

Report Date: 6/16/2026

NMED/AQB Modeler: Sahil Kassanjee

Facility Identification:

Project: YGI Microgrid Company: Yucca Growth Infrastructure

Permit number: 10883 TEMPO ID: 41351

Location Information:

The facility is located 3.6 miles south of Santa Teresa, in Dona Ana County. The facility is located 6.0 miles west-northwest of Sunland Park. (Figure-1)

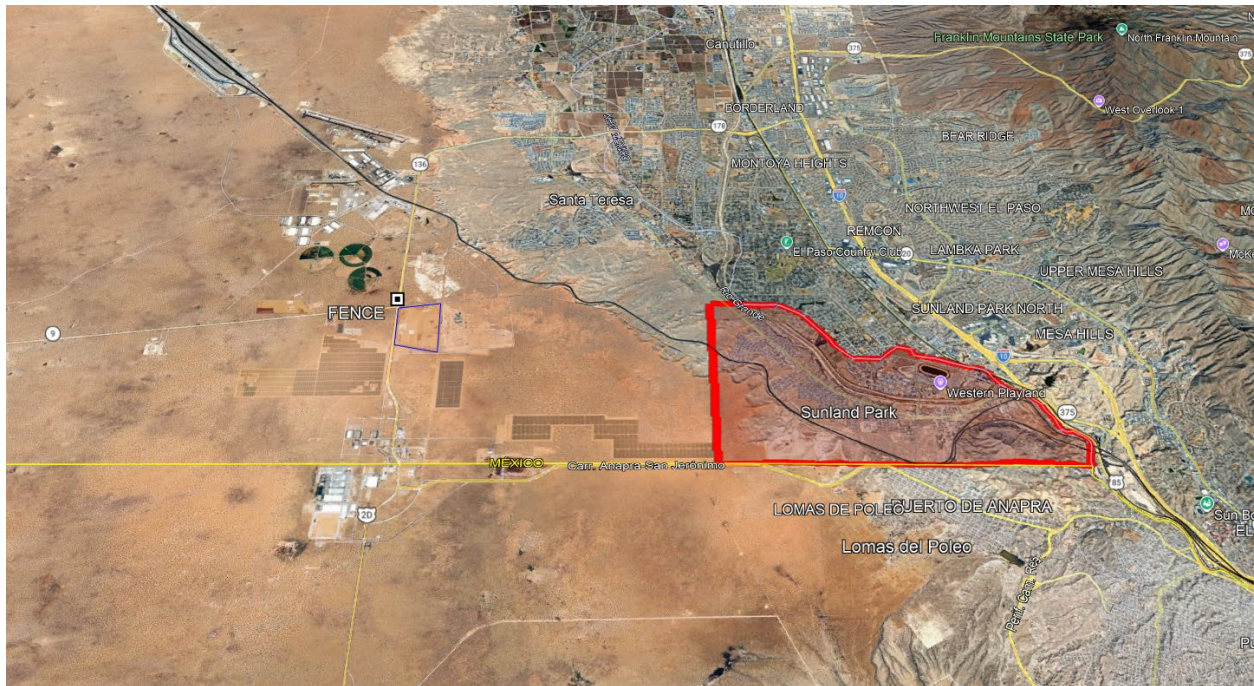

Figure 1. Location of the YGI Microgrid facility in Doña Ana County, New Mexico. The facility boundary is outlined in **purple**. The red shaded area represents the Sunland Park ozone nonattainment area, located approximately **6.0 miles east-southeast** of the facility.

UTM Coordinates: 341,072 m East, 3,521,528 m North, zone 13, Datum: NAD83

Elevation = 4124 feet

Air Quality Control Region (AQCR): 153

Airshed: Lrg

Project Description:

Brief: Yucca Growth Infrastructure has applied to the New Mexico Air Quality Bureau for a New Source Review air quality permit for the construction of the YGI Microgrid facility (the facility). The facility is a power generation microgrid.

Yucca Growth Infrastructure, LLC (Yucca) is proposing to construct a microgrid power generation facility (YGI Microgrid) in Dona Ana County, NM. Bloom Energy Corp (Bloom) will be the operator of the YGI Microgrid. The YGI Microgrid site will consist of a Bloom Energy Server System. This application is an initial NSR application being submitted under 20.2.72.200.A(1) NMAC. The site will be a major source for Title V (20.2.70 NMAC).

The emission sources included in this project are Bloom Energy fuel cells. The emission units used in the modeling are described in the tables below.

For this permit, modeling was required for the following pollutants: Carbon Monoxide (CO), Nitrogen Dioxide (NO₂), Particulate Matter 10 micrometers or less in aerodynamic diameter (PM₁₀), Particulate Matter (2.5 microns or less) (PM_{2.5}), and Sulfur Dioxide (SO₂). Potential impacts from ozone, benzene, xylenes, and methanol were also evaluated.

The appendix provides the supporting location information used in the modeling analysis. Appendix A contains the facility fenceline coordinates, including the UTM eastings and northings for the northwest, northeast, southeast, and southwest corners of the controlled property boundary. Appendix B contains the fuel cell stack and housing location information for the 2,275 Bloom fuel cell stacks. The individual fuel cell stack coordinates are listed in Table B-1, and the fuel cell stacks and housing structures are shown visually in Figure B-1, where the fuel cell stacks are represented by red dots and the housing structures are represented by purple squares.

Table 1: Table of Total Facility Emissions

NO ₂ Rate (lbs/hr)	CO Rate (lbs/hr)	SO ₂ Rate (lbs/hr)	PM ₁₀ Rate (lbs/hr)	PM _{2.5} Rate (lbs/hr)
8.494	36.815	0.02	17.214	17.214

Table 2: Table of Point Sources

Stack Number	Description	Stack Height (ft)	Diameter (ft)	Velocity (ft/s)	Temperature (°F)	NO ₂ Rate (lbs/hr)	CO Rate (lbs/hr)	SO ₂ Rate (lbs/hr)	PM ₁₀ Rate (lbs/hr)	PM _{2.5} Rate (lbs/hr)
BL_1-BL_2275	Bloom Solid Oxide Fuel Cell System	30.0	8.2	16.4	350	0.004	0.016	0.000	0.008	0.008

Modeling Assumptions:

The facility operates continuously, 8,760 hours per year.

Permit Conditions:

The facility may operate 8,760 hours per year.

Conclusion:

This modeling analysis demonstrates that operation of the facility described in this report neither causes nor contributes to any exceedances of applicable air quality standards. The standards relevant at this facility are NAAQS for CO, NO₂, PM₁₀, PM_{2.5}, and SO₂; NMAAQs for CO, NO₂, and SO₂; and Class II PSD increments for NO₂ and PM₁₀.

Action: The permit can be issued based on this modeling analysis.

The modeling report was submitted by Trinity Consultants and dated April 27, 2026.

The air quality analysis demonstrates compliance with applicable regulatory requirements.

Model(s) Used: AERMOD version 24142 was used to run the modeling analysis.

Note: Complete modeling input and output files can be made available and are located in the Modeling Archives in the folder, "10883_Yucca Growth Infrastructure_YGI Microgrid".

Description of model input files: NMED's AERMOD-ready meteorological data was used for this analysis. This data is available on AQB's website. GeoTIFF files were acquired through the USGS.

Modeling Parameters:

The AERMOD regulatory default parameters were included in assumptions made by the model.

Building downwash was modeled because the facility contains buildings that may cause significant building wake effects.

Table 3: Table of Buildings

Building Name	Height (m)	Diagonal Length (m)
SOFC Housing (Building 1 – Building 425)	7.6	32.4

Complex Terrain Data:

Elevations of receptors, facility sources, and surrounding sources were obtained from USGS GeoTIFF files using AERMAP.

Both simple and complex types of terrain were used to model the facility.

Receptor Grid: The following grids were used to determine the maximum concentration for each pollutant.

Table 4: Table of Receptors

Grid Type	Description	Shape	Spacing	Radius or Length
Cartesian	Rough	Square	2 kilometers	50 kilometers
Cartesian	Intermediate	Square	1 kilometers	20 kilometers
Cartesian	Intermediate	Square	500 meters	5 kilometers
Cartesian	Fine	Square	100 meters	500 meters
Cartesian	Fine	Square	50 meters	100 meters

10883 Yucca Growth Infrastructure-YGI Microgrid Modeling Review Report

Cartesian	Very fine	Square	50 meters	Fenceline
Fence line	Very fine	Fence line	50 meters	Fence line

Receptors outside of the radii of impact were discarded for the surrounding source runs. Receptors that demonstrated compliance were then discarded, and further detailed analysis was performed on the remaining receptors.

Meteorological Data: AERMOD – Sunland Park (Desert View) 2018-2022.

Adjacent Sources:

The Division's Modeling Guidance was used to select 351 sources within 50 km of the facility.

The facility is 6.0 km from Stampede Meat, 6.0 km from Rinker Santa Teresa Pipe (GCP5-3602), 8.6 km from Camino Real Landfill, 12.5 km from Rio Grande Generating Station, 36.5 km from Afton Generating Station, and 36.8 km from Afton Compressor Station.

Modeling Procedures:

Hazardous air pollutant emissions from the SOFC unit include benzene, xylenes, and methanol. Total HAP emissions are estimated at 0.32 lb/hr and 1.42 tons/year. Methanol is the largest contributor, with emissions of 0.26 lb/hr and 1.15 tons/year, followed by benzene at 0.046 lb/hr and 0.20 tons/year, and xylenes at 0.015 lb/hr and 0.066 tons/year. Based on the values shown, total HAP emissions are below the federal major source thresholds of 10 tons/year for any individual HAP and 25 tons/year for combined HAPs.

The air dispersion modeling analysis evaluated facility impacts for carbon monoxide (CO), nitrogen dioxide (NO₂), particulate matter less than 10 microns (PM₁₀), particulate matter less than 2.5 microns (PM_{2.5}), and sulfur dioxide (SO₂). The pollutants and modeling demonstrations are summarized below.

Carbon Monoxide (CO)

Carbon monoxide emissions from the facility were modeled and compared to the applicable Significant Impact Levels (SILs) for the 1-hour and 8-hour averaging periods. The modeled impacts were evaluated to determine whether additional cumulative analysis was required.

Nitrogen Dioxide (NO₂)

Nitrogen dioxide impacts were modeled for the applicable averaging periods and compared to the applicable SILs. The NO₂ analysis was used to determine whether the facility's impacts were significant and whether further cumulative modeling was necessary.

Particulate Matter (PM₁₀ and PM_{2.5})

PM₁₀ and PM_{2.5} emissions from the facility were modeled and compared to the applicable Significant Impact Levels (SILs). A cumulative impact analysis (CIA) was evaluated where applicable to assess total particulate matter impacts from the facility, nearby sources, and representative background concentrations. Background concentrations were added to the modeled concentrations for comparison with the applicable ambient air quality standards. For PM_{2.5}, secondary formation from NO_x and SO₂

precursor emissions was also considered using the appropriate MERP-based screening approach for the facility location.

Sulfur Dioxide (SO₂)

Sulfur dioxide emissions from the facility were modeled and compared to the applicable SO₂ SILs. The results were used to determine whether the facility's SO₂ impacts were significant and whether additional cumulative modeling was required.

Overall, the modeling analysis was conducted to demonstrate whether the facility's emissions would cause or contribute to an exceedance of applicable ambient air quality standards or PSD increments.

PSD Increment Information:

The facility is a minor source (for PSD purposes) located in AQCR 153. The minor source baseline dates here are 8/2/1995 for NO₂, not yet established for SO₂, 6/16/2000 for PM₁₀, and not yet established for PM_{2.5}.

The facility is 156.5 km from the Class I area Guadalupe Mountains National Park. Class I area impacts are negligible for minor sources over 50 km from a Class I area. Modeling is not required.

CO Analysis:

The 1-hour CO concentration was below the significance level. No cumulative analysis is required.

The 8-hour CO concentration was below the significance level. No cumulative analysis is required.

NO₂ Analysis:

ARM2 was used with default options (0.5 minimum ratio, 0.9 maximum ratio) to determine the conversion of NO_x to NO₂.

The 1-hour and annual NO₂ concentrations were below the applicable significance levels. No cumulative analysis is required.

PM₁₀ Analysis:

The maximum total 24-hour PM₁₀ concentration was 78.081 µg/m³, which occurred 550 m west-southwest from the center of the facility. This was 52.1% of the NAAQS. A background concentration of 73.000 µg/m³ was added from the monitor 6ZM, at Sunland Park-Desert View Elementary School.

The maximum total 24-hour PM₁₀ concentration was 5.652 µg/m³, which occurred 533 m west-southwest from the center of the facility. This was 18.8% of the PSD Class II increment.

The maximum total annual PM₁₀ concentration was 1.015 µg/m³, which occurred 512 m west from the center of the facility. This was 6.0% of the PSD Class II increment.

PM_{2.5} Analysis:

The maximum total 24-hour PM_{2.5} concentration was 27.532 µg/m³, which occurred 507 m west from the center of the facility. This was 78.7% of the NAAQS. A background concentration of 24.300 µg/m³ was added from the monitor 6ZM, at Sunland Park-Desert View Elementary School.

The maximum total annual PM_{2.5} concentration was 8.204 µg/m³, which occurred 512 m west from the center of the facility. This was 68.4% of the NAAQS. A background concentration of 7.300 µg/m³ was added from the monitor 6ZM, at Sunland Park-Desert View Elementary School.

SO₂ Analysis:

The 1-hour SO₂ concentration was below the significance level. No cumulative analysis is required.

O₃ Analysis

Although this facility will emit less than 250 tons per year of NO_x and less than 250 tons per year of VOC, a project-specific MERPs screening calculation was also performed using the MERPs tool and the NM AQB Dispersion Modeling Guidelines. This additional calculation is provided below to further demonstrate that the project will not cause or contribute to an exceedance of the ozone NAAQS.

$$[O_3]_{8-hour} = \left(\frac{250 \frac{ton}{yr}}{340_{MERP_{NOX}}} + \frac{250 \frac{ton}{yr}}{4679_{MERP_{VOC}}} \right) \times 1.96 \mu g/m^3$$

The resulting 8-hour ozone concentration of 1.546 µg/m³ is below the ozone significance level of 1.96 µg/m³. Therefore, sources with ozone impacts below the ozone SIL are not expected to cause or contribute to ozone concentrations exceeding the ozone NAAQS.

Table 5: Table of Ambient Impact from Emissions

Pollutant	Period	Modeled Facility Concentration (µg/m ³)	Modeled Concentration with Surrounding Sources (µg/m ³)	Secondary Formation (µg/m ³)	Background Concentration (µg/m ³)	Cumulative Concentration (µg/m ³)	Standard	Value of Standard (µg/m ³)	Percent of Standard	UTM East (m)	UTM North (m)	Elevation (ft)
CO	1-hour	29.055				29.055	SIL	2000	1.45	354,000	3,533,000	4335

Appendix

Appendix A: Facility Fenceline coordinates

In air dispersion modeling, the fenceline represents the boundary of the facility property or controlled area. Receptors are typically placed along and outside the fenceline to evaluate where ambient air impacts may occur, while areas inside the fenceline are generally considered under facility control and are not treated as ambient air for public exposure purposes. The coordinates below represent the corners of the fenceline used for the modeling analysis.

Table A-1 Facility Fenceline Coordinates

Corner	Easting	Northing
Northwest (NW)	340560.3	3522076
Northeast (NE)	341510.2	3522199
Southeast (SE)	341537.7	3520739
Southwest (SW)	340570.8	3520974

Appendix B: Fuel Cell Stack Housing

A total of 2,275 fuel cell stacks will be located within housing structures. The locations of the fuel cell stacks and associated housing structures are listed in Tables B-1 and B-2 and shown in Figure B-1. In Figure B-1, the fuel cell stacks are represented by red dots, while the housing structures are represented by purple squares.
