S$ | ½-hour | -- | 139.3 | -- | Model the 1-hr averaging time. Include entire facility and nearby sources. No background concentration is added. |
| $SO_2$ | 1-hour | 196.4 | -- | -- | 3-year average of the 99th-percentile of the annual distribution of daily maximum 1-hour concentrations (H4H). Compliance with 1-hr average demonstrates compliance with all other NAAQS and NMAAQS averaging periods. |
| | 3-hour | -- | -- | 512 | Increment: H2H average |
| | 24-hour | -- | 261.9 | 91 | Increment: H2H average |
| | Annual | 26 | 52.4 | 20 | Annual average, averaged over 3 years |
| $PM_{2.5}$ [b] | 24-hour | 35 | -- | 9 | 98th percentile of the combined concentrations from all sources (H8H) |
| | Annual | 9 | -- | 4 | Annual average |
| $PM_{10}$ | 24-hour | 150 | -- | 30 | H2H and single year of representative met data or H4H with multi-year analysis. |
| | Annual | -- | -- | 17 | Annual average |
| $NO_x$ | 1-hour | 188.03 *(100 ppb)* | 188.03 *(100 ppb)* | -- | 3-year average of the 98th-percentile of the annual distribution of daily maximum 1-hour concentrations (H8H) |
| | 24-hour | -- | 188.03 | -- | The 1-hour NO2 standard is considered a surrogate for the 24-hour NMAAQS. |
| | Annual | 99.66 | 94.02 | 25 | Model entire facility and add annual background concentration or model entire facility and nearby sources. |
| CO | 1-hour | 40,069.6 (35 ppm) | 14,997.5 | -- | NAAQS not to be exceeded more than once per year. NMAAQS not to be exceeded. Compliance with NMAAQS demonstrates compliance with NAAQS. |
| | 8-hour | 10,303.6 (9 ppm) | 9,960.1 | -- | |
| Ozone | 8-hour | 137.3 (70 ppb) | -- | -- | Demonstrate compliance using MERPs method. |

# 6. MODELING RESULTS AND ELECTRONIC FILES

The maximum (highest first high; H1H) modeled ground-level concentrations (GLC) were compared to the applicable SILs. The results are shown in Table 6-1 through Table 6-6. SIL results for all modeled scenarios are provided. The scenario producing the largest impact for each pollutant and averaging period is used for cumulative modeling.

**Table 6-1. CO SIL Results**

| Pollutant | Averaging Period | Scenario | Period | Form | GLC ($\mu g/m^3$) | SIL ($\mu g/m^3$) | Cumulative Modeling Required? |
|---|---|---|---|---|---|---|---|
| CO | 8-hr | 1 | 2017-2021 | H1H | 1085.28 | 500 | Yes |
| CO | 8-hr | 2 | 2017-2021 | H1H | 1068.41 | | Yes |
| CO | 8-hr | 3 | 2017-2021 | H1H | 1068.41 | | Yes |
| CO | 1-hr | 1 | 2017-2021 | H1H | 1357.17 | 2,000 | No |
| CO | 1-hr | 2 | 2017-2021 | H1H | 1330.73 | | No |
| CO | 1-hr | 3 | 2017-2021 | H1H | 1330.73 | | No |

Scenario 1 has the highest modeled impact for the CO 8-hour modeling demonstration. None of the scenarios are greater than the SIL for the CO 1-hour modeling demonstration.

**Table 6-2. $NO_2$ SIL Results**

| Pollutant | Averaging Period | Scenario | Period | Form | GLC ($\mu g/m^3$) | SIL ($\mu g/m^3$) | Cumulative Modeling Required? |
|---|---|---|---|---|---|---|---|
| $NO_2$ | Annual | 1 | 2017-2021 | H1H | 3.92 | 1 | Yes |
| $NO_2$ | Annual | 2 | 2017-2021 | H1H | 3.92 | | Yes |
| $NO_2$ | Annual | 3 | 2017-2021 | H1H | 3.92 | | Yes |
| $NO_2$ | 24-hr | 1 | 2017-2021 | H1H | 72.28 | 5 | Yes |
| $NO_2$ | 24-hr | 2 | 2017-2021 | H1H | 87.72 | | Yes |
| $NO_2$ | 24-hr | 3 | 2017-2021 | H1H | 87.72 | | Yes |
| $NO_2$ | 1-hr | 1 | 2017-2021 | H1H | 111.94 | 7.52 | Yes |
| $NO_2$ | 1-hr | 2 | 2017-2021 | H1H | 130.61 | | Yes |
| $NO_2$ | 1-hr | 3 | 2017-2021 | H1H | 130.61 | | Yes |

Scenario 2 has the highest modeled impact for the $NO_2$ annual modeling demonstration. Scenario 3 has the highest modeled impact for the $NO_2$ 24-hr modeling demonstration. Per NMED Modeling Guidance, passing $NO_2$ 1-hour NAAQS is an appropriate surrogate to demonstrate compliance for the $NO_2$ 24-hour NMAAQS.[39] Scenario 3 has the highest modeled impact for the $NO_2$ 1-hour modeling demonstration.

[39] NMED Air Dispersion Modeling Guidance Table 19.

**Table 6-3. $PM_{2.5}$ SIL Results**

| Pollutant | Averaging Period | Scenario | Period | Form | GLC (µg/m³) | SIL (µg/m³) | Cumulative Modeling Required? |
|---|---|---|---|---|---|---|---|
| $PM_{2.5}$ | Annual | All | 2017-2021 | H1H | 7.62 | 1.2 | Yes |
| $PM_{2.5}$ | 24-hr | All | 2017-2021 | H1H | 0.60 | 0.13 | Yes |

As the scenarios do not impact $PM_{2.5}$ emission rates, all scenarios had the same modeled concentration. Scenario 1 was used for the $PM_{2.5}$ 24-hr and annual modeling demonstrations.

**Table 6-4. $PM_{10}$ SIL Results**

| Pollutant | Averaging Period | Scenario | Period | Form | GLC (µg/m³) | SIL (µg/m³) | Cumulative Modeling Required? |
|---|---|---|---|---|---|---|---|
| $PM_{10}$ | Annual | All | 2017-2021 | H1H | 2.04 | 1 | Yes |
| $PM_{10}$ | 24-hr | All | 2017-2021 | H1H | 57.29 | 5 | Yes |

As the scenarios do not impact $PM_{10}$ emission rates, all scenarios had the same modeled concentration. Scenario 1 was used for the $PM_{10}$ 24-hr and annual modeling demonstrations.

**Table 6-5. $SO_2$ SIL Results**

| Pollutant | Averaging Period | Scenario | Period | Form | GLC (µg/m³) | SIL (µg/m³) | Cumulative Modeling Required? |
|---|---|---|---|---|---|---|---|
| $SO_2$ | Annual | 1 | 2017-2021 | H1H | 7.99 | 1 | Yes |
| $SO_2$ | Annual | 2 | 2017-2021 | H1H | 8.16 | | Yes |
| $SO_2$ | Annual | 3 | 2017-2021 | H1H | 8.16 | | Yes |
| $SO_2$ | 24-hr | 1 | 2017-2021 | H1H | 42.93 | 5 | Yes |
| $SO_2$ | 24-hr | 2 | 2017-2021 | H1H | 43.97 | | Yes |
| $SO_2$ | 24-hr | 3 | 2017-2021 | H1H | 43.96 | | Yes |
| $SO_2$ | 3-hr | 1 | 2017-2021 | H1H | 86.67 | 25 | Yes |
| $SO_2$ | 3-hr | 2 | 2017-2021 | H1H | 89.13 | | Yes |
| $SO_2$ | 3-hr | 3 | 2017-2021 | H1H | 89.13 | | Yes |
| $SO_2$ | 1-hr | 1 | 2017-2021 | H1H | 109.99 | 7.8 | Yes |
| $SO_2$ | 1-hr | 2 | 2017-2021 | H1H | 113.29 | | Yes |
| $SO_2$ | 1-hr | 3 | 2017-2021 | H1H | 113.29 | | Yes |

Scenario 2 has the highest modeled impact for the $SO_2$ annual modeling demonstration. Scenario 3 has the highest modeled impact for the $SO_2$ 24-hr modeling demonstration. Scenario 2 has the highest modeled impact for the $SO_2$ 3-hr modeling demonstration. Scenario 2 has the highest modeled impact for the $SO_2$ 1-hr modeling demonstration.

**Table 6-6. $H_2S$ SIL Results**

| Pollutant | Averaging Period | Scenario | Period | Form | GLC (µg/m³) | SIL (µg/m³) | Cumulative Modeling Required? |
|---|---|---|---|---|---|---|---|
| $H_2S$ | ½ hour | 1 | 2017-2021 | H1H | 130.83 | 5 | Yes |
| $H_2S$ | ½ hour | 2 | 2017-2021 | H1H | 130.83 | | Yes |
| $H_2S$ | ½ hour | 3 | 2017-2021 | H1H | 130.83 | | Yes |

Scenario 3 has the highest modeled impact for the $H_2S$ 1-hour modeling demonstration.

## 6.1 NAAQS/NMAAQS Modeling Results

The results for the NAAQS/NMAAQs results are presented in Table 6-7 and Table 6-8 below. Note that since SSM operations with particulate matter emissions cannot occur more than once per year, Targa did not include those sources in the model. As such, the 24-hour $PM_{10}$ analysis was conducted for the high-5$^{th}$-high (H5H) concentration rather than the H6H design value. Also note that as the impacts shown for the full modeling domain exceeded the 24-hour $PM_{10}$ standard, a source culpability analysis was conducted and demonstrated that Targa was not culpable at any of the exceedances.

**Table 6-7. NAAQS/NMAAQS Modeling Results for CO, $H_2S$, $NO_2$, $PM_{10}$, and $SO_2$**

| Pollutant | Averaging Period | Form[a] | Facility GLC (µg/m³) | Facility + Neighbors GLC (µg/m³) | Background | Full Impact (µg/m³) | NAAQs/ NMAAQS (µg/m³) | % of Standard[b] |
|---|---|---|---|---|---|---|---|---|
| CO | 8-hr | H2H | 1036.76 | - | 1265 | 2301.76 | 10,000 | 23.0% |
| $H_2S$ | 1-hr | H1H | - | 1267.12 | - | 1267.12 | 139.3 | *See footnote b* |
| $NO_2$ | Annual | H1H | 3.925 | - | 9.4 | 13.32 | 94.02 | 14.2% |
| $NO_2$ | 1-hr | H8H | 125.02 | - | 58.3 | 183.32 | 188.03 | 97.5% |
| $PM_{10}$ | 24-hr | H5H | - | 269.58 | 124 | 418.52 | 150 | *See footnote b* |
| $SO_2$ | 1-hr | H4H | - | 184.32 | 5.2 | 189.55 | 196 | 96.7% |

a. The $PM_{10}$ NAAQS form of the standard is H6H. However, Targa is removing SSM sources from the model as Targa does not expect SSM operations to occur more than once per year. Thus, Targa is removing one of the highs from the model and comparing the H5H to the NAAQS.
b. For models that exceed the standard, a culpability analysis was conducted to show that Targa is not culpable for any NAAQS exceedances.

**Table 6-8. NAAQS Modeling Results for $PM_{2.5}$**

| Averaging Period | Form | Facility + Neighbors GLC (µg/m³) | Background (µg/m³) | Secondary Formation (µg/m³) | Full Impact (µg/m³) | NAAQS (µg/m³) | % of Standard |
|---|---|---|---|---|---|---|---|
| 24-hr | H8H | 12.90 | 20 | 0.294 | 33.20 | 35 | 94.8% |
| Annual | H1H | 2.14 | 6.6 | 0.00716 | 8.74 | 9 | 97.1% |

## 6.2 PSD Class II Increment Results

**Table 6-9. PSD Increment Modeling Results for $NO_2$, $PM_{10}$, and $SO_2$**

| Pollutant | Averaging Period | Form[a] | Facility GLC (µg/m³) | Facility + Neighbors GLC (µg/m³) | Background (µg/m³) | Full Impact (µg/m³) | PSD Class II Increment (µg/m³) | % of Standard[b] |
|---|---|---|---|---|---|---|---|---|
| $NO_2$ | Annual | H1H | 3.925 | - | 9.4 | 13.32 | 25 | 53.3% |
| $PM_{10}$ | Annual | H1H | - | 7.46 | - | 7.46 | 17 | 43.9% |
| $PM_{10}$ | 24-hr | H1H | - | 269.58 | - | 269.58 | 30 | *See footnote b* |
| $SO_2$ | Annual | H1H | - | 13.12 | - | 13.12 | 20 | 65.6% |
| $SO_2$ | 24-hr | H2H | - | 77.36 | - | 77.36 | 91 | 85% |
| $SO_2$ | 3-hr | H2H | - | 217.59 | - | 217.59 | 512 | 42.5% |

a. The $PM_{10}$ PSD Increment Class II form of the standard is H2H. However, Targa is removing SSM sources from the model as Targa does not expect SSM operations with particulate matter emissions to occur more than once a year. Thus, Targa is removing one of the highs from the model and comparing the H1H to the PSD Increment.
b. For models that exceed the standard, a culpability analysis was conducted to show that Targa is not culpable for any PSD Increment exceedances.

**Table 6-10. PSD Increment Modeling Results for $PM_{2.5}$**

| Pollutant | Averaging Period | Forma | Facility + Neighbors GLC (µg/m³) | Secondary Formation (µg/m³) | Full Impact (µg/m³) | PSD Class II Increment (µg/m³) | % of Standard[b] |
|---|---|---|---|---|---|---|---|
| $PM_{2.5}$ | Annual | H1H | 1.86 | 0.00716 | 1.87 | 4 | 46.7% |
| $PM_{2.5}$ | 24-hr | H1H | 16.47 | 0.294 | 16.76 | 9 | *See footnote b* |

a. The $PM_{2.5}$ PSD Increment Class II form of the standard is H2H. However, Targa is removing SSM sources from the model as Targa does not expect SSM operations with particulate matter emissions to occur more than once a year. Thus, Targa is removing one of the highs from the model and comparing the H1H to the PSD Increment.
b. For models that exceed the standard, a culpability analysis was conducted to show that Targa is not culpable for any PSD Increment exceedances.

## 6.3 Culpability Analyses

For the culpability analyses, Targa identified the significant receptors that were exceeding the respective NAAQS or PSD Increment. The models were re-run with these significant receptors and postfiles to determine the contribution from Targa sources at each receptor. The analysis showed that for every exceedance of the regulatory threshold, Targa was below the SIL.

The spreadsheets used to conduct this analysis are included with the modeling file submittal compilation.

## 6.4 Electronic Files

| File name (or folder and file name) | Pollutant(s) | Purpose (ROI/SIA, cumulative, culpability analysis, other) |
|---|---|---|
| RHGP_Generators | All | Determine worst-case generator locations |

# 7. ADDITIONAL IMPACTS

All PSD applications must include an Additional Impacts Analysis composed of the following parts:

- Growth analysis
- Soils and vegetation analysis
- State and Federal threatened and endangered species analysis
- Visibility impairment analysis
- Water impact and consumption analysis

## 7.1 Growth Analysis

A growth analysis consists of a projection of the associated industrial, commercial, and residential growth that is likely to occur in the area due to the facility, and an estimate of the emissions generated by that associated growth. Because the facility is an existing source, no new emission units will be constructed and no increase in workforce is planned; therefore, no future growth is anticipated as a result of this project.

## 7.2 Soil and Vegetation Analysis

Pursuant to the requirements in 40 CFR 52.21(o), an analysis of the impact that could occur to soils and vegetation of significant commercial or recreational value as a result of operating the Red Hills Gas Plant is discussed below.

The EPA developed the secondary NAAQS in order to protect soil and vegetation air quality-related values that were not sufficiently protected by the primary NAAQS. The secondary NAAQS represent ambient air concentrations below which most types of soils and vegetation are unaffected by criteria pollutants. If predicted ambient air concentrations are found to be less than the secondary NAAQS, it is presumed that emissions from the Red Hills Gas Plant do not result in harmful effects to either soil or vegetation and no further soil or vegetation analysis will be performed.

## 7.3 State and Federal Endangered Species Analysis

The Endangered Species Act (ESA) protects the habitats of any endangered or threatened species. Threatened and endangered species of plants and animals for the facility and surrounding area have been identified using the U.S. Fish and Wildlife Service website, Information for Planning and Consultation (IPaC; https://ecos.fws.gov/ipac/). The IPaC informal species list is attached. The online Critical Habitat Mapper provided by the U.S. Fish and Wildlife Service (http://criticalhabitat.fws.gov/crithab/) was used to determine critical habitats and project effect determinations for all threatened and endangered species.

The determinations are summarized below. Based on the information provided by IPaC, there are no critical habitats at this location. Therefore, it is expected that no ESA-listed species are adversely impacted by the project.

**Table 7-1. State and Federal Endangered Species Analysis**

| Species | Status | Habitat | Proximity | Determination of Effect |
|---|---|---|---|---|
| Lesser Prairie-chicken | Endangered | This species can be found in the Shinnery Oak Prairie Ecoregion. The species is ground-dwelling, and they require large, ecologically functioning grasslands and shrublands with a diversity of grass and low-growing shrub species with limited anthropogenic structures and trees. | There are no grasslands and shrublands with limited anthropogenic structures in the area, therefore, no critical habitat within the project or action area. | No Effect Expected |
| Northern Aplomado Falcon | Experimental Population, Non-Essential | Habitat includes palm and oak savannahs, various desert grassland associations, and open pine woodlands. Essential habitat elements appear to be open terrain with scattered trees, relatively low ground cover, an abundance of insects and small to medium-sized birds, and a supply of nest sites. | The project area contains minimal low-quality migratory and nesting habitat. | No Effect Expected |
| Monarch Butterfly | Proposed Threatened | Habitat includes western migratory population overwintering sites, though breeding and migratory habitat covers much of the contiguous US. | The project area contains minimal low-quality migratory and breeding habitat. | No Effect Expected |
| Dunes Sagebrush Lizard[1] | Endangered | Habitat primarily relies on shinnery oak sand dune ecosystem. | Based on information available at the time of application submittal, the facility has not been identified as a Critical Habitat for this species. | No Effect Expected |

1. Due to recent regulatory action and jurisdictional overlap, this species was not identified in IPaC, but is included here for completeness of the determination.

## 7.4 Visibility Impairment Analysis

Red Hills identified the Lea County/Jal Airport-E26 as the nearest sensitive receptor. There are no other state parks or wilderness areas within 50 km. A Level 1 VISCREEN analysis was performed for the project emissions to estimate visual plume impacts at that airport location. The default ozone value (0.04 ppm) was updated to the most recent and most conservative nearby ozone design value in the area (0.08 ppm). Based on that

analysis, it was determined that the proposed project will not cause any visible plume impact of concern at the airport.

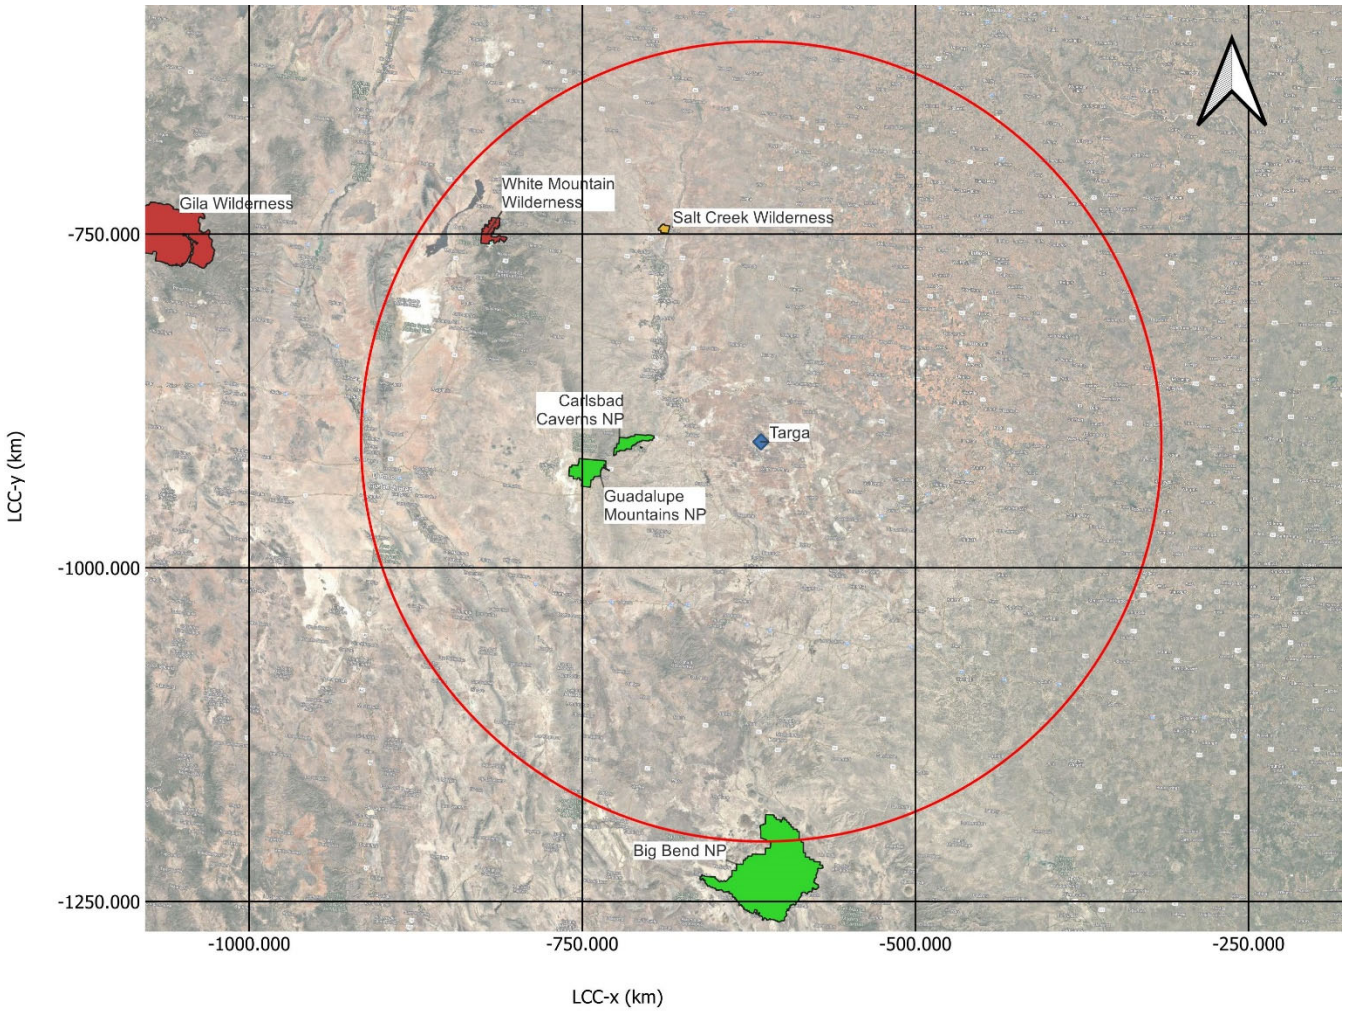
## 7.5 Water Impact and Consumption Analysis

There are no jurisdictional waters of the U.S. or other surface water bodies, including any salt playas, located within the proposed project area. Therefore, there are no direct impacts to surface waters.
There are relatively few groundwater level measurements in the vicinity of the project area. The few that are available indicate various groundwater depths, ranging from approximately 20 to 350 feet below ground surface (USGS). The nearest groundwater well site to the plant site is located approximately 4 miles northwest of the property boundary. The use of this well is currently unknown. Here, the groundwater depth is approximately 40 feet below ground surface so there would be no direct impact from construction or operational activities on groundwater resources.

The facility operates acid gas injection wells for sequestration of carbon dioxide and hydrogen sulfide gases, which would have the potential to directly impact groundwater resources. Based on the necessity to obtain an Underground Injection Control permit through the New Mexico Oil Conservation Division, and the lack of evidence for any domestic or public water supplies within the area, it is unlikely that direct impacts to potable groundwater supplies would occur due to the use of the acid gas injection wells. The facility monitors the aquifer to ensure there is no infiltration of the acid gas from the injection well.

The potential to impact water resources primarily lies with the indirect impacts that could occur due to stormwater runoff from facility activities. While indirect impacts from stormwater movement of contaminants or sediment due to the arid climate is a possibility, the implementation of good housekeeping practices and other best management practices are likely to limit any movement of contaminants or sediment and limit any indirect impacts to surface waterbodies. The distance to the nearest intermittent lake/pond is approximately 1,000 feet. This area east of the facility is relatively small compared to the project area and is not anticipated to typically contain surface water. This project would have no impact on the Pecos River, located approximately 25 miles west of the facility.

The Proposed Action is unlikely to result in direct or indirect impacts to surface water and groundwater resources in the area. No additional mitigation measures are recommended.



# 8. CLASS I MODELING REQUIREMENTS

There are no Class I areas within 50 km of Red Hills. The Class I areas within 300 km of Red Hills are Carlsbad Caverns National Park (~80 km W-WSW), Guadalupe Mountains National Park (~115 km WSW), Salt Creek Wildlife Area (~170 km NNW), White Mountain Wilderness (~275 km WNW), and Big Bend National Park (~280 km SSE). These Class I areas are shown in Figure 8-1. With the exception of Big Bend National Park, the exterior boundaries of the Class I areas are fully within the 300-km distance from the Red Hills.

## 8.1 Initial Screening Analyses

Trinity conducted initial screening analyses of the potential air quality impacts at Class I areas within 300 km of Red Hills. The following sections present the initial screening analysis procedures used and their results.

**Figure 8-1. PSD Class I Areas Within 300 km of Red Hills Gas Processing Plant**

### 8.1.1 Significant Impact Analysis Screening

Initial screening for significant impacts was conducted using EPA's initial screening procedures to address Class I increment impacts from the project.[40]

**Table 8-1. Class I Significant Impact Levels for Air Quality Standards and PSD Increments**

| Pollutant | Averaging Period | SIL [a] (µg/m³) | Form of SIL |
|---|---|---|---|
| $SO_2$ | 3-hour | 1.0 | H1H |
| | 24-hour | 0.2 | H1H |
| | Annual | 0.1 | H1H |
| $PM_{2.5}$ [b] | 24-hour | 0.27 | H1H [c] |
| | Annual | 0.03 | H1H [c] |
| $PM_{10}$ | 24-hour | 0.3 | H1H |
| | Annual | 0.2 | H1H |
| $NO_2$ | Annual | 0.1 | H1H |
| Ozone [d] | 8-hour | 1.96 | See Table Note d |

[a] The modeled facility-only impacts will be the H1H modeled concentrations for comparison to the SILs on an individual year basis unless otherwise noted.

[b] $PM_{2.5}$ modeled impacts will be the sum of direct $PM_{2.5}$ predicted by AERMOD and secondarily formed $PM_{2.5}$ as calculated by CALPUFF.

[C] The annual $PM_{2.5}$ SIL was updated by EPA on 4/30/2024. EPA guidance specifies that the highest of the multi-year averages of the maximum modeled 24 hour and annual $PM_{2.5}$ concentrations predicted each year at each receptor, based on 2 or more years and up to 5 complete years of available meteorological data, be used for the SIL analyses.

[d] See Section 4.13.

## 8.2 Q/D Analysis

A Q/D screening analysis was performed in a manner consistent with the proposed method as outlined in FLAG 2010.[41] This method compares the ratio of visibility-affecting pollutants (VAP, which includes $NO_x$, $SO_2$, $PM_{10}$ and $H_2SO_4$) emission rates associated with the project to the distance from the Class I area. There are no direct $H_2SO_4$ emissions, so the screening analysis only considers $NO_x$, $SO_2$, and $PM_{10}$ emissions.

For the FLAG 2010 approach, "Q" is calculated as the sum of the worst-case 24-hour emissions from the "project", converted to an annual basis. The "D'" term is defined as the distance, in kilometers (km), from the

[40] Federal Land Manager's Air Quality Related Values Work Group (FLAG), Phase 1 Report-Revised (2010), NSP/MRPC/NRR, 2010

[41] Federal Land Manager's Air Quality Related Values Work Group (FLAG), Phase 1 Report-Revised (2010), NSP/MRPC/NRR, 2010

facility to the closest receptor in the corresponding Class I area. A Q/D screening threshold of ten (10) is provided in the FLAG 2010 guidance document.

When considering the proposed emissions for the facility, the total "Q" is roughly 7,100 tons per year (tpy). Table 8-2 to Table 8-4 show the project's Q'D for the three operating scenarios detailed in Section 4.3. Detailed Q/D calculations are included in 10.4Appendix Q.

**Table 8-2. Class I AQRV Screening Analysis Result - Scenario 1**

| Class I Area | Distance (km) | Annualized Maximum Daily Emission Rate (tpy) | | | Q (tpy) | Q/D* | Additional Review? |
|---|---|---|---|---|---|---|---|
| | | $SO_2$ | $NO_X$ | $PM_{10}$ | | | (Yes/No) |
| Carlsbad Caverns National Park | 79.80 | 1,029 | 6,011 | 36.52 | 7,077 | 88.86 | Yes |
| Guadalupe Mountains National Park | 116.00 | | | | | 61.00 | Yes |
| Salt Creek Wilderness | 170.60 | | | | | 41.48 | Yes |
| White Mountain Wilderness | 242.57 | | | | | 29.17 | Yes |
| Big Bend | 279.75 | | | | | 25.30 | Yes |

**Table 8-3. Class I AQRV Screening Analysis Result - Scenario 2**

| Class I Area | Distance (km) | Annualized Maximum Daily Emission Rate (tpy) | | | Q (tpy) | Q/D* | Additional Review? |
|---|---|---|---|---|---|---|---|
| | | $SO_2$ | $NO_X$ | $PM_{10}$ | | | (Yes/No) |
| Carlsbad Caverns National Park | 79.80 | 1,041 | 5,962 | 36.52 | 7,039 | 88.21 | Yes |
| Guadalupe Mountains National Park | 116.00 | | | | | 60.68 | Yes |
| Salt Creek Wilderness | 170.60 | | | | | 41.26 | Yes |
| White Mountain Wilderness | 242.57 | | | | | 29.02 | Yes |
| Big Bend | 279.75 | | | | | 25.16 | Yes |

**Table 8-4. Class I AQRV Screening Analysis Result - Scenario 3**

| Class I Area | Distance (km) | Annualized Maximum Daily Emission Rate (tpy) | | | Q (tpy) | Q/D* | Additional Review? |
|---|---|---|---|---|---|---|---|
| | | $SO_2$ | $NO_X$ | $PM_{10}$ | | | (Yes/No) |
| Carlsbad Caverns National Park | 79.80 | 1,037 | 5,970 | 36.52 | 7,044 | 88.27 | Yes |
| Guadalupe Mountains National Park | 116.00 | | | | | 60.72 | Yes |
| Salt Creek Wilderness | 170.60 | | | | | 41.29 | Yes |
| White Mountain Wilderness | 242.57 | | | | | 29.04 | Yes |
| Big Bend | 279.75 | | | | | 25.18 | Yes |

## 8.3 Class I AQRV Analyses

The FLMs for Class I areas have the responsibility to protect air quality related values and to consider in consultation with the permitting authority whether a proposed major emitting facility will have an adverse impact on such values. Federal Land Managers' Air Quality Related Values Work Group (FLAG) 2010 Phase I Report defines the following:[42]

> *Air Quality Related Value* - A resource, as identified by the FLM for one or more Federal areas that may be adversely impacted by a change in air quality. The resource may include visibility or a specific scenic, cultural, physical, biological, ecological, or recreational resource identified by the FLM for a particular area.
>
> *Adverse Impact on Air Quality Related Values* - An unacceptable effect, as identified by an FLM, that results from current, or would result from predicted, deterioration of air quality in a Federal Class I or Class II area. A determination of unacceptable effect shall be made on a case-by-case basis for each area considering existing air quality conditions. It should be based on a demonstration that the current or predicted deterioration of air quality will cause or contribute to a diminishment of the area's national significance, impairment of the structure and functioning of the area's ecosystem, or impairment of the quality of the visitor experience in the area.

Red Hills evaluated impacts to deposition and visibility to address AQRVs at the five Class I areas. The following sections provide further details on the AQRVs that are addressed for this project.

### 8.3.1 Deposition

In the deposition analysis, the project's contribution to the deposition of chemical species at the four Class I areas will be evaluated against the deposition analysis thresholds (DAT) for nitrate ($NO_3$) and sulfate ($SO_4$), which are set by the FLM. As the five Class I areas are located more than 50 km from the facility, Trinity used CALPUFF to model deposition.

[42] Federal Land Manager's Air Quality Related Values Work Group (FLAG), Phase 1 Report-Revised (2010), NSP/MRPC/NRR, 2010

As stated in FLAG 2010, the DAT represents "the additional amount of nitrogen or sulfur deposition within a Class I area, below which estimated impacts from a proposed new or modified source are considered negligible." Moreover, according to FLAG 2010, "If the new or modified source has a predicted nitrogen or sulfur deposition impact below the respective DAT, the NPS and FWS will consider that impact to be negligible, and no further analysis would be required of that pollutant." The recommended DAT is not necessarily an adverse impact threshold, rather it's used as a screening level value. Since the potentially-affected Class I areas are all in the Southwestern US, the deposition impacts will be evaluated against appropriate sulfur and nitrogen DAT of 0.005 kg/ha/yr (each) for Class I areas in the Western United States.

Consistent with Interagency Workgroup On Air Quality Modeling (IWAQM) Phase 2 Summary Report (IWAQM Phase 2), particulate-phase dry and wet deposition will be modeled for $SO_4$. For sulfur deposition, the sum of wet and dry deposition fluxes for $SO_4$ will be normalized by the molecular weight of sulfur and expressed as total sulfur.

### 8.3.2 Visibility

Visibility can be affected by plume impairment (heterogeneous) or regional haze (homogeneous). Plume impairment results when there is a contrast or color difference between the plume and a viewed background (the sky or a terrain feature). Plume impairment is generally only of concern when the Class I area is near the proposed source (i.e., less than 50 km). Since the distances between the facility and the Class I areas are greater than 50 km, only regional haze will be considered.

Regional haze occurs at distances where the plume has become evenly dispersed into the atmosphere such that there is no definable plume. The primary causes of regional haze are $SO_4$ and $NO_3$ (primarily as ammonium salts). Particulate emissions also contribute to regional haze but to a lesser extent since sulfates and nitrates are hygroscopic species that increasingly reduce visibility with increased relative humidity.

Regional haze is measured using the light extinction coefficient ($b_{ext}$). The Interagency Monitoring of Protected Visual Environments (IMPROVE) workgroup proposed a method informally known as "Method 8" to compute visibility impairments, which has been incorporated as the default method in FLAG 2010. This algorithm will be used to calculate the daily light extinction attributable to the project and light extinction attributable to a natural background.

To determine a change in regional haze, the percentage change of the light extinction coefficient ($\Delta b_{ext}$) will be evaluated using Equation 1:[43]

$$\Delta b_{ext} = (b_{ext(source+nat\ cond)} - b_{ext(nat\ cond)})/b_{ext(nat\ cond)} \quad \textit{(Equation 1)}$$

[43] Federal Land Managers' Air Quality Related Values Work Group (FLAG), Phase I Report-Revised (2010), NSP,/NRPC/NRR, 2010

The background extinction coefficient $b_{ext,(nat\ cond)}$ is affected by various chemical species and the Rayleigh scattering phenomenon and can be calculated as shown in Equation 2:[44]

$$b_{ext} = 2.2 \times f_S(RH) \times [\text{Small Sulfate}] + 4.8 \times f_L(RH) \times [\text{Large Sulfate}] + 2.4 \times f_S(RH) \times [\text{Small Nitrate}] + 5.1 \times f_L(RH) \times [\text{Large Nitrate}] + 2.8 \times [\text{Small Organic Mass}] + 6.1 \times [\text{Large Organic Mass}] + 10 \times [\text{Elemental Carbon}] + 1 \times [\text{Fine Soil}] + 0.6 \times [\text{Coarse Mass}] + 1.7 \times f_{SS}(RH) \times [\text{Sea Salt}] + \text{Rayleigh Scattering (Site Specific)} + 0.33 \times [NO_2\ (ppb)] \left\{\text{or as: } 0.1755 \times \left[NO_2\ \left(\frac{\mu g}{m^3}\right)\right]\right\} \quad \textit{(Equation 2)}$$

Where:

[ ] indicates concentrations in μg/m$^3$

$f_S(RH)$ = Relative humidity adjustment factor for small sulfate and nitrate

$f_L(RH)$ = Relative humidity adjustment factor for large sulfate and nitrate

$f_{SS}(RH)$ = Relative humidity adjustment factor for sea salt

For Total Sulfate < 20 μg/m$^3$:

[Large Sulfate] = ([Total Sulfate] / 20 μg/m$^3$) x [Total Sulfate]

For Total Sulfate ≥ 20 μg/m$^3$:

[Large Sulfate] = [Total Sulfate]

And:

[Large Sulfate] = [Total Sulfate]-[Large Sulfate]

The natural background concentrations and Rayleigh scattering value at the Class I areas considered in this analysis are provided on an annual average basis in FLAG 2010. The values are shown in Table 8-5 and are representative of each of the five Class I areas. The monthly relative humidity (f(RH)) values for each of the Class I areas were also obtained from FLAG 2010 and are shown in Table 8-6 through Table 8-8.

Pollutants that have the potential to affect visibility (particulate species) are emitted from Red Hills. The extinction coefficient $b_{ext(source)}$ due to emissions of visibility affecting pollutants from a single project were calculated using CALPUFF. The extinction due to the project was calculated as shown in Equation 2 above and compared with natural conditions using Equation 1.

[44] Federal Land Managers' Air Quality Related Values Work Group (FLAG), Phase I Report-Revised (2010), NSP,/NRPC/NRR, 2010

**Table 8-5. Annual Average Natural Conditions**

This data is used in the AQRV Analysis provided in Section 10.2 of this report.

Equation 2 above for regional haze requires an estimate of the chemical composition and size distribution of the particulates emitted from the sources at the facility. Particulate extinction coefficients of a natural gas fuel burning source for use in the CALPOST program are based on best estimates for elemental carbon (EC), with the balance of filterable particulate divided between fine soil (PMF) and coarse mass (PMC). Condensable particulate matter will be assumed to be "Inorganic" Condensable $PM_{10}$ (CPM IOR) and secondary organic aerosol (SOA). A relative humidity adjustment factor of 3.0 * f (RH) is used to calculate the sulfate ($SO_4$) component of the light extinction coefficient, which accounts for the hygroscopic growth of sulfate aerosol in the presence of water vapor. Table 8-9 provides a summary of the particle speciation percentages based on the speciation profile from the EPA SPECIATE v5.3 database for a boiler burning natural gas.[45]

**Table 8-9. Particle Speciation Percentages**

| Source | Coarse (PMC) | Fine Soil (PMF) | Fine EC | CPM IOR | SOA | Nitrate (NO3) |
|---|---|---|---|---|---|---|
| Heaters | 0.0 | 81.8 | 3.0 | 4.4 | 8.7 | 2.13 |
| Boilers | 0.0 | 81.8 | 3.0 | 4.4 | 8.7 | 2.13 |
| Thermal Oxidizer | 0.0 | 81.8 | 3.0 | 4.4 | 8.7 | 2.13 |

## 8.4 Class I PSD Increment Analyses

PSD permit applicants are required to demonstrate, through air quality modeling, that the emissions from the project will not cause or contribute to violations of allowable increments within affected Class I areas. A significant contribution to Class I Increment consumption is defined as a modeled concentration in excess of the significant impact levels summarized in Table 8-10.

[45] EPA SPECIATE v5.4, https://www.epa.gov/air-emissions-modeling/speciate

**Table 8-10. Class I PSD Modeling Significance Levels and Increments**

| Pollutant | Averaging Period | SIL ($\mu g/m^3$) | Increment ($\mu g/m^3$) |
|---|---|---|---|
| $NO_2$ | Annual | 0.10 | 2.5 |
| $SO_2$ | 3-Hour | 1.00 | 25 |

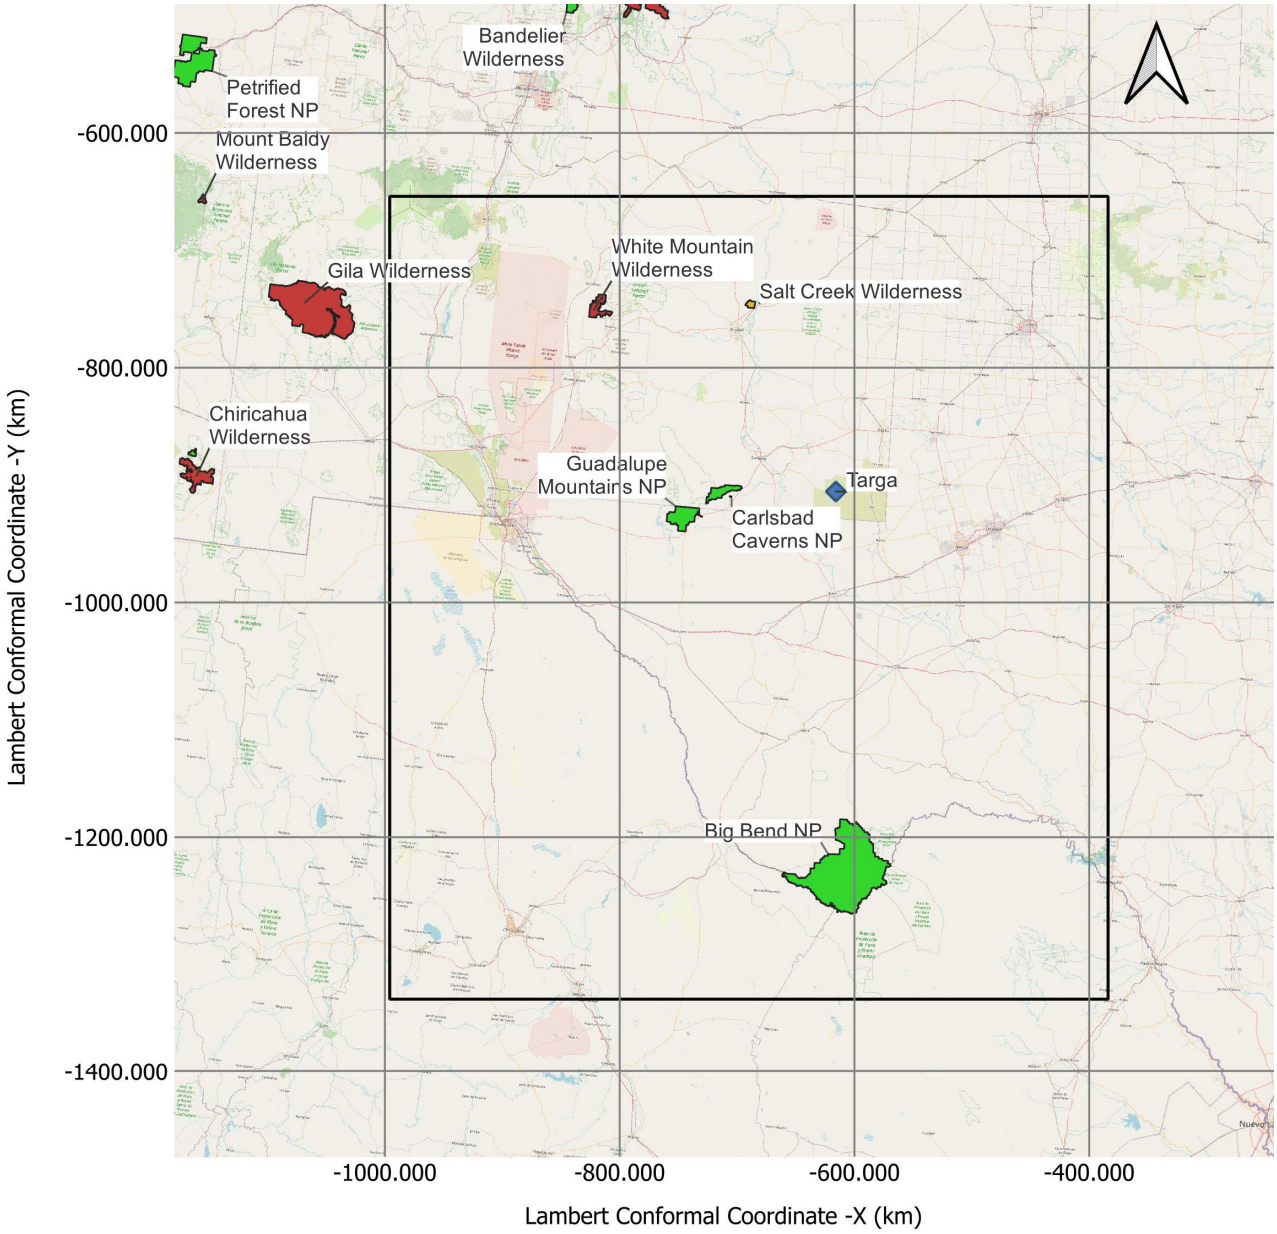
| | Annual | 0.20 | 4 |
| $PM_{2.5}$ | 24-Hour | 0.27 | 2 |
| | Annual | 0.05 | 1 |

# 9. CLASS I MODELING INPUTS

The U.S. EPA no longer recommends the CALPUFF modeling system as a tool for analyzing long-range pollutant transport (i.e., distances greater than 50 km) within the Guideline on Air Quality Models, Appendix W.[46] The FLMs have approved the  version [Version 5.8.5 of CALPUFF (level 151214) and 6.221 of CALPOST (level 082724] of the CALPUFF modeling suite as a screening model for Class I SIL and Increment. The FLMs continue to prefer the use of CALPUFF in the assessment of AQRV impacts. Targa will use CALPUFF to determine the possible impacts of the Red Hills facility on Class I AQRVs at each of the five Class I areas. Class I increment was not modeled as the Class I impacts were less than the Class I SIL.

In addition to gridded meteorological data, the CALPUFF model uses several other input files to specify source and receptor parameters. The selection and control of CALPUFF options are determined by user-specific inputs contained in the control file. This file contains all of the necessary information to define a model run (e.g., starting date, run length, grid specifications, technical options, output options). The air quality modeling was performed using CALPUFF default options unless otherwise noted, as specified in the federal Guideline and IWAQM documents.[47] The following sections describe the modeling domain, meteorological data, background concentrations, and model implementation that were used for the analysis of the Red Hills facility.

## 9.1 Modeling Domains



The location, terrain, and land use within the meteorological MMIF and computational CALPUFF domains are based on previously-developed datasets. Trinity used the 2018-2020 WRF data recently compiled and distributed by Tim Allen at USFWS.[48] The CALPUFF computational domain was set to encompass the entire CALMET domain and used the same grid spacing (12 km). The horizontal domain is comprised of grid cells, each containing a central grid point at which meteorological and computational parameters were calculated at each time step. Trinity used a domain defined with Lambert Conformal Coordinate (LCC) shown in Table 9-1 and as shown in Figure 9-1. This domain is 612 km x 684 km which corresponds to a grid of 51 x 57 cells at a 12-km resolution. The grid center is offset from the facility to capture the Class I areas to the west and south.

**Table 9-1. Model Domain Coordinates**

| Indices | Longitude | Latitude | LCC X (km) | LCC Y (km) |
|---|---|---|---|---|
| SW | -107.04637 | 28.04069 | -996.000 | -1338.000 |
| NE | -101.20709 | 34.58297 | -384.000 | -654.000 |

[47] Federal Land Managers' Air Quality Related Values Work Group (FLAG), Phase I Report-Revised (2010), NSP,/NRPC/NRR, 2010 and Interagency Workgroup on Air Quality Modeling (IWAQM) Phase 2 Summary Report and Recommendations for Modeling Long Range Transport Impacts. EPA-454/R-98-019. December 1998.

**Figure 9-1. Map Showing CALPUFF Modeling Domain**

Vertical grid structure is defined by the cell face height. The cell face height of each cell indicates its vertical extent. The vertical domain is composed of terrain-following grid cells, the number and size of which are chosen to constrain the boundary layer where dispersion and chemical transformations take place. The highest cell face is proposed to be 4,000 meters to constrain the default maximum mixing height of 3,000 meters. CALMET and CALPUFF used the same cell face heights.Table 9-2 summarizes the vertical grid structure used for the analyses.

**Table 9-2. Vertical Grid Structure**

| Vertical Grid Cell | Cell Face Height (meters) |
|---|---|
| 1 | 20 |
| 2 | 40 |
| 3 | 80 |
| 4 | 160 |
| 5 | 320 |
| 6 | 640 |
| 7 | 1,000 |
| 8 | 2,000 |
| 9 | 3,000 |
| 10 | 4,000 |

Ambient impacts were predicted at receptors specified by the FLMs to represent Class I Areas.[49] Receptor elevations were provided by NPS[50]. Note that the coordinates used in this modeling simulation were Lambert Conformal Coordinates (LCC) based on the design of the CALMET meteorological domain. These coordinates have an origin of 40.574°N and 97°W with standard parallels of 33°N and 45°N. Receptor locations for the Class I areas were converted to LCC using the Class I conversion tool provided by the NPS.

## 9.2 CALPUFF Meteorological Processing

Data from the 2018-2020 meteorological data set were extracted in CALPUFF-ready format using the Mesoscale Model Interface (MMIF) tool provided by U.S. EPA. The data was processed using the regulatory default settings in the MMIF guidance document.[51]

## 9.3 CALPUFF Model Processing

Using the data provided by MMIF, CALPUFF was used to simulate the dispersion (along with the deposition and chemical transformation for AQRV analyses) of discrete puffs of mass from emission sources. Each puff contained emissions of each modeled species and was advected throughout the domain while deposition and chemical transformation processes takes place. CALPUFF is a Lagrangian puff model, the principal advantages of which are that plumes can evolve dynamically and chemically over time and can respond to complex winds caused by terrain effects, stagnation, and recirculation.

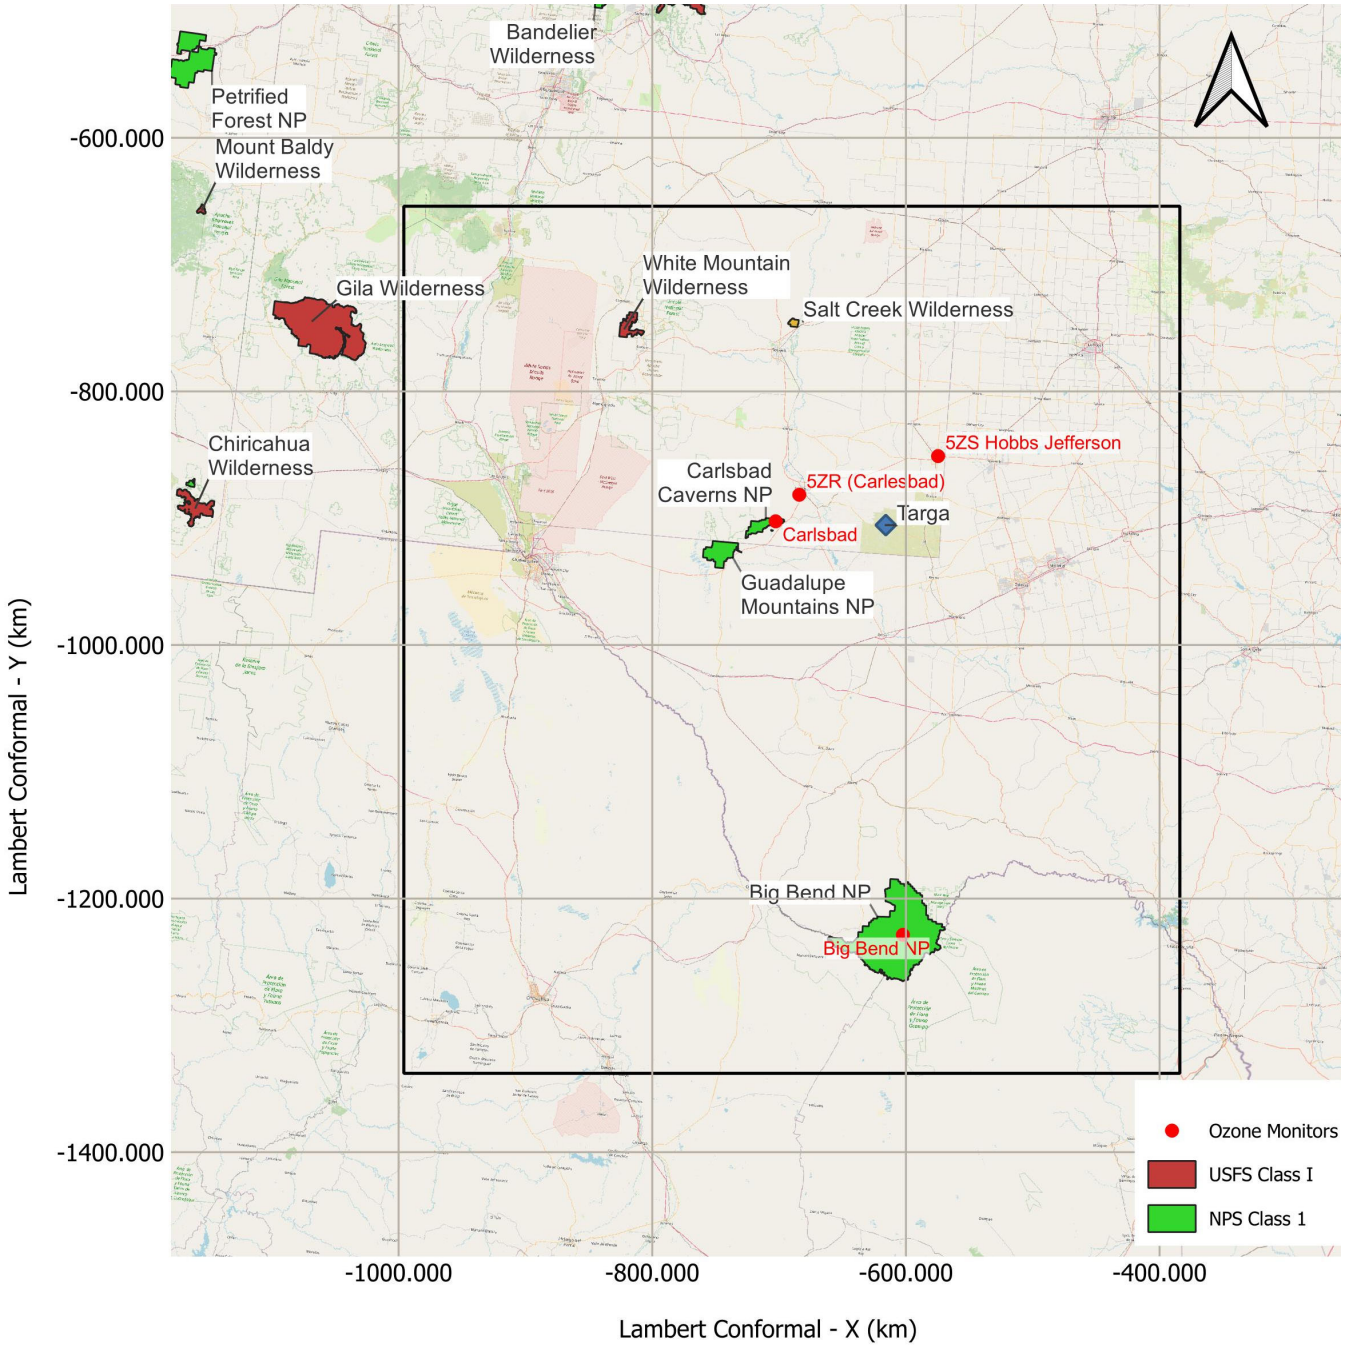
Emissions data for the Red Hills Plant was entered into CALPUFF. The modeling analysis will only include the main combustion sources (i.e., heater, flares, etc.) as this is the source that would be expected to contribute to long-range transport. Fugitive PM emissions such as those from paved roadways were not included due to their very localized nature. Emergency engines were also excluded from the modeling given their infrequent operation and localized impacts.

[50] https://irma.nps.gov/DataStore/Reference/Profile/2249830

[51] Guidance on the Use of the Mesoscale Model Interface Program (MMIF), Document Display | NEPIS | US EPA

This analysis was performed with the deposition algorithm enabled except for particulate SIL analyses. A full resistance model is provided in CALPUFF for the computation of dry deposition rates of gases and particulate matter as a function of geophysical parameters, meteorological conditions, and pollutant species. An empirical scavenging coefficient approach using default options was enabled in CALPUFF to compute the depletion and wet deposition fluxes due to precipitation scavenging.

The CALPUFF model is capable of simulating linear chemical transformation effects by using pseudo-first-order chemical reaction mechanisms for the conversions of $SO_2$ to $SO_4$ and $NO_X$, which consists of NO and $NO_2$, to $NO_3$ and $HNO_3$. There are two user-selected input parameters that affect the MESOPUFF II chemical transformation, ammonia concentrations and ozone concentrations. The selection of each parameter is discussed separately. The chemistry model was not enabled for the particulate SIL modeling.



### 9.3.1 Ozone

Ambient ozone concentrations are required for inputs for the MESOPUFF II chemical scheme in order to handle the $NO_2$ chemistry in the model. Ozone values can be input to the model as a background level or using hourly, spatially varying observations. For this analysis, monthly average ozone background values were computed for each modeled year (2018, 2019 and 2020) from the CASTNET and AIRS data). The sites used for the ozone data are listed in Table 9-3 and their locations are demonstrated in Figure 9-2.

**Table 9-3. Ozone Background Monitors**

| Class I Area | Ozone Monitor Location | Ozone Monitor ID |
|---|---|---|
| White Mountain Wilderness | Carlsbad SZR | 35-015-1005 |
| Salt Creek Wilderness | Carlsbad SZR | 35-015-1005 |
| Guadalupe Mountains NP | Carlsbad and Carlsbad SZR | 35-015-1005 and 35-015-0010 |
| Carlsbad Caverns NP | Carlsbad and Carlsbad SZR | 35-015-1005 and 35-015-0010 |
| Big Bend NP | Big Bend | 48-043-0101 |

**Figure 9-2. Map Showing Ozone Monitor Locations**

## 9.3.2 Ammonia

IWAQM Phase 2 recommends the use of spatially constant background ammonia concentrations to participate in the MESOPUFF-II chemical transformation mechanism. Ammonia background data may be available from the National Atmospheric Deposition Program (NADP), Ammonia Monitoring Network. However no nearby monitors were found within the modeling domain. Given that the land use across the domain is predominantly

comprised of arid lands and through consultation with the FLMs, the default ammonia background of 1.0 ppb was applied for this analysis.

### 9.3.3 CALPUFF Processing Control

CALPUFF modeling was conducted using the recommended regulatory default options specified in Appendix B of IWAQM Phase 2. The integrated puff representation was used and puff splitting will be conservatively disabled.

## 9.4 POSTUTIL Processing

The first postprocessing step involved running POSTUTIL to calculate the concentrations of visibility-affecting and deposited species prior to running CALPOST. Specifically, POSTUTIL was used to combine the appropriate wet and dry fluxes of sulfur-bearing species deposited as particles and gases.

The other step performed in POSTUTIL was to repartition the nitrogen mass between nitric acid and nitrate. This processing stage, referred to as the ammonia limiting method (ALM), was accomplished by utilizing the default setting in POSTUTIL of MNITRATE = 1.

## 9.5 CALPOST Postprocessing Analysis

The CALPOST postprocessor was used to compute the total deposition of nitrogen and sulfur within each of the five Class I areas for assessment against the DAT as well as the 24-hour average visibility impairment. Section 7.4 generally described the technical approach for computing these values from the modeled concentrations of pollutant emissions. A summary of CALPOST program switches is included in 10.4Appendix R.

A change in light extinction attributable to a single facility of 0.5 deciview (DV) or less on a 24-hour average basis is generally acceptable to the FLM[52]. The FLAG 2010 guidance establishes a metric for assessing whether a single facility causes or contributes to visibility impairment. This guidance establishes a 0.5 DV extinction change threshold for contribution and a 1.0 DV extinction change threshold for causation of visibility impairment. These thresholds are applied to the 98th percentile model result for an analysis that considers multiple years of meteorological data. In other words, application of the 98th percentile standard formalizes the intensity, duration, and frequency aspects of modeled visibility impairment events by standardizing discretion left to the FLM on a case-by-case basis to exclude visibility impairment events that could be due to meteorological conditions or other naturally occurring phenomena that are not attributable to the emissions source.

# 10. CLASS I MODELING RESULTS

## 10.1 SIL Analysis

The tables below detail the results of the significant impact screening. Table 10 1 details the results at Carlsbad Caverns, Table 10 2 details the results at Guadalupe Mountains, Table 10 3 details the results at Salt Creek Wilderness, Table 10 4 details the results at White Mountain Wilderness, and Table 10 5 details the results at Big Bend. The project's impact was less than the Class I significant impact level at all Class I areas evaluated. Therefore, no further NAAQS or Increment analysis was completed. Significant Impact Screening Results

## 10.2 Class I AQRV Analyses

### 10.2.1 Deposition

Table 10-6 through Table 10-10 present the modeled impact of nitrogen and sulfur deposition resulting from the facility. As shown, the impacts are less than the established deposition analysis thresholds at the Class I areas.

## Table 10-6. Deposition Results for Big Bend

| Scenario | Class I Area | Year | N (kg/ha/yr) | S (kg/ha/yr) | Threshold (kg/ha/yr) | Below Threshold? |
|---|---|---|---|---|---|---|
| 1 | Big Bend | 2018 | 1.01E-05 | 4.53E-05 | 0.005 | YES |
| 2 | Big Bend | 2018 | 1.01E-05 | 4.53E-05 | 0.005 | YES |
| 3 | Big Bend | 2018 | 1.01E-05 | 4.53E-05 | 0.005 | YES |
| 1 | Big Bend | 2019 | 9.96E-06 | 2.92E-05 | 0.005 | YES |
| 2 | Big Bend | 2019 | 9.97E-06 | 2.92E-05 | 0.005 | YES |
| 3 | Big Bend | 2019 | 9.97E-06 | 2.92E-05 | 0.005 | YES |
| 1 | Big Bend | 2020 | 1.15E-05 | 3.13E-05 | 0.005 | YES |
| 2 | Big Bend | 2020 | 1.15E-05 | 3.13E-05 | 0.005 | YES |
| 3 | Big Bend | 2020 | 1.15E-05 | 3.13E-05 | 0.005 | YES |

* Note that output units in the summary section of the LST file is kg/ha/yr. CALPOST applies the following conversion. 1 (ug/m2/s2) = 315.56926 (kg/ha/yr).

## Table 10-7. Deposition Results for Carlsbad Caverns

| Scenario | Class I Area | Year | N (kg/ha/yr) | S (kg/ha/yr) | Threshold (kg/ha/yr) | Below Threshold? |
|---|---|---|---|---|---|---|
| 1 | Carlsbad Caverns | 2018 | 5.56E-04 | 1.99E-03 | 0.005 | YES |
| 2 | Carlsbad Caverns | 2018 | 5.57E-04 | 1.99E-03 | 0.005 | YES |
| 3 | Carlsbad Caverns | 2018 | 5.56E-04 | 1.99E-03 | 0.005 | YES |

## 10.3 Regional Haze

Table 10-11 through Table 10-15 present the results of the visibility impairment analysis that was conducted for the facility. A change in the extinction attributable to a single facility of 5% or less on a 24-hour average basis is generally acceptable of the FLM. The FLAG 2010 guidance establishes a metric for assessing whether a single facility causes or contributes to visibility impairment. This guidance establishes a 0.5 DV extinction change threshold for contribution and a 1.0 DV extinction change threshold for causation of visibility impairment. These thresholds were applied to the 98$^{th}$ percentile model result for an analysis that considers multiple years of meteorological data. In other words, application of the 98$^{th}$ percentile standard formalized the intensity, duration, and frequency aspects of modeled visibility impairment events by standardizing discretion left to the FLM on a case-by-case basis to exclude visibility impairment events that could be due to meteorological conditions or other naturally occurring phenomena that are not attributable to the emissions source. As shown, the impacts are less than the established change in DV thresholds at the Class I areas.

**Table 10-11. Regional Haze Results for Big Bend**

| Scenario | Class I Area | Year | Maximum Delta DV | 98%tile change in DV | # Days >0.5 | #Days>1 | Threshold | Below Threshold? |

## 10.4 Class I $PM_{2.5}$ Secondary Impacts

In addition to the primary impacts for $PM_{2.5}$ shown in Tables 10-1 through 10-5, Targa also considered secondarily formed $PM_{2.5}$ from project emissions of $NO_x$ and $SO_2$. In this analysis, the project emissions increases are multiplied by the ratio of the modeled concentrations to the modeled emission rates for hypothetical sources to estimate project related secondary $PM_{2.5}$ concentrations. Since the Class I areas are more than 50 km distant, the distance-dependent data was obtained from the U.S. EPA's MERPs View Qlik website.[53] Table 10-16 presents the secondary $PM_{2.5}$ impacts expected at the nearest Class I area (Carlsbad

[53] www.epa.gov/scram/merps-view-qlik

Caverns). Targa conservatively assumed that the secondary $PM_{2.5}$ impacts expected at all other Class I areas would be equal to the impact at the nearest Class I area.

**Table 10-16. Expected Secondary $PM_{2.5}$ Impacts for Carlsbad Caverns**

| Averaging Period | Precursor | Modeled ER from Hypo. Source[a] (tpy) | Modeled Impact from Hypo. Source[a] ($\mu g/m^3$) | Net Emissions Increase (tpy) | Secondary $PM_{2.5}$ Project Impact ($\mu g/m^3$) |
|---|---|---|---|---|---|
| 24-hour | $NO_X$ | 500 | 0.0321 | 179.3 | **0.01152** |
| 24-hour | $SO_2$ | 500 | 0.0846 | 436.3 | **0.07381** |
| 24-hour | | | | **Total** | **0.08533** |
| Annual | $NO_X$ | 500 | 0.0014 | 179.3 | **0.00051** |
| Annual | $SO_2$ | 500 | 0.0016 | 436.3 | **0.00138** |
| Annual | | | | **Total** | **0.00189** |

c. Hypothetical source is a source located in either Otero County, New Mexico or Terry County, Texas from EPA's MERPs View Qlik website, based on the maximum modeled impact between the two locations at a distance of 80 km from the hypothetical source (approximate distance to the closest Class I area from the project location). Hypothetical source emission rate represents the closest value available in MERPs View Qlik to the source-wide PTE for NOX and SO2 for the project.

The values in Table 10-16 were then added to the primary $PM_{2.5}$ impacts provided in Tables 10-1 through 10-5. As discussed previously, Carlsbad Caverns is 80 km from the facility so the 80 km data were selected as the closest datapoint.

# Electronic Files

The file naming conventions and structure is the same for each of the three scenarios.

| SCENARIO | FOLDER | FILE or FOLDER | FILE or FOLDER | FILE | DESCRIPTION |
|---|---|---|---|---|---|

Andrea
The subject facility modeling protocol is approved. Please go ahead and model the facility.
Thank you.

> You don't often get email from andrea.sayles@trinityconsultants.com. Learn why this is important

Hi Sufi,

Was this the last issue before protocol approval? We wanted to confirm the protocol is approved before moving forward with the final modeling. Let me know, thanks!

Hi Sufi,

I left you a voice message and wanted to follow up with an email. Can you let us know if we need to send you an updated protocol or if it is acceptable to include this information in the final modeling report? We are waiting for your response to proceed.

Thanks,

**Andrea Sayles**

**Subject:** RE: [EXTERNAL] RE: Red Hills Gas Plant

Hi Sufi,

Thanks for the comments. Please see below regarding the justification for selecting the Otero County site for MERPs analysis.

EPA has released the "Guidance on the Development of Modeled Emission Rate for Precursors (MERPs) as a Tier 1 Demonstration Tool for Ozone and $PM_{2.5}$ under the PSD Permitting Program", and in this guidance, the EPA states that "source characteristics" and "chemical and physical environment near the project source" are criteria in determining an appropriate hypothetical source.

There are three hypothetical sources in New Mexico: Otero County, Roosevelt County, and McKinley County. EPA identifies all three sources in the Southwest Climate Zone, and for Otero County and McKinley County, the EPA guidance also indicates that the fractional urban coverage within 50 km of the two sources is at 0% These parameters are similar to the Red Hills facility.

At the facility, the average height of all the point sources is 17.75 m. The MERPs only provides two options, either a hypothetical source with a stack height of 10 m or 90 m. As the majority of stacks at the facility are closer to 10 m than 90 m, it is appropriate to select a hypothetical source with a stack height of 10 m. Both the Otero County site and the Roosevelt County site can represent a 10 m stack.

Based on our most recent PTE calculations, controlled NOx and SO2 emissions are below 500 tpy. Among the hypothetical sources in New Mexico with a stack height of 10 m, only the Otero County and McKinley County sources represent a hypothetical source with 500 tpy of emissions.

As the Otero County hypothetical site is the closest in proximity to the facility and the modeled impacts associated with 500 tpy of precursor emissions from a 10 m stack can represent the facility, Targa believes Otero County is the most appropriate source for the MERPs analysis. However, while we plan on stating in the protocol/report that Otero County would be the best hypothetical source, we are amenable to using the Terry County, TX hypothetical source for conservatism. Using Terry County is consistent with our call with you on 7/29/25.

Would you like to receive an updated protocol with this information included or is it more appropriate just to include this in our final modeling report? Please let us know, and don't hesitate to reach out if you have further questions on this information or any other matter.

Thanks,

**John Ke**

**Subject:** RE: [EXTERNAL] RE: Red Hills Gas Plant

Jaimy
The modeling protocol you provided is very detailed and it seems acceptable. You had separately presented an approach to calculate effective flare height which is acceptable. You also suggested to use SO2 monitor data from Albuquerque for background concentrations and we have accepted it.
It appears to me that you have been in conversation with FLM regarding Class I modeling analyses. I hope analyses are provided to their expectation and satisfaction.
I have only one comment below:
The submitted modeling protocol discusses the criteria for the selection of a hypothetical emission source for MERP analyses. Please provide a justification based on the criteria why Otero county site is more appropriate than Roosevelt County site for MERP analyses.
Thank you.

Jaimy
There are few comments on protocol that we discussed. I will compose comments today or tomorrow and send them to you.
Regarding Class I analysis, you sent me your email conversations with Don Shepperd. Did you conclude communications with FLMs. Please share any correspondence, comments or update in the modeling analyses protocol because of it.
Thank you.

As we have discussed over the phone this approach for effective flare height and diameter is acceptable for the modeling analyses of the subject facility.
Thank you.

Hi Sufi,

Please find attached a memo describing our approach for using effective height for flares in AERMOD and the justification for using it as opposed to the physical stack height.

Please do not hesitate to reach out should you have any questions.

Thank you,

Hi Sufi,

Thank you again for taking the time to speak with me. As we discussed, it's our understanding that you have not yet received a response from Erik regarding the items outlined below, nor any updates related to the modeling protocol. We appreciate that you've reached out to him to request either a response or an estimated timeline.

As noted, the modeling protocol approval is the final item we're awaiting before we can proceed with submitting the application.

Would you be available for a brief follow-up discussion with Charles and I on either Tuesday or Wednesday of next week? Please let us know what works best for your schedule.

Have a great holiday weekend!

Regards,

Hi Sufi,

Thank you so much for taking my call this morning! As discussed, we wanted to see what your thoughts were on possibly using the Albuquerque monitor as the background for SO2. The background data is already complete and developed and we believe that it would be representative of non-oil and gas background sources that may be present in New Mexico. Since we are already modeling out to 20 km for SO2 sources, we believe that adding the background from Albuquerque would be appropriately conservative.

Additionally, as mentioned on the call, I will be out of the office from September 3, 2025 to September 19, 2025. Adam will be the Trinity point of contact during my absence. Should anything come up or should you have any questions regarding anything within the protocol, please reach out to him.

Thank you,

## Jaimy Karacaoglu

**From:** Jaimy Karacaoglu
**Sent:** Thursday, December 18, 2025 4:01 PM
**To:** Shepherd, Don
**Cc:** Hedgepeth, McKenna, ENV; Salazer, Holly; Barna, Michael; Devore, Lisa M; 'Charles Bates'; Rob Liles; Sorkin, Jeff- FS; Mcneel, Pleasant - FS; Adam Erenstein; Mustafa, Sufi A., ENV; Allen, Tim
**Subject:** RE: [EXTERNAL] RE: Targa Red Hills flare emissions

Hi Don,

Thank you for your review of our air quality modeling protocol and for the questions you've provided throughout the process. I'm writing to provide a final status update and close the loop on protocol-related questions ahead of our application submittal.

The modeling protocol is in the closing stage of agency review, and we expect to receive final approval and comments from NMED and EPA within the next few days. After we receive that direction, we will proceed with submitting the permit application. The application will include an updated protocol that incorporates the items we have discussed with you previously as well as NMED and EPA's comments. Additionally, the application will contain the facility-wide emissions spreadsheet, which details all of our calculations for both steady state and SSM emissions and contains the calculations for Q values.

We expect the application package will provide the additional context and clarity needed on the topics raised during the protocol review by consolidating the final protocol, inputs, assumptions, and supporting documentation into a single, complete submittal. We will ensure you are provided with a copy at the time of submittal. Accordingly, we look forward to continuing to work with you once you have had a chance to review the complete application.

Regards,

**Jaimy Karacaoglu**

**Subject:** RE: [EXTERNAL] RE: Targa Red Hills flare emissions

Hi Don,

Please see responses below in red.

Thanks for the feedback. I would appreciate it if you would show how you determined that "For the facility as a whole, when looking at only steady-state emissions, Q/d would be less than 10 for all Class I areas within 300 km."

The facility-wide steady state "Q" is 454.85; please see the attached example calculation. This calculation removes all instances of SSM, but retains steady state emissions that are present on a continuous basis. The Q/D results for each Class I area are reported below:

| Class I Area | D (km) | Q/D (max 24 hour) |
|---|---|---|
| Carlsbad | 79.80 | 5.70 |
| Guadalupe | 116.00 | 3.92 |
| Salt Creek | 170.60 | 2.67 |
| White Mountain | 242.57 | 1.88 |
| Big Bend | 279.75 | 1.63 |

I am trying to understand the Alternate Operating Scenarios (AOS) referenced in section 4.3 of the Application and Supplement:

For units with alternative operating scenarios occurring at the same emission point, such as the flares at the facility, the scenario with the maximum modeled impact will be used for the modeling demonstration. The alternative operating scenarios, which have lesser impact, will be detailed Section 15 of the PSD permit application package submittal.

For example, in Scenario 1, the Flare RH2-FL5100 has NOx emission rates of:
SSM 562.98 lb/hr
AOS SSM 3.64 lb/hr
Dehy AOS SSM 0.45 lb/hr

The Note for this item states:
It was conservatively assumed that AOS SSM and Dehy AOS SSM events would last 24 hours. SSM, AOS SSM, and Dehy AOS SSM are not flared simultaneously. The maximum of each stream on a pollutant by pollutant basis was taken to derive the lb/day value as a conservative measure. The unit may operate in a way that allows for flaring of different streams during a given day, but this would not be quantifiable. Therefore, the maximum contributor was used.
Can any two of these three activities occur simultaneously?

Flare units RH1-FL-29-1003, RH2-FL-5100, RH3- FL-5100, RH4-FL-45100, and RH5-FL-55100 are designed to combust startup, shutdown, and maintenance (SSM) emissions from various process equipment at the facility. These flares may also handle flash gas emissions from amine units RH1-AMINE, RH2-AMINE, RH4-AMINE, and RH5-AMINE during cold weather events. Additionally, these flares may also handle regenerator overheads from glycol dehydrator units RH2-DEHY, RH3-DEHY, RH4-DEHY, RH5-DEHY, and RH6-DEHY during thermal oxidizer downtime. **It is important to note that facility SSM emissions and amine flash gas emissions will not be combusted simultaneously.** All other nominal events can still occur within any given hour.

**SSM** – This emission rate includes pilot, purge, and SSM emissions from various process equipment at the facility. [SSM activities will not be initiated intentionally when AOS SSM or Dehy AOS SSM activities are in progress.]

**AOS SSM** – This emission rate includes the AOS emissions resulting from amine flash gas being routed to the flares during cold weather events. [SSM activities will not be initiated intentionally when AOS SSM or Dehy AOS SSM activities are in progress.]

**Dehy AOS SSM** – This emission rate includes the AOS emissions resulting from the dehydrator regenerator overheads during thermal oxidizer downtime. [SSM activities will not be initiated intentionally when AOS SSM or Dehy AOS SSM activities are in progress.]

| Unit ID | Nominal Processes | AOS Processes |
|---|---|---|
| **RH1-FL-29-1003** | Pilot<br>Purge<br>RH1-TEG (dehy) Still Vent<br>SSM Emissions | Pilot<br>Purge<br>RH1-TEG (dehy) Still Vent<br>RH1-AMINE (amine) Flash Gas |
| **RH2-FL-5100** | Pilot<br>Purge<br>SSM Emissions | Pilot<br>Purge<br>RH2-AMINE (amine) Flash Gas<br>RH2-DEHY (dehydrator) Regenerator Overheads |
| **RH3-FL-5100** | Pilot<br>Purge<br>SSM Emissions | Pilot<br>Purge<br>RH3-DEHY (dehydrator) Regenerator Overheads |
| **RH4-FL-45100** | Pilot<br>Purge<br>SSM<br>Pigging Emissions | Pilot<br>Purge<br>RH4-AMINE (amine) Flash Gas<br>RH5-AMINE (amine) Flash Gas<br>RH4-DEHY (dehydrator) Regenerator Overheads<br>Pigging Emissions |

**Subject:** RE: [EXTERNAL] RE: Targa Red Hills flare emissions

Hi Don,

No, we do not intend to model steady-state conditions for the acid gas flares. The steady-state conditions include only pilot and purge gas, the emissions from which are orders of magnitude lower than our three flaring scenarios. Only the three worst-cases are modeled.

For the facility as a whole, when looking at only steady-state emissions, the Q/d would be less than 10 for all Class I areas within 300 km.

Do you intend to also model the "steady state" condition?

**Subject:** RE: [EXTERNAL] RE: Targa Red Hills flare emissions

Hi Don,

Please see below for response to your questions in red.

Has Section 15 of the PSD permit application, which describes Alternate Operating Scenarios, been submitted yet?
This has not been submitted yet. We will make sure you receive a full copy of the application when it is submitted.

Section 4.3, Alternate Operating Scenarios, in the May 2025 Supplement Revision, includes this:
The most significant alternative operating scenario revolves around the flares that operate on the acid gas trains. Three scenarios exist: RHA-FL-5100 operating independently (Scenario #1), RA2-FL-25100 operating independently (Scenario #2), and RHA-FL-5100 and RA2-FL-25100 operating simultaneously (Scenario #3). Details regarding the limitation of these scenarios and their associated emission rates will be provided in detail in the application and modeling report submitted to the NMED. Preliminary emissions associated with the scenarios are presented in Section 3.2. and Appendix A.

Am i correct in thinking that the only differences among the three alternate operating scenarios are operation of the two acid gas flares? Would there ever be a scenario when the two acid gas flares are in a low-emissions "idle" mode?
The difference you have identified is correct; emissions only differ for those two acid gas flares. The scenarios provided are those that could produce “the worst-case” emissions from the combination of the two units. There are times when the two acid gas flares are in “idle-mode” with only the pilots combusting. This should truly be the steady-state operation of the unit, with the “three scenarios” being infrequent.

Let me know if you have any additional questions.

**Subject:** Re: [EXTERNAL] RE: Targa Red Hills flare emissions

Hello Jaimy,

I am hoping that you can help me understand the plant's operating scenarios.

Has Section 15 of the PSD permit application, which describes Alternate Operating Scenarios, been submitted yet?

Section 4.3, Alternate Operating Scenarios, in the May 2025 Supplement Revision, includes this:

> The most significant alternative operating scenario revolves around the flares that operate on the acid gas trains. Three scenarios exist: RHA-FL-5100 operating independently (Scenario #1), RA2-FL-25100 operating independently (Scenario #2), and RHA-FL-5100 and RA2-FL-25100 operating simultaneously (Scenario #3). Details regarding the limitation of these scenarios and their associated emission rates will be provided in detail in the application and modeling report submitted to the NMED. Preliminary emissions associated with the scenarios are presented in Section 3.2. and Appendix A.

Am i correct in thinking that the only differences among the three alternate operating scenarios are operation of the two acid gas flares? Would there ever be a scenario when the two acid gas flares are in a low-emissions "idle" mode?

thanks,

---

**Subject:** [EXTERNAL] RE: Targa Red Hills flare emissions

**This email has been received from outside of DOI - Use caution before clicking on links, opening attachments, or responding.**

Hi Don,

Please see responses to both of your emails below in red.

Thanks for the info you sent Friday June 20. I am working my way through the flare emission scenarios and estimates and i agree with the daily sweet gas flare emission rates shown in Table 3-1 of your May 2025 Supplement. However, i would appreciate an explanation as to how the daily emission rates in Table 3-4 were calculated for the acid gas flares—it looks like the hourly emission rates were multiplied by a factor of 16. Is this correct, and, if so, why? The daily emission rate (lb/day) was back-calculated based on maximum daily predicted impacts used for modeling. When operating at the maximum hourly rate, the proposed daily limit would be exhausted in 16 hours, hence the use of the scalar value of 16. This is what is presented and is the value planned to be used for modeling and permitting. We verified against the facility's prior events to ensure that it was sufficient to capture any potential future SSM events.

Jaimy, it just occurred to me that "residue gas" (discussed in your email last week) is not described or specifically discussed in the modeling protocol. I would appreciate it if you would explain "residue gas." Residue gas is gas that has been treated by the facility to pipeline quality. It may be flared due to loss of takeaway, not being at the required specification, or other miscellaneous reasons.

Please let me know if you have any additional questions.

Thank you,

Hey Jaimy,

I don't have specific comments on the Class I AQRV protocol documents. I still not seeing correspondence on this project for quite some time. Can you fill me in on where you are at?

I do have a request... Once produced, I'd like a copy of an actual Calpuf.inp, Postutil.inp, and Calpost.inp file and their corresponding .lst files produced for analysis. The table of emissions is quite long and the discussion over the flares has me curious on seeing a complete set of files.

Thank you,
Tim

**Subject:** RE: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hi Don,

For residue gas flaring, there are no durations or number of events permitted; however, the flares are metered. All permitted emissions are represented as occurring in a single day to be conservative.

We attempted to be conservative in our approach; the current representation of residue gas flaring in the maximum daily emission rate contains all of the possible emissions that could occur due to residue gas flaring over the course of the entire year. Due to the somewhat unpredictable nature of SSM, we attempted to quantify what the worst-case could possibly look like during the course of the day. Essentially, the flares that combust residue gas have a proposed ton per year limit associated with this flaring event type. We are conservatively representing this proposed annual limit in a single day.

In regards to RHA-FL-5100, there are SSM emissions associated with the unit; however, SSM activities are not conducted at the same time as acid gas flaring. The maximum of each stream on a pollutant-by-pollutant basis was taken to derive the lb/day value as a conservative measure. The unit may operate in a way that allows for flaring of different streams during a given day. Therefore, the maximum contributor was used. The units have a proposed lb/day limit, which will become a permit condition, based on the maximum contribution that could occur. With an actual limit being requested on a daily basis, the flare could not exceed this lb/day limitation (i.e. it could not have a full 18 hours of acid gas flaring and a full 4 hours of SSM flaring and still stay under the proposed lb/day limit).

If it would be helpful, I'd be glad to schedule a call to walk through the details and answer any questions you may have.

Regards,

**Subject:** Re: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hello Jaimy,

I have some initial comments/questions related to the maximum daily emissions information you just sent. FLM FLAG 2010 guidance advises us to consider the magnitude, frequency, duration, timing, and geographic extent of the estimated new source impacts. It looks like flare emissions during startup/shutdown/maintenance (SSM) events are significant contributors to facility emissions of NOx and SO2. I have attached a spreadsheet that contains flare excerpts from your maximum daily emissions document. While the magnitude of the event emissions is shown, i would appreciate further explanation of the duration and frequency of the SSM events, especially with respect to this Note:

> Residue Gas Flaring emissions were most significant and the event duration of 1 hour was conservatively assumed. There are 12 events permitted and it was assumed all events happen in a single day.

Am i correct in understanding that there would be no more than 12 SSM events (per year?) with none exceeding 1-hour duration?

Also, would there be any SSM emissions associated with RHA-FL-51001?

thanks,

---

**Subject:** RE: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hi Don,

Please see responses to your questions below in **red**. Please let us know if you have any additional questions.

3.2.2 **Acid Gas Flares (Supplement)**

**Table 3-2. Acid Gas Flare Scenarios**

| Unit ID | AOS 1 Processes | AOS 2 Processes | AOS 3 Processes |
|---|---|---|---|
| **2.5-EP-5** | Pilot Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot Purge |
| **5.5-EP-1b** | Pilot Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot Purge | Pilot Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions |

In Alternate Operating Scenario (AOS) #1, both 2.5-EP-5 (RHA-FL-5100) and 5.5-EP-1b (RA2-FL-25100) are operating simultaneously. In AOS #2, 2.5-EP-5 (RHA-FL-5100) is operating independently and 5.5-EP-1b (RA2-FL-25100) emissions are minimal. In AOS #3, 5.5-EP-1b (RA2-FL-25100) is operating independently and 2.5-EP-5 (RHA-FL emissions are minimal-5100). Is this correct? **This is correct.**

Under 4.3 **Alternate Operating Scenarios (Supplement)**, it is stated that:
Three scenarios exist: RHA-FL-5100 operating independently (Scenario #1), RA2-FL-25100 operating independently (Scenario #2), and RHA-FL-5100 and RA2-FL-25100 operating simultaneously (Scenario #3).
This appears inconsistent with the scenarios described in Table 3-2—please explain. **These scenarios were incorrectly described. Three scenarios exist: RHA-FL-5100 and RA2-FL-25100 operating simultaneously (Scenario #1), RHA-FL-5100 operating independently (Scenario #2), and RA2-FL-25100 operating independently (Scenario #3), as described in the table above.**

Under 7.2 **Q/D Analysis (Supplement)**, Tables 7-1 thru 7-3 provide **Annualized Maximum Daily Emission Rate (tpy).** It is stated that “For the FLAG 2010 approach, "Q” is calculated as the sum of the worst-case 24-hour emissions due to the “project”, converted to an annual basis." Do "project" emissions include all emissions associated with the facility, or just the new emissions? Where can the

"Maximum Daily Emission Rates be found? **Project emissions include all emissions for the facility. I have attached our current maximum daily emission rate calculations for each of the three scenarios.**

I would appreciate it if we were copied when the application is submitted. **We will make sure that you receive a copy of the application upon submittal.**

**Subject:** Re: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hello Jaimy,

Thank you for sending the additional information on May 22. I would appreciate it if you would help me understand some issues i try to describe below.

3.2.2 **Acid Gas Flares (Supplement)**

**Table 3-2. Acid Gas Flare Scenarios**

| Unit ID | AOS 1 Processes | AOS 2 Processes | AOS 3 Processes |
|---|---|---|---|
| **2.5-EP-5** | Pilot<br>Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge |
| **5.5-EP-1b** | Pilot<br>Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge | Pilot<br>Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions |

In Alternate Operating Scenario (AOS) #1, both 2.5-EP-5 (RHA-FL-5100) and 5.5-EP-1b (RA2-FL-25100) are operating simultaneously. In AOS #2, 2.5-EP-5 (RHA-FL-5100) is operating independently and 5.5-EP-1b (RA2-FL-25100) emissions are minimal. In AOS #3, 5.5-EP-1b (RA2-FL-25100) is operating independently and 2.5-EP-5 (RHA-FL emissions are minimal-5100). Is this correct?

Under 4.3 **Alternate Operating Scenarios (Supplement)**, it is stated that:

> Three scenarios exist: RHA-FL-5100 operating independently (Scenario #1), RA2-FL-25100 operating independently (Scenario #2), and RHA-FL-5100 and RA2-FL-25100 operating simultaneously (Scenario #3).

This appears inconsistent with the scenarios described in Table 3-2—please explain.

Under 7.2 **Q/D Analysis (Supplement)**, Tables 7-1 thru 7-3 provide **Annualized Maximum Daily Emission Rate (tpy).** It is stated that "For the FLAG 2010 approach, "Q" is calculated as the sum of the worst-case 24-hour emissions due to the "project", converted to an annual basis." Do "project" emissions include all emissions associated with the facility, or just the new emissions? Where can the "Maximum Daily Emission Rates be found?

I would appreciate it if we were copied when the application is submitted.

thanks,

Hello again, Jaimy,

I am trying to relate the information in the tables associated with Scenarios 1, 2 & 3 on modeling protocol pages 51 - 59 to the information you sent 4/25.

I have attached a spreadsheet that tries to match the ten flares listed in the AERMOD Input Summary tables to the two flares you described in your 4/25 email. Please let me know if this is correct.

It looks like none of the flares have 24-hour emissions associated with them—is that correct?

thanks,

---

**Subject:** RE: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hi Don,

Thank you for reaching out. We have not submitted an application to NMED yet. Tim Allen had called me a few days ago regarding our Q/d, and we are refining our "Q." I can provide an update next week.

For your prior question:

Please see below for a description of the operating scenarios and tables that detail this concept.

Flare units 2.5-EP-5 and 5.5-EP-1b are designed to combust startup, shutdown, and maintenance (SSM) and gas emissions from various process equipment at the facility. These flares also handle acid gas emissions from RHA-AMINE and RA2-AMINE when AGI-1 and AGI-2 are offline. There are three (3) operating scenarios for these flares summarized in Table 15-1 below. Each flare unit will have hourly emission limits (represented by the three operating scenarios) based on whether the flares are operating simultaneously or exclusively.

**Table 15-1 AGI Flaring Scenarios**

| Unit ID | Nominal Streams | Scenario 1 | Scenario 2 | Scenario 3 |
|---|---|---|---|---|
| **2.5-EP-5** | Assist Gas<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Assist Gas<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Assist Gas<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Not Operating |
| **5.5-EP-1b** | Assist Gas<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Assist Gas<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Not Operating | Assist Gas<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions |

Hopefully this helps explain the operating conditions that we are attempting to both permit and demonstrate via modeling. Please feel free to give me a call at the number in my signature below if you would like to discuss in more detail.

Regards,

**Jaimy Karacaoglu**

Hello again, Jaimy,

Has a permit application been submitted to NMED on their standard forms yet? (These are the best permit application forms i have seen anywhere.) They would be very helpful in answering my following questions:

How were the emission rates for the Q/d calculations developed? I am especially interested in the nature of the emission units, the amounts of their SO2, H2SO4, PM10, and NOx emissions (lb/hr, lb/day, tons/yr), and the frequency and duration of those emissions.

thanks,

---

Hello,

I hope this message finds you well. I'm reaching out to follow up on the Red Hills modeling protocol. I wanted to check if you've had an opportunity to review the document.

If so, I'd like to begin coordinating a meeting to discuss any feedback and next steps. Please let me know your availability or if there are any questions in the meantime.

**Subject:** 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hello Everyone,

Thank you again for taking the time to meet with us today. Please see below for identified Action Items and a summary of what was discussed.

**Actions Items**

1. **Application Timing**
    a. I don't think we fully hammered out what the timeframe for application review was. Can NMED provide an estimated issuance timeframe, barring any significant hurdles?
    b. NMED indicated that they would follow up with Targa / Trinity on the fugitive component emission cap proposal. Let us know if additional discussion on this item is needed.
    c. NMED indicated that they would follow up with Targa / Trinity on future projects being able to be submitted separately during the PSD application review.
    d. McKenna will facilitate scheduling an FLM meeting after they have had a chance to review the modeling protocol.
2. **ECD Replacement Technical Revision**
    a. NMED indicated that a decision would be made tomorrow, 4/11, and they would reach out to Targa.

**Meeting Summary**

1. Red Hills Gas Processing Plant is a 6-train gas treatment facility that also has two front-end treaters.

2. The facility was first constructed in late 2010 and has expanded into the facility it is today over the past 15 years.
3. **Application Highlights –** The following are items that are planned to be included in the PSD application:
    a. Full, comprehensive re-permitting of the site
    b. Sitewide throughput increase
    c. Heater size increase across the entire facility by about 30%
    d. Fugitive emission refinement and update
    e. Startup, shutdown, and maintenance emission additions
    f. Increase H2S concentration increase
    g. Adding assist gas to the acid gas flares
    h. Other minor changes at other facility equipment
4. We discussed the possibility of a fugitive emission cap. Can the facility implement a fugitive emission cap that would allow for the interchange or addition of fugitive components without triggering a technical or significant revision? The facility would be subject to an allowable emission limit and would still submit an application if other changes occur.
5. **BACT –** All units have gone through the BACT review process as if they had not yet been constructed.
6. **Class II Modeling –** The modeling protocol was submitted today and can be accessed at the following link: https://files.trinityconsultants.com/link/zJ8PZpx8nsEvfULavK07tt
    a. Preliminary modeling indicates that Red Hills does not cause or contribute to an exceedance of the NAAQS, NMAAQS, or PSD Class I and II increments
    b. The property boundary will be updated along with equipment locations
    c. It was discussed that Sufi and EPA Region 6 would need to review the modeling protocol and it was estimated that this process would take 2 to 3 weeks, but is subject to be longer depending on EPA availability.
7. **Class I Modeling -** Preliminary results show passing results for Visibility, Deposition, and Class I SILs.
    a. Class 1 Areas Evaluated
        i. Carlsbad Caverns
        ii. Salt Creek Wilderness
        iii. Guadalupe Mountain National Park
        iv. Big Bend National Park
    b. Q/D was discussed; the facility is over 10 for all listed Class I Areas. This is detailed in the modeling protocol.
    c. The FLMs indicated that they would like to review the protocol (linked above). After their review, we can schedule a pre-application meeting with them.
8. **Pre-Construction Monitoring –** The waiver was submitted today and details the identified monitors to be used for Class II modeling.

If I missed anything in the above list, please feel free to respond with any additions. Do not hesitate to reach out should you have any questions.

**Subject:** RE: [EXTERNAL] RE: Targa Red Hills flare emissions

Hi Don,

Please see below for response to your questions in red.

Has Section 15 of the PSD permit application, which describes Alternate Operating Scenarios, been submitted yet?
This has not been submitted yet. We will make sure you receive a full copy of the application when it is submitted.

Section 4.3, Alternate Operating Scenarios, in the May 2025 Supplement Revision, includes this:
The most significant alternative operating scenario revolves around the flares that operate on the acid gas trains. Three scenarios exist: RHA-FL-5100 operating independently (Scenario #1), RA2-FL-25100

operating independently (Scenario #2), and RHA-FL-5100 and RA2-FL-25100 operating simultaneously (Scenario #3). Details regarding the limitation of these scenarios and their associated emission rates will be provided in detail in the application and modeling report submitted to the NMED. Preliminary emissions associated with the scenarios are presented in Section 3.2. and Appendix A.

Am i correct in thinking that the only differences among the three alternate operating scenarios are operation of the two acid gas flares? Would there ever be a scenario when the two acid gas flares are in a low-emissions "idle" mode?
The difference you have identified is correct; emissions only differ for those two acid gas flares. The scenarios provided are those that could produce “the worst-case” emissions from the combination of the two units. There are times when the two acid gas flares are in “idle-mode” with only the pilots combusting. This should truly be the steady-state operation of the unit, with the “three scenarios” being infrequent.

Let me know if you have any additional questions.

**This email has been received from outside of DOI - Use caution before clicking on links, opening attachments, or responding.**

Hi Don,

Please see responses to both of your emails below in red.

Thanks for the info you sent Friday June 20. I am working my way through the flare emission scenarios and estimates and i agree with the daily sweet gas flare emission rates shown in Table 3-1 of your May 2025 Supplement. However, i would appreciate an explanation as to how the daily emission rates in Table 3-4 were calculated for the acid gas flares—it looks like the hourly emission rates were multiplied by a factor of 16. Is this correct, and, if so, why? The daily emission rate (lb/day) was back-calculated based on maximum daily predicted impacts used for modeling. When operating at the maximum hourly rate, the proposed daily limit would be exhausted in 16 hours, hence the use of the scalar value of 16. This is what is presented and is the value planned to be used for modeling and permitting. We verified against the facility's prior events to ensure that it was sufficient to capture any potential future SSM events.

Jaimy, it just occurred to me that "residue gas" (discussed in your email last week) is not described or specifically discussed in the modeling protocol. I would appreciate it if you would explain "residue gas." Residue gas is gas that has been treated by the facility to pipeline quality. It may be flared due to loss of takeaway, not being at the required specification, or other miscellaneous reasons.

Please let me know if you have any additional questions.

**Subject:** RE: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hi Don,

For residue gas flaring, there are no durations or number of events permitted; however, the flares are metered. All permitted emissions are represented as occurring in a single day to be conservative.

We attempted to be conservative in our approach; the current representation of residue gas flaring in the maximum daily emission rate contains all of the possible emissions that could occur due to residue gas flaring over the course of the entire year. Due to the somewhat unpredictable nature of SSM, we attempted to quantify what the worst-case could possibly look like during the course of the day. Essentially, the flares that combust residue gas have a proposed ton per year limit associated with this flaring event type. We are conservatively representing this proposed annual limit in a single day.

In regards to RHA-FL-5100, there are SSM emissions associated with the unit; however, SSM activities are not conducted at the same time as acid gas flaring. The maximum of each stream on a pollutant-by-pollutant basis was taken to derive

the lb/day value as a conservative measure. The unit may operate in a way that allows for flaring of different streams during a given day. Therefore, the maximum contributor was used. The units have a proposed lb/day limit, which will become a permit condition, based on the maximum contribution that could occur. With an actual limit being requested on a daily basis, the flare could not exceed this lb/day limitation (i.e. it could not have a full 18 hours of acid gas flaring and a full 4 hours of SSM flaring and still stay under the proposed lb/day limit).

If it would be helpful, I'd be glad to schedule a call to walk through the details and answer any questions you may have.

Regards,

**Jaimy Karacaoglu**

**Subject:** Re: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hello Jaimy,

I have some initial comments/questions related to the maximum daily emissions information you just sent. FLM FLAG 2010 guidance advises us to consider the magnitude, frequency, duration, timing, and geographic extent of the estimated new source impacts. It looks like flare emissions during startup/shutdown/maintenance (SSM) events are significant contributors to facility emissions of NOx and SO2. I have attached a spreadsheet that contains flare excerpts from your maximum daily emissions document. While the magnitude of the event emissions is shown, i would appreciate further explanation of the duration and frequency of the SSM events, especially with respect to this Note:

> Residue Gas Flaring emissions were most significant and the event duration of 1 hour was conservatively assumed. There are 12 events permitted and it was assumed all events happen in a single day.

Am i correct in understanding that there would be no more than 12 SSM events (per year?) with none exceeding 1-hour duration?

Also, would there be any SSM emissions associated with RHA-FL-51001?

thanks,

**From:** Jaimy Karacaoglu <Jaimy.Karacaoglu@trinityconsultants.com>

**Subject:** RE: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hi Don,

Please see responses to your questions below in **red**. Please let us know if you have any additional questions.

3.2.2 **Acid Gas Flares (Supplement)**

**Table 3-2. Acid Gas Flare Scenarios**

| Unit ID | AOS 1 Processes | AOS 2 Processes | AOS 3 Processes |
|---|---|---|---|
| **2.5-EP-5** | Pilot Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot Purge |
| **5.5-EP-1b** | Pilot Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot Purge | Pilot Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions |

In Alternate Operating Scenario (AOS) #1, both 2.5-EP-5 (RHA-FL-5100) and 5.5-EP-1b (RA2-FL-25100) are operating simultaneously. In AOS #2, 2.5-EP-5 (RHA-FL-5100) is operating independently and 5.5-EP-1b (RA2-FL-25100) emissions are minimal. In AOS #3, 5.5-EP-1b (RA2-FL-25100) is operating independently and 2.5-EP-5 (RHA-FL emissions are minimal-5100). Is this correct? **This is correct.**

Under 4.3 **Alternate Operating Scenarios (Supplement)**, it is stated that:
Three scenarios exist: RHA-FL-5100 operating independently (Scenario #1), RA2-FL-25100 operating independently (Scenario #2), and RHA-FL-5100 and RA2-FL-25100 operating simultaneously (Scenario #3).
This appears inconsistent with the scenarios described in Table 3-2—please explain. **These scenarios were incorrectly described. Three scenarios exist: RHA-FL-5100 and RA2-FL-25100 operating simultaneously (Scenario #1), RHA-FL-5100 operating independently (Scenario #2), and RA2-FL-25100 operating independently (Scenario #3), as described in the table above.**

Under 7.2 **Q/D Analysis (Supplement)**, Tables 7-1 thru 7-3 provide **Annualized Maximum Daily Emission Rate (tpy).** It is stated that “For the FLAG 2010 approach, "Q” is calculated as the sum of the worst-case 24-hour emissions due to the “project”, converted to an annual basis." Do "project" emissions include all emissions associated with the facility, or just the new emissions? Where can the "Maximum Daily Emission Rates be found? **Project emissions include all emissions for the facility. I**

**have attached our current maximum daily emission rate calculations for each of the three scenarios.**

I would appreciate it if we were copied when the application is submitted. **We will make sure that you receive a copy of the application upon submittal.**

Regards,

**Jaimy Karacaoglu**

**Subject:** Re: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hello Jaimy,

Thank you for sending the additional information on May 22. I would appreciate it if you would help me understand some issues i try to describe below.

3.2.2 **Acid Gas Flares (Supplement)**

**Table 3-2. Acid Gas Flare Scenarios**

| Unit ID | AOS 1 Processes | AOS 2 Processes | AOS 3 Processes |
|---|---|---|---|
| **2.5-EP-5** | Pilot<br>Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge |
| **5.5-EP-1b** | Pilot<br>Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge | Pilot<br>Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions |

In Alternate Operating Scenario (AOS) #1, both 2.5-EP-5 (RHA-FL-5100) and 5.5-EP-1b (RA2-FL-25100) are operating simultaneously. In AOS #2, 2.5-EP-5 (RHA-FL-5100) is operating independently and 5.5-EP-1b (RA2-FL-25100) emissions are minimal. In AOS #3, 5.5-EP-1b (RA2-FL-25100) is operating independently and 2.5-EP-5 (RHA-FL emissions are minimal-5100). Is this correct?

Under 4.3 **Alternate Operating Scenarios (Supplement)**, it is stated that:

> Three scenarios exist: RHA-FL-5100 operating independently (Scenario #1), RA2-FL-25100 operating independently (Scenario #2), and RHA-FL-5100 and RA2-FL-25100 operating simultaneously (Scenario #3).

This appears inconsistent with the scenarios described in Table 3-2—please explain.

Under 7.2 **Q/D Analysis (Supplement)**, Tables 7-1 thru 7-3 provide **Annualized Maximum Daily Emission Rate (tpy).** It is stated that "For the FLAG 2010 approach, "Q" is calculated as the sum of the worst-case 24-hour emissions due to the "project", converted to an annual basis." Do "project" emissions include all emissions associated with the facility, or just the new emissions? Where can the "Maximum Daily Emission Rates be found?

I would appreciate it if we were copied when the application is submitted.

thanks,

---

Hello,

Apologies for the delay in response. Please find attached an addendum to the previously submitted modeling protocol. This addendum is intended to provide additional clarity regarding the modeling scenarios for the acid gas flares and also provides an updated Q/D analysis.

Let me know if you have any questions or wish to discuss anything in more detail.

Thank you,

**Subject:** Re: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hello again, Jaimy,

I am trying to relate the information in the tables associated with Scenarios 1, 2 & 3 on modeling protocol pages 51 - 59 to the information you sent 4/25.

I have attached a spreadsheet that tries to match the ten flares listed in the AERMOD Input Summary tables to the two flares you described in your 4/25 email. Please let me know if this is correct.

It looks like none of the flares have 24-hour emissions associated with them—is that correct?

thanks,

---

**Subject:** RE: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hi Don,

Thank you for reaching out. We have not submitted an application to NMED yet. Tim Allen had called me a few days ago regarding our Q/d, and we are refining our "Q." I can provide an update next week.

For your prior question:

Please see below for a description of the operating scenarios and tables that detail this concept.

Flare units 2.5-EP-5 and 5.5-EP-1b are designed to combust startup, shutdown, and maintenance (SSM) and gas emissions from various process equipment at the facility. These flares also handle acid gas emissions from RHA-AMINE and RA2-AMINE when AGI-1 and AGI-2 are offline. There are three (3) operating scenarios for these flares summarized in Table 15-1 below. Each flare unit will have hourly emission limits (represented by the three operating scenarios) based on whether the flares are operating simultaneously or exclusively.

**Table 15-1 AGI Flaring Scenarios**

| Unit ID | Nominal Streams | Scenario 1 | Scenario 2 | Scenario 3 |
|---|---|---|---|---|
| **2.5-EP-5** | Assist Gas<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Assist Gas<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Assist Gas<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Not Operating |
| **5.5-EP-1b** | Assist Gas<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Assist Gas<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Not Operating | Assist Gas<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions |

Hopefully this helps explain the operating conditions that we are attempting to both permit and demonstrate via modeling. Please feel free to give me a call at the number in my signature below if you would like to discuss in more detail.

Regards,

Hello again, Jaimy,

Has a permit application been submitted to NMED on their standard forms yet? (These are the best permit application forms i have seen anywhere.) They would be very helpful in answering my following questions:

How were the emission rates for the Q/d calculations developed? I am especially interested in the nature of the emission units, the amounts of their SO2, H2SO4, PM10, and NOx emissions (lb/hr, lb/day, tons/yr), and the frequency and duration of those emissions.

thanks,

---

Hello,

I hope this message finds you well. I'm reaching out to follow up on the Red Hills modeling protocol. I wanted to check if you've had an opportunity to review the document.

If so, I'd like to begin coordinating a meeting to discuss any feedback and next steps. Please let me know your availability or if there are any questions in the meantime.

Regards,

**Subject:** 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hello Everyone,

Thank you again for taking the time to meet with us today. Please see below for identified Action Items and a summary of what was discussed.

**Actions Items**

1. **Application Timing**
    a. I don't think we fully hammered out what the timeframe for application review was. Can NMED provide an estimated issuance timeframe, barring any significant hurdles?
    b. NMED indicated that they would follow up with Targa / Trinity on the fugitive component emission cap proposal. Let us know if additional discussion on this item is needed.
    c. NMED indicated that they would follow up with Targa / Trinity on future projects being able to be submitted separately during the PSD application review.
    d. McKenna will facilitate scheduling an FLM meeting after they have had a chance to review the modeling protocol.
2. **ECD Replacement Technical Revision**
    a. NMED indicated that a decision would be made tomorrow, 4/11, and they would reach out to Targa.

**Meeting Summary**

1. Red Hills Gas Processing Plant is a 6-train gas treatment facility that also has two front-end treaters.

2. The facility was first constructed in late 2010 and has expanded into the facility it is today over the past 15 years.
3. **Application Highlights –** The following are items that are planned to be included in the PSD application:
    a. Full, comprehensive re-permitting of the site
    b. Sitewide throughput increase
    c. Heater size increase across the entire facility by about 30%
    d. Fugitive emission refinement and update
    e. Startup, shutdown, and maintenance emission additions
    f. Increase H2S concentration increase
    g. Adding assist gas to the acid gas flares
    h. Other minor changes at other facility equipment
4. We discussed the possibility of a fugitive emission cap. Can the facility implement a fugitive emission cap that would allow for the interchange or addition of fugitive components without triggering a technical or significant revision? The facility would be subject to an allowable emission limit and would still submit an application if other changes occur.
5. **BACT –** All units have gone through the BACT review process as if they had not yet been constructed.
6. **Class II Modeling –** The modeling protocol was submitted today and can be accessed at the following link: https://files.trinityconsultants.com/link/zJ8PZpx8nsEvfULavK07tt
    a. Preliminary modeling indicates that Red Hills does not cause or contribute to an exceedance of the NAAQS, NMAAQS, or PSD Class I and II increments
    b. The property boundary will be updated along with equipment locations
    c. It was discussed that Sufi and EPA Region 6 would need to review the modeling protocol and it was estimated that this process would take 2 to 3 weeks, but is subject to be longer depending on EPA availability.
7. **Class I Modeling -** Preliminary results show passing results for Visibility, Deposition, and Class I SILs.
    a. Class 1 Areas Evaluated
        i. Carlsbad Caverns
        ii. Salt Creek Wilderness
        iii. Guadalupe Mountain National Park
        iv. Big Bend National Park
    b. Q/D was discussed; the facility is over 10 for all listed Class I Areas. This is detailed in the modeling protocol.
    c. The FLMs indicated that they would like to review the protocol (linked above). After their review, we can schedule a pre-application meeting with them.
8. **Pre-Construction Monitoring –** The waiver was submitted today and details the identified monitors to be used for Class II modeling.

If I missed anything in the above list, please feel free to respond with any additions. Do not hesitate to reach out should you have any questions.

Regards,

**Subject:** RE: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hi Don,

Please see responses to your questions below in **red**. Please let us know if you have any additional questions.

3.2.2 **Acid Gas Flares (Supplement)**

**Table 3-2. Acid Gas Flare Scenarios**

| Unit ID | AOS 1 Processes | AOS 2 Processes | AOS 3 Processes |
|---|---|---|---|

| | | | |
|---|---|---|---|
| **2.5-EP-5** | Pilot Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot Purge |
| **5.5-EP-1b** | Pilot Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot Purge | Pilot Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions |

In Alternate Operating Scenario (AOS) #1, both 2.5-EP-5 (RHA-FL-5100) and 5.5-EP-1b (RA2-FL-25100) are operating simultaneously. In AOS #2, 2.5-EP-5 (RHA-FL-5100) is operating independently and 5.5-EP-1b (RA2-FL-25100) emissions are minimal. In AOS #3, 5.5-EP-1b (RA2-FL-25100) is operating independently and 2.5-EP-5 (RHA-FL emissions are minimal-5100). Is this correct? **This is correct.**

Under 4.3 **Alternate Operating Scenarios (Supplement)**, it is stated that:
Three scenarios exist: RHA-FL-5100 operating independently (Scenario #1), RA2-FL-25100 operating independently (Scenario #2), and RHA-FL-5100 and RA2-FL-25100 operating simultaneously (Scenario #3).
This appears inconsistent with the scenarios described in Table 3-2—please explain. **These scenarios were incorrectly described. Three scenarios exist: RHA-FL-5100 and RA2-FL-25100 operating simultaneously (Scenario #1), RHA-FL-5100 operating independently (Scenario #2), and RA2-FL-25100 operating independently (Scenario #3), as described in the table above.**

Under 7.2 **Q/D Analysis (Supplement)**, Tables 7-1 thru 7-3 provide **Annualized Maximum Daily Emission Rate (tpy).** It is stated that “For the FLAG 2010 approach, "Q” is calculated as the sum of the worst-case 24-hour emissions due to the “project”, converted to an annual basis." Do "project" emissions include all emissions associated with the facility, or just the new emissions? Where can the "Maximum Daily Emission Rates be found? **Project emissions include all emissions for the facility. I have attached our current maximum daily emission rate calculations for each of the three scenarios.**

I would appreciate it if we were copied when the application is submitted. **We will make sure that you receive a copy of the application upon submittal.**

**Subject:** Re: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hello Jaimy,

Thank you for sending the additional information on May 22. I would appreciate it if you would help me understand some issues i try to describe below.

3.2.2 **Acid Gas Flares (Supplement)**

**Table 3-2. Acid Gas Flare Scenarios**

| Unit ID | AOS 1 Processes | AOS 2 Processes | AOS 3 Processes |
|---|---|---|---|
| **2.5-EP-5** | Pilot<br>Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge |
| **5.5-EP-1b** | Pilot<br>Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Pilot<br>Purge | Pilot<br>Purge<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions |

In Alternate Operating Scenario (AOS) #1, both 2.5-EP-5 (RHA-FL-5100) and 5.5-EP-1b (RA2-FL-25100) are operating simultaneously. In AOS #2, 2.5-EP-5 (RHA-FL-5100) is operating independently and 5.5-EP-1b (RA2-FL-25100) emissions are minimal. In AOS #3, 5.5-EP-1b (RA2-FL-25100) is operating independently and 2.5-EP-5 (RHA-FL emissions are minimal-5100). Is this correct?

Under 4.3 **Alternate Operating Scenarios (Supplement)**, it is stated that:

> Three scenarios exist: RHA-FL-5100 operating independently (Scenario #1), RA2-FL-25100 operating independently (Scenario #2), and RHA-FL-5100 and RA2-FL-25100 operating simultaneously (Scenario #3).

This appears inconsistent with the scenarios described in Table 3-2—please explain.

Under 7.2 **Q/D Analysis (Supplement)**, Tables 7-1 thru 7-3 provide **Annualized Maximum Daily Emission Rate (tpy).** It is stated that “For the FLAG 2010 approach, "Q” is calculated as the sum of the worst-case 24-hour emissions due to the “project”, converted to an annual basis." Do "project" emissions include all emissions associated with the facility, or just the new emissions? Where can the "Maximum Daily Emission Rates be found?

I would appreciate it if we were copied when the application is submitted.

thanks,

---

Hello,

Apologies for the delay in response. Please find attached an addendum to the previously submitted modeling protocol. This addendum is intended to provide additional clarity regarding the modeling scenarios for the acid gas flares and also provides an updated Q/D analysis.

Let me know if you have any questions or wish to discuss anything in more detail.

Thank you,

**Jaimy Karacaoglu**

**Subject:** Re: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hello again, Jaimy,

I am trying to relate the information in the tables associated with Scenarios 1, 2 & 3 on modeling protocol pages 51 - 59 to the information you sent 4/25.

I have attached a spreadsheet that tries to match the ten flares listed in the AERMOD Input Summary tables to the two flares you described in your 4/25 email. Please let me know if this is correct.

It looks like none of the flares have 24-hour emissions associated with them—is that correct?

thanks,

---

**Subject:** RE: [EXTERNAL] FW: 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hi Don,

Thank you for reaching out. We have not submitted an application to NMED yet. Tim Allen had called me a few days ago regarding our Q/d, and we are refining our "Q." I can provide an update next week.

For your prior question:

Please see below for a description of the operating scenarios and tables that detail this concept.

Flare units 2.5-EP-5 and 5.5-EP-1b are designed to combust startup, shutdown, and maintenance (SSM) and gas emissions from various process equipment at the facility. These flares also handle acid gas emissions from RHA-AMINE and RA2-AMINE when AGI-1 and AGI-2 are offline. There are three (3) operating scenarios for these flares summarized in Table 15-1 below. Each flare unit will have hourly emission limits (represented by the three operating scenarios) based on whether the flares are operating simultaneously or exclusively.

**Table 15-1 AGI Flaring Scenarios**

| Unit ID | Nominal Streams | Scenario 1 | Scenario 2 | Scenario 3 |
|---|---|---|---|---|
| **2.5-EP-5** | Assist Gas<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Assist Gas<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Assist Gas<br>RHA-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Not Operating |

| | | | | |
|---|---|---|---|---|
| **5.5-EP-1b** | Assist Gas<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Assist Gas<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions | Not Operating | Assist Gas<br>RA2-AMINE Still Vent<br>Inlet Gas<br>SSM Emissions |

Hopefully this helps explain the operating conditions that we are attempting to both permit and demonstrate via modeling. Please feel free to give me a call at the number in my signature below if you would like to discuss in more detail.

Regards,

Hello again, Jaimy,

Has a permit application been submitted to NMED on their standard forms yet? (These are the best permit application forms i have seen anywhere.) They would be very helpful in answering my following questions:

How were the emission rates for the Q/d calculations developed? I am especially interested in the nature of the emission units, the amounts of their SO2, H2SO4, PM10, and NOx emissions (lb/hr, lb/day, tons/yr), and the frequency and duration of those emissions.

thanks,

Hello Jaimy,

I would appreciate it if you would help me understand what is meant by the three operating "Scenarios" in the modeling protocol pages 51-59. (I shall probably request the data in Excel format in those "Scenario" tables if it looks like they would be useful to us.)

thanks,

---

Hello,

I hope this message finds you well. I'm reaching out to follow up on the Red Hills modeling protocol. I wanted to check if you've had an opportunity to review the document.

If so, I'd like to begin coordinating a meeting to discuss any feedback and next steps. Please let me know your availability or if there are any questions in the meantime.

Regards,

**Subject:** 04/10/2025 - Red Hills Pre-Application Meeting Summary

Hello Everyone,

Thank you again for taking the time to meet with us today. Please see below for identified Action Items and a summary of what was discussed.

**Actions Items**

1. **Application Timing**
    a. I don't think we fully hammered out what the timeframe for application review was. Can NMED provide an estimated issuance timeframe, barring any significant hurdles?
    b. NMED indicated that they would follow up with Targa / Trinity on the fugitive component emission cap proposal. Let us know if additional discussion on this item is needed.
    c. NMED indicated that they would follow up with Targa / Trinity on future projects being able to be submitted separately during the PSD application review.
    d. McKenna will facilitate scheduling an FLM meeting after they have had a chance to review the modeling protocol.
2. **ECD Replacement Technical Revision**
    a. NMED indicated that a decision would be made tomorrow, 4/11, and they would reach out to Targa.

**Meeting Summary**

1. Red Hills Gas Processing Plant is a 6-train gas treatment facility that also has two front-end treaters.
2. The facility was first constructed in late 2010 and has expanded into the facility it is today over the past 15 years.
3. **Application Highlights –** The following are items that are planned to be included in the PSD application:
    a. Full, comprehensive re-permitting of the site
    b. Sitewide throughput increase
    c. Heater size increase across the entire facility by about 30%
    d. Fugitive emission refinement and update
    e. Startup, shutdown, and maintenance emission additions
    f. Increase H2S concentration increase
    g. Adding assist gas to the acid gas flares
    h. Other minor changes at other facility equipment
4. We discussed the possibility of a fugitive emission cap. Can the facility implement a fugitive emission cap that would allow for the interchange or addition of fugitive components without triggering a technical or significant revision? The facility would be subject to an allowable emission limit and would still submit an application if other changes occur.
5. **BACT –** All units have gone through the BACT review process as if they had not yet been constructed.
6. **Class II Modeling –** The modeling protocol was submitted today and can be accessed at the following link: https://files.trinityconsultants.com/link/zJ8PZpx8nsEvfULavK07tt
    a. Preliminary modeling indicates that Red Hills does not cause or contribute to an exceedance of the NAAQS, NMAAQS, or PSD Class I and II increments
    b. The property boundary will be updated along with equipment locations

c. It was discussed that Sufi and EPA Region 6 would need to review the modeling protocol and it was estimated that this process would take 2 to 3 weeks, but is subject to be longer depending on EPA availability.

7. **Class I Modeling -** Preliminary results show passing results for Visibility, Deposition, and Class I SILs.
   a. Class 1 Areas Evaluated
      i. Carlsbad Caverns
      ii. Salt Creek Wilderness
      iii. Guadalupe Mountain National Park
      iv. Big Bend National Park
   b. Q/D was discussed; the facility is over 10 for all listed Class I Areas. This is detailed in the modeling protocol.
   c. The FLMs indicated that they would like to review the protocol (linked above). After their review, we can schedule a pre-application meeting with them.
8. **Pre-Construction Monitoring –** The waiver was submitted today and details the identified monitors to be used for Class II modeling.

If I missed anything in the above list, please feel free to respond with any additions. Do not hesitate to reach out should you have any questions.

Regards,

**Jaimy Karacaoglu**

# APPENDIX E. GCP-5 PERMIT

**CONSTRUCTION PERMIT NO: GCP-5**

| *Registration No.*<br>*(For NMED use only* |
|---|

**GENERAL PERMIT CATEGORY: Concrete Batch Plants**

**ISSUED BY: New Mexico Environment Department**

Date of Issuance 9/12/06

JIM NORTON, Director
Environmental Protection Division

Air Quality Permit No. GCP-5 for Concrete Batch Plants (Permit) is issued by the Air Quality Bureau (AQB) of the New Mexico Environment Department (Department) under Title 20 Chapter 2 Part 72 of the New Mexico Administrative Code. [20.2.72 NMAC – *Construction Permits*, Section 220 – *General Permits*] The Department issues general permits in order to register groups of sources that have similar operations, processes, and emissions and that are subject to the same or substantially similar requirements. [20.2.72.220.A(1) NMAC] General permits provide an additional permitting option for specific types of sources that can meet the predetermined permit requirements. [20.2.72.220.C(1) NMAC]

This Permit authorizes the owner or operator to construct, modify, and operate a Concrete Batch plant (Facility) in New Mexico (excluding Bernalillo County and Tribal lands) under the conditions set forth herein as long as all conditions of this Permit are continually met.

An owner or operator who registers for and receives approval to construct under this Permit, will have satisfied the State of New Mexico's requirement for obtaining an air quality permit prior to constructing, modifying, or operating a source of air pollutants. However, other federal, state, or local agencies may have additional requirements such as zoning restrictions.

All terms written with initial capital letters are defined in Section VII – *Acronyms and Definitions*, of this Permit. Regulatory authority, if applicable, is cited in brackets. Please refer to the guidance document for this Permit for details, descriptions, and registration instructions. Questions regarding eligibility for this Permit can be directed to the Air Quality Bureau of the Environment Department at (505) 827-1494, or visit the New Mexico Environment Department's Web Site at http://www.nmenv.state.nm.us/AQB.

## SECTION I. APPLICABILITY

### I.A. FACILITIES ALLOWED TO REGISTER UNDER THIS GENERAL CONSTRUCTION PERMIT.

The owner or operator may apply for registration of a Concrete Batch plant under this Permit if:

1. The Facility's purpose is to produce Concrete or Concrete products [SIC 3271, 3272 (with Department approval), or 3273];
2. The Facility can comply with all of the requirements of this Permit;
3. The Facility includes any combination of the following Emissions Units used in the production of concrete (and no others) within the Property Boundary:
   a. Permanent or temporary Facility that will have an actual production rate less than or equal to 2400 yards per day (YPD),
   b. Any combination of stockpiles or haul roads,
   c. Conveyers (belt, pneumatic, screw, etc.),
   d. Silos, bins, and hoppers,
   e. Mixers,
   f. Truck loading stations,
   g. Associated emission control systems (air pollution control devices),
   h. Natural gas, diesel, or propane fired heaters with a heat input rate of less than 25 MMBtu per hour that are used to heat water for the concrete mix,
   i. Internal combustion engines, including generators when grid power is not available,
   j. Systems for screening, handling, storing, and weighing aggregate,
   k. Systems for loading, transferring, and storing mineral filler,
   l. Sources exempt under 20.2.72.202 NMAC,
   m. Equipment for storing, measuring and dispensing cement dye, retardants, accelerants or other chemical admixtures,
   n. Truck washing stations,
   o. Wheel washing stations, or
   p. Other equipment typically found at concrete batch plants.

### I.B. EXCLUDED SOURCES

The following facilities cannot register for this Permit:

1. A Facility that does not meet the requirements in Subsection III.C - *Siting Restrictions*;
2. A facility subject to any federal New Source Performance Standard (NSPS) other than 40 CFR § 60 Subparts A and Kb;
3. A facility subject to a National Emissions Standard for Hazardous Air Pollutants (NESHAP) or Maximum Achievable Control Technology (MACT);
4. A Facility that operates in conjunction with another facility on the same property, except as allowed in Subsection III.E – *Co-Locations*;

5. A Facility subject to 20.2.72 NMAC, Sections 400 through 499 – *Permitting for Toxic Air Pollutants;*
6. A facility that processes slag, asbestos tailings or asbestos-containing waste materials; or
7. A facility that encapsulates and/or disposes of radionuclides or hazardous solid waste.

### I.C. PERMITTING ALTERNATIVES

1. The owner or operator of a Facility subject to 20.2.72 NMAC who does not choose to register or whose Facility fails to qualify for this Permit shall apply for a Construction Permit pursuant to 20.2.72 NMAC – *Construction Permits* and must receive such permit prior to construction.

### I.D. FACILITIES WITH BOTH A CONSTRUCTION PERMIT (PART 72) AND A GENERAL CONSTRUCTION PERMIT

1. A Facility that has a Construction Permit under 20.2.72 NMAC may also register for a GCP-5. Subparagraphs II.C.2.b and IV.C.1.i of this Permit contain specific requirements for Facilities that have both a GCP-5 and a Construction Permit.

### I.E. LARGE AND SMALL FACILITIES

1. Table I.E.1 shall govern the applicability of requirements in this GCP to Permitted Facilities based on daily production, which correlates directly with potential emissions. The permittee shall operate the Facility in accordance with one of the operating scenarios in the table. The Facility's initial operating size, when the GCP is granted by the Department, shall be based on information provided by the applicant on the registration form. [see II.C.5.a]

**TABLE I.E.1 REQUIREMENT APPLICABILITY**

| * Facility Size (YPD) | Requirements |
|---|---|
| Greater than 360 yards of concrete per calendar day. | Plants in this category are subject to all requirements in this GCP. |
| Less than or equal to 360 yards of concrete per calendar day. | Plants in this category are subject to all requirements in this GCP except: III.F.2.e, III.F.10.b, IV.A.1.b, IV.A.2, and IV.B.3.j |

* Some extremely small Facilities may emit less than 10 pounds per hour and less than 25 TPY of any single pollutant, and can therefore operate under a NOI instead of a GCP. Any Facility capable of loading more than13.9 TPH of cement or more than 2.9 TPH of fly-ash will exceed the 10 pound per hour limit. An applicant who thinks that his Facility may qualify for a NOI shall submit an NOI application to the Department.

## SECTION II. REGISTRATION PROCESS

### II.A. GENERAL

1. The applicant shall complete the current GCP-5 registration form provided by the Department, submit it to the Department, and provide a copy to the nearest Department Field

Office. [20.2.72.220.A(2)(b) NMAC] Field office locations are found on the Department's Website at http://www.nmenv.state.nm.us/NMED/field_op.html. Within thirty (30) days of receiving an application to register under this Permit, the Department shall review the application and shall grant or deny the registration. The owner or operator of a Facility approved for registration will receive a package containing a copy of the registration form, a copy of this GCP, and the approval letter.

2. Construction, operation or relocation of a Facility shall not begin until the owner or operator has received written authorization from the Department. The Department shall notify the owner or operator of approval or denial by certified mail. [20.2.72.200.E NMAC and 20.2.72.220.C(6)(a) NMAC]

### II.B. PUBLIC NOTIFICATION

1. The applicant shall provide public notice, including newspaper advertisement and posting at the Facility site, 15 days prior to submitting the registration form to the Department, in accordance with 20.2.72.220.C(2) NMAC. (See *GCP-5 Instructions and Guidance* for a public notice template.)

### II.C. REGISTRATION FORM

GCP-5 permit application forms, available from District offices and the Department's website, (http://www.nmenv.state.nm.us/aqb/index.html) shall be completed with the following information and attachments, and submitted to the address on the registration form.

1. General Information
   a. The Facility's site name and the contact person's name, address, phone number, e-mail address and fax number;
   b. The name of the company and the person(s) that own(s) and operate(s) the Facility;
   c. The date the application was notarized; and
   d. The primary four (4) digit Standard Industrial Classification (SIC) code. For concrete Facilities the SIC code will be one of the following:

      3271 Concrete Block and Brick,

      3272 Concrete Products, Except Block and Brick,

      3273 Ready-Mixed Concrete.

2. Initial Facility Status
   a. Whether the Facility is currently constructed and is operating in New Mexico;
   b. Whether the Facility currently has a Construction Permit(s), if so, the current permit number(s), and whether the existing permit(s) will remain active or not;
   c. Whether the application was submitted in response to a Notice of Violation; if so the NOV file number;
   d. Whether the Facility is an excluded source as described in Subsection I.B. – *Excluded Sources* of this Permit; and
   e. The type of material processed by the Facility.
3. Initial Facility Location
   a. The Section, Range, Township, county, and elevation;

b. The Universal Transverse Mercator (UTM) Easting and Northing coordinates (specify NAD-27 or NAD-83), zone, and latitude and longitude coordinates at the center of the Facility's Area of Operations;

c. The name and zip code of the nearest New Mexico town or tribal community;

d. The direction and distance from the Facility to the nearest town or tribal community;

e. The direction and distance from the perimeter of the Area of Operations to the nearest occupied structure;

f. Detailed written driving instructions to the Facility from the nearest town or tribal community;

g. The status of the land (e.g., Private, State, Federal, Tribal); and

h. The name, location, distance and direction from the Facility to any Class I Areas within three (3) miles of the perimeter of the Area of Operations.

4. Initial Operating Schedule

   a. The anticipated month and year that construction will start at this site; and

   b. The anticipated month and year that operation will start at this site.

5. Initial Facility Information

   a. The Facility's maximum proposed production rate, YPD and YPY;

   b. The area (in acres) to which public access is restricted;

   c. The area (in acres) of disturbed earth;

   d. The area (in acres) covered by storage piles and operations;

   e. The haul road length(s) and dust control measures;

   f. The equipment list, excluding engine driven vehicles, with the manufacturer and model number, (if the manufacturer and model number is not available - please indicate), equipment size or capacity, and the function or purpose of each piece of equipment;

   g. The manufacturer's maximum design capacity for each piece of equipment; and

   h. The manufacturer's recommended pressure drop across the Filter(s). If the manufacturer's recommendations are unavailable or are no longer relevant, include a statement that the Facility will use the results of a successful compliance test to establish normal operating range for the Filter(s).

6. Other Required Information and Attachments

   a. A process flow sheet and/or block diagram indicating individual equipment, emission points, unit numbers, and types of controls applied to those points;

   b. A plot plan drawn to scale, showing emission points denoted by unit number, Area of Operations, structures, tanks, fences, Restricted Area, and the Property Boundary of the property owned, leased or under direct control of the owner or operator;

   c. An appropriate legible map, such as a 7.5 minute United States Geological Survey (USGS) Topographic Quadrangle map, that shows the proposed location of the Facility;

   d. Documentation showing that the applicant has given the public notice described in Subsection II.B – *Public Notification*;

   e. A description of the methods by which public access to the Restricted Area is limited;

f. A preliminary operational plan defining the measures to be taken to mitigate source emissions during:

(1) Facility malfunctions, startup, shutdown, or scheduled maintenance as defined in 20.2.7 NMAC, and

(2) Weather conditions that would cause exceedence of the visible emission requirement in paragraph III.A.6. Reasonable measures to be employed include, but are not limited to, application of additional water to storage piles and haul roads.

g. The contact name, address, and date that a copy of the application was sent or delivered to a field office;

h. Certification by the Facility's owner, operator, or authorized representative before a notary public that all of the information included in the registration form is true and complete to the best of the signing individual's knowledge [20.2.72.203 A(12) NMAC]; and

i. A check or money order for the fees required by 20.2.75 NMAC. [payable to: NM Environment Department, AQB.]

## II.D. FEES

1. Permit and annual fees shall be determined pursuant to 20.2.75 NMAC – *Construction Permit Fees.*

2. A Facility that meets the definition of a Small Business [20.2.75.7.F NMAC] shall pay discounted fees [20.2.75.11.C NMAC]. A Facility that has total onsite engine capacity less than or equal to 180 hp (excluding mobile sources) and produces less than or equal to 130,000 YPY shall be considered to emit less than 50 TPY of any regulated air contaminant, and 75 TPY of all regulated air contaminants.

3. In the first year after the Department approves registration under this permit, the Facility's emissions shall be based on the proposed maximum production rate on the registration (subparagraph II.C.5.a). Each year thereafter, the Facility's emissions shall be determined by the annual production during the previous year. If the Facility's Small Business status changes, the next annual fee will change to reflect the new status. Regardless of Small Business status, the Facility may continue to operate under this GCP permit.

## II.E. MODELING

1. The Department has completed general air dispersion modeling for affected Facilities and has used the results to develop the requirements in this Permit. Therefore, air dispersion modeling is not required from the Applicant.

## II.F. REASONS THE DEPARTMENT MAY DENY A REGISTRATION

The Department may deny registration under this Permit if:

1. The registration form is not complete;

2. The Facility is not a source qualified to register for this General Permit;

3. The facility cannot continuously meet the terms and conditions of the Permit [20.2.72.220.C(3) NMAC]; or

4. Any criteria listed in 20.2.72.208 NMAC are applicable.

## SECTION III. FACILITY OPERATING REQUIREMENTS

### III.A. GENERAL TERMS AND CONDITIONS

1. The owner or operator shall operate the Facility using only the equipment described in the registration form or other equipment that has been reported to the department in accordance with Subsection IV.C – *Department Notification*, paragraphs 1.d and 1.e.
2. The owner or operator shall install, operate, and maintain the equipment in accordance with manufacturer's specifications and recommendations unless otherwise specified by a condition of this GCP.
3. The Facility shall use only gasoline, pipeline quality natural gas, liquefied petroleum gas (LPG)/propane, and/or #2 diesel fuel with a sulfur content equal to or less than 0.05 % by weight to fuel engines and heaters.
4. Facility production shall not exceed 2400 cubic yards of concrete per day.
5. A copy of the registration forms, this GCP, and the Department's approval letter, shall be maintained onsite and shall be made available to any representative of the Department upon request.
6. No visible emissions from the permitted Facility shall be observed crossing the perimeter of the Restricted Area for more than a total of five (5) minutes in any two (2) consecutive hours during Facility operation. Compliance with this condition shall be determined by fugitive emission test(s) conducted in accordance with 40 CFR § 60.11 and Reference Method 22 in 40 CFR § 60, Appendix A. During atmospheric conditions under which emissions cannot be controlled to meet the "no visible emission" requirement, the Facility shall either:
   a. cease operations, or
   b. execute the applicable measures set out in Subsection II.C. – *Registration Form*, paragraph 6.f, and perform the notification required in Subsection IV.C – *Department Notification*, paragraph 2.

### III.B. APPLICABLE REGULATIONS

1. The owner or operator registered under this Permit shall comply with any applicable portion of Title 20 of the New Mexico Administrative Code, Chapter 2, Air Quality. [20.2 NMAC]
2. The Department considers a Facility registered and operating under this Permit to be in compliance with the following state regulations as those regulations existed on the date of issuance of this Permit:
   a) 20.2.3 NMAC – *Ambient Air Quality Standards*
   b) 20.2.7 NMAC – *Excess Emissions During Malfunctions, Startup, Shutdown, or Scheduled Maintenance*
   c) 20.2.61 NMAC – *Smoke and Visible Air Emissions*
   d) 20.2.72 NMAC – *Construction Permits*
   e) 20.2.73 NMAC – *Notice of Intent and Emission Inventory Requirements*

f) 20.2.75 NMAC – *Construction Permit Fees*

3. The Department considers a Facility registered under and operating in compliance under this Permit to be in compliance with the federal Clean Air Act (CAA). [42 U.S.C. s/s 7401 et seq. (1970)]
4. The owner or operator shall be responsible for compliance with the current versions of any applicable state and federal regulations.

## III.C. Siting Restrictions

1. The Facility shall meet the following siting restrictions:

**Table III.C.1 Siting Restrictions**

| | Distance 'a' in this table shall be verified when the permitted Facility commences operation. Distance 'b' is continuously applicable during the permit period. | **Distance** |
|---|---|---|
| a. | Minimum distance from the perimeter of the Area of Operations to any Class I Area perimeter. | 4.82 km (3 miles) |
| b. | Minimum distance between any emission source of the permitted Facility and the perimeter of the Restricted Area, except where the haul road crosses the Restricted Area perimeter. | 13 meters (14 yards) |

## III.D. Relocation

1. The owner or operator shall notify the Department of any relocations in accordance with requirements in Subsection IV.C – *Department Notification*, subparagraphs 1.h and 1.i.
2. When operations cease at the site of a permitted Facility, prior to leaving the site, owners or operators should employ reasonable measures to reduce or avoid wind-blown particulate matter.

## III.E. Co-locations

1. A Facility registered under this permit may co-locate with a Hot Mix Asphalt and/or an Aggregate Processing Facility within the Property Boundary if:
   a. Such other source is permitted under 20.2.72 NMAC – *Construction Permits* or under a GCP;
   b. Each facility meets all requirements of its own permit; and
   c. No visible emissions from any co-located facility shall cross the perimeter of the Restricted Area per the requirement in paragraph III.A.6.
2. The daily production for co-located facilities shall not exceed the limits prescribed in Table III.E.1.

**Table III.E.1 Production Limitations**

| Facility/Source Type | Production |
|---|---|
| Aggregate Processing Facility | 7800 TPD |
| Hot Mix Asphalt Plant | 7800 TPD |
| Concrete Batch Plant | 2400 YPD |

3. For any co-located facilities, the minimum distance at the time of co-location from the perimeter of the Area of Operations to any existing state park, recreation area, schoolyard, private residence, office building, or other occupied structure shall be greater than ¼ mile.

## III.F. Emissions Restrictions and Conditions

1. Haul Roads and aggregate stockpiles shall be considered emission sources. Each stockpile shall be contained within a three walled bunker.
2. The Facility's truck-loading point shall control PM emissions by implementing the following controls and operational procedures to comply with paragraph III.A.6. All such control devices shall be maintained in working order. The Facility shall:
   a. Use only washed sand;
   b. Keep sand and aggregate piles controlled during hours of operation;
   c. Put at least 15% of the mix water into the trucks before adding dry batch ingredients;
   d. For truck mix Facilities, inject cementaceous materials through the central portion of a concentric boot surrounded by an aggregate curtain; and
   e. For truck mix Facilities, install and operate a commercially designed and manufactured negative-pressure canopy over the truck loading point. The canopy shall be designed-for and sized-to the permitted Facility and shall be operated such that it effectively controls truck-loading emissions during normal operations.
3. All displaced air from silos shall pass through a Filter before being vented to the atmosphere.
4. The design efficiency of Filters shall be no less than:

**Table III.F.1 Minimum Filter Efficiency**

| Filter Type | Filter Efficiency |
|---|---|
| Sock (allowed on silo(s) only) | 95.0% |
| Cartridge | 99.9% |
| Bag House/Fabric | 99.9% |

5. Filter fines shall be recycled via a closed loop system into a controlled silo.
6. The Facility's silo(s) and Filter(s) shall not exhibit visible emissions for more than a total of five (5) minutes in any consecutive two (2) hour period. [40 CFR § 60.92] Compliance with this condition shall be determined in accordance with procedures in Reference Method 22 in 40 CFR § 60, Appendix A.
7. No visible emissions from the Facility shall cross the perimeter of the Restricted Area per paragraph III.A.6.
8. Silos shall be equipped with audible and visual alarms, which activate prior to the silo being 95 percent full.

9. Haul roads shall, at a minimum, use basecourse and watering to control fugitive emissions.
10. If, at any time, the minimum distance from the perimeter of the Area of Operations to any state park, recreation area, schoolyard, private residence, office building, or other occupied structure is or becomes less than ¼ mile, haul road fugitive emissions shall be controlled by:
    a. surfactant, or by paving and sweeping traffic areas (within 25 meters of the area of operations perimeter), and
    b. use of wheel washing equipment at truck exit(s).
11. Haul roads greater than one (1) mile in length are not allowed by this GCP.
12. Central Mix Facilities shall install, operate and maintain the mixer and associated control equipment as per the manufacturer's specifications.
13. Prior to producing 1920 cubic YPD of concrete, the permittee shall install and maintain a cartridge filter or a baghouse on all silos.

### III.G. Other Emissions Limitations

1. The annual emissions from the permitted Facility, including fugitive sources of emissions, shall not exceed the emissions limitations in Table III.G.1 – *Total Annual Emission Limitations.* [20.2.70 NMAC]

**Table III.G.1 Total Annual Emission Limitations**

| Pollutant | Emissions Limitation |
|---|---|
| Nitrogen Oxides ($NO_x$) | 95 tons per year |
| Carbon Monoxide (CO) | 95 tons per year |
| Volatile Organic Compounds (VOCs) | 95 tons per year |
| Total Suspended Particulate (TSP) | 95 tons per year |
| Sulfur Dioxide ($SO_2$) | 50 tons per year |
| Any one (1) Hazardous Air Pollutant (HAP) | 8 tons per year |
| Sum of all Hazardous Air Pollutants (HAPs) | 23 tons per year |

For co-located plants, if the plant and the co-located source 1) belong to the same "major group" (i.e., which have the same first two digit code) as described in the Standard Industrial Classification Manual, 1972, as amended by the 1977 Supplement; 2) are under the control of the same person (or persons under common control); and 3) are located on one or more contiguous or adjacent properties, then the total emissions from the co-located plant and source shall not exceed the emissions limitations in this table. [40 CFR 52.21(b)(6)] These limits ensure that the plant will not be a major source under 20.2.70 NMAC.

### III.H. Requirements for Stationary Combustion Equipment

1. This subsection does not apply to tailpipe emissions from engines used to propel vehicles on the property.
2. All combustion source emissions shall be vented vertically.
3. Emissions from stationary internal combustion engines and heaters shall not exhibit greater than 20% opacity. Compliance with this requirement shall be determined by opacity test

observations conducted in accordance with 20.2.61 NMAC and Reference Method 9 in 40 CFR § 60 Appendix A.

## SECTION IV. MONITORING, RECORDKEEPING AND NOTIFICATION REQUIREMENTS

### IV.A. MONITORING

1. The registered Facility shall monitor and record the loading activity status of silos and trucks and the pressure (inches of water) across the Filter(s) using a differential pressure gauge:
   a. Each time a silo is being filled;
   b. Each time a concrete truck is being filled;
2. The pressure and loading activity status shall be recorded by a CEMS or data-logger.
3. The records shall confirm that the Filter(s) are being employed per subparagraph III.F.2.e and paragraph III.F.3. The pressure data shall confirm whether the Filter(s) are operating within manufacturer's specifications, or, if manufacturers specifications are not available, within the operating parameters established by Method 22 during initial compliance tests. [Subsection IV.D – *Compliance Testing*, paragraph 9]

### IV.B. RECORDKEEPING

1. Compliance with recordkeeping requirements for this Permit shall be based on Department inspections of records and logs.
2. The owner or operator shall retain records for at least two (2) years after collection either on-site or at a local business office. [20.2.72.220.A(2) NMAC] The owner or operator shall make all records required by this permit available to Department personnel upon request.
3. The owner or operator shall collect and retain the following records:
   a. Actual hours of operation (e.g., beginning and end of operation) for each day of the operation;
   b. Monitoring required under Subsection IV.A- *Monitoring*;
   c. Weekly total production and the monthly rolling 12 month total production;
   d. Number of haul truck trips per day including materials delivery and product;
   e. Fuel delivery manifest that includes the, type of fuel, and number of gallons purchased;
   f. The quantity and frequency of water or surfactant application to haul roads;
   g. The frequency of haul road sweeping (if paved);
   h. Other haul road control measures (if used);
   i. Copies of the manufacturer's (or applicant's proposed) maintenance and operating requirements and records demonstrating conformance with said requirements; and
   j. Copies of documentation that substantiates compliance with the requirement in subparagraph III.F.2.e.

### IV.C. DEPARTMENT NOTIFICATION

1. The owner or operator shall notify the Air Quality Bureau in writing:

a. Within thirty (30) days after the actual date that operations ceased;

b. Within fifteen (15) days if the Facility is permitted as a small business and it no longer qualifies as such, either because its rolling 12 month total production exceeds the quantity in paragraph II.D.2, or because it fails to meet any other criteria defined in 20.2.75.7.F NMAC. This notification shall contain the permit number and "Change of Small Business Status" in the subject line.

c. Prior to making changes to the Facility that affect any information on the registration form [20.2.72.220.D NMAC] except as noted in subparagraphs e through i of this paragraph;

d. Prior to but no earlier than fifteen (15) days before any changes in equipment, using the GCP-5 *Substitution and Equipment Exchange* form or the *Reporting Additional Equipment* form. (Forms are available from the Department's Web Site);

e. Within fifteen (15) days after a change of the Facility ownership;

f. Within fifteen (15) days after a change of the contact person's name, address, phone number, e-mail address and/or fax number;

g. Within fifteen (15) days after the actual date of initial startup of the Facility;

h. Within fifteen (15) days prior to any relocation of the Facility in accordance with the Department's *Relocation Application* form. Relocated Facilities shall continue to meet all requirements of this Permit. Relocation shall not occur until the owner or operator has received written authorization from the Department [20.2.72.220.C.6(a) NMAC].

i. On the *Relocation Application* whether the Facility will continue to operate under GCP-5 or under a regular Construction Permit, and specify the applicable permit or registration number.

2. The owner or operator of a Facility that:

   a. produces excess emissions due to air pollution control equipment malfunctions (e.g. damaged/torn bags), or

   b. violates the visible emission requirement in paragraph III.A.6

   shall notify the Department within twenty-four (24) hours by telephone or fax. The owner or operator shall submit written notification to the Department within ten (10) days after the start of the next business day. All such notifications and actions shall be in accordance with the procedures in 20.2.7 NMAC – *Excess Emissions During Malfunction, Startup, Shutdown, or Scheduled Maintenance*. If the visible emission requirement in paragraph III.A.6 was exceeded due to weather conditions, the owner/operator shall document the weather parameters at the time and the measures taken to reduce or mitigate the emissions.

## IV.D. COMPLIANCE TESTING

1. The owner or operator shall perform initial compliance tests on each heater greater than 5 MMBtu and each combustion engine that has a site rating equal to or greater than 180 hp. The tests shall be conducted in accordance with EPA Reference Methods 1 through 4, Method 7E for NOx, Method 9 for opacity, and Method 10 for CO, contained in 40 CFR § 60, Appendix A; and with the requirements of Subpart A, *General Provisions*, 40CFR § 60.8(f). For NOx and CO, portable analyzer tests will be considered equivalent if Department guidelines (available from the Compliance section of AQB's website) are

followed; however, the Department reserves the right to request Method testing in specific cases. Alternative test methods may be used if approved by the Department. The results of the NOx tests shall be expressed as nitrogen dioxide ($NO_2$) using a molecular weight of 46 lb/lb mole in all calculations (each ppm of $NO/NO_2$ is equivalent to $1.194 \times 10^{-7}$ lb/SCF).

2. Additional compliance tests shall be conducted if it is deemed necessary by the Department to demonstrate that the Facility is in compliance with all the applicable regulations or permit conditions. Compliance test requirements from previous permits (if any) are still in effect, unless the tests have been satisfactorily completed.
3. If any equipment, required by this subsection to undergo initial compliance test(s), is added, changed out, or replaced at the permitted Facility, the owner or operator shall perform a compliance test on the new unit within 60 days of notification (IV.C.1.d), consistent with the requirements of this subsection, unless waived by the Department in writing.
4. The owner or operator shall conduct these tests within sixty (60) days of initial startup of the Facility.
5. The owner or operator shall allow a representative of the Department to be present at the test.
6. The owner or operator shall observe the following pre-testing and testing procedures:
   a. The owner or operator of the Facility shall provide, for the Department Enforcement Program Manager's approval, a written test protocol at least thirty (30) days prior to the anticipated pre-test meeting date.
      (1) The protocol shall describe the test methods or standard operating procedures to be used (including sampling locations), and shall describe data reduction procedures.
      (2) The owner or operator shall identify in the protocol any proposed variation from the established sampling and analytical procedures or from the conditions in this permit.
   b. The test protocol and compliance test report shall conform to the standard format specified by the Department. The current version of the format may be obtained from the Department's Web Site or from the Compliance section of AQB's website.
   c. The owner or operator shall provide the following performance test facilities for the Department:
      (1) Sampling ports necessary for any test methods specified by this Permit,
      (2) Safe sampling platforms,
      (3) Safe access to sampling platforms, and
      (4) Utilities for sampling and test equipment.
   d. Where necessary to prevent cyclonic flow in the stack, the owner or operator shall install flow straighteners in accordance with EPA Reference Method 1 in 40 CFR § 60, Appendix A.
7. During engine and heater compliance tests [Subsection IV.D, paragraph 1], the owner or operator shall monitor and record the Facility's hourly production rate. This information shall be included with the test report that is required to be furnished to the Department and shall be listed in tabular form or as part of the summary page of the test report.
8. Engine compliance tests [Subsection IV.D, paragraph 1] shall be conducted at 90 percent or greater of the engine's site rated capacity, as stated in the registration form of this Permit, and

at additional loads when requested by the Department. The load and the parameters used to calculate it shall be recorded to document operating conditions and shall be included with the test report to the Department.

9. Initial compliance tests on Filters shall demonstrate compliance with paragraph III.F.6, or shall establish an operating range in which there are no visible emissions per paragraph III.F.6. Results shall be furnished to the Department for use as a baseline data set during future compliance inspections as a comparison of Facility performance versus opacity.
10. The owner or operator shall submit one copy of the test protocol and compliance test results to the Enforcement Program Manager of the Department no later than forty five (45) days after the completion of the testing.

## SECTION V. CHANGES THAT PREVENT MEETING THE GENERAL PERMIT REQUIREMENTS

1. The owner or operator shall not change or add equipment that prevents the Facility from complying with the conditions of this permit.
2. Prior to making any modification that would result in the Facility not being able to meet the conditions of this permit; the owner or operator shall obtain a Regular Construction Permit under 20.2.72 NMAC from the Department. [ 20.2.72.220.D(2) NMAC]

## SECTION VI. RIGHTS OF THE ENVIRONMENT DEPARTMENT AND THE REGISTERED FACILITY

### VI.A. PROPERTY ACCESS AND RECORD REVIEW

1. The Department may access the Facility and the nearest operations office of the Facility during operational hours to inspect the equipment at the Facility and any records to ensure that the Facility has operated and continues to operate in compliance with the conditions of this permit. Operational hours shall include all times when employees are present and emissions may be occurring. [Air Quality Control Act, NMSA 1978. Section 74-2-5.1A]

### VI.B. CANCELLATION OF REGISTRATION

1. The Department may cancel registration under this Permit if the owner or operator of the Facility has not notified the Department within two (2) years of approved registration that the construction or modification has begun. The Department may also cancel the registration if construction work is suspended for one (1) year.
2. The Department shall cancel the registration if the owner or operator of the Facility ceases operation for five (5) years or more. [20.2.72.211.A NMAC]

### VI.C. REVOCATION OF REGISTRATION

1. The Department may revoke a registration under this Permit in writing:
   a. If the owner or operator of the Facility has knowingly and willfully misrepresented a fact on the registration form; or
   b. Pursuant to an Administrative Compliance Order or Court Order.

## VI.D. Appeals of Department Permitting Actions

1. Any party affected by the Department's approval, denial or revocation of a registration under this Permit may appeal to the Environmental Improvement Board (EIB) within thirty (30) days of the Department's decision pursuant to Subsections F through H of 20.2.72.207 NMAC and 20.2.72.220.C(5) NMAC.

## VI.E. Revision of the General Construction Permit

1. The Department may revise this Permit pursuant to 20.2.72.220.B NMAC. New Facilities are required to comply with the new GCP-5 transition schedule within the time frame stated in the new version.

## SECTION VII. ACRONYMS AND DEFINITIONS

### VII.A. ACRONYMS

| | |
|---|---|
| AC | Asphalt Concrete |
| APF | Aggregate Processing Facility |
| (AQB) | Air Quality Bureau |
| AQCR | Air Quality Control Regions |
| CO | Carbon monoxide |
| CBP | Concrete Batch Plant |
| CEMS | Continuous Emissions Monitoring System |
| CFR | Code of Federal Regulations |
| EIB | Environmental Improvement Board |
| GCP | General Construction Permit |
| HAP | Hazardous Air Pollutant |
| HMA | Hot Mix Asphalt |
| NAAQS | National Ambient Air Quality Standards [40 CFR Part 50] |
| NAIC | North American Industrial Classification |
| NESHAP | National Emission Standards for Hazardous Air Pollutants [40 CFR Part 61 and 63] |
| NMAAQS | New Mexico Ambient Air Quality Standards [20.2.3 NMAC] |
| NMAC | New Mexico Administrative Code |
| NMED | New Mexico Environment Department |
| NOI | Notice Of Intent |
| NOV | Notice Of Violation |
| $NO_x$ | Oxides of nitrogen |
| NSPS | New Source Performance Standards [40 CFR Part 60] |
| MACT | Maximum Achievable Control Technology |
| PM | Particulate Matter |
| $PM_{10}$ | Particulate Matter with an aerodynamic diameter of 10 microns or less |
| ppm | Parts Per Million |
| PSD | Prevention of Significant Deterioration [20.2.74 NMAC] |
| SCF | Standard Cubic Foot |
| SIC | Standard Industrial Classification |
| $SO_2$ | Sulfur Dioxide |
| TPH | Tons Per Hour |
| U.S. EPA | United States Environmental Protection Agency |
| VOC | Volatile organic compound |
| YPD | (cubic) Yards Per Day |
| YPH | (cubic) Yards Per Hour |
| YPY | (cubic) Yards Per Year |

## VII.B. DEFINITIONS

**"Area of Operations"** means the area within the Restricted Area which contains all Emissions Units and activities which may produce air contaminants, including Emissions Units and activities listed in Subsection I.A. – *Facilities Allowed to Register*, paragraph 3, all disturbed lands and all haul roads except the haul road between the Restricted Area and the Property Boundary. Disturbed lands include all active mining areas, stockpiles, and overburden removal areas used for operation of the Facility.

**"Aggregate Processing Facility "** means any facility or plant that utilizes any combination of equipment or machinery that is used to quarry, separate, screen, combine, or crush, any nonmetallic mineral.

**"Air Quality Control Region" (AQCR)** means an interstate or intrastate area designated by the U.S. Environmental Protection Agency (EPA) for the attainment and maintenance of National Ambient Air Quality Standards (NAAQS).

**"Asphalt"** means the bituminous substance used to bind aggregate together to make asphalt concrete (AC).

**"Concrete"** means a conglomerate of gravel, pebbles, sand, broken stone, blast-furnace slag or cinders, or fly-ash (termed the aggregate) embedded in a matrix of either mortar or cement mixed with water.

**"Concrete Batch Plant"** means any facility or plant used to manufacture concrete by mixing water, aggregate, and cement.

**"Department"** is the State of New Mexico Environment Department, Air Quality Bureau.

**"Emissions Units"** means any building, structure, equipment, facility, installation (including temporary installations), operation or stationary source, which emits or has the potential to emit any air pollutant subject to regulation under the Act.

**"Filter"** means the equipment used by the Facility to capture dust and particulate matter. As used in this GCP, the term Filter includes baghouses, fabric filters, sock filters, and cartridge filters.

**"Fugitive Emissions"** means those emissions, which could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening.

**"Haul Road"** means any on-site road that is not accessible to the general public and is connected to the facility or the nearest public road.

**"Hazardous Air Pollutants"** are air pollutants that are designated as hazardous by the U.S. EPA in the Clean Air Act and listed in 40 CFR Part 61 Section 112b.

**"Hot Mix Asphalt Plant"** means any facility or plant that utilizes any combination of equipment or machinery to store, deliver, or manufacture Asphalt Concrete by mixing Asphalt and heated aggregate.

**"National Ambient Air Quality Standards"** means the primary (health based) and secondary (welfare-based) federal ambient air quality standards promulgated by the U.S. EPA pursuant to Section 112 of the federal Clean Air Act.

**"NSPS" (New Source Performance Standards)** means the regulatory requirements, guidelines and emission limitations promulgated by the U.S. EPA pursuant to Section 111 of the Federal Clean Air Act and 40 CFR Part 60.

**"Opacity"** means the degree to which emissions reduce the transmission of light and obscure the view of an object in the background.

**"Owner or Operator"** is any person who owns or operates a process or process equipment at the source for which coverage under the Permit has been granted.

**"Property Boundary"** means the outside edge of the property, which includes all the equipment, registered under this Permit. The property may consist of one or more continuous and adjacent properties if they are owned, leased, or under direct control of the owner or operator.

**"Ready Mix Plant** or "Redi Mix" or "central mix" means a plant that combines and mixes **Concrete** ingredients with water in a drum at the Facility, before loading the mix into a truck for transport to the point of use.

**"Restricted Area"** means the area to which public access is restricted.

**"Stack Emissions"** means emissions that are released to the atmosphere from a capture system through a stack or other point source discharge on the Facility.

**"Transit Mix Plant"** means a plant where Concrete ingredients are put into trucks and mixed by rotation of the drum on the way to the job-site.

# General Construction Permit GCP-5

## Multi-Form for Concrete Batch Plants

(Locating outside of Bernalillo County and Tribal Communities)

Use this form for any combination of the following permitting activities: **Initial registration** of a facility for a GCP-5 permit, GCP-5 facility **relocations**, GCP-5 **substitution of equipment** notification, and reporting of **additional equipment** for GCP-5 facilities.

### Acknowledgements (Mark all that apply):

☒ **I am submitting this form for an initial GCP-5 registration.**

☐ **I am submitting this form for relocation.** A complete form is required for all relocations including the Equipment List.

☐ **I am submitting this form for equipment substitutions, removals, or additions.** Sections I, VII, VIII and IX.1 are required in addition to the certification form on page 10. Applicable provisions of the GCP-5 may require compliance tests for equipment installed following this notification. Include other sections if information is changing that should be reported in those sections.

☐ **I acknowledge that a pre-application meeting is available to me upon request.**

☐ **I have sent a copy of this application to the nearest Department Field Office (required for initial registrations only).**

☐ **Public notice was posted prior to submitting this form to NMED.**

☐ **I have published the public notice required by Condition II.B.1 of GCP-5 (required for initial registrations only).**

☐ **This facility qualifies to receive assistance from the Small Business Environmental Assistance program (SBEAP) and qualifies for 50% of the current application and permit fees.** To see if you qualify for SBEAP assistance and a fee reduction go to https://www.env.nm.gov/air-quality/small-biz-criteria/

☐ **This facility qualifies to receive assistance from the Small Business Environmental Assistance Program (SBEAP) but does not qualify for 50% of the current application and permit fees.** To see if you qualify for SBEAP assistance go to https://www.env.nm.gov/air-quality/small-biz-criteria/

☒ **I have enclosed a check for the required fee: ☒ initial registration fee: $4,260 prior to 1/1/2021 or $4,320 beginning 1/1/2021; OR ☐ relocation fee $426 prior to 1/1/2021 or $432 beginning 1/1/2021.** There is an annual fee in addition to the registration fee: www.env.nm.gov/air-quality/permit-fees-2/

For facilities qualifying as a "small business" under 20.2.75.7.F NMAC, these fees are or $2,130 and $213 respectively prior to 1/1/2021 or $2,160 and $216 respectively beginning 1/1/2021, provided that NMED has a Small Business Certification Form from your company on file. This form can be found at: https://www.env.nm.gov/air-quality/frequently-requested-forms/
**Provide your Check Number:** _____ **and Amount:** _____.

**This facility is a ☒ Truck Mix ☐ Central Mix ☐ Other (specify):**

| I | Company Information | | |
|---|---|---|---|
| 1 | a) Company name: Roswell Ready Mix | | b) Date application notarized: 6/16 /2021 |
| 2 | a) Facility name: Delaware Basin Concrete Plant | b) 4-digit SIC code: 3273 | c) 6-digit NAICS code: **327320** |
| 3 | Company mailing address: 4100 S. Lea St. Roswell, NM 88203 | | This facility is: ☐ Stationary ☒ Portable |

| | | | |

## II Applicability

| | | |
|---|---|---|
| 1 | Is your facility listed under a NESHAP or MACT? | ☒No ☐Yes |
| 2 | Will your facility process radioactive materials? | ☒No ☐Yes |
| 3 | Will your facility process materials that include any listed Hazardous Air Pollutants (HAPs)? | ☒No ☐Yes |
| 4 | Will your facility process asbestos tailings, or asbestos containing waste materials? | ☒No ☐Yes |
| 5 | Is your facility subject to 20.2.72 NMAC, Subpart IV, *Permitting for Toxic Air Pollutants?* | ☒No ☐Yes |
| 6 | Will this facility be located less than three (3) miles from a Class I (Wilderness) area? See AQB Modeling website for a map of Class I areas at: http://www.env.nm.gov/aqb/modeling/class1areas.html | ☒No ☐Yes |
| 7 | Will this facility use any fuels other than natural gas, liquefied petroleum gas (LPG)/propane, gasoline, and # 2 diesel fuel with a sulfur content greater than 0.05% by weight? | ☒No ☐Yes |
| If you answered ***Yes*** to any of questions 1-7, your facility **does not** qualify for this general construction permit. You need to submit an application for a regular permit under 20 NMAC 2.72 *Construction Permits*. | | |
| 8 | Will your facility meet the location requirements as described in Sections III.C. and III.E. of this general construction permit? | ☐No ☒Yes |
| 9 | Is your facility's primary purpose to produce concrete and concrete products per Condition I.A.1 of this general construction permit? | ☐No ☒Yes |
| 10 | Is your facility's production rate less than or equal to 2400 yards of concrete per day (YPD) as required by Condition III.A.4. of this General Construction Permit? | ☐No ☒Yes |
| 11 | Does your facility include any combination of the Emissions Units listed in Section I.A.3. of the general construction permit, and no others? | ☐No ☒Yes |
| 12 | Can your facility comply with all of the applicable state and federal regulations listed in Section III.B. of the general construction permit? | ☐No ☒Yes |
| 13 | Will the perimeter of the Area of Operations of your facility be located more than one-quarter mile (1/4) from an existing recreation area, private residence, office building, school, or other occupied structure? OR, if your facility does not meet this setback, will the haul road fugitive emissions meet the control requirements as described in Condition III.F.10? | ☐No ☒Yes |
| 14 | If you plan to co-locate this facility with an asphalt facility or a crushing facility, will your facility comply with the location requirements as described in Section III.E – *Co-Locations* of this general construction permit? If this facility is not co-located, check "Yes". | ☐No ☒Yes |
| 15 | Will the minimum distance between any emission source of the permitted Facility and the perimeter of the Restricted Area (except where the haul road crosses the Restricted Area perimeter) be at least 13 meters (14 yards)? | ☐No ☒Yes |
| 16 | Will the haul road control measures meet or exceed the requirements as described in Section III.F of this general construction permit? | ☐No ☒Yes |
| If you answered ***NO*** to any of questions 8-18, your facility **does not** qualify for the general construction permit. You need to submit an application for an individual permit under 20. 2.72 NMAC *Construction Permits*. | | |

## III Current Facility Status

| | | | |
|---|---|---|---|
| 1 | Has this facility previously been issued a general construction permit? ☒Yes ☐No | If yes, the registration No. is:GCP5-1514 | |
| 2 | Has this facility already been constructed? XYes No | If yes, is it currently operating in New Mexico? ☐Yes ☒No | |
| 3 | Does this facility have a 20.2.72.200.A (or B) NMAC construction permit or a 20.2.73 NMAC Notice of Intent (NOI)? ☐Yes ☒No | | If yes, the permit (or NOI) #, and whether the permit will remain active or not: |
| 4 | Is this application in response to a Notice of Violation (NOV)? ☐Yes ☒No If so, provide current permit #: | If yes, NOV date: | NOV Tracking No. |
| 5 | This Facility is submitting this application as a Small Business and will operate under the small business product limitation in the GCP, Section II.D.2 – *Fees*. ☐Yes ☒No | | |

| | |
|---|---|
| 6 | This Facility will operate as a Small Business under Condition II.D. I understand additional reporting requirements are necessary prior to operating over the HP and TPY limits set in condition II.D.2, and as required in Condition IV.C.1.b. ☐Yes ☒No |

## IV Facility Location Information

Please use Montana's Graphical Locater to convert Lat/Long to UTM systems, found at: http://rcn.montana.edu/resources/converter.aspx

| | | | | | |
|---|---|---|---|---|---|
| 1 | a) Section: 7 | b) Range: 34E | c) Township: 24S | d) County: Lea | e) Elevation (ft): 3599 |
| 2 | a) UTM Zone: ☐12 or ☒13 | b) UTME (to nearest 0.01 km): 640185 | | c) UTMN (to nearest 0.01 km): 3566686 | |
| | d) Specify which datum is used: | ☐ NAD 27 | ☒ NAD 83 | ☐ WGS 83 | |
| AND | a) Latitude (decimal degrees): 32.22806 | b) Longitude (decimal degrees): -103.51224 | | | |
| 3 | Name and zip code of nearest New Mexico town and/or tribal community: Jal NM, 88252 | | | | |
| 4 | Detailed Driving Instructions including direction and distance from nearest NM town and/or tribal community (attach a road map if necessary). If there is no street address, provide public road mileage marker: From 3rd St and NM 128, Drive 20.4 miles W on NM 128 to Delaware Basin Rd. Turn N and drive 1.25 miles to haul road on W to the area of operations. | | | | |
| 5 | The facility is 20.5 (distance) miles West (direction) of Jal, NM (nearest town). | | | | |
| 6 | Direction and distance to the nearest occupied structure from the perimeter of the Area of Operations: More than 3.5 miles<br><br>On Attachment C (page 6) required map, indicate (circle) all residences within ¼ mile of area of operations. | | | | |
| 7 | Land Status of Facility (check one): ☒ Private ☐ Indian/Pueblo ☐ Government ☐ BLM ☐ Forest Service ☐ Military | | | | |
| 8 | Name and county of the nearest Class I Area and its direction from the facility: Carlsbad Caverns 267° | | | | |
| 9 | Shortest distance from the facility to the boundary of the nearest Class I Area (to the nearest 1 km): 89 km | | | | |

## V Initial Operating Schedule

| | |
|---|---|
| 1 | Month and year of anticipated construction of the new or modified facility: June 2021 |
| 2 | Month and year of anticipated completion date at this proposed site: June 2022 |

## VI Other Facility Information

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| 1 | Maximum proposed production | 350 | yards/day | 2 | Total miles of haul road (one way) | .25 | miles |
| 3 | Maximum proposed production | 30000 | yards/year | 4 | Estimated Number of Haul truck trips/day (round trip) | 6 | trips/day |
| 5 | Area of disturbed earth | 5 | acres | 6 | Area of storage pile & operations | 5 | acres |

7 a) **Restricted Area**: Provide a written description of the method(s) to be used to restrict public access to the restricted area. Method(s) used to delineate the Restricted Area: The location is fenced on the South along NM 128 and on the East along Delaware Basin Rd. "NO TRESPASSING" signs are posted near the haul road entrance on the east side of the facility. The operation is very remote to the general public.

"**Restricted Area**" is an area to which public entry is effectively precluded. Effective barriers include continuous fencing, continuous walls, or other continuous barriers approved by the Department, such as rugged physical terrain with steep grade that would require special equipment to traverse. If a large property is completely enclosed by fencing, a restricted area within the property may be identified with signage only. Public roads cannot be part of a Restricted Area.

| | |
|---|---|
| 8 | Describe the control measures that will be used on haul roads to meet the fugitive emission requirements described in Section III.F. of this General Construction Permit:<br>Water |
| 9 | Provide the manufacturer's recommended pressure drop across the filter(s), as required by Condition II.C.5.h:<br>12-20 psi |
| 10 | Provide a preliminary operational plan(s) defining the measures to mitigate source emissions during:<br>1) Facility malfunctions, start up, shutdown, scheduled maintenance as defined in 20.2.7 NMAC, and<br>2) weather conditions that would cause an exceedance of the visible emission requirement in Section III.A.6. of the permit.<br><br>During malfunctions, start up, shutdown, scheduled maintenances, and weather exceedances the plant will shut down until it can operate without exceedances. |

## VII Process Equipment Information, including silos (use additional sheets if necessary)

| Unit Number (match attachments) | Component Description (or unit's function). Also enter all silos and control devices. | Manufacturer | Manufacture Date | Model Number | Equipment Size, Capacity or Maximum Process Rate | Manufacturers Emission Factors for Regulated Air Pollutants (for engines or generators). For control devices, enter efficiency. | Date of most recent Compliance Test in New Mexico (or "None") |
|---|---|---|---|---|---|---|---|
| | **Concrete Plant** | | | | | | |
| 01 | FEED BIN | **CEMCO** | 1994 | 150 | 150 YPH | | |
| 02 | CONVEYOR BELT | **CEMCO** | 1994 | 150 | 150 YPH | | |
| 03 | AGGREGATE BIN | **CEMCO** | 1994 | 150 | 15 CY | | |
| 04 | SAND BIN | **CEMCO** | 1994 | 150 | 10 CY | | |
| 05 | CONVEYOR BELT | **CEMCO** | 1994 | 150 | 150 YPH | | |
| 06 | CBP | **CUMMINS** | 1994 | | 150 YPH | | |
| 07 | DIESEL GENERATOR FOR HYDRAULIC PUMP | **CUMMINS** | 1994 | JDXL | 37-75 kW/100HP MAX | N/A < 185 HP | |
| S1 | FLY ASH | **CEMCO** | 1994 | 150 | 150 YPH | | |
| S2 | CEMENT | **CEMCO** | 1994 | 150 | 150 YPH | | |
| S2a | BAGHOUSE | **CEMCO** | 1994 | 150 | 150 YPH | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |

[1] To properly account for power conversion efficiencies, generator set rated capacity shall be reported as the rated capacity of the engine in horsepower, not the kilowatt capacity of the generator set.

## VIII Storage Tank Information (Note: this data will be used to determine 40 CFR 60 Subpart Kb applicability) (Use additional sheets if necessary)

| Tank No. | Materials Stored | Date Installed (MM/DD/YY) | Capacity (bbl) | Capacity ($M^3$) | Diameter (M) | Height (M) | True Vapor Pressure (kPa) | Annual Through-puts (gal) | Annual Turnovers |
|---|---|---|---|---|---|---|---|---|---|
| S1 | FLY ASH | JUNE 2021 | 50 TONS | | 4 | 14 | | | |
| S2 | CEMENT | JUNE 2021 | 75 TONS | | | | | | |
| T1 | PROPANE | JUNE 2021 | 250 GAL | | 4' | 4' | 9.2psig @ 60°F | 600 | 2.4 |
| T2 | DIESEL | JUNE 2021 | 150 GAL | | 4' | 4' | 0.009psig @ 70°F | 2000 | 13.3 |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |

## IX Required Attachments

**The following Attachments are required. Please label each document and verify you have provided the requested information by checking the checkboxes below. A complete application shall include:**

**Attachment # 1 Process Flow Sheet:** For **initial** registration applications and for all **substitutions**, removals, and **additions** of equipment applications; include a process flow sheet and/or block diagram indicating:

- ☒ All regulated equipment (Numbering or naming system should cross reference with Attachment #2)
- ☒ All emission points
- ☒ Types of control (if any) applied to those points.

**Attachment # 2 Facility Layout Map:** Provide a satellite photo or commercial scale map) showing the proposed **layout** of the Facility and the surrounding area including at least 0.25-mile (but not greater than 0.5 mile) distance from the Restricted Area **in all directions**. The map shall also include (show) the following:

- ☒ Include the label "Facility Layout Map" and the name of the facility
- ☒ A graphical scale
- ☒ An indicator showing which direction is north
- ☒ The UTM coordinates (or Longitudinal coordinate system on both axis)
- ☒ All emissions units, structures, tanks
- ☒ The access haul roads from the Area of Operations to the perimeter of the Property Boundary. Label the length.
- ☒ Any relevant topographic features of the area
- ☒ Any co-located particulate sources
- ☒ Facility Property Boundary
- ☒ The perimeter of the Restricted Area (fence line). For the complete definition, refer to the 'Definitions' at the end of the GCP permit). If more than one type of barrier is used, identify the types and locations of each barrier that will be used to restrict access from the public.
- ☒ The perimeter of the Area of Operations (see 'Definitions' at the end of the GCP permit).
- ☒ If it will fit on this map, identify the Property Boundary owned, leased, or under direct control of the applicant and/or owner or operator (refer to the Definitions at the end of the GCP permit). If it will not fit on this map, show Property Boundary on the Facility Location Map.

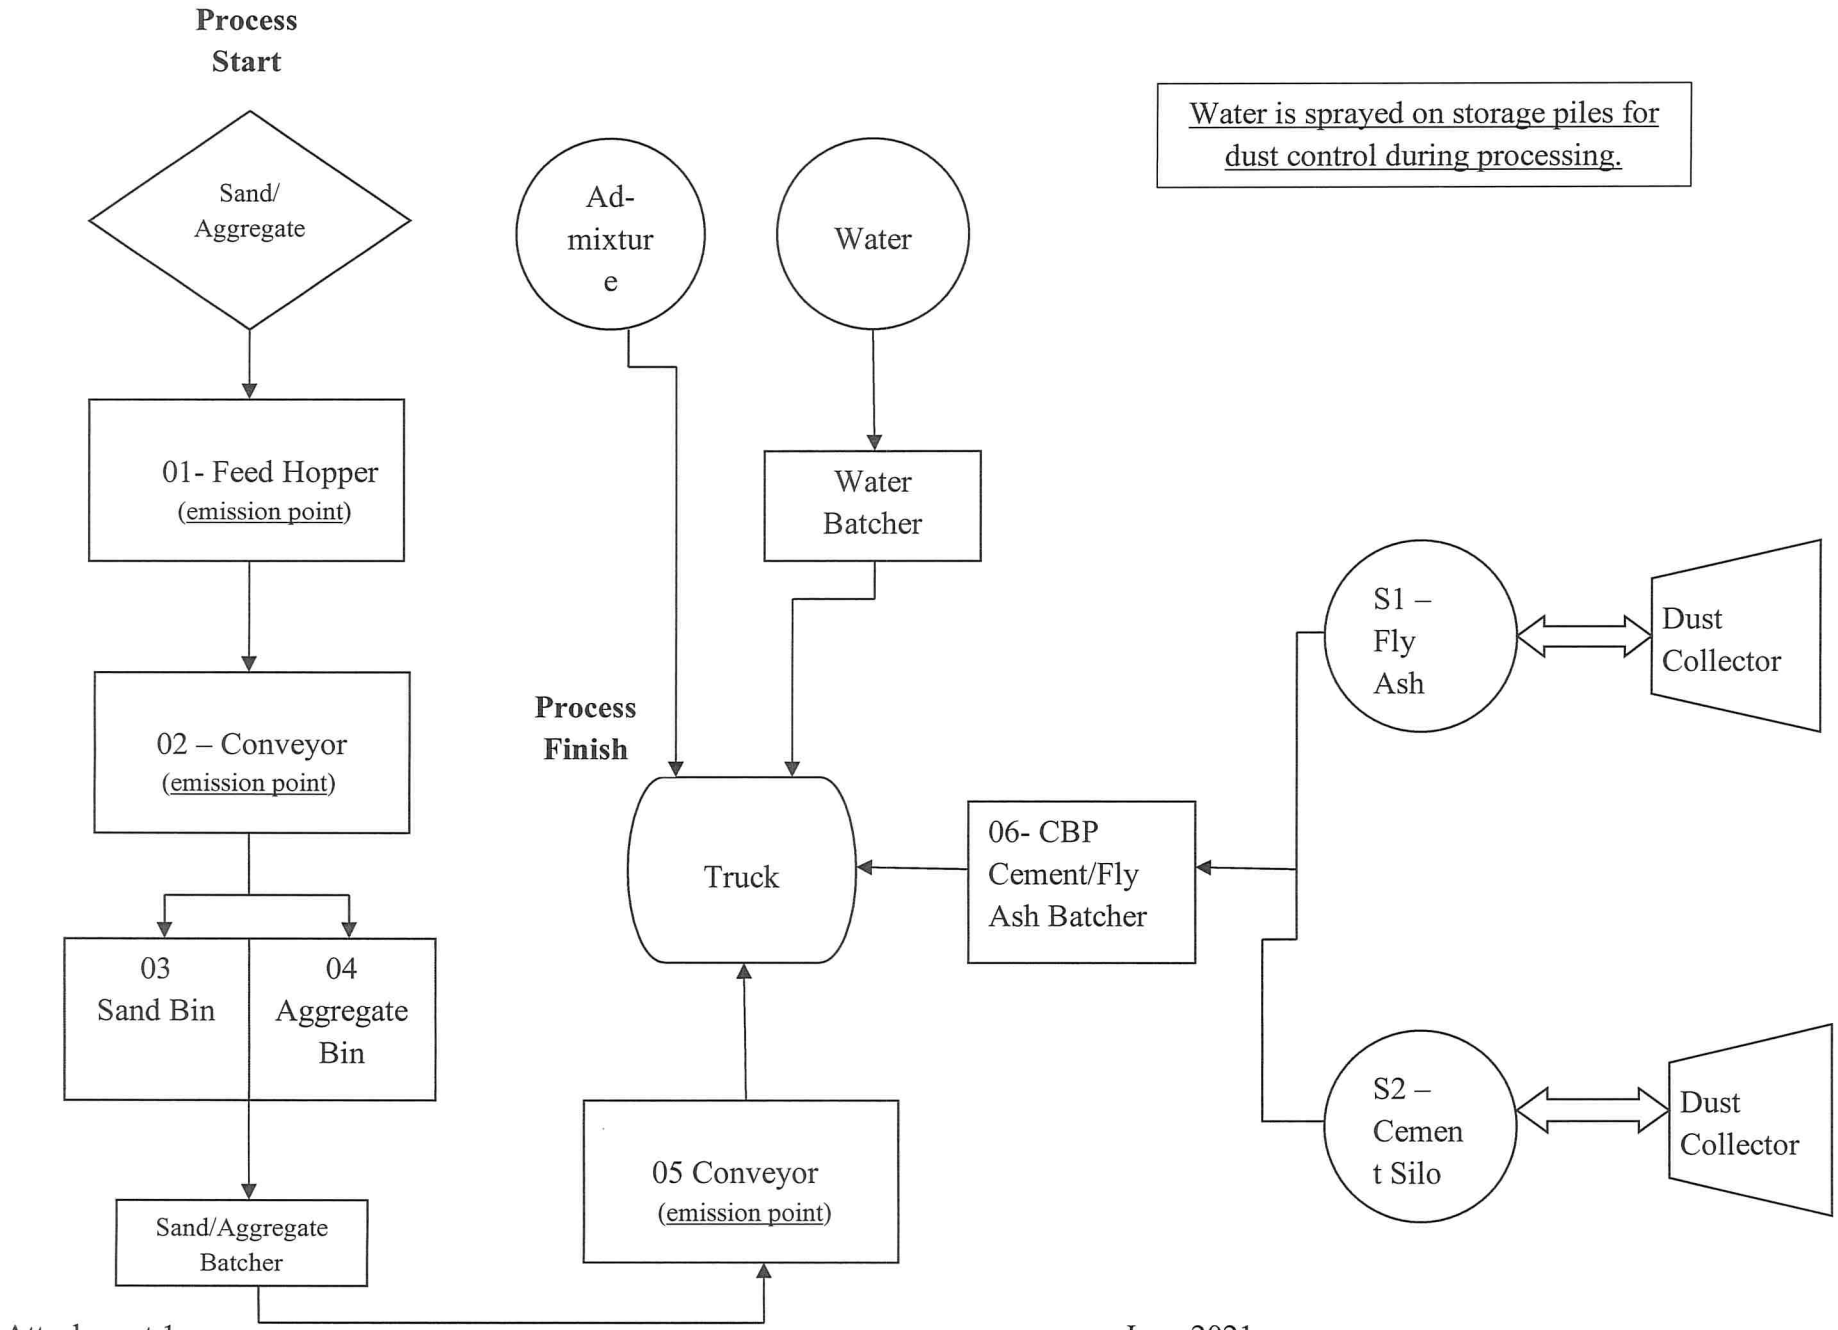
**Attachment # 3 Facility Location Map:** Provide a satellite photo at least 7 miles on each side or commercial scale map such as a 7.5-minute United States Geological Survey (USGS) topographic quadrangle, with the facility shown at or near the center showing the proposed **location** of the Facility. The map shall also include the following:

- ☒ Include the label "Facility Location Map" and the name of the facility.
- ☒ A minimum radius around the plant of 5 km (3.1 miles), showing any Class I area(s)
- ☒ A graphical scale
- ☒ An indicator showing which direction is north
- ☒ The UTM coordinates (or Longitudinal coordinate system on both axis)
- ☒ Any relevant topographic features of the area

**Attachment # 4 Public Notice:** Documentation that **public notice** has been initiated

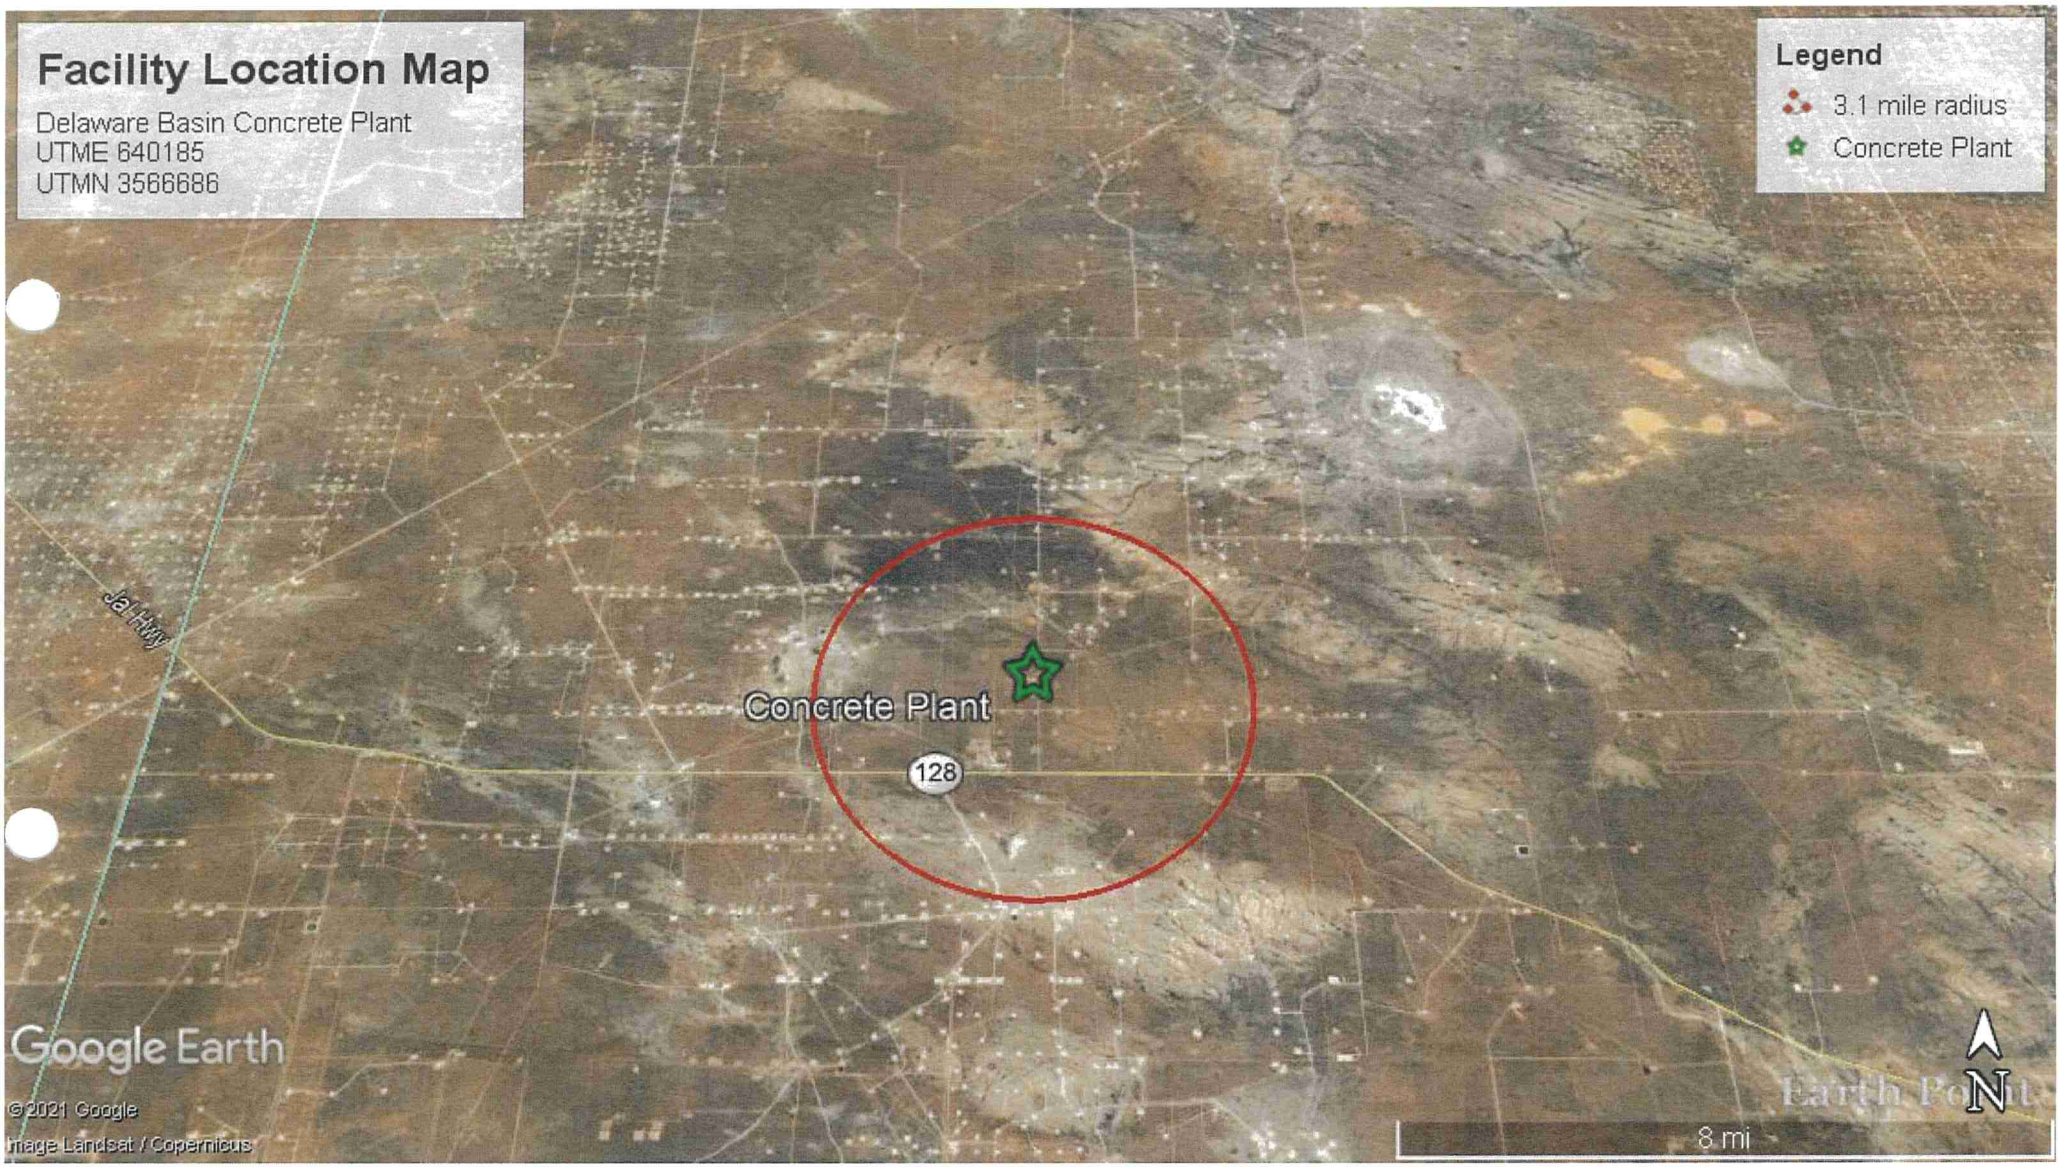
1) ☒ Include the General Posting of Notice-Certification (find the Posting Certification in Part X of this registration form), including location of posted notice, along with the posted sample; date of posting, and name of person posting the notice. **This posting is required for both initial applications and relocation applications.** Additionally, provide a verbal description the posting location. The posting at the facility **must be readable by the public from the nearest public road without trespassing on private property**. Do not post it behind a locked gate or on the haul road inside private property.

**A newspaper ad is not required for relocation applications**



**2a)** ☐ For initial GCP applications, include an original or copy of the actual newspaper advertisement. The original or copy of the advertisement must include the header showing the date and newspaper or publication title.

**OR**



**2b)** ☒ For initial GCP applications, include an affidavit from the newspaper or publication stating that the advertisements were published. The affidavit must include the date of the advertisements' publication, and a legible photocopy of the entire ad.

**Attachment #5 Certification:**

☒ Certification by the Facility's owner or operator, or authorized representative before a notary public that all of the information included in the registration form is true and complete to the best of his or her knowledge (find the Certification in Part XI of this registration form).

Process Start

# NOTICE

**Roswell Ready Mix** announces its intent to apply to the New Mexico Environment Department for an air quality permit to construct a General Construction Permit, **GCP-5_XXXX (Concrete Batch Plant)**. The name of this facility is **Delaware Basin Concrete Plant**. The expected date of the submittal of our application for an air quality permit to the Air Quality Bureau is **6/18/2021.** This notice is a requirement according to New Mexico air quality regulations.

The exact location of the facility is **UTM Zone 13, UTM Easting 640185, UTM Northing 3566686**. The approximate location of this site is **20.5** miles **West** of **Jal, New Mexico**, in **Lea** county.
Air emissions of any regulated air contaminant will be less than or equal to **[do not change TPY provided]**:

| | Tons per year (TPY) |
|---|---|
| 1. Total Suspended Particulates | 95 |
| 2. Nitrogen Oxides ($NO_x$) | 95 |
| 3. Carbon Monoxide (CO) | 95 |
| 4. Volatile Organic Compounds (VOC) | 95 |
| 5. Sulfur Dioxide ($SO_2$) | 50 |
| 6. Any one (1) Hazardous Air Pollutant (HAP) | 8 |
| 7. Sum of all Hazardous Air Pollutants (HAPs) | 23 |

The standard operating schedule of this facility will be **during daylight hours only.**
The owner and/or operator of the Plant is:
**Roswell Ready Mix**
**4100 S. Lea**
**Roswell, NM 88203**
If you have any questions or comments about construction or operation of above facility, and want your comments to be made as a part of the permit review process, you must submit your comments in writing to the address below:

Permits Programs Manager
New Mexico Environment Department
Air Quality Bureau
525 Camino de los Marquez, Suite 1
Santa Fe, New Mexico, 87505
(505) 476-4300

Other comments and questions may be submitted verbally.
Please refer to the company name and site name, as used in this notice or send a copy of this notice along with your comments, since the Department may not have received the permit application at the time of this notice.
Este es un aviso de la Agencia de Calidad de Aire del Departamento de Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor de comunicarse con la oficina de Calidad de Aire al teléfono 505-476-5557.

**Notice of Non-Discrimination**

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non- discrimination programs, policies or procedures, you may contact: Kristine Pintado, Non-Discrimination Coordinator, New Mexico Environment Department, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@state.nm.us. If you believe that you have been discriminated against with respect to a NMED program or activity, you may contact the Non-Discrimination Coordinator identified above or visit our website at https://www.env.nm.gov/NMED/EJ/index.html to learn how and where to file a complaint of discrimination.

# APPENDIX G. AP-42 CHAPTER 13.2.4

## 13.2.4 Aggregate Handling And Storage Piles

### 13.2.4.1 General

Inherent in operations that use minerals in aggregate form is the maintenance of outdoor storage piles. Storage piles are usually left uncovered, partially because of the need for frequent material transfer into or out of storage.

Dust emissions occur at several points in the storage cycle, such as material loading onto the pile, disturbances by strong wind currents, and loadout from the pile. The movement of trucks and loading equipment in the storage pile area is also a substantial source of dust.

### 13.2.4.2 Emissions And Correction Parameters

The quantity of dust emissions from aggregate storage operations varies with the volume of aggregate passing through the storage cycle. Emissions also depend on 3 parameters of the condition of a particular storage pile: age of the pile, moisture content, and proportion of aggregate fines.

When freshly processed aggregate is loaded onto a storage pile, the potential for dust emissions is at a maximum. Fines are easily disaggregated and released to the atmosphere upon exposure to air currents, either from aggregate transfer itself or from high winds. As the aggregate pile weathers, however, potential for dust emissions is greatly reduced. Moisture causes aggregation and cementation of fines to the surfaces of larger particles. Any significant rainfall soaks the interior of the pile, and then the drying process is very slow.

Silt (particles equal to or less than 75 micrometers [μm] in diameter) content is determined by measuring the portion of dry aggregate material that passes through a 200-mesh screen, using ASTM-C-136 method.[1] Table 13.2.4-1 summarizes measured silt and moisture values for industrial aggregate materials.

Table 13.2.4-1. TYPICAL SILT AND MOISTURE CONTENTS OF MATERIALS AT VARIOUS INDUSTRIES[a]

| Industry | No. Of Facilities | Material | Silt Content (%) | | | Moisture Content (%) | | |
|---|---|---|---|---|---|---|---|---|
| | | | No. Of Samples | Range | Mean | No. Of Samples | Range | Mean |
| Iron and steel production | 9 | Pellet ore | 13 | 1.3 - 13 | 4.3 | 11 | 0.64 - 4.0 | 2.2 |

13.2.4.3 Predictive Emission Factor Equations

Total dust emissions from aggregate storage piles result from several distinct source activities within the storage cycle:

1. Loading of aggregate onto storage piles (batch or continuous drop operations).
2. Equipment traffic in storage area.
3. Wind erosion of pile surfaces and ground areas around piles.
4. Loadout of aggregate for shipment or for return to the process stream (batch or continuous drop operations).

Either adding aggregate material to a storage pile or removing it usually involves dropping the material onto a receiving surface. Truck dumping on the pile or loading out from the pile to a truck with a front-end loader are examples of batch drop operations. Adding material to the pile by a conveyor stacker is an example of a continuous drop operation.

The quantity of particulate emissions generated by either type of drop operation, per kilogram (kg) (ton) of material transferred, may be estimated, with a rating of A, using the following empirical expression:[11]

$$E = k(0.0016) \frac{\left(\frac{U}{2.2}\right)^{1.3}}{\left(\frac{M}{2}\right)^{1.4}} \text{ (kg/megagram [Mg])} \quad (1)$$

$$E = k(0.0032) \frac{\left(\frac{U}{5}\right)^{1.3}}{\left(\frac{M}{2}\right)^{1.4}} \text{ (pound [lb]/ton)}$$

where:

E = emission factor
k = particle size multiplier (dimensionless)
U = mean wind speed, meters per second (m/s) (miles per hour [mph])
M = material moisture content (%)

The particle size multiplier in the equation, k, varies with aerodynamic particle size range, as follows:

| Aerodynamic Particle Size Multiplier (k) For Equation 1 | | | | |
|---|---|---|---|---|
| < 30 µm | < 15 µm | < 10 µm | < 5 µm | < 2.5 µm |
| 0.74 | 0.48 | 0.35 | 0.20 | 0.053[a] |

[a] Multiplier for < 2.5 µm taken from Reference 14.

The equation retains the assigned quality rating if applied within the ranges of source conditions that were tested in developing the equation, as follows. Note that silt content is included, even though silt content does not appear as a correction parameter in the equation. While it is reasonable to expect that silt content and emission factors are interrelated, no significant correlation between the 2 was found during the derivation of the equation, probably because most tests with high silt contents were conducted under lower winds, and vice versa. It is recommended that estimates from the equation be reduced 1 quality rating level if the silt content used in a particular application falls outside the range given:

| Ranges Of Source Conditions For Equation 1 | | | |
|---|---|---|---|
| Silt Content (%) | Moisture Content (%) | Wind Speed | |
| | | m/s | mph |
| 0.44 - 19 | 0.25 - 4.8 | 0.6 - 6.7 | 1.3 - 15 |

To retain the quality rating of the equation when it is applied to a specific facility, reliable correction parameters must be determined for specific sources of interest. The field and laboratory procedures for aggregate sampling are given in Reference 3. In the event that site-specific values for

correction parameters cannot be obtained, the appropriate mean from Table 13.2.4-1 may be used, but the quality rating of the equation is reduced by 1 letter.

For emissions from equipment traffic (trucks, front-end loaders, dozers, etc.) traveling between or on piles, it is recommended that the equations for vehicle traffic on unpaved surfaces be used (see Section 13.2.2). For vehicle travel between storage piles, the silt value(s) for the areas among the piles (which may differ from the silt values for the stored materials) should be used.

Worst-case emissions from storage pile areas occur under dry, windy conditions. Worst-case emissions from materials-handling operations may be calculated by substituting into the equation appropriate values for aggregate material moisture content and for anticipated wind speeds during the worst case averaging period, usually 24 hours. The treatment of dry conditions for Section 13.2.2, vehicle traffic, "Unpaved Roads", follows the methodology described in that section centering on parameter p. A separate set of nonclimatic correction parameters and source extent values corresponding to higher than normal storage pile activity also may be justified for the worst-case averaging period.

### 13.2.4.4 Controls[12-13]

Watering and the use of chemical wetting agents are the principal means for control of aggregate storage pile emissions. Enclosure or covering of inactive piles to reduce wind erosion can also reduce emissions. Watering is useful mainly to reduce emissions from vehicle traffic in the storage pile area. Watering of the storage piles themselves typically has only a very temporary slight effect on total emissions. A much more effective technique is to apply chemical agents (such as surfactants) that permit more extensive wetting. Continuous chemical treating of material loaded onto piles, coupled with watering or treatment of roadways, can reduce total particulate emissions from aggregate storage operations by up to 90 percent.[12]

# APPENDIX H. PUBLIC NOTICE FOR GCP-5 PERMIT # 9285

# NOTICE

**Roswell Ready Mix** announces its intent to apply to the New Mexico Environment Department for an air quality permit to construct a General Construction Permit, **GCP-5_XXXX (Concrete Batch Plant)**. The name of this facility is **Delaware Basin Concrete Plant**. The expected date of the submittal of our application for an air quality permit to the Air Quality Bureau is **6/18/2021.** This notice is a requirement according to New Mexico air quality regulations.

The exact location of the facility is **UTM Zone 13, UTM Easting 640185, UTM Northing 3566686**. The approximate location of this site is **20.5** miles **West** of **Jal, New Mexico**, in **Lea** county.
Air emissions of any regulated air contaminant will be less than or equal to **[do not change TPY provided]**:

| | Tons per year (TPY) |
|---|---|
| 1. Total Suspended Particulates | 95 |
| 2. Nitrogen Oxides ($NO_x$) | 95 |
| 3. Carbon Monoxide (CO) | 95 |
| 4. Volatile Organic Compounds (VOC) | 95 |
| 5. Sulfur Dioxide ($SO_2$) | 50 |
| 6. Any one (1) Hazardous Air Pollutant (HAP) | 8 |
| 7. Sum of all Hazardous Air Pollutants (HAPs) | 23 |

The standard operating schedule of this facility will be **during daylight hours only.**
The owner and/or operator of the Plant is:
**Roswell Ready Mix**
**4100 S. Lea**
**Roswell, NM 88203**
If you have any questions or comments about construction or operation of above facility, and want your comments to be made as a part of the permit review process, you must submit your comments in writing to the address below:

Permits Programs Manager
New Mexico Environment Department
Air Quality Bureau
525 Camino de los Marquez, Suite 1
Santa Fe, New Mexico, 87505
(505) 476-4300

Other comments and questions may be submitted verbally.
Please refer to the company name and site name, as used in this notice or send a copy of this notice along with your comments, since the Department may not have received the permit application at the time of this notice.
Este es un aviso de la Agencia de Calidad de Aire del Departamento de Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor de comunicarse con la oficina de Calidad de Aire al teléfono 505-476-5557.

**Notice of Non-Discrimination**

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non- discrimination programs, policies or procedures, you may contact: Kristine Pintado, Non-Discrimination Coordinator, New Mexico Environment Department, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@state.nm.us. If you believe that you have been discriminated against with respect to a NMED program or activity, you may contact the Non-Discrimination Coordinator identified above or visit our website at https://www.env.nm.gov/NMED/EJ/index.html to learn how and where to file a complaint of discrimination.

# APPENDIX I. GCP-O&G PERMIT # 7899

**Acknowledgements Section - Leo Thorsness Facility**

**Construction Status** Existing Permitted (or NOI) Facility

☑ I acknowledge that a pre-application meeting is available to me upon request.

☑ For new registrations or modifications, a check for the registration fee will be sent to the Department for ten fee points for GCP-O&G or $500 for NOIs. We cannot begin processing your action until the full fee is received by the Department. You will receive an email when your action is assigned for review.

☑ There is an annual fee for GCP-O&G in addition to the registration fee: www.env.nm.gov/air-quality/permit-fees-2/ (No annual fee for NOIs. (Facilities qualifying as a 'small business' under 20.2.75.7.F NMAC qualify for reduced fees, provided that NMED has a Small Business Certification Form from your company on file. This form can be found at: www.env.nm.gov/aqb/sbap/Small_Business_Forms.html)

☑ There are required attachments in addition to inputting data in the program. I will include the required attachments.

**1.** Is the facility located in Bernalillo County, on tribal lands, or in a nonattainment area?
○ Yes ◉ No

**2.** Is the facility's SIC code 1311, 1321, 4619, 4612 or 4922? (Other SIC codes may be approved provided that all the equipment at the facility is allowed in the GCP-Oil & Gas Permit. Non-Oil and Gas NOIs should use the paper Universal Application.
◉ Yes ○ No

**GCP-O&G Acknowledgements and Applicability**

Do not use Portal for administrative changes identified in the GCP O&G Permit Condition C101.A. Please use the Permitting Administrative Multiform to submit these requests to the department by mail. www.env.nm.gov/air-quality/air-quality-permit-applications-forms-and-related-information/

☑ The emissions specified in this Registration Form will establish the emission limits in the GCP-Oil and Gas.

**1.** This is a GCP-Oil and Gas Registration Form for an existing facility currently operating under GCP-1 or GCP-4? (No fee required)
◉ No ○ Yes

**2.** Does the regulated equipment under this GCP-Oil and Gas Registration include any combination of Allowable Equipment listed in Table 104 of the GCP Oil & Gas Permit, and no others?
◉ Yes ○ No

**3.** Will the regulated equipment as specified in this GCP-Oil and Gas Registration emit less than the total emissions in Table 106 of the GCP-Oil and Gas permit?
◉ Yes ○ No

**4.** Does all equipment comply with the stack parameter requirements as established in the GCP-Oil and Gas Permit?
◉ Yes ○ No

**5.** Equipment shall be at least 100 meters (m) from any stack to terrain that is five (5) or more meters above the top of the stack. Will the equipment at the facility meet this terrain requirement?
◉ Yes ○ No

**6.** Is the facility at least 150 m from any source that emits over 25 tons/year of NOx? This is the distance between the two nearest stacks that emit NOx at each of the facilities. Not the facility boundaries or the center to center distances.
◉ Yes ○ No

**7.** Is the facility at least 3 miles from any Class I area? This is the distance from the nearest facility boundary to the nearest boundary of the Class I area.
◉ Yes ○ No

Add a New Regulated Source

[1] Unit numbers must correspond to unit numbers in the previous permit unless a complete cross reference table of all units in both permits is provided.

[2] Specify dates required to determine regulatory applicability. If only year or month is known use 01/01/yyyy or mm/01/yyyy.

[3] To properly account for power conversion efficiencies, generator set rated capacity shall be reported as the rated capacity of the engine in horsepower, not the kilowatt capacity of the generator set.

## Table 2C - Emissions Reduction Equipment

☐ **This Table was intentionally left blank.**

In accordance with 20.2.72.203.A(3) and (8) NMAC, 20.2.70.300.D(5)(b) and (e) NMAC, and 20.2.73.200.B(7) NMAC, the permittee shall report all control devices and list each pollutant controlled by the control device regardless if the applicant takes credit for the reduction in emissions. **Also include reductions from process equipment in this table. Entering process equipment in this table is for data entry purposes only, the process vs control analysis will be used to determine process or control status for VRUs.** Only list control equipment for TAPs if the TAPs maximum uncontrolled emissions rate is over its respective threshold as listed in 20.2.72 NMAC, Subpart V, Tables A and B.

Add Reduction Equipment for Unit [Select one] Add

How to complete the table: In the drop down, select regulated sources from Table 2A where emissions are reduced and click "Add." Then add reduced pollutants and associated reduction devices for each. If a pollutant has emissions reduced by more than one device please add a line for each device and label them as primary, secondary, tertiary. Click "Edit" to update reduced pollutants and devices for each regulated source.

Comments (4000 character maximum)

**List each reduction device and all sources they serve, e.g. FL-1: Oil tanks 1-4, loading, VRU downtime. FL-2: compressor and sales downtime. For NOIs, indicate the enforceability behind each device or clarify if it is voluntary and no credit is being claimed for the reduction, e.g., FL-1: Oil tanks 1-8 (OOOOa). FL-1: Loading (voluntary, no emissions reduction credit claimed.)**

ENG-2, ENG-5, ENG-6: NSCR; NOx, CO, VOC
GEN-1: NSCR; NOx, CO, VOC (EPA-certified so no control % shown)
FL-1 LP: OT-1 ¿ OT-6, PWT-1 ¿ PWT-6, PP-1, OLOAD-1; VOC
FL-1 HP: Stranded Gas; VOC
VRU: there is an electric VRU off the tanks but no control is shown

## *Table 2-D: Maximum Emissions* (under normal operating conditions)

**This Table was intentionally left blank because it would be identical to Table 2-E.**

Maximum Emissions are the emissions at maximum capacity and prior to (in the absence of) pollution control, emission-reducing process equipment, or any other emission reduction. Calculate the hourly emissions using the worst case hourly emissions for each pollutant. For each pollutant, calculate the annual emissions as if the facility were operating at maximum plant capacity without pollution controls for 8760 hours per year, unless otherwise approved by the Department. List Hazardous Air Pollutants (HAP) & Toxic Air Pollutants (TAPs) in Table 2-I. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41).

## Table 2-E: Requested Allowable Emissions

Unit & stack numbering must be consistent throughout the application package. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41). Facility totals are a summation of all the emissions entered for equipment in this table plus total tpy SSM emissions from Table 2F.

**GCP-O&G:** Combustion emissions from malfunction events are not allowed under this permit.

**NOI:** Malfunction emissions are not allowed under a Notice of Intent.

## Table 2-F: Startup, Shutdown, and Routine Maintenance (SSM) Emissions

☐ **This table is intentionally left blank as all SSM emissions at this facility do not require an increase in Requested Allowables greater than those listed in Table 2-E.**

All applications for facilities that have emissions during routine our predictable startup, shutdown or scheduled maintenance (SSM)2, including NOI applications, must include in this table the Maximum Emissions during routine or predictable startup, shutdown and scheduled maintenance (20.2.7 NMAC, 20.2.72.203.A.3 NMAC, 20.2.73.200.D.2 NMAC). Provide emissions calculations for all SSM emissions reported in this table. Refer to the guidance "Startup, Shutdown, Maintenance Emissions in Permits" (www.env.nm.gov/air-quality/permitting-section-procedures-and-guidance/) for more detailed instructions. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41).

## Table 2-I: Stack Exit and Fugitive Emission Rates for HAPs and TAPs

☐ **By marking this table as intentionally left blank, you certify that the Total and individual HAPs for this facility are less than 1 ton per year.**

Data may not be provided for subject items (SIs) that are not complete. Please edit the SI in Table 2-A before providing information here.

**GCPs:** Report the potential emission rate for each HAP from each HAP emitting emission unit listed in Table 2A. For each emission unit, HAPs shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41). Emissions less than 0.0001 lb/hr or 0.0001 tpy and emission units that do not emit HAPs shall be omitted from the table. Each facility-wide Individual HAP total and the facility-wide Total HAPs is the sum of all HAP sources entered in the Table. Use the HAP nomenclature as it appears in Section 112 (b) of the 1990 CAA. Include tank-flashing emission estimates of HAP in this table.

**NOIs:** Report the individual and/or Total HAPs for each piece of equipment in Table 2A, only if the facility total for that pollutant is greater than or equal to 1 tpy.

| Edit | Unit No. | Total HAPs | | Formaldehyde HAP | | Benzene HAP | | Toluene; (Methyl benzene) HAP | | Xylenes (total); (Xylol) HAP | | | | | | | | | | Complete |

# Leo Thorsness Facility - Process Flow Sheet

# GCP-Oil and Gas AQB ePermitting Portal Registration Form
# Section 1- (ePermitting Portal submittals)

☒ I understand that I must submit the hard copy check with the required Payment Form for all AQB ePermitting Portal submittals. The 30-day review period will not begin until the check is received. (Does not apply if you are converting from a GCP-1 or GCP-4.) Form available: www.env.nm.gov/air-quality/aqb-epermitting-portal/

☒ I will upload this form to submit via the Portal. I understand that certain pages may be deleted by following instructions on this form, to avoid repeating information I entered directly into the Portal or uploaded separately.

☒ Attach only the electronic copy of the permit with the Department response, do not mail a paper copy. (If box is not checked, a paper copy of the permit will be sent with your response letter.)

**Facility Name or Facility Type Change for Modifications**
Fill out this section if requesting a change to the facility name or facility type that appears in the ePermitting Portal. These items cannot be updated through the Portal and will be corrected as part of the review of your permit. Check the appropriate box(es) and provide complete information in the table.

☒ **Not applicable**

☐ 1. Changing facility name. (Punctuation and special characters not allowed. Use “No123” instead of #123)

☐ 2. Changing facility type.

| | | | |

# Section 3
## Registration Summary

---

**Registration Summary:** The purpose of this submittal is to replace one engine (C-2) and update with new gas and liquid analyses. The representative sample is from a geographically nearby well from the same producing formation (within 25 miles) and was collected at a higher pressure than this facility's tanks' upstream pressure. This permitted facility produces within +/- 3 degrees of the API gravity at the stock tanks compared to the representative sample.

**Written description of the routine operations of the facility:** The full well stream enters the facility and passes through inlet separation where liquids and gas are separated by mechanical processes. Remaining fluids are piped through additional separation (HT-1, HT-2) where separated oil is directed to storage tanks (OT-1 - OT-6). The natural gas from the separators and heater treaters is sent to a series of compressors (ENG-2, ENG-5, ENG-6) and then to sales via pipeline. Produced water from the heater treaters is directed to onsite storage tanks (PWT-1 - PWT-6) until they can be transported offsite. Oil and produced water are loaded and trucked offsite (OLOAD-1, PWLOAD-1) (HR). Vapors produced in the storage tanks are directed to the low pressure flare (FL-1 LP) for combustion. Stranded gas from the separators and heater treaters is controlled by a high pressure flare (FL-1 HP). One generator provides power to the facility (GEN-1). Pneumatic pumps (PP-1) on site are controlled by a standard flare (FL-1 LP). There are also emissions from fugitives (FUG).

**Routine or predictable emissions during Startup, Shutdown and Maintenance (SSM):** 10 TPY VOC have been included for SSM emissions in this registration.

Overview: The facility has included 10 TPY SSM emissions.

☐ No SSM emissions are expected from routine operations.

☒ Applicant requests up to 10 tpy of VOC SSM emissions.

☒ No other activities (e.g. VRU downtime, stranded gas etc.) are considered SSM activities.

☐ Applicant requests site specific VOC SSM and those emission calculations are included in Section 5 and entered in Table 2F

Provide an overview:

☐ Applicant requests site specific combustion SSM and those emission calculations are included in Section 5 and entered in Table 2F.

Provide an overview:

**Malfunction Emissions (M):** Provide an overview of how malfunction emissions are accounted for in this Registration. The permit does not authorize combustion emissions for malfunctions. The permit does not authorize emissions from SSM and Malfunction to be combined as 10 TPY VOC. However, they may be permitted separately. In the allowable emissions table in Section 2, these two events are separate line items and must be kept separate.

Overview: 10 TPY VOC have been included for malfunction emissions in this registration.

☐ No Malfunction emissions are requested for this permit.

**Allowable Operations:** Check the appropriate box below:

☒ Facility operates continuously (8760 hours per year)

☐ The following regulated equipment will operate less than 8760 hours per year. Add additional rows as necessary. These units are subject to Condition A108.C of the Permit.

**Table A – Equipment Operating Less Than 8760 hours per year**

**☐ Table is blank because I completed this information in the ePermitting Portal for each piece of equipment.**

| Unit # | Requested Annual Operating Hours |
|---|---|
| | |

**Verification of Compliance with Stack Parameter Requirements:**

www.env.nm.gov/air-quality/air-quality-oil-and-gas-gcp-application-forms/

**Portal Submittals:** Applications submitted via the ePermitting Portal are required to use the Oil and Gas Stack Calculator.
**Hardcopy submittals** may voluntarily use the stack calculator.

Click "Print" in the stack calculator and attach the generated PDF results. If the stack calculator was completed and results attached, complete the information in this box and then go to Section 4. You may delete the items below this box until Section 4.

Check the box for each type of equipment at this facility & represented in the attached stack calculator results:
☒ Engine(s)
☐ Turbine(s)
☒ Flares(s)
☐ Enclosed Combustion Device (s)
☒ Heater(s)
☐ Reboiler(s)

☒ I attached the results from the current version of the Oil and Gas Stack Calculator from the AQB web page and the results indicate compliance with the stack parameters for all of my engines, turbines, flares, enclosed combustion devices, heaters or reboilers.

1. Does the flare gas contain 6% $H_2S$ or less by volume (pre-combustion)?

☒ Yes (done with section 3)
☐ No.

2. Explain in detail how assist gas will be added to reduce the gas composition to 6%$H_2S$ or less by volume:

# Section 5

## Emissions Calculation Forms

The Department has developed the Air Emissions Calculation Tool (AECT), which is required to be used in the GCP-Oil and Gas Registration. If the AECT, for a piece of equipment is under development, provide alternate calculations. The AECT must be submitted as a "live" interactive PDF. **Do not include alternative calculations unless there is an issue being resolved with the AECT. This will delay review of the application.** The AECT and this Registration Form may be updated as needed.

**Tank Emissions Calculations**: Provide the method used to estimate tank-flashing emissions, the input and output summary from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis. If Pro-Max or Hysis is used, all relevant input parameters shall be reported, including separator pressure, gas throughput, and all other relevant parameters necessary for flashing calculation. **The inputs must match the gas analyses information submitted. Inputs that don't match may be grounds for denial of the application submittal.**

**SSM Calculations**: In this Section, provide emissions calculations for Startup, Shutdown, and Routine Maintenance (SSM) emissions listed in the Table 2, and the rational for why the others are reported as zero (or left blank).

**Control Devices:** Report all control devices and list each pollutant controlled by the control device. Indicate in this section if you chose to not take credit for the reduction in emission rates. Only uncontrolled emission rates can be considered to determine applicability unless the state or federal acts require the control. This information is necessary to determine if federally enforceable conditions are necessary for the control device, and if the control device produces its own regulated pollutants or increases emission rates of other pollutants.

**Calculation Details:** The AECT is required for all emission calculations. If the AECT is not functioning, alternative calculations may be submitted only for the portions of the AECT with issues being resolved. Utilize this section to explain in detail, on an equipment-by-equipment basis, why alternative calculations are necessary.

**Explain here:**

**Equipment Forms Submitted in this Section (add additional rows as necessary):**

| Equipment Type | Quantity | Check Box to Indicate Units that are Controlled | Enter Control Device Type and Pollutant Controlled |
|---|---|---|---|
| **Engine** | **3** | ☒ | **NSCR: NOx, CO and VOC** |
| **Turbine** | | ☐ | |
| **Tanks** | **12** | ☒ | **FL-1 LP: VOC** |
| **Generator** | **1** | ☒ | **NSCR: NOx, CO and VOC (EPA-Certified)** |
| **VRU** | | ☐ | **One VRU off the tanks but not shown as control device** |
| **VRT** | | ☐ | |
| **ULPS** | | ☐ | |
| **Glycol Dehydrator** | | ☐ | |
| **Flare** | **1** | ☐ | **FL-1 LP: OT-1 – OT-6, PWT-1 – PWT-6, PP-1, OLOAD-1; VOC**<br>**FL-1 HP: Stranded Gas; VOC** |
| **Amine Unit** | | ☐ | |
| **Cryogenic Unit** | | ☐ | |
| **Fugitive Emissions** | **1** | ☐ | |

| | | | |
|---|---|---|---|
| **Heater** | **2** | ☐ | |
| **Truck Loading** | **2** | ☐ | **FL-1 LP: OLOAD-1; VOC** |
| **Enclosed Combustion Device (ECD)** | | ☐ | |
| **Thermal Oxidizer (TO)** | | ☐ | |
| **Pneumatic Pumps** | **6** | ☐ | **FL-1 LP: PP-1 VOC** |
| **Other** | | ☐ | |

**For each scenario below, if there are more than one emissions unit, control device, or gas combustion scenario. Please copy and paste each applicable section and label the unit number(s) if the scenarios vary.**

**Vapor Recovery Tower, Ultra Low-Pressure Separator, or Flash Tower Located Upstream of Storage Vessels:** If the facility contains one of the following units located upstream of the storage vessels and is used to flash and capture flashing emissions, check the appropriate box.
Unit number:
☐ Vapor Recovery Tower and VRU Compressor
☐ ULPS and VRU Compressor
☐ Flash Tower and VRU Compressor

**Vapor Recovery Unit (VRU) located upstream of Storage Vessels:** Check the box below if the facility is using a VRU to capture flashing emissions prior to any storage vessels to limit the PTE of the storage vessels to below applicability thresholds of NSPS OOOO or NSPS OOOOa. A process vs control determination should be prepared for this type of VRU application.
Unit number:
☐ VRU capturing emissions prior to any storage vessel and routing directly to the sales pipeline

**Vapor Recovery Unit (VRU) attached to Storage Vessels:** Check the box below if this facility is using a VRU to reduce storage vessel emissions to limit the PTE to below NSPS OOOO or NSPS OOOOa applicability thresholds:
Unit number:
☐ VRU controlling Storage Vessel emissions and the facility is subject to the requirements under NSPS OOOO, 40 CFR 60.5411
☐ VRU controlling Storage Vessel emissions and the facility is subject to the requirements under NSPS OOOOa, 40 CFR 60.5411a

**Gas Combustion Scenarios:** Read through the scenarios below and check the boxes next to any appropriate facility operating scenarios. Flares shall assume a destruction efficiency of 95%, unless the facility is subject to requirements for flares under 40 CFR 60.18, or a higher destruction efficiency (up to 98%) is supported by a manufacturer specification sheet (MSS) for that unit. If so, include the MSS.

A flare, vapor combustion unit (VCU), enclosed combustion device (ECD), thermal oxidizer (TO):
Unit number: FL-1 LP controls tanks and oil loading, FL-1 HP controls stranded gas
☒ Controls storage vessels in accordance with 40 CFR 60, Subpart OOOO or OOOOa. **OT-1 – OT-6**
☒ Provides a federally enforceable control for the storage vessels to limit the PTE to below applicability thresholds of 40 CFR 60, Subpart OOOO or OOOOa. **PWT-1 – PWT-6**
☐ Controls the glycol dehydrator
☐ Controls the amine unit
☒ Controls truck loading
☐ Operates only during maintenance events, such as VRU downtime, check one below:
  ☐ The emissions during VRU downtime are represented as uncontrolled VOC emissions from the compressor
  ☐ The combustion emissions during VRU downtime are represented as controlled emissions from the combustion device

☐ Controls the facility during plant turnaround

**Amine Unit:** Provide the following information for each amine unit.

| | |
|---|---|
| Design Capacity in MMscf/day | |
| Rich Amine Flowrate in gal/min | |
| Lean Amine Flowrate in gal/min | |
| Mole Loading $H_2S$ | |
| Sour Gas Input in MMscf/day | |

**Glycol Dehydration Unit(s):** Provide the following information for each glycol dehydration unit:
Please include an extended gas analysis in Section 6 of this application.

| **Unit #** | **Glycol Pump Circulation Rate** |
|---|---|
| | |

**Voluntary Monitoring in Accordance with §40 CFR 60.5416(a):** Check the box(s) to implement a program that meets the requirements of 40 CFR 60.5416(a). This monitoring program will be conducted in lieu of the monitoring requirements established in the GCP-Oil and Gas for individual equipment. Ceasing to implement this alternative monitoring must be reported in an updated Registration Form to the Department.

☒ Condition A205.B Control Device Options, Requirements, and Inspections for Tanks
☒ Condition A206.B Truck Loading Control Device Inspection
☒ Condition A206.C Vapor Balancing During Truck Loading
☐ Condition A209.A Vapor Recovery Unit or Department-approved Equivalent
☐ Condition A210.B Amine Unit Control Device Inspection

**Fugitive $H_2S$ Screening Threshold and Monitoring in accordance with Condition A212:** Check the box that applies.

☒ Condition A212.A does not apply because the facility is below the fugitive $H_2S$ screening threshold in Condition A212, or

☐ Condition A212.A applies. Because the facility is above the fugitive $H_2S$ screening threshold in Condition A212, or the facility is voluntarily complying with Condition A212.A, and Condition A212.A applies

# Section 6

## Information Used to Determine Emissions

Check the box for each type of information submitted. This documentation is required, if applicable to the facility.

**Failure to include applicable supporting documentation may result in application denial.**

☒ Specifications for control equipment, including control efficiency specifications and sufficient engineering data for verification of control equipment operation, including design drawings, test reports, and design parameters that affect normal operation.

☒ Engine or Generator Manufacturer specifications

☒ Catalyst Manufacturer specifications (If a catalyst is being utilized to reduce emissions, the catalyst manufacturer emission factors must be used in all emission calculations. A 25% safety factor may be applied to each pollutant.

☒ NSPS JJJJ emission factors **may not** be utilized in lieu of catalyst manufacture specifications when a catalyst is installed, and the catalysts manufacturer achieves higher control efficiency.

☒ Flare Manufacturer specifications

☒ Oil/Liquid Analysis: This data is required to match the inputs in all applicable emission calculations. For facilities that have not been constructed and a representative analysis is used it cannot be older than 1 year. For existing facilities, the gas analyses required by Condition A201.A (must be 1 year old or less).

☐ Gas Analysis (must be 1 year old or less) This data is required to match the inputs in all applicable emission calculations.

☒ Extended Gas Analysis (must be 1 year old or less) This data is required to match the inputs in all applicable emission calculations.

☒ If requesting to use a representative gas sample, include a discussion of why the sample is representative for this facility and an explanation of how it is representative (e.g., same reservoir, same similar API gravity, similar composition).

☐ If test data are used, to support emissions calculations or to establish allowable emission limits, include a copy of the complete test report. If the test data are for an emissions unit other than the one being permitted, the emission units must be identical. Test data may not be used if any difference in operating conditions of the unit being permitted and the unit represented in the test report significantly effect emission rates.

☐ Fuel specifications sheet.

☐ If computer models are used to estimate emissions, include an input summary and a detailed report, and a disk containing the input file used to run the model.

☒ For tank-flashing emissions, include a discussion of the method used to estimate tank-flashing emissions, accuracy of the model, the **input and output** summary from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis.

**Representative Gas Analysis Justification:**

Representative sample is from a geographically nearby well, from the same producing formation (within 25 miles) and was collected at a higher pressure than the permitted tanks' upstream pressure. The permitted facility will also produce within +/- 3 degrees of API gravity at the stock tanks compared to the representative sample.

Representative sample analyses are input in the process simulation software, i.e. ProMax, with conservative process flow conditions for flash calculations at the stock tanks. The resulting pounds of VOC per barrel of production at the tanks are used to calculate emission from both oil and water tanks.

# Section 8A

## Applicable State & Federal Regulations

---

**Provide a discussion demonstrating compliance with each applicable state & federal regulation**. All input cells should be filled in, even if the response is 'No' or 'N/A'.

In the "Justification" column, identify the criteria that are critical to the applicability determination, numbering each. For each unit listed in the "Applies to Unit No(s)" column, after each listed unit, include the lowest level citation of the applicable regulation. For each unit, list the information necessary to verify the applicability of the regulation, including date of manufacture, date of construction, size (hp), and combustion type. Doing so will provide the applicability criteria for each unit.

---

### Applicable State Regulations:

| State Regulation Citation | Title | Federally Enforceable | Overview of Regulation | Unit(s) or Facility | Applies? (Yes or No) | **Justification:** Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 $m^3$, 3. VOL) |

| 40 CFR 63, Subpart ZZZZ | NESHAP for Stationary Reciprocating Internal Combustion Engines (**RICE MACT**) | Facilities are subject to this subpart if they own or operate a stationary RICE, except if the stationary RICE is being tested at a stationary RICE test cell/stand. | ENG-2, ENG-5, ENG-6, GEN-1 | Yes | 40 CFR 63.6589(c): The engine is subject as an area source of HAP emissions.<br><br>40 CFR 63.6590(c)(1): The engines and generator will comply with ZZZZ by complying with 40 CFR 60 Subpart JJJJ. |

# Section 8B
# Compliance Test History and Disclosure Form

---

To evaluate the requirement for compliance tests, you must submit a compliance test history. The table below provides an example.

---

## Compliance Test History Table

| Unit No. | Test Description | Test Date |
|---|---|---|
| N/A | N/A | N/A |
| | | |

# Air Permit Application
# Compliance History Disclosure Form

Pursuant to Subsection 74-2-7(S) of the New Mexico Air Quality Control Act ("AQCA"), NMSA §§ 74-2-1 to -17, the New Mexico Environment Department ("Department") may deny any permit application or revoke any permit issued pursuant to the AQCA if, within ten years immediately preceding the date of submission of the permit application, the applicant met any one of the criteria outlined below. In order for the Department to deem an air permit application administratively complete or issue an air permit for those permits without an administrative completeness determination process, the applicant must complete this Compliance History Disclosure Form as specified in Subsection 74-2-7(P). An existing permit holder (permit issued prior to June 18, 2021) shall provide this Compliance History Disclosure Form to the Department upon request.

| **Permittee/Applicant Company Name** | | **Expected Application Submittal Date** |
|---|---|---|
| Matador Production Company | | April 2023 |
| **Permittee/Company Contact** | **Phone** | **Email** |
| Kha Mach | 972-371-5200 | kha.mach@matadorresources.com |

| | **Within the 10 years preceding the expected date of submittal of the application, has the permittee or applicant:** | |
|---|---|---|
| 1 | Knowingly misrepresented a material fact in an application for a permit? | ☐ Yes ☒ No |
| 2 | Refused to disclose information required by the provisions of the New Mexico Air Quality Control Act? | ☐ Yes ☒ No |
| 3 | Been convicted of a felony related to environmental crime in any court of any state or the United States? | ☐ Yes ☒ No |
| 4 | Been convicted of a crime defined by state or federal statute as involving or being in restraint of trade, price fixing, bribery, or fraud in any court of any state or the United States? | ☐ Yes ☒ No |
| 5a | Constructed or operated any facility for which a permit was sought, including the current facility, without the required air quality permit(s) under 20.2.70 NMAC, 20.2.72 NMAC, 20.2.74 NMAC, 20.2.79 NMAC, or 20.2.84 NMAC? | ☒ Yes ☐ No |
| 5b | If "No" to question 5a, go to question 6.<br>If "Yes" to question 5a, state whether each facility that was constructed or operated without the required air quality permit met at least one of the following exceptions:<br><br>a. The unpermitted facility was discovered after acquisition during a timely environmental audit that was authorized by the Department; or<br><br>b. The operator of the facility estimated that the facility's emissions would not require an air permit, **and** the operator applied for an air permit within 30 calendar days of discovering that an air permit was required for the facility. | ☐ Yes ☒ No |
| 6 | Had any permit revoked or permanently suspended for cause under the environmental laws of any state or the United States? | ☐ Yes ☒ No |
| 7 | For each "yes" answer, please provide an explanation and documentation.<br><br>As NMED is aware, Matador is currently in an enforcement action and settlement negotiation with NMED and U.S. EPA relating to alleged violations of the Clean Air Act and New Mexico Air Quality Control Act, including alleged permit violations. In the course of that action, the company has disclosed information about its historic permitting and operations at New Mexico facilities. | |

| | |
|---|---|
| | Since NMED and U.S. EPA's inspection of the company's facilities in 2019, Matador has invested significant resources to re-evaluate and, as needed, update its air permits. As a result of those efforts, Matador is not aware of current noncompliance with NMED permit regulations. Furthermore, as an additional measure, in the draft consent decree under negotiation with NMED and U.S. EPA, the company would systematically evaluate its permitting of facilities in New Mexico.<br><br>By providing the information requested by this form, Matador does not waive, and expressly reserves, all objections, rights, and defenses. |

# APPENDIX J. NOI # 9357

**Construction Status** Existing Permitted (or NOI) Facility

☑ I acknowledge that a pre-application meeting is available to me upon request.

☑ For new registrations or modifications, a payment for the registration fee will be submitted to the Department for ten fee points for GCP-O&G or $500 for NOIs. We cannot begin processing your action until the full fee is received by the Department in the form of a check or an online ePayment. You will receive an automated email when your action is assigned for review.

☑ There is an annual fee for GCP-O&G in addition to the registration fee: www.env.nm.gov/air-quality/permit-fees-2/ (No annual fee for NOIs. (Facilities qualifying as a 'small business' under 20.2.75.7.F NMAC qualify for reduced fees, provided that NMED has a Small Business Certification Form from your company on file. This form can be found at: www.env.nm.gov/aqb/sbap/Small_Business_Forms.html)

☑ There are required attachments in addition to inputting data in the program. I will include the required attachments.

Is the facility located in Bernalillo County, on tribal lands, or in a nonattainment area?
○ Yes ◉ No

Is the facility's SIC code 1311, 1321, 4619, 4612 or 4922? (Other SIC codes may be approved provided that all the equipment at the facility is allowed in the GCP-Oil & Gas Permit. Non-Oil and Gas NOIs should use the paper Universal Application.
◉ Yes ○ No

**For Department use only:**

# Electronic Permitting Application

**Use this application for NOI and GCP-Oil and Gas Permits.**

Use this application for: the initial application, modifications, revisions and when converting from another permit type. Please fill out all sections so that they have check marks and attach all required documents for review. Coordination with AQB is encouraged for first time users. Please use the Request NMED Support button if you would like to set up a walk through.

Add a New Regulated Source

[1] Unit numbers must correspond to unit numbers in the previous permit unless a complete cross reference table of all units in both permits is provided.

[2] Specify dates required to determine regulatory applicability. If only year or month is known use 01/01/yyyy or mm/01/yyyy.

[3] To properly account for power conversion efficiencies, generator set rated capacity shall be reported as the rated capacity of the engine in horsepower, not the kilowatt capacity of the generator set.

## Table 2C - Emissions Reduction Equipment

☐ **This Table was intentionally left blank.**

In accordance with 20.2.72.203.A(3) and (8) NMAC, 20.2.70.300.D(5)(b) and (e) NMAC, and 20.2.73.200.B(7) NMAC, the permittee shall report all control devices and list each pollutant controlled by the control device regardless if the applicant takes credit for the reduction in emissions. **Also include reductions from process equipment in this table. Entering process equipment in this table is for data entry purposes only, the process vs control analysis will be used to determine process or control status for VRUs.** Only list control equipment for TAPs if the TAPs maximum uncontrolled emissions rate is over its respective threshold as listed in 20.2.72 NMAC, Subpart V, Tables A and B.

| Edit | Reduction Equipment Unit No. | Reduction Equipment Description | Date Installed (mm/dd/yyyy). | Reduced Pollutants | Reducing Emissions for Unit Numbers | Efficiency (% Reduction by Weight) | Method used to estimate reduction | Reduction Type | Complete |

Add Reduction Equipment for Unit [Select one] Add

How to complete the table: In the drop down, select regulated sources from Table 2A where emissions are reduced and click "Add." Then add reduced pollutants and associated reduction devices for each. If a pollutant has emissions reduced by more than one device please add a line for each device and label them as primary, secondary, tertiary. Click "Edit" to update reduced pollutants and devices for each regulated source.

Comments (4000 character maximum)

**List each reduction device and all sources they serve, e.g. FL-1: Oil tanks 1-4, loading, VRU downtime. FL-2: compressor and sales downtime. For NOIs, indicate the enforceability behind each device or clarify if it is voluntary and no credit is being claimed for the reduction, e.g., FL-1: Oil tanks 1-8 (OOOOa). FL-1: Loading (voluntary, no emissions reduction credit claimed.)**

CAT-1: LPC-1 (JJJJ, ZZZZ)
ECD-1: Oil Tanks 1-3 (OOOOa); Produced Water Tanks 1-3 (voluntary, no emission reduction credit claimed)
FL-1: stranded gas during pipeline downtime (voluntary, no emission reduction credit claimed)

## *Table 2-D: Maximum Emissions* (under normal operating conditions)

**This Table was intentionally left blank because it would be identical to Table 2-E.**

Maximum Emissions are the emissions at maximum capacity and prior to (in the absence of) pollution control, emission-reducing process equipment, or any other emission reduction. Calculate the hourly emissions using the worst case hourly emissions for each pollutant. For each pollutant, calculate the annual emissions as if the facility were operating at maximum plant capacity without pollution controls for 8760 hours per year, unless otherwise approved by the Department. List Hazardous Air Pollutants (HAP) & Toxic Air Pollutants (TAPs) in Table 2-I. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41).

**[1] Condensable Particulate Matter: Include condensable particulate matter emissions for PM10 and PM2.5 if the source is a combustion source.**

**Comments** (2000 character maximum)

## Table 2-E: Requested Allowable Emissions

Unit & stack numbering must be consistent throughout the application package. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41). Facility totals are a summation of all the emissions entered for equipment in this table plus total tpy SSM emissions from Table 2F.
**GCP-O&G:** Combustion emissions from malfunction events are not allowed under this permit.

**NOI:** Malfunction emissions are not allowed under a Notice of Intent.

## Table 2-F: Startup, Shutdown, and Routine Maintenance (SSM) Emissions

☐ **This table is intentionally left blank as all SSM emissions at this facility do not require an increase in Requested Allowables greater than those listed in Table 2-E.**

All applications for facilities that have emissions during routine our predictable startup, shutdown or scheduled maintenance (SSM)2, including NOI applications, must include in this table the Maximum Emissions during routine or predictable startup, shutdown and scheduled maintenance (20.2.7 NMAC, 20.2.72.203.A.3 NMAC, 20.2.73.200.D.2 NMAC). Provide emissions calculations for all SSM emissions reported in this table. Refer to the guidance "Startup, Shutdown, Maintenance Emissions in Permits" (www.env.nm.gov/air-quality/permitting-section-procedures-and-guidance/) for more detailed instructions. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41).

## Table 2-I: Stack Exit and Fugitive Emission Rates for HAPs and TAPs

☐ **By marking this table as intentionally left blank, you certify that the Total and individual HAPs for this facility are less than 1 ton per year.**

Data may not be provided for subject items (SIs) that are not complete. Please edit the SI in Table 2-A before providing information here.

**GCPs:** Report the potential emission rate for each HAP from each HAP emitting emission unit listed in Table 2A. For each emission unit, HAPs shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41). Emissions less than 0.0001 lb/hr or 0.0001 tpy and emission units that do not emit HAPs shall be omitted from the table. Each facility-wide Individual HAP total and the facility-wide Total HAPs is the sum of all HAP sources entered in the Table. Use the HAP nomenclature as it appears in Section 112 (b) of the 1990 CAA. Include tank-flashing emission estimates of HAP in this table.

**NOIs:** Report the individual and/or Total HAPs for each piece of equipment in Table 2A, only if the facility total for that pollutant is greater than or equal to 1 tpy.

| Edit | Unit No. | Total HAPs | | Benzene HAP | | Hexane HAP | | Toluene; (Methyl benzene) HAP | | | | | | | | | | | | | | | | | | | | Complete |

**AQB ePermitting Portal**

# Abbreviated Application (Notice of Intent)

☒ 1. I understand that I must submit the hard copy check and required Payment Information Form for all AQB ePermitting Portal Submittals before it will be assigned, and the 30-day review period begins.

☒ 2. I understand the AQB ePermitting Portal is a new program and I will use the Request NMED Support function in the Portal to: request help, report issues (bugs), and to provide my constructive feedback for improving the Portal.

# Section 1

## Facility Name or Facility Type Change for Modifications

Fill out this section if requesting a change to the facility name or facility type that appears in the ePermitting Portal. These items cannot be updated through the Portal and will be corrected as part of the review of your permit.

Check the appropriate box(es) and provide complete information in the table.

☒ 1. Changing facility name. (Punctuation and special characters not allowed. Use “No123” instead of #123)
☐ 2. Changing facility type.

# Electronic Permitting Application

**Use this application for NOI and GCP-Oil and Gas Permits.**

Use this application for: the initial application, modifications, revisions and when converting from another permit type. Please fill out all sections so that they have check marks and attach all required documents for review. Coordination with AQB is encouraged for first time users. Please use the Request NMED Support button if you would like to set up a walk through.

[1] Unit numbers must correspond to unit numbers in the previous permit unless a complete cross reference table of all units in both permits is provided.

[2] Specify dates required to determine regulatory applicability. If only year or month is known use 01/01/yyyy or mm/01/yyyy.

[3] To properly account for power conversion efficiencies, generator set rated capacity shall be reported as the rated capacity of the engine in horsepower, not the kilowatt capacity of the generator set.

## Table 2C - Emissions Reduction Equipment

☐ **This Table was intentionally left blank.**

In accordance with 20.2.72.203.A(3) and (8) NMAC, 20.2.70.300.D(5)(b) and (e) NMAC, and 20.2.73.200.B(7) NMAC, the permittee shall report all control devices and list each pollutant controlled by the control device regardless if the applicant takes credit for the reduction in emissions. **Also include reductions from process equipment in this table. Entering process equipment in this table is for data entry purposes only, the process vs control analysis will be used to determine process or control status for VRUs.** Only list control equipment for TAPs if the TAPs maximum uncontrolled emissions rate is over its respective threshold as listed in 20.2.72 NMAC, Subpart V, Tables A and B.

| Reduction Equipment Unit No. | Reduction Equipment Description | Date Installed (mm/dd/yyyy). | Reduced Pollutants | Reducing Emissions for Unit Numbers | Efficiency (% Reduction by Weight) | Method used to estimate reduction | Reduction Type |

| ECD-1 | ECD/VCU | | Volatile Organic Compounds (VOC) | TK-3_0194 | 98 | Design calculation | PRIMARY |

How to complete the table: In the drop down, select regulated sources from Table 2A where emissions are reduced and click "Add." Then add reduced pollutants and associated reduction devices for each. If a pollutant has emissions reduced by more than one device please add a line for each device and label them as primary, secondary, tertiary. Click "Edit" to update reduced pollutants and devices for each regulated source.

Comments (4000 character maximum)

**List each reduction device and all sources they serve, e.g. FL-1: Oil tanks 1-4, loading, VRU downtime. FL-2: compressor and sales downtime. For NOIs, indicate the enforceability behind each device or clarify if it is voluntary and no credit is being claimed for the reduction, e.g., FL-1: Oil tanks 1-8 (OOOOa). FL-1: Loading (voluntary, no emissions reduction credit claimed.)**

CAT-1: LPC-1 (JJJJ, ZZZZ)
ECD-1: Oil Tanks 1-3 (OOOOa); Produced Water Tanks 1-3 (voluntary, no emission reduction credit claimed)
FL-1: stranded gas during pipeline downtime (voluntary, no emission reduction credit claimed)

## Table 2-D: Maximum Emissions (under normal operating conditions)

**This Table was intentionally left blank because it would be identical to Table 2-E.**

Maximum Emissions are the emissions at maximum capacity and prior to (in the absence of) pollution control, emission-reducing process equipment, or any other emission reduction. Calculate the hourly emissions using the worst case hourly emissions for each pollutant. For each pollutant, calculate the annual emissions as if the facility were operating at maximum plant capacity without pollution controls for 8760 hours per year, unless otherwise approved by the Department. List Hazardous Air Pollutants (HAP) & Toxic Air Pollutants (TAPs) in Table 2-I. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41).

## Table 2-E: Requested Allowable Emissions

Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41). Facility totals are a summation of all the emissions entered for equipment in this table plus total tpy SSM emissions from Table 2F.
**GCP-O&G:** Combustion emissions from malfunction events are not allowed under this permit.

**NOI:** Malfunction emissions are not allowed under a Notice of Intent.

Comments (2000 character maximum)

## Table 2-F: Startup, Shutdown, and Routine Maintenance (SSM) Emissions

**This table is intentionally left blank as all SSM emissions at this facility do not require an increase in Requested Allowables greater than those listed in Table 2-E.**

All applications for facilities that have emissions during routine our predictable startup, shutdown or scheduled maintenance (SSM)[2], including NOI applications, must include in this table the Maximum Emissions during routine or predictable startup, shutdown and scheduled maintenance (20.2.7 NMAC, 20.2.72.203.A.3 NMAC, 20.2.73.200.D.2 NMAC). Provide emissions calculations for all SSM emissions reported in this table. Refer to the guidance "Startup, Shutdown, Maintenance Emissions in Permits" ( www.env.nm.gov/air-quality/permitting-section-procedures-and-guidance/) for more detailed instructions. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41).

**[1] Condensable Particulate Matter: Include condensable particulate matter emissions for PM10 and PM2.5 if the source is a combustion source.**

**[2]For instance, if the short term steady-state Table 2-E emissions are 5 lb/hr and the SSM rate is 12 lb/hr, enter 7 lb/hr in the table below. If the annual steady-state Table 2-E emissions are 21.9 TPY, and the number of scheduled SSM events result in annual emissions of 31.9 TPY, enter 10.0 TPY in the table below.**

Comments (2000 character maximum)

## Table 2-I: Stack Exit and Fugitive Emission Rates for HAPs and TAPs

☐ **By marking this table as intentionally left blank, you certify that the Total and individual HAPs for this facility are less than 1 ton per year.**

Data may not be provided for subject items (SIs) that are not complete. Please edit the SI in Table 2-A before providing information here.

**GCPs:** Report the potential emission rate for each HAP from each HAP emitting emission unit listed in Table 2A. For each emission unit, HAPs shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41). Emissions less than 0.0001 lb/hr or 0.0001 tpy and emission units that do not emit HAPs shall be omitted from the table. Each facility-wide Individual HAP total and the facility-wide Total HAPs is the sum of all HAP sources entered in the Table. Use the HAP nomenclature as it appears in Section 112 (b) of the 1990 CAA. Include tank-flashing emission estimates of HAP in this table.

**NOIs:** Report the individual and/or Total HAPs for each piece of equipment in Table 2A, only if the facility total for that pollutant is greater than or equal to 1 tpy.

| Unit No. | Total HAPs | | Benzene HAP | | Hexane HAP | | Toluene; (Methyl benzene) HAP | | | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

# Section 3
## Application Summary and Routine Operations

---

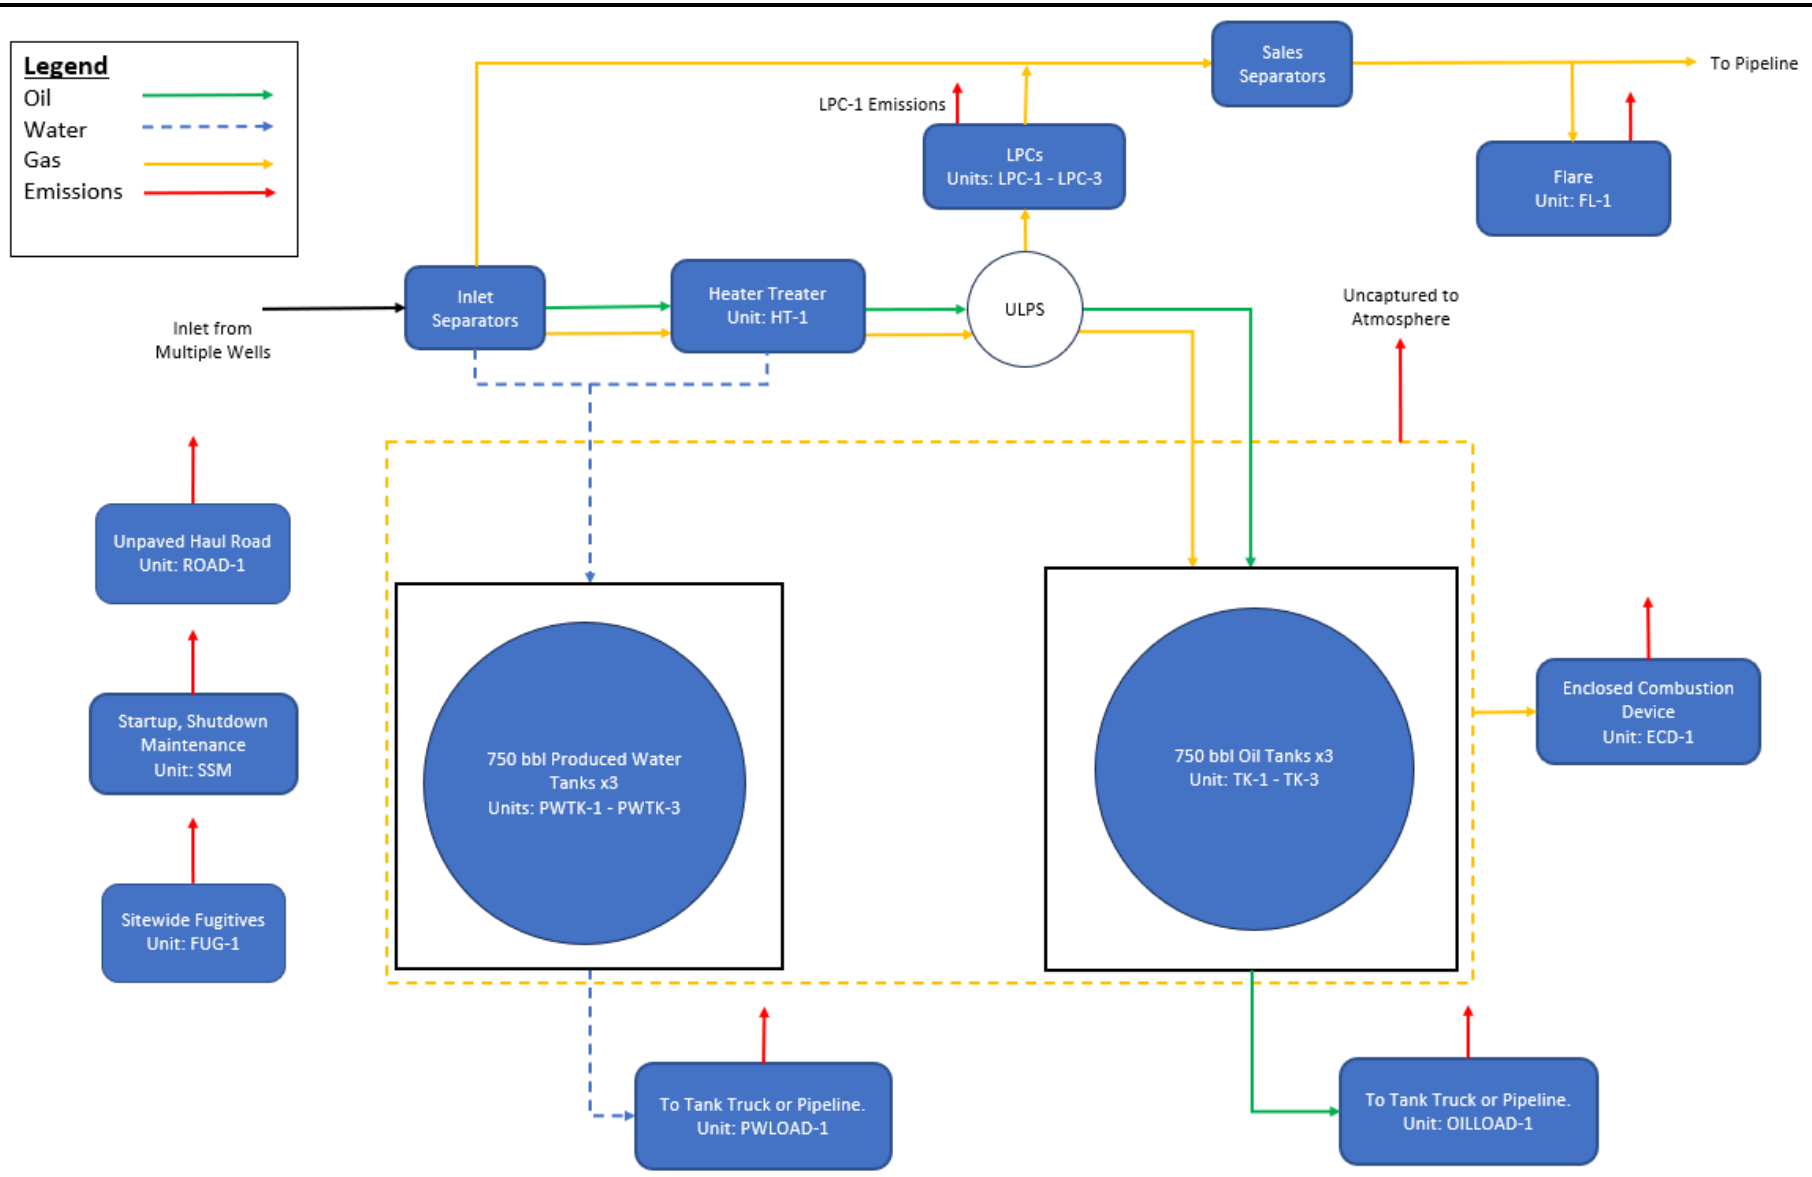
**NOI Summary:** Devon Energy Production Company, L.P. (Devon) owns and operates Broadside 12 Facility 2 (Facility), which is located 20.7 miles west-northwest of Jal in Lea County, New Mexico, under an Oil and Gas General Construction Permit (GCP-O&G). Three (3) 750 bbl oil tanks, three (3) 750 bbl water tanks, one (1) heater treater, one (1) ultra-low-pressure separator (ULPS), one (1) 92 hp natural gas fired low pressure compressor (LPC), two (2) electric LPCs, one (1) flare, and crude and water loading operations are currently authorized under GCP-O&G No. 9357.

Devon is adding one (1) enclosed combustor (ECD), routing water and oil tank emissions to one header controlled by the ECD, and updating production levels with updated representative analyses and transition from a GCP-O&G to a Notice of Intent (NOI).

To authorize the change in equipment and modifications to production at this Facility, Devon is submitting this initial NOI application, which has been prepared in accordance with the requirements set forth in NMAC 20.2.73.

**Process Summary**: Crude oil, natural gas, and produced water are piped to the Facility from producing wells in the surrounding oil field. Production liquid flows from the wells through inlet separators, then oil is processed in the heater treater (Units HT-1). Gas from the inlet separator is further processed through the sales separators and sent to the pipeline or the emergency flare (Unit No. FL-1) during periods of pipeline unavailability. However, because there are no state or federal requirements to control stranded gas, a VOC reduction credit is not taken in this application.

Water from the inlet separators and heater treaters flows into the water storage tanks (Units PWTK-1 - PWTK-3) and is later transferred offsite via pipeline or loading rack (Unit PWLOAD) if the pipeline is unavailable. The water storage tank vapors are routed to the combustor (Unit ECD-1) through the tank header. However, because there are no state or federal requirements to control the water tanks, a VOC reduction credit is not taken in this application.



Oil and entrained gas from the heater treaters is processed further through a ULPS (Unit ULPS-1) before flowing to the oil storage tanks (Units TK-1 – TK-3) and is later transferred offsite via pipeline or loading rack (Unit OILLOAD) during periods of pipeline unavailability. The oil storage tank vapors are routed to the combustor through the tank header.

Gas from the ULPS is sent to the marketing sales gas line using the LPCs (Unit LPC-1 – LPC-3). Because the ULPS/LPC is a part of the process and separates gas just like all of the other separation equipment but at near atmospheric pressure, there is less gas entrained in the oil when it flows to the oil tanks. When the LPC is down for maintenance, gas from the ULPS flows to the tanks and is controlled by the ECD with the rest of the oil tank vapors.

The site was constructed after September 18, 2015, and has not been modified by OOOOb definition since December 6, 2022. The potential volatile organic compound (VOC) emission rate for each of the oil storage tanks is greater than 6 tons per year (TPY). Therefore, the oil storage tanks are subject to New Source Performance Standard (NSPS) Subpart OOOOa. Devon complies with the requirement to reduce emissions from each oil storage tank by 95% by operating a combustor. Approximately 98% of the vapors from the oil storage tanks will be captured and sent to the combustor with a minimum 98% destruction efficiency.

**Routine or predictable emissions during Startup, Shutdown, and Maintenance (SSM):** Check the appropriate SSM box below. SSM emissions from production sites could include but are not limited to VOC venting of compressor blowdowns, pigging, maintenance downtime of VRU, or site-specific combustion SSM emissions.

☐ No SSM emissions are expected from routine operations.
☒ Applicant requests up to 10 tpy of VOC SSM emissions.
☒ Applicant requests site specific VOC SSM and those emissions are included in Section 4.
Provide an overview: Uncontrolled VOC from stranded gas sent to the flare when the pipeline is unavailable.
☒ Applicant requests site specific combustion SSM and those emissions are included in Section 4.
Provide an overview: Combustion of stranded gas sent to the flare when the pipeline is unavailable.

**Section 3**

# Section 4
## All Calculations and Emissions Summary

---

### *Air Emissions Calculation Tool (AECT)*

The AECT is required to be used with this NOI Quick Form. If the AECT for a piece of equipment is under development, provide calculations. www.env.nm.gov/air-quality/air-emissions-calculation-tool-aect/

### *NOI representations must demonstrate enforceability of any reductions claimed to reduce the Potential Emission Rate (PER) or Potential to Emit (PTE).*

PER definition in NMAC 20.2.73.7 NMAC: "Potential emission rate" means the emission rate of a source at its maximum capacity to emit a regulated air contaminant under its physical and operational design, provided any physical or operational limitation on the capacity of the source to emit a regulated air contaminant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored or processed, shall be treated as part of its physical and operational design only if the limitation or the effect it would have on emissions is enforceable by the department pursuant to the Air Quality Control Act or the federal act."

PTE definition in NMAC 20.2.73.7 NMAC: "Potential to emit" means the maximum capacity of a stationary source to emit any air pollutant under its physical and operational design; any physical or operational limitation on the capacity of a source to emit an air pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored, or processed, shall be treated as part of its design if the limitation is federally enforceable; the potential to emit for nitrogen dioxide shall be based on total oxides of nitrogen.

### *20.2.50 NMAC (Part 50)*

The Oil and Gas Sector – Ozone Precursor Pollutants regulation 20.2.50 NMAC (Part 50) establishes emission standards for volatile organic compounds (VOC) and oxides of nitrogen (NOx) for oil and gas production, processing, compression, and transmission sources. The reductions required by Part 50 may be included in PER calculations. However, the reductions required by Part 50 **may not** be included in PTE calculations. Part 50 is not federally enforceable, but it does establish limitations that are enforceable pursuant to the New Mexico Air Quality Control Act. The Title V Operating Permit applicability in 20.2.70 NMAC is based on PTE. When determining Title V major source threshold status, calculations at NOI-only facilities cannot claim reductions required by Part 50.

### *Tank Emissions Calculations*

The information provided to the AQB shall include a discussion of the method used to estimate tank-flashing emissions, accuracy of the model, the input and output summary from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis. If Pro-Max or Hysis is used, all relevant input parameters shall be reported, including separator pressure, gas throughput, and all other relevant parameters necessary for flashing calculation. For each crude oil storage tank, identify if the tanks are in series or in parallel.

For tank and loading emission calculations, the annual throughput used for calculations is not required to be the daily throughput times 365 days. The annual throughput of the facility used for calculations must be consistent throughout the application, and a brief rationale should be included in the note sections on the appropriate pages of the AECT.

For tanks subject to federal regulations that require controls (i.e., NSPS OOOO or NSPS OOOOa), applicants may represent tank controls as two scenarios to provide flexibility. Some facilities will have a vapor recovery unit (VRU) installed initially but may later replace the VRU with a flare due to changes in production levels. Representing **both** scenarios in the NOI application will allow the company to replace the VRU with a flare without submitting a revision to the NOI to the Department. To be eligible for this flexibility, both the VRU and flare must be compliant with the federal regulations that require the control of the tanks. Represent both scenarios using the AECT and include comments to explain the requested flexibility.

Represent the worst-case scenario when filling out the emission tables in the Portal. Provide a process flow diagram and a written process description for each scenario. Represent both scenarios using the AECT and include comments to explain the requested flexibility.

### *Heater Calculations:*

Heaters, heated separators, and heater treaters may be represented as a combined maximum heat input, provided that each individual unit is rated less than 100 MMBTU/hr each. This will allow applicants flexibility in the number and size of units installed, while still demonstrating that the facility will comply with NOI limits. To utilize this flexibility, represent the requested total heat input for all these units in the AECT.

### *Engines*

Engine options may be represented in an NOI to provide flexibility. No more than 4 options are allowed and not more than 4 engines may be included. The engines may be in any combination that meets all state and federal regulations. When representing engine options, a table is required that specifically lists: the engine(s) in each option, the emissions for each engine, and a worst-case emission row which is the highest PER for each pollutant from all the engines in each option.

The composite row is entered in the Portal Tables. E.g. ENG-1*; use the comments box to explain the scenario represented. During minor source emissions inventory reporting you will be required to add and report on the individual engines that operated during that reporting year through AEIR.

Unless information is the same for all options:

- Enter “see list” for model and serial number, leave the manufacture date blank, add any regulations that apply to any engine in the option (2A).
- Do not enter anything in the reduction devices table (2C) but list federal controls for each engine in the comments box.
- Use the worse-case stack parameters between all the engine options (2H).
- Leave the fuel usage (2J) blank.

Engine specificity represented in the NOI must be sufficient to determine the emissions from the engine. Engines shall not be installed which do not meet the specificity provided in the NOI. Fill out a separate page in the AECT for each type of engine, the facility totals in the AECT will not be representative of what is requested in the PER Table.

Engine representations must include either:

- the enforceability and applicable parameters (e.g., 100 to 500 hp; JJJJ applicable engine manufactured after 1/1/2011);
- the manufacturer specification sheet (including installed catalysts) to support emission calculations;
- use AP-42 emission factors, or
- use uncontrolled emission factors.

### *SSM Calculations:*

The applicant must select one of the boxes in Section 2: SSM Summary. If applicant is submitting site specific calculations, include in this section.

### *Control Devices:*

In accordance with 20.2.73.200.B(7) NMAC, report all control devices and list each pollutant controlled by the control device in the Potential Emission Rate Table.

Voluntary flaring of emissions that are not federally enforceable (such as maintenance or loading emissions) should be represented **both** as flared emissions, and as uncombusted emissions. This is necessary to demonstrate that the products of combustion from flaring the emissions do not exceed the applicability threshold for a permit under 20.2.72.200.A(1) NMAC; and that the VOC emissions (if they are not flared) will not cause the site to be defined as a Title V Major Source under 20.2.70.7.4.R NMAC.

**Table 1: Check the equipment entered from the AECT Form Submitted in this Section:**

| Check box if present at facility | Equipment Type | Quantity |
|---|---|---|
| ☒ | **Engine(s)** | **1** |
| ☒ | **Heater(s)** | **1** |
| ☒ | **Haul Road** | **1** |
| ☒ | **Fugitives** | **1** |
| ☒ | **Tanks** | **6** |
| ☒ | **Flare(s)** | **1** |
| ☒ | **Loading** | **2** |
| ☒ | **ECD** | **1** |
| ☐ | **Thermal Oxidizer** | |
| ☐ | **VRU** | |
| ☒ | **ULPS/LPC** | **3** |

**Information Used to Determine Emissions**

**Check the box for each type of information submitted**:

☒ If manufacturer data are used, include specifications for emissions units and control equipment, including control efficiencies specifications and sufficient engineering data for verification of control equipment operation.

☒ For tank emissions, include a discussion of the method used to estimate tank-flashing emissions, accuracy of the model, the input and output summary from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis.

☒ If requesting to use a representative gas sample, include a discussion of why the sample is representative for this facility and an explanation of how it is representative (e.g., same reservoir, same similar API gravity, similar composition).

**A site-specific sample is not available. The sample was pulled from the same reservoir as the Facility and is considered to be a representative analysis.**

# Section 6

## Applicable State & Federal Regulations

---

**Provide a discussion demonstrating compliance with applicable state & federal regulation**. All input cells should be filled in, even if the response is 'No' or 'N/A'.

In the "Justification" column, identify the criteria that are critical to the applicability determination, numbering each. For each unit subject to a state or federal regulation, after each listed unit, include the lowest level citation of the applicable regulation. For each unit, list the information necessary to verify the applicability of the regulation, including date of manufacture, date of construction, size (hp), and combustion type. Doing so will provide the applicability criteria for each unit.

---

**Example of a Table for Applicable State Regulations:**

| STATE REGU-LATIONS CITATION | Title | Federally Enforce-able | Applicability Information: Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 $m^3$, 3. **RE: Notice of Intent to Construct**
**Broadside 1H Battery**
**Devon Energy Production Company, L.P.**

Dear Sir or Madam:

Devon Energy Production Company, L.P. (Devon) plans to construct Broadside 1H Battery (Facility), which will be located approximately 21.2 miles west-northwest of Jal in Lea County, New Mexico. The Facility will consist of four (4) oil tanks, two (2) water tanks, one (1) gunbarrel, one (1) heater treater, one (1) emergency flare, one (1) combustor, one (1) 203 hp combustion engine, and crude and water loading operations. The site will be an oil and gas production facility.

To authorize construction and operation of this Facility, Devon is submitting this Notice of Intent (NOI) to Construct application, which has been prepared in accordance with the requirements set forth in NMAC 20.2.73.

If you have any questions or comments, please feel free to contact me at (405) 228-7270.

Sincerely,

*Aaron Yotter*

# NOI Oil and Gas Quick Application

**Use this application only for oil and gas facilities registering under 20.2.73 NMAC**

Submit the entire application on a single CD (no copies of the CD are needed). Hard copies of Page 1 and 2, and Section 7 of this application are required.

**This application is being submitted as** (check all that apply)**:**

☐ **Updating** an existing registered facility. Provide NOI (or NPR/Permit) number:

☐ **Updating** an application currently under NMED review. Include this page and all pages that are being updated (no fee required).

**Construction Status:** ☐ Not Constructed ☐ Existing Permitted (or NOI) Facility ☒ Existing Non-permitted (or NOI) Facility

☒ **Acknowledgement that facilities with the following equipment may not use this application form and should use the Universal Application form:** glycol dehydrators, non-NMED deration method, and applications using emission calculation tools other than the Air Emission Calculation Tool (AECT) for regulated equipment.

☒ **Acknowledgement that this application contains the required AECT, which is required to be used to determine emissions from equipment:** https://www.env.nm.gov/air-quality/air-quality-oil-and-gas-noi-application-form/

**Acknowledgements:** ☐ I acknowledge that a pre-application meeting is available to me upon request

☒ $500 NOI Filing Fee enclosed ☒ Check No.: in the amount of $500

# Section 1 – Facility Information

## Section 1-A: Company Information

## Section 1-B: Single Source Determination and Source Status

| | |
|---|---|
| 1 | Is this facility a single source as defined in 20.2.73 NMAC? ☑ **Yes** ☐ **No** |
| 2 | Is this facility a Title V or PSD Source? Checking the "NO" box acknowledges and certifies that the Potential To Emit and the Potential Emission Rate of any regulated air contaminant is less than 100 tons per year. ☐ **Yes** ☑ **No** |

## Section 1-C: Facility Location Information

| | | |
|---|---|---|
| 1 | UTM Zone: ☐ 12 or ☒ 13 | County: Lea |
| 2 | Datum: ☐ NAD 27 ☒ NAD 83 ☐ WGS 84 | Elevation (ft): 3603 |
| a | UTM E (in meters, to nearest 10 meters): 638790 | UTM N (in meters, to nearest 10 meters): 3566420 |
| b | Latitude (deg., min., sec.): 32° 13' 32.89" | Longitude (deg., min., sec.): 103° 31' 37.46" |
| 3 | The facility is: 21.2 (distance) miles west-northwest (direction) of Jal (nearest town), zip code of nearest town 88252 | |
| 4 | Status of land (check one): ☒ Private ☐ Indian/Pueblo ☐ Federal BLM ☐ Federal Forest Service ☐ State Land | |
| 5 | Will this facility operate in conjunction with other air regulated parties on the same property? ☐ **Yes** ☑ **No**<br>If yes, what is the name and permit number (if known) of the other facility? | |

## Section 1-D: Other Facility Information

| | | | |
|---|---|---|---|
| 1 | Are there any current Notice of Violations (NOV), compliance orders, or any other compliance or enforcement issues related to this facility? ☐ **Yes** ☑ **No** If yes, specify: | | |
| a | If yes, NOV date or description of issue: | | NOV Tracking No: |
| b | Is this application in response to any issue listed in this section? ☐ **Yes** ☒ **No**<br>If Yes, provide the information below: | | |
| c | Document Title: | Date: | Requirement # (or page # and paragraph #): |

# Section 1-E – Submittal Requirements

Each 20.2.73 NMAC (**NOI**) application package shall consist of the following:

### Hard Copy Submittal Requirements:

1) Hard copies of Pages 1-2, and the signed Certification Page are required.
2) The entire NOI application should be submitted electronically on compact disk (CD).

### Electronic Submittal Requirements [in addition to the required hard copy]:

1) A single Microsoft Office compatible file format (Word) and PDF document of this application.
2) A single version of the Air Emissions Calculation Tool (AECT).
3) The electronic file names shall be a maximum of 25 characters long (including spaces, if any). The format of the electronic Application shall be in the format: "NOI-Facility Name".

# Section 2
## Application Summary and Routine Operations

The **Application Summary** shall include a brief description of the application. In case of a revision or modification to a facility, please describe the proposed changes from the original NOI. If this facility is to be co-located with another facility, provide details of the other facility including permit or NOI number(s).

**Routine or predictable emissions during Startup, Shutdown, and Maintenance (SSM):** Check the appropriate SSM box below. SSM emissions expected from production sites is VOC venting of compressor blowdowns, pigging, or maintenance downtime of VRU, and site-specific combustion SSM emissions.

**Application Summary:**
Devon Energy Production Company, L.P. (Devon) plans to modify and operate Broadside 1H Battery (Facility), which is located approximately 21.2 miles west-northwest of Jal in Lea County, New Mexico. The Facility will consist of four (4) oil tanks, two (2) water tanks, one (1) gunbarrel, one (1) heater treater, one (1) emergency flare, one (1) combustor, one (1) 203 hp natural gas-fired combustion engine, one (1) electric compressor engine, and crude and water loading operations. The combustion engine will have a manufacture date of January 1, 2011 or later; therefore, the engine will be subject to NSPS Subpart JJJJ.

To authorize the modification and operation of this Facility, Devon is submitting this Notice of Intent (NOI) to Construct application, which has been prepared in accordance with the requirements set forth in NMAC 20.2.73.

**Facility Type:**
A narrative is not required if the facility can be described by one of the check boxes below:
☒ The facility is an oil and gas production facility.
☐ The facility is a tank battery.
☐ The facility is a natural gas compressor station.
☐ Other (describe) _____

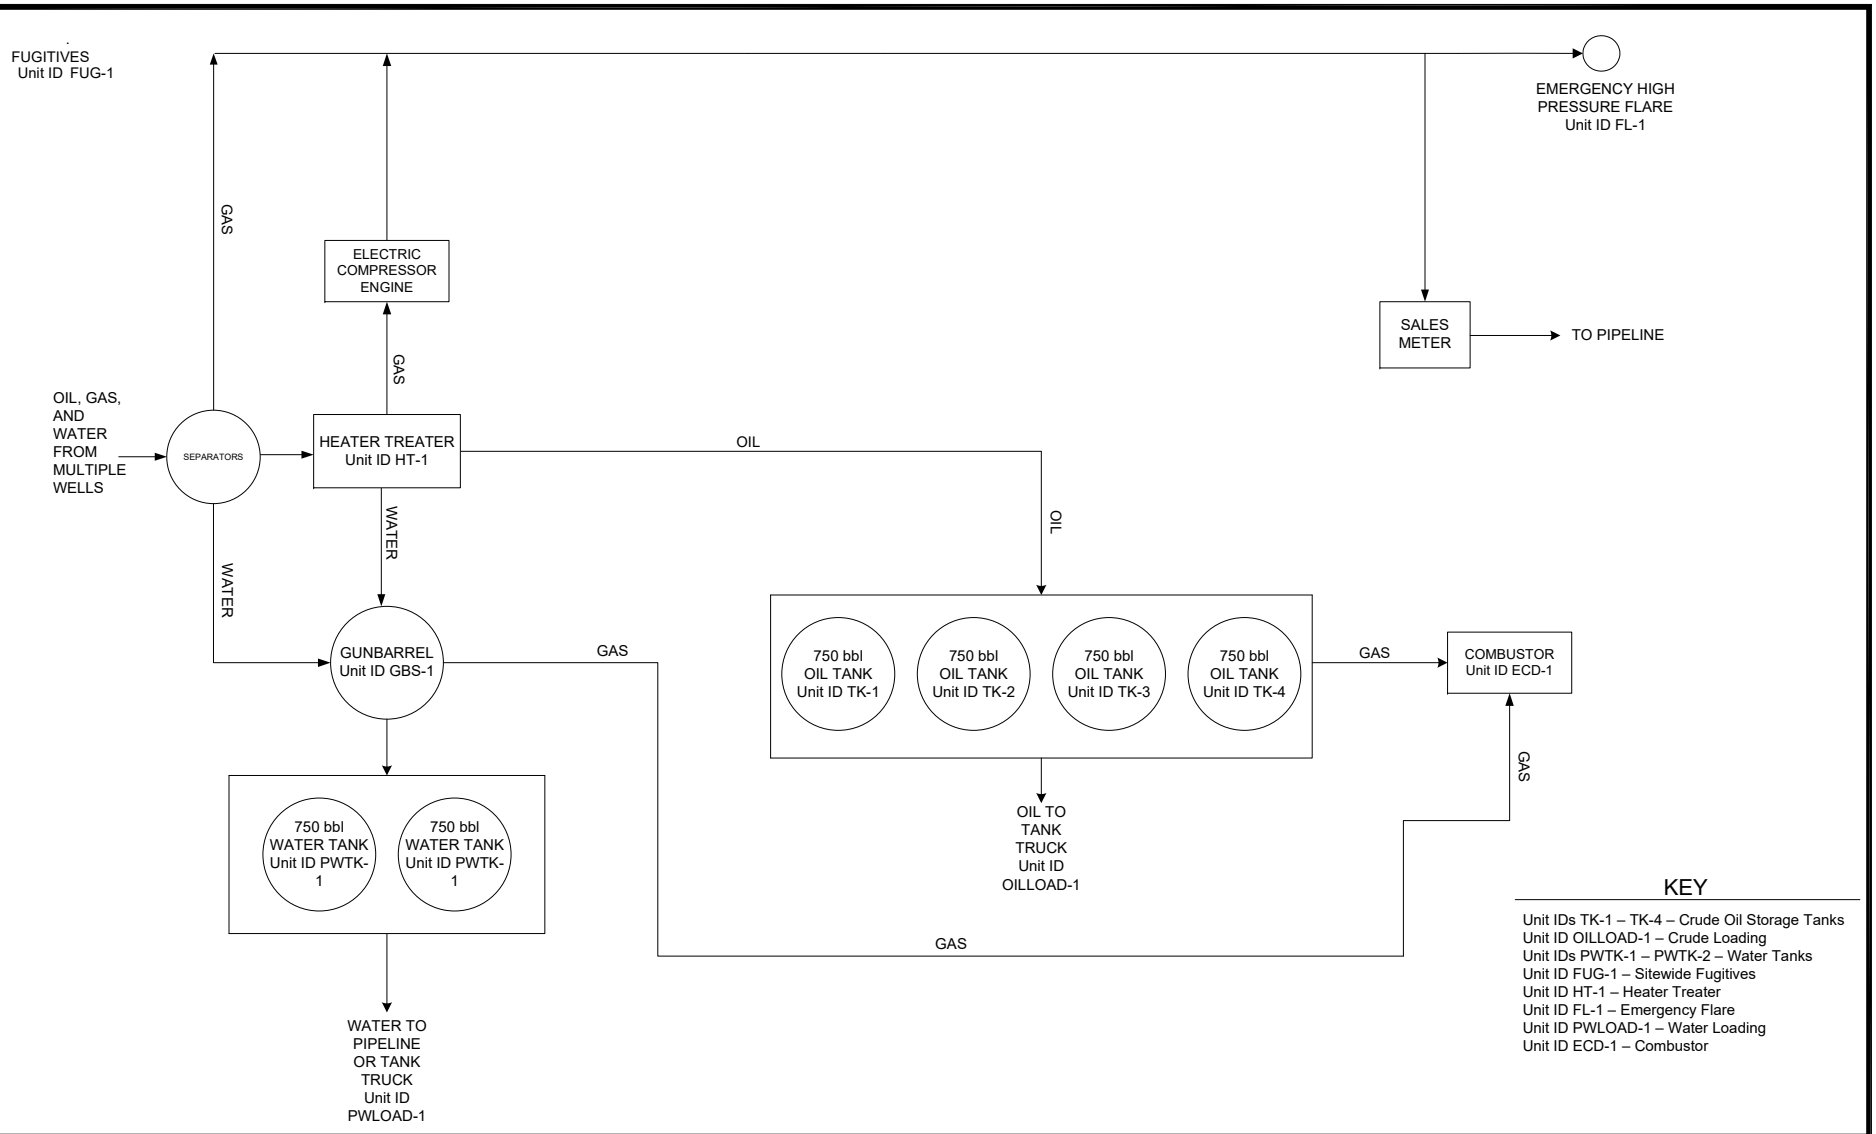
The operating schedule using this application to qualify under 20.2.73 NMAC is 24 hours per day and 8760 hours per year.

**SSM Summary:**
Check the applicable box below:
☐ No SSM emissions are expected from routine operations.
☐ Applicant requests up to 10 tpy of VOC SSM emissions.
☒ Applicant requests site specific VOC SSM and those emissions are included in Section 4.
☐ Applicant requests site specific combustion SSM and those emissions are included in Section 4.

# Section 3
## Process Flow Sheet

---

A **process flow sheet** including all equipment, emission points, and types of control applied to those points. All units should be labeled and the unit numbering system should be consistent throughout this application. Identify all sources of emissions with a vertical arrow. Label each of the different material streams (crude oil, gas, NGL, and produced water).



---

A Process Flow Sheet is included in this section.

Crude oil, natural gas, and produced water are piped to the Facility from producing wells in the surrounding oil field. Production fluid flows from the wells through separators, then oil is processed in the heater treater (Unit ID HT-1). Oil from the heater treater is sent to the oil storage tanks (Unit IDs TK-1 through TK-4). The oil is later transferred offsite via the loading rack (Unit ID OILLOAD-1). Gas from the separators and heater treater is captured in an electric compressor engine and sent to the sales line. Water from the separators and heater treater flows through the gunbarrel (Unit ID GBS-1), then into the water storage tanks (Unit IDs PWTK-1, PWTK-2) and is later transferred offsite via the loading rack (Unit PWLOAD-1) or pipeline. The water storage tanks vent to atmosphere. The oil tanks are controlled by the combustor (Unit ID ECD-1). The gunbarrel is also controlled by the combustor (Unit ID ECD-1). However, because there are no state or federal requirements to control the gunbarrel, a VOC reduction credit is not taken in this application.

The potential volatile organic compound (VOC) emission rate for each of the oil storage tanks is greater than 6 tons per year. Therefore, the oil storage tanks are subject to New Source Performance Standard (NSPS) Subpart OOOOa. Devon complies with the requirement to reduce emissions from the oil storage tanks by 95% by operating a combustor (Unit ID ECD-1). Approximately 98% of the vapors from the oil storage tanks are captured and sent to the combustor.

One combustion engine (Unit ID ENG 1) could be installed. An emergency flare (Unit ID FL-1) is also located at the Facility.

# Section 4
## All Calculations and Emissions Summary

---

**The Department has developed the Air Emission Calculation Tool Form (AECT), which is required to be used in the NOI Oil and Gas Quick Application.** If the AECT for a piece of equipment is under development, provide calculations.

**The AECT can be accessed at the following link:**
https://www.env.nm.gov/air-quality/air-quality-oil-and-gas-noi-application-form/

**Tank Emissions Calculations**: The information provided to the AQB shall include a discussion of the method used to estimate tank-flashing emissions, accuracy of the model, the input and output summary from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis. If Pro-Max or Hysis is used, all relevant input parameters shall be reported, including separator pressure, gas throughput, and all other relevant parameters necessary for flashing calculation. For each crude oil storage tank, identify if the tanks are in series or in parallel.

For tank and loading emission calculations, the annual throughput used for calculations is not required to be the daily throughput times 365 days. The annual throughput of the facility used for calculations must be consistent throughout the application, and a brief rationale should be included in the notes sections on the appropriate pages of the AECT.

For tanks subject to federal regulations that require controls (i.e., NSPS OOOO or NSPS OOOOa), applicants may represent tank controls as two scenarios to provide flexibility. Some facilities will have a vapor recovery unit (VRU) installed initially but may later replace the VRU with a flare due to changes in production levels. Representing **both** scenarios in the NOI application will allow the company to replace the VRU with a flare without submitting a revision to the NOI to the Department. To be eligible for this flexibility, both the VRU and flare must be compliant with the federal regulations that require the control of the tanks. Represent both scenarios using the AECT and include comments to explain the requested flexibility.

**Heater Calculations**: Heaters, heated separators, and heater treaters may be represented as a combined maximum heat input, provided that each individual unit is rated less than 100 MMBTU/hr each. This will allow applicants flexibility in the number and size of units installed, while still providing demonstration that the facility will comply with NOI limits. To utilize this flexibility, represent the requested total heat input for all these units in the AECT.

**SSM Calculations**: The applicant must select one of the boxes in Section 2: SSM Summary. If applicant is submitting site specific calculations, include in this section.

**Control Devices:** In accordance with 20.2.73.200.B(7) NMAC, report all control devices and list each pollutant controlled by the control device in the Potential Emission Rate Table.

Voluntary flaring of emissions that are not federally enforceable (such as maintenance or loading emissions) should be represented **both** as flared emissions, and as uncombusted emissions. This is necessary to demonstrate that the products of combustion from flaring the emissions do not exceed the applicability threshold for a permit under 20.2.72.200.A(1) NMAC; and that the VOC emissions (if they are not flared) will not cause the site to be defined as a Title V Major Source under 20.2.70.7.4.R NMAC.

---

**Table 1: Check the equipment entered from the AECT Form Submitted in this Section:**

| Check box if present at facility | Equipment Type | Quantity |
|---|---|---|
| ☒ | **Engine(s)** | **1** |
| ☒ | **Heater(s)** | **1** |
| ☒ | **Haul Road** | **1** |
| ☒ | **Fugitives** | **1** |
| ☒ | **Tanks** | **6** |
| ☒ | **Flare(s)** | **1** |
| ☒ | **Loading** | **2** |

| Check box if present at facility | Equipment Type | Quantity |
|---|---|---|
| ☒ | ECD | 1 |
| ☐ | Thermal Oxidizer | |
| ☐ | VRU | |
| ☒ | Other | Gunbarrel |

**Information Used to Determine Emissions**
**Check the box for each type of information submitted**:

☐ If manufacturer data are used, include specifications for emissions units and control equipment, including control efficiencies specifications and sufficient engineering data for verification of control equipment operation.
☐ For tank emissions, include a discussion of the method used to estimate tank-flashing emissions, accuracy of the model, the input and output summary from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis.
☒ If requesting to use a representative gas sample, include a discussion of why the sample is representative for this facility and an explanation of how it is representative (e.g., same reservoir, same similar API gravity, similar composition).

The samples are from a nearby site that pulls from the same reservoir as the Broadside 1H Battery wells.

## Table 2: Potential Emission Rate

Enter the maximum lb/hr and ton/yr emission rate from each piece of regulated equipment. Only federally enforceable requirements may be used to reduce the PER of a source. For each unit number, include equipment type (e.g. ENG-1 for engine, HTR-1 for heater, and TANK-1, for storage tank). The basis for the federally enforceable reduction must be included in Section 6.

☒ The emissions in this table are identical to the *Total Allowable NOI Emissions From All Facility Equipment* table from the AECT and are not repeated below. (For any equipment using a federally enforceable control device to reduce the PER, list the unit number/description and control device in this table.)

| Unit No./ Description | NOx | | CO | | VOC | | SOx | | TSP | | PM10 | | PM2.5 | | $H_2S$ | | List Federally Enforceable Control Device |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | lb/ hr | ton/ yr | lb/ hr | ton /yr | lb/ hr | ton/ yr | lb/ hr | ton/ yr | lb/ hr | ton/ yr | lb/ hr | ton/ yr | lb/ hr | ton/ yr | lb/ hr | ton/ yr | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |

# AIR EMISSIONS CALCULATION TOOL

## Instructions for Completing the Equipment Calculation Forms

1. Click the **Start Button** below to reset the form to begin data entry.

2. The ***Air Emissions Calculation Tool*** initially loads with the **Core Data Information Form.** Once all information is entered on this form, the necessary equipment calculation pages will be created based on the information entered on the Core Data Information Form. The customized ***Air Emissions Calculation Tool*** should now be saved to your computer before entering any other information on the equipment calculation pages. **Warning,** every time you click on the **Start Button b**elow, the ***Air Emissions Calculation Tool*** will reset and all data entered will be lost.

3. Green/Blue colored information boxes require users to enter the required information for the subject facility. Default values may be changed if not appropriate for the facility.

4. Yellow colored boxes represent calculated values based on user information entered and may not be changed.

5. Yellow boxes with green/blue cross-hatching represent calculated values based on user information entered, however users may input data in these boxes, if necessary.

Start

# Core Data Information

**Mandatory** - All appropriate Data Must Be Entered For All Boxes Below. This Data Will Automatically Create All Required Equipment Forms And Populate This Data In All Emissions Calculation Forms.

Emission factors for natural gas and field gas internal combustion engines may be based on AP-42, Tables 3.2-1, 3.2-2 or 3.2-3 or NSPS JJJJ emission standards or manufacturer specifications based on engine applicability.

## NOx Sample Calculation Using AP-42 Emission Factors for a 500-HP 4-Stroke Rich Burn Engine

pph = NOx Emission Factor (EF) lb/MMBtu * Heat Value Btu/scf/1020 Btu/scf * Maximum Heat Input (MMBtu/hr) * Allowable HP * 1/1000000 MMBtu/Btu
= 2.21 lb/MMBtu * 1020 Btu/scf/1020Btu/scf * 7500 MMBtu/hr *500 hp * 1/1000000 MMBtu/Btu
=8.29 lb/hr

tpy =NOx Emission Factor (EF) lb/MMBtu * Heat Value Btu/scf/1020 Btu/scf * Maximum Heat Input (MMBtu/hr) * Allowable HP * 1/1000000 MMBtu/Btu * 8760 hrs/yr * 1/2000 tons/lbs
= 2.21 lb/MMBtu * 1020 Btu/scf/1020 Btu/scf * 0.5 MMBtu/hr * 1/1020 Btu/scf * 1000000/1 Btu/MMBtu * 8760 hrs/yr * 1ton/2000lbs
= 36.31 tpy

AP-42 $SO_2$ emissions based on 100% conversion of fuel sulfur to $SO_2$ and assumes sulfur content in natural gas of 2,000 grains/$10^6$ scf. The SO2 emission factor is converted to other natural gas sulfur contents by multiplying the $SO_2$ emission factor by the ratio of the site-specific sulfur content (grains/$10^6$ scf) to 2,000 grains/$10^6$ scf. For all other engines not using AP-42, The $SO_2$ emissions are based on grains S/scf. Fuel Heat values for Diesel = 0.137 MMBtu/gal; LPG = 0.0905 MMBtu/gal and Gasoline = 0.13 MMBtu/gal per AP-42 Appendix A, pg 5 & 6. SO2 emissions for all diesel engines not using AP-42, equals Gal Diesel/hr * diesel wt (lb)/gal * 15 ppm S * 64 lb SO2/32 lb S, where diesel weighs 7.1089 lb/gal.

## NOx Sample Calculation Using NSPS JJJJ Emission Factors for a July 1, 2010 500-HP 4-Stroke Rich Burn Engine

pph = NOx Emission Factor (EF) g/hp-hr * 1/453.6 lbs/grams * Allowable HP
= 1 g/hp-hr * 1/453.6 lbs/grams * 500 hp
= 1.1 lb/hr

tpy =NOx Emission Factor (EF) g/hp-hr * 1/453.6 lbs/grams * Allowable HP * 8760 hrs/yr * 1/2000 tons/lbs
= 1 g/hp-hr * 1/453.6 lbs/grams * 500 hp * 8760 hrs/yr * 1ton/2000lbs
= 4.82 tpy

Technical Disclaimer
This document is intended to help you accurately determine stationary compressor engine emissions. It does not supersede or replace any state or federal law, rule, or regulation. This guidance reflects the current understanding of how these units work and how they generate emissions, how they are monitored or tested, and what data are available for emissions determination, may change over time as the AQB continue scientific studies and as new information becomes available. The AQB welcome any data, information, or feedback that may improve our understanding of stationary compressor engine emissions and thereby further improve determinations within the emissions inventory. The calculation methods represented are intended as an emissions calculation aid; alternate calculation methods may be equally acceptable if they are based upon, and adequately demonstrate, sound engineering assumptions or data. If you have a question regarding the acceptability of a given emissions determination method, contact the Permitting Section at 505-476-4300.

# Calculation Tool for Heaters, Heated Separators & Heater Treater Emissions (Uncontrolled) for Oil & Gas Production Sites (Only for units rated <100 MMBTU/Hr)

All emission factors based on AP-42, Table 1.4-1, Table 1.4-2 and Table 1.4-3 (July 1998)
https://www3.epa.gov/ttn/chief/ap42/ch01/final/c01s04.pdf

Emission factors for natural gas combustion in boilers and furnaces are presented in AP42, Tables 1.4-1, 1.4-2, 1.4-3, and 1.4-4. The Tables present emission factors on a volume basis (lb/$10^6$ scf). To convert to an energy basis (lb/MMBtu), divide by a heating value of 1,020 MMBtu/$10^6$ scf. The emission factors may be converted to other natural gas heating values by multiplying the given emission factor by the ratio of the specified heating value to this average heating value.

NOx Sample Calculation

pph = AP 42 NOx Emission Factor (EF) * site fuel heat value Btu/scf/1020 Btu/scf * Maximum Heat Input (MMBtu/hr) * 1/site fuel heat Value Btu/scf * 1000000/1Btu/MMBtu
= 100 lb/1000000 scf * 2000 Btu/scf/1020 Btu/scf * 0.5 MMBtu/hr * 1/2000 Btu/scf * 1000000/1Btu/MMBtu
=0.096 lb/hr

tpy = AP 42 NOx Emission Factor (EF) * site fuel heat value Btu/scf/1020 Btu/scf * Maximum Heat Input (MMBtu/hr) * 1/site fuel heat value Btu/scf * 1000000/1 Btu/MMBtu * 8760 hrs/yr * 1ton/2000 lbs
= 100 lb/1000000 scf * 2000 Btu/scf/1020 Btu/scf * 0.5 MMBtu/hr * 1/2000 Btu/scf * 1000000/1 Btu/MMBtu * 8760 hrs/yr * 1ton/2000lbs
= 0.42 tpy

$SO_2$ emissions based on 100% conversion of fuel sulfur to $SO_2$ and assumes sulfur content in natural gas of 2,000 grains/$10^6$ scf. The $SO_2$ emission factor is converted to other natural gas sulfur contents by multiplying the $SO_2$ emission factor by the ratio of the site-specific sulfur content (grains/$10^6$ scf) to 2,000 grains/$10^6$ scf.

# Calculation Tool for Tanks Flashing & Working & Standing Emissions for Oil & Gas Production Sites

All flash emissions based on flash calculation methodology selected;

1) The appropriate ECD, flare, TO, VCU or VRU form must also be completed.
2) Manufacturer documentation required to support % control selected. If using a VRU/LPC, calculations assume VRU/ULPC with a 100% control efficiency, but with 5% downtime;
3) Information included in calculation tool must be based on representative oil and gas analysis which must be submitted with application;
4) GOR and Vasquez-Beggs sample calculations outlined below; E & P Tanks, ProMax, HYSYS & VMG Sim flash emissions require submittal of computer simulation model emissions calculations print-outs;
5) Working & Standing emissions based on AP-42 Chpt. 7, tanks 4.09d computer simulation or ProMax, or VMG computer simulation models.

Sample Calculations

**GOR Methodology**

VOC pph = GOR (scf/bbl) * Facility Oil Throughput (BOPD) * 1/24 (Hours/Day * 1/Universal Gas Constant 385 scf/lb-mole @ 70$^{O}$F, 1 atm) * Molecular Weight of Tank Vapors (lb/lb-mol)
= 40 (scf/bbl) * 1000 (BOPD)*1/24 (hrs/day) *1/385 scf/lb-mol * 50 lb/lb-mol
= 216.45 lbs/hr

VOC tpy = GOR (scf/bbl) * Facility Oil Throughput (BOPD) * 1/24 (Hours/Day * 1/Universal Gas Constant 385 scf/lb-mole @ 70$^{O}$F, 1 atm) * Molecular Weight of Tank Vapors (lb/lb-mol) * 8760 hr/yr * 1/2000 lbs/ton
= 40 (scf/bbl) * 1000 (BOPD)*1/24 (hrs/day) *1/385 scf/lb-mol * 50 lb/lb-mol * 8760 hr/yr * 1/2000 lbs/ton
= 948.05 tpy

**Vasquez-Beggs Methodology**

Footnote: * All emission factors based on AP-42, 5.2-4 Equation 1 or AP-42 Table 5.2-5 (July 2008); See next page for calculation notes. You may elect to represent the controlled emissions at the loading rack or at the control device or tanks by selecting the appropriate drop-down options under *Truck Loading VOC Control Method*.

# Calculation Tool for Emissions From Loading Petroleum Liquid

Emissions based on AP-42, 5.2-4 Equation 1 (July 2008) or AP-42, Table 5.2-5

https://www3.epa.gov/ttn/chief/ap42/ch05/final/c05s02.pdf

**AP-42 5.2-4 Equation 1**

Emissions from loading petroleum liquid can be estimated (with a probable error of ±30 percent)[4] using the following expression:

Equation 1 $L_L = 12.46 * SPM/T$

where:

$L_L$ = loading loss, pounds per 1000 gallons (lb/$10^3$ gal) of liquid loaded;

S = a saturation factor (see Table 5.2-1 reproduced below))

P = true vapor pressure of liquid loaded, pounds per square inch absolute (psia) (see Section 7.1, "Organic Liquid Storage Tanks")

M = molecular weight of vapors, pounds per pound-mole (lb/lb-mole) (see Section 7.1, "Organic Liquid Storage Tanks")

T = temperature of bulk liquid loaded, °R (°F + 460)

VOC pph = (12.46*0.6*7.0 (psia)*50 (lb/lb-mole)/550°R)/1000 (gal) * 8400 (gal/hr)
= 39.96 lb/hr

VOC tpy = (12.46*0.6*4.5 (psia)*50 (lb/lb-mole)/525°R)/1000 * 1533000 (gal/yr) * 1/2000 (ton/lbs)
= 2.46 tpy

**Table 5.2-1. SATURATION (S) FACTORS FOR CALCULATING PETROLEUM LIQUID LOADING LOSSES**

| Cargo Carrier | Mode of Operation | S Factor |
|---|---|---|
| Tank trucks and rail tank cars | Submerged loading of a clean cargo tank | 0.5 |
| | Submerged loading: dedicated normal service | 0.6 |
| | Submerged loading: dedicated vapor balance service | 1.0 |
| | Splash loading of a clean cargo tank | 1.45 |
| | Splash loading: dedicated normal service | 1.45 |
| | Splash loading: dedicated vapor balance service | 1.0 |
| Marine vessels[a] | Submerged loading: ships | 0.2 |
| | Submerged loading: barges | 0.5 |

[a] For products other than gasoline and crude oil. For marine loading of gasoline, use factors from Table 5.2-2. For marine Loading of crude oil, use Equations 2 and 3 and Table 5.2-3.

**AP-42 Table 5.2-5**

VOC pph = (2lb/1000 (gal) * ((100-15)/100) * 8400 (gal/hr) = 16.8 pph

VOC tpy = (2lb/1000 (gal) * ((100-15)/100) * 100 (BOPD) * 42 (gal/bbl) * 365 (days/yr) * 1/2000 (ton/lb) = 1.53 tpy

**Table 5.2-5 TOTAL UNCONTROLLED ORGANIC EMISSION FACTORS FOR PETROLEUM LIQUID RAIL TANK CARS AND TANK TRUCKS**

| Emission Source | Mode of Operation | Crude Oil (lb/1000 gal transferred)[b] |
|---|---|---|
| Loading Operations[c] | | |
| | Submerged loading: dedicated normal service | 2 |
| | Submerged loading: dedicated vapor balance service | 3 |
| | Splash loading: dedicated normal service | 5 |
| | Splash loading: dedicated vapor balance service | 3 |

a Reference 2. ……VOC factors for crude oil can be assumed to be 15% lower than the total organic factors, to account for the methane and ethane content of crude oil evaporative emissions. All other products should be assumed to have VOC factors equal to total organics; b The example crude oil has an RVP of 34 kPa (5 psia); c Loading emission factors are calculated using Equation 1 for a dispensed product temperature of 16°C (60°F). In the absence of specific inputs for Equations 1 , the typical evaporative emission factors presented in Tables 5.2-5 should be used. It should be noted that, although the crude oil used to calculate the emission values presented in this tables has an RVP of 5, the RVP of crude oils can range from less than 1 up to 10. In areas where loading and transportation sources are major factors affecting air quality, it is advisable to obtain the necessary parameters and to calculate emission estimates using Equations 1.

1) The appropriate ECD, flare, TO, VCU or VRU form must also be completed.

2) Manufacturer documentation required to support % control selected. If using a VRU/LPC, calculations assume VRU/ULPC with a 100% control efficiency, but with 5% downtime;

3) Information included in calculation tool must be based on representative oil and gas analysis which must be submitted with application;

^) Vapor balancing emissions to tanks must be represented at the tanks;

Technical Disclaimer

This document is intended to help you accurately determine truck loading petroleum emissions. It does not supersede or replace any state or federal law, rule, or regulation. This guidance reflects the current understanding of how truck loading operations work and how it generates emissions, how it is monitored or tested, and what data are available for emissions determination, may change over time as the AQB continue scientific studies and as new information becomes available. The AQB welcome any data, information, or feedback that may improve our understanding of truck loading petroleum emissions and thereby further improve determinations within the emissions inventory. The calculation methods represented are intended as an emissions calculation aid; alternate calculation methods may be equally acceptable if they are based upon, and adequately demonstrate, sound engineering assumptions or data. If you have a question regarding the acceptability of a given emissions determination method, contact the Permitting Section at 505-476-4300.

# Calculation Tool for Tanks Flashing & Working & Standing Emissions for Oil & Gas Production Sites

All flash emissions based on flash calculation methodology selected;

1) The appropriate ECD, flare, TO, VCU or VRU form must also be completed.
2) Manufacturer documentation required to support % control selected. Assumes VRU/ULPC with a 100% control efficieny, but with 5% downtime;
3) Information included in calculation tool must be based on representative oil and gas analysis which must be submitted with application;
4) GOR and Vasquez-Beggs sample calculations outlined below; E & P Tanks, ProMax, HYSYS & VMG Sim flash emissions require submittal of computer simulation model emissions calculations print-outs;
5) Working & Standing emissions based on AP-42 Chpt. 7, tanks 4.09d computer simulation or ProMax, or VMG computer simulation models.

Sample Calculations

**GOR Methodology**

VOC pph = GOR (scf/bbl) * Facility Oil Throughput (BOPD) * 1/24 (Hours/Day * 1/Universal Gas Constant 385 scf/lb-mole @ 70$^{O}$F, 1 atm) * Molecular Weight of Tank Vapors (lb/lb-mol)
= 40 (scf/bbl) * 1000 (BOPD)*1/24 (hrs/day) *1/385 scf/lb-mol * 50 lb/lb-mol
= 216.45 lbs/hr

VOC tpy = GOR (scf/bbl) * Facility Oil Throughput (BOPD) * 1/24 (Hours/Day * 1/Universal Gas Constant 385 scf/lb-mole @ 70$^{O}$F, 1 atm) * Molecular Weight of Tank Vapors (lb/lb-mol) * 8760 hr/yr * 1/2000 lbs/ton
= 40 (scf/bbl) * 1000 (BOPD)*1/24 (hrs/day) *1/385 scf/lb-mol * 50 lb/lb-mol * 8760 hr/yr * 1/2000 lbs/ton
= 948.05 tpy

**Vasquez-Beggs Methodology**

Notes

## Planned SSM Emissions

The venting emissions calculations herein should only be used when only gas (no liquids) is present in the unit. The calculation of the vented gas is based on the volume of the unit and assumes the unit is saturated with vapor at the pressure and temperature of the unit before venting occurs. If liquids are also present in the gas, please enter the calculated amounts in the SSM Other row only and submit separate calculations, since the calculations on this form do not account for the evaporation of liquids that may be present in the unit.

Calculations are based on the Ideal gas law: P(V) = n(R)(T)

VOC result = (((Pressure of Gas Inside the Unit Before Venting) * (Actual Volume of the Vented Unit)) / (Frequency of events) * (Molecular Weight) * VOC wt%)/(Ideal Gas Constant) * (Temperature of Gas Inside the Unit Before Venting)

Where the Ideal Gas Constant = 10.73159 ($ft^3$*psia)/R*lb-mol

For SSM combustion emissions, attach separate calculations.

- ( ) Submerged Loading Vapor Balance Service
- ( ) Splash Loading Dedicated Normal Service
- ( ) Splash Loading Vapor Balance Service

Notes:Under normal operation all water is piped offsite. To account for periods when the water pipeline is unavailable, approximately 328,500 barrels of water can be trucked offsite per year.

***Total VOC Emissions From Loading Produced Water Liquids Based On % Oil in Water Selected Above***

| Pollutant | Uncontrolled Emissions (pph) | Uncontrolled Emissions (tpy) |
|---|---|---|
| VOC | 1.51 | 0.46 |

Footnote: * All emission factors based on AP-42, 5.2-4 Equation 1 or AP-42 Table 5.2-5 (July 2008); See reverse side for calculation notes

# Calculation Tool for Emissions From Loading Produced Water Liquids

Emissions based on AP-42, 5.2-4 Equation 1 (July 2008) or AP-42, Table 5.2-5

https://www3.epa.gov/ttn/chief/ap42/ch05/final/c05s02.pdf

**AP-42 5.2-4 Equation 1**

Emissions from loading produced water liquids can be estimated (with a probable error of ±30 percent)[4] using the following expression:

Equation 1 $L_L = 12.46 * SPM/T$

where:

$L_L$ = loading loss, pounds per 1000 gallons (lb/$10^3$ gal) of liquid loaded (assumes 1% oil in water)

S = a saturation factor (see Table 5.2-1 reproduced below))

P = true vapor pressure of liquid loaded, pounds per square inch absolute (psia) (see Section 7.1, "Organic Liquid Storage Tanks")

M = molecular weight of vapors, pounds per pound-mole (lb/lb-mole) (see Section 7.1, "Organic Liquid Storage Tanks")

T = temperature of bulk liquid loaded, °R (°F + 460)

VOC pph = (12.46*0.6*7.0 (psia)*50 (lb/lb-mole)/550°R)/1000 (gal) * 8400 (gal/hr) * 0.01 (1% oil in water)
= 39.96 lb/hr

VOC tpy = (12.46*0.6*4.5 (psia)*50 (lb/lb-mole)/525°R)/1000 * 1533000 (gal/hr) * 1/2000 (ton/lbs) * 0.01 (1% oil in water)
= 2.46 tpy

**Table 5.2-1. SATURATION (S) FACTORS FOR CALCULATING PETROLEUM LIQUID LOADING LOSSES**

| Cargo Carrier | Mode of Operation | S Factor |
|---|---|---|
| Tank trucks and rail tank cars | Submerged loading of a clean cargo tank | 0.5 |
| | Submerged loading: dedicated normal service | 0.6 |
| | Submerged loading: dedicated vapor balance service | 1.0 |
| | Splash loading of a clean cargo tank | 1.45 |
| | Splash loading: dedicated normal service | 1.45 |
| | Splash loading: dedicated vapor balance service | 1.0 |
| Marine vessels[a] | Submerged loading: ships | 0.2 |
| | Submerged loading: barges | 0.5 |

[a] For products other than gasoline and crude oil. For marine loading of gasoline, use factors from Table 5.2-2. For marine Loading of crude oil, use Equations 2 and 3 and Table 5.2-3.

**AP-42 Table 5.2-5** (assumes 1% oil in water)

VOC pph= (2lb/1000 (gal) * ((100-15)/100) * 8400 (gal/hr) * 0.01 (1% oil in water) = 0.168 pph

VOC tpy = (2lb/1000 (gal) * ((100-15)/100) * 100 (BOPD) * 42 (gal/bbl) * 365 (days/yr) * 1/2000 (ton/lb) * 0.01 (1% oil in water) = 0.0153 tpy

**Table 5.2-5 TOTAL UNCONTROLLED ORGANIC EMISSION FACTORS FOR PETROLEUM LIQUID RAIL TANK CARS AND TANK TRUCKS**

| Emission Source | Mode of Operation | Crude Oil (lb/1000 gal transferred)[b] |
|---|---|---|
| Loading Operations[c] | | |
| | Submerged loading: dedicated normal service | 2 |
| | Submerged loading: dedicated vapor balance service | 3 |
| | Splash loading: dedicated normal service | 5 |
| | Splash loading: dedicated vapor balance service | 3 |

a Reference 2. ……VOC factors for crude oil can be assumed to be 15% lower than the total organic factors, to account for the methane and ethane content of crude oil evaporative emissions. All other products should be assumed to have VOC factors equal to total organics; b The example crude oil has an RVP of 34 kPa (5 psia); c Loading emission factors are calculated using Equation 1 for a dispensed product temperature of 16°C (60°F). In the absence of specific inputs for Equations 1 , the typical evaporative emission factors presented in Tables 5.2-5 should be used. It should be noted that, although the crude oil used to calculate the emission values presented in this tables has an RVP of 5, the RVP of crude oils can range from less than 1 up to 10. In areas where loading and transportation sources are major factors affecting air quality, it is advisable to obtain the necessary parameters and to calculate emission estimates using Equations 1.

Technical Disclaimer

This document is intended to help you accurately determine truck loading produced water emissions. It does not supersede or replace any state or federal law, rule, or regulation. This guidance reflects the current understanding of how truck loading operations work and how it generates emissions, how it is monitored or tested, and what data are available for emissions determination, may change over time as the AQB continue scientific studies and as new information becomes available. The AQB welcome any data, information, or feedback that may improve our understanding of truck loading produced water emissions and thereby further improve determinations within the emissions inventory. The calculation methods represented are intended as an emissions calculation aid; alternate calculation methods may be equally acceptable if they are based upon, and adequately demonstrate, sound engineering assumptions or data. If you have a question regarding the acceptability of a given emissions determination method, contact the Permitting Section at 505-476-4300.

Based on: *1995 Protocol for Equipment Leak Emission Estimates*, Table 2.4 Version Date: 6/23/16; See next page for calculation notes.

# Calculation Tool for Fugitive Emissions Oil & Gas Production

Protocol for Equipment Leak Emission Estimates (EPA-453/R-95-017), Table 2-4;
available at the EPA Web site at https://www3.epa.gov/ttn/chief/efdocs/equiplks.pdf

a) Service categories are defined as follows:

1) Gas/vapor - material in a gaseous state at operating conditions;

2) Light liquid - material in a liquid state in which the sum of the concentration of individual constituents with a vapor pressure over 0.3 kilopascals (kPa) at 200C is greater than or equal to 20 weight percent;

3) Heavy liquid - not in gas/vapor service or light liquid service.

4) Water/Oil emission factors apply to water streams in oil service with a water content greater than 50%, from the point of origin to the point where the water content reaches 99%. For water streams with a water content greater than 99%, the emission rate is considered negligible.

b) These factors are for total organic compound emission rates (including non-VOC's such as methane and ethane) and apply to light crude, heavy crude, gas plant, gas production, and off shore facilities. "NA" indicates that not enough data were available to develop the indicated emission factor.

c) The "other" equipment type was derived from compressors, diaphragms, drains, dump arms, hatches, instruments, meters, pressure relief valves, polished rods, relief valves, and vents. This "other" equipment type should be applied for any equipment type other than connectors, flanges, open-ended lines, pumps, or valves.

d) Note that the average factors generally determine total hydrocarbon emissions. Therefore, you may need to multiply the calculated emission rates by the stream's weight percentage of VOC compounds to determine total VOC emissions. Please attach a copy of the appropriate gas and oil analysis with the stream's weight percentage of VOC compounds identified.

VOC Sample Calculation
For 10 Valves in Gas Service with a gas stream weight percentage of 25% VOC

Emission Factor (EF) lb/hr=0.0045 kg/hr * 2.2046 lbs/kg
Gas Valves Uncontrolled Emissions

pph EF (Valves in Gas Service) * Number of Valves in Gas Service & VOC wt%
0.0099207 lb/hr * 10 valves = 0.099207 lb/hr * 25%/100

tpy EF (Valves in Gas Service) * Number of Valves in Gas Service * 8760 hrs/yr * 1ton/2000 lbs
0.0099207 lb/hr * 10 valves * 8760 hrs/yr * 1/2000 ton/lbs = 0.4345 tons/yr * 25%/100

Total Uncontrolled Fugitive Emissions for all Service types in Gas Service

pph (Uncontrolled pph Emissions for Valves + Pump Seals + Connectors + Flanges + Open Ends + Other) * VOC wt%/100

tpy (Uncontrolled tpy Emissions for Valves + Pump Seals + Connectors + Flanges + Open Ends + Other) * VOC wt%/100

Technical Disclaimer
This document is intended to help you accurately determine equipment leak fugitive emissions. It does not supersede or replace any state or federal law, rule, or regulation. This guidance reflects the current understanding of how piping components work and how they generate emissions, how they are monitored or tested, and what data are available for emissions determination, may change over time as we continue our scientific studies and as new information becomes available. We welcome any data, information, or feedback that may improve our understanding of equipment leak fugitive emissions and thereby further improve determinations within the emissions inventory. The calculation methods represented are intended as an emissions calculation aid; alternate calculation methods may be equally acceptable if they are based upon, and adequately demonstrate, sound engineering assumptions or data. If you have a question regarding the acceptability of a given emissions determination method, contact the Permitting Section at 505-476-4300.

https://www3.epa.gov/ttn/chief/ap42/ch13/final/c13s0202.pdf

Emissions from vehicles traveling on unpaved surfaces at industrial sites (based on 8760 Hours/year) can be estimated using the following expression:

AP-42 13.2.2-4; Equation 1a: $$E = k\,(s/12)^a (W/3)^b$$

where k, a, b, c and d are empirical constants (Reference 6) given below and

E = size-specific emission factor (lb/VMT)

s = surface material silt content (%)

W = mean vehicle weight (tons)

M = surface material moisture content (%)

**To:** Alicia Beasley
**Subject:** RE: Notice of Intent - AECT Tool

Hi Alicia,

After looking at the coding in the form, yes that issue of depicting a red box for TOTAL HAPs over 10 lb/hr is a glitch in the AECT and can be ignored at this time. There is no lb/hr limit for TOTAL HAPS or VOC's for NOI applications. The problem has been fixed and will be included in a future AECT update. Thanks for bringing this to my attention. It is suggested that you make a note of that issue in your submittal and you may attach a copy of this email as well to the application.

If you have any questions, please feel free to contact me. I can be reached by email at Richard.Poley@state.nm.us or please call me in Santa Fe (Tues. or Thurs.) at (505) 476-4308 or in Rio Rancho (Mon. or Wed.) at (505) 771-5993. I am out of the office on Fridays.

Thanks,

**Subject:** [EXT] Notice of Intent - AECT Tool

Rick,

We are trying to complete an NOI for our client and we are getting a red box around our total lb/hr HAPs in the AECT tool. Our total lb/hr HAPs is slightly over 10 lb/hr. We are not aware of a lb/hr limit for total HAPs under an NOI and were unable to find anything in the rule pertaining to a lb/hr limit. Is this a possible glitch in the AECT tool or is there some applicability information we have not found?

Thank you,

# TABLE 4-4

**Heater Treaters**

**Owner/Operator:** **Devon Energy**
**Facility:** **Broadside 1H Battery**

**Equipment Specifications:**

| # of Heaters | 1 | Heater 1 |
|---|---|---|
| Design Heat Rating | mmbtuh | 0.5 |

**Emission Factors:**

| Pollutant | Emission Factors[a] (lb/MMSCF) | Adjusted Factors[b] (lb/MMSCF) |
|---|---|---|
| NOx (a) | 100.00 | 115.460 |
| CO (a) | 84.00 | 96.986 |
| VOC (a) | 5.50 | 6.350 |
| SO2 (c) | 1.66 | 1.657 |
| $PM/PM_{10}$ (a) | 7.60 | 8.775 |
| Hexane (d) | 1.800 | 2.078 |

[a] Criteria Pollutant Emission Factors obtained from AP-42 Nat Gas Combustion, Table 1.4-1, (7/98) < 100 MMBtu/hr heat input; & Table 1.4-2, (7/98).
[b] As per EPA AP-42 Emission Factor Adjusted for Fuel Gas Heating Value
[c] As per EPA AP-42 Emission Factors for Criteria Pollutants and Greenhouse Gases from Natural Gas Combustion, Table 1.4-2
[d] As per EPA AP-42 Emission Factors for Speciated Organic Compounds from Natural Gas Combustion

| SO2 Emission Factor: | mol H2S in feed gas | Molecular Weight SO2 | Combustion Efficiency | Calculated EF |
|---|---|---|---|---|
| *Assumes ideal gas law: | fractional | lb/lbmol | fractional | lb/MMSCF |
| 379 scf/lbmol | 0.00001 | 64.066 | 0.98 | 1.656587863 |

Calculation Method: (1/379)(lbmol/scf)(10^6 SCF/MMSCF)(Combustion Efficiency)(Mol fraction H2S)(64.066 lb/lbmol SO2) = lb/MMSCF
1. H2S emissions are calculated in the same manner, except using the bypass fraction instead of combustion efficiency and the molecular weight of H2S (34.081 lb/lbmol)
2. If the calculated SO2 EF is less than 0.6 lb/MMSCF (per AP-42 table 1.4-2), the EF is conservatively set at 0.6 lb/MMSCF

| | Heat Rating (mmbtuh) | Run Hours | Heating Value (Btu/ft^3) | Emissions | | | | | | | | | | | | | |

## Haul Road

**Facility:** **Broadside 1H Battery**

***Unpaved Haul Road***

| Parameter | Value | Unit |
|---|---|---|
| Empty Vehicle Weight[1] | 16 | ton |
| Truck Capacity | 180 | bbl |
| | 7,560 | gallons |
| Load Size[2] | 26.8 | ton |
| Loaded Vehicle Weight[3] | 42.8 | ton |
| Mean Vehicle Weight[4] | 29.4 | ton |
| Hourly Water Loadout | 540 | bbl/hr |
| Hourly Oil Loadout | 540 | bbl/hr |
| Hourly Water + Oil Loadout | 1,080 | bbl/hr |
| | 45,360 | gal/hr |
| Annual Water Loadout | 328,500 | bbl/yr |
| Annual Oil Loadout | 310,250 | bbl/yr |
| Annual Water + Oil Loadout | 638,750 | bbl/yr |
| | 26,827,500 | gal/yr |
| Turnovers | 6.0 | per hour |
| | 3,549 | per year |
| Max Vehicles Per Hour | 6 | VPH |
| Vehicles Per Day[5] | 10 | VPD |
| Vehicles Per Year | 3,549 | VPY |
| Segment Length | 0.20 | mile |
| Trips per Segment | 1 | - |
| Effective Segment Length[6] | 0.2 | mile |
| Trips per Hour[7] | 0.42 | - |
| Wet Days[8] | 70 | day |
| Surface Silt Content[9] | 4.8 | % |
| Credit for Base Course | 0.00% | |

[1] Empty vehicle weight includes driver and occupants and full fuel load.

[2] Include cargo, transported materials, etc. (7.1 lb/gal RVP5 *7560 gal truck/ 2000lb/ton)

[3] Loaded vehicle weight = Empty + Load Size

[4] Mean Vehicle weight = (Loaded Weight + Empty Weight) / 2

[5] Vehicles per day = (Turnovers/year) / (365 days/year)

[6] Effective segment length = trips per segment * segment length

[7] Trips per hour = Vehicles per day * Segments per trip ÷ Hours of Operation per Day

[8] Wet days is the NM default allowed by NMED without additional justification

[9] Surface silt content based on AP-42 Section 13.2.2.3

| | Calculation Parameters[1] | | | | | | | | | | | | Hourly Emission Factors | | | Annual Emission Factors | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

[1] Emission factors calculated per AP-42 Sec. 13.2.2.3 November, 2006, Equation 2.

***Unpaved Road Emissions***

| Calculation Inputs | | | | | | | | | Haul Road Emissions | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Route | Annual Operation | Segment Length | Trips per Segment | Number of Trucks | | Effective Segment Length | Max VMT/hr | Average VMT/yr[4] | $PM_{30}$ | | $PM_{10}$ | | $PM_{2.5}$ | |
| | hr | mi | | trucks/hr | trucks/yr | mi | mi/hr | mi/yr | lb/hr | tpy | lb/hr | tpy | lb/hr | tpy |
| Haul Trucks | 8,760 | 0.20 | 1 | 6 | 3549 | 0.20 | 1.20 | 710 | 8.65 | 2.1 | 2.20 | 0.53 | 0.22 | 0.053 |
| **Totals** | | | | | | | | | **8.65** | **2.1** | **2.20** | **0.53** | **0.22** | **0.053** |

[1] Surface silt = % of 75 micron diameter and smaller particles

[2] E = k x (s/12)^a x (W/3)^b x (1-0.6) (AP-42 page 13.2.2-4 Equation 1a, November 2006)

E= Size Specific Emission Factor (lb/VMT)

s = surface material silt content (%)

k, a, b = constants from AP-42 Table 13.2.2-2

W = Weighted Mean Vehicle Weight from Haul Road Inputs (tons)

60% for base course

[3] $PM_{30}$ emission factor in equation is assumed as a surrogate for TSP emissions

[4] VMT/hr = Vehicle Miles Travelled per hour= Trips per hour * Segment Length

[5] Wet Day Emission Factor = E * (365 - Wet Days)/365. Wet days value is the NM default allowed by NMED without additional justification.

# PROMAX REPORT - OIL TANKS - ANNUAL

| Project information | |
|---|---|
| File Name | 20210125_Broadside 1H_Promax |
| Company | Devon Energy |
| City, State | {"Roswell, NM","Roswell, NM","Roswell, NM"} |
| Equation of State | {"Peng-Robinson","Peng-Robinson","Peng-Robinson"} |
| Description | DEET Emissions Report |

| Stream Selection for Tank Losses Stencil | |
|---|---|
| Name of Property Stencil | Oil Tank Losses |
| Name of Process Stream | Tank Inlet[Oil Tanks] |

| Loading Information | | |
|---|---|---|
| Mode of Operation | Submerged Loading of a Clean Cargo Tank | |
| Cargo Carrier | Tank Truck or Rail Tank Car | |
| Saturation Factor | 0.6 | |
| VOCs [C3+] | 100 | *Note: VOC weight percent has been conservatively adjusted based on agency guidance* |

| Tank Information | |
|---|---|
| Shell Height [ft] | 24 |
| Diameter [ft] | 15.5 |
| Maximum Fill Percent [%] | 90 |
| Number of Tanks | 4 |
| Average Fill Percent [%] | 50 |
| Total Tank Volume [bbl] | 3226.3 |
| Net Throughput [bbl/yr] | 310250 |
| Max Liquid Surface Temperature [°F] | 75.6836 |
| Average Liquid Surface Temperature [°F] | 66.4265 |
| MW | 40.8187 |
| Turnovers (per year) | 120.728 |
| **Paint Characteristics** | |
| Shell Color | Tan |
| Shell Paint Condition | Average |
| Roof Color | Tan |
| Roof Condition | Average |
| **Roof Characteristics** | |
| Type | Dome |
| Dome Radius [ft] | |
| Slope [ft/ft] | -- |
| **Breather Vent Settings** | |
| Vacuum Settings [psig] | -0.0300000 |
| Pressure Settings [psig] | 0.0300000 |

| Meteorological Data | |
|---|---|
| Location | Roswell, NM |
| Ambient Pressure [psia] | 12.88 |
| Min Ambient Temperature [°F] | 47.6 |
| Max Ambient Temperature [°F] | 75.8 |
| Solar Insolation [BTU/ft2*day] | 1722 |
| Wind Speed [mph] | 8.7 |

| Emission Summary | | | | | | | |
|---|---|---|---|---|---|---|---|
| Item | | Flash Gas | W/B Losses | Loading Losses | Heater Treater Gas | ULPS Gas | |
| | | % | % | % | % | % | |
| Capture Effeciency | | 98 | 98 | 0 | 0 | 0 | |
| Percent to Flare | | -- | -- | -- | 0 | 0 | |

| Emission Summary | | | | | | | |
|---|---|---|---|---|---|---|---|
| Item | | Flash Gas | W/B Losses | Loading Losses | Heater Treater Gas | ULPS Gas | Total Losses |
| | | [ton/yr] | [ton/yr] | [ton/yr] | [ton/yr] | [ton/yr] | [ton/yr] |
| VOCs [C3+] | | 16.184 | 1.311 | 0.000 | 0.000 | 0.000 | 17.495 |

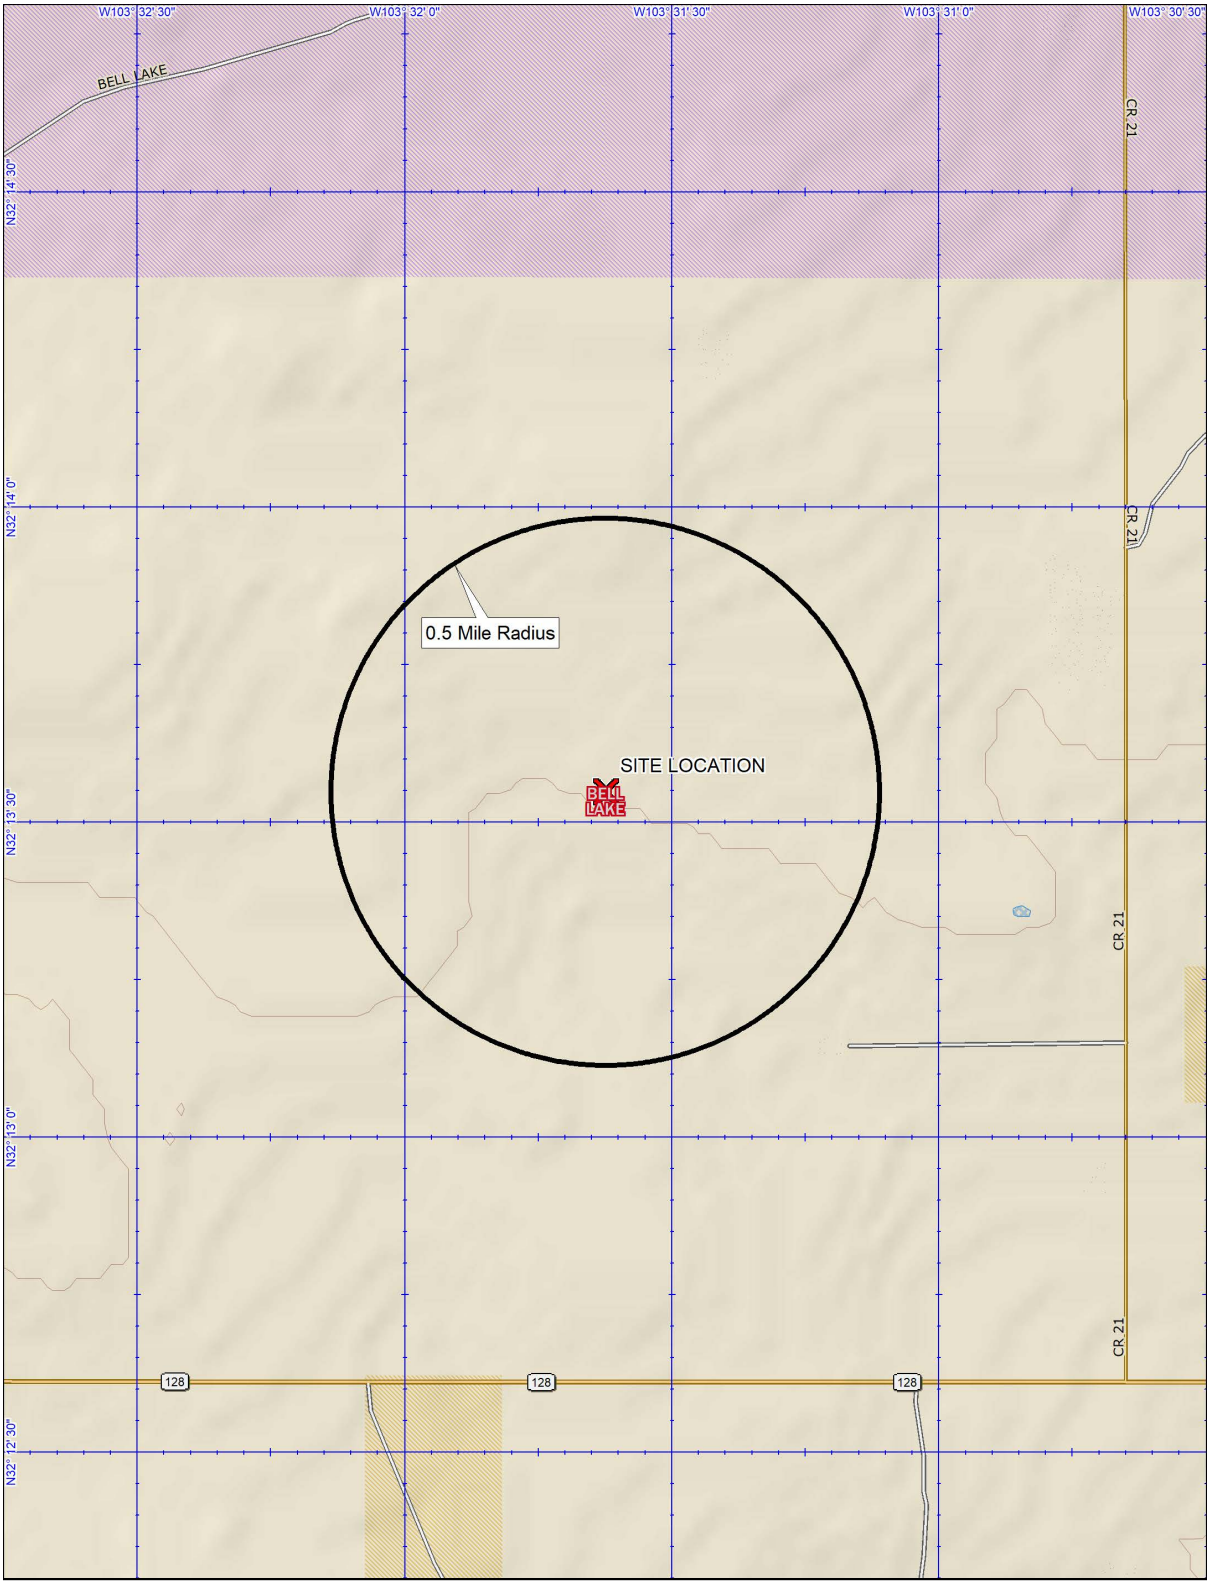
## Map(s)



---

**A map** such as a 7.5 minute topographic quadrangle showing the exact location of the source. The map shall also include the following:

| | |
|---|---|
| The UTM or Longitudinal coordinate system on both axes | An indicator showing which direction is north |
| A minimum radius around the plant of 0.8km (0.5 miles) | Access and haul roads |
| Topographic features of the area | Facility property boundaries |
| The name of the map | The area which will be restricted to public access |
| A graphical scale | |

---

An area map is included in this section.

## Applicable State & Federal Regulations

---

**Provide a discussion demonstrating compliance with applicable state & federal regulation**. All input cells should be filled in, even if the response is 'No' or 'N/A'.

In the "Justification" column, identify the criteria that are critical to the applicability determination, numbering each. For each unit subject to a state or federal regulation, after each listed unit, include the lowest level citation of the applicable regulation. For each unit, list the information necessary to verify the applicability of the regulation, including date of manufacture, date of construction, size (hp), and combustion type. Doing so will provide the applicability criteria for each unit.

---

**Example of a Table for Applicable State Regulations:**

| STATE REGU-LATIONS CITATION | Title | Federally Enforce-able | Applicability Information: Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 $m^3$, 3. VOL) | Applicant's Justification of Applicability | Applicant Identifies if Applies to Entire Facility or Unit No(s) |
|---|---|---|---|---|---|
| 20.2.38 NMAC | Hydrocarbon Storage Facility | No | **Use the regulation link (left) then cut & paste applicable sections.** Note: for 20.2.38.112 NMAC, 65,000 gallons is 1547.62 barrels. | The facility includes a "New Tank Battery" since the tanks were constructed after January 1, 1975. 20.2.38.112, New Tank Battery – More Than 65,000 Gallons Capacity is potentially applicable. Since the total capacity of the crude oil tanks (Unit ID TK-1 through TK-4) is greater than 65,000 gallons, the Facility is subject to 20NMAC2.38.112. The Facility is also subject to 20.2.38.109 due to the storage tank capacity and throughput. The Facility meets the requirements of 20.2.38.112.C. and 20.2.38.109.B by venting tank emissions to a combustor (Unit ID ECD-1) | TK-1 through TK-4 |
| 20.2.61.109 NMAC | Smoke & Visible Emissions | No | Engines and heaters are Stationary Combustion Equipment. Specify units subject to this regulation. | The combustor, combustion engine, and heater treater are Stationary Combustion Equipment. Devon will maintain compliance with the regulation by operating the combustion units according to manufacturer's recommendations to ensure complete combustion. | ECD-1, ENG 1, HT-1 |
| 20.2.73 NMAC | NOI & Emissions Inventory Requirements | No | **NOI:** 20.2.73.200 NMAC applies (requiring a NOI application) | This document serves as the Notice of Intent application requesting approval by the NM AQB to install the proposed equipment at this site. Therefore, Devon is in | FACILITY |

| | | | | | |
|---|---|---|---|---|---|
| | | | | compliance with NMAC 20.2.73.200.<br>Emissions Inventory Reporting: 20.2.73.300 NMAC applies. All Title V major sources meet the applicability requirements of 20.2.73.300 NMAC.<br>Site is not a Title V site. Devon will submit an Emissions Inventory Report if requested. | |
| 20.2.77 NMAC | New Source Performance | Yes | This is a stationary source which is subject to the requirements of 40 CFR Part 60, as amended through 2017.<br>Applies if any subpart applies. | The combustion engine (Unit ID ENG 1) is subject to NSPS JJJJ and is therefore subject to 20.2.77.9. The fugitives (Unit ID FUG-1), oil tanks (Unit ID TK-1 through TK-4), and combustor (ECD-1) are subject to NSPS OOOOa and are therefore subject to 20.2.77.9. | ENG 1, FUG-1, TK-1 through TK-4, ECD-1 |
| 20.2.78 NMAC | Emission Standards for HAPS | Yes | This facility emits hazardous air pollutants which are subject to the requirements of 40 CFR Part 61, as amended through 2017.<br>Applies in any subpart applies | | N/A |
| 20.2.82 NMAC | MACT Standards for source categories of HAPS | Yes | This regulation applies to all sources emitting hazardous air polluta4nts, which are subject to the requirements of 40 CFR Part 63, as amended through 2017.<br>Applies in any subpart applies | The combustion engine (Unit ID ENG 1) is subject to MACT ZZZZ and is therefore subject to 20.2.82.8. | ENG 1 |

**Example of a Table for Applicable Federal Regulations (This is not an exhaustive list):**

Title 40: Protection of Environment
PART 60—STANDARDS OF PERFORMANCE FOR NEW STATIONARY SOURCES (CONTINUED)
Subpart JJJJ—Standards of Performance for Stationary Spark Ignition Internal Combustion Engines

TABLE 1 TO SUBPART JJJJ OF PART 60—$NO_X$, CO, AND VOC EMISSION STANDARDS FOR STATIONARY NON-EMERGENCY SI ENGINES ≥100 HP (EXCEPT GASOLINE AND RICH BURN LPG), STATIONARY SI LANDFILL/DIGESTER GAS ENGINES, AND STATIONARY EMERGENCY ENGINES >25 HP

| Engine type and fuel | Maximum engine power | Manufacture date | Emission standards[a] | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | g/HP-hr | | | ppmvd at 15% $O_2$ | | |
| | | | $NO_X$ | CO | VOC[d] | $NO_X$ | CO | VOC[d] |
| Non-Emergency SI Natural Gas[b] and Non-Emergency SI Lean Burn LPG[b] | 100≤HP<500 | 7/1/2008 | 2.0 | 4.0 | 1.0 | 160 | 540 | 86 |
| | | 1/1/2011 | 1.0 | 2.0 | 0.7 | 82 | 270 | 60 |
| Non-Emergency SI Lean Burn Natural Gas and LPG | 500≤HP<1,350 | 1/1/2008 | 2.0 | 4.0 | 1.0 | 160 | 540 | 86 |
| | | 7/1/2010 | 1.0 | 2.0 | 0.7 | 82 | 270 | 60 |
| Non-Emergency SI Natural Gas and Non-Emergency SI Lean Burn LPG (except lean burn 500≤HP<1,350) | HP≥500 | 7/1/2007 | 2.0 | 4.0 | 1.0 | 160 | 540 | 86 |
| | HP≥500 | 7/1/2010 | 1.0 | 2.0 | 0.7 | 82 | 270 | 60 |
| Landfill/Digester Gas (except lean burn 500≤HP<1,350) | HP<500 | 7/1/2008 | 3.0 | 5.0 | 1.0 | 220 | 610 | 80 |
| | | 1/1/2011 | 2.0 | 5.0 | 1.0 | 150 | 610 | 80 |
| | HP≥500 | 7/1/2007 | 3.0 | 5.0 | 1.0 | 220 | 610 | 80 |
| | | 7/1/2010 | 2.0 | 5.0 | 1.0 | 150 | 610 | 80 |
| Landfill/Digester Gas Lean Burn | 500≤HP<1,350 | 1/1/2008 | 3.0 | 5.0 | 1.0 | 220 | 610 | 80 |
| | | 7/1/2010 | 2.0 | 5.0 | 1.0 | 150 | 610 | 80 |
| Emergency | 25<HP<130 | 1/1/2009 | [c]10 | 387 | N/A | N/A | N/A | N/A |
| | HP≥130 | | 2.0 | 4.0 | 1.0 | 160 | 540 | 86 |

[a]Owners and operators of stationary non-certified SI engines may choose to comply with the emission standards in units of either g/HP-hr or ppmvd at 15 percent $O_2$.

[b]Owners and operators of new or reconstructed non-emergency lean burn SI stationary engines with a site rating of greater than or equal to 250 brake HP located at a major source that are meeting the requirements of 40 CFR part 63, subpart ZZZZ, Table 2a do not have to comply with the CO emission standards of Table 1 of this subpart.

[c]The emission standards applicable to emergency engines between 25 HP and 130 HP are in terms of $NO_X$ + HC.

[d]For purposes of this subpart, when calculating emissions of volatile organic compounds, emissions of formaldehyde should not be included.

[76 FR 37975, June 28, 2011]

# PART A FACILITY SPECIFIC REQUIREMENTS

## A100 Introduction and Applicability

A. Air Quality Permit GCP-Oil and Gas ("Permit") is issued by the Air Quality Bureau (AQB) of the New Mexico Environment Department (Department) under Title 20 Chapter 2 Part 72 of the New Mexico Administrative Code [20.2.72.220 NMAC]. The Department issues general permits in order to register groups of sources that have similar operations, processes, and emissions and that are subject to the same or substantially similar requirements [20.2.72.220.A(1) NMAC]. General permits provide an additional permitting option for specific types of sources that can meet the predetermined permit requirements [20.2.72.220.C(1) NMAC].

B. This Permit authorizes an owner or operator to construct, modify, and operate an oil and gas facility in New Mexico (excluding Bernalillo County, tribal lands, non-attainment areas, and City of Sunland Park) under the conditions set forth herein.

C. An owner or operator that registers for and receives approval to construct under this Permit will have satisfied the State of New Mexico's requirement for obtaining an air quality permit prior to constructing, modifying, or operating a source of air pollutants. However, other federal, state, or local agencies may have additional requirements such as zoning restrictions.

D. All sources for which the Department has approved a Registration Form under GCP-Oil and Gas are subject to GCP-Oil and Gas terms and conditions. No source may construct or operate under GCP-Oil and Gas unless the Department has approved its Registration Form in writing. No source may operate under GCP-Oil and Gas unless such operation meets all the requirements of GCP-Oil and Gas.

E. Construction or modification of a source shall not begin until the Department has approved the Registration Form and the owner or operator has been notified in writing. [20.2.72.200.E NMAC and 20.2.72.220.C(6)(a) NMAC]

F. The Facility shall operate as specified in the Registration Form. The emission limits and equipment specified in the Registration Form are federally enforceable, and shall become the terms and conditions of this Permit.

G. The owner or operator may apply for registration of a Facility under this Permit if:

(1) The Facility can comply with all of the requirements of this Permit; and

(2) The Facility includes any combination of the emissions units listed in Table 104.

H. The Department shall deny a Registration Form if:

(1) The Registration Form is not complete;

(2) The source, as proposed, is not qualified to register for GCP-Oil and Gas;

(3) The source, as proposed, includes emission units not allowed under GCP-Oil and Gas;

(4) The source is, or contains, a petroleum refinery, chemical manufacturing plant, flare pits, or bulk gasoline terminal, or is a listed source in Table 1 of 20.2.74.501 NMAC;

(5) The source, as proposed, cannot meet the terms and conditions of GCP-Oil and Gas as determined by the review of the Registration Form(s);

(6) The Facility is located in a nonattainment area [defined by 20.2.72.216 and 20.2.79 NMAC], Bernalillo County, or tribal lands;

(7) The public notice performed for the Facility is inadequate to meet the requirements in Condition C100.B – *Public Notification*; or

(8) Any criteria listed in 20.2.72.208 NMAC is applicable.

## A101 Permit Duration (expiration)

A. The term of this permit is permanent unless withdrawn or cancelled by the Department.

## A102 Facility: Description

A. The function of the Facility is to treat, process, store and/or transport gases and liquids associated with the production of oil and gas, and/or inject those substances or their byproducts into the earth. [SIC 1311, 1321, 4619, and 4922]

## A103 Facility: Applicable Regulations

A. The permittee shall comply with all applicable sections of the requirements listed in Table 103.

**Table 103.: Applicable Requirements**

| Applicable Requirements | Federally Enforceable |
|---|---|
| 20.2.1 NMAC General Provisions | X |
| 20.2.3 NMAC Ambient Air Quality Standards | X |
| 20.2.7 NMAC Excess Emissions | X |
| 20.2.38 NMAC Hydrocarbon Storage Facilities | |
| 20.2.61 NMAC Smoke and Visible Emissions | X |
| 20.2.72 NMAC Construction Permit | X |

| Applicable Requirements | Federally Enforceable |
|---|---|
| 20.2.73 NMAC Notice of Intent and Emissions Inventory Requirements | X |
| 20.2.75 NMAC Construction Permit Fees | X |
| 20.2.77 NMAC New Source Performance | X |
| 20.2.82 NMAC MACT Standards for Source Categories of HAPS | X |
| 40 CFR 50 National Ambient Air Quality Standards | X |
| 40 CFR 60, Subpart A, General Provisions | X |
| 40 CFR 60, Subpart D, Da, Db, Dc | X |
| 40 CFR 60, Subpart K, Ka, or Kb | X |
| 40 CFR 60, Subpart GG | X |
| 40 CFR 60, Subpart KKK | X |
| 40 CFR 60, Subpart LLL | X |
| 40 CFR 60, Subpart IIII | X |
| 40 CFR 60, Subpart JJJJ | X |
| 40 CFR 60, Subpart KKKK | X |
| 40 CFR 60, Subpart OOOO | X |
| 40 CFR 60, Subpart OOOOa | X |
| 40 CFR 63, Subpart A, General Provisions | X |
| 40 CFR 63, Subpart HH | X |
| 40 CFR 63, Subpart ZZZZ | X |
| Additional CAA Regulations Adopted by EIB | X |

## A104 Facility: Regulated Sources

A. Table 104 lists the emission units authorized for this facility. Emission units identified as exempt activities (as defined in 20.2.72.202 NMAC) and/or equipment not regulated pursuant to the Act are authorized, but not included in Table 104.

**Table 104: Allowable Equipment**

| Equipment List |
|---|
| Storage Tanks |
| Flares, Enclosed Combustion Devices, Thermal Oxidizers |
| Engines, Turbines, and Generators |
| Dehydrators, Cryogenic Units, Acid Gas Removal, Amine (Sweetening) Units, other Natural Gas Processing Equipment |
| Auxiliary Equipment and Activities (includes heaters, separators, loading, Vapor Recover Unit (VRU), Vapor Recovery Tower (VRT), Ultra Low Pressure Separator (ULPS), Flash Tower, blowcase vessels, condensers, associated piping and connectors, pneumatics, pumps, compressors and other equipment as approved by the Department). |

All units must be evaluated for applicability to NSPS and NESHAP requirements.

## A105 Facility: Control Equipment

A. The authorized control equipment is established in the Registration Form. The permittee shall comply with all applicable requirements in this Permit for any control device selected in the Registration Form.

## A106 Facility: Allowable Emissions

A. The allowable hourly and annual emission limits are established in the Registration Form. In order to qualify for this permit, the Facility's annual emissions may not exceed those amounts in Table 106. These limits ensure the facility will not be a major Title V or PSD source under 20.2.70 or 20.2.74 NMAC.

B. Table 106 does not establish facility emission limits, but establishes the eligibility criteria to register under this permit. If, at any time, these emission rates are exceeded, the applicant shall re-evaluate permit applicability.

**Table 106: Maximum Eligible Emission Rates to Register Under this Permit**

| Pollutant | Tons per Year (tpy) |
|---|---|
| Nitrogen Oxides ($NO_x$) | 95 tpy |
| Carbon Monoxide (CO) | 95 tpy |
| Volatile Organic Compounds (VOC)* (non-fugitive) | 95 tpy |
| Sulfur Dioxide | 95 tpy |
| Hydrogen Sulfide | 25 tpy |
| Total Suspended Particulates (TSP) | 25 tpy |
| Particulate Matter less than 10 Microns ($PM_{10}$) | 25 tpy |
| Particulate Matter less than 2.5 Microns ($PM_{2.5}$) | 25 tpy |
| Any Individual Hazardous Air Pollutant (HAP) | < 10 tpy |
| Total HAP | < 25 tpy |

* Fugitive emissions of VOC do not typically count toward Title V or PSD applicability. Thus, the total VOC emissions, including fugitive sources, may exceed 100 tpy without triggering additional permitting requirements.

C. Allowable Hourly and Annual Emission Limits

**Requirement:** For each regulated emission unit in the Registration Form, the emissions specified in the Registration Form shall be the allowable emission limits in this Permit. For each piece of equipment with an hourly emission limit established in the Registration Form, compliance shall be demonstrated by complying with the specific conditions for the emission unit in this Permit.

Compliance with the allowable annual emission limits shall be demonstrated by complying with the process parameters required for each piece of authorized equipment (e.g. tank throughput, engine test and/or run time, glycol circulation rates, control device inspection, etc.) as represented in the Registration Form.

If one of the process parameters required to be monitored has been exceeded, the permittee shall prepare calculations to determine compliance with each applicable emission limit for that piece of equipment. If the permittee determines its emission limit has been exceeded, the permittee shall also determine if that exceedance caused an exceedance of the facility's annual emission limit.

**Monitoring:** The permittee shall comply with the monitoring requirements as stated in the specific conditions of the permit.

**Recordkeeping:** Compliance with each annual emission limit shall be demonstrated by complying with the process parameters required for each piece of authorized equipment, except flares. For flares, the permittee shall comply with the requirements in Condition A207.

Compliance with the allowable emission limits for SSM and Malfunction events (non-flaring) shall be demonstrated by complying with Condition A107.

Upon request by the Department, the permittee shall provide calculations of the facility's monthly cumulative total emissions, or the monthly rolling 12-month total emissions in tons per year. Compliance with the annual emission limits in the Registration Form shall be demonstrated during the first twelve months of operation on a cumulative monthly basis, and after the first twelve months, on a monthly rolling 12-month total basis.

The permittee shall record in accordance with Section B109.

**Reporting:** The permittee shall report in accordance with Section B110.

## A107 Facility: Allowable Startup, Shutdown, & Maintenance (SSM) and Malfunction Emissions

A. The allowable SSM and Malfunction emission limits for this facility are established in the Registration Form and were relied upon by the Department to determine compliance with applicable regulations.

B. Conditions for SSM flaring events are established in Condition A207.

C. If selected by the permittee in the Registration Form, the permittee may select to authorize up to 10 tons per year of VOC from malfunction events. If this option is not selected, Condition A107.D does not apply. The Permit does not authorize combustion emissions due to malfunction events.

D. Malfunction Emissions of VOC (Non-combustion Malfunction Emissions)

**Requirement:** The permittee shall complete the following recordkeeping to demonstrate compliance with malfunction (M) emission limits in the Registration Form.

For emissions due to malfunctions, the permittee has the option to report these as excess emissions of the ton per year limit specified in the Registration Form, in accordance with 20.2.7 NMAC, or include the emissions under the malfunction limit, unless the requested malfunction

limit has been exceeded.

Excess emissions of the malfunction limits shall be reported in accordance with the requirements at 20.2.7 NMAC as follows:

(1) During the first 12 months of monitoring, if the cumulative monthly total of emissions exceeds the specified allowable annual emission limit.
(2) After the first 12 months of monitoring, if the monthly rolling 12-month total exceeds the specified allowable annual emission limit.

Once emissions from a malfunction event are submitted in the final report per 20.2.7.110.A(2) NMAC, the event is considered an excess emission and cannot be applied toward the malfunction limit in this permit.

**Monitoring:** The permittee shall monitor all malfunction events that result in VOC emissions including identification of the equipment or activity that is the source of emissions.

**Recordkeeping:**

(1) To demonstrate compliance, each month records shall be kept of the cumulative total of malfunction VOC emissions during the first 12 months and, thereafter of the monthly rolling 12-month total VOC emissions.

(2) Records shall also be kept of the percent VOC of the gas based on the most recent gas analysis, of the volume of total gas vented in MMscf used to calculate the VOC emissions, and whether the emissions resulting from the event will be used toward the permitted malfunction emission limit or whether the event is reported as excess emissions of the ton per year limit in the Registration Form under 20.2.7 NMAC.

(3) The permittee shall record the demonstrated compliance in accordance with Condition B109, except the requirement in B109.C to record the start and end times of malfunction events shall not apply to the venting of known quantities of VOC.

**Reporting:** The permittee shall report in accordance with Section B110.

E. SSM Emissions of VOC (Non-combustion SSM)

**Requirement:** The permittee shall complete the following recordkeeping to demonstrate compliance with routine and predictable startup, shutdown, and maintenance (SSM) emission limits specified in the Registration Form.

**Monitoring:** The permittee shall monitor the permitted routine and predictable startups, shutdowns, and scheduled maintenance events.

**Recordkeeping:**

(1) To demonstrate compliance, each month records shall be kept of the cumulative total of SSM VOC emissions during the first 12 months and, thereafter of the monthly rolling 12-month total SSM VOC emissions.

(2) Records shall also be kept of the percent VOC and $H_2S$ of the gas based on the most recent

gas analysis, and of the volume of total gas vented in MMscf used to calculate the SSM VOC emissions.

(3) The permittee shall maintain records in accordance with Condition B109, except the requirement in B109.C to record the start and end times of SSM events shall not apply to the venting of known quantities of VOC.

**Reporting:** The permittee shall report in accordance with Section B110.

**A108 Facility: Allowable Operations**

A. This facility is authorized for continuous operation if continuous operation is specified in the Registration Form. Monitoring, recordkeeping, and reporting are not required to demonstrate compliance with continuous hours of operation.

B. If the facility or any emission unit is operated less than 8760 hours per year, the applicant may request a reduced number of hours of operation for the facility or emission unit in the Registration Form. The permittee shall demonstrate compliance with the allowable hours of operation for the facility or emission unit by complying with Condition A108.C.

C. Hours of Operation (For Facility or Emission Units requested in Registration Form to operate less than 8760 hours per year)

**Requirement:** To ensure compliance with allowable emission limits in the Registration Form, the permittee shall comply with the following requirements.

**Monitoring:** The permittee shall monitor the hours of operation of each emission unit authorized to operate less than 8760 hours of operation on a monthly rolling 12-month period.

**Recordkeeping:** The permittee shall record the hours of operation of each such emission unit monthly, shall calculate and record the monthly rolling 12-month total hours of operation, and shall meet the recordkeeping requirements in Section B109.

**Reporting:** The permittee shall report in accordance with Section B110.

**A109 Facility: Reporting Schedules**

A. The permittee shall report according to the Specific Conditions and General Conditions of this permit.

**A110 Facility: Fuel and Fuel Sulfur Requirements**

A. Fuel and Fuel Sulfur Requirements for Equipment other than Flares

**Requirement:** Combustion emission units (except flares) may combust only field gas, natural gas, diesel fuel, propane, or other Department-approved fuel. The $SO_2$ limit for each engine and

turbine is limited by the NOx emission rate of the unit. The allowable $SO_2$ emission limit for engines and turbines is 20% of the NOx emission rate of the unit. Diesel fuel must meet ULSD specifications (15 ppm).

**Monitoring:** None

**Recordkeeping:** The permittee shall demonstrate compliance with the fuel or fuel oil limit on $H_2S$ content by maintaining records of a current purchase contract, tariff sheet, or transportation contract for the gaseous or liquid fuel, or fuel gas analysis, specifying the allowable limit or less. If a fuel gas analysis is used, the analysis shall not be older than one year.

**Reporting:** The permittee shall report in accordance with Section B110.

## A111 Facility: 20.2.61 NMAC Opacity

A. 20.2.61 NMAC Opacity Limit (All Combustion Units)

**Requirement:** Visible emissions shall meet the requirements of 20.2.61.109 NMAC.

**Monitoring:**

(1) Use of natural gas constitutes compliance with 20.2.61 NMAC unless visible emissions are observed. When any visible emissions are observed during operation other than during startup mode, opacity shall be measured over a 10-minute period, in accordance with the procedures at 40 CFR 60, Appendix A, Reference Method 9 (EPA Method 9) as required by 20.2.61.114 NMAC, or the operator will be allowed to shut down the equipment to perform maintenance/repair to eliminate the visible emissions. Following completion of equipment maintenance/repair, the operator shall conduct visible emission observations following startup in accordance with the following procedures:

(a) Visible emissions observations shall be conducted over a 10-minute period during operation after completion of startup mode in accordance with the procedures at 40 CFR 60, Appendix A, Reference Method 22 (EPA Method 22). If no visible emissions are observed, no further action is required.

(b) If any visible emissions are observed during completion of the EPA Method 22 observation, subsequent opacity observations shall be conducted over a 10-minute period, in accordance with the procedures at EPA Method 9 as required by 20.2.61.114 NMAC.

For the purposes of this condition, *Startup mode* is defined as the startup period that is described in the facility's SSM plan.

**Recordkeeping:**

(1) If any visible emissions observations were conducted, the permittee shall keep records in accordance with the requirements of Section B109 and as follows:

(a) For any visible emissions observations conducted in accordance with EPA Method 22, record the information on the form referenced in EPA Method 22, Section 11.2.

(b) For any opacity observations conducted in accordance with the requirements of EPA Method 9, record the information on the form referenced in EPA Method 9, Sections 2.2 and 2.4.

**Reporting:** The permittee shall report in accordance with Section B110.

## EQUIPMENT SPECIFIC REQUIREMENTS

### OIL AND GAS INDUSTRY

### A200 Oil and Gas Industry

A. This section has common equipment related to most oil and gas operations. Only sections specific to operational and control equipment established on the Registration Form apply.

### A201 Gas Analysis Requirements

A. Sites with the following equipment shall perform an annual gas analysis to include $H_2S$ concentration: Flares, Vents, Enclosed Combustion Devices, Thermal Oxidizers;

B. Sites with the following equipment shall perform an annual extended gas analysis to include $H_2S$: Glycol Dehydrators that vent to the atmosphere, Amine units that vent to the atmosphere;

C. For equipment that uses fuel gas other than natural gas, measure and record the $H_2S$ concentration annually; and

D. For all other sites, perform a gas analysis to include $H_2S$ concentration at least once every 24-month period.

### A202 Engines and Turbines (including generators)

A. The permittee shall comply with the minimum engine and turbine stack parameter requirements of this permit.

B. Maintenance and Repair Monitoring for Engines and Turbines under 180 hp and Located at Facilities with a PER Greater than 80 tpy of NOx and CO

**Requirement:** Compliance with the allowable emission limits in the Registration Form shall be demonstrated by properly maintaining and repairing the units. Maintenance and repair shall meet the minimum manufacturer's or permittee's recommended maintenance schedule.

**Monitoring:** Activities that involve maintenance, adjustment, replacement, or repair of

| |
|---|
| functional components with the potential to affect the operation of an emission unit shall be documented as they occur for any maintenance that takes a unit out of service for more than two hours during any twenty-four hour period. |
| **Recordkeeping:** The permittee shall maintain records in accordance with Section B109, including records of maintenance and repair activities and a copy of the manufacturer's or permittee's recommended maintenance schedule. |
| **Reporting:** The permittee shall report in accordance with Section B110. |

C. Initial Compliance Test (Engines and Turbines > 180 hp)

| |
|---|
| **Requirement:** Compliance with the allowable emission limits in the Registration Form shall be demonstrated by performing an initial compliance test. Existing units tested within the last five years shall not be required to perform an initial compliance test. |
| **Monitoring:** The permittee shall perform an initial compliance test in accordance with the General Testing Requirements of Section B111. Emission testing is required for NOx and CO.<br><br>Test results that demonstrate compliance with the CO emission limits shall also be considered to demonstrate compliance with the VOC emission limits. Test results that show an exceedance of a CO emission limit are not considered to show an exceedance of a VOC emission limit. The Department may require an initial compliance test to demonstrate compliance with the VOC emission limit.<br><br>The monitoring exemptions of Section B108 do not apply to this requirement. |
| **Recordkeeping:** The permittee shall maintain records in accordance with the applicable Sections in B109, B110, and B111. |
| **Reporting:** The permittee shall report in accordance with the applicable Sections in B109, B110, and B111. |

D. Periodic Emissions Testing (Engines and Turbines > 180 hp)

| |
|---|
| **Requirement:** Compliance with the allowable emission limits in the Registration Form shall be demonstrated by completing periodic emission tests during the monitoring period. |
| **Monitoring:** The permittee shall test using a portable analyzer or EPA Reference Methods subject to the requirements and limitations of Section B108, General Monitoring Requirements. Emission testing is required for NOx and CO and shall be carried out as described below.<br><br>Test results that demonstrate compliance with the CO emission limits shall also be considered to demonstrate compliance with the VOC emission limits. Test results that show an exceedance of a CO emission limit are not considered to show an exceedance of a VOC emission limit. The Department may require a compliance test to demonstrate compliance with the VOC emission limit.<br><br>Facilities with a PER less than 80 tpy of each regulated air pollutant shall perform periodic testing every three years for each engine and turbine > 180 hp. |

| |
|---|
| Facilities with a PER greater than 80 tpy of any regulated air pollutant shall perform periodic testing once per calendar year for each engine and turbine > 180 hp.<br><br>For annual testing, the first test shall occur within the twelve months after permit issuance. All subsequent monitoring events for engines and turbines shall occur no later than one year from the previous event.<br><br>For 3-year testing, the first test shall occur within 36 months after permit issuance, and at least once per 36-month period thereafter.<br><br>The permittee shall follow the General Testing Procedures of Section B111. |
| **Recordkeeping:** The permittee shall maintain records in accordance with Section B109, B110, and B111. |
| **Reporting:** The permittee shall report in accordance with Section B109, B110, and B111. |

E. 40 CFR 63, Subpart ZZZZ (Engines subject to NESHAP ZZZZ)

| |
|---|
| **Requirement:** For units subject to 40 CFR 63, Subpart A and ZZZZ, the permittee shall comply with all applicable requirements of Subpart A and Subpart ZZZZ. |
| **Monitoring:** The permittee shall comply with all applicable monitoring requirements of 40 CFR 63, Subpart A and Subpart ZZZZ. |
| **Recordkeeping:** The permittee shall comply with all applicable recordkeeping requirements of 40 CFR 63, Subpart A and Subpart ZZZZ. |
| **Reporting:** The permittee shall comply with all applicable reporting requirements of 40 CFR 63, Subpart A and ZZZZ. |

F. 40 CFR 60, Subpart IIII and JJJJ (Engines subject to NSPS IIII and/or JJJJ)

| |
|---|
| **Requirement:** For units subject to 40 CFR 60, Subparts A and IIII and/or JJJJ, the permittee shall comply with the notification requirements in Subpart A and the specific requirements of Subpart IIII and/or JJJJ. |
| **Monitoring:** The permittee shall comply with all applicable monitoring requirements in 40 CFR 60, Subpart A and IIII and/or JJJJ. |
| **Recordkeeping:** The permittee shall comply with all applicable recordkeeping requirements in 40 CFR 60, Subpart A and IIII and/or JJJJ. |
| **Reporting:** The permittee shall comply with all applicable reporting requirements in 40 CFR 60, Subpart A and IIII and/or JJJJ. |

G. 40 CFR 60, Subpart GG or KKKK (Turbines subject to NSPS GG and/or KKKK)

| |
|---|
| **Requirement:** For units subject to 40 CFR 60, Subparts A and GG and/or KKKK, the permittee shall comply with the applicable requirements of 40 CFR 60, Subpart A and GG and/or KKKK. |

| |
|---|
| **Monitoring:** The permittee shall comply with all applicable monitoring requirements in 40 CFR 60, Subpart A and GG and/or KKKK. |
| **Recordkeeping:** The permittee shall comply with all applicable recordkeeping requirements in 40 CFR 60, Subpart A and GG and/or KKKK. |
| **Reporting:** The permittee shall comply with all applicable reporting requirements in 40 CFR 60, Subpart A and GG and/or KKKK. |

H. Engine and Turbine Control Device Operation

| |
|---|
| **Requirement:** Each unit equipped and operated with an oxidation catalytic converter, non-selective catalytic converter, or other control device specified in the Registration Form, shall comply with the requirements of this condition. Except for recommended burn-in period for catalysts, the units may not be operated in normal service without the control device. Units with a non-selective catalytic (NSCR) converter shall also be equipped with an AFR controlling device, or similar device that performs the same function of maintaining an appropriate air-fuel ratio.<br><br>During periods of catalyst maintenance, the permittee shall either (1) shut down the engine or turbine; or (2) replace the catalyst with a functionally equivalent spare to allow the engine or turbine to remain in operation.<br><br>The permittee shall maintain the units per the manufacturers supplier's or permittee's recommended maintenance. |
| **Monitoring:** Units equipped with a catalyst shall be operated with a catalyst except during unit burn in periods. |
| **Recordkeeping:** The permittee shall maintain records in accordance with Section B109. |
| **Reporting:** The permittee shall report in accordance with Section B110. |

I. Engine and Turbine Stack Parameter Requirements

**Engine Stack Parameter Requirements**
There is no limit on the number of engines that can operate under the GCP-Oil and Gas, provided that each engine has at least the minimum stack parameters determined by the facility total emission rate, and the facility total emission rate remains below the permit limit.

The minimum stack heights for engines are determined by performing the following calculation, and comparing the calculated emission rate with the stack parameters in Table 1:

Step 1) Add up the maximum pound per hour $NO_X$ emission rate of all NOx emission sources (except flares and thermal oxidizers). The NOx emission rate from any enclosed combustion device (ECD) must be multiplied by two before adding to the total, as the dispersion from ECD causes twice the impact of other sources.

Step 2) Use the calculated facility total NOx emission rate in Table 1 to determine the minimum stack parameters for engines.

Step 3) An engine with a temperature or velocity that is less than the minimum that would apply to that unit may choose to add 3.3 feet to the unit's required minimum stack height to be considered to be in compliance with these stack parameter requirements. If both temperature and velocity are low, then 6.6 feet may be added. The minimum temperature and velocity for this exception to apply are 206°F and 26.2 feet per second.

Engines are limited to fuels that produce $SO_2$ emission rates of equal to or less than 20% of the $NO_X$ emission rate of that engine.

**Engines (and Heaters) that do not Meet the Minimum Stack Parameters**

Engines (and heaters) that do not meet the minimum stack parameters in Table 1 are authorized if:

1. The minimum height of engine stacks determined in Step 2 above is raised by 3.3 feet, and
2. The applicant adds the pound per hour NOx emission rates from the remaining engines, turbines, and heaters that do not meet the minimum stack parameters after Step 3 above, and those units are able to meet the new minimum stack parameters from Table 1 based on the total emission rate of the remaining engines, turbines, and heaters.

Any number of these engines and heaters are authorized, so long as all of the requirements and facility total emission limits in this condition are met.

**Table 1: Engines**

| Facility total NOx emission rate (lb/hr) | Height (ft) | Temperature (°F) | Velocity (ft/s) | Diameter (ft) |
|---|---|---|---|---|
| 21.7 | 23 | 854 | 91.9 | 1.0 |
| 21 | 19.7 | 854 | 91.9 | 1.0 |
| 20 | 18 | 854 | 91.9 | 1.0 |
| 19 | 14.8 | 854 | 91.9 | 1.0 |
| 17 – 18 | 14.8 | 854 | 88.6 | 1.0 |
| 15 – 16 | 14.8 | 854 | 88.6 | 0.8 |
| 13 – 14 | 14.8 | 782 | 72.2 | 0.8 |
| 10 - 12 | 14.8 | 782 | 72.2 | 0.7 |
| 9 | 14.8 | 782 | 65.6 | 0.7 |
| 8 | 14.8 | 782 | 59.1 | 0.7 |
| 7 | 14.8 | 782 | 49.2 | 0.7 |
| 6 | 14.8 | 710 | 49.2 | 0.7 |
| 5 | 11.5 | 571 | 49.2 | 0.7 |
| 4 | 11.5 | 571 | 49.2 | 0.5 |
| 3 | 9.8 | 571 | 49.2 | 0.3 |
| 2 | 8.2 | 571 | 49.2 | 0.3 |
| 1 | 5.9 | 571 | 49.2 | 0.3 |

**Turbine Stack Parameter Requirements**

There is no limit on the number of turbines that can operate under the GCP-Oil and Gas, provided that each turbine has at least the minimum stack parameters determined by the facility total emission rate, and the facility total emission rate remains below the permit limit.

The minimum stack heights for turbines are determined by performing the following calculation, and comparing the calculated emission rate with the stack parameters in Table 2:

Step 1) Add up the maximum pound per hour $NO_X$ emission rate of all NOx emission sources (except flares and thermal oxidizers). The NOx emission rate from any enclosed combustion device (ECD) must be multiplied by two before adding to the total, as the dispersion from ECD causes twice the impact of other sources.

Step 2) Use this facility total NOx emission rate in Table 2 to determine the minimum stack parameters for turbines.

Step 3) A turbine with a temperature or velocity that is less than the minimum that would apply to that unit may choose to add 3.3 feet to the unit's required minimum stack height to be considered to be in compliance with these stack parameter requirements. If both temperature and velocity are low, then 6.6 feet may be added. The minimum temperature and velocity for this exception to apply are 206°F and 26.2 feet per second.

**Turbines (and Heaters) that do not Meet the Minimum Stack Parameters**

Turbines (and heaters) that do not meet the minimum stack parameters in Table 2 are authorized if:

1. The minimum height of turbine stacks determined in Step 2 above is raised by 3.3 feet, and
2. The applicant adds the pound per hour NOx emission rates from the remaining turbines, engines, and heaters that do not meet the minimum stack parameters after Step 3 above, and those units are able to meet the new minimum stack parameters from Table 2 based on the total emission rate of the remaining turbines, engines, and heaters.

Any number of these turbines and heaters are authorized, so long as all of the requirements and facility total emission limits in this condition are met.

**Table 2: Turbines**

| Facility total NOx emission rate (lb/hr) | Height (ft) | Temperature (°F) | Velocity (ft/s) | Diameter (ft) |
|---|---|---|---|---|
| 21.7 | 23 | 598.7 | 32.8 | 2.3 |
| 21 | 19.7 | 598.7 | 32.8 | 2.3 |
| 20 | 16.4 | 598.7 | 32.8 | 2.3 |
| 19 | 16.4 | 598.7 | 32.8 | 2.0 |
| 17 – 18 | 14.8 | 598.7 | 32.8 | 2.0 |
| 14 – 16 | 14.8 | 598.7 | 32.8 | 1.6 |
| 12 – 13 | 13.1 | 598.7 | 32.8 | 1.6 |
| 9 – 11 | 11.5 | 598.7 | 32.8 | 1.6 |
| 8 | 11.5 | 598.7 | 32.8 | 1.3 |
| 6 – 7 | 9.8 | 598.7 | 32.8 | 1.3 |
| 4 – 5 | 8.2 | 598.7 | 32.8 | 1.3 |
| 3 | 6.6 | 598.7 | 32.8 | 1.1 |
| 2 | 5.9 | 598.7 | 32.8 | 0.8 |
| 1 | 5.9 | 598.7 | 32.8 | 0.8 |

## A203 Heaters and Reboilers

A. Any number of heaters and reboilers are authorized if the units are able to meet the minimum stack parameter requirements in either Table 1 or Table 2 of Condition A202.I.

A heater or reboiler with a temperature or velocity less than the minimum that would apply to that unit in Table 1 or 2 of Condition A202.I may choose to add 3.3 feet to the unit's required minimum stack height to be considered to be in compliance with

these stack parameter requirements. If both temperature and velocity are low, then 6.6 feet may be added. The minimum temperature and velocity for this exception to apply are 206°F and 26.2 feet per second.

B. If any units do not meet the minimum stack parameters in Table 1 or Table 2 of Condition A202.I, an adjustment may be made using the conditions for **Engines or Turbines (and Heaters) that do not Meet the Minimum Stack Parameters** requirement in Condition A202.I of this permit.

C. If, after the above adjustments, any heater or reboiler is unable to meet the minimum stack parameter requirements in Table 1 or 2 of Condition A202.I, the maximum total emission rate allowed for those heaters and reboilers is 1.23 lb/hr of $NO_X$. This limit is based upon the air dispersion modeling used in the development of this permit.

## A204 Glycol Dehydrators

A. Glycol Pump Circulation Rate

| |
|---|
| **Requirement:** Compliance with the allowable emission limits in the Registration Form shall be demonstrated by monitoring the glycol pump circulation rate for each unit. The permittee shall not exceed the throughput in gallons per minute as requested in the Registration Form. |
| **Monitoring:** The permittee shall monitor the circulation rate quarterly unless specified as using the maximum design pump rate in the Registration Form. Monitoring shall include a visual inspection of pump rate setting or other method previously approved by the Department. |
| **Recordkeeping:** The permittee shall maintain records that include a description of the monitoring and are in accordance with Section B109. |
| **Reporting:** The permittee shall report in accordance with Section B110. |

B. Extended Gas Analysis and GRI-GLYCalc Calculation

| |
|---|
| **Requirement:** Compliance with the allowable emission limits in the Registration Form shall be demonstrated by conducting an annual extended gas analysis on the dehydrator inlet gas and by calculating emissions using GRI-GLYCalc or Department-approved equivalent. |
| **Monitoring:** The permittee shall conduct an annual GRI-GlyCalc analysis using the most recent extended gas analysis, and verify the input data. The permittee may use a method of calculating dehydrator emissions other than the most current version of GRI-GlyCalc if approved by the Department. Changes in the calculated emissions due solely to a change in the calculation methodology shall not be deemed an exceedance of an emission limit. |
| **Recordkeeping:** The permittee shall identify in a summary table all parameters that were used as inputs in the GRI-GLYCalc or equivalent software model. A printout of calculation inputs will suffice as the summary table. The permittee shall keep a record of the results, noting the VOC and HAP emission rates for the dehydrator obtained from estimates using GRI-GLYCalc or equivalent. |

**Reporting:** The permittee shall report in accordance with Section B110.

C. Control Device Inspection

**Requirement:** To demonstrate compliance with the allowable emission limits in the Registration Form, the permittee shall control the still vent and/or flash tank emissions as indicated in the Registration Form. If no control device is selected, the permit shall demonstrate compliance with Conditions A204.A and B.

The permittee shall comply with Requirement 1 below, and the control device requirement in Requirement 2 below, for control devices selected in the Registration Form:

1) At no time during normal operations shall any emissions from the still vent, condenser, or flash tank be vented to the atmosphere, if controlled.

**Control Options (selected in Registration Form):**

2) Still vent, condenser, and/or flash tank emissions shall be captured and routed at all times to the selected control or recovery device.
   a) If sending still vent, BTEX condenser, or flash tank emissions to a combustion device, the control device must be in operation at all times the dehydrator is in operation.
   b) If still vent, BTEX condenser, or flash tank emissions are being recovered, those emissions shall at all times be routed to a process point that allows the off-gas to be recycled and recompressed, and not vented to the atmosphere.
   c) Any closed loop system shall be designed and operated so that there are no detectable emissions.
   d) If using a vapor recovery unit (VRU), the still vent and/or flash tank emissions shall be routed to the VRU and re-injected into the process stream. The VRU shall consist of a closed loop system of seals, ducts, and compressor. The VRU shall be operational at all times the glycol dehydrator is in operation.
   e) All control devices and VRU shall be installed, operated, and maintained according to manufacturer's or supplier's or permittee's specifications. The permittee shall develop and implement an annual maintenance program or maintenance checklist for each control device and VRU.
   f) Or other written Department approved method.

**Monitoring:** The permittee shall inspect the glycol dehydrator, the piping to any capture or control equipment, and any capture and control equipment semi-annually to ensure it is operating as designed.

**Recordkeeping:** The permittee shall record the inspection, the name of the inspector, and the results of all equipment and control device inspections chronologically, noting any maintenance or repairs needed to bring the dehydrator into compliance. The permittee shall maintain a copy of the control device and VRU maintenance recommendations, and the annual maintenance program or checklist.

**Reporting:** The permittee shall report in accordance with Section B110.

D. 40 CFR 63, Subpart HH

| |
|---|
| **Requirement:** For units subject to 40 CFR 63, Subpart HH, the permittee shall comply with all applicable requirements. |
| **Monitoring:** The permittee shall comply with the monitoring requirements of 40 CFR 63.773. |
| **Recordkeeping:** The permittee shall comply with the recordkeeping requirements of 40 CFR 63.774 and in Section B109. |
| **Reporting:** The permittee shall comply with the applicable reporting requirements of 40 CFR 63.775 and in Section B110. |

## A205 Tanks

A. Tank Throughput and Separator Pressure

| |
|---|
| **Requirement:** Compliance with the allowable emission limits in the Registration Form shall be demonstrated by limiting the hydrocarbon liquid throughput and average separator pressure to the amount and pressure (psia or psig) as listed in the Registration Form.<br>If tank emissions are controlled by a closed vent system and routed back to facility inlet, then the separator pressure limit shall not apply. |
| **Monitoring:** The permittee shall monitor the monthly total throughput of any hydrocarbon liquid, and the upstream separator pressure once per month. The upstream separator pressure shall be measured at the separator or flashing vessel directly prior to the crude oil or condensate entering the tanks. |
| **Recordkeeping:** The permittee shall record the monthly total throughput of hydrocarbon liquids and the monthly separator pressure.<br>Each month the permittee shall use these values to calculate and record:<br>1) during the first 12 months of monitoring, the cumulative total hydrocarbon liquid throughput and after the first 12 months of monitoring, the monthly rolling 12-month total hydrocarbon liquid throughput, and<br>2) during the first 12 months of monitoring, the average separator pressure, and after the first 12 months of monitoring, the monthly rolling 12-month average separator pressure.<br>Emission rates computed using the same parameters, but with a different Department-approved calculation methodology that exceed these values will not be deemed non-compliance with this permit.<br>Records shall specify the unit of pressure (psia or psig) and shall be consistent with the representation in the Registration Form. Records shall be maintained in accordance with Section B109. |
| **Reporting:** The permittee shall report in accordance with Section B110. |

B. Control Device Options, Requirements, and Inspections for Tanks

| |
|---|
| **Requirement:** The permittee shall demonstrate compliance with the allowable emission limits in the Registration Form by: |

| |
|---|
| 1) limiting the throughput and average separator pressure to the amount listed in the Registration Form; and/or,<br>2) operating a Department approved control device; and/or,<br>3) routing emissions to process.<br>In the case of #2 and #3 above, compliance with the allowable emission limits in the Registration Form shall be demonstrated by operating the control device and/or vapor recovery units as a closed vent system that captures and routes all emissions from tanks back to the process stream or to the control device, and does not vent to the atmosphere. The requested control device is selected in the Registration Form. The permittee may elect to control emissions from any storage vessel in the Registration Form. |
| **Monitoring:** At least once per month, the permittee shall inspect the piping from the tanks to vapor recovery unit or control device for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices. In the event that a leak or defect is detected, the permittee shall repair the leak or defect within 30 calendar days and in a manner that minimizes VOC and HAP emissions to the atmosphere.<br>Alternatively to the above, and if selected in the Registration Form, the Permittee may implement a program that meets the requirements of NSPS OOOOa (40 CFR 60.5416a). |
| **Recordkeeping:** The permittee shall record the results of the control device and/or vapor recovery unit inspections chronologically, the name of the inspector, noting any maintenance or repairs that are required. |
| **Reporting:** The permittee shall report in accordance with Section B110. |

## A206 Truck Loading

A. Truck Loading

| |
|---|
| **Requirement:** Compliance with the allowable emission limits in the Registration Form shall be demonstrated by limiting the total annual loadout volume to the monthly rolling 12-month total volume as requested in the Registration Form. |
| **Monitoring:** The permittee shall monitor the truck loadout volume on a monthly basis. |
| **Recordkeeping:** The permittee shall record the monthly truck loadout volume. Each month, during the first 12 months of monitoring, the permittee shall record the cumulative condensate or crude oil loadout volume, and after the first 12 months of monitoring, the permittee shall calculate and record a monthly rolling 12-month total loadout volume.<br>Records shall also be maintained in accordance with Section B109. |
| **Reporting:** The permittee shall report in accordance with Section B110. |

B. Truck Loading Control Device Inspection

| |
|---|
| **Requirement:** If selected in the Registration Form, all emissions from truck loading shall be captured and routed to the selected control device and shall not vent to atmosphere. Compliance |

with the allowable emission limits in the Registration Form shall be demonstrated by operating the control device as a closed vent system that captures and routes all emissions from loading to the control device, and by complying with the specific conditions in this permit for that control device.

**Monitoring:** At least once per month, the permittee shall inspect the piping from the loading rack to the control device for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices. In the event that a leak or defect is detected, the permittee shall repair the leak or defect within 30 calendar days and in a manner that minimizes emissions to the atmosphere.

Alternatively to the above monitoring requirement, and if selected in the Registration Form, the Permittee may implement a program that meets the requirements of NSPS OOOOa (40 CFR 60.5416a).

**Recordkeeping:** The permittee shall record the results of the control device inspections chronologically, noting any maintenance or repairs that are required.

**Reporting:** The permittee shall report in accordance with Section B110.

C. Vapor Balancing During Truck Loading

**Requirement:** If selected in the Registration Form, the permittee shall comply with the following requirements. Compliance with the allowable emission limits in the Registration Form shall be demonstrated by operating a vapor balancing system in accordance with the following:

1) install and operate the vapor collection and return equipment to collect vapors during loading of tank compartments of outbound transport trucks, and return these vapors to the stationary storage vessels,
2) implement signage and written operating procedures requiring vapor collection equipment,
3) operate all recovery equipment at a back pressure less than the pressure relief valve setting of transport vehicles, and
4) inspect thief hatch seals semi-annually for proper operation and integrity and replace as necessary.

**Monitoring:** Semi-annually, inspect the vapor balance system, hoses, thief hatch seals, and PRD, and include an indication of condition, description of any maintenance, and repairs required.

Alternatively to the above, and if selected in the Registration Form, the Permittee may implement a program that meets the requirements of NSPS OOOOa (40 CFR 60.5416a).

**Recordkeeping:** The permittee shall record the date of the inspection, the results of the above inspections chronologically, and note any maintenance or repairs that are required.

**Reporting:** The permittee shall report in accordance with Section B110.

**A207 Flares**

A. This permit does not authorize flaring of gas with a $H_2S$ content greater than 6 mole percent by volume (pre-combustion). This condition is based upon the air dispersion modeling analysis for this permit.

B. Pilot Flame, Visible Emissions, and Operational Requirements

**Requirement:** Compliance with the allowable emission limits for flare(s) in the Registration Form shall be demonstrated by the following:

1) The flare is limited to the daily and annual throughput, $H_2S$ concentration, and hours of operation, as specified in the Registration Form.
2) The flare shall combust only gas streams represented in the Registration Form.
3) The flare shall be equipped with a continuous pilot flame or an auto-igniter, or require manual ignition.
4) For flares with a continuous pilot flame or an auto-igniter, the flare shall be equipped with a system to ensure that the flare is operated with a flame present at all times that gas is sent the flare.
5) For flares with manual ignition, the permittee shall inspect and ensure that a flame is present upon initiating each flaring event.
6) The flare shall combust gas at all times gas is sent to the flare.
7) The flare shall be installed, operated, and maintained according to manufacturer's or equivalent specifications.
8) The flare shall be operated with no visible emissions except for periods not to exceed a total of sixty (60) seconds during any fifteen (15) consecutive minutes.
9) Compliance with the allowable hourly and annual emission limits in the Registration Form shall be demonstrated by complying with the requirements of this condition.

Malfunction flaring is not authorized under this permit, but is required to be reported under 20.2.7 NMAC. For each malfunction flaring event, the permittee is required to comply with the flow meter requirements in this condition. This information will be used to calculate emissions reported under 20.2.7 NMAC.

**Monitoring:**

1) For flares with a continuous pilot or an auto igniter, the permittee shall continuously monitor the presence of a flare pilot flame using a thermocouple equipped with a continuous recorder and alarm, to detect the presence of a flame, or any other equivalent device approved by the Department.
2) For manually ignited flares, the permittee shall monitor the presence of a flame using visual observation during each flaring event.

3) When any visible emissions are observed, the permittee shall perform a Method 22 observation while the flare pilot flame is present to certify compliance with the visible emission requirements. The observation shall be a minimum of fifteen minutes.

4) For flaring of the following event types, the permittee shall monitor in accordance with the following:

   For startup, shutdown, maintenance, and emergency flaring at high pressure, a gas flow meter and flow totalizer, equipped with a chart recorder or data logger (electronic storage), shall be installed in the flare line to measure and record the total standard cubic feet (scf) of gas sent to the flare during any flaring event.

   Monitoring for low pressure flaring is satisfied by the parametric monitoring of the equipment controlled by the flare.

5) The permittee shall measure the $H_2S$ content, VOC content, and the heating value (Btu/scf) of the gas sent to the flare for combustion with a gas analysis in accordance with Condition A201.

6) For all high pressure flares, the flow meter, totalizer, and if used, the inline monitor shall be operated, calibrated, and maintained as specified by the manufacturer, permittee, or equivalent and as necessary to ensure correct and accurate readings.

**Recordkeeping:** The permittee shall record:

1) Chronologically, all instances of alarm activation, including the date and cause of alarm activation, actions taken to bring the flare into normal operating conditions, the name of the personnel conducting the inspection, and maintenance activities.
2) The results of the Method 22 observations and flame inspection for manual flares.
3) The results of the gas analysis including $H_2S$, VOC content, and heating value.
4) Both the hourly and monthly flow meter and flow totalizer measurements of gas sent to the flare during each flaring event.
5) Monthly, based on the data monitored and recorded in this condition and the throughput of the gas streams sent to any high pressure flare, the calculations and the basis of the calculations of the maximum hourly emission rate and the monthly total emissions in tons per month.
6) If the maximum hourly emission rate calculated in requirement 5 above, exceeds the allowable hourly emission limit, calculate and record the hourly emission rate for each hour of each flaring event of that month.
7) If one of the process parameters for a controlled unit has been exceeded, calculate and record the hourly and annual emission calculations for low and high pressure flares, to determine compliance with each applicable emission limit for that piece of equipment.

**Reporting:** The permittee shall report in accordance with Section B110 and in accordance with 20.2.7 NMAC.

C. Flare Stack Parameter Requirements

The facility can have any number of flares, provided that each flare has at least the minimum stack parameters determined by the $SO_2$ emission rate, and so long as the facility total emission rate remains below the permit limit. Flares that burn pipeline quality natural gas need to be designed for at least the flow rate they are burning, but have no specified height in this permit. Flares that are not limited to pipeline quality natural gas have height restrictions listed in the following table.

**Table 3: Flare Minimum Stack Height Requirements**

| **$SO_2$ Emission Rate** | **Height** |
|---|---|
| **(lb/hr)** | **(ft)** |
| 4501 – 5000 | 59.1 |
| 4001 – 4500 | 52.5 |
| 3501 – 4000 | 45.9 |
| 3001 – 3500 | 39.4 |
| 2501 – 3000 | 29.5 |
| 20 – 2500 | 19.7 |
| 10 – 19 | 13.1 |
| 5 – 9 | 11.5 |
| 3 – 4 | 9.8 |
| 2 | 8.2 |
| 0 – 1 | 6.6 |

Flare gas shall contain no higher than 6% $H_2S$ by volume (pre-combustion). If flare gas contains more than 6% $H_2S$ by volume, then assist gas may be added to reduce the gas composition to 6% $H_2S$ or less by volume.

## A208 Enclosed Combustion Device (ECD) or Thermal Oxidizer (TO)

A. ECD are not permitted to burn gas with high sulfur content. The $SO_2$ emission limit for ECD is 0.9 lb/hr if all ECD operate with a velocity of at least two (2) feet per second. The $SO_2$ limit for ECD is 0.7 lb/hr if all ECD operate with a velocity of at least one (1) foot per second. This limit is based upon the air dispersion modeling used in the development of this permit.

B. Pilot Flame, Visible Emissions, and Operational Requirements

**Requirement:** Compliance with the allowable emission limits for each ECD(s) and TO(s) in the Registration Form shall be demonstrated by the following:

1) The permittee shall at all times operate the ECD or TO as a closed vent system that captures and routes all VOC and HAP emissions from the units listed in the Registration Form to the control device.
2) The permittee shall ensure that the controlled units do not vent uncombusted gas to the atmosphere.
3) Each ECD and TO is limited to the daily and annual throughput, $H_2S$ concentration, and hours of operation as requested in the Registration Form.
4) The units shall be equipped with a continuous pilot flame or an auto-igniter.
5) The units shall be equipped with a system to ensure that it is operated with a flame present at all times that gas is sent the unit.
6) ECD and TO combustion shall be maintained for the duration of time gas is sent to the unit.
7) ECD and TO shall be installed, operated, and maintained according to manufacturer's, or permittee's equivalent specifications.
8) The ECD and TO shall be operated with no visible emissions except for periods not to exceed a total of sixty (60) seconds during any fifteen (15) consecutive minutes.

**Monitoring:**

1) The permittee shall continuously monitor the presence of a pilot flame using a thermocouple equipped with a continuous recorder and alarm, to detect the presence of a flame, or any other equivalent device approved by the Department.
2) Once per calendar year, or when any visible emissions are observed, the permittee shall perform a Method 22 observation while the pilot flame is present to certify compliance with the visible emission requirements. The observation period shall be fifteen minutes.
3) A gas flow meter and flow totalizer, equipped with a chart recorder or data logger (electronic storage), shall be installed in the incoming gas line to measure and record the total standard cubic feet (scf) of gas sent to the unit during any high pressure operation.
4) Monitoring of low pressure combustion by the ECD or TO is satisfied by the parametric monitoring of the equipment controlled by the ECD or TO.
5) The permittee shall measure the $H_2S$ content, VOC content, and the heating value (Btu/scf) of the gas sent for combustion with a gas analysis in accordance with Condition A201.
6) The flow meter, totalizer, and if used, the inline monitor, shall be operated, calibrated, and maintained as specified by the manufacturer, or permittee, or equivalent and as necessary to ensure correct and accurate readings.

**Recordkeeping:** The permittee shall record:

1) Chronologically, all instances of alarm activation, including the date and cause of alarm activation, actions taken to bring the unit into normal operating conditions, and maintenance activities,

2) The results of the Method 22 observations,
3) The results of the gas analyses including $H_2S$, VOC content, and heating value,
4) For high pressure units, both the hourly and monthly flow meter and flow totalizer measurements of gas sent to the unit, and
5) Calculations if one of the process parameters has been exceeded to determine compliance with each applicable emission limit for that piece of equipment.

**Reporting:** The permittee shall report in accordance with Section B110.

## A209 Vapor Recovery Units, Vapor Recovery Towers, and Ultra Low-Pressure Separators

A. Vapor Recovery Unit or Department-approved Equivalent

**Requirement:** Compliance with the allowable emission limits for any of these units in the Registration Form shall be demonstrated by the following:

1) The permittee shall at all times operate the vapor recovery unit (VRU) as a closed vent system that captures and routes all VOC and HAP emissions from units listed in the Registration Form back to the process stream or to a sales pipeline, and does not vent to the atmosphere.
2) The permittee may select in the Registration Form a backup control device or redundant VRU to control emissions during SSM or VRU downtime.

**Monitoring** At least once per month, the permittee shall inspect the VRU and associated piping from the controlled units, and blowcase vessels, for defects that could result in air emissions. Defects include, but are not limited to, visible cracks, holes, or gaps; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices. In the event that a leak or defect is detected, the permittee shall repair the leak or defect within 30 calendar days and in a manner that minimizes VOC and HAP emissions to the atmosphere.

Alternatively to the above, and if selected in the Registration Form, the Permittee may implement a program that meets the requirements of NSPS OOOOa (40 CFR 60.5416a).

**Recordkeeping:** The permittee shall record the results of the VRU inspections chronologically, the name of the personnel conducting the inspection, and noting any maintenance or repairs that are required.

**Reporting:** The permittee shall report in accordance with Section B110.

## A210 Amine Unit

A. Amine Unit Throughput and Amine Circulation Rate

**Requirement:** To demonstrate compliance with the allowable emission limits in the Registration Form, the inlet stream shall not exceed the amount represented in the Registration Form, and the amine pump circulation rate shall not exceed the circulation rate requested (in gallons per minute) in the Registration Form.

| |
|---|
| The permittee shall install, calibrate, and maintain a flow meter that measures the flow rate into the contactor. A flow meter is not required if the permitted capacity of the unit, and the emission calculations as represented in the Registration Form, is equal to and based upon the unit's maximum capacity. |
| **Monitoring:** The permittee shall:<br>1) calibrate the flow meter semi-annually in accordance with the manufacturer's, permittee's, or equivalent recommended schedule. The calibration shall be in accordance with the specifications at 40 CFR 98, and<br>2) monitor the flow rate daily (in units of MMscf/day) and monitor the circulation rate monthly. |
| **Recordkeeping:** The permittee shall keep records in accordance with Section B109, and of the following:<br>1) flow meter calibration results,<br>2) daily total of natural gas or NGL throughput each day in units of MMscf/day or barrels/day,<br>3) the pump flow rate in gpm and the basis for determination of flow rate, and<br>4) the manufacturer's specification sheet indicating the maximum flow rate of the pump. |
| **Reporting:** The permittee shall report in accordance with Section B110. |

B. Amine Unit Control Device Inspection

| |
|---|
| **Requirement:** The permittee shall select the amine unit control device, if any, in the Registration Form. To demonstrate compliance with the allowable emission limits in the Registration Form, the permittee shall ensure a controlled amine sweetening unit is a closed system where all still vent emissions and flash tank emissions are collected and routed at all times back into the process point, and not vented to the atmosphere, or routed to a control device. |
| **Monitoring:** The permittee shall inspect the amine treatment unit, piping, and, if selected, the control equipment semi-annually to ensure it is operating as designed.<br><br>Alternatively to the above, and if selected in the Registration Form, the Permittee may implement a program that meets the requirements of NSPS OOOOa (40 CFR 60.5416a). |
| **Recordkeeping:** The permittee shall record the date, the name of the personnel conducting the inspection, and the results of all equipment and control device inspections chronologically, noting any maintenance or repairs needed to bring the amine treatment unit into compliance. The permittee shall maintain a copy of the manufacturer's, permittees, or equivalent maintenance recommendations. |
| **Reporting:** The permittee shall report in accordance with Section B110. |

## A211 NSPS KKK, OOOO, OOOOa, and Fugitives

A. 40 CFR 60, Subpart KKK (Equipment and Compressors at Onshore Natural Gas Processing Plants subject to NSPS KKK)

| |
|---|
| **Requirement:** Equipment and compressors in VOC or in wet gas service (as defined in 40 CFR §60.631) within process unit(s) are subject to Standards of Performance for Equipment Leaks of VOC from Onshore Natural Gas Processing Plants, 40 CFR 60, Subpart KKK. The permittee |

| |
|---|
| shall comply with all applicable requirements in Subparts A and KKK. |
| **Monitoring:** The permittee shall implement a leak detection and repair program and shall comply with the standards as specified at 40 CFR §60.632 except as provided in §60.633. |
| **Recordkeeping:** The permittee shall comply with the recordkeeping requirements specified at 40 CFR §60.486 except as provided in §§60.633 and 60.635. |
| **Reporting:** The permittee shall comply with the reporting requirements specified at 40 CFR §60.487 except as provided in §§60.633 and 60.636. |

B. 40 CFR 60, Subpart OOOO and/or OOOOa

| |
|---|
| **Requirement:** For units subject to 40 CFR 60, Subpart OOOO and/or OOOOa, the permittee shall comply with all applicable requirements in Subpart A and Subpart OOOO and/or OOOOa. |
| **Monitoring:** The permittee shall comply with all applicable monitoring requirements of these subparts. Where applicable, this requirement satisfies the monitoring inspection conditions of this GCP. |
| **Recordkeeping:** The permittee shall comply with all applicable recordkeeping requirements of these subparts. |
| **Reporting:** The permittee shall comply with all applicable reporting requirements of these subparts. |

## A212 Setbacks and Other Requirements for Facilities Registering under this Permit

**Haul road emissions:**
Haul road emissions do not have additional requirements in this permit.

**Fugitive $H_2S$ emissions from truck loading, tank venting, and leaks:**
The Department has established screening thresholds for fugitive $H_2S$ monitoring. The applicant may either (1) comply with Condition A212.A below, or (2) calculate and provide in the Registration Form the potential emission rate of fugitive $H_2S$. If the emission rate is equal to or lower than the screening thresholds, the fugitive emission monitoring in Condition A212.A below is not required.

The screening thresholds are:

1) 0.01 lb/hr for all areas except the Pecos Permian Basin.
2) 0.1 lb/hr for the Pecos Permian Basin.

If a facility is above the screening thresholds, the following condition applies:

A. Fugitive Emission Monitoring for Facilities Receiving or Processing Sour Gas

| |
|---|
| **Requirement:** Facilities registered under this permit that are receiving or processing sour gas (greater than 4 ppm of $H_2S$ in all areas except the Pecos Permian Basin and greater than 24 ppm |

| |
|---|
| of $H_2S$ in the Pecos Permian Basin) are required to conduct routine fugitive emission leak detection monitoring of each process equipment and control device that contacts the sour gas stream. |
| **Monitoring:** At least once per month, the permittee shall conduct a leak detection and repair program (LDAR) utilizing instrumentation and/or audio, visual and olfactory (AVO) inspection for all process equipment and control devices that are in contact with sour gas. The detection program shall include inspecting the piping from process equipment to any control device. Defects include, but are not limited to, visible cracks, holes, or gaps; broken, cracked, or otherwise damaged seals or gaskets on closure devices; and broken or missing hatches, access covers, caps, or other closure devices. In the event that a leak or defect is detected, the permittee shall repair the leak or defect within 30 calendar days and in a manner that minimizes emissions to the atmosphere. If the repair of the fugitive leak requires a unit shutdown, the repair may be delayed until the next scheduled shutdown. If a repair cannot be completed within 30 calendar days, the equipment shall be documented and tracked through completion of repair. |
| **Recordkeeping:** The permittee shall record the results of the LDAR inspections chronologically, noting any maintenance or repairs that are required and, if applicable, the reason describing why maintenance or repairs were not completed within 30 calendar days. |
| **Reporting:** The permittee shall report in accordance with Section B110. |

**Terrain:**
Equipment shall be at least 100 meters from any stack to terrain that is five (5) or more meters above the top of a stack.

**Nearby facilities:**
The facility must be at least 150 meters from any source that emits over 25 tons/year of $NO_x$.

**Class I areas:**
The facility must be at least (three) 3 miles from any Class I area.

## PART B GENERAL CONDITIONS

### B100 Introduction

A. The Department has determined that all facilities registered under and operating in accordance with this permit will meet all applicable requirements under the federal Clean Air Act, the New Mexico Air Quality Control Act, and Title 20, Chapter 2 NMAC, including 20.2.74 NMAC (Prevention of Significant Deterioration), 20.2.77 NMAC (New Source Performance Standards), 20.2.78 (Emission Standards for Hazardous Air Pollutants), 20.2.82 NMAC (Maximum Achievable Control Technology Standards for Source Categories of Hazardous Air Pollutants), and will not cause or contribute to air contaminant levels in excess of any national or New Mexico ambient air quality standard.

B. Where the permit refers to "Department approved" or "approved by the Department," means for the purposes of this permit to have been approved in writing by the Department. Guidance published on the AQB website meets this requirement.

## B101 Legal

A. The permittee shall construct or modify and operate the Facility in accordance with all of the conditions of the permit, including the representations in the Registration Form. 20.2.72.210.D NMAC, states that any term or condition imposed by the Department on a permit is enforceable to the same extent as a regulation of the Environmental Improvement Board.

B. Unless otherwise specified in Part A or Part C of this permit, any future physical changes, changes in the method of operation, or changes in the authorized area may constitute a modification as defined by 20.2.72 NMAC, Construction Permits. Unless the source or activity is exempt under 20.2.72.202 NMAC, no modification shall begin prior to written approval of a Registration Form. (20.2.72.200.A.2 and E, and 210.B.4 NMAC)

C. Registrations which require notification under Condition C101.A or Condition C101.B for permit revisions and modifications shall be submitted to:

Permit Programs Manager
New Mexico Environment Department
Air Quality Bureau
525 Camino de los Marquez, Suite 1
Santa Fe, New Mexico 87505-1816

D. The GCP-Oil and Gas supersedes GCP-1 and GCP-4 permits issued by the Department. For permittees operating under an existing GCP-1 or GCP-4, the Department will provide a transition schedule for converting to operate under the GCP-Oil and Gas, or for obtaining a regular Part 72 permit.

Within nine (9) months of issuance of this GCP-Oil and Gas, each permittee operating under an existing GCP-1 or GCP-4 shall determine if each facility qualifies to operate under the GCP-Oil and Gas, or if the permittee must obtain a regular Part 72 permit for that facility, and for each existing facility, the permittee shall provide notification to the Department of one of the following:

1) The facility qualifies to operate under the GCP-Oil and Gas, and the date that the permittee commenced operating under the GCP-Oil and Gas, or

2) The facility does not qualify to operate under the GCP-Oil and Gas, and the permittee shall obtain a regular Part 72 permit.

The Department shall establish a transition schedule for each existing facility and shall require the permittee to either (1) submit a Registration Form to operate under the GCP-Oil and Gas, or (2) to submit a regular Part 72 permit application. There is no public notice or fees required for transitioning an existing facility operating under a GCP-1 or GCP-4 permit under the GCP-Oil and Gas. Public notice and fees do apply to facilities applying for a regular Part 72 permit.

E. On an as needed basis, the Department may revise the Registration Form and Air Emission Calculation Tool in order to make necessary revisions, improvements, and updates to the Forms.

## B102 Authority

A. This permit is issued pursuant to the Air Quality Control Act (Act) and regulations adopted pursuant to the Act including Title 20, Chapter 2, Part 72 of the New Mexico Administrative Code (NMAC), (20.2.72 NMAC), Construction Permits, including 20.2.72.220, General Permits, and is enforceable pursuant to the Act and the air quality control regulations applicable to this source.

B. The Secretary of the Department is the Administrator for 40 CFR Parts 60, 61, and 63 pursuant to the delegation and exceptions of Section 10 of 20.2.77 NMAC (NSPS), 20.2.78 NMAC (NESHAP), and 20.2.82 NMAC (MACT).

## B103 Fees

A. Each Registration Form shall include a certified check or money order for 10 fee points. The current fee is available on the Permitting website.

B. The Department will assess an annual fee for this Facility. The current annual fee amount is available by contacting the Department or can be found on the Department's website. The AQB will invoice the permittee for the annual fee amount at the beginning of each calendar year. This fee does not apply to facilities which are assessed an annual fee in accordance with 20.2.71 NMAC. For facilities that satisfy the definition of "small business" in 20.2.75.7.F NMAC, this annual fee will be divided by two. (20.2.75.11 NMAC)

C. All fees shall be remitted in the form of a corporate check, certified check, or money order, or other Department approved method, and made payable to the "NM Environment Department, AQB."

## B104 Appeal Procedures

A. Any person who participated in a permitting action before the Department and who is adversely affected by such permitting action, may file a petition for hearing before the

Environmental Improvement Board. The petition shall be made in writing to the Environmental Improvement Board within thirty (30) days from the date notice is given of the Department's action and shall specify the portions of the permitting action to which the petitioner objects, certify that a copy of the petition has been mailed or hand-delivered and attach a copy of the permitting action for which review is sought. Unless a timely request for hearing is made, the decision of the Department shall be final. The petition shall be copied simultaneously to the Department upon receipt of the appeal notice. If the petitioner is not the applicant or permittee, the petitioner shall mail or hand-deliver a copy of the petition to the applicant or permittee. The Department shall certify the administrative record to the board. Petitions for a hearing shall be sent or hand delivered to: (20.2.72.207.F NMAC)

Secretary, New Mexico Environmental Improvement Board
Post Office Box 5469
1190 St. Francis Drive, Runnels Bldg. Rm. N2153
Santa Fe, New Mexico 87502-5469

**B105 Submittal of Reports and Certifications**

A. Stack Test Protocols and Stack Test Reports shall be submitted electronically to Stacktest.AQB@state.nm.us.

B. Excess Emission Reports shall be submitted electronically to eereports.aqb@state.nm.us. (20.2.7.110 NMAC)

**B106 NSPS and/or MACT General Conditions**

A. If a facility is subject to a NSPS standard in 40 CFR 60, the requirements of 40 CFR 60, Subpart A, General Provisions, also apply.

B. If a facility is subject to a MACT standard in 40 CFR 63, the requirements of 40 CFR 63, Subpart A, General Provisions, also apply.

**B107 Startup, Shutdown, and Maintenance Operations**

A. The owner or operator of a source having an excess emission shall comply with 20.2.7 NMAC and, to the extent practicable, operate the source, including associated air pollution control equipment, in a manner consistent with good air pollutant control practices for minimizing emissions. (20.2.7.109 NMAC). The establishment of allowable malfunction emission limits does not supersede this requirement.

B. The establishment of permitted startup, shutdown, and maintenance (SSM) emission limits does not supersede the requirements of 20.2.7.14.A NMAC. Except for operations or equipment subject to Condition B106, the permittee shall establish and

implement a plan to minimize emissions during routine or predictable start up, shut down, and scheduled maintenance (SSM work practice plan) and shall operate in accordance with the procedures set forth in the plan. (SSM work practice plan) (20.2.7.14.A NMAC)

## B108 General Monitoring Requirements

A. These requirements do not supersede or relax requirements of federal regulations.

B. The following monitoring requirements shall be used to determine compliance with applicable requirements and emission limits. Any sampling, whether by portable analyzer or EPA reference method, that measures an emission rate over the applicable averaging period greater than an emission limit in the Registration Form constitutes noncompliance with this permit. The Department may require, at its discretion, additional tests pursuant to EPA Reference Methods at any time, including when sampling by portable analyzer measures an emission rate greater than an emission limit in the Registration Form; but such requirement shall not be construed as a determination that the sampling by portable analyzer does not establish noncompliance with this permit and shall not stay enforcement of such noncompliance based on the sampling by portable analyzer.

C. If the emission unit is shutdown at the time when periodic monitoring is due to be accomplished, the permittee is not required to restart the unit for the sole purpose of performing the monitoring. Using electronic or written mail, the permittee shall notify the Air Quality Bureau's Compliance and Enforcement Section of a delay in emission tests prior to the deadline for accomplishing the tests. Upon recommencing operation, the permittee shall submit any pertinent pre-test notification requirements set forth in the current version of the Department's Standard Operating Procedures For Use Of Portable Analyzers in Performance Test, and shall accomplish the monitoring.

D. The requirement for monitoring during any monitoring period is based on the percentage of time that the unit has operated. However, to invoke the monitoring period exemption at B108.D(2), hours of operation shall be monitored and recorded.

(1) If the emission unit has operated for more than 25% of a monitoring period, then the permittee shall conduct monitoring during that period.

(2) If the emission unit has operated for 25% or less of a monitoring period then the monitoring is not required. After two successive periods without monitoring, the permittee shall conduct monitoring during the next period regardless of the time operated during that period, except that for any monitoring period in which a unit has operated for less than 10% of the monitoring period, the period will not be considered as one of the two successive periods.

(3) If invoking the monitoring period exemption in B108.D(2), the actual operating time of a unit shall not exceed the monitoring period required by this permit before the

required monitoring is performed. For example, if the monitoring period is annual, the operating hours of the unit shall not exceed 8760 hours before monitoring is conducted. Regardless of the time that a unit actually operates, a minimum of one of each type of monitoring activity shall be conducted during any five-year period.

E. For all periodic monitoring events, except when a federal or state regulation is more stringent, three test runs shall be conducted at 90% or greater of the unit's capacity as stated in the Registration Form, and at additional loads when requested by the Department. If the 90% capacity cannot be achieved, the monitoring will be conducted at the maximum achievable load under prevailing operating conditions except when a federal or state regulation requires more restrictive test conditions. The load and the parameters used to calculate it shall be recorded to document operating conditions and shall be included with the monitoring report.

F. When requested by the Department, the permittee shall provide schedules of testing and monitoring activities.

G. If monitoring is new or is in addition to monitoring imposed by an existing applicable requirement, it shall become effective 120 days after the date of permit issuance. For emission units that have not commenced operation, the associated new or additional monitoring shall not apply until 120 days after the units commence operation.

## B109 General Recordkeeping Requirements

A. The permittee shall maintain records to assure and verify compliance with the terms and conditions of this permit and any other applicable requirements that become effective after permit issuance. The minimum information to be included in these records is:

Records required for testing and sampling:

(1) equipment identification (include make, model and serial number for all tested equipment and emission controls)
(2) date(s) and time(s) of sampling or measurements
(3) date(s) analyses were performed
(4) the qualified entity that performed the analyses
(5) analytical or test methods used
(6) results of analyses or tests
(7) operating conditions existing at the time of sampling or measurement

Records required for equipment inspections and/or maintenance required by this permit:

(1) equipment identification number (including make, model and serial number)
(2) date(s) and time(s) of inspection, maintenance, and/or repair
(3) date(s) any subsequent analyses were performed (if applicable)

(4) name of the person or qualified entity conducting the inspection, maintenance, and/or repair
(5) copy of the equipment manufacturer's or the owner or operator's maintenance or repair recommendations (if required to demonstrate compliance with a permit condition)
(6) description of maintenance or repair activities conducted
(7) all results of any required parameter readings
(8) a description of the physical condition of the equipment as found during any required inspection
(9) results of required equipment inspections including a description of any condition which required adjustment to bring the equipment back into compliance and a description of the required adjustments

B. Except as provided in the Specific Conditions, electronic records shall be maintained on-site or if unstaffed, at the permittee's local business office for a minimum of two (2) years from the time of recording and shall be made available to Department personnel upon request.

C. Unless otherwise indicated by Specific Conditions, the permittee shall keep the following records for malfunction emissions and routine or predictable emissions during startup, shutdown, and scheduled maintenance (SSM):

(1) The owner or operator of a source subject to this permit shall establish and implement a plan to minimize emissions during routine or predictable startup, shutdown, and scheduled maintenance through work practice standards and good air pollution control practices. This requirement shall not apply to any affected facility defined in and subject to an emissions standard and an equivalent plan under 40 CFR Part 60 (NSPS), 40 CFR Part 63 (MACT), or an equivalent plan under 20.2.72 NMAC - Construction Permits. The permittee shall keep records of all sources subject to the plan to minimize emissions during routine or predictable SSM and shall record if the source is subject to an alternative plan and therefore, not subject to the plan requirements under 20.2.7.14.A NMAC.

(2) If the facility has allowable SSM emission limits in the Registration Form, the permittee shall record all SSM events, including the date, the start time, the end time, a description of the event, and a description of the cause of the event. This record also shall include a copy of the manufacturer's, or equivalent, documentation showing that any maintenance qualified as scheduled. Scheduled maintenance is an activity that occurs at an established frequency pursuant to a written protocol published by the manufacturer or other reliable source. The authorization of allowable SSM emissions does not supersede any applicable federal or state standard. The most stringent requirement applies.

(3) If the permittee has allowable malfunction emission limits in the Registration Form, the permittee shall record all malfunction events to be applied against these limits. The permittee shall also include the date, the start time, the end time, and a

description of the event. The authorization of allowable malfunction emissions does not supersede any applicable federal or state standard. The most stringent requirement applies.

**B110 General Reporting Requirements**
(20.2.72 NMAC Sections 210 and 212)

A. Records and reports shall be maintained on-site or at the permittee's local business office unless specifically required to be submitted to the Department or EPA by another condition of this permit or by a state or federal regulation.

B. The permittee shall notify the Air Quality Bureau's Compliance and Enforcement Section using the current Submittal Form posted to NMED's Air Quality web site under Compliance and Enforcement/Submittal Forms in writing of, or provide the Department with (20.2.72.212.A and B):

(1) the anticipated date of initial startup of each new or modified source not less than thirty (30) days prior to the date. Notification may occur prior to issuance of the permit, but actual startup shall not occur earlier than the permit issuance date;

(2) after receiving authority to construct, the equipment serial number as provided by the manufacturer or permanently affixed if shop-built and the actual date of initial startup of each new or modified source within fifteen (15) days after the startup date; and

(3) the date when each new or modified emission source reaches the maximum production rate at which it will operate within fifteen (15) days after that date.

C. Unless otherwise specified in Parts A or C of this permit, the permittee shall notify the Bureau's Permitting Program Manager, in writing of, or provide the Department with (20.2.72.212.C and D):

(1) any change of operators or any equipment substitutions within fifteen (15) days of such change;

(2) any necessary update or correction no more than sixty (60) days after the operator knows or should have known of the condition necessitating the update or correction of the permit.

D. Results of emission tests and monitoring for each pollutant (except opacity) shall be reported in pounds per hour (unless otherwise specified) and tons per year. Opacity shall be reported in percent. The number of significant figures corresponding to the full accuracy inherent in the testing instrument or Method test used to obtain the data shall be used to calculate and report test results in accordance with 20.2.1.116.B and C NMAC. Upon request by the Bureau, tabular data shall be submitted in editable, MS Excel format.

E. The permittee shall submit reports of excess emissions in accordance with 20.2.7.110.A NMAC.

F. Excess Emissions Reporting for Regulated Sources with no Pound per Hour (pph) and/or Ton per Year (tpy) Emission Limits:

(1) Emissions in excess of 1.0 pph or 1.0 tpy for each regulated air pollutant (except for $H_2S$).

(2) For $H_2S$, emissions in excess of 0.1 pph or 0.44 tpy.

## B111 General Testing Requirements

A. Compliance Tests

(1) Compliance test requirements from previous permits (if any) remain in effect, unless the tests have been satisfactorily completed. Compliance test requirements may be re-imposed if it is deemed necessary by the Department to determine whether the source is in compliance with applicable regulations or permit conditions. (20.2.72 NMAC Sections 210.C and 213)

(2) Compliance tests shall be conducted within sixty (60) days after the unit(s) achieve the maximum normal production rate. If the maximum normal production rate does not occur within one hundred twenty (120) days of source startup, then the tests must be conducted no later than one hundred eighty (180) days after initial startup of the source.

(3) Unless otherwise indicated by Specific Conditions or regulatory requirements, the default time period for each test run shall be at least 60 minutes and each performance test shall consist of three separate runs using the applicable test method. For the purpose of determining compliance with an applicable emission limit, the arithmetic mean of results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances, beyond the owner or operator's control, compliance may, upon the Department approval, be determined using the arithmetic mean of the results of the two other runs.

(4) Testing of emissions shall be conducted with the emissions unit operating at 90 to 100 percent of the maximum operating rate allowed by the permit. If it is not possible to test at that rate, the source may test at a lower operating rate, subject to the approval of the Department.

(5) Testing performed at less than 90 percent of permitted capacity will limit emission unit operation to 110 percent of the tested capacity until a new test is conducted.

(6) If conditions change such that unit operation above 110 percent of tested capacity is possible, the source must submit a protocol to the Department within 30 days of such change to conduct a new emissions test.

B. EPA Reference Method Tests

(1) All compliance tests required by this permit, unless otherwise specified by Specific Conditions of this permit, shall be conducted in accordance with the requirements of CFR Title 40, Part 60, Subpart A, General Provisions, and the following EPA Reference Methods as specified by CFR Title 40, Part 60, Appendix A:

(a) Methods 1 through 4 for stack gas flow rate

(b) Method 5 for TSP

(c) Method 6C and 19 for $SO_2$

(d) Method 7E for $NO_X$ (test results shall be expressed as nitrogen dioxide (NOx) using a molecular weight of 46 lb/lb-mol in all calculations (each ppm of NO/NOx is equivalent to 1.194 x 10-7 lb/SCF)

(e) Method 9 for opacity

(f) Method 10 for CO

(g) Method 19 may be used in lieu of Methods 1-4 for stack gas flow rate upon approval of the Department. A justification for this proposal must be provided along with a contemporaneous fuel gas analysis (preferably on the day of the test) and a recent fuel flow meter calibration certificate (within the most recent quarter).

(h) Method 7E or 20 for Turbines per 60.335 or 60.4400

(i) Method 22 for Visible Emissions

(j) Method 201A for filterable $PM_{10}$ and $PM_{2.5}$

(k) Method 202 for condensable PM

(l) Method 320 for organic Hazardous Air Pollutants (HAPs)

(m) Method 25A for VOC reduction efficiency

(n) ASTM D6348-03 may be used for RICE only

(2) Alternative test method(s) may be used if the Department approves the change

C. Periodic Monitoring and Portable Analyzer Requirements

(1) Periodic emissions tests (periodic monitoring) may be conducted in accordance with EPA Reference Methods or by utilizing a portable analyzer. Periodic monitoring utilizing a portable analyzer shall be conducted in accordance with the requirements of the current version of ASTM D 6522. However, if a facility has

met a previously approved Department criterion for portable analyzers, the analyzer may be operated in accordance with that criterion until it is replaced.

(2) Unless otherwise indicated by Specific Conditions or regulatory requirements, the default time period for each test run shall be at least 20 minutes.

Each performance test shall consist of three separate runs. The arithmetic mean of results of the three runs shall be used to determine compliance with the applicable emission limit.

(3) Testing of emissions shall be conducted in accordance with the requirements at Section B108.E.

(4) During emissions tests, pollutant and diluent concentration shall be monitored and recorded. Fuel flow rate shall be monitored and recorded if stack gas flow rate is determined utilizing Method 19. This information shall be included with the test report furnished to the Department.

(5) Stack gas flow rate shall be calculated in accordance with 40 CFR 60, Appendix A, Method 19 utilizing fuel flow rate (scf) determined by a dedicated fuel flow meter and fuel heating value (Btu/scf) determined from a fuel sample obtained preferably during the day of the test, but no earlier than three months prior to the test date. Alternatively, stack gas flow rate may be determined by using EPA Methods 1-4.

D. Test Procedures:

(1) The permittee shall notify the Program Manager of the Air Quality Bureau's Compliance and Enforcement Section consistent with the Section's current published reporting procedures.

(2) Equipment shall be tested in the "as found" condition. Equipment may not be adjusted or tuned prior to any test for the purpose of lowering emissions, and then returned to previous settings or operating conditions after the test is complete.

(3) Contents of test notifications, protocols and test reports shall conform to the format specified by the Department's Universal Test Notification, Protocol and Report Form and Instructions. Current forms and instructions are posted to NMED's Air Quality web site under Compliance and Enforcement Testing.

(4) The permittee shall provide (a) sampling ports adequate for the test methods applicable to the facility, (b) safe sampling platforms, (c) safe access to sampling platforms and (d) utilities for sampling and testing equipment.

(5) The stack shall be of sufficient height and diameter and the sample ports shall be located so that a representative test of the emissions can be performed in accordance with the requirements of EPA Method 1 or ASTM D 6522-00 as applicable.

(6) Where necessary to prevent cyclonic flow in the stack, flow straighteners shall be installed.

(7) Unless otherwise indicated by Specific Conditions or regulatory requirements, test reports shall be submitted to the Department no later than 30 days after completion of the test.

## B112 Compliance

A. The Department has the right to enter the facility at all reasonable times to verify the terms and conditions of this permit. Required records shall be organized by date and subject matter and shall at all times be readily available for inspection. The permittee, upon verbal or written request from an authorized representative of the Department who appears at the facility, shall immediately produce for inspection or copying any records required to be maintained at the facility. Upon written request at other times, the permittee shall deliver to the Department paper or electronic copies of any and all required records maintained on site or at an off-site location. Requested records shall be copied and delivered at the permittee's expense within three business days from receipt of request unless the Department allows additional time. Required records may include records required by permit and other information necessary to demonstrate compliance with terms and conditions of this permit. (NMSA 1978, Section 74-2-13)

B. A copy of the most recent air quality permit and Registration Form issued by the Department shall be kept at the permitted facility or (for unstaffed sites) at the nearest company office and shall be made available to Department personnel for inspection upon request. (20.2.72.210.B.4 NMAC)

## B113 Permit Cancellation and Revocation

A. The Department may revoke this permit if the applicant or permittee has knowingly and willfully misrepresented a material fact in the Registration Form. Revocation will be made in writing, and an administrative appeal may be taken to the Secretary of the Department within thirty (30) days. Appeals will be handled in accordance with the Department's Adjudicatory Procedures, 20.1.5 NMAC.

B. The Department shall automatically cancel any permit for any source which ceases operation for five (5) years or more, or permanently. Reactivation of any source after the five (5) year period shall require a new permit. (20.2.72 NMAC)

C. The Department may cancel a permit if the construction or modification is not commenced within two (2) years from the date of issuance or if, during the construction or modification, work is suspended for a total of one (1) year. (20.2.72 NMAC)

**B114 Notification to Subsequent Owners**

A. The permit and conditions apply in the event of any change in control or ownership of the Facility. No permit modification is required in such case. However, in the event of any such change in control or ownership, the permittee shall notify the succeeding owner of the permit and conditions and shall notify the Bureau's Program Manager, Permits Section of the change in ownership within fifteen (15) days of that change. (20.2.72.212.C NMAC)

B. Any new owner or operator shall notify the Program Manager of the Air Quality Bureau's, Permits Section, within thirty (30) days of assuming ownership, the date of assuming ownership, and the new owner's or operator's name and address. (20.2.73.200.E.3 NMAC)

**B115 Asbestos Demolition**

A. Before any asbestos demolition or renovation work, the permittee shall determine whether 40 CFR 61 Subpart M, National Emissions Standards for Asbestos applies. If required, the permittee shall notify the Program Manager of the Air Quality Bureau's Compliance and Enforcement Section using forms furnished by the Department.

**B116 Short Term Engine Replacement**

A. The following Alternative Operating Scenario (AOS) addresses engine breakdown or periodic maintenance and repair, which requires the use of a short-term replacement engine. The following requirements do not apply to engines that are exempt per 20.2.72.202.B(3) NMAC. Changes to exempt engines must be reported in accordance with 20.2.72.202.B NMAC. A short-term replacement engine may be substituted for any engine specified in the Registration Form for no more than 120 days in any monthly rolling twelve month period per permitted engine. The compliance demonstrations required as part of this AOS are in addition to any other compliance demonstrations required by this permit. If the engine will remain onsite for longer than 120 days, a Registration Form shall be submitted and approved by the Department prior to the expiration of the 120 day period authorized by this condition.

(1) The permittee may temporarily replace an existing engine that is subject to the emission limits established in the Registration Form with another engine regardless of manufacturer, model, and horsepower without modifying the Registration Form. The permittee shall submit written notification to the Department within 15 days of the date of engine substitution according to condition B110.C(1).

(a) The potential emission rates of the replacement engine shall be determined using the replacement engine's manufacturer specifications and shall comply with the permitted emission limits of the engine being replaced as specified in the Registration Form.

(b) The direction of the exhaust stack for the replacement engine shall be either vertical or the same direction as for the existing engine. The replacement engine's stack height and flow parameters shall be at least as effective in the dispersion of air pollutants as the modeled stack height and flow parameters for the existing permitted engine. The following equation may be used to show that the replacement engine disperses pollutants as well as the existing engine. The value calculated for the replacement engine on the right side of the equation shall be equal to or greater than the value for the existing engine on the left side of the equation. The permitting page of the Air Quality Bureau website contains a spreadsheet that performs this calculation.

EXISTING ENGINE REPLACMENT ENGINE

$$\frac{[(g) \times (h1)] + [(v1)^2/2] + [(c) \times (T1)]}{q1} <= \frac{[(g) \times (h2)] + [(v2)^2/2] + [(c) \times (T2)]}{q2}$$

Where
g = gravitational constant = 32.2 ft/sec$^2$
h1 = existing stack height, feet
v1 = exhaust velocity, existing engine, feet per second
c = specific heat of exhaust, 0.28 BTU/lb-degree F
T1 = absolute temperature of exhaust, existing engine = degree F + 460
q1 = permitted allowable emission rate, existing engine, lbs/hour
h2 = replacement stack height, feet
v2 = exhaust velocity, replacement engine, feet per second
T2 = absolute temperature of exhaust, replacement engine = degree F + 460
q2 = manufacturer's potential emission rate, replacement engine, lbs/hour

The permittee shall keep records showing that the replacement engine is at least as effective in the dispersion of air pollutants as the existing engine.

(c) Test measurement of NOx and CO emissions from the temporary replacement engine shall be performed in accordance with Section B111 with the exception of Condition B111A(2) and B111B for EPA Reference Methods Tests or Section B111C for portable analyzer test measurements. Compliance test(s) shall be conducted within fifteen (15) days after the unit begins operation, and records of the results shall be kept according to section B109.B.

i. These compliance tests are not required for an engine certified under 40CFR60, subparts IIII, or JJJJ, or 40CFR63, subpart ZZZZ if the permittee demonstrates that one of these requirements causes such engine to comply with all emission limits of the Registration Form. The permittee shall submit this demonstration to the Department within 48

hours of placing the new unit into operation. This submittal shall include documentation that the engine is certified, that the engine is within its useful life, as defined and specified in the applicable requirement, and shall include calculations showing that the applicable emissions standards result in compliance with the emission limits.

ii. These compliance tests are not required if a test was conducted by portable analyzer or by EPA Method test (including any required by 40CFR60, subparts IIII and JJJJ and 40CFR63, subpart ZZZZ) within the last 12 months. These previous tests are valid only if conducted at the same or lower elevation as the existing engine location prior to commencing operation as a temporary replacement. A copy of the test results shall be kept according to section B109.B.

(d) Compliance tests for NOx and CO shall be conducted if requested by the Department in writing to determine whether the replacement engine is in compliance with applicable regulations or permit conditions.

(e) Upon determining that emissions data developed according to B116.A.1(c) fail to indicate compliance with either the NOx or CO emission limits, the permittee shall notify the Department within 48 hours. Also within that time, the permittee shall implement one of the following corrective actions:

i. The engine shall be adjusted to reduce NOx and CO emissions and tested per B116.A.1(c) to demonstrate compliance with the emission limits.

ii. The engine shall discontinue operation or be replaced with a different unit.

(2) Short term replacement engines, whether of the same manufacturer, model, and horsepower, or of a different manufacturer, model, or horsepower, are subject to all federal and state applicable requirements, regardless of whether they are set forth in this permit (including monitoring and recordkeeping), and shall be subject to any shield afforded by this permit.

(3) The permittee shall maintain a contemporaneous record documenting the unit number, manufacturer, model number, horsepower, emission factors, emission test results, and serial number of any existing engine that is replaced, and the replacement engine. Additionally, the record shall document the replacement duration in days, and the beginning and end dates of the short-term engine replacement.

(4) The permittee shall maintain records of a regulatory applicability determination for each replacement engine (including 40CFR60, subparts IIII and JJJJ and 40CFR63, subpart ZZZZ) and shall comply with all associated regulatory requirements.

B. All records required by this section shall be kept according to section B109.

## PART C REGISTRATION PROCEDURE

### C100 Registration Forms

A. General Requirements

(1) The owner or operator of a Facility to be registered under GCP-Oil and Gas shall complete the following steps. All submittals shall be made on the current Registration Form provided by the Department. The owner or operator shall:

(a) Complete the public notice requirements as required in C100.B. Public notice is required for new facilities, and existing, constructed facilities that are registering under Part 72 for the first time.

(b) At a minimum, complete the following sections of the GCP-Oil and Gas Registration Form:

(i) Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, and 10. This includes the AECT.

(c) Submit a complete GCP-Oil and Gas Registration Form, including proof of Public Notice and a payment of 10 fee points as required by 20.2.75 NMAC, to the Department.

(2) Within thirty (30) calendar days of receiving a Registration Form for the GCP-Oil and Gas, the Department shall review the Registration Form and shall approve or deny the registration. The Department may not grant approval of a Registration Form until fifteen (15) days after Public Notice has been published and posted. Approval or denial, once effective, of a Registration Form is a determination by the Department of whether or not the source qualifies to register for coverage under GCP-Oil and Gas. The Department shall notify the owner or operator of its decision by certified mail.

B. Public Notification

(1) The applicant's public notice requirements shall be completed and submitted as part of the Registration Form.

(2) In accordance with 20.2.72.220.A(2)(b)ii NMAC, the applicant's public notice requirements include:

(a) a notice published once in the legal notices section of a newspaper in general circulation in the county or counties in which the Facility is proposed to be constructed or operated is located. The applicant's legal notice may include up to ten (10) separate facilities if required location information for each facility is included in the notice; and

(b) a notice posted at the proposed or existing Facility entrance in a publicly accessible and conspicuous place on the property on which the Facility is, or is proposed to be, located, until the general permit registration is granted or denied.

(3) In accordance with 20.2.72.220.C(2) NMAC, the Department shall not grant the registration until at least fifteen (15) days after the date the applicant's public notice was initiated.

## C101 Revision Processes

A. Administrative Changes that Require Notification

(1) Owners or operators shall, at a minimum, submit Sections 1 and 10 of the Registration Form to the Department for the following change(s). The notification shall include all information required by the Department to review the request and shall be submitted within fifteen (15) calendar days of the change(s):

(a) Change of owner/operator,

(b) Adding exempt equipment,

(c) Correcting a typographical error, or

(d) Change of contact information for any person identified in the Registration Form.

(2) No public notification is required.

(3) No permit fees under 20.2.75 NMAC apply.

B. Modifications that Require Notification

(1) Prior to any modification of a source, the owner or operator shall, at a minimum, submit Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, and the AECT of the Registration Form to the Department.

(2) No construction of a modification shall begin prior to receiving written approval by the Department.

(3) Types of modifications that require notification include construction of any new regulated equipment, changes in the method of operation, or any other physical changes which modifies any requested allowable hourly or annual emission limit.

(4) The owner or operator shall maintain the current Registration Form on-site or at the permittee's local business office.

(5) The revised Registration Form, including the lb/hr and tpy emission limits of new or altered emissions units, becomes part of the registration and is enforceable.

(6) No public notification is required.

(7) General Construction Permit fees under 20.2.75 NMAC **do** apply. A fee of 10 fee points is required to be submitted with the Registration Form. The current value of a fee point can be found on the Department's Permitting website.

C. Changes that Prevent Meeting General Permit Limits

(1) Changes or equipment additions that prevent the Facility from meeting the requirements of GCP-Oil and Gas shall not occur before the owner or operator applies for and is issued an individual construction permit under 20.2.72.200 NMAC. [20.2.72.220.D(2) NMAC]

## PART D MISCELLANEOUS: SUPPORTING ON-LINE DOCUMENTS; DEFINITIONS; ACRONYMS

### D100 Supporting On-Line Documents

A. Copies of the following documents can be downloaded from NMED's website under Compliance and Enforcement or requested from the Bureau:
1) Excess Emission Form (for reporting deviations and emergencies)
2) Universal Stack Test Notification, Protocol and Report Form and Instructions
3) SOP for Use of Portable Analyzers in Performance Tests

### D101 Definitions

A. **"Enclosed Combustion Device"** means a direct, enclosed, ground level combustion device.

B. **"Flare"** means a direct combustion device in which air and all combustible gases react at the burner with the objective of complete and instantaneous oxidation of the combustible gases.

C. **"Malfunction"** means any sudden and unavoidable failure of air pollution control equipment or process equipment beyond the control of the owner or operator, including malfunction during startup or shutdown. A failure that is caused entirely or in part by poor maintenance, careless operation, or any other preventable equipment breakdown shall not be considered a malfunction. (20.2.7 NMAC)

D. **"Monthly Rolling"** is a concept of incorporating the most recent month's emission s data into a 12-month period. To determine the current monthly rolling total (or average), subtract the oldest month's data from the calculation and add the current (most recent) month's data and perform the required calculation.

E. **"Natural Gas Liquids"** means the hydrocarbons, such as ethane, propane, butane, and pentane that are extracted from field gas. (40 CFR 60.631)

F. **"National Ambient Air Quality Standards"** means, unless otherwise modified, the primary (health-related) and secondary (welfare-based) federal ambient air quality standards promulgated by the US EPA pursuant to Section 109 of the Federal Act.

G. "**NOx**" or "Nitrogen dioxide" means the chemical compound containing one atom of nitrogen and two atoms of oxygen, for the purposes of ambient determinations. The term **"nitrogen dioxide,"** for the purposes of stack emissions monitoring, shall include nitrogen dioxide (the chemical compound containing one atom of nitrogen and two atoms of oxygen), nitric oxide (the chemical compound containing one atom of nitrogen and one atom of oxygen), and other oxides of nitrogen which may test as nitrogen dioxide and is sometimes referred to as NOx or NOx. (20.2.2 NMAC)

H. **"Potential Emission Rate"** or "PER" means the emission rate of a source at its maximum capacity to emit a regulated air contaminant under its physical and operational design, provided any physical or operational limitation on the capacity of the source to emit a regulated air contaminant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored or processed, shall be treated as part of its physical and operational design only if the limitation or the effect it would have on emissions is enforceable by the department pursuant to the Air Quality Control Act or the federal Act.

I. **"Produced Water"** means water that is extracted from the earth from an oil or natural gas production well, or that is separated from crude oil, condensate, or natural gas after extraction.

J. **"Property Boundary"** means the outside edge of the property, which includes all the equipment, registered under this Permit. The property may consist of one or more continuous and adjacent properties if they are owned, leased, or under direct control of the owner or operator.

K. **"SSM"**, for requirements under 20.2.7 NMAC, means routine or predictable startup, shutdown, or scheduled maintenance.

L. **"Shutdown"**, for requirements under 20.2.7 NMAC, means the cessation of operation of any air pollution control equipment or process equipment.

M. **"Startup"**, for requirements under 20.2.7 NMAC, means the setting into operation of any air pollution control equipment or process equipment.

N. **"Storage Vessel"** means a tank or other vessel that contains an accumulation of crude oil, condensate, intermediate hydrocarbon liquids, or produced water, and that is constructed primarily of nonearthen materials (such as wood, concrete, steel, fiberglass, or plastic) which provide structural support.

O. **"Thermal Oxidizer"** means a combustion device that eliminates VOC, CO, and volatile HAP emissions by combusting them to carbon dioxide (CO2) and water. The device maintains a minimum temperature in the combustion chamber to eliminate pollutants.

P. **"Vapor Recovery Unit (VRU)"** means a unit capable of collecting hydrocarbon vapors and gases and routing such hydrocarbon vapors and gases back into the process or to a sales pipeline.

## D102 Acronyms

2SLB ..... 2-stroke lean burn
4SLB ..... 4-stroke lean burn
4SRB ..... 4-stroke rich burn
acfm ..... actual cubic feet per minute
AFR ..... air fuel ratio
AP-42 ..... EPA Air Pollutant Emission Factors
AQB ..... Air Quality Bureau
AQCR ..... Air Quality Control Region
ASTM ..... American Society for Testing and Materials
BTU ..... British ThermalUnit
CAA ..... Clean Air Act of 1970 and 1990 Amendments
CEM ..... continuous emissions monitoring
cfh ..... cubic feet per hour
cfm ..... cubic feet per minute
CFR ..... Code of Federal Regulation
CI ..... compression ignition
CO ..... carbon monoxides
COMS ..... continuous opacity monitoring system
EIB ..... Environmental Improvement Board
EPA ..... United States Environmental Protection Agency
gr./100 cf ..... grains per one hundred cubic feet
gr./dscf ..... grains per dry standard cubic foot
GRI ..... Gas Research Institute
HAP ..... hazardous air pollutant
hp ..... horsepower
$H_2S$ ..... hydrogen sulfide
IC ..... internal combustion
KW/hr ..... kilowatts per hour
lb/hr ..... pounds per hour
lb/MMBtu ..... pounds per million British Thermal Unit
MACT ..... Maximum Achievable Control Technology
MMcf/hr ..... million cubic feet per hour
MMscf ..... million standard cubic feet
N/A ..... not applicable
NAAQS ..... National Ambient Air Quality Standards
NESHAP ..... National Emission Standards for Hazardous Air Pollutants
NG ..... natural gas

NGL ..... natural gas liquids
NMAAQS .....New Mexico Ambient Air Quality Standards
NMAC..... New Mexico Administrative Code
NMED.....New Mexico Environment Department
NMSA.....New Mexico Statues Annotated
NOx.....nitrogen oxides
NSCR.....non-selective catalytic reduction
NSPS..... New Source Performance Standard
NSR.....New Source Review
PEM .....parametric emissions monitoring
PM..... particulate matter (equivalent to TSP, total suspended particulate)
$PM_{10}$ .....particulate matter 10 microns and less in diameter
$PM_{2.5}$ .....particulate matter 2.5 microns and less in diameter
pph.....pounds per hour
ppmv ..... parts per million by volume
PSD .....Prevention of Significant Deterioration
RATA.....Relative Accuracy Test Assessment
RICE .....reciprocating internal combustion engine
rpm ..... revolutions per minute
scfm.....standard cubic feet per minute
SI ..... spark ignition
$SO_2$ ..... sulfur dioxide
SSM.....Startup Shutdown Maintenance (see SSM definition)
TAP ..... Toxic Air Pollutant
TBD.....to be determined
THC.....total hydrocarbons
TSP..... Total Suspended Particulates
tpy .....tons per year
ULPS..... ultra low pressure separator
ULSD .....ultra low sulfur diesel
USEPA..... United States Environmental Protection Agency
UTM.....Universal Transverse Mercator Coordinate system

# APPENDIX M. GCP-O&G # 8851

**Acknowledgements Section - EOG - Bandit Compressor Station**

**Construction Status** Existing Permitted (or NOI) Facility

☑ I acknowledge that a pre-application meeting is available to me upon request.

☑ For new registrations or modifications, a check for the registration fee will be sent to the Department for ten fee points for GCP-O&G or $500 for NOIs. We cannot begin processing your action until the full fee is received by the Department. You will receive an email when your action is assigned for review.

☑ There is an annual fee for GCP-O&G in addition to the registration fee: www.env.nm.gov/air-quality/permit-fees-2/ (No annual fee for NOIs. (Facilities qualifying as a 'small business' under 20.2.75.7.F NMAC qualify for reduced fees, provided that NMED has a Small Business Certification Form from your company on file. This form can be found at: www.env.nm.gov/aqb/sbap/Small_Business_Forms.html)

☑ There are required attachments in addition to inputting data in the program. I will include the required attachments.

**1.** Is the facility located in Bernalillo County, on tribal lands, or in a nonattainment area?
○ Yes ◉ No

**2.** Is the facility's SIC code 1311, 1321, 4619, 4612 or 4922? (Other SIC codes may be approved provided that all the equipment at the facility is allowed in the GCP-Oil & Gas Permit. Non-Oil and Gas NOIs should use the paper Universal Application.
◉ Yes ○ No

**GCP-O&G Acknowledgements and Applicability**

Do not use Portal for administrative changes identified in the GCP O&G Permit Condition C101.A. Please use the Permitting Administrative Multiform to submit these requests to the department by mail. www.env.nm.gov/air-quality/air-quality-permit-applications-forms-and-related-information/

☑ The emissions specified in this Registration Form will establish the emission limits in the GCP-Oil and Gas.

**1.** This is a GCP-Oil and Gas Registration Form for an existing facility currently operating under GCP-1 or GCP-4? (No fee required)
◉ No ○ Yes

**2.** Does the regulated equipment under this GCP-Oil and Gas Registration include any combination of Allowable Equipment listed in Table 104 of the GCP Oil & Gas Permit, and no others?
◉ Yes ○ No

**3.** Will the regulated equipment as specified in this GCP-Oil and Gas Registration emit less than the total emissions in Table 106 of the GCP-Oil and Gas permit?
◉ Yes ○ No

**4.** Does all equipment comply with the stack parameter requirements as established in the GCP-Oil and Gas Permit?
◉ Yes ○ No

**5.** Equipment shall be at least 100 meters (m) from any stack to terrain that is five (5) or more meters above the top of the stack. Will the equipment at the facility meet this terrain requirement?
◉ Yes ○ No

**6.** Is the facility at least 150 m from any source that emits over 25 tons/year of NOx? This is the distance between the two nearest stacks that emit NOx at each of the facilities. Not the facility boundaries or the center to center distances.
◉ Yes ○ No

**7.** Is the facility at least 3 miles from any Class I area? This is the distance from the nearest facility boundary to the nearest boundary of the Class I area.
◉ Yes ○ No

# Electronic Permitting Application

**Use this application for NOI and GCP-Oil and Gas Permits.**

Use this application for: the initial application, modifications, revisions and when converting from another permit type. Please fill out all sections so that they have check marks and attach all required documents for review. Coordination with AQB is encouraged for first time users. Please use the Request NMED Support button if you would like to set up a walk through.

## Section 1 - Facility Information

Add a New Regulated Source

[1] Unit numbers must correspond to unit numbers in the previous permit unless a complete cross reference table of all units in both permits is provided.
[2] Specify dates required to determine regulatory applicability. If only year or month is known use 01/01/yyyy or mm/01/yyyy.
[3] To properly account for power conversion efficiencies, generator set rated capacity shall be reported as the rated capacity of the engine in horsepower, not the kilowatt capacity of the generator set.

## Table 2C - Emissions Reduction Equipment

☐ **This Table was intentionally left blank.**

In accordance with 20.2.72.203.A(3) and (8) NMAC, 20.2.70.300.D(5)(b) and (e) NMAC, and 20.2.73.200.B(7) NMAC, the permittee shall report all control devices and list each pollutant controlled by the control device regardless if the applicant takes credit for the reduction in emissions. **Also include reductions from process equipment in this table. Entering process equipment in this table is for data entry purposes only, the process vs control analysis will be used to determine process or control status for VRUs.** Only list control equipment for TAPs if the TAPs maximum uncontrolled emissions rate is over its respective threshold as listed in 20.2.72 NMAC, Subpart V, Tables A and B.

| Edit | Reduction Equipment Unit No. | Reduction Equipment Description | Date Installed (mm/dd/yyyy). | Reduced Pollutants | Reducing Emissions for Unit Numbers | Efficiency (% Reduction by Weight) | Method used to estimate reduction | Reduction Type | Complete |

Add Reduction Equipment for Unit [Select one] Add

How to complete the table: In the drop down, select regulated sources from Table 2A where emissions are reduced and click "Add." Then add reduced pollutants and associated reduction devices for each. If a pollutant has emissions reduced by more than one device please add a line for each device and label them as primary, secondary, tertiary. Click "Edit" to update reduced pollutants and devices for each regulated source.

Comments (4000 character maximum)

**List each reduction device and all sources they serve, e.g. FL-1: Oil tanks 1-4, loading, VRU downtime. FL-2: compressor and sales downtime. For NOIs, indicate the enforceability behind each device or clarify if it is voluntary and no credit is being claimed for the reduction, e.g., FL-1: Oil tanks 1-8 (OOOOa). FL-1: Loading (voluntary, no emissions reduction credit claimed.)**

FL-1: TK-1 thru TK-4, DEHY, VRU downtime, LOAD
Cat: ENG-1 thru ENG-9

## *Table 2-D: Maximum Emissions* (under normal operating conditions)

**This Table was intentionally left blank because it would be identical to Table 2-E.**

Maximum Emissions are the emissions at maximum capacity and prior to (in the absence of) pollution control, emission-reducing process equipment, or any other emission reduction. Calculate the hourly emissions using the worst case hourly emissions for each pollutant. For each pollutant, calculate the annual emissions as if the facility were operating at maximum plant capacity without pollution controls for 8760 hours per year, unless otherwise approved by the Department. List Hazardous Air Pollutants (HAP) & Toxic Air Pollutants (TAPs) in Table 2-I. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41).

**Comments** (2000 character maximum)

## Table 2-E: Requested Allowable Emissions

Unit & stack numbering must be consistent throughout the application package. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41). Facility totals are a summation of all the emissions entered for equipment in this table plus total tpy SSM emissions from Table 2F.
**GCP-O&G:** Combustion emissions from malfunction events are not allowed under this permit.

**NOI:** Malfunction emissions are not allowed under a Notice of Intent.

## Table 2-F: Startup, Shutdown, and Routine Maintenance (SSM) Emissions

☐ **This table is intentionally left blank as all SSM emissions at this facility do not require an increase in Requested Allowables greater than those listed in Table 2-E.**

All applications for facilities that have emissions during routine our predictable startup, shutdown or scheduled maintenance (SSM)2, including NOI applications, must include in this table the Maximum Emissions during routine or predictable startup, shutdown and scheduled maintenance (20.2.7 NMAC, 20.2.72.203.A.3 NMAC, 20.2.73.200.D.2 NMAC). Provide emissions calculations for all SSM emissions reported in this table. Refer to the guidance "Startup, Shutdown, Maintenance Emissions in Permits" (www.env.nm.gov/air-quality/permitting-section-procedures-and-guidance/) for more detailed instructions. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41).

## Table 2-I: Stack Exit and Fugitive Emission Rates for HAPs and TAPs

☐ **By marking this table as intentionally left blank, you certify that the Total and individual HAPs for this facility are less than 1 ton per year.**

Data may not be provided for subject items (SIs) that are not complete. Please edit the SI in Table 2-A before providing information here.

**GCPs:** Report the potential emission rate for each HAP from each HAP emitting emission unit listed in Table 2A. For each emission unit, HAPs shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41). Emissions less than 0.0001 lb/hr or 0.0001 tpy and emission units that do not emit HAPs shall be omitted from the table. Each facility-wide Individual HAP total and the facility-wide Total HAPs is the sum of all HAP sources entered in the Table. Use the HAP nomenclature as it appears in Section 112 (b) of the 1990 CAA. Include tank-flashing emission estimates of HAP in this table.

**NOIs:** Report the individual and/or Total HAPs for each piece of equipment in Table 2A, only if the facility total for that pollutant is greater than or equal to 1 tpy.

| Edit | Unit No. | Total HAPs | | Formaldehyde HAP | | Acetaldehyde; (Ethyl aldehyde) HAP | | Acrolein HAP | | Hexane HAP | | Benzene HAP | | Toluene; (Methyl benzene) HAP | | Ethylbenzene HAP | | Xylenes (total); (Xylol) HAP | | Complete |

**AQB ePermitting Portal**

# Abbreviated Application (GCP-Oil and Gas)

☒ 1. I understand that I must submit the hard copy check and required Payment Information form for all AQB ePermitting Portal Submittals before it will be assigned, and the 30-day review period begins. (Does not apply if you are converting from a GCP-1 or GCP-4 Permit)

☒ 2. I understand the AQB ePermitting Portal is currently in Beta Testing and I will use the Request NMED Support function in the Portal to: request help, report issues (bugs), and to provide my constructive feedback for improving the Portal.

# Section 1
## Facility Name or Facility Type Change for Modifications

---

Fill out this section if requesting a change to the facility name or facility type that appears in the ePermitting Portal. These items cannot be updated through the Portal and will be corrected as part of the review of your permit.

---

Check the appropriate box(es) and provide complete information in the table.
☒ **Not applicable**
☐ 1. Changing facility name.
☐ 2. Changing facility type.

# Section 3
## Registration Summary

---

**The Registration Summary:** Provide information about the registration submittal. The Registration Summary shall include a brief description of the facility and its process. In case of a modification to a facility, please describe the proposed changes.

---

**Registration Summary:** EOG Resources, Inc. (EOG) is submitting this application pursuant to 20.2.72.200.A for the Bandit Compressor Station (Bandit) to revise its existing permit. The revision is to update the Caterpillar engine emission factors for CO, VOC, and formaldehyde, and to add a Waukesha engine. The facility dehydrates and compresses natural gas to enable transport via pipeline. Bandit is located approximately 23.5 miles west of Jal in Lea County, New Mexico. This facility has already been public noticed for a GCP O&G.

The facility includes the following regulated emission sources:

- (9) Caterpillar G3608 A4 natural gas fired engines (ENG-1 through ENG-9)
- (1) Waukesha P9394GSI S5 natural gas fired engine (ENG-10)
- (1) Process flare with a maximum volumetric flow rate of 5 MMSCFD (FL-1)
- (1) 150 MMSCFD TEG (triethylene glycol) dehydrator with associated 3.0 MMBtu/hr reboiler (DEHY and RBL-1)
- (1) 2.0 MMBtu/hr heated separator (HTR-1)
- (3) 750 bbl condensate storage tanks (TK-1 thru TK-3)
- (1) 750 bbl produced water storage tanks (TK-4)
- Condensate and water loading emissions (LOAD)
- Facility-wide fugitive emissions (FUG)
- Startup, shutdown, and maintenance emissions (SSM)
- Malfunction emissions (MALF)

**Written description of the routine operations of the facility:**
The Bandit facility is a compressor station and dehydrates natural gas and compresses the gas to transport via pipeline. The inlet gas stream is separated into two phases (liquid and gas) as it passes through a slug catcher.

The water and hydrocarbon liquids are sent to a 3-phase heated separator where condensate and produced water are separated from gaseous hydrocarbons. The condensate and produced water are sent to their respective storage tanks. Flash gas and working and breathing emissions from the tanks are controlled by the process flare. The gas from the 3-phase heated separator is sent to a VRU where it is compressed and routed back to the slug catcher as a recycle stream. In the event of VRU downtime, the gas from the heated separator is routed to the process flare.

The gas from the slug catcher is sent to the engines for compression, and the compressed gas is then sent to a filter separator where gas is separated from the liquids. These liquids are routed back as a recycle stream to the initial stream entering the slug catcher. The gas from the filter separator (dehydrator inlet separator) is routed to the glycol contactor.

The TEG dehydrator removes water from the gas stream entering the glycol contactor. Dehydrated gas leaves, passes through a heat exchanger and is sent to oil wells and is used for fuel. Once lean TEG absorbs the water from the gas stream, it leaves as a rich stream from the bottom of the contactor which is then sent to a flash tank where gaseous hydrocarbons are routed to the VRU (or flare in event of VRU downtime). The TEG is then sent to the glycol regenerator (and associated reboiler) where the TEG is reconcentrated by removal of the water. The water vapor is sent to a BTEX condenser and subsequent water knockout vessel. The BTEX vapors are routed to the flare and the separated water is routed to the produced water tank. The lean TEG leaving the regenerator passes through a heat exchanger where it is cooled and then recycled and reintroduced to the glycol contactor where the dehydration process begins again.

The vapor recovery unit (VRU) is designed to minimize economic losses by stabilizing vapors before entering storage in the oil tanks and recovering salable vapors to send to the sales gas line. The VRU is part of the physical and operational design of the facility. This is consistent with the discussions of the use of VRUs to route vapors to a sales gas line in the September 28, 2012 EPA response letter to API regarding NSPS OOOO.

**Routine or predictable emissions during Startup, Shutdown and Maintenance (SSM):** EOG is requesting 3 tpy VOC, 1 tpy HAP, and 3 lb/hr and 2 tpy $H_2S$ for SSM activities.

☐ No SSM emissions are expected for this facility.

SSM Activities that are being controlled:

**Malfunction Emissions (M):** EOG is requesting 1 tpy VOC, 1 tpy HAP, and 3 lb/hr and 2 tpy $H_2S$ for malfunction emissions.

The permit does not authorize combustion emissions for malfunctions. The permit does not authorize emissions from SSM and Malfunction to be combined as 10 TPY VOC. However, they may be permitted separately. In the allowable emissions table in Section 2, these two events are separate line items and must be kept separate.

☐ No Malfunction emissions are requested for this permit.

**Allowable Operations:** Check the appropriate box below:

☒ Facility operates continuously (8760 hours per year)

☐ The following regulated equipment will operate less than 8760 hours per year. Add additional rows as necessary. These units are subject to Condition A108.C of the Permit.

## Verification of Compliance with Stack Parameter Requirements:

**Please use the Stack Calculator and Stack Requirements Explained Guidance on our website: All of the verification information below is required to be filled out.**

www.env.nm.gov/air-quality/air-quality-oil-and-gas-gcp-application-forms/

Check the box for each type of equipment at this facility:

☒ Engine(s)
☐ Turbine(s)
☒ Flares(s)
☐ Enclosed Combustion Device (s)
☒ Heater(s)
☒ Reboiler(s)

For each type of equipment checked above, complete the applicable section below.

### Engines

1. Calculate the pound per hour (lb/hr) $NO_x$ emission rate according to GCP O&G Condition A202.I Step 1 on page 15 of the GCP O&G. Enter this value in the top row of the table below.
2. Based on the calculated facility total $NO_x$ emission rate, determine the minimum stack parameter requirements for engines and heaters from Table 1: Engines (page 17) of the GCP O&G and enter the minimum parameters from Table 1 (page 17) of the GCP O&G in the bottom row of the table below.
3. Enter the stack parameters from each engine and heater in the blank rows of the table below. Add rows as necessary.

**Table B: Engine/Generator/Heater/Reboiler Stack Parameter Verification:**

| **Calculated Facility Total NOx Emission Rate: 16.4 lb/hr** | | | | |
|---|---|---|---|---|
| **Engine/Generator/Heater/Reboiler Unit Number** | **Height (ft)** | **Temperature (°F)** | **Velocity (ft/s)** | **Diameter (ft)** |
| HTR-1 | 20 | 600 | 0.48 | 6 |
| RBL-1 | 20 | 600 | 0.72 | 6 |
| ENG-1 thru ENG-9 | 29 | 779 | 82.3 | 2 |
| ENG-10 | 29 | 1069 | 52.1 | 2 |

| **Calculated Facility Total NOx Emission Rate: 16.4 lb/hr** | | | | |
|---|---|---|---|---|
| **Engine/Generator/Heater/Reboiler Unit Number** | **Height (ft)** | **Temperature (°F)** | **Velocity (ft/s)** | **Diameter (ft)** |
| **Table 1 Minimum Parameters:** For verification, list the minimum parameters based on the NOx lb/hr emission rate from the GCP O&G Table 1. | 14.8 | 854 | 88.6 | 0.8 |

4. Do all engines and heaters comply with the minimum stack parameters from Table 1 (page 17) of the GCP O&G?

☐ Yes. Skip step 5 below.

☒ No. Go to step 5 below.

5. For engines and heaters that do not comply with the minimum stack parameters in Table 1 of the GCP O&G, explain and demonstrate in detail how the engines and heaters will be authorized according to the steps on page 16 of the GCP O&G or Condition A203.C of the GCP O&G. Show all calculations.

The heater and reboiler (HTR-1, RBL-1) do not meet the minimum height, temperature or velocity requirements listed in Table 1. However, these units are authorized pursuant to GCP-O&G condition A203.C since the total hourly NOX emissions rate is less than 1.23 lb/hr. The engines (ENG-1 thru ENG-10) do not meet the minimum temperature or velocity requirement but are at least 6.6 ft taller than the minimum height and are therefore in compliance.

**Turbines**

1. Calculate the pound per hour (lb/hr) $NO_x$ emission rate according to GCP O&G Condition A202.I Step 1 on page 17 of the GCP O&G. Enter this value in the top row of the table below.
2. Based on the calculated facility total $NO_x$ emission rate, determine the minimum stack parameter requirements for turbines and heaters from Table 2: Turbines (page 18) of the GCP O&G. Enter the minimum parameters from Table 2 (page 18) of the GCP O&G in the bottom row of the table below.
3. Enter the stack parameters from each turbine and heater in the blank rows of the table below. Add rows as necessary.

**Table C: Turbine/Heater/Reboiler Stack Parameter Verification:**

| **Calculated Facility Total NOx Emission Rate: _____lb/hr** | | | | |
|---|---|---|---|---|
| **Turbine/Heater/Reboiler Unit Number** | **Height (ft)** | **Temperature (°F)** | **Velocity (ft/s)** | **Diameter (ft)** |
| | | | | |
| | | | | |
| | | | | |
| **Table 2 Minimum Parameters:** For verification, list the minimum parameters based on the NOx lb/hr emission rate from the GCP O&G Table 2. | | | | |

4. Do all turbines and heaters comply with the minimum stack parameters from Table 2 (page 18) of the GCP O&G?

☐ Yes. Skip step 5 below.

☐ No. Go to step 5 below.

5. For turbines and heaters that do not comply with the minimum stack parameters in Table 2 of the GCP O&G, explain and demonstrate in detail how the turbines and heaters will be authorized according to the steps on page 18 of the GCP O&G or Condition A203.C of the GCP O&G. Show all calculations.

**Flares**

1. Enter $SO_2$ emission rates (lb/hr) for each flare in the second column of the table below.
2. Based on the $SO_2$ emission rates, determine the minimum stack height requirements for flares from Table 3 (page 26) of the GCP O&G and enter the minimum stack height requirements for flares from Table 3 (page 26) of the GCP O&G in the last column of the table below.
3. Enter the stack height of each flare in the third column of the table below. Add rows as necessary.

**Table D: Flare Stack Height Parameter Verification:**

| Flare Unit Number | $SO_2$ Emission Rate (lb/hr) | Height (ft) | **Table 3 Minimum Stack Height:** For verification, list the minimum height parameters based on the SO2 emission rate from the GCP O&G Table 3. |
|---|---|---|---|
| FL-1 | 0.040 | 20 | 6.6 |
| | | | |
| | | | |
| | | | |

4. Do all flares comply with minimum stack height requirements?
   ☒ Yes
   ☐ No

5. Does the flare gas contain 6% $H_2S$ or less by volume (pre-combustion)?
   ☒ Yes. Skip step 6 below.
   ☐ No. Go to step 6 below.

6. Explain in detail how assist gas will be added to reduce the gas composition to 6% $H_2S$ or less by volume.

**Enclosed Combustion Device(s) (ECD) and Vapor Combustion Unit(s) (VCU):**

According to GCP O&G Condition A208.A, the facility must meet one of the following options if an ECD or VCU is installed at the facility:

Option 1:

1. Will the ECD(s) meet the $SO_2$ emission limit of 0.7 lb/hr and operate with a velocity of at least one (1) foot per second?
   ☐ Yes. Skip Option 2 below.
   ☐ No. Go to Option 2 below.

Option 2:

2. Will the ECD(s) meet the $SO_2$ emission limit of 0.9 lb/hr and operate with a velocity of at least two (2) feet per second?
   ☐ Yes
   ☐ No

# Section 5

## Emissions Calculation Forms

The Department has developed the Air Emissions Calculation Tool (AECT), which is required to be used in the GCP-Oil and Gas Registration. If the AECT, for a piece of equipment is under development, provide alternate calculations. **Do not include alternative calculations unless there is an issue being resolved with the AECT. This will delay review of the application.** The AECT and this Registration Form may be updated as needed.

**Tank Emissions Calculations**: Provide the method used to estimate tank-flashing emissions, the input and output summary from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis. If Pro-Max or Hysis is used, all relevant input parameters shall be reported, including separator pressure, gas throughput, and all other relevant parameters necessary for flashing calculation. **The inputs must match the gas analyses information submitted. Inputs that don't match may be grounds for denial of the application submittal.**

**SSM Calculations**: In this Section, provide emissions calculations for Startup, Shutdown, and Routine Maintenance (SSM) emissions listed in the Table 2, and the rational for why the others are reported as zero (or left blank).

**Control Devices:** Report all control devices and list each pollutant controlled by the control device. Indicate in this section if you chose to not take credit for the reduction in emission rates. Only uncontrolled emission rates can be considered to determine applicability unless the state or federal acts require the control. This information is necessary to determine if federally enforceable conditions are necessary for the control device, and if the control device produces its own regulated pollutants or increases emission rates of other pollutants.

**Calculation Details:** The AECT is required for all emission calculations. If the AECT is not functioning, alternative calculations may be submitted only for the portions of the AECT with issues being resolved. Utilize this section to explain in detail, on an equipment-by-equipment basis, why alternative calculations are necessary.

**Explain here:**

**Equipment Forms attached for this section (add additional rows as necessary):**

| Equipment Type | Quantity | Check Box to Indicate Units that are Controlled | Enter Control Device Type and Pollutant Controlled |
|---|---|---|---|
| **Engine** | **10** | ☒ | *NOx, CO, VOC, HCHO* |
| **Turbine** | | ☐ | |
| **Tanks** | **4** | ☒ | *Flare (VOC, HAP, H2S)* |
| **Generator** | | ☐ | |
| **VRU** | **1** | ☒ | *Flare (VOC, HAP, H2S)* |
| **VRT** | | ☒ | |
| **ULPS** | | ☐ | |
| **Glycol Dehydrator** | **1** | ☒ | *Flare (VOC, HAP, H2S)* |
| **Flare** | **1** | ☒ | *Tanks, Loading, VRU downtime, Dehydrator* |
| **Amine Unit** | | ☐ | |
| **Cryogenic Unit** | | ☐ | |
| **Fugitive Emissions** | **1** | ☐ | |
| **Heater** | **1** | ☐ | |
| **Truck Loading** | **1** | ☒ | *Vapor capture, Flare (VOC, HAP, H2S)* |
| **Enclosed Combustion Device (ECD)** | | ☐ | |
| **Thermal Oxidizer (TO)** | | ☐ | |
| **Reboiler** | **1** | ☐ | |

| | | | |
|---|---|---|---|
| **Other** | | ☐ | |

**For each scenario below, if there are more than one emissions unit, control device, or gas combustion scenario. Please copy and paste each applicable section and label the unit number(s) if the scenarios vary.**

**Vapor Recovery Tower, Ultra Low-Pressure Separator, or Flash Tower Located Upstream of Storage Vessels:** If the facility contains one of the following units located upstream of the storage vessels and is used to flash and capture flashing emissions, check the appropriate box.
Unit number:
☐ Vapor Recovery Tower and VRU Compressor
☐ ULPS and VRU Compressor
☐ Flash Tower and VRU Compressor

**Vapor Recovery Unit (VRU) located upstream of Storage Vessels:** Check the box below if the facility is using a VRU to capture flashing emissions prior to any storage vessels to limit the PTE of the storage vessels to below applicability thresholds of NSPS OOOO or NSPS OOOOa. A process vs control determination should be prepared for this type of VRU application.
Unit number:
☐ VRU capturing emissions prior to any storage vessel and routing directly to the sales pipeline

**Vapor Recovery Unit (VRU) attached to Storage Vessels:** Check the box below if this facility is using a VRU to reduce storage vessel emissions to limit the PTE to below NSPS OOOO or NSPS OOOOa applicability thresholds:
Unit number:
☐ VRU controlling Storage Vessel emissions and the facility is subject to the requirements under NSPS OOOO, 40 CFR 60.5411
☐ VRU controlling Storage Vessel emissions and the facility is subject to the requirements under NSPS OOOOa, 40 CFR 60.5411a

**Gas Combustion Scenarios:** Read through the scenarios below and check the boxes next to any appropriate facility operating scenarios. Flares shall assume a destruction efficiency of 95%, unless the facility is subject to requirements for flares under 40 CFR 60.18, or a higher destruction efficiency (up to 98%) is supported by a manufacturer specification sheet (MSS) for that unit. If so, include the MSS.

A flare, vapor combustion unit (VCU), enclosed combustion device (ECD), thermal oxidizer (TO):
Unit number: FL-1
☐ Controls storage vessels in accordance with 40 CFR 60, Subpart OOOO or OOOOa.
☒ Provides a federally enforceable control for the storage vessels to limit the PTE to below applicability thresholds of 40 CFR 60, Subpart OOOO or OOOOa.
☒ Controls the glycol dehydrator
☐ Controls the amine unit
☒ Controls truck loading
☒ Operates only during maintenance events, such as VRU downtime, check one below:
  ☐ The emissions during VRU downtime are represented as uncontrolled VOC emissions from the compressor
  ☒ The combustion emissions during VRU downtime are represented as controlled emissions from the combustion device

☐ Controls the facility during plant turnaround

**Amine Unit:** Provide the following information for each amine unit.

| | |
|---|---|
| Design Capacity in MMscf/day | |
| Rich Amine Flowrate in gal/min | |
| Lean Amine Flowrate in gal/min | |
| Mole Loading $H_2S$ | |
| Sour Gas Input in MMscf/day | |

**Glycol Dehydration Unit(s):** Provide the following information for each glycol dehydration unit:
Please include an extended gas analysis in Section 6 of this application.

| Unit # | Glycol Pump Circulation Rate |
|---|---|
| DEHY | 10 gpm |

**Voluntary Monitoring in Accordance with §40 CFR 60.5416(a):** Check the box(s) to implement a program that meets the requirements of 40 CFR 60.5416(a). This monitoring program will be conducted in lieu of the monitoring requirements established in the GCP-Oil and Gas for individual equipment. Ceasing to implement this alternative monitoring must be reported in an updated Registration Form to the Department.

☐ Condition A205.B Control Device Options, Requirements, and Inspections for Tanks
☐ Condition A206.B Truck Loading Control Device Inspection
☐ Condition A206.C Vapor Balancing During Truck Loading
☐ Condition A209.A Vapor Recovery Unit or Department-approved Equivalent
☐ Condition A210.B Amine Unit Control Device Inspection

**Fugitive $H_2S$ Screening Threshold and Monitoring in accordance with Condition A212:** Check the box that applies.

☒ Condition A212.A does not apply because the facility is below the fugitive $H_2S$ screening threshold in Condition A212, or

☐ Condition A212.A applies. Because the facility is above the fugitive $H_2S$ screening threshold in Condition A212, or the facility is voluntarily complying with Condition A212.A, and Condition A212.A applies

# Section 6

## Information Used to Determine Emissions

Check the box for each type of information submitted in the required attachments. This documentation is required if applicable to the facility.

**Failure to include applicable supporting documentation may result in application denial.**

☒ Specifications for control equipment, including control efficiency specifications and sufficient engineering data for verification of control equipment operation, including design drawings, test reports, and design parameters that affect normal operation.

- ☒ Engine or Generator Manufacturer specifications
- ☒ Catalyst Manufacturer specifications (If a catalyst is being utilized to reduce emissions, the catalyst manufacturer emission factors must be used in all emission calculations. A 25% safety factor may be applied to each pollutant.
- ☒ NSPS JJJJ emission factors **may not** be utilized in lieu of catalyst manufacture specifications when a catalyst is installed, and the catalysts manufacturer achieves higher control efficiency.
- ☒ Flare Manufacturer specifications
- ☐ Oil/Liquid Analysis: This data is required to match the inputs in all applicable emission calculations. For facilities that have not been constructed and a representative analysis is used it cannot be older than 1 year. For existing facilities, the gas analyses required by Condition A201.A (must be 1 year old or less).
- ☐ Gas Analysis (must be 1 year old or less) This data is required to match the inputs in all applicable emission calculations.

- ☐ Extended Gas Analysis (must be 1 year old or less) This data is required to match the inputs in all applicable emission calculations.

- ☒ If requesting to use a representative gas sample, include a discussion of why the sample is representative for this facility and an explanation of how it is representative (e.g., same reservoir, same similar API gravity, similar composition).

☐ If test data are used, to support emissions calculations or to establish allowable emission limits, include a copy of the complete test report. If the test data are for an emissions unit other than the one being permitted, the emission units must be identical. Test data may not be used if any difference in operating conditions of the unit being permitted and the unit represented in the test report significantly effect emission rates.

☐ Fuel specifications sheet.

☒ If computer models are used to estimate emissions, include an input summary and a detailed report, and a disk containing the input file used to run the model.

☒ For tank-flashing emissions, include a discussion of the method used to estimate tank-flashing emissions, accuracy of the model, the **input and output** summary from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis.

---

**Representative Gas Analysis Justification:** The representative analysis is from a site that processes gas from the same producing reservoir/formation as the actual site stream; the gas being handled at the representative site and the actual site have very similar components and properties; and the representative analysis is taken from a site that processes the stream in a similar manner as the actual site.

# Section 8A

## Applicable State & Federal Regulations

**Provide a discussion demonstrating compliance with each applicable state & federal regulation**. All input cells should be filled in, even if the response is 'No' or 'N/A'.

In the "Justification" column, identify the criteria that are critical to the applicability determination, numbering each. For each unit listed in the "Applies to Unit No(s)" column, after each listed unit, include the lowest level citation of the applicable regulation. For each unit, list the information necessary to verify the applicability of the regulation, including date of manufacture, date of construction, size (hp), and combustion type. Doing so will provide the applicability criteria for each unit.

### Applicable STATE REGULATIONS:

| STATE REGU-LATIONS CITATION | Title | Federally Enforceable | Overview of Regulation | Unit(s) or Facility | Applies? (Yes or No) | JUSTIFICATION: Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 $m^3$, 3. VOL) |
|---|---|---|---|---|---|---|
| 20.2.1 NMAC | General Provisions | Yes | General Provisions apply to Notice of Intent, Construction, and Title V permit applications. | Facility | Yes | EOG Resources, Inc. will comply with the applicable requirements for the entire facility. |
| 20.2.3 NMAC | Ambient Air Quality Standards NMAAQS | Yes | 20.2.3 NMAC is a State Implementation Plan (SIP) approved regulation that limits the maximum allowable concentration of Sulfur Compounds, Carbon Monoxide, and Nitrogen Dioxide. | Facility | Yes | NAAQS is applicable. Per NMED guidance, documentation of compliance with GCP requirements constitutes documentation of compliance with NAAQS. |
| 20.2.7 NMAC | Excess Emissions | Yes | If your entire facility or individual pieces of equipment are subject to emissions limits in a permit or numerical emissions standards in a federal or state regulation, this applies. | Facility | Yes | EOG Resources, Inc. will comply with the applicable requirements for the entire facility. |
| 20.2.38 NMAC | Hydrocarbon Storage Facility | No | Use the regulation link (left) then cut & paste applicable sections. | N/A | No | The facility is not subject to this regulation for the following reasons:<br>(a) This facility does not store hydrocarbons containing hydrogen sulfide in a container associated with a petroleum production facility of petroleum processing facility having a capacity of 20,000 gallons or greater with a throughput of at least 30,000 gallons per week (20.2.38.109);<br>(b)The tank battery or storage facility is not within a municipality (20.2.38.110) or within five miles of a municipality (20.2.38.111);<br>(c) This facility is not a new tank battery with a |

| STATE REGU-LATIONS CITATION | Title | Federally Enforceable | Overview of Regulation | Unit(s) or Facility | Applies? (Yes or No) | JUSTIFICATION: Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 $m^3$, 3. VOL) |
|---|---|---|---|---|---|---|
| | | | | | | capacity of 65,000 gallons or greater (20.2.38.112); (d) The facility is not located outside of the Pecos-Permian intrastate air quality control region, located within the corporate limits of any municipality within the state or located within five miles of the corporate limits of any municipality within the state that has a population of 20,000 or greater (20.2.38.113) |
| 20.2.61.109 NMAC | Smoke & Visible Emissions | No | Engines and heaters are Stationary Combustion Equipment. Specify units subject to this regulation. | HTR-1, RBL-1, ENG-1 thru ENG-10, FL-1 | Yes | EOG Resources, Inc. does not expect visible emissions from the gas fired heater, reboiler, engines, or flare to equal or exceed 20% opacity. |
| 20.2.73 NMAC | NOI & Emissions Inventory Requirements | Yes | NOI: 20.2.73.200 NMAC applies to all facilities emitting over 10 TPY of any regulated air contaminate. Thus, permitted facilities are also subject to this rule. This GCP-O&G registration also serves the purpose of meeting 20.2.73 the NMAC notification requirements.)<br><br>Emissions Inventory: 20.2.73.300.A(1) NMAC applies to facilities registering under the GCP. Emission Inventory reporting is required upon request by the department per 20.2.73.300.B(4) NMAC. | Facility | Yes | Under 20.2.73.300.B(4) NMAC, the NMED is requesting emissions inventory reporting from minor sources for **calendar year 2020**. |
| 20.2.77 NMAC | New Source Performance | Yes | This is a stationary source which is subject to the requirements of 40 CFR Part 60, as amended on the date of certification. | ENG-1 thru ENG-10, FUG | Yes | This is a stationary source, which is subject to the requirements of 40 CFR Part 60, therefore, this regulation applies to the facility. |
| 20.2.78 NMAC | Emission Standards for HAPS | Yes | This facility emits hazardous air pollutants which are subject to the requirements of 40 CFR Part 61, as amended on the date of certification. | N/A | No | Does not apply. There are no applicable NESHAP standards. |

| STATE REGU-LATIONS CITATION | Title | Federally Enforceable | Overview of Regulation | Unit(s) or Facility | Applies? (Yes or No) | JUSTIFICATION: Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 $m^3$, 3. VOL) |
|---|---|---|---|---|---|---|
| 20.2.82 NMAC | MACT Standards for source categories of HAPS | Yes | This regulation applies to all sources emitting hazardous air pollutants, which are subject to the requirements of 40 CFR Part 63, as amended on the date of certification. | ENG-1 thru ENG-10, DEHY | Yes | This facility has sources which are subject to 40 CFR 63 and therefore, this regulation applies to this facility. |

**Applicable FEDERAL REGULATIONS (This is not an exhaustive list; add applicable regulations such as NSPS GG and KKKK):**

| FEDERAL REGU-LATIONS CITATION | Title | Overview of Regulation | Units(s) or Facility | Applies? (Yes or No) | JUSTIFICATION: Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 m3, 3. VOL) |
|---|---|---|---|---|---|
| 40 CFR 50 | NAAQS | Defined as applicable at 20.2.70.7.E.11, Any national ambient air quality standard | Facility | Yes | NAAQS is applicable. Per NMED guidance, documentation of compliance with GCP-Oil and Gas requirements constitutes documentation of compliance with NAAQS. |
| 40 CFR 60, Subpart A | General Provisions | Applies if any other NSPS subpart applies. | ENG-1 thru ENG-10, FUG | Yes | This facility is subject to 40 CFR 60 Subparts OOOOa and JJJJ and therefore, the general provisions apply. |
| 40 CFR 60, Subpart OOOO | Standards of Performance for Crude Oil and Natural Gas Production, Transmission and Distribution for which Construction, Modification or Reconstruction Commenced After August 23, 2011, and on or before September 18, 2015 | If there is a standard or other requirement, then the facility is an "affected facility." Currently there are standards for: gas wells (60.5375); centrifugal compressors (60.5380); reciprocating compressors (60.5385): controllers (60.5390); storage vessels (60.5395); equipment leaks (60.5400); sweetening units (60.5405).<br><br>**If standards apply, list the unit number(s) and regulatory citation of the standard that applies to that unit (e.g. Centrifugal Compressors 1a-3a are subject to the standards at 60.5380(a)(1) and (2) since we use a control device to reduce emissions)** | N/A | No | Facility was constructed after September 18, 2015. Does not apply. |
| 40 CFR 60, Subpart OOOOa | Standards of Performance for Crude Oil and Natural Gas Facilities for which Construction, Modification or Reconstruction | If there is a standard or other requirement, then the facility is an "affected facility." Currently there are standards for: gas wells (60.5375a); centrifugal | COMP-1 (ENG-1) thru COMP-10 | Yes | This subpart applies to fugitive emissions and to the reciprocating compressors which are located a compressor station. |

| FEDERAL REGULATIONS CITATION | Title | Overview of Regulation | Units(s) or Facility | Applies? (Yes or No) | JUSTIFICATION: Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 m3, 3. VOL) |
|---|---|---|---|---|---|
| | Commenced After September 18, 2015 | compressors (60.5380a); reciprocating compressors (60.5385a): controllers (60.5390a); storage vessels (60.5395a); fugitive emissions at well sites and compressor stations (60.5397a); equipment leaks at gas plants (60.5400a); sweetening units (60.5405a). | (ENG-10), FUG | | |
| 40 CFR 60, Subpart IIII | Standards of performance for Stationary Compression Ignition Internal Combustion Engines | See 40 CFR 60.4200(a) 1 through 4 to determine applicable category and state engine size, fuel type, and date of manufacture. | N/A | No | Does not apply. |
| 40 CFR 60, Subpart JJJJ | Standards of Performance for Stationary Spark Ignition Internal Combustion Engines | See 40 CFR 60.4230(a), 1 through 5 to determine applicable category and state engine size, fuel type, and date of manufacture. | ENG-1 thru ENG-10 | Yes | The engines are subject to Subpart JJJJ. |
| 40 CFR 63, Subpart A | General Provisions | Applies if any other subpart applies. | ENG-1 thru ENG-10, DEHY | Yes | The engines are subject to Subpart ZZZZ. The dehydrator is subject to Subpart HH. |
| 40 CFR 63, Subpart HH | NESHAP for Glycol Dehydrators | See 40 CFR 63, Subpart HH | DEHY | Yes | This facility is subject to 40 CFR 63 Subpart HH, which includes requirements applicable to area sources with TEG dehydrators. Although the site is not a major source of hazardous air pollutants (HAPs) it is still an area source and therefore this subpart applies. However, since Benzene emissions from the unit are less than 0.90 Mg/yr, the unit is exempt from multiple requirements of 40 CFR 63 pursuant to 40 CFR 63.764(e)(1)(ii).<br>Records will be maintained to demonstrate that the exemption criteria are being met in accordance with 40 CFR 63.774(d)(1). |
| 40 CFR 63, Subpart ZZZZ | NESHAP for Stationary Reciprocating Internal Combustion Engines (**RICE MACT**) | Facilities are subject to this subpart if they own or operate a stationary RICE, except if the stationary RICE is being tested at a stationary RICE test cell/stand. | ENG-1 thru ENG-10 | Yes | The engines are subject to Subpart ZZZZ. |

# Section 8B
# Compliance Test History

---

To evaluate the requirement for compliance tests, you must submit a compliance test history. The table below provides an example.

---

No compliance history to report.

# Section 9 Proof of Public Notice

## General Posting of Notice

I, _____, the undersigned, certify that on _____ **(DATE),** I posted a true and correct copy of the attached Public Notice in a publicly accessible and conspicuous place, visible from the nearest public road, at the entrance of the property on which the facility is, or is proposed to be, located.

Signed this _____ day of _____, _____,

_____ _____
Signature Date

_____
Printed Name Title {APPLICANT OR RELATIONSHIP TO APPLICANT}

## Newspaper Publication of Notice

☐ An original or copy of the actual newspaper advertisement posted in a newspaper in general circulation in the applicable county is attached. The original or copy of the advertisement includes the header showing the date and newspaper or publication title.

**OR**

☐ An affidavit from the newspaper or publication in general circulation in the applicable county stating that the advertisement was published is attached. The affidavit includes the date of the advertisement's publication, and a legible photocopy of the entire ad.

_____ _____
Signature Date

Printed Name Title {APPLICANT OR RELATIONSHIP TO APPLICANT}

# GCP-Oil and Gas PUBLIC NOTICE EXAMPLE

*20.2.72 NMAC – General Permits, Section 220.A(2)(b)ii*

**Use this example for all public notices for GCP-Oil and Gas permits (newspaper notice and site posting notice). Customize this document by modifying or deleting, all bracketed and bold text below. Posting of Public Notice is required at the facility entrance and in the newspaper in general circulation as described in Condition C100.B of the GCP-Oil and Gas Permit. Before printing the final notice, delete this sentence and all preceding and subsequent text in red.**

# NOTICE

**[Name of Company]** announces its intent to apply to the New Mexico Environment Department for an air quality General Construction Permit, **(GCP-Oil and Gas).** The name of this facility is **[Name of Facility]**. The expected date of the submittal of our Registration for an air quality permit to the Air Quality Bureau is **[date].** This notice is a requirement according to New Mexico air quality regulations.

The exact initial location of the facility is/will be **["UTM Zone 12/13, UTM Easting XXX, UTM Northing XXX"** The approximate location of this site is **XX.X** miles **[direction]** of **[town name (preferred) or, if no town within 30 miles, a reasonably close, well known point, such as the intersection of two roads, a well-known landmark, or road mile marker]** in **[county name]** county]. The standard operating schedule of this facility will be continuous.

Air emissions of any regulated air contaminant will be less than or equal to **[do not change the TPY values listed below]**:

| | | Tons per year (TPY) |
|---|---|---|
| 1. | Nitrogen Oxides ($NO_x$) | 95 |
| 2. | Carbon Monoxide (CO) | 95 |
| 3. | Volatile Organic Compounds (VOC) (stack) | 95 |
| 4. | Particulate Matter (PM10) | 25 |
| 5. | Particulate Matter (PM2.5) | 25 |
| 6. | Sulfur Dioxide ($SO_2$) | 95 |
| 7. | Hydrogen Sulfide (H2S) | 25 |
| 8. | Any one (1) Hazardous Air Pollutant (HAP) | <10 |
| 9. | Sum of all Hazardous Air Pollutants (HAPs) | < 25 |

The owner and/or operator of the Plant is:
**[Name, company, street address, city, state, zip code]**

If you have any questions or comments about construction or operation of above facility, and want your comments to be made as a part of the permit review process, you must submit your comments in writing to the address below:

New Mexico Environment Department
Air Quality Bureau Permit Section
525 Camino de los Marquez, Suite 1
Santa Fe, New Mexico, 87505
Phone (505) 476-4300
Fax (505) 476-4375

Other comments and questions may be submitted verbally.

**Please refer to the company name and site name, as used in this notice or send a copy of this notice along with your comments, since the Department may not have received the permit Registration at the time of this notice.**

**Attención**

Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono 505-476-5557.

**Notice of Non-Discrimination**

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Kathryn Becker, Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@state.nm.us. You may also visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

# APPENDIX N. GCP-O&G # 9177

**Acknowledgements Section - Bald Eagle LGL Station**

**Construction Status** Existing Permitted (or NOI) Facility

☑ I acknowledge that a pre-application meeting is available to me upon request.

☑ For new registrations or modifications, a check for the registration fee will be sent to the Department for ten fee points for GCP-O&G or $500 for NOIs. We cannot begin processing your action until the full fee is received by the Department. You will receive an email when your action is assigned for review.

☑ There is an annual fee for GCP-O&G in addition to the registration fee: www.env.nm.gov/air-quality/permit-fees-2/ (No annual fee for NOIs. (Facilities qualifying as a 'small business' under 20.2.75.7.F NMAC qualify for reduced fees, provided that NMED has a Small Business Certification Form from your company on file. This form can be found at: www.env.nm.gov/aqb/sbap/Small_Business_Forms.html)

☑ There are required attachments in addition to inputting data in the program. I will include the required attachments.

**1.** Is the facility located in Bernalillo County, on tribal lands, or in a nonattainment area?
○ Yes ◉ No

**2.** Is the facility's SIC code 1311, 1321, 4619, 4612 or 4922? (Other SIC codes may be approved provided that all the equipment at the facility is allowed in the GCP-Oil & Gas Permit. Non-Oil and Gas NOIs should use the paper Universal Application.
◉ Yes ○ No

**GCP-O&G Acknowledgements and Applicability**

Do not use Portal for administrative changes identified in the GCP O&G Permit Condition C101.A. Please use the Permitting Administrative Multiform to submit these requests to the department by mail. www.env.nm.gov/air-quality/air-quality-permit-applications-forms-and-related-information/

☑ The emissions specified in this Registration Form will establish the emission limits in the GCP-Oil and Gas.

**1.** This is a GCP-Oil and Gas Registration Form for an existing facility currently operating under GCP-1 or GCP-4? (No fee required)
◉ No ○ Yes

**2.** Does the regulated equipment under this GCP-Oil and Gas Registration include any combination of Allowable Equipment listed in Table 104 of the GCP Oil & Gas Permit, and no others?
◉ Yes ○ No

**3.** Will the regulated equipment as specified in this GCP-Oil and Gas Registration emit less than the total emissions in Table 106 of the GCP-Oil and Gas permit?
◉ Yes ○ No

**4.** Does all equipment comply with the stack parameter requirements as established in the GCP-Oil and Gas Permit?
◉ Yes ○ No

**5.** Equipment shall be at least 100 meters (m) from any stack to terrain that is five (5) or more meters above the top of the stack. Will the equipment at the facility meet this terrain requirement?
◉ Yes ○ No

**6.** Is the facility at least 150 m from any source that emits over 25 tons/year of NOx? This is the distance between the two nearest stacks that emit NOx at each of the facilities. Not the facility boundaries or the center to center distances.
◉ Yes ○ No

**7.** Is the facility at least 3 miles from any Class I area? This is the distance from the nearest facility boundary to the nearest boundary of the Class I area.
◉ Yes ○ No

# Electronic Permitting Application

**Use this application for NOI and GCP-Oil and Gas Permits.**

Use this application for: the initial application, modifications, revisions and when converting from another permit type. Please fill out all sections so that they have check marks and attach all required documents for review. Coordination with AQB is encouraged for first time users. Please use the Request NMED Support button if you would like to set up a walk through.

## Section 1 - Facility Information

**Section 1-A: Company Information - Bald Eagle LGL Station**
**Last modified by Espinoza, Cynthia on 23-JUN-22.**

| | | | |

Add a New Regulated Source

[1] Unit numbers must correspond to unit numbers in the previous permit unless a complete cross reference table of all units in both permits is provided.

[2] Specify dates required to determine regulatory applicability. If only year or month is known use 01/01/yyyy or mm/01/yyyy.

[3] To properly account for power conversion efficiencies, generator set rated capacity shall be reported as the rated capacity of the engine in horsepower, not the kilowatt capacity of the generator set.

## Table 2C - Emissions Reduction Equipment

☐ **This Table was intentionally left blank.**

In accordance with 20.2.72.203.A(3) and (8) NMAC, 20.2.70.300.D(5)(b) and (e) NMAC, and 20.2.73.200.B(7) NMAC, the permittee shall report all control devices and list each pollutant controlled by the control device regardless if the applicant takes credit for the reduction in emissions. **Also include reductions from process equipment in this table. Entering process equipment in this table is for data entry purposes only, the process vs control analysis will be used to determine process or control status for VRUs.** Only list control equipment for TAPs if the TAPs maximum uncontrolled emissions rate is over its respective threshold as listed in 20.2.72 NMAC, Subpart V, Tables A and B.

| Edit | Reduction Equipment Unit No. | Reduction Equipment Description | Date Installed (mm/dd/yyyy). | Reduced Pollutants | Reducing Emissions for Unit Numbers | Efficiency (% Reduction by Weight) | Method used to estimate reduction | Reduction Type | Complete |

Add Reduction Equipment for Unit [Select one] Add

How to complete the table: In the drop down, select regulated sources from Table 2A where emissions are reduced and click "Add." Then add reduced pollutants and associated reduction devices for each. If a pollutant has emissions reduced by more than one device please add a line for each device and label them as primary, secondary, tertiary. Click "Edit" to update reduced pollutants and devices for each regulated source.

Comments (4000 character maximum)

**List each reduction device and all sources they serve, e.g. FL-1: Oil tanks 1-4, loading, VRU downtime. FL-2: compressor and sales downtime. For NOIs, indicate the enforceability behind each device or clarify if it is voluntary and no credit is being claimed for the reduction, e.g., FL-1: Oil tanks 1-8 (OOOOa). FL-1: Loading (voluntary, no emissions reduction credit claimed.)**

FL-1: TK-1 thru TK-3, DEHY, VRU downtime

## *Table 2-D: Maximum Emissions* (under normal operating conditions)

**This Table was intentionally left blank because it would be identical to Table 2-E.**

Maximum Emissions are the emissions at maximum capacity and prior to (in the absence of) pollution control, emission-reducing process equipment, or any other emission reduction. Calculate the hourly emissions using the worst case hourly emissions for each pollutant. For each pollutant, calculate the annual emissions as if the facility were operating at maximum plant capacity without pollution controls for 8760 hours per year, unless otherwise approved by the Department. List Hazardous Air Pollutants (HAP) & Toxic Air Pollutants (TAPs) in Table 2-I. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41).

## Table 2-E: Requested Allowable Emissions

Unit & stack numbering must be consistent throughout the application package. Fill all cells in this table with the emission numbers or a "-" symbol. A "-" symbol indicates that emissions of this pollutant are not expected. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41). Facility totals are a summation of all the emissions entered for equipment in this table plus total tpy SSM emissions from Table 2F.
**GCP-O&G:** Combustion emissions from malfunction events are not allowed under this permit.

**NOI:** Malfunction emissions are not allowed under a Notice of Intent.

## Table 2-F: Startup, Shutdown, and Routine Maintenance (SSM) Emissions

☐ **This table is intentionally left blank as all SSM emissions at this facility do not require an increase in Requested Allowables greater than those listed in Table 2-E.**

All applications for facilities that have emissions during routine our predictable startup, shutdown or scheduled maintenance (SSM)2, including NOI applications, must include in this table the Maximum Emissions during routine or predictable startup, shutdown and scheduled maintenance (20.2.7 NMAC, 20.2.72.203.A.3 NMAC, 20.2.73.200.D.2 NMAC). Provide emissions calculations for all SSM emissions reported in this table. Refer to the guidance "Startup, Shutdown, Maintenance Emissions in Permits" (www.env.nm.gov/air-quality/permitting-section-procedures-and-guidance/) for more detailed instructions. Numbers shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41).

## Table 2-I: Stack Exit and Fugitive Emission Rates for HAPs and TAPs

☐ **By marking this table as intentionally left blank, you certify that the Total and individual HAPs for this facility are less than 1 ton per year.**

Data may not be provided for subject items (SIs) that are not complete. Please edit the SI in Table 2-A before providing information here.

**GCPs:** Report the potential emission rate for each HAP from each HAP emitting emission unit listed in Table 2A. For each emission unit, HAPs shall be expressed to at least 2 decimal points (e.g. 0.41 or 1.41). Emissions less than 0.0001 lb/hr or 0.0001 tpy and emission units that do not emit HAPs shall be omitted from the table. Each facility-wide Individual HAP total and the facility-wide Total HAPs is the sum of all HAP sources entered in the Table. Use the HAP nomenclature as it appears in Section 112 (b) of the 1990 CAA. Include tank-flashing emission estimates of HAP in this table.

**NOIs:** Report the individual and/or Total HAPs for each piece of equipment in Table 2A, only if the facility total for that pollutant is greater than or equal to 1 tpy.

| Edit | Unit No. | Total HAPs | | Formaldehyde HAP | | Acetaldehyde; (Ethyl aldehyde) HAP | | Acrolein HAP | | Hexane HAP | | Benzene HAP | | Toluene; (Methyl benzene) HAP | | Ethylbenzene HAP | | Xylenes (total); (Xylol) HAP | | Complete |

**AQB ePermitting Portal**

# Abbreviated Application (GCP-Oil and Gas)

☒ 1. I understand that I must submit the hard copy check and required Payment Information form for all AQB ePermitting Portal Submittals before it will be assigned, and the 30-day review period begins. (Does not apply if you are converting from a GCP-1 or GCP-4 Permit)

☒ 2. I understand the AQB ePermitting Portal is currently in Beta Testing and I will use the Request NMED Support function in the Portal to: request help, report issues (bugs), and to provide my constructive feedback for improving the Portal.

# Section 1
## Facility Name or Facility Type Change for Modifications

---

Fill out this section if requesting a change to the facility name or facility type that appears in the ePermitting Portal. These items cannot be updated through the Portal and will be corrected as part of the review of your permit.

---

Check the appropriate box(es) and provide complete information in the table.
☒ **Not applicable**
☐ 1. Changing facility name.
☐ 2. Changing facility type.

# Table 2-B: Exempted Equipment (20.2.72 NMAC)

All 20.2.72 NMAC applications must list Exempted Equipment in this table. If equipment listed on this table is exempt under 20.2.72.202.B.5, include emissions calculations and emissions totals for 202.B.5 "similar functions" units, operations, and activities in Section 5, Calculations. Unit & stack numbering must be consistent throughout the application package.

| Unit Number | Source Description | Manufacturer | Model No / Serial No | Max Capacity / Capacity Units | List Specific 20.2.72.202 NMAC Exemption (e.g. 20.2.72.202.B.5) | Date of Manufacture /Reconstruction1 / Date of Installation /Construction | For Each Piece of Equipment, Check One | |

# Section 3
## Registration Summary

---

**The Registration Summary:** Provide information about the registration submittal. The Registration Summary shall include a brief description of the facility and its process. In case of a modification to a facility, please describe the proposed changes.

---

**Registration Summary:** EOG Resources, Inc. (EOG) is submitting this application pursuant to 20.2.72.200.A NMAC for the Bald Eagle LGL (Localized Gas Lift) Station (Bald Eagle) to revise its existing permit. This revision is to update The Caterpillar engines emission factors. The facility compresses and dehydrates natural gas that is injected into oil wells to stimulate oil production. Bald Eagle is located approximately 17.3 miles northwest of Jal in Lea County, New Mexico. This facility has already been public noticed for a GCP O&G.

**Written description of the routine operations of the facility:**
The Bald Eagle LGL Station is a localized gas lift station and will compress and dehydrate natural gas that is then injected into oil wells to stimulate oil production. The inlet gas stream is separated into two phases (liquid and gas) as it passes through a slug catcher.

The water and hydrocarbon liquids are sent to a 3-phase heated separator where condensate and produced water are separated from gaseous hydrocarbons. The condensate and produced water are sent to their respective storage tanks. Flash gas and working and breathing emissions from the tanks are controlled by the process flare. The gas from the 3-phase heated separator is sent to a VRU where it is compressed and routed back to the slug catcher as a recycle stream. In the event of VRU downtime, the gas from the heated separator is routed to the process flare.

The gas from the slug catcher is sent to the engines for compression, and the compressed gas is then sent to a filter separator where gas is separated from the liquids. These liquids are routed back as a recycle stream to the initial stream entering the slug catcher. The gas from the filter separator (dehydrator inlet separator) is routed to the glycol contactor.

The TEG dehydrator removes water from the gas stream entering the glycol contactor. Dehydrated gas leaves, passes through a heat exchanger and is sent to oil wells and is used for fuel. Once lean TEG absorbs the water from the gas stream, it leaves as a rich stream from the bottom of the contactor which is then sent to a flash tank where gaseous hydrocarbons are routed to the VRU (or flare in event of VRU downtime). The TEG is then sent to the glycol regenerator (and associated reboiler) where the TEG is reconcentrated by removal of the water. The water vapor is sent to a BTEX condenser and subsequent water knockout vessel. The BTEX vapors are routed to the flare and the separated water is routed to the produced water tank. The lean TEG leaving the regenerator passes through a heat exchanger where it is cooled and then recycled and reintroduced to the glycol contactor where the dehydration process begins again.

The vapor recovery unit (VRU) is designed to minimize economic losses by stabilizing vapors before entering storage in the oil tanks and recovering salable vapors to send to the sales gas line. The VRU is part of the physical and operational design of the facility. This is consistent with the discussions of the use of VRUs to route vapors to a sales gas line in the September 28, 2012 EPA response letter to API regarding NSPS OOOO.

**Routine or predictable emissions during Startup, Shutdown and Maintenance (SSM):** EOG is requesting 10 tpy VOC, 1 tpy HAP, and 3 lb/hr and 2 tpy $H_2S$ for SSM activities.

☐ No SSM emissions are expected for this facility.

SSM Activities that are being controlled:

**Malfunction Emissions (M):** EOG is requesting 10 tpy VOC, 1 tpy HAP, and 3 lb/hr and 2 tpy $H_2S$ for malfunction emissions.

The permit does not authorize combustion emissions for malfunctions. The permit does not authorize emissions from SSM and Malfunction to be combined as 10 TPY VOC. However, they may be permitted separately. In the allowable emissions table in Section 2, these two events are separate line items and must be kept separate.

☐ No Malfunction emissions are requested for this permit.

**Allowable Operations:** Check the appropriate box below:

☒ Facility operates continuously (8760 hours per year)

☐ The following regulated equipment will operate less than 8760 hours per year. Add additional rows as necessary. These units are subject to Condition A108.C of the Permit.

## Verification of Compliance with Stack Parameter Requirements:

**Please use the Stack Calculator and Stack Requirements Explained Guidance on our website: All of the verification information below is required to be filled out.**

www.env.nm.gov/air-quality/air-quality-oil-and-gas-gcp-application-forms/

Check the box for each type of equipment at this facility:

☒ Engine(s)
☐ Turbine(s)
☒ Flares(s)
☐ Enclosed Combustion Device (s)
☒ Heater(s)
☒ Reboiler(s)

For each type of equipment checked above, complete the applicable section below.

**Engines**

1. Calculate the pound per hour (lb/hr) $NO_x$ emission rate according to GCP O&G Condition A202.I Step 1 on page 15 of the GCP O&G. Enter this value in the top row of the table below.
2. Based on the calculated facility total $NO_x$ emission rate, determine the minimum stack parameter requirements for engines and heaters from Table 1: Engines (page 17) of the GCP O&G and enter the minimum parameters from Table 1 (page 17) of the GCP O&G in the bottom row of the table below.
3. Enter the stack parameters from each engine and heater in the blank rows of the table below. Add rows as necessary.

**Table B: Engine/Generator/Heater/Reboiler Stack Parameter Verification:**

| **Calculated Facility Total NOx Emission Rate: 13.1 lb/hr** | | | | |
|---|---|---|---|---|
| **Engine/Generator/Heater/Reboiler Unit Number** | **Height (ft)** | **Temperature (°F)** | **Velocity (ft/s)** | **Diameter (ft)** |
| HTR-1 | 20 | 600 | 0.36 | 6 |
| RBL-1 | 8 | 600 | 0.71 | 3.5 |
| ENG-1 | 28 | 835 | 90.2 | 1.67 |
| ENG-2 thru ENG-6 | 29 | 779 | 82.3 | 2 |
| **Table 1 Minimum Parameters:** For verification, list the minimum parameters based on the NOx lb/hr emission rate from the GCP O&G Table 1. | 14.8 | 782 | 72.2 | 0.8 |

4. Do all engines and heaters comply with the minimum stack parameters from Table 1 (page 17) of the GCP O&G?

☐ Yes. Skip step 5 below.
☒ No. Go to step 5 below.

5. For engines and heaters that do not comply with the minimum stack parameters in Table 1 of the GCP O&G, explain and demonstrate in detail how the engines and heaters will be authorized according to the steps on page 16 of the GCP O&G or Condition A203.C of the GCP O&G. Show all calculations.

The heater and reboiler (HTR-1, RBL-1) do not meet the minimum height, temperature or velocity requirements listed in Table 1. However, these units are authorized pursuant to GCP-O&G condition A203.C since the total hourly NOX emissions rate is less than 1.23 lb/hr. The engines (ENG-2 thru ENG-6) do not meet the minimum temperature requirement but are at least 6.6 ft taller than the minimum height and are therefore in compliance.

**Turbines**

1. Calculate the pound per hour (lb/hr) $NO_x$ emission rate according to GCP O&G Condition A202.I Step 1 on page 17 of the GCP O&G. Enter this value in the top row of the table below.
2. Based on the calculated facility total $NO_x$ emission rate, determine the minimum stack parameter requirements for turbines and heaters from Table 2: Turbines (page 18) of the GCP O&G. Enter the minimum parameters from Table 2 (page 18) of the GCP O&G in the bottom row of the table below.
3. Enter the stack parameters from each turbine and heater in the blank rows of the table below. Add rows as necessary.

**Table C: Turbine/Heater/Reboiler Stack Parameter Verification:**

| **Calculated Facility Total NOx Emission Rate: _____lb/hr** | | | | |
|---|---|---|---|---|
| **Turbine/Heater/Reboiler Unit Number** | **Height (ft)** | **Temperature (°F)** | **Velocity (ft/s)** | **Diameter (ft)** |
| | | | | |
| | | | | |
| | | | | |
| **Table 2 Minimum Parameters:** For verification, list the minimum parameters based on the NOx lb/hr emission rate from the GCP O&G Table 2. | | | | |

4. Do all turbines and heaters comply with the minimum stack parameters from Table 2 (page 18) of the GCP O&G?

☐ Yes. Skip step 5 below.

☐ No. Go to step 5 below.

5. For turbines and heaters that do not comply with the minimum stack parameters in Table 2 of the GCP O&G, explain and demonstrate in detail how the turbines and heaters will be authorized according to the steps on page 18 of the GCP O&G or Condition A203.C of the GCP O&G. Show all calculations.

**Flares**

1. Enter $SO_2$ emission rates (lb/hr) for each flare in the second column of the table below.
2. Based on the $SO_2$ emission rates, determine the minimum stack height requirements for flares from Table 3 (page 26) of the GCP O&G and enter the minimum stack height requirements for flares from Table 3 (page 26) of the GCP O&G in the last column of the table below.
3. Enter the stack height of each flare in the third column of the table below. Add rows as necessary.

**Table D: Flare Stack Height Parameter Verification:**

| Flare Unit Number | $SO_2$ Emission Rate (lb/hr) | Height (ft) | **Table 3 Minimum Stack Height:** For verification, list the minimum height parameters based on the SO2 emission rate from the GCP O&G Table 3. |
|---|---|---|---|
| FL-1 | 0.038 | 40 | 6.6 |
| | | | |
| | | | |
| | | | |

4. Do all flares comply with minimum stack height requirements?
   ☒ Yes
   ☐ No

5. Does the flare gas contain 6% $H_2S$ or less by volume (pre-combustion)?
   ☒ Yes. Skip step 6 below.
   ☐ No. Go to step 6 below.

6. Explain in detail how assist gas will be added to reduce the gas composition to 6% $H_2S$ or less by volume.

**Enclosed Combustion Device(s) (ECD) and Vapor Combustion Unit(s) (VCU):**

According to GCP O&G Condition A208.A, the facility must meet one of the following options if an ECD or VCU is installed at the facility:

Option 1:

1. Will the ECD(s) meet the $SO_2$ emission limit of 0.7 lb/hr and operate with a velocity of at least one (1) foot per second?
   ☐ Yes. Skip Option 2 below.
   ☐ No. Go to Option 2 below.

Option 2:

2. Will the ECD(s) meet the $SO_2$ emission limit of 0.9 lb/hr and operate with a velocity of at least two (2) feet per second?
   ☐ Yes
   ☐ No

# Section 5

## Emissions Calculation Forms

The Department has developed the Air Emissions Calculation Tool (AECT), which is required to be used in the GCP-Oil and Gas Registration. If the AECT, for a piece of equipment is under development, provide alternate calculations. **Do not include alternative calculations unless there is an issue being resolved with the AECT. This will delay review of the application.** The AECT and this Registration Form may be updated as needed.

**Tank Emissions Calculations**: Provide the method used to estimate tank-flashing emissions, the input and output summary from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis. If Pro-Max or Hysis is used, all relevant input parameters shall be reported, including separator pressure, gas throughput, and all other relevant parameters necessary for flashing calculation. **The inputs must match the gas analyses information submitted. Inputs that don't match may be grounds for denial of the application submittal.**

**SSM Calculations**: In this Section, provide emissions calculations for Startup, Shutdown, and Routine Maintenance (SSM) emissions listed in the Table 2, and the rational for why the others are reported as zero (or left blank).

**Control Devices:** Report all control devices and list each pollutant controlled by the control device. Indicate in this section if you chose to not take credit for the reduction in emission rates. Only uncontrolled emission rates can be considered to determine applicability unless the state or federal acts require the control. This information is necessary to determine if federally enforceable conditions are necessary for the control device, and if the control device produces its own regulated pollutants or increases emission rates of other pollutants.

**Calculation Details:** The AECT is required for all emission calculations. If the AECT is not functioning, alternative calculations may be submitted only for the portions of the AECT with issues being resolved. Utilize this section to explain in detail, on an equipment-by-equipment basis, why alternative calculations are necessary.

**Explain here:**

---

**Equipment Forms attached for this section (add additional rows as necessary):**

| Equipment Type | Quantity | Check Box to Indicate Units that are Controlled | Enter Control Device Type and Pollutant Controlled |
|---|---|---|---|
| **Engine** | **6** | ☒ | *CO, VOC, HCHO* |
| **Turbine** | | ☐ | |
| **Tanks** | **3** | ☒ | *Flare (VOC, HAP, H2S)* |
| **Generator** | | ☐ | |
| **VRU** | **1** | ☒ | *Flare (VOC, HAP, H2S)* |
| **VRT** | | ☐ | |
| **ULPS** | | ☐ | |
| **Glycol Dehydrator** | **1** | ☒ | *Flare (VOC, HAP, H2S)* |
| **Flare** | **1** | ☐ | *Tanks, Loading, VRU downtime, Dehydrator* |
| **Amine Unit** | | ☐ | |
| **Cryogenic Unit** | | ☐ | |
| **Fugitive Emissions** | **1** | ☐ | |
| **Heater** | **1** | ☐ | |
| **Truck Loading** | **1** | ☒ | *Vapor capture, Flare (VOC, HAP, H2S)* |
| **Enclosed Combustion Device (ECD)** | | ☐ | |
| **Thermal Oxidizer (TO)** | | ☐ | |
| **Reboiler** | **1** | ☐ | |

| | | | |
|---|---|---|---|
| **Other** | | ☐ | |

**For each scenario below, if there are more than one emissions unit, control device, or gas combustion scenario. Please copy and paste each applicable section and label the unit number(s) if the scenarios vary.**

**Vapor Recovery Tower, Ultra Low-Pressure Separator, or Flash Tower Located Upstream of Storage Vessels:** If the facility contains one of the following units located upstream of the storage vessels and is used to flash and capture flashing emissions, check the appropriate box.
Unit number:
☐ Vapor Recovery Tower and VRU Compressor
☐ ULPS and VRU Compressor
☐ Flash Tower and VRU Compressor

**Vapor Recovery Unit (VRU) located upstream of Storage Vessels:** Check the box below if the facility is using a VRU to capture flashing emissions prior to any storage vessels to limit the PTE of the storage vessels to below applicability thresholds of NSPS OOOO or NSPS OOOOa. A process vs control determination should be prepared for this type of VRU application.
Unit number:
☐ VRU capturing emissions prior to any storage vessel and routing directly to the sales pipeline

**Vapor Recovery Unit (VRU) attached to Storage Vessels:** Check the box below if this facility is using a VRU to reduce storage vessel emissions to limit the PTE to below NSPS OOOO or NSPS OOOOa applicability thresholds:
Unit number:
☐ VRU controlling Storage Vessel emissions and the facility is subject to the requirements under NSPS OOOO, 40 CFR 60.5411
☐ VRU controlling Storage Vessel emissions and the facility is subject to the requirements under NSPS OOOOa, 40 CFR 60.5411a

**Gas Combustion Scenarios:** Read through the scenarios below and check the boxes next to any appropriate facility operating scenarios. Flares shall assume a destruction efficiency of 95%, unless the facility is subject to requirements for flares under 40 CFR 60.18, or a higher destruction efficiency (up to 98%) is supported by a manufacturer specification sheet (MSS) for that unit. If so, include the MSS.

A flare, vapor combustion unit (VCU), enclosed combustion device (ECD), thermal oxidizer (TO):
Unit number: FL-1
☐ Controls storage vessels in accordance with 40 CFR 60, Subpart OOOO or OOOOa.
☒ Provides a federally enforceable control for the storage vessels to limit the PTE to below applicability thresholds of 40 CFR 60, Subpart OOOO or OOOOa.
☒ Controls the glycol dehydrator
☐ Controls the amine unit
☒ Controls truck loading
☒ Operates only during maintenance events, such as VRU downtime, check one below:
  ☐ The emissions during VRU downtime are represented as uncontrolled VOC emissions from the compressor
  ☒ The combustion emissions during VRU downtime are represented as controlled emissions from the combustion device

☐ Controls the facility during plant turnaround

**Amine Unit:** Provide the following information for each amine unit.

| | |
|---|---|
| Design Capacity in MMscf/day | |
| Rich Amine Flowrate in gal/min | |
| Lean Amine Flowrate in gal/min | |
| Mole Loading $H_2S$ | |
| Sour Gas Input in MMscf/day | |

**Glycol Dehydration Unit(s):** Provide the following information for each glycol dehydration unit:
Please include an extended gas analysis in Section 6 of this application.

| Unit # | Glycol Pump Circulation Rate |
|---|---|
| DEHY | 10 gpm |

**Voluntary Monitoring in Accordance with §40 CFR 60.5416(a):** Check the box(s) to implement a program that meets the requirements of 40 CFR 60.5416(a). This monitoring program will be conducted in lieu of the monitoring requirements established in the GCP-Oil and Gas for individual equipment. Ceasing to implement this alternative monitoring must be reported in an updated Registration Form to the Department.

☐ Condition A205.B Control Device Options, Requirements, and Inspections for Tanks
☐ Condition A206.B Truck Loading Control Device Inspection
☐ Condition A206.C Vapor Balancing During Truck Loading
☐ Condition A209.A Vapor Recovery Unit or Department-approved Equivalent
☐ Condition A210.B Amine Unit Control Device Inspection

**Fugitive $H_2S$ Screening Threshold and Monitoring in accordance with Condition A212:** Check the box that applies.

☒ Condition A212.A does not apply because the facility is below the fugitive $H_2S$ screening threshold in Condition A212, or

☐ Condition A212.A applies. Because the facility is above the fugitive $H_2S$ screening threshold in Condition A212, or the facility is voluntarily complying with Condition A212.A, and Condition A212.A applies

# Section 6

## Information Used to Determine Emissions

Check the box for each type of information submitted in the required attachments. This documentation is required if applicable to the facility.

**Failure to include applicable supporting documentation may result in application denial.**

☒ Specifications for control equipment, including control efficiency specifications and sufficient engineering data for verification of control equipment operation, including design drawings, test reports, and design parameters that affect normal operation.

☒ Engine or Generator Manufacturer specifications

☒ Catalyst Manufacturer specifications (If a catalyst is being utilized to reduce emissions, the catalyst manufacturer emission factors must be used in all emission calculations. A 25% safety factor may be applied to each pollutant.

☒ NSPS JJJJ emission factors **may not** be utilized in lieu of catalyst manufacture specifications when a catalyst is installed, and the catalysts manufacturer achieves higher control efficiency.

☒ Flare Manufacturer specifications

☐ Oil/Liquid Analysis: This data is required to match the inputs in all applicable emission calculations. For facilities that have not been constructed and a representative analysis is used it cannot be older than 1 year. For existing facilities, the gas analyses required by Condition A201.A (must be 1 year old or less).

☐ Gas Analysis (must be 1 year old or less) This data is required to match the inputs in all applicable emission calculations.

☐ Extended Gas Analysis (must be 1 year old or less) This data is required to match the inputs in all applicable emission calculations.

☒ If requesting to use a representative gas sample, include a discussion of why the sample is representative for this facility and an explanation of how it is representative (e.g., same reservoir, same similar API gravity, similar composition).

☐ If test data are used, to support emissions calculations or to establish allowable emission limits, include a copy of the complete test report. If the test data are for an emissions unit other than the one being permitted, the emission units must be identical. Test data may not be used if any difference in operating conditions of the unit being permitted and the unit represented in the test report significantly effect emission rates.

☐ Fuel specifications sheet.

☒ If computer models are used to estimate emissions, include an input summary and a detailed report, and a disk containing the input file used to run the model.

☒ For tank-flashing emissions, include a discussion of the method used to estimate tank-flashing emissions, accuracy of the model, the **input and output** summary from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis.

---

**Representative Gas Analysis Justification:** The representative analysis is from a site that processes gas from the same producing reservoir/formation as the actual site stream; the gas being handled at the representative site and the actual site have very similar components and properties; and the representative analysis is taken from a site that processes the stream in a similar manner as the actual site.

# Section 8A

## Applicable State & Federal Regulations

**Provide a discussion demonstrating compliance with each applicable state & federal regulation**. All input cells should be filled in, even if the response is 'No' or 'N/A'.

In the "Justification" column, identify the criteria that are critical to the applicability determination, numbering each. For each unit listed in the "Applies to Unit No(s)" column, after each listed unit, include the lowest level citation of the applicable regulation. For each unit, list the information necessary to verify the applicability of the regulation, including date of manufacture, date of construction, size (hp), and combustion type. Doing so will provide the applicability criteria for each unit.

### Applicable STATE REGULATIONS:

| STATE REGU-LATIONS CITATION | Title | Federally Enforceable | Overview of Regulation | Unit(s) or Facility | Applies? (Yes or No) | JUSTIFICATION: Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 $m^3$, 3. VOL) |
|---|---|---|---|---|---|---|
| 20.2.1 NMAC | General Provisions | Yes | General Provisions apply to Notice of Intent, Construction, and Title V permit applications. | Facility | Yes | EOG Resources, Inc. will comply with the applicable requirements for the entire facility. |
| 20.2.3 NMAC | Ambient Air Quality Standards NMAAQS | Yes | 20.2.3 NMAC is a State Implementation Plan (SIP) approved regulation that limits the maximum allowable concentration of Sulfur Compounds, Carbon Monoxide, and Nitrogen Dioxide. | Facility | Yes | NAAQS is applicable. Per NMED guidance, documentation of compliance with GCP requirements constitutes documentation of compliance with NAAQS. |
| 20.2.7 NMAC | Excess Emissions | Yes | If your entire facility or individual pieces of equipment are subject to emissions limits in a permit or numerical emissions standards in a federal or state regulation, this applies. | Facility | Yes | EOG Resources, Inc. will comply with the applicable requirements for the entire facility. |
| 20.2.38 NMAC | Hydrocarbon Storage Facility | No | Use the regulation link (left) then cut & paste applicable sections. | N/A | No | The facility is not subject to this regulation for the following reasons:<br>(a) This facility does not store hydrocarbons containing hydrogen sulfide in a container associated with a petroleum production facility of petroleum processing facility having a capacity of 20,000 gallons or greater with a throughput of at least 30,000 gallons per week (20.2.38.109);<br>(b)The tank battery or storage facility is not within a municipality (20.2.38.110) or within five miles of a municipality (20.2.38.111);<br>(c) This facility is not a new tank battery with a |

| STATE REGU-LATIONS CITATION | Title | Federally Enforceable | Overview of Regulation | Unit(s) or Facility | Applies? (Yes or No) | JUSTIFICATION: Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 $m^3$, 3. VOL) |
|---|---|---|---|---|---|---|
| | | | | | | capacity of 65,000 gallons or greater (20.2.38.112); (d) The facility is not located outside of the Pecos-Permian intrastate air quality control region, located within the corporate limits of any municipality within the state or located within five miles of the corporate limits of any municipality within the state that has a population of 20,000 or greater (20.2.38.113) |
| 20.2.61.109 NMAC | Smoke & Visible Emissions | No | Engines and heaters are Stationary Combustion Equipment. Specify units subject to this regulation. | HTR-1, RBL-1, ENG-1 thru ENG-6, FL-1 | Yes | EOG Resources, Inc. does not expect visible emissions from the gas fired heater, reboiler, engines, or flare to equal or exceed 20% opacity. |
| 20.2.73 NMAC | NOI & Emissions Inventory Requirements | Yes | NOI: 20.2.73.200 NMAC applies to all facilities emitting over 10 TPY of any regulated air contaminate. Thus, permitted facilities are also subject to this rule. This GCP-O&G registration also serves the purpose of meeting 20.2.73 the NMAC notification requirements.)<br><br>Emissions Inventory: 20.2.73.300.A(1) NMAC applies to facilities registering under the GCP. Emission Inventory reporting is required upon request by the department per 20.2.73.300.B(4) NMAC. | Facility | Yes | Under 20.2.73.300.B(4) NMAC, the NMED is requesting emissions inventory reporting from minor sources for **calendar year 2020**. |
| 20.2.77 NMAC | New Source Performance | Yes | This is a stationary source which is subject to the requirements of 40 CFR Part 60, as amended on the date of certification. | ENG-1 thru ENG-6, FUG | Yes | This is a stationary source, which is subject to the requirements of 40 CFR Part 60, therefore, this regulation applies to the facility. |
| 20.2.78 NMAC | Emission Standards for HAPS | Yes | This facility emits hazardous air pollutants which are subject to the requirements of 40 CFR Part 61, as amended on the date of certification. | N/A | No | Does not apply. There are no applicable NESHAP standards. |

| STATE REGU-LATIONS CITATION | Title | Federally Enforceable | Overview of Regulation | Unit(s) or Facility | Applies? (Yes or No) | JUSTIFICATION: Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 $m^3$, 3. VOL) |
|---|---|---|---|---|---|---|
| 20.2.82 NMAC | MACT Standards for source categories of HAPS | Yes | This regulation applies to all sources emitting hazardous air pollutants, which are subject to the requirements of 40 CFR Part 63, as amended on the date of certification. | ENG-1 thru ENG-6, DEHY | Yes | This facility has sources which are subject to 40 CFR 63 and therefore, this regulation applies to this facility. |

**Applicable FEDERAL REGULATIONS (This is not an exhaustive list; add applicable regulations such as NSPS GG and KKKK):**

| FEDERAL REGU-LATIONS CITATION | Title | Overview of Regulation | Units(s) or Facility | Applies? (Yes or No) | JUSTIFICATION: Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 m3, 3. VOL) |
|---|---|---|---|---|---|
| 40 CFR 50 | NAAQS | Defined as applicable at 20.2.70.7.E.11, Any national ambient air quality standard | Facility | Yes | NAAQS is applicable. Per NMED guidance, documentation of compliance with GCP-Oil and Gas requirements constitutes documentation of compliance with NAAQS. |
| 40 CFR 60, Subpart A | General Provisions | Applies if any other NSPS subpart applies. | ENG-1 thru ENG-6, FUG | Yes | This facility is subject to 40 CFR 60 Subparts OOOOa and JJJJ and therefore, the general provisions apply. |
| 40 CFR 60, Subpart OOOO | Standards of Performance for Crude Oil and Natural Gas Production, Transmission and Distribution for which Construction, Modification or Reconstruction Commenced After August 23, 2011, and on or before September 18, 2015 | If there is a standard or other requirement, then the facility is an "affected facility." Currently there are standards for: gas wells (60.5375); centrifugal compressors (60.5380); reciprocating compressors (60.5385): controllers (60.5390); storage vessels (60.5395); equipment leaks (60.5400); sweetening units (60.5405).<br><br>**If standards apply, list the unit number(s) and regulatory citation of the standard that applies to that unit (e.g. Centrifugal Compressors 1a-3a are subject to the standards at 60.5380(a)(1) and (2) since we use a control device to reduce emissions)** | N/A | No | Facility was constructed after September 18, 2015. Does not apply. |
| 40 CFR 60, Subpart OOOOa | Standards of Performance for Crude Oil and Natural Gas Facilities for which Construction, Modification or Reconstruction | If there is a standard or other requirement, then the facility is an "affected facility." Currently there are standards for: gas wells (60.5375a); centrifugal compressors (60.5380a); | COMP-1 (ENG-1) thru COMP-6 (ENG-6), FUG | Yes | This subpart applies to fugitive emissions and to the reciprocating compressors which are located a compressor station. |

| FEDERAL REGULATIONS CITATION | Title | Overview of Regulation | Units(s) or Facility | Applies? (Yes or No) | JUSTIFICATION: Identify the applicability criteria, numbering each (i.e. 1. Post 7/23/84, 2. 75 m3, 3. VOL) |
|---|---|---|---|---|---|
| | Commenced After September 18, 2015 | reciprocating compressors (60.5385a): controllers (60.5390a); storage vessels (60.5395a); fugitive emissions at well sites and compressor stations (60.5397a); equipment leaks at gas plants (60.5400a); sweetening units (60.5405a). | | | |
| 40 CFR 60, Subpart IIII | Standards of performance for Stationary Compression Ignition Internal Combustion Engines | See 40 CFR 60.4200(a) 1 through 4 to determine applicable category and state engine size, fuel type, and date of manufacture. | N/A | No | Does not apply. |
| 40 CFR 60, Subpart JJJJ | Standards of Performance for Stationary Spark Ignition Internal Combustion Engines | See 40 CFR 60.4230(a), 1 through 5 to determine applicable category and state engine size, fuel type, and date of manufacture. | ENG-1 thru ENG-6 | Yes | The engines are subject to Subpart JJJJ. |
| 40 CFR 63, Subpart A | General Provisions | Applies if any other subpart applies. | ENG-1 thru ENG-6, DEHY | Yes | The engines are subject to Subpart ZZZZ. The dehydrator is subject to Subpart HH. |
| 40 CFR 63, Subpart HH | NESHAP for Glycol Dehydrators | See 40 CFR 63, Subpart HH | DEHY | Yes | This facility is subject to 40 CFR 63 Subpart HH, which includes requirements applicable to area sources with TEG dehydrators. Although the site is not a major source of hazardous air pollutants (HAPs) it is still an area source and therefore this subpart applies. However, since Benzene emissions from the unit are less than 0.90 Mg/yr, the unit is exempt from multiple requirements of 40 CFR 63 pursuant to 40 CFR 63.764(e)(1)(ii).<br>Records will be maintained to demonstrate that the exemption criteria are being met in accordance with 40 CFR 63.774(d)(1). |
| 40 CFR 63, Subpart ZZZZ | NESHAP for Stationary Reciprocating Internal Combustion Engines (**RICE MACT**) | Facilities are subject to this subpart if they own or operate a stationary RICE, except if the stationary RICE is being tested at a stationary RICE test cell/stand. | ENG-1 thru ENG-6 | Yes | The engines are subject to Subpart ZZZZ. |

# Section 8B
# Compliance Test History

---

To evaluate the requirement for compliance tests, you must submit a compliance test history. The table below provides an example.

---

No compliance history to report.

# Section 9 Proof of Public Notice

## General Posting of Notice

I, _____, the undersigned, certify that on _____ **(DATE),** I posted a true and correct copy of the attached Public Notice in a publicly accessible and conspicuous place, visible from the nearest public road, at the entrance of the property on which the facility is, or is proposed to be, located.

Signed this _____ day of _____, _____,

_____ _____
Signature Date

_____
Printed Name Title {APPLICANT OR RELATIONSHIP TO APPLICANT}

## Newspaper Publication of Notice

☐ An original or copy of the actual newspaper advertisement posted in a newspaper in general circulation in the applicable county is attached. The original or copy of the advertisement includes the header showing the date and newspaper or publication title.

**OR**

☐ An affidavit from the newspaper or publication in general circulation in the applicable county stating that the advertisement was published is attached. The affidavit includes the date of the advertisement's publication, and a legible photocopy of the entire ad.

_____ _____
Signature Date

Cynthia Espinoza Sr. Environmental Engineer
Printed Name Title {APPLICANT OR RELATIONSHIP TO APPLICANT}

# GCP-Oil and Gas PUBLIC NOTICE EXAMPLE

*20.2.72 NMAC – General Permits, Section 220.A(2)(b)ii*

**Use this example for all public notices for GCP-Oil and Gas permits (newspaper notice and site posting notice). Customize this document by modifying or deleting, all bracketed and bold text below. Posting of Public Notice is required at the facility entrance and in the newspaper in general circulation as described in Condition C100.B of the GCP-Oil and Gas Permit. Before printing the final notice, delete this sentence and all preceding and subsequent text in red.**

# NOTICE

**[Name of Company]** announces its intent to apply to the New Mexico Environment Department for an air quality General Construction Permit, **(GCP-Oil and Gas).** The name of this facility is **[Name of Facility]**. The expected date of the submittal of our Registration for an air quality permit to the Air Quality Bureau is **[date].** This notice is a requirement according to New Mexico air quality regulations.

The exact initial location of the facility is/will be **["UTM Zone 12/13, UTM Easting XXX, UTM Northing XXX"** The approximate location of this site is **XX.X** miles **[direction]** of **[town name (preferred) or, if no town within 30 miles, a reasonably close, well known point, such as the intersection of two roads, a well-known landmark, or road mile marker]** in **[county name]** county]. The standard operating schedule of this facility will be continuous.

Air emissions of any regulated air contaminant will be less than or equal to **[do not change the TPY values listed below**]:

| | | Tons per year (TPY) |
|---|---|---|
| 1. | Nitrogen Oxides ($NO_x$) | 95 |
| 2. | Carbon Monoxide (CO) | 95 |
| 3. | Volatile Organic Compounds (VOC) (stack) | 95 |
| 4. | Particulate Matter (PM10) | 25 |
| 5. | Particulate Matter (PM2.5) | 25 |
| 6. | Sulfur Dioxide ($SO_2$) | 95 |
| 7. | Hydrogen Sulfide (H2S) | 25 |
| 8. | Any one (1) Hazardous Air Pollutant (HAP) | <10 |
| 9. | Sum of all Hazardous Air Pollutants (HAPs) | < 25 |

The owner and/or operator of the Plant is:
**[Name, company, street address, city, state, zip code]**

If you have any questions or comments about construction or operation of above facility, and want your comments to be made as a part of the permit review process, you must submit your comments in writing to the address below:

New Mexico Environment Department
Air Quality Bureau Permit Section
525 Camino de los Marquez, Suite 1
Santa Fe, New Mexico, 87505
Phone (505) 476-4300
Fax (505) 476-4375

Other comments and questions may be submitted verbally.

**Please refer to the company name and site name, as used in this notice or send a copy of this notice along with your comments, since the Department may not have received the permit Registration at the time of this notice.**

**Attención**

Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono 505-476-5557.

**Notice of Non-Discrimination**

NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Kathryn Becker, Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. Box 5469, Santa Fe, NM 87502, (505) 827-2855, nd.coordinator@state.nm.us. You may also visit our website at https://www.env.nm.gov/non-employee-discrimination-complaint-page/ to learn how and where to file a complaint of discrimination.

# APPENDIX O. GCP-O&G # 8932

**Construction Status** Existing Permitted (or NOI) Facility

☑ I acknowledge that a pre-application meeting is available to me upon request.

☑ For new registrations or modifications, a payment for the registration fee will be submitted to the Department for ten fee points for GCP-O&G or $500 for NOIs. We cannot begin processing your action until the full fee is received by the Department in the form of a check or an online ePayment. You will receive an automated email when your action is assigned for review.

☑ There is an annual fee for GCP-O&G in addition to the registration fee: www.env.nm.gov/air-quality/permit-fees-2/ (No annual fee for NOIs. (Facilities qualifying as a 'small business' under 20.2.75.7.F NMAC qualify for reduced fees, provided that NMED has a Small Business Certification Form from your company on file. This form can be found at: www.env.nm.gov/aqb/sbap/Small_Business_Forms.html)

☑ There are required attachments in addition to inputting data in the program. I will include the required attachments.

You have the option to pay your permit application fee electronically or by mailed check. If you opt in for electronic payments, your air permit contact will receive an email notification from the financial provider with an invoice for your fee amount. Please be aware that it may take up to a couple of business days to receive this electronic invoice notification. Please select your payment option bellow.

◉ Check ○ Online Payment

**Send Permit Invoice Email to :**

**Confirm Email :**

Is the facility located in Bernalillo County, on tribal lands, or in a nonattainment area?

○ Yes ◉ No

Is the facility's SIC code 1311, 1321, 4619, 4612 or 4922? (Other SIC codes may be approved provided that all the equipment at the facility is allowed in the GCP-Oil & Gas Permit. Non-Oil and Gas NOIs should use the paper Universal Application.

◉ Yes ○ No

**GCP-O&G Acknowledgements and Applicability**

Do not use Portal for administrative changes identified in the GCP O&G Permit Condition C101.A. Please use the Permitting Administrative Multiform to submit these requests to the department by mail. www.env.nm.gov/air-quality/air-quality-permit-applications-forms-and-related-information/

☑ The emissions specified in this Registration Form will establish the emission limits in the GCP-Oil and Gas.

**1.** This is a GCP-Oil and Gas Registration Form for an existing facility currently operating under GCP-1 or GCP-4? (No fee required)

◉ No ○ Yes

**2.** Does the regulated equipment under this GCP-Oil and Gas Registration include any combination of Allowable Equipment listed in Table 104 of the GCP Oil & Gas Permit, and no others?

◉ Yes ○ No

**3.** Will the regulated equipment as specified in this GCP-Oil and Gas Registration emit less than the total emissions in Table 106 of the GCP-Oil and Gas permit?

◉ Yes ○ No

**4.** Does all equipment comply with the stack parameter requirements as established in the GCP-Oil and Gas Permit?

◉ Yes ○ No

**5.** Equipment shall be at least 100 meters (m) from any stack to terrain that is five (5) or more meters above the top of the stack. Will the equipment at the facility meet this terrain requirement?

◉ Yes ○ No

**6.** Is the facility at least 150 m from any source that emits over 25 tons/year of NOx? This is the distance between the two nearest stacks that emit NOx at each of the facilities. Not the facility boundaries or the center to center distances.

◉ Yes ○ No

**7.** Is the facility at least 3 miles from any Class I area? This is the distance from the nearest facility boundary to the nearest boundary of the Class I area.

◉ Yes ○ No

Air Quality Bureau
Permitting Section
525 Camino de los Marquez, Suite 1
Santa Fe, NM 87505-1816

Phone: (505) 476-4300
Fax: (505) 476-4375
www.env.nm.gov/air-quality/

**For Department use only:**

# Electronic Permitting Application

**Use this application for NOI and GCP-Oil and Gas Permits.**

Use this application for: the initial application, modifications, revisions and when converting from another permit type. Please fill out all sections so that they have check marks and attach all required documents for review. Coordination with AQB is encouraged for first time users. Please use the Request NMED Support button if you would like to set up a walk through.

Add a New Regulated Source

[1] Unit numbers must correspond to unit numbers in the previous permit unless a complete cross reference table of all units in both permits is provided.
[2] Specify dates required to determine regulatory applicability. If only year or month is known use 01/01/yyyy or mm/01/yyyy.
[3] To properly account for power conversion efficiencies, generator set rated capacity shall be reported as the rated capacity of the engine in horsepower, not the kilowatt capacity of the generator set.

## Table 2C - Emissions Reduction Equipment

☐ **This Table was intentionally left blank.**

In accordance with 20.2.72.203.A(3) and (8) NMAC, 20.2.70.300.D(5)(b) and (e) NMAC, and 20.2.73.200.B(7) NMAC, the permittee shall report all control devices and list each pollutant controlled by the control device regardless if the applicant takes credit for the reduction in emissions. **Also include reductions from process equipment in this table. Entering process equipment in this table is for data entry purposes only, the process vs control analysis will be used to determine process or control status for VRUs.** Only list control equipment for TAPs if the TAPs maximum uncontrolled emissions rate is over its respective threshold as listed in 20.2.72 NMAC, Subpart V, Tables A and B.

| Edit | Reduction Equipment Unit No. | Reduction Equipment Description | Date Installed (mm/dd/yyyy). | Reduced Pollutants | Reducing Emissions for Unit Numbers | Efficiency (% Reduction by Weight) | Method used to estimate reduction | Reduction Type | Complete |

Add Reduction Equipment for Unit [Select one] Add

How to complete the table: In the drop down, select regulated sources from Table 2A where emissions are reduced and click "Add." Then add reduced pollutants and associated reduction devices for each. If a pollutant has emissions reduced by more than one device please add a line for each device and label them as primary, secondary, tertiary. Click "Edit" to update reduced pollutants and devices for each regulated source.
