**Sample Calculations:**

Vo = V * Pmin1 * (519.67 °R) / (14.696 psia * To)
Va = V * Pmin2 * (519.67 °R) / (14.696 psia * To)
Vf = Vo - Va
Where:

Vo = Volume at Operating Conditions ($ft^3$)
V = Volume of Vessel ($ft^3$)
Pmin1 = Minimum of vapor and operating pressure (psia)
To = Operating temperature (°R)
Va = Volume released to atmosphere ($ft^3$)
Pmin2 = Minimum of vapor, flared blowdown, and operating pressure (psia)
Vf = Volume of gas sent to flare ($ft^3$)

Efh = Vf / (379 scf/lb-mol) * MW * VOC wt% / t * (1 - DRE)
Efy = Efh * t * a
Eah = Va / (379 scf/lb-mol) * MW * VOC wt% / t
Eay = Eah * t * a
Where:

Efh = hourly flared VOC emission rate (lb/hr)
MW = molecular weight (lb/lb-mol)
VOC wt% = weight percent of VOC (%)
t = activity duration (hr)
DRE = Destruction efficiency of flare (%)
Efy = yearly flared VOC emission rate (tpy)
a = activities per year
Eah = hourly vented VOC emission rate (lb/hr)
Eay = yearly vented VOC emission rate (tpy)

These example calculations are not intended to be representations under 116.116(b), but are an example of the emission calculation approach for a sub-category of MSS emissions activities. The basis of the example emission calculation (such as volume, concentration, pressure) are example conditions and should not be interpreted as representations of a specific plant or activity condition under 116.116(b). Individual activities in this MSS sub-category are performed which may have slight variations in procedure

## Meter Proving and Line Breaths SSM Emissions

**Targa Northern Delaware, LLC**

**Calculation Basis:**

Emissions to the atmosphere after opening lines are calculated using the Ideal Gas Law and conservatively use the maximum pressure for each service to determine blowdown volume.

Piping is conservatively assumed to be one 10-foot length of 16" diameter pipe. Degassing occurs within one hour.

**Sample Calculations:**

E = V / Vs * MW * ( 1 - DRE (%) ) * VOC wt%

Where:

V = blowdown volume, scf

Vs = 379 scf/lb-mol

MW = molecular weight of vapors, lb/lb-mol

# Tank Blowdown SSM Emissions

**Targa Northern Delaware, LLC**

**Blowdown Calculation Basis:**
Emissions from maintenance activities are calculated using the ideal gas law.

| Minimum Flared Blowdown Pressure | 0 | psig |
|---|---|---|

**Train 1**

# Tank Startup SSM Emissions
**Targa Northern Delaware, LLC**

**Startup Calculation Basis:**

Emissions from maintenance activities are calculated using a three step pressurization, where equipment is blown down to check for leaks after pressurizing. The minimum of the vapor pressure or pressurization steps is used to determine the volume of gas or vapor vented to atmosphere or flare.
It is assumed that each maintenance activity occurs over 8 hours.

| | | |
|---|---|---|
| 1st Step Pressure | 50 | psig |
| 2nd Step Pressure | 150 | psig |
| 3rd Step Pressure | 300 | psig |

**Train 1**

# Residue Gas Flaring Emissions

**Targa Northern Delaware, LLC**

**Train 1 Residue Gas Flaring: RH1-FL-29-1003**

**Input Data**

| | Residue Gas | |
|---|---|---|
| **Net HV** | 958 | Btu/scf |
| **Residue Gas Flow Rate** | 3.13 | MMscf/hr |
| **Duration of Flaring Event** | 60 | min/event |
| **Number of Events per Hour** | 1 | event/hr |
| **Estimated Annual Frequency** | 12 | events/yr |
| **Residue Gas Flow Rate** | 3,125,000 | scf/event |
| | 38 | MMscf/yr |
| **Heat Rate** | 2,994.16 | MMBtu/event |
| | 35,929.88 | MMBtu/year |
| **Safety Factor** | 10% | |

**Residue Gas - $NO_x$, CO, and $SO_2$**

| Compound | Flare Emission Factors | | | Flare Emissions | |
|---|---|---|---|---|---|
| | Value | Unit | Reference | lbs/hr[2] | tons/yr[3] |
| $NO_x$ | 0.0641 | lb/MMBtu | TCEQ [1] | 211.12 | 1.27 |
| CO | 0.5496 | lb/MMBtu | TCEQ [1] | 1,810.15 | 10.86 |
| $SO_2$ | 0.6 | lb/MMscf | AP-42 [1] | 1.88 | 1.13E-02 |

**Residue Gas - GHGs**

**Natural Gas Combustion Greenhouse Gas Emission Factors**

| Units[12] | $CO_2$ | $CH_4$ | $N_2O$ | $CO_2e$[17] |
|---|---|---|---|---|
| kg/MMBtu | 53.06 | 1.0E-03 | 1.0E-04 | - |
| Global Warming Potential (GWP) [13] | 1 | 28 | 265 | - |
| lb/MMBtu [14] | 116.98 | 2.20E-03 | 2.20E-04 | - |
| Flare Emissions (lb/hr)[15] | 350,256 | 6.59 | 0.66 | 350,615 |
| Flare Emissions (tpy)[16] | 2,101.54 | 0.04 | 3.95E-03 | 2103.69 |

*The calculations for residue gas use a representative composition of residue gas and a representative flow rate. Due to variability of the composition of this gas, a 10% safety factor was applied to both the hourly and annual NOx, CO, VOC, and HAP emissions. Sulfur content in the gas is assumed to be constant; therefore, no safety was applied to $SO_2$ emissions.*

**Residue Gas - VOC and $H_2S$**

| Compound | Composition [6] | MW | DRE [7] | Gas Vented to Flare [8,9] | | Controlled Emissions [9,10] | |

| Flare Emissions (lb/hr)[15] | 934,017 | 17.57 | 1.76 | 934,974 |
| Flare Emissions (tpy)[16] | 5,604.10 | 0.11 | 0.011 | 5609.85 |

*The calculations for residue gas use a representative composition of residue gas and a representative flow rate. Due to variability of the composition of this gas, a 10% safety factor was applied to both the hourly and annual NOx, CO, VOC, and HAP emissions. Sulfur content in the gas is assumed to be constant; therefore, no safety was applied to SO2 emissions.*

*The calculations for residue gas use a representative composition of residue gas and a representative flow rate. Due to variability of the composition of this gas, a 10% safety factor was applied to both the hourly and annual NOx, CO, VOC, and HAP emissions. Sulfur content in the gas is assumed to be constant; therefore, no safety was applied to SO2 emissions.*

**Residue Gas - VOC and $H_2S$**

**Residue Gas Flaring Notes and Calculation Methodology**

[1] From TCEQ "Air Permit Guidance For Chemical Sources, Flare And Vapor Oxidizers" (Draft Oct. 2000) Table 4, emission factors
$SO_2$ emission factor from AP-42 Chapter 1.4 Natural Gas Combustion Table 2.

[2] Maximum Potential Hourly Emission Rate (lb/hr) = Flare Emission Factor (lb/MMBtu) x Gas Stream Heat Input (MMBtu/hr)

Example $NO_x$ Hourly Emission Rate (lb/hr) = 0.0641 lb/MMBtu | 2,994 MMBtu/hr = 211.12 lb/hr

[3] Maximum Potential Annual Emission Rate (tpy) = Flare Emission Factor (lb/MMBtu) x Gas Stream Heat Input (MMBtu/yr) x (1 ton / 2,000 lb)

Example $NO_x$ Annual Emission Rate (tpy) = 0.0641 lb/MMBtu | 35,930 MMBtu/yr | 1 ton/2,000 lb = 1.27 ton/yr

[4] Maximum $SO_2$ Potential Hourly Emission Rate (lb/hr) = Flare Emission Factor (lb/MMscf) x Hourly Flowrate (scf/hr) x $10^{-6}$ (MMscf/scf)

Example $SO_2$ Hourly Emission Rate (lb/hr) = 0.6 lb/MMscf | 3,125,000 scf/hr | $10^{-6}$ MMscf/scf = 1.88 lb/hr

[5] Maximum $SO_2$ Potential Annual Emission Rate (tpy) = Flare Emission Factor (lb/MMscf) x Annual Flowrate (MMscf/yr) x (1 ton / 2,000 lb)

Example $SO_2$ Annual Emission Rate (tpy) = 0.6 lb/MMscf | 37.5 MMscf/yr | 1 ton/2,000 lb = 1.13E-02 ton/yr

[6] Composition of the gas stream is obtained from Residue Gas stream.

[7] Per TCEQ "Air Permit Guidance For Chemical Sources, Flare And Vapor Oxidizers" (Draft Oct. 2000).

[8] Gas Vented to Flare (lb/hr) = Hourly Flowrate (scf/hr) x Mole Percent x MW (lb/lb-mole) / 379.5 (scf/lb-mole)

Example Propane Hourly Gas Vented to Flare (lb/hr) = 0,038 scf/hr | 0.06% | 0.00 lb/lb-mole | lb-mole/379.5 scf = 227.49 lb/hr

[9] Annual Gas Vented to Flare (tpy) = Hourly Gas Vented to Flare (lb/hr) x Hours of Operation (hrs/yr) x (1 ton / 2,000 lb)

Example Propane Vented to Flare Annual Emission Rate (tpy) = 227.49 lb/hr | 3125000 hrs/yr | 1 ton/2,000 lb = 1.36 ton/yr

[10] Controlled Maximum Potential Hourly Emission Rate (lb/hr) = Gas Vented to Flare (lb/hr) x (1 - DRE)

Example Controlled Propane Hourly Emission Rate (lb/hr) = 227.49 lb/hr | (1 - 0.00 ) = 4.55 lb/hr

[11] Total VOC taken as the sum of NMNEHC.

[12] Emission factors obtained from 40 CFR 98 Subpart C Tables C-1 and C-2 for natural gas.

[13] Global warming potentials obtained from 40 CFR 98 Subpart A Table A-1.

[14] Emission factors converted from kg/MMBtu to lb/MMBtu using the following conversion:

Greenhouse Gas Emission Factor (lb/MMBtu) = Greenhouse Gas Emission Factor (kg/MMBtu) x 2.2046 (lb/kg)

Example $CO_2$ Emission Factor (lb/MMBtu) = 53.06 kg/MMBtu | 2.2046 lb/kg = 116.98 lb/MMBtu

[15] Maximum Potential Hourly Emission Rate (lb/hr) = Hourly Heat Input (MMBtu/hr) x Emission Factor (lb/MMBtu)

Example $CO_2$ Hourly Emission Rate (lb/hr) = 2994.16 MMBtu/hr | 116.98 lb/MMBtu = 350,256.40 lb/hr

[16] Maximum Potential Annual Emission Rate (tpy) = Annual Heat Input (MMBtu/yr) x Emission Factor (lb/MMBtu) x (1 ton / 2,000 lb)

Example $CO_2$ Annual Emission Rate (tpy) = 35,930 MMBtu/yr | 116.98 lb/MMBtu | 1 ton/2,000 lb = 2101.54 ton/yr

[17] $CO_2e$ emissions based on GWPs for each greenhouse gas pollutant.

$CO_2e$ Hourly Emission Rate (lb/hr) = $CO_2$ Emission Rate (lb/hr) x $CO_2$ GWP + $CH_4$ Emission Rate (lb/hr) x $CH_4$ GWP + $N_2O$ Emission Rate (lb/hr) x $N_2O$ GWP

Example $CO_2e$ Hourly Emission Rate (lb/hr) = 350,256.40 lb/hr x 1 + 6.59 lb/hr x 28 + 0.66 lb/hr x 265 = 350,615 lb/hr

# Surface Coating SSM Emissions

**Targa Northern Delaware, LLC**

**Basis of Calculation:**

TCEQ's Painting Basics and Emissions Calculations for TCEQ Air Quality Permit Applications, November 5, 2012

VOC calculations are based on the product usage, VOC or HAP content, and density of a general paint used for MSS. The paint chosen has the highest VOC content of all paints typically used for these activities. It has been assumed that all VOC in the solution escapes to atmosphere. Emissions are calculated using the following equations:

Hourly VOC Emissions (lb/hr) = [Usage Rate (gal/hr)] * [VOC or HAP Content (lb/gal)]

Annual VOC Emissions (tpy) = [Usage Rate (gal/yr)] * [VOC or HAP Content lb/gal)] / [2,000 (lb/ton)]

It is assumed that all surface coating products are sprayed. Particulate emissions are calculated based on the usage rate and solids content for the product, as well as a transfer efficiency and fallout factor obtained from TCEQ's Painting Basics and Emissions Calculations for TCEQ Air Quality Permit Applications. The following equations are used to calculated particulate emissions:

Short-term PM emissions (lb/hr) = Solids Content (%) x Density (lb/gal) x Volume of Product used (gal/hr) x (1 - Transfer Efficiency (%)) x (1-Fallout Factor (%))

Annual PM emissions (tpy) = Solids Content (%) x Density (lb/gal) x Volume of Product used (gal/yr) x (1 - Transfer Efficiency (%)) x (1-Fallout Factor (%)) / 2,000 (lb/ton)

**Potential VOC and HAP Emissions from Paint Usage (MSS)**

| Product | Density (lb/gal) [1] | VOC Content | HAP Content (wt %) [1] | Usage Rates | | VOC Emissions | | HAP Emissions | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | (gal/hr) | (gal/yr) | (lb/hr) | (tpy) | (lb/hr) | (tpy) |
| Paint | 10.71 | 2.92 | 5.0 | 25.0 | 100.0 | 73.00 | 0.15 | 13.39 | 0.03 |
| **Totals** | | | | | | **73.00** | **0.15** | **13.39** | **0.03** |

# Section 7

# Information Used To Determine Emissions

---

**Information Used to Determine Emissions shall include the following**:

- ☑ If manufacturer data are used, include specifications for emissions units and control equipment, including control efficiencies specifications and sufficient engineering data for verification of control equipment operation, including design drawings, test reports, and design parameters that affect normal operation.
- ☐ If test data are used, include a copy of the complete test report. If the test data are for an emissions unit other than the one being permitted, the emission units must be identical. Test data may not be used if any difference in operating conditions of the unit being permitted and the unit represented in the test report significantly effect emission rates.
- ☑ If the most current copy of AP-42 is used, reference the section and date located at the bottom of the page. Include a copy of the page containing the emissions factors, and clearly mark the factors used in the calculations.
- ☐ If an older version of AP-42 is used, include a complete copy of the section.
- ☑ If an EPA document or other material is referenced, include a complete copy.
- ☑ Fuel specifications sheet.
- ☑ If computer models are used to estimate emissions, include an input summary (if available) and a detailed report, and a disk containing the input file(s) used to run the model. For tank-flashing emissions, include a discussion of the method used to estimate tank-flashing emissions, relative thresholds (i.e., permit or major source (NSPS, PSD or Title V)), accuracy of the model, the input and output from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis.

## 1.4 Natural Gas Combustion

### 1.4.1 General[1-2]

Natural gas is one of the major combustion fuels used throughout the country. It is mainly used to generate industrial and utility electric power, produce industrial process steam and heat, and heat residential and commercial space. Natural gas consists of a high percentage of methane (generally above 85 percent) and varying amounts of ethane, propane, butane, and inerts (typically nitrogen, carbon dioxide, and helium). The average gross heating value of natural gas is approximately 1,020 British thermal units per standard cubic foot (Btu/scf), usually varying from 950 to 1,050 Btu/scf.

### 1.4.2 Firing Practices[3-5]

There are three major types of boilers used for natural gas combustion in commercial, industrial, and utility applications: watertube, firetube, and cast iron. Watertube boilers are designed to pass water through the inside of heat transfer tubes while the outside of the tubes is heated by direct contact with the hot combustion gases and through radiant heat transfer. The watertube design is the most common in utility and large industrial boilers. Watertube boilers are used for a variety of applications, ranging from providing large amounts of process steam, to providing hot water or steam for space heating, to generating high-temperature, high-pressure steam for producing electricity. Furthermore, watertube boilers can be distinguished either as field erected units or packaged units.

Field erected boilers are boilers that are constructed on site and comprise the larger sized watertube boilers. Generally, boilers with heat input levels greater than 100 MMBtu/hr, are field erected. Field erected units usually have multiple burners and, given the customized nature of their construction, also have greater operational flexibility and $NO_x$ control options. Field erected units can also be further categorized as wall-fired or tangential-fired. Wall-fired units are characterized by multiple individual burners located on a single wall or on opposing walls of the furnace while tangential units have several rows of air and fuel nozzles located in each of the four corners of the boiler.

Package units are constructed off-site and shipped to the location where they are needed. While the heat input levels of packaged units may range up to 250 MMBtu/hr, the physical size of these units are constrained by shipping considerations and generally have heat input levels less than 100 MMBtu/hr. Packaged units are always wall-fired units with one or more individual burners. Given the size limitations imposed on packaged boilers, they have limited operational flexibility and cannot feasibly incorporate some $NO_x$ control options.

Firetube boilers are designed such that the hot combustion gases flow through tubes, which heat the water circulating outside of the tubes. These boilers are used primarily for space heating systems, industrial process steam, and portable power boilers. Firetube boilers are almost exclusively packaged units. The two major types of firetube units are Scotch Marine boilers and the older firebox boilers. In cast iron boilers, as in firetube boilers, the hot gases are contained inside the tubes and the water being heated circulates outside the tubes. However, the units are constructed of cast iron rather than steel. Virtually all cast iron boilers are constructed as package boilers. These boilers are used to produce either low-pressure steam or hot water, and are most commonly used in small commercial applications.

Natural gas is also combusted in residential boilers and furnaces. Residential boilers and furnaces generally resemble firetube boilers with flue gas traveling through several channels or tubes with water or air circulated outside the channels or tubes.

## 1.4.3 Emissions[3-4]

The emissions from natural gas-fired boilers and furnaces include nitrogen oxides ($NO_x$), carbon monoxide (CO), and carbon dioxide ($CO_2$), methane ($CH_4$), nitrous oxide ($N_2O$), volatile organic compounds (VOCs), trace amounts of sulfur dioxide ($SO_2$), and particulate matter (PM).

Nitrogen Oxides -

Nitrogen oxides formation occurs by three fundamentally different mechanisms. The principal mechanism of $NO_x$ formation in natural gas combustion is thermal $NO_x$. The thermal $NO_x$ mechanism occurs through the thermal dissociation and subsequent reaction of nitrogen ($N_2$) and oxygen ($O_2$) molecules in the combustion air. Most $NO_x$ formed through the thermal $NO_x$ mechanism occurs in the high temperature flame zone near the burners. The formation of thermal $NO_x$ is affected by three furnace-zone factors: (1) oxygen concentration, (2) peak temperature, and (3) time of exposure at peak temperature. As these three factors increase, $NO_x$ emission levels increase. The emission trends due to changes in these factors are fairly consistent for all types of natural gas-fired boilers and furnaces. Emission levels vary considerably with the type and size of combustor and with operating conditions (e.g., combustion air temperature, volumetric heat release rate, load, and excess oxygen level).

The second mechanism of $NO_x$ formation, called prompt $NO_x$, occurs through early reactions of nitrogen molecules in the combustion air and hydrocarbon radicals from the fuel. Prompt $NO_x$ reactions occur within the flame and are usually negligible when compared to the amount of $NO_x$ formed through the thermal $NO_x$ mechanism. However, prompt $NO_x$ levels may become significant with ultra-low-$NO_x$ burners.

The third mechanism of $NO_x$ formation, called fuel $NO_x$, stems from the evolution and reaction of fuel-bound nitrogen compounds with oxygen. Due to the characteristically low fuel nitrogen content of natural gas, $NO_x$ formation through the fuel $NO_x$ mechanism is insignificant.

Carbon Monoxide -

The rate of CO emissions from boilers depends on the efficiency of natural gas combustion. Improperly tuned boilers and boilers operating at off-design levels decrease combustion efficiency resulting in increased CO emissions. In some cases, the addition of $NO_x$ control systems such as low $NO_x$ burners and flue gas recirculation (FGR) may also reduce combustion efficiency, resulting in higher CO emissions relative to uncontrolled boilers.

Volatile Organic Compounds -

The rate of VOC emissions from boilers and furnaces also depends on combustion efficiency. VOC emissions are minimized by combustion practices that promote high combustion temperatures, long residence times at those temperatures, and turbulent mixing of fuel and combustion air. Trace amounts of VOC species in the natural gas fuel (e.g., formaldehyde and benzene) may also contribute to VOC emissions if they are not completely combusted in the boiler.

Sulfur Oxides -

Emissions of $SO_2$ from natural gas-fired boilers are low because pipeline quality natural gas typically has sulfur levels of 2,000 grains per million cubic feet. However, sulfur-containing odorants are added to natural gas for detecting leaks, leading to small amounts of $SO_2$ emissions. Boilers combusting unprocessed natural gas may have higher $SO_2$ emissions due to higher levels of sulfur in the natural gas. For these units, a sulfur mass balance should be used to determine $SO_2$ emissions.

Particulate Matter -

Because natural gas is a gaseous fuel, filterable PM emissions are typically low. Particulate matter from natural gas combustion has been estimated to be less than 1 micrometer in size and has filterable and condensable fractions. Particulate matter in natural gas combustion are usually larger molecular weight hydrocarbons that are not fully combusted. Increased PM emissions may result from poor air/fuel mixing or maintenance problems.

Greenhouse Gases -[6-9]

$CO_2$, $CH_4$, and $N_2O$ emissions are all produced during natural gas combustion. In properly tuned boilers, nearly all of the fuel carbon (99.9 percent) in natural gas is converted to $CO_2$ during the combustion process. This conversion is relatively independent of boiler or combustor type. Fuel carbon not converted to $CO_2$ results in $CH_4$, CO, and/or VOC emissions and is due to incomplete combustion. Even in boilers operating with poor combustion efficiency, the amount of $CH_4$, CO, and VOC produced is insignificant compared to $CO_2$ levels.

Formation of $N_2O$ during the combustion process is affected by two furnace-zone factors. $N_2O$ emissions are minimized when combustion temperatures are kept high (above 1475°F) and excess oxygen is kept to a minimum (less than 1 percent).

Methane emissions are highest during low-temperature combustion or incomplete combustion, such as the start-up or shut-down cycle for boilers. Typically, conditions that favor formation of $N_2O$ also favor emissions of methane.

1.4.4 Controls[4,10]

$NO_x$ Controls -

Currently, the two most prevalent combustion control techniques used to reduce $NO_x$ emissions from natural gas-fired boilers are flue gas recirculation (FGR) and low $NO_x$ burners. In an FGR system, a portion of the flue gas is recycled from the stack to the burner windbox. Upon entering the windbox, the recirculated gas is mixed with combustion air prior to being fed to the burner. The recycled flue gas consists of combustion products which act as inerts during combustion of the fuel/air mixture. The FGR system reduces $NO_x$ emissions by two mechanisms. Primarily, the recirculated gas acts as a dilutent to reduce combustion temperatures, thus suppressing the thermal $NO_x$ mechanism. To a lesser extent, FGR also reduces $NO_x$ formation by lowering the oxygen concentration in the primary flame zone. The amount of recirculated flue gas is a key operating parameter influencing $NO_x$ emission rates for these systems. An FGR system is normally used in combination with specially designed low $NO_x$ burners capable of sustaining a stable flame with the increased inert gas flow resulting from the use of FGR. When low $NO_x$ burners and FGR are used in combination, these techniques are capable of reducing $NO_x$ emissions by 60 to 90 percent.

Low $NO_x$ burners reduce $NO_x$ by accomplishing the combustion process in stages. Staging partially delays the combustion process, resulting in a cooler flame which suppresses thermal $NO_x$ formation. The two most common types of low $NO_x$ burners being applied to natural gas-fired boilers are staged air burners and staged fuel burners. $NO_x$ emission reductions of 40 to 85 percent (relative to uncontrolled emission levels) have been observed with low $NO_x$ burners.

Other combustion control techniques used to reduce $NO_x$ emissions include staged combustion and gas reburning. In staged combustion (e.g., burners-out-of-service and overfire air), the degree of staging is a key operating parameter influencing $NO_x$ emission rates. Gas reburning is similar to the use of overfire in the use of combustion staging. However, gas reburning injects additional amounts of natural gas in the upper furnace, just before the overfire air ports, to provide increased reduction of $NO_x$ to $NO_2$.

Two postcombustion technologies that may be applied to natural gas-fired boilers to reduce $NO_x$ emissions are selective noncatalytic reduction (SNCR) and selective catalytic reduction (SCR). The SNCR system injects ammonia ($NH_3$) or urea into combustion flue gases (in a specific temperature zone) to reduce $NO_x$ emission. The Alternative Control Techniques (ACT) document for $NO_x$ emissions from utility boilers, maximum SNCR performance was estimated to range from 25 to 40 percent for natural gas-fired boilers.[12] Performance data available from several natural gas fired utility boilers with SNCR show a 24 percent reduction in $NO_x$ for applications on wall-fired boilers and a 13 percent reduction in $NO_x$ for applications on tangential-fired boilers.[11] In many situations, a boiler may have an SNCR system installed to trim $NO_x$ emissions to meet permitted levels. In these cases, the SNCR system may not be operated to achieve maximum $NO_x$ reduction. The SCR system involves injecting $NH_3$ into the flue gas in the presence of a catalyst to reduce $NO_x$ emissions. No data were available on SCR performance on natural gas fired boilers at the time of this publication. However, the ACT Document for utility boilers estimates $NO_x$ reduction efficiencies for SCR control ranging from 80 to 90 percent.[12]

Emission factors for natural gas combustion in boilers and furnaces are presented in Tables 1.4-1, 1.4-2, 1.4-3, and 1.4-4.[11] Tables in this section present emission factors on a volume basis ($lb/10^6$ scf). To convert to an energy basis (lb/MMBtu), divide by a heating value of 1,020 MMBtu/$10^6$ scf. For the purposes of developing emission factors, natural gas combustors have been organized into three general categories: large wall-fired boilers with greater than 100 MMBtu/hr of heat input, boilers and residential furnaces with less than 100 MMBtu/hr of heat input, and tangential-fired boilers. Boilers within these categories share the same general design and operating characteristics and hence have similar emission characteristics when combusting natural gas.

Emission factors are rated from A to E to provide the user with an indication of how "good" the factor is, with "A" being excellent and "E" being poor. The criteria that are used to determine a rating for an emission factor can be found in the Emission Factor Documentation for AP-42 Section 1.4 and in the introduction to the AP-42 document.

### 1.4.5 Updates Since the Fifth Edition

The Fifth Edition was released in January 1995. Revisions to this section are summarized below. For further detail, consult the Emission Factor Documentation for this section. These and other documents can be found on the Emission Factor and Inventory Group (EFIG) home page (http://www.epa.gov/ttn/chief).

Supplement D, March 1998

- Text was revised concerning Firing Practices, Emissions, and Controls.
- All emission factors were updated based on 482 data points taken from 151 source tests. Many new emission factors have been added for speciated organic compounds, including hazardous air pollutants.

July 1998 - minor changes

- Footnote D was added to table 1.4-3 to explain why the sum of individual HAP may exceed VOC or TOC, the web address was updated, and the references were reordered.

Table 1.4-1. EMISSION FACTORS FOR NITROGEN OXIDES ($NO_x$) AND CARBON MONOXIDE (CO) FROM NATURAL GAS COMBUSTION[a]

| Combustor Type (MMBtu/hr Heat Input) [SCC] | $NO_x$[b] | | CO | |
|---|---|---|---|---|
| | Emission Factor ($lb/10^6$ scf) | Emission Factor Rating | Emission Factor ($lb/10^6$ scf) | Emission Factor Rating |
| Large Wall-Fired Boilers (>100) [1-01-006-01, 1-02-006-01, 1-03-006-01] | | | | |
| Uncontrolled (Pre-NSPS)[c] | 280 | A | 84 | B |
| Uncontrolled (Post-NSPS)[c] | 190 | A | 84 | B |
| Controlled - Low $NO_x$ burners | 140 | A | 84 | B |
| Controlled - Flue gas recirculation | 100 | D | 84 | B |
| Small Boilers (<100) [1-01-006-02, 1-02-006-02, 1-03-006-02, 1-03-006-03] | | | | |
| Uncontrolled | 100 | B | 84 | B |
| Controlled - Low $NO_x$ burners | 50 | D | 84 | B |
| Controlled - Low $NO_x$ burners/Flue gas recirculation | 32 | C | 84 | B |
| Tangential-Fired Boilers (All Sizes) [1-01-006-04] | | | | |
| Uncontrolled | 170 | A | 24 | C |
| Controlled - Flue gas recirculation | 76 | D | 98 | D |
| Residential Furnaces (<0.3) [No SCC] | | | | |
| Uncontrolled | 94 | B | 40 | B |

[a] Reference 11. Units are in pounds of pollutant per million standard cubic feet of natural gas fired. To convert from $lb/10^6$ scf to $kg/10^6$ $m^3$, multiply by 16. Emission factors are based on an average natural gas higher heating value of 1,020 Btu/scf. To convert from $lb/10^6$ scf to lb/MMBtu, divide by 1,020. The emission factors in this table may be converted to other natural gas heating values by multiplying the given emission factor by the ratio of the specified heating value to this average heating value. SCC = Source Classification Code. ND = no data. NA = not applicable.

[b] Expressed as $NO_2$. For large and small wall fired boilers with SNCR control, apply a 24 percent reduction to the appropriate $NO_X$ emission factor. For tangential-fired boilers with SNCR control, apply a 13 percent reduction to the appropriate $NO_X$ emission factor.

[c] NSPS=New Source Performance Standard as defined in 40 CFR 60 Subparts D and Db. Post-NSPS units are boilers with greater than 250 MMBtu/hr of heat input that commenced construction modification, or reconstruction after August 17, 1971, and units with heat input capacities between 100 and 250 MMBtu/hr that commenced construction modification, or reconstruction after June 19, 1984.

TABLE 1.4-2. EMISSION FACTORS FOR CRITERIA POLLUTANTS AND GREENHOUSE GASES FROM NATURAL GAS COMBUSTION[a]

| Pollutant | Emission Factor ($lb/10^6$ scf) | Emission Factor Rating |
|---|---|---|
| $CO_2$[b] | 120,000 | A |
| Lead | 0.0005 | D |
| $N_2O$ (Uncontrolled) | 2.2 | E |
| $N_2O$ (Controlled-low-$NO_X$ burner) | 0.64 | E |
| PM (Total)[c] | 7.6 | D |
| PM (Condensable)[c] | 5.7 | D |
| PM (Filterable)[c] | 1.9 | B |
| $SO_2$[d] | 0.6 | A |
| TOC | 11 | B |
| Methane | 2.3 | B |
| VOC | 5.5 | C |

[a] Reference 11. Units are in pounds of pollutant per million standard cubic feet of natural gas fired. Data are for all natural gas combustion sources. To convert from $lb/10^6$ scf to $kg/10^6$ $m^3$, multiply by 16. To convert from $lb/10^6$ scf to 1b/MMBtu, divide by 1,020. The emission factors in this table may be converted to other natural gas heating values by multiplying the given emission factor by the ratio of the specified heating value to this average heating value. TOC = Total Organic Compounds. VOC = Volatile Organic Compounds.

[b] Based on approximately 100% conversion of fuel carbon to $CO_2$. $CO_2[lb/10^6 \text{ scf}] = (3.67)(CON)(C)(D)$, where CON = fractional conversion of fuel carbon to $CO_2$, C = carbon content of fuel by weight (0.76), and D = density of fuel, $4.2 \times 10^4$ $lb/10^6$ scf.

[c] All PM (total, condensible, and filterable) is assumed to be less than 1.0 micrometer in diameter. Therefore, the PM emission factors presented here may be used to estimate $PM_{10}$, $PM_{2.5}$ or $PM_1$ emissions. Total PM is the sum of the filterable PM and condensible PM. Condensible PM is the particulate matter collected using EPA Method 202 (or equivalent). Filterable PM is the particulate matter collected on, or prior to, the filter of an EPA Method 5 (or equivalent) sampling train.

[d] Based on 100% conversion of fuel sulfur to $SO_2$. Assumes sulfur content is natural gas of 2,000 grains/$10^6$ scf. The $SO_2$ emission factor in this table can be converted to other natural gas sulfur contents by multiplying the $SO_2$ emission factor by the ratio of the site-specific sulfur content (grains/$10^6$ scf) to 2,000 grains/$10^6$ scf.

TABLE 1.4-3. EMISSION FACTORS FOR SPECIATED ORGANIC COMPOUNDS FROM NATURAL GAS COMBUSTION[a]

| CAS No. | Pollutant | Emission Factor ($lb/10^6$ scf) | Emission Factor Rating |
|---|---|---|---|
| 91-57-6 | 2-Methylnaphthalene[b, c] | 2.4E-05 | D |
| 56-49-5 | 3-Methylcholanthrene[b, c] | <1.8E-06 | E |

## 5.2 Transportation And Marketing Of Petroleum Liquids[1-3]

### 5.2.1 General

The transportation and marketing of petroleum liquids involve many distinct operations, each of which represents a potential source of evaporation loss. Crude oil is transported from production operations to a refinery by tankers, barges, rail tank cars, tank trucks, and pipelines. Refined petroleum products are conveyed to fuel marketing terminals and petrochemical industries by these same modes. From the fuel marketing terminals, the fuels are delivered by tank trucks to service stations, commercial accounts, and local bulk storage plants. The final destination for gasoline is usually a motor vehicle gasoline tank. Similar distribution paths exist for fuel oils and other petroleum products. A general depiction of these activities is shown in Figure 5.2-1.

### 5.2.2 Emissions And Controls

Evaporative emissions from the transportation and marketing of petroleum liquids may be considered, by storage equipment and mode of transportation used, in four categories:

1. Rail tank cars, tank trucks, and marine vessels: loading, transit, and ballasting losses.
2. Service stations: bulk fuel drop losses and underground tank breathing losses.
3. Motor vehicle tanks: refueling losses.
4. Large storage tanks: breathing, working, and standing storage losses. (See Chapter 7, "Liquid Storage Tanks".)

Evaporative and exhaust emissions are also associated with motor vehicle operation, and these topics are discussed in AP-42 *Volume II: Mobile Sources*.

#### 5.2.2.1 Rail Tank Cars, Tank Trucks, And Marine Vessels -

Emissions from these sources are from loading losses, ballasting losses, and transit losses.

##### 5.2.2.1.1 Loading Losses -

Loading losses are the primary source of evaporative emissions from rail tank car, tank truck, and marine vessel operations. Loading losses occur as organic vapors in "empty" cargo tanks are displaced to the atmosphere by the liquid being loaded into the tanks. These vapors are a composite of (1) vapors formed in the empty tank by evaporation of residual product from previous loads, (2) vapors transferred to the tank in vapor balance systems as product is being unloaded, and (3) vapors generated in the tank as the new product is being loaded. The quantity of evaporative losses from loading operations is, therefore, a function of the following parameters:

- Physical and chemical characteristics of the previous cargo;
- Method of unloading the previous cargo;
- Operations to transport the empty carrier to a loading terminal;
- Method of loading the new cargo; and
- Physical and chemical characteristics of the new cargo.

The principal methods of cargo carrier loading are illustrated in Figure 5.2-2, Figure 5.2-3, and Figure 5.2-4. In the splash loading method, the fill pipe dispensing the cargo is lowered only part way into the cargo tank. Significant turbulence and vapor/liquid contact occur during the splash

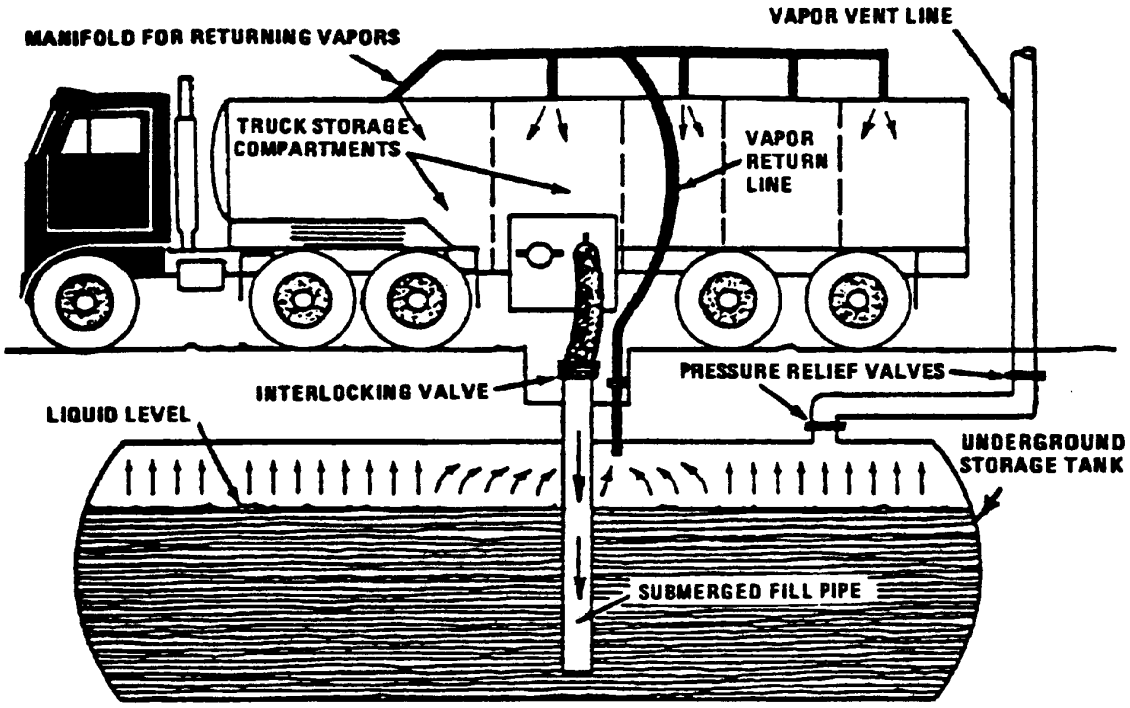

Figure 5.2-5. Tank truck unloading into a service station underground storage tank and practicing "vapor balance" form of emission control.

Table 5.2-1. SATURATION (S) FACTORS FOR CALCULATING PETROLEUM LIQUID LOADING LOSSES

| Cargo Carrier | Mode Of Operation | S Factor |
|---|---|---|
| Tank trucks and rail tank cars | Submerged loading of a clean cargo tank | 0.50 |
| | Submerged loading: dedicated normal service | 0.60 |
| | Submerged loading: dedicated vapor balance service | 1.00 |
| | Splash loading of a clean cargo tank | 1.45 |
| | Splash loading: dedicated normal service | 1.45 |
| | Splash loading: dedicated vapor balance service | 1.00 |
| Marine vessels[a] | Submerged loading: ships | 0.2 |
| | Submerged loading: barges | 0.5 |

[a] For products other than gasoline and crude oil. For marine loading of gasoline, use factors from Table 5.2-2. For marine loading of crude oil, use Equations 2 and 3 and Table 5.2-3.

The saturation factor, S, represents the expelled vapor's fractional approach to saturation, and it accounts for the variations observed in emission rates from the different unloading and loading methods. Table 5.2-1 lists suggested saturation factors.

Emissions from controlled loading operations can be calculated by multiplying the uncontrolled emission rate calculated in Equation 1 by an overall reduction efficiency term:

$$\left(1 - \frac{\text{eff}}{100}\right)$$

The overall reduction efficiency should account for the capture efficiency of the collection system as well as both the control efficiency and any downtime of the control device. Measures to reduce loading emissions include selection of alternate loading methods and application of vapor recovery equipment. The latter captures organic vapors displaced during loading operations and recovers the vapors by the use of refrigeration, absorption, adsorption, and/or compression. The recovered product is piped back to storage. Vapors can also be controlled through combustion in a thermal oxidation unit, with no product recovery. Figure 5.2-6 demonstrates the recovery of gasoline vapors from tank trucks during loading operations at bulk terminals. Control efficiencies for the recovery units range from 90 to over 99 percent, depending on both the nature of the vapors and the type of control equipment used.[5-6] However, not all of the displaced vapors reach the control device, because of leakage from both the tank truck and collection system. The collection efficiency should be assumed to be 99.2 percent for tanker trucks passing the MACT-level annual leak test (not more than 1 inch water column pressure change in 5 minutes after pressurizing to 18 inches water followed by pulling a vacuum of 6 inches water).[7] A collection efficiency of 98.7 percent (a 1.3 percent leakage rate) should be assumed for trucks passing the NSPS-level annual test (3 inches pressure change) A collection efficiency of 70 percent should be assumed for trucks not passing one of these annual leak tests[6].

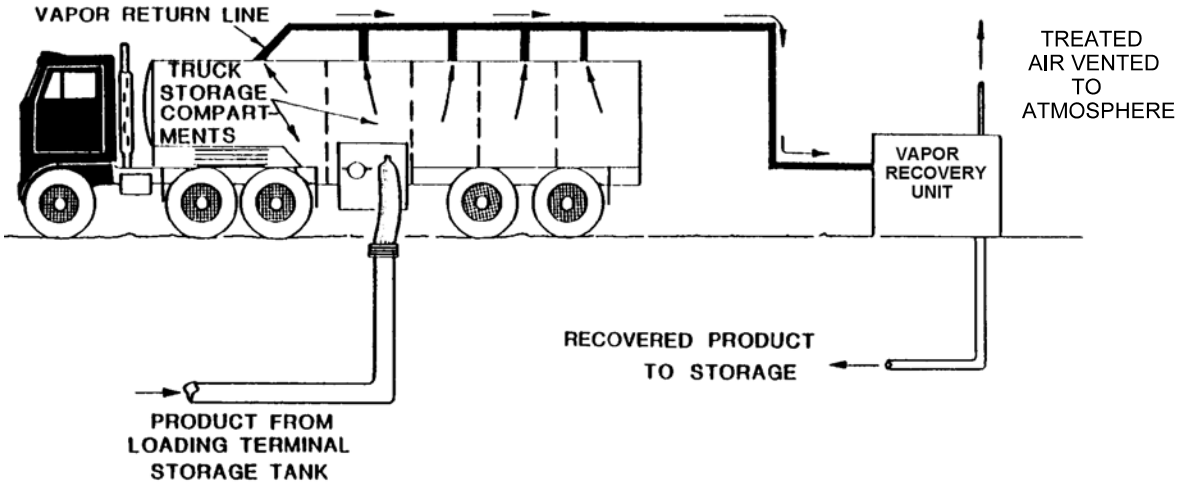

Figure 5.2-6. Tank truck loading with vapor recovery.

Sample Calculation -

Loading losses ($L_L$) from a gasoline tank truck in dedicated vapor balance service and practicing vapor recovery would be calculated as follows, using Equation 1:

Design basis -

Cargo tank volume is 8000 gal
Gasoline Reid vapor pressure (RVP) is 9 psia
Product temperature is 80°F
Vapor recovery efficiency is 95 percent
Vapor collection efficiency is 98.7 percent (NSPS-level annual leak test)

Loading loss equation -

$$L_L = 12.46 \frac{SPM}{T}\left(1 - \frac{eff}{100}\right)$$

where:

S = saturation factor (see Table 5.2-1) - 1.00
P = true vapor pressure of gasoline = 6.6 psia
M = molecular weight of gasoline vapors = 66
T = temperature of gasoline = 540°R
eff = overall reduction efficiency (95 percent control x 98.7 percent collection) = 94 percent

$$L_L = 12.46 \frac{(1.00)(6.6)(66)}{540}\left(1 - \frac{94}{100}\right)$$

$$= 0.60 \text{ lb}/10^3 \text{ gal}$$

Total loading losses are:

$$(0.60 \text{ lb}/10^3 \text{ gal})(8.0 \times 10^3 \text{ gal}) = 4.8 \text{ pounds (lb)}$$

Measurements of gasoline loading losses from ships and barges have led to the development of emission factors for these specific loading operations.[8] These factors are presented in Table 5.2-2 and should be used instead of Equation 1 for gasoline loading operations at marine terminals. Factors are expressed in units of milligrams per liter (mg/L) and pounds per 1000 gallons (lb/$10^3$ gal).

## 3.3 Gasoline And Diesel Industrial Engines

### 3.3.1 General

The engine category addressed by this section covers a wide variety of industrial applications of both gasoline and diesel internal combustion (IC) engines such as aerial lifts, fork lifts, mobile refrigeration units, generators, pumps, industrial sweepers/scrubbers, material handling equipment (such as conveyors), and portable well-drilling equipment. The three primary fuels for reciprocating IC engines are gasoline, diesel fuel oil (No.2), and natural gas. Gasoline is used primarily for mobile and portable engines. Diesel fuel oil is the most versatile fuel and is used in IC engines of all sizes. The rated power of these engines covers a rather substantial range, up to 250 horsepower (hp) for gasoline engines and up to 600 hp for diesel engines. (Diesel engines greater than 600 hp are covered in Section 3.4, "Large Stationary Diesel And All Stationary Dual-fuel Engines".) Understandably, substantial differences in engine duty cycles exist. It was necessary, therefore, to make reasonable assumptions concerning usage in order to formulate some of the emission factors.

### 3.3.2 Process Description

All reciprocating IC engines operate by the same basic process. A combustible mixture is first compressed in a small volume between the head of a piston and its surrounding cylinder. The mixture is then ignited, and the resulting high-pressure products of combustion push the piston through the cylinder. This movement is converted from linear to rotary motion by a crankshaft. The piston returns, pushing out exhaust gases, and the cycle is repeated.

There are 2 methods used for stationary reciprocating IC engines: compression ignition (CI) and spark ignition (SI). This section deals with both types of reciprocating IC engines. All diesel-fueled engines are compression ignited, and all gasoline-fueled engines are spark ignited.

In CI engines, combustion air is first compression heated in the cylinder, and diesel fuel oil is then injected into the hot air. Ignition is spontaneous because the air temperature is above the autoignition temperature of the fuel. SI engines initiate combustion by the spark of an electrical discharge. Usually the fuel is mixed with the air in a carburetor (for gasoline) or at the intake valve (for natural gas), but occasionally the fuel is injected into the compressed air in the cylinder.

CI engines usually operate at a higher compression ratio (ratio of cylinder volume when the piston is at the bottom of its stroke to the volume when it is at the top) than SI engines because fuel is not present during compression; hence there is no danger of premature autoignition. Since engine thermal efficiency rises with increasing pressure ratio (and pressure ratio varies directly with compression ratio), CI engines are more efficient than SI engines. This increased efficiency is gained at the expense of poorer response to load changes and a heavier structure to withstand the higher pressures.[1]

### 3.3.3 Emissions

Most of the pollutants from IC engines are emitted through the exhaust. However, some total organic compounds (TOC) escape from the crankcase as a result of blowby (gases that are vented from the oil pan after they have escaped from the cylinder past the piston rings) and from the fuel tank and carburetor because of evaporation. Nearly all of the TOCs from diesel CI engines enter the

atmosphere from the exhaust. Evaporative losses are insignificant in diesel engines due to the low volatility of diesel fuels.

The primary pollutants from internal combustion engines are oxides of nitrogen ($NO_x$), total organic compounds (TOC), carbon monoxide (CO), and particulates, which include both visible (smoke) and nonvisible emissions. Nitrogen oxide formation is directly related to high pressures and temperatures during the combustion process and to the nitrogen content, if any, of the fuel. The other pollutants, HC, CO, and smoke, are primarily the result of incomplete combustion. Ash and metallic additives in the fuel also contribute to the particulate content of the exhaust. Sulfur oxides ($SO_x$) also appear in the exhaust from IC engines. The sulfur compounds, mainly sulfur dioxide ($SO_2$), are directly related to the sulfur content of the fuel.[2]

3.3.3.1 Nitrogen Oxides -

Nitrogen oxide formation occurs by two fundamentally different mechanisms. The predominant mechanism with internal combustion engines is thermal $NO_x$ which arises from the thermal dissociation and subsequent reaction of nitrogen ($N_2$) and oxygen ($O_2$) molecules in the combustion air. Most thermal $NO_x$ is formed in the high-temperature region of the flame from dissociated molecular nitrogen in the combustion air. Some $NO_x$, called prompt $NO_x$, is formed in the early part of the flame from reaction of nitrogen intermediary species, and HC radicals in the flame. The second mechanism, fuel $NO_x$, stems from the evolution and reaction of fuel-bound nitrogen compounds with oxygen. Gasoline, and most distillate oils have no chemically-bound fuel $N_2$ and essentially all $NO_x$ formed is thermal $NO_x$.

3.3.3.2 Total Organic Compounds -

The pollutants commonly classified as hydrocarbons are composed of a wide variety of organic compounds and are discharged into the atmosphere when some of the fuel remains unburned or is only partially burned during the combustion process. Most unburned hydrocarbon emissions result from fuel droplets that were transported or injected into the quench layer during combustion. This is the region immediately adjacent to the combustion chamber surfaces, where heat transfer outward through the cylinder walls causes the mixture temperatures to be too low to support combustion.

Partially burned hydrocarbons can occur because of poor air and fuel homogeneity due to incomplete mixing, before or during combustion; incorrect air/fuel ratios in the cylinder during combustion due to maladjustment of the engine fuel system; excessively large fuel droplets (diesel engines); and low cylinder temperature due to excessive cooling (quenching) through the walls or early cooling of the gases by expansion of the combustion volume caused by piston motion before combustion is completed.[2]

3.3.3.3 Carbon Monoxide -

Carbon monoxide is a colorless, odorless, relatively inert gas formed as an intermediate combustion product that appears in the exhaust when the reaction of CO to $CO_2$ cannot proceed to completion. This situation occurs if there is a lack of available oxygen near the hydrocarbon (fuel) molecule during combustion, if the gas temperature is too low, or if the residence time in the cylinder is too short. The oxidation rate of CO is limited by reaction kinetics and, as a consequence, can be accelerated only to a certain extent by improvements in air and fuel mixing during the combustion process.[2-3]

3.3.3.4 Smoke and Particulate Matter -

White, blue, and black smoke may be emitted from IC engines. Liquid particulates appear as white smoke in the exhaust during an engine cold start, idling, or low load operation. These are formed in the quench layer adjacent to the cylinder walls, where the temperature is not high enough to ignite the fuel. Blue smoke is emitted when lubricating oil leaks, often past worn piston rings, into the combustion chamber and is partially burned. Proper maintenance is the most effective method of preventing blue smoke emissions from all types of IC engines. The primary constituent of black smoke is agglomerated carbon particles (soot) formed in regions of the combustion mixtures that are oxygen deficient.[2]

3.3.3.5 Sulfur Oxides -

Sulfur oxides emissions are a function of only the sulfur content in the fuel rather than any combustion variables. In fact, during the combustion process, essentially all the sulfur in the fuel is oxidized to $SO_2$. The oxidation of $SO_2$ gives sulfur trioxide ($SO_3$), which reacts with water to give sulfuric acid ($H_2SO_4$), a contributor to acid precipitation. Sulfuric acid reacts with basic substances to give sulfates, which are fine particulates that contribute to PM-10 and visibility reduction. Sulfur oxide emissions also contribute to corrosion of the engine parts.[2-3]

3.3.4 Control Technologies

Control measures to date are primarily directed at limiting $NO_x$ and CO emissions since they are the primary pollutants from these engines. From a $NO_x$ control viewpoint, the most important distinction between different engine models and types of reciprocating engines is whether they are rich-burn or lean-burn. Rich-burn engines have an air-to-fuel ratio operating range that is near stoichiometric or fuel-rich of stoichiometric and as a result the exhaust gas has little or no excess oxygen. A lean-burn engine has an air-to-fuel operating range that is fuel-lean of stoichiometric; therefore, the exhaust from these engines is characterized by medium to high levels of $O_2$. The most common $NO_x$ control technique for diesel and dual-fuel engines focuses on modifying the combustion process. However, selective catalytic reduction (SCR) and nonselective catalytic reduction (NSCR) which are post-combustion techniques are becoming available. Controls for CO have been partly adapted from mobile sources.[4]

Combustion modifications include injection timing retard (ITR), preignition chamber combustion (PCC), air-to-fuel ratio adjustments, and derating. Injection of fuel into the cylinder of a CI engine initiates the combustion process. Retarding the timing of the diesel fuel injection causes the combustion process to occur later in the power stroke when the piston is in the downward motion and combustion chamber volume is increasing. By increasing the volume, the combustion temperature and pressure are lowered, thereby lowering $NO_x$ formation. ITR reduces $NO_x$ from all diesel engines; however, the effectiveness is specific to each engine model. The amount of $NO_x$ reduction with ITR diminishes with increasing levels of retard.[4]

Improved swirl patterns promote thorough air and fuel mixing and may include a precombustion chamber (PCC). A PCC is an antechamber that ignites a fuel-rich mixture that propagates to the main combustion chamber. The high exit velocity from the PCC results in improved mixing and complete combustion of the lean air/fuel mixture which lowers combustion temperature, thereby reducing $NO_x$ emissions.[4]

The air-to-fuel ratio for each cylinder can be adjusted by controlling the amount of fuel that enters each cylinder. At air-to-fuel ratios less than stoichiometric (fuel-rich), combustion occurs under conditions of insufficient oxygen which causes $NO_x$ to decrease because of lower oxygen and lower temperatures. Derating involves restricting the engine operation to lower than normal levels of power production for the given application. Derating reduces cylinder pressures and temperatures, thereby lowering $NO_x$ formation rates.[4]

SCR is an add-on $NO_x$ control placed in the exhaust stream following the engine and involves injecting ammonia ($NH_3$) into the flue gas. The $NH_3$ reacts with $NO_x$ in the presence of a catalyst to form water and nitrogen. The effectiveness of SCR depends on fuel quality and engine duty cycle (load fluctuations). Contaminants in the fuel may poison or mask the catalyst surface causing a reduction or termination in catalyst activity. Load fluctuations can cause variations in exhaust temperature and $NO_x$ concentration which can create problems with the effectiveness of the SCR system.[4]

NSCR is often referred to as a three-way conversion catalyst system because the catalyst reactor simultaneously reduces $NO_x$, CO, and HC and involves placing a catalyst in the exhaust stream of the engine. The reaction requires that the $O_2$ levels be kept low and that the engine be operated at fuel-rich air-to-fuel ratios.[4]

The most accurate method for calculating such emissions is on the basis of "brake-specific" emission factors (pounds per horsepower-hour [lb/hp-hr]). Emissions are the product of the brake-specific emission factor, the usage in hours, the rated power available, and the load factor (the power actually used divided by the power available). However, for emission inventory purposes, it is often easier to assess this activity on the basis of fuel used.

Once reasonable usage and duty cycles for this category were ascertained, emission values were aggregated to arrive at the factors for criteria and organic pollutants presented. Factors in Table 3.3-1 are in pounds per million British thermal unit (lb/MMBtu). Emission data for a specific design type were weighted according to estimated material share for industrial engines. The emission factors in these tables, because of their aggregate nature, are most appropriately applied to a population of industrial engines rather than to an individual power plant. Table 3.3-2 shows unweighted speciated organic compound and air toxic emission factors based upon only 2 engines. Their inclusion in this section is intended for rough order-of-magnitude estimates only.

Table 3.3-3 summarizes whether the various diesel emission reduction technologies (some of which may be applicable to gasoline engines) will generally increase or decrease the selected parameter. These technologies are categorized into fuel modifications, engine modifications, and exhaust after-treatments. Current data are insufficient to quantify the results of the modifications. Table 3.3-3 provides general information on the trends of changes on selected parameters.

### 3.3.5 Updates Since the Fifth Edition

The Fifth Edition was released in January 1995. Revisions to this section since that date are summarized below. For further detail, consult the memoranda describing each supplement or the background report for this section.

Supplement A, February 1996

No changes.

Supplement B, October 1996

- Text was revised concerning emissions and controls.
- The $CO_2$ emission factor was adjusted to reflect 98.5 percent conversion efficiency.

Table 3.3-1. EMISSION FACTORS FOR UNCONTROLLED GASOLINE AND DIESEL INDUSTRIAL ENGINES[a]

| Pollutant | Gasoline Fuel (SCC 2-02-003-01, 2-03-003-01) | | Diesel Fuel (SCC 2-02-001-02, 2-03-001-01) | | EMISSION FACTOR RATING |
|---|---|---|---|---|---|
| | Emission Factor (lb/hp-hr) (power output) | Emission Factor (lb/MMBtu) (fuel input) | Emission Factor (lb/hp-hr) (power output) | Emission Factor (lb/MMBtu) (fuel input) | |
| $NO_x$ | 0.011 | 1.63 | 0.031 | 4.41 | D |
| CO | 6.96 E-03[d] | 0.99[d] | 6.68 E-03 | 0.95 | D |
| $SO_x$ | 5.91 E-04 | 0.084 | 2.05 E-03 | 0.29 | D |
| PM-10[b] | 7.21 E-04 | 0.10 | 2.20 E-03 | 0.31 | D |
| $CO_2$[c] | 1.08 | 154 | 1.15 | 164 | B |
| Aldehydes | 4.85 E-04 | 0.07 | 4.63 E-04 | 0.07 | D |
| TOC | | | | | |
| Exhaust | 0.015 | 2.10 | 2.47 E-03 | 0.35 | D |
| Evaporative | 6.61 E-04 | 0.09 | 0.00 | 0.00 | E |
| Crankcase | 4.85 E-03 | 0.69 | 4.41 E-05 | 0.01 | E |
| Refueling | 1.08 E-03 | 0.15 | 0.00 | 0.00 | E |

[a] References 2,5-6,9-14. When necessary, an average brake-specific fuel consumption (BSFC) of 7,000 Btu/hp-hr was used to convert from lb/MMBtu to lb/hp-hr. To convert from lb/hp-hr to kg/kw-hr, multiply by 0.608. To convert from lb/MMBtu to ng/J, multiply by 430. SCC = Source Classification Code. TOC = total organic compounds.

[b] PM-10 = particulate matter less than or equal to 10 μm aerodynamic diameter. All particulate is assumed to be ≤ 1 μm in size.

[c] Assumes 99% conversion of carbon in fuel to $CO_2$ with 87 weight % carbon in diesel, 86 weight % carbon in gasoline, average BSFC of 7,000 Btu/hp-hr, diesel heating value of 19,300 Btu/lb, and gasoline heating value of 20,300 Btu/lb.

[d] Instead of 0.439 lb/hp-hr (power output) and 62.7 lb/mmBtu (fuel input), the correct emissions factors values are 6.96 E-03 lb/hp-hr (power output) and 0.99 lb/mmBtu (fuel input), respectively. This is an editorial correction. March 24, 2009

Table 3.3-2. SPECIATED ORGANIC COMPOUND EMISSION FACTORS FOR UNCONTROLLED DIESEL ENGINES[a]

EMISSION FACTOR RATING: E

| Pollutant | Emission Factor (Fuel Input) (lb/MMBtu) |
|---|---|
| Benzene[b] | 9.33 E-04 |
| Toluene[b] | 4.09 E-04 |
| Xylenes[b] | 2.85 E-04 |
| Propylene | 2.58 E-03 |
| 1,3-Butadiene[b,c] | <3.91 E-05 |
| Formaldehyde[b] | 1.18 E-03 |
| Acetaldehyde[b] | 7.67 E-04 |

## 1.3 Fuel Oil Combustion

### 1.3.1 General[1-3]

Two major categories of fuel oil are burned by combustion sources: distillate oils and residual oils. These oils are further distinguished by grade numbers, with Nos. 1 and 2 being distillate oils; Nos. 5 and 6 being residual oils; and No. 4 being either distillate oil or a mixture of distillate and residual oils. No. 6 fuel oil is sometimes referred to as Bunker C. Distillate oils are more volatile and less viscous than residual oils. They have negligible nitrogen and ash contents and usually contain less than 0.3 percent sulfur (by weight). Distillate oils are used mainly in domestic and small commercial applications, and include kerosene and diesel fuels. Being more viscous and less volatile than distillate oils, the heavier residual oils (Nos. 5 and 6) may need to be heated for ease of handling and to facilitate proper atomization. Because residual oils are produced from the residue remaining after the lighter fractions (gasoline, kerosene, and distillate oils) have been removed from the crude oil, they contain significant quantities of ash, nitrogen, and sulfur. Residual oils are used mainly in utility, industrial, and large commercial applications.

### 1.3.2 Firing Practices[4]

The major boiler configurations for fuel oil-fired combustors are watertube, firetube, cast iron, and tubeless design. Boilers are classified according to design and orientation of heat transfer surfaces, burner configuration, and size. These factors can all strongly influence emissions as well as the potential for controlling emissions.

Watertube boilers are used in a variety of applications ranging from supplying large amounts of process steam to providing space heat for industrial facilities. In a watertube boiler, combustion heat is transferred to water flowing through tubes which line the furnace walls and boiler passes. The tube surfaces in the furnace (which houses the burner flame) absorb heat primarily by radiation from the flames. The tube surfaces in the boiler passes (adjacent to the primary furnace) absorb heat primarily by convective heat transfer.

Firetube boilers are used primarily for heating systems, industrial process steam generators, and portable power boilers. In firetube boilers, the hot combustion gases flow through the tubes while the water being heated circulates outside of the tubes. At high pressures and when subjected to large variations in steam demand, firetube units are more susceptible to structural failure than watertube boilers. This is because the high-pressure steam in firetube units is contained by the boiler walls rather than by multiple small-diameter watertubes, which are inherently stronger. As a consequence, firetube boilers are typically small and are used primarily where boiler loads are relatively constant. Nearly all firetube boilers are sold as packaged units because of their relatively small size.

A cast iron boiler is one in which combustion gases rise through a vertical heat exchanger and out through an exhaust duct. Water in the heat exchanger tubes is heated as it moves upward through the tubes. Cast iron boilers produce low pressure steam or hot water, and generally burn oil or natural gas. They are used primarily in the residential and commercial sectors.

Another type of heat transfer configuration used on smaller boilers is the tubeless design. This design incorporates nested pressure vessels with water in between the shells. Combustion gases are fired into the inner pressure vessel and are then sometimes recirculated outside the second vessel.

a To convert from lb/103 gal to kg/103 L, multiply by 0.120. SCC = Source Classification Code.
b References 1-2,6-9,14,56-60. S indicates that the weight % of sulfur in the oil should be multiplied by the value given. For example, if the fuel is 1% sulfur, then S = 1.
c References 1-2,6-8,16,57-60. S indicates that the weight % of sulfur in the oil should be multiplied by the value given. For example, if the fuel is 1% sulfur, then S = 1.
d References 6-7,15,19,22,56-62. Expressed as NO2. Test results indicate that at least 95% by weight of NOx is NO for all boiler types except residential furnaces, where about 75% is NO. For utility vertical fired boilers use 105 lb/103 gal at full load and normal (>15%) excess air. Nitrogen oxides emissions from residual oil combustion in industrial and commercial boilers are related to fuel nitrogen content, estimated by the following empirical relationship: lb NO2 /103 gal = 20.54 + 104.39(N), where N is the weight % of nitrogen in the oil. For example, if the fuel is 1% nitrogen, then N = 1.
e References 6-8,14,17-19,56-61. CO emissions may increase by factors of 10 to 100 if the unit is improperly operated or not well maintained.
f References 6-8,10,13-15,56-60,62-63. Filterable PM is that particulate collected on or prior to the filter of an EPA Method 5 (or equivalent) sampling train. Particulate emission factors for residual oil combustion are, on average, a function of fuel oil sulfur content where S is the weight % of sulfur in oil. For example, if fuel oil is 1% sulfur, then S = 1.
g Based on data from new burner designs. Pre-1970's burner designs may emit filterable PM as high as 3.0 1b/103 gal.
h The SO2 emission factor for both no. 2 oil fired and for no. 2 oil fired with LNB/FGR, is 142S, not 157S. Errata dated April 28, 2000. Section corrected May 2010.
i The PM factors for No.6 and No. 5 fuel were reversed. Errata dated April 28, 2000. Section corrected May 2010.

## 13.2.2 Unpaved Roads

### 13.2.2.1 General

When a vehicle travels an unpaved road, the force of the wheels on the road surface causes pulverization of surface material. Particles are lifted and dropped from the rolling wheels, and the road surface is exposed to strong air currents in turbulent shear with the surface. The turbulent wake behind the vehicle continues to act on the road surface after the vehicle has passed.

The particulate emission factors presented in the previous draft version of this section of AP-42, dated October 2001, implicitly included the emissions from vehicles in the form of exhaust, brake wear, and tire wear as well as resuspended road surface material[25]. EPA included these sources in the emission factor equation for unpaved public roads (equation 1b in this section) since the field testing data used to develop the equation included both the direct emissions from vehicles and emissions from resuspension of road dust.

This version of the unpaved public road emission factor equation only estimates particulate emissions from resuspended road surface material [23, 26]. The particulate emissions from vehicle exhaust, brake wear, and tire wear are now estimated separately using EPA's MOBILE6.2 [24]. This approach eliminates the possibility of double counting emissions. Double counting results when employing the previous version of the emission factor equation in this section and MOBILE6.2 to estimate particulate emissions from vehicle traffic on unpaved public roads. It also incorporates the decrease in exhaust emissions that has occurred since the unpaved public road emission factor equation was developed. The previous version of the unpaved public road emission factor equation includes estimates of emissions from exhaust, brake wear, and tire wear based on emission rates for vehicles in the 1980 calendar year fleet. The amount of PM released from vehicle exhaust has decreased since 1980 due to lower new vehicle emission standards and changes in fuel characteristics.

### 13.2.2.2 Emissions Calculation And Correction Parameters[1-6]

The quantity of dust emissions from a given segment of unpaved road varies linearly with the volume of traffic. Field investigations also have shown that emissions depend on source parameters that characterize the condition of a particular road and the associated vehicle traffic. Characterization of these source parameters allow for "correction" of emission estimates to specific road and traffic conditions present on public and industrial roadways.

Dust emissions from unpaved roads have been found to vary directly with the fraction of silt (particles smaller than 75 micrometers [μm] in diameter) in the road surface materials.[1] The silt fraction is determined by measuring the proportion of loose dry surface dust that passes a 200-mesh screen, using the ASTM-C-136 method. A summary of this method is contained in Appendix C of AP-42. Table 13.2.2-1 summarizes measured silt values for industrial unpaved roads. Table 13.2.2-2 summarizes measured silt values for public unpaved roads. It should be noted that the ranges of silt content vary over two orders of magnitude. Therefore, the use of data from this table can potentially introduce considerable error. Use of this data is strongly discouraged when it is feasible to obtain locally gathered data.

Since the silt content of a rural dirt road will vary with geographic location, it should be measured for use in projecting emissions. As a conservative approximation, the silt content of the parent soil in the area can be used. Tests, however, show that road silt content is normally lower than in the surrounding parent soil, because the fines are continually removed by the vehicle traffic, leaving a higher percentage of coarse particles.

Other variables are important in addition to the silt content of the road surface material. For example, at industrial sites, where haul trucks and other heavy equipment are common, emissions are highly correlated with vehicle weight. On the other hand, there is far less variability in the weights of cars and pickup trucks that commonly travel publicly accessible unpaved roads throughout the United States. For those roads, the moisture content of the road surface material may be more dominant in determining differences in emission levels between, for example a hot, desert environment and a cool, moist location.

The PM-10 and TSP emission factors presented below are the outcomes from stepwise linear regressions of field emission test results of vehicles traveling over unpaved surfaces. Due to a limited amount of information available for PM-2.5, the expression for that particle size range has been scaled against the result for PM-10. Consequently, the quality rating for the PM-2.5 factor is lower than that for the PM-10 expression.

## 13.2.2 Unpaved Roads

### 13.2.2.1 General

When a vehicle travels an unpaved road, the force of the wheels on the road surface causes pulverization of surface material. Particles are lifted and dropped from the rolling wheels, and the road surface is exposed to strong air currents in turbulent shear with the surface. The turbulent wake behind the vehicle continues to act on the road surface after the vehicle has passed.

The particulate emission factors presented in the previous draft version of this section of AP-42, dated October 2001, implicitly included the emissions from vehicles in the form of exhaust, brake wear, and tire wear as well as resuspended road surface material[25]. EPA included these sources in the emission factor equation for unpaved public roads (equation 1b in this section) since the field testing data used to develop the equation included both the direct emissions from vehicles and emissions from resuspension of road dust.

This version of the unpaved public road emission factor equation only estimates particulate emissions from resuspended road surface material [23, 26]. The particulate emissions from vehicle exhaust, brake wear, and tire wear are now estimated separately using EPA's MOBILE6.2 [24]. This approach eliminates the possibility of double counting emissions. Double counting results when employing the previous version of the emission factor equation in this section and MOBILE6.2 to estimate particulate emissions from vehicle traffic on unpaved public roads. It also incorporates the decrease in exhaust emissions that has occurred since the unpaved public road emission factor equation was developed. The previous version of the unpaved public road emission factor equation includes estimates of emissions from exhaust, brake wear, and tire wear based on emission rates for vehicles in the 1980 calendar year fleet. The amount of PM released from vehicle exhaust has decreased since 1980 due to lower new vehicle emission standards and changes in fuel characteristics.

### 13.2.2.2 Emissions Calculation And Correction Parameters[1-6]

The quantity of dust emissions from a given segment of unpaved road varies linearly with the volume of traffic. Field investigations also have shown that emissions depend on source parameters that characterize the condition of a particular road and the associated vehicle traffic. Characterization of these source parameters allow for "correction" of emission estimates to specific road and traffic conditions present on public and industrial roadways.

Dust emissions from unpaved roads have been found to vary directly with the fraction of silt (particles smaller than 75 micrometers [μm] in diameter) in the road surface materials.[1] The silt fraction is determined by measuring the proportion of loose dry surface dust that passes a 200-mesh screen, using the ASTM-C-136 method. A summary of this method is contained in Appendix C of AP-42. Table 13.2.2-1 summarizes measured silt values for industrial unpaved roads. Table 13.2.2-2 summarizes measured silt values for public unpaved roads. It should be noted that the ranges of silt content vary over two orders of magnitude. Therefore, the use of data from this table can potentially introduce considerable error. Use of this data is strongly discouraged when it is feasible to obtain locally gathered data.

Since the silt content of a rural dirt road will vary with geographic location, it should be measured for use in projecting emissions. As a conservative approximation, the silt content of the parent soil in the area can be used. Tests, however, show that road silt content is normally lower than in the surrounding parent soil, because the fines are continually removed by the vehicle traffic, leaving a higher percentage of coarse particles.

Other variables are important in addition to the silt content of the road surface material. For example, at industrial sites, where haul trucks and other heavy equipment are common, emissions are highly correlated with vehicle weight. On the other hand, there is far less variability in the weights of cars and pickup trucks that commonly travel publicly accessible unpaved roads throughout the United States. For those roads, the moisture content of the road surface material may be more dominant in determining differences in emission levels between, for example a hot, desert environment and a cool, moist location.

The PM-10 and TSP emission factors presented below are the outcomes from stepwise linear regressions of field emission test results of vehicles traveling over unpaved surfaces. Due to a limited amount of information available for PM-2.5, the expression for that particle size range has been scaled against the result for PM-10. Consequently, the quality rating for the PM-2.5 factor is lower than that for the PM-10 expression.

Table 13.2.2-1. TYPICAL SILT CONTENT VALUES OF SURFACE MATERIAL ON INDUSTRIAL UNPAVED ROADS[a]

| Industry | Road Use Or Surface Material | Plant Sites | No. Of Samples | Silt Content (%) | |
|---|---|---|---|---|---|
| | | | | Range | Mean |
| Copper smelting | Plant road | 1 | 3 | 16 - 19 | 17 |
| Iron and steel production | Plant road | 19 | 135 | 0.2 - 19 | 6.0 |
| Sand and gravel processing | Plant road | 1 | 3 | 4.1 - 6.0 | 4.8 |
| | Material storage area | 1 | 1 | - | 7.1 |
| Stone quarrying and processing | Plant road | 2 | 10 | 2.4 - 16 | 10 |
| | Haul road to/from pit | 4 | 20 | 5.0-15 | 8.3 |
| Taconite mining and processing | Service road | 1 | 8 | 2.4 - 7.1 | 4.3 |
| | Haul road to/from pit | 1 | 12 | 3.9 - 9.7 | 5.8 |
| Western surface coal mining | Haul road to/from pit | 3 | 21 | 2.8 - 18 | 8.4 |
| | Plant road | 2 | 2 | 4.9 - 5.3 | 5.1 |
| | Scraper route | 3 | 10 | 7.2 - 25 | 17 |
| | Haul road (freshly graded) | 2 | 5 | 18 - 29 | 24 |
| Construction sites | Scraper routes | 7 | 20 | 0.56-23 | 8.5 |
| Lumber sawmills | Log yards | 2 | 2 | 4.8-12 | 8.4 |
| Municipal solid waste landfills | Disposal routes | 4 | 20 | 2.2 - 21 | 6.4 |

[a]References 1,5-15.

The following empirical expressions may be used to estimate the quantity in pounds (lb) of size-specific particulate emissions from an unpaved road, per vehicle mile traveled (VMT):

For vehicles traveling on unpaved surfaces at industrial sites, emissions are estimated from the following equation:

$$E = k\,(s/12)^a (W/3)^b \quad (1a)$$

and, for vehicles traveling on publicly accessible roads, dominated by light duty vehicles, emissions may be estimated from the following:

$$E = \frac{k\,(s/12)^a (S/30)^d}{(M/0.5)^c} - C \quad (1b)$$

where k, a, b, c and d are empirical constants (Reference 6) given below and

E = size-specific emission factor (lb/VMT)
s = surface material silt content (%)
W = mean vehicle weight (tons)
M = surface material moisture content (%)
S = mean vehicle speed (mph)
*C* = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.

The source characteristics s, W and M are referred to as correction parameters for adjusting the emission estimates to local conditions. The metric conversion from lb/VMT to grams (g) per vehicle kilometer traveled (VKT) is as follows:

1 lb/VMT = 281.9 g/VKT

The constants for Equations 1a and 1b based on the stated aerodynamic particle sizes are shown in Tables 13.2.2-2 and 13.2.2-4. The PM-2.5 particle size multipliers (k-factors) are taken from Reference 27.

Table 13.2.2-2. CONSTANTS FOR EQUATIONS 1a AND 1b

| Constant | Industrial Roads (Equation 1a) | | | Public Roads (Equation 1b) | | |
|---|---|---|---|---|---|---|
| | PM-2.5 | PM-10 | PM-30* | PM-2.5 | PM-10 | PM-30* |
| k (lb/VMT) | 0.15 | 1.5 | 4.9 | 0.18 | 1.8 | 6.0 |
| a | 0.9 | 0.9 | 0.7 | 1 | 1 | 1 |
| b | 0.45 | 0.45 | 0.45 | - | - | - |
| c | - | - | - | 0.2 | 0.2 | 0.3 |
| d | - | - | - | 0.5 | 0.5 | 0.3 |
| Quality Rating | B | B | B | B | B | B |

*Assumed equivalent to total suspended particulate matter (TSP)
"-" = not used in the emission factor equation

Table 13.2.2-2 also contains the quality ratings for the various size-specific versions of Equation 1a and 1b. The equation retains the assigned quality rating, if applied within the ranges of source conditions, shown in Table 13.2.2-3, that were tested in developing the equation:

Table 13.2.2-3. RANGE OF SOURCE CONDITIONS USED IN DEVELOPING EQUATION 1a AND 1b

| Emission Factor | Surface Silt Content, % | Mean Vehicle Weight | | Mean Vehicle Speed | | Mean No. of Wheels | Surface Moisture Content, % |
|---|---|---|---|---|---|---|---|
| | | Mg | ton | km/hr | mph | | |
| Industrial Roads (Equation 1a) | 1.8-25.2 | 1.8-260 | 2-290 | 8-69 | 5-43 | 4-17[a] | 0.03-13 |
| Public Roads (Equation 1b) | 1.8-35 | 1.4-2.7 | 1.5-3 | 16-88 | 10-55 | 4-4.8 | 0.03-13 |

[a] See discussion in text.

As noted earlier, the models presented as Equations 1a and 1b were developed from tests of traffic on unpaved surfaces. Unpaved roads have a hard, generally nonporous surface that usually dries quickly after a rainfall or watering, because of traffic-enhanced natural evaporation. (Factors influencing how fast a road dries are discussed in Section 13.2.2.3, below.) The quality ratings given above pertain to the mid-range of the measured source conditions for the equation. A higher mean vehicle weight and a higher than normal traffic rate may be justified when performing a worst-case analysis of emissions from unpaved roads.

The emission factors for the exhaust, brake wear and tire wear of a 1980's vehicle fleet (*C*) was obtained from EPA's MOBILE6.2 model [23]. The emission factor also varies with aerodynamic size range

as shown in Table 13.2.2-4

Table 13.2.2-4. EMISSION FACTOR FOR 1980'S VEHICLE FLEET EXHAUST, BRAKE WEAR AND TIRE WEAR

| Particle Size Range[a] | *C*, Emission Factor for Exhaust, Brake Wear and Tire Wear[b] lb/VMT |
|---|---|
| $PM_{2.5}$ | 0.00036 |
| $PM_{10}$ | 0.00047 |
| $PM_{30}$[c] | 0.00047 |

[a] Refers to airborne particulate matter (PM-x) with an aerodynamic diameter equal to or less than x micrometers.
[b] Units shown are pounds per vehicle mile traveled (lb/VMT).
[c] PM-30 is sometimes termed "suspendable particulate" (SP) and is often used as a surrogate for TSP.

It is important to note that the vehicle-related source conditions refer to the average weight, speed, and number of wheels for all vehicles traveling the road. For example, if 98 percent of traffic on the road are 2-ton cars and trucks while the remaining 2 percent consists of 20-ton trucks, then the mean weight is 2.4 tons. More specifically, Equations 1a and 1b are *not* intended to be used to calculate a separate emission factor for each vehicle class within a mix of traffic on a given unpaved road. That is, in the example, one should *not* determine one factor for the 2-ton vehicles and a second factor for the 20-ton trucks. Instead, only one emission factor should be calculated that represents the "fleet" average of 2.4 tons for all vehicles traveling the road.

Moreover, to retain the quality ratings when addressing a group of unpaved roads, it is necessary that reliable correction parameter values be determined for the road in question. The field and laboratory procedures for determining road surface silt and moisture contents are given in AP-42 Appendices C.1 and C.2. Vehicle-related parameters should be developed by recording visual observations of traffic. In some cases, vehicle parameters for industrial unpaved roads can be determined by reviewing maintenance records or other information sources at the facility.

In the event that site-specific values for correction parameters cannot be obtained, then default values may be used.In the absence of site-specific silt content information, an appropriate mean value from Table 13.2.2-1 may be used as a default value, but the quality rating of the equation is reduced by two letters. Because of significant differences found between different types of road surfaces and between different areas of the country, use of the default moisture content value of 0.5 percent in Equation 1b is discouraged. The quality rating should be downgraded two letters when the default moisture content value is used. (It is assumed that readers addressing industrial roads have access to the information needed to develop average vehicle information in Equation 1a for their facility.)

The effect of routine watering to control emissions from unpaved roads is discussed below in Section 13.2.2.3, “Controls”. However, all roads are subject to some natural mitigation because of rainfall and other precipitation. The Equation 1a and 1b emission factors can be extrapolated to annual

average uncontrolled conditions (but including natural mitigation) under the simplifying assumption that annual average emissions are inversely proportional to the number of days with measurable (more than 0.254 mm [0.01 inch]) precipitation:

$$E_{ext} = E\ [(365 - P)/365] \quad (2)$$

where:

$E_{ext}$ = annual size-specific emission factor extrapolated for natural mitigation, lb/VMT

E = emission factor from Equation 1a or 1b

P = number of days in a year with at least 0.254 mm (0.01 in) of precipitation (see below)

Figure 13.2.2-1 gives the geographical distribution for the mean annual number of "wet" days for the United States.

Equation 2 provides an estimate that accounts for precipitation on an annual average basis for the purpose of inventorying emissions. It should be noted that Equation 2 does not account for differences in the temporal distributions of the rain events, the quantity of rain during any event, or the potential for the rain to evaporate from the road surface. In the event that a finer temporal and spatial resolution is desired for inventories of public unpaved roads, estimates can be based on a more complex set of assumptions. These assumptions include:

1. The moisture content of the road surface material is increased in proportion to the quantity of water added;
2. The moisture content of the road surface material is reduced in proportion to the Class A pan evaporation rate;
3. The moisture content of the road surface material is reduced in proportion to the traffic volume; and
4. The moisture content of the road surface material varies between the extremes observed in the area. The CHIEF Web site (http://www.epa.gov/ttn/chief/ap42/ch13/related/c13s02-2.html) has a file which contains a spreadsheet program for calculating emission factors which are temporally and spatially resolved. Information required for use of the spreadsheet program includes monthly Class A pan evaporation values, hourly meteorological data for precipitation, humidity and snow cover, vehicle traffic information, and road surface material information.

It is emphasized that the simple assumption underlying Equation 2 and the more complex set of assumptions underlying the use of the procedure which produces a finer temporal and spatial resolution have not been verified in any rigorous manner. For this reason, the quality ratings for either approach should be downgraded one letter from the rating that would be applied to Equation 1.

### 13.2.2.3 Controls[18-22]

A wide variety of options exist to control emissions from unpaved roads. Options fall into the following three groupings:

1. Vehicle restrictions that limit the speed, weight or number of vehicles on the road;

2. Surface improvement, by measures such as (a) paving or (b) adding gravel or slag to a dirt road; and
3. Surface treatment, such as watering or treatment with chemical dust suppressants.

Available control options span broad ranges in terms of cost, efficiency, and applicability. For example, traffic controls provide moderate emission reductions (often at little cost) but are difficult to enforce. Although paving is highly effective, its high initial cost is often prohibitive. Furthermore, paving is not feasible for industrial roads subject to very heavy vehicles and/or spillage of material in transport. Watering and chemical suppressants, on the other hand, are potentially applicable to most industrial roads at moderate to low costs. However, these require frequent reapplication to maintain an acceptable level of control. Chemical suppressants are generally more cost-effective than water but not in cases of temporary roads (which are common at mines, landfills, and construction sites). In summary, then, one needs to consider not only the type and volume of traffic on the road but also how long the road will be in service when developing control plans.

Vehicle restrictions. These measures seek to limit the amount and type of traffic present on the road or to lower the mean vehicle speed. For example, many industrial plants have restricted employees from driving on plant property and have instead instituted bussing programs. This eliminates emissions due to employees traveling to/from their worksites. Although the heavier average vehicle weight of the busses increases the base emission factor, the decrease in vehicle-miles-traveled results in a lower overall emission rate.

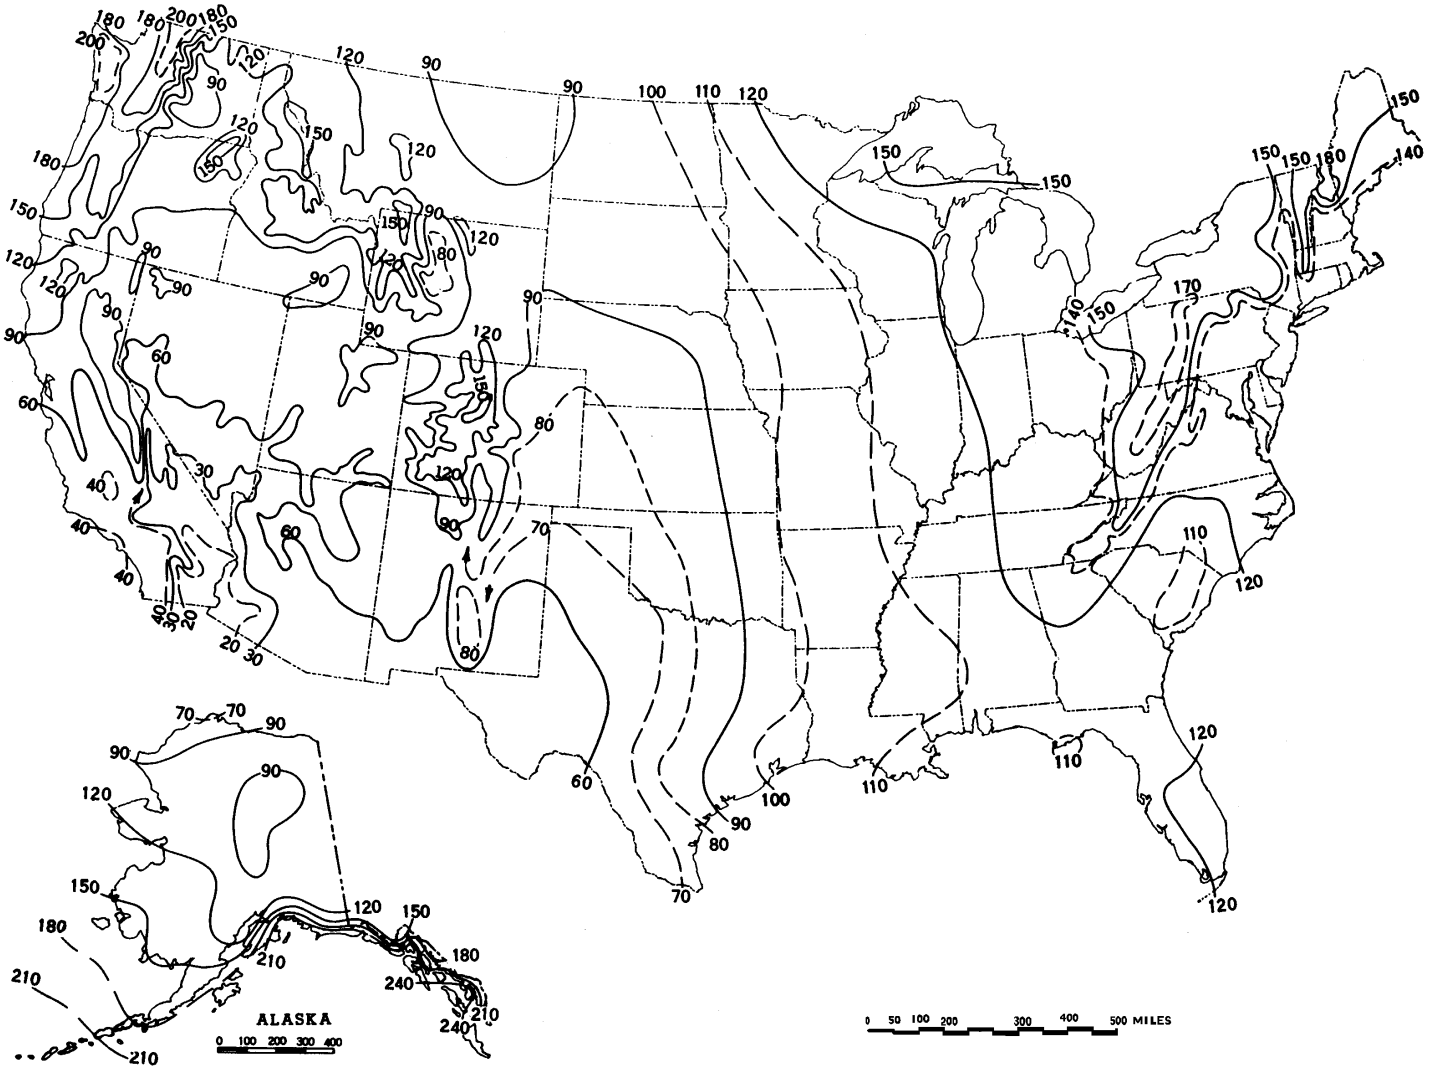

Figure 13.2.2-1. Mean number of days with 0.01 inch or more of precipitation in United States.

## 3.4 Large Stationary Diesel And All Stationary Dual-fuel Engines

### 3.4.1 General

The primary domestic use of large stationary diesel engines (greater than 600 horsepower [hp]) is in oil and gas exploration and production. These engines, in groups of 3 to 5, supply mechanical power to operate drilling (rotary table), mud pumping, and hoisting equipment, and may also operate pumps or auxiliary power generators. Another frequent application of large stationary diesels is electricity generation for both base and standby service. Smaller uses include irrigation, hoisting, and nuclear power plant emergency cooling water pump operation.

Dual-fuel engines were developed to obtain compression ignition performance and the economy of natural gas, using a minimum of 5 to 6 percent diesel fuel to ignite the natural gas. Large dual-fuel engines have been used almost exclusively for prime electric power generation. This section includes all dual-fuel engines.

### 3.4.2 Process Description

All reciprocating internal combustion (IC) engines operate by the same basic process. A combustible mixture is first compressed in a small volume between the head of a piston and its surrounding cylinder. The mixture is then ignited, and the resulting high-pressure products of combustion push the piston through the cylinder. This movement is converted from linear to rotary motion by a crankshaft. The piston returns, pushing out exhaust gases, and the cycle is repeated.

There are 2 ignition methods used in stationary reciprocating IC engines, compression ignition (CI) and spark ignition (SI). In CI engines, combustion air is first compression heated in the cylinder, and diesel fuel oil is then injected into the hot air. Ignition is spontaneous because the air temperature is above the autoignition temperature of the fuel. SI engines initiate combustion by the spark of an electrical discharge. Usually the fuel is mixed with the air in a carburetor (for gasoline) or at the intake valve (for natural gas), but occasionally the fuel is injected into the compressed air in the cylinder. Although all diesel- fueled engines are compression ignited and all gasoline- and gas-fueled engines are spark ignited, gas can be used in a CI engine if a small amount of diesel fuel is injected into the compressed gas/air mixture to burn any mixture ratio of gas and diesel oil (hence the name dual fuel), from 6 to 100 percent diesel oil.

CI engines usually operate at a higher compression ratio (ratio of cylinder volume when the piston is at the bottom of its stroke to the volume when it is at the top) than SI engines because fuel is not present during compression; hence there is no danger of premature autoignition. Since engine thermal efficiency rises with increasing pressure ratio (and pressure ratio varies directly with compression ratio), CI engines are more efficient than SI engines. This increased efficiency is gained at the expense of poorer response to load changes and a heavier structure to withstand the higher pressures.[1]

### 3.4.3 Emissions And Controls

Most of the pollutants from IC engines are emitted through the exhaust. However, some total organic compounds (TOC) escape from the crankcase as a result of blowby (gases that are vented from the oil pan after they have escaped from the cylinder past the piston rings) and from the fuel tank

and carburetor because of evaporation. Nearly all of the TOCs from diesel CI engines enter the atmosphere from the exhaust. Crankcase blowby is minor because TOCs are not present during compression of the charge. Evaporative losses are insignificant in diesel engines due to the low volatility of diesel fuels. In general, evaporative losses are also negligible in engines using gaseous fuels because these engines receive their fuel continuously from a pipe rather than via a fuel storage tank and fuel pump.

The primary pollutants from internal combustion engines are oxides of nitrogen ($NO_x$), hydrocarbons and other organic compounds, carbon monoxide (CO), and particulates, which include both visible (smoke) and nonvisible emissions. Nitrogen oxide formation is directly related to high pressures and temperatures during the combustion process and to the nitrogen content, if any, of the fuel. The other pollutants, HC, CO, and smoke, are primarily the result of incomplete combustion. Ash and metallic additives in the fuel also contribute to the particulate content of the exhaust. Sulfur oxides also appear in the exhaust from IC engines. The sulfur compounds, mainly sulfur dioxide ($SO_2$), are directly related to the sulfur content of the fuel.[2]

3.4.3.1 Nitrogen Oxides -

Nitrogen oxide formation occurs by two fundamentally different mechanisms. The predominant mechanism with internal combustion engines is thermal $NO_x$ which arises from the thermal dissociation and subsequent reaction of nitrogen ($N_2$) and oxygen ($O_2$) molecules in the combustion air. Most thermal $NO_x$ is formed in the high-temperature region of the flame from dissociated molecular nitrogen in the combustion air. Some $NO_x$, called prompt $NO_x$, is formed in the early part of the flame from reaction of nitrogen intermediary species, and HC radicals in the flame. The second mechanism, fuel $NO_x$, stems from the evolution and reaction of fuel-bound nitrogen compounds with oxygen. Gasoline, and most distillate oils, have no chemically-bound fuel $N_2$ and essentially all $NO_x$ formed is thermal $NO_x$.

3.4.3.2 Total Organic Compounds -

The pollutants commonly classified as hydrocarbons are composed of a wide variety of organic compounds and are discharged into the atmosphere when some of the fuel remains unburned or is only partially burned during the combustion process. Most unburned hydrocarbon emissions result from fuel droplets that were transported or injected into the quench layer during combustion. This is the region immediately adjacent to the combustion chamber surfaces, where heat transfer outward through the cylinder walls causes the mixture temperatures to be too low to support combustion.

Partially burned hydrocarbons can occur because of poor air and fuel homogeneity due to incomplete mixing, before or during combustion; incorrect air/fuel ratios in the cylinder during combustion due to maladjustment of the engine fuel system; excessively large fuel droplets (diesel engines); and low cylinder temperature due to excessive cooling (quenching) through the walls or early cooling of the gases by expansion of the combustion volume caused by piston motion before combustion is completed.[2]

3.4.3.3 Carbon Monoxide -

Carbon monoxide is a colorless, odorless, relatively inert gas formed as an intermediate combustion product that appears in the exhaust when the reaction of CO to $CO_2$ cannot proceed to completion. This situation occurs if there is a lack of available oxygen near the hydrocarbon (fuel) molecule during combustion, if the gas temperature is too low, or if the residence time in the cylinder is too short. The oxidation rate of CO is limited by reaction kinetics and, as a consequence, can be accelerated only to a certain extent by improvements in air and fuel mixing during the combustion process.[2-3]

3.4.3.4 Smoke, Particulate Matter, and PM-10 -

White, blue, and black smoke may be emitted from IC engines. Liquid particulates appear as white smoke in the exhaust during an engine cold start, idling, or low load operation. These are formed in the quench layer adjacent to the cylinder walls, where the temperature is not high enough to ignite the fuel. Blue smoke is emitted when lubricating oil leaks, often past worn piston rings, into the combustion chamber and is partially burned. Proper maintenance is the most effective method of preventing blue smoke emissions from all types of IC engines. The primary constituent of black smoke is agglomerated carbon particles (soot).[2]

3.4.3.5 Sulfur Oxides -

Sulfur oxide emissions are a function of only the sulfur content in the fuel rather than any combustion variables. In fact, during the combustion process, essentially all the sulfur in the fuel is oxidized to $SO_2$. The oxidation of $SO_2$ gives sulfur trioxide ($SO_3$), which reacts with water to give sulfuric acid ($H_2SO_4$), a contributor to acid precipitation. Sulfuric acid reacts with basic substances to give sulfates, which are fine particulates that contribute to PM-10 and visibility reduction. Sulfur oxide emissions also contribute to corrosion of the engine parts.[2,3]

Table 3.4-1 contains gaseous emission factors for the pollutants discussed above, expressed in units of pounds per horsepower-hour (lb/hp-hr), and pounds per million British thermal unit (lb/MMBtu). Table 3.4-2 shows the particulate and particle-sizing emission factors. Table 3.4-3 shows the speciated organic compound emission factors and Table 3.4-4 shows the emission factors for polycyclic aromatic hydrocarbons (PAH). These tables do not provide a complete speciated organic compound and PAH listing because they are based only on a single engine test; they are to be used only for rough order of magnitude comparisons.

Table 3.4-5 shows the $NO_x$ reduction and fuel consumption penalties for diesel and dual-fueled engines based on some of the available control techniques. The emission reductions shown are those that have been demonstrated. The effectiveness of controls on a particular engine will depend on the specific design of each engine, and the effectiveness of each technique could vary considerably. Other $NO_x$ control techniques exist but are not included in Table 3.4-5. These techniques include internal/external exhaust gas recirculation, combustion chamber modification, manifold air cooling, and turbocharging.

3.4.4 Control Technologies

Control measures to date are primarily directed at limiting $NO_x$ and CO emissions since they are the primary pollutants from these engines. From a $NO_x$ control viewpoint, the most important distinction between different engine models and types of reciprocating engines is whether they are rich-burn or lean-burn. Rich-burn engines have an air-to-fuel ratio operating range that is near stoichiometric or fuel-rich of stoichiometric and as a result the exhaust gas has little or no excess oxygen. A lean-burn engine has an air-to-fuel operating range that is fuel-lean of stoichiometric; therefore, the exhaust from these engines is characterized by medium to high levels of $O_2$. The most common $NO_x$ control technique for diesel and dual fuel engines focuses on modifying the combustion process. However, selective catalytic reduction (SCR) and nonselective catalytic reduction (NSCR) which are post-combustion techniques are becoming available. Control for CO have been partly adapted from mobile sources.[5]

Combustion modifications include injection timing retard (ITR), preignition chamber combustion (PCC), air-to-fuel ratio, and derating. Injection of fuel into the cylinder of a CI engine initiates the combustion process. Retarding the timing of the diesel fuel injection causes the combustion process to occur later in the power stroke when the piston is in the downward motion and

combustion chamber volume is increasing. By increasing the volume, the combustion temperature and pressure are lowered, thereby lowering $NO_x$ formation. ITR reduces $NO_x$ from all diesel engines; however, the effectiveness is specific to each engine model. The amount of $NO_x$ reduction with ITR diminishes with increasing levels of retard.[5]

Improved swirl patterns promote thorough air and fuel mixing and may include a precombustion chamber (PCC). A PCC is an antechamber that ignites a fuel-rich mixture that propagates to the main combustion chamber. The high exit velocity from the PCC results in improved mixing and complete combustion of the lean air/fuel mixture which lowers combustion temperature, thereby reducing $NO_x$ emissions.[5]

The air-to-fuel ratio for each cylinder can be adjusted by controlling the amount of fuel that enters each cylinder. At air-to-fuel ratios less than stoichiometric (fuel-rich), combustion occurs under conditions of insufficient oxygen which causes $NO_x$ to decrease because of lower oxygen and lower temperatures. Derating involves restricting engine operation to lower than normal levels of power production for the given application. Derating reduces cylinder pressures and temperatures thereby lowering $NO_x$ formation rates.[5]

SCR is an add-on $NO_x$ control placed in the exhaust stream following the engine and involves injecting ammonia ($NH_3$) into the flue gas. The $NH_3$ reacts with the $NO_x$ in the presence of a catalyst to form water and nitrogen. The effectiveness of SCR depends on fuel quality and engine duty cycle (load fluctuations). Contaminants in the fuel may poison or mask the catalyst surface causing a reduction or termination in catalyst activity. Load fluctuations can cause variations in exhaust temperature and $NO_x$ concentration which can create problems with the effectiveness of the SCR system.[5]

NSCR is often referred to as a three-way conversion catalyst system because the catalyst reactor simultaneously reduces $NO_x$, CO, and HC and involves placing a catalyst in the exhaust stream of the engine. The reaction requires that the $O_2$ levels be kept low and that the engine be operated at fuel-rich air-to-fuel ratios.[5]

### 3.4.5 Updates Since the Fifth Edition

The Fifth Edition was released in January 1995. Revisions to this section since that date are summarized below. For further detail, consult the memoranda describing each supplement or the background report for this section.

Supplement A, February 1996

No changes.

Supplement B, October 1996

- The general text was updated.
- Controlled $NO_x$ factors and PM factors were added for diesel units.
- Math errors were corrected in factors for CO from diesel units and for uncontrolled $NO_x$ from dual fueled units.

Table 3.4-1. GASEOUS EMISSION FACTORS FOR LARGE STATIONARY DIESEL AND ALL STATIONARY DUAL-FUEL ENGINES[a]

| Pollutant | Diesel Fuel (SCC 2-02-004-01) | | | Dual Fuel[b] (SCC 2-02-004-02) | | |
|---|---|---|---|---|---|---|
| | Emission Factor (lb/hp-hr) (power output) | Emission Factor (lb/MMBtu) (fuel input) | EMISSION FACTOR RATING | Emission Factor (lb/hp-hr) (power output) | Emission Factor (lb/MMBtu) (fuel input) | EMISSION FACTOR RATING |
| $NO_x$ | | | | | | |
| Uncontrolled | 0.024 | 3.2 | B | 0.018 | 2.7 | D |
| Controlled | 0.013[c] | 1.9[c] | B | ND | ND | NA |
| CO | 5.5 E-03 | 0.85 | C | 7.5 E-03 | 1.16 | D |
| $SO_x$[d] | 8.09 E-03$S_1$ | 1.01$S_1$ | B | 4.06 E-04$S_1$ + 9.57 E-03$S_2$ | 0.05$S_1$ + 0.895$S_2$ | B |
| $CO_2$[e] | 1.16 | 165 | B | 0.772 | 110 | B |
| PM | 0.0007[c] | 0.1[c] | B | ND | ND | NA |
| TOC (as $CH_4$) | 7.05 E-04 | 0.09 | C | 5.29 E-03 | 0.8 | D |
| Methane | [f] | [f] | E | 3.97 E-03 | 0.6 | E |
| Nonmethane | [f] | [f] | E | 1.32 E-03 | 0.2[g] | E |

[a] Based on uncontrolled levels for each fuel, from References 2,6-7. When necessary, the average heating value of diesel was assumed to be 19,300 Btu/lb with a density of 7.1 lb/gallon. The power output and fuel input values were averaged independently from each other, because of the use of actual brake-specific fuel consumption (BSFC) values for each data point and of the use of data possibly sufficient to calculate only 1 of the 2 emission factors (e. g., enough information to calculate lb/MMBtu, but not lb/hp-hr). Factors are based on averages across all manufacturers and duty cycles. The actual emissions from a particular engine or manufacturer could vary considerably from these levels. To convert from lb/hp-hr to kg/kw-hr, multiply by 0.608. To convert from lb/MMBtu to ng/J, multiply by 430. SCC = Source Classification Code.

[b] Dual fuel assumes 95% natural gas and 5% diesel fuel.

[c] References 8-26. Controlled $NO_x$ is by ignition timing retard.

[d] Assumes that all sulfur in the fuel is converted to $SO_2$. $S_1$ = % sulfur in fuel oil; $S_2$ = % sulfur in natural gas. For example, if sulfer content is 1.5%, then S = 1.5.

[e] Assumes 100% conversion of carbon in fuel to $CO_2$ with 87 weight % carbon in diesel, 70 weight % carbon in natural gas, dual-fuel mixture of 5% diesel with 95% natural gas, average BSFC of 7,000 Btu/hp-hr, diesel heating value of 19,300 Btu/lb, and natural gas heating value of 1050 Btu/scf.

[f] Based on data from 1 engine, TOC is by weight 9% methane and 91% nonmethane.

[g] Assumes that nonmethane organic compounds are 25% of TOC emissions from dual-fuel engines. Molecular weight of nonmethane gas stream is assumed to be that of methane.

Table 3.4-2. PARTICULATE AND PARTICLE-SIZING EMISSION FACTORS FOR LARGE UNCONTROLLED STATIONARY DIESEL ENGINES[a]

EMISSION FACTOR RATING: E

| Pollutant | Emission Factor (lb/MMBtu) (fuel input) |
|---|---|
| Filterable particulate[b] | |
| < 1 μm | 0.0478 |
| < 3 μm | 0.0479 |
| < 10 μm | 0.0496 |
| Total filterable particulate | 0.0620 |
| Condensable particulate | 0.0077 |
| Total PM-10[c] | 0.0573 |
| Total particulate[d] | 0.0697 |

[a] Based on 1 uncontrolled diesel engine from Reference 6. Source Classification Code 2-02-004-01. The data for the particulate emissions were collected using Method 5, and the particle size distributions were collected using a Source Assessment Sampling System. To convert from lb/MMBtu to ng/J, multiply by 430. PM-10 = particulate matter ≤ 10 micrometers (μm) aerometric diameter.

[b] Particle size is expressed as aerodynamic diameter.

[c] Total PM-10 is the sum of filterable particulate less than 10 μm aerodynamic diameter and condensable particulate.

[d] Total particulate is the sum of the total filterable particulate and condensable particulate.

Table 3.4-3. SPECIATED ORGANIC COMPOUND EMISSION FACTORS FOR LARGE UNCONTROLLED STATIONARY DIESEL ENGINES[a]

EMISSION FACTOR RATING: E

| Pollutant | Emission Factor (lb/MMBtu) (fuel input) |
|---|---|
| Benzene[b] | 7.76 E-04 |
| Toluene[b] | 2.81 E-04 |
| Xylenes[b] | 1.93 E-04 |
| Propylene | 2.79 E-03 |
| Formaldehyde[b] | 7.89 E-05 |
| Acetaldehyde[b] | 2.52 E-05 |
| Acrolein[b] | 7.88 E-06 |

[a]Based on 1 uncontrolled diesel engine from Reference 7. Source Classification Code 2-02-004-01. Not enough information to calculate the output-specific emission factors of lb/hp-hr. To convert from lb/MMBtu to ng/J, multiply by 430.
[b]Hazardous air pollutant listed in the *Clean Air Act*.

Table 3.4-4. PAH EMISSION FACTORS FOR LARGE UNCONTROLLED STATIONARY DIESEL ENGINES[a]

EMISSION FACTOR RATING: E

| PAH | Emission Factor (lb/MMBtu) (fuel input) |
|---|---|
| Naphthalene[b] | 1.30 E-04 |
| Acenaphthylene | 9.23 E-06 |
| Acenaphthene | 4.68 E-06 |
| Fluorene | 1.28 E-05 |
| Phenanthrene | 4.08 E-05 |
| Anthracene | 1.23 E-06 |
| Fluoranthene | 4.03 E-06 |
| Pyrene | 3.71 E-06 |
| Benz(a)anthracene | 6.22 E-07 |
| Chrysene | 1.53 E-06 |
| Benzo(b)fluoranthene | 1.11 E-06 |
| Benzo(k)fluoranthene | <2.18 E-07 |
| Benzo(a)pyrene | <2.57 E-07 |
| Indeno(1,2,3-cd)pyrene | <4.14 E-07 |
| Dibenz(a,h)anthracene | <3.46 E-07 |
| Benzo(g,h,l)perylene | <5.56 E-07 |
| TOTAL PAH | <2.12 E-04 |

[a] Based on 1 uncontrolled diesel engine from Reference 7. Source Classification Code 2-02-004-01. Not enough information to calculate the output-specific emission factors of lb/hp-hr. To convert from lb/MMBtu to ng/J, multiply by 430.

[b] Hazardous air pollutant listed in the *Clean Air Act*.

Table 3.4-5. $NO_x$ REDUCTION AND FUEL CONSUMPTION PENALTIES FOR LARGE STATIONARY DIESEL AND DUAL-FUEL ENGINES[a]

| Control Approach | | Diesel (SCC 2-02-004-01) | | Dual Fuel (SCC 2-02-004-02) | |
|---|---|---|---|---|---|
| | | $NO_x$ Reduction (%) | ΔBSFC[b] (%) | $NO_x$ Reduction (%) | ΔBSFC (%) |
| Derate | 10% | ND | ND | <20 | 4 |
| | 20% | <20 | 4 | ND | ND |
| | 25% | 5 - 23 | 1 - 5 | 1 - 33 | 1 - 7 |
| Retard | 2° | <20 | 4 | <20 | 3 |
| | 4° | <40 | 4 | <40 | 1 |
| | 8° | 28 - 45 | 2 - 8 | 50 - 73 | 3 - 5 |
| Air-to-fuel | 3% | ND | ND | <20 | 0 |
| | ±10% | 7 - 8 | 3 | 25 - 40 | 1 - 3 |
| Water injection ($H_2O$/fuel ratio) | 50% | 25 - 35 | 2 - 4 | ND | ND |
| SCR | | 80 - 95 | 0 | 80 - 95 | 0 |

[a] References 1,27-28. The reductions shown are typical and will vary depending on the engine and duty cycle. SCC = Source Classification Code. ΔBSFC = change in brake-specific fuel consumption. ND = no data.

[1] The HHV for components of LPG determined at 60 °F and saturation pressure with the exception of ethylene.

[2] Ethylene HHV determined at 41 °F (5 °C) and saturation pressure.

[3] Use of this default HHV is allowed only for: (a) Units that combust MSW, do not generate steam, and are

allowed to use Tier 1; (b) units that derive no more than 10 percent of their annual heat input from MSW and/or tires; and (c) small batch incinerators that combust no more than 1,000 tons of MSW per year.

[4] Reporters subject to subpart X of this part that are complying with § 98.243(d) or subpart Y of this part may only use the default HHV and the default $CO_2$ emission factor for fuel gas combustion under the conditions prescribed in § 98.243(d)(2)(i) and (d)(2)(ii) and § 98.252(a)(1) and (a)(2), respectively. Otherwise, reporters subject to subpart X or subpart Y shall use either Tier 3 (Equation C-5) or Tier 4.

[5] Use the following formula to calculate a wet basis HHV for use in Equation C-1: $HHV_w = ((100 - M)/100)*HHV_d$ where $HHV_w$ = wet basis HHV, M = moisture content (percent) and $HHV_d$ = dry basis HHV from Table C-1.

## Table C-2 to Subpart C of Part 98 —Default $CH_4$ and $N_2O$ Emission Factors for Various Types of Fuel

| Fuel type | Default $CH_4$ emission factor (kg $CH_4$/mmBtu) | Default $N_2O$ emission factor (kg $N_2O$/mmBtu) |
|---|---|---|
| Coal and Coke (All fuel types in Table C-1) | $1.1 \times 10^{-02}$ | $1.6 \times 10^{-03}$ |
| Natural Gas | $1.0 \times 10^{-03}$ | $1.0 \times 10^{-04}$ |
| Petroleum (All fuel types in Table C-1) | $3.0 \times 10^{-03}$ | $6.0 \times 10^{-04}$ |
| Fuel Gas | $3.0 \times 10^{-03}$ | $6.0 \times 10^{-04}$ |
| Municipal Solid Waste | $3.2 \times 10^{-02}$ | $4.2 \times 10^{-03}$ |
| Tires | $3.2 \times 10^{-02}$ | $4.2 \times 10^{-03}$ |
| Blast Furnace Gas | $2.2 \times 10^{-05}$ | $1.0 \times 10^{-04}$ |
| Coke Oven Gas | $4.8 \times 10^{-04}$ | $1.0 \times 10^{-04}$ |
| Biomass Fuels—Solid (All fuel types in Table C-1, except wood and wood residuals) | $3.2 \times 10^{-02}$ | $4.2 \times 10^{-03}$ |
| Wood and wood residuals | $7.2 \times 10^{-03}$ | $3.6 \times 10^{-03}$ |
| Biomass Fuels—Gaseous (All fuel types in Table C-1) | $3.2 \times 10^{-03}$ | $6.3 \times 10^{-04}$ |
| Biomass Fuels—Liquid (All fuel types in Table C-1) | $1.1 \times 10^{-03}$ | $1.1 \times 10^{-04}$ |

Note: Those employing this table are assumed to fall under the IPCC definitions of the "Energy Industry" or "Manufacturing Industries and Construction". In all fuels except for coal the values for these two categories are identical. For coal combustion, those who fall within the IPCC "Energy Industry" category may employ a value of 1g of $CH_4$/mmBtu.

[a]Water/Oil emission factors apply to water streams in oil service with a water content greater than 50%, from the point of origin to the point where the water content reaches 99%. For water streams with a water content greater than 99%, the emission rate is considered negligible.

[b]These factors are for total organic compound emission rates (including non-VOC's such as methane and ethane) and apply to light crude, heavy crude, gas plant, gas production, and off shore facilities. "NA" indicates that not enough data were available to develop the indicated emission factor.

[c]The "other" equipment type was derived from compressors, diaphrams, drains, dump arms, hatches, instruments, meters, pressure relief valves, polished rods, relief valves, and vents. This "other" equipment type should be applied for any equipment type other than connectors, flanges, open-ended lines, pumps, or valves.

# WRAP Fugitive Dust Handbook

## Fugitive Dust Control Measures Applicable for the WRAP Region

| Source Category | Control Measure | Published PM10 Control Efficiency |
|---|---|---|
| Agricultural Tilling | Reduce tilling during high winds | 1 – 5% |
| | Roughen surface | 15 – 64% |
| | Modify equipment | 50% |
| | Employ sequential cropping | 50% |
| | Increase soil moisture | 90% |
| | Use other conservation management practices | 25 - 100% |
| Agricultural Harvesting | Limited activity during high winds | 5 – 70% |
| | Modify equipment | 50% |
| | Night farming | 10% |
| | New techniques for drying fruit | 25 –60% |
| Construction/Demolition | Water unpaved surfaces | 10 – 74% |
| | Limit on-site vehicle speed to 15 mph | 57% |
| | Apply dust suppressant to unpaved areas | 84% |
| | Prohibit activities during high winds | 98% |
| Materials Handling | Implement wet suppression | 50 – 90% |
| | Erect 3-sided enclosure around storage piles | 75% |
| | Cover storage pile with a tarp during high winds | 90% |
| Paved Roads | Sweep streets | 4 – 26% |
| | Minimize trackout | 40 – 80% |
| | Remove deposits on road ASAP | > 90% |
| Unpaved Roads | Limit vehicle speed to 25 mph | 44% |
| | Apply water | 10 – 74% |
| | Apply dust suppressant | 84% |
| | Pave the surface | >90% |
| Mineral Products Industry | Cyclone or muliclone | 68 –79% |
| | Wet scrubber | 78 –98% |
| | Fabric filter | 99 – 99.8% |
| | Electrostatic precipitator | 90 – 99.5% |
| Abrasive Blasting | Water spray | 50 – 93% |
| | Fabric filter | > 95% |
| Livestock Husbandry | Daily watering of corrals and pens | > 10% |
| | Add wood chips or mulch to working pens | > 10% |
| Wind Erosion (agricultural, open area, and storage piles) | Plant trees or shrubs as a windbreak | 25% |
| | Create cross-wind ridges | 24 – 93% |
| | Erect artificial wind barriers | 4 – 88% |
| | Apply dust suppressant or gravel | 84% |
| | Revegetate; apply cover crop | 90% |
| | Water exposed area before high winds | 90% |

The regulations included several other provisions, such as averaging, banking and trading of emission credits and maximum "family emission limits" (FEL) for emission averaging.

Tier 4 Emission Factors

## Tier 4 Emission Standards

The Tier 4 emission standards—phased-in from 2008 through 2015—introduce substantial reductions of NOx (for engines above 56 kW) and PM (above 19 kW), as well as more stringent HC limits. CO emission limits remain unchanged from the Tier 2-3 stage.

**Engines up to 560 kW.** Tier 4 emission standards for engines up to 560 kW are listed in Table 3.

**Table 3**
Tier 4 emission standards—Engines up to 560 kW, g/kWh (g/bhp-hr)

| Engine Power | Year | CO | NMHC | NMHC+$NO_x$ | $NO_x$ | PM |
|---|---|---|---|---|---|---|
| kW < 8<br>(hp < 11) | 2008 | 8.0 (6.0) | - | 7.5 (5.6) | - | 0.4[a] (0.3) |
| 8 ≤ kW < 19<br>(11 ≤ hp < 25) | 2008 | 6.6 (4.9) | - | 7.5 (5.6) | - | 0.4 (0.3) |
| 19 ≤ kW < 37<br>(25 ≤ hp < 50) | 2008 | 5.5 (4.1) | - | 7.5 (5.6) | - | 0.3 (0.22) |
| | 2013 | 5.5 (4.1) | - | 4.7 (3.5) | - | 0.03<br>(0.022) |
| 37 ≤ kW < 56<br>(50 ≤ hp < 75) | 2008 | 5.0 (3.7) | - | 4.7 (3.5) | - | 0.3[b] (0.22) |
| | 2013 | 5.0 (3.7) | - | 4.7 (3.5) | - | 0.03<br>(0.022) |
| 56 ≤ kW < 130<br>(75 ≤ hp < 175) | 2012-2014[c] | 5.0 (3.7) | 0.19 (0.14) | - | 0.40 (0.30) | 0.02<br>(0.015) |
| 130 ≤ kW ≤ 560<br>(175 ≤ hp ≤ 750) | 2011-2014[d] | 3.5 (2.6) | 0.19 (0.14) | - | 0.40 (0.30) | 0.02<br>(0.015) |

a - hand-startable, air-cooled, DI engines may be certified to Tier 2 standards through 2009 and to an optional PM standard of 0.6 g/kWh starting in 2010
b - 0.4 g/kWh (Tier 2) if manufacturer complies with the 0.03 g/kWh standard from 2012
c - PM/CO: full compliance from 2012; NOx/HC: Option 1 (if banked Tier 2 credits used)—50% engines must comply in 2012-2013; Option 2 (if no Tier 2 credits claimed)—25% engines must comply in 2012-2014, with full compliance from 2014.12.31
d - PM/CO: full compliance from 2011; NOx/HC: 50% engines must comply in 2011-2013

In engines of 56-560 kW rated power, the NOx and HC standards are phased-in over a few year period, as indicated in the notes to Table 3. The initial standards (PM compliance) are sometimes referred to as

# olicy: CARB Emission Factors for CI Diesel Engines – ercent HC in Relation to NMHC + NOx

**Policy**

When the non-methane hydrocarbon (NMHC) and nitrogen oxide (NOx) emission factor is combined, assume a breakdown of 5% and 95%, respectively.

**Effective date**

June 28, 2004

**Definitions**

The following is a list of associated definitions.

- ***CI Engine*** – Compression Ignition Engine is an internal combustion engine with operating characteristics significantly similar to the theoretical diesel combustion cycle.
- ***HC*** – Organic compound consistently entirely of hydrogen and carbon.
- ***NMHC*** – Non-Methane Hydrocarbon is the sum of all hydrocarbon air pollutants except methane.
- ***NOx*** – Nitrogen Oxides are compounds of nitric oxide (NO), nitrogen dioxide ($NO_2$), and other oxides of nitrogen, which are typically created during combustion processes.

September 18, 2024

DANIEL JETT

Laboratory Services, Inc.

2609 W. Marland

Hobbs, NM 88240

RE: RED HILLS PLANT

Enclosed are the results of analyses for samples received by the laboratory on 09/06/24 14:50.

Cardinal Laboratories is accredited through Texas NELAP under certificate number TX-C24-00112. Accreditation applies to drinking water, non-potable water and solid and chemical materials. All accredited analytes are denoted by an asterisk (*). For a complete list of accredited analytes and matrices visit the TCEQ website at www.tceq.texas.gov/field/qa/lab_accred_certif.html.

Cardinal Laboratories is accreditated through the State of Colorado Department of Public Health and Environment for:

| | |
|---|---|
| Method EPA 552.2 | Total Haloacetic Acids (HAA-5) |
| Method EPA 524.2 | Total Trihalomethanes (TTHM) |
| Method EPA 524.4 | Regulated VOCs (V1, V2, V3) |

Cardinal Laboratories is accredited through the State of New Mexico Environment Department for:

| | |
|---|---|
| Method SM 9223-B | Total Coliform and E. coli (Colilert MMO-MUG) |
| Method EPA 524.2 | Regulated VOCs and Total Trihalomethanes (TTHM) |
| Method EPA 552.2 | Total Haloacetic Acids (HAA-5) |

Accreditation applies to public drinking water matrices for State of Colorado and New Mexico.

This report meets NELAP requirements and is made up of a cover page, analytical results, and a copy of the original chain-of-custody. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Celey D. Keene

Lab Director/Quality Manager

## Notes and Definitions

| | |
|---|---|
| QR-04 | The RPD for the BS/BSD was outside of historical limits. |
| BS1 | Blank spike recovery above laboratory acceptance criteria. Results for analyte potentially biased high. |
| ND | Analyte NOT DETECTED at or above the reporting limit |
| RPD | Relative Percent Difference |
| ** | Samples not received at proper temperature of 6°C or below. |
| *** | Insufficient time to reach temperature. |
| - | Chloride by SM4500Cl-B does not require samples be received at or below 6°C |
| | Samples reported on an as received basis (wet) unless otherwise noted on report |

## NOTES

1. VENDOR TO PROVIDE INFORMATION FOR ITEMS MARKED WITH AN ASTERISK (*).
2. VENDOR TO PROVIDE RADIATION ISOPLETHS FOR ALL CASES IDENTIFIED UNDER THE MAXIMUM WIND SPEED IDENTIFIED
3. VENDOR TO PROVIDE PRESSURE DROP CURVE FOR THE FLARE WHICH CONSIDERS THE STACK, SEAL, AND TIP; INLET PRESSURE TO ARRESTOR AND FLARE SHALL NOT EXCEED 1 PSI.
4. VENDOR TO PROVIDE RECOMMENDED TYPE AND SIZE OF ARRESTOR WITH PROPOSAL; ARRESTOR SHALL INCLUDE ONE (1) FNPT FOR TEMPERATURE INDICATION CONNECTION.
5. VENDOR TO INCLUDE WASTE GAS AND ASSIST GAS TO BE BURNED SIMULTANEOULSY IN ORDER TO CONDUCT COMPLETE COMBUSTION OF H2S.
6. VENDOR TO PROVIDE NOZZLE FOR ASSIST GAS INLET; FLOW CONTROL OF ASSIST GAS (BASED ON WASTE GAS FLOW) WILL BE PROVIDED BY OTHERS.

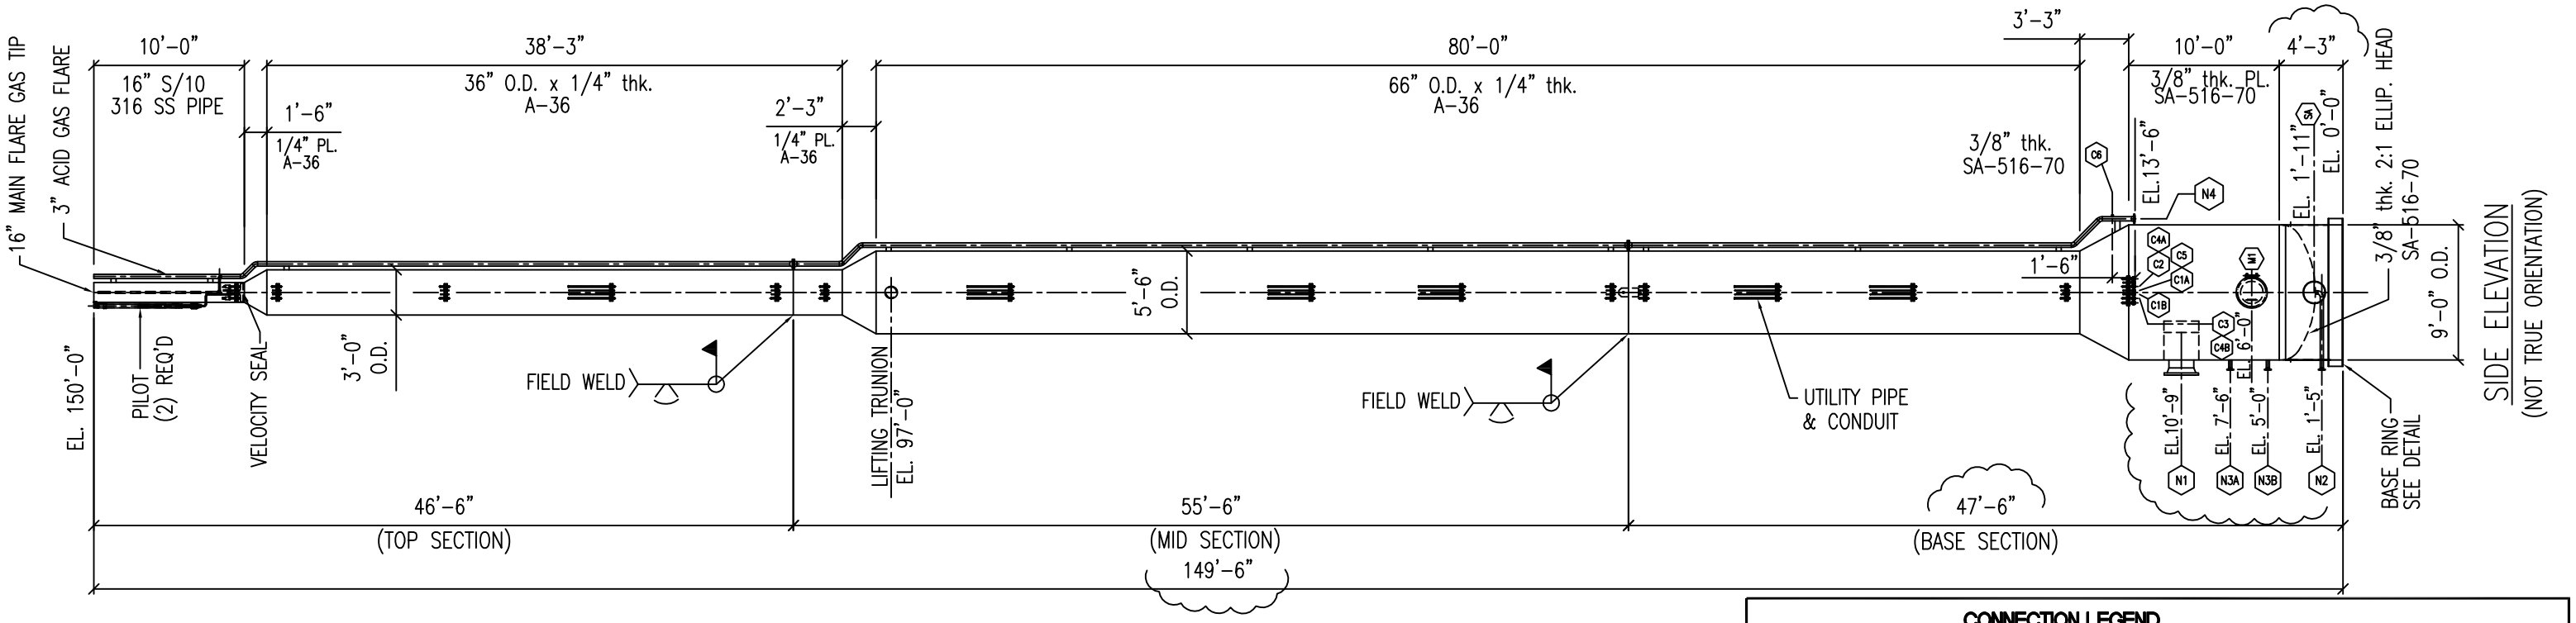
To whom it may concern:

Ref: Lucid Flare – TC #17-09-2126

FL-5100, AGI1 flare was designed and meets CFR 40 requirements for 98% DRE for the original design basis.

If you have any questions please reach out to our office.



Thank you,

## DESIGN CONDITION:

DESIGN WIND SPEED 120 MPH (3 sec. GUST) per ASCE 7-10, EXPOSURE "C"
IMPORTANCE FACTOR, $I_s$ = 1.1 / $I_{EQ}$ = 1.25
RISK CATEGORY : III, SITE CLASS: D
$S_1$ = 0.023 / $S_s$ = 0.064
SEISMIC DESIGN CATEGORY A
SNOW LOAD : 35 PSF GROUND
CORROSION ALLOWANCE = 0.0625"for C.S., 0" for S.S.

WIND GOVERN —
- TOTAL DEAD LOAD (DRY) = 35 KIPS
- TOTAL DEAD LOAD (WET) = 65 KIPS
- TOTAL OVERTURNING MOMENT = 1321 KIP-FT
- TOTAL HORIZONTAL SHEAR = 20 KIPS

## GENERAL NOTES:

1. ALL DESIGN TO BE IN ACCORDANCE WITH AISC.
2. ALL C.S. PLATE MATERIAL A-36 OR BETTER UNLESS NOTED.
3. ALL FLANGE BOLT HOLES STRADDLE CENTERLINES UNLESS NOTED.
4. WELDING PER ASME SETION IX
5. FINISH: EXTERNAL C.S. SURFACE PREP. : SSPC-SP6
   PAINT: HIGH HEAT BLACK, NO PAINT ON S.S.

| **NO. REQ'D.:** | 1 | **SIZE:** 42" Diam x 75' OAH | Page 2 of 5 |

5. TIP — MODEL NO: Callidus AA
   - A. DIAMETER: 42" / 20" INCHES
   - B. LENGTH: 10 FEET
   - C. MATERIAL: 304 SS - Upper 5 ft.; Carbon Steel - Lower 5 ft.
   - D. WEIGHT: _____ LBS
   - E. FLANGED CONNECTION: Yes (YES / NO) 42" Section
   - F. 20" RISER WELDED (IN FIELD)

6. PURGE SEAL — MODEL NO: Callidus VS-20
   - A. TYPE: Velocity
   - B. MATERIAL: 304 SS
   - C. DIAMETER: 20 INCHES
   - D. LENGTH: _____ FEET
   - E. WEIGHT: _____ LBS
   - F. FLANGED CONNECTION: No (YES / NO)

7. PILOTS — MODEL NO: Callidus
   - A. NUMBER REQUIRED: 3
   - B. TYPE: Electric Spark
   - C. FUEL GAS RATE EACH PILOT: 97 SCFH @ 30PSIG
   - D. LENGTH / WEIGHT: _____

8. CONNECTIONS
   - A. FLARED GAS INLET SIZE: 20" - 150#RF
   - B. FUEL GAS SUPPLY SIZE: _____

9. INTEGRAL KNOCKOUT DRUM
   - A. SIZE: N/A
   - B. CORROSION ALLOWANCE:
   - C. DESIGN PRESS./TEMP.:
   - D. INTERNAL COATING _____
   - E. ASME CODE STAMP _____ YES _____ NO

10. ACCESSORIES
    - A. IGNITER: X AUTOMATIC _____ MANUAL MODEL NO: _____
      - POWER REQUIRED: 115V / 1 Phase / 60 Hz
      - RETRACTABLE: (YES/NO) YES (Thermocouple Only)
      - SPARK SOURCE/CONTROL BOX ENCLOSURE: NEMA 7
    - B. FLASHBACK PREVENTION TYPE: _____ MODEL NO: _____
      - SIZE: _____
      - MATERIAL: _____
    - C. WIND SHIELD MODEL NO: TBD
      - SIZE: _____
      - MATERIAL: _____
    - D. FLAME RETENTION RING _____
      - MATERIAL: _____

11. SUPPORT
    - A. TYPE: X FREE STANDING _____ GUYED
    - B. NUMBER OF GUY WIRES REQUIRED: _____

Notes
1) Elevated, self-supported flare.
2) Vendor to propose optimum size of two risers
3) Smokeless rate is 20% of the warm flare design rate.
4) Flare shall be of one-piece lift/erection design for site installation.
5) Instrument air available at 85 to 125 psig.
6) Provide radiation shielding for any JB's, panels, boxes, or other electrical equipment if required to prevent operating temperature out of spec during extended release.
7) Supply heavy duty vaneaxial blower for air assist with VFD control. Aerovent VJ-54D6-43°, Design 47, 54"; with 50 HP TEFC Motor, 1200 / 1800 RPM
8) Pressure at flare base for majority of other cases will be 5 psig or less.

Flare Technology: Air Assist
Smokeless: Yes
Flare Model: G50A13

**Project Reference**: Red Hills Smokeless Flare

Hero Flare is pleased to have the opportunity to provide a firm proposal for the supply of our A+ Series smokeless flare technology. We took our proven air assist smokeless technology and made it even better by achieving higher smokeless capacities at a lower cost.

The A+ series technology is fully Quad O compliant. Our systems come complete with our Hotspot Ignition ™ System which is a high stability pilot that can operate in the most extreme conditions. In addition, all flare systems are provided with a blower VFD to maximize efficiency smokeless capacity across the full operating range.

The Hero Flare system offers the following:

- 40 CFR 60.18 EPA Compliant.
- 98% Destruction Efficiency.
- Continuously Monitored Pilot Ignition System with automatic re-light.
- Blower VFD allows for optimal energy and combustion efficiency to avoid EPA violations.

We look forward to working with you as this project progresses.

Best regards,

# Design Data Sheet

## Design Flow Rate

| Flow Rate Case | Flow Rate (SCFD) | Molecular Weight | Lower Heating Value (Btu/SCF) | Pressure | Temp. (°F) |
|---|---|---|---|---|---|
| LP Inlet: Smokeless Flow Rate | 3 to 200,000 | 30-40 | 1,600 to 2,000 | < 3oz/in²* | Amb. |

*Does not include pressure drop across arrestor
Important Note: Assist Gas is required for this composition to maintain 3-5 MSCFD (125-208 SCFH).

## Site Conditions

| | | | | | |
|---|---|---|---|---|---|
| Wind | 120 MPH | Temperature | 0 to 120 °F | Elevation | 14.5 Psi |

## Site Utilities Required

| | | |
|---|---|---|
| Pilot Gas (per pilot) | Natural Gas: 55 scfh @ 18 psig OR Propane: 25 scfh @ 9 psig (Clean, dry gas) | |
| Plant Air | No Plant Air Required | |
| Pilot Panel Electricity | 120V / 1 Phase / 10 Amps is required to operate pilot ignition system | |
| Blower / VFD Electricity | 240VAC / 3 Phase / 3 Amps | Blower Size: 1 HP |

## Emission / Flare Performance

| | |
|---|---|
| Destruction | A 98% or greater hydrocarbon destruction efficiency will be achieved |
| Smokeless Rate | 100% Smokeless |
| Max Radiation | Less than 500 Btu/hr/SF |
| Tip Velocity | Meets EPA regulations over full operating range |

## Pilot Construction

| | |
|---|---|
| Electrical / Classification | 120VAC / Non-classified area |
| Control Panel Type | Nema 4 (Painted) |
| Pilot(s) | One (1) Stainless Steel Gas Pilot with Easy Glide Retraction System |
| Pilot Construction | Stainless Steel |
| Pilot Monitoring | Type K Thermocouple |
| Pilot Gas Connection | ½" FNPT Located at Base of Flare |

## Flare Construction

| Component | Dimension | Material |
|---|---|---|
| Stack Height | 50' | A53B |
| Flare tip | 2' Long | Stainless |

# 1.0 INTRODUCTION

## 1.1 Summary of Scope of Supply

The vertical thermal oxidizer is intended to oxidize the combustibles present in the specified waste stream. This is understood to apply only when the system is operated in accordance with the operating conditions stipulated in the design summary and for the waste(s) in Section 1.2.1 below.

The firing rate of the system is controlled by maintaining a specified operating temperature inside of the thermal oxidizer while the waste gas flow rates fluctuate. Efficient destruction of the waste is achieved at a thermal oxidizer operating temperature set point controlled at approximately 1,600 $^{o}$F. The temperature works in conjunction with the thermal oxidizer volume and its associated residence time to achieve the efficient destruction of the waste gas stream.

The thermal oxidizer design includes internal shop installed refractory insulation. The selected materials are designed for a long, trouble-free operating lifetime. The list below summarizes the services and equipment provided in Zeeco's supply.

One (1) Thermal Oxidizer Package Including:

- One (1) Vertical Thermal Oxidizer w/ Integral Stack (10'-0" O.D. x 76'-0" OAH)
- Shop Installed Refractory Lining
- One (1) GB Style Burner
- One (1) Fuel Control Rack w/ Local Control Panel
- One (1) Combustion Air Fan w/ Ducting

## 1.2 Process Description

The vertical forced draft thermal oxidizer is equipped with one (1) forced draft fuel gas GB-Series burner. When the purge cycle is complete, the burner pilot is ignited via electric ignition. Once the burner pilot flame is proven, the main burner flame is ignited. The thermal oxidizer is then allowed to achieve a waste permissive temperature of 1,600 $^{o}$F, following the recommended field cure procedures and schedule in APPENDIX D. Waste gas is then injected around the burner via the inlet nozzle. This high temperature accompanied with thermal oxidizer volume, known as residence time, destroys the hydrocarbon constituents of the waste gas stream. The flue gases from the thermal oxidizer then exits to atmosphere.

A temperature controller (supplied by others in DCS) monitors the combustion product's temperature through a thermocouple input and modulates both the fuel gas and combustion air flows into the burner. This ensures that sufficient temperature is maintained to provide complete destruction of varying waste gas compositions.

The fuel gas alone is used for start-up, burner stability, and refractory cure. The normal heat release for burner stability on fuel gas is ~82 MM BTU/HR. When more heat is needed for refractory curing, or if the heat produced by the combustion of the waste gas during operation is not sufficient to maintain a thermal oxidizer temperature of 1,600 $^{o}$F, a maximum fuel gas heat release of 90 MM BTU/HR is available from the burner.

Combustion air is supplied by the blower. All air enters the thermal oxidizer through the burner via the combustion air nozzle (N9) located on the thermal oxidizer. The flue gas exits the vent stack at an elevation of 76 feet.

### 1.2.1 Process Design Conditions (Design Case) for Waste Streams

# 1.0 INTRODUCTION

## 1.1 Summary of Scope of Supply

The vertical thermal oxidizer is intended to oxidize the combustibles present in the specified waste stream. This is understood to apply only when the system is operated in accordance with the operating conditions stipulated in the design summary and for the waste(s) in Section 1.2.1 below.

The firing rate of the system is controlled by maintaining a specified operating temperature inside of the thermal oxidizer while the waste gas flow rates fluctuate. Efficient destruction of the waste is achieved at a thermal oxidizer operating temperature set point controlled at approximately 1,600 °F. The temperature works in conjunction with the thermal oxidizer volume and its associated residence time to achieve the efficient destruction of the waste gas stream.

The thermal oxidizer design includes internal shop installed refractory insulation. The selected materials are designed for a long, trouble-free operating lifetime. The list below summarizes the services and equipment provided in Zeeco's supply.

One (1) Thermal Oxidizer Package Including:

- One (1) Vertical Thermal Oxidizer w/ Integral Stack (10'-0" O.D. x 76'-0" OAH)
- Shop Installed Refractory Lining
- One (1) GB Style Burner
- One (1) Fuel Control Rack w/ Local Control Panel
- One (1) Combustion Air Fan w/ Ducting

## 1.2 Process Description

The vertical forced draft thermal oxidizer is equipped with one (1) forced draft fuel gas GB-Series burner. When the purge cycle is complete, the burner pilot is ignited via electric ignition. Once the burner pilot flame is proven, the main burner flame is ignited. The thermal oxidizer is then allowed to achieve a waste permissive temperature of 1,600 °F, following the recommended field cure procedures and schedule in APPENDIX D. Waste gas is then injected around the burner via the inlet nozzle. This high temperature accompanied with thermal oxidizer volume, known as residence time, destroys the hydrocarbon constituents of the waste gas stream. The flue gases from the thermal oxidizer then exits to atmosphere.

A temperature controller (supplied by others in DCS) monitors the combustion product's temperature through a thermocouple input and modulates both the fuel gas and combustion air flows into the burner. This ensures that sufficient temperature is maintained to provide complete destruction of varying waste gas compositions.

The fuel gas alone is used for start-up, burner stability, and refractory cure. The normal heat release for burner stability on fuel gas is ~59 MM BTU/HR. When more heat is needed for refractory curing, or if the heat produced by the combustion of the waste gas during operation is not sufficient to maintain a thermal oxidizer temperature of 1,600 °F, a maximum fuel gas heat release of 80 MM BTU/HR is available from the burner.

Combustion air is supplied by the blower. All air enters the thermal oxidizer through the burner via the combustion air nozzle (N9) located on the thermal oxidizer. The flue gas exits the vent stack at an elevation of 76 feet.

### 1.2.1 Process Design Conditions (Design Case) for Waste Streams

# 1.0 INTRODUCTION

## 1.1 Summary of Scope of Supply

The vertical thermal oxidizer is intended to oxidize the combustibles present in the specified waste stream. This is understood to apply only when the system is operated in accordance with the operating conditions stipulated in the design summary and for the waste(s) in Section 1.2.1 below.

The firing rate of the system is controlled by maintaining a specified operating temperature inside of the thermal oxidizer while the waste gas flow rates fluctuate. Efficient destruction of the waste is achieved at a thermal oxidizer operating temperature set point controlled at approximately 1,600 °F. The temperature works in conjunction with the thermal oxidizer volume and its associated residence time to achieve the efficient destruction of the waste gas stream.

The thermal oxidizer design includes internal shop installed refractory insulation. The selected materials are designed for a long, trouble-free operating lifetime. The list below summarizes the services and equipment provided in Zeeco's supply.

One (1) Thermal Oxidizer Package Including:

- One (1) Vertical Thermal Oxidizer w/ Integral Stack (10'-0" O.D. x 75'-0" OAH)
- Shop Installed Refractory Lining
- One (1) GB Style Burner
- One (1) Fuel Control Rack w/ Local Control Panel
- One (1) Combustion Air Fan w/ Ducting

## 1.2 Process Description

The vertical forced draft thermal oxidizer is equipped with one (1) forced draft fuel gas GB-Series burner. When the purge cycle is complete, the burner pilot is ignited via electric ignition. Once the burner pilot flame is proven, the main burner flame is ignited. The thermal oxidizer is then allowed to achieve a waste permissive temperature of 1,600 °F, following the recommended field cure procedures and schedule in APPENDIX E. Waste gas is then injected around the burner via the inlet nozzle. This high temperature accompanied with thermal oxidizer volume, known as residence time, destroys the hydrocarbon constituents of the waste gas stream. The flue gases from the thermal oxidizer then exits to atmosphere.

A temperature controller (supplied by others in DCS) monitors the combustion product's temperature through a thermocouple input and modulates both the fuel gas and combustion air flows into the burner. This ensures that sufficient temperature is maintained to provide complete destruction of varying waste gas compositions.

The fuel gas alone is used for start-up, burner stability, and refractory cure. The normal heat release for burner stability on fuel gas is ~57 MM BTU/HR. When more heat is needed for refractory curing, or if the heat produced by the combustion of the waste gas during operation

is not sufficient to maintain a thermal oxidizer temperature of 1,600 °F, a maximum fuel gas heat release of 75 MM BTU/HR is available from the burner.

Combustion air is supplied by the blower. All air enters the thermal oxidizer through the burner via the combustion air nozzle (N9) located on the thermal oxidizer. The flue gas exits the vent stack at an elevation of 76 feet.

### 1.2.1 Site Conditions

| | |
|---|---|
| Elevation, ft | 3612 |
| Seismic Zone | Zone 0, ASCE 7-10 |
| Design Wind Velocity | 100 MPH, ASCE 7-10 |
| Barometric Pressure, psia | 13.0 (assumed) |
| Temperature, °F (Min/Max) | 0 / 105 |
| Design Relative Humidity | 90% (assumed) |

| **Total Flowrate for Base Case, lbmol/hr** | **1622.5** | **3.5** |
| **Total Flowrate for 2x Base Case, lbmol/hr** | **3245.0** | **7.0** |
| **New Case 1x Amine Acid Gas 2x TEG, lbmol/hr** | **1622.5** | **7.0** |
| Mol. Wt. | 42.2 | 50.2 |
| Pressure, psig | 11.8 | 2.0 |
| Temperature, °F | 120 | 120 |

All waste streams are assumed to be in vapor state, no liquids have been considered in the design of the thermal oxidizer. If liquids are present, a knock out drum needs to be installed upstream of the thermal oxidizer as well as heat tracing and insulating the waste lines to avoid condensation. This additional scope is currently not included in Zeeco's scope.

It is assumed that the Acid Gas, Amine and TEG Flash Gases and TEG Overhead streams will be entering in two separate connections, inert streams such as Acid Gas in one connection and rich gases, such as the Amine and TEG Flash Gases and TEG Overhead streams in the other. It is assumed both inert and rich gas streams and will be running continuously and simultaneously. The Acid Gas stream will never be without TEG/ Amine Flash streams and vice versa.

### 1.2.3 Utilities

| | |
|---|---|
| Electrical Power | 460V / 3 Phase / 60 Hz |
| Instrument Air, SCFH | 2000 to 4000 |
| Fuel Gas Required for Base Case- all waste coming to TO simultaneously (Fuel Gas assumed as Methane) | 57 MMBtu/hr |
| Fuel Gas Required for 2x Base Case - all waste coming to TO simultaneously (Fuel Gas assumed as Methane) | 113 MMBtu/hr |

### 1.2.4 Flue Gas at 1600°F

| | **Base Case (all waste streams with 0% margin included)** |
|---|---|
| **COMPONENT:** | **Mol%** |
| $CO_2$ | 38.51 |

| | |
|---|---|
| $H_2O$ | 15.69 |
| $N_2$ | 42.74 |
| $SO_2$ | 0.00 |
| $O_2$ | 3.06 |
| **TOTAL, lbmol/hr** | **4390.11** |

### 1.2.5 System Performance

| Stack Emission | Expected Performance |
|---|---|
| Destruction Efficiency | > 99.9% of VOCs |
| NOx, $ppm_{vd}$ @ 3% O2 | 50 |
| CO, $ppm_{vd}$ @ 3% O2 | 50 |

These values are understood to apply only when the system is operated in accordance with the operating conditions stipulated in the design summary and for the waste stipulated in the design basis sections of this proposal. VOC is defined as non-methane and non-ethane hydrocarbons.

### 1.2.6 Combustion Air Performance

Reference AirPro Fan vendor literature in APPENDIX H for combustion air blower performance curve information.

### 1.2.7 Burner Performance

Reference the burner capacity curve (41184-G009A-001) in APPENDIX E for burner performance information.

## 1.3 Equipment Description

The forced draft thermal oxidizer system is described below.

### 1.3.1 Burner (Reference Zeeco Drawing 41184-G006A-001)

One (1) Forced Draft Zeeco GB Burner is offered with the following features:

- 75 MMBtu/hr maximum fuel gas release rating
- AR/GS Pilot for intermittent use
- A-36 Carbon Steel Construction
- 60% Al2O3 Burner Tile Construction
- 10:1 Fuel Gas Turndown
- All Carbon Steel External Surfaces Sandblasted to SSPC-SP6
- Painted per Zeeco Standard

### 1.3.2 Thermal Oxidizer (Reference Zeeco Drawing 41184-G064A-001)

One (1) vertical thermal oxidizer with integral stack is offered. It is designed to operate at 1600°F with excess air to ensure complete combustion of the waste gas combustible components. The thermal oxidizer has the following features:

- Nominal 10’-0” OD to 76’- 0” elevation
- Shell Material: SA-36

RE: PM Emissions Guarantee for THM Heaters

THM has supplied several heaters to the Targa Resources Red Hills facility over the years. These heaters were provided with various levels of emissions guarantees based on requests made at the time of purchase. Per discussions with all parties involved, THM would like to offer a revised guarantee for Particulate Matter (SPM) emissions of 0.0044 lb/MMBtu for the following THM heaters:

- RH1-H-23-704
- RH1-H-1101
- RH4-H-41100
- RH2-H-2301
- RH2-H-0901
- RH2-H-1001
- RHA-H-4901
- RH3-H-741
- RH3-H-781
- RH3-H-6301
- RH4-H-741
- RH4-H-781
- RH4-H-3901
- RH4-H-5301
- RH4-H-4001
- RH5-H-50902
- RH5-H-50001
- RH5-H-50741
- RH5-H-50781
- RH6-H-60001
- RH6-H-60741
- RH6-H-60781
- RA2-H-20001

Please let us know if there are any additional questions regarding this matter.

Thank you,

## BURNER DATA

MANUFACTURER: Webster Combustion SIZE / MODEL: 12.3-75 (CMS Model: CMS2500) NUMBER: Two

TYPE: Staged Head LOCATION: Firetube End ORIENTATION: HORIZONTAL

HEAT RELEASE PER BURNER, MM Btu/hr. DESIGN: 5.99 (LHV) MAXIMUM: 6.58 (LHV) MINIMUM: 1.32 (LHV) Turndown 5:1

PRESSURE DROP ACROSS BURNER @ DESIGN HEAT RELEASE, in H 20:

DISTANCE BURNER CENTER LINE TO TUBE CENTER LINE, HORIZONTAL, ft. HORIZONTAL: VERTICAL:

DISTANCE BURNER CENTER LINE TO UNSHIELDED REFRACTORY, ft. HORIZONTAL: VERTICAL:

* PILOT, TYPE: GAS CONTINUOUS CAPACITY, BTU / HR: -- COMBUSTION GAS FLOW RATE -- sFT3/hr:

* IGNITION METHOD: ELECTRIC

* FLAME SCANNERS, LOCATION: PILOTS and MAIN BURNERS (Note 1) NUMBER:

DESIGN / GUARANTEED EMISSIONS: LB/MMBTU (CORRECTED TO 3% 02, Dry LHV)
Combustion Mass Balances:
Lb/ MM Btu ~~(LHV) (HHV)~~

NOx: 0.067 CO: 0.081 SOx:
NOx 48 ppm SOx 0 ppm CO 95 ppm VOC 14 ppm
UHC: 14 ppm SPM: 14 ppm PARTICULATES:

NOTES:

1) Include flame scanners on main burners and flame rods on pilots.

2) Unit shall be provided with Ultra Low NOx burners

3) 11.12 MMBTU/hr is the heat release limit set forth by the air permit, based on ultra low NOx burners, and should not be exceeded in the heater design. Minimum efficiency required is based on necessary heat duty to feed plant users.

If higher efficiencies (and thus higher available absorbed duty) are achievable, please quote/design accordingly.

4) Fuel Gas Rate: 14,030 SCFH (296 LBm/hr) Pressure: 5 PSIG

5) Pilot Gas Rate: 272 SCFH Pressure: 1 PSIG

6 ) Combustion Air Rate: 5792 LBm/hr

7) Burner Control:

8) Blower Duct provided with combustion air pressure switch.

9) Fuel Gas Piping carbon steel with flanged and welded connections. Double block with pneumatically actuated shut-off valves, and a pressure transmitter for the main and pilot trains.

**NOTE:**
Emissions above are for design case operation with air and fuel in ratio control. The normal condition defined by cutomer's datasheet will have values less than above on a lb/hr basis and essentially the same on a ppm basis. Turndown and start-up are not considered as guaranteed emissions cases.

* Heat release based on de-rated tuning that occurred on 10-23-25. System configured so that firing rate cannot exceed 12 MMBtu/hr (LHV).

Tube No. 198U OD 0.7500 inch Thk(Avg) 0.0830 inch Length 14.000 ft Pitch 0.9375 inch

Tube Type Plain Material SA-214 Tube (W) K01807 Tube pattern 90

Shell ID 23.375 OD 24.000 inch Shell Cover (Integ.)

Channel or Bonnet Carbon Steel Channel Cover Carbon Steel

Tubesheet-Stationary Carbon Steel Tubesheet-Floating

Floating Head Cover Impingement Plate None

Baffles-Cross Carbon steel Type Support %Cut (Diam) Spacing(c/c) Inlet inch

Baffles-Long Seal Type None

Supports-Tube U-Bend Type None

Bypass Seal Arrangement pairs seal strips Tube-Tubesheet Joint Expanded (2 grooves)

Expansion Joint Type None

Rho-V2-Inlet Nozzle lb/ft-sec2 Bundle Entrance Bundle Exit lb/ft-sec2

Gaskets-Shell Side Tube Side

-Floating Head Internal Enhancements None

Code Requirements ASME TEMA Class C

Weight/Shell lb Filled with Water lb Bundle lb

Remarks:

MDMT: -20 F Both Sides. RT-1 Required.

Ship mechanically cleaned only (blasting & painting to be done in Reset yard)

# 2.0 PROCESS DESIGN CONDITIONS

## 2.1. Process Design (Coil)

| | |
|---|---|
| Media | Chem Therm 550 |
| Flow rate (Lb./Hr.) | 783,476 |
| Operating pressure (PSIG) | 60 |
| Inlet temperature (°F) | 280 |
| Outlet temperature (°F) | 400 |
| Calc. Pressure Drop (PSI) | 7.2 |
| Coil Terminal size/type (IN.) | 8" / 300# |
| Process Passes | Dual |
| Design pressure (PSIG) | 150 |
| Design temperature (°F) | -20 to 600 |
| Size | 8” Sch. 40 |
| Material (SMLS PIPE) | SA-106B |
| Coil heat flux (BTU/HR-SQ.FT.) | 14,788 |
| Net thermal eff. @ Design Duty | 82.3% (2% Setting loss) |
| Radiography: (Coil) | 100% |
| Corr. Allow. | 0.0625” |
| Coil Code | ASME Sect. VIII |

## 2.2 Heater

| | |
|---|---|
| Heater duty (MMBTU/HR) | 55 |
| Calc. Duty (MM BTU/HR) | 55 |
| Turndown | 10:1 |

## 2.3 Preliminary Instrument Set Points

See P & I D drawings for recommended set-points

**These settings / readings are PRELIMINARY only, and are subject to change. Operating conditions may warrant changes after start-up, and again as atmospheric conditions change. Refer to vender literature for adjustment methods.**

# Manufacturer Specification Sheets

Other Unit Specification Sheets

- RH-TRAILER

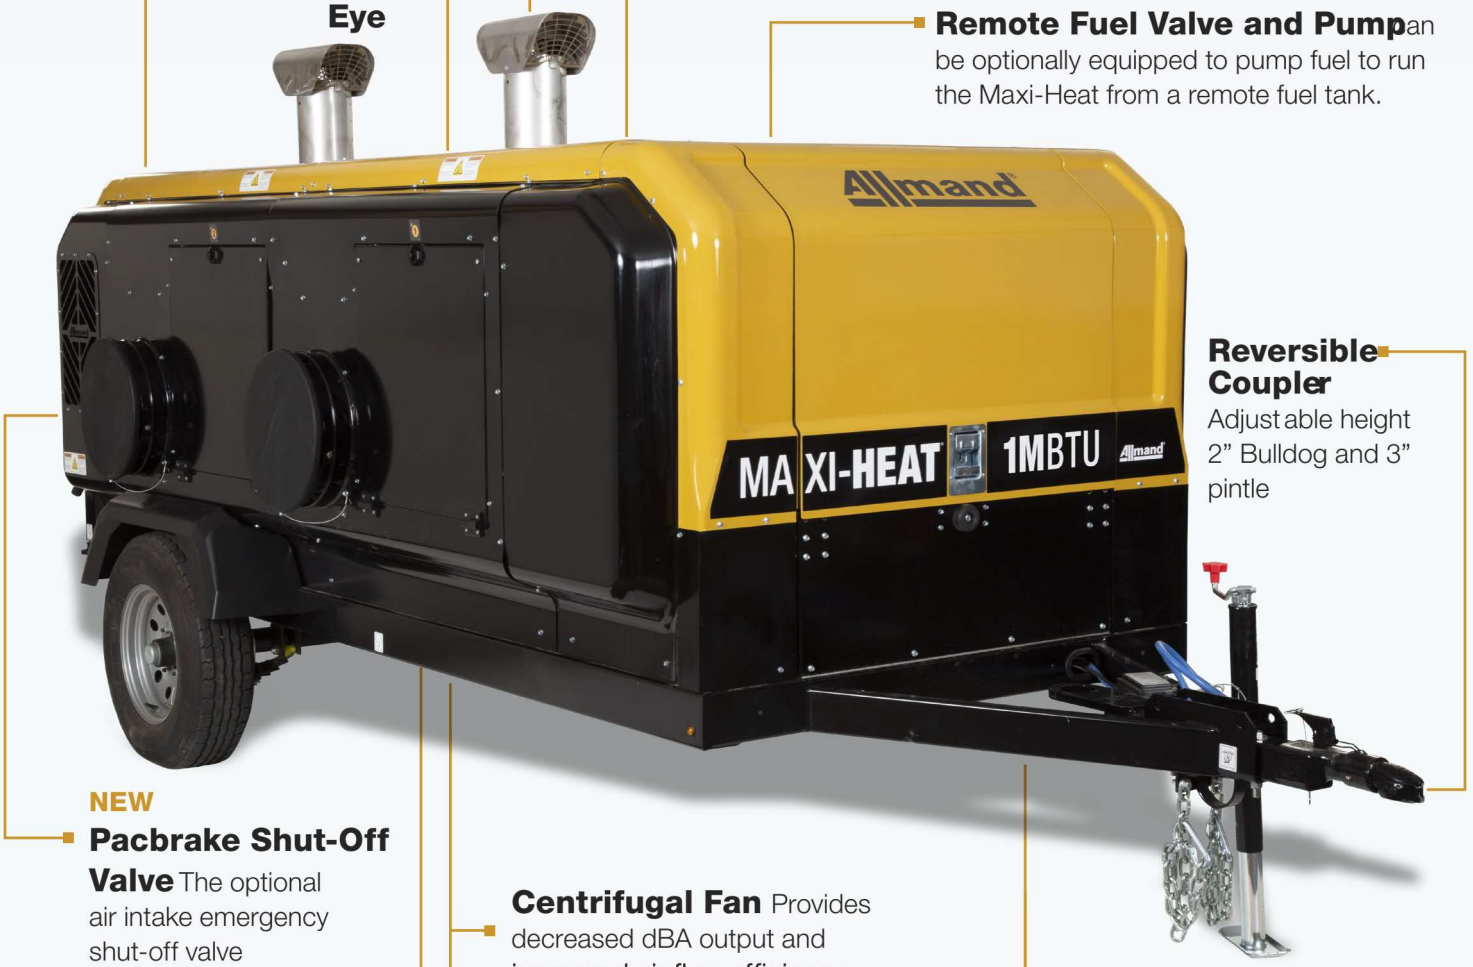
# MAXI-HEAT® 1MBTU

The **Maxi-Heat®** line includes a robustly designed towable indirect fired heater, with 1M BTU. This Unit provides heat for different applications including severe harsh conditions. The 1M includes two independently operating burners providing up to a combined 1,000,000 BTUs of heat. For ease of operation the **Maxi-Heat®** comes fully equipped with the iQ system, which automatically calibrates each burner providing reliable trouble free operation, eliminating the tedious trial and error combustion measurements and adjustments. Recirculation is standard on all **Maxi-Heat®** products resulting in increased efficiency of the heater and less fuel consumed. The **Maxi-Heat®** can go from warming equipment to curing concrete, the heat you can rely on when you need it most.

# KEY FEATURES

## Allmand® MAXI-HEAT®

**External Control Panel** Provides the operator with the necessary operating parameters needed during operation eliminating the need to open the heater door.



**Flexible Applications** Twin Heater units on the 1M BTU model providing flexibility of heat needed for the jobsite.

**iQ System** Automatically calibrates burner for temperature, humidity and barometric pressure. Provides damper setting on color display, and information on efficiency, target and actual outlet temperatures.

**Lifting Eye**

NEW

**Remote Fuel Valve and Pump** can be optionally equipped to pump fuel to run the Maxi-Heat from a remote fuel tank.

**Reversible Coupler** Adjustable height 2" Bulldog and 3" pintle

NEW

**Pacbrake Shut-Off Valve** The optional air intake emergency shut-off valve automatically closes the valve and shuts down the engine when an overspeed runaway condition occurs.

**Centrifugal Fan** Provides decreased dBA output and increased air flow efficiency.

**Air Recirculation Inlet** Air inlet comes standard and results in increased efficiency of the heater and less fuel consumed.

**Durable Steel Enclosure** is built to last through the toughest environments and conditions.

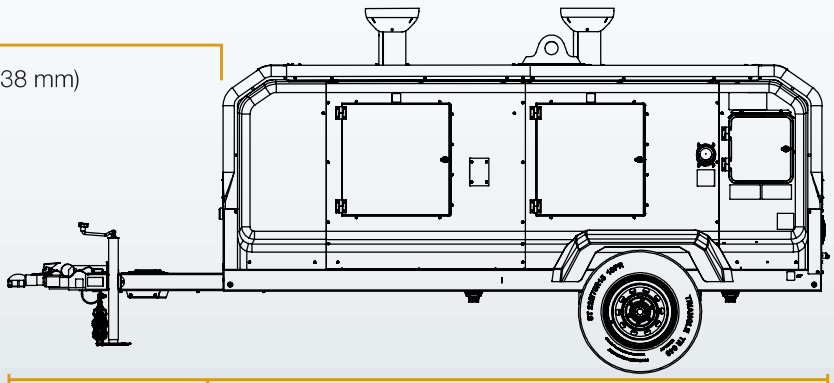
**Sleek Design** allowing for ease of transport and maneuverability.

**16", 20" or Dual 12" Duct Flange Outlets**

NEW

**Adjustable Air Recirculation Inlet** The optional adjustable air recirculation inlet connection changes size to fit either 16" or 20" ducting.

NEW



**CSA Approved Steel Fuel Tank** The optional 175 gallon steel double wall (UN-31A rated) fuel tank meets CSA and Transport Canada standards.

**Fluid Containment System (FCS)** Provides 130%+ fluid containment for all on-board fluids.

* Prime generator electrical output per Allmand® testing. ** Based on one hour run test full fuel tank consumption. *** All power levels are stated gross horsepower as rated by each engine's manufacturer. † Dry and wet weights vary by model. Allmand® has a policy of continuous product improvement and reserves the right to modify its specifications at any time and without prior notice. See operator's manual or www.allmand.com website for complete warranty details.

# OPTIONS

Maxi-Heat®

## Thermostat Package

- Remote Thermostat
- Lead extension

## 2 5/16" Bulldog Hitch

## Lockable Battery Disconnect

## 16", 20" or Dual 12" Duct Flange Outlets (ducting sold separately)

## Adjustable Air Recirculation Inlet

## Air Shut off Valve

## Remote Fuel Valve and Pump

## Single Steel Fuel Tank or Multi Poly Fuel Tanks

## Custom Paint

## Telematics (Customer supplied – consult factory)

## Emergency Stop

## COMPROMISE NOTHING.

At Allmand, our sole focus is providing jobsite support equipment to help your customers get the job done. Whenever they need it. Wherever they are. And whatever it takes. What's more, our genuine commitment to you — the highest standard of service and lowest total cost of ownership — is simply unmatched. Choose the equipment that comes with complete confidence that jobsite productivity won't go dark at 2 a.m. **Allmand. Above All.**

# Wastewater Tanks (5-T, 6-T, 7-T))
# Plant Schematic

| | | |
|---|---|---|
| Client Name: | Targa Northern Delaware | Job: Tank Scenario 2 |
| Location: | Red Hills GP | |
| Flowsheet: | Wastewater Tanks (5-T, 6-T, 7-T)) | |

Total Condensate: 10 bbl/yr

Total Water: 148,875 bbl/yr

Lube Oil Fraction:15 %

**Targa Northern Delaware, LLC – Red Hills Gas Processing Plant**

| Properties | To 5-LOAD | |
|---|---|---|
| Std Liquid Volumetric Flow (Total) | 148885 | bbl/yr |
| Std Liquid Volumetric Flow (Light Liquid) | 9.99999 | bbl/yr |
| Std Liquid Volumetric Flow (Aqueous Liquid) | 148875 | bbl/yr |

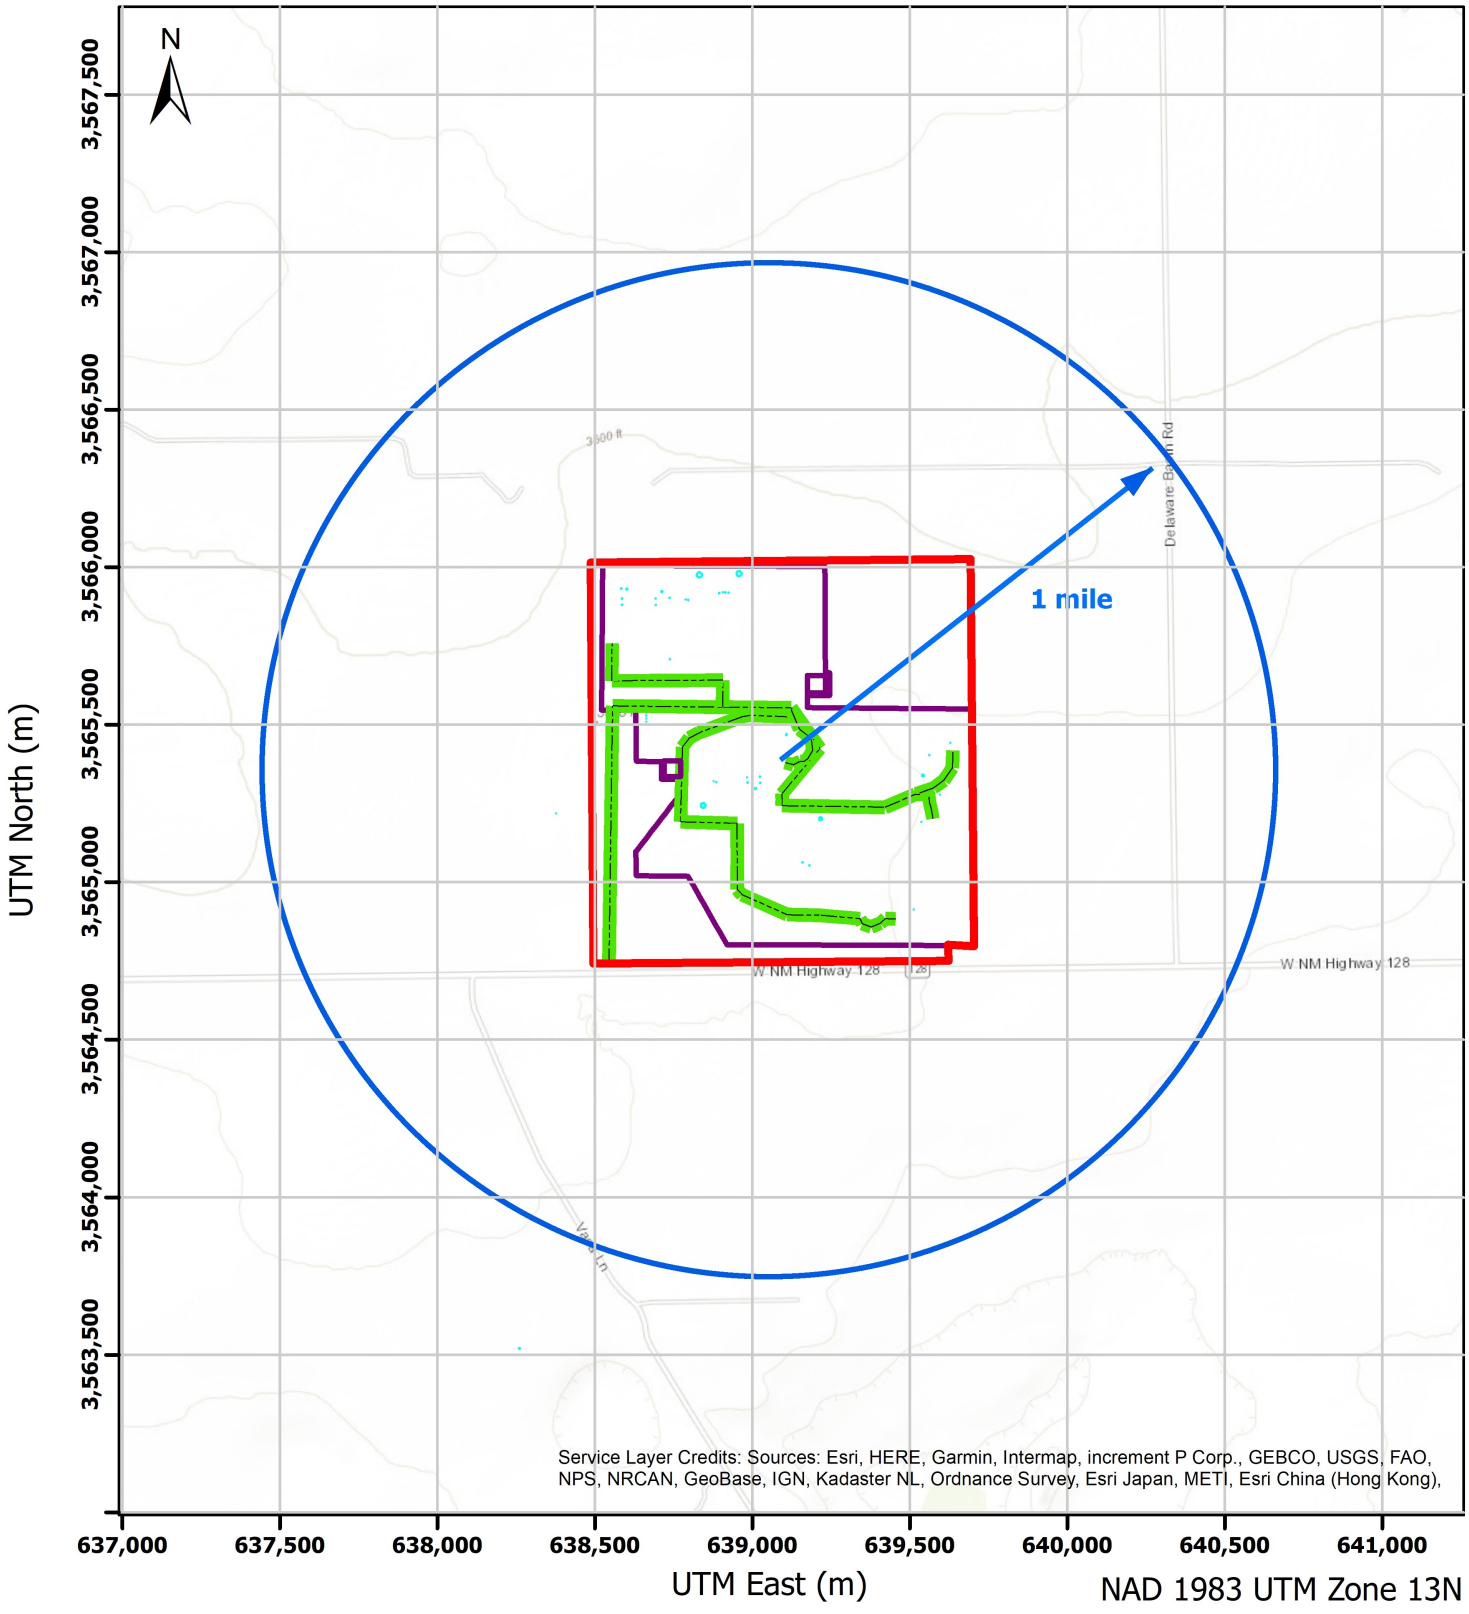
## Map(s)

---



**A map** such as a 7.5 minute topographic quadrangle showing the exact location of the source. The map shall also include the following:

| | |
|---|---|
| The UTM or Longitudinal coordinate system on both axes | An indicator showing which direction is north |
| A minimum radius around the plant of 0.8km (0.5 miles) | Access and haul roads |
| Topographic features of the area | Facility property boundaries |
| The name of the map | The area which will be restricted to public access |
| A graphical scale | |

---

A topographical map is attached.

## Proof of Public Notice

(for NSR applications submitting under 20.2.72 or 20.2.74 NMAC)
(This proof is required by: 20.2.72.203.A.14 NMAC "Documentary Proof of applicant's public notice")

---

☑ **I have read the AQB "Guidelines for Public Notification for Air Quality Permit Applications"**
This document provides detailed instructions about public notice requirements for various permitting actions. It also provides public notice examples and certification forms. Material mistakes in the public notice will require a re-notice before issuance of the permit.

---

Unless otherwise allowed elsewhere in this document, the following items document proof of the applicant's Public Notification. Please include this page in your proof of public notice submittal with checkmarks indicating which documents are being submitted with the application.

**New Permit** and **Significant Permit Revision** public notices must include all items in this list.

**Technical Revision** public notices require only items 1, 5, 9, and 10.

Per the Guidelines for Public Notification document mentioned above, include:

1. ☑ A copy of the certified letter receipts with post marks (20.2.72.203.B NMAC)
2. ☑ A list of the places where the public notice has been posted in at least four publicly accessible and conspicuous places, including the proposed or existing facility entrance. (e.g: post office, library, grocery, etc.)
3. ☑ A copy of the property tax record (20.2.72.203.B NMAC).
4. ☑ A sample of the letters sent to the owners of record.
5. ☑ A sample of the letters sent to counties, municipalities, and Indian tribes.
6. ☑ A sample of the public notice posted and a verification of the local postings.
7. ☑ A table of the noticed citizens, counties, municipalities and tribes and to whom the notices were sent in each group.
8. ☑ A copy of the public service announcement (PSA) sent to a local radio station and documentary proof of submittal.
9. ☑ A copy of the classified or legal ad including the page header (date and newspaper title) or its affidavit of publication stating the ad date, and a copy of the ad. When appropriate, this ad shall be printed in both English and Spanish.
10. ☑ A copy of the display ad including the page header (date and newspaper title) or its affidavit of publication stating the ad date, and a copy of the ad. When appropriate, this ad shall be printed in both English and Spanish.
11. ☑ A map with a graphic scale showing the facility boundary and the surrounding area in which owners of record were notified by mail. This is necessary for verification that the correct facility boundary was used in determining distance for notifying land owners of record.

**November 24, 2025**

CERTIFIED MAIL 9589 0710 5270 3302 0547 78
RETURN RECEIPT REQUESTED *(certified mail is required, **return receipt is optional**)*

Dear **Tip Top Solar Devco, LLC,**
**Targa Northern Delaware, LLC** announces its application submittal to the New Mexico Environment Department for an air quality permit for the **modification** of its **Red Hills Gas Processing Plant** facility. The expected date of application submittal to the Air Quality Bureau is **December 1, 2025.**

The exact location for the proposed facility known as **Red Hills Gas Processing Plant**, is at **1934 W NM Highway 128, Jal, NM 88252**. The approximate location of this facility is **20.7** miles **WNW** of Jal, NM in **Lea** county.

The proposed **modification** consists of updating calculation methodology, representation, and emission limits at the facility for all units.

The estimated maximum quantities of any regulated air contaminant will be as follows in pound per hour (pph) and tons per year (tpy) and could change slightly during the course of the Department's review:

| Pollutant: | Pounds per hour | Tons per year |
|---|---|---|
| Particulate Matter (PM) | 64 | 38 |
| $PM_{10}$ | 16 | 33 |
| $PM_{2.5}$ | 9 | 31 |
| Sulfur Dioxide ($SO_2$) | 382 | 502 |
| Nitrogen Oxides ($NO_x$) | 3,118 | 219 |
| Carbon Monoxide (CO) | 26,428 | 607 |
| Volatile Organic Compounds (VOC) | 21,416 | 1,710 |
| Total sum of all Hazardous Air Pollutants (HAPs) | 1,997 | 231 |
| Hydrogen Sulfide ($H_2S$) | 34 | 21 |
| Green House Gas Emissions as Total $CO_2e$ | N/A | 1,004,166 |

The standard and maximum operating schedules of the facility will be from 24 hours per day, 7 days a week and a maximum of 52 weeks per year.

Owners and operators of the facility include: **Targa Northern Delaware, LLC, 201 S 4th Street, Artesia, NM 88210.**

If you have any comments about the construction or operation of this facility, and you want your comments to be made as part of the permit review process, you must submit your comments in writing to this address: Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Other comments and questions may be submitted verbally. (505) 476-4300; 1 800 224-7009.

Please refer to the company name and facility name, or send a copy of this notice along with your comments, since the Department may have not yet received the permit application. Please include a legible return mailing address with your comments. Once the Department has performed a preliminary review of the application and its air quality impacts, the Department's notice will be published in the legal section of a newspaper circulated near the facility location.

**Attención**

Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono 505-629-7748.

Sincerely,
**Targa Northern Delaware, LLC**
**201 S 4th Street**
**Artesia, NM 88210**

**Notice of Non-Discrimination**
NMED does not discriminate on the basis of race, color, national origin, disability, age or sex in the administration of its programs or activities, as required by applicable laws and regulations. NMED is responsible for coordination of compliance efforts and receipt of inquiries concerning non-discrimination requirements implemented by 40 C.F.R. Part 7, including Title VI of the Civil Rights Act of 1964, as amended; Section 504 of the Rehabilitation Act of 1973; the Age Discrimination Act of 1975, Title IX of the Education Amendments of 1972, and Section 13 of the Federal Water Pollution Control Act Amendments of 1972. If you have any questions about this notice or any of NMED's non-discrimination programs, policies or procedures, or if you believe that you have been discriminated against with respect to a NMED program or activity, you may contact: Non-Discrimination Coordinator, NMED, 1190 St. Francis Dr., Suite N4050, P.O. |---|---|---|
| Particulate Matter (PM) | 64 | 38 |
| $PM_{10}$ | 16 | 33 |
| $PM_{2.5}$ | 9 | 31 |
| Sulfur Dioxide ($SO_2$) | 382 | 502 |
| Nitrogen Oxides ($NO_x$) | 3,118 | 219 |
| Carbon Monoxide (CO) | 26,428 | 607 |
| Volatile Organic Compounds (VOC) | 21,416 | 1,710 |
| Total sum of all Hazardous Air Pollutants (HAPs) | 1,997 | 231 |
| Hydrogen Sulfide ($H_2S$) | 34 | 21 |
| Green House Gas Emissions as Total $CO_2e$ | N/A | 1,004,166 |

The standard and maximum operating schedules of the facility will be from 24 hours per day, 7 days a week and a maximum of 52 weeks per year.

Owners and operators of the facility include: **Targa Northern Delaware, LLC, 201 S 4th Street, Artesia, NM 88210.**

If you have any comments about the construction or operation of this facility, and you want your comments to be made as part of the permit review process, you must submit your comments in writing to this address: Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Other comments and questions may be submitted verbally. (505) 476-4300; 1 800 224-7009.

Please refer to the company name and facility name, or send a copy of this notice along with your comments, since the Department may have not yet received the permit application. Please include a legible return mailing address with your comments. Once the Department has performed a preliminary review of the application and its air quality impacts, the Department's notice will be published in the legal section of a newspaper circulated near the facility location.

CERTIFIED MAIL 9589 0710 5270 3302 0547 54
RETURN RECEIPT REQUESTED *(certified mail is required, **return receipt is optional**)*

Dear **NGL North Ranch, LLC,**
**Targa Northern Delaware, LLC** announces its application submittal to the New Mexico Environment Department for an air quality permit for the **modification** of its **Red Hills Gas Processing Plant** facility. The expected date of application submittal to the Air Quality Bureau is **December 1, 2025.**

The exact location for the proposed facility known as **Red Hills Gas Processing Plant**, is at **1934 W NM Highway 128, Jal, NM 88252**. The approximate location of this facility is **20.7** miles **WNW** of Jal, NM in **Lea** county.

The proposed **modification** consists of updating calculation methodology, representation, and emission limits at the facility for all units.

The estimated maximum quantities of any regulated air contaminant will be as follows in pound per hour (pph) and tons per year (tpy) and could change slightly during the course of the Department's review:

| Pollutant: | Pounds per hour | Tons per year |
|---|---|---|
| Particulate Matter (PM) | 64 | 38 |
| $PM_{10}$ | 16 | 33 |
| $PM_{2.5}$ | 9 | 31 |
| Sulfur Dioxide ($SO_2$) | 382 | 502 |
| Nitrogen Oxides ($NO_x$) | 3,118 | 219 |
| Carbon Monoxide (CO) | 26,428 | 607 |
| Volatile Organic Compounds (VOC) | 21,416 | 1,710 |
| Total sum of all Hazardous Air Pollutants (HAPs) | 1,997 | 231 |
| Hydrogen Sulfide ($H_2S$) | 34 | 21 |
| Green House Gas Emissions as Total $CO_2e$ | N/A | 1,004,166 |

The standard and maximum operating schedules of the facility will be from 24 hours per day, 7 days a week and a maximum of 52 weeks per year.

Owners and operators of the facility include: **Targa Northern Delaware, LLC, 201 S 4th Street, Artesia, NM 88210.**

If you have any comments about the construction or operation of this facility, and you want your comments to be made as part of the permit review process, you must submit your comments in writing to this address: Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. **November 24, 2025**

CERTIFIED MAIL 9589 0710 5270 3302 0547 92
RETURN RECEIPT REQUESTED *(certified mail is required, **return receipt is optional**)*

Dear **Agave Energy Company,**
**Targa Northern Delaware, LLC** announces its application submittal to the New Mexico Environment Department for an air quality permit for the **modification** of its **Red Hills Gas Processing Plant** facility. The expected date of application submittal to the Air Quality Bureau is **December 1, 2025.**

The exact location for the proposed facility known as **Red Hills Gas Processing Plant**, is at **1934 W NM Highway 128, Jal, NM 88252**. The approximate location of this facility is **20.7** miles **WNW** of Jal, NM in **Lea** county.

The proposed **modification** consists of updating calculation methodology, representation, and emission limits at the facility for all units.

The estimated maximum quantities of any regulated air contaminant will be as follows in pound per hour (pph) and tons per year (tpy) and could change slightly during the course of the Department's review:

| Pollutant: | Pounds per hour | Tons per year |
|---|---|---|
| Particulate Matter (PM) | 64 | 38 |
| $PM_{10}$ | 16 | 33 |
| $PM_{2.5}$ | 9 | 31 |
| Sulfur Dioxide ($SO_2$) | 382 | 502 |
| Nitrogen Oxides ($NO_x$) | 3,118 | 219 |
| Carbon Monoxide (CO) | 26,428 | 607 |
| Volatile Organic Compounds (VOC) | 21,416 | 1,710 |
| Total sum of all Hazardous Air Pollutants (HAPs) | 1,997 | 231 |
| Hydrogen Sulfide ($H_2S$) | 34 | 21 |
| Green House Gas Emissions as Total $CO_2e$ | N/A | 1,004,166 |

The standard and maximum operating schedules of the facility will be from 24 hours per day, 7 days a week and a maximum of 52 weeks per year.

Owners and operators of the facility include: **Targa Northern Delaware, LLC, 201 S 4th Street, Artesia, NM 88210.**

If you have any comments about the construction or operation of this facility, and you want your comments to be made as part of the permit review process, you must submit your comments in writing to this address: Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Other comments and questions may be submitted verbally. (505) 476-4300; 1 800 224-7009.

Please refer to the company name and facility name, or send a copy of this notice along with your comments, since the Department may have not yet received the permit application. Please include a legible return mailing address with your comments. Once the Department has performed a preliminary review of the application and its air quality impacts, the Department's notice will be published in the legal section of a newspaper circulated near the facility location.

## Jaimy Karacaoglu

**From:** Daniel Dolce
**Sent:** Tuesday, July 8, 2025 9:41 AM
**To:** Aaron Forrister
**Cc:** Jaimy Karacaoglu; 'Charles Bates'
**Subject:** Request for Public Service Announcement

Good morning,

Per New Mexico Administrative Code 20.2.72.203.B NMAC and according to the Guidance for Public Notice for Air Quality Permit Applications – **(5) Notifications: Submittal of Public Service Announcement (PSA):** A public service announcement required for permits and significant permit revisions must be submitted to at least one radio or television station, which services the municipality, or county which the facility is or will be located. **Therefore, based on the above, we respectfully ask you to air the following script as a Public Service Announcement.**

> "This is a Public Service Announcement for a revision to the air quality permit of a gas processing plant facility per the requirements of New Mexico Administrative Code 20.2.72.203.D. The name of the facility is the Red Hills Gas Processing Plant. The Red Hills Gas Processing Plant is located at the following coordinates: 32.210556 degrees North and -103.523889 degrees West. The type of change for which the permit is sought is a Prevention of Significant Deterioration Major Modification Revision in which the calculation methodology, representation, and emission limits at the facility are updated for all units.
>
> Public notice has been posted near Jal, New Mexico at the following locations:
> (1) At the facility entrance of the Red Hills Gas Processing Plant,
> (2) At the Woolword Community Library located at 100 East Utah Avenue, in Jal New Mexico, Zip Code 88252,
> (3) At the Jal City Hall located at 309 South Main Street in Jal, New Mexico, Zip Code 88252,
> (4) At the Jal United States Post Office located at 111 South 4th Street in Jal, New Mexico, Zip Code 88252.
>
> Comments may be directed to the following address: Permits Program Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez; Suite 1, Santa Fe, New Mexico, 87505-1816. Comments may be directed to the following telephone numbers: (505) 476-4300 or 1(800) 224-7009."

Prior to payment for the PSA, we will need to know the following:
1. What **radio station** will the PSA be played on; and
2. What **date** and **time** will it be aired.

Please let me know if you have any questions.

Thank you and regards,
Daniel Dolce

Title {APPLICANT OR RELATIONSHIP TO APPLICANT}

**LEGAL NOTICE**
**November 23, 2025**

## NOTICE OF AIR QUALITY PERMIT APPLICATION

**Targa Northern Delaware, LLC** announces its application submittal to the New Mexico Environment Department for an air quality permit for the **modification** of its **Red Hills Gas Processing Plant** facility. The expected date of application submittal to the Air Quality Bureau is **December 1, 2025**.

The exact location for the proposed facility known as **Red Hills Gas Processing Plant**, is at **1934 W NM Highway 128, Jal, NM 88252.** The approximate location of this facility is **20.7** miles **WNW** of Jal, NM in **Lea** county.

The proposed **modification** consists of updating calculation methodology, representation, and emission limits at the facility for all units.

The estimated maximum quantities of any regulated air contaminant will be as follows in pound per hour (pph) and tons per year (tpy) and could change slightly during the course of the Department's review:

| Pollutant: | Pounds per hour | Tons per year |
|---|---|---|
| Particulate Matter (PM) | 64 | 38 |
| $PM_{10}$ | 16 | 33 |
| $PM_{2.5}$ | 9 | 31 |
| Sulfur Dioxide ($SO_2$) | 382 | 502 |
| Nitrogen Oxides ($NO_x$) | 3,118 | 219 |
| Carbon Monoxide (CO) | 26,428 | 607 |
| Volatile Organic Compounds (VOC) | 21,416 | 1,710 |
| Total sum of all Hazardous Air Pollutants (HAPs) | 1,997 | 231 |
| Hydrogen Sulfide ($H_2S$) | 34 | 21 |
| Green House Gas Emissions as Total $CO_2e$ | N/A | 1,004,166 |

The standard and maximum operating schedules of the facility will be from 24 hours per day, 7 days a week and a maximum of 52 weeks per year.

Owners and operators of the facility include: **Targa Northern Delaware, LLC, 201 S 4th Street, Artesia, NM 88210.**

If you have any comments about the construction or operation of this facility, and you want your comments to be made as part of the permit review process, you must submit your comments in writing to this address: Permit Programs Manager; New Mexico Environment Department; Air Quality Bureau; 525 Camino de los Marquez, Suite 1; Santa Fe, New Mexico; 87505-1816. Other comments and questions may be submitted verbally. (505) 476-4300; 1-800- 224-7009.

Please refer to the company name and site name, or send a copy of this notice along with your comments, since the Department may have not yet received the permit application. Please include a legible return mailing address with your comments. Once the Department has performed a preliminary review of the application and its air quality impacts, the Department's notice will be published in the legal section of a newspaper circulated near the facility location.

General information about air quality and the permitting process, and links to the regulations can be found at the Air Quality Bureau's website: www.env.nm.gov/air-quality/permitting-section-home-page/. The regulation dealing with public participation in the permit review process is 20.2.72.206 NMAC.

**Atención**

Este es un aviso de la oficina de Calidad del Aire del Departamento del Medio Ambiente de Nuevo México, acerca de las emisiones producidas por un establecimiento en esta área. Si usted desea información en español, por favor comuníquese con esa oficina al teléfono 505-629-7748.

**Notice of Non-Discrimination**

## Written Description of the Routine Operations of the Facility

---

**A written description of the routine operations of the facility**. Include a description of how each piece of equipment will be operated, how controls will be used, and the fate of both the products and waste generated. For modifications and/or revisions, explain how the changes will affect the existing process. In a separate paragraph describe the major process bottlenecks that limit production. The purpose of this description is to provide sufficient information about plant operations for the permit writer to determine appropriate emission sources.

---

The Red Hills Gas Processing Plant (Red Hills) is an existing natural gas processing plant located in Lea County. The primary function of the plant is to remove $CO_2$, water, and other impurities from raw field gas to ensure the processed gas meets pipeline quality specifications. The plant has been designated a primary Standard Industrial Classification (SIC) Code of 1311.

The gas will be treated to remove acid gases ($H_2S$ and $CO_2$) dehydrated to remove water and processed to remove C2+ hydrocarbons from the gas stream. Several plant systems will be involved to perform these functions.

**Slug Catcher / Separator**
Several slug catchers have been installed to catch and separate any free hydrocarbon liquids and water present in the inlet pipeline gas stream prior to undergoing gas treating and processing. The slug catchers are capable of handling large volumes of liquid brought into the plant from pipeline pigging operations. This equipment acts as a three-phase separator to separate the free hydrocarbons, gas to be processed, and free water. Separate inlet systems consisting of a series of separators and slug catchers will be associated with various trains. The south inlet system handles Trains 1 through 3 and the north inlet system handles Trains 4 through 6. Front end treaters RHA-AMINE and RA2-AMINE each have their own inlet systems.

**Condensate Stabilizer / Compressor**
The condensate stabilization system is in place to lower the Reid Vapor Pressure (RVP) of the pipeline liquids / condensate to meet required specifications. Condensate stabilization is accomplished by using a distillation process that uses heat to separate lighter hydrocarbon compounds in vapor phase from heavier hydrocarbon compounds in liquid phase to decrease the condensate RVP to a nominal RVP 9 product. The condensate from various filters/separators and the slug catcher are combined, stabilized, and sent to the tank farms for truck or pipeline sales. Any vapors that are created/removed during the stabilization process are recycled back to the plant inlet via compression.

**Amine Treating**
The amine units are designed to remove $CO_2$ and $H_2S$ from the natural gas stream to meet pipeline specifications. Amine treating is an exothermic chemical reaction process. The treating solution is a mixture of reverse osmosis (RO) water and MDEA (Methyldiethanolamine). This aqueous mixture is regenerated and reused. Lean amine/water solution is pumped to the top of the contactor and allowed to flow downward. Inlet gas is fed into the bottom of the contactor and flows upward. As the lean amine/water solution flows down through the contactor, it contacts the gas. The $CO_2$ and $H_2S$ react with the amine to form amine carbonate. The reacted amine, known as “sour” or “rich” amine, flows to the regeneration system and the processed (“sweet”) gas continues to the glycol dehydration system. Sour gas is first treated in the front end treaters RHA-AMINE or RA2-AMINE to remove the majority of $H_2S$ present in the stream. Emissions from amine units RHA-AMINE and RA2-AMINE are controlled by a redundant Acid Gas Injection well system . During events such as AGI compressor downtime, startup, shutdown, or maintenance events on any associated equipment, or any other operational conditions that would prevent injection into the wells, the emissions are controlled by AGI Flares, units RHA-FL-5100 and RA2-FL-25100, respectively. Sweet gas from inlet pipelines, RHA-AMINE, and RH2-AMINE is then treated in the sweet amine units including RH1-AMINE, RH2-AMINE, RH4-AMINE, and RH5-AMINE. The emissions from these units are routed to various thermal oxidizers, including units RH2-TO-5500, RH4-TO-45500, and RH5-TO-55500, at the facility.

**Hot Oil System**
The hot oil system at the plant is used to provide heat to multiple processes within the facility. The system utilizes pumps to circulate hot oil through natural gas fired heaters to increase the oil temperature and then delivers it to various heat exchangers. Hot oil heaters within the hot oil system include RH1-H-23-704, RH1-H-1101, RH4-H-41100, RH2-H-781, RH2-H-0901, RH2-H-1001, RHA-H-4901, RH3-H-781, RH4-H-781, RH4-H-3901, RH4-H-4001, RH5-H-50902, RH5-H-50001, RH5-H-50781, RH6-H-60001, RH6-H-60781, and RA2-H-20001.

In addition to the hot oil system, the facility utilizes heaters for the regenerator gas, including units RH2-H-741, RH3-H-741, RH4-H-741, RH5-H-50741, and RH6-H-60741 and TEG reboilers, including units RH2-H-2301, RH3-H-6301, and RH4-H-5301.

**Glycol Dehydration**
Triethylene glycol (TEG) dehydration is used to remove water from the natural gas stream by reducing the inlet water dew point (temperature at which vapor begins to condense into a liquid) to the outlet dew point temperature which contains a specified amount of water. The water saturated inlet gas is brought into contact with "lean" TEG in a countercurrent contactor tower. Water vapor is absorbed in the TEG and consequently, the natural gas dew point is reduced. Wet inlet gas passing through the contactor tower is dehydrated, then flows to the molecular sieve beds. The water saturated (or "rich") glycol then flows from the absorber to a regeneration system in which it is partially decompressed, then heated to remove water vapor, resulting in "lean" glycol that is reintroduced to the contactor tower. Emissions from glycol dehydrator units, RH1-TEG, RH2-TEG, RH3-TEG, RH4-TEG, RH5-TEG, and RH6-TEG are controlled by various flares and thermal oxidizers at the facility, including units RH1-FL-29-1003, RH2-TO-5500, RH4-TO-45500, and RH5-TO-55500.

**Molecular Sieve Dehydration**
Molecular sieve dehydration is used upstream of the cryogenic units to achieve a gas stream dew point of -150°F. The process consists of three molecular sieve vessels cycling through one vessel in regeneration mode and two vessels in moisture adsorption mode. During the regeneration mode, hot, dry gas (regen gas) is passed up through the vessel to drive off the adsorbed moisture from the molecular sieve. The gas comes from a slipstream at the outlet of the molecular sieve dehy beds, and it is passed through a heater to achieve a temperature of approximately 500°F. After the gas passes through the molecular sieve vessels, it is cooled in an air-cooled exchanger. The water in the gas condenses and is separated from the gas stream in a separator. This process operates in a closed vent system.

**Cryogenic Unit**
The cryogenic unit is designed to liquefy natural gas components from the sweet, dehydrated inlet gas by removing work (heat) from the gas primarily by means of the propane refrigeration system and turbo expander. The cryogenic unit recovers natural gas liquids (NGL) by cooling the gas stream to extremely cold temperatures (-150°F and lower) and condensing components such as ethane, propane, butanes and heavier components into a liquid phase. The gas is cooled by a series of heat exchangers and by rapidly lowering the pressure of the gas from around 760 PSIG to approximately 190 PSIG. This process operates in a closed vent system under pressure. Once the gas has passed through the system of exchangers and expander, it is re-compressed using the energy obtained from expanding the gas. The gas is sent to residue compressors and pipelined out of the facility. The NGL's are pumped into a pipeline from the NGL Surge Tanks. In case the compressors are shut in, the gas may be temporarily sent to flares, including units RH1-FL-29-1003, RH2-FL-5100, RH3-FL-5100, RH4-FL-45100, and RH5-FL-55100.

**Propane Refrigeration**
The propane refrigeration system works to remove heavier hydrocarbons in the gas stream to increase cryogenic efficiencies later in the process. Typically, the gas stream is refrigerated to just below minus 20°F and C4+ components are dropped out of the process gas in varying efficiencies so the cryogenic equipment can concentrate on the lighter C2 and C3 components. This process operates in a closed vent system.

**Storage and Loading Operations**
The unstabilized liquids will be stored in up to four pressurized 90,000-gallon tanks, also called bullet tanks. These tanks are not a source of regulated pollutants and are considered process vessels. The tank loading will take place via a pressurized, closed loop system. Atmospheric tanks batteries include RH1-TK-COND-EAST (condensate), RHA-TK-SLOP (sour slop), RH1-TK-COND-WEST (condensate), and RA2-TK-SLOP (sour slop) are controlled by flares RHA-FL-5850, RA2-FL-25850, and RH1-FL-2850. RH2-TK-SLOP, and RH1-TK-SLOP contain slop water and are uncontrolled. Loading operations are quantified as units RHA-TK-SLOP-LOAD, RH1-TK-COND-WEST-LOAD, RA2-TK-SLOP-LOAD, RH2-TK-SLOP-LOAD, and RH1-TK-SLOP-LOAD. Haul road emissions associated with loading activities are quantified as RH-HAUL.

There are two scenarios for the slop tank battery at Train 4, RH4-TK-SLOP, and the associated loading, RH4-TK-SLOP-LOAD. RH4-TK-SLOP may receive a combination of condensate, produced water, and slop water from various process streams at the facility. In Tank Scenario 1, up to 19,860 bbls of condensate are routed to the tanks and the emissions from the tanks and associated loading are controlled by a new flare, RH4-FL-46200, with a 98% DRE. Note that the condensate contribution does not constitute the entire flowrate to this set of tanks, but rather a subset. In Tank Scenario 2, up to 120.7 bbls of condensate are routed to the tanks as the condensate streams that were previously routed to this tank battery will be rerouted to another part of facility's process. The rerouting of these streams will require the installation of additional piping at the facility and associated fugitives. Note that the condensate contribution does not constitute the entire flowrate to this set of tanks, but rather a subset. In this scenario, RH4-TK-SLOP and associated loading RH4-TK-SLOP-LOAD remain

uncontrolled. Additional details regarding these operating scenarios are detailed in Section 15. The UA2 tables have been represented with both Tank Scenario 1 and Tank Scenario 2 as appropriate.

**Flares**
The plant flares are used during startup, shutdown, maintenance and upset conditions as well as some AOS SSM situations, as described in Section 15. In most cases, the only steady state operations associated with this flare are from the pilot and purge gas streams. RH1-FL-29-1003 also controls steady state emissions associated with RH1-TEG. SSM emissions from the plant flare result from maintenance activities per manufacturer-recommended or other preventative maintenance schedules. These maintenance activities include, but are not limited to, equipment blowdowns for associated maintenance, instrument calibrations, and process safety device maintenance. The inclusion of flare malfunction emissions captures any emissions that occur during process equipment malfunctions and are routed to any of the included flares (RH1-FL-29-1003, RH2-FL-5100, RH3-FL-5100, RH4-FL-45100, RH5-FL-55100).

**AGI Flare**
During events such as AGI compressor downtime, startup, shutdown, or maintenance events on any associated equipment, or any other operational conditions that would prevent injection into the wells, acid gas will be flared for limited periods at the respective acid gas flares until the facility can safely be brought offline. Under startup, shutdown, maintenance, and upset conditions the AGI wells could be offline. The AGI Flare units, RHA-FL-5100 and RA2-FL-25100, will also control non-condensable and flash tank emissions from the amine vent units, RHA-AMINE and RA2-AMINE during such events.

**Pigging Operations**
Pipeline inspection gauges (PIG) are used in the pipelines to purge, clean, and inspect pipelines to maintain operations and flow assurance of materials. This includes the removal of any accumulated materials or liquids. PIG receivers are used to receive the PIG device as well as to isolate other portions of the pipeline for the pigging process. PIG launchers are used to "launch" the PIG device through the pipeline. Pig Launchers and receivers at the site include RHA-REC-WINKLER, RHA-REC-LIMESTONE-8INCH, RH1-REC-PLANTVIEW, RH1-REC-GUTLINE, RH1-REC-ABU, RH4-REC-24INCH, RHA-REC-LIMESTONE-10INCH, RA2-REC-GREYHOUND, RHA-LAU-LIMESTONE-10INCH, RH1-LAU-NGPL, RH1-LAU-TW, RH1-LAU-ETC, RH1-LAU-ONEOK, and RH2-LAU-GPX.

**Major Process Bottlenecks**
The production at the Red Hills facility is limited at various processes. Inlet separation is constrained by the maximum liquid handling capacity, which limits the ability to manage large slugs or high liquid-to-gas ratios. Amine treating is limited by amine recirculation rates, contactor surface area, and heat duty supplied by the reboilers and hot oil system, which restricts the amount of $CO_2$ and $H_2S$ that can be removed. Glycol dehydration is limited by reboiler capacity. Residue gas compression is constrained by the compression capacity and discharge temperature limits, which restrict the maximum gas throughput and the pressure that can be delivered to the pipeline. NGL production is limited by the heater duty and downstream pumping capacity which restricts how much stabilized product can be processed and exported. Liquid storage is limited by tank volume and export rates, restricting how long the plant can operate at full capacity without offloading. Heaters and the hot oil system are capped by the total installed heat duty, fluid temperature limits, and flow distribution constraints, which together cap how much thermal energy can be supplied to various processes.

# Section 11
## Source Determination

Source submitting under 20.2.70, 20.2.72, 20.2.73, and 20.2.74 NMAC

Sources applying for a construction permit, PSD permit, or operating permit shall evaluate surrounding and/or associated sources (including those sources directly connected to this source for business reasons) and complete this section. Responses to the following questions shall be consistent with the Air Quality Bureau's permitting guidance, Single Source Determination Guidance, which may be found on the Applications Page in the Permitting Section of the Air Quality Bureau website.

Typically, buildings, structures, installations, or facilities that have the same SIC code, that are under common ownership or control, and that are contiguous or adjacent constitute a single stationary source for 20.2.70, 20.2.72, 20.2.73, and 20.2.74 NMAC applicability purposes. Submission of your analysis of these factors in support of the responses below is optional, unless requested by NMED.

**A. Identify the emission sources evaluated in this section** (list and describe)**:** All items listed in Table 2-A of this application.

**B. Apply the 3 criteria for determining a single source:**

**SIC Code:** Surrounding or associated sources belong to the same 2-digit industrial grouping (2-digit SIC code) as this facility, OR surrounding or associated sources that belong to different 2-digit SIC codes are support facilities for this source.

☑ **Yes** ☐ **No**

**Common Ownership or Control:** Surrounding or associated sources are under common ownership or control as this source.

☑ **Yes** ☐ **No**

**Contiguous or Adjacent:** Surrounding or associated sources are contiguous or adjacent with this source.

☑ **Yes** ☐ **No**

**C. Make a determination:**

☑ The source, as described in this application, constitutes the entire source for 20.2.70, 20.2.72, 20.2.73, or 20.2.74 NMAC applicability purposes. If in "A" above you evaluated only the source that is the subject of this application, all "**YES**" boxes should be checked. If in "A" above you evaluated other sources as well, you must check **AT LEAST ONE** of the boxes "**NO**" to conclude that the source, as described in the application, is the entire source for 20.2.70, 20.2.72, 20.2.73, and 20.2.74 NMAC applicability purposes.

☐ The source, as described in this application, **does not** constitute the entire source for 20.2.70, 20.2.72, 20.2.73, or 20.2.74 NMAC applicability purposes (A permit may be issued for a portion of a source). The entire source consists of the following facilities or emissions sources (list and describe):

# Section 12

## Section 12.A
## PSD Applicability Determination for All Sources

(Submitting under 20.2.72, 20.2.74 NMAC)

---

**A PSD applicability determination for all sources**. For sources applying for a significant permit revision, apply the applicable requirements of 20.2.74.AG and 20.2.74.200 NMAC and to determine whether this facility is a major or minor PSD source, and whether this modification is a major or a minor PSD modification. It may be helpful to refer to the procedures for Determining the Net Emissions Change at a Source as specified by Table A-5 (Page A.45) of the EPA New Source Review Workshop Manual to determine if the revision is subject to PSD review.

A. This facility is:

- ☐ **a minor PSD source before and after this modification (if so, delete C and D below).**
- ☐ **a major PSD source before this modification. This modification will make this a PSD minor source.**
- ☑ **an existing PSD Major Source that has never had a major modification requiring a BACT analysis.**
- ☐ **an existing PSD Major Source that has had a major modification requiring a BACT analysis**
- ☐ **a new PSD Major Source after this modification.**

B. **This facility is not one of the listed 20.2.74.501 Table I – PSD Source Categories. The "project" emissions** for this modification are **significant per 20.2.74.300.D NMAC, which states that "if a source or modification becomes a major stationary source or major modification solely due to a relaxation in any enforceable limitation, on the capacity of the source or modification otherwise to emit a pollutant, such as a restriction on hours of operation, then this part shall apply to the source or modification as though construction had not yet commenced." Because enforceable throughput limits are being increased, the entire facility is being treated, for PSD purposes, as if it has not yet been constructed. As such, all emissions associated with the facility are included as part of the analysis. The "project" emissions listed below do only result from changes described in this permit application, thus no emissions from other revisions or modifications, past or future are included to this facility. Also, specifically discuss whether this project results in "de-bottlenecking", or other associated emissions resulting in higher emissions. The project emissions (before netting) for this project are as follows [see Table 2 in 20.2.74.502 NMAC for a complete list of significance levels]:**

a. **NOx: 179.30 TPY**
b. **CO: 512.93 TPY**
c. **VOC: 916.62 TPY**
d. **SOx: 436.28 TPY**
e. **PM: 32.91 TPY**
f. **PM10: 28.17 TPY**
g. **PM2.5: 26.87 TPY**
h. **Fluorides: 0.00 TPY**
i. **Lead: 0.00 TPY**
j. **Sulfur compounds (listed in Table 2): 23.22 TPY**
k. **GHG: 735,360 TPY**

*The emissions represented here are the maximum between the two tank scenarios represented throughout this application.*

Red Hills Gas Processing Plant recently completed an air quality compliance audit under NMED Appendix D: Voluntary Environmental Disclosure policy. The information regarding the compliance status for each applicable permit requirement has been disclosed to the NMED's Compliance and Enforcement Division and a schedule has

been implemented for compliance demonstration. During the course of the audit, Targa Northern Delaware, LLC determined that the facility would be subject to PSD permitting per 20.2.74.300.D NMAC and 40 CFR 52.21(r)(4). This application is being submitted to resolve outstanding air quality permit compliance issues identified during the audit at the facility.

No de-bottlenecking was evaluated for this project as the facility is being re-permitted.

C. **Netting** **Applicant is submitting a PSD Major Modification and chooses not to net.**

D. **BACT** is **required, as this application is a major modification. A BACT analysis is included for all units operating at this facility for the following pollutants: $NO_X$, CO, VOC, $SO_2$, $H_2S$, $PM_{10}$, $PM_{2.5}$, and $CO_2e$. The BACT analysis is included as a separate attachment.**

E. If this is an existing PSD major source, or any facility with emissions greater than 250 TPY (or l00 TPY for 20.2.74.501 Table 1 – PSD Source Categories), determine whether any permit modifications are related, or could be considered a single project with this action, and provide an explanation for your determination whether a PSD modification is triggered.

---

# Section 12.B
# Special Requirements for a PSD Application

(Submitting under 20.2.74 NMAC)

---

## ***Prior*** *to Submitting a PSD application*, the permittee shall:

- ☑ Submit the BACT analysis for review prior to submittal of the application. No application will be ruled complete until the final determination regarding BACT is made, as this determination can ultimately affect information to be provided in the application. A pre-application meeting is recommended to discuss the requirements of the BACT analysis.
- ☑ Submit a modeling protocol prior to submitting the permit application. **[Except for GHG]**
- ☑ Submit the monitoring exemption analysis protocol prior to submitting the application. **[Except for GHG]**

## For PSD applications, the permittee shall also include the following:

- ☑ Documentation containing an analysis on the impact on visibility. **[Except for GHG]** ***included in modeling report***
- ☑ Documentation containing an analysis on the impact on soil. **[Except for GHG]** ***included in modeling report***
- ☑ Documentation containing an analysis on the impact on vegetation, including state and federal threatened and endangered species. **[Except for GHG]** ***included in modeling report***
- ☑ Documentation containing an analysis on the impact on water consumption and quality. **[Except for GHG]** ***included in modeling report***
- ☑ Documentation that the federal land manager of a Class I area within 100 km of the site has been notified and provided a copy of the application, including the BACT and modeling results. The name of any Class I Federal area located within one hundred (100) kilometers of the facility. ***included in modeling report***

---

**PSD Determination**

All emissions from the facility are considered an increase, resulting in the project being a major modification in and of itself. Facility-wide emissions for VOC, CO, and $SO_2$ exceed the PSD threshold of 250 tpy. Each pollutant has been compared to the PSD Significant Emission Rate (SER), and all other pollutants have been deemed significant. Emission totals for each PSD subject pollutant are as follows:

| | $NO_X$ | CO | VOC | $SO_2$ | TSP | $PM_{10}$ | $PM_{2.5}$ | $H_2S$ |
|---|---|---|---|---|---|---|---|---|
| **Project Emission Increases (tpy)** | 179.30 | 512.93 | 916.62 | 436.28 | 32.91 | 28.17 | 26.87 | 23.22 |
| **PSD Threshold (tpy)** | 250 | 250 | 250 | 250 | 250 | 250 | 250 | 250 |
| **Is the Project a Major Modification?** | No | Yes | Yes | Yes | No | No | No | No |
| **PSD SER (tpy)** | 40 | 100 | 40 | 40 | 25 | 15 | 10 | 10 |
| **Section 17 Is the Pollutant Subject to PSD review?** | Yes | Yes | Yes | Yes | Yes | Yes | Yes | Yes |

*The emissions represented here are the maximum between the two tank scenarios represented throughout this application.*

The modeling protocol and report can be found in Section 16 of the application. Please note the following can be found in the modeling report:

- PSD Air Dispersion Modeling Report
- Visibility Impact Analysis
- Soil Impact Analysis
- Vegetation Impact Analysis
- Water Consumption and Quality Impact Analysis

# 1. EXECUTIVE SUMMARY

Targa Resources LLC, dba Targa Northern Delaware LLC, (Targa) owns and operates the Red Hills Gas Plant (Red Hills) at 1934 W NM Highway 128, Jal, 88252, Lea County, New Mexico under Construction Permit 4310-M6 and Title V Operating Permit P278-M1. Targa is developing a Prevention of Significant Deterioration (PSD) application for submittal to the New Mexico Environment Department (NMED). Per the monitoring requirements found in 20.2.74.306.A NMAC:

*"Any application for a permit under this part shall contain an analysis of ambient air quality. Air quality data can be that measured by the applicant or that available from a government agency in the area affected by the major stationary source or major modification. The analysis shall contain the following:*

> *(1) for a major stationary source, each pollutant for which the potential to emit is equal to or greater than the significant emission rates as listed in Table 2 of this part (20.2.74.502 NMAC); or*
> *(2) for a major modification, each pollutant that would result in a significant net emission increase."*

Preliminary calculations show nitrogen oxides ($NO_X$), particulate matter less than 10 microns in diameter ($PM_{10}$), particulate matter less than 2.5 microns in diameter ($PM_{2.5}$), carbon monoxide (CO), sulfur dioxide ($SO_2$), and volatile organic compound (VOC)[1] emission rates are above the significant emission rates listed in 20.2.74.502 NMAC Table 2. Per 20.2.74.306.C NMAC:

*"Continuous air quality monitoring data shall be required for all pollutants for which a national ambient air quality standard exists. Such data shall be submitted to the department for at least the one (1) year period prior to receipt of the permit application. The department has the discretion to:*

> *(1) determine that a complete and adequate analysis can be accomplished with monitoring data gathered over a period shorter than one year but not less than four months; or*
>
> *(2) determine that existing air quality monitoring data is representative of air quality in the affected area and accept such data in lieu of additional monitoring by the applicant."*

Targa contends that, based on the requirements of 40 CFR 51, Appendix W (Guideline),[2] the existing ambient monitoring programs operated by the New Mexico Environmental Department (NMED), Texas Commission on Environmental Quality (TCEQ), and Arizona Department Of Environmental Quality (ADEQ) are sufficient to meet the background ambient air quality monitoring requirements of 40 CFR 51, Appendix W, Section 8.3.1(a)(ii) and thus may be used in lieu collecting site-specific monitoring data for the PSD permit application. Targa is proposing to use ambient air quality data collected at the monitoring stations listed in **Table 1-1** for those pollutants and averaging periods that may exceed a significant impact level (SIL) for the facility-only, source-specific modeling analysis in lieu of collecting site-specific data for nitrogen dioxide ($NO_2$), $PM_{10}$, $PM_{2.5}$, CO, $SO_2$, and ozone.

[1] VOC is a precursor for ozone formation.

[2] Code of Federal Regulations, Title 40 – Protection of Environment, Part 51, Appendix W, Section 8.3. January 17, 2017.

**Table 1-1. Background Ambient Air Quality Design Value Concentrations for Modeling**

| Station/ AQS ID | Pollutant | Averaging Period | Monitored Design Value ($\mu g/m^3$) | NAAQS [a] ($\mu g/m^3$ unless noted) | NMAAQS ($\mu g/m^3$) |
|---|---|---|---|---|---|
| 5ZS Hobbs Jefferson/ 35-025-0008 | $NO_2$ | 1-Hour | 58.3 | 188.03 | --- |
| | | 24-Hour | --- | --- | 188.03 |
| | | Annual | 9.4 | 99.66 | 94.02 |
| El Paso Chamizal/ 48-141-0044 | CO | 1-Hour | 4,697 | 40,069.6 | 14,997.5 |
| | | 8-Hour | 2,291 | 10,303.6 | 9,960.1 |
| N/A | Ozone [b] | 8-Hour | --- | 0.070 ppm | --- |
| Douglas Red Cross/ 04-003-1005 | $PM_{10}$ | 24-Hour | 124 | 150 | --- |
| 5ZS Hobbs Jefferson/ 35-025-0008 | $PM_{2.5}$ | 24-Hour | 20 | 35 | --- |
| | | Annual | 6.6 | 9 | --- |
| N/A | $SO_2$ [c] | 1-Hour | --- | 196.4 | --- |
| | | 3-Hour | --- | 1309.3 | --- |
| | | 24-hour | --- | --- | 261.9 |
| | | Annual | --- | --- | 52.4 |

a. The NAAQS were converted from ppb to $\mu g/m^3$ by NMED.[3] The form of the monitored design value and NAAQS are found in: https://www.epa.gov/criteria-air-pollutants/naaqs-table.
b. If the Targa source-specific analysis shows that the significant impact level (SIL) of 1.0 ppb may be exceeded, Targa will consult with the NMED on how to address cumulative ambient ozone impacts.
c. Per NMED Air Dispersion Modeling Guidelines (Revised July 2024), Section 2.6.8.2, sources located in the Pecos-Permian Basin Intrastate Air Quality Control Regions (AQCR 155) should be modeled explicitly with the source and surrounding sources. Red Hills Gas Plant is located in Lea County, which is part of the AQCR 155, and will be explicitly modeled with surrounding sources; background $SO_2$ concentrations will not be added to the modeled impacts.

[3] NMED Air Dispersion Modeling Guidelines (Revised July 2024), Section 2.5.

# 2. RED HILLS GAS PROCESSING PLANT OVERVIEW

The Red Hills Gas Processing Plant is an existing natural gas processing plant located in Lea County, New Mexico consisting of several treating and processing trains. Natural gas will be treated to remove acid gases ($H_2S$ and $CO_2$), dehydrated to remove water, and processed to remove C2+ hydrocarbons from the gas stream. Amine treating units, glycol dehydration units, mole sieve dehydration units, cryogenic gas processing equipment, associated condensate stabilization systems, and other supporting equipment will be utilized to perform these functions. The plant has been designated a primary Standard Industrial Classification (SIC) Code of 1311.

# 3. EXISTING AIR QUALITY DATA EVALUATION

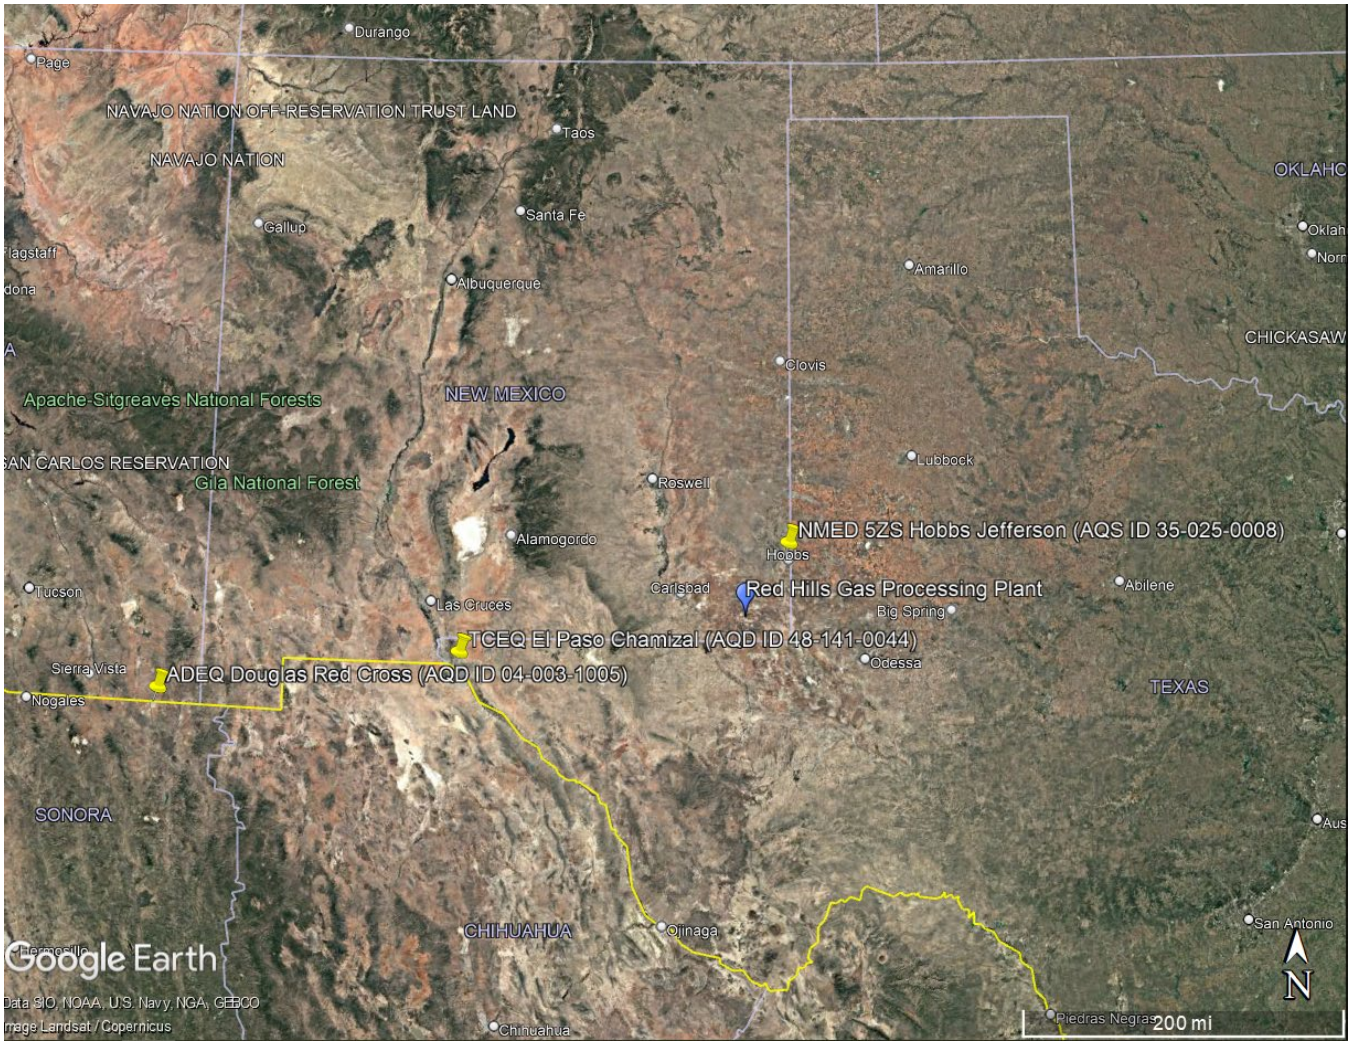
The NMED, TCEQ, and ADEQ operate air quality monitoring stations listed below and shown in **Figure 3-1** are evaluated in this report:

- NMED 5ZS Hobbs Jefferson (AQS ID 35-025-0008): $NO_2$ and $PM_{2.5}$
- TCEQ El Paso Chamizal (AQD ID 48-141-0044): CO
- ADEQ Douglas Red Cross (AQD ID 04-003-1005): $PM_{10}$

## 3.1 Background Ambient Monitoring Requirements for Modeling

The portion of the background air quality that accounts for Other Sources as defined in 40 CFR 51, Appendix W, Section 8.3.1.(ii)[4] [i.e., emission sources other than those that would be explicitly modeled under Section 8.3.1.(i)], should be characterized by ambient monitoring data. Other Sources are defined as the portion of the background attributable to natural sources, other unidentified sources in the vicinity of the project, and regional transport contributions from more distant sources (domestic and international).

Existing air quality monitoring may be used to account for Other Sources as stated in 40 CFR 51, Appendix W, Section 8.3.2.b, which may be applicable to the Red Hills Gas Plant under 40 CFR 51, Appendix W, Section 8.3.3, Sections (a) and (d):



> *If there are no monitors located in the vicinity of the new or modifying source, a "regional site" may be used to determine background concentrations. A regional site is one that is located away from the area of interest but is impacted by similar or adequately representative sources.*

As described in this section, the existing air quality monitors operated by the NMED, TCEQ, and ADEQ are in source environments that may adequately represent Other Sources, as defined above, for purposes of estimating cumulative air quality impacts associated with the Red Hills Gas Plant.

Per NMED Air Dispersion Modeling Guidelines (Revised July 2024), Section 2.6.8.2, sources located in the Pecos-Permian Basin Intrastate Air Quality Control Regions (AQCR 155) should be modeled explicitly with the source and surrounding sources. Red Hills Gas Plant is located in Lea County, which is part of the AQCR 155, and will be explicitly modeled with surrounding sources; background $SO_2$ concentrations will not be added to the modeled impacts.

[4] Code of Federal Regulations, Title 40 – Protection of Environment, Part 51, Appendix W, Section 8.3. January 17, 2017.

## Figure 3-1 Existing Air Quality Monitoring Stations

## 3.2 Existing Data Assessment

### 3.2.1 Monitor Locations

The nearest active $NO_2$ and $PM_{2.5}$ data are collected at the Hobbs Jefferson monitoring station approximately 66 kilometers (km) northeast of the Red Hills Gas Plant. This monitoring station may be adequate to represent existing ambient air quality concentrations for purposes of cumulative NAAQS modeling. The Hobbs Jefferson monitors are located in the Permian Basin and are impacted by adjacent and nearby sources of emissions that are similar in nature to the industrial activity near the Red Hills Gas Plant. The Hobbs Jefferson monitoring station is recommended by NMED[5] for $NO_2$ and $PM_{2.5}$ and therefore proposed to characterize the concentrations from Other Sources defined in Section 8.3.2.b of the Guideline as cited above.

The nearest active $PM_{10}$ monitors are located in El Paso, Texas; Albuquerque, New Mexico; and Douglas, Arizona. The El Paso Chamizal monitor was not considered representative of air quality in the vicinity of the Red Hills Gas Plant because the monitor is located near significant adjacent highways and is immediately downwind of Ciudad Juarez, Mexico and impacted by the urban El Paso area. The El Paso Chamizal monitor was therefore not considered further for $PM_{10}$. The Albuquerque $PM_{10}$ monitors were also not considered representative of air quality in the vicinity of the Red Hills Gas Plant. These monitors are impacted by significant highway traffic, are located in a topographically different region of the state of New Mexico, and therefore not considered further for $PM_{10}$. The Douglas Red Cross monitor is located in a topographically and climatically similar area with similar population densities and industries present in the vicinity of the Red Hills Gas Plant. Therefore, this monitor was selected as a representative monitor for $PM_{10}$.

Carbon monoxide is collected at the TCEQ El Paso Chamizal monitor. The location of the monitor is impacted by higher levels of emissions, especially those emissions related to on road mobile and other urban sources, than those present in the vicinity of the Red Hills Gas Plant. If the Red Hills Gas Plant source-specific (i.e., significance) analysis shows that cumulative CO modeling is required, the TCEQ El Paso Chamizal monitor is adequate, and likely conservative, of the background ambient CO concentrations in the vicinity of the Plant.

It should be noted that nearby sources will be modeled explicitly, as applicable for each pollutant,[6] as part of the PSD permit application in conjunction with the Red Hills Gas Plant emission sources. The addition of adequately representative background concentrations to model-predicted impacts will represent the cumulative air quality impacts for the PSD application.

### 3.2.2 Data Quality

The NMED, TCEQ, and ADEQ have established their respective monitoring networks following each state's most recent annual network plan review documents.[7,8,9]

The Hobbs $NO_2$ and $PM_{2.5}$ monitors are maintained and operated by the NMED in accordance with the State's Quality Assurance Project Plan (QAPP) that has been approved by EPA Region 6. The monitors are

[8] https://www.tceq.texas.gov/airquality/monops/past_network_reviews

[9] https://static.azdeq.gov/pn/aq_2023_monitoring_plan.pdf

subject to periodic calibrations, performance evaluations, and technical systems audits in accordance with 40 CFR 58 Appendix A. The quality assurance/quality control (QA/QC) requirements in 40 CFR 58 Appendix A (State and Local Air Monitoring Stations) are appropriate for characterizing the ambient background concentrations in the Red Hills Gas Plant project area with regards to data quality.

Similarly, TCEQ's El Paso Chamizal and ADEQ's Douglass Red Cross air quality monitors are maintained and operated by the respective agencies in accordance with QAPPs that have been approved by EPA Region 6 and EPA Region 9, respectively. The monitors are also subject to periodic calibrations, performance evaluations, and technical systems audits in accordance with 40 CFR 58, Appendix A.

The NMED, TCEQ, and ADEQ data that have been submitted to EPA's Air Quality System (AQS) database for calendar years 2021-2023 have been certified and are assumed to be acceptable for use in cumulative NAAQS modeling evaluations for the Red Hills Gas Plant PSD permit application.

### 3.2.3 Data Currentness and Completeness

The most recent 3-year period (2021-2023) of certified data are available in AQS and have been used in this evaluation and represent the 3-year period prior to the anticipated submittal date of the PSD permit application. The PSD data completeness requirement is 80 percent by pollutant by quarter. Each of the monitors presented in **Table 1-1** exceeded the quarterly completeness requirement for the respective pollutant.

## 3.3 Existing Air Quality Data Conclusions

The NMED, TCEQ, and ADEQ operate robust networks of ambient air quality monitors in the nearby arid desert southwest. The existing ambient air quality data summarized in this report are adequate to characterize Other Sources, as defined in 40 CFR 51, Appendix W, Section 8.3.1.(ii), in the forthcoming cumulative impact analyses that will be submitted with the PSD application for the Red Hills Gas Plant.

# TABLE OF CONTENTS

1. EXECUTIVE SUMMARY (SUPPLEMENT) 1-1

2. RED HILLS GAS PROCESSING PLANT OVERVIEW 2-2
   - 2.1 Plant Description ..... 2-2
   - 2.2 Plant Location and Surrounding Area ..... 2-2

3. SOURCE CHARACTERIZATION (SUPPLEMENT) 3-1
   - 3.1 Point Sources ..... 3-1
   - 3.2 Flares (Supplement) ..... 3-1
     - 3.2.1 Sweet Gas Flares (Supplement) ..... 3-1
     - 3.2.2 Acid Gas Flares (Supplement) ..... 3-2
   - 3.3 Area Sources ..... 3-3
   - 3.4 Volume Sources - Roads ..... 3-3

4. CLASS II MODELING PROCEDURES (SUPPLEMENT) 4-1
   - 4.1 Model Selection ..... 4-1
   - 4.2 Model Inputs Options ..... 4-1
   - 4.3 Alternate Operating Scenarios (Supplement) ..... 4-1
   - 4.4 Portable Sources ..... 4-1
   - 4.5 Land Use Classification ..... 4-1
   - 4.6 Plume Downwash ..... 4-1
   - 4.7 Meteorological Data ..... 4-1
   - 4.8 Ambient Air Boundary ..... 4-1
   - 4.9 Receptor Network and Terrain Elevations ..... 4-2
   - 4.10 Nearby Source Inventory ..... 4-2
   - 4.11 Background Concentrations ..... 4-2
   - 4.12 Estimating $NO_2$ Impacts ..... 4-2
   - 4.13 Secondary Pollutant Formation ..... 4-2

5. CLASS II MODELING ANALYSIS 5-3
   - 5.1 Significant Impact Analysis ..... 5-3
   - 5.2 Cumulative Impact Analysis ..... 5-3

6. ADDITIONAL IMPACTS 6-4
   - 6.1 Growth Analysis ..... 6-4
   - 6.2 Soil and Vegetation Analysis ..... 6-4
   - 6.3 Visibility Impairment Analysis ..... 6-4

7. CLASS I MODELING PROCEDURES AND ANALYSES (SUPPLEMENT) 7-1
   - 7.1 Initial Screening Analysis ..... 7-1
