Project No. 22236242

SECTIONSIX Groundwater

This section documents and summarizes analytical results for groundwater samples collected as part of the RI/FS at the Molycorp mine and tailings facility near Questa, New Mexico. Groundwater data collection for the RI began in fall 2002 and ended in spring 2004.

Groundwater was sampled and analyzed in the vicinity of the mine site and tailings facility to characterize the nature and extent of potential contamination and to provide the necessary data to evaluate potential exposure to human and ecological receptors. Groundwater samples were collected from existing monitoring wells, extraction wells, piezometers, from the underground workings at the mine site, and reference wells upstream of the mine. New monitoring wells were installed at the mine site and tailings facility during the RI and the new wells were included in the sampling program. Seeps and springs were also sampled and are treated as part of the groundwater medium.

For the purposes of the RI, the mine site was divided into six groundwater exposure areas and three groundwater exposure areas were established at the tailings facility (Figures 6-1 and 6-2, respectively). Groundwater exposures areas were established using several factors that included watershed boundaries, physical features (i.e., rock piles), current or past operational activities, and potential exposure pathways.

Sampling of reference groundwater was conducted for the purpose of evaluating the extent of contamination above reference concentrations. For the mine site, reference locations included wells at the upstream mine boundary, other locations upstream of the mine, and in upper Capulin Canyon. Tailings facility reference locations included wells upgradient (north) and to the west of the tailings facility. On-mine site reference sampling locations are shown on Figure 6-1 and Figure 6-3 shows the off-mine site reference locations. The tailings facility reference locations are shown on Figure 6-2.

Groundwater sampling was conducted on a quarterly basis for all wells and seeps and/or springs. Quarterly sampling events were performed in September/October 2002; January, April, July, and September 2003; and January and April 2004. New monitoring wells were sampled on a monthly basis after they were installed to obtain a sufficient number of data points for statistical evaluation of chemical data and assessment of potential trends.

Groundwater samples were analyzed for 25 dissolved and 25 total metals, typically 16 inorganics, total cyanide, and field parameters that included pH, temperature, conductivity, oxidation-reduction potential, turbidity, dissolved oxygen, and flow for seeps and springs. Subsets of existing wells at the mine area and tailings facility were monitored monthly for field parameters to allow for the evaluation of possible seasonal trends. Hexavalent chromium was analyzed in a subset of the groundwater samples collected only during fall 2002 to allow for the determination of the ratio of trivalent to hexavalent chromium. Selected wells were analyzed for organics potentially released in a given area. Organic compounds analyzed in select wells at the mine site included VOCs, SVOCs, explosives, and total petroleum hydrocarbons (Motor oil and Diesel Fuel No. 2), and dioxins in a very limited number of samples. VOCs and SVOCs were analyzed in select wells at the tailings facility. Rationale for each sampling location, sampling frequency, analyte list, and analyte methods are provided in the Molycorp RI/FS Draft Final Work Plan (URS 2002b).

During spring 2004, additional sampling of wells and springs at the mine site and off-site reference area was performed that was not originally contained in the Work Plan. At the request of EPA, select wells were sampled and analyzed for lead and sulfur isotopes, and lanthanides. At that same time, select wells were also analyzed for the stable isotopes of oxygen and hydrogen, and tritium and helium to estimate the age of the water.

Appendix A-6 contains tables of analyte concentrations and field measurements for groundwater samples collected during the RI, and the additional sampling of select mine site wells and springs during spring 2004. Some values or concentrations may have been rejected during the data validation process. Rejected data are not in Appendix A-6, but are discussed in their respective section of this memorandum.

Section 15.4 describes an evaluation of observed field or laboratory contaminants and provides a list by medium of analytes that are considered as attributable to laboratory or field contamination rather than being related to presence in the medium under evaluation. These compounds are not included in the summary result tables in this section, but results for analysis of these compounds are included in the printout of the RI sample analysis results in Appendix A-6.

Individual summary tables for each groundwater-bearing zone (e.g., alluvium, bedrock) within each groundwater exposure or reference area have been prepared. Individual summary tables combine analytical results from all sampling events and present the number of samples collected; percent detection; and minimum, maximum, mean, and median values. The summary tables also contain EPA Region 6 Risk-Based SLC for Human Health at a Hazard Quotient of one. Groundwater Data Quality Objectives (URS 2002e) require comparison of analyte concentrations to these SLC as a first step in the Data Quality Objectives process.

The following section briefly discusses detected analytes for each groundwater-bearing unit or aquifer within each groundwater exposure or reference area. The discussion focuses on inorganics and metals that are detected in greater than 90 percent of the samples. A summary section discusses mean analyte concentrations that exceed Human Health SLC, and how those concentrations compare to reference areas.

6.1 REFERENCE OFF-SITE MINE GROUNDWATER

The off-site mine reference area is comprised of watersheds upstream of the mine site boundary. These watersheds include Hansen, Straight, and Hottentot creeks, each of which has monitoring wells installed by the U.S. Geologic Survey as part of the Pre-Mining Background Study (Figure 6-3). The U.S. Geological Survey sampled these wells during the RI, but the results are not part of the preliminary site characterization. The geologic setting of these watersheds is believed to be analogous to the mine area prior to mining. The creeks drain volcanic rocks with variable alteration and pyrite content and have not been developed or mined. This area also contains hydrothermal scar areas similar to those that currently exist in Goathill Gulch and upper Sulphur Gulch on the mine area, and buried under portions of the Sugar Shack South and Middle rock piles. The off-site reference area also includes the alluvium within the Red River valley from the town of Red River to the mine. Off-site mine reference groundwater was sampled from the alluvium, colluvium/debris flow, bedrock, and alluvial seeps/springs.

6.1.1 Alluvium

Alluvial groundwater within the off-site mine reference area occurs along the Red River valley and floodplain. Alluvial wells that were sampled included LB-A 0.5 miles upstream of the mine, SC-7A, and SC-8A in the lower portion of Straight Creek drainage, and Elephant Rock Campground Well 1. Table 6-1 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 14 samples were collected and analyzed for metals and inorganics analyses, and one sample was analyzed for the stable isotopes of oxygen and hydrogen. During June 2003, two phosphorous values were rejected during data validation, one for the Elephant Rock Campground well and the other for the SC-8A well.

Values of pH ranged from 3.7 to 6.8 standard units (su), with a mean value of 5.2 su. Specific conductance values ranged from 254 to 1,620 microSiemens per centimeter (uS/cm), with a mean value of 782 uS/cm.

Eleven inorganic analytes were detected. Of the detected analytes, fluoride, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

A total of 16 dissolved metal analytes were detected. Of the detected dissolved metals, calcium and magnesium were detected in greater than 90 percent of the samples. A total of 18 metal (total) analytes were detected. Of the detected total metals, calcium and magnesium were detected in greater than 90 percent of the samples. Metals (total) that were not detected in any samples included: arsenic, chromium, mercury, molybdenum, silver, thallium, and vanadium.

A single sample from alluvial well SC-8A was additionally analyzed for stable isotopes of oxygen (δO^{18}) and hydrogen (δD) and specific results for these analytes are contained in Table 6-1.

6.1.2 Colluvium/Debris Flow

The majority of colluvial/debris flow wells in the off-mine site reference area is located in the Straight Creek drainage and include: SC-1A, -3A, -4A, -5A, and –6A, and two wells at the Water Treatment Facility AWWT-1 and –2. Additionally, colluvial/debris flow wells in the Hottentot Creek drainage (HTT-A) and Hansen Creek drainage (HAN-A) were sampled in the off-mine site reference area. Table 6-2 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 31 samples were collected and analyzed for metals and inorganics analyses, and one sample was analyzed for the stable isotopes of oxygen and hydrogen, sulfur isotopes, lead isotopes, and for age dating using helium and tritium.

Values of pH ranged from 2.5 to 6.6 su, with a mean value of 3.5 su. Specific conductance values ranged from 1,090 to 3,000 uS/cm, with a mean value of 2,280 uS/cm.

Thirteen inorganic analytes were detected. Of the detected analytes, fluoride, sulfate, and total dissolved solids were always detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for mercury, silver, and thallium. Of the detected dissolved metals, aluminum, calcium, magnesium, manganese, and zinc were detected in greater than 90 percent of the sample. All total metals were detected except for mercury, silver, and thallium. Of the detected total metals, aluminum, calcium, magnesium, manganese and zinc were detected in greater than 90 percent of the samples.

A single sample from colluvial/debris flow well SC-1A was additionally analyzed for helium and tritium to estimate the age of the water. The age was estimated to be 0.87 years. A single sample from SC-1A was also analyzed for the stable isotopes of oxygen (δO^{18}) and hydrogen (δ D), sulfur isotopes (δ ^{34}S), and lead isotopes (^{204}Pb/^{206}Pb, ^{207}Pb/^{206}Pb, and ^{208}Pb/^{206}Pb). Specific results for these analytes are contained in Table 6-2.

6.1.3 Bedrock

All of the bedrock wells in the off-mine site reference area are located in the Straight Creek drainage and include: SC-1B, -2B, and –5B. Table 6-3 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 16 samples were collected and analyzed for metals and inorganics analyses, and one sample was analyzed for the stable isotopes of oxygen and hydrogen, and for age dating using helium and tritium.

Values of pH ranged from 5.6 to 7.3 su, with a mean value of 6.4 su. Specific conductance values ranged from 2,270 to 3,360 uS/cm, with a mean value of 2,750 uS/cm.

Twelve inorganic analytes were detected. Of the detected analytes, bicarbonate, fluoride, alkalinity, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for cadmium, mercury, silver, and thallium. Of the detected dissolved metals, calcium, magnesium, and manganese were detected in greater than 90 percent of the samples. All total metals were detected except for cadmium, mercury, silver, and thallium. Of the detected total metals, calcium, magnesium, and manganese were detected in greater than 90 percent of the samples.

A single sample from bedrock well SC-1B was additionally analyzed for tritium to estimate the age of the water; however, the helium component for age dating was not analyzed. SC-1B was also analyzed for the stable isotopes of oxygen (δO^{18}) and hydrogen (δ D). Specific results for these analytes are contained in Table 6-3.

6.1.4 Alluvial Seeps

Alluvial seeps and springs sampled in the off-mine site reference area included Waldo and Chambers springs (Figure 6-3). Waldo Spring is approximately 2,000 ft downstream of Hansen Creek. Chambers Spring is approximately 2,500 feet south of the mill and Red River. Although not upstream of the mine site, Chambers Spring was included in the off-mine site reference area because it is south of Red River in an area that is unimpacted by mine activities. Table 6-4 contains summary statistics for analyte values and comparisons to Human Health SLC. A total

of nine samples were collected and analyzed for metals and inorganics analyses, and one sample was analyzed for the stable isotopes of oxygen and hydrogen.

Values of pH ranged from 4.5 to 7.8 su, with a mean value of 6.3 su. Specific conductance values ranged from 252 to 906 uS/cm, with a mean value of 518 uS/cm.

Ten inorganic analytes were detected. Of the detected analytes, chloride, fluoride, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Thirteen dissolved metals were detected. Of the detected dissolved metals, calcium and magnesium were detected in greater than 90 percent of the samples. Thirteen total metals were detected. Of the detected total metals, calcium and magnesium were detected in greater than 90 percent of the samples.

A single sample from Chambers Spring was additionally analyzed for the stable isotopes of oxygen (δO^{18}) and hydrogen (δD). Specific results for these analytes are contained in Table 6-4.

6.1.5 Town of Red River Tap Water

Groundwater wells are the water supply source for the town of Red River. The town operates four wells that are located approximately 0.5 mile upstream of the ski area along Pioneer Creek. The wells are about 100 feet deep and completed within alluvium near the bedrock contact. The town also operates a single well at the south end of town, near the present-day Prospector Lodge. This well is about 150 feet deep and completed within the Red River alluvium. The only form of treatment for the water from the wells is chlorination (personal comm. Jake Pierce 2004). Water from drinking water taps in the town was sampled and the water has been included as part of the off-mine site reference area. The sampled locations include: Red River Condos Nos. 1 and 2, and the Red River Lodge (Figure 6-3). Table 6-5 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of three samples were collected and analyzed for metals and inorganics analyses.

Values of pH ranged from 7 to 7.5 su, with a mean value of 7.2 su. Specific conductance values ranged from 211 to 255 uS/cm, with a mean value of 237 uS/cm.

Seven inorganic analytes were detected. Of the detected analytes, bicarbonate, chloride, nitrate, sulfate, alkalinity, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Eleven dissolved metals were detected. Of the detected dissolved metals, barium, calcium, copper, lead, magnesium, manganese, potassium, sodium, and zinc were detected in greater than 90 percent of the samples. Thirteen total metals were detected. Of the detected metals (total), barium, calcium, copper, lead, magnesium, potassium, sodium, uranium, and zinc were detected in greater than 90 percent of the samples.

6.2 REFERENCE ON-SITE MINE GROUNDWATER

On-site mine reference groundwater locations include areas of the mine site that are distant from mining operations and are considered to be unimpacted by current or past mining activities. The Work Plan identified one area that met these requirements, which is at the upstream mine property boundary east of the mill. During winter 2002/2003, the U.S. Geological Survey installed groundwater monitoring wells in upper Capulin Canyon as part of the Pre-Mining Background Study (Figure 6-1). The Capulin Canyon wells are located west of the Capulin Canyon water collection system and in a drainage that has not been affected by mining activities. On-site mine reference groundwater was sampled from the alluvium, colluvium, and bedrock.

6.2.1 Alluvium

On-site reference groundwater for the alluvium was sampled at one monitoring well, MMW-17A, which is at the upstream mine property boundary. Table 6-6 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 15 samples were collected and analyzed for metals and inorganics analyses. One sample was analyzed for the stable isotopes of oxygen and hydrogen, explosives, and hexavalent chromium. All total metals from the November and December 2002 sampling events for MW-17A were rejected during data validation. Additional data rejected for MMW-17A included: one explosive compound in November 2003, phosphorous in June 2003, and dissolved and total chromium and dissolved nickel in October 2003.

Values of pH ranged from 3.3 to 4.6 su, with a mean value of 4.2 su. Specific conductance values ranged from 96 to 1,430 uS/cm, with a mean value of 757 uS/cm.

Twelve inorganic analytes were detected. Of the detected analytes, fluoride, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Eleven dissolved metals were detected. Of the detected dissolved metals, calcium and manganese were detected in greater than 90 percent of the samples. Of the detected total metals, calcium and manganese were detected in greater than 90 percent of the samples.

A single sample from MMW-17A was additionally analyzed for the stable isotopes of oxygen (δO^{18}) and hydrogen (δD). Specific results for these analytes are contained in Table 6-6. One sample was analyzed for four explosive compounds and hexavalent chromium, and each was not detected.

6.2.2 Colluvium

Two wells, CC-1A and CC-2A, are located in upper Capulin Canyon (Figure 6-1) and represent on-site mine reference groundwater for the colluvium. The two wells were installed by the U.S. Geological Survey as part of the Pre-Mining Background Study, and were added to the RI sampling program in spring 2003. Table 6-7 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 21 samples were collected and analyzed for

metals and inorganics analyses. A single sample from one well was additionally analyzed for the stable isotopes of oxygen and hydrogen, and a single sample from the other well was additionally analyzed for sulfur and lead isotopes.

Values of pH ranged from 4.4 to 7.2 su, with a mean value of 6.2 su. Specific conductance values ranged from 261 to 1,680 uS/cm, with a mean value of 918 uS/cm.

Fourteen inorganic analytes were detected. Of the detected analytes, bicarbonate, fluoride, sulfate, alkalinity, total dissolved solids, and total suspended solids were always detected in each sample. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for antimony, lead, mercury, silver, and thallium. Of the detected dissolved metals, calcium, magnesium, manganese, and sodium were detected in greater than 90 percent of the samples. All total metals were detected except for antimony. Of the detected total metals, aluminum, calcium, iron, magnesium, manganese, and sodium were detected in greater than 90 percent of the samples.

A single sample from colluvial well CC-1A was additionally analyzed for stable isotopes of oxygen (δO^{18}) and hydrogen (δD). The other well CC-2A was additionally analyzed for sulfur isotopes ($\delta {}^{34}S$) and lead isotopes ($^{204}Pb/^{206}Pb$, $^{207}Pb/^{206}Pb$, and $^{208}Pb/^{206}Pb$). Specific results for these analytes are contained in Table 6-7.

6.2.3 Bedrock

Three wells were sampled and represent the on-site mine reference bedrock groundwater (Figure 6-1). Two of the wells, CC-1B and CC-2B, are located in upper Capulin Canyon. The other well is MMW-17B, which is at the eastern mine property boundary. Table 6-8 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 41 samples were collected and analyzed for metals and inorganics analyses. A single sample from two wells was additionally analyzed for the stable isotopes of oxygen and hydrogen, and a single sample from one well was analyzed for hexavalent chromium and age dating. All total metals for MMW-17B from samples collected in October and December 2002 were rejected during data validation. Phosphorous values for CC-1B and CC-2B in June 2003 were also rejected.

Values of pH ranged from 4 to 7.3 su, with a mean value of 5.8 su. Specific conductance values ranged from 96 to 1,810 uS/cm, with a mean value of 1,010 uS/cm.

Thirteen inorganic analytes were detected. Of the detected analytes, fluoride, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for antimony, lead, mercury, silver, and thallium. Of the detected dissolved metals, calcium and manganese were detected in greater than 90 percent of the samples. All total metals were detected except for antimony, cadmium, cobalt, mercury, silver, and thallium. Of the detected total metals, calcium and manganese were detected in greater than 90 percent of the samples.

A single sample from bedrock wells CC-1B and MMW-17B was additionally analyzed for stable isotopes of oxygen (δO^{18}) and hydrogen (δD). A single sample from MMW-17B was additionally analyzed for hexavalent chromium, which was not detected, and tritium and helium for age dating. Specific results for these analytes are contained in Table 6-8.

6.3 MINE SITE GROUNDWATER

Groundwater at the mine site was divided into six exposure areas (Figure 6-1.). Exposure areas at the mine site include:

- GW-1 – Area Drained by Capulin Canyon
- GW-2 – Area That Contains Capulin Rock Pile
- GW-3 – Portions of Goathill Gulch and Open Pit Area
- GW-4 – South Mine Site Rock Piles
- GW-5 – Administration and Maintenance & Electrical Area
- GW-6 – Mill Site Area

The following subsections discuss analytical results for each groundwater-bearing unit i.e., alluvium, colluvium, bedrock, or seeps/springs) within each of the six exposures areas.

6.3.1 Groundwater Area 1 – Area Drained by Capulin Canyon

Exposure area GW-1 covers the area drained by Capulin Canyon to the downstream mine property boundary. The exposure area also includes the Red River floodplain. There are two sets of paired monitoring wells located in Capulin Canyon and pair of wells near the downstream property boundary. Several seeps occur along the northern bank of Red River near the mouth of Capulin Canyon and are within the exposure area (Figure 6-1).

The Capulin Rock Pile, although located within the Capulin Canyon drainage basin, is not included in GW-1 because most of the surface runoff from the rock pile is captured by the existing surface water collection system and directed to the underground workings. Similarly, the mine reference wells in upper Capulin Canyon are not included in GW-1.

6.3.1.1 Alluvium

Alluvial groundwater within exposure area GW-1 occurs along the Red River floodplain. Monitoring well MMW-45A was installed during the RI to characterize alluvial groundwater at the downstream mine property boundary. An additional alluvial monitoring well, MMW-50A, was installed in February 2004 at the request of EPA. The additional well was sampled three consecutive months in spring 2004. Four shallow piezometers were installed near Spring 13 for the design of the Spring 13 water collection system. They include Spring 13 P-1, P-2, P-3 and P-4. A sample from Spring 13 P-1 was collected and analyzed once in May 2004, and field parameters were measured in the other three piezometers at the same time. The remaining

alluvial well in exposure area GW-1 is a well at the Questa Ranger Station Well. The Questa Ranger Station well is approximately 3,000 feet downstream of the mine property boundary and exposure area GW-1. Although the well is not within the GW-1 exposure area identified in the Work Plan, it was added to the exposure area because it represents alluvial groundwater just downstream of and proximal to the mine site.

Table 6-9 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 20 samples were collected and analyzed for metals and inorganics analyses. A single sample from MMW-45A and MMW-50A was additionally analyzed for the stable isotopes of oxygen and hydrogen, and the sample from MMW-45A was also analyzed for lead and sulfur isotopes, and lanthanides.

Values of pH ranged from 2.6 to 6.3 su, with a mean value of 3.5 su. Specific conductance values ranged from 410 to 2,250 uS/cm, with a mean value of 1,490 uS/cm.

Thirteen inorganic analytes were detected. Of the detected analytes, chloride, fluoride, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for antimony, boron, silver, and thallium. Of the detected dissolved metals, aluminum, calcium, copper, magnesium, manganese, and zinc were detected in greater than 90 percent of the samples. All total metals were detected except for antimony, boron, silver, and thallium. Of the detected total metals, aluminum, calcium, copper, magnesium, manganese, and zinc were detected in greater than 90 percent of the samples.

A single sample from alluvial well MMW-45A and MMW-50A was additionally analyzed for stable isotopes of oxygen (δO^{18}) and hydrogen (δD). A single sample from MMW-45A was also analyzed for sulfur isotopes ($\delta {}^{34}S$) and lead isotopes ($^{204}Pb/^{206}Pb$, $^{207}Pb/^{206}Pb$, and $^{208}Pb/^{206}Pb$) for lanthanides. Specific results for these analytes are contained in Table 6-9.

6.3.1.2 Colluvial/Debris Flow

Colluvial groundwater within exposure area GW-1 is found along the Capulin Canyon drainage. Two monitoring wells were sampled in this exposure area and include: MMW-23A in upper Capulin Canyon, and MMW-2 near the mouth of Capulin Canyon. Table 6-10 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 17 samples were collected and analyzed for metals and inorganics analyses. A single sample from each well was additionally analyzed for the stable isotopes of oxygen and hydrogen, and sulfur and lead isotopes. MMW-23A was also analyzed once for hexavalent chromium. All total metals for MMW-2 in November 2002 and all total metals in MMW-23A in October 2002 were rejected during data validation.

Values of pH ranged from 2.8 to 6.2 su, with a mean value of 5.7 su. Specific conductance values ranged from 1,630 to 5,250 uS/cm, with a mean value of 2,600 uS/cm.

Thirteen inorganic analytes were detected. Of the detected analytes, fluoride, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for antimony and silver. Of the detected dissolved metals, beryllium, calcium, magnesium, manganese, and zinc were detected in greater than 90 percent of the samples. All total metals were detected except for antimony, molybdenum, and silver. Of the detected total metals, aluminum, beryllium, calcium, magnesium, manganese, and zinc were detected in greater than 90 percent of the samples.

A single sample from colluvial well MMW-23A and MMW-2 was additionally analyzed for stable isotopes of oxygen (δO^{18}) and hydrogen (δD), and sulfur isotopes ($\delta {}^{34}S$) and lead isotopes ($^{204}Pb/^{206}Pb$, $^{207}Pb/^{206}Pb$, and $^{208}Pb/^{206}Pb$). A single sample from MMW-23A was also analyzed for hexavalent chromium, which was not detected. Specific results for these analytes are contained in Table 6-10.

6.3.1.3 Bedrock

Bedrock groundwater within exposure area GW-1 was sampled at three wells. MMW-23B and MMW-3 are at the upper and lower reaches of Capulin Canyon, respectively. MMW-45B is at the downstream mine property boundary. Table 6-11 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 29 samples were collected and analyzed for metals and inorganics analyses. A single sample from each well was additionally analyzed for the stable isotopes of oxygen and hydrogen. MMW-23B was also analyzed once for hexavalent chromium.

Values of pH ranged from 3.3 to 8.7 su, with a mean value of 5.8 su. Specific conductance values ranged from 480 to 4,650 uS/cm, with a mean value of 2,130 uS/cm.

Eleven inorganic analytes were detected. Of the detected analytes, fluoride, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for antimony, silver, and thallium. Of the detected dissolved metals, calcium, magnesium, and manganese were detected in greater than 90 percent of the samples. All total metals were detected except for antimony and thallium. Of the detected total metals, calcium, magnesium, and manganese were detected in greater than 90 percent of the samples.

A single sample from colluvial well MMW-23B, MMW-3, and MMW-45B was additionally analyzed for stable isotopes of oxygen (δO^{18}) and hydrogen (δD). A single sample from MMW-45B was also analyzed for hexavalent chromium, which was not detected. Specific results for these analytes are contained in Table 6-11.

6.3.1.4 Alluvial Seeps

Seeps issue from the alluvial groundwater system within exposure area GW-1. The seeps occur along the bank of Red River and include (from upstream to downstream): Spring 13, Lower Spring 13, Spring 14M, Spring 14MA, and Spring 15M. The Spring 13 water collection system is also within this exposure area and sampled at its downstream vault and identified as Spring 13-Pump. Table 6-12 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 47 samples were collected and analyzed for dissolved metals and inorganics analyses; 44 samples were analyzed for total metals. Two samples were additionally analyzed for hexavalent chromium, and a single sample was analyzed for lead and sulfur isotopes, explosives, and helium and tritium for age dating. Three samples were analyzed for the stable isotopes of oxygen and hydrogen.

All total metals for Lower Spring 13 and Spring 13 in October 2002, and all total metals for Spring 14-M in November 2002 were rejected during data validation. Cyanide was rejected for Lower Spring 13 in October 2002 and January 2003. Dissolved chromium and nickel for Spring 13-Pump were rejected in December 2003 and phosphorous in June 2003.

Values of pH ranged from 2.8 to 4.8 su, with a mean value of 3.7 su. Specific conductance values ranged from 288 to 4,170 uS/cm, with a mean value of 1,540 uS/cm.

Twelve inorganic analytes were detected. Of the detected analytes, chloride, fluoride, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for antimony, boron, molybdenum, silver, and thallium. Of the detected dissolved metals, aluminum, calcium, manganese, and zinc were detected in greater than 90 percent of the samples. All total metals were detected except for boron and thallium. Of the detected total metals, aluminum, calcium, manganese, and zinc were detected in greater than 90 percent of the samples.

A sample from Lower Spring 13, Spring 13, and Spring 14M was additionally analyzed for stable isotopes of oxygen (δO^{18}) and hydrogen (δD). Lower Spring 13 and Spring 14M were additionally analyzed for hexavalent chromium, which was detected in only the Lower Spring 13 sample at 0.022 mg/L. Spring 13 was also analyzed for sulfur isotopes ($\delta {}^{34}S$) and lead isotopes ($^{204}Pb/^{206}Pb$, $^{207}Pb/^{206}Pb$, and $^{208}Pb/^{206}Pb$), and helium and tritium for age dating. A single sample from Spring 13-Pump was analyzed for five explosive compounds, which were each not detected. Specific results for these analytes are contained in Table 6-12.

6.3.2 Groundwater Area 2 – Area That Contains Capulin Rock Pile

Exposure area GW-2 covers the uppermost portion of the Capulin Canyon drainage and contains the Capulin Rock Pile. There are currently no monitoring wells located within groundwater exposure area GW-2. However, groundwater issuing from the side of the Capulin Rock Pile has been sampled to characterize the groundwater in this exposure area. The seepage is identified as Capulin Spring Source (Figure 6-1).

6.3.2.1 Colluvial Seeps

Water from the side of Capulin Rock Pile was sampled and represents seepage from colluvial material within exposure area GW-2. Table 6-13 contains summary statistics for analyte values and comparisons to Human Health SLC. Two samples were collected and analyzed for metals and inorganics analyses. A single sample of the seepage was additionally analyzed for the stable isotopes of oxygen and hydrogen.

Values of pH ranged from 2.4 to 2.8 su, with a mean value of 2.6 su. Specific conductance values ranged from 10,800 to 11,100 uS/cm, with a mean value of 10,900 uS/cm. The seepage flow ranged from 5.3 to 15.9 gallons per minute (gpm).

Eleven inorganic analytes were detected. Of the detected analytes, chloride, fluoride, nitrite, ortho phosphorous, sulfate, total dissolved solids, total suspended solids, and TOC were always detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for antimony, barium, lead, molybdenum, potassium, silver, sodium, and thallium. Some of these metals may not have been detected due to elevated reporting limits. The following lists the dissolved metals that were detected in greater than 90 percent of the samples.

Analyte	Analyte	Analyte
Aluminum	Cobalt	Nickel
Beryllium	Copper	Selenium
Cadmium	Iron	Vanadium
Calcium	Magnesium	Zinc
Chromium	Manganese	

Metals (total) not detected were the same as for the dissolved metals listed above. Detected total metals in greater than 90 percent of the samples are the same as for dissolved metals.

A single sample from Capulin Spring Source additionally analyzed for stable isotopes of oxygen (δO^{18}) and hydrogen (δD). Specific results for these analytes are contained in Table 6-13.

6.3.3 Groundwater Area 3 – Portions of Goathill Gulch and Open Pit Area

Exposure area GW-3 includes the central mine, open pit, and Blind Gulch and Spring Gulch Rock Piles. It also includes Goathill North and South Rock Piles and portions of Goathill Gulch. Groundwater within this area is influenced by the open pit and development of the new underground mine and subsidence zone above the mine in Goathill Gulch. Alluvial groundwater does not occur in this exposure area. Three wells are completed into colluvial materials in this exposures area, and are located at the Blind Gulch and Spring Gulch Rock Piles. However, only one of these wells intersects colluvial groundwater, the other two are dry. Bedrock groundwater

was sampled at two wells near the Spring Gulch Rock Pile and at three underground locations. Seepage from colluvial materials downstream of the Goathill North Rock Pile was also sampled.

6.3.3.1 Colluvial/Debris Flow

Three wells have been installed into colluvial materials to monitor colluvial groundwater in exposure area GW-3: MMW-35A, MMW-41A, and MMW-40A. Only MMW-40A has been sampled and the other two wells have been dry. Table 6-14 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of seven samples were collected and analyzed for metals and inorganics analyses. A single sample from the well was additionally analyzed for explosive compounds, VOCs, SVOCs, and the stable isotopes of oxygen and hydrogen.

Values of pH ranged from 5.4 to 6.9 su, with a mean value of 6.1 su. Specific conductance values ranged from 977 to 1,230 uS/cm, with a mean value of 1,070 uS/cm.

Eleven inorganic analytes were detected. Of the detected analytes, bicarbonate, chloride, fluoride, nitrate, phosphorous, sulfate, alkalinity, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for antimony, chromium, cobalt, iron, mercury, silver, and thallium. Of the detected dissolved metals, calcium, magnesium, and molybdenum were detected in greater than 90 percent of the samples. All total metals were detected except for antimony, chromium, cobalt, mercury, and thallium. Of the detected total metals, calcium and magnesium were detected in greater than 90 percent of the samples.

Three of the seven samples were analyzed for VOCs, SVOCs, and explosive compounds, and none were detected. A single sample was additionally analyzed for stable isotopes of oxygen (δO^{18}) and hydrogen (δ D). Specific results for these analytes are contained Table 6-14.

6.3.3.2 Bedrock

Five bedrock sample locations are within exposure area GW-3. Two locations are bedrock monitoring wells, MMW-34B and MMW-35B, near the Spring Gulch Rock Pile. The other three are underground locations Mine1, F1, and P1. The Mine1 sample location is at the end of the Decline and represents a mixture of groundwater from numerous underground locations before the water is pumped to the mill. F1 and P1 are locations beneath the subsidence zone that collect groundwater (Figure 6-1).

Table 6-15 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 21 samples were collected and analyzed for metals and inorganics analyses from the two monitoring wells and the Mine1 location. Nine samples were analyzed for explosives, VOCs, and SVOCs from the same two wells and Mine1 location. Hexavalent chromium was analyzed in a single sample from the two wells. Stable isotopes of oxygen and hydrogen were analyzed in a single sample from the two wells and the F1 and P1 underground locations.

Values of pH ranged from 4.2 to 7.8 su, with a mean value of 6.0 su. Specific conductance values ranged from 46 to 6,490 uS/cm, with a mean value of 2,960 uS/cm.

Fourteen inorganic analytes were detected. Of the detected analytes, chloride, fluoride, sulfate, total dissolved solids, and total suspended solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for antimony and mercury. Of the detected dissolved metals, beryllium, calcium, magnesium, manganese, molybdenum, and zinc were detected in greater than 90 percent of the samples. All total metals were detected except for antimony and mercury. Of the detected total metals, beryllium, calcium, lead, magnesium, manganese, molybdenum, and zinc were detected in greater than 90 percent of the samples.

Explosive compounds VOCs and SVOCs were not detected. Hexavalent chromium was detected at 0.0073 mg/L in one of the two samples that were analyzed. Four samples were additionally analyzed for stable isotopes of oxygen (δO^{18}) and hydrogen (δD). Specific results for these analytes are contained in Table 6-15.

6.3.3.3 Colluvial Seeps

Seepage from colluvial materials occurs near the toe of Goathill South Rock Pile. Two locations were sampled during the RI to characterize colluvial groundwater within exposure area GW-3. The two locations are Goathill Spring Source and Goathill Spring. Goathill Spring Source is a few 10's of feet down slope of where the seepage first issues from the ground, whereas Goathill Spring is approximately 800 feet further down slope (Figure 6-1).

Table 6-16 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of nine samples were collected and analyzed for metals and inorganics analyses from the two seep locations. One sample was additionally analyzed for hexavalent chromium and stable isotopes of oxygen and hydrogen. All total metals for Goathill Spring from the October 2002 sample were rejected during data validation.

Values of pH ranged from 2.3 to 2.8 su, with a mean value of 2.5 su. Specific conductance values ranged from 10,000 to 13,700 uS/cm, with a mean value of 11,400 uS/cm. Seepage flow ranged from 2.4 to 20 gpm.

Twelve inorganic analytes were detected. Of the detected analytes, chloride, fluoride, nitrite, ortho phosphorus, sulfate, total dissolved solids, total suspended solids, and TOC were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for antimony, barium, molybdenum, potassium, silver, and thallium. The following lists the dissolved metals that were detected in greater than 90 percent of the samples.

Analyte	Analyte	Analyte
Aluminum	Chromium	Magnesium
Beryllium	Cobalt	Manganese
Cadmium	Copper	Nickel
Calcium	Iron	Zinc

Metals (total) that were not detected included antimony, boron, molybdenum, and sodium. The detected total metals in greater than 90 percent of the samples are the same as for dissolved metals.

The single sample that was analyzed for hexavalent chromium was detected at 0.0023 mg/L. A single sample that was analyzed for stable isotopes of oxygen (δO^{18}) and hydrogen (δD) and specific results for these analytes are contained in Table 6-16.

6.3.4 Exposure Area GW-4 – South Mine Site Rock Piles

Exposure area GW-4 covers the front rock pile area that includes Sulphur Gulch, Middle, and Sugar Shack South Rock Piles. The exposure area also includes the Red River floodplain from Sulphur Gulch to just downstream of Columbine Creek. Groundwater in exposure area GW-4 occurs in the alluvium along Red River, in colluvium underlying some of the rock piles, and in bedrock at lower elevation along the river. Several seeps occur along the banks of Red River that issue from the alluvial aquifer.

6.3.4.1 Alluvium

Numerous alluvial monitoring wells are within exposure area GW-4 and were sampled to characterize the alluvial groundwater quality. A total of 22 alluvial wells were sampled during the RI. Individual wells are listed below.

Private and Campground Wells:

D1GW, F1GW, Columbine Canyon Well, Columbine Campground Well, Company Cabin Well

Water Collection System Wells:

GWW-1, GWW-2, and GWW-3

Monitoring Wells:

MMW-10A, MMW-10C, MMW-13, MMW-29A, MMW-30A, MMW-31A, MMW-32A, MMW-33A, MMW-49A, P-3, P-4A, P-4B, P-5A, and P-5B

Table 6-17 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 184 samples were collected and analyzed for metals and inorganics analyses.

Sixty-one samples were analyzed for explosives. Hexavalent chromium was analyzed in nine samples. Stable isotopes of oxygen and hydrogen were analyzed in 14 samples. Sulfur and lead isotopes were analyzed in one sample, and three samples were analyzed for lanthanides. For the dissolved lanthanides analysis in MMW-30A, an additional type of QC sample was collected to evaluate adsorption of lanthanides on the filter material. The evaluation of the results for the QC sample is discussed in detail in the Data Validation Report (DVR) for the February 2004 specialty sampling event and in Section 15. Helium and tritium were analyzed in two samples for age dating.

As a result of data validation, all total metals were rejected for November 2002 samples in the following wells: D1GW, MMW-10A, MMW-10C, MMW-29A, MMW-30A, MMW-31A, MMW-32A, MMW-33A, P-3, P-4B, and P-5B. The June 2003 phosphorous values in Columbine Campground Well, MMW-33A, P4A, and P5A were rejected. A single explosive compound from the May 2003 samples in MMW-10A, MMW-29A, and MMW-33A was rejected. The cyanide value was rejected for GWW-1 in April 2003, GWW-3 in January 2004, MMW-29A in January 2003, and MMW-33A in December 2003.

Values of pH ranged from 2.2 to 7.9 su, with a mean value of 4.6 su. Values of pH for alluvial groundwater lower than the upper 3's may be suspect. Therefore, the lower end of the pH range and the mean value are affected by the suspect values. Specific conductance values ranged from 139 to 2,630 uS/cm, with a mean value of 1,540 uS/cm.

All of the inorganic analytes were detected except for carbonate. Of the detected analytes, fluoride, nitrate, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for silver and thallium. Of the detected dissolved metals, calcium, magnesium, and zinc were detected in greater than 90 percent of the samples. All total metals were detected. Of the detected total metals, calcium, magnesium, and zinc were detected in greater than 90 percent of the samples.

Explosive compounds were not detected in any of the samples that were analyzed. Hexavalent chromium was detected in three of the nine samples at a maximum concentration of 0.0053 mg/L. Specific results for lead isotopes ($^{204}Pb/^{206}Pb$, $^{207}Pb/^{206}Pb$, and $^{208}Pb/^{206}Pb$), sulfur isotopes ($\delta\ ^{34}S$), stable isotopes of oxygen ($\delta\ O^{18}$) and hydrogen (δ D), lanthanides analytes, and tritium and helium for age dating are contained in Table 6-17.

6.3.4.2 Colluvial/Debris Flow

Colluvial monitoring wells in exposure area GW-4 were sampled to characterize groundwater quality within the colluvial water-bearing unit. The colluvial wells are primarily near the base of Sugar Shack South, Middle, and Sulphur Gulch Rock Piles. Two of the colluvial wells are completed in colluvial materials underlying the Middle and Sulphur Gulch Rock Piles. A total of six colluvial wells were sampled during the RI: MMW-11A, MMW-16, MMW-19A, MMW-27A, MMW-38A, and MMW-39A (Figure 6-1).

Table 6-18 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 38 samples were collected and analyzed for metals and inorganics analyses. Twelve samples were analyzed for explosives. Hexavalent chromium was analyzed in two samples. Stable isotopes of oxygen and hydrogen were analyzed in five samples. Sulfur isotopes were analyzed in three samples and lead isotopes were analyzed in six samples. Four samples were analyzed for lanthanides. Helium and tritium were analyzed in three samples for age dating. One sample was analyzed for VOCs and SVOCs.

As a result of data validation, all total metals from November 2002 samples in MMW-11A, MMW-19A, MMW-38A, and MMW-39A were rejected. Phosphorous values for MMW-16 and MMW-27A were rejected for the June 2003 and January 2004 respective samples. A single explosive compound from the May 2003 sample for MMW-27A was rejected.

Values of pH ranged from 2.8 to 4.4 su, with a mean value of 3.8 su. Specific conductance values ranged from 1,950 to 7,560 uS/cm, with a mean value of 3,800 uS/cm.

Twelve inorganic analytes were detected. Of the detected analytes, chloride, fluoride, phosphorous, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was detected in three of the 35 samples that were analyzed at a maximum concentration of 0.12 mg/L.

All dissolved metals were detected except for antimony, barium, mercury, and thallium. Of the detected dissolved metals, aluminum, beryllium, calcium, copper, magnesium, manganese, nickel, and zinc were detected in greater than 90 percent of the samples. All total metals were detected except for antimony, barium, and thallium. Total metals detected in greater than 90 percent of the samples are the same as the dissolved metals.

Explosive compounds were not detected in any of the samples that were analyzed. Hexavalent chromium was detected in one of the two samples that were analyzed at a concentration of 0.0023 mg/L. The one sample that was analyzed for VOCs and SVOCs did not detect any organic compounds. Specific results for lead isotopes ($^{204}Pb/^{206}Pb$, $^{207}Pb/^{206}Pb$, and $^{208}Pb/^{206}Pb$), sulfur isotopes ($\delta\ ^{34}S$), stable isotopes of oxygen ($\delta\ O^{18}$) and hydrogen (δ D), lanthanides, and tritium and helium for age dating are contained in Table 6-18.

6.3.4.3 Bedrock

The bedrock groundwater within exposure area GW-4 is monitored by 11 wells and one underground location (i.e., Moly Tunnel). Most all of the wells are located near the base of the front rock piles that include Sulphur Gulch, Middle, and Sugar Shack South: MMW-10B, MMW-11, MMW-18B, MMW-19B, MMW-24, MMW-25B, MMW-29B, MMW-30B, MMW-31B, and MMW-32B. One bedrock well, P-5C is located in the Columbine Park area. Groundwater within the Moly Tunnel was sampled from a discharge pipe that penetrates the concrete bulkhead.

Table 6-19 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 91 samples were collected and analyzed for metals and inorganics analyses. Explosive compounds were analyzed in 42 samples. Hexavalent chromium was analyzed in

eight samples. Stable isotopes of oxygen and hydrogen were analyzed in six samples. Two samples were analyzed for lanthanides. For the dissolved lanthanides analysis in MMW-30B, an additional type of QC sample was collected to evaluate adsorption of lanthanides on the filter material. The evaluation of the results for the QC sample is discussed in detail in the DVR for the February 2004 specialty sampling event and in Section 15. Helium and tritium were analyzed in three samples for age dating. One sample was analyzed for dioxins, two for SVOCs, and nine for VOCs.

Based on the data validation, all total metals from November 2002 samples for MMW-10B, MMW-11, MMW-24, and P-5C were rejected. The July 2003 total and dissolved values for selenium and silver were rejected for MMW-30B. For MMW-30B, the April 2003 ortho phosphate and July 2003 nitrite values were rejected. For MMW-31B, the December 2002 total dissolved solids and August 2003 nitrite values were rejected. Two explosive compounds in the July 2003 MMW-30B sample and one compound in the January 2004 sample were rejected. One explosive compound from the May 2003 sample from MMW-31B was rejected.

Values of pH ranged from 2.9 to 7.8 su, with a mean value of 6 su. The minimum value of 2.9 su is suspect because all other values for that particular well were greater than 4.3 su. Specific conductance values ranged from 332 to 6,810 uS/cm, with a mean value of 2,640 uS/cm.

All inorganics were detected except for carbonate. Of the detected analytes, chloride, fluoride, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for antimony, silver, and thallium. Of the detected dissolved metals, calcium, magnesium, and manganese were detected in greater than 90 percent of the samples. All total metals were detected except for thallium. Total metals detected in greater than 90 percent of the samples are the same as the dissolved metals.

Three explosive compounds were detected. Four samples detected 2,4,6-trinitrotoluene with a maximum concentration of 0.0089 mg/L. Seven samples detected cyclotrimethylenetrinitramine with a maximum concentration of 0.0038 mg/L. Two samples detected pentaerythrltoltetranitrate with a maximum concentration of 0.088 mg/L. Hexavalent chromium was detected in three samples at a maximum concentration of 0.025 mg/L. The one sample that was analyzed for dioxins did not detect any of the seven aroclors that were analyzed. No SVOCs were detected. Two VOCs were detected including 1,2-dichloroethane and 2-butanone. Specific results for stable isotopes of oxygen (δO^{18}) and hydrogen (δ D), lanthanides, and tritium and helium for age dating are contained in Table 6-19.

6.3.4.4 Alluvial Seeps

Three seeps along the banks of Red River have been historically sampled within exposure area GW-4. These seeps include Sulphur Gulch Seep, Portal Springs, and Cabin Springs (Figure 6-1). The source of the seepage is primarily from the alluvial groundwater. These seeps were sampled infrequently during the RI because of insufficient or no flow most of the time.

Table 6-20 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of four samples were collected and analyzed for metals and inorganics analyses.

Values of pH ranged from 4.3 to 5.8 su, with a mean value of 4.8 su. Specific conductance values ranged from 580 to 2,290 uS/cm, with a mean value of 1,250 uS/cm. Flows ranged from 0.1 to 1.0 gpm.

Eleven inorganics were detected. Of the detected analytes, chloride, fluoride, nitrate, phosphorous, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Seventeen dissolved metals were detected. Of the detected dissolved metals, calcium, magnesium, and manganese were detected in greater than 90 percent of the samples. Sixteen total metals were detected. Total metals detected in greater than 90 percent of the samples are the same as the dissolved metals.

6.3.5 Groundwater Area 5 – Administration and Mechanical & Electrical Area

Exposure area GW-5 covers the lower Goathill Gulch drainage, administration facilities, M&E, Sugar Shack West Rock Pile, and the Columbine/Cottonwood Park area along the Red River floodplain. An unnamed drainage channel flows through the M&E area. The drainage bifurcates into two channels above the mine site. One channel extends across the new underground mine to the base of the Goathill South Rock Pile, and the other leads to a buried drainage channel beneath the Sugar Shack West Rock Pile. Groundwater occurs in the alluvium along the Red River floodplain, colluvium/debris flow, and bedrock. Seeps occur that are sourced by alluvial and colluvial groundwater.

6.3.5.1 Alluvium

Alluvial groundwater within exposure area GW-5 was sampled in nine wells. Two of the wells, Columbine Nos. 1 and 2 are water supply wells for the mill. Alluvial monitoring wells included: P-1, P-2, and MMW-47A in the Columbine Park area; US-1, US-2, and US-3 around the Upper Sump; and MMW-42A near the entrance to the mine from State Highway 38. Note that MMW-42A is partially screened in debris flow materials and it may be a mixture of alluvial and colluvial groundwater (Figure 6-1).

Based on the data validation, all total metals from November 2002 samples for Columbine No. 1, Columbine No. 2, MMW-42A, MMW-47A, P-1, P-2, and US-2 were rejected. The April 2003 cyanide value for P-2 was rejected. One explosive compound from the May 2003 sample from MMW-47A was rejected.

Table 6-21 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 75 samples were collected and analyzed for metals and inorganic analyses. Twenty samples were analyzed for explosives, VOCs, and SVOCs. Hexavalent chromium and stable isotopes of oxygen and hydrogen were analyzed in four samples.

Values of pH ranged from 2.7 to 7.2 su, with a mean value of 5.2 su. Specific conductance values ranged from 202 to 2,800 uS/cm, with a mean value of 1,070 uS/cm.

All of the inorganic analytes were detected except for carbonate and hydroxide. Of the detected analytes, fluoride, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for antimony, arsenic, and thallium. Of the detected dissolved metals, calcium and magnesium were detected in greater than 90 percent of the samples. All total metals were detected except for thallium. Of the detected total metals, calcium and magnesium were detected in greater than 90 percent of the samples.

Explosive compounds, hexavalent chromium, VOCs, and SVOCs were not detected in any of the samples that were analyzed. Stable isotopes of oxygen (δO^{18}) and hydrogen (δD) were analyzed and specific results are contained in Table 6-21.

6.3.5.2 Colluvial/Debris Flow

Colluvial groundwater within exposure area GW-5 was sampled in five monitoring wells. Two of the wells, MMW-21 and MMW-22, are located in the M&E area. The other three wells, MMW-8B, MMW-44A, and MMW-48A monitor groundwater within the Goathill Gulch debris flow materials (Figure 6-1).

Table 6-22 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 56 samples were collected and analyzed for metals and inorganics analyses. Explosive compounds were analyzed in 25 samples. Hexavalent chromium was analyzed in one sample. Stable isotopes of oxygen and hydrogen were analyzed in five samples. Sulfur and lead isotopes and lanthanides were analyzed in one sample. For the dissolved lanthanides analysis in MMW-21, an additional type of QC sample was collected to evaluate adsorption of lanthanides on the filter material. The evaluation of the results for the QC sample is discussed in detail in the DVR for the February 2004 specialty sampling event and in Section 15. Helium and tritium were analyzed in two samples for age dating. Twenty-nine samples were analyzed for VOCs and SVOCs. Total petroleum hydrocarbons (Motor oil and Diesel Fuel No. 2) were analyzed in four samples.

As a result of data validation, all total metals from MMW-21, MMW-22, and MMW-44A were rejected for the November 2002 samples. One explosive compound from the May 2003 samples for MMW-44A and MMW-48A was rejected. One VOC from MMW-48A was rejected in each of the January and April 2004 samples.

Values of pH ranged from 1.8 to 6.2 su, with a mean value of 4 su. The minimum value of 1.8 su is suspect because all other values for that particular well were one su greater. Specific conductance values ranged from 2270 to 5,330 uS/cm, with a mean value of 3,330 uS/cm.

All inorganics were detected except for carbonate and hydroxide. Of the detected analytes, chloride, fluoride, phosphorous, sulfate, and total dissolved solids were detected in greater than

90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for antimony and silver. Of the detected dissolved metals, calcium, magnesium, and zinc were detected in greater than 90 percent of the samples. All total metals were detected except for mercury. Total metals detected in greater than 90 percent of the samples included, aluminum, calcium, magnesium, and zinc.

One explosive compound, 2,4,6-trinitrotoluene, was detected at a concentration of 0.00046 mg/L in one sample. Hexavalent chromium, SVOCs Motor oil, and Diesel Fuel No. 2 were not detected. Four VOCs were detected. Maximum concentrations were 1,1,1-Trichloroethane, 0.021 mg/L; 1,1-Dichloroethene, 0.005mg/L; m&p-Xylene 0.00024 mg/L; Total Xylene 0.00024 mg/L.

Specific results for lead isotopes ($^{204}Pb/^{206}Pb$, $^{207}Pb/^{206}Pb$, and $^{208}Pb/^{206}Pb$), sulfur isotopes ($\delta\ ^{34}S$), stable isotopes of oxygen ($\delta\ O^{18}$) and hydrogen (δ D), lanthanides, and tritium and helium for age dating are contained in Table 6-22.

6.3.5.3 Bedrock

Bedrock groundwater within exposure area GW-5 was sampled in five monitoring wells. Bedrock monitoring wells that were sampled include: MMW-7 at the M&E area; MMW-8A, MMW-42B, and MMW-44B beneath the Goathill Gulch debris fan; and MMW-36B at the toe of Sugar Shack West Rock Pile. In addition, five underground locations were sampled: C3, Neck Fault, P4, P6, and P9 (Figure 6-1). However, only stable isotopes of oxygen and hydrogen were analyzed from the underground locations.

Table 6-23 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 54 samples were collected and analyzed for metals and inorganics analyses. Explosive compounds were analyzed in 16 samples. Hexavalent chromium was analyzed in two samples. Stable isotopes of oxygen and hydrogen were analyzed in 10 samples. Two samples were analyzed for lanthanides. Helium and tritium were analyzed in two samples for age dating. Two samples were analyzed for sulfur and lead isotopes. VOCs and SVOCs were analyzed in 16 samples.

Based on data validation, all total metals from the October 2002 sample for MMW-36B and the November 2002 sample from MMW-7 were rejected. One explosive compound from the May 2003 sample for MMW-44B was rejected.

Values of pH ranged from 3.7 to 7.9 su, with a mean value of 6 su. Specific conductance values ranged from 1,880 to 7,650 uS/cm, with a mean value of 3,880 uS/cm.

All inorganics were detected except for carbonate and hydroxide. Of the detected analytes, chloride, fluoride, sulfate, total dissolved solids, and total suspended solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for silver and thallium. Of the detected dissolved metals, calcium, iron, magnesium, manganese, and sodium were detected in greater than 90 percent of the samples. All total metals were detected except for silver. Total metals detected in greater than 90 percent of the samples are the same as the dissolved metals.

No explosive compounds were detected. One sample detected hexavalent chromium at a concentration of 0.0033 mg/L. No SVOCs were detected. Three VOCs were detected. Maximum concentrations of the detected VOCs were: 1,1,1-trichloroethane at 0.002 mg/L, 1,1-dichloroethene at 0.001 mg/L, and toluene at 0.008 mg/L. Specific results for lead isotopes ($^{204}Pb/^{206}Pb$, $^{207}Pb/^{206}Pb$, and $^{208}Pb/^{206}Pb$), sulfur isotopes ($\delta\ ^{34}S$), stable isotopes of oxygen ($\delta\ O^{18}$) and hydrogen (δ D), lanthanides, and tritium and helium for age dating are contained in Table 6-23.

6.3.5.4 Alluvial Seeps

Seepage from the alluvial aquifer within exposure area GW-5 occurs primarily at one location, Spring 39. Spring 39 issues from the banks of Red River and was sampled during the RI when measurable flow occurred. Associated with Spring 39 is Upper Spring 39, which is approximately 200 feet upstream of Spring 39. Alluvial seepage was also sampled from the Spring 39 drain and water collection system, identified as Spring 39-Pump (Figure 6-1). Shaft Spring has been sampled in the past and is within the exposure area; however, the spring was dry during the RI or obscured by riprap along the riverbank.

Table 6-24 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 20 samples were collected and analyzed for metals and inorganics analyses. One sample was additionally tested for explosives and hexavalent chromium.

All total metals from the October 2002 Spring 39 sample were rejected as a result of data validation. The June 2003 phosphorous value from Spring 39-Pump was also rejected.

Values of pH ranged from 4.4 to 6.4 su, with a mean value of 5.1 su. Specific conductance values ranged from 168 to 1,860 uS/cm, with a mean value of 1,220 uS/cm. Flows ranged from 0.1 to 200 gpm. The high flow of 200 gpm was measured at Upper Spring 39 and believed to be a mixture of Red River water and seepage.

Twelve inorganics were detected. Of the detected analytes, chloride, fluoride, nitrate, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Seventeen dissolved metals were detected. Of the detected dissolved metals, calcium and magnesium were detected in greater than 90 percent of the samples. Twenty-one total metals were detected. Total metals detected in greater than 90 percent of the samples are the same as the dissolved metals.

Hexavalent chromium and explosive compounds were not detected in the one seep sample.

6.3.5.5 Colluvial Seeps

Groundwater seepage from colluvial/debris fan material occurs at one location within exposure area GW-5. The single location is Goathill Gulch Seep (Figure 6-1), which is near the confluence of Goathill Gulch and Red River. The seep issues from debris flow material near the riverbank.

Table 6-25 contains summary statistics for analyte values and comparisons to Human Health SLC. One sample was collected and analyzed for metals and inorganics analyses. The seepage flow was measured an additional two times, but the flow was insufficient to collect a water sample for metals and inorganic analyses.

The value of pH was 4.1 su. Specific conductance was 1,810 uS/cm.

Eight inorganics were detected. Of the detected analytes, ammonia, chloride, fluoride, phosphorous, sulfate, total dissolved solids, total suspended solids, and TOC were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Seven dissolved metals were detected. Of the detected dissolved metals, beryllium, calcium, copper, lead, magnesium, manganese, and zinc were detected in greater than 90 percent of the samples. Five total metals were detected. Of the detected total metals, beryllium, calcium, magnesium, manganese, and zinc were detected in greater than 90 percent of the samples.

6.3.6 Groundwater Area 6 – Mill Site Area

Groundwater exposure area GW-6 covers the mill site and Red River floodplain along the mill (Figure 6-1). Groundwater occurs within the alluvium and bedrock in this exposure area. Colluvial groundwater and seeps are not present in the exposure area.

6.3.6.1 Alluvium

Alluvial groundwater in exposure area GW-6 was sampled from two monitoring wells and one supply well. The monitoring wells include MMW-43A and MMW-28A, which are upgradient and downgradient of the mill, respectively. The Lab Well is completed in the alluvium and supplies water for the lab at the mill (Figure 6-1). Other supply wells (Mill 1 and Mill 1A1) are in the mill area, but were not sampled during the RI. Potato Patch Spring has been sampled in the past and is within the exposure area; however, the spring was dry during the RI.

Table 6-26 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 30 samples were collected and analyzed for metals and inorganics analyses. Explosives were analyzed in six samples. Stable isotopes of oxygen and hydrogen were analyzed in two samples. Tritium and helium were analyzed in one sample for age dating. Thirteen samples were analyzed for VOCs and SVOCs. As a result of data validation, one explosive compound from May 2003 sample and the June 2003 phosphorous value for MMW-28A were rejected.

Values of pH ranged from 5 to 7.2 su, with a mean value of 6.2 su. Specific conductance values ranged from 110 and 2,390 uS/cm, with a mean value of 1000 uS/cm.

All inorganic compounds were detected except for carbonate, hydroxide, and nitrite. Of the detected analytes, bicarbonate, fluoride, sulfate, and alkalinity were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except for antimony, lead, mercury, silver, and thallium. Of the detected dissolved metals, calcium and magnesium were detected in greater than 90 percent of the samples. All total metals were detected except for antimony, mercury, silver, and thallium. Of the detected total metals, calcium and magnesium were detected in greater than 90 percent of the samples.

Explosive compounds and hexavalent chromium were not detected. Three VOCs were detected. Detected VOCs and maximum concentrations include: 1,1,1-trichloroethane at 0.002 mg/L, 1,1-dichloroethane at 0.004 mg/L, and trichloroethane at 0.0009 mg/L. No SVOCs were detected. Specific results for stable isotopes of oxygen (δO^{18}) and hydrogen (δD) and tritium and helium for age dating are contained in Table 6-26.

6.3.6.2 Bedrock

Bedrock groundwater in exposure area GW-6 was sampled in one monitoring well. The bedrock monitoring well, MMW-28B, is downgradient of the mill (Figure 6-1).

Table 6-27 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of eight samples were collected and analyzed for metals and inorganics analyses. Explosives were analyzed in two samples. Stable isotopes of oxygen and hydrogen, and tritium and helium were analyzed in one sample. Three samples were analyzed for VOCs and SVOCs. As a result of data validation, all total metals for the November 2002 sample for MMW-28B were rejected.

Values of pH ranged from 3.9 to 4.7 su, with a mean value of 4.4 su. Specific conductance values ranged from 842 and 966 uS/cm, with a mean value of 904 uS/cm.

Ten inorganic compounds were detected. Of the detected analytes, chloride, fluoride, sulfate, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Seven dissolved metals were detected. Of the detected dissolved metals, calcium, magnesium, manganese, and zinc were detected in greater than 90 percent of the samples. Ten total metals were detected. Of the detected total metals, calcium, magnesium, manganese, and zinc were detected in greater than 90 percent of the samples.

Explosive compounds were not detected. One VOC, 1,1,1-trichloroethane, was detected at a maximum concentration of 0.001 mg/L. No SVOCs were detected. Specific results for stable isotopes of oxygen (δO^{18}) and hydrogen (δD), and tritium and helium for age dating are contained in Table 6-27.

6.4 REFERENCE TAILINGS FACILITY GROUNDWATER

Reference groundwater occurs upgradient of the tailings facility within hydrogeologic settings that are analogous to those within the tailings facility. The overall direction of groundwater flow is to the south and southwest; therefore, upgradient reference groundwater is north and northeast of the tailings facility.

Groundwater occurs within three primary units at the tailings facility and in reference groundwater. Groundwater occurs within an alluvial aquifer that is divided into an upper and basal section. The Upper Alluvial Aquifer is comprised of the first occurrence of the water table and may contain perched groundwater. The Basal Alluvial Aquifer is comprised of deeper groundwater within alluvial sediments, typically found at depths greater than 80 to 100 feet. Deep groundwater also occurs within consolidated basalt and andesite (volcanics) and referred to as the Basal Bedrock Aquifer. The Basal Bedrock Aquifer underlies the western portion of the tailings facility and Guadalupe Mountain. Additional reference groundwater for the tailings facility was sampled from private wells in Questa and a well at Cater Ranch, which is approximately six miles north of the tailings facility.

6.4.1 Upper Alluvial Aquifer

Reference groundwater within the Upper Alluvial Aquifer was sampled at MW-21, which is located at the northeast boundary of the tailings facility (Figure 6-2). Table 6-28 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 10 samples were collected and analyzed for metals and inorganics analyses.

Values of pH ranged from 6.9 to 7.6 su, with a mean value of 7.4 su. Specific conductance values ranged from 1,030 and 1,190 uS/cm, with a mean value of 1,110 uS/cm.

All inorganic compounds were detected except carbonate and hydroxide. Of the detected analytes, bicarbonate, chloride, fluoride, nitrate, sulfate, alkalinity, total dissolved solids, and total suspended solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Fourteen dissolved metals were detected. Of the detected dissolved metals, arsenic, barium, calcium, magnesium, selenium, and sodium were detected in greater than 90 percent of the samples. Seventeen total metals were detected. Of the detected total metals, arsenic, barium, calcium, magnesium, selenium, sodium, and vanadium were detected in greater than 90 percent of the samples.

6.4.2 Basal Alluvial Aquifer

Reference groundwater within the Basal Alluvial Aquifer was sampled at MW-20, which is located at the northeast boundary of the tailings facility (Figure 6-2). Table 6-29 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 16 samples were collected and analyzed for metals and inorganics analyses.

Values of pH ranged from 5.3 to 7.6 su, with a mean value of 7.2 su. Specific conductance values ranged from 416 and 480 uS/cm, with a mean value of 447 uS/cm.

All inorganic compounds were detected except carbonate. Of the detected analytes, bicarbonate, chloride, fluoride, nitrate, phosphorous, sulfate, alkalinity, total dissolved solids, and total suspended solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Sixteen dissolved metals were detected. Of the detected dissolved metals, barium, calcium, magnesium, selenium, sodium, and vanadium were detected in greater than 90 percent of the samples. Eighteen total metals were detected. Of the detected total metals, barium, calcium, magnesium, selenium, sodium, and vanadium were detected in greater than 90 percent of the samples.

6.4.3 Basal Bedrock Aquifer

Reference groundwater within the Basal Bedrock Aquifer was sampled at MW-22. The reference bedrock well is completed in the volcanics immediately west of the tailings facility (Figure 6-2). Table 6-30 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of eight samples were collected and analyzed for metals and inorganics analyses.

Values of pH ranged from 7 to 8.3 su, with a mean value of 7.9 su. Specific conductance values ranged from 225 and 244 uS/cm, with a mean value of 237 uS/cm.

All inorganic compounds were detected except carbonate, hydroxide, and TOC. Of the detected analytes, bicarbonate, chloride, fluoride, and alkalinity were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Sixteen dissolved metals were detected. Of the detected dissolved metals, arsenic, barium, boron, calcium, magnesium, molybdenum, and vanadium were detected in greater than 90 percent of the samples. Eighteen total metals were detected. Of the detected total metals, arsenic, barium, boron, calcium, magnesium, molybdenum, and vanadium were detected in greater than 90 percent of the samples.

6.4.4 Questa Residential Tap Water

Two private residence taps were sampled and are included in the tailings reference groundwater. The two locations are identified as PR1 and PR2 and are located in Questa, south of Red River (Figure 6-2). The source of the water is presumed to be from the Red River alluvium (i.e., Upper Alluvial Aquifer). Table 6-31 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of two samples were collected and analyzed for metals and inorganics analyses.

Values of pH were 7.6 and 7.8 su. Specific conductance values were 382 and 394 uS/cm.

Seven inorganic compounds were detected. Of the detected analytes, bicarbonate, chloride, fluoride, nitrate, sulfate, alkalinity, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Thirteen dissolved metals were detected. Of the detected dissolved metals, arsenic, barium, boron, calcium, copper, lead, magnesium, molybdenum, potassium, sodium, vanadium, and zinc were detected in greater than 90 percent of the samples. Total metals detected in greater than 90 percent of the samples were the same as dissolved metals.

6.4.5 Cater Ranch Tap Water

A well at Cater Ranch was sampled during the RI and is representative of reference groundwater. The well is identified as "Cater Ranch" and is approximately six miles north of the tailings facility (Figure 6-2). The source of the groundwater is presumed to be from a depth comparable to the Basal Alluvial Aquifer. It is not known if the water is treated or not. Table 6-32 contains summary statistics for analyte values and comparisons to Human Health SLC. One sample was collected and analyzed for metals and inorganics analyses.

The pH value was 7.4 su. The specific conductance value was 149 uS/cm.

Eight inorganic compounds were detected. Of the detected analytes, bicarbonate, chloride, fluoride, nitrate, sulfate, alkalinity, total dissolved solids, and total suspended solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Ten dissolved metals were detected. Of the detected dissolved metals, barium, calcium, copper, magnesium, manganese, molybdenum, potassium, sodium, vanadium, and zinc were detected in greater than 90 percent of the samples. Total metals detected in greater than 90 percent of the samples were the same as dissolved metals, with the addition of barium and uranium.

6.5 TAILINGS FACILITY GROUNDWATER

Groundwater occurs within three primary units at the tailings facility. Groundwater occurs within an alluvial aquifer that is divided into an upper and basal section. The Upper Alluvial Aquifer is comprised of the first occurrence of the water table and may contain perched groundwater. The Basal Alluvial Aquifer is comprised of deeper groundwater within alluvial sediments, typically found at depths greater than 80 to 100 feet. Deep groundwater also occurs within consolidated basalt and andesite (volcanics) and referred to as the Basal Bedrock Aquifer. The Basal Bedrock Aquifer underlies the western portion of the tailings facility and Guadalupe Mountain.

The tailings facility was initially divided into three groundwater exposure areas. The three exposure areas are:

- GW-11 – Groundwater Area 11 - Dry/Maintenance Area and Downgradient
- GW-12 – Groundwater Area 12 - IX Plant and Pope Lake

- GW-13 – Groundwater Area 13 – Groundwater for Tailings Area

The GW-12 exposure area near the IX Plant and Pope Lake was identified in the Work Plan as a potential exposure area only if soil sample results indicated a potential for impacts to groundwater. A well was to be installed in the exposure area if soil results showed the potential for impact to groundwater. Review of soil sample results in the exposure area showed that all analytes were below the EPA Region 6 Soil SLC at a Hazard Quotient of 1, except for arsenic. Arsenic values ranged from 2 to 4 mg/kg in the soil samples, and are typical of naturally occurring concentrations in the Western United States. Given the low soil concentrations and that the depth to the groundwater table is approximately 200 feet in this area, leaching of metals and inorganics to groundwater is not expected to impact groundwater. Consequently, no monitoring well was installed in groundwater exposure area GW-12 and the exposure area has been removed from the RI.

The following subsections discuss analytical results for each aquifer within the two remaining exposure areas GW-11 and GW-13.

6.5.1 Groundwater Area 11 – Dry/Maintenance Area and Downgradient

Groundwater exposure area GW-11 encompasses a relatively small area in the vicinity of the Dry/Maintenance (Figure 6-2). The exposure area extends downgradient of the Dry/Maintenance. Two wells are within the exposure area and were sampled during the RI.

6.5.1.1 Upper Alluvial Aquifer

The Upper Alluvial Aquifer groundwater in exposure area GW-11 is monitored by MW-17, which is downgradient of the Dry/Maintenance (Figure 6-2). Table 6-33 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 16 samples were collected and analyzed for metals and inorganics analyses. One sample was analyzed for hexavalent chromium. Eight samples were analyzed for VOCs and SVOCs.

Values of pH ranged from 7.3 to 7.7 su, with a mean value of 7.5 su. Specific conductance values ranged from 87 to 768 uS/cm, with a mean value of 667 uS/cm.

All inorganic compounds were detected except carbonate, hydroxide, and nitrite. Of the detected analytes, bicarbonate, fluoride, sulfate, alkalinity, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Sixteen dissolved metals were detected. Of the detected dissolved metals, barium, boron, calcium, magnesium, molybdenum, sodium, and vanadium were detected in greater than 90 percent of the samples. Detected total metals included those mentioned above in addition to arsenic and iron.

Hexavalent chromium was not detected. No VOCs or SVOCs were detected.

6.5.1.2 Basal Alluvial Aquifer

The Basal Alluvial Aquifer groundwater in exposure area GW-11 is monitored by MW-CH. This well is used for non-potable water supply at the Dry/Maintenance (Figure 6-2). Table 6-34 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of seven samples were collected and analyzed for metals and inorganics analyses. Three samples were analyzed for VOCs and SVOCs.

Values of pH ranged from 6.6 to 7.9 su, with a mean value of 7.4 su. Specific conductance values ranged from 454 to 526 uS/cm, with a mean value of 498 uS/cm.

Eleven inorganic compounds were detected. Of the detected analytes, bicarbonate, fluoride, sulfate, and alkalinity were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Sixteen dissolved metals were detected. Of the detected dissolved metals, barium, boron, calcium, copper, magnesium, vanadium, and zinc were detected in greater than 90 percent of the samples. Twelve total metals were detected. Of the detected total metals, barium, boron, calcium, copper, magnesium, vanadium, and zinc were detected in greater than 90 percent of the samples.

No VOCs or SVOCs were detected.

6.5.2 Groundwater Area 13 – Groundwater for Tailings Area

Groundwater exposure area GW-13 encompasses the entire tailings facility aside from the small area around the Dry/Maintenance (Figure 6-2). Monitoring wells, temporary piezometers, and drive points were sampled to characterize the groundwater quality within the Upper and Basal Alluvial aquifers and in the Basal Bedrock Aquifer. Seeps and springs issuing from the alluvium and bedrock were also sampled.

6.5.2.1 Upper Alluvial Aquifer

A total of 41 locations were sampled in the Upper Alluvial Aquifer. These locations included (Figure 6-2):

Monitoring Wells:

MW-A, MW-B, MW-14, MW-15, MW-2, MW-26, MW-28, MW-29, MW-4, MW-7A, MW-9A, LS-1, LS-2, LS-3, and Hunt's Pond Well

Extraction Wells:

EW-3, EW-4, EW-5A, EW-5B, EW-5C, EW-5D, EW-6, 002 Pumpback and 002 Pumpback Discharge (i.e., at the end of the pumpback pipeline)

Temporary Piezometers and Drive Points:

TPZ-5U, TPZ-6U, TPZ-7U, DP-1 through DP-14

The collective discharge from the 002 Outfall is discussed separately in the GW-13 Exposure Area section. The 002 Pumpback was included with the Upper Alluvial Aquifer locations because it represents only a portion of the discharge from the 002 Outfall and it is not entirely characteristic of the 002 Outfall chemistry. For this reason, the 002 Pumpback was kept separate from 002 Outfall and included in the Upper Alluvial Aquifer section.

Table 6-35 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 181 samples were collected and analyzed for inorganics, and 181 and 177 samples were analyzed for dissolved and total metals, respectively. Thirteen samples were analyzed for hexavalent chromium.

As a result of data validation, all total metals from the October/November 2002 samples from EW-5B, MW-15, MW-4, and MW-B were rejected. The June 2003 phosphorous value for MW-9A and April 2004 nitrate value for MW-A were rejected.

Values of pH ranged from 5 to 12.7 su, with a mean value of 7 su. The 12.7 pH value was from a grout-contaminated temporary piezometer. Specific conductance values ranged from 235 and 3,960 uS/cm, with a mean value of 1,300 uS/cm. A single flow value 85 gpm was measured from the 002 Pumpback.

All inorganic compounds were detected. Of the detected analytes, bicarbonate, chloride, fluoride, sulfate, alkalinity, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except beryllium, mercury, silver, and thallium. Of the detected dissolved metals, barium, calcium, magnesium, molybdenum, and sodium were detected in greater than 90 percent of the samples. All total metals were detected except for antimony. Of the detected total metals, barium, calcium, magnesium, and sodium were detected in greater than 90 percent of the samples. Hexavalent chromium was detected in two of 13 samples at a maximum concentration of 0.0023 mg/L.

6.5.2.2 Basal Alluvial Aquifer

A total of five locations were sampled in the Basal Alluvial Aquifer. These locations included (Figure 6-2): monitoring wells MW-10, MW-7C, and MW24, extraction well EW-2, and temporary piezometer TPZ-7L.

Table 6-36 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 38 samples were collected and analyzed for metals and inorganics analyses. Three samples were analyzed for hexavalent chromium.

Values of pH ranged from 6.6 to 8.4 su, with a mean value of 7.4 su. Specific conductance values ranged from 26 to 3,190 uS/cm, with a mean value of 575 uS/cm.

All inorganic compounds were detected. Of the detected analytes, bicarbonate, sulfate, and alkalinity were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except antimony, beryllium, mercury, silver, and thallium. Of the detected dissolved metals, barium, calcium, magnesium, sodium, and vanadium were detected in greater than 90 percent of the samples. All total metals were detected except for antimony. Of the detected total metals, barium, calcium, magnesium, sodium, and vanadium were detected in greater than 90 percent of the samples.

6.5.2.3 Basal Bedrock Aquifer

A total of 11 locations were sampled in the Basal Bedrock Aquifer. These locations included (Figure 6-2) seven monitoring wells: MW-1, MW-11, MW-12, MW-13, MW-23, MW-25, and MW-27; one extraction well: EW-1; and three temporary piezometers: TPZ-1, TPZ-2, and TPZ-5B.

Table 6-37 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 76 samples were collected and analyzed for metals and inorganics analyses. Five samples were analyzed for hexavalent chromium.

Values of pH ranged from 6.5 to 8.3 su, with a mean value of 7.6 su. Specific conductance values ranged from 82 to 1,770 uS/cm, with a mean value of 665 uS/cm.

All inorganic compounds were detected except for carbonate and hydroxide. Of the detected analytes, bicarbonate, fluoride, sulfate, alkalinity, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and a single, qualified value of cyanide was detected at 0.01 mg/L.

All dissolved metals were detected except beryllium, cadmium, mercury, silver, and thallium. Of the detected dissolved metals, barium, boron, calcium, magnesium, molybdenum, and vanadium were detected in greater than 90 percent of the samples. All total metals were detected except for cadmium, mercury, and thallium. Of the detected total metals, barium, calcium, magnesium, molybdenum, and vanadium were detected in greater than 90 percent of the samples. Hexavalent chromium was detected in one sample at a concentration of 0.0023 mg/L.

6.5.2.4 Upper Alluvial Seeps

Several seeps issue from the alluvium within exposure area GW-13. A total of 10 seep locations were sampled in the Upper Alluvial Aquifer. The seeps occur at three general areas (Figure 6-2):

Dam No. 1A:

West Seep and East Seep

South of Tailings:

Embargo Road Seep, Spring 7, Spring 8, and Spring 17

003 Drainage:

003 West Seep, 003 East Seep, 003 Central Seep, and 003 Seep Confluence.

Note that the location where Spring 17 is sampled is at the fish hatchery. However, the source area for Spring 17 is south of the tailings facility and the water is piped to the fish hatchery.

Table 6-38 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 38 samples were collected and analyzed for metals and inorganics analyses. One sample was additionally analyzed for VOCs, SVOCs, and total petroleum hydrocarbons.

Values of pH ranged from 6 to 7.8 su, with a mean value of 7.2 su. Specific conductance values ranged from 256 to 2,760 uS/cm, with a mean value of 1,700 uS/cm.

All inorganic compounds were detected except for carbonate and hydroxide. Of the detected analytes, bicarbonate, chloride, fluoride, sulfate, alkalinity, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was detected in nine of the 38 samples corresponding to the 003 East Seep and 003 Central Seep locations. The maximum concentration of cyanide was 0.019 mg/L.

All dissolved metals were detected except antimony, cadmium, mercury, silver, and thallium. Of the detected dissolved metals, barium, boron, calcium, magnesium, and sodium were detected in greater than 90 percent of the samples. All total metals were detected except for the same metals previously identified for dissolved metals. Of the detected total metals, barium, boron, calcium, magnesium, and sodium were detected in greater than 90 percent of the samples.

The sample that was analyzed for organic compounds did not have any detections of VOCs, SVOCs, and total petroleum hydrocarbons inclusive of Diesel Fuel No. 2, Motor oil, and Gasoline.

6.5.2.5 Basal Bedrock Seeps

Several seeps issue from the bedrock within exposure area GW-13. A total of eight seep locations were sampled in the Basal Bedrock Aquifer. Seeps that issue from the bedrock (volcanics) primarily occur south of Dam No. 4 (Figure 6-2) and include: Spring 9, Spring 9A, Spring 10, Spring 12, Spring 12A, Spring 14-T, Spring 15-T, and Spring 18.

Table 6-39 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 52 samples were collected and analyzed for metals and inorganics analyses. Two samples were additionally analyzed for hexavalent chromium.

Values of pH ranged from 5.9 to 8.3 su, with a mean value of 7.4 su. Specific conductance values ranged from 46 to 2,590 uS/cm, with a mean value of 623 uS/cm.

All inorganic compounds were detected except for carbonate and hydroxide. Of the detected analytes, bicarbonate, chloride, fluoride, sulfate, alkalinity, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

All dissolved metals were detected except antimony, beryllium, cadmium, mercury, nickel, and thallium. Of the detected dissolved metals, barium, boron, calcium, magnesium, molybdenum, potassium, and sodium were detected in greater than 90 percent of the samples. All total metals were detected except for antimony, cadmium, silver, and thallium. Of the detected total metals, barium, boron, calcium, magnesium, molybdenum, potassium, and sodium were detected in greater than 90 percent of the samples. Hexavalent chromium was not detected.

6.5.2.6 Outfall 002 Discharge

Groundwater within exposure area GW-13 is discharged to Red River at the 002 Outfall. The 002 Outfall has been historically sampled at the manhole (well) near the southern property boundary before the water is piped off site and to the river. Sampling of the 002 Outfall water during the RI occurred at the historically sampled manhole location, as well as at the end of the pipe near the river (Figure 6-2). Samples collected during the RI were not part of the NPDES Compliance Sampling.

Table 6-40 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of 12 samples were collected and analyzed for metals and inorganics analyses. One sample was additionally analyzed for hexavalent chromium and uranium.

Values of pH ranged from 6.4 to 7.7 su, with a mean value of 7.1 su. Specific conductance values ranged from 1,550 to 3,400 uS/cm, with a mean value of 1,790 uS/cm.

All inorganic compounds were detected except for carbonate, hydroxide, and nitrite. Of the detected analytes, bicarbonate, chloride, fluoride, phosphorous, sulfate, alkalinity, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Sixteen dissolved metals were detected. Of the detected dissolved metals, barium, calcium, magnesium, manganese, molybdenum, potassium, sodium, and vanadium were detected in greater than 90 percent of the samples. Twenty total metals were detected. Of the detected total metals, barium, calcium, magnesium, manganese, molybdenum, potassium, sodium, and vanadium were detected in greater than 90 percent of the samples. Hexavalent chromium was not detected and uranium was detected at 0.037 mg/L in the one sample that was analyzed.

6.5.2.7 Residential Tap Water South of Tailings Facility

Upper Alluvial Aquifer groundwater south of the tailings facility was sampled at three residential taps. The source of the water is from a well at each home. The three sample locations are identified as PR-3, PR-4, and PR-5 (Figure 6-2). The samples were collected as part of the Tailings Spill Investigation in May 2004.

Table 6-41 contains summary statistics for analyte values and comparisons to Human Health SLC. A total of five samples were collected and analyzed for metals and inorganics analyses, of which three samples were from PR-3.

Values of pH ranged from 6.3 to 6.7 su, with a mean of 6.5 su. Specific conductance values ranged from 299 and 466 uS/cm, with a mean of 411 uS/cm.

Ten inorganic compounds were detected. Of the detected analytes, bicarbonate, chloride, fluoride, nitrate, sulfate, alkalinity, and total dissolved solids were detected in greater than 90 percent of the samples. Each sample was additionally tested for cyanide (total) and cyanide was not detected.

Fourteen dissolved metals were detected. Of the detected dissolved metals, barium, calcium, magnesium, molybdenum, potassium, and zinc were detected in greater than 90 percent of the samples. Twelve total metals were detected. Of the detected total metals, barium, calcium, magnesium, and zinc were detected in greater than 90 percent of the samples.

6.6 SUMMARY

The following summarizes detected analytes in groundwater at reference areas, mine site, and tailing facility. Analytes exceeding human health SLC are also discussed. Comparisons between analytes that exceeded SLC for the mine site/tailings facility groundwater and reference groundwater are also presented. The comparisons are made for those analytes that exceed SLC and are detected in 50 percent or greater of the samples that were analyzed. Comparisons are made based on water-bearing unit or source (i.e., alluvium or bedrock) and between groundwater exposure areas and reference areas.

6.6.1 Off-Mine Site Reference

Of the 16 inorganic analytes, 12 were detected in alluvial and bedrock groundwater, and 13 were detected in colluvial groundwater. Of the 25 metals (total) that were analyzed, the alluvial groundwater had the fewest detected metals at 18, while 22 metal were detected in the colluvial groundwater, and 21 metals were detected in the bedrock groundwater.

The following lists the inorganic and metals that exceeded SLC for each water-bearing unit or source. Underlined analytes in the table had 50 percent or greater of the detections that exceeded the SLC. Colluvial groundwater had the greatest number of inorganic and metal analytes that exceeded SLC. Exceedance of fluoride, iron, and manganese SLC was common for the alluvial, colluvial, and bedrock groundwater. Exceedance of the manganese SLC was common to all groundwaters except for the Red River Tap water. The Red River Tap water did not exceed any SLC.

Off-Mine Site Reference Exceedance of Human Health SLC	
Water-Bearing Unit	**Metal/Inorganic Analytes**
Alluvium	F, Al, Sb, Fe, Mn
Colluvium	F, SO_4, Al, Sb, As, Cd, Cr, Fe, Pb, Mn, Ni, Zn
Bedrock	Cl, F, SO_4, Be, Fe, Mn
Alluvial Seeps	Mn
Red River Tap Water	None

6.6.2 On-Mine Site Reference

Between 12 and 14 of the 16 inorganic analytes were detected in alluvial, colluvial, and bedrock groundwater. Of the 25 metals (total) that were analyzed, the alluvial groundwater had the fewest detected metals at 11, while 24 metals were detected in the colluvial groundwater, and 18 metals were detected in the bedrock groundwater. Explosive compounds were not detected in alluvial groundwater and hexavalent chromium was not detected in alluvial and bedrock groundwater.

The following lists the inorganics and metals that exceeded SLC for each water-bearing unit. Colluvial groundwater had the greatest number of inorganic and metal analytes that exceeded SLC. Exceedance of the fluoride and manganese SLC was common for the alluvial, colluvial and bedrock groundwater. For each groundwater, 50 percent or greater of the manganese detections exceeded the SLC.

On-Mine Site Reference Exceedance of Human Health SLC	
Water-Bearing Unit	**Metal/Inorganic Analytes**
Alluvium	F, Mn
Colluvium	F, Be, Fe, Mn, Pb
Bedrock	F, Mn

6.6.3 Mine Site

The following sections summarize detected metals and inorganics, and identify analytes exceeding Human Health SLC. Analytes exceeding SLC are divided into water-bearing units within each of the six groundwater exposure areas at the mine site. Graphs were prepared that compare mean concentrations of mine site analytes exceeding SLC in 50 percent or greater of the detected values, to the same analyte exceedances for the off- and on-mine site reference areas. A white bar on the graphs indicates the 50 percent or more of the values were not detected, and a mean was not calculated. In these cases, the maximum detected value or the maximum reporting

limit, whichever was greater, was plotted. Comparisons were made for alluvial, colluvial, and bedrock groundwater and alluvial seep/springs.

Alluvial Groundwater

Alluvial groundwater was sampled in four exposure areas: GW-1, GW-4, GW-5, and GW-6; alluvial groundwater was not present in GW-2 and GW-3. Within the four exposure areas, between 11 and 15 of the 16 inorganic analytes were detected in alluvial groundwater. Exposure area GW-4 had the greatest number of detected inorganic analytes and GW-1 had the least. Between 18 and 25 metals (total) were detected in the four exposure areas. Exposure area GW-4 had the greatest number of metals (total) and GW-1 had the least.

Alluvial groundwater in GW-4, GW-5, and GW-6 was analyzed for explosive compounds and none were detected. Exposure area GW-5 had no detections of VOCs and GW-6 had three detected VOCs, but the detected values were below Human Health SLC. Exposure area GW-5 and GW-6 had no detections of SVOCs.

The following table lists the inorganics and metals that exceeded SLC for alluvial groundwater. Underlined analytes in the table had 50 percent or greater of the detections that exceeded the SLC. Exposure areas GW-4 and GW-5 had the greatest number of analytes that exceeded SLC. Fluoride and manganese exceeded SLC in all exposure areas where alluvial groundwater was present, and the two analytes typically exceeded SLC more than 50 percent of the time. Exposure area GW-6 had the fewest exceedances of SLC and none of the detected analytes exceeded SLC more than 50 percent of the time.

Mine Site Alluvial Groundwater Exceedance of Human Health SLC

Groundwater Exposure Area	Metal/Inorganic Analytes
GW-1	F, Al, As, Cd, Fe, Mn
GW-2	No alluvial groundwater present
GW-3	No alluvial groundwater present
GW-4	F, SO_4, Al, Sb, As, Be, Cd, Fe, Pb, Mn, Ni, Th
GW-5	Cl, F, SO_4, Al, Sb, As, Cd, Cr, Cu, Pb, Mn, Ni
GW-6	F, SO_4, Mn

Graphical comparisons were made between alluvial groundwater at the mine site exposure areas and the off- and on-mine site reference areas for individual analytes that were detected greater than 50 percent of the time. The analytes that meet these criteria in at least one exposure or reference area include:

- Fluoride
- Aluminum

- Manganese

Comparisons were made using total concentrations for inorganics and metals and the computed mean concentrations.

Figure 6-4 shows mean concentrations for fluoride at the six mine site exposure areas and the two reference areas. Mean fluoride concentrations at GW-1, GW-4, GW-5, and on-mine site reference area were greater than the SLC and greater than the mean concentration at the off-mine site reference area.

Figure 6-5 shows mean concentrations for aluminum (total). Mean aluminum concentration exceeded the SLC only at exposure area GW-1. Exposure areas GW-4, GW-5, GW-6, and on-mine site reference areas had mean concentrations below the SLC.

Figure 6-6 shows mean concentrations for manganese (total). Mean manganese concentrations at GW-1, GW-4, GW-5, and the off-mine site reference were greater than the SLC and greater than the mean concentration at the on-mine site reference area. The mean manganese concentrations at the off- and on-mine site reference areas were equal to or slightly greater than the SLC.

Colluvial Groundwater

Colluvial groundwater was sampled in four exposure areas: GW-1, GW-3, GW-4, and GW-5. Colluvial monitoring wells were not present in GW-2 and colluvial groundwater was not present in GW-6. Within the four exposure areas, between 11 and 14 of the 16 inorganic analytes were detected in colluvial groundwater. Exposure area GW-5 had the greatest number of detected inorganic analytes and GW-3 had the least. Between 20 and 24 metals (total) were detected. Exposure area GW-5 had the greatest number of metals (total) and GW-3 had the least.

Colluvial groundwater in GW-3, GW-4, and GW-5 was analyzed for explosive compounds, VOCs, and SVOCs. None of these compounds were detected in GW-3 and GW-4. In GW-5, one explosive compound, and four VOCs were detected, but none were greater than Human Health SLC. No SVOCs were detected in these exposure areas. Colluvial groundwater in exposure area GW-5 was additionally analyzed for Motor Oil and Diesel Fuel No. 2 and these compounds were not detected.

The following table lists the inorganics and metals that exceeded SLC for alluvial groundwater. Underlined analytes in the table had 50 percent or greater of the detections that exceeded the SLC. Exposure area GW-4 had the greatest number of analytes that exceeded SLC, followed by GW-5 and GW-1. Only sulfate exceeded SLC in GW-3. Fluoride, sulfate, manganese, and to a lesser extent aluminum, exceeded SLC more than 50 percent of the time in exposure areas GW-1, GW-4, and GW-5.

Mine Site Colluvial Groundwater Exceedance of Human Health SLC	
Groundwater Exposure Area	**Metal/Inorganic Analytes**
GW-1	F, SO_4, Al, As, Be, Cd, Cr, Fe, Mn, Ni, Zn
GW-2	No colluvial groundwater sampled
GW-3	SO4
GW-4	F, NO_3, SO_4, Al, As, Be, Cd, Cr, Co, Cu, Fe, Pb, Mn, Ni, Zn
GW-5	F, SO_4, Al, Sb, As, Cd, Cr, Co, Cu, Fe, Pb, Mn, Ni
GW-6	No colluvial groundwater

Graphical comparisons were made between colluvial groundwater at mine site exposure areas and the off- and on-mine site reference areas for individual analytes that were detected greater than 50 percent of the time. Analytes that meet these criteria in at least one exposure or reference area include:

- Fluoride
- Sulfate
- Aluminum
- Cadmium
- Copper
- Iron
- Manganese
- Nickel

Comparisons were made using total concentrations for inorganics and metals and the computed mean concentrations.

Figure 6-7 shows mean concentrations for fluoride at the six mine site exposure areas and the two reference areas. Mean fluoride concentrations at GW-1, GW-4, and GW-5 were greater than the SLC and greater than the mean concentration at the off- and on-mine site reference areas. Exposure area GW-4 had the highest mean fluoride concentration. The mean fluoride concentrations at the off- and on-mine site reference areas also exceeded SLC.

Mean concentrations of sulfate are shown on Figure 6-8. Mean sulfate concentrations exceeded SLC at GW-1, GW-4 and GW-5. Mean sulfate concentrations at the off-mine site reference area exceeded SLC, but the on-mine site reference area did not.

Figure 6-9 shows mean concentrations for aluminum (total). Mean aluminum concentrations at GW-4 and GW-5 were greater than the SLC and greater than the mean concentration at the off-mine site reference area. The mean aluminum concentration at the off-mine site reference area also exceeded SLC, but the on-mine site reference area did not.

Mean concentrations of cadmium (total) are shown on Figure 6-10. Mean cadmium concentrations exceeded SLC at GW-1 and GW-4.

Mean concentrations of copper (total) are shown on Figure 6-11. Mean copper concentrations exceeded SLC at GW-4 and GW-5.

Figure 6-12 shows mean concentrations for iron (total). Mean iron concentrations at GW-1 and GW-5 were greater than the SLC. The mean iron concentration at the off- and on-mine site reference areas also exceeded SLC, and the mean concentrations at the two reference areas were greater than the mean concentration at GW-1, but not GW-5.

Figure 6-13 shows mean concentrations for manganese (total). Mean manganese concentrations at GW-1, GW-4, and GW-5 were greater than the SLC. The mean manganese concentrations at the off- and on-mine site reference areas also exceeded SLC. The mean manganese concentration at the on-mine site reference area was approximately equal to the mean concentration at GW-5.

Mean concentrations of nickel (total) are shown on Figure 6-14. Mean nickel concentrations exceeded SLC at GW-4 and GW-5.

Bedrock Groundwater

Bedrock groundwater was sampled in five exposure areas: GW-1, GW-3, GW-4, GW-5, and GW-6. Bedrock monitoring wells were not present in GW-2. Within the five exposure areas, between seven and 15 of the 16 inorganic analytes were detected in bedrock groundwater. Exposure area GW-4 had the greatest number of detected inorganic analytes and GW-6 had the least. Between 10 and 24 metals (total) were detected. Exposure area GW-4 and GW-5 had the greatest number of metals (total) and GW-6 had the least.

Bedrock groundwater in GW-3, GW-4, GW-5, and GW-6 was analyzed for explosive compounds, VOCs, and SVOCs. Explosive compounds were not detected in each of the exposure areas except for GW-4, where three compounds were detected. One of the three explosive compounds (2,4,6-trinitrotoluene) was detected at 0.0089 mg/L and exceeded the SLC of 0.0022 mg/L. Up to three VOCs were detected in the four exposure areas. Concentrations of VOCs were low and below SLC. No SVOCs were detected in the four exposure areas. Dioxins (aroclors) were analyzed in one sample in GW-4 and none were detected.

The following table lists the inorganics and metals that exceeded SLC for bedrock groundwater. Underlined analytes in the table had 50 percent or greater of the detections that exceeded the SLC. Exposure area GW-4 had the greatest number of analytes that exceeded SLC, followed by GW-5. Exposure area GW-6 had the fewest analytes that exceeded SLC. Fluoride, sulfate, manganese, iron, and lead exceeded SLC more than 50 percent of the time in two or more exposure areas. Aluminum exceeded SLC more than 50 percent of the time in only GW-1.

Mine Site Bedrock Groundwater Exceedance of Human Health SLC	
Groundwater Exposure Area	**Metal/Inorganic Analytes**
GW-1	F, SO4, Al As, Cd, Cr, Fe, Pb, Mn, Ni, Zn
GW-2	No bedrock groundwater sampled
GW-3	F, SO4, Al, As, Be, Cd, Cu, Fe, Pb, Mn, Mo, Zn
GW-4	Cl, F, NO3, NO2, SO4, Al, As, Be, Cd, Cr, Cu, Fe, Pb, Mn, Ni, Zn
GW-5	F, SO4, Al, As, Be, Cd, Cr, Co, Cu, Fe, Pb, Mn, Ni, V
GW-6	F, Mn

Graphical comparisons were made between bedrock groundwater mine site exposure areas and the off- and on-mine site reference areas for individual analytes that were detected greater than 50 percent of the time. Analytes that meet these criteria in at least one exposure or reference area include:

- Fluoride
- Sulfate
- Aluminum
- Beryllium
- Iron
- Lead
- Manganese

Comparisons were made using total concentrations for inorganics and metals and the computed mean concentrations.

Figure 6-15 shows bedrock groundwater mean concentrations for fluoride at the six mine site exposure areas and the two reference areas. Mean fluoride concentrations at GW-1, GW-3, GW-4, and GW-5 were greater than the SLC. The mean fluoride concentrations at the off-mine site reference area also exceeded SLC.

Mean sulfate concentrations in bedrock groundwater are shown on Figure 6-16. Mean sulfate concentrations in exposure areas GW-3 and GW-5 exceeded SLC, whereas, mean sulfate concentrations were less than SLC at GW-1, GW-4, and GW-6. Bedrock groundwater at the off-mine site reference area also had a mean sulfate concentration that exceeded SLC.

Figure 6-17 shows mean concentrations for aluminum (total) at the six mine site exposure areas and the two reference areas. The mean aluminum concentration at only GW-1 was greater than the SLC.

Figure 6-18 shows mean concentrations for beryllium (total) at the six mine site exposure areas and the two reference areas. The mean beryllium concentration only at GW-3 exceeded the SLC.

Mean iron (total) concentrations in bedrock groundwater are shown on Figure 6-19. Mean iron concentrations in exposure areas GW-1 and GW-5 exceeded SLC. Bedrock groundwater at the off-mine site reference area also had a mean iron concentration that exceeded SLC.

Figure 6-20 shows mean concentrations for lead (total) at the six mine site exposure areas and the two reference areas. The mean lead concentrations at GW-1 and GW-3 exceeded the SLC.

Mean manganese (total) concentrations in bedrock groundwater are shown on Figure 6-21. Mean manganese concentrations at each exposure area equaled or exceeded SLC. Bedrock groundwater at both the off- and on-mine site reference areas also had mean manganese concentrations that exceeded SLC.

Seeps/Springs

Seeps and/or springs occur in all exposure areas except for GW-6. Exposure areas GW-1, GW-4, and GW-5 have alluvial seeps that were sampled and exposure areas GW-2, GW-3, and GW-5 have colluvial seeps. In general, the colluvial seeps have more detected inorganic and metal analytes than alluvial seeps.

The following table lists the inorganics and metals that exceeded SLC for seeps. Underlined analytes in the table had 50 percent or greater of the detections that exceeded the SLC. Exposure area GW-3 had the greatest number of analytes that exceeded SLC, followed closely by GW-2 and then GW-1. Exposure areas GW-4 and GW-5 had the fewest analytes that exceeded SLC. Fluoride and manganese exceeded SLC in more than 50 percent of the samples in all exposure areas where seeps were sampled.

Mine Site Seeps and Springs
Exceedance of Human Health SLC

Groundwater Exposure Area	Source of Seep/Spring	Metal/Inorganic Analytes
GW-1	Alluvium	F, SO_4, Al, Sb, As, Cd, Cr, Cu, Fe, Mn, Ni
GW-2	Colluvium	F, SO_4, Al, As, Be, Cd, Cr, Co, Cu, Fe, Mn, Ni, Zn
GW-3	Colluvium	Cl, F, SO_4, Al, As, Be, Cd, Cr, Co, Cu, Fe, Pb, Mn, Ni, Se, Th, Zn
GW-4	Alluvium	F, Cd, Mn
GW-5	Alluvium	F, As, Mn
	Colluvium	F, Mn
GW-6	No seeps/springs	No seeps/springs

Graphical comparisons were made between seepage at the mine site and reference areas. Seepage from colluvial materials at reference areas did not occur or was not sampled. Therefore, comparisons were made only for mine site and reference alluvial seepage, and for individual analytes that were detected greater than 50 percent of the time. Analytes that meet these criteria in at least one exposure or reference area include:

- Fluoride
- Aluminum
- Iron
- Manganese

Comparisons were made using total concentrations for inorganics and metals and the computed mean concentrations. Alluvial seepage was sampled in exposure areas GW-1, GW-4, and GW-5, and the off-mine site reference area. Exposure areas GW-2, GW-3, and GW-6, and the on-mine site reference area were not part of the comparison because no alluvial seepage was present.

Figure 6-22 shows mean concentrations for fluoride in alluvial seepage at the mine site exposure areas and reference areas. Mean fluoride concentrations at GW-1, GW-4, and GW-5 were greater than the SLC.

Mean aluminum (total) concentrations in alluvial seepage are shown on Figure 6-23. The mean aluminum concentration at exposure area GW-1 exceeded SLC.

Mean iron (total) concentrations in alluvial seepage are shown on Figure 6-24. The mean iron concentration at exposure area GW-1 exceeded SLC.

Figure 6-25 shows mean concentrations for manganese (total) in alluvial seepage at the mine site exposure areas and reference areas. Mean manganese concentrations at GW-1 and GW-4 were greater than the SLC.

6.6.4 Tailings Facility Reference

Upper Alluvial Aquifer

Of the 16 inorganic analytes tested, 14 were detected in reference groundwater in the Upper Alluvial Aquifer. Of the 25 metals (total) that were analyzed, 17 were detected. None of the analytes exceeded the Human Health SLC.

Basal Alluvial Aquifer

All but one of the 16 inorganic analytes was detected in the Basal Alluvial Aquifer. Of the 25 metals (total) that were analyzed, 18 were detected. None of the analytes exceeded the Human Health SLC.

Basal Bedrock Aquifer

Of the 16 inorganic analytes tested, 13 were detected in reference groundwater in the Basal Bedrock Aquifer. Of the 25 metals (total) that were analyzed, 18 were detected. None of the analytes exceeded the Human Health SLC.

Questa Residential Tap Water

Of the 16 inorganic analytes tested, seven were detected in reference residential tap water. The residential tap water had the fewest detected inorganic analytes of all tailings facility reference groundwater. Of the 25 metals (total) that were analyzed, 13 were detected. None of the analytes exceeded the Human Health SLC.

Cater Ranch

Eight of the 16 inorganic analytes were detected in reference groundwater at Cater Ranch. Of the 25 metals (total) that were analyzed, 10 were detected. Groundwater at Cater Ranch had the fewest detected metals (total) of all tailings facility reference groundwater. None of the analytes exceeded the Human Health SLC.

6.6.5 Tailings Facility

The following summarizes detected inorganic and metal analytes in groundwater at exposure areas GW-1 and GW-13, including Outfall 002. Mean concentrations are presented for analytes having greater than 50 percent of detections exceeding the Human Health SLC. Comparisons of detected analytes greater than Human Health SLC are made between exposure and reference areas.

Upper Alluvial Aquifer

Between 13 and 16 inorganic analytes were detected in the Upper Alluvial Aquifer groundwater. Of the 25 metals (total) that were analyzed, between 18 and 24 were detected. The number of detected inorganics and metals (total) were greater in exposure area GW-13 than in GW-11. In exposure area GW-11, no VOCs or SVOCs were detected; VOCs and SVOCs were not analyzed in exposure area GW-13.

The following lists the inorganics and metals that exceeded Human Health SLC for the Upper Alluvial Aquifer. Underlined analytes in the table had 50 percent or greater of the detections that exceeded the SLC.

Tailing Facility Upper Alluvial Aquifer Exceedance of Human Health SLC	
Groundwater Exposure Area	**Metal (total)/Inorganic Analytes**
GW-11	<u>Mo</u>
GW-13	Al, As, NO_3, Mn, Mo, Cr, Fe, Pb, V

*Note: In GW-13, aluminum, arsenic, chromium, iron, lead, and vanadium may be considered as outliers because they were detected in only a few samples that had high turbidity.

Exposure area GW-13 had the greatest number of analytes that exceeded SLC, but none of the exceedances occurred in greater than 50 percent of the samples. Many of the analytes that exceeded SLC did so in only a few samples (i.e., low percent exceedance of SLC), most of which were associated with the samples from drive points south of the tailings facility. These rare exceedances are most likely due to high turbidity of the sample that affects the particulate, or total, fraction of the sample analytes. Support for this is evident in the low number of dissolved analytes (from filtered samples) that exceeded SLC, which was limited to only two analytes: manganese and molybdenum. Consequently, the following metal analytes in GW-13 that exceeded SLC may be considered as outliers: aluminum, arsenic, chromium, iron, lead, and vanadium. Manganese and molybdenum, on the other hand, had exceedances of SLC in samples of 19 and 27 percent, respectively. The higher percentage of exceedances for these two analytes suggests that they are not outliers and may be the only metals to actually exceed SLC.

In exposure area GW-11, the only analyte exceeding SLC was molybdenum. Molybdenum exceeded SLC in greater than 50 percent of the samples where molybdenum was detected. The mean concentration was 0.77 mg/L.

Groundwater in the Upper Alluvial Aquifer at the tailings facility had two metals (manganese and molybdenum) and one inorganic (nitrate) that exceeded SLC, taking into account that several of the metals that exceeded SLC may be outliers. In comparison, reference groundwater in the Upper Alluvial Aquifer had no metals or inorganics that exceeded SLC.

Basal Alluvial Aquifer

Between 11 and 16 inorganic analytes were detected in the Basal Alluvial Aquifer groundwater. Of the 25 metals (total) that were analyzed, between 12 and 24 were detected. The number of detected inorganics and metals (total) were greater in exposure area GW-13 than in GW-11. In exposure area GW-11, no VOCs or SVOCs were detected. VOCs and SVOCs were not analyzed in exposure area GW-13.

The following lists the inorganics and metals that exceeded Human Health SLC for the Basal Alluvial Aquifer.

Tailings Facility Basal Alluvial Aquifer Exceedance of Human Health SLC	
Groundwater Exposure Area	**Metal (total)/Inorganic Analytes**
GW-11	Pb
GW-13	Al, Cr, Fe, Pb, Mn, V

None of the analytes listed above exceeded SLC in greater than 50 percent of the samples.

In exposure area GW-11, the only analyte exceeding SLC was lead. The exceedance of lead occurred in one sample from MW-CH. The lead (total) concentration of 0.0154 mg/L slightly exceeded the SLC of 0.015 mg/L. Compared to the other lead values from MW-CH, the 0.0154 mg/L is uncharacteristically high and may be considered to be an outlier.

Exposure area GW-13 had the greatest number of analytes that exceeded SLC. Many of the analytes that exceeded SLC did so in only a few samples (i.e., low percent exceedance of SLC). These rare exceedances may be associated with turbidity of the sample that affects the particulate, or total, fraction of the sample analytes. Support for this is that no dissolved analytes (from filtered samples) exceeded SLC. Consequently, the metal analytes in GW-13 that exceeded SLC may be considered as outliers.

Taking into account that the metal analytes exceeding SLC in the Basal Alluvial Aquifer at the tailings facility may be outliers, potentially no metals or inorganics exceeded SLC. In comparison, reference groundwater in the Basal Alluvial Aquifer also had no metals or inorganics that exceeded SLC.

Basal Bedrock Aquifer

Basal bedrock groundwater occurs only in exposure area GW-13. Fourteen of the 16 inorganic analytes were detected in the Basal Bedrock Aquifer groundwater. Of the 25 metals (total) that were analyzed, 22 were detected.

No inorganic analytes and three metals (total) exceeded Human Health SLC. The three metals included iron, manganese, and molybdenum. None of the three metals exceeded SLC in greater than 50 percent of the samples. Only one sample in one well exceeded the iron SLC. That iron concentration was an order of magnitude greater than the other samples for the well, suggesting that the high iron concentration is an outlier. Consequently, the analytes exceeding SLC may only include manganese and molybdenum. In comparison, reference groundwater in the Basal Bedrock Aquifer had no metals or inorganics that exceeded SLC.

Upper Alluvial and Basal Bedrock Aquifer Seepage

Seepage from the Upper Alluvial and Basal Bedrock aquifers occurs only in exposure area GW-13. Fourteen of the 16 inorganic analytes were detected in the seepage. Of the 25 metals (total) that were analyzed, 20 were detected in the seepage from the Upper Alluvial Aquifer and 21 were detected in seepage from the Basal Bedrock Aquifer. A single sample was analyzed for organic compounds including: Motor Oil, Diesel Fuel No. 2, gasoline, VOCs, and SVOCs. No organic compounds were detected.

One inorganic (sulfate) analyte and one metal (total molybdenum) exceeded Human Health SLC in seepage from the Upper Alluvial Aquifer. Detections of the two analytes that exceeded SLC occurred in less than 50 percent of the samples. The mean concentrations for the two analytes were: sulfate 853 mg/L and molybdenum 0.12 mg/L. No Human Health SLC were exceeded in seepage from the Basal Bedrock Aquifer

Reference seepage did not occur or was not sampled; therefore, comparison of tailings facility seepage to reference seepage could not be made.

002 Outfall Discharge

Outfall 002 occurs in exposure area GW-13. Thirteen of the 16 inorganic analytes were detected in the discharge water. Of the 25 metals (total) that were analyzed, 20 were detected. One analyte was detected at concentrations that exceeded Human Health SLC, namely molybdenum (total). Exceedances of the molybdenum SLC occurred in greater than 50 percent of the samples. The mean molybdenum concentration was 1.2 mg/L.

"No SLC" indicates that there is not a Screening Level Criterion for this medium specified for the RI/FS.
"HH DW (HQ=1)" EPA Region 6 RBSLs Human Health Tap Water (HQ=1)
Median Value determined using 1/2 the Reporting Limit value for Non-Detects if greater than 50% of the values were detected.
Mean Value calculated using 1/2 the Reporting Limit for Non-Detects if greater than 50% of the values were detected.

T = Total Fraction
D = Filtered Fraction (0.45 micron filter)
A = Filtered Fraction (0.1 micron filter)
ND = Non-Detected Value

"No SLC" indicates that there is not a Screening Level Criterion for this medium specified for the RI/FS.
"HH DW (HQ=1)" EPA Region 6 RBSLs Human Health Tap Water (HQ=1)
Median Value determined using 1/2 the Reporting Limit value for Non-Detects if greater than 50% of the values were detected.
Mean Value calculated using 1/2 the Reporting Limit for Non-Detects if greater than 50% of the values were detected.

T = Total Fraction
D = Filtered Fraction (0.45 micron filter)
A = Filtered Fraction (0.1 micron filter)
ND = Non-Detected Value
